
Result

The selected cross-reference list is printed out with the set print options.

11.18.8 Adding a new object to the cross-reference list

Introduction

Depending on the selected object, all cross-references belonging to this source object are displayed when the cross-reference list is opened.

You have the following options for inserting new source objects in an existing cross-reference list:

- By clicking the "Add new source object" button which is displayed at the end of the cross-reference list.

Requirement

You have created a project which contains objects with references.

Adding a new object to the cross-reference list

To add new objects to the cross-reference list, follow these steps:

1. Open an existing cross-reference list.
2. Click the "Add new source object" button and enter the required object. When an existing object is inserted, you are supported by the intelligent pre-selection.

Note

Multiple insertion of identical objects

If you insert an identical object multiple times in the cross-reference list, the duplicates are automatically removed after the next update.

Note

Functionality for newly added source objects

Note that the "Undo and redo operations" functionality is not available for newly added source objects.

Result

The newly added object is displayed as last object in the cross-reference list.

The current filter selection is applied to the newly added object only after the next update.

11.18.9 Show overlapping accesses in the cross-reference list

Introduction

The overlapping access to a selected object can be displayed in a second window in the lower part of the cross-reference list.

The display of the overlapping access cannot be saved and is no longer available after the cross-reference list is opened again.

Definition

Overlapping access for tags and structured tags is determined based on the absolute addresses.

We refer to "overlapping access" if the address for a tag or structured tag is partly or completely in the address space of the associated source object.

Note

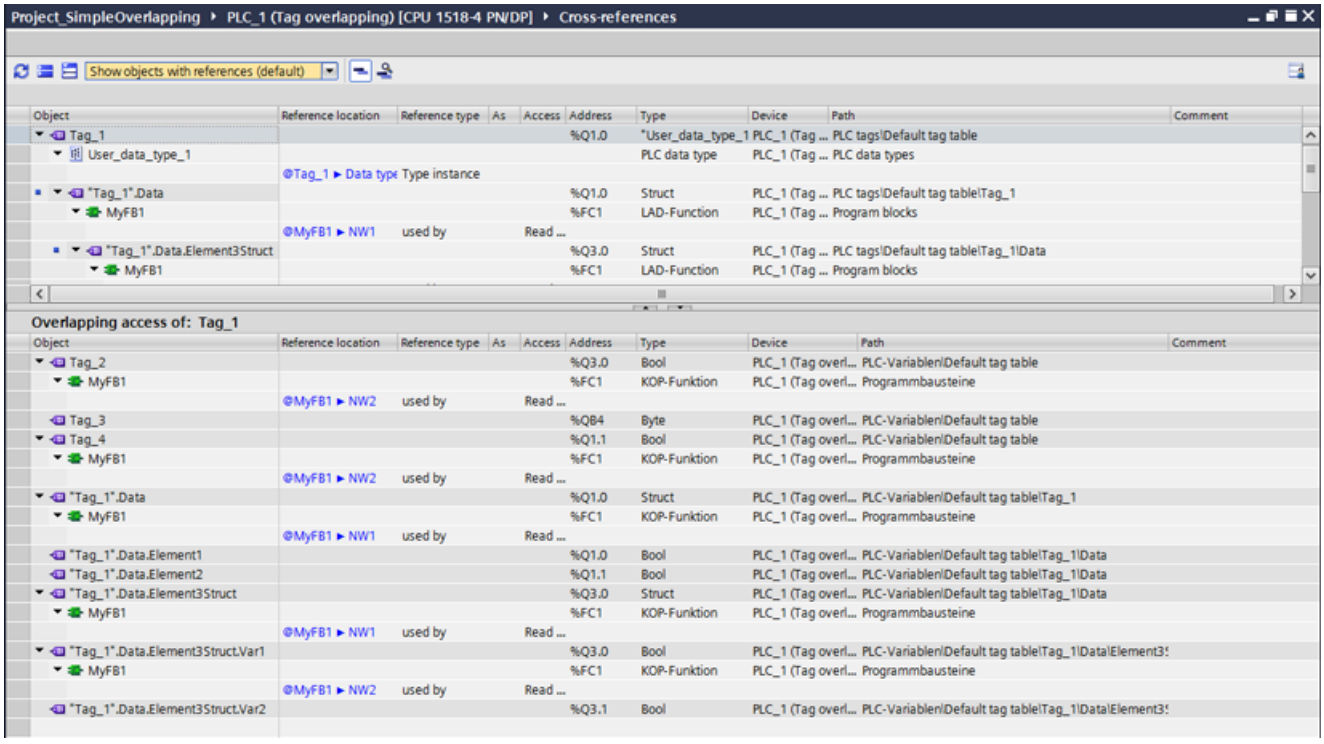
Displaying "overlapping access"

Overlapping access is only displayed for a single selected source object or lower-level source object in the cross-reference list.

If several objects are selected in the cross-references shown, no overlapping access is displayed.

Example

The following graphic shows the cross-reference list with the display of the overlapping access for "Tag_1":



Requirement

A project has been created which contains objects with overlapping access.

Showing overlapping access in the cross-reference list

Proceed as follows to display overlapping access in the cross-reference list:

1. Open the cross-reference list and click the "Show overlapping accesses" button in the toolbar.
   Result: All objects that have overlapping access are marked with the corresponding overlapping access symbol in the "Object" column.
2. In the upper part of the cross-reference list, select a marked object and call the "Show overlapping accesses" command via the shortcut menu.
   Result: The overlapping access to the selected object is displayed in a second window with the header "Overlapping accesses of: <ObjectName>".

Note

Display of the overlapping access

The display of the overlapping access cannot be saved and is no longer shown after the cross-reference list is opened again.

To show the overlapping access again, perform the steps described above.

11.18.10 Restoring cross-references after project upgrade.

Introduction

After a project upgrade to a higher TIA Portal version, you have the option of recreating the associated cross-reference information for the updated project.

This happens automatically at the end of the upgrade process. The current project is opened after this and the cross-references are then available again.

You are notified if the cross-reference information is inconsistent or incomplete. A banner text with a link to additional information is displayed when the cross-reference list is opened.

In this case, you can reorganize the cross-reference information yourself.

Requirements

You have performed a project upgrade and received the message that the cross-reference information is inconsistent or incomplete.

Recreate the cross-reference information

To create new cross-references, follow these steps:

1. To restore the cross-references, click the link in the displayed message.
   Alternatively, you can also call and execute the command via "Options" > "Settings" > "General" > "Cross-references".
   The settings for the TIA Portal then open under "Cross-references".
2. Click the displayed button "Recreate the cross-reference information" to start the process.
3. When the restoration has been completed, check the message in the Inspector window to see if the process was successful.
   If the process was successful, you receive a message which you must confirm with "OK".
   If the process was not successful, you receive an error message.
4. In the cross-reference list, click the "Update" button to close the displayed banner again.

Result

The new cross-reference information for the selected project was created.

11.18.11 Displaying cross-references in the Inspector window

Introduction

The Inspector window displays cross-reference information about an object you have selected in the "Info > Cross-references" tab.

If you select an object in any editor in the TIA Portal, the associated reference to the selected object is shown in this tab.

Displaying cross-references in the Inspector window

To display cross-reference information in the Inspector window, follow these steps:

1. Select the required object (e.g. in the project tree or in the program editor) and click "Show cross reference list" in the shortcut menu.
   Result: The references to the selected object are displayed in the Inspector window in the "Info" > "Cross-references" tab.

Note

Please note that only the cross-reference information for supported objects can be shown in the Inspector window

If, for example, you have selected a folder, you will not receive any cross-reference information for this.

Structure

The Inspector window displays the cross-reference information in tabular format.

The cross-reference list has the following structure:

Column	Content/meaning
Object	Displays the name of the source object which was selected when the cross-reference list was opened, with all lower-level objects and the associated reference objects.
Reference location	Shows the reference location of the objects, e.g. a network.
Reference type	Shows the relationship between the source object and the referenced objects: • "Uses": The source object uses this object • "Used by": The source object is used by this object • "Type/instance": The source object is a type or an instance of the referenced object • "contains": The source object contains the reference object (with HMI objects) • "belongs to": The source object belongs to the reference object (with HMI objects)

Column	Content/meaning
As	Shows additional information about objects, e.g. that a tag is used by several devices.
Access	Shows the type of access, e.g. whether access to the operand is read access (R) and/or write access (W).
Address	Shows the address of the relevant object.
Type	Shows the type and the language used to create the object.
Device	Shows the associated device name, e.g. "CPU_1".
Path	Displays the path of the object in the project tree with specification of folders and groups.
Comment	Displays comments on individual objects, if available.

11.19 Testing the user program

11.19.1 Basics of testing the user program

Functions

You have the option of testing the running of your user program on the device. You can then monitor signal states and values of tags and can assign values to tags to simulate certain situations in the running of the program.

Requirement

There must be an executable program loaded on the device.

Test options

The following test options are available:

- Testing with program status
  The program status allows you to monitor the running of the program. You can display the values of operands and the results of logic operations (RLO) allowing you to recognize and fix logical errors in your program.
- Testing in single step mode (S7-300/400 only)
  You can test blocks you created in STL or SCL in the single step mode. You do this by setting breakpoints in the program code at which program execution stops. You can then continue to run the program one step at a time. Within a CPU, you can test either with program status or in single step mode. You cannot, however, use both test options at the same time within a CPU.

- Testing with the watch table
  With the watch table, you can monitor and modify the current values of individual tags in the user program or on a CPU. You can assign values to individual tags for testing and run the program in a variety of different situations. You can also assign fixed values to the I/O outputs of a CPU in STOP mode, for example to check the wiring.
- Testing with the force table
  With the force table, you can monitor and force the current values of individual tags in the user program or on a CPU. When you force, you overwrite individual tags with specified values. This allows you to test your user program and run through various situations. When forcing, make sure that you keep to the necessary safety measures for forcing (Page 4969)!

Introduction to testing with program status (Page 4904)

Introduction to testing with the watch table (Page 4923)

Introduction for testing with the force table (Page 4951)

11.19.2 Testing with program status

11.19.2.1 Introduction to testing with program status

Program status function

You can monitor the execution of the program by displaying the program status. This shows you the values of the individual operands and their results of logic operations. This allows you to check whether the components of the automation system are being correctly controlled.

The display of the program execution in the program status can differ slightly, depending on the CPU series used.

Testing with program status for S7-300/400

During testing with program status, the CPU cycle time can become extended because the recording of the data affects the duration of the programmed instructions.

During execution of the following test functions, an alarm is displayed once for each online session indicating that there is a risk of a timeout:

- During testing with call conditions
- During testing with breakpoints

You can only perform these test functions after you have acknowledged the alarm.

Note

With older CPUs from the S7-300/400 CPU series, you will need to change the operating response using the hardware configuration and then load the hardware configuration to the device. You have the option to set the "Process operation" or "Test mode" operating response.

Testing with program status for S7-1200/1500

When you run the "Testing with program status" function with a CPU from the S7-1500 series, the cycle time can increase significantly when monitoring loops due to the fast program execution. The CPU may go to STOP, especially when it exceeds the configured cycle clock for interrupt OBs or the configured maximum cycle time.

Note

To avoid a possible STOP in the CPU, ensure that no programmed loops are displayed in the active monitoring window during "Testing with program status". Alternatively, you can also increase the maximum permissible cycle time of the CPU.

Restrictions with the "Program status" function

The monitoring of loops can increase the cycle time significantly, depending in each case on the number of tags to be monitored and on the actual number of loops processed.

To ensure that the cycle time is influenced as little as possible, the "Program status" function is restricted as described below:

For CPUs from the S7-300/400 series:

- The status display of a programmed loop is stopped at the return point.

For CPUs from the S7-1200/1500 series:

- The monitoring of loops is deactivated by default. If required, monitoring can be activated via the shortcut menu.
- If the monitoring of loops is enabled with an S7-1200 CPU, the program status for the area is not displayed after a loop that is processed multiple times. In this case, move the visible editor window to the area after the loop so that the monitor values are displayed again.

⚠ WARNING

Testing with program status

A test with the "Program status" function can cause serious damage to property or injury to persons if malfunctions or program errors occur.

Make sure that no dangerous situations can arise before you conduct a test with the "Program status" function.

Recommended procedure if there is a risk of a timeout

If there is a risk of a timeout during monitoring with program status, you are alerted by the system with a corresponding alarm.

To continue monitoring, you have to acknowledge the alarm with "Yes".

In this case, you also have the following option to avoid exceeding the maximum permissible cycle time during testing with program status:

- Reduce the size of the editor window so that fewer tags are displayed and thus fewer tags are monitored.
- Monitor the required tags within the watch table.

11.19.2.2 Setting the call environment

Basics of the call environment

Function

You can define the call environment for block monitoring and for breakpoints. With this, you specify the conditions for recording the program status of a block or for stopping program execution at a breakpoint.

Specification of the call environment for block monitoring

Alternatively, you can activate one of the following options to specify the call environment:

- No condition defined
  If no other option was selected this option is the default.
- Instance data block
  The program status of a function block will then only be recorded when you call the function block with the selected instance data block.
- Call path
  The program status of a block will then only be recorded when you call the block with a specific block or from a specific path.
- Manually adapted call path
  You can enter the desired call environment manually in this field. The "Transfer to 'adjusted manually'" button is used to transfer the content selected under "Call environment", which you can edit further if required.
  The program status of a block will then only be recorded when you call the block with a specific block or from a specific path.

Specification of the call environment for breakpoints

You can also specify a separate condition for each breakpoint.

If you do not specify the call environment, the program status of a block call is selected at random and recorded within the call structure and program execution is always interrupted at the relevant breakpoint. You should therefore always specify the call environment if you want to display the program status for a specific call.

See also

Setting the call environment for block monitoring (Page 4907)

Setting the call environment for block monitoring

By setting the call environment, you can specify when the program status of a block is recorded.

The section "Setting the call environment for breakpoints" describes how to set the call environment for breakpoints.

Requirement

- The block is open.

Specifying the call environment

To set the call environment, follow these steps:

1. Open the "Testing" task card.
2. Click "Change" in the "Call environment" pane.
   The "Call environment of the block" dialog opens.
3. Select the condition you want to apply.
   See also: Basics of the call environment (Page 4906)
4. Confirm your selection with "OK".

Result

The selected call environment is displayed in the "Testing" task card within the "Call environment" pane. The program status is now carried out in accordance with the set call environment.

Changing the call environment

Proceed as follows to change the call environment:

1. Open the "Testing" task card.
   If a call environment is already set, this is displayed in the "Call environment" pane.
2. Click "Change" in the "Call environment" pane.
   The "Call environment of the block" dialog opens.
3. Select the condition you want to apply.
   See also: Basics of the call environment (Page 4906)
4. Confirm your selection with "OK".

Result

The selected call environment is displayed in the "Testing" task card within the "Call environment" pane. The program status is now carried out in accordance with the set call environment.

See also

Basics of the call environment (Page 4906)

Introduction to testing with program status (Page 4904)

11.19.2.3 Switching test with program status on/off

You can monitor all blocks by switching on the program status of the block. This function is available to you for all code blocks, regardless of the programming language used. For blocks that were programmed with LAD, FBD or SCL you can also enable the program status from a specific position or for a specific selection. You can switch on the program status for an open block directly, or open a block from the calling block and view the program status.

Note

Note the following:

- The resources for testing with program status are limited. If there are not enough resources for an additional test, the tests that are already running are terminated.
- It is possible that another user can carry out a loading process on the selected CPU through joint parallel working on a CPU. It is therefore possible in the following cases that you can either not start the test with program status or that a running test is terminated:
  - Through the loading process the block for which you want to start or already have carried out the test with program status is loaded.
  - You use an instance data block as the call environment for the test with program status and the block changes structurally through the loading process, e.g. by renumbering.
  - You use a call path as the test condition for the test with program status and a block within the call path changes through the loading process.

  If a running test is terminated, a corresponding message is displayed in the Inspector window.

Requirement

- Code block: The code of the offline block is identical with the code of the online block. In this case the "Code time stamps" of the blocks are identical.
- Data block: The structure of the offline block is identical with the structure of the online block. In this case the "Interface time stamps" of the blocks are identical.

Switching the program status on or off directly in the block

To switch the program status for a block on or off directly in the block, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click "Monitoring on/off" in the toolbar.
   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
   See also: Establishing and terminating an online connection
3. Click "Monitoring on/off" in the toolbar again to switch the program status off.

Switching on or off program status starting at a specific point in a network

To start the program status for LAD and FBD at a specific point, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click "Monitoring on/off" in the toolbar.
3. Right-click on the tag you want program status to start from.
4. Select "Modify > "Monitor from here" in the shortcut menu.
5. Click "Monitoring on/off" in the toolbar again to switch the program status off.

To start the program status in SCL at a specific point, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click "Monitoring on/off" in the toolbar.
3. Select the tag from which you want to start the program status.
4. After this, click "Display program status from the selected line" in the toolbar.
5. Click "Monitoring on/off" in the toolbar again to switch the program status off.
6. To make matters clearer, you can use the shortcut menu commands "Open" and "Close" or "Open all" and "Close all" to expand or collapse individual or all closed code sections within the block.

Switching on or off program status for selected tags

To start the program status for LAD and FBD for selected tags, follow these steps:

1. Open the block for which you wish to switch on the program status.
2. Click "Monitoring on/off" in the toolbar.
3. Select the tags for which you want to start the program status.
4. Select "Modify > Monitor selection" in the shortcut menu.
5. Click "Monitoring on/off" in the toolbar again to switch the program status off.

Switching on program status from the calling block

To switch on the program status for a block from the calling block (e.g. OB1), follow these steps:

1. Open the calling block.
2. Right-click on the block call.
3. Select the command "Open and monitor" in the shortcut menu.
   The block will open in the program editor. An online connection is established and the program status is displayed. The calling block is set in the call path.

Result

If you enable the display of the program status, an online connection is established and the program status is displayed. When you turn off the display of the program status, you can terminate the online connection at the same time.

The call path of the block is shown under the block interface. If necessary, you can change the call environment in the "Call environment" section at the right-hand edge at "Test" and "Options". In the case of CPUs of the S7-1200/1500 series the "Call hierarchy" is displayed additionally on the right-hand edge. You can open the calling block by clicking the link.

11.19.2.4 Monitoring loops

Introduction to monitoring loops

If you display the program status, you can monitor the execution of the program with a block. This provides you with an overview of the values of the individual operands and the results of the logic operations and you can check whether the components of the automation system are correctly controlled.

If the values are shown in a lighter, less saturated font, these values do not come from the current cycle.

Note

The monitoring of loops can increase the cycle time of the CPU significantly, depending in each case on the number of tags to be monitored and on the actual number of loops processed.

Special rules apply to loop monitoring, depending on the specific CPU and the programming language that are used.

Rules for loop monitoring (S7-300/400)

To ensure that the cycle time is influenced as little as possible, the "Program status" function is restricted as follows during the monitoring of loops with CPU from the S7-300/400 family in all programming languages:

- The status display of a programmed loop is stopped at the return point.

Rules for loop monitoring in STL (S7-1500)

The display of the program status within programmed loops is disabled by default during the monitoring of loops in STL. To avoid any lengthening of the cycle time, no values are displayed for the tags within loops between the "Label" and the associated "Loop" instruction.

If you are monitoring an STL block with programmed loops, a tooltip informs you that the monitoring of loops is currently disabled and can be enabled if required via the shortcut menu.

Note

Please note that only those loops that are programmed within a network are recognized.

Enabling/disabling the monitoring of loops in STL (S7-1500)

To enable the monitoring of loops in STL, follow these steps:

1. Open the STL block that you want to monitor.
2. Click "Monitoring on/off" in the toolbar.
   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
   See also: Establishing and terminating an online connection
3. Enable the monitoring within the program editor with the shortcut menu command "Monitoring" > "Monitor loops".
4. Confirm the next prompt with "Yes".
   Result: The monitoring of loops is enabled for the entire block and is active until monitoring of loops is once again disabled or the online connection to the CPU is terminated.
5. Click "Monitoring on/off" in the toolbar again to switch the program status off.

Rules for loop monitoring in SCL (S7-1200/1500)

The display of the program status within programmed loops is disabled by default during the monitoring of loops in SCL.

This affects the instructions "FOR", "WHILE" and REPEAT-UNTIL": To avoid any lengthening of the cycle time, no values are displayed for the tags within these instructions.

If you are monitoring an SCL block with programmed loops, a tooltip informs you that the monitoring of loops is currently disabled and can be enabled if required via the shortcut menu.

Enabling/disabling the monitoring of loops in SCL (S7-1200/1500)

To enable the monitoring of loops in SCL, follow these steps:

1. Open the SCL block that you want to monitor.
2. Click "Monitoring on/off" in the toolbar.
   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
   See also: Establishing and terminating an online connection

3. Right-click within the loop, in the column "value, for example, and enable monitoring with the shortcut menu command "Monitor loops".
4. Confirm the next prompt with "Yes".
   Result: The monitoring of loops is enabled for the entire block and is active until monitoring of loops is once again disabled or the online connection to the CPU is terminated.
5. Click "Monitoring on/off" in the toolbar again to switch the program status off.

11.19.2.5 Monitoring structures

Introduction to monitoring structures

You can monitor the execution of the program with a block. This provides you with an overview of the values of the individual operands and the results of the logic operations and you can check whether the components of the automation system are correctly controlled.

As of TIA Portal V14, it is also possible to monitor structured PLC tags.

Special rules apply to monitoring structures, depending on the specific CPU that is used, the programming language that is used, and the properties of the relevant structures.

Rules for monitoring structures (S7-1200/1500)

During the monitoring of structures, the values of a structured PLC tag are displayed in the program editor and in the Inspector window, with the following exception:

- It is not possible to monitor structures whose elements have adjustable retentivity properties.

To display the monitor values for a structure, you must first enable monitoring via the shortcut menu.

Displaying the monitor values for structures in the Inspector window

If the monitoring of structures is enabled and a structure tag is selected in the program editor, the associated monitor values are displayed in the Inspector window in the tab "Diagnostics" > "Monitor values".

The Inspector window is structured as follows:

- The "Name" column shows the selected structure tag with the lower-level elements on the first step open. If you click the name of the structure tag, the program editor jumps to this tag's point of use.
- The "Data type" column shows the associated data type.
- The "Value" columns shows the associated monitor values. If dashes are shown here instead of values, the monitoring of loops is disabled. In this case, enable the monitoring of loops again by means of the shortcut menu in the program editor.
- Columns "Value - IN" and "Value - OUT": These columns with the corresponding values are only displayed if the selected structure is used as InOut parameter.
- If the monitor values are displayed in a font with only 50 % saturation, this means that these vales are not from the current cycle.

- The monitor values displayed in the Inspector window use the same call path that is set as default for the block.
- The table with monitor values displayed in the Inspector window can be copied to an Excel file.
- If it is not possible to display any monitor values in the Inspector window, you will receive information that these are not available.

Procedure for monitoring structures

To enable the monitoring of structures, follow these steps:

1. Open the block in the program editor.
2. Click "Monitoring on/off" in the toolbar.
   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
   See also: Establishing and terminating an online connection
3. If the structure to be monitored is located in a loop, first enable the monitoring of loops.
   See also: Monitoring loops (Page 4910)
4. Right-click on a structure and enable the monitoring of structures by means of the shortcut menu command "Monitoring" > "Monitor values".
   Result: The selected structure tag is displayed in the Inspector window in the tab "Diagnostics" > "Monitor values" is open up to the first level with the current values displayed.
5. If required, open the still closed elements of the structure, to display all lower-level elements and their values.
6. Click "Monitoring on/off" in the toolbar again to switch the program status off.

Note

Monitoring a structure within an array

Click directly behind the closing bracket to select the relevant structure for monitoring.

See also

Monitoring loops (Page 4910)

11.19.2.6 Editing blocks during the program test

If you edit blocks while they are being monitored, monitoring will be interrupted and you will be able to edit the block offline. If the block is not available offline in the project, you will first have to load it from the device to the project. After editing the block, you will also have to compile and download it again.

Procedure

To edit blocks while these are being monitored, follow these steps:

1. Edit the block as necessary.
   Monitoring is interrupted and the block is switched offline mode assuming it exists offline.
2. If the block does not exist offline, load it to the project from the device.
3. Compile the block.
   See also: AUTOHOTSPOT
4. Download the block to the device.
   See also: AUTOHOTSPOT

Result

The block now contains your modifications both online and offline. The online connection is re-established and monitoring continues.

11.19.2.7 Modifying tags during monitoring

During monitoring, you have the option to modify tags immediately and once to the following values:

- Modify to 1
  Modifies tags of the "Bool" data type to the value "True".
- Modify to 0
  Modifies tags of the "Bool" data type to the value "False"
- Modify operand
  You can enter a modify value for tags that do not belong to the "Bool" data type.

Note that you cannot modify peripheral inputs, for example, via TagName:P.

Procedure

To modify tags during monitoring, follow these steps:

1. Right-click on the tag you want to modify.
2. Select one of the following commands in the shortcut menu:
   - "Modify > Modify to 1"
   - "Modify > Modify to 0"
   - "Modify > Modify operand"
3. If you select "Modify operand", the "Modify operand" dialog opens. Enter the value you require in the "Modify value" box and confirm with "OK".

11.19.2.8 Switching display formats in the program status

Introduction

The display formats for tags depend on the respective tag type. During monitoring, you have the option of switching the current display format by means of the shortcut menu. The possible display formats for a tag are offered in a list. This is useful, for example, when you need a hexadecimal display in order to search for a hexadecimal error code.

Procedure

To switch the display format, follow these steps:

1. Open the desired block in the programming editor.
2. Switch on the program status by clicking "Monitoring on/off" in the toolbar.
   If you have not already established an online connection, the "Go online" dialog opens. In this dialog, you can establish an online connection.
3. Select the tags you want to monitor.
4. Select "Modify > Monitor selection" in the shortcut menu to start monitoring this tag.
5. Select the desired tag at the corresponding block output and then select the desired display format in the shortcut menu, for example, "Modify > Display format > Hexadecimal".

Result

The display format for the selected tag is shown in hexadecimal form.

Note

Switching display format during monitoring

Please note that it is not possible to switch the display format for unconnected outputs, as no monitoring value is output in this case.

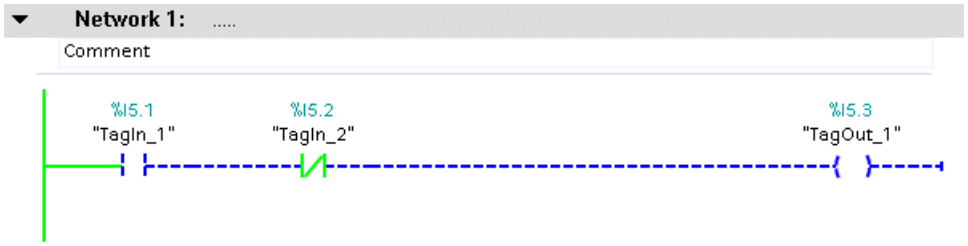
11.19.2.9 Examples of program status display

Program status display for LAD programs

Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for LAD:



Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

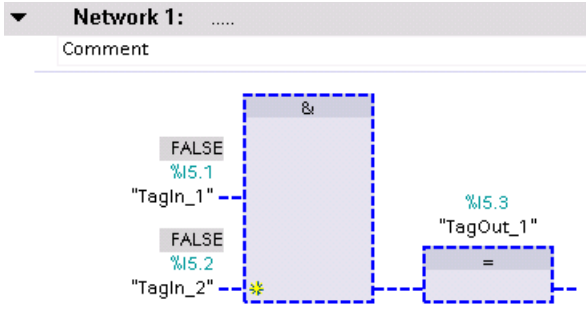
Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Lines or parameters in a frame with a saturation of 100 %	Value is current
Lines or parameters in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

Program status display for FBD programs

Displays in program status

The display of the program status is updated cyclically.

The following figure shows an example of the program status display for FBD:



Representation of the program status

You can recognize the status of individual instructions and lines of a network quickly based on the color and type of lines and symbols. The following table shows the relationship between representation and status:

Representation	Status
Green solid	Satisfied
Blue dashed	Not satisfied
Gray solid	Unknown or not executed
Black	Not interconnected
Lines or parameters in a frame with a saturation of 100 %	Value is current
Lines or parameters in a frame with a saturation of 50 %	Value originates from an earlier cycle. The point in the program was not executed in the current cycle.

The values of the operands are displayed above the relevant operand name in a gray box.

Note

Program status display for outputs which are not interconnected

Please note that a monitor value cannot be displayed for outputs which are not interconnected.

Program status display for STL programs (S7-300, S7-400, S7-1500)

Displays in program status

The display of the program status is updated cyclically and shown in tables. The tables are shown directly next to the STL program. You can read the program status for each line of the program. The display depends on the CPU in use (S7-300, S7-400, or S7-1500).

The tables to be displayed in the program status always contain the following information:

- RLO
  The "RLO" column shows the result of logic operation for each line of program. You can recognize the value of the RLO based on the background color of the table cell. Here, green means an RLO of 1 and lilac an RLO of 0.
- Value
  The current value of the operand is shown in the "Value" column.
- Extra
  The "Extra" column shows additional information depending on the particular operation, for example, relevant status bits for mathematical instructions, time or count values for timers and counters or memory addresses for indirect addressing.

The following figure shows an example of the program status display of a CPU S7-300 under STL:

Network 1: .....

Comment

			RLO	Value	Extra
1	OPN "DB1"	%DB1	0	DB1

Program status display for SCL programs

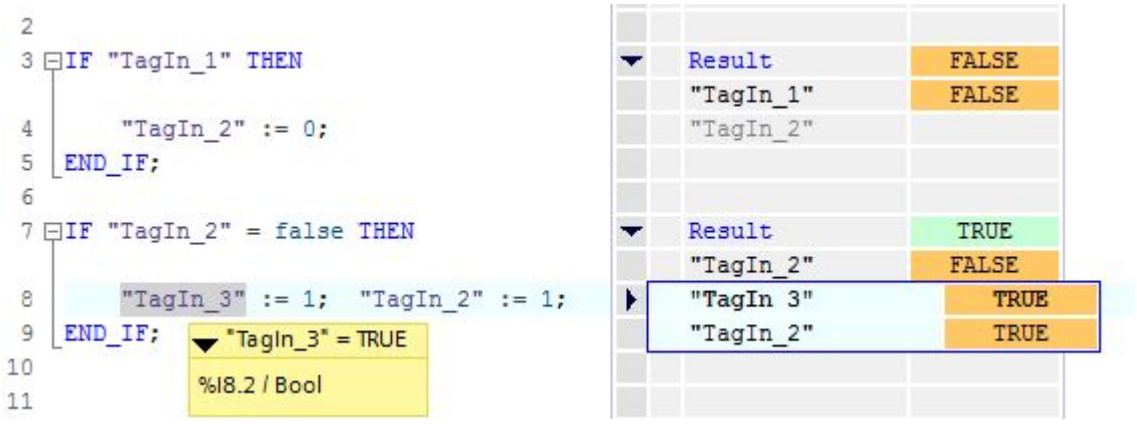
Displays in program status

The display of the program status is updated cyclically and shown in a table. The table is displayed immediately beside the SCL program and you can see the program status for each line of the program. The table contains the following information:

- Tag names
- Value

You can move the table to the left or right at any time.

The following figure shows an example of the program status display for SCL:



Explanation on monitoring in SCL

- If the code of the line is not executed, the tag name is displayed in the values table in gray text.
- The current values of the tags are displayed in the last column. If no values can be displayed for a tag, the corresponding cell has a yellow background and three question marks are shown. In this case, select the "Create extended status information" check box in the properties of the block and download the block to the device again. All values are then displayed.
- In the first column, you can see the name of the tag for which the current value is being displayed.
- If the line includes the "IF", "WHILE" or "REPEAT" instruction, the result of the instruction is displayed in the line as "True" or "False".
- If the line contains more than one tag, the value of the first tag is displayed. In both cases, all tags of these lines are displayed with their values in a separate list as soon as you select a line.
- If you place the cursor in a tag in the program code, this is shown in bold face in the list. You can also display the other tags of a line explicitly by clicking the arrow right located in front of lines containing more than one tag.

Program status display for GRAPH programs (S7-300, S7-400, S7-1500)

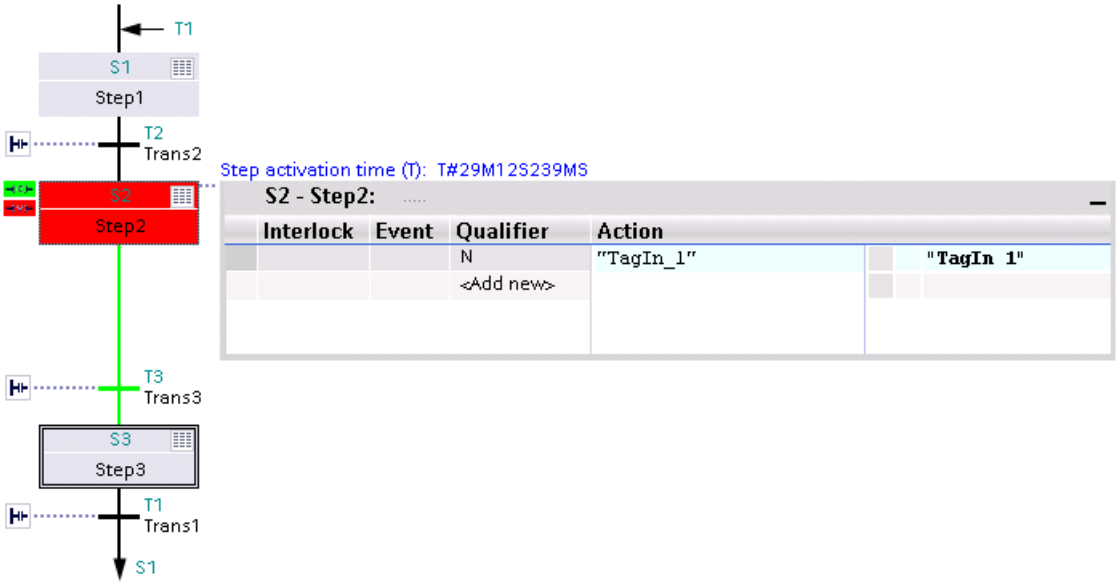
Displays in program status

For GRAPH programs you can have the program status displayed in sequence view and in single step view and for the permanent instructions. The program status display of permanent instructions corresponds to the program status display for LAB/FBD programs. The display of the program status is updated cyclically.

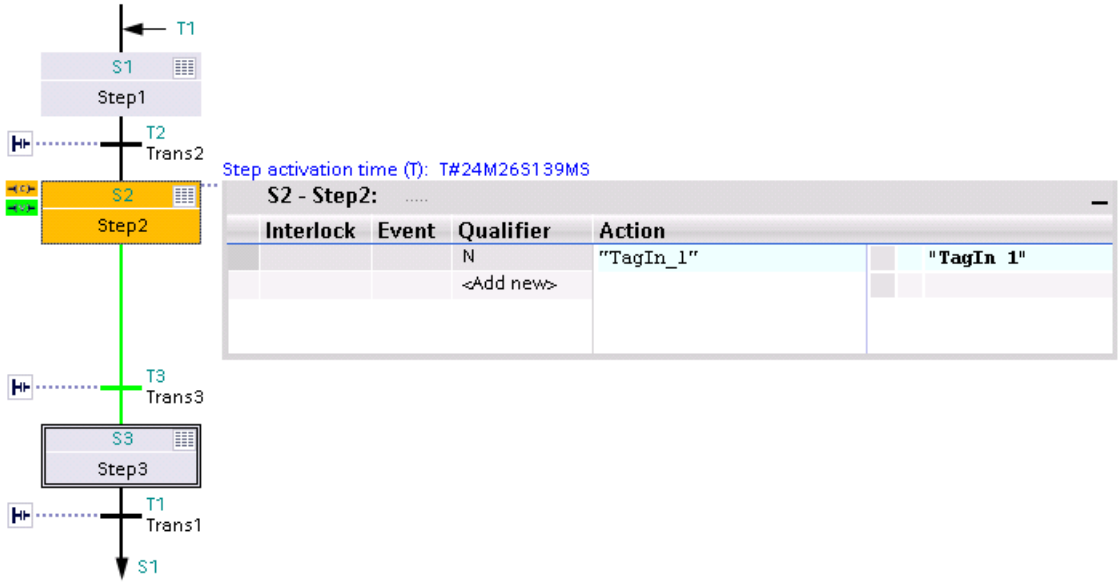
The following table shows the relationship between representation and status:

Representation	Area	Status
Green	Step, sequencer	There are no faults.
Light green	Step, sequencer	There are no faults. The values are from elapsed cycles.
	Condition	The transition is fulfilled.
Red	Step, sequencer	There is a supervision error.
Yellow	Step, sequencer	There is an interlock error.
Black	Condition	The transition is not fulfilled.

The following figures show examples of the display for the program status in the sequence view:

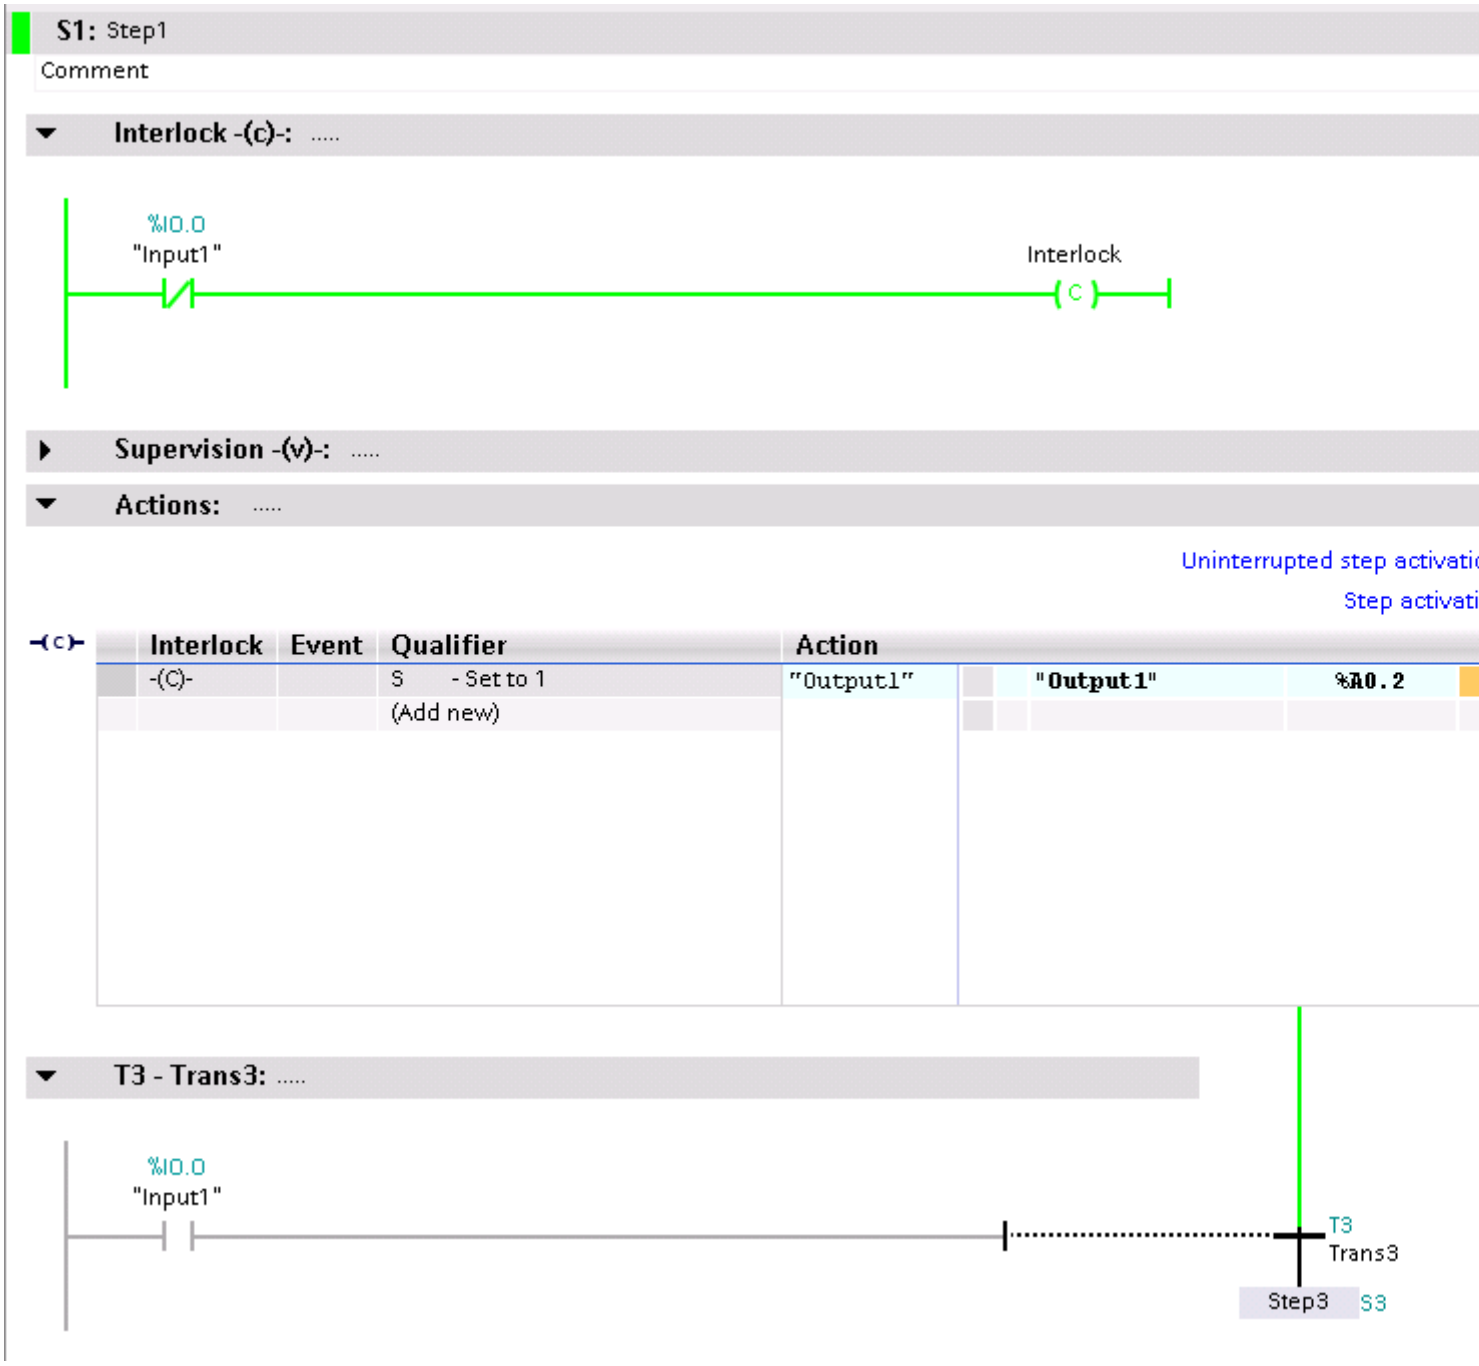


Step 2 contains a supervision error. The transition for switching from step 2 to step 3 is fulfilled.



Step 2 contains an interlock error. The transition for switching to step 3 is fulfilled.

The figure below shows an example of the display for the program status in the single step view of a S7-300:



The step does not contain an interlock error. The subsequent transition is not satisfied.

11.19.3 Testing with the watch table

11.19.3.1 Introduction to testing with the watch table

Overview

The following functions are available in the watch table:

- **Monitoring tags**
  This allows the current values of the individual tags of a user program or a CPU to be displayed on the programming device or PC.
- **Monitoring tags**
  You can use this function to assign fixed values to the individual tags of a user program or CPU. Modifying is also possible with Test with program status .
- **"Enable peripheral outputs" and "Modify now"**
  These two functions enable you to assign fixed values to individual peripheral outputs of a CPU in the STOP mode. You can also use them to check your wiring.

Monitoring and modifying tags

The following tags can be monitored and modified:

- Inputs, outputs, and bit memories
- Contents of data blocks
- Content of UDTs
- I/O

Team engineering in the watch table

As of TIA Portal V13 SP1, within the framework of team engineering with an S7-1500 CPU with firmware version >= 1.7, several Engineering Systems can access the CPU online simultaneously, for example to monitor and modify tags and download blocks. If you use this function, make sure that you keep to the requirements and rules that apply to team engineering as explained in the information system in "Using Team Engineering" in the section "Shared commissioning of projects".

Possible applications

The advantage of the watch table is that a variety of test environments can be stored. This enables you to reproduce tests during commissioning or for service and maintenance purposes.

Basic mode and expanded mode in the watch table (Page 4925)

Icons in the watch table (Page 4926)

Creating and editing watch tables (Page 4927)

11.19.3.2 Layout of the watch table

Introduction

A watch table contains the tags you defined for the entire CPU. A "Watch and force tables" folder is automatically generated for each CPU created in the project. You create a new watch table in this folder by selecting the "Add new Watch table" command.

Layout of the watch table

The columns displayed in the watch table depend on the mode you are working in: basic mode or expanded mode.

The following additional columns are shown in expanded mode:

- Monitor with trigger
- Modify with trigger

The names of the columns can also be changed dynamically based on the action.

Meaning of the columns

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode		Identifier column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, depending on the selected display format.
	Modify value	Value with which the tag is modified.
		Select the tag to be modified by clicking the corresponding check box.
	Comment	Comment for documentation of the tags
The following additional columns are shown in expanded mode:	Monitor with trigger	Display of selected monitoring mode
	Modify with trigger	Display of selected modify mode

See also

Icons in the watch table (Page 4926)

11.19.3.3 Basic mode and expanded mode in the watch table

Difference between basic mode and expanded mode in the watch table

Depending on the mode specified, the watch table displays different columns and column headings that can be used to perform different actions.

You will find a detailed list of the columns in Layout of the watch table (Page 4924).

Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.
  Or:
- In the "Online" menu, select the "Expanded mode" check box. Deactivate this check box to return to the basic mode.

Functionality in expanded mode

The following functionality is only possible in expanded mode:

- Monitor with trigger
- Modify with trigger
- Enable peripheral outputs
- Monitor peripheral inputs
- Modify peripheral outputs

NOTICE
Danger of a time-out while monitoring peripheral inputs and controlling peripheral outputs Note that the monitoring of peripheral inputs and the controlling of peripheral outputs in the watch table can result in a time-out. The CPU assumes the "STOP" mode.

See also

Setting the monitoring and modify mode (Page 4938)

11.19.3.4 Icons in the watch table

Meaning of the icons

The following table shows the meaning of the icons in the watch table:

Icon	Meaning
	Identifies a table inside the project tree as a watch table.
	Shows information in the identifier column.
	Inserts a row before the selected row.
	Inserts a row after the selected row.
	Modifies the addresses of all selected tags immediately and once. This command is executed once and as quickly as possible without reference to a defined trigger point in the user program.
	Modifies the addresses of all selected tags with reference to a defined trigger point in the user program.
	Disables the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode.
	Displays all columns of expanded mode. If you click this icon again, the columns of expanded mode will be hidden.
	Displays all modify columns. If you click this icon again, the modify columns will be hidden.
	Starts monitoring of the visible tags in the active watch table. The default setting for the monitoring mode in basic mode is "permanent". In expanded mode, you can set defined trigger points for the monitoring of tags.
	Starts monitoring of the visible tags in the active watch table. This command is executed immediately and the tags are monitored once.
	Displays the check box for the selection of tags to be modified.
	Indicates that the value of the selected tag has been modified to "1".
	Indicates that the value of the selected tag has been modified to "0".
	Indicates that the address is being used multiple times.
	Indicates that the substitute value is being used. Substitute values are values that are output to the process in case of signal output module faults or are used instead of a process value in the user program in case of signal input module faults. The substitute values can be assigned by the user (e.g., retain old value).
	Indicates that the address is blocked because it is already being modified.
	Indicates that the address cannot be modified.
	Indicates that the address cannot be monitored.
	Indicates that an address is being forced.
	Indicates that an address is being partly forced.

Icon	Meaning
	Indicates that an associated I/O address is being fully or partly forced.
	Indicates that an address cannot be fully forced. Example: It is indeed possible to force the address QW0:P, but it is not possible to force the address QD0:P since this address area is eventually not available on the CPU.
	Indicates that a syntax error occurred.
	Indicates that the address is selected but at the moment e.g. has not yet been modified.

11.19.3.5 Creating and editing watch tables

Creating a watch table

Introduction

The watch table allows you to monitor and modify tags in the user program. Once you have created a watch table, you can save it, duplicate it, and print it and use it again and again to monitor and modify tags.

Requirement

A project is open.

Procedure

To create a watch table, follow these steps:

1. Click "Project view" in the status bar.
   The project view is displayed.
2. In the project tree, double-click the CPU for which you want to create a watch table.
3. Double-click the "Watch and force tables" folder and then the "Add new watch table" command.
   A new watch table is added.
4. In the "Name" column or in the "Address" column, enter the name or the absolute address for the tags that you want to monitor or modify.
5. You can select a display format from the drop-down list in the "Display format" column if you want to change this default setting.
6. Now decide whether you want to monitor or modify the entered tags and, if applicable, enter the desired values for modifying.

Opening a watch table

Requirement

A watch table has been created.

Procedure

To open a watch table, follow these steps:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click on the required watch table in the folder.

Result

The selected watch table opens.

Copying and pasting a watch table

Requirement

A watch table has been created.

Procedure

To copy a watch table, follow these steps:

1. Right-click the watch table that you want to copy.
2. In the context menu, select "Copy".
3. In the project tree, open the folder structure for the CPU in which you want to paste the copied watch table.
4. Right-click on the "Watch and force tables" folder.
5. In the context menu, select "Paste".
6. Alternatively, you can select the entire contents of the watch table and Drag & Drop it onto another watch table.

Result

A copy of the selected watch table is placed in the "Watch and force tables" folder of the relevant CPU.

Saving a watch table

Prerequisite

A watch table has been created.

Procedure

To save a watch table, follow these steps:

1. In the project tree select the watch table you want to save.
2. If you wish to change the preset name of the table, select the "Rename" command in the context menu and enter a new name for the table.
3. In the "Project" menu, select "Save". Note that this save operation will save the entire project.

Result

The contents of the watch table and the project are saved.

Note

You can reuse saved watch tables to monitor and modify tags when retesting your program.

11.19.3.6 Entering tags in the watch table

Basic information on entering tags in the watch table

Recommended procedure

- Select the tags whose values you want to monitor or modify, and enter them in the watch table.
- When entering tags into the watch table, please note that these tags must be previously defined in the PLC tag table.
- When entering tags, work from the outside to the inside. This means that you start by entering the tags for the inputs in the watch table. Then, you enter the tags that are affected by the inputs or that affect the outputs. Finally, you enter the tags for the outputs.

Example of filling out a watch table

- Enter the absolute address to be monitored or modified in the "Address" column.
- Enter the symbolic name for the tag in the "Name" column.

- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.
- Now decide whether you want to monitor or modify the entered tags. Enter the desired values for modifying as well as a comment in the corresponding columns of the watch table.

Create comment row

If required, you can create a comment row by entering the string "//" in the "Name" column.

Syntax check

When you enter the tags in the watch table, the syntax of each cell is checked when you exit the cell. Incorrect entries are marked in red.

Note

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

See also

Permitted operands for the watch table (Page 4930)

Permissible modify values for the watch table (Page 4931)

Permitted operands for the watch table

Permissible operands for the watch table

The following table shows the operands that are permitted for the watch table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P; Q0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P; QB1:P
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P; QW3:P
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P; QD1:P
Timers	TIMER	T1
Counters	COUNTER	C1
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1

Permitted operand	Example of data type	Example (International mnemonics)
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

Note

Please observe the following notes to work with the watch table.

- You cannot enter "DB0..." because it is used by the system!
- Peripheral outputs can be modified but not monitored.
- Peripheral inputs can be monitored but not modified.

NOTICE
Danger of a time-out while monitoring peripheral inputs and controlling peripheral outputs
Note that the monitoring of peripheral inputs and the controlling of peripheral outputs in the watch table can result in a time-out.
The CPU assumes the "STOP" mode.

See also

Basic information on entering tags in the watch table (Page 4929)

Overview of the valid data types (Page 2131)

Permissible modify values for the watch table

Entry of modify values in the watch table

The following table shows the operands that are permitted for the entry of modify values in the watch table:

Table 11-109 Bit operands

Possible bit operands	Example for permitted modify values
I1.0	True
M1.7	False
Q1.0	0
Q1.1:P	1
DB1.DBX1.1	2#0
M1.6	2#1

Table 11-110 Byte operands

Possible byte operands	Example for permitted modify values
IB1	2#0011_0011
MB12	B#16#1F
QB10	1F
QB11:P	'a'
DB1.DBB1	10

Table 11-111 Word operands

Possible word operands	Example for permitted modify values
IW1	2#0011_0011_0011_0011
MW12	W#16#ABCD
MW14	ABCD
QW10	B#(12, 34)
QW12:P	12345
DB1.DBW1	'ab'
MW16	S5T#9s_340ms
MW18	C#123
MW9	D#2006-12-31

Table 11-112 Double word operands

Possible double word operands	Example for permitted modify values
ID1	2#0011_0011_0011_0011_0011_0011_0011_0011
QD10	Dw#16#abcdef10
QD12:P	ABCDEF10
DB1.DBD2	b#(12,34,56,78)
MD8	L#-12
MD12	L#12
MD16	123456789
MD20	123456789
MD24	T#12s_345ms
MD28	Tod#1:2:34.567
MD32	P#e0.0

Table 11-113 Timers

Possible operands of the "Timer" type	Permitted control values	Explanation
T1	0 ms	Time value in milliseconds (ms)
T12	20 ms	Time value in milliseconds (ms)

Possible operands of the "Timer" type	Permitted control values	Explanation
T14	12400 ms	Time value in milliseconds (ms)
T16	S5t#12s300ms	Time value 12s 300 ms

Table 11-114 Counters

Possible operands of the "Counter" type	Permitted control values
C1	0
C14	20
C16	C#123

Notes on timers and counters

- Timers

  Note

  Modifying a timer influences only the value, not the status. Timer T1 can be modified to the value "0", but the result of logic operation for A T1 is not changed.

  The time sequences "s5t" and "s5time" can be written in both lower-case and upper-case characters.

- Counters

  Note

  Modifying a counter influences only the value, not the status. Counter C1 can be changed to the value "0", but the result of the logic operation for A C1 is not changed.

Overview of the display formats

Display formats in the watch table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

Example

The following table shows the 32-bit data types permitted for all CPU families in the watch table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Unicode_Character, SIMATIC_Time, Date, Counter
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Unicode_Character, Floating-point number, Time of day, Timer
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Time, Counter, Date
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Time, Counter, Date
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character,Dec, Dec+/-, Dec_Sequence, Time of day, Timer
DATE	Date, Dec, Hex, Bin
TIME_OF_DAY	Time of day, Dec, Hex, Bin
TIME	Timer, Hex, Bin, Dec, Dec+/-
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Time, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
WCHAR	Unicode_Character, Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
WSTRING	Unicode_character string
POINTER	Pointer, Hex
COUNTER	Counter, Hex, BCD, Bin
S5TIME	SIMATIC_Time, Hex, BCD, Bin

For the S7-1200 CPU family, all 32-bit data types are permitted (see table above), as well as the 64-bit data type LREAL with the following possible display formats:

Data type	Possible display formats
LREAL	In a project created with TIA Portal < V12: Floating-point number Note: The display of LREAL is limited to 13 digits plus exponent.
LREAL	In a project created with TIA Portal >= V12: Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Time, Date and time Note: The display of LREAL is limited to 13 digits plus exponent.

For the S7-1500 CPU family, in addition to 32-bit data types, the 64-bit data types listed in the table are also permitted with the following possible display formats:

Data type	Possible display formats
LWORD	Hex, Octal, BCD, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Time, Date and time
LINT	Dec+/-, Dec, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Time, Date and time
ULINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Time, Date and time
LREAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Time, Date and time
LTIME	Timer, Dec+/-, Dec, Hex, Bin
LTOD	Time of day, Dec, Hex, Bin
LDT	Date and time, Dec, Hex, Bin

For more information, refer to the description of the valid data types (Page 2131).

Note

Rounding of floating-point numbers

In the watch table, floating-point numbers are stored as binary numbers in IEEE format. Because not every floating point number (real, longreal) that can be displayed on the user interface can be mapped to the IEEE format, there is a possibility that floating-point numbers will be rounded. If a rounded floating-point number in the watch table is copied and, in turn, inserted in another input field, the rounding may cause a slight difference.

Note

Only symbolic addressing is possible

In the watch table, LongDataTypes such as LWORD or LREAL can only be addressed symbolically.

Selecting the display format for tags

Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the watch table.
2. Click the desired cell in the "Display format" column, and open the drop-down list. The permissible display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

Note

If the selected display format cannot be applied, then the last selected display format will be displayed automatically.

See also

Overview of the valid data types (Page 2131)

Creating and editing comment lines

Basic principles of comment lines

In addition to the row related comments in the comment column, you can now also create complete comment lines to enhance the structure of the watch table.

The contents of the comment line are stored in the "Languages & Resources" folder in the "Project texts" tab and can be compiled in other project languages.

Creating comment lines

To create comment lines, follow these steps:

1. Open the watch table and enter the required addresses.
2. To create a comment line, enter the character string "//" in the "Name" column. No comment lines can be created in the other columns.

3. Enter the required comment in the comment line. The entered comment is shown in green.
4. To show all comments you entered, double-click "Project texts" in the project tree under "Languages & Resources".
5. If you are working in multi-lingual projects and want your comment to be translated into other languages, you can set the project languages required in addition to the editing language in the project tree under "Languages & Resources > Project languages".

Deleting comment lines

To delete comment lines, follow these steps:

1. Open a watch table containing comment lines.
2. Delete the entire comment including the introductory string "//", if you no longer required this.
3. Alternatively, delete only the introductory string "//". In this case the existing comment is retained and is displayed in the "Comment" column in the watch table.

Note

Deleting comment lines

When you delete comment lines the project languages and any existing translations for these comments are also deleted.

11.19.3.7 Monitoring tags in the watch table

Introduction to monitoring tags in the watch table

Introduction

The watch table allows you to monitor the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 4938) selected. To monitor tags, an online connection to the CPU must exist.

NOTICE
Danger of a time-out while monitoring peripheral inputs
Note that the monitoring of peripheral inputs can result in a time-out.
The CPU assumes the "STOP" mode.

Options for monitoring tags

The following options are available for monitoring tags:

- Monitor now
  This command starts the monitoring of the visible tags in the active watch table immediately and once only.
- Monitor all
  This command starts the monitoring of all visible tags in the active watch table, depending on the selected watch mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

  Note

  If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:
  CPUs from this family can only monitor the first 30 characters of a string.
- CPU S7-1200/1500:
  CPUs from this family can monitor a string up to the total size of 254 characters.

Setting the monitoring and modify mode

Introduction

By selecting the monitoring and modify mode, you specify the trigger point and the duration of the tag monitoring in the watch table and the force table.

Possible monitoring and modify modes (duration of monitoring or modifying)

The following monitoring and modifying modes are available:

Trigger	Execution	CPU status	Duration
Permanent	Permanent During monitoring: The inputs are monitored at the end of the cycle and the outputs at the start of the cycle. During modify: The inputs are modified at the start of the cycle and the outputs at the end of the cycle.	RUN	Will be executed until the user stops the action or the online connection to the CPU is interrupted.
Permanently, at start of scan cycle	Permanently, at start of scan cycle	RUN	Will be executed until the user stops the action or the online connection to the CPU is interrupted.
Permanently, at end of scan cycle	Permanently, at end of scan cycle	RUN	Will be executed until the user stops the action or the online connection to the CPU is interrupted.
Permanently, at transition to STOP	Permanently, at transition from RUN to STOP	RUN > STOP	Will be executed until the user stops the action or the online connection to the CPU is interrupted.
Once only, at start of scan cycle	Once only, at start of scan cycle	RUN	Ends automatically after being executed once.
Once only, at end of scan cycle	Once only, at end of scan cycle	RUN	Ends automatically after being executed once.
Once only, at transition to STOP	Once only, at transition from RUN to STOP	STOP > RUN	Ends automatically after being executed once.

Special features when using "Permanent" mode

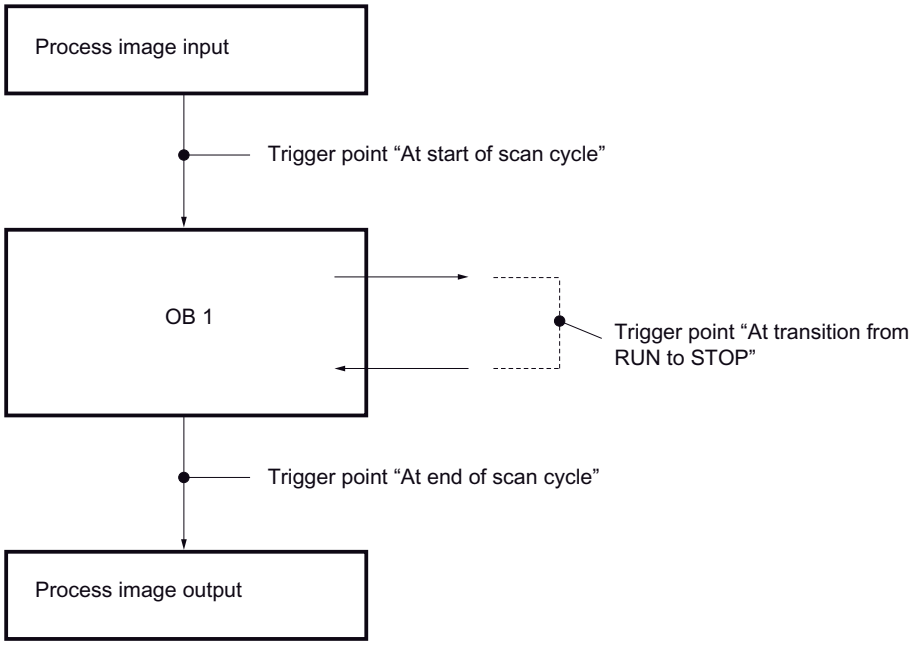
The "Permanent" mode is executed differently for the monitoring and modifying of tags.

- Monitoring: The inputs are monitored at the end of the cycle and the outputs at the start of the cycle.
- Modifying: The inputs are modified at the start of the cycle and the outputs at the end of the cycle.

Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:



Position of the trigger points

From the position of the trigger points, it follows that:

- Modifying of inputs is only appropriate at the beginning of the scan cycle (corresponding to the beginning of the user program OB 1), because otherwise the process image input is updated again after modifying and is thus overwritten.
- Modifying of outputs is only appropriate at the end of the scan cycle (corresponding to the end of the user program OB 1), because otherwise the process image output can be overwritten by the user program.
- The modified value is displayed in the "Monitor value" column, provided that monitoring is active and the modified value is not overwritten by the user program.

Monitoring tags

When tags are being modified, the following applies to the trigger points:

- If you have specified the modify mode as "once only", you will receive an alarm if the selected tags cannot be modified.
- In "permanent" modify mode, you do not receive an alarm.

Note regarding the "Modify now" command

You can modify the values of selected tags immediately using the "Online > Modify >Modify now" command. This command is executed once only and as quickly as possible without reference to a defined position (trigger point) in the user program. This function is used mainly for modifying when the CPU is in STOP mode.

"Monitor all" command for tags

Introduction

The "Monitor all" command allows you to start monitoring the visible tags in the active watch table. The default setting for the monitoring mode in basic mode of the watch table is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

NOTICE
Danger of a time-out while monitoring peripheral inputs
Note that the monitoring of peripheral inputs can result in a time-out.
The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.
2. Switch to expanded mode by clicking the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

Result

The tags of the active watch table are monitored using the monitoring mode selected.

"Monitor now" command for tags

Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out once only and displayed in the watch table.

NOTICE
Danger of a time-out while monitoring peripheral inputs
Note that the monitoring of peripheral inputs can result in a time-out.
The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the watch table.
2. Click the "Monitor now" icon in the toolbar.

Result

The tags of the active watch table are monitored immediately and once only.

11.19.3.8 Modifying tags in the watch table

Introduction to modifying tags

Introduction

The watch table allows you to modify the tags of the configured input and output modules in the CPU, depending on the monitoring and modify mode (Page 4938) selected.

To monitor the tags, an online connection to the CPU must exist.

DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

NOTICE

Danger of a time-out while controlling peripheral outputs

Note that the controlling of peripheral outputs in the watch table can result in a time-out.

The CPU assumes the "STOP" mode.

NOTICE

Danger due to modifying an identical operand in parallel with different modify values in more than one watch table

When working with more than one watch table, avoid modifying identical operands permanently multiple times with different modify values.

If an identical operand is modified permanently with different modify values at the same time in different watch tables, all watch tables will display the last modified value, because the modify value assigned last will be used in this case.

Options for modifying tags

The following options are available for modifying tags:

- Modify to "0"
  This command modifies the selected address to the modify value "0".
- Modify to "1"
  This command modifies the selected address to the modify value "1".
- Modify once only and immediately
  This command modifies all selected addresses in the active watch table "once only and immediately".
- Modify with trigger
  This command modifies all selected addresses in the active watch table using the monitoring and modify mode (Page 4938) selected.
  The "Modify with trigger" function is only available in expanded mode. You will not receive an alarm indicating whether or not the selected addresses were actually modified with the specified value. You should use the "Modify once only and immediately" function if you require such a confirmation.
- Enable peripheral outputs
  This command disables the command output disable.
  This function can only be executed in expanded mode, when the CPU is in STOP and the option Force (Page 4968) of tags is not enabled. If desired, deactivate this function in the force table.

Note

When modifying, note the following:

Modifying of tags **cannot** be undone.

Modify tags to "0"

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

⚠ DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

NOTICE
Danger of a time-out while controlling peripheral outputs
Note that the controlling of peripheral outputs in the watch table can result in a time-out.
The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags to "0", follow these steps:

1. Enter the desired address in the watch table.
2. Select the "Online > Modify > Modify to 0" command in order to modify the selected address with the specified value.

Result

The selected address is modified to "0".

Note

When modifying, note the following:

Modifying can **not** be undone!

Modify tags to "1"

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

⚠ DANGER
Danger when modifying:
Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors! Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

NOTICE
Danger of a time-out while controlling peripheral outputs
Note that the controlling of peripheral outputs in the watch table can result in a time-out.
The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags to "1", follow these steps:

1. Enter the desired address in the watch table.
2. Select the "Online > Modify > Modify to 1" command in order to modify the selected address with the specified value.

Result

The selected address is modified to "1".

Note

When modifying, note the following:

Modifying can **not** be undone!

"Modify now" command for tags

Introduction

You can assign one-time values to tags independent of the monitoring and modify mode and modify them immediately. The modify command is executed as fast as possible, similar to a "Trigger now" command, without reference to a defined position in the user program.

⚠ DANGER
Danger when modifying:
Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors! Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

NOTICE
Danger of a time-out while controlling peripheral outputs
Note that the controlling of peripheral outputs in the watch table can result in a time-out.
The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.

Procedure

To modify tags immediately, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Select the "Online > Modify > Modify once and now" command in order to immediately modify the selected address once only with the specified value.

Result

The selected addresses are modified immediately and once only.

Note

When modifying, note the following:

Modifying can **not** be undone!

"Modify with trigger" command for tags

Introduction

You can assign values to addresses dependent on the defined monitoring and modify mode and modify them. The modify command is executed as specified in the monitoring and modify mode, with reference to the defined trigger position in the user program.

⚠ DANGER

Danger when modifying:

Serious personal injury and material damage can result from changes in the tags or addresses during plant operation in the event of malfunctions or program errors!
Make sure that dangerous conditions cannot occur before you execute the "Modify" function.

NOTICE

Danger of a time-out while controlling peripheral outputs

Note that the controlling of peripheral outputs in the watch table can result in a time-out.

The CPU assumes the "STOP" mode.

Requirements

- A watch table has been created.
- An online connection to the CPU exists.
- The watch table has to be in expanded mode.

Procedure

To modify tags "with trigger", follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.
   The "Monitor with trigger" and "Modify with trigger" columns are displayed.

4. In the "Modify with trigger" column, select the desired modify mode from the drop-down list box. The following options are available:
   - Permanent
   - Permanently, at start of scan cycle
   - Once only, at start of scan cycle
   - Permanently, at end of scan cycle
   - Once only, at end of scan cycle
   - Permanently, at transition to STOP
   - Once only, at transition to STOP
5. Start modifying using the "Online > Modify > Modify with trigger" command.
6. Confirm the prompt with "Yes" if you want to start modifying with trigger.

Result

The selected tags are modified using the selected monitoring and modify mode. The yellow triangle is no longer displayed.

Note

When modifying, note the following:

Modifying can **not** be undone!

Enable peripheral outputs

Introduction

The "Enable peripheral outputs" function deactivates the command output disable of the peripheral outputs. You can then modify the peripheral outputs when the CPU is in STOP mode. This function is available in the watch table in "Expanded mode" only.

⚠ DANGER

Danger when enabling the peripheral outputs:

Attention, the enabling of the peripheral outputs can cause serious personal injury and material damage!
Make certain that dangerous conditions cannot occur before you execute the "Enable peripheral outputs" function.

Prerequisites

- A watch table has been created.
- An online connection to the CPU exists.

- The CPU is in STOP mode before you can enable the peripheral outputs.
- The watch table has to be in expanded mode.
- The option Force (Page 4968) of tags must not be enabled.

Note

"Enable peripheral outputs" function

- This function is possible only in STOP mode. The function is exited by an operating state change of the CPU and by the termination of the online connection.
- While the function is enabled, forcing is not possible.

Procedure

To enable the peripheral outputs in STOP mode, follow these steps:

1. Enter the desired addresses and modify values in the watch table.
2. Select the addresses to be modified by selecting the check boxes for modifying in the column after the "Modify value".
   A yellow triangle appears behind the selected check box, indicating that the address is now selected for modifying but has not yet been modified.
3. Switch to expanded mode using the icon "Show/hide advanced settings columns" in the toolbar or the "Online > Expanded mode" command.
   The "Monitor with trigger" and "Modify with trigger" columns are displayed.
4. Change the relevant CPU to STOP using the operator panel.
5. Right-click to open the shortcut menu and select "Enable peripheral outputs".
6. Confirm the prompt with "Yes" if you want to unlock the command output disable for the peripheral outputs.
7. Modify the peripheral outputs using the "Online > Modify > Modify now" command.

Result

The peripheral outputs are modified with the selected modify values. The yellow triangle is no longer displayed.

Enabling the peripheral outputs

The "Enable peripheral outputs" function remains active until:

- The "Enable peripheral outputs" command is deactivated again via the shortcut menu or via the "Online > Modify > Enable peripheral outputs" command.
- The CPU is no longer in STOP mode.
- The online connection is terminated.

Note

When modifying, note the following:

Modifying can **not** be undone!

11.19.4 Testing with the force table

11.19.4.1 Introduction for testing with the force table

Overview

You can use the force table to assign permanent values to individual tags

of the user program. This action is referred to as "forcing".

The following functions are available in the force table:

- **Monitoring tags**
  This allows the current values of the individual tags of a user program or a CPU to be displayed on the programming device or PC. Tags can be monitored with or without a trigger condition.
- **Forcing tags**
  This function lets you assign a fixed value to individual I/O tags of the user program.

Monitoring and forcing tags

The monitoring and forcing of tags is always dependent on the operand scope of the CPU used.

The following tags can be monitored:

- Inputs, outputs, and bit memories
- Contents of data blocks
- Peripheral inputs

The following tags can be forced:

- Peripheral inputs
- Peripheral outputs

Example

Independent of the CPU used, only I/O can be forced, such as: "Tag_1":P or "QW0:P" or "IW0:P". Note that "Tag_1":P must not be the symbolic name of a bit memory.

Possible applications

One advantage of the force table is that you can simulate different test environments and overwrite tags in the CPU with a permanent value. This enables you to intervene in the ongoing process for regulating purposes.

See also

Layout of the force table (Page 4953)

Basic mode and expanded mode in the force table (Page 4954)

Icons in the force table (Page 4955)

Open and edit force table (Page 4956)

11.19.4.2 Safety precautions when forcing tags

Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

CAUTION

Prevent personal injury and material damage!

- Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.
- Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online > Force > Stop forcing" command. Closing the active force table does **not** stop the forcing!
- Forcing can **not** be undone!
- Review the differences between " modifying tags" (Page 4943) and "forcing tags" (Page 4968).
- If a CPU does not support the "Force" function, the relevant icons cannot be selected.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is **not** possible on this CPU. If desired, deactivate this function in the watch table.

11.19.4.3 Layout of the force table

Introduction

In the force table, enter the CPU-wide tags that you have defined and selected and which are to be forced in the allocated CPU. Only peripheral inputs and peripheral outputs can be forced.

For each CPU created in the project, a force table will automatically be created in the "Watch and force tables" folder. Only one force table can be allocated to a CPU. This force table displays all the addresses forced in the allocated CPU.

Layout of the force table

The columns displayed in the force table depend on the mode you are working in: basic mode or expanded mode.

In expanded mode the "Monitor with trigger" column is also displayed.

Meaning of the columns

The following table shows the meaning of the individual columns in basic mode and expanded mode:

Mode	Column	Meaning
Basic mode	i	Identification column
	Name	Name of the inserted tag
	Address	Address of the inserted tag
	Display format	Selected display format
	Monitor value	Values of the tags, dependent on the selected display format.
	Force value	Value with which the tag is forced.
	F ("Force")	Select the tag to be forced by activating the corresponding check box.
	Comment	Comment for documentation of the tags
The following additional column is shown in expanded mode:	Monitor with trigger	Display of selected monitoring mode

See also

Icons in the force table (Page 4955)

Basic mode and expanded mode in the force table (Page 4954)

11.19.4.4 Basic mode and expanded mode in the force table

Difference between basic mode and expanded mode in the force table

In expanded mode the "Monitor with trigger" column is also displayed in the force table.

You will find a detailed list of the columns under Layout of the force table (Page 4953).

Switching between basic mode and expanded mode

You have the following options of toggling between the basic and expanded mode:

- Click the icon "Show/hide advanced setting columns". Click this icon again to return to the basic mode.
  Or:
- In the "Online" menu, select the "Expanded mode" check box. Deactivate this check box to return to the basic mode.

Functionality in expanded mode

The following functionality is only possible in expanded mode:

- Monitor with trigger
- Monitor peripheral inputs

11.19.4.5 Icons in the force table

Meaning of the icons

The following table shows the meaning of the icons in the force table:

Icon	Meaning
	Identifies a table inside the project tree as a force table.
	Identification column
	Inserts a row before the selected row.
	Inserts a row after the selected row.
	Displays all columns of expanded mode. If you click this icon again, the columns of the expanded mode will be hidden.
	Updates all operands and values currently being forced on the CPU in the open force table.
	Starts forcing for all addresses of the selected tags. If forcing is already running, the previous action is replaced without interruption.
	Stops forcing of addresses in the force table.
	Starts monitoring of the visible tags in the force table. The default setting for monitoring in basic mode is "permanent". In expanded mode an additional column is shown and you can set certain trigger points for monitoring tags.
	Starts monitoring of the visible tags in the force table. This command is executed immediately and the tags are monitored once.
	Displays the check box for the selection of tags to be forced.
	Indicates that an address cannot be fully forced. Example: It is possible to force the address QW0:P, but it is not possible to force the address QD0:P because this address area is potentially not available on the CPU.
	Indicates that an address cannot be monitored.
	Indicates that an address is being forced.
	Indicates that an address is being partly forced.
	Indicates that the associated peripheral address is being forced.
	Indicates that a syntax error occurred.
	Indicates that the address is selected but has not been forced yet.

Icon	Meaning
	Indicates that the selected tag was monitored for the value "1".
	Indicates that the selected tag was monitored for the value "0".
	Indicates that the address is being used more than once.
	Indicates that a substitute value is being used. Substitute values are values that are output to the process in case of signal output module faults or are used instead of a process value in the user program in case of signal input module faults. The substitute values can be assigned by the user (e.g., retain old value).

Layout of the force table (Page 4953)

11.19.4.6 Open and edit force table

Display force table

Introduction

You cannot create a new force table; one force table already exists for each CPU. It is permanently allocated to this CPU and cannot be copied or duplicated.

Requirements

A project with an allocated CPU has to be open.

Displaying a force table

The force table is always displayed below a CPU in the "Watch and force tables" folder.

Open force table

Requirements

A project with an allocated CPU must be created.

Procedure

Proceed as follows to open a force table:

1. Open the "Watch and force tables" folder below the desired CPU.
2. Double-click the "Force table" in this folder.

Result

The selected force table opens.

Save force table

Requirements

A project with an allocated CPU has been created.

Procedure

Proceed as follows to save a force table:

1. Enter the desired changes in the force table.
2. Select the "Save" command in the "Project" menu or click the "Save project" icon in the toolbar. Note that this save operation will save the entire project.

Result

The contents of the force table and the associated project are saved.

Note

You cannot rename a force table.

11.19.4.7 Entering tags in the force table

Basic principles for entering tags in the force table

Recommended procedure

Select the tags whose values you want to monitor or force, and enter them in the force table.

When entering tags in the force table, please note that these tags must be previously defined in the PLC tag table.

Example of filling out a force table

- You can enter the absolute address that is to be forced or monitored in the "Address" column or you can enter the symbolic name of the tag in the "Name" column.
- Select the display format you require from the drop-down list in the "Display format" column, if you do not want to use the default setting.

- Now you have to decide whether you want to monitor or force the entered tags. Enter the required force value and a comment in the appropriate columns of the force table.
- Note that only peripheral inputs and peripheral outputs can be forced and review the Safety precautions when forcing tags (Page 4969).

Create comment line

If required, you can create a comment row by entering the string "//" in the "Name" column.

Syntax check

When you enter tags in the force table, the syntax of each cell will be checked when you exit the cell. Incorrect entries are marked in red.

Note

When you place the mouse pointer in a cell marked in red, brief information is displayed with additional notes on the error.

Permitted operands for the force table

Permitted operands for the force table

The following table shows the operands that are permitted for forcing in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Peripheral input/peripheral output	BOOL	I0.0:P; Q0.0:P
Peripheral input/peripheral output	BYTE	IB1:P; QB1:P
Peripheral input/peripheral output	WORD	IW2:P; QW3:P
Peripheral input/peripheral output	DWORD	ID2:P; QD1:P

The following table shows the operands that are permitted for monitoring in the force table:

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	BOOL	I1.0, Q1.7, M10.1 I0.0:P
Input/output/bit memory	BYTE	IB1/QB10/MB100 IB1:P
Input/output/bit memory	WORD	IW1; QW10; MW100 IW2:P

Permitted operand	Example of data type	Example (International mnemonics)
Input/output/bit memory	DWORD	ID4; QD10; MD100 ID2:P
Timers	TIMER	T1
Counters	COUNTER	C1
Data block	BOOL	DB1.DBX1.0
Data block	BYTE	DB1.DBB1
Data block	WORD	DB1.DBW1
Data block	DWORD	DB1.DBD1

Note

You cannot enter "DB0..." because it is used by the system!

Permitted force values for the force table

Entering force values in the force table

The following table shows the operands that are permitted for entering force values in the force table:

Table 11-115 Bit operands

Possible bit operands	Example for permitted force values
I1.0:P	True
I1.1:P	False
Q1.0P	0
Q1.1:P	1
I2.0:P	2#0
I2.1:P	2#1

Table 11-116 Byte operands

Possible byte operands	Example for permitted force values
IB1:P	2#00110011
IB2:P	B#16#1F
QB14:P	1F
QB10:P	'a'
IB3:P	10

Table 11-117 Word operands

Possible word operands	Example for permitted force values
IW0:P	2#0011001100110011
IW2:P	W#16#ABCD
QW10:P	ABCD
QW12:P	B#(12, 34)
IW4:P	'ab'
IW6:P	12300
IW8:P	S5T#9S_300ms
IW10:P	C#123
IW12:P	D#2006-12-31

Table 11-118 Double word operands

Possible double word operands	Example for permitted force values
ID0:P	2#00110011001100110011001100110011
ID4:P	1.2
QD10:P	1.234.e4
QD14:P	Dw#16#abcdef10
ID8:P	16#ABCDEF10
ID12:P	b#(12,34,56,78)
ID16:P	L#-12
ID20:P	L#12
ID24:P	123456789
ID28:P	123456789
ID32:P	T#12s300ms
ID36:P	Tod#14:20:40.645
ID40:P	P#e0.0

Overview of the display formats

Display formats in the force table

The display format you select specifies the representation of a tag value.

When entering the address a display format is automatically preset. If you want to change this, you can select a display format from the drop-down list in the "Display formats" column. The drop-down list only offers the display formats which are valid for this data type. The display format that appears first in the list is the pre-selected format.

Example

The following table shows the 32-bit data types permitted for all CPU families in the force table and their possible display formats:

Data type	Possible display formats
BOOL	Bool, Hex, BCD, Octal, Bin, Dec, Dec+/-
BYTE	Hex, BCD, Octal, Bin, Dec, Dec+/-, Character
WORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, SIMATIC_Time, Date, Unicode_Character, Counter
DWORD	Hex, BCD, Octal, Bin, Dec, Dec+/-, Dec_Sequence, Character, Floating-point number, Time of day, Timer, Unicode_Character
SINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
INT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Time, Counter, Date
DINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer
USINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character
UINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, SIMATIC_Time, Counter, Date
UDINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Timer
REAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Timer
DATE	Date, Dec, Hex, Bin
TIME_OF_DAY	Time of day, Dec, Hex, Bin
TIME	Timer, Hex, Bin, Dec, Dec+/-
DATE_AND_TIME	Date and time,
TIMER	SIMATIC_Time, Hex, BCD, Bin
CHAR	Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
WCHAR	Unicode_Character, Character, Hex, BCD, Octal, Bin, Dec, Dec+/-
STRING	Character string
WSTRING	Unicode_character string
POINTER	Pointer, Hex
COUNTER	Counter, Hex, BCD, Bin
S5TIME	SIMATIC_Time, Hex, BCD, Bin

For the S7-1200 CPU family, all 32-bit data types are permitted (see table above), as well as the 64-bit data type LREAL with the following possible display formats:

Data type	Possible display formats
LREAL	In a project created with TIA Portal < V12: Floating-point number Note: The display of LREAL is limited to 13 digits plus exponent.
LREAL	In a project created with TIA Portal >= V12: Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Time, Date and time Note: The display of LREAL is limited to 13 digits plus exponent.

For the S7-1500 CPU family, in addition to 32-bit data types, the 64-bit data types listed in the table are also permitted with the following possible display formats:

Data type	Possible display formats
LWORD	Hex, Octal, BCD, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Floating-point number, Time of day, Time, Date and time
LINT	Dec+/-, Dec, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Time, Date and time
ULINT	Dec, Dec+/-, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec_Sequence, Time of day, Time, Date and time
LREAL	Floating-point number, Hex, BCD, Octal, Bin, Character, Unicode_Character, Dec, Dec+/-, Dec_Sequence, Time of day, Time, Date and time
LTIME	Timer, Dec+/-, Dec, Hex, Bin
LTOD	Dec, Hex, Bin, Time of day
LDT	Dec, Hex, Date and time, Bin

For more information, refer to the description of the valid data types (Page 2131).

Note

Rounding of floating-point numbers

In the force table, floating-point numbers are stored as binary numbers in IEEE format. Because not every floating point number (real, longreal) that can be displayed on the user interface can be mapped to the IEEE format, there is a possibility that floating-point numbers will be rounded. If a rounded floating-point number in the force table is copied and, in turn, inserted in another input field, the rounding may cause a slight difference.

Note

Only symbolic addressing is possible

In the force table, LongDataTypes such as LWORD or LREAL can only be addressed symbolically.

Selecting the display format for tags

Procedure

To select the display format of the tags, follow these steps:

1. Enter the desired address in the force table.
2. Click the desired cell in the "Display format" column, and open the drop-down list. The permitted display formats are shown in the drop-down list.
3. Select the desired display format from the drop-down list.

Note

If the selected display format cannot be applied, then the last selected display format will be displayed automatically.

Creating and editing comment lines

Basic principles of comment lines

In addition to the row-related comments in the comment column, you can now also create complete comment lines to enhance the structure of the force table.

The contents of the comment line are stored in the "Languages & Resources" folder in the "Project texts" tab and can be compiled in other project languages.

Creating comment lines

To create comment lines, follow these steps:

1. Open the force table and enter the required addresses.
2. To create a comment line, enter the character string "//" in the "Name" column. No comment lines can be created in the other columns.

3. Enter the required comment in the comment line. The entered comment is shown in green.
4. To show all comments you entered, double-click "Project texts" in the project tree under "Languages & Resources".
5. If you are working in multi-lingual projects and want your comment to be translated into other languages, you can set the project languages required in addition to the editing language in the project tree under "Languages & Resources > Project languages".

Deleting comment lines

To delete comment lines, follow these steps:

1. Open a force table containing comment lines.
2. Delete the entire comment including the introductory string "//", if you no longer require this.
3. Alternatively, delete only the introductory string "//". In this case the existing comment is retained and is displayed in the "Comment" column in the force table.

Note

Deleting comment lines

When you delete comment lines the project languages and any existing translations for these comments are also deleted.

11.19.4.8 Monitoring tags in the force table

Introduction to monitoring tags in the force table

Introduction

Use the force table to monitor the tags of the configured input and output modules in the CPU, dependent on the monitoring mode (Page 4965) you have selected. An online connection to the CPU must exist to monitor tags.

Options for monitoring tags

The following options are available for monitoring tags:

- Monitor all
  This command starts the monitoring of all visible tags in the active force table, dependent on the selected monitoring mode:
  - In basic mode, the monitoring mode is set to "permanent" by default.
  - In expanded mode, you can specify defined trigger points for the monitoring of tags.

  Note

  If the monitoring mode is changed while in expanded mode and then a switch is made to basic mode, the monitoring mode set before will also be applied in basic mode.

- Monitor now
  This command starts the monitoring of the visible tags in the active force table immediately and once only.

CPU-specific limitations when monitoring tags

The following CPU-specific differences exist:

- CPU S7-300/400:
  CPUs from this family can only monitor the first 30 characters of a string.
- CPU S7-1200:
  CPUs from this family can monitor a string up to the total size of 254 characters.

Setting the monitoring mode in the force table

Introduction

By selecting the monitoring mode, you specify the trigger point and the duration of tag monitoring in the force table.

Possible monitoring mode (duration of monitoring)

The following selection options are available:

- Permanent
- Once only, at start of scan cycle
- Once only, at end of scan cycle
- Permanently, at start of scan cycle
- Permanently, at end of scan cycle
- Once only, at transition to STOP
- Permanently, at transition to STOP

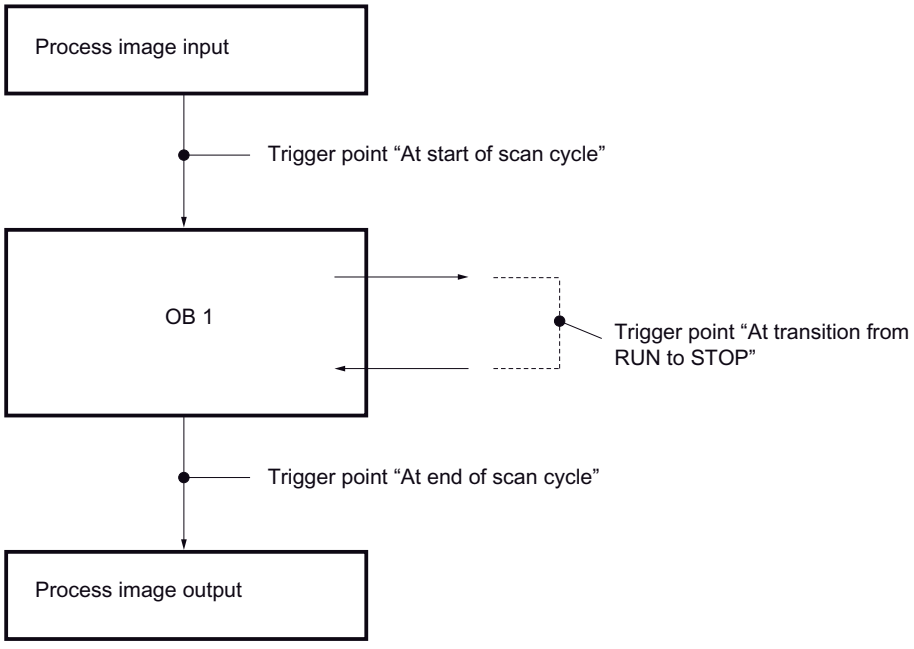
Special features when using "Permanent" mode

The "Permanent" mode is executed as follows for the monitoring of tags: The inputs are monitored at the end of the cycle and the outputs at the start of the cycle.

Selecting the trigger point

The trigger points "Beginning of scan cycle", "End of scan cycle", and "Switch to stop" specify the time at which the tags are to be read from the CPU or updated in the CPU.

The following diagram shows the position of these trigger points:



"Monitor all" command for tags

Introduction

Use the "Monitor all" command to start monitoring the visible tags in the active force table. In basic mode of the force table, the default setting for the monitoring mode is "permanent". In expanded mode, you can specify defined trigger points for the monitoring of tags. In this case, the tags are monitored with reference to the specified trigger points.

Requirements

An online connection to the CPU exists.

Procedure

To execute the "Monitor all" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.
2. Switch to expanded mode by clicking the icon "Show/hide advanced setting columns" in the toolbar.
3. If you want to change the default monitoring mode for a tag, click the appropriate cell in the "Monitor with trigger" column and select the desired monitoring mode from the drop-down list.
4. Click the "Monitor all" icon in the toolbar.

Result

The tags of the active force table will be monitored using the set monitoring mode.

"Monitor now" command for tags

Introduction

The "Monitor now" command starts the monitoring of tags immediately without reference to defined trigger points. The tag values are read out only once and displayed in the force table.

Requirements

An online connection to the CPU exists.

Procedure

To execute the "Monitor now" command, follow these steps:

1. Enter the tags to be monitored and the corresponding addresses in the force table.
2. Click the "Monitor now" icon in the toolbar.

Result

The tags of the active force table are monitored immediately and once only.

11.19.4.9 Forcing tags in the force table

Introduction to forcing tags

Introduction

You can use the force table to assign permanent values to individual tags of the user program. This action is referred to as forcing. Only peripheral inputs and peripheral outputs can be forced.

To use the forcing function, you must have an online connection to the CPU and the utilized CPU must support this functionality.

If you open a force table in the "Watch and force tables" folder below a CPU on which a force job is already running, you will first be prompted to update the display of the forced operand. Forcing or stopping forcing in the open force table is only possible following this command.

Possible applications

By permanently assigning defined values to tags, you can specify defined default settings for your user program and, thus, test the programmed functions. Forcing is possible in basic mode and in expanded mode (Page 4954).

Caution when forcing tags

Before forcing, make sure that you review the safety precautions for this procedure (Page 4969).

⚠ DANGER

Prevent personal injury and material damage!

Remember that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Options for forcing tags

The following options are available for forcing tags:

- Force to "0"
  This command forces the selected address in the CPU to the force value "0".
- Force to "1"
  This command forces the selected address in the CPU to the force value "1".

- Force all
  This command starts the forcing of enabled addresses in the active force table or replaces an existing force job without interruption.
- Stop forcing
  This command stops the forcing of all addresses in the active force table.

Constraints when forcing tags

Note the following constraints when forcing:

- Forcing is always dependent on the operand scope of the CPU used.
- In principle, only peripheral inputs and peripheral outputs can be forced.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is not possible. If desired, deactivate this function in the watch table.

Unique aspects when forcing tags

Note that forcing of tags will overwrite values in the CPU and will continue even after the online connection to the CPU is terminated.

- **Stop forcing**
  Terminating the online connection is not sufficient to stop the forcing operation! To stop forcing, you must select the "Online > Force > Stop forcing" command. Only then will the tags that are visible in the active force table no longer be forced.
- **Stop forcing of individual tags**
  The "Online > Force > Stop forcing" command always applies to all tags displayed in the force table. To stop forcing individual tags, you must clear the check mark for forcing of these tags in the force table and restart forcing using the "Online > Force > Force all" command.

Safety precautions when forcing tags

Safety precautions when forcing tags

Because the forcing function allows you to intervene permanently in the process, observance of the following notices is essential:

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

CAUTION

Prevent personal injury and material damage!

- Before you start the "Force" function, you should ensure that no one else is currently executing this function on the same CPU.
- Forcing can only be stopped by clicking the "Stop forcing" icon or using the "Online > Force > Stop forcing" command. Closing the active force table does **not** stop the forcing!
- Forcing can **not** be undone!
- Review the differences between " modifying tags" (Page 4943) and "forcing tags" (Page 4968).
- If a CPU does not support the "Force" function, the relevant icons cannot be selected.
- If the function "Enable peripheral outputs" is active on your CPU, then forcing is **not** possible on this CPU. If desired, deactivate this function in the watch table.

Updating forced operands

Introduction

If a force job is already running on a CPU, after opening the force table, you first need to make sure that the operands and values currently being forced on the CPU are displayed in the force table.

The command "Online" > "Force" > "Update forced operands" updates all operands and values currently being forced on the CPU in the open force table.

"Force" or "Stop forcing" in the open force table is only possible following this command.

Caution when forcing tags

Before forcing, make sure you are familiar with the safety precautions when forcing tags (Page 4969).

DANGER

Prevent personal injury and material damage!

Remember that an incorrect action when executing the "Force" function can:

- Harm persons or pose a health hazard.
- Cause damage to machinery or the entire plant.

Requirement

- An online connection to the CPU is possible.
- A force job is currently running on the CPU being used.

Procedure

To update the forced operands and values, follow these steps:

1. Open a force table.
2. Establish an online connection to the CPU.
3. Confirm the "Update forced operands" dialog that follows with "Yes".

Result

All forced operands in the open force table are updated with the relevant values. A red "F" is displayed in the first column indicating which operands are being forced.

This enables the "Force all" and "Stop forcing" buttons and you can select these functions.

Note

When forcing, note the following:

- Forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing function!
- To stop forcing, the forced address must be visible in the active force table.

Force tags to "0"

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 4969).

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Pose a risk to the life or health of persons.
- Cause damage to machinery or the entire plant.

Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags to "0", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force> Force to 0" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

Result

The selected address is forced to "0". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Force tags to "1"

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 4969).

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Endanger the life or health of personnel
- Cause damage to machinery or the entire plant.

Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags to "1", follow these steps:

1. Open the force table.
2. Enter the desired address in the force table.
3. Select the "Online > Force> Force to 1" command in order to force the selected address with the specified value.
4. Confirm the next dialog with "Yes".

Result

The selected address is forced to "1". The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected values is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

"Force all" command for tags

Introduction

You can use the force function to assign permanent values to individual tags of a user program.

If forcing is already active, this forcing operation is replaced without interruption by the "Online > Force > Force all" command. Any forced addresses that are not selected will no longer be forced.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 4969).

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when executing the "Force" function can:

- Pose a risk to the life or health of persons.
- Cause damage to machinery or the entire plant.

Requirements

- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is **not** enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

To force tags with the "Online > Force > Force all" command, follow these steps:

1. Open the force table.
2. Enter the desired addresses and force values in the force table.
3. Select the addresses to be forced by selecting the check boxes for forcing in the column after the "Force value".
   A yellow triangle appears behind the selected check box, indicating that the address is selected for forcing but is not being forced at the moment.
4. Select the "Online > Force> Force all" command in order to force the selected addresses with the specified values.
5. Confirm the next dialog with "Yes".

Result

The selected addresses are forced to the specified values. The yellow triangle is no longer displayed. A red "F" is displayed in the first column, for example, indicating that the tag is being forced.

Stop forcing

To stop forcing, follow these steps:

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command.
3. Confirm the next dialog with "Yes".

Result

Forcing of the selected addresses is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is selected for forcing but is not being forced at the moment.

Note

When forcing, note the following:

- Forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

11.19.4.10 Stop forcing tags

Stop forcing all tags

Introduction

Note the following before you stop forcing tags:

- Stopping forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 4969).

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when stopping the "Force" function can:

- Pose a risk to the life or health of persons.
- Cause damage to machinery or the entire plant.

Requirements

- Tags are forced in a force table.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

Proceed as follows to stop **forcing all tags** :

1. Open the force table.
2. Select the "Online > Force > Stop forcing" command in order to stop forcing the displayed addresses.
3. Confirm the "Stop forcing" dialog with "Yes".

Result

The forcing of all tags is stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

Stop forcing individual tags

Introduction

Note the following before you stop forcing tags:

- Stopping forcing **cannot** be undone!
- Terminating the online connection does **not** stop the forcing!
- To stop forcing, the forced address must be visible in the active force table.

Caution when forcing tags

Before forcing, you must review the safety precautions when forcing tags (Page 4952).

DANGER

Prevent personal injury and material damage!

Note that an incorrect action when stopping the "Force" function can:

- Pose a risk to the life or health of persons.
- Cause damage to machinery or the entire plant.

Requirements

- Tags are forced in a force table.
- An online connection to the CPU exists.
- The utilized CPU supports the force function.
- The "Enable peripheral outputs" function is not enabled on the CPU on which the tags are to be forced. If desired, deactivate this function in the watch table.

Procedure

Proceed as follows to stop **forcing individual tags** :

1. Open the force table.
2. Deactivate the check boxes for the addresses that are no longer to be forced.
3. Reselect the "Online > Force" command.

Result

Forcing of the disabled addresses will be stopped. The red "F" in the first column is no longer displayed. The yellow triangle reappears behind the check box again to indicate that the address is flagged for forcing but is not being forced at the moment.

Visualizing processes

12

12.1 Creating screens

12.1.1 Basics

12.1.1.1 Elements and basic settings

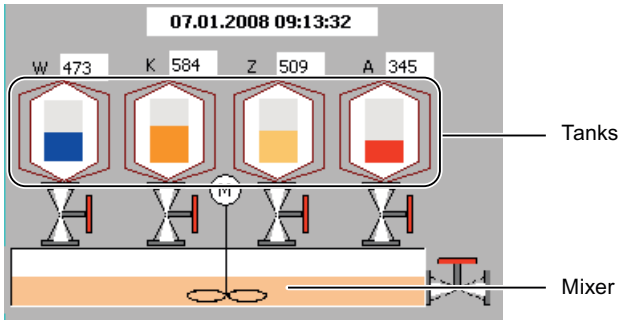
Screen basics (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC you create screens that an operator can use to control and monitor machines and plants. When you create your screens, the object templates included support you in visualizing processes, creating images of your plant, and defining process values.

Application example

The figure shows a screen that was created in WinCC. With the help of this screen, the operator can operate and monitor the mixing station of a fruit juice manufacturing system. Fruit juice base is supplied from various tanks to a mixing unit. The screen indicates the fill level of the tanks.



Screen design

Insert an object you need to represent a process into your screen. Configure the object to correspond to the requirements of your process.

A screen may consist of static and dynamic elements.

- Static elements such as text or graphic objects do not change their status in runtime. The tank labels (W, K, Z, A) shown in this example of a mixing unit are static elements.
- Dynamic elements change their status based on the process. Visual current process values as follows:
  - From the memory of the PLC
  - From the memory of the HMI device in the form of alphanumeric displays, trends and bars.

  Input fields on the HMI device are also considered dynamic objects. The fill level values of the tanks in our example of a mixing plant are dynamic objects.

Process values and operator inputs are exchanged between the controller and the HMI device via tags.

Screen properties

The screen layout is determined by the features of the HMI device you are configuring. It corresponds with the layout of the user interface of this device. If the set HMI device has function keys, the screen shows these function keys. Other properties such as the screen resolution, fonts and colors are also determined by the characteristics of the selected HMI.

Function keys

A function key is a key on the HMI device to which you can assign one or several functions in WinCC. The functions are triggered as soon as the operator presses the key on the HMI device.

A function key can be assigned global or local functions:

Global function keys always trigger the same action, regardless of the currently displayed screen.

Local function keys trigger different actions depending on the currently displayed screen on the HMI device. This assignment applies only to the screen in which you have defined the function key.

Navigation

You configure a screen navigation to enable the operator to call a screen on the HMI device in Runtime.

- The "Screen" editor is used to configure buttons for calling other screens.
- You use the "Global Screen" editor to configure globally assigned function keys.

Basic principles of graphics lists (Page 5095)

Device-dependent functional scope of screens

Introduction

The functions of an HMI device determine the display of the device in WinCC and the scope of functions of the editors.

The following screen properties are determined by the functions of the selected HMI device:

- Device layout
- Screen resolution
- Number of colors
- Fonts
- Objects available

Device layout

The device layout of a screen forms the image of the HMI device in your configuration. The device layout of the screen shows all the function keys available on the HMI device, for example.

Screen resolution

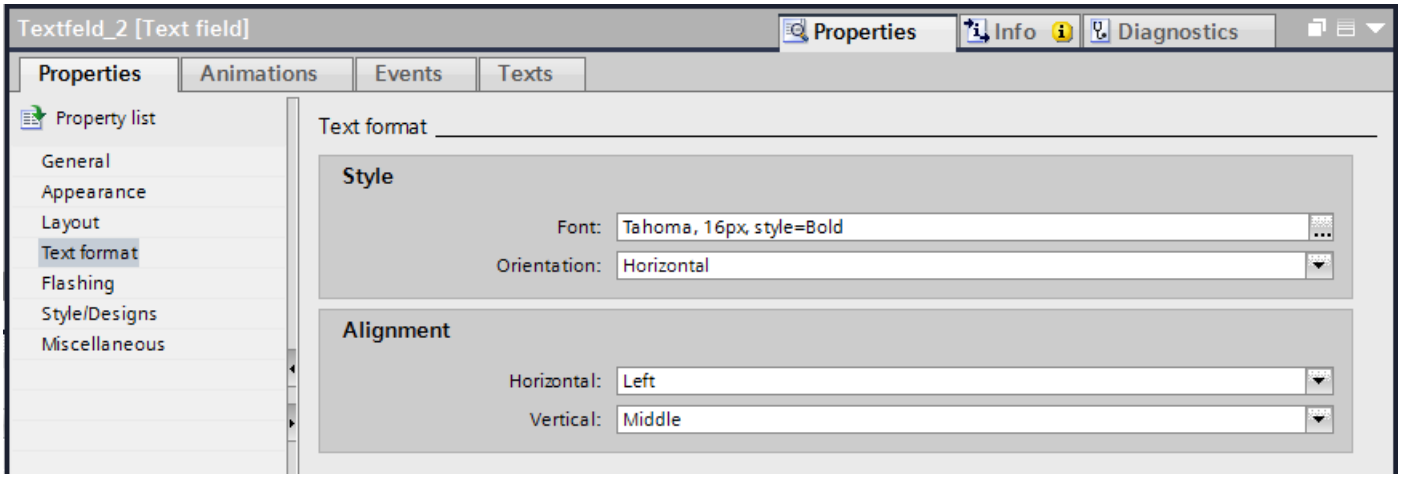
The screen resolution is determined by the different display dimensions of the various operator panels. You can only change the screen resolution if you configure the "WinCC Runtime Advanced" or "WinCC Runtime Professional" HMI device.

Number of colors

You can assign colors to the screen objects. The number of possible colors is determined by the color depth and specific colors supported on the selected HMI device.

Fonts

You can customize the appearance of the texts in all the screen objects that contain static or dynamic text. How to highlight individual texts in a screen. Select the font, font style and size, and set additional effects such as underscoring, for example.



The settings for the text markups such as font style and effects always refer to the entire text of a screen object. That is, you can display the complete title in bold format, but not its individual characters or words, for example.

Objects available

Some of the screen objects can not be configured globally for all HMI devices. These screen objects are not displayed in the "Tools" task card. For a KTP 1000 touch panel unit you can not configure a slider, for example.

Screen basics (Page 4979)

Task cards

Introduction

The following task cards are available in the "Screens" editor:

- Toolbox: Display and operating objects
- Animations: Templates for dynamic configuration

- Layout: Aid for customizing the display
- Libraries: Administration of the project library and of the global libraries

Note
WinCC Basic

The "Animations" task card is not available in WinCC Basic.

Toolbox

The "Toolbox" task card contains objects in different panes:

- Basic objects
- Elements
- Controls
- User controls (optional)
- Graphics

You paste objects from the palettes into your screens by drag&drop or a double click. The objects available for selection are determined by the features of the HMI device you are configuring. The following icons are used to change the display mode:

Icon	Meaning
	Displays the objects as a list.
	Displays the objects as a graphic.

Animations

The "Animations" task card contains the possible dynamizations of a screen object in the palettes. You paste the animations to a screen object by drag&drop or a double click from the "Movements", "Display" and "Tag Binding" palettes.

Layout

The "Layout" task card contains the following panes for displaying objects and elements:

- Layers: Serves to manage screen object layers The layers are displayed in a tree view and contain information about the active layer and the visibility of all layers.
- Grid: You specify whether you want to align the objects to a grid or to other objects and set the grid size for a grid.
- Objects out of range: Objects that lie outside the visible area are displayed with name, position and type.

Libraries

The "Libraries" task card show the following libraries in separate panes:

- Project library: The project library is stored together with the project.
- Global library: The global library is stored in a separate file in the specified path on your configuration PC.

Moving the view (Page 4984)

Zooming the view (Page 4985)

Screen basics (Page 4979)

Moving the view

Introduction

To display only a section of the entire screen in the work area, use the icon of the "Screens" editor:

Requirement

- A screen is open.
- The view shows only a screen section.

Procedure

To move the view:

1. Click the icon at the bottom right corner of the work area and press the left mouse button. A miniature view of the full screen is shown. An orange frame shows the currently selected area.
2. Hold down the mouse button and drag the frame to the desired area.

Note

The screen is scrolled when you drag a screen object from the visible to a currently hidden section.

See also

Task cards (Page 4982)

Zooming the view

Introduction

To view a small screen section in closer detail, use the zoom tool to magnify the screen in the working area. The maximum zoom amounts to 800%.

You can zoom with the toolbar in the work area or with the "Layout > Zoom" task card.

There are different ways to increase the screen, for example, with the zoom factor or by adapting the work area to the height of the screen.

Requirement

The screen is opened.

Procedure

Proceed as follows to zoom a view with the selection frame:

1. Click the toolbar button.
2. Use the mouse to draw a selection frame in the screen.

After you have released the mouse button, the section enclosed by the selection frame is zoomed to fit the complete work area.

Alternatively, use the slider in the lower right-hand corner of the screen.

Result

The selected screen section is magnified.

Task cards (Page 4982)

12.1.1.2 Working with screens

Steps (Basic Panels, Panels, RT Advanced)

Steps

To create screens, you need to take the following initial steps:

- Plan the structure of the process visualization: Number of screens and their layout
  Example: Subprocesses are visualized in separate screens, and merged in a master screen.
- Define your screen navigation control strategies.

- Adapt the templates and the global screen.
  You define objects centrally and assign function keys for example.
- Create the screens. Use the following options of efficient screen creation:
  - Working with libraries
  - Working with layers
  - Working with faceplates

Creating a new screen (Page 4986)

Managing screens (Page 4987)

Defining the start screen of the project (Page 4988)

Screen basics (Page 4979)

Creating a new screen (Basic Panels, Panels, RT Advanced)

Introduction

Create screens to display processes in your system.

Requirement

- The project has been created.
- The Inspector window is open.

Procedure

1. Double-click "Screens > Add New Screen" in the project navigation.
   The screen is generated in the project and appears in your view. The screen properties are shown in the Inspector window.
2. Enter a meaningful name for the screen.
3. Configure the screen properties in the Inspector window:
   - Specify whether and on which template the screen is based.
   - Set the "Background Color" and the "Screen Number."
   - Specify a documenting text under "Tooltip".
   - Specify the layers to be displayed under "Layers" in the engineering system.
   - Select dynamic screen update under "Animations."
   - Select "Events" to define which functions you want to execute in Runtime when you call and exit the screen or at other events.

   Note

   Not all HMI devices support the "Visibility" animation.

Result

You created the screen in your project. You can now paste objects and control elements from the "Tools" task card and assign function keys in further work steps.

See also

Steps (Page 4985)

Managing screens (Basic Panels, Panels, RT Advanced)

Introduction

You can move screens within a project to other groups, or copy, rename, and delete them.

Moving screens in a group

1. Select the "Screens" folder in the project tree.
2. Select the "Add group" command from the shortcut menu.
   A folder called "Group_x" is inserted.
3. Select the screen in the project tree.
4. Drag-and-drop the screen to the required group.
   The screen is moved into this group.

Copy screen

1. Select the screen in the project tree.
2. Select the "Copy" command in the shortcut menu to copy the screen to the clipboard.
3. In the project tree, select the screen insert position.
4. Select "Paste" from the shortcut menu to insert the screen.
   A copy of the screen is inserted. A consecutive number is appended to the name of the original in the copy.

Alternatively, press <Ctrl> while you drag the screen to the required position.

Note

If you copy a screen with interconnected template for several devices and projects, the template will also be copied. Any existing matching template is not used. This holds particularly true when you copy the screens with drag-and-drop.

Rename screen

1. Select the screen in the project tree.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.
4. Press <Enter>.

As an option, use the <F2> function key to rename the screen.

Delete screen

1. Select the screen in the project tree.
2. Select "Delete" from the shortcut menu.
   The screen and all its objects are deleted from the current project.

Steps (Page 4985)

Defining the start screen of the project (Basic Panels, Panels, RT Advanced)

Introduction

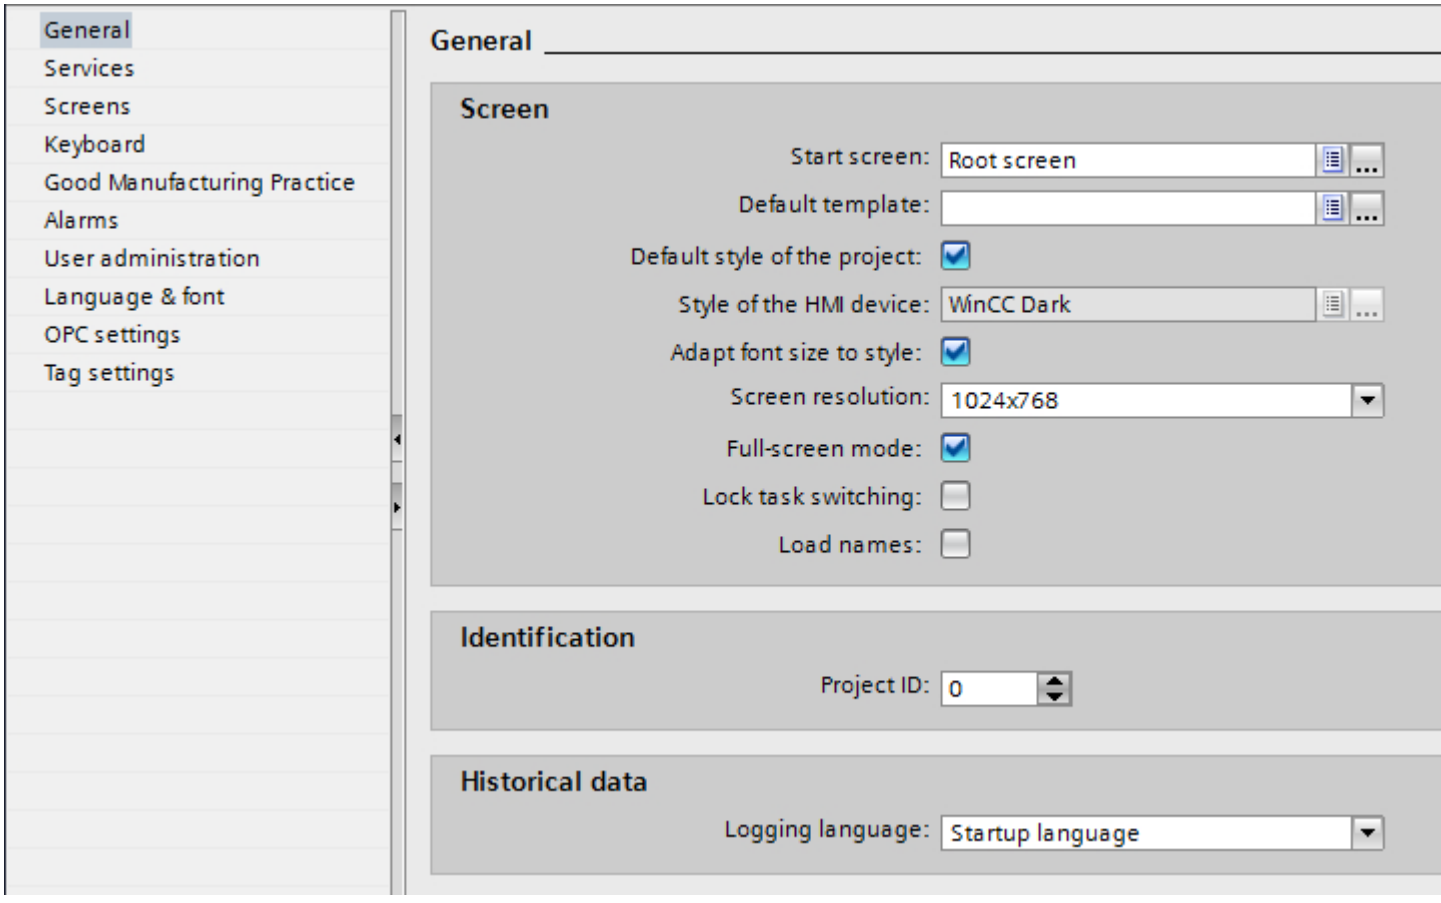
The start screen is the initial screen opened at the start of project in Runtime. You can define a different start screen for each one of the HMI devices. Beginning at this start screen, the operator calls the other screens.

Requirement

The project contains the screen you want to use as the start screen.

Procedure

1. Double-click "Runtime settings > General" in the project tree.



2. Select the desired screen as "Start screen".

   Alternatively select a screen in the project tree and select "Use as start screen" in the shortcut menu.

Result

The start screen opens on the HMI at the start of Runtime.

See also

Steps (Page 4985)

Changing the screen resolution (RT Advanced)

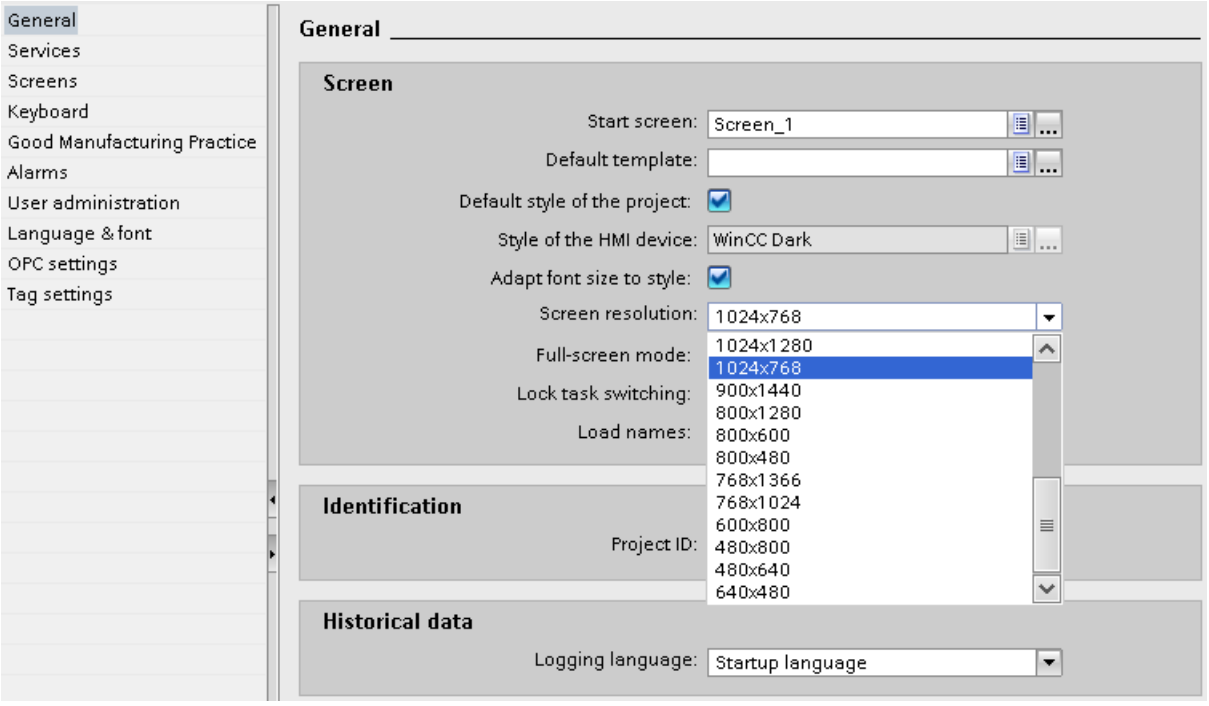
You change the screen resolution in the Runtime settings of the HMI device.

The screen resolution can be configured for the following HMI devices:

- RT Advanced

Configuring a fixed screen resolution

1. Open the Runtime settings of the HMI device.
2. Select the screen resolution under "General > Screen > Screen resolution".



12.1.1.3 Working with templates

Basics on working with templates (Basic Panels, Panels, RT Advanced)

Introduction

Configure the objects in a template which are to be displayed in all screens based on this template.

Note the following rules:

- A screen must not be based on a template.
- A screen is only based on one template.

- You can create several templates for one device.
- A template cannot be based on another template.

Objects for a template

You determine functions and objects in the template which are to apply for all screens based on this template:

- Assignment of function keys: You also assign the function keys in the template for HMI devices with function keys. This assignment overwrites a possible global assignment.
- Permanent areas: Some devices support a permanent area for all screens in the top area of the screen. In contrast to the template, the permanent area occupies an area of the screen for itself alone.
- Operator controls: You can paste all screen objects which you also use for a screen into a template.

Application examples

- You want to assign the ActivateScreen" function to a function key in the template. The operator uses this key to switch to another screen in runtime. This configuration applies to all screens that are based on this template.
- A graphic with your company logo can be added to the template. The logo appears on all screens that are based on this template.

Note

If an object from the template has the same position as an object in the screen, the template object is covered.

Managing templates (Page 4993)

Creating a new template (Page 4994)

Global screen (Page 4991)

Screen basics (Page 4979)

Using a template in the screen (Page 4996)

Configuring permanent areas in the template (Page 4995)

Global screen (Basic Panels, Panels, RT Advanced)

Introduction

You define global elements for all screens of an HMI device independently of the used template.

Function keys

For HMI devices with function keys you assign the function keys globally in the "Global Screen" editor. This global assignment applies for all screens of the HMI device.

Proceed as follows to assign function keys locally in screens or templates:

1. Click the function key in your screens or templates.
2. Deactivate "Properties > Properties > General > Use Global Assignment" in the inspection window.

Indicator and control objects for alarms

The "Alarm window" and "Alarm indicator" objects that are available as global objects are configured within the "Global screen" editor.

The "Alarm window" and "Alarm indicator" are always shown in the foreground.

For Comfort Panels you also have the possibility of configuring a "System diagnostic view" in the global screen.

Note

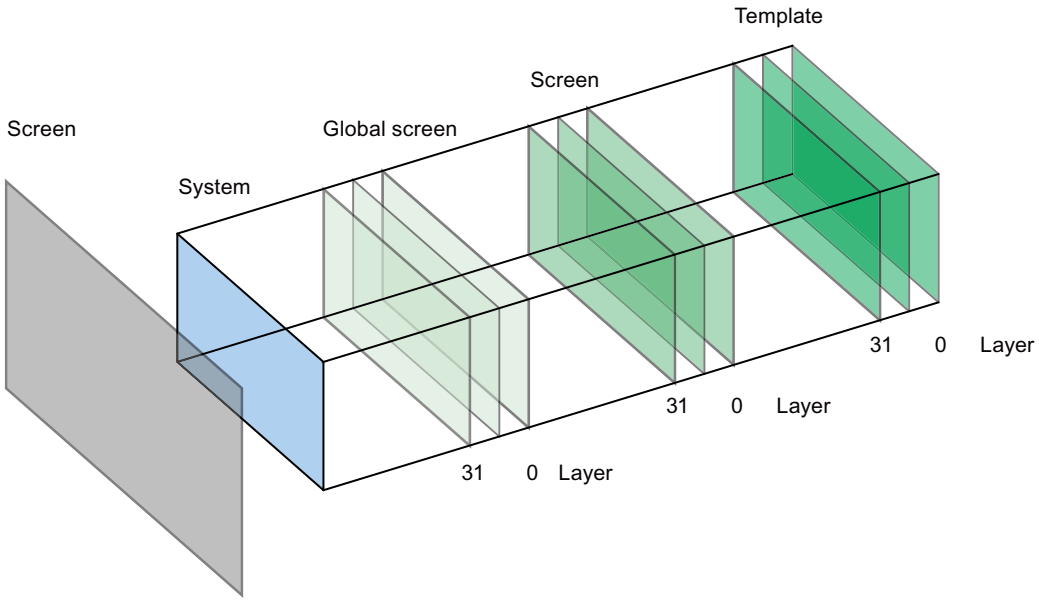
If you have configured a permanent area in a template, do not position the alarm window and alarm indicator in the area of the permanent area. Otherwise, the alarm window and the alarm indicator will not be displayed in Runtime.

However, the permanent area is not visible in the "Global screen" editor.

Order of configuration of screens

The following order applies for the configuration:

- The global screen comes before screens and templates
- Screens come before templates



The system layer is not configurable. This contains

- input dialog boxes
- alarms from the operating system
- the direct keys for touch panels

See also

Basics on working with templates (Page 4990)

Managing templates (Basic Panels, Panels, RT Advanced)

Introduction

You can move, copy, rename, and delete templates within a project in the Project window.

Moving a template into a group

1. Select the templates in the project navigation "Screen management > Templates".
2. Select "Add group" in the shortcut menu.
   A folder called "Group_x" is inserted.

3. Select the template in the project navigation.
4. Drag-and-drop the template to the required group.
   The template is moved to this group.

Copying templates

1. Select the template in the project navigation.
2. Select "Copy" in the shortcut menu.
3. Select the position in the project navigation where you want to paste the template.
4. Select "Paste" from the shortcut menu to insert the template.
   A unique name is assigned automatically to the copy.

Alternatively, you can hold down the <Ctrl> key, and drag the template into position.

Deleting a template

1. In the project navigation, select the template to be deleted.
2. Select "Delete" in the shortcut menu.
   The template, and all its objects are deleted from the current project.

Assigning a template to a screen

1. In the project navigation, select the screen to which you want to assign the template.
2. In the Inspector window, select "Properties > Properties > General".
3. Select the desired template under "Template."
   The selected template and all the objects contained in it are assigned to the screen.

See also

Basics on working with templates (Page 4990)

Creating a new template (Basic Panels, Panels, RT Advanced)

Introduction

In a template, you can centrally modify objects and function keys. Changes to an object or of a function key assignment in the template are applied to the object in all the screens which are based on this template.

Note

HMI device dependency

Function keys are not available on all HMI devices.

Requirement

- The project has been created.
- The Inspector window is open.

Procedure

1. Select "Screen management > Templates" in the project tree and then double-click "Add new template".
   The template is created in the project, and appears in your view.
   The properties of the template are displayed in the Inspector window.
2. Define the name of the template under "Properties > Properties > General" in the Inspector window.
3. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.
4. Add the necessary objects from the "Tools" task card.
5. Configure the function keys.

Result

The template is created in your project.

See also

Basics on working with templates (Page 4990)

Configuring permanent areas in the template (Panels, RT Advanced)

Introduction

In the permanent area, you configure objects which are visible in all screens. In contrast to the template, the permanent area occupies an area of the screen for itself alone. You configure permanent areas in the "Permanent areas" editor or in a screen.

The default height of the permanent area is "0". The maximum height is the maximum height of the screen minus 10 pixels.

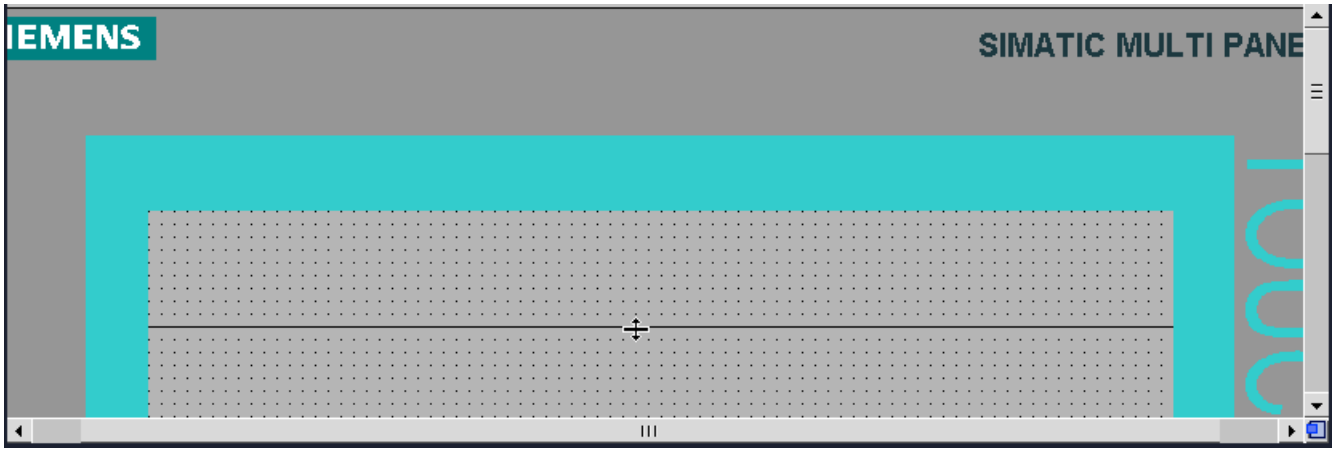
Configuring permanent areas

1. Double-click in the project tree under "Screen management > Permanent areas".
   The permanent area is created in the project and displayed in the work area.
   The properties of the permanent area are displayed in the Inspector window.
2. Configure the desired objects within the permanent area.

Configuring permanent areas in a screen

To configure a permanent area, follow these steps:

1. Open a template for a HMI device with a permanent area.
2. Using the mouse (cursor form:), drag the top edge of the editable screen area downwards.



3. Configure the desired objects within the permanent area.

Result

The content of the permanent area is shown on every screen and in the template. The area above this line is now used as a permanent area in all the screens of the HMI device. Objects already configured in the screens are moved down by the height of the permanent area.

See also

Basics on working with templates (Page 4990)

Using a template in the screen (Basic Panels, Panels, RT Advanced)

Introduction

You use a template in the screen. All the objects configured in the template are also available in the screen.

Requirement

A template has been created.

A screen has been created.

Procedure

Proceed as follows to use a template in a screen:

1. Double click a screen in the project tree. The screen opens in the work area.
2. Open "Properties > Properties > General" in the inspector window.
3. Select a template that is to be applied to the screen under "Template".

Show template in screen

When you edit a screen, you can show an existing template in the screen.

Proceed as follows to show a template in the screen:

1. Activate "Extras > Settings > Visualization > Show template in screens" in the menu.

Result

The screen is based on the selected template. All objects which you have configured in the template are available in the screen. The template is displayed in the screen.

See also

Basics on working with templates (Page 4990)

12.1.1.4 Working with pop-up screens

Basics on working with pop-up screens (Panels, RT Advanced)

Introduction

You use the pop-up screen to configure a screen for additional content, for example, object settings. The pop-up screen is displayed on top of the current screen as soon as you call a system function.

Only one pop-up screen at a time is displayed in a screen.

Note

Device dependency of the "Pop-up screen" object

The "Pop-up screen" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

Use

You configure a button in the screen and assign the "ShowPopupScreen" or "ShowPopupScreenSizable" function in order to display a pop-up screen with a defined size.

When operating the button, a pop-up screen is opened or closed. In the pop-up screen, you make the settings.

Size

You have the option to configure pop-up screens that are larger than the screen size:

- Horizontal, up to maximum double the width
- Vertical, up to maximum six times the height

Objects in the pop-up screen

You configure the following objects in the pop-up screen:

- Basic objects, such as lines and polygon-based objects
- Elements, such as buttons
- Controls, such as trend view or alarm view
- Faceplates

Note

You cannot configure alarm windows, system diagnostics windows and alarm indicators in the pop-up screen.

Softkeys and hotkeys are not supported in the "Pop-up screen" object.

Note

Objects in the pop-up screen as well as the pop-up screen itself do not support access with VB scripting.

Creating a new pop-up screen (Panels, RT Advanced)

Introduction

A new pop-up screen is created in Project tree > Screen management. The size of a pop-up screen is defined in the properties.

Requirements

- The project has been created.
- The Inspector window is open.

Creating a new pop-up screen

1. Double-click "Screen management > Pop-up screens > Add new pop-up screen" in the project tree.
   The pop-up screen is generated in the project and is displayed in the work area.
   The pop-up screen properties are displayed in the Inspector window.
2. Define the name of the pop-up screen under "Properties > Properties > General" in the Inspector window.
3. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.
4. Define the height and width of the pop-up screen under "Properties > Properties > Layout" in the Inspector window.
5. Define the color for the scroll arrows and the sizing handle in the scroll bar in "Properties > Properties > Scroll bar" in the Inspector window.
6. Add the necessary objects from the "Tools" task card.
7. Configure the function keys.

Note

You cannot address the "Pop-up screen" object and the objects configured in it with VB scripts.

Note

Objects and controls can be dynamized in the pop-up screen. The pop-up screen itself does not support dynamization.

Result

You have created a new pop-up screen in which you have configured objects and functions.

Managing pop-up screens (Panels, RT Advanced)

Introduction

You can move, copy, rename, and delete pop-up screens within a project in the Project window.

Moving pop-up screens in a group

1. Select "Screen management > Pop-up screens" in the project tree.
2. Select "Add group" in the shortcut menu.
   A folder called "Group_x" is inserted.
3. Select the pop-up screen in the project tree.
4. Drag-and-drop the pop-up screen to the required group.
   The pop-up screen is moved into this group.

Copying pop-up screen

1. Select the pop-up screen in the project tree.
2. Select "Copy" from the shortcut menu.
3. In the project tree, select the pop-up screen insert position.
4. Select "Paste" in the shortcut menu.
   A unique name is assigned automatically to the copy.

Deleting pop-up screen

1. Select the pop-up screen you want to delete in the project tree.
2. Select "Delete" in the shortcut menu.
   The pop-up screen and all its objects are deleted from the current project.

Using the pop-up screen (Panels, RT Advanced)

Introduction

You configure the system function to open a pop-up screen at the event of an operating object. The linked system function is executed when the event occurs in runtime.

Note

You configure a button to open a pop-up screen in a slide-in screen.

If the configured position of the pop-up screen is outside the slide-in screen, the slide-in screen is closed when the pop-up screen closes.

Requirements

- A pop-up screen has been configured.
- A screen is open.
- The Inspector window is open.

Procedure

1. Configure a button.
2. Click "Properties > Events" in the Inspector window.
3. Select an event, for example, "Click".
4. Click on "Add function" in the table.
5. Select the "ShowPopupScreen" system function.

Result

The pop-up screen opens when the operator clicks the button in runtime.

12.1.1.5 Working with slide-in screens

Basics on working with slide-in screens (Panels, RT Advanced)

Introduction

The "Slide-in screen" object provides quick navigation between the start screen and the slide-in screens containing additional configured contents stored outside the start screen. Navigation is supported by the multi-touch functions. The configurable handles appearing at the edges of the start screen provide quick access to the stored slide-in screens.

The size of the slide-in screens depends on the HMI device used.

Note

Device dependency of the "Slide-in screen" object

The "Slide-in screen" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

Application

The "Slide-in screen" is used to configure up to four slide-in screens for additional contents and operator controls, for example, a virtual keyboard or a system dialog.

By default, the following slide-in screens are set up for each device:

- "Slide-in screen top": appears at the top of the start screen in Runtime
- "Slide-in screen bottom": appears at the bottom of the start screen in Runtime
- "Slide-in screen left": appears at the left of the start screen in Runtime
- "Slide-in screen right": appears at the right of the start screen in Runtime

It is possible to configure objects in each of these slide-in screens.

Note

It is not possible to delete the default slide-in screens or to set up your own slide-in screens.

Objects in the slide-in screen

You configure the following objects in the slide-in screen:

- Basic objects, such as lines and polygon-based objects
- Elements, such as buttons
- Controls, such as trend view or alarm view
- Faceplates

Note

Objects in the slide-in screen as well as the slide-in screen itself do not support access with VB scripting.

Note

Release buttons and locked operator controls cannot be configured in the slide-in screen.

Softkeys and hotkeys are not supported in the slide-in screen.

See also

Configuring slide-in screens (Page 5002)

Configuring slide-in screens for devices without multi-touch function (Page 5004)

Using slide-in screens (Page 5005)

Configuring slide-in screens (Panels, RT Advanced)

Introduction

By default, four slide-in screens are preset for each device in the project tree under "Screen management > Slide-in screens". For each of these slide-in screens, you configure the size, the layout and the handle for operation in Runtime using the properties.

Requirement

- The project has been created.
- An HMI device has been created.
- The Inspector window is open.

Configuring properties for slide-in screens

1. Select the slide-in screen you wish to configure in the project tree under "Screen management > Slide-in screens.
   The slide-in screen properties are displayed in the Inspector window.

   Note

   The names of all slide-in screens are write-protected and cannot be changed.

2. Define the background color of the slide-in screen in the "Background color" selection list of the "Properties > Properties > General" Inspector window.
3. Define the grid color of the slide-in screen in the "Grid color" selection list.
4. Enable the "Activate" check box.
5. Specify the layers in the engineering system that are displayed under "Properties >Properties >Layers" in the Inspector window.
6. Define the height and width of the slide-in screen in "Properties > Properties > Layout" in the Inspector window:
   - Define the height only for "Slide-in screen top" and "Slide-in screen bottom".
   - Define the width only for "Slide-in screen left" and "Slide-in screen right".

Note

If you do not need all four slide-in screens, enable the slide-in screens relevant to you only.

If you do not need any slide-in screens, leave the "Activate" check box empty for all four slide-in screens.

Note

Slide-in screens cannot be deleted nor copied to a different HMI device.

However, it is possible to copy the objects configured in a slide-in screen to another slide-in screen.

Configuring handles for slide-in screens

1. Define the color of the first line of the handle in the "Lines" area of the "Color" selection list under "Properties > Properties > Handle" in the Inspector window.
2. Define the color of the second line of the handle in the "Alternative color" selection list.
3. Define the color for the operable area of the handle in the "Color" selection list under "Operable area".
4. Select one of the following options from the "Visibility" area:
   - "Hide handle automatically" (activated by default)
   - "Always show handle"
   - "Never show handle"

Note

When selecting the "Hide handle automatically" option, the handle only becomes visible once the user clicks the operable area.

You select the "Never display handle" option when the slide-in screen is configured using the "ShowSlideInScreen" system function.

Note

You are notified by a warning if a handle which is configured as visible covers a configured object in a screen, such as a button, completely or partially.

Note

The following dimensions are defined for the handle:

- The width of a handle for the "Slide-in screen top" and "Slide-in screen bottom" objects is one-third of the screen length.
- The height of a handle for the "Slide-in screen left" and "Slide-in screen right" objects is one-third of the screen width.

Result

You have configured the properties of the slide-in screens and the handle for operation in Runtime.

See also

Basics on working with slide-in screens (Page 5001)

Configuring slide-in screens for devices without multi-touch function (Page 5004)

Configuring slide-in screens for devices without multi-touch function (Panels, RT Advanced)

Introduction

You use the "ShowSlideInScreen" system function to make the slide-in screens available on devices without multi-touch functions, for example Key Panels. You link this system function to buttons. Buttons are used to navigate between the start screen and the slide-in screens.

Requirement

- The project has been created.
- An HMI device has been created.
- A screen is open.
- The Inspector window is open.

Procedure

1. Drag the "Button" object to the screen from the toolbox.

   Note

   Navigation in Runtime is much easier if the buttons for operating the slide-in screens are created directly in the start screen.

2. Enter a suitable text of any length for the button.
3. In the Inspector window, select "Properties > Events > Click".
   The "Function list" dialog box is opened.
4. Select the "ShowSlideInScreen" system function from the "Keyboard operation for screen objects" group.
5. Assign the ID of the slide-in screen appearing in runtime when the button is operated to the "ShowSlideInScreen" function:
   - "Slide-in screen left"
   - "Slide-in screen top"
   - "Slide-in screen right"
   - "Slide-in screen bottom"
6. Assign the appropriate mode to the "ShowSlideInScreen" function:
   - "Toggle"
   - "Off"
   - "On"

Result

You have configured the slide-in screens for operation on devices without multi-touch function. When clicking on the respective button in the screen in Runtime, the slide-in screen behaves in accordance with the configuration.

See also

Basics on working with slide-in screens (Page 5001)

Configuring slide-in screens (Page 5002)

Using slide-in screens (Panels, RT Advanced)

Introduction

In slide-in screens, you configure additional contents and operator controls, for example, navigation buttons, an alarm view or a trend view.

Requirements

- The project has been created.
- An HMI device has been created.
- A slide-in screen is open.
- The Inspector window is open.

Procedure

1. Add the necessary objects from the "Tools" task card to the slide-in screen.
2. Configure the function keys.

Note

You cannot address the "Slide-in screen" object and the objects configured in it with VB scripts.

Note

Objects and controls can be dynamized in the slide-in screens. The slide-in screens as such do not support dynamization.

Result

You have configured objects and functions in the slide-in screen.

See also

Basics on working with slide-in screens (Page 5001)

12.1.1.6 Working with styles and style sheets

Basics on working with styles (Basic Panels, Panels, RT Advanced)

Introduction

The style editor is a global editor. You define a uniform appearance for display and operating elements in the style editor. In this way, you harmonize the display of objects in Runtime. The style editor offers predefined styles. Additional predefined styles are available for download at Siemens Industry Online Support (http://support.automation.siemens.com/WW/view/en/91174767).

You can choose one of the predefined styles or create your own style. You use the style editor independently of devices and projects.

Views in the style editor

Objects are grouped in the style editor according to their main visual features.

The following groups are available:

- Buttons, lines, and polygon-based objects
- Text-based objects
- Trend-based objects, such as trend view,
- graphic or value-based objects, such as value table.

Style items

You use a style item to define the appearance of a screen object within a style. You can design several objects of the same type differently in one style. You define, for example, different style items for simple buttons and navigation buttons.

You create and manage style items in the style editor.

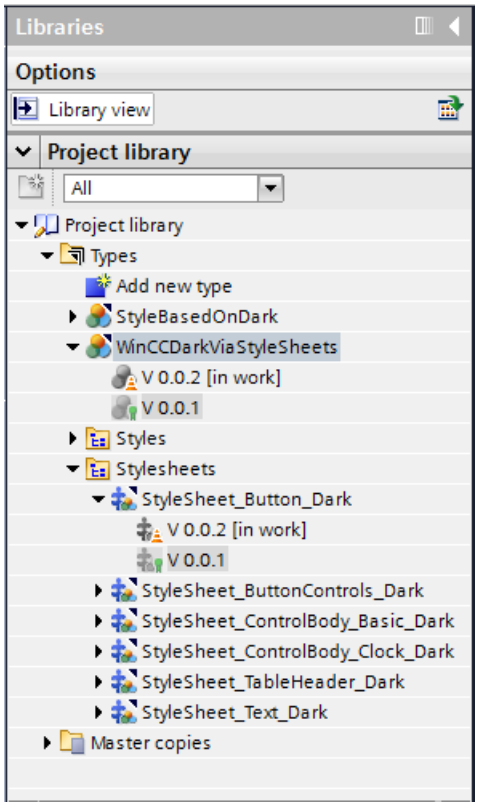
Style sheets

You use style sheets to configure the same properties for a group of objects. In a style sheet you can, for example, define the width and background color of table headers for all table-based objects. Style sheets are divided into predefined types depending on the included properties, for example, buttons, limits, table headers.

You use style sheets to define the design of shared object properties. Some special object properties are not included in style sheets. You use styles to design all objects of a project with visual consistency.

Managing styles and style sheets

You create and edit styles and style sheets in the project library. To get a better overview of types in expansive libraries, you save styles and style sheets in folders with meaningful names. You should also assign meaningful names to the styles and style sheets you create yourself.



Support of styles in faceplates

Styles and style items can be assigned to faceplate instances.

However, there is no direct connection between the faceplate types and styles, so selection and preview of a style item in the faceplate editor is not possible. To assign a style item to a faceplate, enter the name of the style item under "Style item appearance".

The configured style item is used in the instance of a faceplate, provided the name of the style item exists in the style used. Ensure that the name is written correctly.

See also

Displaying predefined styles (Page 5009)

Defining a style (Page 5009)

Managing styles (Page 5011)

Using style items (Page 5014)

Displaying predefined styles (Basic Panels, Panels, RT Advanced)

Introduction

In the "Style" editor, you see predefined styles and create your own styles for representing display and operating objects in Runtime.

Open "Styles" editor

1. Double-click "Common data" in the project navigation.
2. Click the "Styles" editor. The editor opens.

Note

Style editor in the project navigation

The style editor is only visible in the project navigation if a device that supports styles, e.g., Comfort Panels, is created in the project.

3. The standard styles are displayed in the work area of the "Style" editor:

- WinCC Light
- WinCC Dark
- WinCC Fresh
- WinCC Wireframe.

Result

The settings for the groups and individual objects are displayed in the work area.

You will assign predefined styles or define your own styles in the next steps.

Predefined styles are write-protected and cannot be changed.

See also

Managing styles (Page 5011)

Defining a style (Page 5009)

Defining a style (Basic Panels, Panels, RT Advanced)

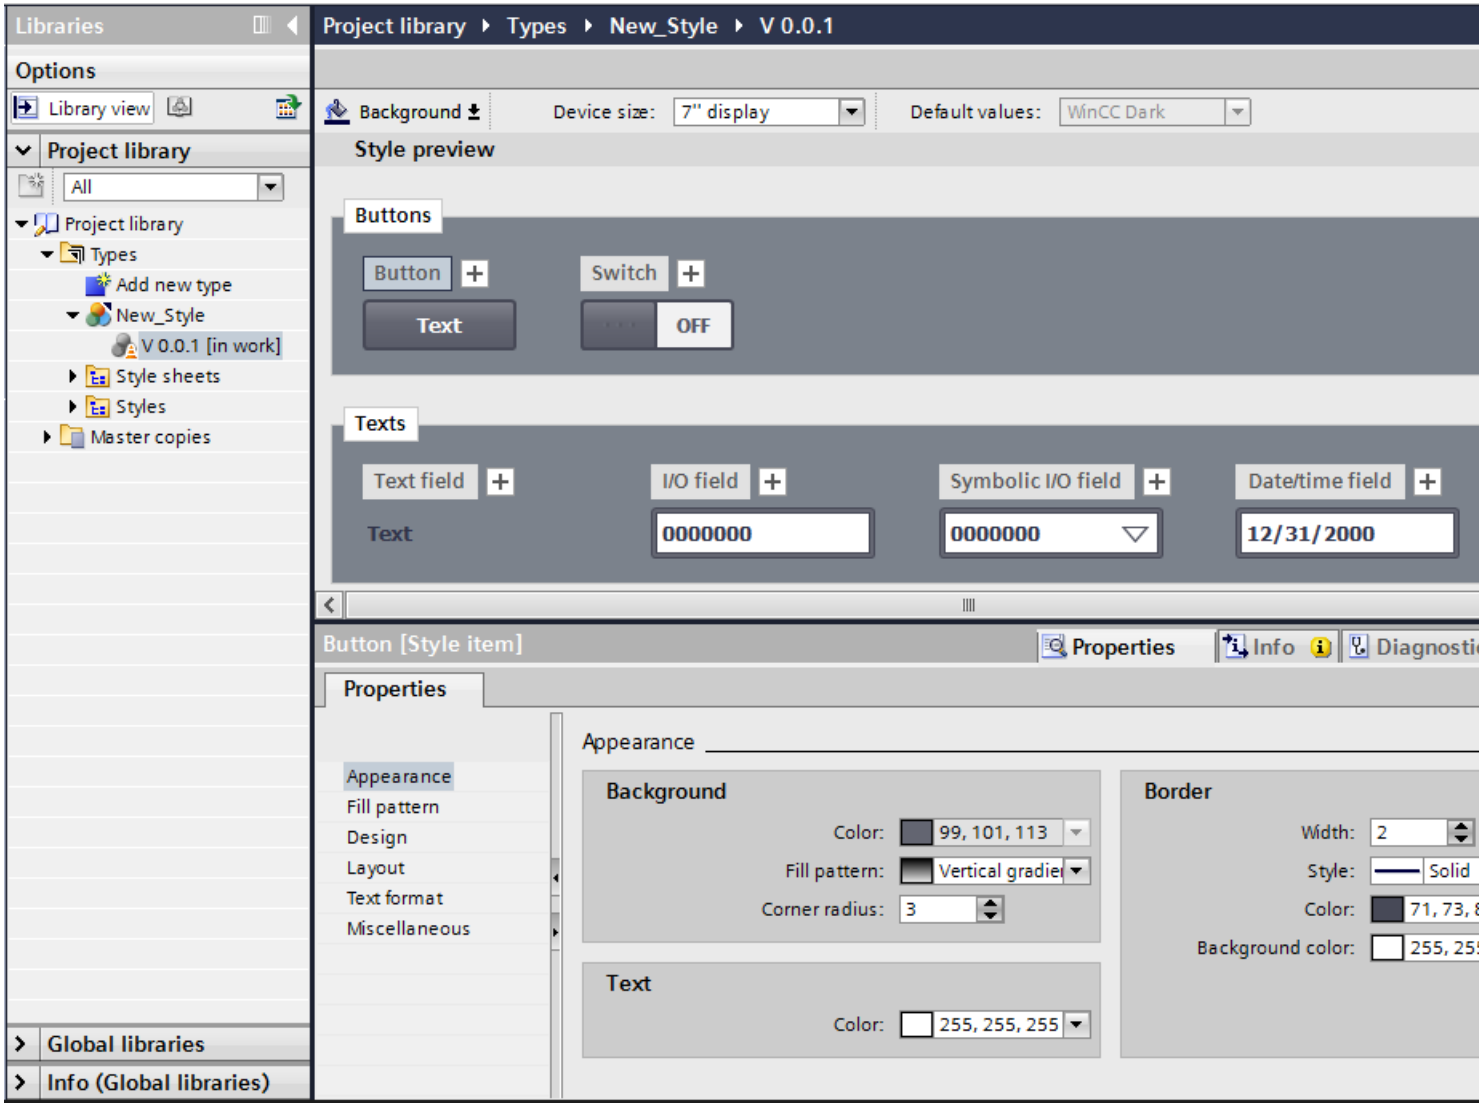
Introduction

In the "Styles" editor, you see predefined styles. Predefined styles are write-protected and cannot be changed.

In addition, you have the option of defining your own styles and applying them to individual objects, groups, and even projects.

Defining a style

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Click "Add" in the "Styles" area.
   A new style is created.
   The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.1 has the status "in progress".
4. In the Inspector window, select the colors, borders and other settings for individual objects.



5. In order to activate the new style, select the current version "in progress" and select "Release version" in the shortcut menu.
   The new style appears in the "Styles" editor.

Result

You have added a new style which can be applied to objects or projects.

Defining a style based on a predefined style

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select a predefined style in the work area.
4. Select the "Duplicate type" command in the shortcut menu.
   The "Duplicate type" dialog opens.
5. Overwrite the suggested name with a meaningful name.
6. In the "Comment" column, enter a description of the style, e.g. the intended use.
7. Click "OK" to confirm your input.
8. Select the created type in the project library.
9. Select "Edit new type" in the shortcut menu.
   The library view opens. The version of the type is displayed in the "Types" folder. The version 0.0.2 has the status "in progress".
10. Configure the type as required.
11. Select the "Release version" command from the shortcut menu of the edited version.

Result

They have configured a new style based on the predefined style of WinCC.

See also

Displaying predefined styles (Page 5009)

Managing styles (Basic Panels, Panels, RT Advanced)

Deleting a style

You can delete styles that you have defined yourself.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Select the style in the work area that you want to delete.

   Note

   You cannot delete the predefined styles of WinCC.

4. Select the "Delete" command in the shortcut menu.

The style is deleted.

Editing a style

You can edit styles that you have defined yourself.

1. Open the project library.
2. Select the released version of the style that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.
4. Make the required changes in the Inspector window.
5. Select the "Release version" command from the shortcut menu of the edited version to put the changes into effect.
   The changes made take effect.

Determining a standard style for a project

A project can be assigned a standard style to achieve a visual conformity of all display objects in the project.

1. Open the "Common data" folder in the project navigation.
2. Open the "Style" editor.
3. Activate a style in the work area.

The activated style is used as standard style in the project. When you add a device to the project, this device uses the standard style.

Changing the style for a specific device

Within a project, you change the style for a specific device.

1. Open the "Runtime settings" editor of the HMI device.
2. Select a device style under "General".

The selected style is applied to the device.

If the device style is not assigned, the device uses the standard style of the project.

See also

Displaying predefined styles (Page 5009)

Adjusting the font size to the device size (Basic Panels, Panels, RT Advanced)

Introduction

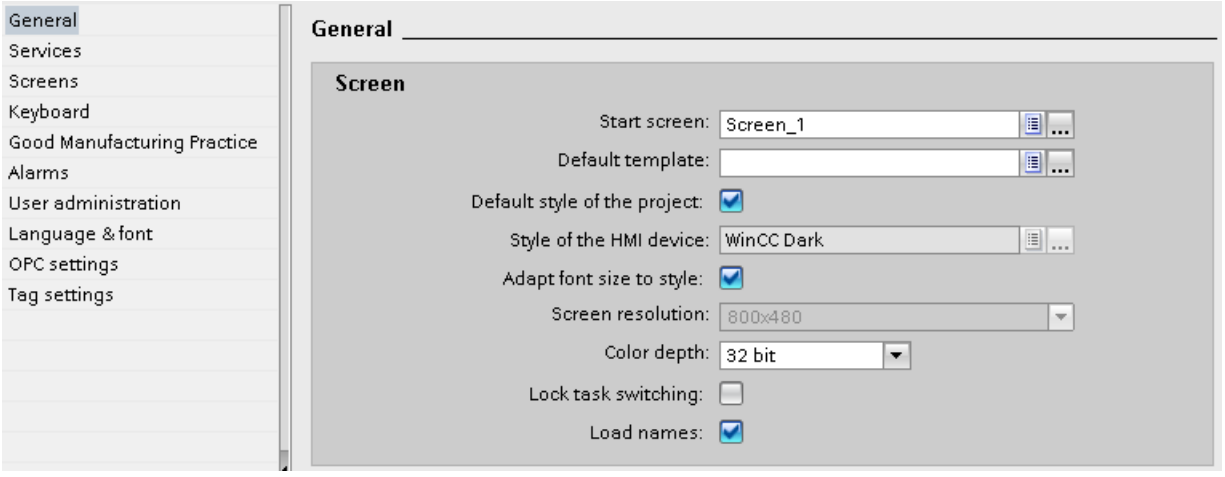
You define the size of the device to whose objects you want to apply a style in the style editor. This means you specify device-dependent font sizes in a style. All font sizes are automatically adapted to the device size by selecting a specific reference size.

The table below shows the device sizes and the reference font sizes in pixels:

Device size	Font size in pixels
4" display	15 px
7" display	17 px
9" display	15 px
12" display	19 px
15" display	19 px
19" display	17 px
22" display	21 px
WinCC RT Advanced	17 px

Activating automatic adjustment of font sizes

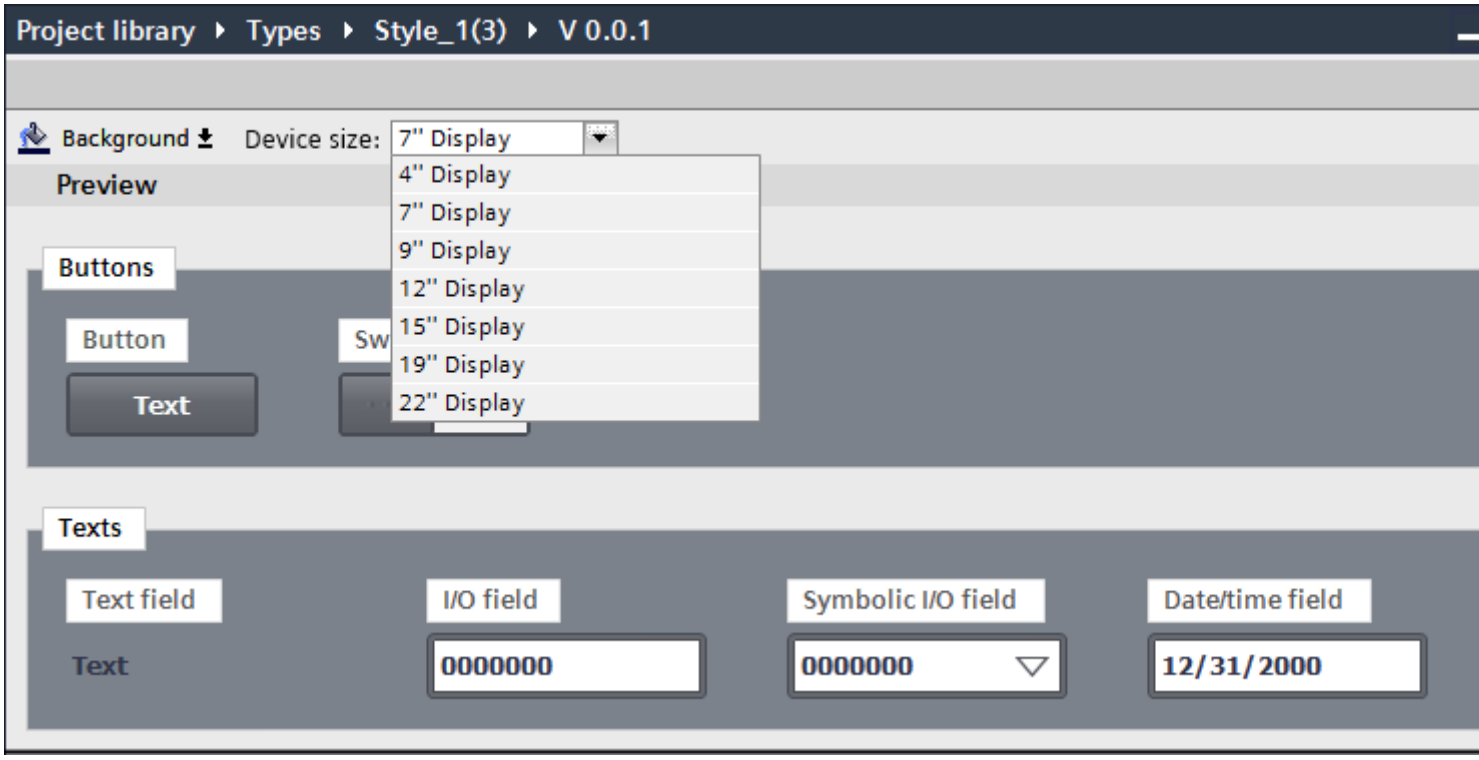
1. Double-click the "Runtime settings" editor in the project window.
2. Click "General".
3. Activate the option "Adjust font size in style" under "General > Screen".



Automatic adjustment of font sizes to the device size was activated in a style.

Adjusting font size in a device style

1. Open the corresponding style for editing in the project library.
2. Select the reference size of the HMI device in the work area.



All font sizes in the style are automatically adjusted to the selected device size.

Using style items (Basic Panels, Panels, RT Advanced)

Introduction

You use style items to change the style of a screen object without changing the entire device style. You can, for example, define types of buttons with the help of different style items that are to receive the same appearance in one or several devices.

You define style items in the style editor.

Adding a new style item

1. Open the project library.
2. Select the released version of the style that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.
4. Select the object that you want to use in a different style.

5. Click the plus sign next to the object name.

   A new style item has been created.
   You can also select "Duplicate style item" in the shortcut menu of the object.

6. Make the required changes in the inspector window.
7. Assign a meaningful name to the new style item under "Properties > Miscellaneous > Object > Name".
8. Release the version of the style.

Deleting a style item

You can delete style items that you have defined yourself.

1. Open the project library.
2. Select the style that includes the style item.
3. Open the "in progress" version.
4. Select the style item that you want to delete in the work area.
5. Select the "Delete" command in the shortcut menu.

   Note

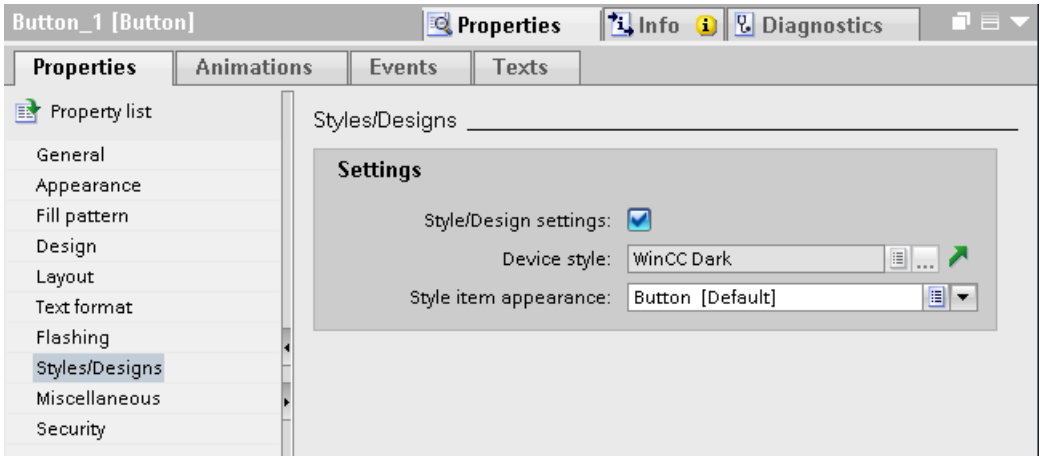
   You cannot rename or delete predefined WinCC style items.

The style item is deleted.

Specifying a style item for an object

If you have configured additional style items for an object in the device style, you can use the predefined style item for a screen object.

1. Open "Properties > Styles/Designs > Settings".
2. Enable the option "Use style/design".
3. Select the predefined style item under "Style item appearance".



The object is displayed as selected style item.

Basics on working with style sheets (Basic Panels, Panels, RT Advanced)

Introduction

Some screen objects have the same properties which can be configured similarly. These general properties are grouped in style sheets. You can configure several properties for several objects simultaneously and consistently by using style sheets.

Types of style sheets

Style sheets are divided into several predefined categories. Each category contains a specific number of common properties shared by different objects. Select the required category when you create a style sheet. A style sheet can only be applied to objects for which the corresponding category is defined.

The table below shows the available categories and objects that can be configured with them.

Category/Objects	Polylines/ Lines	Text-based objects	Buttons	Value-based objects	Table-based objects	Diagrams
Button	-	-	X	-	X	X
Object body	X	-	-	X	X	X
Diagram body	-	-	-	-	-	X
Focus and selection	-	X	X	-	X	X

Category/Objects	Polylines/ Lines	Text-based objects	Buttons	Value-based objects	Table-based objects	Diagrams
Limits	-	X	-	X	-	-
Labels	-	-	-	X	-	-
Scale	-	-	-	X	-	-
Table body	-	-	-	-	X	X
Table header	-	-	-	-	X	X
Text field	-	X	-	-	-	-

Use of style sheets

You apply a style sheet to a style item when editing a style. The properties configured in the style sheet are transferred to the style item.

To apply a style sheet to a style item, drag the required style sheet from the task card to the style item in the work area using drag-and-drop.

Managing style sheets

Style sheets are library types. You manage style sheets in the project library. Style sheet categories are available in the project library in the "Style sheets > Categories" task card during style editing.

The style sheets that are available for a style sheet type are available in the "Style sheets > Visual attributes" task card. The task card includes predefined style sheets as well as style sheets you have created yourself and released.

Creating a new style sheet (Basic Panels, Panels, RT Advanced)

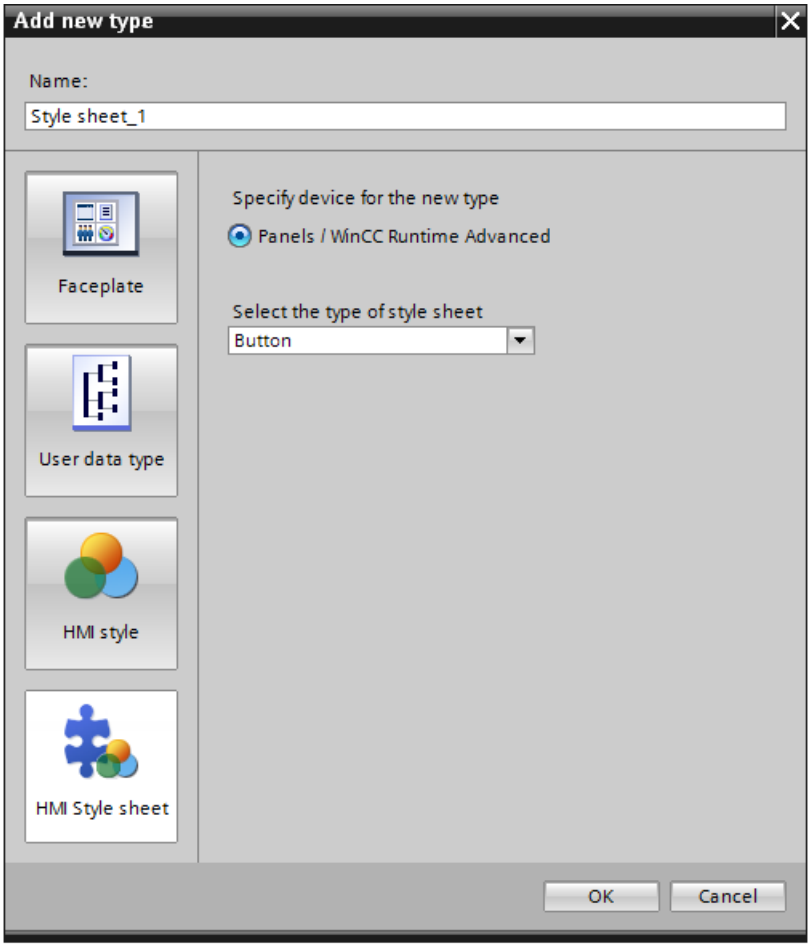
Introduction

You configure the properties for several objects of a similar type in a style sheet.

Create new style sheet

1. Open the project library.
2. Click the "Add new type" button.
   The "Add new type" dialog opens.
3. Select the option "HMI style sheet" in the dialog.

4. Select the type of the style sheet.



5. Assign a meaningful name to the style sheet.
6. Click "OK" to confirm your input.
   The new style sheet was created.

Create new style sheet based on a style

To automatically configure the properties for similar screen objects when editing a style, create a new style sheet based on properties of a style item that have already been configured.

1. Select the style item you want to use to create a style sheet.
2. Select "Create new style sheet" in the shortcut menu.
3. Select the category for the style sheet in the submenu.
   The "Add type" dialog opens.

4. Assign a meaningful name to the style sheet.
5. Click "OK" to confirm.
   The new style sheet based on a style was created and has been added to the "Style sheets > Visual attributes" task card.
   The properties in the style sheet were applied from the selected style item. The properties of the style sheet not included in the selected style have been assigned default values.

Managing style sheets (Basic Panels, Panels, RT Advanced)

Introduction

You edit, copy and delete the style sheets in the project library.

You can also open, copy, create and delete style sheets with the commands in the shortcut menu of the "Style sheets > Categories" task card.

Edit style sheet

You can edit style sheets that you have created yourself.

1. Open the project library.
2. Select the released version of the style sheet that you want to change.
3. Select "Edit type" in the shortcut menu.
   A new version "in progress" is created.
4. Make the required changes in the Inspector window.
5. Select the "Release version" command from the shortcut menu of the edited version to put the changes into effect.
   The changes made take effect.

Delete style sheet

You can delete style sheets that you have defined yourself.

1. Open the project library.
2. Select the style sheet that you want to delete in the project library.

   Note

   You cannot delete the predefined style sheets of WinCC.

   Note

   You cannot delete the style sheet which includes an "in progress" type. To delete the style sheet, start by releasing all versions of the style sheet.

3. Select the "Delete" command in the shortcut menu.

The style sheet is deleted.

Copy style sheet

1. Open the project library.
2. Select the style sheet that you would like to copy.
3. Select "Duplicate type" in the shortcut menu.
4. Overwrite the suggested name with a meaningful name.
5. In the "Comment" column, enter a description of the style sheet, for example, the intended use.
6. Click "OK" to confirm your input.
   The required style sheet was copied and stored in the same folder.

Using style sheets (Basic Panels, Panels, RT Advanced)

Introduction

You are using a style sheet while editing a style in the style editor. Style sheets are object-specific and are only applied to style items with which they are compatible.

Only a released version of a style sheet can be applied to a style item.

You have the following options to use a style sheet:

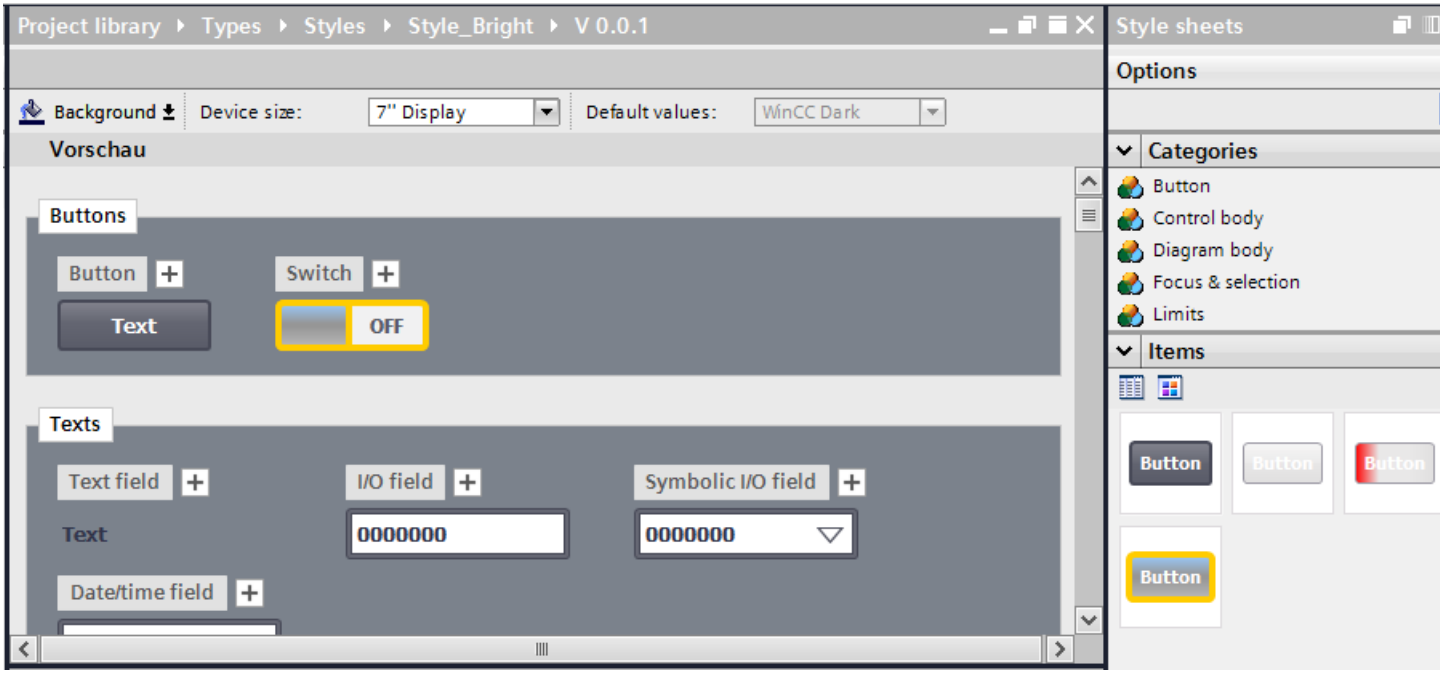
- To design the selected style item, drag the style sheet to a style item in the style editor.
- To design several style items of a group, drag the style sheet to a group of style items.
- To design all style items of the style which are compatible with the style sheet, drag the style sheet to an empty area in the style editor.

Requirement

- You have created a style.
- A version of the style is opened "in progress".

Apply style sheet to style item

1. Select the style sheet category in the "Style sheets > Categories" task card.
2. Select the required style sheet in the "Style sheets > Visual attributes" task card.
3. Drag the selected style sheet to a style item with drag&drop.



When you drop the style sheet on the style item, the style item applies the settings from the style sheet.

Note

There is no connection between the style item and the used style sheet. When you change the style sheet, the changes are not automatically applied in the style item. Apply the style sheet again to make the changes to the style sheet effective in the style item.

Note

Style sheets are not linked with screen objects. Unused or outdated style sheet versions are deleted by cleaning up or versioning the library.

Result

You have applied a style sheet to a style item in a style.

12.1.2 Working with objects and object groups

12.1.2.1 Working with objects

Overview of objects (Basic Panels)

Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Tools" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"
  The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"
  The elements include basic operator controls, e.g. "I/O field", "Button" or "Gauge".
- "Controls"
  The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.

- "Graphics"
  Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Operator controls
  - Flags
  - Buildings

  You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.
- "Libraries" task card
  In addition to the display and operating elements, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches".
  You can also store customized objects, and faceplates in user libraries.
  Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

Note

HMI device dependency

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

Basic objects

Symbol	Object	Instructions
	"Line"	-
	"Ellipse"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: "*.emf", "*.wmf", "*.dib", "*.bmp", "*.jpg", "*.jpeg", "*.gif" and "*.tif".

Elements

Symbol	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a function list, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.

Controls

Symbol	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"HTML Browser"[1)]	Displays HTML pages.
	"Recipe view"	Displays data records, and allows them to be edited.
	"System diagnostics view"	Provides an overview of all devices capable of diagnostics. Displays errors in the plant.

[1)]Available for Basic Panels 2nd Generation.

Introduction

Objects are graphics elements which you use to design the screens of your project.

The "Toolbox" task card contains all objects that can be used for the HMI device. Display the Task Card with menu command "View" by activating the "Task Card" option.

The toolbox contains various palettes, depending on the currently active editor. If the "Screens" editor is open, the toolbox contains the following palettes:

- "Basic objects"
  The basic objects include basic graphic objects such as "Line", "Circle", "Text field" or "Graphic view".
- "Elements"
  The elements include basic control elements, e.g. "I/O field", "Button" or "Gauge".
- "Controls"
  The controls provide advanced functions. They also represent process operations dynamically, for example Trend view and Recipe view.
- "Graphics"
  Graphics are broken down into subjects in the form of a directory tree structure. The various folders contain the following graphic illustrations:
  - Machine and plant areas
  - Measuring equipment
  - Operator controls
  - Flags
  - Buildings

  You can create links to your own graphic folders. The external graphics are located in these folders and subfolders. They are displayed in the toolbox and incorporated into the project using links.
- "Libraries" task card
  In addition to the display and operating objects, the library objects are available. They are located within the palettes of the "Libraries" task card. A library contains preconfigured objects such as graphics of pipes, pumps, or preconfigured buttons. You can also integrate multiple instances of library objects into your project without having to reconfigure them. The WinCC software package includes libraries, e.g. "HMI Buttons & Switches".
  You can also store customized objects, and faceplates in user libraries.
  Faceplates are objects that you create from existing screen objects, and for which you define the configurable properties.

Note

HMI device dependency

Some of the toolbox objects are either available with restricted functionality, or not at all. This depends on the HMI device you are configuring. Unavailable properties of an object are displayed as deactivated, and cannot be selected.

Basic objects

Icon	Object	Instructions
	"Line"	-
	"Polyline"	The polyline is an open object. Even if the start and end points have the same coordinates, the area they enclose cannot be filled in. If you want to fill a polygon, select the "Polygon" object.
	"Polygon"	-
	"Ellipsis"	-
	"Circle"	-
	"Rectangle"	-
	"Text field"	One or more lines of text. The font and layout are adjustable.
	"Graphic view"	Displays graphics from external graphic programs, and inserts OLE objects. The following graphic formats can be used: "*.emf", "*.wmf", "*.dib", "*.bmp", "*.jpg", "*.jpeg", "*.gif" and "*.tif".

Elements

Icon	Object	Instructions
	"I/O field"	Outputs the values of a tag, and/or writes values to a tag. You can define limits for the tag values shown in the I/O field. To hide the operator input in runtime, configure "Hidden input".
	"Button"	Executes a list of functions, or a script as configured.
	"Symbolic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A text from a text list is displayed in relation to the tag value.
	"Graphic I/O field"	Outputs the values of a tag, and/or writes values to a tag. A graphic from a graphics list is displayed in relation to the tag value.
	"Date/time field"	Outputs the system date and time, or the time and date from a tag. This allows the operator to enter new values. The display format is adjustable.
	"Bar"	The bar represents a value from the PLC in the form of a scaled bar graph.
	"Charge condition"	Shows the charge condition of the battery for Mobile Wireless

Icon	Object	Instructions
	"Switch"	Toggles between two defined states. You can label a switch with text, or a graphic.
	"Slider"	Displays a current value from the PLC, or sends a numeric value to the PLC.
	"Symbol library"	Used to add screen objects based on controls of the same name.
	"Effective range name"	Shows the name of the effective range.
	"Effective range name (RFID)"	Displays the name of the effective range (RFID).
	"Effective range signal"	Indicates how accurately the Mobile Panel Wireless is positioned within an effective range.
	"WLAN reception"	Indicates how good the WLAN radio connection is.
	"Gauge"	Displays numeric values. The appearance of the gauge is adjustable.
	"Zone name"	Displays the name of the zone.
	"Zone signal"	Indicates how accurately the Mobile Panel Wireless is positioned within a zone.
	"Clock"	Displays the system time in analog or digital format.

Controls

Icon	Object	Description
	"Alarm view"	Shows currently pending alarms or alarm events from the alarm buffer or alarm log.
	"Trend view"	Represents multiple curves with values from the PLC, or from a log.
	"User view"	Allows an administrator to administer users on the HMI device. It also allows an operator without administrator rights to change his password.
	"HTML browser"	Displays HTML pages.
	"Camera view"[1)]	Displays pictures from a connected network camera.
	"PDF view"	Displays PDF documents.
	"Watch table"	This function gives the operator direct read / write access from the HMI device to individual address areas in the connected SIMATIC S7.

Icon	Object	Description
	"Sm@rtClient view"	Allows an operator to monitor and maintain a connected device remotely.
	"Recipe view"	Displays data records, and allows them to be edited.
	"f(x) trend view"	Represents the values of a tag as a function of another tag.
	"System diagnostics view"	Provides an overview of all diagnostics capable devices. Displays errors in the plant.
	"PLC code view"[2]	Displays the PLC programs which have been programmed in the LAD or FBD programming languages.
	"GRAPH overview"[3]	Shows the current program status for executed steps of the PLC sequencer.
	"ProDiag overview"[3]	Indicates the current state of operand monitoring.
	"Media Player"	Media files are shown in the media player.

[1] Available for Comfort Panels and KTP Mobile Panels (as of device version V13).

[2] Available for WinCC Runtime Advanced (as of device version V14) and Comfort Panels and KTP Mobile Panels (as of device version V14 with a display size > 4").

Options for editing objects

Introduction

Objects are graphics elements which you use to design the screens of your project.

You have the following options for editing objects:

- Copying, pasting or deleting objects using the shortcut menu If you copy an object in a screen and the screen already includes an object of the same name, the name of the object is changed.
- Maintaining the standard size of the objects you are inserting or customizing their size on insertion.
- Moving an object in front of or behind other objects
- Rotating objects
- Mirroring objects
- Defining the tab sequence for objects
- Stamping: Inserting several objects of the same type
- Selecting several objects simultaneously
- Repositioning and resizing multiple objects
- You can assign external graphics to objects, e.g. in the Graphic View.
  You can view only the images you have previously stored in the graphic browser of your WinCC project.
  You can save graphics in the graphic browser:
  - Via drag & drop from the "Graphics" object group to the working area
  - As graphic files in the following formats: *.bmp, *.dib, *.ico, *.emf, *.wmf, *.gif, *.tif, *.jpeg or *.jpg
  - As an OLE object
    You either create a new OLE object or save an existing graphic file as an OLE object. To save an OLE object, an OLE-compatible graphics program must be installed on the configuration computer.

Inserting an object

Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

Note

Basic Panels

The "Reports" editor is not available for Basic Panels.

Requirement

The "Tools" task card is open.

Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.
   When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.
   The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set.
   This fixes all the points of the polygon or polyline.

Note

Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the icon in the toolbar of the "Tools" task card.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Deleting an object

Introduction

You can delete objects individually or with a multiple selection.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to delete.
   To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

Result

The selected objects are deleted.

Overview of objects (Page 5025)

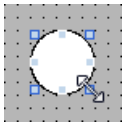
Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Positioning an object

Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.



Note

If the position is outside the work area the object is not displayed in Runtime.

Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you resposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

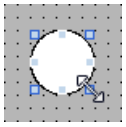
- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to move.
   The selected object is framed by a rectangle with resizing handles.



2. Left-click the object and keep the mouse button pressed.
3. Move the mouse pointer onto the new position.
   The contour of the object moves with the mouse and displays the new position for the object.

   The object initially remains at its original position.
4. Now release the mouse button.
   The object is moved into the position indicated by the contour of the selection rectangle.

Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

Result

The object appears at its new position.

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Resizing objects

Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

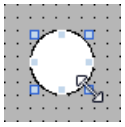
- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to resize.
   The selection rectangle appears. The following figure shows a selected object:



2. Drag a resizing contact of the rectangle to a new position.
   The size of the object changes.
   - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
   - Press <ALT> to disable this function while you drag the object.
     In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

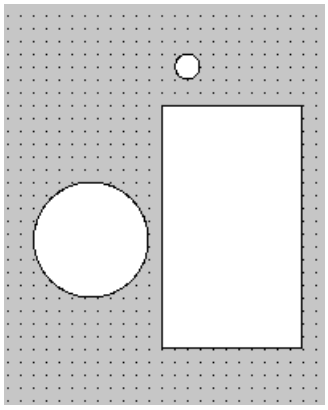
Alternative procedure

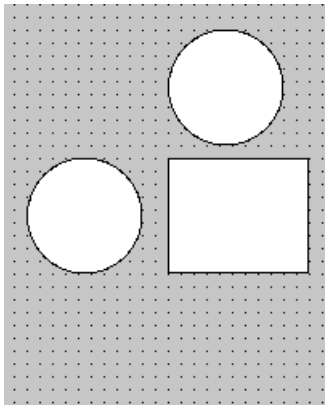
1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons: or or
   The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:





Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

Result

The object now appears with its new size.

Overview of objects (Page 5025)

Designing an object (Page 5042)

Aligning objects

Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.
   The selected objects will be aligned.

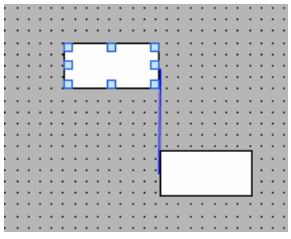
Aligning objects flush

The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.



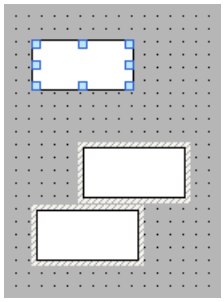
If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

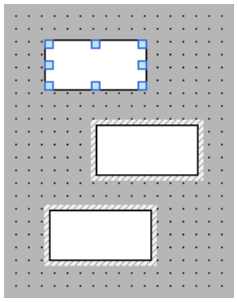
Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal".
   The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:





Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

Moving objects with keyboard shortcuts

Introduction

You can move the objects in the screen by using shortcut keys or select them by type.

Controlling objects with the keyboard

Function	Keyboard shortcut
Moves the selected screen object to the left to the first available vertical alignment position.	<Alt+Shift+Left>
Moves the selected screen object to the right to the first available vertical alignment position.	<Alt+Shift+Right>
Moves the selected screen object up to the first available horizontal alignment position.	<Alt+Shift+Up>
Moves the selected screen object down to the first available horizontal alignment position.	<Alt+Shift+Down>
Selects all screen objects of this type.	<Ctrl+Shift+A>
Selects all objects that support the use styles.	<Ctrl+Shift+D>

Moving an object forwards or backwards

Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

Note

ActiveX controls are always positioned in front of an object layer (.NET property).

Requirement

You have opened a screen which contains a layer with multiple objects.

Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.
3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

Result

The object is moved up or down.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Showing objects outside the screen area

Introduction

If you assign objects to positions that are outside the configurable area, these objects will be hidden. The functions of the "Objects outside the visible area" palette in the "Layout" task card are used to move these objects back into the screen.

Requirement

- You have opened a screen which contains objects that are outside the configurable area.
- The "Layout" task card is open.

Procedure

1. Open the "Layout > Objects outside the area" task card.
   This displays a list of objects that are outside the configurable area.
2. Select the the object which you want to move back into the screen from the list.
3. Select "Move to screen" in the object shortcut menu.

Alternatively open the "Layout > Layer" task card. Objects outside the area are indicated by the icon. If you click this icon, the object is moved back into the screen.

Result

The objects are moved to the configurable area.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Rotating objects

Introduction

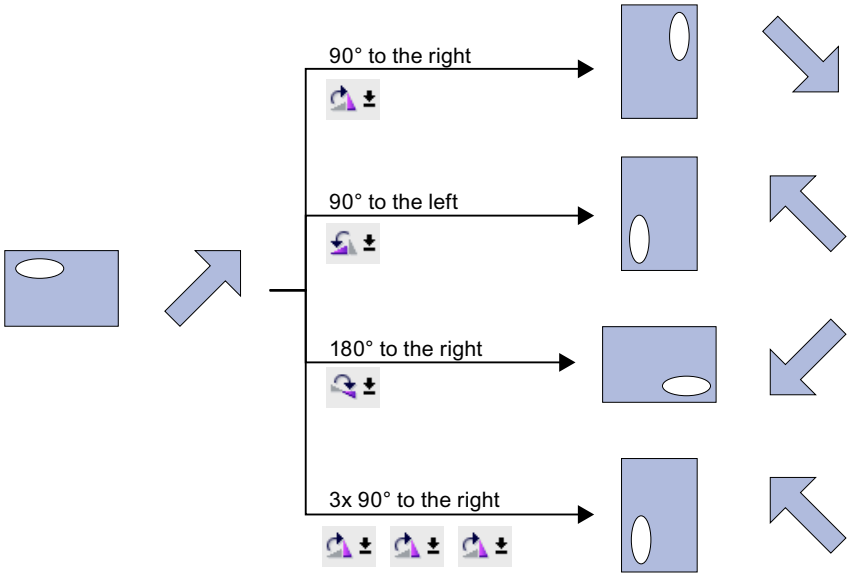
You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:



Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
   , to rotate the object clockwise around its center point. The angle of rotation is 90°.
   , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
   , to rotate the object clockwise by 180°.

Result

The object is shown at its new angle.

Overview of objects (Page 5025)

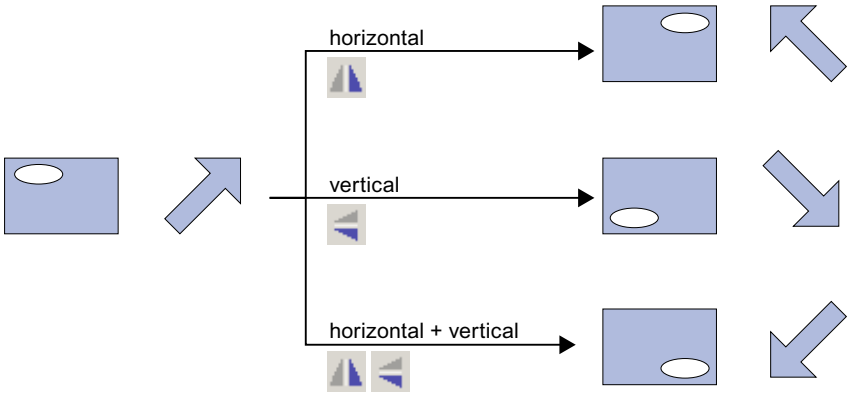
Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Flipping objects

Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.



Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
   - , to flip the selected object along its vertical center axis.
   - , to flip the selected object along its horizontal center axis.

Result

The object is shown at its flipped position.

Designing an object (Page 5042)

Flashing (Panels, RT Advanced)

Introduction

You want an object to flash in Runtime.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to flash.
2. In the Inspector window, select the type "Standard enabled" under "Properties > Properties > Flashing".

Result

The object flashes in runtime.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Designing an object

Introduction

You design the border and background of an object.

Requirements

A line has been created in a screen.

Procedure

1. Select the line on your screen.
2. In the Inspector window, select "Properties > Properties > Appearance":
3. Select "Dash" as the style.
4. To display the dashed line in two colors, select the line width "1".
5. Select the setting "Arrow" in the "Line ends" area.

Result

The line is displayed in two colors as a dashed line. The end of the line is an arrow.

Designing the fill pattern

Introduction

WinCC lets you design the background color and the fill pattern of an object. The design options change in the Inspector window depending on object for which you are making the filling pattern.

For certain objects, you can not only define the color, but also a transparent background or a background with a color gradient.

Note

Device-specific nature of the properties

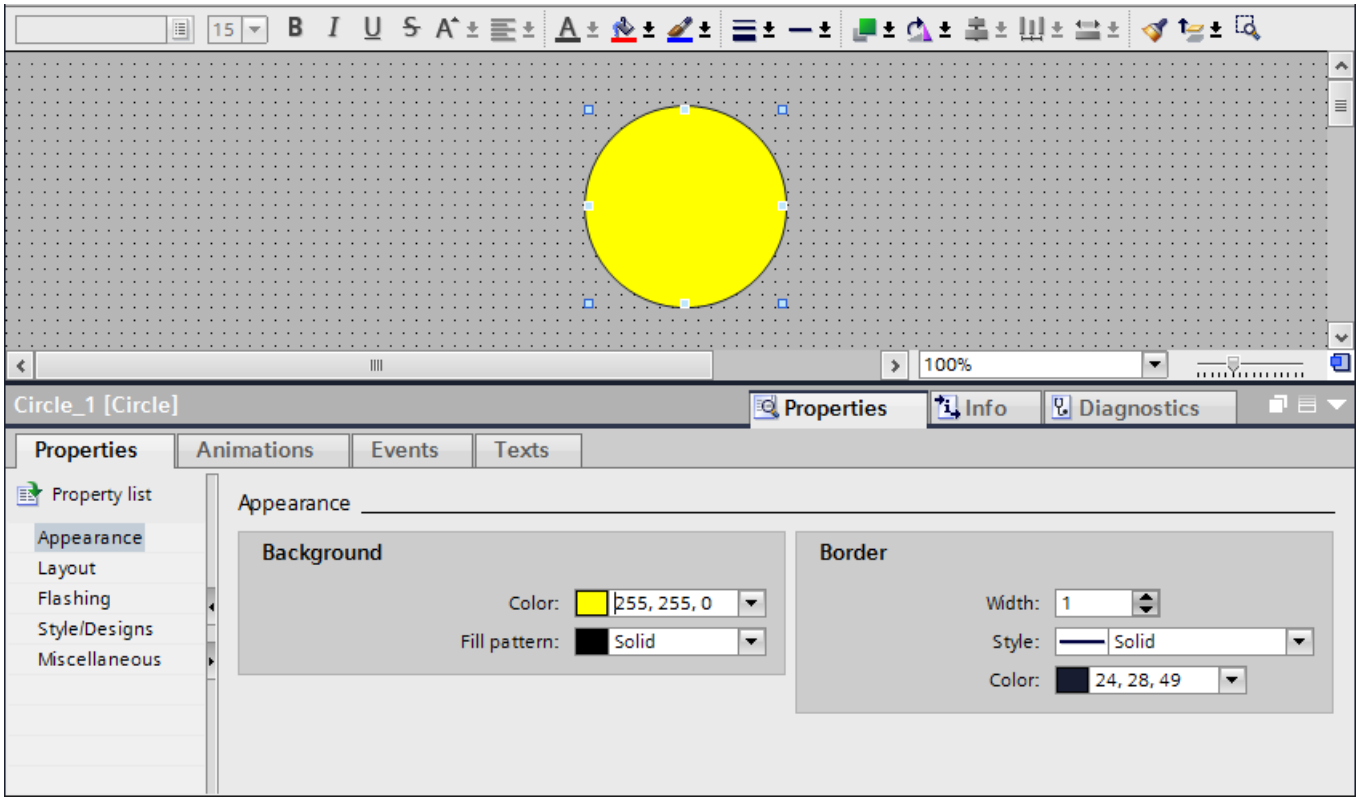
The fill style that is available depends on the object and the HMI device used.

Requirement

The object has been created and selected.

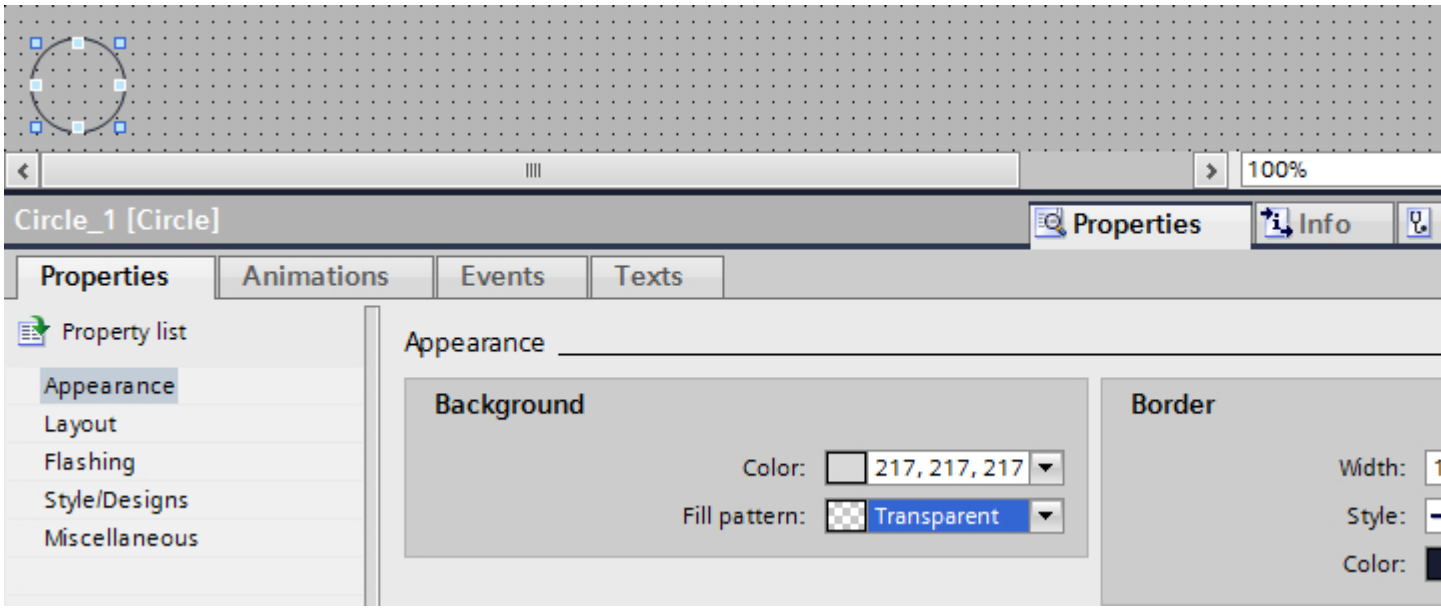
Designing the background color of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. Select a color for the background of the object, for example, yellow.
   The object is filled with the selected color.



Designing the fill pattern of an object

1. In the Inspector window, select "Properties > Properties > Appearance".
2. To define a transparent background for the object, select transparent.
   You can find information about designing a fill pattern with a color gradient in the section Defining color gradients (Page 5054).
   The object is shown as transparent.



You can optionally set the fill pattern in the Inspector window under "Properties > Properties > Fill Pattern".

See also

Defining color gradients (Page 5054)

Configuring ranges

Introduction

As of WinCC V14, you have the option of defining up to five value ranges for the "Gauge", "Bar" and "Slider" objects and configuring them centrally in a process tag. This means you can, for example, distinguish between different operating states with different colors. To display the ranges defined in the tag in the screen object, activate the option "Display ranges of tags" in the Inspector window under "Properties > Limits/Ranges".

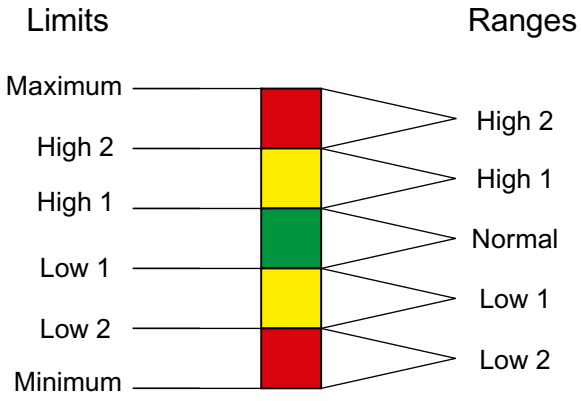
This setting is not available for display with inner scale, for example, the option "Layout with inner bar" must be cleared for the bar.

You define the following five ranges:

Limit/range	Use
Upper 2	Displays the high danger range.
Upper 1	Displays the high warning range.
Normal	Displays the normal range.
Lower 1	Displays the low warning range.
Lower 2	Displays the low danger range.

Limits/ranges

You specify limits for numerical values to restrict the value range. This range is defined by a high limit and a low limit. You specify the use and color of ranges as well as the maximum and minimum values at the screen object.



Additional information on limits is available under "Defining limits for a tag".

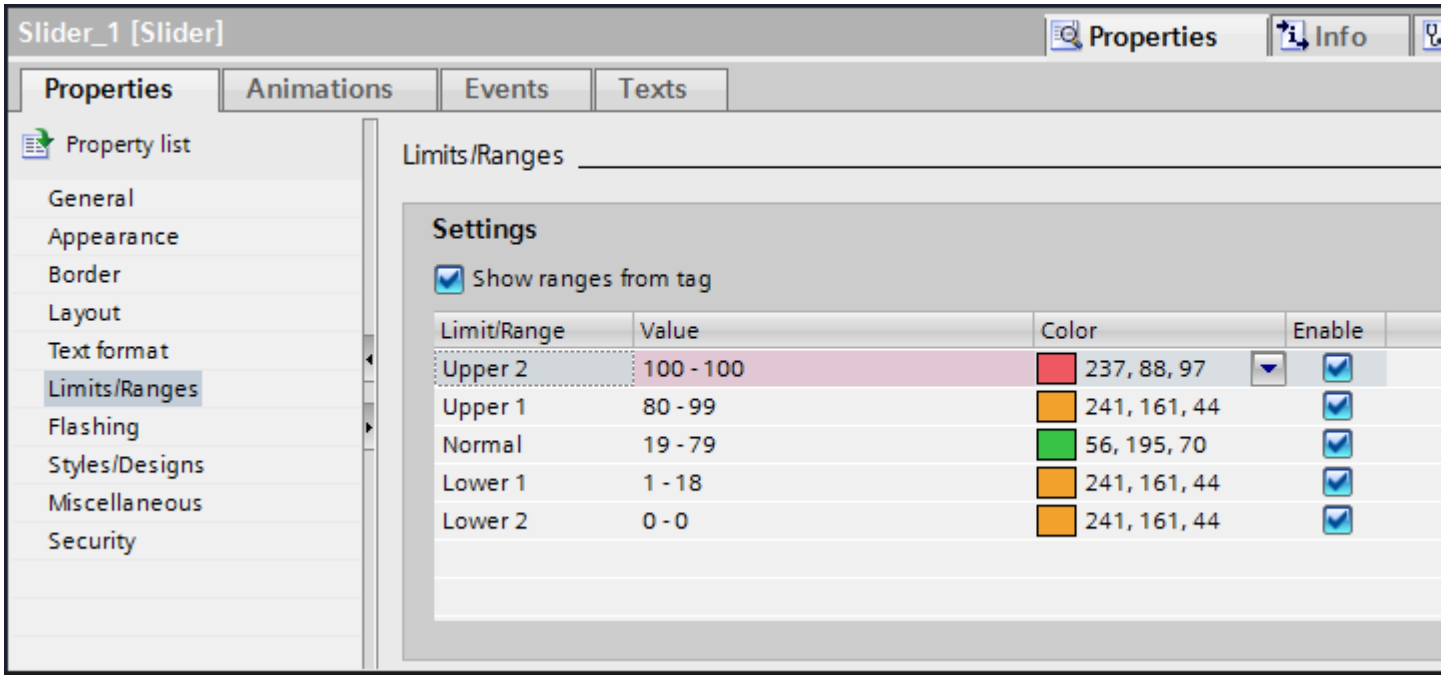
Requirements

- You have created at least one tag.
- You have defined four ranges at the tag.
- You have created the screen object.

Configuring ranges

1. Specify the tag that defines the ranges for the screen object under "Properties > General > Process tag".
2. If necessary, specify the values for maximum and minimum.

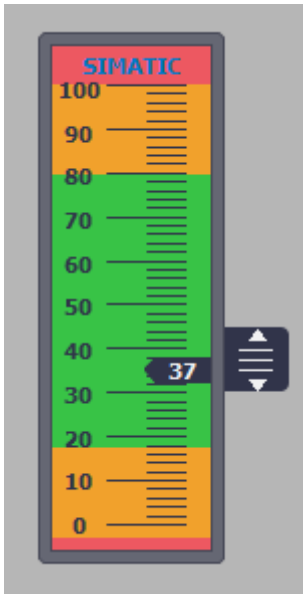
3. Select the option "Display ranges of tags" under "Properties > Limits/Ranges".



4. Specify which ranges are displayed in the object.
5. You can change the default colors for the ranges, if required.

Result

You have configured ranges in a screen object. The ranges are displayed in different configured colors in Runtime.



Formatting text in an object

Introduction

Some objects, for example, the I/O field, support text within the object.

You have several options to align text.

Configuring the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value "5" for the left border, for example.

The text is aligned five pixels from the left border of the object.

Aligning the text position

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the horizontal alignment, for example, centered.
3. Select the vertical alignment, for example, top.
   The text is shown at the top center in the object.

Defining the text orientation

1. In the Inspector window, select "Properties > Properties > Text format".
2. Select the orientation of the text, for example, vertical, right.
   The text flow is shown from bottom to top.

Formatting graphics in an object

Introduction

WinCC lets you insert graphics into some objects and format them. You can change the size, orientation and distances of a graphic to the object border. You change the properties of the graphic in the Inspector window of the relevant object.

Requirement

- The selected object is in graphic mode.
- The selected object contains at least one graphic.

Resizing a graphic

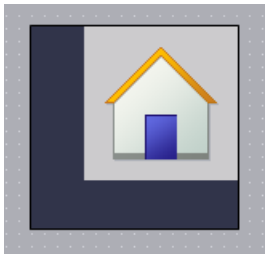
1. In the Inspector window, select "Properties > Properties > Layout".
2. Select "No stretching of picture" or "Stretch picture".
   The contained graphic is displayed in its original size or stretched to the size of the object.

Note

To adjust the object size to the contained graphic, select "Fit object to contents".

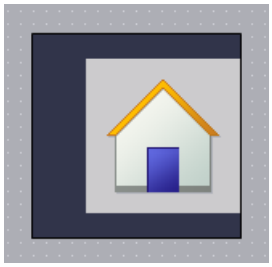
Aligning a graphic horizontally and vertically

1. In the Inspector window, select "Properties > Properties > Layout".
2. To determine the horizontal position of the graphic, select "Right", for example.
3. To determine the vertical position of the graphic, select "Top", for example.
   The graphic is then shown at the top right of the object.



Defining the distance from the object border

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the value for the distance to the object border, for example, "20" for the top border.
   The graphic is shown with a distance of 20 pixels to the top border of the object.



Icon	Description
	Sets the distance from the left border of the object.
	Sets the distance from the right border of the object.
	Sets the distance from the top border of the object.
	Sets the distance from the bottom border of the object.

Connecting tags and text lists in the text (RT Advanced)

Introduction

Comfort Panels and WinCC Runtime Advanced give you the option to add output fields for tags or entries to a text list for the following objects:

- Symbolic I/O field
- Text field

Note

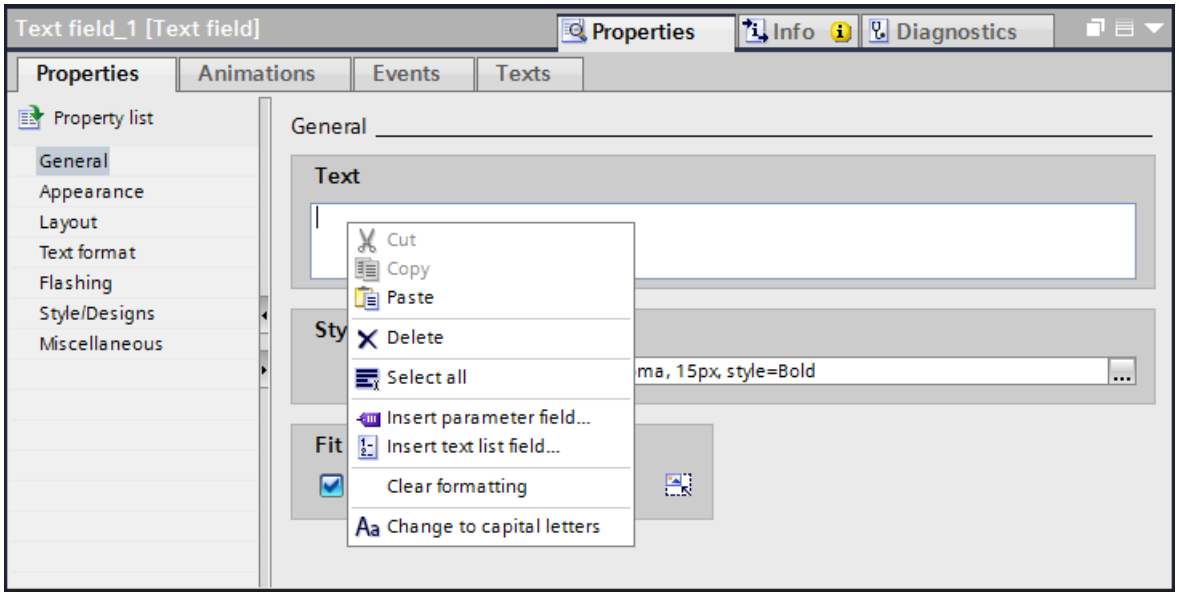
The symbolic I/O field supports the connection of tags and text list entries in the "Two states" mode.

Requirement

- The object has been created and selected

Connecting tags in a text field

1. Open "Properties > Properties > General" in the inspector window.
2. Open the shortcut menu of the input field.



3. Select the command "Insert parameter field ...".
   A dialog opens.
4. Select the tag and the format in which you want to display the tag.
5. Confirm your entries.

The name of the connected tag is displayed in the text field of the object.

Connecting the text list

1. Open "Properties > Properties > General" in the inspector window.
2. Open the shortcut menu of the input field.
3. Select the command "Insert text list field ...".
   A dialog opens.
4. Select the text list from which a text entry is displayed.
5. Confirm your entries.

The reference to the text list entry is displayed in the text field of the object.

Note

The number of references to text list entries that in turn include references to text list entries or tags is limited to three layers.

Designing a border

Introduction

WinCC offers various properties for designing display and operating objects.

The I/O field example below shows the possible settings for designing borders.

You change the appearance in the Inspector window of the relevant object.

Designing a border

1. Open "Properties > Properties > Appearance".
2. Select the width of the border, e.g. "5".
3. Select the style of the border, e.g. double line.
4. Select the foreground color.
5. Select the background color.

Figure 12-1 "Double line" border style

Border style

The figure below shows a border in "3D style".

The figure below shows a border in "Solid" style.

Note

Device-specific nature of the properties

The border style that is available depends on the object and the HMI device used.

Designing table-based objects

Introduction

WinCC offers various properties for designing display and operating objects.

You change the properties of table-based objects in the Inspector window of the relevant object.

Designing colors

Select the colors for font, selections and areas under "Properties > Properties > Appearance".

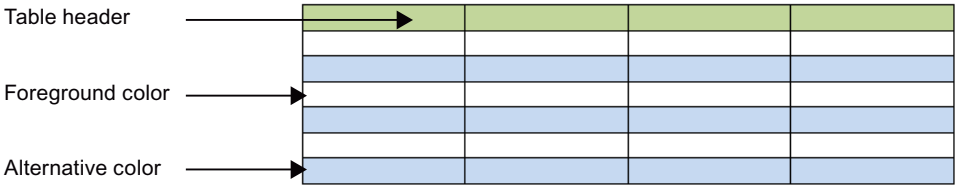


Figure 12-2 Selecting table properties

Designing the border of the table header

1. In the Inspector window, open "Properties > Properties > Table header border".
2. Select "Solid", for example, as the style.
3. Select 5, for example, as the "Width".
4. Select red, for example, as a foreground color.

The border of the table header is shown with a red border and width of 5 pixels. With "Solid" border style, only the foreground color is visible.

Colors and color gradient in the table header

1. Select the table-based object in the screen.
2. In the Inspector window, open "Properties > Properties > Table header fill pattern".
3. Select the fill pattern, for example "Horizontal gradient".
4. Select a background color, for example, blue, under "Gradient".
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, white.
7. Select a "Width" for the color gradient, for example, 12.
8. Activate Gradient 2.
9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10

The table header is displayed with a color gradient.

Defining color gradients

Introduction

For the objects in WinCC, color gradients can be specified as background for various surfaces.

Change the category in the Inspector window, depending on which surface you fill with a color gradient. The procedure remains the same.

The following section describes how to configure the color gradient of buttons.

Horizontal color gradient with two colors

1. Select an object with buttons, for example, a button.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select "Fill Pattern > Horizontal gradient".
4. Select a background color for the vertical color gradient, for example, orange.
5. Activate "Gradient 1".
6. Select a "Color" for Gradient 1, for example, red.
7. Select a "Width" for Gradient 1, for example, "10".

The background of the button is displayed in orange.

For the horizontal color gradient, Gradient 1 is shown from the left border. Gradient 1 is 10 pixels wide.

Vertical color gradient with three colors

1. Select a button in the screen.
2. In the Inspector window, select "Properties > Properties > Fill Pattern".
3. Select the "Vertical gradient" background.
4. Select a background color under "Gradient", for example, orange.
5. Activate "Gradient 1".
6. Select a color for "Gradient 1", for example, red.
7. Select a "Width" for the color gradient, for example, 8.
8. Activate Gradient 2.

9. Select a color for Gradient 2, for example, yellow.
10. Select a "Width" for the color gradient, for example, 10.

	← Color Gradient 1
	← Background color
	← Color Gradient 2

For the vertical color gradient, Gradient 1 is shown from top to bottom. Gradient 1 is 8 pixels wide.

The background of the button is displayed in orange.

Gradient 2 is shown at the bottom border. Gradient 2 is 10 pixels wide.

Specifying scroll bars

You can use the scroll bars for navigation in the table-based objects:

- Use the scroll arrows to scroll line by line either up or down or from left to right in the view.
- Use the scroll box in the scroll bar to scroll slowly to the required position in an object.
- Click on the scroll box to navigate quickly in the object through a large volume of data.

Note

On HMI devices with keys, you can move the scroll bar with arrow keys.

In pop-up screens, use <ALT>+<arrow key> to scroll.

In WinCC version V14 and higher, you can configure different colors for the scroll bars.

Scrolling in controls

Two scroll display options are available under "Runtime settings > Screens > Scrolling in controls":

- Scroll bar with scroll arrows for devices with device version V14 or higher
  The scroll bar is displayed in the screen object with scroll arrows and scroll box.
- Scroll indicator
  A scroll indicator is shown in the screen object

In the Engineering System, you can see the scroll preview in all controls with the exception of HTML browser, PDF display and NC partial program display.

Note

The display of scroll indicators is not supported in the PLC code display or in the pop-up screens.

Showing all data

The scroll bars are used to display content in limited space on the screen. Please remember in configuration that the scroll bars themselves take up space in the control. The width and height of the scroll bars vary depending on the screen resolution.

If you configure a control to display just a few lines, the scroll bars may cover the content in runtime. To avoid hiding the data, take account of the scroll bars in configuration.

Note

When configuring the user display, avoid the setting "Fit object to contents". This setting calculates the object size in runtime automatically and cannot be changed.

Configuring scroll bar colors

You can configure the color of the scroll bar in conjunction with other colors for certain objects.

- The scroll bar arrows and scroll box are shown in the text color of the table
- The scroll bar background color is the alternative color of the table

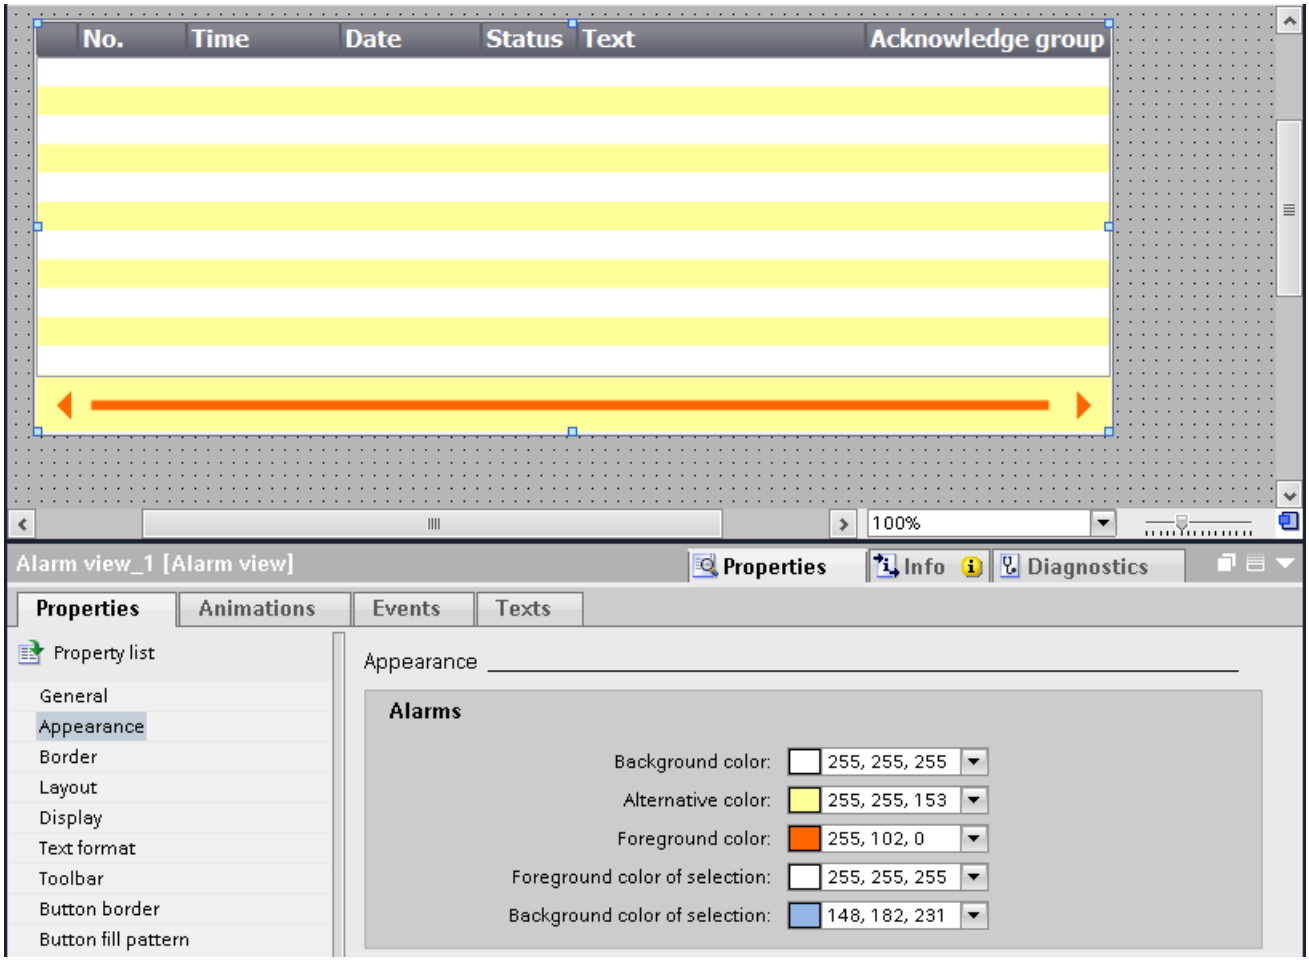
Note

In the objects graphic I/O field, HTML browser, PDF display and file browser, the scroll bar colors cannot be changed.

Example

This example shows the configuration of scroll bar colors for an alarm view.

1. Open "Properties > Properties > Appearance".
2. Select a color for the table foreground, for example "blue" for the scroll arrows and the scroll box in the scroll bar.
3. Select the alternative color, for example "yellow" for the even rows in the table and the background of the scroll bar.
   The scroll bar is displayed in the configured colors.



Using predefined styles

Introduction

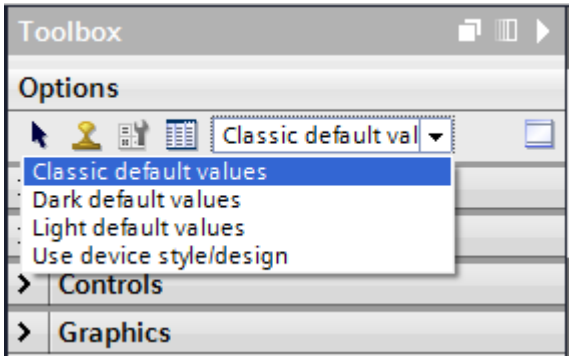
You can assign predefined styles to objects and faceplates in Runtime. You can change the background color of the display and operating elements using predefined styles. In this way, you harmonize the display in Runtime.

Requirement

The "Tools" task card is open.

Setting predefined styles

1. Select the object that you want to insert in the "Toolbox" task card.
2. Select one of the following options in the "Toolbox" task card:
   - "Classic default values" to use the default style
   - "Dark default values" to use the dark color scheme
   - "Light default values" to use the light color scheme
   - "Use device style/design" to use the settings from the current device design



3. Insert the required object in the work area.
   The object is displayed in the selected style.
4. The objects are created in the selected style as long as the style remains activated in the toolbar.
   To return to the default style, select the "Default" option in the toolbar.

See also

Working with styles and style sheets (Page 5006)

Inserting multiple objects of the same type (stamping)

Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

Requirement

The "Tools" task card is open.

Inserting several objects of one type

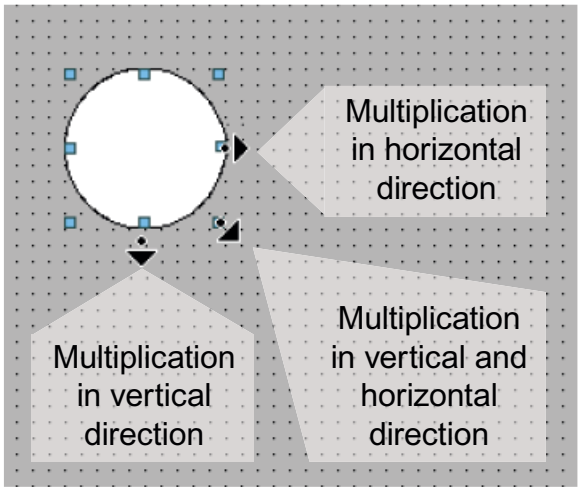
1. Select the object that you want to insert in the "Tools" task card.
2. Click the icon in the toolbar of the "Tools" task card.
   The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.
   To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.
   The object is inserted in the work area as soon as you release the mouse button.
4. Repeat step 3 to insert further objects of the same type.
5. Click the icon again.
   The "Stamp" function is deactivated.

Note

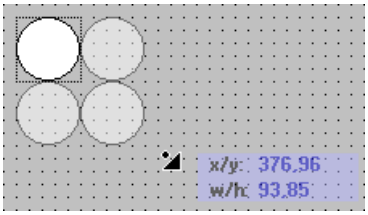
You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.



3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.



Result

You have pasted and stamped an object in a screen.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Selecting multiple objects

Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

Selection frame of a multiple selection

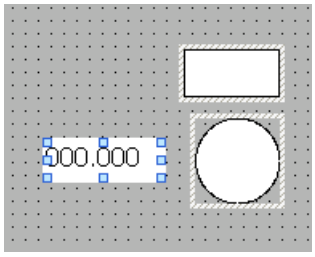
The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:



You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

Requirement

You have opened the work area containing at least two objects.

Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
2. Click the relevant objects, working in succession.
   All the selected objects are identified by frames.
   The object selected first is identified as reference object.

Note

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

Result

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size
- Moving all the objects in one group
- Aligning the objects to the reference object

See also

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Repositioning and resizing multiple objects

Possible modifications

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

Overview of objects (Page 5025)

Designing an object (Page 5042)

Managing own controls (RT Advanced, RT Professional)

Introduction

You can use your own controls in the WinCC editions "WinCC Advanced" and "WinCC Professional". Add standardized or user-defined controls in the "Toolbox > My Controls" task card. All the ActiveX controls registered in the operating system and the .Net controls on your system are available for use in WinCC.

- ActiveX controls
  ActiveX controls are operator controls from any providers, which can be used by other programs over a defined OLE-based interface.
- .Net controls
  .Net controls are operator controls from any providers based on the Microsoft .Net Framework.
- Custom .Net controls
  .Net controls are operator controls from any providers based on the Microsoft .Net Framework.

When you intend to run external controls in your WinCC project, you need to verify that these run on the HMI device you are configuring. If you are using controls from third parties, you

must first of all add these to the "My controls" palette before you copy the project to different PCs.

Note

Only the simple .Net controls are supported by the TIA Portal. XAML controls, for example, WPF (Windows Presentation Foundation) controls, are not supported in the TIA Portal.

If you use any controls that are not included in the product package (for example, from third parties), errors may occur, for example, reduced performance or system crashes.

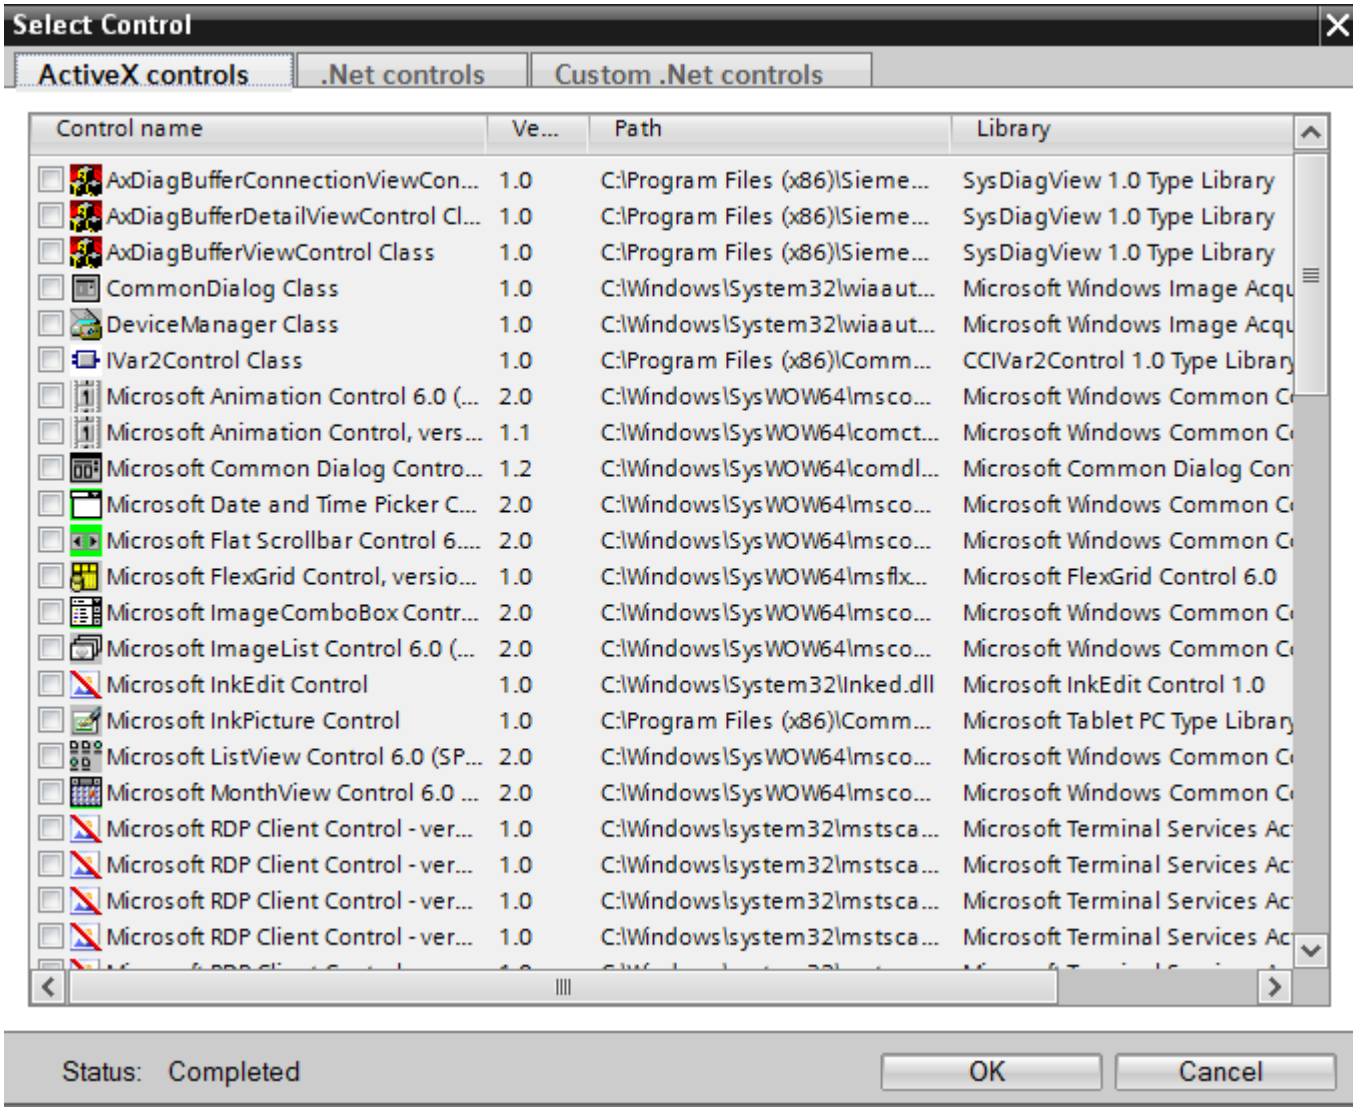
The user of such control software is alone responsible for any problems caused by its use. We therefore advise you to closely examine such elements prior to their use.

Requirements

- The required ActiveX control is installed in the PC's operating system.
- The desired .Net control is available on the PC in an assembly.
- A screen is open.
- The "Toolbox" task card is open.

Adding a new control to the "My controls" group

1. Open "Toolbox > My controls" in the "Toolbox" task card.
2. Select "Select objects" from the shortcut menu.
   A dialog opens. This contains all the controls available on the system. Controls that already exist in the "Toolbox" task card are identified by a check mark.



3. Select the desired tab, e.g. ActiveX controls.
4. Activate the required control.
5. Confirm your selection with "OK".

Inserting a custom .Net control in the "My controls" group

1. Select the "Custom .Net controls" tab. The list is empty the first time you select the tab.
2. Click the "…" button.

3. Select the folder in which the assembly is contained.
4. Select a file.
5. Click "Open." All the available controls are displayed in the "Custom .Net controls" tab.
6. Activate the required .Net control.
7. Confirm your selection with "OK".

Note

.Net controls in Runtime Advanced

If you have incorporated a .Net control in your project as "Custom .Net control", you have to copy the files belonging to these controls to the installation directory of WinCC Runtime, e.g. "C:\ProgramFiles\Siemens\Automation\WinCC RT Advanced". Otherwise, the control cannot be loaded in Runtime.

Result

The control now appears in the "Toolbox > My controls" task card and can be configured in a screen.

Removing a control from the "My controls" group

1. Select "Delete" from the shortcut menu for the control concerned.
   The control is removed from the "My controls" group.

Synchronization of the ActiveX controls

Changes to properties of ActiveX controls are only saved if the control synchronizes the OCXState property correctly in the case of changes.

For controls such as "Microsoft Date and Time Picker Control" that do not synchronize the OCXState property correctly, the changes are discarded after the screen is closed, during compilation or after the migration.

Designing an object (Page 5042)

External graphics

Introduction

You can use graphics created with an external graphic program in WinCC. To use these graphics you store them in the graphic browser of the WinCC project.

You can save graphics in the graphic browser:

- When you drag-and-drop graphics objects from the "Graphics" pane into the work area, these are stored automatically in the graphic browser. The graphic names are numbered in the order of their creation, for example, "Graphic_1." Use the <F2> function key to rename the graphic.
- As a graphic file with the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.png, *.jpeg or *.jpg
- As an OLE object that is embedded in WinCC and is linked to an external graphic editor. In the case of an OLE link, you open the external graphic editor from WinCC. The linked object is edited using the graphic editor. An OLE link only works if the external graphic editor is installed on your PC, and supports OLE.

Use of graphics from the graphic browser

Graphics from the graphic browser are used in your screens:

- In a Graphic view
- In a graphics list
- As labeling for a button/function key

Transparent graphics

In WinCC you also use graphics with a transparent background. When a graphic with a transparent background is inserted into a graphic object of WinCC, the transparency is replaced by the background color specified for the graphic object. The selected background color is linked firmly with the graphic. If you use the graphic in another graphic object of WinCC, this object is displayed with the same background color as the graphic object that was configured first. If you want to use the graphic with different background colors, include this graphic in the graphic browser again under a different name. The additional background color is configured when the graphic is used at the corresponding graphic object of WinCC.

Managing graphics

An extensive collection of graphics, icons and symbols is installed with WinCC, for example:

In the Toolbox window of the "Graphic" pane the graphic objects are structured by topic in the "WinCC graphics folder." The link to the WinCC graphics folder cannot be removed, edited or renamed.

The "Graphics" pane is also used to manage the external graphics. The following possibilities are available:

- Creating links to graphics folders
  The external graphic objects in this folder, and in the subfolders, are displayed in the toolbox and are thus integrated in the project.
- Editing folder links
- You open the program required for editing of the external graphic in WinCC.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Managing external graphics

Introduction

External graphics that you want to use in WinCC are managed in the "Screens" editor by using the "Tools" task card in the "Graphics" pane.

Requirement

- The "Screens" editor is open.
- The "Tools" task card is open.
- The graphics are available.
- The graphics have the following formats:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tif, *.jpeg or *.jpg

Creating a folder link

1. Click "My graphics folder."
2. Select "Link" in the shortcut menu.
   The "Create link to folder" dialog is opened. The dialog suggests a name for the folder link.
3. Edit the name as required. Select the path containing the graphic objects.
4. Click "OK" to confirm your input.
   The new folder link is added to the "Graphics" object group. The external graphics that are located in the target folder and in sub-folders are displayed in the toolbox.

Editing folder links

1. Select the folder link to edit.
2. Select the "Edit link..." command from the shortcut menu.
   The "Create link to folder" dialog is opened.
3. Edit the name and path of the folder link as required.
4. Click "OK" to confirm your input.

Renaming the folder link

1. Select the folder link to rename.
2. Select "Rename" from the shortcut menu.
3. Assign a name to the new folder link.

Removing a folder link

1. Select the folder link you want to delete.
2. Select "Remove" in the shortcut menu.

Edit external graphics

1. Select the graphic you want to edit.
2. Select the "Edit graphic" command from the shortcut menu.
   This opens the screen editor associated with the graphic object file.

Editing graphics folders from WinCC

1. Select the graphic you want to edit.
2. Select the "Open parent folder" command from the shortcut menu.
   The Windows Explorer opens.

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

Storing an external image in the graphics library

Introduction

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

Requirement

- A screen has been created.
- A Graphic View is inserted in the screen.
- The Inspector window of the Graphic view is open.

To store an external graphic in the image browser:

- A graphic is available.

To store an OLE object in the browser:

- An OLE-compatible graphics program is installed on your configuration computer.

Save graphics file

1. Open the Windows Explorer.
2. Select the graphic that you want to store.
3. Drag-and-drop the graphic into the graphic browser.

Creating and saving a new graphic as an OLE object

1. Select the Graphic view on your screen.
2. In the Inspector window, select "Properties > Properties > General":
3. Open the graphic selection list.
4. Click .
5. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

6. From the "Insert object" dialog box, select "New" and an object type. The settings in "Settings > "OLE settings" determine which object types are shown.
7. Click "OK." The associated graphic program is opened.
   When you are finished creating graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC."
   The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

Inserting created graphics in WinCC

Note

A new graphic object created as OLE object may not be directly accepted in WinCC when you save it to an external graphics program.

1. Reopen the dialog for inserting a graphic.
2. From the "Insert object" dialog box, select "Create from file."
3. Click the "Browse" button.
4. Navigate to the created graphic and select it.

Saving an existing graphic object as an OLE object

1. In the Inspector window, select "Properties > Properties > General":
2. Open the graphic selection list.
3. Click .
4. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

5. From the "Insert object" dialog box, select "Create from file."
6. Click the "Browse" button.
7. Use the dialog to help you navigate to the folder in which the graphic file is saved.

   Note

   To import graphics files, note the following size restrictions:

   *.bmp, *.tif, *.emf, *.wmf ≤4 MB

   *.jpg, *.jpeg, *.ico, *.gif "*≤1 MB

Result

The image file is now stored in your image browser. It is shown in a screen with a Graphic view , or is added as a list element in an image list.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor. When you have finished editing graphics, end the graphic programming software with "File > Close" or "File > Close & return to WinCC." The changes are applied to WinCC.

Example: Configuring a rectangle (Page 5081)

Designing an object (Page 5042)

12.1.2.2 Working with object groups

Basics on groups

Introduction

Groups are several objects that are grouped together with the "Group" function. You edit a group in the same way as any other object.

Overview

WinCC offers the following methods for editing multiple objects:

- Multiple selection
- Grouping objects

Editing mode

To edit an individual object in a group, select the object in the "Layout > Layers" task card.

Alternatively select "Group > Edit group" in the object group's shortcut menu.

Hierarchical groups

You add further objects or groups to extend a group. The group is enlarged by the new objects and is structured hierarchically in main and sub-groups. Such hierarchical groups must be broken up in stages. You also break up the group in the same order in which you grouped the objects or groups. It takes exactly the same number of steps to break up these hierarchical groups as it did to create them.

Rectangle surrounding the object

Only one surrounding rectangle is now displayed for the whole group. The surrounding rectangles of all objects are displayed for a multiple selection on the other hand.

Layers

All objects of a group are located in the same layer.

Properties of a group

A group has its own properties, such as authorization. If you set a property at a group, all objects of the group inherit this setting. If the same property is configured differently at an object in the group, the value of the property at the object and not the value in the group applies in Runtime.

Grouping objects (Page 5072)

Ungroup (Page 5073)

Adding objects to a group (Page 5074)

Removing objects from the group (Page 5075)

Editing an object in a group (Page 5076)

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Grouping objects

Introduction

The "Group" command combines multiple objects to form a group.

You can change the size and position of the group. The following rules apply:

- The system automatically adapts the position coordinates of the grouped objects when you reposition the group. The relative position of the grouped objects to the group is not affected.
- The system automatically adapts the height and width of the grouped objects in proportion to a change of the group size.
- To change the size of the group proportionately, hold down the <Shift> key and drag the rectangle around the object until has the required size.

Note

To create a hierarchical group, organize the individual groups like objects.

Requirement

- You have opened a screen which contains at least two objects.

Creating object groups

1. Select all the objects you want to organize in a group.
2. Select the command "Group > Group" from the shortcut menu.

The objects of the group are displayed with a rectangle around the objects.

Grouping objects within a group

1. Select the group you want to edit.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group that you are editing is highlighted by a red frame.

3. Select the objects of a group that you want to combine into a subgroup.
4. Select the command "Group > Group" from the shortcut menu.

A subgroup with the objects is created.

Adding objects into an existing group

1. Select the group to which you want to add objects.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

The object is added to this group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

Result

The selected objects are combined in a group. The multiple selection rectangle becomes the rectangle surroundings the objects in the group. The handles are shown only for the group. The group in in the active layer.

See also

Basics on groups (Page 5071)

Example: Configuring a rectangle (Page 5081)

Ungroup

Introduction

Select the "Ungroup" command to split a group into the original object fractions.

Requirement

- You have opened a screen that contains a group.

Ungroup

1. Select the group.
2. Select the "Group > Ungroup" command from the shortcut menu.

Ungrouping a group within a group

1. Select the higher-level group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group that you are editing is highlighted by a red frame.
3. Select the lower-level group.
4. Select the "Group > Ungroup" command from the shortcut menu.

Result

The lower-level group is ungrouped. The objects are assigned to the next higher group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

See also

Basics on groups (Page 5071)

Example: Configuring a rectangle (Page 5081)

Adding objects to a group

Introduction

The "Add objects to group" command is used to add objects to a group, without ungrouping it first.

Requirements

A screen with one group and at least one other object is opened.

Procedure

1. Select the group.
2. Press the <Shift> key and select the object you want to add to the group.
3. Select the "Group > Add to group" command from the shortcut menu.

Result

The group consists of the original objects, and the newly-added objects. The added objects are arranged at the front of the group.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag&drop you can also easily edit hierarchical groups in the "Layers" palette.

See also

Basics on groups (Page 5071)

Example: Configuring a rectangle (Page 5081)

Removing objects from the group

Introduction

You use the "Remove objects from group" command to remove individual objects from a group, without ungrouping it first.

You do not have to remove the object from the group to edit an object in a group. You can edit the objects of a group individually.

Requirement

- You have opened a screen that contains a group.

Removing objects from a group

To remove an object from a group:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group you want to edit is highlighted by a red frame.
3. Select all objects in the group that you want to remove from the group.
4. Select the "Group > Remove from group" command from the shortcut menu.

The objects are removed from the group.

Note

If there are only two objects in the group, the menu command "Remove from group" is not available.

Deleting objects from a group

To remove an object from the group, and from the screen:

1. Select the group.
2. Select the command "Group > Edit group" from the shortcut menu.
   The group you want to edit is highlighted by a red frame.
3. Select the objects in the group that you want to delete.
4. Select "Delete" from the shortcut menu.

Note

If there are only two objects in the group, the menu command "Delete" is not available.

Alternative procedure

You can also edit groups in the "Layout" task card. Using drag-and-drop you can also easily edit nested groups in the "Layers" pane.

See also

Basics on groups (Page 5071)

Example: Configuring a rectangle (Page 5081)

Editing an object in a group

Introduction

You can edit the objects of a group individually.

Requirement

You have opened a screen that contains a group.

Editing grouped objects

1. Select the group.

   The properties of the group are displayed in the Inspector window.
2. Change the position and size of the grouped objects in "Properties > Properties >Layout."
3. Change the name of the group in "Properties > Properties > Miscellaneous."

Modifying the properties of an object within a group

1. Select the group.
2. Select the object whose properties you want to change in the Inspector window.

   The properties of the object are displayed.
3. Change the object properties.

Note

The dynamization of properties for all objects of the group which have these properties is not possible in a group. You can only dynamize the properties of the objects associated with a group for each object itself.

Result

Although you have edited the object, it is still an element of the group. These changes do not affect the other objects of the group.

12.1.2.3 Configuring the keyboard access

Overview of keyboard access (Basic Panels, Panels, RT Advanced)

Introduction

For keyboard units without a mouse, the operator activates control objects using the <Tab> key. You can set up keyboard input to make the process easier to run, and to make sure that the operator enters all the necessary values. If you are using the keyboard, use the <Tab> key to activate the objects in a certain order, and to enter the necessary values.

For HMI devices without key, you can simulate the <Tab> key by configuring the "SimulateSystemKey" system function to a function key.

Operator authorizations and operator control enables

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

Editing the tab sequence

The tab sequence is determined automatically when the control objects are created. The numbers of the tab sequence are assigned in the sequence in which the libraries are created.

It makes sense to change the tab sequence in the following cases:

- The operator changes directly to a specific control object.
- The screen requires a specific sequence

Change to the tab sequence mode to change the tab sequence. In this mode, the tab sequence number is displayed at the top left of the control objects. The tab sequence numbers of hidden objects are also shown. The distribution of these numbers is edited using the mouse.

Note

Other functions are not available in the tab sequence mode.

See also

Setting the tab sequence order (Page 5080)

Defining the operator authorization and operator control enable for an object (Page 5079)

Overview of objects (Page 5025)

Example: Configuring a rectangle (Page 5081)

Defining the operator authorization and operator control enable for an object

Introduction

If you configure an object for operator input with the <Tab> key, the object must have both an operator authorization, and an operator control enable.

Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object.
2. Select "Properties > Properties > Security" in the Inspector window.
3. Select the operator authorization under "Authorization."
4. Activate the authorization to operate.

Result

The operator can use the <Tab> key in Runtime to select the object.

See also

Overview of keyboard access (Page 5078)

Example: Configuring a rectangle (Page 5081)

Setting the tab sequence order

Introduction

All operable objects can be reached in runtime with the <Tab> key. You use the "Tab sequence" command to define the order in which the operator can activate objects in runtime.

Note

You cannot reach objects with the "Output" or "Two states" mode in runtime with the <Tab> key.

You can operate the screen in runtime:

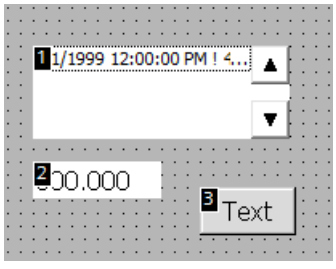
- Using the <Tab> key
- Using the mouse
- Using a configured hotkey

Requirement

- The active screen contains operable objects.
- No object is selected.
- The objects have been enabled for use in runtime, and have operator authorization.

Procedure

1. Select "Edit tab sequence" in the "Edit" menu.
   Tab sequence mode is activated. The tab sequence number is displayed for all objects that can be used. The tab sequence number is also displayed for hidden objects.
2. Use edit the tab sequence mode, click the accessible objects in the order in which you want them to be activated using <Tab> in runtime.
   The following figure shows how the tab sequence is defined in the screen. In runtime, the <Tab> key first activates the alarm view (number 1), then the I/O field (number 2), and then the button (number 3):



3. To exclude a screen object from the tab sequence, press the key combination <Shift+Ctrl> and click on the desired object.
   The tab sequence number is no longer displayed in the screen object. The screen object is now excluded from the tab sequence. The remaining tab sequence numbers are automatically decreased by 1.
4. To reenter an excluded screen object in the tab sequence, repeat step 3.
   The screen object entered as the first object in the tab sequence.

Result

The operator selects the objects in the specified order in Runtime with the <Tab> key.

Note

Changes after upgrades to a new software version

If you have configured a tab sequence in screens with faceplates in an older WinCC version, you should check the tab sequence of these screens after an upgrade to a newer WinCC version. The tab sequence may have been changed in both the screen and the faceplate.

Overview of keyboard access (Page 5078)

Example: Configuring a rectangle (Page 5081)

12.1.2.4 Examples

Example: Configuring a rectangle

Task

In this example you configure a rectangle:

- Color = red
- Black frame 2 pixels wide
- Position = (20, 20)
- Size = (100,100)

Changing the color of the rectangle

To change the color of the rectangle:

1. Select the rectangle.
2. Define the background color in "Properties > Properties > Appearance > Background > Color" in the Inspector window.
3. Select "Solid" as the fill pattern.

4. Define the color for the border in "Properties > Properties > Appearance > Border > Color" in the Inspector window.
5. Enter the value "2" for "width".
6. Select "Solid" as the "Style".

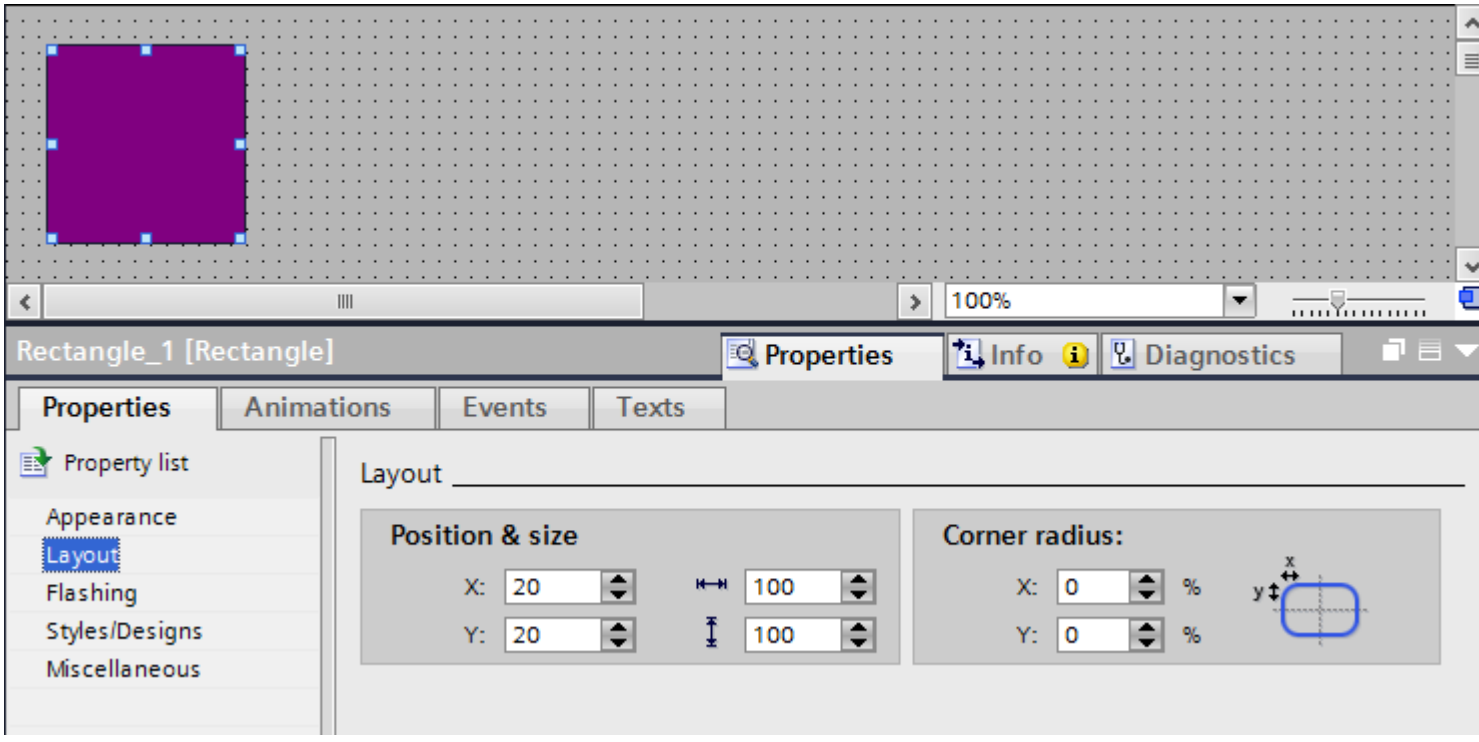
Interim result

The rectangle is red and has a black frame with a width of two pixels.

Repositioning and resizing the rectangle

To change the position and size of the rectangle:

1. Select the rectangle.
2. In the Inspector window, select "Properties > Properties > Layout".



3. Set "20" for the both the X and Y coordinates under "Position & Size".
4. Set "100" for the height and for the width.

Result

The rectangle is positioned at the coordinates (20, 20), and has a width and height of 100 pixels.

See also

Example: Inserting and configuring a rectangle (Page 5083)

Example: Inserting a rectangle (Page 5083)

Overview of objects (Page 5025)

Example: Inserting a rectangle

Task

In this example, you insert and rename a rectangle. Do not use the special characters ?, ", /, \, *, <, > for the name.

Requirement

- A screen is open.
- The Inspector window is open.
- The "Tools" task card is open.

Procedure

1. Click the "Basic objects" palette in the "Tools" task card.
2. Drag the "Rectangle" object into the screen.
3. In the Inspector window, select "Properties > Properties > Miscellaneous".
4. Type in the new name "MyRectangle".

Result

The rectangle is now inserted and named "MyRectangle". The rectangle has the default properties of the "rectangle" object.

See also

Example: Configuring a rectangle (Page 5081)

Example: Inserting and configuring a rectangle

Task

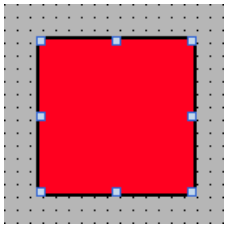
In this example, you insert a rectangle in a screen. You can configure the following properties:

- Name = "MyRectangle"
- Position = (20, 20)
- Size = (100,100)

- Color = red
- Black frame 2 pixels wide

Principle

The rectangle is a closed object which can be filled with a color or pattern. The height and width of a rectangle can be adjusted to allow its horizontal and vertical alignment.



Overview

Carry out the following steps in order to create a rectangle:

- Inserting a rectangle
- Configuring a rectangle

See also

Example: Configuring a rectangle (Page 5081)

12.1.3 Working with text lists and graphics lists

12.1.3.1 Working with text lists

Basics on text lists

Introduction

Texts are assigned to the values of a tag in a text list. Assign the text list to a symbolic I/O field for example in the configuration. This supplies the text to be displayed to the object. The text lists are created in the ""Text List" editor. You configure the interface between the text list and a tag at the object that uses the text list.

The selection of objects that can have a text list assigned depends on the Runtime.

Application

The text list is used, for example, to display a drop-down list in a symbolic I/O field.

If the symbolic I/O field is a display field, the associated texts will differ according to the value of the configured tags. If the symbolic I/O field is an input field, the configured tag assumes the associated value when the operator selects the corresponding text in Runtime.

Note

Display of tag values without text

The display of tag values to which no text has been assigned depends on the Runtime:

- The display and operating element remains empty.
- Three asterisks *** are displayed.

Ranges for the text list

Three types are available for the text lists:

- Value/Range
  This setting assigns text entries from the text list to integer values or value ranges of a tag. You can select the number of text entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns text entries from the text list to two states of a binary tag. You can create a text entry for each state of the binary tag.
- Bit number (0 - 31)
  This setting assigns a text entry from the text list to each bit of a tag. The maximum number of text entries is 32. This form of text list can be used, for example, in a sequence control when processing a sequence in which only one bit of the used tag may be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Multilingual texts

You can configure multiple languages for the texts in a text list. The texts will then be displayed in the set language in Runtime. To this purpose you set the languages in the Project window under "Language support > Project languages."

Configuration steps

The following steps are necessary to display texts in a symbolic I/O field for example:

1. Creating the text list
2. Assignment of the texts to values or value ranges of a text list
3. Assignment of a text list in the display object, for example, to the symbolic I/O field

See also

Creating a text list (Page 5086)

Assigning texts and values to an area text list (Page 5087)

Assigning texts and values to a bit text list (Page 5089)

Assigning texts and values to a bit number text list (Page 5090)

Configuring objects with a text list (Page 5093)

Screen basics (Page 4979)

Creating a text list

Introduction

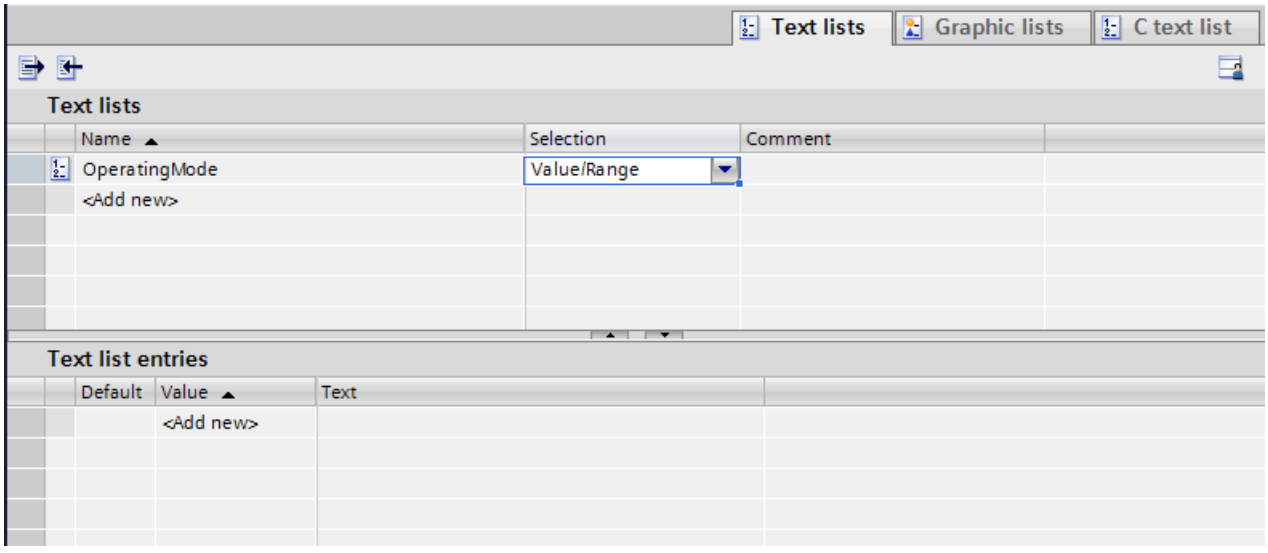
The text list allows you to assign specific texts to values and to output these in Runtime, for example in a symbolic I/O field. The type of symbolic I/O field can be specified, for example as a pure input field.

The following types of list are available:

- Value/Range
- Bit
- Bit Number

Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Text lists" tab.



3. Click "Add" in the "Text lists" table.
   The Inspector window of the text list is open.

4. Assign a name to the text list that indicates its function.
5. Select the text list type under "Selection":
   - Value/Range: Text from the text list is displayed when the tag has a value that lies within the specified range.
   - Bit (0,1): A text from the text list is displayed when the tag has the value 0. A different text from the text list is displayed when the tag has the value 1.
   - Bit number (0-31): Text from the text list is displayed when the tag has the value of the assigned bit number.
6. Enter a comment for the text list.

Note

You should not use semicolons in the texts in a text list in WinCC Runtime Professional. The semicolon is a control character and is automatically deleted from a text.

Result

A text list is created.

See also

Basics on text lists (Page 5084)

Assigning texts and values to an area text list (Basic Panels, Panels, RT Advanced)

Introduction

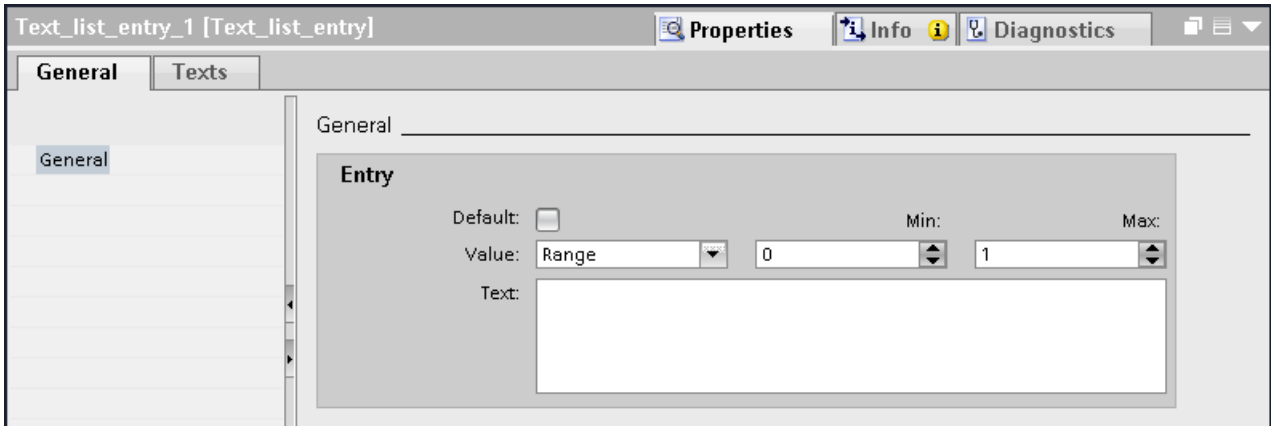
For each area text list you specify which texts are displayed at which value range.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- An area text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.

   – Enter the value "1" for "Min" for example.
   – Enter the value "20" for "Max" for example.
   – For "Text", enter the text that is displayed in Runtime if the tag is within the specified value range.

   Note

   Use a maximum of 320 characters for the text.

3. Click "Add" in the "Text list entries" table. A second list entry is created.
4. Select the setting "Range" in "Properties > Properties > General > Value" in the Inspector window.
   – Enter the value "21" for "Min" for example.
   – Enter the value "40" for "Max" for example.
   – For "Text", enter the text that is displayed in Runtime when the tag is within the specified value range.
5. If required, activate the "default entry".
   The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.

Result

An area text list is created. Texts have been assigned to the possible value ranges.

See also

Basics on text lists (Page 5084)

Notes for bit number text list (Page 5092)

Assigning texts and values to a bit text list

Introduction

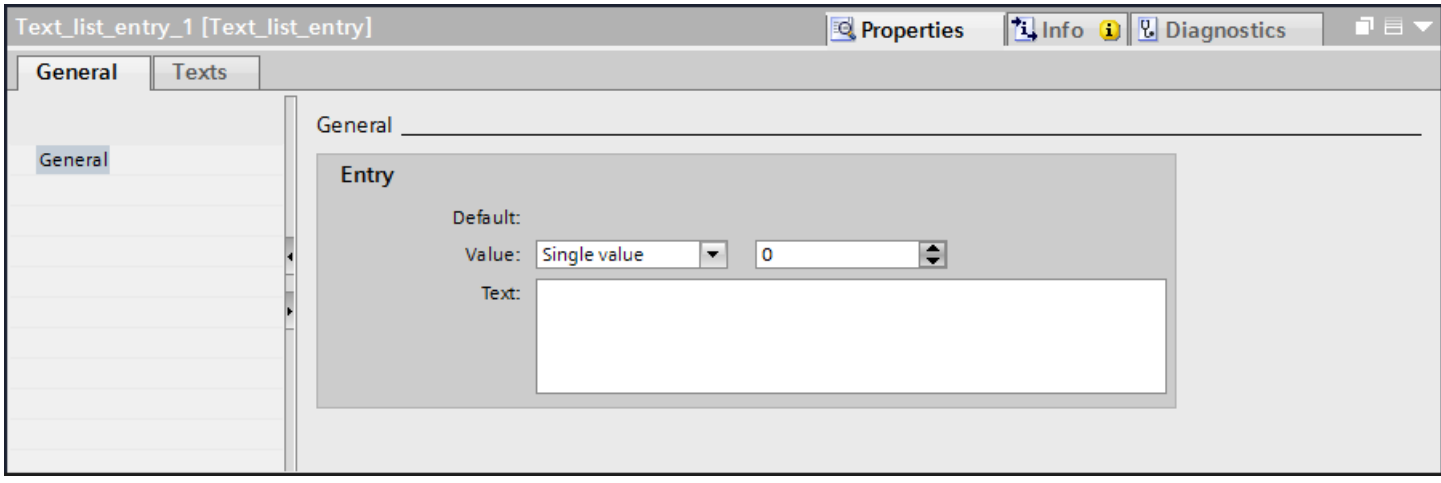
For each text list, you specify which text is displayed at which bit value.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "0" for "Value."
   - Enter the text which is displayed in Runtime under "Text" if the bit tag is set to "0".
3. Click "Add" in the "Text list entries" table. A second list entry is created.
4. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "1" under "Value."
   - Enter the text which is to be displayed in Runtime under "Text" if the bit tag is set to "1".

Note

Use a maximum of 320 characters for the text.

Use a maximum of 255 characters and no semicolons for the text in WinCC Runtime Professional.

Result

A bit text list is created. Texts that appear in Runtime are assigned to the possible values "0" and "1".

See also

Basics on text lists (Page 5084)

Assigning texts and values to a bit number text list

Introduction

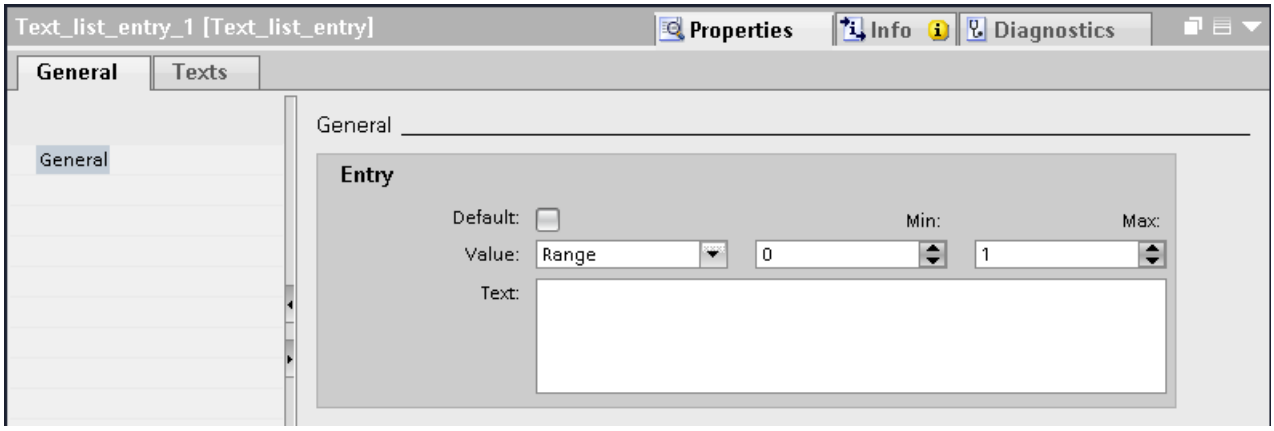
For each bit number text list you specify which texts are displayed at which bit number.

Requirement

- The "Text and graphics list" editor is open.
- The "Text lists" tab is open.
- A bit number text list has been created and selected.

Procedure

1. Click "Add" in the "Text list entries" table.
   The Inspector window for this list entry opens.



2. Select the setting "Single value" in "Properties > Properties > General > Value" in the Inspector window.
   - Enter "10", for example, for "Value".
   - Under "Text", enter the text that is displayed in Runtime when the tag has the value "10".
3. If required, activate the "default entry".
   The entered text is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same text list.

Note

Use a maximum of 320 characters for the text.

Use a maximum of 255 characters and no semicolons for the text in WinCC Runtime Professional.

Note

Bit selection for text lists

The output of the text list depends on the "Bit selection for text and graphics lists" option in the Runtime settings. Use this option to specify that the bit selection for text lists should be used on your HMI device. When you enable the option, the text displayed is the one configured for the set bit with the least significance. When you disable this option, only the text that has been configured for the set bit is displayed .

Result

A bit number text list is created. Texts that appear in Runtime are assigned to the specified bit numbers.

See also

Basics on text lists (Page 5084)

Notes for bit number text list

Introduction

The bit number (0 - 31) range assigns a text entry from the list to each bit of a tag. If the option "Bit selection for text and graphic lists" is disabled in the Runtime settings and no default value is set, the following standard behavior applies:

- If only 1 bit is configured of all set bits, the stored text is displayed for the configured bit. In the following example, only the set bit with significance "4" is configured. Text 2 is displayed.

Significance	7	6	5	4	3	2	1	0
Set bits	0	0	1	1	0	1	0	0
Configured	-	Text 3	-	Text 2	Text 1	-	-	-

- If no bit is set or when several configured bits are set, no text is displayed.

Default value

Define a default value to prevent an empty display. A configured default value is displayed in the following cases:

- The option "Bit selection for text and graphic lists" is disabled. No bit or several configured bits are set in the tag.
- The option "Bit selection for text and graphic lists" is enabled and no bit is set or a text is not configured for the set bit with the least significance.

Displaying the default value

1. Enable the text for the default entry in the "Default" column of the "Text list entries" table. The value "Default entry" appears in the "Value" column of the text entry.
2. You can also select the "Default" option under "Properties > General" in the inspector window.

Set bit with the least significance

If no text is configured for the set bit with the least significance and if no

default value is set, nothing is displayed. If a default value is configured, the default value is displayed.

If no text is configured for the set bit with the least significance and if no default value is set, nothing is displayed. If a default value is configured, the default value is displayed.

To only display the text for the set bit with the least significance, enable the "Bit selection for text and graphic lists" option in the "Runtime settings" editor.

This setting is deselected by default to maintain downward compatibility. The setting is valid for all text lists of the HMI device.

Multiline text list entries

Use the <SHIFT>+<RETURN> shortcut to enter a line break in the text entry. Line breaks are represented by the "¶" paragraph mark.

Multiline text list entries are only output in symbolic output fields as well as on buttons with multiple lines. In all other cases, multiline texts are displayed with the paragraph mark.

Configuring objects with a text list (Basic Panels, Panels, RT Advanced)

Introduction

The output value and value application for text lists are specified in the display and operating object that displays the texts of the text list in Runtime. The properties of these objects are configured as required.

Requirement

- A text list is created.
- You have created a tag.
- The "Screens" editor is open.
- A screen with a symbolic I/O field is open. The object is edited.

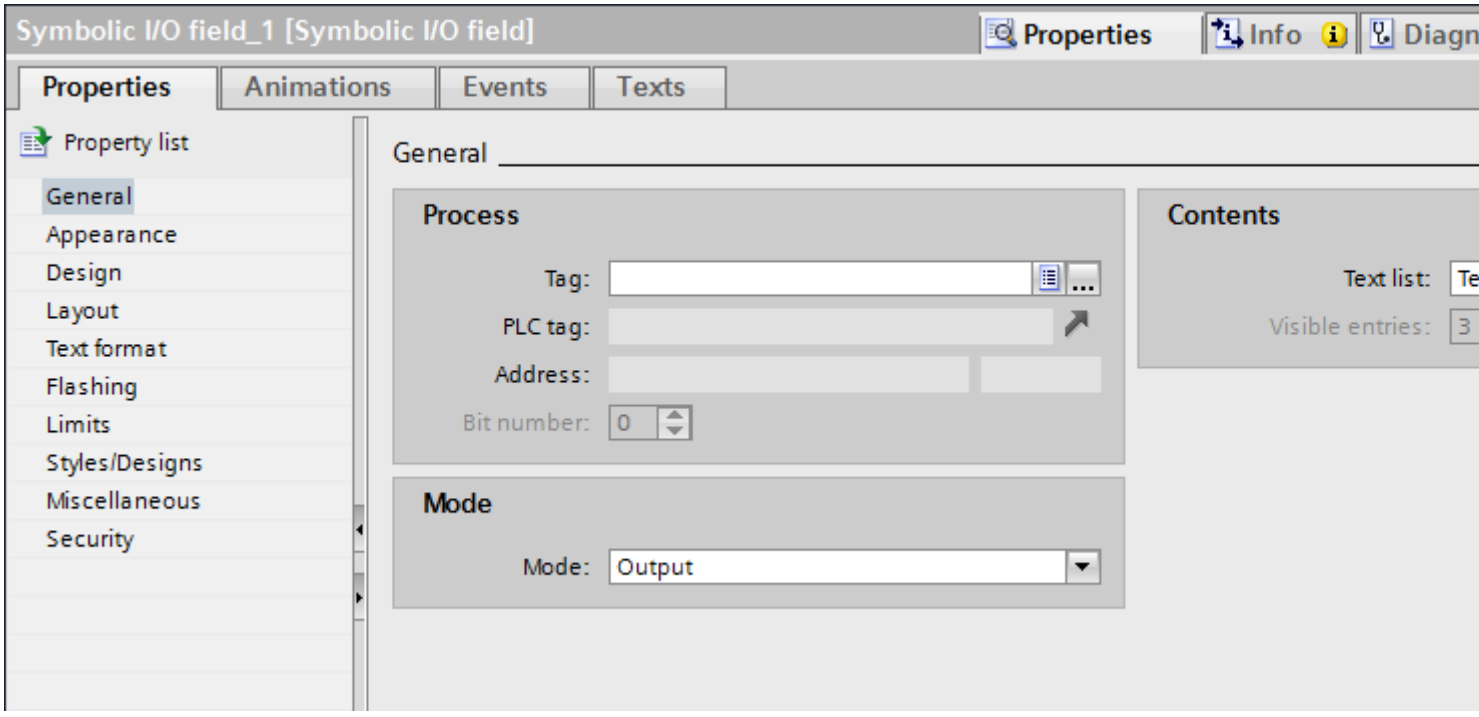
Procedure

1. Select the text list which you want to have displayed in Runtime in "Properties > Properties > General > Text list" in the Inspection window.
2. Select the setting "Output" as the "Mode".

   Note
   Runtime dependency

   Different field types are available for a symbolic I/O field depending on the Runtime.

3. Select the tag the value of which determines the display in the symbolic I/O field as "Tag".



Result

The defined texts of the text list are displayed in the symbolic I/O field in Runtime when the tag has the specified value.

See also

Basics on text lists (Page 5084)

12.1.3.2 Working with graphics lists

Basic principles of graphics lists

Introduction

The possible values of a tag are assigned to specific graphics in a graphics list. During configuration, you can create a graphics list for a button or a graphic I/O field. This supplies the graphics to be displayed to the object.

The graphics lists are created with the "Text and graphics list" editor. You configure the interface between the graphics list and a tag at the object that uses the graphics list. The availability of the graphics list is determined by the HMI device used.

Application

You can configure the graphics list for the following situations:

- Drop-down list with a graphic I/O field
- State-specific graphic for a button

The graphics in a graphics list can be configured as multilingual. The graphics will then be displayed in the set language in Runtime.

Graphic sources

Graphics can be added to the graphics list from the following sources:

- By selecting from a graphic browser
- By selecting an existing file
  You can use the following file types:
  *.bmp, *.ico, *.emf, *.wmf, *.gif, *.tiff, *.png, *.jpeg and *.jpg.
- By creating a new file

Function

If the graphic I/O field is a display field, the associated graphics will differ according to the value of the configured tags. If the graphic I/O field is an input field, the configured tag assumes the associated value when the operator selects a graphic in Runtime.

Ranges for the graphics list

Three types are available for the graphics lists:

- Value/Range
  This setting assigns graphic entries from the graphics list to integer values or value ranges of a tag. You can select the number of graphic entries as needed. The maximum number of entries depends on the HMI device you are using.
  You specify a default value which is shown if the value of the tag lies outside the defined range.
- Bit (0, 1)
  This setting assigns graphic entries from the graphics list to two states of a binary tag. You can create a graphic entry for each state of the binary tag.
- Bit number (0 - 31)
  This setting assigns a graphic entry from the graphics list to each bit of a tag. The maximum number of graphic entries is 32. This form of graphics list can be used, for example, in a sequence control when processing a sequence in which only one bit of the used tag may be set. You influence the behavior of the bit number (0 - 31) with the set bit of the least significance and a default value.

Configuration steps

The following tasks are required to display graphics, for example, in a graphic I/O field:

1. Creating the graphics list
2. Assignment of the graphics to values or value ranges of a graphics list
3. Assignment of a graphics list in the display object, for example, the graphic I/O field

Assigning graphics and values to a bit number graphics list (Page 5101)

Configuring objects with a graphics list (Page 5104)

Screen basics (Page 4979)

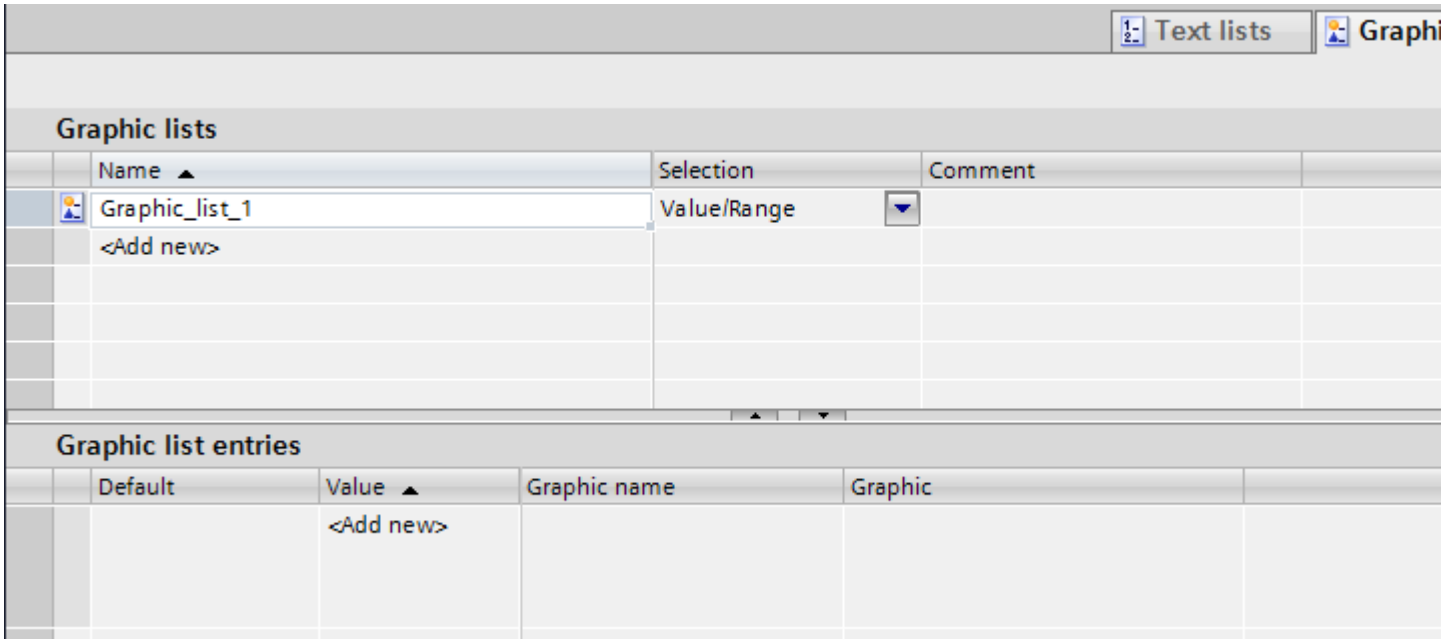
Creating a graphics list (Basic Panels, Panels, RT Advanced)

Introduction

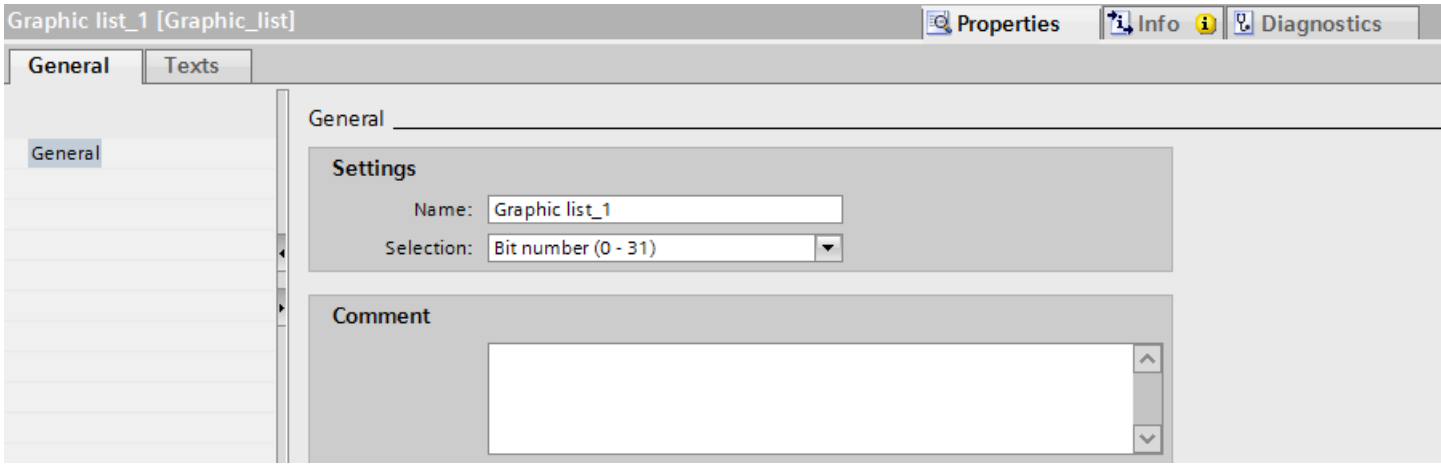
The graphics list allows you to assign specific graphics to variable values and to output these in a graphic IO field in Runtime. You can specify the type of graphic I/O field, for example as a pure output field.

Procedure

1. Double-click "Text and graphics lists" in the project window.
2. Open the "Graphics lists" tab.



3. Click "Add" in the "Graphics lists" table. The Inspector window of the graphics list will open up.



4. Assign a name to the graphics list that indicates its function.
5. Select the graphics list type "Bit number (0 - 31)" for example under "Select".
6. Enter a comment for the graphics list.

Result

A graphics list of the type "Range (0 - 31)" is created.

See also

Basic principles of graphics lists (Page 5095)

Assigning a graphic and values to an area graphics list

Introduction

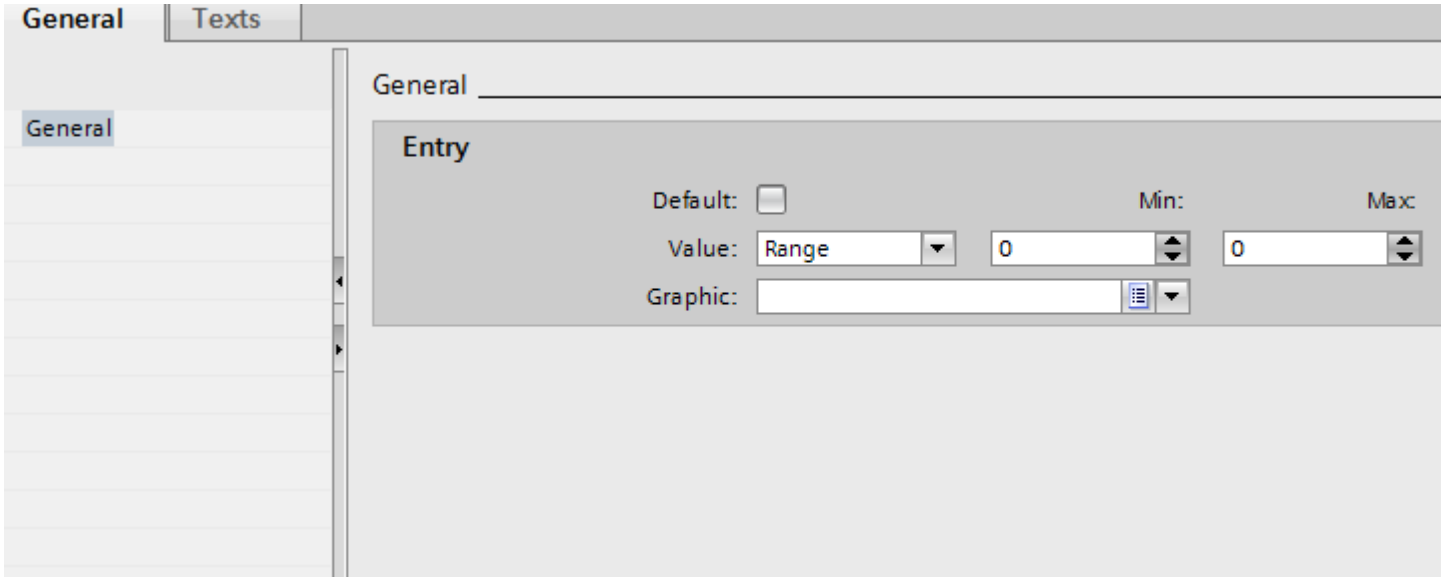
For each area graphics list you specify which graphics are displayed at which value range.

Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- An area graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Range" in "Properties > Properties > General > Value" in the Inspector window:
   - Enter the value "1" for "Min" for example.
   - Enter the value "20" for "Max" for example.
   - Select a graphic that is displayed in Runtime when the tag is within the specified value range.

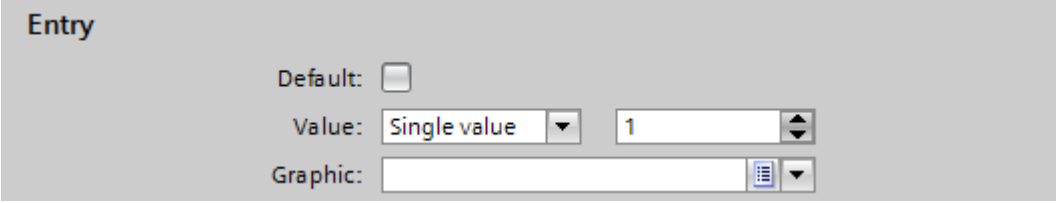
Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. Click "Add" in the "Graphics list entries" table. A further list entry is created.

4. Select the settings "Single value" in "Properties > Properties > General > Value" in the Inspector window:
   - Enter the value "21" for example.
   - Select a graphic which is displayed in Runtime if the bit "21" is set in the tag.



5. If required, activate the "default entry".
   The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.

Result

An area graphics list is created. Graphics that appear in Runtime are assigned to the possible values.

See also

Basic principles of graphics lists (Page 5095)

Assigning graphics and values to a bit graphics list (Basic Panels, Panels, RT Advanced)

Introduction

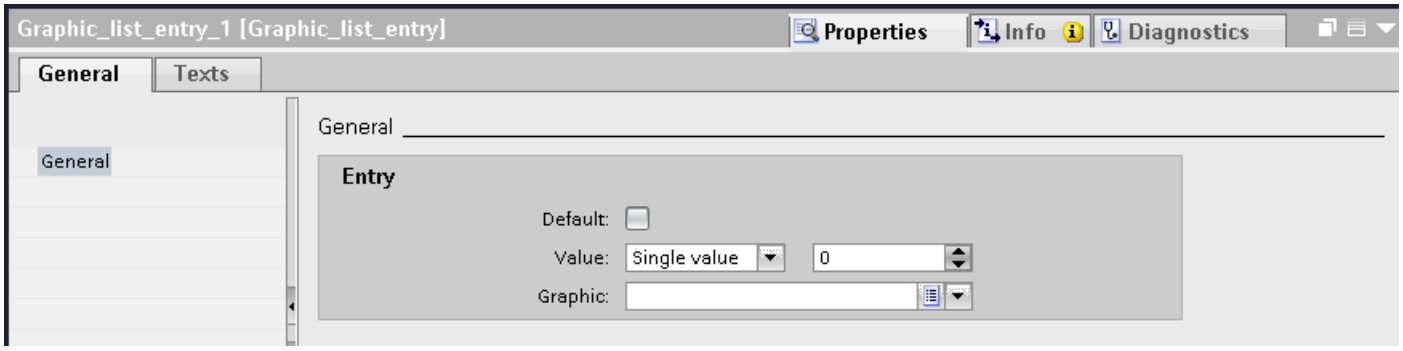
For each graphics list you specify which graphic is displayed at which bit value.

Requirement

- The "Text and graphics list" editor is open.
- The "Graphics list" tab is opened.
- A bit graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Single value" in the inspector window "Properties > Properties > General > Value":
   - Enter "0" as the value.
   - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.

   Note

   As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:
   1. Select a graphic in the library or in your file system.
   2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.
3. Click "Add" in the "Graphics list entries" table. A new list entry is created.
4. Select "Properties > Properties > General > Value > Single value": in the Inspector window.
   - Enter "1" as the value.
   - Select a graphic which is displayed in Runtime if the bit "1" is set in the tag.

Result

A bit graphics list is created. Graphics that appear in Runtime are assigned to the values "0" and "1".

See also

Basic principles of graphics lists (Page 5095)

Assigning graphics and values to a bit number graphics list (Basic Panels, Panels, RT Advanced)

Introduction

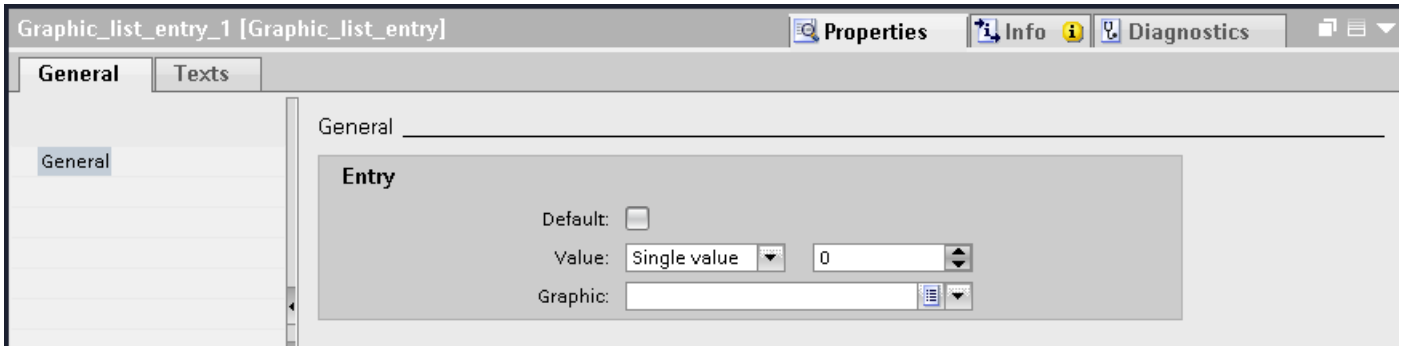
For each bit number graphics list you specify which graphics are displayed at which bit number.

Requirement

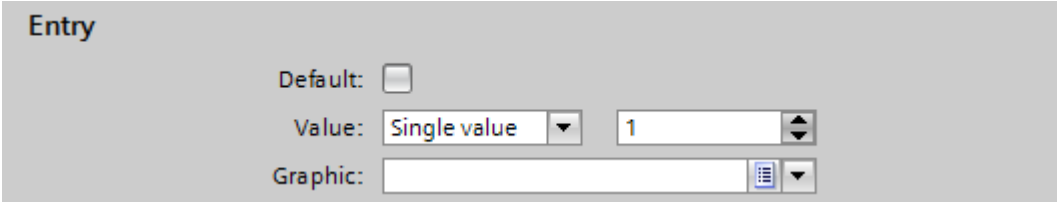
- The "Text and graphics list" editor is open.
- The "Graphics list" tab is open.
- A bit number graphics list has been created and selected.

Procedure

1. Click "Add" in the "Graphics list entries" table.
   The Inspector window for this list entry opens.



2. Select the settings "Single value" in the Inspector window "Properties > Properties > General > Value":
   - Enter the value "1" for example.
   - Select a graphic which is displayed in Runtime if the bit "0" is set in the tag.



Note

As an alternative to the drop-down menu, you can insert graphics from libraries or from your file system:

1. Select a graphic in the library or in your file system.
2. Drag-and-drop the graphic into the "Graphics list entries > Graphic" table.

3. If required, activate the "default entry".
   The graphic is always displayed when the tag has an undefined value. Only one default entry is possible per list.
4. Create further list entries for additional bit numbers of the same graphics list.

Note

Bit selection for graphic lists

The output of the graphic list depends on the "Bit selection for text and graphics lists" option in the Runtime settings. Use this option to specify that the bit selection for graphic lists should be used on your HMI device. When you enable the option, the graphic displayed is the one configured for the set bit with the least significance. When you disable this option, the graphic that has been configured only for the set bit is displayed.

Result

A bit number graphics list is created. Graphics that appear in Runtime are assigned to the specified bit numbers.

See also

Basic principles of graphics lists (Page 5095)

Notes for bit number graphics list

Introduction

The bit number (0 - 31) range assigns a graphic entry from the list to each bit of a tag. If the option "Bit selection for text and graphic lists" is disabled in the Runtime settings and no default value is set, the following standard behavior applies:

- If only 1 bit is configured of all set bits, the stored graphic is displayed for the configured bit. In the following example, only the set bit with significance "4" is configured. Graphic 2 is displayed.

Significance	7	6	5	4	3	2	1	0
Set bits	0	0	1	1	0	1	0	0
Configured	-	Graphic 3	-	Graphic 2	Graphic 1	-	-	-

- If no bit is set or when several bits are set that are also configured, only the cactus graphic is displayed.

Default value

Define a default value to prevent an empty display. A configured default value is displayed in the following cases:

- The option "Bit selection for text and graphic lists" is disabled. No bit or several configured bits are set in the tag.
- The option "Bit selection for text and graphic lists" is enabled and no bit is set or a graphic is not configured for the set bit with the least significance.

Displaying the default value

1. Enable the graphic for the default entry in the "Default" column of the "Graphics list entries" table.
   The value "Default entry" appears in the "Value" column of the entry.
2. You can also select the "Default" option under "Properties > General" in the inspector window.

Set bit with the least significance

When "Bit selection for text and graphic lists" is enabled, the graphic displayed is the one configured for the set bit with the least significance.

If no graphic is configured for the set bit with the least significance and if no default value is set, the cactus graphic is displayed. If a default value is configured, the graphic configured for the default value is displayed.

To only display the graphic for the set bit with the least significance, enable the "Bit selection for text and graphic lists" option in the "Runtime settings" editor.

This setting is deselected by default to maintain downward compatibility. The setting is valid for all graphic lists of the HMI device.

Configuring objects with a graphics list

Introduction

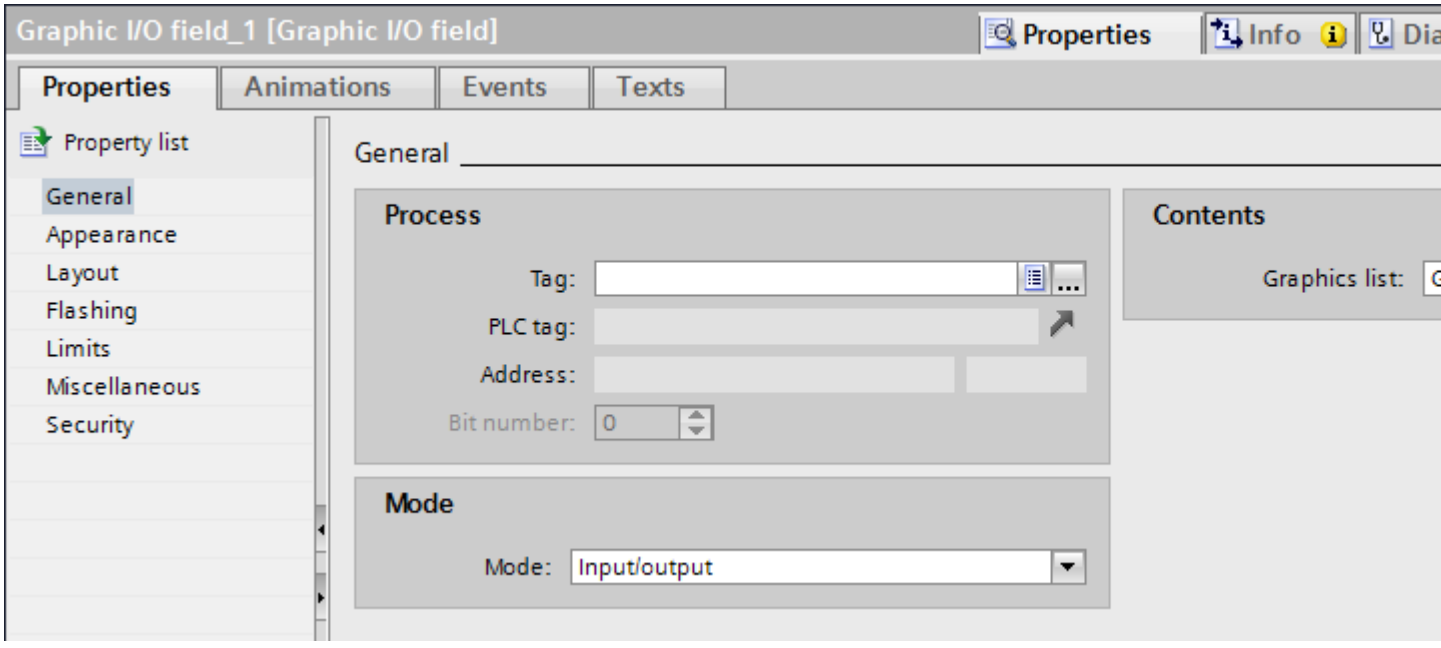
The output value and value application for graphics list are specified in the display and operating object that displays the graphics of the graphics list in Runtime. The properties of these objects are configured as required.

Requirement

- A graphics list is created. The values have been defined. Graphics have been assigned to the values.
- You have created a tag.
- The "Screens" editor is open.
- A screen with a graphics I/O field is open. The object is edited.

Procedure

1. Select the graphics list the graphics of which you want to have displayed in Runtime in "Properties > Properties > General > Graphics list" in the Inspector window.
2. Select the "Input/output" setting for "Mode".



Note

Runtime dependency

Different field types are available for a graphic I/O field depending on the Runtime.

3. As "Tag", select the tag whose values are defined by the display in the graphic I/O field.

Result

The defined graphics of the graphics list are displayed in the graphic I/O field in Runtime when the tag has the specified value.

12.1.4 Dynamizing screens

12.1.4.1 Basics on dynamizing screens

Basics on dynamizing screens (Basic Panels)

Dynamizing objects

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- Tags
- System functions

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

Screen basics (Page 4979)

Dynamization in the inspector window (Page 5107)

Dynamization in the inspector window (Page 5109)

Basics on dynamizing screens (Panels, RT Advanced)

Dynamizing objects

In WinCC you dynamize objects to map your system and show processes on HMI devices.

You implement dynamizations by

- Animations
- System functions

- Tags
- Local scripts

One example is the mapping of a tank, the liquid level of which rises or falls in relation to a process value.

The options for dynamization depend on the object involved. When you copy an object, its dynamization functions are included.

See also

Basics on dynamizing screens (Page 5106)

Dynamization in the inspector window (Basic Panels)

Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

Animations

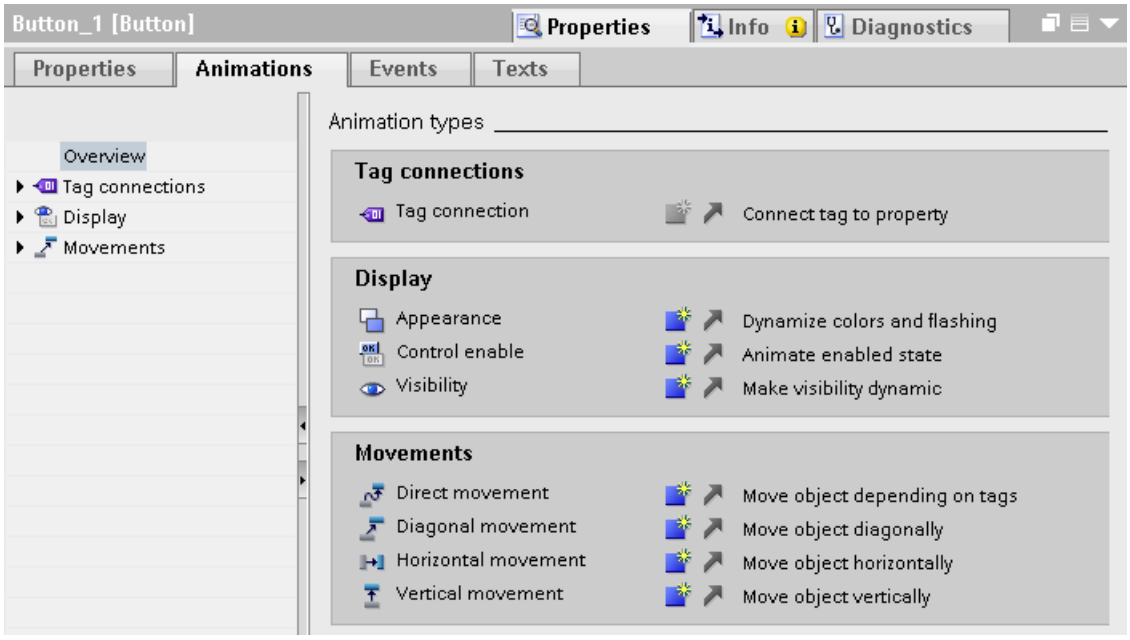
WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation in the object's inspector window. Then adapt the animation to the requirements of your project.

The selection of the supported animations depends on the HMI device and the selected object. You choose between the following types of animation:

- Layout: Appearance, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Variable binding

You can configure the "Variable binding" type of animation several times for one object.

You configure animations in the "Properties > Animations" inspector window.

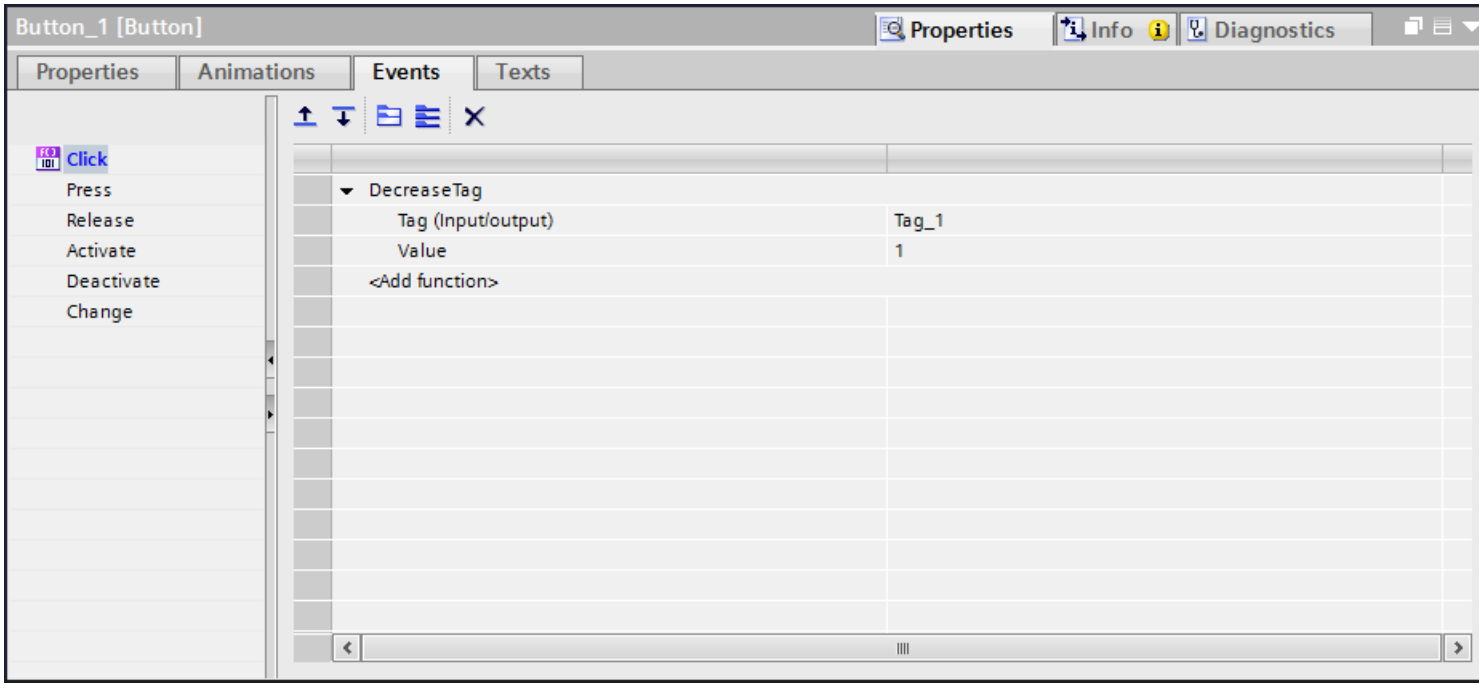


Events

Operable objects also react to events, such as a mouse click.

You configure a function list with system functions on an event. The system functions are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.



You will find further information in "Working with function lists".

See also

Basics on dynamizing screens (Page 5106)

Dynamization in the inspector window

Introduction

Basically, you can dynamize all the screen objects which you have configured in a screen. Which dynamization possibilities and which events are available depends on the device and the selected object.

The inspector window offers you the possibilities for dynamization of screen objects in three tabs.

Property list

With the button you go to the properties list in the "Properties > Properties" inspector window.

In the property list, you set any dynamization for the individual object properties using tags or local C and VB scripts. You can, for example, dynamically change the background color of an object.

In the "Dynamic Value" column you can dynamize the object property of a tag, a C-script or a VB-script.

Whether an object property can be dynamized is indicated in the Property list by means of the background color:

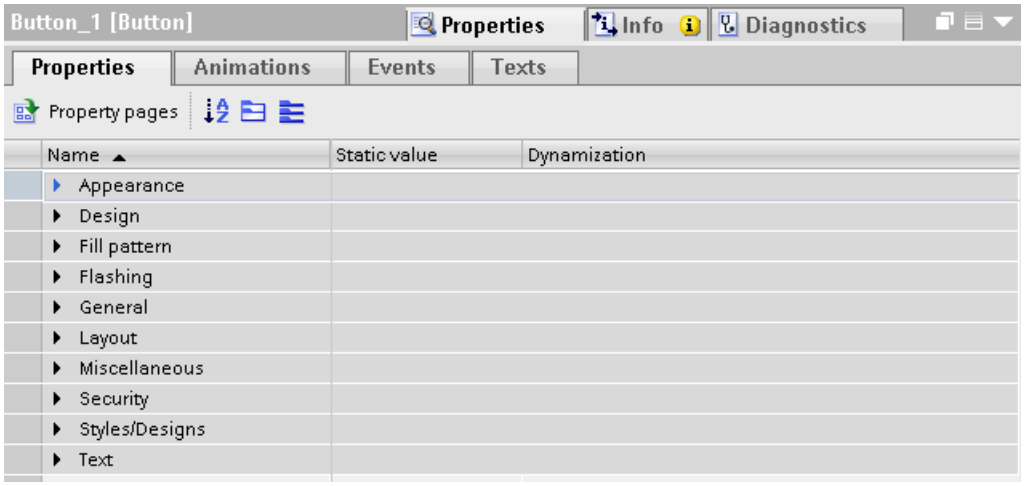
- Light gray: Can be dynamized
- Dark gray: Cannot be dynamized

Any animations you have already configured will also appear in the object property list, where you can edit the animations.

The following table shows you how to sort the property list:

	Sort by alphabet
	Sort by category

With the button you return to the property pages in the inspector window.



Animations

You have two different options for animating objects.

You configure animations

- in the inspector window under "Properties > Animations",
- in the "Animations" task card.

WinCC helps you to implement dynamization using predefined animations. If you want to animate an object, first configure the desired animation with the tools of the toolbox or in the object's inspector window. Then customize the animation in the Inspector window to suit the requirements of your project.

The selection of the supported animations depends on the device and the selected object. You choose between the following types of animation:

- Tag binding
- Layout: Appearance, control enable, visibility
- Movements: direct, diagonal, horizontal and vertical movement
- Property animation

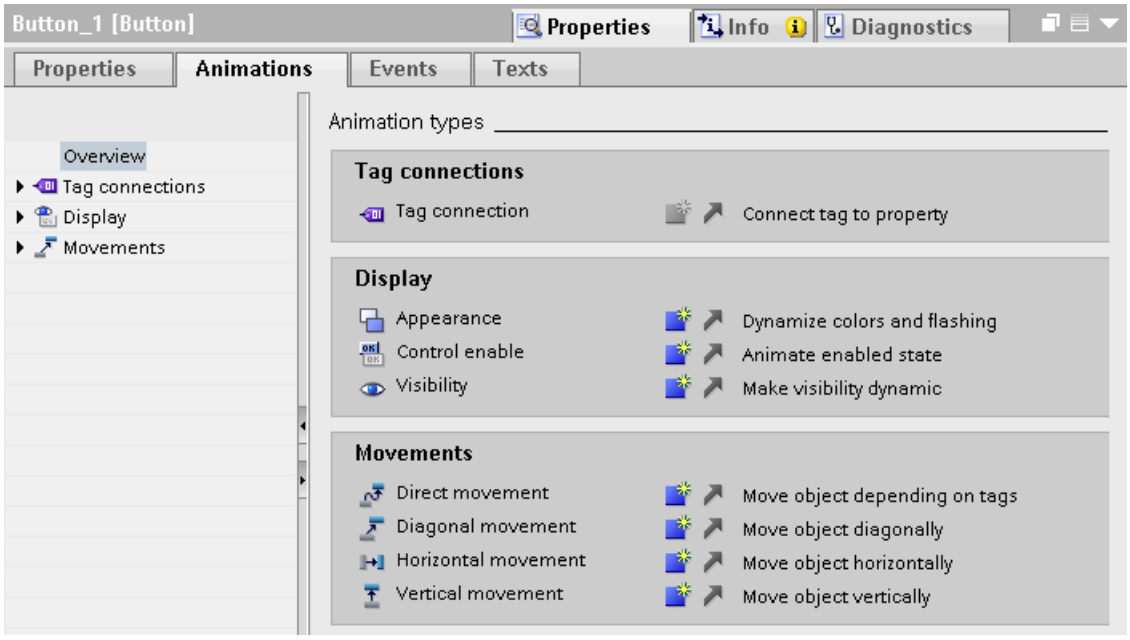
Note

HMI device dependency

The "Control enable" animation is not available for every HMI device.

You can configure the "Tag binding" and "Property animation" types of animation several times for one object.

You configure animations in the "Properties > Animations" inspector window.

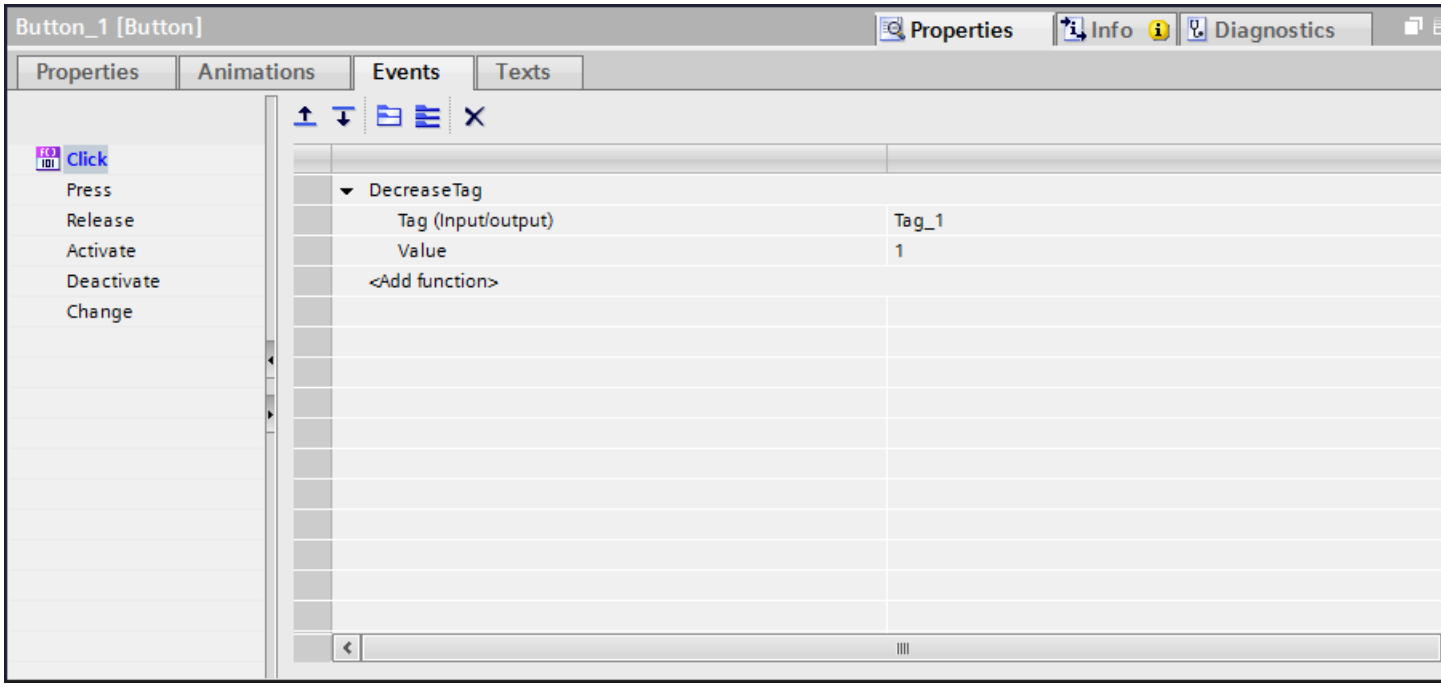


Events

Operator control enabled objects also react to events, such as a mouse click.

You configure a function list with system functions or local scripts on an event. The system functions or the local script are processed as a reaction to the triggered event.

You configure events in the "Properties > Events" inspector window.



You will find further information in "Working with function lists".

Basics on dynamizing screens (Page 5106)

12.1.4.2 Dynamization with animations

Configuring a new animation

Introduction

Use predefined animations to dynamize screen objects.

Requirement

- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure in the inspector window

1. In the Inspector window, select "Properties > Animations".
2. Select the animation you want to use.
3. Click the button.

Procedure in the "Animations" task card.

1. Open the object group containing the required animation in the "Animations" task card.
2. Drag the animation onto the object that you want to make dynamic.

Alternatively you select the object in the screen and double click the desired animation in the "Animation" task card.

Result

The animation appears in the Inspector window of the object. You configure the animation in the following steps.

In the animations overview the green arrow indicates which animation is already configured. The configured animation opens in the inspector window when you click the green arrow.

Configuring direct movement (Page 5117)

Configuring movements (Page 5115)

Dynamizing the appearance of an object (Page 5113)

Dynamizing the appearance of an object

Introduction

The appearance of a screen object is controlled by changing the value of a tag in runtime. When the tag adopts a certain value, the screen object changes its color or flashing characteristics according to the configuration.

Type

Areas or single values of the tag are observed in Runtime depending on the selection. The appearance of the object changes according to the configuration.

Note

"Multiple bits" selection

If you use the "Multiple bits" option, also select "Bit selection for appearance" option in the runtime settings under "Screens > General".

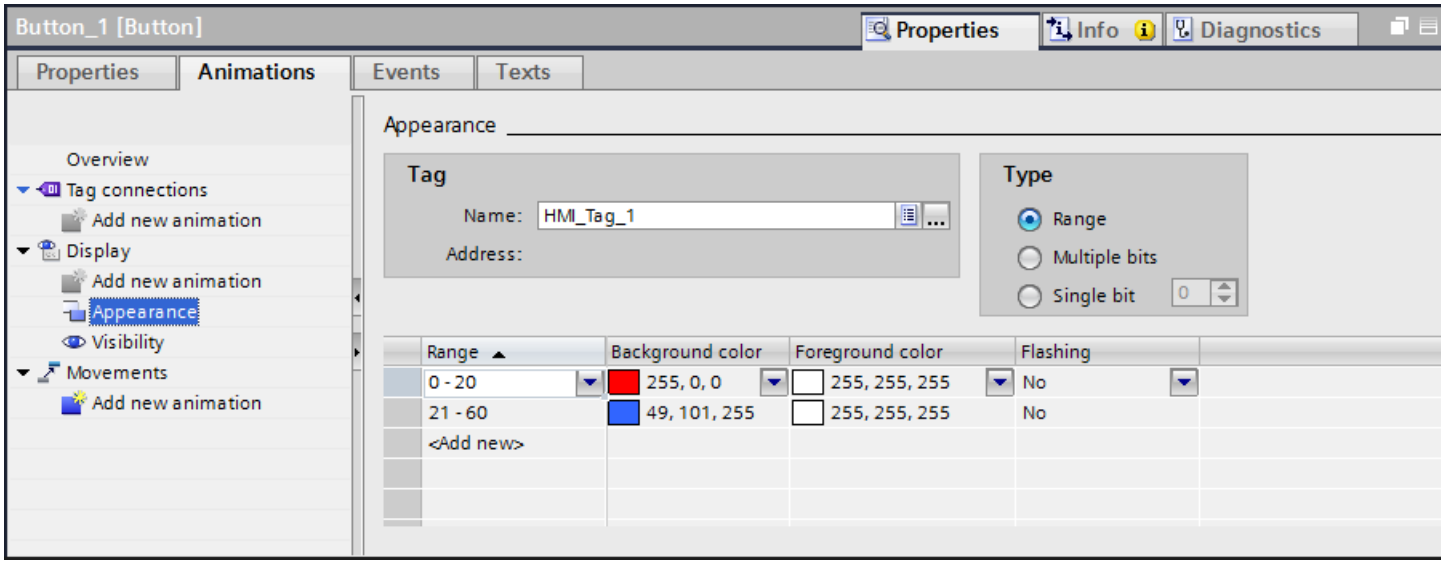
Requirement

- A screen is open.
- A dynamic object is contained and selected in the screen.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
2. Select the animation "Appearance" and click the button.
   The parameters of the animation are displayed.
3. Select a tag in "Tag > Name".
4. Select "Type > Range" for example.
5. Click "Add" in the table.
6. Enter the tag interval "0 - 20" in the "Range" column for example.
7. For "Foreground color" and "Background color", select the color the object is to acquire in Runtime when the tag reaches the interval.

8. Select a flashing mode for the object from the "Flashing" list.
9. Repeat steps 5 to 8 to create another tag interval, e.g. "21 - 60".



Result

In Runtime, the flashing response, and color of the object change dynamically according to the process value returned in the tag.

See also

Configuring a new animation (Page 5112)

Configuring movements

Introduction

You can configure dynamic objects in such a way that they move on a certain track. The movement is controlled via tags. The object moves every time the tag is updated.

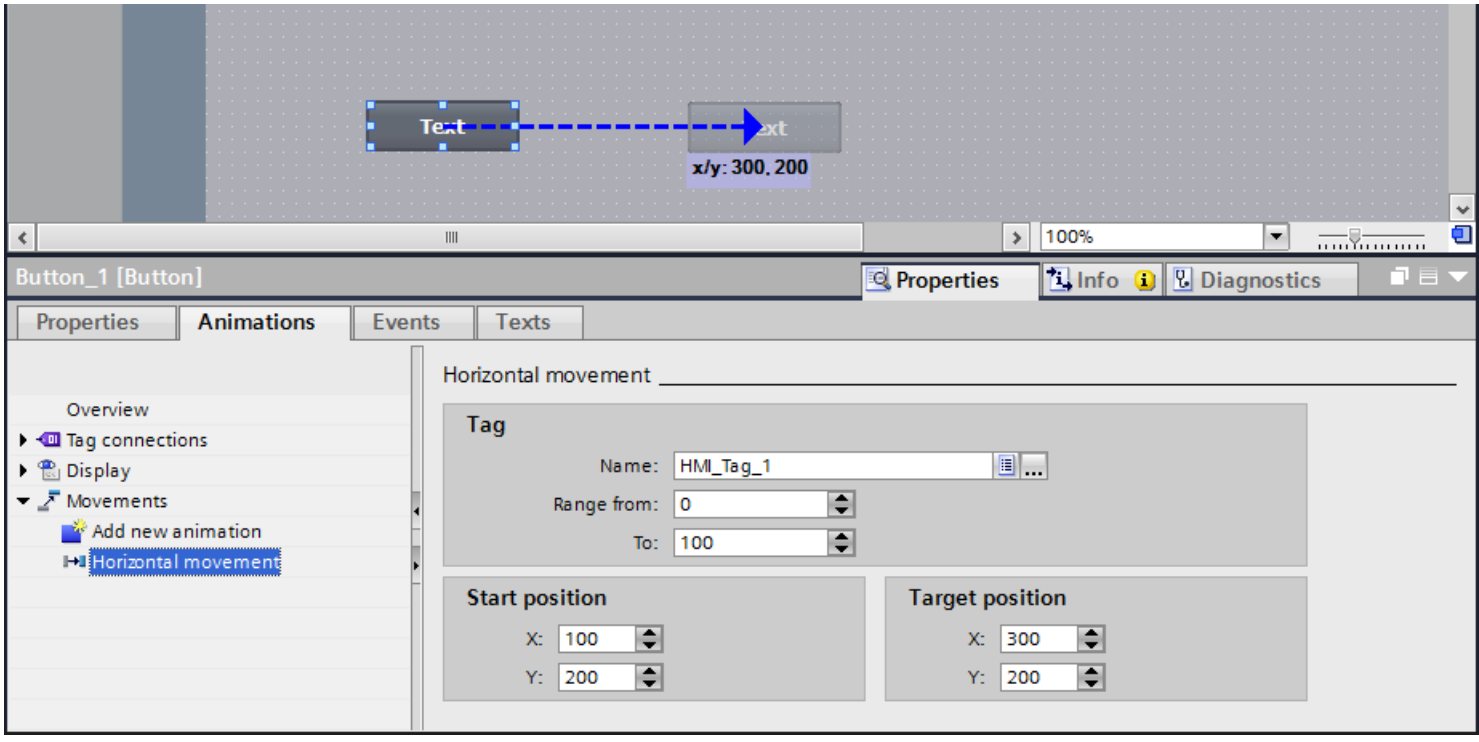
You can only program one type of movement for each object.

Requirement

- You have created a tag.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the button.
   The parameters of the animation are displayed.
   A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.
5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.



Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

Note

You configure vertical and diagonal movements similar to horizontal movements

See also

Configuring a new animation (Page 5112)

Configuring direct movement

Introduction

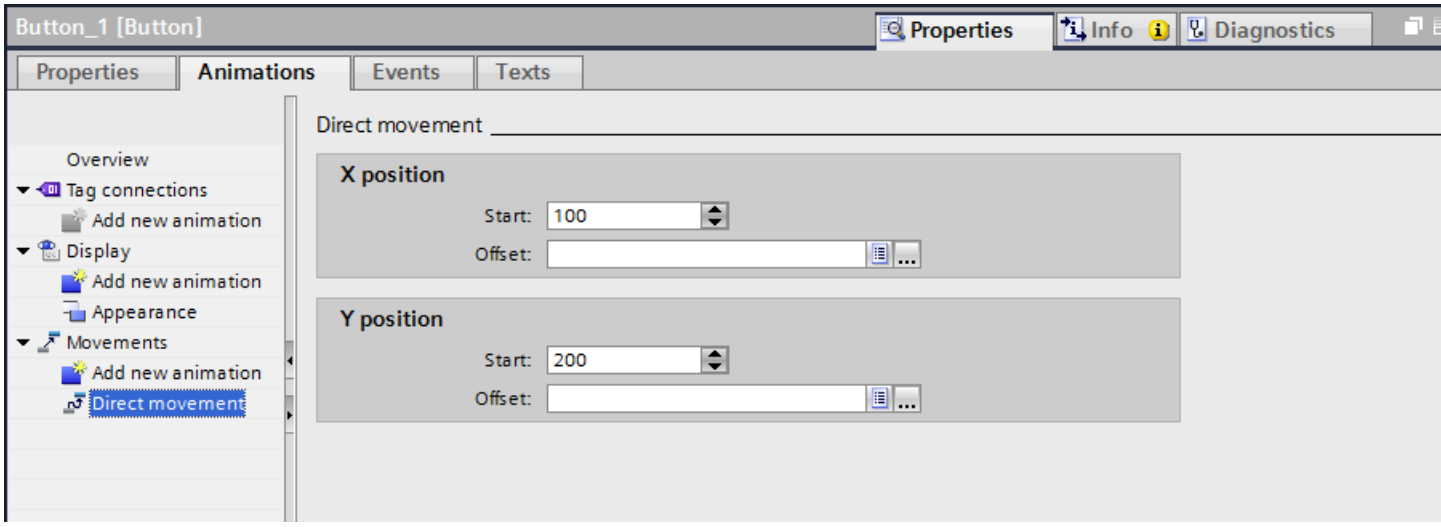
The object is moved respectively in x direction and y direction with "Direct movement". Two tags define the number of pixels by which the object moves from its original static start position.

Requirement

- Two tags are set up.
- You have opened a screen which contains at least one dynamic object.
- The Inspector window is open.
- The toolbox window is displayed.

Configuring "Direct movement"

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
3. Select "Direct movement" and click the button.
   The parameters of the animation are displayed.
4. Select a tag for the X position with which the movement in x direction is controlled.
5. Select a tag for the Y position with which the movement in y direction is controlled.



Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement.

See also

Configuring a new animation (Page 5112)

Dynamization of the control enable state of an operating element (Panels, RT Advanced, RT Professional)

Introduction

You can dynamically change the usability of an operating element. The object either can, or cannot be used in Runtime, depending on the value of a tag.

You can use this dynamic control to restrict operator access to an operating element to specific situations, such as for maintenance.

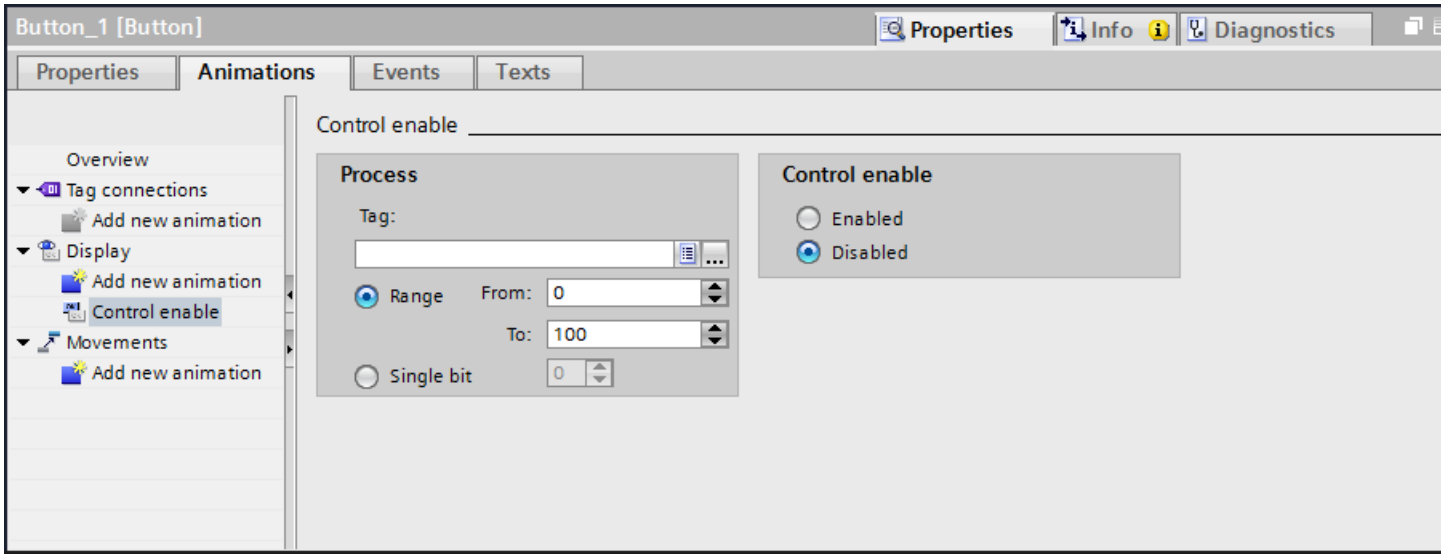
Requirement

- You have created a tag.
- A screen with an operating element is open.
- The Inspector window is open.
- The toolbox window is displayed.

Procedure

1. Select the operating element in the screen that you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.

3. Select "Control enable" and click the button.
   The parameters of the animation are displayed.



4. Select a tag.
5. Activate "Range".
   - For "From:" enter e.g. the value "0"
   - For "To:" enter e.g. the value "100"
6. Activate "Control enable > Activated".

Result

The screen object is operator control enabled in Runtime depending on the tag value:

- The object becomes operator control enabled when the tag value is between 0 and 100.
- The object is not operator control enabled if the tag value is outside the range.

See also

Configuring a new animation (Page 5112)

Dynamizing the visibility of an object (Panels, RT Advanced, RT Professional)

Introduction

Dynamization of the "Visibility" property allows you to output an alarm to your screen, which is triggered when the tag value exceeds a critical range, for example. The alarm is cleared when the tag value returns to the non-critical range.

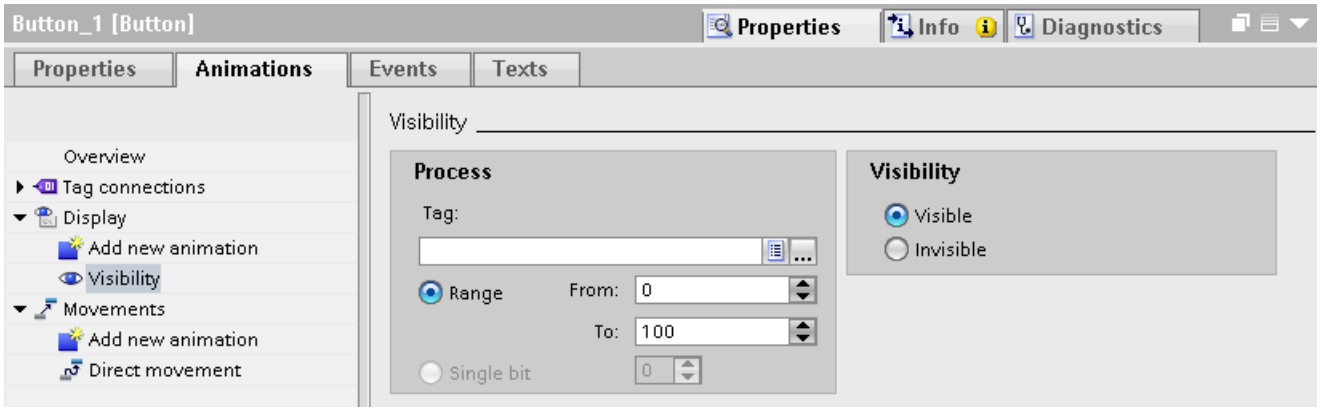
The "Simple recipe view" and "Simple alarm view" objects are always visible.

Requirement

- You have created a tag.
- You have opened a screen containing an object that you want to show or hide in Runtime.
- The Inspector window is open.

Procedure

1. Select the screen object you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animations".
   The animations available for the selected object are displayed.
3. Select "Visibility" and click the button.
   The parameters of the animation are displayed.
4. Select a tag.
5. Activate "Range".
6. Select, for example, "from 20" and "to 40"
7. Activate "Visible".



Result

The screen object is shown or hidden in Runtime depending on the tag value.

- If the tag value matches the configured range between 20 and 40, the screen object is shown.
- If the tag value is outside the configured range, the screen object is hidden.

See also

Configuring a new animation (Page 5112)

Configuring animation with tag connection (Panels, RT Advanced, RT Professional)

Introduction

When you object property an object property with a tag, the object property is changed in Runtime depending on the tag value.

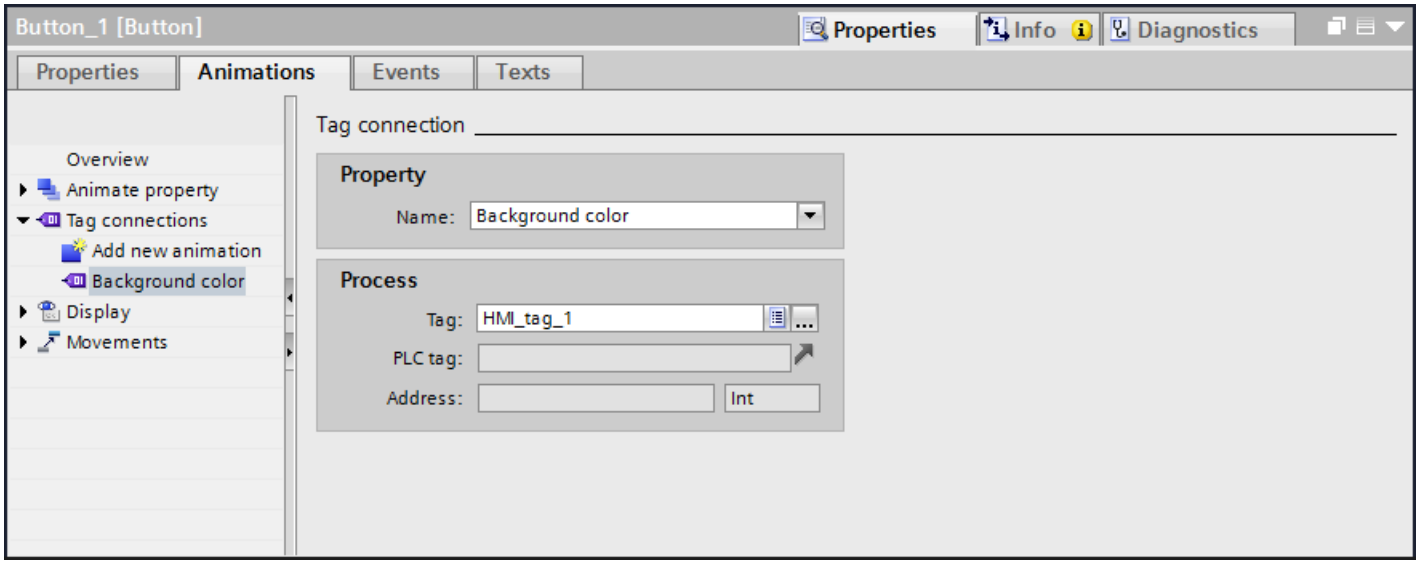
The following example shows the tag binding in the "Properties > Animations" inspector window. If you have configured tag binding it is also visible in the property list or in the property pages in the inspector window.

Requirement

- An object with the property to be dynamized is selected.
- You have created a tag.
- The Inspector window is open.

Procedure

1. Select the screen object whose properties you want to control dynamically.
   The object properties are displayed in the Inspector window.
2. In the Inspector window, select "Properties > Animation".
   The animations available for the selected object are displayed.
3. Select "Tag connection" and click the button.
   The parameters of the animation are displayed.
4. Select the object property that you want to dynamize in "Properties > Animation > Tag binding > Property > Name", e.g. "Background color".
5. Select a tag.



Result

You have dynamized the "Background color" property with a tag. The background color of the screen object changes in Runtime depending on which value the tag adopts.

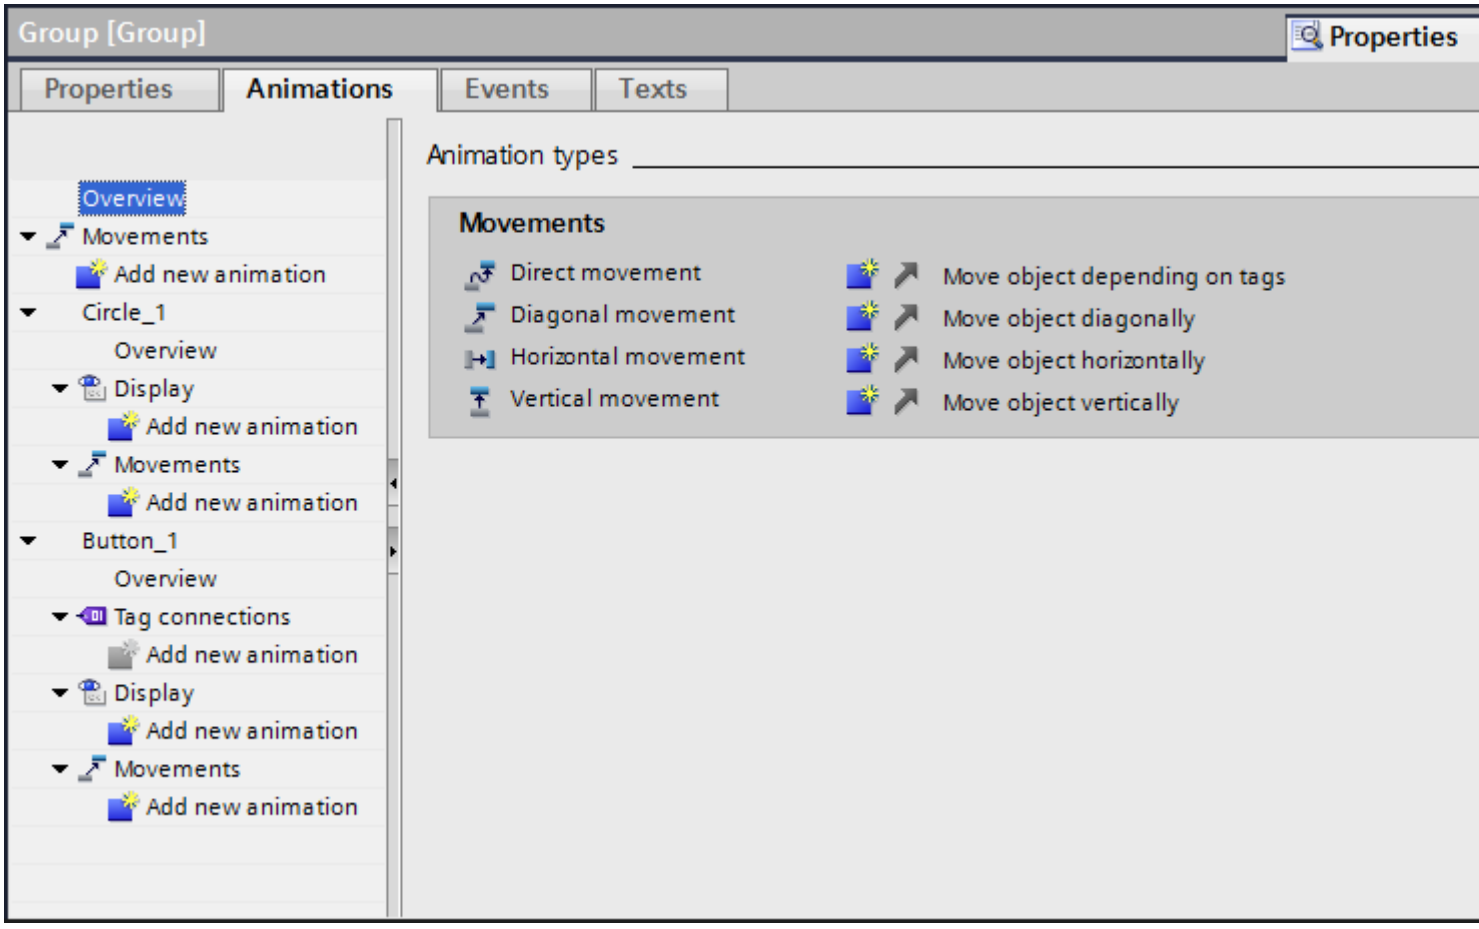
Configuring a new animation (Page 5112)

Animations of object groups (Basic Panels)

Applying animations to object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.



If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.

The animation of nested groups is not supported.

Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Only the animation of the object group i.e. "direct movement" is executed in Runtime. This also applies for object groups within object groups. Only the animation of the group on the top layer is listed.

See also

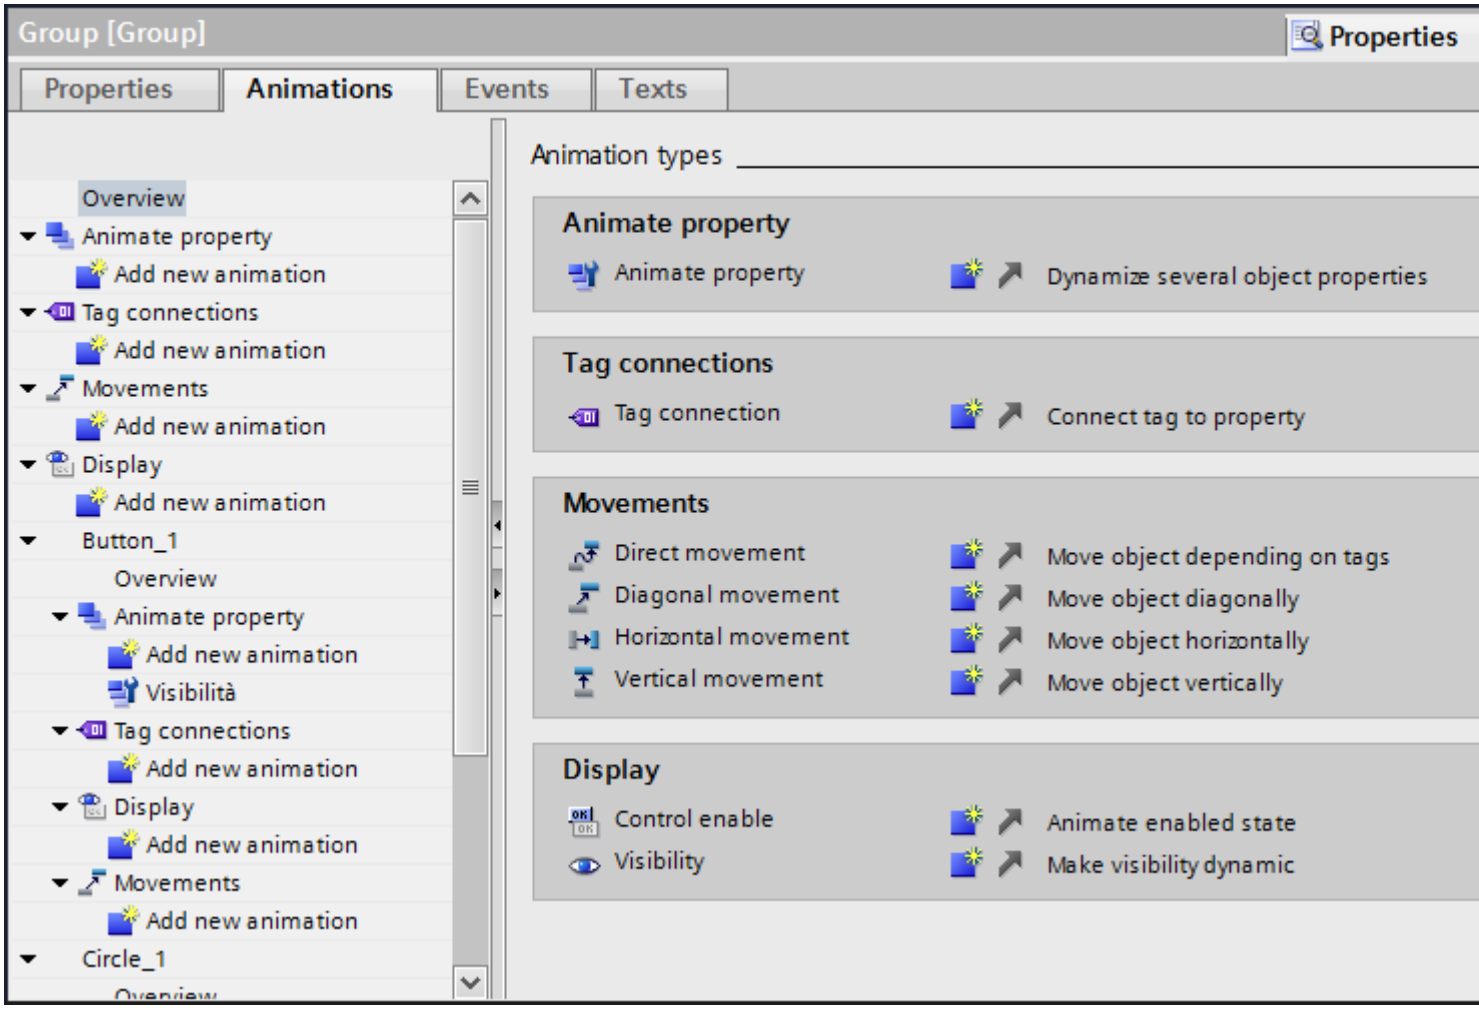
Configuring a new animation (Page 5112)

Animations of object groups (Panels, RT Advanced, RT Professional)

Changing animations of object groups

The inspector window shows all objects of a group and their possible animations. The animation types which are supported by all objects in the group are also listed separately.

If you configure an animation for an object group, this animation will apply to all individual objects that support this animation.



Application example

The "horizontal movement" animation is configured for the object of an object group. The "direct movement" animation is configured for the whole object group. Both animation types are executed in runtime. This also applies for object groups within object groups.

See also

Configuring a new animation (Page 5112)

Animations in multiple selection

Changing animations for multiple objects

For a multiple selection, the animations that are configured for the reference object appear in the Inspector window. You can change the animations as usual. The changes will apply to all the objects in the multiple selection that support the configured animation. This means that even objects for which you have not yet configured an animation will have the reference object's animation.

Application example

Select a button, and a circle at the same time. The button is the reference object. The "Appearance" animation is already configured for the button, so it appears in the Inspector window of the multiple selection. When you activate "Properties > Animations >Appearance > Flashing" in the inspector window, the settings of the "Appearance" animation apply for the button and for the circle.

Configuring new animations for multiple objects

If you configure a new animation for the objects of a multiple selection, this animation will apply to all selected objects that support the configured animation. If the new animation replaces an existing animation, a security prompt appears.

Application example

You select a circle, and a rectangle. The "Diagonal movement" animation is already configured for the circle. You configure the "Horizontal movement" animation for the multiple selection. This animation applies to the rectangle since no animation of the Movement type is yet configured for it. For the circle, you are asked to confirm that you want to replace the existing "Diagonal movement" animation with the new "Horizontal movement" animation.

Configuring a new animation (Page 5112)

12.1.4.3 Dynamizing with system functions

Basic on events

Introduction

Screen objects react to events. You configure a function list with system functions on the events of an object.

Events

Which events and system functions are available depends on the object used.

If the operator activates a screen object for example, the configured system function is executed.

You can find additional information under "Basics on the function list".

See also

Basics of the function list (Page 5700)

Basics on dynamizing screens (Page 5106)

Example: Configuring a button for language switching (Page 5127)

Configure system function on the "Click" event (Page 5126)

Configure system function on the "Click" event (Basic Panels)

Introduction

You configure a function list on an object event. The linked system function is executed when the event occurs in runtime.

Requirements

A screen is open.

A button has been created in the screen.

The inspector window is open.

Procedure

1. Select the button.
2. Click "Properties> Events" in the Inspector window.
3. Select the "Click" event.
4. Click "Add function" in the table.
5. Select the "ShowAlarmWindow" system function.

Result

The alarm window opens in the screen if the operator clicks the button in runtime.

See also

Basics of the function list (Page 5700)

Basic on events (Page 5125)

Example: Configuring a button for language switching

Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen_1" screen is open.
- The button on the screen has been selected.

Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

Basic on events (Page 5125)

Button (Page 5270)

12.1.5 Working with function keys

12.1.5.1 Working with function keys

Introduction

The function key is a physical key on your HMI device and its functions can be configured. A function list can be configured for the events "Key pressed" and "Release key".

A function key can be assigned global or local functions.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Global function keys

Global function keys always trigger the same action, regardless of the displayed screen.

Global function keys are configured in the "Global Screen" editor. The global assignment applies for all the screens of the set HMI device.

Global function keys reduce programming considerably, because there is no need to assign these global keys to each individual screen.

Local function keys in screens

Local function keys in screens can trigger a different action in each screen. This assignment applies only to the screen in which you have defined the function key.

Within a screen, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

Note

If a screen with local function keys is overlapped by an alarm view or an alarm window, then the function keys are still active in runtime. This may happen in particular on HMI devices with a small display.

Local function keys in templates

Local functions keys that are assigned in templates are valid for all the screens based on this template. They can trigger a different action in every screen. Function keys for templates are assigned in the template of the "Screens" editor. Within a template, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

Hotkey assignment

You can assign hotkeys, such as buttons, to control objects. The available hotkeys depend on the HMI device.

Note

The function key has a local or global action assigned to it. If the function key also has a hotkey assigned to it, then the hotkey function will be executed in Runtime.

Graphics

When a function key is placed directly next to the display, you can assign a graphic to it to make the function of the function key more clear.

Display of assignment

Table 12-1 The following table shows which symbols display the assignment of the function keys:

Function key	Description
	Not assigned
	Global assignment
	Assigned locally in the template
	Local assignment
	Local assignment (local assignment of the template overwrites global assignment)
	Local assignment (local assignment overwrites global assignment)
	Local assignment (local assignment overwrites local assignment of the template)
	Local assignment (local assignment overwrites local assignment of the template, which already overwrites global assignment)
	Assigning buttons with screen navigation

Note

Basic Panels

The "Screen Navigation" editor is not available for Basic Panels.

12.1.5.2 Assigning function keys globally

Introduction

You define the global assignment of a function key in the "Global Screen" editor. The global assignment applies to all screens of the set HMI device.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

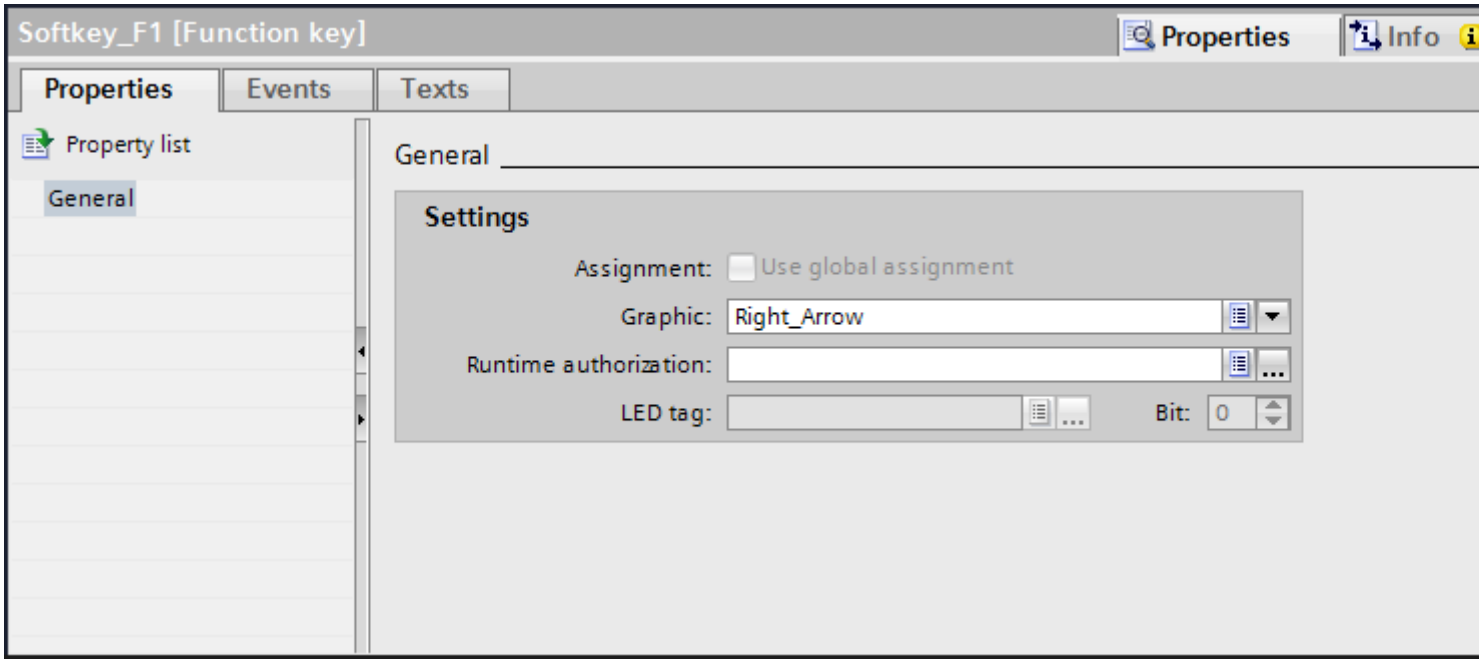
Requirement

- You have opened the project.
- The Inspector window is open.

Procedure

Proceed as follows to assign a screen-based function to a function key:

1. To open the "Global Screen" editor, double-click "Global Screen" in the "Screen management" group of the Project window.
2. Select the desired function key.
   The properties of the function key are shown in the Inspector window.



3. Under "General", configure a graphic and an operator authorization for the function key.
4. Configure a function list for the required event under "Events".

Result

If a local assignment does not overwrite the global assignment, the assignment of the function key changes in all the screens of the set HMI device in accordance with your entry.

See also

Working with function keys (Page 5127)

12.1.5.3 Local assignment of function keys

Introduction

Function keys are assigned globally and locally. A local assignment of the function keys is only valid for the screen or the template in which it was defined. The following local function keys are available:

- Local function keys of a screen
  Different functions are assigned to the function key for each screen. This assignment applies only to the screen in which you have defined the function key.
- Local function keys of a template
  You assign the function keys in a template. The assignment applies to all the screens that are based on this template and are not overwritten by a local assignment in a screen.

A local assignment overwrites the global assignment of a function key.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Using existing assignments

The option for using existing assignments is referred to as follows in the Inspector window:

- In a template: "Use global assignment"
- In a screen:
  - Screen based on a template: "Use local template"
  - Screen not based on a template: "Use global assignment"

The "Use local template" option includes the use of the local assignment in the template and the global assignment.

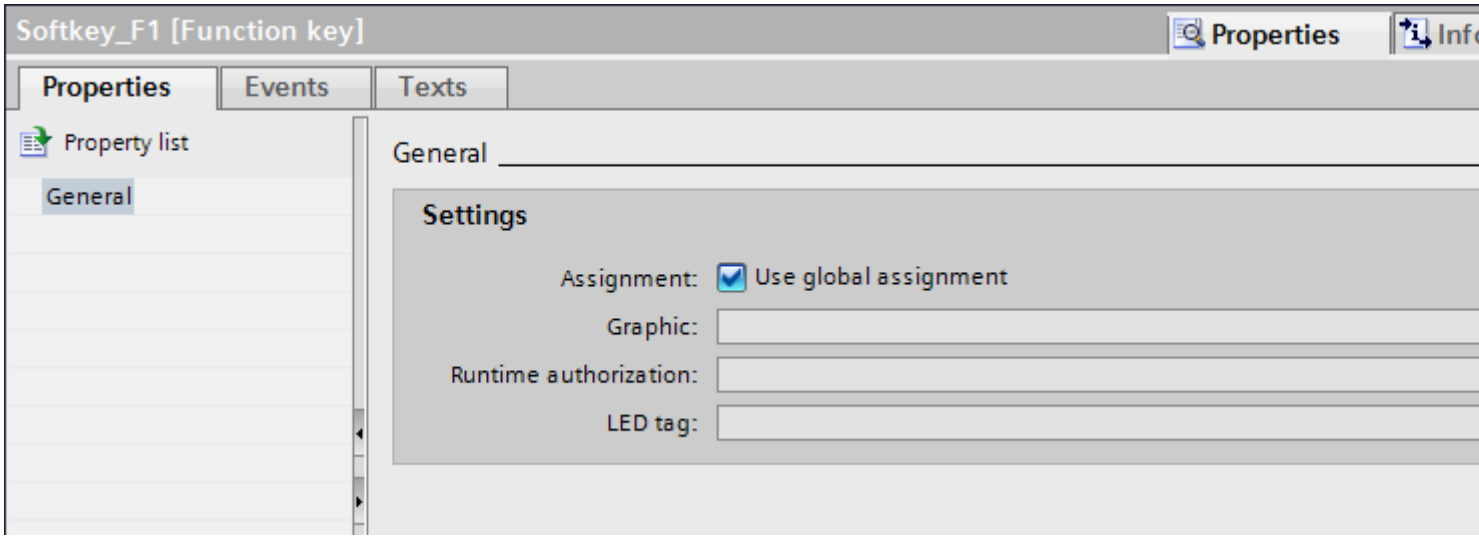
Requirement

- You have opened the screen or the template in which you want to assign a function key locally.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the desired function key in the screen or in the template.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.



3. Disable the "Use local template" or "Use global assignment" option.
4. Under "General", configure a graphic and an operator authorization for the function key.
5. Configure a function list for the required event under "Events".

Result

The function key is assigned the configured function in the screen or in the template.

See also

Working with function keys (Page 5127)

12.1.5.4 Assigning a function to a function key

Introduction

A function key can have two states:

- Pressed: Defined by the "Key pressed" event.
- Released: Defined by the "Release key" event.

Both of these events are configured in the Inspector window of the function key. You can assign any event a function list which contains system functions or scripts. Execution of this function list is event-driven in runtime.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Note

Basic Panels

Scripts are not available for Basic Panels.

Requirement

To assign the function key a global function:

- The "Global Screen" editor is open.

To assign the function key a local function:

- The screen in which you want to assign a function key is open.

If you want to assign a function key locally in a template:

- The template in which you want to assign a function key is open.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the function key you want to define.
   The properties of the function key are shown in the Inspector window.
2. Configure the function list for the desired result in the Inspector window under "Properties" in the "General" group.

Result

The function list is executed in runtime when the operator presses or releases the function key.

See also

Working with function keys (Page 5127)

12.1.5.5 Assigning operator authorization for a function key

Introduction

In WinCC you can assign an operator authorization for a function key in runtime. This allows you to restrict access to the function keys to specific persons or operator groups when you configure your project. Only authorized personnel can then change important parameters and settings in runtime.

You configure access protection in order to avoid operator errors and increase plant or machine security.

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

Requirement

- The user groups have been defined.

To protect a global function key:

- The "Global Screen" editor is open.

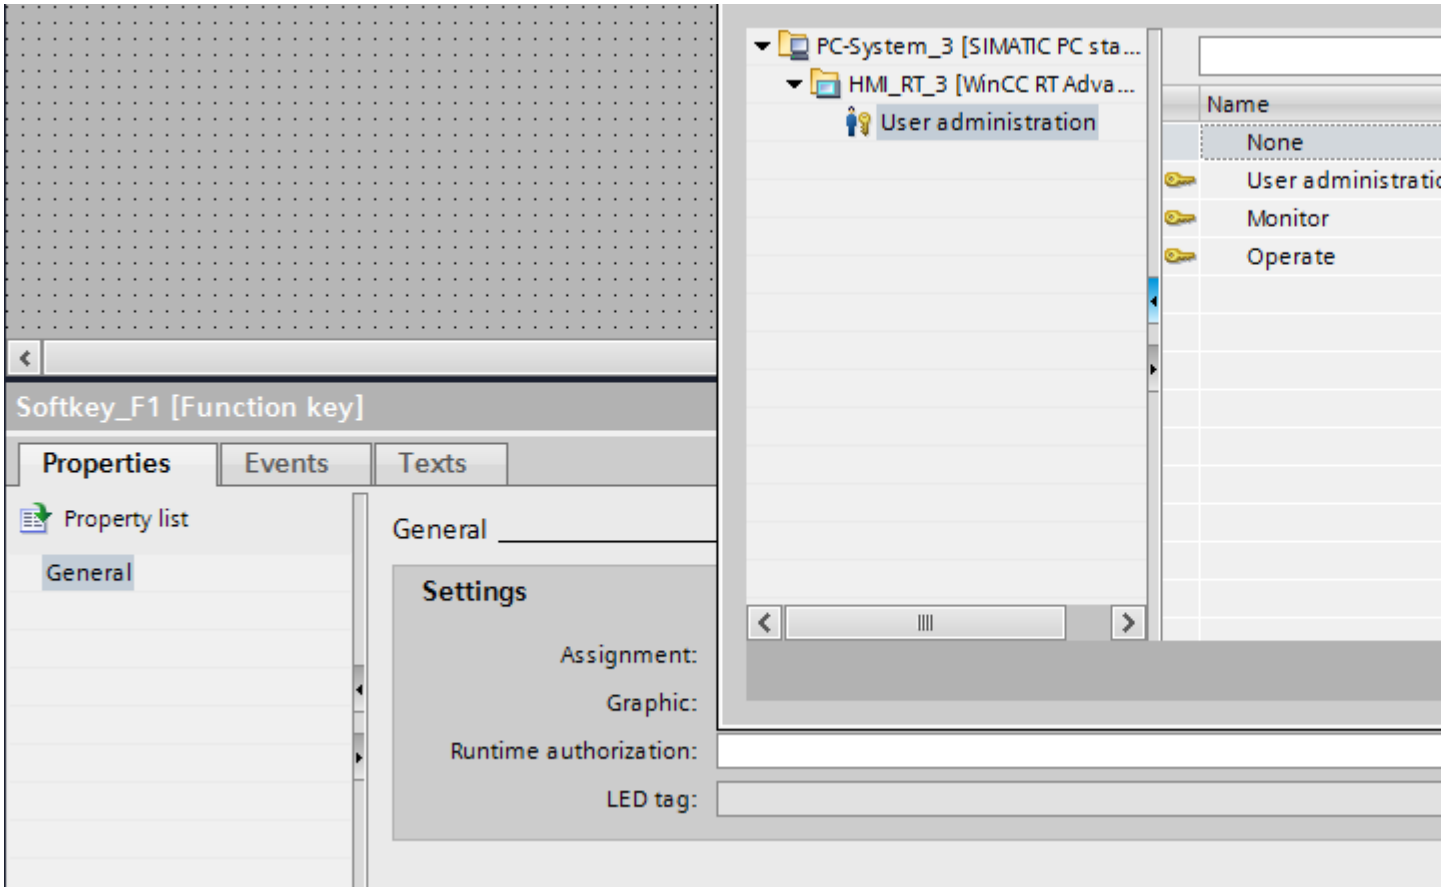
If you want to protect a local function key of a screen or of a template:

- The screen or the template which contains the function key is open.
- The Inspector window is open.

Procedure

Proceed as follows:

1. Select the relevant function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the Inspector window.



3. In the "Authorization" list, select the user group you want to allow runtime access to the function key.

Result

The operator authorization is configured.

See also

Working with function keys (Page 5127)

12.1.5.6 Assigning a graphic to a function key

Introduction

In order to make the function of a key more clear, you can insert a graphic in the screen alongside the function key. Graphics can only be assigned to function keys that border the screen margin of the HMI device.

Note

HMI device dependency

Function keys are not available on all HMI devices.

Note

Assigning graphics to a function key

A graphic can only be assigned to a function key if the bottom edge of the permanent window does not conceal the area of the function key graphic.

Requirement

To assign a graphic to a global function key:

- The "Global Screen" editor is open.

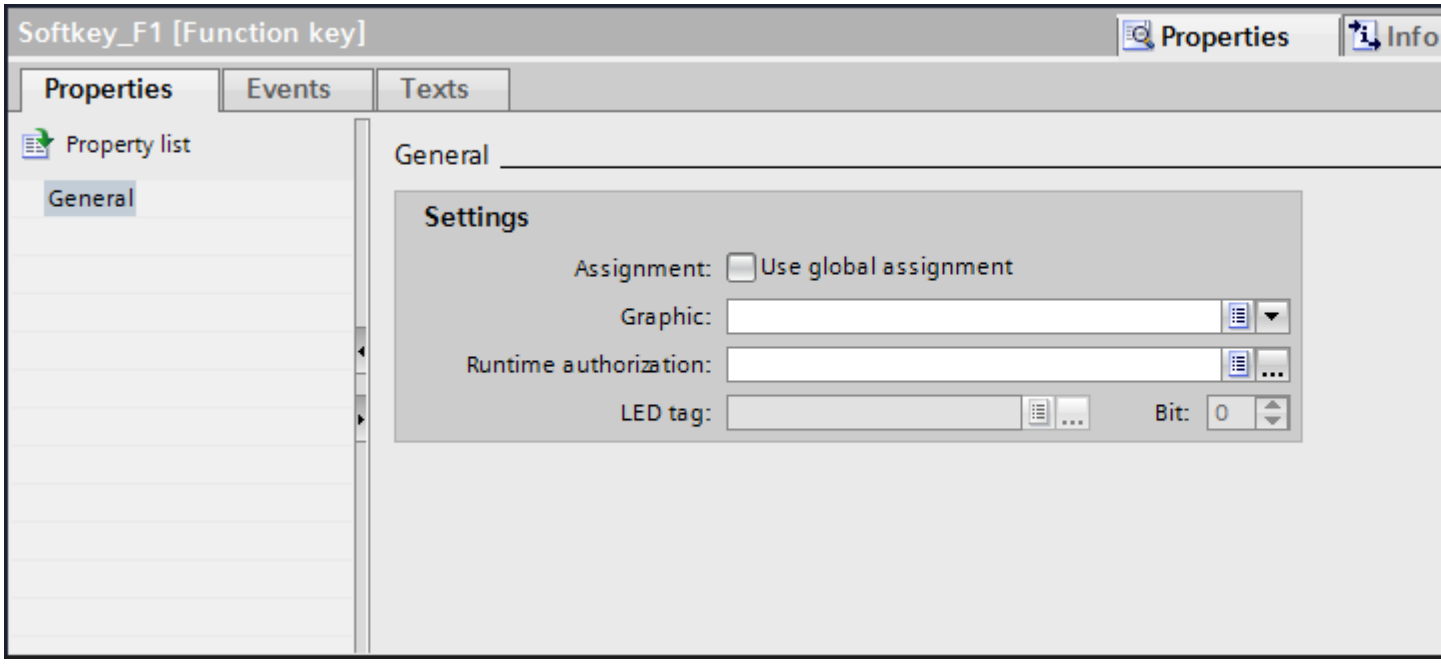
If you want to assign a graphic to a local function key in a screen or template:

- The screen or the template that contains the corresponding function key is open.
- The Inspector window is open.
- You have created the graphic for the function key.

Procedure

Follow these steps:

1. Select the relevant function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General" in the inspector window.



3. Click in the "Graphic" area of the list.
   The graphic browser of your WinCC project appears. The pane on the left side shows the external graphics which are stored in the browser. The pane on the right side shows you a preview of the graphic you have selected in the browser.

   Using the and icons, you can display the collection either in form of thumbnails or as a list.
   In order to open and edit OLE objects with the associated graphics program, double-click on the object.
4. In the browser click the desired graphic or store the relevant graphic in the graphic browser.
   The graphic preview is shown in the right pane.
5. Click "Select" to add the graphic to the screen.
   Click "Clear" to remove the graphic from the screen.

Result

The graphic is displayed next to the function key.

See also

Working with function keys (Page 5127)

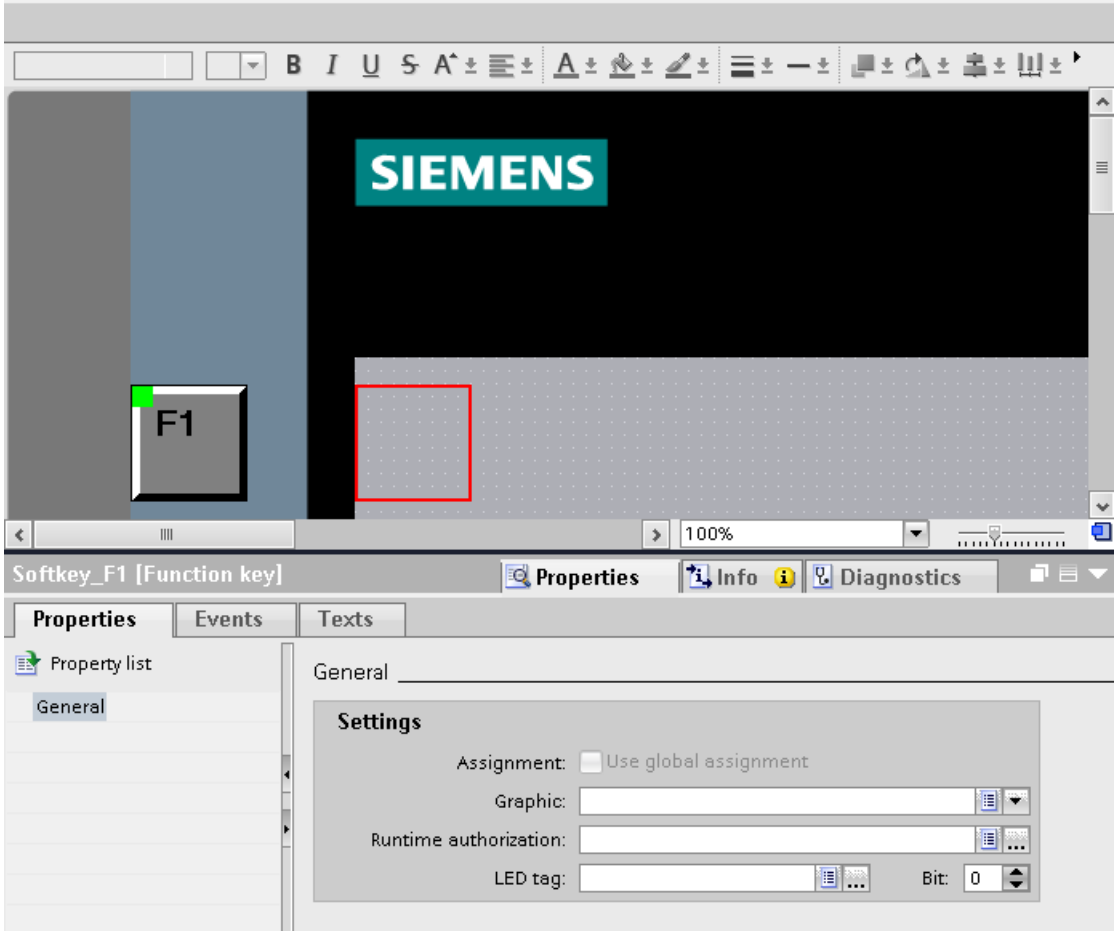
12.1.5.7 Configuring LED tags

Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.
- The global screen is open.

Procedure

1. Click an F-key of the HMI device.
2. In the Inspector window, click "Properties > Properties > General".



3. Select a tag under "LED tag" in the "General > Settings" area.
4. Under "Bit" enter the correct bit number.
   The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: AUTOHOTSPOT
- PROFIBUS DP direct keys: AUTOHOTSPOT

12.1.5.8 Example: Using function keys for screen navigation

Task

In this example you create a local function key in a screen. When the operator presses this function key, a screen change to a predefined screen is triggered, for example "Boiler 2".

Note

Availability for specific HMI devices

Function keys are not available on all HMI devices.

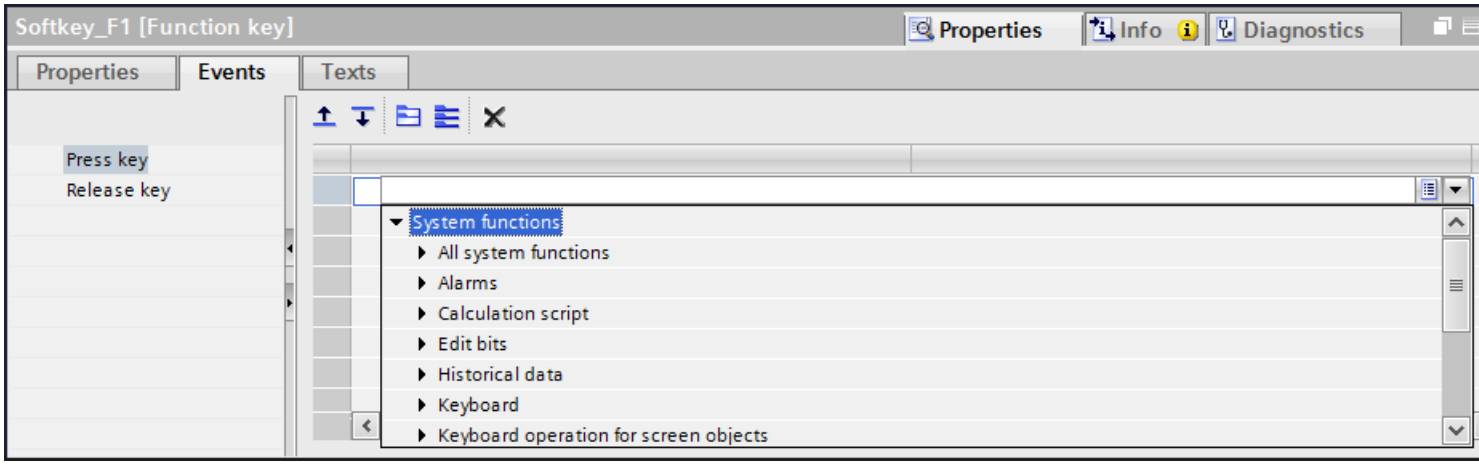
Requirement

- The screen in which you want to assign the function key is open.
- You have created the "Boiler 2" screen.
- The Inspector window is open.

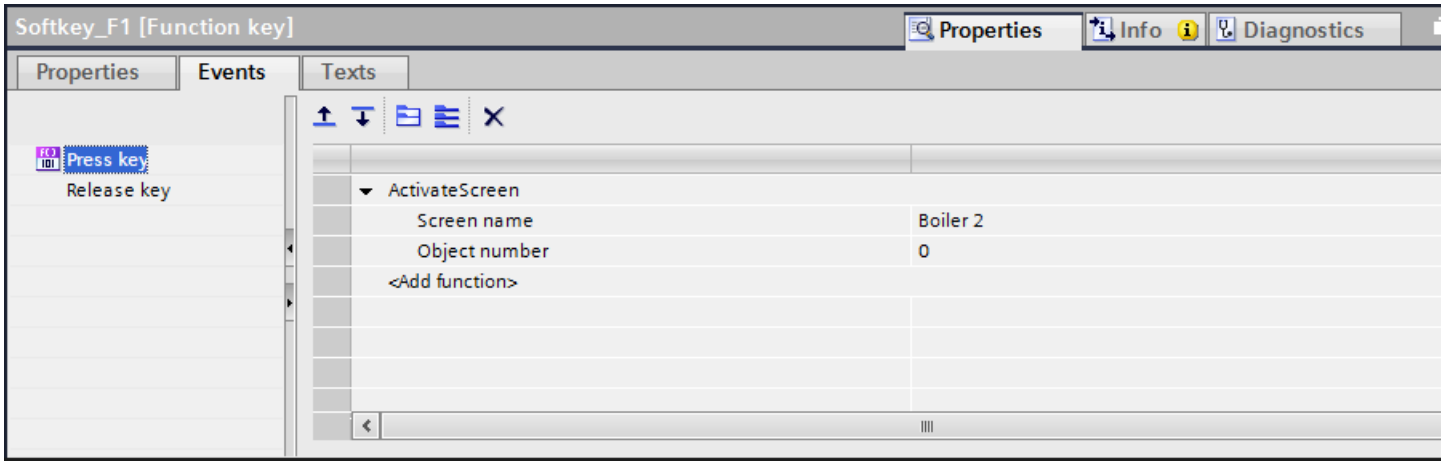
Procedure

Proceed as follows to use the "ActivateScreen" function:

1. Select the desired function key.
   The properties of the function key are shown in the Inspector window.
2. Click "General."
3. To overwrite a global assignment, disable the "Use local template" option.
4. Click "Key pressed" under "Events".



5. Select the "ActivateScreen" system function from the list.
   The "ActivateScreen" function appears in the "Function list" dialog box, including the "Screen name" and "Object number" parameters.



6. Select the "Boiler 2" screen from the "Screen name" list.

Result

The operator changes to the "Boiler 2" screen in runtime by pressing the selected function key.

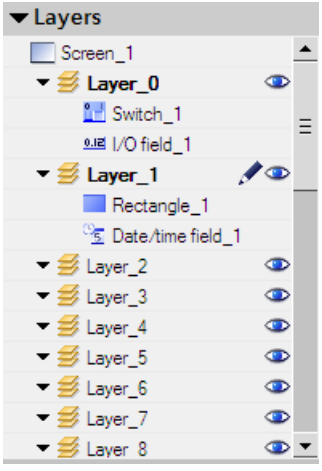
Working with function keys (Page 5127)

12.1.6 Working with layers

12.1.6.1 Basics on working with layers

Layers

Use layers in order to achieve differentiated editing of the objects in a screen. A screen consists of 32 layers that you can give any names. If you assign objects to the layers, you thereby define the screen depth. Objects of layer 0 are located at the screen background, while objects of layer 31 are located in the foreground.



The objects of a single layer are also arranged hierarchically. When you create a screen, the object inserted first is located at the rear within the layer. Each further object is placed one position towards the front. You can shift objects forwards and backwards within a layer.

Principle of the layer technique

Always one layer of the 32 layers is active. New objects you add to the screen are always assigned to the active layer. The number of the active level is displayed in the inspector window of the screen and in the "Layout > Layers" task card.

When you open a screen, all 32 layers of the screen are displayed. You can hide all the layers except for the active layer in the inspector window of the screen and in the "Layout > Layers" task card. You then explicitly edit objects of the active layer.

In the tree view of the "Layers" palette in the "Layout" task card, you administer layers and objects with drag-and-drop and the context menu.

Application examples

Use layers, for example, in the following cases:

- To hide the labeling of objects when editing,
- To hide objects, e.g. alarm windows, while configuring other objects

See also

Screen basics (Page 4979)

Renaming layers (Page 5146)

Showing and hiding layers (Page 5145)

Setting the active layer (Page 5144)

Moving objects on layers (Page 5143)

12.1.6.2 Moving objects on layers

Introduction

By default, a new object is inserted on the active layer. You can, however, assign an object to another layer at a later time.

Requirement

- A screen with an object is open.
- The Inspector window is open.

Procedure

1. Select the object in the screen.
   The object properties are displayed in the Inspector window.
2. Enter the layer to which you want to move the object in "Properties > Properties > Miscellaneous > Layer" in the Inspector window.

Alternatively, select the object from the "Layout" task card and drag it to the required layer.

Changing the order of objects

1. Select the object in the screen.
   The object properties are displayed in the Inspector window.
2. To move the object to the front or back, select the "Order" > "Move backward" or "Move forward" command from the shortcut menu.
   Alternatively, use the or button in the toolbar.

Result

The object is assigned to the selected layer, and positioned at the top of the layer.

See also

Setting the active layer (Page 5144)

Showing and hiding layers (Page 5145)

Renaming layers (Page 5146)

Basics on working with layers (Page 5142)

12.1.6.3 Setting the active layer

Introduction

The screen objects are always assigned to one of the 32 layers. There is always an active layer in the screen. New objects you add to the screen are always assigned to the active layer.

The number of the active layer is indicated in the "Layer" toolbar. The active layer is indicated by the icon in the "Layout > Layers" task card.

Layer 0 is the active layer when you start programming. You can activate a different layer during configuration, if necessary.

Requirement

- You have opened a screen which contains at least one object.
- The Inspector window of the active screen is open.

Procedure

1. Click "Properties > Properties > Layers" in the Inspector window of the current screen.
2. Enter the layer number in "Settings > Active layer".

Alternative procedure

1. Select "Layout > Layers" in the "Layout" task card.
2. Select the "Set to active" command from the shortcut menu of a layer.

Result

The layer with the specified number is now active.

See also

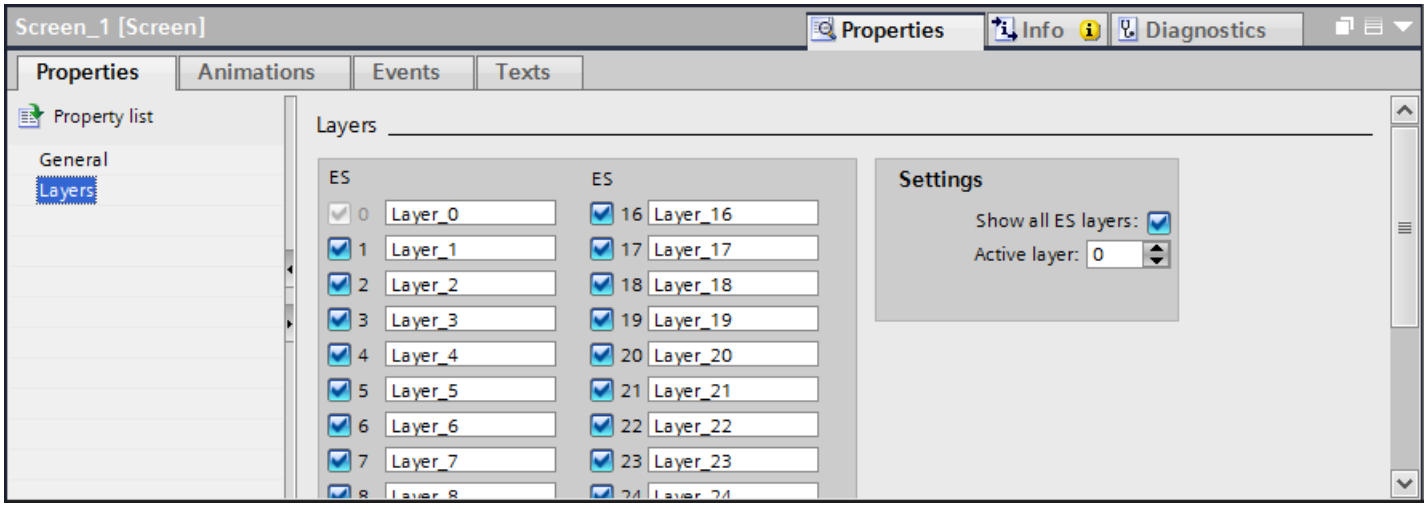
Moving objects on layers (Page 5143)

Basics on working with layers (Page 5142)

12.1.6.4 Showing and hiding layers (Basic Panels, Panels, RT Advanced)

Introduction

You can show or hide the layers of a screen as required. You specify the layers that are shown in the Engineering System. When you open a screen, all the layers are always shown.



Requirement

- The screen is opened.
- The "Layout" task card is open.

Procedure

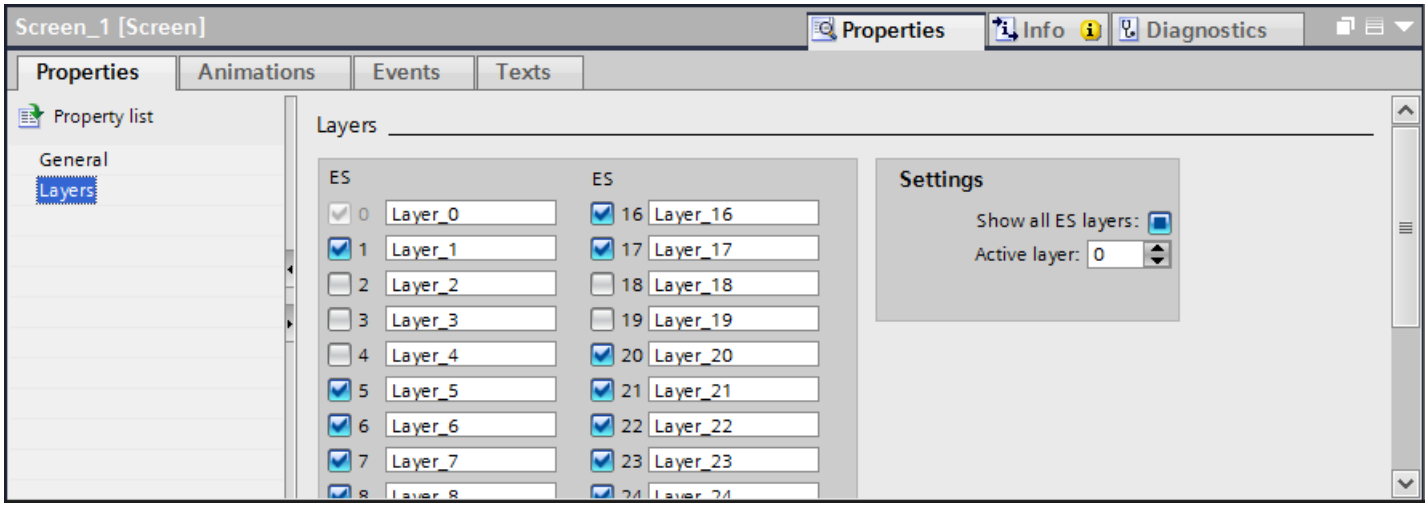
1. Select the layer that you want to hide or show in the "Layout > Layers" task card.
2. Click one of the icons next to the corresponding layer:
   - A shown layer is hidden
   - A hidden layer is shown

   Note

   The active layer cannot be hidden.

Alternative procedure

1. Click in an area of the screen that does not contain an object.
   The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers":



3. In the list, disable the levels you wish to hide.
   If you activate "All ES layers" for a layer, the objects in this layer will be shown in the Engineering System.

Result

The layers are shown according to your settings.

See also

Moving objects on layers (Page 5143)

Basics on working with layers (Page 5142)

12.1.6.5 Renaming layers

Introduction

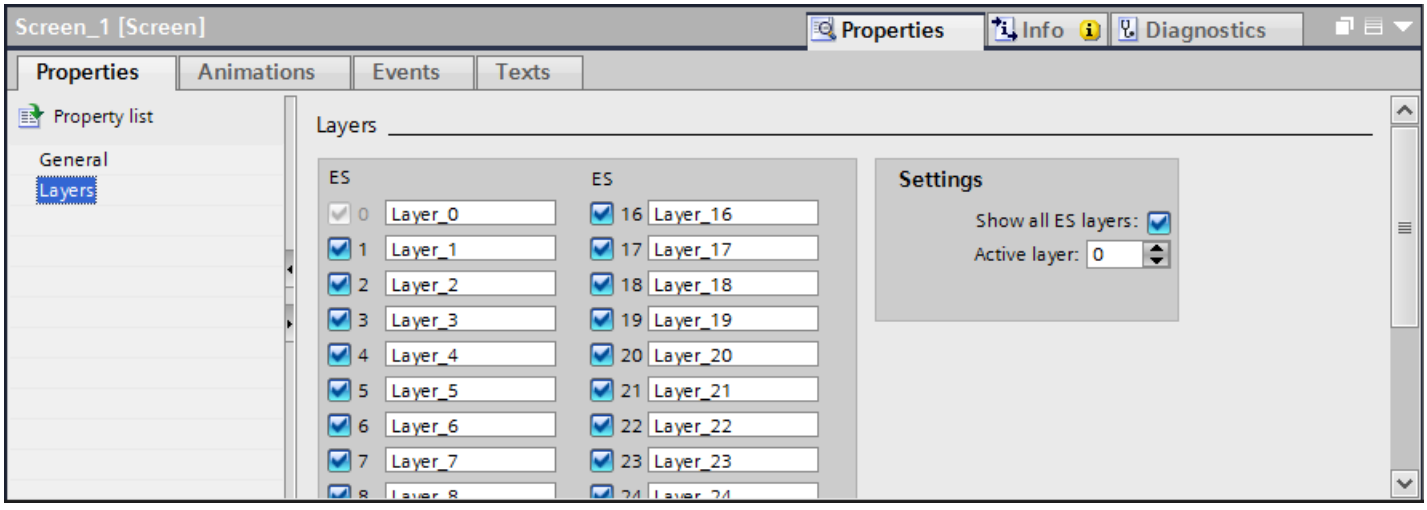
When you create a screen, the 32 layers are numbered consecutively by default. To improve clarity, you can rename the layers to suit your requirements.

Requirement

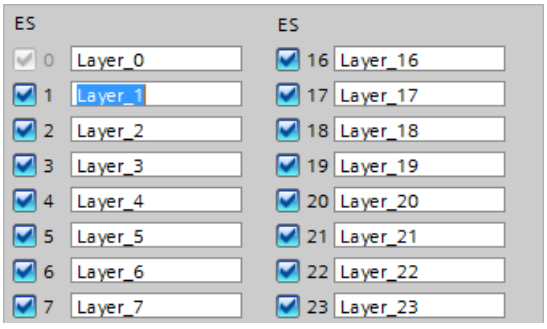
- The screen is opened.

Procedure

1. Click in an area of the screen that does not contain an object.
   The screen properties are shown in the Inspector window.
2. In the Inspector window, select "Properties > Properties > Layers".



3. Enter the new layer name.



Result

The layer is displayed with the new name.

See also

Moving objects on layers (Page 5143)

Basics on working with layers (Page 5142)

12.1.7 Working with faceplates

12.1.7.1 Basics on faceplates

Basics on faceplates (Panels, RT Advanced, RT Professional)

Introduction

Faceplates are a configured group of display and operating objects that you manage and change centrally in a library. You can use a faceplate in several projects as required. The faceplates are stored in the project library.

Use

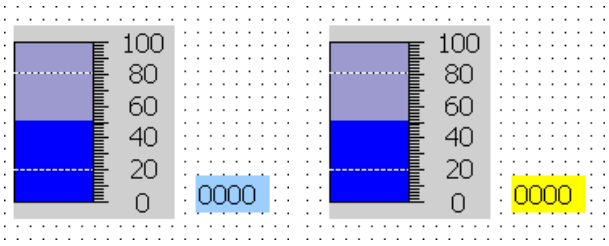
You use faceplates to create individually configured display and operating objects. You can use faceplates several times in the project or in different projects. All instances of a faceplate in the project are changed centrally. This reduces the configuration effort.

Types and instances

Faceplates are based on a type-instance model to support the central changeability. You create central properties for an object in types. The instances represent local points of use of the types.

- Faceplate type
  You create a display and operating object according to your requirements and store it in the project library. The instances are bound to the respective faceplate type. If you change a property of a faceplate type, the property is saved centrally and also changed in all instances. In the faceplate type, you define the properties that can be changed on the faceplate. You edit a faceplate type in the "Faceplates" editor.
- Faceplate
  The faceplate is an instance of the faceplate type. You use a faceplate in screens as a display and operating object. You configure the variable properties of the faceplate type on the instance. You assign the tags of your project to the faceplate, for example. If you configure properties on the faceplate, you overwrite the properties of the faceplate type. The changes on the faceplate are saved at the point of use and have no effect on the faceplate type. To reset the variable properties at the faceplate to the properties of the faceplate type, select "Reset instance" in the shortcut menu.

The figure below shows the relationships between the faceplate type and the faceplate. The background color of the I/O field is configured in the faceplate type in such a way that every instance can change the property. Blue is used as the background color in the faceplate type. You use yellow as the background color in the faceplate.



When you change the background color in the faceplate type, this has no effect on the faceplate because the "Background color" property is assigned on an instance-specific basis.

Screen basics (Page 4979)

Basics of dynamizing faceplates (Page 5172)

Example: Configuring a faceplate (Page 5173)

Device dependency of faceplates (Panels, RT Advanced, RT Professional)

Device dependency of faceplates

Not all HMI devices support every display and operating object. The screen objects that are not available in the respective HMI device are not displayed when using the faceplate.

Independent of the device, all properties are offered for the configuration during the generation of faceplates. When using a faceplate in a screen, only the properties supported by the configured device are available.

The following devices support faceplates:

Runtimes

- WinCC Runtime Advanced
- WinCC Runtime Professional

Comfort Panels

- KTP 400
- KP 400
- TP 700
- KP 700
- TP 900
- KP 900

- TP 1200
- KP 1200
- TP 1500
- KP 1500
- TP 1900
- TP 2200

Panels

- TP 277
- OP 277

Mobile Panels

- Mobile Panel 277

- Mobile Panel KTP 400F
- Mobile Panel KTP 700
- Mobile Panels KTP 700F
- Mobile Panel KTP 900
- Mobile Panel KTP 900F

Multi Panels

- MP 277
- MP 377

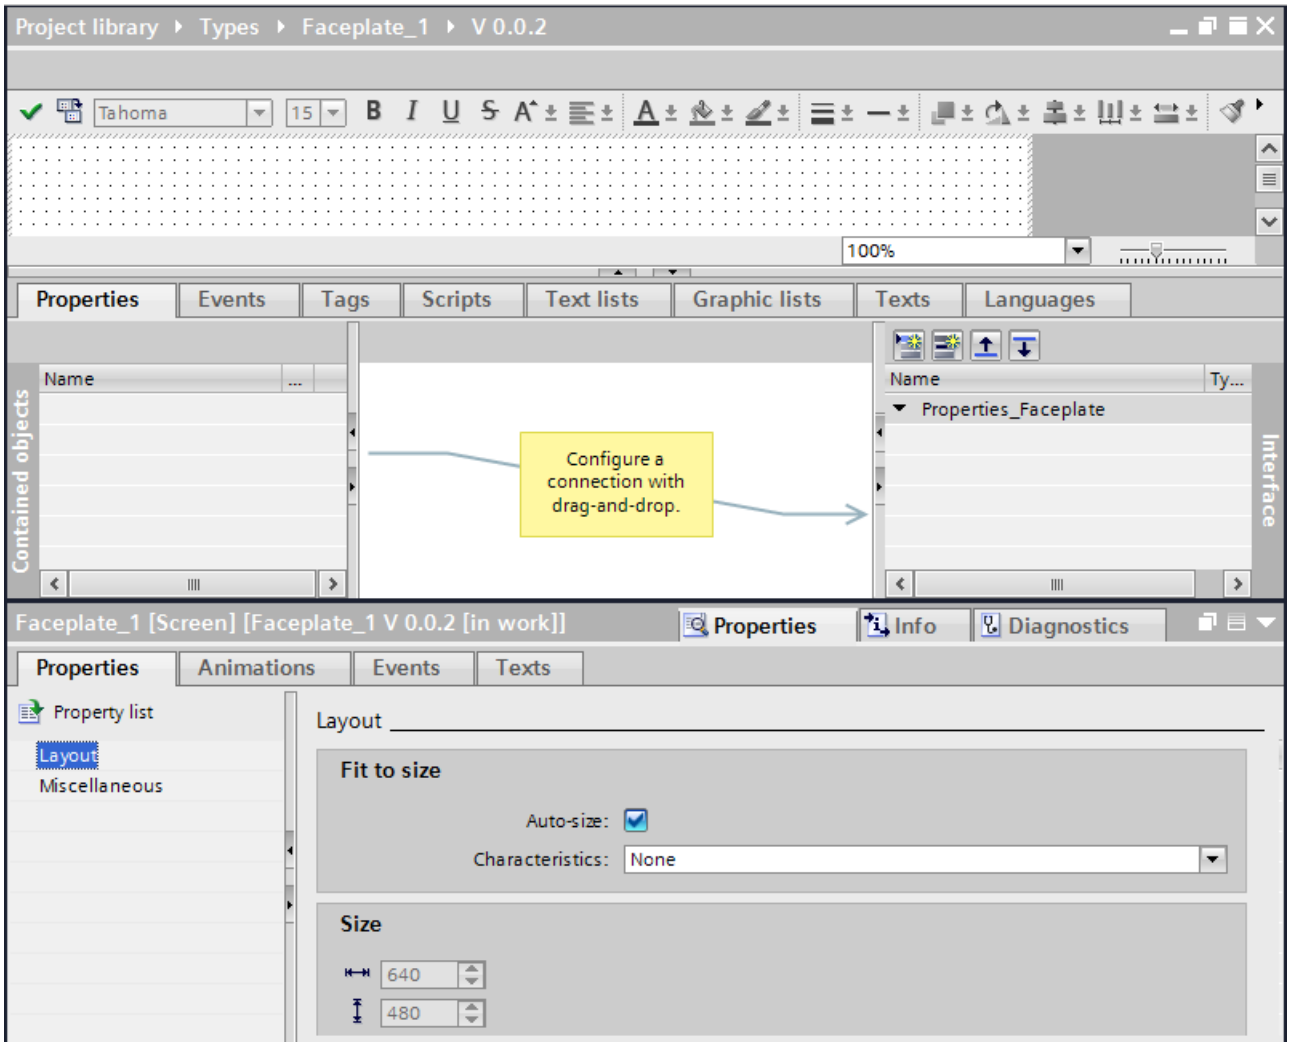
Faceplate editor (Panels, RT Advanced, RT Professional)

Open

Create faceplate types and edit them in the library view.

Layout

The library view for faceplate types consists of several editors, e.g. "Screens" and "Tags" which are arranged in the work area and the configuration area.



Work area

In the work area, place the objects contained in the faceplate type as you usually do in the "Screens" editor. You can remove objects, or use the "Toolbox" task card to add new objects.

Note

Faceplates cannot be rotated or mirrored.

Configuration section

- Properties
  The static and dynamic properties are identified as follows:
  - The symbol identifies a dynamic property. Dynamic implementation of this property, using tags or text and graphic lists.
  - The symbol identifies a static property. You change only the values of a static property.

  Note

  Device dependency of static properties

  Static properties are only available for panels and RT Advanced.

  You define the faceplate type properties in the "Properties" tab.
  You use the following two lists for this:
  - The "Contained objects" list
    This list includes the properties of the objects contained in the faceplate type. These properties can only be configured in the faceplate type in the "Faceplate" editor.
  - The "Interface" list contains the properties and tags of the faceplate type. The "Interface" list consists of the pre-defined category "Dynamic properties" and user-defined categories.
- Events
  You define the faceplate type events in the "Events" tab. You use the following two lists for this:
  - The "Contained objects" list contains the events of the objects embedded in the faceplate type.
  - The "Interface" list contains the events of the faceplate.
    You create links between the two lists using a drag and drop operation.
- Tags
  You can also create faceplate tags on the "Tags" tab. The tags are only available within the faceplate type. You can interconnect the faceplate type tags directly with an object contained in the faceplate type.
- Scripts
  You configure scripts for the faceplate type in the "Scripts" tab. In the script, you can call system functions or program new functions to convert values, for example. The scripts are only available within the faceplate type. They work with VB Script code.

  Note

  The "Scripts" tab is not available for Runtime Professional.

- Text lists
  You can also create and edit texts lists for the faceplate type in the "Text lists" tab. These text lists are only available within the faceplate type. You can interconnect the text lists of the faceplate type directly with an object contained in the faceplate type, such as a symbolic I/O field.

- Graphic lists
  If necessary, you can also create graphics lists for the faceplate type in the "Graphics lists" tab. These graphic lists are only available within the faceplate type. You can interconnect the graphic lists of the faceplate type directly with an object contained in the faceplate type, e.g. a graphic I/O field.
- User texts
  The "User text" tab shows the contained user text of the opened faceplate type, for example entries from text lists. You can enter the compilations for the individual project languages directly in the "User text" tab.

Basics on faceplates (Page 5148)

Example: Configuring a faceplate (Page 5173)

12.1.7.2 Creating and managing faceplates

Creating a faceplate type (Panels, RT Advanced, RT Professional)

Introduction

Faceplate types are display and operating objects which are made up of several objects, e.g. controller modules.

Requirements

You have opened a screen which contains multiple objects.

Procedure in the project view

1. Select all the objects that you need for the faceplate type.
2. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. A dialog opens.
3. Enter a name for the faceplate.
4. If necessary, add a comment or change the version number.

Result

The library view opens. Two versions of the type are displayed in the "types" folder. Version 0.0.1 has been released and contains the currently selected objects.

The 0.0.2 version has the status "in progress". Edit the faceplate type in version 0.0.2 as required.

Procedure in the library view

1. The library view is open.
2. Select the "Add new type" command in the shortcut menu of the project library. A dialog opens.
3. Select the runtime for which the faceplate type is to be available. An empty faceplate type is created.
4. Drag-and-drop the objects from the "Toolbox" task card to the work area of the faceplate type.

Result

The new faceplate type is created and displayed under the selected name in the project library.

The faceplate type is assigned the status "in progress" and the version 0.0.1.

Removing faceplate from faceplate type (Page 5171)

Resizing a faceplate (Page 5169)

Configuring a faceplate type (Panels, RT Advanced, RT Professional)

Introduction

In the configuration area of the "Faceplates" editor you define which properties and process values of the objects contained in the faceplate can be configured in the "Properties" tab.

Note

For tooltip texts configured for objects in the faceplate to be displayed in Runtime, insert the property "Tooltip text" as faceplate property.

Note

Independent of the device, all properties are offered for the configuration during the generation of faceplates. When using a faceplate in a screen, only the properties supported by the configured device are available.

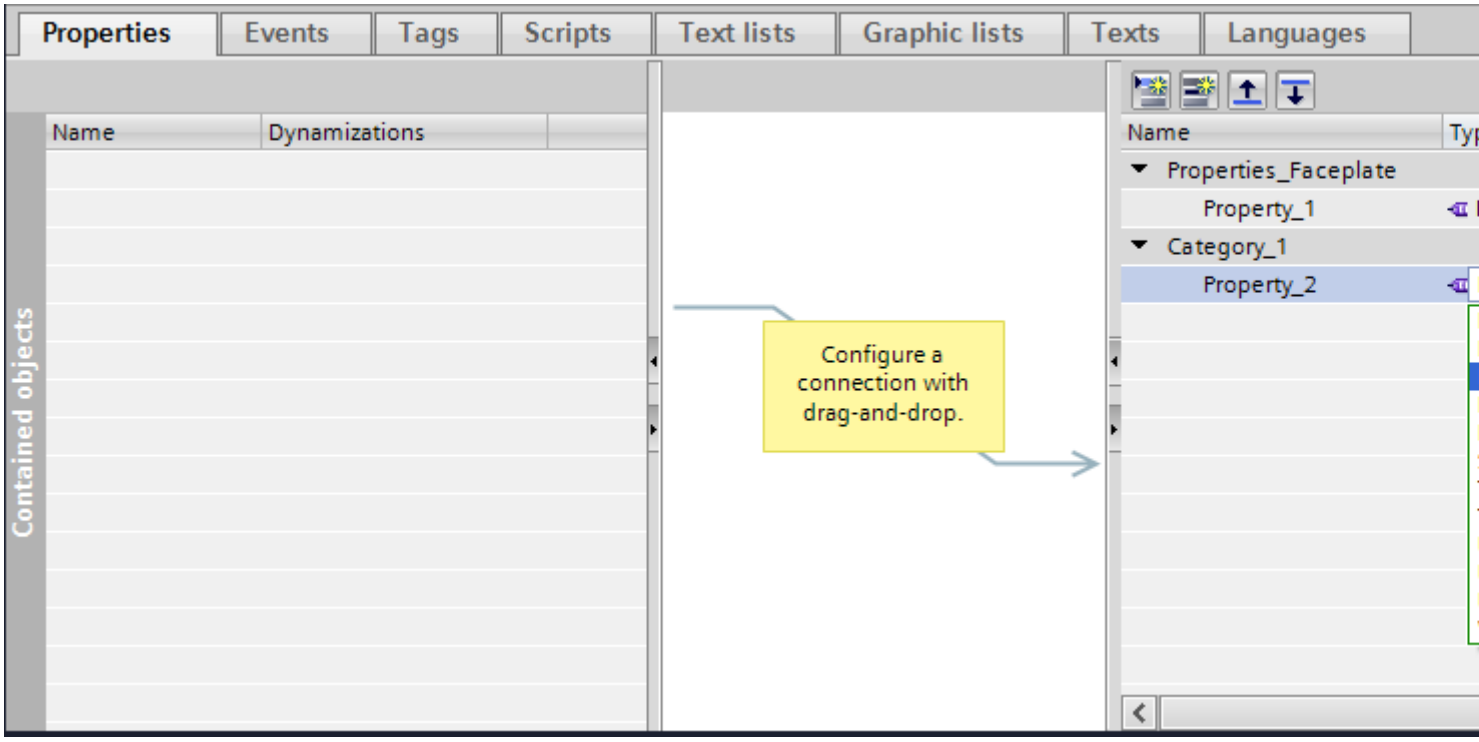
Requirements

- The faceplate is generated and is displayed in the "Faceplate" editor.
- The "Properties" tab is open in the configuration area.

Procedure

1. To create a new property, click the "Add property" button in the interface list.
   A new property is displayed in the "Interface" list.
2. To create a new category, click the "Add category" button in the interface list.
   A new category including a new property is displayed in the "Interface" list.

3. Click the name of the property and assign a name, for example, "Color".
4. Select the data type.



Note

Property names of the faceplates in RT Professional

Note the following rules when entering property names of the faceplates:

- The name must start with a letter.
- The name can contain alphanumeric characters and the underscore.
- The name may not contain more than 255 characters.
- Do not use any UNICODE characters (for example, Chinese characters).

Note

Using user data types (UDTs) in faceplates in RT Professional

If an element of a faceplate is assigned as data type of the user data type (UDT), the following rule applies:

The length of the name of a property of the faceplate together with the length of the name of the lower-level element of the "User Data Type" (UDT) data type must not exceed 126 characters.

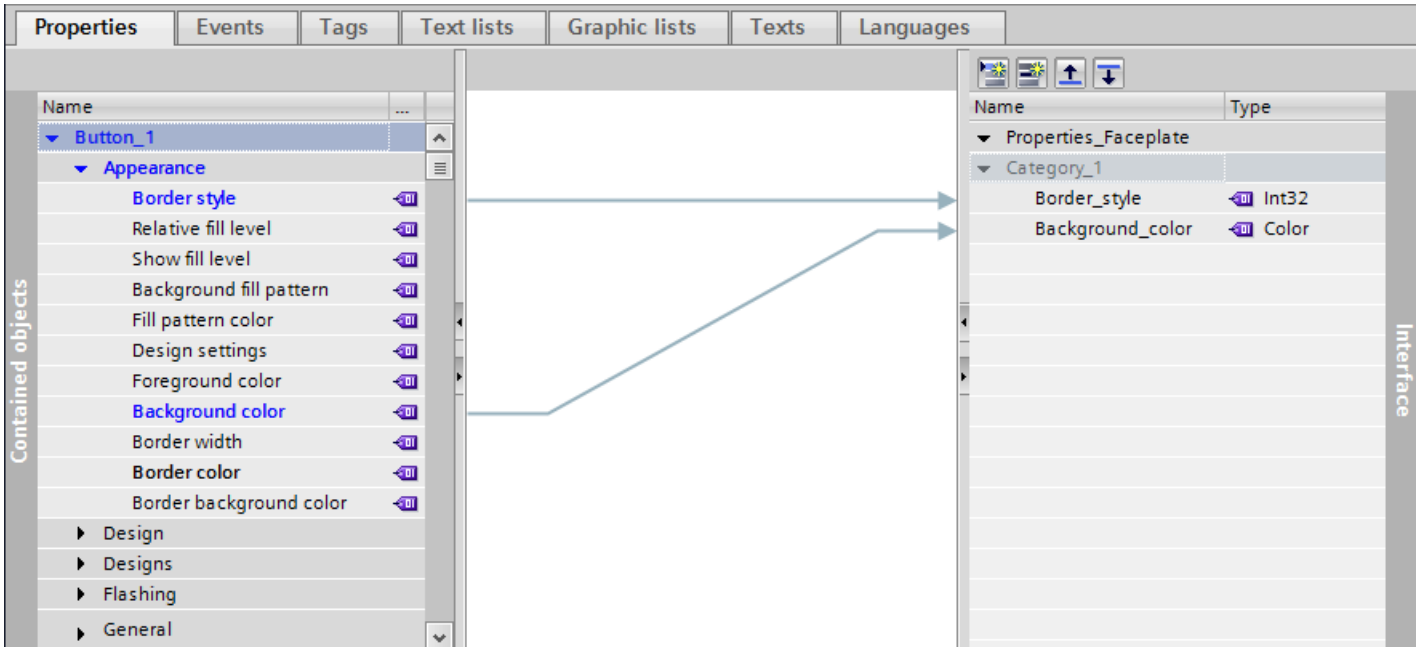
Interim result

You have created a new property.

1. Click an object in the "Contained objects" list.
2. Select a property, e.g. "Appearance > Background color".
3. Move the property from the "Contained objects" list to the desired property in the "Interface" list by drag&drop.
   The connection is displayed as a colored line.
   The system assigns the same data type to the property in the "Interface" list as that of the property in the "Contained objects" list.
   To change the data type, select the data type from the data types of the connected property.
4. Repeat step 3 to connect other properties of the contained properties with the interface.

Note

The property from the "Contained objects" list must be in concordance with the data type of the already connected property of the "Interface" list.



Deleting a connection

1. Click the connection that you wish to delete.
2. In the shortcut menu select the "Delete" command or use the <DEL> key.
   The connection is deleted.

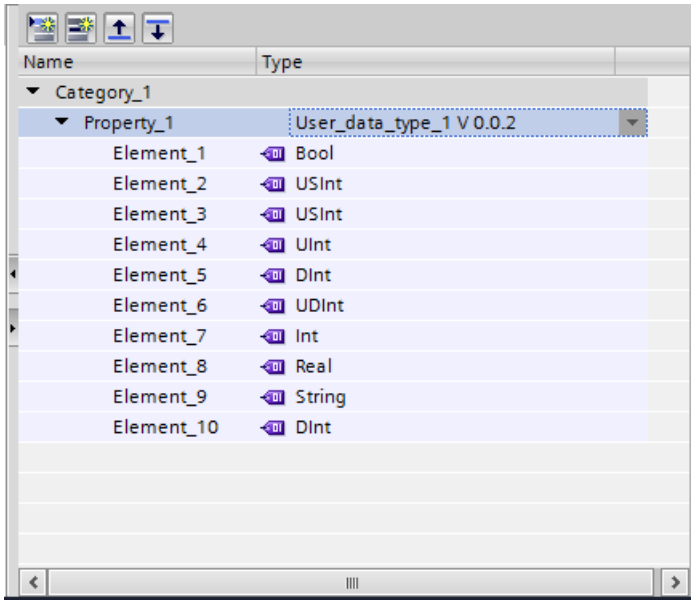
Interconnecting user data types with faceplates

As of V13 SP1, you can use the HMI user data types and the PLC user data types as properties of the faceplates.

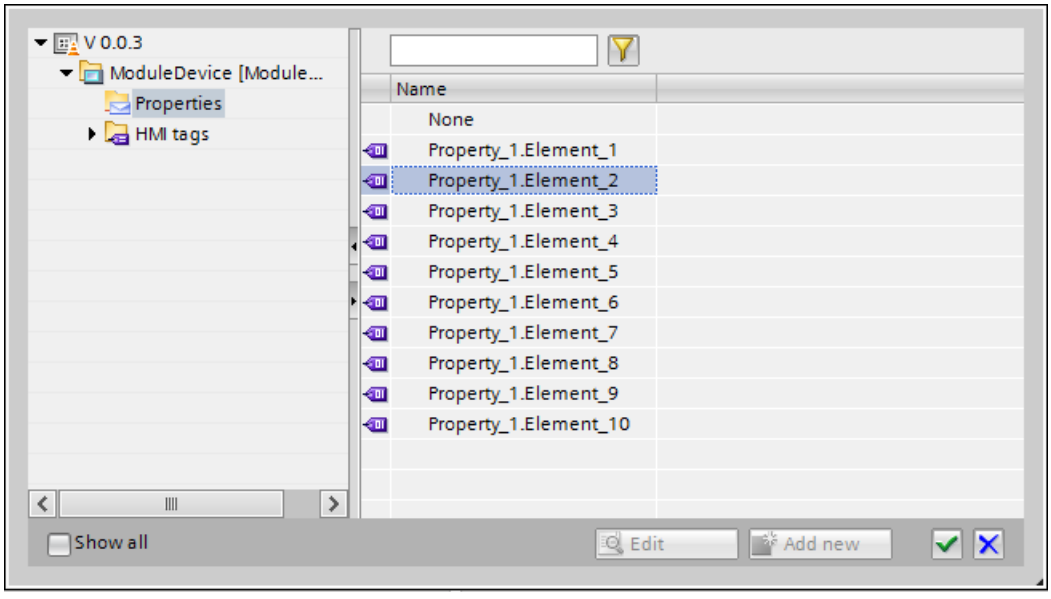
You interconnect the HMI user data types and the PLC user data types with the faceplates using interface properties by connecting the faceplates with the structural elements of the interface properties.

To set the HMI user data types and the PLC user data types as properties of the faceplates, follow these steps:

1. Select the user data type in the selection list under "Type".



2. In the Inspector window under "Properties > Properties > General", select the interface property of the faceplate in the "Tag" selection list.



The faceplate is interconnected with the user data type.

Result

You have created a new property or a new category with a property. You have connected the property of the interface with a property of the contained objects. If you use an instance of the faceplate type in a screen, you configure the properties of the faceplate which you have created in the "Interface" list.

Note

Device dependency of static properties

Static properties are only available for panels and RT Advanced. You work with dynamic properties in RT Professional.

See also

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Editing the category and property of a faceplate type (Panels, RT Advanced, RT Professional)

Deleting a property in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the property which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The property is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific property.

Deleting a category in the "Interface" list

1. Select "Edit faceplate" in the shortcut menu. The "Faceplates" editor is open.
2. Select the category which you want to delete in the "Interface" list.
3. Select "Delete" in the shortcut menu.

The category including the properties is deleted from the "Interface" list. Existing connections to the contained objects are deleted. All linked faceplates lose their instance-specific properties.

Moving a property to another category

1. Select a property in the "Interface" list.
2. Move the property to a new category by "drag&drop".

You have moved the property to a new category.

Changing the data type of a property

1. Select a property in the "Interface" list.
2. Click the second column of the drop-down list.
3. Select a data type.

You have changed the data type of the property in the "Interface" list.

Creating a faceplate type (Page 5153)

Configuring a tag in the faceplate type (Panels, RT Advanced, RT Professional)

Introduction

You connect a tag in the faceplate type directly with the properties of the objects contained in the faceplate type. The tags in the faceplate type are a central means of defining dynamic properties in the faceplate type.

The tags of a faceplate type have limited functionality. The "Tags" tab of the configuration area has the same structure as the "Tags" editor.

Note

Use of the "." or "@" character in names of tags in faceplate types is not permitted. Do not use the special characters in the tag names in faceplates.

Array elements for faceplates

In the following situations, you may not assign an array element or a multiplex tag that is interconnected with a faceplate to a property of a screen object:

- The property is configured in a faceplate as parameter of a system function.
- System functions or scripts are assigned in the faceplate to events of the property.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Tags" tab is open in the configuration area.

Procedure

1. Click "Add" in the "HMI tags" table. A new tag is created in the faceplate type.
2. Open "Properties > Events" in the inspector window if necessary. You configure the "Value change" event on the tag for example.
3. In the work area, select the object to which you want to assign this tag, e.g. an I/O field.
4. Select the tag in the inspector window of the I/O field "Properties > Properties > General > Process > Tag".

Note

Only tags of the faceplate type are displayed in the object list in the "Faceplates" editor.

Result

You have created a tag in the faceplate type. You are using the tag in the faceplate for scripting, for example.

See also

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Configuring an event in the faceplate type (Panels, RT Advanced)

Introduction

In the configuration area of the "Faceplates" editor you define which events of the objects contained in the faceplate can be configured in the "Events" tab. You configure a function list on the events of the faceplate in the "Screens" editor.

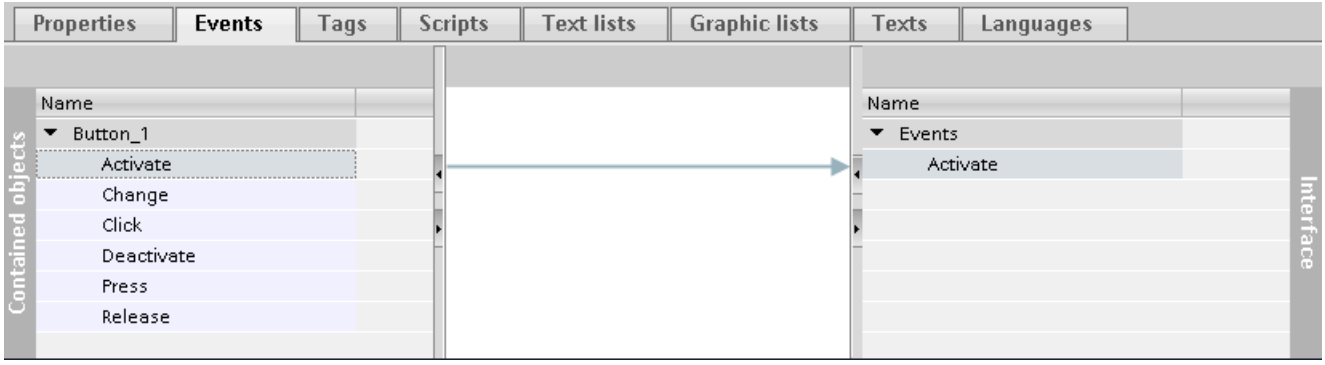
Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Events" tab of the configuration area is open.

Procedure

1. Click an object in the "Contained objects" list.
2. Select an event, e.g. "Activate".

3. Move the event from the "Contained objects" list to a new category in the "Interface" list.
   The new event is displayed in the "Interface" list.
   The connection appears as a colored line.



4. Double-click the event and, if required, change the name of the event.

Result

You have created an event in the faceplate type. if you use an instance of the faceplate type, you will only be offered the configured events in the inspector window. You configure a function list on the event in the faceplate.

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Configuring scripts in the faceplate type (Panels, RT Advanced)

Introduction

In the configuration area of the "Faceplates" editor you create scripts which you only use within a faceplate type. You can only refer to tags of the faceplate type or properties of the contained objects within the script. The script is used as a copy in the instance of the faceplate type.

Requirement

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- Faceplate tags or dynamic properties have been created.

Procedure

1. Click the "Scripts" tab in the configuration area of the faceplate.
2. Double click "Faceplate scripts > Add VB script".
3. Write the program code.
4. Press the shortcut keys <CTRL+J> to Include tags of the faceplate type in the script. The object list opens.
5. Click "HMI tags".
   All tags of the faceplate type are displayed in the object list.
6. Select a tag and confirm the selection.
7. Press the shortcut keys <CTRL+J> to use properties of the faceplate type in the script. The object list opens.
8. Click "Properties".
   All dynamic properties of the "Interface" list for the faceplate type are displayed in the object list.

Result

You have created a script in the faceplate type. The instance of the faceplate type uses a copy of the script. The script is executed in runtime depending on the configuration.

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Configuring text lists in the faceplate type (Panels, RT Advanced, RT Professional)

Introduction

In a faceplate type, you connect a text list with an object included in the faceplate type. Text is assigned to the values of a tag in a text list. The text list is used, for example, to display a selection list in a symbolic I/O field contained in the faceplate type. The interface between the text list and a tag of the faceplate type is configured at the object that uses the text list.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Text list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

Procedure

1. Click "Add" in the "Text lists" table. A new text list is created in the faceplate type.
2. Assign a name to the text list that indicates its function.
3. Select the text list type, e.g. "Value/Range" under "Select".
4. Click "Add" in the "Text list entries" table.
5. Define the values or range of values for the text list.
6. Enter a text for every value range which is displayed in Runtime when the tag is within the specified value range.
7. Select an object, e.g. a symbolic I/O field, in the work area of the faceplate type.
8. In the Inspector window of the object, enable "Properties > Properties > General > Label > Text list".
9. Select the "Text list" from the selection list.
10. Select a tag of the faceplate type under "Process > Tag".

Result

You have created a text list in the faceplate type. This text list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

Creating a faceplate type (Page 5153)

Configuring a graphics list in the faceplate type (Panels, RT Advanced, RT Professional)

Introduction

In a graphics list, specific graphics are assigned to possible values of a tag. In a faceplate type, you connect a graphics list with an object included in the faceplate type. Graphics are assigned to the values of a tag in a graphics list. For example, the graphics list is used to display a selection list in a graphic I/O field contained in the faceplate type. The interface between the graphics list and a tag of the faceplate type is configured at the object that uses the graphics list.

Requirements

- The library view is open.
- The faceplate type is created and has the "in progress" status.
- The "Graphics list" tab is open in the configuration range.
- A tag has been created in the faceplate type.

Procedure

1. Click "Add" in the "Graphics lists" table. A new graphics list is created in the faceplate type.
2. Assign a functional name to the graphics list.
3. Select a graphics list type, e.g. "Range (... - ...)", under "Selection".
4. Click "Add" in the "Graphics list entries" table. A new entry is created in the list.
5. Define the values or range of values for the graphics list.
6. Select a graphic for every value or value range which is displayed in runtime when the tag is within the specified value range.
7. Select an object, e.g. a graphic I/O field, in the work area of the faceplate type.
8. Activate "Properties > Properties > General > Contents > Graphics list" in the object's Inspector window.
9. Select the "Graphics list" from the selection list.
10. Select a tag of the faceplate type in "Process > Tag".

Result

You have created a graphics list in the faceplate type. This graphics list is linked to an object contained in the faceplate type. You have configured a faceplate type tag at the object.

Creating a faceplate type (Page 5153)

Translating texts directly in the faceplate type (Panels, RT Advanced, RT Professional)

Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

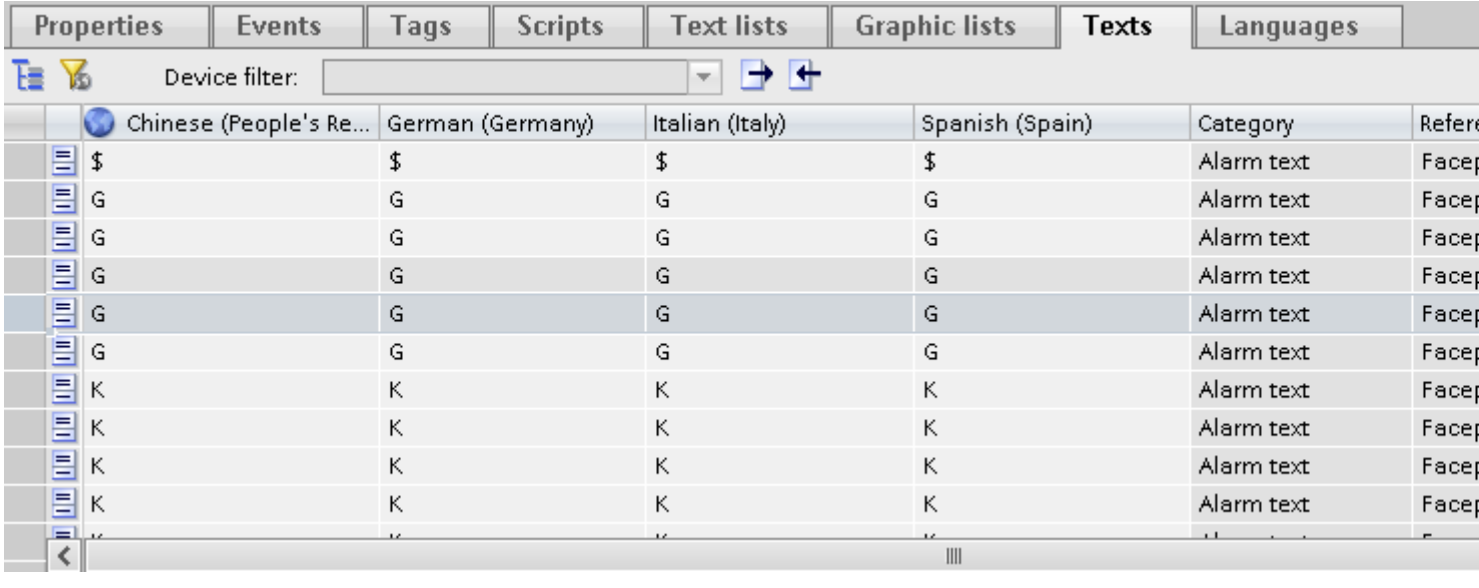
Requirements

- A project is open.
- You have opened the "Faceplates" editor.
- You have created a faceplate type.
- The faceplate type contains at least one object with text, e.g. a text field.

Procedure

Proceed as follows to translate individual texts:

1. Open the "Tasks" task card.
2. Click the button under "Languages & Resources > Editing language". The "Project languages" editor opens.
3. Activate at least two project languages.
4. Open the "Texts" tab in the "Faceplates" editor.
   A list with the texts in the project is displayed in the work area. There is a separate column for each project language.



5. Click on the button in the toolbar to group identical texts together.

6. To hide texts that do not have a translation, click on the button in the toolbar.
7. Click on an empty column and enter the translation.

Result

You have translated individual texts in the "Texts" tab of the faceplate type. The texts will then be displayed in the runtime language.

Editing a faceplate type (Panels, RT Advanced, RT Professional)

Introduction

All faceplate types in the project library have a status. You create a faceplate type in the "in progress" status. You can edit the faceplate types as required in this status. When editing is complete, release the faceplate type.

Requirement

- A faceplate type has been created.
- The faceplate type has the version 0.0.1. and the status "in progress".
- The "Library" task card or the library view is open.

Enable faceplate type

1. Select version 0.01 of the faceplate type in the project library.
2. Select "Release version" in the shortcut menu.

You have released version 0.0.1 of the faceplate type.

Edit faceplate type

1. Select, for example, the released version 0.0.1 of a faceplate type in the project library.
2. Select "Edit faceplate type" in the shortcut menu.

The library view opens. The new version 0.0.2 of the faceplate type has been created.

The faceplate type has the "In progress" status.

Restoring the last version of the faceplate type

The last released version of the faceplate type is version 0.0.2.

Edit the faceplate type. A new version 0.0.3 is created and the "in progress" status is assigned to it.

1. Select the faceplate type from the project library.
2. Select "Discard changes and restore type" in the shortcut menu.

All changes to the faceplate type since the last enabling operation are rejected. The faceplate type is enabled again and has the version 0.0.2.

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Duplicating faceplate type

Introduction

You can duplicate a released faceplate type and a released version of the faceplate type in the project library.

Requirement

- A faceplate type has been created.
- The faceplate type is released and no version of the faceplate type has the "in progress" status.
- The "Libraries" task card or the library view is open.

Duplicating faceplate type

1. Select a released faceplate type from the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.
   A dialog opens.
3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.
   The new faceplate type is in the same folder as the original.

Duplicating a version of a faceplate type

1. Select a released version of a faceplate type in the project library.
2. Select "Duplicate faceplate type" in the shortcut menu.
   A dialog opens.
3. Enter a name for the new faceplate type.
4. If necessary, add a comment or change the version number.
   The new faceplate type is in the same folder as the original.

See also

Editing a faceplate type (Page 5167)

Creating a faceplate type (Page 5153)

Resizing a faceplate (Panels, RT Advanced)

Introduction

In the faceplate type, specify the response of the faceplate when it is resized.

Requirements

- A faceplate type has been created.
- You have opened the "Faceplates" editor.
- The Inspector window is open.

Specifying the response to resizing

1. Activate "Properties > Properties > Layout > Fit to size > Auto-size".
2. Select the "Fixed aspect ratio" setting, for example.
   This setting retains the aspect ratio when you resize the faceplate.
3. Click the faceplate in the "Libraries" task card.
4. Select "Release version" in the shortcut menu.

Result

You have specified how the faceplate responds when its size in a screen is changed. You can change the response for a particular faceplate.

Select a faceplate in the screen. Select the required setting in "Properties > Properties > Layout > Characteristics" in the Inspector window.

See also

Creating a faceplate type (Page 5153)

Creating an instance of the faceplate type (Panels, RT Advanced, RT Professional)

Introduction

The faceplate type is stored in the project library. If you use the faceplate type in a screen, you create an instance of the faceplate type.

Note

Note that a faceplate is always configured for a particular class of HMI devices. For example, you cannot use a faceplate type that is configured for "RT Professional" in a screen on an "RT Advanced" HMI device.

Note

The number of faceplate instances per screen is not limited. However, you should be aware of the fact that the number of faceplate instances used, or the use of scripts in the faceplate instances, will have an impact on performance.

Requirement

- A screen is open.
- The "Libraries" task card is opened.
- The project library is open and it contains at least one faceplate type.

  Note

  Faceplate types are also stored in global libraries. When you add a faceplate type from the global library to the screen, the system automatically saves a copy of it to the project library.

- The Inspector window is open.

Procedure

1. Move the desired faceplate type from a library to the screen by drag&drop.

Result

You have created an instance of the faceplate type. The instance is given the version number of the most recently released type.

Configure the properties of the faceplate in the Inspector window as required. To dynamize the faceplate, open the interface in the Inspector window.

See also

Creating a faceplate type (Page 5153)

Example: Configuring a faceplate (Page 5173)

Removing faceplate from faceplate type (Panels, RT Advanced, RT Professional)

Introduction

Cancel application, to remove specified instances from the update of the faceplate type.

Requirement

- A faceplate type has been created.
- The faceplate must be used in a minimum of one screen.

Disconnect the faceplate object from faceplate type.

1. Select a faceplate on the screen.
2. In the shortcut menu, select "Disconnect faceplate object from faceplate type".

Result

The faceplate is independent of the associated faceplate type. Changes to the faceplate type are not updated in the faceplate.

See also

Creating a faceplate type (Page 5153)

12.1.7.3 Dynamizing faceplates

Basics of dynamizing faceplates (Panels, RT Advanced, RT Professional)

Use

You can dynamically control events and properties of faceplates in two ways:

- Dynamically controlling faceplates
  You configure the events or dynamic properties individually for the application point on the faceplate. To do this, define in the "Faceplates" editor that these properties and events are configurable in the faceplate. To dynamize the faceplates in the "Screens" editor, use the scripts and tags that are created in the project.
- Dynamizing the faceplate type
  You dynamize the objects which are contained in the faceplate type in the "Faceplates" editor. You configure the individual objects as in the "Screens" editor. Tags and scripts are available in the "Faceplates" editor to dynamize properties and events. You do not have access to the tags and scripts of the project within the faceplate.
  Every faceplate created with the faceplate type has the same preconfigured dynamization. You can edit this dynamic control only in the "Faceplates" editor.

Note

Dynamization of instances of a faceplate type in a group

You are using the instance of a faceplate type in an object group. The properties of the instance are also displayed as properties of the group. Any dynamization with tags, scripts or animations of the group is not displayed in Runtime.

Animation

WinCC provides preconfigured dynamic control in the "Animations" task card. You use animations to dynamize faceplates and faceplate types.

See also

Basics on faceplates (Page 5148)

Example: Configuring a faceplate (Page 5173)

Dynamizing faceplates (Panels, RT Advanced, RT Professional)

Introduction

You dynamize a faceplate in exactly the same way as you dynamize an object from the "Tools" task card.

You connect the dynamic properties of the faceplate in the "Screens" editior with a tag or a script which supplies values to the property in runtime.

You Include tags and scripts which you have created in the project for the faceplate.

Requirements

- A faceplate is inserted in the screen.

Procedure

1. Select the faceplate.
2. In the Inspector window, open "Properties > Animation".
   The animations available for the selected object are displayed.
3. Select "Horizontal movement" and click the button.
   The parameters of the animation are displayed.
   A transparent copy of the object is shown in the work area, which is connected to the source object by means of an arrow.
4. Select a tag for control of movement.
5. Move the object copy to the relevant destination. The system automatically enters the pixel values of the final position in the Inspector window.
6. Customize the range of values for the tag as required.

Result

In Runtime, the object moves in response to every change in value of the tag that is used to control the movement. The direction of movement corresponds to the configured type of movement "horizontal".

12.1.7.4 Examples of faceplates

Example: Configuring a faceplate

Introduction

In this example you create a faceplate in which you can convert the value of a length measuring system from kilometers into meters. The length in meters is displayed in an output field.

Procedures overview

The example is divided into the following steps:

1. Creating a faceplate type
2. Configuring a faceplate type
3. Creating a script in the faceplate type
4. Connecting a script with the contained objects of the faceplate type
5. Creating a faceplate and connecting with a tag

See also

Basics on faceplates (Page 5148)

Example: Creating an instance of the faceplate type (Page 5178)

Example: Configuring included objects (Page 5178)

Example: Creating a script in the faceplate type (Page 5176)

Example: Configuring a faceplate type (Page 5175)

Example: Creating a faceplate type (Page 5174)

Example: Creating a faceplate type

Task

You create a faceplate type.

Requirement

- A screen is open.
- The toolbox window is displayed.

Settings

For the example you require objects with the following settings:

Object	Object name	Properties
Text field	Label_Meter	Text: Meter
I/O field	Output_Meter	Mode: Output
Button	KM_to_Meter	Text OFF: Convert

Procedure

1. In the toolbox, click the individual objects and drag&drop the objects into the screen.
2. Set the properties as shown above.
3. Select all objects.
4. Select the "Create faceplate type" command in the shortcut menu of the multiple selection. The "Add type" window opens.
5. Enter "KMtoMeter" as type name.

Result

The faceplate type appears in the project library under the name "KMtoMeter". The faceplate type is assigned the "in progress" status.

See also

Example: Configuring a faceplate (Page 5173)

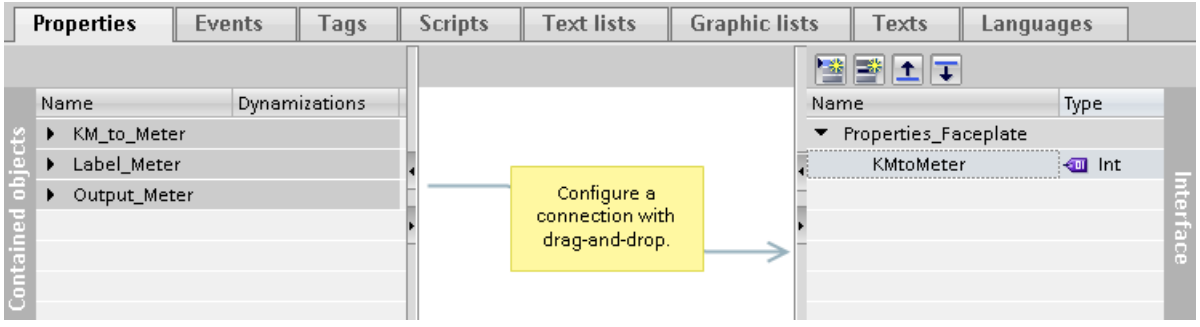
Example: Configuring a faceplate type

Job

You create the dynamic property and tag of the faceplate type.

Creating a new property

1. Click "Properties" in the configuration area of the faceplate.
2. In the "Interface" list, click the icon "Add property".
   A new property is added to the "Interface" list.
3. Double click the name of the property and enter "KMToMeter".
4. Click the selection list and select the data type "Int".



Interim result

The "KMToMeter" property is displayed in the "Interface" list. The symbol identifies the dynamic property. The property will be linked to a tag in the next step.

Creating a tag in the faceplate type

1. Click "Tags" in the configuration area.
2. Click "Add" in the "HMI tags" table. A new tag is added to the table. The inspector window of the tag is opened.
3. In the Inspector window, select "Properties > Properties > General":
4. Enter "BB_Tag" as the name. Select the "Int" data type.

Result

The "KMToMeter" property and the "BB_Tag" of the faceplate type are created in the configuration area of the "Faceplates" editor.

See also

Example: Configuring a faceplate (Page 5173)

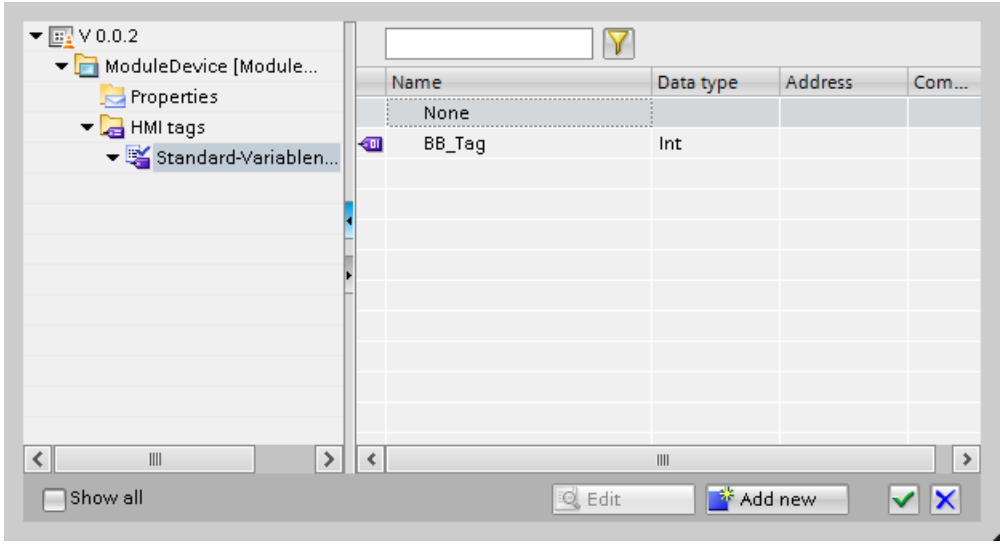
Example: Creating a script in the faceplate type (Panels, RT Advanced)

Task

You create a script that converts the value of a length measuring system from kilometers to meters.

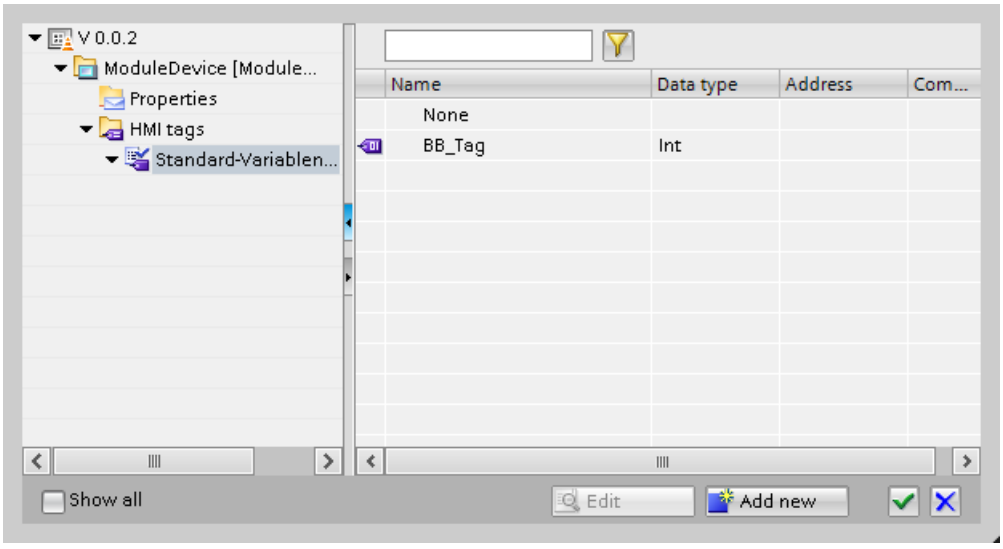
Procedure

1. Click "Scripts > Faceplate scripts" in the configuration area.
2. Double click "Add VB script".
3. Press the shortcut keys <CTRL+J>.
   The object list opens.
4. Click "HMI tags".
   The faceplate tag "BB_Tag" is displayed in the object list.

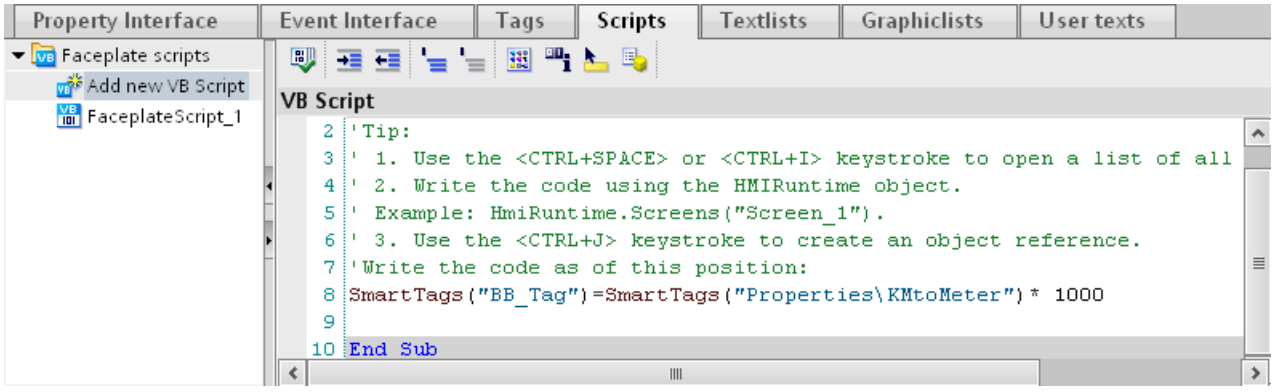


5. Select the faceplate type tag "BB_Tag". Confirm the selection.
6. Insert an "=" sign.
7. Press the shortcut keys <CTRL+J>. The object list is opened.

8. Click "Properties."
   The dynamic property "KMtoMeter" is displayed in the object list.



9. Select the "KMToMeter" dynamic property. Confirm the selection.
10. Enter "*1000" at the end of the code. This corresponds to the conversion factor from kilometers to meters.
11. Enter the name "Script_1" under "Properties > Properties > General >Setting > Name" in the Inspector window.



Result

The script has been created in the faceplate type. If you use the "KMtoMeter" faceplate type in a screen, you assign a tag to the "KMtoMeter" property. The value of this tag is multiplied by factor 1000 and assigned to the tag of the faceplate type "BB_Tag" as a new value. In this way you supply values to the tags of the faceplate type.

See also

Example: Configuring a faceplate (Page 5173)

Example: Configuring included objects

Task

You connect the included objects in the faceplate "KMtoMeter" to a faceplate tag and a faceplate script.

You connect the I/O field with the "BB_Var" tag of the faceplate type. You connect the "Click" event for a button to the script "Script_1".

Requirement

The faceplate is displayed in the "Faceplates" editor.

Interconnecting I/O field with a tag

1. Select the "Output_Meter" I/O field in the faceplate.
2. Connect the I/O field with the faceplate tag "BB_Tag" in the "General > Process > Tag" inspector window.

Connecting an event to a faceplate script

1. Select the "KM_to_Meter" button in the faceplate.
2. Select "Script_1" in the inspector window under "Events > Click".

Result

The I/O field is connected with the tag of the faceplate type. The button is connected with the script of the faceplate type.

If you click the button of the faceplate during runtime, the script is executed. The value of the tag of the faceplate is output in the I/O field.

See also

Example: Configuring a faceplate (Page 5173)

Example: Creating an instance of the faceplate type

Task

You insert the faceplate type "KMtoMeter" in a screen and assign a tag to the dynamic property "KMtoMeter".

Requirement

- The "Screens" editor is open.
- A new screen has been created.

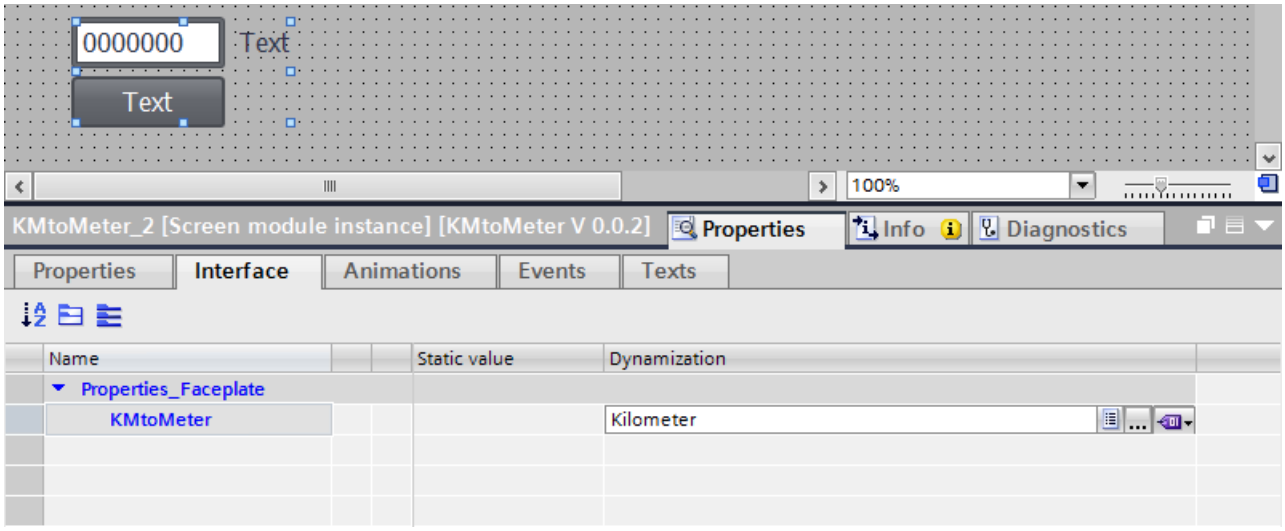
Settings

For the example you require a tag with the following settings:

Name	PLC connection	Type
Kilometer	No	ULong

Procedure

1. Create the HMI tag "Kilometer" with the settings named above.
2. Open the "project library" in the "Libraries" task card.
3. Move the "KMtoMeter" faceplate type into the screen by drag&drop.
4. Click "Properties > Properties > Interface" in the Inspector window.
   The table shows all the properties which you can dynamize in the faceplate.



5. Click the "Dynamization" column in the "KMtoMeter" line.
6. Select "HMI tag".
7. Click the "..." button.
8. Select the tag "Kilometer" from the object list.
9. Confirm the selection.

Result

The dynamic property "KMtoMeter" is linked with the "Kilometer" tag. During runtime the dynamic property is supplied with values of the "Kilometer" tag. The values are multiplied by factor 1000 in the script of the faceplate type and assigned to the tag in the faceplate as a new value.

12.1.8 Configuring screen navigation

12.1.8.1 Basics on screen navigation (Basic Panels, Panels, RT Advanced)

Types of navigation for the screen change

For a production process consisting of multiple subprocesses, you will configure multiple screens. You have the following options to enable the operator to switch from one screen to the next in Runtime:

- Assign buttons to screen changes
- Configuring screen changes at local function keys

Procedure

Before you create a screen change, define the plant structure and derive from it the screen changes that you want to configure.

Create the start screen under "Runtime Settings > General > Start screen".

See also

Screen basics (Page 4979)

Assigning screen change to function key (Page 5182)

Assigning screen change to button (Page 5181)

12.1.8.2 Assigning screen change to button (Panels, RT Advanced, RT Professional)

Introduction

Configure a button in the screen to switch between the screens on the HMI device during operation.

Note

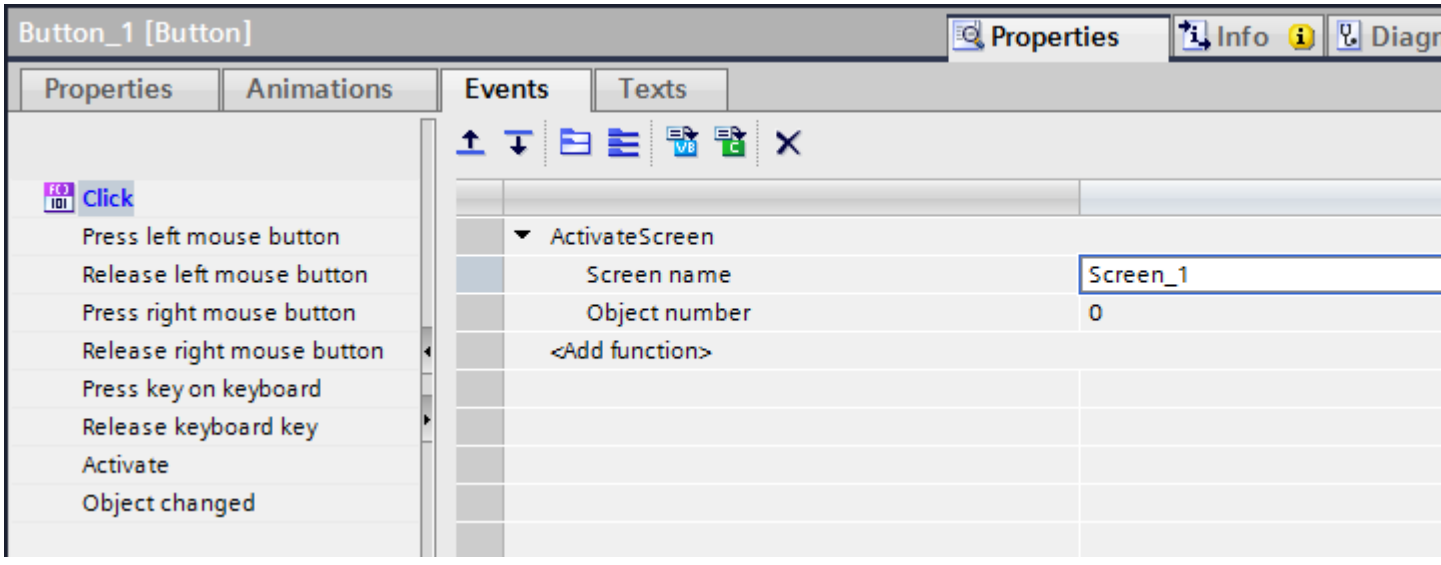
If you have set the "Visibility" of animations to "Hidden" in the Inspector window of a screen, this screen cannot be called up in Runtime.

Requirements

- You have created the project.
- You have created the "Screen_2" screen.
- "Screen_1" is created.

Procedure

1. Double-click "Screen_1" in the project navigation. The screen is displayed in the work area.
2. Move "Screen_2" from the project tree to the open screen by drag&drop.
   A button with the name "Screen_1" is inserted.
3. In the Inspector window, select "Properties > Events > Click".
   The "ActivateScreen" system function is displayed in the "Function list".



4. At the "Object number" attribute, define, if required, the tab sequence number of the object on which the focus is to be set after a screen change. You can also specify a tag that contains the object number.

Alternative procedure

1. Move a button from the "Tools" task card to "Screen2" by drag&drop.
2. In the Inspector window, select "Properties > Events > Click".
3. Select the "ActivateScreen" system function.
4. Select "Screen_2" for the "Screen number".

Result

The operator goes to "Screen_1 with the button in Runtime. If you have specified an object number, the object with this object number has the focus following a screen change.

See also

Basics on screen navigation (Page 5180)

12.1.8.3 Assigning screen change to function key

Introduction

Configure a screen change function key in the screen to switch between the screens on the HMI device during operation.

Note

If you have set the "Visibility" of animations to "Hidden" in the inspector window of a screen, this screen cannot be called up in Runtime.

Requirements

- You have created a project.
- You have created the "Screen_2" screen.
- You have created the "Screen_1" screen.

Procedure

1. Double click "Screen_1" in the project tree. The screen is displayed in the work area.
2. Move "Screen_2" from the project tree to a function key, e.g. "F2".
   The configured function key displays a yellow triangle.
3. Click "Properties > Events > Press key" in the inspector window.
   The "ActivateScreen" system function is displayed.

Result

The operator goes to the specified "Screen_2" with function key "F2" in Runtime.

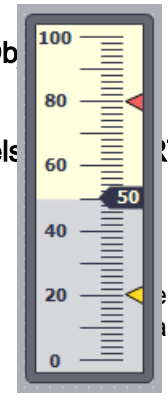
PDF view (Page 5250)

12.1.9.2 Ob



Bar (Basic Panels RT Advanced)

Use

displayed graphically using the "Bar" object. The bar graph can be labeled with lues.

Layout

In the Inspector window, you customize the settings for the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Color transition: Specifies the change in color display when limit values are exceeded.
- Displaying the limit lines / limit markers: Shows the configured limit as a line or marker.
- Define bar segments: Defines the gradations on the bar scale.
- Define scale gradation: Defines the subdivisions, scale markings and intervals of a bar scale.

Color transition

You define how the color change is represented in "Properties > Properties > Appearance" in the Inspector window.

Color transition	Description
"Segmented"	If a particular limit was reached, the bar changes color segment by segment. With segment by segment representation, you visualize, for example, which limits are exceeded by the displayed value.
"Entire bar"	If a particular limit was reached, the entire bar changes color.

Displaying limit lines and limit markers

You display the configured limit in the bar as a line or marking in Runtime using the "Lines" and "Markings" property:

1. In the Inspector window, select "Properties > Properties > Appearance":
2. Activate "Lines" and "Markings".

Define bar segments

Use the "Subdivisions" property to define the number of segments into which the bar is divided by the main gradations on the scale.

Use the "Interval" property to divide the distance between the main gradations. The value appears as the difference in value between two adjacent main gradations:

1. In the Inspector window, select "Properties > Properties > Scales":
2. Activate "Show scale."
3. Select the corresponding value for "Settings > Subdivisions".
4. Select the corresponding value for "Settings > Marks label".
5. Select the corresponding value for "Large interval > Interval".

Configuring limits/ranges

You can represent limits and ranges in different colors. Define the colors in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Limits/Ranges".
2. Activate the limits/ranges that are to be displayed in Runtime
3. If necessary, change the default colors for the limits/ranges.

Note

If you select the option "Show ranges of tags", you can display up to five ranges in a slider with values that can be specified via a process tag. You define the values for the ranges with a process tag, which you interconnect with the screen object.

The "Show ranges of tags" option is available for Comfort Panels, KTP Mobile Panels and RT Advanced.

Note

If the "Show ranges of tags" option is enabled, the setting "Color gradient Segmented" under "Properties > Appearance > Bar" has no effect in Runtime.

See also

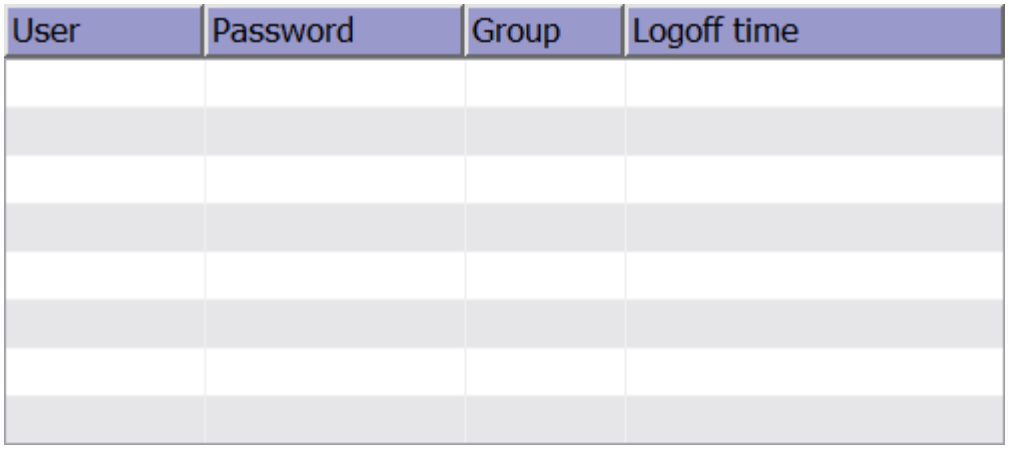
Device dependency of the objects (Page 5183)

User view (as of V13) (Basic Panels, Panels, RT Advanced)

Application

The "User view" object is used to set up and administer users and authorizations. The user view is used, for example, to create new users in Runtime and assign them to a user group.

On HMI devices with device version V13 or later, the table-based user view is available for managing users and authorizations.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

In addition, you set the borders, the fill pattern and the colors of the table header in the Inspector window.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if "Fit object to contents" is active.

1. Click "Properties > Properties > View" in the Inspector window.
2. Enter an integer value under "Number of lines".
3. Click "Properties > Properties > Layout" in the Inspector window.
4. Select "Fit object to contents".

Columns moveable

The operator can change the sequence of columns in Runtime with the "Columns moveable" property.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Activate "Columns moveable".

Column width

In the Inspector window, you can change the width of columns displayed in runtime.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Enter integer values for the column width under "Columns".

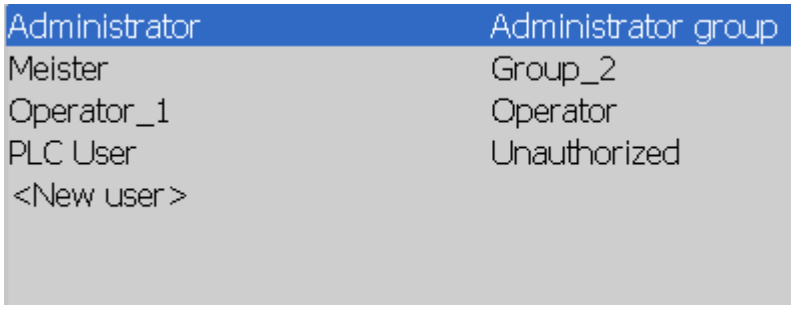
Note

The "Password" column is a dynamic column: it adapts to the outer dimensions of the object so that the object content occupies the entire width. The column width you assign is applied as the minimum size. In a dynamic column, the minimum size is changed; however, the width is displayed dynamically to fill the display.

User view, simple

Application

The "User view" object is used to set up and administer users and authorizations.



Note

Do not use the user view in a group.

Note

The "Simple user view" object cannot be operated dynamically with a script.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if the property "Fit object to contents" is active.

1. In the Inspector window, select "Properties > Properties > View".
2. Enter an integer value under "Number of lines".
3. In the Inspector window, activate "Properties > Properties > Layout".
4. Select "Fit object to contents".

Display in Runtime

The appearance depends on the authorizations:

- All users on the HMI device are displayed in the User view to the administrator or to a user with administrator authorizations.
- For a user without administrator rights, only the user's own entry is shown.

Operation

Depending on the configuration you can:

- Manage users, e.g. create, delete.
- Change existing user data.
- Export or import user data.

Note

The number is limited to 100 users and one PLC user on an HMI device. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

User view, advanced

Application

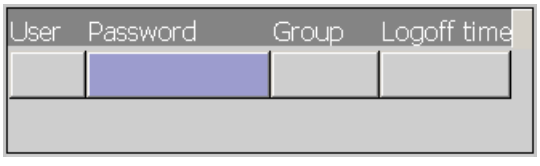
The "User view" object is used to set up and administer users and authorizations. The user view is used, for example, to create new users in Runtime and assign them to a user group.

Note

Configure only one user view at a time in one screen on the HMI devices TP 177A 6", TP 177A 6" (Portrait), OP 73 and OP 77A. Otherwise, a corresponding error message appears during generation.

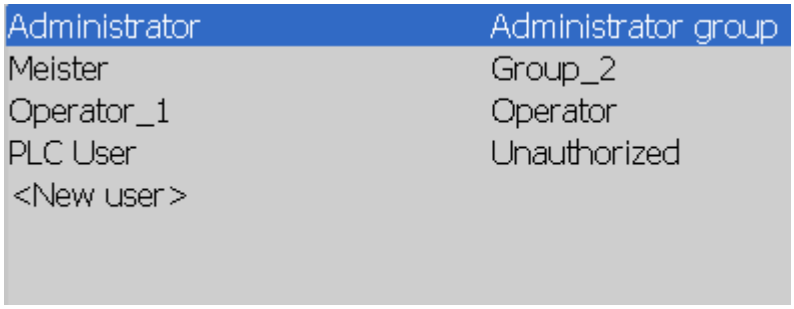
Advanced user view

Depending on the HMI devices, the extended or simple user view is available for administration of users and authorizations.



Changing the view type

On HMI devices with a display size larger than 6 ", you can configure both the advanced user view and a simplified user view. The view type is only available for configuration on devices up to device version V13.



Proceed as follows to configure the appropriate user view:

1. Click "Properties > Properties > Layout > Mode" in the Inspector window.
2. Select "Simplified" or "Advanced".

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Number of lines: Specifies the maximum number of visible entries.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

Number of lines

The number of lines in the user view displayed in Runtime is specified in the Inspector window. The setting for the number of lines is only effective if "Fit object to contents" is active.

1. Click "Properties > Properties > View" in the Inspector window.
2. Enter an integer value under "Number of lines".
3. Click "Properties > Properties > Layout" in the Inspector window.
4. Select "Fit object to contents".

Columns moveable

The operator can change the sequence of columns in Runtime with the "Columns movable" property.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Activate "Columns moveable".

This option is only available at the complex user view.

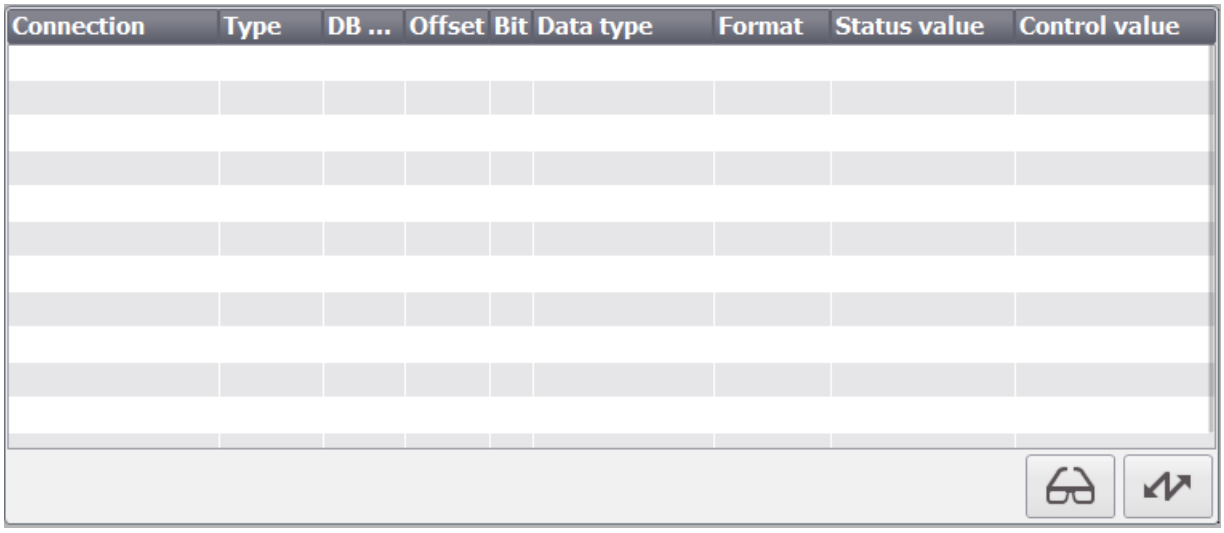
Creating users (Page 5675)

Device dependency of the objects (Page 5183)

Watch table (Panels, RT Advanced)

Use

The "Watch table" object is used to configure an editor that will allow you to process single address areas of a SIMATIC S7 in runtime.



Note

The "Watch table" object is enabled for the following PLCs:

- SIMATIC S7-300
- SIMATIC S7-400

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- PLC type: Specifies the PLC type in the object for which the address area is output in runtime.
- Operator controls: Specifies the controls of the object.

- Visible columns: Specifies the displayed columns in Runtime.
- Columns moveable: Specifies whether the operator can change the sequence of columns in Runtime.

Operator controls

Set the control elements that you can use to control the "Watch table" object in runtime under "Properties > Properties > Display" in the "Settings" area of the inspector window.

	Function
	This button refreshes the display in the status value column.
	Use this button to accept the new value in the control value column. The control value is then written to the PLC.

Visible columns

The columns that are displayed in runtime are specified in the Inspector window in the "General" group in the "Visible columns" area.

Column	Description
"Connection"	The PLC of which the address areas are displayed.
"Type" "DB number" "Offset" "Bit"	The address area of the operand.
"Data type" "Format"	The data type of the operand.
"Status value"	The value that was read from the specified address of the operand.
"Control value"	The value written to the specified address of the operand.

Sequence of columns

The operator can use the "Column ordering" property to change the sequence of columns in runtime.

1. Select "Properties > Properties > Columns" in the Inspector window.
2. Activate "Properties of columns > Sequence of columns".

System functions

Two system functions are available for updating the values in the watch table and transferring the values to the PLC:

- StatusSteuernLeseWerte
- StatusSteuernSchreibeWerte

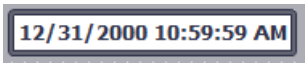
Device dependency of the objects (Page 5183)

Date/time field

Application

The "Date/time field" object shows the system time and the system date. The appearance of the "Date/time field" depends on the language set on the HMI device.



Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Display system time: Specifies that the system time is displayed.
- Include tag: Specifies that the time of the connected tag is displayed.
- Long date/time format: This setting defines the format displayed for the data and time.

Display system time

The time displayed in the "Date/time field" on the HMI device is specified in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "Format > System time".

Using tags

The time of the interconnected tag is displayed in the date/time field.

1. In the Inspector window, select "Properties > Properties > General".
2. In the "Format" area, select a tag with the "DateTime" data type, e.g. an internal tag.

Long date/time format

Visualization of the date and time is specified in the "Format" area under "General" in the Inspector window.

Option	Description
"Enabled"	Date and time are displayed in full, e.g. "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and time are displayed in short form, e.g. "12/31/2000 10:59:59 AM"

Behavior during operation

When the operator ignores the syntax when entering values, or enters illegal values, the system rejects these. Instead, the original value (plus the time that has elapsed in the meantime) appears in the date/time field and a system event is displayed on the HMI device.

I/O field

Application

The "I/O field" object is used to enter and display process values.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Display format: Specifies the display format in the I/O field for input and output of values.
- Hidden input: Specifies whether the input value is displayed normally or encrypted during input.

Note

Reports

In reports, I/O fields only output data. "Output" mode is preset. Properties for configuring input are not available, e.g. "hidden input".

Mode

The response of the I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Input"	Values can only be input into the I/O field in Runtime.
"Input/output"	Values can be input and output in the I/O field in Runtime.
"Output"	The I/O field is used for the output of values only.

Layout

The "display format" for the input and output of values is specified in "Properties > Properties > General > Format" in the Inspector window.

Layout	
"Binary"	Input and output of values in binary form
"Date"	Input and output of date information. The format depends on the language setting on the HMI device.
"Date/time"	Input and output of date and time information. The format depends on the language setting on the HMI device.
"Decimal"	Input and output of values in decimal form
"Hexadecimal"	Input and output of values in hexadecimal form
"Time"	Input and output of times. The format depends on the language setting on the HMI device.
"Character string"	Input and output of character strings.

Note

Data formats

Not all data formats are available for selection for Runtime Professional.

Hidden input

In Runtime the input can be displayed normally or encrypted, for example for hidden input of a password. A "*" is displayed for every character during hidden input. The data format of the value entered cannot be recognized.

1. In the Inspector window, select "Properties > Properties > Response":
2. Select "Hidden input".

Avoid overlaps in output fields

If several I/O fields are configured as output fields with a transparent background in a screen, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in Runtime. In order to avoid such overlaps, set the borders of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Select "Properties > Properties > Layout > Fit object to contents."

Limits

Under "Properties > Properties > Limits" in the Inspector window, set the colors for the values that violate the high or low limits.
You define the limits via the properties of a tag. In Runtime Professional you can specify if the colors should be used.

When there is a limit violation during Runtime, the background color of the I/O field changes according to your configuration, even if the I/O field is in "Input" mode.

In Runtime Professional, you can also define the limit range for the entry in the I/O field via "Properties > Properties > Limits".

If you enter a numeric value outside this limit, it is not applied; for example, 80 with a limit of 78. In this case, the HMI device generates a system event, if an alarm window is configured. The original value is displayed again.

Decimal places for numerical values

The configuration engineer can define the number of decimal places for a numerical input field. The number of decimal places is checked when you enter a value in this type of I/O field. Decimal places in excess of the limit are ignored. Empty decimal places are filled with "0".

Behavior when switching between input fields

When you change to another input field within the same screen, and the screen keyboard appears, the "Exit field" event is not executed for the previous field unless you close the screen keyboard.

See also

Using multiple tags simultaneously in a screen (Page 5322)

Ellipse

Application

The "Ellipse" is an enclosed object that can be filled with a color or pattern.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Horizontal radius: Specifies the horizontal radius of the elliptical object.
- Vertical radius: Specifies the vertical radius of the elliptical object.

Horizontal radius

The horizontal radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 under "Horizontal."

Vertical radius

The vertical radius of the "Ellipse" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 at "Vertical."

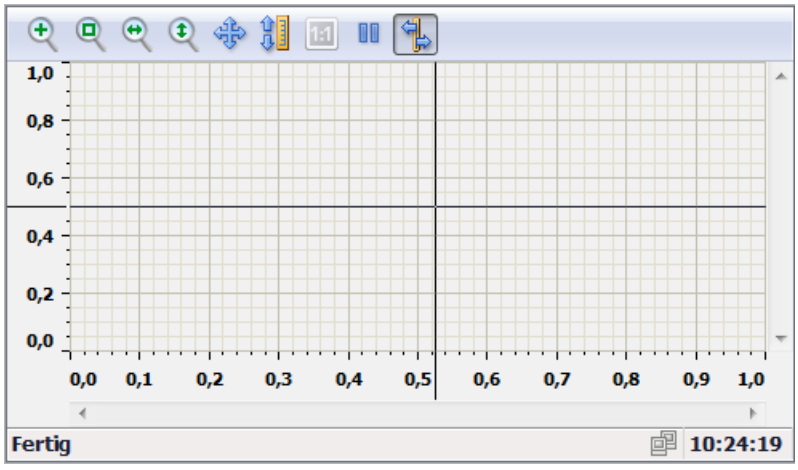
Device dependency of the objects (Page 5183)

f(x) trend view (Panels, RT Advanced)

Application

You use the "f(x) trend view" object to represent the values of a tag as a function of another tag. This means that you can present temperature trends as a function of the pressure, for example.



Layout

In the Inspector window, you customize the position, geometry, style, colors and font types of the object. You can adapt the following properties in particular:

- Adding and configuring trends
- Configuring a diagram
- Window settings
- Persistence
- Toolbar

Configuring trends

You create and configure trends in the Inspector window "Properties > Properties > Properties > Trend".

1. Select the data supply for the trend in the "Data source" column.
   - "Logging tag": The trend view is supplied with values from a data log.
   - "Tags": The trend view is supplied with current values from the PLC. The values are constantly updated.
2. Configure the area of the trend display under "Data area".
   - "Time span": You define the time range using a starting time and a following time span.
   - "End time": You define the time range using a starting time and an end time.
   - "Measuring points": You define the time range using a starting time and a number of measuring points.
3. Configure the value range of the trend display under "X axis" and "Y axis".
4. Under "Limits", configure the colored marking of specific values, .e.g. high and low limit, uncertain status.

Configuring a diagram

Configure the display of several trends under "Properties > Properties > Appearance":

- Common diagram or separate diagrams
- Common or separate axes
- Writing direction of all trends

Toolbar

In Runtime, the operator controls of the f(x) trend view are defined in the "Properties > Properties > Toolbar" Inspector window. The following operator controls are available for the f(x) trend view:

Button	Name	Function
	Zoom +/-	Increases or decreases the size of the trends in the trend window. Increase the size of the trends by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the trends.
	Zoom area	Increases the size of any section of the trend window. Specify an area in the trend window by using the mouse. This area of the trend window is enlarged.
	Zoom X axis	Increases or decreases the size of the X axis in the trend window. Enlarge the X axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the X axis.
	Zoom Y axis	Increases or decreases the size of the Y axis in the trend window. Enlarge the Y axis by left-clicking with the mouse. Hold down <Shift> and left-click to decrease the size of the Y axis.
	Trend area	Shift the trends in the trend window along the X axis and Y axis by using this button.

Button	Name	Function
	Axis area	Shift the trends in the trend window along the value axis by using this button.
	Original view	Switches from the magnified trend view back to the normal view.
	Start/stop	Stops and starts the trend update. The values are buffered and updated as soon as you start trend update again.
	Ruler	Determines the coordination of a point of the trend.

The order of the buttons is fixed. The operator can set up individual key assignments, and shortcuts for every button on the toolbar.

Bar (Page 5193)

Trend view (Page 5226)

Device dependency of the objects (Page 5183)

Graphic view

Application

The "Graphic view" object is used to display graphics.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Adjust graphic: Specifies the automatic size stretching for objects with graphics.
- Transparent color: Specify whether or not the transparent color is used for the graphic.

Inserting graphics

Use the following image formats in the "Graphic Display" object: *.bmp, *.tif, *.png, *.ico, *.emf, *.wmf, *.gif, *.jpg or *.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. Click "Properties > Properties > General" in the Inspector window.
2. Select the graphic that you wish to insert.
   The graphic preview is shown in the right pane.
   You have the option to create the graphic from a file using the button, or to create a new graphic from an OLE object using the button.
3. Click "Apply" to insert the graphic in the Graphic view .

Adjust graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in runtime is specified in the Inspector window.

Option	Description
"No auto-sizing"	The size is not automatically adapted in Runtime.
"Fit graphic to object size"	The graphic is automatically adapted to the object size in Runtime.
"Fit object size to graphic"	Graphic display is adapted to the largest used graphic and other graphics are stretched.
"Adjust object size to graphic"	Graphic display is adapted to the largest used graphic but the other graphics retain their original size.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the required size adjustment for the graphic.

Transparent color

This property defines whether the transparent color is used for the graphic to be displayed.

1. Click "Properties > Properties > Appearance" in the Inspector window:
2. Select "Background > Transparent".
3. Select a transparent color.

Note

When using bitmaps in WinCC screens the "Transparent color" setting demands a high character performance in the layout on the panel. Visualization performance is enhanced by disabling the "Transparent" setting in the properties of the relevant display object. This restriction applies in particular when bitmaps are used as background image.

Note

Basic Panels

The "Transparent" property is not available for Basic Panels.

Note

If the selected transparent color of the graphics is not shown properly despite an enabled "Transparent" property, the color in the graphics is not entirely consistent with the selected color. For example, the selected transparent color [R=255;G=255;B=255] looks almost exactly like the color in the graphic that is expected to be transparent [R=255;G=251;B=255]. In this case, the graphics used in the object must be reedited. Under "Project Navigation > Languages & Resources > Graphics", select the graphic that you want to display transparently. From the shortcut menu of the default graphic, select the "Edit" command and fill in the background of the graph with the desired color that appears transparent in the screen. Save the graphic.

Graphic I/O field (Basic Panels, Panels, RT Advanced)

Application

The "Graphic I/O field" object can be used to configure a list for display and selection of graphic files.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Scroll bar type: Specifies the graphic layout of the scroll bar.
- Mode: Specifies the response of the object in Runtime.

Note

Scroll bar

The "Scroll bar > Type" property is available for Panels and Runtime Advanced up to device version V12.

Note

Reports

Graphic I/O fields output exclusively graphics in reports. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "scroll bar".

Note

Border

You can configure the width and the style of the border of a graphic I/O field in the "Two states" mode.

Mode

The response of the "Graphic I/O field" object is specified under "Properties > Properties > General > Type > Mode" in the Inspector window.

Mode	Description
"Input"	The "Graphic I/O field" object is only used to select graphics.
"Input/output"	The "Graphic I/O field" object is used to select and display graphics.
"Output"	The "Graphic I/O field" object is used to display graphics only.
"Two states"	The "Graphic I/O field" object is only used to display graphics and can have a maximum of two states. You use no graphics list but insert one graphic each for the "ON" and "OFF" state.

Adjust graphic

Whether a graphic displayed in a graphic I/O field is stretched to the size of the view in Runtime is specified in the Inspector window.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the required size adjustment for the graphic.

Scroll bar type

The response for the graphic representation of the scroll bar is specified under "Properties > Properties > Appearance > Scroll Bar > Type" in the Inspector window.

Type	Description
"Permanent"	The scroll bar is always visible.
"No scrollbar"	The scroll bar is not visible.
"Visible after clicking"	The scroll bar is made visible by a mouse click.

Behavior during operation

If the graphic I/O field displays a cactus image, a graphic to be output for a specific value has not been defined in the project. The contents of the graphic I/O field change color to show that it is now activated. The frame in 3D is only shown graphically in an output field.

Symbolic I/O field (Page 5282)

Device dependency of the objects (Page 5183)

GRAPH overview (Panels, RT Advanced, RT Professional)

Use

The "GRAPH Overview" object is used to display the current program status for executed steps of the GRAPH sequencer. Errors during execution of a program are displayed directly at the corresponding step.

The following information is displayed in the "GRAPH Overview" object:

- Name and status of the function block
- Status of initial and simultaneous steps
- Number and name of the first step currently executed step
- Operating mode for running the GRAPH sequencer

Note

The "GRAPH Overview" object cannot be used in faceplates or in the global screen.

Note

Device dependency of the "GRAPH Overview" object

The "GRAPH Overview" object is available for RT Advanced, RT Professional, Comfort Panels and KTP Mobile Panels.

Layout

In the Inspector window, you customize the position, style, colors and font types of the object. You can adapt the following properties in particular:

- Assigned GRAPH DB tag
- Buttons on the toolbar

Operating mode

Four operating modes are available for running the GRAPH sequence:

- Auto (default setting) - Automatically switches to the next step when the transition is fulfilled.
- TAP - Automatically switches to the next step when the transition is fulfilled and there is an edge change from "0" to "1" at the T_PUSH parameter.
- TOP - Automatically switches to the next step when the transition is fulfilled or there is an edge change from "0" to "1" at the T_PUSH parameter.
- Manual - The next step is not automatically enabled when the transition is fulfilled. The steps can be selected and deselected manually.

Note

You set the operating mode by modifying the interface parameters of the GRAPH block in your control program.

In WinCC Runtime Professional, you have the option of editing the name of the operating mode that is displayed in the GRAPH overview.

Configuring a compact view

You can also configure the GRAPH overview compactly without the buttons of the toolbar or the operating mode display, which was already possible in WinCC Professional prior to version V14.

To display the GRAPH overview compactly in single-line compatibility mode, select the "Single-line mode" option under "Properties > Appearance > Options".

Symbols

You specify the symbols that are displayed in the GRAPH Overview in the Inspector window under "Properties > Appearance > Options". The following symbols are available for GRAPH Overview:

Icon	Name	Function
	Error	Indicates that an error has occurred during the execution of a step.
	Initial step	Indicates that the currently executing step is the first step in the GRAPH block.
	Simultaneous step	Shows that there are other simultaneous steps in the GRAPH block in addition to the current one.

Buttons

You specify the buttons that are displayed in the GRAPH Overview under "Properties > Toolbar > General".

Button	Name	Function
	Next step	Jumps to the next step, if the GRAPH block contains more than four steps.
	Last step	Jumps to the first step of the sequencer when the final step has been reached.
	Alarm view	Opens the configured alarm view with the error message in Panels and RT Advanced. Opens the configured alarm view with the error message in RT Professional.
	PLC code view	Opens the configured PLC code view.

Display the current program status

A PLC including a GRAPH instance data block has been created and contains at least one PLC tag which is visible in and accessible from the HMI.

1. In the Inspector window, select "Properties > Properties > General".
2. Open the selection button under the "Assigned GraphDB tag" property.
   The "Add new object" dialog opens.
3. Select the corresponding PLC in the "Program blocks" folder.
4. Select the corresponding PLC tag of the GRAPH instance data block.
5. You can dynamize the properties in the "GRAPH Overview" object using tags and color-code the states.
   You can find a detailed description of dynamizing a property in the section AUTOHOTSPOT.

Note

If no connection exists between the HMI device and the selected PLC, a connection is set up automatically.

In addition, an HMI tag is created which is connected to the PLC tag.

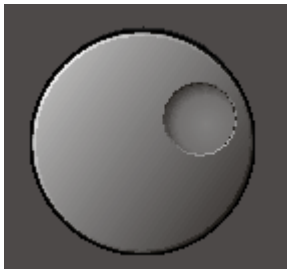
Handwheel (Panels)

Application

The object "Handwheel" is a control element for some SIMATIC Mobile Panels. You can enter incremental values in Runtime using the "HandWheel" object.



Layout

You can set the following property in the Inspector window:

- Tag: Specifies the tags to which the "HandWheel" object is linked.

Tag

Global assignment

The "Tag" property is specified in the template for the global assignment of the "HandWheel" object. There is only one template for each HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Select a tag from the selection list under "Settings > Tag".

Local assignment

The "HandWheel" object is assigned to another tag. To do so you configure a function that assigns the tag to the handwheel in Runtime.

Example for configuration to a button:

1. Open the screen in which the "HandWheel" object is assigned to another tag.
2. Drag the "Button" object from the toolbox to the screen. Select the button on your screen.
3. Click "Properties > Events > Click" in the Inspector window.
4. The "Function list" dialog box opens. Click the first line of the function list. The list of system functions and scripts available in the project appears.
5. Select the system function "SetTagToHandWheel" from the "Other functions" group. Select a tag from the combo box at "Value".

Note

The Mobile Panel may ignore the change of the value in the PLC made at another location while the handwheel is being operated. The value is the PLC is overwritten again.

See also

Illuminated pushbutton (Page 5229)

Device dependency of the objects (Page 5183)

Help indicator (Basic Panels)

Application

The object "help indicator" is available for the HMI devices OP 73 and KP300 Basic. If a a tooltip exists for the selected object, the help indicator is displayed during runtime. If a tooltip was configured for the opened screen, the help indicator always remains visible.

You configure the object "help indicator" exclusively in the global screen.

Layout

You can adapt the following properties in the Inspector window:

- Position: Determines the position of the object "Help indicator."

Position

You can use this property to set the position of the object "Help indicator."

1. Select the object "Help indicator" in the template.
2. In the Inspector window, select "Properties > Properties > Layout".
3. Enter a value for X and Y. You can also use the cursor keys to position the selected object.

If you have configured a screen object at this position, the visible help indicator covers the screen object. The help indicator is covered only by incoming system alarms and dialogs.

See also

Device dependency of the objects (Page 5183)

HTML browser (Basic Panels, Panels, RT Advanced)

Use

The "HTML Browser" object is designed for the visualization of simple HTML pages. This function allows you to draw up machine-specific descriptions which are stored centrally and which can then be displayed from different HMI devices.

Note

Switching the functionality of the HTML Browser to that of a file explorer by one of the following methods, for example, is not authorized in the context of WinCC:

- Entering a folder or drive, for example "\" or "C:", or
- Connecting to an FTP server, for example "ftp://"

One reason is to prevent inadvertent changes to files, their deletion or execution.

When configuring, ensure that the operator can only enter valid Internet addresses, for example, by using symbolic I/O fields. Configure a password-protected input for service purposes.

Note

Only one instance of the HTML Browser is supported per screen for Panels to preserve memory space.

If you move quickly from a slide-in-screen to a pop-up screen and an HTML browser is configured in both screens, the second HTML browser will not open. Wait two seconds after closing the slide-in screen until the handle is no longer visible and then open the pop-up screen.

Layout

Customize the object position and size in the Inspector window. In particular, you can customize the following property:

- URL: Specifies which Internet address is opened in the HTML Browser.
- Tag for URL: Specifies the tag which sets the Internet address.

Address

The Internet address is specified in "Properties > Properties > General >URL" in the Inspector window.

Note

For Basic Panels 2nd Generation:

If you want to load a website from a USB flash drive to your HMI device, the address in the "URL" field must begin with the prefix "\media\usb\".

Example: You want to load the html5.htm web page from the USB device USB_XY. Enter "\media\usb\USB_XY\html5.htm" in the Inspector window.

Browser type (RT Advanced as of V13 SP1)

You can select the browser type in Runtime Advanced as of version V13 SP1.

Specify the type of the Web browser under "Properties > Properties > General > HTML browser type" in the Inspector window.

Two options are available:

- Web browser based on WebKit engine without Active X support

  Note

  Dialogs from websites are not supported in the WebKit browser. "Yes" or "OK" is always set as answer instead.

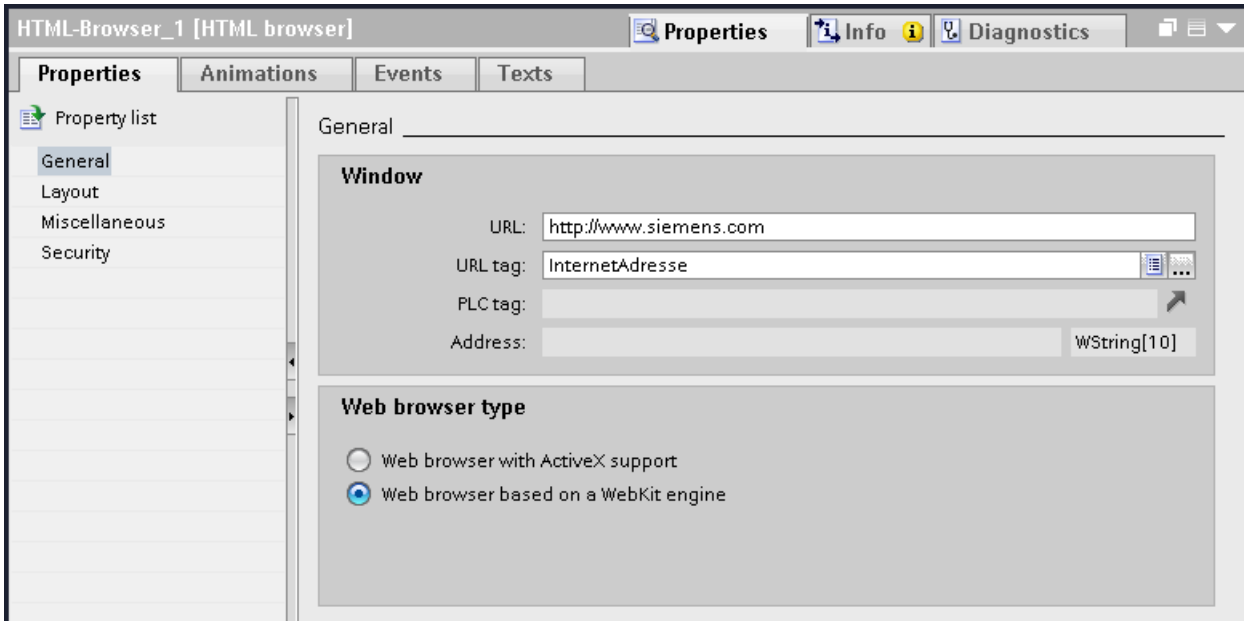
- Web browser based on Internet Explorer with Active X support

  Note

  If Internet Explorer does not load the website, use the WebKit browser without Active X support.

Basic procedure

1. Create an internal tag of the "String" data type, for example, InternetAddress, in the "Tag" editor.
2. Insert the "HTML Browser" object in the screen in the "Screens" editor.
3. In the Inspector window, select "Properties > Properties > General".
4. At "Tag for the URL", select the "InternetAddress" tag from the selection list.
5. Insert an I/O field in the screen in the "Screens" editor.
6. In the Inspector window of the IO field "Properties > Properties > General > Tag for URL", select the "InternetAddress" tag from the selection list.



The HTML Browser opens the relevant page after the operator has entered an address in the I/O field.

Operator controls

Operator controls are configured buttons in the process screen or softkeys on the HMI device.

The "HTML Browser" object does not have its own operator controls. Assign the system functions used to control the "HTML Browser" object to your configured operator controls, such as buttons.

1. For example, drag the "Button" object to the screen from the toolbox.
2. Input a text of any length or select a graphic, for example Update.
3. In the Inspector window, select "Properties > Events > Click".
   The "Function list" dialog opens.
4. The system functions for controlling the "HTML Browser" object can be found in the list of system functions in the "Keyboard operation for screen objects" group.
   Select a function from the list, for example, HTMLBrowserRefresh.
5. Select the object name of the HTML Browser in which the command will be executed from the "Screen object" list.

Defining the website selection

To define the website selection that is provided in the HTML browser, you can define a number of allowed URL addresses.

You define a String or Wstring type tag or for the "Tag for URL" property of the HTML browser that can be filled with the predefined URL addresses in the following ways:

- Using the "SetTag" system function, which you configure on a button
- Using an I/O field

  Note

  Any website can be accessed by entering the address in an I/O field.

  To restrict the selection of permitted websites, use the provision of the pre-defined URL addresses via a system function or a script.

- Via a script (Panels and RT Advanced only)
- Via the PLC

Displaying SIMOTION PLC websites in the HTML browser

If the SIMOTION PLC websites are not displayed correctly in the HTML browser, add "/basic" after the website URL to display the websites in basic mode.

Comments

The functional scope of the HTML Browser is limited in comparison to the Internet Explorer:

- The HTML Browser will only show pure HTML pages. VBScript, Java, JavaScript, Flash and ActiveX controls are not supported. Set up the HTML pages for display in the HTML Browser by using a text editor or using a simple HTML editor.
- Links to embedded files, for example *.pdf or *.xls, are not supported.
- Queries and dialogs that are conducted during the access of, for example protected pages are not supported. When accessing protected pages, enter your user name and password in the URL: <http://username:password@servername> (e.g. "http://Administrator:Admin123@192.168.0.199").

Note

The object "HTML Browser" supports dynamization.

If you select the HTML browser type "Web browser, based on a WebKit engine", only the tag connection is available for dynamization under "Address".

Note

For Basic Panels 2nd Generation and Comfort Panels:

The object "HTML Browser" does not support proxy settings. This means the "HTML Browser" object cannot access URLs that require a change of the proxy settings.

Note

HTML browser in "Scroll indicator" mode

If you have specified the "Scroll indicator" scroll mode in "Runtime settings > Screens > Scrolling in controls", it may occur that some websites are not correctly displayed.

See also

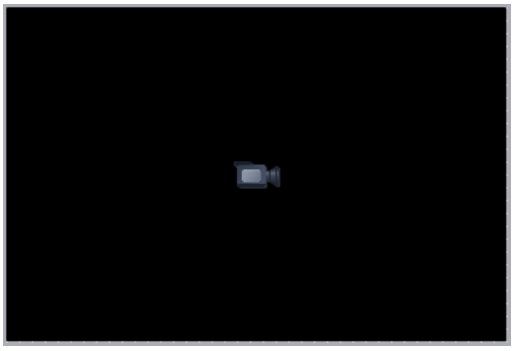
Web browser of WebKit engine: Overview (Page 6350)

Camera view (Panels)

Use

You use the "Camera view" object to configure the camera view which outputs screens for the operator in runtime from a connected network camera.

Monitoring with the help of the network camera lends itself for situations in which the operator has limited visibility of the plant or cannot get close to the machines. The operator can then respond to any problem much faster to remedy its cause.



The camera view can be configured in the following screens:

- In a screen
- In a template
- In a slide-in screen
- In a pop-up screen

Note

Device dependency of the "Camera view" object

The "Camera view" object is available for Comfort Panels and KTP Mobile Panels (as of device version V13).

Note

Only one camera view may be in operation in runtime at the time.

Note

Use the "Camera view" object only with network cameras.
Make sure that the connected network camera is located in a secure network with known devices and IP addresses.

For more information on security, go to:

http://www.siemens.com/industrialsecurity

Layout

You enter the information on the source of the video stream as well as position and size of the camera view in the Inspector window. You can adapt the following properties in particular:

- URL for the source of the video stream:
  - Camera URL: Specifies a static URL which is only entered during configuration.
  - Camera URL tag: Specifies a dynamic URL which the operator can change later in runtime.
- Transmission protocol: Specifies the transmission protocol by which the data exchange between the panel and the network camera takes place.
- Position and size of the camera view: Specifies position and size of the camera view as well as the aspect ratio and size of the displayed video stream.

Specifying URL for the source of the video stream

1. Insert the camera view in the screen in the "Screens" editor. The camera view is found in the task card "Tools" > "Controls".
2. Click "Properties > Properties > General > Media" in the Inspector window.
3. Enter the static camera URL in the "Camera URL" field, for example, "rtsp://user:password@192.168.56.208" for a Siemens camera.
   The address of the network camera is available in the network camera manual.

   Note

   The camera URL always starts with "rtsp://" and must only include permitted characters. If you enter characters that are not permitted or if the URL does not start with "rtsp://", the camera cannot be operated in runtime. The operator will receive an error message in the "Camera view" to indicate the problem.

   The following characters of the US ASCII character set are permitted:

   0123456789

   A...Z a...z

   !#$%&()*+,'-_./:;<=>?@ [\]_{|}~^(")`
4. Assign a tag to the camera view under "Camera URL tag" in the Inspector window. The tag must be of the data type "String" for external tags and "WString" for internal tags.
   When you assign a tag to the camera view, the user can change the source of the video stream in runtime.

Note

If you leave the "Camera URL tag" field blank, the static URL is used in runtime.

If you enter information in the "Camera URL" and "Camera URL tag" field, the dynamic URL is used in runtime.

Specifying the transmission protocol

1. Click "Properties > Properties > General > Media" in the Inspector window.
2. Specify the transmission protocol with the "Use UDP instead of TCP" check box.
   The selection of the protocol depends on the protocol types which your network camera supports. Information on supported protocols is available in the network camera manual.
   In most cases, a TCP connection has reliable synchronization with the camera view.

Specifying position and size of the camera view

1. Click "Properties > Properties > General > Layout" in the Inspector window.
2. Enter the size of the object under "Camera view" in the "Position & Size" area. To achieve the best picture quality of the video stream, enter the physical resolution of the network camera as size of the camera view.
   The recommended setting "Keep video size" is selected by default in the "Fit to size" area. The "Keep aspect ratio" check box is disabled and cannot be selected.
3. To keep the aspect ratio of the video stream, disable "Keep video size".
   The "Keep aspect ratio" check box is automatically selected.

Note

The screen is not scaled when you keep the size of the video stream. The screen size of the network camera is output 1:1 by the camera view. If the camera view is smaller than the selected resolution of the network camera, only a corresponding section of the camera screen is output by the camera view. If the camera view is greater than the selection solution of the network camera, any blank spaces are displayed as black horizontal or vertical margins.

Any blank spaces are output as black horizontal or vertical margins by the camera view when you keep the aspect ratio of the video stream.

Note

When you disable the "Keep video size" and "Keep aspect ratio" check boxes, the camera screen may be distorted.

Result

You have configured a camera view which can be used for monitoring the plant in runtime.

Note

You cannot configure system functions for the camera view.

Note

When you test a project with the simulator, a black screen with a camera symbol is output.

See also

Device dependency of the objects (Page 5183)

Circle

Application

The "Circle" object is a closed object which can be filled with a color or pattern.

Layout

In the Inspector window you can customize the settings for the object position, geometry, style, frame and color. You can adapt the following properties in particular:

- Radius: Specifies the size of the circle.

Radius

The radius of the "Circle" object is specified in the Inspector window. The value is entered in pixels.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter a value between 0 and 2500 in the "Radius" area.

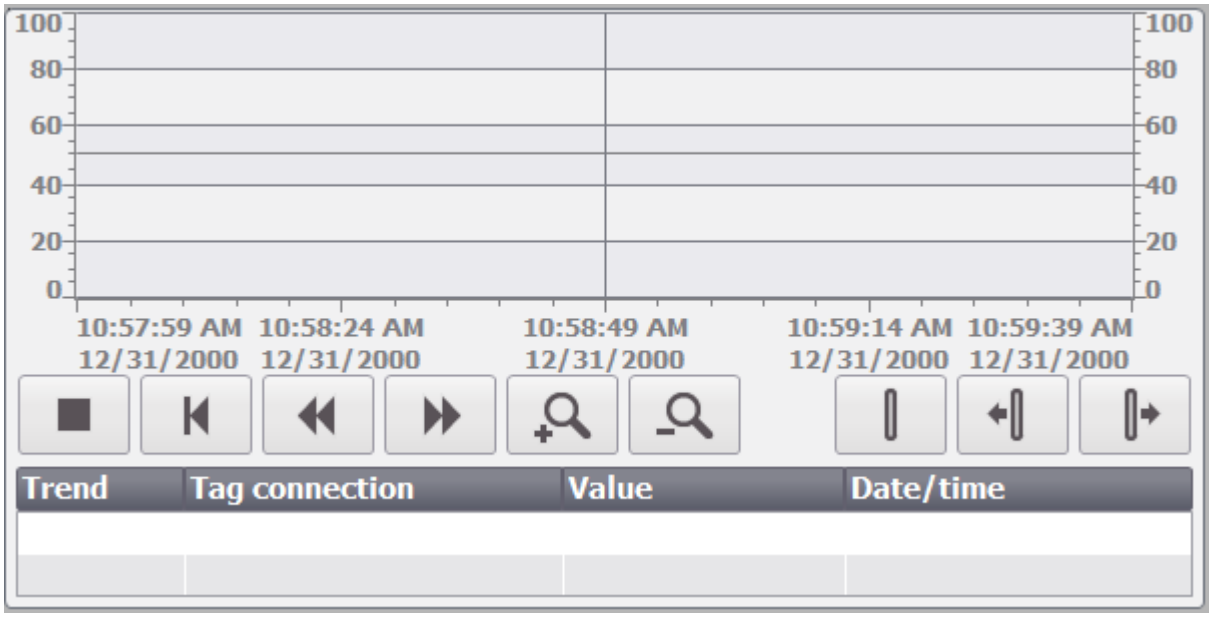
See also

Device dependency of the objects (Page 5183)

Trend view (Panels, RT Advanced)

Application

The trend view is meant for the graphical representation of tag values from the current process or from a log in form of trends.



Layout

In the Inspector window, you customize the position, geometry, style, color, and font types of the object. You can adapt the following properties in particular:

- Display value table, ruler and grid: Specifies whether a value table, a ruler or a grid is displayed in addition to the coordinate system to improve legibility.
- Toolbars: Defines the display of the operator controls.

Display value table, ruler and grid

For improved legibility a value table, a ruler and a grid can be displayed in Runtime.

1. Activate "Properties > Properties > Appearance > Show ruler".
2. Activate "Properties > Properties > Table > Show table".
3. Activate "Properties > Properties > Table > Show grid".

Toolbars

The layout of the operator controls is defined in the "Properties > Properties > Toolbar" inspector window.

Note

Basic Panels

Because archiving with Basic Panels is only possible for devices as of the 2nd Generation, the operator controls are not available on all Basic Panels.

Toolbar button	Brief description	Description
	"Go to start"	Scroll to the current value of the trend.
	"Zoom in"	Reduces the displayed time slice.
	"Zoom out"	Zooms into the displayed time section.
	"Ruler backward"	Moves the ruler back.
	"Ruler forward"	Moves the ruler forward.
	"Backward"	Scrolls back one display width.
	"Forward"	Scrolls forward one display width.
	"Ruler"	Shows or hides the ruler. The ruler displays the X-value associated with a Y-value.
	"Start/stop"	Stops trend recording or continues trend recording.

Operation on Basic Panels and devices with small display size

The trend view buttons are not displayed on Basic Panels and HMI devices with a display size of less than 6". You can operate the trend view using the function keys of the HMI device that are assigned corresponding system functions.

Displaying column headers

The layout of the table in the trend view depends on the view settings in the Control Panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Consistency test

If warnings or errors are displayed in the output window during a consistency check in connection with trend views, clicking "Go to Error/Tag" on the shortcut menu will not always take you to the exact error position. In some cases only the trend view is shown as cause of error.

Adding, configuring, and removing trends

The trends of the trend view are managed in the Inspector window under "Properties > Properties > Trend". You can copy trends between different trend views.

Configuring trend display for values from the PLC (Basic) (Page 5382)

Device dependency of the objects (Page 5183)

Charge condition (Panels, RT Advanced)

Application

The object "Charging condition" is a control element for some SIMATIC Mobile Panels. The "Charging condition" object indicates the charging status of the battery. Charge the battery in good time. Alternatively, you can replace the battery with a spare battery.

Layout

Symbol	Description	Charging condition
	Battery is charged	>20 %
	Battery must be charged	<20 % and >6 %
	Battery is weak	< 6 %

Operation

The object is for display only and cannot be controlled by the operator.

Zone signal (Page 5303)

Device dependency of the objects (Page 5183)

Illuminated pushbutton (Panels)

Application

The object "Illuminated pushbutton" is a control element for some SIMATIC Mobile Panels. The LEDs can be activated by the PLC. The illuminated LED signals the operator in Runtime that the illuminated pushbutton has to be pressed. The illuminated pushbutton is configured in the global screen.

Layout

You can adapt the following properties in the Inspector window:

- Tag: Specifies the tag in which the status of the illuminated pushbutton is written.
- LED assignment: Specifies the assignment of the LED to the bit in the LED tag.

Tag

The "Tag" property is used to specify the global assignment of the "Illuminated pushbutton" object in the global screen.

Note

Notes on configuring

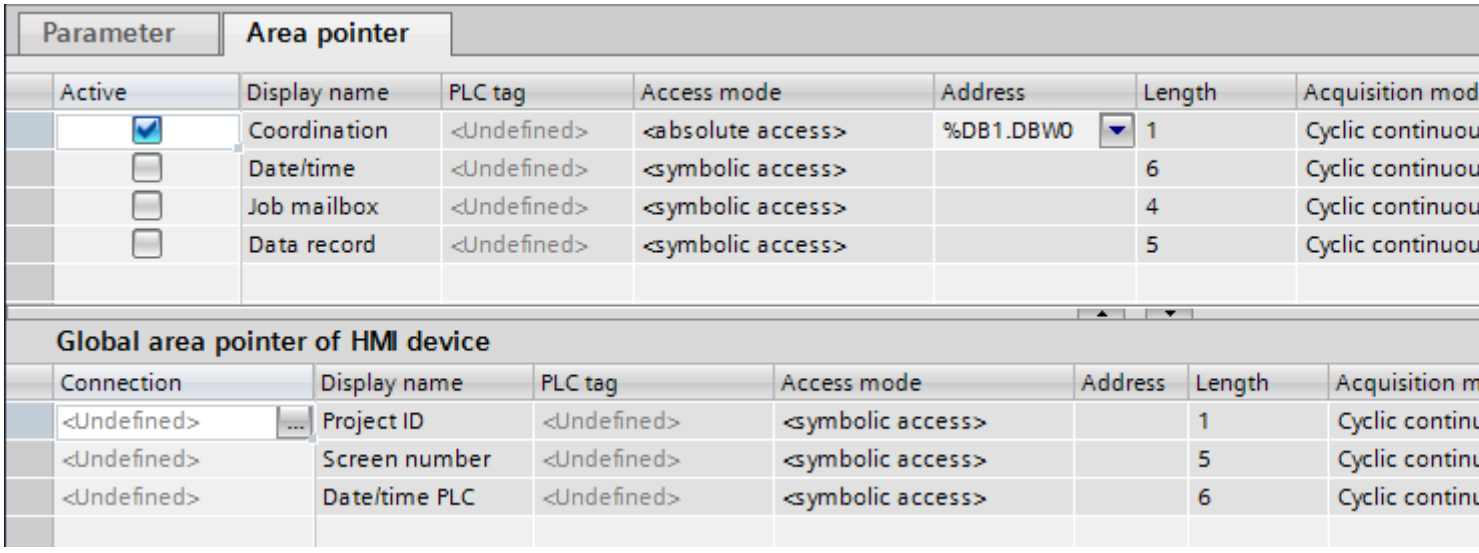
The current status of the illuminated pushbutton is written to the tag when Runtime is started and whenever the button is pressed. This may cause inconsistencies between the status of the illuminated pushbutton and the illuminated pushbutton tags.

1. If the tag has a connection to the PLC, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current status of the key is overwritten by this process. The illuminated pushbutton tag may therefore no longer reflect the current value of the illuminated pushbutton, for example if the Mobile Panel is switched off while the illuminated pushbutton is pressed.
2. If the illuminated pushbutton is pushed before communication to the PLC could be established (for example after a device start-up), it may not be possible to send the value of the illuminated pushbutton tag to the PLC. In this case the value of the tag in the PLC is different from the current status of the key.

Carry out the following configuration steps so that the illuminated pushbutton always reflects the actual state.

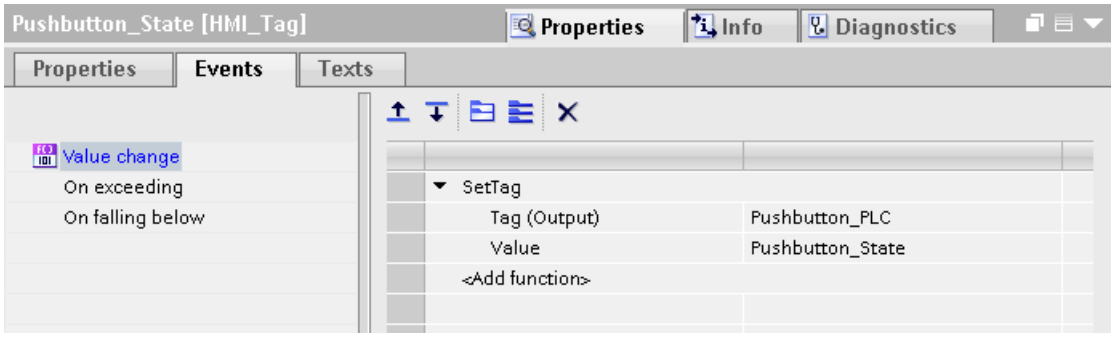
Basic procedure

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.



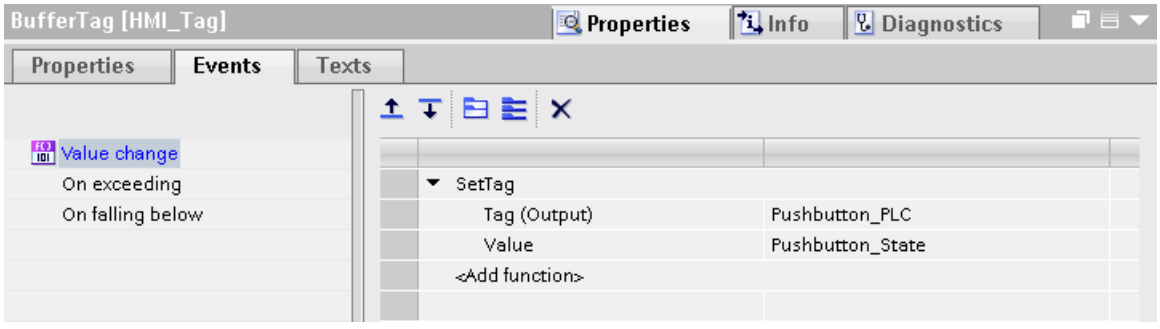
2. Open the "HMI tags" editor and create three tags.
   - Internal tag: Pushbutton_State
   - External tag: BufferTag
   - External tag: Pushbutton_PLC

3. Open the Inspector window of the "Pushbutton_State" tag.
4. In the Inspector window, select "Properties > Events > Value change". Click the first line of the function list. The list opens, showing the system functions available in the project.
5. Select the "SetTag" system function.
   - Select the "Pushbutton_PLC" tag at "Tag (output)".
   - Select the "Pushbutton_State" tag at "Value".



The value of the "Pushbutton_PLC" tag is written to the PLC with the "Pushbutton_PLC" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Pushbutton_PLC" tag from the PLC. The "BufferTag" is required to transfer the current position of the pushbutton to the PLC.

6. Open the Inspector window of the "BufferTag" tag.
7. In the Inspector window, select "Properties > Events > Value change".
8. Click the first line of the function list. The list opens, showing the system functions available in the project.
9. Select the "SetTag" system function.
   - Select the "Pushbutton_PLC" tag at "Tag (output)".
   - Select the "Pushbutton_State" tag at "Value".



After establishing communication the current value is written to the "BufferTag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tag. The system function re-allocates the value of the "Pushbutton_State" tag to the "Pushbutton_PLC" tag.

10. Open the global screen in the "Screen navigation" editor.

11. Select the illuminated key on the global screen.
12. Select the tag "Pushbutton_State" in "Properties > Properties > General > Settings >Tag" in the Inspector window.
    If you press the illuminated pushbutton, the value is written to the "Pushbutton_PLC" tag.

LED assignment

To actuate the LED an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration. The LED tag is specified at "LED tag" in the "Settings" area in the "General" group. With "LED bit" the allocated bit is given. When the bit is set the following states of the LED can be realized in runtime.

Bit n+1	Bit n	LED function
0	0	Off
0	1	Fast flash
1	0	Slow flash
1	1	On permanently

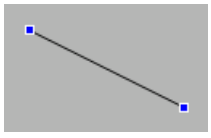
Handwheel (Page 5215)

Device dependency of the objects (Page 5183)

Line

Application

The "Line" object is an open object. The line length and gradient slope are defined by the height and width of the rectangle enclosing the object.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line style
- Line start and end

Line style

The representation of the line is specified under "Properties > Properties > Appearance" in the Inspector window. The line is shown without interruption if you select "Solid", for example.

Note

The line styles available depend on the selected HMI device.

Line start and end

The start and end points of the line are specified under "Properties > Properties > Appearance > Line ends" in the Inspector window.

Use arrow point, for example, as start and end point. The available start and end points depend on the device.

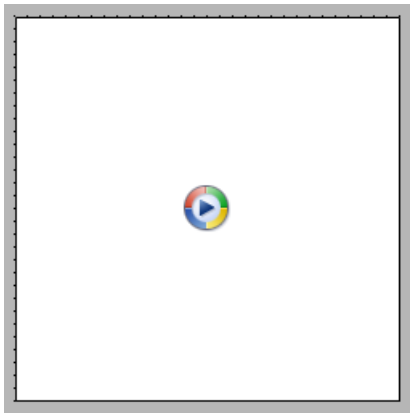
See also

Device dependency of the objects (Page 5183)

Media Player (Panels, RT Advanced, RT Professional)

Use

In Runtime, the Media Player is used to play multimedia files.



The Media Player is only available for the following devices:

- MP 377
- Comfort Panels
- RT Professional

Note

Playing videos on Comfort Panels

You can play video sequences on Comfort Panels in the "Media Player" screen object. You can find more detailed information on playing videos on the Internet under: http://support.automation.siemens.com (entry ID 62101921)

Layout

You can set the following properties in the Inspector window:

- Display status bar: Determines whether to display the status bar.
- Display operator controls: specifies the operator controls in Runtime.
- Show tracker: establishes, whether a slider is available for the operation.

Operator controls

The operator controls that can be used to control the Media Player in Runtime are specified in the Inspector window under "Properties > Properties > Appearance > Elements".

Number of replays (Comfort Panels and MP 377)

To play the file multiple times, select number of playbacks under "Properties > Properties > General > Number of replays". Select a value from 0 to 2,147,483,647.

Supported file formats (Comfort Panels and MP 377)

The following audio formats are supported by Media Player:

- Moving Picture Experts Group standard 1, Layer 1, 2, 3 (.mpa, .mp2, .mp3)
- Waveform Audio (.wav)

The following video formats are supported by Media Player:

- Moving Picture Experts Group standard 1 (.mpg, .mpeg, .mpv, .mpe)
- Advanced Streaming Format (.asf)
- Windows Media Video Format (.wmv)
- Audio-Video Interleaved (.avi)

Note

Media Player does not support the creation and management of favorites. If you create favorites before closing the Media Player, they will not reappear when you open it again.

Note

The Media Player cannot be operated using the keyboard.

You cannot simulate the Media Player. A static screen appears in the simulation window instead of the Media Player.

Supported file formats (RT Professional)

The following file formats are supported by Media Player:

- graphics file formats (.gif, .bmp, .jpg, .jpeg, .png)
- Moving Picture Experts Group standard 1 (.mpg, .mpeg, .mp4)
- QuickTime Movie (.mov, .qt)
- Advanced Streaming Format (.asf)
- Windows Media Video Format (.wmv)
- Audio Video Interleave (.avi)

Note

Requirements for video files

To play video files in the Windows Server 2008 R2 SP1 and 2012 R2, install the Microsoft feature "Desktop Experience". You will find more detailed information on this topic on the Internet in the Microsoft documentation.

Note

Playing back multimedia files in the control depends on the video and audio codecs installed on the PC, as well as on the file format.

Note

Data loss when copying the project

If you copy the project to another PC, keep the following in mind:

Files indicated in the WinCC Media Control are not copied along with the other files if they are dynamically linked and no UNC path is specified. You have to load the files into the project again.

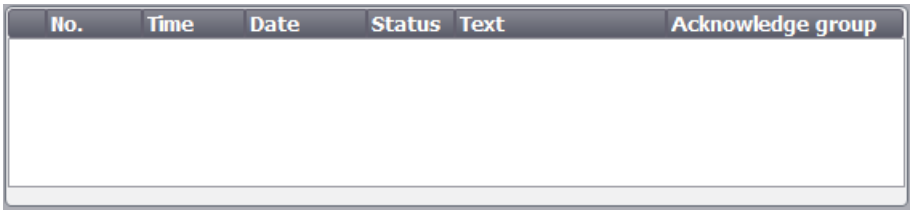
Device dependency of the objects (Page 5183)

Alarm view (as of V13) (Basic Panels, Panels, RT Advanced)

Use

Advanced alarm view is used to display alarms on the HMI device.

On HMI devices with device version V13 or later, the advanced table-based alarm view is available for managing alarms.



Alarm line

The alarm line allows display of the most current pending alarm in Runtime. The following figure shows an alarm line:

How to configure the alarm line:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Alarm line".

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

Note

The fonts available for selection depend on the fonts you have configured in the Runtime settings under "Language & font" and the fonts supported by your HMI device.

You can adapt the following properties in particular:

- Toolbar: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.
- Columns moveable: Specifies whether the sequence of columns can be changed in Runtime.
- Identification of alarm classes: To be able to distinguish various alarm classes, they are identified in the first column of the alarm view.

- Filter: Defines that only alarms that contain a specific character string will be displayed in the alarm text.
- Define display area: This setting specifies the date from which alarms are displayed in the alarm view.
- Sorting by date/time possible: Specifies whether the alarms can be sorted in Runtime by date and time.

Note

If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the Inspector window under "Properties > Properties > Toolbar". The following table shows the operator controls in the alarm view and their function:

Button	Name	Function
	"Tooltip"	Displays a tooltip for an alarm.
	"Acknowledge"	Acknowledges an alarm.
	"Loop-in-alarm"	If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties > Properties > General" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Access protection in Runtime

You can configure access protection in the "Properties > Security" group in the properties of the alarm view. A logged-on user with the required authorization can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-on user does not have the required authorization, or if no user is logged in, pressing the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the logon dialog.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Visible columns".

Sequence of columns

If this property is enabled, the column sequence in the alarm view can be changed in Runtime.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Columns moveable".

Sorting

If this property is enabled, the alarms displayed in the alarm view in Runtime can be sorted by date and time.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Sorting by date/time possible".

Filter alarms

This property is used to define that only alarms that contain a configured string in the alarm text will be displayed in Runtime for the extended alarm view.

1. In the Inspector window, select "Properties > Properties > Filter.
2. In the "Filter string" field, enter the desired term for filtering.
   Alternatively, you can configure a filter tag using the "Filter tag" field. The contents of the filter tag serve as the filter criterion in Runtime.

Identify alarm classes

An icon is displayed in the first column of the alarm view. This symbol allows the alarm to be allocated to an alarm class.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Visible columns > Alarm class name".
3. Open the "HMI alarms" editor and click on the "Alarm classes" tab.
4. Specify an icon for use to identify the alarms of this alarm class for an alarm class in the "Display name" column.

Note

The "alarm view" object cannot be grouped.

Set colors for alarm classes

You have the option of having alarms of selected alarm classes shown in different colors in Runtime. You set the background colors of the alarms in the "HMI alarms" editor.

1. Open the "HMI alarms" editor and click on the "Alarm classes" tab.
2. Set the colors for alarms under "Properties > Properties > Colors".

3. Depending on the HMI device, also change the flashing characteristics if required.
4. Under "Runtime settings > Alarms > General", select the "Colors of alarm classes" option to have alarms shown in the defined colors in the alarm view.

Define display area

You select a tag which defines the time from which alarms should be displayed. The following data types are permitted:

- External tags: Date, Date_and_Time, Time_of_Day
- Internal tags: DateTime

To define the display area, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Define the tag in which the time is specified under "Control tag for display area".

Switch to PLC code view

You configure the "ActivatePLCCodeView" system function on a button to enable the jump from a monitoring alarm in the display to the affected program code in the PLC code view. In the alarm view, you define a control tag that you use to give the button dynamic properties. Control tag is used to evaluate whether the entry point of the selected monitoring signal is possible in the PLC code view. To define the control tag, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Specify a Boolean tag under "Properties > Display > Control tag for PLC code view" that will control the jump from the last active ProDiag alarm or GRAPH alarm to the PLC code view.

You have the option make the button dynamic using animations, for example, so that the button changes color with an incoming alarm.

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

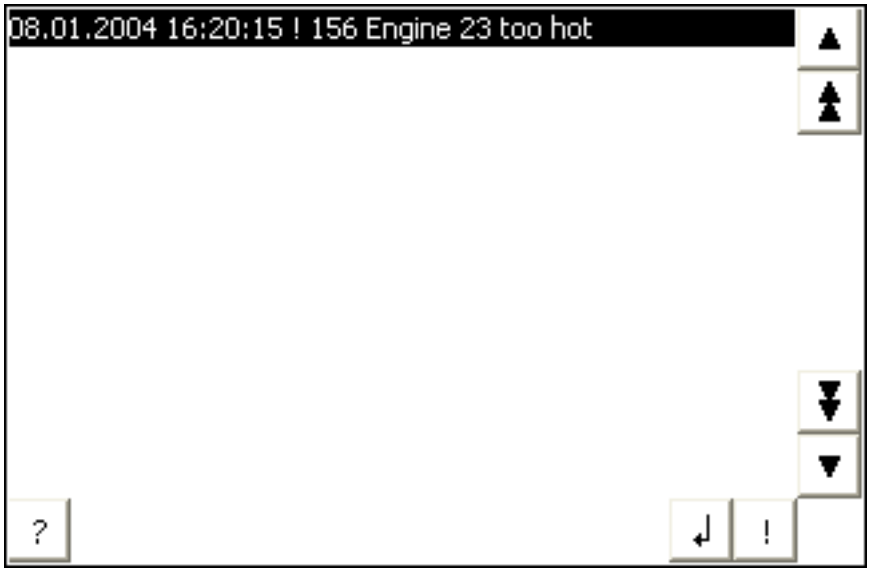
This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Alarm view, simple (Basic Panels, Panels, RT Advanced)

Application

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device.

The following screen contains a simple alarm view:



Note

The "Single alarm view" object cannot be operated dynamically with a script.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

Note

The fonts available for selection depend on the fonts you have configured in the Runtime settings under "Language & font" and the fonts supported by your HMI device.

You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.

  Note

  If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm display in Runtime are specified in the Inspector window under "Display > Settings". The following table shows the operator controls in the alarm view, and what they do:

Button		Function
"Info text"		Displays info text for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, click "Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Columns".

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

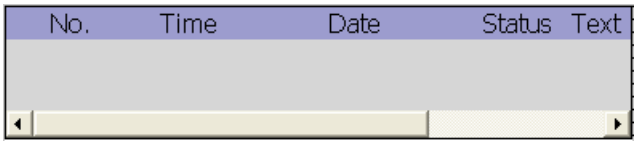
Note

In the engineering system you can dynamically control the visibility of an object, for example, in the "Animations" group of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you have configured an animation and, for example, wish to perform a consistency check of the project, then an error alarm is issued in the Output window.

Alarm view, advanced (Panels, RT Advanced)

Alarm view

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The following screen contains an alarm view with no content:



Alarm line

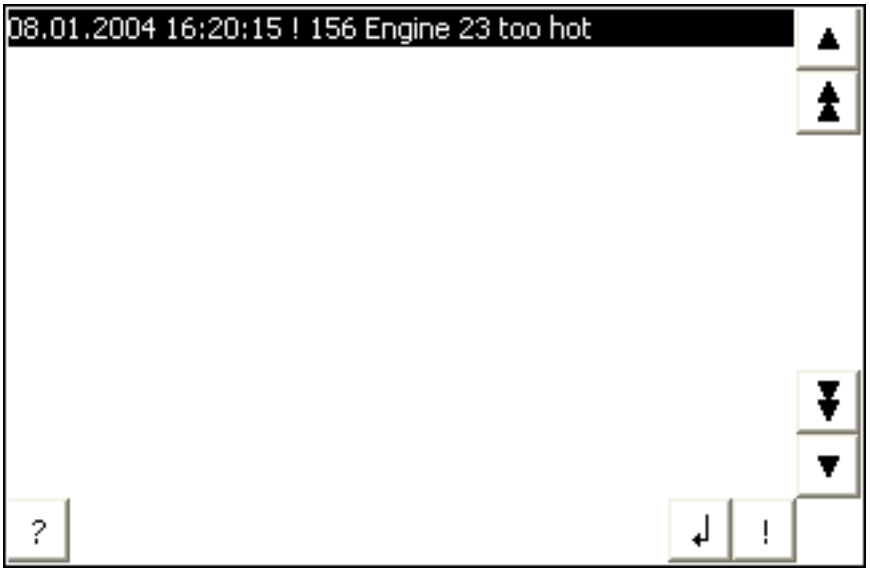
The alarm line allows display of the most current pending alarm in Runtime. The following figure shows an alarm line:

How to configure the alarm line:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Alarm line".

Changing the view type

On HMI devices with a display size larger than 6 ", you can configure both the advanced alarm view and a simplified alarm view. The view type is only available for configuration on devices up to device version V13.



Proceed as follows to configure the simplified user view:

1. Click "Properties > Properties > Layout > Mode" in the Inspector window.
2. Select "Simplified".

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object.

Note

The fonts available for selection depend on the "Language and fonts" you have configured in the device settings and the fonts your HMI device supports.

You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the alarm view.
- Alarm classes: This setting defines which alarm classes are displayed in the alarm view.
- Columns: Specifies the displayed columns in Runtime.
- Sequence of columns: Specifies whether the sequence of columns can be changed in Runtime.
- Identification of alarm classes: To be able to distinguish various alarm classes, they are identified in the first column of the alarm view.
- Filter: Defines that only alarms that contain a specific character string will be displayed in the alarm text.
- Enable sorting: Specifies whether the alarms can be sorted in Runtime by date and time.
- Define display area: This setting specifies the date from which alarms are displayed in the alarm view.

  Note

  If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the Inspector window under "Properties > Properties > Display > Settings". The following table shows the operator controls in the alarm view, and what they do:

Button		Function
"Tooltip"		Displays a tooltip for an alarm.
"Acknowledge"		Acknowledges an alarm.
"Loop-In-Alarm"		If a screen change is configured, the display switches to a screen containing information about the alarm.

Select alarm classes

1. Click "Properties > Properties > General" in the Inspector window.
2. Under "Alarm classes", activate the alarm classes to be displayed in the alarm view in Runtime.

Access protection in Runtime

Configure access protection in the "Properties > Security" group in the properties of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-on user does not have the required authorization, or if no user is logged in, pressing the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the logon dialog.

Define columns

Define the columns to be displayed in the alarm view in Runtime in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Activate the columns that are to be displayed in Runtime under "Columns".

Sequence of columns

If this property is enabled, the column sequence in the alarm view can be changed in Runtime.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Column order".

Enable sorting

If this property is enabled, the alarms displayed in the alarm view in Runtime can be sorted by date and time.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Column properties > Sorting by date/time possible".

Filter alarms

This property is used to define that only alarms that contain a configured string in the alarm text will be displayed in Runtime for the extended alarm view.

1. In the Inspector window, select "Properties > Properties > Filter.
2. Enter the required term for filtering in the field "Filter string".
   Alternatively, you configure a filter tag using the field "Filter tag". The contents of the filter tag serve as the filter criterion in Runtime.

Identify alarm classes

An icon is displayed in the first column of the alarm view. This symbol allows the alarm to be allocated to an alarm class.

1. In the Inspector window, select "Properties > Properties > Columns".
2. Select "Columns > Alarm class".
3. Open the "Alarms" editor, and click the "Alarm classes" tab.
4. Specify an icon for use to identify the alarms of this alarm class for an alarm class in the "Display name" column.

Note

The "alarm view" object cannot be grouped.

Specifying colors for alarm classes

You have the option to display alarms of the selected alarm classes in different colors in Runtime. You specify the background colors of the alarms in the "HMI alarms" editor.

1. Open the "HMI alarms" editor, and click the "Alarm classes" tab.
2. Define the colors for alarms under "Properties > Properties > Colors".
3. To show alarms in the alarm view in the defined colors, activate the option "Alarm classes colors" under "Runtime settings > Alarms > General".

Define display area

You select a tag which defines the time from which alarms should be displayed. The following data types are permitted:

- External tags: Date, Date_and_Time, Time_of_Day
- Internal tags: DateTime

To define the display area, proceed as follows:

1. Click "Properties > Properties > Display" in the Inspector window.
2. Define the tag in which the time is specified under "Control tag for the display area".

Configuration behavior

Displaying column headers

The layout of the alarm view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Layout tab" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Displaying the buttons for operation

The alarm view in the HMI devices OP 73, OP 77A and TP 177A has a button which displays the alarm text in a separate window. This button is not shown during configuration.

The display of the buttons for using the alarm view depends on the configured size. You should check on the HMI device whether all necessary buttons are available.

Alarm window (Page 5246)

Alarm indicator (Page 5249)

Configuring an alarm view for active alarms (Page 5437)

Device dependency of the objects (Page 5183)

Alarm window (Basic Panels, Panels, RT Advanced)

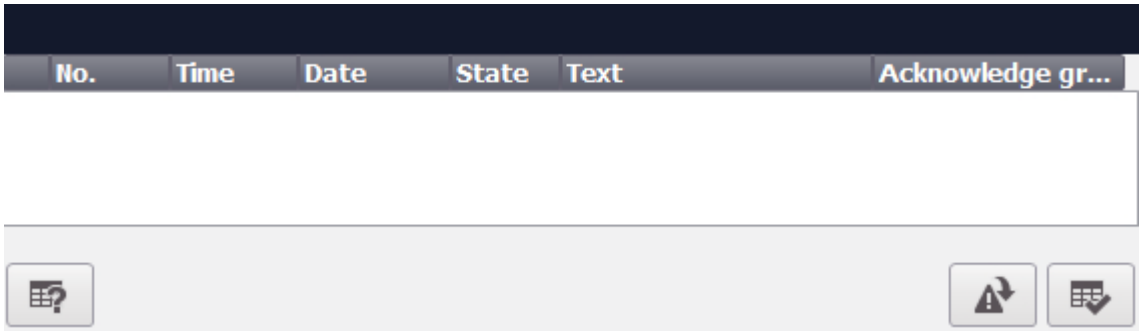
Application

Alarms are indicated in the Alarm view or in the Alarm window of the HMI device. The layout and operation of the Alarm window are similar to that of the Alarm view. The Alarm window has the following characteristics that are the same as in the Alarm view:

- Alarm window
- Alarm line: The alarm line is not available on Basic Panels.

The Alarm window is configured in the "Global screen" editor.

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Based on the configuration, it is not closed until the alarm is acknowledged.

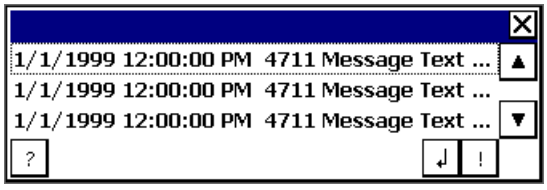


Note

In the engineering system you dynamize, for example, the visibility of an object in "Properties > Animations" in the inspector window. In Runtime, the "Simple alarm window" object does not support animations. If you have configured an animation and, for example, wish to perform a consistency check of the project, then an error alarm is issued in the Output window.

Simple alarm window

The simple alarm window is available on Basic Panels with a device version prior to V13 to display the alarms.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You configure the Alarm window in the same way as the Alarm view. In addition you adapt the following properties:

- Fixed alarm window: Specifies that the Alarm window retains the focus after a screen change.
- Window: You define the operator input and response of the Alarm window in Runtime.

Note

If you have different alarm classes output, these will be initially sorted into alarm classes in Runtime, and then by the time at which the alarm occurred.

Operator controls

The operator controls that can be used to control the alarm view in Runtime are specified in the inspector window under "Properties >Display > Settings". The following table shows the operator controls in the Alarm window, and what they do:

Button		Function
"Tooltip"	?	Displays a tooltip for an alarm.
"Acknowledge"	!	Acknowledges an alarm.
"Loop-In-Alarm"	↵	If a screen change is configured, the display switches to a screen containing information about the alarm.

Access protection in Runtime

Configure access protection under "Properties > Properties > Security" in the inspector window of the alarm view. If a logged-on user has the required authorization, he can acknowledge and edit alarms using the operator controls in the alarm view. If the logged-in user does not have the required authorization, or if no user is logged in, clicking the "Acknowledge" or "Edit" buttons or double-clicking an alarm line opens the login dialog box.

Note

Basic Panels

Access protection is not available for Basic Panels.

Activating the focus of the Alarm window

Select the following option so that the Alarm window does not lose the focus after a screen change:

1. In the Inspector window, select "Properties > Properties > Mode".
2. Enable "Label".

Window

Define the response of the Alarm window under "Properties > Properties > Mode > Window" in the inspector window. The following table shows the possible properties:

Option	Function
Automatic display	The Alarm window is automatically displayed when a system event occurs, for example.
Closable	The window closes again after a set time has elapsed. You define the display duration in the alarm settings.
Modal	The Alarm window is linked to a confirmation, such as: Alarm must be acknowledged. If the modal alarm window has the focus, the buttons in the screen behind it cannot be used. The functions configured on a function key are carried out.
Sizeable	You can change the size of the Alarm window in Runtime.

Alarm view, advanced (Page 5242)

Alarm indicator (Page 5249)

Configuring an alarm window (Page 5444)

Device dependency of the objects (Page 5183)

Alarm indicator (Basic Panels, Panels, RT Advanced)

Application

The alarm indicator is a graphic symbol that shows current errors or errors that need to be acknowledged, depending on the configuration. The alarm indicator is configured in the "Global screen" editor. The following figure shows an alarm indicator:

Alarm indicator OP 73

A "simple" alarm indicator is available for the HMI OP 73. The following diagram shows the alarm indicator for the OP 73 HMI devices:

The "simple" alarm indicator shows alarms to be acknowledged or alarms which have already been acknowledged and have not yet gone. Only the position can be defined for the "simple" alarm indicator. The alarm indicator is displayed on the device at the selected position. If you have configured a screen object at this position, the visible alarm indicator covers the screen object. The alarm indicator is covered by system dialogs, such as the login dialog, Help dialog, and alarm windows.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Alarm classes: Establishes the alarm classes where the alarm indicator is displayed.
- Operator control in Runtime: Defines the operator actions in Runtime that cause the Alarm window to open.

Alarm classes

You define which alarm classes are shown with an alarm indicator in "General > Alarm classes" in the Inspector window. Alarm classes, such as "Warnings" or "Errors".

Define operator control in Runtime

1. Select the alarm indicator in the screen.
2. Click "Events > Click" or "Click when flashing" in the Inspector window.
3. The "function list" opens. Click the first line of the function list. The list of system functions, and scripts available in the project opens.

4. Select the "ShowAlarmWindow". system function under "Alarms."
5. Under "object name" select the name of the Alarm window from the selection list. Under "Layout", define whether the Alarm window should be visible, hidden, or should toggle between the two states.

Alarm window (Page 5246)

Configuring an alarm indicator (Page 5445)

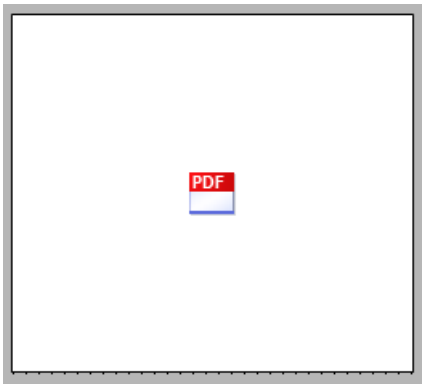
Device dependency of the objects (Page 5183)

PDF view (Panels, RT Advanced)

Use

Using the object "PDF view" you project a PDF view on which the operator can open and display documents in PDF format in runtime. The documents in PDF format are located in the internal or external memory of the respective HMI device in this case.

The PDF view supports the PDF version 1.7.



You can configure the PDF view in the following:

- In a screen
- In a template
- In a slide-in screen
- In a pop-up screen

Note

The "PDF view" object may be configured multiple times in a project. However, a maximum of one PDF view may be active at the same time.

Note

Device dependency of the "PDF view" object

The "PDF view" object is only available for KTP Mobile Panels, Comfort Panels and RT Advanced.

Note

Only one "PDF view" object may be inserted per screen.

Layout

You provide information about the position and size of the PDF view in the Inspector window. You can adapt the following properties in particular:

- File name: Specifies the PDF file that opens by default in the PDF view.
- File name tag: Specifies the tag that opens any PDF file.

Basic procedure

1. Create an internal tag of data type "String" in the "Tag" editor, for example, "PDFFile".
2. Insert the PDF view in the screen of the "Screens" editor. The PDF view is available in the "Tools > Controls" task card.
3. In the Inspector window, select "Properties > Properties > General".
4. Enter the file name of the PDF file that opens by default in runtime in "File name". You can also leave the "File name" field blank.
5. For "File name tag", select the "PDFFile" tag from the selection list.
6. Insert an I/O field in the screen in the "Screens" editor.
7. In the Inspector window of the I/O field "Properties > Properties > General > Tag" select the "PDFFile" tag from the selection list.
8. Assign the PDF view the "PDFFile" tag under "File name tag" in the Inspector window.
9. Create a text field for the label in the configured I/O field, for example, "PDF path".

If the operator enters the file name along with the path in the I/O field, the PDF view opens the file in question.

Operator controls

Operator controls are configured buttons in the process picture or softkeys on the HMI device for operating the object.

The "PDF view" object does not have its own operator controls. Configure operator controls yourself, for example, buttons, and link the operator controls with system functions.

1. For example, drag the "Button" object to the screen from the toolbox.
2. Enter a text of any length.

3. In the Inspector window, select "Properties > Events > Click".
   The "Function list" dialog box is opened.
4. The system functions for operation of the PDF view are available in the list of system functions in the group "Keyboard operation for screen objects".
   From the list select a function, for example, "PDFZoomIn".
5. From the "Screen object" list, select the object name of the PDF view in which the command is executed.

System functions

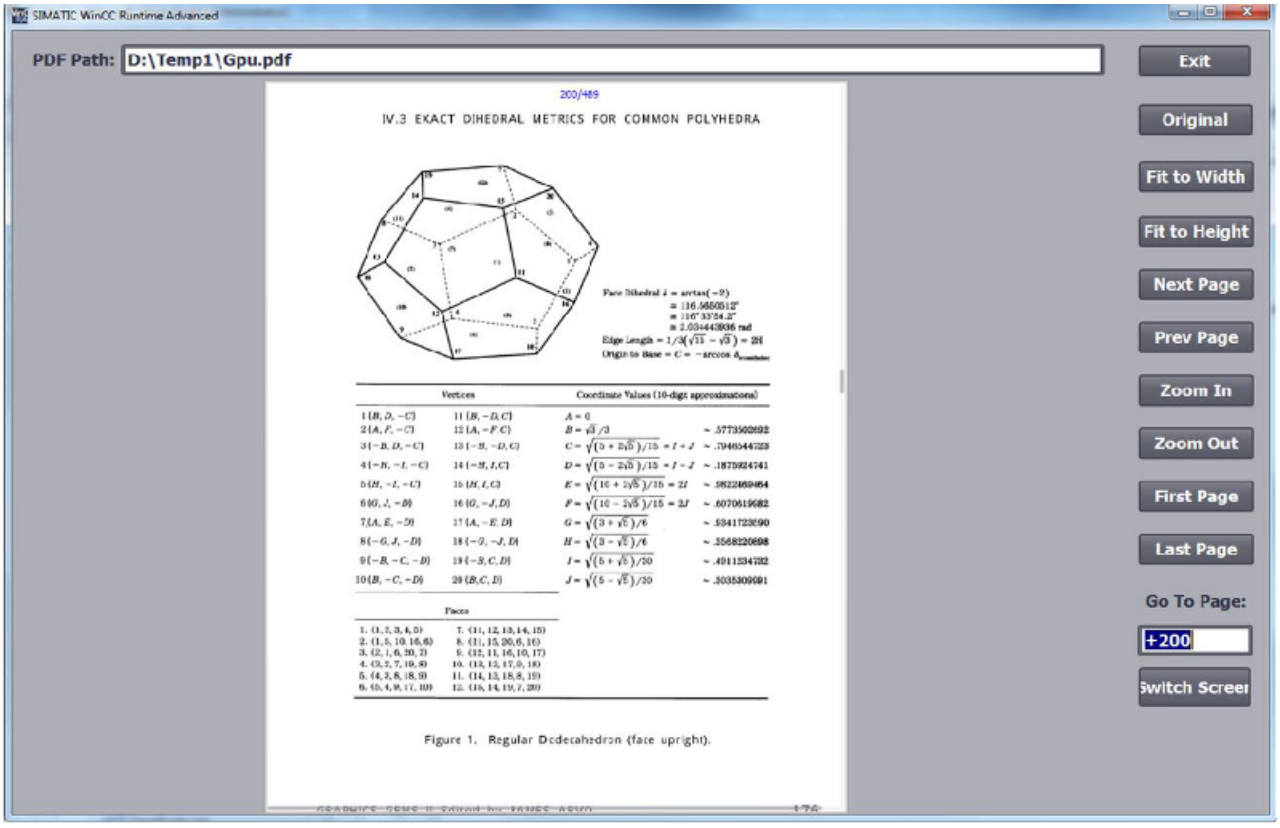
The following system functions are available for the "PDF view" object:

System function	Description
"PDFZoomIn"	Zooms in one zoom level
"PDFZoomOut"	Zooms out one zoom level
"PDFGotoNextPage"	Moves to the next page
"PDFGotoPrevious-Page"	Moves to the previous page
"PDFGotoFirstPage"	Moves to the first page
"PDFGotoLastPage"	Moves to the last page
"PDFFitToWidth"	Fits the display to fit the width of the PDF view window
"PDFFitToHeight"	Fits the display to the height of the PDF view window
"PDFZoomOriginal"	Changes the display to the original size
"PDFScrollUp"	Scrolls up
"PDFScrollDown"	Scrolls down
"PDFScrollLeft"	Scrolls to the left
"PDFScrollRight"	Scrolls to the right
"PDFGotoPage"	Moves to the specified page

Note

Scrolling on all HMI devices also works with multi-touch operation.

The figure below shows a PDF view with the configured operator controls:



Comments

Compared to Adobe Acrobat, the PDF view has limited functionality:

- The PDF view does not support links.
- The PDF view supports zoom levels 25% to 200%.

Note

The "PDF view" object cannot be addressed by using VB scripting.

Note

A lot of RAM may be needed to display and browse through large PDF files. In such cases, the system event 130000 "Not enough RAM" is displayed.

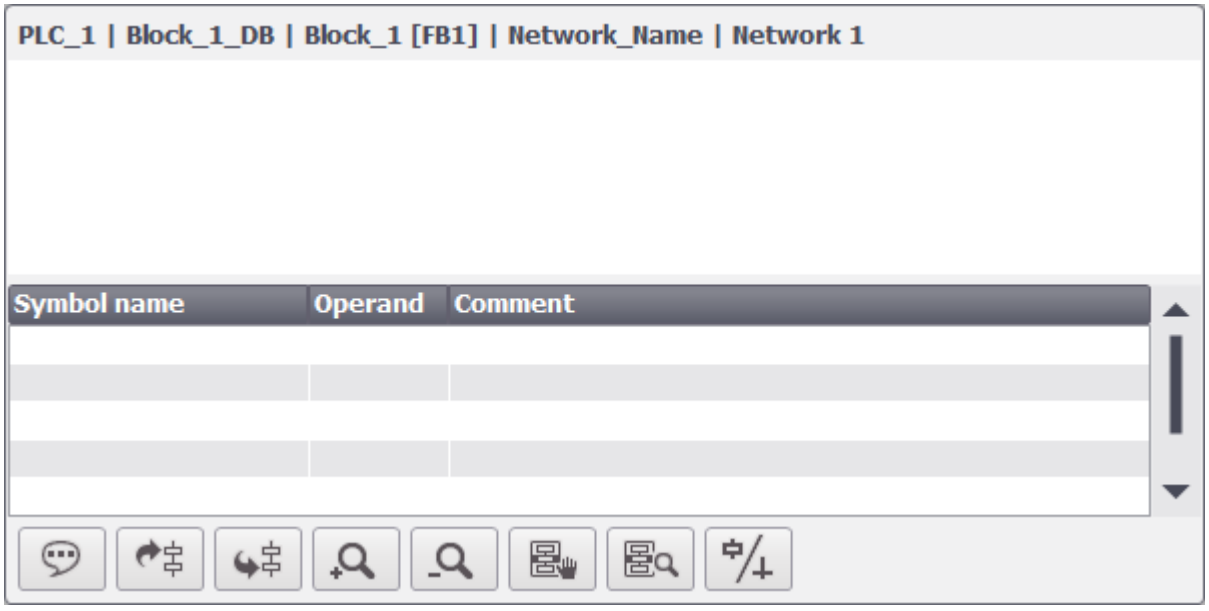
See also

Device dependency of the objects (Page 5183)

PLC code view (Panels, RT Advanced)

Use

The "PLC Code View" object is used to display the current program status of user programs which have been programmed in the LAD, FBD or GRAPH programming languages. Errors during execution of a GRAPH sequencer are displayed directly at the corresponding step.



The PLC code view is divided into the following areas:

- Header
  The header shows the PLC name, the FB name, as well as the number and name of the network in Runtime.
- Information area
  The PLC network is graphically represented in the information area in Runtime.
- Symbol table
  The symbol table shows the symbolic names of the operands, absolute addresses of the operands and corresponding comments.
- Toolbar
  The toolbar shows the buttons available in the PLC code view in Runtime.

Note

The "PLC Code View" object cannot be used in faceplates, in the global screen, in pop-up screens and slide-in screens.

Note

Device dependency of the "PLC code view" object

The "PLC code view" object is available for RT Advanced, Comfort Panels and KTP Mobile Panels with 7" display size or more.

Layout

You change the settings for the position, style, colors, and fonts of the object in the Inspector window. You also, importantly, adjust the toolbar buttons here.

To change the order of columns in the symbol table in Runtime, select the "Reorder columns" option under "Properties > Layout > Column settings".

Toolbar

The operator controls with which the PLC code view is operated in Runtime are configured under "Properties > Properties > Toolbar > Buttons" in the Inspector window.

Operator control	Designation	Function
	"Symbol area"	Shows the symbol area.
	"Previous network"	Navigates to the previous network
	"Next network"	Navigates to the next network
	"Zoom in"	Enlarges the information area.
	"Zoom out"	Reduces the information area.
	"Detail"	Shows the detail view.
	"Step mode"	Switches between manual and automatic step selection for the active step.
	"Transition/Interlock"	Switches between the transition and interlock network views.

Configuring the PLC code view

1. Drag-and-drop the PLC Code View from the toolbox view.
2. Click "Properties > Properties > Toolbar" in the Inspector window.

3. Select the buttons that you require in Runtime, for example: Next network, Previous network, Step mode.
4. If required, configure the button display, e.g. background color or fill pattern.
5. In the Inspector window, select "Properties > Properties > Columns".
6. Select the columns that you require in the device view for Runtime.
7. Customize the column headers or order if necessary.
8. Select an authorization for operation in "Properties > Properties > Security".

Controlling the PLC code view with the keyboard

To control the PLC code view with the keyboard, proceed as follows:

1. Press the <Tab> key repeatedly until the focus is on the desired button.
   You can use the <Shift + Tab> shortcut keys to navigate back to the previous button.
2. Press <Enter>.
   The command is executed.

Operation with the touch screen

Scrolling by dragging in the symbol table of the PLC code view is not supported.
To scroll horizontally and vertically in the symbol table, use the scroll bars and the scroll arrows.

Properties of a PLC in Runtime

If a PLC is connected to the PLC code view in WinCC and Runtime is active, changing the name of the PLC will trigger errors. Therefore, do not change the PLC name, the IP address, or other properties of the HMI connection.

Addressing tags in the "PLC code view" object

The "PLC code view" object only supports symbolic addressing of tags. If the operand is not addressed symbolically, the network with the operand cannot be displayed and an error message is generated.

Displaying time-value constants

When time-value constants are displayed, the time is shown in the format "Hours/Minutes/Seconds/" in the PLC code view, depending on the input configured in the Engineering System. For example, a constant "150 s" specified in the Engineering System appears in Runtime as "2 min 30 s".

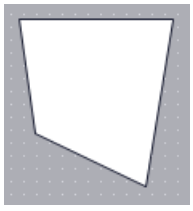
Polygon (Panels, RT Advanced, RT Professional)

Application

The "Polygon" is a closed object which you can fill with a background color.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. In particular, you can customize the following property:

Geometry: Modifies, deletes or adds corners.

Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. In the Inspector window, select "Properties > Properties > Layout".
2. Select the required corner point in the "Geometry" area. Input a value at "X position " and "Y position ".
3. To add a corner point, click the button.
4. To delete a corner point, click the button.

Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.
3. Right-click the position at which you want to insert the corner point. Select "Add point" from the shortcut menu.

Configuring Rotation in runtime

You configure the "Polygon" object so that it rotates about a reference point in runtime. The rotation in runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for the following attributes in the "Rotation" area.
   - X
   - Y
   - Angle

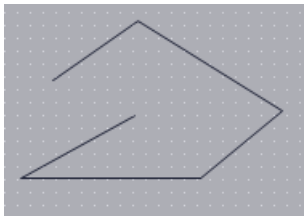
Polyline (Page 5258)

Device dependency of the objects (Page 5183)

Polyline (Panels, RT Advanced, RT Professional)

Application

The "Polyline" is an open object. Use the "Polygon" object if you want to fill the object with color.



Layout

In the Inspector window, you customize the settings for the object position, shape, style, and color. You can adapt the following properties in particular:

- Line start and end: Specifies the type of line start and line end.
- Geometry: Modifies, deletes or adds corners.

Line start and end

You define the start point and the end point of the line under "Properties > Properties >"Appearance" in the Inspector window. Use arrow point, for example, as start and end point. The available start and end points depend on the device.

Geometry

The corner points are numbered in the order of their creation. You can change, delete, or add more corner points:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the required corner point in the "Geometry" area. Input a value at "X position" and "Y position".
3. To add a corner point, click the button.
4. To delete a corner point, click the button.

Alternative procedure

You can also change, delete, or add new corner points using the mouse:

1. Select the object. Position the mouse cursor on the desired corner. The mouse cursor changes to a crosshair.
2. Drag the corner to the desired position while holding down the mouse button.

Configuring rotation in Runtime

You configure the "Polyline" object so that it rotates about a reference point in Runtime. The rotation in Runtime is only possible for devices with Runtime Professional.

Enter the values for the angle of rotation using Degrees as the unit.

1. Click "Layout" in the Inspector window.
2. Enter values for the following attributes in the "Rotation" area.
   - X
   - Y
   - Angle

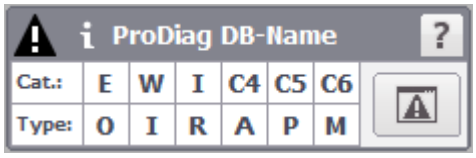
Polygon (Page 5257)

ProDiag overview (Panels, RT Advanced, RT Professional)

Use

The "ProDiag overview" object provides an overview of the current status of the configured monitoring in Runtime. When an error occurs, the type of error and the error category are determined in the ProDiag overview. You can navigate directly to the error message in an alarm view and have the affected program code shown in the PLC code view.



Note

The "ProDiag overview" object cannot be used in faceplates or in the global screen.

Note

Device dependency of the "ProDiag overview" object

The "ProDiag overview" object is available for RT Advanced, RT Professional, Comfort Panels and KTP Mobile Panels.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Displayed buttons
- Names and colors for categories
- Names and colors for monitoring types

Configuring the ProDiag overview

A CPU and a ProDiag FB are created.

1. In the Inspector window, select "Properties > Properties > General".
2. Open the selection button under the "Tag" property.
3. Select the status tag of ProDiag FB.
   Alternatively, drag the status tag from the detail view and drop it at the desired point of use.
4. Under "Output > Categories", define the names and colors for the categories.
5. Under "Output > Monitoring types", define the names and colors for the monitoring categories.
6. Select an authorization for operation under "Properties > Properties > Security".

Configuring a compact view

You can configure the ProDiag overview in a compact view.

Disable the display of categories and monitoring types under "Properties > Appearance > Options". Disable all buttons under "Properties > Toolbar > General".

Monitoring types and categories

You can display a maximum of eight categories and six types of monitoring in the "ProDiag overview" object. The pre-defined categories and monitor types are available:

Designation	Categories
E	Error
W	Warning
I	Info

Rename the categories C4 to C8, which are created by default, according to your requirements.

Designation	Monitoring type
O	Operand error
I	Interlock error
R	Reaction error
A	Action error
P	Position error
M	Alarm

You can change the display symbols of monitoring types and categories at any time under "Output" in the Inspector window.

Symbols

You specify the symbols that are displayed in the ProDiag overview in the Inspector window under "Properties > Appearance > Options". The following symbols are available for ProDiag overview:

Icon	Name	Function
	Help	Opens the user-defined tooltip.
	Info	Displays the information for monitoring.
	Error	Indicates that an error has occurred.

"Alarm view" button

To display the "Alarm view" in the ProDiag overview, select the "Show alarm window button" property under "Properties > Toolbar > General".

Button	Name	Function
	Alarm view	Opens the configured alarm view with the error message.

Deactivated display

If there is a faulty connection to the controller during runtime, the object "ProDiag overview" is displayed grayed-out (unavailable). This deactivated display can be due to the following:

- The controller is deactivated
- The configured ProDiag program block was removed from the control program
- The controller is in stop mode

As soon as the cause of the error is removed and the connection reestablished, the ProDiag overview shows the current online status of the monitoring during runtime.

Rectangle

Application

The "Rectangle" is a closed object which you can fill with a color.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Corner radius: Specifies the horizontal and vertical distance between the corner of the rectangle and the start point of a rounded corner.

Corner radius

The corners of the "Rectangle" object can be rounded to suit your requirements. When the properties "X" and "Y" are set to the 100 % value, the rectangle is displayed as an ellipse. As soon as one of the properties has the value 0%, a normal rectangle without a rounded corner is shown.

1. Click "Properties > Properties > Layout" in the inspector window.
2. Enter a value for "X" in the "Corner radius" area.
   The input value is the percentage proportion of half the width of the rectangle.
3. Enter a value for "Y" in the "Corner radius" area.
   The input value is the percentage proportion of half the height of the rectangle.

Recipe view (as of V13) (Basic Panels, Panels, RT Advanced)

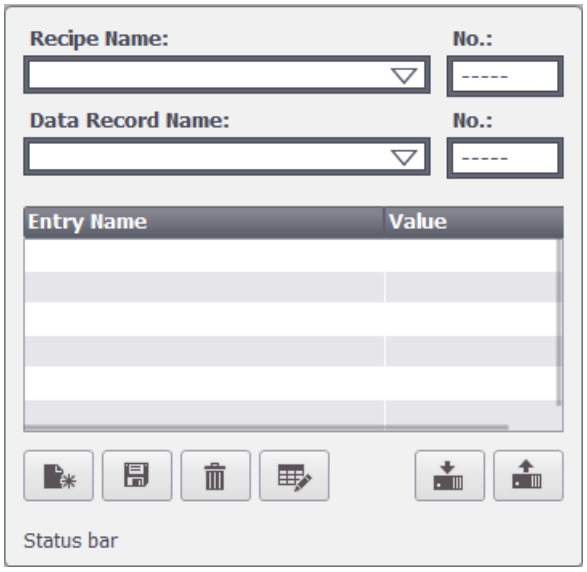
Application

The "Recipe view" object is used to display recipes on the HMI device.

Note

Device dependency of the "Advanced recipe view" object

The "Advanced recipe view" object is available on the HMI devices Basic Panels 2nd Generation, Comfort Panels, Mobile Panels with the device version V13.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Toolbar: Defines the operator controls of the recipe view.
- Display number: Defines whether the number of the recipe and the number of the recipe data record is displayed.
- Label: Sets the label for the name of the recipe and the recipe data record.

Operator controls

The operator controls with which the recipe view is operated in Runtime are configured under "Properties > Properties > Buttons" in the Inspector window. In the simple recipe view the operating elements are based on the functions of the menu.

Operator control		Description
	"Tooltip"	Calls up the configured tooltip for the selected recipe.
	"Add data record"	Creates a new recipe data record in the recipe.
	"Delete data record"	Deletes the selected data record.
	"Rename"	Changes the name of selected data record.
	"Save"	Saves the modified record with its current name.

Operator control		Description
	"Save as..."	Saves the modified record with a new name.
	"Write to PLC"	Sends the current value to the PLC.
	"Read from PLC"	Reads the current value from the PLC.
	"Synchronize recipe tags"	Compares the values of the selected data record with the values on the PLC.

Display number

Specifies whether the number of the recipe and the number of the recipe data record are displayed in Runtime. The number of the recipe uniquely identifies the recipe in the project.

1. Click "Properties > Properties > View" in the Inspector window.
2. Select "Display > Display numbers".

Display label

Use this property to specify the name to be shown for recipes and data records in the recipe view.

1. Click "Properties > Properties > Label" in the Inspector window.
2. Select "Display labels".
3. Enter the labels for the recipe and the recipe data record.

Behavior during configuration

Displaying column headers

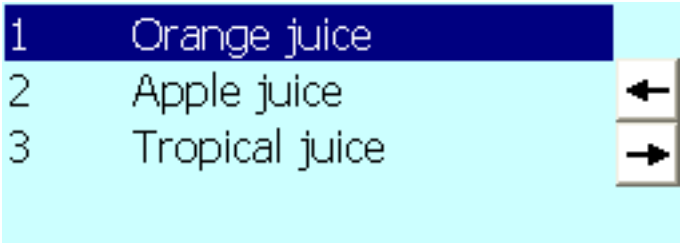
The layout of the recipe view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Recipe view, simple (Basic Panels, Panels, RT Advanced)

Application

The "Recipe view" object is used to display and modify recipes.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Toolbar: Specifies the menu commands of the recipe view.

Toolbar

The menu items with which the recipe view is operated in Runtime are configured under "Properties > Properties > Toolbar" in the Inspector window.

Menu command	Description
"Tooltip"	Calls up the configured tooltip for the selected recipe.
"Add data record"	Creates a new recipe data record in the recipe.
"Delete data record"	Deletes the selected data record.
"Save"	Saves the modified record with its current name.
"Save as"	Saves the modified record with a new name.
"Write to PLC"	Sends the current value to the PLC.
"Read from PLC"	Reads the current value from the PLC.
"Rename"	Specifies that the "Rename" button is shown.
"Forward"	Specifies that the menu buttons are visible.
"Back"	Specifies that the "Back" button is shown.

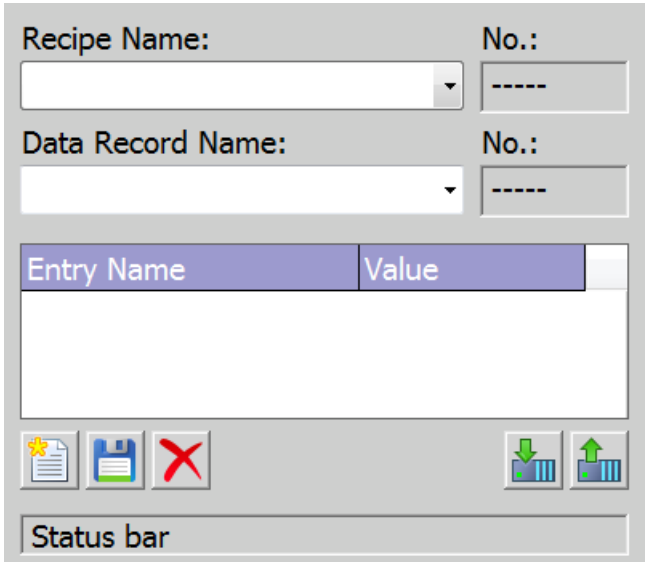
See also

Objects for Basic Panels (Page 5183)

Recipe view, advanced (Basic Panels, Panels, RT Advanced)

Advanced recipe view

The "Recipe view" object is used to display and modify recipes. The advanced or the simple user view is available depending on the HMI device

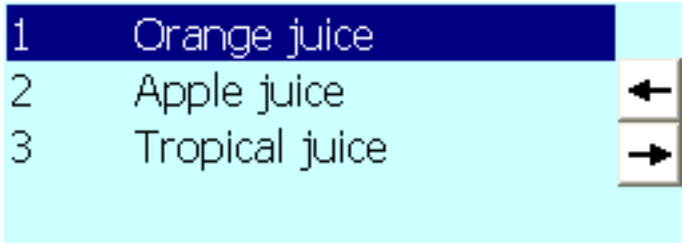


Changing the view type

On HMI devices with a display larger than 6", both the advanced and the simplified recipe view can be used to manage and process recipes. The view type is only available for configuration on devices up to device version V13.

Note

Do not use the simple recipe view in a group.



Configuring the simple recipe view:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Mode > Display type > Simplified".

Note

Behavior for Runtime Professional, Runtime Advanced and Panels

In the Engineering System you can dynamically control the visibility of an object, for example, in the "Animations" tab of the Inspector window. In Runtime, the "Simple recipe view" does not support animations. If you have configured an animation and, for example, want to check the consistency of the project, an error alarm is displayed in the Output window.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Operator controls: Defines the operator controls of the recipe view.
- Display number: Defines whether the number of the recipe and the number of the recipe data record is displayed.

Operator controls

The operator controls with which the recipe view is operated in Runtime are configured under "Properties > Properties > Buttons" in the Inspector window. In the simple recipe view the operating elements are based on the functions of the menu.

Operator control		Description
	"Tooltip"	Calls up the configured tooltip for the selected recipe.
	"Add data record"	Creates a new recipe data record in the recipe.
	"Delete data record"	Deletes the selected data record.
	"Save"	Saves the modified record with its current name.
	"Save as"	Saves the modified record with a new name.
	"Synchronize recipe tags"	Compares the values of the selected data record with the values on the PLC.
	"Write to PLC"	Sends the current value to the PLC.
	"Read from PLC"	Reads the current value from the PLC.

Display number

Specifies whether the number of the recipe and the number of the recipe data record are displayed in Runtime. The number of the recipe uniquely identifies the recipe in the project.

1. Click "Properties > Properties > View" in the Inspector window.
2. Select "Display > Display numbers".

Configuration behavior

Displaying column headers

The layout of the recipe view is dependent on the view settings in the control panel. Depending on the setting, the column headers may be truncated. This setting is found under "Display > Appearance" in the control panel. To display column headers correctly, set the display in "Windows and buttons" to "Windows Classic" style.

This behavior only occurs during configuration. The column headers are displayed correctly in Runtime.

Switch (Basic Panels, Panels, RT Advanced)

Application

The "Switch" object is used to configure a switch that is used to switch between two predefined states in runtime. The current state of the "Switch" object can be visualized with either a label or a graphic.

The following figure shows a "Switch" type switch.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. In particular, you can customize the following property:

- Type: Defines the graphic representation of the object.

Type

Button visualization is specified at "Properties > Properties > General >Type" in the Inspector window.

Type	Description
"Switch"	The two states of the "Switch" are displayed in the form of a switch. The position of the switch indicates the current state. The state is changed in runtime by sliding the switch. You specify the direction of movement of the switch in "Switch orientation" with this type.
"Switch with text"	The switch is shown as a button. The current state is visualized with a label. In runtime click on the button to actuate the switch.
"Switch with graphic"	The switch is shown as a button. The current state is visualized with a graphic. In runtime click on the button to actuate the switch.

Note

Basic Panels

The "Switch" type is not available for Basic Panels.

See also

Elements (Page 5983)

Overview of objects (Page 5025)

Device dependency of the objects (Page 5183)

Button

Application

The "Button" object allows you to configure an object that the operator can use in Runtime to execute any configurable function.

Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Defines the graphic representation of the object.
- Text / Graphic: Defines whether the Graphic view is static or dynamic.
- Define hotkey: Defines a key, or shortcut that the operator can use to actuate the button.

Note

You can only define a hotkey for HMI devices with keys.

Mode

The button display is defined in "Properties > Properties > General >Mode" in the Inspector window.

Mode	Description
"Invisible"	The button is not visible in Runtime.
"Text"	The button is displayed with text. This text explains the function of the button.
"Graphic"	The button is displayed with a graphic. This graphics represents the function of the button.
"Graphics or text"	The button is displayed with text or graphics. If the graphics cannot be displayed, the corresponding text is displayed.
"Graphics and text"	The button is displayed with text and graphics.

Different options are available depending on the device.

Text / Graphic

The "Mode" property settings are used to define whether the display is static or dynamic. The display is defined in "Properties > Properties > General >Text" or "Graphic" in the Inspector window.

You can, for example, select the following options for the "Graphic" or "Text" type.

Type	Option	Description
"Graphic"	"Graphic"	Use "Graphic when button is "not pressed"" to specify a graphic displayed in the button for the "OFF" state. Use "Graphic when button is "pressed"" to specify a graphic for the "ON" state.
	"Graphics list"	The graphic in the button depends on the state. The corresponding entry from the graphics list is displayed depending on the state.
"Text"	"Text"	Use "Text when button is "not pressed"" to specify the text displayed in the button for the "OFF" state. Use "Text when button is "pressed"" to specify text for the "ON" state.
	"Text list"	The text in the button depends on the state. The entry from the text list corresponding to the state is displayed.

Note

You cannot use text lists and graphics lists in buttons in WinCC Runtime Professional.

Define hotkey

In the Inspector window, a key or key combination is defined that the operator can use to control the button in Runtime.

1. In the Inspector window, select "Properties > Properties > General".
2. Select a key or key combination from the selection list in the "Hotkey" area.

Example: Configuring a button with access protection (Page 5690)

Device dependency of the objects (Page 5183)

Slider

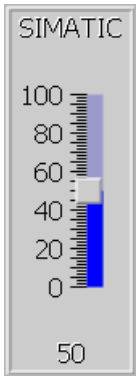
Use

Process values are monitored and adapted within a defined range with the "Slider" object. The monitored range is visualized in the form of a slider. By adjusting the slider, you intervene in the process and correct the displayed process value.

Note

Do not configure a system function at the "Change" event for a regulated project if it is used to execute a GMP-relevant action.

Instead configure the system functions at the "Value change" event of the tags in order to reduce the number of user actions.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can, in particular, adapt the following properties as required:

- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Display current value: Specifies whether the current position of the controller appears below the slider.
- Display of bars: The sliders above and below the bar can be hidden.

Maximum Value and Minimum Value

The top and bottom end values of the scale are specified in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > General".
2. Enter a number at "Maximum scale value" and "Minimum scale value". If you select a tag as the end value of the scale, the number will be no longer available.

Configuring limits/ranges

You can display limits and ranges in different colors. You define the colors in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Limits/Ranges".
2. Activate the limits/ranges that are to be displayed in runtime.
3. You can change the default colors for the ranges, if required.

Note

When you select the option "Show ranges from tag", you can display up to five ranges in the slider whose values are specified by means of a process tag. You define the values for the ranges with a process tag, which you interconnect with the screen object.

The option "Show ranges from tag" is available for Comfort Panels, KTP Mobile Panels and RT Advanced.

Display current value

Specify that the value of the current position is displayed below the slider in the Inspector window.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Select "Show current value."

Display bar

The bar can be hidden.

1. In the Inspector window, activate "Properties > Properties > Layout".
2. Deactivate "Display bar".

Behavior during operation

The displayed value on the slider control may deviate from the actual value of the associated tag in the following circumstances:

- The value range (minimum and maximum value) configured for the slider control does not correspond to the configured limits for the slider control tag.
- An invalid password has been entered for a password-protected slider control.

Device dependency of the objects (Page 5183)

Key switch

Application

The object "KeySwitch" is an optional control element for the SIMATIC Mobile Panel. In runtime, the key switch is used to lock functions that can be triggered from the Mobile Panel.

You configure the object "key switch" object in the "global screen" or in a template.

Layout

You can set the following properties in the Properties view:

- Tag: Specifies the tag in which the position of the key switch is written.

Tag

The "Tag" property is used to specify the "Key switch" object assignment in the global screen or template.

Note

Notes on configuring

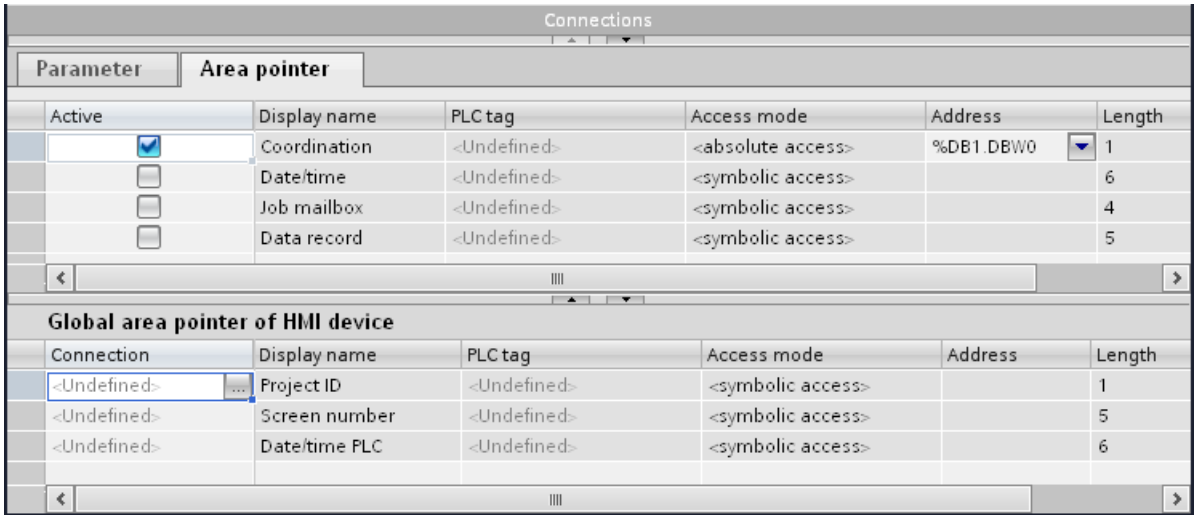
When starting runtime and every time the key is pressed the current position of the key switch is written to the tag. In doing so it can cause inconsistencies between the position of the key switch and the key switch tags.

1. If the tag has a process connection, the current value is transferred from the PLC to the tag after establishment of communication. The tag that contains the current position of the key is overwritten by this process. It can be that the key switch tag no longer reflects the current value of the key switch, e.g. if the Mobile Panel is switched off while the key is being turned.
2. If the key switch is pressed before communication with the PLC has been established (e.g. after a device start-up), it may not be possible to send the value of the key switch tag to the PLC. In this case the value of the tag in the PLC is different from the current position of the key.

A specific configuration is required to make sure that the key switch tag reflects the actual position of the key switch at all times. See the instructions below for the basic procedure.

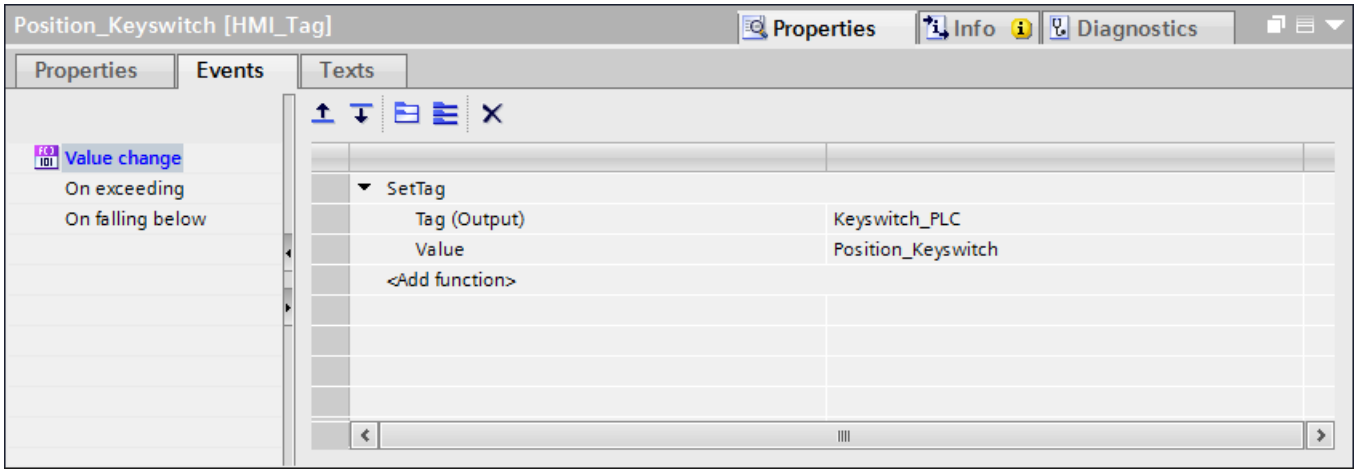
Basic procedure

1. Specify the connection to the PLC in the "Connections" editor. Activate the "Coordination" area pointer to ensure that the life bit is available to the PLC side.



2. Create three tags in the "Tag" editor.
   - Internal tag: Position_Keyswitch
   - External tag: Auxiliary tag
   - External tag: Keyswitch_PLC

3. Open the Inspector window of the "Position_KeySwitch" tag.
4. In the Inspector window, select "Properties > Events > Value change".
5. Click the first line of the function list. The list opens, showing the system functions available in the project.
6. Select the "SetTag" system function.
   - Select the "Keyswitch_PLC" tag at "Tag (output)".
   - Select the "Position_Keyswitch" tag at "Value".



The value of the "Keyswitch_PLC" tag is written to the PLC with the "Position_Keyswitch" tag. A program in the PLC evaluates the life bit. If communication is established, the current value is written to the "Keyswitch_PLC" tag from the PLC.

7. Open the Inspector window of the "Auxiliary tag" tags.
8. In the Inspector window, select "Properties > Events > Value change".
9. Click the first line of the function list. The list opens, showing the system functions available in the project.

10. Select the "SetTag" system function.
    - Select the "Keyswitch_PLC" tag at "Tag (output)".
    - Select the "Position_Keyswitch" tag at "Value".

    After establishing communication the current value is written to the "Auxiliary Tag" from the PLC. The "SetTag" system function is executed by the value change in the auxiliary tag. The system function re-allocates the value of the "Position_Keyswitch" tag to the "Keyswitch_PLC".

11. Open the global screen or a template in the "Screen navigation" editor.
12. Select the key switch in the screen.
13. Select the "Position_KeySwitch" tag in the Inspector window under "Properties > Properties > General > Settings > Tag".
    If you actuate the key switch, the value is written to the "Position_KeySwitch" tag.

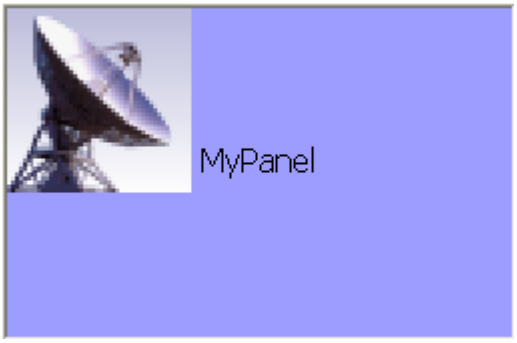
Field of application of the Mobile Panel Wireless (Page 6002)

Sm@rtClient view (Panels, RT Advanced)

Application

The "Sm@rtClient View" object is used to configure a network connection to the remote monitoring and remote maintenance of a connected unit.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Connect on start: Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which should be remote-controlled.
- Shared use_ Specifies that an HMI device is shared by several Sm@rtClient Views.
- Local cursor: Specifies whether the cursor data is transferred separately in order to increase the performance.
- Use cursor key scroll: For keyboard devices places the control of the horizontal and vertical scroll with the cursor keys.
- Show controls: Establishes whether additional fields exist for entering the address and password.
- Allow menu: Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
- Connection type: Establishes the expected transfer speed for the remote monitoring.
- Scaling: Specifies whether the Sm@rtClient view can be zoomed in or out.

Connect on start

Establishes whether when opening the Sm@rtClient view the connection to the HMI device is automatically created which is remote-controlled.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Connect on start".

Shared use

Define whether the HMI device can be used by several Sm@rtClient views under "Properties > Properties > General > View > Shared".

Shared use	
Enabled	HMI devices on which remote control is activated can access the remote HMI device and control the process. Only one HMI device can be active at a time in this case. A different HMI device can only assume control when there has been no activity on the active HMI device for a specified period of time.
Disabled	Only one HMI device can use the remote control at any given time. The activities can be followed on the other HMI devices. Depending on the settings on the Sm@rtServer the following options are available if another HMI device logs on: • The HMI device is rejected. • The active HMI device is disconnected and the new HMI device is connected.

Local cursor

If this property is set, then the cursor data is transferred separately.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Local cursor".

Display extended objects

If this property is set then there are additional fields for inputting the address and password. For the fields to be shown the "Connect on start" option is not activated.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Show enhanced objects".

Allow menu

If this property is set, then a shortcut menu to control the Sm@rtClient view is opened in Runtime.

When operating using the mouse, the left mouse key must remain depressed for a few seconds for the shortcut menu to open.

1. In the Inspector window, select "Properties > Properties > General".
2. Select "View > Allow Menu".

Connection type

The "Connection type" property establishes the expected transfer speed for the remote monitoring.

Set the connection type at "Connection type" under "Properties > Properties > General > Connection type" in the Inspector window.

Connection type	
LAN	Connection via network
Slow	Connection with a low transfer speed
Medium speed	Connection with a medium transfer speed
Modem	Connection via an analog modem
Very slow	Connection with a very low transfer speed

Scaling

If this property is set, then via "Client scale factor" and "Server scale" you can reduce or enlarge the Sm@rtClient view on the HMI device.

1. In the Inspector window, select "Properties > Properties > Scaling".
2. Select "Scaling > Scaling".
3. Enter the values for the scaling under "Client scale factor" and "Server scale factor".

Behavior during operation

If the program cannot resolve the dynamic address of a Sm@rtClient view after a screen change, the system connects to the configured server using the static address of the server. If a tag is now set using the dynamic address, you can make a second connection to this server. As a remedy preset the tags of the dynamic address for example by means of a script.

Device dependency of the objects (Page 5183)

Symbol library (Panels, RT Advanced, RT Professional)

Application

The "Symbol library" object contains a large collection of ready-to-use icons. These icons are used to represent systems and plant areas in screens.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

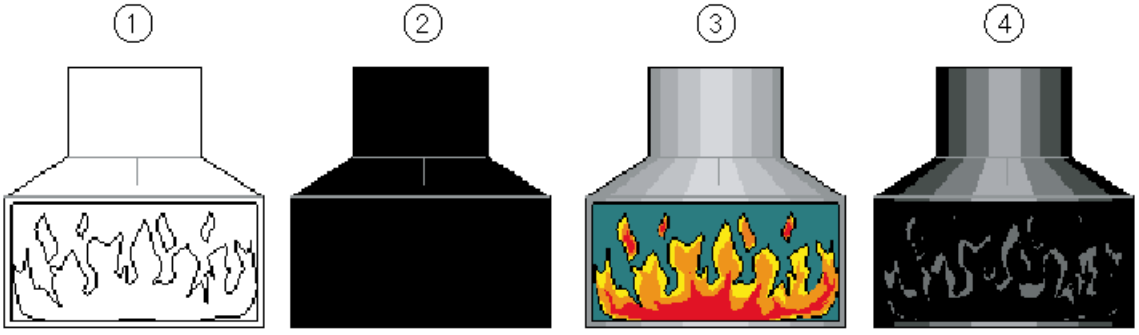
- Select icon: Specifies which library object will be used.
- Fill style: Specifies the graphic design of the object.
- Flip: Specifies the flip type of the library object.
- Rotate: Specifies the angle around which the library object is rotated.
- Fixed aspect ratio Defines whether the aspect ratio is maintained if the size is changed.

Select symbol

Select the icon at "Properties > Properties > General" in the Inspector window.

Fill style

Specify the design of the library object at "Properties > Properties > Appearance > Style" in the Inspector window.



1	"Hollow"	The library object is displayed in outline.
2	"Solid"	Black lines remain as outlines. Elements of the icon with a different color are displayed as a main color.
3	"Original"	The screen object will not be changed.
4	"Shaded"	Black lines remain as outlines. Elements of the symbol in other colors are displayed as brightness levels of a main color.

At the TP 177B mono and OP 177B mono HMI devices the library object is displayed as an outline. "Hollow" is set as the default value for the fill style.

If you change the setting from "hollow" to "original" or "shaded" then the color of the display on the configuration computer will deviate from that on the HMI device. This deviation is caused by the different color resolutions. You may also use a graphic object from the "Graphics" object group. The graphic objects are structured by topic and by depth of color in the "WinCC graphics folder."

Flip and rotate

The content of the screen flips around the horizontal or vertical central axis of the icon. The icon can be flipped horizontally, vertically or simultaneously horizontally and vertically.

The screen content rotates around the central point of the icon. The symbol is rotated clockwise in increments of 90, 180, or 270 degrees.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select the mirroring mode at "Orientation > Mirror image".
3. Select the angle of rotation at "Orientation > Rotate".

Fixed aspect ratio

The smaller page of the library object defines the maximum size of the symbol. If you change the size of the library object unproportionally, the symbol is still scaled proportionally. Proceed as follows to configure a fixed aspect ratio:

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select "Form > Fixed aspect ratio".

Behavior during operation

The possibility of operating the mouse is indicated in Runtime by the cursor symbol changing, depending on the configuration. Operation feedback, e.g. by means of a color change, does not take place.

Device dependency of the objects (Page 5183)

Symbolic I/O field (Basic Panels, Panels, RT Advanced)

Application

The "Symbolic I/O field" object can be used to configure a selection list for input and output of texts in Runtime.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Mode: Specifies the response of the object in Runtime.
- Text list: Specifies the text list that is linked to the object.
- Button for selection list: Specifies that the object has a button to open the selection list.

Note

Reports

In reports, symbolic I/O fields only output data. "Output" mode is preset. Properties for configuring the selection of graphics are not available, e.g. "button for selection list".

Mode

The response of the symbolic I/O field is specified in the Inspector window in "Properties > Properties > General > Type".

Mode	Description
"Output"	The symbolic I/O field is used to output values.
"Input"	The symbolic I/O field is used to input values.
"Input/output"	The symbolic I/O field is used for the input and output of values.
"Two states"	The symbolic I/O field is used only to output values and has a maximum of two states. The field switches between two predefined texts. This is used, for example, to visualize the two states of a valve: closed or open.

Note

The behavior possible for the symbolic I/O field depends on the Runtime.

Text list

In the Inspector window, you specify which text list is linked to the symbolic I/O field.

1. In the Inspector window, select "Properties > Properties > General".
2. Under "Contents" open the selection list for "Text list".
3. Select a text list.

Button for selection list

The "Button for selection list" property is used to display a button for opening the selection list.

1. Select "Properties > Properties > Layout" in the Inspector window.
2. Select "Response > Button for selection list".

Note

Basic Panels

The "Button for selection list" option is not available for Basic Panels.

Behavior during operation

The selection list of the symbolic I/O field displays an empty text line if a corresponding entry was not defined in the project. The active state is indicated on the HMI device by changing the color of contents of the symbolic I/O field.

System diagnostics view (Basic Panels)

Introduction

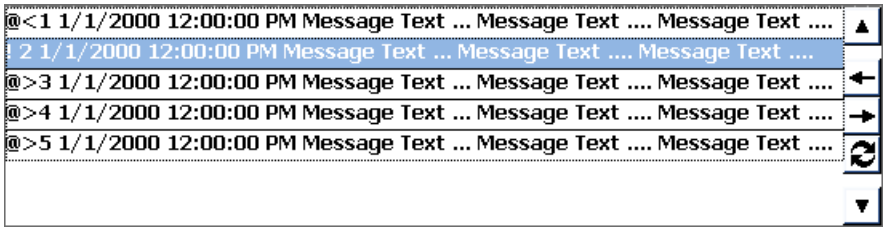
The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

Application

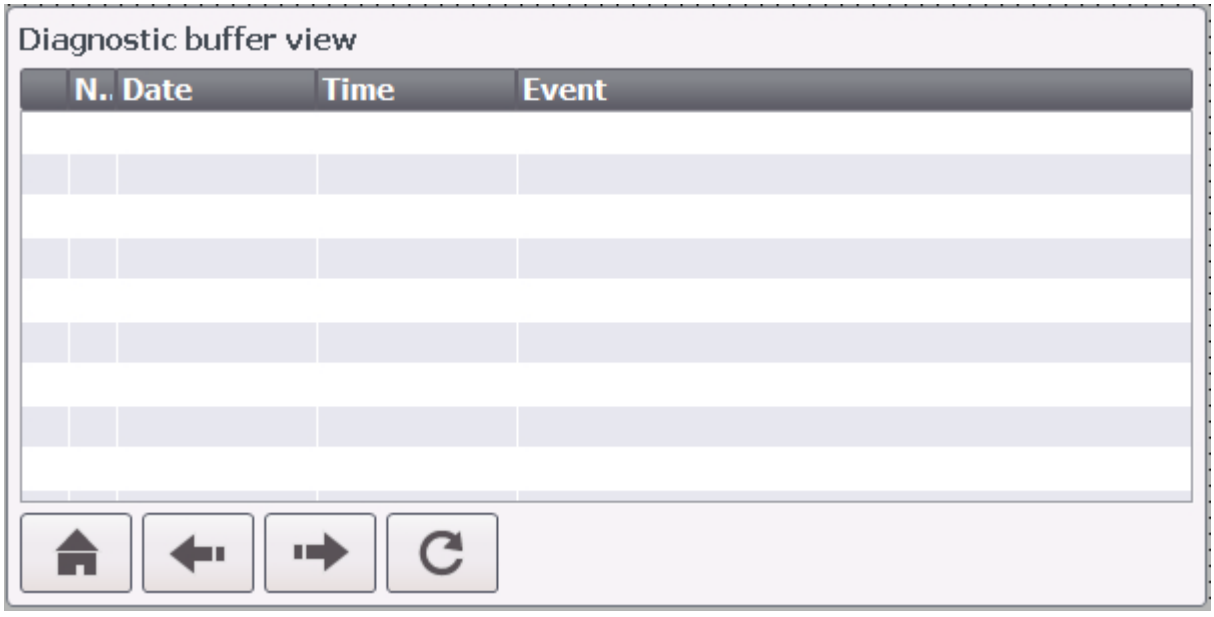
The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.

Views in the system diagnostics view

A simple system diagnostics view is available on Basic Panels with a device version prior to V13.



The advanced system diagnostics view is available on Basic Panels with a device version of V13 or later.



Three different views are available in the system diagnostics view.

- Device view
- Diagnostic buffer view
- Detail view

Device view

The device view of the system diagnostics view shows all the available connections in tabular form. Double-clicking a connection opens the detail view. The device view is only displayed if more than one connection has been created in the "Devices & Networks" editor.

Diagnostic buffer view

In the diagnostic buffer view, the current data from the diagnostic buffer is displayed.

Detail view

The detail view shows detailed information on the selected connection. You cannot sort error texts in the detail view. The detail view is only available if there is an integrated connection to an S7-1200 or S7-1500.

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Lines per entry: Specifies the number of lines that are shown for an entry.

Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. In the Inspector window, select "Properties > Layout".
3. Enter a number under "Lines per entry", i.e. 5.
4. Select an authorization for operation in "Properties > Properties > Security".

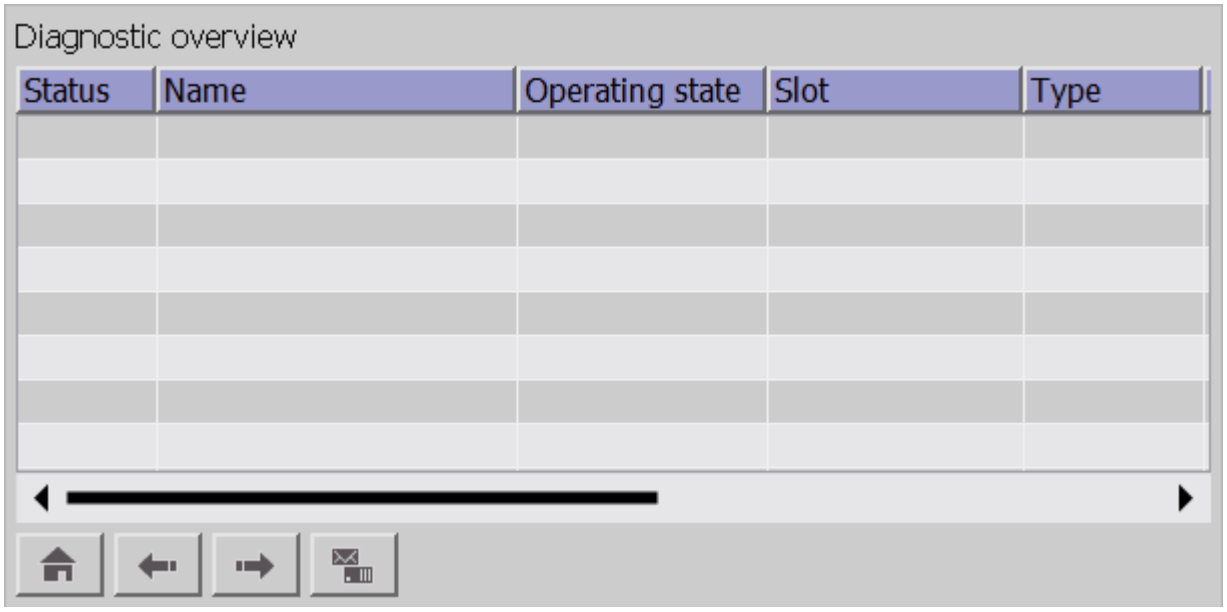
System diagnostic view (Panels, RT Advanced)

Introduction

The system diagnostics view offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

Application

The system diagnostics view enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.



Four different views are available in the system diagnostics view.

- Device view
- Detail view
- Diagnostic buffer view
- Distributed I/O view

Note

The "System diagnostics view" object cannot be used in faceplates.

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Show split view: Specifies that the device view and the detail view are shown simultaneously.

Configuring the system diagnostics view

1. Drag-and-drop the system diagnostics view from the toolbox.
2. You define the start view for the system diagnostics view under "Properties > Properties > General > Mode".
3. In the Inspector window, select "Properties > Properties > Columns".
4. Select the columns that you require in the device view for Runtime, for example, Operating mode, Name, Slot.
5. Select the columns which you need in the detail view for runtime, e.g., Operating mode, Name, Address.
6. Select the columns that you require in the diagnostic buffer view, e.g., Status, Name, Rack.
7. Customize the column headers, if necessary.
8. Enter "IP" for "Address", for example.
   The column header "IP" is displayed in the device view in Runtime.
9. Rename other elements if necessary.
10. Select an authorization for operation in "Properties > Properties > Security".

Showing device view and detail view in a single display

You can split the system diagnostics view and allow the device and detail view to be shown in the same window.

1. In the Inspector window, click "Properties > Properties > Layout".
2. Activate "Show split view".

Symbols in the system diagnostics view

Icon	Function
	Device in operation
	Device cannot be accessed
	Errors in device
	Input/output data are not available
	Device deactivated
	Maintenance required
	Maintenance recommended
	Superimposed symbol Shows the subordinate status
	Current configuration

Icon	Function
	Stop e.g. Update, Boot, Own initialization
	Stop

System diagnostics window (Panels, RT Advanced)

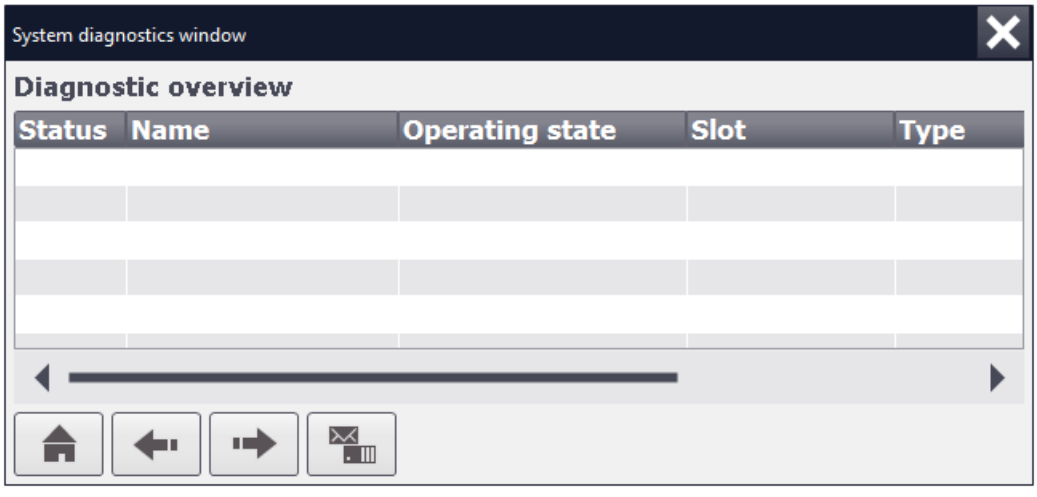
Introduction

The system diagnostics window offers you an overview of all the available devices in your plant. You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

The system diagnostics window is only available in the global screen.

Application

The system diagnostics window enables you to achieve the maximum level of detail of the diagnostics data. A precise diagnosis is possible, as all the available data is displayed. You have the system status of the entire plant at one glance.



Four different views are available in the system diagnostics window.

- Device view
- Detail view
- Diagnostic buffer view
- Distributed I/O view

Note

The "System diagnostics window" object cannot be used in faceplates.

Layout

You change the settings for the position, geometry, style, color, and font of the object in the Inspector window. You can adapt the following properties in particular:

- Columns: Defines the elements of the device view and detail view.
- Table headers: Specifies the table headers of the view.
- Window: Specifies whether the system diagnostics window can be closed, for example.

Configuring the system diagnostics window

1. Drag and drop the system diagnostics view from the toolbox into the global screen.
2. You define the start view for the system diagnostics window under "Properties > Properties > General > Mode".
3. In the Inspector window, select "Properties > Properties > Columns".
4. Select the columns that you require in the device view for Runtime, e.g., Operating mode, Name, Slot.
5. Select the columns that you require in the detail view for Runtime, e.g., Operating mode, Name, Plant designation.
6. To change a column header, click in the field and (for example) enter "IP" for "Address". The column header "IP" is displayed in the device view in Runtime.
7. Rename other elements if necessary.
8. To be able to close the system diagnostics window in Runtime, select "Properties > Properties > Window > Closable" in the Inspector window.

Icons in the system diagnostics window

Button	Function
	Device in operation
	Device cannot be accessed
	Errors in device

Button	Function
	Device deactivated
	Input/output data are not available
	Maintenance required
	Maintenance recommended
	Superimposed symbol Shows the subordinate status
	Current configuration
	Stop e.g. Update, Boot, Own initialization
	Stop

System diagnostics window: Show wire break error

You have activated wire break diagnostics for a module. The error text is displayed in the system diagnostics window when a wire break error occurs. You can see the error text and possible causes of the error in the module detail view. Output of the channel number of the affected channel is not supported.

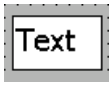
Basics on Panels and Runtime Advanced (Page 6060)

Configuring system diagnostics objects (Page 6064)

Text field

Application

The "Text field" is a closed object which you can fill with a color.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.
   For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

See also

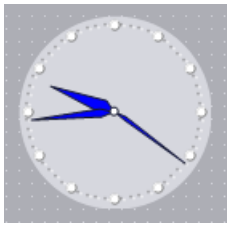
Connecting tags and text lists in the text (Page 5050)

Device dependency of the objects (Page 5183)

Clock

Application

The "Clock" object displays the date and time.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Analog display: Specifies whether the clock is shown as an analog clock or digital clock.
- Display clock dial: Specifies whether hour marks of the analog clock will be displayed.
- Width and length of hands: Specifies the width and length of the hands.

Analog display

In the Inspector window you can specify whether the clock is displayed as an analog or digital clock. The digital clock shows both the time and the date. The display format depends on the language set on the HMI device.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".

Display dial

In the Inspector window you can specify whether hour marks will be displayed.

1. In the Inspector window, select "Properties > Properties > General":
2. Activate "Analog".
3. Activate "Show dial".

Width and length of hands

The width of the second hand, minute hand and hour hand is set for the analog display.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter values for "width" and "length".
   The values for the length are interpreted as a percentage of the size of the clock. The value for the length of the second hand influences the radius of the dial at the same time.

Device dependency of the objects (Page 5183)

Effective range name (Panels, RT Advanced)

Use

The "Effective range name" object is a operator control for some SIMATIC Mobile Panels. The "Effective range name" object shows the names of the effective range in which the HMI device is located and also the logon status.

Layout

Symbol	Meaning	Description	Logon status
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	It is not possible to log on to the effective range
	Acknowledgement button functions	Within the "MixingAxisControl" effective range	Logged on to effective range
	Acknowledgement button has no effect	Within the "MixingAxisControl" effective range	Logon to the effective range is rejected because a different HMI device is already logged on. Note: When using the "Override" mode: Although no other HMI device is still logged on to the effective range, logon is rejected because the override switch is still set.
	Acknowledgement button has no effect	Outside of each effective range	Note: You can only log on within the effective range

In the Inspector window "Properties > Properties > Security", assign an authorization to log on to a machine in runtime.

Logon requirements

- The HMI device is located within the effective range.
- No HMI device is logged on to this effective range.

Logon procedure

1. Click on the "Effective range name" object.
   The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.
3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

Result

If the ID and effective range match, the HMI device is logged on to the effective range. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range.

Requirement for logging off

The HMI device is logged on to this effective range.

Logoff procedure

Before you leave the effective range or runtime, you must log off from the effective range first. If you leave the effective range without logging off, a warning appears.

1. Click on the "Effective range name" object. The "Effective range logoff" dialog box opens.
2. Confirm logoff with "Yes".

Result

The HMI device is no longer logged into the effective range. Other HMI devices can now log on to this effective range.

Note

Do not deactivate the "Override" mode again unless you logon a different HMI device.

Effective range name (RFID) (Panels, RT Advanced)

Use

The "Effective range name (RFID)" object is a operator control for some SIMATIC Mobile Panels. The "Effective range name (RFID)" object shows the name of the effective range (RFID) in which the HMI device is located and also the logon status.

Note

RFID tags in the plant area

RFID tags may only be attached in demarcated areas which are secured by additional protective measures, e.g. protective fencing.

Layout

Symbol	Meaning	Description	Logon status
	Acknowledgement button has no effect	Within the effective range (RFID) "MixingAxisControl"	It is not possible to log on to the effective range (RFID)
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logon to effective range (RFID) running
	Acknowledgement button functions	Within the effective range (RFID) "MixingAxisControl"	Logged on to the effective range (RFID)

In the "Properties > Properties > Security" category of the Inspector window, you can assign an authorization for the user group that logs on to the effective range (RFID) during runtime.

Logon requirements

- The HMI device is located within the effective range (RFID).
- The machine is demarcated by additional protective measures.
- No HMI device is logged on to this effective range (RFID).

Logon procedure

1. Click on the "Effective range name (RFID)" object.
   The "Effective range logon" dialog box opens.
2. Read the ID from the machine or plant to be operated.
3. Enter the ID you read.
4. Confirm your entries by clicking "OK".

Result

If the ID and effective range (RFID) match, the HMI device is logged on to the machine. Successful logon is signaled by an icon on green background. No other HMI device can log on to this effective range (RFID) or the machine.

Logoff requirements

The HMI device is logged on to this effective range (RFID).

Logoff procedure

Before you exit the effective range (RFID) or runtime, you must first log off from the effective range (RFID). If you exit the effective range (RFID) without logging off, a local rampdown is executed.

1. Click on the "Effective range name (RFID)" object. The "Effective range (RFID) - logoff" dialog box opens.
2. Confirm logoff with "Yes".

Result

The HMI device is no longer logged into the effective range (RFID) or machine. Other HMI devices can now log on to this effective range (RFID).

Charge condition (Page 5228)

WLAN reception (Page 5299)

Configuring the effective range name (RFID) (Page 6039)

Device dependency of the objects (Page 5183)

Effective range signal (Panels, RT Advanced)

Application

The "Effective range signal" object is a control element for some SIMATIC Mobile Panels. The "Effective range signal" object indicates how accurately the Mobile Panel Wireless is positioned within an effective range.

Layout

Symbol	Description
	Within an effective range
	When leaving an effective range When entering an effective range
	Outside of each effective range
	Override function is activated: Within a special security range of the effective range

The "Effective range name" object indicates which effective range this concerns.

Override function

An effective range, e.g. "robots" is formed outwardly through transponders. However, within a special protection zone, e.g. "robot cells", the effective range is not formed by transponders, but by alternative restrictions e.g. by railings and a door.

The operator initially logs on to the effective range. An operator who enters the restricted and secure zone "robot cells" must press an additional switch to activate the override function:

- The effective range is allocated and can no longer be established by the transponder.
- Therefore, the quality does not play a role and is no longer displayed.
- The HMI device remains logged into the effective range.
- Other HMI devices can no longer logon to this effective range.

Calculating the signal quality

The quality within an effective range depends, as follows, on the measured distance:

- In the center of the effective range the quality is 100%.
- On the transponder and on the border of the effective range, the quality is 0%.

Operation

The object is for display only and cannot be controlled by the operator.

See also

Charge condition (Page 5228)

Effective range name (Page 5293)

WLAN reception (Page 5299)

Zone name (Page 5302)

Zone signal (Page 5303)

Configuring additional Mobile Wireless objects (Page 6036)

Device dependency of the objects (Page 5183)

WLAN reception (Panels, RT Advanced)

Application

The "WLAN reception" object is a control element for some SIMATIC Mobile Panels. The "WLAN reception" object displays the signal strength of the WLAN wireless connection. In addition, the signal strength is measured and displayed by means of 5 bars.

Layout

Symbol	Meaning	Signal strength
	No wireless connection	No signal
	Very poor wireless connection	=<20 %
	Poor wireless connection	>20 % =<40 %
	Wireless connection OK	>40 % =<60 %
	Good wireless connection	>60 % =<80 %
	Very good wireless connection	>80 %

Operation

The object is for display only and cannot be controlled by the operator.

See also

Charge condition (Page 5228)

Effective range name (RFID) (Page 5296)

Effective range signal (Page 5297)

Zone name (Page 5302)

Zone signal (Page 5303)

Configuring additional Mobile Wireless objects (Page 6036)

Device dependency of the objects (Page 5183)

Gauge

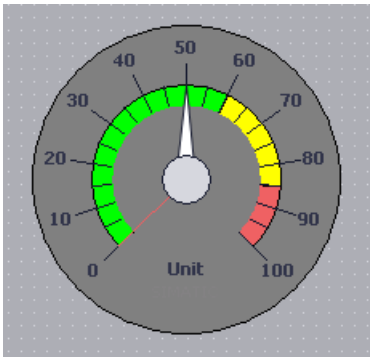
Use

The "Gauge" object shows numeric values in the form of an analog gauge. For example, a glance in Runtime is enough to note that the boiler pressure is in the normal range.

Note

The gauge is for display only and cannot be controlled by the operator.

Configure system functions that are performed at value changes in the tag properties at the "Value change" event and not at the "Change" event of the gauge. If your project is to comply with Good Manufacturing Practices, and the system function performs a GMP-relevant action. e.g. increasing a GMP-relevant tag, every value change of the tag used at the gauge is interpreted as a user action.



Layout

In the Inspector window, you customize the position, geometry, style, color and font types of the object. You can adapt the following properties in particular:

- Display peak value pointer: Specifies whether the actual measurement range is indicated with a slave pointer.
- Maximum Value and Minimum Value: Specifies the top and bottom values of the scale.
- Start value of the danger range and start value of the warning range: Specifies the scale value from which the danger range and the warning range start.
- Display normal range: Specifies whether the normal range is shown in color on the scale.
- Color of individual ranges: Different operating modes, such as normal range, warning range and danger range, are shown in different colors so that the operator can distinguish them easily.

Note

The use of many differently sized "Gauge" objects can reduce the performance in Runtime. With "Gauge", avoid minimally different heights and widths, for example, 48 pixels, 49 pixels, 51 pixels, etc. Use the same sizes instead.

Display peak value

The "Display peak value" property can be used to activate a marker function for the maximum and minimum pointer movement in Runtime. The actual measurement range is shown with a slave pointer.

1. In the Inspector window, activate "Properties > Properties > Appearance > Show peak values".

Maximum Value and Minimum Value

You can set the top and bottom end values of the scale in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a number under "Process > Maximum scale value" and for "Minimum scale value". If you select a tag as the end value of the scale, the number will be no longer available.

Note

Ensure that the minimum value is always less than the maximum value, especially if you make the minimum value or maximum value dynamic through a tag. If the minimum value is greater than the maximum value, no adjustment is made to the scale end values.

Start value of the danger range and start value of the warning range

Define the scale value at which the danger range and the warning range start in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Limits/Ranges".
2. Enter the start value for the danger range in "Upper 2" and the start value for the warning range in "Upper 1".
3. Select "start value of danger range" and "start value of warning range" to display the ranges on the scale.

Normal range visible

In the Inspector window, define whether to show the normal range in color.

1. In the Inspector window, select "Properties > Properties > Limits/Ranges".
2. Select "Normal".

Color of individual ranges

You can display the normal range, the danger range and the warning range in different colors. Define the color in the Inspector window.

1. In the Inspector window, select "Properties > Properties > Limits/Ranges".
2. Select a color from the color palette for the three areas.

Note

The following restrictions apply for HMI devices with Windows CE up to version 5.0:

- The three ranges (normal / warning / danger) are not visualized in different colors in Runtime.

Note

When you select the option "Show ranges from tag", you can display up to five ranges in the gauge whose values are specified by means of a process tag. You define the values for the areas with a process tag, which you interconnect with the screen object.

The option "Show ranges from tag" is available for Comfort Panels, KTP Mobile Panels and RT Advanced.

See also

Device dependency of the objects (Page 5183)

Zone name (Panels, RT Advanced)

Application

The "Zone name" object is a control element for some SIMATIC Mobile Panels. The "Zone name" object shows the names of the zone in which the HMI device is located.

Layout

Symbol	Meaning	Description
	The "On entry" and "On exit" events of the zone and the zone ID can be used in the configuration.	Within the "MixingPlant" zone
	–	Outside of each zone

Procedure for "On entry" event

1. In the "Zones" or "Zones and effective ranges" editor, configure the function "ActivateScreen" on the "On entry" event.

Procedure with zone ID

1. Select an internal tag as the "Zone ID / Connection point ID" in the "Runtime settings > General" editor.
2. Animate the visibility of an object, e.g. "I/O field" via the internal tag.

Operation

The object is for display only and cannot be operated.

Charge condition (Page 5228)

Effective range name (Page 5293)

Effective range signal (Page 5297)

WLAN reception (Page 5299)

Zone signal (Page 5303)

Device dependency of the objects (Page 5183)

Zone signal (Panels, RT Advanced)

Application

The "Zone signal" object is a control element for some SIMATIC Mobile Panels. The "Zone signal" object indicates how well the Mobile Panel is still in a zone. Compared to the "WLAN reception" object, it is not the signal strength that is measured, it is calculated from the distance.

Layout

Symbol	Meaning	Quality
	Within one zone	>=15 %
	When leaving a zone When entering a zone	<15 % and >0 %
	Outside of each zone	=0 %

The "Zone name" object indicates which zone this concerns.

Calculating the signal quality

The quality of the signal within a zone depends, as follows, on the measured distance:

- In the centre of the zone the quality is 100%.
- To the rear towards the transponder and to the front away from the transponder, the quality starts to diminish linearly.
- On the transponder and on the border of the zone, the quality is 0%.

Operation

The object is for display only and cannot be operated.

12.2 Working with Tags (Basic Panels, Panels, RT Advanced)

12.2.1 Basics (Basic Panels, Panels, RT Advanced)

12.2.1.1 Basics of tags (Basic Panels, Panels, RT Advanced)

Introduction

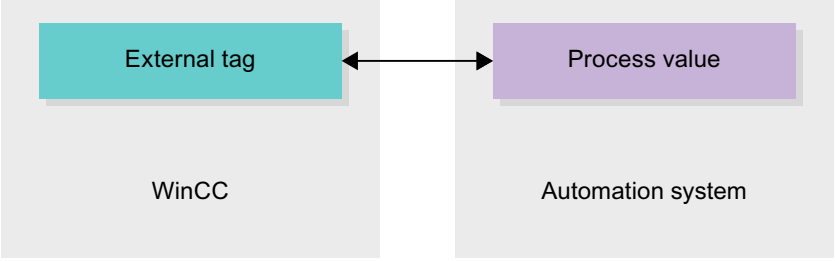
Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of

the automation system. It is also possible to rewrite a process value in the memory of the automation system.



Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

12.2.1.2 Overview of HMI tag tables (Basic Panels, Panels, RT Advanced)

Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.
If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

Basics of tags (Page 5304)

12.2.1.3 External tags (Basic Panels, Panels, RT Advanced)

Introduction

External tags allow communication (data exchange) between the components of an automation system, for example, between an HMI device and a PLC.

Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

If you write a PLC control program in STEP 7, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "AUTOHOTSPOT" for additional information.

Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

Central tag management in STEP 7

You can connect also connect DB instances of user-defined PLC data types (UDT) to the HMI tags.

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Data block instances of a UDT

The data type is taken from STEP 7 and is not converted to an HMI data type. The access type is always "Symbolic access". Depending on the release for WinCC in STEP 7, elements and structured elements of the PLC data type are applied to WinCC. Elements of a structured UDT are applied and displayed in the PLC tag table if the instance-specific properties "Visible in HMI" and "Accessible from HMI" have been set.

Note

Accessing PLC data types

Access to PLC data types is only available in conjunction with SIMATIC S7-1200 or S7-1500.

Synchronization with PLC tags

A variety of options for synchronizing external tags with the PLC tags are available in the Runtime settings under "Settings for tags".

When you perform synchronization, you have the option of automatically applying the tag names of the PLC to external tags and reconnecting the existing tags.

The generated tag name is derived from the position of the data value in the hierarchical structure of the data block.

Update of tag values

For external tags, the current tag values are transmitted in Runtime via the communication connection between WinCC and the connected automation systems and then saved in the runtime memory. Next, the tag value will be updated to the set cycle time. For use in the runtime project, WinCC accesses tag values in the runtime memory that were read from the PLC at the previous cycle time. As a result, the value in the PLC can already change while the value from the runtime memory is being processed.

Note

PLC array elements in conjunction with S7-1200 or S7-1500

The index of the PLC array elements can begin with any number. In WinCC, indexing always starts with 0.

A PLC tag "Array [1..3] of Int", for example, is mapped to "Array [0..2] of Int" in WinCC.

When you access an array in a script, pay attention to the correct indexing.

Basics of tags (Page 5304)

12.2.1.4 Addressing external tags (Basic Panels, Panels, RT Advanced)

Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- Integrated connection
  Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- Non-integrated connection
  Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "AUTOHOTSPOT".

Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

Symbolic addressing of data blocks with optimized access and standard access:

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.
For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

Symbolic addressing is also available if you have an integrated link.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7-300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7-300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7-1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the behavior described for the S7-300/400 applies.
S7-1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the behavior described for the S7-300/400 applies.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

Basics of tags (Page 5304)

12.2.1.5 Internal Tags (Basic Panels, Panels, RT Advanced)

Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
Array	One-dimensional array
Bool	Binary tag
DateTime	Date/time format
DInt	Signed 32-bit value
Int	Signed 16-bit value
LReal	Floating-point number 64-bit IEEE 754
Real	Floating-point number 32-bit IEEE 754
SInt	Signed 8-bit value
UDnt	Unsigned 32-bit value
UInt	Unsigned 16-bit value
USInt	Unsigned 8-bit value
WString	Text tag, 16-bit character set

Basics of tags (Page 5304)

12.2.1.6 User-defined PLC data types (UDT) (Basic Panels, Panels, RT Advanced)

Overview

You can connect with the HMI tags and DB instances of user-defined PLC data types (UDT).

The PLC data type and the corresponding DB instances are created and updated centrally in STEP 7. In WinCC, you can use the following sources as PLC tag (DB instances):

- Data block elements that use a UDT as data type
- Instance data blocks of a UDT

The data type is taken from STEP 7 and is not converted into an HMI data type. The access type is always "Symbolic access".

Elements of a PLC data type

You have access to the following elements in WinCC with a structured PLC data type:

- Elements that have been released for WinCC in STEP 7.
- Elements whose data types are supported in WinCC.

Note

Invalid elements of a PLC data type in WinCC

Invalid elements generate an error in WinCC.

If you disable the "Accessible from HMI" option for the corresponding elements of the associated PLC data type in STEP 7, these elements are excluded in WinCC.

Naming conventions

The following characters are invalid in the name of the PLC data type and generate an error in WinCC:

- Period: "."
- Brackets: "(" and ")"

Properties

The properties of the PLC data type and its elements are adopted in WinCC. Depending on the data type used, the properties are read-only or can be written to in WinCC.

If you change the connection of the PLC data type in WinCC, all elements of the PLC data type are deleted and the properties of the newly connected PLC tag are used.

In WinCC, you have access to STEP 7 comments on elements of the PLC data type.

You have limited access to properties in WinCC for the following elements of PLC data types:

- Elements of the data type "Struct"
- PLC data type
- Multidimensional arrays
- Array of complex data types except "DTL"

Mapping of the data type "DTL"

If a PLC data type contains elements of the data type "DTL", these elements are mapped in WinCC without lower-level elements. The data type "DTL" turns into "DateTime" in WinCC.

Tags with elements of the "DTL" data type

Tags that use the "DTL" data type element by element can only be used as read-only with symbolic addressing, e.g. with SIMATIC S7 1200 and SIMATIC S7 1500. With absolute addressing, write access is also possible.

12.2.2 Working with Tags (Basic Panels, Panels, RT Advanced)

12.2.2.1 Creating tags (Basic Panels, Panels, RT Advanced)

Creating external tags (Basic Panels, Panels, RT Advanced)

Introduction

You can access an address in the PLC via a PLC tag using an external tag. The following options are available for addressing:

- Symbolic addressing
- Absolute Addressing

You can find further details on symbolic addressing in section "Addressing external tags (Page 5309)". If possible, use symbolic addressing when configuring a tag. You create tags either in the standard tag table or in a tag table you defined yourself.

Requirement

- You have opened the project.
- A connection to the PLC is configured.
- The Inspector window is open.

Procedure

To create an external tag, proceed as follows:

1. Open the "HMI tags" folder in the project tree and double-click the standard tag table. The tag table open.
   Alternatively, create a new tag table and then open it.
2. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
3. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. The tag name must be unique throughout the device.
4. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.

5. Select the connection to the required PLC in the "Connection" box. If the connection you require is not displayed, you must first create the connection to the PLC. You create the connection to a SIMATIC S7 PLC in the "Devices & Networks" editor. You create the connection to external PLCs in the "Connections" editor.
   If the project contains the PLC and supports integrated connections, you can also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.
6. If you are working with an integrated connection, click the ... button in the "PLC tag" field and select an already created PLC tag in the object list. Click the ✓ button to confirm the selection.

   Alternatively, use the autocomplete to select a PLC tag for an integrated connection.
   If you select a PLC tag from the autocomplete list, it is entered in the input path. The elements of the PLC tags are displayed in the autocomplete list. If you have selected a PLC tag that can be connected to the HMI tags, the PLC tag is connected to the HMI tags.
7. If you are working with a non-integrated connection, enter the address from the PLC in the "Address" field. The "PLC tag" field remains empty.
8. Configure the other properties of the tag in the inspector window.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can also create tively directly at the application point, e.g. on an I/O field. To do this, click the Add new button in the object list. You then configure the new tag in the Inspector window.

Result

An external tag has been created and linked to a PLC tag or an address in the PLC.

Alternative procedure

You can also create external HMI tags by dragging and dropping data block elements or global PLC tags in an HMI tag table.

See also

Creating internal tags (Page 5316)

Creating multiple tags (Page 5317)

Basics of tags (Page 5304)

Addressing external tags (Page 5309)

Manage tags (Page 5318)

Tag Limits (Page 5327)

Indirect addressing of tags (Page 5344)

Creating internal tags (Basic Panels, Panels, RT Advanced)

Introduction

You must at least set the name and data type for internal tags. Select the "Internal tag" item, rather than a connection to a PLC.

For documentation purposes, it is a good idea to enter a comment for every tag.

Requirement

You have opened the project.

Procedure

1. Open the "HMI tags" folder in the project tree and double-click the entry "Standard tag table". The tag table opens.
   Alternatively, create and then open a new tag table.
2. Double-click "Add" in the "Name" column of the tag table. A new tag is created.
3. If the Inspector window is not open, select the "Inspector window" option in the "View" menu.
4. Select the "Properties > Properties >General" category in the Inspector window and, if required, enter a unique tag name in the "Name" field. This tag name must be unique throughout the project.

5. If required, select the "Display name" field to enter a name to be displayed in Runtime. The name to be displayed is language-specific and can be translated for the required Runtime languages. The display name is available for Basic Panels, Panels and Runtime Advanced.
6. Select "Internal tag" as the connection in the "Connection" field.
7. Select the required data type in the "Data type" field.
8. In the "Length" field, you must specify the maximum number of characters to be stored in the tag according to the selected data type. The length is automatically defined by the data type for numerical tags.
9. As an option, you can enter a comment regarding the use of the tag. To do so, click "Properties > Properties > Comment" in the Inspector window and enter a text.

You can also configure all tag properties directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

You can a ags alternatively directly at the application point, e.g. on an I/O field. Click the 
button in the object list. You can then configure the new tag in the Properties window that opens.

Result

An internal tag is created. You can now use this in your project.

In additional steps you can configure the tag, for example, by setting the start value and limits.

See also

Creating external tags (Page 5314)

Creating multiple tags (Basic Panels, Panels, RT Advanced)

Introduction

In a tag table, you create additional identical tags by automatically filling the rows of the table below a tag.

The tag names are incremented automatically when filling in automatically.

You can also use the auto fill function to fill table cells below a tag with a single tag property and thus modify the corresponding tags.

If you apply the automatic filling in to already filled cells of a tab table, you will be asked whether you want to overwrite the cells or insert new tags.

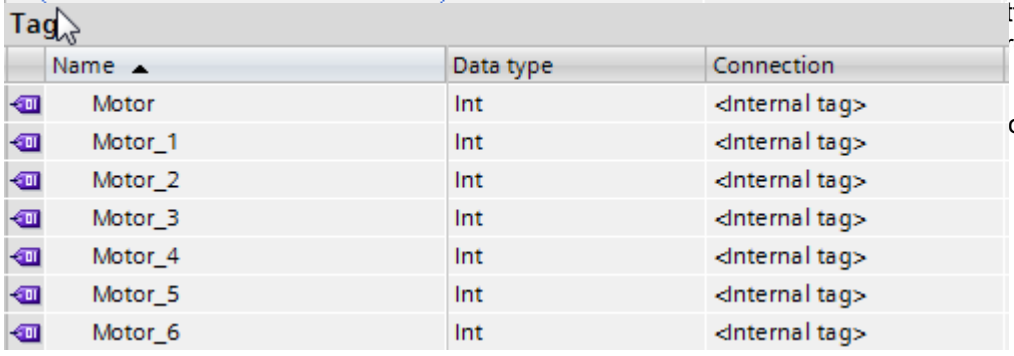
If you do not want to overwrite already configured tags, activate insert mode. Activate insert mode by keeping the <Ctrl> key pressed during insertion. Already existing entries in the tag table are moved down if insert mode is activated.

Requirement

- You have opened the project.
-
-

Procedure

1. 
d as
ins
ttom
ross.
2. o fill
3.



Result

Depending on which cells were selected, the function may automatically fill individual properties or create new tags.

See also

Creating external tags (Page 5314)

12.2.2.2 Editing tags (Basic Panels, Panels, RT Advanced)

Manage tags (Basic Panels, Panels, RT Advanced)

Introduction

You can always rename, copy or delete tags.

When a tag is renamed, the new name must be unique for the whole device.

If you use the "Copy" command to copy a tag to the clipboard, the objects and references linked to the tag are copied as well.

If you use the "Insert" command to add a tag to another device, the tag will be added without the connected references. Only the object name of the reference will be inserted. If a reference

of the same name and valid properties exists in the target system, the existing reference will then be connected to the copied tag.

If you copy a tag, some of the objects linked to the tag are copied as well. The following objects are copied:

- Logging tags
- Cycles
- Alarms

If you add the copied tag to another device, the tag is added together with the linked objects.

Requirements

- The tag which you wish to rename, copy or delete must exist.
- The tag table containing the tag is open.

Renaming tags

Note

The connection to the tags can be interrupted in Runtime under the following conditions during renaming:

- HMI tag is used in a type, for example, to dynamize an object property via a script.
- One or more instances of the type are used in the project.
- Project is in Runtime.
- After the renaming, execute the command "Compile > Software (only changes)".

Solution: Exit Runtime and rename the tag. Execute the "Compile > Software (rebuild all)" command.

1. In the "Name" field, select the tag in the tag table.
2. Select "Rename" from the shortcut menu.
3. Type in a new name.
   The tag appears under its new name.

Copying tags

1. Select one or more tags in the tag table.
2. Select "Copy" from the shortcut menu.
3. Click on the point at which you want to insert the tag. For example, click another tag table in the same device or the tag table in a second device.
4. Select "Paste" from the shortcut menu. The tag is inserted as described above.

Deleting a tag

1. Select one or more tags in the tag table.
2. Select the "Cross-reference" command from the "Tools" menu. In the "Cross-reference" editor, check to see where the tags are used. In this manner, you can see what impact the deletion of the tag will have on your project.
3. Select "Delete" in the pop-up menu of the tag.
   All marked tags will be deleted.

Note

If you want a warning to be output during compiling when HMI tags are deleted in screens, clear the "Do not check deleted HMI tags in screens" check box under "Runtime settings > General > Compiler options". If this option is not activated, the affected field with the deleted tag is marked as invalid.

Export and import of tags

WinCC gives you the option to export and import tags. With Export and Import, you have the option to export tags from one project and import them into another project. There is also the option to create larger numbers of tags outside of WinCC, edit them and subsequently import into any WinCC project. See AUTOHOTSPOT for additional information.

Creating external tags (Page 5314)

Edit tags (Basic Panels, Panels, RT Advanced)

Introduction

You can modify tags at any time to adapt them to changed requirements in the project.

Edit tags

You have the following options to change the configuration of a tag:

- You open the tag table in which the tag is contained.
- Open the tag table "Show all tags".
- You open the Inspector window of a tag with the "Edit" button in the object selection on the display and operating object.

In the tag tables, you can perform such tasks as comparing and adjusting the properties of multiple tags or sorting the tags by their properties.

You can change the properties either directly in the table or in the Inspector window.

If you change a tag property and this change causes a conflict with another property, it will be highlighted in color to draw your attention to this fact. If you link the tag with another controller, for example, which does not support the set data type, this property is highlighted in color.

Manage tags (Page 5318)

Configuring multiple tags simultaneously (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC, you can assign the same properties to multiple tags in a single operation. This facilitates efficient programming.

Requirement

- You created the tags you want to configure.
- The tag table is open.
- The Inspector window is open.

Procedure

1. In the tag table, select all the tags that you want to configure at the same time.
   If the selected property is identical for all the tags, the setting for this property will appear in the Inspector window. The associated field will remain blank otherwise.
2. You can define the shared properties in the Inspector window or directly in the tag table.

if you change a property commonly on several tags, only this one property is changed. The other properties of the tag remain unchanged.

Result

All marked tags will be reconfigured.

To edit tag properties which differ from one tag to the other, simply clear the multiple selection.

Manage tags (Page 5318)

Using multiple tags simultaneously in a screen (Basic Panels, Panels, RT Advanced)

Introduction

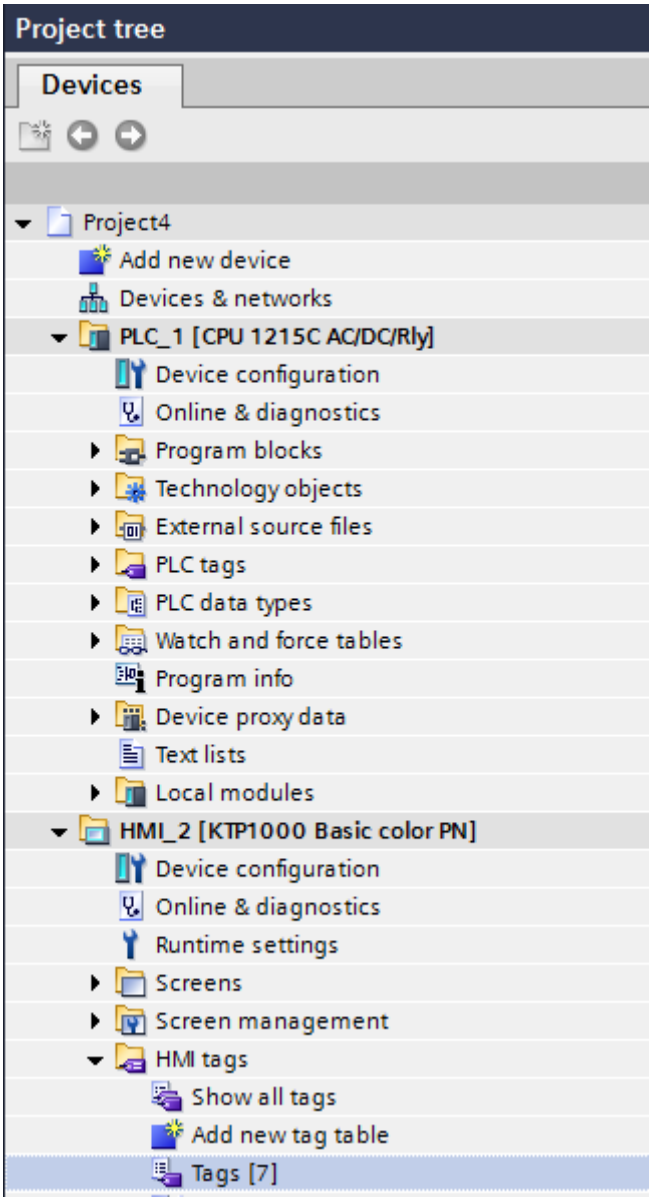
In WinCC, you can create multiple I/O fields that are linked with tags in one screen in a single operation. This facilitates efficient programming.

Requirement

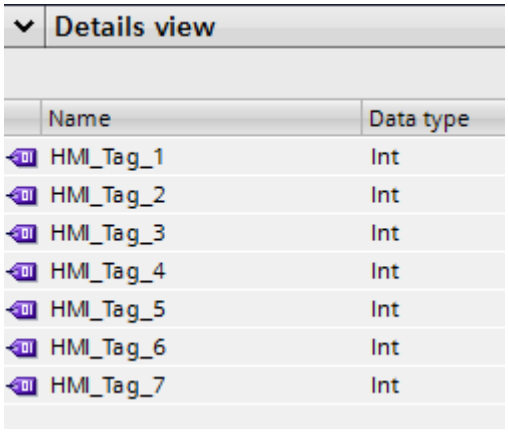
- Several tags are set up.
- A screen is open.

Procedure

1. In the project tree, select the required tag table under "HMI tags".



2. Select the detail view at the bottom of the project tree. The detail view shows the tags that exist in the selected tag group.



3. Mark the tags in the detail window.
4. Drag the tags to the screen. For each tag, this creates an I/O field that is connected to the tag.

Note

When you move a PLC tag from the detail window to the work area by drag&drop, a network and a connection are created additionally in the "Devices & Networks" editor.

See also

Manage tags (Page 5318)

Settings for synchronization (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC, you can map the location of a data value in the structure of a data block in the WinCC tag name. To do this, you synchronize the WinCC tags with the connected PLC tags. If necessary, the PLC name is set as a prefix.

You configure the name matching based on the requirements of your project set under "Runtime Settings > Settings for Tags". WinCC offers you several options for this.

You specify whether the names are matched and the conditions for this to occur during synchronization.

Settings for tags

To avoid conflicts within complex tag types that you configure under "Settings for tags", the delimiters of the path statement from STEP 7 are replaced in WinCC similar to name matching:

- Compatibility mode
  In compatibility mode, an underscore is set between the names of the data block and the element name of the first hierarchy level. The delimiters in the lower hierarchy levels are retained. When you enable this option, all other options are disabled.
- Replace delimiter
  Depending on your selection, the delimiters of all hierarchy levels are replaced during synchronization.
- PLC prefix
  The PLC name is set as a prefix to the WinCC tag name. You set the option for each HMI connection.

Note

Duplicate tag names

If the newly generated tag name is already in use, a number is added in parentheses, for example, Datablock_1_Static_2{1}(1).

Example

The "PLC1" controller contains the structured data block "DB1". The "Db1.a[1].b.c[3]" data block element is used in a picture. Depending on your settings, the WinCC tag name is generated as follows:

WinCC tag name	Selected option	Comment
Db1_a[1].b.c[3]	Compatibility mode	
Plc1.Db1.a[1].b.c[3]	PLC prefix	
Db1;a(1);b;c(3)	Dot and parenthesis replaced with ; ( )	
Plc1_Db1_a{10}_b_c{3}	Dot and parenthesis replaced with _ { } PLC prefix	
Db1.a[1].b.c[3]	Delimiter replaced without character selection	The tag name is enclosed in quotes at the point of use in the picture: "Db1.a[1].b.c[3]"

See also

Synchronizing tags (Page 5326)

Synchronizing tags (Basic Panels, Panels, RT Advanced)

Introduction

To synchronize the PLC and HMI tags, WinCC offers the following options:

- Synchronizing tags with or without name matching between PLC and WinCC
  The following options are available for this:
- Link tags with addresses in the PLC
  This procedure is suitable, for example, if changes were made to the connection between the HMI device and the PLC and the tag connections were lost. The function can also be used if you have configured the control program and HMI project separately.

Requirement

- External HMI tags have been created.
- PLC tags have been created.
- An HMI connection to a PLC in the project has been established.

Procedure

To synchronize HMI tags with PLC tags, follow these steps:

1. In the project tree, select the directory that contains the tags in question.
2. Select "Connect HMI tags to matching PLC tags" from the shortcut menu.
   A dialog opens.

3. Select the option you want to use.
   If you want to synchronize the tags without name matching, disable "Replace WinCC tag name with PLC tag name".
   If you want to connect HMI tags new with absolute access, select "Data type and absolute address match".
4. Confirm with "Synchronize".
   The system searches for a suitable PLC tag according to the selected option.

Result

The external HMI tags are synchronized with the PLC tags.

If you have selected the option "Data type and absolute address match", the tag connection is established as soon as a suitable PLC tag is found.

If you have selected a different option, the WinCC tags are updated accordingly and the PLC tag names are applied in WinCC.

12.2.2.3 Configuring Tags (Basic Panels, Panels, RT Advanced)

Tag Configuration Basics (Basic Panels, Panels, RT Advanced)

Tag Limits (Basic Panels, Panels, RT Advanced)

Introduction

You can restrict the value ranges with limits for numerical tags.

Principle

You can specify a value range defined by a high limit and a low limit for numerical tags.

You configure four limit values that limit the value range. Using the limits Upper 2 and Lower 2 , you specify the maximum and minimum value for the value range. The limits Upper 1 and Lower 1 specify the threshold values at which the normal range is exceeded or undershot.

Limit	Use
Upper 2	Specifies the maximum value.
Upper 1	Specifies the value at which the normal range is exceeded.
Lower 1	Specifies the value at which the normal range is undershot.
Lower 2	Specifies the minimum value.

If the operator enters a value for the tag that is outside the configured value range, the input is rejected. The value is not accepted. You configure a function list when configuring for

Runtime Advanced and Panels. When the tag value leaves the value range, the function list is processed.

Note

If you want to output an analog alarm when a limit is violated, configure the respective tag in the "Analog alarms" tab. You can also configure the analog alarm in the "HMI alarms" editor. The values for output of an analog alarm depend on the configured tag limits.

Application example

Use the limits to warn the operator when the value of a tag enters a critical range, for example.

Defining Limits for a Tag (Basic Panels, Panels, RT Advanced)

Introduction

For numerical tags, you can specify a value range by defining a low and high limit as well as the threshold values.

For Runtime Advanced and Panels you can configure the system to process a function list whenever a tag value drops below or exceeds its configured value range.

Requirements

- The tag for which you want to set the limits is created.
- The Inspector window with the properties for this tag is open.

Procedure

To define limits for a tag, proceed as follows:

1. In the Inspector window, select "Properties > Properties > Range". If you want to define one of the limits as a constant value, select "Constant" using the button. Enter a number in the relevant field.
   If you want to define one of the limits as a tag value, select "HMI tag" using the button. Use the object list to define the tag for the limit.
2. To set additional limits for the tag, repeat step 1 with the appropriate settings.

Alternative procedure

You can also configure the limits directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Configuring a function list for Runtime Advanced and Panels

When you configure Runtime Advanced and Panels, you can have a function list called up if a high or low limit is violated.

1. If you want to start a function list when the value drops below the value range, click "Properties > Events > On falling below" in the Inspector window. Create a function list in this dialog.
2. If you want to start a function list when the value exceeds the value range, click "Properties > Events > On exceeding" in the Inspector window. Create a function list in this dialog.

Result

You have set a value range defined by the limits for the selected tag. If the value range is exceeded or undershot, a function list may be carried out.

Tag Limits (Page 5327)

Start value of a tag (Basic Panels, Panels, RT Advanced)

Value of a tag at start of Runtime

You can configure a start value for numeric tags and tags for date/time values. The tag will be preset to this value when Runtime starts. In this way, you can ensure that the tag has a defined status when Runtime starts.

For external tags, the start value will be displayed on the HMI device until it is overwritten by the PLC or by input.

If no start value was configured, the tag contains the value "0" when starting Runtime.

In WinCC Runtime Professional you can enter a tag value in place of the start value on a tag with the "String" data type. The tag value is saved in the "Project texts" editor and is multilingual.

After the text has been translated, it is displayed in Runtime as a language-dependent start value.

Application example

You can assign a default value to an I/O field. Enter the desired default value as start value for the tag that is linked to the I/O field.

See also

Tag Limits (Page 5327)

Defining the start value of a tag (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC you can configure a start value for a numeric tag and a tag for date/time values which this adopts at Runtime start.

Requirement

- You have created the tag for which you want to define a start value.
- The Inspector window with the tag properties is open.

Procedure

To configure a start value, proceed as follows:

1. In the Inspector window select "Properties > Properties > Values."
2. Enter the desired "Start value."

Alternative procedure

You can also configure the start value directly in the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Result

The start value you selected for the tag is transferred to the project.

See also

Tag Limits (Page 5327)

Updating the Tag Value in Runtime (Basic Panels, Panels, RT Advanced)

Introduction

Tags contain process values which change while Runtime is running. Value changes are handled differently at internal and external tags.

Principle

When Runtime starts, the value of a tag is equal to its start value. Tag values change in Runtime.

In Runtime, you have the following options for changing the value of a tag:

- A value change in an external tag in the PLC.
- By input, for example, in an I/O field.
- By running a system function, such as "SetValue."
- A value assignment in a script.

Updating the Value of External Tags

The value of an external tag is updated as follows:

- Cyclic in operation
  If you select the "Cyclic in operation" acquisition mode, the tag is updated in Runtime while it is displayed in a screen or is logged. The acquisition cycle determines the update cycle for tag value updates on the HMI device. You can either choose a default acquisition cycle or define a user-specific cycle.
- Cyclic continuous
  If you select the "Cyclic continuous" acquisition mode, the tag will be updated continuously in Runtime, even if it is not in the currently-open screen. This setting is activated for tags that are configured to trigger a function list when their value changes, for example.
  Only use the "Cyclic continuous" setting for tags that must truly be updated. Frequent read operations increase communication load.
- On demand
  If you select the "On demand" acquisition mode, the tag is not updated cyclically. It will only be updated on demand using the "UpdateTag" system function, for example, or by a script.

See also

Tag Limits (Page 5327)

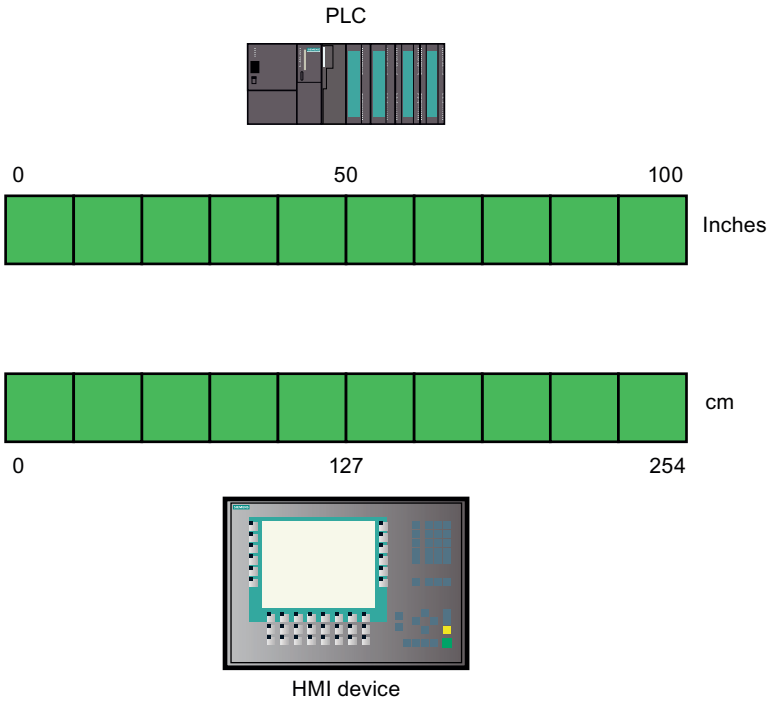
Linear scaling of a tag (Basic Panels, Panels, RT Advanced)

Introduction

Numeric data types can be processed with linear scaling. The process values in the PLC for an external tag can be mapped onto a specific value range in the project.

Principle

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.



As soon as data from the HMI device is written to an external tag, it will be automatically mapped to the value range of the PLC. As soon as data from the HMI device is read from the external tag, a corresponding transformation will be performed in the other direction.

Note

You can also use the system functions "LinearScaling" and "InvertLinearScaling" to automatically convert process values.

Application example

The user enters length dimensions in centimeters but the PLC is expecting inches. The entered values are automatically converted before they are forwarded to the controller. Using linear scaling, the value range [0 to 100] on the PLC can be mapped onto the value range [0 to 254] on the HMI device.

See also

Tag Limits (Page 5327)

Applying linear scaling to a tag (Basic Panels, Panels, RT Advanced)

Introduction

To apply linear scaling to a tag, you must specify one value range on the HMI device and one on the PLC. The value ranges will be mapped to each other linearly.

Requirement

- The external tag to which linear scaling is to be applied must exist.
- The Inspector window with the properties for this tag is open.

Procedure

To apply linear scaling to a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > Linear scaling."
2. Click on "Enable" to switch on linear scaling.
   Using this option, you can temporarily switch off linear scaling for testing purposes, for example. Settings which were made earlier for linear scaling remain unchanged.
3. In the "PLC" area, enter the start and end values of the value range to be applied to the process values on the PLC.
4. In the "HMI device" area, enter the end and start values of the value range to be applied to the process values on the HMI device.

Result

In Runtime the data will be automatically mapped from one value range to the other.

Note

You can also use the "LinearScaling" and "InvertLinearScaling" system functions to automatically convert process values.

See also

Tag Limits (Page 5327)

Connecting a tag to another PLC (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC, you can change the PLC connection of a tag at any time. This is needed when you change the configuration of your plant, for example.

Depending on the PLC selected, you may need to modify the configuration of the tag. The tag properties which must be changed will be highlighted in color.

Requirement

- The external tag, whose connection you wish to change, must already exist.
- The connection to the PLC must already exist.
- The Properties window for this tag is open.

Procedure

To change the PLC connection of a tag, proceed as follows:

1. In the Inspector window select "Properties > Properties > General."
2. Select the new connection in the "Connection" field.
   The tag properties that you must change will be highlighted in color in the tag table and in the Inspector window.
3. Change all highlighted properties of the tag to suit the requirements of the new PLC.

Result

The external tag is connected to the new PLC.

See also

Tag Limits (Page 5327)

Address multiplexing (Basic Panels, Panels, RT Advanced)

Introduction

Using address multiplexing, you can use a single tag to access a multitude of memory locations within the PLC's address range. You read and write to the addresses without defining a tag for each individual address.

The square brackets indicate address multiplexing.

Multiplexing with absolute addressing

When using multiplexing with absolute addressing, you configure tags as placeholders for the address in the PLC to be addressed.

If you want to access, for example, an address of the format "%DBx.DBWy", the expression for multiplexing is as follows:

"%DB[HMITag1].DBW[HMITag2]"

In Runtime, you supply the tag "HMITag1" with the required value for the data block you want to address.

In Runtime, you supply the tag "HMITag2" with the required address from the data block.

Tags are supplied with values, for example, with the help of values from the PLC or via a script.

Multiplexing with absolute addresses is supported for the following PLCs and communication drivers.

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Multiplexing with absolute addresses is not available for data blocks with optimized access.

Multiplexing with symbolic addressing

When multiplexing with symbolic addressing, you access various array elements of an array tag in a data block of the connected controller by means of a multiplex tag and an index tag.

First, connect an element of the desired array tags in a data block to the multiplex tags in the HMI device. Then replace the array index (leftmost in the symbolic address) with the index tag.

If you want to access, for example, the various elements of the array tag "Arraytag_1" in the data block "Datablock_1", the expression for symbolic addressing is as follows:

"Datablock_1.Arraytag_1["HMITag_1"]

You control the access to the index of the array elements with the HMI tag "HMITag_1". In Runtime, you supply the tag with the index of the array element that you want to access.

Multiplexing with symbolic addressing is only available if the following components support symbolic addressing:

- HMI device
- PLC
- Communication driver

Symbolic addressing is supported by the following communication drivers:

- SIMATIC S7-1200
- SIMATIC S7-1500

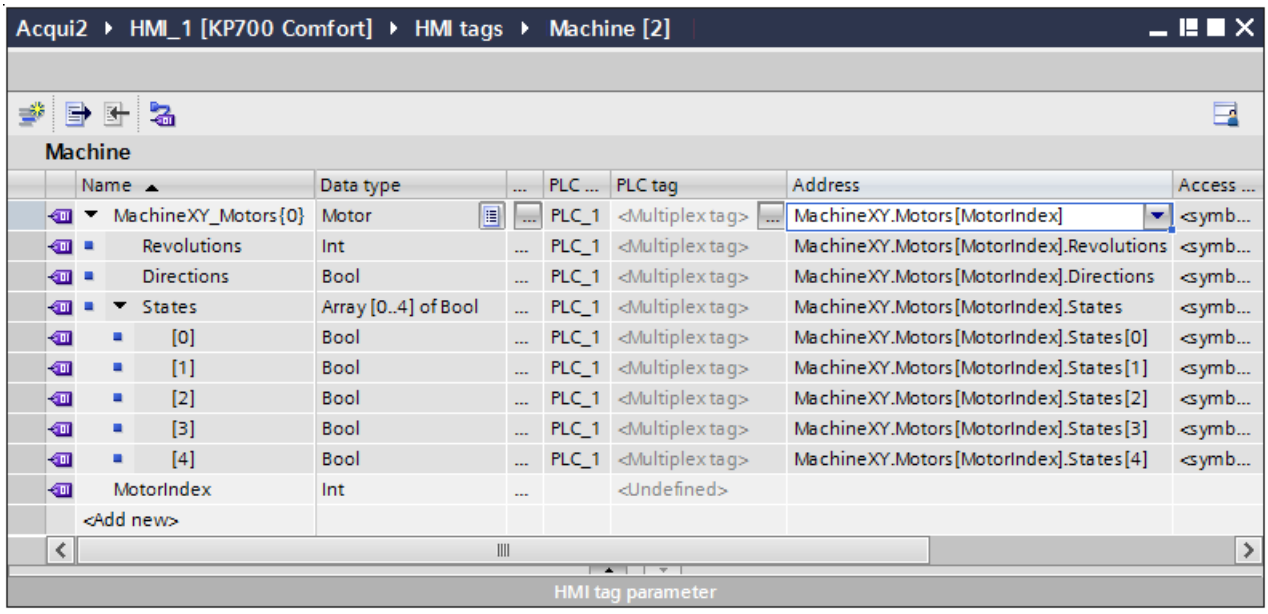
Structured HMI tags with user-defined PLC data types (UDT) and arrays can be used for multiplexing with symbolic addressing.

Multiplexing is possible under the following conditions:

- The path of the connected PLC tag includes at least one array index.
- The array, which is left in the path of the PLC tags, is one-dimensional.
- If there are multiple arrays in the path of the PLC tags, only the array at the far left is available for multiplexing.
- The index tag must be of the "USInt", "UInt", "UDInt", "SInt", "Int" or "DInt" data type.

The following figure shows multiplexing with symbolic addressing using a structured HMI tag with custom PLC data types (UDT). The data block element "db1.udt3Arr[0]" is linked to the

HMI tag "db1_udt3Arr{0}". Symbolic addressing of the HMI tag "db1_udt3Arr{0}" is multiplexed by the "index" HMI tag:



The following tags can not be used as index tags for multiplexing with symbolic addressing:

- HMI tags that are not of the "USInt", "UInt", "UDInt", "SInt", "Int" or "DInt" data type
- HMI tags that are already multiplexed
- Array elements
- HMI tags that are elements of structured HMI tags

Note

In Runtime, the first array element is always addressed with the index value "0". Have your array element in the data blocks also start with the index "0".

Note

You can export the HMI tags that are used for multiplexing with symbolic addressing to MS Excel. You can also import such HMI tags from MS Excel into an HMI tag table that contains all HMI tags of the HMI device.

See also

Tag Limits (Page 5327)

Configuring address multiplexing with absolute addressing (Basic Panels, Panels, RT Advanced)

Introduction

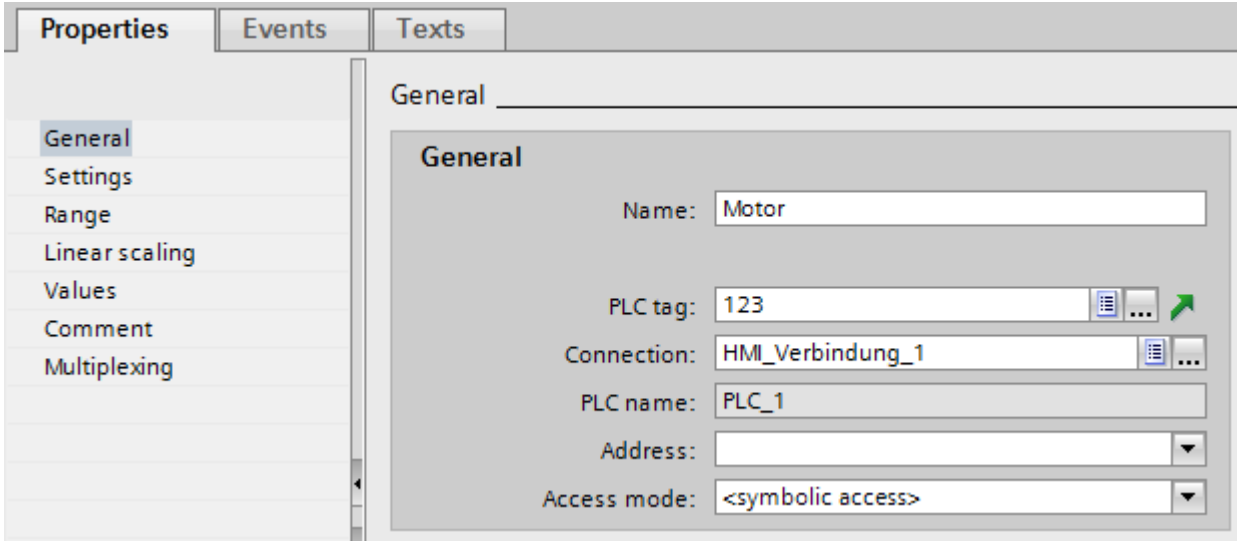
When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the absolute address in the PLC, you use tags in order to be able to change the address in Runtime.

Requirement

- The tag for address multiplexing is created and connected to the PLC.
- The Properties window for this tag is open.

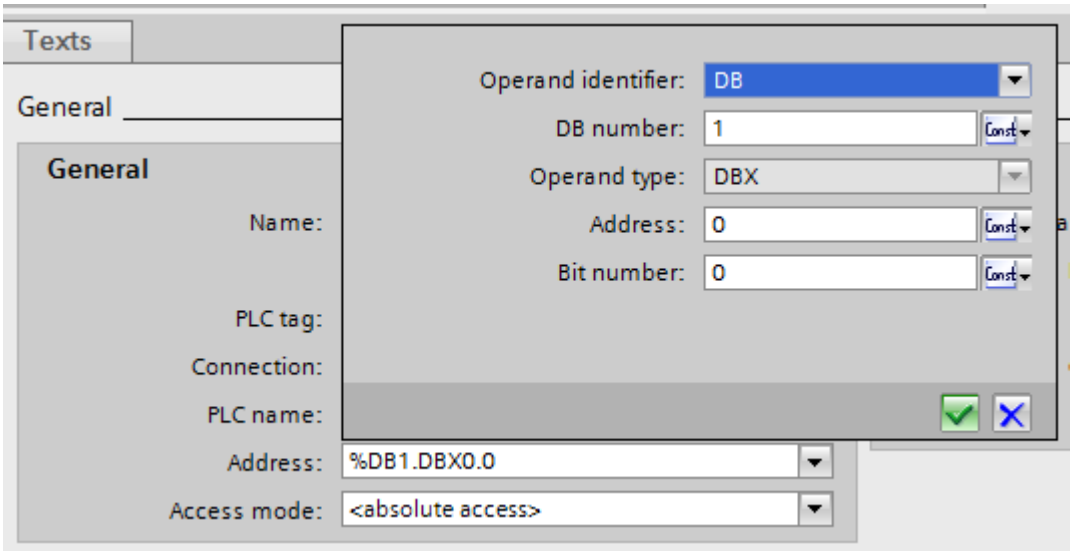
Procedure

1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.

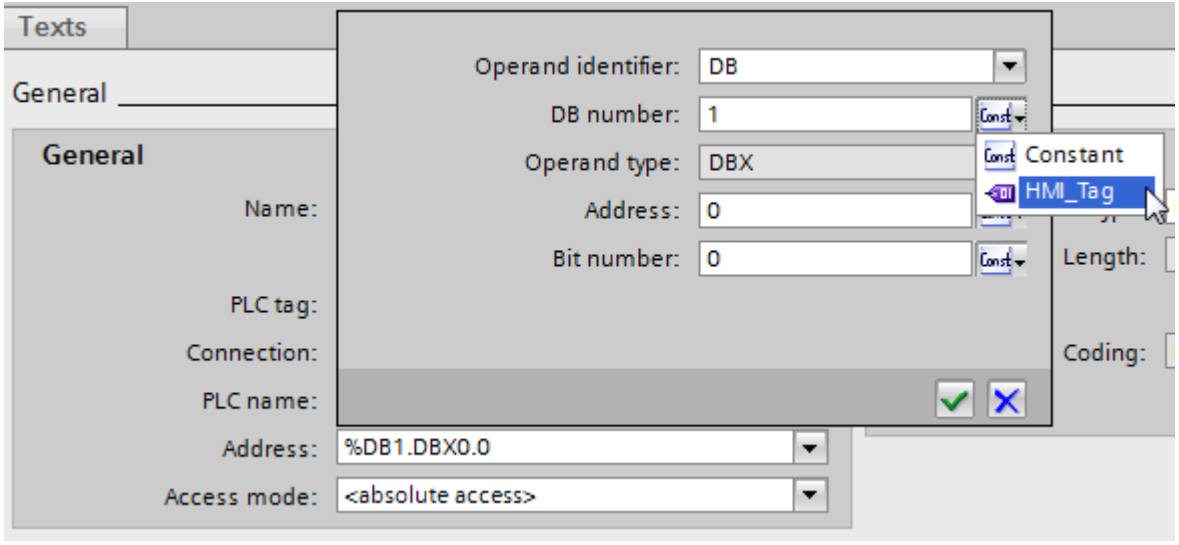


2. Select the "Int" data type for this example.
3. Select the access type "Absolute addressing".

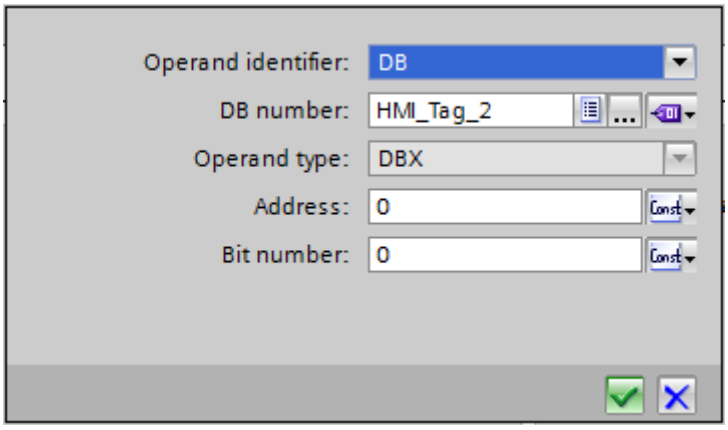
4. Click the selection button in the "Address" field. The address dialog opens.



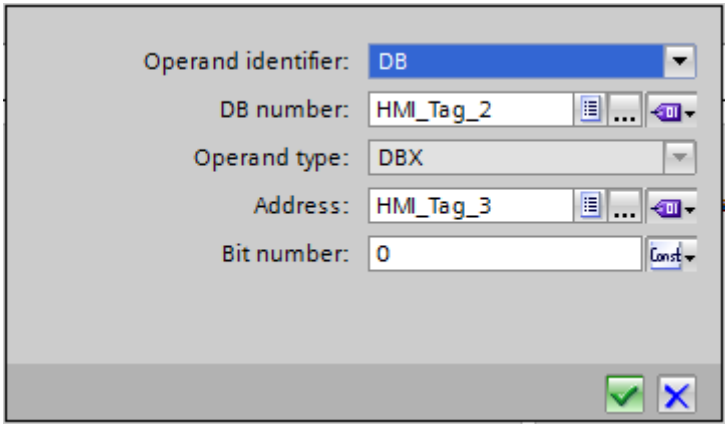
5. Click the selection button in the "DB number" field and select the entry "HMI tag".



6. In the "DB number" field, click the ... button and select a tag for the DB number in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the button.



7. Repeat steps 3 and 4 for the "Address" field and configure a further tag for calling the address area in the data block.



The selection options in the Address dialog depend on the selected data type of the multiplex tag. The Address dialog offers only address settings that can be configured with the selected data type.

Result

In runtime, the multiplex tag is used to access the memory location corresponding to the address currently found in the tag. You control access to the data block with the tag in the DB number field. You control access to the address in the selected data block with the tag in the "Address" field.

Note

The value in the memory location will only be read at the next update cycle for the addressed tag.

If, for example, you use a multiplex tag in a script, do not attempt to access contents of the memory location directly after changing it.

See also

Tag Limits (Page 5327)

Configuring address multiplexing with symbolic addressing (Basic Panels, Panels, RT Advanced)

Introduction

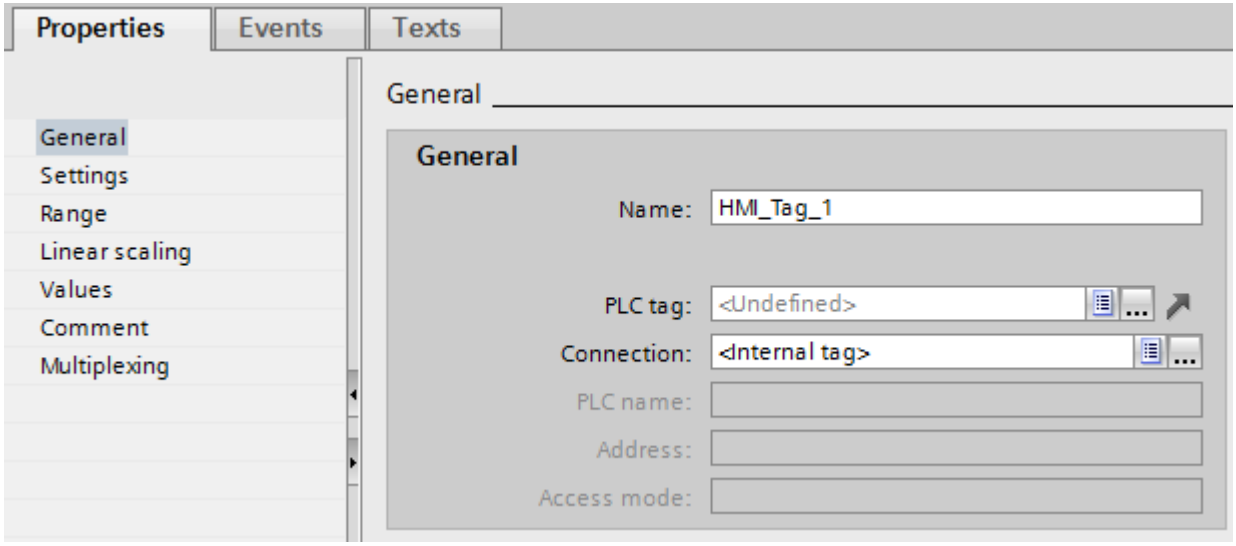
When using address multiplexing, you can efficiently access different addresses in the PLC with the help of a small number of tags. Instead of the symbolic address in the PLC, you use tags in order to be able to change the address in Runtime.

Requirement

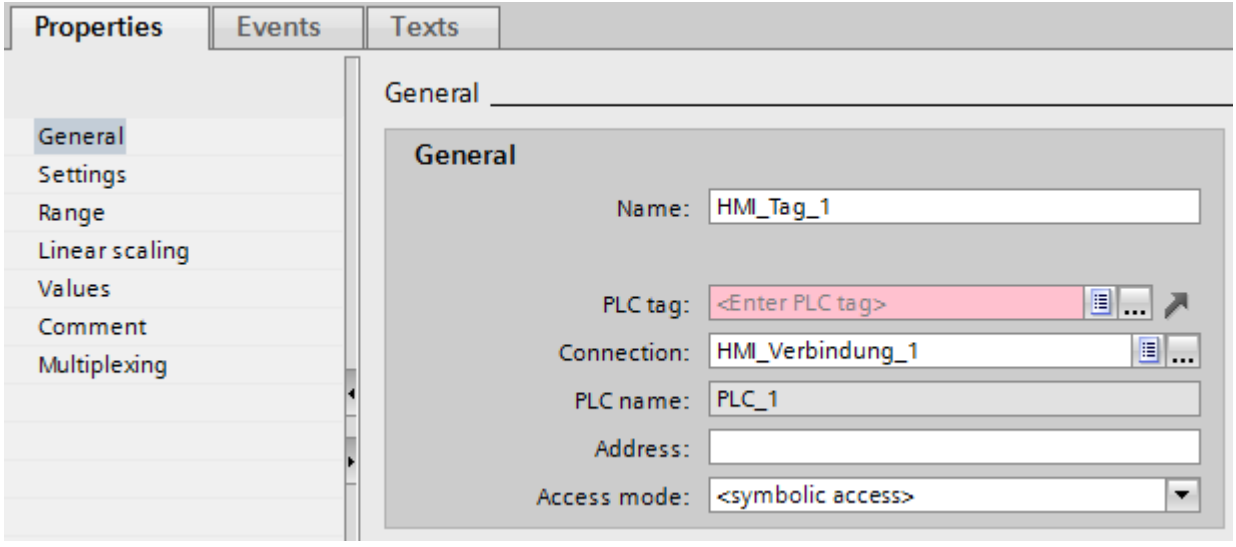
- The tag for address multiplexing is created.
- The Properties window for this tag is open.
- A data block with an array tag is created in the connected PLC.
- The data block was compiled.

Procedure

1. Select the tag for address multiplexing in the tag table, and select "Properties > Properties > General" in the Inspector window. The general properties of the tag are displayed.

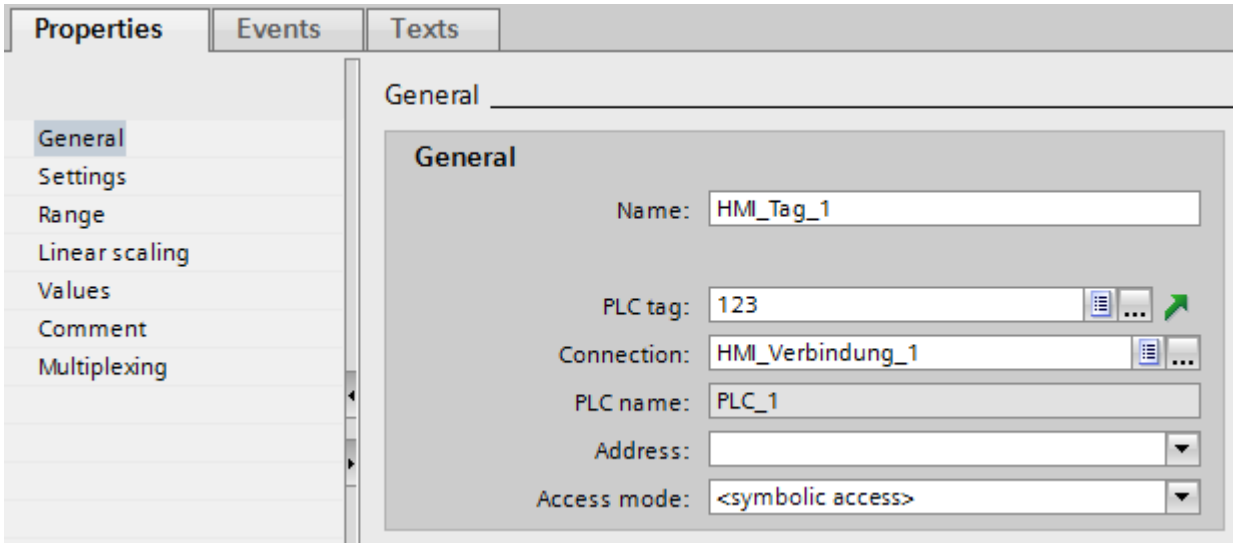


2. Select the connection to the PLC via the "Connection" field.

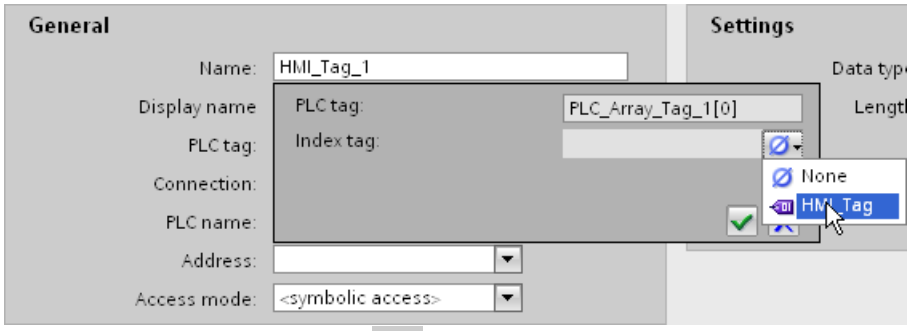


3. Select the access type "Symbolic access".

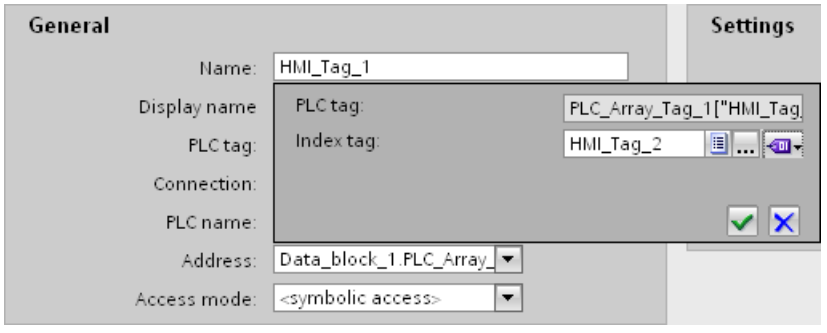
4. Navigate to the data block of the PLC via the "PLC tag" field and select an array element of the array tag.



5. Click the selection button in the "Address" field. The address dialog opens.
6. Click the selection button in the "Index tag" field and select the entry "HMI tag".



7. In the "Index tag" field, click the ... button and select a tag for the array index in the object list. Or create a new tag with the help of the object list. Accept the tag by clicking the button.



Result

In Runtime, the array element whose index value is contained in the index tag is accessed.

Indirect addressing of tags (Page 5344)

Tag Limits (Page 5327)

Making characters available for HMI tags of the type WString/WChar (Panels, RT Advanced)

Introduction

In tags of the type WString or WChar, you specify the strings that can be displayed with specific fonts.

Only those characters that are used in texts in the configuration are transferred to the Basic Panels and Comfort Panels via the configuration. Therefore, it is possible that characters that are displayed via tags of the WString or WChar type are not displayed.

The Tahoma and Courier New fonts are fully pre-installed on the Comfort Panels. The Tahoma font is fully pre-installed on the Basic Panels. The characters of most languages can be displayed with the Tahoma font. The characters of the Chinese, Taiwanese, Japanese and Korean languages cannot be displayed with Tahoma.

WinCC Runtime Advanced supports all fonts that are installed on the configuration PC and the Runtime PC. If you want to use a different font, install it on the configuration PC and the Runtime PC.

For Comfort Panels, it is possible to load the complete font to the HMI device via ProSave.

For Basic Panels, it is not possible to install fonts via ProSave. Therefore, the characters must always be contained in the configured texts.

Basics

For Comfort Panels, you can download the following fonts to the HMI device with the additional ProSave options:

- SimSun for the input of strings in Chinese (PRC), Chinese (Singapore), English, German, Italian, French and Spanish.
- Gulim for the input of strings in Korean.
- MS PGothic for the input of strings in Japanese.

You can find additional information on the topic of "Loading Asian fonts via ProSave" under Loading Asian fonts to the HMI device (Page 6377).

Note

"Chinese Traditional" (Taiwan, Hong Kong, Macao)

You need the "MingLiU" font to display traditional Chinese characters for Taiwan, Hong Kong and Macao. It is not possible to load this font to the Comfort Panels via the ProSave options. The SimSun and Tahoma fonts cannot be used to display traditional Chinese characters.

Therefore, the traditional Chinese characters that occur in WStrings/WChars must be contained in the configured texts on Comfort Panels.

Using characters as configured texts in screens

To use fonts that are not installed on an HMI device in Runtime, provide the characters as configured texts in a screen:

1. Create a new screen.
2. Insert a text box.
3. In the properties of the text box, set a font that contains characters that you wish to use later.
4. Insert the characters of the font that you wish to use later into the text box.

After the project is compiled, you can use the characters configured in the text in HMI tags of the type WString/WChar.

Special configuration options (Basic Panels, Panels, RT Advanced)

Indirect addressing of tags (Panels, RT Advanced)

Principle

In multiplexes, a type of indirect addressing, the tag used is first determined at runtime. A list of tags is defined for the multiplex tag. The relevant tag is selected from the list of tags in runtime. The selection of the tag depends on the value of the index tag.

In Runtime, the system first reads the value of the index tag. Then the tag which is specified in the corresponding place in the tag list is accessed.

Application example

Using indirect addressing, you could configure the following scenario:

The operator selects one of several machines from a selection list. Depending on the operator's selection, data from the selected machine will be displayed in an output field.

To configure such a scenario, configure the index tag for a symbolic I/O field. Configure the multiplex tag at an I/O field. Configure the tag list of the multiplex tag to reflect the structure of the selection list.

If the operator selects another machine, the value of the index tag will change. The selection field then displays the content of the tag that is pointed to in the tag list in the multiplex tag by the new index value.

Addressing tags indirectly (Page 5345)

Using tags to trigger functions (Page 5346)

Defining the acquisition cycle for a tag (Page 5347)

Basics of tags (Page 5304)

Configuring address multiplexing with symbolic addressing (Page 5340)

Creating external tags (Page 5314)

Addressing tags indirectly (Panels, RT Advanced)

Introduction

With indirect addressing, the tag used is first determined at runtime. Instead of a single tag, a list of tags is defined. The list entries consist of an index value and the name of the tag to be used. You can control which entry in the tag list is accessed using an index tag.

Note

Data type of the index tags

If you use tags in the tag list with different data types, the properties of the largest data type are used. If you use tags of the INT and REAL data types, for example, the values are shown in floating point numbers.

Requirement

- The tag which you wish to address indirectly must already exist.
- The index tag must exist.
- The tags which will be contained in the tag list must already exist.
- The Inspector window with the tag properties is open.

Procedure

To address tags indirectly, proceed as follows:

1. In the Inspector window select "Properties > Properties > Multiplexing".
2. Select the "Multiplexing" option to activate indirect addressing.
   Using this option, you can temporarily switch off indirect addressing for testing purposes, for example. Settings which were made earlier for indirect addressing remain unchanged.
3. Select an "Index tag" or define a new tag using the object list.
4. Click the first entry in the "Tags" column in the tag list.
5. Select a tag as a list entry or define a new tag using the object list.
   The entry in the "Index" column will be generated automatically.
6. Repeat step 5 for all tags that you wish to add to the tag list.
7. If necessary, you can use drag-and-drop to change the order of the entries in the list.

Result

In runtime, the system will dynamically access the tag in the tag list which has the same index value as the value currently in the index tag.

See also

Indirect addressing of tags (Page 5344)

Using tags to trigger functions (Panels, RT Advanced)

Introduction

You can use the values of variables as the triggering event for an action in runtime. To start an action in Runtime, configure a function list for a tag. Include one or more system functions or VB scripts in the function list. The function list is processed when the configured event occurs.

The following events are available for a tag:

- Change in value of the tag
  Function list processing is triggered by each change in the value of the variable.
  When the tag is defined as an array tag, the function list is processed whenever an array element changes.
- Violation of the tag's high limit
  The function list is processed when the high limit is violated.
- Violation of the tag's low limit
  The function list is processed when the low limit is violated.

Requirement

- The tag whose value you wish to use as an event already exists.
- The Inspector window with the properties for this tag is open.

Procedure

To configure a tag with a function list, proceed as follows:

1. Under "Properties > Events >" in the Inspector window, select the event for which you want to create a function list.
   The function list associated with the selected event is shown.
2. Click "<Add function>". The second table column contains a selection button.
3. Click the selection button and select a system function.
4. Define the parameter values.

Alternatively, select a script to run in the function list, rather than a system function. The "VB scripts" entry is only displayed if there is a script available in the project.

Result

If the configured event occurs in Runtime, the function list or the script is processed.

Indirect addressing of tags (Page 5344)

Defining the acquisition cycle for a tag (Basic Panels, Panels, RT Advanced)

Introduction

The value of an external tag can be changed in Runtime by the PLC to which the tag is linked. To ensure that the HMI device is informed of any changes in tag values by the PLC, the values must be updated on the HMI. The value is updated at regular intervals while the tag is displayed in the process screen or is logged. The interval for regular updates is set with the acquisition cycle. The update can also be made continuous.

Requirement

- You have created the tag for which you want to define an acquisition cycle.
- The Inspector window with the tag properties is open.

Procedure

To configure an acquisition cycle for a tag, follow these steps:

1. In the Inspector window select "Properties > Properties > General."
2. If you want to update the tag at regular intervals as long as it is being displayed on the screen or logged, select "Cyclic in operation" as the acquisition mode.
   Or:
   If you want to update the tag at regular intervals even though it is not being displayed on the screen or logged, select "Cyclic continuous" as the acquisition mode.
   The "Cyclic continuous" setting is selected for a tag, for example, that has a function list configured for a change of its value and that is not directly visible in a screen.
3. Select the required cycle time in the "Acquisition cycle" field or define a new acquisition cycle using the object list.

Alternatively, you can configure the acquisition cycle directly in the work area of the tag table. To view hidden columns, activate the column titles using the shortcut menu.

Note

Only use the "Cyclic continuous" acquisition mode for tags that really have to be continuously updated. Frequent read operations generate a heavy communication load.

Note

For structured HMI tags, the acquisition mode can be selected for the respective structured HMI tag as well as their individual subordinate elements. The acquisition mode of the elements of the array tag cannot be changed. The elements of the array tag is automatically assigned to the acquisition mode of the higher-level array tag.

When the acquisition mode of structured HMI tags is changed, it is applied to all subordinate elements. This means changing the acquisition mode may overwrite subordinate elements.

Result

The configured tag is updated in Runtime with the selected acquisition cycle.

Indirect addressing of tags (Page 5344)

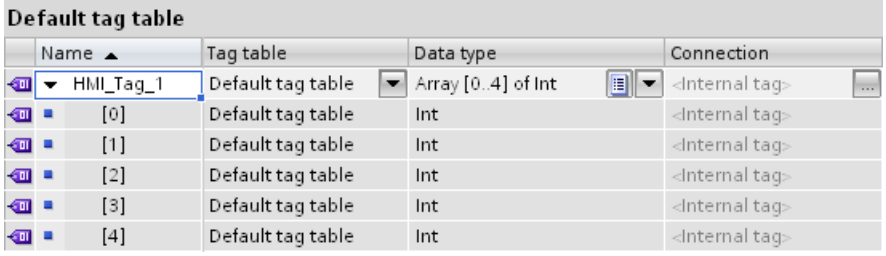
12.2.3 Working with arrays (Basic Panels, Panels, RT Advanced)

12.2.3.1 Basics on arrays (Basic Panels, Panels, RT Advanced)

Definition

An array is a data list with data elements of a uniform data type. This data list is referred to as array tag or array for short. The data elements are referred to as array elements.

The individual array elements can be addressed by one or multiple integer indices. The properties of each array element are mainly identical and can be configured centrally at the array tag.



Advantages

Many similar array elements can be combined in a structured manner with only one array tag. You can specify the shared properties of similar array elements centrally at the array tag. You can then generally use each individual array element as individual tag with the same data type in the configuration.

Restrictions

When using arrays on HMI devices, RT Advanced and RT Professional, the following restrictions apply:

- An array can only contain one dimension. Multi-dimensional arrays of the PLCs are mapped to individual tags on the HMI systems.
- Only elementary data types without additional substructure can be used as data type of an array. This means that only scalable arrays are supported.
- The lower index of an array must begin with "0". The indices are moved accordingly for other low limits on the PLCs.
- Unlike individual tags, scalable arrays do not support ranges, linear scaling or tag multiplexing.

Application examples

Array tags can be used in the following situations:

- To group process values in profile trends: You map process values to trends which are acquired at different points in time, for example.
- To access specific values which are grouped in trends: For example, display all recorded values of the profile trend by gradually increasing the index tag.
- To configure discrete alarms with successive bit number.
- To save the complete machine data records in a recipe.

Tag count with arrays

- Scalable arrays on HMI devices and RT Advanced are counted as one tag.
- In RT Professional, each array element contained is counted separately.
- Multi-dimensional arrays of the PLCs are mapped to individual tags of the same data type and are counted as such.
- Structured arrays of the PLC are mapped to individual tags with the corresponding data type and are counted as such.

Special features

On HMI devices as well as in RT Advanced, all array elements are always read or written at once by the PLC when an element of a scalable array is accessed (except arrays of String/ WString).

In RT Professional, the array elements are always read and written individually to and from the PLC.

Example for HMI devices and RT Advanced:

- An array tag which consists of 100 array elements of data type "Real" was configured.
- If an array element with a length of 4 bytes changes, 100 x 4 bytes are written to the PLC.

WARNING

Increased system load and performance losses

Due to the simultaneous transmission of all array elements of a scalable array, writing to the PLC, in particular, takes longer when accessing an element of a larger array than writing a tag with the same data type. Take this into consideration when designing the communication.

Also note that, with scalable arrays, reading entire array tags by the PLC is usually faster than the sum of read accesses to the same number of elementary tags of the same data type.

CAUTION

Data inconsistency at array tags

If the value of a single element must be changed in a scalable array tag, the entire array is read, changed and rewritten as a complete array. Changes to other array elements carried out in the meantime in the PLC are overwritten during rewriting.

You should always prevent the HMI device and the PLC from concurrently writing values to the same array tag. Use synchronous transfer of recipe data records, for example, to synchronize an array tag with the PLC.

Note

Array tags as list entry of multiplex tags

You can use the array tags of the Char or WChar data type just like the tags of the String data type.

The use of an array tag of the Char or WChar data type as list entry of a multiplex tag in the "HMI tags" editor is not supported.

Use in scripts

To maintain performance, always use internal arrays in scripts to change scalable arrays.

1. Copy the PLC array to the internal array at the start of the script.
2. No load is placed on communication to the PLC while the script processes the internal array.

CAUTION

Data inconsistency at array tags

If the value of a single element must be changed in an array tag, the whole array is read, changed and rewritten as a complete array. Changes to other array elements carried out in the meantime in the PLC are overwritten during rewriting.

You should always prevent the HMI device and the PLC from concurrently writing values to the same array tag. Use synchronous transfer of recipe data records, for example, to synchronize an array tag with the PLC.

12.2.3.2 Creating array tags (Basic Panels, Panels, RT Advanced)

Introduction

Create an array tag to configure a large number of tags of the same data type. The array elements are saved to a consecutive address space.

You can create an array tag as an internal tag or as an external tag.

Note

Connecting HMI tags to PLC array tags

If you want to create an array tag as an external tag, first configure an array tag in a data block of the connected PLC. You then connect the array tag to an HMI tag.

Note

HMI array tags of the following data types are only supported with PLC array tags:

- Char
- WChar
- String
- WString

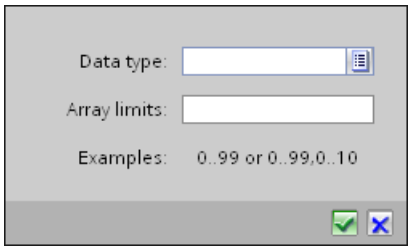
Creating HMI array tags

To create an array tag, follow these steps:

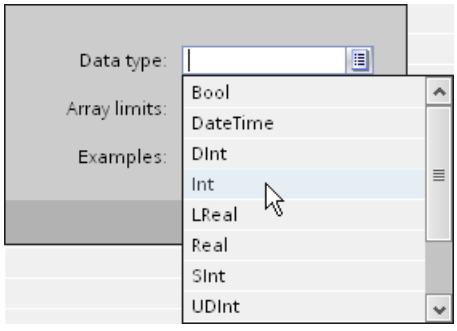
1. Open the HMI tag table.
2. Double click <Add> in the "Name" column of the HMI tag table.
   A new HMI tag is created.

Configuring HMI array tags

1. Click in the Data type column of the HMI tag table and select the "Array" data type.
2. Click in the data type column.
   The dialog box for configuring the array is opened.



3. Select the desired data type for the array tag in the "Data type" field.



4. Define the number of array elements in the "Array limits" field. The lower limit must begin with "0".
5. Click . The settings for the array are saved.
6. As with tags with elementary data types, you still need to assign the address of the array tag in the PLC.
7. Save the project.

Result

An array tag is created. The properties of the array elements are inherited from the parent array tag.

See also

Basics on arrays (Page 5348)

12.2.3.3 Examples of arrays (Basic Panels, Panels, RT Advanced)

Introduction

Array tags combine a large number of tags, e.g. 100 array elements.

The common properties of array elements of the same kind can be defined centrally in the array tag. In the configuration, you then use each individual array element as an individual tag with the same data type. However, array elements cannot be used as parameters in function lists.

You use array tags as complete arrays in the following places:

- In the "Alarms" editor
- In the "Recipes" editor
- For address multiplexing
- In function lists

Examples

You can drag a PLC array tag straight from the PLC tag table to the HMI tag table.

Alternatively, you can configure an array tag separately with the corresponding number of array elements to handle multiple tags of the same data type.

- The individual array elements can be accessed indirectly by means of an index tag, for example.
- Use these index tags to operate and monitor the array elements.

Basics on arrays (Page 5348)

12.2.4 Working with user data types (Panels, RT Advanced)

12.2.4.1 Basics on user data types (Panels, RT Advanced)

Introduction

With user data types you bundle a number of different tags that form one logical unit. You create a user data type as a type and use instances of this type in the project. User data types are project-associated data and are available for all HMI devices of the project.

User data types differ in their association to a family of devices. User data types are available for the following families of devices:

- WinCC Runtime Advanced and Panels
- WinCC Runtime Professional

WinCC also supports the connection of PLC data types (UDTs) and user data types to HMITags.

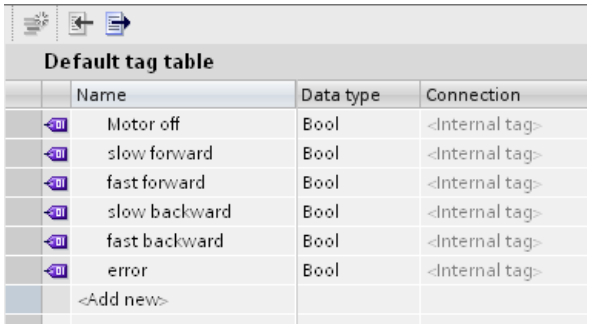
User data types also differ in their applicability with a specific communication driver. User data types are available for the following communication drivers:

- SIMATIC S7-300/400
- SIMATIC S7-1200
- SIMATIC S7-1500

Create user data types and user data type elements in the project library.

Principle

For example, the different conditions of a motor can be described using 6 unique Boolean tags.



Default tag table

	Name	Data type	Connection
	Motor off	Bool	<Internal tag>
	slow forward	Bool	<Internal tag>
	fast forward	Bool	<Internal tag>
	slow backward	Bool	<Internal tag>
	fast backward	Bool	<Internal tag>
	error	Bool	<Internal tag>
	<Add new>		

If the overall condition should be described with a single tag, this tag can be created based on a user data type. For each of the individual Boolean tags you create a user data type element in the user data type.

This user data type can then be assigned complete to a faceplate for the motor. The created and released version of user data type is displayed at the tag in the "Data type" selection field.

The configured properties of a user data type are used in the instances of the user data type. If required, you change individual properties directly at the point of use, e.g. at a tag. Changing a property at the tag does not affect the user data type created.

NOTICE
Availability of user data types The connection of user data types to faceplates is only supported in WinCC Runtime Advanced and Panels.

License regulation in Runtime

If you use external tags of the "User data type" data type in a faceplate instance, each user data type element is counted as a tag in Runtime.

Example

You have created two screens in the "Screens" editor: Screen_1 and Screen_2.

3 instances of a faceplate type are inserted in Screen_1. 4 instances of a faceplate type are inserted in Screen_2.

Each faceplate instance is connected to an external tag of the "User data type" data type. The user data type includes 10 user data type elements.

Screen 1: 3 faceplate instances * 10 user data type elements corresponds to 30 external tags = 30 PowerTags.

Screen 2: 4 faceplate instances * 10 user data type elements corresponds to 40 external tags = 40 PowerTags.

In Runtime, 70 PowerTags are counted together for both screens. This also applies to the user data type elements that are not required.

Creating a user data type (Page 5355)

12.2.4.2 Creating a user data type (Panels, RT Advanced)

Introduction

You create a user data type in the project library.

Requirement

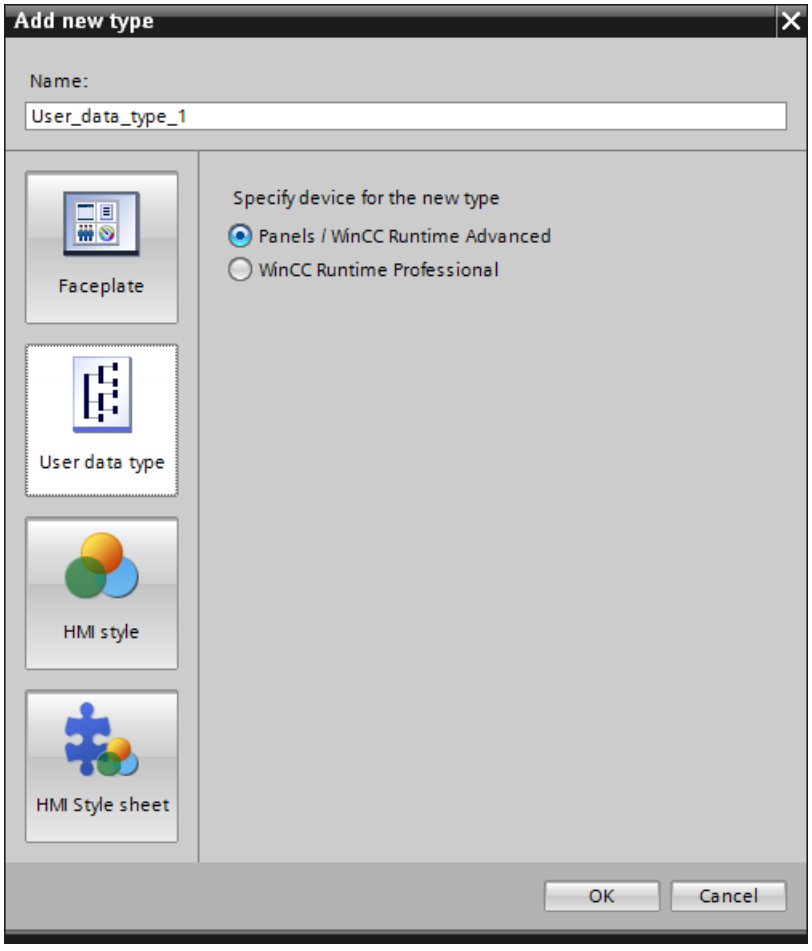
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

Procedure

To create a user data type, follow these steps:

1. Click the "Libraries" task card.
2. Double-click the "Project library" item. The folder structure of the project library is open.

3. Click the "Create new type" button.
   A dialog opens.



4. Click the "HMI UDT" button in the dialog.
5. In the "Specify device for the new type" area select the HMI device on which the user data type is used.
6. Enter a descriptive name in the "Name" field.
7. Click "OK" to apply your settings. The user data type is created. The library view opens.

Result

A user data type with the configured properties is created. Version 0.0.1 of the user data type is created and receives the status "in progress".

Create the required user data type elements in the next step.

Before you use the version of user data types, for example at a tag, the version must be released.

See also

Basics on user data types (Page 5353)

Managing versions of user data types (Page 5358)

12.2.4.3 Creating user data type elements (Panels, RT Advanced)

Introduction

You define user data type elements in the library view. You add or delete elements in the "HMI user data types" table in the work area.

Requirement

- The library view is open.
- A user data type is created and opened in the editor.

Procedure

1. Select a communication driver for the user data type.

- If you select the <Internal communication> entry, you can only assign the user data type to the internal tags as the data type.
- If a connection to a PLC is selected as the communication driver, the user data type can only be assigned to tags with a connection to this PLC as the data type.
- The communication type set applies to all user data type elements of a user data type. In a user data type for the"WinCC Runtime Professional" family of devices, you can define for each user data type element whether the configured driver is used for control or internal communication.

1. Double-click "Add" in the "Name" column of the table. A new user data type element is added to the user data type.
2. Assign a name.
3. Select the required data type in the "Data Type" field.
4. Create as many user data type elements as you need.
5. You configure the user data type elements in the "Properties" group in the Inspector window.

Alternatively, you can configure the properties of the user data type elements directly in the table. To view hidden columns, activate the column titles using the shortcut menu.

Result

You have added elements to version 0.0.1 of the user data type. The version 0.0.1 has the status "in progress".

To use the version in the project, release the version in the next step.

See also

Basics on user data types (Page 5353)

12.2.4.4 Managing versions of user data types (Panels, RT Advanced)

Introduction

All user data types have at least one version. When a user data type is created, a version is created at the same time and this version has the status "in progress". You can edit the user data type in this status as required. When the editing is complete, you release the version of the user data type.

Requirement

- You have created a user data type.
- The user data type has the version 0.0.1. and the status "In progress".
- The "Libraries" task card or the library view is open.

Releasing a version

1. Select the version 0.0.1 of the user data type in the project library.
2. Select "Release version" in the shortcut menu.
   A dialog opens.
3. If necessary, change the properties of the version:
   - Enter a name for the type in the "Name" field.
   - In the "Version" field, define a main and an intermediate version number for the version to be released.
   - To clean up version management of the type, enable "Delete unused type versions from the library".

You have released version 0.0.1 of the user data type.

Editing a version

1. Select, for example, the released version 0.0.1 of a user data type in the project library.
2. Select "Edit type" in the shortcut menu.

The library view opens. The new version 0.0.2 of the user data type is created.

The version has the status "in progress".

Restoring the last version of a user data type

The last released version of the user data type is version 0.0.2.

You edit the user data type. A new version of the user data type, 0.0.3, is generated and receives the status "In progress".

1. Select the version of the user data type in the project library.
2. Select "Discard changes and restore version" in the shortcut menu.

Alternatively

1. If you have opened a version for editing, click "Discard changes and restore version" in the toolbar.
   The version is deleted.

All changes to the user data type since the last release operation are discarded. The user data type is released again and has version 0.0.2.

Deleting user data type

If you delete a user data type, all instances and master copies of this user data type are deleted as well. The same is true for HMI tags that use an HMI user data type.

To delete a user data type, follow these steps:

1. In the project library, under "Types", select the user data type you want to delete.
2. Select "Delete" from the shortcut menu.

See also

Basics on user data types (Page 5353)

Creating a user data type (Page 5355)

12.2.4.5 Creating tags with a user data type data type (Panels, RT Advanced)

Introduction

When a tag is created, you assign the version of user data type as a data type. In the "Tag" editor you can create internal tags or tags with a link to a PLC. A tag has access to all user data type versions that use the same communication driver as the tag itself.
In connection with a PLC, a user data type can only be used if the absolute addressing is selected.

Requirement

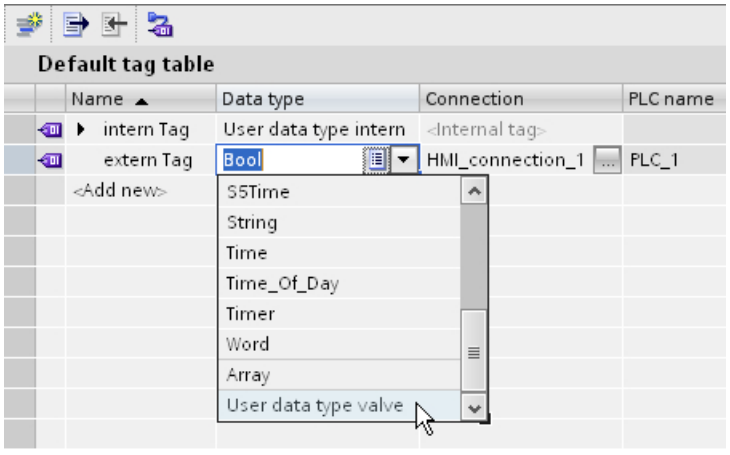
- A user data type with a user data type element is created.
- The user data type is enabled.
- The tag table is open.
- The Inspector window with the tag properties is open.

Procedure

To create a tag of the "User data type" data type, follow these steps:

1. In the "Name" column, double-click "Add" in the tag table. A new tag is created.
2. In the Inspector window select "Properties > Properties > General".
3. Enter a unique tag name in the "Name" field.
4. Select the connection to the required PLC in the "Connection" box.
5. Select the desired version of the user data type in the "Data type" field.
   The selected connection determines which user data types will be displayed.
   For internal tags, only user data type versions of the <Internal user data type> type are available.

   For tags with a connection to a PLC, only those user data types that have a link to a PLC can be accessed.



6. Enter the address of the PLC that you want to access with the external tags in the "Address" field of the "Settings" area. The specified address must always point to the start data bit, for example, <DB1.DBX0.0>.

Result

You have created a tag of the "User data type" data type. In additional steps you can configure the tag, for example, by setting the start value and limits.

With tags of the "User data type" data type, you can connect the dynamic properties of a faceplate instance, which then supplies these properties with values in Runtime.

If you wish to change the properties of a user data type tag, you must change the properties of the user data type element.

Properties such as "Start value", "Use substitute value" or " Linear scaling" can be changed in the employed instances of the user data type.

Basics on user data types (Page 5353)

12.2.5 Working with cycles (Basic Panels, Panels, RT Advanced)

12.2.5.1 Cycle basics (Basic Panels, Panels, RT Advanced)

Introduction

Cycles are used to control actions that regularly occur in runtime. Common applications are the acquisition cycle, the logging cycle and the update cycle. You can also define your own cycles in addition to those already provided in WinCC.

Principle

In Runtime, actions that are performed regularly are controlled by cycles. Typical applications for cycles:

- Acquisition of external tags
  The acquisition cycle determines when the HMI device will read the process value of an external tag from the PLC. Set the acquisition cycle to suit the rate of change of the process values. The temperature of an oven, for example, changes much more slowly than the speed of an electrical drive.
  Do not set the acquisition cycle too low, since this will unnecessarily increase the communication load of the process.
- Logging process values
  The logging cycle determines when a process value is saved in the logging database. The logging cycle is always an integer multiple of the acquisition cycle.

The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The values of all other cycles are always an integer multiple of the smallest value.

If the cycles provided in WinCC do not meet the needs of your project, you can define your own cycles using the "Cycles" editor. User-defined cycles must always be an integer multiple of the smallest value.

Note

Device dependency

You cannot configure self-defined cycle times for Basic Panels.

Application example

You can use cycles for the following tasks:

- To regularly log a process.
- To draw attention to maintenance intervals.

See also

Basics of tags (Page 5304)

Defining cycles (Page 5362)

12.2.5.2 Defining cycles (Panels, RT Advanced)

Introduction

Use cycles to control actions that are run at regular intervals in Runtime. You can also define your own cycles in addition to those already provided in WinCC.

Requirement

You have opened the project.

Procedure

1. Double-click the "Cycles" entry in the project navigation.
   The "Cycles" editor opens.
2. In the "Name" column of the "Cycles" editor, double-click "Add".
   A new cycle time is created.
3. Enter a unique name in the "Name" field.
4. Select the desired cycle unit.

5. Select the desired value for the cycle time.
   The available selection of values varies depending on the cycle unit selected. The smallest possible value for the cycle depends on the HMI device that will be used in your project. For most HMIs, this value is 100 ms. The available values are always an integer multiple of this value.
6. As an option, you can enter a comment regarding the use of the cycle.

Result

The cycle you configured is created and beside the default cycles in WinCC for use during configuration.

Cycle basics (Page 5361)

12.2.6 Logging tags (Basic Panels, Panels, RT Advanced)

12.2.6.1 Basic principles for data logging (Panels, RT Advanced)

Introduction

Data logging is used to collect, process and log process data from an industrial system.

When you analyze the logged process data, you can extract important business and technical information regarding the operational state of the system.

Application of the data logging

You can use data logging to analyze error statuses and to document the process. By analyzing data logs, you can extract the information necessary to allow you to optimize maintenance cycles, increase product quality and ensure that quality standards are met.

Data logging (Page 5364)

Logging Tags (Page 5365)

Basics of tags (Page 5304)

12.2.6.2 Data logging in Runtime Advanced and Panels (Basic Panels, Panels, RT Advanced)

Basics (Basic Panels, Panels, RT Advanced)

Data logging (Basic Panels, Panels, RT Advanced)

Introduction

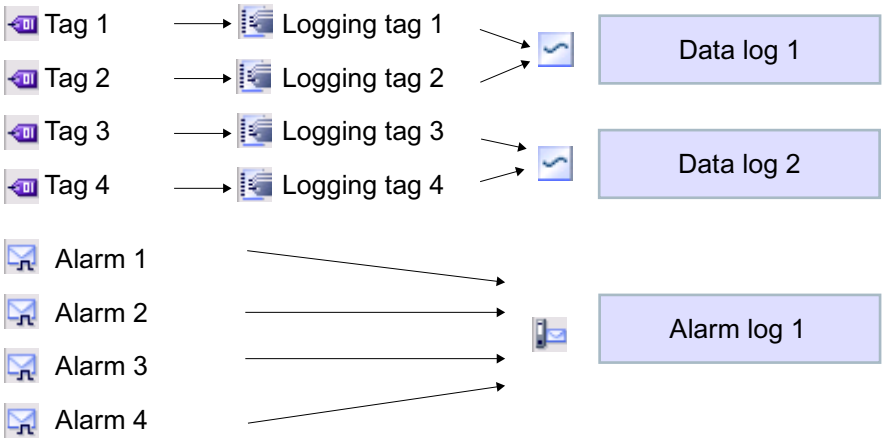
Data is information that is collected during the process and saved in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. You define tags for acquiring and editing the process values in WinCC.

External tags are used in WinCC to collect process values and to access a memory address in the connected automation system. Internal tags are not linked to any process and are only available at the associated HMI device.

Principle

The values of external and internal tags can be saved in data logs. Create a logging tag for every tag and specify the log in which it is saved.

Data logging is controlled via cycles and events. Logging cycles are used to ensure continuous acquisition and storage of the tag values. You can also trigger data logging in response to events, such as the change in value of a tag. Define these settings independently for each logging tag.



The tag values to be logged are compiled, processed and saved in the data log in Runtime. The HMI device you are using determines where the data log is saved. You can further process the saved data in other programs for analysis purposes, for example.

Logging methods

WinCC supports the following logging methods:

- Circular log
- Segmented circular log
- Circular log which sends a system alarm when it is full
- Circular log which executes system functions when it is full.

Outputting logged data

In runtime, you can output the logged tag values as trends in the process screens.

See also

Basic principles for data logging (Page 5363)

Storage locations of logs (Page 5532)

Working with Data Logs (Basic Panels, Panels, RT Advanced)

Logging Tags (Basic Panels, Panels, RT Advanced)

Introduction

In Runtime, you store tag values in logs. You can then analyze the logged data at a later date. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- The data log in which the tag is stored.
- The cycle or the event with which the tag is stored.
- The value range within which the tag is stored.

Note

You use data logging mainly to log the values of external tags. You can also log the values of internal tags.

Principle

Several steps come together during data logging:

- Creating and configuring the data log
  When you create a data log, you define the following settings:
  - General settings, such as name, size and storage location
  - Runtime start characteristics
  - Behavior when the log is full
- Configuring the logging of tags
  For every log tag, specify a data log in which the values of the connected tags and other information are logged, such as the time of logging.
  When and how often the values of a log tag are logged are also defined. You have the following options:
  - "On demand":
    The tag values are logged by calling the "LogTag" system function.
  - "On change":
    The tag values are logged as soon as the HMI device detects a change in the value of the tag.
  - "Cyclic":
    The tag values are logged at regular intervals. You can supplement the default cycles in WinCC with your own cycles based on the default cycles. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
    You can also restrict the logging of values within or outside a tolerance band. In this way, the logging of values within a relevant range of values is restricted.

  Note the following points if you want to log a tag on demand:
  - Do not log this type of tag in a segmented circular log in which tags are logged in a continuous cycle or in response to changes.

  Background:
  - If logging takes place on demand only rarely, the log segment will be filled by cyclically-logged values, for example, and the next log segment will be created. If you then attempt to access the tag that was logged on demand, it will not be possible to display the tag since it is the current log segment that is accessed in Runtime. To remedy this, you should create a separate data log for tags that are logged only rarely.
- Further processing logged tag values
  You can analyze the logged tag values directly in your project, such as in a trend view, or in another user program, such as Excel.

Configuring a checksum for a log (Page 5374)
Evaluating the checksum of log data (Page 5376)

Creating a data log (Basic Panels, Panels, RT Advanced)

Introduction

Data logs are used to store values from external and internal tags in runtime. When you create a log, you must give it a name and define its size and storage location. In addition you can enter comments for each log.

Requirement

- A project is open.
- The Inspector window is open.

Procedure

To create a data log, proceed as follows:

1. Double-click on the "Historical Data" entry in the project tree.
   The editor for data logs and alarm logs opens.
2. Open the "Data logs" tab and double-click "Add" in the "Name" column of the "Data logs" editor.
   A new data log is created.
3. In the Inspector window select "Properties > Properties > General."
4. Enter a unique name for the log in the "Name" field.
5. Define the number of data records to be logged in each log in the "Number of data records per log" field.
   The size of a log is calculated as follows: The number of items * the length of each tag value to be logged.
   In the Inspector window, the maximum size that the log can reach if the currently selected number of data records is observed is displayed beneath the "Number of data records" input field.
6. In the "Storage location" field you select where the log entries are saved.
7. Depending on the selected "Storage location", you either select the "Path" or the "Name of the data source".
8. If necessary, enter a descriptive text in the "Comment" category to document your configuration.

Alternatively you can configure log properties directly in the "Data log" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

The data log is created.

You can now configure tags so that their values are stored in this log.

To continue the log configuration, perform the following steps:

- Define the restart characteristics of the log when Runtime is started.
- Define how the log should behave when it is full.
- Configure a function list for the "Overflow" event.

See also

Logging Tags (Page 5365)

Managing logging behavior when Runtime starts (Basic Panels, Panels, RT Advanced)

Introduction

When you configure a log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Historical Data" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior".
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.
   You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
   - The logged values are deleted and logging is started again with the option "Reset log".
   - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Historical Data" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

Logging will start in runtime according to your settings.

Controlling the Logging in relation to the Fill Level (Basic Panels, Panels, RT Advanced)

Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

Logging methods

The following logging methods are available:

- Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
- Segmented circular log
  In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
- Log that sends a system alarm when it is full
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
- Log with level-dependent triggering of an event.
  When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.
  The following system functions are available for further processing of full logs: For further details, refer to System functions for logs (Page 5373).

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

1. Select the log for which you want to define the logging method in the "Historical Data" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments.
   If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered.
   If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Historical Data" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

Result

The selected log responds according to the settings in Runtime.

Logging Tags (Page 5365)

System functions for logs (Page 5373)

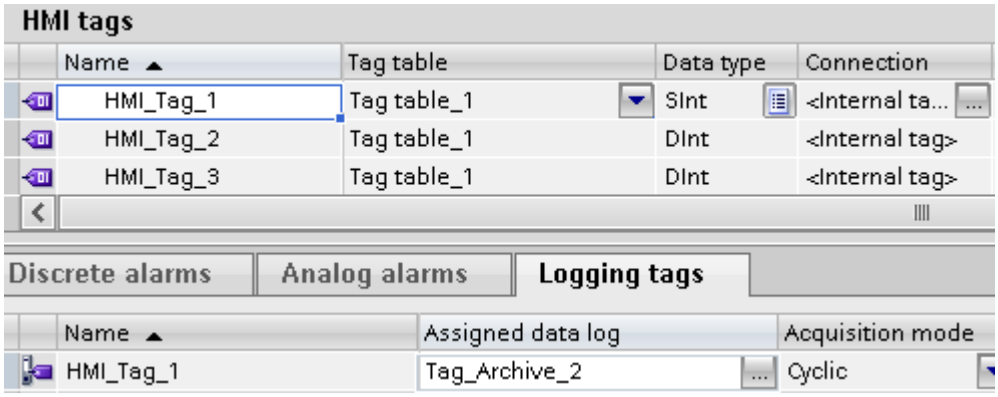
Logging process values (Basic Panels, Panels, RT Advanced)

Introduction

You can save the process values of a tag in a data log in Runtime. You define the following conditions for logging a tag:

- The log tag, through which the values of the connected tag are logged.
- In which log the values are stored
- The conditions under which the values are stored
- If only process values for a certain range of values are stored

To log the tag values, assign a logging tag to an HMI tag. The logging tag is stored in the data log and logs the values of the connected HMI tag. You can configure logging tags directly in the "HMI tags" editor. The " HMI tags" editor contains the "Logging tags" editing table.



If the view of the "Logging tags" table is minimized, click the arrow button below the tag table.

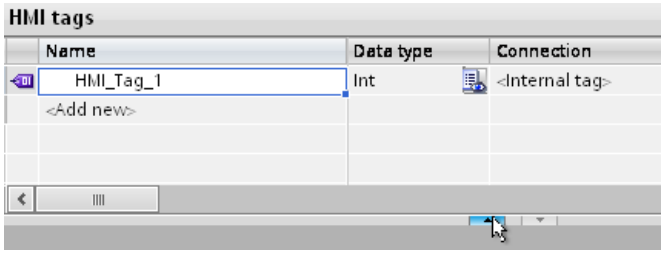


Figure 12-3 The "Logging tags" table is displayed.

Requirement

- The data log has been created.
- The tag for which you wish to configure the logging must already exist.
- The "Tags" editor is open.
- The "Logging tags" table is displayed.
- The Inspector window with the tag properties is open.

Procedure

To log process values in a tag, proceed as follows:

1. Select a tag in the tag table.
2. Double-click "Add" in the "Name" field in the "Logging tags" table.
   A new logging tag is created; it is given the same name as the associated HMI tag.
3. Select the data log in which the values of the tags are to be logged under "Properties > Properties > General" in the Inspector window.

4. Select "Properties > Properties > Logging type" in the Inspector window and select the log type for logging.
   - "Cyclic": The tag values are logged in accordance with the set logging cycle.
   - "On change": The tag values are logged, as soon as the operator device detects a change in value.
   - "On demand": The tag values are logged by calling the "LogTag" system function.
5. If you want to log tag values cyclically, select a cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
6. If you only want to log tag values outside or inside a defined value range, select "Properties > Properties > Deadband for logging" in the Inspector window. Define the values for the high and low limits.
   If you want to configure a dynamic limit, select "HMI tag" using the selection button. In the second field, select the tag that contains the limit.
   If you want to configure a fixed limit, select "Constant." Enter the limit value in the second field.
   If you want to leave a limit undefined, select "None".
7. Under "Scope", specify whether tag values are to be logged only if they are within the defined limits or only if they are outside the defined limits.

Alternatively, you can configure the logging of a tag directly in the "Logging tags" editor table. To view hidden columns, activate the column titles using the shortcut menu.

You can also fully configure a logging tag in the "Historical Data" editor.

Result

The process values of the configured tag are logged in Runtime according to the selected settings.

Note

To have the tag values actually logged in runtime, you must ensure that the data log is started. Logging can be started automatically at start up or by means of a system function. To automatically start the log, use the setting in the log Properties window.

Logging Tags (Page 5365)

Triggering a system function when log is full (Basic Panels, Panels, RT Advanced)

Introduction

You can select a logging method that executes a function list as soon as the log is full.

Application example

You can use system functions, for example, to swap the data from a full log file out to another log before the full log is overwritten. You can then continue to process the transferred data in another program. Assign the "CopyLog" system function to the "Overflow" event accordingly.

Requirement

- A log with the "Trigger event" logging method is created.
- The "Data log" editor is open.
- The Inspector window with the data log properties is open.

Procedure

To configure a system function for the "Overflow" event, proceed as follows:

1. Select the required log in the table in the "Data Log" editor.
2. In the Inspector window select "Properties > Events > Overflow."
   The function list will open.
3. Double-click "Add function" and select the desired system function.
4. Configure the required parameters of the selected system function.

Result

During runtime, the function list will be executed as soon as the log is full.

Logging Tags (Page 5365)

System functions for logs (Basic Panels, Panels, RT Advanced)

System functions

The following system functions are available for logging:

Function name	How it works
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function if you want to move the Audit Trail, for example, from a local storage medium to the server. With Audit Trails, always use the "Move log (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.

Function name	How it works
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the log segment that has been configured for the given log.
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is restored.
CopyLog	Copies the contents of the specified log to another log.

Configuring a checksum for a log (Basic Panels, Panels, RT Advanced)

Introduction

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

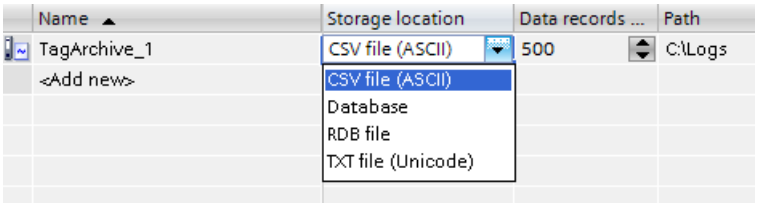
Requirements

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

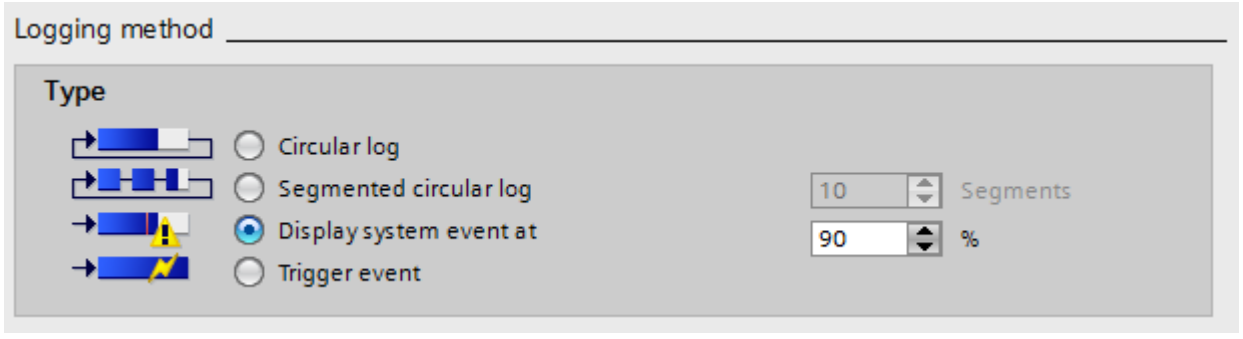
Procedure

Proceed as follows to configure a data log or alarm log for the use of a checksum:

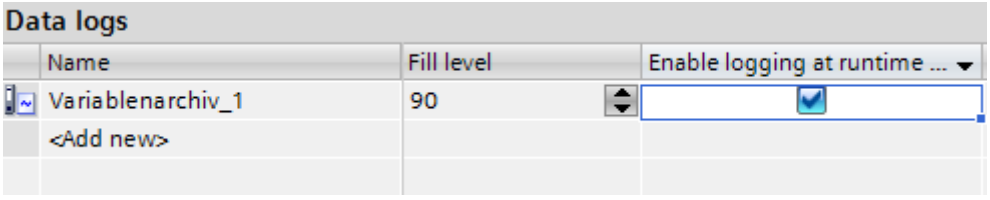
1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".



3. Under "Properties > Properties > Logging method" in the Inspector window, select the option "Display system event at" or "Trigger event".



4. In the editor table, activate the option "Enable checksum".
5. In the editor table, activate the option "Enable logging at runtime start".
   Columns that are not displayed are activated with the shortcut menu of the column title.



6. Save the project.

Result

The log data of the log is assigned a checksum in runtime.

Logging Tags (Page 5365)

Evaluating the checksum of log data (Page 5376)

Evaluating the checksum of log data (Basic Panels, Panels, RT Advanced)

Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens \Automation WinCC Runtime Advanced>.

Note

Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

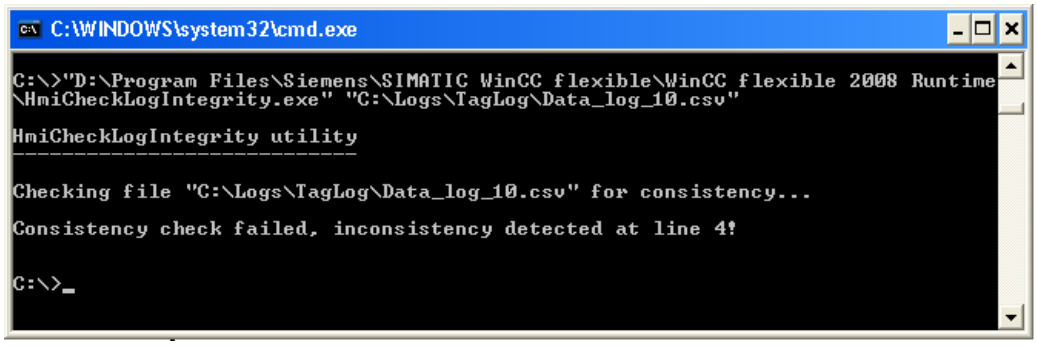
Make sure that the logs are started at a defined state with the new version.

Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.

4. Press <Enter>.
5. The check is performed.
   When the checked data are consistent, the "Consistency check succeeded" message appears.

   When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.



Note

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

You can also check the integrity of the log data with the AuditViewer.

Configuring a checksum for a log (Page 5374)

Log response to language switching in runtime (Basic Panels, Panels, RT Advanced)

Introduction

In the "Device Settings" editor, select the language to be used for writing to logs in runtime.

Requirements

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)" .

Procedure

1. Open the "Languages and fonts" editor.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".
3. Set the "Language switch order":
   - German 0
   - English 1
     With "0", German is specified as the "Startup language".
4. Open the "Device settings" editor.
5. Select "Startup language" in the "Settings for Runtime" area.

Result

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

Direct access to the ODBC log database (Advanced) (Panels, RT Advanced)

Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

Setting up the ODBC data source (Panels, RT Advanced)

Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

Requirement

- A log database has been created.
  You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)".
   The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".
3. Select the "SQL-Server and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".
7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

Logging tags in the "Historical Data" editor (Basic Panels, Panels, RT Advanced)

Configuring logging tags (Basic Panels, Panels, RT Advanced)

Introduction

You can also create and edit logging tags in the "Historical Data" editor in WinCC. You also directly edit the properties of logging tags in the "Historical Data" editor.

Note

If you delete, move or copy in the "Historical Data" editor, the changes also take effect in the tag table.

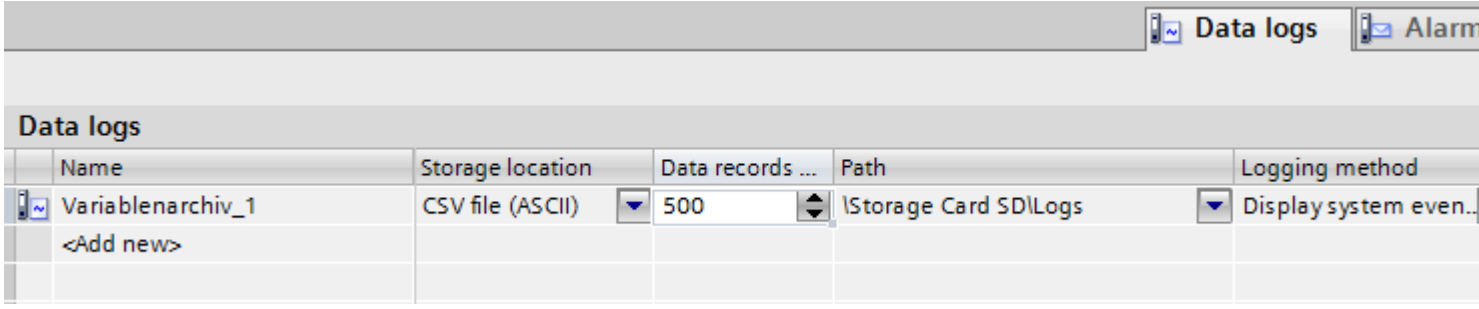
Requirement

- The "Data logs" tab is open in the "Historical Data" editor.
- A data log has been created.

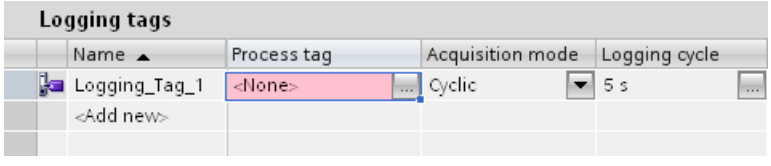
Procedure

Proceed as follows to configure a logging tag in the "Historical Data" editor:

1. Select an existing data log in the "Data logs" table of the editor.
   Alternatively, double-click on "Add..." in the "Name" column to create a new data log.

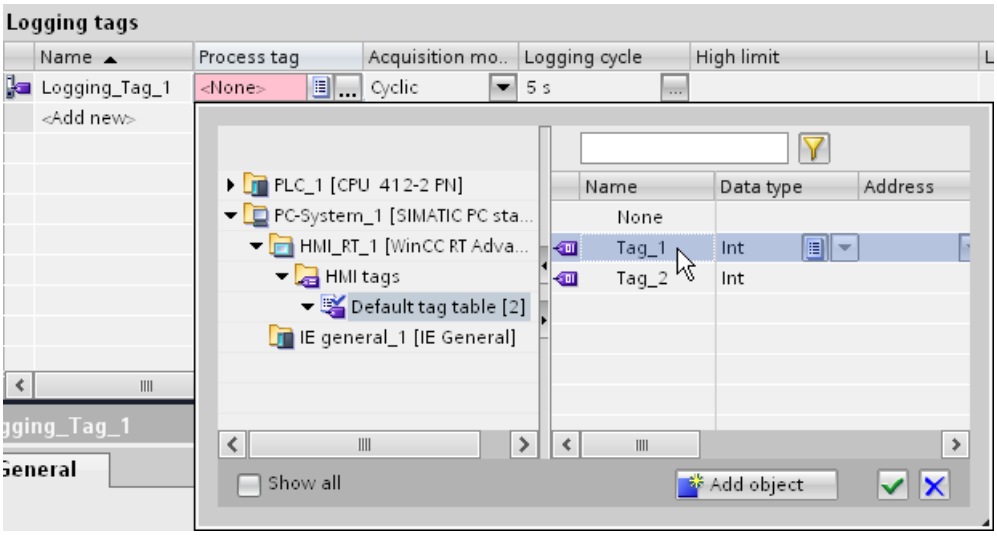


2. Double-click "Add ..." in the "Name" column of the editor "Logging tags" table.



3. Enter a unique name for the logging tag in the "Name" field.

4. In the "Process tag" field, click on the selection button and select the process tag for logging in the object list.



5. Select the desired trigger mode in the "Log type" field:
   - "Cyclic": The tag values are logged in accordance with the set logging cycle.
   - "On change": The tag values are logged, as soon as the operator device detects a change in value.
   - "On demand": The tag values are logged by calling the "LogTag" system function.
6. If you want to log tag values cyclically, select the desired cycle time in the "Logging cycle" area. Alternatively, you can define your own cycle using the object list. The smallest value that can be set is 1 s. All other values are integer multiples of this value.
7. Configure additional parameters for logging in the table of the editor or in the Inspector window.

Result

The configured logging tag is created in the "Historical Data" editor and is also displayed in the tag table.

12.2.7 Displaying Tags (Basic Panels, Panels, RT Advanced)

12.2.7.1 Displaying tags with Basic Panels (Basic Panels)

Outputting tag values in screens (Basic) (Basic Panels)

Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. A trend is a graphic representation of the values that a tag takes during runtime. Use the "Trend display" graphic object to represent it. Process values for the trend display are loaded by the PLC from the ongoing process.

The values to be displayed are determined individually within a fixed, configurable cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

You can control the updating of the trend display by defining the cycle time.

See also

Configuring trend display for values from the PLC (Basic) (Page 5382)

Basics of tags (Page 5304)

Configuring trend display for values from the PLC (Basic) (Basic Panels)

Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

Requirement

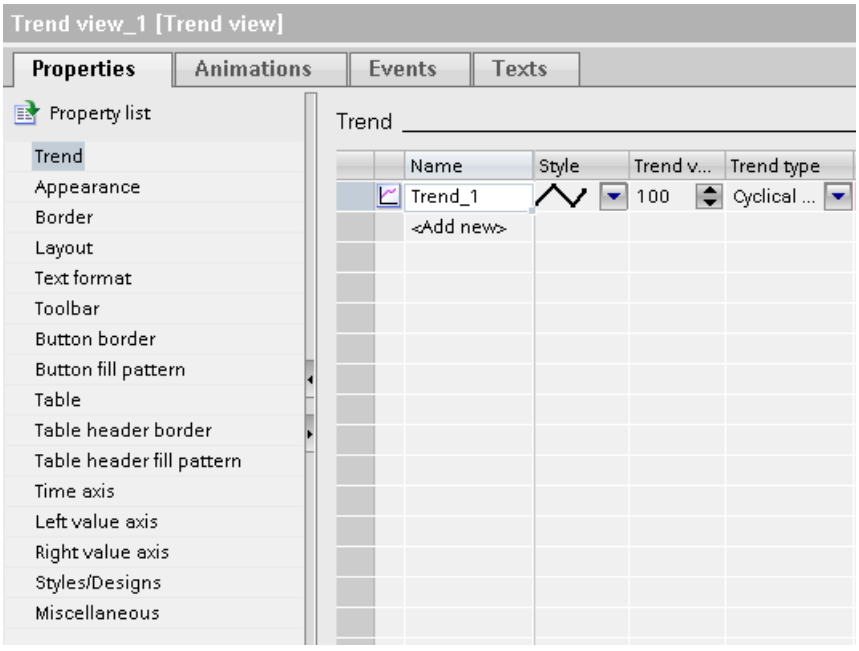
- A screen is open.
- The Inspector window with the trend view properties is open.

Procedure

To configure a trend view, follow these steps:

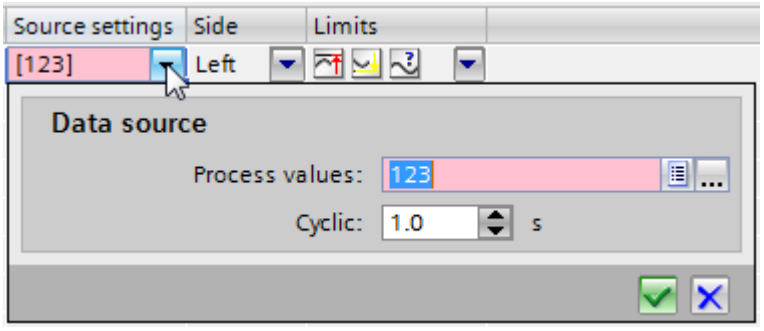
1. Add the "Trend view" object from the toolbox in the "Control" group to the screen.

2. Select the "Trend" category from the "Properties" group in the Inspector window and double-click "<Add>" in the "Name" column.



3. Assign a name to the trend in the "Name" column.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

6. In the "Settings" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values.
   Specify the cycle for reading the tags from the PLC.



7. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You set the column width and the position of the columns in the table header of the values table in active mode. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the values of the selected tags are displayed in the configured trend view.

See also

Outputting tag values in screens (Basic) (Page 5382)

12.2.7.2 Displaying tags with Runtime Advanced and Panels (Basic Panels, Panels, RT Advanced)

Trends (Basic Panels, Panels, RT Advanced)

Introduction

A trend is a graphic representation of the values that a tag takes during runtime. In order to display trends, configure a trend view in a screen of your project.

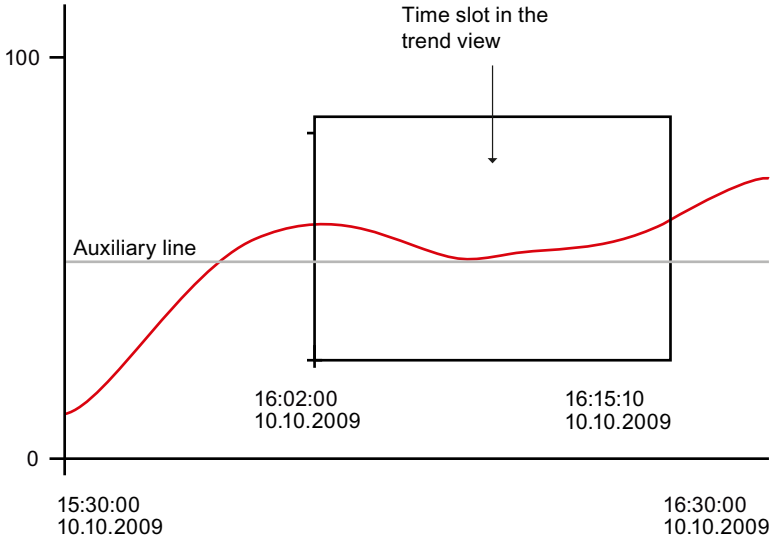
To configure the trend view, specify a trend type for the values to be displayed.

- Log: For displaying the logged values of a tag
- Cyclical real time: For time-triggered display of values

- Bit-triggered real time: For event-triggered display of values
- Bit-triggered buffer: For event-triggered display with buffered data acquisition

Displaying logged values

In Runtime, the trend view displays the values of a tag from a data log. The trend shows the logged values in a particular window in time. The operator can move the time window in Runtime to view the desired information from the log.



Pulse-triggered trends

The values to be displayed are determined individually with a definable time pattern. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.

Bit-triggered trends

The values to be displayed are event-driven by setting a defined bit in "Trend transfer" tags. The bit is reset after reading has been completed. Bit-triggered trends are useful for displaying fast-changing values, such as the injection pressure for producing plastic parts.

Bit-triggered trends with buffered data acquisition

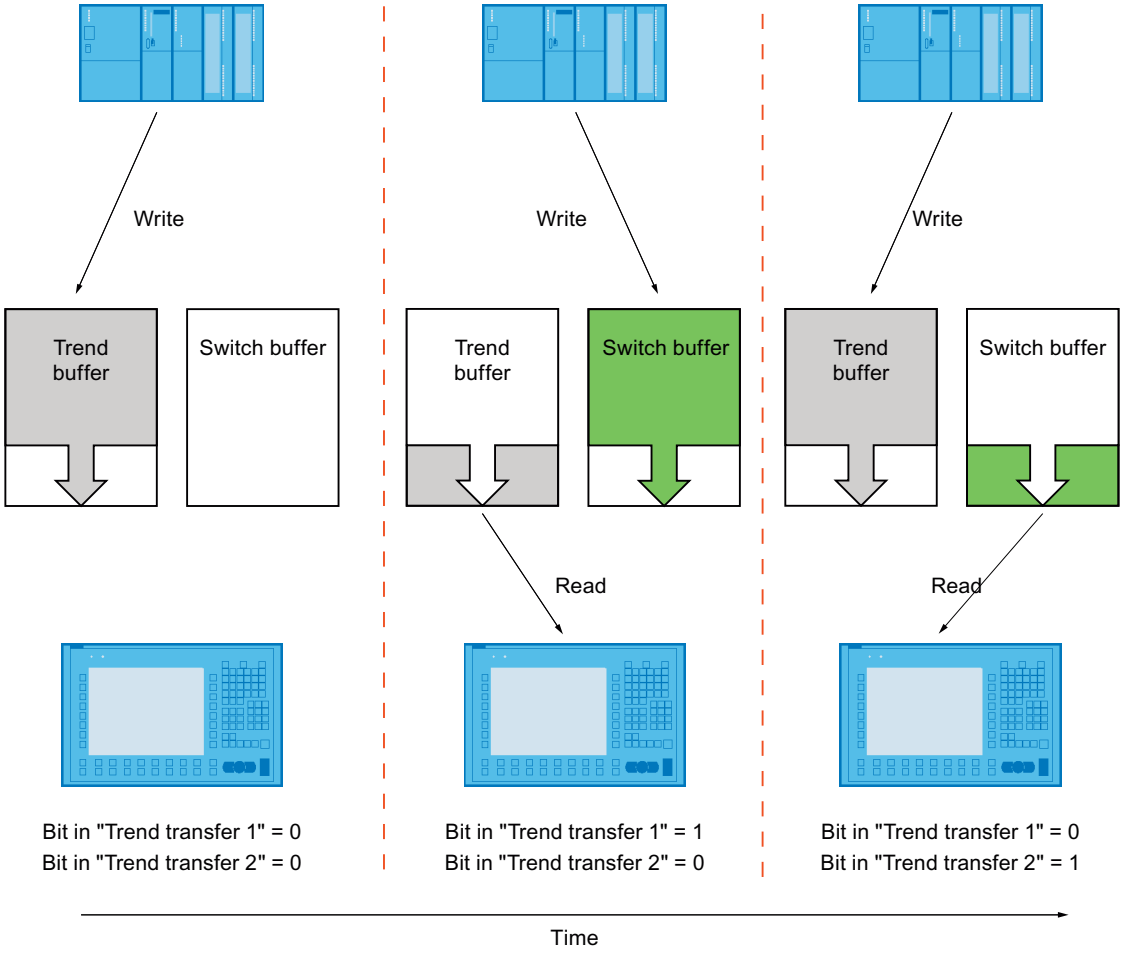
When you set buffered data acquisition, the values to be displayed are buffered in the PLC and read in bit-triggered as a block. These trends are suitable for displaying rapid changes when the course of the trend as a whole is interesting and not so much the individual values.

You configure a switch buffer in the PLC so it can continue to write the new values while the trend buffer is being read. The switch buffer ensures that the PLC does not overwrite values while the operator devices reads the values for the trend.

The switch between the trend buffer and the switch buffer functions as follows:

Whenever the bit assigned to the trend is set in the "Trend transfer 1" tag, all the values are read simultaneously from the trend buffer and are displayed as a trend on the HMI device. The bit in "Trend Transfer 1" is reset after reading has been completed.

While the operator device is reading the tag values from the trend buffer, the PLC writes the new tag values into the switch buffer. When the bit which is assigned to the trend is set in the "Trend transfer 2" tag , all the trend values are read from the switch buffer and displayed at the operator device. While the operating device is reading the switch buffer, the PLC writes again to the trend buffer.



Outputting tag values in screens (Basic Panels, Panels, RT Advanced)

Introduction

In runtime you can output tag values in the screens of the operator device in the form of a trend. The process values are loaded by the PLC from the current process or from a log database.

Displayed values

You will need to configure a trend view in a screen so that tag values are displayed on the HMI device. When configuring the trend view, specify which tag values are to be displayed.

The following options are available:

- Current values from the PLC
  Writing of the trend is continued with individual values from the PLC. The following trigger types are available for display in real time:
  - Bit-triggered real time: The time of the update can be controlled by setting a bit. Bit-triggered trends are normally used to visualize rapidly changing values. One example might be the injection pressure in the production of plastic parts.
  - Cyclical real time: You control the update time with a cycle. Cyclically-triggered trends are suitable for representing continuous curves, such as the changes in the operating temperature of a motor.
  - Bit-triggered buffer: The trend contains values that were stored in a buffer in the period between two reads from the PLC. Use this format pattern if the course of the trend as a whole is more interesting than the individual values.
- Logged tag values
  In runtime, the trend view displays the values of a tag from a data log. The following trigger type is available to display logged tag values:
  - Data log: The trend shows the logged values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

Configuring trend displays for values from the PLC (Basic Panels, Panels, RT Advanced)

Introduction

You use a trend view to graphically represent values that a tag assumes during the process.

Requirement

- A screen is open.

Procedure

To configure a trend view, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. Select the number of trend values in the "Trend values" column.

6. In the "Trend type" column, select the required trend type. The following entries are available:
   - "Bit-triggered real time"
   - "Cyclical real time"
   - "Bit-triggered buffer"
   - "Data log"
7. In the "Settings source" column, use the selection button to open the "Data source" dialog and select the tags to supply the trend with values.
   If you selected the "Cyclical real time" trend type, specify a cycle for reading the tags from the PLC.
   Only for bit-triggered trends:
   - Under "Bit", specify which bit of the "Trend request" tag and of the "Trend transfer" tags are to be assigned to the trend. Select a different value for each trend.
   - Enter a tag under "Trend request" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies which trend is currently being displayed at the operator device.

   Only for the trend type "Bit-triggered real time":
   - Enter a tag under "Trend transfer" which contains at least as many bits as trends are to be displayed in the trend view. The status of the bits of these tags specifies for which trend values are to be read from the PLC.

   Only for the trend type "Bit-triggered buffer":
   - Enter a buffer tag for the switch buffer. The tags have to be of the same type and of the same length as the trend tag.
   - Enter a tag each under "Trend transfer 1" and "Trend transfer 2" which contains at least as many bits as trends are to be displayed in the trend view. The status of these tag bits specifies the trend for which values will be read from the PLC. "Trend transfer 1" controls reading from the trend buffer; "Trend transfer 2" controls reading from the switch buffer.
8. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the values of the selected tags are displayed in the configured trend view.

Configuring a trend view for a data log (Basic Panels, Panels, RT Advanced)

Introduction

You can use a trend view to display logged tag values in Runtime. The trend view shows the logged tag values in a particular window in time. To obtain the requested information from the archive, the operator uses the corresponding operator controls in the screen or in the trend view.

Application example

At the end of a shift, for example, an operator wants information about the process carried out during the shift.

Requirement

- A data log has been created.
- A screen is open.
- The Inspector window with the trend view properties is open.

Procedure

To configure a trend view to display values from a data log, follow these steps:

1. Add the "Trend view" object from the toolbox in the "Controls" group to the screen.
2. Select "Properties . Properties > Trend" in the Inspector window and double-click "Add" in the "Name" field. A new trend is created.
3. If required, enter a unique name for the trend in the "Name" field.
4. In the "Style" column, use the selection button to open the "Style" dialog and select the style of the line.
5. In the "Trend type" column, select the trend type "Data log".
6. In the "Settings" column, use the selection button to open the "Data source" dialog; select the data log and the tags to supply the trend with values.
7. You can make other settings in the dialogs of the Inspector window. For example, you can select the "Display table" option in the "Table" category to display a value table beneath the trend view.

Note

If you hold down the <CTRL> key and double-click the trend view, the trend view is activated. You can set the column width and the position of the columns in active mode in the values table. In order to activate the trend view the zoom factor has to be set to 100 %.

Result

In runtime, the logged values of the selected tags are displayed in the configured trend view.

Representing path trends in the trend view (Page 5392)

The structure of a *.CSV file with tags (Basic Panels, Panels, RT Advanced)

Introduction

In the *.csv (comma-separated value) file format, the "Name" and "Value" table columns of the entry are separated by semicolons. Each table row ends with a line break.

Example of a *.CSV file

The example shows a file with logged tag values:

"VarName";"TimeString";"VarValue";"Validity";"Time_ms"

"Var_107";"01.04.98 11:02:52";66,00;1;35886460322,81

"Var_108";"01.04.98 11:02:55 AM";60.00;1;35886460358.73

"Var_109";"01.04.98 11:02:57 AM";59.00;1;35886460381.22

Structure of a log file in *.csv format

The following values are entered in the individual columns of a log file:

Parameters	Description
VarName	Name of the tag from WinCC
Time string	Time stamp as a STRING, e.g. readable data format
VarValue	Value of the tag
Validity	Validity: 1 = value is valid 0 = an error occurred (e.g. interrupted connection)
Time_ms	Specify a time stamp as a decimal value (see below for conversion). Only needed to display the tag values in a trend.

Conversion of the time stamp decimal value

If the value needs to be processed using a different program, proceed as follows:

1. Divide Time_ms by 1,000,000.
   Example: : 36343476928:1 000 000 = 36343,476928
2. The whole number portion (36344) is the date calculated from 31.12.1899.
   Example: 36343 results in 02.07.1999
   You can now convert the time stamp value to days in Excel by assigning a corresponding format from the "Date" group to the cells, which contain the time stamp.
   Result: 37986 results in 31.12.2003
3. The value after the comma (0,476928) indicates the time:
   - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
   - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
   - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).

   Result 11:26:46.579
   This conversion is supported by Microsoft Excel, for example.

Representing path trends in the trend view (Page 5392)

Accessing the ODBC log database directly (Basic Panels, Panels, RT Advanced)

Introduction

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database you want to use in WinCC from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

To store log data, specify the DSN, rather than a directory name during configuration. With the DSN, you are referencing the database and the storage location.

Application

The entire functional scope of the database is available for additional processing and evaluation of log data.

Principle

The data source establishes the connection to the database. You create the data source on the same computer that contains the Runtime software. Then enter the DSN configured here when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

With the "StartProgram" system function, you can also configure a program call (to MS Access, for example) on the HMI device. This does not interrupt Runtime.

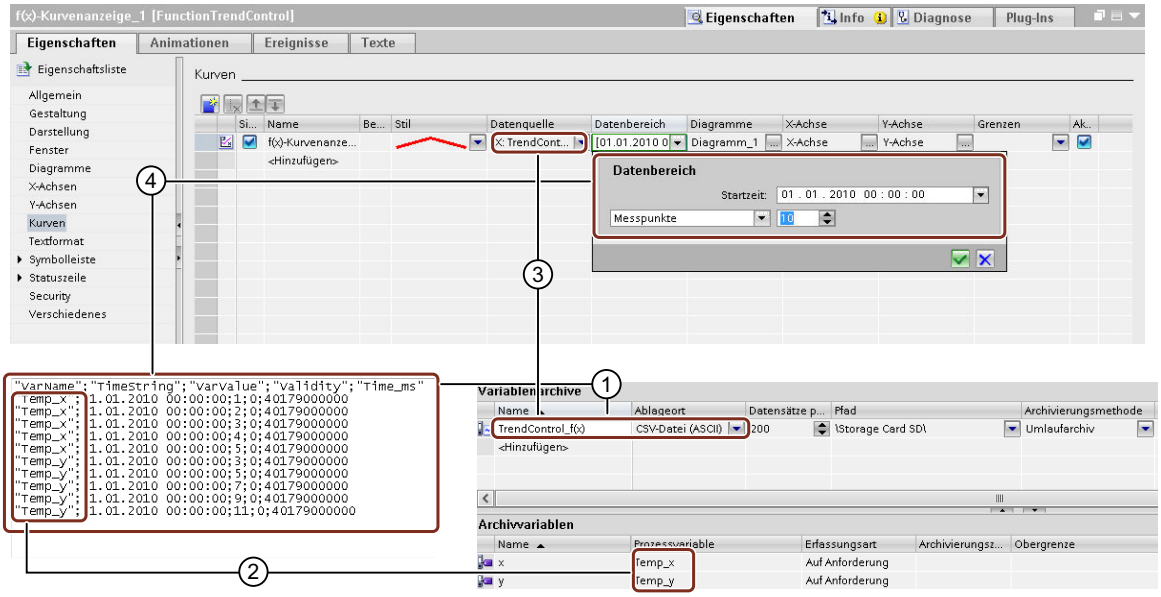
Representing path trends in the trend view (Basic Panels, Panels, RT Advanced)

Introduction

To visualize two-dimensional traverse paths of a machine prior to execution, for example, you can use the f(x) trend view.

Implementation

The basis for the implementation is a data log in which the coordinates are saved with an identical time stamp. The following figure shows the components involved:



① The basis for representation of value pairs in the f(x) trend view is a data log archive that reads the calculated value pairs from a CSV file. The time stamps of each value pair are identical, for example, "01/01/2010 00:00:00".

② The data records in the CSV file contain the logging tags with the calculated values. You can calculate the values in the PLC, for example, and store them in two data blocks. Then you can use a VB script, for example, to create the CSV file.

③ The data source for the trend is the data log.

④ The following settings are relevant for the configuration of the data area:

- The time range must exactly match the time stamps from the CSV file
- The number of "measuring points" must exactly match the number of data records in the CSV file.

VB script for creating a CSV file

The following VB script generates "Input_X" and "Input_Y" from the values of the HMI tags. The HMI tags have the "Array (0..10) of Real" data type.

```
'#############################################################################
' Location of date log and name of data log which are used in f(x) control
Dim ObjFileName, ObjFilePath

' Name of data log
ObjFileName = "TrendControl_f(x)0.csv"

' File location for data log
ObjFilePath = "\Storage Card SD\"

'#############################################################################
' create objects to edit files and use file system
Dim ObjFile, ObjFileSystem
Set ObjFile = CreateObject("FileCtl.File")
Set ObjFileSystem = CreateObject("FileCtl.Filesystem")

'#############################################################################
' Write header into the new data log
ObjFile.LinePrint(Chr(34)&"VarName"&Chr(34)&";"&Chr(34)&"TimeString"&Chr(34)&";"&Chr(34)&"
VarValue"&Chr(34)&";"&Chr(34)&"Validity"&Chr(34)&";"&Chr(34)&"Time_ms"&Chr(34))
If Err.Number <> 0 Then
    ShowSystemAlarm "Error: Cannot write to data log. " & Err.Number & " " & Err.Description
    Err.Clear
    OpenAllLogs
    TrendControl = 3
    Exit Function
End If
'#############################################################################
' Write entries into data log
' Adapt loop counter to length of archive and array of data tag
Dim ObjLoopCount
ObjLoopCount = 10 ' last element of array

Dim ObjIndex, ObjTime, ObjTimeStamp

For ObjIndex = 0 To ObjLoopCount
    ' Calculate time stamp
    ' 40179000000 = 01.01.2010 00:00:00
    ObjTime = ObjIndex/(60*60*24)*1000
    ObjTimeStamp = 40179000000 + ObjTime
    ' Write x element to log
    Dim Objx
    Objx = SmartTags("Input_X")(ObjIndex)
    ObjFile.LinePrint(Chr(34)&"Temp_x"&Chr(34)&";"&Chr(34)&"01.01.2010
00:00:00"&Chr(34)&";"&Objx&";1;"&ObjTimeStamp)
   ' Write y element to log
    Dim Objy
    Objy = SmartTags("Input_Y")(ObjIndex)
    ObjFile.LinePrint(Chr(34)&"Temp_y"&Chr(34)&";"&Chr(34)&"01.01.2010
00:00:00"&Chr(34)&";"&Objy&";1;"&ObjTimeStamp)
Next
' Write line counter to log
Dim ObjLineCount
ObjLineCount = 41
ObjFile.LinePrint(Chr(34)&"$RT_COUNT$"&Chr(34)&";"&ObjLineCount&";;;;")
```

```
'#########################################################################
' Close new log
ObjFile.close
Set ObjFile = Nothing
Set ObjFileSystem = Nothing

12.3 Working with alarms

12.3.1 Basics

12.3.1.1 Alarm Logging in WinCC (Basic Panels)

Introduction

The alarm system allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

No.	Time	Date	Alarm text	Status	Alarm class
5	12:50:24 :590	24.02. 2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

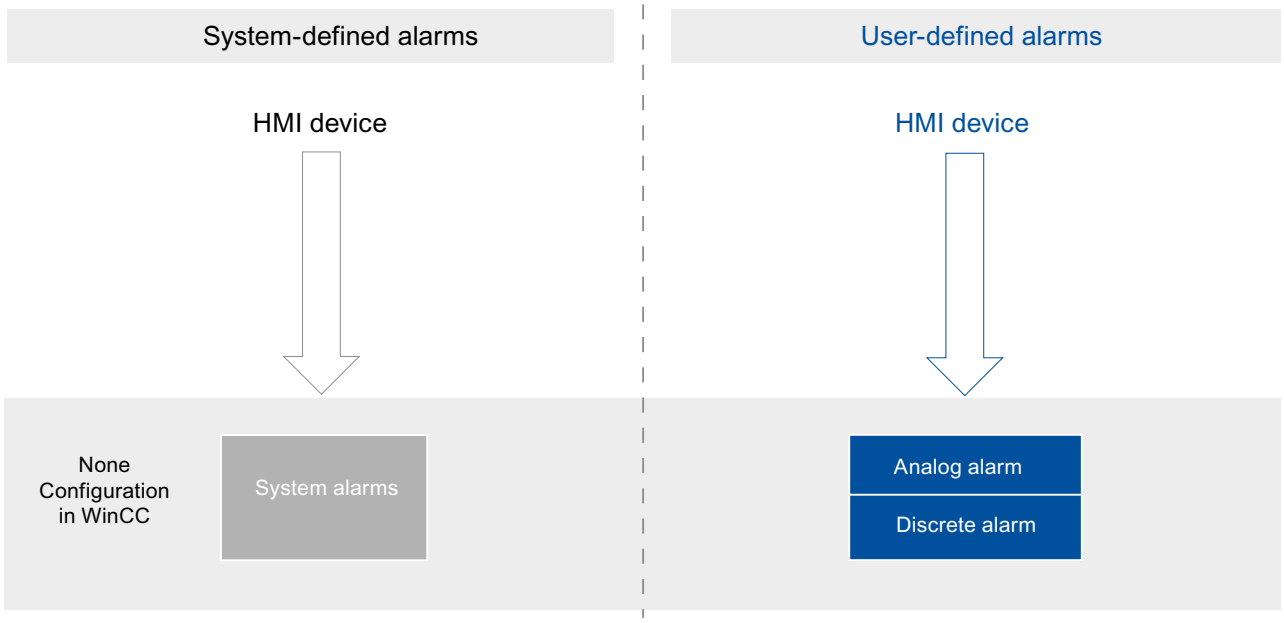
Alarm system in WinCC

The alarm system processes a variety of alarm types. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms are used to monitor the plant process.
- System-defined alarms monitor the HMI device.

The detected alarm events are displayed on the HMI device. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The following figure shows the alarm system structure:



12.3.1.2 Alarm Logging in WinCC (Panels, RT Advanced)

Introduction

Alarm logging allows you to display and record operating states and faults on the HMI device that are present or occur in a plant.

An alarm may have the following content:

No.	Time of day	Date	Alarm text	Status	Alarm class
5	12:50:24 :590	24.02. 2007	Boiler pressure above high limit.	Incoming Outgoing	Warning: Color Red

Alarm Logging in WinCC

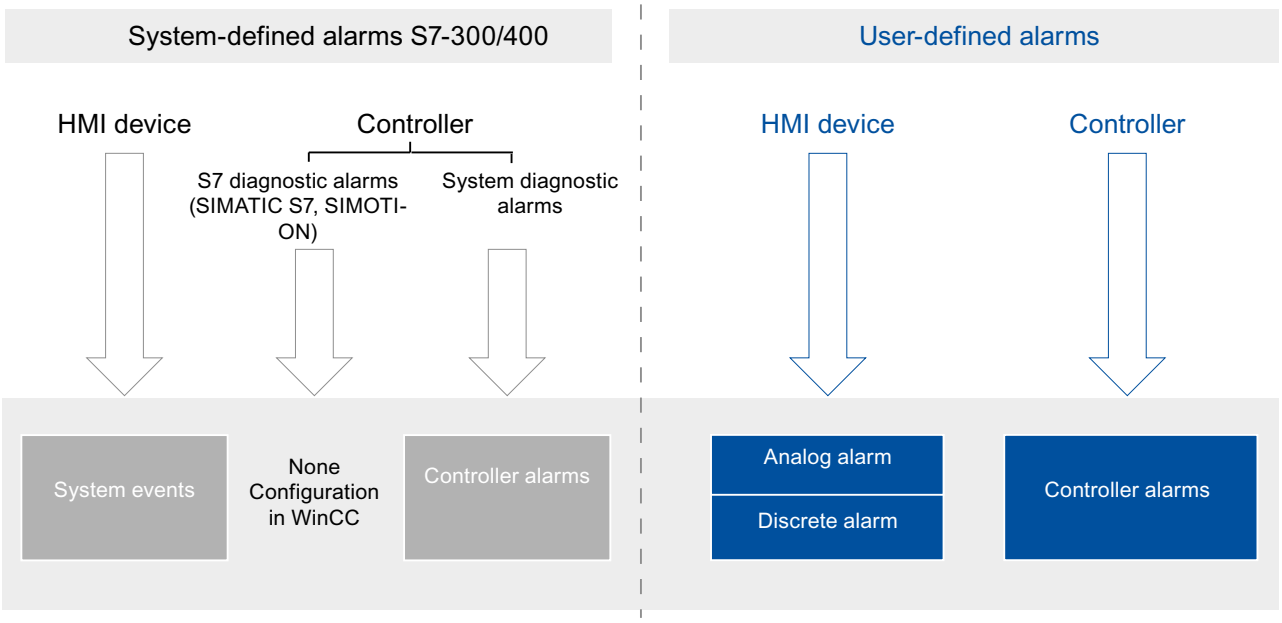
Alarm logging processes various alarm procedures used by the PLC and the HMI device. The alarm procedures can be broken down into system-defined alarms and user-defined alarms:

- User-defined alarms serve to monitor the plant.
- System-defined alarms are used to monitor the HMI device or the PLC.

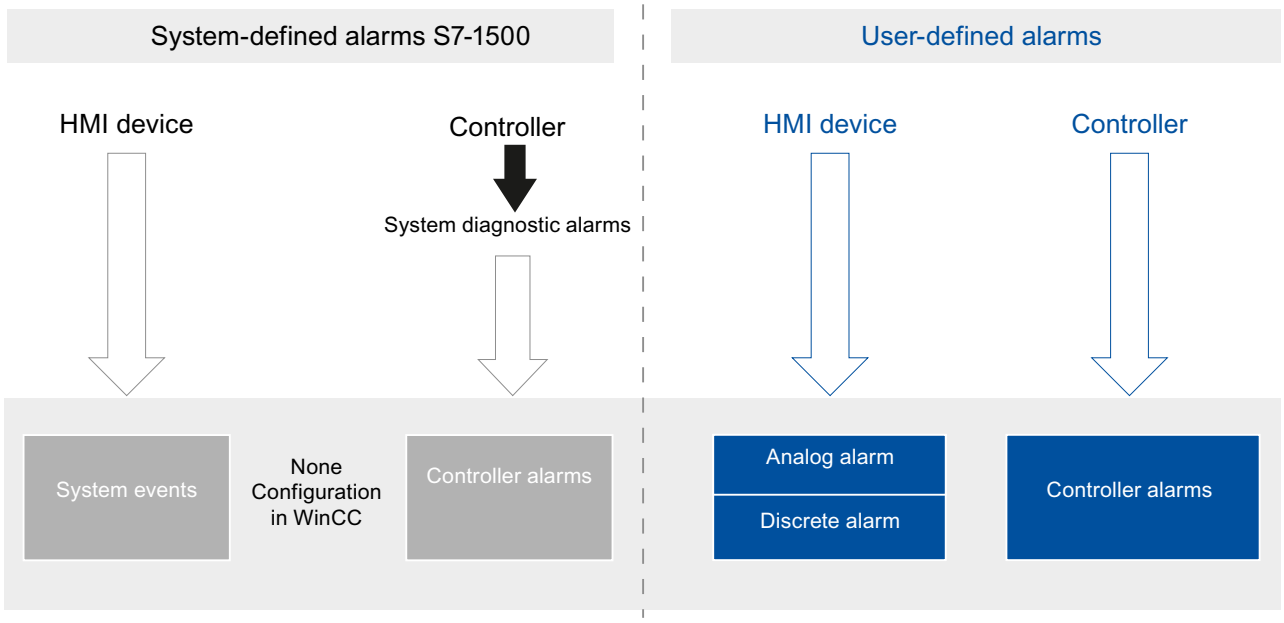
The detected alarm events are displayed on the HMI device. You can use the alarm logging system to log alarms from the ongoing process. Targeted access to the alarms combined with supplementary information about individual alarms ensures that faults are localized and cleared quickly. This reduces stoppages or even prevents them altogether.

The types of system-defined controller alarms depend on the controller used.

The following figure shows the structure of the alarm logging system for communication with the SIMATIC S7-300/400 controllers:



The following figure shows the structure of the alarm logging system for communication with the SIMATIC S7-1500 controllers:



12.3.1.3 Alarm Procedures

Overview of the alarm types (Basic Panels)

Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

Alarm types in WinCC

WinCC supports the following alarm types:

User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.

System-defined alarms

- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

Overview of the alarm types (Panels, RT Advanced)

Introduction

The alarm types serve various purposes for monitoring the plant. The alarms from the individual alarm types are configured and triggered in different ways.

Select the relevant tab in the "HMI alarms" editor to configure alarms based on the individual alarm types.

Alarm types in WinCC

WinCC supports the following alarm types:

User-defined alarms

- **Analog alarms**
  - Analog alarms are used to monitor limit violations.
- **Discrete alarms**
  - Discrete alarms are used to monitor states.
- **Controller alarms**
  - You configure controller alarms in STEP 7.
  - You continue to process the controller alarms in WinCC.

  Note
  Device dependency

  The controller alarm is not supported on all HMI devices.

System-defined alarms

- **System-defined controller alarms**
  - System-defined controller alarms consist of diagnostic alarms (SIMATIC S7) and system errors (SFM)
  - System-defined controller alarms are used to monitor the PLC.

  Note
  Device dependency

  System-defined controller alarms are not supported on all HMI devices.

- **System events**
  - System events belong to the HMI device and are imported into the project.
  - System events monitor the HMI device.

User-defined alarms

Analog alarms

Description

Analog alarms signal limit violations during the process.

Example

The speed of the mixer in a fruit juice mixing plant must not be too high or too low. You can configure analog alarms to monitor the speed of the mixer. If the high or low limit for the speed of the mixer is violated, an alarm is output on the HMI device containing the following alarm text, for example: "Mixer speed is too low".

Discrete alarms

Description

Discrete alarms indicate a status in the current process.

Example

A fruit juice mixing plant consists of several tanks containing the ingredients. To ensure the correct mixing ratio of water, fruit concentrate, sugar, and flavoring, the valves in the intakes open and close at the right moment. This operation should be monitored.

You configure a suitable discrete alarm for all the valve states. If a valve on one of the four tanks opens or closes, an alarm is displayed, such as "Water valve closed".

The operator can thus monitor whether the plant is producing correctly.

PLC alarms (Panels, RT Advanced, RT Professional)

Example of an alarm

CPU operating mode switch to Stop

Description

The configuration engineer creates a custom controller alarm in STEP 7. The PLC status values, such as time stamp and process values, are mapped in the controller alarm. If controller alarms are configured in STEP 7, accept them into the integrated WinCC operation as soon as a connection is established to the PLC.

Note

Automatic update of new or modified controller alarms on the HMI device

When controller alarms are configured in STEP 7 and a connection to an S7-1500 controller with firmware version 2.0 (or later) is established, the controller alarms are sent to the HMI devices of device version V14. After changes of the controller alarms, the HMI device configuration must no longer be transferred.

In STEP 7, the controller alarm is assigned to an alarm class. You can import this alarm class with the controller alarm as a common alarm class.

Types of controller alarms

SIMATIC S7 supports different types of controller alarms. WinCC supports different types of controller alarms according to which Runtime is used.

Controller alarms for multiple HMI devices

If a PLC is connected to multiple HMI devices, the project engineer assigns display classes to the controller alarms in STEP7. The display classes determine the allocation to the HMI device. You can activate the display classes for your HMI device that are to be displayed on it. In this case, only the controller alarms from this display class will be displayed on the HMI device. Up to 17 display classes are possible.

See also

Editing controller alarms (Page 5429)

Sending and automatically updating complete alarm from the controller to the HMI device (Page 5484)

System-defined Alarms

System events (Basic Panels)

Examples for alarms

- "An online connection to the PLC is established."

Description

A system alarm indicates the status of the system, plus communication errors between the HMI device and system.

Under "Runtime settings > Alarms" you specify how long a system alarm is shown on the HMI device.

Support

The reference contains a list of the possible system events, along with the cause and possible remedies. If you contact online support because of a system alarm on the HMI device, you will need the alarm number and tags used in the system alarm.

System events (Panels, RT Advanced, RT Professional)

Examples of alarms

- "Overflow of the buffer for printing lines in text mode"
- "No printer is installed or a default printer has not been set up."

Description

A system event indicates the system status, including errors in the communication between the HMI device and system.

The system events depend on the HMI device.

You can load system events in the "HMI alarms" editor from a an *.xml file.

Support

The reference contains a list of the possible system events, along with the cause and possible remedies. When contacting Online Support because of a system event on the HMI device, you need the event number and tags used in the system event.

System-defined controller alarms (Panels, RT Advanced)

Example of an alarm

Valve open due to overpressure

Description

System-defined controller alarms are installed with STEP 7 and are only available if WinCC is operated in the STEP 7 environment.

WinCC processes system-defined controller alarms of the type "SIMATIC S7 diagnostic alarm".

S7 diagnostic alarms show states and events in the SIMATIC S7 controllers. You only have read access to S7 diagnostic alarms.

- The system assigns the alarms to the "Diagnostics" alarm class.
- The available properties of the alarm, for example, the number of the alarm group, are accepted without changes.
- S7 diagnostic alarms are not acknowledged or reported. They are for signaling purposes only.

See also

Enabling system-defined controller alarms (Page 5430)

12.3.1.4 Alarm states

Introduction

An alarm assumes various alarm states in Runtime. The user analyzes and reports on the process execution with reference to the alarm states.

Note

Device dependency

Reporting and logging are not available for all HMI devices.

Description

Every alarm has an alarm status. The alarm states are made up of the following events:

- **Incoming**
  The condition for triggering an alarm is satisfied. The alarm is displayed, such as "Boiler pressure too high".
- **Outgoing**
  The condition for triggering an alarm is no longer satisfied. The alarm is no longer displayed as the boiler was vented.
- **Acknowledge**
  The operator acknowledges the alarm.

Alarms without acknowledgment

The following table shows the alarm states for alarms that do not have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied.
Outgoing	The condition for an alarm is no longer satisfied.

Alarms with acknowledgment

The following table shows the alarm states for alarms that have to be acknowledged:

Status	Description
Incoming	The condition for an alarm is satisfied
Outgoing, not acknowledged	The condition for an alarm is no longer satisfied. The operator has not acknowledged the alarm.
Outgoing, and subsequently acknowledged	The condition for an alarm is no longer satisfied. The operator has acknowledged the alarm after this time.
Incoming, acknowledged	The condition for an alarm is satisfied. The operator has acknowledged the alarm.
Outgoing, but acknowledged first	The condition for an alarm is no longer satisfied. The operator acknowledged the alarm while the condition was still satisfied.

Each occurrence of these states can be displayed and logged on the HMI device and a protocol printed.

Note

The display text for the states of an alarm is language-specific and configuration-specific.

12.3.1.5 Alarm classes

Basics on alarm classes (Basic Panels)

Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

Description

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

Note

The choice of display modes for alarm classes depends on the options on your HMI device.

Examples of how to use alarm classes

- The alarm "Speed of fan 1 in upper tolerance range" has alarm class "Warnings". The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

Using alarm classes

Use the following alarm classes to define the state machines and display of alarms for your project:

- Predefined alarm classes
  You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- Custom alarm classes
  You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of user-defined alarm classes depends on the Runtime used in your project.

Note

Alarm classes from STEP 7

If an HMI device is connected to the controller, alarm classes from STEP 7 will also be displayed in WinCC.

Display of system-defined controller alarms is not supported by Basic panels.

See also

Predefined alarm classes (Page 5407)

Creating alarm classes (Page 5415)

Using project-wide alarm classes (Page 5416)

Basics on alarm classes (Panels, RT Advanced, RT Professional)

Introduction

Many alarms occur in a plant. These are all of different importance. You can assign the alarms of your project to alarm classes to clearly show the user which of the alarms are most important.

Description

The alarm class defines how an alarm is displayed. The alarm class specifies if and how the user has to acknowledge alarms of this alarm class.

A new alarm class with mandatory acknowledgment is generated in WinCC.

Note

The choice of display modes for alarm classes depends on the options on your HMI device.

Examples of how to use alarm classes

- The alarm "Speed of fan 1 in upper tolerance range" has alarm class "Warnings". The alarm is displayed with a white background. The alarm does not have to be acknowledged.
- The alarm "Speed of fan 2 has exceeded upper warning range" is assigned to the "Errors" alarm class. The alarm is displayed with a red background and flashes at high frequency in runtime. The alarm is displayed until the user acknowledges it.

Using alarm classes

Use the following alarm classes to define the state machines and display of alarms for your project:

- Predefined alarm classes
  You cannot delete predefined alarm classes and edit them only to a limited extent. Predefined alarm classes have been created for each HMI device under "HMI alarms > Alarm classes".
- Custom alarm classes
  You can create new alarm classes under "HMI alarms > Alarm classes", configure how you want the alarms to be displayed, and define an acknowledgment model for alarms of this alarm class. The possible number of custom alarm classes depends on which runtime is used in your project.
- Common alarm classes
  Common alarm classes are displayed under "Shared data > Alarm classes" in the project tree and can be used for the alarms of an HMI device. Common alarm classes originate in the alarm configuration of STEP 7. If needed, you can create additional common alarm classes in WinCC.

See also

Predefined alarm classes (Page 5407)

Creating alarm classes (Page 5415)

Using project-wide alarm classes (Page 5416)

Predefined alarm classes

Predefined alarm classes

The following alarm classes already created in WinCC for every HMI device:

Alarm classes for user-defined alarms

- "Warnings"
  The "Warnings" alarm class is designed to show irregular statuses and routines in the process. Users do not acknowledge alarms from this alarm class.
- "Errors"
  The "Errors" alarm class is intended to show critical or dangerous states or limit violations in the process. The user must acknowledge alarms from this alarm class.

Alarm classes for system-defined alarms

- "System"
  The "System" alarm class contains alarms that display states of the HMI device and the PLCs. Alarms of the "System" alarm class belong to the system alarms.
- "Diagnosis Events"
  The "Diagnosis Events" alarm class contains alarms that display states and events in SIMATIC S7 controllers. Users do not acknowledge alarms from this alarm class.

  Note

  Device dependency

  The "Diagnosis Events" alarm class is not available for all HMI devices.

- "Safety Warnings"
  The "Safety Warnings" alarm class contains alarms for fail-safe operation. Users do not acknowledge alarms from this alarm class. Alarms of the "Safety Warnings" alarm class belong to the system alarms.

  Note

  Device dependency

  The "Safety Warnings" alarm class is not available for all HMI devices.

See also

Basics on alarm classes (Page 5406)

Creating alarm classes (Page 5415)

Using project-wide alarm classes (Page 5416)

12.3.1.6 Acknowledgement

Acknowledging alarms

Introduction

To make sure that an alarm was registered by the plant operator, configure this alarm so that it is displayed until acknowledged by the operator. Alarms that display critical or hazardous states in the process have to be acknowledged.

Description

The acknowledgment of an alarm is an event that is logged and reported. Acknowledging an alarm changes the alarm status from "Incoming" to "Acknowledged". When the operator acknowledges an alarm, the operator confirms that he or she has processed the status that triggered the alarm.

Note

HMI device dependency

Reporting and logging are not available for all HMI devices.

Triggering acknowledgment of an alarm

In Runtime, you trigger alarm acknowledgments in various ways:

- Acknowledgement by the authorized user at the HMI device
- Automatic acknowledgment by the system without operator action, e.g. by means of
  - Tags
  - PLC
  - System functions in function lists or scripts

  Note

  HMI device dependency

  Scripts are not available for all HMI devices.

Acknowledging alarms that belong together

To make the alarm system clearer and easier to use in Runtime, you can configure an alarm group. You can acknowledge all alarms belonging to this alarm group in a single pass.

Acknowledgment by the PLC

Discrete alarms will be automatically acknowledged by the PLC, if necessary. The acknowledgment is triggered by a bit in the "Acknowledgment tag PLC". You define the bit and tag at the configuration stage.

Acknowledgment of an alarm on the HMI device

In Runtime, the user acknowledges an alarm in one of the following ways, depending on the configuration:

- Using the acknowledgment button <ACK> on the HMI device
- Using the button in the alarm view
- Using configured function keys or buttons in screens

Note

Acknowledgment button <ACK> on the HMI device

To ensure that critical alarms are processed only by authorized users, protect the "ACK" button on the HMI devices, including the operating controls and display objects of the alarms. Use the appropriate operator authorization for this.

Note

HMI device dependency

The acknowledgement key <ACK> is not available on all HMI devices.

Reaction to the acknowledgment of alarms of an alarm group

- Alarm acknowledgment by the operator
  You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- Alarm acknowledgment by the controller
  The controller sets a tag bit to acknowledge the alarm of an alarm group.
  The respective alarm is acknowledged.

Acknowledgement Model (Basic Panels, Panels, RT Advanced)

Overview

You define the state machines for an alarm class. Alarms that are assigned to this alarm class will be acknowledged on the basis of these state machines. The following state machines are used in WinCC:

- Alarm without acknowledgment
  This alarm comes and goes without having to be acknowledged. There is no visible response from the system.
- Alarm with simple acknowledgment
  This alarm must be acknowledged as soon as the event that triggers the alarm occurs. The alarm remains pending until it is acknowledged.

12.3.1.7 Alarm groups (Basic Panels, Panels, RT Advanced)

Introduction

Many alarms from different areas and processes occur in a plant. You can compile associated alarms into alarm groups.

Alarm groups

You can use the alarm groups to monitor the parts of the plant and to acknowledge the associated alarms together as required.

Alarm groups can contain alarms from different alarm classes. You only assign alarms that require acknowledgment to alarm groups.

Using alarm groups

It is a good idea to compile alarm groups for alarms such as the following:

- Alarms that are caused by the same fault.
- Alarms of the same type
- Alarms from a machine unit, such as "Fault in drive XY"
- Alarms from an associated part of the process, such as "Fault in cooling water supply"

Display in Runtime

In Runtime, the "Alarm group" column displays the number of the alarm group to which the alarm belongs.

See also

Configuring Alarm Groups (Page 5419)

12.3.1.8 Alarm number (Basic Panels, Panels, RT Advanced)

Assigning alarm numbers

The system assigns unique alarm numbers within an alarm type.

Note

When adapting alarm numbers, observe the uniqueness of the alarm number within an alarm type.

12.3.2 Working with Alarms

12.3.2.1 Alarm components and properties

Overview

You configure the components of alarms in WinCC. The following table shows the basic components of alarms:

Alarm class	Alarm number	Time of day	Date	Alarm status	Alarm text	Alarm group	Tooltip	Trigger tag	Limit
Warn-ing	1	11:09 :14	06.08.2 007	IO	Maximum speed reached	2	This alarm is ...	speed_1	27
Sys-tem	110001	11:25 :58	06.08.2 007	I	Switch to "Online" mode	0	This alarm is ...	PLC-Varia-ble_1	–

Alarm class

Alarm classes, such as "Warnings" or "Errors". The alarm class defines the following for an alarm:

- State machine
- Appearance in Runtime (e.g. color)
- Logging

Note

Device dependency

Logging is not available for all HMI devices.

Alarm number

An alarm is identified by a unique alarm number. The alarm number is assigned by the system. You can change the alarm number to a sequential alarm number, if necessary, to identify alarms associated in your project.

Time and date

Every alarm has a time stamp that shows the time and date at which the alarm was triggered.

Alarm status

An alarm has the events "Incoming," "Outgoing," "Acknowledge." For each event, a new alarm is output with the current status of the alarm.

Alarm text

The alarm text describes the cause of the alarm.

The alarm text can contain output fields for current values. The values you can insert depend on the Runtime in use. The value is retained at the time at which the alarm status changes.

Alarm group

The alarm group bundles individual alarms.

Tooltip

You can configure a separate tooltip for each alarm; the user can display this tooltip in Runtime.

Trigger tag

Each alarm is assigned a tag as trigger. The alarm is output when this trigger tag meets the defined condition, e.g. when its state changes or it exceeds a limit.

Limit

Analog alarms indicate limit violations. Depending on the configuration, WinCC outputs the analog alarm as soon as the trigger tag exceeds or undershoots the limit value.

See also

Output of a tag value in the alarm text (Page 5426)

Alarm states (Page 5403)

Basics on alarm classes (Page 5406)

Alarm groups (Page 5411)

12.3.2.2 Configuring Alarms

Overview of alarm configuration tasks (Basic Panels)

Steps to configure alarms

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes
   You use the alarm class to define how an alarm will be displayed in runtime and to define the state machines for it.
2. Creating tags in the "HMI tags" editor
   - Configure the tags for your project.
   - You create range values for the tags.

3. Creating tags in the "HMI alarms " editor
   - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
   - You can also assign system functions or scripts to the alarm events.
4. Output of configured alarms
   To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

1. Creating alarm groups
   You assign the alarms of your project to alarm groups according to their association, such as by the cause of the problem (power failure) or source of the error (Motor 1).
2. Configuring Loop-In-Alarm
   A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

Overview of alarm configuration tasks (Panels, RT Advanced, RT Professional)

Steps to configure alarms

Configuring alarms in WinCC involves the following steps:

1. Edit and create alarm classes
   You use the alarm class to define how an alarm will be displayed in runtime and to define the state machines for it.
2. Creating tags in the "HMI tags" editor
   - Configure the tags for your project.
   - You create range values for the tags.

1. Creating tags in the "HMI alarms " editor
   - Create custom alarms and assign these the tag to be monitored, alarm classes, alarm groups, and other properties.
   - You can also assign system functions or scripts to the alarm events.
2. Output of configured alarms
   To output configured alarms, configure an alarm view or an alarm window in the "Screens" editor.

Additional configuration tasks

Additional tasks may be necessary for configuring alarms, depending on the requirements of your project:

- Activating and editing system events
  You can import system events when you initially open the "System events" tab in the "HMI alarms" editor. On completion of the import, you can edit the system events.
- Activating and editing controller alarms
  For integrated operation of a project in STEP 7, specify the controller alarms to be displayed on your HMI device in the alarm settings.
- Creating alarm groups
  Assign the alarms of your project to alarm groups based on their relation, e.g. by error cause (e.g. "power failure"), or by error source (e.g. "Motor 1").
- Configuring Loop-In-Alarm
  Configure a Loop-In-Alarm in order to change to a screen that contains information about an incoming alarm.

Configuring Alarm Classes

Creating alarm class

Introduction

Cre
cla
You

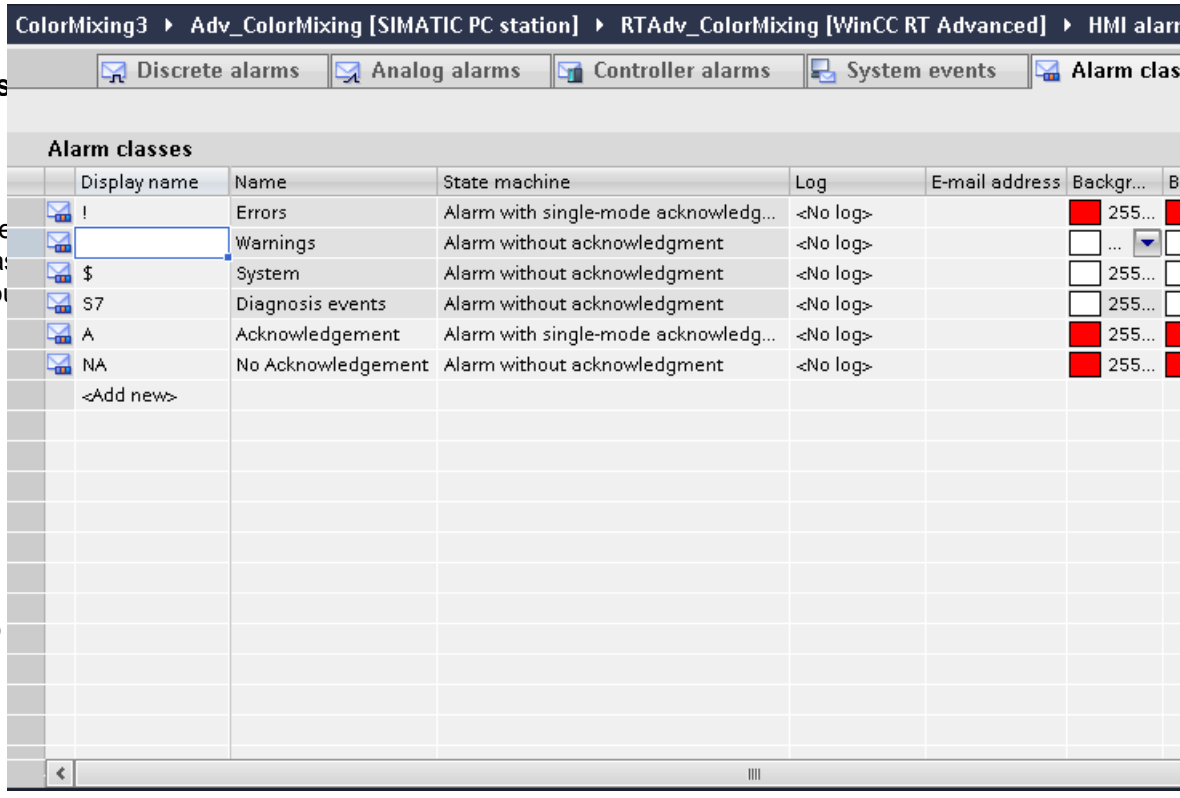
Requirement

-
-

Procedure

To

1.



1. Double-click "<Add>" in the table.
   A new alarm class is created. Each new alarm class is automatically assigned a static ID. The properties of the new alarm class are shown in the Inspector window.
2. Configure the alarm class under "Properties > Properties >General" in the Inspector window.
   - Enter a "Name" and the "Display name".
   - Depending on the HMI device, you can also activate logging, or automatic sending of e-mails.
3. Define the state machines for the alarm class under "Properties > Properties > Acknowledgment" in the Inspector window.
4. Change the default text under "Properties > Properties > Status texts" in the Inspector window.
   This text indicates the status of an alarm in Runtime.
5. Change the default colors under "Properties > Properties > Colors" in the Inspector window. Depending on the HMI device, also change the flashing characteristics.

These settings define how alarms from this alarm class are displayed in Runtime.

Note

To display the alarm classes in color in Runtime, the "Use alarm class colors" option must be activated. In the project navigation, enable "Runtime settings > Alarms > General > Use alarm class colors" accordingly.

Predefined alarm classes (Page 5407)

Basics on alarm classes (Page 5406)

Using project-wide alarm classes (Panels, RT Advanced, RT Professional)

Introduction

Project-wide alarm classes are displayed under "Shared data > Alarm classes" in the project navigation. Create additional common alarm classes in WinCC.

Controller alarms are assigned to common alarm classes. If you work with controller alarms, common alarm classes are automatically loaded in WinCC.

Requirements

- You have created a project.

Creating project-wide alarm class

To create a project-wide alarm class, proceed as follows:

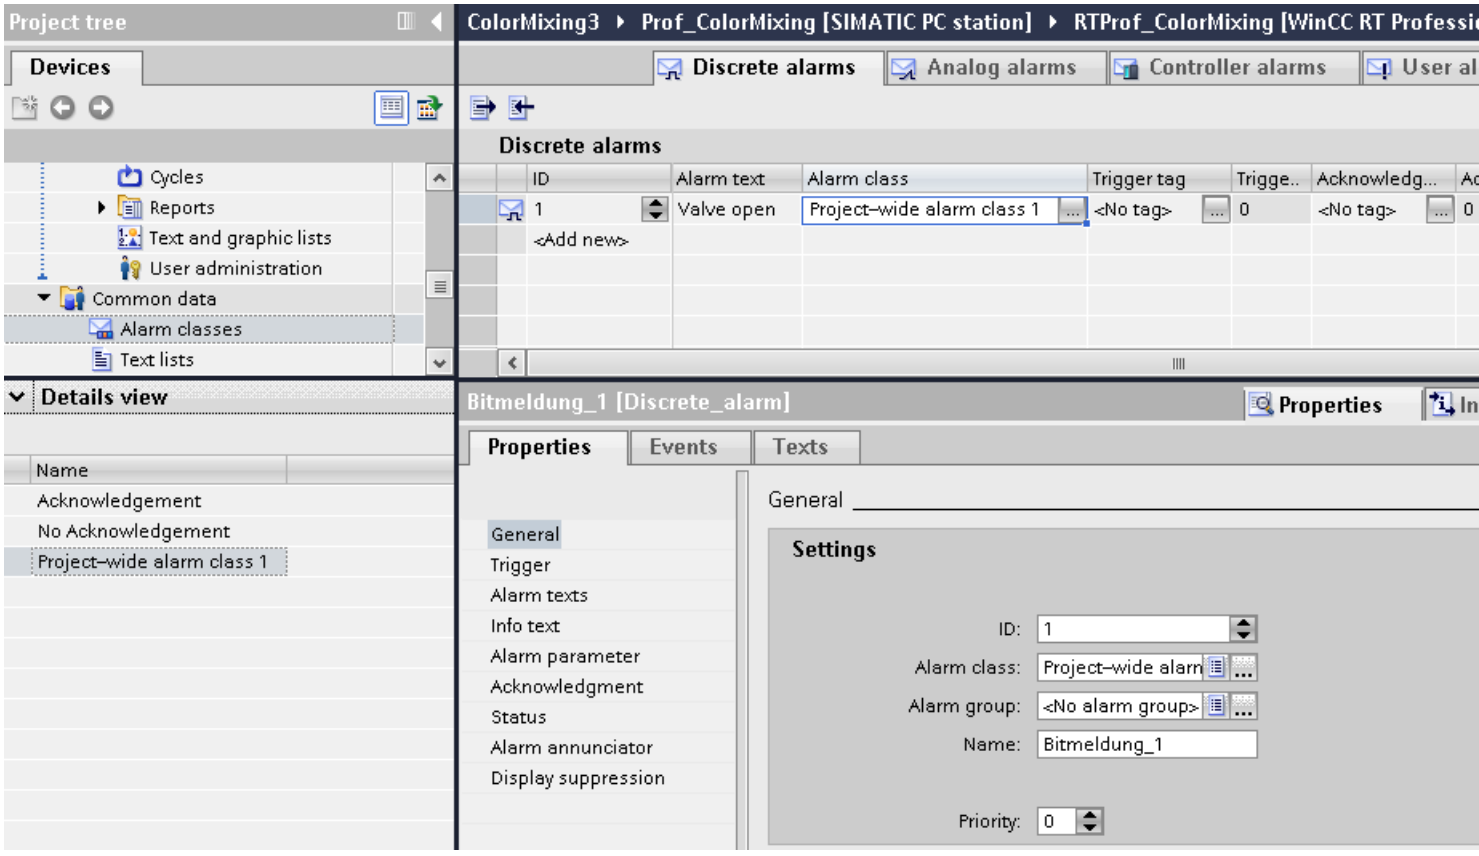
1. Double-click "Shared data > Alarm classes" in the project navigation.
   The "Project-wide message classes" editor opens in the work area.
2. To create a project-wide message class, double-click in the first empty line of the table editor.
3. Specify the name and display name of the alarm class.
4. Select "With acknowledgment" if the alarm class requires acknowledgment.

Assign alarms to a common alarm class

Proceed as follows to assign an analog or discrete alarm to a common alarm class:

1. In the "HMI alarms" editor, select the alarm that you want to assign to the common alarm class.
2. Click "General" in the Inspector window.
3. Click "Shared data > Alarm classes" in the project navigation.
4. Select the common alarm class in the detail view.

5. Drag-and-drop the alarm class to the "Alarm class" selection box or "Alarm class" column in the work area of the Inspector window of the alarm.



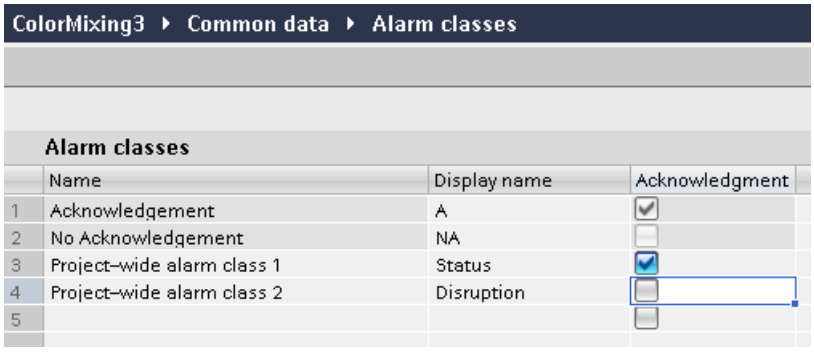
The system creates a new alarm class that is linked to the common alarm class. The new name of the common alarm class is displayed in the "Alarm class" area of the Inspector window of the alarm. The display name of the common alarm class is activated for the alarm class in your project.

6. Click the "Alarm Class" tab.
7. Check to see whether the display name of the common alarm class is displayed in WinCC.
8. You can change the object name of the alarm class.

Alternative procedure

To assign an alarm to a common alarm class, proceed as follows:

1. Click the "Alarm Classes" tab.
   The alarm classes are displayed.
2. Click "Shared data > Alarm classes" in the project navigation. The following table shows the common alarm classes:



3. Select the common alarm class in the detail view.
4. Drag-and-drop the alarm class to the "Alarm classes" tab of the "HMI alarms" editor
   The system creates a new alarm class that is linked to the common alarm class. The new name of the new alarm class in your project is displayed in the "Alarm class" tab.
5. Open the tab with the alarm procedure for the required alarm.
6. Under "General" in the Inspector window, select the alarm and the alarm class linked to the common alarm class.

Note

Deleting a common alarm class

If you delete a common alarm class, the linked alarm class is maintained. If necessary, link the alarm class with another common alarm class or use it as WinCC alarm class.

Predefined alarm classes (Page 5407)

Basics on alarm classes (Page 5406)

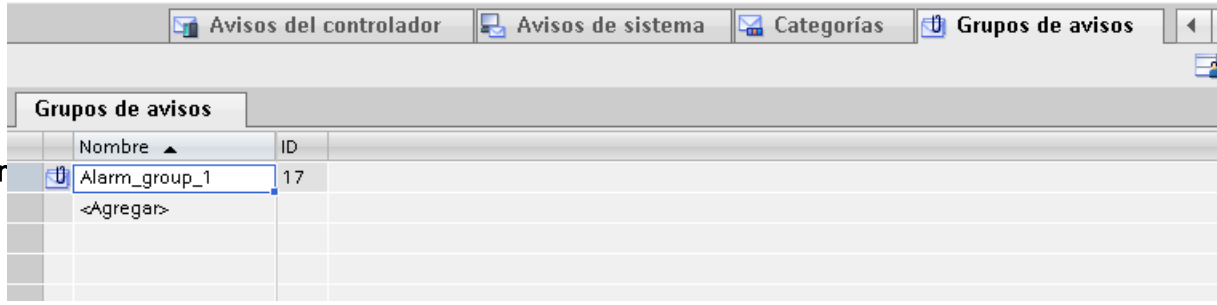
Configuring Alarm Groups (Basic Panels, Panels, RT Advanced)

Introduction

Create alarm groups on the "Alarm Groups" tab in the "HMI alarms" editor. An alarm group is a compilation of single alarms. You assign alarms in an alarm group by association, such as cause of the problem or source of the error. If you acknowledge an alarm from this alarm group in Runtime, all other alarms in the alarm group are acknowledged automatically.

Requirement

- You have created a project.
-
-



Creating a new alarm

1.
2. In the work area of the table, double-click "<Add>" in the first free row.
   A new alarm group is created.
3. You can overwrite the proposed "Name".

Result

An alarm group is created. For the group acknowledgment of alarms in Runtime, assign the associated alarms that require acknowledgment to an alarm group.

Configuring discrete alarms (Basic Panels, Panels, RT Advanced)

Introduction

Discrete alarms triggered by the PLC indicate status changes in a plant. They indicate the opened or closed state of a valve, for example.

The following sections describes the configuration procedures in the "HMI alarms" editor. You can also configure discrete alarms in the "HMI tags" editor.

Requirements

- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

Procedure

To configure a discrete alarm, proceed as follows:

1. Open the "Discrete alarms" tab.
2. To create a new discrete alarm, double-click in the work area on "<Add>".
   A new discrete alarm is created.

3. To configure the alarm, select "Properties > Properties >General" in the Inspector window:
   - Enter an alarm text as event text.
     Use the functions of the shortcut menu to format the text on a character-by-character basis, or to insert output fields for HMI tags, or texts from the text lists.
   - You can renumber the alarm.
   - Select the alarm class and the alarm group, if necessary.
4. In the Inspector window, select the tag and the bit that triggers the alarm under "Properties > Properties > Trigger". Note the following information:
   - Use the data types "Int" or "UInt" to select an HMI tag.
   - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
   - Use trigger tag bits only for alarms.
   - Do not use trigger tags for anything else.
   - If you want to acknowledge the alarm via the PLC, use this tag also as PLC acknowledgment tag.

Note

Note the method used to count bits in the utilized PLC when specifying the bit. For more information, refer to the "Communication" section in the PLC Online Help.

Note

If the object does not yet exist in the selection list, create it directly in the object list and change its properties later.

Status-dependent alarm texts

To display a different text independent of the alarm status, link a text list to the alarm text. You control the text list with a tag.

Additional settings for discrete alarms

Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Enter your text under "Properties > Properties > Tooltip".

Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the discrete alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

See also

Configuring trigger for alarm acknowledgment (Page 5453)

Output of a tag value in the alarm text (Page 5426)

Formatting alarm text (Page 5425)

Configuring loop-in alarm (Page 5431)

Configuring analog alarms (Basic Panels, Panels, RT Advanced)

Introduction

Analog alarms indicate limit violations. For example, if the speed of a motor drops below a certain value, an analog alarm is triggered.

Requirements

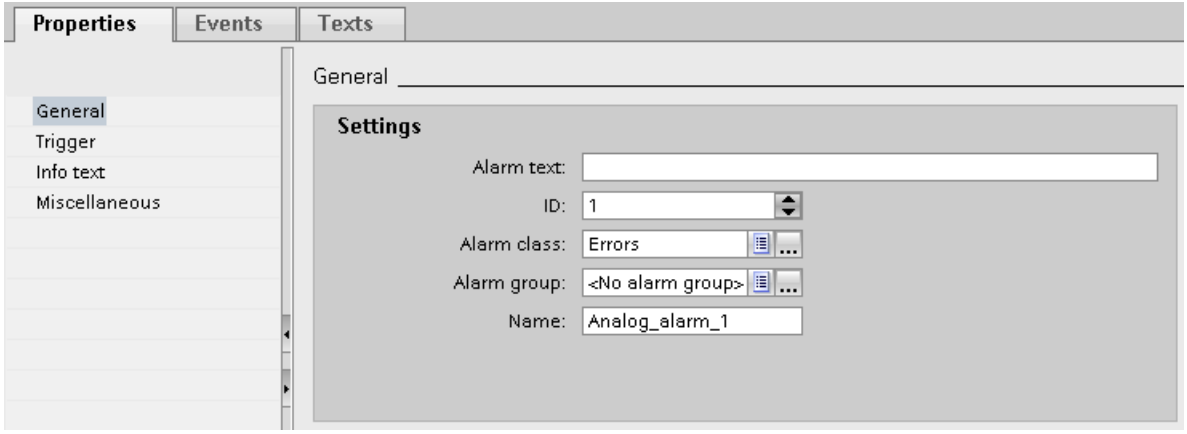
- The "HMI alarms" editor is open.
- The Inspector window is open.
- You have created the required alarm classes and alarm groups.

Procedure

To configure an analog alarm, proceed as follows:

1. Click the "Analog alarms" tab.
2. To create a new analog alarm, double-click in the table on "<Add>".
   A new analog alarm is created.

3. To configure the alarm, select "Properties > Properties >General" in the Inspector window:
   - Enter an alarm text as event text.
     Format the text character-for-character using the shortcut menu.
     Using the shortcut menu, you can insert output fields for HMI tags, or text from text lists.
   - You can renumber the alarm.
   - Select the alarm class and the alarm group, if necessary.



4. Configure the tag that triggers the alarm under "Properties > Properties > Trigger > Settings".
   Do not use trigger tags for anything else.

Configure limit values for an analog alarm

1. In the Inspector window, click the Const button under "Properties > Properties > Trigger > Limit > Value".
   - To use a constant as limit value, select "Constant".
     Enter the required limit value.
   - To use a tag as limit value, select "HMI tag".
     The ... button appears. Use this button to select the tag you want to use.

   Note

   If the required tag does not exist in the selection list yet, create it in the object list and change its properties later.

2. Select the mode:
   - "Higher": The alarm is triggered when the limit is exceeded.
   - "Lower": The alarm is triggered when the limit is undershot.

Optional settings for analog alarms

Setting the delay time

To set the delay time, proceed as follows:

- Enter a time period in the Inspector window under "Properties > Properties> Trigger > Settings > Delay".
  The alarm is only triggered when the trigger condition is still present after the delay time has elapsed.

Setting the deadband

Note

If a process value fluctuates around the limit, the alarm associated with this fault may be triggered multiple times. To prevent this from happening, configure a deadband or delay time.

To enter the deadband, follow these steps:

1. Under "Properties > Properties> Trigger > Deadband > Mode", select the change in alarm status for which the deadband is to be taken into account.
2. Enter a constant value under "Value".
3. To define the deadband value as a percentage of the limit, set the "in %" check box.

Automatic reporting

To print the alarms continuously:

- Select the "Activate" option under "Properties > Properties > Miscellaneous > Report."

Note

Device dependency

Reporting is not available for all HMI devices.

Creating a tooltip

To configure a tooltip for the alarm, follow these steps:

- Select "Properties > Properties > Tooltip" in the Inspector window and enter your text.

Configuring event-driven tasks

To configure event-driven tasks, such as a loop-in alarm, follow these steps:

1. Select the analog alarm.
2. Select "Properties > Events" in the Inspector window and configure a new function list for the relevant event.

See also

Configuring trigger for alarm acknowledgment (Page 5453)

Output of a tag value in the alarm text (Page 5426)

Formatting alarm text (Page 5425)

Configuring loop-in alarm (Page 5431)

Formatting alarm text (Basic Panels, Panels, RT Advanced)

Introduction

The alarm texts can be formatted or special characters inserted in the alarm texts to emphasize specific events or processes.

Requirement

- The "HMI alarms" editor is open.
- An alarm has been created.

Formatting alarm texts

To format an alarm text, proceed as follows:

1. Select the alarm to edit.
2. In the Inspector window, select the characters to format under "Properties > Properties > General > Alarm text".
3. Select the formatting from the shortcut menu, e.g. "Underscored" or "Uppercase".
   The selected characters are displayed in Runtime with the selected formatting.

Note

It is not possible to underline tags and text list entries.

Note

Displaying special characters in alarm texts

When configuring alarm texts, a fixed character set is used in the Engineering System. This character set allows you to use numerous special characters in alarm texts.

Language-dependent fonts are used in runtime to display the texts, for example MS PGothic, SimSun. The fonts used in runtime do not support all special characters. As a result, some special characters are not displayed in runtime.

Removing format settings

To remove all text formats, proceed as follows:

1. In the Inspector window, select the characters whose formatting you want to remove in the alarm text.
2. Select "Delete formatting characters" from the shortcut menu.
   The selected characters are displayed in unformatted notation in Runtime.

Output of a tag value in the alarm text (Basic Panels, Panels, RT Advanced)

Introduction

In WinCC, you can insert output fields into the alarm text which display the content of tags.

Requirements

- The "HMI alarms" editor is open.
- The alarm is selected.

Output of a tag value in the alarm text

To insert an output field for a tag value in the alarm text, proceed as follows:

1. Place the cursor onto the required position in the event text.
2. Select "Insert tag output field" in the shortcut menu.
3. Open the object list under "Tag" and select a tag.
   You can also create the tag in the object list.
4. Under "Format", specify the length of the output field and the format for tag value output in the alarm text.
   Configure an output field of sufficient size. Otherwise, the tag content is not output to the full extent in the alarm.
5. Click to save your entries.

WinCC inserts a placeholder for the output field into the alarm text: "<tag: n, [tag name]>" whereby n = text string length.

Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

Deleting an output field from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

Note

The sequence of the tag output fields in the alarm text depends on the language. The sequence of the Runtime language is used for logging alarms to a CSV log file.

Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This changes the sequence of the output fields in the log.

Device dependency

Logging is not available for all HMI devices.

Output of texts from a text list in an alarm (Basic Panels, Panels, RT Advanced)

Introduction

Text lists are used to create dynamic alarm texts. For example, you can configure the output of both states of a discrete alarm in an alarm text.

Insert a corresponding output field in the alarm text and specify the tag that returns the search key for the text list.

Requirements

- A text list is created.
- The "HMI alarms" editor is open
- The alarm is selected

Output of a text list value in an alarm text

To insert an output field for a value from a text list in the alarm text, proceed as follows:

1. Place the cursor at the required position in the alarm text.
2. Select "Insert text list output field" command from the shortcut menu.
3. Select the text list under "Text list".
4. Open the object list under "Tag" and select the tag that returns the search key for the text list.
   You can also create the tag in the object list.
5. Define the length of the output field under "Format".
   Configure an output field of sufficient size so that the complete text from the text list is displayed in the alarm.
6. Click on the icon to save your entries.
   WinCC inserts a placeholder for the output field into the alarm text:
   ""<textlist: n, [textlist name]>" whereby n = text string length.

Editing output field properties

To edit the properties of an output field, proceed as follows:

- Double-click on the output field in the alarm text and edit the settings.

Deleting text list from the alarm text

To delete an output field from the alarm text, proceed as follows:

- Select the output field in the alarm text and then select the "Delete" command from the shortcut menu.

Editing System Events (Panels, RT Advanced)

Editing system events

When you open the "System events" tab in the "HMI alarms" editor, WinCC prompts you to import or update the system events. Import the system events and specify the display period. You cannot delete or create new system events. You can only edit the alarm text with system events.

Requirements

- You have imported the system events.

Specifying the display period

To determine the display period, proceed as follows:

1. Double-click "Runtime settings" in the project navigation.
2. Enter a value under "Alarms > System events > Display period".
   This value specifies a time in seconds during which the system events are displayed on the HMI device. If you want to display system events permanently, enter "0".

Changing the alarm text

To change the alarm text of a system event, follow these steps:

1. Open the "HMI alarms" editor and then click the "System events" tab.
2. Select the system event that you want to edit.
1. Change the alarm text under "Properties > Properties > Properties > General" in the Inspector window.

Note

If you change an alarm text for a system event that contains a placeholder, leave the number of placeholders unchanged. A placeholder may be a "%1".

Configuring event-driven tasks

The "Incoming" event is available for certain system events, depending on the HMI device. To configure event-driven tasks, proceed as follows:

1. Select the system event.

2. Select "Properties > Properties > Incoming" in the inspector window and configure a function list.

Editing controller alarms (Panels, RT Advanced, RT Professional)

Introduction

Controller alarms are configured in STEP 7. Controller alarms are available in WinCC running in a STEP 7 environment.

In WinCC you only edit the properties of controller alarms that are specific to an HMI device. Different properties of a controller alarm can be edited, depending on the HMI device and PLC.

You can filter the displayed controller alarms for your project using the display classes that were configured on the PLC for controller alarms.

Note

When "Automatic update" is set for controller alarms for the connection to the S7-1500 controller, you cannot edit the properties of the respective controller alarms. The controller alarms are not displayed in the "HMI alarms" editor in this case.

Requirements

- The connection was established to the PLC.
- Alarms were configured in STEP 7.

Editing controller alarms

Proceed as follows to edit controller alarms:

1. Double-click "HMI alarms" in the project navigation.
   The "HMI alarms" editor is opened.
2. Open the "Controller alarms" tab.
3. Select the alarm that you want to change in the work area.
4. Make your changes. Depending on the HMI device, it may not be possible to display or enable some of the controller alarm properties.

Editing SIMATIC S7 alarms

You can edit these controller alarms in the STEP 7 alarm configuration system. Proceed as follows:

1. Select the alarm that you want to change in the work area.
2. Select "Open in alarm editor of the PLC" from the shortcut menu.
   The STEP 7 alarm configuration system is opened.
3. Make your changes.

Filtering the controller alarm using display classes

To filter controller alarms by display classes, proceed as follows:

1. Click "Runtime settings > Alarms" in the project navigation under your HMI device.
   One or several connections to a PLC are shown in "Contoller alarms".
2. Select the display classes whose controller alarms you want to display for the connection.

Result

Only those controller alarms whose display class you have enabled for your HMI device will be displayed on the "Controller alarms" tab of the "HMI alarms" editor.

See also

PLC alarms (Page 5401)

Sending and automatically updating complete alarm from the controller to the HMI device (Page 5484)

Enabling system-defined controller alarms (Panels, RT Advanced)

Enabling system-defined controller alarms

To activate system-defined controller alarms of the type "SIMATIC S7 diagnostic alarm" for your HMI device, follow these steps:

1. Select "Runtime settings > Alarms" in the project navigation.
   The alarm settings open.
2. Under "System events" select the check box "S7 diagnostic alarms (number)".

3. To display the system events with alarm text, activate "Show text".
4. To display these alarms in Runtime, configure an alarm view or an alarm window that displays alarms from the "Diagnosis Events" alarm class.

Note

For HMI devices with small display units, specify to display only the alarm number for system-defined controller alarms.

Note

The procedure described above can only be applied to connections with SIMATIC S7-300/400 controllers for system-defined controller alarms of the type "SIMATIC S7 diagnostic alarm".

See also

System-defined controller alarms (Page 5403)

Configuring loop-in alarm

Introduction

A Loop-In-Alarm is configured in order to change to a screen containing relevant information on an alarm received.

Requirement

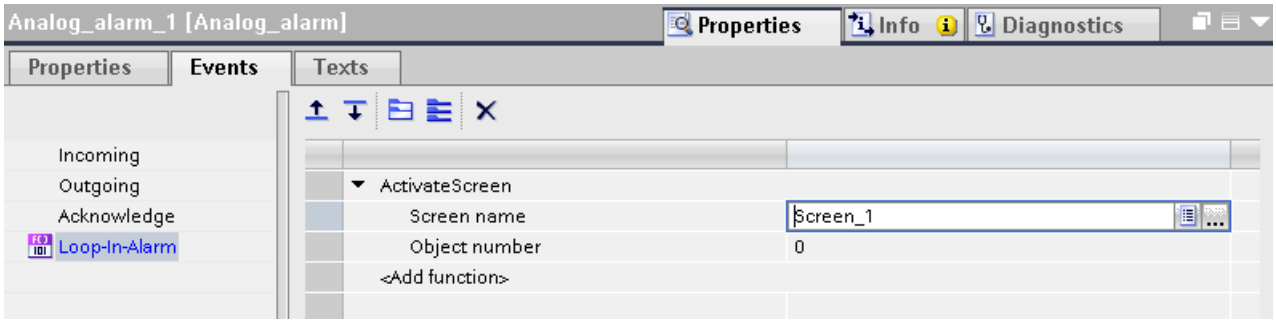
- The screen called by the Loop-In-Alarm has been created.
- The "HMI alarms" editor is open.

Procedure

To configure a Loop-In-Alarm for an alarm, proceed as follows:

1. Click the tab that contains the alarm for which you want to configure the Loop-In-Alarm.
2. Select the alarm.
3. In the Inspector window, select "Properties > Events > Loop-In-Alarm".

4. Select the "ActivateScreen" system function.
5. Select the screen called by the Loop-In-Alarm as parameter.



Note

To configure the Loop-In-Alarm for an alarm view with an "alarm line" format, use a button with the following system functions:

- "EditAlarm" for HMI devices with keys
- "AlarmViewEditAlarm" for HMI devices without keys

The system functions trigger the "Loop-In-Alarm" event. The alarm line has no buttons.

Result

If you click on the "Loop-In-Alarm" button of the alarm view in Runtime, a screen is opened with information on the selected alarm.

See also

Configuring discrete alarms (Page 5420)

Configuring analog alarms (Page 5422)

Alarms in the "HMI tags" Editor

Configuring discrete alarms

Introduction

In WinCC, you can create and edit discrete and analog alarms, including the trigger tags, in the "HMI tags" editor.

Note

If you delete, move or copy objects in the "HMI tags" editor, the changes also take effect in the "HMI alarms" editor.

Requirements

The "HMI tags" editor is open.

Procedure

To configure a discrete alarm, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.
   A new tag is created.
2. Configure an internal or external tag as required.
   - Use the data types "Int" or "UInt" to select an HMI tag.
   - When you select a PLC tag, use the data types "Int" or "Word". The input and output area of a PLC tag is unsuitable as trigger.
3. Select the tag at the top of the work area.
4. Click on "<Add>" in the table on the "Discrete alarms" tab at the bottom of the work area.
   A new discrete alarm is created for the tag. If you have selected the incorrect data type, the tag will be marked in the discrete alarm.
5. Configure the discrete alarm in the Inspector window:
   - Enter the alarm text under "Properties > Properties > General > Alarm text".
     You can also insert output fields into the alarm text.
   - Select an alarm class.
   - Select the trigger bit of the tag that triggers the discrete alarm under "Properties > Trigger".
6. You can create additional discrete alarms to monitor the tags.

Note

A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

Result

The configured discrete alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

Configuring analog alarms

Introduction

In WinCC, create the discrete and analog alarms, including the trigger tags, in the "HMI tags" editor. You can also edit the alarms as in the "HMI alarms" editor. You can create up to two range values for a tag. You monitor these limits with analog alarms.

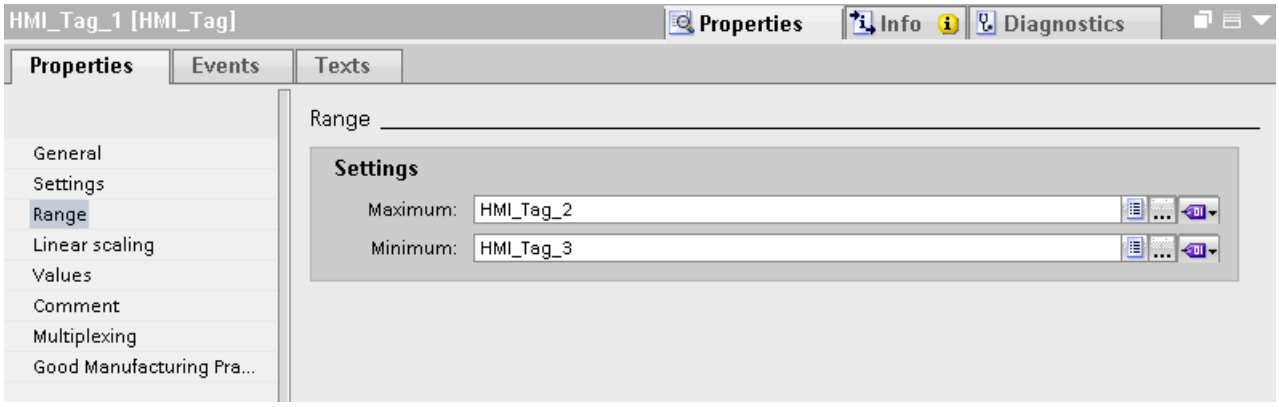
Requirements

The "HMI tags" editor is open.

Procedure

To configure an analog alarm in the "HMI tags" editor, proceed as follows:

1. To create a tag, click on "<Add>" in the table at the top of the work area.
   A new tag is created.
2. Configure an internal or external tag as required.
3. In the Inspector window, configure the range values of the tags under "Properties > Properties > Range":
   – Select whether to use a "Constant" or an "HMI tag" as limit value for your range values. The object list opens when you select "HMI tag". Select the tag you want to use.



1. Click the "Analog Alarms" tab at the bottom of the work area.
   Create an analog alarm for both range values.
2. Select an analog alarm and configure it in the Inspector window:
   – Enter the alarm text under "Properties > Properties > General > Alarm text".
   – You can also insert output fields into the alarm text.
   – You can change the default alarm class.
3. Configure the analog alarms as in the "HMI alarms" editor.
4. Complete the configuration of all analog alarms.

Note

A tag is monitored using only one alarm type. You should therefore create either analog alarms **or** discrete alarms for a tag.

Result

The configured analog alarms are created in the "HMI tags" editor and displayed in the "HMI alarms" and "HMI tags" editors.

12.3.2.3 Configuring the Outputting of Alarms

Overview of configuring alarm output

Steps to complete when configuring alarm output

You configure the alarm output in WinCC in the following steps:

1. Create alarm view
   Use the display and control objects in the "Screens" editor to display alarms in Runtime. You can also configure an alarm view for logged alarms.
2. Configure acknowledgment
   In the "Screens" editor, you can set the operator action that will trigger the acknowledgment.
3. Configure reporting
   You can create reports in the "Reports" editor to print alarms in Runtime. In the "Scheduler", "Screens", "HMI alarms" or "HMI tags" editors, you define when and how the printing of a report is triggered.

Note

Device dependency

Reporting and logging are not available for all HMI devices.

Note

Note that only ASCII characters are supported when printing alarms directly in Runtime.

Additional configuration tasks

Additional tasks may be necessary for configuring alarm views, depending on the requirements of your project:

1. Setting up authorizations
   To make sure only authorized operators process the alarms, assign authorizations for the alarm view and the function keys of the HMI device.
2. Configuring the filtering of the alarm view
   You configure the filtering of the alarms in Runtime in the "Screens" editor. You can also configure alarm views that only display selected alarms.
3. Configure operator input alarms
   Configure the operator input alarms on the operator controls of the HMI device in the "Screens" editor. A preconfigured operator input alarm is output for an operator action. An operator input is, e.g. the acknowledgment of an alarm.

Displaying alarms (Basic Panels, Panels, RT Advanced)

Options for displaying alarms on the HMI device

WinCC offers the following options for displaying alarms on the HMI device:

- Alarm view
  The alarm view is configured in a screen. More than one alarm can be displayed simultaneously, depending on the configured size. You can configure multiple alarm views with different contents.
- Alarm window
  The Alarm window is configured in the "Global screen" editor. The alarm window can display multiple alarms at the same time, depending on the configured size. An event can trigger closing and reopening of the alarm window. To hide it during configuration, create an alarm window on its own level.

Additional signals

- Alarm indicator
  The alarm indicator is a configurable, graphical icon. When an alarm comes in, the alarm indicator is displayed on the HMI device. You configure the alarm indicator in the "Global screen" editor.
  The alarm indicator has two states:
  - Flashing: At least one alarm that requires acknowledgment is pending.
  - Static: The alarms are acknowledged but at least one of them has not gone out yet. The alarm indicator also displays the number of pending alarms according to the HMI device.
- E-mail notification
  To inform someone other than the operator, such as an engineer, when an alarm with a specific alarm class arrives, assign the alarm class to an e-mail address.

  Note

  Device dependency

  E-mail notification is not available for all HMI devices.

- System functions
  You can configure a list of functions for the event associated with an alarm. These functions must be executed in Runtime when the event occurs.
  Use system functions for alarms in WinCC to control the alarm view or the alarm window other than via the toolbar.

Displaying the predefined alarm classes in Runtime

The following table shows the symbols used to display the predefined alarm classes in the alarm view:

Alarm class	Displayed icon
"Diagnosis Events"	S7
"Errors"	!
"System"	$
"Warnings"	<No symbol>

See also

Configuring alarm filtering (Page 5446)

Displaying Logged Alarms (Page 5449)

System functions for alarms (Page 5488)

Configuring an alarm view

Configuring an alarm view for active alarms (Basic Panels, Panels, RT Advanced)

Introduction

Current alarms are displayed in Runtime in an alarm view or alarm window.

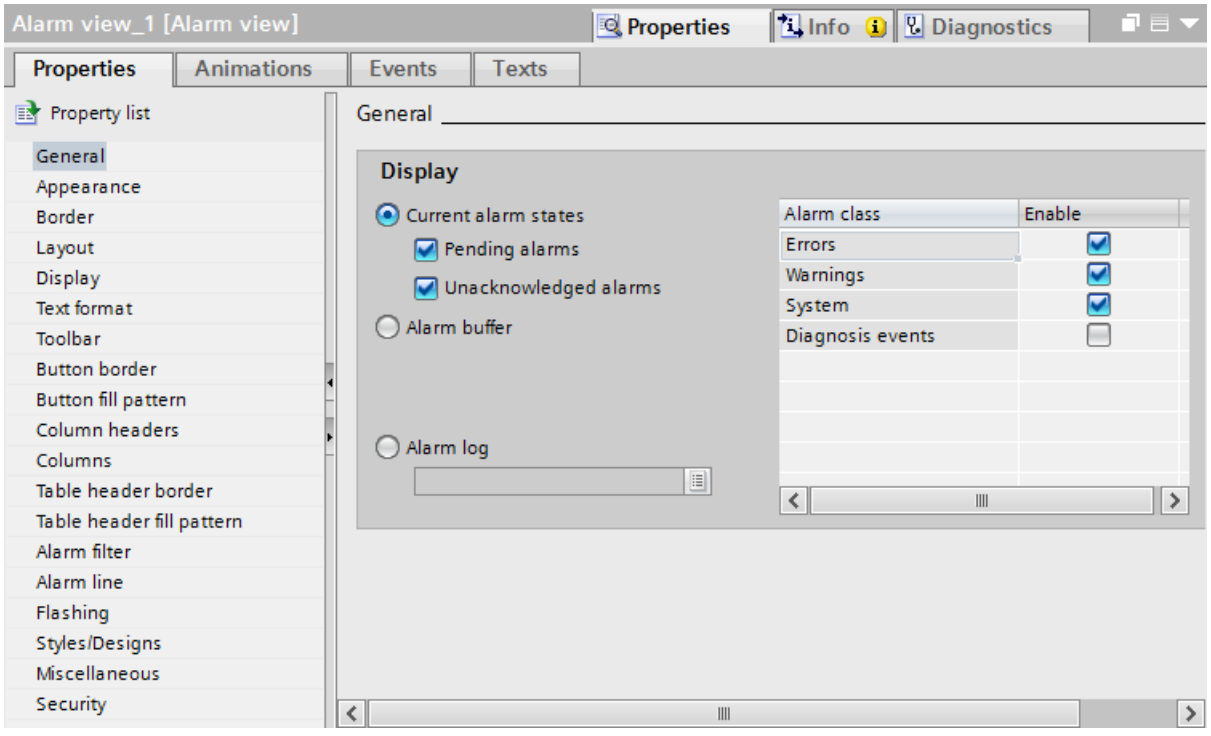
Requirement

- A screen is open in the "Screen" editor.
- The "Tools" task card is open.

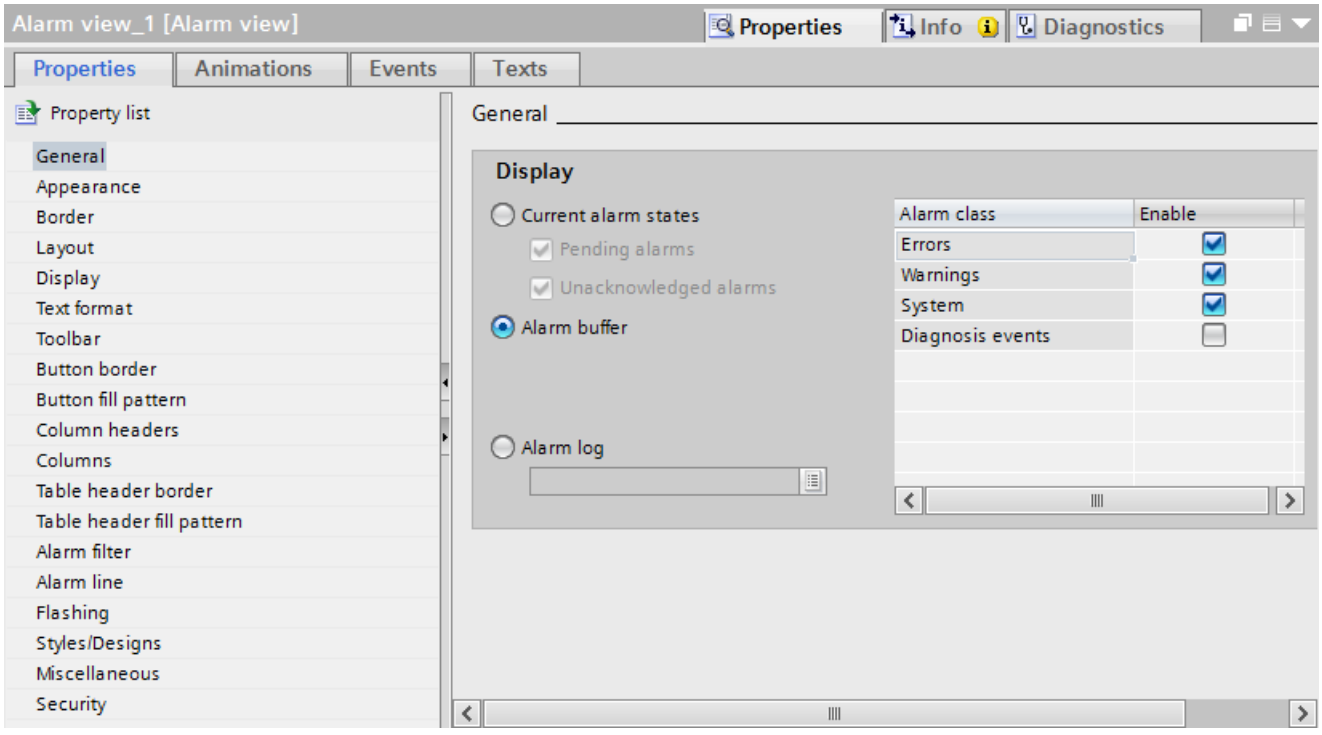
Configuring alarms for the alarm view

To specify the alarms that will be shown in the alarm view, proceed as follows:

1. Insert an "Alarm view" object from the "Tools" task card into the screen.
2. Select the alarm view.
   - In the Inspector window, select "Properties > Properties > General > View > Current alarm states".
     Set whether to display alarms with and/or without mandatory acknowledgment.



– To display all alarms in the alarm buffer, enable "Alarm buffer".

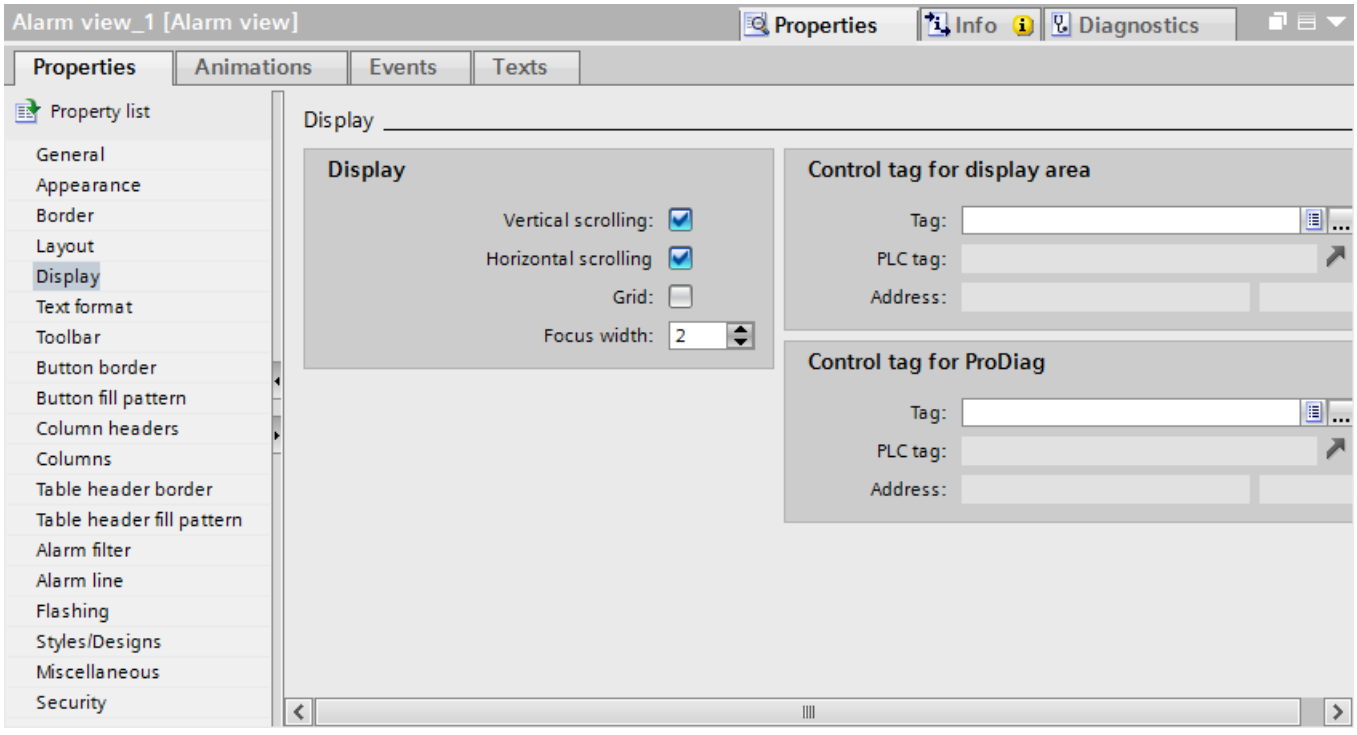


3. In the table, activate the alarm classes to be displayed in the alarm view.
4. Under ""Properties > Properties > View > Control tag for display area", define the tag that returns the date as of which the alarms will be displayed.

Note

Device dependency

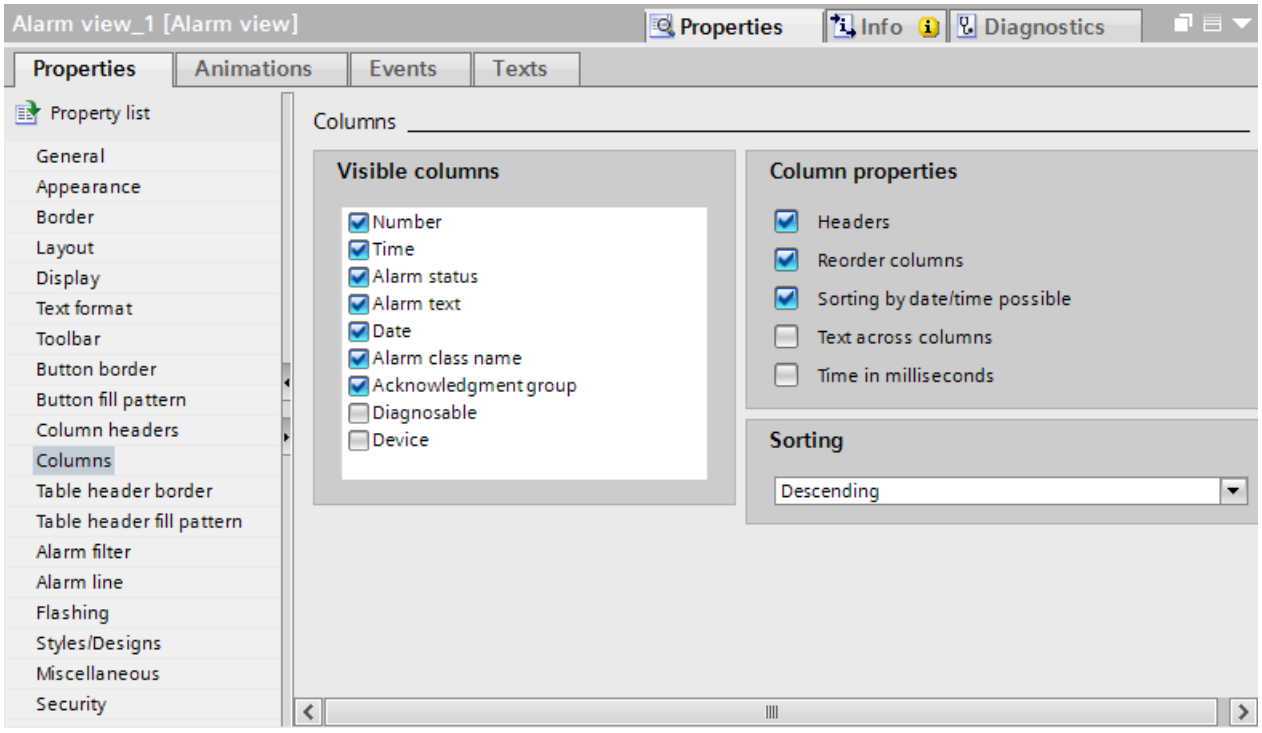
The "Control tag for display area" property is not available for all HMI devices.



Configuring the layout of the alarm view

To specify how the alarms are shown in the alarm view, proceed as follows.

1. Under "Properties > Properties > Layout > Settings > Lines per alarm" in the Inspection window, specify the number of lines to display for each alarm.
2. In "Properties > Properties > View", select the control elements that are available on the HMI device.
3. Configure the columns under "Properties > Properties > Columns":
   - Under "Visible columns" select the columns to be output in the alarm view.
   - Under "Properties Column", define the properties of the columns.
   - Under "Sort", select the sorting order of the alarms.



Note

Select the "Edit" command in the shortcut menu for the alarm view to activate the alarm view. You can set the column width and position in active mode. To enable the alarm view, set the zoom factor to 100 %.

The alarm view is deactivated as soon as you deselect the object in the screen.

Result

Alarms of various alarm classes are output in the alarm view during runtime.

See also

Creating alarm classes (Page 5415)

Configuring an alarm window (Page 5444)

Configuring an alarm view for the S7 diagnostic alarms (Panels, RT Advanced)

Introduction

To display S7 diagnostic alarms, configure an alarm view or alarm window for the predefined "Diagnosis Events alarm class. Activate the diagnostic alarms accordingly in the Runtime settings of your HMI device.

Note

Device dependency

- The "Diagnosis Events" alarm class is not available for all HMI devices.
- System-defined controller alarms of the type "SIMATIC S7 diagnostic alarm" can be activated for your HMI device only for connections with a SIMATIC S7-300/400 controller.

Requirements

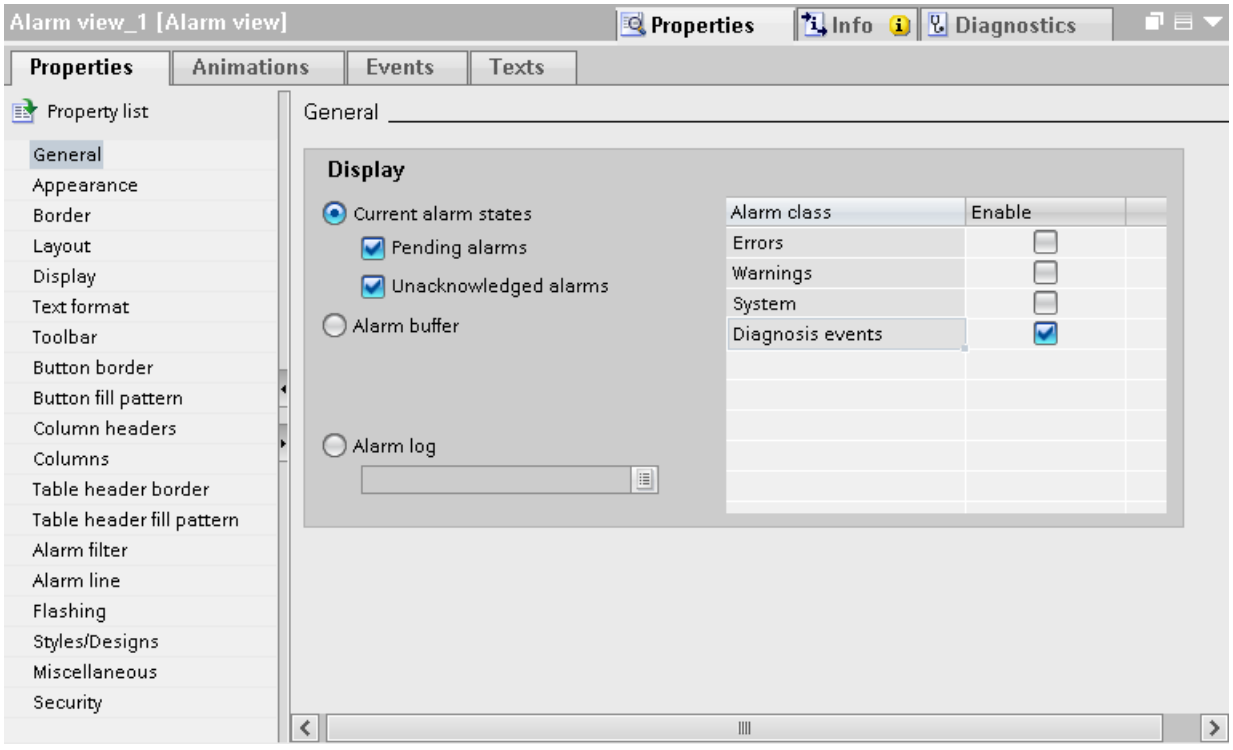
- An alarm view or alarm window is configured in the "Screens" editor
- A connection to a SIMATIC S7-300/400 controller has been established.

Configuring the display of S7 diagnostic alarms

To configure the display of S7 diagnostic alarms, follow these steps:

1. Select "Runtime settings > Alarms" in the project navigation.
2. Under "System events" select the check box "S7 diagnostic alarms (number)".
3. To display the S7 diagnostic alarms with text, activate "With event text".
4. Open the screen with the alarm view and select the alarm view.

5. In the Inspector window, select "Properties > Properties > General > Display > Alarm class "Diagnosis Events".



6. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime the alarm view displays the S7 diagnostic alarms of the controller.

Configuring an alarm view for logged alarms

Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".
3. Click the "...." button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime, the logged alarms are output in the alarm view.

Configuring an alarm window (Basic Panels, Panels, RT Advanced)

Introduction

The alarm window displays current alarms. The alarm window is configured in the "Global screen" editor. The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged. The HMI device can still be used, even if alarms are pending and displayed. An alarm window is displayed and configured like an alarm view.

To hide an alarm window during configuration, create it on its own level.

Requirement

- The "Global Screen" editor is open.
- The "Tools" task card is displayed.
- The Inspector window is open.

Procedure

Proceed as follows to configure an alarm window:

1. Insert an "Alarm window" object from the "Tools" task card into the global screen.
2. Configure the alarm window like an alarm view.
3. Under "Properties > Properties > Mode > Window" in the Inspector window, select how the alarm window reacts and is operated in Runtime.
   - Activate "Modal" if the alarm window is to retain the focus in Runtime after a screen change.
     This option is important, as switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported.

Result

During runtime, the alarms of the selected alarm class are displayed in the alarm window.

See also

Configuring an alarm view for active alarms (Page 5437)

Creating alarm classes (Page 5415)

Configuring an alarm indicator (Basic Panels, Panels, RT Advanced)

Introduction

The alarm indicator uses a warning triangle to indicate that alarms are pending or require acknowledgment. If an alarm of the configured alarm class occurs, the alarm indicator is displayed.

The alarm indicator has two states:

- Flashing: At least one alarm that requires acknowledgment is pending.
- Static: At least one of the acknowledged alarms has not gone out yet.

During configuration, specify whether Runtime has to open an alarm window when you operate the alarm indicator.

Requirement

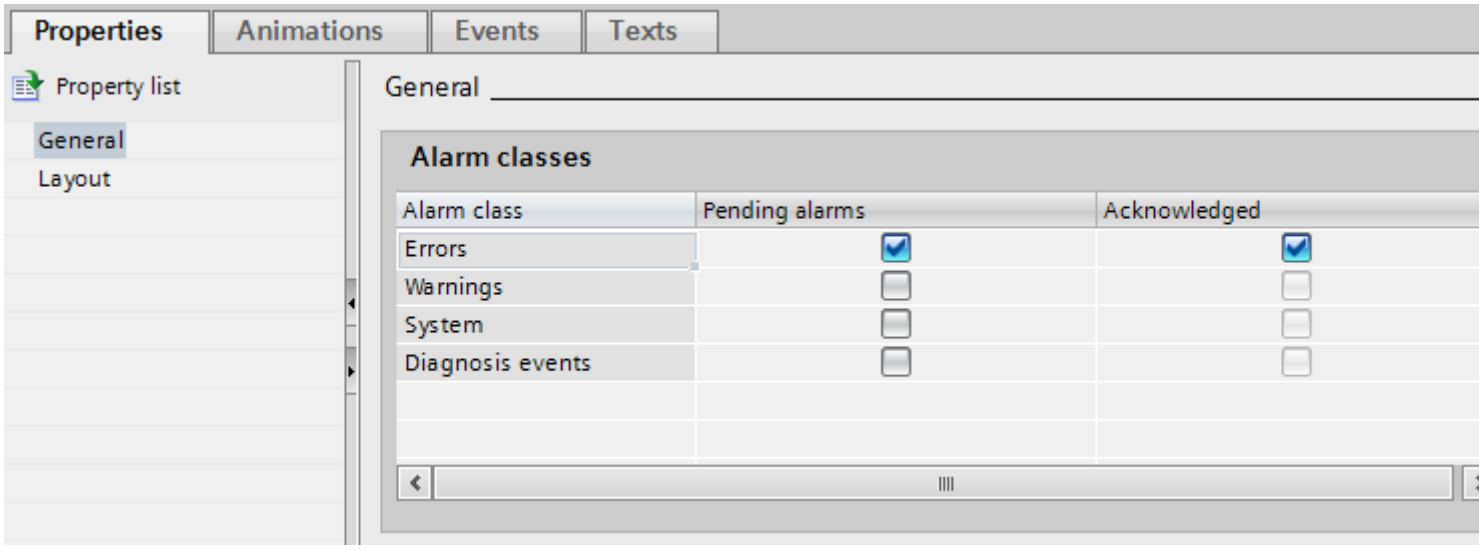
- The "Global Screen" editor is open.
- The "Tools" task card is open.
- The Inspector window is open.

Procedure

Proceed as follows to configure the alarm indicator:

1. Insert the "Alarm view" object from the "Tools" task card into the work area.
2. Select the alarm indicator.

3. Under "Properties > Properties > General" in the Inspector window, select the alarm classes to be displayed by the alarm view.
   Specify whether to display pending and/or acknowledged alarms in the alarm view.



4. Under "Properties > Event", assign the system function "ShowAlarmWindow" to an event of the alarm view.

Note

If you have configured a permanent area in the screen or template, do not position the alarm window and alarm view in the vicinity of the permanent area. Otherwise, the alarm window and the alarm view will not be displayed in Runtime. However, the permanent area is not visible in the "Global screen" editor.

Result

The alarm view is displayed if alarms from the selected alarm class are pending or need to be acknowledged in Runtime. The alarm window opens when the user operates the alarm view.

Configuring alarm filtering (Panels, RT Advanced)

Introduction

You can filter the display of alarms in the enhanced alarm view. The criterion is always a character string. There are two ways to filter the alarm view:

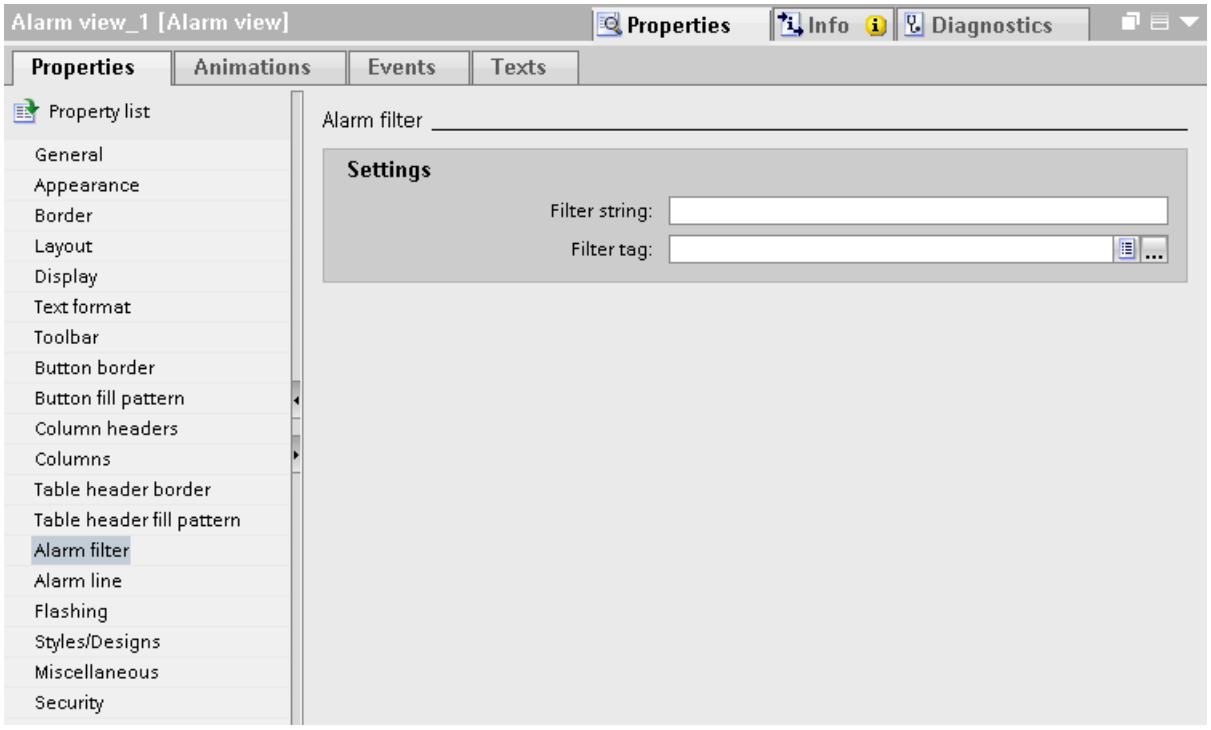
- A fixed criterion is configured in WinCC.
  In Runtime, all alarms that contain the complete character string in the alarm text are displayed.
- You filter the alarm view in Runtime.
  In Runtime, a filter tag sets the relevant character string in the alarm view by means of an I/O field, e.g. as described below.
  The filter affects the display in the alarm view. All alarms in the alarm buffer are retained.

Requirement

- The alarm view has been configured.
- The screen with the alarm view is open.
- The Inspector window is open.

Configuring filters for a fixed character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Alarm filter".
3. Enter a filter string in "Filter string".



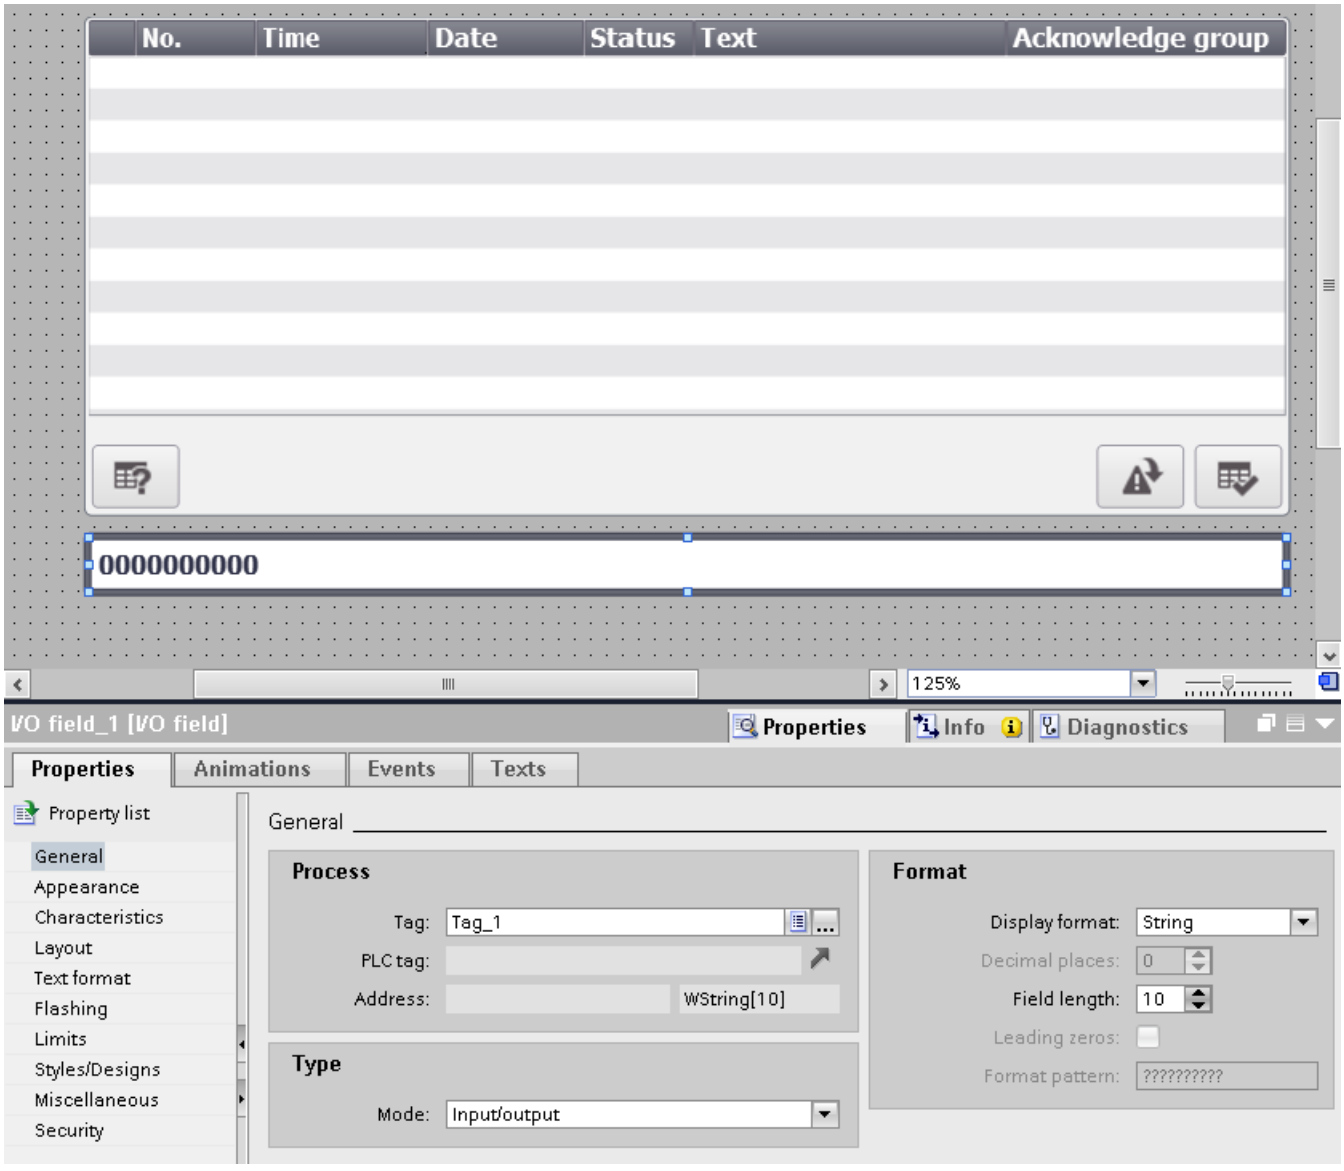
Result

Only those alarms are displayed in Runtime that contain the complete character string from the filter in the alarm text.

Configuring filters for a variable character string

1. Select the alarm view.
2. In the Inspector window, select "Properties > Properties > Filter".

3. Select a tag from "Filter tag". The tag must be of the "String" type.
4. In the screen, configure an I/O field for entering the filter string in Runtime.
   - In the Inspector window, select "Properties > Properties > General > Format > Display format > String".
   - To link the I/O field to the alarm view, select "Process" to set the filter tag you selected for the alarm view.



Result

If you enter a string in the I/O field in Runtime, the alarm view only displays alarms that contain the complete string in their alarm text.

If a permanently configured character string and a filter tag were configured, the alarms will be filtered in Runtime according to the content of the filter tag. If the filter tag is blank, the permanently configured character string is used as the filter.

Note

Filtering is not possible for the following alarm views:

- Simple alarm view
- Alarm line
- Alarm window
- Alarm view for logged alarms

Displaying Logged Alarms (Panels, RT Advanced)

Introduction

You display logged alarms in Runtime in an alarm view. The alarm view shows the content of an alarm log.

Application

For example, you want to view information about the process at the end of a shift.

Requirements

- An alarm log has been created.
- A screen is open.
- The Inspector window is open.

Procedure

Proceed as follows to configure an alarm view to output an alarm log:

1. Configure an alarm view in a screen.
2. Under "Properties > Properties > General > Display > Alarm log"" in the Inspector window, select the required alarm log.
   You can always create a new alarm log.

Result

During runtime, the alarms logged in the selected alarm log appear in the Alarm view.

Note

In runtime, the alarm texts logged are not displayed but rather the alarm texts in the current project. The logged alarm texts are only intended for external evaluation of the log file.

If the alarm log displayed was configured differently, the alarm texts displayed may not correspond with those logged.

Reporting Alarms (Panels, RT Advanced)

Overview

WinCC can report on all alarms that occur in the system. The following options are available:

- Output an alarm sequence report
  In Runtime, the standard printer of the HMI device will continuously print each alarm and any changes in its status.
- Output of an alarm report
  You configure an alarm report in the "Reports" editor and specify when it is output in Runtime:
  - For event-driven output, configure an object that is assigned the "PrintReport" system function. The object can be a button or tag.
  - For time-driven output, create a "Print job" in the scheduler. Assign an alarm report to the job.

    Note

    In the alarm report, specify whether to output current or logged alarms.

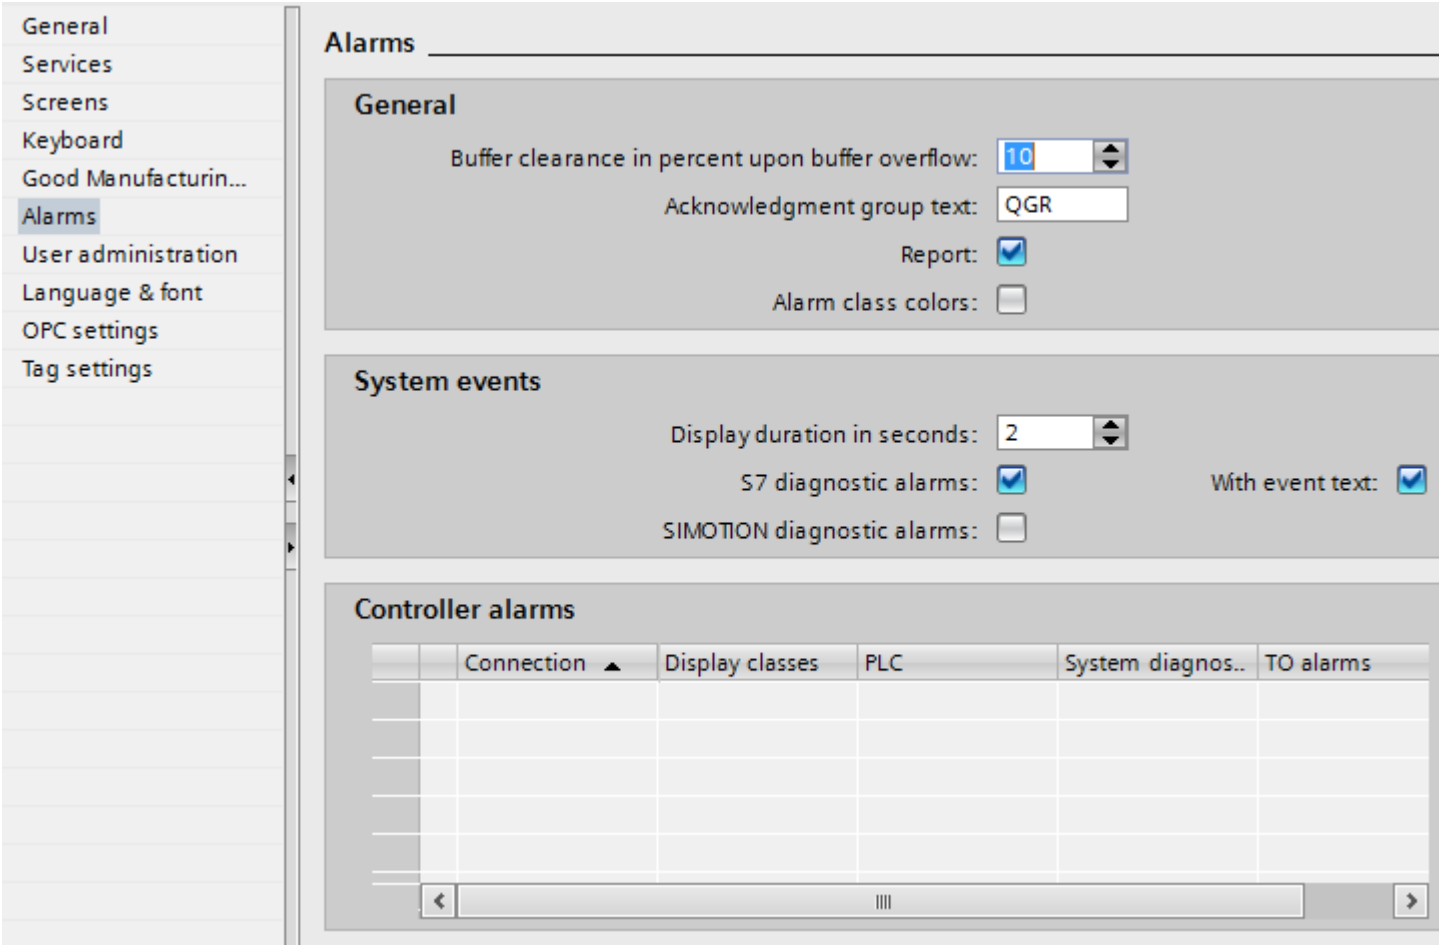
Requirements

- A printer was configured on the HMI device.

Activating continuous alarm reporting

To activate continuous reporting of alarms, follow these steps:

1. Double-click "Runtime settings" in the project navigation.
2. Select "Alarms > General > Report".



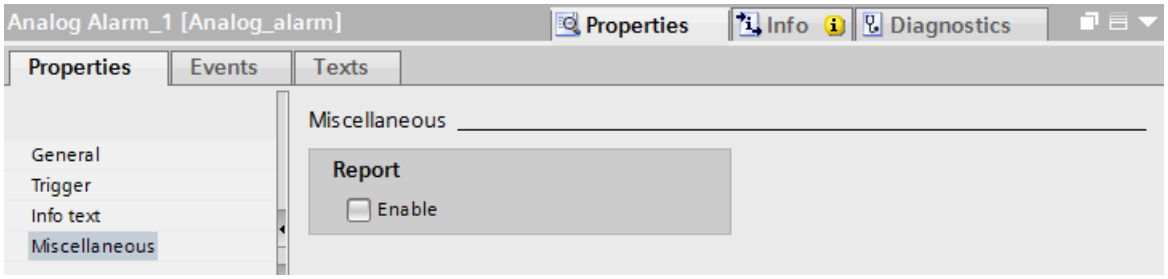
Result

The latest alarms are output at the printer of the HMI device.

Excluding an alarm from reporting

To exclude specific alarms from reporting, proceed as follows:

1. Open the "HMI alarms" editor.
2. Select the alarm to exclude from reporting on the tab of the selected alarm type.
3. In the Inspector window, disable "Properties > Properties > Miscellaneous > Report".



Result

WinCC does not output these alarms currently on the connected printer.

See also

Working with reports (Page 5618)

12.3.2.4 Acknowledging alarms

Configuring alarm acknowledgment by means of alarm class (Basic Panels, Panels, RT Advanced)

Introduction

To configure an alarm with alarm acknowledgment, assign it to an alarm class with the "Alarm with single acknowledgment" state machine.

Requirement

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.

Selecting the state machines for an alarm class

The state machine for a predefined alarm class has already been set. You can only set the state machines for user-defined alarm classes. Proceed as follows:

1. In the "HMI alarms" editor, click the "Alarm class" tab and select the alarm class.
2. Select the required acknowledgment model under "Properties > Properties > Acknowledgment" in the Inspector window.

Assign alarms to an alarm class requiring acknowledgment

Proceed as follows to assign an alarm to an alarm class requiring acknowledgment.

1. In the "HMI alarms" editor, click the tab for the alarm type and select the alarm.
2. Under "Properties > Properties > General" in the Inspector window, select the alarm class of the alarm.

Result

The alarm will not disappear in Runtime until it is acknowledged by the operator.

Configuring trigger for alarm acknowledgment (Basic Panels, Panels, RT Advanced)

Introduction

You always specify the acknowledgment requirement for an alarm using the alarm class. Then the operator acknowledges the alarm using the "ACK" function key of the HMI device or the "Acknowledgment" button of the alarm view.

The following options are also available to trigger acknowledgment:

- Configuring a button to acknowledge an alarm
- Acknowledgment of a Discrete Alarm by the PLC

Requirements

- The "HMI alarms" editor is open.
- The required alarm class has been created.
- The required alarm has been created.
- An alarm view and a button are created in the "Screens" editor.

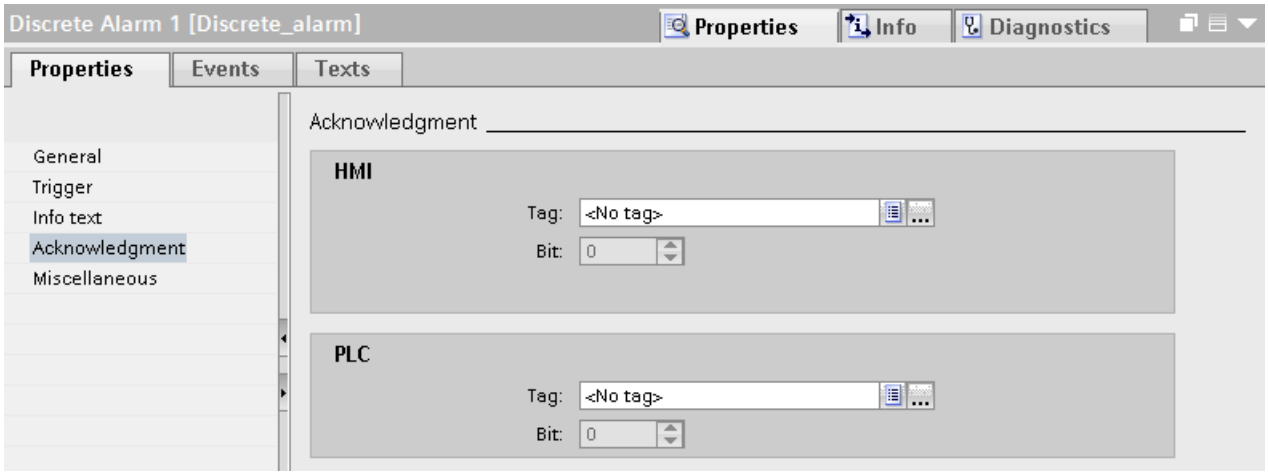
Configuring a button to acknowledge an alarm

To configure a button for acknowledging an alarm, proceed as follows:

1. Select the button in the "Screens" editor.
2. Under "Properties > Events" in the Inspector window, assign the "AlarmViewAcknowledgeAlarm" system function to the "Click" event.
3. Select the alarm view as parameter.

Acknowledgment of a Discrete Alarm by the PLC

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select the tag and the bit that acknowledges the PLC alarm under "Properties > Properties > Acknowledgment > PLC".



Acknowledging alarms in an alarm group

The various acknowledgment options have the following effect in alarm groups:

- Operator acknowledges the alarm
  You acknowledge the alarm of an alarm group, for example, using the <ACK> acknowledgment key or a function key. All alarms of the alarm group are acknowledged.
- The PLC acknowledges the alarm
  The alarm of an alarm group is acknowledged by setting a bit in the tag.
  Only the alarm to be acknowledged is acknowledged.

Sending alarm acknowledgments to the PLC (Basic Panels, Panels, RT Advanced)

Requirement

- The "HMI alarms" editor is open.
- The required alarm has been created and assigned to an alarm class requiring acknowledgment.

Note

You cannot send the acknowledgment of analog alarms to the PLC.

Sending alarm acknowledgments to the PLC

To configure that acknowledgment of an alarm is sent to the PLC, follow these steps:

1. In the "HMI alarms" editor, click the "Discrete alarm" tab and select the discrete alarm.
2. In the Inspector window, select "Properties > Properties > Acknowledgment".
3. Under "HMI", select the tag and the bit set by the alarm acknowledgment function.

Note

The HMI device and PLC only have read access to the acknowledgment tag memory area.

Result

If the operator acknowledges the alarm in Runtime, the operating step is forwarded to the PLC.

12.3.3 Logging Alarms (Basic Panels, Panels, RT Advanced)

12.3.3.1 Alarm Logging Basics (Basic Panels, Panels, RT Advanced)

Introduction

An alarm log is used to record project alarms.

Note

Alarm logging is not available for every HMI device.

Configuration steps

To log an alarm, follow these configuration steps:

1. Creating an alarm log
   You define the following properties for the alarm log:
   - Logging method
     Behavior of the log when reaching a specific fill level
   - Storage location and file format
   - Log size
   - Runtime start characteristics
2. Assigning an alarm log to an alarm class
   You can log the alarms from multiple alarm classes in an alarm log.
3. Assigning an alarm to a loggable alarm class
4. Configure display of logged alarms in an alarm view

Content of the alarm log

All states are logged for configured alarms. The following three entries, for example, are stored in the log for an alarm that requires acknowledgment:

- 04.08.2007 10:00:25:520, analog alarm, ID5, **K**, error, fill level exceeded by 10%
- 04.08.2007 10:01:20:442, analog alarm, ID5, **Q**, error, fill level exceeded by 10%
- 04.08.2007 10:01:30:112, analog alarm, ID5, **G**, error, fill level exceeded by 10%

In the example, the alarm states are identified by the following letters:

K = Incoming

Q = Acknowledged

G = Outgoing

All data belonging to an alarm is stored in the alarm log, including configuration data such as the alarm class, time stamp, and alarm text.

The potential number of logged alarms depends on the data medium used. You can further process the logged alarms in other programs for analysis purposes, for example.

Note

Alarm text and point of error are only logged if you have configured such a setting in the log properties.

Logged alarms that contain alarm text and the point of error exceed the estimated size of the configured alarms. Check to see whether the specified storage location still has sufficient space.

Note

The time stamp of a logged alarm is always specified in standard UTC format (Universal Time Coordinated).

Logging methods

The logging method determines how the alarm log responds when the configured size is reached. WinCC supports the following logging methods:

- Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
- Segmented circular log
  In a segmented circular log, multiple single logs of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.
- Log with level-dependent system alarm
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the configured size of the log has been reached, new alarm events are not logged.
- Log with level-dependent execution of system functions
  When the log is completely full, the "Overflow" event is triggered. You configure a function list for the event.
  When the configured size of the log has been reached, new alarm events are not logged.

Displaying logged data

On the HMI device, the logged data is displayed in an alarm view that is configured for this purpose.

See also

Checksums for logs in regulated projects (Page 5466)

Configuring alarm buffer overflow (Page 5461)

12.3.3.2 Creating an alarm log (Basic Panels, Panels, RT Advanced)

Introduction

In Runtime, you save alarms to the alarm logs. Specify the alarm log in the alarm class. An alarm log contains the alarms of several alarm classes. Create the alarm log in the "Logs" editor. When creating an alarm log, define the following parameters:

- Name
- Size
- Storage location
- Runtime start characteristics
- Log type
- Advanced content
- Checksum

You can also enter comments for each log.

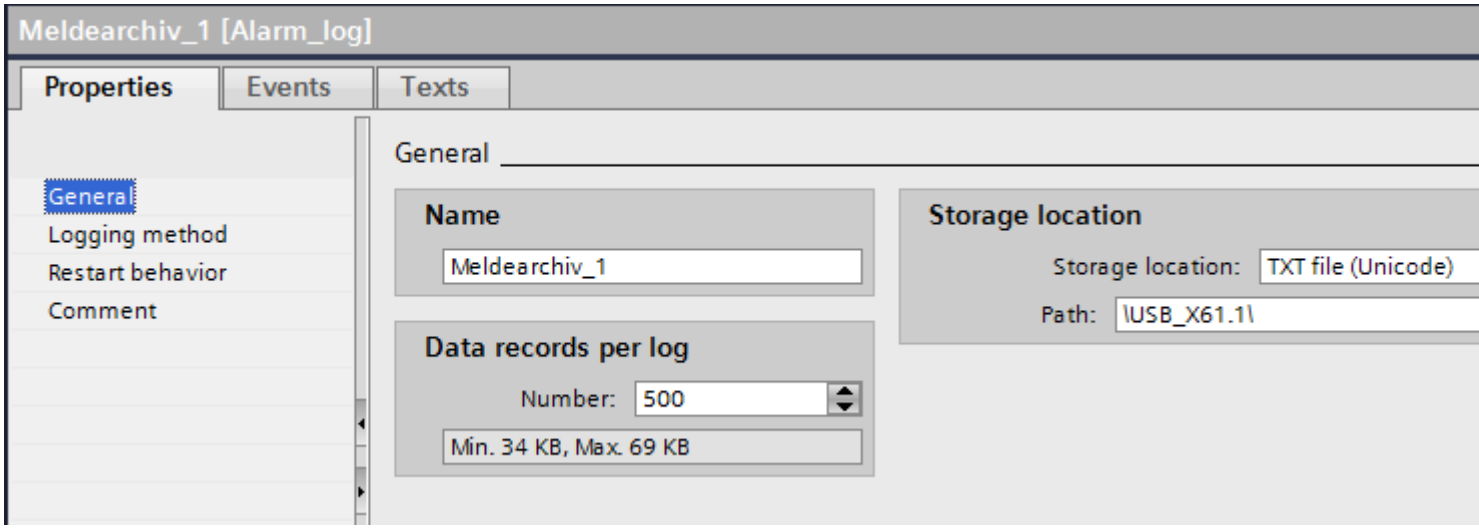
Requirement

- The "Alarm log" tab is open in the "Log" editor.
- The Inspector window is open.

Procedure

To create an alarm log, proceed as follows:

1. Double-click "<Add>" in the table.
   A new alarm log is created.
2. Under "Properties > Properties > General" in the Inspector window, enter a unique name for the alarm log.



3. Under "Number of data records per log", define the number of alarms to be saved to a log file.
   The approximate space required on the storage medium is displayed. Memory space requirements will increase accordingly if you log alarm texts with tag values.
4. In the "Storage location" field you select where the log entries are saved.
5. Depending on the selected "Storage location", you either select the "Path" or the "Name of the data source".

6. To determine if audit trail data were changed at a later time, activate "Properties > Properties > General > Checksum".

   Note
   Device dependency

   The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

7. If necessary, enter a descriptive text in the "Comment" category to document your configuration.

Result

The alarm log is created. You can assign one or several alarm classes to this alarm log.

See also

Managing logging behavior when Runtime starts (Page 5468)

Controlling the Logging in relation to the Fill Level (Page 5469)

12.3.3.3 Logging Alarms (Basic Panels, Panels, RT Advanced)

Overview

To log alarms, follow these steps:

- Create an alarm log.
- Assign the created alarm log to an alarm class.
- Assign the alarm class with the created alarm log to an alarm.
- In the Runtime settings specify the language in which you want to write the logs.
- You evaluate logged alarms.
  You can analyze the logged alarms directly in your WinCC project, such as in an alarm view, or in another user program, such as Microsoft Excel.

  Note
  Tag fields in the alarm text

  The sequence of tag fields in the alarm text is language dependent. The sequence of the Runtime language is used for logging alarms to a "*.csv" log file.

  Changing the tag of an output field in one language causes the modified output field to appear at the end of the alarm text in all other languages. This means the sequence of the output fields in the log file can change.

Requirements

- You have created an alarm log.
- The "HMI alarms" editor is open.

Assigning an alarm log to an alarm class

To assign the alarm log to an alarm class, proceed as follows:

1. Open the "Alarm classes" tab in the "HMI alarms" editor.
2. Select the required alarm class.
3. Under "Properties > Properties > General > Log" in the Inspector window, select the alarm log.

Assign alarm to an alarm class

To assign an alarm to the alarm class, proceed as follows:

1. In the "HMI alarms" editor, open the "Analog alarms" tab, or the "Discrete alarms" tab.
2. Select the required alarm.
3. Under "Properties > Properties > General > Alarm class" in the Inspection window, select the alarm class for which the alarm log was configured.

Result

The alarm is saved to the configured alarm log.

12.3.3.4 Configuring an alarm view for logged alarms (Basic Panels, Panels, RT Advanced)

Introduction

In Runtime, logged alarms are displayed in an alarm view or alarm window.

Requirements

- An alarm view or alarm window is configured in the "Screens" editor
- An alarm log was created in the "Log" editor.
- The alarms are assigned the "loggable" attribute in the "HMI alarms" editor.

Configuring an alarm view for logged alarms

To configure an alarm view for logged alarms, proceed as follows:

1. Open the screen with the alarm view and select the alarm view.
2. In the Inspector window, select "Properties > Properties > General > Alarm log".

3. Click the "...." button and select the alarm log.
4. Continue to configure the alarm view as for the display of current alarms.

Result

In Runtime, the logged alarms are output in the alarm view.

12.3.3.5 Configuring alarm buffer overflow (Basic Panels, Panels, RT Advanced)

Introduction

The size of the alarm buffer depends on the type of HMI device. In WinCC, specify the percentage of the alarm buffer to be deleted on alarm buffer overflow.

Requirements

- You have created a project.

Procedure

To configure the response to an alarm buffer overflow, follow these steps:

1. Double-click "Runtime settings" in the project navigation under your HMI device.
2. Under "Alarms > General > Buffer clearance in percent upon buffer overflow", enter a value between 1 and 100.
   This value specifies the percentage of the alarm buffer that is deleted on alarm buffer overflow.

Result

If data in the alarm buffer exceeds the resources of alarm buffer memory, the configured percentage of data will be deleted from the oldest alarms in the alarm buffer.

Note

You cannot check the alarm buffer overflow separately by alarm method. You can use the "ClearAlarmBuffer" system function to delete specific alarms of specific alarm classes from the alarm buffer.

See also

Alarm Logging Basics (Page 5455)

12.3.3.6 Direct access to the ODBC log database (Panels, RT Advanced)

Overview

The storage location of a log can be a database or a file.

The database is addressed by means of its "Data source name" (DSN). Select the database to be used in WinCC as follows:

Select the database from the Windows Start menu under "Settings > Control panel > ODBC Data Sources".

In your configuration, specify the "Data source name" (DSN) instead of a directory name as storage path for log data. With the DSN, you are referencing the database and the storage location.

The entire functional scope of the database is available for additional processing and evaluation of log data.

Application

The data source sets up the connection to the database. Create the data source on the same PC on which the Runtime software is stored. Then enter the DSN configured on this PC when you create a log in WinCC.

The ODBC interface allows you to use other programs, such as MS Access or MS SQL Server, to access the database directly.

In addition, you can use the "StartProgram" system function to configure program calls, e.g. MS Access, on the HMI device. Runtime is not interrupted while you configure such calls.

12.3.3.7 Setting up the ODBC data source (Panels, RT Advanced)

Introduction

To store process values or alarms in the log database in Runtime, set up the ODBC data source.

Requirement

- A log database has been created.
  You create the log database using the SQL Enterprise Manager. You can find more detailed information on how to do this from Microsoft.

Procedure

To set up an ODBC data source, follow these steps:

1. In Control Panel, open "Administrative Tools" and select "Data Sources (ODBC)".
   The "ODBC Data Source Administrator" dialog is opened.
2. Click "User DSN > Add".

3. Select the "SQL-Server and click on "Finish".
4. In the dialog that follows, enter a name for the User DSN and the SQL-Server and click on "Next".
5. In the dialog that follows, define the logon procedure for the SQL database and click on "Next".
6. Activate "Change the default database to".
7. Select the database you have created and click on "Next".
8. In the dialog that follows, click "Finish".

12.3.3.8 Configuring a checksum for a log (Basic Panels, Panels, RT Advanced)

Introduction

In a regulated project, you have the option of assigning a checksum to the log data of an data log or alarm log. This checksum can be used during plant operation to determine if the data of this log has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

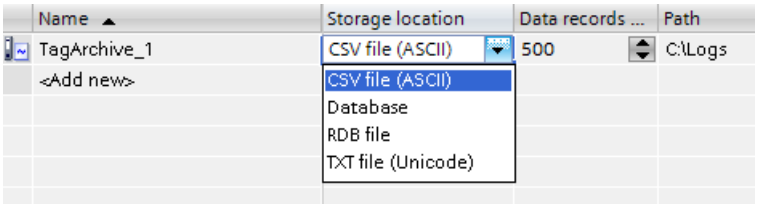
Requirements

- GMP compliant configuration is enabled.
- A data log or alarm log has been created.

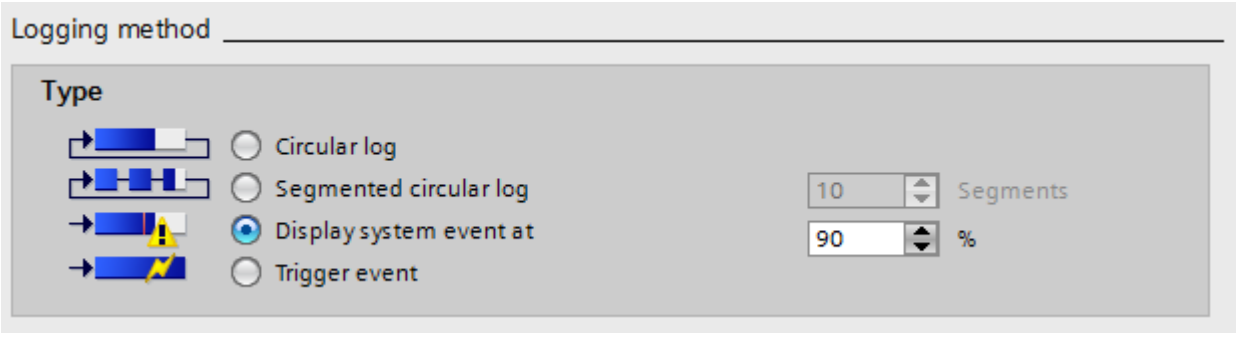
Procedure

Proceed as follows to configure a data log or alarm log for the use of a checksum:

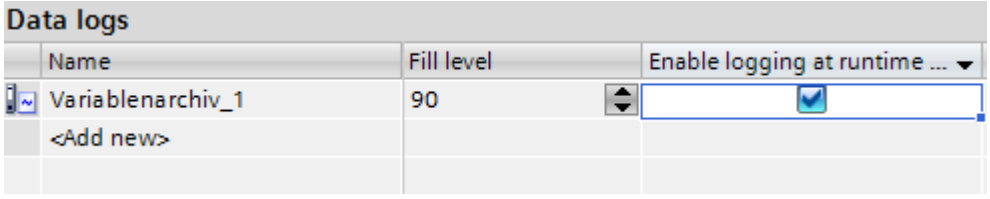
1. Open the data log or alarm log in the corresponding log editor.
2. In the "Storage location" box, select "File - CSV (ASCII)" or "File - TXT (Unicode)".



3. Under "Properties > Properties > Logging method" in the Inspector window, select the option "Display system event at" or "Trigger event".



4. In the editor table, activate the option "Enable checksum".
5. In the editor table, activate the option "Enable logging at runtime start".
   Columns that are not displayed are activated with the shortcut menu of the column title.



6. Save the project.

Result

The log data of the log is assigned a checksum in runtime.

See also

Checksums for logs in regulated projects (Page 5466)

12.3.3.9 Evaluating the checksum of log data (Basic Panels, Panels, RT Advanced)

Introduction

If you have configured a data log or alarm log with generation of a checksum, you can check if the log data has subsequently changed.

Note

Device dependency

The "Checksum" option is only available for display and HMI devices which support "Configuration conforms to GMP".

The DOS program "HmiCheckLogIntegrity" is available for checking the integrity of the log data.

The "HmiCheckLogIntegrity" program supports verification of the following files:

- Log files of alarm logs, data logs, and Audit in CSV format
- Log files of alarm logs, data logs, and Audit in TXT format
- Recipe data records in CSV format
- Recipe data records in TXT format

You can find the "HmiCheckLogIntegrity.exe" program in the installation directory of WinCC under the folder "WinCC Runtime Advanced", for example <C:\Program Files\Siemens \Automation WinCC Runtime Advanced>.

Note

Audit Trail and Log with Checksum

Before you update WinCC with a Service Pack or a new version, exit and save the Audit Trail or the logs using checksum. After WinCC is updated, the audit trail or logs will be continued with new files using checksum.

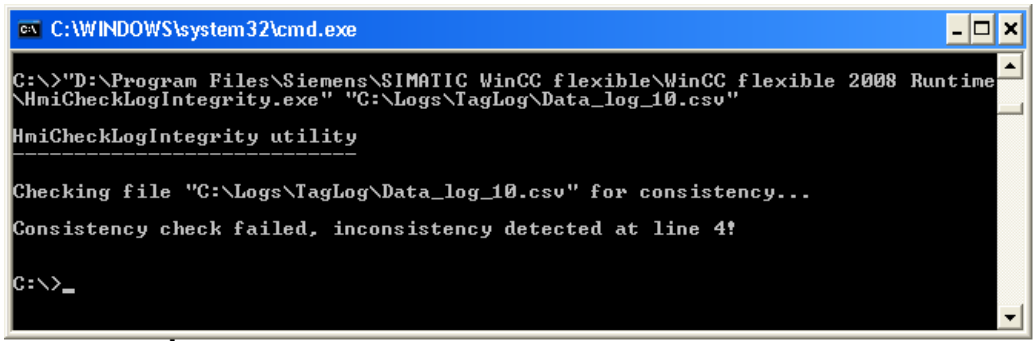
Make sure that the logs are started at a defined state with the new version.

Procedure

1. Copy the file to be checked from the HMI device to your configuration computer.
2. Open a command line prompt with "Start > Programs > Accessories > Command Prompt".
3. Enter the path to "HmiCheckLogIntegrity.exe" followed by a space in the command line prompt. After the space, enter the storage location of the file to be checked within quotation marks.

4. Press <Enter>.
5. The check is performed.
   When the checked data are consistent, the "Consistency check succeeded" message appears.

   When the checked data are inconsistent, the "Consistency check failed" message appears. Information about the first inconsistent line in the file is also displayed.



Note

If there are spaces in the path to the "HmiCheckLogIntegrity.exe" program, you need to specify the path in quotation marks.

You can also check the integrity of the log data with the AuditViewer.

See also

Checksums for logs in regulated projects (Page 5466)

12.3.3.10 Checksums for logs in regulated projects (Basic Panels, Panels, RT Advanced)

Checksums in regulated projects

With WinCC you configure regulated projects as required by FDA guidelines, if necessary. Use the "Audit" option to create regulated projects.

In regulated projects you supply a checksum for the logged data of an alarm log. The operator will use this checksum during operation of the plant to see if the data of an alarm log have been changed.

For the checksum to be clear, it starts with the first line of an alarm log and integrates the previous lines when continuously generating the checksum. This means a checksum can only be generated for the following logs:

- Log that sends a system alarm when it is full
- Log with execution of system functions when log is full.

Generation of a checksum is also available for alarm logs that are saved as files of the "*.csv" or "*.txt" (Unicode) format.

If you want to continue an existing log without checksum as one with checksum, a backup copy of the existing log is created in the "*.keep" file format. A new log with checksums is created.

To maintain the validity of checksums, the following limitations apply when using the system function "CopyLog":

- You cannot copy a log without checksums into a log with checksums.
- You cannot copy a log with checksums into a log without checksums.

See also

Alarm Logging Basics (Page 5455)

Configuring a checksum for a log (Page 5463)

Evaluating the checksum of log data (Page 5464)

12.3.3.11 Log response to language switching in runtime (Basic Panels, Panels, RT Advanced)

Introduction

In the Runtime settings of your HMI device, select the language to be used for writing to logs in runtime.

Requirement

- The languages used in your project are activated in the "Project languages" editor, for example, "German (Germany)" and "English (USA)" .

Procedure

To determine the startup language, follow these steps:

1. Select "Runtime settings > Language and fonts" in the project navigation.
2. Activate the runtime language, for example, "German (Germany)" and "English (USA)".

3. Set the "Language switch order". Use 0 to determine the startup language, for example:
   - German 0.
   - English 1
     With "0", German is specified as the "Startup language".
4. Select "Runtime settings > General" in the project navigation.
5. Select the "Logs > Logging language > Startup language".

Result

The project starts after it is transferred. German is specified as the "Startup language" with "Language switch order". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

The operator closes runtime. Due to the previously performed language switch, the next time the system starts the "startup language" is English. Since English is the startup language, the logs are now written in English.

The logging language remains English even when the language is switched again in runtime until runtime is closed once again.

If you use another option instead of "Startup language" to select the language, the logs are always written in the same language. This is true regardless of the language selected by the operator in runtime.

See also

Sending and automatically updating complete alarm from the controller to the HMI device (Page 5484)

12.3.3.12 Managing logging behavior when Runtime starts (Basic Panels, Panels, RT Advanced)

Introduction

When you configure a log, you define the restart characteristics of the log when Runtime is started. You define whether the logging should start when Runtime starts in the log properties. You can also define whether an existing log will be continued or overwritten.

You define the restart characteristics separately for each log.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

To configure the restart characteristics of a data log, proceed as follows:

1. Select the log for which you want to define the restart characteristics in the "Historical Data" editor.
2. In the Inspector window select "Properties > Properties > Restart behavior".
3. If you want logging to start when Runtime starts, enable the "Enable logging at runtime start" option in the "Logging" area.
   You can also start logging in Runtime using the "StartLogging" system function, for example.
4. Select the restart behavior of the log in the "Log handling at restart" area.
   - The logged values are deleted and logging is started again with the option "Reset log".
   - The option "Append data to existing log" is used to append the values to be logged to the existing log.

Alternatively you can configure the restart characteristics of a log directly in the "Historical Data" editor. To view hidden columns, activate the column titles using the shortcut menu.

Result

Logging will start in runtime according to your settings.

12.3.3.13 Controlling the Logging in relation to the Fill Level (Basic Panels, Panels, RT Advanced)

Introduction

The size of a log is determined by the number of entries. You use the logging method to determine how the log responds when it is full.

Logging methods

The following logging methods are available:

- Circular log
  When the configured log size has been reached, the oldest entries are deleted. When the configured log size has been reached, approximately 20% of the oldest entries are deleted. It is therefore not possible to display all the configured entries. During configuration, select an appropriate size for the circulation log. Alternatively, configure a segmented circular log.
- Segmented circular log
  In a segmented circular log, multiple log segments of the same size are filled in succession. When all logs are completely full, the oldest log is overwritten.

- Log that sends a system alarm when it is full
  When a defined level is reached, such as 90 %, a system alarm is triggered. When the log is 100% full, new tag values are not logged.
- Log with level-dependent triggering of an event.
  When the log is completely full, the "Overflow" event is triggered. Configure a function list for the event that will be carried out when the "Overflow" event occurs. When the configured size of the log is reached, new tag values are not logged.
  The following system functions are available for further processing of full logs: For further details, refer to AUTOHOTSPOT.

Requirement

- You have created a log.
- The "Historical Data" editor is open.
- The Inspector window with the log properties is open.

Procedure

1. Select the log for which you want to define the logging method in the "Historical Data" editor.
2. Select "Properties > Properties > Logging method" in the Inspector window and select the required logging method.
3. If you have selected the "Segmented circular log" type, enter the number of log segments.
   If you selected a log with the "Display system alarm on" setting, specify the level as a percentage at which a system alarm is to be triggered.
   If you selected the "Trigger event" setting, configure the function list in the "Events" group.

Alternatively you can configure the logging method directly in the "Historical Data" editor table. To view hidden columns, activate the column titles using the shortcut menu.

The "Overflow" event is not available in the editor table. You must therefore configure the function list in the Inspector window.

Result

The selected log responds according to the settings in Runtime.

12.3.4 Using Alarms in Runtime

12.3.4.1 Alarms in Runtime (Basic Panels)

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge
- Loop-in-alarm

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"
  Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this class do not require acknowledgement.
- "Errors"
  Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"
  System alarms indicate states or events which occur on the HMI device.
  System alarms provide information on occurrences such as operator errors or communication faults.
- Custom alarm classes
  The properties of this alarm class must be defined in the configuration.

Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

Alarm view

The alarm view shows selected alarms or alarm events from the alarm buffer. Whether alarm events have to be acknowledged or not is specified in your configuration.

Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active.

You can configure the order in which the alarms are displayed. You can choose to display the alarms in ascending or descending order of their occurrence. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string will be shown.

Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

12.3.4.2 Alarms in Runtime (Panels, RT Advanced)

Alarms

Alarms indicate events and states on the HMI device which have occurred in the system, in the process or on the HMI device itself. A status is reported when it is received.

An alarm could trigger one of the following alarm events:

- Incoming
- Outgoing
- Acknowledge

The configuration engineer defines which alarms must be acknowledged by the user.

An alarm may contain the following information:

- Date
- Time
- Alarm text
- Location of fault
- Status
- Alarm class
- Alarm number
- Alarm group

Alarm classes

Alarms are assigned to various alarm classes.

- "Warnings"
  Alarms of this class usually indicate states of a plant such as "Motor switched on". Alarms in this alarm class do not require acknowledgment.
- "Errors"
  Alarms in this class must always be acknowledged. Error alarms normally indicate critical errors within the plant such as "Motor temperature too high".
- "System"
  System alarms indicate states or events which occur on the HMI device.
  System alarms provide information on occurrences such as operator errors or communication faults.
- "Diagnosis Events"
  SIMATIC diagnostic alarms show states and events in the SIMATIC S7 controller.
- "Safety Warnings"
  The "Safety Warnings" alarm class shows alarms for fail-safe operation. Users do not acknowledge alarms from this alarm class.
- STEP 7 alarm classes
  The alarm classes configured in STEP 7 are also available to the HMI device.
- Custom alarm classes
  The properties of this alarm class are defined in the configuration.

Alarm buffer

Alarm events are saved to an internal buffer. The size of this alarm buffer depends on the HMI device type.

Alarm report

When alarm logging is enabled in the project, alarms are output directly to the printer.

You can set the logging function separately for each alarm. Printing of such an alarm is initiated when the "incoming" and "outgoing" alarm events are generated.

The output of alarms of the "System" alarm class to a printer must be initiated by means of the corresponding alarm buffer. This outputs the content of the alarm buffer to the printer. To be able to initiate this print function, you need to configure an operating element in the project.

Alarm log

Alarm events are stored in an alarm log, provided this log file is configured. The capacity of the log file is limited by the storage medium and system limits.

Alarm view

The alarm view shows selected alarms or events from the alarm buffer or alarm log. Whether alarm events have to be acknowledged or not is specified in your configuration. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string in their alarm text are shown.

Alarm window

The alarm window is not assigned to any screen. Depending on the configuration the alarm window is opened when an alarm that belongs to a specific alarm class is active. Depending on the configuration, it is not closed until the alarm is acknowledged.

You can configure the order in which the alarms are displayed. At the first position, the current, or the oldest alarm will be displayed. The alarm window can also be set to indicate the exact location of the fault, including the date and time of the alarm event. By means of configuration, the display can be filtered in such a way that only alarms that contain a specific character string in their alarm text are shown.

Alarm indicator

The alarm indicator is a graphic symbol that is displayed on the screen when an alarm of the specified alarm class is activated.

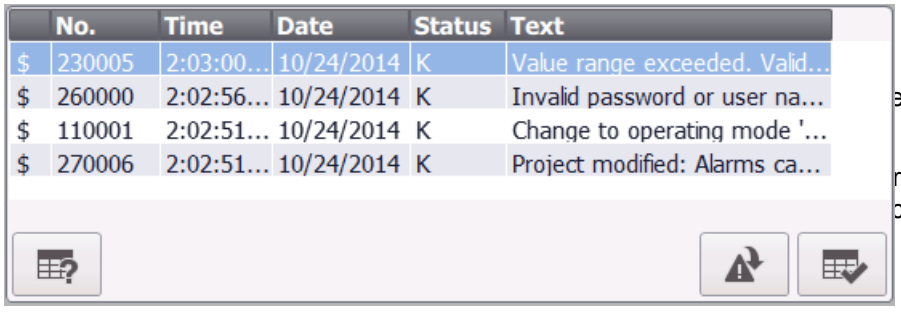
The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

12.3.4.3 Using the Alarm Window or Alarm View (Panels, RT Advanced)

Alarm window, alarm view in Runtime (Panels, RT Advanced)

Application



evice. The layout

ration the alarm

ctive. Depending

Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed. If a filter is configured, only alarms that contain a specific string in the alarm text will be displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Symbol	Alarm class
!	"Errors"
Empty	"Warnings"
depends on the configuration	Custom alarm classes
$	"System"
S7	"Diagnosis Event"
!!	"Safety Warnings"

Operation

You use the alarm view as follows, depending on how it is configured:

- Change the order of the columns.
- Change the order in which the alarms are displayed.
- Acknowledging alarms
- Editing alarms

Operator controls

The buttons have the following functions:

Button	Function
	Displaying a tooltip for an alarm
	Loop-In-Alarm Changes to the screen that contains information about the error event
	Acknowledge alarm

Operation behavior

Linked alarm window for touch panels

When configuring the alarm window for keyboard units, enable the "Connected" (modal) property under "Properties > Mode". This ensures that the alarm window does not defocus during screen changes. Switching back and forth between the screen and different windows with <Ctrl+TAB> is not supported. If the linked alarm window has the focus, then the buttons

in the screen behind it cannot be operated. The functions configured on a function key are carried out.

Changing the order of the displayed alarms

When you click on the column, first of all alarms requiring acknowledgment are sorted according to date and time. Then those alarms that do not require acknowledgment are sorted according to date and time.

Using the Alarm Window, Alarm View (Panels, RT Advanced)

Introduction

As an alternative to using the mouse, you can operate the alarm view and the alarm window using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

Change the order of the columns

1. Select the column header, such as the "Date" column header.
2. While holding down the mouse button, drag the column header to the column header "Time". The "Date" column is in front of the "Time" column.

Change the sorting

You can sort the list according to date or time.

1. Click on the corresponding column header.
   The list is sorted in descending or ascending order according to this criterion.
2. Click the same column header again to reverse the sort order.

Acknowledge alarm

1. Click on the alarm to be edited.
2. Click the button.

Loop-In-Alarm trigger

1. Click on the alarm to be edited.
2. Click the button.
   The screen containing information about the alarm is displayed.

Note

If you trigger a Loop-In-Alarm during an unacknowledged alarm, it is acknowledged automatically.

Displaying configured tooltip

1. Click on the alarm concerned.
2. Click the button.
   The tooltip configured for the alarm is displayed.

12.3.4.4 Using the Simple Alarm Window, Alarm View

Basic alarm view, alarm window in Runtime (Basic Panels, Panels, RT Advanced)

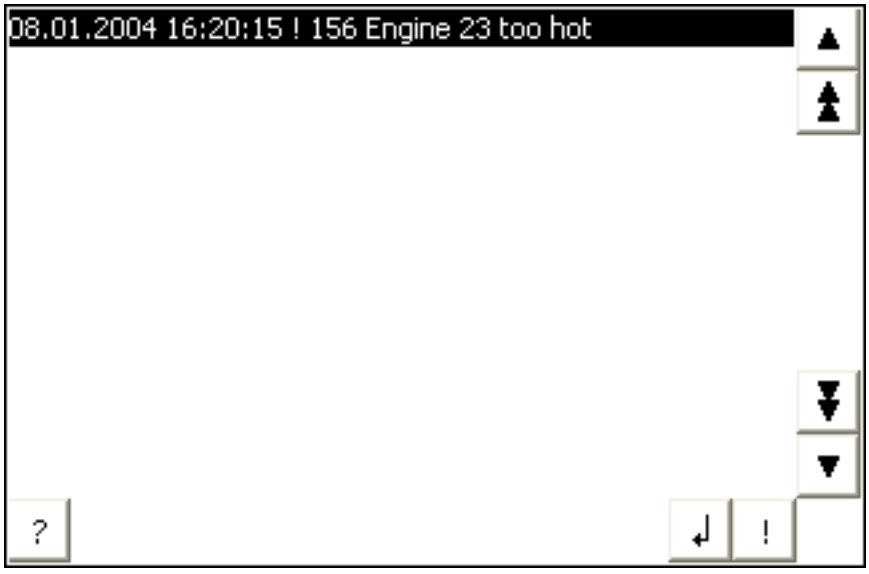
Application

The simple alarm view shows selected alarms or alarm events from the alarm buffer. The layout and operation of the simple alarm window correspond to that of the simple alarm view.

Note

The "Single alarm view" object is not assigned dynamic functions by means of scripting.

In the Engineering System, for example, dynamize the visibility of an object in the "Animations" tab of the Inspector window. In Runtime, the "Simple alarm view" does not support animations. If you configured an animation and, for example, run a consistency check on the project, an error alarm is displayed in the output window.



Layout

Depending on the configuration, in the alarm view different columns with information regarding an alarm or an alarm event are displayed.

To differentiate between the different alarm classes, the first column in the alarm view contains an icon:

Icon	Alarm class
!	"Errors"
empty	"Warnings"
depends on the configuration	Custom alarm classes
$	"System"

Operation

You use the alarm view as follows, depending on how it is configured:

- Acknowledging alarms
- Editing alarms

Control elements

The buttons have the following functions:

Button	Function
!	Acknowledge alarm
↲	Loop-In-Alarm Changes to the screen that contains information about the error event

Button	Function
?	Displaying a tooltip for an alarm
▶	Displays the full text of the selected alarm in a separate window, namely the alarm text window In the alarm text window, you can view alarm texts that exceed the space available in the Alarm view. Close the alarm text window with the ✕ button.
▲	Scrolls one alarm up.
⏫	Scrolls one page up in the alarm view.
⏬	Scrolls one page down in the alarm view.
▼	Scrolls one alarm down.

Format of the control elements

The display of the buttons for using the simple alarm view depends on the configured size. You should therefore check on the HMI device whether all the required buttons are available.

Basic alarm view, using the alarm window (Basic Panels, Panels, RT Advanced)

Introduction

As an alternative to using the mouse, you can operate the simple alarm view using the <TAB> key on your HMI device. This allows you to select the button and the most recently selected alarm in the alarm view. Depending on the configuration, you can also operate the alarm view via the function keys.

Operation using the mouse

1. Select the alarm to be edited.
2. Click the button whose function you want to run.

Operation using the keyboard

1. Press the <Tab> key until the list of displayed alarms is selected in the alarm view.
2. Click on the alarm to be edited. Use the <Up> and <Down> keys accordingly.
3. Press the <Tab> key until the button whose function you wish to use is selected.
4. Press <Enter>.

Acknowledge alarm

1. Select the alarm to be acknowledged.
2. Click the ! button.

Loop-In-Alarm trigger

1. Select the alarm to be edited.
2. Click the ↲ button.
   The screen containing information about the alarm is displayed.

Calling the infotext

1. Select the alarm to be edited.
2. Click the ? button.
3. To close the window for displaying the operator note, press the ✕ button or use the key combination <Alt+F4>.

12.3.4.5 Using the Alarm Indicator

Alarm indicator in Runtime (Basic Panels, Panels, RT Advanced)

Application

The alarm indicator is displayed if alarms of the specified alarm class are pending or require acknowledgment.

Layout

The alarm indicator can have one of two states:

- Flashing: At least one unacknowledged alarm is pending.
- Static: The alarms are acknowledged but at least one of them is not yet deactivated. The number indicates the number of queued alarms.

Operation

Depending on the configuration, when operating the alarm indicator an alarm window is opened. The icons from the symbol library can only be operated with a mouse or touch screen.

Note

Device dependency

Operation with mouse is not available for all HMI devices.

Operating the alarm indicator using the mouse (Panels, RT Advanced)

Operation using the mouse

1. Click on the alarm indicator with the mouse pointer. Depending on the configuration, the Alarm window is open.
2. Click to close the alarm window. The Alarm window can be opened again by clicking on the alarm indicator.

12.3.4.6 Acknowledging alarms (Basic Panels, Panels, RT Advanced)

Introduction

You can acknowledge alarms in Runtime according to your project configuration settings. You can acknowledge alarms as follows:

- Using the display and control object buttons
- Using the "ACK" key on your HMI device
- Using individually-configured function keys or buttons

If an operator authorization is configured for an individual control, the alarms can only be acknowledged by authorized users.

To automatically acknowledge alarms in Runtime, use the system functions and scripts, plus the "Acknowledgment by the PLC" option.

Note

Device dependency

Scripts are not available for all HMI devices.

Acknowledgment variants

You acknowledge individual alarms or multiple alarms together in Runtime. They are distinguished as follows:

- Single acknowledgment
  Acknowledgment of an alarm using a button or a function key.
- Acknowledge alarm groups
  Acknowledgment of all the alarms of an alarm group using a button or a function key.

Requirement

- An alarm is displayed on the HMI device.

Procedure

To acknowledge an alarm, proceed as follows:

1. Select the alarm.
2. If you are using an alarm view or an alarm window, click the button.
3. If you are using a simple alarm view or a simple alarm window, click the button.
4. Press the "ACK" button on your HMI device to acknowledge an alarm in an alarm line.

Note

Device dependency

The extended alarm view or alarm window and the alarm line are not available for all HMI devices.

Result

The alarm status changes to "Acknowledged". If the condition for triggering an alarm no longer applies, the alarm status also changes to "Outgoing", and it is no longer displayed on the HMI device.

12.3.4.7 Filtering Alarms (Panels, RT Advanced)

Introduction

The alarm view in Runtime does not contain a control element for entering filter criteria. To provide this functionality, configure an I/O field using the "Screens" editor.

Requirements

- A filter has been configured for the alarm view.
- An I/O field for entering the criterion is displayed.
- Alarms are displayed in Runtime.

Enable filter

1. Enter the filter string in the I/O field.
2. Confirm your input.
   The alarm view displays only those alarms that are contained in the specified character string. Thereby this distinguishes between upper and lower case letters.

Disable filter

1. Delete the string from the I/O field that is used to filter the alarm view.
2. Confirm your input.
   All alarms are displayed in the alarm view once more.

12.3.5 Displaying security events

12.3.5.1 Displaying security events on the HMI device (Panels, RT Advanced, RT Professional)

Introduction

You can also view security events on the HMI device for existing alarms from WinCC.

Security events are, for example, an attack on a device over the network or a change of the protection level for communication between the controller and the HMI device.

Security events are detected by the controller and forwarded to the HMI devices. The security events are displayed in the alarm log on the HMI devices.

A configuration or activation of the security events functionality is not necessary within the controller. Security events are automatically detected by the controller.

Restrictions

You can display security events from the following controllers on the HMI device:

- SIMATIC S7-1200
- SIMATIC S7-1500

Note

Device dependency

The security events of controllers are not displayed on Basic Panels and Basic Panels 2nd Generation.

Configuring the display of security events

The following steps are required to display security events on the HMI device:

- Selection of controller alarms
- Creation of an alarm log for controller alarms

For more detailed information about configuration, see:Configuring the display of security events (Page 5483)

12.3.5.2 Configuring the display of security events (Panels, RT Advanced, RT Professional)

Requirements

A HMI connection is established between the HMI device and PLC.

Procedure

1. Open the "Runtime settings" of the HMI device.
2. Enable the "Security events" function under "Alarms".

   Note

   The "Security events" function is deactivated by default and must be activated for each HMI connection.

3. Create a new alarm log in the "Log" editor under "Alarm logs".
4. Open an HMI screen.
5. Create an alarm view.

Result

The security events are displayed in the alarm log.

See also

Displaying security events on the HMI device (Page 5483)

12.3.6 Sending complete alarm from the controller to the HMI device

12.3.6.1 Sending and automatically updating complete alarm from the controller to the HMI device (Panels, RT Advanced)

Basics

In addition to alarms in WinCC, you can configure controller alarms in STEP 7 and show them on your HMI device.

When controller alarms are configured in STEP 7, a connection to an S7-1500 controller is established, and controller alarms are currently pending, the controller alarms are automatically updated and sent to the HMI devices after alarm changes (e.g. change of the alarm text). This will save you time because you do not have to load configuration changes of the alarms to the HMI device separately. The HMI device does not need to exit Runtime operation when the alarms are changed.

The following controller alarms can be sent to the HMI device:

- System diagnostics
- ProDiag alarms
- Program alarms

The controller alarms can be sent completely to the HMI devices with device version V14 if the corresponding settings are configured in the controller and on the HMI device. The option "Automatic update" must be activated on the HMI device for the respective connection under

"Runtime settings Alarms > Controller alarms". For additional information on the settings, refer to Configuring automatic update of controller alarms on the HMI device (Page 5486).

Device dependency

The controller alarms of the following controller are sent automatically and completely to the HMI device when they occur:

- SIMATIC S7-1500 (firmware version 2.0 and higher)

Basic Panels and Basic Panels 2nd Generation do not support controller alarms. For Basic Panels and Basic Panels 2nd Generation as well as HMI devices with a device version before V14, configuration changes of the alarms must be loaded to the controller and the HMI device.

When "Automatic update" is deactivated in the HMI device, configuration changes of the alarms must be loaded to the controller and the HMI device.

Note

When upgrading a project to the TIA Portal version V14, the transfer of controller alarms to the HMI device is deactivated under the "Runtime settings" of the HMI device because the connection between the HMI device and the respective controller was created in an older TIA Portal version.

Language settings

For alarms to be displayed in the correct language on the HMI device, the same three languages or fewer must be configured for the alarms in the controller and on the HMI device. You may have to coordinate the language selection with the configuration engineer.

If different languages are configured on the HMI device and in the controller, the HMI device shows the text "###Text missing###" rather than the controller alarms during operation.

Note

If you want to use more than three languages simultaneously on the HMI device, you must deactivate the option for automatic update of the controller alarms. Otherwise, "##Text missing##" is displayed instead of the controller alarms for the fourth and any additional language.

Special considerations for Asian fonts

When using Asian languages, only the Asian characters that were used in configuring the HMI device are loaded to the HMI device during the transfer. If the texts are sent directly from the controller to the HMI device, you may encounter display problems. You can load the complete Asian font to the HMI device in these cases. For more information, refer to Loading Asian fonts to the HMI device (Page 6377).

Notes and rules

- Modified texts that you load to the controller are displayed immediately on the HMI device when the controller alarm has already been triggered.
- The following applies to alarms that are displayed in the alarm log:
  - The alarm log includes alarms in the set language. This language is set during configuration of the HMI device under "Runtime settings > General > Logs > Logging language". Regardless of whether you set a specific language for logging of the controller alarms in the alarm log or select the default language, the respective language must also be activated in the controller. When you specify startup language, this can lead to mixed languages in the alarm log in conjunction with the "Automatic update" option. Additional information on language selection of the log in Runtime is available at Log response to language switching in runtime (Page 5467).
  - The check box "Log event text and error location" must be selected for the respective alarm log under "Properties > Properties > Logging method" so that the logged controller alarms are displayed in the alarm view or in the alarm window.

See also

Editing controller alarms (Page 5429)

PLC alarms (Page 5401)

12.3.6.2 Configuring automatic update of controller alarms on the HMI device (Panels, RT Advanced, RT Professional)

Introduction

The option "Automatic update" is selected by default for all connections between the S7-1500 controllers (firmware version 2.0) and the HMI devices with the device version V14.

If the connection between an HMI device and an S7-1500 controller was created in a TIA Portal version before V14, the option "Automatic update" is deactivated even after upgrading the project to version V14. You can configure automatic updating of the controller alarms later for this connection.

Requirements

- There is an HMI connection between the HMI device and an S7-1500 controller (firmware version 2.0 or later) or a compatible device (for example, WinAC 1500).
- Controller and HMI device have at least version 14 or later.
- "Central alarm management" is activated in the controller (automatic updating was activated for the controller).
- Controller alarms were configured in STEP 7.
- An alarm view or an alarm window was configured on the HMI device.

- The alarm classes associated with the controller alarms are selected in the alarm view or in the alarm window.
- The same three languages (or fewer) are configured in the controller and on the HMI device for alarms.

Procedure

1. Open the "Runtime settings" of the HMI device.
   One or more connections to controllers are displayed under "Alarms > Controller alarms".
2. Activate the "Automatic update" option for the respective connection for which you want to display the controller alarms.
   The "Automatic update" function must be activated separately for each connection.

Note

If the languages configured for the controller differ from those for the HMI device, the alarms cannot be displayed in Runtime. Instead, the alarm "##Text missing##" is displayed.

Note

If you want to use more than three languages simultaneously on the HMI device, you must deactivate the "Automatic update" option. Otherwise, the alarm "##Text missing##" is displayed instead of the controller alarms for the fourth and any additional language.

Result

In Runtime, the controller alarms are displayed in the alarm view.

See also

Sending and automatically updating complete alarm from the controller to the HMI device (Page 5484)

12.3.7 Reference

12.3.7.1 System functions for alarms

System functions

System functions are predefined functions you can use to implement many tasks in runtime, even with no programming knowledge. You use system functions in a function list or in a script.

Note

Device dependency

Scripts are not available for all HMI devices.

The table shows all the system functions available for displaying and editing alarms.

System function	Effect
EditAlarm	Triggers the Loop-In-Alarm event for the selected alarm or for the last selected alarm in case of multiple selection.
ClearAlarmBuffer	Deletes alarms from the alarm buffer on the HMI device.
ClearAlarmBufferProtoolLegacy	Function such as "ClearAlarmBuffer". This system function has been retained to ensure compatibility and uses the old ProTool numbering.
AlarmViewUpdate	Updates the alarm view.
AlarmViewEditAlarm	Triggers the event Loop-In-Alarm for all alarms selected in the specified alarm view.
AlarmViewAcknowledgeAlarm	Acknowledges the alarms that are selected in the specified alarm view.
AlarmViewShowOperatorNotes	Displays the configured tooltip for the alarm selected in the specified alarm view.
AcknowledgeAlarm	Acknowledges all selected alarms.
SetAlarmReportMode	Switches the automatic reporting of alarms on the printer on or off.
ShowAlarmWindow	Hides or shows the alarm window on the HMI device.
ShowSystemEvent	Displays the value of the delivered parameter as a system event on the HMI device.

Note

Device dependency

The following system functions are not available for all HMI devices:

- SetAlarmReportMode
- AlarmViewUpdate
- ShowSystemEvent

12.3.7.2 Alarm events (Basic Panels, Panels, RT Advanced)

Alarm events and their display and control objects

In Runtime, the following alarm events are triggered by their display and control objects. You can configure a function list for every event.

Object	Configurable events
Alarms	Incoming Outgoing Acknowledge Loop-In-Alarm
Alarm view	Enabling Disable Selection changed
Alarm indicator	Click Click when flashing

Note

Device dependency

The following events in the alarm view are not available for all HMI devices:

- Enabling
- Disable
- Selection changed
- Click
- Click when flashing

12.3.7.3 System functions for logs (Panels, RT Advanced, RT Professional)

System functions

The following system functions are available for logging:

Function name	Function method
ArchiveLogFile	This function moves or copies a log to another storage location for long-term archiving. Use the system function, for example, to move the audit trail from a local storage medium to the server. When handling audit trails, always use the "Move log (hmiMove)" mode in order to avoid noncompliance with FDA guidelines as a result of redundant data storage.
LogTag	Saves the value of the given tags in the given data log. Use the system function to log a process values at a specific time.
StartLogging	Starts the logging process in the specified log. You can interrupt logging in Runtime by calling the "StopLogging" system function.
StopLogging	Stops the logging process in the specified log. To resume logging in Runtime, select the "StartLogging" system function.
ClearLog	Deletes all entries in the specified log.
StartNextLog	Stops the logging process in the specified log. Logging is continued in the sequential log that has been configured for the specified log file.
CloseAllLogs	Closes all logs. The connection between WinCC and the log files or log database is terminated. You can use this system function, for example, to enable hot-swapping of the storage medium on the HMI device without exiting the Runtime software.
OpenAllLogs	Opens all logs to resume logging. The connection between WinCC and the log files or log database is recovered.
CopyLog	Copies the contents of the specified log to another log.

12.3.7.4 Structure of *.csv files that contain alarms (Panels, RT Advanced, RT Professional)

Introduction

You can save an alarm log as a file in "*.csv" format. CSV stands for **C**omma **S**eparated **V**alue. In this format, the table columns that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break.

Example of a log file in *.csv format

This example shows a file with logged alarms:

"Time_ms";"MsgProc";"StateAfter";"MsgClass";"MsgNumber";"Var1";...;"Var8";"TimeString";"MsgText";"PLC"37986550590,27;1;1;3;110001;"";...;"";"30.06.99 13:12:51";"Change to operating mode 'online'";37986550682,87;1;1;3;140010;"";...;"";"30.06.99 13:12:59";"Connection established: PLC_1, Station 2, Rack 0, Position 2";

Structure of a log file in *.csv format

The following values are entered in the log file columns:

Parameters	Description
Time_ms	Specify a time stamp as a decimal value (see below for conversion)
Msg_Proc	Alarm procedures: 0 = Unknown alarm procedure 1 = System event 2 = Alarm bit procedure (operating alarms) 3 = Alarm number procedure ALARM_S 4 = Diagnostic event 7 = Analog alarm procedure 100 = Alarm bit procedure (fault alarms)
State after	Alarm event: 0 = Incoming/Outgoing 1 = Incoming 2 = Incoming/Acknowledged/Outgoing 3 = Incoming/Acknowledged 4 = All alarms in the PLC were deleted with SFC106 or after PLC STOP/RUN an alarm is pending 6 = Incoming/Outgoing/Acknowledged
Msg_Class	Alarm class: 0 = No alarm class 1 = "Errors" 2 = "Warnings" 3 = "System" 4 = "Diagnostic Events" 64 ... = user-configured alarm classes
Msg Number	Alarm number
Var1 to Var8	Value of the trigger tag as a STRING
Time string	Time stamp, as STRING in legible data format
Msg text	Alarm in a readable STRING
PLC	Alarm localization (relevant PLC)

Conversion of the time stamp decimal value

To further process the time stamp value using a different program, proceed as follows:

1. Divide Time_ms by 1,000,000.
   Example: 37986476928 : 1,000,000 = 37986.476928
2. The whole number portion (37986) is the date calculated from 12/31/1899.
   In Excel you can now convert the time stamp into days. To do this, assign to the cell that contains the time stamp, a respective format form the "Date" group.
   Result: 37986 results in 12/31/2003
3. The value after the point (0.476928) indicates the time:
   - Multiply the value (0.476928) by 24 to obtain the hours (11.446272).
   - Multiply the remainder (0.446272) by 60 results in the minutes (26.77632).
   - Multiply the remainder (0.77632) by 60 results in the seconds (46.5792).

   Result 11:26:46.579
   This conversion is supported by Microsoft Excel, for example.

12.3.7.5 System events

Basics on system events (Basic Panels, Panels, RT Advanced)

System events

System events on the HMI device provide information about internal states of the HMI device and PLC.

The following overview illustrates when a system event occurs and how to eliminate the cause of error.

Note

HMI device dependency

Some of the system events described in this section apply to the individual HMI devices based on their scope of functions.

Note

System events are output in an alarm view. System events are output in the language currently set on your HMI device.

The time format (AM/PM or 24-hour format) is based on the selected language. If there is no translation of the alarm texts in this language, English or Russian is selected as a replacement language and displays the appropriate time format.

System event parameters

System events may contain encrypted parameters. The parameters are of relevance when troubleshooting because they provide a reference to the source code of the Runtime software. These parameters are output after the "Error code:"

9999 - Global alarm (Panels, RT Advanced)

Meaning of the system event

The most important system events are listed below.

Table 12-2 9999 - Global alarm

Number	Effect/cause	Remedy
9999	The system start was interrupted. Check the following: • Line voltage • Cable connections • System settings • Configurations • Conversions	Check the power supply and cable connections. Check the system settings. Check the configurations and conversions. If the error occurs repeatedly, contact the hotline!

10000 - Printer alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-3 10000 - Printer alarms

Number	Effect/cause	Solution
10000	The print job could not be started or was canceled due to an unknown error. Faulty printer setup. Or: No authorization is available for accessing the network printer. The power supply was interrupted during data transfer.	Check the printer settings, cable connections and the power supply. Set up the printer once again. Obtain a network printer authorization. If the error persists, contact the hotline!
10001	No printer is installed or a default printer has not been set up.	Install a printer and/or select it as the default printer.
10002	The buffer for printing graphics is full. Up to two graphics are buffered.	Allow more time between print jobs.
10003	Graphics can now be buffered again.	--
10004	The buffer for printing lines in text mode (e.g. alarms) is full. Up to 1000 lines are buffered.	Allow more time between print jobs.

Number	Effect/cause	Solution
10005	Text lines can now be buffered again.	--
10006	The Windows printing system reports an error. Refer to the output text and the error ID to determine the possible causes. Nothing is printed or the printing is incorrect.	If necessary, repeat the action.

20000 - Global script alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below. The system events are divided into different ranges.

Table 12-4 20000 - Global script alarms

Number	Effect/causes	Solution
20010	An error has occurred in the specified script line. Execution of the script was therefore aborted. Note the system event that may have occurred prior to this.	Select the specified script line in the configuration. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20011	An error has occurred in a script that was called by the specified script. Execution of the script was therefore aborted in the called script. Note the system event that may have occurred prior to this.	In the configuration, select the script that has been called directly or indirectly by the specified script. Ensure that the tags used are of the allowed types. For system functions, verify the correct number of parameters and the parameter types.
20012	Inconsistent configuration data. The script could therefore not be generated.	Recompile the configuration data.
20013	Incorrect installation of the scripting component of WinCC Runtime. Therefore, no scripts can be executed.	Reinstall WinCC Runtime on your PC. Recompile your project using the "Compile > Software (rebuild all)" command from the context-sensitive menu and then download the project to the HMI device.
20014	The system function returns a value that is not written in any return tag.	Select the specified script in the configuration. Check whether the script name has been assigned a value.
20015	Too many successive scripts have been triggered in short intervals. When more than 20 scripts are queued for processing, any subsequent scripts are rejected. In this case, the script indicated in the alarm is not executed.	Check what is triggering the scripts. Extend the times, e.g. the acquisition cycle of the tag initiating the script.

30000 - Alarms errors when using system functions (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below. The system events are divided into different ranges.

Table 12-5 30000 - Alarms errors when using system functions

Number	Effect/causes	Remedy
30010	The tag could not accept the function result, e.g. when it has exceeded the value range.	Check the tag types of the system function parameters.
30011	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.
30012	A system function could not be executed because the function was assigned an invalid value or type in the parameter.	Check the parameter value and tag type of the invalid parameter. If a tag is used as a parameter, check its value.

40000 - Linear scaling alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below. The system events are divided into different ranges.

Table 12-6 40000 - Linear scaling alarms

Number	Effect/causes	Remedy
40010	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.
40011	The system function could not be executed since the parameters could not be converted to a common tag type.	Check the parameter types in the configuration.

50000 - Data server alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below. The system events are divided into different ranges.

Table 12-7 50000 - Data server alarms

Number	Effect/causes	Remedy
50000	The HMI device is receiving data faster than it is capable of processing. Therefore, no further data is accepted until all current data have been processed. Data exchange then resumes.	--
50001	Data exchange has been resumed.	--

60000 - Win32 function alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-8 60000 - Win32 function alarms

Number	Effect/causes	Solution
60000	This alarm is generated by the "ShowSystemEvent" system function. The text to be displayed is transferred to the function as a parameter.	--
60010	The file could not be copied in the direction defined because one of the two files is currently open or the source/target path is not available. It is possible that the Windows user has no access rights to one of the two files.	Restart the system function or check the paths of the source/target files. Under Windows: Users executing WinCC Runtime must be granted access to the files.
60011	An attempt was made to copy a file to itself. It is possible that the Windows user has no access rights to one of the two files.	Check the path of the source/target file. In Windows with NTFS: Users executing WinCC Runtime must be granted access to the files.

70000 - Win32 function alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-9 70000 - Win32 function alarms

Number	Effect/causes	Remedy
70010	The application could not be started because it could not be found in the path specified or there is insufficient memory space.	Check whether the application exists in the specified path or close other applications.
70011	The system time could not be modified. The error message only appears in connection with area pointer "Date/time PLC". Possible causes: • An invalid time was transferred in the job mailbox. • The Windows user has no right to modify the system time. If the first parameter in the system event is displayed with the value 13, the second parameter indicates the byte containing the incorrect value.	Check the time that is to be set. Under Windows: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70012	Error when executing the system function "StopRuntime" with the "Runtime and operating system" option. Windows and WinCC Runtime are not closed. The error may have been generated because other programs cannot be closed.	Close all programs currently running. Now close Windows.
70013	The system time could not be modified because an invalid value was entered. An incorrect delimiter may have been used.	Check the time which is to be set.
70014	The system time could not be modified. Possible causes: • An invalid time was transferred. • The Windows user has no right to modify the system time. Windows rejects the setting request.	Check the time that is to be set. Under Windows: Users running WinCC Runtime must be granted the right to set the system time of the operating system.
70015	The system time could not be read because Windows rejects the reading function.	--
70016	An attempt was made to select a screen by means of a system function or job. This is not possible because the configured screen number does not exist. Or: A screen could not be generated due to insufficient system memory. Or: The screen is blocked. Or: Screen call has not been executed correctly.	Check the screen number in the system function or job against the screen numbers configured. Assign the number to a screen if necessary. Check the details for the screen call and whether the screen is blocked for specific users.
70017	Date/time is not read from the area pointer because the address set in the PLC is either not available or has not been set up.	Change the address or set up the address in the PLC.
70018	Acknowledgment that the password list has been successfully imported.	--

Number	Effect/causes	Remedy
70019	Acknowledgment that the password list has been successfully exported.	--
70020	Acknowledgment for activation of alarm reporting.	--
70021	Acknowledgment for deactivation of alarm reporting.	--
70022	Acknowledgment to starting the Import Password List action.	--
70023	Acknowledgment to starting the Export Password List action.	--
70024	The tag value range was exceeded during system function execution. No calculation of the system function.	Check and correct the calculation.
70025	The tag value range was exceeded during system function execution. No calculation of the system function.	Check and correct the calculation.
70026	No other screens are stored in the internal screen memory. No other screens can be selected.	--
70027	The backup of the RAM file system has been started.	--
70028	RAM file system backup is complete. The files from the RAM have been copied to the Flash memory. Following a restart, these saved files are copied back to the RAM file system.	--
70029	Backup of the RAM file system has failed. No backup copy of the RAM file system has been made.	Check the settings in the "Control Panel > OP" dialog and save the RAM file system using the "Save Files" button in the "Persistent Storage" tab.
70030	The parameters configured for the system function are faulty. The connection to the new PLC was not established.	Compare the parameters configured for the system function with the parameters configured for the PLCs and correct them as necessary.
70031	The PLC configured in the system function is not an S7 PLC. The connection to the new PLC has not been established.	Compare the S7 PLC name parameter configured for the system function with the parameters configured for the PLC and correct them as necessary.
70032	The object configured with this number in the tab sequence is not available in the selected screen. The screen changes but the focus is set to the first object.	Check the number of the tab sequence and correct it if necessary.
70033	An e-mail could not be sent because a TCP/IP connection to the SMTP server no longer exists. This system event is only generated at the first failed attempt. All subsequent unsuccessful attempts to send an e-mail will no longer generate a system event. The event is only generated again if an e-mail has been successfully sent in the meantime. The central e-mail component in WinCC Runtime attempts to connect to the SMTP server at regular intervals (1 minute) in order to transmit the remaining e-mails.	Check the network connection to the SMTP server and re-establish it if necessary.
70034	Following a disruption, the TCP/IP connection to the SMTP server was successfully re-established. The queued e-mails are then sent.	--

Number	Effect/causes	Remedy
70036	No SMTP server for sending e-mails is configured. An attempt to connect to an SMTP server therefore fails and it is not possible to send e-mails. WinCC Runtime generates the system event at the first attempt to send an e-mail.	Configure an SMTP server: In the WinCC Engineering System using "Device settings > Device settings" In the Windows CE operating system using "Control Panel > Internet Settings > E-mail > SMTP Server"
70037	An e-mail could not be sent for unknown reasons. The contents of the e-mail are discarded.	Check the e-mail parameters (recipient etc.).
70038	The SMTP server has rejected the sending or forwarding of an e-mail because the domain of the recipient is unknown to the server or because the SMTP server requires authentication. The contents of the e-mail are discarded.	Check the domain of the recipient address or disable the authentication on the SMTP server if possible. SMTP authentication is currently not used in WinCC Runtime.
70039	The syntax of the e-mail address is incorrect or contains invalid characters. The contents of the e-mail are discarded.	Check the e-mail address of the recipient.
70040	The syntax of the e-mail address is incorrect or contains illegal characters.	--
70041	The import of the user management has been aborted due to an error. Nothing has been imported.	Check your user administration or download it again to the panel.
70042	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70043	The range of values of the tag was exceeded while executing the system function. The system function was not calculated.	Check and correct the calculation.
70044	An error occurred while sending the e-mails. The e-mails were not sent.	Check the SMTP settings and the error message in the system event.
70045	Cannot load a file required for encrypting the e-mail.	Update the operating system and Runtime.
70046	The server does not support encryption.	Select an SMTP server that supports encryption.
70047	The SSL versions of the HMI device and SMTP server may not be compatible.	Contact your network administrator or the operator of the SMTP server.

80000 - Log alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-10 80000 - Log alarms

Number	Effect/causes	Remedy
80001	The log specified is filled to the size defined (in percent) and must be stored elsewhere.	You swap out the file or table by executing a ‘move’ or ‘copy’ function.
80002	A line is missing in the specified log.	--

Number	Effect/causes	Remedy
80003	The copying process for logging was not successful. In this case, it is advisable to check any subsequent system events, too.	--
80006	Since logging is not possible, this causes a permanent loss of the functionality.	In the case of databases, check whether the corresponding data source exists and start up the system again.
80009	A copying action has been completed successfully.	--
80010	An incorrect storage location was entered in WinCC and causes permanent loss of functionality.	Configure the storage location for the respective log again and restart the system when the full functionality is required.
80012	Log entries are stored in a buffer. If the values are read to the buffer faster than they can be physically written (using a hard disk, for example), overloading may occur and recording is then stopped.	Archive fewer values. Or: Increase the logging cycle.
80013	The overload status no longer exists. Archiving resumes the recording of all values.	--
80014	The same action was triggered twice in quick succession. Since the process is already in operation, the action is only carried out once.	--
80015	This system event is used to report DOS or database errors to the user.	--
80016	The logs are separated by system function "CloseAllLogs" and the incoming entries exceed the defined buffer size. All buffer entries are deleted.	Reconnect the logs.
80017	The number of incoming entries cause a buffer overflow. This can be caused, for example, by several copying actions being activated at the same time. All copy jobs in the buffer are deleted.	Stop the copy action.
80019	The connection between WinCC and all log files was shut down, for example, after execution of the "CloseAllLogs" system function. Entries are written to the buffer and written to the logs when the connection is recovered. There is no connection to the storage location and the storage medium can be changed.	--
80020	The maximum number of simultaneously copy operations has been exceeded. Copying is not executed.	Wait until the current copying actions have been completed, then restart the last copy action.
80021	An attempt was made to delete a log which is still busy with a copy action. Deletion has not been executed.	Wait until the current copying actions have been completed, then restart the last action.
80022	An attempt was made to use system function "StartSequenceLog" to start a sequence log for a log which is not configured as sequence log. No sequence log file is created.	In the project, check • whether the "StartSequenceLog" system function was properly configured. • if the tag parameters are properly provided with data on the HMI device.

Number	Effect/causes	Remedy
80023	An attempt was made to copy a log to itself. The log is not copied.	In the project, check • whether the "CopyLog" system function was properly configured. • if the tag parameters are properly provided with data on the HMI device.
80024	In your configuration, you specified that the "CopyLog" system function should not allow copying if the destination log already contains data ("Mode" parameter). The log is not copied.	Edit the "CopyLog" system function in your configuration, if necessary. Before you initiate the system function, delete the destination log file.
80025	You have canceled the copy operation. Data written up to this point are retained. The target log file (if configured) was not deleted. The cancellation is reported by an error entry RT_ERR at the end of the target log.	--
80026	This alarm is output after all logs are initialized. Values are written to the logs from then on. No entries are written to the logs before this time has expired, irrespective of the active state of WinCC Runtime.	--
80027	The internal Flash memory has been specified as the storage location for a log. This is not permissible. No values are written to this log and the log file is not created.	Configure "Storage Card" or network path as the storage location.
80028	The alarm serves as status report indicating that the logs are currently being initialized. No values are logged until the alarm 80026 is output.	--
80029	The number of logs specified in the alarm could not be initialized. Initialization of logs was finished. The faulty log files are not available for logging jobs.	Evaluate the additional system events related to this alarm. Check the configuration, the ODBC (Open Database Connectivity), and the specified drive.
80030	The structure of the existing log file does not match the expected structure. Logging is stopped for this log.	Delete the existing log data manually, in advance.
80031	The log in CSV format is corrupted. The log cannot be used.	Delete the faulty file.
80032	Logs can be configured with events. These are triggered as soon as the log is full. Assuming WinCC Runtime is started and the log is already full, the event would never be triggered. The specified log is full and no longer accepts data.	Close WinCC Runtime, delete the log, and restart WinCC Runtime. Or: Configure a button which contains the same actions as the event and press it.
80033	"System Defined" is set in the data log file as the data source name. This causes an error. No data is written to the database logs, whereas the logging to the CSV logs works.	Reinstall SQL Sever 2005 Express.
80034	An error has occurred in the initialization of the logs. An attempt has been made to create the tables as a backup. This action was successful. A backup copy of the tables of the corrupted log file was generated and the cleared log restarted.	No action is necessary. However, it is recommended to save the backup files or delete them in order to make the space available again.
80035	An error has occurred in the initialization of the logs. An attempt has been made to create backups of the tables and this has failed. No logging or backup has been performed.	It is recommended to save the backups or to delete them in order to release memory.

Number	Effect/causes	Remedy
80044	The export of a log was interrupted because Runtime was closed or due to a power failure. At the restart of Runtime, it was detected that the export must be resumed.	The export resumes automatically.
80045	The export of a log was interrupted due to an error in the connection to the server or at the server itself.	The export is repeated automatically. Check: • The connection to the server. • If the server is running. • If there is enough free space on the server.
80046	The destination file or the associated directory could not be created on the server.	Check whether there is enough space on the server and it you have permission to create the log file.
80047	The log could not be read while exporting it.	Check whether the storage medium is correctly inserted.
80049	The log could not be renamed while preparing to export it. The job can not be completed."	Check whether the storage medium is correctly inserted and if there is sufficient space on the medium.
80050	The log which shall be exported is not closed. The job can not be completed.	Make sure to call the "CloseAllLogs" system function before using the "ExportLog" system function. Change the configuration as required.
80051	The log to be copied contains an invalid checksum. The log was not copied.	Select a log with a valid checksum. The selected log may have been manipulated.
80052	The log cannot be read.	Check the log and the specified path.
80053	The closed log cannot be read.	Open the log.

90000 - FDA alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-11 90000 - FDA alarms

Number	Effect/causes	Solution
90024	No operator actions can be logged due to lack of space on the storage medium for log. The operator action will therefore not be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90025	No user actions can be logged because of error state of the archive. Therefore the user action will not be executed.	Check whether the storage medium is correctly inserted.
90026	No operator actions can be logged because the log is closed. The operator action will therefore not be executed.	Before further operator actions are carried out, the log must be reopened with the help of system function "OpenAllLogs". Change the configuration as required.
90028	The password you entered is incorrect.	Enter the correct password.

Number	Effect/causes	Solution
90029	Runtime was closed during ongoing operation (perhaps due to a power failure) or a storage medium in use is incompatible with Audit Trail. An Audit Trail is not suitable if it belongs to another project or has already been logged. It could also be that archiving was not stopped before automatic execution of the "CloseAllArchives" function was started (e.g. by the task scheduler).	Ensure that you are using the correct storage medium.
90030	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90031	Runtime was closed during ongoing operation (perhaps due to a power failure).	--
90032	Running out of space on the storage medium for log.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90033	No more space on the storage medium for log. As of now, no more operator actions requiring logging will be executed.	Provide more storage space by inserting a blank storage medium, or backup the log files to the server using the "ExportLog" function.
90039	You do not have the necessary authorization to perform this action.	Adapt or upgrade your authorizations.
90040	Audit Trail is switched off because of a forced user action.	Reactivate the "Audit Trail" with the help of system function "StartLog".
90041	A user action which has to be logged has been executed without a logged on user.	A user action requiring logging should only be possible with permission. Change the configuration by setting a required authorization for the input object.
90044	A user action which has to be confirmed was blocked, because there is another user action pending.	Repeat the user action if necessary.
90048	The Audit Trail cannot be printed while data relevant to the audit is being logged.	Stop logging by calling system function "StopLogging".
90049	Access to required file is not possible.	Check the network connection or the storage medium.
90056	The recipe was not imported because the file contains no checksum.	Select a file with a checksum. You can also disable checksum verification by calling system function "ImportDataRecords".
90057	The recipe was not imported because the file contains an invalid checksum. The selected file may have been manipulated.	Select a file with a valid checksum.

110000 - Offline function alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-12 110000 - Offline function alarms

Number	Effect/causes	Remedy
110000	The operating mode was changed. "Offline" mode is now set.	--
110001	The operating mode was changed. "Online" mode is now set.	--
110002	The operating mode was not changed.	Check the connection to the PLCs. Check whether the address range for the “Coordination" area pointer is present in the PLC.
110003	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "offline" operating mode is now set.	--
110004	The operating mode of the specified PLC was changed by the "SetConnectionMode" system function. The "online" operating mode is now set.	--
110005	An attempt was made to use the "SetConnectionMode" system function to set the specified PLC to "online" mode, although the entire system is in "offline" mode. This changeover is not allowed. The PLC remains in "offline" mode.	Switch the complete system to "online" mode and repeat execution of the system function.
110006	The content of the "project ID" area pointer does not match the project ID configured in WinCC. The WinCC Runtime is therefore terminated.	Check: • the project ID entered on the PLC. • the project ID entered in WinCC.

120000 - Trend alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-13 120000 - Trend alarms

Number	Effect/causes	Remedy
120000	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120001	The trend is not displayed because you configured an incorrect axis to the trend or an incorrect trend.	Change the configuration.
120002	The trend is not displayed because the tag assigned attempts to access an invalid PLC address.	Check whether the data area for the tag is available on the PLC, whether the configured address is correct, or whether the value range for the tag is correct.

130000 - System information alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-14 130000 - System information alarms

Number	Effect/causes	Solution
130000	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130001	The action was not executed.	Delete files no longer required from the hard disk.
130002	The action was not executed.	Close all other programs. Delete files no longer required from the hard disk.
130003	No data medium found. The operation is canceled.	Check the following conditions, for example: • Access to the correct data carrier? • Is a data carrier inserted?
130004	The data carrier is write-protected. The operation is canceled.	Check whether the correct data medium is being accessed. Remove the write-protection if necessary.
130005	The file is read only. The operation is canceled.	Check whether the correct file is being accessed. Change the file attributes.
130006	No access to the file. The operation is canceled.	Check the following conditions, for example: • Is the correct file being accessed? • Does the file exist? • Is another action preventing concurrent access to the file?
130007	The network connection is interrupted. Records cannot be saved or read via the network connection.	Check the network connection and eliminate the cause of error.
130008	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.
130009	The specified folder does not exist on the storage card. The files stored in this directory are not backed up after switching off the HMI device.	Insert the storage card.
130010	The maximum nesting depth can be exhausted when, for example, value changes in a script initiate the call of an infinite number of further scripts. The configured functionality is not provided.	Check the configuration.
130013	No storage card available. The specified records cannot be saved to or read from Storage Card.	Insert the storage card.

140000 - Connection alarms: Connection + device (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-15 140000 - Connection alarms: Connection + device

Number	Effect/causes	Remedy
140000	An online connection to the PLC is established.	--
140001	The online connection to the PLC was shut down.	--
140003	No tag update or write operations are executed.	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140004	No tag update or write operations are executed due to an incorrect access point, or incorrect module configuration.	Check the connection and whether the PLC is switched on. Check the access point or the module configuration (MPI, PPI, PROFIBUS) in the Control Panel with "Set PG/PC interface". Restart the system.
140005	No tag update or write operations are executed due to an incorrect HMI device address (possibly too high).	Use a different address for the HMI device. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.
140006	No tag update or write operations are executed due to an incorrect baud rate setting.	Select a different baud rate in WinCC (according to module, profile, communication peer, etc.).
140007	An incorrect bus profile prevents tag updates or write operations (see %1). The following parameters cannot be written to the registry database: 1: Tslot 2: Tqui 3: Tset 4: MinTsdr 5: MaxTsdr 6: Trdy 7: Tid1 8: Tid2 9: Gap factor 10: Retry limit	Check the custom bus profile. Check the connection and whether the PLC is switched on. Check the parameters set in the "Set PG/PC interface" dialog of the Control Panel. Restart the system.

Number	Effect/causes	Remedy
140008	An incorrect baud rate prevents tag updates or write operations. The following parameters cannot be entered in the registry database. 0: general error 1: incorrect version 2: Profile cannot be entered in the registry database. 3: Subnet type cannot be entered in the registry database. 4: Target rotation time cannot be entered in the registry database. 5: Highest address (HSA) is incorrect.	Check whether the connection is up and the PLC is switched on. In the Control Panel, check the set parameters using the "Set PG/PC interface" function. Restart the system.
140009	No tag updates or write operations because the S7 communication module was not found.	To reinstall the module, open the Control Panel and select "Set PG/PC interface".
140010	No S7 communication partner found because the PLC is shut down. DP/T: The option "PG/PC is the only master" is not set in the Control Panel under "Set PG/PC interface".	Switch on the PLC. DP/T: If only one master is connected to the network, disable "PG/PC is the only master" in "Set PG/PC interface". If several masters are connected to the network, enable these. Do not change any settings, for this will cause bus errors.
140011	No tag updates or write operations because communication is down.	Check the connection and whether the communication partner is switched on.
140012	Initialization error (e.g. if WinCC Runtime was closed in Task Manager). Or: Another application (e.g. STEP 7) with different bus parameters is active and the driver cannot be started with the new bus parameters (baud rate, for example).	Restart the HMI device. Or: Start WinCC Runtime and then start your other applications.
140013	The MPI cable is disconnected and, therefore, there is no power supply.	Check the connections.
140014	The configured bus address is in use by another application.	Change the HMI device address in the PLC configuration.
140015	Incorrect baud rate Or: Incorrect bus parameters (e.g. HSA) Or: OP address > HSA or: Incorrect interrupt vector (interrupt not registered by the driver)	Correct the parameters.
140016	The hardware does not support the configured interrupt.	Change the interrupt number.
140017	The set interrupt is in use by another driver.	Change the interrupt number.
140018	SIMOTION Scout disabled the consistency check. Only a corresponding note appears.	In SIMOTION Scout, reactivate the consistency check and once again download the project to the PLC.
140019	SIMOTION Scout is downloading a new project to the PLC. Connection to the PLC is canceled.	Wait until the end of the reconfiguration.
140020	Mismatch of the PLC and project (FWX file) versions. The connection to the PLC is canceled.	The following remedies are available: Download the current version to the PLC using SIMOTION Scout. Recompile the project using WinCC ES, close WinCC Runtime, and restart with the new configuration.

Number	Effect/causes	Remedy
140021	Setup of the connection to the PLC failed. Incorrect configuration of the "Access password" for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. Assign the correct password. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140022	Setup of the connection to the PLC failed. Incorrect configuration of the access password for the connection to the PLC.	Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC. The "Password" for the connection to the PLC is assigned in the "Security" area of the PLC properties.
140023	Error during time synchronization: Unable to read system time of PLC %1.	Check whether the PLC is switched on. Select the "Access password" area in the "Connections" editor to check the password entered for the connection to the PLC.
140025	Setup of the connection to the PLC failed. The access password of the PLC is disabled in the PLC display.	Enable the access password in the PLC display.

160000 - Connection alarms: OPC: Connection (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-16 160000 - Connection alarms: OPC: Connection

Number	Effect/causes	Solution
160000	No more data is read or written. Possible causes: • The cable connection is interrupted. • The PLC does not respond or has failed, etc. • The wrong port is used for the connection. • System overload	Check whether the cable is plugged in and the PLC is OK, and whether the correct port is used. Restart the system if the system event persists.
160001	The connection is recovered because the cause of the interruption has been eliminated.	--
160010	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check access rights.
160011	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: • Correct server name? • Correct station name? • Is the server registered?

Number	Effect/causes	Solution
160012	No connection to the server because the server ID (CLS-ID) cannot be determined. Values cannot be read or written.	Check the following conditions, for example: • Correct server name? • Correct station name? • Is the server registered? Note for advanced users: Interpret the value from HRESULT.
160013	The specified server was started as InProc server. This has not been released and may lead to undefined behavior because the server is running in the same process area as WinCC Runtime.	Configure the server as OutProc Server or Local Server.
160014	Only one OPC server project can be started on a PC/MP. An alarm is output after an attempt was made to start a second project. The second project has no OPC server functionality and cannot be located as an OPC server by external sources.	Do not start a second project with OPC server functionality on the computer.

170000 - S7 dialog alarms (Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-17 170000 - S7 dialog alarms

Number	Effect/causes	Solution
170000	S7 diagnostics events are not displayed because it is not possible to log on to the S7 diagnostics at this device. The service is not supported.	--
170001	The S7 diagnostics buffer cannot be viewed because communication with the PLC is shut down.	Set the PLC to online mode.
170002	The S7 diagnostics buffer cannot be viewed because reading of the diagnostics buffer (SSL) was canceled with an error.	--
170003	An S7 diagnostic alarm cannot be visualized. The system returns internal error %2.	--
170004	An S7 diagnostic alarm cannot be visualized. The system returns an internal error of error class %2, error number %3.	--
170007	It is not possible to read the S7 diagnostics buffer (SSL) because this operation was canceled with an internal error of class %2 and error code %3.	--

180000 - General alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-18 180000 - General alarms

Number	Effect/causes	Solution
180000	A component/OCX received configuration data with a version ID which is not supported.	Install a newer component.
180001	System overload because too many actions are running in parallel. Certain actions can be executed, while others are discarded.	Several remedies are available: • Generate alarms at a slower rate (polling). • Initiate scripts and functions at greater intervals. If the alarm appears more frequently: Restart the HMI device.
180002	The screen keyboard could not be activated. Possible causes: "TouchInputPC.exe" was not registered due to faulty Setup.	Reinstall WinCC Runtime.

Note

Alarms without additional information

Alarm 180003 is not described since the alarm text contains all the necessary information.

190000 - Tag alarms (Basic Panels, Panels, RT Advanced)

Meaning of the system events

The most important system events are listed below.

Table 12-19 190000 - Tag alarms

Number	Effect/causes	Remedy
190000	It is possible that the tag is not updated.	--
190001	The tag is updated after the cause of the last error state has been eliminated (recovery of normal operation).	--
190002	The tag is not updated because communication with the PLC is down.	Select system function "SetOnline" to enable communication.
190004	The tag is not updated because the address configured for this tag does not exist.	Check the configuration.
190005	The tag is not updated because the configured PLC type does not exist for this tag.	Check the configuration.
190006	The tag is not updated because it is not possible to map the PLC type in the data type of the tag.	Check the configuration.

Number	Effect/causes	Remedy
190007	The tag value is not modified because the connection to the PLC is interrupted or the tag is offline.	Set online mode or reconnect to the PLC.
190008	The configured tag limits were violated due to one of the following events: • Value input • System function • Script	Observe the configured or current tag limits.
190009	An attempt was made to assign this tag a value that is outside the valid range of values for this data type. For example, input of the value 260 for a byte tag, or input of the value -3 for an unsigned word tag.	Observe the range of values for the data type of the tags.
190010	The rate at which values are written to the tag is too high (e.g. initiated in a script loop). Values will be lost because buffer capacity is limited to 100 operations.	The following remedies are available: • Extend the interval between multiple write actions. • Do not use an array tag longer than 6 words when configuring an acknowledgment on the HMI device using "HMI acknowledgment tag".
190011	Possible cause 1: The value entered could not be written to the configured PLC tag because the high or low limit was exceeded. The system discarded the entry and restored the original value. Possible cause 2: The connection to the PLC was interrupted.	Note that the value entered must be within the range of values of the control tag. Check the connection to the PLC.
190012	It is not possible to convert a value from a source format to a target format, for example: An attempt is being made to write a counter value that is outside the valid, PLC-specific range of values. A tag of the type Integer should be assigned a value of the type string.	Check the range of values, or the data type of the tag.
190013	You entered a string that exceeds the tag length. The string is truncated automatically to a valid length.	Always enter strings that do not exceed the valid tag length.

190100 - Area pointer alarms (Basic Panels, Panels, RT Advanced)

190100 - Area pointer alarms

The most important system events are listed below.

Number	Effect/causes	Remedy
190100	The area pointer is not updated because the address configured for this pointer does not exist. Type 1 Warnings 2 Errors 3 PLC acknowledgment 4 HMI device acknowledgment 5 LED image 6 Trend request 7 Trend transfer 1 8 Trend transfer 2 No.: Consecutive number displayed in WinCC ES.	Check the configuration.
190101	The area pointer is not updated because it is not possible to map the PLC type to the area pointer type. Parameter type and no.: see alarm 190100	--
190102	The area pointer is updated after the cause of the last error state has been eliminated (recovery of normal operation). Parameter type and no.: See alarm 190100.	--

200000 - PLC coordination alarms (Basic Panels, Panels, RT Advanced)

200000 - PLC coordination alarms

The most important system events are listed below.

Number	Effect/causes	Remedy
200000	Coordination is not executed because the address configured in the PLC does not exist/is not set.	Change the address or set up the address in the PLC.
200001	Coordination is canceled because the write access to the address configured in the PLC is not possible.	Change the address or set the address in the PLC at an area which allows write access.
200002	Coordination is not carried out at the moment because the address format of the area pointer does not match the internal storage format.	Internal error
200003	Coordination can be executed again because the last error state is eliminated (return to normal operation).	--

Number	Effect/causes	Remedy
200004	The coordination may not be executed.	--
200005	No more data is read or written. Possible causes: • The cable connection is interrupted. • The PLC does not respond or has failed, etc. • System overload	Ensure that the cable is plugged in and the PLC is operational. Restart the system if the system event persists.

200100 - Area pointer alarms project ID (Basic Panels, Panels, RT Advanced)

200100 - Area pointer alarms project ID

The most important system events are listed below.

Number	Effect/causes	Remedy
200101	The project ID of the area pointer cannot be described. No entry possible.	Check the configuration.
200102	Error in the type conversion.	Check the type conversion.
200103	The project ID of the area pointer is updated as the cause of the last error state has been eliminated (recovery of normal operation).	--
200104	Unknown error	Check the • Configuration • HMI tags • HMI alarms • System alarms • Controller alarms If the error occurs repeatedly, contact the hotline!
200105	The online connection to the PLC was interrupted. The connection is interrupted.	Check the following conditions, for example • Are the access correct? • Correct server name? • Correct station name? • Is the server registered? • Is the configuration correct?

210000 - PLC job alarms (Basic Panels, Panels, RT Advanced)

210000 - PLC job alarms

The most important system events are listed below.

Number	Effect/causes	Remedy
210000	Jobs are not processed because the configured address does not exist/has not been set up in the PLC.	Change the address or set up the address in the PLC.
210001	Jobs are not processed because read/write access to the configured address is not possible in the PLC.	Change the address, or set up the address in a PLC area at which read/write access is possible.
210002	Jobs are not executed because the address format of the area pointer does not match the internal storage format.	Internal error
210003	The job buffer is processed again because the last error status has been eliminated (recovery of normal operation).	--
210004	The job buffer is possibly not going to be processed.	--
210005	A job mailbox with invalid number was initiated.	Check the PLC program.
210006	An error occurred while executing the job mailbox. As a result, the control job is not executed. Observe the next/previous system event.	Check the parameters of the control job. Recompile the configuration data.

220000 - WinCC communication driver alarms (Basic Panels, Panels, RT Advanced)

220000 - WinCC communication driver alarms

The most important system events are listed below.

Number	Effect/causes	Remedy
220001	The tag is not downloaded because write access to data type Bool/Bit is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220002	The tag is not downloaded because write access to data type Byte is not supported by the sublevel communication driver/HMI device.	Change the configuration.
220003	The communications driver could not be loaded. The driver might not be installed.	Install the driver by reinstalling WinCC Runtime.
220004	Communication is down and no update data is transferred because the cable is not connected or defective etc.	Check the connection.
220005	Communication is up.	--
220006	The connection between the specified PLC and the specified port is active.	--

Number	Effect/causes	Remedy
220007	The connection to the specified PLC is interrupted at the specified port.	Check the following: • Is the cable plugged in? • Is the PLC OK? • Is the right port being used? • Is your configuration OK (port parameters, protocol settings, PLC address)? Restart the system if the system event persists.
220008	The communication driver cannot access or open the specified port. This port might be in use by another application, or a port that does not exist on the target device is being used. No communication with the PLC.	Close all applications that access the port and restart the computer. Use another port that exists in the system.
220009	The communication path is either empty, incomplete or has an invalid format.	Enter the communication path in the correct format.

230000 - Screen object alarms (Basic Panels, Panels, RT Advanced)

230000 - Screen object alarms

The most important system events are listed below.

Number	Effect/causes	Solution
230000	The value entered could not be used. The system discards this entry and restores the previous value. Possible causes: • The range of values is exceeded. • You entered invalid characters • The valid maximum number of users has been exceeded.	Enter a practical value, or delete a user that is no longer required.
230002	The user currently logged on does not have the necessary authorization, so the system discards the entry and restores the previous value.	Log on as user with appropriate authorization.
230003	Change to the specified screen failed because this screen is not available/configured. The current screen remains selected.	Configure the screen and check the selection function.
230005	The range of values of the tag has been exceeded in the I/O field. The original tag value is retained.	Observe the range of values for the tag when entering a value.
230100	During navigation in the Web browser, the system returned a message which may be of interest to the user. The Web browser continues to run but may not (fully) show the new page.	Navigate to another page.

Number	Effect/causes	Solution
230200	The HTTP channel connection was interrupted due to an error. This error is explained in detail by another system event. Data is no longer exchanged.	Check the network connection. Check the server configuration.
230201	The HTTP channel connection is set up. Data is exchanged.	--
230202	WININET.DLL has detected an error. Usually, this error occurs if it is not possible to connect to the server, or the server denies a connection because the client lacks proper authorization. An unknown server certificate may also be the cause if the connection is encrypted by means of SSL. The alarm text provides details. This text is always in the language of the Windows installation because it is returned by the Windows OS. Process values are no longer exchanged. The part of the alarm returned by the Windows OS might not be displayed, e.g. "An error has occurred". WININET.DLL returns the following error: Number: 12055 Text:HTTP: <no error text available>."	Depending on the cause: When an attempt to connect fails, or a timeout occurs: • Check the network connection and the network. • Check the server address. • Check whether the WebServer is actually running on the target station. Incorrect authorization: • The configured user name and/or password do not match the entries on the server. Set consistent data. If the server certificate is rejected: Certificate signed by an unknown CA ( ): • Ignore this point, or install a certificate that has been signed with one of the root certificates known to the client station. The date of the certificate is invalid: • Ignore this point, or install a certificate with valid date on the server. Invalid CN (Common Name or Computer Name): • Ignore this point, or install a certificate with a name that corresponds to the server address.
230203	Although a connection can be made to the server, the HTTP server refused to connect. Possible causes: • WinCC Runtime does not run on the server • The HTTP channel is not supported (503 Service unavailable). Other errors can only occur if the Webserver does not support the HTTP channel. The language of the alarm text depends on the Webserver. Data is not exchanged.	On 503 Service unavailable error: Check whether WinCC Runtime is running on the server and whether the HTTP channel is supported.
230301	Internal error. An English text explains the error in more detail. The error may be caused by insufficient memory. OCX does not work.	--
230302	The name of the remote server cannot be resolved. An attempt to connect has failed.	Check the configured server address. Check whether the DNS service is available on the network.

Number	Effect/causes	Solution
230303	The remote server is not running on the addressed computer. incorrect server address. An attempt to connect has failed.	Check the configured server address. Check whether the remote server is running on the target computer.
230304	The remote server on the addressed computer is incompatible with VNCOCX. An attempt to connect failed.	Use a compatible remote server.
230305	Authentication has failed due to incorrect password. An attempt to connect failed.	Configure the correct password.
230306	Error in the connection to the remote server. This may occur as a result of network problems. An attempt to connect failed.	Check whether the network cable is plugged in, or whether there are network problems.
230307	The connection to the remote server was shut down. Possible causes: • The remote server was shut down • The user instructed the server to close all connections. The connection is cancelled.	--
230308	This alarm provides information on the connection status. An attempt is made to connect.	--

Note

Alarms without additional information

Alarms 230400-230409 and 230500-230501 are not described since the alarm text contains all the necessary information.

240000 - Authorization alarms (Panels, RT Advanced)

240000 - Authorization alarms

The most important system events are listed below.

Number	Effect/causes	Solution
240000	WinCC Runtime is running in demo mode. You have no authorization, or your authorization is corrupted.	Install the authorization.
240001	WinCC Runtime is running in demo mode. You configured too many tags for the installed version.	Load an adequate authorization / powerpack.
240002	WinCC Runtime is running with time-limited emergency authorization.	Restore the full authorization.

Number	Effect/causes	Solution
240004	Error when reading the emergency authorization. WinCC Runtime is running in demo mode.	Restart WinCC Runtime. Install or repair the authorization (see Commissioning Instructions for Software Protection).
240005	Automation License Manager has detected an internal system error. Possible causes: • Corrupted file • Faulty installation • No free memory space for Automation License Manager, or similar.	Restart the HMI device/PC. If this procedure does not solve the problem, remove and then reinstall Automation License Manager.

250000 - S7 Status/Force alarms (Panels, RT Advanced)

250000 - S7 Status/Force alarms

The most important system events are listed below.

Number	Effect/causes	Solution
250000	The tag in the specified line in "Status Force" is not updated because the address configured for this tag is not available.	Check the set address and then verify that the address is set up in the PLC.
250001	The tag in the specified line in "Status Force" is not updated because the PLC type configured for this tag does not exist.	Check the set address.
250002	The tag in the specified line in "Status Force" is not updated because it is not possible to map the PLC type in the tag type.	Check the set address.
250003	An attempt to connect to the PLC failed. The tags are not updated.	Check the connection to the PLC. Check that the PLC is switched on and is online.

260000 - Password system alarms (Basic Panels, Panels, RT Advanced)

260000 - Password system alarms

The most important system events are listed below.

Number	Effect/causes	Solution
260000	An unknown user or an unknown password has been entered in the system. The current user is logged off from the system.	Log on to the system as a user with a valid password.
260001	The logged in user does not have sufficient authorization to execute the protected functions on the system.	Log on to the system as a user with sufficient authorization.
260002	This alarm output when the "TrackUserChange" system function is triggered.	--
260003	The user has logged off from the system.	--

Number	Effect/causes	Solution
260004	The user name entered into the user view already exists in the user management.	Select another user name because user names have to be unique in the user management.
260005	The entry is discarded.	Enter a shorter user name.
260006	The entry is discarded.	Use a shorter or longer password.
260007	The logoff time entered is outside the valid range from 0 to 60 minutes. The new value entered is discarded and the original value is retained.	Enter a logon timeout value between 0 and 60 minutes.
260008	An attempt was made in WinCC to read a PTProRun.pwl file created with ProTool V 6.0. Reading of the file was canceled due to incompatibility of the format.	--
260009	You have attempted to delete the user "Administrator" or "PLC User". These users are fixed components of the user management and cannot be deleted.	If you need to delete a user, because perhaps you have exceeded the maximum number permitted, delete another user.
260012	The password entries in the "Change Password" dialog and in the confirmation field do not match. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter the identical password twice to be able to change the password.
260013	The password entered in the "Change Password" dialog is invalid because it is already in use. The password is not changed. User will be logged off.	You have to log on to the system again. Then enter a new password that has not been used before.
260014	You have tried to log on with an incorrect password three times in a row. You will be locked out and assigned to group no. 0.	You can log on to the system with your correct password. Only an administrator can change the assignment to a group.
260024	The password you entered does not meet the necessary security guidelines.	Enter a password that contains at least one number.
260025	The password you entered does not meet the necessary security guidelines.	Enter a password that comprises at least three characters.
260026	The password you entered does not meet the necessary security guidelines.	Enter a password that contains at least one special character.
260028	Upon system start-up, an attempt to log on, or when trying to change the password of a SIMATIC log-on user, the system attempts to access the SIMATIC Logon Server. If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable. Or use a local user.
260030	The SIMATIC Logon user could not change his password on the SIMATIC Logon Server. The new password is possibly noncompliant with password rules set on the server, or the user is not authorized to change his password. The old password remains and the user is logged off.	Log in again and choose a different password. Check the password rules on the SIMATIC Logon Server.

Number	Effect/causes	Solution
260033	The action change password or log on user could not be carried out.	Check the connection to the SIMATIC Logon Server and its configuration; for example: 1. Port number 2. IP address 3. Server name 4. Functional transfer cable Or use a local user.
260034	The last logon operation has not yet ended. A user action or a logon dialog can therefore not be called. The logon dialog is not opened. The user action is not executed.	Wait until the logon operation is complete.
260035	The last attempt to change the password was not completed. A user action or a logon dialog can therefore not be called. The logon dialog is not opened. The user action is not executed.	Wait until the procedure is complete.
260036	There are insufficient licenses on the SIMATIC Logon Sever. The logon is not authorized.	Check the licensing on the SIMATIC Logon Server.
260037	There is no license on the SIMATIC Logon Sever. A logon is not possible. It is not possible to log on via the SIMATIC Logon Server, only via a local user.	Check the licensing on the SIMATIC Logon Server.
260040	The system attempts to access the SIMATIC Logon Server upon system start-up or when trying to change the password. If attempting to log on, the new user is not logged in. If a different user was logged on before, then this user is logged off.	Check connection to the domain and its configuration in the Runtime security settings editor. Or use a local user.
260043	It was not possible to log the user on to the SIMATIC Logon Server. The user name or the password could be incorrect or the user does not have sufficient rights to log on. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Try again. If necessary, check the password data on the SIMATIC Logon Server.
260044	It was not possible to log the user on to the SIMATIC Logon Server as his account is blocked. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check the user data on the SIMATIC Logon Server.
260045	The SIMATIC Logon user is not associated to any or several groups. The new user is not logged in. If a different user was logged on before, then this user is logged off.	Check user data on the SIMATIC Logon Server and the configuration in your WinCC project. A user may only be assigned to one group.

Note

Alarms without additional information

Alarms 260010, 260011, 260015-260023, 260029, 260031, 260032, 260038, 260039, 260041, 260042 and 260048 are not described since the alarm text contains all the necessary information.

270000 - System alarms (Basic Panels, Panels, RT Advanced)

270000 - System Alarms

The most important system events are listed below.

Number	Effect/causes	Remedy
270000	The alarm does not indicate the tag because it is accessing an invalid address in the PLC.	Check whether the data area for the tag exists on the PLC, whether the configured address is correct, and whether the value range for the tag is correct.
270001	There is a device-specific limit as to how many alarms may be queued for viewing (see the operating instructions). This limit has been exceeded. The view no longer contains all the alarms. However, all alarms are written to the alarm buffer.	--
270002	The view shows alarms of a log for which there is no data in the current project. Placeholders are output for the alarms.	Delete old log data, if necessary.
270003	The service cannot be set up because too many devices want to access this service. A maximum of four devices can execute this action.	Reduce the number of HMI devices which want to use the service.
270004	Access to the persistent alarm buffer is not possible. Alarms cannot be restored or backed up.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270005	Persistent alarm buffer corrupted: Alarms cannot be restored.	If the problems persist at the next restart, contact Customer Support (delete Flash).
270006	Project modified: Alarms cannot be restored from the persistent alarm buffer.	The project was compiled and downloaded again to the HMI device. The error should no longer occur at the next restart of the HMI device.
270007	A configuration problem is preventing you from the restoring the data (e.g. a DLL was deleted, or unknown directory).	Update the operating system and download your project again to the HMI device.

280000 - Alarms SIMATIC 505 DP Communication Driver (CSP)

Alarms SIMATIC 505 DP Communication Driver (CSP)

The most important system events are listed below.

Number	Effect/causes	Solution
280000	The connection between the controller and port is active.	--
280001	The connection to the PLC at the port is interrupted.	Check the following: • Is the cable plugged in? • Is the controller active? • Is the correct port being used? • Is the configuration OK?
280002	The parameters of the controller are correct, the XSUB and .REC files are available.	--
280003	• The parameters of the controller are correct, the XSUB and .REC files are not available. • The controller is in STOP mode.	• Download the XSUB and .REC files to the controller. • Verify that the controller is in STOP mode.
280004	• The communication cable between HMI device and controller is disconnected. • The controller is in STOP mode.	Check the following: • The communication cable between operating unit and controller • Mode of the controller (Run/STOP)

290000 - Recipe system alarms (Basic Panels, Panels, RT Advanced)

290000 - Recipe system alarms

The most important system events are listed below.

Number	Effect/causes	Solution
290000	The recipe tag could not be read or written. It is assigned the start value. The alarm can be entered in the alarm buffer for up to four more faulty tags. After that, alarm 290003 is output.	Check the configuration to see whether the address has been set up in the PLC.
290001	An attempt was made to assign the recipe tag a value that is outside the valid range of values for this type. The alarm can be entered in the alarm buffer for up to four more faulty tags if necessary. After that, alarm 290004 is output.	Observe the range of values for the tag type.
290002	It is not possible to convert a value from a source format to a target format. The alarm can be entered in the alarm buffer for up to four more faulty recipe tags if necessary. After that, alarm 290005 is output.	Check the range of values or type of the tag.

Number	Effect/causes	Solution
290003	This alarm is output after alarm 290000 was triggered more than five times. In this case, no further separate alarms are generated.	Check the configuration to see whether the tag addresses have been set up in the PLC.
290004	This alarm is output after alarm 290001 was triggered more than five times. In this case, no further separate alarms are generated.	Observe the range of values for the tag type.
290005	This alarm is output after alarm 290002 was triggered more than five times. In this case, no further separate alarms are generated.	Check the range of values or type of the tag.
290006	The limits configured for the tag have been exceeded by the values entered.	Observe the configured or current tag limits.
290007	There is a difference between the source and target structure in the recipe currently being processed. The source structure contains an additional recipe tag that is not available in the target structure and cannot be assigned. The value is discarded.	Remove the specified recipe tag in the specified recipe from your configuration.
290008	There is a difference between the source and target structure in the recipe currently being processed. The target structure contains an additional recipe tag that is not available in the source structure. The recipe tag specified is assigned its start value.	Insert the specified recipe tag into the source structure.
290010	The storage location configured for the recipe is invalid. Possible causes: Invalid characters, write protection, data carrier out of space or not available.	Check the configured storage location.
290011	A data record of the specified number does not exist.	Check the source for the number (constant or tag value).
290012	A recipe of the specified number does not exist.	Check the source for the number (constant or tag value).
290013	An attempt was made to save a data record under a data record number that already exists. The operation is not executed.	The following remedies are available: • Check the source for the number (constant or tag value). • First, delete the data record. • Modify the "Overwrite" function parameter.
290014	The specified import file was not found.	Check the following: • The file name • Ensure that the file is in the specified directory.
290020	Check back to verify that the download of data records from the HMI device to the PLC has started.	--
290021	Check back to verify that the download of records from the HMI device to the PLC was completed.	--

Number	Effect/causes	Solution
290022	Check back to indicate that the download of data records from the HMI device to the PLC was canceled due to an error.	Check the following conditions in the configuration: • Are the tag addresses configured in the PLC? • Does the recipe number exist? • Does the data record number exist? • Is the "Overwrite" function parameter set?
290023	Check back to verify that the download of data records from the PLC to the HMI device has started.	--
290024	Check back to verify that the download of data records from the PLC to the HMI device was completed.	---
290025	Check back to indicate that the download of data records from the PLC to the HMI device was canceled due to an error.	Check the following conditions in the configuration: • Are the tag addresses configured in the PLC? • Does the recipe number exist? • Does the data record number exist? • Is the "Overwrite" function parameter set?
290026	An attempt was made to read/write a data record that is not free at present. This error can occur if recipes were configured for download with synchronization.	Set the mailbox status to zero.
290027	Unable to connect to the PLC at present. As a result, the data record cannot be read or written. Possible causes: No hardware connection to the PLC (no cable plugged in, cable is defect), or the PLC is switched off.	Check the connection to the PLC.
290030	This alarm is output after you selected screen which contains a recipe view in which a data record is already selected.	Reload the data record from the storage location, or retain the current values.
290031	While saving, it was detected that a data record with the specified number already exists.	Overwrite the data record, or cancel the action.
290032	During the export of data records, a file with the specified name was found.	Overwrite the file, or cancel the process.
290033	Confirmation prompt before deleting data records.	--
290040	A data record error with error code %1 that cannot be described in more detail occurred. The action is canceled. It is possible that the mailbox was not installed correctly on the PLC.	Check the storage location, the data record, the "Data record" area pointer, and the connection to the PLC. Restart the action after a short waiting time. If the error persists, contact Customer Support. Forward the relevant error code to Customer Support.
290041	A data record or file cannot be saved because the storage location is out of sufficient space.	Delete files no longer required.
290042	An attempt was made to execute several recipe actions simultaneously. The last action is not executed.	Retrigger the action after a short waiting time.
290043	Confirmation prompt before saving data records.	--
290044	The database for the recipe was corrupted and will be deleted.	--

Number	Effect/causes	Solution
290050	A check back indicates that the export of data records was started.	--
290051	A check back indicates successful completion of the export of data records.	--
290052	A check back indicates that the export of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290053	A check back indicates that the import of records was started.	--
290054	A check back indicates successful completion of the import of data records.	--
290055	A check back indicates that the import of data records was canceled due to an error.	Ensure that the structure of the data records at the storage location and the current recipe structure on the HMI device are identical.
290056	Error when reading/writing the value in the specified row/column. The action was canceled.	Check the specified row/column.
290057	The tags of the recipe specified were toggled from "offline" to "online" mode. Each change of a tag in this recipe is now immediately transferred to the PLC.	--
290058	The tags of the specified recipe were toggled from "online" to "offline" mode. Modifications to tags in this recipe are no longer immediately transferred to the PLC but must be transferred there explicitly by downloading a data record.	--
290059	A check back indicates that the specified record was successfully saved.	--
290060	A check back indicates that the specified data record memory was cleared.	--
290061	A check back indicates that deletion of the data record memory was canceled due to an error.	--
290062	The data record number exceeds the maximum of 65536. This data record cannot be created.	Select another number.
290063	This occurs when you execute system function "ExportDataRecords" while the "Overwrite" parameter is set to "No". An attempt was made to save a recipe under a file name that already exists. The export is canceled.	Check the parameters of the "ExportDataRecords" system function.
290064	A check back indicates that the deletion of data records was started.	--
290065	A check back indicates successful completion of the deletion of data records.	--
290066	Confirmation prompt before deleting data records.	--
290068	Confirmation prompt for deletion of the selected recipe data records.	--

Number	Effect/causes	Solution
290069	Confirmation prompt for deletion of all recipe data records.	--
290070	The data record specified was not found in the import file.	Check the source of the data record number, or the data record name (constant, or tag value).
290071	When the editing data record values, you entered a value that is below the low limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.
290072	When editing data record values, you entered a value that exceeds the high limit of the recipe tag. The entry is discarded.	Enter a value within the recipe tag limits.
290073	An action (e.g. saving a record) failed for an unknown reason. The error corresponds to status alarm IDS_OUT_CMD_EXE_ERR in the large recipe view.	--
290074	While saving, a data record with the specified number but with different name was found.	Overwrite the record, change the record number or cancel the action.
290075	A data record of this name already exists. The data record is not saved.	Select a different data record name.
290110	The default values could not be set due to an error.	--
290111	The recipes subsystem cannot be used. Recipe views have no content and recipe-specific functions will not be executed. Possible causes: • Error when loading the recipes. • The recipe structure was changed in the ES. The recipes were not included in the latest project download. This means that the new configuration data no longer matches the old recipes on the device.	Download the project to the device again, including the recipes (the corresponding check box in the download dialog must be check marked).

Note

Alarms without additional information

Alarms 290067 and 290076-290109 are not described since the alarm text contains all the necessary information.

300000 - Alarm_S alarms (Panels, RT Advanced)

300000 - Alarm_S alarms

The most important system events are listed below.

Number	Effect/causes	Solution
300000	Faulty configuration of process monitoring (e.g. using PDiag or S7-Graph): More alarms are queued than specified in the specifications of the CPU. No further ALARM_S alarms can be managed by the PLC and reported to the HMI devices.	Change the PLC configuration.
300001	ALARM_S is not registered on this PLC.	Select a controller that supports the ALARM_S service.

Note

Alarms without additional information

Alarms 300100-300102 are not described since the alarm text contains all the necessary information.

310000 - Reporting alarms (Panels, RT Advanced)

310000 - Reporting alarms

The most important system events are listed below.

Number	Effect/causes	Solution
310000	An attempt is being made to print too many reports in parallel. Only one log file can be output to the printer at a given time; the print job is therefore rejected.	Wait until the previous active log was printed. Repeat the print job if necessary.
310001	An error occurred on triggering the printer. The report is either not printed or printed with errors.	Evaluate the additional system events related to this alarm. Repeat the print job if necessary.

330000 - Interaction alarms (Panels, RT Advanced)

330000 - Interaction alarms

The most important system events are listed below.

Number	Effect/causes	Solution
330022	Too many open dialogs on the HMI device.	Close all dialogs you do not require on the HMI device.

Note

Alarms without additional information

Alarms 330001-330021, 330023-330070 are not described since the alarm text contains all the necessary information.

340000 - Alarms info text

340000 - Alarms info text

Note

Alarms without additional information

Alarms 340001-340005 are not described since the alarm text contains all the necessary information.

350000 - PROFIsafe alarms (Panels, RT Advanced)

350000 - PROFIsafe alarms

The most important system events are listed below.

Number	Effect/causes	Solution
350000	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. RT is terminated.	Check the WLAN connection.
350001	PROFIsafe packets were not received within the specified time. There is a communication problem with the F-CPU. The PROFIsafe connection is set up again.	Check the WLAN connection.
350002	Internal error. Runtime is terminated.	Internal error
350003	Check back for indicating the connection setup to the F-CPU. The Emergency-Off buttons are active immediately.	--
350004	PROFIsafe communication was set up and the connection was shut down. Runtime can be terminated. The Emergency-Off buttons are deactivated immediately.	--

Number	Effect/causes	Solution
350005	Incorrect address configured for the F-Device. A PROFIsafe connection cannot be set up.	Check and modify the address of the F-Device in WinCC ES.
350006	The project was started. At the start of the project, check the proper function of the ACK buttons.	Press the two ACK buttons successively in the "Acknowledge" and "Panic" positions.
350008	You configured an incorrect number of failsafe buttons. A PROFIsafe connection cannot be set up.	Modify the number of failsafe buttons in the project.
350009	The device is in Override mode. It may no longer be possible to detect the location because transponder detection fails.	Exit the override mode.
350010	Internal error: The device has no failsafe buttons.	Return the device to Siemens. Worldwide contact partners

380000 - Alarms Sm@rtServer (Panels, RT Advanced, RT Professional)

380000 - Alarms Sm@rtServer

Note

Alarms without additional information

Alarms 380000-380100 are not described since the alarm text contains all the necessary information.

12.4 Working with logs (Basic Panels, Panels, RT Advanced)

12.4.1 Working with logs for Runtime Advanced and Panels (Basic Panels, Panels, RT Advanced)

12.4.1.1 Log Basics (Basic Panels, Panels, RT Advanced)

Introduction

WinCC provides the following types of log for logging process data for HMI Runtime:

- Data logs
- Alarm logs

A data log is used to log process data from an industrial plant.

An alarm log is used to log alarms that occur in the monitored process.

Principle

The two types of log both have roughly the same structure and largely work in the same way. They are very clear and easy to configure. With both types of log you define the same properties for the log. The same logging methods are also available for both types of log.

The following logging methods are available:

- Circular log
  If a circular log is totally full, the oldest entries are overwritten.
- Segmented circular log
  In a segmented circular log, multiple single logs of the same size are filled in succession. When all log segments are filled, the oldest log segment is overwritten.
- Log with level-dependent system alarm
  A system alarm is triggered when a defined level is reached.
- Log with level-dependent triggering of an event
  The "Overflow" event is triggered when the log is full. The "Overflow" event triggers a system function.

12.4.1.2 Properties of Logs (Basic Panels, Panels, RT Advanced)

Introduction

You define the properties of a data log in the "Data logs" editor.

You define the properties of an alarm log in the "Alarm log" editor.

The properties of the data log and alarm log are configured in the same way. You configure the properties either directly in the table of the respective editor or in the log properties of the Inspector window.

General properties

- Name
  You can assign any name to the log. The name must contain at least one letter or one number.
- Storage location
  The storage location specifies where the log is saved. The HMI device determines which storage locations are available.

- Size
  The size of a log depends on the type of log and the selected settings.
  - Size of a data log
    The size of a data log is calculated as follows:
    The number of items * the length of each tag value to be logged.
    In the "Properties" window, the maximum size that the log accepts for retention of the currently selected number of data records is displayed in the input field "Number of data records". The maximum log size is limited by the volume of the storage medium.
  - Size of an alarm log
    The size of an alarm log is calculated from the number of data records and the approximate size of an entry. The size of an entry depends on whether the alarm text and the associated tag values are to be logged as well.
- Restart characteristics
  Under Restart characteristics you can specify that the logging starts when Runtime starts. Check the "Enable logging at runtime start" check box.
  You can also control the behavior when Runtime starts. Enable "Reset log" if you want to overwrite existing logged data with the new data. Select the "Append data to existing log" option if you want to retain the existing logged data. This setting adds the data to be logged to an existing log.

See "AUTOHOTSPOT" and "AUTOHOTSPOT" for more details.

Note

You can use system functions to control the restarting of a log in Runtime.

Automatic log entries

In Runtime, the following log entries are created as standard:

Entry	File format	Log type	Meaning
RT_DIS	Any	Data log	Indicates that the connection to the log was interrupted at this point in time. (A bold line is shown in the trend view for this time period.)
RT_OFF	Any	Data log	Indicates that Runtime was shut down at this point in time. (No line is shown in the trend view for this time period.)
RT_ERR	Any	Data log Alarm log AuditTrail[1]	Indicates in the destination log that a copy operation was not successful or was interrupted. (The log copy was not fully created.)
$RT_COUNT	*.CSV *. TXT	Data log Alarm log AuditTrail[1]	This entry was created at the end of the log and serves to increase the system performance when Runtime starts.

[1] The "AuditTrail" logging method is not available for all HMI devices.

See also

Storage locations of logs (Page 5532)

12.4.1.3 Storage locations of logs (Basic Panels, Panels, RT Advanced)

Storage location of a log

When you configure a log in WinCC, the available storage locations depend on the HMI device you are using.

HMI devices	Supported logs			Supported storage locations	Supported storage locations
	Alarms	Tags	Audit Trail		
Basic Panels[1]	No	No	No	-	-
Basic Panels 2nd Generation[2]	Yes	Yes	No	a TXT file (Unicode)	USB memory (at USB port)
Panels[3]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) Network drive
Comfort Panels[4]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) Storage card (USB) Network drive
Multi Panels[5]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (MMC) Storage card (USB) Network drive
Mobile Panels[6]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (MMC) Storage card (USB) Network drive

HMI devices	Supported logs			Supported storage locations	Supported storage locations
	Alarms	Tags	Audit Trail		
• Mobile Panels 2nd Generation[7]	Yes	Yes	Yes	a CSV file (ASCII) RDB file a TXT file (Unicode)	Storage card (SD) USB memory (at USB port) Network drive
PC systems with Runtime Advanced	Yes	Yes	Yes	a CSV file (ASCII) Database RDB file a TXT file (Unicode)	Local file system Network drive

1 KP 300, KP 400, KTP 1000, TP 1500

2 KTP 400, KTP 700, KTP 900, KTP 1200

3 TP 277 and OP 277 only

4 All HMI devices from the device list

5 MP 277 and MP 377 only

6 Mobile Panel 277 only

7 KTP 400F Mobile, KTP 700 Mobile, KTP 900 Mobile - including fail-safe versions

Note

Logging on network drives

Do not log alarms, tags and Audit Trail directly on a network drive. Power supply can be interrupted at any time. This means there is no guarantee for a reliable operation of logs and audit trails.

Save the logs on your local hard drive or a local storage card. Use the system function "ArchiveLogFile" to save the logs long-term on a network drive. This step ensures reliable operation.

Syntax examples for storage locations

Storage card storage location:

- <\Storage Card MMC\My_Archives\TagLogs>: Saves the archive on the MMC storage card to the subdirectory "My_Archives\TagLogs".

Local file system storage location:

- <C:\My_File_Folder\My_Archives\Machine_1>: Saves the log on the local hard disk drive C: in the subdirectory "My_File_Folder\My_Archives\Machine_1"

Network drive storage location:

- <\\ArchiveServer\My_File_Folder\My_Archives\Machine_1>: Saves the archive on the "ArchiveServer" server to the subdirectory "My_File_Folder\My_Archives\Machine_1".

Naming conventions

The log names must be unambiguous in a project. The name of a log must always be unique, regardless of whether different storage locations are selected for the log.

Note

The characters which can be used in the name of the data source depend on the storage location.

The \ / * ? : " < > | characters are not allowed at the following locations:

- File - RDB
- File - CSV (ASCII)
- File - TXT (Unicode)

If the "Database" storage location is used, the following characters may be used: a-z A-Z 0-9 _ @ # $

The characters _ @ # $ cannot be used as the first character of a name.

Note

Only applies to Basic Panels 2nd Generation

Unicode characters are not supported for the log names and the log paths.

File - CSV (ASCII)

Data is saved to a CSV file in standard ASCII format.

If you want to read or evaluate logged data without using WinCC Runtime, use the "CSV file" storage location.

Note

Double quotation marks or multiple characters are not permitted as list separators for the "CSV file" storage location. You can find the settings for list separators under "Start > Settings > Control Panel > Regional and Language Options".

Note

Logging tags of the "BOOL" data type

Boolean values are logged as digits:

- 0 (False) corresponds to the log entry 0
- 1 (True) corresponds to the log entry -1

File - TXT (Unicode)

Data is stored in Unicode.

This file format supports all characters that can be used in WinCC and WinCC Runtime. For editing, you will need software that can save files in Unicode, such as Notepad.

Note

Use "File - TXT (Unicode)" as the storage location to log Asian languages.

File - RDB

Data is saved with quick access in a proprietary database.

If you require maximum read performance in Runtime, use the "RDB file" storage location.

Database

Data is saved to a database which is set up for ODBC access by the PC administrator.

Log with checksum (Audit Trail)

The following files are generated under special circumstances:

***.keep**

1. If a log is started without checksum and will be continued with a checksum.
2. If you update WinCC with a service pack or a new version and the Audit Trail or the log is continued with the checksum.

The content of the keep file will remain the same when compared with the original csv file or txt file.

***.bak**

If WinCC Runtime has determined a serious, irregular problem in the file.

Properties of Logs (Page 5530)

12.5 Working with recipes (Basic Panels, Panels, RT Advanced)

12.5.1 Basics (Basic Panels, Panels, RT Advanced)

12.5.1.1 Definition and applications (Basic Panels, Panels, RT Advanced)

Introduction

Recipes are collections of related data, for example, machine parameterizations or production data.

Note

Restrictions for recipes

Recipes are not available on the HMI device OP 73:

Examples:

- Machine parameter settings that are needed to convert production to a different product variant.
- Product components that result in different compositions for different end products.

A recipe has a fixed data structure. The structure of a recipe is defined during configuration. A recipe contains recipe data records. These differ in terms of their values, but not their structure.

Recipes are stored on the HMI device or on an external storage medium. Recipe data records are always transferred complete and in a single pass between the HMI device and the PLC. In addition, production data can be imported in runtime, in the form of a CSV file.

Note

Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

Using recipes

Recipes can be used in the following situations:

- Manual production
  You select the required recipe data and display it on the HMI device. You modify the recipe data as required and save it on the HMI device. You transfer the recipe data to the PLC.
- Automatic production
  The control program starts transfer of the recipe data between the PLC and HMI device. You can also start the transfer from the HMI device. Production is then implemented automatically. It is not essential to display or modify the data.
- Teach-in mode
  You optimize production data that was optimized manually on the system, e.g. axis positions or filling volumes. The values thus determined are transferred to the HMI device and saved in a recipe data record. You can then transfer the saved recipe data back to the PLC at a later date.

Entering and modifying the recipe data

You enter the data in the individual recipe data records and modify it as required. The following options are available:

- Data entry during configuration
  If the production data exists already, you enter the data in the "Recipes" editor during recipe configuration.
- Entering the data in Runtime
  If you have to frequently modify production data, you can do this directly in Runtime as follows:
  - Enter the data directly on the HMI device.
  - Set the parameters directly on the machine. You then transfer the data from the PLC to the HMI device and save it in the recipe.

12.5.1.2 Examples for using recipes (Basic Panels, Panels, RT Advanced)

Recipes are used in the manufacturing industry and mechanical engineering, for example. The following recipes show typical applications which you can implement with the recipe function of WinCC:

- Machine parameter assignment
  One field of application for recipes is the assignment of machine parameters in the manufacturing industry: A machine cuts wooden boards to a certain size and drills holes. The guide rails and drill have to be moved to new positions according to the board size. The required position data are stored as data records in a recipe. You reassign the machine parameters using "Teach in" mode if, for example, a new board size is to be processed. You transfer the new position data directly from the PLC to the HMI device and save it as a new data record.
- Batch production
  Batch production in the food processing industry represents another field of application for recipes: A filling station in a fruit juice plant produces juice, nectar, and fruit drinks in a variety of flavors. The ingredients are always the same, differing only in their mixing ratios. Each flavor corresponds to a recipe. Each mixing ratio corresponds to a data record. All of the required data for a mixing ratio can be transferred to the machine control at the touch of a button.

12.5.1.3 Recipe structure (Basic Panels, Panels, RT Advanced)

Introduction

The basic structure of a recipe is illustrated with reference to the filling station in a fruit juice plant.

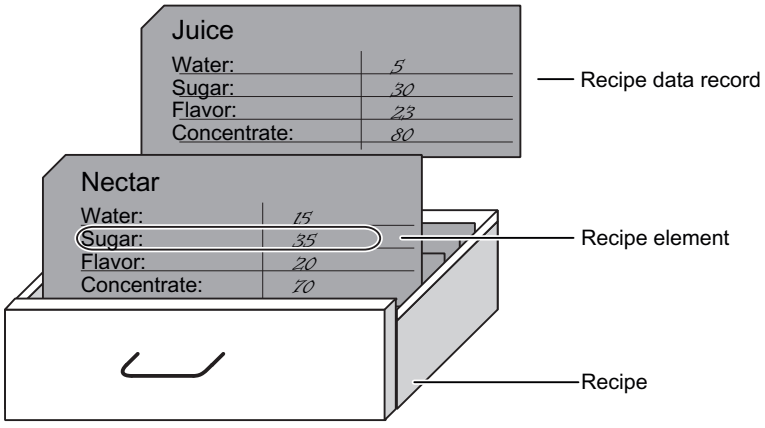
There may be several different recipes in an HMI device. A recipe can be compared to an index card box that contains several index cards. The index card box contains several variants for manufacturing a product family. All the data for each manufacturing variant is contained on a single index card.

Example:

In a soft drinks production plant, a recipe is needed for different flavors. Drink variants include fruit juice drink, juice and nectar.

Recipe

The recipe contains all the recipe data records for the different drink variants.



Recipe data records

Each index card represents a recipe data record needed to manufacture a product variant.

Recipe entries

Each index card in a drawer has the same structure. All the index cards contain fields for the different ingredients. Each field corresponds to a recipe entry. All the records of a recipe thus contain the same entries. The records differ, however, in the value of the individual entries.

Example:

All the drinks contain the following ingredients:

- Water
- Concentrate
- Sugar
- Flavoring

The records for juice drink, fruit juice or nectar differ, however, in the quantity of sugar used in production.

12.5.1.4 Display of recipes (Basic Panels, Panels, RT Advanced)

Introduction

You can display recipes in the following ways:

- Recipe view
- Recipe screen

Input in the recipe view and recipe screen

You change the values of a recipe in the recipe screen or recipe view and thus modify the manufacturing process or a machine.

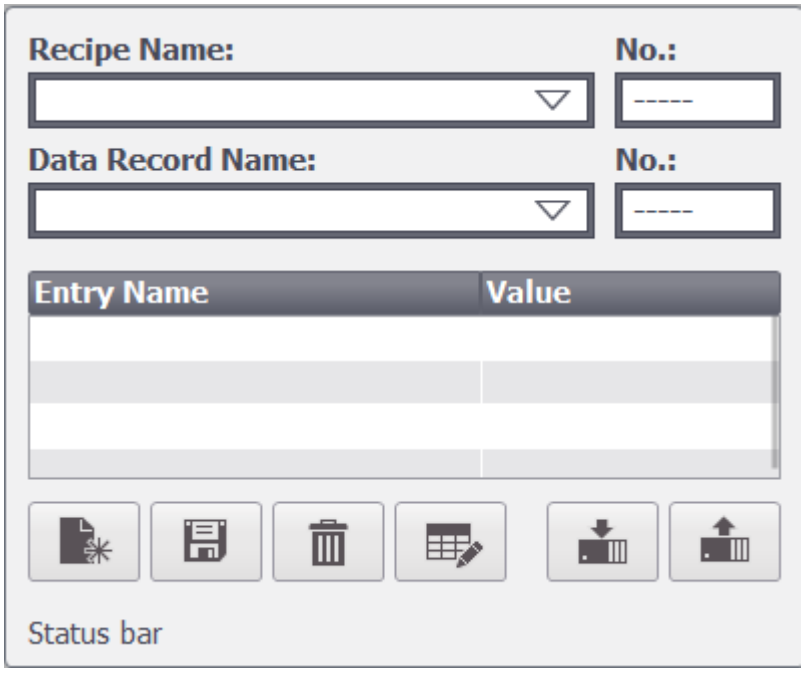
The recipe view and recipe screen can perform the same functions when using recipes. They differ in the following respects:

- Display options
- Operation
- Possibility of transferring data between the PLC and the HMI device

Recipe view

The recipe view is suitable for viewing simple recipes.

The recipe view is an off-the-shelf WinCC display and operator control object for managing recipe data records. The recipe view is always part of a screen. The recipe view shows recipe data records in tabular form. You adapt the appearance and the possible operations to suit your specific needs.

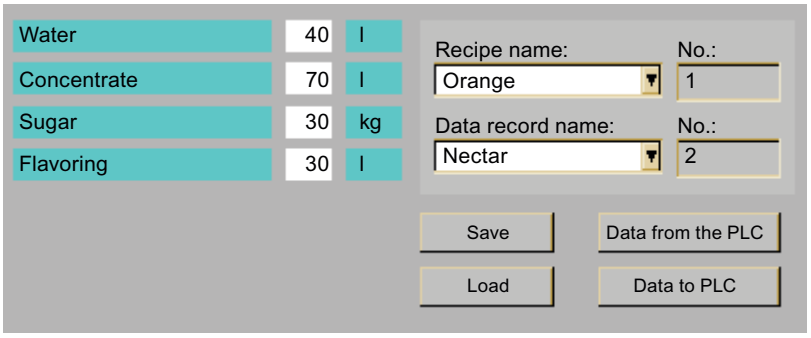


If you are editing recipes with a recipe view in your project, the values are saved in recipe data records. The values are not transferred between the HMI device and PLC until you use the relevant operator control object.

Recipe screen

The recipe screen is an individual screen that contains:

- Input fields for recipe variables
- Operator control objects for using the recipes, e.g. "SaveDataRecord"



The recipe screen is suitable in the following situations:

- Large recipes
- Allocation of recipe fields to the graphic display of the relevant plant area
- Breakdown of the recipe data into several screens

Note

The values of recipe variables are transferred between the PLC and recipe screen at the following times depending on the configuration:

- Immediately after modification
- When a relevant operator control object is used

Synchronizing recipe view and recipe screen

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.

A complete recipe data record will always be saved or synchronized.

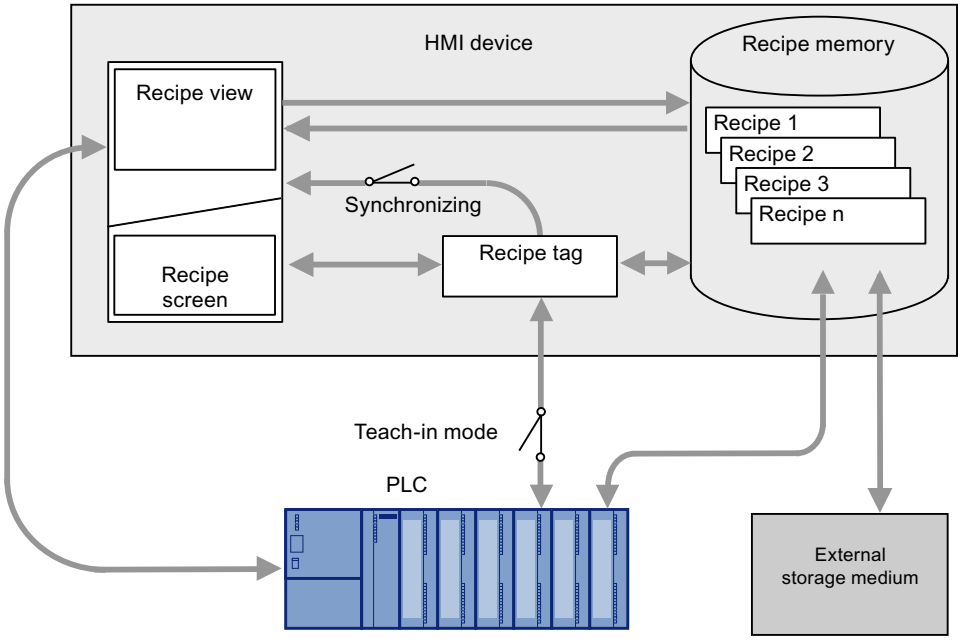
Note

Recipe tags can only be synchronized in the advanced recipe view. Synchronization only takes place if the "Synchronize recipe view and recipe tags" setting is activated for the recipe.

12.5.1.5 Transferring recipe data records (Basic Panels, Panels, RT Advanced)

Flow of data in recipes

The following picture illustrates the flow of data in recipes:



Interaction between the components

There is interaction between the following components at runtime:

- Recipe view / recipe screen
  On the HMI device, recipes are displayed and edited in the recipe view or in a recipe screen:
  - The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
  - The values of the recipe tags are displayed and edited in the recipe screen.

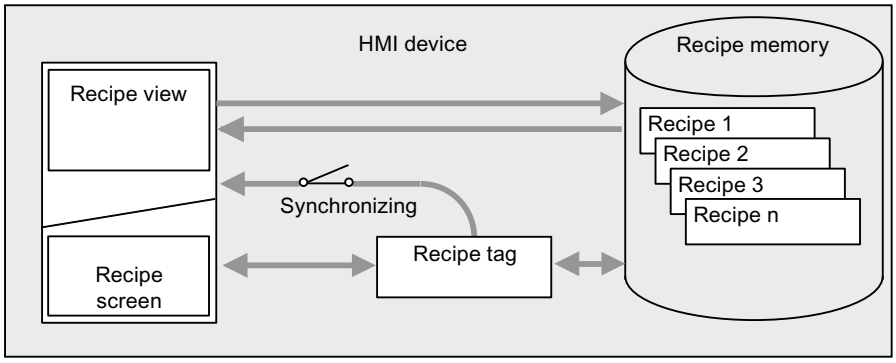
  You synchronize the values displayed in the recipe view with the values of recipe tags according to the configuration.
- HMI device recipe memory
  Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- Recipe tags
  The recipe tags contain recipe data. When you edit recipes in a recipe screen, the recipe values are stored in recipe tags. The point at which the values of the recipe tags are exchanged with the PLC depends on the configuration.

Note

You can synchronize the recipe tags with the recipe data records so that the same values are saved in both.

Loading and saving recipe data

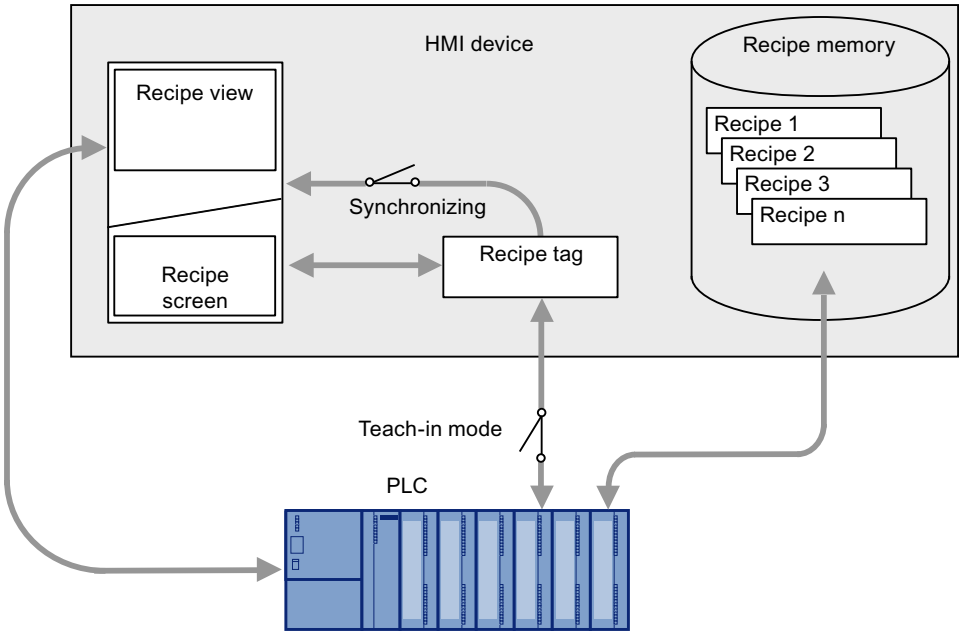
Complete recipe data records are loaded from or saved to the recipe memory on the HMI device in the recipe view.



The values of the recipe data record are loaded from the recipe memory to the recipe tags in the recipe screen. When they are saved, the values of the recipe tags are saved to a recipe data record in the recipe memory.

Transferring the recipe values between the HMI device and the PLC

Complete recipe data records are transferred between the recipe view and PLC.



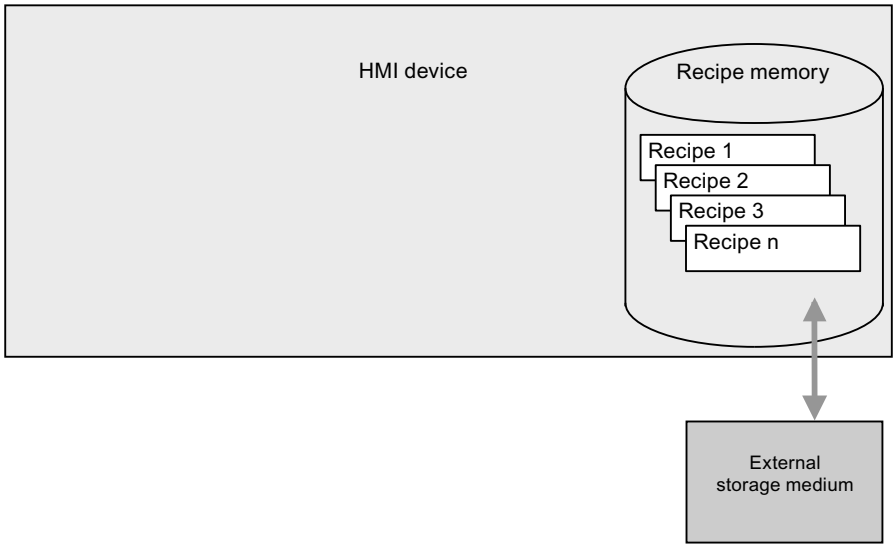
The following transfers are possible between the recipe screen and PLC, depending on the configuration:

- Transferring recipe data records between recipe view and recipe tags
- Immediate transfer of individual modified values between the recipe tags and PLC. The following settings are needed in the recipe in order to do this:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

Recipe data records can be transferred directly between the HMI device and PLC. In these situations, the display on the HMI device is not essential.

Exporting and importing recipe data records

Recipe data records are exported from the HMI device recipe memory and are saved to a CSV file on the external storage medium. The records can be reimported from the storage medium to the recipe memory.



The following external storage media may be used, depending on the HMI device:

- No storage medium, for example, for basic panels
- Memory card
- USB stick
- Hard disk

12.5.1.6 Configuration of recipes (Basic Panels, Panels, RT Advanced)

Introduction

Recipes are configured differently according to the intended use:

- If you are editing recipes with a recipe view in your project, the values are only saved in recipe data records.
- If you are editing recipes in a recipe screen in your project, the values are saved in recipe tags.

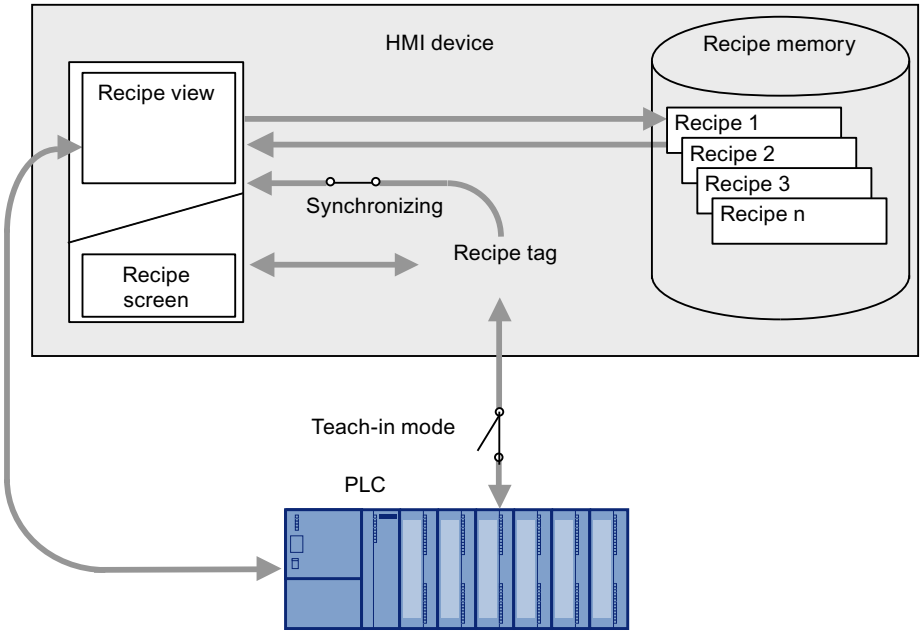
The following possible settings determine how the recipe data records, recipe tags and PLC all interact.

"Synchronizing recipe view and recipe tags" deactivated

The data in a data record is only displayed and can only be edited in the recipe view. If you use data outside the recipe view, they are not synchronized with the recipe view.

"Synchronizing recipe view and recipe tags" activated

There may be differences in Runtime between the values displayed in the recipe view and the values saved in the associated tags when you edit recipes in both a recipe view and a recipe screen. To prevent this, you must synchronize the recipe data record values with the values of the recipe tags.



Note

Recipe tags can only be synchronized in the advanced recipe view.

The values of the recipe view and the associated recipe tags are not synchronized automatically. The recipe tags and the recipe view are not synchronized until you use the operating element with the "RecipeViewSynchronizeDataRecordWithTags" function.

"Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" activated

With this setting, modified recipe values are not synchronized immediately between the recipe tags in the recipe screen of the HMI device,and PLC.

There must be an operating element with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values.

If recipe values are changed in the controller, the modified values are displayed immediately in the recipe screen if you use the operating element with the "GetDataRecordFromPLC" function.

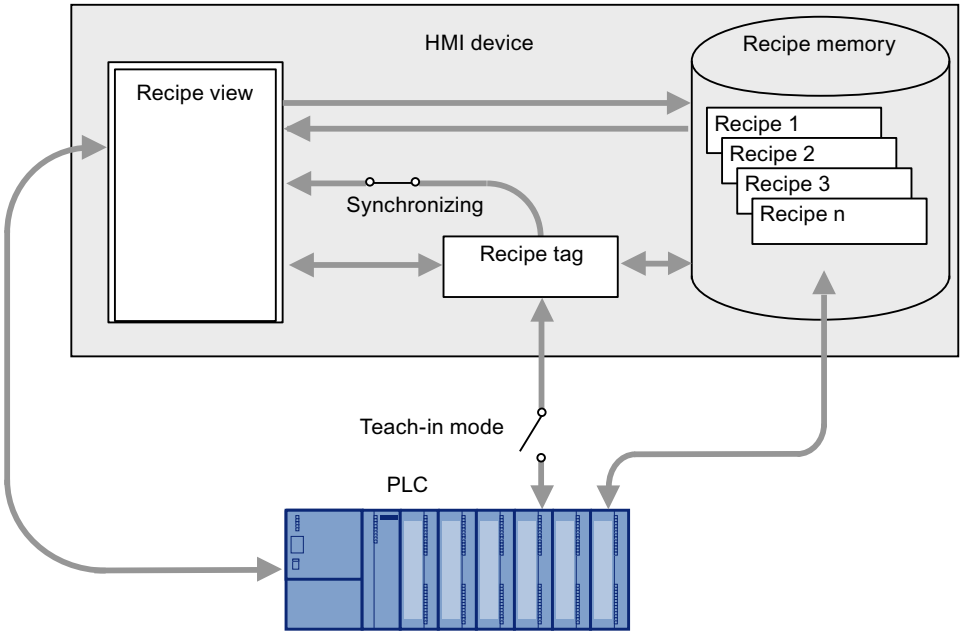
"Synchronize recipe view and recipe tags" activated and "Manual transfer of individual modified values (teach-in mode)" deactivated

With this setting, modified recipe values are synchronized immediately between the recipe tags on the HMI device and PLC.

When you change recipe values in the recipe screen, these changes are applied immediately by the PLC and immediately influence the process.

If recipe values are changed in the PLC, the changed values are displayed immediately in the recipe screen.

12.5.1.7 Special features of some devices (Basic Panels, Panels, RT Advanced)



Basic panels, OP 77A, TP 177A and TP 177A (Portrait) respond differently to the other HMI devices in the following respects:

- Only the simple recipe view is supported.
- Recipe tags are always synchronized with the recipe view (see figure above): When the operator changes a value of the recipe element in recipe view, the value of the associated recipe tag will also change.
- Recipe tags are not automatically transferred between the PLC and HMI device when they are modified. Recipe tags are always transferred manually in teach-in mode.
  There must be an operator control object with the "SetDataRecordToPLC" and "GetDataRecordFromPLC" functions present in order to synchronize the values with the PLC.

Note

Restrictions for recipe tags

Generally, in Basic Panels and OP77A, TP177A (Portrait) recipe tags cannot be used, except in a recipe.

Note

Restrictions for Import / Export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Complete recipe data, but not single recipe data records, can be exported and imported using ProSave in CSV format and transferred to the HMI device. Thereby, Runtime is interrupted.

NOTICE

Data loss with several recipe views in the screen

Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data.

The result is data loss and unpredictable status of recipe data.

Make sure the operators do not select and edit the same recipe in different recipe views.

- Display only one recipe in a recipe view.
- Display a different recipe in each recipe view.

Interaction between the components

There is interaction between the following components at runtime:

- Recipe view
  Recipes are displayed and edited in the recipe view on the HMI device.
  The recipe data records from the internal memory of the HMI device are displayed and edited in the recipe view.
- HMI device recipe memory
  Recipes are saved in the form of recipe data records in the HMI device's recipe memory.
- Recipe tags
  The recipe tags contain the values of recipe elements.

12.5.1.8 Synchronization of recipe data records with the PLC (Basic Panels, Panels, RT Advanced)

Overview

When recipe data records are transferred between the HMI device and PLC, both communication peers access common communication areas on the other peer.

Recipe data records are always transferred directly. The values of the tags are written directly to or read directly from the configured addresses without being placed on the clipboard.

Data transfer types

There are two ways to transfer recipe data records between the HMI device and PLC:

- Transfer without coordination
- Coordinated transfer via the "Data record" area pointer.

Note

Coordinated transfer

Transfer with coordinated transfer is used to prevent the uncontrolled overwriting of data in either direction in your control program.

Requirements for coordinated transfer

The following requirements apply to coordinated transfer:

- The "Data record" area pointer must be set up for the required connection in the "Communication > Connections" editor.
- In the properties of the recipe "Coordinated transfer of data records" is activated.
- The connection to the PLC is specified in the properties of the recipe with which the HMI device coordinates the transfer.

Coordinated transfer

In the case of coordinated transfer, both the PLC and the HMI device set the status bits in the shared data compartment.

Coordinated transfer of recipe data records can be a useful solution in the following cases:

- The PLC is the "active partner" for the transfer of recipe data records.
- The PLC evaluates information about the recipe number and name, as well as the recipe data record number and name.
- The transfer of recipe data records is started by the following PLC jobs:
  - "Set_data_record_in_PLC"
  - "Get_data_record_from_PLC"

12.5.1.9 "Recipes" editor (Basic Panels, Panels, RT Advanced)

Introduction

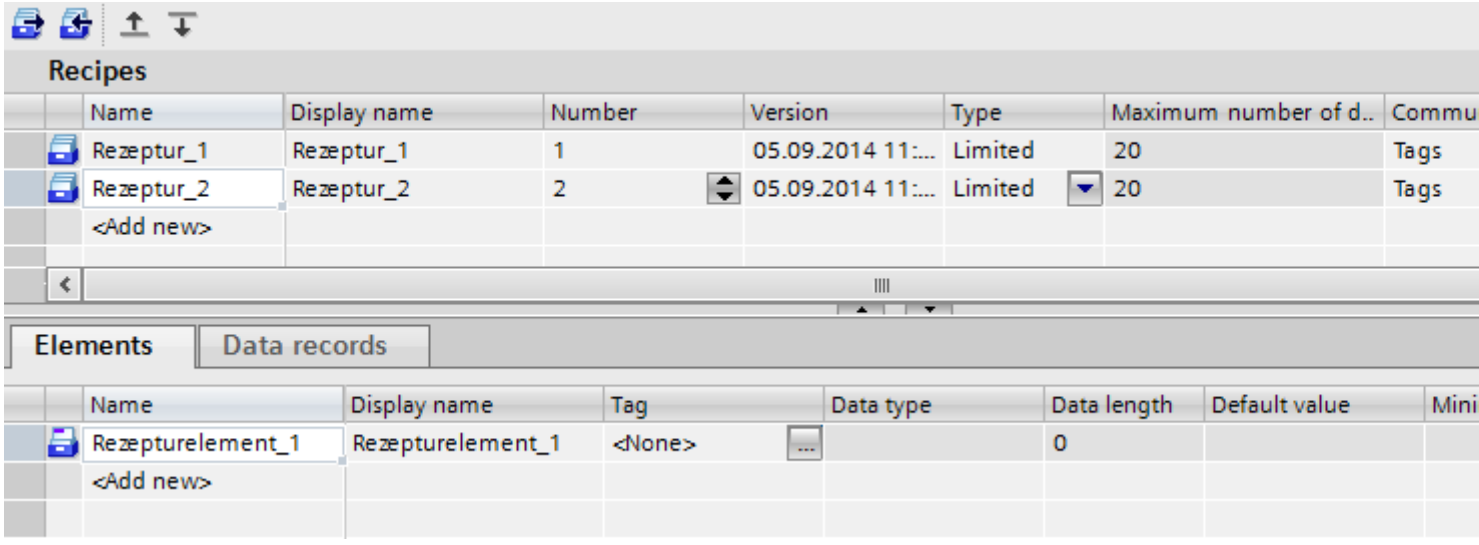
You can create, configure and edit recipes, recipe entries and recipe data records in the "Recipes" editor. The "Recipes" editor also allows you to enter values in recipe data records.

Structure of the "Recipes" editor

You create recipes in the top part of the table editor. You can also configure them there or in the Inspector window.

The bottom part of the table editor has the following tabs:

- Elements
  Define the recipe elements of the selected recipe using the table cells provided here. You can move recipe elements within the table with the shortcut menu commands, "Up" and "Down".
- Data records
  Define the values of the data records of the selected recipe using the table cells provided here.



You can then configure the selected recipe, the recipe element or the recipe data record in the Inspector window. You will find further notes on configuring the components of a recipe under "Configuring Recipes".

Recipe settings

The following settings are available for recipes:

Setting	Description
Name of the recipe	This is a unique identification for the recipe within the HMI device.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign descriptive names or designations which the operator can associate directly with a recipe, e.g. "fruit juice drink".
Recipe number	This is a unique identification for the recipe within the HMI device.
Version	Information about the recipe. The date and time of the last change to the recipe is set by default.
Path	Defines the storage location for recipes. The recipes are stored as a file.
Size type [fixed]	The recipe data records are limited to a predetermined number by default.
Number of data records [fixed]	Maximum number of data records in a recipe in Runtime. The number is limited by the recipe memory of the HMI device.
Communication type [fixed]	The recipe data records are written directly to the addresses of the recipe tags and read from there.
Tooltip	Tooltip for the recipe which is shown to the operator in Runtime.

Note

Path

The storage location depends on the storage media available on the HMI device.

Basic Panels and OP77A, TP177A (Portrait)

These HMI devices have no external memory. Recipes are always saved in the internal Flash memory. The "Path" setting is therefore not available.

Recipe element settings

You can make the following settings on the "Elements" tab:

Setting	Description
Name of the recipe element	Identifies a recipe element uniquely within the recipe. Enter meaningful names or labels that you can allocate uniquely, such as axis labels on a machine or ingredients such as "Flavoring".
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or designations which the operator can associate directly, e.g. "fruit juice flavoring".
Recipe tag	An assigned tag in Runtime stores the current value of the recipe element in the recipe data record.
Data type	Data type of the recipe tag.
Data length [fixed]	Data length of the recipe tag, depending on the data type.
Text list	Text is assigned to a value or range of values in a text list. You can display this text in an output field, for example. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.
Default value	This is used as the default entry when you create a new recipe data record.
Minimum value [fixed]	The smallest representable value of a number-based recipe tag, depending on the type of data.
Maximum value [fixed]	The largest representable value of a number-based recipe tag, depending on the type of data.
Decimal places	Determines how many places a decimal number is rounded to, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.
Tooltip	Tooltip about the recipe element which is shown to the operator in Runtime.

Recipe data record settings

You can make the following settings on the "Data records" tab:

Setting	Description
Name of the recipe data record	Identifies a recipe data record uniquely within the recipe.
Display name	Appears in the recipe view, for example, in Runtime. You can configure display names in multiple languages. Assign meaningful names or product numbers which the operator can associate directly with a product, e.g. "yellow fruit juice E231".
Recipe data record number	Identifies a recipe data record uniquely within the recipe.
Recipe elements 1 to n	You can store various values for each recipe element even during configuration. Together with the values of the other recipe elements, a value always forms a recipe data record. You can store multiple recipe data records. If enabled in the transfer settings, the recipe data records are transferred to the HMI device when downloading the project and existing data records on the HMI device are overwritten.
Comment	Comment about the recipe data record

12.5.2 Recipes in runtime (Basic Panels, Panels, RT Advanced)

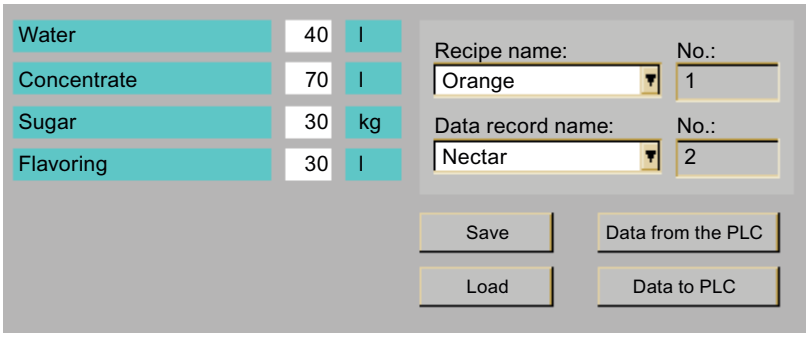
12.5.2.1 Recipe screen and recipe view (Basic Panels, Panels, RT Advanced)

Basics on the recipe screen (Basic Panels, Panels, RT Advanced)

Introduction

The recipe screen contains an individual screen form for entering the recipes. The screen form contains I/O fields and other display and operator control objects. The recipe functionality is implemented with system functions, e.g. for saving recipe data records.

The picture below contains an example of a recipe screen:



Note

Availability

Basic Panels and OP73A, OP77A, TP177A (Portrait) do not support any recipe screens.

Designing recipe screens

Configuring a recipe screen allows you to customize the display. You can spread large recipes over several screens according to topic and display them clearly using features such as graphical display and operator control objects.

- Spreading recipes over several screens according to topic
  - You can spread recipe data records containing lots of entries across several screens. For example, for each plant area you can configure a screen containing the associated screen forms for the recipe data records.

  Spreading recipes over several screens is useful for HMI devices with small displays as they avoid having to scroll through tables in Runtime.
- Visual machine simulation
  You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements such as axes or guide rails. which produces a direct relationship between the values and the machine.

Synchronizing recipe values

To enter recipe data record values outside the advanced recipe view in the configured I/O fields, activate "Synchronize recipe view and recipe tags" under "Properties > Synchronization" in the recipe properties.

The "Synchronize recipe view and recipe tags" option is not available for the simple recipe view.

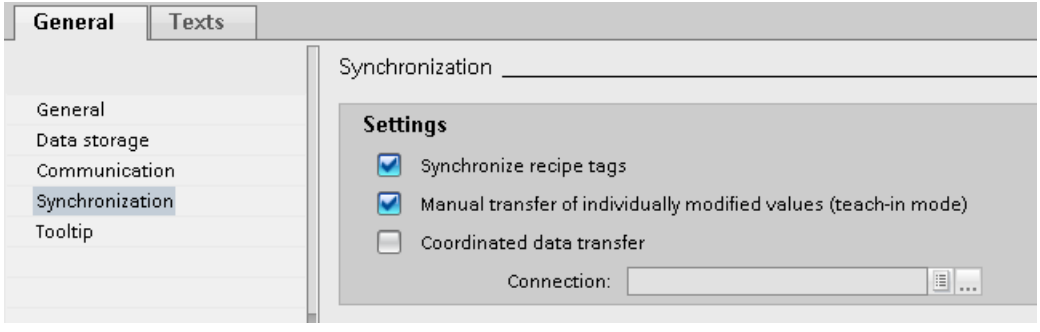


Figure 12-4 Recipes_Synchronization_Advanced

Transferring recipe values automatically

If the entered recipe values must be immediately transferred to the connected PLC in Runtime, deactivate "Manual transfer of individual modified values (teach-in mode)" under "Properties > Options".

Configure the "SetRecipeTags" system function if you want to enable and disable the immediate transfer of entered recipe values in Runtime.

System functions

The system functions for loading, saving and transferring recipe data records and recipes are located in the "Recipes" group.

The following system functions are available for operator control of a recipe screen:

- ImportDataRecords
- ExportDataRecords
- LoadDataRecord
- GetDataRecordFromPLC
- ClearDataRecord
- SaveDataRecord
- SetDataRecordToPLC
- SetDataRecordTagsToPLC
- SetRecipeTags
- GetDataRecordTagsFromPLC

The following system functions are available for operator control of the recipe view when it is being used in the recipe screen:

- RecipeViewSaveDataRecord
- RecipeViewSaveAsDataRecord
- RecipeViewSynchronizeDataRecordWithTags
- RecipeViewClearDataRecord
- RecipeViewNewDataRecord
- RecipeViewGetDataRecordFromPLC
- RecipeViewSetDataRecordToPLC
- RecipeViewRenameDataRecord
- RecipeViewShowOperatorNotes
- RecipeViewMenu (for simple recipe view only)
- RecipeViewOpen (for simple recipe view only)
- RecipeViewBack (for simple recipe view only)

12.5.2.2 Simple recipe view (Basic Panels, Panels, RT Advanced)

Description of the simple recipe view (Basic Panels, Panels, RT Advanced)

Recipe view

The simple recipe view is a display and operating object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons and information displayed in the columns are adjustable.

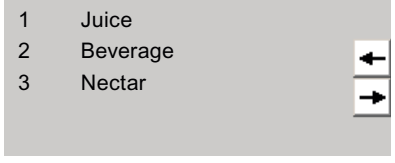
The values displayed or entered in the recipe view are saved in recipe data records. The recipe data record displayed can be written to the PLC and values read in from the PLC using buttons.

Layout of the display

The simple recipe view consists of the following display areas:

- Recipe list
- Data record list
- Element list

This application is illustrated below:



In the simple recipe view, each area is shown separately on the HMI device. You can use the shortcut menu to operate each of these display areas.

The simple recipe view always begins with the recipe list.

Operation

You have the following options for using the simple recipe view, according to the configuration:

- Create, change, copy or delete recipe data records
- Read recipe data records from the PLC or transfer to the PLC

Using the display area and shortcut menu

Toggle between the display areas and the shortcut menus to operate the simple recipe views.

Table 12-20 Operation of the display area

Button	Key	Function
	<Enter>	The next lowest display area is opened, i.e. the data record list or the element list.
	<Esc>	The previous display area opens.
	<INS>	Creates a new data record for the selected recipe if the list of recipes or recipe data records is displayed. Then changes to the list of recipe element. Requirement: "Properties >General > Processing mode" is activated. The button can be simulated with the "Key SimulateSystem-Key" function even on devices without keys.
	<DEL>	Deletes the selected recipe data record in the list of recipe data records. Requirement: "Properties >General > Processing mode" is activated.
	<Up>/<Down>	Selects the previous/next entry.
	<Pg Up>/<Pg Down>	Moves the display up or down one page.
	<Home>/<End>	Selects the first/last entry. The first/last entry is selected.

Table 12-21 Operation of the shortcut menu

Button	Key	Function
	<Right>	The shortcut menu of the display area opens.
	<Esc>	The menu is closed. The display area opens.
	Input of the number of the menu command	The menu command is executed.

Shortcut menus of the simple recipe view

You can click the button in each display area to call up a selection of commands. The command selection lists those commands that are available in the current display area. A number is assigned to each command. The command is executed when you enter this number. Alternatively select the command and press the <Return> key.

Shortcut menus in the recipe list

Menu command	Function
New	A new recipe data record is created for the selected recipe. If a start value is configured, it is displayed in the input field.
Display tooltip	The tooltip configured for the recipe is displayed.
Open	The record list of the selected recipe opens.

Shortcut menus of the recipe data record list

Menu command	Function
New	Creates a new recipe data record. If a start value is configured, it is shown in the input field.
Delete	The displayed record is deleted.
Save as	The selected data record is saved under a different name. A dialog box opens where you can enter the name.
Rename	Renames the selected data record. A dialog box opens where you can enter the name.
Open	The element list of the selected data record opens.
Previous	The recipe list opens.

Shortcut menus of the recipe element list

Menu command	Function
Save	The selected data record with the recipe element is saved.
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.
Save as	The data record is saved under a new name. A dialog box opens where you can enter the name.
Display tooltip	The tooltip configured for the recipe element is displayed.
Rename	The selected recipe element is renamed. A dialog box opens where you can enter the name.
Previous	The data record list opens.

Shortcut menus in the data record list

Note

HMI device dependency

The following menu commands are configured in Basic Panels and in OP 77A, TP 177A, TP 177A (Portrait) and TP 177B.

Menu command	Function
To PLC	The displayed values of the selected data record are transferred from the HMI device to the PLC.
From PLC	The recipe values from the PLC are displayed in the recipe view of the HMI device.

Updating and displaying values

Note

Processed recipe data record is changed in the background

Only applies for Basic Panels: If an operator has changed a recipe data record and a PLC job wants to read or write any recipe data record of this recipe, the PLC job is stopped and a system alarm is output. On the other hand, the changed value is displayed immediately if only the PLC job and no operator has changed recipe data.

Does not apply for Basic Panels: If an operator has changed a recipe data record and a PLC job has changed values of the recipe data record concerned, the recipe view is not updated automatically. To update the recipe view, reselect the relevant recipe data record.

Recipe view basics (Page 5555)

Configuration options of the simple recipe view (Page 5560)

Configuration options of the simple recipe view (Basic Panels, Panels, RT Advanced)

The response of the simple recipe view can be defined in the recipe view inspector window. Some devices, for example basic panels, only support the simple recipe view.

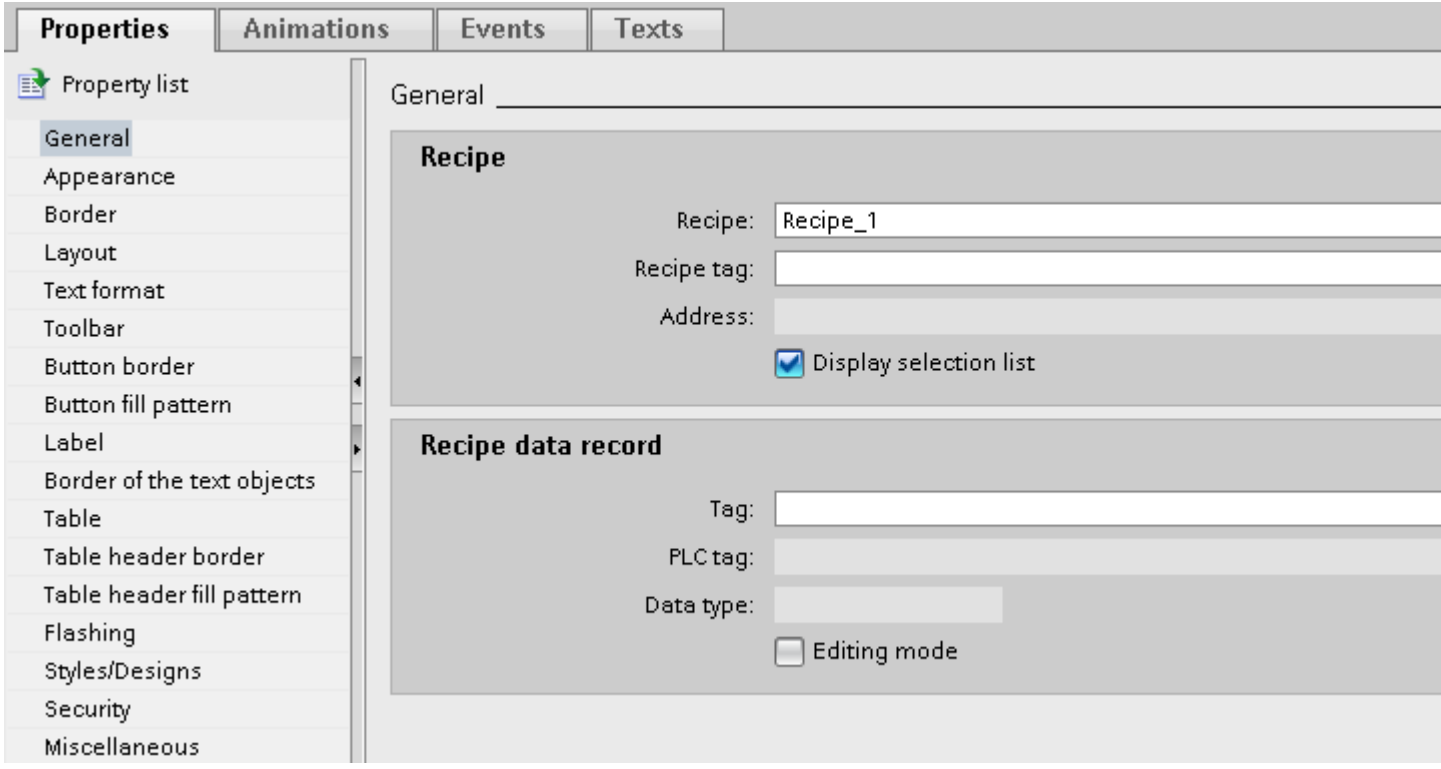
Please note the following for devices with a simple recipe view:

1. In the Inspector window, under "Properties > Display > Mode", select "Simple view" as "View type".
2. The "Properties > Simple view" area contains additional properties only applicable to the simple recipe view.
3. All other properties are also applicable to the advanced recipe view.

Displaying recipe data record values only

To display the recipe data in a recipe view for checking only, proceed as follows:

1. Deselect "Edit mode" in the "General" group.



You cannot create, rename, edit or delete recipe data.

Writing a recipe data record number or name to a tag

A tag to each recipe data record can be configured in the advanced recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe data record is stored in the tag. Conversely, the tag can also be used to select a recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Follow these steps:

1. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The number of the recipe data record is stored in a tag.

Configuring an event on the recipe view

Note

Events and buttons

The "Events" register is faded out when a minimum of one button is enabled.

To configure an event on the recipe view, follow these steps:

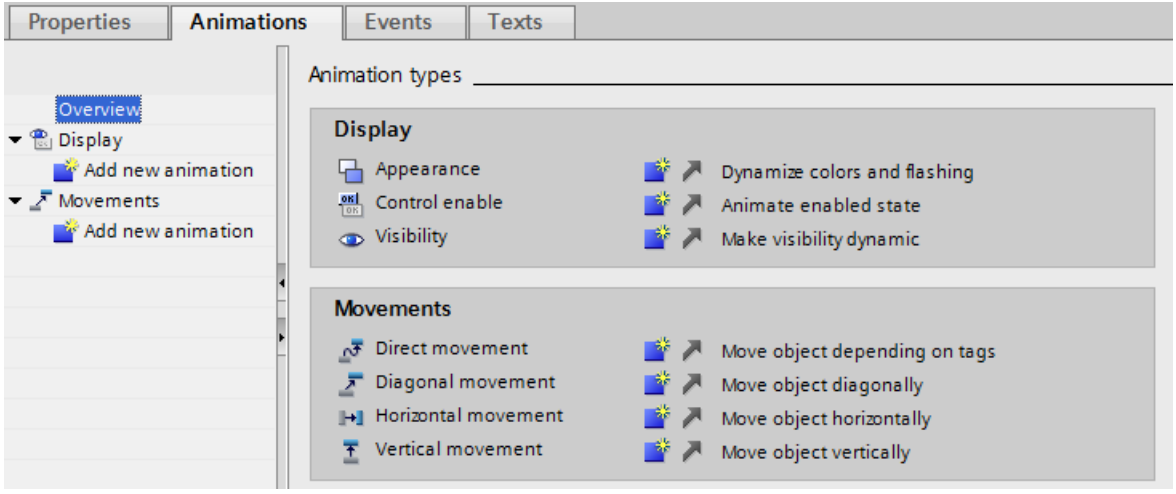
1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are displayed in the Inspector window.
2. Deactivate all buttons under "Properties > Toolbar" and "Properties > Simple view".
3. In the Inspector window, under "Properties > Events", click the event to be configured, e.g. "Enable".
4. Configure a function list for the event.

The function list is processed when the operator enables the recipe view.

Animation properties of the recipe view

To configure an animation of a recipe view, proceed as follows:

1. Select the recipe view that was added to the screen in the "Screens" editor. The properties of the recipe view are displayed in the Inspector window.
2. Click under "Properties > Animations" in the Inspector window.



3. Link a tag to one or more of the following properties.
   - X-Position and y-Position
   - Design: Colors, flashing
   - Operability
   - Visibility
     In the "Animations> Overview" area, all animations are summarized in tabular form. Under "Animations> Tag links > Tag linkage", as well as visibility and position a tag can also be linked to height and width.

Note

Animations and buttons

If all buttons are not disabled, an error message appears whilst compiling the project for windows-CE HMI devices.

Constraints on the simple recipe view

The following functions are not possible in the simple recipe view:

- Synchronizing recipe view and recipe tags
- Writing a recipe number / name to a tag
- Display status bar
- Display data record number
- Display label
- Display table

Recipe view basics (Page 5555)

Description of the simple recipe view (Page 5557)

Configuration of recipes (Page 5545)

Using the simple recipe view (Basic Panels, Panels, RT Advanced)

Controlling the simple recipe view with mouse or touchpad

To control the simple recipe view with mouse or touchpad, proceed as follows:

1. Select the desired recipe from the recipe view.
2. Click the → button.
   The shortcut menu is opened.
3. Select the desired menu command.
   The menu command is executed.

Controlling the simple recipe view with the keyboard

To control the simple recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the simple recipe view is selected.
2. Select the desired recipe with the cursor keys.
3. Press <Right>.
   The shortcut menu is opened.
4. Press the <Down> key until the desired menu command is selected.
5. Press <Enter> to confirm the command.

Key shortcuts for the simple recipe view

The following key shortcuts are activated for the simple recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Key shortcut	Effect	Menu command
<Insert>	Generates a new recipe data record	New
<Del>	Deletes the recipe data record displayed.	Delete

Operating the recipe view with function keys

The recipe view can be operated with function keys, for example if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

Managing recipe data records (Basic Panels, Panels, RT Advanced)

Administration of recipe data records

You have the following options for managing the simple recipe view, according to the configuration:

- Creating new recipe data records
- Copy recipe data records
- Edit recipe data records
- Delete recipe data records

Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Select the "New" command from the shortcut menu for the recipe list.
   A new data record with the next available number will be created.
   The element list of the new recipe data record opens.
3. Enter values for the elements of the recipe data record.
   The configuration data may already contain default values for the recipe data record.
4. Select the "Save" command from the shortcut menu for the element list.
   The dialog "Save as" opens.
5. Enter the name and number of the recipe data record.
6. Click the "OK" button.
   The data record is saved under the new name.
   If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. On the HMI device, select the recipe data record of which you want to save a copy.
3. Select the "Save As" command from the shortcut menu for the data record list.
   The dialog "Save as" opens. The recipe data record is automatically given the next free recipe data record number.
4. Under name, enter the name of the record.
5. Click the "OK" button.

Modifying a recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Select the recipe data record.
   The element list of the recipe data record is displayed.
4. Replace the old values with new ones.
5. Select the "Save" command from the shortcut menu for the element list.

Deleting a recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device from which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Select the "Delete" command from the shortcut menu for the data record list.
4. Confirm this security prompt to delete the data record.

Read recipe data record from PLC (Basic Panels, Panels, RT Advanced)

Introduction

In Runtime, you can change values directly in the plant that are also stored in recipes in the HMI device. This applies if a valve was opened further directly in the plant than was specified in the recipe. The values of the recipe data records saved in the HMI device possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The read values are written to the recipe data record that is currently displayed on the HMI device.

Procedure

To read a recipe data record from the PLC, proceed as follows:

1. Open the recipe on the HMI device.
   The data record list opens.
2. Select the element list of the recipe data record to which you want to apply the values from the PLC.

3. Select the "From PLC" command from the shortcut menu for the element list.
   The values are read from the PLC and displayed in the current recipe data record.
4. If you want to save the values, select the "Save" or "Save As" command.

Result

The values are read from the PLC, visualized on the HMI device and saved to the recipe data record.

Note

Basic Panels

With Basic Panels, the "From PLC" menu command can also be configured for the data record list. In this case, you can also select the "From PLC" menu command in the data record list.

Recipe view basics (Page 5555)

Transferring a recipe data record to the PLC (Basic Panels, Panels, RT Advanced)

Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

Procedure

To transfer a recipe data record to the PLC, proceed as follows:

1. Open the recipe you want to use.
   The data record list opens.
2. Select the element list of the recipe data record whose values you want to transfer to the PLC.
3. Select the "To PLC" command from the shortcut menu for the element list.

Result

The values of the recipe data record are transferred to the PLC.

Note

Basic Panels

With Basic Panels, the "From PLC" menu command can also be configured for the data record list. In this case, you can also select the "From PLC" menu command in the data record list.

12.5.2.3 Advanced recipe view (prior to V13) (Basic Panels, Panels, RT Advanced)

Description of the advanced recipe view (prior to V13) (Panels, RT Advanced)

Recipe view

The advanced recipe view is a display and operating object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons, headers and information displayed in the columns can be set.

The values displayed or entered in the recipe view are saved in recipe data records.

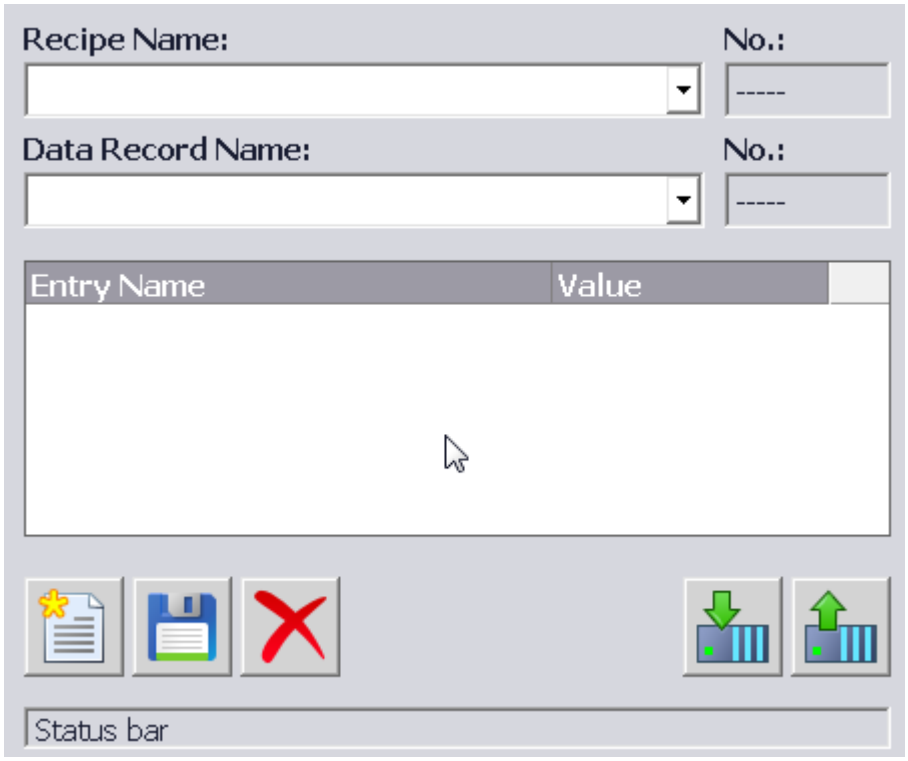
The layout of the recipe views is dependent on the device and the device version.

Application

The recipe view is used to display, edit and manage data records.

Layout of the display

The figure below shows an example of the advanced recipe view on an HMI device prior to device version V13.



Operation

Depending on the configuration you can:

- Create, edit, copy or delete recipe data records
- Read recipe data records from or transfer to the PLC
- Synchronize recipe data records with the associated recipe tags

Operating elements

The following operating elements can be configured in the recipe view:

Operating object	Key combination	Function
		The configured tooltip is displayed.
	<Ctrl+Spacebar>	Creates a new recipe data record. If a start value is configured, it is shown in the input field.
	<Ctrl+Enter>	Saves the displayed values of the recipe data record. The storage location is predefined by the project.

Operating object	Key combination	Function
	<Ctrl+*>	The recipe data record is saved under a different name regardless of the recipe view. A dialog box opens where you can enter the name.
	<Ctrl+Del>	Deletes the recipe data record displayed.
	<Ctrl+=>	The system always updates the current value of the recipe view with the up-to-date recipe tag value. When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag. "Synchronize recipe view and recipe tags" must be activated in the recipe properties before this function can be used.
	<Ctrl+Down Arrow>	The values of the set recipe data record displayed in the recipe view are transferred to the PLC.
	<Ctrl+Up Arrow>	The recipe values from the PLC are displayed in the recipe view.

Updating and displaying values

If values of the corresponding recipe data record are changed by a job mailbox, the recipe view is not updated automatically. The values are changed in the background. To update the recipe view, reselect the relevant recipe data record.

Reading recipe data records from the PLC (Page 5577)

Transferring a recipe data record to the PLC (Page 5577)

Configuration options of the advanced recipe view (Page 5570)

Configuration options of the advanced recipe view (Panels, RT Advanced)

You can specify the behavior of the advanced recipe view in the Inspector window of the recipe view.

The layout of the recipe views is dependent on the device and the device version.

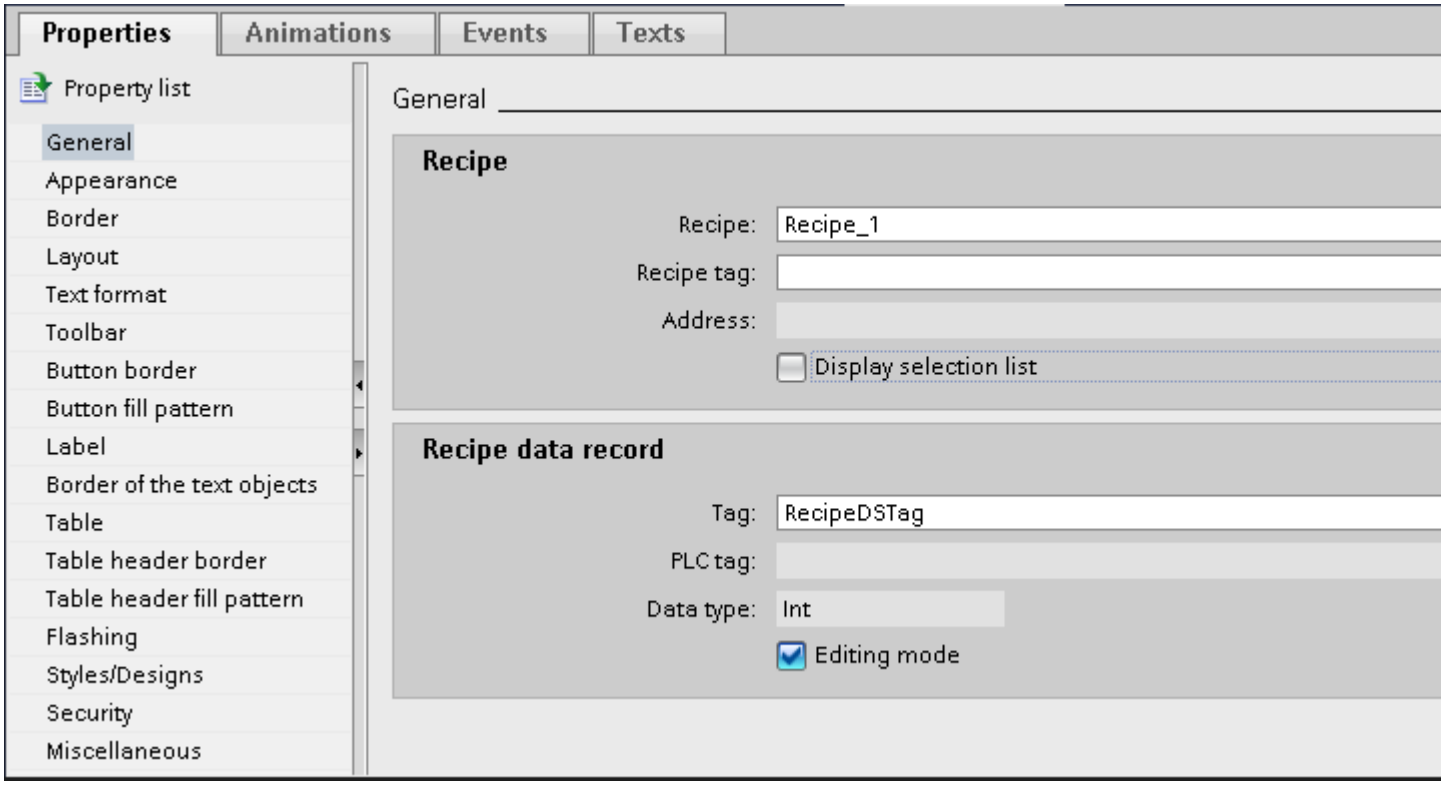
Please note the following for devices with an advanced recipe view:

1. In the Inspector window under "Properties > Display > Mode", select "Advanced view" as the "View type".
2. The "Properties > Simple view" area contains properties only applicable to the simple recipe view.
3. All other properties apply to the advanced recipe view.

Displaying a recipe

To only allow access to the recipe data records of a specific recipe in a screen, follow these steps:

1. Enter the required recipe or select an existing recipe in the "Recipe" field under "Properties > General".
2. When a recipe is entered in the "Recipe" field, you will have to enable the "Selection list" if you want to display the recipe name in runtime.



The selected recipe appears in the recipe view.

Writing a recipe number or name and recipe data record number or name to a tag

Both the recipe and the recipe data record can each be configured to a tag in the recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe or recipe data record is stored in the tag. Conversely, the tag can be used to select the recipe or recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Follow these steps:

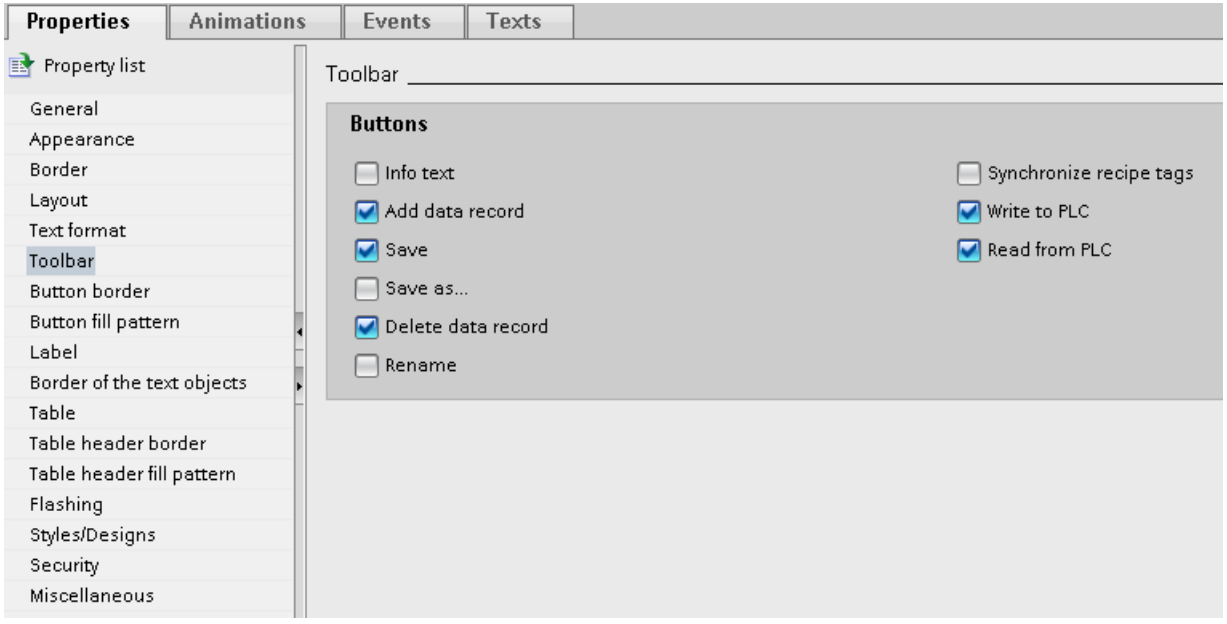
1. Enter a tag of the "String" type in the field "Recipe tag", under "Properties > General > Recipe".
2. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The name of the recipe and the number of the recipe data record are each stored in a tag.

Using the recipe view as a drop-down list

To use the recipe view as a selection field for recipes and recipe data records in a recipe screen, follow these steps:

1. Select the tag for the recipe name under "General > Recipe > Recipe tag".
2. Select the tag for the recipe data record name under "General > Recipe data record >Tag".
3. Disable the "Editing mode". You cannot create, rename, edit or delete recipe data.
4. In order to select recipes, enable "Display selection list" and make sure that no recipe is selected under "Properties > General > Recipe".
5. Deactivate all buttons under "Properties > Toolbar".



Configuring an event on the recipe view

To configure an event on the recipe view, follow these steps:

1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are displayed in the Inspector window.
2. In the Inspector window, click the event you want to configure under "Properties > Events".
3. Configure a function list for the selected event.
   The function list is processed when the configured event occurs.

Recipe view basics (Page 5555)

Description of the advanced recipe view (prior to V13) (Page 5568)

Configuration of recipes (Page 5545)

Using the advanced recipe view (Basic Panels, Panels, RT Advanced)

Introduction

You can control the recipe view using both mouse or touchpad or with the keyboard.

The layout of the recipe views is dependent on the device and the device version.

Controlling the recipe view with mouse or touchpad

To control the recipe view with mouse or touchpad, proceed as follows:

1. Select the recipe you want to use.
   The records for the recipe are displayed.
2. Click on the data record you wish to edit.
3. Click the button whose function you want to run.

Controlling the recipe view with the keyboard

To control the recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the cursor reaches the field for selecting the recipe.
2. Press <Enter>.
   The drop-down list box for the recipes opens.
3. Select a recipe. You navigate between the next or previous entry in the list by using the cursor keys <Left>, <Right>, <Up> and <Down>.
4. Select a data record.
5. Press the <Tab> key until the operator control object you wish to use is selected.

Alternatively you can control the recipe view using certain key combinations.

Operating the recipe view with function keys

The recipe view can be operated with function keys, for example if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

Key shortcuts for the advanced recipe view

The following key shortcuts are activated for the advanced recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Keys shortcut	Effect	Menu command	Button
<HELP>	Calls up the configured tooltip for the selected recipe.	Tooltip	
<Ctrl+Spacebar>	Generates a new recipe data record. Any configured start value is displayed in the input field.	Add data record	
<Ctrl+Enter>	Saves the modified record with its current name.	Save	
<Ctrl+*>	Saves the modified record with a new name.	Save as	
<Ctrl+Del>	Deletes the recipe data record displayed.	Delete data record	
<Ctrl+=>	Compares the values of the selected data record with the values on the PLC. Any value in the recipe view which is more recent compared to the current recipe tag value is written to the recipe tag.	Synchronize recipe tags	
<Ctrl+Down Arrow>	Sends the current value to the PLC.	Write to PLC	
<Ctrl+Up Arrow>	Reads the current value from the PLC.	Read from PLC	

Screen change

If you change to another screen and have not yet saved changes to the recipe data in the recipe view, you will be prompted to save the recipe data. The recipe name and the name of the recipe data record are displayed to show which recipe data have not been saved yet.

Managing recipe data records (Basic Panels, Panels, RT Advanced)

Administration of recipe data records

You have the following options for managing recipe data records, according to the configuration:

- Creating new recipe data records
- Copy recipe data records

- Edit recipe data records
- Delete recipe data records

Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Click or press <Ctrl+Spacebar>.
   A new recipe data record with the next available number is created.
   If you change the new data record number to an existing data record number, the existing data record is overwritten.
3. Enter values for the elements of the data record.
   The elements of the recipe data record can be assigned default values depending on the configuration.
4. Click or press <Ctrl+*>.
   The dialog "Save as" opens.
5. Enter a name for the data record.
6. Click "OK" to confirm your input.
   The data record is saved under the new name.
   If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. Select the recipe data record that you want to copy on the HMI device.
3. Click in the recipe view or press <Ctrl+*>.
   The dialog "Save as" opens.
4. Enter a name for the data record.
5. Click "OK" to confirm your input.

Modifying a recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Replace the old values with new ones.
4. Click in the recipe view or press <Ctrl+Enter>.

Deleting a recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Click in the recipe view or press <Ctrl+Del>.

Example of creating a recipe (Page 5607)

Synchronizing recipe data record (Basic Panels, Panels, RT Advanced)

Introduction

Differences between the following values may occur during runtime:

- The values displayed in the recipe view
- The actual values of the recipe tags

Depending on the configuration, the values displayed in the recipe view are synchronized with the recipe tags. Synchronization encompasses all tags of a recipe data record.

Note

Changed tag name

The tag and the value of the recipe data record cannot be associated if you have renamed the tag you want to synchronize. The tags in question are not synchronized.

Note

Recipe tags can only be synchronized in the advanced recipe view.

Requirement

- A recipe data record is displayed in the recipe view.
- The values of recipe tags were modified by teaching, for example.

Procedure

To synchronize a recipe data record, proceed as follows:

- Click in the recipe view or press <Ctrl+=>.

The system always updates the current value of the recipe view with the up-to-date recipe tag value.

When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag.

12.5.2.4 Advanced recipe view (as of V13) (Basic Panels, Panels, RT Advanced)

Description of advanced recipe view (as of V13) (Basic Panels, Panels, RT Advanced)

Introduction

The advanced recipe view is a display and operating object that is used to manage recipe data records. The recipe view shows recipe data records in tabular form.

The buttons, headers and information displayed in the columns can be set.

The values displayed or entered in the recipe view are saved in recipe data records.

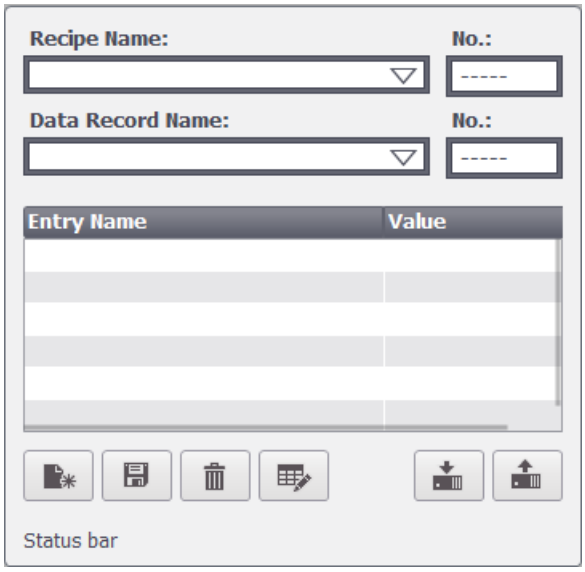
The layout of the recipe views is dependent on the device and the device version.

Application

The recipe view is used to display, edit and manage data records.

Layout of the display

The figure below shows an example of the advanced recipe view on an HMI device, device version V13 or later.



Operation

Depending on the configuration you can:

- Create, edit, copy or delete recipe data records
- Read recipe data records from or transfer to the PLC
- Synchronize recipe data records with the associated recipe tags

Operator controls

The following operating elements can be configured in the recipe view:

Operator con-	Keyboard shortcut	Function
	<HELP>	The configured tooltip is displayed.
	<Ctrl+Spacebar>	Creates a new recipe data record. If a start value is configured, it is shown in the input field.
	<Ctrl+Enter>	Saves the displayed values of the recipe data record. The storage location is predefined by the project.
	<Ctrl+*>	The recipe data record is saved under a different name regardless of the recipe view. A dialog box opens where you can enter the name.
	<Ctrl+Del>	Deletes the recipe data record displayed.
	<Ctrl+Shift+T>	The selected recipe data record is renamed. A dialog box opens where you can enter the name.

Operator con-	Keyboard shortcut	Function
	<Ctrl+=>	The system always updates the current value of the recipe view with the up-to-date recipe tag value. When the value shown in the recipe view is more recent than the current recipe tag value, the system writes this value to the recipe tag. "Synchronize recipe view and recipe tags" must be activated in the recipe properties before this function can be used.
	<Ctrl+Down Arrow>	The values of the set recipe data record displayed in the recipe view are transferred to the PLC.
	<Ctrl+Up Arrow>	The recipe values from the PLC are displayed in the recipe view.

Updating and displaying values

If values of the corresponding recipe data record are changed by a job mailbox, the recipe view is not updated automatically. The values are changed in the background. To update the recipe view, reselect the relevant recipe data record.

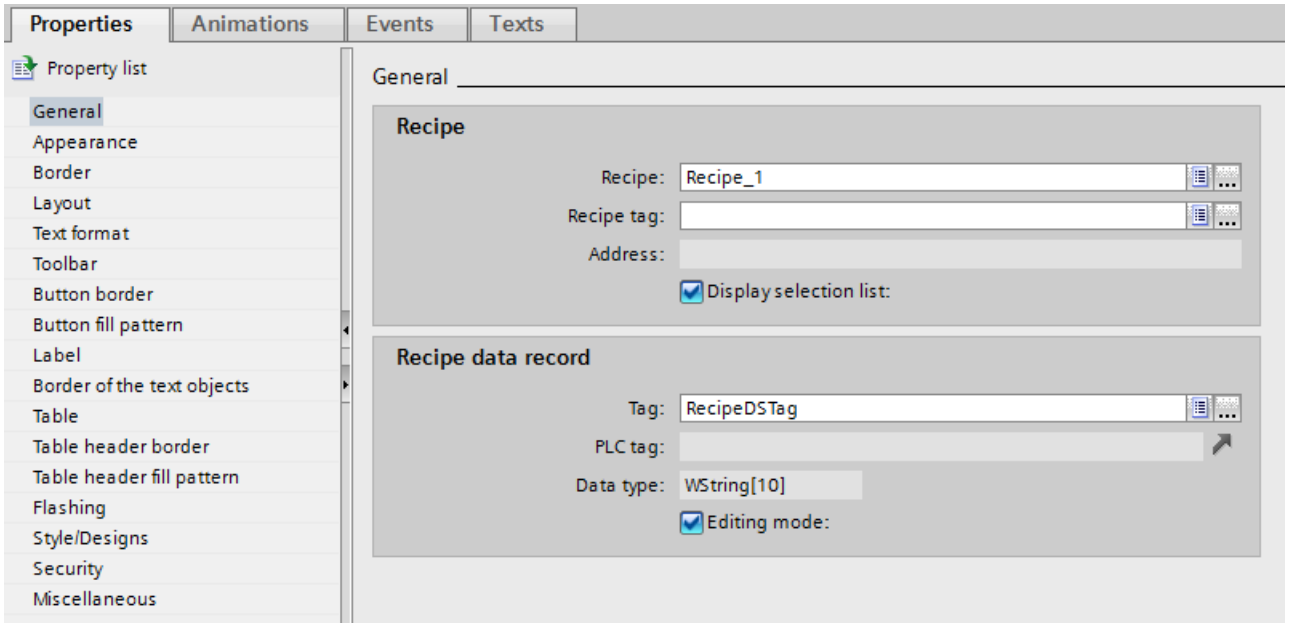
Configuration options of the advanced recipe view (V13 or higher) (Basic Panels, Panels, RT Advanced)

You can specify the behavior of the advanced recipe view in the Inspector window of the recipe view.

Displaying a recipe

To only allow access to the recipe data records of a specific recipe in a screen, follow these steps:

1. Enter the required recipe or select an existing recipe in the "Recipe" field under "Properties > General".
2. When a recipe is entered in the "Recipe" field, you will have to enable the "Selection list" if you want to display the recipe name in runtime.



The selected recipe appears in the recipe view.

Writing a recipe number or name and recipe data record number or name to a tag

Both the recipe and the recipe data record can each be configured to a tag in the recipe view. Depending on the "String" or "Int" data type of the tag, the name or number of the recipe or recipe data record is stored in the tag. Conversely, the tag can be used to select the recipe or recipe data record by entering the corresponding value. For example, the tag can be transferred as a parameter for a system function.

Follow these steps:

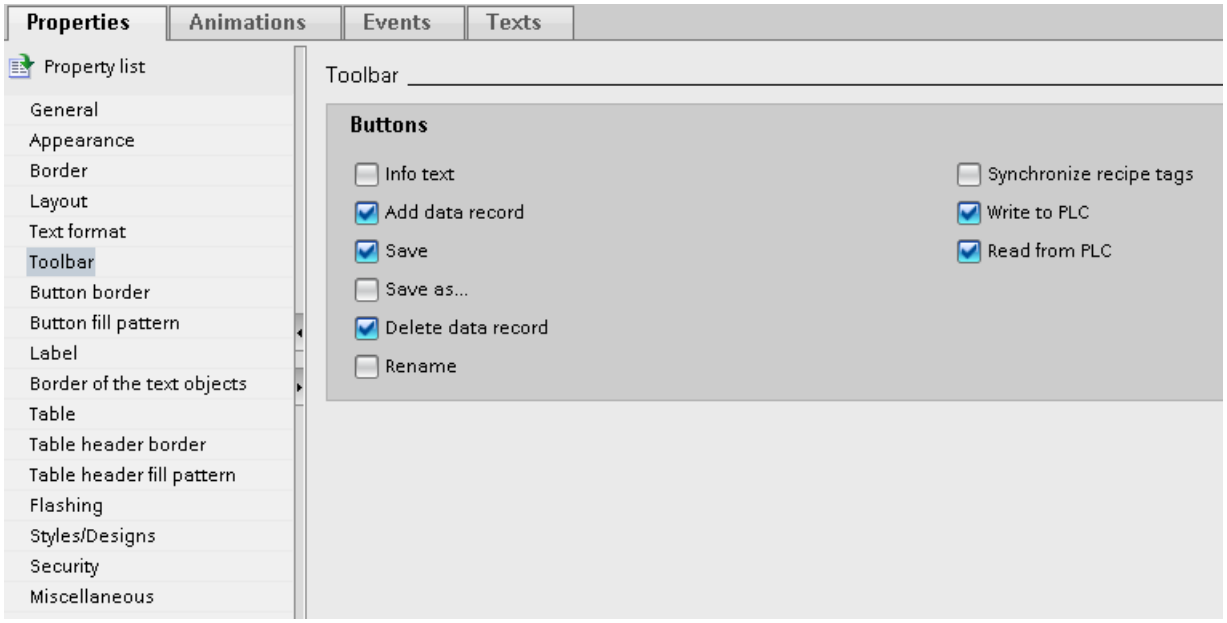
1. Enter a tag of the "String" type in the field "Recipe tag", under "Properties > General > Recipe".
2. Enter a tag of the "Int" type in the field "Tag", under "Properties > General > Recipe data record".

The name of the recipe and the number of the recipe data record are each stored in a tag.

Using the recipe view as a drop-down list

To use the recipe view as a selection field for recipes and recipe data records in a recipe screen, follow these steps:

1. Select the tag for the recipe name under "General > Recipe > Recipe tag".
2. Select the tag for the recipe data record name under "General > Recipe data record >Tag".
3. Disable the "Editing mode". You cannot create, rename, edit or delete recipe data.
4. In order to select recipes, enable "Display selection list" and make sure that no recipe is selected under "Properties > General > Recipe".
5. Deactivate all buttons under "Properties > Toolbar".



Configuring an event on the recipe view

To configure an event on the recipe view, follow these steps:

1. Select the recipe view that was added to the screen in the "Screens" editor.
   The properties of the recipe view are displayed in the Inspector window.
2. In the Inspector window, click the event you want to configure under "Properties > Events".
3. Configure a function list for the selected event.
   The function list is processed when the configured event occurs.

Configuration of recipes (Page 5545)

Using the advanced recipe view (Basic Panels, Panels, RT Advanced)

Introduction

You can control the recipe view using both mouse or touchpad or with the keyboard.

Controlling the recipe view with mouse or touchpad

To control the recipe view with mouse or touchpad, proceed as follows:

1. Select the recipe you want to use.
   The records for the recipe are displayed.
2. Click on the data record you wish to edit.
3. Click the button whose function you want to run.

Controlling the recipe view with the keyboard

To control the recipe view with the keyboard, proceed as follows:

1. Press the <Tab> key until the cursor reaches the field for selecting the recipe.
2. Press <Enter>.
   The drop-down list box for the recipes opens.
3. Select a recipe. You navigate between the next or previous entry in the list by using the cursor keys <Left>, <Right>, <Up> and <Down>.
4. Select a data record.
5. Press the <Tab> key until the operator control object you wish to use is selected.

Alternatively you can control the recipe view using certain key combinations.

Operating the recipe view with function keys

The recipe view can be operated with function keys, for example if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

Key shortcuts for the advanced recipe view

The following key shortcuts are activated for the advanced recipe view in Runtime if "Activate keyboard operation" is enabled in the ES.

Keys shortcut	Effect	Menu command	Button
<HELP>	Calls up the configured tooltip for the selected recipe.	Tooltip	
<Ctrl+Spacebar>	Generates a new recipe data record. Any configured start value is displayed in the input field.	Add data record	
<Ctrl+Enter>	Saves the modified record with its current name.	Save	
<Ctrl+*>	Saves the modified record with a new name.	Save as	
<Ctrl+Del>	Deletes the recipe data record displayed.	Delete data record	
<Ctrl+Shift+T>	Changes the name of selected data record.	Rename data record	

Keys shortcut	Effect	Menu command	Button
<Ctrl+=>	Compares the values of the selected data record with the values on the PLC. Any value in the recipe view which is more recent compared to the current recipe tag value is written to the recipe tag. This function is only available if enabled in the ES.	Synchronizing recipe view and recipe tags	
<Ctrl+Down Arrow>	Sends the current value to the PLC.	Write to PLC	
<Ctrl+Up Arrow>	Reads the current value from the PLC.	Read from PLC	

Screen change

If you change to another screen and have not yet saved changes to the recipe data in the recipe view, you will be prompted to save the recipe data. The recipe name and the name of the recipe data record are displayed to show which recipe data have not been saved yet.

Managing recipe data records (Basic Panels, Panels, RT Advanced)

Administration of recipe data records

You have the following options for managing recipe data records, according to the configuration:

- Creating new recipe data records
- Copy recipe data records
- Edit recipe data records
- Delete recipe data records
- Rename recipe data records

Creating new recipe data records

To create a new recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to create a new recipe data record.
2. Click or press <Ctrl+Spacebar>.
   A new recipe data record with the next available number is created.
   If you change the new data record number to an existing data record number, the existing data record is overwritten.

3. Enter values for the elements of the data record.
   The elements of the recipe data record can be assigned default values depending on the configuration.
4. Enter a name for the data record.
5. Click on the button or press the keyboard shortcut <Ctrl+Enter>.
   Alternatively, click on the button to save the data record or press the keyboard shortcut <Ctrl+*>.
   The "Save as" dialog opens. Enter the name for the data record and confirm your entries with "OK".
6. The data record is saved under the new name.
   If the recipe data record already exists, a dialog is opened. In this dialog, specify whether the existing data record is to be overwritten.

Copying a recipe data record

To copy a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to copy an existing recipe data record.
2. Select the recipe data record that you want to copy on the HMI device.
3. Click in the recipe view or press <Ctrl+*>.
   The dialog "Save as" opens.
4. Enter a name for the data record.
5. Click "OK" to confirm your input.

Modifying a recipe data record

To change a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to edit an existing recipe data record.
2. Select the recipe data record that you want to edit on the HMI device.
3. Replace the old values with new ones.
4. Click in the recipe view or press <Ctrl+Enter>.

Deleting a recipe data record

To delete a recipe data record, proceed as follows:

1. Select the recipe on the HMI device in which you want to delete an existing recipe data record.
2. Select the recipe data record that you want to delete on the HMI device.
3. Click in the recipe view or press <Ctrl+Del>.

Renaming recipe data records

Proceed as follows to rename a recipe data record:

1. Select the recipe on the HMI device in which you want to rename an existing recipe data record.
2. Select the recipe data record that you want to rename on the HMI device.
3. Click in the recipe view or press <Ctrl+Shift+T>.
4. Enter a new name in the dialog window.

Introduction

In runtime, you can change values directly in the plant that are also stored in recipes in the HMI device. This applies for example if a valve was opened right at the plant wider than specified in the recipe. The values of the recipe data records saved in the HMI device may then possibly no longer match the values in the PLC.

You can read the values of the recipe tags from the PLC and write them to a recipe data record.

The values read are written to the recipe data record that is currently displayed on the HMI device.

Procedure

Proceed as follows to read a recipe data record from the PLC:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record whose values you want to read from the PLC.
3. Click in the recipe view or press <Ctrl+Up Arrow>.

See also

Description of advanced recipe view (as of V13) (Page 5578)

Transferring recipe data records to the PLC (Basic Panels, Panels, RT Advanced)

Introduction

For the values of a data record that was changed in the recipe view to take effect, you must transfer the values to the PLC.

The values displayed in the recipe view are always transferred to the PLC.

Procedure

Proceed as follows to transfer a recipe data record to the PLC:

1. Select the recipe on the HMI device.
2. On the HMI device, select the recipe data record whose values you want to transfer to the PLC.
3. Click in the recipe view or press <Ctrl+Down Arrow>.

Transferring recipe data records (Page 5542)

12.5.2.5 Exporting and importing recipe data (Basic Panels, Panels, RT Advanced)

Exporting and importing recipe data records (Panels, RT Advanced)

Introduction

You can either export recipe data records to a CSV file for editing in MS Excel, for example, or import them from a CSV file.

Recipe export and import depends on the configuration of the device and the device version.

List separators

A list separator is used to separate the data records during importing and exporting. The list separator used as the default depends on the setting for formats and numbers in the operating system.

Select "Start > Settings > Control Panel > Regional and Language Options".

If you want to import or export recipe data records, do not use this list separator in the display name of the recipe data records.

The following operating elements can, for example, be configured for using the export/import function:

- Selection field for the recipe
- Selection field for the recipe data record
- Operating element with the "ExportDataRecords" functionality
- Operating element with the "ImportDataRecords" functionality

Exporting a recipe data record

Proceed as follows to export a recipe data record to a CSV file:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ExportDataRecords" functionality.

Importing recipe data records

To import a recipe data record, proceed as follows:

1. Select the relevant recipe and recipe data record from the selection boxes.
2. Click the control element with the "ImportDataRecords" functionality.

Display after import of recipes

If you open the recipe view during the import of recipe data, only the recipe data that is already completely imported will be displayed. The recipe view is not automatically updated following a data import. In order to have a complete view of all the recipe data, do not open the recipe view until the system reports that the recipe data has been imported successfully.

Alternatively, you can update the recipe view after successful completion of the import process.

Restrictions on import/export

It is not possible to export or import the recipes for the following HMI devices:

- Basic Panels
- OP 77A
- OP 177A
- TP 177A (Portrait)

Note

Exporting and importing with ProSave to CSV format

Individual recipe data records cannot be exported or imported to CSV format with ProSave.

Only complete recipe data can be exported and imported to CSV format with ProSave and transferred to the HMI device.
Runtime is paused while this is done.

See also

Response of the recipe view in Runtime (Page 5590)

Reactions to modifications of the recipe structure (Basic Panels, Panels, RT Advanced)

Introduction

Different recipe structures can occur in the following situations:

- In the event of changes during commissioning
- When work is carried out on the machine by the machine manufacturer (retrofit)
- When CSV files are imported, the structure of the CSV file can differ from the recipe structure.

Nevertheless, you can still use any recipe data records already created.

NOTICE
When a tag is renamed, the assignment is lost.

Effects

Handle any structural differences as follows:

- If the old recipe data record or the CSV file contains additional values, these values will be discarded.
- If the old recipe data record or the CSV file contains values of the wrong data type, the configured default value will be used in the recipe data record.
  Example: The recipe data record contains values that show the tank contents and were input as floating point numbers. However, the corresponding recipe tag expects an integer value. In this case, the system discards the transferred value and the configured default value is used.
- If the old recipe data record or the CSV file contains too few values, the configured default value will also be used in the recipe data record.

See also

Description of the advanced recipe view (prior to V13) (Page 5568)

Description of advanced recipe view (as of V13) (Page 5578)

Recipe view basics (Page 5555)

Response of the recipe view in Runtime (Basic Panels, Panels, RT Advanced)

Screen change

If you change to another screen and have not yet saved changes to the recipe data in the recipe view, you will be prompted to save the recipe data. The recipe name and the name of the recipe data record are displayed to show which recipe data have not been saved yet.

Create, change, copy or delete recipe data records

If you attempt to create a new recipe data record and a recipe data record already exists, a system alarm will appear on screen.

Operating the recipe view with function keys

The Recipe view can be operated with function keys, e.g. if the HMI device does not have touch functionality. You can assign functions such as "SaveDataRecord" to the function keys on the HMI device.

Display after import of recipe data

Note

Availability

Import and export of recipe data is not available for Basic Panels and OP77A, TP177A (Portrait).

If you open the recipe view during the import of recipe data, only the recipe data that is already completely imported will be displayed. The recipe view is not automatically updated with a data import. In order to have a complete view of all the recipe data, do not open the recipe view until the system prompts you that the recipe data has been imported successfully. Alternatively, update the recipe view after successful completion of the import procedure.

Updating tag for recipes and recipe data records

Note

Availability

Tags for recipes and recipe data records are not available for Basic Panels and OP77A, TP177A (Portrait).

The current recipe data record or its number can be saved to a tag, depending on the configuration. The tag will be updated under the following conditions:

- The recipe data record has been loaded.
- The screen with the recipe view was not exited during loading.

This operation may take some time.

12.5.3 Configuring Recipes (Basic Panels, Panels, RT Advanced)

12.5.3.1 Creating and Editing Recipes (Basic Panels, Panels, RT Advanced)

General configuration procedure (Basic Panels, Panels, RT Advanced)

Carry out the following configuration steps when you create a new recipe:

Step	Description
1	Define the structure of the recipe.
2	Create tags according to the recipe structure. Assign process names to these tags.
3	Create the recipe.
4	Enter the required properties for the recipe: • Language-dependent view name of the recipe • "Coordinated transfer of data records" option Not for Basic Panels: • Recipe storage location • "Synchronize recipe view and recipe tags" option • "Manual transfer of individual modified values (teach-in mode)" option
5	Create the recipe elements and enter the required properties: • Language-dependent view name of the recipe elements • Tag binding of the recipe elements • Standard values and decimal places (power of ten) for the recipe elements
6	Create the recipe data records. Enter the language-specific display names for the recipe data records.
7	Configure a screen with recipe view or a recipe screen.

Note

Basic Panels and OP77A, TP177A (Portrait)

The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

Note

Restrictions recipe view and recipe image

Only the simple recipe view is available in Basic Panels and OP77A, TP177A. Recipe images are not available in Basic Panels and OP73, OP77A, TP177A (Portrait).

Creating a new recipe (Basic Panels, Panels, RT Advanced)

Introduction

To create a complete recipe, start by creating a new recipe, assign the corresponding recipe elements and then define the associated values in a recipe data record.

Note

Character strings that can be imported

Recipe data that contains semicolons or commas cannot be imported.

Only ever used character strings without semicolons or commas for recipes and recipe data records.

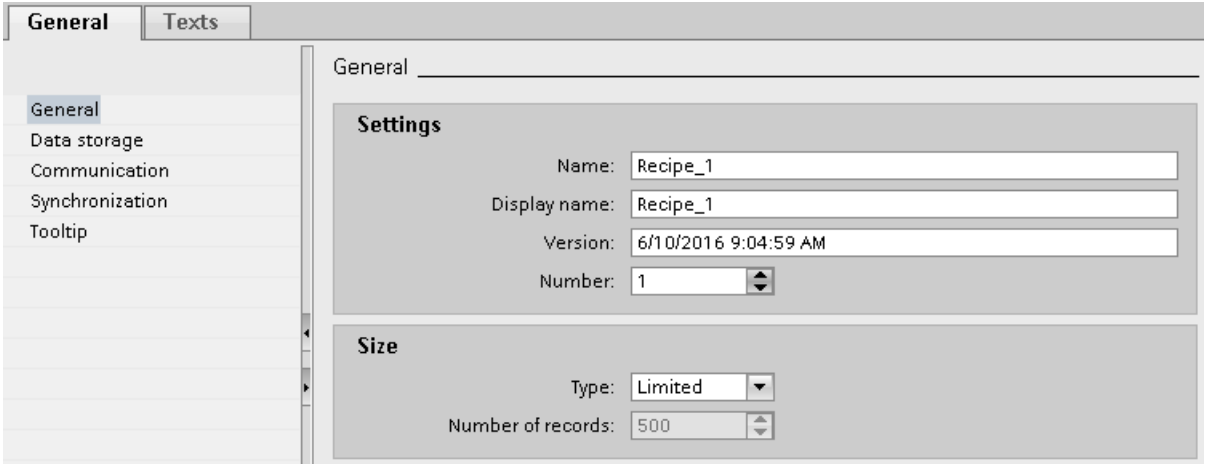
Requirement

- The tags for the recipe have been created.
- The "Recipes" editor is open.

Creating a recipe

Proceed as follows to create a recipe:

1. Click "Add" in the first free row of the table in the "Recipes" editor.
   The new recipe is created and displayed on a line.



2. Enter a descriptive name for the recipe under "Name" in the "General" area.
   This name identifies the recipe unambiguously within the project.
3. Select "Display name" to enter the language-specific name to be displayed in runtime.
4. Select a recipe number in "Number".
   The number identifies the recipe unambiguously within the HMI device.
   The recipe is automatically assigned a version that indicates the date and time of the last change. As an alternative, you can enter specific information relating to the recipe.

5. Specify the storage location for recipe data records in "Data medium". The options offered depend on the specific HMI device used.

   Note

   Basic Panels and OP77A, TP177A (Portrait)

   The selection of the storage location is not available for these devices. The recipes are always saved in the internal Flash memory.

   Recipe tags cannot be used outside a recipe, e.g. not in I/O fields, not in alarms as trigger tags, not in systems functions as parameters, etc.

6. Enter a tooltip that is shown to the operator in runtime.
7. To compare recipe tags which are configured in I/O fields with the recipe view in Runtime, activate "Synchronize recipe view and recipe tags" in the Inspector window under "Properties > Synchronization".

   Note

   Basic Panels and OP77A, TP177A (Portrait)

   Because the recipe tags cannot be additionally used in I/O fields in screens for Basic Panels, the "Synchronize recipe view and recipe tags" is not available; you will also not be able to use the "Manual transfer of individual modified values (teach-in mode)" option.

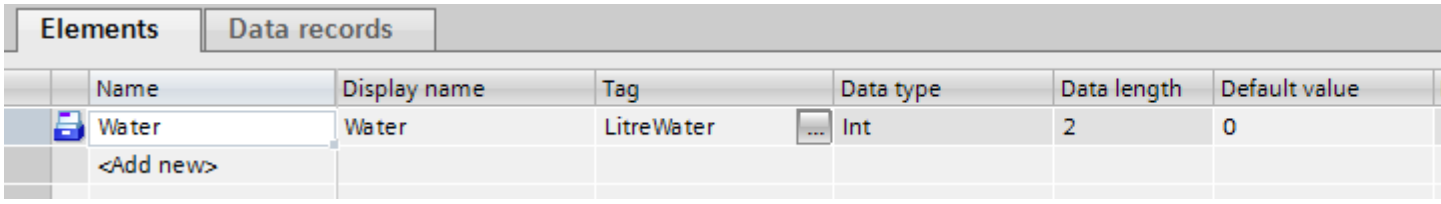
8. Deactivate "Manual transfer of individual modified values (teach-in mode)" to specify that the recipe tags are automatically transferred to the PLC when editing the I/O fields.
9. Activate "Coordinated transfer of data records" to monitor the transfer of recipe data in Runtime using area pointers.
10. Select the appropriate connection to the PLC for coordinated transfer under "Synchronize with".

Create recipe element

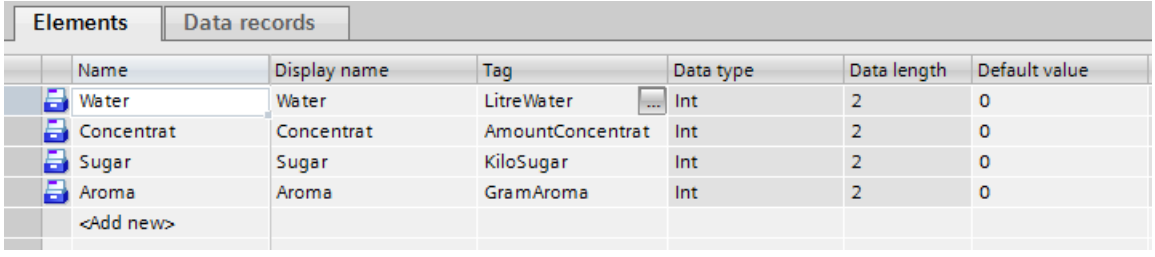
To create recipe elements, proceed as follows:

1. Click the "Elements" tab.
2. Click "Add" in the first free line of the table editor.
   A new recipe element is created.
3. Enter a descriptive name for the element under "Name".
   The name identifies the element uniquely within the recipe.

4. Enter a language-specific display name for the element under "Display name".
   The display name appears in the recipe view, for example, in runtime.
5. Select the tag you want to link to the recipe element under "Tag".
   The value of the recipe data element is saved in Runtime in this tag, which is stored in a recipe data record.



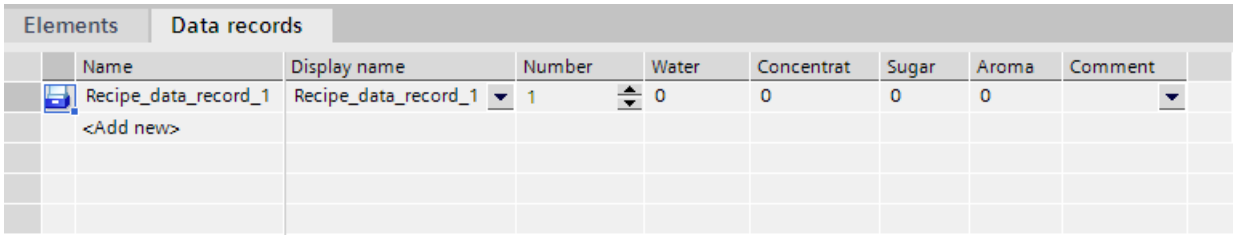
6. Enter a tooltip.
   The tooltip is shown to the operator in Runtime.
7. Under "Default value", enter the value that you want to use as the default entry when you create a new recipe data record.
8. To assign text to a value or range of values, select the relevant text list here. The assigned recipe tag must have the data type of a number. The tag value must be within the range of values of the text list.
   The text stored in the text list is displayed in an output field, for example, in Runtime.
9. Determine exactly how many places a decimal number is rounded to in the "Decimal places" column, e.g. 3 decimal places and vice versa by what power of ten an integer value is multiplied, e.g. 1,000.
   Examples for 3 decimal places: Entering "5" for a recipe element with the "Integer" data type gives the value "5000". Entering "5.6789" for a recipe element with the "Real" data type gives the value "5.679".
10. Create as many recipe entries as needed for the recipe. The maximum number of recipe entries possible depends on the HMI device being used.



Create recipe data record with known recipe values

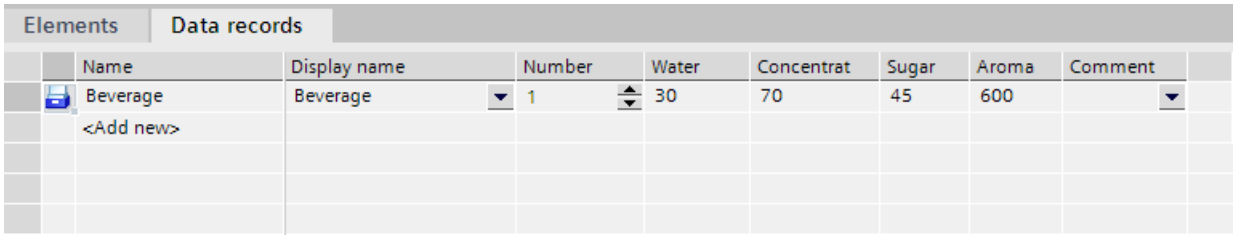
To create recipe elements, proceed as follows:

1. Click the "Data records" tab.
2. Click "Add" in the first free line of the table editor.
   A new recipe data record is created. The recipe data record has a separate column for every recipe element created in the recipe.



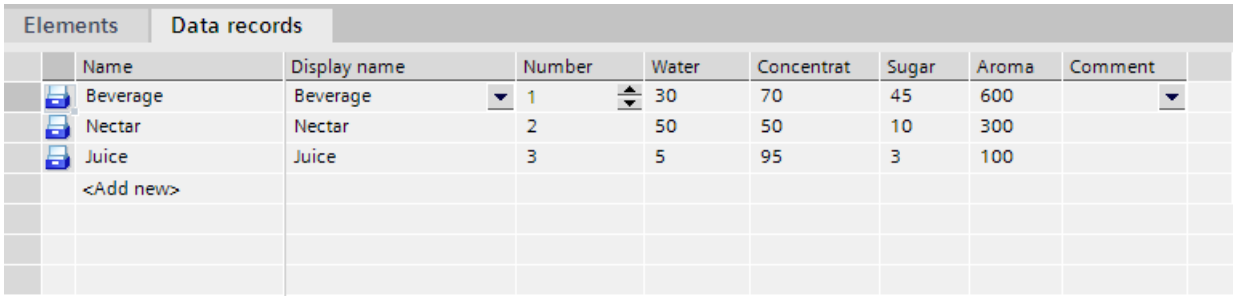
Elements	Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
	Recipe_data_record_1	Recipe_data_record_1	1	0	0	0	0	
	<Add new>							

3. Enter a descriptive name under "Name".
   The name identifies the data record uniquely within the recipe.
4. Enter a language-specific name under "Display name".
   The display name appears in the recipe view, for example, in runtime.
5. Enter a recipe data record number under "Number".
   The recipe data record number identifies the recipe data record uniquely within the recipe.
6. If you already know the recipe values at the configuration stage, you can enter the relevant value for each recipe element.



Elements	Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
	Beverage	Beverage	1	30	70	45	600	
	<Add new>							

7. Create as many data records as you need for the recipe.



Elements	Data records							
	Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
	Beverage	Beverage	1	30	70	45	600	
	Nectar	Nectar	2	50	50	10	300	
	Juice	Juice	3	5	95	3	100	
	<Add new>							

Enter the values in runtime

The following options are available for entering values in the recipe data records at runtime:

- Transfer data directly from the PLC (Teach-in mode)
- Import of values from a CSV file
- Input values on the HMI device

Note

Basic Panels and OP77A, TP177A (Portrait)

The import of values is not available for these devices.

Result

The complete recipe is configured.

Recipe data records with date or time stamp

If you use date or time data, make sure that the system setting for time and date on the configuring computer match those on the target system. Example: You load a recipe data record on the target system at 13:55 in which 14 h is stored as the processing time. If it is already 14:05 on the target computer, the recipe will not be processed. If an operator processes the recipe, change information will not written back correctly into the database.

After loading to the target system, check the recipes with date or time stamps on the target system.

Editing a recipe (Basic Panels, Panels, RT Advanced)

Purpose

You want to modify, extend or delete parts of a recipe.

Requirement

- You have created at least one recipe.
- The "Recipes" editor is open.

Changing recipe settings

To change the recipe settings, proceed as follows:

1. Select the recipe that you want to change in the "Recipes" editor.
   The Inspector window opens.
2. Change the recipe configuration in the Inspector window.

You change recipe elements and recipe data records in the same way.

Change recipe values

To change recipe values, proceed as follows:

1. Select the recipe whose values you want to change.
2. Click the "Data records" tab.
3. Enter the new values in the value columns.

Adding a recipe element

To add more recipe elements to a recipe, proceed as follows:

1. Select the recipe to which you want to add more elements in the "Recipes" editor.
2. Click the "Elements" tab.
3. Click "Add" in the first free line.
   The recipe element is created.
4. Configure the recipe element.

You add recipe data records in the same way.

Managing recipes (Basic Panels, Panels, RT Advanced)

Requirement

- You have created a recipe with recipe elements and recipe data record.
- The "Recipes" editor is open.

Renaming recipes

We distinguish between internal names and display names for recipes, recipe entries and recipe data records.

To rename recipe elements, proceed as follows:

1. Select the recipe that you want to rename.
   The Inspector window opens.
2. Select the "Rename" command from the shortcut menu.
3. Enter the new name.
   You rename recipe elements and recipe data records on the relevant tab in the same way.

Note

The view names in the "Recipes" editor can also be renamed under "Languages & Resources > Project Texts". This possibility is useful when you have already configured in several languages for example.

Copying and pasting recipes

To copy and paste recipes, proceed as follows:

1. Select the recipe that you want to copy.
2. Select the "Copy" command from the shortcut menu.
3. Select the "Paste" command from the shortcut menu in the first free table row.

The copied recipe is pasted into the table. The recipe elements and recipe data records are also copied in the appropriate tab with the recipe.

You also copy the recipe elements and recipe data records on the appropriate tab in the same way.

If a recipe data record of the same name already exists, the name of the copied recipe data record is extended by one digit. This ensures that the name is unique. Recipe data records can only be copied or pasted within the same recipe.

Deleting a recipe

To delete a recipe, proceed as follows:

1. Select the recipe that you want to delete.
2. Select the "Delete" command from the shortcut menu.
   The recipe is deleted.

You delete recipe elements and recipe data records on the relevant tab in the same way.

Note

When a recipe is deleted, the recipe data records contained in the recipe are also deleted.

Note

When you delete a recipe element, the associated values in the recipe data records are also deleted. The assigned tags are retained.

Importing recipes into the configuration and exporting them (Basic Panels, Panels, RT Advanced)

Introduction

You can export recipes as a CSV file and import them again into the configuration.

Application case

Recipe data is exported for long-term storage and backup on a computer.

In order to unify and distribute recipe data, export the recipe data to an HMI device. Change the CSV file in Microsoft Excel and import the CSV file to all HMI devices that require the same recipe data.

You want to exchange recipe data between different projects. You change the recipe data in Runtime. To transfer the modified recipe data to WinCC ES, export the recipe data records in Runtime and copy the CSV file to the configuring computer. There you import the CSV file containing the recipe data records into the recipe. And in the opposite direction, you transfer the modified recipe data records to the HMI device in WinCC ES in Runtime.

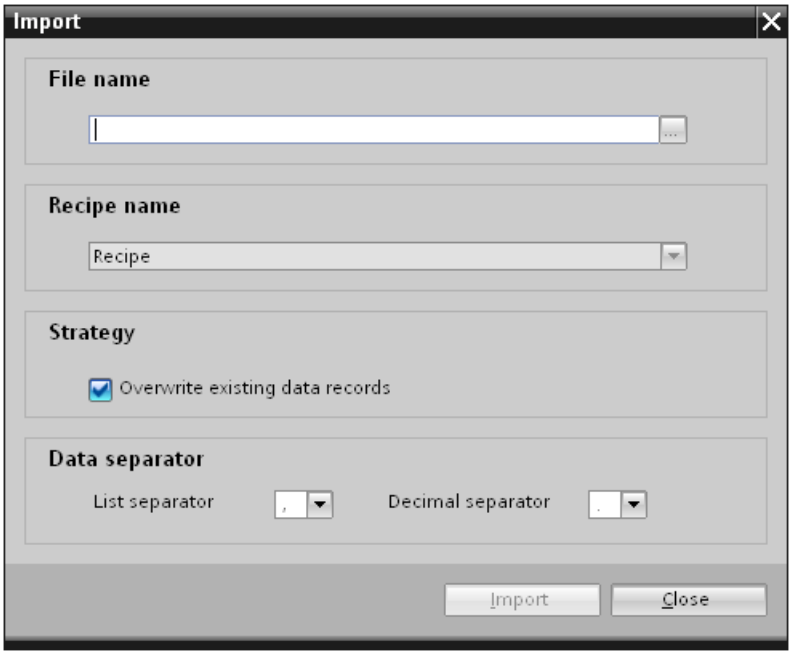
Requirement

- You have created the recipe.
- The structures of the exported CSV file and the recipe in WinCC ES match; name, number and data type of the recipe elements are identical.
- The "Recipes" editor is open.
- Any semicolons or commas in the import file are used as separators only.

Importing CSV files

To import recipe data records into a recipe, proceed as follows:

1. Select the row which contains the desired recipe in the "Recipes" tab.
2. Select the "Import recipe data" command from the shortcut menu.
   The "Import" dialog box opens.



3. To select the desired CSV file, go to "File name".
4. Under "Strategy", specify whether a recipe data record with the same recipe number in WinCC ES should be overwritten.

5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.

   Note

   Use the same list separator for import as in the CSV file for export.

6. Click "Import" to start the operation.

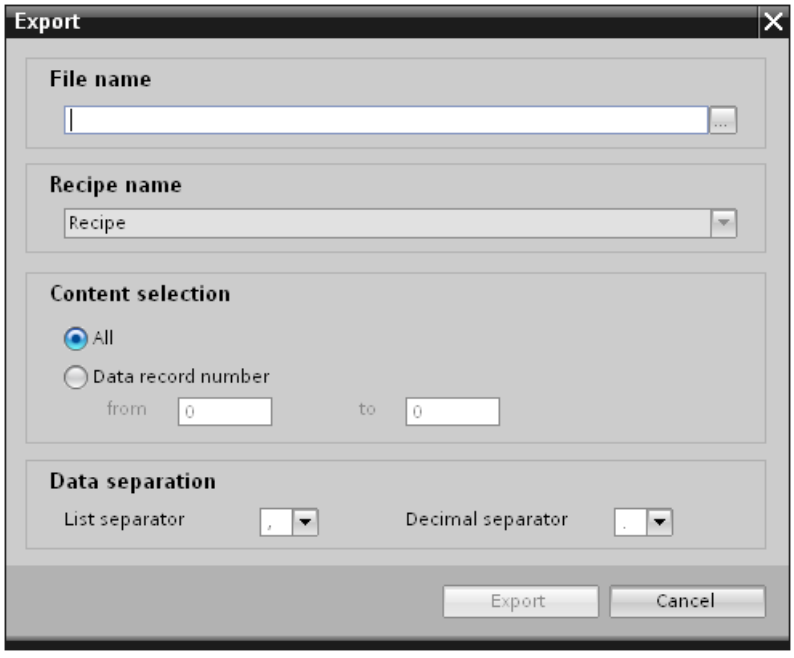
Result

The recipe will be amended by recipe data records from the CSV file that have not yet been entered. If the option is selected, existing recipe data records will be overwritten.

An error message is shown in the "Info" of the Inspector window if the structure of the recipe does not match the structure of the CSV file.

Exporting CSV files

1. Select the row which contains the recipe to export in the "Recipes" tab.
2. Select the "Export recipe data" command from the shortcut menu.
   The "Export" dialog box opens.



3. Under "File name", specify the path of the CSV file.
4. Select all recipe data records under "Selection content", or restrict the selection to specific record numbers of the recipe data.

5. Specify the list separator and decimal separator under "Data separation". The list separator separates individual recipe elements in the CSV file. The decimal separator separates integers and decimal places.
6. Click "Export" to start the operation.

Result

The configuration is exported as a CSV file.

12.5.3.2 Configuring the display of recipes (Basic Panels, Panels, RT Advanced)

Configuring the simple recipe view (Basic Panels, Panels, RT Advanced)

Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

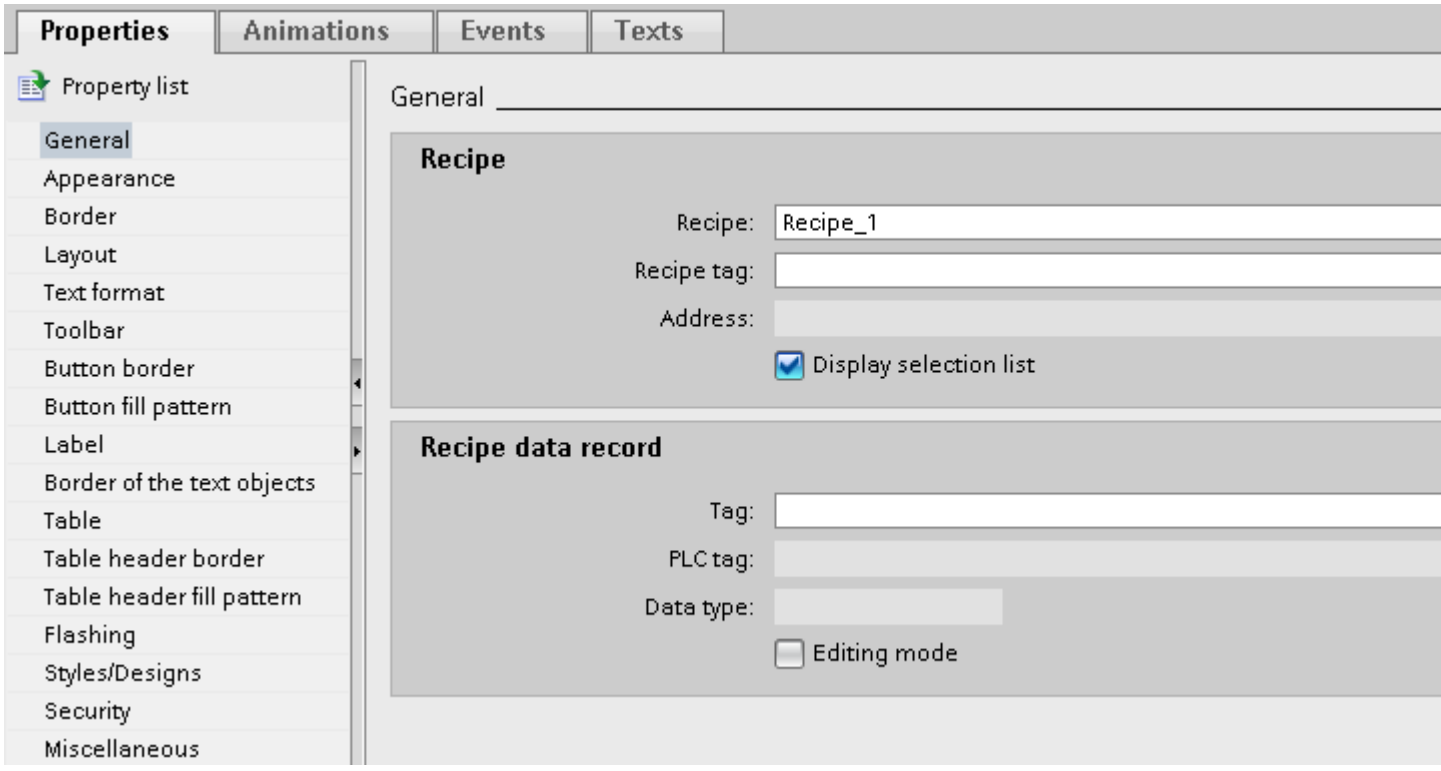
NOTICE
Data loss with several recipe views in the screen Applies only to Basic Panels, OP73, OP77A, TP177A and TP177A (Portrait): If two or more recipe views show the same recipe in a screen, you have a conflict when accessing the data. The result is data loss and unpredictable status of recipe data. Make sure the operators do not select and edit the same recipe in different recipe views. • Display only one recipe in a recipe view. • Display a different recipe in each recipe view.

Procedure

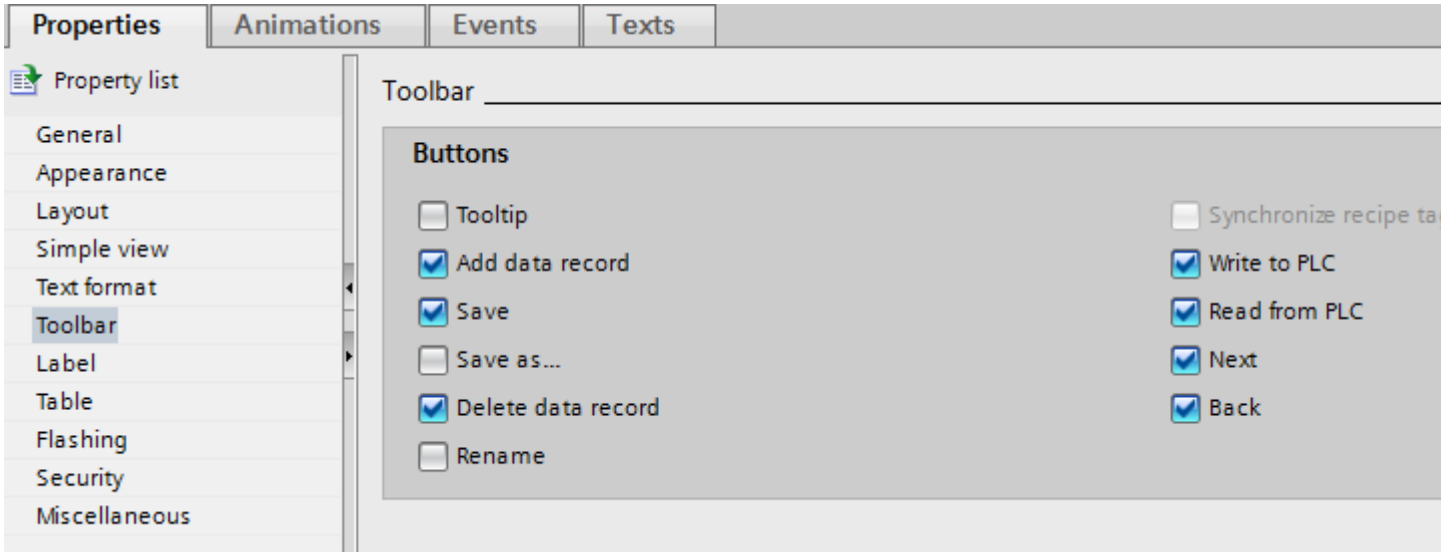
To configure a simple recipe view, proceed as follows:

1. Paste the recipe view into the screen. You will find the recipe view under "Controls" in the "Tools" task card.
2. Only in devices which also support the extended recipe view: Activate "Simple view" under "Properties > Display > Mode".

3. If you want to display only the recipe data records of a specific recipe in the recipe view, select the specific recipe under "Properties > General > Recipe".



4. If you only want to display the recipe data in the recipe view, deactivate "Processing mode" in the "Recipe data record" area.
5. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".
6. Under "Properties" > Toolbar" specify which menu commands are available in the recipe view in Runtime.



Result

The simple recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons activated under "Properties > Toolbar" can still be used even if editing mode is disabled.

Configuring the Advanced Recipe View (Panels, RT Advanced)

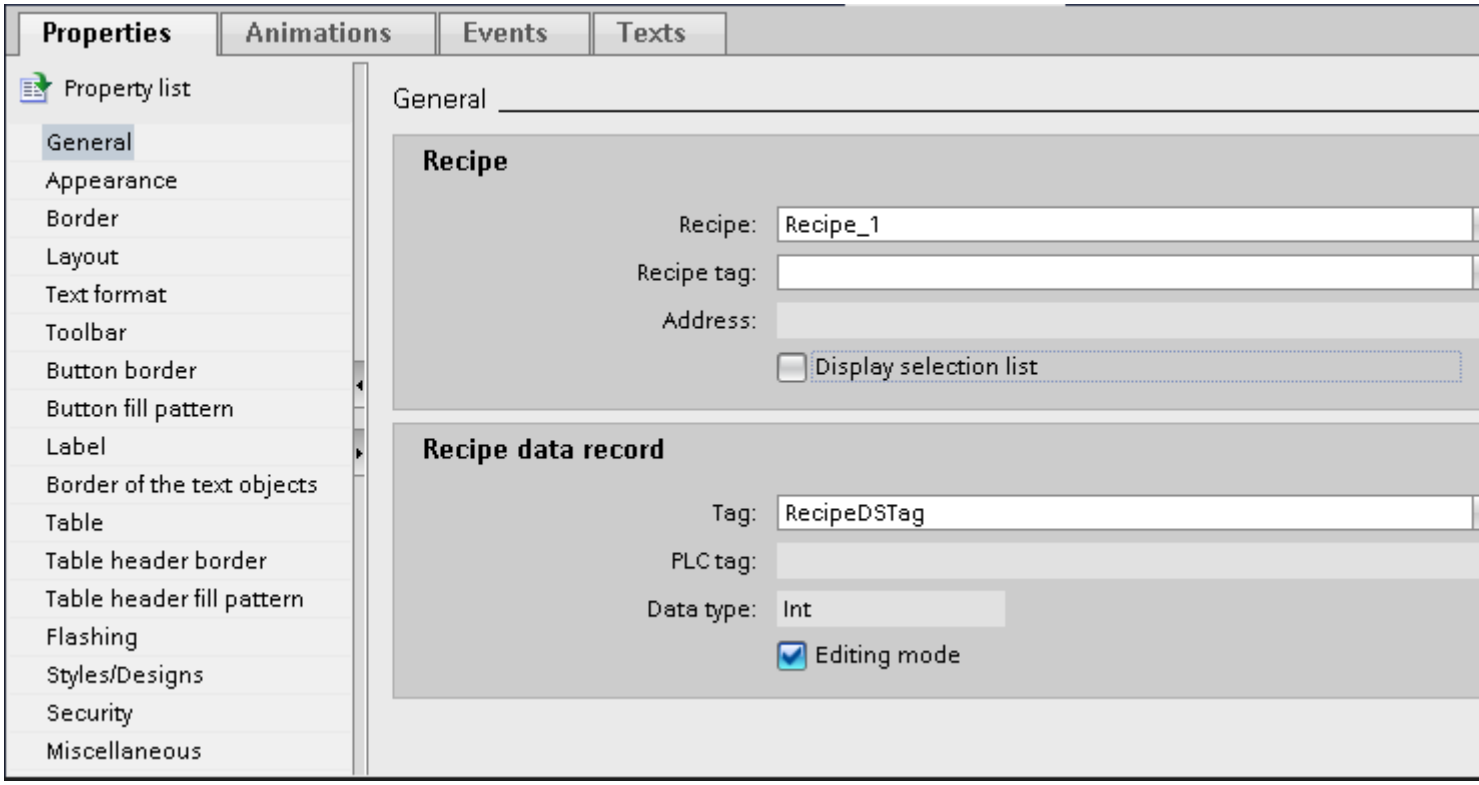
Requirement

- The recipe has been created.
- The "Screens" editor is open.
- The screen has been created and opened.

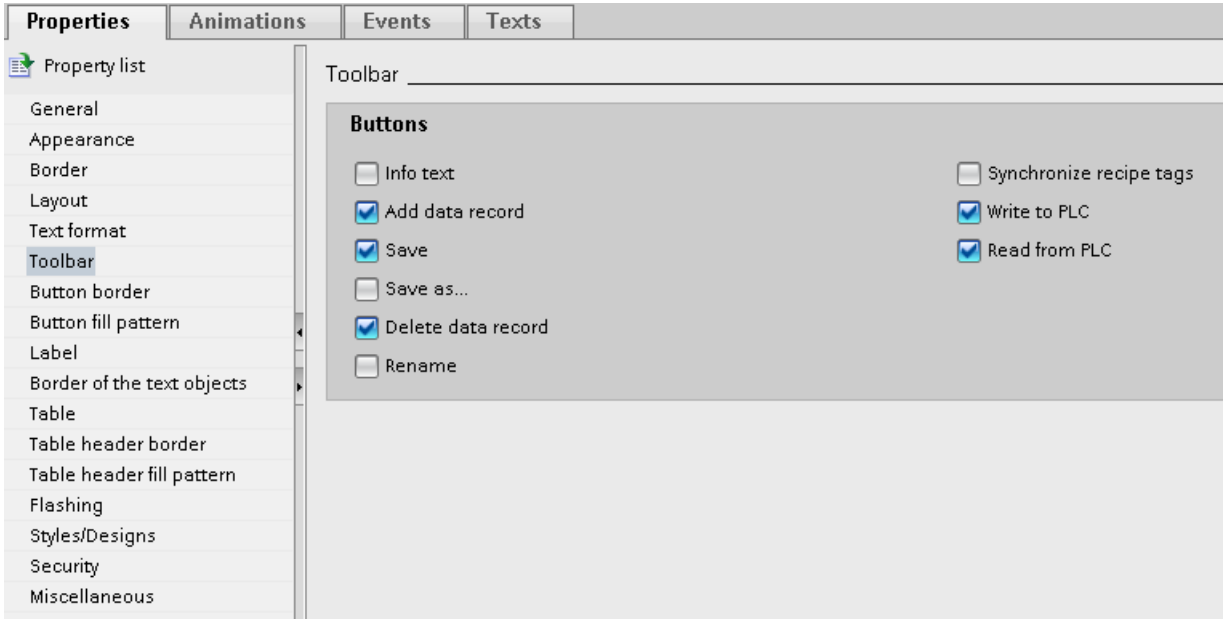
Procedure

To configure an advanced recipe view, proceed as follows:

1. Paste the recipe view into the screen. The recipe view is found in the task card "Tools" > "Controls".
2. Select "Properties > Display > Mode > Advanced view" in the Inspector window.



3. Select the required settings from the "General" group in the Inspector window.
   - If you want to display only the recipe data records for a particular recipe in the recipe view, select the recipe under "Recipe" in the "Recipes" area.
   - If you want to save the recipe name or the recipe number in a tag, select the tag under "Recipe tag" in the "Recipe" area.
   - If you want to save the recipe data record name or number in a tag, select the tag under "Tag" in the "Recipe data record" area.
   - If you only want to display the recipe data in the recipe view, deselect "Edit mode".
   - If you only want to use the recipe view to select recipes, disable "Display table" under "Properties > Table".
4. You can define additional options for the recipe view under "Properties > Appearance" and "Properties > Layout".
5. If you want to change the label in the recipe view, enter a suitable text under "Properties" > "Label".
6. Under "Properties" > Toolbar" specify which buttons are available in the recipe view in Runtime.



Note

If you select the "Edit" command in the context menu of the recipe view, the recipe view becomes active. To activate the recipe view, the zoom factor must be set to 100%.

You can set the column width and the position of the "Entry name" and "Value" columns in active mode.

Result

The recipe view is configured. You can use the recipe view to display and edit recipe data during runtime.

Deactivation of the editing mode in "Properties > Properties > General" has no impact on the toolbar icons. The buttons you activated in "Properties > Toolbar" can still be used even if editing mode is disabled.

Configuring a recipe screen (Panels, RT Advanced)

Introduction

The recipe screen is a screen in which you configure a customized screen form in the "Screens" editor. You create the screen form from input/output fields and other display and operator control objects. System functions are used to configure the recipe functionality, such as saving recipe data records.

Note

Availability

Recipe screens cannot be created for basic panels and OP73, OP77A and TP177A (Portrait).

Application

You can spread recipe data records containing lots of entries across several screens. For example, for each plant you can configure a screen containing the associated screen forms for the recipe data records.

You can visually simulate your machine in a screen using graphical screen objects. This enables you to display parameter settings more clearly by positioning I/O fields immediately next to machine elements, such as axes or guide rails. You can use this to produce a direct reference between the values and the machine.

Requirement

- You have created the recipe.
- The "Screens" editor is open.

Procedure

To configure a recipe screen, proceed as follows:

1. Configure the screen and create the I/O fields for the input mask of the recipe.
   You can create multiple screens to suit the size and complexity of the recipe.
2. Configure the I/O fields with the tags you have linked to the recipe element.
3. Configure I/O fields for selecting recipes and recipe data records.

Alternatively:

1. Configure a recipe view as a selection list for recipe data records and recipes.
2. Hide the buttons that are not required in the recipe view.
3. Configure the system functions for editing recipe data records on the configured control elements.
   Control elements are configured buttons in the screen or function keys on the HMI device.
   You will find the system functions for editing recipe data records under "Recipes" and "Keyboard operation for screen objects".

Result

The recipe screen is created.

12.5.4 Examples (Basic Panels, Panels, RT Advanced)

12.5.4.1 Example of creating a recipe (Basic Panels, Panels, RT Advanced)

Task

In this example, you create three recipes for a fruit juice mixing machine. The fruit juice mixing machine produces drinks with "orange", "apple" and "tropical" flavors. You create a recipe for each flavor.

Each recipe contains a recipe data record for the following mixing ratios:

- Beverage
- Nectar
- Juice

Settings

The settings relate to an HMI device which is connected to a SIMATIC S7-300 or SIMATIC S7-400.

In this example, you will need the following tags, recipes, recipe entries and recipe data records:

Tags:

Name	PLC connection	Address	Type
Liter water	Yes	DB 120, DBW 0	Integer
Liter concentrate	Yes	DB 120, DBW 4	Integer
Kilo sugar	Yes	DB 120, DBW 8	Integer
Gram flavoring	Yes	DB 120, DBW 12	Integer

Recipes:

- Orange
- Apple
- Tropical

Recipe entries:

Recipe element	Associated tag
Liter water	Liter water
Liter concentrate	Liter concentrate
Kilo sugar	Kilo sugar
Gram flavoring	Gram flavoring

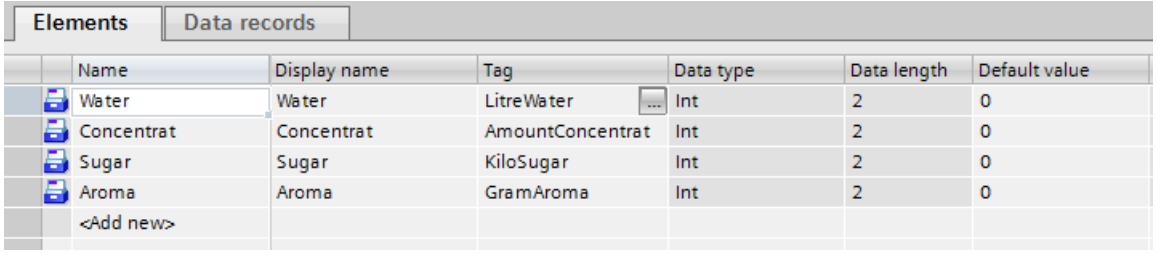
Recipe data records for drink, nectar and juice:

Data record name	Liter water	Liter concentrate	Kilo sugar	Gram flavoring
Beverage	30	70	45	600
Nectar	50	50	10	300
Juice	5	95	3	100

Procedure

To create a recipe, proceed as follows:

1. Create the following tags with the settings specified above: "LiterWater", "LiterConcentrate", "KiloSugar" and "GramFlavoring".
2. Create the "Orange", "Apple" and "Tropical" recipes with the settings indicated above. Create the recipe entries in each recipe.



3. Not for Basic Panels: Configure each recipe so that you can synchronize the recipe data records between the recipe screen and recipe view. The values of the recipe tags should not be transferred automatically to the PLC.
   You will have to make the following settings in the Properties dialog for the recipe concerned: Under "Properties > Options":
   - Activate the "Synchronize recipe view and recipe tags" option.
   - Activate the "Manual transfer of individual modified values (teach-in mode)" option.
4. Create the data records indicated above in each recipe. Enter the values indicated above in each of the data records.

Elements | Data records

Name	Display name	Number	Water	Concentrat	Sugar	Aroma	Comment
Beverage	Beverage	1	30	70	45	600	
Nectar	Nectar	2	50	50	10	300	
Juice	Juice	3	5	95	3	100	
<Add new>							

Result

The "Orange", "Apple" and "Tropical" recipes have been created.

See also

Configuration options of the advanced recipe view (V13 or higher) (Page 5580)

12.5.4.2 Example of configuring a recipe screen (Panels, RT Advanced)

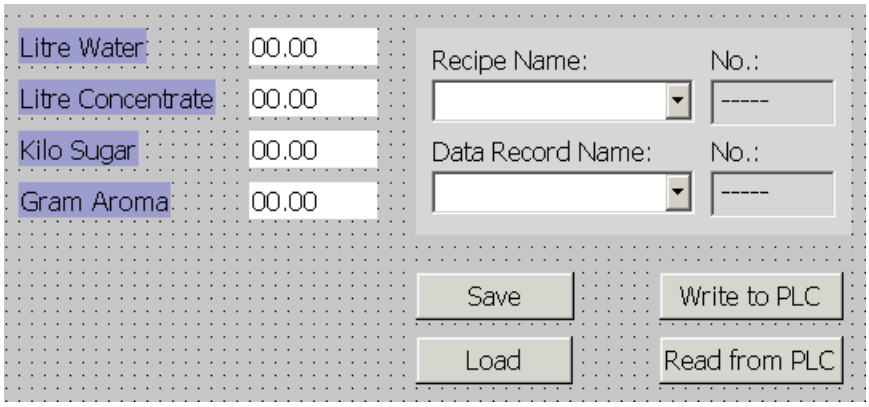
Task

In this example, you create a recipe screen for the visualization of values of the fruit juice mixing machine. You use a recipe view to select the recipes and their associated recipe data records.

You should be able to use the following functions with the buttons:

- "Load" Button
  The selected recipe data record is loaded from the recipe memory on the HMI device and displayed in the recipe screen.
- "Save" Button
  The displayed recipe tags are saved in the recipe memory of the HMI device.

- "Data to PLC" button
  The displayed tags are transferred to the PLC.
- "Data from PLC" button
  The current recipe data record in the PLC is transferred to the recipe variables and displayed on the HMI device.



Requirement

- The "Creating a recipe" sample application has been carried out.
- You have created and opened the "Fruit juice mixing plant" screen.

Settings

In this example, you need the following tags and buttons with the indicated settings:

Tags:

Name	PLC connection	Type
RecipeNumber	No	Integer
Data record number	No	Integer

Buttons:

Labeling	Configured event	System function
Load	Click	LoadDataRecord
Save	Click	SaveDataRecord
Data to PLC	Click	SetDataRecordTagsToPLC
Data from PLC	Click	GetDataRecordTagsFromPLC

Procedure

To configure a recipe screen, proceed as follows:

1. Drag-and-drop the "Liter water", "Liter concentrate", "Kilo sugar" and "Gram flavoring" tags from the object view to the "Fruit juice mixing machine" process screen.
   Four IO fields are created and linked by the specified tags.
2. Add a recipe view containing selection fields for the recipe name and data record name only.
   Make the following settings in the Inspector window for the recipe view:
   - Select the "Advanced view" display type under "General".
   - Deselect "Edit mode" under "Properties > General" and "Display table" under "Properties > Table".
   - Connect the "Recipe tag" field to the "RecipeNumber" tag.
   - Connect the "Tag" field to the "DataRecordNumber" tag.
   - Disable all the buttons under "Properties > Buttons".
3. Assign the above settings to four buttons. Transfer each "Recipe number" and "Data record number" tag as a parameter for the recipe number and recipe data record number.

Result

You can select the recipe and the associated recipe data record from the recipe view and modify the recipe values at runtime. You can load, save and transfer the recipe data records using the buttons.

12.5.4.3 Scenario for Entering Recipe Data Records in Runtime (Panels, RT Advanced)

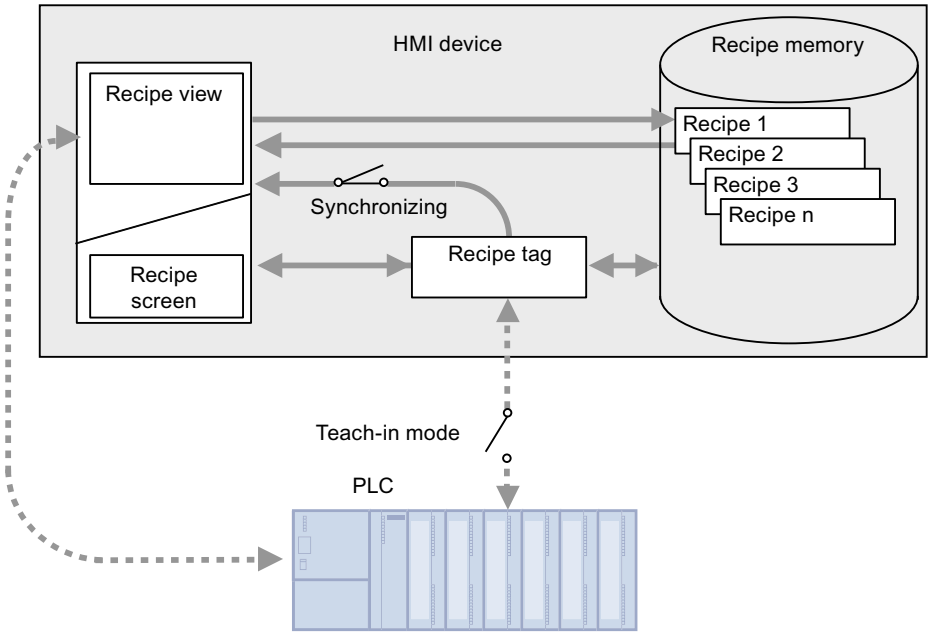
Objective

You want to enter production data on the HMI device without disturbing the process that is currently underway. Therefore, the production data should not be transferred to the PLC.

Requirement

- The recipe has been created.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated or deactivated.
  - If "Synchronize recipe view and recipe tags" is activated, "Manual transfer of individual modified values (teach-in mode)" has to be activated.
    This will prevent the recipe tags being transferred automatically between the HMI device and PLC.
- A recipe screen or a screen with recipe view is available.
- There is an operating element for saving the recipe data records.

Sequence



1. Enter the production data in the recipe view or recipe screen.
2. Save the modified recipe data record.

Transfer the recipe data to the PLC

The configuration may provide operating elements for transferring recipe data to the PLC.

12.5.4.4 Scenario for a manual production sequence (Panels, RT Advanced)

Objective

A reading device connected to the PLC reads a bar code on the work piece to be processed. The recipe data record names correspond to the respective bar code names. This will enable the PLC to load the necessary recipe data record from the storage medium of the HMI device. The recipe data record is displayed for inspection on screen.

You want to be able to correct the transferred production data online, if necessary.

Requirement

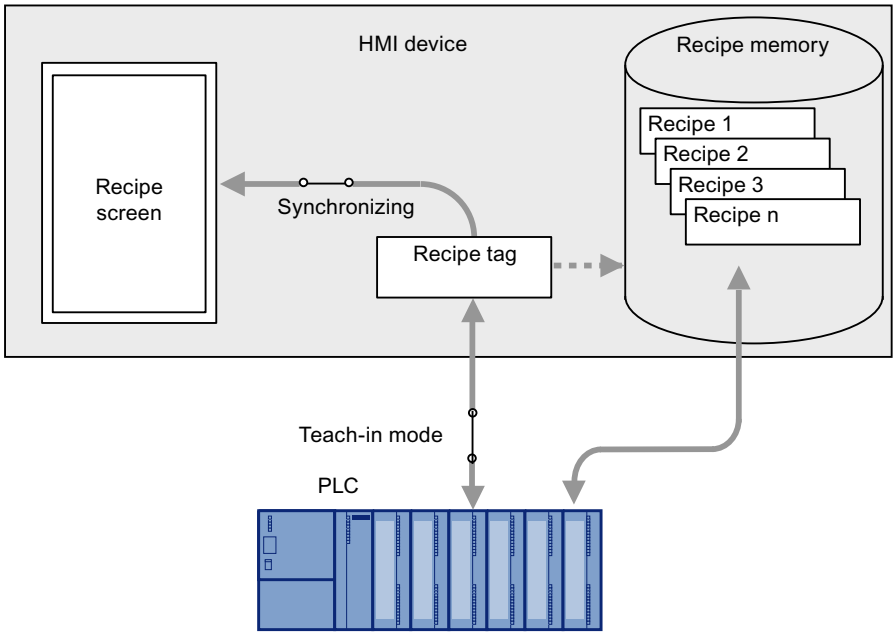
- You have created the recipe.
- The recipe has the following settings:
  - "Synchronizing recipe view and recipe tags" is activated.
  - "Manual transfer of individual modified values (teach-in mode)" is deactivated.

  Note

  The changes are immediately transferred to the PLC

- There is a recipe screen available.
  There may also be an operating element for saving the recipe data records in the recipe screen.

Sequence



Behavior when the recipe view is used

If the recipe view is used, it is not possible to transfer changes immediately. You must use the operating element to transfer the recipe data record to the PLC.

12.5.4.5 Scenario for an Automatic Production Sequence (Panels, RT Advanced)

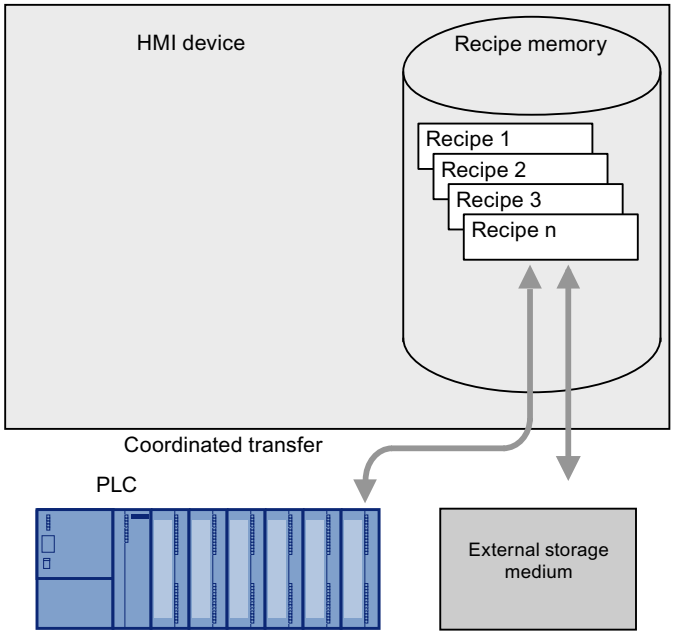
Objective

You want production to be executed automatically. The production data is to be transferred directly to the PLC, either from the recipe memory in the HMI device or from an external storage medium. The screen display is not necessary.

Requirement

- You have created the recipe.
- The recipe has the following settings:
  - "Coordinated transfer of data records" is activated.
    The production data is transferred to the PLC, so a coordinated transfer with the PLC in necessary to prevent the data from being accidentally overwritten.

Sequence



Implementation

You can control the flow of data in the following ways:

- The control program controls the automatic transfer via control jobs or via WinCC system functions, if necessary.
  The sequence is controlled via the status information in the mailbox and via return values from the functions used.
- One or more scripts control the automatic transfer via WinCC system functions.
  The sequence can be checked using the values returned by the functions used.

You can implement the automatic production sequence with available system functions:

- "ImportDataRecords"
  This function loads data records from a *.CSV file into the recipe memory of the HMI device.
- "SetDataRecordToPLC"
  This function transfers a data record from the HMI device's recipe memory to the PLC.

12.6 Working with reports (Panels, RT Advanced)

12.6.1 Basics (Panels, RT Advanced)

12.6.1.1 Reports (Panels, RT Advanced)

Introduction

Reports are used to record process data and processed production cycles. You have the opportunity, for example, to create regular shift reports, output batch data, or record the production process for quality control (QC).

Creating reports

A report is created and edited in the "Reports" editor. In this editor, you configure the following report items:

- Formal appearance
  Specify the formal layout of the report in the Inspector window. In this window, for example, you specify the page format, page margins, title page, back page, headers, or footers for the report.
- Contents
  In the work area, specify the content of the report, for example, the alarms of a shift. To this purpose you insert the corresponding objects into the report.

The modular structure lets you configure reports that suit all of your applications.

Note

The "Reports" editor is not available at HMI devices that do not support reporting.

Report output

In runtime, the configured reports are printed on the default printer of the HMI device.

Reports are output to the printer in graphic mode. The use of a serial printer is not recommended because of the accumulated data volume.

In runtime, report output is event or time-controlled.

- Time-controlled: Automatic print at specific dates, times or intervals.
- Event-driven: Printing is initiated by specific events, e.g. click on a button, or when a limit is exceeded.

For proper output, the printer must support the paper format and page layout of the report.

Note

The value of a tag in the report is read and output at the moment of printing. A substantial period of time may elapse between printing out the first and the last page of a report consisting of several pages. This may lead to the same tag being output with a different value on the last page than on the first page.

Inserting an object (Page 5624)

Printing reports (Page 5638)

Audit report (Page 5639)

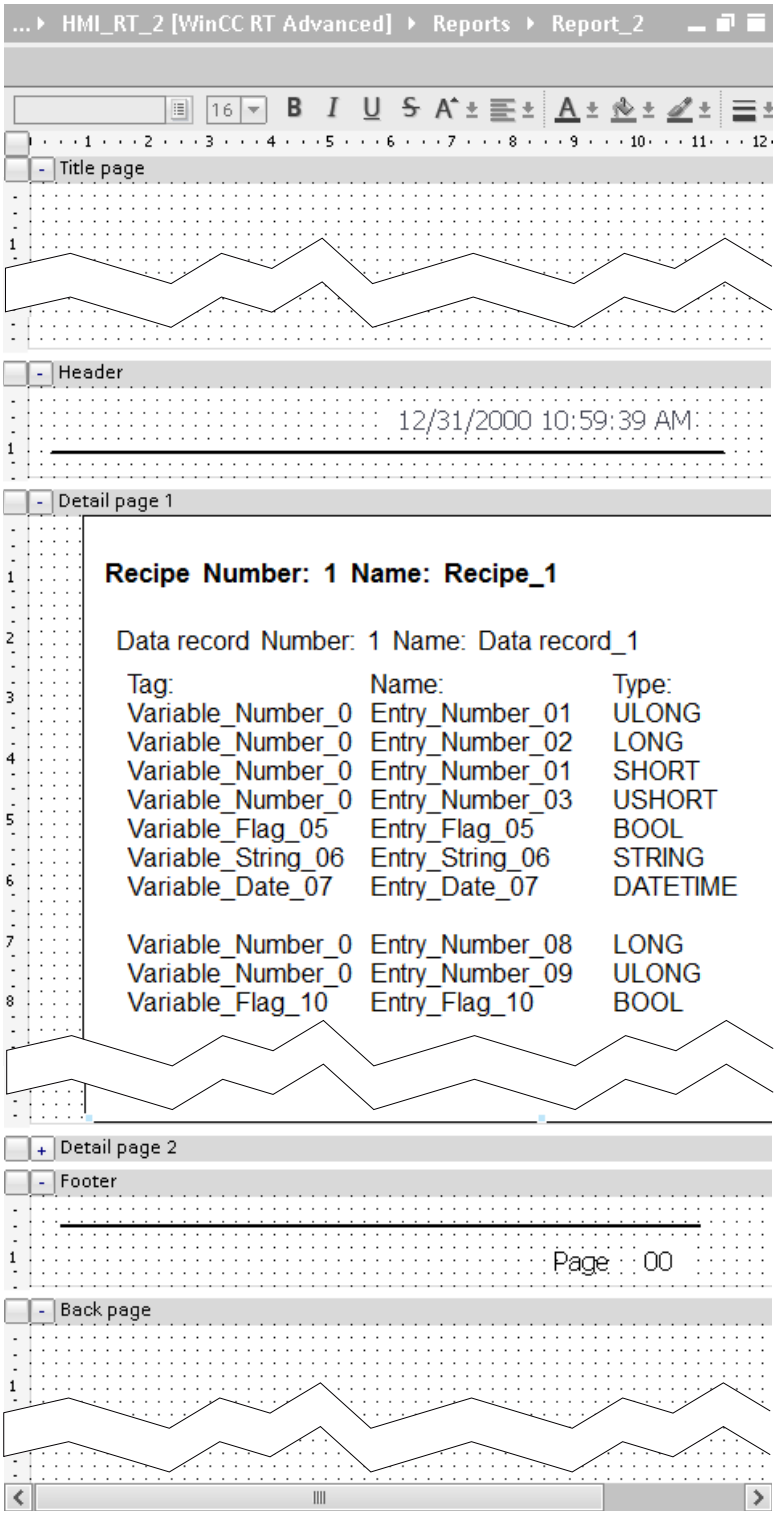
12.6.1.2 Structure of reports (Panels, RT Advanced)

Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

Sections of a report

The following figure shows an example of the different sections of a report in the "Reports" editor.



Title page and back page

The title page contains important information about the report content. The back page is used, for example, as Impressum, on which you provide contact information of shift managers or service technicians. The title page and back page are output separately on a single page. Each of them consist of exactly one page and page breaks are not used.

Detail page

Configure the output of runtime data such as recipe or alarm reports on the detail pages of the report.

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

Header and footer

The header and footer are output on each detail page of the report. You typically insert the page numbers or the date in the header or footer.

See also

Reports (Page 5615)

Principles for preparation of reports (Page 5618)

12.6.2 Working with reports (Panels, RT Advanced)

12.6.2.1 Creating and printing reports (Panels, RT Advanced)

Principles for preparation of reports (Panels, RT Advanced)

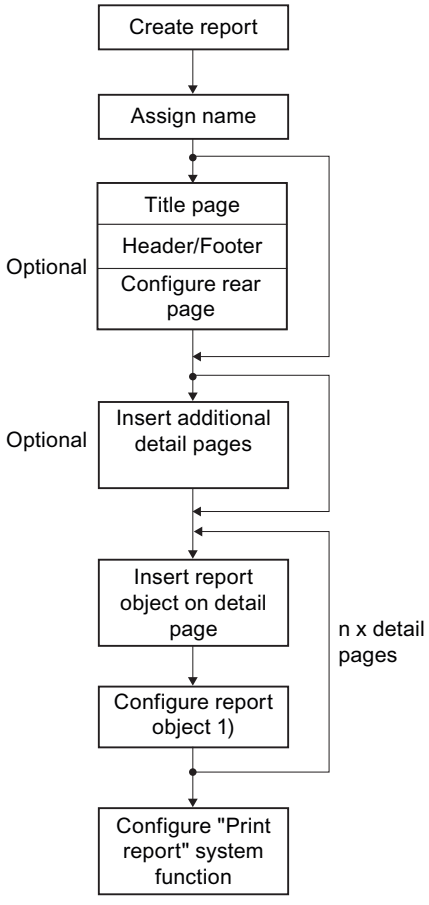
Introduction

A report in WinCC consists of several sections that can be enabled or disabled, as required.

- Title page
- Back page
- Detail pages
- Headers and footers for the detail pages

Procedure

The following figure shows the general procedure for creating a report:



1) Settings depend on the report object used.

Tools for the design of reports

The tools that you can use to design reports are available in the "Tools" task card.

- For *graphic design* insert "basic objects", "elements" and "graphics" in the different sections of the report. For example, for a Logo in the header, separation lines and a page number in the footer.
- Using the "Controls" in the detail pages, configure the *output of runtime data*.

Note

The "Screens" editor provides many objects for designing a report – however, with restricted functionality. Data input properties are not available. The I/O fields in the reports, for example, serve only to output data.

Position and size of objects

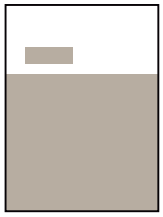
Insert the objects at the position where you want them to be output in the report. The objects are output in their configured size and with the following special features:

On the detail pages, configure "recipe reports" or "alarm reports" that serve to output runtime data in tabular format.

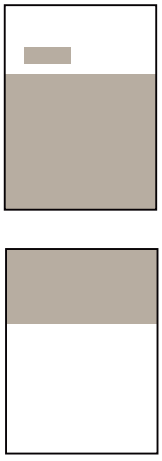
- The *width* of the table is set up automatically to fit the width of the detail page. You cannot modify the width.
- WinCC automatically wraps the *height* of the table to fit the data content for output in the report. The table can be continued on the next page.
  In the detail page, WinCC automatically extends tables of dynamic length to the bottom margin.

The following figure shows an example of a detail page in the report and its output in Runtime:

Detail page in the report



Report output in Runtime



Additional detail pages

Use the shortcut menu on the detail page to insert additional detail pages or change their order.

See also

Objects in reports (Page 5638)

Structure of reports (Page 5616)

Administration of detail pages (Page 5622)

Create a report (Panels, RT Advanced)

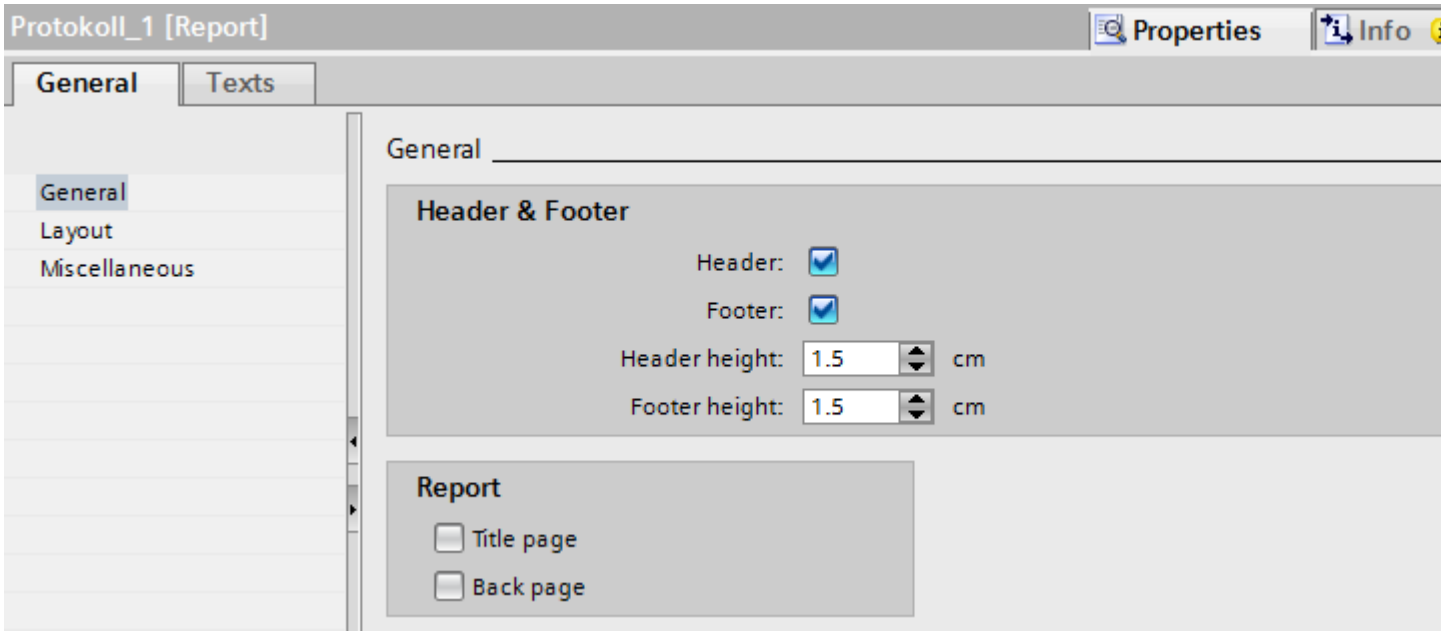
Requirement

A project with an HMI device is open.

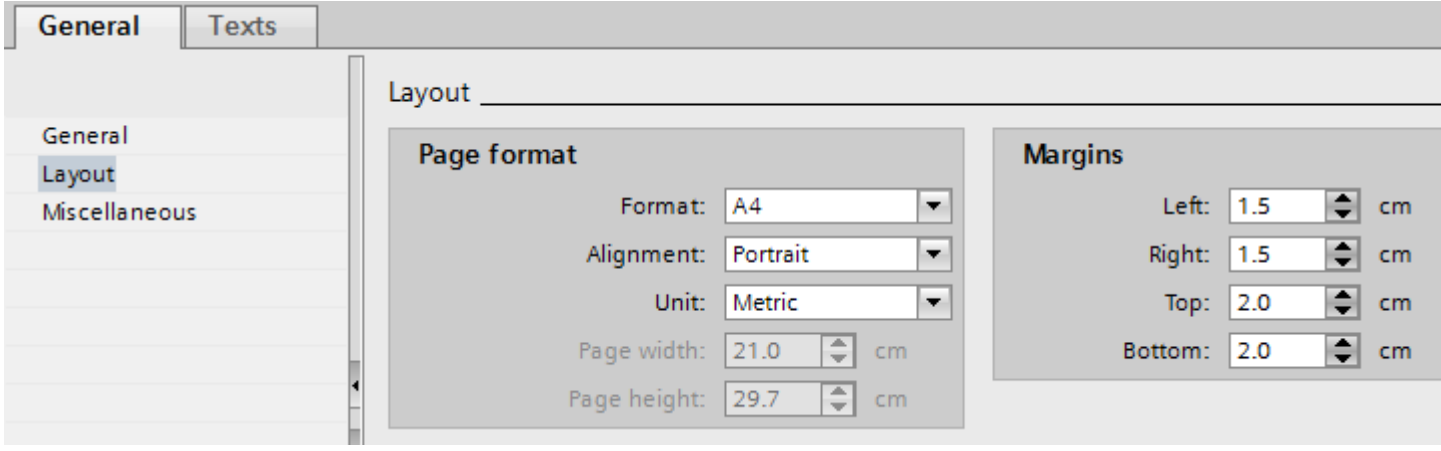
Procedure

To create a report, proceed as follows:

1. Double-click "Add new report" under "Reports" in the project navigation.
   A new blank report is displayed in the "Reports" editor.
2. Select the "Report properties" command in the shortcut menu of the report.
3. In the "Properties > Properties > General" area of the Inspector window, specify whether you want to configure the "Title page", "Back page", "Header" and "Footer" in the report.
   The report sections are updated accordingly.



4. Configure the format, the page layout, and the page margins of the report under "Properties > Properties > Layout."



5. Enter a meaningful report name under "Properties > Properties > Miscellaneous."

6. Design the report sections as required.
   Drag and drop the necessary basic objects, elements, graphic images and controls from the "Tools" task card to the required position.
   Alternatively, you can also copy or move objects already configured from a screen to the report.
7. Configure the objects in the Inspector window:

See also

Objects in reports (Page 5638)

Administration of detail pages (Panels, RT Advanced)

Adding a detail page

1. Open the shortcut menu of a detail page.
2. Select the command "Pages > Insert page before" or "Pages > Insert page after."
   Depending on the selected command, the new detail page is inserted either before or after the existing detail page.

Deleting a detail page

1. Open the shortcut menu of the detail page that you want to remove.
2. Select the command "Pages > Delete detail page".
   The detail page is deleted.

Sorting detail pages

1. Open the shortcut menu of the detail page that you want to move.
2. Select the "Pages > Move one page up" or "Pages > Move one page down" command.
   Depending on the selected command, the detail page is moved either upward or downward.

Showing and hiding sections

1. To show or hide a specific section, click on the plus or minus sign in the title bar of the section in the working area.
2. If you want to show or hide all sections of a report, select the command "Show all pages" or "Hide all pages" in the report shortcut menu.

See also

Structure of reports (Page 5616)

Principles for preparation of reports (Page 5618)

Printing reports (Panels, RT Advanced)

Introduction

In Runtime, report output is event-driven or time-driven.

Event-driven output

The report is output after an event was generated.

Examples:

- A tag value changes or exceeds a limit.
- Alarm is incoming, outgoing or acknowledged
- Action by the operator, for example, clicking a button

Time-driven output

The report is output automatically.

Examples:

- Once at a specified date, e.g. on December 31, 2010
- At intervals, e.g. daily at 8 am, or on Mondays at 6 pm

Configuration steps

Configuring event-driven output:

- An event is configured on a button or tag with the "PrintReport" system function.

Configuring time-driven output:

- In the scheduled tasks, configure a "Print job" task and assign it to the desired report. In the task properties, specify the time and frequency of report output.

Output in Runtime

On the control panel of the HMI device, the report is output to the printer that is specified as the default printer.

The default printer enabled for a HMI device can be found in the "Printer list". For further information about the "Printer list", refer to the Internet page of Siemens Customer Support and the Article ID "11376409".

Note

When printing PDFs, keep in mind the device-specific differences. You can find additional information at: PDF (Page 6381).

Printing reports (Page 5638)

Planning jobs (Page 6047)

12.6.2.2 Working with objects (Panels, RT Advanced)

Inserting an object (Panels, RT Advanced)

Introduction

In the "Screens" or "Reports" editor, insert the objects to the "Toolbox" task card. Use the mouse to drag the objects into the work area. You either keep the objects in their original size, or scale them up or down when you paste them.

In addition, you can copy or move objects via the clipboard from one editor to another, for example to transfer a screen object to a report. Alternatively, you can also use the mouse instead of the clipboard for copying and moving:

- Copying: <Ctrl + Drag&Drop>
- Moving: Drag&drop

Note

Basic Panels

The "Reports" editor is not available for Basic Panels.

Requirement

The "Tools" task card is open.

Inserting objects in their standard size

1. In the "Toolbox" task card, select the desired graphic object or the desired graphic in the WinCC graphics folder.
   When you move the cursor across the work area, it turns into a crosshair with an appended object icon.
2. Click the location in the work area where you want to insert the object or graphic.
   The object is inserted with its standard size at the desired position in the work area.

Alternatively, double-click the object in the "Toolbox" task card.

Copying an object

1. Select the desired object.
2. Select "Copy" in the shortcut menu.
3. Click the desired location and select "Paste" in the shortcut menu.

WinCC inserts a copy of the object at the desired location. You can only change the properties that are appropriate for the relevant context.

Example: In the "Screens" editor, you can set for I/O fields and the mode for input and output. In the "Reports" editor, the mode is set to "Output".

Original and copy are not interconnected and are configured independently from one another.

Inserting lines

1. Select the desired graphic object in the "Tools" task card.
2. Click on a location in the work area. A line in the standard size is inserted.

Inserting a polygon or polyline

1. Select the desired object "Polyline" or "Polygon" in the "Tools" task card.
2. Click on a location in the work area. This fixes the starting point of the object.
3. Click another location in the work area. A corner point is set.
4. For every additional corner point, click on the corresponding location in the work area.
5. Double-click on a location in the work area. The last corner point is set.
   This fixes all the points of the polygon or polyline.

Note

Basic Panels

The "Polyline" and "Polygon" objects are not available for Basic Panels.

Note

If you want to insert several objects of the same type, use the "Stamp" function. This avoids having to reselect the object in the "Tools" task card every time before inserting it. To do so, select the icon in the toolbar of the "Tools" task card.

See also

Deleting an object (Page 5626)

Inserting multiple objects of the same type (stamping tool) (Page 5626)

Positioning objects (Page 5628)

Resizing objects (Page 5630)

Moving an object forwards or backwards (Page 5629)

Flipping objects (Page 5637)

Reports (Page 5615)

Deleting an object (Panels, RT Advanced)

Introduction

You can delete objects individually or with a multiple selection.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to delete.
   To delete multiple objects, keep the <Shift> key pressed and select the objects to be deleted one after the other. Alternatively, drag and maximize an area around the desired objects with the mouse.
2. Select "Delete" from the shortcut menu.

Result

The selected objects are deleted.

Inserting multiple objects of the same type (stamping tool) (Panels, RT Advanced)

Introduction

WinCC offers the possibility to "stamp" several objects of the same type directly one after the other, i.e. paste without having to reselect the object every time. In addition you have the possibility of multiplying an object that has already been inserted.

Requirement

The "Tools" task card is open.

Inserting several objects of one type

1. Select the object that you want to insert in the "Tools" task card.
2. Click the icon in the toolbar of the "Tools" task card.
   The "Stamp" function is activated.
3. To insert the object with its standard size, click the relevant insertion position in the work area.
   To insert the object with another size, position the mouse pointer at the desired location in the work area. Press the left mouse button and drag the object to the required size.
   The object is inserted in the work area as soon as you release the mouse button.

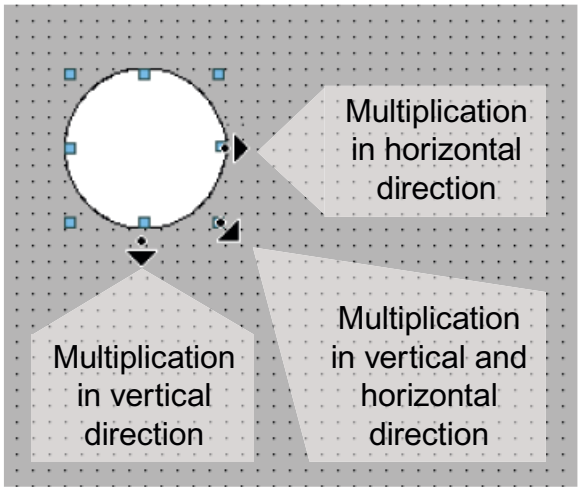
4. Repeat step 3 to insert further objects of the same type.
5. Click the icon again.
   The "Stamp" function is deactivated.

Note

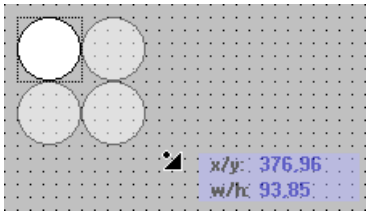
You can copy existing objects using the drag-and-drop +<CTRL> function. The existing object is not moved in this case. You paste a copy of this object into the new position instead.

Inserting and multiplying an object

1. Insert the desired object from the "Tools" task card.
2. Press the <Ctrl> key and position the cursor on one of the handles displayed in the figure shown below.



3. Drag the handles to the right and/or down while keeping the left mouse button pressed.
4. The object is multiplied depending on available space if you keep moving the cursor.



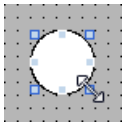
Result

You have pasted and stamped an object in a screen.

Positioning objects (Panels, RT Advanced)

Introduction

When you select an object, it is enclosed by a rectangle with resizing handles. This rectangle is the rectangle which surrounds the object. The position of an object is defined by the coordinates of the top left corner of the rectangle surrounding the object.



Note

If the position is outside the work area the object is not displayed in Runtime.

Position and align

You have the possibility of having a grid displayed in the work area. You have three options for easier positioning of objects:

- "Snap to grid" When you resposition objects, they are automatically snapped and pasted to the grid. If you hold down the <Alt> key, the object is no longer snapped to the grid.
- "Snap to objects" When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.
- "None": You position the objects in any position.

You activate and deactivate the grid and options as follows:

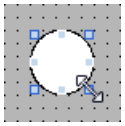
- In the "Options > Settings > Visualization > Screens" menu
- In the "Layout > Grid" task card

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to move.
   The selected object is framed by a rectangle with resizing handles.



2. Left-click the object and keep the mouse button pressed.

3. Move the mouse pointer onto the new position.
   The contour of the object moves with the mouse and displays the new position for the object.

   The object initially remains at its original position.
4. Now release the mouse button.
   The object is moved into the position indicated by the contour of the selection rectangle.

Alternative procedure

1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the X and Y values for the position under "Position & Size".

Result

The object appears at its new position.

See also

Rotating objects (Page 5636)

Moving an object forwards or backwards (Panels, RT Advanced)

Introduction

You can use the "Order" functions in the shortcut menu of a selected object or in the toolbar to move a selected object in front of or behind other objects within an object layer.

Note

ActiveX controls are always positioned in front of an object layer (.NET property).

Requirement

You have opened a screen which contains a layer with multiple objects.

Procedure

1. Select the object you want to move forward or backward.
2. Select the "Sort" command and one of the following commands from the shortcut menu:

Icon	Description
	Moves the selected object before all the other objects of the same layer
	Moves the selected object to the lowest position in the same layer
	Moves the selected object up by one position
	Moves the selected object down by one position

Alternative procedure

1. Open the "Layers" palette of the "Layout" task card.
2. Navigate to the required object.
3. Hold down the mouse button, and drag the object in the tree topology to the required position in the layer.
4. Now release the mouse button.

Result

The object is moved up or down.

See also

Inserting an object (Page 5624)

Resizing objects (Panels, RT Advanced)

Introduction

When you select an object, it is enclosed by a rectangle with handles. You have the following options of resizing an object:

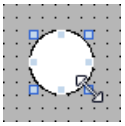
- Drag the handles using the mouse.
- Modify the "Size" property in the Inspector window.

Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object you want to resize.
   The selection rectangle appears. The following figure shows a selected object:



2. Drag a resizing contact of the rectangle to a new position.
   The size of the object changes.
   - The size of the object is aligned to the grid pattern, provided the "Snap to grid" function is set.
   - Press <ALT> to disable this function while you drag the object.
     In order to scale the object proportionally, keep the <Shift> key pressed while changing the size with the mouse.

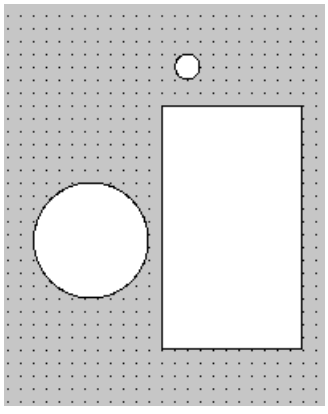
Alternative procedure

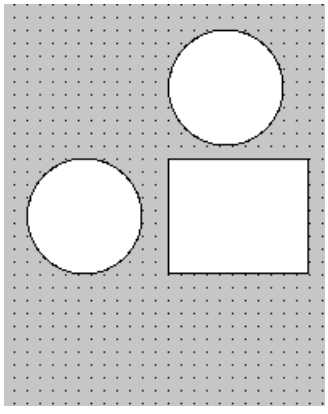
1. In the Inspector window, select "Properties > Properties > Layout".
2. Enter the size of the object under "Position & Size".

Harmonizing the object size

1. Select the objects.
2. Now, click one of the following buttons: or or
   The size of the selected objects is matched to each other.

The following screen shows how the selected objects are adapted to the height of the reference object:





Icon	Description
	Aligns the selected objects to the width of the reference object.
	Aligns the selected objects to the height of the reference object.
	Aligns the selected objects to the width and height of the reference object.

Result

The object now appears with its new size.

Selecting multiple objects (Panels, RT Advanced)

Introduction

Select all objects you want to align with each other or to change global properties. This procedure is called "multiple selection."

The Inspector window shows all the properties of the selected objects.

You now have several options of selecting multiple objects:

- Draw a selection frame around the objects.
- Hold down the <Shift> key, and click the required objects.

Selection frame of a multiple selection

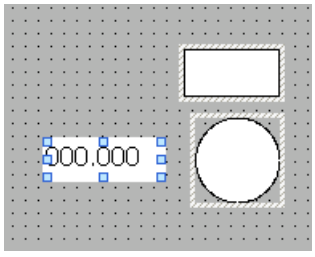
The selection frame surrounds all objects of a multiple selection. The selection frame is comparable with the rectangle that surrounds an individual object.

The selection frame is not visible. When you have made your multiple selection, the following frame is displayed:

- The reference object is indicated by the rectangle around it.
- The other selected objects are indicated by a dashed-line frame.

Specifying a reference object

The reference object is the object upon which the other objects are oriented. The reference object is framed by a rectangle with handles. The following figure shows a reference object with two other selected objects:



You have the following options to specify the reference object:

- Select the objects via multiple selection. The object selected first is then the reference object.
- Draw a selection frame around the objects. The reference object compiled automatically. If you wish to specify a different object within the selection as the reference object, click on the desired object. This action does not cancel your multiple selection.

Requirement

You have opened the work area containing at least two objects.

Selecting multiple objects with a selection frame

1. Position the mouse pointer in the work area close to one of the objects to be selected.
2. Hold down the mouse button, and draw a selection frame around the objects to be selected.

Or:

1. Hold down the <Shift> key.
2. Click the relevant objects, working in succession.
   All the selected objects are identified by frames.
   The object selected first is identified as reference object.

Note

To remove an object from the multiple selection, press <SHIFT>, hold it down and then click the relevant object once again.

Result

Multiple objects are selected. One of those is identified as the reference object. You can now perform the following steps:

- Changing the object properties of all the objects
- Resizing all the objects by the same ratio, by dragging the selection frame to increase or reduce the size

- Moving all the objects in one group
- Aligning the objects to the reference object

Repositioning and resizing multiple objects (Panels, RT Advanced)

Possible modifications

After you have selected multiple objects, you edit them:

- Shift using the mouse
  - To change the absolute position of the marked objects, position the mouse pointer over an object, and shift the multiple selection with the mouse button pressed.
  - To resize all the objects by the same ratio, grab the resizing handles of the reference object.
- Move over the work area with the icons of the toolbar
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects
- Moving with the shortcut menu commands of the work area
  - Change the position of the marked objects with respect to each other
  - Align the height and width of the marked objects

Aligning objects (Panels, RT Advanced)

Procedure

1. Select the objects via multiple selection.
2. Specify an object as the reference object.
3. Select the desired command in the toolbar or the shortcut menu - see table below.
   The selected objects will be aligned.

Aligning objects flush

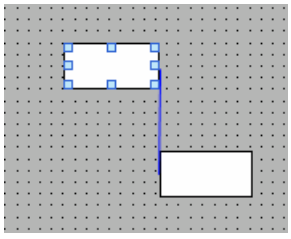
The selected objects will be aligned flush to the reference object.

Icon	Description
	Aligns the selected objects to the left edge of the reference object.
	Aligns the selected objects to the vertical center axis of the reference object.
	Aligns the selected objects to the right edge of the reference object.
	Aligns the selected objects to the upper edge of the reference object.
	Aligns the selected objects to the horizontal center axis of the reference object.
	Aligns the selected objects to the lower edge of the reference object.

Icon	Description
	Centers the selected objects to the center points of the reference object.
	Centers the selected objects vertically in the screen.

Snap to object

When you reposition objects, they are displayed with help lines. You can use other objects for orientation during positioning.



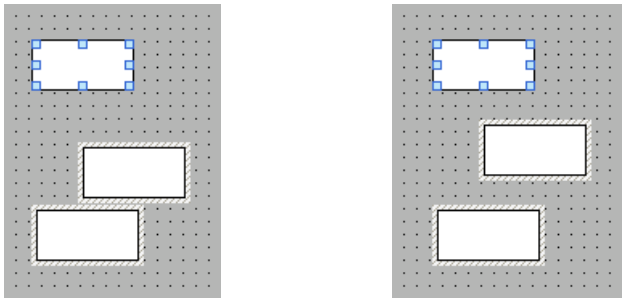
If you are working with the keyboard, press the Alt key. When you move the selected object with the arrow keys, the next anchor point is displayed.

Distributing objects evenly

You need at least three selected objects. A reference object is not required.

1. Select the objects.
2. Click one of the buttons "Distribute horizontally equal" or "Distribute vertically equal". The selected objects are distributed at equal distances.

The following screen shows how you align the vertical spacing of the selected objects:



Icon	Description
	Aligns the horizontal distance between the objects. The position of the objects on the extreme left and right side remains unchanged. All other objects are distributed evenly between them.
	Aligns the vertical distance between the objects. The position of the objects at the extreme top and bottom (right and left) remains unchanged. All other objects are distributed evenly between them.

Rotating objects (Panels, RT Advanced)

Introduction

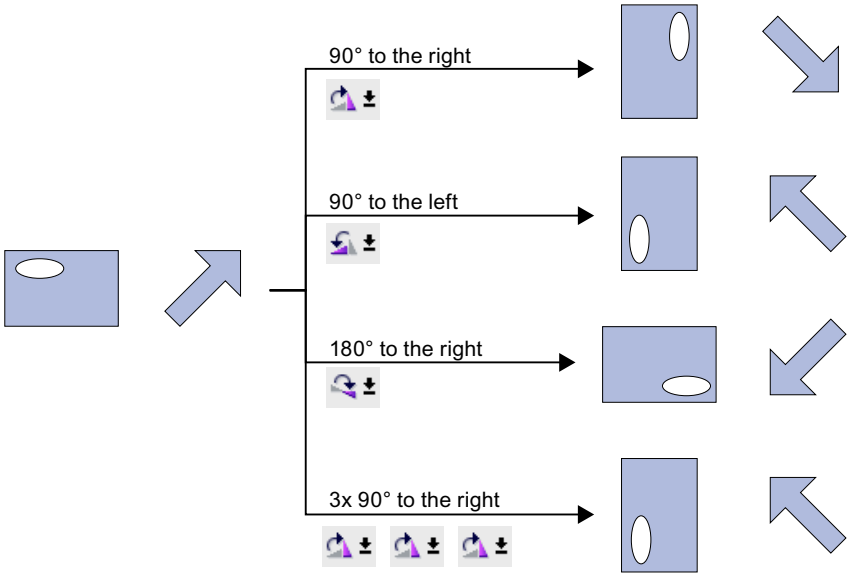
You can rotate a suitable object clockwise or counterclockwise around its center axis in steps of 90°.

Note

Not all the objects can be rotated. Some objects that can be rotated in screens cannot be rotated in reports.

You can also rotate multiple objects using the multiple selection function. Certain WinCC objects such as buttons cannot be rotated.

The alignment of elements in an object will change in a rotated object. The following figure shows how a rectangle and an ellipse behave under the different commands for rotating an object:



Requirement

You have opened the work area containing at least one object.

Procedure

1. Select the object that you want to rotate.
2. Click one of the following toolbar icons:
   , to rotate the object clockwise around its center point. The angle of rotation is 90°.
   , to rotate the object counterclockwise around its center point. The angle of rotation is 90°.
   , to rotate the object clockwise by 180°.

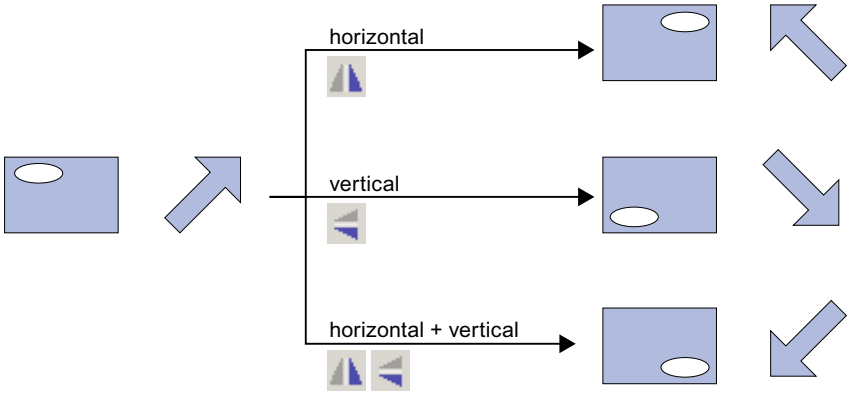
Result

The object is shown at its new angle.

Flipping objects (Panels, RT Advanced)

Introduction

You can flip an object along its vertical or horizontal center axis. The alignment of elements in an object will change when you flip an object. The following figure shows how a rectangle and an ellipse behave under the different commands for flipping an object.



Requirement

You have opened a screen which contains at least one object.

Procedure

1. Select the object that you want to flip.
2. Click the "Flip" command in the shortcut menu and select one of the options displayed:
   - , to flip the selected object along its vertical center axis.
   - , to flip the selected object along its horizontal center axis.

Result

The object is shown at its flipped position.

12.6.3 Operation in Runtime (Panels, RT Advanced)

12.6.3.1 Printing reports (Panels, RT Advanced)

Printing a report in Runtime

If you have configured an object with the "PrintReport" system function, the operator can print out a report in Runtime. To do this, the operator uses the "Print report" button on a screen. The operator can set or change further settings for the report. The report is output to the default printer.

See also

Printing reports (Page 5623)

Principles for preparation of reports (Page 5618)

Reports (Page 5615)

12.6.4 Objects in reports (Panels, RT Advanced)

12.6.4.1 Overview (Panels, RT Advanced)

Objects in the "Reports" editor

Different objects are available in the "Reports" editor:

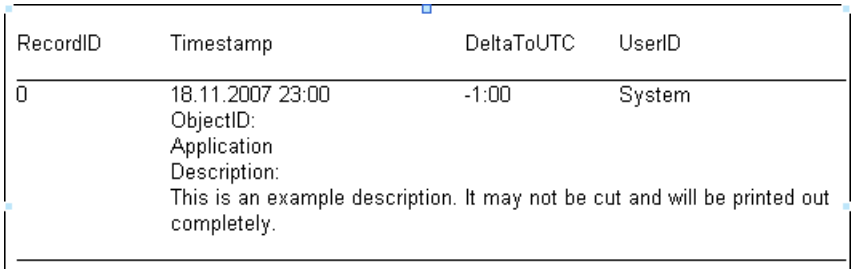
- Objects for formal design of a report,
  for example, "Page number", "Line" or "Circle"
- Objects for output of contents,
  for example, objects for alarm reports or output of recipes

The next section describes report-specific objects with special properties. Simple design objects are not further explained.

12.6.4.2 Audit report (Panels, RT Advanced)

Application

With the audit report, the content of the audit trail of a HMI device is output as a report.



RecordID	Timestamp	DeltaToUTC	UserID
0	18.11.2007 23:00 ObjectID: Application Description: This is an example description. It may not be cut and will be printed out completely.	-1:00	System

Requirements

The "audit report" object is available only if the following requirements are met:

- The HMI device supports a GMP-compliant configuration.
- GMP-compliant configuration is active in the Runtime settings of the HMI device.

Note that operator actions and system operations are only recorded if a corresponding log is configured.

Layout

In the Inspector window the position, shape, style, color and font types of the object are customized. In particular, the following can be adjusted:

- Visibility of the comment

Text field (Page 5648)

Reports (Page 5615)

12.6.4.3 Date/time field (Panels, RT Advanced)

Application

The "Date/time field" object shows the system time of the HMI device or the date and / or time of a connected tag. The layout depends on the language setting on the HMI device.

Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. In the "Properties > Properties > General" dialog, you can adapt the following properties in particular:

- Long date/time format: This setting defines the format displayed for the data and / or time.
- System time: Specifies whether to use the system time of the HMI device, or the data and / or time of a connected tag.

Long date/time format

Option	Description
"Enabled"	Date and / or time is fully displayed, for example "Sunday, December 31, 2000 10:59:59 AM"
"Disabled"	Date and / or time is displayed in abbreviated form, e.g. "12/31/2000 10:59:59 AM"

System time

Option	Description
"Enabled"	The system time of the HMI device is displayed
"Disabled"	The date and / or time of the connected tag is displayed Select a tag of the "DateTime" data type, e.g. an internal tag. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

Principles for preparation of reports (Page 5618)

Audit report (Page 5639)

12.6.4.4 I/O field

Application

The "I/O field" object is used to enter process values.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Display format: Specifies the format in which the values in the I/O field are output.

Note

The "I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

Display format

The "display format" for the output of values is specified in "Properties > Properties > General > Format", in the Inspector window.

Layout	
"Binary"	Output of values in binary form
"Date" *	Output of date specifications. The format depends on the language setting on the HMI device.
"Date/time" *	Output of date and time specifications. The format depends on the language setting on the HMI device.
"Decimal" *	Output of values in decimal form.
"Hexadecimal"	Output of values in hexadecimal form.
"Time" *	Output of time specifications. The format depends on the language setting on the HMI device.
"Character string"	Output of strings.
*: not in Runtime Professional	

Avoid overlaps with output fields

If several I/O fields are configured as output fields with a transparent background in a report, these I/O fields may overlap. The transparent part of the one field covers the digits of the other field. This may cause display problems in the report. In order to avoid such overlaps, set the margins of the I/O fields to zero in the object properties under "Properties > Properties > Appearance". Activate "Properties > Properties > Layout > Fit object to contents."

Audit report (Page 5639)

12.6.4.5 Graphic view (Panels, RT Advanced)

Application

The "Graphic view" object is used to display graphics.

Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Graphic: Specifies the graphic file that is displayed in the object.
- Adjust graphic: Specifies the automatic size stretching for objects with graphics.

Inserting graphics

Use the following image formats in the "Graphic Display" object: *.bmp, *.tif, *.png, *.ico, *.emf, *.wmf, *.gif, *.jpg or *.jpeg. You may also use graphics as OLE objects in the Graphic view .

1. Click "Properties > Properties > General" in the Inspector window.
2. Select the graphic that you wish to insert.
   The graphic preview is shown in the right pane.
3. Click "Apply" to insert the graphic in the Graphic view .

Adjust graphic

Whether a graphic displayed in a Graphic view is stretched to the size of the Graphic view in runtime is specified in the Inspector window.

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Select one of the following options from the "Fit to size" area:
   - Do not adapt automatically
   - Fit graphic to object size
   - Fit object size to graphic
   - Adjust object size to graphic

Audit report (Page 5639)

12.6.4.6 Graphic I/O field (Panels, RT Advanced)

Application

With the "Graphic I/O field" object, the graphics of a graphics list are displayed, depending on the tag value. In the Inspector window, the tag and graphics list are configured, under "Properties > Properties > General":

Note

The "Graphic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

Layout

Customize settings for color, frame, position and object size in the inspector window. In particular, the "Fit to size" is defined by specifying whether the object is adjusted to the graphics during output in the report or the graphic is adjusted in the object.

Objects in reports (Page 5638)

12.6.4.7 Alarm report (Panels, RT Advanced)

Application

Use the "Alarm report" object to output alarms of the selected alarm classes from the alarm buffer or alarm log to the report.

No.	Time	Status	Date		GR		PLC
0	12:00:00 PM normal kursiv normal	KGQ	1/1/1999	Class name	0	*	Device
1	12:00:00 PM normal blinken normal	KGQ	1/1/1999	Class name	1	*	Device
2	12:00:00 PM Message Text	KGQ	1/1/1999	Class name	2	*	Device
3	12:00:00 PM normal bold normal	KGQ	1/1/1999	Class name	3	*	Device
4	12:00:00 PM normal underline normal	KGQ	1/1/1999	Class name	4	*	Device

Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Source
- Alarm classes
- Time range
- Additional settings for the display
- Visible columns

Specifying the source

Under "Properties > Properties > General > Settings > Source", specify whether to display alarms from the alarm buffer, or from the alarm log. Select the alarm log in the "Alarm log" dialog.

Note

The "Alarm log" source is only available if the HMI device supports logs.

Specifying alarm classes

Under "Properties > Properties > General > Alarm classes, enable the alarm classes for the alarms output to the report.

Specifying the time range

If you want to restrict alarm output to a specific time range, select the start and end tags for the time range in the "Properties > Properties > General > Time range" dialog. The tag must be of the "DateTime" type.

Additional settings for the display

Under "Properties > Properties > General > Settings, specify the following settings for the display in the alarm report:

- Under "Sorting", specify whether to start the display with the oldest or most recent alarm.
- Under "Lines per entry", specify the number of lines to be available for each alarm. The required number of lines depends on the following factors:
  - Number and width of the selected columns for the output
  - Font size used
  - Paper format of the printer
- Select "Visible heading" to enable the display of column headers.
- Select "Display milliseconds" to enable the display of milliseconds for time data.

Visible columns

Under ""Properties > Properties > Layout > Visible columns", enable the columns to be displayed in the alarm report.

Create a report (Page 5620)

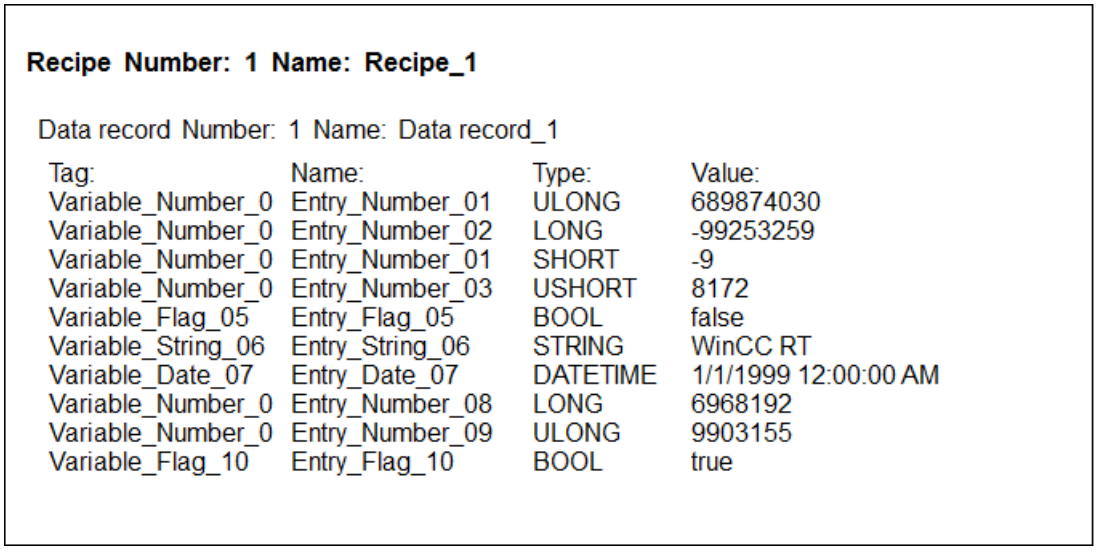
Principles for preparation of reports (Page 5618)

Audit report (Page 5639)

12.6.4.8 Recipe report (Panels, RT Advanced)

application

Use the "Recipe report" object to output the elements of recipe data records in the report.



Recipe Number: 1 Name: Recipe_1

Data record Number: 1 Name: Data record_1

Tag:	Name:	Type:	Value:
Variable_Number_0	Entry_Number_01	ULONG	689874030
Variable_Number_0	Entry_Number_02	LONG	-99253259
Variable_Number_0	Entry_Number_01	SHORT	-9
Variable_Number_0	Entry_Number_03	USHORT	8172
Variable_Flag_05	Entry_Flag_05	BOOL	false
Variable_String_06	Entry_String_06	STRING	WinCC RT
Variable_Date_07	Entry_Date_07	DATETIME	1/1/1999 12:00:00 AM
Variable_Number_0	Entry_Number_08	LONG	6968192
Variable_Number_0	Entry_Number_09	ULONG	9903155
Variable_Flag_10	Entry_Flag_10	BOOL	true

Layout

In the Inspector window, you customize the position, shape, style, color, and font types of the object. You can adapt the following properties in particular:

- Recipe
- Data record
- Format
- Visible entries

Selecting a recipe

Specify the recipes to be output in the recipe report under "Properties > Properties > General > Recipe". You can define the recipes based on their recipe name, or on a range of recipe numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all recipes.

Selecting a data record

Under "Properties > Properties > General > Data record", specify which data records of the selected recipes are to be output in the recipe report. You can define the data records based on the data record name, or on a range of data record numbers. Under "First recipe" and "Last recipe", enter a value or select a tag.

You can also choose to display all data records of the selected recipes.

Format

In the "Format" field of the "Properties > Properties > Layout > Settings" dialog, specify whether to output the data records as a table in column format or line report format.

WinCC updates the preview in the detail page accordingly.

Visible entries

Under ""Properties > Properties > Layout > Visible entries", enable the columns to be displayed in the recipe report. Select "Show headings" to enable the display of column headers.

See also

Create a report (Page 5620)

Principles for preparation of reports (Page 5618)

Audit report (Page 5639)

12.6.4.9 Page number (Panels, RT Advanced)

application

Use the "Page number" object to output the current page number in the report.

Layout

In the inspector window, change the settings for color, font, position and object size. In particular, specify "Size adaptation":

Fit to size

Under "Properties > Properties > Layout > Fit to size", the "Fit object to content" option is used to specify whether WinCC adjusts to the object size of the field content:

- Enabled "Fit object to contents" option:
  WinCC automatically adjusts the size of the object to the configured format. The font size and field length are defined under "Properties > Properties > General > Text".
  The object can be moved in the working area, however, the size cannot be changed. During report output, the entire field content is output at the time of report output.
- Disabled "Fit object to contents" option:
  Customize the field size by yourself. WinCC does not resize the field for report output. It can be possible that not all content of the field is output in the report. Therefore, configure a field of sufficient size.

Audit report (Page 5639)

12.6.4.10 Symbolic I/O field (Panels, RT Advanced)

application

With the "Symbolic I/O field" object, the content of a text list in reports is displayed, depending on the tag value. In the inspector window, the tag and text list is configured under "Properties > Properties > General":

Layout

In the inspector window, change the settings for color, frame, font, position and object size. In particular, the "Fit to size" is defined, by specifying whether the object size is adjusted to the text during output in the report or not.

Note

The "Symbolic I/O field" object is also available in "Screens" editor. In reports, the object only outputs data. Accordingly only configure the output of data for application in reports.

See also

Create a report (Page 5620)

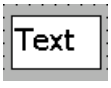
Principles for preparation of reports (Page 5618)

Audit report (Page 5639)

12.6.4.11 Text field (Panels, RT Advanced)

Application

The "Text field" is a closed object which you can fill with a color.



Layout

In the Inspector window, you customize the position, shape, style, color and font types of the object. You can adapt the following properties in particular:

- Text: Specifies the text for the text field.
- Size of text field: Defines whether the size of the object is adapted to the space required by the largest list entry.

Text

Specify the text for the text field in the Inspector window.

1. In the Inspector window, select "Properties > Properties > General".
2. Enter a text.
   For texts over several lines you can set a line break by pressing the key combination <Shift + Enter>.

Size of text field

In the Inspector window, you can define whether the size of the object is adapted to the space required by the largest list entry.

1. In the Inspector window, select "Properties > Properties > Layout".
2. Activate "Resize > Fit to contents".

Audit report (Page 5639)

12.7 Configuring user administration

12.7.1 Basics

12.7.1.1 Field of application of the user administration

Principle

The access protection controls access to data and functions in Runtime. This feature protects your applications against unauthorized operation. Safety-related operations are already limited to specific user groups when a project is being created. To this purpose you set up users and user groups that you equip with characteristic access rights, so-called authorizations. You then configure the authorizations required for operation of safety-related objects. Operators only have access, for example, to specific operator controls. Commissioners, for example, have unlimited access in Runtime.

Definition

You administer users, user groups and authorizations centrally in the user administration of WinCC. You transfer users and user groups together with the project to the HMI device. The users and passwords are managed on the HMI device in the User view.

Application example

You configure the "Service" authorization so that only service technicians have access to the configuration parameters. You assign the authorization to the "Service technician" user group. This allows all members of this group to set the protected configuration parameters.

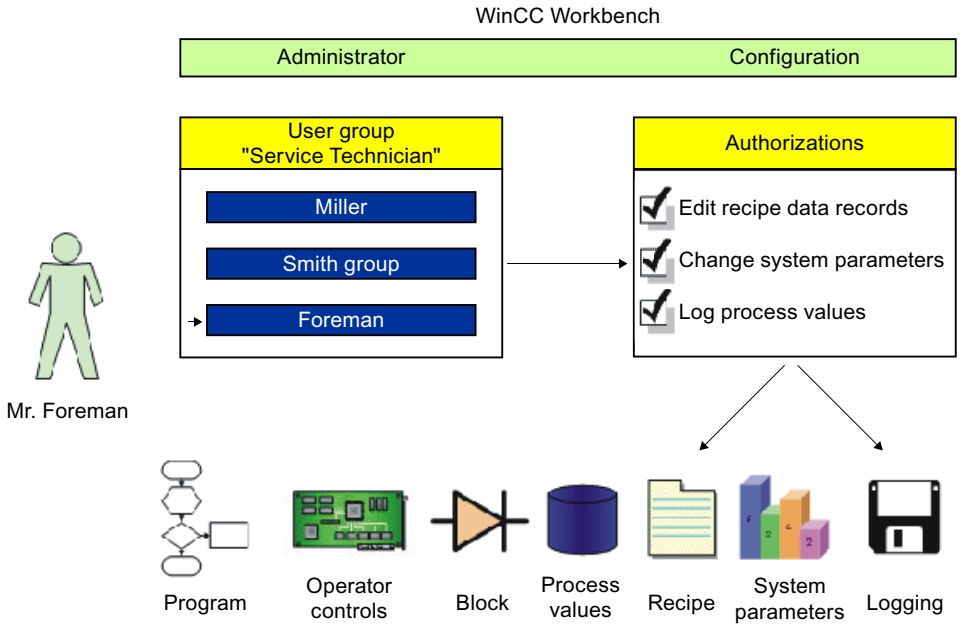
NOTICE
Access protection does not protect against incorrect operations. It is your job to ensure that only authorized personnel with appropriate training will design, commission, operate and maintain plants and machines. Access protection is not suitable for defining work routines and monitoring their observance.

12.7.1.2 Form of the user administration

Introduction

In case of a project in manufacturing engineering, the environment at the equipment manufacturer has to be differentiated from the environment at the end customer as plant operator.

The equipment manufacturer allows users, for example Mr. Foreman, a specific access within the application or HMI device. However, a user Foreman does not exist at the end customer. The machine manufacturer cannot know the end users and the tasks they have to perform for configuration. The final users are usually set after commissioning at the end customer.



Principle

To minimize the work required for management, authorizations are assigned via user groups and not directly to individual users.

A user group assembles configured authorizations according to common jobs. For example, all permissions required for a service job are collected in a "Service technician" group. When you create a user who should be responsible for servicing, you simply assign him to the "Service technician" group.

The user view enables user administration in Runtime. Use user view to create, delete and assign an authorization to users in Runtime.

The user administration separates the administration of the users from the configuration of the authorizations. This ensures flexibility at the access protection.

Defaults can be set for the user administration during the configuration phase in the Engineering System.

12.7.1.3 Users

Introduction

You can create users in the "Users" tab of the "User administration" editor and assign them to user groups. The "Users" tab is part of the user administration in WinCC.

Open

To open the "Users" tab, double-click "User administration" in the project window.

Work area

The users are managed in the work area:

- You create or delete users.
- You assign users to user groups.

Note

You can assign a user to exactly one user group.

Note

On an HMI device the number is limited to 100 users and one PLC user. This restriction does not apply to PCs. On a PC, the maximum number of users is restricted by the physical memory.

Inspector window

When you select a user, you can change the password in the "General" group. Under "Automatic logoff" you can specify if the user is to be automatically logged off by the HMI device when there is no operator activity after the specified time.

Backup and restore

The user data is encrypted and saved on the HMI device to protect it from loss due to power failure.

The users, passwords, group assignments and logoff times set up on the HMI device can be backed up and restored. This prevents you having to enter all of the data again on another HMI device.

Note

The currently valid user data is overwritten in the following cases:

- Depending on settings, the next time the project is downloaded
- Upon restore of a backed-up project
- Upon import of the user administration via an operator control. The newly downloaded or restored user data and passwords take effect immediately.

Note

The user data from earlier Runtime versions can be backed up and restored in the V14.

The user data of the V14 cannot be restored to earlier versions.

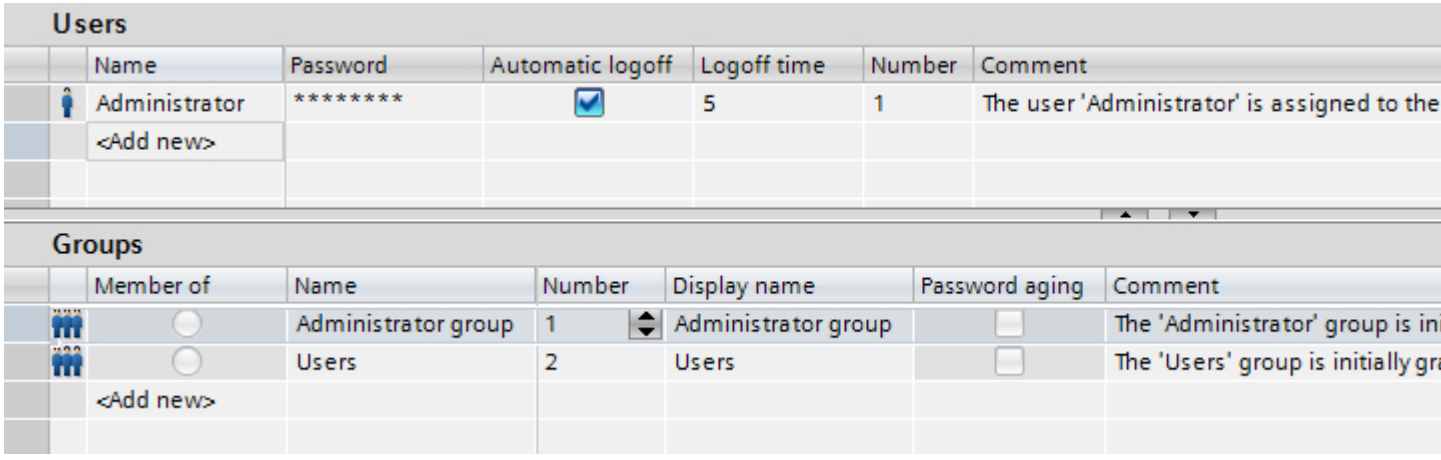
12.7.1.4 Users work area

Introduction

The "Users" work area lists the users and user groups in table form. You administrate the users and assign them to a user group.

Principle

The work area consists of the "Users" and "Groups" tables.



The "Users" table shows the existing users. When you select a user in this table, the "Groups" table shows the user group to which the user belongs.

Note

For the user "Administrator", the default password is "administrator". For security reasons, you should change the password of this user.

12.7.1.5 User groups

Introduction

You can create users and authorizations in the "User groups" tab of the "User Administration" editor. The "User groups" tab is part of the user administration in WinCC.

Open

Double-click the "User administration" in the project window. Open the "User groups" tab.

Work area

The user groups and authorizations are managed in the work area:

- You create new user groups and authorizations or delete them.
- You assign the authorizations to the user groups.

Inspector window

When a user group or an authorization is selected, you can edit the name in the "General" group. You can also enter a brief description in the "Comment" group.

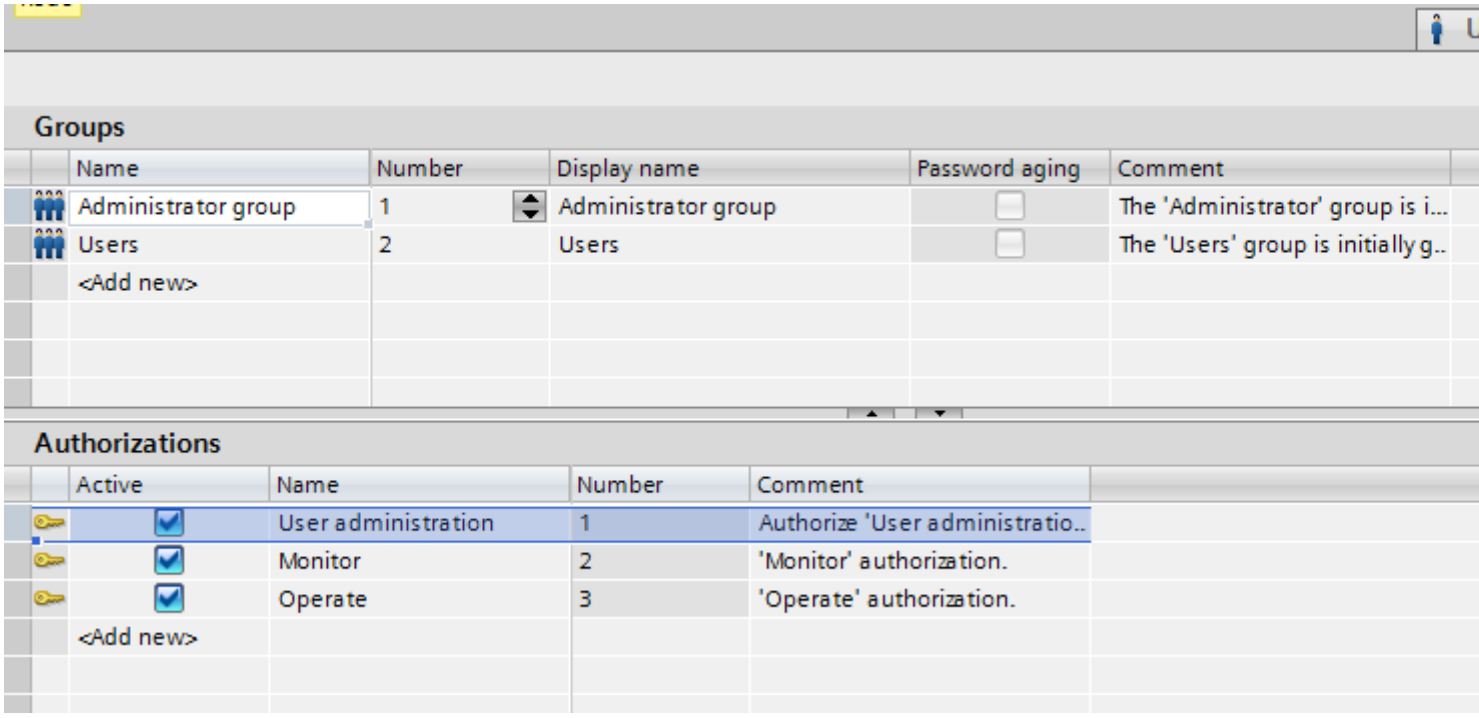
12.7.1.6 User groups work area

Introduction

The "User groups" work area shows a table of the groups and their authorizations. You administer the user groups and assign authorizations to them.

Principle

The work area consists of the "Groups" and "Authorizations" tables.



The "Groups" table shows the existing user groups. When you select a user group in this table, the "Active" column of the "Authorizations" table shows the authorizations which were assigned to the user group.

The number of the user group and of the authorization is assigned by the user administration. The designations and descriptions are assigned by you.

The number of predefined authorizations are fixed. Authorizations that you create can be freely edited. Ensure that the assigned numbers are unique.

12.7.1.7 Settings for the user administration (Basic Panels)

Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

Note

If the password from a previous project no longer corresponds to the policy, the user is prompted to enter a new password.

Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Enable limit for logon attempts" check box selected
    The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.
    "Enable limit for logon attempts" check box not selected
    The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field
    If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.
    You can specify 1 to 9 attempts.
  - "Logon only with password" check box
    When the check box is selected, the user will be authenticated by the password. The user name is not required.
    To match users to passwords, you cannot configure passwords more than once.

    Note

    If the "Logon only with password" option is enabled, the system sets the passwords for users that have already been created. It is therefore recommended to always enable the "Logon only with password" option before creating users.

    If you transfer user data from previous device versions in which the "Logon only with password" option was disabled, there may be multiple users with identical passwords. These users are listed in the user view. However, only users whose user name comes first by alphabetical order can log on in Runtime.

- "Hierarchy level" group
  - "Group-specific rights for user administration" check box
    When this check box is selected, administrators only manage users whose group number is less than or equal to their own.
    For example, an administrator whose group number is 5 can only manage users whose group number is less than or equal to 5. This means that the administrator can assign users only to groups with a group number less than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected
    The password expires after the number of days set in the "Validity of the password (days)" field.
    The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field
    The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field
    If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected
    The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected
    The user must enter a password containing at least one number at any position.
  - "Minimum password length" field
    The user must enter a password with a minimum length, as specified in the "Minimum password length" field.
    The minimum length of the password is 3 characters.

Note

If the "Must include special characters" option is enabled, the system sets the passwords for users that have already been created. It is therefore recommended to always enable the "Must include special characters" option before creating users.

The following special characters are permitted for passwords:

-+.,/*:\"?_()=^!€%~`§'{}[]<>#$;&|@

12.7.1.8 Settings for the user administration (Panels, RT Advanced)

Introduction

In the "Runtime settings > User administration" editor, configure the security settings for users and their passwords in runtime.

Open

Double-click the "Runtime settings" editor in the project window. Click "User administration".

Work area

You carry out the settings for the validity of passwords in runtime in the work area. You determine the complexity of the password, for example.

Note

If the password from a previous project no longer corresponds to the guideline, the user is prompted to enter a new password.

Effects in Runtime

The security settings have the following effects in runtime, depending on the configuration.

- "General" group
  - "Change initial password" check box selected
    The user must change the administrator-assigned password when logging on for the first time.
  - "Change logoff time" checkbox selected
    Simple user rights are sufficient for changing the logoff time.
    The logoff time is the period after which the user administration automatically logs off a user when no operator activity is detected in the system.
    The logoff time for the SIMATIC Logon user corresponds to the logoff time of the default user "Administrator".
    Any user changes of the logoff time are logged in the Audit Trail.
  - "Enable limit for logon attempts" check box selected
    The number entered in the "Number of incorrect logon attempts" box defines the number of logon attempts a user is allowed before being assigned to the "Unauthorized" group.
    "Enable limit for logon attempts" check box not selected
    The user has an unlimited number of logon attempts in runtime.
  - "Number of incorrect logon attempts" field
    If you enter "4" in the field, for example, and the fourth logon attempt fails, the user is automatically assigned to the "Unauthorized" group.
    You can specify 1 to 9 attempts.
  - "Logon only with password" check box
    When the check box is selected, the user will be authenticated by the password. The user name is not required.
    To match users to passwords, you cannot configure passwords more than once.

    Note

    If the "Logon only with password" option is enabled, the system resets the passwords for users that have already been created. We therefore recommend that you always enable the "Logon only with password" option before creating users.

    If you transfer user data from previous device versions in which the "Logon only with password" option was disabled, there may be multiple users with identical passwords. These users are listed in the user view. However, only users whose user name comes first by alphabetical order can log on in Runtime.

- "Hierarchy level" group
  - "Group-specific rights for user administration" check box
    When this check box is selected, administrators only manage users whose group number is less than or equal to their own.
    For example, an administrator whose group number is 5 can only manage users whose group number is lower than or equal to 5. This means that the administrator can assign users only to groups with a group number lower than or equal to 5.

- "Password" group
  - "Enable password aging" checkbox selected
    The password expires after the number of days set in the "Validity of the password (days)" field.
    The "Password aging" column is selected in the "User groups" editor. This enables you to specify group-by-group, if the passwords should expire or if the password generations should be saved. Passwords never expire for groups for which password aging is not enabled.
  - "Prewarning time (days)" field
    The user is informed that the password will expire the specified number of days before the password expires.
  - "Password generations" field
    If the user changes the password, the new password must be different from the specified number of previous passwords. The number of password generations ranges from 1 to 5.
- "Password complexity" group
  - "Must include special characters" check box selected
    The user must enter a password containing at least one special character at any position.
  - "Must include number" check box selected
    The user must enter a password containing at least one number at any position.
  - "Minimum password length" field
    The user must enter a password with a minimum length, as specified in the "Minimum password length" field.
    The minimum length of the password is 3 characters.

    Note

    If the "Must include special characters" option is enabled, the system resets the passwords for users that have already been created. We therefore recommend that you always enable the "Must include special characters" option before creating users.

    The following special characters are permitted for passwords:

    -+.,/*:\"?_()=^!€%~`§'{}[]<>#$;&|@
- "SIMATIC Logon" group
  - "Activate SIMATIC Logon" check box selected
    A connection is established to the server. Authorization is performed via SIMATIC Logon.
  - "Encrypted transfer" checkbox selected
    The data is encrypted before it is transferred to the server.

12.7.1.9 Target groups in the user administration

Principle

The target groups serve as examples for different groups of persons who use the user administration. We can distinguish between the following four groups in the user administration:

1. Administrator OEM
2. Administrator RT
3. Project engineer
4. Operator

As Administrator OEM, you create the user groups, users and authorizations for Runtime in the Engineering System of, for example, an equipment manufacturer.

As Administrator RT, you administer users in Runtime by means of the "User view."

As the project engineer, you assign the authorizations to the user groups in the Engineering System. You also configure authorizations for objects.

As Operator, you log on in Runtime. You can only access a protected object if you have the required authorization.

Note

The Administrator RT target group already exists in the Runtime user administration as the predefined user group "Administrator group." For ease of understanding, the predefined user groups and authorizations are not used below.

12.7.2 Building up and structuring a user administration

12.7.2.1 Administering users for Runtime

Creating an authorization

Introduction

You create an authorization and assign it to one or more user groups.

Requirements

The "User groups" work area is open.

Procedure

1. Double-click "Add" in the "Authorizations" table.
2. Enter "Stop runtime" as the name of the authorization.
3. Enter a brief description as the "Comment".

See also

Creating a user group (Page 5662)

Creating a user group (Basic Panels, Panels, RT Advanced)

Introduction

User groups are created so that you do not have to assign an authorization to every single user. You create a user group, assign authorizations and then assign users to it.

Note

The name of the user group has to be unique within the project. Otherwise the input is not accepted.

Note

Using SIMATIC Logon

Ensure that the names of the user groups in Windows and WinCC are identical.

Requirements

The "User groups" work area is open.

Procedure

1. Double-click "Add" in the "Groups" table.
2. Enter "Operators" as the "Name" of the user group.
3. Change the "Number" of the user group as required.
4. Enter "Display name" of the "Operators" user group.
5. Enter a brief description as the "Comment".

In runtime, the user view shows the display name of the user group. The display name of the user group depends on the language. You can specify the name in several languages and switch between languages in runtime.

See also

Creating an authorization (Page 5661)

Example: Configuring a button with logon dialog box (Page 5686)

Example: Logging the logon and logoff events (Page 5687)

Assigning an authorization

Introduction

When you allocate an authorization to a user group, all assigned users have this authorization.

Requirements

- A "Stop runtime" authorization has been created.
- An "Operators" user group has been created.
- The "User groups" work area is open.

Procedure

1. Click on the "Operators" user group in the "Groups" table. The "Authorizations" table shows all authorizations.
2. Enable the "Stop runtime" authorization in the "Authorizations" table.

Note

The "Stop runtime" authorization is only a designation and does not have any relation to the function "StopRuntime". You have to establish this relation yourself. To do so, configure the "StopRuntime" system functions at a button and select "Stop runtime" as the "Authorization".

Creating users

Introduction

You create a user so that users can log on with their user names in runtime after loading to the device.

As an alternative, you can create and change users by means of the "User view" in Runtime.

Note

Applies only to Runtime Professional:

New users who want to access through a Web client or a WebUX client on the system, can only be created in the engineering system.

When you create a user in Runtime with the user view, it is not possible to assign a Web startup screen to this user. This user is therefore not authorized to access the Web.

Neither can existing users be granted web access rights in Runtime.

In order for a created user to have authorizations you have to assign him to a user group and allocate authorizations to the user group.

The logon is successful when the user name entered during the logon matches a user in Runtime. In addition, the entered password must agree with the stored password of the user.

Note

Note that the entry is case-sensitive.

Requirements

The "Users" work area is open.

Procedure

1. Double-click "Add" in the "Users" table.
2. Enter "Foreman" as the user name.

   Note

   The user name must be unique within the project. Otherwise the input is not accepted.

   Note

   Do not use special characters such as / " § $ % ? ' & when you enter a user name and a password.

3. Click the button in the "Password" column. A dialog box for entering the password is displayed.
4. Enter the password of the user.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box using the icon.
7. If a user is to be logged off after a specific time period, activate "Automatic logoff".

8. Click in the "Logoff time" column. The preset value for "Logoff time" is 5 minutes.
9. Enter a brief description as the "Comment".

Assigning a user to a user group

Introduction

When you assign a user to a user group, the user has the authorizations of the user group.

Note

You have to assign a user to exactly one user group. The assignment is checked during the consistency check and generation of the project.

Requirements

- The user "Foreman" has been created.
- An "Operators" user group has been created.
- The "Users" work area is open.

Procedure

1. Click on the "Foreman" user in the "Users" table. The "Groups" table shows all user groups.
2. Activate the "Operators" user group in the "Groups" table.

Managing users

Introduction

In the work area, you can administer users and assign them to user groups.

Requirements

The "Users" work area is open.

Changing the user name

1. In the "Users" table, double-click the field in the "Name" column to change the user name.
2. Change the user name.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the user name under "Properties > Properties > General" in the Inspector window.

Changing the password of the user

1. Click the button in the "Password" column of the "Users" table. A dialog for entering the password opens.
2. In the "Enter password" field, enter the new password.
3. Reenter the new password in the "Confirm password" field.
4. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the password under "Properties > Properties > General" in the Inspector window.

Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Logoff time" column, for example.

Changing the logoff time of the user

1. In the "Users" area, double-click on the field in the "Logoff time" column to change the logoff time.
2. Change the logoff time.
3. Confirm your entry with <Return>.

Alternatively, select the user in the work area. Change the logoff time under "Properties > Properties > Automatic logoff" in the Inspector window.

Deleting a user

1. Select the line of the user to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined users cannot be deleted.

Managing user groups

Introduction

In the workplace you administer user groups and assign authorizations for use in runtime.

Requirements

The "User groups" work area is open.

Changing the name of the user group

1. In the "Groups" table, double-click the field in the "Name" column to change the name of the user group.
2. Change the name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

Note

Predefined user groups cannot be deleted.

Displaying invisible columns

1. Position the mouse cursor on the title of the "Users" table.
2. Right-click to open the shortcut menu and enable the display of the "Display name" column, for example.

Changing the displayed name of the user group

1. In the "Groups" table, double-click the field in the "Display name" column to change the display name of the user group.
2. Change the displayed name of the user group.
3. Confirm your entry with <Return>.

Alternatively, select the user group in the work area. Change the display name under "Properties > Properties > General" in the Inspector window.

Deleting a user group

1. Mark the line of the user group to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined user groups cannot be deleted.

Changing the name of the authorization

1. In the "Authorizations" table, double-click the field in the "Name" column to change the name of the authorization.
2. Change the name of the authorization.
3. Confirm your entry with <Return>.

Alternatively, select the authorization in the work area. Change the name under "Properties > Properties > General" in the Inspector window.

Deleting authorizations

1. Mark the line of the authorization to be deleted.
2. Open the shortcut menu with the right mouse button and select the "Delete" command.

Note

Predefined authorizations cannot be deleted.

12.7.2.2 Managing users on the server

Central user administration using SIMATIC Logon (Panels, RT Advanced, RT Professional)

Introduction

To manage users and user groups for several applications or HMI devices, activate SIMATIC Logon.

Principle

SIMATIC Logon is a tool for system-wide user administration. If you use SIMATIC Logon, the users are centrally managed outside the application or HMI device.

You configure the user groups and their permissions as you usually do with the local user administration in WinCC. You assign identical names to the user groups on the server and in WinCC. Authorizations are assigned in runtime to a user group when the names are identical.

You do not have to create users in WinCC because they are taken dynamically from Windows user management during the logon process. The application or HMI device forwards each logon or password change to SIMATIC Logon for processing.

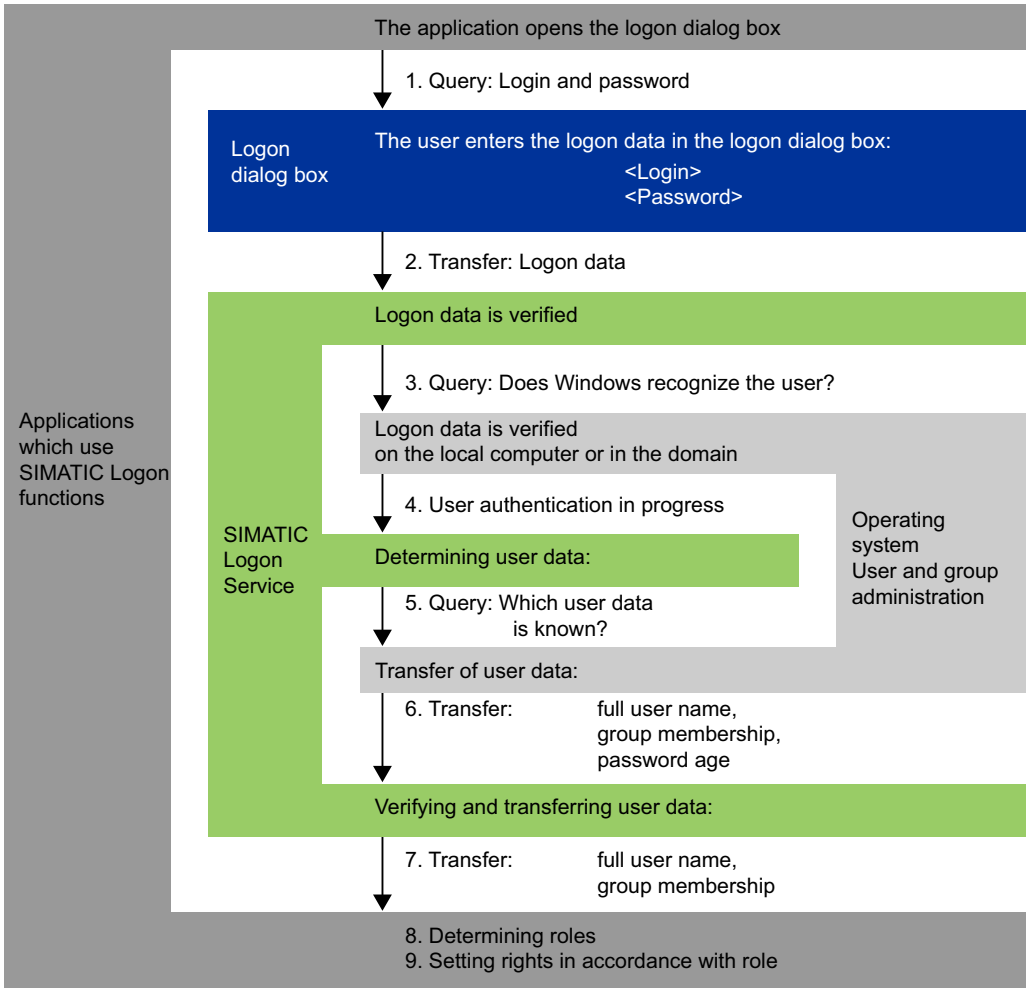
Note

SIMATIC Logon is a product requiring a license. For more information on SIMATIC Logon go to <http://support.automation.siemens.com>.

Enter the ID "34519648" in the search field and start searching. The "SIMATIC Logon - Electronic Signature" manual is available to download.

Log on process via SIMATIC Logon Service

The following diagram illustrates the process that runs automatically when a user logs onto Runtime.



Results: The user can implement the role functions.

See also

Authentication and certificate management in SIMATIC Logon (Page 5670)

Authentication and certificate management in SIMATIC Logon

Introduction

SIMATIC Logon (V1.5 SP3 and later) supports secure encrypted communication connections to the following device families as of device version V13 SP1 and higher:

- Comfort Panels
- KTP Mobile Panels
- Runtime Advanced

Note

HMI devices with a device version V13 or earlier can only make a non-secure / non-encrypted connection to a SIMATIC Logon server.

Basics

The first time a connection is made the SIMATIC Logon certificate is compared with the local certificate of the HMI device. The compared certificate is stored under "SimaticLogon\rejected". If you trust the certificate of the SIMATIC Logon server, copy the stored certificate into the local certificate store.

The certificate store is located in the following path:

- On the PC usually under "C:\Program Files\Siemens\CoRtHmiRtm\SimaticLogon\certs"
- On HMI panels under "\flash\simatic\SimaticLogon\certs"

When the comparison has been successfully performed can a secure encrypted connection be successfully established.

You can find additional information about tested browsers on the Internet on the Customer Support pages, entry ID=109480490:

- https://support.industry.siemens.com/cs/document/109480490/ (https://support.industry.siemens.com/cs/document/109480490/)

See also

Central user administration using SIMATIC Logon (Page 5668)

Making settings on the server (Panels, RT Advanced, RT Professional)

Introduction

Perform the following steps on your sever to ensure correct operation of SIMATIC Logon.

Procedure

1. Install SIMATIC Logon Services.
2. Create the user group in the user administration of the operating system.
3. Create the users in the user administration of the operating system.

   Note

   Users of SIMATIC Logon must be members of a user group of the operating system. Members of a subgroup cannot be logged on.

4. Assign the new users to a group.
5. Transfer the licenses for each HMI device on the server.

Note

You can find more detailed information in the documentation supplied with SIMATIC Logon.

Note

The password policies stored on the server are valid if users are authorized by means of SIMATIC Logon.

Note

You can configure the logoff time for the SIMATIC Logon user with "Configure SIMATIC Logon" on the server.

You set the automatic logoff time identical for all users, regardless of the panels.

Logging on using SIMATIC Logon (Panels, RT Advanced)

Requirements

- User administration exists.
- The groups created in WinCC agree with the Windows groups on the server.
- There is a server with SIMATIC Logon Service installed.

Note

A user may only be a member of one user group in WinCC. When a user is a member of several user groups on the server, only one of these user groups can be made known in WinCC.

"Administrators" and "Users" are predefined groups in both Windows and WinCC. Any new user created in Windows is automatically a member of the "Users" group. A user will be a member of two groups if assigned to a new group, for example, to the "SL user" group.

Remove this user from the "Users" group of the operating system to enable logon of this user using SIMATIC Logon.

A system message in runtime always confirms the successful logon of a user on the server.

Note

When you use SIMATIC Logon to manage access to a panel or a device with WinCC Runtime Advanced, you must note that the characters '/' and '\' cannot be used in the names of Windows user groups or Windows users.

Procedure

1. Open the "Runtime settings > User administration" editor in the Project window.
2. Select "Enable SIMATIC Logon".
3. Select "Windows domain" or "Windows computer", depending on where you administer your users.
4. Enter the name or IP address of the SIMATIC Logon server in the "Server name" text box.

   Note

   Make sure your SIMATIC Logon Server always has the same IP address if you use IP addresses.

5. Enter the port number for TCP/IP communication in the "Port number" text box. The valid range of values lies between 1024 and 49151. The preset port number is "16389" and used by SIMATIC Logon as the default.
6. Enter the Windows domain or the logon server with the user data in the "Windows domain" text box.
   Enter the name of the sever to access users on the logon server.
   Enter the name of the domain if the logon sever is in a domain and you wish to access users of the domain.

   Note

   Local Windows users are not accepted when the logon server is in a domain.

7. Activate the "Encrypted transfer" check box in order to encrypt the data before sending it to the server.

Emergency user

If the server cannot be accessed, all local users that were created in WinCC user administration can also be used as emergency users.

Emergency users have the rights of the user group to which they were assigned.

Note

For additional information, refer to the included SIMATIC Logon documentation.

Can be located under: [Installation directory SIMATIC Logon] \manuals

12.7.2.3 Administering users in Runtime

Users in runtime

Principle

You create users and user groups and assign authorizations to them. You configure objects with authorizations. After download to the HMI device, all objects which were configured with an authorization are protected against unauthorized access in Runtime.

User view

When you configure a user view in the Engineering System, you administer users in this user view following download to the HMI device.

NOTICE
Changes in the user view are effective immediately in Runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

Users who have a "User administration" authorization have unlimited access to the user view. This allows them to administer all users. Any other user has only limited access to the user view for self administration.

See also

User view (Page 5674)

User view (Panels, RT Advanced, RT Professional)

Purpose

You configure a user view in the engineering system to also administer the users in Runtime.

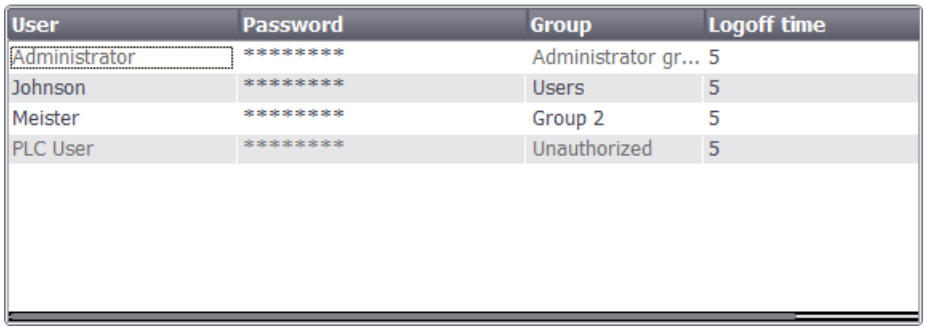
Structure

The user view shows the following in each line:

- The user
- The encrypted password
- The corresponding user group
- The logoff time

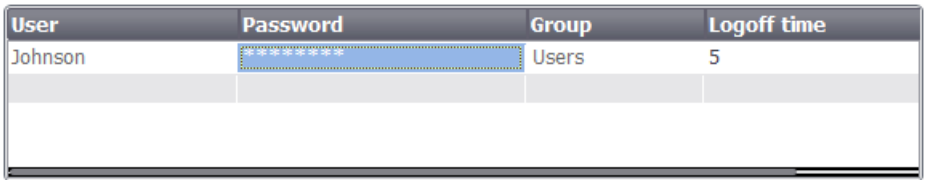
If no user is logged on, the user view is empty. The content of the individual fields is displayed after logon.

User view of an administrator



When an administrator is logged on, the user view shows all the users. The administrator changes the user name and the password. The administrator creates new users and assigns them to an existing user group.

User view of a user



When no administrator is logged on, the user view shows only the logged-on user. Users can change their own passwords and logoff time.

See also

Users in runtime (Page 5673)

Configuring a user view

Introduction

You configure a user view in the Engineering System to also administer users in Runtime.

Requirements

A screen has been created.

Procedure

1. Select the "User view" object from the "Controls" category in the toolbox.
2. Drag-and-drop the "User view" object into the screen.
3. Click on "Properties > Properties" in the Inspector window.
4. Specify the appearance of the "User view".
5. You can, for example, select " "Display mode > Fit to size > Fit object to contents".

Result

You have created a user view in the screen.

Creating users

Introduction

You create a user so that users can log on under their user name in runtime.

As an alternative, you can create users in the engineering system and download them to the HMI device.

Note

Applies only to Runtime Professional:

New users who want to access through a Web client or a WebUX client on the system, can only be created in the engineering system.

When you create a user in Runtime with the user view, it is not possible to assign a Web startup screen to this user. This user is therefore not authorized to access the Web.

Neither can existing users be granted web access rights in Runtime.

The logon is successful only when the user name entered during the logon matches a user in runtime. In addition, the password entered at logon has to match that of the user.

Note

Note that the entry is case-sensitive.

Note

Do not use special characters such as / " § $ % ? ' & when you enter a user name and a password.

You assign the user to a user group. The user then has the authorizations of the user group.

Note

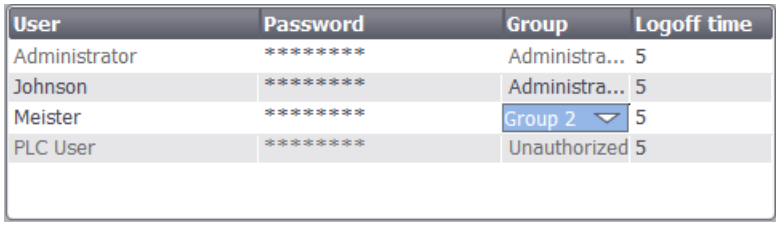
Runtime users must be assigned to a user group. The user group is created in the engineering system. The designation of the user group is language-dependent.

Requirements

- The user view is open.
- A "Group 2" user group has been created.

Procedure

1. Click "<New User>" in the user view. A dialog opens.
2. Enter "Foreman" as the user name.
3. Press the <Return> button.
4. Click "Password."
5. Enter the password of the user.
6. Press the <Return> button. The password is hidden.
7. Click in the "Group" column.
8. Select "Group 2" as the "Group".



9. Press the <Return> button.

10. Click in the "Logoff time" column.
11. Enter the time after which the user is logged off automatically.

Managing users in the user view (Panels, RT Advanced, RT Professional)

Introduction

If you have configured a user view in the engineering system, the users and user groups can be managed in runtime.

NOTICE
Changes in the user view are effective immediately in runtime. Changes in runtime are not updated in the engineering system. When downloading the user administration to the HMI device, all changes in the user view are overwritten after a security prompt and based on the settings.

Requirements

- Runtime is enabled.
- A complex user view has been created.
- The screen with the user view is open.
- You have the default "User administration" authorization.

Note

If you do not have a "User administration" authorization, you can only change your own password and your logoff time.

Changing the user name

1. Enter a new user name in the "Users" column in the user display.
2. Confirm your entry with <Return>.

Note

The user can then no longer log on with his previous password in runtime. If you delete the name and press <Return>, the user is deleted.

Changing the password of the user

Availability of complex user display in selected devices only.

1. Enter a new password in the "Password" column in the user display.
2. Confirm your entry with <Return>.

Note

The user can then no longer log on with his previous password in runtime.

If you delete the password in the complex user view and press <Return>, the user will be deleted.

Changing the logoff time of the user

1. Enter a new logoff time in the "Logoff time" column in the user display.
2. Confirm your entry with <Return>.

Deleting a user

1. Click the name of the user to be deleted.
2. Delete the name.
3. Press the <Return> button.

Note

The user can no longer log on in runtime.

Assigning a user to a different user group

1. Activate the user group field for the corresponding user.
2. Select a user group.
3. Confirm your selection with <Return>.

Unlock locked out users (Basic Panels, Panels, RT Advanced)

Unlock locked out users

The check box "Activate limit for login attempts" is activated in the "Runtime settings > User administration".
The number 3 is entered in the field "Number of invalid login attempts".

If users have three failed attempts at login, e.g. by entering an incorrect password, they are assigned to the "Unauthorized" group. The user loses all authorizations. The user can still log on, but no longer has any authorizations. Only a user with administrator rights re-assigns the unauthorized user to a user group.

Exporting the user administration (Panels, RT Advanced, RT Professional)

Introduction

The users and user groups are transferred to the HMI device from the Engineering System. If you have configured a user view, you can administer the users at the HMI device via the user view.

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You program a function which exports the user data at a button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

NOTICE
When exporting, the user data are encrypted and written from the HMI device to the target file. The target file is overwritten

Requirements

- An HMI device has been created.
- A screen has been created.
- A button has been created in the screen.
- The Inspector window is open.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.
3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Export" as the "Direction". When exporting, the target file is overwritten with the user data.
6. Enter the full path of the destination file as the "File name", for example "a:\test \usersview.txt".

   Note

   Ensure that the file name is written correctly. If the directory, for example "\test\", does not exist, it will be created without a prompt.

Importing the user administration (Panels, RT Advanced, RT Professional)

Introduction

If a user has access to several HMI devices, the same user and the same password must be configured on each HMI device. Create a standard for user administration of the different HMI devices. Export the users and passwords on an HMI device to a storage medium, such as a floppy, memory card or a network drive. You import the users and passwords from this storage medium at all the other HMI devices.

You configure a function which imports the user data at a command button.

The system function "ExportImportUserAdministration" is not available on all HMI devices.

NOTICE
When importing, the user data are read in from the source file and written into the HMI device. The users and passwords currently valid in the HMI device are overwritten. The imported users and passwords are valid immediately.

Requirements

- A screen has been created.
- A command button has been created in the screen.
- The Inspector window is open.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Click" in the Inspector window.
3. Click the entry "Add function" in the function list.
4. Select the "ExportImportUserAdministration" system function.
5. Select "Import" as the "Direction." When importing, the user data in the HMI device are overwritten.
6. Enter the full path of the source file as the "File name", for example "a:\test\usersview.txt".

   Note

   Ensure that the file name is written correctly. If the folder, for example "\test\", or the file does not exist, an error message will be displayed.

Logging on as a user (Basic Panels, Panels, RT Advanced)

Introduction

As a rule you log-on as a user by means of a special button. The logon dialog box is displayed to this purpose.

The logon dialog box is displayed by default during access to a protected object if

- No user is logged on in Runtime.
- The logged-on user does not have the required authorization.

Note

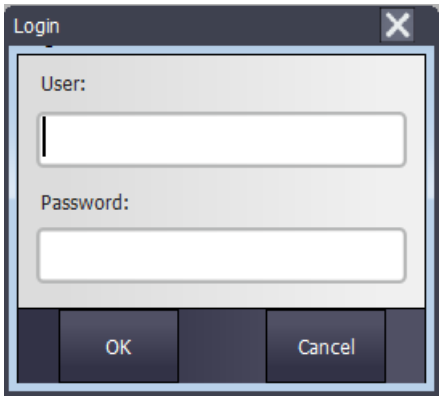
The system always opens the logon dialog on the OP 73, OP 77A, TP 177A and Basic Panels HMI devices when you press an access-protected button.

Requirements

- Under "Runtime settings > User administration" the
  - "Enable limit for logon attempts" check box has been selected.
  - The number 3 is entered in the field "Number of incorrect login attempts".
- The "ShowLogonDialog" system function is configured on a button called "Logon".

Procedure

1. Click the "Logon" button. The logon dialog box is displayed.



2. Enter your user name as it was specified in the user administration, for example "Foreman". If someone has logged on before you, the name of the user will be displayed.
3. Enter the corresponding password. The input is concealed.

Note

When entering the password, note that it is case sensitive.

4. Click "OK" to close the dialog box.

Note

When you change the HMI device, you do not need to re-enter the password if the permitted special characters are included in the password on all HMI devices.

The following special characters are permitted for passwords:

()€&@$%+#^[]|*-"<>!,.;:/_=\'? `~{}$

If you switch to V14 from an older device version and prohibited special characters were used for the password, the password is deleted. You are informed about this with an error message and have to save a new password.

Logon was successful

If you have entered the user name "Foreman" and the entered password corresponds with the stored password, you are logged on as the user "Foreman" in Runtime. You have the authorizations of the user "Foreman".

When the user "Foreman" accesses a protected object such as the "Logging" button, access to this protected object will only be authorized if the user "Foreman" has the required authorization. The programmed function is executed immediately.

If you do not have the required authorization after the successful log-on, a corresponding error message is displayed. However, you remain logged on in Runtime.

Logon was unsuccessful

An error message is displayed.

In order to maintain security, you or the user logged-on before you no longer has any authorizations. However, access to unprotected objects remains possible. The user view does not, however, show any entries. The user view and the authorizations change after the next successful log-on.

If the third login attempt has failed, the user will be assigned to the "Unauthorized" group. For this reason, do not configure a user group with this display name.

If the "Log off" function is called up or the logoff time of the user has expired, the user is logged off.

12.7.2.4 Configuring access protection

Access protection

Introduction

You configure an authorization at an object in order to protect it against access. All logged-on users who have this authorization can then access the object. If a user does not have authorization to operate an object, the logon dialog is displayed automatically.

Note

Several system functions are available under "User administration" so that user, password, and user group can be edited, for example, in the PLC.

Configuring operating authorizations

Introduction

You configure the "Stop runtime" authorization on a button. Then only those users who have the appropriate authorization have access to this button, for example all the users of the "Operators" user group.

This ensures that access to the command button is protected. If a logged-on user who belongs to the "Operators" user group and has the required authorizations clicks the button, runtime is stopped.

An example describes in detail how to configure a command button with access protection.

Requirements

- The "Operators" user group has been created.
- The "Stop runtime" authorization has been created.
- A screen has been created and opened.
- The screen contains a button.

Procedure

1. Click the button in the screen.
2. Click "Properties > Properties > Security" in the Inspector window.
3. Select "Stop runtime" as the "Authorization".

4. In the Inspector window, select "Properties > Events > Click".
5. Select a system function from the function list, for example, "StopRuntime".

Note

The "Enable" and "Disable" events are only used to detect whether an object was selected or deselected. The events do not, however, trigger a password prompt.

Do not use the "Enable"or "Disable" event if you want to configure access protection at the function call of the object.

12.7.3 Reference

12.7.3.1 Objects with access protection (Basic Panels)

Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- Graphic I/O field
- Recipe view
- Switch
- Button
- Symbolic I/O field
- System diagnostic view

12.7.3.2 Objects with access protection (Panels, RT Advanced)

Introduction

The following objects can be configured with an authorization:

- Date/time field
- I/O field
- f(x) trend view
- Graphic I/O field
- GRAPH overview
- HTML browser

- Alarm view
- Alarm window
- PLC code view
- ProDiag overview
- Recipe view
- Switch
- Button
- Slider
- Symbol library
- Symbolic I/O field
- System diagnostic view
- System diagnostic window
- Effective range name
- Effective range name (RFID)

12.7.3.3 Default user groups and authorizations (Basic Panels, Panels, RT Advanced)

Principle

The predefined user groups and authorizations have the following numbers:

User group	Number
"Administrator group"	1
"Users"	2

Authorization	Number
"User administration"	1
"Monitor"	2
"Operate"	3

12.7.4 Examples

12.7.4.1 Example: Configuring a button with logon dialog box

Task

In the following example, you configure the function "ShowLogonDialog" for a button. A different user can then log on in runtime when the shift changes, for example. In the process the user previously logged on is logged off.

Note

In runtime the logon dialog box is not displayed by default until you access a protected object. Either no user is logged on or the logged-on user does not have the required authorization.

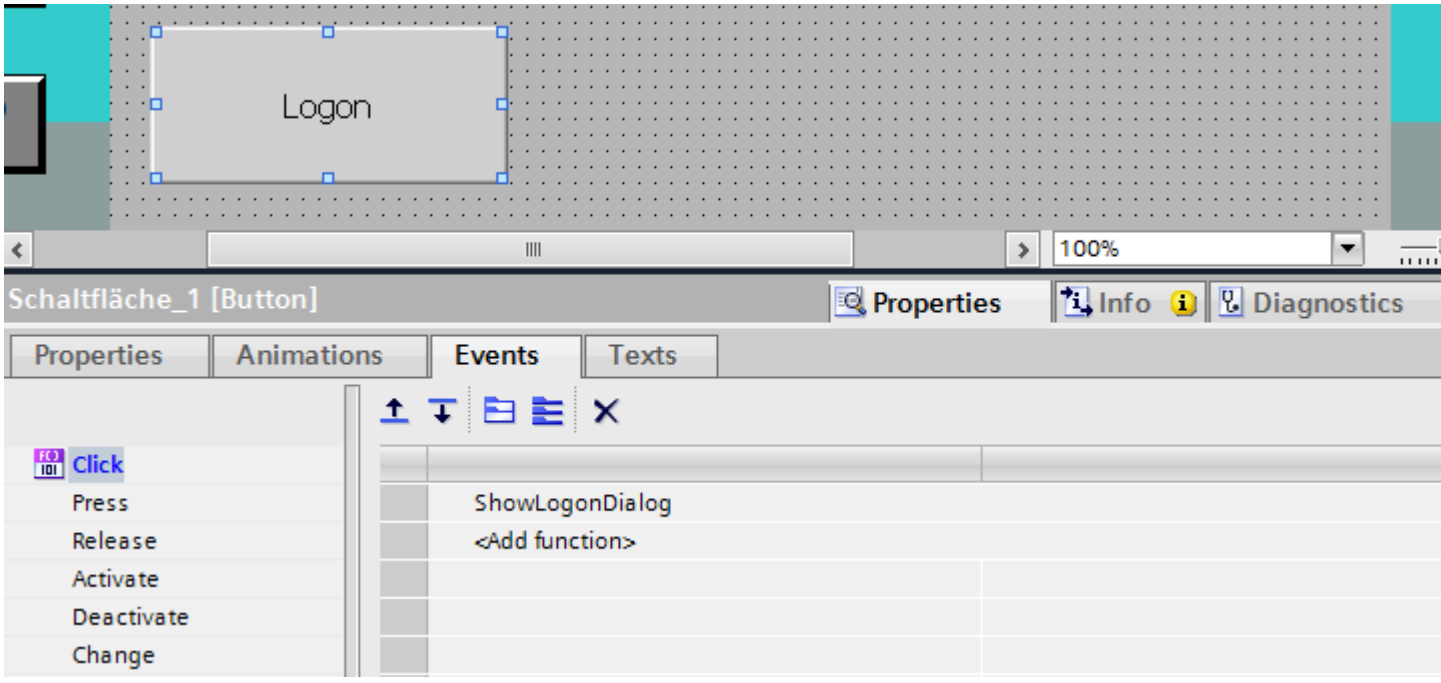
Requirements

- A screen has been created.
- A button has been created in the screen.

Procedure

1. Click the button in the screen.
2. Click "Properties > Events > Release" in the Inspector window.

3. Click the entry "Add function" in the "Function list" table.
4. Select the system function "ShowLogonDialog" from the "User administration" group.



Result

If the user clicks on the button in runtime, the function "ShowLogonDialog" is called up. When the function "ShowLogonDialog" is called up, the logon dialog box is displayed. The user logs on with his user name and password.

12.7.4.2 Example: Logging the logon and logoff events (Basic Panels, Panels, RT Advanced)

Task

In the following example, you configure the function "TraceUserChange" to the event "User change".

Principle

The "TraceUserChange" function is called when a user logs on or off. When a function is called up, a system message with information about the corresponding user is output.

This system message can be archived. When archiving, the system message is provided with a date stamp and time stamp. This ensures that you can track which user was logged on at the HMI device at which time and for how long.

Requirements

- You have created an HMI device with Runtime Advanced.
- The Inspector window is open.

Procedure

1. Double-click the "Scheduler" in the Project view.
2. Double-click "Add" in the table of the tasks.
3. Enter "Logon-Protocol" as the "Name".
4. Select "User change" as the "Trigger".
5. Open "Properties > Events" in the Inspector window.
6. Click the entry "Add function" in the "Function list" table.
7. Select the "TraceUserChange" system function.

Result

A system message is output when a user logs on or logs off.

12.7.4.3 Example: Structure of user administration

Task

In the following example you set up a user administration for different users and user groups. The example orientates itself to a typical requirement profile from manufacturing engineering.

Principle

Completely different groups of persons are involved in a plant or project. Each group of persons protects its respective data and functions against access by others. For this purpose, users are created and assigned to a user group.

You can reproduce different views through user groups.

Example:

- Organizational view: Commissioners, Operators, Shift I, Shift II
- Technological view: Axis control, Tool changers, Plant North, Plant South

The following example orientates itself to the organizational view.

Every user group has characteristic requirements regarding access protection: A user group has operating authorizations for specific application cases. A programmer changes, for example, recipe data records.

In the example the users Miller, Group Smith and Foreman are created and assigned to different user groups.

Ms. Miller works as a programmer in the engineering system. The Group Smith are commissioners. Mr. Foreman is an operator.

Requirements

- A new project has been created.
- The "User administration" editor is open.

Procedures overview

Working with user administration has the following procedure in the example:

1. Creating authorizations The planner specifies which authorizations are required for access protection.
2. Configuring authorizations: The planner specifies which objects may be operated and which functions may be executed.
3. Creating user groups and allocating authorizations: The administrator creates the user groups together with the planner. The planner uses the authorizations to specify who may operate objects and change parameters.
4. Creating users and assigning them to a user group: The administrator administers the users.

Result

The aim is the following structure of the user administration of users, user groups and authorizations:

Users			User groups	Authorizations			
Miller	Smith	Foreman	Roles	Changing recipe records	Changing system parameters	Changing process parameters	Managing
			Administrator group				x
X			Programmer	X			
	X		Commissioning engineers	X	X	X	
		X	Operators	x			

The user "Foreman" who belongs to the "Operators" user group has access to the configured "To Recipe view" button.

Note

Alternatively, you can create several users as operators with different operating authorizations, for example, Operator Level 1, Operator Level 2.

12.7.4.4 Example: Creating and configuring authorizations

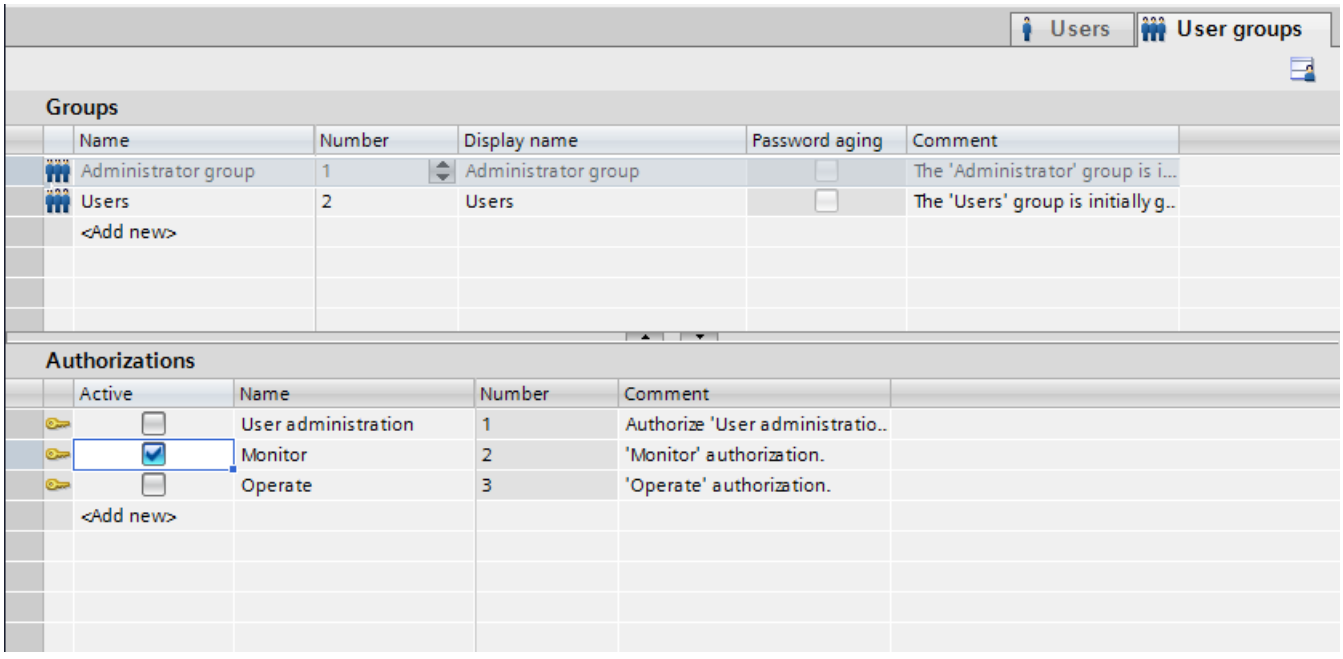
Task

The following example shows you how to create the authorizations

Procedure

1. Open the "User groups" work area.
2. Double-click "Add" in the "Authorizations" table.
3. Enter "Change recipe data records" as the "Name" of the authorization.
4. Repeat steps 2 and 3 to create additional authorizations: "Change system parameters", "Change process parameters".

Result



12.7.4.5 Example: Configuring a button with access protection

Task

In the following example you use a system function to create a button for a screen change. You protect the "To Recipe view" button against unauthorized operation. To do so, you configure the "Change recipe data records" authorization at the "To Recipe view" button.

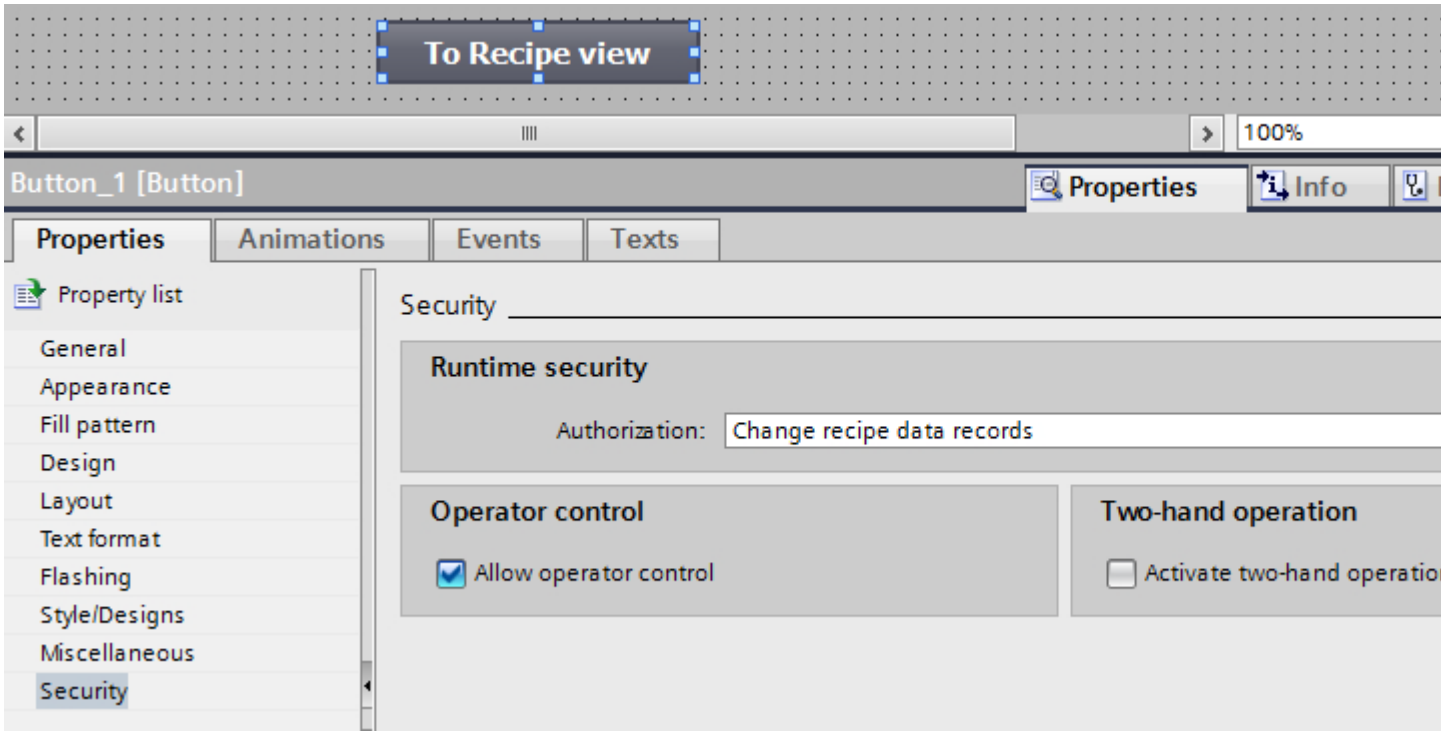
Requirements

- A "Change recipe data records" authorization has been created.
- A "Recipes" screen has been created.
- A "Start" screen has been created and opened.
- A button has been created and marked in the "Start" screen.

Procedure

1. Click "Properties > Properties > General" in the Inspector window.
2. Enter "To Recipe view" as the text.
3. Click "Properties > Events > Click" in the Inspector window.
4. Click the "Add function" entry in the first line of the "Function list" table.
5. Select the "ActivateScreen" system function in the "Screens" group.
6. Click the ... button in the "Screen name" field. A dialog box for selecting the screen opens.
7. Select the "Recipes" screen and use the button to close the dialog box.
8. Click "Properties > Properties > Security" in the Inspector window.
9. Select "Change recipe data records" as the "Authorization."

Result



Access to the "To Recipe view" button is protected. If, for example, the user "Smith" clicks the button in Runtime, the function "Recipe view" screen is called up. Prerequisite is that the user "Smith" has logged on correctly and has the required authorization. The "Recipes" screen contains a recipe view and other screen objects.

If the logged-on user does not have the required authorization or if no user is logged on, the "Logon dialog box" is displayed.

12.7.4.6 Example: Creating user groups and assigning authorizations:

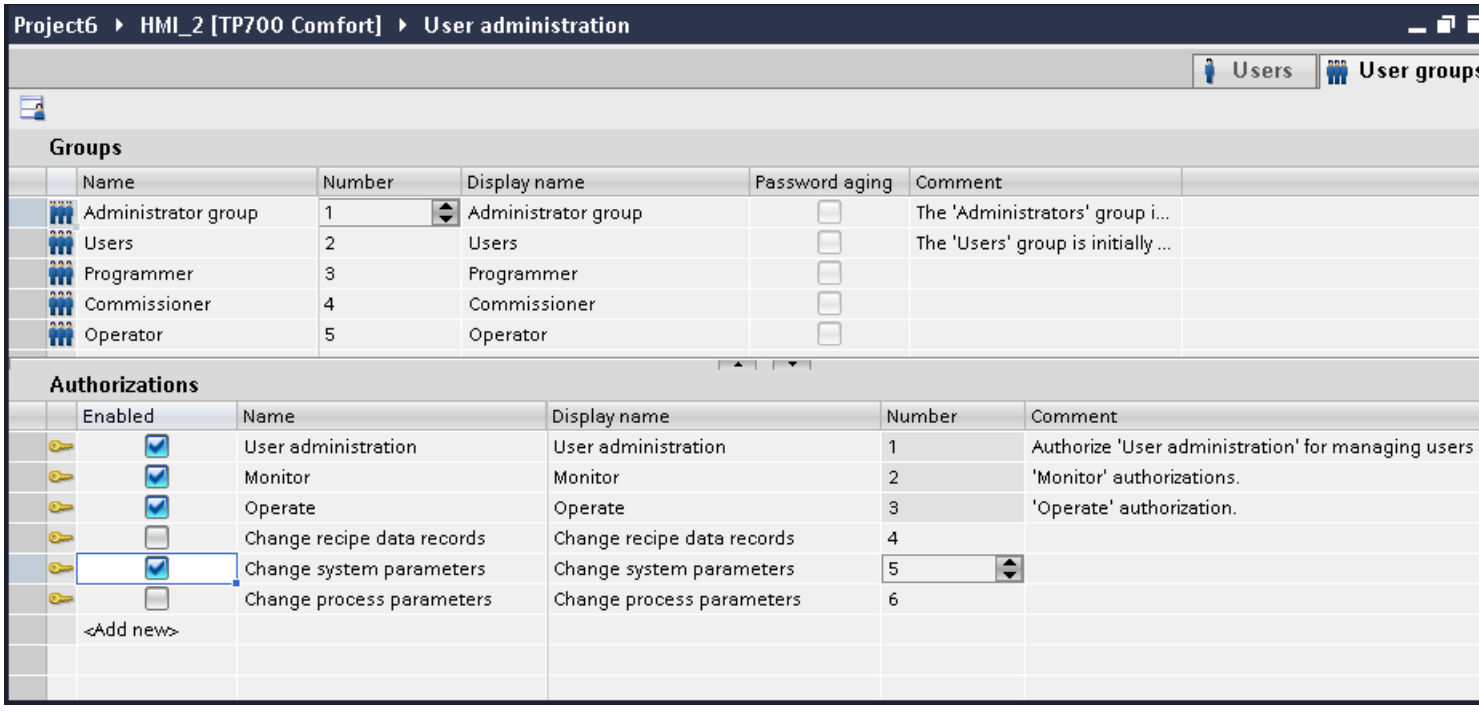
Task

In the following example you create the user groups and assign authorizations to them.

Procedure

1. Open the "User groups" work area.
2. Double-click "Add" in the "Groups" table.
3. Enter "Programmer" as the "Name".
4. Repeat steps 2 and 3 to create the "Commissioner" and "Operator" user groups.
5. Click "Administrator" in the "Groups" table.
6. Activate the "Change system parameters" authorization in the "Authorizations" table.

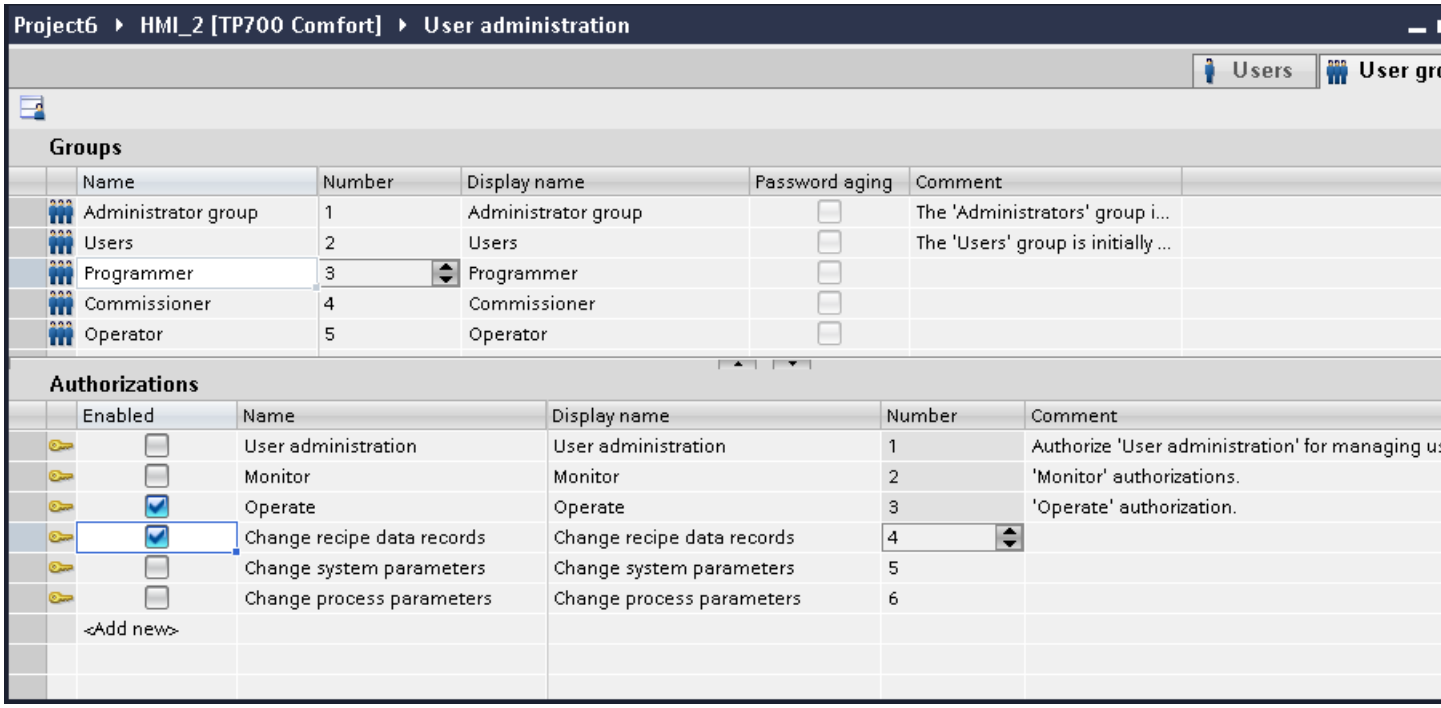
Interim result



Procedure

1. Click "Operator" in the "Groups" table.
2. Activate the "Change recipe data records" authorization in the "Authorizations" table.
3. Click "Commissioner" in the "Groups" table.
4. Activate the authorizations "Change recipe data records", "Change system parameters" and "Change process parameters" in the "Authorizations" table.
5. Click "Programmer" in the "Groups" table.
6. Activate the "Change recipe data records" authorization in the "Authorizations" table.

Result



12.7.4.7 Example: Creating users and assigning them to a user group

Task

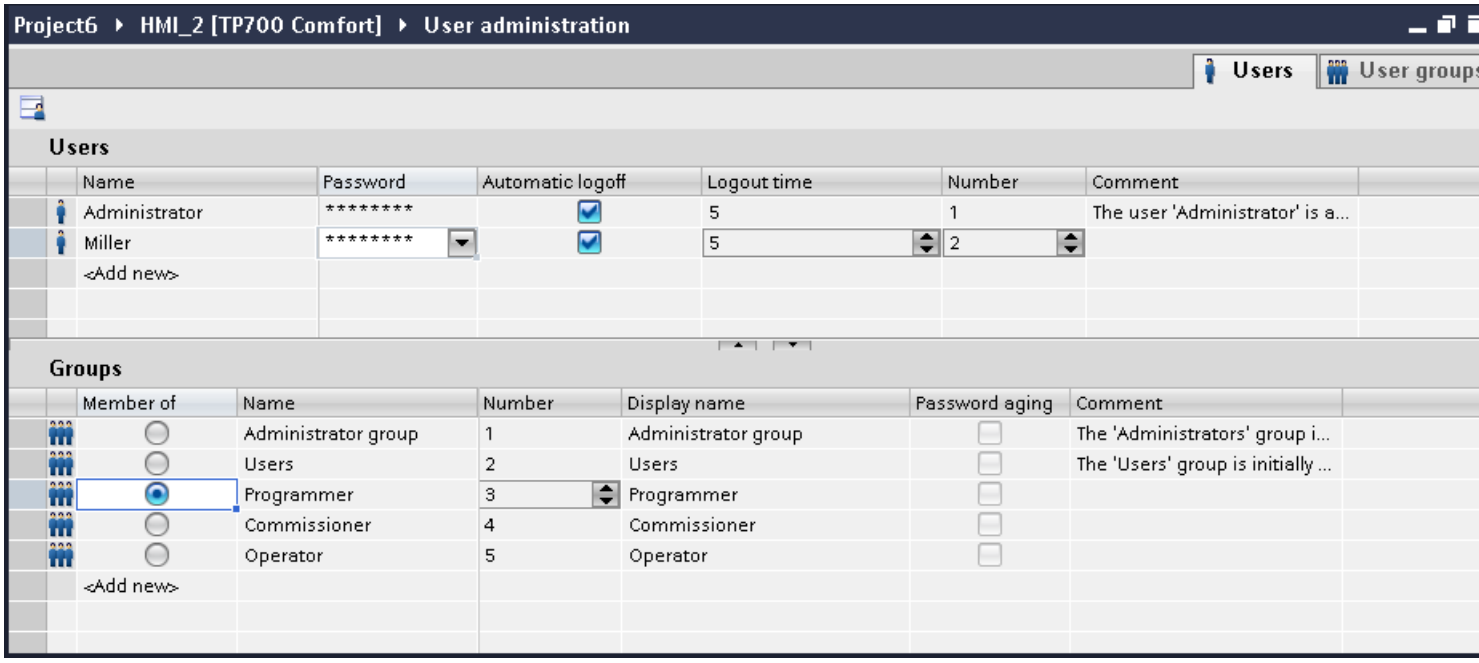
In the following example you create the users and assign user groups to them. The users are sorted alphabetically immediately after the name has been entered.

Procedure

1. Open the "Users" work area.
2. Double-click "Add" in the "Users" table.

3. Enter "Miller" as the user name.
4. Click the button in the "Password" column. The dialog box for entering the password is displayed.
5. Enter "miller" as the password.
6. To confirm the password enter it a second time in the lower field.
7. Close the dialog box by using the icon.
8. Activate the "Programmer" user group in the "Groups" table.

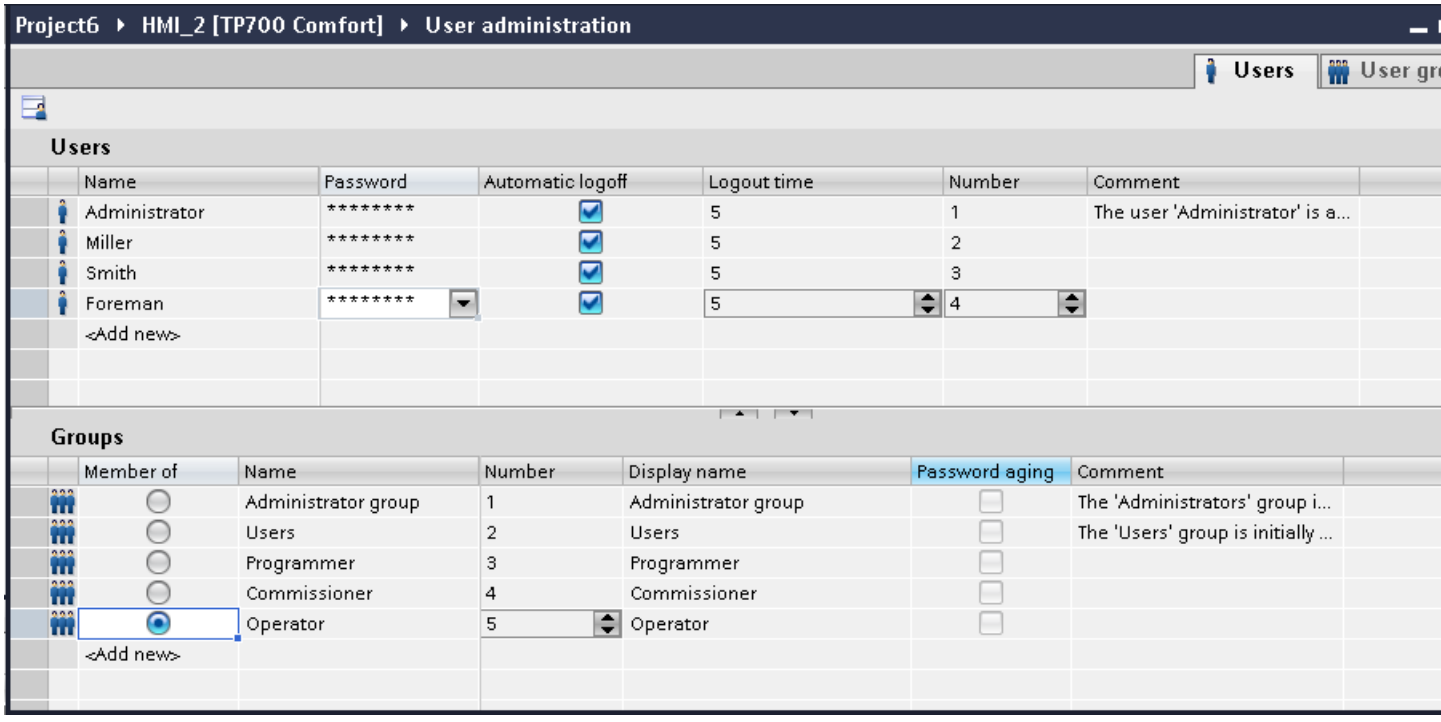
Interim result



Procedure

1. Double-click "Add" in the "Users" table.
2. Enter "Smith" as the user name.
3. Click the button in the "Password" column. The dialog box for entering the password is displayed.
4. Enter "smith" as the password.
5. To confirm the password enter it a second time in the lower field.
6. Close the dialog box by using the icon.
7. Activate the "Commissioner" user group in the "Groups" table.
8. Repeat steps 2 to 6 for the user "Foreman."
9. Activate the "Operators" user group in the "Groups" table.

Result



12.8 Working with system functions and Runtime scripting

12.8.1 Basics (Panels, RT Advanced)

12.8.1.1 Runtime scripting (Panels, RT Advanced)

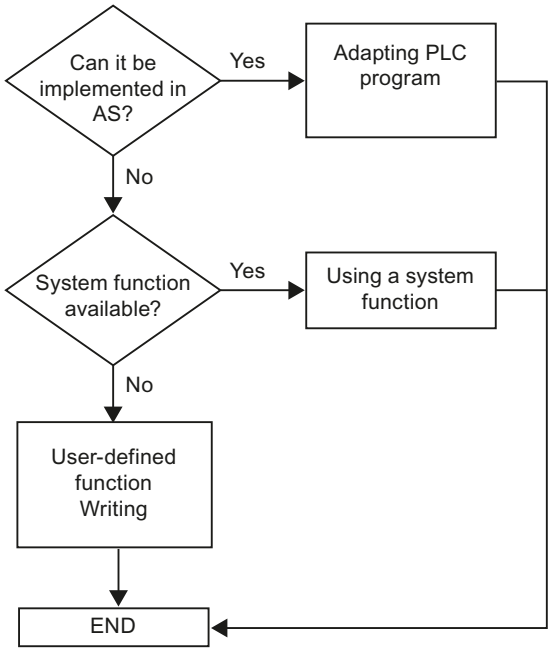
Term definition

The following terms are used in the documentation:

Term	
Runtime scripting	Generic term for all activities in user-defined functions.
Function	Generic term for system functions and user-defined functions.
System functions	System functions are all functions supplied with WinCC. The system functions are used either in function lists or user-defined functions.
User-defined functions	User-defined functions are functions written in the "Scripts" editor. For more precise specification, the term "User-defined VB function" is used in the documentation.
VBS / VBScript	Abbreviation for Visual Basic Script

Applying Runtime scripting

The following figure serves as a decision guide for programming tasks at hand:



12.8.1.2 System functions (Panels, RT Advanced)

Applications

You use system functions for the following:

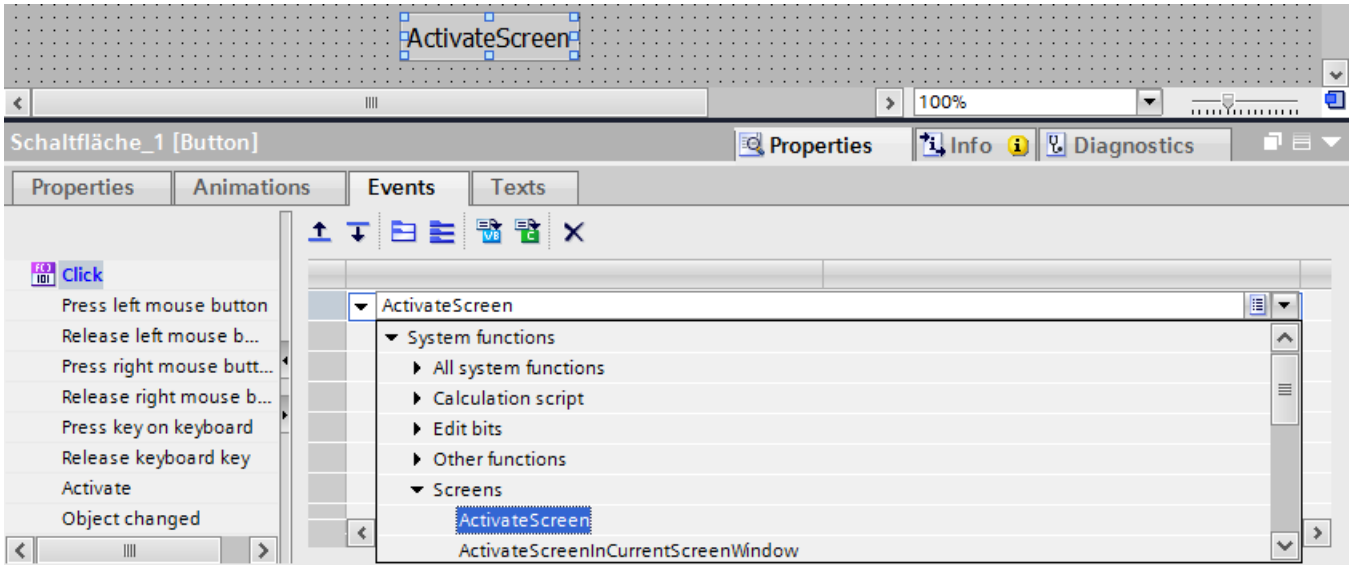
- Function lists
  A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. For additional information, refer to "Runtime characteristics".
- User-defined functions
  If the HMI device supports customized functions, you use system functions in combination with instructions and conditions in the code of a customized function. In this way you execute a customized function depending on a specific system state. In addition, you can evaluate return values of system functions, for example. Depending on the return value, you then perform test functions, for example, that in turn affect the user-defined function flow.

Application examples of system functions

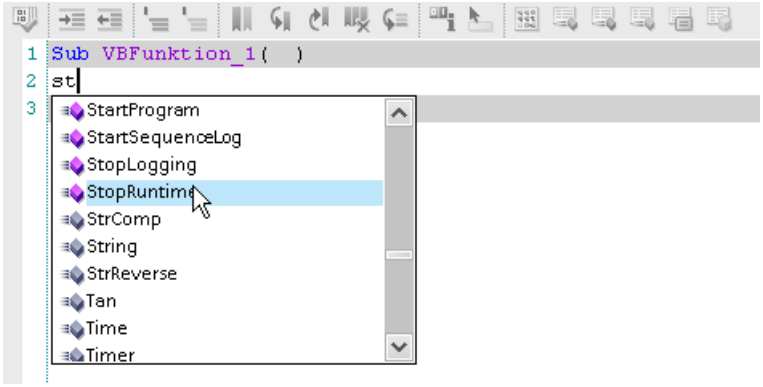
- Calculations, increase tag value by a defined or variable amount.
- Log function, e.g. to start a process value log.
- Settings, e.g. to switch the PLC or set a bit in the PLC.
- Alarms, e.g after changing the user.

Application

- Function list
  When configuring a function list, you select the system functions from a selection list that is sorted by categories:



- User-defined function
  If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .



Language dependency

In the function list, the names of the system functions are dependent on the set project language. The functionality can then be recognized immediately by the project planner.

You use the English name of the system function in user-defined functions. You will find the English name of the system function in the reference.

Availability

Which system functions are available depends on the selected HMI device.

HMI device replacement

If you use system functions in a function list that are not available on the set HMI device, these system functions are marked in color.

If you use a system function in a user-defined function which is not available on the set HMI device, a warning is issued. In addition, the respective system function will be underlined with a wavy blue line.

See also

System functions for logs (Page 5373)

12.8.1.3 User-defined functions (Panels, RT Advanced)

Applications

You use customized functions for the following for example: :

- Configuring an extended function list
  In a customized function you have the option to have customized functions and system functions executed depending on conditions or executed repeatedly. You then add the customized function to a function list.
- Programming new functions
  Customized functions are only valid in the project in which they are defined. For user-defined functions you define transfer parameters and return values, for example, for conversion of values.

Properties of customized functions

A customized function has the following properties:

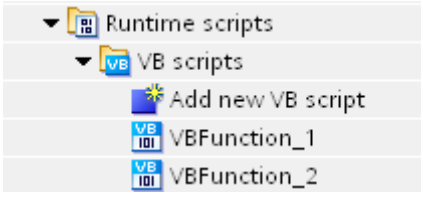
- Name
- Parameter (optional)
- Return value and type (optional)
- Can be modified centrally
- has no trigger. You have to call the customoized function explicitly, e.g. in a function list.
- behaves like a system function

Usage

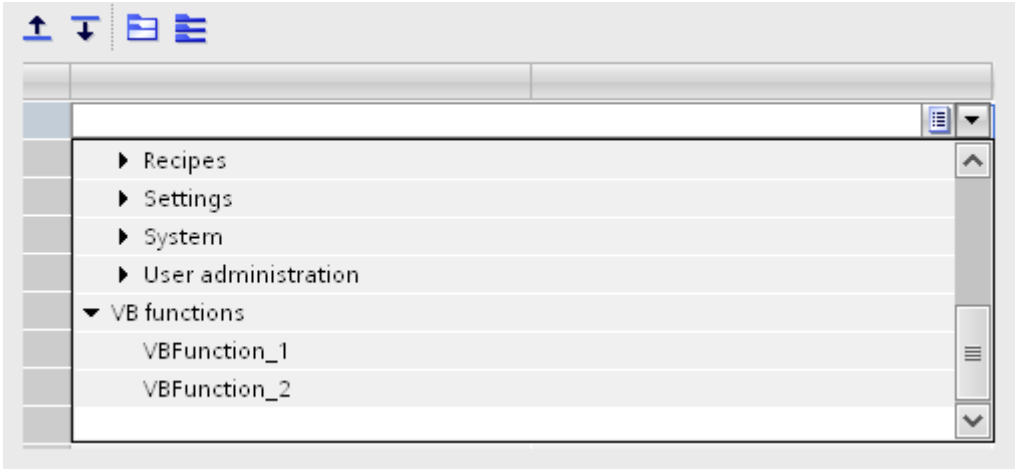
You create customized functions with the "Scripts" editor. See "Scripts" editor (Page 5704) for additional information.

Customized functions are saved in the project. To protect user-defined functions, set up know-how protection. See AUTOHOTSPOT for additional information.

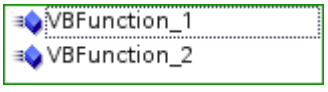
- Project tree
  The user-defined functions are listed in the project tree under "VB scripts".



- Function list
  The user-defined functions are listed in a function list under "VB functions".



- User-defined function
  If you are using a system function in a user-defined function, you choose it from a selection list. To open the selection list, use the key shortcut <Ctrl+Space> or click .



Recursion level

The recursion level in user-defined functions is limited by the stack size of the HMI device. If the number is exceeded, a system error message is output in Runtime. This means you should limit the number of recursions in a user-defined function.

12.8.2 Working with function lists (Panels, RT Advanced)

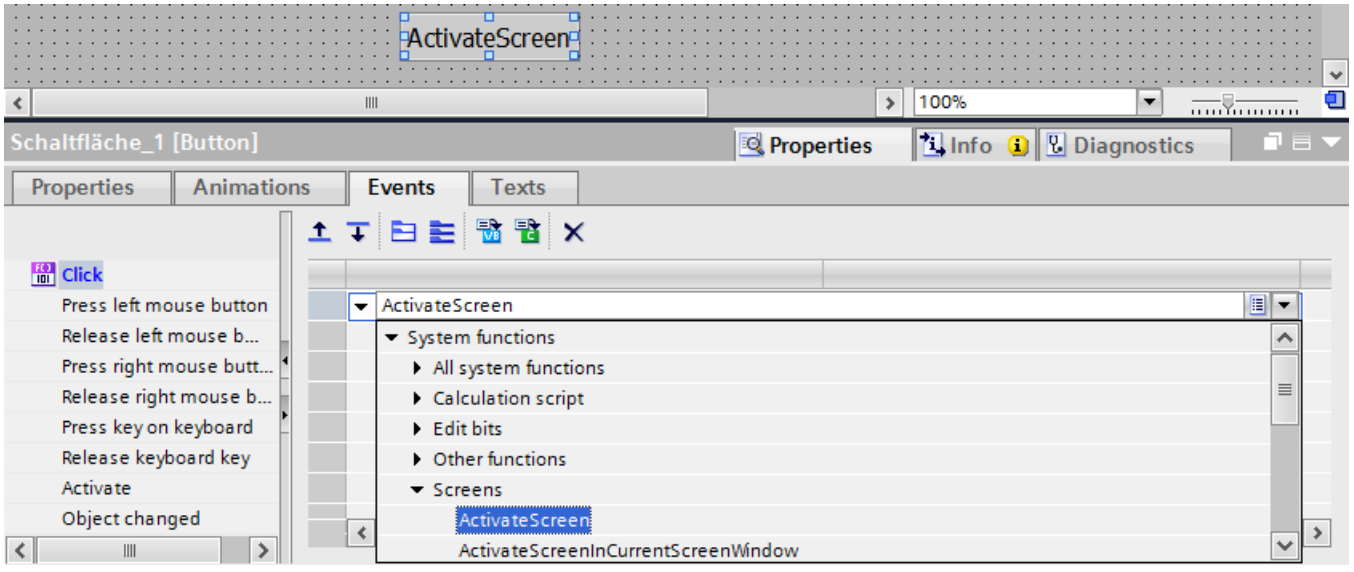
12.8.2.1 Basics of the function list (Panels, RT Advanced)

Introduction

A function list performs one or more system functions and user-defined functions when the configured event occurs.

Principle

The function list is configured for an event of an object, for example, for a screen object or a task. You can configure a function list precisely on every event. The events which are available depend on the selected object and the HMI device.



Events occur only when the project is in Runtime. Events include:

- Execution of a task
- Pressing of a button
- Acknowledging an alarm

Note

The choice of configurable system functions in a function list is dependent on the selected HMI device. For additional information, refer to "Availability for specific devices of system functions".

12.8.2.2 Properties of a function list (Panels, RT Advanced)

Status information

During configuration the project data is tested in the background.

With the following causes the function list is not executed in Runtime and the incorrect entries are marked red:

- At least one system function or one user-defined function is not completely supplied with parameters.
- At least one system function or one user-defined function is contained which is not supported by the selected HMI device, e.g. by changing the device type.

Processing of system functions and user-defined functions (WinCC Runtime Advanced and Panels)

A function list is executed from top to bottom in Runtime. If a function list includes system functions with longer runtime, these are processed asynchronously. You can find additional information about this in the sections "Calling system functions" and "Calling user-defined functions".

See also

Executing a function list in Runtime (Page 5727)

Processing sequence for user-defined functions and system functions (Page 5729)

12.8.2.3 Configuring a function list (Panels, RT Advanced)

Introduction

You configure a function list by selecting the system functions and customized functions from a drop-down list. The system functions are arranged in the selection list according to categories.

You only use customized functions of a programming language in a function list. Your selection of the first user-defined function determines whether user-defined VB functions or user-defined C functions can be selected in the function list. Which programming languages are available depends on the selected HMI device.

If you have created a user-defined VB function, for example, the user-defined function is available under the entry "VB functions".

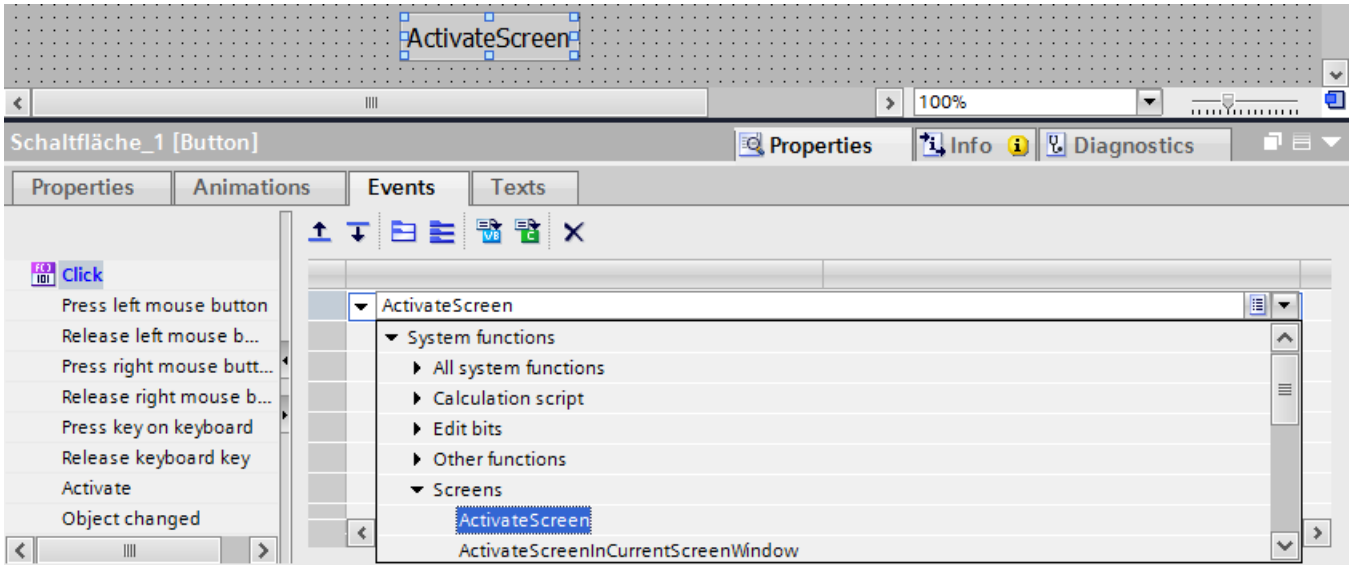
Requirement

Object has at least one configurable event.

Procedure

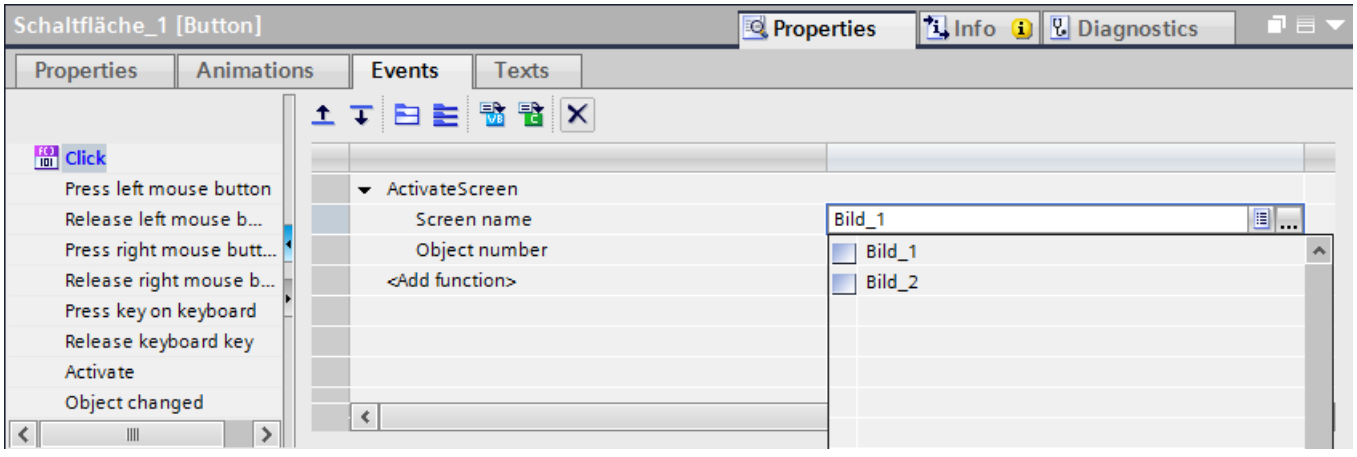
Proceed as follows to configure a function list:

1. Open the editor in which the object is located.
2. Select the object.
3. Click "Properties > Events" in the Inspector window. Choose the event for which you want to configure the function list.
4. Mark the "<Add function>" entry in the inspector window in the drop-down list.
5. Select the desired system function or the desired user-defined function from the selection list. You can also enter the name of the system function or the user-defined function.



The system function or the customized function is entered in the function list.

6. If the system function or the customized function has parameters, select the appropriate values for the parameters.



7. If you want to add other system functions or user-defined functions to the function list, repeat steps 4) to 6).

Result

The function list is configured. In addition, to the configured event, the status of the function list is displayed in the Inspector window. When the configured event occurs in Runtime, the function list is completed from top to bottom.

12.8.2.4 Editing a function list (Panels, RT Advanced)

Introduction

A function list can be edited as follows:

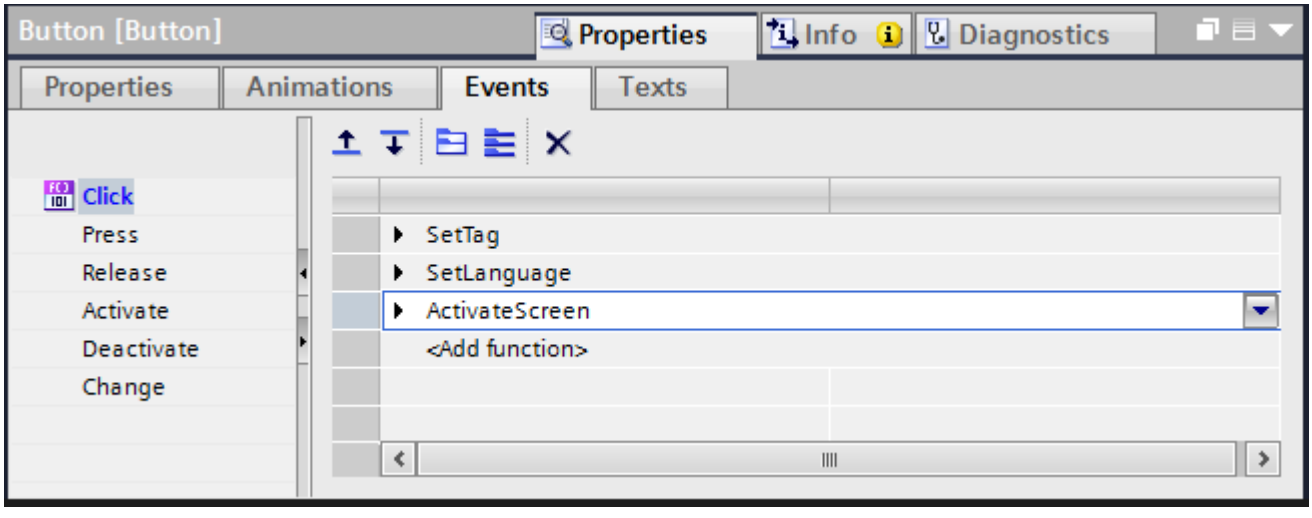
- Change the order of system functions and user-defined functions.
- Remove system functions or user-defined functions.

Requirement

The function list is configured and opened.

Changing the order of a system function or a customized function

1. Select the desired system function or customized function in the function list.
2. Then click the appropriate direction arrow in the inspector window until the system function or customized function is in the desired position.



Changing the order of several system functions and customized functions

1. Hold down the <Shift> key.
2. Click desired system functions or customized functions one after another with the mouse.
3. Move the selection to the desired position by drag&drop.

Removing a system function or customized function

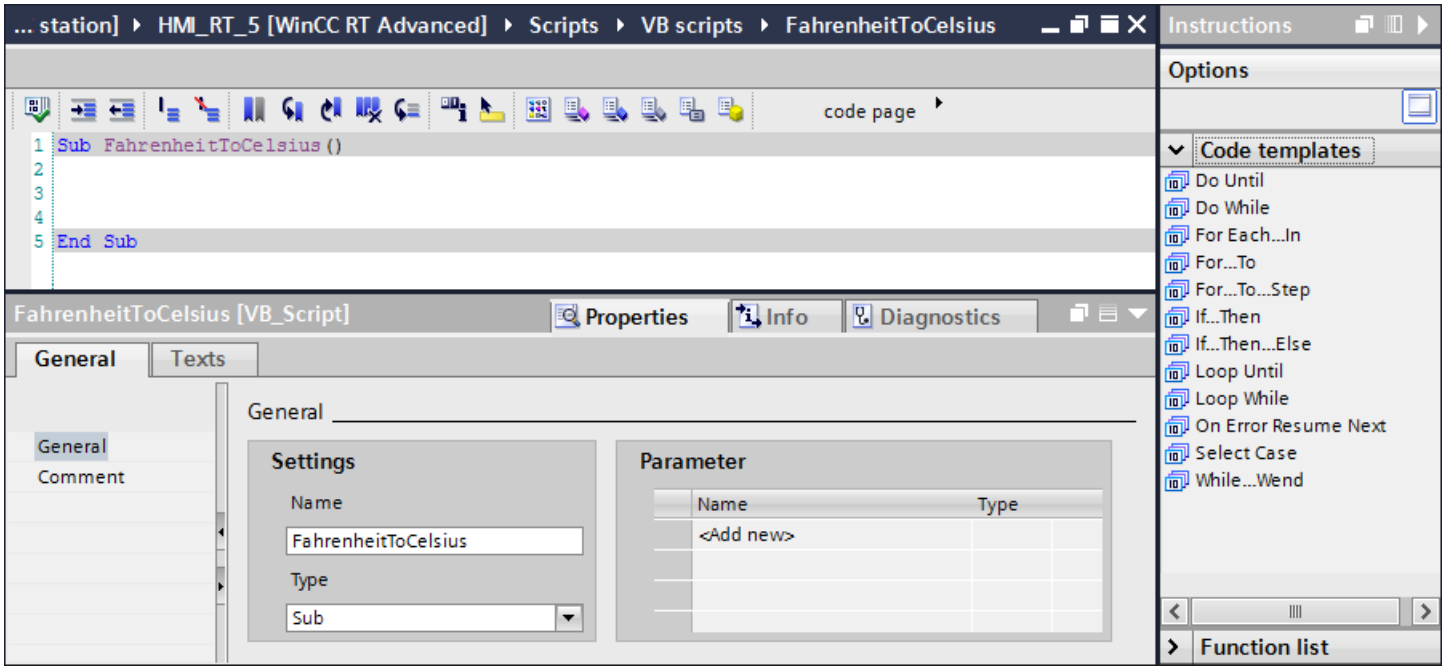
1. Select the desired system function or customized function in the function list.
2. Select "Delete" in the shortcut menu.

12.8.3 Working with user-defined VB functions (Panels, RT Advanced)

12.8.3.1 "Scripts" editor (Panels, RT Advanced)

Introduction

The "Scripts" editor supports you in the creating of user-defined functions with functionalities such as auto-completion and syntax highlighting. You can insert code templates for frequently used instructions with the "Instructions" task card for example.



Autocompletion and parameter entry

The "Scripts" editor provides you context-dependent programming support with autocompletion parameter entry support.

When you use system functions, the parameters of the function are shown as a tooltip.

<Ctrl+J>

The object list can be called context-specifically by using the shortcut <Ctrl+J>. Use the object list to supply values to system functions, methods, and properties: For example, you select screens, screen objects, tags, or colors. You transfer a selected object from the object list into the code by double-clicking it.

Note

Tags and screens can also be inserted using a drag-and-drop operation. Use, for example, drag-and-drop to assign values to parameters.

<Ctrl+Space>

With the key combination <Ctrl+Space> you call a list with the following contents:

- Constants and functions of the programming language used in the "Scripts" editor.
- User-defined functions
- System functions

Integrating control characters in strings

If you want to use control characters such as tabs or line breaks in strings, use the function "Chr()". Transfer the decimal ASCII code of the required control character as parameter:

Example:

- Chr(9) returns "Tab".
- Chr(15) returns "SI" (Shift in).
- Chr(20) returns "DC4" (Device Control 4).

You will find more detailed information on this VBS function on the Internet.

"Instructions" task card

The "Instructions" task card contains the "Code templates" and "Function list" palettes.

- Code templates
  To insert frequently used instructions, double click the desired instruction in the "Code templates" palette. Replace the space holders with the used expressions.
- Function list
  In the function list you select the system functions and user-defined functions from a drop-down list. Proceed as for configuring a function list. To transfer the function list to the code, click the "Transfer" button. The function list is automatically converted into the correct syntax.

  Note

  Not all system functions are available in the "Scripts" editor. For additional information, refer to the reference.

Edit functions

Use the buttons of the toolbar "Advanced Edit" to make the code more readable by means of indentation and the use of comments.

Bookmarks help you keep an overview, even of many lines of code.

Further information regarding each button can be obtained in the accompanying direct help.

Synchronization of tags and objects

If you change tag names or object names in the project which you use in a user-defined function, the names are adapted automatically in the user-defined function.

If you change the tag name or object name in the function, the tag names or object names are not adapted in the project. An appropriate error message is output when executing the user-defined function.

Syntax highlighting

Keywords in the "Scripts" editor are highlighted using different colors. Unknown words are underlined with a red wavy line.

The table shows the preset colors for the most important keywords:

Color	Meaning	Example
Blue	Keyword	If, Then
Dark violet	Function	FahrenheitToCelsius
Chocolate	System function	SetTag
Orange	HMI tag	Tag_1
Green	Comment	'This is a comment'

Adapting display properties

When you have opened a user-defined function, you can customize the display properties in the editor. Select the "Options > Settings" menu command. Click "General > Text editors" in the "Settings" editor. For example, you can change the colors for syntax highlighting or adapt the indents for code in the work area.

See also

Create customized VB functions (Page 5712)

12.8.3.2 Access to HMI tags (Panels, RT Advanced)

Introduction

In user-defined VB functions, you have access to HMI tags which you have created in the project. Change or read the tag value with a user-defined VB function in Runtime.

In addition, you can create local tags as counters or buffers in the user-defined VB function. You must declare each tag to avoid errors due to misspelled tags.

HMI tags

The user-defined VB function accesses the tag value which is saved in Runtime memory. Next, the tag value will be updated to the set cycle time. The user-defined VB function first accesses the tag values which were read at the previous cycle time.

If the tag name matches the VBS name conventions in the project, you can use the HMI tag directly in the function.

```
'VBS_Example_03
If BeltDriveOilTemperature > 100 Then [instruction]
```

If the tag name in the project does not match the VBS name conventions, you must reference the HMI tag using the "SmartTags list". In the following example the tag name contains the "&" character that is not permitted in accordance with the VBS name conventions:

```
'VBS_Example_04
SmartTags("Test&Trial")= 2005
```

Local tags

You define local tags with the Dim instruction. You can only use local tags within user-defined VB functions. They therefore do not appear in the "HMI Tags" editor. You use a local tag in the user-defined VB function, for example, as a counter in a For instruction.

```
'VBS_Example_05
Dim intCount
For intCount = 1 To 10 [instruction] Next
```

Access to HMI tags with a dynamic name

The user-defined VB function accesses the tag value using the tag name. You can specify the tag name in such a way that the tag name is composed at the runtime of the user-defined function.

If you only call the user-defined VB function in a screen in which the HMI tag is also used elsewhere, for example in an I/O field, you should for performance reasons configure the HMI tag with "Cyclic in operation" acquisition mode.

If the user-defined VB function is accessed and the HMI tag is not being used in the screen currently displayed, configure the HMI tag with "Cyclic continuous" acquisition mode. This ensures that the current value of the tag is always available.

12.8.3.3 Access to objects (Panels, RT Advanced)

Introduction

The objects of the VBS object model with the appropriate properties and methods are available in user-defined VB functions.

The object properties can be read and changed in Runtime.

Referencing objects

In customized VB functions you reference the objects by the corresponding list. To identify the object, use its name or the position number within the list.

If you access the properties of an object more often, create an object reference. You can access object properties with and without object reference.

With the following instruction the first object is referenced in the "MainScreen":

```
'VBS_Example_01
Dim objObject
'Change to Screen "MainScreen"
HMIRuntime.BaseScreenName = "MainScreen"
Set objObject = HMIRuntime.Screens(1).ScreenItems(1)
```

With the following instruction an object is referenced by its name and an object property is changed. You must have created the object with this name in the screen.

```
'VBS_Example_02
Dim objCircle
HMIRuntime.BaseScreenName = "MainScreen"
Set objCircle = HMIRuntime.Screens(1).ScreenItems("Circle_01")
objCircle.BackColor = vbGreen
```

12.8.3.4 Calling system functions (Panels, RT Advanced)

Introduction

You can insert system functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with
- Direct input
- With the "Function list" palette

With <Ctrl+Space> or with

Open the list of system functions with <Ctrl+Space> or with and select the desired system function.

Direct input

You enter the system functions directly into the code. You use the English name of the system function. You can find the English name of the system function in the system function reference under "Syntax". The editing language setting is not taken into consideration.

References to objects, e.g. screens, connections and logs are transferred in inverted commas:

Calling system functions without return value in VBS

```
SetTag "Tag1",64
```

Calling system functions with return value in VBS

```
InverseLinearScaling "XValue","Tag1", 0, 1
```

With the "Function list" palette

Select the system functions from a selection list that is sorted by categories in the "Function list" palette. Proceed as for configuring a function list.

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

HMI device replacement

The code of a customized function depends on the selected HMI device. If you use system functions in the customized function which are not supported by the selected HMI device, you receive an error message in the output window. You will find additional information under "Device dependency of system functions".

See also

Configuring a function list (Page 5701)

12.8.3.5 Calling user-defined VB functions (Panels, RT Advanced)

Introduction

You can only insert user-defined VB functions in a user-defined VB function.

This can be done in the following ways:

- With <Ctrl+Space> or with
- Direct input
- With the "Function list" palette

With <Ctrl+Space> or with

Open the list of user-defined VB functions with <Ctrl+Space> or with and select the desired user-defined VB function.

Direct input

You enter the user-defined VB function directly into the code. References to objects, e.g. screens, connections and logs are transferred in inverted commas.

```
Function Average(ByVal Var1, ByVal Var2)
  Average = (Var1+Var2)*(1/2)
End Function
```

Calling user-defined VB functions without return value in VBS

```
Average 4,10
```

Calling user-defined VB functions with return value in VBS

```
Dim ValueA
ValueA = Average (4,10)
```

If you do not want to evaluate the return value, use the call as for a user-defined VB function without return value.

With the "Function list" palette

Select the desired user-defined VB function from a selection list in the "Function list" palette.

Proceed as for configuring a function list. You will find additional information under "Configuring a function list".

To transfer the list to the code, click the "Transfer" button. The list is automatically converted into the correct syntax.

12.8.3.6 Transfer and return of values in VBS (Panels, RT Advanced)

Transfer of a value

The following options are available for transferring parameters.

- "Call by Value" - ByVal
  ByVal transfers the parameter value. If you transfer a tag as a parameter, the tag value is transferred to the user-defined function when the user-defined function is executed.
- "Call by Reference" - ByRef
  ByRef transfers the address of the parameter. If you transfer a tag as a parameter, the tag address is transferred to the user-defined function when the user-defined function is executed.
  When user-defined functions and system functions are called in user-defined functions, the parameter is transferred as ByRef.

Return of a value

Return values can return the result of a calculation (e.g., average value of two numbers). But a return value can also give information about whether an instruction was executed correctly.

Therefore, the system functions that perform file operations such as "Delete" also have return values.

For a user-defined function to return a value, you must set the "Function" type. You assign the function name to the return value in the user-defined function:

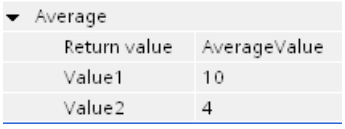
```
1 Function Average( Value1 , Value2 )
2 'Check if Parameters are not numeric:
3 If IsNumeric (Value1) = False Then Value1 = 1
4 If IsNumeric (Value2) = False Then Value2 = 1
5 Average = (Value1+Value2)/2
6
7 End Function
```

To form an average value of two numbers, call the user-defined VB function Average and transfer the result to the HMI tag for example AverageValue.

- In a customized VB function

```
SmartTags("AverageValue") = Average ("4", "10")
```

- In the function list



You can output the value of the HMI tag AverageValue in an I/O field.

See also

Create customized VB functions (Page 5712)

12.8.3.7 Create customized VB functions (Panels, RT Advanced)

Introduction

When you create a customized VB function, you define the following settings:

- The name with which you call the user-defined VB function.
- The type of user-defined VB function.
- The parameters which are transferred to the user-defined VB function in Runtime.

Use only the following characters for the name:

- "A" to "Z"
- "a" to "z"
- "0" to "9"
- "_" as a separator

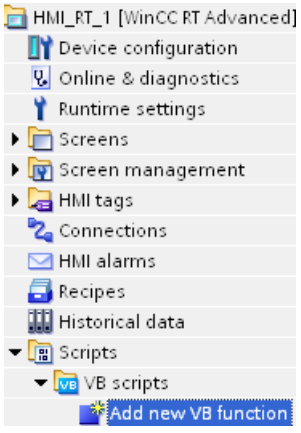
Note

When you change the parameters or the function type, the change is color marked at the application point, e.g. in the function list.

Procedure

To create a user-defined VB function, follow these steps:

1. Open "Scripts" in the project tree.
2. Double click "Add new VB function" in the project tree under "VB scripts".



The user-defined VB function is created as a new tab in the work area. The input mask for the configuration settings of the user-defined VB function opens in the Inspector window.

3. Configure the user-defined VB function in the Inspector window "Properties > General > General".
4. Enter a descriptive "Name" for the user-defined VB function.
5. Select the "Type" of the user-defined VB function.
   - "Function" have a return value.
   - "Sub" have no return value.
6. Click "<Add>" in the "Parameters" list to add parameters. Enter the parameter name and specify the parameter type.
   Further information can be found in "Transfer and return of values in VBS (Page 5711)".
   - "ByVal" transfers the parameter value.
   - "ByRef" transfers the address of the parameter.
7. Enter its code in the work area.
   You will find further information about this in ""Scripts" Editor" (Page 5704)".

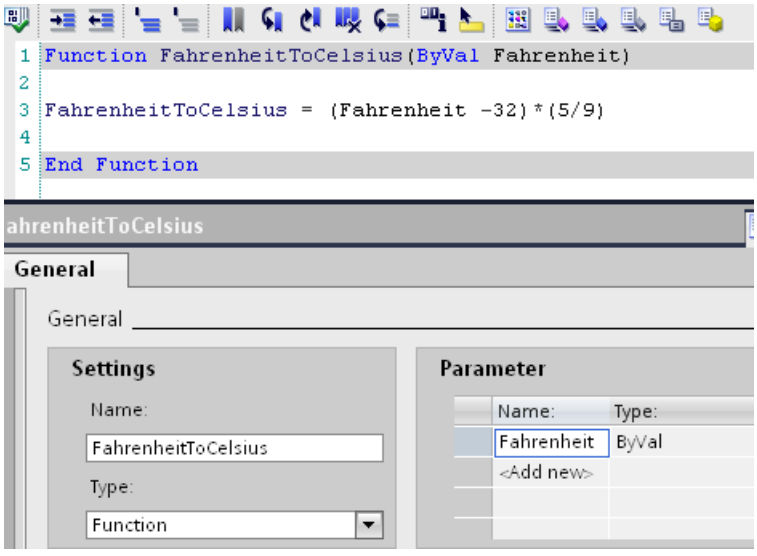
Result

The user-defined VB function has been created. The type, name, and function parameters are displayed in the title bar.

The start and end are inserted automatically when the user-defined function is created.

If you have protected the user-defined VB functions by a password, it is saved encrypted in the project. For additional information, refer to "Protecting user-defined functions".

The figure below shows a user-defined VB function which converts the temperature from "Fahrenheit" to "Degrees Celsius":



12.8.3.8 Testing the syntax of customized functions (Panels, RT Advanced)

Introduction

During programming, the code is tested in the background. Syntactical errors are marked with a wavy red line. The customized function is checked for correct syntax and valid object references.

Check the syntax in the "Scripts" editor to identify all the errors in the code and output the appropriate error messages. In this case, error messages generated by the script parser are output.

Use a separate debugger to check customized VB functions for logical programming errors.

Error types

The following error types are detected in the syntax test and output in the "output window":

- Unknown string (e.g., not a keyword)
- Assignment of value to a constant
- The name of a local tag created with the Dim instruction is already known, e.g.: as a parameter, object, or component of the object model
- Syntax error

Requirements

- Customized function is open.

Procedure

Proceed as follows to check the syntax:

1. Click to start the syntax check.
   The syntax is checked. The result of the syntax check is displayed in the Inspector window under "Info > Compilation." Syntax errors are output with the line number.
2. Correct the errors in the customized function if necessary.

Special consideration in the syntax checking of customized functions

Customized functions are not interpreted until in Runtime. When an HMI device is being compiled, the system checks its user-defined functions for correct syntax. However, runtime errors may occur in certain circumstances.

See also

Configuring a function list (Page 5701)

12.8.3.9 Renaming customized VB functions (Panels, RT Advanced)

Renaming a user-defined VB function in the project tree

Proceed as follows to rename a user-defined VB function in the project tree:

1. Select the desired user-defined VB function in the project tree.
2. Select the "Rename" (F2) command in the shortcut menu of the user-defined VB function.
3. Enter a new name for the user-defined VB function.

Renaming a user-defined VB function in the Inspector window

Proceed as follows to rename a user-defined VB function in the Inspector window:

1. Open the user-defined VB function in the "Scripts" editor.
2. In the Inspector window, click "Properties > Properties > General".
3. Enter the new function name.

Result

The user-defined VB function is renamed. The application points are adapted automatically.

12.8.3.10 Executing customized VB functions (Panels, RT Advanced)

Introduction

In WinCC you have the following options to execute a customized function:

- Function list
- Customized VB function

Calling a customized VB function in a function list

1. Add the user-defined VB function to a function list like a system function. You will find the customized VB functions in the drop-down list under "VB functions". You will find further information in "Configuring a function list (Page 5701)".
2. If the VB function has parameters, supply the parameters with static values or HMI tags.
3. If the VB function has a return value, select an HMI tag. The value to be processed is transferred to the HMI tag.

Calling a customized VB function in a customized VB function

1. Open the user-defined VB function in which you want to call the user-defined VB function.
2. Call the customized VB function in the syntax of the programming language. You will find further information in "Calling user-defined VB functions (Page 5709)".
3. If the VB function has a return value, assign an expression, e.g. a local tag, to the VB function.

Calling user-defined VB functions (Page 5709)

12.8.4 Protecting user-defined functions

12.8.4.1 Setting up know-how protection (Panels, RT Advanced, RT Professional)

Procedure

To set up know-how protection for user-defined functions, follow these steps:

1. Select the user-defined function without know-how protection that you want to protect.
2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Click "Define".
   The "Define password" dialog box opens.
4. Enter a password in the "New" field.
5. Enter the same password in the "Confirm" field.
6. Confirm your entries with "OK".
7. Close the "Know-how protection" dialog by clicking on "OK".

Result

The user-defined function receives know-how protection. User-defined functions with know-how protection are marked with a lock in the project tree. The password entered is valid for all user-defined functions selected.

12.8.4.2 Opening user-defined functions with know-how protection

You can only open multiple user-defined functions with know-how protection at once if they are protected with the same password.

Procedure

To create a user-defined function with know-how protection, follow these steps:

1. Double-click the user-defined function you want to open.
   The "Access protection" dialog will open.
2. Enter the password for the user-defined function with know-how protection.
3. Confirm your entry with "OK".

Result

The user-defined function with know-how protection will open provided you have entered the correct password. However, the function will remain know-how protected.

Once you have opened the user-defined function, you can edit it for as long as the user-defined function or TIA portal is open. You must enter the password again the next time you open the user-defined function. If you close the "Access protection" dialog with "Cancel" or "Close", the user-defined function is opened but the code is not displayed. You cannot edit the user-defined function.

12.8.4.3 Removing know-how protection

Procedure

To remove the know-how protection of a user-defined function, follow these steps:

1. Select the user-defined function for which you want to remove know-how protection.

   Note

   To remove know-how protection for several user-defined functions at once, all selected user-defined functions must have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Deactivate the check box "Hide code (know-how protection)".
4. Enter the password.
5. Confirm your entries with "OK".

Result

Know-how protection will be disabled for the selected user-defined function.

12.8.4.4 Changing a password

Procedure

To change the password, follow these steps:

1. Select the user-defined function with know-how protection for which you want to change the password.

   Note

   To change the password for several user-defined functions at once, all selected user-defined functions must have the same password.

2. Select the command "Know-how protection" in the "Edit" menu.
   The "Know-how protection" dialog will open.
3. Click the "Change" button.
4. Enter the old password in the "Old" field.
5. Enter the new password in the "New" field.
6. Enter the new password again in the "Confirm" field.
7. Confirm your entries with "OK".
8. Close the "Know-how protection" dialog by clicking on "OK".

12.8.5 Debugging user-defined VB functions (Panels, RT Advanced)

12.8.5.1 Debugging user-defined VB functions (Panels, RT Advanced)

Introduction

Debugging allows you to test the user-defined VB functions for logical programming errors in Runtime. For example, you can test whether the proper values were transferred to the tags, and whether cancellation terms are realized correctly.

The following VBScript-capable debuggers have been tested and approved:

- "Microsoft Script Debugger"
- "Microsoft Script Editor": The debugger is supplied with Microsoft Office.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

Note

Difference with regard to VBScript for Windows and Windows CE

The debugger checks the syntax for VBScript for Windows. If the function contains a VBScript function for Windows CE, a corresponding error message is output. Some VBScript functions are different, e.g., CreateObject. You can find a list of these VBScript functions under "VBScript for Windows CE".

Microsoft Script Debugger

If you want to use the Microsoft Script Debugger for debugging, the English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

"Microsoft Script Debugger" provides the following functionality:

- Viewing the source code of the function you are debugging
- Checking the step-by-step execution of the functions
- Viewing and editing tags and property values

Note

For tips and tricks on debugging, common sources of errors, and additional information, refer to the online help for the Microsoft Script Debugger.

The Microsoft Script Debugger is located in the Microsoft Download Center under the following URL:

- http://www.microsoft.com/downloads/Search.aspx?displaylang=en833a6a92-961e-4ce1-9069-528d22605127

Use the "Search" field to search for "Script Debugger" and select the required download.

Basic procedure

The debugger is only intended for identifying error locations in the user-defined VB function. For this purpose, for example, you use break points or execute the user-defined VB function step-by-step. For detailed information, refer to the documentation of the debugger you are using. In order to correct errors, you change to the "Scripts" editor in WinCC. After having recompiled and reloaded the script, you test the user-defined VB function once again using the debugger.

Note

Your code is displayed in the debugger, but is write-protected. You cannot edit the code directly in the debugger; you can only test the required changes.

Error types

The following error types are distinguished when debugging:

- Logical error
  A logical error occurs when the event you are expecting does not take place, e.g., because a condition was checked incorrectly. To debug logical errors, you go through the user-defined VB function step by step. This way, you identify the portion of the user-defined VB function that is not working.
- Runtime error
  A runtime error is generated if an attempt is made to execute an invalid or faulty instruction, e.g., if a tag is not defined.
  To intercept runtime errors, use the "On Error Resume Next" instruction in the user-defined VB function. With this instruction, the next instruction is executed after a runtime error. You check the error code with the Err object in the next line. To stop the handling of runtime errors in the user-defined VB function again, use the "On Error Goto 0" instruction.
  Example for error handling

```
Sub OnClick(ByVal Item)
'VBS27
  Dim objScreenItem
'
  'Activation of errorhandling:
  On Error Resume Next
  For Each objScreenItem In ScreenItems
    If "HMIRectangle" = objScreenItem.Type Then
    '
      '=== Property "RoundCornerHeight" only available for RoundRectangle
      objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
      If 0 <> Err.Number Then
        HMIRuntime.Trace objScreenItem.Name & ": no RoundedRectangle" & vbCrLf
        '
        'Delete error message
        Err.Clear
      End If
    End If
  Next
  On Error Goto 0  'Deactivation of errorhandling
End Sub
```

Screen change while debugging

If you change to another screen while debugging, the user-defined VB function of the previous screen stays open but is no longer valid. The debugger could return invalid error messages in this case, as the objects called will no longer exist after the screen change.

12.8.5.2 Integrating the debugger (Panels, RT Advanced)

Installing a script debugger for WinCC

A VBScript-capable debugger must be installed to search for errors in user-defined VB functions.

The following VBScript-capable debuggers have been tested and released:

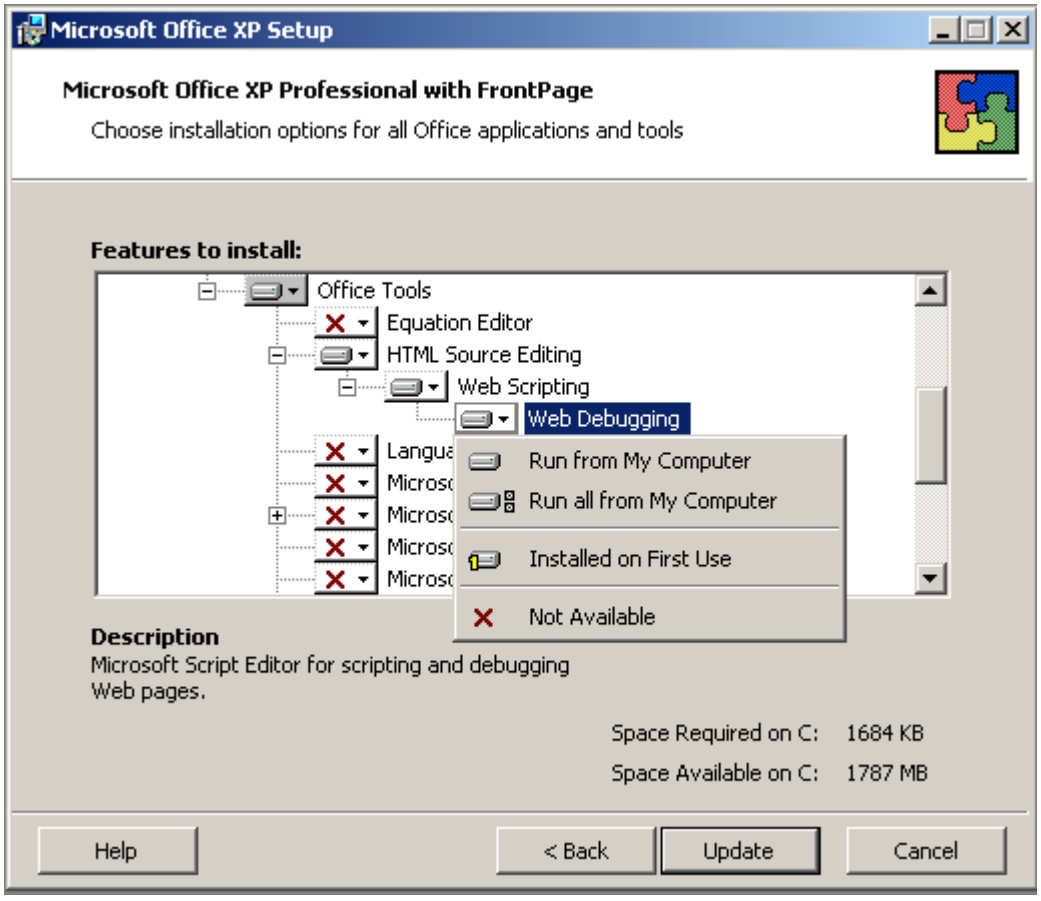
- Microsoft Script Editor by Office XP
- Microsoft Script Debugger: The English version "scd10en.exe" must be used. The German version "scd10de.exe" may not be installed.

An installed debugger is started as follows:

- If a runtime error occurs during execution
- Via "Online > Simulate Runtime > With script debugger"

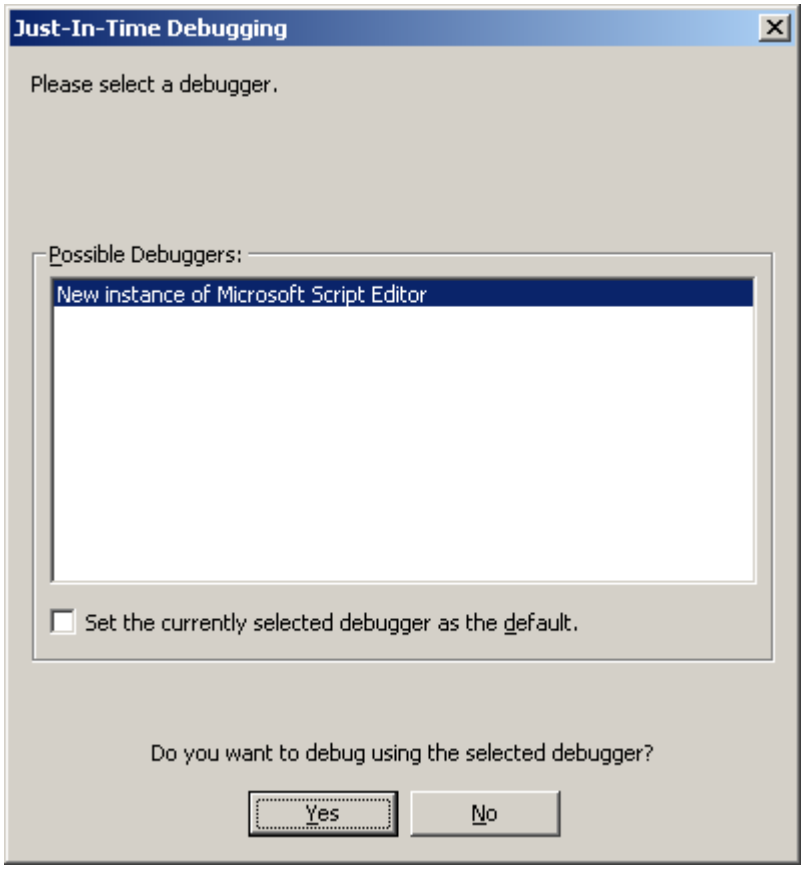
Microsoft Script Editor

The Microsoft Office XP component "Microsoft Script Editor" contains a Script Debugger. If the default configuration was installed by Microsoft Office Setup, the "Microsoft Script Editor" component is not installed until called the first time ("Installed on First Use"). If you wish to explicitly install these components, you must specify it in the Microsoft Office setup. Select the component selection menu, click"Web Debugging" component and then select the "Run from My Computer" option.

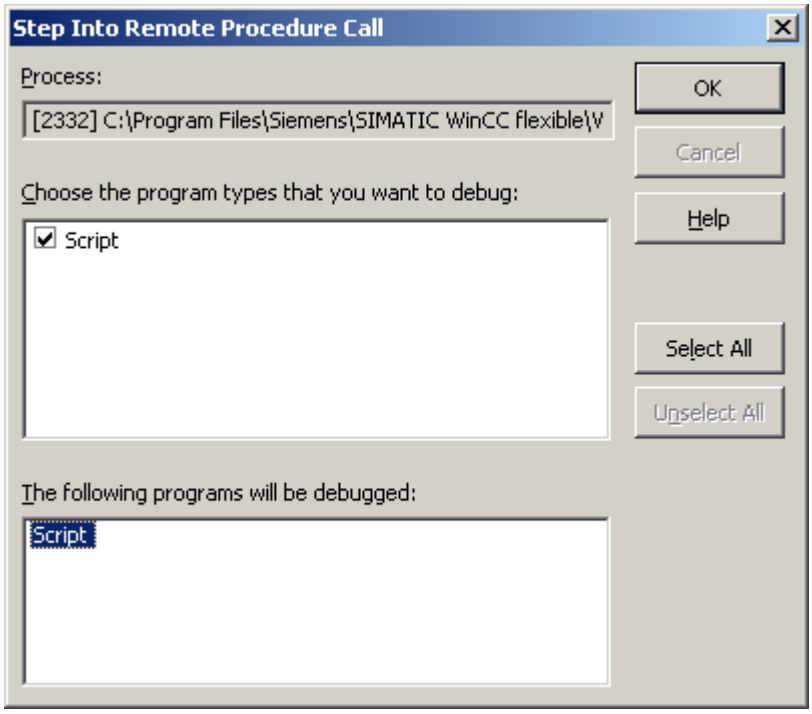


If a project is activated in WinCC via "Online > Simulate Runtime > With script debugger", a dialog containing the list of available script debuggers appears when the first user-defined function is run.

Other installed script debuggers such as "Microsoft Visual Interdev" or "Microsoft Visual Studio .NET" may also appear in the list. Select "Microsoft Script Editor" and confirm your selection with "Yes".



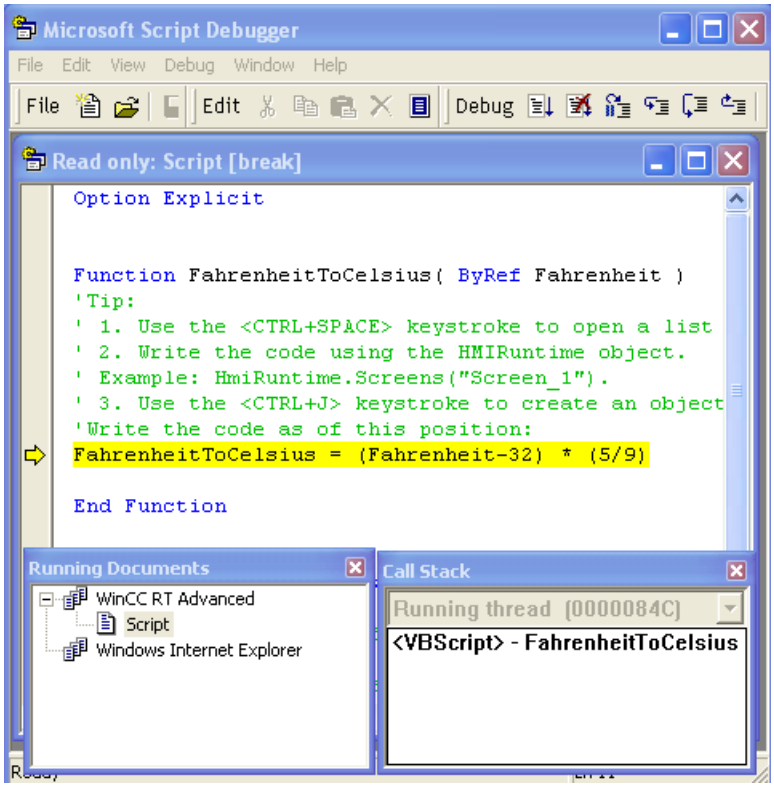
Activate the "Script" program object in the "Step Into Remote Procedure Call" dialog and confirm your selection with "OK".



The "Microsoft Script Editor" is launched. The execution pauses at the first line of the first function.

Microsoft Script Debugger

If a script debugger is not available, download "Microsoft Script Debugger" (scd10en.exe) free of charge from Microsoft (www.microsoft.com). It will be started automatically in WinCC once it is installed.



Note

The "Microsoft Script Debugger" can no longer be called or installed when another VBScript-capable script debugger is available on your computer.

12.8.5.3 Registering Microsoft Script Debugger (Panels, RT Advanced)

Introduction

Under Windows 7 / Windows 8, the Microsoft Script Debugger starts in the simulation only after it has been automatically entered once in the registry as the default script debugger.

Requirement

- Microsoft Script Debugger is installed on the configuration PC.
- You have administrator rights on the configuration PC.

Procedure

1. Open a command prompt with "Start > Run > cmd".
2. Enter the command: [File path]/Regserver, e.g.: "c:\Program Files\Microsoft Script Debugger\msscrdbg.exe/Regserver".

Once the Microsoft Script Debugger has been successfully registered as the default script debugger, you will see the following entries in the registry:

- "HKEY_CLASSES_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}]
  (Default)="ScriptDebugSvc Class"
  "AppID"="{A87F84D0-7A74-11D0-B216-080000185165}"
- [HKEY_CLASSES_ROOT\CLSID
  \{834128A2-51F4-11D0-8F20-00805F2CD064}\LocalServer32]
  (Default)="c:\\Program Files\\Microsoft Script Debugger\\msscrdbg.exe"
- [HKEY_CLASSES_ROOT\CLSID\{834128A2-51F4-11D0-8F20-00805F2CD064}\ProgID]
  (Default)="ScriptDebugSvc.ScriptDebugSvc.1"
- [HKEY_CLASSES_ROOT\CLSID
  \{834128A2-51F4-11D0-8F2000805F2CD064}\VersionIndependentProgID]
  (Default)="ScriptDebugSvc.ScriptDebugSvc"

The "LocalServer32" file path must point to the installation folder of Microsoft Script Debugger. If you have installed Microsoft Script Debugger in a different folder, adapt the path information.

Result

You have registered the Microsoft Script Debugger as the default script debugger. The Microsoft Script Debugger now starts automatically when Runtime is started.

12.8.5.4 Starting and stopping the debugger (Panels, RT Advanced)

Requirement

- VBScript-capable debugger (e.g., MS Script Debugger) and WinCC Runtime are installed on the configuration PC.
- Project is open.

Starting the debugger

To start the debugger, proceed as follows:

1. Select the HMI device and then select the "Online > Simulation > With script debugger" menu command.
   The Runtime software searches for debuggers installed on the configuration PC.
2. If several debuggers are found click on the one required.

Or:

1. Click "Start > Run".
2. Enter the following command: "HmiRtm /ScriptDebug /<ProjectFile>".
   Further information about the project file can be found in "Starting Runtime Advanced and Panels (Page 6319)".

Or:

1. Select the "debug" command in the project file shortcut menu in the Windows Explorer.

Result

The debugger is connected automatically with the runtime software.

Stopping the debugger

The debugger is not closed automatically when you close the Runtime software. Therefore, close the debugger separately.

12.8.6 Runtime behavior in Runtime (Panels, RT Advanced)

12.8.6.1 Executing a function list in Runtime (Panels, RT Advanced)

Principle

A function list is executed from top to bottom in Runtime. A distinction is made between synchronous and asynchronous execution, so that no waiting periods ensue during execution. The distinction is made by the system by evaluating the different runtimes of the system functions. User-defined functions are always executed synchronously independent of the runtime. If a system function returns an error status, the execution of the function list is cancelled.

Synchronous execution

During synchronous execution, the system functions in a function list are executed one after the other. The previous system function must be finished before the next system function can be executed.

Asynchronous execution

System functions that perform file operations such as saving and reading have a longer runtime than system functions that, for example, set a tag value.

Therefore, system functions with longer runtimes are executed asynchronously. For example, while a system function is writing a recipe data record to a storage medium, the next system function is already being executed. Due to the parallel execution of system functions, waiting periods at the HMI device are avoided.

12.8.6.2 Executing user-defined functions in Runtime (Panels, RT Advanced)

Principle

Only one user-defined function at a time is executed in Runtime. If several user-defined functions are waiting to be executed, they are lined up in a queue and executed one after the other.

Note

A loop in a user-defined function therefore blocks the execution of the other functions in the queue even if the functions were initiated asynchronously.

WinCC supports a maximum nesting depth of eight user-defined functions. Note that the nesting depth is not checked.

Note

If a user-defined function is configured for the "Runtime stop" event, the only system functions that may be used in this user-defined function are those which are available at the "Runtime stop" event.

Ensure that the ending of the Runtime is not interfered with by the execution of the user-defined function.

Note

Configuration of user-defined functions

During configuration make sure that not too many user-defined functions are activated at the same time. Avoid a continuous system load of 100%.

User-defined functions are processed at a lower priority so as not to interfere with the display of values and operability. If system utilization is extreme, the user-defined functions to be executed are therefore first only reserved for execution. The maximum size of the reservation list is dependent on the HMI device and is limited by the maximum permitted number of user-defined functions. For additional information, see the performance features. If more user-defined functions are activated at one time than can be reserved, excess calls are discarded and a system alarm displayed.

HMI device changeover

If you use system functions in a customized function which are not available on the set HMI device, you get a warning. In addition, the corresponding system function in the user-defined function will be underlined with a wavy blue line.

See also

Runtime Stop (Page 5999)

12.8.6.3 Processing sequence for user-defined functions and system functions (Panels, RT Advanced)

⚠ WARNING
Adherence to the expected processing sequence for user-defined functions and system functions in Runtime cannot always be guaranteed. This fact may lead to unexpected operating states. Please note the following description in which the correlations are explained. Instructions for a solution are available under "Remedy".

Use of user-defined functions for events

It is not always possible to adhere to the processing sequence for user-defined functions and system functions expected in the configuration, for example, when the processing of a user-defined function lasts beyond the trigger time of a subsequent event. In this case, system functions that are configured for the following event may be executed before the system functions that were configured with the user-defined function for the same event.

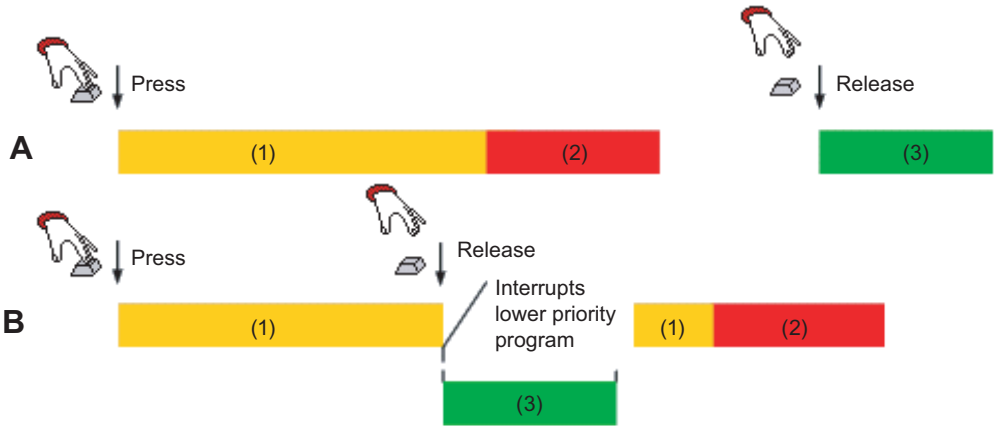
Background

User-defined functions are arranged in a low-priority queue. The queue is processed in sequence. If system functions and user-defined functions are configured for an event, all system functions and user-defined functions configured for this event are executed in this queue.

Example

On a button, you have configured:

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	ResetBit(Tag) (3)



(1) Execution time of the user-defined function

(2) Execution time of system function SetBit(Tag)

(3) Execution time of system function ResetBit(Tag)

A: Expected execution of the user-defined function and system functions in the configuration.

When you press the button, user-defined function (1) and then system function SetBit(Tag) (2) are executed. When you release the key, system function ResetBit(Tag) (3) is then executed.

B: Processing of the user-defined function is not yet complete when you release the key.

When you press the key, the user-defined function (1) is then executed. The execution of the user-defined function (1) is not yet complete and you have already released the key. System function ResetBit(Tag) (3) interrupts the execution of the function. In this case, system function ResetBit(Tag) (3) is executed before system function SetBit(Tag) (2). As a result, the bit remains placed.

System function "SetBitWhileKeyPressed" shows the same behavior, if the system function is configured together with user-defined functions.

Remedy

The processing sequence of the previous Example A is adhered to, if you additionally configure a user-defined function for the "Release" event. The user-defined function does not require functionality for this purpose.

	Event	Functions
	Press	User-defined function (1) SetBit(Tag) (2)
	Release	User-defined function_2 (3) ResetBit(Tag) (4)

Note

Make sure that the user-defined function queue does not overflow; otherwise the system function for the following event may not be executed.

An overflow is recognizable by "Overload: Script <name> is rejected" or "Adherence to the expected processing order for user-defined functions and system functions in Runtime cannot always be ensured".

12.8.6.4 Making object properties dynamic in Runtime (Panels, RT Advanced)

Introduction

You can use user-defined functions to access object properties of screen objects as well as tags in Runtime. If you use a user-defined function to change values of object properties, this will not affect the project data.

Changes to object properties

If you use a user-defined function in Runtime to change an object property of a screen element, this change will only remain effective while the screen is active. If you change to the screen, or reload the screen, the configured object properties are displayed once more.

Language switching

If you switch the language in Runtime, the foreign language labels are loaded from the project data. If you use a user-defined function to change texts, the texts changed by the user-defined function are overwritten again.

12.8.7 Examples (Panels, RT Advanced)

12.8.7.1 Example: Converting Fahrenheit into degrees Celsius (Panels, RT Advanced)

Scheduled task

In this example, create a user-defined VB function which converts the values of a temperature sensor from Fahrenheit to degrees Celsius. The temperature is displayed in an output field on the HMI device.

Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

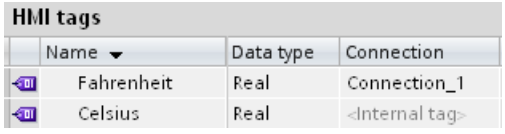
Name	PLC connection	Type
Fahrenheit	Yes	Real
Centigrade	No	Real

User-defined VB function:

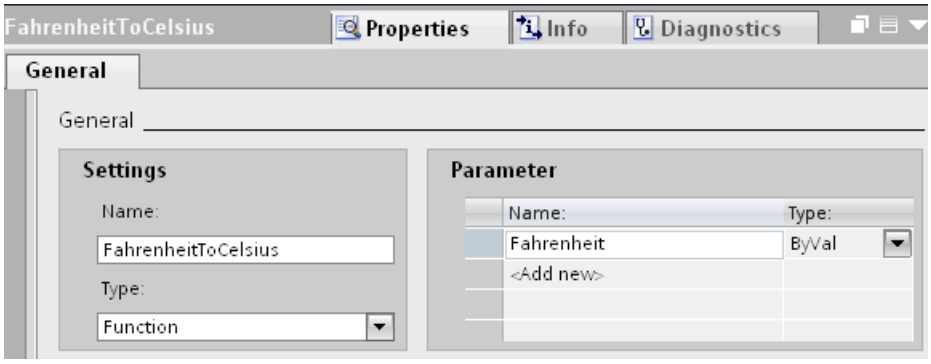
Name	Type	Parameters
FahrenheitToCelsius	Function	Fahrenheit

Procedure

1. Create the two HMI-tags "Fahrenheit" and "Celsius" with the settings named above.

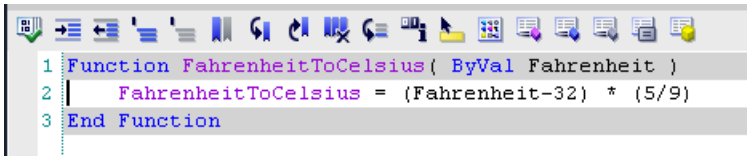


2. Create the user-defined VB function "FahrenheitToCelsius" with the settings given above.



3. Write the following VBS code:

```
FahrenheitToCelsius = (Fahrenheit-32) * (5/9)
```



Interim result

The HMI tags and the VB user-defined function are created.

Procedure

1. Open the "HMI Tag"editor and click on the "Fahrenheit" tag.
2. Click the "Properties > Events" tab in the Inspector window. Select the "Value change" event.

3. Configure the user-defined VB function "FahrenheitToCelsius" to the "Value change" event.
4. Select the tag "Fahrenheit" for the parameter "Fahrenheit".
5. Select the HMI-tag "Celsius" for the return value "Fahrenheit to Celsius".
6. Configure an output field in a screen and connect it with the tag "Celsius".

Alternative procedure

Instead of using a user-defined VB function of the "Function" type, you can also use the "Sub" type. In this case, assign the converted value directly to the HMI-tag "Celsius".

```
SmartTags("Celsius") = (Fahrenheit-32) * (5/9)
```

In this case the return value of the user-defined VB function is not applicable.

Result

When the tag value of "Fahrenheit" changes in Runtime, the user-defined VB function "Fahrenheit to Celsius" is performed. The converted temperature value is returned to the HMI-tag "Celsius" and displayed in the output field.

12.8.7.2 Example: Converting inches into meters (Panels, RT Advanced)

Scheduled task

In this example you create a user-defined VB function that converts the value of a length measuring system from inches into meters. The length in meters is displayed on the HMI device in an output field.

Settings

For the example you need two HMI tags and a user-defined VB function with the following settings:

HMI tags:

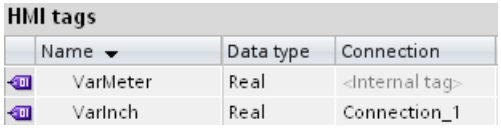
Name	PLC connection	Type
VarInch	Yes	Real
VarMeter	No	Real

Customized VB function

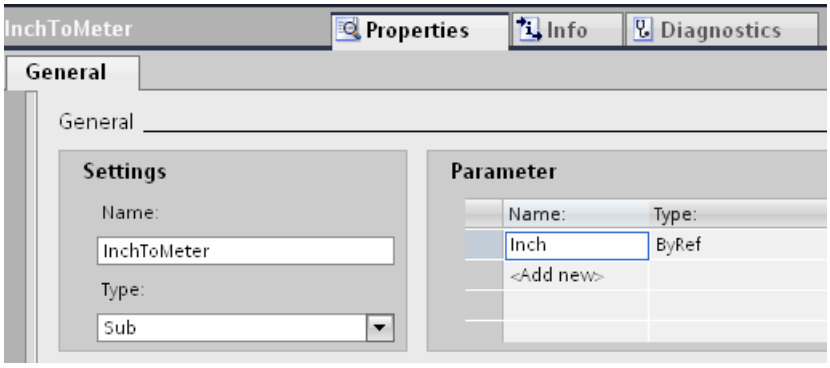
Name	Type	Parameters
InchToMeter	Sub	Inch

Procedure

1. Create the two HMI tags "VarInch" and "VarMeter" with the above settings.

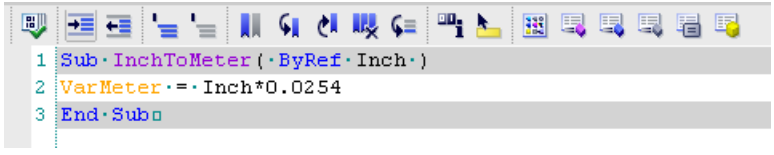


2. Create the user-defined VB function "InchToMeter" with the settings given above.



3. Write the following VBS code:

```
VarMeter = Inch*0.0254
```



Interim result

The tags and the user-defined VB function are created.

Procedure

1. Open the "HMI tags" editor and click the "VarInch" tag.
2. Click "Properties> Events" in the Inspector window. Select the "Value change" event.
3. Configure the user-defined VB function "InchToMeter" to the "Value change" event.
4. Select the "VarInch" HMI tag for the "Inch" parameter.
5. Configure an output field in a screen and connect it with the "VarMeter" HMI tag.

Result

When the tag value of "VarInch" changes in Runtime, the "InchToMeter" user-defined VB function is performed. The calculated value is written into the "VarMeter" HMI tag and displayed in the output field.

12.8.7.3 Example: Changing the operating mode on the HMI device with the current display (Panels, RT Advanced)

Scheduled task

In this example, you use the "SetDeviceMode" system function to switch between the "online" and "offline" modes on the HMI device. You also display the current set operating mode on the HMI device.

Requirements

A screen has been created.

Settings

For this example you require a HMI-tag and a text list with the following settings:

HMI tag:

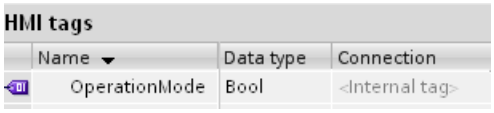
Name	PLC connection	Type
OperatingMode	No	Bool

Text list:

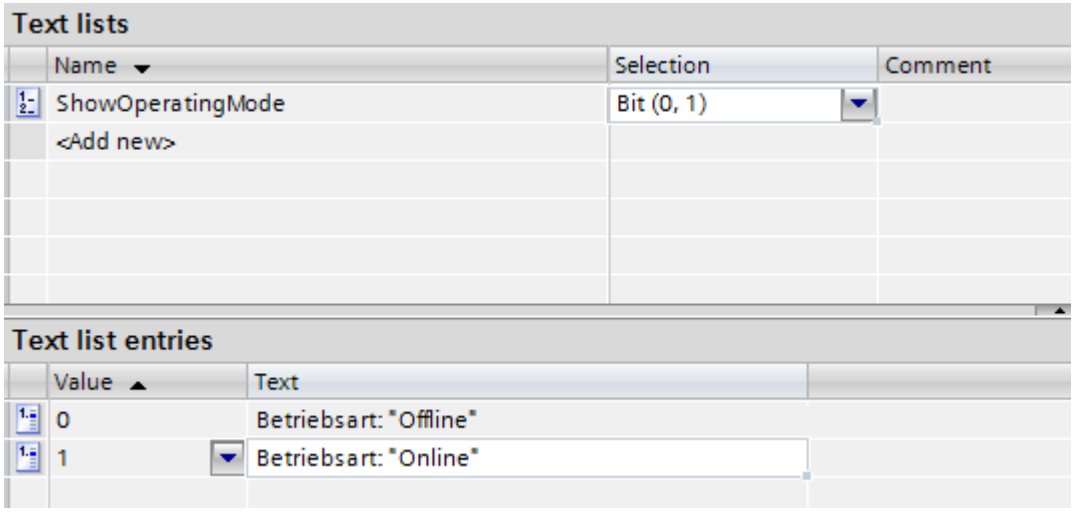
Name	Contains	Values
ShowOperatingMode	Bit (0/1)	1: Operating mode: "Online" 0: Operating mode: "Offline"

Procedure

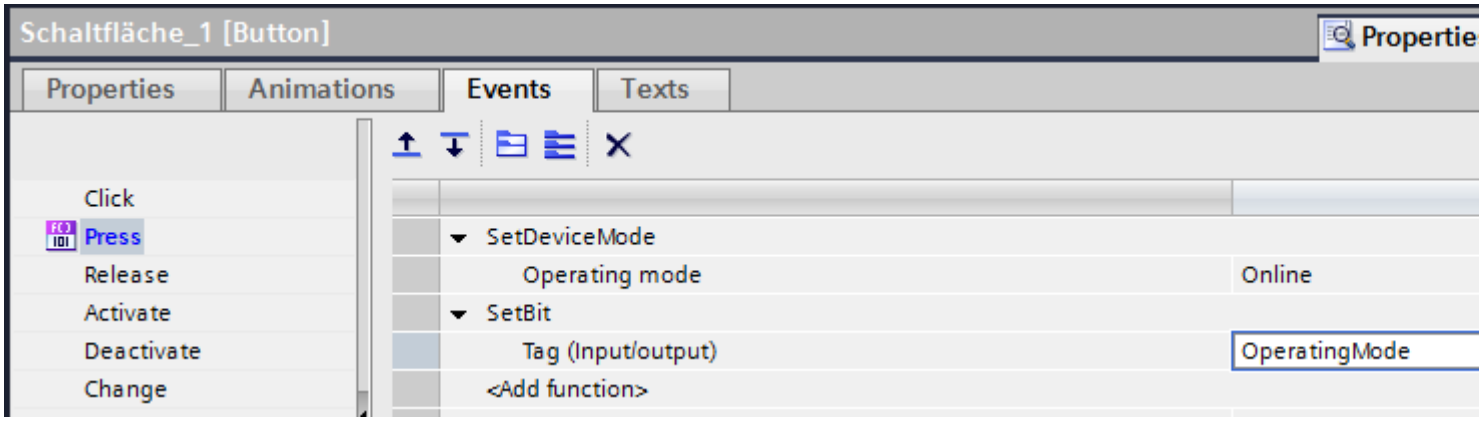
1. Create the "OperatingMode" HMI-tag indicated above.



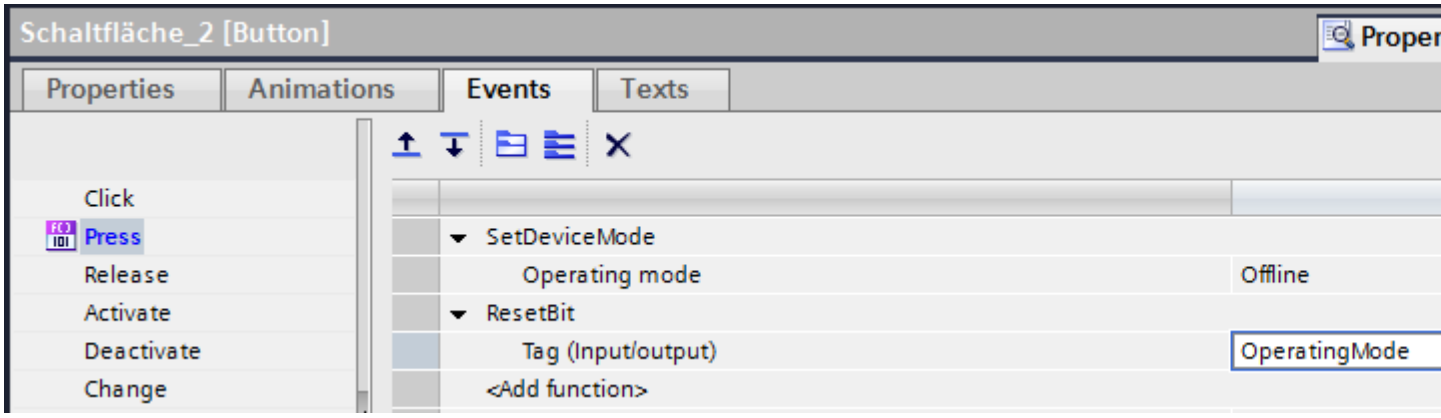
2. Create the "ShowOperatingMode" text list indicated above.



3. Open the screen and insert a button for which you configure the operating mode change to "online".
4. Click "Properties> Events" in the Inspector window. Select the "Press" event.
5. Configure the "SetDeviceMode" system function for the "Press" event. The system function is found in the selection list under "Settings".
6. For the "Mode" parameter, select the "Online" entry.
7. Configure the system function "SetBit" on the event "Press". The system function is found in the selection list under "Bit processing".
8. Select the HMI-tag "Operating mode" from the selection list for the parameter "Tag".



9. Add a button in the process screen for which you configure the operating mode change to "offline".
10. Repeat steps four to seven. For the "Mode" parameter, select the "Offline" entry. Configure the system function "ResetBit" in place of the system function "SetBit."



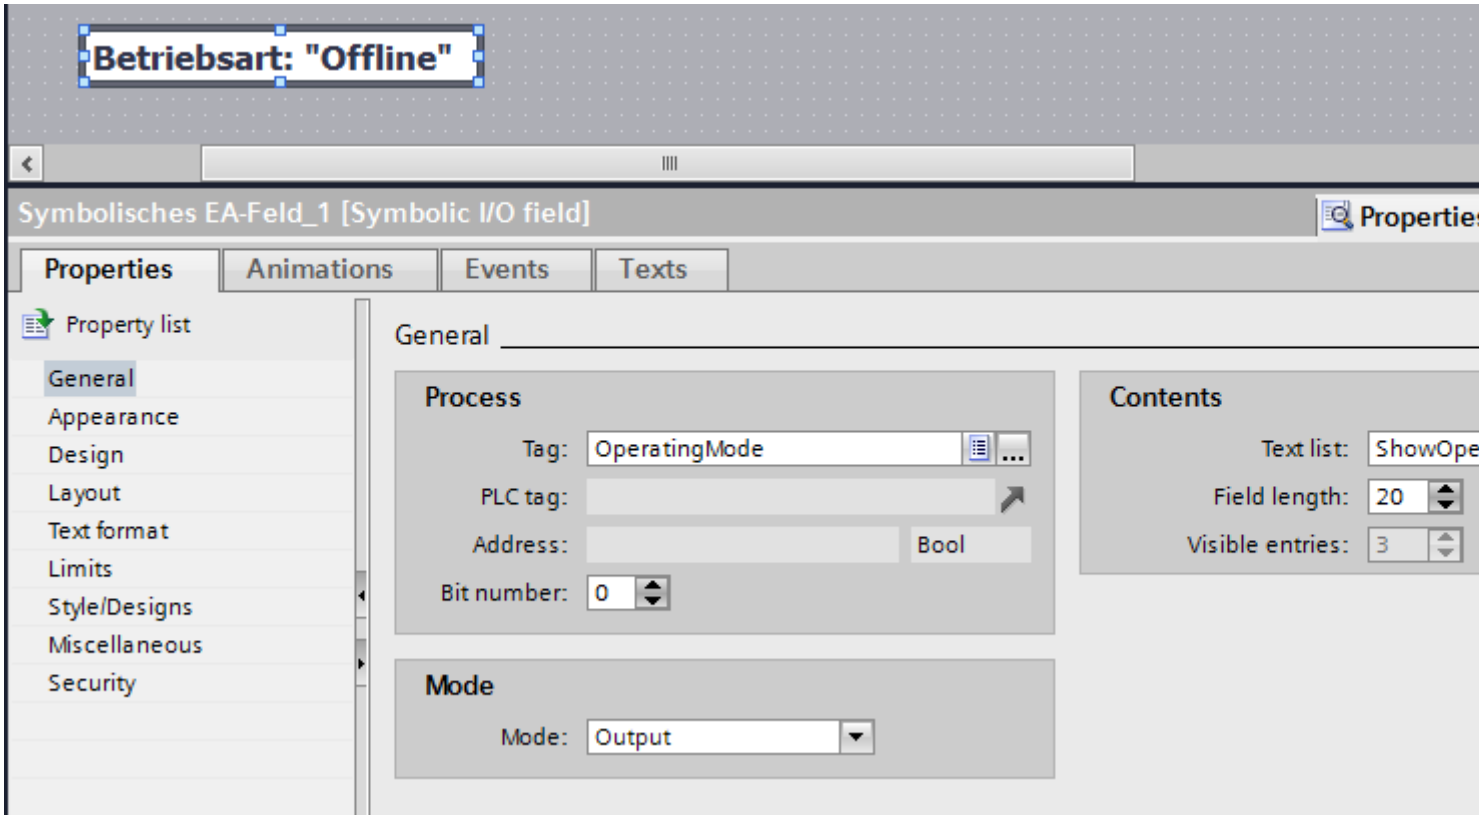
Interim result

You can toggle the operating mode of the HMI device with the two buttons in Runtime.

You want to display the current set operating mode in an output field on the HMI device.

Procedure

1. Create a "Symbolic I/O field" in the process image. Click "Properties > Properties" in the Inspector window.
2. Make the following settings in the "General" group:
   - Select "Output" as the "Mode".
   - Select the text list "Show operating mode" as "Text list".
   - Select "Operating mode" as "Tag".



Result

When you change the operating mode with the buttons, the currently set operating mode on the HMI device is always shown.

1) Not available for devices as of device version V14.0 and higher

System functions (Panels, RT Advanced)

Other functions (Panels, RT Advanced)

ActivateScreen (Panels, RT Advanced)

Description

Performs a screen change to the given screen.

Use the "ActivateScreenByNumber" system function to change from the root screen to the permanent area or vice versa.

Use in the function list

ActivateScreen (Screen name, Object number)

Use in user-defined functions

ActivateScreen (Screen_name, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Name of the screen to which you change.

Object number

The operator control element which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent area when the system function is called up, the permanent area maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

Note

If the "Reach margin" event is assigned to the "ActivateScreen" system function, only the value "0" is valid for the "Object number" parameter. The active object is not defined by the object number, but rather by the X position it had prior to the screen change.

Example

The following program code activates "Screen_2" with the ActivateScreen function, for example, when you click a button.

```
Sub ActivateScreen_2()

'User-defined code
'' i. e. when pressing a button

ActivateScreen "Screen_2",0
```

See also

ActivateScreenByNumber (Page 5787)

Availability for specific devices of system functions (Page 5739)

ActivateScreenByNumber (Panels, RT Advanced)

Description

Performs a screen change to a screen depending on a tag value.

The screen is identified by its screen number.

Use in the function list

ActivateScreenByNumber (Screen number, Object number)

Use in user-defined functions

ActivateScreenByNumber (Screen_number, Object_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen number

Tag which contains the screen number of the destination screen.

When a change from the root screen to the permanent area is desired, specify "0" or "-1":

0 = Change from root screen to permanent area.

-1 = Change from permanent area to root screen

Object number

The number of the screen object which receives the focus in the given screen after the screen change. The number of the operator control element is to be determined using the tabulator sequence during configuration.

When "0" is specified:

- If the focus is in the permanent area when the system function is called up, the permanent area maintains the focus.
- If the focus is in the root screen when the system function is called up, the first operator control element in the given screen receives the focus.

See also

ActivateScreen (Page 5785)

Availability for specific devices of system functions (Page 5739)

ActivatePreviousScreen (Panels, RT Advanced)

Description

Performs a screen change to the screen which was activated before the current screen. The screen change is not performed if no screen was activated beforehand.

The last 10 screens that were called up are saved. A system alarm is output when you change to a screen which is no longer saved.

Note

If you want to use the system function, the screen to which you change has to be used in the navigation structure.

Use in the function list

ActivatePreviousScreen

Use in user-defined functions

ActivatePreviousScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

UpdateTag (Panels, RT Advanced)

Description

Reads the current value of the tag with the specified Update ID from the PLC.

Use in the function list

UpdateTag (Update ID)

Use in user-defined functions

-

Parameters

Update ID

Update ID assigned to the tag that will be updated.

See also

Logoff (Page 5831)

Availability for specific devices of system functions (Page 5739)

Encode (Panels, RT Advanced)

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

Use in the function list

Encode (Byte array, String, Coding)

Use in user-defined functions

Encode (Byte_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

See also

Availability for specific devices of system functions (Page 5739)

EncodeEx (Panels, RT Advanced)

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

Use in the function list

EncodeEx (Byte-Array, String, Encoding, Line break)

Use in user-defined functions

EncodeEx (Byte_array, String, Encoding, Line_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encoding

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n' (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n' (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

See also

Availability for specific devices of system functions (Page 5739)

DirectKey (Panels, RT Advanced)

Description

Allows rapid operation of keys on an HMI device without having communication caused delays occur.

Use this system function, for example. to set bits in the I/O area of a SIMATIC S7 directly from the HMI device.

Note

If you have integrated WinCC in SIMATIC STEP 7 and have configured a DP area in SIMATIC STEP 7: When the button on which the system function was configured is activated, a bit is set in the IO area of the CPU. Releasing the button resets the bit.

Notes on configuring the system function

When a button is configured with the "DirectKey" system function, a fixed area of the touch display is reserved for DirectKey operation.

Screen objects that are above the button with the "DirectKey" system function in this area in runtime will hide the button visually. However, the screen objects do not interfere with the triggering of the "DirectKey" system function.

Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the "DirectKeyScreenNumber" function is no longer set and the keys or buttons which are assigned the "DirectKey" function no longer to trigger the associated bit in the PLC.

WARNING

Triggering the "DirectKey" system function by mistake will endanger personnel or result in damage to the machine.

In order to avoid this danger, the following must be observed:

- When the process screen is configured, the button with the "DirectKey" system function must not be covered by a screen object.
- The dynamic positioning or display (release) of a screen object in relation to process values must not cover the button with the "DirectKey" system function in runtime.

Note

Please observe this guideline during configuration. Check also existing configurations and adjust them immediately.

In the following cases, the covering of a button with the "DirectKey" system function does not lead to the problems described above:

- Operation of the alarm window
- Operation of the Recipe view
- Cancellation of the screen saver
- Use of the screen keyboard
- Running the "ActivateCleanScreen" system function

Actions of DP direct-keys in offline operation

When the "ChangeConnection" system function is performed with the "Offline" parameter on the HMI device, the connection to the specified PLC is disconnected.

Note

Please note the following on the SIMATIC STEP 7 side as well as the WinCC side:

The DP DirectKeys are still active in this case. If you activate a button with the "DirectKey" system function in "Offline" operating mode or activate the DirectKey on a keyboard device, the corresponding bit is set in the PLC.

Use in the function list

DirectKey (Bit)

Use in user-defined functions

-

Parameters

Bit

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

Application example

Objective

You want to set bits in the IO area of a SIMATIC S7 directly from the HMI device using a button.

Requirement

WinCC integrated in SIMATIC STEP 7 is installed.

During operation, the HMI device is coupled to a SIMATIC S7 through PROFIBUS-DP.

WinCC integrated was installed when you compiled your project.

The bit area for DirectKeys is determined in SIMATIC STEP 7. For configuration see the "Communication" user's manual.

Notes on configuring

Configure the button to be used as the DirectKey. Assign the "DirectKey" system function to the button. As a parameter, enter the number of the bit which is set when the key is pressed.

Procedure on HMI device

When the DirectKey is touched, the bit is set, and reset when the key is released or the screen is exited.

See also

Availability for specific devices of system functions (Page 5739)

DirectKeyScreenNumber (Panels, RT Advanced)

Description

Sets the bit within the given bit area of a DirectKey and transfers it to the S7 controller to which the HMI device is connected. This ensures unambiguous allocation of a control bit to screen number at all times.

Without the use of the system function, the S7 controller must distinguish the respective functionality by means of the screen number. This delays the updating of the screen number after a screen change.

Note

If an external application, such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. Nevertheless, the bit for the "DirectKeyScreenNumber" function is set and the keys or buttons with the configured "DirectKey" function continue to trigger the associated bit in the PLC.

Use in the function list

DirectKeyScreenNumber (Bit)

Use in user-defined functions

-

Parameters

Bit

Specifies the bit which is set. Depending on the HMI device, the bit numbers 0 to 31 or 0 to 39 are possible.

See also

Availability for specific devices of system functions (Page 5739)

NotifyUserAction (Panels, RT Advanced)

Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

Use in user-defined functions

NotifyUserAction (Confirmation_type, Mandatory_commenting, Category, Object_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

Category

Category or class name of the modified object

Object name

Name of the modified object

Description

Text which describes the archiving user action.

See also

Availability for specific devices of system functions (Page 5739)

IncreaseFocusedValue (Panels, RT Advanced)

Description

Adds the given value to the value of the tag which is connected to the input field (drop-down list, graphic selection list, slider bar) which has the current focus.

This system function can only be used for function keys.

Use in the function list

IncreaseFocusedValue (Value)

Use in user-defined functions

-

Parameters

Value

The value which is added to the tag value.

See also

Availability for specific devices of system functions (Page 5739)

SafelyRemoveHardware (Panels)

Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

Use in the function list

SafelyRemoveHardware(Path, Result)

Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system alarm will be output.

FALSE : The storage medium cannot be removed safely. A corresponding system alarm will be output.

Path

Path of storage medium, e.g. \Storage Card USB\

See also

Availability for specific devices of system functions (Page 5739)

OpenControlPanelDialog (Panels, RT Advanced)

Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

Note

Project security

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

Use in the function list

OpenControlPanelDialog (Dialog)

Use in user-defined functions

-

Parameters

Dialog

Sets the Control Panel dialog to be opened.

- PROFINET_X1: Setting of the IP address and Ethernet parameters
- PROFINET_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

See also

Availability for specific devices of system functions (Page 5739)

OpenCommandPrompt (Panels, RT Advanced)

Description

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

Use in the function list

OpenCommandPrompt

Use in user-defined functions

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

OpenInternetExplorer (Panels, RT Advanced)

Description

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

Note

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

Use in the function list

OpenInternetExplorer (Start page)

Use in user-defined functions

OpenInternetExplorer (Start_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Start page

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

See also

Availability for specific devices of system functions (Page 5739)

OpenControlPanel (Panels, RT Advanced)

Description

Opens the window that displays the Windows CE control panel. You cannot use this system function on a PC.

This system function enables you to set the following on the Windows CE-based HMI device:

- Select printer
- Select transfer properties

- Configure screen saver
- Configure flash memory

Note

No backup or restore during Runtime

Backup and restore functions may only be executed if Runtime has been terminated. Otherwise, this could result in undesired effects, such as display errors.

Use in the function list

OpenControlPanel

Use in user-defined functions

OpenControlPanel

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

TerminatePROFIsafe (Panels, RT Advanced)

Description

Disconnects the PROFIsafe connection for fail-safe operation between a KTP Mobile Panel and the PLC.

After execution of the system function "TerminatePROFIsafe", the connector of the KTP Mobile Panel can be removed from the PLC without the system signaling an error.

Use in the function list

TerminatePROFIsafe

Use in user-defined functions

TerminatePROFIsafe

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

--

SendEMail (Panels, RT Advanced)

Description

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

Note

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

Use in the function list

SendEMail (Address, Subject, Text, Return address)

Use in user-defined functions

SendEMail (Address, Subject, Text, Return_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Address

The e-mail address of the addressee.

Subject

The subject line of the e-mail.

Text

The text sent in the e-mail.

Return address

The e-mail address to which the addressee of this e-mail should send the reply.

See also

Availability for specific devices of system functions (Page 5739)

SetDaylightSavingTime (Panels, RT Advanced)

Description

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

Note

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

Note

Windows 7

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

Use in the function list

SetDaylightSavingTime(DaylightSavingTime)

Use in user-defined functions

SetDaylightSavingTime (Daylight_saving_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Daylight Saving Time

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

See also

Availability for specific devices of system functions (Page 5739)

PressButton (Panels, RT Advanced)

Description

You configure the system function to the function keys of an HMI device. The system function "PressButton" triggers the function that is assigned to the event "PressKey" at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, the "ReleaseButton" system function is configured on the "Release" event for the same function key.

Use in the function list

PressButton (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object on which the event is triggered.

See also

Availability for specific devices of system functions (Page 5739)

ReleaseButton (Panels, RT Advanced)

Description

The system function can only be configured on the function keys of an HMI device and triggers the "Release button" event at the specified screen object.

Use this system function when you want to operate a button in a screen with a function key of the HMI device, for example.

Note

The "PressButton" and "ReleaseButton" system functions must always be configured together. If you configure the "PressButton" system function on the "Press key" event for a function key, then the "ReleaseButton" system function is configured on the "Release key" event for the same function key.

Use in the function list

ReleaseButton (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object on which the event is triggered.

See also

Availability for specific devices of system functions (Page 5739)

BackupRAMFileSystem (Panels, RT Advanced)

Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

Use in the function list

BackupRAMFileSystem

Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

SimulateSystemKey (Panels, RT Advanced)

Description

Simulates the behavior of a system key. Use this system function if a system key, such as the "ACK" key, "Input" key or the number pad is not available on the HMI device.

Use in the function list

SimulateSystemKey (System key)

Use in user-defined functions

-

Parameters

System key

System key whose behavior is to be simulated.

System key "+/-"

With the SimulateSystemKey system function, the system key "+/-" is only supported for the following HMI devices:

- KP300 Basic
- KP400 Basic
- KTP400 Basic mono PN
- KTP400 Basic color PN
- KTP400 Basic color PN Portrait
- KTP600 Basic mono PN
- KTP600 Basic color PN
- KTP600 Basic color DP
- KTP700 Basic PN / DP
- KTP900 Basic PN

- KTP1000 Basic PN
- KTP1000 Basic DP
- KTP1200 Basic PN / DP
- Comfort Panels

Use the system keys "+" and "-" separately for all other HMI devices.

See also

Availability for specific devices of system functions (Page 5739)

SimulateTag (Panels, RT Advanced)

Description

Simulates the behavior of tags and dynamic objects such as text lists, without having the HMI device connected to a PLC. You can, for example, configure the system function to the "Loaded" event of a screen.

This system function is used, for example, to demonstrate the functionality of a project.

Only tags of the data type Integer can be used for simulation. Tags of the data types Integer and Double Integer, however, can be used with OP 73, OP 77A, TP 177A.

Note

If you use the system function "SimulateTag" with a short cycle time on a Basic Panel, the HMI device may be overloaded.

Use in the function list

SimulateTag (Tag, Cycle, Maximum value, Minimum value, Value)

Use in user-defined functions

-

Parameter

Tag

The tag whose value is changed.

Cycle

The factor by which the basic cycle of 200 milliseconds is multiplied. The cycle defines when the tag value is changed by the specified value. Possible cycles between 1 and 32767.

Maximum value

The maximum value that the tag can assume during simulation. The maximum value must be greater than the minimum value but less than / equal to 32767.

Minimum value

The minimum value that the tag can assume during simulation. The minimum value must be lower than the maximum value but greater than / equal to -32768.

Value

The value by which the tag value is changed during each cycle. Possible values between -32768 and 32767.

- A positive value increases the tag value. When the maximum value is reached, the tag value is set to the minimum value after the next update cycle.
- A negative value reduces the tag value. When the minimum value is reached, the tag value is set to the maximum value after the next update cycle.

See also

Availability for specific devices of system functions (Page 5739)

StartProgram (Panels, RT Advanced)

Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

Use in the function list

StartProgram (Program name, Program parameters, Display mode, Wait for program to end)

Use in user-defined functions

StartProgram (Program_name, Program_parameters, Display_mode, Wait_for_program_to_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

Display mode

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

See also

Availability for specific devices of system functions (Page 5739)

StatusForceGetValues (Panels, RT Advanced)

Description

Starts or stops the updating of values in the watch table. The values are read from the PLC connected to the HMI device until the update is stopped.

Note

As long as the values are updated, no entries are possible in the input fields of the watch table.

Use in the function list

StatusForceGetValues (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the watch table to which data from the PLC is written.

See also

Watch table (Page 5200)

Availability for specific devices of system functions (Page 5739)

StatusForceSetValues (Panels, RT Advanced)

Description

Writes the values from the watch table to the PLC to which the HMI device is connected.

Use in the function list

StatusForceSetValues (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the watch table from which data is written to the PLC.

See also

Watch table (Page 5200)

Availability for specific devices of system functions (Page 5739)

ControlSmartServer (Panels, RT Advanced)

Description

Starts or stops the Sm@rtServer.

Use in the function list

ControlSmartServer (Mode)

Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

See also

Availability for specific devices of system functions (Page 5739)

ControlWebServer (Panels, RT Advanced)

Description

Starts or stops the Web server.

Use in the function list

ControlWebServer (Mode)

Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

See also

Availability for specific devices of system functions (Page 5739)

StopRuntime (Panels, RT Advanced)

Description

Exits the runtime software and thereby the project running on the HMI device.

Use in the function list

StopRuntime (Mode)

Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

Example

The following program code shuts down Runtime and the operating system.

```
{

//Stop runtime and shutdown
StopRuntime (hmiStopRuntimeAndOperationSystem);

}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 5739)

LookupText (Panels, RT Advanced)

Description

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

Use in the function list

LookupText (Output text, Index, Language, Text list)

Use in user-defined functions

LookupText (Output_text, Index, Language, Text_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Output text

The tag to which the result is written.

Index

The tag that defines the value of the list entry.

Language

Defines the runtime language in which the list entry is identified.

- Runtime language
  Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.
- Tag
  The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- Integer
  The number that corresponds to the order of runtime languages for language switching. The selection depends on the activated runtime languages, for example, "0" for the language that appears when you first start runtime. You can find more information under the topic of "Languages in Runtime".

Text list

Defines the text list. The list entry is read from the text list.

See also

Availability for specific devices of system functions (Page 5739)

ResetTagToHandWheel (Panels, RT Advanced)

Description

Separates the tag that is connected with the operating element handwheel, and reconnects the handwheel with the global tags.

Use in the function list

ResetTagToHandWheel

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 5739)

SetTagToHandWheel (Panels, RT Advanced)

Description

Connect the tag with the operating device handwheel If the handwheel is operated, the tag value changes. The connection can be reset using the "ResetTagToHandWheel" system function.

Use in the function list

SetTagToHandWheel (Value)

Use in user-defined functions

-

Parameters

Value

Tag names which are connected to the operating device handwheel.

See also

Availability for specific devices of system functions (Page 5739)

DecreaseFocusedValue (Panels, RT Advanced)

Description

Subtracts the specified value from the value of the tag which is connected to the screen object and currently has the focus.

This system function can only be used for function keys.

Use in the function list

DecreaseFocusedValue (Value)

Use in user-defined functions

-

Parameters

Value

The value which is subtracted from the tag value.

See also

Availability for specific devices of system functions (Page 5739)

ShowOperatorNotes (Panels, RT Advanced)

Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the button

Use in the function list

ShowOperatorNotes (Layout)

Use in user-defined functions

ShowOperatorNotes (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 5739)

ShowSoftwareVersion (Panels, RT Advanced)

Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

Use in the function list

ShowSoftwareVersion (Display mode)

Use in user-defined functions

ShowSoftwareVersion (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 5739)

ShowPopupScreen (Panels, RT Advanced)

Description

Opens the pop-up-screen, for example, when a button is pressed.

You can enter a constant value or assign a tag as coordinates.
If the configured pop-up screen is not visible or only partially visible, the coordinates are set to 0.0.

Regardless of the size of the permanent area, the start position of the coordinates is always 0.0.

Use in the function list

ShowPopupScreen (Name of the screen, X coordinate, Y coordinate, Display mode, Animation, Animation speed)

Use in user-defined functions

ShowPopupScreen (Name of the Screen, X coordinate, Y coordinate, Display mode, Animation, Animation speed)

Parameters

Name of the screen

Specifies the name of the pop-up screen that appears in Runtime when a button is pressed.

X coordinate

Position of the pop-up screen in the current screen on the X axis

Y coordinate

Position of the pop-up screen in the current screen on the X axis

Display mode

Specifies the mode for the pop-up screen:

Switching

Off

On

Animation

Specifies the direction from which the pop-up screen is shown:

Off

Left

Top

Right

Bottom

Animation speed

Specifies the speed at which the pop-up screen is shown:

Slow

Medium

Fast

See also

System functions for Runtime Advanced (Page 5780)

Availability for specific devices of system functions (Page 5739)

ShowPopupScreenSizable (Panels, RT Advanced)

Description

Opens the pop-up screen with a defined size. You can open a pop-up screen in a different size with this system function; the scroll bars are displayed for navigating in the content of the pop-up screen.

You can enter a constant value or assign a tag as coordinates. If the configured pop-up screen is not visible or only partially visible, the coordinates are set to 0.0. Regardless of the size of the permanent area, the start position of the coordinates is always 0.0.

You also define the displayed width and height of the pop-up screen, which can deviate from the sizes of the configured pop-up screen. The scroll bars are displayed in the pop-up screen in this case.

Note

Operation on HMI devices with keys

You scroll in pop-up screens using the keyboard shortcut <ALT>+<arrow key>.

Display only one scroll bar

If you specify only one of the sizes smaller than the size of the configured pop-up screen in the parameters of the system function, the two scroll bars are displayed in the pop-up screen. You have two options to configure only one scroll bar in the pop-up screen:

- Reduce the width/height of the configured pop-up screen by the size of the device-specific scroll bar.
- Specify a value that corresponds to the actual size of the pop-up screen for one of the size parameters and add the device-specific size of the scroll bar. You specify the value for the other size as needed.
  Example:
  You want to open a pop-up screen with the configured size of 500 x 420 in the size 500 x 300 with a vertical scroll bar. Specify the value 534 for the width parameter which corresponds to the actual width of the configured pop-up screen plus the size of the scroll bar of 34. Enter the value 300 for the height. The pop-up screen is opened in the size 500 x 300 in Runtime and only the vertical scroll bar is displayed.

Device type (version V14)	Width	Height
HMI devices with 4" display Comfort Panels with 19" display Runtime Advanced	25	25
HMI devices with 9" display Comfort Panels with 15" display Comfort Panels with 22" display	27	27
HMI devices with 7" display HMI devices with 12" display	34	34

Use in the function list

ShowPopupScreenSizable (Name of the screen, X coordinate, Y coordinate, Width, Height, Display mode, Animation, Animation speed)

Use in user-defined functions

ShowPopupScreenSizable (Name of the Screen, X coordinate, Y coordinate, Width, Height, Display mode, Animation, Animation speed)

Parameters

Name of the screen

Specifies the name of the pop-up screen that appears in Runtime when a button is pressed.

X coordinate

Position of the pop-up screen in the current screen on the X axis

Y coordinate

Position of the pop-up screen in the current screen on the X axis

Width

Specifies the width of the pop-up screen. The maximum width must not exceed the screen width of the configured HMI device.

Height

Specifies the height of the pop-up screen. The maximum height must not exceed the screen width of the configured HMI device.

Display mode

Specifies the mode for the pop-up screen:

Switching

Off

On

Animation

Specifies the direction from which the pop-up screen is shown:

Off

Left

Top

Right

Bottom

Animation speed

Specifies the speed at which the pop-up screen is shown:

Slow

Medium

Fast

ShowSlideInScreen (Panels, RT Advanced)

Description

Calls the slide-in screen, for example, when operating a button.

Use in the function list

ShowSlideinScreen (screen name, mode)

Use in user-defined functions

ShowSlideInScreen (SlideInScreen_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Specifies the slide-in screen that appears in Runtime when a button is pressed:

Top Slide-in screen

Bottom Slide-in screen

Left Slide-in screen

Right Slide-in screen

Mode

Specifies the mode for the slide-in screen:

Switching

Off

On

System functions for Runtime Advanced (Page 5780)

Availability for specific devices of system functions (Page 5739)

Logs (Panels, RT Advanced)

ArchiveLogFile (Panels, RT Advanced)

Description

This system function moves or copies a log to another storage location for long-term logging.

With Audit Trails, always use the "Move" (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

Use in user-defined functions

ArchiveLogFile (Log_type, Log, Directory_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log being archived.

Directory name

Path for saving the log.

Mode

0 (hmiCopy) = Copy log

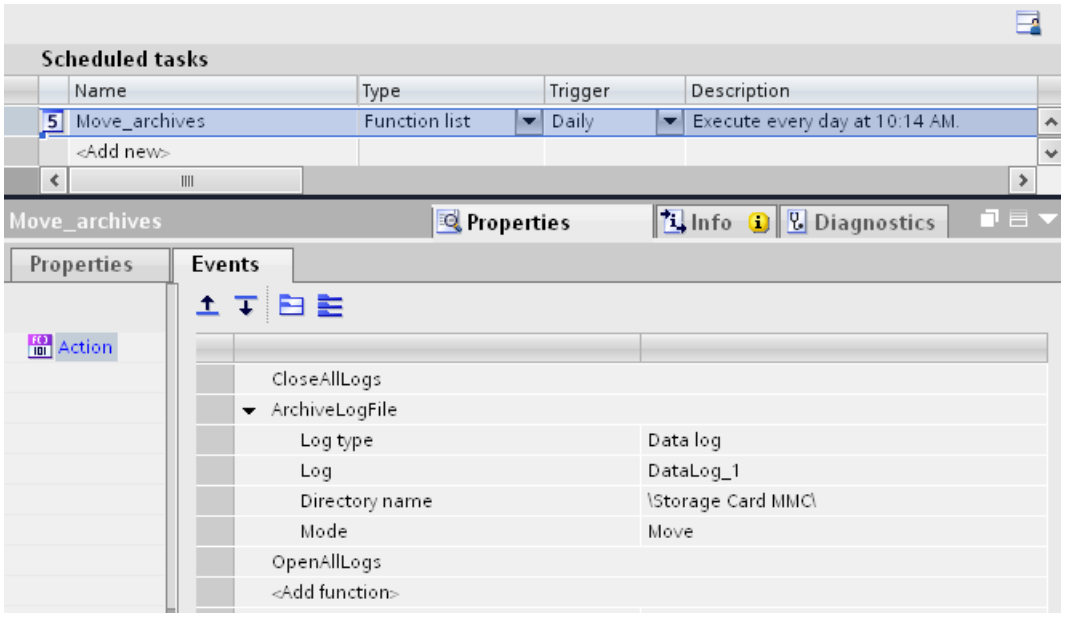
1 (hmiMove) = Move log

Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:



Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

See also

Availability for specific devices of system functions (Page 5739)

LogTag (Panels, RT Advanced)

Description

Saves the value of the given tags in the given data log.

This system function is used to archive a process value at a certain point in time.

Use in the function list

LogTag (Tag)

Use in user-defined functions

-

Parameters

Tag

The tag whose value is logged. The tag is stored in the log which is configured for the specified tag.

See also

System functions for Basic Panels (Page 5739)

Availability for specific devices of system functions (Page 5739)

CopyLog (Panels, RT Advanced)

Description

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

Note

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

Note

80% of the log entries are copied when copying the circular logs. 20% of entries are not copied because the space is reserved for buffer overflow by default.

Use in the function list

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

Use in user-defined functions

CopyLog (Log_type, Destination log, Source_log, Mode, Delete_source_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Destination log

Name of the log into which the entries are copied (Destination log).

Source log

Name of the log from which the entries are copied (Source log).

Mode

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

Delete source log

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

See also

Storage locations of logs (Page 5532)

Availability for specific devices of system functions (Page 5739)

ClearLog (Panels, RT Advanced)

Description

Deletes all data records in the given log.

Use in the function list

ClearLog (Log type, Log)

Use in user-defined functions

ClearLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log from which all entries are deleted.

See also

Availability for specific devices of system functions (Page 5739)

OpenAllLogs (Panels, RT Advanced)

Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

Note

Run the "StartLogging" system function in order to restart logging.

Use in the function list

OpenAllLogs

Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

See also

Availability for specific devices of system functions (Page 5739)

CloseAllLogs (Panels, RT Advanced)

Description

Disconnects the connection between WinCC and all logs.

Use in the function list

CloseAllLogs

Use in user-defined functions

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "CloseAllLogs" system function on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When you press the "Close Archive" button, the opened logs are closed. The data medium can be changed. The logging continues during the change of the data medium. The process values to be logged are cached. You open all logs with the "Open Archive" button. The logging process will continue in the specified log. The buffered process values are later added to the log.

See also

Availability for specific devices of system functions (Page 5739)

StartLogging (Panels, RT Advanced)

Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

Use in the function list

StartLogging (Log type, Log)

Use in user-defined functions

StartLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log which is started.

See also

Managing logging behavior when Runtime starts (Page 5368)

Availability for specific devices of system functions (Page 5739)

StartNextLog (Panels, RT Advanced)

Description

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

Use in the function list

StartNextLog (Log type, Log)

Use in user-defined functions

StartNextLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Log

Name of the log for which the logging is stopped and continued in the next log.

See also

Availability for specific devices of system functions (Page 5739)

StopLogging (Panels, RT Advanced)

Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

Note

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

Use in the function list

StopLogging (Log type, Log)

Use in user-defined functions

StopLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log that is stopped.

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

See also

Availability for specific devices of system functions (Page 5739)

User administration (Panels, RT Advanced)

Logoff (Panels, RT Advanced)

Description

Logs off the current user on the HMI device.

Use in the function list

Logoff

Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

Logon (Panels, RT Advanced)

Description

Logs on the current user on the HMI device.

Use in the function list

Logon (Password, User name)

Use in user-defined functions

Logon (Password, User_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Password

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

User name

The tag from which the user name for the user logging on is read.

See also

Availability for specific devices of system functions (Page 5739)

ExportImportUserAdministration (Panels, RT Advanced)

Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

Note

Exporting and importing of the user administration from V14 is not supported on HMI devices with a Runtime version older than V14.

Use in the function list

ExportImportUserAdministration (File name, Direction)

Use in user-defined functions

ExportImportUserAdministration (File_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (*.txt), for example, "C:\TEMP\Passwords.txt".

Note

If a storage card is used as file location, specify the file location as follows: "\StorageCard \<FileName".

Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

See also

Availability for specific devices of system functions (Page 5739)

GetUserName (Panels, RT Advanced)

Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

Use in the function list

GetUserName (Tag)

Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the user name is written.

See also

Availability for specific devices of system functions (Page 5739)

GetGroupNumber (Panels, RT Advanced)

Description

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

Use in the function list

GetGroupNumber (Tag)

Use in user-defined functions

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the number of the group is written.

See also

Availability for specific devices of system functions (Page 5739)

GetPassword (Panels, RT Advanced)

Description

Writes the password of the user currently logged on to the HMI device in the given tag.

Note

Make sure that the value of the given tag is not displayed in another place in the project.

Note

The passwords of SIMATIC Logon users cannot be read.

Note

The "GetPassword" system function is not available for devices as of device version 14.0.0.0.

If this system feature is used in a project older than version V14, it is removed after migration to V14. The event linked to the system function is thereby invalidated. The "GetPassword" system function appears to be faulty in the configuration. A warning is generated during compiling. The "GetPassword" system function is no longer included in the compiled Runtime project.

Use in the function list

GetPassword (Tag)

Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the password is written.

See also

System functions for Runtime Advanced (Page 5780)

Availability for specific devices of system functions (Page 5739)

TraceUserChange (Panels, RT Advanced)

Description

Outputs a system event that shows which user is currently logged in on the HMI device.

This system function can only be used in the Scheduler.

Use in the function list

TraceUserChange

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 5739)

ShowLogonDialog (Panels, RT Advanced)

Description

Opens a dialog on the HMI device with which the user can log on to the HMI device.

Use in the function list

ShowLogonDialog

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 5739)

Calculation (Panels, RT Advanced)

IncreaseTag (Panels, RT Advanced)

Description

Adds the given value to the value of the tags.

X = X + a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

IncreaseTag (Tag, Value)

Use in user-defined functions

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the given value is added.

Value

The value that is added.

See also

SetTag (Page 5840)

Availability for specific devices of system functions (Page 5739)

InvertLinearScaling (Panels, RT Advanced)

Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function X = (Y - b) / a.

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

InvertLinearScaling (X, Y, b, a)

Use in user-defined functions

InvertLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

X

The tag which is assigned the value calculated from the linear equation.

Y

The tag that contains the value used for calculation.

b

The value which is subtracted.

a

The value through which is divided.

Example

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
 InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n, varX);
...
}
```

The saved return value can be processed in the following code.

Availability for specific devices of system functions (Page 5739)

LinearScaling (Panels, RT Advanced)

Description

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function Y= (a *X) + b.

The inverse of this function is the "InvertLinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

LinearScaling (Y, a, X, b)

Use in user-defined functions

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Y

The tag which is assigned the value calculated from the linear equation.

a

The value with which is multiplied.

X

The tag that contains the value used for calculation.

b

The value that is added.

Example

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{
BYTE Yvar;
BYTE Xvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

// linear scaling
 LinearScaling ( Yvar, avalue, Xvalue, bvalue);

printf ("Yvar = %d\r\n, Yvar);
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 5739)

SetTag (Panels, RT Advanced)

Description

Assigns a new value to the given tag.

Note

This system function can be used to assign strings and numbers, depending on the type of tag.

Use in the function list

SetTag (Tag, Value)

Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag to which the given value is assigned.

Value

The value which the given tag is assigned.

Note

The "SetTag" system function is only executed after a connection has been established.

Example

The following program code uses the SetTag function to set the value of the gs_tag_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
if(ok)
{
  // succeeded
  printf ( "Function has run through.\r\n" );
bvalue = GetTagBit("gs_tag_bit");
  printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
  // failed
  printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

See also

Availability for specific devices of system functions (Page 5739)

DecreaseTag (Panels, RT Advanced)

Description

Subtracts the given value from the tag value.

X = X - a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

DecreaseTag (Tag, Value)

Use in user-defined functions

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag from which the given value is subtracted.

Value

The value which is subtracted.

See also

Availability for specific devices of system functions (Page 5739)

Bit processing (Panels, RT Advanced)

InvertBit (Panels, RT Advanced)

Description

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

Use in the function list

InvertBit (Tag)

Use in user-defined functions

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag whose bit is set.

Example

The following program code inverts the value of the Boolean tag bStatus and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, strResult

Set myTag = SmartTags("bStatus")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Get current value
bValue=myTag.Value

'Save current value
bSaved=bValue

'Invert Bit
InvertBit(myTag)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BOOL bStatus = 0;
BOOL bSaved = bStatus;

//Invert variable
invertBit(bStatus);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatus, bSaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 5739)

InvertBitInTag (Panels, RT Advanced)

Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

Use in the function list

InvertBitInTag (Tag, Bit)

Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which the given bit is set.

Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

Example

The following program code inverts a bit at the specified bitposition in the bStatusWord tag and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, bitposition, strResult

Set myTag = SmartTags("bStatusWord")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Get current value
bValue=myTag.Value

'Save current value
bSaved=bValue

'Invert Bit in position
bitposition=2
InvertBit(myTag, bitposition)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BYTE bStatusWord;
BYTE bsaved = bStatusWord;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bStatusWord, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatusWord, bsaved);
  ...
}
```

See also

Availability for specific devices of system functions (Page 5739)

ResetBit (Panels, RT Advanced)

Description

Sets the value of a "Bool" type tag to 0 (FALSE).

Use in the function list

ResetBit (Tag)

Use in user-defined functions

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 0 (FALSE).

Example

The following program code sets the value of the Boolean tag bStatus to 0 by means of the ResetBit function and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, strResult

Set myTag = SmartTags("bStatus")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Set value
bValue=1
myTag.Value=bValue

'Save current value
bSaved=bValue

'Reset Bit
ResetBit(myTag)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BOOL bStatus = 1;
BOOL bSaved = bStatus;

//Reset bit
  ResetBit (bStatus);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatus, bSaved);
...
}
```

See also

ResetBitInTag (Page 5848)

Availability for specific devices of system functions (Page 5739)

ResetBitInTag (Panels, RT Advanced)

Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

Use in the function list

ResetBitInTag (Tag, Bit)

Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 0 (FALSE).

Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Example

The following program code sets a bit to 0 at the specified bitposition in the bStatusWord tag and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, bitposition, strResult

Set myTag = SmartTags("bStatusWord")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Save current value
bValue=myTag.Value
bSaved=bValue

'Reset Bit
bitposition=2
ResetBit(myTag, bitposition)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BYTE bStatusWord;
BYTE bSaved = bStatusWord;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bStatusWord, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatusWord, bSaved);
  ...
}
```

ResetBit (Page 5846)

Availability for specific devices of system functions (Page 5739)

ShiftAndMask (Panels, RT Advanced)

Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

Use in user-defined functions

ShiftAndMask (Source_tag, Target_tag, Bits_to_shift, Bits_to_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001.
Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

Bits to mask

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern. Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

Note

If you change the device version of the target HMI device after configuration (e.g."13.1.0" to "13.0.0" or vice versa), you must check and test the parameters of this system function.

You can use the "Char" and "Word" data types for the "Source tag" and "Target tag" parameters as of device version 13.1.0. In the device versions before 13.1.0, these parameters must be assigned other data types:

- Use "SInt" instead of "Char"
- Use "Int" instead of "Word"

Otherwise, there may be unwanted effects, for example incorrect or unexpected behavior of the configured system functions.

Availability for specific devices of system functions (Page 5739)

SetBit (Panels, RT Advanced)

Description

Sets the value of a "Bool" type tag to 1 (TRUE).

Use in the function list

SetBit (Tag)

Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 1 (TRUE).

Example

The following program code sets the value of the Boolean tag bStatus to 1 by means of the SetBit function and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, strResult

Set myTag = SmartTags("bStatus")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Set value
bValue=0
myTag.Value=bValue

'Save current value
bSaved=bValue

'Set Bit
SetBit(myTag)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BOOL bStatus = 0;
BOOL bSaved = bStatus;

//Set bit
  SetBit (bStatus);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatus, bSaved);
...
}
```

See also

Availability for specific devices of system functions (Page 5739)

SetBitInTag (Panels, RT Advanced)

Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitInTag (Tag, Bit)

Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 1 (TRUE).

Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

Example

The following program code sets a bit to 1 at the specified bitposition in the bStatusWord tag and outputs the result along with the original bSaved value.

```
'Programming language: VB
Dim myTag
Dim myOutputField
Dim bValue, bSaved, bitposition, strResult

Set myTag = SmartTags("bStatusWord")
Set myOutputField=HMIRuntime.Screens("MyScreen").ScreenItems("objTextField")

'Save current value
bValue=myTag.Value
bSaved=bValue

'Set Bit in tag
bitposition=2
SetBitInTag(myTag, bitposition)
bValue=myTag.Value

'Output result old and new value:
strResult="Old Value: "&bSaved &Chr(13)&"New Value: "&bValue
myOutputField.Text=strResult
```

```
//Programming language: C
{
BYTE bStatusWord;
BYTE bSaved = bStatusWord;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bStatusWord, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bStatusWord, bSaved);
  ...
}
```

SetBit (Page 5852)

Availability for specific devices of system functions (Page 5739)

SetBitWhileKeyPressed (Panels, RT Advanced)

Description

Sets the bit of the given tag to 1 (TRUE) as long as the user keeps the configured key pressed.

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC. You should only access tags of the BOOL type with this system function to avoid problems with overlapping access to the same tag.

Note

All functions on the event "Release" are performed immediately by means of a screen change configured for a key, even if the key is kept pressed.

If the "SetBitWhileKeyPressed" system function is configured for a function key, the bit will be reset immediately following a screen change. This action is necessary since the key assignments change after the screen change.

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitWhileKeyPressed (Tag, Bit)

Use in user-defined functions

-

Parameters

Tag

The tag in which a bit is temporarily set to 1 (TRUE). Use only tags of the type BOOL, as far as allowed by the PLC.

Bit

The number of the bit that is temporarily set to 1 (TRUE).

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an IO field, or assign the function to a screen element such as a button.

If you configured a short event such as the activation of an alarm for the function you can only access the actual process values by setting the tag for continuous reading.

SetBit (Page 5852)

Availability for specific devices of system functions (Page 5739)

Printing (Panels, RT Advanced)

PrintScreen (Panels, RT Advanced)

Description

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

Note

The printer settings are taken over from the current settings in the Windows operation system.

Use in the function list

PrintScreen

Use in user-defined functions

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

PrintReport (Panels, RT Advanced)

Description

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

Note

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

Use in the function list

PrintReport (Report)

Use in user-defined functions

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Report

Name of the report to be printed.

Note

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report_1" has no printed pages."

In order to remedy the warning, open the "Report_1" via the project view and recompile the project.

See also

Availability for specific devices of system functions (Page 5739)

SetAlarmReportMode (Panels, RT Advanced)

Description

Switches the automatic reporting of alarms on the printer on or off.

Use in the function list

SetAlarmReportMode (Mode)

Use in user-defined functions

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 5739)

Settings (Panels, RT Advanced)

GetPLCMode (Panels, RT Advanced)

Description

Evaluates the current state of the connected PLC.

The system function "GetPLCMode" can only be configured for the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

Use in the function list

GetPLCMode (Connection, Mode)

Use in user-defined functions

-

Parameters

Connection

Connection of PLC and HMI device.

Mode

Evaluates the state of the connected PLC.
8: RUN = The PLC program is being executed.
4: STOP = The PLC program has been interrupted.
Select a suitable user variable for the evaluation.

SetDisplayMode (Panels, RT Advanced)

Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

Use in the function list

SetDisplayMode (Layout)

Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): Foreground; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

See also

Availability for specific devices of system functions (Page 5739)

SetDeviceMode (Panels, RT Advanced)

Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Loading".

Use in the function list

SetDeviceMode (Operating mode)

Use in user-defined functions

SetDeviceMode (Operating_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = online: The connection to the PLC is established. The configured connection status is always set in this process. The states that were last used in Runtime are not considered.

1 (hmiOffline) = offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = Load: A project can be transferred from the configuration computer to the HMI device.

Note

If you use a PC as an HMI device, the runtime software will be exited when you switch operating mode after "Load".

See also

SetConnectionMode (Page 5864)

Availability for specific devices of system functions (Page 5739)

SetScreenKeyboardMode (Panels, RT Advanced)

Description

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

Note

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

Use in the function list

SetScreenKeyboardMode (Mode)

Use in user-defined functions

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

See also

Availability for specific devices of system functions (Page 5739)

SetPLCDateTime (Panels, RT Advanced)

Description

Changes the data and the time of the linked PLC

The system function "SetPLCDateTime" can only be configured for the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

Use in the function list

SetPLCDateTime (connection, time)

Use in user-defined functions

-

Parameters

Connection

Connection of PLC and HMI device.

Time

Transfers the date and the time of the HMI device to the PLC. The PLC applies the date and the time of the HMI device.

SetPLCMode (Panels, RT Advanced)

Description

Switches the operating mode of the PLC to one of the following states:

- RUN
- STOP

The system function "SetPLCMode" can only be configured for the following PLCs:

- SIMATIC S7-1200
- SIMATIC S7-1500

Use in the function list

SetPLCMode (connection, mode)

Use in user-defined functions

-

Parameters

Connection

Connection of PLC and HMI device.

Mode

Specifies the operating mode of the PLC:

8: RUN = The controller is set to the RUN state. The control program is executed.

4: STOP = The controller is set to the STOP state. The PLC program is interrupted.

See also

SystemDiagnosticViewUpdatePLCBuffer (Page 5908)

SetLanguage (Panels, RT Advanced)

Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

Use in the function list

SetLanguage (Language)

Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).
  An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

See also

Availability for specific devices of system functions (Page 5739)

SetConnectionMode (Panels, RT Advanced)

Description

Connects or disconnects the given connection.

Note

A connection to the PLC cannot be established until the "Online" operating mode has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

If the connection is loaded in "Offline" mode, the connection is closed again each time the mode switches to "Offline". To re-establish the connection after switching to "Online" mode, set the connection again to "Online" mode.

Use in the function list

SetConnectionMode (Mode, Connection)

Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = online: Connection is established.

1 (hmiOffline) = offline: Connection is disconnected.

Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

Application example

Two typical application examples for this system function are as follows:

- Test
  As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning
  Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

Availability for specific devices of system functions (Page 5739)

SetWebAccess (Panels, RT Advanced)

Description

Determines the access mode to the runtime application using the Internet.

Use in the function list

SetWebAccess (Access mode)

Use in user-defined functions

-

Parameters

Access mode

Determines the access mode to the runtime application:

-1 (hmiToggle) = Toggle: Toggles between the two modes.

0 (hmiReadOnly) = Read-only.

1 (hmiReadWrite) = Read-write.

See also

Availability for specific devices of system functions (Page 5739)

ChangeConnection (Panels, RT Advanced)

Description

Disconnects the connection to the PLC currently in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class (S7-300, S7-400, etc).

Note

When changing to another address, ensure that the address is not already being used by another HMI device.

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7 1200 (device version up to V11)
- SIMATIC S7-NC
- SIMOTION

Use in the function list

ChangeConnection (Connection, Address, Slot, Rack)

Use in user-defined functions

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Connection

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

Address

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

Note

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
- MPI connection: "Int" data type

Slot

Slot of the PLC to which the connection will be established.

Rack

Rack of the PLC to which the connection will be established.

Application example

You want to operate one HMI device on several machines. Configure a controller in the project. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. All tags in this connection are now updated from the new controller.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

Availability for specific devices of system functions (Page 5739)

ChangeConnectionEIP (Panels, RT Advanced)

Description

Terminates the connection to the Allan Bradley controller currently in use and establishes a connection to another Allan Bradley controller in Runtime. "EIP" stands for "Ethernet/IP".

The newly connected controller must belong to the same device class (Allen Bradley).

For the connection to be established, the CPU type of the controller to be connected must match the CPU type of the controller already connected, for example, both controllers have the CPU type "SLC/Micrologix PLC".

Note

When changing to another address, ensure that the address is not already being used by another HMI device.

The follows address types are supported:

- IP address

Use in the function list

ChangeConnectionEIP (Connection, Address, Communication path)

Use in user-defined functions

ChangeConnectionEIP (Connection, Address, Communication Path)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Connection

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

Address

IP address of the controller to which the connection is being established.

Note

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data type "String".

Note

The stored IP address must consist of 4 decimal numbers with the value range 0 to 255.

Communication path

CIP path from the Ethernet module to the controller to which the connection is being established.

You specify the communication path either with a String tag or an HMI tag of the "String" data type.

Application example

You want to operate one HMI device on several machines. To do so, you configure a PLC in the project. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. All tags of this connection are now updated from the new PLC.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnectionEIP" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

Functions of the display (Panels, RT Advanced)

AdjustContrast (Panels, RT Advanced)

Description

Changes the contrast of the display one level on the HMI device.

Use in the function list

AdjustContrast (Adjust)

Use in user-defined functions

-

Parameters

Adjust

Specifies how the contrast is changed:

0 (hmiDecrease) = Decrease: Decreases the contrast one level.

1 (hmiIncrease) = Increase: Increases the contrast one level.

Application example

Objective

One button each for increasing and decreasing the screen contrast is desired.

Notes on configuring

Configure two buttons and configure the "AdjustContrast" system function on the "Press" event. The parameters "Increase" and "Decrease" are allocated.

Procedure on HMI device

When one of the two buttons is pressed in runtime, the contrast is increased or decreased one level.

Logoff (Page 5831)

Availability for specific devices of system functions (Page 5739)

CalibrateTouchScreen (Panels, RT Advanced)

Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

Use in the function list

CalibrateTouchScreen

Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Note

The CalibrateTouchScreen system function cannot be simulated.

See also

Availability for specific devices of system functions (Page 5739)

SetAcousticSignal (Panels, RT Advanced)

Description

Configures the acoustic feedback of touch screen operation on the HMI device.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetAcousticSignal (Volume)

Use in user-defined functions

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Volume

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

Availability for specific devices of system functions (Page 5739)

SetBrightness (Panels, RT Advanced)

Description

Determines the brightness of the display.

Note

The configuration that is set in the Control Panel / Start Center will be reestablished when you restart the HMI device.

For Basic Panels 2nd Generation, Mobile Panels and Comfort Panels:

The value for the system function "SetBrightness" can be set between 0% and 100%. The set value is transferred to the HMI device. The brightness settings on the HMI device can be viewed and edited in "Start Center > Settings > Display". The HMI devices support a brightness setting between 10% and 100%.

If the system function "SetBrightness" is assigned a value of 0%, the display of the HMI device is switched off by default in Runtime. If the operator touches the display, the display switches to the previous brightness setting.

If the system function "SetBrightness" is assigned a value between 1% and 10% and the operator opens the display settings in the Start Center, brightness is reset to 10%.

Use in the function list

SetBrightness (value)

Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Value

New value for the brightness.

See also

Availability for specific devices of system functions (Page 5739)

SetAndGetBrightness (Panels, RT Advanced)

Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

New value for the brightness.

Mode

Specifies if the new brightness value is set as absolute or relative to the current value.

Current value

Tag in which the current brightness value is stored.

See also

Availability for specific devices of system functions (Page 5739)

SetBacklightColor (Panels, RT Advanced)

Description

Defines the background lighting of the button.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetBacklightColor (Value)

Use in user-defined functions

-

Parameters

Value

Defines the background lighting of the button:

0 (hmiWhite) = White: No color

1 (hmiGreen) = Green: Green color

2 (hmiYellow) = Yellow: Yellow color

3 (hmiRed) = Red: Red color

See also

Availability for specific devices of system functions (Page 5739)

GetBrightness (Panels, RT Advanced)

Description

Reads the value of the brightness.

Use in the function list

GetBrightness (Brightness)

Use in user-defined functions

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

The tag to which the value is written.

Functions of the trend view (Panels, RT Advanced)

TrendViewScrollForward (Panels, RT Advanced)

Description

Scrolls forward one display width in the Trend view.

Use in the function list

TrendViewScrollForward (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which is scrolled forward.

See also

Availability for specific devices of system functions (Page 5739)

TrendViewScrollBack (Panels, RT Advanced)

Description

Scrolls back one display width in the trend view.

Use in the function list

TrendViewScrollBack (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which is scrolled back.

See also

TrendViewExtend (Panels, RT Advanced)

Description

Reduces the time period which is displayed in the trend view.

Use in the function list

TrendViewExtend (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the displayed time period is reduced.

See also

Availability for specific devices of system functions (Page 5739)

TrendViewCompress (Panels, RT Advanced)

Description

Increases the time period which is displayed in the trend view.

Use in the function list

TrendViewCompress (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the displayed time period is increased.

See also

Availability for specific devices of system functions (Page 5739)

TrendViewRulerLeft (Panels, RT Advanced)

Description

Moves the read-line backwards (to the left) in the trend view.

Note

In order to be able to move the read-line, the read-line must have been switched on. This is done using the "TrendViewSetRulerMode" system function.

Use in the function list

TrendViewRulerLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the read-line is moved backwards.

See also

TrendViewSetRulerMode (Page 5887)

TrendViewSetRulerMode (Panels, RT Advanced)

Description

Hides or shows the read-line in the trend view. The read-line displays the Y value belonging to the X value.

Note

To ensure that the ruler is displayed, you have to activate the setting "Show ruler" in the trend view properties.

Use in the function list

TrendViewSetRulerMode (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the read-line is hidden or shown.

See also

TrendViewRulerRight (Page 5886)

TrendViewRulerLeft (Page 5885)

Availability for specific devices of system functions (Page 5739)

TrendViewStartStop (Panels, RT Advanced)

Description

Stops the trend recording or continues the trend recording in the trend view.

Use in the function list

TrendViewStartStop (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which the recording of the trend is started or stopped.

See also

Availability for specific devices of system functions (Page 5739)

TrendViewBackToBeginning (Panels, RT Advanced)

Description

Scrolls back to the beginning of the display range in the trend view.

Use in the function list

TrendViewBackToBeginning (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the trend view in which you scroll to the beginning of the display range.

Availability for specific devices of system functions (Page 5739)

PDFZoomOriginal (Panels, RT Advanced)

Description

Switches the display of the PDF file in the PDF view to the original size.

Use in the function list

PDFZoomOriginal (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PDF view in which the command is executed.

Functions of the PLC code view (Panels, RT Advanced)

ActivatePLCCodeViewer (Panels, RT Advanced)

Description

Performs a screen change to the given screen with the PLC code view. The PLC code view shows the program code of the relevant network.

You configure the ActivatePLCCodeView system function at the "Click PLC code view button" event of a GRAPH overview or at an event of a button.

Screen change from the GRAPH overview

You configure the system function at the "Click PLC code view button" event in a GRAPH overview to display the GRAPH step sequencer in the PLC code view. If no error is pending, the sequence of the GRAPH step sequencer is displayed.

If an error occurs, the faulty step is displayed in the PLC code view after jump of the faulty step. If multiple errors have occurred, the first faulty step of the sequencer is displayed after the jump. If you have corrected the error, the next faulty step is automatically displayed in the view. In the detail view, the transition or the interlock is displayed depending on the type of error.

Screen change from an alarm

You configure the system function at an event of a button. When the button is pressed in Runtime, the system function checks whether the alarm selected last in the configured alarm view is a supervision alarm or a GRAPH alarm. If a jump is possible for this alarm, the configured PLC code view is opened with the corresponding program code.

The jump from an alarm in the alarm view to the PLC code view is made possible for the following supervision alarms:

- With global supervisions, only for interlock supervisions (Interlock)
- With local supervisions, for all basic supervisions at input parameters

You can find more information on supervisions in the section "Programming PLC > Supervising machinery and plants with ProDiag".

The jump to the PLC code view is possible for all GRAPH alarms. After the jump, the GRAPH sequencer and the faulty step are displayed in the PLC code view.

The jump in connection with the alarm buffer or the alarm log is not supported.

Use in the function list

ActivatePLCCodeView(Screen name, Screen object)

Use in user-defined functions

ActivatePLCCodeView (Screen_name, Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Note

Use of the system function "ActivatePLCCodeView" in a VB script has no effect at a GRAPH overview.

Parameters

Screen name

Name of the screen that contains the PLC code view.

Note

Screen change to a pop-up screen or a slide-in screen is not supported.

Screen object

Object name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewMoveScrollBar (Panels, RT Advanced)

Description

Moves the scroll bar in the PLC code view. This system function provides you with the option of accessing up to six scroll bars in specific drawing areas.

Use in the function list

PLCCodeViewMoveScrollBar (Screen object, Area, Direction)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

Area

Area in which the scroll bar is moved:

Drawing area

Symbol table

Detail view

Direction

Direction in which the scroll bar is moved

Left

Right

Top

Bottom

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewDetails (Panels, RT Advanced)

Description

Shows the detail view in the selected PLC code view.

Use in the function list

PLCCodeViewDetails (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewNextNetwork (Panels, RT Advanced)

Description

Navigates to the next network in the PLC code view.

Use in the function list

PLCCodeViewNextNetwork (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewShowStepMode (Panels, RT Advanced)

Description

Switches between manual and automatic step selection of the active step in the PLC Code View.

Use in the function list

PLCCodeViewShowStepMode (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewSymbols (Panels, RT Advanced)

Description

Displays the detail view in the select PLC code view

Use in the function list

PLCCodeViewSymbols (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewTransitionInterlock (Panels, RT Advanced)

Description

Toggles between the display of transition and interlock networks in the PLC code view.

Use in the function list

PLCCodeViewTransitionInterlock (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewZoomIn (Panels, RT Advanced)

Description

Zooms in the view of the network in the network area of the PLC Code View.

Use in the function list

PLCCodeViewZoomIn (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewZoomOut (Panels, RT Advanced)

Description

Zooms out the view of the network in the network area of the PLC code view.

Use in the function list

PLCCodeViewZoomOut (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code viewer.

See also

Availability for specific devices of system functions (Page 5739)

PLCCodeViewPreviousNetwork (Panels, RT Advanced)

Description

Navigates to the previous network in the PLC code view.

Use in the function list

PLCCodeViewPreviousNetwork (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the PLC code view.

See also

Availability for specific devices of system functions (Page 5739)

Functions of the SmartClient display (Panels, RT Advanced)

SmartClientViewRefresh (Panels, RT Advanced)

Description

Updates the contents displayed in the Sm@rtClient view.

Use in the function list

SmartClientViewRefresh (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SmartClientViewReadOnlyOff (Panels, RT Advanced)

Description

Sets read-only access to "Off" in the Sm@rtClient view.

This setting allows a distant HMI device to be operated. The "SmartClientViewReadOnlyOn" system function is used to switch read-only access on again.

Use in the function list

SmartClientViewReadOnlyOff (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SmartClientViewReadOnlyOn (Panels, RT Advanced)

Description

Sets read-only access to "On" in the Sm@rtClient view.

This setting allows a distant HMI device to be monitored only. The "SmartClientViewReadOnlyOff" system function is used to switch read-only access off again.

Use in the function list

SmartClientViewReadOnlyOn (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SmartClientViewDisconnect (Panels, RT Advanced)

Description

Executes the "Disconnect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used.

Use in the function list

SmartClientViewDisconnect (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SmartClientViewConnect (Panels, RT Advanced)

Description

Executes the "Connect" command in the Sm@rtClient view.

This system function is used when the integrated button of the screen object should not be used. The Sm@rtClient view establishes a connection with the configured HMI device.

Use in the function list

SmartClientViewConnect (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SmartClientViewLeave (Panels, RT Advanced)

Description

Exits the Sm@rtClient view and returns to operation of the HMI device.

The connection to the HMI device configured in the smart client view is retained.

Use in the function list

SmartClientViewLeave (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the Sm@rtClient view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

Functions of the System Diagnostics view (Panels, RT Advanced)

ActivateSystemDiagnosticsView (Panels, RT Advanced)

Description

Activates the system diagnostics view. The system diagnostics view shows the detail view of the device concerned.

Use in the function list

ActivateSystemDiagnosticsView (Screen name, Screen object)

Use in user-defined functions

ActivateSystemDiagnosticsView (Screen_name, Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen name

Name of the screen contained in the system diagnostics view.

Screen object

Object name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 5739)

SystemDiagnosticViewUpdatePLCBuffer (Panels, RT Advanced)

Description

Refreshes the data from the diagnostics buffer of the PLC in the system diagnostics view.

Use in the function list

SystemDiagnosticViewUpdatePLCBuffer (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 5739)

SystemDiagnosticViewDetailView (Panels, RT Advanced)

Description

The detail view returns detailed information about the selected connection and errors pending.

Use in the function list

SystemDiagnosticViewDetailView (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the system diagnostics view that is switched to the detail view.

See also

Availability for specific devices of system functions (Page 5739)

SystemDiagnosticViewDiagnosticBuffer (Panels, RT Advanced)

Description

Opens a view in a system diagnostics for displaying the current data of the diagnostics buffer.

Use in the function list

SystemDiagnosticViewDiagnosticBuffer (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the system diagnostics view that is switched to the detail view.

See also

Availability for specific devices of system functions (Page 5739)

SystemDiagnosticViewDeviceView (Panels, RT Advanced)

Description

Opens a view in a system diagnostics for displaying all available connections.

Use in the function list

SystemDiagnosticViewDeviceView (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 5739)

SystemDiagnosticViewBack (Panels, RT Advanced)

Description

Changes in a system diagnostics to the higher-level view.

- The function opens the device view if the diagnostics buffer view is set in the system diagnostics view.
- The function opens the diagnostics buffer view if the detail view is displayed in the system diagnostics view.

Use in the function list

SystemDiagnosticViewBack (screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the system diagnostics view.

See also

Availability for specific devices of system functions (Page 5739)

ShowSystemDiagnosticsWindow (Panels)

Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

Use in user-defined functions

ShowSystemDiagnosticsWindow (Target_Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen object

Name of the system diagnostic window which is hidden or shown.

See also

Availability for specific devices of system functions (Page 5739)

Functions for WinAC MP (Panels, RT Advanced)

WinACMPUpdateControllerForStartAtBoot (Panels)

Description

Reads whether WinAC MP is automatically started after startup of the HMI device. The LED display of the "StartAtBoot" button is updated.

Use in the function list

WinACMPUpdateControllerForStartAtBoot(Start at boot, Action)

Use in user-defined functions

-

Parameters

Start at boot

The tag that contains the value.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: LED display is gray. WinAC MP is not started on startup of the HMI device.

1 (SwitchOn) = On: LED display has the color "cyan". WinAC MP is started automatically on startup of the HMI device.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateKeySwitchSetting (Panels)

Description

Updates the status display of the position of the mode selector switch.

Use in the function list

WinACMPUpdateKeySwitchSetting (Key switch, Action)

Use in user-defined functions

-

Parameters

Key switch

The tag that contains the value of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

Action

Determines whether the status display will be updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateBUSF1LED (Panels)

Description

Updates the status display of the BUSF1 LED tag.

Use in the function list

WinACMPUpdateBUSF1LED(BUSF1, Action)

Use in user-defined functions

-

Parameters

BUSF1

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the BUSF1 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateBUSF2LED (Panels)

Description

Updates the status display of the BUSF2 LED tag.

Use in the function list

WinACMPUpdateBUSF2LED(BUSF2, Action)

Use in user-defined functions

-

Parameters

BUSF2

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the BUSF2 LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateAverageExecTime (Panels)

Description

Updates the display of the average OB 1 execution time. The OB 1 execution time will be displayed in milliseconds.

Use in the function list

WinACMPUpdateAverageExecTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

Tag that contains the value of the average OB 1 execution time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateAverageCycleTime (Panels)

Description

Updates the display of the average cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateAverageCycleTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the average cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateEXTFLED (Panels)

Description

Updates the status display of the EXTF LED tag.

Use in the function list

WinACMPUpdateEXTFLED(EXTF, Action)

Use in user-defined functions

-

Parameters

EXTF

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the EXTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateHMIEnableTime (Panels)

Description

Updates the value of the HMI Enable Time from WinAC MP (in ms).

Use in the function list

WinACMPUpdateHMIEnableTime(HMI Enable time, Action)

Use in user-defined functions

-

Parameters

HMI Enable time

The tag that contains the value of the HMI Enable Time.

Action

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateINTFLED (Panels)

Description

Updates the status display of the INTF LED tag.

Use in the function list

WinACMPUpdateINTFLED(INTF, Action)

Use in user-defined functions

-

Parameters

INTF

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the INTF LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateLastCycleTime (Panels)

Description

Updates the display of the last cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateLastCycleTime (Cycle time , Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the last cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateMaximumCycleTime (Panels)

Description

Updates the display of the longest cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateMaximumCycleTime(Cycle time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the longest cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: Display is not updated.

1 (SwitchOn) = On: Display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

WinACMPUpdateMinimumCycleTime (Panels)

Description

Updates the display of the shortest cycle time. The cycle time is displayed in milliseconds.

Use in the function list

WinACMPUpdateMinimumCycleTime (Cycle Time, Action)

Use in user-defined functions

-

Parameters

Cycle time

The tag that contains the value of the shortest cycle time.

Action

Determines whether the display is updated:

0 (SwitchOff) = Off: The display is not updated.

1 (SwitchOn) = On: The display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdatePowerLED (Panels)

Description

Updates the status display ON/OFF of the Power LED tag.

Use in the function list

WinACMPUpdatePowerLED (Power, Action)

Use in user-defined functions

-

Parameters

Power

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Determines whether the status display ON/OFF is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateSleepTime (Panels)

Description

Updates the value of the HMI Enable Time from WinAC MP (in ms).

Use in the function list

WinACMPUpdateSleepTime(SleepTime, Action)

Use in user-defined functions

-

Parameters

SleepTime

The tag that contains the value.

Action

Determines whether the value is updated:

0 (SwitchOff) = Off: Value is not updated.

1 (SwitchOn) = On: Value is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateRUNLED (Panels)

Description

Updates the status display of the RUN LED tag.

Use in the function list

WinACMPUpdateRUNLED(RUN, Action)

Use in user-defined functions

-

Parameters

RUN

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the RUN LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

Availability for specific devices of system functions (Page 5739)

WinACMPUpdateSTOPLED (Panels)

Description

Updates the status display of the STOP LED tag.

Use in the function list

WinACMPUpdateSTOPLED (STOP, Action)

Use in user-defined functions

-

Parameters

STOP

The tag that contains the value of the status display.

0 = Off

1 = Slow flashing

2 = Quick flashing

3 = On

Action

Defines whether the status display of the STOP LED tag is updated:

0 (SwitchOff) = Off: Status display is not updated.

1 (SwitchOn) = On: Status display is updated.

Notes on configuring

You configure this system function on the "Loaded" event or on the "Cleared" event of a screen.

Note the following during configuration:

- System function on the "Loaded" event
  Set the "Update" parameter to "On".
- System function on the "Cleared" event
  Set the "Update" parameter to "Off".
- If you call the system function repeatedly in a screen, always use the same tag. Otherwise, only the last activated tag will be updated.
- If you want to configure all system functions with the prefix "WinACMPUpdate" in a screen, each system function is only permitted once per screen.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPArchive (Panels)

Description

Saves the current STEP 7 user program, the current system configuration and the current values of the DBs in a log file.

Use in the function list

WinACMPArchive (File name)

Use in user-defined functions

-

Parameters

File name

Name of the log file in which the data is saved. Enter the file location and the file extension (*.wld), for example, "\flash\AddOn\WinACMP\Default.wld ".

See also

Availability for specific devices of system functions (Page 5739)

WinACMPGetStartMode (Panels)

Description

Reads in the 'desired' operating state after startup of the HMI device of WinAC MP.

Use in the function list

WinACMPGetStartMode (Start mode, Action)

Use in user-defined functions

-

Parameters

Start mode

The tag that defines the value of the operating mode.

Action

Determines whether the operating mode is read out:

0 (SwitchOff) = Off: Operating mode is not read out.

1 (SwitchOn) = On: Operating mode is read out.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPGetVersion (Panels)

Description

Reads out the value of the version number of WinAC MP.

Use in the function list

WinACMPGetVersion (Version, Action)

Use in user-defined functions

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to AUTOHOTSPOT.

Parameters

Version

The tag that contains the value.

Action

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPClearCycleTimeBuffer (Panels)

Description

Clears the cycle time data of the histogram.

Use in the function list

WinACMPClearCycleTimeBuffer

Use in user-defined functions

-

Parameters

--

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetStartAtBoot (Panels)

Description

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

Use in the function list

WinACMPSetStartAtBoot (Start at boot)

Use in user-defined functions

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to AUTOHOTSPOT.

Parameters

Start at boot

Specifies whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetKeySwitch (Panels)

Description

Sets the mode selector switch to RUN or STOP and is also used for memory reset.

Use in the function list

WinACMPSetKeySwitch(Key switch)

Use in user-defined functions

-

Parameters

Key switch

Defines the position of the key switch:

0 (MRES) = MRES: PLC memory reset

1 (STOP) = STOP: STOP mode

3 (RUN) = RUN: RUN mode

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetHMIEnableTime (Panels)

Description

Sets the value of the HMI Enable Time.

Use in the function list

WinACMPSetHMIEnableTime(HMI Enable time)

Use in user-defined functions

-

Parameters

HMI Enable time

The tag that contains the value.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetResetMethod (Panels)

Description

Sets the restart method, either cold restart (CRST) or warm restart (WRST).

Use in the function list

WinACMPSetRestartMethod (Restart behavior)

Use in user-defined functions

-

Parameters

Restart characteristics

Defines the restart action:

0 (WarmRestart) = Warm restart: A warm restart is performed.

1 (ColdRestart) = Cold restart: A cold restart is performed.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetSleepTime (Panels)

Description

Sets the value of the HMI Execution Time of WinAC MP.

Use in the function list

WinACMPSetSleeptime (SleepTime)

Use in user-defined functions

-

Parameters

Sleep time

The tag that contains the value.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPSetStartMode (Panels)

Description

Sets the operating mode of WinAC MP after startup of the HMI device.

Use in the function list

WinACMPSetStartMode (Start mode)

Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to AUTOHOTSPOT.

Parameters

Start mode

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPStartHistogram (Panels)

Description

Starts the cyclic sending of histogram values and updates the display. The histogram shows the percentual distribution of the measured cycle times.

Use in the function list

WinACMPStartHistogram (Update, Percentage, Cycle time, Y axis, ID)

Use in user-defined functions

-

Parameters

Action

Defines whether WinAC returns histogram values:

0 (SwitchOff) = Off: The cyclic sending of the histogram values is not started. The display is not updated.

1 (SwitchOn) = On: The cyclic sending of the histogram values is started. The display is updated.

Percent

Percentage of the cycles which are performed during the recorded cycle times.

Cycle time

Histogram of cycle times.

Y-axis bounds

Maximum value of Y axis

ID

Histogram ID

See also

Availability for specific devices of system functions (Page 5739)

WinACMPControl (Panels)

Description

Starts or stops WinAC MP.

Use in the function list

WinACMPControl (WinAC)

Use in user-defined functions

-

Parameters

WinAC

Determines whether WinAC MP is started or stopped.

0 (ShutdownWinACMP) = Stop: WinAC MP is stopped.

1 (StartWinACMP) = Start: WinAC MP is started.

See also

Availability for specific devices of system functions (Page 5739)

WinACMPStopHistogram (Panels)

Description

Stops the cyclic sending of histogram data and deletes the history data.

Use in the function list

WinACMPStopHistogram (ID)

Use in user-defined functions

-

Parameters

ID

Histogram ID

See also

Availability for specific devices of system functions (Page 5739)

WinACMPRestore (Panels)

Description

Loads the STEP 7 user program, the system configuration and the DBs from a log file.

Use in the function list

WinACMPRestore (File name)

Use in user-defined functions

-

Parameters

File name

Name of the log file in which the data is saved. Enter the file location and the log file, for example, ""\flash\AddOn\WinACMP\Default.wld ".

See also

Availability for specific devices of system functions (Page 5739)

Alarms (Panels, RT Advanced)

EditAlarm (Panels, RT Advanced)

Description

Triggers the "Edit" event for the selected alarm or, with multiple selection, the last selected alarm.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

Use in the function list

EditAlarm

Use in user-defined functions

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

ClearAlarmBuffer (Panels, RT Advanced)

Description

Deletes alarms from the alarm buffer on the HMI device.

Note

Alarms which have not yet been acknowledged are also deleted.

Use in the function list

ClearAlarmBuffer (Alarm class number)

Use in user-defined functions

ClearAlarmBuffer (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Determines which alarms are to be deleted from the alarm buffer:

0 (hmiAll) = All alarms

1 (hmiAlarms) = Alarms of alarm class "Error"

2 (hmiEvents) = Alarms of alarm class "Warning"

3 (hmiSystem) = Alarms of alarm class "System event"

4 (hmiS7Diagnosis) = Alarms of alarm class "S7 diagnostic alarm"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 5739)

ClearAlarmBufferProTool (Panels, RT Advanced)

Description

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

Use in the function list

ClearAlarmBufferProTool (Alarm class number)

Use in user-defined functions

ClearAlarmBufferProtoolLegacy (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Alarm class number whose messages are to be deleted:

-1 (hmiAllProtoolLegacy) = All alarms/events

0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"

1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"

2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

See also

Availability for specific devices of system functions (Page 5739)

AlarmViewUpdate (Panels, RT Advanced)

Description

Updates the enhanced alarm view.

Use in the function list

AlarmViewUpdate (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view which is updated.

See also

Availability for specific devices of system functions (Page 5739)

AlarmViewLoopInAlarm (Panels, RT Advanced)

Description

Triggers the "Loop-in-Alarm" event for all alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

You can configure a system function for the "Loop-in-Alarm" event in turn. For example, it is possible to change to the process screen in which the alarm appeared.

Note

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

Use in the function list

AlarmViewLoopInAlarm (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 5739)

AlarmViewAcknowledgeAlarm (Panels, RT Advanced)

Description

Acknowledges the alarms selected in the given alarm view.

This system function is used when the integrated button of the ActiveX control should not be used.

Use in the function list

AlarmViewAcknowledgeAlarm (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 5739)

AlarmViewShowOperatorNotes (Panels, RT Advanced)

Description

Displays the configured tooltip of the alarm selected in the given alarm view.

Use in the function list

AlarmViewShowOperatorNotes (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the alarm view in which the event is triggered.

Note

The HMI devices listed below do not support this system function for the "screen" object: OP 73, OP 77A, TP 177A.

See also

Availability for specific devices of system functions (Page 5739)

AcknowledgeAlarm (Panels, RT Advanced)

Description

Acknowledges all selected alarms.

This system function is used when the HMI device does not have an ACK key or when the integrated key of the alarm view should not be used.

This system function can only be used for function keys.

Use in the function list

AcknowledgeAlarm

Use in user-defined functions

AcknowledgeAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

ShowAlarmWindow (Panels, RT Advanced)

Description

Hides or shows the alarm window on the HMI device.

Use in the function list

ShowAlarmWindow (Object name, Display mode)

Use in user-defined functions

ShowAlarmWindow (Object_name, Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Object name

Name of the alarm view which is hidden or shown.

Display mode

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

See also

Availability for specific devices of system functions (Page 5739)

ShowSystemAlarm (Panels, RT Advanced)

Description

Displays the value of the parameter passed as a system event to the HMI device.

Use in the function list

ShowSystemAlarm (Text/value)

Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Text/Value

The text or the value, which was output as a system alarm.

See also

Availability for specific devices of system functions (Page 5739)

Recipes (Panels, RT Advanced)

ExportDataRecords (Panels, RT Advanced)

Description

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

Use in the function list

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecords (Recipe_number/name,Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

File name

Name of the CSV file to which the recipe data records are exported. Enter the storage location and the file extension (*.csv), for example "C:\TEMP\Orange.csv", for Basic Panels "\USB_X60.1\Orange.csv".

Note

Storage of the CSV file

Does not apply for Basic Panels:

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<FileName>".
- If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
- When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp\", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp_Recipe names.csv.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

Does not apply for Basic Panels:

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

You want to export all data records using a key.

Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv, for Basic Panels "\USB_X60.1\orange.csv"
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system alarm is output.

See also

Availability for specific devices of system functions (Page 5739)

ExportDataRecordsWithChecksum (Panels, RT Advanced)

Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe_number/name, Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp_Recipe names.csv.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

Using a key, you want to export all data records and assign a checksum.

Notes on configuring

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

See also

Availability for specific devices of system functions (Page 5739)

ImportDataRecords (Panels, RT Advanced)

Description

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

Use in the function list

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ImportDataRecords (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

File name

Name of the CSV file from which the recipe data records are imported. Enter the storage location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv", for Basic Panels "\USB_X60.1\Orange.csv".

Note

Does not apply for Basic Panels: If a storage card is used as file location, specify the file location as follows: "\StorageCard\<FileName".

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Configurable objects

Object	Event
Tag	Value change Upper limit exceeded Lower limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

See also

Availability for specific devices of system functions (Page 5739)

ImportDataRecordsWithChecksum (Panels, RT Advanced)

Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

Use in user-defined functions

ImportDataRecordsWithChecksum (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status, Verify_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\StorageCard\<File name>".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Verify checksum

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

See also

Availability for specific devices of system functions (Page 5739)

LoadDataRecord (Panels, RT Advanced)

Description

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

Use in the function list

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

Use in user-defined functions

LoadDataRecord (Recipe_number/name, Data_record_number/name, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which a recipe data record is loaded.

Data record number/name

Number or name of the recipe data record to be loaded.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

GetDataRecordFromPLC (Panels, RT Advanced)

Description

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

Use in the function list

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

GetDataRecordFromPLC (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are transferred.

Data record number/name

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

Overwrite

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

Notes on configuring

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

See also

Availability for specific devices of system functions (Page 5739)

GetDataRecordName (Panels, RT Advanced)

Description

Writes the name of the given recipe and recipe data record to the given tags.

Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

Note

Only internal tags or external tags are supported as tags.

Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

Use in user-defined functions

GetDataRecordName (Recipe_number, Data_record_number, Recipe_name, Data_record_name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number

Number of the recipe whose name is written to the given tag.

Data record number

Number of the recipe data record whose name is written to the given tag.

Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- RecNumber" of type INTEGER
- RecDataNumber" of type INTEGER
- RecName" of type STRING
- RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

See also

Availability for specific devices of system functions (Page 5739)

GetDataRecordTagsFromPLC (Panels, RT Advanced)

Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe_number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe data record whose values are written from the PLC to the tags.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

ClearDataRecord (Panels, RT Advanced)

Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

Use in the function list

ClearDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

Data record number/name

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

ClearDataRecordMemory (Panels, RT Advanced)

Description

Deletes all recipes data records from the specified storage medium.

Use in the function list

ClearDataRecordMemory (Storage location, After confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecordMemory (Storage_location, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card

With confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Availability for specific devices of system functions (Page 5739)

RecipeViewNewDataRecord (Panels, RT Advanced)

Description

Creates a new data record in the given recipe view.

Use in the function list

RecipeViewNewDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the new recipe data record is created.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewGetDataRecordFromPLC (Panels, RT Advanced)

Description

Transfers the data record that is currently loaded in the PLC to the HMI device and displays it in the recipe view.

Use in the function list

RecipeViewGetDataRecordFromPLC (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record from the PLC is displayed.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewClearDataRecord (Panels, RT Advanced)

Description

Deletes the data record which is currently displayed in the recipe view.

Use in the function list

RecipeViewClearDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the displayed recipe data record is deleted.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewMenu (Panels, RT Advanced)

Description

Opens the menu of the specified simple recipe view.

Only use this system function at a simple recipe view.

Use in the function list

RecipeViewMenu (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the menu is to be opened.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewOpen (Panels, RT Advanced)

Description

Displays the data record values in the given recipe view or changes to the next selection field. The system function has no effect if the selection field for the recipe data record values is displayed on the HMI device.

Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewBack" system function to display the previous selection list.

Use in the function list

RecipeViewOpen (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the command is triggered.

See also

RecipeViewBack (Page 5965)

Availability for specific devices of system functions (Page 5739)

RecipeViewSetDataRecordToPLC (Panels, RT Advanced)

Description

Transfers the recipe data record which is currently displayed in the recipe view to the PLC.

Use in the function list

RecipeViewSetDataRecordToPLC (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view from which the recipe data record is transferred to the connected PLC.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewSaveDataRecord (Panels, RT Advanced)

Description

Saves the recipe data record which is currently displayed in the recipe view.

Use in the function list

RecipeViewSaveDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record is saved.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewSaveAsDataRecord (Panels, RT Advanced)

Description

Saves the data record currently being displayed in the recipe view under a new name.

Use in the function list

RecipeViewSaveAsDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Saves the data record currently being displayed in the recipe view under a new name and/or new number.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewSynchronizeDataRecordWithTags (Panels, RT Advanced)

Description

Synchronizes the values of the data record which is currently displayed in the recipe view with their recipe tags. Only use this system function at an advanced recipe view.

During synchronization, all values of the data record are written to their recipe tags.

Use in the function list

RecipeViewSynchronizeDataRecordWithTags (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the values are synchronized with their tags.

Note

The OP 77A and TP 177A HMI devices do not support this function for the screen object.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewRenameDataRecord (Panels, RT Advanced)

Description

Renames the selected data record in the given recipe view.

Use in the function list

RecipeViewRenameDataRecord (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the recipe data record is renamed.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewShowOperatorNotes (Panels, RT Advanced)

Description

Displays the configured tooltip of the specified recipe view.

Use in the function list

RecipeViewShowOperatorNotes (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view whose configured tooltip is displayed.

See also

Availability for specific devices of system functions (Page 5739)

RecipeViewBack (Panels, RT Advanced)

Description

Returns to the previous selection list in the given recipe view.

The system function has no effect if the selection field for the recipe is displayed on the HMI device. Operation sequence of the selection lists in runtime:

- Recipe name
- Data record name
- RecipeDataRecordValues

This system function is used when a simple recipe view has been configured. In the simple recipe view, only one selection list is displayed at a time on the HMI device. Use the "RecipeViewOpen" system function to display the recipe data record values or the next selection field.

Use in the function list

RecipeViewBack (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the recipe view in which the command is triggered.

See also

Availability for specific devices of system functions (Page 5739)

SetDataRecordToPLC (Panels, RT Advanced)

Description

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

Note

The values of the recipe data record don't need to be displayed on the HMI device.

Use in the function list

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

Use in user-defined functions

SetDataRecordToPLC (Recipe_number/name, Data_record_number/name, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Data record number/name

Number or name of the recipe data record to be transferred to the PLC.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

SetDataRecordTagsToPLC (Panels, RT Advanced)

Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

Use in user-defined functions

SetDataRecordTagsToPLC (Recipe_ number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

SetRecipeTags (Panels, RT Advanced)

Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

Use in user-defined functions

SetRecipeTags (Recipe_number/name, Status, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

See also

Availability for specific devices of system functions (Page 5739)

SaveDataRecord (Panels, RT Advanced)

Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

SaveDataRecord (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

System (Panels, RT Advanced)

ActivateCleanScreen (Panels, RT Advanced)

Description

Activates the clean screen on the HMI device. The display of the HMI device is disabled for the given time period.

When the display of the HMI device is deactivated, it can be cleaned without triggering touch functions by mistake.

Use in the function list

ActivateCleanScreen (Time period)

Use in user-defined functions

--

Parameters

Time period

Time period for which the display is disabled. The time remaining is displayed as a progress bar.

Value range in seconds from 10 through 300.

Note

The system function ActivateCleanScreen cannot be simulated.

See also

Logoff (Page 5831)

Availability for specific devices of system functions (Page 5739)

OpenFileBrowser (Panels, RT Advanced)

Description

Opens a file browser dialog.

Depending on the mode the user can select a file or a folder.

Use in the function list

OpenFileBrowser (Mask, Output Folder, File, Navigation Back, Navigation Up, New folder, Path, Status)

Use in user-defined functions

-

Parameters

Mask

Sets a mask for filtering the displayed files. This parameter is only evaluated in "File" mode. The filter criteria must be delimited by ; semicolon. Example: *.htm;*.html

Start folder

Specifies the folder with which the file selection dialog starts.

File

Specifies the mode in which the dialog is opened.

0 = folder search mode

1 = file search mode

Navigation Back

Specifies whether or not the "Back" button is activated. This button offers simple navigation to the last folder you opened.

Navigation Up

Specifies whether or not the "Up" button is activated. This button offers simple navigation to the parent folder.

New folder

Specifies whether or not the button can be used to create a new folder.

Path

Contains the path name of the last folder opened after you close the dialog.

Status

Returns information about the dialog closing mode

-1 = dialog was canceled

0 = dialog was closed with "OK".

OpenTaskManager (Panels, RT Advanced)

Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

Note

The appearance of the task manager depends on the operating system installed.

Use in the function list

OpenTaskManager

Use in user-defined functions

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

Keyboard (Panels, RT Advanced)

OpenScreenKeyboard (Panels, RT Advanced)

Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

Use in the function list

OpenScreenKeyboard (Display mode)

Use in user-defined functions

OpenScreenKeyboard (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

Keyboard operation for screen objects (Panels, RT Advanced)

ScreenObjectCursorDown (Panels, RT Advanced)

Description

Results in a line-by-line, downward cursor movement in the table of the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display
- PLC code view

Use in the function list

ScreenObjectCursorDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 5739)

ScreenObjectCursorUp (Panels, RT Advanced)

Description

Results in a line-by-line, upward cursor movement in the table of the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display
- PLC code view

Use in the function list

ScreenObjectCursorUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 5739)

ScreenObjectCursorRight (Panels, RT Advanced)

Description

Results in a line-by-line, cursor movement to the right in the specified screen object.

Use in the function list

ScreenObjectCursorLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the command is executed.

See also

ScreenObjectPageDown (Panels, RT Advanced)

Description

Results in a page-by-page, downward cursor movement in the table of the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectPageDown (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 5739)

ScreenObjectPageUp (Panels, RT Advanced)

Description

Results in a page-by-page, upward cursor movement in the table of the specified screen object.

The system function can be used for the following screen objects:

- User view
- Alarm view
- Recipe view
- NC subprogram display

Use in the function list

ScreenObjectPageUp (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the key function is triggered.

See also

Availability for specific devices of system functions (Page 5739)

ScreenObjectCursorLeft (Panels, RT Advanced)

Description

Results in a line-by-line, cursor movement to the left in the specified screen object.

Use in the function list

ScreenObjectCursorLeft (Screen object)

Use in user-defined functions

-

Parameters

Screen object

Name of the screen object in which the command is executed.

See also

PageDown (Panels, RT Advanced)

Description

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

Use in the function list

PageDown

Use in user-defined functions

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 5739)

PageUp (Panels, RT Advanced)

Description

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

Use in the function list

PageUp

Use in user-defined functions

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

See also

Availability for specific devices of system functions (Page 5739)

GoToHome (Panels, RT Advanced)

Description

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToHome

Use in user-defined functions

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

See also

Availability for specific devices of system functions (Page 5739)

GoToEnd (Panels, RT Advanced)

Description

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToEnd

Use in user-defined functions

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Events (Basic Panels, Panels, RT Advanced)

Cleared (Basic Panels, Panels, RT Advanced)

Description

Occurs when the active screen on the HMI device is cleared.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Activate (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user selects a display or operating object using the configured tab sequence.

Note

Note that the availability of the event depends on the HMI device and object type.

Note

If the user e.g. clicks a button with the mouse, the "Click" event is triggered. Users wishing to trigger the "Enable" event must select the button using the tab key.

The "Enable" event is only used to detect whether an object was selected. The event does not trigger a password prompt.

For this reason, do not use the "Enable" event if you want to configure access protection on the function call of the object.

Change (Basic Panels, Panels, RT Advanced)

Description

Occurs if the status of a display and operator control object changes.

The status of an object changes if, for example, the user presses the key.

Note

Note that the availability of the event depends on the HMI device and object type.

Loaded (Basic Panels, Panels, RT Advanced)

Description

Occurs when all configured display and operating objects are loaded in the active screen after a screen change.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

Enable a screen change to ensure that the connection with the control is established after switch-on.

Execute (Basic Panels, Panels, RT Advanced)

Description

Occurs when the scheduled task has been executed.

Selection changed (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user changes the selection.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

On exceeding (Basic Panels, Panels, RT Advanced)

Description

Occurs when the high limit of a tag is exceeded.

Note

Note that the availability of the event depends on the HMI device and object type.

On falling below (Basic Panels, Panels, RT Advanced)

Description

Occurs when the low limit of a tag is undershot.

Note

Note that the availability of the event depends on the HMI device and object type.

When dialog is opened (Basic Panels, Panels, RT Advanced)

Description

The event is triggered when a modal dialog opens.

Note

Please note that the availability of the event depends on the HMI device and object type.

When dialog is closed (Basic Panels, Panels, RT Advanced)

Description

The event is triggered when a modal dialog closes.

Note

Please note that the availability of the event depends on the HMI device and object type.

User change (Basic Panels, Panels, RT Advanced)

Description

Occurs when a user logs off at an HMI device or another user logs on at the HMI device.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Screen change (Basic Panels, Panels, RT Advanced)

Description

Occurs when all configured display and operating objects are loaded in the screen after a screen change.

Use the "Loaded" event if you want to perform other system functions during a screen change to a certain screen.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Deactivate (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user takes the focus from a display and operating object.

A screen object can be disabled using the configured tab order or by performing another action with the mouse.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

System functions or user-defined functions on the "Deactivate" event of a screen are not executed when a screen is being closed.

The "Deactivate" event is only used to detect whether an object was deselected. The event does not trigger a password prompt.

For this reason, do not use the "Deactivate" event if you want to configure access protection on the function call of the object.

Double-click (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user double-clicks on an object from the symbol library.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Press (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user clicks on a button with the left mouse button, presses <RETURN> or <SPACE>.

Also occurs when the user right-clicks on an object of the symbol library.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

On Finish Input (Basic Panels, Panels, RT Advanced)

Description

Triggered when you confirm input at an I/O field by pressing ENTER, or by mouse click, or by touch screen operation.

The "On Finish Input" event is also started if the value of a tag does not change, for example, if a value is exceeded, or if a user cancels the dialog to acknowledge a tag (Audit option package) that has to be acknowledged.

The event is not triggered, on the other hand, by user logon or by input fields configured with an authorization.

Note

Note that the availability of the event depends on the HMI device and object type.

Press ESC twice (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user presses the <ESC> key twice at the HMI device.

Note

Note that the availability of the event depends on the HMI device and object type.

Outgoing (Basic Panels, Panels, RT Advanced)

Description

Occurs when an alarm is deactivated.

Note

Please note that the availability of the event depends on the HMI device and object type.

Incoming (Basic Panels, Panels, RT Advanced)

Description

Occurs when an alarm is triggered and displayed in the alarm view.

Note

Please note that the availability of the event depends on the HMI device and object type.

Click (Basic Panels, Panels, RT Advanced)

Description

Occurs if the user clicks a display and operating object with the mouse or touches the touch display with a finger.

In case you click the incorrect object, prevent processing of configured function list as follows:

- Move the mouse pointer away from the object while keeping the mouse button pressed. Release the mouse button as soon as the mouse pointer leaves the object. The function list will then not be processed.
- On touch displays, the display must be touched with the finger until a reaction occurs, e.g., a screen change.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Click when flashing (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user clicks a flashing alarm indicator with the mouse or touches it with a finger.

Note

Note that the availability of the event depends on the HMI device and object type.

Loop-in alarm (Basic Panels, Panels, RT Advanced)

Description

Occurs as soon as the user selects an alarm in the alarm view and then clicks on the "Loop-In-Alarm" button or double clicks on the alarm.

For the "Loop-In-Alarm" event, you configure system functions, such as a change to the screen in which the alarm occurred.

You cannot configure local scripts for the "Loop-In-Alarm" event in Runtime Professional.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Release (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user releases a button.

This even does not occur, as long as the button remains pressed.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Alarm buffer overflow (Basic Panels, Panels, RT Advanced)

Description

Occurs when the configured size of the alarm buffer is reached.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Acknowledge (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user acknowledges an alarm.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Reach margin (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user reaches the beginning or the end of a scrollable area.

Note

Note that the availability of the event depends on the HMI device and object type.

Note

A user-defined function must not be configured for the "Boundary reached" event.

Configurable objects

The event can only be configured on the <Up> and <Down> keys, or on the keys on which you have configured the "ScreenObjectPageUp" or "ScreenObjectPageDown" system functions.

Runtime Stop (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user exits the Runtime software on the HMI device.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Note

A user-defined function must not be configured for the "Runtime stop" event.

Press key (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user presses a function key.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Release key (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user releases a function key.

Note

Note that the availability of the event depends on the HMI device and object type.

Overflow (Basic Panels, Panels, RT Advanced)

Description

Occurs when the configured size of the log is reached. You use the log type "Trigger event".

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Switching (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user toggles a display and operating object, e.g. a switch from "ON" to "OFF".

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

Switch OFF (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user moves the display and operating object "Switch" to the OFF position.

Note

Note that the availability of the event depends on the HMI device and object type.

Switch ON (Basic Panels, Panels, RT Advanced)

Description

Occurs when the user moves the display and operating object "Switch" to the ON position.

Note

Note that the availability of the event depends on the HMI device and object type.

Low free storage space (Basic Panels, Panels, RT Advanced)

Description

This event is triggered if the storage space available on the medium to which the Audit Trail is less than the configured minimum.

Free space critically low (Basic Panels, Panels, RT Advanced)

Description

This event is triggered if the storage medium to which an Audit Trail is saved provides insufficient storage space due to hardware restrictions.

Value change (Basic Panels, Panels, RT Advanced)

Description

Occurs when the value of a tag or the value of an array element changes.

The value change of a tag is triggered by the PLC or by the user, e.g. when a new value is entered. No event is output if a system function changes the value.

Note

Please note that the availability of the event depends on the HMI device and object type.

Time expired (Basic Panels, Panels, RT Advanced)

Description

Occurs when the time configured in the scheduler expires.

Note

Please note that the availability of the event is dependent upon the HMI device and object type.

12.8.8.3 WinCC Advanced V14 - Programming reference

WinCC VB-Scripting

You can find a detailed description of VB-Scripting in the "WinCC Advanced V14 - Programming reference" manual.

12.9 Mobile Panels (Panels, RT Advanced)

12.9.1 Basics (Panels, RT Advanced)

12.9.1.1 Field of application of the Mobile Panel Wireless (Panels, RT Advanced)

Introduction

The Mobile Panel Wireless enables you to move through the plant without restrictions and with or without security technology. You can operate and monitor moving machine parts or the entire plant depending on the situation. You can plan, configure, simulate and extend wireless networks quickly and reliably.

The Mobile Panels Wireless are based on standardized WLAN technology and are specially tailored to the requirements of automation.

WLAN area

A WLAN area is the area of the plant in which the HMI device communicates with the PLC over a wireless local area network. The wireless coverage of the network has a sufficient signal strength in this area.

The WLAN of a plant is formed by the radio area of one or more Access Points.

Access Point

The Access Point serves as a gateway between the wireless and hard-wired network. The HMI device communicates with an Access Point via WLAN. You can operate the different machines or plants without annoying cables. The HMI device is connected to a network in which it communicates with a PLC via the access point.

Effective range

Safety-related operator input is only possible in a limited part of a WLAN area upstream of a machine or plant known as the effective range. One exception to this rule is the emergency stop, which works in the entire WLAN area.

The configured effective ranges are stored in the HMI device. The HMI device can only log on to a machine within the effective range. This also requires there no other HMI device is logged on in the same effective range.

To ensure clear logon and machine operator inputs, one effective range must not overlap another effective range.

Tags

Effective ranges are formed by the spatial assignment of tags to a machine or plant. Tags create a geometrical space which is relevant for logon to a machine. After logon you operate the machine using acknowledgement buttons.

A distinction is made between two types of tags:

- Transponder
- RFID tag

Transponder

After successful logon to a machine, the spanned geometrical area will be monitored. The distance between the HMI device and the transponder can only be measured if the two devices are in the reception range of each other. When you leave the effective range, safety-related operator input of the machine with acknowledgment buttons is prevented.

Zones in the transponder system

Zones are configurable objects within a transponder system. A zone is defined by the maximum distance from one or more transponders. In a hard-wired Mobile Panel, the length of the connection cable defines a zone around a connection box.

Zones are operating areas in which safety-related operator input is not possible. To enter a zone, you have to configure a screen change to the correct process picture.

RFID tag

After successful logon to a machine, the spanned geometrical area is not monitored. Monitoring therefore calls for an additional organizational measure, for example: a light barrier or a protective fence. The protection area is separated from the plant by a security system. The protection area is the area in the plant in which you operate one or more machines in fail-safe operation. One or more RFID Tags are distributed within protection zones. The protection area is not a configurable object.

12.9.1.2 How does the transponder system work? (Panels, RT Advanced)

Overview

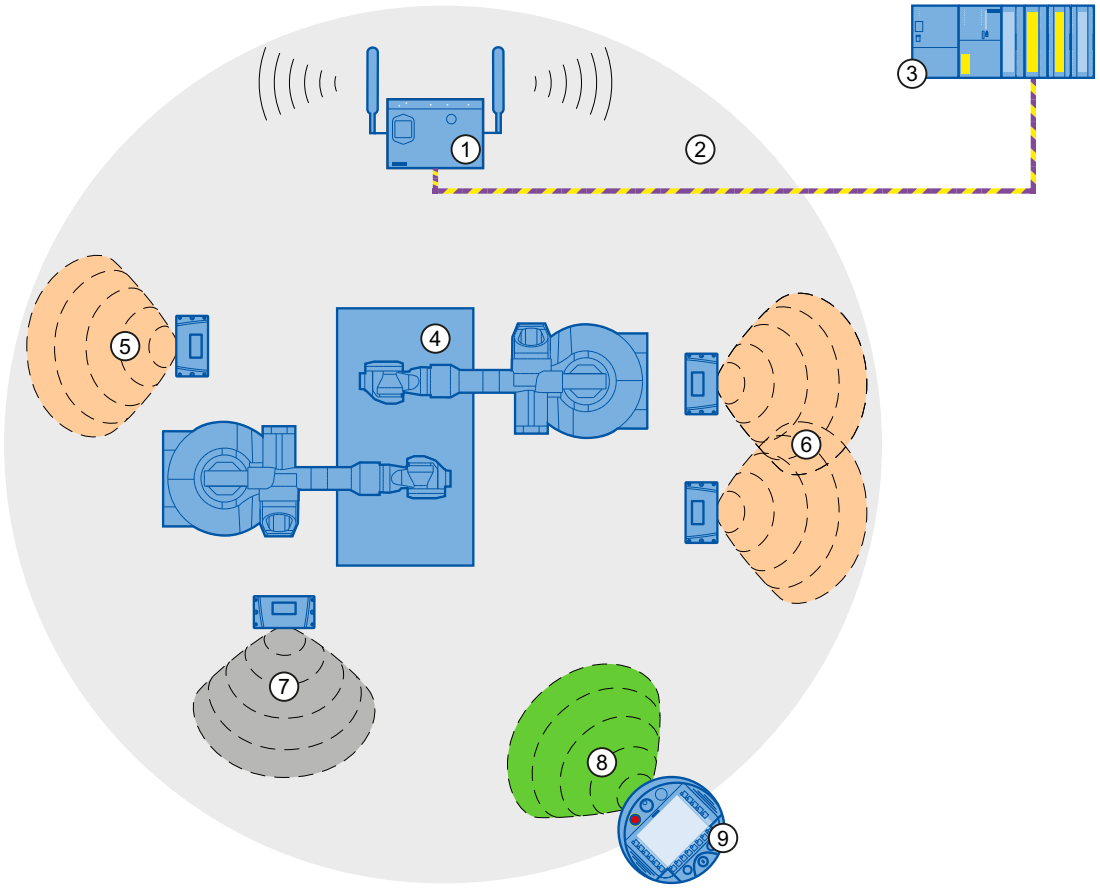
To give a basic understanding of all this, the following section describes the interaction between:

- HMI device
- Zone
- Effective range
- Transponder

Note

You should always assign administrator rights or set up encryption to protect the project containing a Mobile Panel Wireless for fail-safe operation against unauthorized access.

Principle of operation in the transponder system



1 Access Point
2 WLAN of the Access Point
3 PLC
4 Plant
5 Effective range "Robot 1" with a transponder
6 Effective range "Robot 2" with two transponders
7 Zone "Zone 1" with a transponder
8 Radio area of the HMI device
9 HMI device

Example:

- A screen change is configured for "Zone 1".
- Transponder1 is assigned to the "Robot 2" effective range.
- The operator enters the radio cone of the transponder to receive the transponder ID.

- To log onto the machine "Robot 2", the operator presses the object "Effective range - Name".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range ID and confirms with "OK". The dialog is closed.
- If the logon was successful, then the acknowledgement buttons will be active.
- The HMI device measures the distance from the transponder which is less than the configured distance of the effective range.

Result:

The operator is logged onto the machine "Robot 2". The operating element "Effective range - Name" is green and shows the name of the effective range "Robot 2".

If the HMI device is logged onto the effective range, then the following will apply:

- The operator may not leave the effective range without logging off. If the operator leaves the effective range without logging off for more than 30 seconds, a local rampdown will occur.
- No other HMI device can log onto the machine.

To log off from the machine, the operator presses the operating element "Effective range - Name". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot2".

When the operator enters "Zone 1", a screen change will take place.

12.9.1.3 How does the RFID system work? (Panels, RT Advanced)

Overview

RFID stands for radio frequency identification. RFID allows wireless identification of objects without contact or visual sighting.

For a basic understanding, the following section describes the interaction between:

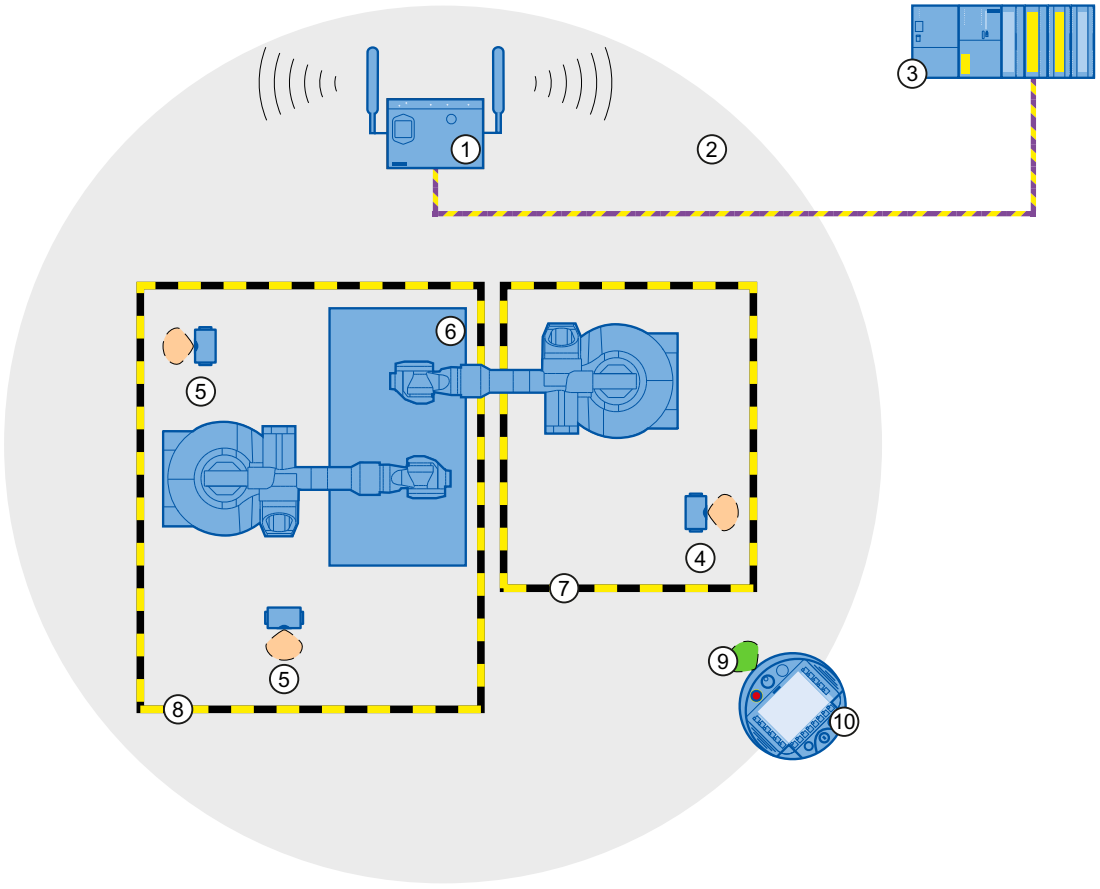
- HMI device
- Effective range (RFID)
- RFID tag

Note

RFID Tags in the plant area

You may only affix RFID Tags in restricted plant areas that are protected by additional protective measures, for example, protective railings.

Principle of operation in the RFID system



① Access Point
② WLAN of the Access Point
③ PLC
④ RFID tag with effective range (RFID) for logon to "Robot 1"
⑤ RFID tag with effective range (RFID) for logon to "Robot 2"
⑥ Plant
⑦ Protective area limit of the machine "Robot1"
⑧ Protective area limit of the machine "Robot2"
⑨ Radio area of the HMI device
⑩ HMI device

Example:

- "RFID Tag1" is assigned to the effective range (RFID) "Robot1".
- An operator enters the restricted plant area. The operator manually switches to the screen with the configured operating element "Effective range - Name (RFID)".

- At "RFID Tag1", he presses the "Scan" button.
  During the logon operation, the button is yellow and displays the text "Scanning…".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range (RFID) ID and confirms it with "OK". The dialog is closed.
- The "Confirmation of logon" dialog box opens. The operator confirms logon with the acknowledgment button.
- If logon was successful, the acknowledgement buttons are active.

Result:

The operator is logged on to the machine "Robot 1" and operates the machine within the protection area in fail-safe operation. The operating element "Effective range - Name (RFID)" is green and shows the name of the effective range (RFID) "Robot1".

If the HMI device is logged on to the machine, the following applies:

- The user may not leave the protection area without logging off from the machine. If the operator leaves the protection area without logging off, a local rampdown occurs.
- No other HMI device can log on to this machine.

To log off from the machine, the operator presses the operating element "Effective range - Name (RFID)". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot 1".

12.9.1.4 Zones (Panels, RT Advanced)

Introduction

The section below applies to the following Mobile Panels:

- Mobile Panels Wireless, for example, Mobile Panel 277 IWLAN V2 and Mobile Panel 277F IWLAN V2
- KTP Mobile Panels, wired, e.g., Mobile Panel KTP700

A "Zones" work area is only visible for these HMI devices.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Depending on the HMI device selected, open the work area in the project window by double-clicking on "Zones" or "Zones and effective ranges".

Work area

For Mobile Panels Wireless, the "Zones" work area displays the zones that have been set up and the transponders assigned to them.

For wired Mobile Panels, the "Zones" work area shows the zones that have been set up and the associated box ID of the connection box.

Inspector window

When a zone is selected, edit the name and display name under "General".

For Mobile Panels Wireless, configure the limit of the zone around the transponder. The zone of a transponder has the events "Upon entry" and "Upon exit"

With wired Mobile Panels enter the box ID of the connection box. The zone of a connection box includes the event "Connected".

Configure the system function ActivateScreen" to the events.

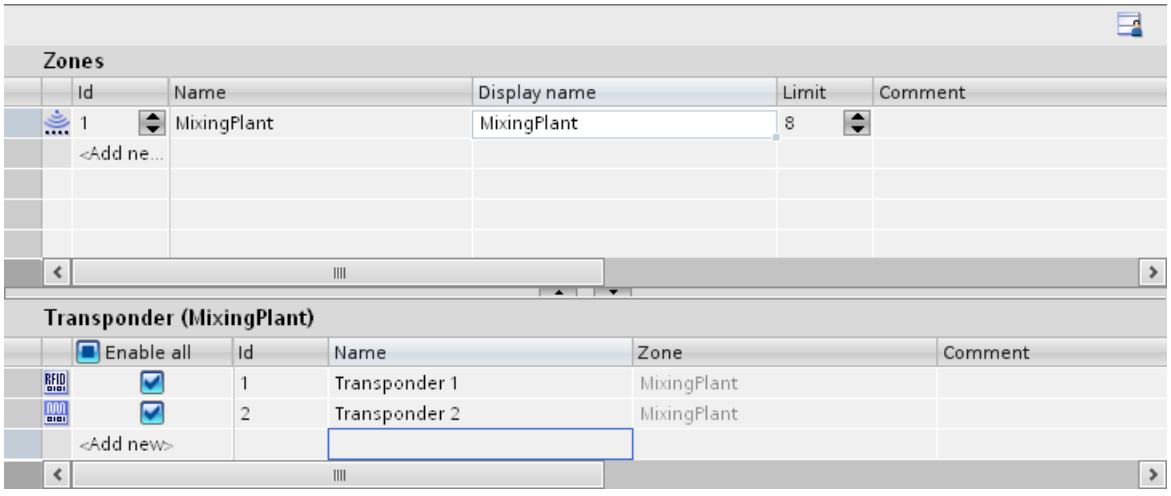
12.9.1.5 Zones work area at transponders (Panels, RT Advanced)

Introduction

The "Zones" work area displays the zones and the transponders assigned to them in table format. You create a list of transponders and assign certain transponders to a zone. The limit of the zone is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Zones" and "Transponders" tables.



If you select a zone in the "Zones" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected zone.
- Transponder deactivated: The transponder is not yet assigned to any zone.
- Transponder not available: The transponder has already been assigned to another zone. To undo the assignment, switch to the relevant zone and deactivate the transponder.

The zone and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 254 zones may be configured.
- The zone ID must be unique and fall within the range from 1 - 254.
- You can initially configure transponders without assigning them to a zone.
- There may be no more than 255 transponders assigned to a zone.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

12.9.1.6 Zones work area on connection boxes (Panels, RT Advanced)

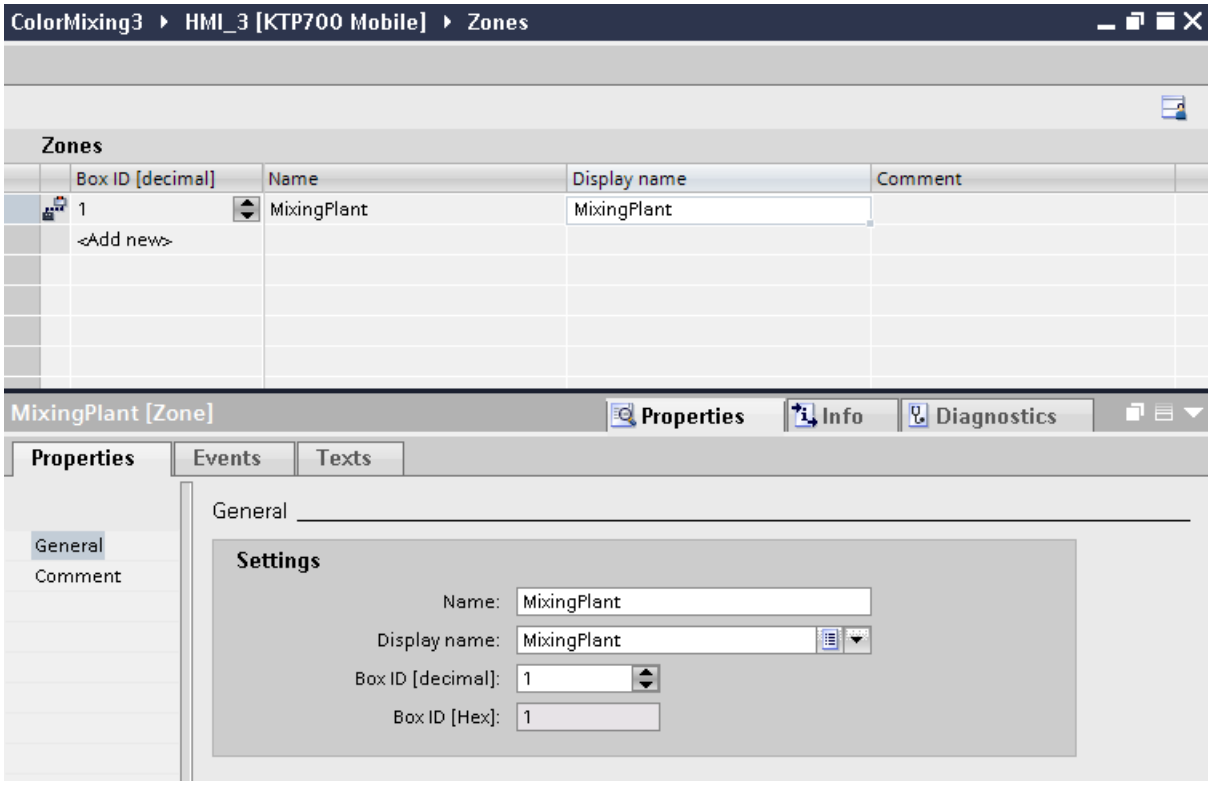
Introduction

The "Zones" work area displays the box IDs of the connection boxes and their zones in table format.

You create a list of box IDs of the connection boxes and assign specific connection boxes to a zone. The limit of the zone is defined by the length of the connecting cable to your Mobile Panel.

Principle

The work area consists of the "Zones" table.



The box ID is set on the connection box and can be read out from the HMI device.

12.9.1.7 Effective ranges (Panels, RT Advanced)

Introduction

The following section applies only to the Mobile Panels Wireless that support fail-safe operation, e.g. Mobile Panel 277F IWLAN V2. The "Effective ranges" work area is only visible for these HMI devices.

You set up effective ranges in order to control safety related operations. An effective range is defined by the maximum distance from one or more transponders.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Zones & effective ranges". Click the "Effective ranges" tab.

Work area

The "Effective ranges" work area displays the effective ranges that have been set up and the transponders assigned to them.

Inspector window

When an effective range is selected, you can edit the names, display names and the limits of the effective range under the "General" category.

When you select a transponder, you can see both the effective range and the zone that are assigned to that transponder. You can only assign a transponder to one effective range so that the effective ranges do not overlap.

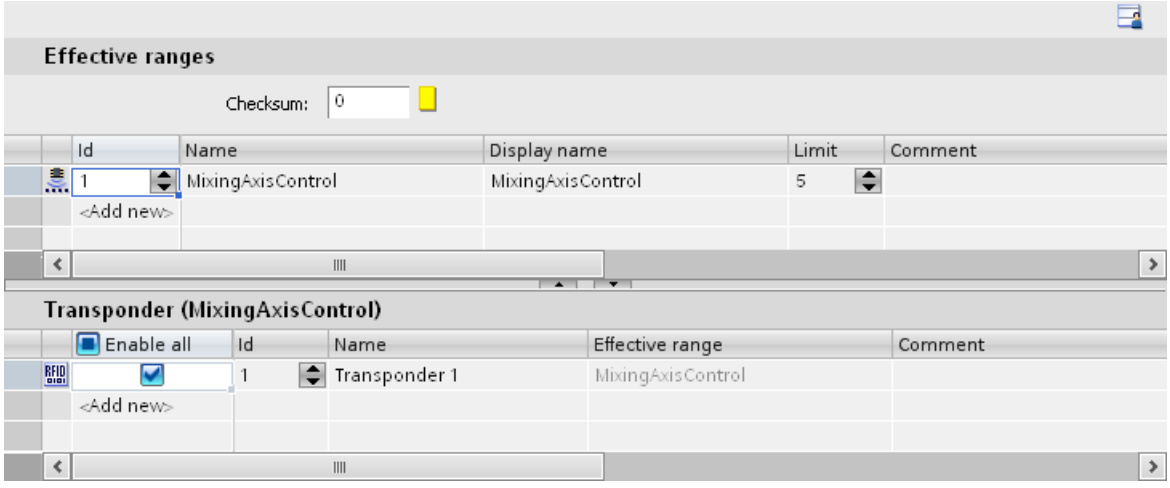
12.9.1.8 Effective ranges working area (Panels, RT Advanced)

Introduction

The "Effective ranges" work area displays the effective ranges and their transponders in table format. You create a list of transponders and assign certain transponders to an effective range. The limit of the effective range is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Effective ranges" and "Transponders" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges and transponders reliably match those locally on the machine. The project cannot be

started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges" editor.

When you select an effective range from the "Effective ranges" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected effective range.
- Transponder deactivated: The transponder is not yet assigned to any effective range.
- Transponder not available: The transponder has already been assigned to another effective range. To undo the assignment, switch to the relevant effective range and deactivate the transponder.
- The zone assigned to the transponder is displayed in addition to the effective range.

The effective range and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges may be configured.
- The effective range ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range must not be the same as its ID.
- You can initially configure transponders without assigning them to an effective range.
- There may be no more than 127 transponders assigned to an effective range.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

Effective range in Runtime

To log on to the effective range in Runtime, only the display name of the effective range appears to the operator in the Runtime language. The operator reads the effective range ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

12.9.1.9 Effective ranges (RFID) (Panels, RT Advanced)

Introduction

The following section only applies to the Mobile Panel 277F IWLAN (RFID tag) which supports fail-safe operation with RFID. The "Effective ranges (RFID)" work area is only visible with these HMI devices.

To monitor safety-related operator inputs, you set up effective ranges (RFID).

Note

For more information, refer to the operating instructions of the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Effective ranges (RFID)".

Work area

The "Effective ranges (RFID)" work area displays the effective ranges that have been set up and the RFID Tags assigned to them.

Inspector window

When an effective range (RFID) is selected, you can edit the name, display name and ID of the effective range under the "General" category.

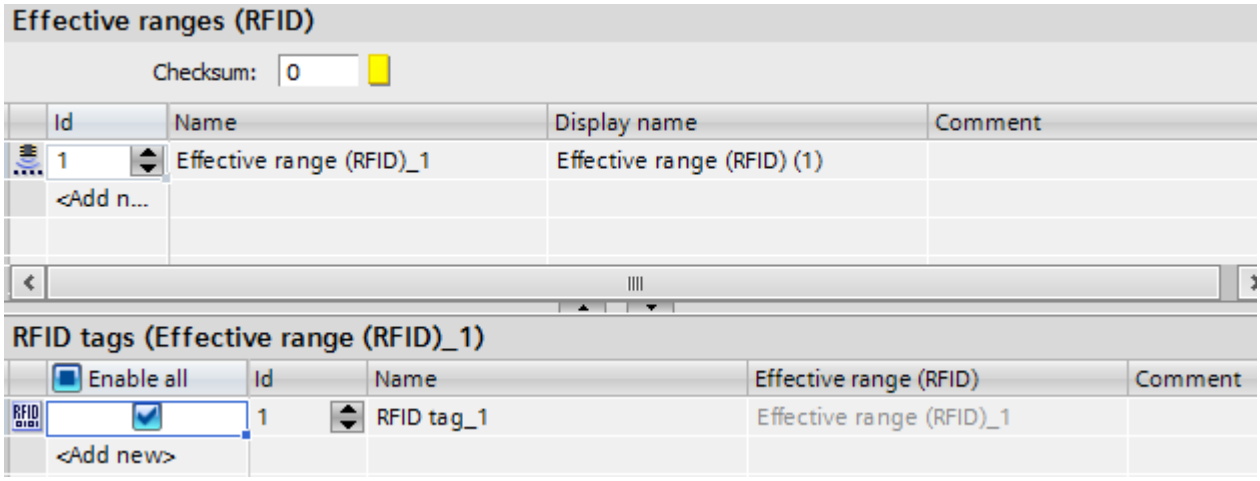
12.9.1.10 Work area for effective ranges (RFID) (Panels, RT Advanced)

Introduction

The "Effective ranges (RFID)" work area displays the effective ranges (RFID) and their RFID Tags in table format. You create a list of RFID Tags and assign specific RFID Tags to an effective range.

Principle

The work area consists of the "Effective ranges (RFID)" and "RFID Tags" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges (RFID) and RFID Tags reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges (RFID)" editor.

When you select an effective range (RFID) in the "Effective ranges (RFID)" table, the "RFID Tags" table displays the following:

- RFID Tag enabled: The RFID Tag is assigned to the selected effective range (RFID).
- RFID Tag disabled: The RFID Tag is not yet assigned to any effective range (RFID).
- RFID Tag not available: The RFID Tag has already been assigned to another effective range (RFID). To undo the assignment, switch to the relevant effective range (RFID) and deactivate the RFID Tag.

The IDs of the effective ranges (RFID) and RFID Tags are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges (RFID) may be configured.
- The effective range (RFID) ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range (RFID) must not be the same as its ID.
- You can initially configure RFID Tags without assigning them to an effective range (RFID).
- A maximum of 127 RFID Tags is available to assign to an effective range (RFID).
- The RFID Tag ID must be unique and fall within the range 1-65534.

The RFID Tag ID is written to the RFID Tag by the HMI device.

Effective range in Runtime

To log on to the effective range (RFID) in Runtime, only the display name of the effective range (RFID) is displayed to the operator in the Runtime language. The operator reads the effective range (RFID) ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

12.9.2 Configuring Mobile Panels V2 for fail-safe operation (up to V11 SP2) (Panels, RT Advanced)

12.9.2.1 Configuration overview (Panels, RT Advanced)

Introduction

Additional steps in the TIA Portal up to version V11 SP1 are necessary before configuration of the Mobile Panels V2 for fail-safe operation.

This affects the following HMI devices:

- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

Procedures overview

1. Creating PLC for fail-safe operation
2. Installing a general station description (GSD)
3. Creating a module from the GSD file
4. Creating a connection between a module from the GSD file and the PLC
5. Creating Mobile Panel V2 for fail-safe operation

See also

Creating Mobile Panel (Page 6022)

Creating a module from the GSD file (Page 6018)

Creating PLC for fail-safe operation (Page 6017)

Creating a connection between a module and the PLC (Page 6021)

12.9.2.2 Creating PLC for fail-safe operation (Panels, RT Advanced)

Requirement

A project is open

Procedure

1. Click "Add new device" in the project navigation.
2. Click "PLC" in the "Add new device" dialog.
3. Select a PLC for fail-safe operation, for example, CPU-315F-2PN/DP. The "Devices & Networks" editor opens.
4. Open the device view.
5. Select the device and click on "Device overview".
6. Select the device.
7. Click "Properties > PROFINET interface [X2] >Ethernet addresses > Interface connected with > Add new subnet" in the inspector window.
8. Enter the IP address under "IP protocol > Set IP address in the project".
9. Enter a time for "Properties > PROFINET interface [X2] > F parameter > Set default F monitoring time for F I/O of this interface".
10. Specify the properties for fail-safe operation in "Properties > Fail-safe"
    - "F-capability activated"
    - "Basis for PROFIsafe addresses"
11. Specify further properties for fail-safe operation as usual, for example, protection level.

Result

You have created a PLC in the project and made the settings for fail-safe operation.

12.9.2.3 Installing a general station description (GSD) (Panels, RT Advanced)

Introduction

A GSD file (device master data file) contains all the IO device properties. The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). Install a GSD file to expand the hardware catalog.

Requirement

- The "Devices & Networks" editor is open.
- The "Network view" is open.
- The GSD file is available on your PC.

The GSD file can be found online:

GSD file of Mobile Panel V2 for fail-safe operation (http://support.automation.siemens.com/WW/view/de/60497002)

Procedure

1. Click "Options > Install general station description (GSD)".
2. In the "Install general station description" dialog, choose the directory in which the GSD files are located.
3. Select the GSD file from the list.
4. Click the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

Result

You have installed the GSD file. You can find the new devices installed by means of the GSD files in the hardware catalog under "Additional field devices > PROFINET". Any problems that occur during the installation can be traced using the log file.

See also

Configuration overview (Page 6016)

12.9.2.4 Creating a module from the GSD file (Panels, RT Advanced)

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- The "Network view" is opened in the "Devices & Networks" editor.

Procedure

1. Open the hardware catalog.
2. Open the directory "Additional field devices > PROFINET-IO > HMI > Siemens AG > SIMATIC HMI > 277".

3. Now open the folder of the Mobile Panel V2 for fail-safe operation whose device type you also have as hardware:
   - Mobile Panel 277F IWLAN V2 or
   - Mobile Panel 277F IWLAN V2 (RFID tag)
4. For Mobile Panel 277F IWLAN V2, select the module with the order number 6AV6645-0EC01-0AX1.

5. For Mobile Panel 277F IWLAN V2 (RFID tag), select the module with the order number 6AV6645-0EF01-0AX1.

Note

The order number of the module in the GSD file has to match the order number of the Mobile Panel V2 in the software.

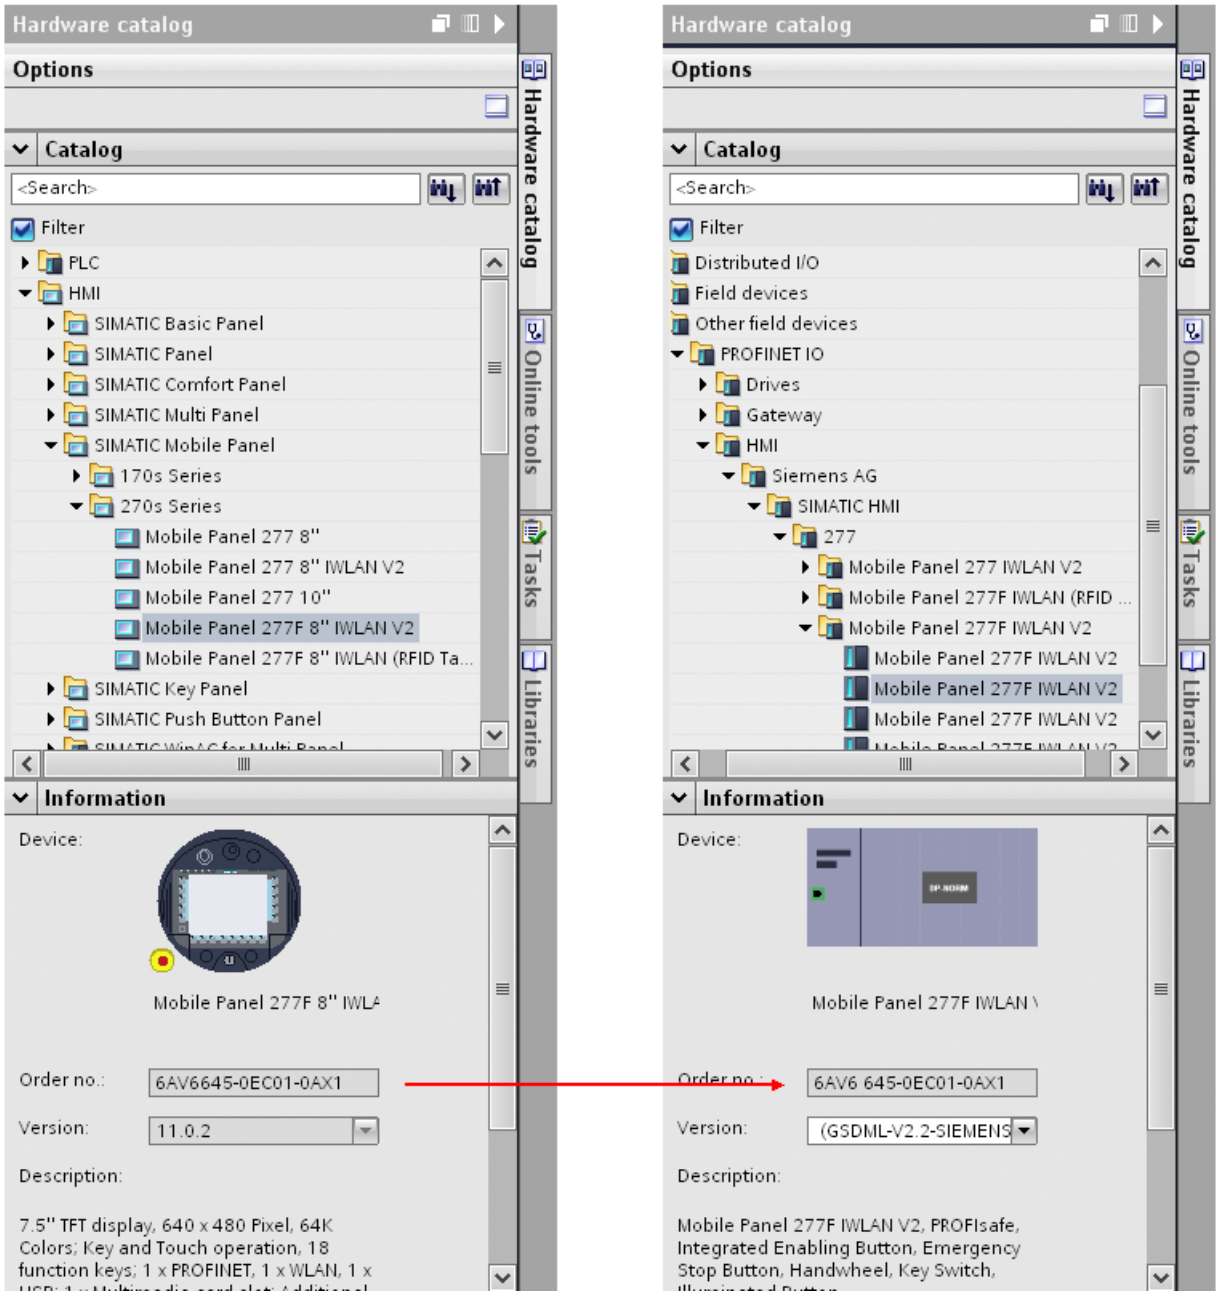

Figure 12-5 Left: Mobile Panel in the software. Right: Module in the GSD file

6. Drag-and-drop the desired module into the network view.

Result

You have created a module from the GSD file in your project.

PROFIsafe address (Page 6039)

Configuration overview (Page 6016)

12.9.2.5 Creating a connection between a module and the PLC (Panels, RT Advanced)

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- A module from the GSD file has been created.
- The "Devices & Networks" editor is open.

Procedure

1. Open the "Network view".
2. Select the module and right-click on "Not assigned". The shortcut menu is opened.
3. Select "Assign new IO controller". A dialog opens.
4. Select the IO controller and confirm with OK. A connection is established.
5. Open the device view
6. Click on "Mobile277Failsafe_IO_1" in the device overview.
7. Specify the properties for fail-safe operation in the inspector window under "Properties > PROFIsafe":
   - "F-Source-Add"
   - "F-Dest-Add"
8. Click on the module in the device view.
9. Assign a name under "Properties > General > Name" in the inspector window.
10. Assign an IP address under "PROFINET interface [X1] > Ethernet addresses > IP protocol > Set IP address in the project".

Result

The module from the GSD file is connected to the PLC. The module adopts the settings made in the PLC for PROFIsafe and PROFINET.

Configuration overview (Page 6016)

12.9.2.6 Creating Mobile Panel (Panels, RT Advanced)

Requirement

- The inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-315F-2PN/DP.
- The GSD device is created in the project.

Inserting Mobile Panel into the project.

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a Mobile Panel V2 for fail-safe operation, for example, Mobile Panel 277F IWLAN V2. The device is inserted into the project.

Note

Select the corresponding Mobile Panel for the module already installed from the GSD file.

Defining properties

1. Open the "Devices and Networks" editor.
2. Open the "Device view".
3. Select the Mobile Panel in the work area.
4. Open "Properties > General" in the inspector window.
5. To facilitate assignment in the project, enter the name of the associated module under "Name"
6. Enter the same IP address as in the module under "Set IP address in the project".
7. Activate "Set IP address using a different method".

Result

Entering the same IP address as in the device enables error-free communication. Alternatively, you can set the IP address on the Mobile Panel after loading the project.

Configuration overview (Page 6016)

12.9.3 Configuring Mobile Panels V2 for fail-safe operation (from V12 SP1) (Panels, RT Advanced)

12.9.3.1 Configuration overview (Panels, RT Advanced)

Introduction

Configure fail-safe operation in the "Devices & Networks" editor of the TIA Portal, version V12 SP1 or later, for the following Mobile Panels V2:

- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

To configure Mobile Panel V2 with device version V11, see "Configuring Mobile Panels V2 for fail-safe operation (up to V11 SP2) (Page 6016)".

Procedures overview

1. Create a PLC for fail-safe operation.
2. Create a Mobile Panel V2 for fail-safe operation.
3. Create a connection between the Mobile Panel and PLC.

Creating PLC for fail-safe operation (Page 6023)

Creating a connection between the Mobile Panel and PLC (Page 6025)

12.9.3.2 Creating PLC for fail-safe operation (Panels, RT Advanced)

Requirement

A project is open

Procedure

1. Click "Add new device" in the project navigation.
2. Click on "Controller" in the "Add new device" dialog.
3. Select a PLC for fail-safe operation, for example CPU 315F-2 PN/DP.
   The "Devices & Networks" editor opens.
4. Select the device in the "Device overview".
5. Click "Properties > General > PROFINET interface [X2] >Ethernet addresses > Interface connected with > Add new subnet" in the inspector window.

6. Enter the IP address under "IP protocol > Set IP address in the project".
7. Enter a time for "Properties > PROFINET interface [X2] > F parameter > Default F monitoring time for F I/O of this interface".
8. Specify the properties for fail-safe operation in "Properties > Fail-safe":
   – "F-capability activated"
   – "Basis for PROFIsafe addresses"
9. Specify further properties for fail-safe operation as usual, for example, protection level.

Result

You have created a PLC in the project and made the settings for fail-safe operation.

Configuration overview (Page 6023)

12.9.3.3 Creating Mobile Panel (Panels, RT Advanced)

Requirement

- The Inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-315F-2PN/DP.

Inserting Mobile Panel into the project.

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a Mobile Panel V2 for fail-safe operation, for example, Mobile Panel 277F IWLAN V2. The device is inserted into the project.

Defining properties

1. Open the "Devices and Networks" editor.
2. Select the Mobile Panel in the work area.
3. Open "Properties > General" in the inspector window.
4. To facilitate assignment in the project, enter the name of the associated module under "Name"
5. Enter the IP address under "Ethernet addresses > IP protocol > Set IP address in the project".

Result

You have created a Mobile Panel for fail-safe operation in the project.

See also

Configuration overview (Page 6023)

12.9.3.4 Creating a connection between the Mobile Panel and PLC (Panels, RT Advanced)

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- A device has been created.
- The "Devices & Networks" editor is open.

Procedure

1. Open the "Network view".
2. Select the Mobile Panel in the work area.
3. Select "Properties > General > Mode > IO device" in the inspector window.
4. Assign the fail-safe PLC under "Assigned IO controller".
   PROFINET is activated and the transfer areas of I-device communication are displayed.
5. Click "Connections" and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
6. Click on the PLC interface and drag-and-drop a connection to the interface of the HMI device.
   An HMI connection is created.
7. Select the Mobile Panel in the work area.
8. Configure the F parameters under "Properties > General > F parameters".
   To set a different F-monitoring time from that specified by the PLC, select "Manual assignment of F-monitoring time".
   Enter an F-monitoring time suitable for your HMI device and plant.

Result

The HMI device is connected to the PLC and you have made the settings for fail-safe operation.

Configuration overview (Page 6023)

12.9.4 Configuring KTP Mobile Panels for fail-safe operation (Panels, RT Advanced)

12.9.4.1 Creating KTP Mobile Panel for fail-safe operation (Panels, RT Advanced)

Introduction

Configure fail-safe operation in the "Devices & Networks" editor for the following KTP Mobile Panels:

- KTP400F Mobile Panel
- KTP700F Mobile Panel
- KTP900F Mobile Panel

Requirement

- The Inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-1517F-2PN/DP.

Inserting a mobile panel into the project

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a KTP Mobile Panel for fail-safe operation, for example, Mobile Panel KTP700F.
   The device is inserted into the project.

Configuring fail-safe operation for the mobile panel

1. Open the network view in the "Devices & Networks" editor.
2. Select the Mobile Panel in the work area.
3. Select "Properties > General > Mode > IO device" in the inspector window.
4. Assign the fail-safe PLC under "Assigned IO controller".
   PROFINET is activated and the transfer areas of the I-device communication are displayed.
5. In the Inspector window, click "Activate PROFIsafe" under "Properties > General" > PROFIsafe".
   PROFIsafe is activated and the F-parameters are displayed under "Properties > General> PROFIsafe parameters > F-parameters".
6. To enter a new F-monitoring time, select "Manual assignment of F-monitoring time".
7. Enter an F-monitoring time suitable for your HMI device and plant.

Result

The fail-safe operation of the KTP Mobile Panel is configured in WinCC. Now create the corresponding F-blocks in STEP 7 and interconnect them in the controller. The PROFIsafe address must be set on the Mobile Panel.

You can find additional information on configuration and programming of fail-safe blocks in the manual "SIMATIC Safety - Configuration and Programming" of the STEP 7 documentation and in the device manual of your mobile panel.

12.9.4.2 Configuring the termination of the PROFIsafe connection (Panels, RT Advanced)

Procedure

Before you disconnect your Mobile Panel from a connection box, you have to terminate the connection to PROFIsafe.

Use the "Disconnect PROFIsafe" system function to close the PROFIsafe connection. The system function forwards your call to the fail-safe PROFINET module.

Requirements

- A mobile panel has been created for fail-safe operation, for example, KTP700F Mobile Panel.
- A screen has been created and opened.

Procedure

To configure the PROFIsafe the connection and disconnection, follow these steps:

- Configure the "Disconnect PROFIsafe" system function on a button, for example, or use it in a script.

Result

If you release the configured trigger for terminating the PROFIsafe connection in runtime, a dialog for ending the PROFIsafe connection opens. The user can select "Yes" or "No".

12.9.5 Working with zones on transponders (Panels, RT Advanced)

12.9.5.1 Configuring a zone in the transponder system (Panels, RT Advanced)

Validity

The next section applies to all Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN.

Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

Requirements

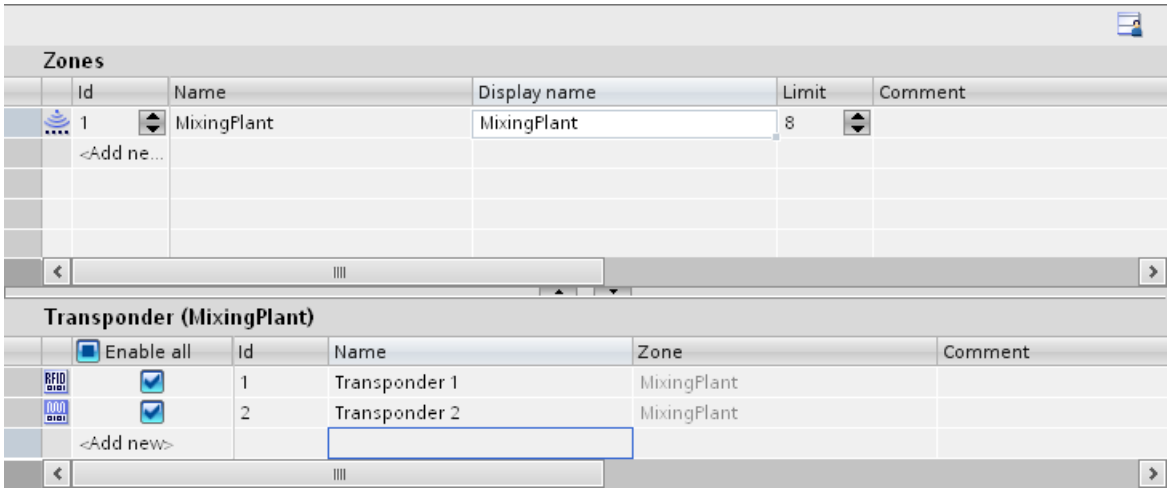
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the "MixingPlant" zone in the "Name" field.
3. Enter "MixingSystem" as the "Display name" for the zone at runtime. Enter zone "1" in the "ID" field.
4. Enter "8" meters as the zone "Limit".
5. Double-click "Add..." in the "Transponders" table.
6. Enter "Transponder 1" as the "Name" of the transponder.
7. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
8. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingPlant" zone.
9. Repeat steps 6 to -9 accordingly for "Transponder 2".
   "Transponder 2" is assigned to the "MixingPlant" zone.

Result

The "MixingPlant" zone is configured as two conical areas arranged at a distance of 8 meters, regardless of the effective ranges: one area around "Transponder 1" and one around "Transponder 2".



The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.5.2 Displaying the screen on entering a zone (Panels, RT Advanced)

Introduction

Configure a screen change when entering and leaving the zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "MixingPlant" zone is configured.
- The "Plant_1" screen has been created and opened.
- The "MixingPlant_1" screen has been created and opened.
- The "Zones" work area is open.

Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click the event "On entry".

4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant_1" as the "Screen name".
6. Click the event "On exit".
7. Select the "ActivateScreen" system function in the function list.
8. Select "Plant_1" as the "Screen name".

Result

The "MixingPlant_1" screen is displayed on the HMI device when you enter the "MixingPlant" zone. When you exit the zone, the "Plant_1" screen appears once more.

12.9.5.3 Displaying an object in relation to the zone (Panels, RT Advanced)

Validity

The following example is independent of the WLAN and applies to all Mobile Panels.

Introduction

You configure an I/O field that is only visible within a specific zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "Zone_id" variable of the "Int" data type has been created.
- A "Plant_1_Overview" screen has been created.

Procedure

1. Open the "Runtime Settings > General" editor.
2. Select the "Zone_id" tag as the "ID Zone/ Effective range".
3. Open the screen "Plant_1_Overview".
4. Drag and drop the "I/O box" object from the toolbox into the screen.
5. Click "Properties > Animations" in the Inspector window.
6. Click "Layout > Visibility."
7. Select "Zone_id" as the "tag".
8. Select "from" 1 "to" 1 as the "Range".
9. Enable "Visible".

Result

The IO field is only visible at runtime under the following conditions:

- The hard-wired Mobile Panel is connected to a connection box with ID = 1.
- The Mobile Panel Wireless is located in a zone with ID = 1, for example, the "MixingPlant" zone.

12.9.6 Working with zones on connection boxes (Panels, RT Advanced)

12.9.6.1 Configuring the zone of a connection box (Panels, RT Advanced)

Validity

The following section applies to all KTP Mobile Panels, for example, Mobile Panel KTP700.

Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

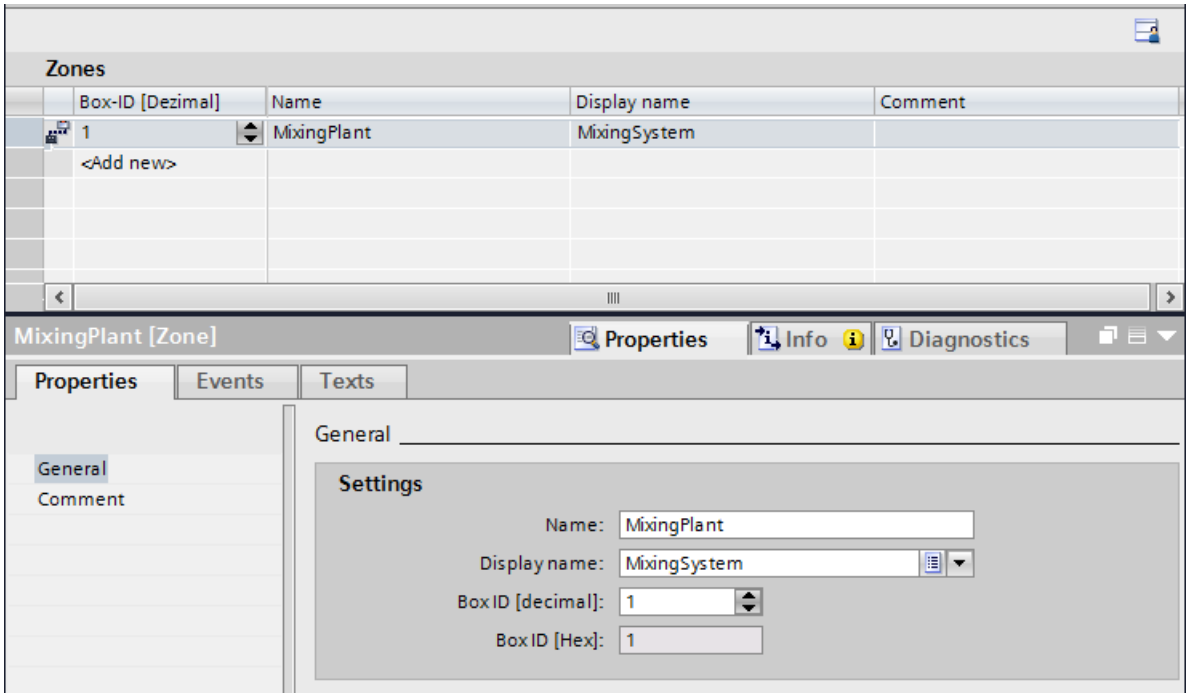
Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the box ID of your connection box for "ID".
3. Enter the "MixingPlant" zone in the "Name" field.

4. Enter "MixingSystem" as the "Display name" for the zone at runtime.



5. Repeat these steps for all required connection boxes in the project.

Result

The "MixingPlant" zone is configured. The range of the zone is defined by the length of the connecting cable of the Mobile Panel.

The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.6.2 Configuring a screen for connection to connection box (Panels, RT Advanced)

Introduction

You configure the screen that is displayed when a Mobile Panel is connected to a connection box.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel KTP700.
- The "MixingPlant" zone is configured.
- The "Plant_1" screen has been created and opened.

- The "MixingPlant_1" screen has been created and opened.
- The "Zones" work area is open.

Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click on the "Connected" event.
4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant_1" as "Screen name".

Result

When you connect your Mobile Panel to the connection box of the "MixingPlant" zone, the "MixingPlant_1" screen appears on the display of the HMI device.

12.9.7 Working with effective ranges (transponders) (Panels, RT Advanced)

12.9.7.1 Overview (Panels, RT Advanced)

Introduction

The following configuration guide describes the steps needed to set up an effective range for fail-safe operation on a Mobile Panel Wireless.

Procedures overview

1. Configuring the effective range:
   You configure the "MixingAxisControl" effective range as a conical area around "Transponder1 " at a distance of 5 meters.
2. Configuring the name of the effective range:
   To ensure logon to the effective range, configure the object "Effective range - Name".
3. Configuring additional effective range objects:
   Configure additional objects for displaying the position and signal strength within an effective range.
4. Set parameters for loading:
   - PROFIsafe communication
   - WLAN network
   - Power management
   - Interface

5. Configure the data channel
6. Configure network operation
7. Set the transponder
8. Commissioning effective ranges
9. Switching on and Testing the HMI device
10. Start loading manually
11. Acknowledging the effective range at the plant:
    You acknowledge the effective ranges and their transponders.
12. Determine the checksum
13. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
14. Test effective range

Note

For detailed information on items 5 to 14, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

12.9.7.2 Configuring an effective range (transponder) (Panels, RT Advanced)

Introduction

You set up an effective range in order to control safety related operator input upstream of a machine or plant.

Requirements

- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones & effective ranges" work area is open.
- The "Effective ranges" tab is open.

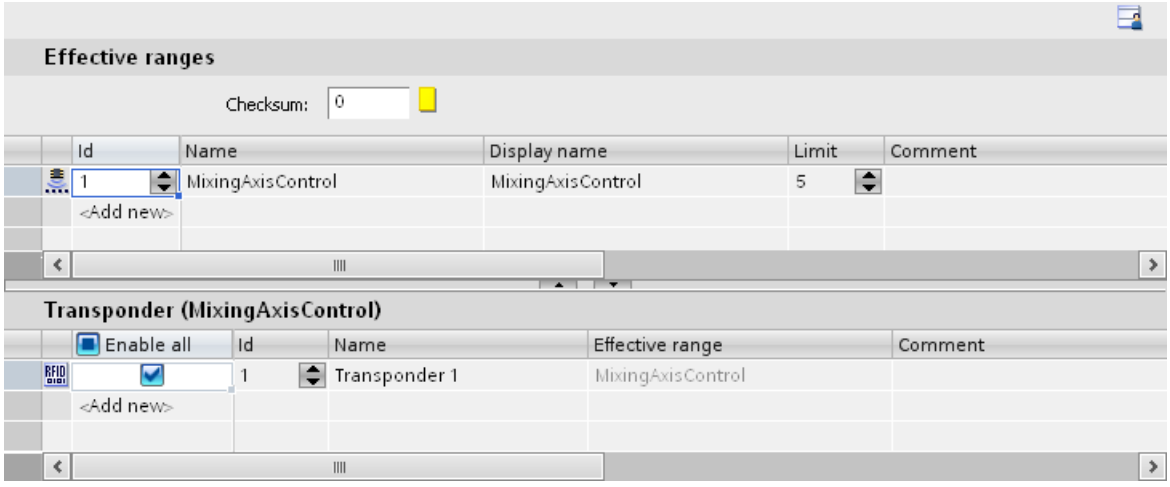
Procedure

1. Double-click "Add..." in the "Effective Ranges" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range.
3. Enter "Mixing_axis_PLC" as the "Display name" for the effective range at runtime.
4. Enter effective range "1" in the "ID" field.
   Make sure that the effective range ID matches the ID on the machine.

5. Enter "5" meters as the "Limit" of the effective range.
6. Double-click "Add..." in the "Transponders" table.
7. Enter "Transponder 1" as the "Name" of the transponder.
8. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
9. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingAxisControl" effective range.

Result

You configure the "MixingAxisControl" effective range as a conical area around "Transponder 1" at a distance of 5 meters, regardless of the zones.



The display name designates the effective range in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.7.3 Configuring the effective range name (Panels, RT Advanced)

Introduction

Configure at least the "Effective range - Name" object so that an operator can log on and off a machine using an effective range. If you do not configure an effective range object for a Mobile Panel Wireless for fail-safe operation, a warning appears during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range name" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Name" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he initiates logon or logoff of the HMI device to a machine that is assigned to an effective range.

12.9.7.4 Configuring additional Mobile Wireless objects (Panels, RT Advanced)

Introduction

Configure other objects such as the charge condition or WLAN reception in order to display further information about the effective range.

Requirements

- A screen has been created and opened.
- The effective range name is configured in the screen.

Procedure

1. Select the "Effective range - Signal" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Signal" object from the toolbox into the screen.
3. Repeat steps 1 and 2 with the "WLAN - Reception" object.

Result

The "Effective range - Signal" object indicates how accurately the Mobile Panel Wireless is within an effective range. The "WLAN - Reception Quality" object displays the signal strength of the WLAN wireless connection.

Effective range name (Page 5293)

Effective range signal (Page 5297)

WLAN reception (Page 5299)

12.9.8 Working with effective ranges (RFID) (Panels, RT Advanced)

12.9.8.1 Overview (Panels, RT Advanced)

Validity

The next section applies only to Mobile Panels Wireless with RFID, for example, Mobile Panel 277F IWLAN (RFID Tag).

Introduction

The following configuration guide describes the steps required to set up an effective range (RFID) for fail-safe operation on a Mobile Panel Wireless with RFID.

Procedures overview

1. Configure effective range (RFID):
   You configure the effective range (RFID) "MixingAxisControl".
2. Configuring the name of the effective range (RFID):
   To ensure logon to the effective range, configure the object "Effective range - Name (RFID)".
3. Set parameters for loading
4. Configure the data channel
5. Configure network operation
6. Install RFID Tag in the plant
7. Turn on the HMI device and enable loading mode
8. Loading a project
9. Write the suitable IDs to the RFID Tags in the plant
10. Determine the checksum
11. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
12. Test effective range (RFID)

Note

For detailed information on items 4 to 12, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

12.9.8.2 Configuring effective range (RFID) (Panels, RT Advanced)

Introduction

You set up an effective range (RFID) to control safety-related operator input upstream of a machine or plant.

Requirements

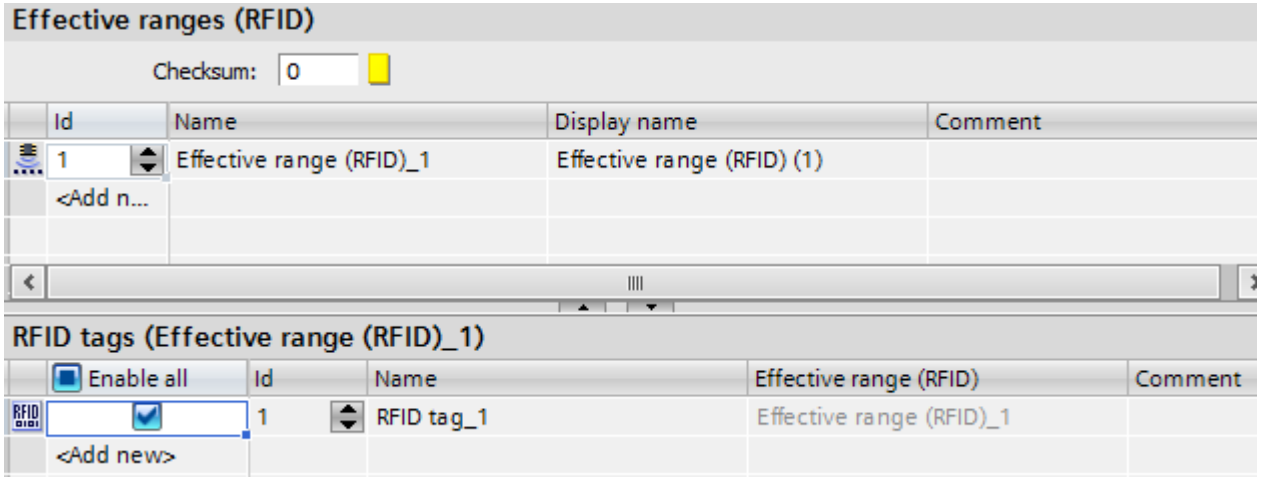
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges (RFID)" work area is open.

Procedure

1. Double-click "Add..." in the "Effective Ranges (RFID)" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range (RFID).
3. Enter "MixingAxisControl" in the "Display name" field of the effective range (RFID).
4. Enter "1" in the "ID" field of the effective range (RFID).
   Make sure that the effective range (RFID)-ID matches the ID on the machine.
5. Double-click "Add..." in the "RFID Tag table.
6. Enter "RFID Tag 1" as the "Name" of the RFID Tag.
7. Enter "1" as the "ID" of the RFID Tag. Then set the RFID Tag-ID for the RFID Tag.
8. Enable the assignment of "RFID Tag 1".
   "RFID Tag 1" is assigned to the effective range (RFID) "MixingAxisControl".

Result

The effective range (RFID) "MixingAxisControl" is configured.



The display name describes the effective range (RFID) in the set editing language. An overview of the display names can be found in the "Project texts" editor.

12.9.8.3 Configuring the effective range name (RFID) (Panels, RT Advanced)

Introduction

Configure the "Effective range - Name" object so that an operator can log on and off a machine using an effective range (RFID). If you do not configure the "Effective range-Name" object for a Mobile Panel Wireless RFID with (RFID), a warning will appear during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Name (RFID)" object from "<Elements" in the toolbox.
2. Drag and drop the "Effective range - Name (RFID)" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he will initiate logon or logoff of the HMI device to a machine which has been assigned to an effective range (RFID).

12.9.9 Reference (Panels, RT Advanced)

12.9.9.1 PROFIsafe address (Panels, RT Advanced)

Validity

The PROFIsafe address is available for Mobile Panels Wireless and KTP F-devices.

Note

Additional information on fail-safe operation can be found in the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

PROFIsafe address

The PROFIsafe address used for fail-safe I/Os in PROFIsafe communication is unique on the entire network and on all stations. On the Mobile Panel Wireless, you create a default value in the project and load it to the HMI device. You can also store a PROFIsafe address on the HMI device.

The PROFIsafe address fall within the range from 1 to 65534. The two PROFIsafe addresses (in the Engineering System and on the HMI device) are checked for formal validity.

The PROFIsafe address is loaded as follows at the start of Runtime:

- You programmed a valid PROFIsafe address in the Control Panel.
  The HMI loads the PROFIsafe address set in the Control Panel.

12.9.9.2 Power Management (Panels, RT Advanced)

Validity

In the "Runtime Settings > Power Management" editor, configure the energy-saving mode of a Mobile Panel.

Power Management

The Mobile Panel Wireless can save energy in the following ways:

- Reduce brightness - minimal saving
- Switch off display - significant saving

You can also indicate after how long without operator input the power management function is enabled. The communication link is maintained. The time for "Switch monitor off" is longer than the time for "Reduce brightness".

12.9.9.3 Zone ID / connection point ID (Panels, RT Advanced)

Validity

In the "Runtime Settings > General" configure an internal tag which, depending on the value, shows specific information on the display of the HMI device.

Note

Mobile Panels Wireless with RFID

For Mobile Panels Wireless with RFID, the area "Zone ID / Connection point ID" is not available.

Zone ID / connection point ID

This field is used to configure an internal tag that contains the following value at runtime in relation to the type of HMI device:

- The ID of the connection box or effective range to which the hard-wired Mobile Panel is connected.
- The ID of the zone in which the Mobile Panel Wireless is located. If the value is set to 255, then the HMI device is not in any zone.

12.10 Planning tasks

12.10.1 Basics

12.10.1.1 Field of application of the Scheduler

Definition

You can use the Scheduler to configure tasks to run independent of the screen in the background. You create tasks by linking system functions or scripts to a trigger. The linked functions will be called when the triggering event occurs.

Example of an application

The Scheduler is used to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs
- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

Note

The availability of the listed examples is determined by the HMI device.

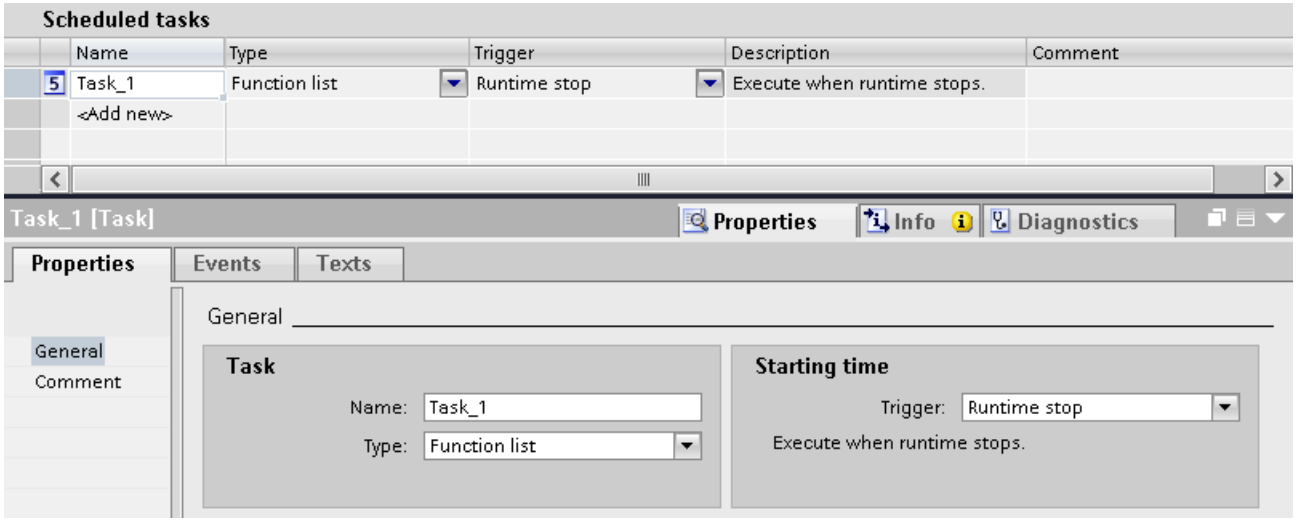
See also

Work area of the "Scheduler" editor (Page 6042)

12.10.1.2 Working with tasks and triggers

Introduction

A task consists of a trigger and a task type.



Starting a task

Controlled by a trigger, the Scheduler starts the task linked to the trigger.

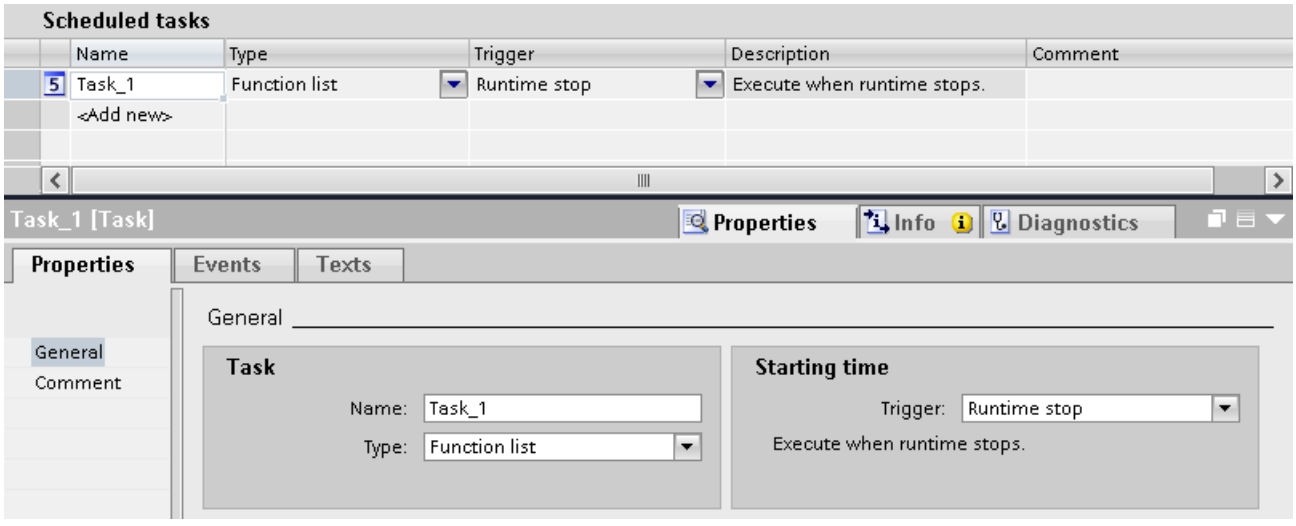
12.10.1.3 Work area of the "Scheduler" editor

Introduction

Double-click on "Scheduler" to open it in the project view. The work area shows the scheduled tasks, which consist of the trigger and the task type, for example, the function list.

Structure

The work area consists of the table of jobs.



The table of tasks shows specified tasks with their properties, such as triggers. You select a task type and a trigger. You assign a name and a comment to the task. The description provides a written summary of the task including the timing for the task.

Inspector window

The "Properties" tab of the Inspector window is split into two parts.

The "Job" area lists the name of the job and the job type. The "Starting time" area shows the trigger. The area is different depending on the trigger selected.

In the "Events" tab use the function list with system functions that will be executed in the task.

Note

You can obtain more detailed information about the elements of the user interface using the tooltips. To do so, move the mouse pointer to the relevant object or press <F1> if the object has already been selected.

See also

Field of application of the Scheduler (Page 6041)

Triggers (Page 6044)

12.10.1.4 Triggers (Basic Panels)

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. System events include, for example, Runtime stop, screen change, user change, etc.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the system event "Shutdown". This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "Runtime stop" system event available again.

Note

The available triggers depend on the HMI device.

See also

Work area of the "Scheduler" editor (Page 6042)

12.10.1.5 Triggers (Panels, RT Advanced, RT Professional)

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Types of triggers

The Scheduler recognizes different types of triggers:

Acyclic triggers

They consist of a specification for the date and time of day. Tasks with an acyclic trigger are performed once by the Scheduler on the specified date and at the specified time.

Cyclic triggers

Tasks linked to a cyclic trigger occur regularly at a specific point in time.

- Standard cycle: With a standard cycle, the beginning of the first interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- Trigger with defined starting time: You specify a start time and a time interval. You can use cyclic triggers to perform tasks on a daily or weekly basis, for example. For example, you can select a "Weekly" trigger to specify a week as the interval. You specify the beginning of the interval with the day of the week and the time of day.

Note

User-defined cycles

You have defined your own cycles. You can only use cycles in the Scheduler whose maximum value amounts to one hour.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. In contrast to cyclic triggers, system events usually occur acyclically. A Runtime stop is a system event, for example.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the "User change" system event. This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "User change" system event available again.

Note

The available triggers depend on the HMI device.

12.10.1.6 Timers for cyclic triggers (Panels, RT Advanced)

Timers for cyclic and acyclic triggers

You have the option to change the start time of a task dynamically in Runtime. You can select an HMI variable as the timer. The value of the tag determines the start time for the task during Runtime.

Note

An HMI tag must be of the type "DateTime". A PLC tag must be of the type "Date and Time" or "DTL".

As long as the operator does not change the tag after Runtime starts, the start time configured in the task is valid. As soon as the operator enters a change to the tag, the current value of the tag is always the start time. To reset the configured time as the start time, the operator has to enter the configured time again.

12.10.1.7 Function list (Basic Panels)

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

12.10.1.8 Function list (Panels, RT Advanced, RT Professional)

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function or a local script. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

Processing of system functions and scripts

System functions and scripts in a function list are processed in Runtime sequentially from top to bottom.

AUTOHOTSPOT

Use a script with loops, conditional statements and abort conditions to program non-sequential and conditional procedures.

12.10.2 Planning jobs

12.10.2.1 Planning tasks with acyclic triggers (Panels, RT Advanced, RT Professional)

Introduction

You are planning a one-time Runtime stop for maintenance work. The task starts a function which requires Runtime to stop.

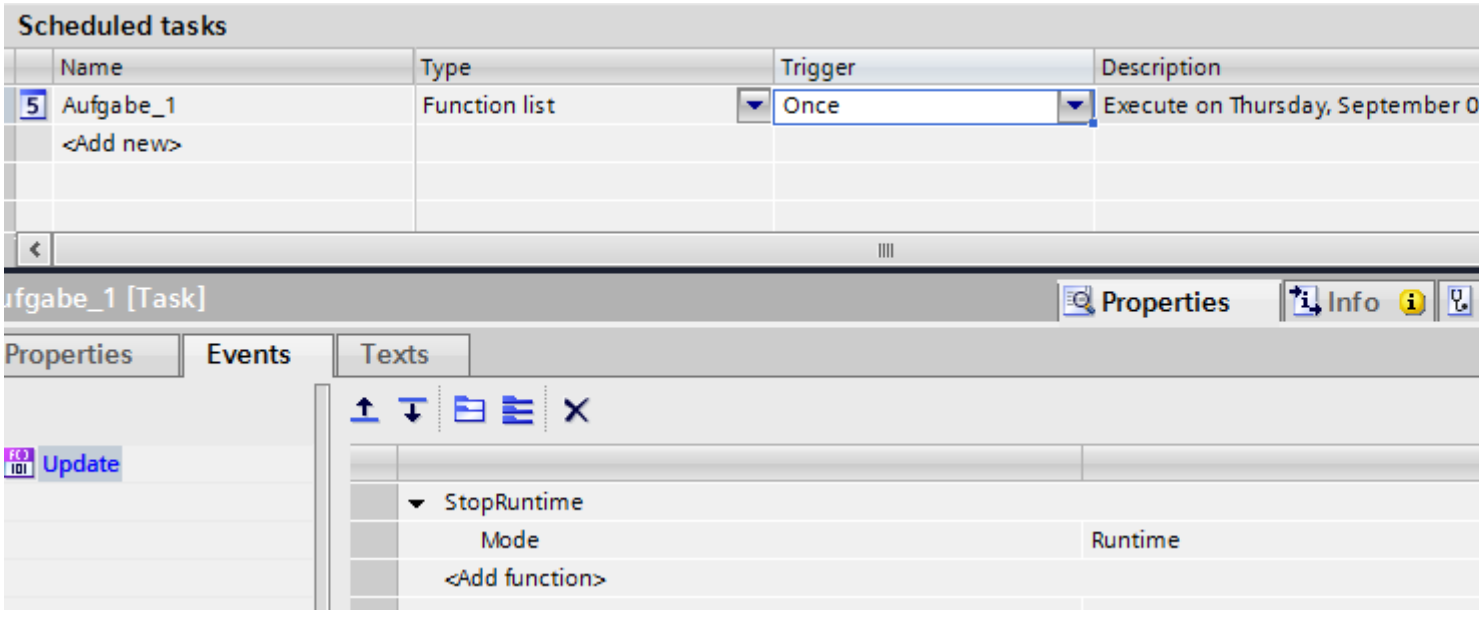
Requirements

- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Maintenance at end of year" as the "Name."
3. Select "Once" as the "Trigger."
4. Select "31.12.2008" in the "Properties > Properties > General > on" field of the Inspector window.
5. Enter the time "18:00" in the "at" field.
6. Click "Properties > Events" in the Inspector window.

7. Select the "StopRuntime" system function in the function list.
8. Select "Runtime" as the "Mode".



Result

The task is executed once. Runtime will be stopped at 18:00 on December 31, 2008.

Note

"StopRuntime" event on RT Professional

Please note that the "StopRuntime" event means runtime is in the process of ending and that some functionalities are therefore no longer available.

12.10.2.2 Planning tasks with cyclic triggers

Introduction

You plan a job that provides a weekly printout of a report.

Requirements

- A "Weekly report" report has been created.
- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Weekly report printout for end of shift" as the "Name."
3. Select "Weekly" as the "Event".
4. Open the "Properties" tab in the Inspector window.
5. Select "Friday" in the "on day" field of the "Starting point" area.
6. Enter the time "18:00" in the "at" field in the "Starting point" area.
7. Click in the "Events" tab of the "Function list" on the entry "No function."
8. Select "Print/PrintReport" as the function.
9. Select "Weekly report" report.

Result

The task is executed weekly. The report "Weekly report" will be printed every Friday at 18:00 hours.

12.10.2.3 Planning tasks with event triggers (Basic Panels, Panels, RT Advanced)

Introduction

You plan a task that generates a screen change when the user changes.

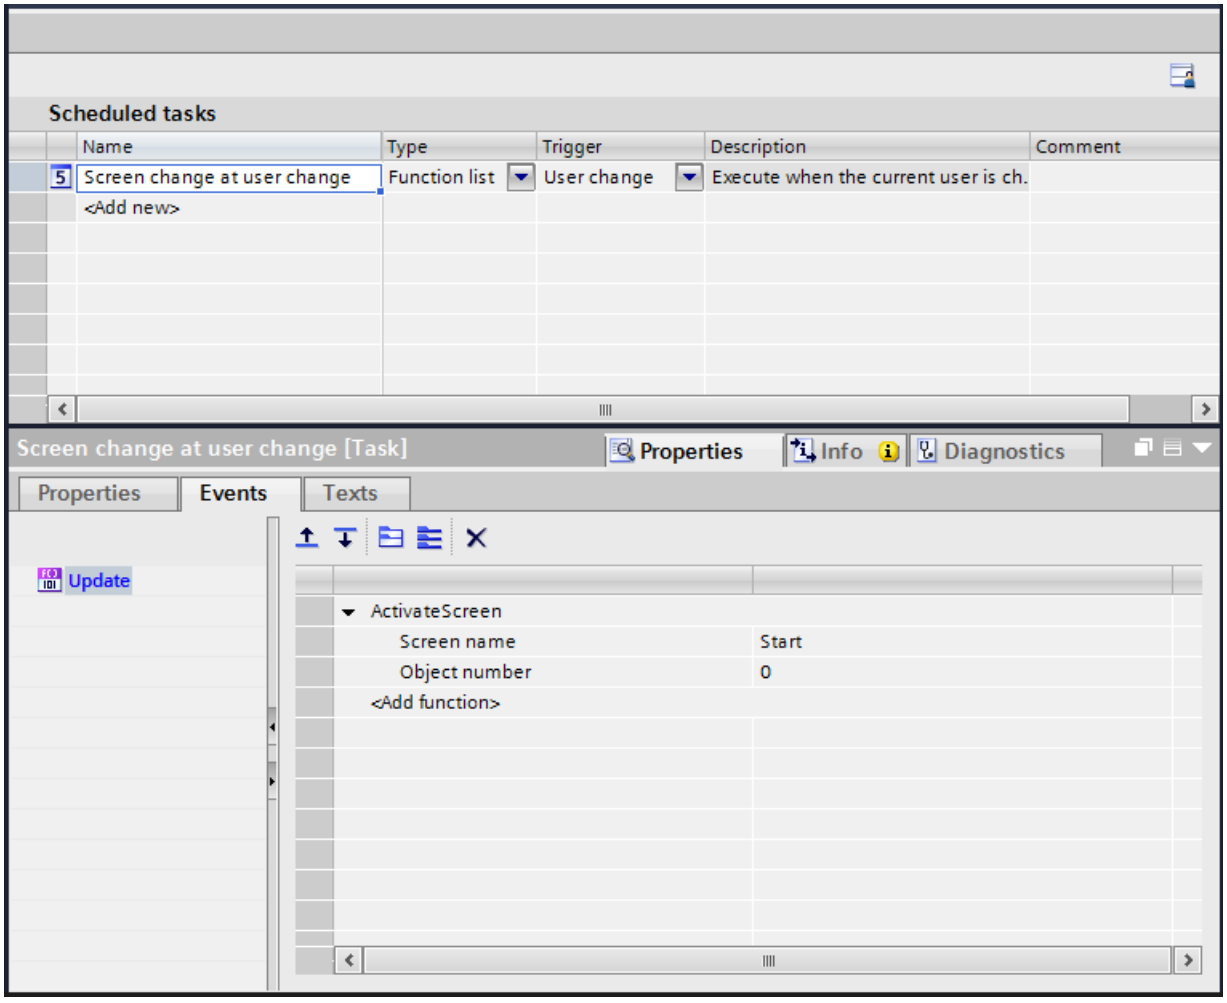
Requirements

- The "Scheduler" work area is open.
- You have created the "Start" screen.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Screen change at user change" as the "Name."
3. Select "User change" as the "Trigger."
4. In the Inspector window, select "Properties > Events".

5. Select the "Screen/ActivateScreen" system function in the function list.
6. Select the "Start" screen in the screen name field.



Result

The task is executed with the "User change" event. When a new user logs on successfully, the "Start" screen is called up.

12.10.2.4 Administer task

Changing the designation

1. In the work area, double-click the field in the "Name" column.
2. Change the name of the task.
3. Confirm your entry with <Return>.

As an alternative, you can change the designation in the "Job > Name" box of the Inspector window.

Changing triggers

1. In the work area, mark the field in the "Trigger" column.
2. Open the drop-down list using the button and select the trigger you require.

You can alternatively change the trigger in the "Starting time" area of the Inspector window.

Deleting a task

1. Select one or more lines for the tasks to be deleted.
2. Open the shortcut menu with the right button and select the menu command "Delete".

As an alternative, delete one or more tasks by using the <Del> button.

12.10.3 Examples

12.10.3.1 Example: Update user following change of user (Basic Panels, Panels, RT Advanced)

Task

Configure an I/O field which displays the logged on user. Configure a task which updates the I/O field when the logged on user changes.

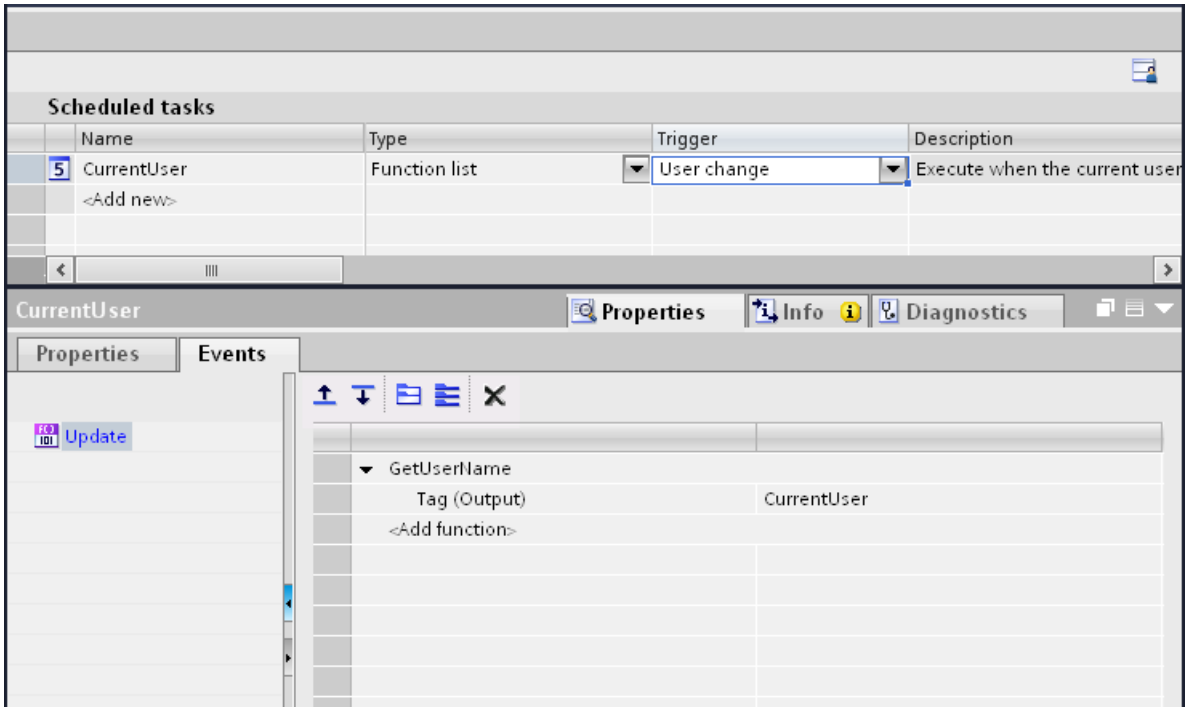
Requirements

- A "CurrentUser" tag of the "String" type is created.
- A screen has been created and opened.
- An I/O field is created in the screen.

Procedure

1. Click on the "I/O field" object.
2. In the Inspector window, select "Properties > Properties > General":
   - Select "String" as the "Display format."
   - Select "CurrentUser" as the "Variable."
   - Select "Output" as the mode.
3. Change to the work area of the Scheduler.
4. Click "Add..." in the table of the task area.
5. Enter "CurrentUser" as the "Name".
6. Select "User change" as the "Trigger."
7. In the Inspector window, select "Properties > Events".

8. Select the system function "ReadUserName" from the "User Management" group in the function list.
9. Select "CurrentUser" as the "Variable."



Result

When a new user logs on successfully, the "ReadUserName" function is called up. The "CurrentUser" tag is updated and displayed in the I/O field of the newly logged on user.

If a user does not log on successfully, the logged on user is logged off. The I/O field continues to display the user previously logged on until a new user logs on successfully.

12.10.3.2 Example: Terminating Runtime every day

Task

You plan a job that terminates Runtime every day at the end of work.

Requirements

- The "Scheduler" work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Runtime stop at end of work" as the "Name."

3. Select "Daily" as the "Event."
4. Open the "Properties" tab in the Inspector window.
5. Enter the time "21:00" in the "at" field in the "Starting point" area.
6. Open the "Events" tab in the Inspector window.
7. Click the "No function" entry in the "Function list".
8. Select "System functions/System/StopRuntime" as the function.

Result

Runtime is terminated every day at 21:00.

12.10.3.3 Example: Changing the starting point of a task in Runtime (Panels, RT Advanced)

Introduction

A cyclic trigger, for example "Starting daily at 18:00," is configured in the Engineering System. The time "18:00" is fixed as a constant. To change the start time in Runtime, select a tag as the "Timer." The value of the tag determines the start time of the task during Runtime.

Task

You plan a task that swaps out log data daily and has the "LogTime" tag as the timer. You configure a "LogTime" tag in an input field.

Requirements

- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- A "ChangeLogTime" screen has been created.

Procedures overview

1. Creating a timer tag: You create a tag with which you change the starting point of the log data swap in Runtime.
2. Configuring a Date/time field: The operator changes the starting point of the task by using the Date/Time field in Runtime.
3. Configure the task with a timer tag: You create a task whose start time can be changed dynamically in Runtime.

Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

See also

Example: 2. Configuring a Date/time field (Page 6054)

12.10.3.4 Example: 1. Configuring a tag for Runtime (Panels, RT Advanced)

Task

In the following example you configure the "LogTime" variable.

Procedure

1. Open the "HMI tags" editor.
2. Click "Add..." in the table of the task area.
3. Enter "LogTime" as the "Name" of the variable.
4. Select "Internal variable" in the "Connection" column.
5. Select "DateTime" in the "Date type" column.

Result

A variable of the "DateTime" type has been created.

12.10.3.5 Example: 2. Configuring a Date/time field (Panels, RT Advanced)

Task

In the following example you configure a Date/time field. To change the starting point of the task in Runtime, link the "LogTime" variable to the Date/time field.

Requirements

- The "LogTime" variable of the "DateTime" type has been created.
- The "ChangeLogTime" screen is open.

Procedure

1. In the toolbox view, drag-and-drop a "Date/time field" from the "Basic objects" category to the screen.
2. In the Inspector window, click "Properties >Properties > General".
3. Disable the "System time."
4. Click "Variable" and select "LogTime."
5. Disable "Display date" and enable "Display time."
6. Select "Input/output" as the "Mode."
7. Click "Properties > Miscellaneous."
8. Enter "LogDataTimeField" as the "Name".

Result

The operator enters a time using the created date/time field.

See also

Example: Changing the starting point of a task in Runtime (Page 6053)

12.10.3.6 Example: 3. Configuring a swap to archive with a timer variable (Panels, RT Advanced)

Task

In the following example you configure a task with a timer tag with which you change the starting point of the task in Runtime.

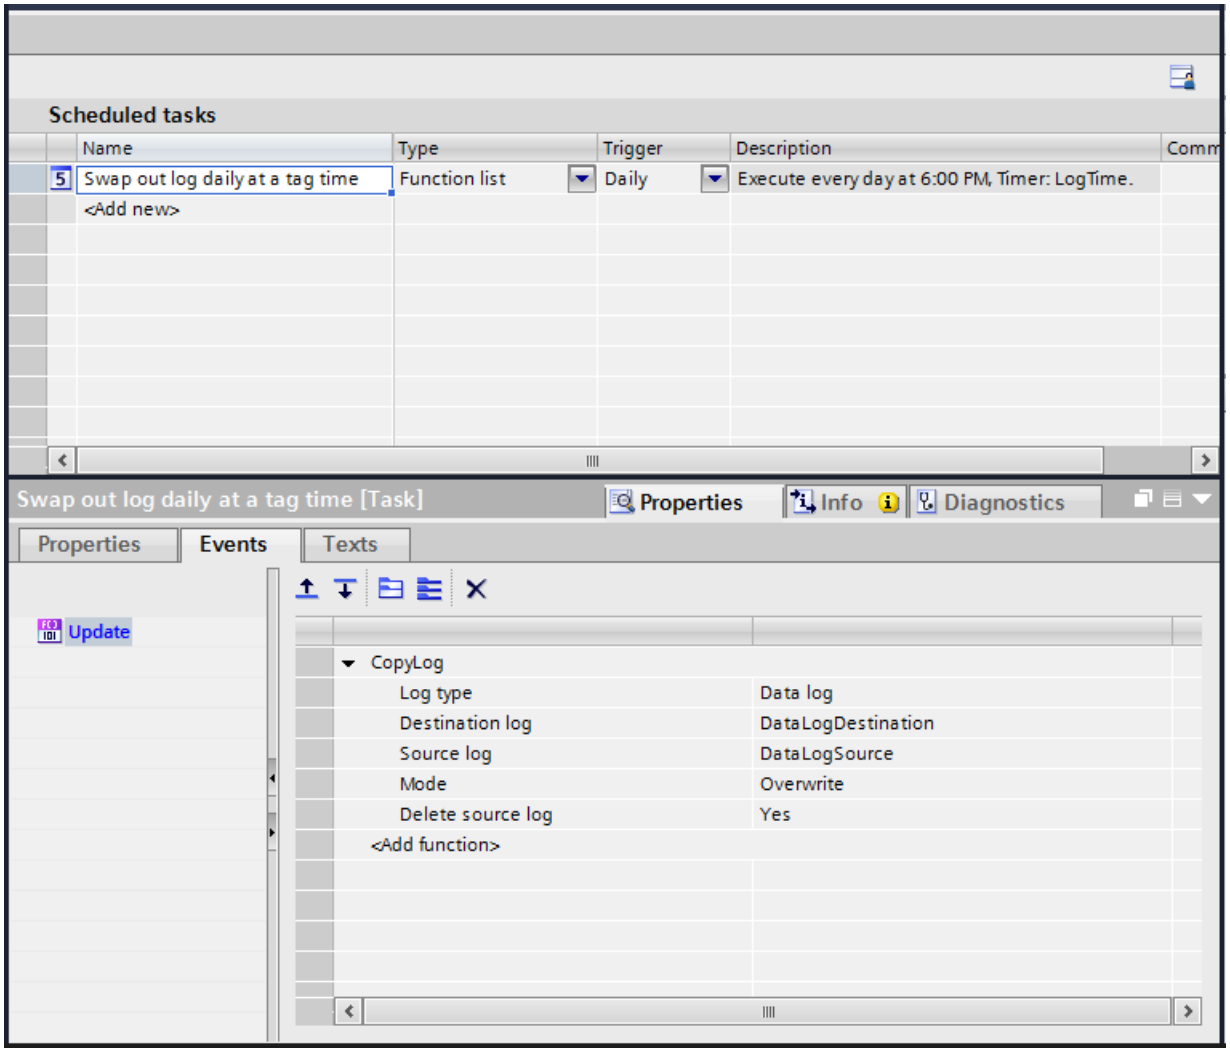
Requirements

- The "LogTime" tag has been created.
- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- The Scheduler work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Swap out log daily at a tag time" as the "Name".
3. Select "Daily" as the "Trigger".
4. In the Inspector window "Properties >Properties > General > at" enter the time "18:00".
5. Select the "LogTime" tag as the "Standard timer".
6. In the Inspector window, open "Properties > Events".

7. Select the "System functions/Logs/CopyLog" system function in the function list.
8. Select these settings:
   - Select "Data log" as the "Log type".
   - Select "DataLogDestination" as the "Destination log".
   - Select "DataLogSource" as the "Source log".
   - Select "Overwrite" as the "Mode".
   - Select "Yes" for "Delete source log".



Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

12.11 Using diagnostics functions

12.11.1 Configuring system diagnostics

12.11.1.1 Basic Panel basics (Basic Panels)

System diagnostics basics (Basic Panels)

Introduction

Using system diagnostics, you can display the messages from the diagnostic buffer of all integrated connections.

System diagnostics view

The system diagnostics display is an operating and display object that you use in a screen.

You navigate directly to the cause of the error and the associated connection. You have access to all integrated connections that you have configured in the "Devices & networks" editor.

System diagnostics views (Basic Panels)

Introduction

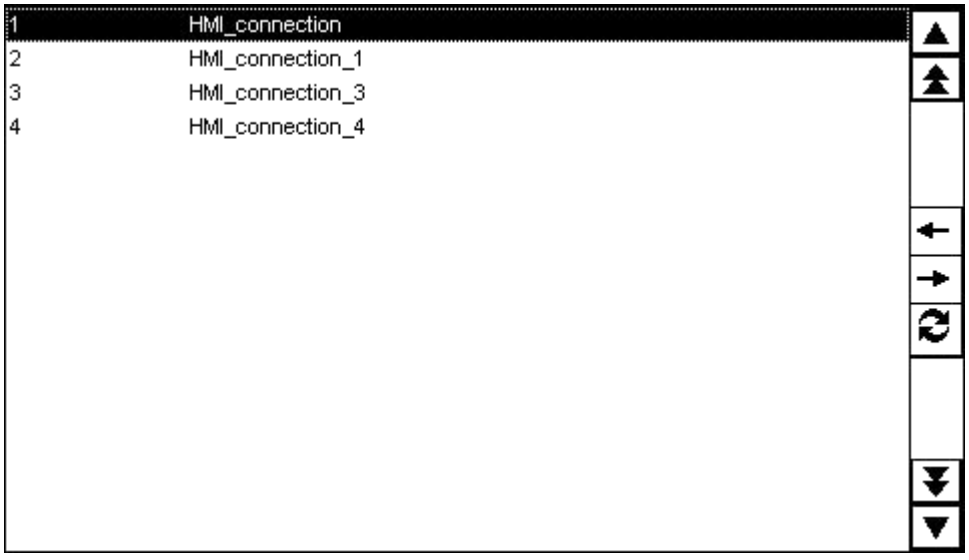
Three different views are available in the simple system diagnostic view.

- Device view
- Diagnostic buffer view
- Detail view

Device view

The device view is only displayed if more than one integrated connection has been configured.

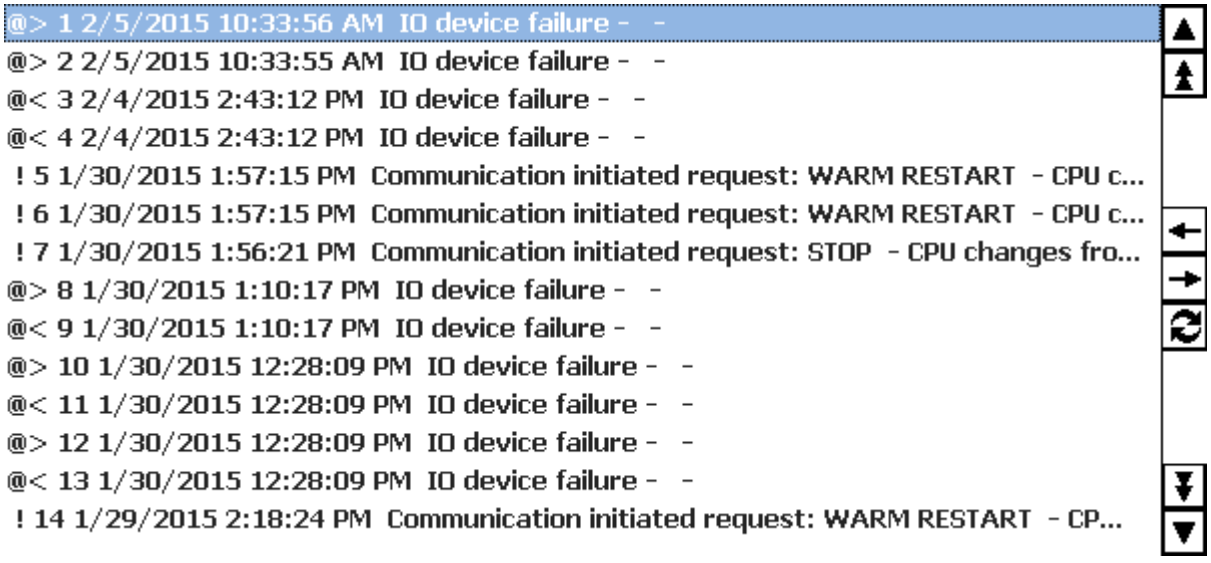
The device view shows all available connections in a table. Double-clicking a connection opens the diagnostic buffer view.



Diagnostic buffer view

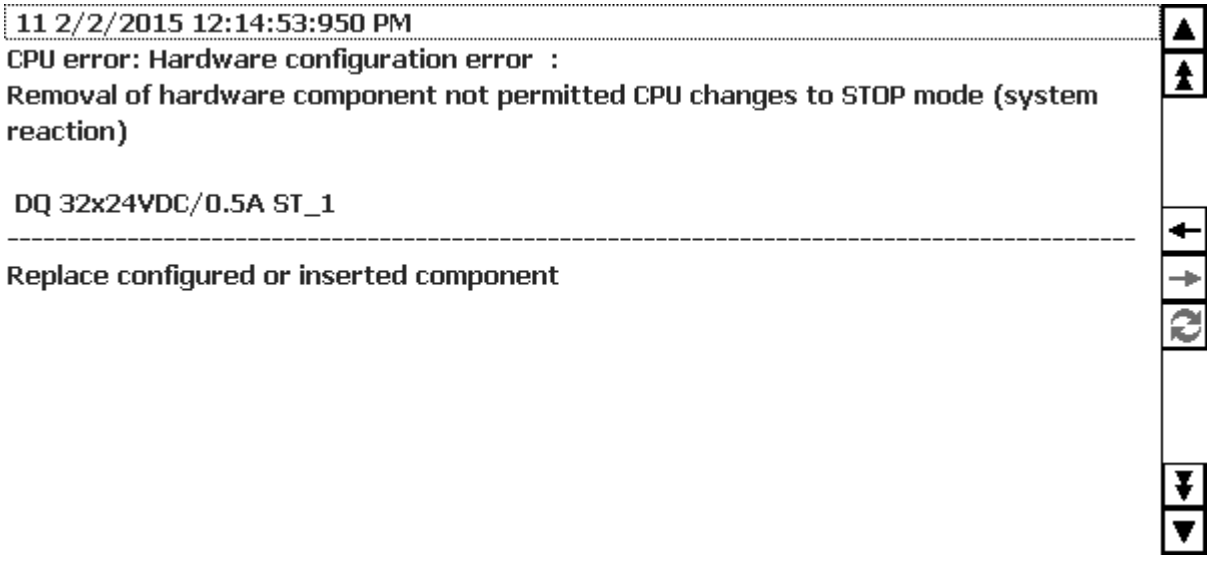
The diagnostic buffer view shows the current data from the diagnostic buffer.

To update the diagnostic buffer view, you click .



Detail view

The detail view gives detailed information about the selected connection and any pending errors. Check whether the data is correct in the detail view.



Note

Contents of the detail view

The contents of the detail view are only available for integrated connections with S7-1200 and S7-1500 PLCs.

Navigation buttons

Button	Key	Function
	Enter key	In the device view: Opens the diagnostic buffer view of the selected device. In the diagnostic buffer view: Opens the detail view.
	Esc key	In the diagnostic buffer view: Opens the device view. In the detail view: Opens the diagnostic buffer view.
	Configured function key, e.g. F1.	Updates the diagnostic buffer view.

12.11.1.2 Basics on Panels and Runtime Advanced

System diagnostics basics (Panels, RT Advanced)

Introduction

You use system diagnostics to detect problems and errors in any part of your plant. WinCC has two display and operating elements for quick error localization.

For the controller to be able to transfer error messages to the system diagnostics view or the system diagnostics window, you must activate the system diagnostics in the settings for some controllers.

During communication with the SIMATIC S7-1500 and SIMATIC S7-1200 PLCs, system diagnostics is automatically activated.

The option "System diagnostics" is automatically activated for the respective HMI connection on the HMI device under "Runtime settings > Alarms > Controller alarms".

System diagnostics view

The alarm view shows the status of a PLC while the system diagnostics view gives you an overview of all devices available in your plant: You navigate directly to the cause of the error and to the relevant device. You have access to all diagnostics-capable devices which you have configured in the "Devices & networks" editor.

System diagnostics window

The system diagnostics window is an operating and display element that you can only use in the global screen.

The functions of the system diagnostics window are no different than those of the system diagnostics view. Because the system diagnostics window is configured in the global screen, you can, for example, also specify if the object is closable in Runtime.

Note

System diagnostics on Basic Panels

The "System diagnostics window" object is not available on Basic Panels.

See also

System diagnostics views (Page 6061)

Enabling system diagnostics in the PLC (Page 6064)

System diagnostics views (Panels, RT Advanced, RT Professional)

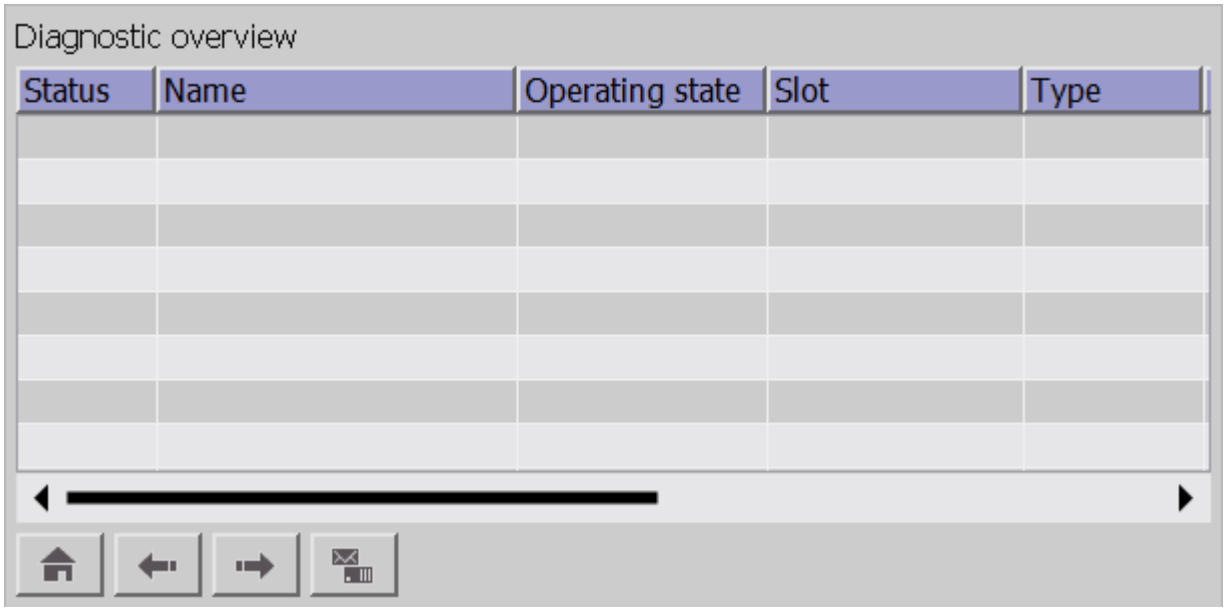
Introduction

There are four different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Diagnostic buffer view
- Detail view
- Matrix view (for master systems, PROFIBUS, PROFINET only)

Device view

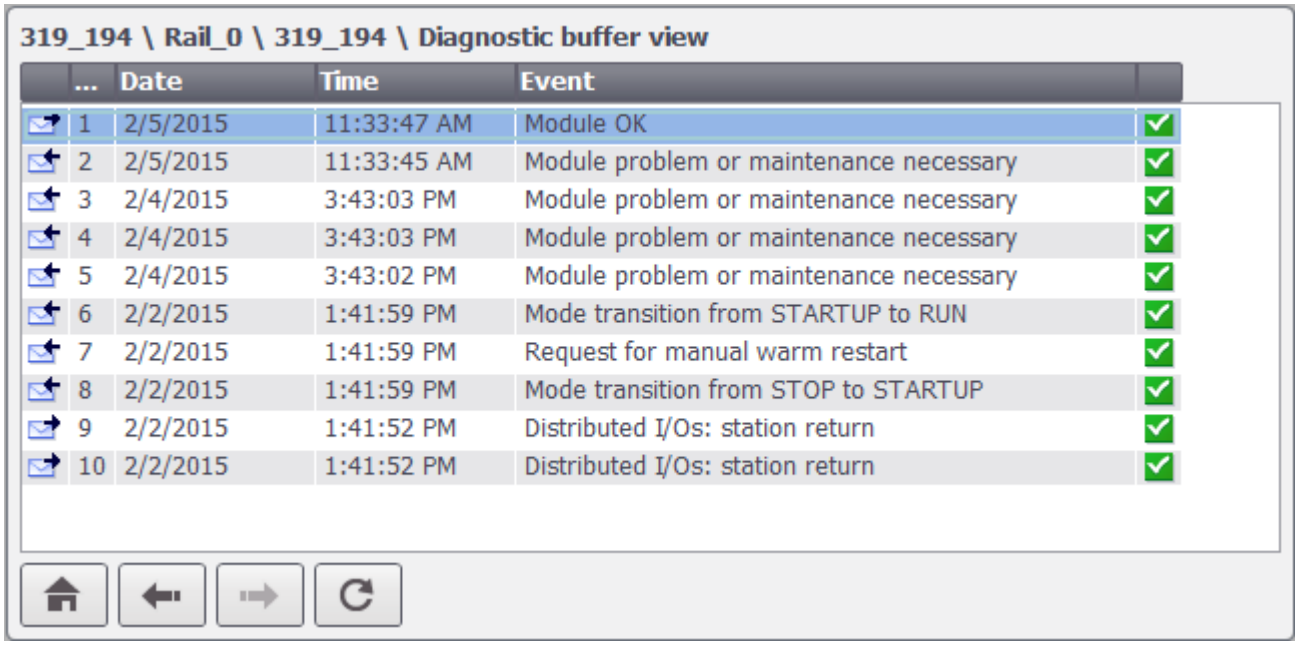
The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the child devices or the detail view. Symbols in the first column provide information about the current status of the device.



Diagnostic buffer view

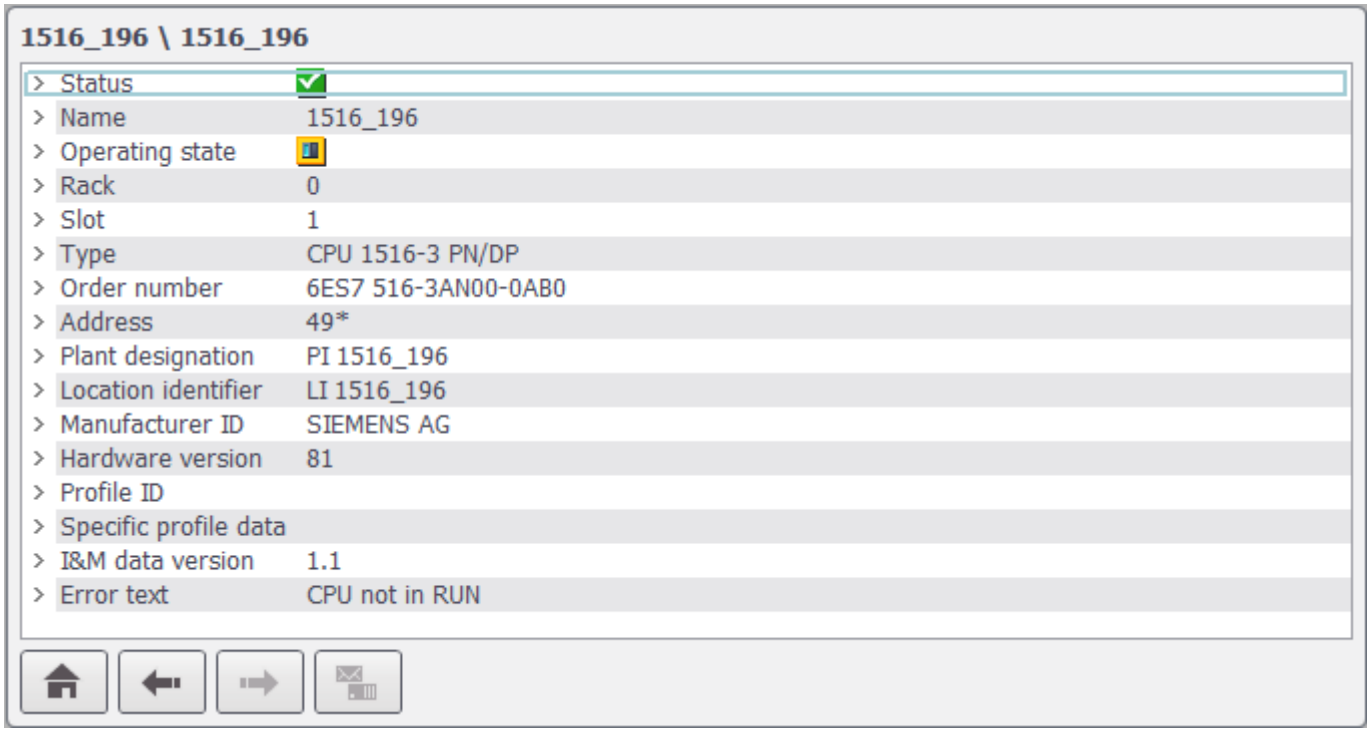
In the diagnostic buffer view, the current data from the diagnostic buffer of the device is displayed. The diagnostic buffer view can only be called up in the device view.

To update the diagnostic buffer view, you click .



Detail view

The detail view gives detailed information about the selected device and the pending errors. Check whether the data is correct in the detail view. You cannot sort error texts in the detail view.



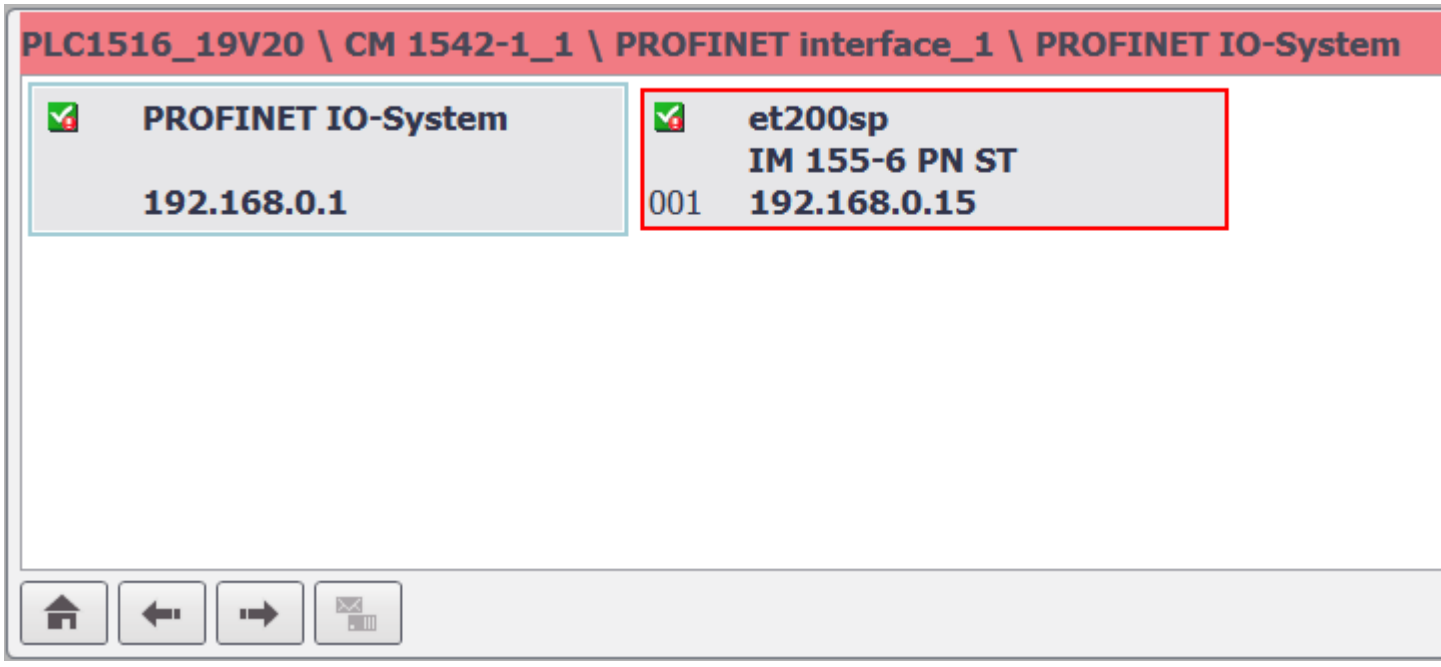
Note

Contents of the detail view

The contents of the detail view are only available for integrated connections with S7-1200 and S7-1500 PLCs.

Distributed I/O view

The distributed I/O view is available for master systems and IO systems. In this view, you can see the status of the subdevices of the system. Each element in the view shows the device name, the device type and the IP address or the PROFIBUS address.



In the case of a fault, the affected element is visually highlighted:

- Red border indicates a fault in a lower-level element
- Red background indicates a fault in the element itself, for example, the device is not available.

Navigation buttons

Button	Key	Function
	Enter key	Opens the child devices or the detail view if there are no child devices.
	Esc key	Opens the parent device or the device view if there is no parent device.

Button	Key	Function
	Home key	Opens the device view.
	Configured function key, e.g. F1.	Opens the diagnostic buffer view. Only visible in the device view.
	Configured function key, e.g. F2.	Updates the diagnostic buffer view.

Note

Navigation in the matrix view of Comfort Panels with function keys

The Shift key is additionally used to select PNIO or PROFIBUS slaves in the matrix view.

Language switching in runtime

Switch over the language in runtime before you open the details view.

If you switch over the runtime language while the details view is opened, you change back to the diagnostic buffer view.

Open the details view again. The selected runtime language is now displayed correctly.

See also

System diagnostics basics (Page 6060)

12.11.1.3 Configuring system diagnostics objects

Enabling system diagnostics in the PLC (RT Professional)

Introduction

During communication with the SIMATIC S7-1500 and SIMATIC S7-1200 PLCs, system diagnostics is automatically activated.

For other PLCs, the following settings must be implemented in the PLC to enable the PLC to transfer error messages to the system diagnostics view.

Requirements

- A PLC such as SIMATIC S7-300/400 or ET 200 has been created.
- The "Devices & Networks" editor is open in the "Device view".

Procedure

1. Select the PLC in the selection list.
2. Click on the PLC and select "Properties" in the shortcut menu. The properties of the PLC are displayed in the Inspector window.
3. Select "Properties > General > System diagnostics" in the Inspector window.
4. Enable "Activate system diagnostics for this CPU".
5. Select the PLC and then "Compile > Hardware configuration" in the shortcut menu.

Note

Special feature system diagnostic alarms SIMATIC S7-300/400

When you deactivate the display class 0 for the respective HMI connection under "Runtime settings > Alarms > Controller alarms > Display classes", the system diagnostic alarms are not transferred to the HMI device by the controller even when the "System diagnostics" option is activated in the controller and on the HMI device.

Result

The settings will be effective following the next compilation. The PLC can now transfer error messages to the system diagnostics display.

See also

System diagnostics basics (Page 6060)

Adding a system diagnostics indicator (Panels, RT Advanced, RT Professional)

Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your system.

If an error occurs, the appearance of the object changes. The library object can display two states:

- No error

- Error

Requirement

- The "Libraries" task card is opened.
- The global library "Buttons and Switches > Master copies > DiagnosticsButtons" is open.
- A screen is open.
- A system diagnostics window has been created in the global screen.

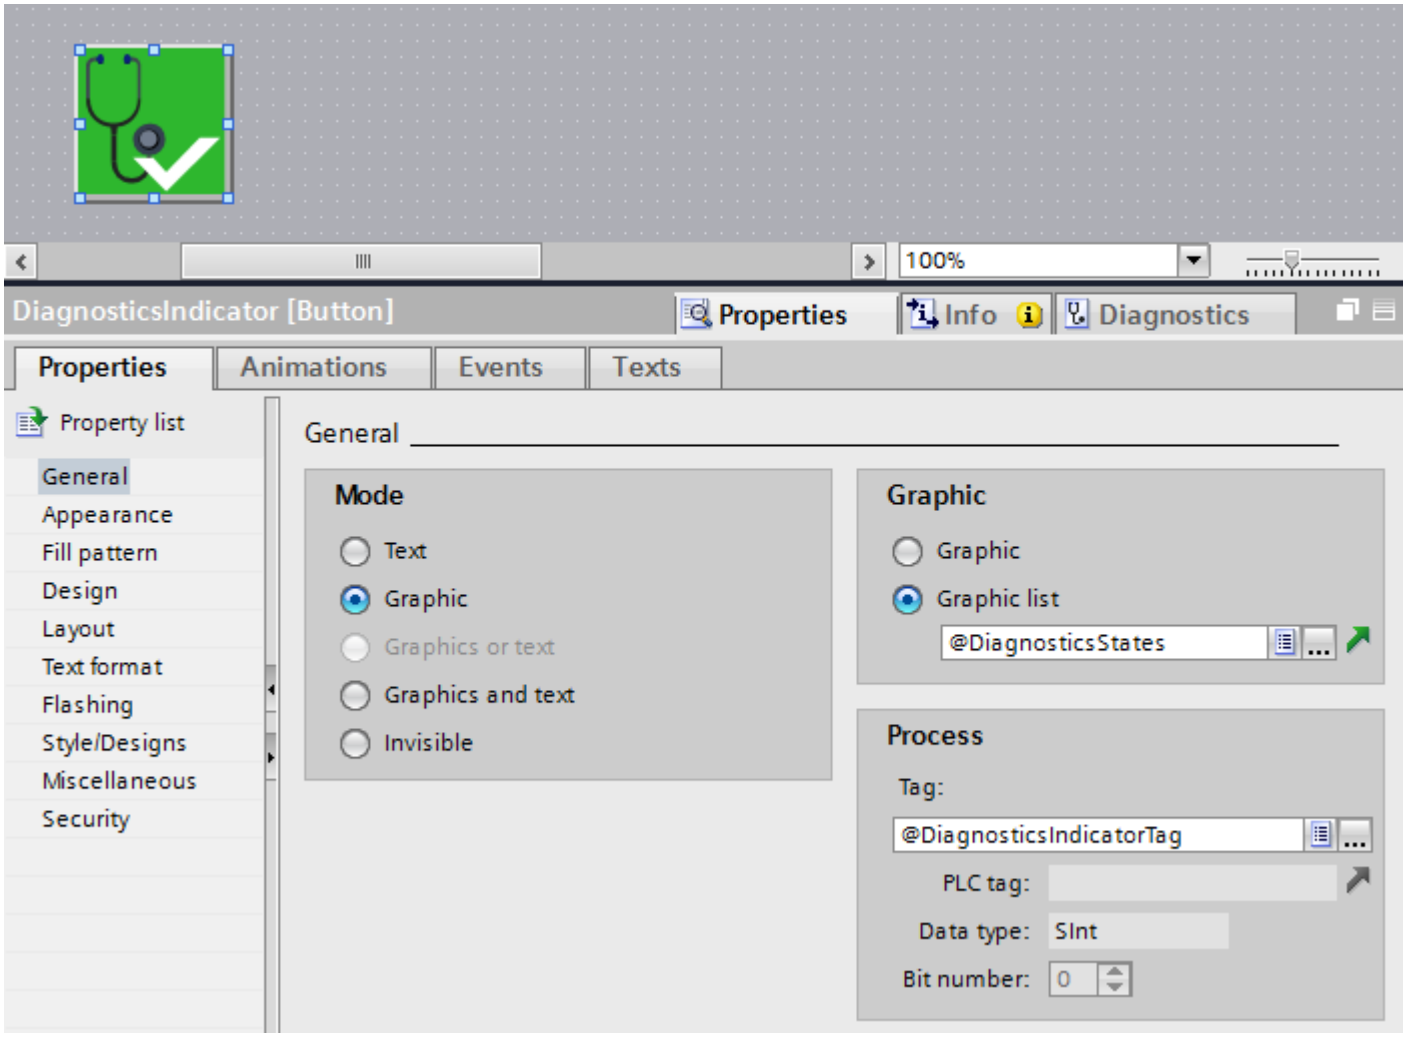
Procedure

1. Select the "DiagnosticsIndicator" object in the library.

   Note
   System diagnostics indicator for different device types

   When selecting the object ensure that you use the correct object for the device type used in the project.

2. Drag-and-drop the library object to the position in the work area where you want to insert the object.
   The library object is inserted.



3. Select the library object.
4. Click "Properties > Events" in the Inspector window.
   The system function "ShowSystemDiagnosticsWindow" is preset for the event "Click".

Result

The status diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics window.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Select an authorization in "Properties > Properties > Security in Runtime" in the Inspector window.

A logon dialog opens when you click on the system diagnostics indicator in Runtime. The system diagnostics window does not open unless you have the required authorization.

Configuring a system diagnostics window in the global screen (Panels, RT Advanced)

Introduction

The system diagnostics window gives you an overview of all devices available in your plant. The system diagnostics window operates like the system diagnostics view, but it is only available in the global screen.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- The global screen is open.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics window" object in the "Tools" task card. The object is added to the global screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Enable the columns that you require in the device view for Runtime, for example: status, name, address.
4. Enable the properties which you require in the detail view for Runtime, for example: status, name, plant designation.

5. Activate the columns that you require in the diagnostic buffer view, for example, status, name.
6. Customize the column headers, if necessary.
7. Enable "Properties >Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
8. Enable "Properties > Properties > Window > Closable" to allow the system diagnostics window to be closed in Runtime.

Result

The system diagnostics window has been added to the global screen. The system diagnostics window will respond to error messages in the plant and display the device affected.

Configure a system diagnostics indicator in a screen to open the system diagnostics window.

Configuring button as system diagnostics indicator (Panels, RT Advanced, RT Professional)

Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can configure a button, for example, to indicate errors in your plant.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the statuses.
- A screen is open.
- You have created a system diagnostics view.

Procedure

1. Double-click the "Button" object in the "Tools" task card. A button will be added to the screen.
2. In the Inspector window, select "Properties > Properties > General > Mode > Graphic".
3. Select the bit graphics list under "Graphic > Graphics list".
4. Select the "@DiagnosticsIndicatorTag" tag under "Properties > Properties > General > Tag" in the Inspector window.

Configuring system function to the button

1. Click "Properties > Events" in the Inspector window.
2. Select the "Click" event.

3. Click on "Add function" in the table.
4. Select the "ActivateSystemDiagnosticsView" system function.
5. Select the system diagnostics view.

Result

You have now configured a button which will respond to error messages from the PLC. The button changes its appearance if an error message is output in Runtime.

The button has two states:

- Error
  The system diagnostics view opens when you click the button. The system diagnostics view shows the detail view of the device concerned.
- No error
  The system diagnostics view opens when you click the button. The system diagnostics view shows the device view.

Configuring the system diagnostic view (Panels, RT Advanced)

Introduction

You add a system diagnostics view to your project to get an overview of all devices available in your plant.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- A Comfort Panel or WinCC RT Advanced has been created.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. Select "Properties > Properties > Columns > Devices/Detail view" in the Inspector window.
3. Activate the columns that you require in the device view for Runtime, e.g. Status, Name, Slot.
4. Activate the columns that you require in the detail view for Runtime, e.g. Status, Name, Plant designation.
5. Activate the columns that you require in the diagnostic buffer view, for example, Status, Name.

6. Enable "Properties >Properties > Layout > Column settings > Columns moveable" to move the columns in Runtime.
7. You can change the column headers under "Properties > Properties > Column headers", if necessary.

Result

The system diagnostics view has been added to the screen. Error for the entire plant are now displayed in the system diagnostics view in Runtime.

Configuring the system diagnostic view (Basic Panels)

Introduction

For an overview of all integrated connections, you insert a system diagnostics view in your project.

Requirements

- A PLC has been created.
- A Basic Panel has been created.
- An integrated connection has been created in the "Devices & Networks" editor.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, select "Properties > Layout".
3. Enter a number under "Lines per entry", i.e. 5.

Result

The system diagnostics view has been added to the screen.

To obtain the latest alarms, update the diagnostic buffer.

Splitting the view in system diagnostics view (Panels, RT Advanced)

Introduction

The system diagnostics view also offers a split view of the display. You have the option to see the devices and the associated details at a glance.

Requirements

- At least one PLC has been created.
- The option "Activate system diagnostics for this CPU" is activated on each PLC.
- An HMI device has been created, for example, a Comfort Panel.
- You have created a screen.
- The Inspector window is open.

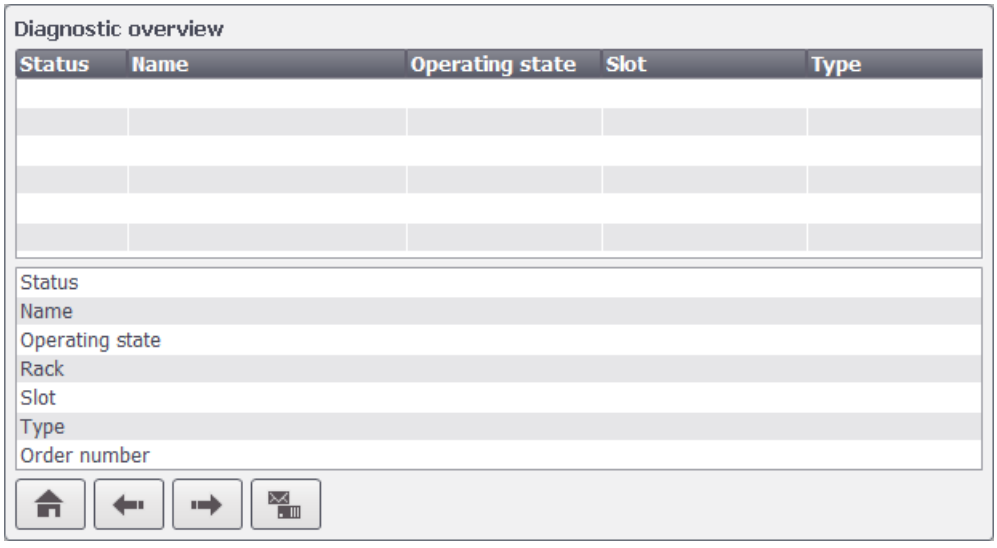
Procedure

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.
2. In the Inspector window, click "Properties > Properties > Layout".
3. Activate "Show split view".
4. Activate "Sizing > Auto-size"
5. You may also change the number of lines for the "Device view" and the "Detail view" if required.

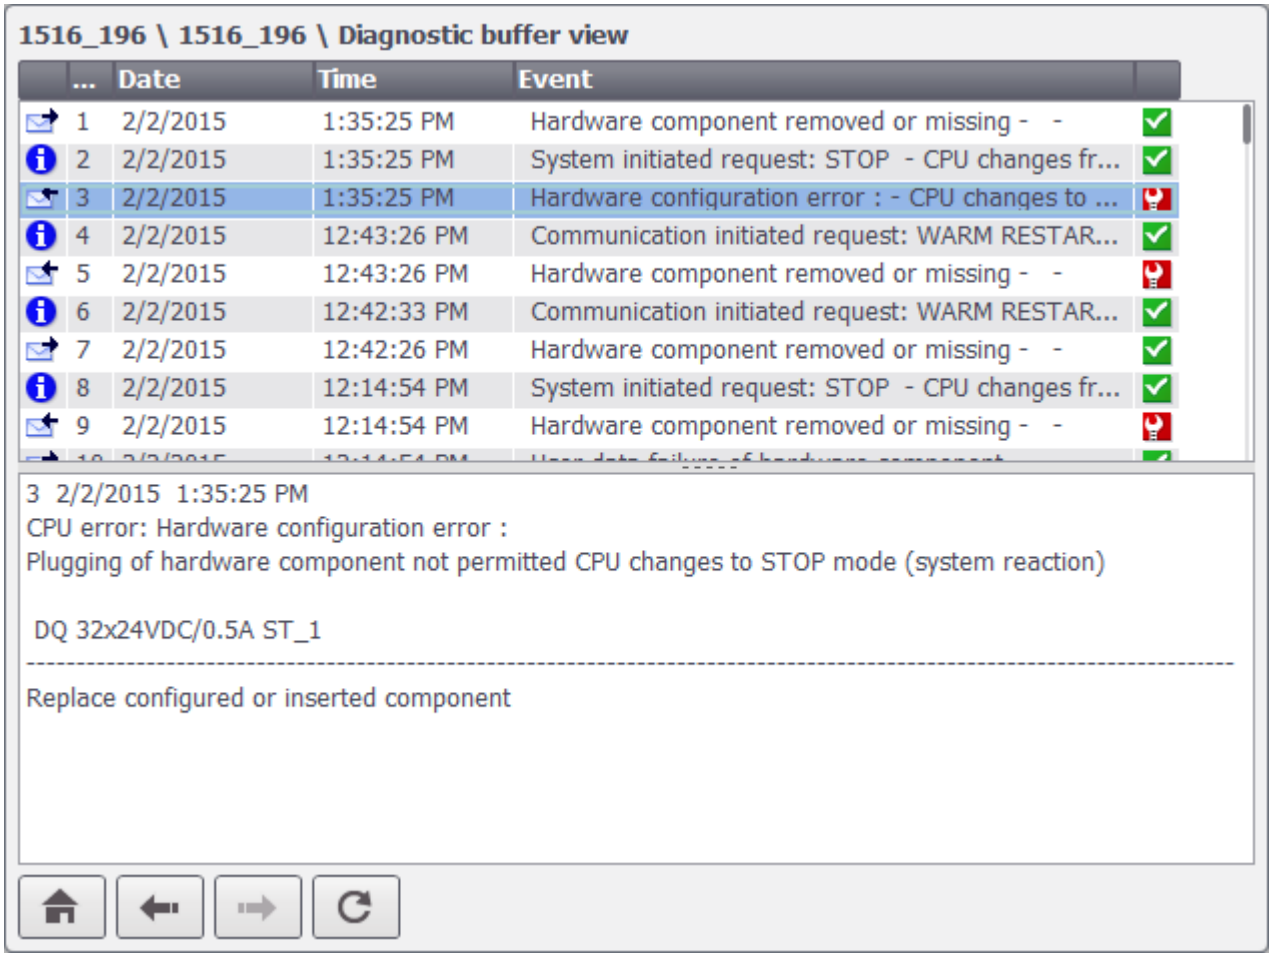
Result

The system diagnostics view has been added to the screen. The system diagnostics view is split into two areas.

The top area shows the device view. The bottom view shows the detail view.



If you open the diagnostic buffer view, the top area displays an overview of the diagnostic buffer and the bottom area displays the details.



Note

Contents of the detail view

The contents of the detail view are only available for integrated connections with S7-1200 and S7-1500 PLCs.

12.11.2 Monitoring functions for SIMATIC IPCs

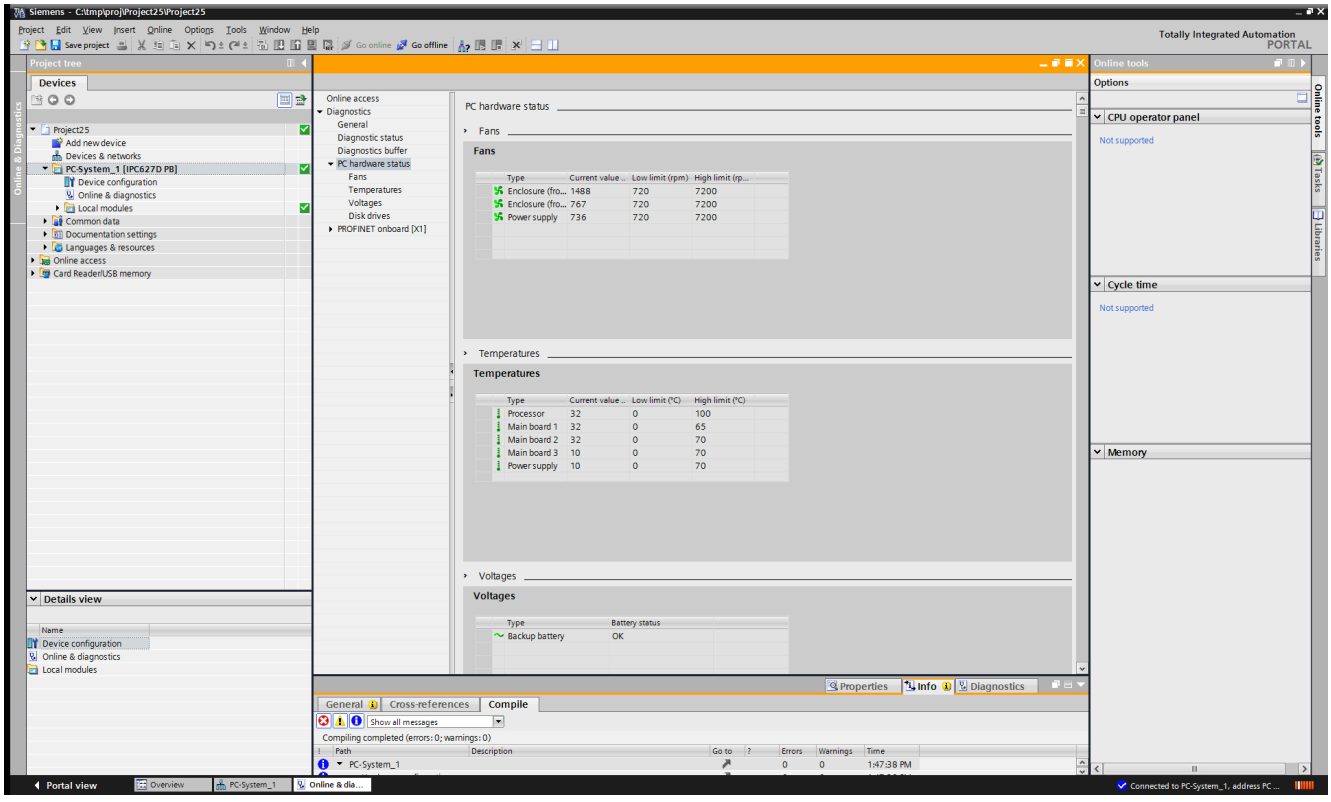
Hardware monitoring for SIMATIC IPCs

All SIMATIC IPCs support monitoring functions. Some of the monitoring functions can be displayed in the TIA Portal if you connect to the IPC online. The diagnostics editor provides information on operating states of the following groups:

- Fans
- Temperatures

- Voltages
- Drives/Storage media

The following figure shows an overview of all groups in the diagnostics editor.



You can choose between the complete view and the single view in the diagnostics editor.

"Temperatures" group

The "Temperatures" group displays the temperatures of different components.

"Fans" group

The "Fans" group indicates the status of available fans (depending on the device). The speeds are given in revolutions per minute (rpm).

"Voltages" group

The "Voltages" group indicates the status of the available voltage sensors (depending on the device). The voltage of the CMOS battery is monitored. This sensor provides information about whether the voltage is OK, critical or faulty.

"Drives" group

The "Drives" group indicates the status of the available drives/storage media (depending on the device). The following storage media are supported here:

- ATA hard disks
- CompactFlash cards
- SCSI hard disks
- USB hard disks or USB sticks
- Hard disks of an INTEL RAID adapter

Information about whether each drive has S.M.A.R.T. capability and/or is a RAID drive is specified in the properties. Status information is displayed in this case.

Limits

High and low limits are defined for the two groups, Fans and Temperatures. The limits depend on the IPC and cannot be changed.

Color code

The icons next to each display object change color depending on the state of the object. The following applies to all groups:

- Green = OK
- Red = High or low limit violation or status of the object is critical.

Reaction to deviations

If there is a high or low limit violation or one of the groups has reached a critical state, an entry is triggered in the diagnostic buffer. At the same time, the icon color changes to red.

You can find additional information on the diagnostics functions of the IPCs in SIOS Portal (https://support.industry.siemens.com/cs/de/en/view/39129913)

12.11.3 Supervising machinery and plants with ProDiag (Panels, RT Advanced, RT Professional)

12.11.3.1 Basics of supervision with ProDiag (Panels, RT Advanced, RT Professional)

Introduction

The TIA Portal ProDiag functionality is used for monitoring and identification of errors that occur in your plant or machine. You can use ProDiag to show the type of error, the cause of the error and the location of the error on the HMI device.

Use

You can use ProDiag functions to monitor your plant and to visualize it on an HMI device. The main objective of ProDiag is the reduction of downtime and loss of production after an error occurs, and the avoidance of errors using timely warnings. Diagnostic and display objects provide specific information for the user for troubleshooting and show the processes on an HMI device on site.

Principle

In STEP 7, you create operand supervisions and configure the settings according to your requirements. When an error occurs, a supervision alarm is generated based on the criteria you have configured. The configured supervision instances are stored in the preset ProDiag function block. You can use the automatically generated ProDiag FBs or create and configure your own ProDiag FBs.

You can use WinCC to visualize the ProDiag functions for display on an HMI device. You configure the screen objects which provide an overview of the current status of the plant and display the affected code or the step sequence when an error occurs.

12.11.3.2 Basics of supervising operands (Panels, RT Advanced, RT Professional)

Supervising operands

You can use a supervision to view the status of a Boolean tag. If an event occurs in your plant or machine, it triggers the configured supervision and the status of the operand is written to a ProDiag block in an error bit. The following types of supervision are available:

- Operand supervision
- Interlock monitoring
- Action supervision
- Reaction supervision
- Position supervision
- Text message
- Error message

Categories and subcategories

You can define categories and subcategories for each supervision instance. You can use eight categories to classify occurring events according to their urgency. Subcategories are used to further subdivide information. You can combine categories and subcategories in a supervision instance.

You can find categories, subcategories and alarm texts for the supervision in the project tree under "Common data > Supervision settings". You can find more information about supervisions and categories in the chapter "Programming PLC > Supervising machinery and plants with ProDiag".

Tracking a supervision in HMI

Track the status of the configured supervision in WinCC using the "ProDiag overview" object.

When an event occurs in your plant, the corresponding symbols of the supervision category and the type of supervision light up in the ProDiag overview. You jump directly to the error message or to the display if the affected network in the PLC code view via the configured buttons.

You display the status of the GRAPH sequencer of a GRAPH data block in the object "GRAPH overview". If a GRAPH supervision error occurs in one of the steps, the error symbol in the GRAPH overview lights up and the faulty step is highlighted visually.

With the object "PLC code display", you show the user program in the LAD, FBD and GRAPH programming languages on your HMI device.

12.11.3.3 Requirements and licensing (Panels, RT Advanced, RT Professional)

Introduction

You configure the ProDiag supervisions in the TIA Portal using STEP 7 Professional and create the screen objects for the supervision and diagnostics using WinCC. You need a license to use the ProDiag functionality and the corresponding screen objects.

Software requirements

To configure ProDiag supervisions, you need the following products:

- TIA Portal STEP 7 Professional
- TIA Portal WinCC
  - Comfort/Advanced V14 or higher or
  - Professional V14 or higher

Hardware requirements

ProDiag functionality is available for CPUs of the S7-1500 series with firmware version 2.0 or higher.

The objects for the supervision and diagnostics of plants are available for the following HMI devices:

- Comfort Panels und KTP Mobile Panels*
- RT Advanced
- RT Professional

* The "PLC code view" object is available on Comfort Panels and KTP Mobile Panels from display size 7"

Licensing of ProDiag supervisions

The number of ProDiag supervisions that you configure using STEP 7 Professional is licensed. You do not need a license for the first 25 supervisions, licenses must be used for additional supervisions.

Number of supervisions	<= 25	<= 250	<= 500	<= 750	<= 1000	> 1000
Number of licenses	None	1	2	3	4	5

Licensing of ProjDiag objects

To use the objects for the diagnostics and supervision in conjunction with the ProDiag supervision in your program, you need a ProDiag license.

12.11.3.4 Visualizing supervisions (Panels, RT Advanced, RT Professional)

Objects for the supervision and diagnostics of plants (Panels, RT Advanced, RT Professional)

Introduction

WinCC offers the following objects for displaying the current monitoring status and for fault diagnostics in the program code:

- ProDiag overview
- GRAPH overview
- PLC code view

ProDiag overview

The "ProDiag overview" object is available on Comfort Panels and KTP Mobile Panels and provides you with an overview of the current status of the configured supervisions.

GRAPH overview

The "GRAPH overview" object is available on Comfort Panels and KTP Panels and is used to display the current program status for executed steps of the GRAPH sequencer.

PLC code view

The "PLC code view" object is available on Comfort Panels and KTP Mobile Panels from display side 7" and is used to display the current program status of user programs which have been programmed in the LAD, FBD or GRAPH programming languages.

Interaction of the objects for the supervision and diagnostics (Panels, RT Advanced)

Introduction

With the objects for the supervision and diagnostics of plants, you have the following options:

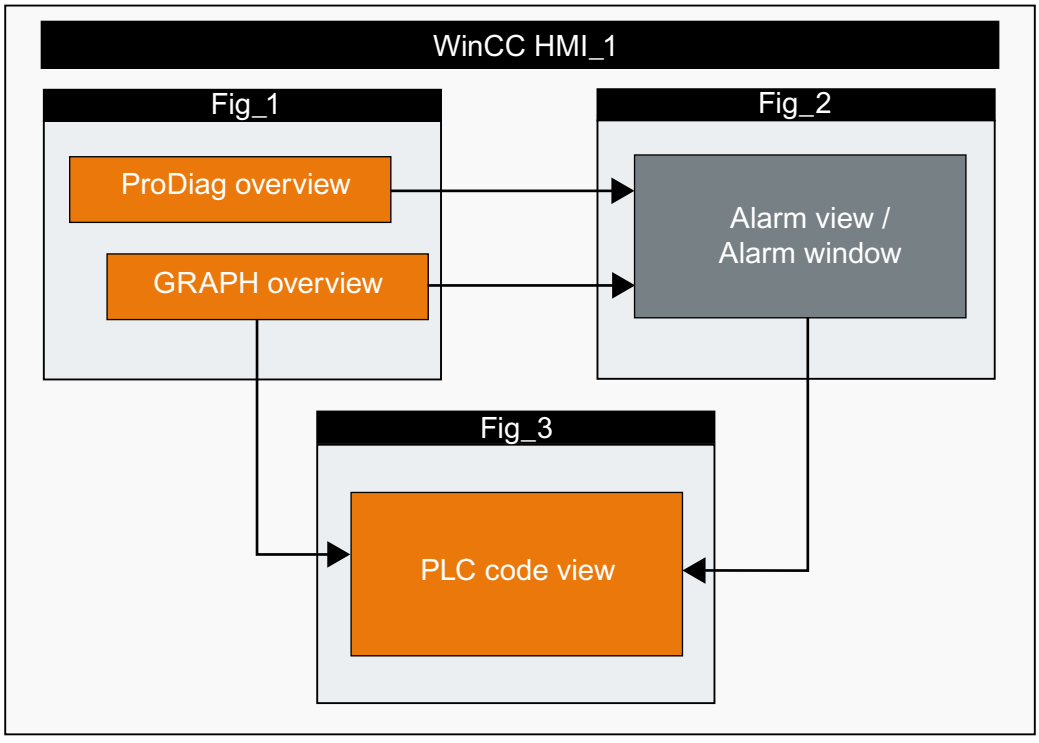
- On a HMI device, you show the status of the supervisions configured in the user program
- Evaluate the current alarms and display the network that causes the alarms,
- Display the program code on the HMI device

Depending on the network, you display the following information on the HMI device:

- With the object "ProDiag overview" you display the current status of the ProDiag supervisions.
- With the object "GRAPH overview" you display the current status of the GRAPH sequencer.

Interaction of ProDiag objects

The figure below shows the interaction of objects for visualizing the ProDiag supervisions:



The visualization of the ProDiag functionality on the HMI device is comprised of the following actions:

1. Display program status
   - Display status of the supervisions with the ProDiag overview
     On the HMI device the connection is established to the PLC and the connected ProDiag FB and the current status of the supervisions is displayed. The corresponding symbol in the ProDiag overview lights up as soon as an event occurs.
     The "Alarm view" button allows you to jump to the alarm view or alarm window showing details on the event that occurred. To find the supervision-relevant alarms more easily in the alarm view/alarm window, it is recommended to use a filter to restrict the alarm shown.
   - Show sequence of the GRAPH sequencer using the GRAPH overview
     As soon as the connection is established to the PLC, the currently executed step of the GRAPH sequencer is shown in Runtime. Navigate to the next step or to the initial step of the sequencer using the operator buttons.
     The "Alarm view" button allows you to jump to the alarm view or alarm window showing details on the event that occurred.
     The "PLC code view" allows you to jump to the PLC code view, for example, to display an error in the execution of the GRAPH sequencer.
2. Display current alarms in the alarm view or in the alarm window
   Alarms that occur in Runtime are display in the alarm view or in the alarm window.

   Note

   Display of alarms of "Acknowledgment" and "No Acknowledgment" alarm classes

   To display the supervision alarms of the system alarm classes or self-defined alarm classes in your alarm view or in your alarm window, enable the display of the these alarm classes in the Inspector window under "Properties > Properties > General".

   In the alarm view/alarm window the alarm classes of the supervision alarms can only be enabled after the supervisions have been configured and the PLC compiled.

   The system function "ActivatePLCCodeView" allows you to jump from the last active or a selected alarm to the PLC code view with the affected program code.
3. Display program code in the PLC code view
   As soon as the connection has been established to the PLC, the PLC code view displays the current status of the network depending on the configuration:
   - In Runtime, the LAD/FBD network and the program code is displayed. The symbol names, absolute addresses of the symbols and corresponding comments are show in the symbol table.
   - In Runtime, the GRAPH sequencer is shown. In the detail view, the transitions of the steps are displayed.

   You have the option of configuring a button that changes its appearance in case of an error and allows you to jump to the configured PLC code view. To do so, specify a button and configure the system function "ActivatePLCCodeView" to it. Dynamize the appearance (e.g. background color) of the button using the control tag for PLC code view that you previously connected with the alarm view, so that the button changes its color, for example, in the event of an incoming ProDiag alarm.

Transfer of languages from CPU to HMI device

In TIA Portal V14, the texts for the ProDiag functionality, such as symbol names and comments in a PLC code view and supervision alarm texts, are automatically loaded from the PLC's user program to the HMI device. In multi-lingual projects, make sure that the languages that are available in the PLC match the Runtime languages of the HMI device. The alarm texts on the HMI device can only be displayed in the desired languages if the languages match.

For more information on multilingual projects, refer to "Configuring devices and networks > Additional information on configurations > Functional description of S7-1500 CPUs > Setting the operating behavior > CPU properties > Multilingual capability".

Configuring the ProDiag overview (Panels, RT Advanced, RT Professional)

Overview of the supervision configuration (Panels, RT Advanced, RT Professional)

Introduction

In TIA Portal, configure ProDiag supervision functions in your user program in STEP 7 and configure the visualization for the HMI devices in WinCC.

Requirements

- An S7-1500 controller has been created.
- There is at least one Boolean tag, either in a data block, tag table or in a block interface.
- An HMI device has been created
- A screen has been created

Steps for configuring the supervisions with ProDiag

You configure the ProDiag functionality in the TIA Portal in the following steps:

In STEP 7

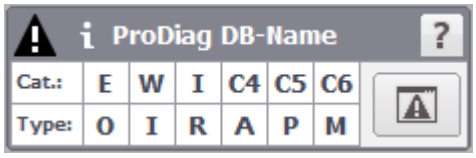
1. Create ProDiag function block for supervision.
2. Define settings at the ProDiag function block.
3. Defining the ProDiag supervision settings
   - Specify the type of supervision
   - Set the delay time
   - You select the conditions by which a supervision signal is triggered
   - Define the categories and subcategories
4. Add supervision for a Boolean tag.
   You create either global or a local supervision for a Boolean tag.
5. Call the ProDiag function block.
6. Compile and download the project

In WinCC

1. Insert the "ProDiag overview" object in the HMI screen.
2. Select a status tag.
3. Configure the display and the representation of the object in the settings.
4. Configuring the jump to the alarm view.

In addition, you can have the program execution in the "GRAPH overview" object displayed, as well as the current program status in the "PLC code view" object.

Assignment of symbols in the ProDiag overview



The status tag "State" from the PLC data type "SV_FB_State" of the ProDiag function block contains the group error bits for the supervision types and categories that you visualize with the help of the ProDiag overview.

You can visualize two types of group error bit in the "ProDiag overview" object:

- Group error bit for supervisions (All, O, I, R, A, P, Merr, Mtxt)
- Group error bit for categories (C1 to C6)

The table below shows the assignment of the group error bits of the status tag "State" to the symbols in the ProDiag overview.

ProDiag overview	Elements in ProDiag FB	Description
Symbols		
	All	Group error bit for all supervision types, excluding message text If value of All = TRUE, at least one supervision was triggered and the symbol is visually highlighted in the ProDiag overview.
	SV_Types	Byte for all group error bits of the supervision types
	Mtxt (message text)	Group error bit for all alarms
	-	Tooltip with information on this ProDiag overview
Categories		
E (Error)	C1 (Category)	Error
W (Warning)	C2 (Category)	Warning
	Categories	Group error byte for all categories.

ProDiag overview	Elements in ProDiag FB	Description
I (Info)	C3 (Category)	Information
C4 to C6	C4 to C6 (Category)	Additional categories
Supervision types		
O	O (Operand)	Group error bit for operand supervisions
I	I (Interlock)	Group error bit for interlock supervisions
A	A (Action)	Group error bit for action supervisions
R	R (Reaction)	Group error bit for reaction supervisions
P	P (Position)	Group error bit for position supervisions
M	Merr (Message error)	Group error bit for error texts

Configuring the ProDiag overview (Panels, RT Advanced, RT Professional)

Introduction

ProDiag overview is used to monitor your machine or system at runtime and determination of diagnostics information in the event of a fault occurring.

Once you have set the status tag in the object and the connection to a ProDiag FB has been established, the status of the "State" status tag of the corresponding PLC data type is queried. In Runtime, the states of the monitored operands are represented as symbols in the ProDiag overview, similar to a traffic light colors.

In WinCC, you configure the display and the representation of categories and supervision types that are displayed in the "ProDiag overview" object independent of the supervision settings in STEP7.

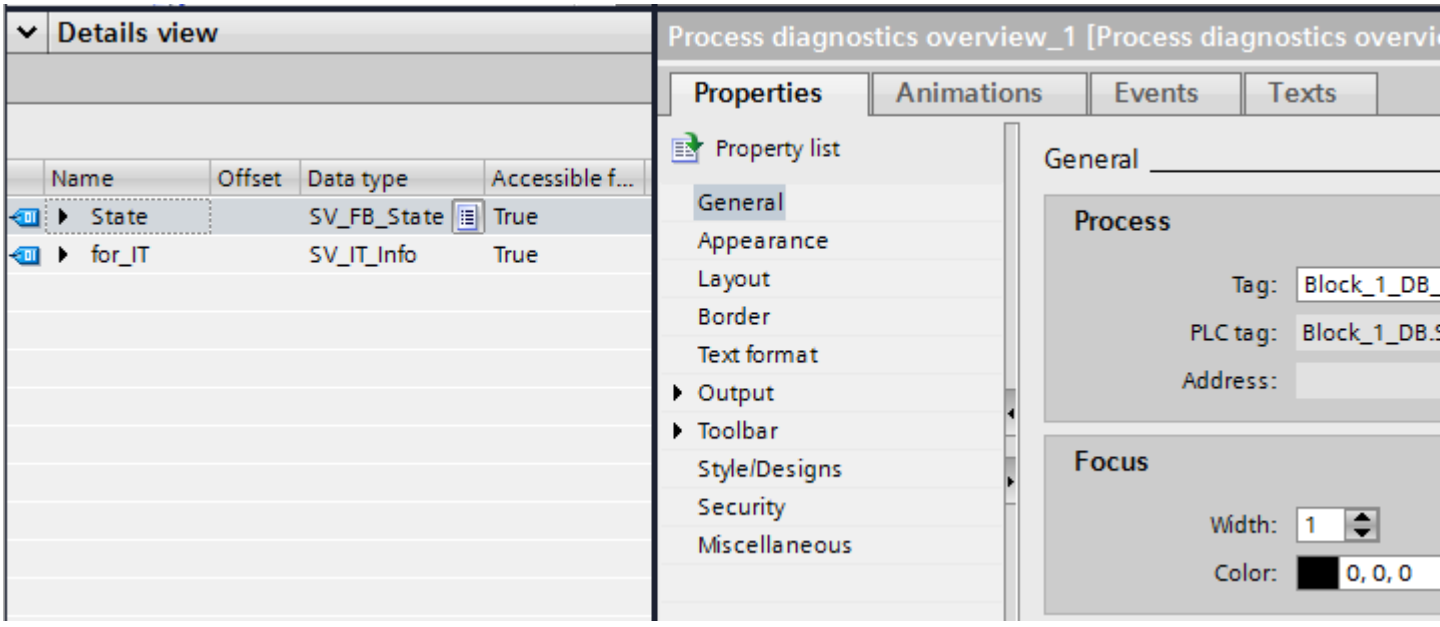
Requirements

- At least one S7-1500 controller has been created.
- At least one supervision instance has been configured.
- A ProDiag FB and ProDiag DB are available.
- A PC station or an HMI device that supports the ProDiag functionality has been created.
- An HMI connection has been established between the controller and HMI device.
- An screen is created and the Inspector window is open.

Procedure

1. In the Inspector window, select "Properties > Properties > General".
2. Open the selection button under the "Tag" property.

3. Select the status tag of ProDiag FB.
   Alternatively, you can add the corresponding status tags from the detail view using drag-and-drop.



4. Under "Output > Categories", define the names and colors for the supervision categories.
5. Under "Output > Monitoring types", define the names and colors for the supervision categories.
6. Under "Layout", specify which icons and buttons are to be displayed in the object.
7. Select an authorization for operation under "Properties > Properties > Security".
8. You can configure a system function to the event "Alarm view button click" under "Properties > Events" to jump from the ProDiag overview to the alarm view in Runtime.

Result

The ProDiag overview is inserted in the screen. The current states for supervised events are displayed in Runtime.

Configuring jump to the alarm view (Panels, RT Advanced, RT Professional)

Introduction

After an error has occurred, you have the option of jumping directly from the ProDiag overview to an alarm window or a screen with an alarm view.

Requirement

- You have created a screen.
- An alarm view or an alarm window has been created.

- The "ProDiag overview" object has been created.
- The Inspector window is open.

Configuring the jump to the alarm view

1. Click "Properties > Events" in the Inspector window.
2. Click on the event "Click alarm view button".
3. Select the "ShowAlarmWindow" system function under "<Add function".
4. Specify the object name of the alarm window.
5. Alternatively, open the screen with the configured alarm view using the "ActivateScreen" function.
   Specify the screen name of the screen that contains the configured alarm view.

Result

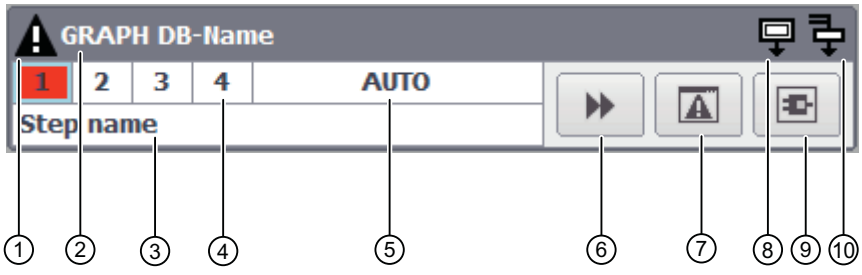
When you press the "Alarm view" button in the configured ProDiag overview, the screen with the corresponding alarm view or an alarm window opens automatically.

Configuring a GRAPH overview (Panels, RT Advanced, RT Professional)

Displaying the status of the GRAPH sequencer (Panels, RT Advanced, RT Professional)

Introduction

With the help of the "GRAPH overview" object, you visualize the status of the GRAPH sequencer.



① Error symbol

② Name of the GRAPH data block

③ Name of the currently executed step

④ Active step of the sequencer

- If an error occurs in a step, the step number is highlighted in red.

⑤ Operating mode

⑥"Step" button

- If the sequencer is in the last step, the "Initial step" button is displayed.

⑦ "Alarm view" button

⑧ Initial step symbol

⑨ "PLC code view" button

⑩ Simultaneous step symbol

Displaying the status of the GRAPH sequencer

You connect the GRAPH overview to the PLC via the GRAPH DB tag. After the connection has been established to the PLC, the object shows the step numbers of the steps of the GRAPH sequencer. The name of the currently executed step is shown below the sequencer. If there are additional simultaneous steps besides the currently executed step, the simultaneous step symbol lights up in the GRAPH overview.

Depending on the application, you can switch between the four operating modes for executing the GRAPH sequencer. The currently selected mode is displayed in the GRAPH overview.

If an error occurs during the execution of a step, the faulty step and the error symbol are highlighted visually.

In the case of error you have the option of jumping to the alarm in the configured alarm view or of viewing the affected program in the PLC code view.

Use

You have the option of displaying the GRAPH overview in the standard view or in single line mode. You can, for example, configure multiple GRAPH overviews in a screen. This provides you with the overview of the current status of multiple production areas, whose supervisions are summarized in the corresponding GRAPH FBs.

Configuring a GRAPH overview (Panels, RT Advanced, RT Professional)

Introduction

You can use the GRAPH overview to view the current program status for the executed steps of a GRAPH sequencer.

Requirement

- A PLC including a GRAPH instance data block has been created.
- GRAPH instance data block contains at least one tag which is visible in HMI and accessible from HMI.

  Note

  The process tag you are using for the GRAPH overview must be visible in HMI and accessible from HMI.

  To identify the tags of the GRAPH data block as visible and accessible for HMI, open the GRAPH function block, select the block in the work area, and select "Edit > Internal parameters visible/accessible from HMI" in the menu bar. Then compile the program blocks.

- An HMI device has been created.
- You have created a screen.
- The Inspector window is open.

Procedure

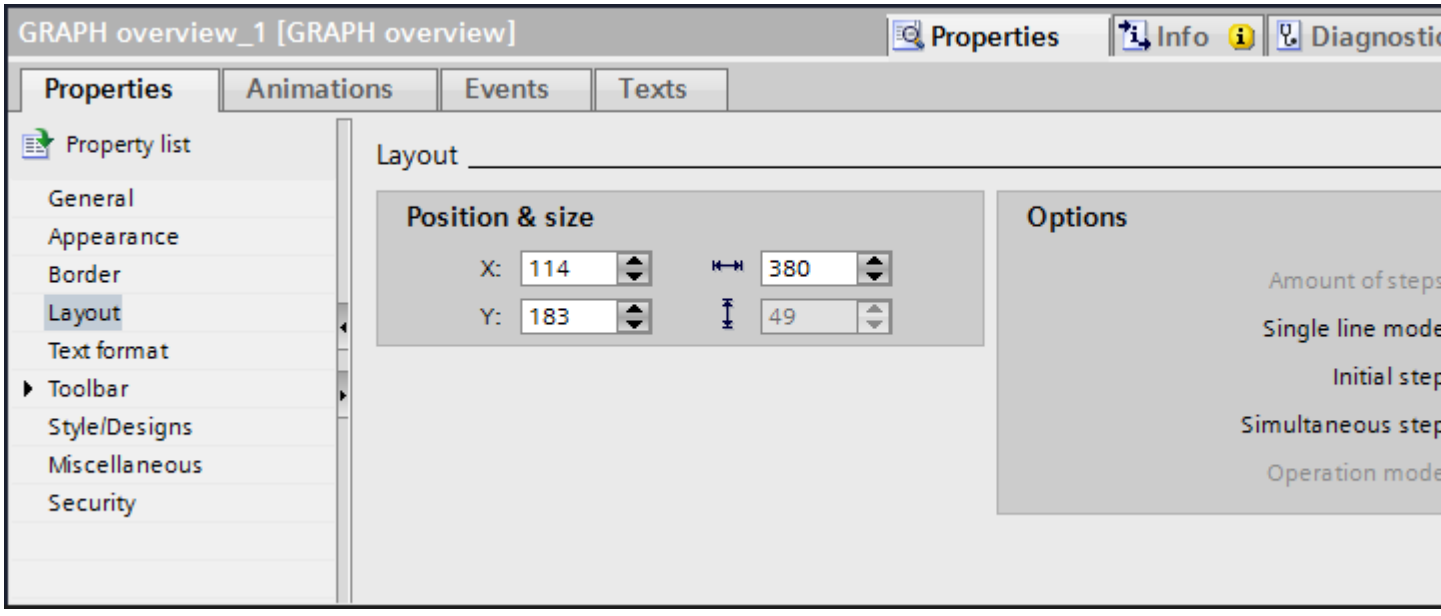
1. In the Inspector window, select "Properties > Properties > General".
2. Open the selection button under the "Assigned GraphDB tag" property.
   The "Add new object" dialog opens.
3. Select the corresponding PLC in the "Program blocks" folder.
4. Select the corresponding PLC tag of the GRAPH instance data block.

   Note

   If no connection was configured between the HMI device and the selected PLC, a connection is set up automatically.

   In addition, an HMI tag is created which is connected to the PLC tag.

5. Under "Properties > Properties > Layout > Options", specify the symbols that are displayed in the GRAPH overview .
   To represent the GRAPH overview in compatibility mode without toolbar buttons and operating mode display, enable the "Single-line mode" property.



6. Under "Properties > Properties > Toolbar > General", specify the buttons that will be displayed in the object.
7. You can dynamize the properties in the "GRAPH overview" object using tags and color-code the states.
   You can find a detailed description of dynamizing a property in the section Dynamizing screens (Page 5106)
8. Under "Properties > Events", you can assign system functions to the buttons in the GRAPH overview to jump to the alarm view and the PLC code view in Runtime.

Result

The GRAPH overview is inserted in the screen. The current status of the GRAPH step sequence is displayed in Runtime.

See also

Dynamizing screens (Page 5106)

Configuring the PLC code view (Panels, RT Advanced, RT Professional)

Configuring the PLC code view (Panels, RT Advanced, RT Professional)

Introduction

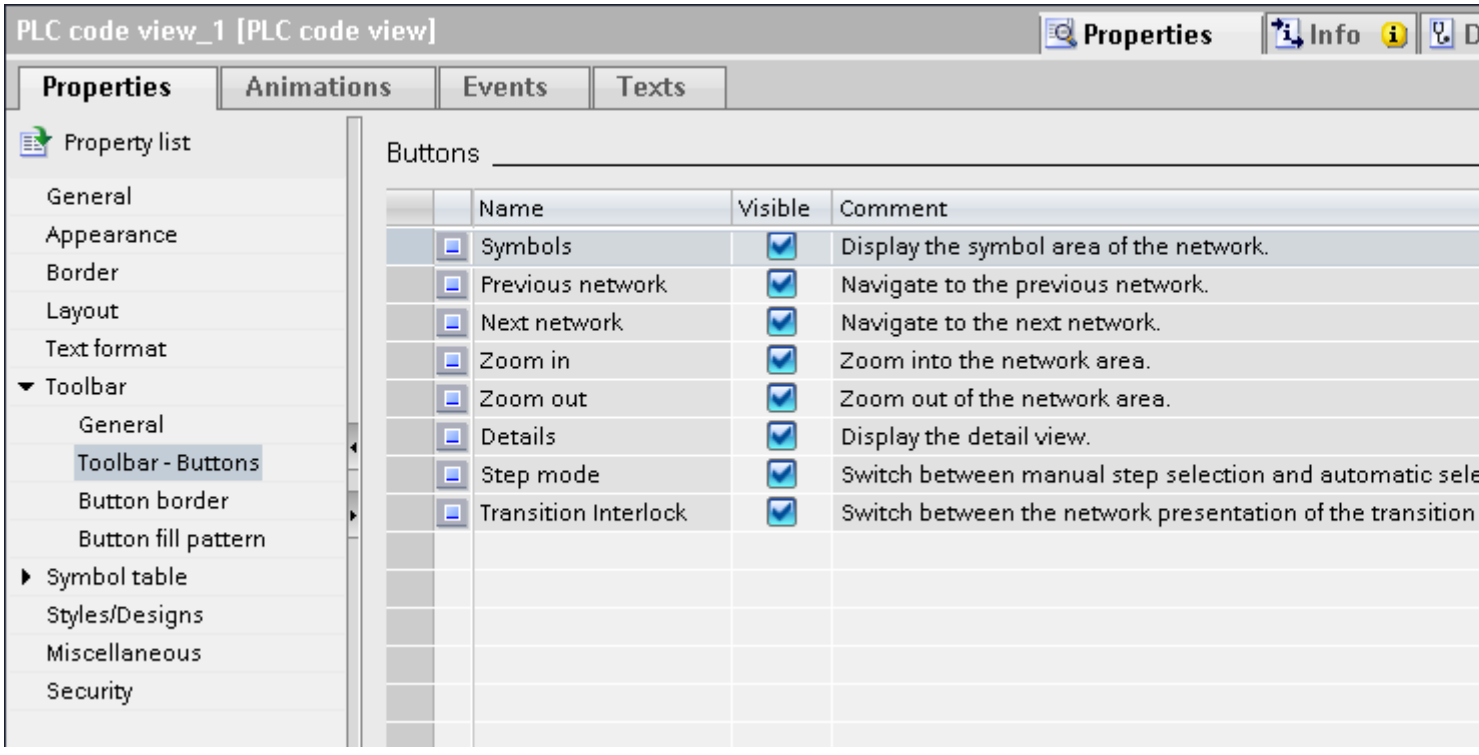
To display the PLC program networks in the LAD, FBD and GRAPH programming languages in Runtime, insert a PLC code view into your project.

Requirement

- At least one PLC has been created.
- An HMI device has been created.
- An HMI connection has been established between the controller and HMI device.
- You have created a screen.
- The Inspector window is open.

Procedure

1. Drag-and-drop the PLC code view from the toolbox view.
2. Click "Properties > Properties > Toolbar" in the Inspector window.
3. Select the buttons that you require in Runtime, for example: Next network, Previous network, Step mode.



4. If required, configure the button display, e.g. background color and fill pattern.
5. In the Inspector window, select "Properties > Properties > Columns".
6. Adapt the column headers or change the order if necessary.
7. Select an authorization for operation in "Properties > Properties > Security".

Result

The PLC code view is inserted in the screen. In Runtime, PLC user programs that are programmed in the LAD, FBD or GRAPH programming languages can be displayed.

Views in the PLC code view (Panels, RT Advanced, RT Professional)

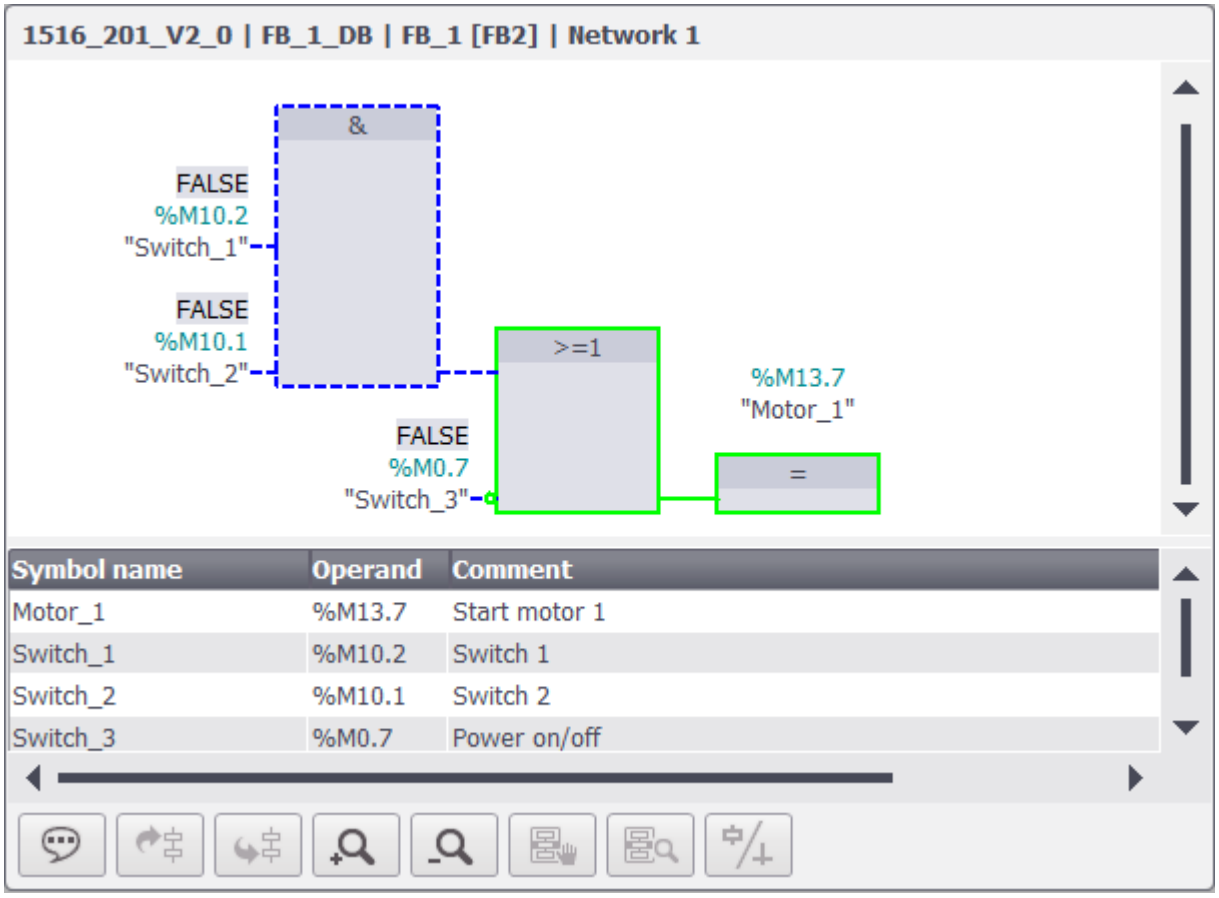
Introduction

In the PLC code view you display various items of information about the user program:

- Information area
- Symbol table
- Detail view
- "Transition/Interlock view"

Information area

The information area displays the LAD/FBD program code of your user program, and/or the GRAPH sequencer of a GRAPH data block. After the connection to the PLC has been established, the network status is displayed in the information area highlighted via the program code.



Symbol table

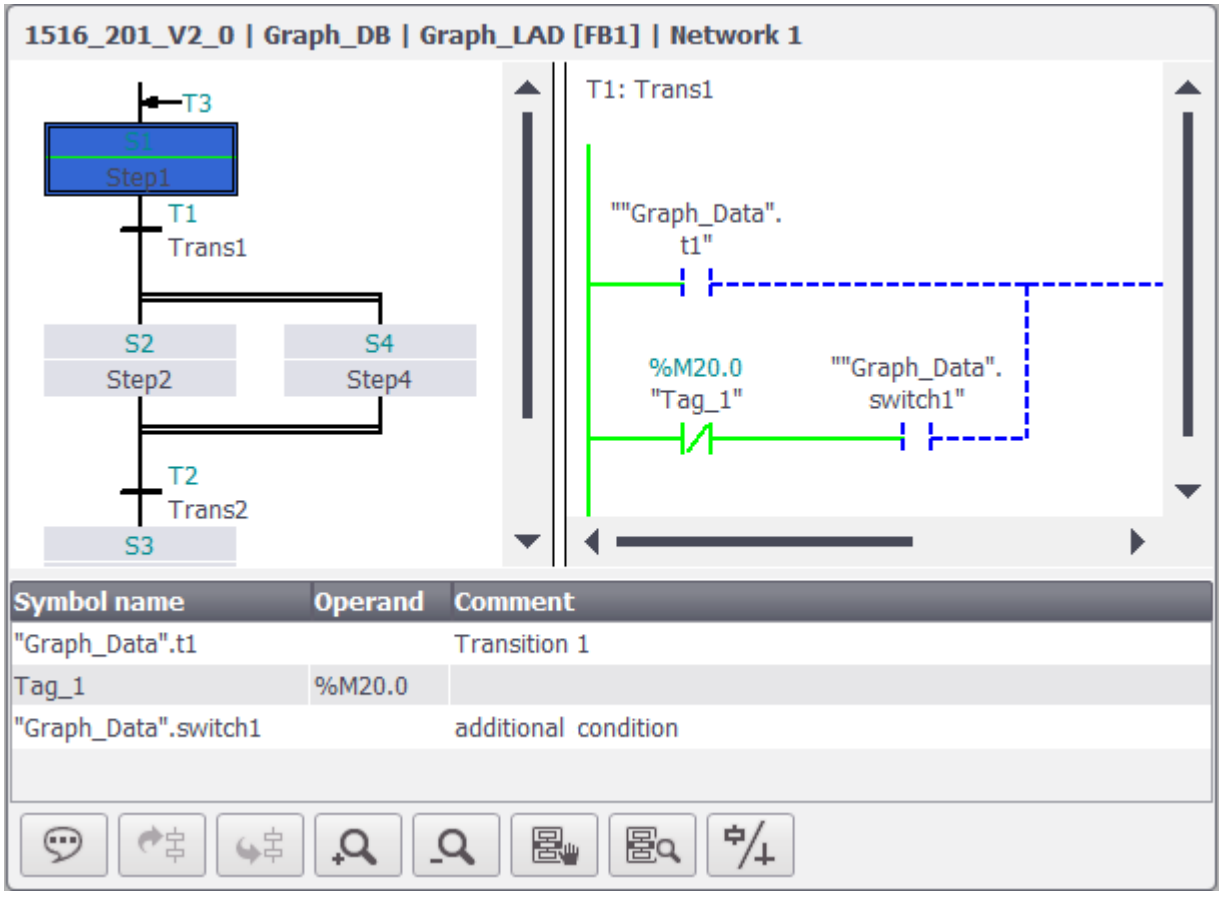
The symbol table displays the symbols that are used in the displayed network. The three columns of the symbol table display the symbol names of the tags, the absolute address and the comments. As the comments are loaded from the user program, these are displayed in the language that is stored in the PLC.

You can dynamically change the height and width of the symbol table in Runtime.

Detail view

The detail view is also available for displaying your GRAPH sequencer.

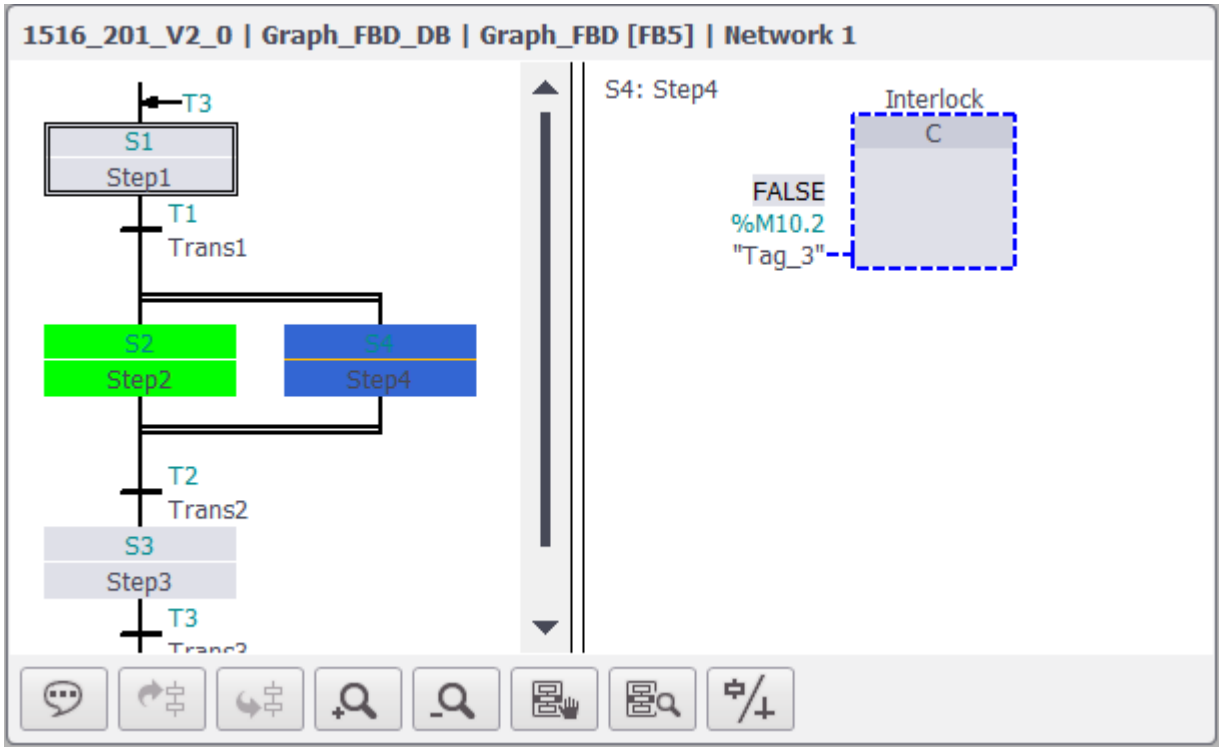
The detail view gives detailed information about the selected network and the pending errors. In the detail view you see, for example, the transition of the first active step of the GRAPH sequencer. Open the detail view in Runtime using the "Detail view" button.



"Transition/Interlock view"

You have the option of switching between the transition and interlock views in the display of your user program. The transition/interlock view is available when the detail view is displayed.

To switch between the transition/interlock views in Runtime, use the "Transition/Interlock" button. When the button is enabled the interlock network is displayed, when disabled the transition network.



Buttons on the toolbar

The table below shows the buttons on the toolbar and their meaning.

Operator control	Designation	Function
	"Symbol area"	Shows the symbol area.
	"Previous network"	Navigates to the previous network
	"Next network"	Navigates to the next network
	"Zoom in"	Enlarges the information area.
	"Zoom out"	Reduces the information area.
	"Detail"	Shows the detail view.
	"Step mode"	Switches between manual and automatic step selection for the active step.
	"Transition/Interlock"	Switches between the transition and interlock network views.

Configuring a view in the PLC code view (Panels, RT Advanced)

Introduction

The PLC code view also provides a split view of the display to show the GRAPH sequencer. You have the option of viewing the program and the associated details at a glance. Press "Detail view" to open the detail view in Runtime.

In WinCC, you can define the size ratio between the information area and the detail view.

Requirement

- You have created a screen.
- A PLC code view has been created in the screen.
- The Inspector window is open.

Define width of detail view

1. Click "Properties > Properties > Layout" in the Inspector window.
2. Specify the width of the detail view in relation to the information area using the option "GRAPH detail view width (%)".

Result

The PLC code view is divided in two areas to represent the GRAPH sequencer in Runtime. The left-hand area shows the GRAPH sequencer and the right-hand area shows the detail view with the transition of the active step.

Supported instructions (Panels, RT Advanced, RT Professional)

Introduction

The "PLC code view" object supports instructions in the FBD and LAD programming languages.

Instructions

The following instructions are supported in the PLC code view:

- Bit logic operations
- Comparator operations
- Timers
- Counters

Bit logic operations

Instruction	LAD	FBD
Normally closed contact		Normally open contact		Set output		Reset output		Assignment		
NOT: Invert RLO		
Negated contact		SR: Set/reset flip-flop		RS: Reset/set flip-flop		AND	Is implemented by the corresponding interconnection of normally closed contacts or normally open contacts.	
Instruction	LAD	FBD
OR	Is implemented by the corresponding interconnection of normally closed contacts or normally open contacts.	EXCLUSIVE OR	Is implemented by the corresponding interconnection of normally closed contacts or normally open contacts.	
You can find additional information on this in the section "Programming PLC > Instructions".

Comparator operations

Instruction	LAD	FBD
CMP ==: Equal		CMP <>: Not equal		CMP >=: Greater or equal		CMP <=: Less or equal		CMP >: Greater than		CMP <: Less than		
Note

PLC code view supports the following data types for displaying the comparator: Binary numbers, integers, floating-point numbers and timers with exception of S5TIME.

You can find additional information on this in the section "Programming PLC > Instructions".

Timers

Instruction	LAD	FBD
TP: Generate pulse		
TON: Generate on-delay		
TOF: Generate off-delay		
TONR: Time accumulator		

You can find additional information on this in the section "Programming PLC > Instructions".

Counters*

* Counters support the integer data types

Instruction	LAD	FBD
CTU: Count up		CTD: Count down		CTUD: Count up and down		
You can find additional information on this in the section "Programming PLC > Instructions".

Supported data types (Panels, RT Advanced, RT Professional)

Supported data types

The following table shows data types supported in the "PLC Code View" object and their display formats:

Data type	Length	Format
Binary numbers		
BOOL	1 bit	Bool
BYTE	8-bit	Hex

Data type	Length	Format
WORD	16-bit	Hex
DWORD	32-bit	Hex
LWORD	64-bit	Hex
Integers		
SINT	8-bit	Dec
USINT	8-bit	Dec
INT	16-bit	Dec
UINT	16-bit	Dec
DINT	32-bit	Dec
UDINT	32-bit	Dec
LINT	64-bit	Dec
ULINT	64-bit	Dec
Floating-point numbers		
REAL	32-bit	Floating point number
LREAL	64-bit	Floating point number
Timers		
TIME	32-bit	Time
LTIME	64-bit	LTime
Date and time		
DATE	2 bytes	Date
TOD (TIME_OF_DAY)	4 bytes	Time_Of_Day
LTOD (LTIME_OF_DAY)	8 bytes	LTime_Of_Day
DT (DATE_AND_TIME)	8 bytes	Date_And_Time
LDT (DATE_AND_LTIME)	8 bytes	Date_And_LTime
DTL	12 bytes	Date and Time
Character (only for displaying the contents of user data types)		
CHAR	8-bit	Character
WCHAR	16-bit	Unicode character
STRING	n + 2 ** byte	Character string
* Only with Boolean operands ** An operand of the STRING data type occupies two bytes more than the specified maximum length in the memory.		

Note

You can find more information on the data types under "PLC Programming > Data Types".

Note

The 64-bit PLC data types LINT, ULINT and LWORD are mapped to the HMI data type LREAL in the HMI channel. A loss of accuracy can be expected when the value exceeds the size 2^50.

Correcting display problems in the PLC code view (Panels, RT Advanced, RT Professional)

Introduction

If an error occurs in visualizing the program code, an error message with the associated error number is output in the PLC code view. To correct the display error, first work through the recommended first measures.

If the error persists, contact Customer Support.

First measures for error correction

Observe the following general information about troubleshooting:

1. Make sure that the current configuration was loaded onto the HMI device.
2. If you display program code in the PLC code view using a Runtime API function, check the notation and the sequence of the parameters of the call.
3. Restart Runtime on your HMI device.

Notes on error messages

The table below shows the error messages and the notes for correcting some specific errors in displaying the program code (if any):

Error number	Error message	Instructions
3101, 3107, 3109, 3113, 3402, 3501, 3502, 3601, 3602, 4000 - 4107, 4110 - 4113, 4115 - 4121 4200 - 4203, 4300 - 4604	A general error occurred in determining the display data.	
3102 4114, 4122, 4123	The parameters of the call are not correct.	Check whether all parameters of the call were entered in the specified order. Make sure that the information is complete and correct.
3103	The PLC was not found or the name of the PLC is incorrect.	Check the specified PLC name.
3104	The address of the code block could not be determined.	
3105	The address of the instance data block could not be determined.	Make sure that the name of the instance data black and not the name of the function block was specified in the parameter.
3106	The block is know-how protected.	
3108	The version of the Engineering System is not compatible.	Make sure that the user program and the visualization were configured with the corresponding version of the TIA Portal. The PLC code view with WinCC V14 only supports the configuration with the Engineering System of the TIA Portal V14.

Error number	Error message	Instructions
3112	The network contains an operand that is not supported.	
3117	The network language is not supported.	
3201	The operand was not found.	
3301	The called block was not found.	
3302	No block was found in which this UDT is used.	
3303	No matching entries were found, or the entries contain data types that are not supported.	
3401	An error occurred in determining the data of a GRAPH block.	Make sure that the specified block is a GRAPH block.
3114, 3110, 3111 4103	The network contains an element that is not supported.	
4106	An error occurred during the calculation of the online status.	Disconnect the HMI device by unplugging the network cable. Wait a moment and then re-connect the network cable.
4108	The PLC name was not specified.	
4109	The DB name was not specified.	
4202	The ProDiag UDT was not specified.	

12.11.3.5 Example: Visualization of the ProDiag functionality (Panels, RT Advanced, RT Professional)

Procedures overview (Panels, RT Advanced, RT Professional)

Introduction

ProDiag enables you to supervise faults in your plant and display information on the supervisions on your HMI device.

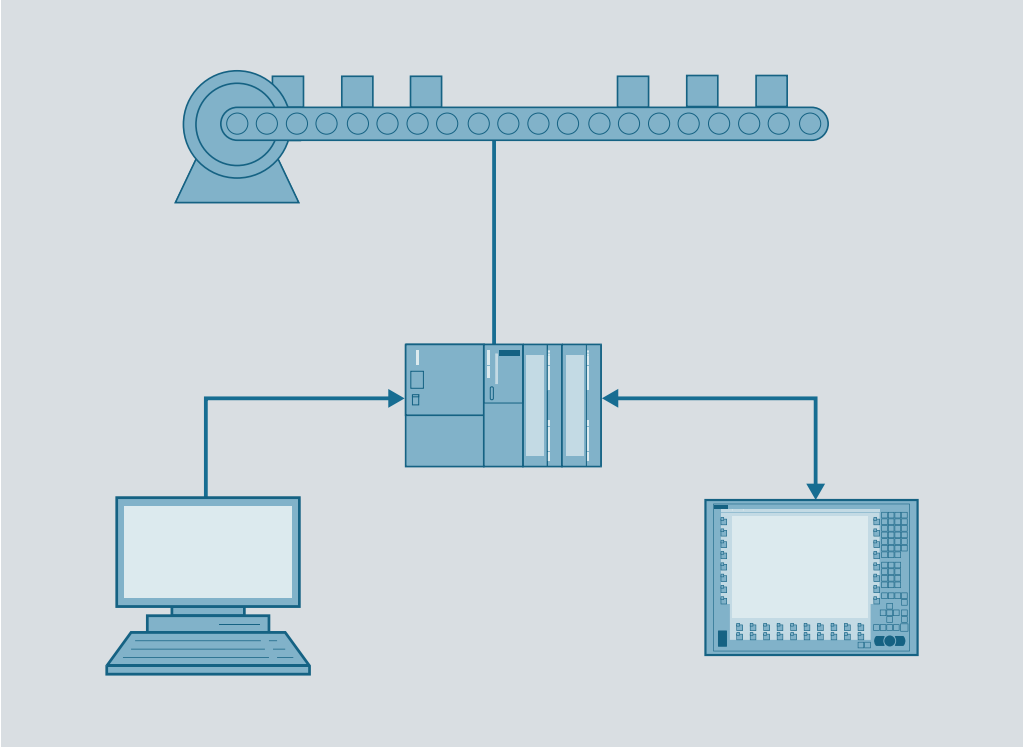
The following example shows you how to use objects for the supervision and diagnostics of plants in WinCC.

Example

In this example you configure the visualization for supervision of a conveyor belt operation.

You track the movement of the production units on the conveyor belt with a ProDiag supervision that you created beforehand.

You create your user program in STEP 7 and set up ProDiag supervisions for the operands. In WinCC you then configure the screens and objects required to display the program, the current program status and the output of error messages.



Configuration steps

The example is divided into several steps:

- Creating screens
  - Overview screen with the ProDiag screen objects
  - Screen for the alarm view
  - Screen for the PLC code view
- Inserting objects in the screens
  - ProDiag overview for display of the ProDiag supervisions
  - GRAPH overview for display of the GRAPH sequencer
  - Alarm view for display of the ProDiag alarms
  - PLC code view for display of the program code in the languages LAD, FBD and GRAPH
- Configuring objects
  Interconnecting the objects to enable targeted navigation to the cause of the error in runtime.

Requirements (Panels, RT Advanced, RT Professional)

Requirements

- An S7-1500 controller with firmware version 2.0 or higher has been created.
- A user program for controlling the conveyor belt has been created.
- The user program contains a GRAPH function block with the motion sequence of the conveyor belt.
- The user program contains a ProDiag function block with the configured operand monitoring.
  You can find more information about creating ProDiag supervisions in the section "Programming PLC > Supervising machinery and plants with ProDiag".
- The HMI device TP1200 Comfort has been created.
- A connection has been established between the controller and your HMI device.

Control program

A program for the sequence of the conveyor belt and a ProDiag function block with operand monitoring was previously created in STEP 7. The following table shows the blocks and tags which are used in this example of visualization with WinCC:

Name	Designation/type	Explanation
Conv_Seq [FB]	GRAPH function block	Contains the program sequence for moving the conveyor belt.
Conv_Seq_DB	GRAPH data block	Associated GRAPH instance data block.
OFF_SQ	Tag of the type Bool from the GRAPH data block	PLC tag which is used as the process tag for displaying the status of the GRAPH sequencer.
Conveyor [FB]	ProDiag function block	ProDiag function block contains the configured ProDiag monitoring for the operands which control the operation of the conveyor.
Conveyor_DB	ProDiag data block	Associated ProDiag instance data block.
State	Tag of the type SV_FB_State from the ProDiag data block	The status tag of the "SV_FB_State" PLC data type contains the group error bits of all the supervisions that are assigned to the ProDiag function data block.

Creating screens (Panels, RT Advanced, RT Professional)

Introduction

You will create three screens for displaying various objects to visualize the ProDiag supervisions in your plant.

Procedure

1. Open the project tree.
2. Click "Add new screen" in the Screens folder.
3. Open the shortcut menu of the screen and assign the name "Overview".
4. Create two additional screens named "Alarm" and "Program code".

Result

You have created an overview screen and two additional screens for visualization of the supervisions in Runtime.

Inserting diagnostic objects (Panels, RT Advanced, RT Professional)

Introduction

To visualize the program code and the program status on your HMI device in runtime, insert the diagnostic objects into the created screens.

In the GRAPH overview, you can see the currently executed steps of the GRAPH sequencer that you have configured in Runtime.

ProDiag overview shows you whether a fault has occurred and a ProDiag supervision was triggered.

Requirements

- The screens "Program code", "Overview" and "Alarm" have been created.
- The "Tools" task card is open.

Procedure

1. Open the screen "Program code".
2. Drag-and-drop a "PLC code view" from the "Tools" task card into the screen.
3. Enter the object name "PLC code view" under "Properties > Properties > Miscellaneous > Name" in the Inspector window.
4. Open the screen "Overview".
5. Drag-and-drop the "ProDiag overview" object from the "Tools" task card into the screen. If you want to supervise multiple ProDiag blocks from your program, create a ProDiag overview for each block.
6. Enter a meaningful object name, such as "Overview_Conveyor", under "Properties > Properties > Miscellaneous > Name" in the Inspector window.
7. Drag-and-drop a "GRAPH overview" from the "Tools" task card into the screen.
8. Enter the name "GRAPH_Sequence" under "Properties > Properties > Miscellaneous > Name" in the Inspector window.

9. Open the screen "Alarm".
10. Drag-and-drop an alarm view from the "Tools" task card into the screen.
11. Enter the name "ProDiag_Alarm" under "Properties > Properties > Miscellaneous > Name" in the Inspector window.

Result

You have created objects for supervision and diagnostics in the respective screens.

- Objects for display of the current program status in the screen "Overview".
- PLC code view for display of program code in the languages LAD, FBD and GRAPH in the screen "Program code".
- Alarm view for display of ProDiag alarms in the screen "Alarm".

Configuring diagnostic objects (Panels, RT Advanced, RT Professional)

Introduction

In this example, you connect the objects for visualization of program code and supervisions to your control program. You have previously created a program in STEP 7 for transportation of the production units on the conveyor belt. You have also created a ProDiag function block in which you set up the supervisions for the operands.

Requirements

- The "Overview" screen has been created.
- A GRAPH overview and a ProDiag overview have been created in the screen.
- A ProDiag function block was created in the control program.
- A GRAPH instance data block "Conv_Seq_DB" was created in the control program.
- GRAPH instance data block "Conv_Seq_DB" contains the "OFF_SQ" tag which is visible in HMI and accessible from HMI.

Procedure

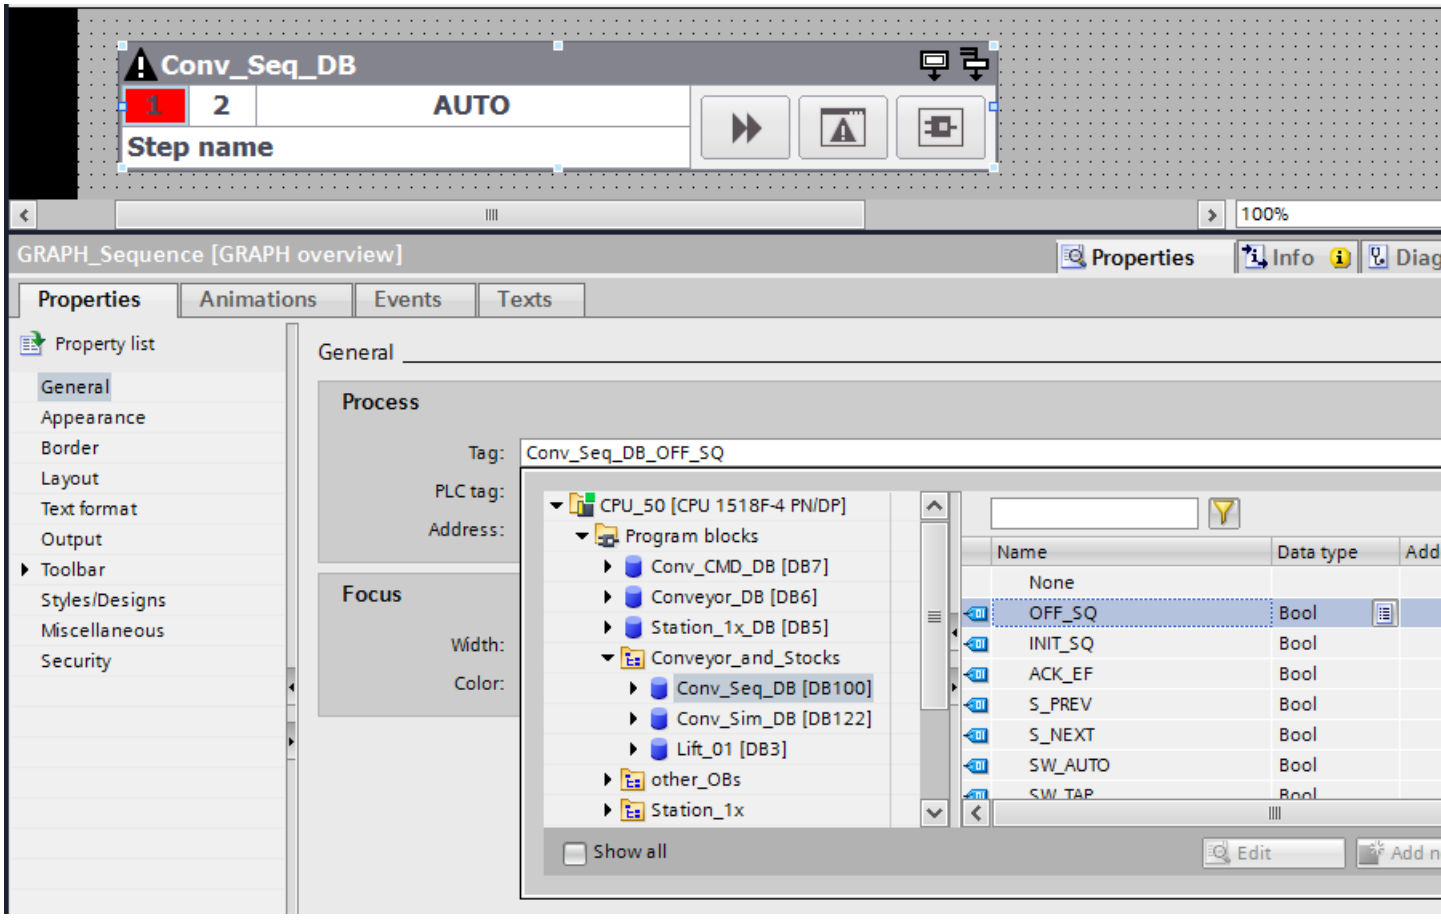
1. Select the GRAPH overview.
2. Click on the selection button under "Properties> General> Process > Tag" in the Inspector window.
   A dialog opens.
3. Click on the GRAPH instance data block "Conv_Seq_DB" in the "Program blocks" folder.

4. Select the PLC tag "OFF_SQ" of the GRAPH instance data block and confirm your selection.

Note

The process tag you are using for the GRAPH overview must be visible in HMI and accessible from HMI.

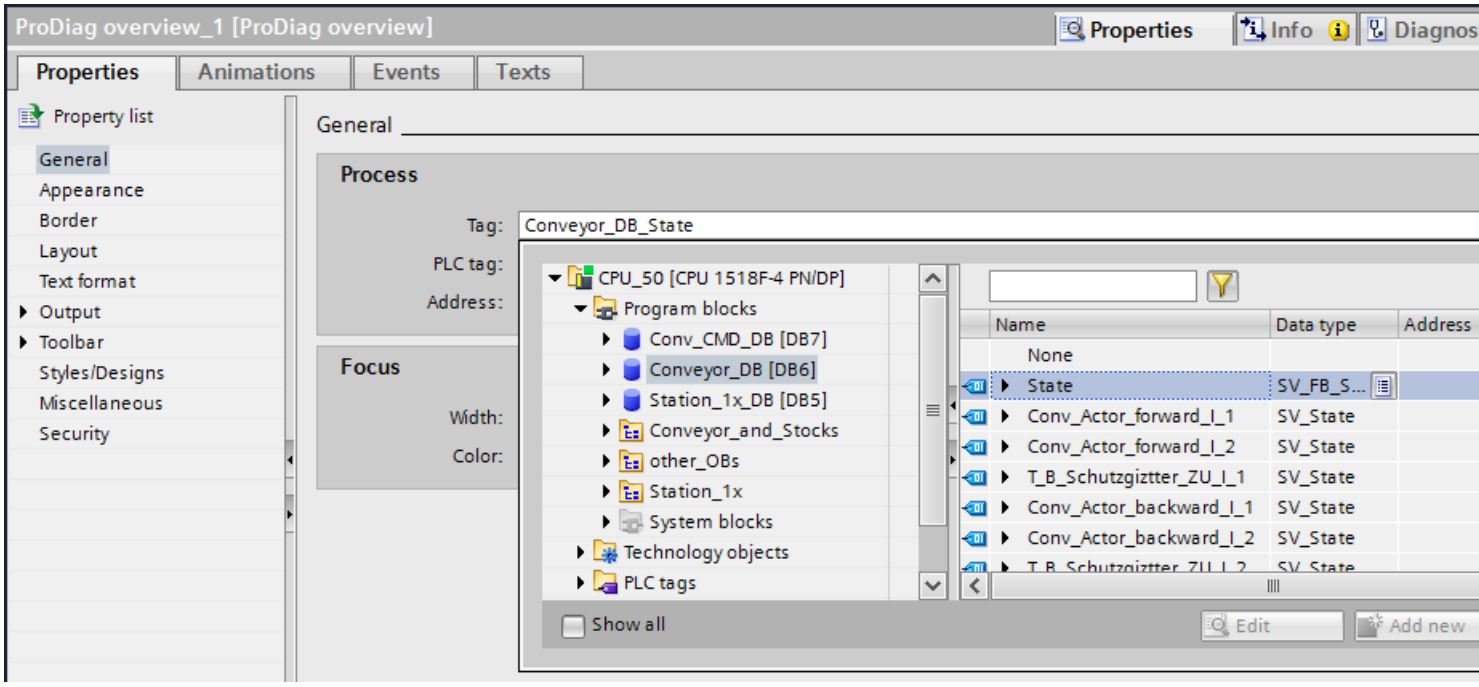
To identify the tags of the GRAPH data block as visible and accessible for HMI, open the GRAPH function block, select the block in the work area, and select "Edit > Internal parameters visible/accessible from HMI" in the menu bar. Then compile the program blocks.



The GRAPH instance data block and the "GRAPH overview" object are connected.

5. Select the ProDiag overview "Overview_Conveyor".
6. Click on the selection button under "Properties> General> Process > Tag" in the Inspector window.
A dialog opens.

7. Click on the data block "Coveyor_DB" in the "Program blocks" folder.
8. Select the status tag "State" of the "Conveyor_DB" data block.



The ProDiag data block and the "ProDiag overview" object are connected.

Result

GRAPH overview and ProDiag overview are connected to the data blocks of the control program. In Runtime, the objects show the incoming monitoring errors and the current status of the GRAPH sequencer.

Configuring the alarm view for ProDiag (Panels, RT Advanced, RT Professional)

Introduction

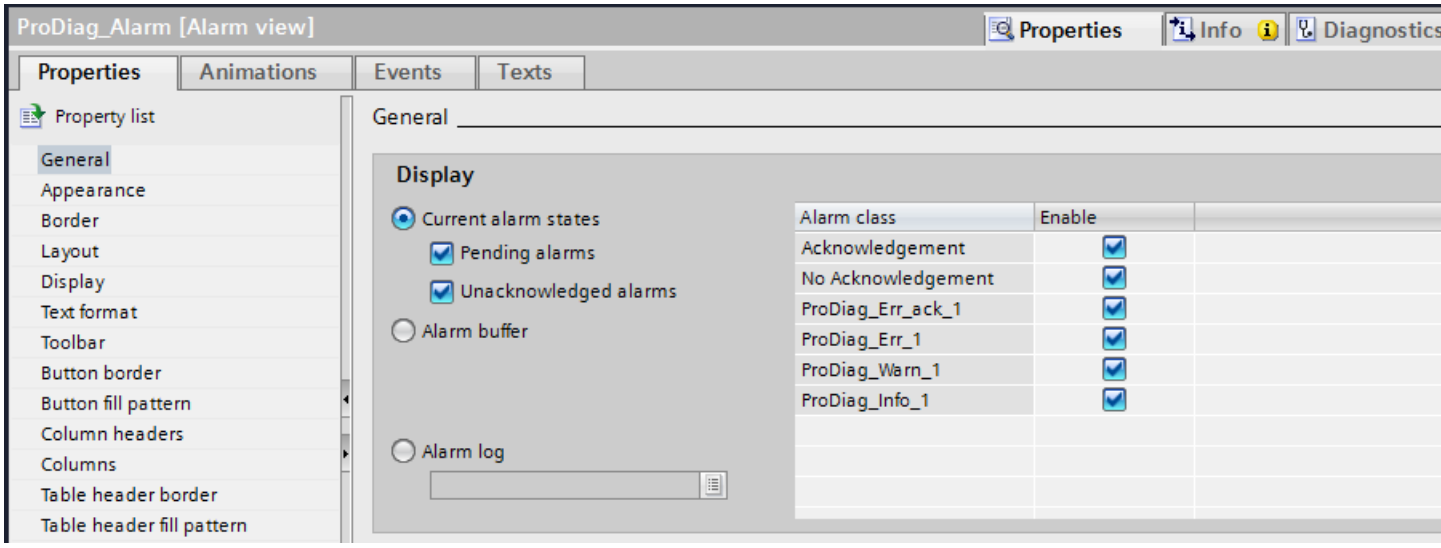
In this example you configure the alarm view for display of the monitoring alarms and jump to the PLC code view with the program code.

Requirements

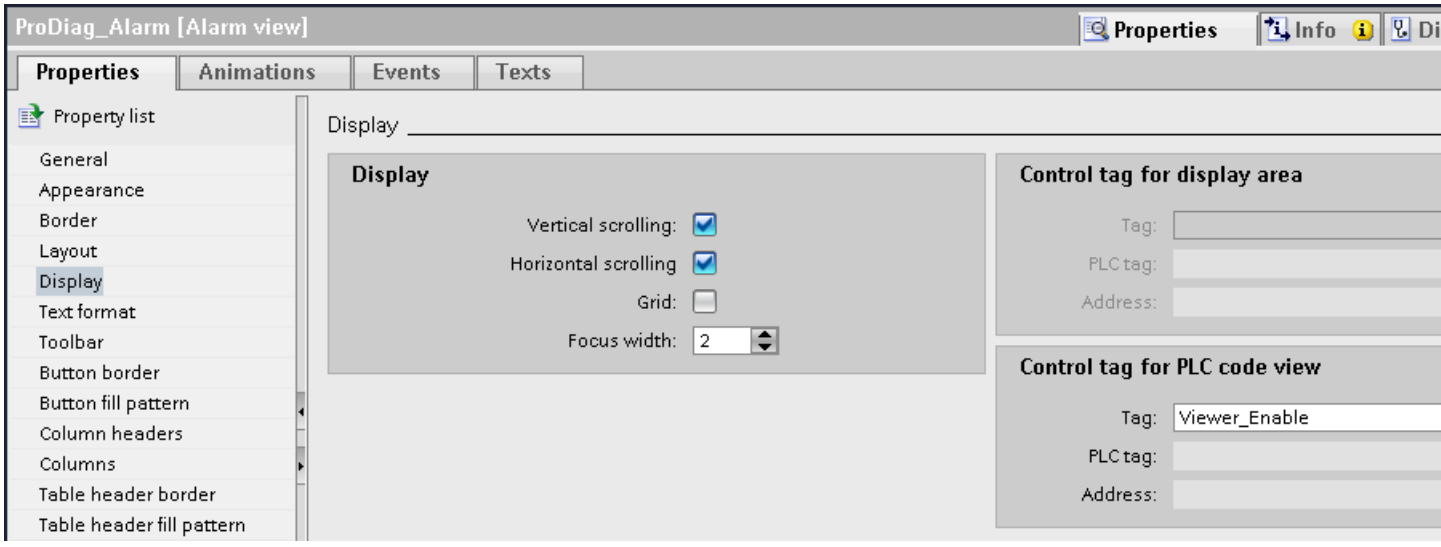
- The "Alarm" screen has been created.
- The alarm view "ProDiag_Alarm" has been created.
- The PLC code view "PLC code view" is created in the "Program code" screen.

Procedure

1. Open the "Alarm" screen and select the alarm view.
2. In the Inspector window, select "Properties > General".
3. Select the alarm classes of alarms that are displayed in the alarm view, for example, the system-internal alarm classes "Acknowledgement" and "No Acknowledgement".
   You have the option to also display alarms of alarm classes that you have defined previously in STEP 7.

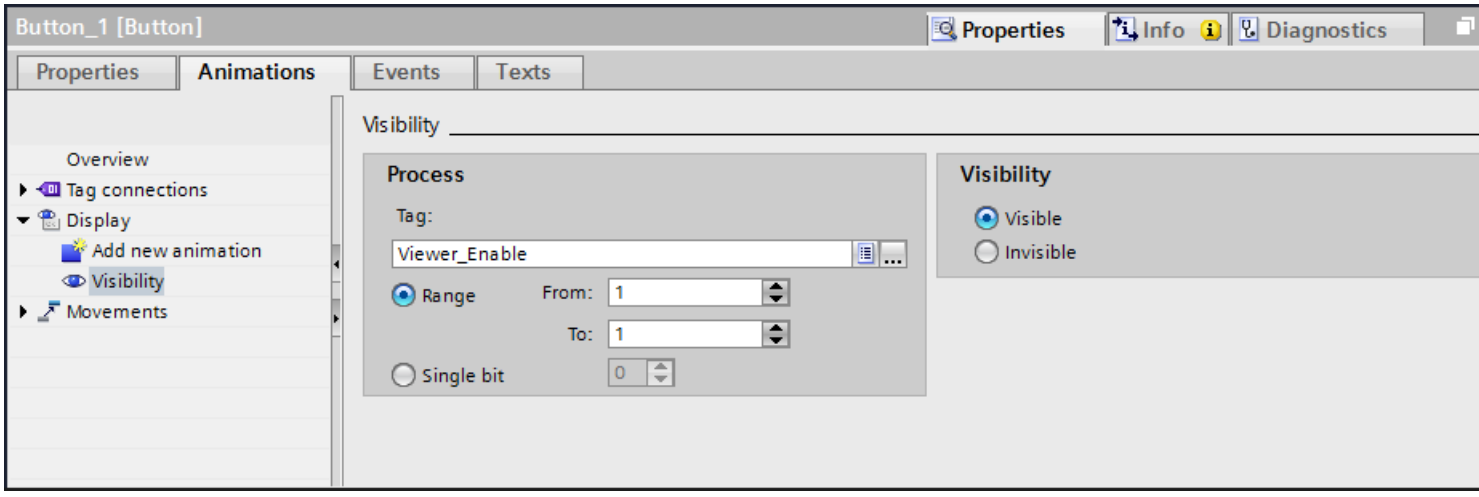


4. Specify a Boolean tag under "Properties > Display > Control tag for PLC code view" that will control the jump from the last active ProDiag alarm to the PLC code view.
   This tag is used to evaluate whether the jump from the selected alarm to the PLC code view is possible.



5. Drag-and-drop a button from the "Tools" task card into the "Alarm" screen.
   Enter the name "Program code" under "Properties > Properties > Miscellaneous > Name" in the Inspector window.
6. Select "Events > Click" in the Inspector window.

7. Select the "ActivatePLCCodeView" system function under "Add function".
8. Enter the screen name "Program code" and the object name "PLC code view" as parameters.
9. Under "Properties > Animations > Visibility > Tag", select the previously specified Boolean control tag for PLC code view.



If the jump from the incoming ProDiag alarm to the PLC code view is possible, the "Program code" button is visible.

Result

You have activated the display of alarms of the defined alarm classes in the alarm view. In Runtime, the alarms of the corresponding alarm classes are displayed in the alarm view.

Using the configured button, you jump to Runtime in the PLC code view with the program instance that has triggered the ProDiag alarm.

Configuring the jump from the GRAPH overview (Panels, RT Advanced, RT Professional)

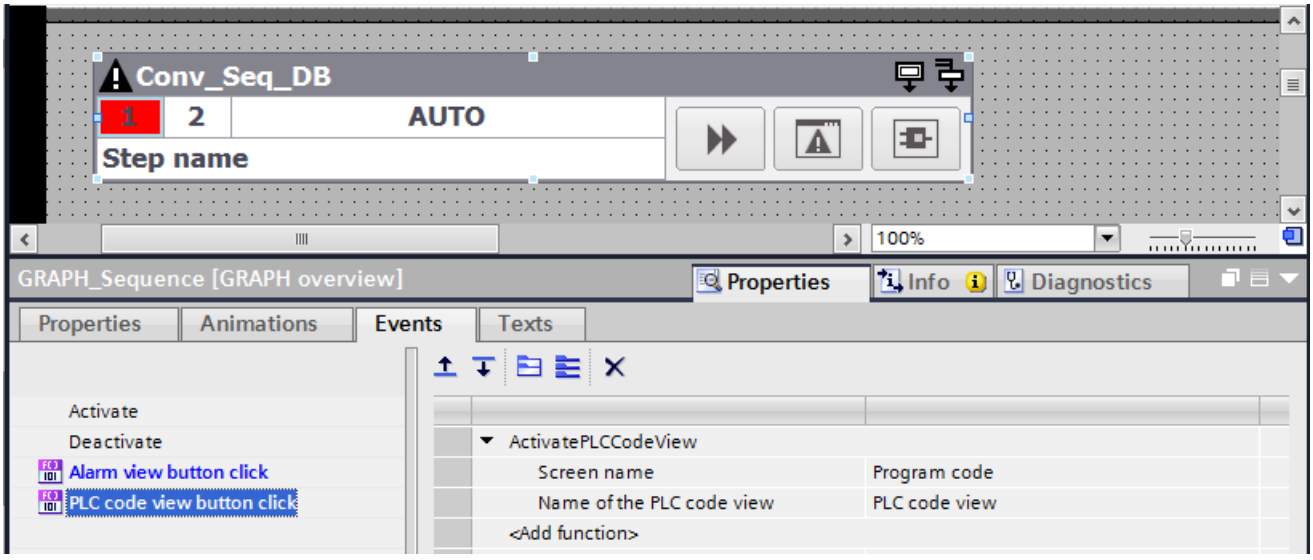
Introduction

In this step you configure the basic navigation between the GRAPH overview, the alarm view and the PLC code view.

Configuring the jump from the GRAPH overview

1. Select the GRAPH overview "GRAPH_Sequence".
2. Select "Events > Alarm view button click" in the Inspector window.
3. Select the "ActivateScreen" system function under "Add function".
4. Specify the name of the "Alarm" screen that contains the alarm view.
5. Select "Events > PLC code view button click" in the Inspector window.

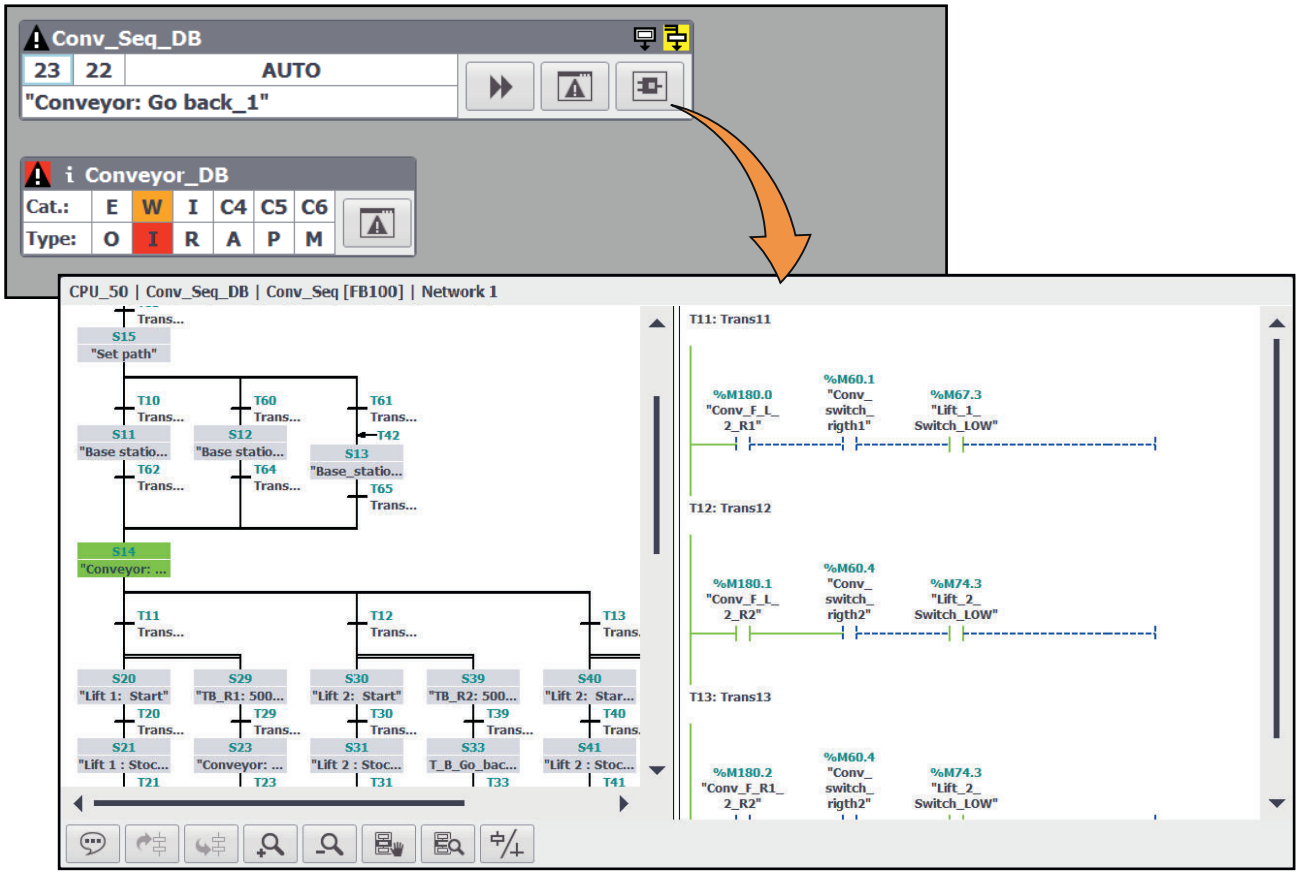
6. Select the "ActivatePLCCodeView" system function under "Add function".
7. Enter the name of the "Program code" screen and of the PLC code view "PLC code view".



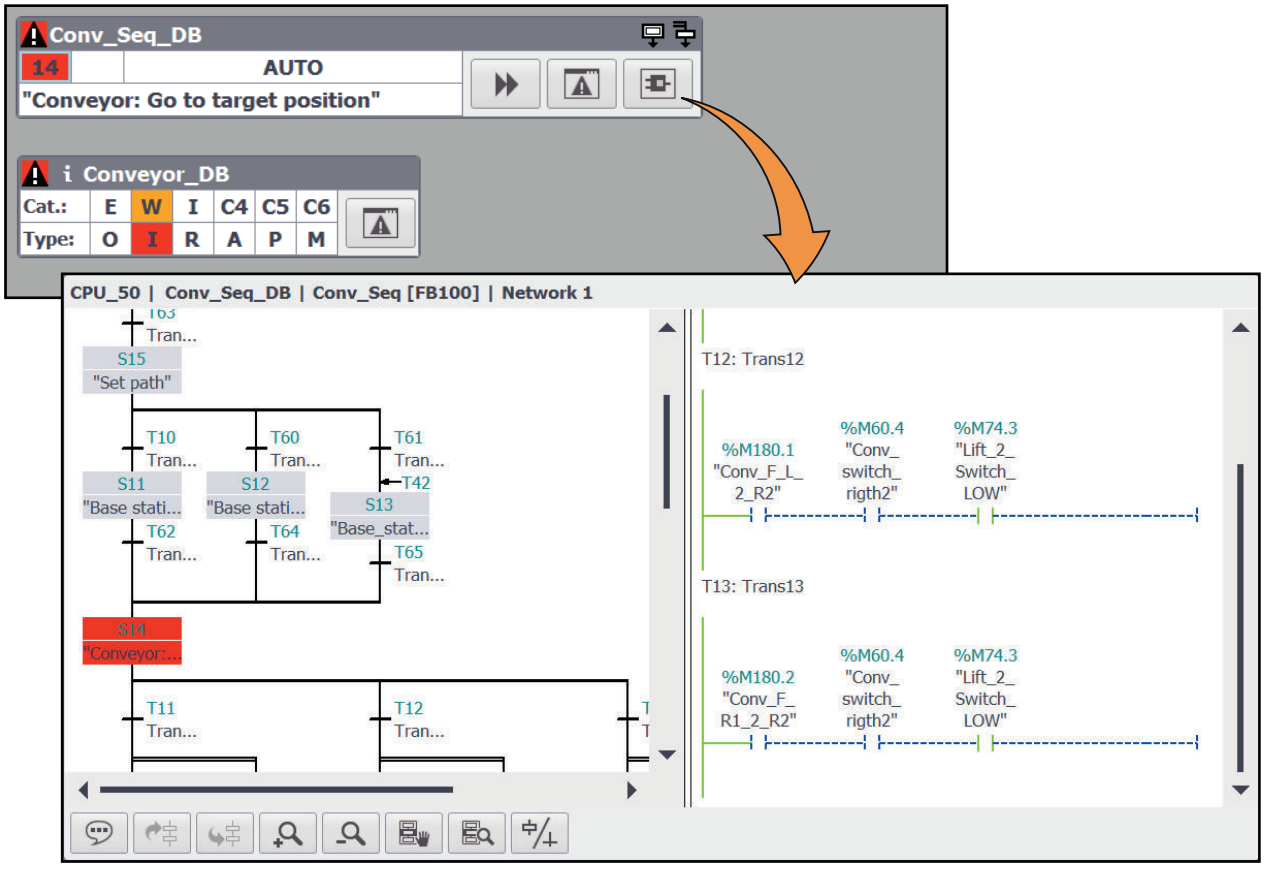
You have connected the GRAPH overview to the PLC code view. By clicking the "PLC code view" button, the screen with the display of the GRAPH sequencer is shown in Runtime.

Result

You monitor the current status of the sequencer using the GRAPH overview in Runtime. You have the option of viewing the GRAPH sequencer at any time in the PLC code view.



In case of a fault, you use the configured buttons to jump to the corresponding alarm in the alarm view or directly to the PLC code view with display of the step sequencer.



Configuring the jump from the ProDiag overview (Panels, RT Advanced, RT Professional)

Introduction

In this step you configure the basic navigation between the ProDiag overview, the alarm view and the PLC code view.

Configuring the jump from the ProDiag overview

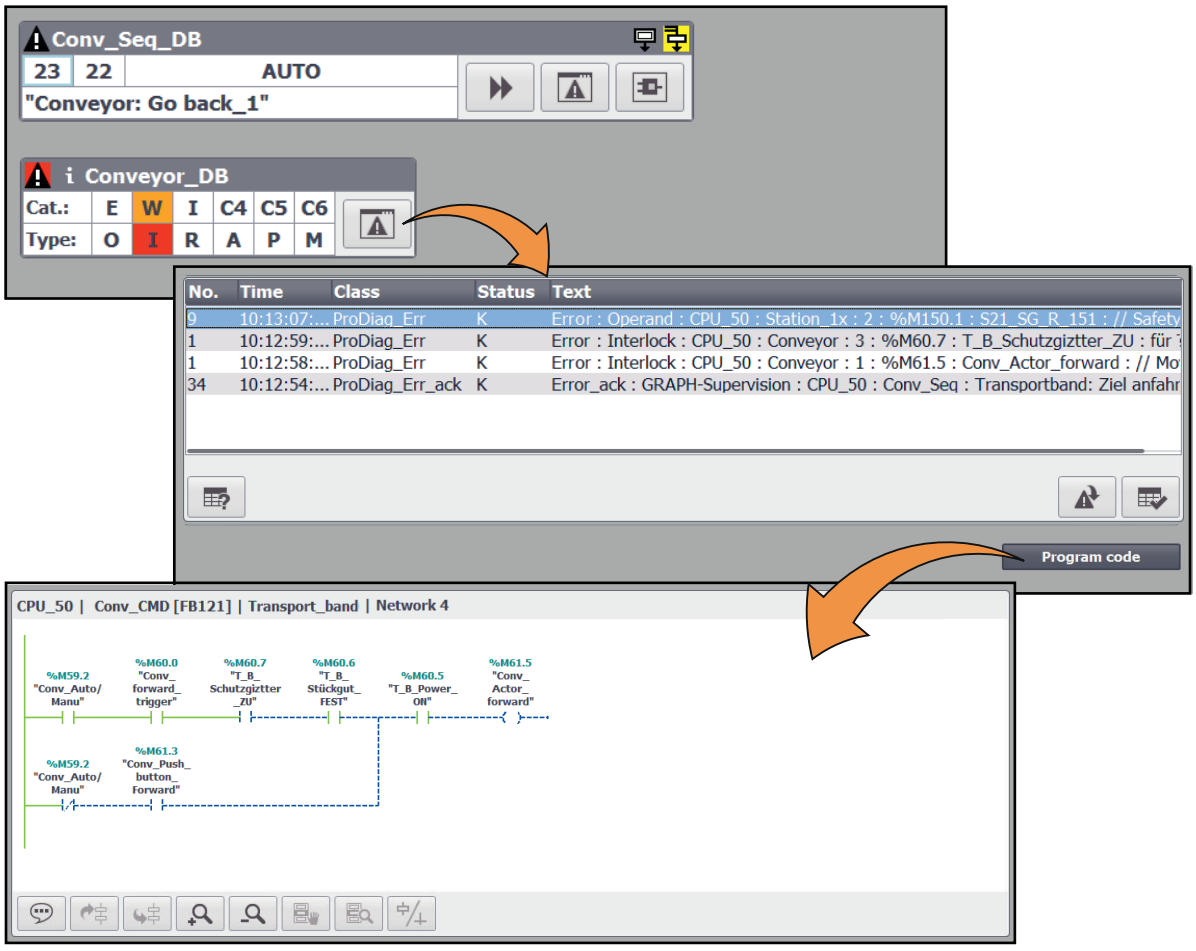
1. Select the ProDiag overview "Overview_Conveyor".
2. Select "Events > Alarm view button click" in the Inspector window.
3. Select the "ActivateScreen" system function under "Add function".
4. Specify the name of the "Alarm" screen that contains the alarm view.

Result

You have connected the diagnostic objects to each other.

You monitor the status of the ProDiag supervisions using the ProDiag overview in Runtime. In case of an error, the corresponding supervision icon is visually highlighted.

By clicking the "Alarm view" button, the screen with the alarm view and the currently pending alarms is displayed. Using the configured buttons, you jump, for example, from a ProDiag alarm to the display of the network in the PLC code view.



12.12 Communicating with controllers

12.12.1 WinCC Advanced V14 - Communication

Communicating with controllers

You can find a detailed description of communicating with controllers in the "WinCC Advanced V14 - Communication" manual.

12.13 Using global functions

12.13.1 Working with libraries

12.13.1.1 Basics on libraries

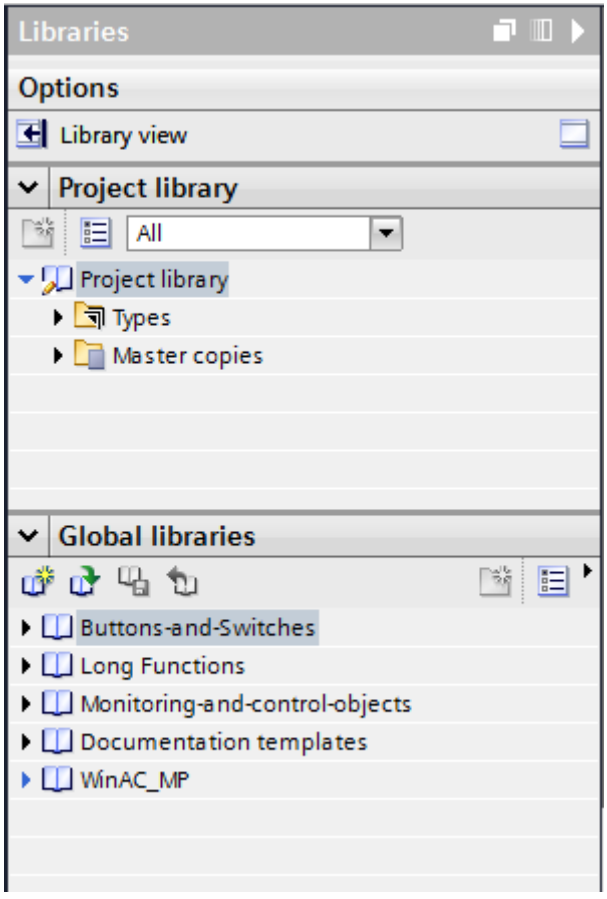
Introduction

Store all objects you need frequently in the libraries. An object that is stored in the library only has to be configured once. It can then be used repeatedly as often as required. Library objects extend the number of available screen objects and increase the effectiveness during configuration through the multiple usage of ready-to-use objects.

Your WinCC software package is supplied with comprehensive libraries that contain, for example, "Motor" or "Valve" objects. You may, however, define your own library objects.

You manage libraries in the "Libraries" task card or library view. The following libraries are available:

- Project library
- Global libraries



Note

There is a symbol library in the "Tools" task card in the "Graphics" palette.

Project library

There is one library for each project. Objects of the project library are stored alongside with the project data and are available only for the project in which the library was created. If the project is moved to another PC, any project library created in it is also moved.

To use the library object of the project library in other objects, move or copy the object into a global library.

Global libraries

A global library is saved independently of the project data in its own file with the extension *.al12.

A project can access several global libraries. A global library may be used concurrently in several projects.

When a library object is changed by a project, this library will be changed in all projects in which these libraries are open.

Library objects

A library can contain all WinCC objects. Examples:

- Complete HMI device
- Screens
- Display and control objects including tags and functions
- Graphics
- Tags
- Alarms
- Text and graphics lists
- Faceplates
- User data types

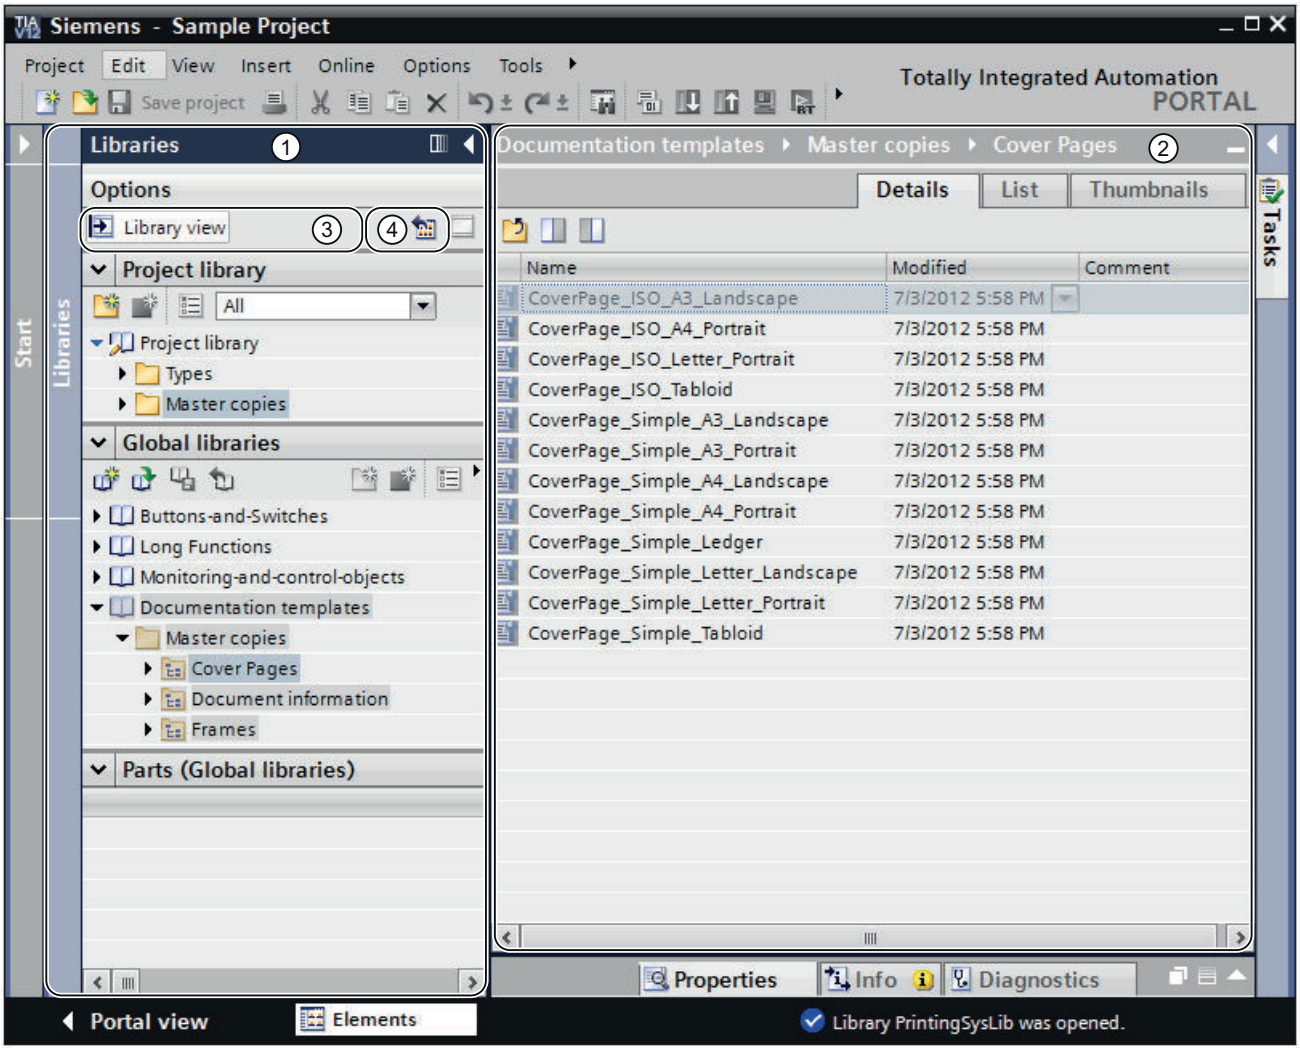
12.13.1.2 Overview of the library view

Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

Layout of the library view

The following figure shows the components of the library view:



1 Library tree
2 Library overview
3 "Library view" button
4 "Open or close library overview" button

Library tree

The library tree is similar to the "Libraries" task card, apart from a few minor differences. In contrast to the task card, there is no "Elements" palette, because the elements are displayed in the library overview. In addition, you can close the library view in the library tree, or open and close the library overview.

Library overview

The library overview corresponds to the overview window and displays the elements of the currently selected object in the library tree. You can display the elements in three different views. You can also perform the following actions in the library overview, for example:

- Copying elements
- Moving elements
- Versioning types
- Editing faceplates and HMI user data types
- Editing type instances

12.13.1.3 Master copies and types

Introduction

Both the "Project library" and the "Global library" contain the two folders "Master copies" and "Types". You can create or use the library objects either as a master copy or a type.

Master copies

Use master copies to create independent copies of the library object.

Types

Create instances of objects of the "Types" folder and use these in your project. The instances are bound to their respective type.

Administration of the library objects

You can copy and move library objects to another library. You can only copy master copies to the "Master copies" folder or any sub-folder of "Master copies". You can also only insert types in the "Types" folder or any sub-folder of "Types".

See also

Basics on libraries (Page 6113)

State of type versions (Page 6133)

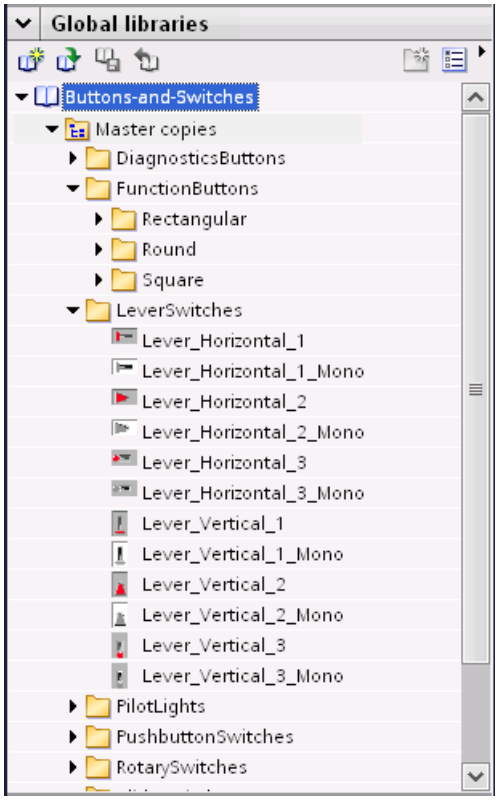
12.13.1.4 Libraries in WinCC

Introduction

The WinCC software package includes extensive libraries. Sorted by topic into folders, they contain preassembled graphic objects which you can use in screens for operation and monitoring of your plant.

Global library "Buttons and Switches"

The libraries "Buttons and Switches" offer a wide selection of buttons and switches.



The folders divide switches and buttons into categories. The "DiagnosticsButtons" folder contains the object "System diagnostics indicator", for example. You use the "System diagnostics indicator" object for system diagnostics in your plant.

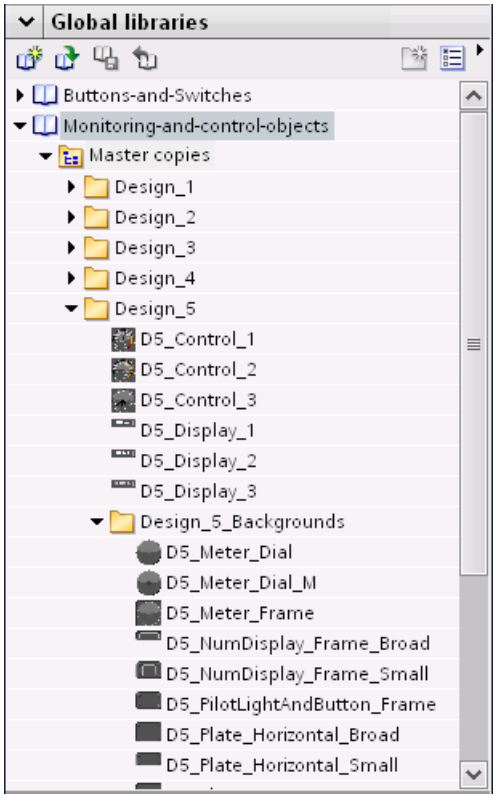
Note

You can only use the objects in the "DiagnosticsButtons" folder on Comfort Panels.

You cannot use objects which have "Switch" in the object name or in the associated folder name in Runtime Professional.

Global library "Monitoring and Control objects"

The "Monitoring and Control objects" library offers more complex display and operating objects in several designs and corresponding control lights, buttons and switches.



In addition, graphics views for the designs are stored in the "Design_Backgrounds" folder; they can be used as object backgrounds for the custom extension of the scope of the library.

Note

You cannot use objects which have "Switch" in the object name in Runtime Professional. The same applies for the object "D5_Display_3" with the date/time field it contains.

12.13.1.5 Managing libraries

Overview of the library management

Function of the library management

Master copies and types with dependencies to other library elements are subject to some functional restrictions. They can, for example, not be deleted as long as dependencies still exist. This prevents other library elements from becoming useless. The library management is used to identify the dependencies and to create an overview of the work progress.

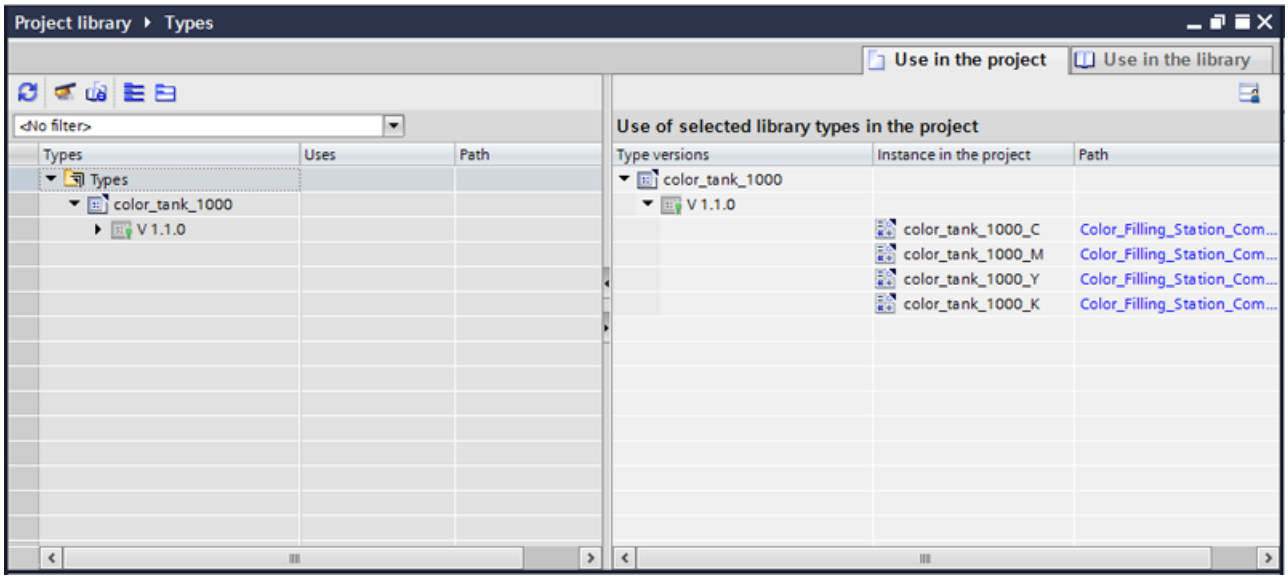
The library management offers the following functions:

- Display of the correlations of types and master copies
  If a type is referenced in other types or master copies, the correlations are displayed in the library management. You will also be able to see which library elements reference a type or a master copy.
- Display of points of use of types in the project
- Display all types that include a version with the "In test" or "In progress" status

Layout of the library management

The figure shows the library management, consisting of the following components:

- Toolbar of the library management
- "Types" area
- "Use" area



Toolbar of the library management

You can perform the following tasks in the toolbar of the library management:

- Update view
  If the project was changed, you can update the view of the library management.
- Clean up library
  You can clean up the project library and global libraries. By cleaning up a library, you delete all types and type versions that are not linked to an instance in the project.
- Harmonize project
  By harmonizing a project, you adapt the names and the path structures of type uses in the project to the corresponding names and path structures of the types within a library.

"Types" area

The "Types" area displays the contents of the folder that you have selected in the library view. You can open or close all types by using the buttons in the toolbar of the "Types" area. You can also use the "Filter" drop-down list to filter the view and display all types with the "In test" or "In progress" status only. For each type, the types that it references are displayed.

"Uses" area

The "Uses" area gives you an overview of the points of use of the selected types and master copies. The "Uses" area is divided into two tabs:

- "Uses in the project" tab
  The "Uses in the project" tab is used to show the instances of type versions and their respective point of use in the project. When you select an instance, you can show the cross references of the instance in the project in the Inspector window.
- "Uses in the library" tab
  The "Uses in the library" tab is used to show all points within the library at which a type or a master copy is used.

Opening library management

Procedure

To open the library management, follow these steps:

1. Open the library view.
2. Select a type or any folder that contains types.
3. Select the "Library management" command from the shortcut menu.

Result

The library management opens and the types are displayed with their versions.

Filtering types in the library management

Introduction

A filter function in the library management enables you to limit the displayed types. The following filters are available:

- Display all types that include a version with "in progress" status
- Display all types that have no instances in the project
- Display all types that have more than one version
- Display all released types

Requirement

At least one type has been created.

Filtering according to all types with pending changes

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Types with pending changes" from the "Filter" drop-down list.
   The "Types" area only displays types that have the "in progress" status.

Filtering for all types that have no instances in the project

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Types not used in the project" from the "Filter" drop-down list.
   The "Types" area only displays types that have no instances in the project.

Filtering for types with multiple versions

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Multiple versions" from the "Filter" drop-down list.
   The "Types" area only displays types that have more than one version.

Filtering for all released types

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Released types" from the "Filter" drop-down list.
   The "Types" area only displays types that have released versions.

Filtering according by types with new versions for upgrading other types

1. Select the "Types" folder in the project library.
2. Select the "Library Management" command in the shortcut menu of the "Types" folder.
   The library management opens.
3. Select "Types with new versions for upgrading other types" from the "Filter" drop-down list.
   In the "Types" area, only types which can be potentially used as a source for the upgrading other types are displayed.

Opening library management (Page 6121)

Creating a faceplate type (Page 5153)

Creating a global library

Introduction

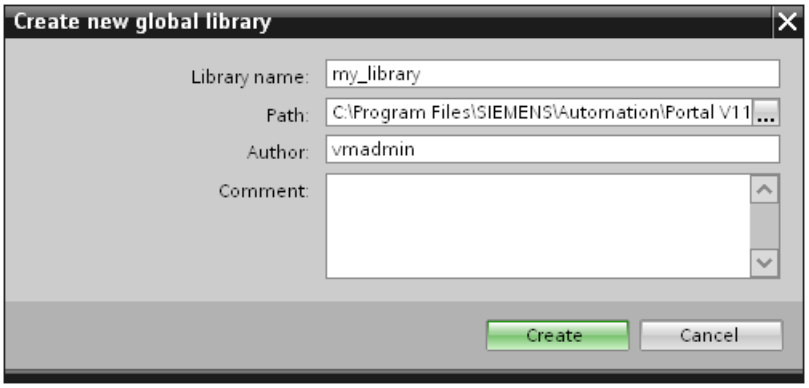
In the libraries you store the configured objects that you want to use several times in your configuration. To use objects in several projects, create a global library.

Requirement

- A project is open.
- The "Libraries" task card is displayed or the "Library view" is open.

Procedure

1. Click the icon under "Global library".
   The "Create new global library" dialog opens.



2. Enter a name.
3. Select the path where the new library is to be stored.
4. Click "Create".

Result

The new library is shown in the "Global libraries" palette. The global library contains the "Types", "Master copies" and "Common data" folders. Under the "Common data" you can find reports for the global library.

A folder with the name of the global library is created in the file system at the storage location of the global library. This actual library file is given the file name extension ".al12".

See also

Basics on libraries (Page 6113)

Saving a global library

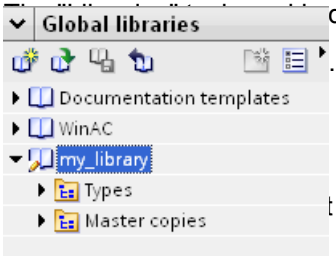
Introduction

A global library is stored in a separate file on your hard disk drive. The file contains the objects of the global library including the referenced objects. E.g. the reference of a tag which was configured on an I/O field is also saved in the library.

WinCC prompts you to save the global libraries when you close WinCC or your project without saving. You also can store the global library during configuration, without storing the entire project.

Requirement

- You have opened a project which contains at least one library.
- displayed or the library view is open.
- .



Procedure

1. you want to save.
2. Click the icon in the "Global library" palette.

You can alternatively select the "Save Library" command in the shortcut menu.

If you want to store the global library in a different folder, select "Save as" in the shortcut menu. Select the path in which you want to store the new library and enter a file name.

Result

The global libraries are saved under their current file name or a file name you have specified.

See also

Basics on libraries (Page 6113)

Opening a global library

Introduction

In WinCC, the global libraries are stored in separate files. You can use a global library in every project.

Requirement

- You have saved a global library.
- A project is open.
- The "Libraries" task card is displayed or the library view is open.

Procedure

1. Click the icon in the "Global library" palette.
   The "Open global library" dialog box is displayed.
2. Select the path in which the library is stored.
3. Click "Open".

Note

To have the access to a global library from multiple projects, open the global library read-only. As soon as a global library is not opened read-only, access from other projects is blocked.

Result

WinCC displays the opened global library in the "Global library" palette.

See also

Basics on libraries (Page 6113)

Displaying logs of global libraries

Logs listing all changes made to the global library are created when global libraries are updated. The logs are stored together with the global library and are always available once you have opened the global library.

Procedure

To open the logs of a global library, follow these steps:

1. Open the global library in the "Libraries" task card or in the library view.
2. Open "Common data > Logs" in the lower-level folder.
3. Double-click the required log.
   The log opens in the work area.

Updating a project with the contents of a library

Introduction

After you have edited several types in the project library, update all instances in the project to the most recent version of the types from the project library.

Requirement

The "Libraries" task card or the library view is open.

Procedure

1. Select the project library.
2. Select "Update > Project" from the shortcut menu. A dialog opens.
3. Select either the entire project or individual devices for the update.
4. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
5. Click "OK" to confirm.

Result

All instances of the types are updated in the project to the most recent version of the selected types in the project library.

You can find a log of the update process in the project tree under "Common data".

Updating a library with the contents of another library

The following options are available for updating libraries:

- Updating a global library with types from another global library
- Updating the project library with types from a global library

Each of the following elements can be selected as source for the update:

- An entire library
- Individual folders within a library
- Individual types

Requirement

To update a global library, open the library with write rights.

Requirement

The "Libraries" task card or the library view is open.

Procedure

To update a library with the contents of a different library, follow these steps:

1. Select the entire library or a folder within the library or individual types.
2. Right-click the source and select the "Update > Library" command from the shortcut menu. The "Update library" dialog box opens.

3. Select the type of library you want to update:
   - Select "Update the project library" to update the project library with types from a global library.
   - Select "Update a global library" if you want to update a global library.
4. Optional: Select the global library you want to update from the drop-down list.
5. Select the "Delete all unused versions of affected types" check box to delete all older versions of the updated types from the project library.
6. Click "OK" to confirm.

Result

- Types not yet available in the target library are supplemented there with all their versions. More recent versions are added to the types that already exist in the target library.
  If a more recent version of a type already exists in the target library, the latest version is nevertheless copied and automatically assigned a newer version number.
- A log listing all performed changes to the target library is created for the update process.
  If you have updated the project library, you can find the log in the project tree under "Common data > Logs".
  If you have updated a global library, you can find the log in the "Common data > Logs" folder in the level below the global library.

12.13.1.6 Managing objects in a library

Displaying library objects

Introduction

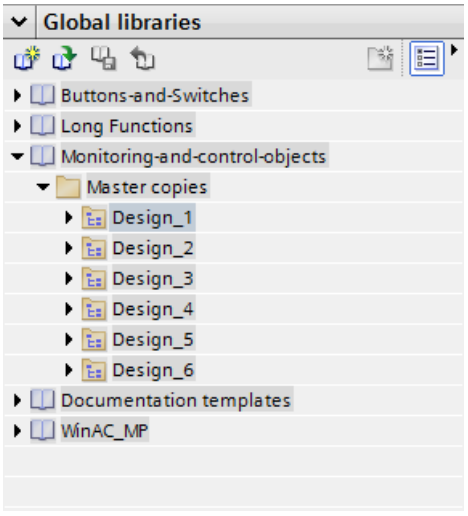
The libraries are displayed as file folders in the corresponding palette. The elements contained in the library are displayed in the file folder and in the "Elements" palette.

Requirement

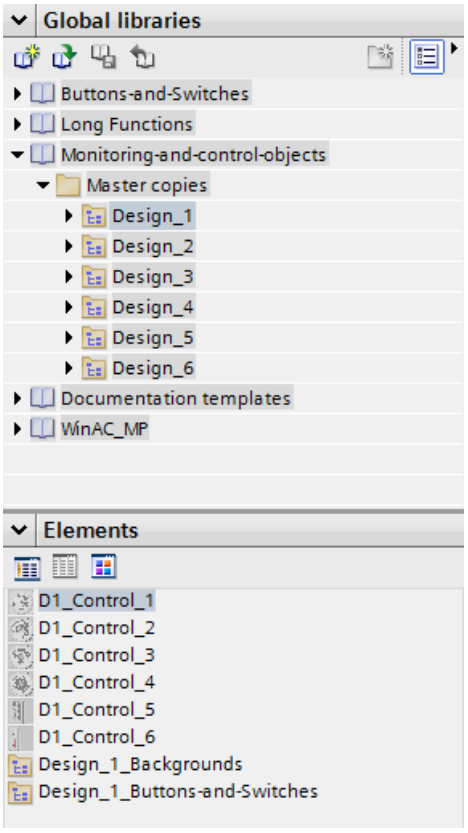
- At least one library object has been created in a library.
- The "Libraries" task card is opened.

Procedure

1. Select the library in the corresponding palette whose library objects you want to display.



2. Click .
The contained library objects are displayed in the "Elements" palette.



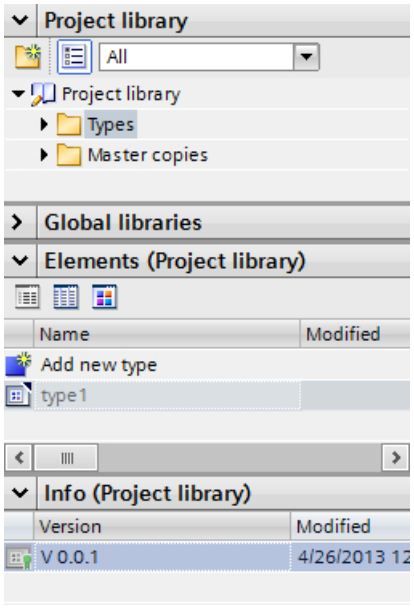
3. Click one of the following icons:

Icon	Description
	Element view in detailed mode
	Element view in list mode
	Element view in overview mode with icons

When several objects are assigned to the library with a multiple selection, only one of the objects is shown in the "Elements" palette. The individual components of this element are displayed in the "Parts" palette.

Show parts of the library objects

1. Select the library in the corresponding palette from which you want to view the components of an element.
2. Click .
3. The contained library objects are displayed in the "Elements" palette.
4. Select the element.
   The "Parts" palette shows the objects of which the element consists.



Result

The library objects are displayed in accordance with the configuration. The components of the faceplates are displayed.

Basics on libraries (Page 6113)

Storing an object in a library

Introduction

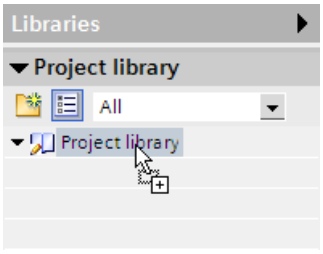
You can store all of WinCC objects, such as screens, tags, graphic objects or alarms in your libraries. You can use drag-and-drop to move the corresponding object from the work area, project window or detail view to the library. In a library you have divided into categories, you can directly add objects to a specific category.

Requirement

- The "Screens" editor is open.
- A screen object has been created in the work area of the screen.
- The created libraries are displayed.

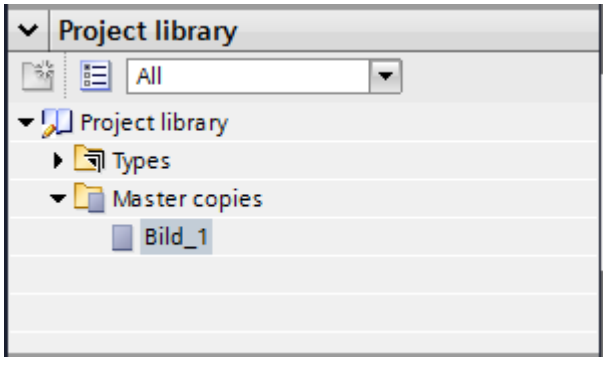
Procedure

1. Select the object in the work area of the "Screens" editor.
2. Drag-and-drop the object from the work area to the desired library.
   The mouse pointer is transformed into a crosshair with an appended object icon.



Result

The object is saved to the library for further use in multiple instances of your configuration.



See also

Basics on libraries (Page 6113)

Inserting a library object

Introduction

The system always assigns the inserted library object a name which consists of the name of the object type and of a consecutive number.

If the inserted object already exists, you have the option of replacing the object or of saving it under a new name.

You cannot insert library objects that are not supported by the HMI device.

Note

If you insert a screen with interconnected template from the library, the template will also be inserted. Any existing matching template is not used.

Requirement

- The "Libraries" task card is opened.
- The editor in which you want to insert the library object is open.

Procedure

1. Select a library object from the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.
   The library object is inserted.

Result

If the object was contained in the "Copy templates" folder, you have inserted an independent copy of the library object in the editor.

If the object was contained in the "Types" folder, you have inserted an instance of the library object in the editor.

See also

Basics on libraries (Page 6113)

12.13.1.7 Using types and their versions

State of type versions

Introduction

Depending on the point of use, the version of a type has different statuses.

Released version

The "released version" status is available for all types, regardless of the point of use.

If you want to edit a released version, you must first create a new test version or an "in progress" version.

Released type versions of scripts and screens can be opened and viewed at their instance.

"In progress" version

The "in progress" status is possible for the following types:

- Faceplates
- User data
- Styles
- Style sheets

When you create a new type or a new version of a released type, the type is assigned the status "in progress".

Types with the "in progress" status can be edited in the library view without the need for a reference to an instance in the project. Upon release, the compatibility of the type is tested by a consistency check.

"In test" version

Only versions of scripts and HMI screens have the "In test" status.

When you create a new version of a type, the type is assigned the status "In test".

A version with "In test" status is linked to an instance in the project. You can set only one version to "In test" for each type at a given time.

A version in testing may only be linked to a single instance in the project. Therefore, it is not possible to copy an instance to the clipboard, to duplicate it or to create an additional type from the instance as long as it has "In test" status.

See also

Generating a script as a type (Page 6134)

Generating a screen as a type (Page 6134)

Creating a faceplate type (Page 5153)

Create a new version of a type (Page 6136)

Master copies and types (Page 6117)

Generating a script as a type

Requirement

- A project is open.
- An HMI device has been created and opened.
- The project tree is open.
- The "Libraries" task card is opened.

Procedure

1. Open the "Scripts" editor in the project tree.
2. Create a new script.
3. Select the script in the project tree.
4. Drag-and-drop the script into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

Result

You have created a type version of a script in the library. The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the script create a new version of the script.

See also

State of type versions (Page 6133)

Generating a screen as a type

Requirement

A project is open.

An HMI device has been created and opened.

The project tree is open.

The "Libraries" task card is opened.

Procedure

1. Open the "Screens" editor in the project tree.
2. Create a new screen.
3. Select the screen in the project tree.
4. Drag-and-drop the screen into a library in the "Libraries" task card. A dialog opens.
5. Enter a name.
6. Enter a comment.

Result

You have created a type of a screen in the library.

The created type is stored as a released version in the library. An instance of the type is used in the project.

To change the screen create a new version of the screen.

See also

State of type versions (Page 6133)

Generating a style as a type

Introduction

To define a new style, add a new type in the project library.

Adding a new style

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library. A dialog opens.
3. Select "HMI style".

Result

The new style is created and displayed under its selected name in the project library. The HMI style type is assigned the status "in progress" and the version 0.0.1.

Creating a style sheet as a type

Introduction

To define a new style sheet, add a new type in the project library.

Adding a new style sheet

1. Open the "Libraries" task card.
2. Select the "Add new type" command under "Types" in the shortcut menu of the project library. A dialog opens.
3. Select "HMI style sheet".
4. Assign a meaningful name to the style sheet.
5. Select the style sheet category from the list.

Result

The new style sheet is created and displayed under its selected name in the project library.

The HMI style sheet type is assigned the status "in progress" and the version 0.0.1.

Create a new version of a type

Principle

If you create a new version of a type, the point of use of the type determines the status of the newly created version.

Requirement

The "Libraries" task card is opened.

A type has been created and released.

Procedure

1. Select the released type.
2. Select "Edit type" in the shortcut menu.

Result for types of faceplates, user data, and styles

A new version of the type is created.

The version has the status "in progress". The library view opens.

Result for types of scripts and screens

A dialog opens.

After you have selected the settings in the dialog, the version is set to the status "In test". The instance used in the project is set to the status "In test". The library view opens.

State of type versions (Page 6133)

12.13.2

12.13.2.1 Importing and exporting project data

Introduction

WinCC gives you the option of exchanging project data between the projects or copying them to external applications.

Exporting and importing between projects

You can export the following project data from a project and import them into another project.

- Recipe data records
- Alarms
- Tags
- Text lists
- Project texts

Exporting and importing reduces the workload. Instead of creating new data records, you use data already created in previous projects.

Editing the export file

The following file formats are available for export and import depending on the editor:

- *.xlsx for alarms, tags, project texts and text lists
- *.csv for recipe data records

You can edit the import file in Excel, for example.

XLSX file format

XLSX format is a file format for Excel tables based on the Open XML format. XLSX files are optimized for Microsoft Excel 2007.

You can sort the columns as required in the XLSX file.

CSV file format

CSV stands for Comma Separated Value. In this format, the columns of the table that contain the names and the value of the entry are separated by semicolons. Each table row terminates with a line break. You can also open the CSV file for editing in Excel.

Importing project data

When project data is imported, the objects in the project are created.

The syntax of the import file is checked during import. The accuracy of the values imported and dependencies between the imported values are not checked.

Any errors found in the imported data are reported when the project is compiled.

Copying in Excel format

In all spreadsheet editors you can copy the content in Excel format into the buffer of your PC. Then you insert the project data in Excel format directly into any application outside the TIA Portal. To this purpose you use the corresponding command in the shortcut menu of the work area:

- If you select the command in the shortcut menu of the line header, the complete line is copied into the buffer.
- If you select the command in the shortcut menu of a cell, only the cell content is copied into the buffer.
- If you select several lines and select the command, all marked data are always copied into the buffer.

This data exchange is only possible as an export.

12.13.2.2

Exporting recipes (Basic Panels, Panels, RT Advanced)

Introduction

WinCC features an export function for exporting data records from recipes.

Requirements

- The WinCC project for the export is open.
- Recipes have been created in a project.
- The "Recipes" editor is open.

Exporting recipes

1. In the "Recipes" editor, select the recipe with the data records you want to export.
2. Click .
   The "Export" dialog box opens.

   The selected recipe is shown under "Recipe selection".
3. Under "Content selection", specify if all or only selected data records are to be exported.
4. Under "File selection", specify the file in which the recipe data is to be stored.
5. Specify the list separator and decimal separator under "Data separation".
6. Click "Export."
   The export will start.

Result

The exported data has been written to a CSV file. The CSV file will be stored in the specified directory.

Importing recipes

Introduction

Recipes are identified by their name. The recipe name must therefore be unique. Open the import file in a simple text editor to check that it has the correct data structure.

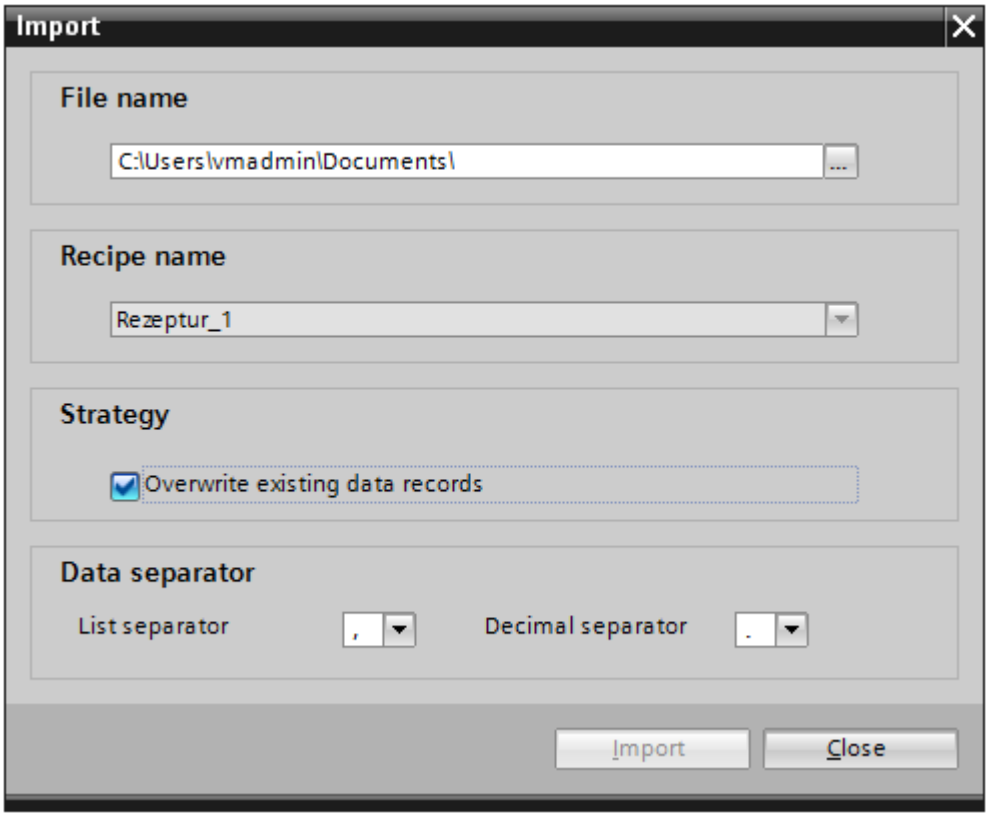
Specify whether or not existing data records should be overwritten by records with the same name during the import.

Requirements

- A CSV file containing at least one recipe has been created.
- The WinCC project for the import is open.
- The "Recipes" editor is open with at least one recipe.

Importing a recipe

1. In the "Recipes" editor, select the recipe with the data records you want to import.
2. Click .
   The "Import" dialog box opens.



The selected recipe is shown under "Recipe selection".

3. Select the file you want to import under "File selection".
4. Under "Strategy", specify if existing data records should be overwritten by records of the same name.
5. Under "Data separation", select the list separator and the decimal separator to use in the CSV file.
6. Click "Import".
   The import will start.

Result

The data records are created in the selected recipe. Depending on the setting for "Strategy", existing data records are overwritten by records with the same name from the CSV file.

Existing data records with the same name will also be imported from the CSV file if you deactivate the "Overwrite existing data records" option.

Format of recipe data

Introduction

This section describes the required format of the file for the import of recipes. The file containing the data of the recipes must be available in "*.csv" format. :

Structure of recipe data

The structure of the import file is fixed. The following example shows the structure of a recipe containing two recipe elements, each with two data records:

```
List separator=<List separator>Decimal symbol=<Decimal
separator><List separator><Line break>
<Name of the recipe><List separator><List separator><Line break>
LANGID_<ID of the language><List separator>
<Display name, recipe element 1><List separator>
<Display name, recipe element 2><Line break>
<Number recipe><List separator>
<Recipe data record number 1><List separator>
<Recipe data record number 2><Line break>
<Tag recipe element 1><List separator>
<Recipe data record 1 value 1><List separator>
<Recipe data record 2 value 1><Line break>
<Tag recipe element 2><List separator>
<Recipe data record 1 value 2><List separator>
<Recipe data record 2 value 2><Line break>
```

ID of the language

Use the "Windows language ID" in decimal notation, e.g. "1033" for English. Additional information is available in the documentation for the Windows operating system.

12.13.2.3 Importing and exporting alarms

Exporting alarms

Introduction

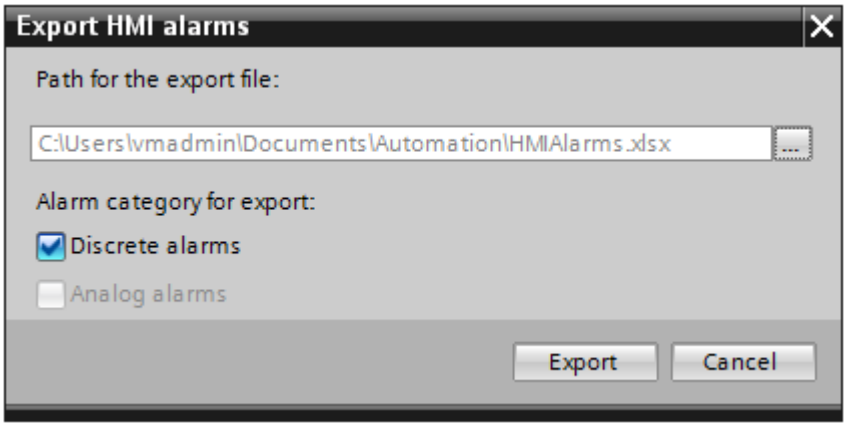
WinCC has an export function for alarms.

Requirements

- The WinCC project for the export is open.
- Alarms have been created in the project.
- The "HMI alarms" editor is open.

Exporting alarms

1. Click the button in "Discrete alarms" or "Analog alarms".
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. Specify whether you want to export "Disrete alarms" or "Analog alarms".
4. Click "Export". The export will start.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

See also

Importing alarms (Page 6143)

Format of the analog alarm data (Page 6144)

Format of the discrete alarm data (Page 6147)

Importing alarms (Basic Panels, Panels, RT Advanced)

Introduction

Alarms are identified by their alarm number. The alarm numbers must be unique in the analog and discrete alarm types. Alarms with redundant alarm numbers will be overwritten. An alarm without an existing alarm number is created.

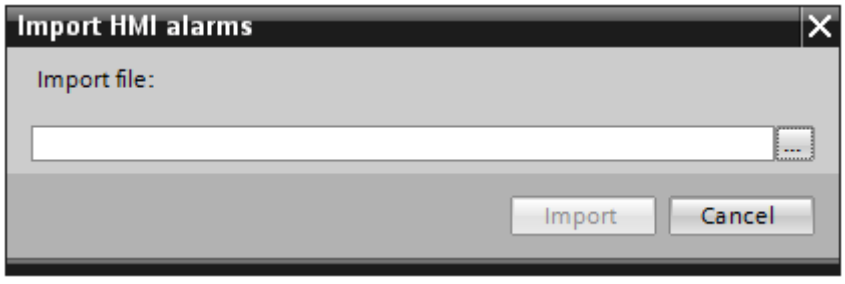
Any empty list entries for existing alarms contained in an xlsx file will be ignored for the purposes of the import. The entries of the existing alarms remain active and will not be replaced by empty ones.

Requirements

- An xlsx file with alarms has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.
- The "HMI alarms" editor is open.

Importing alarms

1. Click the button in "Discrete alarms" or "Analog alarms". The "Import" dialog box opens.



2. Click the "..." button and select the file that you want to import.
3. Click on the "Import" button. The import will start. A progress bar indicates the progress of the import operation.

Result

The corresponding alarms including alarm texts are created in WinCC on the basis of the import data. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example dynamic parameters such as tags. These parameters must be available in all languages to be imported.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign an alarm a trigger tag of the incorrect type, such as String. An error will be reported during compilation.

See also

Exporting alarms (Page 6142)

Format of the discrete alarm data (Page 6147)

Format of the analog alarm data (Basic Panels, Panels, RT Advanced)

Introduction

This chapter describes the required format of the file for the import of analog alarms. The file containing the analog alarm data must be in "*.xlsx" format.

Structure of the alarm data

The import file in Microsoft Excel consists of a number of worksheets:

- Analog alarms(Analog alarms)
- Limits (Limits)

Each alarm is assigned a separate row in the import file. The import file with the analog alarms must be formatted as follows:

Example of the worksheet "Analog alarms"

	A	B	C	D	E
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class
2	1	Analog_alarm_1	AA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz		Errors
3	2	Analog_alarm_2	AA2 Warning-AC this text should be bold		Warnings
4	3	Analog_alarm_3	AA3 SDm-AC this text should be italic		SDm
5	4	Analog_alarm_4	AA4 SDo-AC <u>this text should be underlined</u>		SDo
6	5	Analog_alarm_5	AA5 SystemAcknowledgement-AC <blink>this text should be flashing<		System_Ackn
7	25	Analog_alarm_25	Internal AA23 switchDT: Deadband mode in case of violation - value HL		AADT-Interna
8	26	Analog_alarm_26	Internal AA23 switchDT: Deadband mode in case of violation - percent		AADT-Interna
9	31	Analog_alarm_31	Internal AA23 switchDT: Low limit violation static		AADT-Interna
10	32	Analog_alarm_32	Internal AA23 switchDT: High limit violation static		AADT-Interna
11	33	Analog_alarm_33	Internal AA23 switchDT: Low limit violation dynamic		AADT-Interna
12	34	Analog_alarm_34	Internal AA23 switchDT: High limit violation dynamic		AADT-Interna
13	35	Analog_alarm_35	Internal AA23 switchDT: delay 3 seconds High limit violation		AADT-Interna
14	42	Analog_alarm_40	Internal AA23 switchDT: delay 3 seconds Low limit violation LLV		AADT-Interna
15	23	Analog_alarm_41	AA23 DT in event text: <field ref="0" /> Bool, <field ref="1" /> Byte, <fi	<ref id = 0; type = AlarmTag; T	ACAT
16	24	Analog_alarm_42	AA24 DT in event text: <field ref="0" /> Timer, <field ref="1" /> Counte	<ref id = 0; type = AlarmTag; T	ACAT

Table 12-22 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. Alarm texts must be assigned a language ID for import. An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FeldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag monitored for limit value violation.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.

List entry	Meaning
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

Example of the worksheet "Limits"

	A	B	C	D	E	F	G
1	Alarm ID	Limit type	Limit value	Limit mode	Deadband mo	Deadband valu	Deadband in percent
2	1	Constant	0	Upper limit	Off	0	False
3	2	Constant	1	Upper limit	Off	0	False
4	3	Constant	2	Upper limit	Off	0	False
5	4	Constant	3	Upper limit	Off	0	False
6	5	Constant	4	Upper limit	Off	0	False
7	25	Constant	50	Upper limit	On both	5	False
8	26	Constant	50	Upper limit	On both	10	True
9	31	Constant	50	Lower limit	Off	0	False
10	32	Constant	50	Upper limit	Off	0	False
11	33	Tag	AASDTdyn	Lower limit	Off	0	False
12	34	Tag	AASDT1dyn	Upper limit	Off	0	False
13	35	Constant	50	Upper limit	Off	0	False
14	36	Constant	50	Lower limit	On both	5	False

Table 12-23 Meaning of the entries

List entry	Meaning
Alarm ID	Alarm number The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Limit mode	Trigger mode Indicates the method used for monitoring the limit value.
Limit type	Specifies the limit that will be monitored. Both a tag and a constant can be used as limit value.
Limit value	Limit value Indicates the tag or constant monitored for limit violation.

List entry	Meaning
Deadband mode	Hysteresis mode Specifies whether and in which cases hysteresis will be used. For "Outgoing" For "Incoming" For "Incoming" and "Outgoing"
Deadband in percent	0 = The value specified for "Hysteresis" is considered to be absolute. 1 = The value specified for "Hysteresis" is referred to as a percentage of the limit value.
Deadband mode	Hysteresis Specifies a constant as a value of the hysteresis.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

Exporting alarms (Page 6142)

Format of the discrete alarm data (Page 6147)

Format of the discrete alarm data (Basic Panels, Panels, RT Advanced)

Introduction

This chapter describes the required format of the file for the import of discrete alarms. The file containing the discrete alarm data must be in "*.xlsx" format.

Structure of the alarm data

The import file in Microsoft Excel consists of the worksheets "Discrete alarms" (discrete alarms). Each alarm is assigned a separate row in the import file. Structure of the import file containing the discrete alarms:

Example of the worksheet "Discrete alarms"

	A	B	C	D	E	F
1	ID	Name	Event text [en-US], Alarm text	FieldInfo [Alarm text]	Class	Trigger t
2	1	Discrete_alarm_1	DA1 Error-AC with maximum text length: abcdefghijklmnopqrstuvwxyz äöü\na		Errors	HMI_AC
3	2	Discrete_alarm_2	DA2 Warning-AC this text should be bold		Warnings	HMI_AC
4	3	Discrete_alarm_3	DA3 SDm-AC this text should be italic		SDm	HMI_AC
5	4	Discrete_alarm_4	DA4 SDo-AC <u>this text should be underlined</u>		SDo	HMI_AC
6	5	Discrete_alarm_5	DA5 SystemAcknowledgement-AC <blink>this text should be flashing</blink>		System_Ackn	HMI_AC
7	6	Discrete_alarm_6	DA6 SystemNoAcknowledgement-AC mixed test: Bold, Italic, <l		System_No_A	HMI_AC
8	7	Discrete_alarm_7	DA7 DT in event text: <field ref="0" /> Integer, <field ref="1" /> Real, <field re	<ref id = 0; type = AlarmTag; Tag = Pl	ACAT	HMI_Tri
9	8	Discrete_alarm_8	DA8 DT in event text: <field ref="0" /> S5Time, <field ref="1" /> Timer, <field r	<ref id = 0; type = AlarmTag; Tag = Pl	ACAT	HMI_Tri
10	11	Discrete_alarm_9	DA11 DT in event text: <field ref="0" /> Int, <field ref="1" /> Real, <field ref="2	<ref id = 0; type = AlarmTag; Tag = In	ACAT	HMI_Tri
11	12	Discrete_alarm_10	DA12 DT in event text: <field ref="0" /> UDInt, <field ref="1" /> UInt;	<ref id = 0; type = AlarmTag; Tag = U	ACAT	HMI_Tri
12	13	Discrete_alarm_11	DA13 Textformat: Integer: <field ref="0" /> decimal, <field ref="1" /> binary, <	<ref id = 0; type = AlarmTag; Tag = H	ACAT	HMI_TF

Table 12-24 Meaning of the entries

List entry	Meaning
ID	The alarm number is used to reference an alarm. The alarm number is unique. Alarms with identical alarm numbers are overwritten during import. An alarm without an existing alarm number is created.
Name	Name of the analog alarm
Event text [de-DE], Alarm text	Displays the alarm text. The field designation contains a language ID. For import, a language ID must be assigned to alarm text. An expression with a reference ID will be added to the alarm text if the text has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign dynamic parameters to alarm texts.
FeldInfo	Specifies whether the alarm text contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = AlarmTag; Tag = Tag1; DisplayType = Decimal; Length = 5;> Text list: <ref id = 1; type = CommonTextList; TextList = Textlist1; Tag = tag 2; Length = 5;>
Class	The class of an alarm determines whether or not the alarm must be acknowledged. It can also be used to determine how the alarm appears when it is displayed on the HMI device. The alarm class also determines whether and where the corresponding alarm will be logged.
Group	Indicates the allocation to an alarm group. If an alarm belongs to a group with other alarms, it can be acknowledged together with these alarms of the same group in a single operation.
Trigger tag	Specifies the tag containing the bit that triggers the alarm.
Trigger bit	Specifies the number of the bit that triggers the alarm.
Acknowledge tag	Specifies the tag containing the bit that is set by the operator upon acknowledgment. Only available if the selected alarm class requires alarm acknowledgment.
Acknowledgment bit	Specifies the number of the bit that is set when the operator acknowledges the alarm.
PLC acknowledgement tag	Specifies the tag containing the bit that acknowledges the alarm of the control program. Only available if the selected alarm class requires alarm acknowledgment.

List entry	Meaning
PLC acknowledgment bit	Specifies the number of the bit that acknowledges the alarm of the control program.
Delay time value	Specifies the delay time. The alarm is not triggered until the duration of the limit value violation equals the specified delay time.
Delay time unit	Specifies the time unit for the delay.
Report	Enables reporting of the specific alarm on a printer. True or "1" = Reporting enabled. False or "0" = Reporting disabled. Reporting must also be globally enabled in the project.
Info text [de-DE], Info text	The tooltip is an optional property of an alarm. Tooltips can contain additional information about the alarm. A tooltip will be displayed in a separate window on the HMI device when the operator presses the <HELP> key. The field designation contains a language ID.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing alarm of the same name.

Format of the analog alarm data (Page 6144)

Importing alarms (Page 6143)

12.13.2.4 Importing and exporting tags

Exporting tags

Introduction

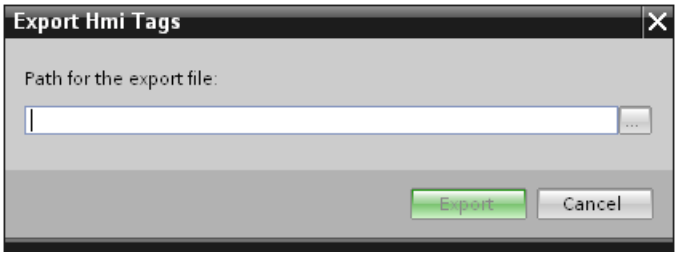
WinCC has an export function for tags.

Requirements

- The WinCC project for the export is open.
- Tags have been created in the project.
- The "HMI tags" editor is open.

Exporting tags

1. Click on the button in the "HMI Tags" tab.
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. Click "Export". The export will start.

Note

The version number of the xlsx file with the exported tags depends on the TIA Portal version. If the xlsx file was exported from a project in WinCC V13 SP1, it has the version number 1.2. If the xlsx file was exported from a project prior to WinCC V13 SP1, it has the version number 1.1.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

See also

Importing tags (WinCC V13 SP1 or higher) (Page 6150)

Format of the tag data (Page 6153)

Importing tags (WinCC V13 SP1 or higher)

Introduction

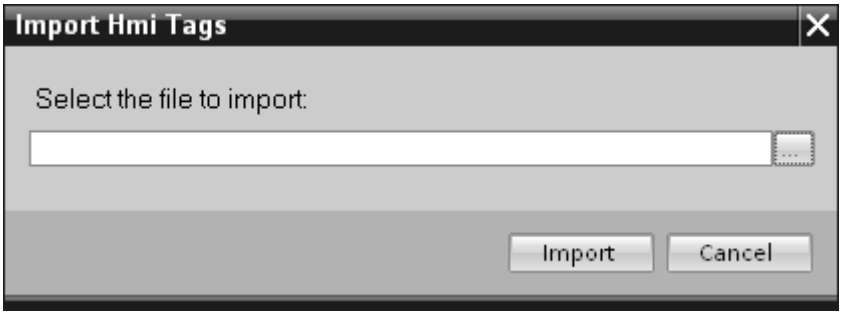
Tags are identified by the tag name. An existing tag is overwritten with the data from the xlsx file if the tag name already exists in the project. A new tag is created if the tag does not yet exist.

Requirements

- An xlsx file with tags has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.

Importing tags

1. Click "HMI tags" in the project navigation.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click the button. The "Import" dialog box opens.



4. Click the "..." button and select the file that you want to import.
5. Click on the "Import" button. The import will start.

Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a tag a trigger tag of the wrong type, for example, string. An error will be reported during compilation.

Exporting tags (Page 6149)

Format of the tag data (Page 6153)

Importing array elements and structure elements

Basics

Array tags and structure tags are always imported in full with all elements. The elements of the array tags and structure tags are not filled further during import.

A new tag is created if the name of the structured data type corresponds to the name of an array element or structure element in the import file.

Example:

The import file contains an array tag called "Otto" with 10 array elements. The array elements are then called Otto[1], Otto[2], for example.

If the import file contains a tag named "Otto[1]", the first element of the array tag will not be filled. Instead, a new tag will be created in the Engineering System.

Importing tags (prior to WinCC V13 SP1)

Introduction

Tags are identified by the tag name. An existing tag is overwritten with the data from the xlsx file if the tag name already exists in the project. A new tag is created if the tag does not yet exist.

The version number of the xlsx file depends on the TIA Portal version. If the xlsx file was exported from a project in WinCC V13 SP1, it has the version number 1.2. If the xlsx file was exported from a project prior to WinCC V13 SP1, it has the version number 1.1.

To import files with the version number 1.2 into a project that was created prior to WinCC V13 SP1, you must prepare the files.

Requirements

- An xlsx file with tags has been created.
- The structure of the xlsx file meets the requirements.
- The WinCC project for the import is open.

Preparing files for the import

1. Open the corresponding file in Microsoft Excel.
2. Select "File > Properties > Advanced properties".
   The "Properties" dialog is opened.
3. Switch to the "Fit to size" task card.
4. Select "TIA_Version" in the "Properties" area.
5. Change the value in the column from "1.2" to "1.1".
6. Click the "Change" button.

7. Click "OK".
8. Delete the right column "Synchronization" in the file.
9. Save the file.

Importing tags

1. Click "HMI tags" in the project navigation.
2. Double-click "Show all tags". The "HMI tags" editor opens.
3. Click the button. The "Import" dialog box opens.
4. Click the "..." button and select the file that you want to import.
5. Click on the "Import" button. The import will start.

Result

The relevant tags have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Note

The syntax of the import file is checked during xlsx file import. The meaning of the properties or dependencies between the properties is not checked. It is possible to assign a tag a trigger tag of the wrong type, for example, string. An error will be reported during compilation.

Format of the tag data (Basic Panels, Panels, RT Advanced)

Introduction

This section describes the format required for the file with tag data used for imports. The tag data file must be in "*.xlsx" format.

Tag data structure

The import file in Microsoft Excel consists of a number of worksheets:

- HMI Tags (HMI tags)
- Multiplexing (multiplex tags)

Each tag is on a separate line in the import file. The import file with the tag data must have the following format:

Example of the worksheet "HMI Tags"

	A	B	C	D	E	F	G	H
1	Name	Path	Connection	PLC tag	DataType	Length	Address	Access Me
2	HMI_Int	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
3	Mux_Tag_1	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
4	Mux_Tag_2	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
5	Mux_11	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
6	Mux_21	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
7	Mux_13	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
8	Mux_12	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
9	Mux_23	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
10	Mux_22	Internal Tags	<No Value>	<No Value>	Int	2	<No Value>	<No Value
11	Mux_Tag_1_Index	Internal Tags	<No Value>	<No Value>	UInt	2	<No Value>	<No Value
12	Mux_Tag_12	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
13	Mux_Tag_11	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
14	Mux_Tag_13	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
15	HMI_UDInt	Internal Tags	<No Value>	<No Value>	UDInt	4	<No Value>	<No Value
16	Gauge_Process	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Value
17	Button_Tag_4	Default tag table	<No Value>	<No Value>	Int	2	<No Value>	<No Value
18	HMI_USInt	Internal Tags	<No Value>	<No Value>	USInt	1	<No Value>	<No Value
19	Data_block_2_PLC_DateTime_2	Default tag table	HMI_connection_1	Data_block_2.PLC_I	Date_And_Time	8	%DB28.DBX598.(	<absolute

Table 12-25 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag.
Path	Specifies which folders in the project tree contain the tag. The folder structure is represented by "\" : "FolderName1\FolderName2\TagName".
PLC Tag	Indicates whether the tag is linked to a PLC tag.
Connection	Indicates the name of the connection to the PLC.
Data type	Specifies the data type of a tag. The data types allowed depend on the communication driver being used. See the "Communication" section of the documentation for additional information on the data types permitted for the various communication drivers.
Length	Specifies the length of the tag. This entry is only useful for data types with a dynamic length such as strings; it is left empty for all other data types.

List entry	Meaning
Address	Specifies the tag address in the PLC. The tag address must exactly match the one used in WinCC, for example, "%DB1.DBW0". The tag address is empty for internal tags.
Multiplexing	Specifies whether multiplexing is used.
Index tag	Shows the name of the index tag for multiplexing. In Runtime, the system first reads the value of the index tag. It then accesses the tag in the corresponding place in the tag list.
StartValue	Specifies the start value of a tag.
ID tag	The update ID updates the value of a tag with the aid of a function or a PLC job. The update ID must be unique within an HMI device.
Coding	Shows the coding method.
DiplayName [de_DE]	Shows the display name of an HMI tag. The field designation contains a language ID. The field designation contains a language ID. Display names must be assigned a language ID for import. Texts are imported to the corresponding project language.
Acquisition mode	Specifies the tag acquisition mode.
Acquisition cycle	Specifies the tag acquisition cycle. The acquisition cycle must correspond exactly to the one used in WinCC. The value is not language-dependent and should therefore be the same in every language. The default value is "1 s". The acquisition cycle is undefined if the tag acquisition mode is "on demand". User-defined acquisition cycles must be created beforehand as the file will otherwise not be imported.
High High Limit type	Indicates whether the limit value "High high" is monitored by a constant, a tag or not at all.
High High Limit	Displays the limit value "High High".
High Limit type	Indicates whether the limit value "High" is monitored by a constant, a tag or not at all.
High Limit	Displays the limit value "High".
Low Limit type	Indicates whether the limit value "Low" is monitored by a constant, a tag or not at all.
Low Limit	Displays the limit value "Low".
Low Low Limit type	Indicates whether the limit value "Low Low" is monitored by a constant, a tag or not at all.
Low Low Limit	Displays the limit value "Low Low".
Linear scaling	Indicates whether linear scaling is enabled. This entry can only be used for external tags.
End value PLC	Specifies the end value of the PLC tag.
Start value PLC	Specifies the start value of the PLC tag.
End value HMI	Specifies the end value of the HMI tag.
Start value HMI	Specifies the start value of the HMI tag.

Example of the worksheet "Multiplexing"

	A	B	C
1	HMI Tag name	Multiplex Tag	Index
2	Mux_Tag_1	Mux_11	0
3	Mux_Tag_1	Mux_12	1
4	Mux_Tag_1	Mux_13	2
5	Mux_Tag_2	Mux_21	0
6	Mux_Tag_2	Mux_22	1
7	Mux_Tag_2	Mux_23	2
8	Mux_Tag_12	HMI_Array_Mux2	-1
9	Mux_Tag_11	HMI_Array_Mux1	-1
10	Mux_Tag_13	HMI_Array_Mux3	-1

Table 12-26 Meaning of the entries

List entry	Meaning
Name	Indicates the configured name of an HMI tag which uses indirect addressing. The HMI tag must be available in the "HMI Tags" worksheet.
Index	Shows the value which governs which tag is selected.
Multiplex Tag	Displays the tag from the tag list corresponding to the index value.

Note

"No value" in the table

Entries in the table which have the value "No value" delete the corresponding values in an existing tag of the same name.

Importing tags (WinCC V13 SP1 or higher) (Page 6150)

12.13.2.5 Importing and exporting text lists

Exporting text lists

Introduction

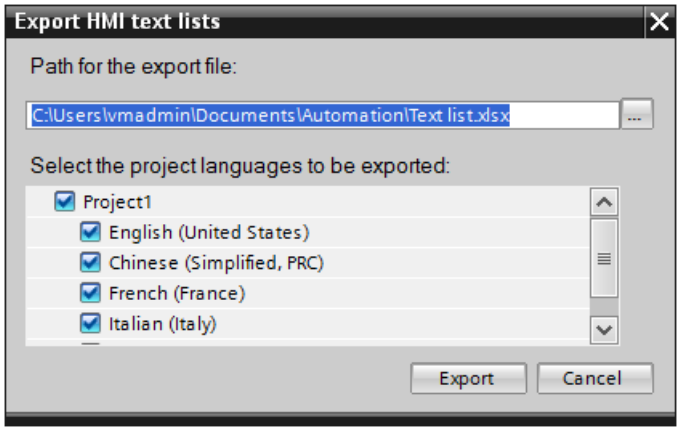
WinCC has an export function for text lists.

Requirements

- The WinCC project for the export is open.
- Text lists have been created in the project.
- The "Text & graphics lists" editor is open.

Exporting text lists

1. Click on the button in the "TextLists" tab.
   The "Export" dialog box opens.



2. Click the "..." button and specify in which file the data are saved.
3. By default, texts are exported in all defined project languages.
   If you do not want to export specific languages, disable the unnecessary languages in the dialog.
4. Click "Export". The export will start.

Result

The exported data has been written to an xlsx file. The xlsx file will be stored in the specified folder.

Importing text lists

Introduction

You then import text lists from an xlsx file to WinCC.

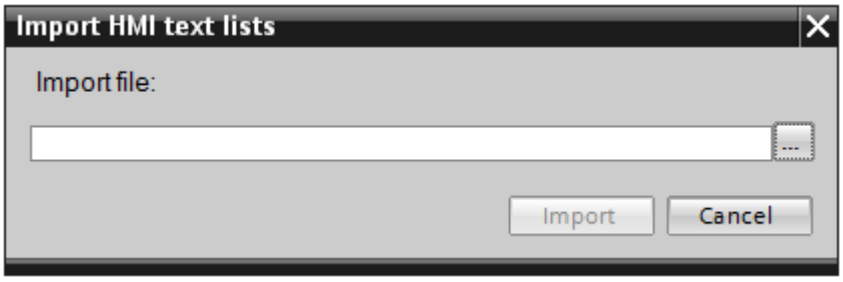
Requirements

- An xlsx file with text lists has been created.
- The structure of the xlsx file meets the requirements.

- The WinCC project for the import is open.
- The "Text & graphics lists" editor is open.

Importing text lists

1. Click on the button in the "Text lists" tab.
   The "Import" dialog box opens.



2. Select the file you want to import under "File selection".
3. Click on the "Import" button. The import will start.

Result

You have now imported the text lists. The relevant text lists have been created in WinCC. Alarms relating to the import operation are displayed in the output window. A log file is saved in the source directory of the import files. The log file has the same name as the respective import file but with the "*.xml" extension.

Check when importing the data whether there are any links to objects, for example, dynamic parameters such as tags.

- If an object with the same name already exists, the existing object is used.
- If no object of the same name yet exists, create an object with the relevant name or create a new link.

Format of text list data

Introduction

This section describes the format required for the file with the text lists used for imports. The text list data file must be in "*.xlsx" format.

Tag data structure

The import file in Microsoft Excel consists of two worksheets:

- TextList (Text lists)
- TextListEntry (Text list entry)

Each text list is assigned a separate line in the import file. The import file containing the data must be structured as follows:

Example of the worksheet "TextList"

	A	B	C
1	Name	ListRange	Comment
2	TLValue/Range	Decimal	
3	TLBit	Bit	
4	TLBitnumber	Binary	
5	TLall_1	Decimal	
6	TLall_2	Decimal	

Table 12-27 Meaning of the entries

List entry	Meaning
Name	Shows the name of the text list.
ListRange	Shows the text list range: Number = Bit number (0-31) Range = value/range (...-...) Bit = Bit (0;1)
Comment	Any comments on the text list. You can use up to 500 characters

Example of the worksheet "TextListEntry"

	A	B	C	D	E	F
1	Name	Parent	DefaultEntry	Value	Text	FieldInfos
2	Text_list_entry_1	TLValue/Range	TRUE	0 - 1	Default entry TLValue/Range ->	
3	Text_list_entry_2	TLValue/Range		2 - 3	TLValue/Range = 2-3 ->	
4	Text_list_entry_3	TLValue/Range		1	TLValue Range - single value = 1 ->	
5	Text_list_entry_1	TLBit		0	TLBit = 0 ->	
6	Text_list_entry_2	TLBit		1	TLBit = 1 ->	
7	Text_list_entry_1	TLBitnumber	TRUE	0	Default entry TLBitnumber; ->	
8	Text_list_entry_2	TLBitnumber		0	TLBitnumber - Bitnumber 0 is set ->	
9	Text_list_entry_3	TLBitnumber		1	TLBitnumber - Bitnumber 1 is set ->	
10	Text_list_entry_4	TLBitnumber		2	TLBitnumber - Bitnumber 2 is set ->	
11	Text_list_entry_5	TLBitnumber		3	TLBitnumber - Bitnumber 3 is set ->	
12	Text_list_entry_1	TL1	TRUE	0 - 1	Default entry TL1	
13	Text_list_entry_2	TL1		1 - 3	TL1 Value between 1 - 3 ->	
14	Text_list_entry_3	TL1		4 - 6	TL1 Value between 4 - 6 ->	
15	Text_list_entry_4	TL1		7	TL1 Single value = 7 ->	
16	Text_list_entry_1	TL2	TRUE	0 - 1	<field ref="0" /> ->	<ref id = 0; type = CommonTextList; TextList = TL1; Tag = HMI_TL1control; Lengt
17	Text_list_entry_2	TL2		1	TL2 Single value = 1 ->	
18	Text_list_entry_3	TL2		2 - 3	TL2 Range between 2 - 3 ->	
19	Text_list_entry_1	TLMultilined	TRUE	0 - 1	Default entry TLMultilined; last row	
20	Text_list_entry_2	TLMultilined		0 - 3	TLMultilined Value between 0-3\nwith test of"\n"	
21	Text_list_entry_1	TLall_1	TRUE	0 - 1	Default entry TLall_1	
22	Text_list_entry_1	TLall_2	TRUE	0 - 1	Default entry TLall_2	

Table 12-28 Meaning of the entries

List entry	Meaning
Name	Shows the name of the text list entry.
Parent	Specifies the name of the corresponding text list.
DefaultEntry	Indicates whether the text list entry is a default entry. The default entry is always displayed when the tag has an undefined value.
Value	Specifies the tag integer values or value ranges which are assigned to the text entries in the text list.
Text	Shows the text list entry. The field designation contains a language ID. Text list entries must be assigned a language ID for import. An expression with a reference ID will be added to the text if the text list entry has a dynamic parameter. Example: text <field ref="0" />. Use the ID to assign the dynamic parameter to a text list entry.
FeldInfo	Specifies whether the text list contains dynamic parameters. The settings are separated by a semicolon ";". Example of dynamic parameters: Tag: <ref id = 0; type = CommonTagDisplayFormat; Tag = tag 1; DisplayType = Decimal; DisplayFormat = 9;> Text list: <ref id = 1; type = CommonTextList; TextList = Textliste_1; Tag = tag 2; Length = 5;> PLC tag: <ref id = 0; type = CommonControlTagDisplayFormat; DisplayType = Decimal; DisplayFormat = 9;>

12.13.2.6 Import and export of project texts

Importing project texts

Edit the xlsx file or send it to a translator. Import the texts once they have been translated. The foreign languages will be imported to the relevant object in the project.

Note

In WinCC, you only import the previously exported project texts into the same project. Importing into a different project is not supported.

Requirements

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Importing project texts

To import a project text file, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.

3. Click on the button. The "Import" dialog opens.
4. Select the path and file name of the import file from the "Import file" field.
5. Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
6. Click on "Import".

Result

You have imported the project texts.

Exporting project texts

Project texts are exported for translation. Texts are exported to Office Open XML files ending in ".xlsx". These files can be edited in Microsoft Excel, for example.

You can exchange the file with the translators and import it back to the project as soon as it has been translated.

Requirements

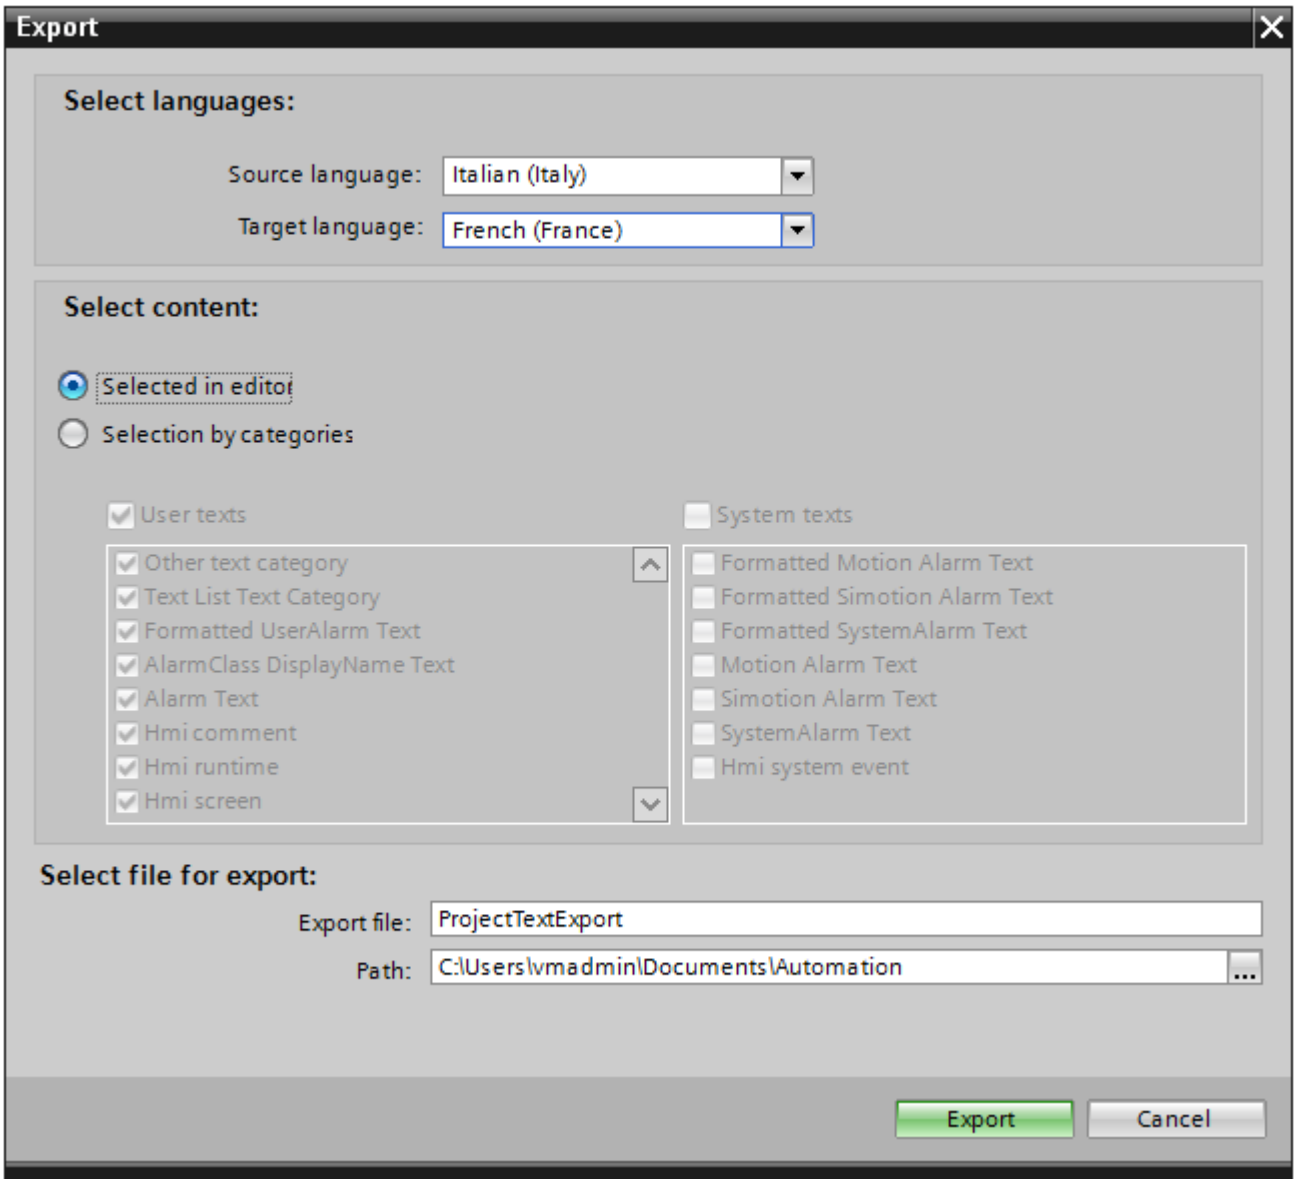
- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Exporting project texts

To export individual project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The child elements are displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Select the texts you want to export.

4. Click on the button. The "Export" dialog opens.



5. From the "Source language" drop-down list, select the language from which you wish to translate, for example Italian.
6. From the "Target language" drop-down list, select the language into which the texts are to be translated, for example, French.
7. Enter a file path and a file name for the export file in the "Export file" input field.
8. Click "Export".

Result

The texts selected in the "Project texts" editor are written to an xlsx file. The xlsx file will be stored in the specified folder.

You can alternatively select and export all project texts from categories. Select "User texts" or "System texts" in the "Export" dialog in line with the type of texts you wish to export. In this case, export can additionally be limited by categories.

Note

Project texts in library objects cannot be exported.

12.13.3 Using cross-references

12.13.3.1 General information about cross references

Introduction

The cross-reference list provides an overview of the use of objects and devices within the project and project library. The cross-reference list can be used to show the relationships and the dependencies of objects among themselves.

Uses of cross-reference list

The cross-reference list offers you the following advantages:

- When creating and changing a program, you retain an overview of the devices, objects, tags, alarms, scripts, etc. that you have used.
- From the cross-references, you can jump directly to the object location of use.
- You can see whether the object uses other objects or is used by itself.
- You can learn the following when debugging:
  - Which objects are used in which screen and on which devices.
  - The alarms and recipes shown in a specific display.
  - The tags used in a specific alarm or object.
- As part of the project documentation, the cross-references provide a comprehensive overview of all object, alarms, recipes, tags and screens.

For additional information on working with cross-reference lists, please refer to "Displaying cross-reference lists".

12.13.3.2 Special features when working with cross-reference lists in WinCC (Panels, RT Advanced, RT Professional)

Working with cross-references in WinCC

In WinCC, there are a number of special features that you must take into account when working with cross-references.

For additional information on working with cross-reference lists, please refer to "Displaying cross-reference lists".

"Change cross-reference" dialog

You can change the references of tags in the properties of screen objects using the "Change object references" dialog.

Using textual cross-references when working with VB scripts

When working with VB scripts, you can reference tags directly with the help of textual cross-references without having to access the SmartTags list.

Adding a new object to the cross-reference list

The auto-complete function only offers HMI tags for selection. Array elements of an HMI tag are not displayed in auto-complete. You can only add array elements by entering the name of an array element.

Displaying cross-references in the Inspector window

If you select an object in the screen and an HMI tag is being used as the process tag at the object, the object and the linked HMI tag are displayed in the cross-references. All locations of use of the object and the HMI tags are also listed.

If the HMI tag is interconnected with a PLC tag or a DB tag, the locations of use of the interconnected PLC tag or DB tag are displayed.

Shortcut menu in the cross-reference list

The shortcut menu is object-oriented. The shortcut menu is available for each row when the "Object" column actually contains an object.

12.13.3.3 Rewiring tags in the screens

Introduction

You can change the references of tags in the properties of screen objects using the "Change object references" dialog.

This function lets you to replace a large number of tags in various screen objects. Replacing references is useful, for example, if you have created a screen by copying and pasting and need to adapt its references.

You search for and replace individual or multiple characters in the tag names.

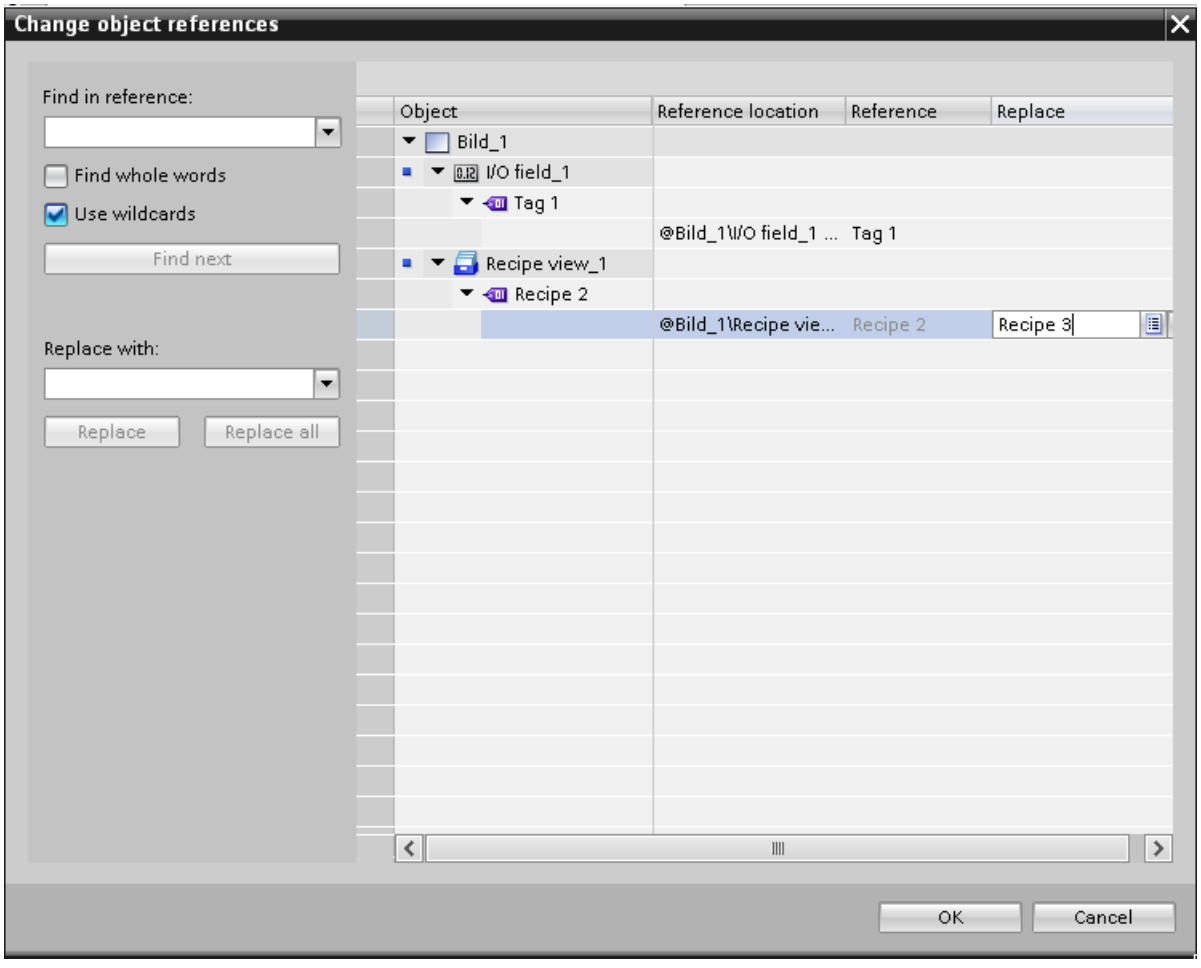
You can open the "Change object references" dialog with the command in the shortcut menu. You can open the dialog for one or more screen objects or a screen.

The "Change object references" dialog is available for the following screens.

- Overview screen (permanent area)
- Templates
- Pop-up screens
- Slide-in screens
- Global screen

How to replace a tag

1. Select an object in the screen that contains a tag that you want to change.
2. Select the "Change object references" command in the shortcut menu or in the "Edit" menu. The "Change object references" dialog opens. You can see the selected screen objects and the tags used in the "Object" column.



3. Enter the name or part of the name you want to find in the "Find in reference" input box.

4. Start the search with the "Find next" button. If a reference is found, it is highlighted in the "Reference" column.
   Another click on the "Find next" button continues the search process until the list has been completely searched.
   After this, the search process starts again from the top of the list.
5. Enter the name or part of the name you want to replace for the found name in the "Replace with" input box.
6. Click the "Replace" button to replace the selected tag.
   All references found are replaced by clicking the "Replace all" button. In this way, you can replace a large number of references with another
   reference.
7. To select a tag from the list of all tags created in the project, click on the button in the "Replace" column.
8. To select a tag from the object list or to create a new tag, click on the button in the "Replace" column.
9. Confirm your entry with "OK".

The rewiring of the tags is applied in the project.

Alternatively, you can enter a tag to replace the existing tag directly in the "Replace" column. You are supported by the auto-complete function in this process.

Note

When you search for a tag in the "Replace" column, you are supported by the auto-completion. After entering the first letter of the tag name in the "Replace", the auto-completion list contains the tags whose names contain the letters. Depending on the context, the auto-completion list only contains the tags that are permitted for the intended purpose.

Note

The tags shown in the column are displayed as read-only if the reference object is read-only, for example, a tag in a screen that has been stored in the library.

Note

It is possible to manually create a tag that does not yet exist. You create this tag at a later time.

Additional options for searching

You can narrow down your search by enabling the following options:

- Use wildcards
  Enter * for any number of characters. Example: You want to search for all tags starting with "HMI". Enter "HMI*" in the search key box.
  Enter ? for an individual character.
- Find whole words
  To search only for full names, enable the "Find whole words" option.

Replacing arrays and user-defined tags

Tags with names containing the special characters . [ ] are shown in quotation marks.

Array type tags and tags of user-defined data types (UDT) contain special characters to separate tags from their elements. However, they are not shown in quotation marks. To replace an array or a UDT with an HMI tag with special characters, enter the name of the HMI tag in quotation marks in the "Replace" input box. If you type the name without quotation marks, a reference to a non-existent array or UDT is created instead of a reference to the desired HMI tag with special characters.

Correcting entries

If an incorrect entry is made in the "Replace with" input box, the existing references can be replaced by references to non-existent tags.

If you detect an incorrect entry before confirming with "OK", you can correct the error. To do this, select the "Replace" column and press the "Remove" button. Any incorrect entries in the "Reference" column are deleted.

If you confirm the dialog with "OK", the affected properties of the screen objects are marked in red. Non-existent tags are highlighted in red in the "Change cross references" dialog.

If the new tag does not yet exist, you must subsequently create the tag.

12.13.3.4 Textual cross-references (Panels, RT Advanced, RT Professional)

Introduction

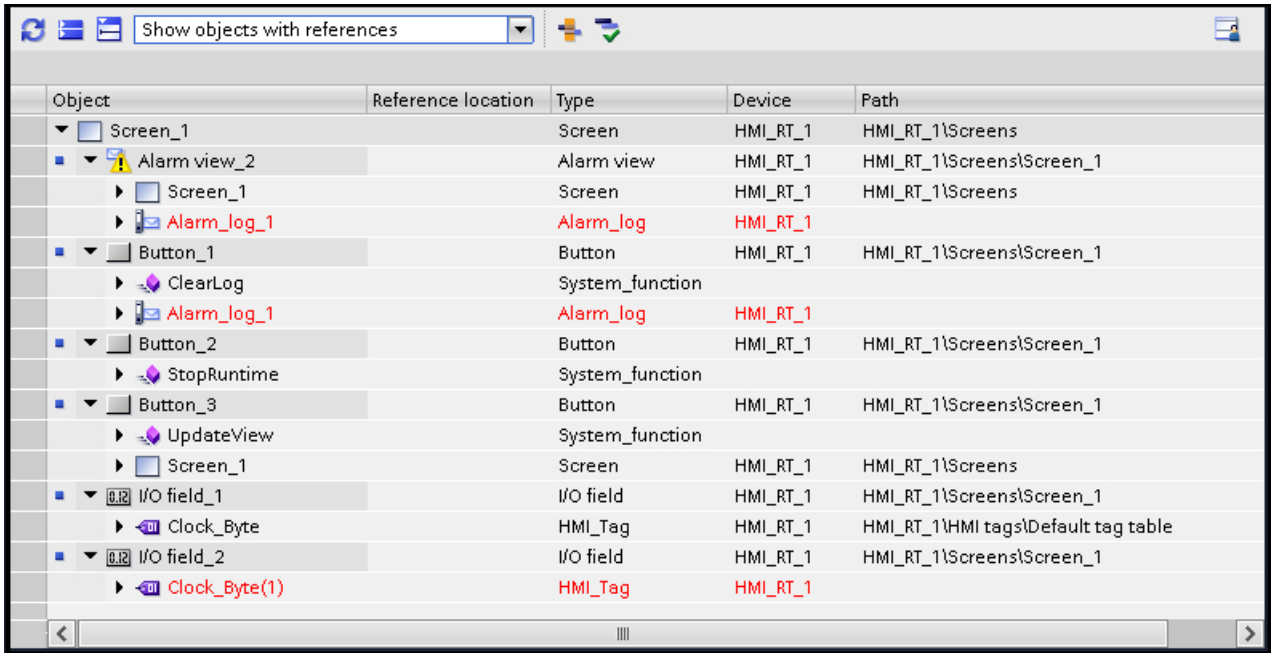
Textual cross-references are cross-references that are stored as pure text. You cannot navigate to a different object with the help of textual cross-references. Such cross-references are displayed in red in the cross-reference list.

Textual cross-references are created as follows:

- You create a textual cross-reference for a non-existent object manually by entering the object name under Property.
- The object used has already been deleted, and the connection to it is shown as textual cross-reference.

Basics

When references and subordinate objects of a source object are deleted, they are converted into textual cross-references. A textual cross-reference is not stored when the source object itself is deleted.



Note

Almost all objects, with the exception of data logs, support textual cross-references.

Note

Textual cross-references cannot be deleted.

You can also create a textual cross-reference manually to establish a connection to a non-existent object. This procedure can be helpful if you want to access tags directly in VB scripts without SmartTags.

Note

Textual cross-references for tags in RT Professional

If no user data type (UDT) is assigned to a screen or the tags are referenced as user data type element with @NOP, @NOTP, @NOSP, textual cross-references appear for the tags.

Using textual cross-references when working with VB scripts

When working with VB scripts, you can reference tags directly with the help of textual cross-references without having to access the SmartTags list.

When you enter an object name, the script parser looks for the referenced object.

For example: `DIM x`

```
x = MyObject
```

A reference is made to any VB script or tag that already exists under this name. If a VB script and a tag exist under this name, the script parser establishes the reference to the VB script.

If neither a tag nor a VB script exists under this name, the system creates two textual cross-references: one for the tag and one for the VB script.

The first object that is created under this name (a tag or a VB script) is assigned one of the two textual cross-references. The textual cross-reference turns into an actual cross-reference. The second textual cross-reference is deleted.

Note

In RT Professional, only one textual cross-reference is created for the VB script, because direct addressing of tags is not possible in this context.

12.13.3.5 Invalid cross-references (Panels, RT Advanced, RT Professional)

Introduction

A cross-reference can become invalid as a result of certain changes to the configuration. Invalid cross-references are shown grayed out in the cross-reference list and in the Inspector window. A question mark is displayed beside the cross-reference text. Clicking on the question mark opens the online help.

Invalid cross-references do not have any negative implications for your project.

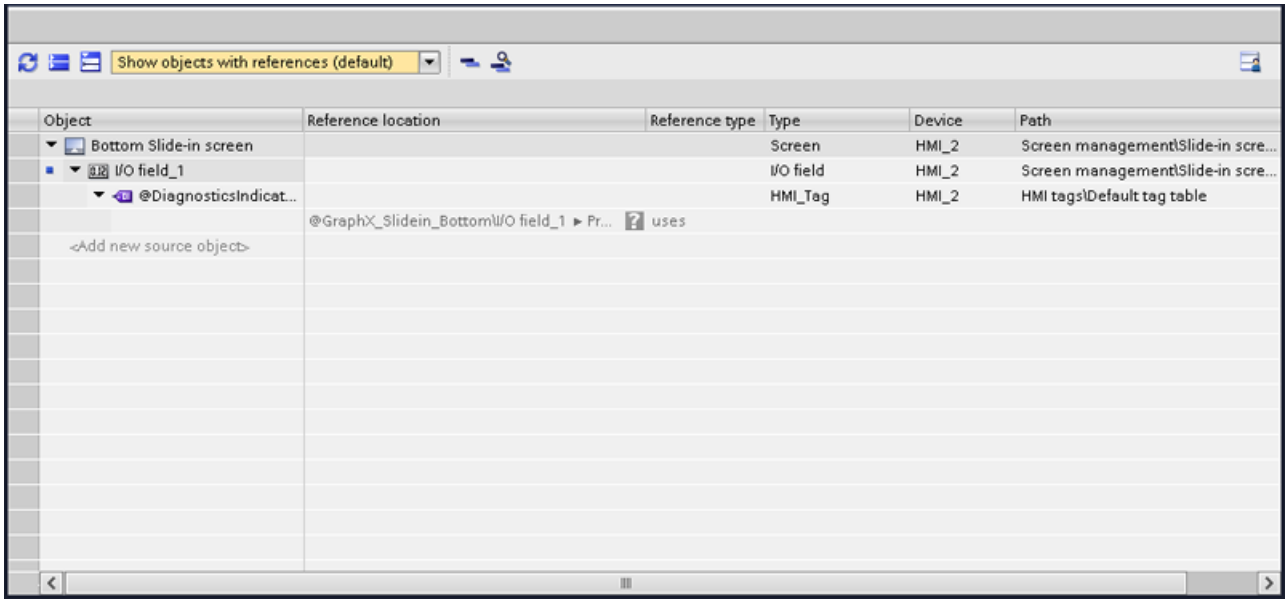
Basics

A cross-reference can become invalid for the following reasons:

- A change of device type
- Copying a cross-reference from another HMI device to an HMI device that does not support the object in question or object property.
- A change to an object property or the assignment of invalid values

The following objects can be invalid in the cross-reference list:

- Source and target object
- Subordinate objects and their higher-level objects
- Location of use



If an object or location of use is invalid, you cannot navigate to that object or location of use. You cannot change the properties of an invalid location of use. For invalid objects, you can access the commands "Delete" and "Properties" over the shortcut menu. No other shortcut menu commands are available. No shortcut menu is available for invalid locations of use.

Note

Textual cross-reference invalid

An object can be an invalid object and a textual cross-reference in the cross-reference list at the same time. In such a case, the invalid cross-reference is shown in red like a textual cross-reference.

Examples

Source object invalid

You have created a screen for a Comfort Panel and added a VB scripts reference to the function list. You change the device type from "SIMATIC Comfort Panel" to "SIMATIC Basic Panel". As VB scripts are not available for Basic Panels, the cross-reference for the VB script is invalid.

Target object invalid

For a Comfort Panel, you have created a screen that has a cross-reference to the audit trail log with the system function "ClearLog". You copy this screen to Runtime Professional. As the audit trail log is not available for Runtime Professional, the cross-reference is invalid.

Property that links the source object to the target object is invalid

In Runtime Professional, you have created an entry in the graphics list that has a cross-reference to the "Flashing" property. You copy this graphics list to a Comfort Panel. As this property is not available on Control Panels, the cross-reference from the graphics list to the "Flashing" propery is invalid.

Property invalid if source object invalid

For a Comfort Panel, you have saved a slide-in screen that has a cross-reference to a tag over an I/O field. You change the device type from "SIMATIC Comfort Panel" to "SIMATIC Basic Panel". As the slide-in screen is not available on Basic Panels, the cross-reference is invalid.

Textual cross-reference invalid

You have created a tag for a Comfort Panel and linked the VB function "SetTag" to that tag. You have also created a screen that is connected to the "SetTag" VB function over the "Established" event. You delete the VB function. A textual cross-reference is created for the deleted VB function. You change the device type from "SIMATIC Comfort Panel" to "SIMATIC Basic Panel". As VB scripts are not available for Basic Panels, the textual cross-reference for the VB script is invalid. The invalid cross-reference is shown in red.

12.13.4 Managing languages

12.13.4.1 Languages in WinCC

User interface language and project languages

A distinction is drawn between two different language levels in WinCC:

- User interface language
  During configuration, the text in the WinCC menus and dialogs is displayed in the user interface language. The user interface language also affects the labeling of operating elements, the parameters of the system functions, the online help, etc.
- Project languages
  Project languages are all languages in which a project will later be used. Project languages are used to create a project in multiple languages.

The two language levels are completely independent of one another. For example, you can create English projects at any time using a German user interface and vice versa.

Project languages

The following languages are differentiated within the project languages:

- Reference language
  The reference language is the language that you use to configure the project initially. During configuration, you select one of the project languages as the reference language. You use the reference language as a template for translations. All of the texts for the project are first created in the reference language and then translated. While you are translating the texts, you can have them displayed simultaneously in the reference language.
- Editing language
  You produce translations of the texts in the editing language.
  Once you have created your project in the reference language, you can translate the texts into the remaining project languages. Select a project language respectively as an edit language and edit the texts for the appropriate language variant. You can change the editing language at any time.

  Note

  When switching the project languages, the assignment to the keys on the keyboard also changes. For some languages (for example, Spanish), the operating system does not allow you to switch to the corresponding keyboard assignment. In this case, the keyboard assignment is switched to English.

- Runtime languages
  Runtime languages are those project languages that are transferred to the HMI device. You decide which project languages to transfer to the HMI device depending on your project requirements.
  You must provide appropriate controls so that the operator can switch between languages in runtime.

See also

Language settings in the operating system (Page 6172)

Operating system settings for Asian languages (Page 6173)

12.13.4.2 Language settings in the operating system

Introduction

The configuration PC operating system settings influence WinCC language management in the following areas:

- Selection of project languages
- Regional format of dates, times, currency, and numbers
- Displaying ASCII characters

Project language selection

A language is not available as a project language unless it is installed in the operating system.

Regional format of dates, times, currency, and numbers

WinCC specifies a fixed date and time format in the Date - Time field for the selected project language and runtime language.

In order for dates, times, and numbers to be presented correctly in the selected editing language, this language must be set in the Regional Options in the Control Panel.

Displaying ASCII characters

With text output fields, the display of ASCII characters as of 128 depends on the set language and the operating system being used.

If the same special characters are to be displayed on different PCs, the PCs must use the same operating system and regional settings.

See also

Languages in WinCC (Page 6171)

Operating system settings for Asian languages (Page 6173)

12.13.4.3 Operating system settings for Asian languages

Settings on Western operating systems

If you want to enter Asian characters, you must activate the support for this language in the operating system.

The Input Method Editor (IME) is available in Windows for configuring Asian texts. Without this editor, you can display Asian text but not edit it. For more information on the Input Method Editor, refer to the documentation for Windows. To enter Asian characters when configuring, switch to the Asian entry method in the "Input Method Editor".

Switch the operating system to the appropriate language to have language-specific project texts, such as alarm texts, displayed in the simulator in Asian characters.

Settings on Asian operating systems

If you are configuring on an Asian operating system, you must switch to the English default input language to enter ASCII characters, for example, for object names. As the English default input language is included in the basic installation of the operating system, you do not need to install an additional input locale.

Enable language support

1. Open the system controller.
2. Select "Regional and Language Options".
3. On the "Languages" tab, activate the check box "Install files for East Asian languages".
4. Then click on "Details" under "Text Services and Input Languages". The dialog "Text Services and Input Languages" is opened.
5. On the "Settings" tab add the required default input language under the "Installed Services".
6. Select the language of the operating system in the "Language for non-Unicode programs" area in the "Advanced" tab.

See also

Languages in WinCC (Page 6171)

Language settings in the operating system (Page 6172)

12.13.4.4 Setting project languages

Selecting the user interface language

Introduction

The user interface language is used for displaying menu entries, title bars, infotexts, dialog texts and other designations in the WinCC user interface.

You can switch between the installed user interface languages during configuration. The labeling of the operating elements remains in the language you set when you added the object even if you change the user interface language.

Procedure

1. Select "Options > Settings" in the menu.
   The "Settings" dialog box is opened.
2. Select the desired user interface language under "General > General settings".

Result

WinCC will use the selected language as user interface language.

See also

Enable project languages (Page 6175)

Selecting the reference language and editing language (Page 6175)

Languages in WinCC (Page 6171)

Enable project languages

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language.

Enable project languages

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project languages".
   The possible project languages will be displayed in the working area.
3. Enable the relevant project languages.

Note

Copying multilingual objects

The copies of multilingual objects to a different project only include text objects in the project languages which are activated in the target project. Activate all project languages in the target project to include the corresponding text objects when transferring the copy.

Disabling project languages

1. Disable the languages which are not relevant for the project.

NOTICE
If you disable a project language, all text and graphic objects you have already created in this language will be deleted from the current project.

See also

Selecting the user interface language (Page 6174)

Selecting the reference language and editing language (Page 6175)

Selecting the reference language and editing language

Introduction

The project languages are set in the "Project languages" editor. You define which project language is to be the reference language and which the editing language. You can change the editing language at any time.

Requirements

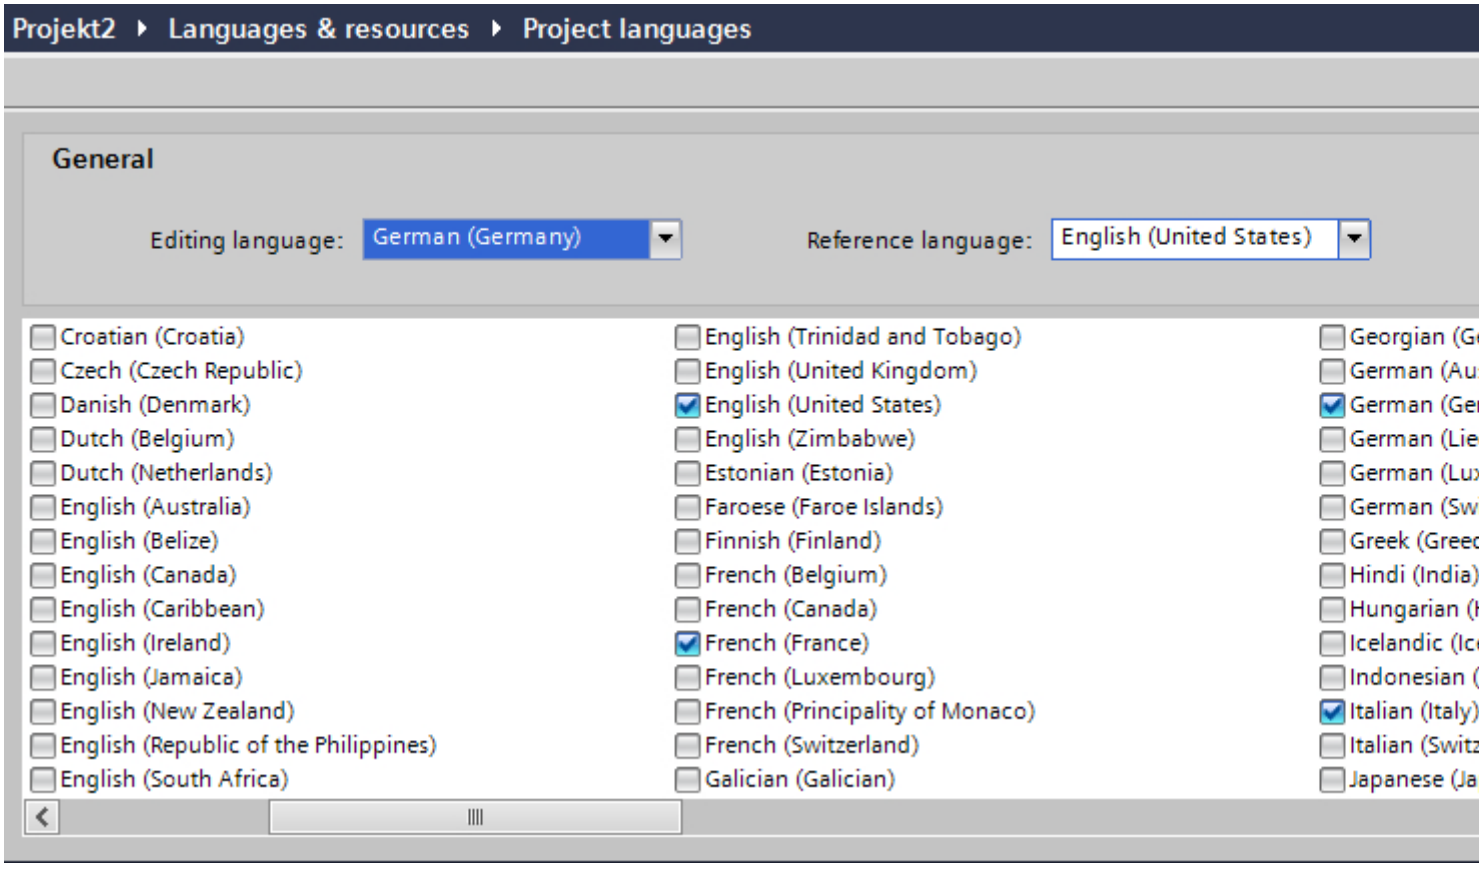
The "Project languages" editor is open.

Several project languages have been activated.

Selecting the reference language and editing language

1. Click the arrow in the drop-down list in the "General > Editing language" section.
2. Click on the required language in the drop-down list, for example, German.
3. Click on the arrow in the drop-down list in the "General > Reference language" section.
4. Click on the required language in the drop-down list, for example, English.

The language selection is displayed in the list box.



Result

You have now selected the editing and reference languages.

If you change the editing language, all future text input will be stored in the new editing language.

12.13.4.5 Creating one project in multiple languages

Working with multiple languages

Multilingual configuration in WinCC

You can configure your projects in multiple languages using WinCC. There are various reasons for creating a project in multiple languages:

- You would like to use a project in more than one country.
  You create the project in multiple languages but when the HMI device is commissioned, only the language spoken by the operators at the respective site will be transferred to the HMI device.
- The operators of a system speak a range of different languages.
  Example: An HMI device is used in China, but the service personnel understand only English.

Translating project texts

With WinCC, you can enter project texts directly in several languages in various different editors, for example, in the "Project texts" editor. WinCC also allows you to export and import your configuration for translation purposes. This is particularly advantageous if you configure projects containing a large amount of text and want to have it translated.

Language management and translation in WinCC

The following editors are used to manage languages and translate texts in WinCC:

Editor	Short description
Project languages	Selection of project languages, editing language and reference language.
Languages and fonts	Management of runtime languages and fonts used on the HMI device.
Project texts	Central management of configured texts in all project languages.
Graphics	Graphic library for managing graphics and their language-specific versions.

See also

Project text basics (Page 6178)

Translating texts directly (Page 6179)

Translating texts using reference texts (Page 6181)

Exporting project texts (Page 6181)

Importing project texts (Page 6183)

Project text basics

Texts in different languages in the project

Texts that are output on display devices during processing are typically entered in the language in which the automation solution is programmed. Comments and the names of objects are also entered in this language.

If operators do not understand this language, they require a translation of all operator-relevant texts into a language they understand. You can therefore translate all the texts into any language. In this way, you can ensure that anyone who is subsequently confronted with the texts in the project sees the texts in his/her language of choice.

User texts and system texts

In the interests of clarity, a distinction is drawn between user texts and system texts:

- User texts are texts created by the user.
- System texts are texts created automatically and which are a product of configuration in the project.

The project texts are managed in the project text editor. This can be found in the project tree under "Languages & Resources > Project texts".

Examples of multilingual project texts

You can, for example, manage the following types of text in more than one language:

- Display texts
- Alarm texts
- Comments in tables
- Labels of screen objects
- Text lists

Translating texts

There are two ways of translating texts.

- Translating texts directly
  You can enter the translations for the individual project languages directly in the "Project texts" editor.
- Translating texts using reference texts
  You can change the editing language for shorter texts. You can enter the new texts in the editing language while the texts of the reference language are displayed.

See also

Working with multiple languages (Page 6177)

Translating texts directly (Page 6179)

Translating texts using reference texts (Page 6181)

Exporting project texts (Page 6181)

Importing project texts (Page 6183)

Translating texts directly

Translating texts

If you use several languages in your project, you can translate individual texts directly. As soon as you change the language of the software user interface, the translated texts are available in the selected language.

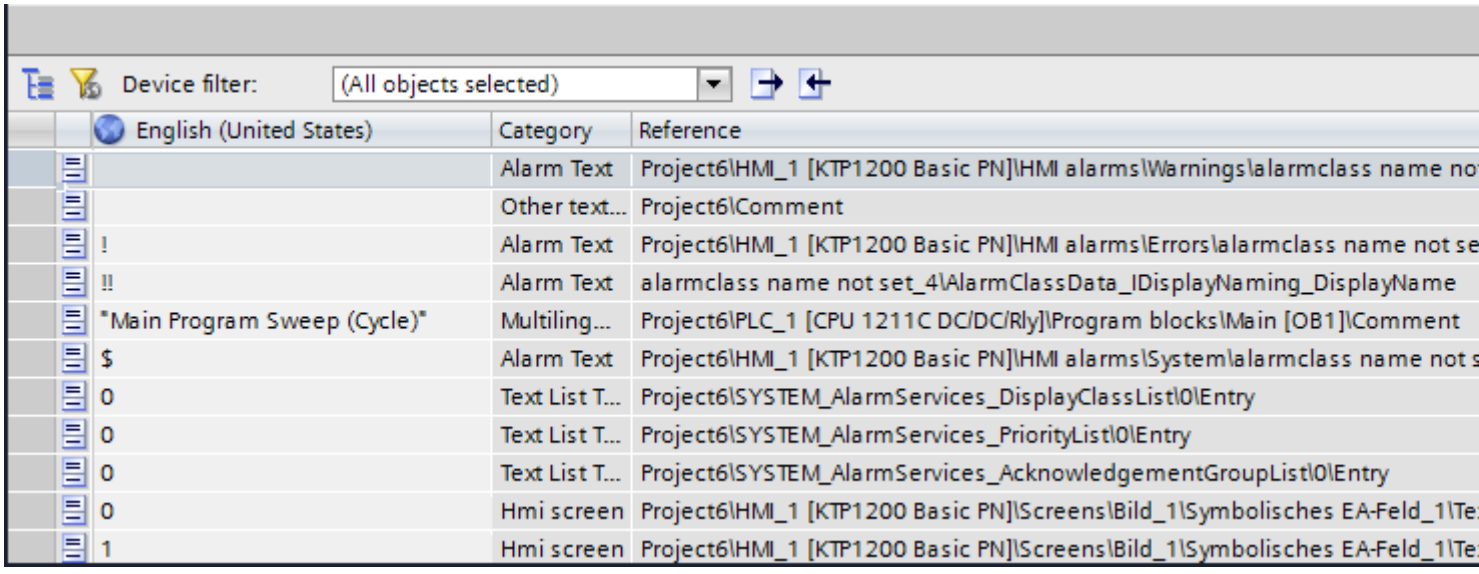
Requirements

- You are in the project view.
- A project is open.
- You have selected at least two further project languages.

Procedure

Proceed as follows to translate individual texts:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The elements below this are displayed.
2. Double-click on "Project texts".
   A list with the texts in the project is displayed in the work area. There is a separate column for each project language.



3. To group identical texts and translate them simultaneously, click on the "" button in the toolbar.
4. To hide texts that do not have a translation, click on the button in the toolbar.
5. Click on an empty column and enter the translation.

Result

You have translated individual texts in the "Project texts" editor. The texts will then be displayed in the runtime language.

See also

Working with multiple languages (Page 6177)

Exporting project texts (Page 6181)

Project text basics (Page 6178)

Importing project texts (Page 6183)

Translating texts using reference texts

Introduction

After changing the editing language, all texts are shown in input boxes in the new editing language. If there is not yet a translation available for this language, the input boxes are empty or filled with default values.

If you enter text again in an input field, this is saved in the current editing language. Following this, the texts exist in two project languages for this input field, in the previous editing language and in the current editing language. This makes it possible to create texts in several project languages.

You can display existing translations for an input box in other project languages. These serve as a comparison for text input in the current editing language and they are known as the reference language.

Requirement

There is at least one translation into a different project language for an input field.

Procedure

To display the translation of an input cell in a reference language, follow these steps:

1. Select "Tasks > Languages & resources" in the task card.
2. Select a reference language from the "Reference language" drop-down list.

Result

The reference language is preset. If you click in a text block, translations that already exist in other project languages are shown in the "Tasks > Reference text" task card.

See also

Working with multiple languages (Page 6177)

Project text basics (Page 6178)

Exporting project texts (Page 6181)

Importing project texts (Page 6183)

Exporting project texts

Project texts are exported for translation. Texts are exported to Office Open XML files ending in ".xlsx". These files can be edited in Microsoft Excel, for example.

You can exchange the file with the translators and import it back to the project as soon as it has been translated.

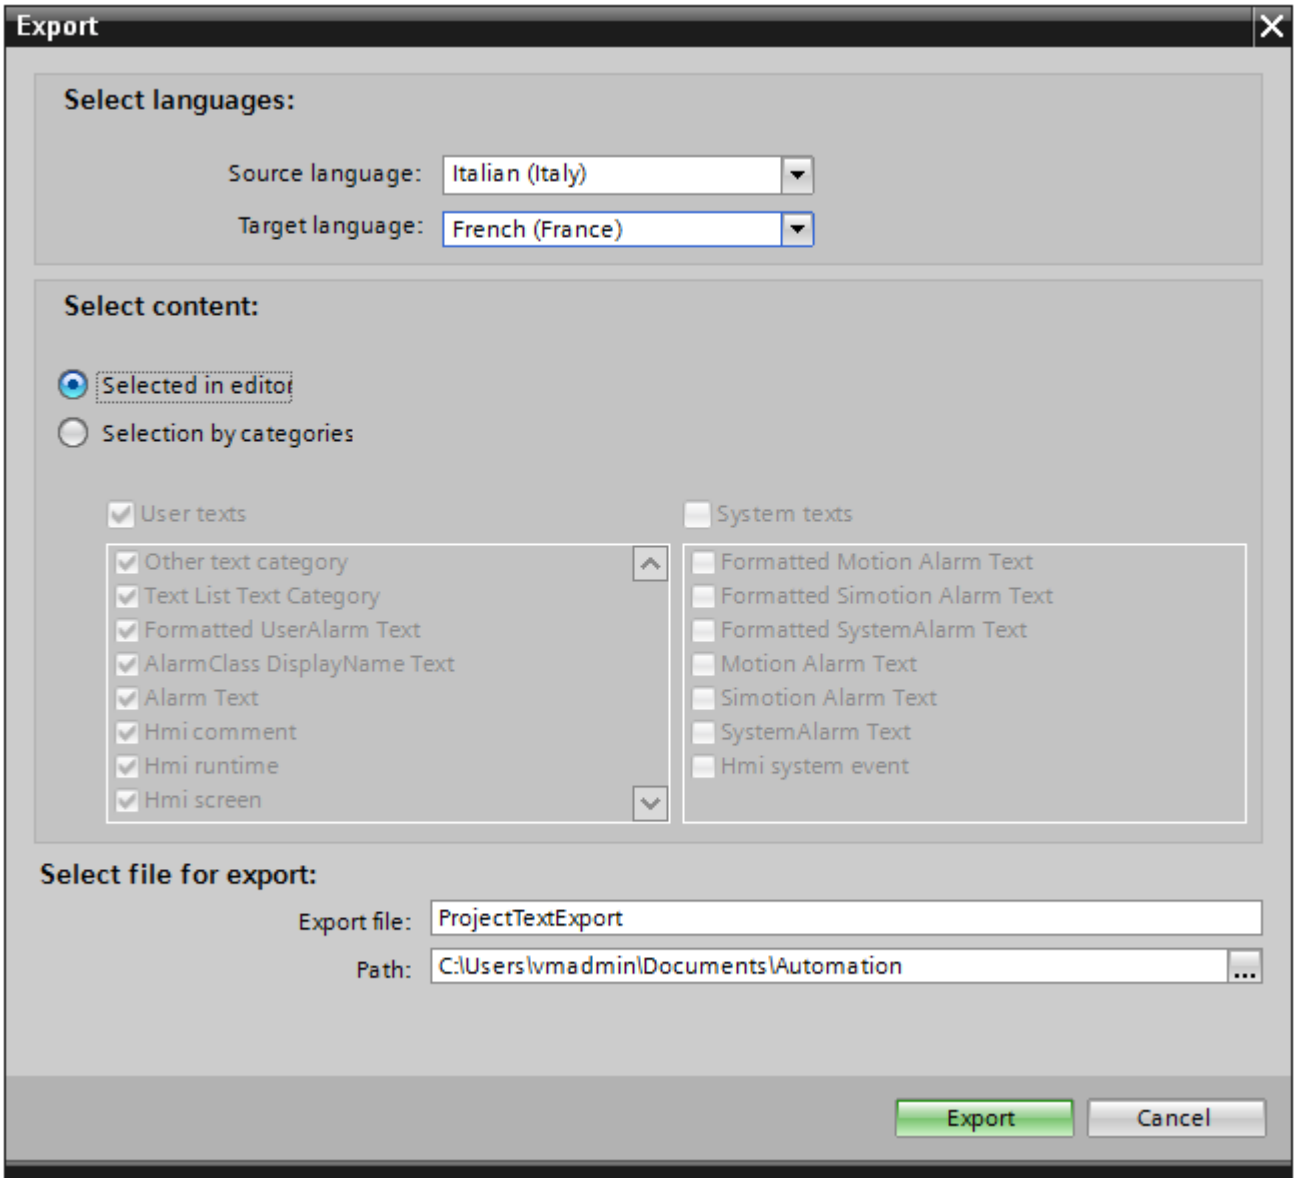
Requirements

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Exporting project texts

To export individual project texts, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The child elements are displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Select the texts you want to export.
4. Click on the button. The "Export" dialog opens.



5. From the "Source language" drop-down list, select the language from which you wish to translate, for example Italian.
6. From the "Target language" drop-down list, select the language into which the texts are to be translated, for example, French.
7. Enter a file path and a file name for the export file in the "Export file" input field.
8. Click "Export".

Result

The texts selected in the "Project texts" editor are written to an xlsx file. The xlsx file will be stored in the specified folder.

You can alternatively select and export all project texts from categories. Select "User texts" or "System texts" in the "Export" dialog in line with the type of texts you wish to export. In this case, export can additionally be limited by categories.

Note

Project texts in library objects cannot be exported.

See also

Working with multiple languages (Page 6177)

Project text basics (Page 6178)

Translating texts directly (Page 6179)

Translating texts using reference texts (Page 6181)

Importing project texts (Page 6183)

Importing project texts

Edit the xlsx file or send it to a translator. Import the texts once they have been translated. The foreign languages will be imported to the relevant object in the project.

Note

In WinCC, you only import the previously exported project texts into the same project. Importing into a different project is not supported.

Requirements

- At least two languages have been enabled in the "Project languages" editor, for example, Italian and French.

Importing project texts

To import a project text file, proceed as follows:

1. Click on the arrow to the left of "Languages & resources" in the project tree.
   The lower-level elements will be displayed.
2. Double-click on "Project texts". The "Project texts" editor will open.
3. Click on the button. The "Import" dialog opens.
4. Select the path and file name of the import file from the "Import file" field.
5. Activate the "Import source language" check box if you have made changes to the source language in the export file and would like to overwrite the entries in the project with the changes.
6. Click on "Import".

Result

You have imported the project texts.

12.13.4.6 Using language-specific graphics

"Project graphics" editor

Introduction

You use the "Project Graphics" editor to manage the configured graphic objects in different language versions. Multilingual projects sometimes also require language-specific versions of the graphics, for example, if

- the graphics contain text;
- cultural aspects play a role in the graphics.

Opening the "Project graphics" editor

Double-click in the project tree on "Languages and resources > Project graphics".

Work area

The work area displays all configured graphic objects in a table. There is a separate column in the table for each project language. Each column in the table contains the versions of the graphics for one particular language.

In addition, you can specify a default graphic for each graphic to be displayed whenever a language-specific graphic for a project language does not exist.

Preview

The preview shows you how the graphics will look on various devices.

See also

Storing an external image in the graphics library (Page 6186)

Storing an image in the graphics library (Page 6185)

Languages in WinCC (Page 6171)

Storing an image in the graphics library

Introduction

You use the "Graphics" editor to import graphics you want to use in screens in the "Screens" editor. It also allows you to manage language-specific versions of graphics. A preview shows the graphic displays on various HMI devices.

Note

File names for language-dependent graphics

Case is relevant in the file names of language-dependent graphics. Make sure that the format is consistent for all languages.

Requirement

- The language-dependent versions of a graphic are available.
- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.

Inserting graphics

1. Click "Add" in the "Graphics library" table. A dialog opens.
2. Select the required graphic file.
3. Click "Open" in the dialog box.
   The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.

4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Add graphic" from the shortcut menu. A dialog box opens.
6. Select the desired graphic file and click "Open."
   The language-dependent version is inserted in the table in place of the reference language graphic.
7. Then, in the "Default graphic" column, import a graphic to be displayed in runtime for those languages for which there is no language-specific graphic.

You can also drag&drop a graphic from Windows Explorer to the relevant position in the "Graphics library" table.

Displaying graphics in the HMI device preview

1. Click on a graphic in the table.
2. Select the required HMI device under "Properties > Graphics settings > Device preview" in the Inspector window.
   The graphic will then be displayed as it will appear in runtime on the selected HMI device.

Result

The graphics added are available in the "Graphics" editor. The graphic assigned to the respective editing language will be displayed during editing. The default screen will be displayed in all editing languages for which no screen has been imported.

The screens assigned to the respective runtime language are displayed during runtime. The default screen is displayed in all runtime languages for which a screen has not been imported.

Note

If you disable a project language, all of the graphic objects you have already created in this language will be deleted from the current project.

See also

"Project graphics" editor (Page 6184)

Storing an external image in the graphics library

Introduction

To display graphics that have been created in an external graphics program in your screens, you will first have to store these graphics in the graphics browser of the WinCC project.

Requirement

- Multiple languages have been enabled in the "Project languages" editor.
- The "Graphics" editor is open.
- There is a graphic in the "Graphics" editor.

Creating and adding a new graphic as an OLE object

1. Click "Add" in the "Graphics library" table. A dialog box opens.
2. Navigate to the folder in which the graphic is stored.
3. Click "Open" in the dialog box.
   The graphic will be imported to the project and displayed in all cells in this row in the "Graphics" editor.
4. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
5. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

6. Select "Insert object > Create new" and an object type in the dialog.
7. Click "OK." The associated graphic program is opened.
8. Close the graphics program once you have created the graphic.
   The graphic will be stored in the graphic programming software standard format and added to the graphic browser.

Inserting created graphics in WinCC

1. Click in the corresponding cell of a language for which a language-dependent version of this graphic exists.
2. Select "Insert object" from the shortcut menu. The "Insert object" dialog box opens.

   Note

   In addition, the dialog "External application running..." will open. The dialog will not close until you exit the external application.

3. From the "Insert object" dialog box, select "Create from file."

4. Click the "Browse" button.
5. Navigate to the created graphic and select it.

Note

To import graphics files, note the following size restrictions:

*.bmp, *.tif, *.emf, *.wmf ≤4 MB

*.jpg, *.jpeg, *.ico, *.gif "*≤1 MB

Result

The OLE objects added are available in the "Graphics" editor.

Versions of the graphics for the current editing language are displayed in the "Screens" editor. The default graphic is displayed in all editing languages for which no screen has been imported.

The graphic is displayed in runtime in the set runtime language. The default graphic is displayed in all runtime languages for which no graphic has been imported.

You can double-click OLE objects in your library to open them for editing in the corresponding graphic editor.

12.13.4.7 Languages in Runtime

Languages and fonts in Runtime

Using multiple Runtime languages

You can decide which project languages are to be used in Runtime on a particular HMI device. The number of Runtime languages that are available at one time on the HMI device depends on the device. To enable the operator to switch between languages in Runtime, you need to configure a corresponding operator control.

When Runtime starts, the project is displayed according to the most recent language setting. When Runtime starts the first time, the language with the lowest number in the "Order for language setting" is displayed.

"Language & font" Runtime setting

Configure the following under "Language & font":

- The project languages available as Runtime languages for the respective HMI device.
- The order in which the languages are switched.
- Default font for a Runtime language

The license status of the fonts is also shown in the "Download font" area. If a specific license is required for a protected font, this is indicated in the "License status" column.

Note

Post installing fonts

When a configured font on the configuration computer is missing, the project is not compiled. Re-installation is required.

After installing a font, restart the TIA Portal and completely re-compile your project. Only then can the HMI device be compiled without errors.

Note

Runtime language in controls (RT Professional)

If you have configured a control in a specific Runtime language that is not a user-interface language, it can happen that some texts, for example, system texts in the status bar, appear in the English language.

Note

Specify Runtime languages as input languages

To enter and edit data in Runtime, configure the specified Runtime languages also as input languages for the keyboard of your PC.

See also

Methods for language switching (Page 6189)

Enabling the runtime language (Page 6190)

Setting the runtime language order for language switching (Page 6192)

Selecting the log language (Page 6195)

Languages in WinCC (Page 6171)

Methods for language switching

Introduction

You need to configure language switching if you want to have multiple runtime languages available on the HMI device. This is necessary to enable the operator to switch between the various Runtime languages.

Methods for language switching

You can configure the following methods for language switching:

- Direct language selection
  Each language is set by means of a separate button. In this case, you create a button for each Runtime language.
- Language switching
  The operator switches the languages using a button.

Regardless of the method used, the button names must be translated into each of the languages used. You can also configure an output field that displays the current language setting.

See also

Languages and fonts in Runtime (Page 6188)

Selecting the log language (Page 6195)

Enabling the runtime language (Page 6190)

Setting the runtime language order for language switching (Page 6192)

Setting the default font for a runtime language (Page 6193)

Enabling the runtime language

Introduction

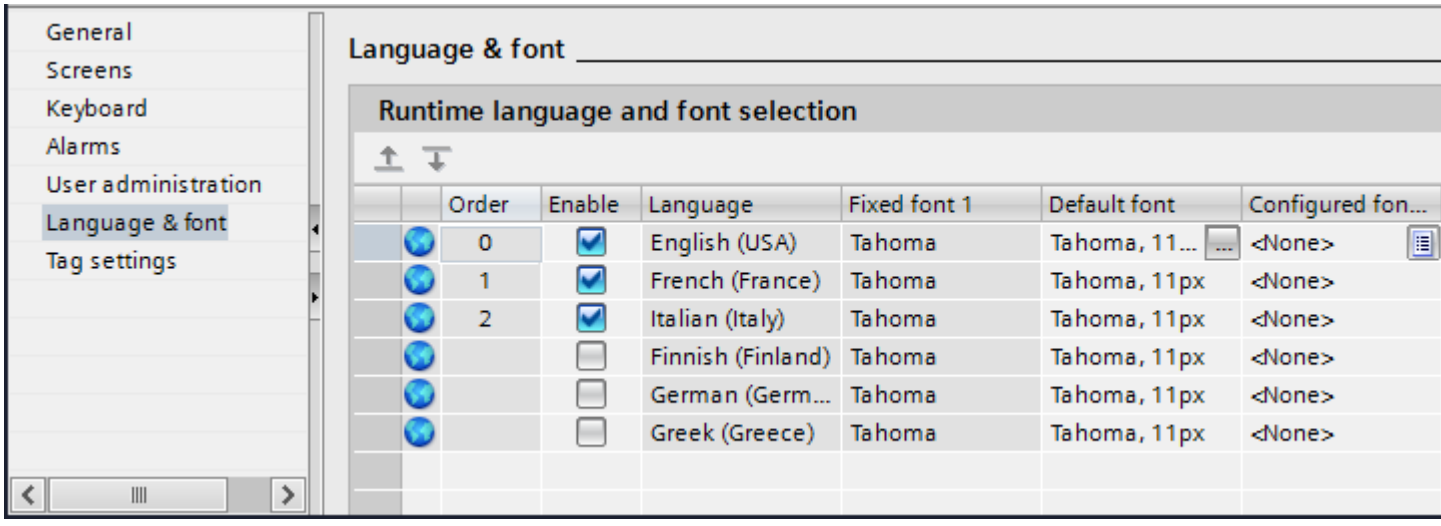
The "Language & Font" editor shows all project languages available in the project. Here you select which project languages are to be available as runtime languages on the HMI device.

Requirements

Multiple languages have been selected in the "Project languages" editor.

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Select the following languages:
   - English
   - French
   - Italian



Result

You have now set three runtime languages. A number is automatically assigned to each language in the "Order" column. The enabled runtime languages are transferred with the compiled project to the HMI device.

If the number of languages selected exceeds the number that can be transferred to the HMI device, the table background changes color.

See also

Languages and fonts in Runtime (Page 6188)

Selecting the log language (Page 6195)

Setting the runtime language order for language switching (Page 6192)

Methods for language switching (Page 6189)

Setting the runtime language order for language switching

Introduction

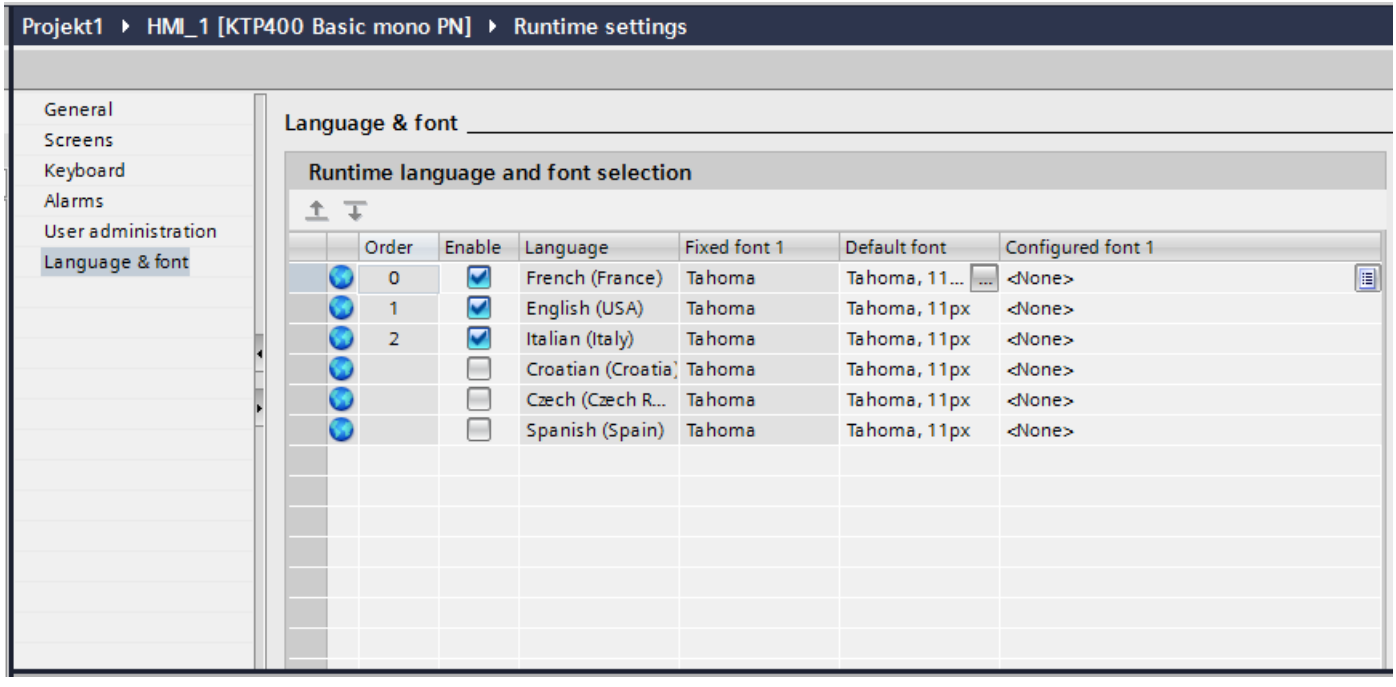
You specify the language order for Runtime language switching. The first time Runtime starts, the project is displayed in the language with the lowest number in the "Order" column.

Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- The "Language & Font" editor is open and three Runtime languages have been set in the following order:
  1. English
  2. Italian
  3. French

Procedure

1. Select the runtime language "English".
2. Click the button. The runtime language "English" is moved down a place. The number will automatically be changed to "1" in the "Order" column.



Result

You have changed the order of Runtime languages. The first time runtime starts, the project will be displayed in the language with the lowest number. If the language is switched, this will happen in numerical order.

See also

Languages and fonts in Runtime (Page 6188)

Selecting the log language (Page 6195)

Enabling the runtime language (Page 6190)

Setting the default font for a runtime language (Page 6193)

Methods for language switching (Page 6189)

Setting the default font for a runtime language

Introduction

You can specify the font used to display the texts for each runtime language on the HMI device in the "Language & Font" editor. The default font is used in all texts, such as dialog texts, for which you cannot define a specific font.

WinCC offers only fonts supported by the HMI device.

Note

"Bold" and "Italic" fonts

"Bold" and "italic" fonts are not supported on all HMI devices in Runtime.

Requirements

- Multiple languages have been enabled in the "Project languages" editor.
- Three runtime languages have been enabled in the "Language & Font" editor.
  1. Chinese
  2. German
  3. French

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font". The table shows the runtime languages and fonts set.
3. Click in the "French" row in the "Default font" column.
4. Select the font to be used by default if a font cannot be selected for a given text.

Result

The project texts for the runtime language "French" are displayed on the HMI device in the selected font.

These fonts are transferred to the HMI device during a transfer operation.

The default font is also used for the representation of dialogs in the operating system of the HMI device. Select a smaller font as default if the full length of the dialog texts or headers is not displayed.

Selecting the log language (Page 6195)

Setting the runtime language order for language switching (Page 6192)

Methods for language switching (Page 6189)

Standardizing font for all languages

Introduction

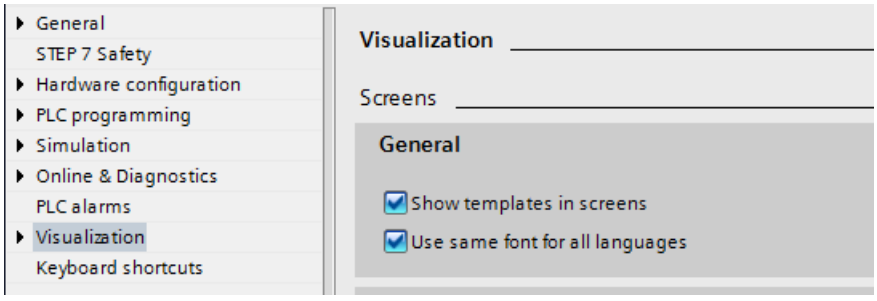
You can standardize the font for all project languages during configuration with the "Use same font for all languages" option.

Requirement

- Multiple languages have been selected in the "Project languages" editor.
- Multiple languages have been selected in the "Language & font" editor.
- The same font is defined for the selected runtime languages under "Configured font".

Procedure

1. In the "Options > Settings > Visualization > General" menu, select the "Use same font for all languages" option.



Result

You have enabled the option "Use same font for all languages". If you change the font of an object in one language during configuration, this font will be applied to all active languages.

Selecting the log language

Introduction

In the "Runtime settings > General" editor, select the language to be used for writing to logs in runtime.

Requirements

- The languages used in your project are activated in the "Project languages" editor, for example "German" and "English" .

Procedure

1. Double-click on "Runtime settings" in the project tree.
2. Click on "Language & Font".
3. Activate the runtime languages, for example, "German" and "English".
4. Specify the "order":
   - 1 German
   - 2 English
5. Click on "Runtime settings > General".
6. Select "German" for "Logs > Log language".

Result

After loading, the project will start in the runtime language "German". The logs are now written in German. During runtime, the operator switches the runtime language to English. The logs will still to be written in German.

Methods for language switching (Page 6189)

Enabling the runtime language (Page 6190)

Specific features of Asian and Eastern languages in Runtime (Panels, Multipanels, Comfort Panels, Mobile Panels, RT Advanced)

Introduction

Note the following special considerations for the operation in Runtime of projects for Asian languages.

Note

During configuration, only use the Asian fonts that your configuration computer supports.

Memory requirement for Asian character sets

The memory requirement is greater when using Asian languages. Therefore look out for corresponding error messages when compiling the project.

Font size for Asian character sets

Use at least a font size of 10 points to display the text of projects created for Asian languages in Runtime. Asian characters will become illegible if smaller font sizes are used. This also applies to the default font in the Runtime settings under "Language & font".

Text field length for Asian languages

Make allowances for an appropriate length of the text fields when working on multilingual projects with Asian languages. Field contents may be partially hidden, depending on the font and the font size.

1. Open the "Properties > Appearance" text box in the Inspector window.
2. Under "Fit to size", disable the "Auto-size" option.
3. Verify the proper display in Runtime.

12.13.4.8 Example of multilingual configuration

Example: Configuring a button for language switching

Introduction

In this example, you configure a button that can be used to toggle between multiple runtime languages during runtime.

Requirements

- You have completed the "Configuring a button in multiple languages" example.
- The "Screen_1" screen is open.
- The button on the screen has been selected.

Procedure

1. In the Inspector window, select "Properties > Events > Press".
2. Click on "Add function" in the table.
3. Select the "SetLanguage" system function and the "Switch" setting.

Result

You have assigned the button the function "SetLanguage". Pressing the button during runtime will switch the runtime language. The runtime languages are switched in the order specified by the number sequence in the "Languages and fonts" editor.

See also

Example: Configuring a button in multiple languages (Page 6197)

Example: Configuring a button for language switching for each runtime language (Page 6198)

Languages in WinCC (Page 6171)

Example: Configuring a button in multiple languages

Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

Requirements

- The languages "German" and "English" have been enabled in the "Project languages" editor.
- German has been set as editing and reference language.
- You have created and opened the "Screen_1" screen.
- The Inspector window is open.

Procedure

1. Drag-and-drop a button from the "Tools" task card into the screen.
   The button will be added to the screen.
2. In the Inspector window, open "Properties > Properties > General".

3. Enter the text ""Sprache umschalten" under "Text > off".
4. Press <Enter> to confirm. The button is named.
5. Open the "Tasks" task card.
6. Select "English" under "Languages & Resources > Editing language".
7. Enter the label "Switch Language" under "Properties > Properties > General > Text > Off" in the Inspector window.

Result

The button name is configured in German and English language. The button name corresponding with the current Runtime language is shown in Runtime.

See also

Example: Configuring a button for language switching (Page 6196)

Example: Configuring a button for language switching for each runtime language (Page 6198)

Example: Configuring a button for language switching for each runtime language

Introduction

In this example, you configure a "Sprache umschalten" button in German and "Switch language" button in English.

Requirements

- The following languages have been enabled in the "Project languages" editor
  - German
  - English
  - Italian
- All languages have been set as runtime languages in the "Runtime settings > Language & Font" editor.
- You have created and opened the "Screen_1" screen.
- Three buttons have been created on the screen:
  - Button_1 labelled "Deutsch"
  - Button_2 labelled "English"
  - Button_3 labelled "Italiano"
- The Inspector window is open.

Procedure

1. Select "Button_1".
2. In the Inspector window, select "Properties > Events > Press".
3. Click on <Add function> in the table.
4. Select the "SetLanguage" system function.
5. Click on the "Switch" field.
6. Click on the button.
7. Select "Runtime language". The field will be highlighted in red.
8. Select "German" from the drop-down list.
9. Repeat steps 1 - 8 for the other two buttons and select the corresponding runtime language.

Result

You have configured three buttons for switching language in runtime. Each button will switch to a different runtime language. For example, clicking on the "English" button during runtime will switch the runtime language to English.

12.13.5 Replacing devices

12.13.5.1 Basics (Basic Panels, Panels, RT Advanced)

Introduction

You can use existing configurations for new devices and optimize these configurations with little manual effort.

All data configured by you is retained in the configuration data. This means you do not need to copy individual objects of one device and paste them to another.

Principle

The following applies when you replace devices:

- Only functions supported by the new device are available. Only configuration data supported by the new device are displayed.
  This affects
  - recipes,
  - objects available on the screens,
  - available system functions,
  - available communication logs, etc.
- The number of supported objects, such as screens or tags, may be limited on the new device. If the existing objects exceed the limitations on the new device, the objects are displayed in full. The objects are, however, highlighted in color in the individual editors. An error is generated when the project data is compiled.
  Manual post processing is required when switching to a device with fewer features.
  Example: Limited number of connections
  All connections will be highlighted in color as invalid if fewer connections are supported on the new device than have been configured. Delete any excess connections.
- After an HMI device has been replaced, you should check the appearance of the configured screens. Changing the size of the display may result in changes to the position and appearance of screen objects, e.g. the recipe view and alarm view.

Note

If you replace a Panel and select a PC Station as your new device, for example, WinCC Runtime Advanced will automatically be moved below the PC Station in the project tree.

Comfort Panel (Page 6408)

WinCC Runtime Advanced (Page 6414)

12.13.5.2 Device-specific functions

Device-specific functions (Basic Panels, Panels, RT Advanced)

Functions dependent on the device

Functions dependent on the device are implemented as follows:

- Colors
  The color is changed automatically when you switch from a device with full color display to one with a smaller color range.
  If you change the color manually and then change back again to a device with a larger range of colors, the reduced range of colors will be retained.
- Fonts
  Any configured font not available on a device will be replaced by a similar one or by the configured default font. The default font depends on the device selected.
- Character sets with different font sizes
  Avoid using too many different font sizes when configuring the following devices:
  - OP 73
  - OP 77A
  - TP 177A

  A character set is downloaded to the device for each font size. Check the Inspector window during compilation to see how much of the device memory is being used by the character sets.
- Font size
  Use small Windows fonts to display the text on devices. If you use large Windows fonts, then, depending on the size of the display, the text will not be displayed in full.
  Using font sizes of 28 pixels or more for the OP 77A and TP 177A devices will affect device performance.
  The character scope is much greater for Asian languages. The use of different font sizes therefore has serious implications on the memory requirements of all devices.
  Use the same font type for all large characters throughout the project to ensure effective and efficient configuration.
- Screens and screen objects
  If the new device supports a different resolution than the previous device when you replace a device, there are several ways to adjust the screens.
  Adjust the size of the screens to the new device in the menu under "Options > Settings > Visualization > Fit to size screen".

See also

Example: Replacing devices (Page 6213)

Basics (Page 6199)

Key assignment when replacing devices (Panels, RT Advanced)

Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

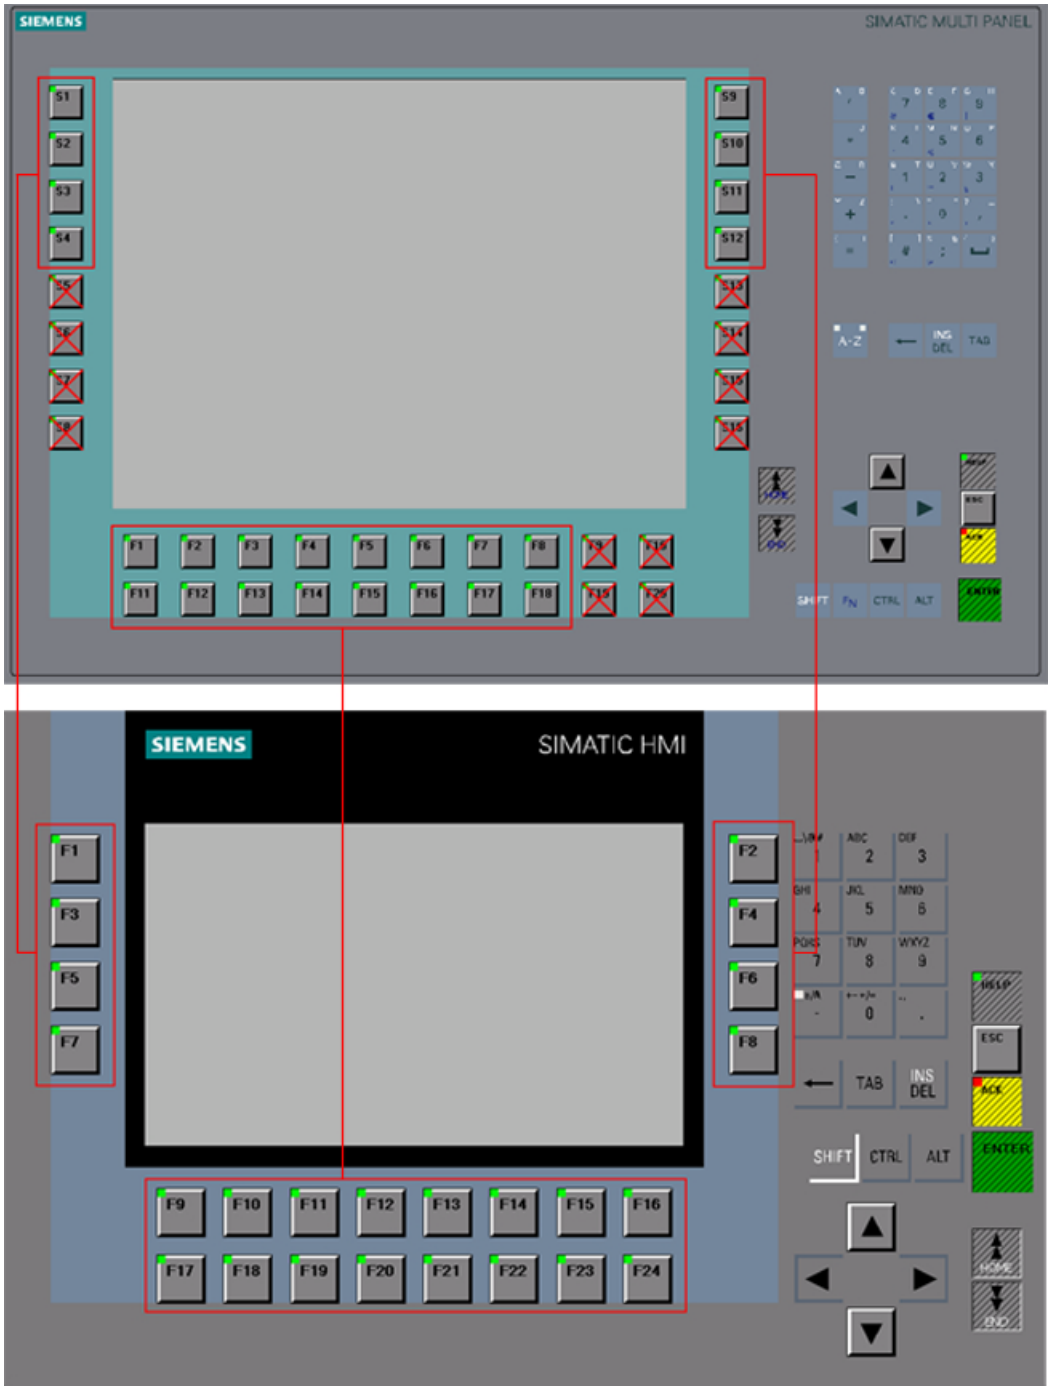
Function key mapping

The function keys to the left and right of the display are mapped from top to bottom to the new device. If the new device has fewer keys, the keys it does not have are not mapped. The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

Example: Exchange MP 377 with KP700 Comfort

You have configured a function on key S3 on the MP 377. This function is triggered by F5 if the panel is replaced with an KP700 Comfort.

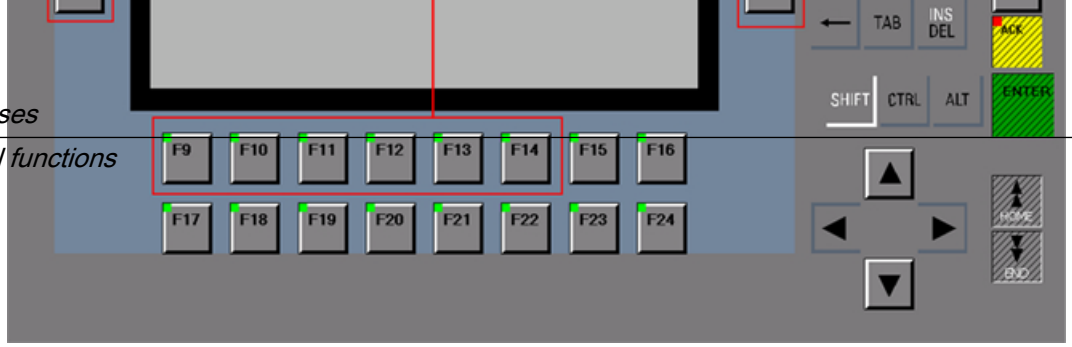
If you use the S8 key on an MP 377, this function is no longer available when the panel is replaced with a KP700 Comfort.



Mapping K-keys

K-keys are only mapped to the same K-keys in the new device, e.g. K5 to K5.

If the new device has no K keys, configurations for the K keys are lost.



Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK
- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

Exception

"HELP" is triggered by "SHIFT+ ESC" on OP 73.

See also

Key assignment when replacing devices (Page 6204)

Basics (Page 6199)

Screen adjustment options (Page 6207)

Key assignment when replacing devices (Basic Panels)

Introduction

The devices available each have different function keys. The functions configured for these keys will be mapped to the available function keys of the new device if the device is replaced.

Function key mapping

The function keys below the display are mapped from left to right to the new device. If the new device has fewer keys, the keys it does not have are not mapped.

Note

HMI devices without LED keys

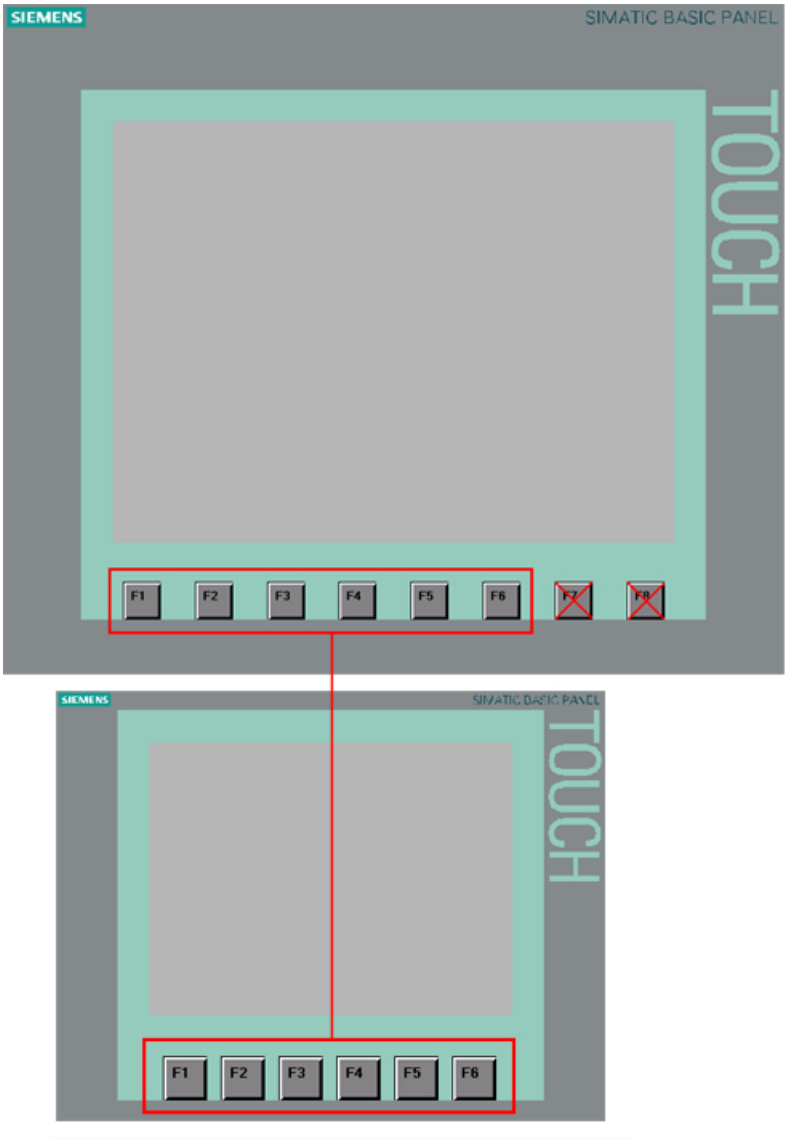
If you replace a device with configured LED keys with a device without LED keys in the Engineering System, runtime will not start after the project data have been transferred to the device.

Delete the LED key configuration before you replace the device.

Example: Replacing a KTP1000 Basic with a KTP600 Basic

You have configured a function for F2 in KTP1000 Basic. This function is triggered by F2 following replacement with a KTP600 Basic.

If you have used F7 in a KTP1000 Basic, this function will no longer be available if the panel is replaced with a KTP600 Basic.



Mapping of control keys and cursor keys

The following keys are mapped only to the same keys of the new device:

- HELP
- ESC
- ACK
- ENTER
- PAGE UP
- PAGE DOWN
- CURSOR UP
- CURSOR DOWN

Key assignment when replacing devices (Page 6202)

12.13.5.3 Adjusting screens to the new device

Screen adjustment options (Basic Panels, Panels, RT Advanced)

Introduction

Select fit to size for screens before you replace a device. Fit to size is particularly important when switching devices with different display resolutions.

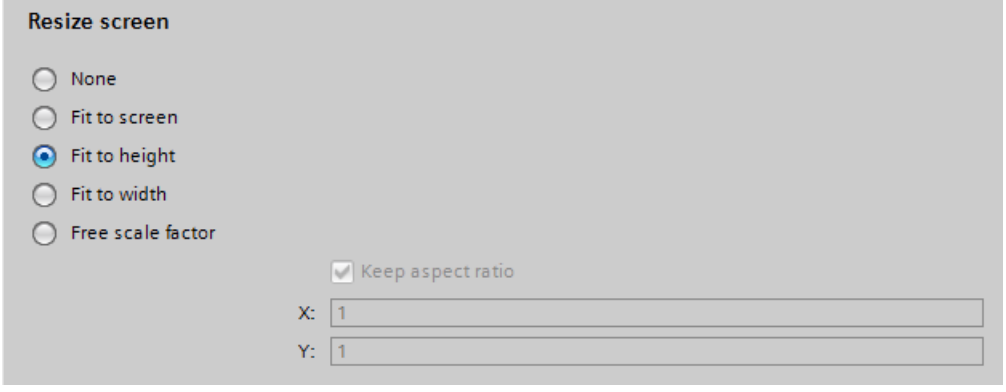
Object adjustment to content can be prevented for objects such as graphic views or text fields.

Note

The objects are distorted if you replace a device with a landscape format display with a device with a portrait format display. The difference in display format can, for example, result in object labels being cut off and content not being fitted to the object. You must therefore adjust the screens to the new device once you have replaced devices.

Screen adjustment when replacing devices

Adjust the size of the screens to the new device in the menu under "Tools > Settings > Visualization > Resize screen".



Select one of the following settings.

None (default setting)

The screens are not scaled. The objects in the screen retain their position and size. Use this setting as first test for checking of a possible exchange result because there are no rounding losses during forth and back exchange.

This option may result in objects being outside the configurable area if the display of the new device is smaller than the old one.

Fit to screen

The position and object size are adjusted to the new display size. Resizing takes place along the x-axis and the y-axis. Graphics and font size are adjusted accordingly.

Fit to height

The aspect ratio is maintained and the screens are adjusted to the height of the new device.

Use this option when you are replacing a device with display format 4:3, for example, with a device with widescreen.

Fit to width

The aspect ratio is maintained and the screens are adjusted to the width of the new device.

Use this option when you are replacing a device with widescreen, for example, with a device with display format 4:3.

Free scale factor

You select a free scale factor for screen adjustment. You can specify a factor for the x-axis and the y-axis.

Using a free scale factor of < 1 may distort the objects. Object labels may, for example, be cut off and the content may not be fitted to the object.

You must therefore adjust the screens to the new device once you have replaced devices.

Note

The aspect ratio is not adjusted for objects with a fixed aspect ratio, for example, gauge, circle. The objects are displayed on the new device with the same aspect ratio as prior to the replacement of the device.

See also

Example: Adjusting screens (Page 6212)

Specifying the position of screen objects (Page 6211)

Fit objects to contents (Page 6209)

Basics (Page 6199)

Key assignment when replacing devices (Page 6202)

Fit objects to contents (Basic Panels, Panels, RT Advanced)

Introduction

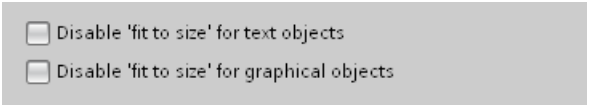
For some objects, you can specify fit to respective content in the Inspector window, for example:

- Text field: fit to text content
- I/O field: fit to text content
- Symbolic I/O field: fit to text content or to text list
- Graphic view: fit to included graphic

Fit to size for text and graphic objects

Disable automatic fit to size of the individual objects in the menu under "Options > Settings > Visualization > Resize screen and screen objects > Fit to content". This results in scaling of the objects as specified under "Options > Settings > Visualization > Resize screen and screen objects".

Select the objects which are not automatically fitted to size.



- If "Disable 'fit to size' for text objects" is activated, automatic fit to size is ignored in the text object properties.
  If you have activated "Fit screen to window height", the text field along with the other objects is scaled in accordance with the height of the new device.
- If "Disable 'fit to size' for graphic objects" is activated, automatic fit to size is ignored in the graphic object properties.
  If you have activated "Fit screen to window width", the graphics view along with the other objects is scaled in accordance with the width of the new device.

  Note

  The settings have no effect on screen objects whose size cannot be changed, such as alarm indicators or screen objects with a fixed aspect ratio.

"Disable 'fit to size' for text objects" and "Disable 'fit to size' for graphic objects" have no effect if:

- You have activated "Resize screen and screen objects > None".

- You have activated "Fit screen to window width and height" and the new device has the same resolution as the current device.

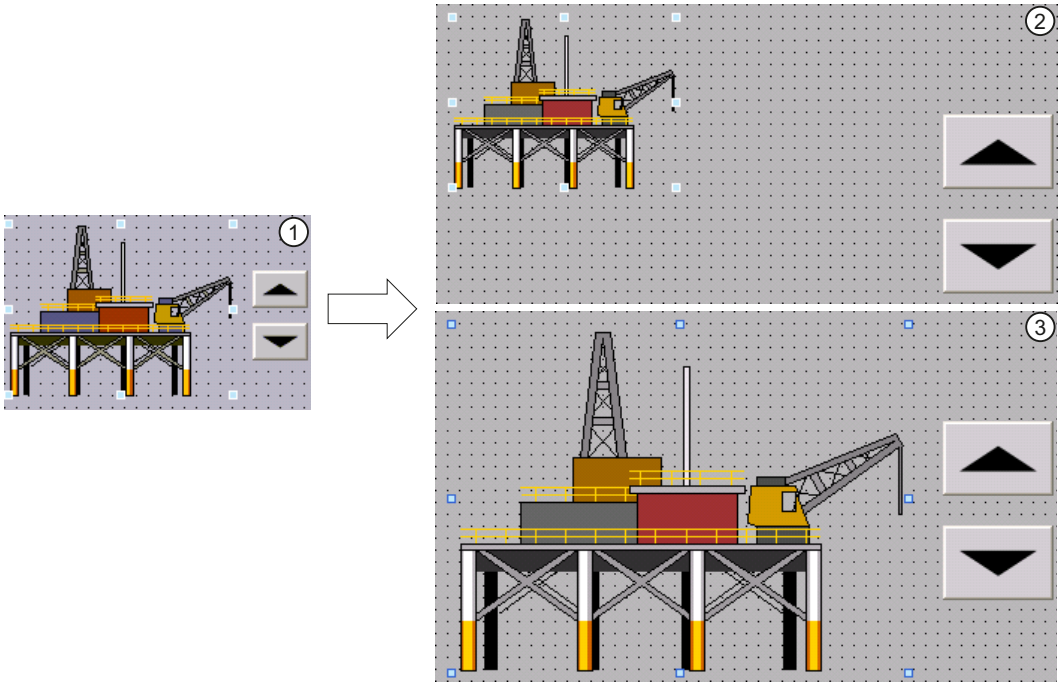
- You have activated "Fit screen to window height" and the new device has the same resolution as the current device.

- You have activated "Fit screen to window width" and the new device has the same resolution as the current device.

- You have selected "Resize screen and screen objects > None" and position "Top left" which means an adaptation is not necessary.

Example

The figure below shows the effects of automatic sizing using a graphic object with two buttons aligned as an example:



① Initial situation:

- Two buttons are aligned on a graphic object.
- The option "Fit object size to graphic" or "Adjust object size to graphic" is activated in the object properties of the graphic object under "Display > Sizing".

② Option 1: The original properties of the graphic object are to be maintained after switching the HMI device.

- Deactivate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

Effect: The graphic object retains its original size after switching the HMI device. The alignment to the buttons is lost.

③ Option 2: The graphic object is to be placed relative to the new screen resolution after switching the HMI device.

- Activate the option "Disable 'fit to size' for graphical objects" in the settings under "Size adaptation of objects".

The option "Fit graphic to object size" is activated automatically in the object properties of the graphic object. The two buttons are properly aligned on the graphic object even after switching the HMI device.

Specifying the position of screen objects (Page 6211)

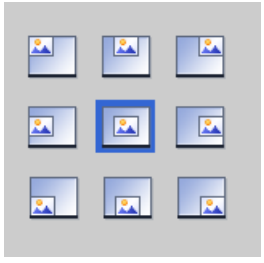
Screen adjustment options (Page 6207)

Example: Adjusting screens (Page 6212)

Specifying the position of screen objects (Basic Panels, Panels, RT Advanced)

Introduction

There are various ways to adjust the position of screen objects to the new device.



Select position

Adjust the position of the screen objects to the new device in the menu under "Options > Settings > Visualization > Fit to size screen > Select position".

Example

The following option aligns the objects with the top left edge.

The following object centers the objects in the middle of the screen.

12.13.5.4 Example: Replacing devices

Example: Procedures overview (Panels, RT Advanced)

Introduction

In the following example you replace a TP177 B 6" PN/DP with a TP700 Comfort.

Procedures overview

The procedure when replacing a device is as follows:

1. Adjust screens to the new device
2. Replacing devices

Example: Adjusting screens (Panels, RT Advanced)

Introduction

Adapt the screen before you replace a device. Screen adaptation is required as the display formats are different.

The TP 177B format is 320 x 240 pixels while the format of the TP700 Comfort is 800 x 480 pixels.

Requirements

- A project is open.
- The TP 177B 6" PN/DP device is used in the project.

Adjusting screens

1. Open the "Options > Settings" menu.
2. Click on "Visualization > Resize screen".

3. Activate "Fit to height".

4. Select "Disable fit to size for text objects".
5. Select "Disable fit to size for graphical objects".

Result

You have carried out screen adjustment in preparation for replacing devices.

See also

Example: Replacing devices (Page 6213)

Specifying the position of screen objects (Page 6211)

Fit objects to contents (Page 6209)

Example: Procedures overview (Page 6212)

Example: Replacing devices (Panels, RT Advanced)

Introduction

The following example shows you how to replace a device.

Requirements

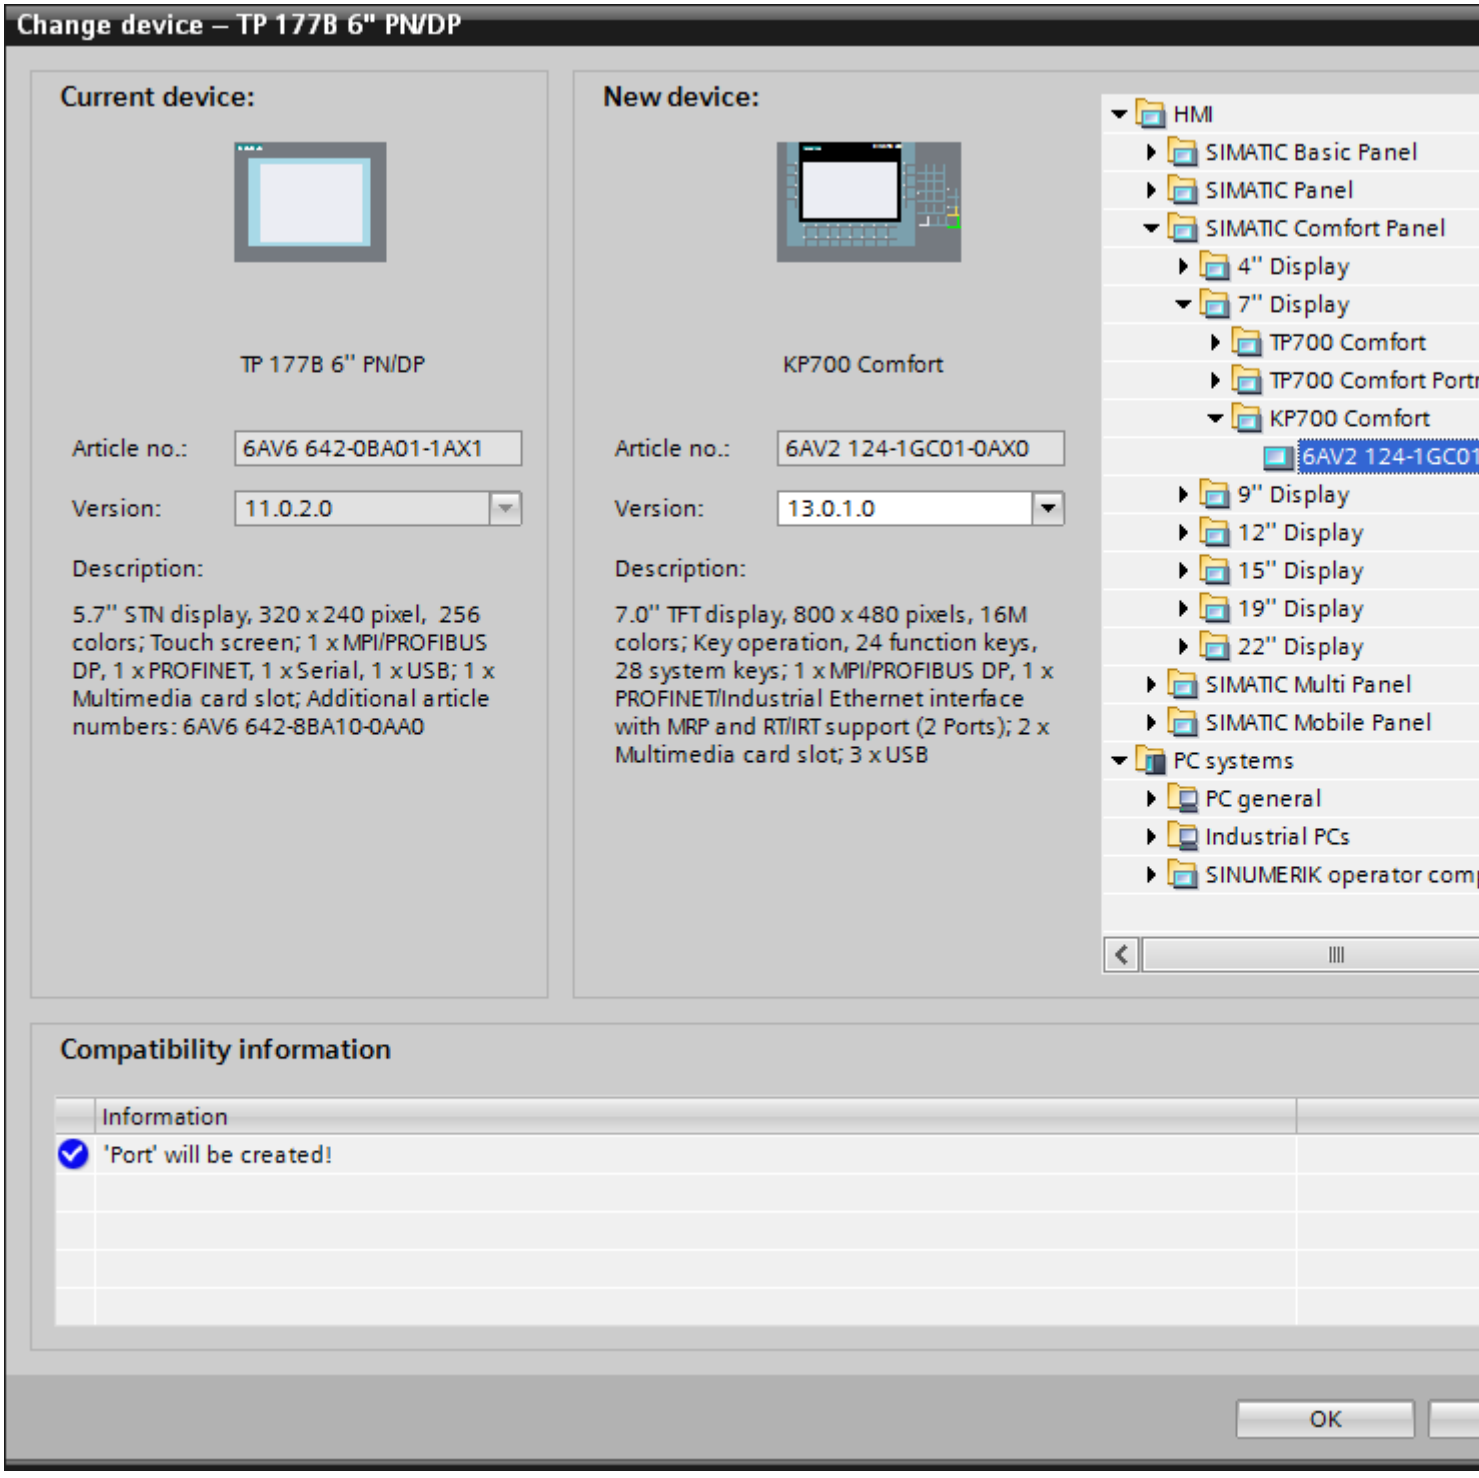
- A project has been created and opened.
- The TP 177B 6" PN/DP device is used in the project.

Procedure

1. Double-click on "Devices & Networks" in the project navigation. The editor opens.
2. Click on the "TP 177B" device.
3. Select "Change Device/Version" in the device shortcut menu. A dialog opens.

4. Select the TP700 Comfort device.

5. Select the matching image for the HMI device version that suits your configuration under "Version".
   When you change the image, the new image is automatically transferred to the target system with the next download. All runtime files are deleted during this step.
   Details of hardware differences can be found in the "Compatibility information".



6. Click "OK". Device replacement is started.

Result

You have replaced the TP 177B device used in the project. You now use the TP700 Comfort device.

12.13.6 Copying between devices and editors

12.13.6.1 Basics

Basics

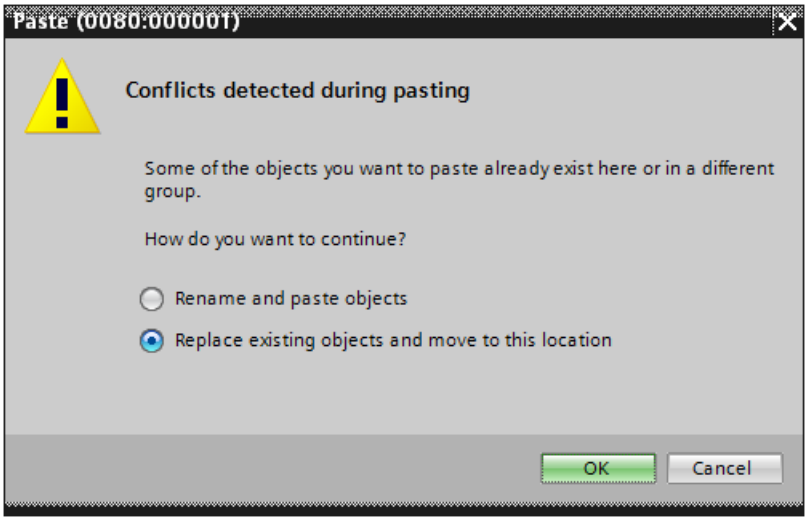
Copying and pasting within an HMI device

You can copy and paste objects, such as display objects, within an HMI device. If the object is already created in the editor, when the object name is inserted a number is automatically attached, in accordance with the following principle:

- "<Object_name>_1" is renamed to "<Object_name>_2".
- "<Object_name>_2" is renamed to "<Object_name>_3".

Copying and pasting between HMI devices

You can also copy and paste between HMI devices. If an object with the same name already exists, you have the following options:



Note

Exception to this basic rule

Copying and pasting of an alarm class that has been generated from project-wide alarm class is handled differently than with this basic rule. When the copied alarm class already exists in the target HMI device within the same project, the "Paste" command is not performed.

Copying user-defined folders

You can create user-defined folders for editors, for example, for HMI tags, screens, etc.

You can copy user-defined folders and paste them into another HMI device. The objects contained in a user-defined folder may exceed the limitations applying to the other HMI device, such as the number of supported screens. After they have been pasted, all the objects are displayed. An error is displayed when the project data is compiled.

System folders cannot be copied.

See also

Unsupported objects and functionalities (Page 6219)

Copy and paste options (Page 6219)

Copy and paste options

Copy and paste options

Copy and pasting individual objects simplifies configuration.

WinCC offers a number of options for copying and pasting objects.

Shortcut menu

To copy and paste objects using the shortcut menu, proceed as follows:

1. Select an object, for example a button.
2. Select "Copy" in the shortcut menu.
3. Move the mouse cursor to the place on the screen where you want to paste the button.
4. Select "Paste" in the shortcut menu.
   The button will be pasted together with all properties already defined.

Drag&drop

To drag-and-drop objects, proceed as follows:

1. Click on "Screens > Start" in the project tree of a device.
2. Drag-and-drop the "Start" screen into the "Screens" folder of another device.
3. A dialog will appear if the second device already contains a screen with the same name.
4. Choose whether to replace or rename the existing screen.

See also

Basics (Page 6217)

Unsupported objects and functionalities (Panels, RT Advanced)

Introduction

When an object is copied, all its properties and settings are transferred to the target HMI device.

Unsupported objects

Objects that are not supported in the target HMI device cannot be pasted.

Note

When you copy a screen containing objects which are not supported by the destination HMI device, the objects remain in the background. When you copy the screen again and the new device supports the objects, they are displayed again.

Invalid objects

The following objects become invalid once they have been pasted into the target HMI device:

- Referenced objects that do not exist in the target HMI device.
- Objects with settings that are not supported in the target HMI device.
- System functions that were configured for objects and that are not supported in the target HMI device.

Invalid objects are highlighted by a color coding. Select a supported object or create a new one. If you retain an invalid object, an error will be displayed when the project data is compiled.

Colors and fonts

Colors and fonts are supported to varying degrees by HMI devices. When unsupported colors and fonts are pasted, they are replaced by supported colors and fonts. When you paste the same object back into the source HMI device, the original settings become active again.

Alarm classes

Only some of the enabled alarm classes are enabled.

When you configure an alarm window, for example, in the global screen in Project_1, you copy the alarm window and paste it to the global screen in Project_2.

Only some of the enabled alarm classes are enabled after pasting.

This behavior applies to the following display objects:

- Alarm window
- Alarm indicator
- Alarm view

See also

Basics (Page 6217)

12.13.6.2 Copying and pasting

Copying screens

Introduction

You copy one or more screens from the "Screens" folder and paste them into the "Screens" folder of another device.

Type and size of the displays

In the case of HMI devices with keys, the available keys are displayed automatically in the screen. When a screen is copied between HMI devices, the keys are either displayed or hidden; functions configured for function keys are not transferred.

If there is less space for the screen in the target HMI device than in the source HMI device, you can adjust the size of and the spacing between existing objects.

Automatic fit to size for objects

1. Select "Options > Settings > Visualization > Resize screen and screen objects" in the menu.
2. Activate, for example, "Fit to height".

See also

Copying recipes within an HMI device (Page 6221)

Copying objects with linked objects (Page 6222)

Linked objects copied automatically (Page 6222)

Linked objects copied automatically (Page 6223)

Drag & drop from the details view (Page 6223)

Copying recipes within an HMI device

"Recipes" Editor

You can copy recipes, recipe elements and recipe data records within each table. You copy a recipe element to another recipe.

Only WinCC Runtime Professional: You can copy a recipe view element to another recipe view. If a recipe view element of the same name already exists, a conflict dialog is displayed. You can select whether to replace or rename the recipe element. You can copy recipe elements to the first empty row of the "Recipe views" editor, "Elements" tab.

You can copy a recipe data record to another recipe, if the other recipe contains the same number of recipe elements. If the data types differ, the value will be copied to the target data record but it is assigned an error flag.

"Tags" editor

You can drag-and-drop a tag to a recipe element in the "Tag" column. The tag is linked to the recipe element. If a tag is already linked, an error message will be generated.

"Screens" editor

If you drag-and-drop a recipe to a screen, a new recipe display will be created and linked to the recipe.

See also

Copying screens (Page 6220)

Copying objects with linked objects

Introduction

An object is linked to another object in the following situations, for example:

- You specify a tag for an alarm as a trigger tag.
  The alarm is the object. The tag is the linked object.
- You specify a connection for an external tag.
  The tag is the object. The connection is the linked object.

The object is always fully inserted during copying and pasting. Whether or not the linked object is pasted depends on the command used to insert it.

Simple pasting

The linked object is not copied. The linked object is transferred and handled as follows in the target HMI device:

- If an object with the same name exists, the existing object with its settings is used.
- If no object with the same name exists, the name of the object will be displayed. The object becomes invalid.

For some objects, linked objects are pasted automatically during simple pasting.

See also

Copying screens (Page 6220)

Linked objects copied automatically (Basic Panels)

Copying linked objects

The following table shows the objects for which linked objects are pasted automatically in simple pasting.

Object	Linked object
Screen	Template

Copying screens (Page 6220)

Drag & drop from the details view

Introduction

You can improve configuration efficiency with just a few simple measures. Below are a few examples of efficient configuration.

Pasting objects to a screen from the details view

You can drag objects in the details view from various different editors to other editors.

Pasting a symbolic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a text list, for example, "Textlist1" in the Details view.
4. Drag-and-drop a text list from the Details view to a screen. A symbolic I/O field has been created and connected to the text list "Textlist1".

Pasting a graphic I/O field

1. Open a screen.
2. Click on the "Text and graphics lists" editor in the project tree. All existing text and graphics lists will be shown in the details view.
3. Click on a graphics list in the Details view, for example "Graficlist1".
4. Drag-and-drop a graphics list from the Details view to a screen. A graphic I/O field has been created and connected to the graphics list "Graficlist1".

Pasting an I/O field

1. Open a screen.
2. Click on the "HMI tags" editor in the project tree. All existing HMI tags will be shown in the Details view.
3. Click on an HMI tag in the Details view, for example "Tag1".
4. Drag-and-drop the HMI tag from the Details view to a screen. An I/O field has been created and connected to the HMI tag "Tag1".

Copying screens (Page 6220)

12.13.6.3 Copying between different RT and ES versions

Introduction

You can copy and paste project data such as screens, objects or tags between projects with different WinCC versions.

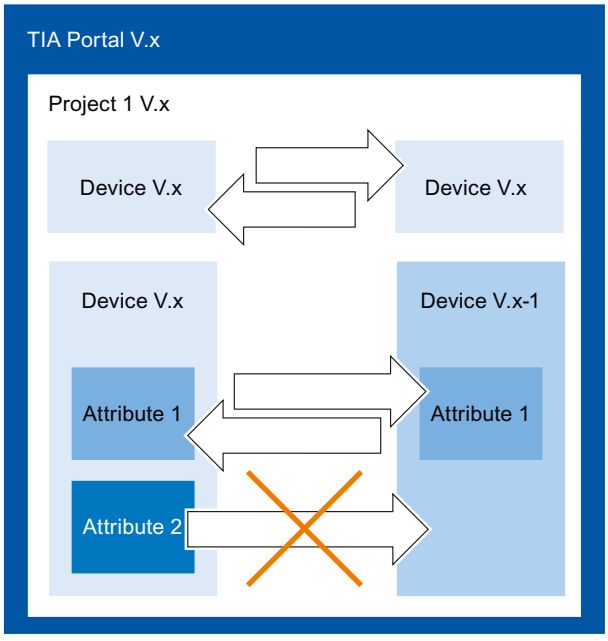
All configurations that are supported in the target version are retained when you copy data between projects of different WinCC versions. Configurations that are not supported by the target version are marked as invalid with a color code.

Copy of control between HMI devices from different device versions

WinCC supports all configurations of a previous WinCC version.

The following applies when copying within different ES versions:

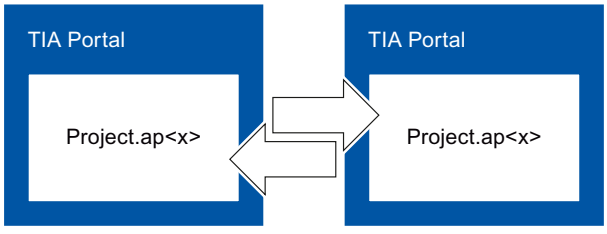
- All the configurations that are also supported in the respective RT version are retained.
- Default settings are defined for configurations that are only supported in the WinCC version of the target project.
- Configurations that are not supported by the respective RT version are marked by color as invalid or are not displayed.
  All properties and settings originally defined in the source HMI device are reactivated when you copy an object back to the source HMI device unchanged.

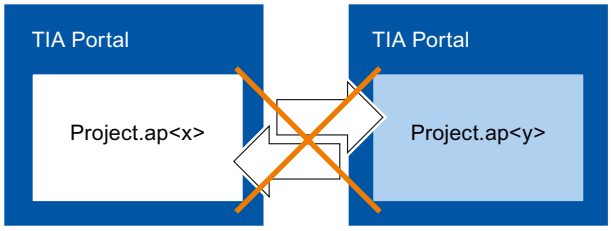


- The HMI device must be valid for the current Runtime version.

Copying between different ES versions

To copy between two TIA projects, open a second instance of the TIA Portal. You can only copy between projects that have the same ES version. The ES version of a project is indicated by the file extension *.ap<version_number>.





12.13.7 Using WinCC version compatibility

12.13.7.1 Basics on version compatibility (Basic Panels, Panels, RT Advanced)

Introduction

Edit existing projects as follows with WinCC:

- You edit, compile and download existing projects with the range of functions of the previous version of WinCC. You can continue to edit these projects afterwards with the previous version of WinCC.
- You upgrade existing projects and use the functions of the current WinCC version.

Note

WinCC functions

While editing a project of a previous WinCC version, you can only access the functions and HMI devices of this previous WinCC version.

Versions in WinCC

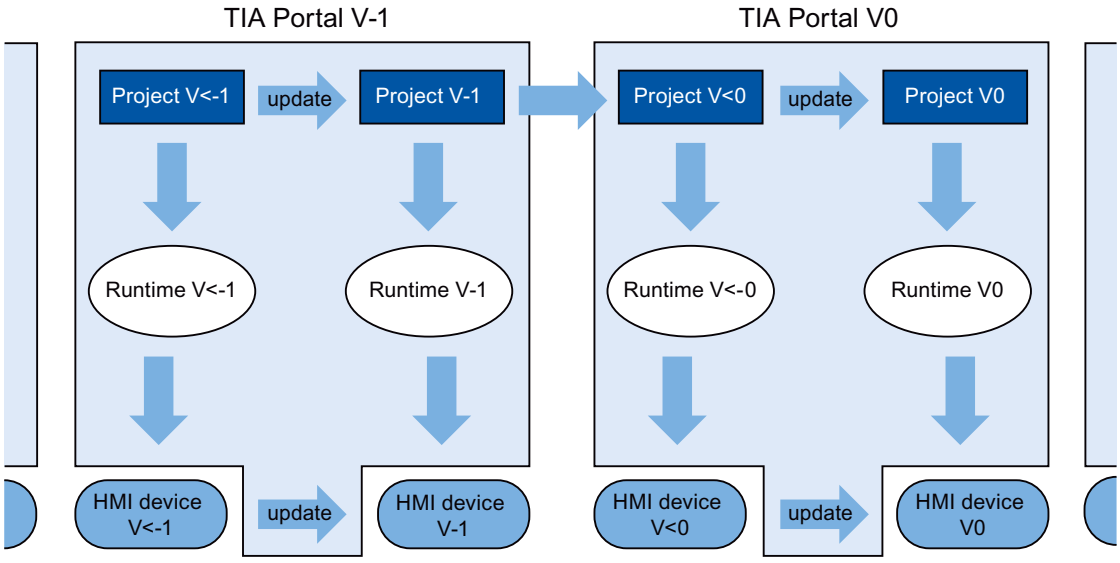
In WinCC, you work with different version types:

- WinCC version
  The WinCC version installed on the configuration PC, for example, WinCC V12.
- Project version
  Projects are created using the WinCC version that is installed on the configuration PC. While you are editing a WinCC project from a previous version in the current WinCC version, the version ID is displayed behind the project name in the project tree.

- Runtime version
  You can configure HMI devices with different runtime versions in WinCC. You specify the runtime version once for an HMI device. The device version must match the Runtime version.
- Device versions
  Depending on the used HMI device, the image is a combination of the operating system and / or runtime software. For each HMI device, WinCC provides various images which can be loaded onto the HMI device, if necessary, according to the configuration. The device version corresponds to a specific image. The device version must match the configuration.

Compatibility of WinCC versions, Runtime versions and device versions

The figure below shows the interaction of the versions in the TIA Portal:



Creating projects

After you create a new project in WinCC, open and edit it in the WinCC version in which you created it.

Saving

To save a project of a predecessor WinCC version in this version again, save it in the usual way. If you manually upgrade the project to your WinCC version, please note that you will no longer be able to open the project in the previous WinCC version.

To save a project of the previous WinCC version in the current version, upgrade the project to your WinCC version. You can then no longer edit the project with a previous version of WinCC.

Compiling, simulating and loading

If you are using a project of a previous WinCC version, you can use your current version to generate Runtime data for this previous version. This also allows you to load HMI devices that are no longer compatible with your WinCC version.

Copying within projects with different WinCC versions

If objects and configurations are also available in the target version, copy these as required via the clipboard or using drag-and-drop.

Opening, editing and saving projects of a previous WinCC version

You can open and edit projects of previous WinCC versions as required. In doing so, you only utilize the functions of the previous WinCC version. Once you have completed editing, you can once again save and edit the project in the previous WinCC version.

Compiling, downloading and simulating projects of a previous WinCC version

You can compile, download and simulate projects of previous WinCC versions as required. Your current WinCC version will provide the Runtimes and device versions for the corresponding WinCC version.

Changing the device version (Page 6232)

12.13.7.2 Editing projects of a previous WinCC version (Basic Panels, Panels, RT Advanced)

Introduction

WinCC provides the option of editing projects of a previous WinCC version. While editing a project of a previous WinCC version, you can only access the functions of this version. In order to use the functions of your current WinCC version for this project, upgrade the project to your WinCC version.

Note

If you upgrade a project to your WinCC version, please note that you will no longer be able to open and edit the project in the previous WinCC version.

Requirement

- A project of a previous WinCC version has been created.
- The current WinCC version is installed on the configuration PC.

Procedure

Proceed as follows to edit a project of a previous WinCC version:

1. Open the project.
2. Edit the project using the functions of the previous WinCC version.
3. Save the project.
4. Compile the project.
5. Download and simulate the project.
6. You can open the project in the previous WinCC version for further editing, if required.

Result

The modified project data can be edited further on a different configuration PC with the previous WinCC version for further processing. The Runtime project was generated and downloaded in the corresponding Runtime version.

Basics on version compatibility (Page 6226)

12.13.7.3 Upgrading projects

Introduction

If the project version is older than the WinCC version, the version ID is displayed in the project navigation. Your WinCC version also contains the previous version that you can use to edit projects as required. In order to use the functions and options of your WinCC version in a project, upgrade the project to your WinCC version. Then change your device or Runtime version(s) to match the new project version.

Note

WinCC version compatibility

If you upgrade a project to your WinCC version, please note that you will no longer be able to edit the project with the previous version.

Requirements

- The project version is a predecessor of your WinCC version.
- You have write access to your project drive.
- The project drive provides sufficient storage capacity for another project of this size.

Procedure

Proceed as follows to upgrade a project to your WinCC version:

1. Select the project in the project navigation.
2. Select the "Upgrade project" command from the shortcut menu of the project.
   A dialog opens.
3. Click "Confirm".
   The project closes and the progress bar is displayed.

An alarm is output when the project has been upgraded.

Result

- The project has been saved on the project drive in the previous WinCC version and with the corresponding file extension.
- The project is displayed on the project drive in the current WinCC version and with the corresponding file extension.
- The project is displayed without a WinCC version ID in the project navigation.

To make use of the functions of the new WinCC version, change your device or Runtime version(s) in accordance with the new project version in the next step.

Basics on version compatibility (Page 6226)

12.13.7.4 Upgrading a global library

Introduction

In order to process objects of a global library in a project, the global library must be available in the product version of the project. You can upgrade each global library from an older product version to the current product version. You are prompted accordingly when you open the global library.

Requirements

- The version of the global library is a predecessor of your WinCC version.
- You have write access to your project drive.
- All types in the library have been released.

Note

Upgrading a user library

If you want to use a user library from an earlier version of WinCC, you must upgrade it. Make sure that all types of the library have been released. The library being upgraded cannot contain a type with the "in progress" status.

Procedure

Proceed as follows to upgrade a global library from TIA Portal V12.x or lower:

1. Open the global library.
   The "Upgrade global library" dialog box opens.
2. Click "OK".

A copy of the global library is created and upgraded. The copy of the global library receives the name extension "_V13". The global library opens.

Result

The global library is stored with the appropriate file extension.

Basics on version compatibility (Page 6226)

Managing libraries
(Page 6120)

12.13.7.5 Changing between device versions

Selection of the device version

When you configure a new HMI device, WinCC automatically selects the latest version of the device.

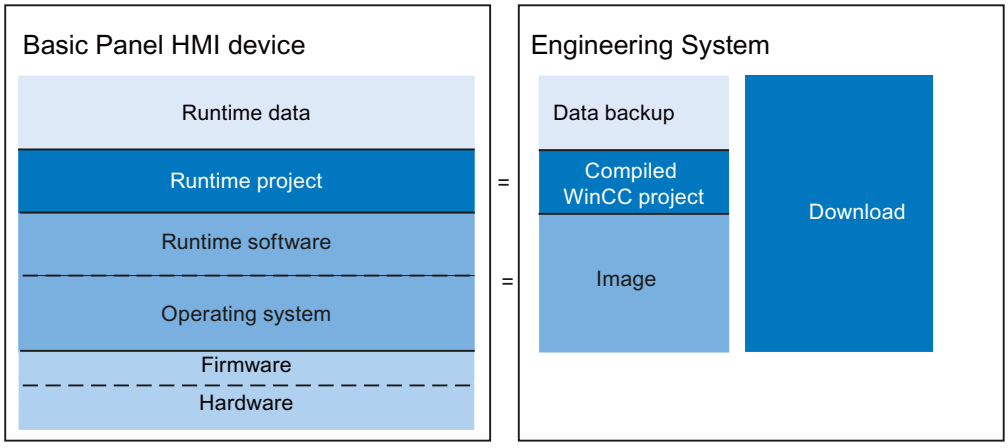
If you want to use a device version other than the one set in WinCC, transfer an image to the HMI device. WinCC provides the images required for the supported HMI devices.

Information on the device versions used in WinCC is available in the FAQs on the Internet, entry ID 21742389.

NOTICE
Changing the device version deletes all data on the HMI device. Data is deleted on the target system if you change the device version. For this reason, you should save existing Runtime data before changing the device version.

HMI device configuration

The following figure shows the software components of an HMI device:



See also

Basics on version compatibility (Page 6226)

Updating the operating system (Page 6370)

Changing the device version (Page 6232)

12.13.7.6 Changing the device version

Introduction

Depending on the required Runtime version, select the suitable device version for your configuration.

Note

Selection of device versions

The selection of available devices versions depends on the version of the project.

Requirements

- A project has been created and opened.
- The project contains an HMI device.

Procedure

To change the device version, follow these steps:

1. Double-click on "Devices & Networks" in the project tree.
   The editor opens.
2. Select the required HMI device from the device view.
3. Select "Change Device/Version" in the device shortcut menu of the HMI device.
   A dialog opens.
4. Select the required HMI device.
5. Select the required device version under "Version".
6. Confirm your selection with "OK".

Result

You have changed the device version in the WinCC project.

NOTICE
Changing the device version deletes all data on the HMI device. All data is deleted from the HMI device when you change the device version and compile/ download the project. You should therefore backup your Runtime data prior to the download.

Basics on version compatibility (Page 6226)

Changing between device versions (Page 6231)

12.13.8 Viewing memory card data

12.13.8.1 Basics (Basic Panels, Panels)

Introduction

WinCC provides you with the possibility of viewing data stored on your memory card. The function supports the use of memory cards of the HMI device and of the CPU.

You have the following options:

Viewing a backup (Page 6234)

Renaming and deleting backups (Page 6235)

Viewing HMI device images (Page 6236)

Deleting HMI device images (Page 6238)
Creating HMI device images on memory card (Page 6239)

See also

Viewing a backup (Page 6234)
Renaming and deleting backups (Page 6235)
Viewing HMI device images (Page 6236)
Deleting HMI device images (Page 6238)
Creating HMI device images on memory card (Page 6239)

12.13.8.2 Working with backups

Viewing a backup (Basic Panels)

Introduction

The backup of a Basic Panel that is stored on a memory card can also be viewed in the TIA Portal.

Requirements

- WinCC is installed.
- A memory card with a backup is available.
- The card reader is connected to the configuration PC.
- The project view is open.

Backup on the memory card in the card reader

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder
5. Click the backup to open the shortcut menu.
6. Select "Properties".

Backup on the memory card of the PLC

Proceed as follows if the backup is stored on the memory card of the PLC:

1. Connect the PLC with the configuration PC.
2. Click on the PLC in the project navigation.
3. Select "Connect online" from the shortcut menu.
   A connection to the PLC is established.
   Once the PLC is connected, the "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder.

   Note

   Accessing a password-protected PLC

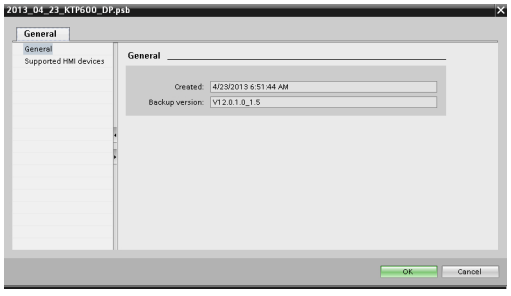
   When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

   You need at least read access rights in order to view the data that is stored on the memory card.

5. Click the backup to open the shortcut menu.
6. Select "Properties".

Result

The backup properties are displayed in a separate dialog.



See also

Renaming and deleting backups (Page 6235)

Basics (Page 6233)

Renaming and deleting backups (Basic Panels)

Introduction

You can rename and delete backups from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
  The PLC is connected online with the configuration PC.
- A memory card with a backup is available.
- The project view is open.
- The backup is displayed in the project navigation.

Note

Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

You need write access rights to rename or delete memory card data.

Procedure

1. Click on the backup in the project navigation.
2. Open the shortcut menu.
3. Select "Rename" to rename the file.
4. Enter a new name.
5. Select "Delete" to delete the file.

Result

The backup file is now renamed or deleted.

See also

Viewing a backup (Page 6358)

Basics (Page 6357)

12.13.8.3 Working with HMI device images

Viewing HMI device images

Introduction

The HMI device image of a Comfort Panel that is stored on a memory card can be viewed in the TIA Portal.

Requirements

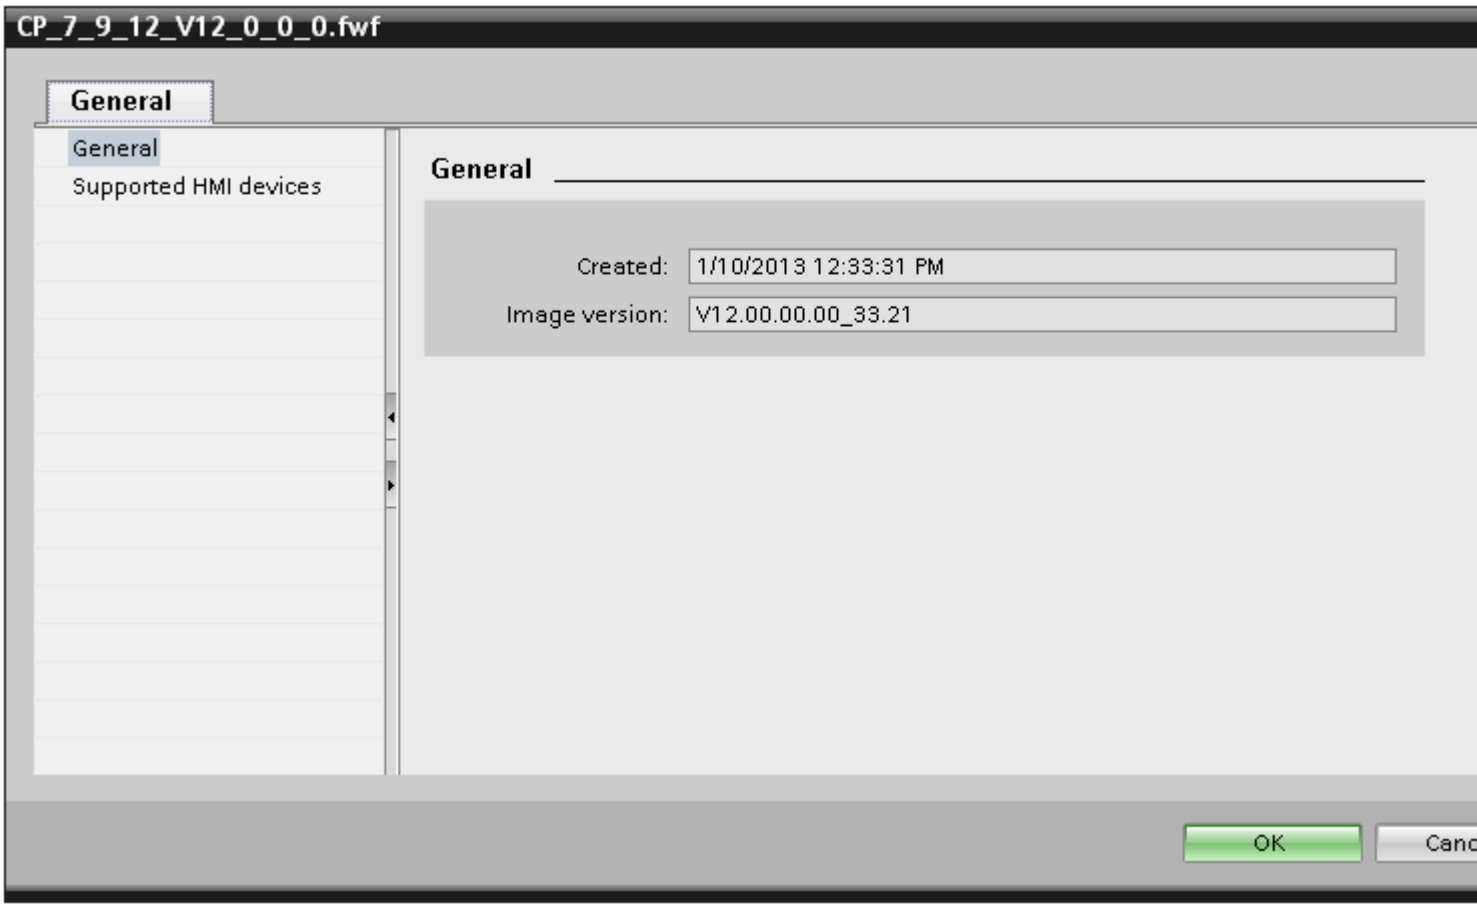
- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with the HMI device image is available.
- The project view is open.

Procedure

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" dialog is displayed.
4. Open the "Online Card Data" folder.
   The available images of the HMI device are displayed in additional folders.
5. Click the required HMI device image.
6. Select "Properties" in the shortcut menu.

Result

The properties of the HMI device image are displayed in a separate dialog.



See also

Deleting HMI device images (Page 6238)

Creating HMI device images on memory card (Page 6239)

Basics (Page 6233)

Deleting HMI device images

Introduction

You can delete the HMI device image of a Comfort Panel from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with an HMI device image is available.
- The project view is open.
- The HMI device image is displayed in the project navigation.

Procedure

1. Click the HMI device image in the project navigation.
2. Open the shortcut menu.
3. Select "Delete" to delete the file.

Result

The HMI device image is deleted.

See also

Viewing HMI device images (Page 6236)

Basics (Page 6233)

Creating HMI device images on memory card

Introduction

You may edit the HMI device image of a Comfort Panel without connecting the Comfort Panel to the configuration PC.

Simply create the HMI device image on an external memory card or USB stick and then transfer it from there to the Comfort Panel.

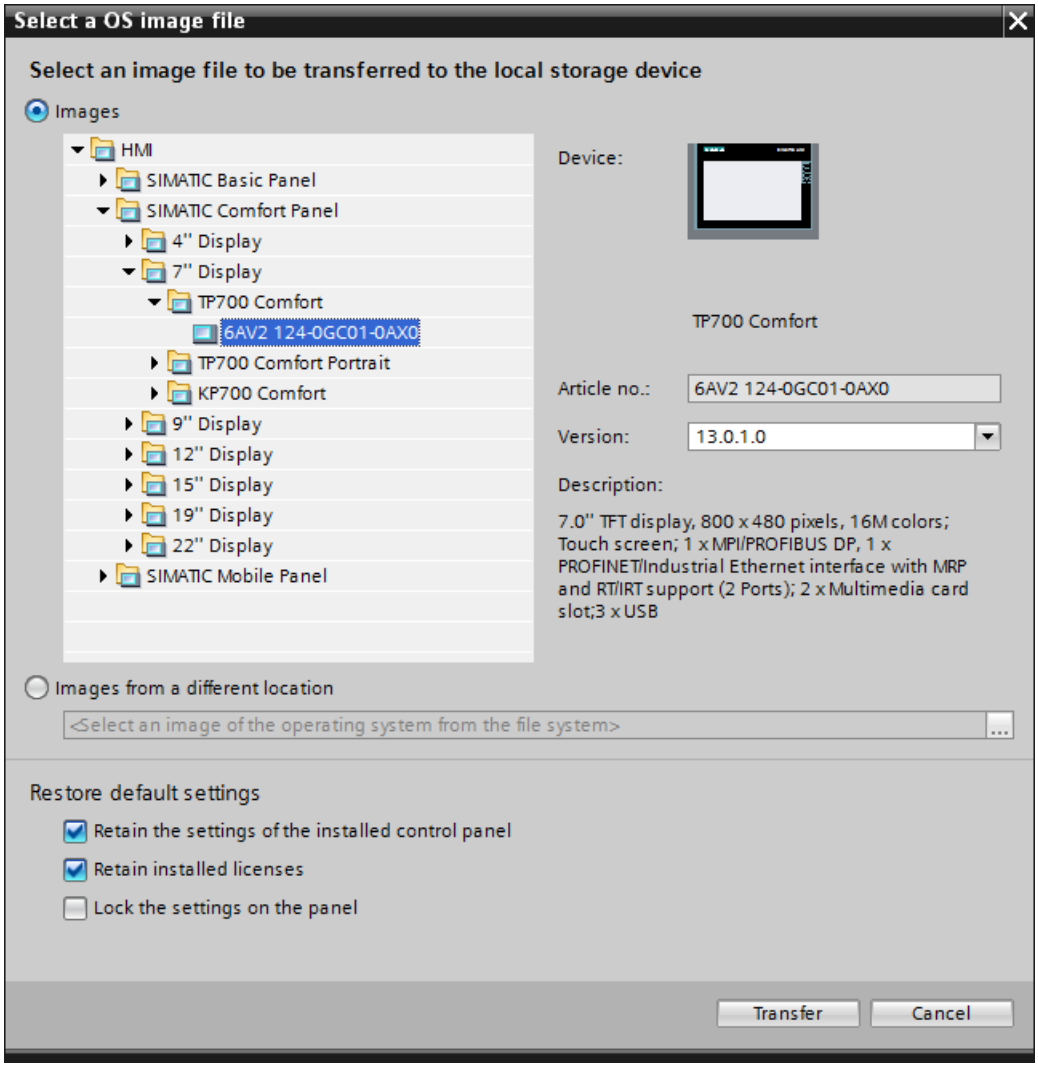
Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- The project view is open.

Procedure

1. Insert the memory card into the card reader.
2. Click on the memory card in the project navigation.
3. Open the shortcut menu.

4. Select "Create HMI OS image on memory card".
   A dialog opens.



5. Select an HMI device image.
6. Select the settings for the restoration.
   - Activate "Retain installed settings of the Control Panel"
     The settings you have made on the Comfort Panel are retained.
   - Activate "Retain installed licenses":
     The licenses on the Panel are retained.
   - Activate "Lock settings on the Panel"
     You can no longer change the selected settings for "Retain installed settings of the Control Panel" and "Retain installed licenses" on the Comfort Panel.

Result

You have created an HMI device images on memory card. You may use a USB stick instead of a memory card.

See also

Viewing HMI device images (Page 6236)

Basics (Page 6233)

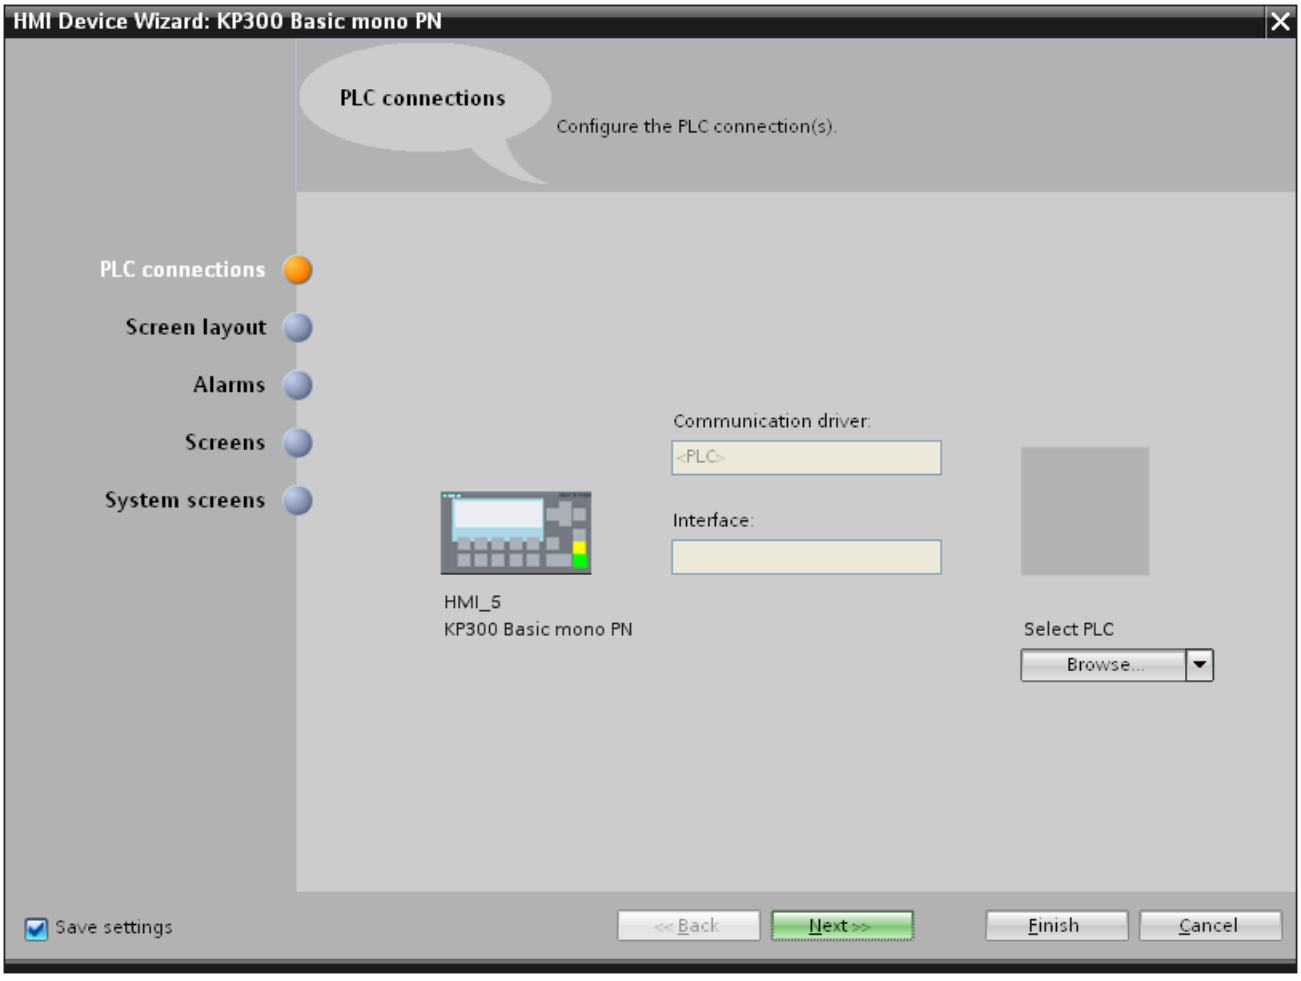
12.13.9 HMI device wizard basics (Basic Panels, Panels)

Introduction

The HMI device wizard will automatically start when you create a new HMI device in your project.

HMI device wizard

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



Note

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

Note

Multiple languages in the HMI device wizard

If you create multilingual screen navigation with the HMI device wizard, WinCC uses the user interface language for user-defined labels in all project languages.

If the character set of the user interface language is not supported in a project language, these names will not appear in this project language, for example, with a Chinese interface language and English project language.

Note

Interface type of the connection

If possible, the HMI device wizard makes a connection between the HMI device and controller with the default interface type of the HMI device.

After configuration with the HMI device wizard, check the connection in the "Devices & Networks" editor.

See also

HMI device wizard basics (Page 6245)

12.13.10 Managing colors centrally

12.13.10.1 Basic principles for color management

Introduction

WinCC provides the option of changing the colors used in a project centrally. The "Change color reference" dialog box contains a hierarchical overview of all color-relevant properties contained in the selected object. In the display, you can navigate within the display and operating objects that are shown and thus get an overview of all colors used. Using search and filter you can specify a color selection and replace it with other colors, if necessary.

Supported objects

You have access to all colors used and configured in the project with the "Change color reference" dialog. Excluded from this are colors that are used as follows:

- In types and instances from a library
- In faceplates
- In scripts
- In designs
- In screens with write protection

12.13.10.2 Finding and replacing colors

Introduction

The scope of the objects displayed in the "Change color references" dialog depends on the location at which the dialog is called.

- If you select an HMI device and call the dialog, all color references used on the HMI device are displayed.
- If you select a display object within a screen and call the dialog, only those color references that are included in the display object are displayed.

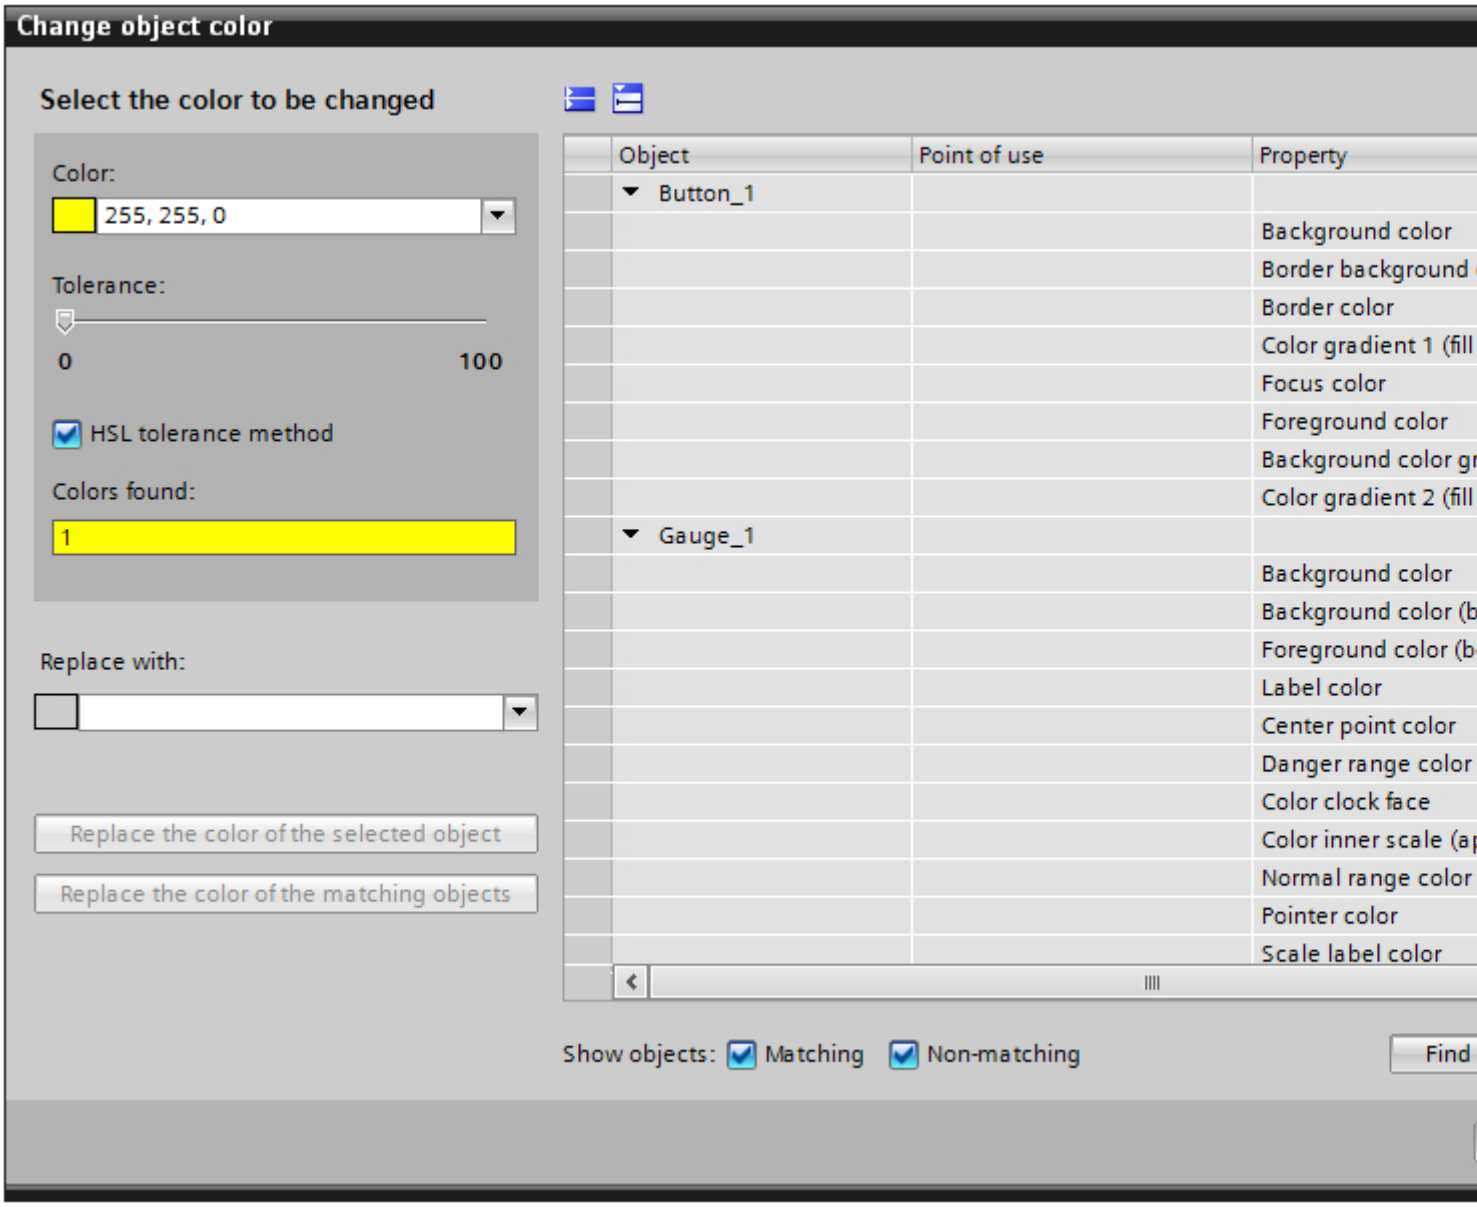
Requirement

- You have created a project.
- Screens have been created.

Procedure

1. Select the object that contains the required color references.
2. Select "Change object color" in the shortcut menu.
   A dialog opens.

3. Select the color that you want to change.
   - Click the color field in the search box.
     The project color selection opens.
   - To select a standard color or a user-defined color, click "More colors".
   - To use a color directly from the selected object, drag a color field from the overview table to the search box.
   - To select similar colors as well, set a tolerance.



4. Filter the displayed table.
5. In the table column "Replace with" select the new color for the individual properties.
6. Click "OK".

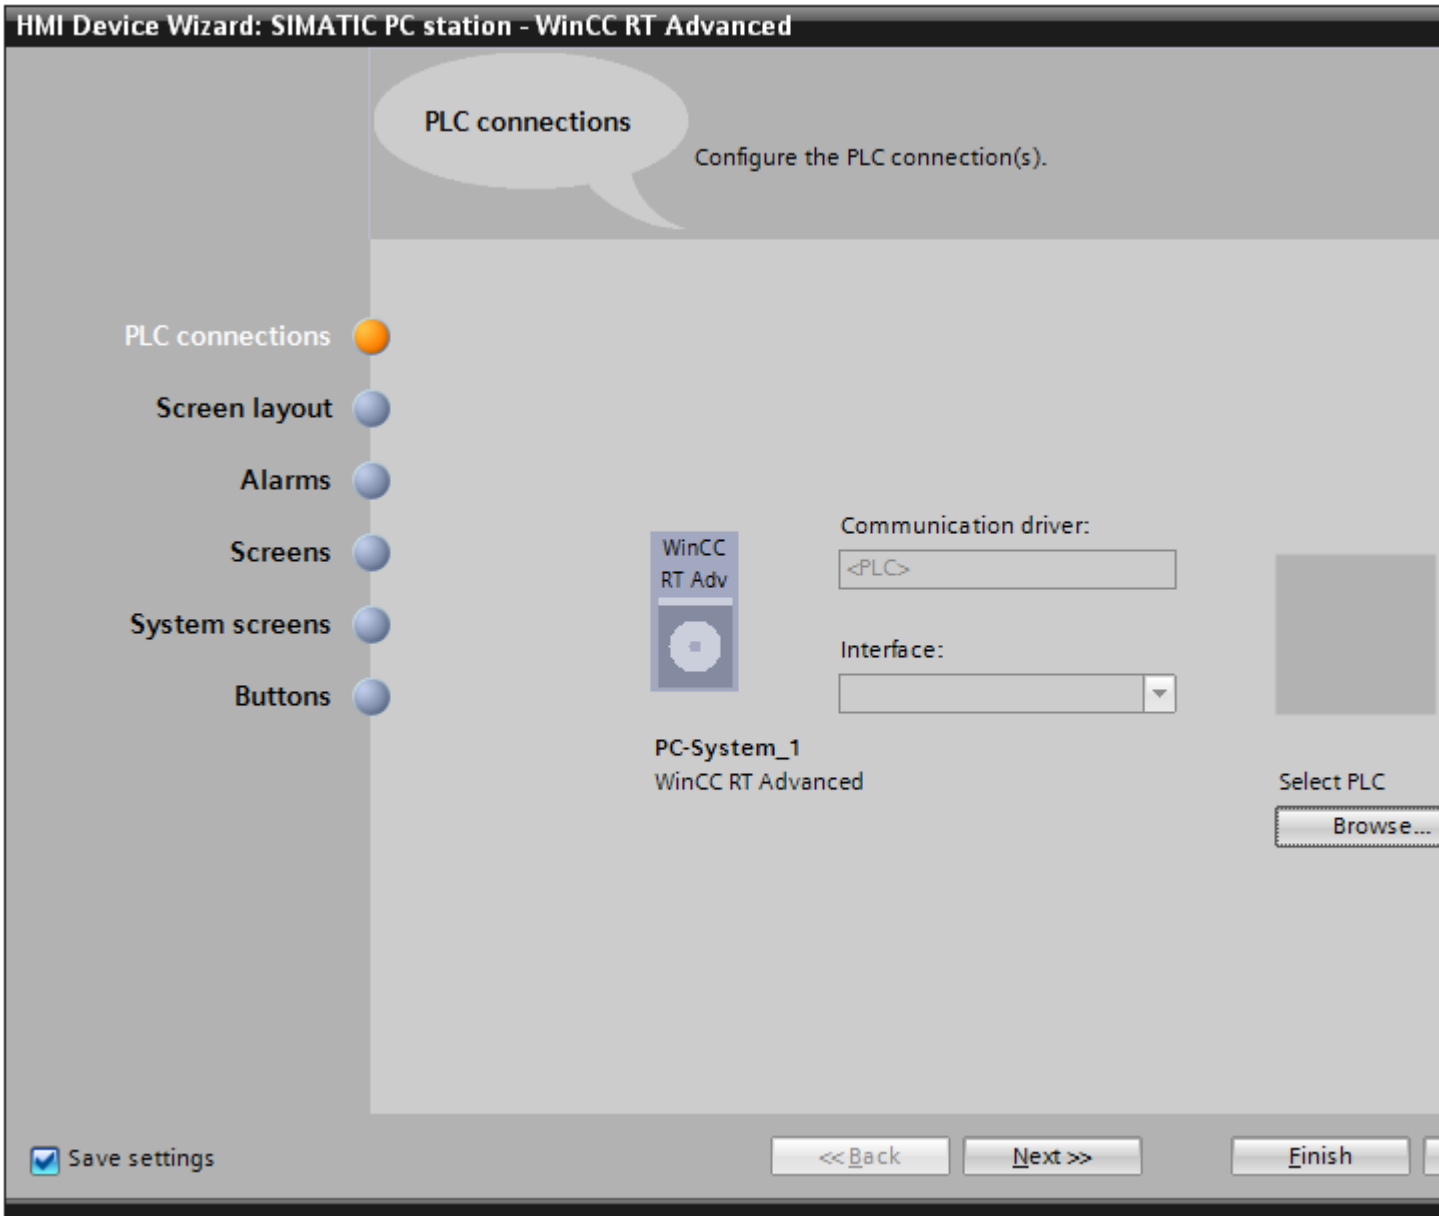
Result

The new color references are configured in the selected object.

12.13.11 HMI device wizard basics (RT Advanced, RT Professional)

Introduction

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



Opening the HMI device wizard

1. Add a new device to your project, for example, RT Advanced.
2. Click on the device in the project tree.
3. Select "Start the HMI device wizard" in the shortcut menu. The "HMI device wizard" opens.

Note

If you make changes after adding the device, such as adding a new screen, the HMI device wizard will not open again.

Note

When you create a device with a color display using the HMI device wizard, the graphics of the navigation buttons may be displayed in black and white. This error only occurs, however, if the new device is created with the same name as a device with a monochrome display which has been deleted in the meantime.

You can avoid this error by always deleting the associated graphics in the Graphics collection whenever you delete a device from the project.

Note

Device dependency - quotation marks in project names

WinCC Professional projects whose names are in quotation marks have not been compiled.

When you create an HMI device for WinCC RT Professional, do not use quotation marks within the project name.

Note

Multiple languages in the HMI device wizard

If you create multilingual screen navigation with the HMI device wizard, WinCC uses the user interface language for user-defined labels in all project languages.

If the character set of the user interface language is not supported in a project language, these names will not appear in this project language, for example, with a Chinese interface language and English project language.

See also

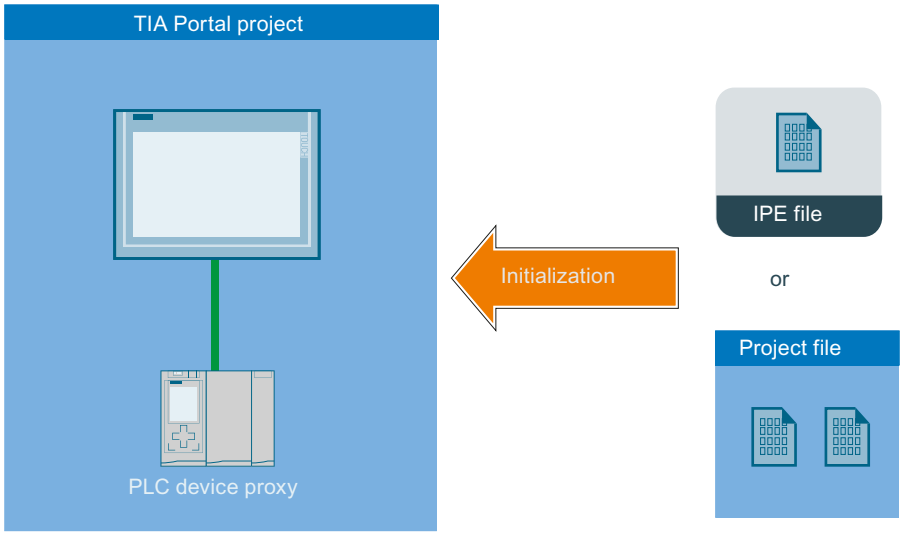
HMI device wizard basics (Page 6241)

12.13.12 Exchanging controller data from other projects

Inter-project engineering

You can use the IPE (Inter Project Engineering) function to read in controller data from other TIA Portal projects and use it for configuring.

IPE enables you to transfer and merge the HMI configuration and PLC programming communication into various TIA Portal projects.



You can find more information and notes on configuration under: Basics of Inter Project Engineering (IPE)

12.14 Compiling and loading

12.14.1 Establishing a connection to the HMI device

Introduction

To download a WinCC project to an HMI device, a properly configured connection must be set up between the configuration PC and HMI device. The connection cannot be set up, the download is cancelled.

Setting up a connection between the configuration PC and HMI device

1. Check the cable connection between the HMI device and configuration PC.
2. Open the "Devices & Networks" editor in WinCC and start the network view.
3. Select the subnet in the network view and check the settings for the subnet.
4. Select the interface of the HMI device in the network view or device view and check the connection parameters in the Inspector window.
5. Switch on the HMI device and press the "Control Panel" button in the loader.
   The Control Panel opens.
6. Press "Transfer" twice in the Control Panel.
   The "Transfer Settings" dialog box opens.

7. Check the settings and then press "Advanced".
   The [Protocol*] Settings" dialog opens.
   *: The title of the dialog depends on the protocol used, for example, "PROFIBUS Settings".
8. Check the advanced settings and close the dialog with "OK".

Important settings

Check the connection settings and in particular the following parameters:

- Network and station addresses
- Selected transmission rate
- Master on the bus; as a general rule, only one master is permitted.

Note

Connections over Ethernet

For Ethernet-based communication, check the required network settings. You can find additional information under "Readme > WinCC > Security information".

If using a configurable adapter for the connection, check the adapter settings, for example, transmission rate, master on the bus.

Loading a project (Page 6307)

12.14.2 Basic Panels (Basic Panels)

12.14.2.1 Runtime settings (Basic Panels)

Runtime settings (Basic Panels)

Introduction

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree.

Note

Device dependency

The options available for selection in the Runtime settings depend on the HMI device.

Overview

You configure options from different areas of your project in the runtime settings:

- Display in Runtime
  - Start screen
  - Default template
  - Standard style of the project and style of the HMI device
  - Screen resolution
  - Full-screen mode
  - Graphic browser
  - Bit selection for color and flashing
  - Bit selection for text and graphic lists
- Project ID for compatibility check with the controller
- Logging language
- Remote control via Sm@rt server in the "Services" area
  You can find additional information on this in the WinCC online help under "Options > Sm@rt Options"
- Operating in Runtime
  - Task switching
  - Load additional information for debugging scripts: Object names and comments in scripts
  - Show limits as a tooltip
  - On-screen keyboard
  - Disable function keys
  - Release buttons when you leave the button
  - Keyboard layout and keyboard shortcuts
- GMP-compliant configuration
  You can find additional information on this in the WinCC online help under "Options > WinCC Audit".
- Alarms
  - Buffer overflow
  - Text of the acknowledgment group
  - Log
  - Colors of the alarm classes
  - Configuration of the system events
  - Configuration of the controller alarms

- User administration
  - Configuration of the password and logoff time
  - Limit for logon attempts
  - Hierarchy levels
  - Configuration of SIMATIC Logon
- Language and font
  - Available Runtime languages
  - Order of language switching
  - Default font
  - Download font with valid license
- Configuration of the OPC Unified Architecture Server
- Settings for synchronization of the controller and HMI tags

See also

Working with logs for Runtime Advanced and Panels (Page 5529)

Managing languages (Page 6171)

Configuring the display in Runtime (Basic)

Introduction

In the Runtime settings you specify how screens, alarms and language are displayed.

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree. The options available for selection depend on the HMI device.

Display on the target system

In WinCC, configure the visual representation of the generated project in Runtime:

- Select the full-screen or window mode for the project. The window has a smaller size than the screen. In full-screen mode, the project is zoomed to the full screen. There will be no window and operator controls for this view.
  Click "General" in the "Settings" editor to activate the full-screen display at startup. Activate the "Full-screen mode" check box in the "Screen" field.

  Note

  Truncated view

  If the HMI screen does not match the configured size (in pixels), the project only appears on part of the screen in full-screen mode.

- Under "General > Screen", you specify whether the HMI device uses the default style of the project or another pre-defined style.

Screen settings

In the Runtime settings, specify the start screen and default template. You can find additional information in the online help for WinCC under "Working with screens".

Language settings

- Logging language
  Under "General > Logs", you specify the language in which you want to write the logs. The selected logging language always remains the same, even if the user switches the language in Runtime.
  If you select "Startup language", the logging language remains the same until Runtime is stopped, even if the user has switched the language. However, the next time Runtime is started, the last configured Runtime language is used as the logging language.
- Runtime language
  Under "Language & font", you specify all Runtime languages and their display. Text entries may be truncated if you selected an unsuitable font size or style. This setting can, for example, affect the following texts:
  - Tooltips
  - Long alarm text
  - Text in dialogs

Setting for specific screen objects

- Specify bit selection
  Under "Screens > Bit selection", you specify whether bit selection will be used on this HMI device for the following:
  - Text and graphics (text lists and graphic lists)
  - Color and flashing (appearance analysis)
    When you enable an option, the selection that is configured in the set bit with the least significance is displayed:
    When you disable an option and several bits are set, the selection that has been configured only for the set bit is displayed.
- Tooltips for I/O fields
  Under "Screens > Display", you specify whether configured limit values are displayed as tooltips in Runtime when values are entered in I/O fields.
- Colored objects
  You specify the color depth of your HMI device under "General > Screens > Color depth". As needed, you assign screen objects a colored appearance. The range of colors is determined by the color depth supported on your selected HMI device.

Configuring operation in Runtime (Basic) (Basic Panels)

Introduction

In the Runtime settings you specify how screens are operated, and how you use keys for operation in Runtime.

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree. The options available for selection depend on the HMI device.

Locking task switching

Depending on the HMI device, you can lock task switching on the HMI device. This will prevent the operator from opening other applications in Runtime.

In the Runtime settings of the HMI device, enable the "Lock task switching" option under "General > Screen".

Note

Stop Runtime

If you lock program switching, always configure in your project the system function "StopRuntime" for an object, e.g. a softkey or button.

Settings for data transfer to the HMI device

- Transferring names of the screen objects in scripts
  If you enable the "Load names" option under "General > Screen", the object names of the screen objects are transferred instead of coded addressing information. You need the object names, if you want to address the screen objects in a script via the object names. When you test a script in the debugger, the code becomes more comprehensible by displaying the object names.
- Displaying comments in scripts
  Under "Screens > Display", you specify whether the comments in scripts are also transferred to the HMI device.
  If you do not transfer the comments, you save storage space on your HMI device.
  If you transfer the comments, the script is more easily understood during testing in the debugger.

Operation using function keys

To symbolize the function of a function key for keyboard devices, you configure a graphic next to the function key in the display. Under "Screens > Function keys > User-defined pictogram size", you specify whether you want to use a graphic size that deviates from the standard size.

Operation with keyboard

Under "Keyboard > General > Use screen keyboard", you specify whether the screen keyboard is available on your HMI device.

Under "Keyboard > General > Release button on exit", you specify whether the "Release" event is triggered when the user exits a button without releasing it.

Under "Keyboard > Disable function keys in dialogs", you specify for keyboard HMI devices whether the function keys are disabled for the duration of the displayed dialog. Large dialogs can hide explanatory areas or graphics at function keys or that border function keys. Functions keys can be unintentionally pressed due to this.

Compatibility check with the controller

Introduction

The "Project ID" area pointer is used to configure the project ID for checking the consistency of the project with the PLC. The area pointer reads the project version from the PLC. You can find additional information in the online help for WinCC under "Communicating with controllers".

Compatibility check with the controller

You select the project ID in the Runtime settings of the HMI device under "General > Identification > Project ID".

At startup, Runtime checks whether the project ID of the project matches the PLC project version. Runtime will only start if the two values match.

An area pointer "Project ID" is created for connections whose address you specify in the PLC. The value that you store at this address will become the project ID.

The project ID is not available on all HMI devices.

Password protection in Runtime (Basic Panels)

Password protection in Runtime (Basic Panels)

Overview

Connection establishment in the TIA Portal can be password-protected. The configured passwords are saved in encrypted form. When transferred to the target system, the passwords are also protected from unauthorized access and cannot be read. The passwords are securely decrypted on the HMI devices in runtime.

Password protection can be set up for the following connections:

- SIMATIC S7-1200
- SIMATIC S7-1500
- SIMATIC S7-1500 software controller (WinAC)
- PC Station 2.0 (station manager)

Note

The passwords become invalid if you switch to an older version.

Downloading certificates

The certificate for decrypting the passwords is saved in the certificate store of the HMI device. A system alarm is output if the certificate is not available.

You can restore the certificate by downloading the configuration again.

See also

Configuring a password for transport (Page 6254)

Resetting the password for transport (Page 6255)

Configuring a password for transport (Basic Panels)

Introduction

To protect the private password key during transport, you can configure a password for transport under "Runtime settings".

Creating a password

1. Open the "Runtime settings > General" editor in the Project window.
2. Enter the password in the "Enter password" box in the "Transport password" area.
3. Confirm the password in the "Confirm password" box.

Note

If there was no previous password, the "Old password" box is disabled.

Result

You have now configured the password for transport. If a password for transport has been configured and you transfer the project to the HMI device, a dialog with a password prompt will appear once in runtime.

The dialog with the password prompt also appears if the password has been changed. If the password entered is correct, the certificate is saved in the certificate store of the HMI device.

See also

Password protection in Runtime (Page 6254)

Resetting the password for transport (Page 6255)

Resetting the password for transport (Basic Panels)

Introduction

If you have moved the transport password, for example, you can create a new security certificate. To do so, reset the transport password.

Resetting the password

1. Click the "Reset password" button.
   The password is reset. A new certificate without a password is generated.

   Note

   Other passwords, for example the password for the PLC, will become invalid. The next time you compile, an error message will appear telling you that these passwords are no longer valid.

2. Enter the new password and confirm it in the "Confirm password" field.

   Note

   The certificate is not password-protected until you enter a new password for transport.

Password protection in Runtime (Page 6254)

Configuring a password for transport (Page 6254)

12.14.2.2 Overview of compiling and loading projects (Basic Panels)

Overview

The project is compiled in the background even as you are configuring it in WinCC. This reduces the time for final compilation. When you start compilation, you create a file that can be run on the corresponding HMI device.

If an error occurs during compilation, WinCC provides support in locating and correcting it.

Once you have corrected any problems, you download the compiled project to the HMI devices on which the project is to run.

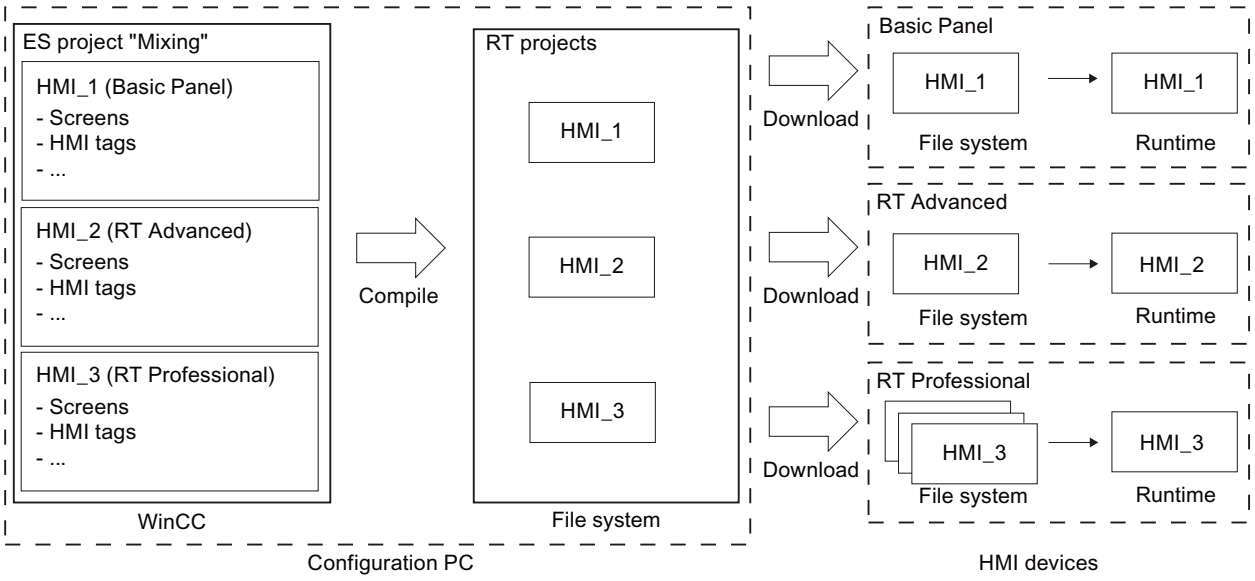
If you are using HMI tags in your project that are connected to PLC tags, you should also compile all modified S7 blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

Definition of terms

The term "project" has two different meanings in the contexts of compilation and loading. "Project" is the WinCC project on the configuration PC. "Project" is also the Runtime project you create by compiling the configuration data of an HMI device and download to the HMI device.

- WinCC project: contains the configuration data of one or more HMI devices
- Runtime project: contains the compiled configuration data of an HMI device

The figure below illustrates the link between WinCC projects and Runtime projects using the example of the "Compile and load" process:



Runtime version

The Runtime version depends on the image of the configured HMI device. The Runtime version of the compiled project is displayed under "Info" in the Inspector window.

12.14.2.3 Compiling a project (Basic Panels)

Introduction

The changes made to the project are compiled in the background even as you are configuring a project in WinCC. Projects are compiled automatically when you load them. This ensures that the latest version of the project is loaded at all times.

WinCC checks consistency of the project during compilation. The error locations in the project are listed in the Inspector window. You can jump directly to the source of the error from the entry in the Inspector window. Check and correct errors found.

Scope of the compilation

Configuration data is compiled in the background as soon as you start configuring an HMI device. If you compile a project manually, only the changes in the configuration made since the last compilation process are compiled in the background.

You can start complete project compilation manually at any time; this may, for example, be done to test the consistency of the configured data.

Requirement

- A project is open.

Procedure

Proceed as follows to compile a project:

1. If you want to compile several HMI devices at the same time, select all the relevant HMI devices with multiple selection in the project tree.
2. Compile the project:
   - To only compile changes in the project, select the "Compile > Software (only changes)" command from the shortcut menu of the HMI device.
   - To compile all project data, select the "Compile > Software (compile all)" command from the shortcut menu.

Result

The configuration data of all selected HMI devices is compiled. Any errors that occur during compilation are shown in the Inspector window.

12.14.2.4 Simulating projects (Basic Panels)

Simulation basics (Basic Panels)

Introduction

You can use the simulator to test the performance of your configuration on the configuration PC. This allows you to quickly locate any logical configuration errors before productive operation.

You can start the simulator as follows:

- In the shortcut menu of the HMI device, or in a screen: "Start simulation"
- Menu command "Online > Simulation > [Start|With tag simulator|With script debugger]"
- Under "Visualization > Simulate device" in the portal view.

Requirements

The simulation/runtime component is installed on the configuration PC.

Field of application

Use the simulator to test various functions of the operator control and monitoring system, such as:

- Checking limit levels and alarm outputs
- Consistency of interrupts
- Configured interrupt simulation
- Configured warnings

- Configured error messages
- Check of status displays
- Interconnection and screen layout

Simulating a project

Introduction

You simulate your project with one of the following two methods:

- Without a connected PLC
  You change the value of area pointers and tags in a tag simulator that is read for the simulation of WinCC Runtime.
- With a connected PLC without a running process
  You simulate your project by running it directly in Runtime. The tags and area pointers become active. This allows you to create an authentic simulation of your configured HMI device in Runtime.

Note

Simulation restrictions

You cannot simulate the following system functions:

- CalibrateTouchScreen

You cannot simulate the Media Player. A static screen appears in the simulation window instead of the Media Player.

File access via scripts is not possible for HMI devices with Windows CE.

Requirement

- Simulation without a connected PLC: Tags have been created
- Simulation with a connected PLC but no active process: A project with tags and area pointers has been created

Procedure

To simulate a project using the tag simulator, follow these steps:

1. Open the project on the configuration PC.
2. Select the "Online > Simulation > With tag simulator" menu command.
   For initial project simulation, the simulator is started with a new, empty table. The project is opened simultaneously in Runtime.
   Toggle between the tag simulator and Runtime using the <Alt +Tab> key combination.
3. To simulate a process value, select the corresponding "tag" from the tag simulator.
   The table lists all configured tags. You can simulate up to 300 tags simultaneously.
4. Select the simulation mode in the "Simulation" column.

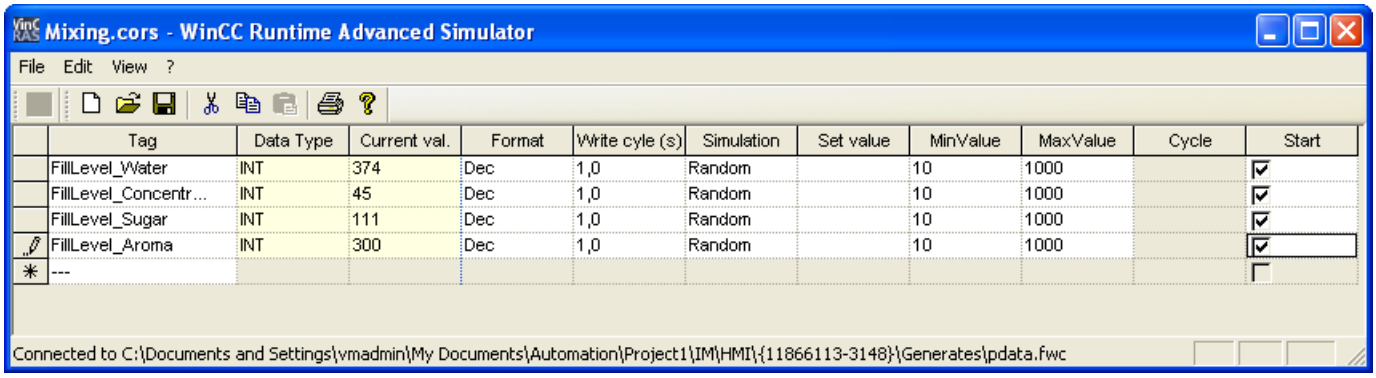
5. Change the value of tags and area pointers in the respective columns.
6. Activate the "Start" check box to start the simulation for this tag.
7. To save the simulation, select the menu command "File > Save" and enter a descriptive name, for example, "Mixing".
   The file name is assigned the extension "*.cors".

Result

The process values are simulated in Runtime. The tag values are created at random, or incremented, depending on the simulation mode.

To specify tag values, change the simulation mode to "<Display>" and enter a value at "Set value".

The following figure shows a tag simulator with four tags whose values can be determined at random in a range of values from 10 to 1000:



Managing simulation data

If you have saved data from a previous simulation, you can open the file at a later point in time and simulate your project again. The tags and area pointers listed in the tag simulator must still be available in the project.

Proceed as follows to open a simulation file:

1. Select the menu command "Online > Simulate Runtime > With tag simulator".
2. Select the menu command "File > Open" in the tag simulator.
3. Select the corresponding simulation file and click "Open".
   The simulator loads the stored data.

Enabling and disabling tags

Start and stop the simulation for each tag separately in order to facilitate the transition from offline to online engineering. Activate "Start" in the corresponding row.

If a tag is activated, the simulation values are calculated and transferred to the WinCC simulator.

Deleting a tag

To delete a tag from the tag simulator, follow these steps:

1. Select the cell that contains the tag name.
2. Select the "Edit > Cut" menu command.
   The tag is removed from the table.

Working with the tag simulator (Basic Panels)

About the tag simulator

The tag simulator has the following columns:

Column	Description
Tag	Specifies the tags for the simulation.
Data type	Shows the data type of the selected tag.
Current value	Shows the simulated value of the defined tags.
Format	Specifies the selected format in which the tag values are simulated: • Decimal (1, 2, 3, 4, ...) • Hexadecimal (03CE, 01F3, ...) • Binary (0 and 1)
Write cycle	Specifies the selected time interval at which the current tag values are simulated. If you enter "2", for example, the current value of the tag will be shown every 2 seconds.
Simulation	Shows the method by which the tag values are processed during simulation.
Set value	Sets the selected value for the respective tag. The simulation start with the specified value.
minValue maxValue	Specifies the value range of the tag. You set a minimum and maximum value for this range. The default values are -32768 for the minimum and 32767 for the maximum.
Period	Contains the period during which the value of the tag is repeated for the "Increment" and "Decrement" simulation modes.
Start	Starts simulation of the tag based on the previously entered information.

Simulation modes

The simulator has six different simulation modes. The configured tags are supplied with nearly realistic values during the simulation.

Simulation mode	Description
Sinusoidal	Changes the tag value to form a sinusoidal curve. The value is visualized as a periodic, non-linear function.
Random	Provides randomly generated values. The tag value is changed by means of a random function.
Increment	Increases the value of the tag continuously up to a specified maximum value. Begins again at the minimum after the maximum has been reached. The value trend corresponds to a positive saw-tooth curve.

Simulation mode	Description
Decrement	Reduces the value of the tag continuously down to a specified minimum value. Begins again at the maximum after the minimum has been reached. The value curve corresponds to a negative saw-tooth curve.
Shift bit	Shifts a set bit continuously by one position. The previous position is always reset. This lets you test the alarms of an HMI device, for example.
<Display>	The current tag value is displayed statically.

Example: Simulate tags with the "Shift bit" simulation mode

Proceed as follows to simulate tags with the "Shift bit" simulation mode:

1. Open the project you want to simulate.
2. Select the menu command "Online > Simulate Runtime > With tag simulator". The tag simulator opens.
3. In the "Tag" column, select a tag from your project.
4. Select "Bin" in the "Format" column.
5. Enter the value "1" in the "Write cycle" column.
6. Select the "Shift bit" simulation mode in the "Simulation" column.
7. Enter the value "1" in the "Set value" column.
8. Enable the tag with the "Start" check box.

Result

The simulator tests the selected tag bit-by-bit as follows:

Simulation values	Byte for alarms
Set start value	00000001
1. Simulation value	00000010
2. Simulation value	00000100
3. Simulation value	00001000
....	...

In Runtime you see if the desired alarm is output at a given value.

Simulation restrictions (Basic Panels)

Alarms with dynamic parameters

If you use tags or text lists as external tags for alarms, the dynamic parameters of the alarms are not displayed.

Only internal tags are enabled for the simulation of alarms in the tag simulator .

You can use PLCSim to simulate dynamic parameters.

12.14.2.5 Loading projects (Basic Panels)

Overview for loading of projects (Basic Panels)

Overview

Delta data of the project is automatically compiled before you download it to one or several HMI devices. This always ensures that the latest version of the project is transferred.

Loading a project to an HMI device

The following steps are completed prior to downloading:

1. The download settings are verified. The "Extended loading" dialog box is opened automatically during the initial download of a project to an HMI device. You use this dialog to define the protocol and interface or destination path for the project in accordance with the HMI device Runtime used.
   You can open the "Extended download" dialog at any time with the menu command "Online > Extended download to device...".
   The "Load preview" dialog opens.
2. The project is compiled. Warnings and errors during compilation are displayed in the Inspector window and in the "Load preview" dialog.
3. The "Load preview" dialog shows you the following information for each HMI device:
   - The individual steps for loading
   - If the image of the target HMI device does not match the image from the configuration, a prompt is displayed asking whether you want to now change the image.

NOTICE
Changing the image deletes all data from the HMI device. Data is deleted on the target system if you change the image. For this reason, first back up the following data, if necessary: • User administration • Recipes

   - Presettings that take effect at loading. You can change the default settings for this download process, if necessary.
   - Occurring warnings (optional).
     You can download a project while ignoring the "warnings". The functionality may be restricted in runtime.
   - Occurring errors (optional).
     You cannot load the project.
     WinCC will open the invalid configuration in the corresponding editor if you double-click the error message in the Inspector window. Correct the errors and reload the project.

If you are using HMI tags in your project that are connected to PLC tags, you should also compile the user program before you compile the HMI device.

Loading with S7 routing

Configure the S7 routing settings in the "Devices & Networks" editor in the relevant controller. The settings depend on the device configured.

S7 routing supports the following protocols:

- MPI/PROFIBUS
- Ethernet

Transferring Runtime add-ons

Projects can contain Runtime add-ons in the form of controls or CSP (Communication Support Packages). These Runtime add-ons are automatically transferred with the project.

Loading a project (Basic Panels)

Introduction

Before a project can run on an HMI device, you must first load it to the HMI device. During loading, you must most importantly specify whether existing data on the HMI device such as "user administration" and "recipe data" is to be overwritten.

If the HMI device supports PROFINET, the name of the HMI device entered in the project tree is used as the device name for the PROFINET communication. The name is written to the HMI device during download. If a device name for the PROFINET communication has already been entered in the HMI device, it will be overwritten.

As a general rule, only one project can be active in Runtime on an HMI device. An HMI device is generally configured to exit Runtime automatically when loading is started. If this is not the case, you will have to exit Runtime manually on the HMI device.

If the image of the target HMI device does not match the image from the configuration, a prompt is displayed asking whether you want to now change the image.

NOTICE
Changing the image deletes all data from the HMI device. Data is deleted on the target system if you change the image. For this reason, first back up the following data, if necessary: • User administration • Recipes

Controlling the transfer behavior on the HMI device

As a general rule, only one project can be active in Runtime on an HMI device. An HMI device is generally configured to exit Runtime automatically when loading is started. If this is not the case, you will have to exit Runtime manually on the HMI device.

You define how the HMI device reacts when the project is loaded in the "Start Center" under "Settings" on the HMI device:

Transfer mode	Effect
Off	The project cannot be loaded to the HMI device.
Manually	The project can only be loaded to the HMI device if the following requirements are met: • Runtime is not running • The HMI device is in "Transfer" mode.
Automatic	The project can always be loaded to the HMI device. If a transfer is started on the configuration PC and a project is in runtime on the HMI device, the running project is automatically closed. For Mobile Panels, this transfer mode is disabled for security reasons.

Note

Closing Runtime automatically

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can trigger unwanted responses in the plant.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the "Start Center".

Please refer to the documentation for the HMI device used for more detailed information on transfer settings.

Requirements

- You have created an HMI device in the project.
- The HMI device is connected to the configuration PC.
- The "Start Center" has been started on the HMI device.
- The protocol by which the project is loaded is set on the HMI device in the "Start Center" under "Settings".
- Transfer mode is set as "Automatically" or "Manually" in the HMI device.

Procedure

Proceed as follows to load a project:

1. To download a project simultaneously to several HMI devices, select the HMI devices by means of multiple selection in the project tree.
2. Select the "Download to device > Software" command from the shortcut menu of an HMI device.

3. If the "Extended loading" dialog is open, configure the "Settings for loading". Make sure that the "Settings for loading" correspond to the "Transfer settings in the HMI device".
   - Select the protocol used, for example, Ethernet or HTTP.
   - Configure the relevant interface parameters on the configuration PC.
   - Make any interface-specific or protocol-specific settings required in the HMI device.
   - Click "Download".

   You can open the "Extended download" dialog at any time with the menu command "Online > Extended download to device...".
   The "Load preview" dialog opens. The project is compiled at the same time. The result is displayed in the "Load preview" dialog.
4. Check the displayed presettings and change them as necessary.
5. Click "Download".

Result

The project is loaded to all selected HMI devices. Any existing project is replaced. The data for user administration and / or recipes is replaced in accordance with the settings in the "Load preview" dialog.

During the download, you can keep track of the files that are transferred.

If errors or warnings occur during the download, corresponding alarms are displayed under "Info > Load" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

Note

If the transfer is interrupted, WinCC automatically ensures that no data is lost and that existing data is deleted on the HMI device only after complete transmission.

12.14.2.6 Runtime start (Basic Panels)

Starting Runtime on the HMI device (Basic Panels)

Introduction

On completion of the project download to the HMI device, you can start the project in Runtime. The project is saved in the HMI device to a file with the following extension:

- Basic Panels as well as OP 73, OP 77A and TP 177A: "*.srt"

The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in Runtime.

The programs that you can use to start projects on the HMI device are available in the Runtime installation folder.

Note

Closing Runtime automatically

If automatic transfer is activated on the HMI device and a transfer is started on the configuration PC, the running project is automatically terminated.

The HMI device then automatically switches to "Transfer" operating mode.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can trigger unwanted responses in the plant.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the "Start Center".

Requirements

- WinCC Runtime is installed on the HMI device.
- The project was downloaded to the HMI device.
- The "Start Center" has been started.

Procedure

The project is stored on a panel in a folder you specify in the HMI device transfer settings. The "Start Center" application is started on a panel. The project loaded is started automatically after expiration of the configured delay.

If the project does not start automatically:

1. Click on "Start" in the "Start Center" to start the loaded project.

Refer to the documentation for the HMI device for additional information on startup of projects.

12.14.2.7 Error messages during loading of projects (Basic) (Basic Panels)

Possible problems during the download

When a project is being downloaded to the HMI device, status messages regarding the download progress are displayed in the output window.

Usually, problems arising during the download of the project to the HMI device are caused by one of the following errors:

- Incorrect download settings on the HMI device
- Incorrect HMI device type in the project
- The HMI device is not connected to the configuration PC.

The most common download failures and possible causes and remedies are listed below.

The serial download is cancelled

Possible remedy: Select a lower baud rate.

The download is cancelled due to a compatibility conflict

Possible cause	Remedy
The configuration PC is connected to the wrong device, e.g. a controller.	Check the cabling. Correct the communication parameters.

Project download fails

Possible cause	Remedy
Connection to the HMI device cannot be established (alarm in the output window)	Check the physical connection between the configuration PC and the HMI device. Check whether the HMI device is in transfer mode. Exception: Remote control
The default communication driver is not listed in the Windows Device Manager.	Check the device status of the COM connection in the properties window of the Device Manager.

Download over MPI/DP interface fails

Possible cause	Remedy
"Configured mode" is set on the CP, for example, if you are using the SIMATIC NET CD.	Set the CP to "PG mode" using the "Set PC station" application. Check the "baud rate" and "MPI address" network parameters. Download the project from WinCC to the CP. Set the CP back to "configured mode".
On the programming device/PC panel, the "S7ONLINE" access point is not set to a hardware device such as CP5611 (MPI). The cause may be the installation of "SIMATIC NET CD 7/2001".	Set the access point "S7ONLINE" on the selected device using the "PG/PC Panel" or "Set PC station" application. Check the "baud rate" and "MPI address" network parameters. Download the project from WinCC to the HMI device. Restore the "S7ONLINE" access point to the original device.

The configuration is too complex

Possible cause	Remedy
The configuration contains too many different objects or options for the HMI device selected.	Remove all objects of a type, e.g. all graphic views.

12.14.2.8 Adapting the project for another HMI device (Basic Panels)

Introduction

When you download a WinCC project to an HMI device, WinCC checks whether this is compatible with the HMI device type used in the project. If the types of HMI device do not match, you will see a message before the download starts.

The download is aborted.

Adapting the project for the HMI device

You need to adapt the project accordingly to be able to download the project to the connected HMI device.

- Add a new HMI device in the project tree. Select the correct type of HMI device from the HMI device selection.
- Copy the configured components from the previous to the new HMI device.
  Copy large amounts of components directly in the project navigation and details view.
  For example, copy the "Screens" folder to the screens folder of the new HMI device with the help of the shortcut menu.
- Use the detail view to copy entries in the project tree for which the "Copy" command is not available in the shortcut menu.
- Select the "Recipes" entry in the project tree, for example. The recipes are displayed in the detail view.
- Select the recipes in the detail view and drag them to the "Recipes" entry of the new HMI device. The recipes are copied. You can also select multiple objects in the detail view.
- Configure the components that cannot be copied, e.g. connections, area pointers, and alarms.
- Save the project at various points in time.
- Compile the full project.
- When the compilation is successfully completed, download the project to the HMI device.

Linking references

References to linked objects are included in the copying. The references are linked again once the linked objects are copied.

Example:

You copy a screen in which objects are linked to tags. The tag names are entered at the individual objects after the screen is added to the new HMI device. The tag names are marked in red because the references are open. When you then copy the tags and insert them into the new HMI device, the open references are closed. The red marking for the tag names disappears.

For complete references to connected objects in the PLC, you first need to configure a connection to the PLC.

Using the information area

When you compile the project for the HMI device, errors and warnings are displayed in the "Info" tab of the Inspector window. You can use the shortcut menu command "Go to" to go directly to the location where the error or warning can be corrected.

Work through the list of errors and warnings from top to bottom.

When the compilation is successfully completed, download the project to the HMI device.

12.14.2.9 Reducing the project size (Basic Panels)

Introduction

When loading a large-scale project to an HMI device, the memory of the HMI device may be insufficient for the project. There are several ways to reduce the size of your project.

Options for reducing the project size

There are several ways to reduce the size of the project and save space:

- Reduce the number of available Runtime languages
  Check whether all selected Runtime languages are actually needed. You can disable the languages that you do not need under "Runtime settings > Language & Font > Runtime language and font selection".
- Do not use help texts for S7 diagnostic alarms
  To reduce the size of the project, you can disable the download of help texts for the S7 diagnostic alarms. In order to avoid downloading the help texts to the HMI device, disable the option "Download S7 diagnostics help texts" under "Runtime settings > Alarms > General".
- Rebuild all software
  In order to optimize the project data and to clean up obsolete changes, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.
- Harmonize the presentation using styles (as of WinCC V13)
  It is recommended to harmonize screen objects using styles. Standardize the appearance of screen objects in a project to optimize project data. Use the specified preset or customized style for the configuration of the screen objects throughout the project.
- Enable automatic update of PLC alarms (for S7-1500 controllers and V14 HMI devices)
  To save space, you can specify that the PLC alarm texts are only to be loaded in Runtime when needed. To do this, enable the "Automatic update" option under "Runtime settings > Alarms > Controller alarms". Make sure that automatic update of alarms is also enabled in the corresponding controller.
  The "Automatic update" option is not available on Basic Panels.
  The amount of space that can be saved depends on the number of PLC alarms and the number of Runtime languages.

- Reduce the number of fonts loaded
  Check whether the number of downloaded user-defined fonts can be reduced. If necessary, configure only the standard fonts for the required Runtime languages under "Runtime settings > Language & font > Runtime language and font selection".
  To save space, use fewer font groups for the configuration.
- Reduce the size of the graphics
  Check the size of the graphics that you use in the project. If necessary, reduce the size of the graphics by reducing the resolution or choose a higher compression format without noticeable loss of quality for the project graphics.
  To keep the project size small for Basic HMI devices, harmonize the sizes of graphics used in the project.
  Select appropriate graphic formats for your screens: For example, use PNG images for drawings that are not vector graphics and JPEG images for photos.

12.14.2.10 Basics of operating in Runtime (Basic Panels)

Overview (Basic Panels)

Overview of operator control of a project

Depending on the HMI device, the following options are available for the input with Basic HMI devices.

- Touch screen
- Function keys
- Mouse and keyboard

Use the touch screen and function keys or mouse and keyboard to operate the Control Panel / Start Center or the project running on your HMI device.

Note

Incorrect operation

A project can contain certain operations that require in-depth knowledge about the specific plant on the part of the operator.
Make sure that your plant is only operated by qualified personnel.

Operating options for an HMI device

Depending on your HMI device, operate your plant as follows:

- Touch screen operation
  The display of the device is touch-sensitive. You operate the operating elements in the display with your finger or a stylus.
- Operation with control keys and function keys
  Control keys and function keys are integrated into the housing of the device.
  - Control keys have a specified function, for example, navigation or the acknowledgment of alarms.
  - Function keys are freely user-assignable and their function is therefore project-specific.
- Mouse and keyboard operation
  Mouse and keyboard are connected via an integrated USB port. You operate the operating objects with mouse and keyboard.

Individually configured operation

The configuration engineer has various options available for setting up operation.

Examples of actions whose execution is always determined on a project-specific basis:

- Screen change
- Reporting
- Changing Runtime language

There are no specific operating elements to execute certain functions. The configuration engineer specifies the project-specific execution. A screen change can be triggered with a button or a function key, for example.

Information on project-specific operations can be found in the system documentation.

Operation with the touch screen (Basic Panels)

Overview of operation with the touch screen (Basic Panels)

Use the touch screen to operate the HMI device of the project that is running on your HMI device.

Operating the touch screen

NOTICE
Damage to the touch screen Do not touch the touch screen with sharp or pointed objects. Avoid tapping the touch screen with hard objects, and avoid constantly using motion control. Both can significantly reduce the useful life or even cause the failure of the touch screen. **Triggering unintended actions** You can trigger unintended actions if you touch several operating elements at the same time. Always touch only one operating element on the screen. Operating elements are touch-sensitive symbols on the screen of the HMI device.

Special features of operation using the touch screen

Operation with the touch screen is characterized by the following special features:

- Enable
  To enable an operator control, touch the touch screen with your fingers or with a stylus. To generate a double-click, touch the operator control twice in rapid succession.
- Value input
  You enter numbers and letters on the touch screen with a screen keyboard.
- Careful operation
  If you touch multiple operator controls at the same time, you may trigger unintentional actions.

Value input using the screen keyboard

The screen keyboard is displayed as soon as you operate a screen object that requires an input. Depending on the HMI device and the configured operating element, the system displays different screen keyboards for entering numerical or alphanumerical values. The screen keyboard is hidden again when input is complete.

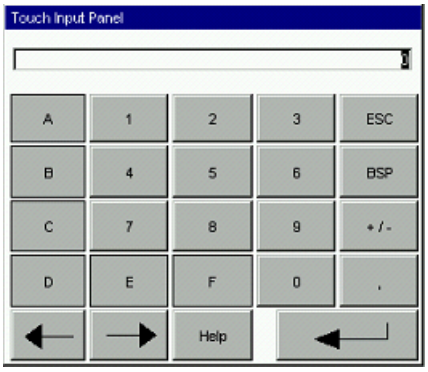
File browser on a Windows 8 PC

You can only operate the file browser dialog with a mouse, keyboard or on-screen keyboard (without using the touch function) on a Windows 8 PC with touch screen. Use the file browser dialog of the Windows operating system with the help of a script on a touch screen PC with Windows 8.

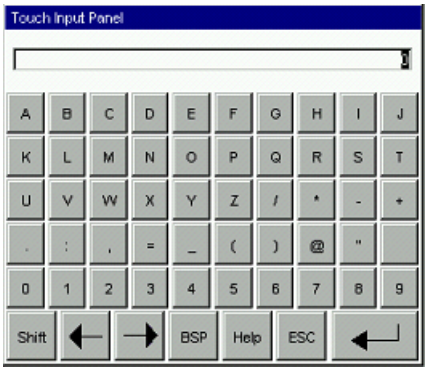
Screen keyboard (Basic Panels)

Layout

The figure below shows the basic layout of a screen keyboard on a TP1500 Basic.



Numbers



Letters

Operator controls

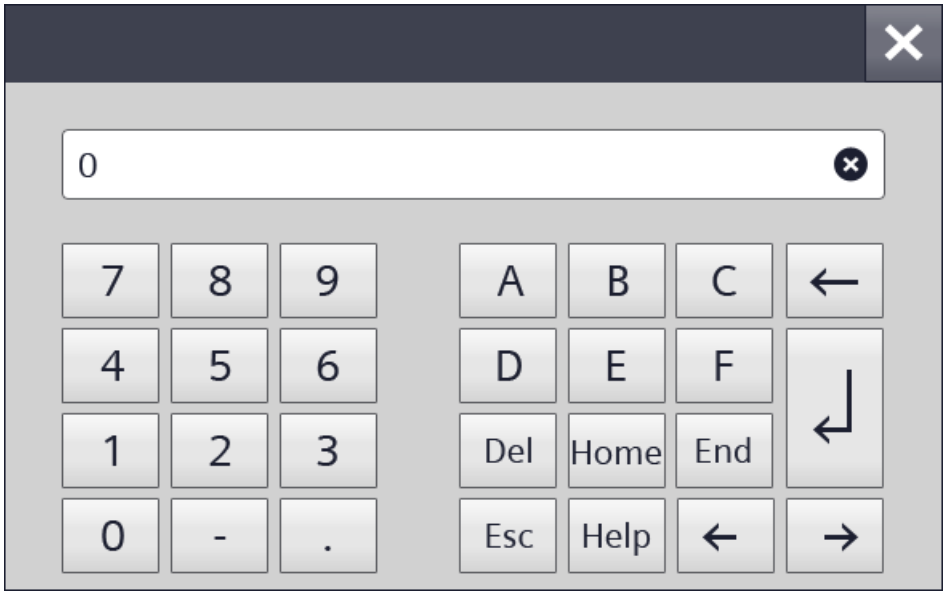
The following keys are available on the screen keyboard of all HMI devices:

Button	Name	Function
	Cursor left	Navigates to the left
	Cursor right	Navigates to the right
	Backspace	Deletes a character
	Escape	Cancels the input
	Enter	Confirms the input
	Help	Displays the infotext This key is only displayed when an infotext has been configured for the operator control.

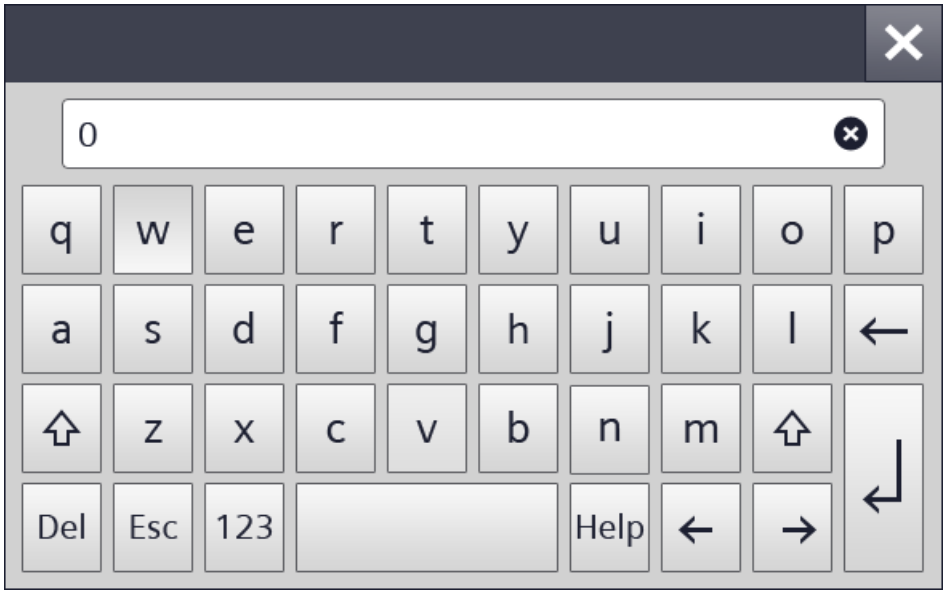
Screen keyboard for 2nd generation Basic Panels (Basic Panels)

Layout

The figure below shows the basic layout of a screen keyboard on a Basic Panel 2nd Generation.



Numbers



Letters

Operator controls

The following keys are available on the screen keyboard of all HMI devices:

Button	Name	Function
	Cursor left	Navigates to the left
	Cursor right	Navigates to the right
	Backspace	Deletes a character
	Escape	Cancels the input
	Enter	Confirms the input
	Help	Displays the infotext This key is only displayed when an infotext has been configured for the operator control.

Operation with keys (Basic Panels)

Overview of operation with keys (Basic Panels)

Introduction

Use the keys of the HMI device to operate the Control Panel / Start Center of your HMI device or the project that is running on your device. Depending on the device, control keys and function keys are available.

For more detailed information, refer to the operating instructions for your HMI device.

Control keys and shortcuts (Basic Panels)

Introduction

The following tables list the control keys available to operate the project.

Note

The availability of control keys is determined by the HMI device used.

You trigger functions on keyboard HMI devices either with a key or a shortcut. With shortcuts, you keep the first key pressed. Then you press the second key.

Navigating in the display

Key or shortcut		Function	Description
TAB		Tabulator	Selects the next operating element in the tab sequence
SHIFT	TAB	Tabulator	Selects the previous operating element in the tab sequence
◀ ▶ ▼ ▲		Cursor keys	Selects the next operating element to the left, to the right, above or below the current screen object Navigating in the operating element

Operation of operating elements

Key or shortcut		Function	Description
ENTER		ENTER key	• Controls buttons. • Applies and ends an entry • Opens a selection list • Toggles between character mode and standard mode within an input field A single character is selected in character mode. In this mode, you can scroll within the character set using the cursor keys.
SHIFT	▶ ◀ ▲ ▼	Positioning cursor	Positioning the cursor within an operating element, for example, in an I/O field
←		Delete characters	Deletes the character to the left of the current cursor position
INS DEL		Delete characters	Deletes the next character to the right of the current cursor position
ESC		Cancel	• Deletes the input characters of a value and restores the original value • Closes the active dialog.
F N	HOME	Scroll to start	Scrolls to the start page of a list
HOME		Scrolling back	Scrolls the list back by one page
F N	END	Scroll to end	Scrolls to the end of a list.
END		Scrolling up	Scrolls the list up by one page
ALT	▼	Open selection list	Opens a selection list
CTRL	ENTER	Accept value	Accepts the value selected in the selection list without closing the list

Enter shortcut

Key	Function	Purpose
A-Z	Toggle (numbers/letters)	Toggles the assignment from numbers to letters • No LED is lit: The number assignment is enabled. Pressing the key once switches to letter assignment. • The right or left LED is lit: The left or right letter assignment is enabled. Each time the key is pressed, the system toggles between the left letter assignment, the right letter assignment and the number assignment.
SHIFT	Shift (upper/lower case)	Used in shortcuts, for example, for switching to uppercase letters
F_N	Toggle to additional keyboard layout	Some of the keys contain a blue special character in their bottom left corner, for example, the percent sign "%". To input these characters, press the relevant key in combination with the special character key shown on the left.
CTRL	General control function	Used in shortcuts, for example, for navigating trend views
ALT	General control function	Used in shortcuts, for example for the "Watch table" screen object

Acknowledge alarms

Key	Function	Purpose
ACK	Acknowledge	Acknowledges the currently displayed alarm or all alarms of an alarm group The LED is lit as long as an unacknowledged alarm is active.

Displaying infotext

Key	Function	Description
HELP	Displaying infotext	For the selected object, opens a window with the configured infotext, for example, for an alarm or an I/O field The LED is lit if an infotext is available for the selected object.

Key or shortcut

Function Keys (Basic Panels)

The assignment of the function keys (F1, F2, F3, etc.) is defined during configuration.

Function keys with global function assignment

A globally assigned function key always triggers the same action on the HMI device or in the PLC regardless of the screen displayed. The activation of a screen or the closing an alarm window, for example, is such an action.

Function keys with local function assignment

A function key with local function assignment is screen-specific and is therefore only effective within the active screen.

The function of a locally assigned function key can vary from screen to screen.

Within a screen, a function key has only one function assignment, either a global or local one. The project planner specifies which assignment has priority.

Operating function keys

Note

Operating function key after screen change

If you press a function key after a screen change, the associated function may be triggered in the new screen before the new screen is fully displayed.

Navigating in the display (BS) (Basic Panels)

Introduction

You navigate on the display of your HMI device as follows:

- between configured screen objects
- within screen objects
  When you select a complex screen object, the cursor focus switches to the screen object and follows the tab sequence there.
- in tables of screen objects

Procedure

- To navigate in the specified tab sequence, press the <TAB> key.
- To navigate freely between the operator controls, press the cursor keys.

Depending on the configuration of your HMI device, you can also use function keys or shortcuts for navigation.

When you operate your HMI device with the touch screen or with the mouse, you implicitly navigate by triggering a desired action. For this purpose, touch or click the operator control.

Result

The operator controls receive the cursor focus according to the selected sequence. You can trigger an action on the selected operator control.

For more detailed information, refer to the operating instructions for your HMI device.

Triggering an action (Basic Panels)

Introduction

Triggering an action at an operator control can mean the following:

- A command is executed.
  Example: Click a button to trigger a script or to execute a predefined function.
- An object is enabled.
  Example: To enter a value, select a table cell with the <Enter> key.

Requirement

- You have navigated to the operator control on which you want to trigger the action.
- The operator control has the cursor focus.

Procedure

- Press <Enter>.
  Or
- Touch the operator control on the touch screen once or twice in rapid succession.
  Or
- Click or double-click the operator control with the mouse.

Result

The following results are possible:

- The requested command is executed.
- The screen keyboard is opened and/or the cursor blinks in the input area of the operator control.
- The element is selected and can be moved.

For more detailed information, refer to the operating instructions for your HMI device.

Entering a value (Basic Panels)

Introduction

Depending on the input format, you enter numerical or alphanumerical values in an input field.

You enter these values depending on the existing hardware using the screen keyboard, the control keys of the HMI device or an external keyboard.

Requirement

- The object is an input field or table field.
- The operator control is enabled.

Entering a value

1. Enter the desired value.
2. To confirm the value and exit the field, press the <Enter> key.
3. To discard the value and exit the field, press the <Esc> key.

Result

A value is entered or discarded. You navigate as needed to the next operator control.

For more detailed information, refer to the operating instructions for your HMI device.

Moving operator controls (Basic Panels)

Introduction

In Runtime, you can move the movable operator controls of a screen object with the mouse or using the touch screen, for example, a slider or a scroll bar. Operation with the keyboard is described below.

Requirement

- A movable operator control is selected.

Procedure

- To move the operator control, proceed as follows depending on the operating element:
  - Standard for touch screen: Press the cursor keys.
  - Standard for keyboard devices: Press <SHIFT> and the cursor keys.
  - Switches: Press <ENTER>
  - Slider: Press <PgUp> or <PgDn>

1. To finish the movement, navigate to another screen object or operator control.

Slider procedure

1. To move the operator control, press the cursor keys.
2. To finish the movement, navigate to another screen object or operator control.

Result

The position of the movable operator control and the display in the screen object have changed.

For more detailed information, refer to the operating instructions for your HMI device.

Displaying infotext (Basic Panels)

Introduction

Depending on the configuration, additional information and operating instructions are available as infotext. The infotext is assigned to an operating element, an alarm or to the open screen. The infotext of an I/O field may contain, for example, information about the value to be entered.

As an alternative to the <Help> key of the HMI device, use the <Help> key of the screen keyboard for input objects.

Requirement

- An infotext is configured for the operating element, the screen or an alarm.

Calling the infotext

1. Enable the desired operating element.
2. Press the <Help> key of the HMI device.
   The infotext for the operating element is displayed.

If you are operating your input object with the touch screen, the screen keyboard opens. If the <Help> key appears, an infotext is configured for the operating element or the current screen.

If there is no infotext for the selected screen object, the infotext for the current screen is displayed, if it has been configured.

Use the scroll bar for long infotexts.

Depending on your configuration, infotext can also be retrieved by means of a configured operating element.

Switching between infotexts

- To switch between the infotexts of the operating elements and the screen, enable the infotext window.

Hiding infotext

- To hide the infotext, press the <Esc> key or press the <Help> key again.

Changing Runtime language (Basic Panels)

Introduction

The HMI device supports multilingual projects. A corresponding operating element which lets you change the language setting on the HMI device in Runtime has been configured.

The project always starts with the language set in the previous session.

Requirement

- The required language for the project is available on the HMI device.
- The language switching function is linked to an operating element, for example, to a button.

Selecting a language

You can change project languages at any time. Language-specific objects are immediately displayed on the screen in the new language when you switch languages.

You can switch the language in Runtime in one of the following ways:

- Use a configured operating element to switch from one language to the next in a list.
- Use a configured operating element to directly set the required language.

12.14.2.11 Security on the HMI device (Basic Panels)

Signature basics (Basic Panels)

Overview

The HMI device software and the runtime and device options are protected from manipulation by signatures. The device options available over ProSave are also signed.

HMI device signature

The validity of the HMI device signature is checked when the HMI device software is loaded. If the HMI device signature is invalid, loading of the HMI device software is canceled and an error message is output.

Signature for runtime and device options

If the signature check finds that the signature is invalid, an error message to this effect is output. An error message indicating an invalid signature is also output in ProSave.

Note

To allow loading of the HMI device software or the options without a signature (for versions prior to V14), you will need to switch off the signature check.

For details of how to do this, see Switching off the signature check (Page 6285).

Switching off the signature check (Basic Panels)

Procedure

1. Press "Transfer" twice in the control panel of the HMI device.
   The "Transfer Settings" dialog box opens.
   The option "Validate signatures" is enabled by default.

   Note

   If you wish to load an older WinCC project to an HMI device, you will need to check the settings for the signature check.

2. To allow the HMI device software to be loaded without a signature or to allow the download of a trustworthy option from a third-party provider, disable the "Validate signatures" option.

Signature basics (Page 6284)

12.14.3 Runtime Advanced and Panels (Panels, RT Advanced)

12.14.3.1 Runtime settings (Panels, RT Advanced)

Runtime settings (Panels, RT Advanced)

Introduction

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree.

Note

Device dependency

The options available for selection in the Runtime settings depend on the HMI device.

Overview

You configure options from different areas of your project in the Runtime settings:

- Display in Runtime
  - Start screen
  - Default template
  - Standard style of the project and style of the HMI device
  - Screen resolution
  - Full-screen mode
  - Project graphics
  - Bit selection for color and flashing
  - Bit selection for text and graphics lists
- Project ID for compatibility check with the controller
- Logging language
- Remote control via Sm@rt Server in the "Services" area
  You can find additional information on this in the WinCC online help under "Options > Sm@rt options"
- Operating in Runtime
  - Task switching
  - Load additional information for debugging scripts: Object names and comments in scripts
  - Show limits as a tooltip
  - Screen keyboard
  - Disable function keys
  - Release of buttons when cursor leaves the button
  - Keyboard layout and shortcuts
- GMP-compliant configuration
  You can find additional information on this in the WinCC online help under "Options > WinCC Audit".
- Alarms
  - Buffer overflow
  - Text of the acknowledgment group
  - Log
  - Colors of the alarm classes
  - Configuration of the system events
  - Configuration of the controller alarms

- User administration
  - Configuration of the password and logoff time
  - Limit for logon attempts
  - Hierarchy levels
  - Configuration of SIMATIC Logon
- Language and font
  - Available Runtime languages
  - Order of language switching
  - Default font
  - License status of the fonts
- Configuration of the OPC Unified Architecture Server
- Settings for synchronization of the PLC and HMI tags

Configuring display in Runtime

Introduction

In the Runtime settings, you specify how screens, alarms and language are displayed.

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree. The options available for selection depend on the HMI device.

Display on the target system

In WinCC, configure the visual representation of the generated project in Runtime:

- Select the full-screen or window mode for the project. The window has a smaller size than the screen. In full-screen mode, the project is zoomed to the full screen. There will be no window and operator controls for this view.
  Click "General" in the "Settings" editor to activate the full-screen display at startup. Activate the "Full-screen mode" check box in the "Screen" field.

  Note

  Truncated view

  If the HMI screen does not match the configured size (in pixels), the project only appears on part of the screen in full-screen mode.

- To hide the taskbar, disable the taskbar under Windows.
- Under "General > Screen", you specify whether the HMI device uses the default style of the project or another pre-defined style.

Language settings

- Logging language
  Under "General > Logs", you specify the language in which you want to write the logs. The selected logging language always remains the same, even if the user switches the language in Runtime.
  If you select "Startup language", the logging language remains the same until Runtime is stopped, even if the user has switched the language. However, the next time Runtime is started, the last configured Runtime language is used as the logging language.
- Runtime language
  Under "Language & font", you specify all Runtime languages and their display.

  Note

  "Bold" and "Italic" fonts

  "Bold" and "italic" fonts are not supported on all HMI devices in Runtime.

  Note

  Basic Panels, OP73, OP77A and TP177A

  Text entries may be truncated if you select an unfavorable font size or style. This setting may have an effect on the following text entries:
  - Tooltips
  - Long alarm text
  - Text in the dialogs

Setting for specific screen objects

- Specify bit selection
  Under "Screens > Bit selection", you specify whether bit selection will be used on this HMI device for the following:
  - Text and graphics (text lists and graphic lists)
  - Color and flashing (appearance analysis)
    When you enable an option, the selection that is configured in the set bit with the least significance is displayed:
    When you disable an option and several bits are set, the selection that has been configured only for the set bit is displayed.
- Tooltips for I/O fields
  Under "Screens > Display", you specify whether configured limit values are displayed as tooltips in Runtime when values are entered in I/O fields.
- Colored objects
  You specify the color depth of your HMI device under "General > Screens > Color depth". As needed, you assign screen objects a colored appearance. The range of colors is determined by the color depth supported on your selected HMI device.

Design settings in the Windows Control Panel

Select the "Windows 7" design for the configuration PC and the Runtime PC in the system settings of Windows. Use this setting to ensure correct representation of the dialogs and the on-screen keyboard in Runtime.

Configuring operation in Runtime (Panels, RT Advanced)

Introduction

In the Runtime settings you specify how screens are operated, and how you use keys for operation in Runtime.

To edit the Runtime settings for your HMI device, select "Runtime settings" under your HMI device in the project tree. The options available for selection depend on the HMI device.

Locking task switching

Depending on the HMI device, you can lock task switching on the HMI device. This will prevent the operator from opening other applications in Runtime.

In the Runtime settings of the HMI device, enable the "Lock task switching" option under "General > Screen".

To use the "Lock task switching" option on a Runtime PC, disable the Aero theme in Windows 7 and Windows 8.x. To disable the Aero theme, right-click on the desktop and select

"Personalize". In the "Personalization" menu, select the designs "Windows Basic" or "Windows - Classic".

Note

Stop Runtime

If you lock program switching, always configure in your project the system function "StopRuntime" for an object, e.g. a softkey or button.

Settings for data transfer to the HMI device

- Transferring names of the screen objects in scripts
  If you enable the "Load names" option under "General > Screen", the object names of the screen objects are transferred instead of coded addressing information. You need the object names if you want to address the screen objects in a script using the object names. When you test a script in the debugger, the code becomes more comprehensible through the display of object names.
- Displaying comments in scripts
  Under "Screens > Display", you specify whether the comments in scripts are also transferred to the HMI device.
  If you do not transfer the comments, you save storage space on your HMI device.
  If you transfer the comments, the script is more easily understood during testing in the debugger.

Operation using function keys

To symbolize the function of a function key for keyboard devices, you configure a graphic next to the function key in the display. Under "Screens > Function keys > User-defined pictogram size", you specify whether you want to use a graphic size that deviates from the standard size.

Operation with keyboard

Under "Keyboard > General > Use screen keyboard", you specify whether the screen keyboard is available on your HMI device.

Under "Keyboard > General > Release button on exit", you specify whether the "Release" event is triggered when the user exits a button without releasing it.

Under "Keyboard > Disable function keys in dialogs", you specify for key devices whether the function keys are disabled for the duration of the displayed dialog. Large dialogs can hide explanatory areas or graphics at function keys or bordering function keys. Functions keys can be unintentionally pressed due to this.

Compatibility check with the controller (Panels, RT Advanced)

Introduction

The "Project ID" area pointer is used to configure the project ID for checking the consistency of the project with the PLC. The area pointer reads the project version from the PLC. You can find additional information in the online help for WinCC under "Communicating with controllers".

Compatibility check with the controller

You select the project ID in the Runtime settings of the HMI device under "General > Identification > Project ID".

At startup, Runtime checks whether the project ID of the project matches the PLC project version. Runtime will only start if the two values match.

An area pointer "Project ID" is created for connections whose address you specify in the PLC. The value that you store at this address will become the project ID.

The project ID is not available on all HMI devices.

Setting time base (Panels, RT Advanced)

Setting the time base for the time of day

You set the time in the Control Panel of your HMI device. For more detailed information, refer to the operating instructions for your HMI device.

Synchronize date and time with the PLC

You can find additional information on this subject in the online help for WinCC under "Communicating with the PLC".

Printing in Runtime (Panels, RT Advanced)

Print functions

Print functions available in online mode:

- Hardcopy
  You print out the currently displayed screen by means of an operator control that triggers the "PrintScreen" system function.
- Printing alarms
  Every alarm that has occurred and its state changes are reported along on a printer.
- Printing reports
  Reports are output in graphic mode. The use of a serial printer is not recommended because of the accumulated data volume.
  For proper output, the printer must support the paper format and page layout of the report.

Note

The value of a tag in the report is read and output at the moment of printing. A substantial time may elapse between printing out the first and the last page of a report consisting of several pages. This may lead to the same tag on the last page being output with a different value from that on the first page.

Password protection in Runtime (Panels, RT Advanced)

Password protection in Runtime: Basics (Panels, RT Advanced)

Overview

The connection establishment can be protected with passwords in the TIA Portal. The configured passwords are saved encrypted. The passwords are also protected against unauthorized access during transfer to the target system and cannot be read. These passwords are decrypted securely on the HMI devices in Runtime.

Password protection can be created for the following connections:

- SIMATIC S7-1200
- SIMATIC S7-1500
- SIMATIC S7-1500 Software Controller (WinAC)
- PC Station 2.0 (station manager)
- SIMATIC HMI HTTP

Password protection can also be created for the following system function:

- "SendEMail" system function

Note

The passwords are deleted when you change to an older version.

Download certificate

The certificate for decryption of the passwords is saved in the certificate store of the HMI device. You will be informed by a system message if the certificate is not available.

You restore the certificate by downloading the configuration once again.

See also

Resetting the password for transport (Page 6294)

Configuring a password for transport (Page 6293)

Configuring a password for transport (Panels, RT Advanced)

Introduction

To protect the private password key during transport, you can configure a password for transport under "Runtime settings".

Creating a password

1. Open the "Runtime settings > General" editor in the Project window.
2. Enter the password in the "Enter password" box in the "Transport password" area.
3. Confirm the password in the "Confirm password" box.

Note

If there was no previous password, the "Old password" box is disabled.

Result

You have now configured the password for transport. If a password for transport has been configured and you transfer the project to the HMI device, a dialog with a password prompt will appear once in runtime.

The dialog with the password prompt also appears if the password has been changed. If the password entered is correct, the certificate is saved in the certificate store of the HMI device.

See also

Password protection in Runtime: Basics (Page 6292)

Resetting the password for transport (Page 6294)

Resetting the password for transport (Panels, RT Advanced)

Introduction

If you have moved the transport password, for example, you can create a new security certificate. To do so, reset the transport password.

Resetting the password

1. Click the "Reset password" button.
   The password is reset. A new certificate without a password is generated.

   Note

   Other passwords, for example the password for the PLC, will become invalid. The next time you compile, an error message will appear telling you that these passwords are no longer valid.

2. Enter the new password and confirm it in the "Confirm password" field.

   Note

   The certificate is not password-protected until you enter a new password for transport.

See also

Configuring a password for transport (Page 6293)

Password protection in Runtime: Basics (Page 6292)

12.14.3.2 Overview of compiling and loading projects (Panels, RT Advanced)

Overview

The project is compiled in the background even as you are configuring it in WinCC. This reduces the time for final compilation. When you start compilation, you create a file that can be run on the corresponding HMI device.

If an error occurs during compilation, WinCC provides support in locating and correcting it.

Once you have corrected any problems, you download the compiled project to the HMI devices on which the project is to run. If the configuration PC is not connected to the HMI device, save the compiled project on a data medium of your choice. The compiled project is then transferred from a PC connected to the HMI device to the HMI device.

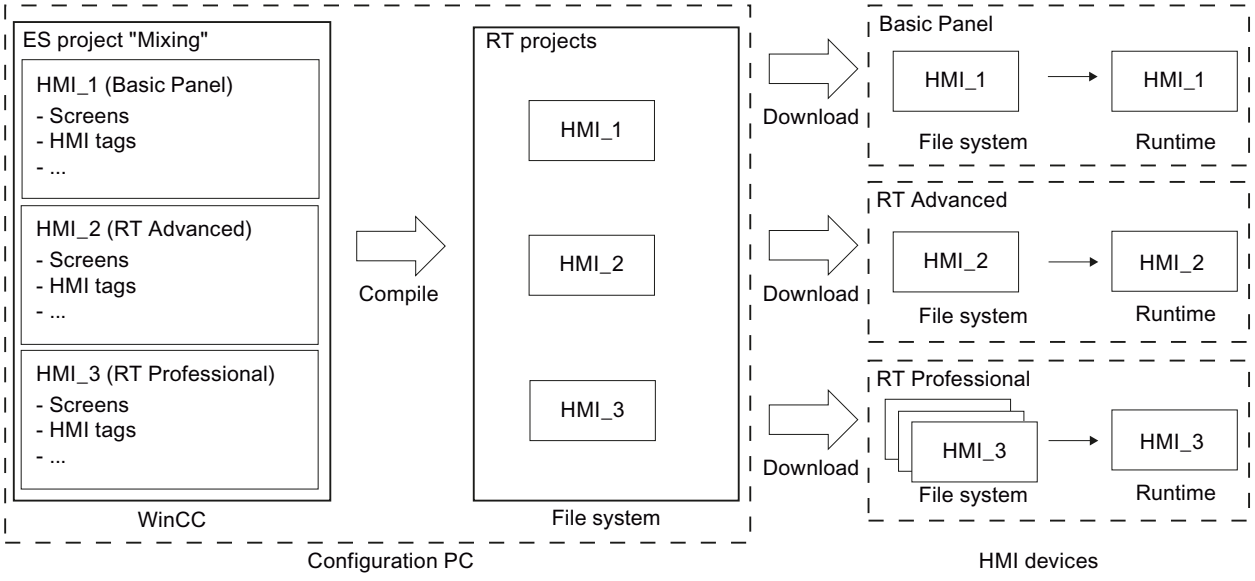
If you are using HMI tags in your project that are connected to PLC tags, you should also compile all modified S7 blocks with the command "Compile > Software" in the shortcut menu before you compile the HMI device.

Project

The term "project" has two different meanings in the contexts of compilation and loading. "Project" is the WinCC project on the configuration PC. "Project" is also the Runtime project you create by compiling the configuration data of an HMI device and download to the HMI device.

- WinCC project: contains the configuration data of one or more HMI devices
- Runtime project: contains the compiled configuration data of an HMI device

The figure below illustrates the link between WinCC projects and Runtime projects using the example of the "Compile and load" process:



Runtime

Runtime is the software for process visualization. In Runtime, you execute the project in process mode.

A distinction is made between two types of Runtime:

1. Runtime on a panel
   Before running a Runtime project on a panel, you have to transfer the Runtime project to the panel before startup.
2. Runtime on a PC
   You can execute the Runtime project directly on the configuration PC if Runtime has been installed on the configuration PC.
   If you want to execute the Runtime project on a different PC, you have to transfer the Runtime project to the PC before startup.

Runtime version

The Runtime version depends on the image of the configured HMI device. The Runtime version of the compiled project is displayed under "Info" in the Inspector window.

Simulation

You test your configuration with a simulation. You can start a simulation without a link to the active process.

In a simulation, you test configured tags or screen changes, for example. During the simulation, the configured tags can be manipulated, activated and deactivated with the help of the tag simulator.

There are two types of simulation:

1. Simulating a panel
   If you created a panel in your project, the panel is displayed in the simulation. With the help of this type of simulation, you can test your configuration on the HMI device without transferring the project to the panel.
2. Simulating Runtime
   Simulating Runtime allows you to test the project directly on the configuration PC.

See also

Generating a "Pack&Go" file (Page 6310)

Starting Runtime Advanced and Panel Runtime (Page 6319)

12.14.3.3 Compiling a project (Panels, RT Advanced)

Introduction

The changes made to the project are compiled in the background even as you are configuring a project in WinCC. Projects are compiled automatically when you load them. This ensures that the latest version of the project is loaded at all times.

WinCC checks consistency of the project during compilation. The error locations in the project are listed in the Inspector window. You can jump directly to the source of the error from the entry in the Inspector window. Check and correct errors found.

Scope of the compilation

Configuration data is compiled in the background as soon as you start configuring an HMI device. If you compile a project manually, only the changes in the configuration made since the last compilation process are compiled in the background.

You can start complete project compilation manually at any time; this may, for example, be done to test the consistency of the configured data.

Requirement

- A project is open.

Procedure

Proceed as follows to compile a project:

1. If you want to compile several HMI devices at the same time, select all the relevant HMI devices with multiple selection in the project tree.
2. Compile the project:
   - To only compile changes in the project, select the "Compile > Software (only changes)" command from the shortcut menu of the HMI device.
   - To compile all project data, select the "Compile > Software (compile all)" command from the shortcut menu.

Result

The configuration data of all selected HMI devices is compiled. Any errors that occur during compilation are shown in the Inspector window.

12.14.3.4 Simulating projects (Panels, RT Advanced)

Simulation basics (Panels, RT Advanced)

Introduction

You can use the simulator to test the performance of your configuration on the configuration PC. This allows you to quickly locate any logical configuration errors before productive operation.

You can start the simulator as follows:

- In the shortcut menu of the HMI device or in a screen: "Start simulation"
- Menu command "Online > Simulation > [Start|With tag simulator|With script debugger]"
- Under "Visualization > Simulate device" in the portal view.

Requirement

The simulation/runtime component is installed on the configuration PC.

Field of application

You can use the simulator to test the following functions of the HMI system, for example:

- Checking limit levels and alarm outputs
- Consistency of interrupts

- Configured interrupt simulation
- Configured warnings
- Configured error messages
- Check of status displays

See also

Simulating a screen (Page 6301)

WinCC Runtime Advanced simulation (Page 6298)

Working with the tag simulator (Page 6301)

WinCC Runtime Advanced simulation (Panels, RT Advanced)

Introduction

There are two different simulation modes for Runtime Advanced simulation:

- Device simulation
- Tag simulation

Both types of simulation simulate the project without a direct process link to the configuration PC. Data such as logs or recipes generated during simulation are not deleted. This data is saved on the configuration PC in the paths configured in the project.

Device simulation

Use device simulation to simulate operator control of the HMI device. Device simulation is, for example, used to test screen switching.

Tag simulation

Use tag simulation to simulate the configured process tags. You can either have tag values generated automatically by a simulation table or define tag values yourself.

See also

Simulation basics (Page 6297)

Simulating a project (Page 6299)

Start debugger (Page 6303)

Simulating a project (Panels, RT Advanced)

Introduction

You simulate your project with one of the following two methods:

- Without a connected PLC
  You change the value of area pointers and tags in a tag simulator that is read for the simulation of WinCC Runtime.
- With a connected PLC without a running process
  You simulate your project by running it directly in Runtime. The tags and area pointers become active. This allows you to create an authentic simulation of your configured HMI device in Runtime.

Note

Simulation restrictions

You cannot simulate the following system functions:

- CalibrateTouchScreen

You cannot simulate the Media Player. A static screen appears in the simulation window instead of the Media Player.

File access via scripts is not possible for HMI devices with Windows CE.

Requirement

- Simulation without a connected PLC: Tags have been created
- Simulation with a connected PLC but no active process: A project with tags and area pointers has been created

Procedure

To simulate a project using the tag simulator, follow these steps:

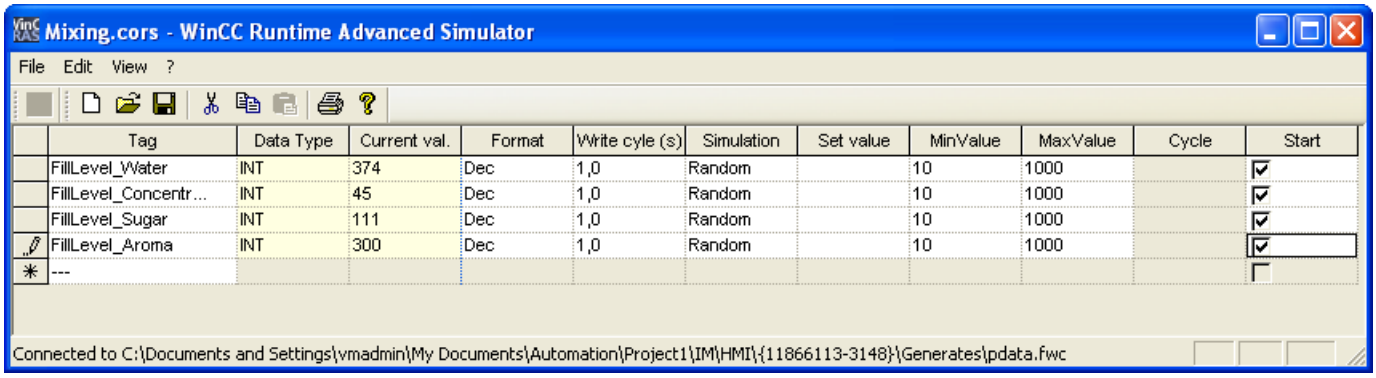
1. Open the project on the configuration PC.
2. Select the "Online > Simulation > With tag simulator" menu command.
   For initial project simulation, the simulator is started with a new, empty table. The project is opened simultaneously in Runtime.
   Toggle between the tag simulator and Runtime using the <Alt +Tab> key combination.
3. To simulate a process value, select the corresponding "tag" from the tag simulator.
   The table lists all configured tags. You can simulate up to 300 tags simultaneously.
4. Select the simulation mode in the "Simulation" column.
5. Change the value of tags and area pointers in the respective columns.
6. Activate the "Start" check box to start the simulation for this tag.
7. To save the simulation, select the menu command "File > Save" and enter a descriptive name, for example, "Mixing".
   The file name is assigned the extension "*.cors".

Result

The process values are simulated in Runtime. The tag values are created at random, or incremented, depending on the simulation mode.

To specify tag values, change the simulation mode to "<Display>" and enter a value at "Set value".

The following figure shows a tag simulator with four tags whose values can be determined at random in a range of values from 10 to 1000:



Managing simulation data

If you have saved data from a previous simulation, you can open the file at a later point in time and simulate your project again. The tags and area pointers listed in the tag simulator must still be available in the project.

Proceed as follows to open a simulation file:

1. Select the menu command "Online > Simulate Runtime > With tag simulator".
2. Select the menu command "File > Open" in the tag simulator.
3. Select the corresponding simulation file and click "Open".
   The simulator loads the stored data.

Enabling and disabling tags

Start and stop the simulation for each tag separately in order to facilitate the transition from offline to online engineering. Activate "Start" in the corresponding row.

If a tag is activated, the simulation values are calculated and transferred to the WinCC simulator.

Deleting a tag

To delete a tag from the tag simulator, follow these steps:

1. Select the cell that contains the tag name.
2. Select the "Edit > Cut" menu command.
   The tag is removed from the table.

Simulating a screen (Panels, RT Advanced)

Introduction

If you have only made changes to one screen, you can temporarily specify this screen as the start screen for simulation. In this way, you can debug changes without having to modify the start screen, or opening the screen on the HMI device.

Requirements

You created a project that contains at least one screen.

Procedure

To define a screen as temporary start screen for simulation, follow these steps:

1. In the project navigation, select the image to display as the start screen in the simulation.
2. Select the "Start simulation" command from the shortcut menu of the screen.

Result

Project simulation is started. Instead of the configured start screen, the simulation window the screen you selected in the project navigation.

Simulation basics (Page 6297)

Working with the tag simulator (Panels, RT Advanced)

About the tag simulator

The tag simulator has the following columns:

Column	Description
Tag	Specifies the tags for the simulation.
Data type	Shows the data type of the selected tag.
Current value	Shows the simulated value of the defined tags.
Format	Specifies the selected format in which the tag values are simulated: • Decimal (1, 2, 3, 4, ...) • Hexadecimal (03CE, 01F3, ...) • Binary (0 and 1)
Write cycle	Specifies the selected time interval at which the current tag values are simulated. If you enter "2", for example, the current value of the tag will be shown every 2 seconds.
Simulation	Shows the method by which the tag values are processed during simulation.

Column	Description
Set value	Sets the selected value for the respective tag. The simulation start with the specified value.
minValue maxValue	Specifies the value range of the tag. You set a minimum and maximum value for this range. The default values are -32768 for the minimum and 32767 for the maximum.
Period	Contains the period during which the value of the tag is repeated for the "Increment" and "Decrement" simulation modes.
Start	Starts simulation of the tag based on the previously entered information.

Simulation modes

The simulator has six different simulation modes. The configured tags are supplied with nearly realistic values during the simulation.

Simulation mode	Description
Sinusoidal	Changes the tag value to form a sinusoidal curve. The value is visualized as a periodic, non-linear function.
Random	Provides randomly generated values. The tag value is changed by means of a random function.
Increment	Increases the value of the tag continuously up to a specified maximum value. Begins again at the minimum after the maximum has been reached. The value trend corresponds to a positive saw-tooth curve.
Decrement	Reduces the value of the tag continuously down to a specified minimum value. Begins again at the maximum after the minimum has been reached. The value curve corresponds to a negative saw-tooth curve.
Shift bit	Shifts a set bit continuously by one position. The previous position is always reset. This lets you test the alarms of an HMI device, for example.
<Display>	The current tag value is displayed statically.

Example: Simulate tags with the "Shift bit" simulation mode

Proceed as follows to simulate tags with the "Shift bit" simulation mode:

1. Open the project you want to simulate.
2. Select the menu command "Online > Simulate Runtime > With tag simulator".
   The tag simulator opens.
3. In the "Tag" column, select a tag from your project.
4. Select "Bin" in the "Format" column.
5. Enter the value "1" in the "Write cycle" column.
6. Select the "Shift bit" simulation mode in the "Simulation" column.
7. Enter the value "1" in the "Set value" column.
8. Enable the tag with the "Start" check box.

Result

The simulator tests the selected tag bit-by-bit as follows:

Simulation values	Byte for alarms
Set start value	00000001
1. Simulation value	00000010
2. Simulation value	00000100
3. Simulation value	00001000
....	...

In Runtime you see if the desired alarm is output at a given value.

Simulation restrictions (Panels, RT Advanced)

Alarms with dynamic parameters

If you use tags or text lists as external tags for alarms, the dynamic parameters of the alarms are not displayed.

Only internal tags are enabled for the simulation of alarms in the tag simulator .

You can use PLCSim to simulate dynamic parameters.

Start debugger (Panels, RT Advanced)

Introduction

Select the "With script debugger" script mode to test scripts. The debugger allows you to set breakpoints in the code, for example, or implement a script step by step.

Requirements

- A debugger that supports VBS is installed on the Engineering Station, e.g. "MS Script Debugger".
- WinCC Runtime is installed on the Engineering Station.
- A project is open.

Procedure

1. Select the "Online > Simulation > With script debugger" menu command.
   The Runtime software searches for debuggers installed on the Engineering Station.
2. If several debuggers are found, click on a selected.

Result

The debugger is connected automatically with the runtime software.

12.14.3.5 Loading projects (Panels, RT Advanced)

Overview for loading of projects (Panels)

Overview

Delta data of the project is automatically compiled before you download it to one or several HMI devices. This always ensures that the latest version of the project is transferred.

Loading a project to an HMI device

The following steps are completed prior to downloading:

1. The download settings are verified. The "Extended download to device" dialog box opens automatically during the initial download of a project to an HMI device. You use this dialog to define the protocol and interface or destination path for the project in accordance with the HMI device Runtime used.
   If the HMI device is part of a subnet, for example, you also select the subnet and the first gateway.
   You can open the "Extended download" dialog at any time with the menu command "Online > Extended download to device...".
   The "Load preview" dialog opens.
2. The project is compiled. Warnings and errors during compilation are displayed in the Inspector window and in the "Load preview" dialog.
3. The "Load preview" dialog shows you the following information for each HMI device:
   - The individual steps for loading
   - If the device version of the target HMI device does not match the configured device version, you are queried if you want to change the device version at this time.
     As long as the project with the selected device version of the target HMI device is not executable, you cannot start the download.

     NOTICE

     Changing the device version deletes all data on the HMI device.

     Data is deleted on the target system if you change the device version. For this reason, you should first back up the following data:
     - User administration
     - Recipes
     - License keys

     With Comfort devices, the licenses can only be deleted when resetting to factory settings. Back up the license keys before you restore the factory settings.
   - Presettings that take effect at loading. You can change the default settings for this download process, if necessary.
   - Warning events (optional). You can download a project while ignoring the "warnings". The functionality may be restricted in runtime.
   - Error events (optional). You cannot load the project. Eliminate the errors and then reload the project.
     WinCC will open the invalid configuration in the corresponding editor if you double-click the error message in the Inspector window. Correct the errors and reload the project.

If you are using HMI tags in your project that are connected to PLC tags, you should also compile the user program before you compile the HMI device.

Note

Interruption of a download

If the download is interrupted, WinCC automatically ensures that no data is lost and that existing data is deleted on the HMI device only after complete transmission.

Loading of projects without recipe data records

You are using recipes in a project. You transfer the project to a Basic Panel without recipe data records.

You may encounter inconsistencies if you have altered the structure of the recipe in the engineering system and the device already held recipe data records.

Check the consistency of the data records in this case. The device will not issue a note for all structural changes.

Pack&Go

If you cannot establish a direct connection from the configuration PC to the HMI device, copy the compiled project to a PC that is connected to the HMI device, for example via a network. Download the project from this PC to the HMI device.

Loading with S7 routing

Configure the S7 routing settings in the "Devices & Networks" editor in the relevant PLC. The settings depend on the device configured.

S7 routing supports the following protocols:

- MPI/PROFIBUS
- PN/IE

Transferring Runtime add-ons in WinCC

Projects can contain Runtime add-ons in the form of controls or CSP (Communication Support Packages). These Runtime add-ons are automatically transferred with the project.

See also

Loading a project (Page 6307)

Generating a "Pack&Go" file (Page 6310)

Loading a project (Panels, RT Advanced)

Introduction

Before a project can run on an HMI device, you must first load it to the HMI device. During loading, you must most importantly specify whether existing data on the HMI device such as "user administration" and "recipe data" is to be overwritten.

If the HMI device supports PROFINET, the name registered in the project tree is used for the PROFINET communication. The use of the name corresponds to the default settings of the PROFINET interface of the HMI device. For devices with more than one PROFINET interface, the name of the IE CP is automatically added to the device name with a separating period. The name is written to the HMI device during download. If a device name for the PROFINET communication has already been entered in the HMI device, it will be overwritten.

You can find additional information about these settings in the information system in the "Assigning a device name and IP address" section.

If the device version of the target HMI device does not match the configured device version, you are asked whether you wish to change the device version at this time.

NOTICE
Changing the device version deletes all data on the HMI device. Data is deleted on the target system if you change the device version. For this reason, you should first back up the following data: • User administration • Recipes • Licenses Resetting to factory settings also deletes the license keys. Back up the license keys before you reset the system to factory settings. With Comfort devices, the licenses can only be deleted when resetting to factory settings. Back up the licenses and license keys before you reset the system to factory settings.

Note

Transfer to an HMI device with WinAC MP

The "PN/IE" channel is not approved for the project transfer on HMI devices with WinAC MP.

Use the "Ethernet" channel instead of "PN/IE" to transfer data to an HMI device that is running PLC WinAC MP.

Note

Transfer to an HMI device with PC station V1.0 or PC station V2.0

The version of the PC station set in the device settings of the HMI device must match the version installed on the HMI device.

Additional information on configuration settings for "PC Station" on the HMI device is available in the "SIMATIC NET" documentation.

Note

Overwriting existing data during loading

During loading, you must specify whether existing data on the HMI device is to be overwritten. By selecting the check boxes in the "Load preview" dialog you can always overwrite the following data during loading:

- Existing user administration data on the device
- Existing recipe data on the device

Establishing a connection to WinCC Runtime Advanced

Ensure that the device version configured in the engineering system matches the installed Runtime version; otherwise, communication when the project is loaded will not be established or will be delayed.

If the device version does not match the installed Runtime version, you have the following options:

1. Change the device version configured in the engineering system.
2. Install the version of WinCC Runtime Advanced corresponding to the configured device version.

Note

If your HMI device is a PC, the device version of the target system is not automatically updated during the download.

Verify that the configured device version corresponds to the one of the target HMI device before you compile and download your project. If necessary, install the matching Runtime version on your HMI device or change the device version manually using the properties of the HMI device.

Controlling the transfer behavior on the HMI device

As a general rule, only one project can be active in Runtime on an HMI device. An HMI device is generally configured to exit Runtime automatically when loading is started. If this is not the case, you will have to exit Runtime manually on the HMI device.

You define how the HMI device reacts when the project is loaded in the "Start Center" under "Settings" on the HMI device:

Transfer mode	Effect
Off	The project cannot be loaded to the HMI device.
Manually	The project can only be loaded to the HMI device if the following requirements are met: • Runtime is not running • The HMI device is in "Transfer" mode.
Automatic	The project can always be loaded to the HMI device. If a transfer is started on the configuration PC and a project is in runtime on the HMI device, the running project is automatically closed. For Mobile Panels, this transfer mode is disabled for security reasons.

Note

Closing Runtime automatically

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can trigger unwanted responses in the plant.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the "Start Center".

Please refer to the documentation for the HMI device used for more detailed information on transfer settings.

Requirement

- You have created an HMI device in the project.
- The HMI device is connected to the configuration PC.
- The "Start Center" has been started on the HMI device.
- The protocol by which the project is loaded is set on the HMI device in the "Start Center" under "Settings".
- Transfer mode is set as "Automatically" or "Manually" in the HMI device.

Procedure

Proceed as follows to load a project:

1. To download a project simultaneously to several HMI devices, select the HMI devices by means of multiple selection in the project tree.
2. Select the "Download to device > Software" command from the shortcut menu of an HMI device.

3. If the "Extended loading" dialog is open, configure the "Settings for loading". Make sure that the "Settings for loading" correspond to the "Transfer settings in the HMI device".
   - Select the protocol used, for example, Ethernet or HTTP.
   - Configure the relevant interface parameters on the configuration PC.
   - Make any interface-specific or protocol-specific settings required in the HMI device.
   - Click "Download".

   You can open the "Extended download" dialog at any time with the menu command "Online > Extended download to device...".
   The "Load preview" dialog opens. The project is compiled at the same time. The result is displayed in the "Load preview" dialog.
4. Check the displayed presettings and change them as necessary.
5. Click "Download".

Result

The project is loaded to all selected HMI devices. In WinCC V13, the project with the Runtime add-ons is loaded to the selected HMI devices.

During the download, you can keep track of the files that are transferred.

If errors or warnings occur during the download, corresponding alarms are displayed under "Info > Load" in the Inspector window.

On completion of the successful download of the project, you can execute it on the HMI device.

Note

If the transfer is interrupted, WinCC V13 automatically ensures that no data is lost and that existing data is deleted on the HMI device only after complete transmission.

Error messages during the download of projects (Page 6328)

Overview for loading of projects (Page 6304)

Generating a "Pack&Go" file (Panels)

Introduction

Create a "Pack&Go" file if you cannot connect the HMI device to the configuration PC. The "Pack&Go" file is a ZIP file containing the following data:

- The compiled project
- A program for transferring the project to the HMI device
- Image for the configured HMI device

Typical example of an application: An engineering company creates a project variant for a new HMI device. The project engineer of the engineering company does not have direct access to the plant. The project engineer therefore e-mails the "Pack&Go" file to his local contact. The contact unpacks the "Pack&Go" file on a PC connected to the HMI device via a network. He then transfers the project from the PC to the HMI device.

Requirement

- You have created an HMI device in the project.

Procedure

To create a "Pack&Go" file, follow these steps:

1. Select the HMI device in the project tree.
2. Select the "Pack&Go" command from the menu under "Online > HMI Device maintenance".
3. The "Create Pack&Go file" opens.
4. Verify that the displayed device version corresponds with that of the target HMI device.
5. Select a protocol as transfer mode.
6. Select the storage location under "Pack&Go file" and enter the file name.
7. If necessary, specify if the "Pack&Go" file is split into several files.
8. Click "Create".

Note

To unzip a "Pack&Go" file which is distributed over several files, you need a compression program. The compression program integrated into the operating system is not adequate to unzip distributed files.

Result

The "Pack&Go" file is created and saved to the specified folder in the file system. Now copy the "Pack&Go" file to the PC connected to the HMI device.

See also

Downloading projects from a "Pack&Go" file to the HMI device (Page 6311)

Downloading projects from a "Pack&Go" file to the HMI device (Panels)

Introduction

Pack&Go is a 64-bit application that can only run on a 64-bit operating system.

If the TIA Portal is not installed on your PC, install Microsoft Visual C++ 2015 Redisitributable Package (x64) and .Net Framework 4.6.1 to run the Pack&Go application.

- You can find the Microsoft Visual C++ 2015 Redistributable Package (x64) in the Download Center of Microsoft at the following URL:
  http://www.microsoft.com/en-us/download/details.aspx?id=48145
- You can find .Net Framework 4.6.1 at the following URL:
  https://www.microsoft.com/en-us/download/details.aspx?id=49982

Requirements

- .NET Framework with version 4.6.1
- ProSave is installed on the PC
- The "Pack&Go" file has been stored in the file system of a PC.
- The PC is connected to the HMI device.
- The device version of the HMI device is consistent with the device version in the project

Note

To unzip a "Pack&Go" file which is distributed over several files, you need a compression program. The compression program integrated into the operating system is not adequate to unzip distributed files.

Procedure

To download the project from a "Pack&Go" file to an HMI device, follow these steps:

1. Unpack the "Pack&Go" file to a folder of your choice in the file system of the PC.
2. From the "PackNGo" subfolder of this directory, run "Siemens.Simatic.Hmi.PackNgo.exe". The "Pack'n Go" dialog opens. The settings for loading are set by default. Exception: You must select the target device if you are using an S7 USB connection.
3. Adjust the settings for loading appropriately if they differ from the interfaces or protocols available on the PC.
4. Legen Sie fest, ob die Daten der Benutzerverwaltung und der Rezepturen, die bereits auf dem Bediengerät gespeichert sind, überschrieben werden sollen.
5. Click "Transfer".

Result

The connection to the HMI device is set up via the selected path. An alarm is output if the device version used in the project differs from that of HMI device.

If this is the case, update the operating system on the HMI device. To update the operating system on the HMI device, you need ProSave. A prompt for operating system update will appear automatically if ProSave has been installed and the selected connection supports the update of the operating system.

Generating a "Pack&Go" file (Page 6310)

Updating the operating system (Page 6370)

Updating the operating system on the HMI device (Page 6372)

Loading via USB interface (Panels, RT Advanced)

Introduction

When you load a project via a USB port, connect the configuration PC and the HMI device with a USB cable.

Requirements for transfer via USB

The following conditions must be met to ensure successful data transfer using a USB port:

- Use a USB host-to-host cable, USB 2.0 standard.
- You have installed the provided USB driver.
  You can find the driver on the WinCC Product DVD under "Support\DeviceDriver\USB".
- The HMI device being used is based on Windows CE and has a USB port.

You can find more information on the cables used and the manufacturers/suppliers in the Internet at:

- http://support.automation.siemens.com (http://support.automation.siemens.com/WW/view/en/19142034)

Note

Driver installation

To avoid problems when transferring projects, only use the USB driver provided on the WinCC Product DVD.

Note

Comfort HMI devices

Use the mini USB port to load projects via USB with Comfort HMI devices. This driver is installed automatically.

Restrictions

A project can always be transferred to an HMI device. Simultaneous transfer to several HMI devices is not possible.

Installing a USB driver in Windows 7 (Panels, RT Advanced)

Introduction

To load a project via the USB port, install the USB drivers provided on the WinCC product DVD.

Note

Driver installation

To avoid problems when transferring projects, only use the USB driver provided on the WinCC product DVD.

Note

Comfort HMI devices

Use the mini USB port to load projects via USB with Comfort HMI devices. This driver is installed automatically.

Requirement

- The WinCC product DVD is available.
- You are using a USB host-to-host cable, USB 2.0 standard.
- The HMI device has a USB port.

Procedure

To install the USB driver under Windows 7, follow these steps:

1. Connect the USB host-to-host cable to the PC's USB port.
   The USB cable is detected, but the wizard for the driver installation does not find the driver.

   Note

   Connect the HMI device only when the driver has been completely installed on the PC.

2. Open the Device Manager in the Control Panel.
3. Select "Other devices > USB host-to-host cable".
4. Select "USB host-to-host cable" and then select "Update driver software..." in the shortcut menu.
5. When the "How do you want to search for driver software?" prompt appears, select "Search for driver software on the computer".
6. Click "Update driver software > Browse...".
7. Insert the WinCC product DVD as the source for driver installation.

8. Select "Include subfolders" and then click "Next".
   The system will search the WinCC product DVD for the corresponding driver for the USB host-to-host cable.
   The drivers available on the WinCC product DVD are displayed. The wizard highlights the appropriate driver for Windows 7.
9. Check the selection and click "Next".
10. To continue with the installation, click "Hardware Installation > Continue installation".
    The driver is installed.
11. Click "Finish".
    The installation is complete.

Result

The driver required for the USB host-to-host cable has been installed. To load the project, now connect the HMI device to the USB cable.

12.14.3.6 Compiling and loading with Multi-User Engineering (Panels, RT Advanced)

Compiling and loading with multiuser engineering (overview) (Panels, RT Advanced)

Introduction

When using multiuser engineering for your projects, you should take into account the response when compiling the Runtime projects and the response when downloading them to HMI devices.

You can compile and download to an HMI device in both the server project view and in the local session.

You can find more information about the topic of "multiuser engineering" under "Using Multiuser Engineering".

Basics

For HMI devices and RT Advanced, the following scenarios are possible in multiuser engineering:

- Compiling in the server project view
- Compiling in the local session
- Loading from the server project view
- Loading from the local session

Note

Complete download from the server project view or local session is no different to complete download in a single-user project. With a complete download, the current Runtime project is loaded from the currently active view to an HMI device.

Note

Compiling and downloading in a local session is no different from compiling and downloading in a single-user project.

In principle, you can execute all commands for compiling and loading in multiuser engineering projects:

- "Software (rebuild all)"
- "Compile > Software (only changes)"
- Software (all)

The term "project"

The term "project" has two different meanings in the contexts of compilation and loading. "Project" is the WinCC project on the configuration PC. "Project" is also the Runtime project you create by compiling the configuration data of an HMI device and download to the HMI device.

- WinCC project: contains the configuration data of one or more HMI devices
- Runtime project: contains the compiled configuration data of one HMI device

Rules

The following basic rules apply to compiling and downloading in multiuser engineering:

- The Runtime project that has been compiled in a local session always remains local and is not uploaded to the multiuser server. It cannot be saved in the multiuser server project.
- Only Runtime projects compiled in the server project view can be saved in the multiuser server project.

See also

Compiling in the server project view (Page 6316)

Compiling in the local session (Page 6317)

Compiling in the server project view (Panels, RT Advanced)

Basics

Compiling and downloading in the server project view is no different from compiling and downloading in a single-user project.

During the compiling of a project in the server project view, the multiuser server project is blocked. Other users cannot make changes to this server project during this time. The Runtime project compiled in the server project view is stored along with the engineering project in the central multiuser server. Blocking the multiuser server project ensures that the configuration data and the Runtime project remain in sync.

Note

When you compile and save in the server project view, other users obtain the Runtime project you have updated along with the engineering project when they "refresh" their local session. Other users do not have to recompile the changes you have made after an update.

Example: Compiling during check-in

You make changes to a tag in a local session. All prior changes have been compiled in the associated server project.

If there are no compilation errors, both projects - the modified engineering project (with the modified tags) and the compiled Runtime project - are saved in the central multiuser server project with the "Save changes" command .

If you skip compiling during the check-in, the project contains the changes that have been saved on the server.

The next user who creates a local session from the server project or updates an existing local session must compile your two changes in addition to his or her own changes.

Note

Working on a shared project through multiple local sessions increases the probability of error. It is therefore recommended to compile the project at check-in and eliminate any errors that are reported during compiling. In this way, you provide the next user with a project free of errors.

See also

Compiling in the local session (Page 6317)

Compiling and loading with multiuser engineering (overview) (Page 6315)

Compiling in the local session (Panels, RT Advanced)

Basics

Compiling and downloading projects in the local session is no different from compiling and downloading in a single-user project.

Since the local session is a copy of the server project, the first compilation status of the local session is identical to that of the server project. If the server project contains contents that are

not compiled or error messages occurred during the compiling, they are transferred to the local session.

Note

It is recommended to compile the project at check-in and eliminate any errors that are reported during compiling. In this way, you provide the next user with a project free of errors and avoid spreading errors.

Updating in the local session

If you update a project in the local session, the local session - including the compilation status - is completely replaced by the content of the server project. Only the changes marked for check-in are retained in the updated local session and generate additional compiling steps in the local session.

Example: Updating the local session

You make changes to a tag in a local session. All prior changes have been compiled in the associated server project.

You update the content of the local session by clicking the "Update" button. After the update, the local session obtains the compilation status of the server project. There are also compiling tasks for the acquisition of the modified tags.

12.14.3.7 Runtime start (Panels, RT Advanced)

Starting Runtime on the configuration PC (Panels, RT Advanced)

Introduction

You can start a project in Runtime on the configuration PC if Runtime has been installed. The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in Runtime.

Note

You can only simulate HMI devices with Runtime Panels on the configuration PC. Select the "Online > Start simulation" menu command.

Note

Exiting Runtime automatically

If automatic transfer is activated on the HMI device and if a transfer is started on the configuration PC, the running project is automatically ended.

The HMI device then switches autonomously to the "Transfer" operating mode.

Deactivate automatic transfer after the commissioning phase so that the HMI device does not inadvertently go into transfer mode.

Transfer mode can cause undesired reactions in the system.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the Start Center.

Requirement

- A project is open on the configuration PC.
- Runtime is installed on the configuration PC.
- There is no project in Runtime on the configuration PC.

Procedure

To start runtime on the configuration PC, follow these steps:

1. Select the desired HMI device in the project navigation.
2. Select the "Online > Start Runtime" menu command.

Result

Runtime is started and the project is displayed on the configuration PC.

See also

Simulating a project (Page 6299)

Starting Runtime Advanced and Panel Runtime (Panels, RT Advanced)

Introduction

You can start the project in Runtime as soon as you have downloaded the project to the HMI device. The project is generally started automatically on the HMI device.

There may be several projects in the file system of the HMI device for HMI devices with Runtime Advanced. You can start one of these projects in Runtime.

The project settings defined in the "Runtime settings" of the HMI device are activated when the project is started in Runtime. Make sure when defining the Runtime settings "Lock task

switching" and "Full screen" that you will be able to stop Runtime again. You can, for example, configure a button with the system function "StopRuntime".

Note

Closing Runtime automatically

If automatic transfer is activated on the HMI device and a transfer is started on the configuration PC, the running project is automatically terminated.

The HMI device then automatically switches to "Transfer" operating mode.

After the commissioning phase, disable the automatic transfer function to prevent the HMI device from switching inadvertently to transfer mode.

Transfer mode can trigger unwanted responses in the plant.

In order to restrict access to the transfer settings and thus avoid unauthorized changes, enter a password in the "Start Center".

Requirements

- WinCC Runtime Advanced or Panel Runtime is installed on the HMI device.
- The project was downloaded to the HMI device.
- The "Start Center" has been started.

Starting Runtime on a PC

The compiled project is saved in the PC file system with the extension "*.fwc" and is freely accessible.

1. Enter the project file with complete path information in the "Start Center" under "Settings > Configuration path".
2. To start the project automatically after booting the HMI device:
   - Select the required delay time in seconds under "Wait until Autostart".
   - Add the "Start Center" application to the "Autostart" group in the Windows Start menu.
3. Click on "Start" in the "Start Center" to manually start the project in the HMI device.

Starting Runtime on a panel

The project is stored on a panel in a folder you specify in the HMI device transfer settings. The "Start Center" application is started on a panel. The project loaded is started automatically after expiration of the configured delay.

If the project does not start automatically:

1. Click on "Start" in the "Start Center" to start the loaded project.

Refer to the documentation for the HMI device for additional information on startup of projects.

Result

Runtime is started on the HMI device.

Downloading projects from a "Pack&Go" file to the HMI device (Page 6311)

12.14.3.8 Viewing memory card data (Panels, RT Advanced)

Basics (Panels)

Introduction

WinCC provides you with the possibility of viewing data stored on your memory card. The function supports the use of memory cards of the HMI device and of the CPU.

You have the following options:

AUTOHOTSPOT

Working with backups (Panels, RT Advanced)

Viewing a backup

Introduction

The backup of a Basic Panel that is stored on a memory card can also be viewed in the TIA Portal.

Requirements

- WinCC is installed.
- A memory card with a backup is available.
- The card reader is connected to the configuration PC.
- The project view is open.

Backup on the memory card in the card reader

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder
5. Click the backup to open the shortcut menu.
6. Select "Properties".

Backup on the memory card of the PLC

Proceed as follows if the backup is stored on the memory card of the PLC:

1. Connect the PLC with the configuration PC.
2. Click on the PLC in the project navigation.
3. Select "Connect online" from the shortcut menu.
   A connection to the PLC is established.
   Once the PLC is connected, the "Online Card Data" folder is displayed.
4. Open the "Online Card Data" folder.

   Note

   Accessing a password-protected PLC

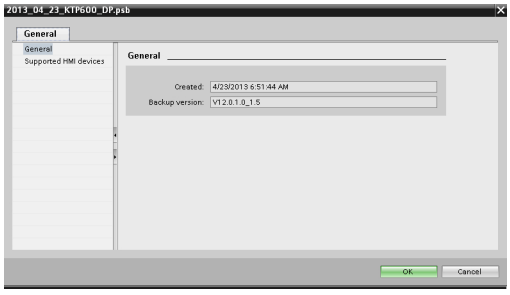
   When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

   You need at least read access rights in order to view the data that is stored on the memory card.

5. Click the backup to open the shortcut menu.
6. Select "Properties".

Result

The backup properties are displayed in a separate dialog.



Renaming and deleting backups

Introduction

You can rename and delete backups from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
  The PLC is connected online with the configuration PC.
- A memory card with a backup is available.
- The project view is open.
- The backup is displayed in the project navigation.

Note

Accessing a password-protected PLC

When you attempt to access a PLC that is protected by a password, you will be prompted to enter the password.

You need write access rights to rename or delete memory card data.

Procedure

1. Click on the backup in the project navigation.
2. Open the shortcut menu.
3. Select "Rename" to rename the file.
4. Enter a new name.
5. Select "Delete" to delete the file.

Result

The backup file is now renamed or deleted.

Working with HMI device images (Panels, RT Advanced)

Viewing HMI device images (Panels, RT Advanced)

Introduction

The HMI device image of a Comfort Panel that is stored on a memory card can be viewed in the TIA Portal.

Requirements

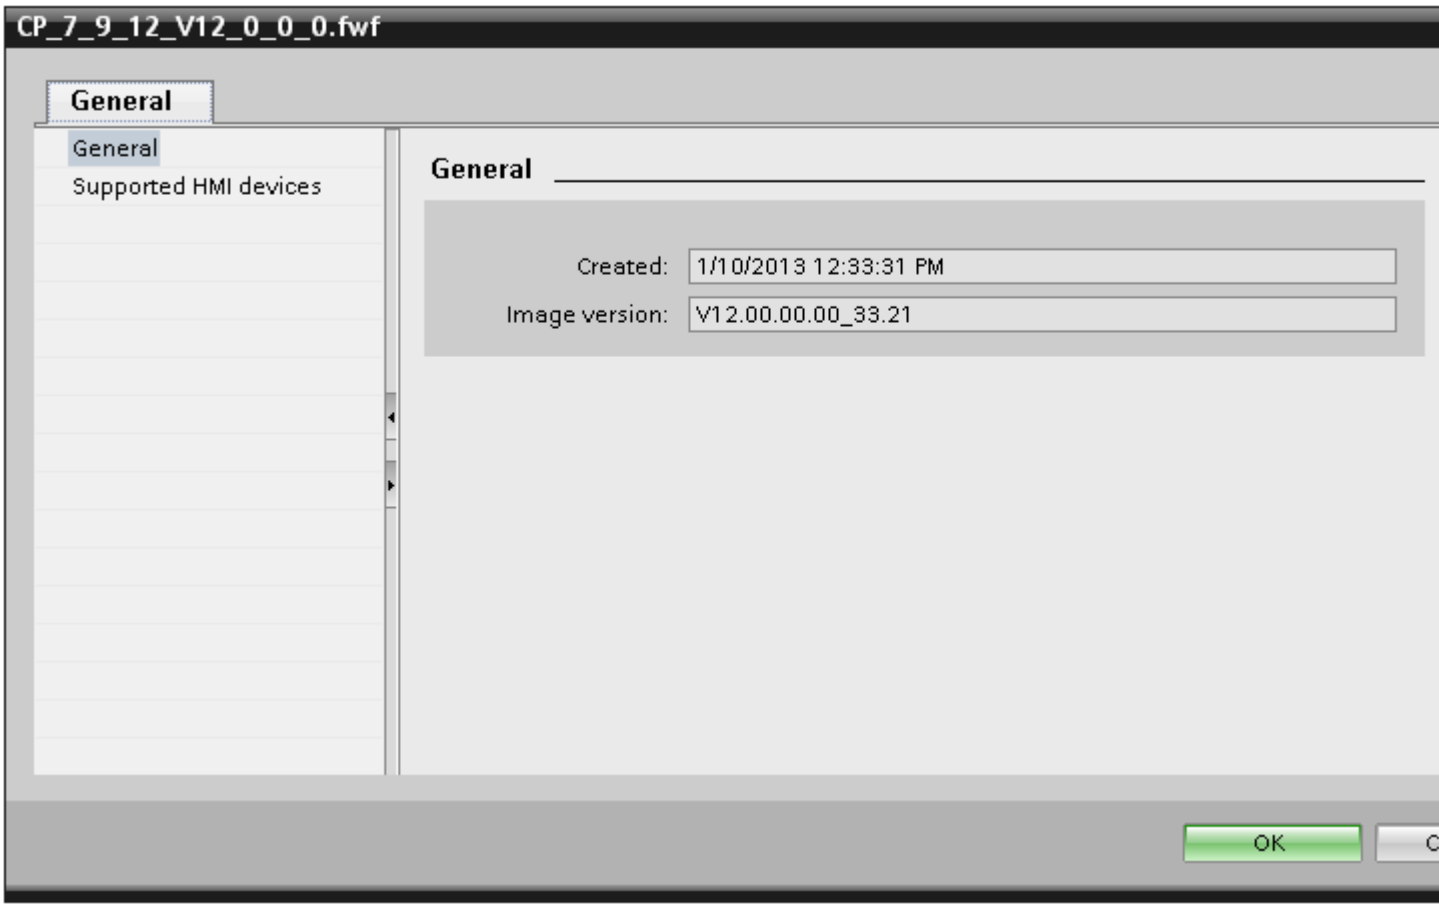
- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with the HMI device image is available.
- The project view is open.

Procedure

1. Insert the memory card into the card reader.
2. Open "SIMATIC Card Reader" in the project navigation.
3. Select the card reader drive.
   The "Online Card Data" dialog is displayed.
4. Open the "Online Card Data" folder.
   The available images of the HMI device are displayed in additional folders.
5. Click the required HMI device image.
6. Select "Properties" in the shortcut menu.

Result

The properties of the HMI device image are displayed in a separate dialog.



Deleting HMI device images (Panels, RT Advanced)

Introduction

You can delete the HMI device image of a Comfort Panel from a memory card in the project navigation of the TIA Portal.

Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- A memory card with an HMI device image is available.
- The project view is open.
- The HMI device image is displayed in the project navigation.

Procedure

1. Click the HMI device image in the project navigation.
2. Open the shortcut menu.
3. Select "Delete" to delete the file.

Result

The HMI device image is deleted.

Creating HMI device images on memory card (Panels, RT Advanced)

Introduction

You may edit the HMI device image of a Comfort Panel without connecting the Comfort Panel to the configuration PC.

Simply create the HMI device image on an external memory card or USB stick and then transfer it from there to the Comfort Panel.

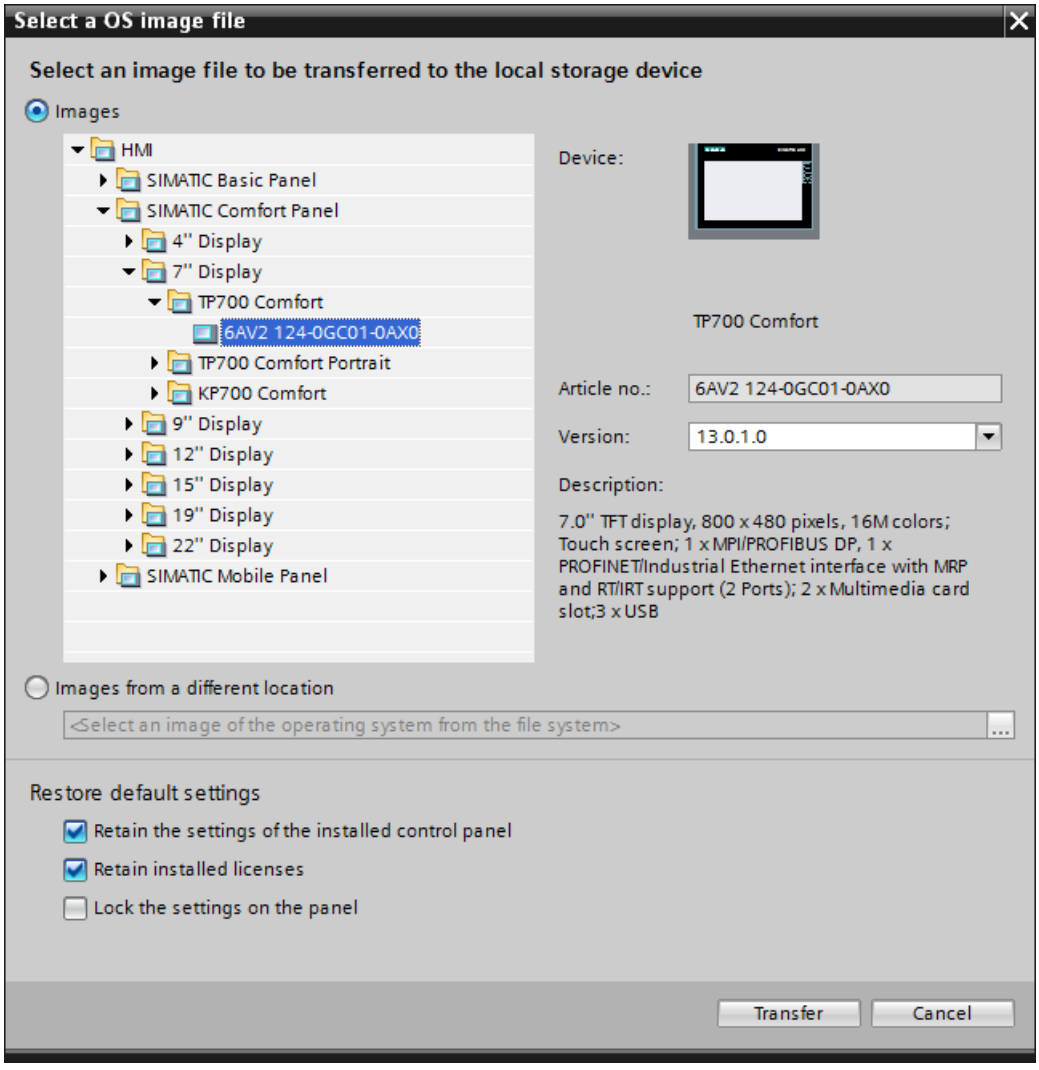
Requirements

- WinCC is installed.
- The card reader is connected to the configuration PC.
- The project view is open.

Procedure

1. Insert the memory card into the card reader.
2. Click on the memory card in the project navigation.
3. Open the shortcut menu.

4. Select "Create HMI OS image on memory card".
   A dialog opens.



5. Select an HMI device image.
6. Select the settings for the restoration.
   - Activate "Retain installed settings of the Control Panel"
     The settings you have made on the Comfort Panel are retained.
   - Activate "Retain installed licenses":
     The licenses on the Panel are retained.
   - Activate "Lock settings on the Panel"
     You can no longer change the selected settings for "Retain installed settings of the Control Panel" and "Retain installed licenses" on the Comfort Panel.

Result

You have created an HMI device images on memory card. You may use a USB stick instead of a memory card.

12.14.3.9 Error messages during the download of projects (Panels, RT Advanced)

Possible problems during the download

When a project is being downloaded to the HMI device, status messages regarding the download progress are displayed in the output window.

Usually, problems arising during the download of the project to the HMI device are caused by one of the following errors:

- Wrong operating system version on the HMI device
- Incorrect download settings on the HMI device
- Incorrect HMI device type in the project
- The HMI device is not connected to the configuration PC.

The most common download failures and possible causes and remedies are listed below.

The serial download is cancelled

Possible remedy: Select a lower baud rate.

The download is cancelled due to a compatibility conflict

Possible cause	Remedy
Conflict between versions of the configuration software and the operating system of the HMI device	Synchronize the operating system of the HMI device with the version of the configuration software. To update the operating system on the HMI device, select the "Update operating system" command from the "Online > HMI device maintenance" menu in WinCC. You can also use ProSave. For additional information, refer to the operating instructions for the HMI device.
The configuration PC is connected to the wrong device, e.g. a controller.	Check the cabling. Correct the communication parameters.

Project download fails

Possible cause	Remedy
Connection to the HMI device cannot be established (alarm in the output window)	Check the physical connection between the configuration PC and the HMI device. Check whether the HMI device is in transfer mode. Exception: Remote control
The default communication driver is not listed in the Windows Device Manager.	Check the device status of the COM connection in the properties window of the Device Manager.

Download over MPI/DP interface fails

Possible cause	Remedy
"Configured mode" is set on the CP, for example, if you are using the SIMATIC NET CD.	Set the CP to "PG mode" using the "Set PC station" application. Check the "baud rate" and "MPI address" network parameters. Download the project from WinCC to the CP. Set the CP back to "configured mode".
On the programming device/PC panel, the "S7ONLINE" access point is not set to a hardware device such as CP5611 (MPI). This may be due to the installation of "SIMATIC NET CD".	Set the access point "S7ONLINE" on the selected device using the "PG/PC Panel" or "Set PC station" application. Check the "baud rate" and "MPI address" network parameters. Download the project from WinCC to the HMI device. Restore the "S7ONLINE" access point to the original device.

The configuration is too complex

Possible cause	Remedy
The configuration contains too many different objects or options for the HMI device selected.	Remove all objects of a specific type, for example all HTML browsers. Alternatively, remove options such as Sm@rtServer or OPC server.

12.14.3.10 Reducing the project size (Panels, RT Advanced)

Introduction

When loading a large-scale project to an HMI device, the memory of the HMI device may be insufficient for the project. There are several ways to reduce the size of your project.

Options for reducing the project size

There are several ways to reduce the size of the project and save space:

- Reduce the number of available Runtime languages
  Check whether all selected Runtime languages are actually needed. You can disable the languages that you do not need under "Runtime settings > Language & Font > Runtime language and font selection".
- Do not use help texts for S7 diagnostic alarms
  To reduce the size of the project, you can disable the download of help texts for the S7 diagnostic alarms. In order to avoid downloading the help texts to the HMI device, disable the option "Download S7 diagnostics help texts" under "Runtime settings > Alarms > General".

- Rebuild all software
  In order to optimize the project data and to clean up obsolete changes, compile the entire project using the "Compile > Software (rebuild all)" command from the shortcut menu of the HMI device.
- Harmonize the presentation using styles (as of WinCC V13)
  It is recommended to harmonize screen objects using styles. Standardize the appearance of screen objects in a project to optimize project data. Use the specified preset or customized style for the configuration of the screen objects throughout the project.
- Enable automatic update of PLC alarms (for S7-1500 controllers and V14 HMI devices)
  To save space, you can specify that the PLC alarm texts are only to be loaded in Runtime when needed. To do this, enable the "Automatic update" option under "Runtime settings > Alarms > Controller alarms". Make sure that automatic update of alarms is also enabled in the corresponding controller.
  The "Automatic update" option is not available on Basic Panels.
  The amount of space that can be saved depends on the number of PLC alarms and the number of Runtime languages.
- Reduce the number of fonts loaded
  Check whether the number of downloaded user-defined fonts can be reduced. If necessary, configure only the standard fonts for the required Runtime languages under "Runtime settings > Language & font > Runtime language and font selection".
  To save space, use fewer font groups for the configuration.
- Reduce the size of the graphics
  Check the size of the graphics that you use in the project. If necessary, reduce the size of the graphics by reducing the resolution or choose a higher compression format without noticeable loss of quality for the project graphics.
  To keep the project size small for Basic HMI devices, harmonize the sizes of graphics used in the project.
  Select appropriate graphic formats for your screens: For example, use PNG images for drawings that are not vector graphics and JPEG images for photos.

12.14.3.11 Adapting the project for another HMI device (Panels, RT Advanced)

Introduction

When you download a WinCC project to an HMI device, WinCC checks whether this is compatible with the HMI device type used in the project. If the types of HMI device do not match, you will see a message before the download starts.

The download is aborted.

Adapting the project for the HMI device

You need to adapt the project accordingly to be able to download the project to the connected HMI device.

- Add a new HMI device in the project tree. Select the correct type of HMI device from the HMI device selection.
- Copy the configured components from the previous to the new HMI device.
  Copy large amounts of components directly in the project navigation and details view.
  For example, copy the "Screens" folder to the screens folder of the new HMI device with the help of the shortcut menu.
- Use the detail view to copy entries in the project tree for which the "Copy" command is not available in the shortcut menu.
- Select the "Recipes" entry in the project tree, for example. The recipes are displayed in the detail view.
- Select the recipes in the detail view and drag them to the "Recipes" entry of the new HMI device. The recipes are copied. You can also select multiple objects in the detail view.
- Configure the components that cannot be copied, e.g. connections, area pointers, and alarms.
- Save the project at various points in time.
- Compile the full project.
- When the compilation is successfully completed, download the project to the HMI device.

Linking references

References to linked objects are included in the copying. The references are linked again once the linked objects are copied.

Example:

You copy a screen in which objects are linked to tags. The tag names are entered at the individual objects after the screen is added to the new HMI device. The tag names are marked in red because the references are open. When you then copy the tags and insert them into the new HMI device, the open references are closed. The red marking for the tag names disappears.

For complete references to connected objects in the PLC, you first need to configure a connection to the PLC.

Using the information area

When you compile the project for the HMI device, errors and warnings are displayed in the "Info" tab of the Inspector window. You can use the shortcut menu command "Go to" to go directly to the location where the error or warning can be corrected.

Work through the list of errors and warnings from top to bottom.

When the compilation is successfully completed, download the project to the HMI device.
