No supply voltage	011_H	No L+ supply voltage for the technology module	Connect L+ supply voltage to the Technology Module.
Short-circuit or overload at the 24 V DC sensor supply	$10E_H$	Error on 24 V DC sensor supply Possible causes: • Short-circuit • Overload	• Correct wiring to 24 V DC. • Check loads connected to 24 V DC.
Error at the digital outputs	$10F_H$	Error at the digital outputs Possible causes: • Short-circuit • Overload	• Correct wiring at the digital outputs. • Check loads connected to the digital outputs.
Supply voltage error	110_H	Error at L+ supply voltage Possible causes: • Low voltage • Wiring of L+ supply voltage defective	• Check the L+ supply voltage. • Check the wiring of L+ supply voltage.
Over temperature	506_H	Possible causes: • Short-circuit or overload at the digital outputs • Ambient temperature outside specifications	• Correct process wiring • Improve cooling • Check connected loads

Technical specifications

8

	6ES7138-6DB00-0BB1
Product type designation	TM Pulse 2x24 V
General information	
Firmware version	V1.0
• FW update possible	Yes
usable BaseUnits	BU type B1
Color code for module-specific color identification plate	CC40
Product function	
I&M data	Yes; I&M 0
Isochronous mode	Yes
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13 SP1
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
PROFIBUS as of GSD version/GSD revision	GSD Revision 5
PROFINET as of GSD version/GSD revision	GSDML V2.31
Supply voltage	
Load voltage L+	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19,2 V
permissible range, upper limit (DC)	28,8 V
Short-circuit protection	Yes
Reverse polarity protection	Yes; against destruction
Input current	
Current consumption, max.	70 mA; without load
Encoder supply	
Number of outputs	2; A common 24V encoder supply for both channels
24 V encoder supply	
24 V	Yes; L+ (-0.8 V)
Short-circuit protection	Yes; per module, electronic
Output current, max.	300 mA
Power loss	
Power loss, typ.	1,7 W

	6ES7138-6DB00-0BB1
Address area	
Occupied address area	
Inputs	16 byte; 8 per channel
Outputs	24 byte; 12 per channel
Digital inputs	
Number of digital inputs	2; 1 per channel
Digital inputs, parameterizable	Yes
Input characteristic curve in accordance with IEC 61131, type 3	Yes
Digital input functions, parameterizable	
Freely usable digital input	Yes
HW enable for digital output	Yes
Input voltage	
Type of input voltage	DC
Rated value (DC)	24 V
for signal "0"	-30 to +5V
for signal "1"	+11 to +30V
permissible voltage at input, min.	-30 V
permissible voltage at input, max.	30 V
Input current	
for signal "1", typ.	2,5 mA
Input delay (for rated value of input voltage)	
for standard inputs	
• parameterizable	Yes; none / 0.05 / 0.1 / 0.4 / 0.8 / 1.6 / 3.2 / 12.8 / 20 ms
• at "0" to "1", min.	4 µs; for parameterization "none"
• at "1" to "0", min.	4 µs; for parameterization "none"
Cable length	
shielded, max.	1000 m; Depending on load and cable quality
unshielded, max.	600 m; Depending on load and cable quality
Digital outputs	
Type of digital output	P- and M-switching
Number of digital outputs	2; 1 per channel
Current-sinking	Yes
Current-sourcing	Yes
Digital outputs, parameterizable	Yes
Short-circuit protection	Yes; electronic/thermal
• Response threshold, typ.	6.8 A with Standard output, 2 A with High Speed output

	6ES7138-6DB00-0BB1
Limitation of inductive shutdown voltage to	-0.8 V
Controlling a digital input	Yes
Accuracy of pulse duration	±100 ppm ±0.5 µs with High Speed output, ±100 ±100 ppm ±9 µs with Standard output
minimum pulse duration	1,5 µs; With High Speed output, 10 µs with Standard output
Digital output functions, parameterizable	
Freely usable digital output	Yes
PWM output	Yes
• Number, max.	2; 1 per channel
• Cycle duration, parameterizable	Yes; Max. 85 s
• ON period, min.	0 %
• ON period, max.	100 %
• Resolution of the duty cycle	0,0036 %; For S7 analog format, min. 20 ns
Connection of a proportional valve	Yes
Dithering	Yes
• Frequency adjustable	Yes
• Amplitude adjustable	Yes
Current measurement	Yes
Current control	Yes
Connection of a DC motor	Yes
ON-delay	Yes
OFF-delay	Yes
Frequency output	Yes
Pulse train	Yes
Pulse output	Yes
Switching capacity of the outputs	
with resistive load, max.	2 A
on lamp load, max.	10 W; 1 W with High Speed output
Load resistance range	
lower limit	12 Ω; 240 ohm with High Speed output
upper limit	12 kΩ
Output voltage	
Type of output voltage	DC
for signal "0", max.	1 V
for signal "1", min.	23,2 V; L+ (-0.8 V)
Output current	
for signal "1" rated value	2 A; 0.1 A with High Speed output, observe derating

	6ES7138-6DB00-0BB1
Output delay with resistive load	
"0" to "1", typ.	0 µs; With High Speed output, 4.5 µs with Standard output
"0" to "1", max.	0,8 µs; With High Speed output, 9 µs with Standard output
"1" to "0", typ.	0 µs; With High Speed output, 4.5 µs with Standard output
"1" to "0", max.	0,8 µs; With High Speed output, 9 µs with Standard output
Parallel switching of 2 outputs	
for uprating	Yes
Switching frequency	
with resistive load, max.	100 kHz; With High Speed output, 10 kHz with standard output
with inductive load, max.	100 kHz; With High Speed output, 10 kHz with standard output
on lamp load, max.	10 Hz
Total current of the outputs	
Current per channel, max.	2 A
Current per group, max.	4 A
Current per module, max.	4 A
Cable length	
shielded, max.	1000 m; Depending on load and cable quality
unshielded, max.	600 m; Depending on load and cable quality
Isochronous mode	
Isochronous operation (application synchronized up to terminal)	Yes
Bus cycle time (TDP), min.	250 µs; with 1 channel configuration, 375 µs with 2 channel configuration
Jitter, max.	1 µs; typically ±
Interrupts/diagnostics/status information	
Substitute values connectable	Yes; Parameterizable
Alarms	
Diagnostic alarm	Yes
Diagnostic messages	
Diagnostics	Yes
Monitoring the supply voltage	Yes
Short-circuit	Yes
Diagnostics indication LED	
Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
Channel status display	Yes
for module diagnostics	Yes; green/red DIAG LED

	6ES7138-6DB00-0BB1
Potential separation	
Potential separation digital inputs	
between the channels and backplane bus	Yes
Potential separation digital outputs	
between the channels and backplane bus	Yes
Potential separation channels	
between the channels	No
between the channels and backplane bus	Yes
Permissible potential difference	
between different circuits	75 V DC/60 V AC (base isolation)
Isolation	
Isolation tested with	707 V DC (type test)
Ambient conditions	
Ambient temperature during operation	
horizontal installation, max.	60 °C; Observe derating
vertical installation, max.	50 °C; Observe derating
Decentralized operation	
to SIMATIC S7-300	Yes
to SIMATIC S7-400	Yes
to SIMATIC S7-1200	Yes
to SIMATIC S7-1500	Yes
to standard PROFIBUS master	Yes
to standard PROFINET controller	Yes
Dimensions	
Width	20 mm
Weights	
Weight, approx.	50 g

Ambient temperature output current derating information

Use the following graphs to find the maximum output current, when operating at higher loads and temperatures.

The output current derating for single channel (4 A) is twice (2x) the derating of the dual channel (2 A per channel) values shown in the derating graphs.

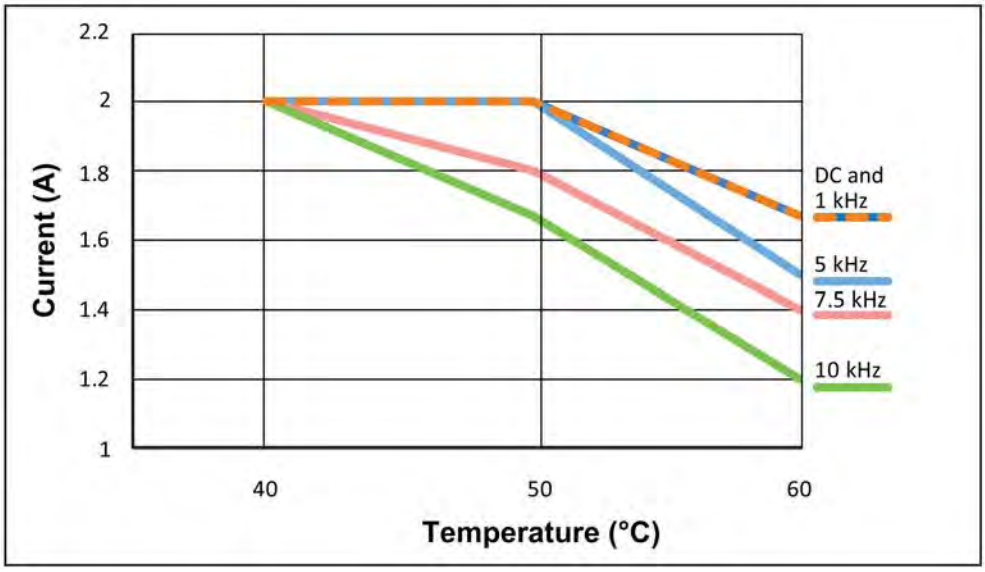

Figure 8-1 Maximum output current temperature derating for DC and 90%/10% duty cycle

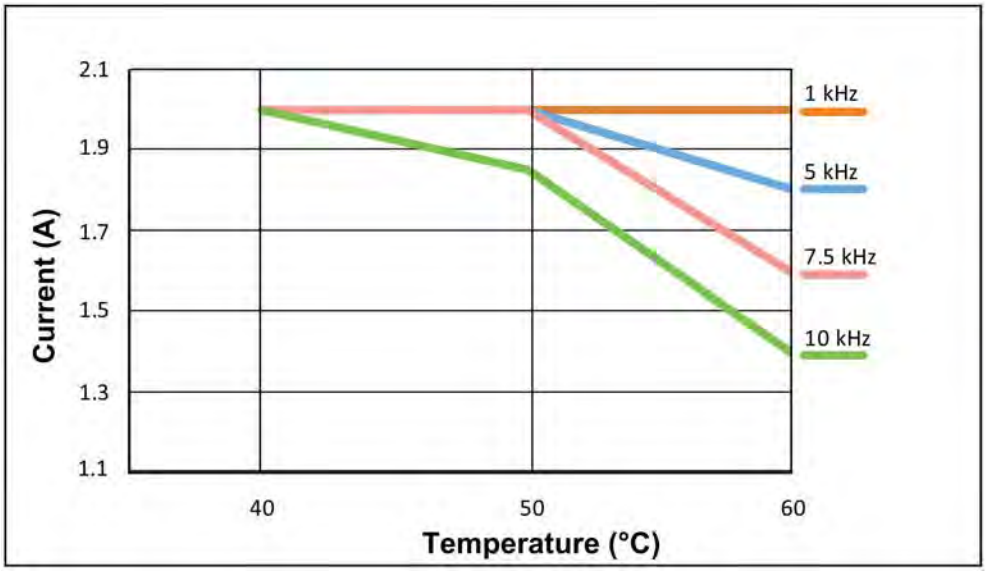

Figure 8-2 Maximum output current temperature derating for 50% duty cycle

BaseUnit technical specifications

Refer to the user manual for ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)

8.1 Programming reference

Control interface: 2 channels, 24 output bytes (Q addresses)

CPU input address		Description
Channel 0	Channel 1[1]	
DWord 0	DWord 12	Depending on the mode: • Pulse output mode: Pulse duration in µs • PWM mode: Duty cycle On-ratio (Number range set by Output format configuration) – "Per 100": 0 to 100 – "Per 1000": 0 to 1,000 – "Per 10000": 0 to 10,000 – "S7 analog output": 0 to 27,648 • PWM mode with current control: Target current is assigned as a ratio of target current/reference current • Pulse train mode: Number of pulses to output as a DWord number value between 1 to 4,294,967,295 (2^{32}-1) • On/Off-delay mode: Off-delay in µs • Frequency output mode: Output frequency in Hz
DWord 4	DWord 16	SLOT value: Behavior depends on operating mode, MODE_SLOT(1 bit), and LD_SLOT (four bits).
Byte 8: Bits 0 to 3	Byte 20: Bits 0 to 3	LD_SLOT value controls interpretation of SLOT value. • 0 = No action / idle state • 1 = Period duration µs (PWM, Pulse train, and DC motor) • 2 = On-delay µs (Pulse output, PWM, Pulse train, Frequency output, and DC motor) • 3 = Off-delay µs (On/Off-delay) • 4 = Duty cycle On-ratio (Pulse train) • 5 = Dither ramp-up time and ramp-down time (PWM) • 6 = Dither amplitude (PWM) • 7 = Dither period (PWM)
Byte 8: Bit 4	Byte 20: Bit 4	MODE_SLOT value controls the SLOT update process. • 0 = single update (SLOT changed sometimes, prior to output sequence) • 1= permanent update (SLOT controlled continuously)

CPU input address		Description
Channel 0	**Channel 1[1]**	
Byte 9: Bit 0	Byte 21: Bit 0	SW_ENABLE: Transition from 0 → 1 and remaining 1 during the input delay starts the output sequence. Only active for the first positive edge, additional positive edges are ignored and no start occurs.
Byte 9: Bit 1	Byte 21: Bit 1	TM_CTRL_DQ: Set DQ output source: Selects either CPU program or module's output sequence. • 0 = DQn.A and DQn.B are controlled by the CPU (in your program) using the SET_DQA and SET_DQB control bits. • 1 = DQn.A and DQn.B are controlled by the module's output sequence.
Byte 9: Bit 2	Byte 21: Bit 2	SET_DQA: Controls the value of the digital output DQn.A, if TM_CTRL_DQ = 0 • 0 = 0V on DQn.A • 1 = 24V on DQn.A
Byte 9: Bit 3	Byte 21: Bit 3	SET_DQB: Controls the value of the digital output DQn.B, if TM_CTRL_DQ = 0 • 0 = 0V on DQn.B • 1 = 24V on DQn.B
Byte 10: Bit 0	Byte 22: Bit 0	RES_ERROR: Reset pending errors (ERR_LD, ERR_DQA, ERR_DQB, and ERR_24V). • 0 = Reset of errors is not active. • 1 = Reset of errors is active.

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Feedback Interface: 2 channels, 16 input bytes (I addresses)

CPU output address		Description
Channel 0	**Channel 1[1]**	
Byte 0: Bit 0	Byte 8: Bit 0	ERR_PWR: 1 = 24 V DC present, but is not in the correct range. 0 = no error
Byte 0: Bit 1	Byte 8: Bit 1	ERR_24V: 1 = Short-circuit/overload, in the 24 V DC sensor supply output. 0 = no error
Byte 0: Bit 2	Byte 8: Bit 2	ERR_LD: 1 = Error while loading a parameter value using single-update mode. 0 = no error
Byte 0: Bit 3	Byte 8: Bit 3	ERR_PULSE: 1 = Pulse duration reduced to smaller than the minimum allowed during operation. 0 = No error
Byte 0: Bit 4	Byte 8: Bit 4	ERR_DQA: 1 = Short-circuit/overload on the digital output DQn.A. 0 = no error
Byte 0: Bit 5	Byte 8: Bit 5	ERR_DQB: 1 = Short-circuit/overload on the digital output DQn.B or attempt to set both DQn.A and DQn.B to high. 0 = no error
Byte 0: Bit 6	Byte 8: Bit 6	ERR_OUT_VAL: 1 = The value in OUTPUT_VALUE is not valid. 0 = no error
Byte 0: Bit 7	Byte 8: Bit 7	ERR_SLOT_VAL: 1 = The value in SLOT is not valid where MODE_SLOT = 1 (permanent update). 0 = no error
Byte 1: Bit 2	Byte 9: Bit 2	STS_LD_SLOT: Toggle acknowledge bit for each action of the SLOT in single-update SLOT-mode Each toggle of this bit means a successful LD_SLOT action.
Byte 1: Bit 4	Byte 9: Bit 4	STS_READY: 1 = Module is parameterized correctly, running, and delivering valid data. 0 = not ready
Byte 1: Bit 5	Byte 9: Bit 5	ST_SW_ENABLE: 1 = SW_ENABLE active. 0 = SW_ENABLE not active
Byte 2: Bit 0	Byte 10: Bit 0	STS_ENABLE: 1 = Output sequence running. 0 = No output sequence running
Byte 2: Bit 1	Byte 10: Bit 1	STS_DQA: 1 = DQn.A output active. 0 = DQn.A output not active.
Byte 2: Bit 2	Byte 10: Bit 2	STS_DQB: 1 = DQn.B output active. 0 = DQn.B output not active.
Byte 2: Bit 3	Byte 10: Bit 3	STS_DI: 1 = DIn.0 digital input active. 0 = DIn.0 digital input not active.

CPU output address		Description
Channel 0	Channel 1[1]	
Byte 3: Bit 0 to 3	Byte 11: Bit 0 to 3	SEQ_CNT: Sequence counter: Is incremented after completion of an output sequence (Range 0 to 15)
Word 4	Word 12	MEASURED_CURRENT: Current measurement uses a SIMATIC S7 analog value. Full-scale value depends on module configuration, as 2 channel (2 A) or 1 channel (4 A). • 2 channel (2 A): 0 to 32767 corresponds with 0 to 2.4 A • 1 channel (4 A): 0 to 32767 corresponds with 0 to 4.8 A
Byte 6: Bit 0	Byte 14: Bit 0	QLMN_LLM: The low limit of the manipulated value has been reached.
Byte 6: Bit 1	Byte 14: Bit 1	QLMN_HLM: The high limit of the manipulated value has been reached.

[1] Only if the module is configured as "2 channels (2 A)" and not "1 channel (4 A)"

Note

If the TM Pulse 2x24V external supply voltage is interrupted, then, 16#00000000 is returned as feedback value (substitute value).

Controlling the different operating modes

You select an output channel's operating mode during device configuration. Configuration data is stored in parameter data record 128.
The following table shows the program variables that the different operating modes use.

Program control variable	Notes
Software enable	
SW_ENABLE	Transition from 0 → 1 and remaining 1 during the input delay starts the output sequence. Only active for the first positive edge, additional positive edges are ignored and no start occurs. You must always issue the software enable in your control program. If you don't use a HW enable, the output sequence will be started by the positive edge of the software enable. If you reset the software enable, the current output sequence will be terminated.
Direct control of the digital output	
TM_CTRL_DQ	• If TM_CTRL_DQ = 1, then the TM Pulse 2x24V module has control and produces pulse sequences at the DQ outputs. • If TM_CTRL_DQ = 0, then the CPU has control and your program can set outputs DQn.A and DQn.B directly with the SET_DQA and SET_DQB control bits
SET_DQA SET_DQB	These control bits set/reset a channel's DQn.A and DQn.B outputs while TM_CTRL_DQ = 0. Note: You cannot set a channel's DQn.A and DQn.B to high at the same time. Otherwise, error ERR_DQB is set and only DQn.A is set high.
Pulse output operating mode	
Pulse duration	Assign the pulse duration directly with the control interface parameter OUTPUT_VALUE, as a DWord number value in µs.
On-delay	The time from the start of the output sequence to the start of the DQ output pulse. Assign the On-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.

Program control variable	Notes
PWM operating mode	
Duty cycle or Target current (current control enabled)	**Current control disabled**: PWM: OUTPUT_VALUE assigns the duty cycle (On/Off ratio) for the current period duration. You select the range of the OUTPUT_VALUE control interface field with the "Output format" configuration. • Output format "Per 100 (%)": Value range between 0 and 100 Pulse duration = (OUTPUT_VALUE/100) x period duration. • Output format "Per 1,000": Value range between 0 and 1,000 Pulse duration = (OUTPUT_VALUE/1,000) x period duration. • Output format "Per 10,000": Value range between 0 and 10,000 Pulse duration = (OUTPUT_VALUE/10,000) x period duration. • "S7 analog output" output format: Value range between 0 and 27,648 Pulse duration = (OUTPUT_VALUE/27,648) x period duration. **Current control enabled:** OUTPUT_VALUE assigns the target current as a ratio of target current/reference current. The reference current value is used to define the maximum set point and the high and low limits of the controlled current. Typically, the maximum current can be measured in PWM mode with current control disabled and a duty cycle set to 100%. The value measured can be set as a reference for the current control. The maximum value is 4000 mA for single channel operation (parallel channel connection enabled) and 2000 mA per channel for dual channel operation (parallel connection disabled).
Period duration	The Period duration of an output PWM cycle. Assign the period duration value in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 1. When you assign the period duration, take into account the minimum pulse duration configuration and the response time of the control element connected to the DQ digital output.
On-delay	The time from the start of the output sequence to the start of the DQ output pulse. Assign the On-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
Pulse train operating mode	
Number of pulses	Number of pulses that are output at the DQ digital output on expiration of the On-delay. Your control program can set the pulse count directly with the control interface parameter (OUTPUT_VALUE). Set the number of pulses directly as a DWord number value between 0 to 4,294,967,295 (2^{32}-1).
Period duration	The Period duration of an output pulse cycle. Assign the period duration in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 1. When you assign the period duration take into account the minimum pulse duration configuration and the response time of the control element connected to the DQ digital output.
Duty cycle	Assign the duty cycle with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 4. The range of the duty cycle parameter is selected using the "Output format" configuration. If the number value you assign exceeds the upper limit, then a duty cycle of 100% of the period duration is used and this action does not cause an error. • Output format "Per 100 (%)": Value range 0 to 100 Pulse duration = (duty cycle/100) x period duration. • Output format "Per 1000": Value range 0 to 1,000 Pulse duration = (duty cycle/1,000) x period duration. • Output format "Per 10000": Value range 0 to 10,000 Pulse duration = (duty cycle/10,000) x period duration. • Output format "S7 analog output": Value range 0 to 27,648 Pulse duration = (duty cycle/27,648) x period duration.

Program control variable	Notes
On/Off-delay operating mode	
On-delay	The time between a positive edge of the DIn.0 digital input and DQn.A digital output (DQ follows DI state). Assign the On-delay in µs directly using the OUTPUT_VALUE control interface field.
Off-delay	The time between a negative edge of the DIn.0 digital input and its output on the DQn.A digital output (DQ follows DI state). Assign the Off-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 3.
Frequency output operating mode	
Output frequency	Frequency output at the digital output DQ. Assign the frequency in real format as Hz using the OUTPUT_VALUE control interface field. The possible range is dependent on the "High Speed Output" configuration. • High Speed Output disabled Frequency (OUTPUT_VALUE): 0.02 Hz to 10,000 Hz • High Speed Output enabled Frequency (OUTPUT_VALUE): 0.02Hz to 100,000Hz
On-delay	The time from the start of the output sequence to the output of the frequency. Assign the On-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
DC motor operating mode	
OUTPUT_VALUE	The OUTPUT_VALUE determines the duty cycle (pulse duration/period duration ratio) within a period (PWM). The period duration can be adjusted. The new output value is applied at the next rising edge of the output. The sign indicates direction of rotation (positive for forward) and (negative for backward). S7 analog output format: value range is -27,648 to +27,648 DInt data type: Only 2 least significant bytes are used For channel 0: bytes 2 and 3 For channel 1: bytes 14 and 15
On-delay	The time from the start of the output sequence to the output of the frequency. Assign the On-delay in µs with control interface parameter SLOT, after setting up MODE_SLOT (0 or 1) and LD_SLOT = 2.
If "Function DI" is parameterized as "External stop":	A rising edge on DIn.0 will stop the output sequence and stop the DC motor.

Device configuration (Assignments stored in parameter data record 128)

Parameters	Value Range	Default
Channel configuration	• 2 channels (2 A) • 1 channel (4 A)	2 channels (2 A)
Channel (0 and 1)		
Reaction to CPU STOP	• Continue working mode • DQ substitute a value	DQ substitute a value
Substitute value DQA	0 or 1	0
Substitute value DQB	0 or 1	0
Group diagnostics	Disable/enable	Disabled
Diagnostics DQA		Disabled
Diagnostics DQB		Disabled
Operating mode	• Pulse output • PWM • Pulse train • On/Off-delay • Frequency output • DC motor	PWM
High-speed output (0.1 A)	Disable/enable	Disabled
Current control (for PWM mode only)	Disable/enable	Disabled
Function DI HW enable option available for Pulse output, Pulse train, Frequency output and DC motor modes.	• Input • HW enable • External stop (DC motor only)	Input
Activate P	P-SEL: Add Proportional term for current control	Enabled
Activate I	I-SEL: Add Integral term for current control	Enabled
Activate D	D-SEL: Add Derivative term for current control	Disabled
Input delay	• Off (4µs) • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 12.8 ms • 20 ms	0.1 ms
Output format: PWM and Pulse train modes DC motor mode, (only S7 analog output format is possible)	• S7 analog output format • Per 100 • Per 1000 • Per 10000	Per 100

Parameters	Value Range			Default
Output format (in the "Frequency output" operating mode)	1 Hz			1 Hz
Dithering (PWM mode only): Superimpose dithering waveform on PWM output sequence.	Disable/enable			Disabled
	Minimum		Maximum	
	High-speed **disabled**	High-speed **enabled**		
DWord: Minimum pulse duration for PWM and DC motor modes	10 µs	1.5 µs	85,000,000 µs	0
DWord: Period duration for PWM, Pulse train, and DC motor modes	100 µs	10 µs		2,000,000 µs
DWord: On-delay for all modes except On/Off-delay	0 µs	0 µs		0
DWord: Value depends on mode				
PWM: Dither ramp	Low word: Dither ramp-up time 0 to 30000 ms High word: Dither ramp-down 0 to 30000 ms			0 ms 0 ms
Pulse train: Duty cycle	S7 analog output format: 0 to 27648			13824 (50%)
	Per 100 format: 0 to100			50 (50%)
	Per 1000 format: 0 to 1000			500 (50%)
	Per 10000 format: 0 to 10000			5000 (50%)
On/Off delay: Off delay	0 to 85,000,000 µs			0
DWord: Dither amplitude for PWM only	0 to 500 ‰ (per mill)			50 ‰
DWord: Dither period for PWM only	From (4 times the PWM period µs) to 100000 µs (must be higher than 2000 µs)			50000 µs
Word: Reference value current for PWM with current control only	• 0 mA to 2000 mA for "2 channels (2 A)" operation • 0 mA to 4000 mA for "1 channel (4 A)" operation to 4000 mA for "1 channel (4 A)" operation			0 mA
Word: Dead band width (µA) for current control	0 µA to 65535 µA			0 µA
Word: High current limit for current control	S7-analog value relative to the reference value current: Range is 1 to 65535 (>= 27648 means 100%)			27648
Word: Low current limit for current control	S7-analog value relative to the reference value current: Range 0 to 27647 (Low limit must be less than the High limit)			0
Gain for current control	Real value (DWord size)			2.0 s
TI: Integration time (s) for current control	Real value (DWord size)			20.0 s
TD: Derivative action time (s) for current control	Real value (DWord size)			10 .0 s
TM LAG: Time lag of the derivative action (s)	Real value (DWord size)			2.0 s

Parameter data record

A

The TM Pulse 2x24V parameter data record is modified and stored for you by the TIA portal when you perform a Device configuration, successful configuration block compilation, and download a new configuration block to the system hardware.

You may also directly edit the module parameters with the CPU in RUN mode. The WRREC instruction is used to transfer parameters to the module using data record 128.

If errors occur during the transfer or validation of parameters with the WRREC instruction, the module continues operation with the previous parameter assignment. A corresponding error code is then written to the STATUS output parameter. If no errors occur, the STATUS output parameter contains the length of the data actually transferred.

The description of the WRREC instruction and the error codes is available in the STEP 7 online help (TIA Portal).

Structure of data record 128

The following table shows you the structure of data record 128 for the TM Pulse 2x24V. The values in byte 0 to byte 3 are fixed and may not be changed. Default values are indicated in bold font.

- A total of 108 bytes (4 header bytes + 2(52 channel bytes) is required for the 2 channel configuration (parallel connection disabled).
- A total of 56 byes (4 header bytes + 52 channel bytes) is required for the 1 channel configuration (parallel connection enabled).
- Bytes 4 to 55 are the channel 0 parameters
- Bytes 56 to 107 are the channel 1 parameters.
- Channel 1 parameters use the same data structure as channel 0. Add a 52 byte offset to the channel 0 byte numbers, to determine the channel 1 byte numbers.

Table A- 1 Header and channel 0 basic configuration

Bit → / Byte ↓	7	6	5	4	3	2	1	0
0 to 3	**Header**							
0	Reserved[1]		Major version = 0		Minor version = 1			
1	Channel parameter data length = 52 bytes							
2	Reserved[1]							
3								
4 to 55	**Channel 0 parameters**							
4	Current control	Dithering	High-speed output		Mode			
	0$_B$: Disabled	**0**$_B$: Disabled	**00**$_B$: Disabled					
	1$_B$: Enabled (not if High-speed mode is enabled)	1$_B$: Enabled	01$_B$: Enabled Not allowed for "1 channel (4A)" configuration that connects the two channels in parallel.					
			10$_B$-11$_B$: Reserved					
					0: Pulse output

Table A- 2 Channel 0 Word, DWord, and Real values configuration

Byte	Channel 0 mode and variable usage	Value range
8 to 11	**Minimum pulse duration DWord**	
	PWM (only if current-control is inactive)	Minimum pulse duration: Default value = **0 µs**
	Pulse output, Pulse train, On/Off-delay, and Frequency output	Reserved
12 to 15	**Period duration DWord**	
	PWM, Pulse train	Period duration: High-speed disabled: 100 µs to 85,000,000 µs High-speed enabled: 10 µs to 85,000,000 µs Default value = **2,000,000 µs**
	DC motor	Period duration: 100 µs to 85,000,000 µs Default value = 1000 µs
	Pulse output, On/Off-delay, and Frequency output	Reserved
16 to19	**On-delay DWord**	
	Pulse output, PWM, Pulse Train, Frequency output, and DC motor	On-delay: **0 µs** to 85,000,000 µs
	On/Off-delay	Reserved
20 to 23	**Value DWord**	
	PWM	Dithering ramp times (2 bytes each): • Ramp-up time (low word): **0 ms** to 30,000 ms • Ramp-down time (high word): **0 ms** to 30,000 ms
	Pulse train	Duty cycle %: 0 to 27648, Default = **50** (50%)
	On/Off-delay	Off-delay: **0 µs** to 85,000,000 µs
	Pulse output, Frequency output, and DC motor	Reserved

Byte	Channel 0 mode and variable usage	Value range
24 to 27	**Dither amplitude DWord**	
	PWM	Dither amplitude (per mil): 0 to 500 the default value is **50**.
	Pulse output, Pulse train, On/Off-delay, Frequency output, and DC motor	Reserved
28 to 31	**Dither period DWord**	
	PWM	Dither period: Valid from ((4 x PWM period) AND (> 2000)) µs to 100,000 µs. The default value is **50,000 µs**.
	Pulse output, Pulse train, On/Off-delay, Frequency output, and DC motor	Reserved
32 to 55	**PWM mode only: Current control parameters**	
32 to 33	Reference value current (mA)	Word size: **0 mA** to 2000 mA for "2 channels (2 A)" operation **0 mA** to 4000 mA for "1 channel (4 A)" operation
34 to 35	Dead band width (µA)	Word size: **0 µA** to 65535 µA
36 to 37	High limit - S7-analog value relative to the reference value current	Word size: 1 to 65535 (>= **27648** means 100%)
38 to 39	Low limit - S7-analog value relative to the reference value current	Word size: **0** to 27647 (because Low limit must be less than the High limit)
40 to 43	Gain	Real (DWord size): Default value = **2.0 s**
44 to 47	TI: Integration time (s)	Real (DWord size): Default value = **20.0 s**
48 to 51	TD: Derivative action time (s)	Real (DWord size): Default value = **10.0 s**
52 to 55	TM LAG: Time lag of the derivative action (s)	Real (DWord size): Default value = **2.0 s**

Open Source Software

B

For Resellers: In order to avoid infringements of the license conditions by the reseller or the buyer, the instructions and license conditions provided here must be passed on to the buyers.

License Conditions and Disclaimers for Open Source Software and other licensing software

The Open Source software listed below is used in unmodified form or in a form we have modified as well as other license software listed below in the "digital modules, analog modules, technology modules, communication modules and power supply modules of the SIMATIC S7-1500, ET 200MP", ET 200SP Copyright Siemens AG, 2013-2014 (hereinafter referred to as "Product").

Liability for Open Source Software

The Open Source software is provided free of charge. We are liable for the Product including the Open Source software contained in it pursuant to the license conditions applicable to the Product. We explicitly reject any liability for the use of Open Source software beyond the program sequence intended for the Product. Furthermore, any liability for defects resulting from modifications to the Open Source software is excluded.

We do not provide any technical support for the Product if it has been modified.

Please read the license conditions and copyright information of Open Source software as well as other licensing software:

Open Source Software: GNU GCC libstdc++ / libsupc++ - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software GNU GCC libstdc++ / libsupc++ - 4.4.1

License conditions:

1 License

There are two licenses affecting GNU libstdc++: one for the code, and one for the documentation.

There is a license section in the FAQ regarding common questions. If you have more questions, ask the FSF or the gcc mailing list.
The Code: GPL

The source code is distributed under the GNU General Public License version 3, with the addition under section 7 of an exception described in the “GCC Runtime Library Exception, version 3.1” as follows (or see the file COPYING.RUNTIME):

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyright.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyright requirements of the license of GCC.

Hopefully that text is self-explanatory. If it isn't, you need to speak to your lawyer, or the Free Software Foundation.
The Documentation: GPL, FDL

The documentation shipped with the library and made available over the web, excluding the pages generated from source comments, are copyrighted by the Free Software Foundation, and placed under the GNU Free Documentation License version 1.2. There are no Front-Cover Texts, no Back-Cover Texts, and no Invariant Sections.

For documentation generated by doxygen or other automated tools via processing source code comments and markup, the original source code license applies to the generated files. Thus, the doxygen documents are licensed GPL.

If you plan on making copies of the documentation, please let us know. We can probably offer suggestions.

9 GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <http://fsf.org/>
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyright license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.

b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

d) Limiting the use for publicity purposes of names of licensors or authors of the material; or

e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work

conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT
HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY
OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO,
THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR
PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM
IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF
ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING
WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS
THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY
GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE
USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF
DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD
PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS),
EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF
SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided
above cannot be given local legal effect according to their terms,
reviewing courts shall apply local law that most closely approximates
an absolute waiver of all civil liability in connection with the
Program, unless a warranty or assumption of liability accompanies a
copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest
possible use to the public, the best way to achieve this is to make it
free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest
to attach them to the start of each source file to most effectively
state the exclusion of warranty; and each file should have at least
the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short
notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate
parts of the General Public License. Of course, your program's commands
might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

Open Source Software: libgcc - 4.4.1

Enclosed you'll find the license conditions and copyright notices applicable for Open Source Software libgcc - 4.4.1

License conditions:

1 GCC is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 3, or (at your option) any later version.
GCC is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.
Under Section 7 of GPL version 3, you are granted additional permissions described in the GCC Runtime Library Exception, version 3.1, as published by the Free Software Foundation.
You should have received a copy of the GNU General Public License and a copy of the GCC Runtime Library Exception along with this program; see the files COPYING3 and COPYING.RUNTIME respectively. If not, see <http://www.gnu.org/licenses/>.

GCC RUNTIME LIBRARY EXCEPTION

Version 3.1, 31 March 2009

Copyright (C) 2009 Free Software Foundation, Inc. <http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

This GCC Runtime Library Exception ("Exception") is an additional permission under section 7 of the GNU General Public License, version 3 ("GPLv3"). It applies to a given file (the "Runtime Library") that bears a notice placed by the copyright holder of the file stating that the file is governed by GPLv3 along with this Exception.

When you use GCC to compile a program, GCC may combine portions of certain GCC header files and runtime libraries with the compiled program. The purpose of this Exception is to allow compilation of non-GPL (including proprietary) programs to use, in this way, the header files and runtime libraries covered by this Exception.

0. Definitions.

A file is an "Independent Module" if it either requires the Runtime Library for execution after a Compilation Process, or makes use of an interface provided by the Runtime Library, but is not otherwise based on the Runtime Library.

"GCC" means a version of the GNU Compiler Collection, with or without modifications, governed by version 3 (or a specified later version) of the GNU General Public License (GPL) with the option of using any subsequent versions published by the FSF.

"GPL-compatible Software" is software whose conditions of propagation, modification and use would permit combination with GCC in accord with the license of GCC.

"Target Code" refers to output from any compiler for a real or virtual target processor architecture, in executable form or suitable for input to an assembler, loader, linker and/or execution phase. Notwithstanding that, Target Code does not include data in any format that is used as a compiler intermediate representation, or used for producing a compiler intermediate representation.

The "Compilation Process" transforms code entirely represented in non-intermediate languages designed for human-written code, and/or in Java Virtual Machine byte code, into Target Code. Thus, for example, use of source code generators and preprocessors need not be considered part of the Compilation Process, since the Compilation Process can be understood as starting with the output of the generators or preprocessors.

A Compilation Process is "Eligible" if it is done using GCC, alone or with other GPL-compatible software, or if it is done without using any work based on GCC. For example, using non-GPL-compatible Software to optimize any GCC intermediate representations would not qualify as an Eligible Compilation Process.

1. Grant of Additional Permission.

You have permission to propagate a work of Target Code formed by combining the Runtime Library with Independent Modules, even if such propagation would otherwise violate the terms of GPLv3, provided that all Target Code was generated by Eligible Compilation Processes. You may then convey such a combination under terms of your choice, consistent with the licensing of the Independent Modules.

2. No Weakening of GCC Copyright.

The availability of this Exception does not imply any general presumption that third-party software is unaffected by the copyright requirements of the license of GCC.

GNU GENERAL PUBLIC LICENSE

Version 3, 29 June 2007

Copyright © 2007 Free Software Foundation, Inc. <http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.
Preamble

The GNU General Public License is a free, copyright license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.
TERMS AND CONDITIONS

0. Definitions.

“This License refers to version 3 of the GNU General Public License.

“Copyright also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

“The Program refers to any copyrightable work licensed under this License. Each licensee is addressed as “you”. “Licensees” and “recipients” may be individuals or organizations.

To “modify” a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a “modified version” of the earlier work or a work “based on” the earlier work.

A “covered work” means either the unmodified Program or a work based on the Program.

To “propagate” a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To “convey” a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays “Appropriate Legal Notices” to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided),

that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The “source code” for a work means the preferred form of the work for making modifications to it. “Object code” means any non-source form of a work.

A “Standard Interface” means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The “System Libraries” of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A “Major Component”, in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The “Corresponding Source” for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to “keep intact all notices”.
c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.
d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an “aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.
b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.
c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and non-commercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.
e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A “User Product” is either (1) a “consumer product”, which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, “normally used” refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

“Installation Information” for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's “contributor version”.

A contributor's “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. “Knowingly relying” means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is “discriminatory” if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS
How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software: you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation, either version 3 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program. If not, see <http://www.gnu.org/licenses/>.

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an “about box”.

You should also get your employer (if you work as a programmer) or school, if any, to sign a “copyright disclaimer” for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

2 This configure script is free software; the Free Software Foundation
gives unlimited permission to copy, distribute and modify it.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that generally relate to the system are described in this system manual.

The information provided in this manual and in the system/function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

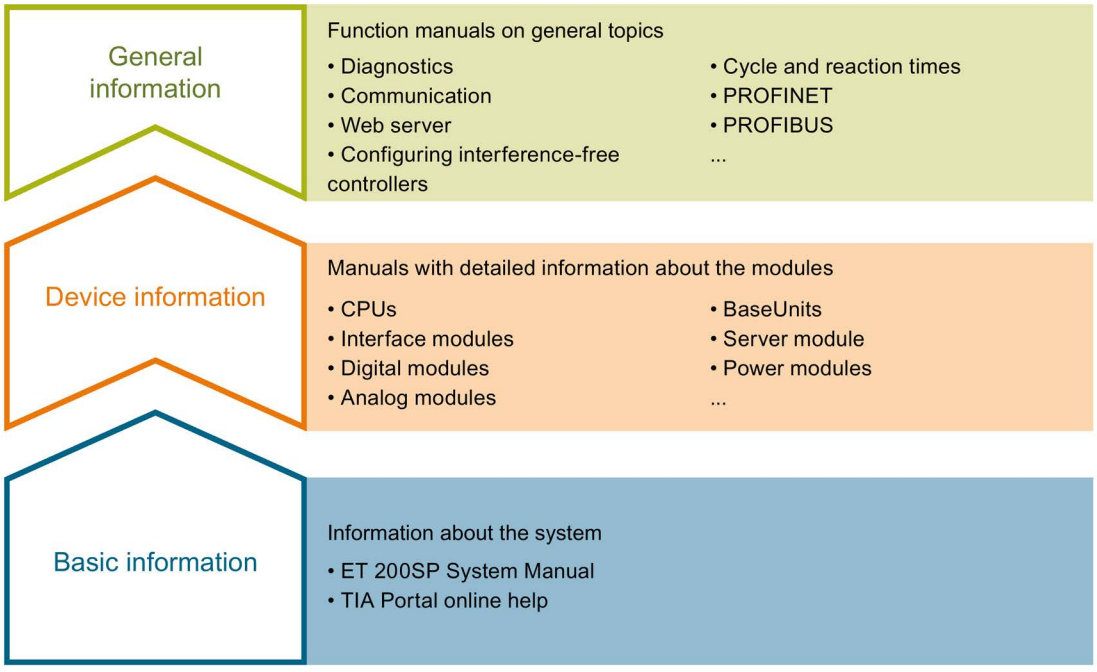
ET 200SP Documentation Guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

2.1 Properties

Article number

6ES7545-5DA00-0AB0

View of the module

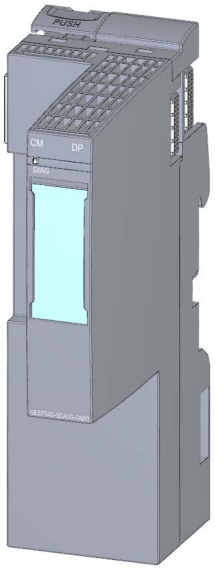


Figure 2-1 View of the CM DP communication module

Properties

The communication module CM DP can be used with the ET 200SP CPUs. You insert the communication module to the right next to the CPU.

The communication module has the following properties:

- Technical properties
  - Connects the CPU of the ET 200SP distributed I/O system with PROFIBUS DP
  - Bus connection via RS485 interface
- Supported functions
  - Operation as DP master or DP slave
  - Enable/disable DP slave
  - Diagnostics requirements
  - Identify the bus topology in a DP master system
  - Identification data I&M 0
  - Time-of-day synchronization
  - Line diagnostics
  - S7 services

Supported communication services

The communication module supports the following communication services:

- PROFIBUS DP-Master, as of STEP 7 V13, Update 3
  - PROFIBUS DP according to IEC 61158 and 61784 DPV1, DP master for DP slaves according to PROFIBUS DP and DPV1 standard
- PROFIBUS DP slave, as of STEP 7 V13, SP1
  - PROFIBUS DP according to IEC 61158 and 61784 DPV1, DP slave and I-slave

Note

DP master or DP slave

Note however: The CM DP only supports alternative operation as DP master or DP slave.

Maximum configuration as DP Master

Table 2- 1 General characteristics of DP mode

Feature	Explanation/values
Number of operable DP slaves	125
Max. size of the input area over all DP slaves	8 KB
Max. size of the output area via all DP slaves	8 KB
Maximum number of inputs per DP slave	244 bytes
Maximum number of outputs per DP slave	244 bytes
Max. size of the consistency area for a module	128 bytes

Note

Setting the PROFIBUS DP address on the communication module CM DP

The communication module CM DP does not have a DIP switch. You set the PROFIBUS DP address via STEP 7 (TIA Portal). You can find more information on this topic in the STEP 7 online help.

Accessories

A detailed list of the available accessories can be found in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

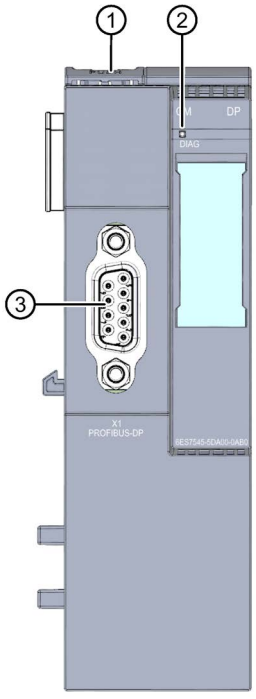
Additional information

You can obtain detailed information on the topic of PROFIBUS in the function manual PROFIBUS (http://support.automation.siemens.com/WW/view/de/59193579/0/en)

2.2 Operating and display elements

Operating and connection elements

The following figure shows the operating and connection elements of the CM DP communication module.



① Mounting rail release
② DIAG LED
③ DP interface

Figure 2-2 Operating and display elements of the communication module CM DP

Wiring

3

3.1 Pin assignment

PROFIBUS DP with RS485 interface

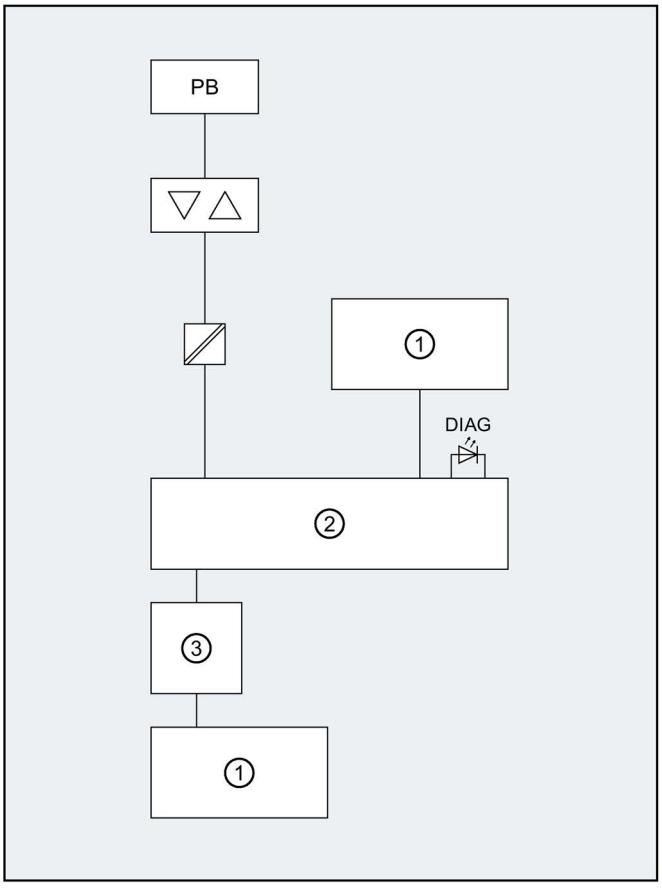
The following table shows the signal names and the designations of the pin assignment for the PROFIBUS DP interface.

Table 3- 1 Pin assignment PROFIBUS DP with RS485 interface

View	Signal name		Designation
	1	-	-
	2	-	-
	3	RxD/TxD-P	Data line B
	4	RTS	Request To Send
	5	M5V2	DP data reference potential (from station)
	6	P5V2	Supply plus (from station)
	7	-	-
	8	RxD/TxD-N	Data line A
	9	-	-

3.2 Block diagram

The following figure shows the block diagram of the CM DP communication module.



①	Backplane bus	PB	PROFIBUS interface
②	ET 200SP PROFIBUS interface and backplane bus transmission	DIAG	LED diagnostics (green/red)
③	Internal power supply		

Figure 3-1 Block diagram of the CM DP

Programming

4

Instructions

Pre-written instructions are available as an interface in your STEP 7 user program for communication services.

Table 4- 1 Instructions for PROFIBUS DP

Instructions	Meaning when used with CM DP	
	DP master	DP slave (I-slave)
DPSYC_FR	Synchronize DP slaves/Freeze inputs (SYNC/FREEZE instruction)	-
DPNRM_DG	Read diagnostics data of a DP slave	-
DP_TOPOL	Determine topology for DP master system	-
WRREC	Write data record of a DP slave	-
RDREC	Read data record of a DP slave	-
GETIO	Read process image of a DP standard slave	Read process image
SETIO	Transfer process image of a DP standard slave	Transfer process image
GETIO_PART	Read process image area of a DP standard slave	Read process image area
SETIO_PART	Transfer process image area of a DP standard slave	Transfer process image area
D_ACT_DP	Enable/disable DP slaves	-
DPRD_DAT	Read consistent data of a module (user data)	
DPWR_DAT	Write consistent data of a module	
RALRM	Event-driven reading of alarm information (diagnostics, pull/plug, hardware interrupt) as well as DPV1-specific interrupts (update, status, vendor-specific interrupt)	Event-driven reading of interrupt information (diagnostic interrupt)

Read the documentation for the instructions in the STEP 7 online help

Calling instructions for distributed I/O

Multiple calls are required for the instructions of the distributed I/O.

The duration of the call processing is dependent on the load, bus cycle time and transmission rate. Timeouts may occur if these instructions are called in a loop within a cycle.

Exceptions:

- Only one call is necessary for the RALRM instruction "Receive interrupt".

Program blocks for DPV1 (according to PNO standard) [1]:

- "Read data record from a DP slave" RDREC instruction is functionally equivalent to SFC59 (write record)
- "Write data record to a DP slave" WRREC instruction is functionally equivalent to SFC58 (read record)
- "Read interrupt information from a DP slave" RALRM instruction call is made within an interrupt OB

[1] PNO: PROFIBUS user organization

Diagnostics, error and system alarms

5

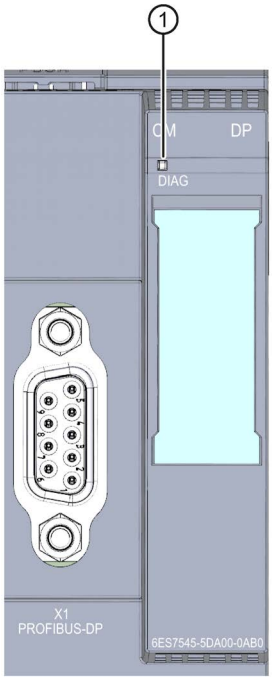
5.1 Status and error displays

Introduction

Diagnostics by means of LEDs is an initial tool for error localization. In order to localize errors still further, you usually evaluate the display of the module status in STEP 7 or the diagnostics buffer of the CPU. The buffer contains plain text information on the error that has occurred. For example, you will find the number of the relevant error OB in the plain text information.

LED display

The figure below shows the LED display on the CM DP communication module.



① DIAG (green/red)

Figure 5-1 LED display on the CM DP communication module

Meaning of the DIAG LED display on the communication module

The CM DP communication module has an LED for monitoring the diagnostics.

DIAG LED

Table 5- 1 DIAG LED fault display

DIAG LED	Meaning
Flashes	Module parameters not assigned
On	Module parameters assigned and no diagnostics
Flashes	Diagnostics of subordinate modules (as of firmware version V1.7)

Additional information

You can find more information on diagnostics in the Diagnostics function manual (http://support.automation.siemens.com/WW/view/de/59192926/0/en) for diagnostic options that are available for SIMATIC systems S7-1500, ET 200MP, ET 200SP and ET 200AL.

5.2 DP slave diagnostics

DP V1 slave: Diagnostic interrupt

Transmission of diagnostic data is made as a diagnostic interrupt. Diagnostic interrupts must be acknowledged by the DP master.

Supported diagnostic functions

The CM DP supports the following blocks of the DP diagnostics:

- Standard diagnostics (6 bytes)
- Identifier-related diagnostics (2...17 bytes depending on the number of configured transfer areas)
- Module status (5...35 bytes depending on the number of configured transfer areas)
- Diagnostic interrupt (8 bytes, if any)

User program (DP master)

The "DPNRM_DG" instruction is used to read the diagnostic data of a DP slave (DP single diagnostics) in the DP master.

The diagnostic interrupts for DP V1 slaves are periodically evaluated in the user program of the master via the "RALRM" instruction.

You can find the required parameter assignment for the instruction in the STEP 7 online help.

The following is a structural overview of the diagnostic data.

Overview of standard diagnostics

Standard diagnostics	
Byte	**Meaning**
0	Station status 1
1	Station status 2
2	Station status 3
3	Master address
4...5	Manufacturer ID of the slave

Overview of device-specific diagnostics

The device-specific diagnostics data depends on the protocol variant in which the DP slave is operated:

- **DP-V1 slave**

Table 5- 2 Overview of device-specific diagnostics of the CM DP for DP V1 slaves

Device-specific diagnostics		
Byte	**Meaning**	
0	Header	
1	Variant Interrupt type	Variant Status type
2	Slot number	
3	Variant Interrupt specifier	Variant Status specifier
4...62	Module-specific diagnostic data	

5.3 Standard diagnostics

Standard diagnostics

The coding of the standard diagnostic bytes is explained below.

Byte 0: Station status 1

Table 5- 3 Structure of station status byte 1

Bit no.	Name	Explanation
7	Master_Lock	The DP slave was configured by a different DP master. The DP slave can only be accessed read-only by the DP master configured as productive. This bit is set by the DP master when its bus address does not match the configured address.
6	Parameter_Fault	The most recently received parameter frame was corrupt or not permitted. This bit is set by the DP slave. Remedy: Check the parameter assignment with respect to invalid parameters.
5	Invalid_Slave_Response	This bit is set by the DP master if an implausible response has been received by the DP slave.
4	Service_Not_Supported	This bit is set by the DP master if a function is called by the master that is not supported by the DP slave. Remedy: Disable the parameter assignment of the required function at the master.
3	Ext_Diag	This bit is set by the slave. • Bit =1: Diagnostic data is available in the diagnostic area specific to the slave. The diagnostic data can be evaluated in the user program of the master. • Bit =0: A status message can be available in the diagnostic area specific to the slave. The status message can be evaluated in the user program of the master.
2	Slave_Config_Check_Fault	The configuration data sent by the DP master is rejected by the DP slave. Cause: Configuration error. Remedy: Change the configuration.
1	Station_Not_Ready	The DP slave is not yet ready for productive data exchange. This is a temporary condition and cannot be influenced by the DP master.
0	Station_Non_Existent	The DP slave is not responding on the bus. This bit is set by the DP master 1 (the slave permanently sets this bit to 0). If the bit is set, the diagnostic bits contain the status of the last diagnostic alarm or the initial value.

Byte 1: Station status 2

Table 5- 4 Structure of station status byte 2

Bit no.	Name	Explanation
7	Deactivated	The DP slave was shown as inactive in the local parameter set and will not be cyclically queried.
6	Reserved	- Reserved -
5	Sync_Mode	The DP slave is in SYNC mode. The bit is set by the slave.
4	Freeze_Mode	The DP slave is in FREEZE mode. The bit is set by the slave.
3	Watchdog_On	The watchdog is activated on the DP slave. The bit is set by the slave.
2	Status_From_Slave	Bit =1: The diagnostics comes from the DP slave. The bit is permanently set by the slave to 1.
1	Static_Diag	Static diagnostics If the DP slave sets this bit, the DP master must fetch the diagnostic data from the DP slave until the DP slave resets this bit. The DP slave sets this bit, for example, if it cannot perform data transfer.
0	Parameter_Request	The DP slave sets this bit when it has to be re-parameterized and configured. If bit 0 and bit 1 are both set, bit 0 has the higher priority.

Byte 2: Station status 3

Table 5- 5 Structure of station status byte 3

Bit no.	Name	Explanation
7	Ext_Data_Overflow	If this bit is set, there is more diagnostic information than is specified in the diagnostics data. This data cannot be viewed.
6...0	Reserved	- Reserved -

Byte 3: Master address

The address of the DP master that has configured this DP slave is entered in the "Master_Add" byte.

If the DP slave was not configured by a DP master, the DP slave sets address 255 in this byte.

Bytes 4 and 5: Manufacturer ID of the slave ("Ident_Number")

The manufacturer ID ("Ident_Number") for the DP slave type is entered in the bytes 4 and 5. This identifier can be used to identify the slave.

The most significant part of the value is in byte 5.

5.4 Device-specific diagnostics with DP-V1

Device-specific diagnostics

The device-specific diagnostics of DP V1 slaves is available in two variants:

- Interrupt type
- Status type

The two variants differ in the coding of byte 1, bit 7 of the device-specific diagnostic data. The distinction is component-specific.

Byte 0: Header

The two most significant bits have the value 00. This identifies the "Module-specific diagnostic data" block as a whole (see bytes 4...62).

The remaining six bits indicate the length of the data block including byte 0.

Byte 1: "Interrupt type" variant

Table 5- 6 Structure of byte 1 of the device-specific diagnostics ("Interrupt type" variant)

Bit no.	Meaning	
7	Value	Meaning
	0	**Interrupt**
6...0	**Alarm_Type**	
	0	- Reserved -
	1	Diagnostic interrupt
	2	Process interrupt
	3	Pull interrupt
	4	Plug interrupt
	5	Status interrupt
	6	Update interrupt
	7...31	- Reserved -
	32...126	Manufacturer-specific
	127	- Reserved -

Older status interrupts can be overwritten by newer ones when status interrupts occur in rapid succession.

Byte 1: "Status type" variant

Table 5- 7 Structure of byte 1 of the device-specific diagnostics ("Status type" variant)

Bit no.	Meaning	
7	Value	Meaning
	1	**Status message**
6...0	**Status_Type**	
	0	- Reserved -
	1	Status message
	2	Module_Status (see also bytes 4...62)
	3...31	- Reserved -
	32...126	Vendor-specific
	127	- Reserved -

Byte 2: Slot number

Slot number (1...n) of the slave module

0 is the placeholder for the overall device.

Byte 3: "Interrupt specifier" variant

Table 5- 8 Structure of byte 3 of the device-specific diagnostics ("Interrupt specifier" variant)

Bit no.	Meaning	
7...3	Seq_No	Unique identification of an alarm message
2	Add_Ack	If this bit is set, the DP V1 master indicates that this interrupt expects an acknowledgment in the form of a WRITE job.
1...0	Alarm_Specifier	
	0	No further distinction
	1	Interrupt appears, slot is disrupted The slot generates an interrupt due to an error.
	2	Interrupt disappears, slot is OK The slot generates an interrupt and indicates that there is no other error.
	3	Interrupt disappears, slot is still disrupted The slot generates an interrupt and indicates that errors remain.

Byte 3: "Status specifier" variant

Table 5- 9 Structure of byte 3 of the device-specific diagnostics ("Status specifier" variant)

Bit no.	Meaning	
7...2	- Reserved -	
1...0	Status_Specifier	
	0	No further distinction
	1	Status appears
	2	Status disappears
	3	- Reserved -

Bytes 4...62: Module-specific diagnostic data: General coding

This byte contains data with module-specific information that is described in the respective module documentation. The particular module is identified by the slot (byte 2).

Bytes 4...62: Module-specific diagnostics for "Status type" and "Modul_Status"

In the case of the "Status type" variant of device-specific diagnostics from DP V1 slaves (see byte 1, bit 7) and the "Module_Status" setting (see byte 1, bits 0...6) two status bits are provided here for each slot (= module). Unneeded bits are set to 0.

Table 5- 10 Structure of the bytes for the module-specific diagnostic data

Byte	Bit assignment							
Bit	7	6	5	4	3	2	1	0
4	Module status 4		Module status 3		Module status 2		Module status 1	
5	Module status 8		Module status 7		Module status 6		Module status 5	
...	...		...		...		...	
62	Module status 236		Module status 235		Module status 234		Module status 233	

The respective status bits are coded as follows:

Table 5- 11 Meaning of the values of the status bits

Value	Meaning
00	Data valid
01	Data invalid - error (e.g. short-circuit)
10	Data invalid - wrong module
11	Data invalid - no module plugged

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation provides important information on installing, wiring and commissioning the ET 200SP point-to-point communications module.

This device manual complements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Conventions

This documentation contains figures of the described device. The figures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

Note

A note contain important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Note on IT security

Siemens offers IT security mechanisms for its automation and drive product portfolio in order to support the safe operation of the plant/machine. We recommend that you inform yourself regularly on the IT security developments regarding your products. You can find information on this on the Internet (http://support.automation.siemens.com).

You can register for a product-specific newsletter here.

For the safe operation of a plant/machine, however, it is also necessary to integrate the automation components into an overall IT security concept for the entire plant/machine, which corresponds to the state-of-the-art IT technology. You can find information on this on the Internet (http://www.siemens.com/industrialsecurity).

Products used from other manufacturers should also be taken into account here.

Copyright notice for the open-source software used

Open-source software is used in the firmware of the product described. The open-source software is provided free of charge. We are liable for the product described, including the open-source software contained in it, pursuant to the conditions applicable to the product. Siemens accepts no liability for the use of the open source software over and above the intended program sequence, or for any faults caused by modifications to the software.

For legal reasons, we are obliged to publish the original text of the following copyright notices.

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-1500 and ET 200SP automation systems consists of system manuals, function manuals and manuals.

The STEP 7 information system (Online Help) also helps you configure and program your automation system.

Overview of the documentation provided for the CM PtP communication module (ET 200SP)

The following table lists additional references that you will need when using the CM PtP communication module.

Table 1- 1 Documentation for the CM PtP communication module

Topic	Documentation	Key content
System description	System Manual S7 -1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Addressing • Commissioning • Maintenance
	Device manual Interface module (http://support.automation.siemens.com/WW/view/en/55683316/133300)	• Connecting • Interrupt, error and system messages • Technical specifications • Dimensional drawing

2.1 Properties

Order number

6ES7137-6AA00-0BA0

View of the module

Figure 2-1 View of CM PtP (without BaseUnit)

Properties

The communication module has the following properties:

- Technical properties
  - RS232 interface (via BaseUnit)
  - RS422/485 interface (via BaseUnit)
  - short-circuit proof
  - electrically disconnected
  - Protocols: 3964(R), Modbus master (RTU), Modbus slave (RTU), Freeport and USS with instructions
- Supported system functions
  - Firmware update
  - Identification data I&M0
  - Parameter re-assignment in CPU RUN mode (using instructions)
  - Diagnostic interrupts

Additional information

Additional information on the properties of the CM PtP can be found in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).

You can find additional information on the design of the ET 200SP and the associated modules in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

2.2 Accessories

ET 200SP accessories

Accessories and spare parts for ET 200SP can be found in the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Online catalog

Additional order numbers for ET 200SP can be found on the Internet (http://www.siemens.com/industrymall) in the online catalog and online ordering system.

2.3 Functions

Introduction

The communication module allows you to exchange data between your own and other programmable controllers or computers by means of a point-to-point connection, and to connect various devices from a variety of manufacturers.

Functionality of the CM PtP

The CM PtP communication module offers the following functionality:

- RS232 and RS422/485 interface
- Data transmission rate: 300 to 115200 bps
- Maximum frame length: 2 kbyte
- Transmission protocols: Freeport, 3964(R) and Modbus

Note

The USS protocol can be implemented with instructions included in STEP 7 (TIA Portal).

Hardware components of a point-to-point connection

You require certain hardware components for a point-to-point connection with the CM PtP.

Components	Function
Automation system	... contains the CPU and PROFINET interface, and the central I/O, if applicable, and executes the user program.
ET 200SP Distributed I/O System	... contains the distributed I/O.
Interface module (IM)	... connects the distributed I/O system ET 200SP to PROFINET IO and supports all ET 200SP I/O modules.
CM PtP communication module	... communicates with a communication partner (point-to-point) by means of the interface.
BaseUnit (6ES7193-6BP00-0xA0)	... connects the communication module with the I/O system and the supply voltage.
Server module	... completes the setup of the ET 200SP

System environment

The communication module can be used in the following system environments:

Applications	Components required	Configuration
Distributed operation in an S7-1500 system	• CPU 151x • IM 155-6 • CM PtP • Power supply (optional)	STEP 7 (TIA Portal)
Distributed operation in an S7-300/400 system	• CPU 31x / CPU 41x • IM 155-6 • CM PtP • BaseUnit	STEP 7 (TIA Portal) STEP 7 with integration of a GSD file
Distributed operation in a third-party automation system	• Third-party automation system • IM 155-6 • CM PtP	GSD file imported to/installed in the engineering system [1]

[1] Information on using the communication module in a third-party system is available in the programming and operating manual CM PtP operation with PROFINET controller (http://support.automation.siemens.com/WW/view/en/59062563).

Additional information

Information on configuration and programming of the CM PtP communications module is available in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) and in the information system of the TIA Portal.

2.4 Properties of the interfaces

Interfaces of the CM PtP

The CM PtP has the following interfaces, which are connected by means of the associated BaseUnit (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment):

- RS232 interface
- RS422/485 interface

2.4.1 Properties of the RS232 interface

Definition - RS232 interface

The RS232 interface is a voltage interface used for serial data transmission.

Properties - RS232 interface

The RS232 interface has the following properties and meets the following requirements:

Type	Voltage interface
BaseUnit terminals	Terminals connected to the electronics module (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment)
RS232 signals	TXD, RXD, RTS, CTS, DTR, DSR, RI, DCD, GND; all signals isolated against the backplane bus and load voltage
Max. data transmission rate	115.2 kbps
max. cable length	15 m, cable type LIYCY 9 x 0.14
Standard	DIN 66020, DIN 66259, EIA-RS 232C, CCITT V.24/V.28

RS232 signals

The table below shows the meaning of the individual RS232 accompanying signals.

Table 2- 1 Signals of the RS232 interface

Signal	Designation	Meaning
TXD	Transmit Data	Transmit data; transmit cable logically held to "1" by communication module in idle state.
RXD	Receive Data	Receive data; receive cable logically held to "1" by communication partner in idle state.
RTS	Request To Send	Request to send RTS set to "ON": Communication module ready to send; signals to the communication partner that there is data ready to send RTS set to "OFF": Communication module does not send
CTS	Clear To Send	Clear to send CTS set to "ON": Signals "clear to send" to the communication partner CTS set to "OFF": Signals "Not clear to send" to the communication partner
DTR	Data Terminal Ready	DTR set to "ON": Communications module switched on, ready for operation DTR set to "OFF": Communications module not switched on, not ready for operation
DSR	Data Set Ready	DSR set to "ON": Communication partner signals "ready for operation" DSR set to "OFF": Communication partner not switched on, not ready for operation
RI	Ring Indicator	Incoming call when connecting a modem
DCD	Data Carrier Detect	Carrier signal when connecting a modem. The communication partner signals with a high level that it detects incoming data on the cable.

2.4.2 Properties of the RS422/485 interface

Definition - RS422/485 interface

The RS422/485 (X27) interface is a differential voltage interface for serial data transmission.

Properties - RS422/485 interface

The RS422/485 (X27) interface has the following properties and meets the following requirements:

Type	Differential voltage interface
BaseUnit terminals	Terminals connected to the electronics module (see RS232 and RS422/485 interface of the communication module (Page 17) for assignment)
RS422 signals:	T (A), R (A), T (B), R (B), GND; all signals are isolated against the backplane bus and the load voltage
RS485 signals:	R/T (A), R/T (B), GND; all signals isolated against backplane bus and load voltage
Max. data transmission rate:	115.2 kbps
Max. cable length:	1200 m; cable type LIYCY 3 x 2 x 0.14. T(A)/T(B) and R(A)/R(B) twisted in pairs.
Standard:	DIN 66259 Parts 1 and 3, EIA-RS422/485, CCITT V.11

Connecting

3

3.1 RS232 and RS422/485 interface of the communication module

Pin assignment

Table 3- 1 RS232 connection

Terminal assignment of the communication module BaseUnit	Pin	Designation	Input/output	Meaning
	1	TXD Transmit Data	Output	Transmit data
	2	RXD Receive Data	Input	Receive data
	3	RTS Request To Send	Output	Request to send
	4	CTS Clear To Send	Input	Clear to send
	5	DTR Data Terminal Ready	Output	Data terminal ready
	6	DSR Data Set Ready	Input	Data set ready
	7	DCD Data Carrier Detect	Input	Received signal level
	8	RI Ring Indicator	Input	Incoming call
	9+10	PE Ground	-	GND functional ground (isolated)
Front view				

Table 3- 2 RS422/485 connection

Terminal assignment of the communication module BaseUnit	Pin	Designation	Input/output	Meaning
	11	T (A) -	Output	Send data (four-wire mode)
	12	R (A) - T(A)/R(A)	Input Input/output	Receive data (four-wire mode) Receive/send data (two-wire mode)
	13	T (B) +	Output	Send data (four-wire mode)
	14	R (B) + T(B)/R(B)	Input Input/output	Receive data (four-wire mode) Receive/send data (two-wire mode)
	15+16	PE Ground	-	GND functional ground (isolated)
Front view				

Note

Ensure the power supply is disconnected before you wire the communication module.

Additional information

Information on connecting the modules can be found in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Installation guidelines

To take into consideration

The general installation guidelines must be taken into consideration (see function manual EMC/EMI compatible installation of control systems (http://support.automation.siemens.com/WW/view/en/59193566)).

The cable shield must be installed on a grounding rail to maintain the EMC values (electromagnetic compatibility).

Parameters/address space 4

4.1 Parameter assignment

Introduction

You configure and assign the parameters of the communication module with STEP 7 (TIA Portal V12 or later) or with STEP 7 with integration of a GSD file.

Additional information

The device manual of the communication module is supplemented by the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) and the TIA Portal information system.

There you will find information on the following topics:

- Operating modes
- Receive buffer
- Data flow control
- Transmission integrity
- Data transmission - protocol specific
- Programming/configuring in STEP 7 (TIA Portal)
- Module-specific instructions
- Diagnostics

4.2 Reaction to CPU STOP

Ongoing transmissions are aborted when the higher-level control (CPU) goes to STOP.

Frames in the receive buffer are retained. With a corresponding configuration in the properties dialog of the communication module, you can automatically clear the receive buffer on the communication module during CPU startup.

4.3 Address space

Address space of the communication module

The input addresses of the communications module total 8 bytes. The input addresses are automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal). Output addresses are not required.

Hardware identification (not freely configurable)

The hardware identification (HW ID) is automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal).

The hardware ID is issued along with the diagnostic messages to localize the module. In addition, the HW identification is required for S7-1500 at the communication instructions in order to identify the communication module. For S7-300/400, the communication module is identified by the start address of the input data.

Programming

5

Overview of the instructions

Communication between the CPU, the communication module and a communication partner takes place by means of special instructions and protocols that support the corresponding communication modules. The instructions process the exchange of data between the CPU and the communication module. They must be called cyclically from the user program. Data transmission takes place asynchronously across several cycles.

The transmission protocols are implemented on the communication module. The protocol is used to adapt the interface of the communication module to the interface of the communication partner.

Instruction	Meaning
Port_Config	You use the Port_Config instruction to dynamically assign basic interface parameters.
Send_Config	You use the Send_Config (send configuration) instruction to dynamically assign serial send parameters of a protocol.
Receive_Config	You use the Receive_Config (receive configuration) instruction to dynamically assign serial receive parameters of a protocol.
P3964_Config	You use the P3964_Config (protocol configuration) instruction to dynamically assign the parameters of the 3964(R) procedure.
Send_P2P	You use the Send_P2P instruction to send data to a communication partner.
Receive_P2P	You use the Receive_P2P instruction to receive data from a communication partner.
Receive_Reset	You use the Receive_Reset instruction to delete the receive buffer of the communication module.
Signal_Get	You use the Signal_Get instruction to read the RS232 accompanying signals.
Signal_Set	You use the Signal_Set instruction to set the RS232 accompanying signals.
Get_Features	You use the Get_Features instruction to read expanded functions supported by the communication module.
Set_Features	You use the Set_Features instruction to set expanded functions supported by the communication module.
USS_Port_Scan	You use the USS_Port_Scan instruction to communicate using the USS.
USS_Drive_Control	You use the USS_Drive_Control instruction to exchange data with a drive.
USS_Read_Param	You use the USS_Read_Param instruction to read parameters from the drive.
USS_Write_Param	You use the USS_Write_Param instruction to change parameters in the drive.
Modbus_Comm_Load	The instruction Modbus_Comm_Load allows you to configure the port of the communication module for Modbus RTU.

Instruction	Meaning
Modbus_Master	The instruction Modbus_Master allows you to communicate as Modbus master by means of the PtP port.
Modbus_Slave	The instruction Modbus_Slave allows you to communicate as Modbus slave by means of the PtP port.

The instructions are part of STEP 7 (TIA Portal). The instructions are available in the "Instructions" task card under Communication > Communication processor.

Additional information

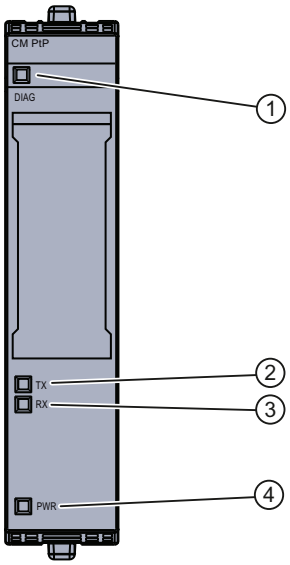
Additional information on programming the communication modules can be found in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).

Error and system messages

6

LED displays of the communication module

The figure below shows the LED displays of the CM PtP communication module.



① LED display DIAG
② LED display TX
③ LED display RX
④ LED display PWR

Figure 6-1 View of CM PtP (without BaseUnit)

Meaning of DIAG LED display

LED DIAG	Meaning	Solution
■ On	CM configured and ready for operation	---
☼ Flashes	CM in startup, parameters not assigned yet	---
☼ Flashes	Error information; diagnostic interrupt (break)	Evaluate the diagnostics data and eliminate the error. [1)]

1) Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual

Meaning of the TXD/RXD LED displays

LED		Meaning	Solution
TX	RX		
☼ Flashes	□ Off	Interface is transmitting	---
□ Off	☼ Flashes	Interface is receiving	---

Meaning of PWR LED display

LED PWR	Meaning	Solution
■ On	Power ON (supply voltage present)	---
□ Off	Power OFF (supply voltage missing)	Check the voltage supply of the load group

Additional information

Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual.

Technical specifications

7

Technical specifications of the CM PtP communication module

	6ES7137-6AA00-0BA0
Product type designation	ET 200SP CM PtP
General information	
• I&M data	Yes: I&M 0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V12.0 / V12.0
STEP 7 can be configured/integrated as of version	V5.5 SP2 or higher with a GSD file
PROFIBUS as of GSD version/GSD revision	- / -
PROFINET as of GSD version/GSD revision	V2.3
Installation type/mounting	
• Rail mounting possible	Yes; standard - DIN rail
Supply voltage	
Voltage type of supply voltage	24 V DC
• Rated value (DC)	24 V
• Low limit of valid range (DC)	19.2 V
• High limit of valid range (DC)	28.8 V
• Reverse polarity protection	Yes
Input current	
• Current consumption (rated value)	29 mA
Power loss	
• Power loss, typ.	0.7 W
Address area	
Occupied address area	
• Inputs	8 bytes

	6ES7137-6AA00-0BA0
Interfaces	
1. Interface	
Interface hardware	
• RS 232	Yes
• RS 422	Yes
• RS 485	Yes
Interface hardware	
RS 232	
• Transmission rate, max.	115.2 kbps
• Max. cable length	15 m
RS-232 accompanying signals	RTS, CTS, DTR, DSR, RI, DCD
RS 485	
• Transmission rate, max.	115.2 kbps
• Max. cable length	1200 m
RS 422	
• Transmission rate, max.	115.2 kbps
• Max. cable length	1200 m
• 4-wire full duplex connection	Yes
• 4-wire multipoint connection	Yes
Protocols	
Integrated protocols	
Freeport	
• Frame length, max.	2 kbyte
• Bits per character	7 or 8
• Number of stop bits	1 or 2 bits
• Parity	None, even, odd, always 1, always 0, any
3964 (R)	
• Frame length, max.	2 kbyte
• Bits per character	7 or 8
• Number of stop bits	1 or 2 bits
• Parity	None, even, odd, always 1, always 0, any
Modbus RTU master	
Address area	1 to 247, extended 1 to 65,535
• Max. number of slaves	32

	6ES7137-6AA00-0BA0
Modbus RTU slave	
Address area	1 to 247, extended 1 to 65,535
Frame buffer	
• Buffer memory for frames	4 kbyte
• Number of frames which can be buffered	255
Interrupts/diagnostics/status information	
Interrupts	
• Diagnostic interrupt	Yes
• Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes
• Wire break	Yes
Diagnostics display LED	
• Monitoring of supply voltage	Yes; green PWR-LED
• For module diagnostics	Yes; green/red DIAG-LED
• Receive RxD	Yes; green LED
• Send TxD	Yes; green LED
Electrical isolation	
• between backplane bus and interface	Yes
Permitted potential difference	
Between the different circuits	75 V DC / 60 V AC (Basic insulation)
Insulation	
Insulation tested with	707 V DC (Type Test)
Ambient conditions	
Operating temperature	
• Horizontal installation, min.	0 °C
• Horizontal installation, max.	60 °C
• Vertical installation, min.	0 °C
• Vertical installation, max.	50 °C
Distributed operation	
• At SIMATIC S7-300	Yes
• At SIMATIC S7-400	Yes
• At SIMATIC S7-1200	No
• At SIMATIC S7-1500	Yes
• At Standard Profinet Controller	Yes

	6ES7137-6AA00-0BA0
Dimensions	
• Width	15 mm
• Height	73 mm
• Depth	58 mm
Weights	
• Weight, approx.	30 g

Additional general technical specifications for SIMATIC ET 200SP can be found in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

Dimensional drawing

A

In this appendix, you will find the dimensional drawing of the communication module, inserted into a BaseUnit and mounted on a DIN rail. You have to consider the dimensions during installation in control cabinets, control rooms, etc (BaseUnit: 6ES7193-6BP00-0xA0).

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Validity of this manual

This document contains information on the following modules:

- **CP 1542SP-1**
  Article number **6GK7542-6UX00-0XE0**
  Hardware version 1
  Firmware version V1.0
  Communications processor for connecting a SIMATIC ET 200SP CPU to Industrial Ethernet
- **CP 1542SP-1 IRC**
  Article number **6GK7542-6VX00-0XE0**
  Hardware version 1
  Firmware version V1.0
  Communications processor for connecting a SIMATIC ET 200SP CPU via Industrial Ethernet to a control room (TCSB, DNP3, IEC 60870-5-104)
- **CP 1543SP-1**
  Article number **6GK7543-6WX00-0XE0**
  Hardware version 1
  Firmware version V1.0
  Communications processor for connecting a SIMATIC ET 200SP CPU to Industrial Ethernet, Security

Figure 1 CP 1542SP-1 with plugged in bus adapter (here 2xRJ-45)

On the front of the module at the right edge, the hardware version is printed as a placeholder "X". If the printed text is, for example, "X 2 3 4", "X" would be the placeholder for hardware product version 1.

Directly below, you will find the firmware version of the CP as it shipped.

The MAC address is printed on the front at the bottom left, above the connectors for the power supply.

Product names, terms and abbreviations/acronyms

Below you will find terms and abbreviations/acronyms used often in this manual.

- **CP**

  When the property being described is valid in the current context for all three CP types or if the CP type being used is clear from the context, the abbreviation "CP" will be used instead of the three following product designations

  – CP 1542SP-1

  – CP 1542SP-1 IRC

  – CP 1543SP-1

  If information applies only to a certain product variant. the full module name is specified.

- **TCSB**

  Control center software "TeleControl Server Basic"

- **Telecontrol server**

  PC with installed software "TeleControl Server Basic"

Purpose of the manual

This manual describes the properties of this module and supports you when installing and commissioning it.

The required configuration steps are described as an overview and there are explanations of the relationship between firmware functions and configuration.

You will also find information about the diagnostics options of the device.

Required experience

To install, commission and operate the CP, you require experience in the following areas:

- Automation engineering
- Setting up the SIMATIC ET 200SP
- SIMATIC STEP 7 Professional

Cross references

In this manual there are often cross references to other sections.

To be able to return to the initial page after jumping to a cross reference, some PDF readers support the command <Alt>+<Left arrow>.

Current manual release on the Internet

You will also find the current version of this manual on the Internet pages of Siemens Industry Online Support under at the following addresses:

- CP 1542SP-1 / CP 1543SP-1
  Link: (https://support.industry.siemens.com/cs/ww/en/ps/22144/man)

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit
Link: (http://www.siemens.com/industrialsecurity)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under
Link: (http://www.siemens.com/industrialsecurity).

Firmware

The firmware is signed and encrypted. This ensures that only firmware created by Siemens can be downloaded to the device.

SIMATIC NET glossary

Explanations of many of the specialist terms used in this documentation can be found in the SIMATIC NET glossary.

You will find the SIMATIC NET glossary here:

- SIMATIC NET Manual Collection or product DVD

  The DVD ships with certain SIMATIC NET products.

- On the Internet under the following address:

  Link: (https://support.industry.siemens.com/cs/ww/en/view/50305045)

Training, Service & Support

You will find information on training, service and support in the multilanguage document "DC_support_99.pdf" on the Internet pages of Siemens Industry Online Support:

Application and functions

1

1.1 Components of the product

The following components are supplied with the product:

- CP 154xSP-1
- Plug for the socket of the power supply (24VDC) of the CP
- DVD with documentation and license texts

A BusAdapter for the Ethernet connection of the CP does not ship with the product.

1.2 Application

Application of the CP variants

The CP is used to connect the ET 200SP to Industrial Ethernet via a copper cable or fiber-optic cable. It can be used as an additional Ethernet interface of the CPU for S7 communication.

For the Ethernet connection, the CP requires a bus adapter that does not ship with the product.

The three CP variants are intended for the following communication tasks:

- **CP 1542SP-1**

  The CP 1542SP-1 allows the ET 200SP a further Ethernet connection.

- **CP 1542SP-1 IRC**

  The CP 1542SP-1 IRC supports telecontrol communication for connecting the ET 200SP CPU to a control center. The following telecontrol protocols can be used as alternatives:

  – TeleControl Basic

    For connection of the ET 200SP to a master station with telecontrol server (TCSB V3 SP3)

  – DNP3

    For connection of the ET 200SP to a master station with DNP3 masters

  – IEC 60870-5-104

    For connection of the ET 200SP to a master station with IEC masters

- **CP 1543SP-1**

  The CP 1543SP-1 has Security functions for network security, such as a firewall and VPN. This makes protected access to the ET 200SP possible.

1.3 Communications services

Communications services

The following communications services are supported:

- **S7 communication and PG/OP communication with the following functions:**
  - PUT/GET as client and server for data exchange with S7 stations
  - PG functions
  - Operator control and monitoring functions (HMI)

  For S7 communication, the CP requires a fixed IP address.
- **S7 routing**
  - Routing of S7 connections via the backplane bus and the CPU to other S7 stations
- **Open User Communication (OUC)**

  OUC via program blocks with the following protocols:
  - TCP/IP
  - ISO-on-TCP
  - UDP

  The CP 1543SP-1 supports Secure OUC.

  You will find the program blocks supported by the three CP types in the section Programming (OUC) (Page 93).
- **E-mail using program blocks**
- **HTTP / HTTPS**

  Via HTTP / HTTPS you can access the Web server of the CPU.

For telecontrol communication of the CP 1542SP-1 IRC, see section Telecontrol communication of the CP 1542SP-1 IRC (Page 13).

For information on the Security functions of the CP 1543SP-1, refer to the section Security functions (CP 1542SP-1 IRC, CP 1543SP-1) (Page 15).

1.4 Telecontrol communication of the CP 1542SP-1 IRC

Telecontrol protocols

In addition to the communications services named above, the CP 1542SP-1 IRC supports the following telecontrol protocols for communication with a master station:

- **TeleControl Basic**

  This is a proprietary protocol of Siemens for telecontrol applications. The IP-based protocol is used to connect the CP to the application TCSB.

  TCSB is installed on a PC in the master station, the telecontrol server. Via the OPC-DA or OPC-UA server of TCSB, an OPC client can access the process data of the CP.

  TCSb is supported as of the following version: V3.0 + SP3

  For the TCSB manual, see /3/ (Page 118).

- **DNP3**

  The CP functions as a DNP3 station (Outstation).

  Communication is based on the DNP3 SPECIFICATION Version 2.11 (2007/2009).

  You will find a detailed overview of the attributes and properties specified in the DNP3 protocol and supported by the CP in the DNP3 device profile, see Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/man).

  You will find the supported object groups and variations in the section Datapoint types (Page 58).

  Communications partner (DNP3) can be:

  – SIMATIC PCS7 TeleControl
  – SIMATIC WinCC TeleControl
  – SIMATIC WinCC OA
  – A TIM module with DNP3 capability (TIM 3V IE DNP3 / TIM 4R IE DNP3)

    For the manual of the TIM module see /5/ (Page 118).
  – Third-party systems that support the DNP3 specification named above.

- **IEC 60870-5-104**

  The CP functions as a substation (slave).

  Communication is based on the specification IEC 60870-5 Part 104 (2006).

  You will find a detailed overview of the attributes and properties specified in the IEC specification and supported by the CP in the IEC device profile, see Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/man).

  You will find the supported IEC type identifiers as in the section Datapoint types (Page 58).

  Communications partner (IEC master) can be:

  – SIMATIC PCS7 TeleControl
  – SIMATIC WinCC TeleControl

- SIMATIC WinCC OA
- Third-party systems that support the DNP3 specification named above.

Properties of the telecontrol CP

- **Data point configuration**

  The process values are configured as data points for the communication. The data points access PLC tags in the CPU. The data points can be processed one-to-one in the control system.

- **Messages / e-mail**

  With configurable events in the process image of the CPU, the CP 1542SP-1 IRC can send messages as e-mails. The data sent by e-mail is configured using PLC tags.

- **Storage of events**

  The CP 1542SP-1 IRC can store events of different classes and transfer them together to the communications partner.

- **Analog value processing**

  Analog values can be preprocessed on the CP 1542SP-1 IRC according to various methods.

1.5 Other services and properties

Further services and properties of the CP

- **IP configuration**
  - Address types

    The CP supports IP addresses according to IPv4 and IPv6.
  - Addressing

    The IP address, the subnet mask and the address of a gateway can be set manually in the configuration. As an alternative, the IP address can be obtained using program blocks.
  - DHCP: As an alternative, the IP address can be obtained from a DHCP server.
  - DCP (Discovery and Configuration Protocol) is supported.
- **Time-of-day synchronization**
  - NTP

    On the Ethernet interface, the CP can synchronize its time of day via NTP.

– Only CP 1542SP-1 IRC

When telecontrol communication is enabled, the CP always obtains its local time of day as UTC time from the communications partner. The time of day of the CP can be read by the CPU using a PLC tag. For information on the format of the time stamp of the data frames, refer to the section Datapoint types (Page 58).

if telecontrol communication is disabled, the CP can synchronize its time of day via NTP.

– Only CP 1543SP-1

If the Security functions are enabled, the secure method NTP (secure) can be used.

For more information, refer to the section Time-of-day synchronization (Page 41).

- **SNMP**

  As SNMP agent, the CP supports queries via SNMPv1.

  The CP 1543SP-1 also supports SNMPv3.

  For more detailed information, refer to section SNMP (Page 43).

1.6 Security functions (CP 1542SP-1 IRC, CP 1543SP-1)

The Security functions described below are enabled in the configuration for the relevant CP.

For information on the Securityfunctions of Open User Communication, refer to the section Programming (OUC) (Page 93).

Note

Recommendation for critical security plants

Refer to the information in the section Security recommendations (Page 37).

Security functions of the CP 1542SP-1 IRC

- **E-mail**

  For secure transfer of information with encrypted e-mails you have the alternative of using:

  – SSL/TLS

  – STARTTLS

  For information on the configuration, refer to the section Security > E-mail configuration (Page 84).

- **Certificates**

  For the secure authentication of the communications partners, certificates are used.

- **Secure telecontrol communication**

  The telecontrol protocols provide the following Security functions:

  – TeleControl Basic

    As an integrated security function, the telecontrol protocol encrypts the data for transfer between the CP and telecontrol server. The interval for the key exchange between CP and telecontrol server is set to 1 hour.

    The telecontrol password is used to authenticate the CP with the telecontrol server

  – DNP3

    The CP supports the Security mechanisms listed in the specification.

Security functions of the CP 1543SP-1

With Industrial Ethernet Security, individual devices, automation cells or network segments of an Ethernet network can be protected. The data transfer via the CP 1543SP-1 can be protected from the following attacks by a combination of different security measures:

- Data espionage
- Data manipulation
- Unauthorized access

Secure underlying networks can be operated via additional Ethernet/PROFINET interfaces of the CPU.

As a result of using the CP, as a security module, the following security functions are accessible to the ET 200SP station on the interface to the Ethernet network:

- **Firewall**

  The firewall protects the device with:

  – IP firewall with stateful packet inspection (layer 3 and 4)

  – Firewall also for "non-IP" Ethernet frames according to IEEE 802.3 (layer 2)

  – Limitation of the transmission speed ("Bandwidth limitation")

- **Certificates**

  For the secure authentication of the communications partners, certificates are used.

- **Communication made secure by IPsec tunnels (VPN)**

  VPN tunnel communication allows the establishment of secure IPsec tunnels for communication with one or more security modules. The CP can be put together with other modules to form VPN groups during configuration. IPsec tunnels (VPN) are created between all security modules of a VPN group.

- **Logging**

  To allow monitoring, events can be stored in log files that can be read out using the configuration tool or can be sent automatically to a Syslog server.

- **NTP (secure)**

  For secure transfer during time-of-day synchronization

- **SNMPv3**

  For secure transmission of network analysis information safe from eavesdropping

For information on configuring the security functions, refer to the section Security configuration(CP 1543SP-1) (Page 84).

You will find further information on the functionality and configuration of the security functions in the information system of STEP 7 and in the manual /4/ (Page 118).

1.7 Configuration limits and performance data

Number of CPs per station

In each ET 200SP station, up to three special modules can be plugged in and configured; this allows a maximum of two CP 154xSP-1 modules.

For details of the permitted special modules and the slot rules, refer to section Installing the CP (Page 32).

Connection resources

Number of connections via Industrial Ethernet in total maximum of 32,
of which:

- S7: Max. 16
- TCP/IP: Max. 32
- ISO-on-TCP: Max. 32
- UDP: Max. 32

Also:

- Online connections of the engineering station (STEP 7): Max. 2
- TCP connections for HTTP

  For HTTP access upp to 12 TCP connection resources are available that are used by one or more Web browsers to display data of the CP.
- PG/OP connections (HMI): In total maximum of 16,
  of which:
  - Connection resources for PG connections: Max. 16
  - Connection resources for OP connections: Max. 16

Frame memory (send buffer)

Only CP 1542SP-1 IRC

The CP has a frame memory (send buffer) for the values of data points configured as an event.

The volume of the send buffer is divided equally among all configured communications partners.

The size of the send buffer can be configured in STEP 7, refer to the section Communication with the CPU (Page 55).

The maximum size of the send buffer depends on the telecontrol protocol being used and is as follows:

- TeleControl Basic

  64000 events

- DNP3

  100000 events

- IEC 60870-5-104

  100000 events

You will find details of how the send buffer works such as storing events as well as the options for transferring the data in the section Process image, types of transmission, event classes, triggers (Page 62).

E-mail (via message editor)

Only CP 1542SP-1 IRC

With telecontrol communication enabled, up to 10 messages can be configured in STEP 7. The messages are sent as e-mails.

Telecontrol connections and data points

Only CP 1542SP-1 IRC

- **Telecontrol connections**
  - TeleControl Basic

    A connection can be established to a single or redundant telecontrol server.
  - DNP3

    Connections to up to four masters can be established.
  - IEC 60870-5-104

    Connections to up to four masters can be established.
- **Data points**

  The data to be transferred by the CP is assigned to various data points in the STEP 7 configuration. The size of the user data per data point depends on the data type of the relevant data point. You will find details in the section Datapoint types (Page 58).

  The maximum number of configurable data points is 500.

  In the allocation of the internal CP memory for data points, the length of the data point name is also included. See also the note in section Configuring the data points (Page 56).

Security functions

Only CP 1543SP-1

- **VPN tunnel**

  A maximum of four VPN tunnels can be established for secure communication with other Security modules.

- **Firewall rules**

  The maximum number of firewall rules in advanced firewall mode is limited to 256. The firewall rules are divided up as follows:

  – Maximum 226 rules with individual addresses

  – Maximum 30 rules with address ranges or network addresses (e.g. 140.90.120.1 - 140.90.120.20 or 140.90.120.0/16)

  – Maximum 128 rules with limitation of the transmission speed ("Bandwidth limitation")

1.8 Requirements for use

1.8.1 Hardware requirements

Bus adapter

To connect to the Ethernet network, the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

The CP supports the following BusAdapter:

- BA 2xRJ45
- BA 2xFC
- BA 2xSCRJ
- BA SCRJ/RJ45
- BA SCRJ/FC
- BA 2xLC
- BA LC/RJ45
- BA LC/FC

For more detailed information on the bus adapters, refer to the section BusAdapter (Page 115) and the manual /2/ (Page 117).

CPUs and other components of the ET 200SP

The CP supports operation in stations that contain one of the following CPUs:

- CPU 1510SP-1 PN

  Article number: 6ES7510-1DJ01-0AB0
- CPU 1510SP F-1 PN

  Article number: 6ES7510-1SJ01-0AB0
- CPU 1512SP-1 PN

  Article number: 6ES7512-1DK01-0AB0
- CPU 1512SP F-1 PN

  Article number: 6ES7512-1SK01-0AB0

Further parts and modules that are also required to set up the ET 200SP station, such as rails, I/O modules or cabling are not listed here. See also /2/ (Page 117) for information on this.

Components of the communications partner

Components required by the communications partners of the CP 1542SP-1 IRC are not listed here. You will find references to other products (e.g. TCSB) in the list of references in the appendix of the manual.

1.8.2 Software requirements

Configuration software

To configure the CP, the following configuration tool is required:

- STEP 7 Professional as of version 14.

Software for online functions

To use the online functions, the following software is required:

- STEP 7 in the version specified above

CPU firmware

To use the CP, a CPU 151xSP with a firmware version ≥ V2.0 is required.

Telecontrol protocols (CP 1542SP-1 IRC)

You will find telecontrol protocols supported by the CP in the section Telecontrol communication of the CP 1542SP-1 IRC (Page 13).

1.9 Configuration examples

Below you will find configuration examples for the use of the three CP variants.

CP 1542SP-1 - Network separation

The CP is used in the ET 200SP to operate lower-level networks separately or to achieve separation from the higher-level network.

The ET 200SP can be expanded flexibly with further Ethernet interfaces via the CP. The network separation allows the setting up of identical machines with the same IP address. The CP takes over the communication and relieves the CPU.

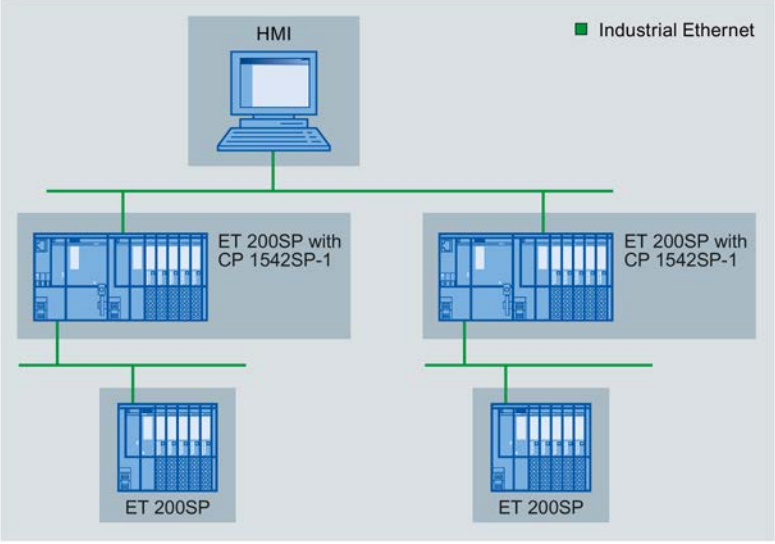

Figure 1-1 Configuration example of an ET 200SP with CP 1542SP-1

CP 1543SP-1 - Cell protection with Security functions

The CP communicates encrypted with communications partners in the connected network. The firewall monitors the access to the ET 200SP and therefore protects lower-level networks. This avoids data loss, disruptions of production and damage to machines.

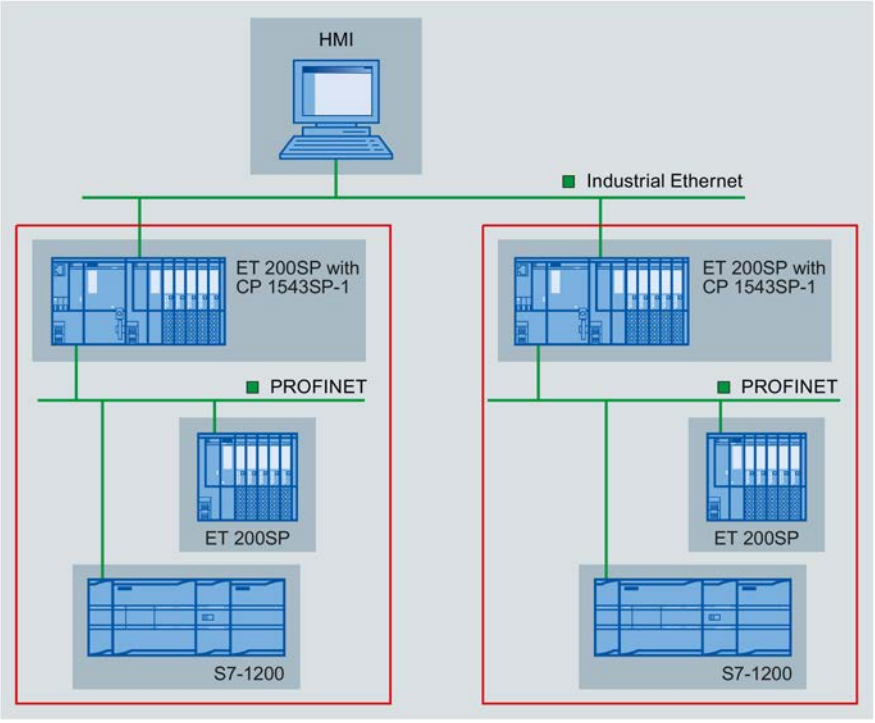

Figure 1-2 Configuration example of an ET 200SP with CP 1543SP-1

CP 1542SP-1 IRC - Connection to control centers

By using the CP the ET 200SP can be used as a remote terminal unit. For the communication, the following telecontrol protocols can be used:

- TeleControl Basic

  The Siemens telecontrol protocol for connection to master stations with TCSB
- IEC 60870-5-104
- DNP3

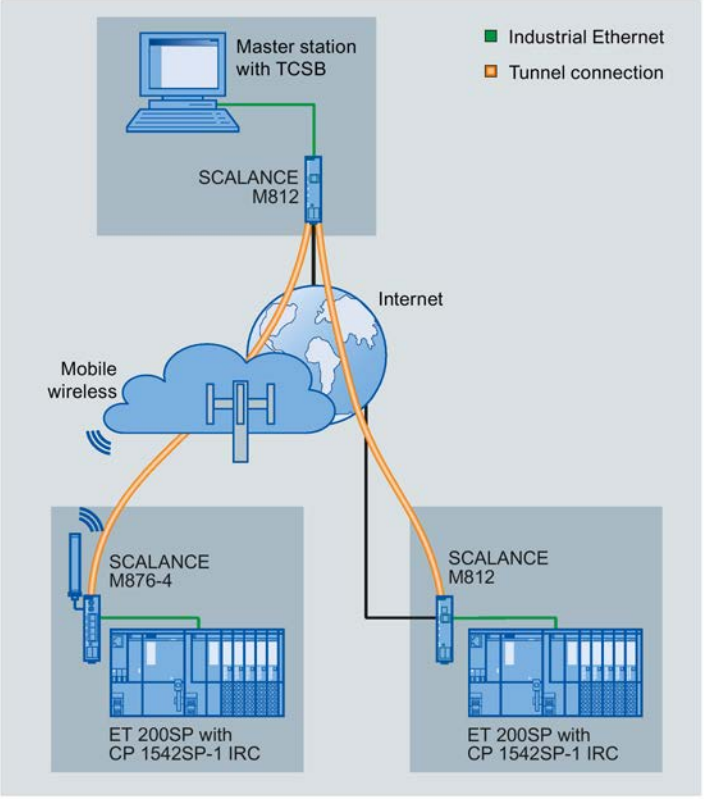

Figure 1-3 Configuration example of an ET 200SP with CP 1542SP-1 IRC; protocol: TeleControl Basic

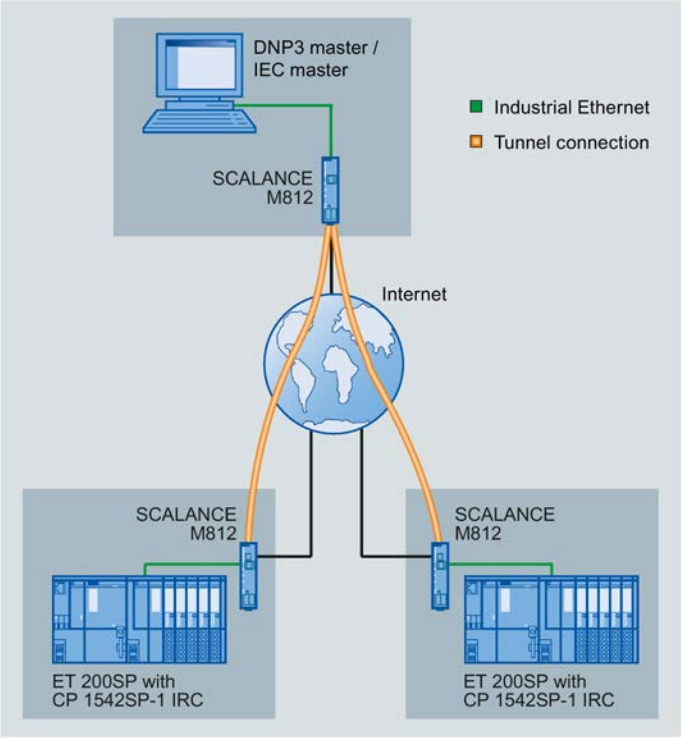

Figure 1-4 Configuration example of an ET 200SP with CP 1542SP-1 IRC; protocol: DNP3 or IEC 60870-5-104

LEDs and connectors

2

2.1 LEDs

Meaning of the LED displays of the CP

The CP has the following light emitting diodes (LEDs) on the front:

LED name	Meaning
PWR	Power supply
RN	Operating mode
ER	Error
MT	Maintenance

Table 2- 1 Legend for the following tables

Symbol				-
Meaning / LED status	ON (LED lit)	OFF	LED flashes	Any

Table 2- 2 Meaning of the LED displays of the CP

PWR (green)	RN (green)	ER (red)	MT (yellow)	Meaning
				No supply voltage on the CP or supply voltage too low
				CP startup
				CP in RUN mode
	-			Error. LED display with the following events: • Duplicate IP address • Bus adapter not plugged in or pulled • No telecontrol connection (CP 1542SP-1 IRC)
				Error: CP defective
				Missing configuration data
				Firmware update running
				There is a maintenance request from the CP. Example: • End of the firmware update

LEDs of the bus adapter

Every port of a bus adapter has an LED "LKx" that informs about the connection status with Ethernet and the frame traffic of the port.

Table 2- 3 Meaning of the LED displays of the bus adapters

LK (green)	Meaning
○	No Ethernet connection. Possible causes: • No physical connection to the network • Port disabled in the configuration
☼	LED flashing test
●	There is an Ethernet connection between the port and communications partner.

2.2 Power supply

External power supply required

The connector for the external 24 VDC power supply is located on the front of the CP.

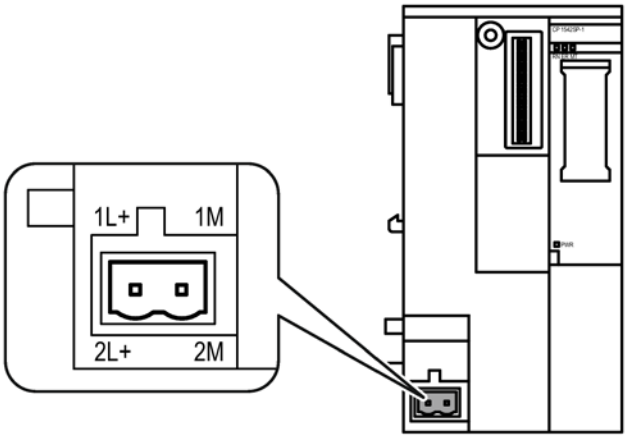

Figure 2-1 Power supply of the CP

Connector X80 is intended for connection to a single or redundant power supply. The power supply is connected to the CP with the supplied plug-in terminal block. The terminal block is plugged in to the socket X80 of the CP.

For information on installing and connecting up, refer to the sections Installing the CP (Page 32) and Connecting the CP (Page 36).

Reverse polarity protection

The plug-in terminal block for connector X80 is designed so that it can only be plugged in in one position. This provides constructional reverse polarity protection.

The connector X80 also has electronic reverse polarity protection.

You will find further data on the power supply in section Technical specifications (Page 107).

2.3 Connector for the BusAdapter

Operation of the device only with BusAdapter

For connecting to Ethernet the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

The slot is on the front of the device:

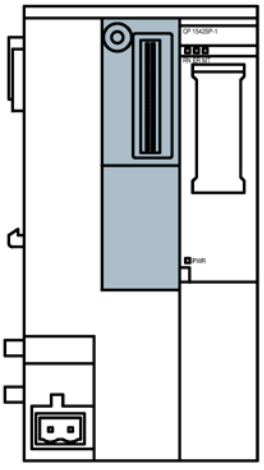

Figure 2-2 Front of the CP, the slot for the bus adapter is marked gray.

You will find the bus adapters supported by the CP in section BusAdapter (Page 115).

For information on installing and connecting up, refer to the sections Installing the CP (Page 32) and Connecting the CP (Page 36).

You will find the pinout of the Ethernet interface in section Assignment of the Ethernet interface of the bus adapter (Page 116). You will find further technical specifications of the bus adapter in the manual /2/ (Page 117).

Installation and connecting up

3

3.1 Important notes on using the device

Safety notices on the use of the device

Note the following safety notices when setting up and operating the device and during all associated work such as installation, connecting up or replacing the device.

Overvoltage protection

NOTICE
Protection of the external power supply If power is supplied to the module or station over longer power cables or networks, the coupling in of strong electromagnetic pulses onto the power supply cables is possible. This can be caused, for example by lightning strikes or switching of higher loads. The connector of the external power supply is not protected from strong electromagnetic pulses. To protect it, an external overvoltage protection module is necessary. The requirements of EN61000-4-5, surge immunity tests on power supply lines, are met only when a suitable protective element is used. A suitable device is, for example, the Dehn Blitzductor BVT AVD 24, article number 918 422 or a comparable protective element. Manufacturer: DEHN+SOEHNE GmbH+Co.KG Hans Dehn Str.1 Postfach 1640 D-92306 Neumarkt, Germany

3.1.1 Notes on use in hazardous areas

⚠ WARNING
EXPLOSION HAZARD DO NOT OPEN WHEN ENERGIZED.

⚠ WARNING
The device may only be operated in an environment with pollution degree 1 or 2 (see IEC 60664-1).

WARNING

The equipment is designed for operation with Safety Extra-Low Voltage (SELV) by a Limited Power Source (LPS).

This means that only SELV / LPS complying with IEC 60950-1 / EN 60950-1 / VDE 0805-1 must be connected to the power supply terminals. The power supply unit for the equipment power supply must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

If the equipment is connected to a redundant power supply (two separate power supplies), both must meet these requirements.

WARNING

EXPLOSION HAZARD

Do not connect or disconnect cables to or from the device when a flammable or combustible atmosphere is present.

WARNING

EXPLOSION HAZARD

Replacing components may impair suitability for Class 1, Division 2 or Zone 2.

WARNING

When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or a suitable enclosure.

WARNING

DIN rail

In the ATEX and IECEx area of application only the Siemens DIN rail 6ES5 710-8MA11 may be used to mount the modules.

3.1.2 Notes on use in hazardous areas according to ATEX / IECEx

WARNING

Requirements for the cabinet/enclosure

To comply with EU Directive 94/9 (ATEX95), the enclosure or cabinet must meet the requirements of at least IP54 in compliance with EN 60529.

WARNING

If the cable or conduit entry point exceeds 70 °C or the branching point of conductors exceeds 80 °C, special precautions must be taken. If the equipment is operated in an air ambient in excess of 50 °C, only use cables with admitted maximum operating temperature of at least 80 °C.

WARNING

Take measures to prevent transient voltage surges of more than 40% of the rated voltage. This is the case if you only operate devices with SELV (safety extra-low voltage).

3.1.3 Notes on use in hazardous areas according to UL HazLoc

WARNING

EXPLOSION HAZARD

DO NOT DISCONNECT WHILE CIRCUIT IS LIVE UNLESS AREA IS KNOWN TO BE NON-HAZARDOUS.

This equipment is suitable for use in Class I, Division 2, Groups A, B, C and D or non-hazardous locations only.

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

3.2 Installing the CP

NOTICE
Install and remove the CP only when the power is off Switch off the power supply of the ET 200SP and the CP before you install or remove modules. Installing and removing modules with the power supply on can lead to damage to the modules and to loss of data.

Note

Note the installation guidelines

When installing and connecting up the CP note the instructions in the manual /2/ (Page 117).

NOTICE
Installation location - Dependency of the temperature range The module must be installed so that its upper and lower ventilation slits are not covered, allowing adequate ventilation. Above and below the modules, there must be a clearance of 25 mm to allow air to circulate and prevent overheating. Note the dependency of the permitted temperature range of the installation location. • Horizontal installation of the rack (DIN rail) means vertical position of the CP. • Vertical installation of the rack (DIN rail) means horizontal position of the CP. You will find the permitted temperature ranges in the section Technical specifications (Page 107).

Installation of the rack	Installation position of the CP
Horizontal installation of the rack	Vertical installation of the rack	
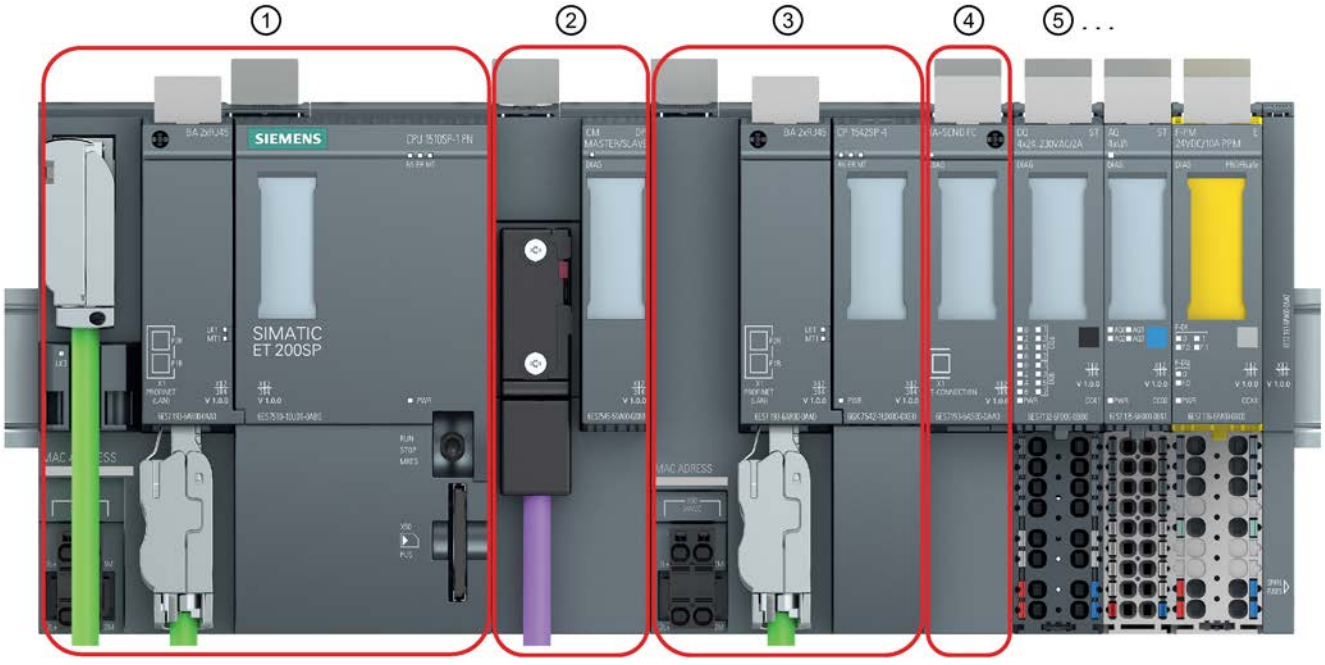
Slot rules

The CPU always occupies slot 1. In an ET 200SP you can plug in up to three of the following modules in slots 1 ... 4 (see figure) to the right of the CPU:

- CMs
- CPs
- BusAdapter Send

Of these three modules, up to two CP 154xSP-1 modules can be plugged in. These two CPs can be of the same type or different.



① Slot 1 - only permitted for the CPU.

② Slot 2 - for CM / CP / BusAdapter Send *
If you use a PROFIBUS CM, you must plug this in directly beside the CPU in slot 1.

③ Slot 3 - for CM / CP / BusAdapter Send *

④ Slot 4 - for CM / CP / BusAdapter Send *

⑤ Slot 5 ff for IO modules

* If you use a BusAdapter Send, this must be plugged in to the slot directly beside the IO modules.

Figure 3-1 Slots of the ET 200SP

Installation on a DIN rail

Note

Protecting the modules from slipping on the DIN rail

If you install the modules in an area with mechanical load, use suitable clamping devices at both ends of the device group to secure the modules on the DIN rail, e.g. Siemens and retainer 8WA1808.

The end retainers prevent the modules separating under mechanical load.

When using the device in the areas of application ATEX or IECEx, note the information on the DIN rai in section Notes on use in hazardous areas (Page 29).

The ET 200SP system is suitable for installation on a mounting rail according to EN 60715 (35 × 7.5 mm or 35 × 15 mm)

1. Hang the CPU / the interface module on the mounting rail.
2. Tilt the CPU / the interface module to the back until the mounting rail release audibly locks in place.
3. Hang the CP to the right next to the CPU.
4. Tilt the CP to the back until the mounting rail release audibly locks in place.
5. Move the CP to the left until it audibly locks in place in the CPU.
6. Mount the other base units and modules accordingly.

   See manual /2/ (Page 117) for information on this.

Plugging in the bus adapter

NOTICE
Touching the plug-in contacts
Do not touch the plug-in contacts when no bus adapter is plugged in.

1. Connect the appropriate cable to the bus adapter if you use a bus adapter with optical or direct electrical or optical connection (without plug).

2. Plug the bus adapter into the slot of the CP.

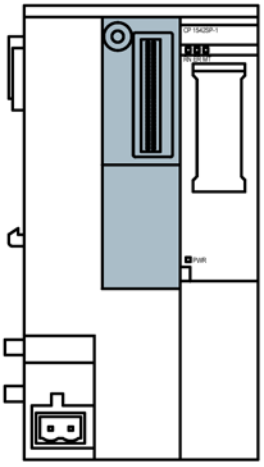


Figure 3-2 Front of the CP, the slot for the bus adapter is marked gray.

3. Screw the bus adapter to the CP.

   The securing screw is located at the top left on the front of the bus adapter.

   To do this use a screwdriver with 3 to 3.5 mm blade width or a suitable Torx screwdriver (T15).

   The maximum tightening torque is 0.25 Nm.

4. Plug the connector of the connecting cable into the socket of the bus adapter if you use a bus adapter with plug.

For information on plugging in the bus adapter and fitting cables see also the manual /2/ (Page 117).

Removal from the DIN rail

Follow the steps below to remove a CP from the DIN rail:

1. Turn off the power supply to the entire station including the CP and CPU.
2. Activate the mounting rail release of the modules to be moved (CPU, CPs) and move them parallel to the left until they are released from the remaining module group (free space approx. 16 mm).

   Press the locking slide marked "PUSH" on the top of a module down to be able to move the module in the DIN rail.
3. Activate the mounting rail release on the CP and move it to the right until it is released from the CPU (free space approx. 8 mm).
4. While holding the mounting rail release on the CP, swing the CP out of the mounting rail.

3.3 Connecting the CP

Order of the work

NOTICE
Connection only with power off Connect the CP only when the power is off. Refer to the information in the system manual, see /2/ (Page 117).

The bus adapter is already connected to the relevant cable, see section Installing the CP (Page 32).

1. Connect the external power supply to the terminal block of connector X80.

   Use the same power supply as the CPU.

2. Turn the power supply on only after the CP has been completely wired and connected.

Power supply at connector X80

You will find the location of the connector X80 four the power supply to the CP in section Power supply (Page 26). There, you will also find notes on reverse polarity protection..

The 2-terminal plug-in terminal block has the following pin assignment for the socket:

Terminal	Assignment
1L+ / 2L+	24 VDC
1M / 2M	Ground

The two terminals 1L+/L2+ and 1M/2m of the terminal block are each bridged internally so that you can connect either a single or a redundant power supply.

Connectable cable cross-section

- Without wire end ferrule 0.2 .. 2.5 mm^2 / AWG 24 .. 13
- With wire end ferrule 0.25 .. 1.5 mm^2 / AWG 24 .. 16
- With TWIN wire end ferrule: 0.5 .. 1.0 mm^2 / AWG 20 .. 17

You will find information about the power consumption and further technical details of the connectors in section Technical specifications (Page 107).

Configuration and operation 4

4.1 Security recommendations

Keep to the following Security recommendations to prevent unauthorized access to the system.

Note

Security functions of the CP types

Depending on the supported function - the following notes do not apply to every CP type described in this manual.

General

- You should make regular checks to make sure that the device meets these recommendations and other internal security guidelines if applicable.
- Evaluate your plant as a whole in terms of security. Use a cell protection concept with suitable products.
- Do not connect the device directly to the Internet. Operate the device within a protected network area.
- Keep the firmware up to date. Check regularly for security updates of the firmware and use them.
- Check regularly for new features on the Siemens Internet pages.
  - Here you will find information on network security:

    Link: (http://www.siemens.com/industrialsecurity)
  - Here you will find information on Industrial Ethernet security:

    Link: (http://w3.siemens.com/mcms/industrial-communication/en/ie/industrial-ethernet-security/Seiten/industrial-security.aspx)
  - You will find an introduction to the topic of industrial security in the following publication:

    Link: (http://w3app.siemens.com/mcms/infocenter/dokumentencenter/sc/ic/InfocenterLanguagePacks/Netzwerksicherheit/6ZB5530-1AP02-0BA4_BR_Network_Security_en_112015.pdf)

Physical access

Restrict physical access to the device to qualified personnel.

Network attachment

Do not connect the PC directly to the Internet. If a connection from the CP to the Internet is required, arrange for suitable protection before the CP, for example a SCALANCE S with firewall or use the CP 1543SP-1.

Security functions of the product

Use the options for security settings in the configuration of the product. These includes among others:

- Protection levels

  Configure a protection level of the CPU.

  You will find information on this in the information system of STEP 7.

- Disabling the bus adapter ports

  In the configuration disable a port of the bus adapter being used that is not required.

- Security function of the communication
  - Enable the Security functions of the CP and set up the firewall.

    If you connect to public networks, you should use the firewall. Think about the services you want to allow access to the station via public networks. By using the "bandwidth limitation" of the firewall, you can restrict the possibility of flooding and DoS attacks.
  - Use the secure protocol variants NTP (secure) and SNMPv3.
  - Use the Security functions of the telecontrol protocols. e.g. the DNP3 Security options.
  - Use the secure Open User Communication (Secure OUC) via the appropriate program blocks.
  - Leave access to the Web server of the CPU (CPU configuration) and to the Web server of the CP disabled.

- Protection of the passwords for access to program blocks

  Protect the passwords stored in data blocks for the program blocks from being viewed. You will find information on the procedure in the STEP 7 information system in the topic "Know-how protection".

- Logging function

  Enable the function in the Security configuration and check the logged events regularly for unauthorized access.

Passwords

- Define rules for the use of devices and assignment of passwords.
- Regularly update the passwords to increase security.
- Only use passwords with a high password strength. Avoid weak passwords for example "password1", "123456789" or similar.

- Make sure that all passwords are protected and inaccessible to unauthorized personnel.

  See also the preceding section for information on this.
- Do not use one password for different users and systems.

Protocols

Secure and non-secure protocols

- Only activate protocols that you require to use the system.
- Use secure protocols when access to the device is not prevented by physical protection measures.

  The NTP protocol provides a secure alternative with NTP (secure).

Table: Meaning of the column titles and entries

The following table provides you with an overview of the open ports on this device.

- **Protocol / function**

  Protocols that the device supports.
- **Port number (protocol)**

  Port number assigned to the protocol.
- **Default of the port**
  - Open

    The port is open at the start of the configuration.
  - Closed

    The port is closed at the start of the configuration.
- **Port status**
  - Open

    The port is always open and cannot be closed.
  - Open according to configuration

    The port is open if it has been configured.
  - Open (login, when configured)

    As default the port is open. After configuring the port, the communications partner needs to log in.
  - Closed after configuration

    The port is closed because the CP is always client for this service.
- **Authentication**

  Specifies whether or not the protocol authenticates the communications partner during access.

Protocol / function	Port number (protocol)	Default of the port	Port status	Authentication
DHCP	68 (UDP)	Closed	Open after configuration (while the CP obtains a new address)	No
S7 and online connections	102 (TCP)	Open	Open after configuration	No
Online diagnostics (CP 1543SP-1)	8448 (TCP)	Closed	Open after configuration	No
DNP3 listener port	20000 (TCP/UDP) can be set	Closed	Open after configuration	Yes, when Security is enabled.
IEC listener port	2404 (TCP) can be set	Closed	Open after configuration	No
SMTP	25 (TCP) can be set	Closed	Closed after configuration	No
SSL/TLS	587 (TCP) can be set	Closed	Closed after configuration	No
NTP	123 (TCP)	Closed	Closed after configuration	No
HTTP	80 (TCP)	Closed	Open after configuration	Yes
HTTPS	443 (TCP)	Closed	Open after configuration	Yes
SNMP	161 (UDP)	Open	Open after configuration	Yes (with SNMPv3)

4.2 Configuration in STEP 7

Configuration in STEP 7

You configure the modules and networks in SIMATIC STEP 7. You will find the required version in the section Software requirements (Page 20). You can configure a maximum of two CP 154xSP-1 for an ET 200SP.

You will find comprehensive information on configuration in the Information system of STEP 7 and in the following sections.

Overview of configuration of the CP

Follow the steps below when configuring:

1. Create a STEP 7 project.
2. Insert the required SIMATIC stations.
3. Insert the CPs and the required input and output modules in the stations.
4. Create an Ethernet network.
5. Connect the stations to the Ethernet subnet.
6. Configure the inserted CPs.

7. Optional: Create the program blocks for the Open User Communication.
8. Save and compile the project.

Here you will find information on individual parameter groups in the following sections. You will find information on parameters not described in this manual in the information system of STEP 7.

Details on the parameters of the telecontrol communication of the CP 1542SP-1 IRC can be found in the section Telecontrol communication (CP 1542SP-1 IRC) (Page 44).

Details on the parameters of the security functions can be found in the section Security configuration(CP 1543SP-1) (Page 84).

Loading and saving the configuration data

When you load the station, the project data of the station including the configuration data of the CP is stored on the CPU. You will find information on loading the station in the STEP 7 information system.

4.3 Ethernet interface

4.3.1 IPv6

Configuring the Ethernet addresses

You will find information on configuration in the information system of STEP 7.

Note

Communication via IPv6

If you want to use IPv6 addresses and connect the CP to the Internet, make sure that the router connected to the Internet and the providers of the Internet services used (e.g. e-mail) also support IPv6 addresses.

4.3.2 Time-of-day synchronization

Procedure for time-of-day synchronization

You will find the parameter group for time-of-day synchronization under the Ethernet interface.

If the Security functions are enabled, the parameter group is displayed below "Security".

Note

Recommendation for setting the time

Synchronization with a external clock at intervals of approximately 10 seconds is recommended. This achieves as small a deviation as possible between the internal time and the absolute time.

Note

No forwarding of the time of day with NTP / NTP (secure)

Both the CPU and CP can have the time of day synchronized using NTP. If you enable time-of-day synchronization for both modules, it is recommended that you use the same NTP server to retain a consistent time-of-day within the station.

The CP supports the following time-of-day synchronization method:

- **NTP**

  You configure the addresses of the NTP server(s), the synchronization interval and the "Accept time from non-synchronized NTP servers" option

CP 1542SP-1 IRC

With telecontrol communication enabled (parameter group "Communication types" the time of day is normally taken from the partner:

- **Time from partner**

  The CP sets its clock using the time of day that it receives in frames from the communications partner.

The CP 1542SP-1 IRC provides the CPU with the option of it taking its time from the CP using a PLC tag. See section Auto-Hotspot for information on this.

Note

No time-of-day synchronization of the CPU when the time is taken from the CP

When the CPU takes the time from the CP using a PLC tag, disable the CPU's own time-of-day synchronization.

CP 1543SP-1

Note

Ensuring a valid time of day

If you use security functions, a valid time of day is extremely important. It is recommended to use the NTP (secure)NTP (secure) method.

The CP supports the following time-of-day synchronization methods:

- **NTP**
- **NTP (secure)**

  The secure method NTP (secure) uses authentication with symmetrical keys according to the hash algorithms MD5 or SHA-1.

  In the global security settings, you can create and manage additional NTP servers also of the type NTP (secure).

See also

Communication with the CPU (Page 55)

4.4 SNMP

"SNMP" parameter group

- "**Enable SNMP**" parameter group

  Releases the function of the SNMP agent on the CP.

Note

If the security functions are enabled for the CP 1543SP-1 you will find the parameter group "SNMP" in "Security".

Scope of performance of the CPs

The CPs support the following SNMP version:

- **CP 1542SP-1, CP 1542SP-1 IRC**
  - SNMPv1
- **CP 1543SP-1**
  - SNMPv1
  - SNMPv3 (with activated Security functions)

Traps are not supported by the CP.

You will find detailed information about the supported functions in the section Diagnostics with SNMP (Page 98).

4.5 Telecontrol communication (CP 1542SP-1 IRC)

4.5.1 Configuration

Data points for telecontrol communication

No program blocks need to be programmed for the CP 1542SP-1 IRC to transfer user data between the station and communications partner.

The data areas in the memory of the CPU intended for communication with the partner are configured data point-related on the CP. Each data point is linked to a PLC tag or element in a data block on the CPU.

The individual data points can be transferred to the control system and processed there.

To transfer the process data and for some options of the parameter groups "Partner stations" and "Communication with the CPU" configured data points are required.

For further information, refer to section Data point configuration (Page 56).

4.5.2 Communication types

In this parameter group, you enable the communication types you want to use for the particular CP..

To minimize the risk of unauthorized access to the station via Ethernet, you need to enable the communications services that the CP will execute individually.

The Open User Communication does not exist in the parameter group because these communications services are not configured but programmed using program blocks.

The parameter group does not exist for the CP 1542SP-1, since the communications services supported by this CP are always enabled.

"Communication types" parameter group

- **Enable telecontrol communication**

  Only with the CP 1542SP-1 IRC

  Enables telecontrol communication on the CP. The following protocols can be used as alternatives:

  – **TeleControl Basic**

    Enables communication with the telecontrol server

  – **DNP3**

    Enables communication with up to four DNP3 masters

  – **IEC 60870-5-104**

    Enables communication with up to four IEC masters

Note

Full telecontrol functionality only when Security functions are enabled

For the following functions, you need to enable the Security functions:

- Send messages (e-mails) using the telecontrol functionality
- Use of the "TeleControl Basic" protocol (general)
- Use of the DNP3 Security functions
- Use of certificates

Note

Loss of configuration data when changing the telecontrol protocol

If you change the protocol on a configured CP, protocol-specific configuration data is lost, for example, the data point configuration, the partner configuration and the messages (e-mails).

- **Activate online functions**

  Enables access to the CPU for the online functions via the CP (diagnostics, loading project data etc.). If the function is enabled, the engineering station can access the CPU via the CP.

  If the option is disabled, you have no access to the CPU via the CP with the online functions. Online diagnostics of the CPU with a direct connection to the interface of the CPU however remains possible.

- **Enabling S7 communication**

  Enables the functions of S7 communication with a SIMATIC S7 and S7 routing on the CP.

  If you configure S7 connections to the relevant station, and these run via the CP, you will need to enable this option.

4.5.3 Address and authentication information

Address and authentication information for telecontrol communication

Depending on the telecontrol protocol the news, the communications partners of the CP require the following address and authentication information of the CP that needs to be configured for the CP:

- **TeleControl Basic**

  The telecontrol server requires:

  – Project number

  – Station number

  – Telecontrol password (for authentication)

  You will find the parameters in the parameter group "CP idenfication" under "Security".

  – IP address (in the "Ethernet interface“ parameter group)

    Since the CP always establishes the connection to the telecontrol server, the IP address of the CP does not need to be configured in TCSB.

- **DNP3**

  The master requires:

  – Station number (in the "CP identification" parameter group)

  – IP address (in the "Ethernet interface“ parameter group)

  – Port number of the CP

- **IEC**

  The master requires:

  – Station number (in the "CP identification" parameter group)

  – IP address (in the "Ethernet interface“ parameter group)

  – Port number of the CP

Address information required by the CP

You will find information about the address information of the communications partner required by the CP in section Partner stations (Page 50).

4.5.4 Ethernet interface (X1) > Advanced options

Configure the generally available parameters just as for every other Ethernet interface:

- General data (name etc.)
- Addresses and possibly routers

- Port settings
- Access to the Web server

Below you will find only the description of the specific parameters for telecontrol communication.

TCP connection monitoring

The setting made here applies globally to all TCP connections of the CP. Note the option of overwriting the value configured here for individual communications partners, see below.

- **TCP connection monitoring time**

  If there is no data traffic within the connection monitoring time, the CP sends a keepalive to the communications partner.

  Permitted range: 1 ... 65535 s. Default setting: 180

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations", compare section Partner stations (Page 50). The function can only be disabled by entering 0 (zero) for the partners.

- **TCP keepalive monitoring time**

  After sending a keepalive, the CP expects a reply from the communications partner within the keepalive monitoring time. If the CP does not receive a reply within the configured time, it terminates the connection.

  Permitted range: 1 ... 65535 s. Default setting: 10

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations". The function can only be disabled by entering 0 (zero) for the partners.

Transmission settings - TeleControl Basic

- **Connection establishment delay**

  Basic value for the wait time until the next connection establishment following an unsuccessful attempt to establish a connection. After every 3 attempts, the basic value is doubled up to a maximum of 900 s.

  Permitted range: 10 ... 300. Default setting: 10

  Example: The basic value 20 results in the following wait times: 3 x 20 s, 3 x 40 s, 3 x 80 s etc. up to max. 3 x 900 s.

- **Send monitoring time**

  Time (seconds) for the arrival of the acknowledgment from the communications partner (Telecontrol server) after sending spontaneous frames. The time is started after sending an unsolicited frame. If no acknowledgement has been received from the partner when the connection monitoring time elapses, the frame is repeated up to three times. After three unsuccessful attempts, the connection is terminated and re-established.

  Permitted range: 1 ... 65535. Default setting: 5

- **Key exchange interval**

  Here, you enter the interval in hours after which the key is exchanged again between the CP and the communications partner (TCSB V3). The key is a security function of the telecontrol protocol used by the CP and TCSB V3.

  Permitted range: 0 ... 65535. Default setting: 8

  If you enter 0 (zero), the function is disabled.

Transmission settings - DNP3

You will find information on the permitted ranges of the functions and defaults in the tooltips of STEP 7.

- **Disturbance bit**

  The disturbance bit can be used as bit 1.6 (IIN1.6) of the "Internal Indication Bytes" to indicate to the master when the CPU is in STOP mode.

- **Max. time between Select and Operate**
- **Frame repetitions**
- **Connection confirmation**
- **Connection monitoring time**
- **Transfer mode "Unsolicited"**
- **Max. number of unsolicited frames**
- **Monitoring time for unsolicited frames**
- **Buffer for class 1 / 2 / 3 events**

  Here, for each of the three event classes you specify the number of events after which the stored events are sent to the communications partner.

  Permitted range: 1 ... 255.

- **Delay time class 1 / 2 / 3 events**

  Here, for each of the three event classes you specify the maximum time in seconds the events can be stored in the send buffer before they are sent to the communications partner.

  Permitted range: 0 ... 255.

  If you enter 0 (zero), the function is disabled.

You will find details of how the send buffer works (storing and sending events) as well as the options for transferring data in the section Process image, types of transmission, event classes, triggers (Page 62).

Transmission settings - IEC

Note

Settings on the master

When configuring the monitoring times t_1 and t_2 make sure that you make the corresponding settings on the master so that there are no unwanted error messages or connection aborts.

You will find information on the permitted ranges of the functions and defaults in the tooltips of STEP 7.

- **Max. time between Select and Operate**
- **Monitoring time for connection establishment (t_0)**
- **Frame monitoring time (t_1)**

  Monitoring time for the acknowledgement of frames sent by the CP by the communications partner. The monitoring time applies to all frames sent by the CP in I, S and U format.

  If the partner does not send an acknowledgment during the monitoring time, the CP terminates the connection to the partner.

- **Monitoring time for S and U frames (t_2)**

  Monitoring time for the acknowledgment of data frames of the master by the CP.

  After receiving data from the master, the CP acknowledges the received data alternatively:

  – If the CP sends data to the master itself within t_2, it acknowledges the data frames received from the master during t_2 at the same time along with the sent data frame (I format).

  – The CP sends an acknowledgment frame (S format) to the master at the latest when t_2 elapses.

  The value of t_2 should be less than that of t_1.

- **Idle time for test frames (t_3)**

  Monitoring time during which the CP has not received any frames from the master.

  When t_3 elapses, the CP sends a test/control frame (U format) to the master.

  This parameter is intended for longer times without data traffic.

- **Difference between send sequence number N(S) and receive sequence number N(R)**

  Maximum number of unacknowledged data frames (I-APDUs) as maximum difference between send sequence number N(S) and receive sequence number N(R).

  When k is reached and t_1 has not yet elapsed, the CP does not send any frames until all the frames sent have been acknowledged by the master.

  When k is reached and t_1 has elapsed, the TCP connection is terminated.

- **Max. number of unacknowledged data frames**

  Maximum number of received data frames (I-APDUs), after which the oldest frame received from the master must be acknowledged.

Acknowledgment mechanism for the IEC protocol

With each sent data frame, the CP sends a continuous send sequence number. The data frame remains initially stored in the send buffer.

When it receives the data frame, the master sends the send sequence number from this or (if several frames are received) the last frame as an acknowledgement to the CP. The CP saves the send sequence number returned by the master as a receive sequence number and uses it as an acknowledgement.

Frames whose send sequence number is equal to or lower than the current receive sequence number are evaluated as having been successfully transferred and are deleted from the send buffer of the CP.

Recommendations of the specification:

- w should not be higher than 2/3 of k.
- Recommended value for k: 12
- Recommended value for w: 8

Port [X1 Px]

If you do not want to use both ports of the bus adapter, you can disable one of the two ports.

You will find information on the other parameters in the information system of STEP 7.

4.5.5 Partner stations

4.5.5.1 Partner configuration

The STEP 7 configuration of the communications partners of the CP (telecontrol server, DNP3 or IEC master) and the connections to the partners is not possible and not necessary.

Address information of the communications partners

For the communications partners of the CP, the following information is required during the configuration of the CP:

- TeleControl Basic
  - Partner IP address

    See section Auto-Hotspot for information on this.
  - Partner port (port number of the listener port of TCSB)

- DNP3 / IEC
  - Master station address

    Station address specified on the master

    With the IEC protocol the Master station address is not evaluated.
  - Partner IP address

    IP address of the master

    For the addressing of redundant partners, see section Addressing of single and redundant communications partners (Page 53).
  - Partner port

"Partner stations" (only with DNP3 / IEC)

- **Listener port**

  CP's own listener port

"Telecontrol server" / "Partner"

- **Activate partner**

  Enable the option to be able to use the partners configured later for the communication.

  In "TeleControl Basic" the telecontrol server is always enabled as a partner.
- **Partner number**

  The partner number is always signed by STEP 7.
- **Station address / Master station address**

  The station address of the telecontrol server is assigned automatically by the system if telecontrol communication is enabled.

"Connection to partner"

You will find information on the permitted ranges and defaults in the tooltips of STEP 7.

- **Partner IP address**

  IP address or host name (FQDN) of the telecontrol server. This can, for example, also be the FQDN of a DynDNS service.
- **Connection monitoring**

  When the function is enabled, the connection to the communications partner is monitored by sending keepalive frames.

  The TCP connection monitoring time is set for all TCP connections of the CP in the parameter group of the Ethernet interface, see also the section Ethernet interface (X1) > Advanced options (Page 46). These settings apply to all TCP connections of the CP.

  Here in the parameter group "Partner stations" the globally set monitoring time can also be set separately for this partner. The value set here overwrites the global value for this partner that was set in the "Ethernet interface (X1) > Advanced options > TCP connection monitoring" parameter group.

- **TCP connection monitoring time**

  Only with TCP: If there is no data traffic within the connection monitoring time, the CP sends a keepalive to the communications partner.

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations" and this overwrites the global value for this partner that was set in the parameter group "Ethernet interface".

  The function can be disabled by entering 0 (zero) for the individual partners.

- **TCP keepalive monitoring time**

  Only with TCP: After sending a keepalive, the CP expects a reply from the communications partner within the keepalive monitoring time. If the CP does not receive a reply within the configured time, it terminates the connection.

  The monitoring time is configured for the Ethernet interface as the default for all TCP connections. The default value can be adapted individually for each connection in "Partner stations".

  The function can be disabled by entering 0 (zero) for the individual partners.

- **Connection mode**

  In the "Permanent" connection mode, there is a permanent connection to the communications partner.

- **Connection establishment**

  Specifies the communications partner that establishes the connection (always the CP).

- **Partner port**

  Port number of the communications partner

"Connection to redundant partner" (only with DNP3 / IEC)

- **Redundancy mode**

  Enable the option if the communications partner is a redundant master.

For information on the other parameters see above.

"Advanced settings"

- **Partner monitoring time (only with DNP3 / IEC)**

  If the CP does not receive a sign of life from the communications partner within the configured time, the CP interprets this as a fault/error on the partner. If you enter 0, the function is deactivated.

- **Report partner status (connection to partner)**

  If the function is enabled, the CP signals the status of the connection to the communications partner to the CPU.

  – Bit 0 of "PLC tag for partner status" (data type WORD) is set to 1 if the partner can be reached.

  – Bit 1 is set to 1 if all the paths to the remote partner are OK (useful with redundant paths).

  – Bits 2-3 indicate the status of the send buffer (frame memory).
  The following values are possible:

  - 0: Send buffer OK

  - 1: Send buffer threatening to overflow (more than 80 % full).

  - 3: Send buffer has overflowed (fill level 100 % reached).

  As soon as the fill level drops below 50%, bits 2 and 3 are reset to 0.

  Bits 4 to 15 of the PLC tags are not used and do not need to be evaluated in the program.

DNP3-specific settings

- **DNP3 level**

  DNP3 conformity level supported by the partner.

- **Event transmission mode**

  Mode with which the frames in the send buffer of the CP (events) are transferred:

  – Chronological transfer of individual frames

  or

  – Block-by-block transfer of the frames of a data point

4.5.5.2 Addressing of single and redundant communications partners

Addressing the telecontrol server

- **Addressing of a single telecontrol server**

  Configure the IP address of the telecontrol server or the DSL router when connecting via the Internet.

  When using a DynDNS service with the host name (FQDN) can be specified.

- **Addressing of the TCSB redundancy group by the stations using one IP address**

  In the LAN in the master station to which the TCSB server PCs and the DSL router (e.g. SCALANCE M) are connected, the Network Load Balancing (NLB) of the computer operating system will assign a common virtual IP address to the two server PCs.

  This IP address is configured depending on the network setup:

  – If a CP without a DSL router is connected, the virtual address assigned by the NLB must be configured in the CP as the IP address of the telecontrol server.

  – If a DSL router is used, only one IP address will be configured to address the redundant telecontrol server in the stations, the public address of the DSL router.

    Set the port forwarding (TCP) on the DSL router so that the public IP address (external network) is led to the virtual IP address of the TCSB server PCs (internal network). Only the public IP address is reachable from the Internet. The station does not therefore receive any information telling it which of the two computers of the redundancy group it is connected to.

Addressing redundant DNP3 or IEC masters

For each master specify the master station address and the IP address being used.

4.5.5.3 Partner for inter-station communication

Only when using the "TeleControl Basic" protocol

Inter-station communication

In this table, you specify the S7 stations and CPs with which the current station will use inter-station communication. Connections for inter-station communication run via the telecontrol server.

Partner

The partner number is assigned by the system. It is required during data point configuration to assign data points to their communications partners.

For inter-station communication, the partner is addressed with the parameters "Project", "Station" and "Slot".

Project

Here, enter the project number of the CP in the partner station. (Parameter group "Security > CP identification" on the partner)

Station

Here, enter the station number of the CP in the partner station. (Parameter group "Security > CP identification" on the partner)

Slot

Here, enter the slot number of the CP in the partner station via which the connection will be established.

Frame memory

When enabled, the frames are stored in the send buffer (frame memory) of the CP if the connection is disturbed. Note that the capacity of the frame memory is shared by all communications partners.

If the option is disabled, frames for events are stored in the image memory of the CP; in other words if there are problems on the connection older values are overwritten by new values.

Access ID

The access ID displayed here is formed from the hexadecimal values of project number, station number and slot. The parameter of the type DWORD is allocated as follows:

- Bits 0 - 7: Slot
- Bits 8 - 20: Station number
- Bits 21 - 31: Project number

4.5.6 Communication with the CPU

Communication with the CPU

Using the first three parameters you specify the CPU access by the CP in the CPU scan cycle. You will find the structure of the CPU scan cycle in the section Read cycle (Page 69).

The fourth parameter "Frame memory size" decides the size of the send buffer on the CP for frames of data points that are configured as an event.

- **Cycle pause time**

  Wait time between two scan cycles of the CPU memory area

- **Max. number of write jobs**

  Maximum number of write jobs to the CPU memory area within a CPU scan cycle

- **Max. number of read jobs**

  Maximum number of low-priority read jobs from the CPU memory area within a CPU scan cycle.

- **Frame memory size**

  Here, you set the size of the frame memory for events (send buffer).

  The size of the frame memory is divided equally among all configured communications partners. You will find the size of the frame memory in the section Configuration limits and performance data (Page 17).

  You will find details of how the send buffer works (storing and sending events) as well as the options for transferring data in the section Process image, types of transmission, event classes, triggers (Page 62).

Watchdog bit

- **CP monitoring**

  Via the watchdog bit the CPU can be informed of the status of the telecontrol communication of the CP.

CP time of day

- **CP time to CPU**

  Using this function, the CP can make its time of day available to the CPU.

  You will find details in the STEP 7 information system.

4.5.7 Data point configuration

4.5.7.1 Configuring the data points

Creating data points and messages

You configure the data points and messages in STEP 7 in the editor for the data point and message configuration. You can find this using the project tree:

Project > directory of the relevant station > Local modules > CP

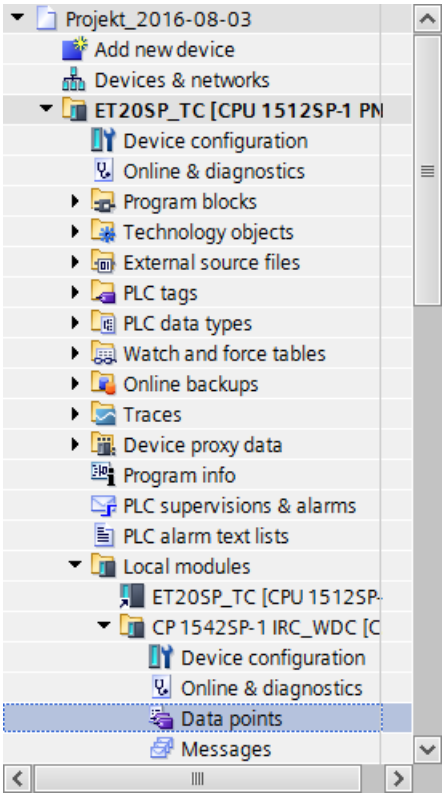

Figure 4-1 Open the data point and message editor

Open the data point and message editor by double-clicking on the entry "Data points" or "Messages".

Requirement for data points: PLC tags and/or data blocks (DBs)

PLC tags or DBs must first be created in the CPU program to allow configuration of the data points.

The PLC tags for data point configuration can be created in the standard tag table or in a user-defined tag table.

Remember the maximum possible number of PLC tags the can be used for data point configuration in the section Configuration limits and performance data (Page 17).

Access to the memory areas of the CPU

The values of the PLC tags or DBs referenced by the data points are read and transferred to the communications partner by the CP. Data received from the communications partner is written by the CP to the CPU via the PLC tags or DBs.

The address ranges, formats and S7 data types of the PLC tags that are compatible with the protocol-specific data point types of the CP can be found in the section Datapoint types (Page 58).

Properties of the data points

All PLC tags intended to be used for data point configuration must have the attribute "Visible in HMI".

Note

Length of the data point names

If you want to use the maximum number of configurable data points, assign data point names, CP names and station names that are as short as possible.

Character set for data point names

When you create a data point, a preset name "DataPoint_n" is adopted. In the data point table and in the "General" tab of the data point you can change the name of the data point.

When assigning names only ASCII characters from the band 0x20 ... 0x7e may be used with the exceptions listed below.

The following characters are forbidden since they do not adhere to the syntax rules of TCSB for OPC items:

Non-permitted characters: . ' [ ] / \ |
period, apostrophe, square brackets, slash, back slash, vertical line (pipe)

4.5.7.2 Datapoint types

Supported data point types of the CP 1542SP-1 IRC

During the configuration of the user data to be transferred by the CP 1542SP-1 IRC, each data point is assigned a protocol-specific data point type. The data point types along with the compatible S7 data types are listed below. They are grouped according to format (memory requirements).

TeleControl Basic: Data point types

Table 4- 1 Supported data point types and compatible S7 data types

Format (memory requirements)	Data point type	S7 data types	Address area
Bit	Digital input	Bool	I, Q, M, DB
	Digital output	Bool	Q, M, DB
	Command output	Bool	Q, M, DB
Byte	Digital input	Byte, USInt	I, Q, M, DB
	Digital output	Byte, USInt	Q, M, DB
Integer with sign (16 bits)	Analog input	Int	I, Q, M, DB
	Analog output	Int	Q, M, DB
Counter (16 bits)	Counter input	Word, UInt	I, Q, M, DB
Integer with sign (32 bits)	Analog input	DInt	Q, M, DB
	Analog output	DInt	Q, M, DB
Counter (32 bits)	Counter input	UDInt, DWord	I, Q, M, DB
Floating-point number with sign (32 bits)	Analog input	Real	Q, M, DB
	Analog output	Real	Q, M, DB
Floating-point number with sign (64 bits)	Analog input	LReal	Q, M, DB
	Analog output	LReal	Q, M, DB
Block of data (1 .. 64 bytes)	Data	ARRAY [1)]	DB
	Data	ARRAY [1)]	DB

[1)] For the possible formats of the ARRAY data type, refer to the following section.

Block of data (ARRAY)

With the ARRAY data type, contiguous memory areas up to a size of 64 bytes can be transferred. The following S7 data types are compatible components of ARRAY:

- Byte, USInt (total of up to 64 per data block)
- Int, UInt, Word (total of up to 32 per data block)
- DInt, UDInt, DWord (total of up to 16 per data block)

Time stamp in UTC format

Time stamps are transferred in UTC format (48 bits) and contain the time difference in milliseconds since 01.01.1970.

DNP3: Data point types

Table 4- 2 Supported data point types, DNP3 object groups, variants and compatible S7 data types

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types	Operand area
Bit	Binary Input	**1** [1, 2]	in	Bool	I, Q, M, DB
	Binary Input Event	**2** [1, 2]	in	Bool	I, Q, M, DB
	Binary Output [1]	**10** [2]	out		
	Binary Output Event [1]	**11** [1, 2]	out		
	Binary Command	**12** [1]	out	Bool	Q, M, DB
Integer (16 bits)	Counter Static	**20** [2]	in	UInt, Word	I, Q, M, DB
	Frozen Counter [2]	**21** [2, 6]	in		
	Counter Event	**22** [2, 6]	in	UInt, Word	I, Q, M, DB
	Frozen Counter Event [3]	**23** [2, 6]	in		
	Analog Input	**30** [2]	in	Int	I, Q, M, DB
	Analog Input Event	**32** [2]	in	Int	I, Q, M, DB
	Analog Output Status [4]	**40** [2]	out		
	Analog Output	**41** [2]	out	Int	Q, M, DB
	Analog Output Event [4]	**42** [2, 4]	out		
Integer (32 bits)	Counter Static	**20** [1]	in	UDInt, DWord	I, Q, M, DB
	Frozen Counter [2]	**21** [1, 5]	in		
	Counter Event	**22** [1, 5]	in	UDInt, DWord	I, Q, M, DB
	Frozen Counter Event [3]	**23** [1, 5]	in		
	Analog Input	**30** [1]	in	DInt	Q, M, DB
	Analog Input Event	**32** [1]	in	DInt	Q, M, DB
	Analog Output Status [4]	**40** [1, 3]	out		
	Analog Output	**41** [1]	out	DInt	Q, M, DB
	Analog Output Event [4]	**42** [1]	out		
Floating-point number (32 bits)	Analog Input	**30** [5]	in	Real	Q, M, DB
	Analog Input Event	**32** [5, 7]	in	Real	Q, M, DB
	Analog Output Status [4]	**40** [3]	out		
	Analog Output	**41** [3]	out	Real	Q, M, DB
	Analog Output Event [4]	**42** [5, 7]	out		
Floating-point number (64 bits)	Analog Input	**30** [6]	in	LReal	Q, M, DB
	Analog Input Event	**32** [6, 8]	in	LReal	Q, M, DB
	Analog Output	**41** [4]	out	LReal	Q, M, DB
	Analog Output Event [4]	**42** [6, 8]	out		
Block of data (1...64 bytes) [5]	Octet String / Octet String Output	**110** [-]	in, out	[5]	DB
	Octet String Event [5]	**111** [-]	in, out	[5]	DB

Format (memory requirements)	Data point type	DNP3 object group [variations]	Direction	S7 data types	Operand area

[1] This object group can be configured in the Data point editor of STEP 7 using the substitute object group 12.

[2] This object group can be configured in the Data point editor of STEP 7 using the substitute object group 20.

[3] This object group can be configured in the Data point editor of STEP 7 using the substitute object group 22.

[4] This object group can be configured in the Data point editor of STEP 7 using the substitute object group 41.

[5] With these data point types, contiguous memory areas up to a size of 64 bytes can be transferred. All S7 data types with a size between 1 and 64 bytes are compatible.

Explanation of the table footnotes [1], [2], [3], [4]: Configuring data points using substitute object groups

The initial data point types of the following object groups can be configured using the substitute object groups listed above:

- 10 [2]
- 11 [1, 2]
- 21 [1, 2, 5, 6]
- 23 [1, 2, 5, 6]
- 40 [1, 2, 3]
- 42 [1, 2, 4, 5, 6, 7, 8]

To configure the DNP3 CP, use the specified substitute object group.

Assign each data point on the master using the configurable data point index in STEP 7. The data point of the DNP3 CP is then assigned to the corresponding data point on the master.

Example of configuring the data point Binary Output (10 [2])
The data point is configured as follows:
On the DNP3 CP as Binary Command (12 [1])
On the master as Binary Output (10 [2])

With the data point types Binary Output Event (11) and Analog Output Event (42) you also need to enable mirroring back, refer to the next section.

Configuration of the mirroring back for output events (object groups 11 and 42)

You first create the data point types Binary Output Event (object group 11) and Analog Output Event (object group 42) as described above as data points of the object groups 12 or 41.

The local values of these two object groups can be monitored for change and the changes transferred to the master. Changing a local value can, for example, be caused by manual operator input on site.

To allow the value resulting from local events or interventions to be transferred to the master, the data point in question requires a channel for mirroring back. You configure this mirroring back function using the "Value monitoring" option in data point configuration, General tab.

Remember that to use the mirror back function, you need to interconnect the local values in the controller with the relevant PLC tag of the data point.

Time stamp of the DNP3 CP in UTC format

Time stamps are transferred in UTC format (48 bits) and contain milliseconds since 01.01.1970.

IEC: Data point types

Table 4- 3 Supported data point types, IEC types and compatible S7 data types

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
Bit	Single point information	<1>	in	Bool	I, Q, M, DB
	Single point information with time tag [1]	<30>	in	Bool	I, Q, M, DB
	Single command	<45>	out	Bool	Q, M, DB
Byte	Step position information	<5>	in	Byte, USInt	I, Q, M, DB
	Step position information with time tag [1]	<32>	in	Byte, USInt	I, Q, M, DB
Integer (16 bits)	Measured value, normalized value	<9>	in	Int	I, Q, M, DB
	Measured value, normalized value with time tag [1]	<34>	in	Int	I, Q, M, DB
	Measured value, scaled value	<11>	in	Int	I, Q, M, DB
	Measured value, scaled value with time tag [1]	<35>	in	Int	I, Q, M, DB
	Set point command, normalised value	<48>	out	Int	Q, M, DB
	Set point command, scaled value	<49>	out	Int	Q, M, DB
Integer (32 bits)	Bitstring of 32 bits	<7>	in	UDInt, DWord	I, Q, M, DB
	Bitstring of 32 bits with time tag CP56Time2a [1]	<33>	in	UDInt, DWord	I, Q, M, DB
	Integrated totals	<15>	in	UDInt, DWord	I, Q, M, DB
	Integrated totals with time tag CP56Time2a [1]	<37>	in	UDInt, DWord	I, Q, M, DB
	Bitstring of 32 bits	<51>	out	UDInt, DWord	Q, M, DB
Floating-point number (32 bits)	Measured value, short floating point number	<13>	in	Real	Q, M, DB
	Measured value, short floating point number with time tag CP56Time2a [1]	<36>	in	Real	Q, M, DB
	Set point command, short floating point number	<50>	out	Real	Q, M, DB
Block of data (1...2 Bit) [2]	Double-point information	<3>	in	[2]	DB
	Double-point information with time tag CP56Time2a [1]	<31>	in	[2]	DB
	Double command	<46>	out	[2]	DB
	Regulating step command	<47>	out	[2]	DB

Format (memory requirements)	Data point type	IEC type	Direction	S7 data types	Operand area
Block of data (1...32 Bit) [3]	Bitstring of 32 bits [3]	<7>	in	[3]	DB
	Bitstring of 32 bits with time tag CP56Time2a [1] [3]	<33>	in	[3]	DB
	Bitstring of 32 bits [3]	<51>	out	[3]	DB

[1] For the format of the time stamp, see the following section.

[2] For these data point types, create a data block with an array of precisely 2 bool.

[3] With these data point types, contiguous memory areas up to a size of 32 bits can be transferred. Only the S7 Bool data type is compatible.

Time stamp with the IEC CP

IEC CP time stamps are transferred according to the IEC specification in the "CP56Time2a" format. Note that in the frames only the first 3 bytes for milliseconds and minutes are transferred.

4.5.7.3 Process image, types of transmission, event classes, triggers

Saving the data point values

The values of data points are stored in the image memory of the CP and transferred only when queried by the communications partner.

Events are also stored in the send buffer and can be transferred unsolicited.

Data points are configured as a static value or as an event using the "Type of transmission" parameter (see below):

- **Static value (no event)**

  Static values are entered in the image memory (process image of the CP).

  Static values correspond to the following classes:

  – DNP3: Class 0

  – IEC: Class 2

- **Event**

  The values of data points configured as an event are also entered in the image memory of the CP. The value of the event is sent unsolicited to the communications partner if this function is enabled by the master.

  The values of events are also entered in the send buffer of the CP.

  Events correspond to the following classes:

  – DNP3: Class 1 / 2 / 3

  – IEC: Class 1

The image memory, the process image of the CP

All the current values of the configured data points are stored in the image memory. New values of a data point overwrite the last stored value in the image memory.

The values are sent after being queried by the communications partner. Refer to "Transfer after call" in the section "Types of transmission".

The send buffer

The send buffer of the CP is the memory for the individual values of data points that are configured as an event. The maximum number is divided equally among all configured and enabled communications partners. You configure the size of the send buffer with the parameter "Frame memory size", see the section Communication with the CPU (Page 55).

If the connection to a communications partner is interrupted, the individual values of the events are retained in the buffer. When the connection returns, the buffered values are sent. The frame memory operates chronologically; in other words, the oldest frames are sent first (FIFO principle).

If a frame was transferred to the communications partner, the transferred value is deleted from the send buffer.

If frames cannot be transferred for a longer period of time and the send buffer is threatening to overflow, the response is as follows depending on the protocol being used:

- TeleControl Basic

  The forced image mode

  If the send buffer reaches a fill level of 80%, the CP changes to the forced image mode. New values from data points configured as an event are no longer added to the send buffer but rather they overwrite older existing values in the image memory.

  When the connection to the communications partner returns, the CP changes back to the send buffer mode if the fill level of the send buffer has fallen below 50%.

- DNP3 / IEC

  If a send buffer fill level of 100% is reached, the oldest values are overwritten.

  When using the DNP3 protocol, additional conditions for sending the events can be specified:

  – A maximum number of events in the send buffer, configurable for each event class.

  – A configurable maximum storage period for events in the send buffer.

Types of transmission

The following types of transmission are possible:

- **Transfer after call (class 0)**

  The current value of the data point is entered in the image memory of the CP. New values of a data point overwrite the last stored value in the image memory.

  After being called by the communications partner, the current value at the time is transferred.

- **Triggered (events)**

  The values of data points configured as an event are entered in the image memory and also in the send buffer of the CP.

  The values of events are saved in the following situations:

  – The configured trigger conditions are fulfilled (data point configuration > "Trigger" tab, see below)

  – The value of a status bit of the status of the identifiers of the data point changes see also the section Status IDs of the data points (Page 66).

Event classes with the "Triggered" type of transmission

Depending on the protocol used the following event classes are available:

- **TeleControl Basic**
  - **Every value triggered**

    Each value change is entered in the send buffer in chronological order.

  - **Current value triggered**

    Only the last, current value is entered in the send buffer. It overwrites the value stored there previously.

- **DNP3**

  The evaluation of the following classification must be handled by the master.

  - **Event class 1**

    Class according to DNP3 protocol: Class 1

    Each value change is entered in the send buffer in chronological order.

  - **Event class 2**

    Class according to DNP3 protocol: Class 2

    Each value change is entered in the send buffer in chronological order.

  - **Event class 3**

    Class according to DNP3 protocol: Class 3

    Only the current value at the time the trigger condition is met is entered in the send buffer and overwrites the last value stored there.

- **IEC**

  Both of the following event classes correspond to the user data class 1 of the IEC protocol

  – **Every value triggered**

    Each value change is entered in the send buffer in chronological order.

  – **Current value triggered**

    Only the current value at the time the trigger condition is met is entered in the send buffer and overwrites the last value stored there.

Trigger

Trigger types

Various trigger types are available for event-driven transfer:

- **Threshold value trigger**

  The value of the data point is transferred when this reaches a certain threshold. The threshold is calculated as the difference compared with the last stored value, refer to the section Threshold value trigger (Page 71).

- **Time trigger**

  The value of the data point is transferred at configurable intervals or at a specific time of day.

- **Event trigger**

  The value of the data point is transferred when a configurable trigger signal is fired. For the trigger signal, the edge change (0 → 1) of a trigger bit is evaluated that is set by the user program. When necessary, a separate trigger bit can be configured for each data point.

  Resetting the trigger tag in the bit memory area / DB:

  If the memory area of the trigger tag is in the bit memory or in a data block, the trigger tag is reset to zero when the data point value is transferred.

Transmission time of the frame

Whether the value of a data point is transferred to the communications partner immediately after the trigger or after a delay depends on the protocol used and the settings.

- **TeleControl Basic**

  You specify the time of transmission with the parameter "Transmission mode" in the "Trigger" tab of the data point:

– **Unsolicited**

The value is transferred immediately.

– **Conditional spontaneous**

The value is transferred only when one of the following conditions is fulfilled:

- The telecontrol server queries the station.
- The value of another event with the Transmission mode “Unsolicited" is transferred.
- The fill level of the transmission buffer has reached 80% of its maximum capacity.

- **DNP3 / IEC**

The spontaneous transmission in these protocols depends on whether spontaneous sending or asymmetric communication is possible in the network.

4.5.7.4 Status IDs of the data points

Status IDs of data points

The status IDs od the data points listed below are transferred for each data point in each frame. They differ slightly in the three protocol types.

For the meaning of the status bits, see below. The "Meaning" (2nd table row) relates to the "bit status" (3rd table row).

Generation of events if a data point status changes

With data points that were configured as an event, the change to the status bit of the status identifiers described below also leads to an event being generated.

Example: If the value of the status "RESTART" of a data point configured as an event changes form 1 (value not yet updated) to 0 (value updated) when the station starts up, this causes an event to be generated.

Status IDs - TeleControl Basic

The status bits are converted to the OPC quality code as follows by TCSB.

- Quality = BAD, If:

  NON_EXISTENT or OVER_RANGE = 1

- Quality = UNCERTAIN, If:

  RESTART or CARRY or SB = 1

- Quality = GOOD, If:

  Bits 1, 2, 3, 5 and 6 = 0

Table 4- 4 Bit assignment of status byte 0

Bit	7	6	5	4	3	2	1	0
Flag name	-	NON_ EXISTENT	SB	LOCAL_ FORCED	CARRY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	Data point does not exist or S7 address unreachable	Substitute value	*(Bit is not set)*	Counted value overflow before reading the value	Limit value of the analog value preprocessing overshot / undershot	Value not yet updated after start	Value is valid, CPU in RUN
Bit status	*(always 0)*	1	1	*(irrelevant)*	1	1	1	1

Status IDs - TeleControl Basic

The status IDs can be evaluated by the master. They correspond to the following elements of the specification:

OBJECT FLAGS - DNP3 Specification, Volume 6, Data Object Library - Part 1

Table 4- 5 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	-	LOCAL_ FORCED	DISCONTI NUITY	OVER_ RANGE	RESTART	ONLINE
Meaning	-	-	-	Local operator control	Counted value overflow before reading the value	Limit value of the analog value preprocessing overshot / undershot	Value not updated after start	Value is invalid
Bit status	*(always 0)*	*(always 0)*	*(always 0)*	1	1	1	1	1

Status IDs - IEC

The status IDs can be evaluated by the master. They correspond to the following elements of the specification:

Quality descriptor - IEC 60870 Part 5-101

Table 4- 6 Bit assignment of the status byte

Bit	7	6	5	4	3	2	1	0
Flag name	-	-	SB substituted	-	CY carry	OV overflow	NT not topical	IV invalid
Meaning	-	-	Substitute value	-	Counted value overflow before reading the value	Value range exceeded, analog value	Value not updated	Value is valid
Bit status	*(always 0)*	*(always 0)*	1	*(always 0)*	1	1	1	0

4.5.7.5 Rules for configuring the data point index:

Configuration of the data point index

Below you will find the configuration rules for the data point index depending on the protocol being used.

TeleControl Basic

Within a CP, the indexes of the data point classes must comply with the following rules:

- Input

  The index of a data point of the type input must be unique throughout all data point types (digital inputs, analog inputs etc.).

- Output
  - A data point of the type output can have the same index as a data point of the type input.
  - Several data points of the type output can have the same index.

Note

Data points for the inter-station communication with a CP in another S7 station

Note that for inter-station communication, the indexes of the two corresponding data points (data point pair) must be identical for the sending and receiving CP.

DNP3

On a CP, data point indexes must be unique within each of the following object groups:

- Binary Input / Binary Input Event
- Binary Output / Binary Command
- Counter / Counter Event
- Analog Input / Analog Input Event
- Analog Output
- Octet String / Octet String Event

Indexes of two data points in different object groups can be identical.

IEC

The data point indexes must be unique in a CP.

Data point indexes assigned twice are indicated as errors in the consistency check and prevent the project being saved.

4.5.7.6 Read cycle

Priority of the data points

The cyclic reading of the values of input data points from their assigned PLC tags on the CPU can be prioritized.

Less important input data points do not need to be read in every CPU scan cycle. Important input data points, on the other hand, can be prioritized for updating in every CPU scan cycle.

You can prioritize the data points in STEP 7 in the data point configuration in the "General" tab with the "Read cycle" parameter. There you will find the two following options for input data points:

- Fast cycle
- Normal cycle

The data points are read according to the method described below.

Structure of the CPU scan cycle

The cycle (including the pause) with which the CP scans the memory area of the CPU is made up of the following phases:

- **High-priority read jobs**

  The values of input data points with the scan priority "High-priority" are read in every scan cycle.

- **Low priority read jobs**

  Some of the values of input data points with the scan priority "Low-priority" are read in every scan cycle.

  The number of values read per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of read jobs" parameter. The values that exceed this value and can therefore not be read in one cycle are then read in the next or one of the following cycles.

- **Write jobs**

  In every cycle, the values of a certain number of unsolicited write jobs are written to the CPU. The number of values written per cycle is specified for the CP in the "Communication with the CPU" parameter group with the "Max. number of write jobs" parameter. The values whose number exceeds this value are then written in the next or one of the following cycles.

- **Cycle pause time**

  This is the waiting time between two scan cycles. It is used to reserve adequate time for other processes that access the CPU via the backplane bus of the station.

Duration of the CPU scan cycle

Since no fixed time can be configured for the cycle and since the individual phases cannot be assigned a fixed number of objects, the duration of the scan cycle is variable and can change dynamically.

4.5.7.7 "Trigger“ tab

Trigger

Data points are configured as a static value or as an event using the "Type of transmission" parameter:

Saving the value of a data point configured as an event

Saving the value of a data point configured as an event in the send buffer (message memory) can be triggered by various trigger types:

- **Threshold value trigger**

  The value of the data point is saved when this reaches a certain threshold. The threshold is calculated as the difference compared with the last stored value, refer to the section Threshold value trigger (Page 71).

- **Time trigger**

  The value of the data point is saved at configurable intervals or at a specific time of day.

- **Event trigger (Trigger tag)**

  The value of the data point is saved when a configurable trigger signal is fired. For the trigger signal, the edge change (0 → 1) of a trigger tag is evaluated that is set by the user program. When necessary, a separate trigger tag can be configured for each data point.

  Resetting the trigger tag in the bit memory area / DB:

  If the memory area of a trigger tag is in the bit memory or in a data block, the CP resets the trigger variable itself to 0 (zero) as soon as the value of the data point has been transferred. This can take up to 500 milliseconds.

Note

Fast setting of triggers

Triggers must not be set faster than a minimum interval of 500 milliseconds. This also applies to hardware triggers (input area).

Note

Hardware trigger

You need to reset hardware triggers via the user program

Transferring the value of a data point configured as an event

You specify whether the value of a data point is transferred to the communications partner immediately after the trigger fires or after a delay in the "Transmission mode" parameter.

Transmission mode

The transmission mode of a frame is set in the "Trigger" tab of the data point. With the option, you specify whether messages of events are sent immediately or following a delay:

- Immediate transfer - Spontaneous

  The value is transferred immediately.

- Buffered transfer - Conditionally spontaneous

  The value is transferred only when one of the following conditions is fulfilled:

  – The communications partner queries the station.

  – The value of another event with the transmission mode “Spontaneous" is transferred.

4.5.7.8 Threshold value trigger

Note

Threshold value trigger: Calculation only after "Analog value preprocessing"

Note that the analog value preprocessing is performed before the check for a configured threshold value and before calculating the threshold value.

This affects the value that is configured for the threshold value trigger.

Note

No Threshold value trigger if Mean value generation is configured

If mean value generation is configured, no threshold value trigger can be configured for the analog value event involved.

For the time sequence of the analog value preprocessing refer to the section Analog value preprocessing (Page 73).

Threshold value trigger

Function

If the process value deviates by the amount of the threshold value, the process value is saved.

Two methods are used to calculate the threshold value deviation:

- **Absolute method**

  With binary and counter values as well as with analog values with configured mean value generation, the absolute method is used to calculate the threshold value deviation.

- **Integrative method**

  With analog values without configured mean value generation, the integrating method is used to calculate the threshold value deviation.

  In the integration threshold value calculation, it is not the absolute value of the deviation of the process value from the last stored value that is evaluated but rather the integrated deviation.

Absolute method

For each binary value a check is made to determine whether the current (possibly smoothed) value is outside the threshold value band. The current threshold value band results from the last saved value and the amount of the configured threshold value:

- Upper limit of the threshold value band: Last saved value + threshold value
- Lower limit of the threshold value band: Last saved value - threshold value

As soon as the process value reaches the upper or lower limit of the threshold value band, the value is saved. The newly saved value serves as the basis for calculating the new threshold value band.

Integrative method

The integration threshold value calculation works with a cyclic comparison of the integrated current value with the last stored value. The calculation cycle in which the two values are compared is 500 milliseconds.
(Note: The calculation cycle must not be confused with the scan cycle of the CPU memory areas).

The deviations of the current process value are totaled in each calculation cycle. The trigger is set only when the totaled value reaches the configured value of the threshold value trigger and a new process value is entered in the send buffer.

The method is explained based on the following example in which a threshold value of 2.0 is configured.

Table 4- 7 Example of the integration calculation of a threshold value configured with 2.0

Time [s] (calculation cycle)	Process value stored in the send buffer	Current process value	Absolute deviation from the stored value	Integrated deviation
0	**20.0**	**20.0**	0	0
0.5		20.3	+0.3	0.3
1.0		19.8	-0.2	0.1
1.5		20.2	+0.2	0.3
2.0		20.5	+0.5	0.8
2.5		20.3	+0.3	1.1
3.0		20.4	+0.4	1.5
3.5	**20.5**	**20.5**	+0.5	**2.0**
4.0		20.4	-0.1	-0.1
4.5		20.1	-0.4	-0.5
5.0		19.9	-0.6	-1.1
5.5		20.1	-0.4	-1.5
6.0	**19.9**	**19.9**	-0.6	**-2.1**

With the changes in the process value shown in the example, the threshold value trigger configured with 2.0 fires twice:

- At the time 3.5 s: The value of the integrated deviation is at 2.0. The new process value stored in the send buffer is 20.5.
- At the time 6.0 s: The value of the integrated deviation is at 2.1. The new process value stored in the send buffer is 19.9.

In this example, if a deviation of the process value of approximately 0.5 should fire the trigger, then with the behavior of the process value shown here a threshold value of approximately 1.5 ... 2.5 would need to be configured.

4.5.7.9 Analog value preprocessing

CPs with data point configuration support analog value preprocessing. For analog value data points, some or all of the functions described below can be configured.

Requirements and restrictions

You will find the requirements for the configuration of the preprocessing options and restrictions in the section relating to the particular function.

Note

Restrictions due to configured triggers

The analog value preprocessing options "Fault suppression time", "Limit value calculation" and "smoothing" are not performed if no threshold value trigger is configured for the relevant data point.. In these cases, the read process value of the data point is entered in the image memory of the CP before the preprocessing cycle of the threshold value calculation (500 ms) elapses.

Sequence of the analog value preprocessing options

The values of analog inputs configured as an event are processed on the CPU according to the following scheme:

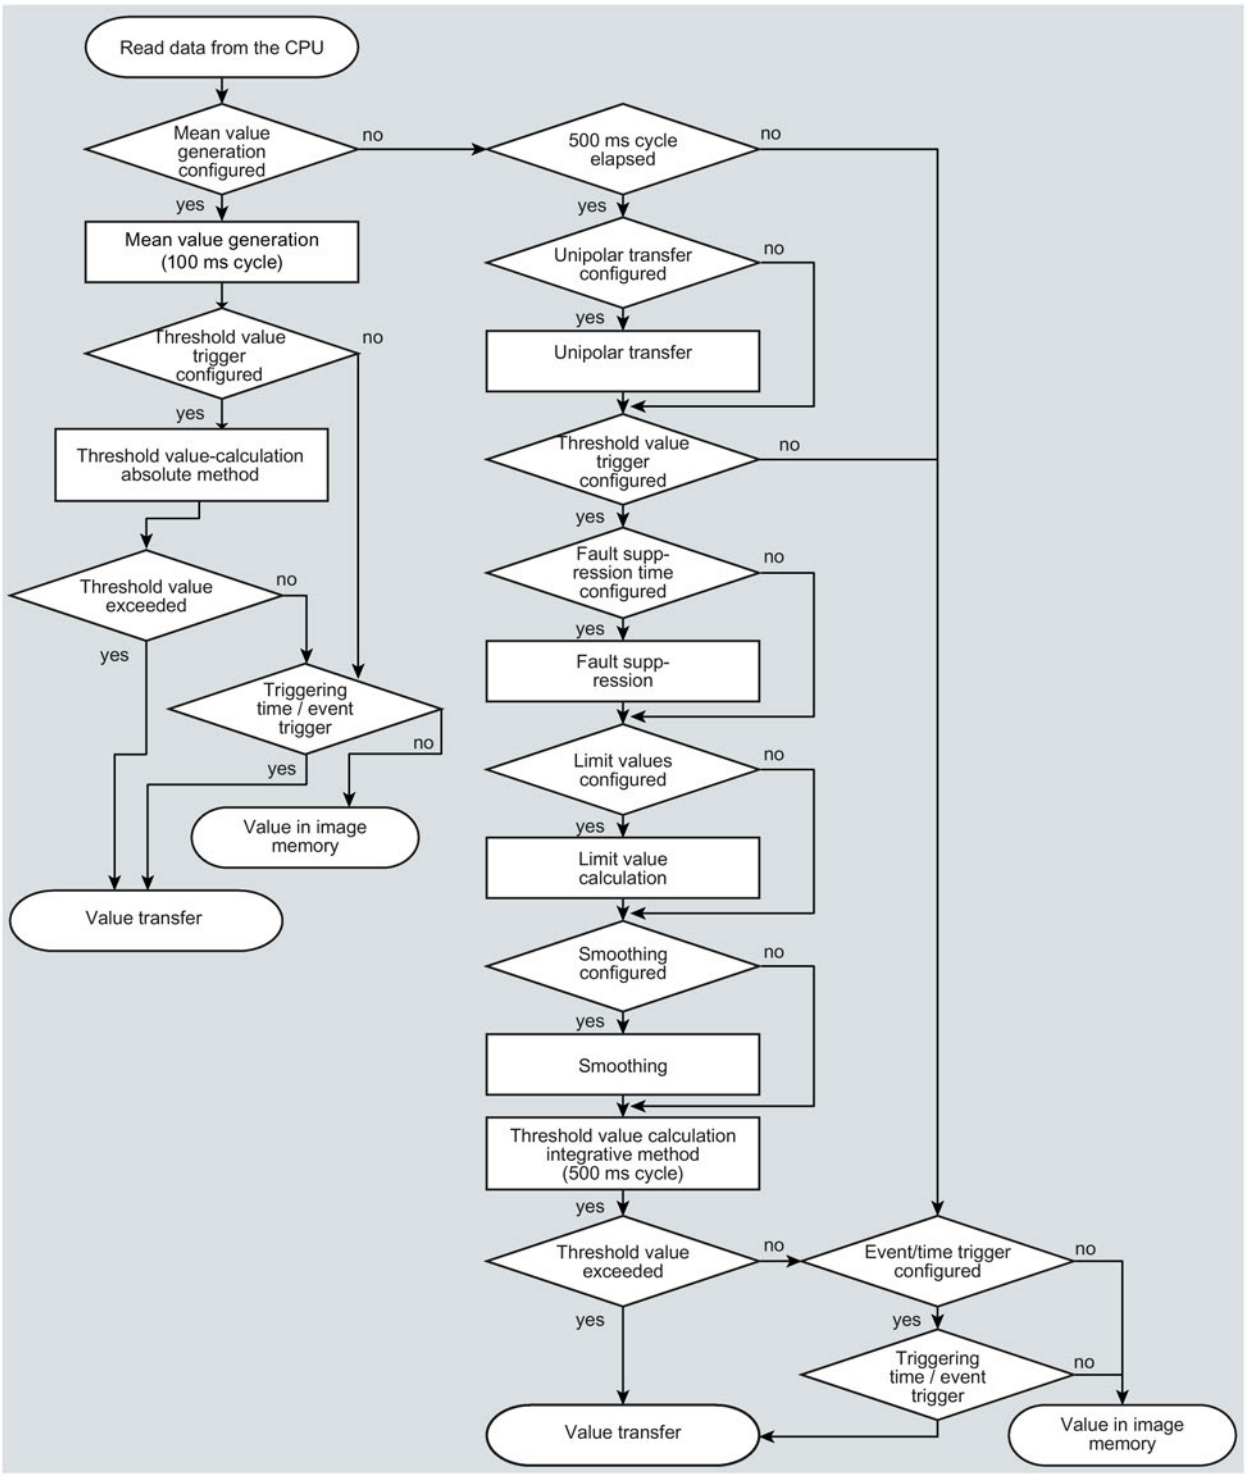

Figure 4-2 Sequence of the analog value preprocessing

The 500 millisecond cycle is started by the integrative threshold value calculation. In this cycle, the values are saved even when the following preprocessing options are enabled:

- Unipolar transfer
- Fault suppression time
- Limit value calculation
- Smoothing

Mean value generation

Note

Restricted preprocessing options if mean value generation is configured

If you configure mean value generation for an analog value event, the following preprocessing options are not available:

- Unipolar transfer
- Fault suppression time
- Smoothing

Function

With this parameter, acquired analog values are transferred as mean values.

If mean value generation is active, it makes sense to configure a time trigger..

The current values of an analog data point are read in a 100 millisecond cycle and totaled. The number of read values per time unit depends on the read cycle of the CPU and the CPU scan cycle of the CP.

The mean value is calculated from the accumulated values as soon as the transfer is triggered by a trigger. Following this, the accumulation starts again so that the next mean value can be calculated.

The mean value can also be calculated if the transmission of the analog value message is triggered by a request from the communications partner. The duration of the mean value calculation period is then the time from the last transmission (for example triggered by the trigger) to the time of the request. Once again, the accumulation restarts so that the next mean value can be calculated.

Input modules: Overflow range / underflow range

As soon as a value is acquired in the overflow or underflow range, mean value generation is stopped. The value 32767 / $7FFF_h$ or -32768 / 8000_h is saved as an invalid mean value for the current mean value calculation period and sent with the next message.

The calculation of a new mean value is then started. If the analog value remains in the overflow or underflow range, one of the two values named is again saved as an invalid mean value and sent when the next message is triggered.

Note

Fault suppression time > 0 configured

If you have configured an error suppression time and then enable mean value generation, the value of the error suppression time is grayed out but no longer used. If mean value generation is enabled, the error suppression time is set to 0 (zero) internally.

Unipolar transfer

Restrictions

Unipolar transfer cannot be configured at the same time as mean value generation. Enabling unipolar transfer has no effect when mean value generation is activated.

Function

With unipolar transfer, negative values are corrected to zero. This can be desirable if values from the underrange should not be transferred as real measured values.

Exception: With process data from input modules, the value -32768 / 8000_h for wire break of a live zero input is transferred.

With a software input, on the other hand, all values lower than zero are corrected to zero.

Fault suppression time

Requirements for the function

Configuration of the threshold trigger for this data point

Restrictions

The fault suppression time cannot be configured at the same time as mean value generation. A configured value has no effect when mean value generation is activated.

Function

A typical use case for this parameter is the suppression of peak current values when starting up powerful motors that would otherwise be signaled to the control center as a disruption.

The transmission of an analog value in the overflow ($7FFF_h$) or underflow range (8000_h) is suppressed for the specified time. The value $7FFF_H$ or 8000_H is only sent after the fault suppression time has elapsed, if it is still pending.

If the value returns to the measuring range before the fault suppression time elapses, the current value is transferred.

Input modules

The suppression is adjusted to analog values that are acquired directly by the S7 analog input modules as raw values. These modules return the specified values for the overflow or underflow range for all input ranges (also for live zero inputs).

An analog value in the overflow range (32767 / $7FFF_h$) or underflow range (-32768 / 8000_h) is not transferred for the duration of the fault suppression time. This also applies to live zero inputs. The value in the overflow/underflow range is only sent after the fault suppression time has elapsed, if it is still pending.

Recommendation for finished values that were preprocessed by the CPU:

If the CPU makes preprocessed finished values available in bit memory or in a data block, suppression is only possible or useful if these finished values also adopt the values listed above 32767 / $7FFF_h$ or -32768 / 8000_h in the overflow or underflow range. If this is not the case, the parameter should not be configured for preprocessed values.

For finished values preprocess in the CPU, the limits for the overflow and underflow can be freely assigned.

Smoothing factor

Requirements for the function

Configuration of the threshold trigger for this data point

Restrictions

The smoothing factor cannot be configured at the same time as mean value generation. A configured value has no effect when mean value generation is activated.

Function

Analog values that fluctuate quickly can be evened out using the smoothing function.

The smoothing factors are calculated according to the following formula as with S7 analog input modules.

$$y_n = \frac{x_n + (k-1)y_{n-1}}{k}$$

where
y_n = smoothed value in the current cycle
x_n = value acquired in the current cycle n
k = smoothing factor

The following values can be configured for the module as the smoothing factor.

- 1 = No smoothing
- 4 = Weak smoothing
- 32 = Medium smoothing
- 64 = Strong smoothing

Set limit value 'low' / Set limit value 'high'

Requirements for the function

- Configuration of the threshold trigger for this data point
- PLC tag in the bit memory operand area or data area

  The analog value data point must be linked to a PLC tag in the bit memory or data area (data block). For PLC tags of hardware modules (input operand area) limit value configuration is not possible.

The configuration of limit values is pointless for measured values that have already been preprocessed on the CPU.

Function

In these two input boxes, you can set a limit value in the direction of the start of the measuring range or in the direction of the end of the measuring range. You can also evaluate the limit values, for example as the start or end of the measuring range.

Status identifier "OVER_RANGE"

If a limit value is overshot or undershot, the status identifier "OVER_RANGE" of the data point is set. This status identifiers are described in the section Status IDs of the data points (Page 66).

The "OVER_RANGE" bit of the status identifier of the data point is set as follows when the relevant analog value is transferred:

- Limit value 'high':
  - If the limit value is exceeded: OVER_RANGE = 1
  - If the value falls below the limit value: OVER_RANGE = 0
- Limit value 'low':
  - If the value falls below the limit value : OVER_RANGE = 1
  - If the value then exceeds the limit value: OVER_RANGE = 0

Configuration of the limit value

The limit value is configured as a whole decimal number. The range of values is based on the range of values of the raw value of analog input modules.

Range	Raw value (16 bits) of the PLC tag		Module output [mA]			Measuring range [%]
	Decimal	Hexadecimal	0 .. 20 (unipolar)	-20 .. +20 (bipolar)	4 .. 20 (life zero)	
Overflow	32767	7FFF	> 23.515	> 23.515	> 22.810	> 117.593
Overrange	32511 ... 27649	7EFF ... 6C01	23.515 ... 20.001	23.515 ... 20.001	22.810 ... 20.001	117.593 ... 100.004
Nominal range (unipolar / life zero)	27648 ... 0	6C00 ... 0000	20 ... 0		20 ... 4	100 ... 0

Range	Raw value (16 bits) of the PLC tag		Module output [mA]			Measuring range [%]
	Decimal	Hexadecimal	0 .. 20 (unipolar)	-20 .. +20 (bipolar)	4 .. 20 (life zero)	
Nominal range (bipolar)	27648 ... 0 ... -27648	6C00 ... 0000 9400		20 ... 0 ... -20		100 ... 0 ... -100
Underrange (unipolar / life zero)	-1 ... -4864	FFFF ... ED00	-0.001 ... -3.518		3.999 ... 1.185	-0.004 ... -17.59
Underrange (bipolar)	-27649 ... -32512	93FF ... 8100		-20.001 ... -23.516		-100.004 ... -117.593
Undershoot / wire break	-32768	8000	< -3.518		< 1.185	< -17.593

Note

Evaluation of the value even when the option is disabled

If you enable one or both options and configure a value and then disable the option later, the grayed out value is nevertheless evaluated.

To disable the two options, delete the previously configured values limit values from the input boxes and then disable the relevant option.

Recommendation for quickly fluctuating analog values:

If the analog value fluctuates quickly, it may be useful to smooth the analog value first if limit values are configured.

4.5.8 Message configuration

Configuring e-mails

If important events occur, the CP can send e-mails to a communications partner.

You configure the e-mail in STEP 7 in the editor for the data point and message configuration. You can find this using the project tree:

Project > directory of the relevant station > Local modules > CP

For the view in STEP 7, refer to the section Configuring the data points (Page 56).

Requirements and necessary information

Remember the following requirements in the CP configuration for the transfer of e-mails:

- Enabling telecontrol communication ("Communication types") parameter group
- Configuring the "E-mail configuration" parameter group (see "Security" parameter group)

  To do this, you require the following information:

  – Access data of the SMTP server: Address, port number, user name, password

  – Email address of the recipient

Trigger: Triggering e-mail transfer

Using the "Trigger" parameter group in the message table, you configure which of the following events triggers the sending of the e-mail.

- CPU changes to STOP.
- CPU changes to RUN.
- The connection to the partner is interrupted.
- The connection to the partner is re-established.
- A trigger signal is fired.

  For the trigger signal to send the e-mail, the edge change (0 → 1) of a trigger bit is evaluated that is set by the user program. When necessary, a separate trigger bit can be configured for each e-mail.

  If the memory area of the trigger bit is in the bit memory or in a data block, the trigger bit is reset to zero when the e-mail is sent.

With the "TeleControl Basic" protocol, the following events can be configured as the trigger of an e-mail:

- Connection establishment to the partner has failed.
- A TeleService session has started.
- A TeleService session has ended.

Include value Transfer the value of a PLC tag with a message

If you enable the option "Include value" in the "Trigger" parameter group, the CP sends a value for the placeholder $$ from the memory area of the CPU in the message. To do this enter "$$" as a placeholder for the value to be sent in the message text.

Select a PLC tag whose value will be integrated in the message. The value is entered in the message text instead of the placeholder $$.

$$ can be a placeholder for data point types with a simple data type up to a size of 32 bits.

Enable identifier for processing status

If this option is enabled in STEP 7, a status is output on the CP that provides information about the processing status of the sent message. The status is written to a PLC tag of the type DWORD. Select this tag via the "PLC tag for processing status" box.

If there are problems delivering messages, you can determine the status for example via the Web server of the CPU by displaying the value of the PLC tag there.

For the significance of the individual statuses, refer to the section Processing status of the telecontrol e-mails (Page 102).

4.5.9 Security > CP identification

CP identification

Only valid when using the "TeleControl Basic" protocol.

- Project number

  The project number is the same for all telecontrol CPs in a STEP 7 project. TCSB evaluates project numbers from 1 ... 2000. If you change the project number, this parameter is changed for all CPs in the STEP 7 project.

- Station number

  For each station with a telecontrol CP, an individual station number is configured. TCSB evaluates station numbers from 1 ... 8000.

- Telecontrol password

  Password for the authentication of the CP on the telecontrol server. 8 ... 29 characters of the ASCII character set 0x20...0x7e. The password can be the same for all CPs of the STEP 7 project.

  The same password is configured in the "TCSB" application for this station.

4.5.10 Security > DNP3 security options

Authentication and key exchange with the DNP3 protocol

If the Security functions are enabled, the master and station (CP) authenticate themselves with a secret key, the pre-shared key.

With the help of the common pre-shared key, after the first connection establishment between master and DNP CP session keys are agreed that are then renewed cyclically. Renewal of the session keys is normally initiated by the master. The criteria for renewing the key are specified in the following parameters.

- Authentication requests before key exchange
- Key exchange interval

As soon as one of these conditions is met, the session key is renewed.

DNP3 security options

- **Enable DNP3 security options**

  Method with which the CP authenticates itself to the master.

  – Disabled

    Non-secure authentication. If this option is selected the CP logs on only using its station address.

  – Enabled

    Secure authentication. If this option is selected, the CP and master use the DNP3 Security mechanisms. The parameters are configured as follows.

- **IKE mode**

  Selection of the mode for key exchange (IKE)

  – The Main Mode is the default mode.

  – The Aggressive Mode is somewhat faster but transfers the identity unencrypted.

- **Security statistics**

  Specifies whether the statistics of security events are sent to the master. Security events are authentication requests to the CP. If the option is enabled, authentication requests with date, time and result are saved on the CP and sent to the master for further evaluation.

- **SHA-1 interlock**

  Setting to select whether the CP may use the secure hash algorithm SHA-1 if "SHA-256" was configured as the Secure hash algorithm and the master does not support SHA-256. Meaning of the options:

  – SHA-1 mode allowed

    The CP can use SHA-1 if the master does not support SHA-256.

  – SHA-1 mode not allowed

    The CP may not use SHA-1.

    Note: If the master does not support SHA-256, no connection will be established if this option is selected.

- **Secure hash algorithm**

  Selection of the Secure Hash Algorithm (SHA). Possible selections:

  – SHA-1

  – SHA-256

- **Key wrap algorithm**

  Selection of the Advanced Encryption Standard (AES). Possible selections:

  – AES-128

  – AES-256

- **Key length**

  Length of the pre-shared key in bytes

  The following lengths are used depending on the key wrap algorithm.

  – For AES-128: 16 bytes

  – For AES-256: 32 bytes

- Max. number of key exchange requests

  The function is disabled.

- **Authentication requests before key exchange**

  Maximum number of authentication requests of the CP with the master before the session key is renewed.

  If you enter 0 (zero), the function is deactivated and the session key is renewed only depending on the key exchange interval.

  Recommendation: Set the number for the CP twice as high as for the master.

- **Key exchange interval**

  Period after which the session key is exchanged again between the CP and the master.

  If you enter 0 (zero), the function is deactivated and the key will never be renewed.

  The interval must be matched up on both communications partners.

- **Authentication timeout**

  Maximum waiting (seconds) time for the response from the master to an authentication request of the CP.

  Exceeding the wait time is evaluated as an error by the CP. In this case, the CP generates a Security event and sends this to the master.

  Range of values: 1 ... 65535

- **Pre-shared key**

  The pre-shared key of the CP must be identical to the pre-shared key that the master uses.

  The key must have the key length configured above (2 characters per byte).

  The pre-shared key can be configured in two ways:

  – Manual configuration

    Enter the pre-shared key manually as a hexadecimal value.

  – Import as file

    Import the pre-shared key from the file system of the engineering station if the pre-shared key was generated by the master or another system.

4.5.11 Security > E-mail configuration

E-mail configuration

- **No configuration**

  As default, the sending of e-mails is disabled.

- **Activate SMTP**

  Enable this option if you want to use the sending of unencrypted e-mails via SMTP port 25.

- **Enable SSL/TLS**

  If your e-mail service provider only supports encrypted transfer, enable this option. Select the protocol via the port number:

  – Port no. 587

    When using STARTTLS the CP sends encrypted e-mails.

  – Port no. 465

    When using SSL/TLS (SMTPS) the CP sends encrypted e-mails.

  Ask your e.mail service provider which option is supported.

  If you want to use an Internet connection with an IPv6 infrastructure, note the information in the section IPv6 (Page 41).

4.6 Security configuration(CP 1543SP-1)

4.6.1 VPN

4.6.1.1 VPN (Virtual Private Network)

VPN tunnel

Virtual Private Network (VPN) is a technology for secure transportation of confidential data in public IP networks, for example the Internet. With VPN, a secure connection (tunnel) is set up and operated between two secure IT systems or networks via a non-secure network.

One of the main features of the VPN tunnel is that it forwards all frames even from protocols of higher layers (HTTP, FTP etc.).

The data traffic between two network components is transported practically unrestricted through another network. This allows entire networks to be connected together via a neighboring or intermediate network.

Properties

- VPN forms a logical subnet that is embedded in a neighboring (assigned) network. VPN uses the usual addressing mechanisms of the assigned network, however in terms of the data, it transports its own frames and therefore operates independent of the rest of this network.
- VPN allows communication of the VPN partners with the assigned network.
- VPN is based on tunnel technology and can be individually configured.
- Communication between the VPN partners is protected from eavesdropping or manipulation by using passwords, public keys or a digital certificate (authentication).

Areas of application

- Local area networks can be connected together securely via the Internet ("site-to-site" connection).
- Secure access to a company network ("end-to-site" connection)
- Secure access to a server ("end-to-end" connection)
- Communication between two servers without being accessible to third parties (end-to-end or host-to-host connection)
- Ensuring information security in networked automation systems
- Securing the computer systems including the associated data communication within an automation network or secure remote access via the Internet
- Secure remote access from a PC/programming device to automation devices or networks protected by security modules via public networks.

Cell protection concept

With Industrial Ethernet Security, individual devices or network segments of an Ethernet network can be protected:

- Access to individual devices and network segments protected by security modules is allowed.
- Secure connections via non-secure network structures becomes possible.

Due to the combination of different security measures such as firewall, NAT/NAPT routers and VPN via IPsec tunnels, security modules protect against the following:

- Data espionage
- Data manipulation
- Unwanted access

4.6.1.2 Creating a VPN tunnel for S7 communication between stations

Requirements

To allow a VPN tunnel to be created for S7 communication between two S7 stations or between an S7 station and an engineering station with a security CP (for example CP 1628), the following requirements must be met:

- The two stations have been configured.
- The CPs in both stations must support the security functions.
- The Ethernet interfaces of the two stations are located in the same subnet.

Note

Communication also possible via an IP router

Communication between the two stations is also possible via an IP router. To use this communications path, however, you need to make further settings.

Procedure

To create a VPN tunnel, you need to work through the following steps:

1. Creating a security user

   If the security user has already been created: Log on as a user.
2. Select the "Activate security features" check box
3. Creating the VPN group and assigning security modules
4. Configure the properties of the VPN group
5. Configure local VPN properties of the two CPs

You will find a detailed description of the individual steps in the following paragraphs of this section.

Creating a security user

To create a VPN tunnel, you require appropriate configuration rights. To activate the security functions, you need to create at least one security user.

1. In the local security settings of the CP, click the "User login" button.

   Result: A new window opens.
2. Enter the user name, password and confirmation of the password.
3. Click the "Logon" button.

   You have created a new security user. The security functions are now available to you.

With all further logons, log on as user.

Select the "Activate security features" check box

After logging on, you need to select the "Activate security features" check box in the configuration of both CPs.

You now have the security functions available for both CPs.

Creating the VPN group and assigning security modules

1. In the global security settings, select the entry "Firewall" > "VPN groups" > "Add new VPN group".
2. Double-click on the entry "Add new VPN group", to create a VPN group.

   Result: A new VPN group is displayed below the selected entry.
3. In the global security settings, double-click on the entry "VPN groups" > "Assign module to a VPN group".
4. Assign the security modules between which VPN tunnels will be established to the VPN group.

Note

Current date and current time on the CP for VPN connections

Normally, to establish a VPN connection and the associated recognition of the certificates to be exchanged, the current date and the current time are required on both stations.

Configure the properties of the VPN group

1. Double-click on the newly created VPN group.

   Result: The properties of the VPN group are displayed under "Authentication".
2. Enter a name for the VPN group. Configure the settings of the VPN group in the properties.

   These properties define the default settings of the VPN group that you can change at any time.

Note

Specifying the VPN properties of the CPs

You specify the VPN properties of the CPs in the "Security" > "Firewall" > "VPN" parameter group of the relevant module.

Result

You have created a VPN tunnel. The firewalls of the CPs are activated automatically: The "Activate firewall" check box is selected as default when you create a VPN group. You cannot deselect the check box.

Download the configuration to all modules that belong to the VPN group.

4.6.1.3 VPN communication with SOFTNET Security Client (engineering station)

VPN tunnel communication works only if the internal node is disabled

Under certain circumstances the establishment of VPN tunnel communication between SOFTNET Security ClientSOFTNET Security Client and the CP fails.

SOFTNET Security Client also attempts to establish VPN tunnel communication to a lower-level internal node. This communication establishment to a non-existing node prevents the required communication being established to the CP.

To establish successful VPN tunnel communication to the CP, you need to disable the internal node.

Use the procedure for disabling the node as explained below only if the described problem occurs.

Disable the node in the SOFTNET Security Client tunnel overview:

1. Remove the checkmark in the "Enable active learning" check box.

   The lower-level node initially disappears from the tunnel list.
2. In the tunnel list, select the required connection to the CP.
3. With the right mouse button, select "Enable all members" in the shortcut menu.

   The lower-level node appears again temporarily in the tunnel list.
4. Select the lower-level node in the tunnel list.
5. With the right mouse button, select "Delete entry" in the shortcut menu.

Result: The lower-level node is now fully disabled. VPN tunnel communication to the CP can be established.

4.6.1.4 Establishment of VPN tunnel communication between the CP and SCALANCE M

Create a VPN tunnel between the CP and a SCALANCE M router as described for the stations.

VPN tunnel communication will only be established if you have selected the check box "Perfect Forward Secrecy" in the global security settings of the created VPN group ("VPN groups > Authentication").

If the check box is not selected, the CP rejects establishment of the tunnel.

4.6.1.5 CP as passive subscriber of VPN connections

Setting permission for VPN connection establishment with passive subscribers

If the CP is connected to another VPN subscriber via a gateway, you need to set the permission for VPN connection establishment to "Responder".

This is the case in the following typical configuration:

VPN subscriber (active) ⇔ gateway (dyn. IP address) ⇔ Internet ⇔ gateway (fixed IP address) ⇔ CP (passive)

Configure the permission for VPN connection establishment for the CP as a passive subscriber as follows:

1. In STEP 7, go to the devices and network view.
2. Select the CP.
3. Open the parameter group "VPN“ in the local security settings.
4. For each VPN connection with the CP as a passive VPN subscriber, change the default setting "Initiator/Responder" to the setting "Responder".

4.6.2 Firewall

4.6.2.1 Pre-check of messages by the MAC firewall.

Each incoming or outgoing frame initially runs through the MAC firewall (layer 2). If the frame is discarded at this level, it will not be checked by the IP firewall (layer 3). This means that with suitable MAC firewall rules, IP communication can be restricted or blocked.

4.6.2.2 Online diagnostics and downloading to station with the firewall activated

Setting the firewall - steps involved

With the security function enabled, follow the steps outlined below:

1. In the global security settings (see project tree), select the entry "Firewall > Services > Define services for IP rules".
2. Select the "ICMP" tab.
3. Insert a new entry of the type "Echo Reply" and another of the type "Echo Request".
4. Now select the CP in the ET 200SP station.
5. Enable the advanced firewall mode in the local security settings of the CP in the "Security > Firewall" parameter group.
6. Open the "IP rules" parameter group.
7. In the table, insert a new IP rule for the previously created global services as follows:
   - Action: Allow; "From external -> To station " with the globally created "Echo request" service
   - Action: Allow; "From station -> to external" with the globally created "Echo reply" service
8. For the IP rule for the Echo Request, enter the IP address of the PG/PC in "Source IP address". This ensures that only PING packets from your PG/PC can pass through the firewall.

4.6.2.3 Notation for the source IP address (advanced firewall mode)

If you specify an address range for the source IP address in the advanced firewall settings of the CP, make sure that the notation is correct:

- Separate the two IP addresses only using a hyphen.

  Correct: 192.168.10.0-192.168.10.255

- Do not enter any other characters between the two IP addresses.

  Incorrect: 192.168.10.0 - 192.168.10.255

If you enter the range incorrectly, the firewall rule will not be used.

4.6.2.4 Firewall settings for S7 connections via a VPN tunnel

IP rules in advanced firewall mode

If you set up configured connections (S7, OUC) with a VPN tunnel between the CP and a communications partner, you will need to adapt the local firewall settings of the CP:

In advanced firewall mode ("Security > Firewall > IP rules") select the action "Allow*" for both communications directions of the VPN tunnel.

4.6.3 Filtering of the system events

Communications problems if the value for system events is set too high

If the value for filtering the system events is set too high, you may not be able to achieve the maximum performance for the communication. The high number of output error messages can delay or prevent the processing of the communications connections.

In "Security > Log settings > Configure system events", set the "Level:" parameter to the value "3 (Error)" to ensure the reliable establishment of the communications connections.

4.7 Table "Certificate manager" (CP 1542SP-1 IRC, CP 1543SP-1)

If the Security functions are enabled, in the STEP 7 project the certificates for all Security modules involved are generated for example to allow communication via VPN connections.

Certificates generated by STEP 7 such as SSL certificates or VPN group certificates are automatically assigned to the corresponding modules and do not need to be assigned using the local security settings.

The local certificate manager

Certificates that were imported via the certificate manager in the global security settings are not automatically assigned to the corresponding modules. Imported certificates must be included in the list of trustworthy partner certificates manually via the entry "Certificate manager" in the local Security settings. When assigning a CA certificate the module is also assigned the certificates derived from it.

Parameter group "Security" > table "Certificate manager"

Via the local certificate manager assign certificates to the CP for certain services (e.g. secure sending of e-mails).

1. To do this, click the table cell "Add new".
2. Click on the button on a white background "...".
3. In the certificate list that opens, you can either add a new certificate using the "Add" button or select an existing certificate of the project using the check mark symbol.

   You can recognize the properties of the displayed certificates in the global certificate manager.

Certificates for the CP 1542SP-1 IRC

Requirement in the global security settings

For the secure sending of e-mails, import the certificate of the e-mail service provider into the certificate manager.

Assign the certificate in the CP configuration

Select the following certificate in the CP configuration:

- Table "Trustworthy client certificates":

  The certificate of the e-mail service provider

Certificates for the CP 1543SP-1

Before certificates can be referenced in the program blocks for Secure Communication, these certificates must be assigned to the Security module as device certificates via the local certificate manager.

Requirement in the global security settings

To be able to assign the CP certificate of a communications partner, you need to first import the certificates of the partner in the global certificate manager (Global security settings).

To make the assigned certificate known to the partner module, this certificate must be entered in the list of trustworthy partner certificates after import.

Assign the certificates in the CP configuration

Select the following certificates in the CP configuration:

- Table "Device certificates":

  The device certificate of the CP generated by STEP 7
- Table "Certificates of the partner devices":

  The imported certificate of the partner

Programming (OUC)

5

5.1 Program blocks for OUC

Using the program blocks for Open User Communication (OUC)

Connections of Open User Communication are not configured.

For TCP / UDP / ISO-on-TCP communication via Ethernet, the blocks of Open User Communication (OUC) listed below are used. For this, create a suitable program blocks. You will find details on the program blocks in the information system of STEP 7.

Note

Different program block versions

Note that in STEP 7 you cannot use different versions of a program block in a station.

Supported program blocks for OUC

Program blocks for all three CP types

The following instructions in the specified minimum version are available for programming Open User Communication for all three CP types:

- **TSEND_C V3.0 / TRCV_C V3.1**

  Compact blocks for connection establishment/termination and for sending and receiving data

  or

- **TCON V4.0 / TDISCON V2.1**

  Connection establishment / connection termination

- **TUSEND V4.0 / TURCV V4.0**

  Sending and receiving data via UDP

- **TSEND V4.0 / TRCV V4.0**

  Sending and receiving data via TCP or ISOonTCP

- **TMAIL_C V4.0**

  Sending e-mails

The program block can be found in STEP 7 in the "Instructions > Communication > Open User Communication" window.

Connection descriptions in system data types (SDTs)

For the connection description, the blocks listed above use the parameter CONNECT (or MAIL_ADDR_PARAM with TMAIL_C). The connection description is stored in a data block whose structure is specified by the system data type (SDT).

Creating an SDT for the data blocks

You create the SDT required for every connection description as a data block. You generate the SDT type in STEP 7 by entering the name (e.g. "TCON_Param") in the "Data type" box manually in the declaration table of block instead of selecting an entry from the "Data type" drop-down list. The corresponding SDT is then created with its parameters.

Depending on the security functions supported, the three CP types support the following SDTs:

SDTs for all three CP types

The following SDTs can be used by all three CP types:

- **TCON_Param**

  For transferring frames via TCP

- **TADDR_Param**

  For transferring frames via UDP

- **TCON_IP_RFC**

  For transferring frames via ISO-on-TCP

- **TMail_V4**

  For transferring e-mails addressing the e-mail server using an IPv4 address

- **TMail_V6**

  For transferring e-mails addressing the e-mail server using an IPv6 address

- **TMail_FQDN**

  For transferring e-mails addressing the e-mail server using the host name

You will find the description of the SDTs with their parameters in the STEP 7 information system under the relevant name of the SDT.

SDT for CP 1542SP-1 IRC and CP 1543SP-1

These two CP types can use the following SDT for e-mail connections with Security function:

- **TMail_V4_SEC**

  For secure transfer of e-mails addressing the e-mail server using an IPv4 address

- **TMail_QDN_SEC**

  For secure transfer of e-mails addressing the e-mail server using the host name

SDT only for CP 1543SP-1

The CP 1543SP-1 can use the following SDT for data transfer with Security function:

- **TCON_IP_V4_SEC**

  For the secure transfer of data via TCP

Connection establishment and termination

Connections are established using the program block TCON. Note that a separate program block TCON must be called for each connection.

A separate connection must be established for each communications partner even if identical blocks of data are being sent.

After a successful transfer of the data, a connection can be terminated. A connection is also terminated by calling "TDISCON".

Note

Connection abort

If an existing connection is aborted by the communications partner or due to disturbances on the network, the connection must also be terminated by calling TDISCON. Make sure that you take this into account in your programming.

Diagnostics and maintenance 6

6.1 Diagnostics options

The following diagnostics options are available.

LEDs of the module

For information on the LED displays, refer to the section LEDs (Page 25).

STEP 7: The "Diagnostics" tab in the Inspector window

Here, you can obtain the following information on the selected module:

- Entries in the diagnostics buffer of the CPU
- Information on the online status of the module

STEP 7: Diagnostics functions in the "Online > Online and diagnostics" menu

Using the online functions, you can read diagnostics information from the CP from an engineering station on which the project with the CP is stored. You obtain the following static information on the selected module:

- General information on the module
- Diagnostics status
- Information on the interfaces of the module

  Information on other functions of the module

If you want to operate online diagnostics with the station via the CP, you need to activate the online functions in the parameter group "Communication types" see the section Communication types (Page 44).

You will find further information on the diagnostics functions of STEP 7 in the STEP 7 information system.

Web server of the CPU

Via the CP you can access the Web server of the CPU and the information available there. For access, refer to the section Web server of the CPU (Page 100).

SNMP

For information on the functions, refer to the section Diagnostics with SNMP (Page 98).

6.2 Diagnostics with SNMP

Requirement

The requirement for using SNMP is the enabling of the function in the configuration, see section SNMP (Page 43).

SNMP (Simple Network Management Protocol)

SNMP is a protocol for diagnostics and managing networks and nodes in the network. To transmit data, SNMP uses the connectionless UDP protocol.

The information on the properties of SNMP-compliant devices is entered in MIB files (MIB = Management Information Base).

You will find detailed information on SNMP and the Siemens Automation MIB in the manual /6/ (Page 118).

Scope of performance of the CPs

The CPs support the following SNMP version:

- **CP 1542SP-1, CP 1542SP-1 IRC**
  - SNMPv1
- **CP 1543SP-1**
  - SNMPv1
  - SNMPv3 (with activated Security functions)

Traps are not supported by the CP.

Supported MIBs in SNMPv1

The CPs support the following MIBs:

- **MIB II (acc. to RFC1213)**

  The CP supports the following groups of MIB objects:
  - System
  - Interfaces
  - IP
  - ICMP
  - TCP
  - UDP
  - SNMP
- **LLDP MIB**
- **Siemens Automation MIB**

  Note the rights for writing to the MIB objects, see the next section (SNMPv3).

Supported MIB objects in SNMPv3

If SNMPv3 is enabled, the CP returns the contents of the following MIB objects:

- **MIB II (acc. to RFC1213)**

  The CP supports the following groups of MIB objects:

  – System

  – Interfaces

    The "Interfaces" MIB object provides status information about the CP interfaces.

  – IP (IPv4/IPv6)

  – ICMP

  – TCP

  – UDP

  – SNMP

  The following groups of the standard MIB II are not supported:

  – Adress Translation (AT)

  – EGP

  – Transmission

- **LLDP MIB**
- **Siemens Automation MIB**

  Note that write access is permitted only for the following MIB objects of the "System" group:

  – sysContact

  – sysLocation

  – sysName

    A set sysName is sent as the host name using DHCP option 12 to the DHCP server to register with a DNS server.

  For all other MIB objects and groups, only read access is possible for security reasons.

Access rights using community names (SNMPv1)

TCP uses the following community strings to control the permissions for access to the SNMP agent:

Table 6- 1 Access rights in the SNMP agent

Type of access	Community string *)
Read access	public
Read and write access	private

*) Note the use of lowercase letters!

6.3 Web server of the CPU

The Web server of the CPU

The CPU has a Web server which you can access from an engineering station using HTTP/HTTPS via the CP.

The Web server of the CPU provides a wide variety of functions for diagnostics and service purposes for example loading firmware files. You will find detailed information in the system manual /2/ (Page 117)and in the information system of STEP 7 in the topic and under the heading "Web server".

Requirements for access to the Web server

Permitted web browsers

You will find the Web browsers supported on the engineering station for access to the Web server of the CPU in the STEP 7 information system under the heading "Web server".

Requirements in the CPU configuration

1. Open the corresponding project on the engineering station.
2. Select the CPU of the station involved in STEP 7.
3. Select the "Web server" entry.
4. In the parameter group "General", select the "Enable Web server for this interface" option.
5. In the user management create a user with suitable rights on the CPU.

   To load firmware you need to assign this user the right to perform firmware updates in the access level.

   The user name and password are required later for access.
6. Configuration of the option "Allow access only using HTTPS" in the parameter group "General"

   Depending on whether you want to access the Web server using HTTP or HTTPS, the configuration of the parameter differs:

   – "Allow access only using HTTPS" enabled

     Connection establishment is possible only using HTTPS.

   – "Allow access only using HTTPS" disabled

     Connection establishment is possible using HTTP and HTTPS.

Additional requirements in the configuration of the CP 1543SP-1

Activate the firewall in the "Security" parameter group.

Depending on the protocol used you need to make the following further settings in the parameter group of the firewall "From external to station".

- With connection establishment using HTTP
  - Enable the "Allow HTTP" option.
  - Enable the "Allow HTTPS" option
    Reason: There is a switch to HTTPs after authentication on the Web server.
- With connection establishment using HTTPS
  - Disable the "Allow HTTP" option
  - Enable the "Allow HTTPS" option.

Establishing a connection to the Web server

Follow the steps below to connect to the Web server of the CPU from the engineering station.

These two variants are described in the following sections.

Connection establishment with HTTP

1. Connect the PC on which the new firmware file is located to the CP via the Ethernet interface.
2. Enter the address of the CP in the address box of your web browser:
   http://<IP address>
3. Press the Enter key.

   The start page of the Web server opens.
4. Click on the "Download certificate" entry at the top right of the window.

   The "Certificate" dialog opens.
5. Download the certificate to your PC by clicking the "Install certificate ..." button.

   The certificate is loaded on your PC.

   You will find information on downloading a certificate in the help of your Web browser and in the STEP 7 information system under the keyword "Certificates for Web server".

When the connection has changed to the secure mode HTTPS (https://<IP address>/..." in the address box of the Web server), you can work with the Web server for example download a firmware file (see the following section).

If you terminate the connection to the Web server, the next time you can log in with the Web server without downloading the certificate using HTTP.

Connection establishment with HTTPS

1. Connect the PC on which the new firmware is located to the CP or CPU via the Ethernet interface.
2. Enter the address of the CP in the address box of your web browser:
   https://<IP address>
3. Press the Enter key.

   The start page of the Web server opens.

You can work with the Web server.

Downloading firmware files via the Web server of the CPU

Requirement: The new firmware file is stored on your engineering station.

1. Log in on the start page of the Web server.
2. After logging in, select the entry "Module status" in the navigation panel of the Web server.
3. Select the CP in the module list.
4. Select the "Firmware" tab lower down in the window.
5. Browse for the firmware file on your PC using the "Browse..." button and download the file to the station using the "Run update" button.

Refer to the information on the duration of the firmware update in the section Downloading firmware (Page 104).

6.4 Processing status of the telecontrol e-mails

Configuration of the processing status of telecontrol e-mails (CP 1542SP-1 IRC)

The following status identifiers apply to e-mails configured with the message editor of the CP 1542SP-1 IRC, see also section Message configuration (Page 79).

E-mails sent via program blocks of Open User Communication return a different status via the block (see block help).

Processing status of the telecontrol e-mails

The meaning of the status of the "PLC tag for processing status" is as follows:

Table 6- 2 Meaning of the status ID output in hexadecimal format

Status	Meaning
0000	Transfer completed free of errors
82xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.
8401	No channel available. Possible cause: There is already an e-mail connection via the CP. A second connection cannot be set up at the same time.
8403	No TCP/IP connection could be established to the SMTP server.
8405	The SMTP server has denied the login request.
8406	An internal SSL error or a problem with the structure of the certificate was detected by the SMTP client.
8407	Request to use SSL was denied.
8408	The client could not obtain a socket for creating a TCP/IP connection to the mail server.
8409	It is not possible to write via the connection. Possible cause: The communications partner reset the connection or the connection aborted.
8410	It is not possible to read via the connection. Possible cause: The communications partner terminated the connection or the connection was aborted.
8411	Sending the e-mail failed. Cause: There was not enough memory space for sending.
8412	The configured DNS server could not resolve specified domain name.
8413	Due to an internal error in the DNS subsystem, the domain name could not be resolved.
8414	An empty character string was specified as the domain name.
8415	An internal error occurred in the cURL module. Execution was aborted.
8416	An internal error occurred in the SMTP module. Execution was aborted.
8417	Requests to SMTP on a channel already being used or invalid channel ID. Execution was aborted.
8418	Sending the e-mail was aborted. Possible cause: Execution time exceeded.
8419	The channel was interrupted and cannot be used before the connection is terminated.
8420	Certificate chain from the server could not be verified with the root certificate of the CP.
8421	Internal error occurred. Execution was stopped.
8450	Action not executed: Mailbox not available / unreachable. Try again later.
84xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.
8500	Syntax error: Command unknown. This also includes the error of having a command chain that is too long. The cause may be that the e-mail server does not support the LOGIN authentication method. Try sending e-mails without authentication (no user name).
8501	Syntax error. Check the following configuration data: Alarm configuration > E-mail data (Content): • Recipient address ("To" or "Cc").

Status	Meaning
8502	Syntax error. Check the following configuration data: Alarm configuration > E-mail data (Content): • Email address (sender)
8535	SMTP authentication incomplete. Check the "User name" and "Password" parameters in the CP configuration.
8550	SMTP server cannot be reached. You have no access rights. Check the following configuration data: • CP configuration > E-mail configuration: – User name – Password – Email address (sender) • Alarm configuration > E-mail data (Content): – Recipient address ("To" or "Cc").
8554	Transfer failed
85xx	Other error message from the e-mail server Apart from the leading "8", the message corresponds to the three-digit error number of the SMTP protocol.

6.5 Downloading firmware

New firmware versions of the CP

If a new firmware version is available for the CP, you will find this on the Internet pages of Siemens Industry Online Support:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/22144/dl)

Link: (https://support.industry.siemens.com/cs/ww/en/ps/22143/dl)

There are three different ways of loading a new firmware file on the CP:

- Saving the firmware file on the memory card of the CPU

  You will find a description of the procedure for loading on the memory card of the CPU on the Internet page of Industry Online Support shown above.

- Loading the firmware with the online functions of STEP 7 via Ethernet / Internet

  The description of these methods follows.

- Downloading the firmware via the Web server of the CPU

  You will find the description of these methods in the section Web server of the CPU (Page 100).

Note

Duration of the firmware update

Downloading a new firmware file can take several minutes.

Note that the procedure takes longer the larger the station due to I/O modules.

Always wait until the completion of the firmware update can be recognized from the LEDs (LED pattern "Maintenance demanded" - End of the firmware update).

Loading the firmware with the online functions of STEP 7 via Ethernet / Internet

Requirements:

- The CP or the CPU can be reached via the IP address.
- The engineering station and the CP are located in the same subnet.
- The new firmware file is stored on your engineering station.
- The engineering station is connected to the network.
- The relevant STEP 7 project is open on the engineering station.

Procedure:

1. Select the CP or the CPU of the station whose CP you want to update with new firmware.
2. Enable the online functions using the "Connect online" icon.
3. In the "Connect online" dialog, select the Ethernet interface in the "Type of PG/PC interface" list box.
4. Select the slot of the CP or the CPU.

   Both methods are possible.
5. Click on "Start search" to search for the module in the network and to specify the connection path.

   When the module is found it is displayed in the table.
6. Connect using the "Connect" button.

   The "Connect online" wizard guides you through the remaining steps in installation.
7. In the network view, select the CP and select the "Online & Diagnostics" shortcut menu (right mouse button).
8. In the navigation panel of the Online & Diagnostics view select the entry "Functions > Firmware update".
9. Using the "Browse" button (parameter group "Firmware loader") search for the new firmware file in the file system of the engineering station.
10. Start to download the firmware with the "Start update" button when the correct version of the signed firmware is displayed in the "Status" output box.

You will find further information on the online functions in the STEP 7 information system.

6.6 Module replacement

CAUTION

Read the system manual "SIMATIC ET 200SP Distributed I/O System"

Prior to installation, connecting up and commissioning, read the relevant sections in the system manual "SIMATIC ET 200SP Distributed I/O System" refer to the documentation in the Appendix.

When installing and connecting up, keep to the procedures described in the system manual "SIMATIC ET 200SP Distributed I/O System".

Make sure that the power supply is turned off when installing/uninstalling the devices.

Module replacement

The STEP -7 project data of the CP is stored on the local CPU. If there is a fault on the device, this allows simple replacement of the CP without needing to download the project data to the station again.

When the station starts up again, the new CP reads the project data from the CPU.

Attachment to Industrial Ethernet		
Quantity	1	
Design	Slot for bus adapter	
Properties	100BASE-TX, IEEE 802.3-2005, half duplex/full duplex, autocrossover, autonegotiation, galvanically isolated	
Transmission speed	10/100 Mbps	
Permitted cable lengths Ethernet, copper, at 100 Mbps *		
Cable type - Copper	Max. lengths	
TP Torsion Cable	• Max. 55 m TP Torsion Cable with IE FC RJ45 Plug 180 • Max. 45 m TP Torsion Cable with IE FC RJ45 + 10 m TP Cord via IE FC RJ45 Outlet	
TP FC Marine Cable, TP FC Trailing Cable, TP FC Flexible Cable, TP FC FRNC Cable, TP FC Festoon Cable, TP FC Food Cable	• Max. 55 m TP Torsion Cable with IE FC RJ45 Plug 180 • Max. 75 m TP Torsion Cable + 10 m TP Cord via IE FC RJ45 Outlet	
TP FC Standard Cable	• Max. 100 m TP FC Standard Cable with IE FC RJ45 Plug 180 • Max. 90 m TP FC Standard Cable + 10 m TP Cord via IE FC RJ45 Outlet	
Permitted cable lengths Ethernet, fiber-optic cable (FO cable), at 100 Mbps *		
Cable type - Glass FO (multiode).	Max. lengths	
• FO FRNC Cable GP, FO Standard Cable GP, FO Ground Cable, FO Trailing Cable, FO Trailing Cable GP, FO Robust Cable GP	• Max. 2000 m	
• INDOOR FO cable, FO standard cable, flexible FO, trailing cable	• Max. 750 m	
• FO Robust Cable GP	• Max. 2000 m	
Cable type - PCF and plastic FO cable	Max. lengths	

Technical specifications		
• POF Standard Cable GP 980/1000, POF Trailing Cable 980/1000	• Max. 50 m	
• PCF Standard Cable GP, PCF Trailing Cable, PCF Trailing Cable GP	• Max. 100 m	
Electrical data		
External power supply (X80), design	Socket Terminal block for socket	Two terminals with reverse polarity protection 2 x two terminal for single or redundant power supply
Power supply (external)	• Type of voltage • Permitted low limit • Permitted high limit	• 24 VDC • 19.2 V • 28.8 V
Current consumption	• From 24 VDC (external) • From backplane bus (3.3 V)	• 250 mA (typ.) • 4 mA (typ.)
Maximum Inrush current	(Rated value)	12 A
Effective power loss	(typical)	6 W
Permitted ambient conditions		
Ambient temperature	During operation with the rack installed horizontally	0 .. + 60 °C
	During operation with the rack installed vertically	0 .. + 50 °C
	During storage	-40 .. +70 °C
	During transportation	-40 .. +70 °C
Relative humidity	During operation	≤ 95 % at 25 °C, no condensation
Design, dimensions and weight		
Module format	Compact module ET 200SP	
Degree of protection	IP20	
Weight		
• Without bus adapter	• 180 g	
• With bus adapter 2xRJ45	• 230 g	
Dimensions (W x H x D)	60 x 117 x 74 mm	
Installation options	DIN rail (35 mm)	
Mean Time Between Failures (MTBF)		
• At + 40 °C	• 56.87 years	
• At + 60 °C	• 24.78 years	
Product functions **		

***** For details of the cable lengths see ET 200SP system manual, /2/ (Page 117).

****** You will find additional properties and performance data in the section Application and functions (Page 11).

Approvals

A

Approvals issued

Note

Issued approvals on the type plate of the device

The specified approvals apply only when the corresponding mark is printed on the product. You can check which of the following approvals have been granted for your product by the markings on the type plate.

Scope of validity of the approvals

The approvals listed below are valid for the CP.

The tests required for the approvals were performed with a plugged-in bus adapter.

The bus adapters have their own approvals, that are not listed here.

EC declaration of conformity

CE

The CP meets the requirements and safety objectives of the following EU directives and it complies with the harmonized European standards (EN) for programmable logic controllers which are published in the official documentation of the European Union.

- **2014/34/EU (ATEX explosion protection directive)**

  Directive of the European Parliament and the Council of 26 Febrary 2014 on the approximation of the laws of the Member States concerning equipment and protective systems intended for use in potentially explosive atmospheres, official journal of the EU L96, 29/03/2014, pages. 309-356

- **2014/30/EU (EMC)**

  EMC directive of the European Parliament and of the Council of February 26, 2014 on the approximation of the laws of the member states relating to electromagnetic compatibility.; official journal of the EU L96, 29/03/2014, pages. 79-106

- **2011/65/EU (RoHS)**

  Directive of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment, official journal of the EC L174, 01/07/2011, page 88-110

The EC Declaration of Conformity is available for all responsible authorities at:

Siemens Aktiengesellschaft
Division Process Industries and Drives
Process Automation
DE-76181 Karlsruhe
Germany

You will find the EC Declaration of Conformity on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/)

> Entry type: "Certificates", certificate type: "EC declaration of conformity"

IECEx

The CP meet the requirements of explosion protection according to IECEx.

IECEx certificate: IECEx DEK 14.0089X

The CP meets the requirements of the following standards:

- IEC 60079-0

  Hazardous areas - Part 0: Equipment - General requirements

- EN 60079-15

  Explosive atmospheres - Part 15: Equipment protection by type of protection 'n'

You can see the current versions of the standards in the IECEx certificate that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/ps/)

The conditions must be met for the safe deployment of the CP according to the section Notes on use in hazardous areas according to ATEX / IECEx (Page 31).

You should also note the information in the document "Use of subassemblies/modules in a Zone 2 Hazardous Area" that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/view/78381013)

ATEX

The CP meets the requirements of the EC directive 2014/34/EU "Equipment and Protective Devices for Use in Potentially Explosive Atmospheres".

Applied standards:

- EN 60079-0

  Hazardous areas - Part 0: Equipment - General requirements

- EN 60079-15

  Explosive atmospheres - Part 15: Equipment protection by type of protection 'n'

The current versions of the standards can be seen in the EC Declaration of Conformity, see above.

ATEX approval: II 3 G Ex nA IIC T4 Gc

Test number: DEKRA 12 ATEX0240 X

The conditions must be met for the safe deployment of the CP according to the section Notes on use in hazardous areas according to ATEX / IECEx (Page 31).

You should also note the information in the document "Use of subassemblies/modules in a Zone 2 Hazardous Area" that you will find on the Internet at the following address:

Link: (https://support.industry.siemens.com/cs/ww/en/view/78381013)

EMC

The CP meets the requirements of the EC Directive 2014/30/EU "Electromagnetic Compatibility" (EMC directive).

Applied standards:

- EN 61000-6-4

  Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments

- EN 61000-6-2

  Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments

RoHS

The CP meets the requirements of the EC directive 2011/65/EU on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

Applied standard:

- EN 50581:2012

c(UL)us

Applied standards:

- Underwriters Laboratories, Inc.: UL 61010-1 (Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 1: General Requirements)
- IEC/UL 61010-2-201 (Safety requirements for electrical equipment for measurement, control and laboratory use. Particular requirements for control equipment)
- Canadian Standards Association: CSA C22.2 No. 142 (Process Control Equipment)

Report / UL file: E85972 (NRAG, NRAG7)

cULus Hazardous (Classified) Locations

Underwriters Laboratories, Inc.: CULUS Listed E223122 IND. CONT. EQ. FOR HAZ. LOC.

Applied standards:

- ANSI ISA 12.12.01
- CSA C22.2 No. 213-M1987

APPROVED for Use in:

- Cl. 1, Div. 2, GP. A, B, C, D T4
- Cl. 1, Zone 2, GP. IIC T4

Ta: Refer to the temperature class on the type plate of the CP

Report / UL file: E223122 (NRAG, NRAG7)

Note the conditions for the safe deployment of the CP according to the section Notes on use in hazardous areas according to UL HazLoc (Page 31).

FM

Factory Mutual Approval Standard Class Number 3600, 3611, 3810

Class I, Division 2, Group A, B, C, D, T4 or Class I, Zone 2, Group IIC, T4

Ta: Refer to the temperature class on the type plate of the CP

Australia - RCM

The CP meets the requirements of the AS/NZS 2064 standards (Class A).

Marking for the customs union

EAC (Eurasian Conformity)

Customs union of Russia, Belarus and Kazakhstan

Declaration of the conformity according to the technical regulations of the customs union (TR CU)

MSIP 요구사항 - For Korea only

Certification Number: MSIP-REM-S49-ET200SP

A급 기기(업무용 방송통신기자재)

이 기기는 업무용(A급) 전자파 적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정 외의 지역에서 사용하는것을 목적으로 합니다.

Current approvals

SIMATIC NET products are regularly submitted to the relevant authorities and approval centers for approvals relating to specific markets and applications.

If you require a list of the current approvals for individual devices, consult your Siemens contact or check the Internet pages of Siemens Industry Online Support:

Link: (http://support.automation.siemens.com/WW/view/en/45605894)

Dimension drawings

B

All dimensions in the dimension drawings are in millimeters.

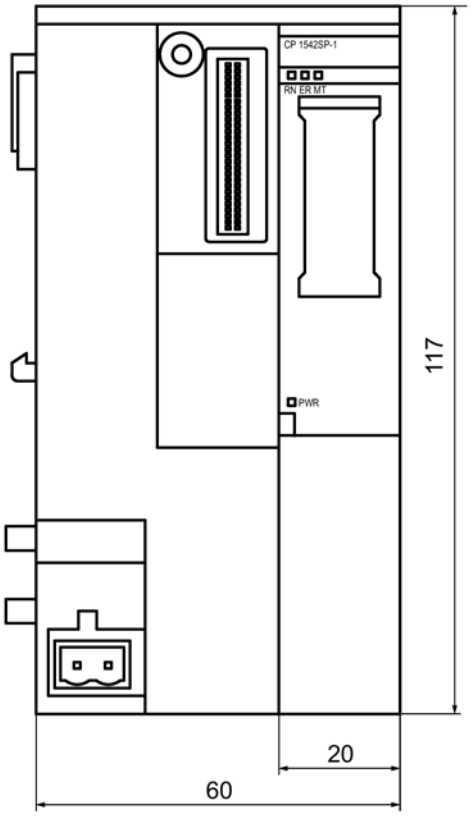

Figure B-1 Front view of the CP

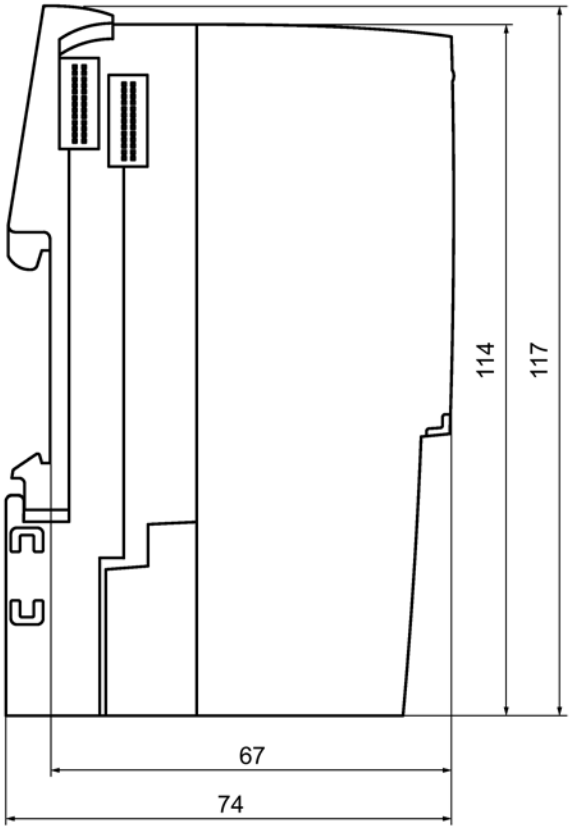

Figure B-2 Side view (left) of the CP

Accessories

C

C.1 BusAdapter

BusAdapter

To connect to the Ethernet network, the CP requires a BusAdapter. A BusAdapter does not ship with the CP.

Figure C-1 Example of a bus adapter, here BA SCRJ/RJ45

The CP supports the following bus adapters:

- BA 2×RJ45

  PROFINET bus adapter with the following connectors:

  – 2 x Ethernet jack RJ-45

  Article number: 6ES7193-6AR00-0AA0

- BA 2xFC

  PROFINET bus adapter with the following connectors:

  – 2 x direct connection of the bus cable (FastConnect)

  Article number: 6ES7193-6AF00-0AA0

- BA 2xSCRJ

  PROFINET bus adapter with the following connectors:

  – 2 x fiber-optic cable POF/PCF

  Article number: 6ES7193-6AP00-0AA0

- BA SCRJ/RJ45

  PROFINET bus adapter, media converter FO - copper with the following connectors:

  – 1 x fiber-optic cable POF/PCF

  – 1 x Ethernet jack RJ-45

  Article number: 6ES7193-6AP20-0AA0

- BA SCRJ/FC

  PROFINET bus adapter, media converter FO - copper with the following connectors:

  – 1 x fiber-optic cable POF/PCF

  – 1 x direct connection of the bus cable (FastConnect)

  Article number: 6ES7193-6AP40-0AA0

- BA 2xLC

  PROFINET bus adapter, media converter FO - copper with the following connectors:

  – 2 x fiber-optic cable glass fiber

  Article number: 6ES7193-6AG00-0AA0

- BA LC/RJ45

  PROFINET bus adapter, media converter FO - copper with the following connectors:

  – 1 x fiber-optic cable glass fiber

  – 1 x Ethernet jack RJ-45

  Article number: 6ES7193-6AG20-0AA0

- BA LC/FC

  PROFINET bus adapter, media converter FO - copper with the following connectors:

  – 1 x fiber-optic cable glass fiber

  – 1 x direct connection of the bus cable (FastConnect)

  Article number: 6ES7193-6AG40-0AA0

You will find further details in the manual /2/ (Page 117) and in the Siemens Industry Mall in Link: (https://mall.industry.siemens.com).

C.2 Assignment of the Ethernet interface of the bus adapter

Pinout of the Ethernet interface

The table below shows the pin assignment of the Ethernet interface. The pin assignment corresponds to the Ethernet standard 802.3-2005, 100BASE-TX version.

Table C- 1 Pin assignment of the Ethernet interface

View of the RJ-45 jack	Pin	Signal name	Assignment
	1	TD	Transmit data +
	2	TD_N	Transmit data -
	3	RD	Receive data +
	4	GND	Ground
	5	GND	Ground
	6	RD_N	Receive data -
	7	GND	Ground
	8	GND	Ground

Documentation references

Where to find Siemens documentation

- Article numbers

  You will find the article numbers for the Siemens products of relevance here in the following catalogs:

  – SIMATIC NET - Industrial Communication / Industrial Identification, catalog IK PI

  – SIMATIC - Products for Totally Integrated Automation and Micro Automation, catalog ST 70

  You can request the catalogs and additional information from your Siemens representative. You will also find the product information in the Siemens Industry Mall at the following address:

  Link: (https://mall.industry.siemens.com)

- Manuals on the Internet

  You will find SIMATIC NET manuals on the Internet pages of Siemens Industry Online Support:

  Link: (https://support.industry.siemens.com/cs/ww/en/ps/15247/man)

  Go to the required product in the product tree and make the following settings:

  Entry type “Manuals”

- Manuals on the data medium

  You will find manuals of SIMATIC NET products on the data medium that ships with many of the SIMATIC NET products.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual. It describes functions that generally affect the ET 200SP distributed I/O system.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

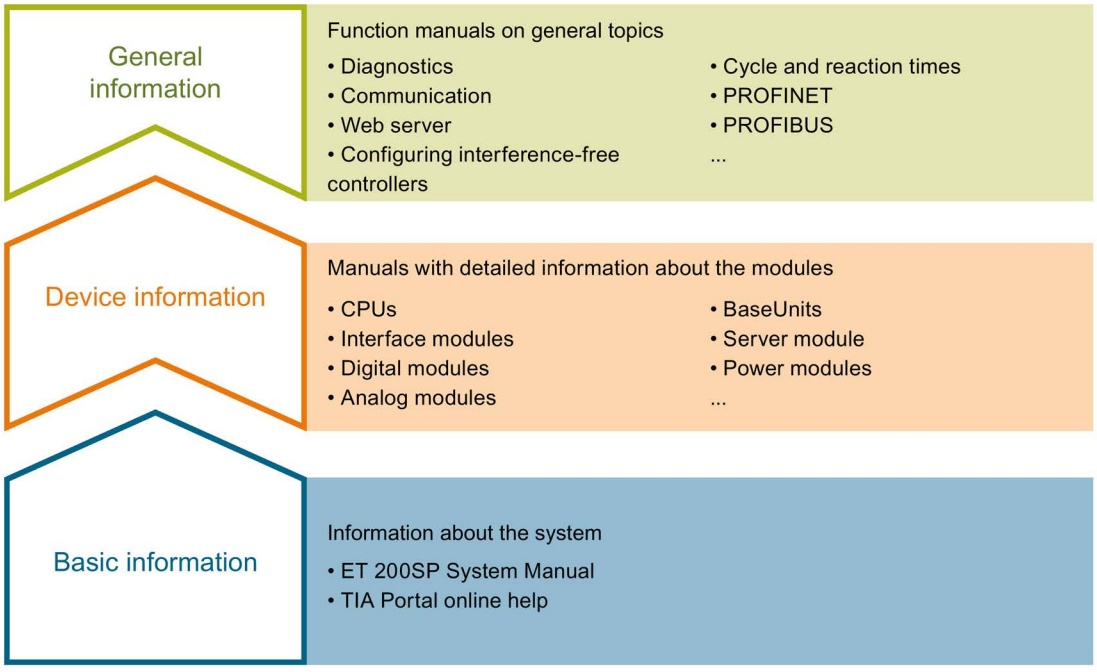
Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Figure 2-1 View of the IO-Link Master CM 4xIO-Link communication module

Properties

The module has the following technical properties:

- IO-Link master according to IO-Link specification V1.1
- Serial communication module with 4 ports (channels)
- Data transmission rate COM1 (4.8 kbaud), COM2 (38.4 kbaud), COM3 (230.4 kbaud)
- SIO mode (standard IO mode)
- Suitable for connecting up to 4 IO-Link devices (3-wire connection) or 4 standard actuators or encoders
- Programmable diagnostics function by port

The module supports the following functions:

Table 2- 1 Version dependencies of the module functions

Function	Firmware version of the module
Firmware update	V1.0 or higher
Identification and maintenance data (I&M)	V1.0 or higher
PROFIenergy	V1.0 or higher
Parameter assignment of the IO-Link parameters by means of S7-PCT	V1.0 or higher
Module replacement with automatic data recovery without engineering for IO-Link master and IO-Link device	V1.0 or higher
Time-based IO (time stamping)	V2.0 or higher
Variable address area of I/O data with up to 32 bytes inputs and 32 bytes outputs	V2.0 or higher
Variable address area of I/O data with up to 144 bytes inputs and 128 bytes outputs	V2.1 or higher

The module can be used with the following engineering tools:

Table 2- 2 Engineering tools depending on the firmware version of the module

Firmware version of the module	S7-PCT	STEP 7 (TIA Portal)	STEP 7 V5.5	GSD file
V1.0 (in PROFINET station)	V3.0 or higher	V12 SP1 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V1.0.3 (in PROFIBUS station)	V3.1 or higher	V13 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V2.0	V3.2 or higher	As of V13 (Time-based IO only with CPU S7-1500)	As of V5.5 SP3 with HSP0231 as of V1.0 (without Time-based IO)	X (without Time-based IO)
V2.1	As of V3.3 and SupportedModules.xml V1.2	As of V13 SP1 with HSP0136 as of V1.0 (Time-based IO only with CPU S7-1500)	As of V5.5 SP4 with HSP0231 as of V4.0 (without Time-based IO)	X (without Time-based IO)

Accessories

The following accessories can be used with the module and are not included in the scope of delivery:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual in the Accessories/Spare parts section.

2.2 Functions

IO-Link is a point-to-point connection between a master and a device. Both conventional and intelligent sensors/actuators can be used as devices at the IO-Link via unshielded standard cables using proven 3-wire technology. IO-Link is backward compatible with conventional digital sensors and actuators. The circuit state and data channel are designed in proven 24 V DC technology.

Reference

Additional information can be found in the IO-Link System (http://support.automation.siemens.com/WW/view/en/65949252) function manual.

2.3 Replacement of the IO-Link Master CM 4xIO-Link communication module with an electronic coding element

If you remove the communication module from the BaseUnit, part of the electronic coding element remains in the BaseUnit. The parameters of the IO-Link Master CM 4xIO-Link and of the IO-Link devices are stored in this part. A newly inserted (but not yet configured) IO-Link master takes over the parameters from the electronic coding element.

⚠ CAUTION

Removal and insertion

Plugging in the IO-Link Master CM 4xIO-Link communication module when the load is switched on can result in dangerous conditions in your plant.

The ET 200SP distributed I/O system may be damaged as a result.

The IO-Link Master CM 4xIO-Link communication module should only be plugged in or pulled out when the load is switched off.

Reference

For more information on the topic of "Coding element", refer to the Changing the type of an I/O module chapter of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.4 Time-based IO

Time-based IO ensures that signals are output with a precisely defined response time. A combination of inputs and outputs allows, for example, passing products to be measured precisely or liquids to be dosed optimally.

As of firmware version V2.0.0, the IO-Link master supports the Time-based IO function. You configure the connected IO-Link devices with time stamp functionality as normal with the SIMATIC S7 Port Configuration Tool (S7-PCT). In the "Ports" tab in S7-PCT, set the necessary parameters in the "Operating mode" section:

- IO-Link_Time_based_IO_IN
- IO-Link_Time_based_IO_OUT
- IO-Link_Time_based_IO_INOUT

The Time-based IO function can be used for IO-Link master with 32 bytes I/O data. Larger I/O data ranges are not supported by Time-based IO.

Note

Time stamp function

The time stamp function requires defined address assignment (mapping).

If the address area you require is already occupied, you must modify the user data arrangement of the IO-Link devices in the address space of the IO-Link master.

The "High-precision input/output with Time-based IO" function manual describes how to move user data in the address space.

Reference

You can find more information about Time-based IO in the High-precision input/output with Time-based IO (http://support.automation.siemens.com/WW/view/en/82527590) function manual.

2.5 Reset communication module to factory settings

Effects of resetting to the factory settings

Use the "Reset to factory settings" function to restore the parameter assignments of your IO-Link Master CM 4xIO-Link communication module made with S7-PCT to the factory state.

After a "Reset to factory settings", the parameters of the IO-Link Master CM 4xIO-Link communication module are assigned as follows:

- The ports are in DI mode
- The ports are mapped to the relative addresses 0.0 ... 0.3
- The PortQualifier is disabled
- I&M data 1 to 3 is deleted
- The electronic coding element (if it exists) is deleted

Note

The device parameters are deleted and the factory state is restored.

You should reset a removed IO-Link Master CM 4xIO-Link communication module to the factory settings before you place it in storage.

Procedure

To perform a "Reset to factory settings", proceed as described in the S7-PCT online help.

NOTICE

Internal encoder supply

Use only the supply voltage (US_n/M) made available by the IO-Link Master CM 4xIO-Link communication module to supply the IO-Link device (L+/L-).

3.2 Block diagram

The following figure shows the block diagram of the IO-Link Master CM 4xIO-Link communication module.

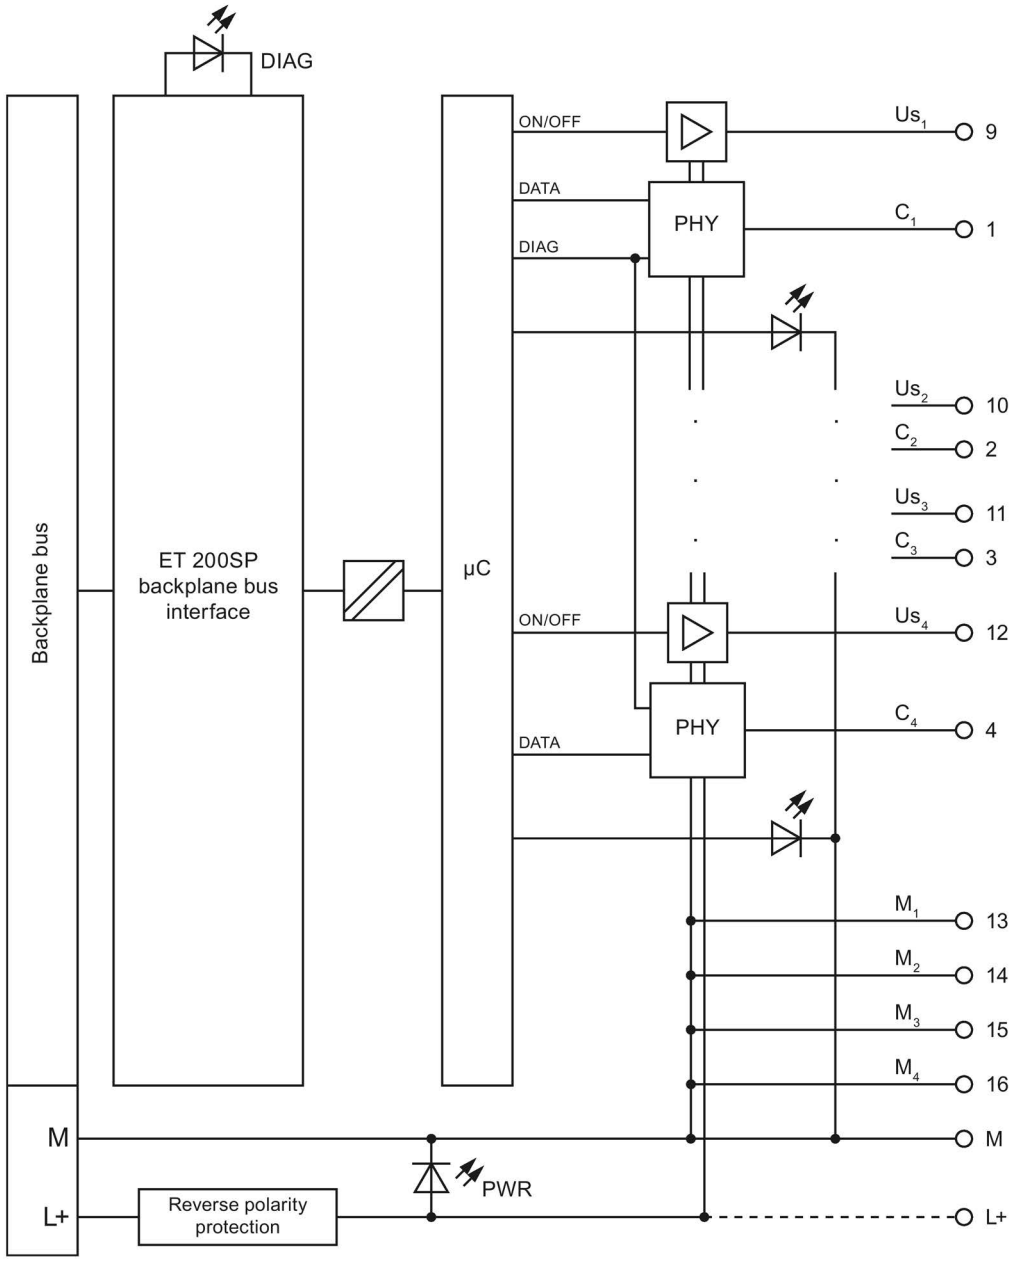

Figure 3-1 Block diagram

Parameters/address space

4

4.1 Parameters

GSD file parameters

The following table shows the parameters for the IO-Link Master CM 4xIO-Link communication module.

Table 4- 1 Parameters (GSD file)

Parameters	Value range	Default	Configuration in RUN	Efficiency range
Diagnostics missing supply voltage L+	• disable • enable	disable	Yes	Module
Diagnostics port 1	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 2	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 3	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 4	• disable • enable	disable	Yes	Port (channel)
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module

4.2 Declaration of parameters

Diagnostics Supply voltage L+ missing

Enabling the diagnostic alarm for missing or insufficient supply voltage L+.

Diagnostics port 1 to port 4

This parameter allows diagnostics to be individually enabled for the four IO-Link ports.

The following assignment applies here:

- Port 1 → Channel 1
- Port 2 → Channel 2
- Port 3 → Channel 3
- Port 4 → Channel 4

Potential group

With the "Potential group" parameter, you specify whether the module is inserted on a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the black BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

ET 200SP distributed I/O system
(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

Address space of the IO-Link Master CM 4xIO-Link communication module

The size of the input and output addresses of the IO-Link Master CM 4xIO-Link communication module with firmware version V1.0 is 32 bytes in each case. As of firmware version V2.0, the modules support a variable address space for I/O data. You specify the assignment of the IO-Link devices in S7-PCT.

The following table lists the possible settings of the supported address spaces for I/O data:

Supported address space for I/O data	IO-Link master with firmware V1.0	IO-Link master with firmware V2.0	IO-Link master with firmware V2.1
1 byte input/1 byte output		X	X
2 bytes inputs/2 bytes outputs		X	X
8 bytes inputs/8 bytes outputs		X	X
16 bytes inputs/16 bytes outputs		X	X
32 bytes inputs/32 bytes outputs	X	X	X
64 bytes inputs/64 bytes outputs			X
144 bytes inputs[1]/128 bytes outputs			X

[1] The address area 144 bytes inputs comprises additional quality information (port qualifier) as well as the 128 bytes process data.

Note

Use of the IO-Link Master CM 4xIO-Link with I/O data > 32 bytes

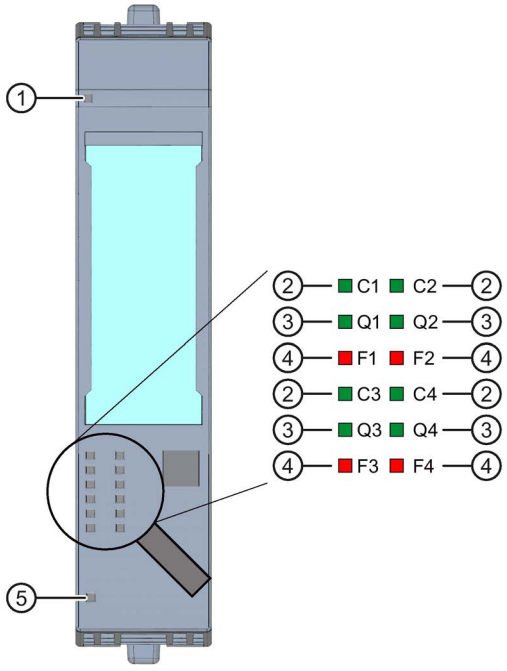
IM 155-6 PN HF/ST interface modules with firmware versions up to V3.0 only support I/O data up to 32 bytes. If you are using IO-Link Master CM 4xIO-Link with I/O data > 32 bytes, you need the IM 155-6 PN HF/ST interface module with firmware version as of V3.1.

Diagnostic alarms

5

5.1 Status and error displays

LED display



①	Diagnostics (DIAG)	(green/red)
②	Port status (Cn)	(green)
③	Channel status (Qn)	(green)
④	Port error (Fn)	(red)
⑤	Supply voltage L+ (PWR)	(green)

n - Channel number

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the Diagnostic alarms (Page 22) chapter.

LED DIAG

Table 5- 1 DIAG LED fault display

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module is not configured
On	Module parameterized and no module diagnostics
Flashes	Module parameterized and module diagnostics

Cn LEDs

Table 5- 2 Status displays of C1, C2, C3 and C4 LEDs

C1, C2, C3 or C4	Meaning
Off	Port disabled or in SIO mode
Flashes	Port in IO-Link mode, device not connected or port not connected with the configured device
On	Port in IO-Link mode, device not connected

Qn LEDs

Table 5- 3 Status displays of Q1, Q2, Q3 and Q4 LEDs

Q1, Q2, Q3 or Q4	Meaning
Off	Process signal = 0 in SIO mode, deactivated or in IO-Link mode
On	Process signal = 1 in SIO mode

Fn LEDs

Table 5- 4 F1, F2, F3 and F4 LED error displays

F1, F2, F3 or F4	Meaning
☐ Off	No error
■ On	Error

LED PWR

Table 5- 5 Status display of the PWR LED

PWR	Meaning
☐ Off	Supply voltage L+ missing
■ On	Supply voltage L+ present

5.2 Diagnostic alarms

Module errors are indicated as diagnostics (module status) only in IO-Link mode.

Table 5- 6 Error types

Diagnostic alarm	Error code	Meaning (IO-Link error code)	IO-Link master	IO-Link device
Short-circuit	1_H	• Short-circuit in the process cables on the IO-Link device (1804_H)	X	
		• Short-circuit on IO device (7710_H)		X
Undervoltage	2_H	• Supply voltage too low (5111_H, 5112_H)		X
Overvoltage	3_H	• Supply voltage too high (5110_H)		X
Overheating	5_H	• Temperature exceeded on master (1805_H)	X	
		• Temperature exceeded on device (4000_H, 4210_H)		X
Wire break	6_H	• No IO-Link device connected • There is a break in the signal line to the IO-Link device • IO-Link device cannot communicate due to another error (1800_H)	X	
Overflow	7_H	• Process tag range exceeded ($8C10_H$) • Measuring range exceeded ($8C20_H$)		X
Underflow	8_H	• Process tag range too low ($8C30_H$)		X
Error	9_H	• All IO-Link error codes which are not listed here are mapped to this PROFIBUS DP error		X
Configuration error	10_H	• Cannot configure IO-Link master (1882_H, 1883_H) • Incorrect device (1802_H) • Storage error (1886_H)	X	
		• Device was not configured correctly (6320_H, 6321_H, 6350_H)		X
Supply voltage missing	11_H	• L+ supply voltage for device missing (1806_H) • L+ supply voltage for device too low (<20 V) (1807_H)	X	
Defective fuse	12_H	• Fuse on device is defective (5101_H)		X
Safety shutdown	19_H	• Serious error (master has to be replaced) (1880_H)	X	
External fault	$1A_H$	• Error in data storage (1809_H, $180A_H$, $180B_H$, $180C_H$, $180D_H$) • Consistency error in electronic coding element (1885_H) • More than 6 errors are pending simultaneously on the IO-Link device (1808_H)	X	

Technical specifications

6

Technical specifications of the IO-Link Master CM 4xIO-Link communication module

	6ES7137-6BD00-0BA0
Product type designation	ET 200SP, CM 4xIO-Link
General information	
Firmware version	V2.1
Product function	
I&M data	Yes
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1 / -
STEP 7 can be configured/integrated as of version	V5.5 SP3 / V5.5 SP4 (in compatibility mode Firmware V1.0)
PROFIBUS as of GSD version/GSD revision	- / GSD as of revision 5
PROFINET as of GSD version/GSD revision	V2.3 / -
Supply voltage	
Rated value (DC)	24 V
Valid range low limit (DC)	19.2 V; 20.5 V if IO-Link is used, because the supply voltage for IO-Link devices on the master must be at least 20 V.
Valid range high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	45 mA; without load
Encoder supply	
Number of outputs	4
Output current, rated value	200 mA
Power loss	
Power loss, typ.	1 W
Digital outputs	
Cable length	
Cable length unshielded, max.	20 m; also applies to shielded cables

	6ES7137-6BD00-0BA0
IO-Link	
Number of ports	4
Number of ports	
• of which can be controlled at the same time	4
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	Yes
Transmission rate	4.8 kBd (COM1); 38.4 kBd (COM2), 230.4 kBd (COM3)
Cycle time, min.	2 ms; dynamic, dependent on the user data length
Size of process data, input per port	32 byte; max.
Size of process data, input per module	144 byte; max.
Size of process data, output per port	32 byte; max.
Size of process data, output per module	128 byte; max.
Memory size for device parameters	2 Kbyte; for each port
Cable length unshielded, max.	20 m; max.
Operating modes	
IO-Link	Yes
DI	Yes
DO	Yes; max. 100 mA
Connection of IO-Link devices	
Port type A	Yes
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes; only for PROFINET
Constant bus cycle time	Yes
Bus cycle time (TDP), min.	250 µs
Jitter, max.	36 µs; typical +/-
Interrupts/diagnostics/status information	
Status display	Yes
Interrupts	
Diagnostic interrupt	Yes; the port diagnostics is only available in IO-Link mode.
Diagnostic alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Diagnostic indicator LED	
Monitoring of supply voltage	Yes, green PWR LED
Channel status display	Yes; per channel one green LED for channel status Qn (SIO mode) and PORT status Cn (IO-Link mode)
For channel diagnostics	Yes; red Fn LED
For module diagnostics	Yes; green / red DIAG LED

	6ES7137-6BD00-0BA0
Electrical isolation	
Electrical isolation channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Permitted potential difference	
Between the different circuits	75 V DC / 60 VAC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	30 g

Overview of the response time

The following figure shows the response time for IO-Link without Time-based IO.

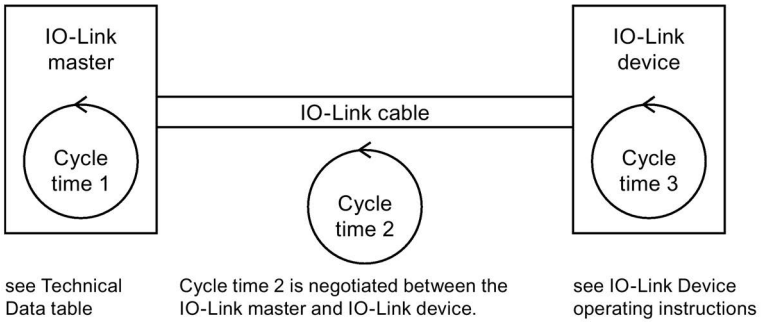


Figure 6-1 Cycle time for IO-Link without Time-based IO

Dimensional drawing

See manual ET 200SP BaseUnits
(http://support.automation.siemens.com/WW/view/en/58532597/133300)

Appendix A

A.1 Parameter data record

Configuration in the user program

You can configure the modules in runtime.

Changing parameters in runtime

The module parameters are included in data record 128. You can transmit the modifiable parameters to the module with the WRREC instruction. The parameters set with STEP 7 are not changed in the CPU by this action.

Instruction for configuration

The following instruction is provided for configuring the IO-Link Master CM 4xIO-Link communication module in the user program:

Table A- 1 Instruction for configuration

Instruction	Application
SFB 53 "WRREC"	Transfer of the alterable parameters to the selected module of the ET 200SP.

Note

If you transfer invalid parameters to the module with the SFB 53 "WRREC" instruction, the module discards the transferred parameters and works with the last valid parameter assignment.

Error message

In the event of an error the following return value is reported:

Table A- 2 Error message

Error code	Meaning
$80B1_H$	Error in data length
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Structure of data record 128

Table A- 3 IO-Link parameters

Offset	Description	Type	Default	Description
0	Version	1 byte	0x02	Shows the structure of the record 0x02 for the IO-Link master in accordance with IO-Link V1.1
1	Parameter length	1 byte	0x02	Parameter length (2 bits + 2 headers)
IO-Link start parameters				
2	Port diagnostics (Port1 1 to n)	1 byte	0x00	Activating the diagnostics for port 1 to n
3	Module properties	1 byte	0x00	Load voltage diagnostics

Table A- 4 Data record: Version

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved		Major version (00)		Minor version (0010)			

Table A- 5 Data record: Port diagnostics

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved				EN_Port4	EN_Port3	EN_Port2	EN_Port1

EN_Portx:

0 = Diagnostics deactivated

1 = Diagnostics activated

Table A- 6 Data record: Module properties

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved						EN_L+	Reserved

EN_L+:

0 = No diagnostics, if no voltage is applied

1 = Diagnostics, if L+ connected

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

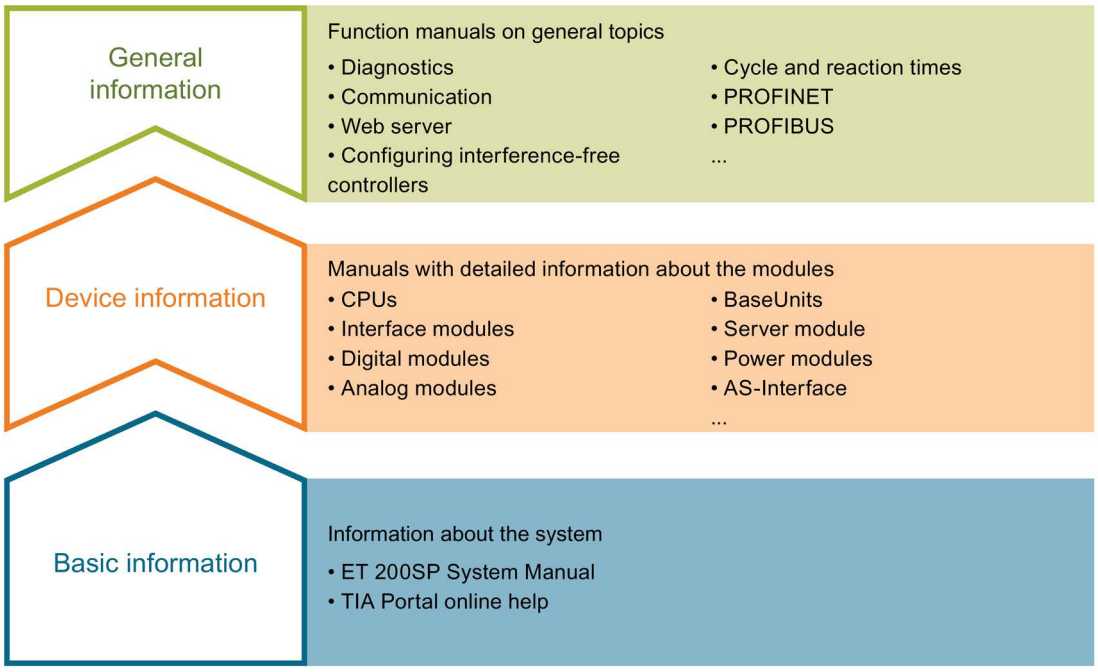
Documentation guide

1

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

The documentation for the SIMATIC ET200 SP distributed I/O system is subdivided into three areas.

This enables you to access the required content quickly.



Basic information

The System Manual describes configuration, assembly, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The *STEP 7* online help supports you with configuration and programming.

Device information

Manuals contain a compact description of the module-specific information, such as properties, connection diagrams, characteristics and technical specifications.

General information

The Function Manuals contain detailed descriptions on topics relating to the SIMATIC ET 200SP environment, such as configuring diagnostics, communications, web servers and controllers for problem-free operation.

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

Documentation for the ET 200SP distributed I/O system with the CM AS-i master ST

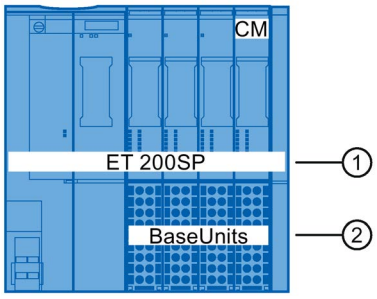


Figure 1-1 Example of a system structure

Table 1- 1 Documentation for the ET 200SP distributed I/O system with the CM AS-i master ST

No.	Component	Documentation	Most important contents
①	System	SIMATIC ET 200SP ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en) SIMATIC distributed I/O (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx)	• Application planning • Installation • Connecting • Commissioning • Technical specifications
②	BaseUnits	SIMATIC ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521)	• Connecting • Technical specifications

Changes and additions to the manuals are documented in the Product Information.

Safety instructions

2

Important safety instructions

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

For use in Pollution Degree 2 Environment.

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

When used in hazardous hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or a suitable enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 in compliance with EN 60529.

⚠ WARNING

Explosion Hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect equipment when a flammable or combustible atmosphere is present.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect while circuit is live unless area is known to be non-hazardous.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Substitution of components may impair suitability for class I, division 2 or zone 2.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not open when energized.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

The equipment is designed for operation with Safety Extra-Low Voltage (SELV) by a Limited Power Source (LPS).

This means that only SELV / LPS complying with IEC 60950-1, EN 60950-1, VDE 0805-1 must be connected to the power supply terminals.

The power supply unit for the equipment power supply must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 40 %. This criteria is fulfilled if supples are derived from SELV (Safety Extra-Low Voltage) only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Division 2, Groups A, B, C, and D or non-hazardous locations only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

Product overview

3.1 Characteristics of the CM AS-i Master ST

Article number

3RK7137-6SA00-0BC1

Brief introduction to AS-Interface

AS-Interface or Actuator-Sensor-Interface (AS-i for short) is a fieldbus system for industrial use that is used to transmit digital and analog signals between a controller and machine or process in real-time. The system can be used for standard signals as well as for safety-related signals.

AS-Interface is designed to connect actuators and sensors to the controller as easily, flexibly and efficiently as possible.

The system consists of an AS-i master and up to 62 AS-i slaves that are simply plugged onto the yellow AS-i flat ribbon cable at any point or connected via terminals. The AS-i cable can be up to 100 m long with free choice of topology. A length of up to 200 m is possible with an additional extension plug. The system can be extended beyond that through the use of repeaters.

In addition, an AS-i power supply unit is connected to the cable such that the slaves and their connected sensors are supplied with operating voltage without additional cabling. Actuators are usually supplied with voltage by means of a 24 V cable, because they generally need more power than sensors.

A typical digital AS-i slave has up to 4 inputs and 4 outputs. The slaves are installed directly in the plant as close as possible to the sensors or actuators so that the connecting cables can be kept very short. The insulation displacement method is the preferred method for connection to the AS-i flat ribbon cable so that assembly can be completed without errors in the least amount of time. For safety-related signals, safety slaves and modules are available for safety-related processing of signals. In addition, analog slaves and complete switchgear with integrated AS-i slave are offered.

The default voltage fed in from the AS-i power supply unit is 30 V DC. As a result, sensors with a rated voltage of 24 V can be used without any problems despite the voltage drop on a longer AS-i cable. Because the AS-i cable transmits both operating DC voltage and modulated communication signals, the AS-i power supply unit contains a data decoupling unit for separating the two voltage waveforms.

A standard power supply can be used in place of the easy-to-use AS-i power supply if the AS-i cable is connected via a separate data decoupling module. When a standard power supply with 24 V DC is used, it must be ensured that the connected AS-i components and sensors are designed for operation with the corresponding lower voltage.

You will find further information on the Internet at: AS-Interface (http://www.siemens.com/as-interface).

Use of the module

The CM AS-i Master ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The CM AS-i Master ST features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The CM AS-i Master ST can be plugged into C0-type BaseUnits (BU).

You can plug several CM AS-i Master ST modules into one SIMATIC ET 200SP station. Each CM AS-i Master with firmware version V1.0 occupies 32 bytes of I/O address space. From firmware version V1.1 onwards, the CM AS-i Master ST supports up to 288 bytes of I/O address space. The number of possible AS-i master modules depends on the maximum address space of the utilized Interface Module (IM) of the ET 200SP or the utilized ET 200SP CPU.

In a SIMATIC ET 200SP station with an IM 155-6 PN ST standard interface module and a maximum address space of 256 bytes, up to eight CM AS-i Master ST modules can be plugged in (when the I/O address space is configured as 32 bytes).

Significantly more modules can be plugged into a SIMATIC ET 200SP station with High Feature Interface Module IM 156-6 PN HF and a maximum address space of 1440 bytes.

If the ET 200SP contains other modules, the available address space is reduced and the maximum number of AS-i master modules is reduced accordingly. The maximum number of modules can be increased by shortening the I/O address space of the CM AS-i Master ST module.

For further information, see the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/84133942).

The CM AS-i Master ST module can generally be combined with all ET 200SP interface modules. Any exceptions to this are documented in the delivery release product announcement(s) of the interface module.

The CM AS-i Master ST module (Firmware V1.1 and higher) can generally be combined with all ET 200SP CPU modules (Firmware V1.8 and higher). Any exceptions to this are documented in the delivery release product announcement(s) for a CPU module.

The interface modules und CPU modules differ, among other things, in terms of the maximum number of I/O modules, the length of the I/O process image in the station and the length of the I/O process image for each I/O module. The technical specifications of the interface modules and CPU modules can limit the selection of possible parameters of the CM AS-i Master ST module. Note, in particular, that the length of the I/O process image of the CM AS-i Master ST module must be selected in such a way that the maximum length of the I/O process image of the interface module or CPU module is not exceeded.

View of the module

Figure 3-1 View of the CM AS-i Master ST

Properties

- Technical properties
  - AS-i master acc. to AS-Interface Specification 3.0
  - Transmission of digital I/O values to cyclic process image
  - Transmission of analog I/O values in the cyclic process image (Firmware V1.1 and higher) or via acyclic data record communication.
  - Configuration button can be connected to terminals
- Supported functions
  - I&M identification data
  - Firmware update
  - Configuration of the AS-i master and AS-i slaves via data records (Read / Write or command interface)

The module can be used with the following engineering versions:

Table 3- 1 Version dependence of the CM AS-i Master ST engineering versions

Firmware version of the module	*STEP 7* (TIA portal)	*STEP 7* V5.5	GSD file
V1.0	V12 and higher	V5.5 SP3 HF5 and higher	X
V1.1	V13 SP1 and higher	V5.5 SP3 HF5 and higher	X

For additional information, see product announcement for: CM AS-i Master ST (https://support.industry.siemens.com/cs/ww/en/view/72865595)

Table 3- 2 Version dependence of the CM AS-i Master ST functions

Function	Firmware version of the module
Configuring in *STEP 7* (TIA Portal) V12 and higher	V1.0 and higher
GSD file (PROFIBUS)	V1.0 and higher
GSD file (PROFINET)	V1.0 and higher
Access via command data records	V1.0 and higher
Structure of the process image: 32 bytes	V1.0 and higher
Transmission of digital I/O values in the cyclic process image	V1.0 and higher
Transmission of analog I/O values via data record transfer	V1.0 and higher
Firmware update	V1.0 and higher
Duplicate address detection	V1.0 and higher
Automatic address programming with manual writing of the ID1 code	V1.0 and higher
Write ID1 code to AS-i address "0"	V1.0 and higher
Configuring in *STEP 7* (TIA Portal) V13 SP1 and higher	V1.1 and higher
Status information for all slaves of the AS-i master system (TIA Portal)	V1.1 and higher
Detailed, device-specific diagnostics (TIA Portal)	V1.1 and higher
Configuring in *STEP 7* V5.5 and higher	V1.1 and higher
Option handling	V1.1 and higher
Proxy slave	V1.1 and higher
Structure of the process image: Up to 288 bytes, adjustable length	V1.1 and higher
Transmission of analog I/O values via process data	V1.1 and higher
Variable address area for I/O data	V1.1 and higher
Automatic address programming with automatic writing of the ID1 code	V1.1 and higher
AS-i slave_ID1_write_with_target_address	V1.1 and higher
Automatic duplicate address detection for AS-i voltage of either 24 V or 30 V	V1.1 and higher

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

3.2 Operating modes of the CM AS-i Master ST

The AS-i master has two operating modes:

- "Configuration mode"
- "Protected operation"

"Configuration mode"

"Configuration mode" can be used for commissioning an AS-i installation. You can also use "configuration mode" for productive operation. The AS-i bus configuration is not defined in this case. This means that error messages for a change of bus configuration are not possible.

You switch the AS-i master from "protected operation" to "configuration mode" in *STEP 7*. The "CM" LED (Configuration Mode) then lights up green.

In "configuration mode", the AS-i master can exchange data with every AS-i slave that is connected to the AS-i cable. This does not apply to AS-i slaves with the address "0". The AS-i master immediately detects and activates newly added AS-i slaves and includes them in cyclic data exchange. The digital process data of the connected AS-i slaves are stored according to a fixed scheme in the process image starting from a configurable start address. See "Transmitting AS-i digital values (Page 50)". The digital process image for the inputs of non-existent slaves is filled with the substitute value "0". Analog process data can only be accessed by means of data record communication.

In "configuration mode", configuration errors of AS-i slaves are not signaled to the higher-level station via an alarm and are not indicated by the "DIAG" LED.

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. In case of changes to the bus configuration, error messages are automatically generated if diagnostics is enabled. See "Parameter assignment/addressing (Page 47)".

Configuration can be performed:

- By configuring the AS-i slaves in the *STEP 7* project (Configuration of the AS-i slaves in STEP 7 (Page 32))
- By transferring the slave configuration with the online "ACTUAL → CONF" function in *STEP 7* (Applying the slave configuration (Page 39))
- By calling the command interface in the SIMATIC user program with the following commands:
  - Store_Actual_Configuration (Page 113)
  - Write_overall_configuration (Page 130)
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 35))

If you have configured the AS-i slave in the *STEP 7* project, the changeover to "protected operation" occurs automatically.

Changeover between "configuration mode" and "protected operation"

- By switching the operating mode using the "Online functions in the TIA Portal (Page 38)".
- By calling the command interface in the user program of SIMATIC with command "Set_Operation_Mode (Page 118)".
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 35)).

Changeover is not possible if the AS-i slaves have been configured in the *STEP 7* project and the CPU is in RUN operating mode.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Following a firmware update, mark the current firmware version on the housing of the CM AS-i Master ST.

Current firmware updates are available on the Internet for download (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Pay careful attention to the information on performing the firmware update contained in the download entry.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs are off

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

LED behavior after a successfully completed firmware update

When the TIA Portal is used, an error-free firmware update is indicated by the message that the firmware was successfully transferred. You must confirm the message using the button before you continue. Without confirmation, the LED status remains unchanged so that the firmware update is incomplete and must be repeated.

When *STEP 7* V5.5 (classic) is used, there is no concluding message and the LED status changes autonomously.

If the firmware is updated without errors, the LED status is updated:

- DIAG flashes red until the AS-i voltage is switched off and back on again
- PWR is lit green
- Remaining AS-i LEDs are lit

⚠ WARNING

Required intermediate step for firmware update of a CM AS-i Master ST with FW V1.0 using an ET 200SP CPU.

Failure to perform this step causes the CM AS-i Master ST to become permanently inoperable.

If you want to perform an update to a higher firmware version for a CM AS-i Master ST module with FW V1.0 and are using an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), you must always perform the following intermediate step:

After the update of the LED status, the CM AS-i Master ST module must be removed from the ET 200SP BaseUnit. Instead of removing the module, it is also sufficient to switch off the AS-i voltage and the 24 V voltage of the ET 200SP. A TIA Portal error message appears approximately one minute after the module has been removed indicating that online access to the module is no longer possible. Confirm the error message. Then plug the module onto the BaseUnit again or switch the voltages back on.

Now repeat the firmware update. In this case, the intermediate step described here can be skipped.

The intermediate step is not required for:

- Firmware update of a CM AS-i Master ST module with active FW V1.1 or higher
- Use of an ET 200SP configuration with a PROFINET interface module (IM) and PROFINET connection to a released SIMATIC CPU
- Use of an ET 200SP configuration with a PROFIBUS interface module (IM) and PROFIBUS connection to a released SIMATIC CPU.

Note

For operation of the CM AS-i Master ST module in an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), the following minimum requirements of the firmware and software versions apply:

- CM AS-i Master ST with FW V1.1 or higher, and
- ET 200SP CPU with FW V1.8 or higher (CPU 1510SP-1 PN, CPU 1510SP F-1 PN, CPU 1512SP-1 PN, CPU 1512SP F-1 PN, Open Controller CPU 1515SP PC)
- Configuration with *STEP 7* V13 SP 1 Update 4 or higher

Note

Restart after a firmware update

Following a firmware update, the AS-i voltage must be switched off and back on again in order for the new firmware to be activated.

Wait for the LED status to update before performing the restart. Otherwise the firmware update is not complete and must be repeated.

LED behavior in the event of an error during a firmware update

If an error occurs during the firmware update, the LEDs assume the following status:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs indicate the status of the AS-i and are not relevant here.

In this case, switch the AS-i voltage off and back on again and repeat the firmware update.

Connection

4

4.1 Terminal assignment

Requirements

For connecting, you require a BaseUnit:

- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other I/O module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

Exception:

BaseUnits with power busbars without connection to the terminals of the plug-in I/O module can be used within a BaseUnit group for AS-i. These BaseUnits include the following dark BaseUnits with 20 mm width:

- BU20-P12+A0+4B (BU type B1)
- BU20-P12+A0+0B (BU type D0)
- BU20-P8+A4+0B (BU type F0)

Make sure that external voltage from adjacent BaseUnits cannot under any circumstances be connected to the AS-i modules.

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in Section "Schematic circuit diagram (Page 27)", "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

General terminal assignment

Table 4- 1 Terminal assignment of the CM AS-i Master ST

Terminal	Assignment	Description
1	SET1	Connection of the "SET" button (optional),
2	SET2	see "Configuration of the AS-i slaves using the "SET" button (Page 35)"
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L [1)]	ASI+	Connection of the AS-i cable, positive polarity
1N, 2N [1)]	ASI-	Connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "SET" button

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This enables you to apply the ACTUAL configuration of the connected AS-i slaves as the CONFIGURED configuration. This function is activated by closing the button contact on the SET1 and SET2 terminals.

The maximum cable length between the terminal and "SET" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

See also

"ET 200SP Distributed I/O System" System Manual
(http://support.automation.siemens.com/WW/view/en/58649293/0/en)

"ET 200SP BaseUnits" Manual
(http://support.automation.siemens.com/WW/view/en/59753521/0/en)

4.2 Schematic circuit diagram

Schematic circuit diagram

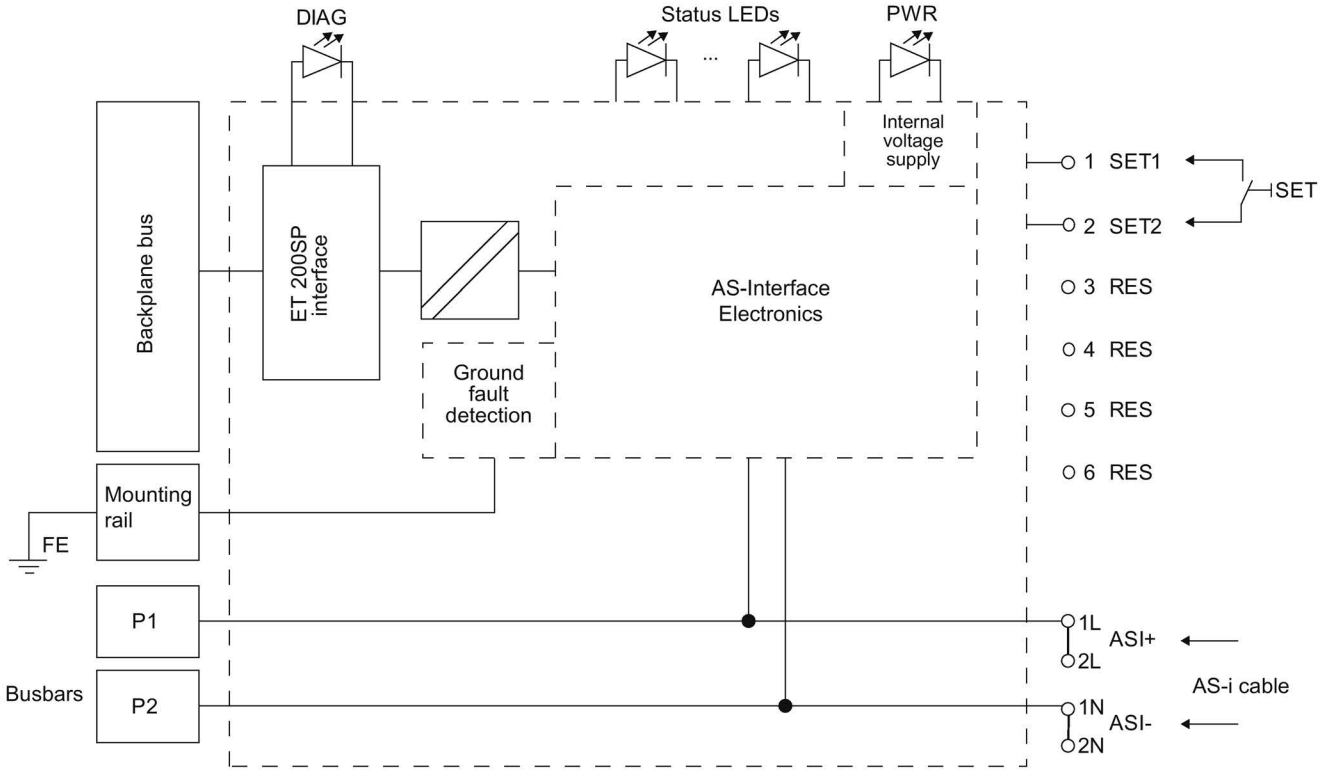

Figure 4-1 Circuit diagram of the CM AS-i Master ST

1L, 2L are connected through in the BaseUnit.

1N, 2N are connected through in the BaseUnit.

Connection to power busbars

The following are connected via the CM AS-i Master ST:

- 1L and power busbar P1
- 1N and power busbar P2

The maximum permitted current here is 4 A. For a conducted current of 4 A, the reduced ambient temperature range applies:

- Max. 55 °C for a horizontally mounted rail
- Max. 50 °C for a vertically mounted rail

If safety-related signals are to be processed on the AS-i cable, you can arrange a dark BaseUnit type C1 to the right of the light BaseUnit type C0 with the CM AS-i Master ST module and plug a safety-related F-CM AS-i Safety ST module onto this dark BaseUnit. The AS-i cable is continued from the light BaseUnit to the dark BaseUnit via the power busbars so that the F-CM AS-i Safety ST module is connected to the AS-i network of the master without additional wiring.

It is not permitted to transmit the AS-i voltage from the connecting terminals on the front of the dark BaseUnit because a current draw of this type may cause an overload in the modules.

Connect the AS-i cable with AS-i power supply unit and AS-i slaves only to terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the light BaseUnit.

You can find additional information on safety-related processing in the "Fail-safe module F-CM AS-i Safety ST (https://support.industry.siemens.com/cs/ww/en/view/90265988)" manual.

Power supply units supported for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to max. 40 V in the event of a fault

The Siemens power supply units for AS-Interface meet these requirements (see operating instructions of the power supply unit).

Use an AS-Interface power supply unit (with integrated data decoupling) or a combination of a standard power supply unit and a data decoupling module.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/42806066)

Power supply

The CM AS-i Master ST is fully powered from the AS-i voltage. Only the internal backplane bus interface for the ET 200SP station (including the DIAG LED) is powered from the operating voltage of the ET 200SP station.

If the operating voltage of the ET 200SP station fails, the communication between the AS-i master and AS-i slaves continues without interruption, in which case the outputs of the AS-i slave are reset to zero.

Configuring

5

5.1 Requirements

Introduction

You configure the ET 200SP station and its CM AS-i Master ST and assign their parameters using *STEP 7* or the configuration software of another manufacturer.

Configuring the CM AS-i Master ST

Configuring in *STEP 7* or another configuration software is required in order to use the CM AS-i Master ST in an ET 200SP. A distinction is made here between the necessary basic configuration of the AS-i master and the optional configuration of the AS-i slaves.

You can configure the module using *STEP 7* or with a GSD file. Version dependencies:

Table 3-1 Version dependence of the CM AS-i Master ST engineering versions (Page 17)

Note

CM AS-i Master ST in the hardware catalog of *STEP 7*

If the CM AS-i Master ST module in the applicable firmware version is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". You can install this HSP from the Internet using the corresponding function in *STEP 7*.

Further information can be found in the documentation and in the online help for *STEP 7*.

Installing the HSP in *STEP 7* V5.5 (classic)	"HW Config" > "Options" menu > "Install HW Updates"
Installing the HSP in *STEP 7* V13 (TIA Portal):	"Options" menu > "Support packages"

You can find additional information on the HSP and download it in Internet (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Download the GSD file from the internet:

PROFINET GSD file (https://support.industry.siemens.com/cs/ww/en/view/57138621)

PROFIBUS GSD file (https://support.industry.siemens.com/cs/ww/en/view/73016883)

Observe the *STEP 7* online help or the documentation of the configuration software manufacturer.

Configuring the AS-i system requires two steps:

1. Basic configuration of the AS-i master (Basic configuration of the CM AS-i Master ST (Page 31))
2. Configuration of the AS-i slaves

Configuring the AS-i slaves includes defining the slave modules and, if necessary, assigning the slave operating parameters.

See also

Configuration of the AS-i slaves in STEP 7 (Page 32)

Configuration of the AS-i slaves using the "SET" button (Page 35)

Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 37)

Configuration of the AS-i slaves using the PLC program (Page 37)

Characteristics of the CM AS-i Master ST (Page 15)

5.2 Basic configuration of the CM AS-i Master ST

The following is carried out as a result of the basic configuration:

- The AS-i master is made known with the system.
- The length of the cyclic process image is made known (length can be set in FW V1.1 and higher).
- The operating parameters of the AS-i master are assigned.

Procedure

The basic configuration is performed by inserting the AS-i master module into the project of the configuration software.

Change the operating parameters according to their use. You will find information on operating parameters in the Sections:

- Parameters (Page 47)
- Explanation of the parameters (Page 47)

Should the need arise, you can change the size of the process image to be transferred as follows:

- In *STEP 7* in the "Properties" dialog of the AS-i master
- When the GSD file is used, by selecting the respective module variant from the GSD selection list

Further information on the process image:

- Address space (Page 48)

See also

Configuration of the AS-i slaves in STEP 7 (Page 32)

5.3 Configuration of the AS-i slaves

5.3.1 Configuration of the AS-i slaves in STEP 7

During configuration of the AS-i slaves, you specify the stations that the AS-i master is to communicate with in *STEP 7*.

Configuration in *STEP 7* provides the following advantages:

- AS-i slaves are displayed graphically in the network view along with their AS-i addresses (*STEP 7* (TIA Portal)) or displayed as a list (*STEP 7* V5.5 and higher).
- The assigned I/O addresses of an AS-i slave are displayed in the Properties window of the AS-i slave.
- The slave parameters can be configured in the *STEP 7* user interface.
- The configuration of the slaves is stored in the *STEP 7* project, which makes documentation easier.
- The configuration data is stored in the PLC and transferred automatically when the AS-i master is replaced.
- During power-up, the AS-i master switches automatically to "protected operation".
- The diagnostic status of the slave is displayed in *STEP 7* (TIA portal) in the network view as a symbol (currently only in combination with S7-300 / S7-400 CPU).

Note

If you do not configure any AS-i slaves in *STEP 7* or if you configure using a GSD file, AS-Interface uses the CONFIGURED configuration saved in the AS-i master. The following sections describe how you can create the CONFIGURED configuration:

- Configuration of the AS-i slaves using the "SET" button (Page 35)
- Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 37)
  This does not apply when configuring with a GSD file.
- Configuration of the AS-i slaves using the PLC program (Page 37)

Procedure

You activate configuration of the AS-i slaves in *STEP 7*:

- In *STEP 7* (TIA Portal) by connecting at least one AS-i slave to the AS-i master over an AS-i network in the network view.
- In *STEP 7* V5.5, by inserting at least one AS-i slave in the configuration table of the AS-i master (FW V1.1 and higher).

When the AS-i slaves are configured in *STEP 7*, configuration is not possible using the "SET" button, via the online function or the PLC program.

This configuration switches the AS-i master automatically to "protected operation".

Option 1: Selection from the hardware catalog

To configure the AS-i slaves, open the hardware catalog in *STEP 7*.

STEP 7 (TIA Portal).

In *STEP 7* (TIA Portal), you will find the AS-i slaves under "Field devices".

1. Select a module from the hardware catalog.
2. Drag the module to the network view.
3. Connect the AS-i interface of the module (yellow square in the slave symbol) to the AS-i interface of the AS-i master (yellow square in the master) or directly to the yellow line of the AS-i subnet. When a connection is made to the AS-i subnet, a free AS-i address is automatically assigned in the configuration.

   You can change this AS-i address in the properties dialog of the AS-i slave in the "AS-Interface" area.

STEP 7 V5.5:

1. Open the "Object properties" dialog of the CM AS-i Master ST in the ET 200SP. To do so, select "Object properties" in the shortcut menu.
2. Click the "Slave configuration" tab (FW V1.1 and higher) in the "Properties..." dialog of the CM AS-i Master ST (FW V1.1 and higher) to open it.
3. Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.
4. Click the "Select" button to open the "Slave selection dialog".
5. Select a slave in this dialog.

   Alternatively: Select a slave from the "Module" list box.

Option 2: Reading out an existing AS-i configuration

If an AS-i cable with AS-i slaves is connected to the AS-i master, you can transfer the connected slaves to the configuration of *STEP 7*. The connected AS-i slaves must have addresses other than "0".

Procedure:

1. Switch on the AS-i voltage.
2. Compile the project and download it to the station.
3. *STEP 7* (TIA Portal):
   - Right click the AS-i master.
   - Select "Hardware detection" in the shortcut menu.

   STEP 7 V5.5:
   - Select the ET 200SP.
   - Open the "Properties" dialog of the CM AS-i Master ST by double-clicking the slot of the CM AS-i Master ST, for example.
   - Change to the "Options AS-i slaves" tab.
   - Click the "Upload to PG" button.

4. The detected slaves are applied as universal slaves in the project.

   Note

   Automatic reading out of article numbers is not possible.

   Slave addresses already present in the project are not overwritten. If you want to transfer a slave address that is already present, you must delete the existing slave in the hardware detection before the readout.

5. You can now edit the slaves applied to the project as if you had taken them directly from the hardware catalog.

The following basic types are available:

- Siemens AS-i slave
- Universal slave with the following forms:
  - AS-i F Slave Universal for safety-related applications
  - AS-i Standard Slave Universal, for configuring with standard address or extended address (A/B slaves)
  - Universal AS-i Proxy Slave

The article numbers for the slaves are only saved in the offline project. Comparison of the article numbers in the offline project with those of the slaves on the AS-i cable is not performed. The AS-i master uses the configuration data of the slave profile (IO.ID.ID2) and ID1 code of the AS-i slave for comparison of the actual status with the configured status.

Configuring the properties of Siemens AS-i slaves

When you use an AS-i slave from Siemens, you select the slave directly from the hardware catalog.

This selection offers the following properties:

- The device type is represented in *STEP 7* (TIA Portal) using an image.
- The meaning of the slave parameters is displayed as text.
- The underlying slave profile is already set. The IO, ID and ID2 identifiers do not need to be entered.

Parameter bits that are irrelevant for the Siemens slave are set to the default value "1". They cannot be changed.

The ID1 code is preassigned according to the factory setting of the Siemens slave. If you change the ID1 code of the slave, you must also change the setting in the slave configuration.

See also the command "AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address) (Page 159)".

Configuring the properties of universal AS-i slaves

When configuring with the universal AS-i slave or universal AS-i F slave, you must make the following settings:

- Profile identification of the AS-i slave (IO, ID, ID2)
- Parameters of the AS-i slave

You will find the profile identification, the ID1 code, and the meaning of the AS-i slave parameters in the documentation for the AS-i slave.

The I/O assignment of the slave is shown, depending on the specified profile identification, in the "Configuration" section.

Applying the slave configuration (Page 39)

Store_Actual_Configuration (Page 113)

5.3.2 Configuration of the AS-i slaves using the "SET" button

Functional principle

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This supports the teaching procedure for the connected AS-i slaves. This function is activated by closing the button contact on the SET1 and SET2 terminals.

Behavior in "configuration mode" and in "protected operation"

Table 5- 1 "Configuration mode"/"Protected operation"

Mode of the CM AS-i Master ST	Behavior of the "CM" LED
"Configuration mode"	The "CM" LED lights up.
"Protected operation"	The "CM" LED does not light up.

When the AS-i master is in "configuration mode", the AS-i master is configured automatically when the "SET" button is pressed. Configuration is carried out as follows:

1. The CM AS-i Master ST saves the AS-i slave configuration present on the AS-i cable as the CONF configuration in non-volatile memory.
2. The AS-i master then switches over to "protected operation".

If the AS-i master is in "protected operation", it will switch to "configuration mode" when the "SET" button is pressed.

The "SET" button is only activated when the CPU is in "STOP" state or after disconnecting the bus from the IM module of the ET 200SP.

Requirements

Ensure the following states exist:

1. The CPU is in "STOP" state or the bus is disconnected from the IM module of the ET 200SP.
2. The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
3. No AS-i slave with address 0 is connected to AS-Interface. The AS-i slaves have unique addresses that differ from one another.

Procedure

1. Check whether the AS-i master is in "configuration mode". (The "CM" LED lights up.)

   If the "CM" LED does not light up, switch the AS-i master to "configuration mode" by pressing the "SET" button once.
2. Press the "SET" button. This configures the AS-i master. In so doing, the ACTUAL configuration detected is saved as the CONF configuration in non-volatile memory in the CM AS-i Master ST. At the same time, the AS-i master switches over to "protected operation". The "CM" LED goes out.

Note

Parameter setting when configuring with the "SET" button

If no AS-i slaves are connected, all internal lists are set to default values. In particular, the following are set: all AS-i parameters = F_{Hex} and bit "AutoAdress_Enable = 1".

When configuring is performed using the "SET" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the Set_Permanent_Parameter (Page 107) command.

Note

The existing configuration can be overwritten using the "SET" button

Note regarding the CM AS-i Master ST:

A configuration of AS-i slaves specified using *STEP 7* and downloaded to the S7 station is transferred to the AS-i master again during S7 station start-up or after station recovery of the head module. Any configuration implemented using the "SET" button will be overwritten.

When configuring with the "SET" button, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 45)"). The AS-i voltage must be present.

See also

Terminal assignment (Page 25)

5.3.3 Configuration of the AS-i slaves via the control panel in the TIA Portal

You can also execute the functionality of the "SET" button described in Section "Configuration of the AS-i slaves using the "SET" button (Page 35)" via the control panel in *STEP 7*.

When configuring the AS-i slaves over the control panel in TIA Portal, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 45)"). The AS-i voltage must be present.

5.3.4 Configuration of the AS-i slaves using the PLC program

You can use the PLC program to completely define the configuration of the AS-i slaves.

The command interface of the AS-i master is available for this. You use the Write_overall_configuration (Page 130) command to specify the CONF configuration of the AS-i slaves in the AS-i master, similarly as when configuring the slave in the TIA Portal.

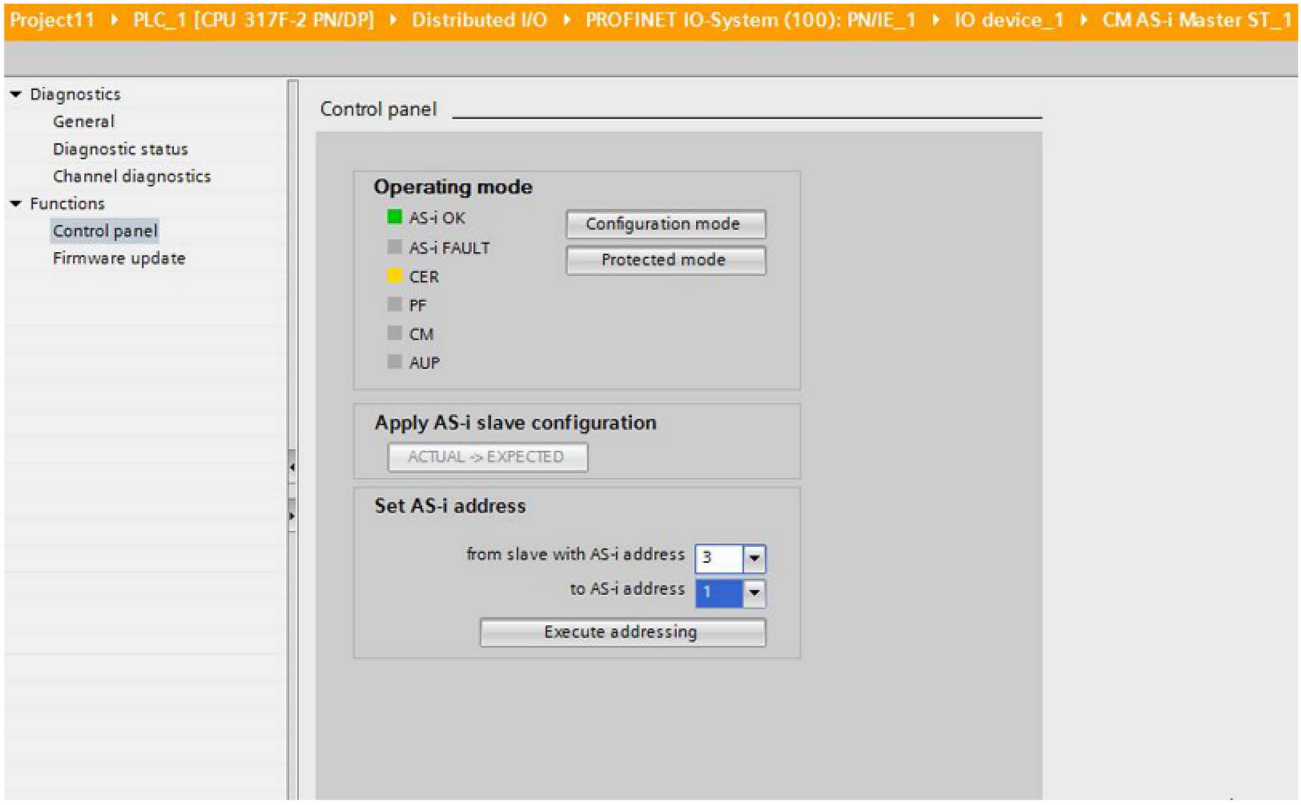
The Store_Actual_Configuration (Page 113) command allows you to save the ACTUAL configuration as the CONF configuration in the AS-i master, similarly as when using the "SET" button for this.

5.4 Online functions in the TIA Portal

5.4.1 Switching from one operating mode to another

In *STEP 7* "Online" > "Diagnostics", you can switch between "protected operation" and "configuration mode" under "Functions". There are two buttons:

- "Configuration mode"
- "Protected operation"



The LEDs on the AS-i master and in *STEP 7* indicate the current operating mode of the AS-i master. You will find additional information in Section "Meaning of the LEDs (Page 64)".

The operating mode can only be switched when the CPU is in "STOP" state.

Note

Online functions

The online functions can only be performed when at least the basic configuration has been completed and the configuration has been loaded into the ET 200SP station.

5.4.2 Applying the slave configuration

Application

This step is only necessary if AS-i slaves have not been configured in *STEP 7* and the configuration of the AS-i slaves is not performed using the "SET" button.

If AS-i slaves have already been configured in *STEP 7* and the slave configuration has been downloaded to the AS-i master, the system deactivates the function for applying the slave configuration. It is then no longer possible for this function to be called.

Requirements

The following requirements must be satisfied to do this:

- The CPU is in "STOP" state.
- The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
- No AS-i slave with addess 0 is connected to the AS-Interface. The AS-i slaves have unique addresses that differ from one another.
- The AS-i master is in "configuration mode".

Applying the slave configuration

The "ACTUAL → CONF" button in the "Online" > "Diagnostics" window can be used to apply the configuration of slaves connected to the master.

The following data of the AS-i slaves is saved in non-volatile memory in the AS-i master:

- AS-i addresses
- The slave profile for each AS-i slave: IO code, ID code, ID2 code
- ID1 code for each AS-i slave

It is not possible to apply the slave configuration via the "ACTUAL -> CONF" button if AS-i slaves have already been configured in *STEP 7* and downloaded to the AS-i master or if the CPU is in "RUN" state. You reactivate the "ACTUAL -> CONF" function by downloading only the basic configuration – that is, the configuration without configured AS-i slaves – in *STEP 7* again.

Note

Parameter setting when applying the slave configuration

When configuring is performed using the "ACTUAL→CONF" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the Set_Permanent_Parameter (Page 107) command.

5.4.3 Setting the address of an AS-i slave

In the "Online" > "Diagnostics" window, you can assign a new address to an AS-i slave using a selection menu and the "Execute addressing" button. Only free AS-i addresses are available here.

5.5 Variable configuration

Option handling and proxy slaves can be combined.

5.5.1 Option handling

A machine consists of a basic configuration and several expansion stages. The overall configuration is configured in the *STEP 7* project. The slaves that belong to an expansion stage are configured as optional slaves. When the system is commissioned, the user program (PLC) defines which expansion stages are installed. The configuration in *STEP 7* remains unchanged.

You can use option handling to activate and deactivate AS-i slaves that you have defined in HW Config in the user program during operation.

You configure the AS-i slaves in the AS-i master as described in Section "Configuration of the AS-i slaves in STEP 7 (Page 32)":

1. Activate option handling.

   STEP 7 (TIA Portal):

   – Select "Options > Option handling" in the slave properties dialog.

   – Select the "Option handling" check box.

   STEP 7 V5.5:

   – Select the "Slave configuration" tab in the "Properties..." dialog of the CM AS-i Master ST.

   – Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.

   – Select the "Option handling" check box.

   This activates the option handling for this slave.

2. Activate the slave using the user program (PLC).

   You can also deactivate the slave in the user program.

The AS-i master treats an optional slave that is not activated like a slave that is not configured. The AS-i master treats an activated optional slave like a slave that is configured without option handling.

Procedure

1. Define the AS-i slaves in *STEP 7* (TIA Portal) > Network view or in *STEP 7* V5.5 > "HW Config".
2. Specify whether option handling is enabled for each AS-i slave.
3. In the user program, you can activate or deactivate AS-i slaves for which option handling is activated during runtime. To do this, a combination of 2 bits must be set or reset in data record DS 131.

Note

Option handling and safe AS-i slaves

When data record DS 131 is written to the CM AS-i Master ST module, the signals of the safety-related slaves on the same bus are reset. Before transferring the option data record DS 131, ensure that the system is in an operating state in which a safety signal reset will not adversely affect the course of operation. Before restarting, error acknowledgement or reintegration must be performed for the safe AS-i inputs and, where applicable, the safe AS-i outputs. The correct procedure for the fail-safe evaluation system used must be observed.

DS 131 Activate/deactivate optional slaves (Page 43)

DS 131 Read status of option handling (Page 44)

Set_Configuration_Online (Page 158)

5.5.1.1 DS 131 Activate/deactivate optional slaves

Description

By writing this data record, you activate or deactivate slaves configured as optional on the AS-i bus.

Table 5- 2 Structure of DS 131 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2 … 9	List of slaves to be activated							
	Bit = 0	No action						
	Bit = 1	The slave will be activated.						
10 ... 17	List of slaves to be deactivated							
	Bit = 0	The slave will not be deactivated.						
	Bit = 1	The slave will be deactivated.						

Note

Identical entries in each list

If a "1" is entered for an AS-i slave in both lists, the slave will be deactivated.

Note

Activated/deactivated status of the optional slaves

The activated/deactivated status of the optional slaves is stored in non-volatile memory of the master and is retained even if a new configuration is downloaded to the master. The status of an optional slave is set to deactivated if the slave is not set as optional in a configuration.

If a configuration contains slaves without option handling, the status stored internally in the master for these slaves is reset (bit = 0).

See also

Address space (Page 48)

Option handling (Page 41)

5.5.1.2 DS 131 Read status of option handling

Description

The current status of the slaves configured as optional is returned by reading this data record.

Table 5- 3 Structure of DS 131 read

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2 … 9	List of activated, optional slaves							
	Bit = 0	The optional slave is deactivated or the optional slave is not an optional slave.						
	Bit = 1	The optional slave is activated.						
10 ... 17	List of configured, optional slaves							
	Bit = 0	The slave is not configured as an optional slave or it is not contained in the configuration.						
	Bit = 1	The slave is configured as an optional slave.						

If a slave is configured as not optional, then the associated bit in the list of activated optional slaves in the non-volatile memory of the master is reset to the value 0.

See also

Option handling (Page 41)

5.5.2 AS-i proxy slave

Description

A proxy slave is used to represent any given slave. This means you define the I/O addresses in the PLC program in advance. You define the slave itself at runtime.

Procedure

- Configure a proxy slave in "*STEP 7* > HW Config" with the associated digital and / or analog I/O addresses. You can then use these I/O addresses in the user program to access the data of the proxy slave once you have defined the slave profile at runtime.

  To do this, select the proxy slave from the universal AS-i slaves in the hardware catalog.
- At runtime, specify in the PLC program which slave type should be operated under this address.
- You define the slave profile of the proxy slave by changing the overall configuration ("Set_Configuration_Online (Page 158)" command). In this case, the AS-i branch is not reset.
- The slave type defined in the user program is retained in the CM AS-i Master ST module, even after the power supply has been switched off.
- The slave type of a proxy slave defined in the user program is retained in the CM AS-i Master ST module, even after the hardware configuration has been reloaded into the station.

Applications

- Variable machine configurations that can be changed at runtime.
- Flexible expansion of the system in the future, without the need to specify the actual type of slave beforehand.

Parameter assignment/addressing

6

6.1 Parameters

Parameters of the AS-i master

Table 6- 1 Assignable parameters and their default setting (GSD file)

Parameters	Value range	Default
Diagnostic interrupt in case of errors in AS-i configuration	• Enable • Disable	Enable
Diagnostic interrupt in case of AS-i cable fault	• Enable • Disable	Enable
Automatic address programming	• Enable • Disable	Enable
Ground-fault monitoring activated	• Enable • Disable	Enable
Automatic ID1 code assignment (Firmware V1.1 and higher)	• Enable • Disable	Disable
Duplicate address detection[1)]	• Enable for AS-i voltage 24 V • Enable for AS-i voltage 30 V • Disable	Disable

1) This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.2 Explanation of the parameters

Diagnostic interrupt if AS-i configuration error:

With this parameter, you specify whether AS-i configuration errors will be signaled to the higher-level system. The following are signaled as a configuration error:

- A surplus slave
- A missing slave
- A slave of the wrong type

Diagnostic interrupt if AS-i cable fault:

This parameter is used to specify whether faults concerning the AS-i cable should be reported to the higher-level system. Possible AS-i cable faults are:

- Ground fault
- Insufficient AS-i voltage
- Peripheral fault of an AS-i slave

Automatic address programming:

When a defective AS-i slave is being replaced, you use this parameter to specify whether the configured AS-i address will be automatically assigned to the new device.

For details on this functionality, see Section "Replacing a defective AS-i slave / automatic address programming (Page 74)"

Ground-fault monitoring activated:

This parameter is used to specify whether ground faults on the AS-i cable should be detected by the AS-i master. Deactivate this setting if you are using an external unit for ground fault detection.

Automatic ID1 code assignment:

When you activate this parameter, in the case of automatic address programming the ID1 code of a slave is written to the value specified during configuring.

Duplicate address detection:

The duplicate address detection function can identify inadvertent duplicate addressing. When you activate it, you must select the AS-i line voltage in use.

This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.3 Address space

The assignment of the address space is described in the following Section:

Data exchange between the user program and AS-i slaves (Page 49)

Data exchange between the user program and AS-i slaves

7

7.1 Access to AS-Interface

The distributed I/O system communicates with the AS-i slaves via the CM AS-i Master ST. The AS-i communication objects are mapped onto a continuous data area for input and output data.

Firmware V1.1 and higher

From Firmware V1.1 and higher, you can flexibly arrange the process image:

- Shortening the process image for a process image with maximum length of 288 bytes.
- Map analog values and digital values in one process image
- Variable division of the process image:
  - The slave address is not bound to a specific position in the process image.
  - The number of bits per slave can vary.

    For example, the digital input data of the slave at address 1 can be one bit long and the analog data of the slave at address 5 can be two bytes long.

If your configuration contains fewer AS-i slaves, you may reduce the length of the reserved I/O area (depending on the configuration software version).

This reduces the volume of data to be transmitted on PROFIBUS or PROFINET. You set the length of the I/O area in *STEP 7* (TIA Portal) in the properties of the AS-i master. This does not change the assignment of the slave address to the offset. This means:

When the length is reduced, the higher AS-i bus addresses can no longer be addressed.

7.2 Transmitting AS-i digital values

If there are no slaves, the input data is filled with 0 values. In the output direction, the non-assigned values have no effect.

Special characteristics of AS-i Safety slaves

The AS-i master performs a non-safe evaluation for the data of safe input slaves. The evaluation is represented in the process image of a Safety input slave as follows:

Table 7- 1 Process image of a Safety input slave

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	All contacts are open.
0	0	0	1	F-IN1 is closed.
0	1	0	0	F-IN2 is closed.
0	1	0	1	F-IN1 and F-IN2 are closed.

Likewise, the AS-i master evaluates in a non-safe manner to determine whether a safe AS-i output is to be addressed. The information is in the input process image of the PLC:

Table 7- 2 Process image of the "safety module"

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	The safe AS-i output is deactivated.
1	1	1	1	The safe AS-i output is switched on.

Note

This involves a non-safe evaluation of the safe signals.

Addressing of slaves by the controller

Input data and output data of the AS-i slaves are exchanged with the controller via an I/O area of 32 bytes. As a result, the digital values of up to 62 AS-i slaves are transmitted.

In doing so, 4 bits are assigned to each digital slave. The offset for accessing this data depends on the AS-i address of the AS-i slave.

Configuration example

The following graphic shows an example of addressing 4 digital slaves. In the example, you configure the start addresses n = 40 for the I/O data in *STEP 7* .

The bits with a gray background are relevant for the user program. The bits with a white background are not relevant for the user program, because AS-i slave bits are not assigned here.

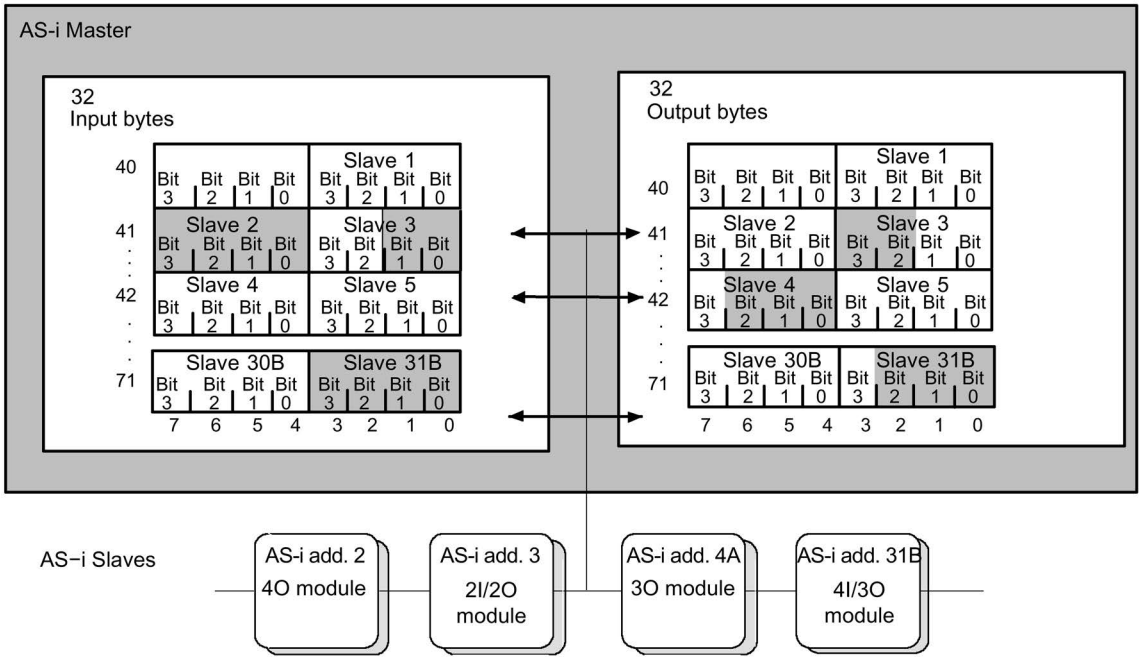

Figure 7-1 Example of addressing 4 digital slaves

The AS-i slave with address 3 and with two inputs and two outputs, referred to as a 2I/2O module, occupies bits 0 and 1 in input byte 41 and bits 2 and 3 in output byte 41 in the graphic, for example.

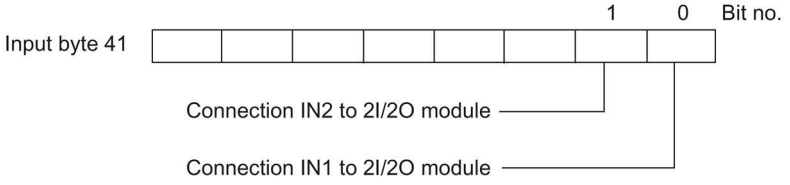

Figure 7-2 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the input bytes for slave with address 3

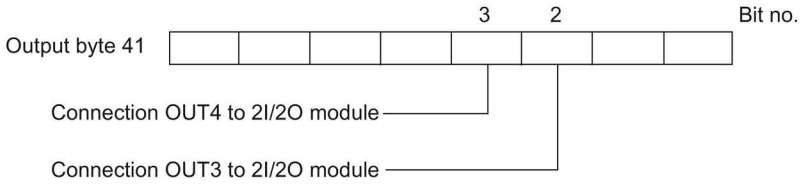

Figure 7-3 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the output bytes for slave with address 3

See also

List of abbreviations (Page 175)

7.2.1 CM AS-i Master ST with configured AS-i slaves

Boundary conditions:

- The larger the process image, the longer it takes to transmit it.

CM AS-i Master ST with configured AS-i slaves

If you configure the AS-i slaves according to Section "Configuration of the AS-i slaves in STEP 7 (Page 32)", you set the I/O addresses of the slaves using the properties dialog of the AS-i slave. The I/O address can be set individually in the area of the defined process image of the AS-i master. The input bits x.4 to x.7 in the first byte of the process image of the AS-i master cannot be used for AS-i slaves. The process image can contain input/output data of digital and analog slaves.

The bit length of a slave depends on the configured profile. It is defined in the AS-i specification and cannot be changed.

7.2.2 CM AS-i Master ST without configured AS-i slaves

Addressing of slaves by the controller

If you configure according to Sections "Configuration of the AS-i slaves using the "SET" button (Page 35)" to "Configuration of the AS-i slaves using the PLC program (Page 37)", the I/O addresses of digital slaves in the process image of the AS-i master are located at a fixed position according to the following table. The I/O data of digital slaves can be accessed via a data record.

Input data and output data of the AS-i slaves are exchanged with the controller via an I/O area with a size of 32 bytes. As a result, the digital values of up to 62 AS-i slaves are transmitted. In doing so, 4 bits are assigned to each digital slave. The offset for accessing this data depends on the AS-i address of the AS-i slave.

If you configure a project without AS-i slaves, you can specify a digital address area that is 32 or 16 bytes long.

Default setting: 32 bytes long

In an I/O address area of 16 bytes, you can only assign standard addresses or A addresses for slaves. In an I/O address area of 32 bytes, you can also assign B addresses for slaves.

Table 7- 3 Bit assignment per digital slave

Byte number [1]		**Bit 7 … 4**				**Bit 3 … 0**			
n+0		Reserved				Slave 1 or 1A			
						Bit 3	Bit 2	Bit 1	Bit 0
n+1		Slave 2 or 2A				Slave 3 or 3A			
n+2		Slave 4 or 4A				Slave 5 or 5A			
n+3		Slave 6 or 6A				Slave 7 or 7A			
n+4		Slave 8 or 8A				Slave 9 or 9A			
n+5		Slave 10 or 10A				Slave 11 or 11A			
n+6		Slave 12 or 12A				Slave 13 or 13A			
n+7		Slave 14 or 14A				Slave 15 or 15A

n+31		Slave 30B				Slave 31B			
		Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0

1) n = Start address

2) You can activate and deactivate these status bits in *STEP 7* (TIA Portal).

List of abbreviations (Page 175)

7.3 Transferring AS-i analog values

The following information only applies to AS-i slaves whose data is stored in the analog area.

Note

The CM AS-i Master ST does not support the transmission of analog values in accordance with AS-i Slave Profile 7.1 / 7.2. Transmission of analog values must be implemented in the software for these slaves.

Analog interface between the CPU and the CM AS-i Master ST

In the user program, you use the process image (Firmware V1.1 and higher) or data records to access I/O data of analog slaves.

For more detailed information, refer to Section "Accessing AS-i analog data via the process image (Page 57)".

Representation of the analog values or the transparent values

The analog values are to be interpreted as 16-bit values in two's complement.

The transparent/digital values must be interpreted as two independent bytes.

In the case of AS-i slave profiles for transparent/digital data, the AS-i master passes through the data of the AS-i slave to the controller without interpreting the content.

For universal AS-i slaves, the following is displayed in the "Configuration" field in *STEP 7*:

- Information about the number of channels
- Information about the resolution
- Information about the data frame of transparent I/O data

In the documentation for the respective AS-i slave, you will find further information about:

- Value range
- Measuring range
- Accuracy of analog slaves
- Meaning of transparent data

Special cases in analog value transfer

- In the input direction, the AS-i master sends a substitute value in the event of a slave failure or AS-i communication error:
  - For slaves with analog transmission, the AS-i master always supplies the substitute value $7FFF_H$, if the slave fails after power-up of the master.

    "Transparent" mode exception:

    For slaves according to the following profiles, the AS-i master supplies the substitute value 0000_H:

    7.3.0 to 7.3.3 (Type CTT1, output slave 16 DO in "Transparent" mode)

    7.3.8 to 7.3.A (Type CTT1, input slave 16 DI in "Transparent" mode)

    7.A.A (CTT3, 8 DI / 8 DO slave with A/B address)

    7.A.8 (ID1 = 3, 4, 5) (Type CTT4, max. 16 DI slave with A/B address)

    7.A.5, 7.5.5 and B.A.5, if you have transparent input (Type CTT2)

    6.0.x where x = 2 … 7 (Type CTT5, in "Transparent" mode)
- In the output direction, the AS-i master sends logic "0" to all slaves in the event of a failure or in "STOP" state.
- If the AS-i master or the communication between the AS-i master and PLC fails, data record access to the analog values or transparent/digital input values is not possible. Note that the analog input values and transparent/digital input values are not updated in your user program in this case, and ensure a substitute value processing via the program.

NOTICE
Behavior in the event of a slave failure If the slave fails prior to or during the power-up of the AS-i master, the substitute value $7FFF_H$ may also be supplied. That is, the input bits of these transparent or digital slaves have the substitute value 1. For this reason, check whether the diagnostic data of these slaves indicate a slave failure and, if required, ensure an appropriate substitute value processing via the program.

Special characteristics of combined transaction type slaves

When using slaves in accordance with CTT 1 to 5, all or some I/O bits are used for special transfer functions in the process image for AS-i digital values. For further details, please refer to the documentation of the respective AS-i slave.

The following applies to these protocol bits:

- In the input direction, the AS-i master sets the value "0".
- In the output direction, the AS-i master ignores the bits.

7.3.1 Accessing AS-i analog data via the process image

If you assigned I/O addresses to the analog slaves when configuring, you can access the AS-i analog values with word commands (Firmware V1.1 and higher).

Analog and transparent I/O addresses for configured AS-i slaves

The analog and transparent I/O addresses of an AS-i slave can be freely assigned within the overall process image of the CM AS-i Master ST. This is regardless of the size of the process image. If you only require a few analog inputs and outputs in the process image and want to save space, you can change the length of the I/O data of an AS-i slave. If the set length is less than the actual length of the I/O data of the AS-i slaves, you cannot access the data at addresses greater than the set length via the process image. You can also deactivate the process image for analog inputs/outputs.

Access to analog I/O data is also possible via data records independent of the process image. You can find more detailed information on this in Section "Accessing AS-i analog data via acyclic services (Page 57)".

7.3.2 Accessing AS-i analog data via acyclic services

Representation of the analog values in the data records

Analog values are transferred in the data records numbered from 140 to 147.

- You access the analog input values using system functions for reading data records.
- You output analog values using system functions for writing data records.

In combination with SIMATIC S7, system function blocks SFB 52 "RDREC" and SFB 53 "WRREC" enable this.

Access to analog data via acyclic services can also be selected, for example, if there is a need to save I/O address space in SIMATIC S7.

NOTICE
Simultaneous write access via cyclic and acyclic services not possible Simultaneous write access to analog data of a slave is not permissible with different process values either via cyclic or acyclic services. If both services are used the analog output values that are output via cyclic and acyclic services to the same slave address must be synchronized with each other via the user program.

You can use data record lengths ranging from 2 bytes to 240 bytes for each data record number. For each slave address, an area of 8 bytes is available to address 4 analog channels.

The table below shows which data record is used by each AS-i slave to transfer the analog values. The subsequent table shows the assignment of analog values to the respective analog slaves.

The tables are applicable to analog inputs and analog outputs.

Table 7- 4 Access to analog values via data records

AS-i address of the slave	Start addresses for analog values in the data record							
	DS 140	DS 141	DS 142	DS 143	DS 144	DS 145	DS 146	DS 147
1	0	—	—	—	—	—	—	—
2	8	—	—	—	—	—	—	—
3	16	—	—	—	—	—	—	—
4	24	—	—	—	—	—	—	—
5	32	0	—	—	—	—	—	—
6	40	8	—	—	—	—	—	—
7	48	16	—	—	—	—	—	—
8	56	24	—	—	—	—	—	—
9	64	32	0	—	—	—	—	—
10	72	40	8	—	—	—	—	—
11	80	48	16	—	—	—	—	—
12	88	56	24	—	—	—	—	—
13	96	64	32	0	—	—	—	—
14	104	72	40	8	—	—	—	—
15	112	80	48	16	—	—	—	—
16	120	88	56	24	—	—	—	—
17	128	96	64	32	0	—	—	—
18	136	104	72	40	8	—	—	—
19	144	112	80	48	16	—	—	—
20	152	120	88	56	24	—	—	—
21	160	128	96	64	32	0	—	—
22	168	136	104	72	40	8	—	—
23	176	144	112	80	48	16	—	—
24	184	152	120	88	56	24	—	—
25	192	160	128	96	64	32	0	—
26	200	168	136	104	72	40	8	—
27	208	176	144	112	80	48	16	—
28	216	184	152	120	88	56	24	—
29	224	192	160	128	96	64	32	0
30	232	200	168	136	104	72	40	8
31	—	208	176	144	112	80	48	16

Examples / notes on reading this table:

The subsequent table shows the assignment of analog values to the respective analog slaves.

For additional information, refer to the operating instructions of the slaves.

Table 7- 5 Address range for the analog values of an AS-i slave

Byte no. (start address + offset)	Analog value channel
Start address + 0	Channel 1 / high byte
Start address + 1	Channel 1 / low byte
Start address + 2	Channel 2 / high byte
Start address + 3	Channel 2 / low byte
Start address + 4	Channel 3 / high byte
Start address + 5	Channel 3 / low byte
Start address + 6	Channel 4 / high byte
Start address + 7	Channel 4 / low byte

Analog A/B slaves with 2 channels only reserve half the address range. A slaves occupy bytes 0 to 3 and B slaves bytes 4 to 7.

Examples of the configuration:

1. Configuration:

   Analog slaves have the AS-i addresses 1 to 6.

   You use data record 140 and enter 48 as data record length.

2. Configuration:

   1 analog slave with AS-i address 7 is used.

   You use data record 141 and enter 24 as data record length. Only bytes 16 to 23 are relevant.

3. Configuration:

   The full address range for 31 analog slaves is used.

   You use data record 140 and enter 224 as data record length. You can then address analog slaves 1 to 28.

   For the remaining analog slaves 29 to 31, you use data record 147 in a second job and enter 24 as data record length.

4. Configuration:

   Analog slaves have the addresses 29 to 31.

   You use data record 147 and enter 24 as data record length.

Mixed access:

- Configuration:

  You want to access slaves 1 to 12 using I/O commands and slaves 13 to 31 using data records.

  You use data record 143 for slaves 13 to 31.

Alarms, faults and system events

8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the AS-i master:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Online presentation of the network and device view
  - Diagnostic buffer
- Alarm messages in user program
- Creation of user-specific web pages via the web server of a connected SIMATIC controller

You will find information on the LEDs in Section "Meaning of the LEDs (Page 64)".

The diagnostic possibilities in *STEP 7* and in the user program are described in the following sections.

8.2 Diagnostics in STEP 7

Diagnostics in STEP 7

For diagnostics of the AS-i master and the AS-i slave, use the "Go online" function to switch *STEP 7* to "Online" status.

If you have configured AS-i slaves in *STEP 7*, the diagnostic information about slaves can be displayed in *STEP 7*.

The diagnostics of the AS-i slaves in STEP 7 V13 SP1 (TIA Portal) are not displayed via the online network view function. The information of the AS-i master is displayed symbolically in the device view. The status of these devices will also be displayed to the right of the device in the project navigation by means of a symbol. For an explanation of the different status symbols, please refer to the relevant tool tip.

STEP 7 offers several possibilities for requesting the diagnostic information of the AS-i master:

- Special diagnostic symbols indicate the status of the AS-i master in the network view of the device configuration. Red symbols signal an error, and green symbols indicate that the devices are OK.
- In *STEP 7* V13 SP1 (TIA Portal), you can call up information about the status of the AS-i master and AS-i slaves. To do so, open the diagnostics as follows:
  - Select the AS-i master.
  - Select "Online & diagnostics" in the shortcut menu.
  - In the "Online & diagnostics" view, select "Detailed diagnostics > Error overview".

    Here you see the current status of every AS-i slave address.

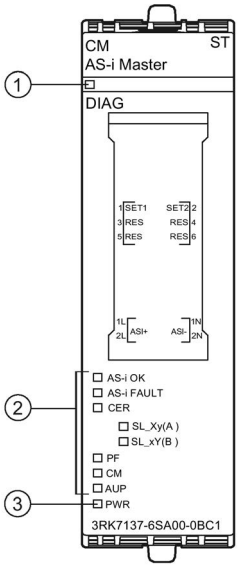
  To analyze sporadic errors, you can read out the error counter for the AS-i network.

  Diagnostics are also available in *STEP 7* V5.5 HSP 2092 V3.0 and higher.
- The control panel of the AS-i master can also be called up in this display. This shows the status of the LEDs.
- All the relevant events are stored in the diagnostic buffer of the CPU. You can display the diagnostic buffer in the "Online & Diagnostics" window for a selected CPU.

8.3 LED statuses

8.3.1 Arrangement of the LEDs on the CM AS-i Master ST

Introduction



① DIAG (green/red)
② Status LEDs (AS-Interface)
③ PWR (green)

Figure 8-1 Arrangement of the LEDs on the CM AS-i Master ST

8.3.2 Meaning of the LEDs

Meaning of the LEDs

The tables below explain the status and fault indications. Remedies for the diagnostic messages are in Section "Diagnostic messages (Page 69)".

"PWR" LED

Table 8- 1 Meaning of the "PWR" LED

PWR	Meaning
☐ OFF	The AS-i voltage is not provided (terminals L+, M).
■ Green ON	The AS-i voltage is provided (terminals L+, M).

"DIAG" LED

Table 8- 2 Meaning of the DIAG LED

DIAG	Meaning
☐ OFF	The supply voltage for the interface module of the ET 200SP is not provided.
✳ Green flashes	The AS-i master parameters have not been assigned.
■ Green ON	The AS-i master parameters have been assigned and are error-free. No diagnostic message of the AS-i master is pending.
✳ Red flashes	The AS-i master parameters have been assigned and the AS-i master signals diagnostic errors for the AS-i master or an AS-i slave or an active firmware update.

"AS-i OK" LED

Table 8- 3 Meaning of the AS-i OK LED

AS-i OK	Meaning
☐ OFF	An error has occurred (see AS-i FAULT LED) or the AS-i master is offline. This means: No I/O data exchange is taking place, e.g., during power-up.
■ Green ON	The AS-i bus is fault-free. I/O data exchange takes place.

"AS-i FAULT" LED

Table 8- 4 Meaning of the AS-i FAULT LED

AS-i FAULT	Meaning
☐ Red OFF	No AS-i cable faults have occurred. The AS-i master is in "Offline" mode.
■ Red ON	The AS-i bus has failed, e.g. the supply voltage for AS-Interface is too low, ground fault.
✻ Red "flashes"	A fault has occurred, e.g. a duplicate address or parameterization error has been detected.

"PF" LED

This LED indicates peripheral faults.

Table 8- 5 Meaning of the "PF" LED

PF	Meaning
Red OFF	No peripheral fault is being signaled.
Red ON	At least one AS-i slave is signaling a peripheral fault. Refer to the operating instructions for the respective slave for the meaning of the peripheral fault, e.g., overload at the standard outputs and/or overload of the sensor power supply of the standard inputs.

Firmware update (Page 21)

"CER" LED

This LED indicates configuration errors. It lights when the slave configuration detected on the AS-i cable does not match the CONFIGURED configuration in the AS-i master.

Table 8- 6 Meaning of the "CER" LED

CER	Meaning
Yellow OFF	No AS-i configuration error.
Yellow ON	Failure of an AS-i slave: • A configured AS-i slave is not present on the AS-i cable. • An excess slave not configured beforehand is present on the AS-i cable. • A connected slave has different configuration data (IO, ID, ID1, ID2) than the slave configured in the AS-i master. • A slave with address "0" is in "Configuration mode" on the AS-i bus.

"CM" LED

This LED indicates the operating status (Configuration Mode).

Table 8- 7 Meaning of the "CM" LED

CM	Meaning
☐ Green OFF	The AS-i master is in "protected operation".
■ Green ON	The AS-i master is in "configuration mode".
✻ Green flashes	During a firmware update: Errors have occurred during the firmware update.

"AUP" LED

This LED indicates whether automatic address programming is possible or not.

Table 8- 8 Meaning of the "AUP" LED

AUP	Meaning
☐ Green OFF	Automatic address programming is not possible. This LED is always off in configuration mode.
■ Green ON	When the AS-i master is in "protected operation", this LED indicates that automatic address programming of an AS-i slave is possible. Automatic address programming makes it easier to replace a defective AS-i slave on the AS-i cable. For more detailed information, refer to Section "Replacing a defective AS-i slave / automatic address programming (Page 74)".

"SL_Xy(A)" and "SL_xY(B)" LEDs

These LEDs indicate the slave addresses to which an error is signaled. The following states are taken into account:

- The slave has failed.
- The slave is an excess slave.
- The slave type is incorrect.
- Double addressing detected.

The following diagram shows the indication sequence:

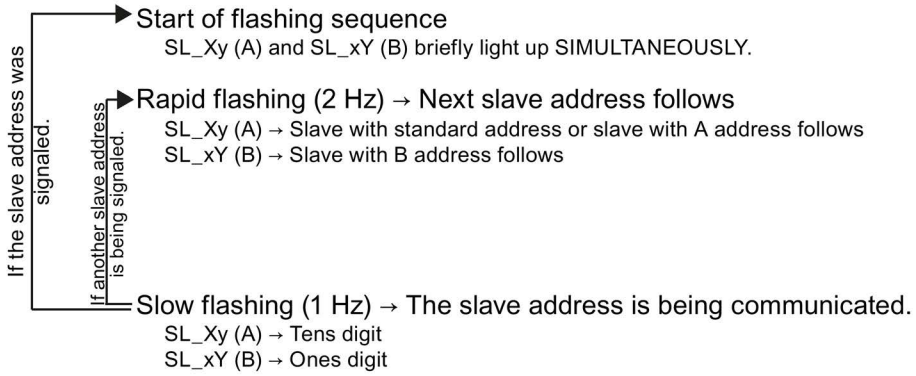


Figure 8-2 Indication sequence

Example: Slave 15 and 21B have failed

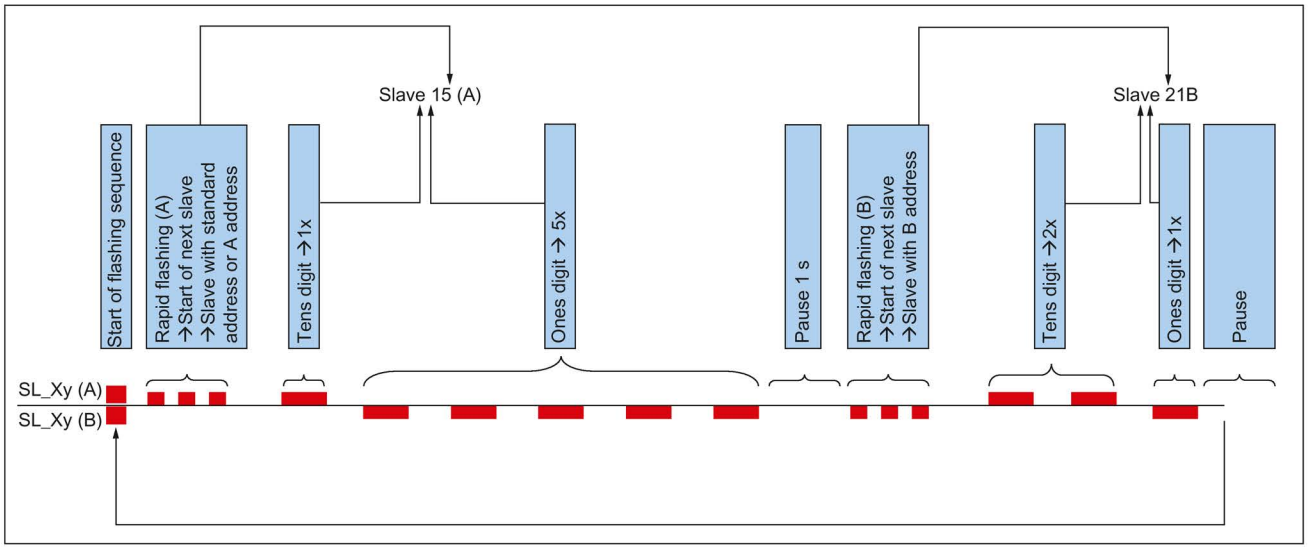

Figure 8-3 Example: Slave 15 and 21B have failed

8.4 Diagnostic messages

8.4.1 Alarms

The AS-i master sends a diagnostic interrupt request to the CPU in the following situations:

- The AS-i master has detected a problem, e.g. failure of a slave (incoming event).
- The problem was rectified or no longer exists (outgoing event).

If there is no OB 82 in the user program, a CPU of the S7-300 / S7-400 product range will switch to "STOP".

If an OB 82 exists, the operating system responds to an incoming event by calling the OB 82. The S7 CPU then interrupts the cyclic user program and enters the event in the system diagnostic buffer as a "Module fault" message.

Some diagnostic information is made available to the user in the local data of the OB 82, e.g.: Which module triggered the interrupt? What type of error has occurred?

Following execution of the OB 82, the S7 CPU continues the cyclic program from the point of interruption.

When parameterizing the CM AS-i Master ST, you can specify whether and in what cases a diagnostics interrupt should be triggered.

See Section "Parameter assignment/addressing (Page 47)"

See Section "Fault indications/fault remedies (Page 80)" for a list of possible error cases.

8.4.2 Possible response to the diagnostic interrupt

Diagnostic events of the AS-i master and all AS-i slaves are signaled by means of OB82, e.g. No voltage on AS-Interface, peripheral fault

Note

Diagnostic buffer

Please note that OB 82 is only called for the first error event. If an error caused by an AS-i slave is already active, subsequent AS-i slave errors will only be noted in the diagnostic buffer of the CPU.

The cause of the interrupt can be determined by reading out data records with diagnostic data during execution of the OB 82 block or during cyclic program execution. See Section "Data records for diagnostics (Page 82)".

8.4.3 Error messages

AS-i-specific faults

The following AS-i-specific faults are possible:

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0400_H	1024	AS-i slave failed	An AS-i slave on an A address or a slave with standard address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • There is a break in the cable • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators
0401_H	1025	AS-i slave on B address failed	An AS-i slave on a B address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • The cable is interrupted. • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0402_H	1026	Peripheral fault in AS-i slave	An AS-i slave on an A address or a slave with a standard address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave. Possible cause: • An overload at the output of a digital slave or an overload at the actuator • Measuring range exceeded for analog input slaves • Overload of the sensor supply at the input slave (only for some slave types) • Group fault message for M200D motor starters	Note the information in the manual for the AS-i slave. Check: • Slave • Overload • Connected sensors and actuators
0403_H	1027	Peripheral fault in AS-i slave on B address	An AS-i slave on a "B" address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave. Possible cause: • An overload at the output of a digital slave or an overload at the actuator • Measuring range exceeded for analog input slaves • Overload of the sensor supply at the input slave (only for some slave types) • Group fault message for M200D motor starters	Note the information in the manual for the AS-i slave. Check: • Slave • Overload • Connected sensors and actuators
0404_H	1028	AS-i address used multiple times	Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a standard address or A address. The channel number of the message shows the address of the affected AS-i slave.	Change the addresses of the AS-i slaves to addresses that are unique in the network.
0405_H	1029	AS-i B address used multiple times	Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a B address. The channel number of the message shows the address of the affected AS-i slave.	Change the addresses of the AS-i slaves to addresses that are unique in the network.

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0406_H	1030	No or erroneous voltage on the AS-i cable	The AS-i master has detected insufficient voltage on the AS-i cable. Data exchange on the AS-Interface has been stopped.	Check: • Voltage • Polarity on AS-i cable • Power supply
0407_H	1031	AS-i configuration error (CER)	The ACTUAL configuration of the AS-i slaves on the AS-i cable differs from the CONFIGURED configuration saved in the AS-i master. Possible causes of short-term failures: • High levels of electromagnetic interference are affecting the AS-i installation. Other possible causes: • The functional ground connection to the AS-i power supply unit or AS-i data decoupling module is not connected to ground potential. • Protected operation: A configured slave has failed or there is an excess slave on the bus. • Configuration mode: A slave with address "0" has been detected on the bus.	Check: • AS-i slave failure • Overload • Excess slave • Incorrect address • Incorrect slave type • EMC environment Remove the electromagnetic interference.
0408_H	1032	Ground fault on AS-i cable	A ground fault is present between AS-i+ and ground or between AS-i- and ground. Possible consequences: • Disruption of communication • Slave failure • Configuration error • Hazard as a result of secondary faults	Check: • Insulation fault on AS-i cable • Sensor/actuator cable Ensure that the ground fault is rectified.
$040A_H$	1034	Excess AS-i slave	There is an unconfigured AS-i slave with a default address or an A address on the AS-i bus. The channel number of the message shows the address of the affected AS-i slave.	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.
$040B_H$	1035	Excess AS-i slave at B address	On the AS-i bus there is an unconfigured AS-i slave with a B address. The channel number of the message indicates the B address of the affected AS-i slave	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
$040C_H$	1036	Incorrect AS-i slave	On the AS-i bus there is an incorrect AS-i slave with a default address or an A address. The channel number of the message shows the address of the AS-i slave involved.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.
$040D_H$	1037	Incorrect AS-i slave at B address	There is an incorrect AS-i slave with a B address on the AS-i bus. The channel number indicates the B address of the affected slave.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.

8.5 Replacing a defective AS-i slave / automatic address programming

Automatic address programming after failure of one or more AS-i slaves - replacement of AS-i slave

The "Automatic address programming" function allows you to easily replace defective AS-i slaves.

Note

Automatic address programming

Automatic address programming is only possible if the AS-i master is operating in "protected operation" and **one or more** AS-i slaves have failed.

If several AS-i slaves have failed, you must uniquely identify the failed slaves in the configuration using the slave profile:

- IO code
- ID code
- ID2 code
- ID1 code

The automatic address programming function also supports slaves with the "CTT5" profile (multi-address slaves) and AS-i devices that contain multiple internal slave addresses. This requires each internal slave to have different identifications (IO code, ID code, ID2 code, and ID1 code).

Note

The automatic address programming function does not work if two identical slaves have failed.

Examples of devices with multiple internal slave addresses which support automatic address programming:

- Module K60 with 8DI/2DO (3RK2400-1HQ00-0AA3)
- Motor Starter M200D AS-i Standard (3RK1325-...).

If no address has yet been assigned to these devices (delivery state), only **one** address "0" is visible on the bus. The device automatically suppresses the other internal "0" addresses.

Note

Exceptions

The automatic address programming function is not available for the following devices, because the identifications of each internal slave are identical (IO code, ID code, ID2 code, and ID1 code).

- Module K60 with 8 DI (3RK1200-0DQ00-0AA3, 3RK2200-0DQ00-0AA3, 3RK2200-1DQ00-1AA3)
- Safety-related module K45 with 4 F-DI (3RK1205-0CQ00-0AA3).

Detection of a defective AS-i slave

An illuminated "AUP" LED signals the following in "protected operation":

- Slave failure was detected:
  - Exactly **one** slave has failed, or
  - A device containing multiple different slaves has failed, **or**
  - Multiple slaves or devices have failed, each of the failed slaves having a different configuration
- Automatic address programming by the AS-i master is possible.

If an AS-i slave fails, the AS-i master indicates the address of the failed slave via the "SL_Xy (A)" and "SL_xY (B)" LEDs.

If a device with multiple internal slave addresses fails, the AS-i master indicates the failure of multiple slaves.

Replacement of a defective AS-i slave

- Replace the defective AS-i slave with an **identical** AS-i slave with address "0" (setting in delivery state).
- Replace the defective AS-I device containing multiple internal slave addresses with an identical AS-i device with address "0" on all internal slaves (setting in delivery state).

> **Note**
>
> **Replacement of a defective AS-i slave**
>
> Only one address "0" may be configured on the bus at any one time. If you want to replace several slaves or devices, you must replace them one after the other with the AS-i master switched on.

For the new slave or device, the AS-i master programs the address or addresses of the original failed device.

The LEDs "AUP" and "CER" go out once all slaves have been correctly replaced.

8.6 Duplicate address detection

To ensure that the AS-Interface system functions correctly, all the AS-i slaves must have a unique AS-i address on the bus.

If the same AS-i address is assigned to one or more slaves, this incorrect assignment is referred to herein as a duplicate address.

As part of standard operation, the AS-i master monitors the data exchange for errors and thus often excludes slaves with a duplicate address automatically from the cyclic data exchange. This is the case for duplicate addresses in which the slave types are different (profile identification IO code, ID code, ID2 code, and ID1 code) and duplicate addresses for slaves having a different status at their inputs.

In "protected operation", this fault condition is displayed on the AS-i master as a configuration error with the relevant AS-i address and the affected slaves detect a communication error.

The duplicate address detection function of the CM AS-i Master ST also detects cases of slaves with duplicate address in which the cyclic data exchange is not excluded by standard mechanisms. Such cases include duplicate addresses in which the slave types are identical (profile identification, IO code, ID code, ID2 code, and ID1 code) and in which the slaves either have the same status at their inputs or have no inputs (output slaves).

When a duplicate address is detected, the AS-i master signals a duplicate address error and automatically resets the output data of the address concerned to "0" so that the outputs of the affected slaves are switched off. Communication with the affected slaves is not interrupted, i.e. the slaves do not signal a communication error.

For slaves without cyclic data communication, the duplicate address detection function of the CM AS-i Master ST cannot be executed.

Note

System behavior according to AS-i specification

If you connect a slave with duplicate address to the AS-i cable while the bus is operating, the added slave is initially excluded from cyclic data communication and its LEDs indicate a communication error. According to the specification, the AS-i master does not activate an AS-i slave until its address is recognized as a new address on the bus, e.g., when a power-up of the bus takes place. If the bus contains an active slave, no further automatic slave activation occurs on the same address during operation, even if an additional slave with the same address (duplicate address) is added.

However, manual activation of the the slave can be initiated via the command interface by writing parameters to the slave address.

For physical reasons, the duplicate address detection function of the CM AS-i Master ST cannot detect a duplicate address during cyclic data exchange in every configuration. Therefore, like for any AS-i system, it is essential to ensure when assigning AS-i addresses that each AS-i slave contains a unique AS-i address on the bus, e.g., by using addressing device 3RK1904-32AB02.

The duplicate address detection function can assist in identifying inadvertent duplicate addressing.

The duplicate address detection of the CM AS-i Master ST from firmware V1.1 and higher has been optimized for an AS-i cable length up to 100 m without branches.

The duplicate address detection function of firmware V1.0 is designed for shorter cable lengths.

The duplicate address detection function can be used in the specified and additional configurations, but it cannot be guaranteed that duplicate addresses will be uniquely detected in every case.

For configurations with an AS-i repeater, the duplicate address detection function does not work due to the separation of the cable into multiple segments.

Enabling the duplicate address detection function

For the CM AS-i Master ST with firmware V1.1 and higher, the duplicate address detection function is activated in the configuration via HW Config or the GSD setting. After a start or restart of the CM AS-i Master ST V1.1 and higher, the setting is accepted from HW Config or the GSD setting.

For the CM AS-i Master ST with firmware V1.0 and higher, the duplicate address detection function is deactivated when the AS-i Master is switched on and can be set by writing data record DS 100, see Chapter "DS 100 Switch duplicate address detection on/off (Page 173)". The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST V1.0, the duplicate address detection function must be activated via the user program, if required.

Function description

The duplicate address detection function assists you in identifying inadvertent duplicate addressing.

When commissioning the AS-i system, check that duplicate address detection can be used for the AS-i configuration used.

- Install the complete AS-i system and ensure that the specified addresses of the slaves are correct and unique.
- Enable the duplicate address detection function. In firmware V1.1 and higher you can do this for AS-i voltages of either 24 V or 30 V.
- Check whether the CM AS-i Master ST signals a duplicate address in spite of correct slave address assignment. If a duplicate address is signaled on the AS-i master even though the bus configuration is correct, this means that duplicate address detection cannot be used for this bus configuration. Should this occur, disable the duplicate address detection function.
- Note that when the duplicate address detection function is enabled, the presence of a duplicate address may not be detected, depending on the bus configuration.

Note

The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST, duplicate address detection must be activated again via the user program, if required.

The CM AS-i Master ST signals a detected duplicate address as follows:

- The "CER" LED lights up to indicate a configuration error.
- The "SL_Xy (A)" and "SL_xY (B)" LEDs signal the AS-i address concerned.
- The message "AS-i address used multiple times" is output.

To rectify the fault, check and change the address of the affected AS-i slave, e.g. using the addressing unit. Via the online function of *STEP 7* it is not possible to change the AS-i address of an individual slave if there are multiple slaves with the same address on the AS-i cable.

8.7 Diagnosis via the web server

Web server functionality

Many SIMATIC controllers provide integrated web server functionality. This enables access via a web browser to the data of the CPU and its connected components, e.g. the AS-i master.

A *STEP 7* library is available as a download for diagnosing the AS-i master via a web browser. It presents the most important diagnostic information in a clear overview. The package is based on the concept of user-defined web pages. You can obtain the package from the Siemens Service & Support Portal under the following link:

Service and support portal (http://support.automation.siemens.com/WW/view/en/50897766)

8.8 Fault indications/fault remedies

Fault indications/remedies for faults on the CM AS-i Master ST

Below are possible fault indications during operation of the AS-i master and potential remedial measures.

Table 8- 9 Fault indications and remedies for faults on the AS-i Master

Fault	Possible cause	Remedy
"AS-i fault" LED lights up red	The current consumption of the AS-i slaves is too high. Result: Voltage on the AS-i cable is too low.	Check the current consumption of the AS-i slaves.
	No voltage is present on the AS-i cable or the voltage is too low.	Check the connection with the AS-i power supply unit.
	Short-circuit on the AS-i cable	Check the AS-i cable and the connected AS-i slaves.
"DIAG" LED not lit	There is no supply over the communications bus.	Check whether the module is inserted correctly.
"DIAG" LED flashes green, but does not switch to constant green light	The AS-i master is not configured.	Configure the AS-i master in *STEP 7*.
"CER" LED is lit.	A configured AS-i slave has failed. • Evaluate the slave indication.	Replace the defective AS-i slave or configure the AS-i master again if the AS-i slave is not required.
	A non-configured AS-i slave was connected to the AS-i cable.	Remove the AS-i slave or configure the AS-i master again.
	An AS-i slave has been connected whose configuration data, e.g., IO code, ID codes, does not match the values of the configured AS-i slave.	Check whether an incorrect AS-i slave has been connected. Configure the AS-i master again, if necessary.
"CER" LED flashes erratically , i.e. a configured AS-i slave fails sporadically.	Loose connection	Check the connections of the AS-i slaves.
	Injection of interference on the AS-i cable.	Check that the grounding of the AS-i master and routing of the AS-i cable are correct. Check whether the shield of the AS-i power supply unit is connected correctly.
	The connected sensor is causing an overload.	Check the sensor and the sensor cable for damage.
The AS-i master does not switch from "configuration mode" to "protected operation".	An AS-i slave with address 0 is connected to the AS-i cable. The AS-i master is unable to switch to "protected operation" as long as this slave is connected.	Remove the AS-i slave with address 0 or set the correct address using the AS-i addressing device.
In *STEP 7* it is not possible to switch between "configuration mode" and "protected operation"	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.
The AS-i master does not switch from "protected operation" to "configuration mode".	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.

Fault	Possible cause	Remedy
Automatic address programming does not take place.	The configuration data, e.g., IO code, ID code, ID2 code, and ID1 code, of the replaced AS-i slave does not match the values of the original slave.	Check that the correct replacement slave was used. Compare the manufacturer's information with regard to configuration data. If the original slave is to be replaced by a different type, assign the address with the AS-i addressing device and configure the AS-i master again.
	Replaced AS-i slave does not have the address "0".	Set the address of the replaced slave with the AS-i addressing device.
	Replaced AS-i slave is not correctly connected or is defective.	Check the connections of the slave. Replace the slave, if necessary.
	The AS-i master is in "configuration mode".	Program the address of the new AS-i slave with the AS-i addressing device or via the command interface of the AS-i master.
	Several slaves with the same profile have failed.	Program the addresses of the new AS-i slaves with the AS-i addressing device.
No LEDs are lit, except possibly for the "DIAG" LED	The AS-i voltage is missing.	
"PF" LED is lit	One or more AS-i slaves signal a fault in the connected I/O.	Check the I/O components connected to the AS-i slaves and the cabling for wire break or short-circuit.

Reference

You will find further information about the LEDs on the AS-i master in Section "Meaning of the LEDs (Page 64)".

8.9 Data records for diagnostics

8.9.1 DS 92 Diagnostic data record (FW V1.1 and higher)

The operating status of the AS-i master, the connected AS-i network and the AS-i slave is stored as diagnostic data record DS 92 in the CM AS-i Master ST module.

Description

This data record provides information about the status of an AS-i network.

Table 8- 10 Structure of diagnostic data record DS 92, read

Byte	Description							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0 … 1	Reserved							
2	MA30V	MA24V	Res.	Res.	Res.	MADDR	PF	CER
3	Reserved				EFD	CM	CFGOK	DIAG
4	**Flags_1** (See Table "AS-i master flags")							
5	**Flags_2** (See Table "AS-i master flags")							
6	Reserved							
7	Reserved							
Slave diagnostics								
8 … 15	List of active slaves (see Table "Structure of bit fields")							
	Bit = 0	Slave is not in the list of active slaves.						
	Bit = 1	Slave is in the list of active slaves.						
16 … 23	List of failed slaves (see Table "Structure of bit fields")							
	Bit = 0	The configured slave has not failed.						
	Bit = 1	The configured slave has failed.						
24 … 31	List of incorrect slaves (see Table "Structure of bit fields")							
	Bit = 0	The profile of the connected slave is correct.						
	Bit = 1	The profile of the connected slave is incorrect.						
32 … 39	List of excess slaves (see Table "Structure of bit fields")							
	Bit = 0	The connected slave is configured or no slave is connected.						
	Bit = 1	The connected slave is not configured.						
40 … 47	List of multiple addressing (see Table "Structure of bit fields")							
	Bit = 0	The AS-i address is not assigned or is only assigned once.						
	Bit = 1	The AS-i address is assigned more than once.						
48 … 55	List of I/O errors (see Table "Structure of bit fields")							
	Bit = 0	The slave at the AS-i address does not have an I/O error.						
	Bit = 1	The slave at the AS-i address°has an I/O error.						

Byte	Description							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
56 … 63	List of configured ID = A (see Table "Structure of bit fields")							
	Bit = 0	A standard slave is configured at the AS-i address.						
	Bit = 1	An A/B slave is configured at the AS-i°address.						
64 … 71	List of actual ID = A (see Table "Structure of bit fields")							
	Bit = 0	A standard slave is connected at the AS-i address.						
	Bit = 1	An A/B slave is connected at the AS-i°address.						
72 … 79	List of detected slaves (see Table "Structure of bit fields")							
	Bit = 0	No slave detected at the AS-i°address.						
	Bit = 1	Slave detected at the AS-i°address.						
80 … 87	List of configured slaves (see Table "Structure of bit fields")							
	Bit = 0	No slave configured at the AS-i°address.						
	Bit = 1	Slave configured at the AS-i°address.						

Structure of the bit fields:

7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of status bits:

MA30V	= 0	Multiple address detection for AS-i 30 V is deactivated.
	= 1	Multiple address detection for AS-i 30 V is activated.
MA24V	= 0	Multiple address detection for Power24V is deactivated.
	= 1	Multiple address detection for Power24V is activated.
MADDR	= 0	No multiple addresses detected on the AS-i°cable.
	= 1	Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.
PF	= 0	No I/O errors detected.
	= 1	I/O errors detected.
CER	= 0	No AS-i configuration errors detected.
	= 1	AS-i configuration errors detected.
EFD	0 =	No ground fault detected
	1 =	Ground fault detected
CM	0 =	Master in protected operation
	1 =	Master in configuration mode
CFGOK	0 =	Configuration not OK or slave exists with address°0.
	1 =	Configuration OK
DIAG	0 =	No diagnostics pending
	1 =	Diagnostics pending. It is set when:

- The AS-i master is in "offline" mode.
- The AS-i voltage is not OK.
- Multiple addresses were detected.
- An I/O error was detected.
- A configuration error was detected.
- A slave with address°0 exists.

AS-i master flags:

Flag	Bit	Name of the bit	Meaning
Flag_1	0	Config_OK	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
	1	LDS.0	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
	2	Auto_Address_Assign	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves is connected to AS-Interface.
	3	Auto_Address_Available	The flag is set when automatic address programming is performed as soon as a slave with a valid configuration is connected at address zero.
	4	Configuration_Active	The flag is set in "configuration mode" and reset in "protected operation".
	5	Normal_Operation_Active	The flag is set when the AS-i master is in "protected operation".
	6	APF	The flag is set when the voltage on the AS-i cable is too low, or a power down was detected during data transmission (AS-i Power Fail).
	7	Offline_Ready	The flag is set if the offline phase is active.
Flag_2	0	Periphery_OK	The flag is set if none of the AS-i slaves signal a peripheral fault. All bits in the LPF are zero.
	1	Data_Exchange_Active	Controlling: When the flag is set, data transfer starts between the master and slave.
	2	Off_Line	Controlling: When the flag is set, the device is switched "OFFLINE" or is "Offline".
	3	AUTO_ADDR_ENABLE	The flag is set when automatic address programming is enabled by the user.
	4	GROUND FAULT	The flag is set if a ground fault has been detected on the AS-i cable.
	5	EEPROM_OK	The flag is set if the test of the internal EEPROM was successful.
	6	EFD_Disable	The flag indicates whether ground fault detection is switched on (BIT = 0) or off (BIT = 1).
	7	Reserved	--

8.9.2 DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher)

Meaning

This data record reads out error counters that pertain to the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The count starts again each time the device is powered up.

Table 8- 11 Meaning of error counter

Count value / Information	Meaning
AS-i Power Fail	The count value is incremented when the AS-i power supply drops to a value that is too low.
Ground fault	The count value is increased when a ground fault has been detected on the AS-i cable.
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave message frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Process data transmission is not interrupted in this case.
Erroneous slave message frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Process data transmission is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Process data transmission is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 12 Structure of the data record

Byte	Meaning		
0	Reserved		High byte
1			Low byte
2	Summation counter: AS-i Power Fail		High byte
3			Low byte
4	Summation counter: Ground fault		High byte
5			Low byte
6	Summation counter: Slave failure		High word, high byte

4	SLAVE 7B	SLAVE 6B	SLAVE 5B	SLAVE 4B	SLAVE 3B	SLAVE 2B	SLAVE 1B	Reserved
5	SLAVE 15B	SLAVE 14B	SLAVE 13B	SLAVE 12B	SLAVE 11B	SLAVE 10B	SLAVE 9B	SLAVE 8B
6	SLAVE 23B	SLAVE 22B	SLAVE 21B	SLAVE 20B	SLAVE 19B	SLAVE 18B	SLAVE 17B	SLAVE 16B
7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of the status bits

MADDR= 0 No multiple addressing detected on the AS-i°cable.

= 1 Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.

8.9.3 DS 97 Read and reset AS-i master error counters (FW V1.1 and higher)

Description

This data record functions in the same manner as the "DS 96 Read AS-i slave error counters" data record. After the DS 97 data record is read, all error counters in the AS-i master are reset to "0".

The structure of the DS 97 data record is identical to the structure of the DS 96 data record. For the meaning of the error counters, refer to Section "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)".

8.9.4 DS 150 to DS 153 Read AS-i error counters

These data records read the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153.

Error counter

The CM AS-i Master ST module manages several counters internally which log the number of master frames sent and the number of different error occurrences.

These counter values can be read out using data records DS 150 to DS 153:

- DS 150 contains counter values for slave addresses 1(A) to 16(A).
- DS 151 contains counter values for slave addresses 16(A) to 31(A).
- DS 152 contains counter values for slave addresses 1B to 16B
- DS 153 contains counter values for slave addresses 16B to 31B

Each data record also contains the total count of master frames sent. To determine a relative error rate, divide the count of error occurrences by the number of master frames sent.

The bus system allows the automatic sending of repeat message frames. This ensures that the process data is reliably transferred between master and slave in the industrial environment, even in the case of brief interruptions in transmission, e.g. due to switching operations. If the fault limit value is exceeded, or the slave is not functioning correctly due to a defect, communication to the slave cannot be performed within the defined time period. In this case, transmission of the process data is interrupted. The master signals failure of the slave address and tries to establish communication again.

Under error-free conditions, one master frame is sent to every available slave address for cyclic data transfer per AS-i bus cycle. The addressed slave responds with a corresponding slave frame. Depending on the configuration of the bus, between 1 and 31 slaves are addressed in each AS-i bus cycle. This results in a maximum bus cycle time of 5 ms. When two slaves with extended addressing have the same numerical address, but one is the A address and one the B address, these two slaves are automatically addressed in two consecutive bus cycles. It can be assumed that around 64 000 master frames are sent per second.

Table 8- 13 Meaning of error counter

Count value / Information	Meaning
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Transmission of process data is not interrupted in this case.
Erroneous slave frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Transmission of process data is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Transmission of process data is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 14 Slave address structure of the counters

Byte	Counter	
0	Counter: Slave failure	High byte
1		Low byte
2	Counter: Missing slave frame	High byte
3		Low byte
4	Counter: Erroneous slave frame	High byte
5		Low byte
6	Counter: I/O fault	High byte
7		Low byte
8	Counter: Protocol error	High byte
9		Low byte
10	Counter: Erroneous master frame	High byte
11		Low byte

The counters are integer values (2 bytes).

Table 8- 15 Master frame structure of the counters

Byte	Meaning	
0	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)	High word, high byte
1		High word, low byte
2		Low word, high byte
3		Low word, low byte
4	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)	High word, high byte
5		High word, low byte
6		Low word, high byte
7		Low word, low byte
8	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word, high byte
9		High word, low byte
10		Low word, high byte
11		Low word, low byte

The counters are integer values (4 bytes).

8.9.4.1 DS 150 Read AS-i slave error counters 1/1A to 16/16A

Table 8- 16 Structure of data record DS 150

Byte	Meaning
0	Version High
1	Version Low
2 … 13	Counter for slave address 1 / 1A
14 … 25	Counter for slave address 2 / 2A
26 … 37	Counter for slave address 3 / 3A
38 … 49	Counter for slave address 4 / 4A
50 … 61	Counter for slave address 5 / 5A
62 … 73	Counter for slave address 6 / 6A
74 … 85	Counter for slave address 7 / 7A
86 … 97	Counter for slave address 8 / 8A
98 … 109	Counter for slave address 9 / 9A
110 … 121	Counter for slave address 10 / 10A

Using the command interface

9

9.1 Introduction

You control the behavior of the AS-i master in your user program entirely through the command interface.

This chapter contains the information you need for accessing the command interface of the CM AS-i Master ST.

9.2 Command interface with SIMATIC S7

Instruction "ASI_CTRL"

The instruction "ASI_CTRL" is available for controlling the command interface. You will find this instruction in *STEP 7* in the task card "Instructions" under "Advanced instructions" > "Distributed I/O" > "Others" > "ASI".

For detailed instructions on using the instruction "ASI_CTRL", see: ASI_CTRL (http://support.automation.siemens.com/WW/view/en/51678777).

9.3 Command interface with controllers of other manufacturers

Functional principle

AS-i commands are read and written via the acyclic services of PROFINET/PROFIBUS. You use the "Read_data_record" and "Write_data_record" (data record 2) services in the user program of the IO controller/DP master for this.

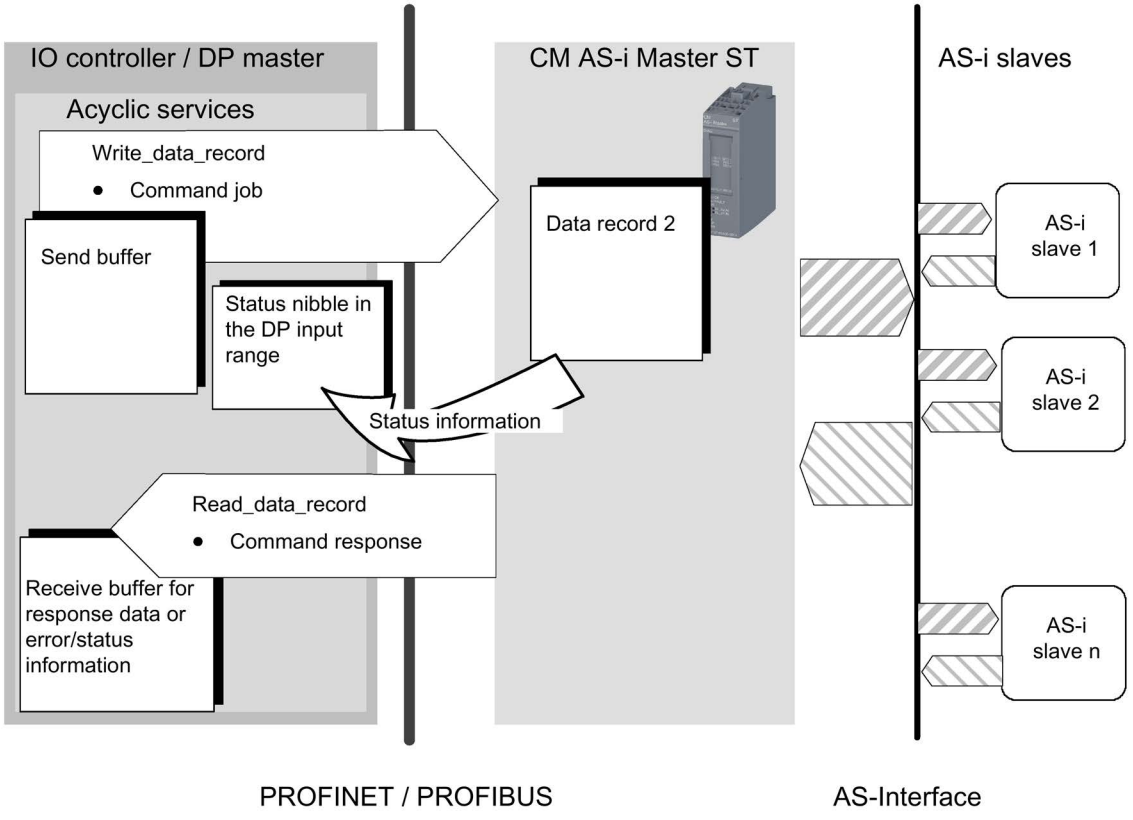

Figure 9-1 Functional principle

Job parameters

You assign parameters for the "Read_data_record" and "Write_data_record" jobs. The following parameters control the issuance of the commands:

- Index:

  Defines the data record number = 2

- Length:
  - With "Write_data_record", you specify the length of the send data depending on the command.
  - With "Read_data_record", the CM AS-i Master ST signals the length of the receive data via the status nibble.

Command processing in the user program

Structure the command processing in the user program as follows:

1. Specify the command call (Page 103) in a send buffer in the user program.
2. Send this data record call to the CM AS-i Master ST with Write_data_record (data record 2).
3. Then, query the status of the command processing in the input range for digital values (cyclic services). The status information is stored in the first byte reserved for it (byte 0) in bits 4 to 7 of the input range (status nibble).
4. Different reactions occur depending on the result of the status evaluation. You can find these in the following sequence chart. Details on the meaning of the status nibble can be found in the "Coding of the status nibble" table.

   To complete the command processing, you must always issue a Read_data_record (data record 2) job either to obtain further information or to apply the response data.

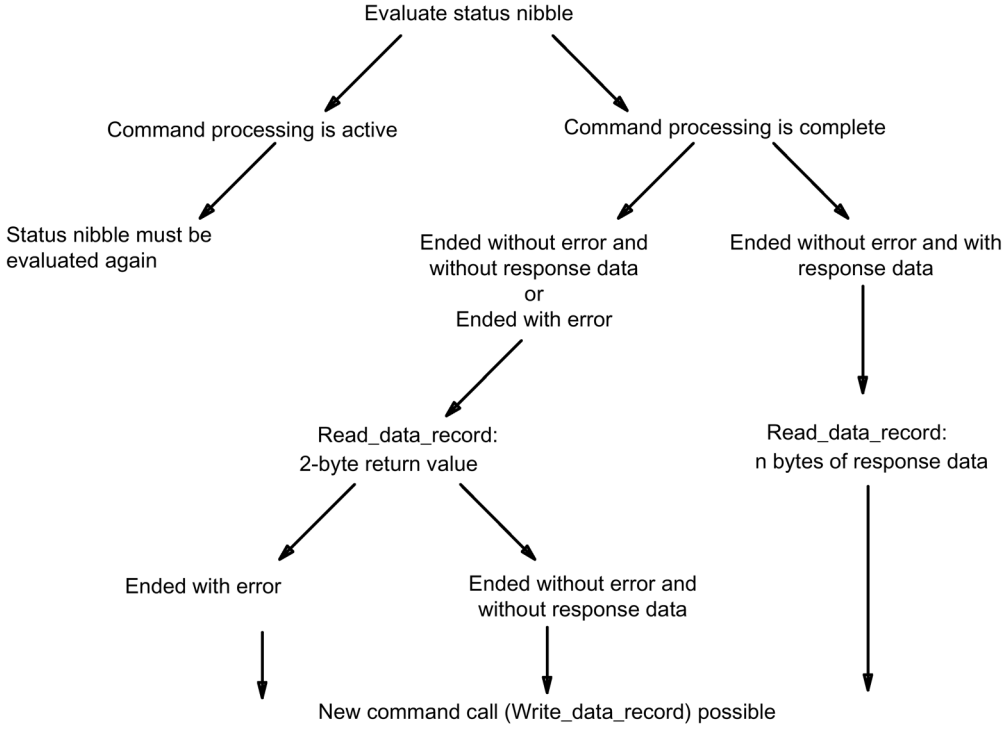

Figure 9-2 Flowchart

Table 9- 1 Coding of the status nibble

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	
1	0	0	0	Startup detection 1: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	1	0	Startup detection 2: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	0	0	Reserved for SIMATIC S7 use FB ASI_CTRL Initiation of a command by the user program is possible.
0	0	1	0	The command processing is active Initiation of a command by the user program is not possible.
0	0	0	1	Command processing has ended. An asynchronous read access can be used to retrieve a **2-byte** return value from the AS-i master. Two cases are distinguished here: • The return value is 0: A command without response data has been ended without errors. • The return value is a value **other than 0**: The command has been ended **with error** (see "Return value in response buffer" table). Initiation of a new command by the user program is possible.
0	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **1 byte** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **4 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **14 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **16 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **32 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **56 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	Bit 6	Bit 5	Bit 4	
1	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **221 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	0	Job processing is complete. The response data or return value of the previous job has already been read by the user. Initiation of a new command by the user program is possible.

Example

The table below indicates the behavior of the status nibble display as a result of the device status and the command processing in the user program:

	Action	Response in the status nibble
1.	Switching on the AS-i voltage of the CM AS-i Master ST.	1110_B … 1000_B … 1110_B …
2.	The user program transfers a command (e.g., Write_parameter) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly; dependent on command)
3.	The AS-i master ends the command. The user program can read the return value	0001_B
4.	The user program reads the 2-byte return value with an asynchronous read access.	0100_B
5.	... Further program processing ...	…
6.	The user program transfers a command (e.g., Read_expanded_lists_and_flags) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly, dependent on command)
7.	The AS-i master ends the command without errors. The user program can read the response data.	1011_B
8.	The user program reads 32 bytes of response data with an asynchronous read access.	1011_B

Return value

Processing errors are itemized in the return value of the response buffer, if necessary. An error indication exists when "ended without error and without response data or ended with error" is displayed in the status nibble (coding: 0001_H).

Table 9- 2 Return value in the response buffer

STATUS	Meaning
0000_H	**Job completed without errors**
8381_H	The AS-i slave address is incorrect.
8382_H	The AS-i slave is not activated (not in LAS).
8383_H	Error on the AS-Interface
8384_H	The command is not permitted in the current state of the AS-i master.
8385_H	An AS-i slave with address 0 exists.
8386_H	The AS-i slave has impermissible configuration data (IO, ID, ID2, or ID1 code).
$83A1_H$	The referenced AS-i slave was not found on the AS-Interface.
$83A2_H$	An AS-i slave with address 0 exists.
$83A3_H$	An AS-i slave with the new address already exists on the AS-Interface.
$83A4_H$	The AS-i slave address cannot be deleted.
$83A5_H$	The AS-i slave address cannot be set.
$83A6_H$	The AS-i slave address cannot be permanently saved.
$83A7_H$	Error while reading the ID1 code
$83A8_H$	The destination address is not plausible: e.g. a B slave address is used for a standard slave.
$83B1_H$	A length error occurred during the string transfer in accordance with Profile 7.4.
$83B2_H$	A protocol error occurred during the string transfer in accordance with Profile 7.4.
$83C0_H$	The AS-i slave has an invalid profile, e.g. the standard slave or A slave is configured at a B address.
$83C1_H$	The standard slave cannot be configured, because the B address is already assigned.
$83F8_H$	The job number or the job parameter is not known.
$83F9_H$	The AS-i master has detected an EEPROM error.

Note

Errors that occur during processing of acyclic services and are reported via call parameters, such as "Return Value", can be found in the documentation of the relevant programming interface.

9.4 Description of the AS-i commands

Overview

The commands that the user program can issue to the CM AS-i Master ST are described below. With these commands, the AS-i master makes available the complete functionality of the M4 master profile of the AS-i master specification.

Note

Adaptations when using existing user programs

Please observe the following adaptations when using existing user programs:

For some commands of the CM AS-i Master ST, the command numbers have been changed and the data structures belonging to the command have been optimized compared to other AS-i masters (e.g., DP/AS-i LINK Advanced).

The following table provides an overview of the modified command numbers:

Command name	Coding for DP/AS-i LINK Advanced	Coding for CM AS-i Master ST
Set_Permanent_Configuration (Page 111)	25_H	$A5_H$
Get_Permanent_Configuration (Page 112)	26_H	$A6_H$
Read_Actual_Configuration (Page 114)	28_H	$A8_H$
Set_LPS (Page 115)	29_H	$A9_H$
Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)	30_H	$B0_H$
Read_overall_configuration (Page 124)	39_H	$B9_H$
Write_overall_configuration (Page 130)	$3A_H$	BA_H
Get_LPF (Page 146)	$3E_H$	BE_H
Read_Error_Counter (Page 151)	$4A_H$	CA_H
Read_and_Delete_AS-i-Master_Error_Counter (Page 154)	$4B_H$	CB_H
Read_AS-i_error_counter (Page 154)	$4C_H$	CC_H
Read_and_delete_AS-i_Slave_error_counter (Page 156)	$4D_H$	CD_H

The following table lists the commands that can be executed with the CM AS-i Master ST.

Table 9- 3 AS-i commands

Name	Parameters	Return value	Coding
Set_Permanent_Parameter (Page 107)	Slave address, parameter	—	00_H
GET_Permanent_Parameter (Page 108)	Slave address	Parameter	01_H
Write_Parameter (Page 109)	Slave address, parameter	Optional: Parameter echo	02_H
Read_Parameter (Page 110)	Slave address	Parameter value	03_H
Store_Actual_Parameters (Page 110)	—	—	04_H
Set_Permanent_Configuration (Page 111)	Slave address, configuration data to be configured	—	$A5_H$
Get_Permanent_Configuration (Page 112)	Slave address	Configured configuration data	$A6_H$
Store_Actual_Configuration (Page 113)	—	—	07_H
Read_Actual_Configuration (Page 114)	Slave address	ACTUAL configuration	$A8_H$
Set_LPS (Page 115)	LPS	—	$A9_H$
SET_Offline_Mode (Page 116)	Mode	—	$0A_H$
Set_Auto_Address_Enable (Page 117)	Mode	—	$0B_H$
Set_Operation_Mode (Page 118)	Mode	—	$0C_H$
Change_AS-i-Slave_Address (Page 119)	Address 1, Address 2	—	$0D_H$
Read_Status (Page 120)	Slave address	Error data record of AS-i slave	$0F_H$
Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)	—	LDS, LAS, LPS, flags	$B0_H$
Read_overall_configuration (Page 124)	—	ACTUAL configuration data, actual parameters, LAS, flags	$B9_H$
Write_overall_configuration (Page 130)	Overall configuration	—	BA_H
Set_PI (Page 136)	Parameter list	—	$3C_H$
AS-i Parameter Echolist (Page 138)	—	Parameter echo list	33_H
Read_Write_CTT2_String (Page 140)	Slave address CTT2 string	CTT2 string	44_H
Read_Version (Page 141)	—	Version string	14_H
Read ID_Code (Page 142)	Slave address	ID code	17_H
Read_ID1-Code (Page 143)	Slave address	ID1 code	37_H
Write ID1-Code (Page 143)	ID1 code	—	$3F_H$
Read_ID2-Code (Page 144)	Slave address	ID2 code	38_H
Read_IO-Code (Page 145)	Slave address	IO code	18_H
Get_LPF (Page 146)	—	LPF	BE_H
Write_Parameter_String (Page 147)	Slave address, parameter string	—	40_H
Read_String (Page 148)	Slave address	Parameter string	41_H
Read_String (Page 149)	Slave address	Identification string	42_H
Read_String (Page 150)	Slave address	Diagnostics string	43_H

Name	Parameters	Return value	Coding
Read_Error_Counter (Page 151)	—	—	CA_H
Read_and_Delete_AS-i-Master_Error_Counter (Page 154)	—	—	CB_H
Read_AS-i_error_counter (Page 154)	Slave address	—	CC_H
Read_and_delete_AS-i_Slave_error_counter (Page 156)	Slave address	—	CD_H
Activate_ground fault detection (reset EFD) (Page 157)	Mode	—	13_H
Set_Configuration_Online (Page 158)	Slave address, configuration data to be configured, parameters	—	$D0_H$
AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address) (Page 159)	Address, ID1 code	—	$D1_H$

General structure of the send buffer

The basic structure of the send buffer for commands is shown below.

The length of the job data depends on the respective command. Some commands do not require any job data. In this case, the send buffer only has one byte (byte 0).

Table 9- 4 Basic structure of the send buffer for commands

Byte	Meaning
0	Number of the command
1	**Job data**
…	**Job data**

General structure of the receive buffer

The basic structure of the receive buffer for commands is shown below. The length of the response data depends on the respective command.

Some commands do not supply any response data. In this case, there is no receive buffer.

Table 9- 5 Basic structure of the receive buffer

Byte	Meaning
0	**Response data**
1	**Response data**
…	**Response data**

General operating state of the AS-i slave address

If an AS-i slave must be addressed in a command or in a response, it must be addressed as follows:

Table 9- 6 Structure of the AS-i slave address

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	Select bit	Slave address				

The Select bit for the selection of the slave type is specified as follows:

- Select bit = 0

  AS-i slave with standard-address (0 to 31) or AS-i slave with extended address in address area A (1A to 31A)

- Select bit = 1:

  AS-i slave with extended address in address area B (1B to 31B)

9.4.1 Set_Permanent_Parameter

Meaning

This command configures a parameter value for the specified AS-i slave in the AS-i master. The value is stored in the non-volatile EEPROM of the CM AS-i Master ST. The parameter value is additionally forwarded to the addressed AS-i slave.

However, the "parameter echo" of the AS-i slave cannot be read out with this command (see Write_Parameter (Page 109) command).

Note

Use of other Siemens AS-i masters

Other Siemens AS-i masters do not transfer the configured parameters to the AS-i slave immediately.

For AS-i slaves that meet the AS-i standard slave profile 7.4, this command is not permitted. For these slaves, the AS-i master itself administers the parameter assignment of the AS-i slave. In this case, the configured parameters are always equal to F_H.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

Structure of the job data in the send buffer

Table 9- 7 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: 00_H			
1	Slave address			
2	0		Parameters	

9.4.2 GET_Permanent_Parameter

Significance

This command reads a slave-specific parameter value that has been saved in EEPROM of the CM AS-i Master ST.

Structure of the job data in the send buffer

Table 9- 8 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 01_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 9 Structure of the reply data in the receive buffer

Byte	Significance			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Configured parameters	

9.4.3 Write_Parameter

Meaning of the command

The command transfers an AS-i slave parameter value. This is transferred to the addressed AS-i slave.

The parameter is only stored in volatile memory in the AS-i master and it is not transferred to the EEPROM as a configured parameter!

The AS-i slave transfers its current "Parameter echo" parameter value in the response. In accordance with the AS-i master specification "AS-Interface Complete Specification", this value can deviate from the value just written. The response from the AS-i slave is supplied in the response data as a parameter echo.

For AS-i slaves that meet the AS-i standard slave profile 7.4, this command is not permitted. For these slaves, the AS-i master itself administers the parameter assignment of the AS-i slave.

Structure of the job data in the send buffer

Table 9- 10 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: 02_H			
1	Slave address			
2	0		Parameters	

Structure of the response data in the receive buffer

Table 9- 11 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameter echo	

9.4.4 Read_Parameter

Meaning

This command returns the current "ACTUAL parameter" parameter value of an AS-i slave sent by the AS-i master.

You must not confuse this value with the parameter echo that the AS-i slave supplies as reply to Write_Parameter.

Structure of the job data in the send buffer

Table 9- 12 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 03_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 13 Structure of the reply data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameters	

9.4.5 Store_Actual_Parameters

Significance

This command overwrites the configured parameters stored on EEPROM with the current ACTUAL parameters stored in non-volatile memory. That is, the parameters of all AS-i slaves are configured.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that meet AS-i slave standard profile 7.4. The configured parameters for these AS-i slaves are always equal to F_H.

Structure of the job data in the send buffer

Table 9- 14 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 04_H

9.4.6 Set_Permanent_Configuration

Meaning

With this command, the following configuration data are configured for the addressed AS-i slave:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses these configuration data as the specified expected configuration data for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

If the addressed AS-i slave does not support ID code 1 or ID code 2, the value F_H must be specified for this in the command.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 15 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: $A5_H$			
1	Slave address			
2	IO code		ID code	
3	ID1 code		ID2 code	

9.4.7 Get_Permanent_Configuration

Meaning

The configuration data (configured CONF data) of an addressed AS-i slave stored on the EEPROM of the AS-i master are read with this command:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

Structure of the job data in the send buffer

Table 9- 16 Structure of the job data in the send buffer

Byte	Meaning
0	Command number $A6_H$
1	Slave address

Structure of the response data in the receive buffer

Table 9- 17 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	IO code		ID code	
1	ID1 code		ID2 code	
2	0			
3	0			

9.4.8 Store_Actual_Configuration

Meaning

The following ACTUAL configuration data of all AS-i slaves is obtained from the AS-i master:

- Slave profile (IO, ID, ID2 codes)
- ID1 code

This command saves the obtained ACTUAL configuration data as CONF configuration data in the non-volatile EEPROM. The List of activated AS-i slaves (LAS) is also loaded into the List of configured AS-i slaves (LPS).

When this command is executed, the AS-i master switches to the offline phase and then switches back to "protected operation". The AS-i master restarts.

This command is not executed in "protected operation".

The slave parameter values in volatile memory of the AS-i master and the content of the non-volatile memory for the parameters are not changed. The "Set_Permanent_Parameter" command must be executed, if necessary.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 18 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 07_H

9.4.9 Read_Actual_Configuration

Meaning

This command reads the following configuration data of an addressed AS-i slave obtained from the AS-i master on the AS-Interface:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

Structure of the job data in the send buffer

Table 9- 19 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $A8_H$
1	Slave address

Structure of the response data in the receive buffer

Table 9- 20 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	IO code		ID code	
1	ID1 code		ID2 code	
2	Reserved			
3	Reserved			

9.4.10 Set_LPS

Meaning

This command transfers the list of configured AS-i slaves for non-volatile storage in the EEPROM of the master.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 21 Structure of the job data in the send buffer

Byte	Meaning							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0	Command number: $A9_H$							
1	00_H							
2	Slave 7(A)	Slave 6(A)	Slave 5(A)	Slave 4(A)	Slave 3(A)	Slave 2(A)	Slave 1(A)	0
3	Slave 15(A)	Slave 14(A)	Slave 13(A)	Slave 12(A)	Slave 11(A)	Slave 10(A)	Slave 9(A)	Slave 8(A)
4	Slave 23(A)	Slave 22(A)	Slave 21(A)	Slave 20(A)	Slave 19(A)	Slave 18(A)	Slave 17(A)	Slave 16(A)
5	Slave 31(A)	Slave 30(A)	Slave 29(A)	Slave 28(A)	Slave 27(A)	Slave 26(A)	Slave 25(A)	Slave 24(A)
6	Slave 7B	Slave 6B	Slave 5B	Slave 4B	Slave 3B	Slave 2B	Slave 1B	0
7	Slave 15B	Slave 14B	Slave 13B	Slave 12B	Slave 11B	Slave 10B	Slave 9B	Slave 8B
8	Slave 23B	Slave 22B	Slave 21B	Slave 20B	Slave 19B	Slave 18B	Slave 17B	Slave 16B
9	Slave 31B	Slave 30B	Slave 29B	Slave 28B	Slave 27B	Slave 26B	Slave 25B	Slave 24B

The bits have the following meanings in the LPS data:

0: AS-i slave is not configured

1: AS-i slave is configured

9.4.11 SET_Offline_Mode

Meaning

This command switches between online and offline mode.

Online mode is the normal mode for the AS-i master. The following jobs are processed in online mode:

1. In the data exchange phase, the fields of the output data are transferred to the slave outputs for all AS-i slaves of the LAS. In error-free transmission, the addressed AS-i slaves transfer the values of the slave inputs to the master.
2. In the loading phase, a search is conducted for the existing AS-i slaves. Newly added AS-i slaves are inserted in the LDS or LAS.
3. In the management phase, jobs forwarded by the user, such as writing parameters, are executed.

In offline mode, the AS-i master only processes jobs from the user. Jobs that immediately activate an AS-i slave are rejected with an error. Cyclic data exchange is not performed with the AS-i slaves.

The bit OFFLINE=TRUE is not stored permanently. This means that after startup or restart, the AS-i master is in online mode again.

Structure of the job data in the send buffer

Table 9- 22 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0A_H$		
1	0		Mode 0 = Online 1 = Offline

9.4.12 Set_Auto_Address_Enable

Meaning

This command enables or disables the "Automatic address programming" function.

The bit AUTO_ADDR_ENABLE is stored in non-volatile memory. It is retained even after startup or warm restart of the AS-i master.

Structure of the job data in the send buffer

Table 9- 23 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0B_H$		
1	0		Value for AUTO_ADDR_ENABLE 1 = Automatic address programming enabled 0 = Automatic address programming disabled

9.4.13 Set_Operation_Mode

Meaning

This command chooses between "configuration mode" and "protected operation".

In **"protected operation"**, only the AS-i slaves that are flagged in the LPS and whose CONFIGURED and ACTUAL configurations match are activated. This is the case when the I/O code and the ID codes of the detected AS-i slaves are identical to the configured values.

In **"configuration mode"**, all the detected AS-i slaves are activated - with the exception of AS-i slave "0". This also applies to AS-i slaves that differ in their CONFIGURED and ACTUAL configurations.

The "OPERATING MODE" bit is saved in **non-volatile** memory. As a result, this bit is retained in the event of startup or restart.

On switching from "configuration mode" to "protected operation", the AS-i master restarts. It enters the offline phase and then switches to online mode.

Note

AS-i slave with address 0 prevents switchover to "protected operation"

If an AS-i slave with address 0 is present on the AS-i bus, the AS-i master cannot switch from "configuration mode" to "protected operation".

Structure of the job data in the send buffer

Table 9- 24 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0C_H$		
1	0		Operating mode 0 = "Protected operation" 1 = "Configuration mode"

9.4.14 Change_AS-i-Slave_Address

Meaning of the command

This command changes the AS-i slave address of an AS-i slave.

This command is used predominantly for adding a new AS-i slave with the default address "0". In this case, the address is changed from "AS-i slave address, old" = 0 to "AS-i slave address, new".

The change is only executed if the following conditions are met:

1. An AS-i slave with "AS-i slave address, old" must exist.
2. If "AS-i address, old" is not equal to "0", an AS-i slave with the address "0" must not be connected at the same time.
3. "AS-i slave address, new" must have a valid value.
4. An AS-i slave with "AS-i slave address, new" must not already exist.

Note

When changing the AS-i slave address, the AS-i slave is not reset. The output data of the AS-i slave are retained until new data arrive for the new address.

Structure of the job data in the send buffer

Table 9- 25 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $0D_H$
1	Slave address, old
2	Slave address, new

9.4.15 Read_Status

Meaning

This command reads the status register for the addressed AS-i slave. The flags of the status register have the following meaning depending on the type of the AS-i slave:

Table 9- 26 Meaning of the flags of the status register depending on the type of the AS-i slave

Status bit	AS-i slave according to standard 2.0	AS-i slave according to standard 2.1
S0	**Address volatile**	**Address/ID code volatile**
	This flag is set if • The internal routine of the AS-i slave for permanent storage of the AS-i slave address is running. This can last up to 15 ms and must not be interrupted by another addressing call. • The internal address comparison of the AS-i slave determines that the permanently saved address is not identical to the entry in the address register.	
S1	**Parity error detected** This flag is set if the AS-i slave has detected a parity error in a receive frame since the last "Read and delete status" job.	**Peripheral fault detected** An AS-i slave can set this flag if it detects a fault, e.g. wire break, on the connected I/O.
S2	**End bit error detected** This flag is set if the AS-i slave has detected an end bit error in a message frame since the last "Read and delete status" job.	Reserved
S3	**Read error in non-volatile memory (EEPROM)** This bit is set if the AS-i slave has discovered a read error when reading the non-volatile memory.	

Structure of the job data in the send buffer

Table 9- 27 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $0F_H$
1	Slave address

Structure of the job data in the receive buffer

0	0		S 3	S 2	S 1	S 0

9.4.16 Get_LPS, Get_LAS, Get_LDS, Get_Flags

Meaning

This command reads the following entries from the AS-i master:

- List of activated AS-i slaves, LAS
- List of detected AS-i slaves, LDS
- List of configured AS-i slaves, LPS
- The flags in accordance with the AS-i slave specification

24	Flag 1							
25	Flag 2							
26 … 31	Reserved							

Meaning of the bits in Byte 0 to 23

- Bit = 0:

  The AS-i slave is **not** activated, detected or configured.

- Bit = 1:

  The AS-i slave **is** activated, detected or configured.

Table 9- 31 Structure of flag 1 and flag 2

Flag 1			**Flag 2**	
Bit	**Meaning**		**Bit**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

Table 9- 32 Meaning of the flags

Flag	**Meaning**
Config_OK	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
LDS.0	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
Auto_Address_Assign	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves are connected to AS-Interface.
Auto_Address_Available	The flag is set if automatic address programming can be performed. This means that one AS-i slave has failed.
Configuration_Active	The flag is set in "configuration mode" and reset in "protected operation".
Normal_Operation_Active	The flag is set when the AS-i master is in "protected operation".
APF	The flag is set when the voltage on the AS-i cable is too low (AS-i Power Fail).
Offline_Ready	The flag is set if the offline phase is active.
Periphery_OK	The flag is set if none of the AS-i slaves signal a peripheral fault.
Data_Exchange_Active	The "Data_Exchange_Active" flag is set when cyclic data exchange is in "protected operation".
Off_Line	The flag is set if the "OFFLINE" operating status is to be adopted or has already been adopted.
AUTO_ADDR_ENABLE	The flag indicates whether automatic address programming is disabled (BIT = 0) or enabled (BIT = 1) by the user.
Earth_Fault	The flag is set if a ground fault has been detected on the AS-i cable.
EEPROM_OK	The flag is set if the test of the internal EEPROM was successful.
EFD Disable	The flag indicates whether ground fault detection is enabled (BIT = 0) or disabled (BIT = 1) by the user.

9.4.17 Read_overall_configuration

Meaning

This command reads the following data from the AS-i master:

- List of activated AS-i slaves (LAS).

  It specifies which of the connected AS-i slaves are activated
- The current configuration data for the connected AS-i slaves:
  - IO code
  - ID code
  - ID1 code
  - ID2 code
- The current parameters of the AS-i slaves (ACTUAL parameters)
- The current status of the AS-i master (Flag 1, Flag 2)

After commissioning, you can use this command, for example, to determine the configuration of the stations connected to the AS-i cable. You can modify this read-in configuration data if required and store it as the CONFIGURED configuration in the AS-i master with the "Write_overall_configuration" command.

Write_overall_configuration (Page 130)

167	Parameter Slave 26B				Parameter Slave 27B			
168	Parameter Slave 28B				Parameter Slave 29B			
169	Parameter Slave 30B				Parameter Slave 31B			
170	Flag 1							
171	Flag 2							
172 … 218	Reserved							

Table 9- 35 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit number	**Meaning**		**Bit number**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

For the meanings of flags, refer to Chapter:

Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)

9.4.18 Write_overall_configuration

Meaning

This command transfers the desired overall configuration of AS-Interface to the AS-i master and saves it as the CONFIGURED configuration in the non-volatile EEPROM. This configures the AS-i master.

When this command is executed, the AS-i master changes to the offline phase and then switches back over to "normal operation". The AS-i master restarts.

The "Protected operation" or "Configuration mode" operating mode of the AS-i master after execution of the command is determined by the "Configuration_Active" flag (see Table "Structure of Flag 1 and Flag 2").

This command is permissible both in "Protected operation" and "Configuration mode.

Note

Configuration data are overwritten

If you configure the AS-i slaves using *STEP 7*, there is normally no need to use the command described here. If you have configured proxy slaves, you can specify the configuration data of the proxy slaves with this command. To avoid the offline changeover, the configuration data of the proxy slaves can be specified preferentially with the "Set_Configuration_Online (Page 158)" command.

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring the AS-i master using the "SET" button or configuring using *STEP 7*.

Specifically, the following data are transferred:

- List of configured AS-i slaves

  This specifies which AS-i slaves are permitted to be activated by the AS-i master in "protected operation".

- List of configuration data.

  This specifies the ID codes and the IO code that the connected AS-i slaves must have.

- The list of the AS-i slave parameters that have been configured in the AS-i master and stored in non-volatile memory. These parameters are transferred to the AS-i slaves when the AS-i master starts up.

- The flags that determine the operating state of the AS-i master after startup.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that comply with standard profile 7.4. For slaves in accordance with standard profile 7.4, the AS-i master ignores the parameter values specified in the command.

NOTICE
Note the size of the I/O image If you have configured the AS-i slaves in *STEP 7*, the size of the I/O image of the individual slaves is defined using *STEP 7*. When using this command, ensure that the I/O image of the individual slaves corresponds to the slaves configured using the command. If the size of the I/O image does not match, only the lower-order data will be transferred. The data that do not fit into the image are truncated or are filled with substitute value "0" in the case of digital values and with substitute value 7FFF (Hex) in the case of analog values.

Structure of the job data in the send buffer

170	Flag 1							
171	Flag 2							

Table 9- 37 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit number	**Meaning**		**Bit number**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		**3**	**AUTO_ADDR_ENABLE** 1)
4	**Configuration_Active** 1)		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

1) The "Configuration_Active" and "AUTO_ADDR_ENABLE" flags change the operating mode of the AS-i master. The values of the remaining flags are insignificant for the command "Set_LPS, Set_PCD, Set_PP, Set_Flags" and cannot be modified in the AS-i master by this call.

Configuration_Active	"0" means: After the command has been executed, the AS-i master will switch to "protected operation". "1" means: The AS-i master runs in "configuration mode" after completion of the job.
AUTO_ADDR_ENABLE	"0" means: Automatic address programming is disabled. "1" means: Automatic address programming is enabled.

For the meanings of flags, refer to Chapter:

Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)

9.4.19 Set_PI

Meaning

This command transfers parameters for all AS-i slaves to the AS-i master. It only transfers those parameters that have changed to the AS-i slaves, i.e. those that differ from the previously sent ACTUAL parameters.

9.4.20 AS-i Parameter Echolist

Meaning

This command outputs the echo values for all AS-i slaves. The echo values of an AS-i slave originate in the last parameter call sent to this AS-i slave.

9.4.21 Read_Write_CTT2_String

Meaning

This command sends a CTT2 request according to the AS-i slave profile "CombinedTransactionType2" to the AS-i master with a byte string. The master forwards the string bytes to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 222 bytes to the AS-i master. The AS-i master calculates the actual number of string bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The addressed AS-i slave answers the CTT2 request with a CTT2 response. The AS-i master communicates this response as a byte string in the receive buffer. The strings are transmitted by the AS-i master with the response.

The structure of the CTT2 request or CTT2 response (code, index, etc.) starts with string byte 1 in each case. You will find details about this in the respective AS-i slave description.

Note

While transmission of the strings is being executed on AS-i, there is no cyclic data transfer with the addressed AS-i slave. The type of protocol used means that transfer of up to 200 bytes can take up to half a minute.

Structure of the job data in the send buffer

Table 9- 41 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 44_H
1	Slave address
2	Number of string bytes
3	String byte 1
4	String byte 2
…	—
n + 1	String byte n-1
n + 2	String byte n

Maximum value for n = 220

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		ID1 code	

9.4.25 Write ID1-Code

Meaning

This command writes the ID1 code of an AS-i slave with the address "0" directly over the AS-i cable.

The AS-i master forwards the ID1 code to the AS-i slave without a plausibility check.

Structure of the job data in the send buffer

Table 9- 48 Structure of the job data in the send buffer

Byte	Meaning	
0	Command number: $3F_H$	
1	Not relevant	ID1 code

9.4.26 Read_ID2-Code

Meaning

This command reads the ID2 code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 49 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 38_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 50 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		ID2 code	

9.4.27 Read_IO-Code

Meaning

This command reads the IO code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 51 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 18_H
1	Slave address

Table 9- 52 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		IO code	

9.4.28 Get_LPF

Meaning

This command reads the list of I/O faults (periphery faults) (LPF) signaled by the AS-i slaves from the AS-i master. The AS-i master updates the LPF cyclically. Refer to the description of the AS-i slave to learn whether the slave can detect a fault in the connected I/O, e.g. wire break, and when it signals the fault.

Structure of the job data in the send buffer

Table 9- 53 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: BE_H

Structure of the responses in the receive buffer

Table 9- 54 Structure of the responses in the receive buffer

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Slave 7(A)	Slave 6(A)	Slave 5(A)	Slave 4(A)	Slave 3(A)	Slave 2(A)	Slave 1(A)	Reserved
1	Slave 15(A)	Slave 14(A)	Slave 13(A)	Slave 12(A)	Slave 11(A)	Slave 10(A)	Slave 9(A)	Slave 8(A)
2	Slave 23(A)	Slave 22(A)	Slave 21(A)	Slave 20(A)	Slave 19(A)	Slave 18(A)	Slave 17(A)	Slave 16(A)
3	Slave 31(A)	Slave 30(A)	Slave 29(A)	Slave 28(A)	Slave 27(A)	Slave 26(A)	Slave 25(A)	Slave 24(A)
4	Slave 7B	Slave 6B	Slave 5B	Slave 4B	Slave 3B	Slave 2B	Slave 1B	Reserved
5	Slave 15B	Slave 14B	Slave 13B	Slave 12B	Slave 11B	Slave 10B	Slave 9B	Slave 8B
6	Slave 23B	Slave 22B	Slave 21B	Slave 20B	Slave 19B	Slave 18B	Slave 17B	Slave 16B
7	Slave 31B	Slave 30B	Slave 29B	Slave 28B	Slave 27B	Slave 26B	Slave 25B	Slave 24B
8 … 13	Reserved							

The bits have the following meanings in the LPF data:

Bit = 0: The slave signals no I/O fault.

Bit = 1: The slave signals I/O fault.

9.4.29 Write_Parameter_String

Meaning

This command sends a parameter string in accordance with AS-i slave profile 7.4 to the AS-i master. The master forwards the parameter string to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 223 bytes to the AS-i master. The AS-i master calculates the actual number of parameter bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The AS-i master does not evaluate any other information in the parameter string. It transfers this to the AS-i slave transparently. While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 55 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 40_H
1	Slave address
2	Number of parameter bytes
3	Parameter string byte 1
4	Parameter string byte 2
…	…
n + 1	Parameter string byte n - 1
n + 2	Parameter string byte n

Maximum value for n = 220

9.4.30 Read_String

Meaning

This command causes the AS-i slave to read a parameter string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer.

The AS-i master supplies up to 221 bytes of response data. The AS-i master signals the actual number of parameter bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a parameter string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the job program.

While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 56 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 41_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 57 Structure of the response data in the receive buffer

Byte	Meaning
0	Number of parameter bytes
1	Parameter string byte 1
2	Parameter string byte 2
…	…
n - 1	Parameter string byte n - 1
n	Parameter string byte n

Maximum value for n = 220

9.4.31 Read_String

Meaning

This command causes the AS-i slave to read an identification string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of ID bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends an ID string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

As long as the transmission of the identification string is running, there is no transfer of user/analog data with the addressed AS-i slave.

Note

In a deviation from normal procedure, this command also transfers the bytes that contain the bits "Follows" and "Valid".

For further details, refer to AS-i slave profile 7.4

Structure of the job data in the send buffer

Table 9- 58 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 42_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 59 Structure of the reply data in the receive buffer

Byte	Meaning
0	Number of ID bytes
1	ID string byte 1
2	ID string byte 2
…	…
n - 1	ID string byte n - 1
n	ID string byte n

Maximum value for n = 220

9.4.32 Read_String

Significance

This command causes the AS-i slave to read a diagnostics string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of diagnostics bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a diagnostics string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

While transmission of the diagnostics string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 60 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 43_H
1	Slave address

Structure of the reply data in the receive buffer

Byte	Significance
0	Number of diagnostics bytes
1	Diagnostic string byte 1
2	Diagnostic string byte 2
…	…
n - 1	Diagnostic string byte n - 1
n	Diagnostic string byte n

Maximum value for n = 220

9.4.33 Read_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)" for reading out the error counters. The Read_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out error counters that concern the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The counting starts over each time the device is powered up.

For the meaning of the error counters, refer to Table "Table 8-11 Meaning of error counter (Page 86)".

Structure of the job data in the send buffer

Table 9- 62 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CA_H

9.4.34 Read_and_Delete_AS-i-Master_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 97 Read and reset AS-i master error counters (FW V1.1 and higher) (Page 89)" for reading out the error counters. The Read_and_Reset_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command functions like the "Read_AS-i-Master_Error_Counter" command. In addition, the AS-i master then sets all error counters to 0.

Structure of the job data in the send buffer

Table 9- 64 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CB_H

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "Read_Error_Counter (Page 151)" command.

9.4.35 Read_AS-i_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)". The Read_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out AS-i slave-specific error counters. For the meaning of the error counters, refer to Section "Table 8-13 Meaning of error counter (Page 90)".

Structure of the job data in the send buffer

Table 9- 65 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CC_H
1	AS-i slave address

Structure of the responses in the receive buffer

23		Low word / low byte
24 … 31	Reserved	

9.4.36 Read_and_delete_AS-i_Slave_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)" and "DS 154 Delete AS-i error counters (from V1.1) (Page 96)". The Read_and_Reset_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153. Data record DS 154 resets all AS-i slave error counters.

Structure of the job data in the send buffer

Table 9- 67 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CD_H
1	AS-i slave address

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "Read_AS-i_error_counter (Page 154)" command.

9.4.37 Activate_ground fault detection (reset EFD)

Meaning

The setting for enabling the integrated ground fault detection is always made when configuring the CM AS-i Master.
This command is used to enable or disable the ground fault detection via the user program so as to overwrite the configured setting.
After a startup or restart, the configured setting is applied again.

Structure of the job data in the send buffer

Table 9- 68 Structure of the job data in the send buffer

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Command number 13_H							
1	0							0 = Ground fault detection is enabled 1 = Ground fault detection is disabled

9.4.38 Set_Configuration_Online

Meaning

The following configuration data for the addressed AS-i slave is configured with this command:

- IO code
- ID code
- ID1 code
- ID2 code
- Parameter value

The configuration data is stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses this configuration data as the specified expected configuration for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification". If the addressed AS-i slave does not support ID code 1 or ID code 2, the command must be specified in the value FH for this. When this command is executed, the AS-i master remains in the online phase. This means that the AS-i master is not restarted. The command can be executed in "Protected operation".

The command can be executed for any slaves including proxy slaves. Ensure that you have defined an adequate length for the I/O image when configuring the slave. If the the I/O image for the slave is not long enough, surplus input data are truncated and surplus output data are transmitted with substitute value 0. This applies to a digital I/O image and an analog I/O image.

If the value F (hex) is written to a proxy slave for all four codes (IO code, ID code, ID1 code and ID2 code), any slave type at this AS-i address is activated by the AS-i master.

Note

Configuration data are overwritten

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring using the "SET" button or configuring using HW Config.

Note

The configuration data for all proxy slaves can be reset to value F (hex) in the CM AS-i Master ST module by configuring the AS-i slaves using the "SET" button with no slaves connected (see Section "Configuration of the AS-i slaves using the "SET" button (Page 35)").

Structure of the job data in the send buffer

Table 9- 69 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D0_H$			
1	Slave address			
2	IO code		ID code	
3	ID1 code		ID2 code	
4	0		Parameter	

9.4.39 AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address)

Meaning

This command writes the ID1 code of an AS-i slave with the specified address directly via the AS-i cable.

The AS-i master forwards the ID1 code to the AS-i slave without a plausibility check.

Requirements

- The AS-i slave at the target address must support writing of the ID1 code.
- There are no AS-i slaves on the AS-i bus with address "0".

Structure of the job data in the send buffer

	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D1_H$			
1	AS-i slave address			
2	0		ID1 code	

Technical data

10

10.1 Technical specifications

Technical specifications of CM AS-i Master ST

		3RK7137-6SA00-0BC1
product designation		AS-Interface Master
Product-type designation		CM AS-i Master ST
Protection class IP		IP20
Design of the electrical connection of the AS-Interface		ET 200SP BaseUnit (Type C0), 20 mm
Type of voltage supply		Via AS-i and backplane bus
Operating condition separate power supply 24 V		No
Current consumed		
• from shaped cables of AS-Interface		
– at 24 V with AS-i Power24V maximum	A	0.07
– with external 24 V-supply voltage maximum	A	0.07
• from backplane bus		0.02
Resistive loss	W	1.7
Insulation voltage rated value	V	500
Product function adapted for AS-i Power24V		Yes
Product feature redundancy capability		No
Product function web-based management		No
Product function diagnosis via E-mail		No
Product function galvanic isolation		Yes
Type of projection of the AS-interface		Set pushbutton on device, STEP7, GSD, command interface
Version of the AS-interface specification		V 3.0
AS-interface masterprofile is supported		M4 (in acc. with AS-interface specification V 3.0)
Type of data transmission		ET 200SP backplane bus
Transfer rate of the AS-interface maximum	bit/s	167 000

		3RK7137-6SA00-0BC1
Number of interfaces		
• as AS-interface		1
• according to Industrial Ethernet		0
• according to PROFINET		0
• according to RS 485		0
• according to USB		0
• according to wireless		0
• others		1
Product component optical interface		No
Protocol is supported		
• ASIsafe(Safety at work) protocol		No
• PROFIBUS protocol		No
• PROFINET CBA protocol		No
• PROFINET IO protocol		No
• PROFIsafe protocol		No
• SNMP		No
• other bus systems		No
• TCP/IP		No
Standard for wireless communication IEEE 802.11		No
Number of inputs for AS Interface maximum		496
Number of outputs for AS Interface maximum		496
Number of AS-i slaves per AS-Interface maximum		62
Bus cycle time of the AS-interface		
• at 31 slaves	s	0.005
• at 62 slaves	s	0.01
Access to digital I/O data		via process diagram/peripheral addresses and data record transfer
Access to analog I/O data		via data record transfer
Width	mm	20
Height	mm	69.2
Depth	mm	53.6
Type of mounting		Pluggable in BaseUnit

		3RK7137-6SA00-0BC1
Ambient temperature		
• if installed on horizontal mounting rail		
– during operation	°C	0 60
• if installed on vertical mounting rail		
– during operation	°C	0 50
• during storage	°C	-40 70
• during transport	°C	-40 70
Relative humidity at 25 °C during operating maximum	%	95
Installation altitude at a height over sea level maximum	m	2 000
Module format		IP20
Type of display as status display by LED		DIAG, AS-i OK, AS-i FAULT, PF, CER, CM, AUP, PWR, SL_Xy (A), SL_xY (B)
Acceptability for application safety-related function		No
Explosion protection labeling for intrinsic safety of related operating resources		
• EEX ia		No
• EEX ib		No
Explosion protection category for gas		none
Explosion protection category for dust		none

You will find additional information in the manual ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521).

AS-Interface Protocol Implementation Conformance Statements

Data sets

C

C.1 DS 100 Switch duplicate address detection on/off

Description

The duplicate address detection function can be activated/deactivated via the user program by means of write access to data record DS 100.

For the CM AS-i Master firmware V1.0 the status is stored in the AS-i Master volatile memory, i.e. if the AS-i voltage fails, duplicate address detection is deactivated.

For the CM AS-i Master firmware V1.0 and higher, duplicate address detection is adopted according to the setting in HW Config or GSD after failure of the AS-i voltage.

Note

From firmware V1.1 onwards use the setting option via HW Config or GSD to activate duplicate address detection. Data record DS 100 continues to exist for compatibility reasons.

Table C- 1 Structure of DS 100 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0							
1	0							
2	0							0 / 1
3	0							

Bit 0 = 0 Duplicate address detection is activated.

= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be changed in this case.

See also

Duplicate address detection (Page 76)

C.2 DS 100 Read setting for duplicate address detection

Description

Via read access to data record DS 100 the enable status of duplicate address detection can be read back.

Table C- 2 Structure of DS 100 read

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2	Reserved							0 / 1
3	Reserved							

Bit 0 = 0 Duplicate address detection is activated

= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be read out in this case.

USB	Universal Serial Bus
WRREC	Write record

Glossary

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. "Configured" means that the slave addresses and configuration data stored in the AS-i master agree with the values of existing AS-i slaves.

APF

AS-i Power Fail. Flag or LED display that indicates that the supply voltage on the AS-i cable is too low or has failed, e.g., failure of the AS-i power supply unit.

AS-i (AS-Interface)

Actuator-Sensor-Interface. A networking system for the plant-floor automation layer. It is suitable for networking sensors and actuators with controllers.

AS-i analog slave

AS-i analog slaves are special AS-i standard slaves that exchange analog values with the AS-i master; see also CTT.

AS-i master

The AS-i master monitors and controls simple digital or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are distinguished according to their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing type (AS-i slave with standard address in the range 0 ... 31 and AS-i slave with A/B address in the range 0, 1A ... 31A, 1B, 31B) or their functionality (standard slave for non-safety-related data transmission and ASIsafe slave for safety-related data).

AS-i slave with A/B address

AS-i slaves with A/B address use extended addressing. A (numerical) address can thus be used by two slaves with A/B address, e.g., 1A and 1B. Based on the address organization, up to 62 slaves with A/B address can be connected to the AS-Interface.

For cyclic data transmission, the master accesses each (numerical) address once per AS-i cycle (max. 5 ms). If two slaves use a (numerical) address on the bus both as an A address and a B address, two consecutive AS-i cycles are required for their data transmission (max. 10 ms rms). If a (numerical) address is used only as an A address or as a B address on the bus, the data transmission for these slaves occurs in every AS-i cycle.

AS-i slave with standard address

Each AS-i slave with standard address occupies one address on the AS-Interface; based on the address organization, up to 31 AS-i slaves with standard address can therefore be connected to the AS-Interface. If a slave with standard address occupies an address, this address is no longer available for slaves with A/B address.

For cyclic data transmission, the master accesses each address once per AS-i cycle (max. 5 ms).

CER

Configuration Error (Indication of configuration errors). The configuration error is indicated by an LED if the actual bus configuration does not match the specified configuration.

CM

Communication module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CTT

Combined Transaction Type. Special AS-i slave profile:

CTT slaves require several AS-i cycles or several AS-i addresses for updating process data between an AS-I slave and AS-i master.

The following CTT variants are defined:

CTT1: Slave profiles S-7.3, S-7.4

For cyclic data transmission of analog values or transparent data (up to 16 bits per channel).

Depending on the slave, the data transmission is in the direction of the input or output.

The S-7.1 and S-7.2 profiles are outdated profiles that are not managed automatically by the AS-i master (function blocks are required for decoding the process data).

CTT2: Slave profiles S-7.5.5, S-7.A.5, S-B.A.5

For transmission of data blocks similar to data record transmission in PROFIBUS/PROFINET.

The transmission can be initiated individually via the user program (acyclically, see "CTT2-Request_lesen_schreiben (Read_Write_CTT2_String)") or automatically by the master (cyclically, same as for analog values). Refer to the slave documentation.

The transmission process is managed automatically by the master and corresponds to a serial data transmission with approximately 12 bytes (or 6 bytes for A/B address with maximum configuration).

Depending on the slave, in parallel to the data block transmission, digital data of up to 2 DI / DO are also transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT3: Slave profiles S-7.A.7, S-7.A.A

For cyclic transmission of digital data.

Slave profile S-7.A.7 transmits 4 DI / 4 DO using a slave with A/B address. Like for standard slaves, the inputs are transmitted in each AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration). The outputs require double the transmission time.

Slave profile S-7.A.A transmits 8 DI / 8 DO using a slave with A/B address. The inputs and outputs are transmitted using four AS-i cycles.

CTT4: Slave profiles S-7.A.8, S-7.A.9

For cyclic transmission of analog values or transparent data (up to 16 bits per channel) in the input direction using a slave with A/B address.

Depending on the slave, in parallel to the data block transmission, digital data of up to 1 DO can also be transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT5: Slave profile S-6.0.x, where x = 2 … 7, A … C

For cyclic transmission of analog values or transparent data (up to 16 bits) in the input and output direction.

The CTT5 types each occupy 2, 3, or 4 slave addresses simultaneously, depending on the data record, so that consistent transmission of the full data width occurs in each AS-i cycle (5 ms).

DIAG

Diagnosis

EFD

Ground fault detection

GSD file

Generic station description file for PROFIBUS or PROFINET devices

GSDML file

GSD file for PROFINET devices. As a generic station description, this file contains all of the properties of a PROFINET device necessary for its configuration.

HSP

The Hardware Support Package supplements the hardware catalog of *STEP 7*.

ID code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

ID1 code

Also called: Extended ID1 code

Fixed or editable identification code saved in the AS-i slave.

See also: Slave profile

ID2 code

Also called: Extended ID2 code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

Inspector window

The inspector window of *STEP 7* / TIA Portal displays additional information about a selected object or executed actions. The indicated properties and parameters of the selected object can be edited within the inspector window.

IO code

Also called: I/O configuration

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

LAS

List of Activated Slaves

LDS

List of Detected Slaves

LED

A light-emitting diode that is used to display the signal status.

LPF

List of periphery faults This list in the AS-i master designates the status of the peripheral fault of the activated slaves.

LPS

List of Projected Slave (list of configured slaves)

Nibble

A nibble is a unit of information that comprises four bits.

Option handling

Option handling allows the user program to activate optional functions during normal operation without the need for reconfiguration.

PF

Peripheral fault: Error message of an active AS-i slave to the master, e.g., overload at output (depending on slave, see documentation of the AS-i slave).

Slave profile

The slave profile classifies the basic properties of an AS-i slave. The slave profile consists of the IO code, ID code, and ID2 code, which are stored as fixed, uneditable codes in each slave. In addition, a slave has an ID1 code, which is saved in the slave as a fixed code or a code that is editable by the user (e.g., with an addressing device). The value of the ID1 code usually has no effect on the operating characteristics of the slave. In this case, the user should not change the value, so that compatibility problems do not occur if the device is replaced. Note the documentation of the slave for the ID1 setting.

Each of the four identification codes consists of a 4-bit value that is usually written in hexadecimal notation with a value range of 0 to F. On power-up, the AS-i master reads the codes automatically from each slave and saves this ACTUAL configuration in the volatile memory of the AS-i master.

If the AS-i master is in “protected operation”, it compares the ACTUAL configuration with a CONFIGURED configuration, which is normally stored in non-volatile memory in the AS-i master. Slaves whose ACTUAL configuration matches the CONFIGURED configuration are activated and then participate in the cyclic data exchange. Slaves without a match are not activated and do not exchange cyclic data. A configuration error is also signaled.

ID2 and ID1 are optional codes. That is, some slaves do not have these two codes. In this case, the master enters the hexadecimal value “F” as a substitute value in the ACTUAL configuration.

Slaves with extended addressing, the so-called A/B slaves, use only the three less significant bits of the ID1 code as the slave identification. The most significant bit of the ID1 code is reserved and is used by the AS-i system to distinguish between an A address or B address. The effective value range of the ID1 code is thus 0 ... 7. For the read-out of the ID code, only the 3 less significant bits or all 4 bits are displayed, depending on the system, so that the displayed ID1 code can be within the value range 8 to F for slaves with B address. The user or programmer can ignore the most significant bit of the ID1 code for A/B slaves since it is managed automatically by the system.

The slave profile is usually shown in the documentation with the S prefix and a hyphen (in some cases), followed by the IO, ID, and ID2 codes, each separated by a dot.

Example: S-7.0.F

Since the ID1 code is usually editable, the value is often not documented or documented only as a default value.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://www.siemens.com/industrialsecurity)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://support.automation.siemens.com)

Documentation guide

1

1.1 Documentation guide for the F-DI 8x24VDC HF digital input module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital input module F-DI 8×24VDC HF

The table below lists additional documents that complement this description of the fail-safe digital input module F-DI 8×24VDC HF and are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital input module F-DI 8×24VDC HF

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate
BaseUnits	Manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)	Technical specifications
Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-DI 8x24VDC HF

Order number

6ES7136-6BA00-0CA0

View of the module

Figure 2-1 View of the F-DI 8×24VDC HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 8 inputs (SIL3/Cat.4/PLe)
  - 8 outputs for sensor supply
  - Use of various interconnection types (1oo1, 1oo2) is possible
  - Supply voltage L+
  - Sink input (P-reading)
  - Suitable for connection of 3/4-wire sensors according to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Internal short circuit proof sensor supplies for each input
  - External sensor supply possible
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input (green LED)
  - Error display for each input (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 47).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Connecting

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

The first BaseUnit must be a light BaseUnit.

Note

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for F-DI 8×24VDC HF

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
DI parameters:			
Sensor supply			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters			
Channel n, n+4			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non equivalent	no	Channel pair
Discrepancy behavior	• Supply 0 value • Supply last valid value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal not necessary • Test 0-signal necessary	no	Channel pair
Channel n			
Activated	• enable • disable	no	Channel
Sensor supply	• Sensor supply 0 to 7 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the sensor supply

4.2.2.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.2.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.2.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.3 Parameters of the channel pairs

4.2.3.1 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.3.2 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Evaluation of the sensors" parameter:

- 1oo1 evaluation
- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo1 evaluation

The sensor is available once for 1oo1 evaluation.

1oo2 evaluation, equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One two-channel sensor
- Two single-channel sensors
- One non-equivalent sensor

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

4.2.3.3 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.3.4 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.3.5 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4 Parameters of the channels

4.2.4.1 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 19)

4.2.4.2 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

Technical specifications (Page 53)

Response times (Page 57)

4.2.4.3 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.4 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

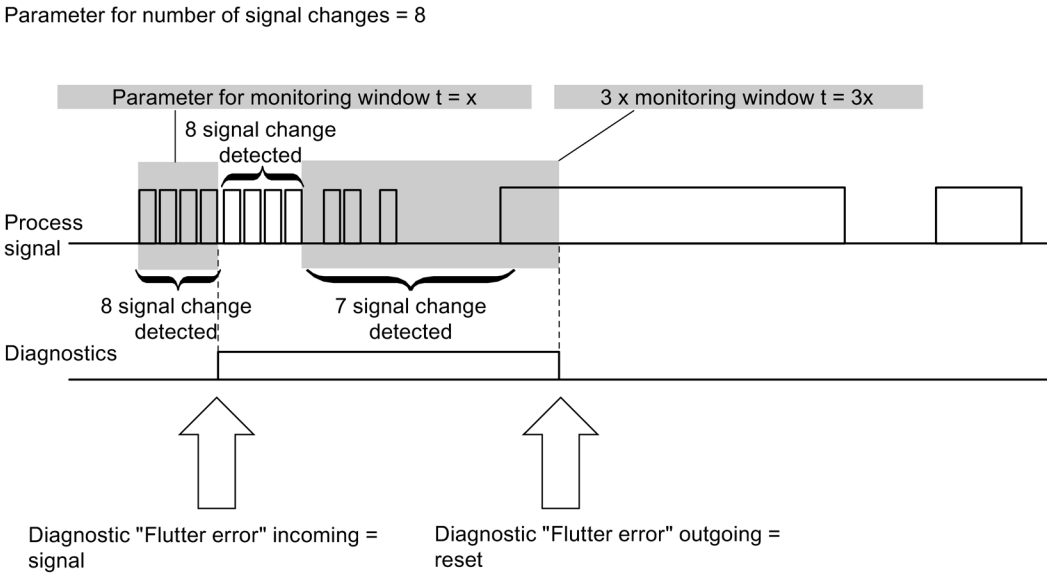

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.5 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.3 Address space

Address assignment of the digital input module F-DI 8×24VDC HF

The digital input module F-DI 8×24VDC HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 5	x + 0 to x + 3

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 4- 3 Address assignment through user data

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	Value status for DI_7	Value status for DI_6	Value status for DI_5	Value status for DI_4	Value status for DI_3	Value status for DI_2	Value status for DI_1	Value status for DI_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

5.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

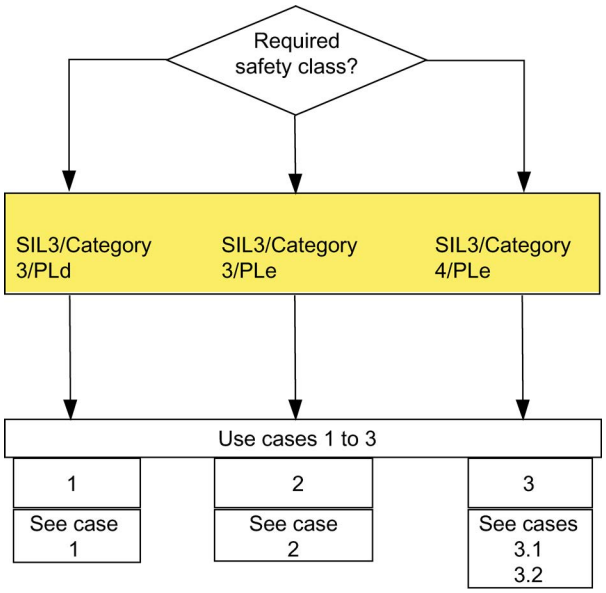

Figure 5-1 Selecting the application – digital input module F-DI 8×24VDC HF

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 1 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Note

You can operate the various inputs of an F-DI module simultaneously in SIL3/Cat.3/PLd **and** in SIL3/Cat.3 or Cat.4/PLe. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

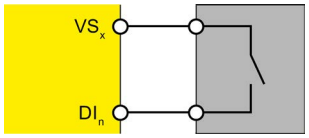

Figure 5-2 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

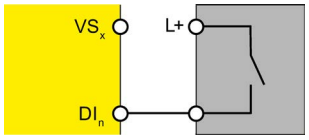

Figure 5-3 One sensor connected via one channel, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 2 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n • External sensor supply	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 3 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit of the input with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

⚠ WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the cable must be routed short circuit proof.

5.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 and DI_4
- DI_1 and DI_5
- DI_2 and DI_6
- DI_3 and DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor equivalent

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

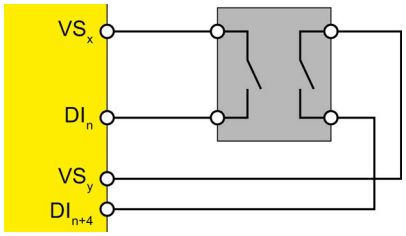

Figure 5-4 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

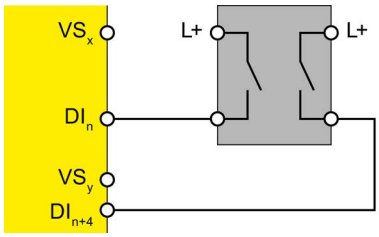

Figure 5-5 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

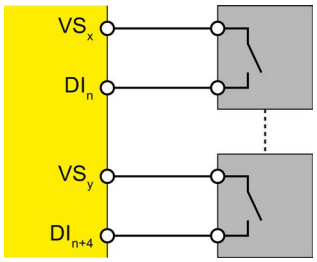

Figure 5-6 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

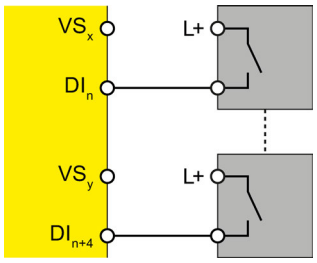

Figure 5-7 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 4 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 5 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair	no	no
Short circuit with other channels or other sensor supplies	yes*	yes
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 with DI_4
- DI_1 with DI_5
- DI_2 with DI_6
- DI_3 with DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied internally by at least one channel for application 3.1.

The sensor can be supplied internally or externally for application 3.2.

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- The actuators must be wired as seen in sections Use case 3.1 (SIL3/Cat.4/PLe) (Page 38) or Use case 3.2 (SIL3/Cat.4/PLe) (Page 40). You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.4.1 Use case 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

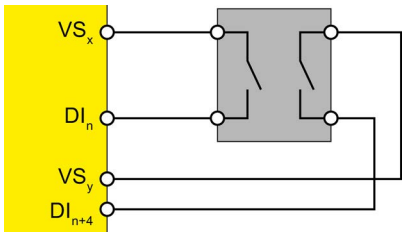

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

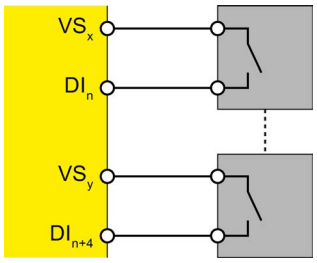

Figure 5-9 Two single-channel sensors connected via two channels, internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 6 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n (internally by at least one channel) • External

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 7 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4.2 Use case 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor

A nonequivalent sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation, non equivalent).

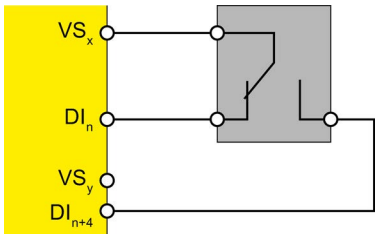

Figure 5-10 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

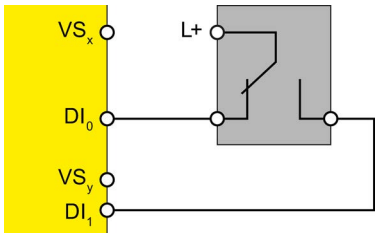

Figure 5-11 Nonequivalent sensor connected, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent

Two single-channel sensors are connected nonequivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

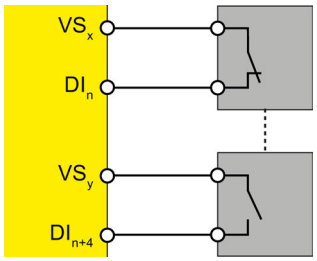

Figure 5-12 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

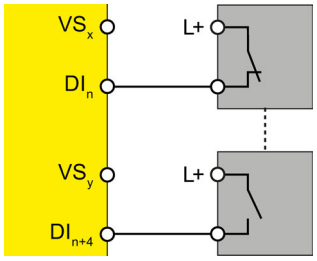

Figure 5-13 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 8 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 9 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

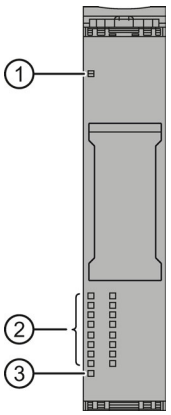
*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Interrupts/diagnostic messages

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 47).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DI 8×24VDC HF fail-safe digital input module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 47).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

Table 6- 5 Diagnostic interrupts of the F-DI 8×24VDC HF

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	1, 2, 3	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			
Discrepancy error, channel status 0/0	768_D	2, 3	Channel	
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D			No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D		Channel	
PROFIsafe communication error (timeout)	792_D		F-module	
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Supply voltage too high	803_D		F-module	No
Supply voltage too low	804_D			

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DI 8×24VDC HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	

Diagnostic message	Fault code	Meaning	Remedy
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		

Diagnostic message	Fault code	Meaning	Remedy
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.

Diagnostic message	Fault code	Meaning	Remedy
No pulse detected	778$_D$	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too high. • The "Minimum pulse time" parameter setting is too low. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784$_D$	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor/switch is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785$_D$	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 53))
Undertemperature	786$_D$	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53))
Fault in input circuit	787$_D$	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.
PROFIsafe communication error (timeout)	792$_D$	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 53) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is deactivated, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. For this reason, tables on fault detection for the applications are presented under Applications of the F-I/O module (Page 29).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all F-modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of inputs and outputs for the value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the value status can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications of F-DI 8×24VDC HF

	6ES7136-6BA00-0CA0
Product type designation	F-DI 8x24VDC HF
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFINET as of GSD version/GSD revision	V2.31
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Sensor supply	
Number of outputs	8
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 1.8 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	800 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	4 W

	6ES7136-6BA00-0CA0
Address space	
Address space per module	
Input	6 bytes
Output	4 bytes
Digital inputs	
Number of inputs	8
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED

	6ES7136-6BA00-0CA0
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C
Dimensions	
Width	15 mm
Weights	
Weight, approx.	49 g

Response times

A

Introduction

The next section shows the response times of the digital input module F-DI 8×24VDC HF. The response time of the digital input module F-DI 8×24VDC HF is included in the calculation of the F-system response time.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 20 ms

Maximum cycle time: T_{cycle} = 11.5 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, and discrepancy time are configured in STEP 7.

If you have configured "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Maximum response time with external short circuits

Maximum response time = input delay + (n × T_{cycle}) + sum ("Time for short circuit test" + "Startup time after short circuit test" for sensor with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

Documentation guide

1

1.1 Documentation guide for F-DQ 4x24VDC/2A PM HF digital output module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital output module F-DQ 4×24VDC/2A PM HF

The table below lists additional documents that complement this description of the fail-safe digital output module DQ 4×24VDC/2A PM HF and are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital output module F-DQ 4×24VDC/2A PM HF

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-DQ 4x24VDC/2A PM HF

Order number

6ES7136-6DB00-0CA0

View of the module

Figure 2-1 View of the F-DQ 4×24VDC/2A PM HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 4 outputs, PM-switching (SIL3/Cat.4/PLe)
  - Supply voltage L+
  - Output current per output 2 A
  - Source output (PM-switching)
  - Suitable for solenoid valves, DC contactors and signal lamps
  - Diagnostic display (DIAG red/green LED)
  - Status display for each output (green LED)
  - Fault display for each output (red LED)
  - Diagnostics, e.g., short circuit/wire break/load voltage missing, channel-specific
  - Channel-specific or passivation throughout the module
  - Direct interconnection to F-DI possible (single channel: SIL1, two-channel: SIL3)
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 38).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting

3

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-DQ 4×24VDC/2A PM HF

L+	DC24V	**M**	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

The first BaseUnit must be a light BaseUnit.

Note

The fuse integrated in BaseUnit type A1 can trigger with the digital output module which renders the terminals useless.

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

Switching of grounded loads

The F-DQ 4×24VDC/2A PM HF can switch loads with a connection between chassis and ground of at least 100 kΩ. Otherwise a short circuit is detected.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection.

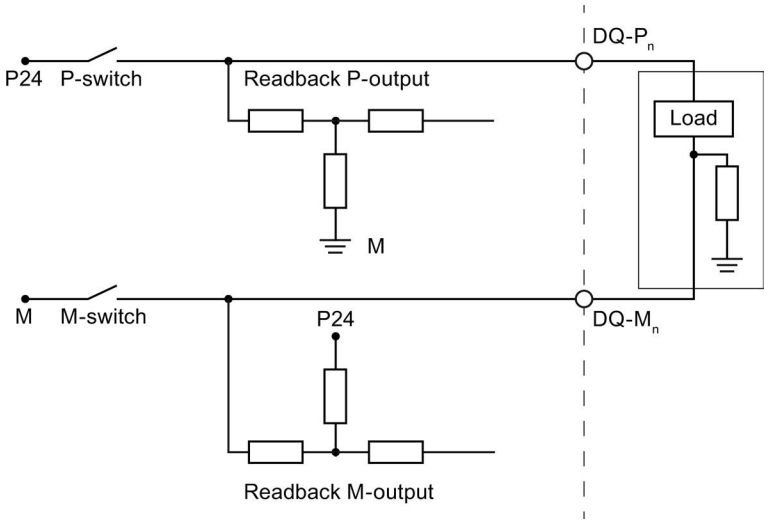

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

Alternatively, you can use F-PM-E 24VDC/8A PPM ST power module in which the output is configured as a PP-switching output.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for F-DQ 4×24VDC/2A PM HF

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
DQ parameters:			
Maximum test period	• 100 s • 1000 s	no	Module

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters:			
Channel n			
Activated	• disable • enable	no	Channel
Max. readback time dark test	0.6 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.6 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the channels

4.2.2.1 Maximal test period

With this parameter, you specify the time within which the light, dark and switch on tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test time is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

4.2.2.2 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

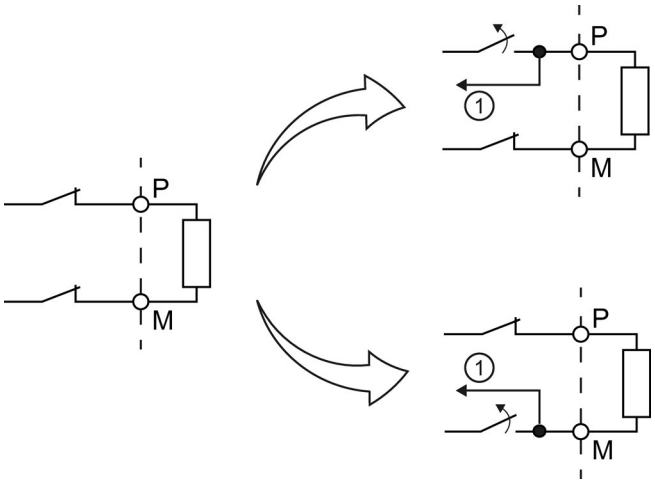
You can deactivate an unused channel with this parameter.

4.2.2.3 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-1 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads.

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

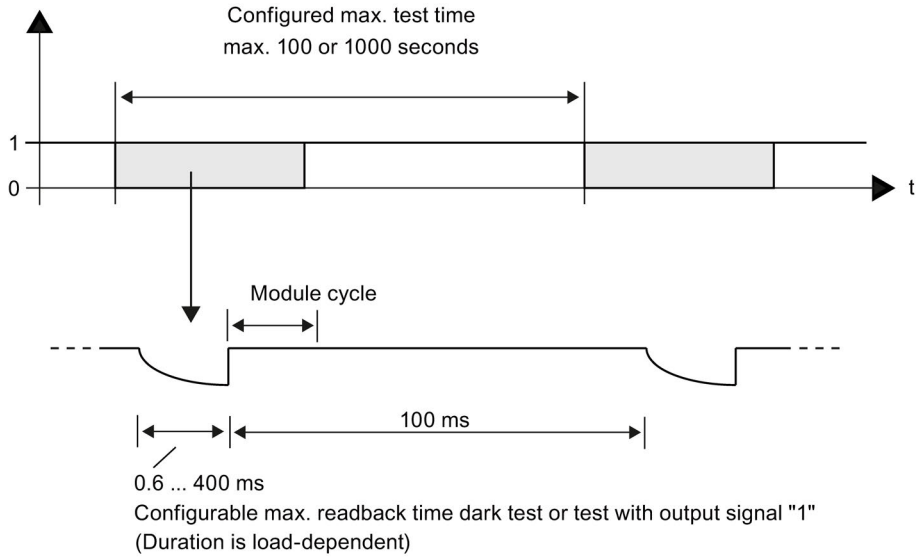


Figure 4-2 Test pulses of the dark test

The interval between two test pulses is 100 ms.

4.2.2.4 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, a single dark test pulse is directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. This also applies to the operating time if the operating time is < 48 hours. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING

If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated but all outputs are shut down and the module is passivated. This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.

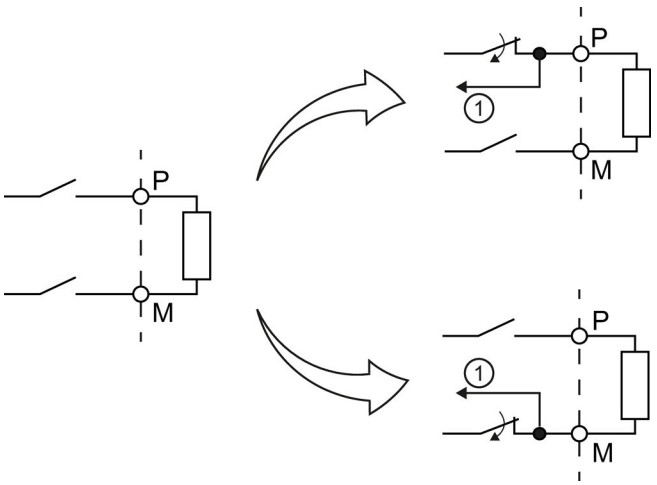
Consult the respective requirements of your product standards regarding error detection time.

4.2.2.5 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-3 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads.

If the capacitance of the actuator is not known, you may have to determine the required value for the readback time switch-on test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time is too small for a connected capacitive load. The charge of the capacitive load cannot take place during the configured readback time. Increase the readback time.

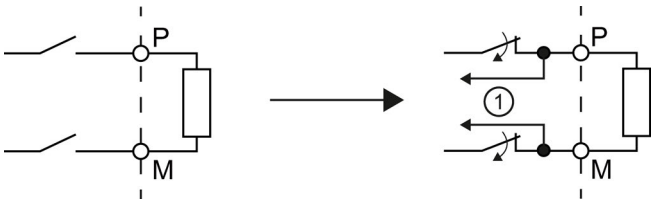
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.2.6 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, a test signal is switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-4 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

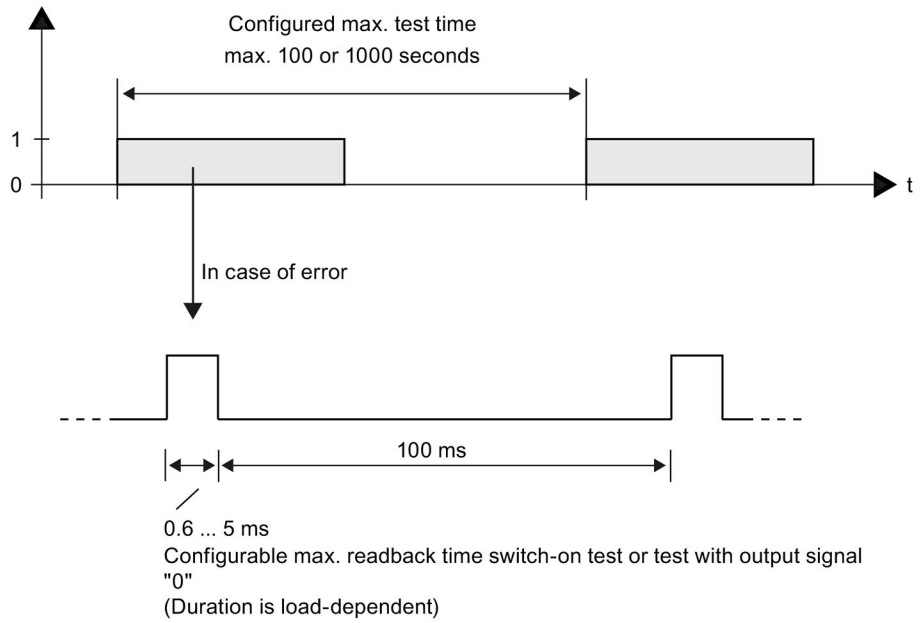


Figure 4-5 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test time per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 100 ms. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.2.7 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of the digital output module F-DQ 4×24VDC/2A PM HF

The digital output module F-DQ 4×24VDC/2A PM HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 4	x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 4×24VDC/2A PM HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 4×24VDC/2A PM HF:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Value status (Page 42)

Applications of the F-I/O module

5

5.1 Applications of the F-DQ 4x24VDC/2A PM HF

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is carried out on the matching BaseUnit (Page 13).

5.2 Application: Wiring a load to each digital output

Each of the four fail-safe digital output consists of a P-switch DQ-P_n and an M-switch DQ-M_n. You connect the load between the P-switch and the M-switch. The two switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

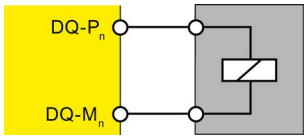

Figure 5-1 Wiring diagram for 1 relay each at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

5.3 Application: Connection of loads to L+ and M at each digital output

You can connect two relays using one fail-safe digital output. The following conditions should be kept in mind:

- Same reference potential
- The normally open contacts of the two relays must be connected in series.

This configuration achieves SIL3/Cat.4/PLe (process status readback required).

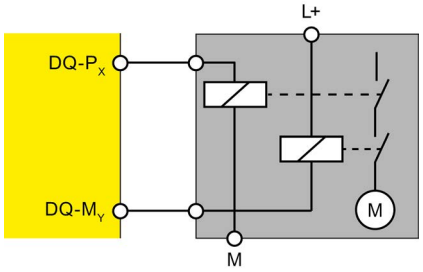

Figure 5-2 Wiring diagram for connecting 2 relays each to 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

When two relays are connected to one digital output, as shown in the figure above, the "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).

WARNING

With a cross circuit between P-switch and M-switch of the output, the module detects the fault and switches off the output. But the actuator is still supplied with power due to the external fault.

To avoid cross circuits between the P-switch and M-switch of a fail-safe digital output, you should always install the cables for the connection of the relays to the P-switch and M-switch separately to prevent any cross circuits (for example, as separately sheathed cables or in separate cable ducts).

Note

The digital output module F-DQ 4×24VDC/2A PM HF performs a bit pattern test depending on the parameter assignment. For this, the module outputs up to 5 ms pulses depending on the parameter assignment. This test (switch-on test) is run with a time offset between the P-switch and M-switch to prevent the actuator from being activated. This pulse may cause the corresponding relay to operated, which may reduce its service life.

We therefore recommend adhering to the wiring scheme described below.

5.4 Application: Wiring two loads in parallel to each digital output

To protect against cross-circuits between P-switch and M-switch in fail-safe digital outputs, we recommend the following wiring scheme. This circuit achieves SIL3/Cat.4/PLe.

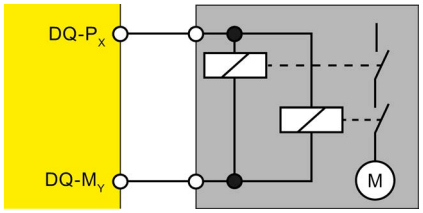

Figure 5-3 Wiring diagram for 2 relays each parallel at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

Note

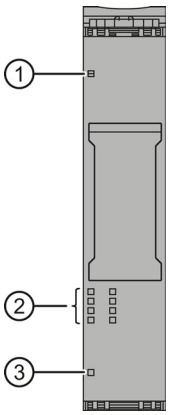
With a parallel connection of two relays on one digital output (as shown above) the "wire break" fault is only detected if the wire break disconnects both relays from P or M. This diagnostics is not safety-related.

Interrupts/diagnostic messages

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 38).

WARNING
The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DQ 4x24VDC/2A PM HF fail-safe digital output module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 38).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 38).

Table 6- 5 Diagnostic interrupts of the F-DQ 4x24VDC/2A PM HF

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	F-module	No
Parameter assignment error	16_D		
Load voltage missing	17_D		
Access to retentive storage of F-address not possible	30_D		
Different destination address (F_Dest_Add)	64_D		
Invalid destination address (F_Dest_Add)	65_D		
Invalid source address (F_Source_Add)	66_D		
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D		
"F_SIL" parameter exceeds the application-specific SIL	68_D		
"F_CRC_Length" parameter does not match the generated CRC	69_D		
Incorrect F-parameter version or F_Block_ID	70_D		
CRC1 error	71_D		
Inconsistent iParameters (iParCRC error)	75_D		
F_Block_ID not supported	76_D		

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Internal error	256_D		
Time monitoring activated	259_D		
Internal supply voltage of the module failed	260_D		
Output short-circuited to L+	261_D	Channel	Yes
Output short-circuited to ground	262_D		
Wire break	265_D		
Incorrect/inconsistent firmware present. Firmware update required	283_D	F-module	No
Switching frequency too high	785_D	Channel	
Undertemperature	786_D	F-module	
PROFIsafe communication error (timeout)	792_D	F-module	
PROFIsafe communication error (CRC)	793_D	F-module	
PROFIsafe address assignment error	794_D	F-module	
		Channel	No
Output defective	797_D		
Readback error	798_D	Channel	
Overload	800_D	Channel	
Supply voltage too high	802_D	F-module	
Supply voltage too low	803_D	F-module	

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Note

You can connect two actuators per output.

The diagnostics of the two actuators influenced each other in the case of duplicate wiring.

This means:

- a wire break is only signaled if both actuators are affected
- a single short circuit affects both actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DQ 4×24VDC/2A PM HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type

Diagnostic message	Fault code	Meaning	Remedy
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).

Diagnostic message	Fault code	Meaning	Remedy
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • There is a short circuit between two output channels. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 43))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43))
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • The capacitive load is too high. • Short circuit to L+ or M • The F-module is defective	• Increase the test times (dark, light, switch-on tests). • Check the wiring. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Readback error	798D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The capacitive load is too high. • The F-module is defective.	• Increase the test times (dark, light, switch-on tests). • If the error persists, replace the F-module.
Overload	800D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 43) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Dimensions	
Width	15 mm
Weights	
Weight, approx.	57 g

Temperature characteristic values

Mounting position	Maximum temperature	Total current across all channels
Horizontal	40 °C	6 A
	50 °C	5 A
	60 °C	4 A
Vertical	50 °C	4 A

Note

Because of the small size of the modules, pay attention to the development of heat between adjacent modules when output modules are exposed to elevated loads. If overtemperature occurs in an output module exposed to an elevated load, shutdown may result and reduce the plant availability. If you fully load an output module, the average total current of the modules directly adjacent to it should not exceed 75% of the values listed in the technical specifications. If you load directly adjacent modules with their maximum total current, reduce the maximum total current of the output module by 1 A (e.g., for horizontal installation up to 60 °C → total current of 3 A across all channels).

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times

A

Introduction

The next section shows the response times of the digital output moduleF-DQ 4×24VDC HF. The response times of digital output module F-DQ 4×24VDC HF are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

Maximum cycle time: T_{cycle} = 15.5 ms

You assign the dark test time and switch-on time in STEP 7.

Maximum response time in the error-free case

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 4×24VDC HF digital output module is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load impedance and maximum switched load capacitance at a supply voltage of 24 V DC.

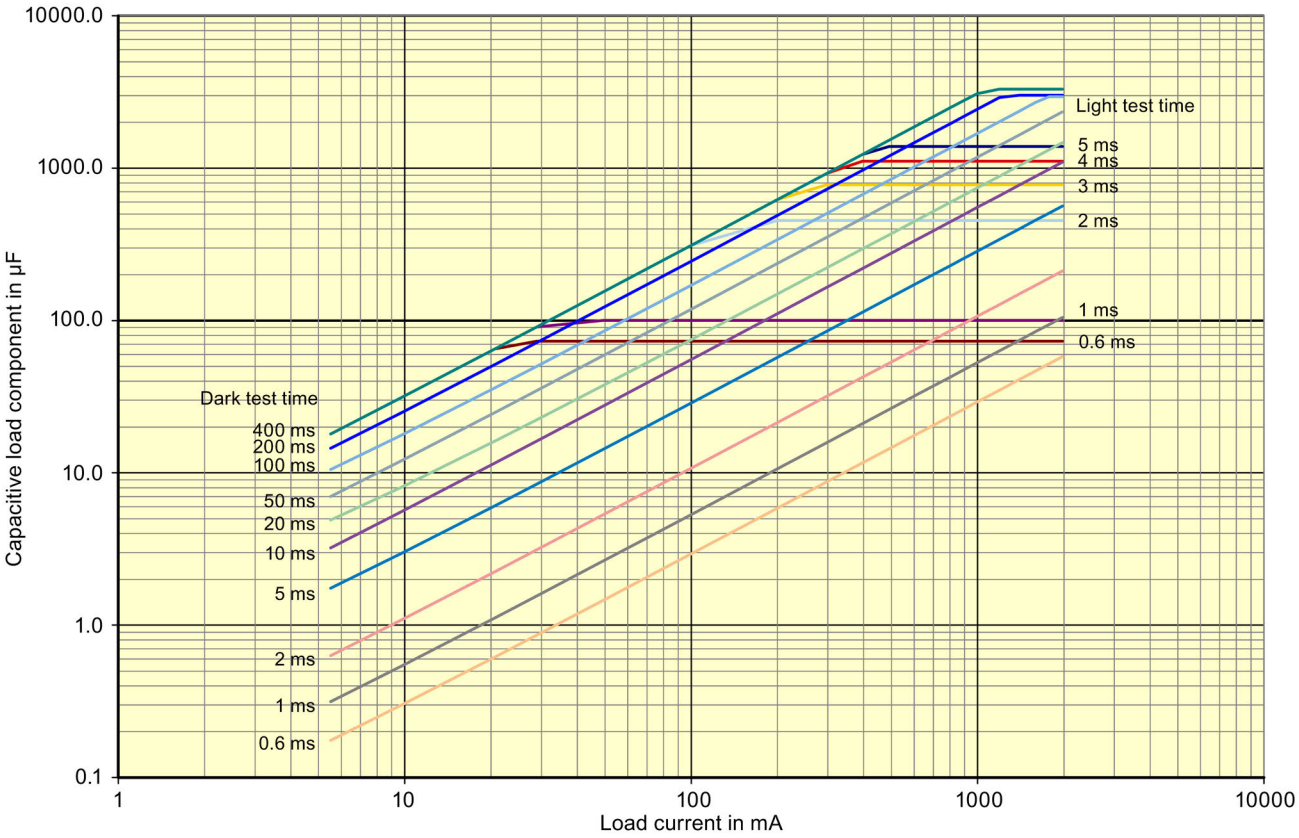

Figure B-1 Switching of capacitive loads for the F-DQ 4×24VDC HF digital output module depending on the configured dark and light test times

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

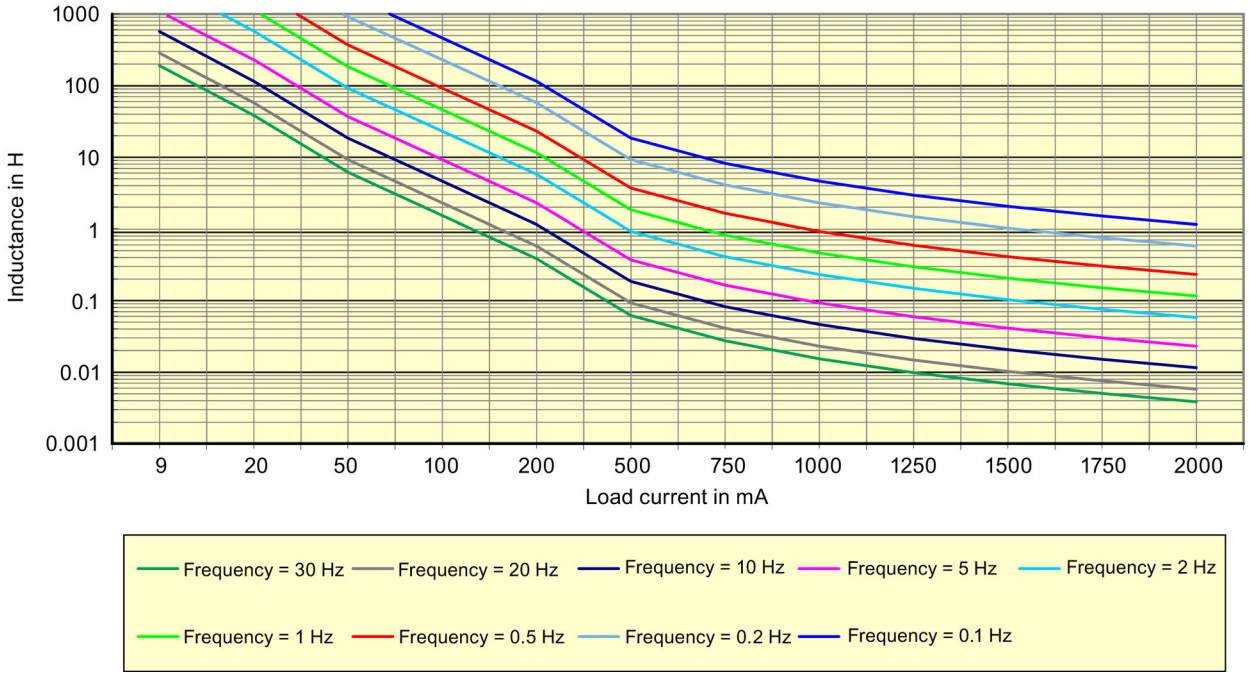

Figure B-2 Switching of inductive loads for the F-DQ 4x24VDC/2A PM HF digital output module depending on the load current and switching frequency

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of this documentation

This manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information in this manual and the system manual supports you when commissioning the ET 200SP system.

Conventions

Pay particular attention to notes highlighted as follows::

Note

A note contains important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Guide to the documentation

1

1.1 Guide to the documentation for the digital output module F-RQ 1x24VDC/24..230VAC/5A

Introduction

The documentation of the SIMATIC products has a modular structure and includes topics relating to your automation system.

The complete documentation of the ET 200SP system consists of different modules made up of system manuals, function manuals and device manuals.

The STEP 7 (online help) information system supports you when configuring and programming your automation system.

Overview of the documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

The table below lists additional documents that complement this description of the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A and that are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

Topic	Documentation	Most important contents

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment and verification right through to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/automation/service&support).

Please e-mail any queries you may have e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-RQ 1x24VDC/24..230VAC/5A

Article number

6ES7136-6RA00-0BF0

View of the module

Figure 2-1 View of the F-RQ 1x24VDC/24..230VAC/5A module

Properties

- Technical properties
  - Digital module with 1 relay output (2 isolated NO contacts)
  - Safety class SIL3/category 4/PLecan be achieved if the F-RQ module is controlled by a fail-safe output (for example F-module F-DQ 4x24VDC/2A PM HF)
  - Control voltage 24 VDC
  - Total current for both NO contacts 5 A max.
  - Isolated from control voltage
  - Suitable for solenoid valves, DC contactors and signal lamps
- Supported system functions
  - I&M identification data
  - Firmware update

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a service life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the module in question from the BaseUnit or switch off its supply voltage before 100 hours are up.

Accessories

The following components can be used with the module:

- Labeling strips
- Color identification labels
- Reference identification labels

Connecting up

3

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A

Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)						
Terminal	**Assignment**	**Terminal**	**Assignment**	**Description**	**BaseUnit**	**Color identification label (terminals 1 to 16)**

Addressing

4

4.1 Address space

Address assignment of the digital output module F-RQ 1x24VDC/24..230VAC/5A

The digital output module F-RQ 1x24VDC/24..230VAC/5A occupies the following address ranges in the F-CPU:

Table 4- 1 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
in input range	in output range
x.0 and x.1	—

x = Module start address

Address assignment of the user data of the digital output module F-RQ 1x24VDC/24..230VAC/5A

Of the occupied addresses of the digital output module F-RQ 1x24VDC/24..230VAC/5A, the user data occupies the following addresses in the F-CPU:

Table 4- 2 User data address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-RQ module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	RQ_1 Inverted readback channel (corresponds to process signal at IN)	RQ_0 Readback channel

x = Module start address

The user data is in the standard process image of the inputs and is not transferred to the F-CPU in safety-related communication. The readback channel in the user program is therefore displayed as a non-failsafe variable.

Note

With migration projects from the ET 200S product family, note the following:

The readback channel RQ_0 (bit 0) allows direct interconnection with the FDBACK instruction (F-block F_FDBACK) to its FEEDBACK input without additional inversion.

The readback channel RQ_1 (bit 1) is inverted.

Additional information

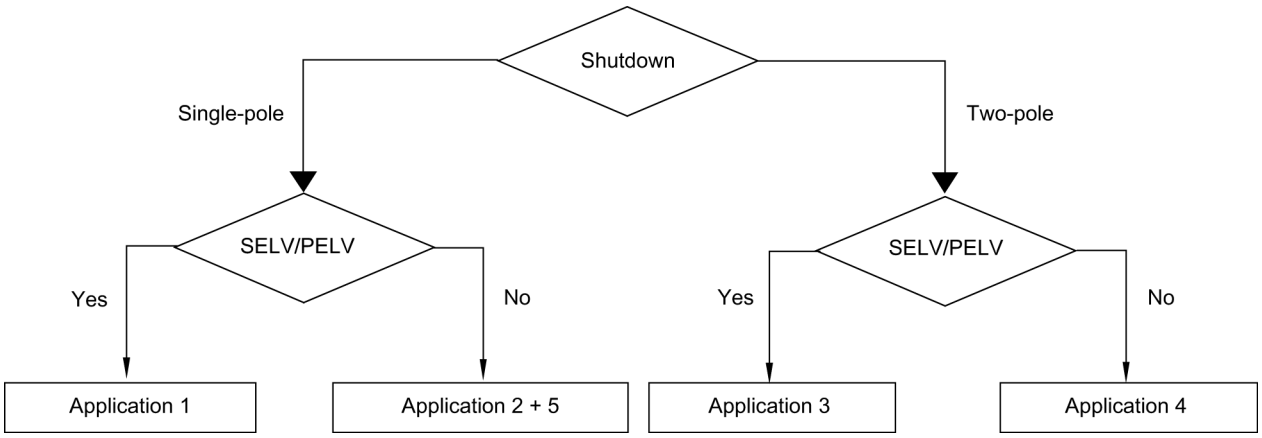
For detailed information about F-I/O access, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

5.1 Applications of the F-RQ 1x24VDC/24..230VAC/5A

You can achieve SIL3/category 4/PLe in the following applications if the activating F-module supports SIL3/category 4/PLe.



The wiring is carried out on the suitable BaseUnit (http://support.automation.siemens.com/WW/view/en/58532597/133300).

Wiring the 24 VDC power supply

Apply the 24 VDC control voltage to IN P (terminal 9) and IN M (terminal 11). The 24 VDC supply line is usually connected via a sourcing/sinking fail-safe output (e.g. digital output module F-DQ 4x24VDC/2A PM HF). Wire the P output (sourcing) of the F-DQ to the IN P of the F-RQ module and the M output (sinking)to the IN M of the F-RQ module.

As an alternative, you can also connect to a sourcing-sourcing fail-safe output. However, note that external short-circuits to P at the P input cannot be controlled. In this case, IN M would be connected directly to the control voltage ground.

NOTICE
Connecting the control voltage to the IN P and IN M inputs with the reverse polarity will destroy the F-module.

Wiring the load voltage and the load

The connectors of the relay output are electrically isolated NO contacts. This means that power must be supplied to these contacts from an external source. Connect the load supply (supply 1) and the load (load 1) in series to the RQ_{01} connectors (terminals 1;2). This ensures that the NO contacts of the relay interrupt the current flow of the power supply through the load. Due to the two relay contacts connected in series, the current flow can still be interrupted if one of the two relays has a fault..

The second circuit is independent of the first. They are logically interconnected by the common control. This means that the potential in the RQ_{02} (terminals 3;4), supply 2 and load 2 circuit may be different.

⚠ WARNING
If you connect a non-SELV/PELV power supply to one channel, you must not use the other channel.

Parameter assignment of the digital output module F-DQ 4x24VDC/2A PM HF

Assign the following parameters for the channel of the F-DQ 4x24VDC/2A PM HF digital output module to be activated:

Table 5- 1 Parameter assignment

Parameter	
Max. readback time dark test	1 ms
Max. readback time switch on test	1 ms

As the relays are highly inductive, you have the option of activating "Diagnostics: wire break" *or "*enable light test".

5.2 Application 1: 2 loads, single-pole switch-off

Wiring diagram

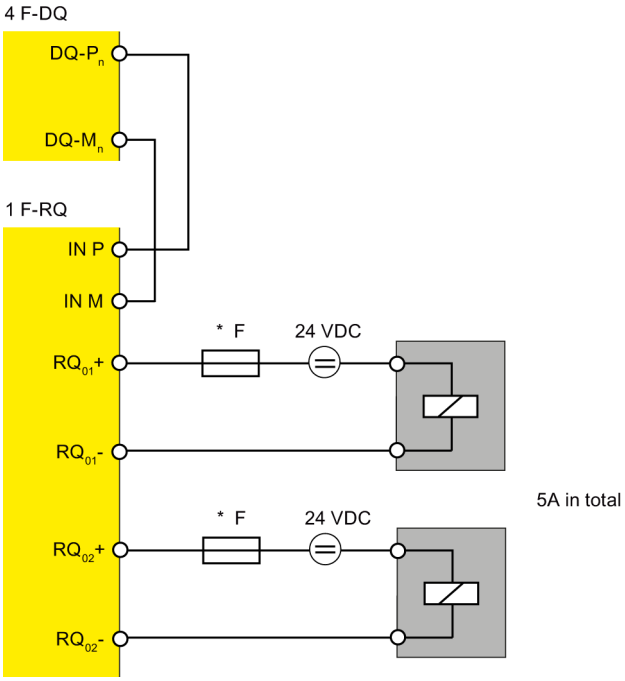


Figure 5-1 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

In this application, you can use one F-RQ module for single-pole switching of two loads with a total of 5A and one/two SELV/PELV power supplies.

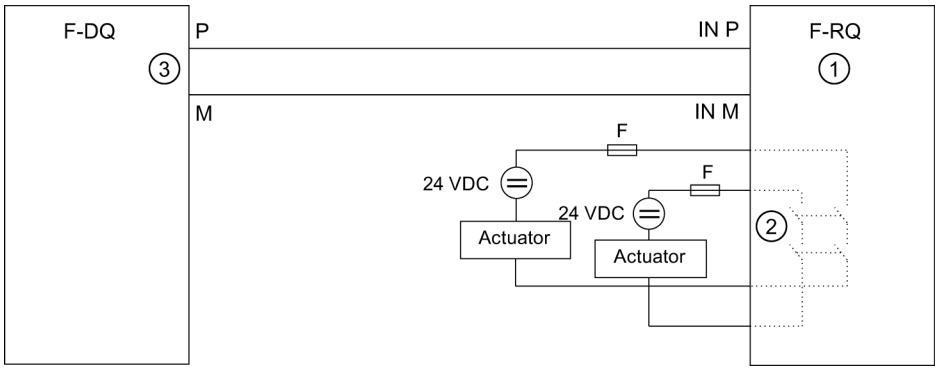
⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-2 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.3 Application 2: 1 load, single-pole switch-off

Wiring diagram

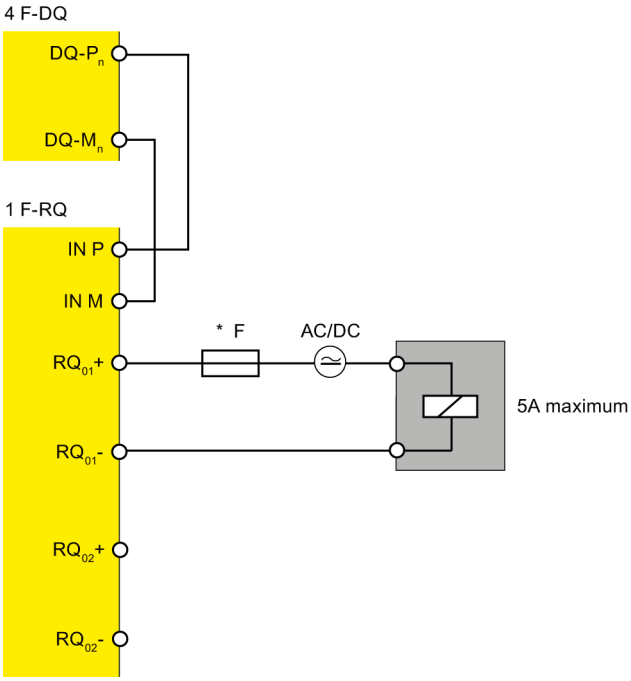


Figure 5-3 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

This application allows single-pole switching of one load with a total of 5A with one F-RQ module.

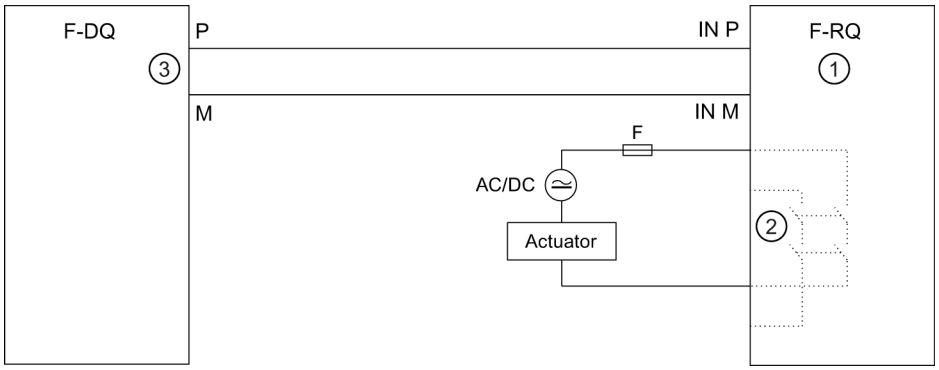
⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Please note that for applications in accordance with EN 50156-1, the specified rated current of the overcurrent protective device must be multiplied by the safety factor 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-4 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.4 Application 3: 1 load, two-pole switch-off with 1 F-RQ module

Wiring diagram

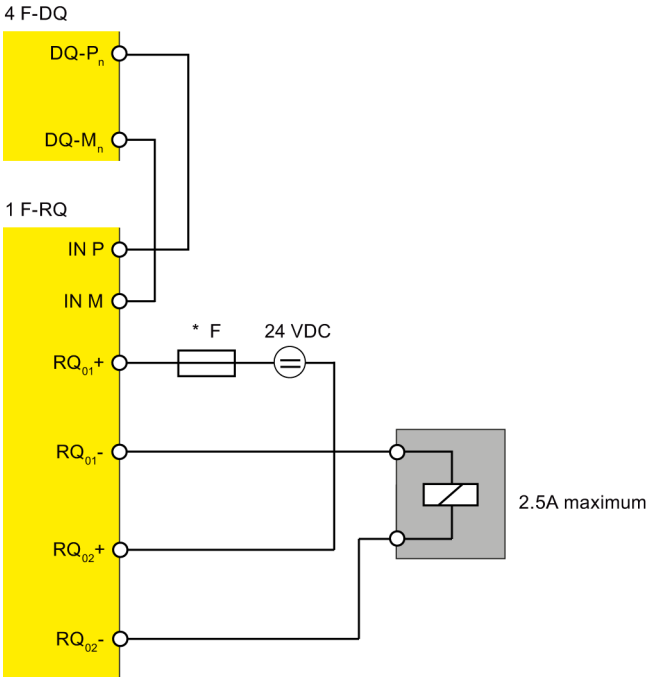


Figure 5-5 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows two-pole switching with one F-RQ module of one load with a maximum of 2.5A and an SELV/PELV power supply.

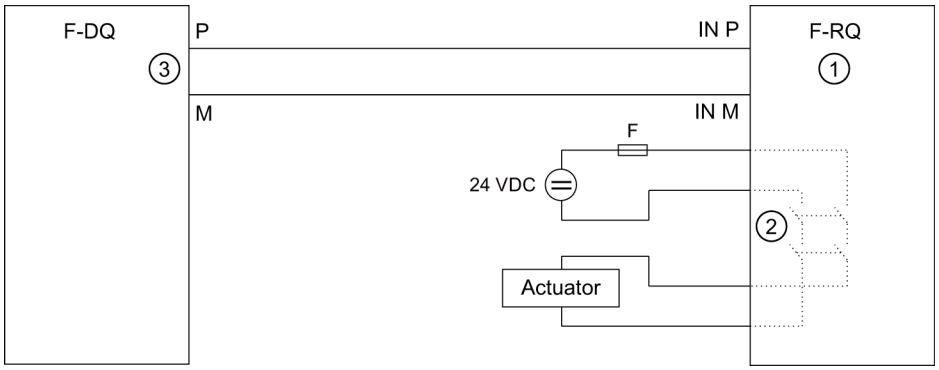
⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-6 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.5 Application 4: 1 load, two-pole switch-off with 2 F-RQ modules

Wiring diagram

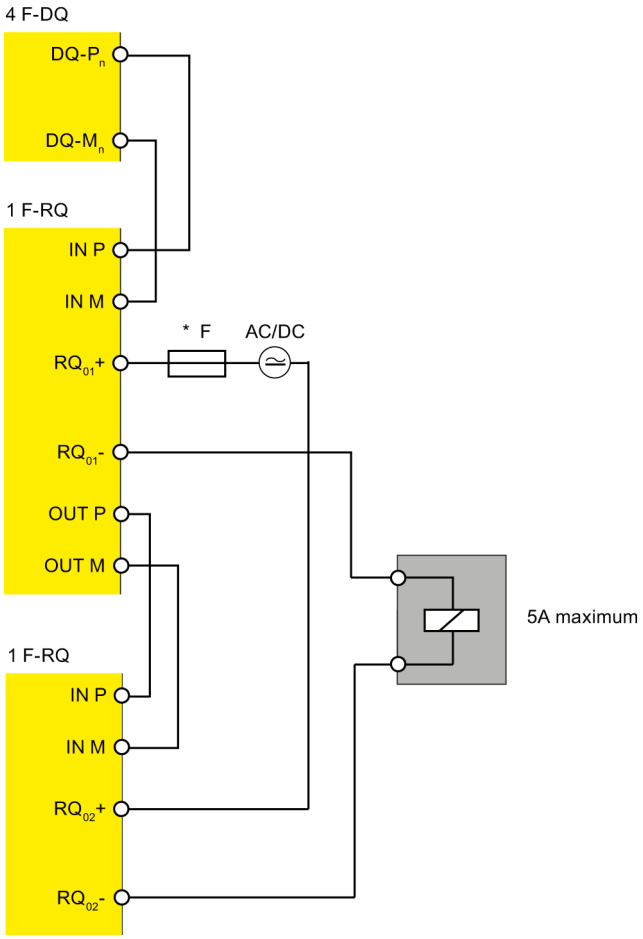


Figure 5-7 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows two-pole switching of one load with a max. of 5A with two F-RQ modules.

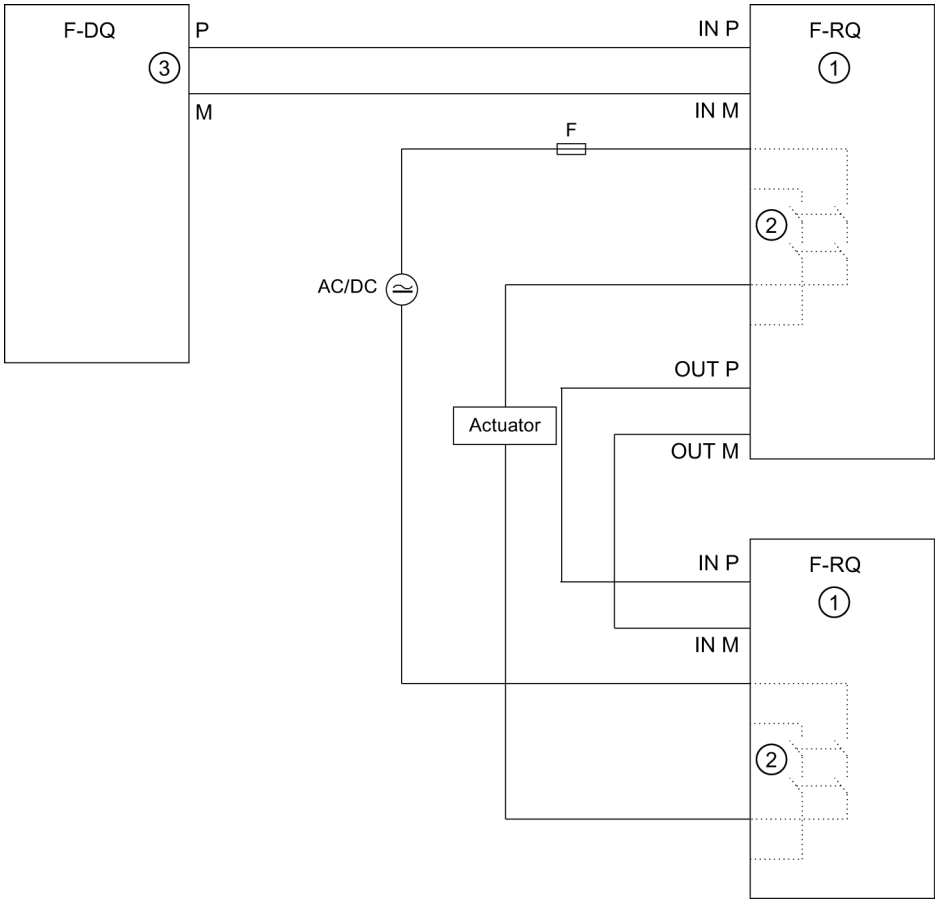
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-8 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

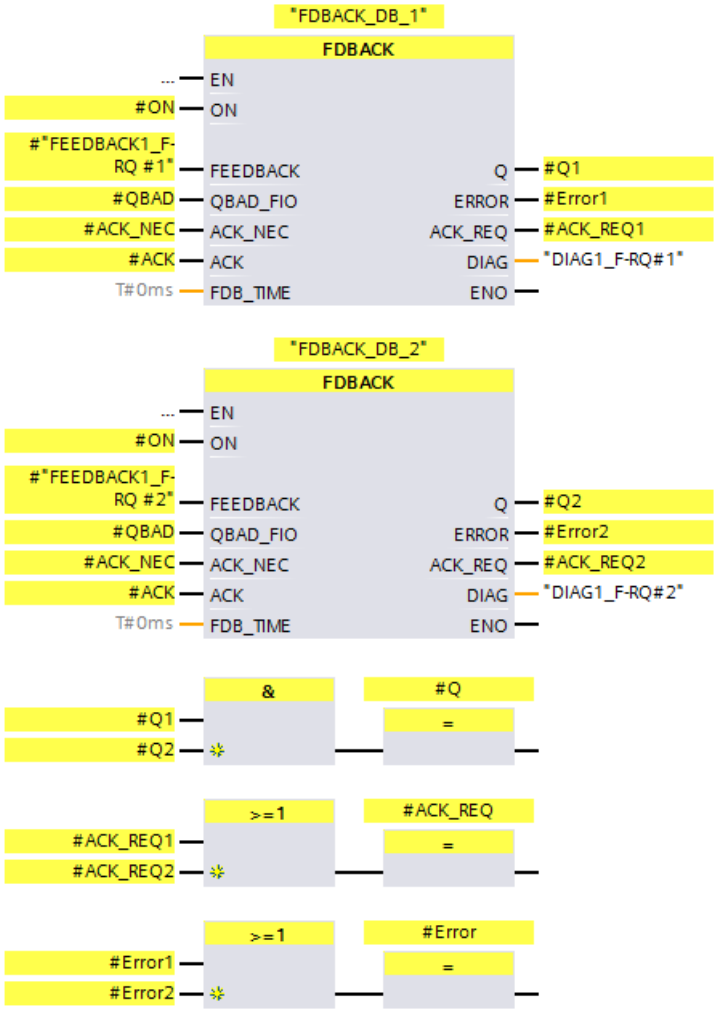
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:



5.6 Application 5: 2 loads, single-pole switch-off with 2 F-RQ modules

Wiring diagram

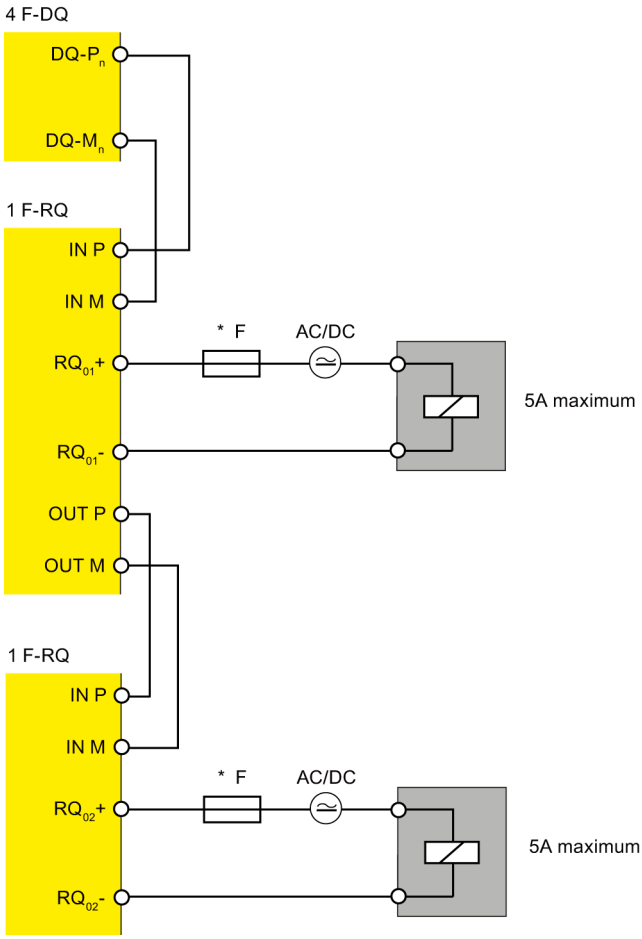


Figure 5-9 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows the single-pole switching of two loads with 5A each with two F-RQ modules. One power supply is not SELV/PELV.

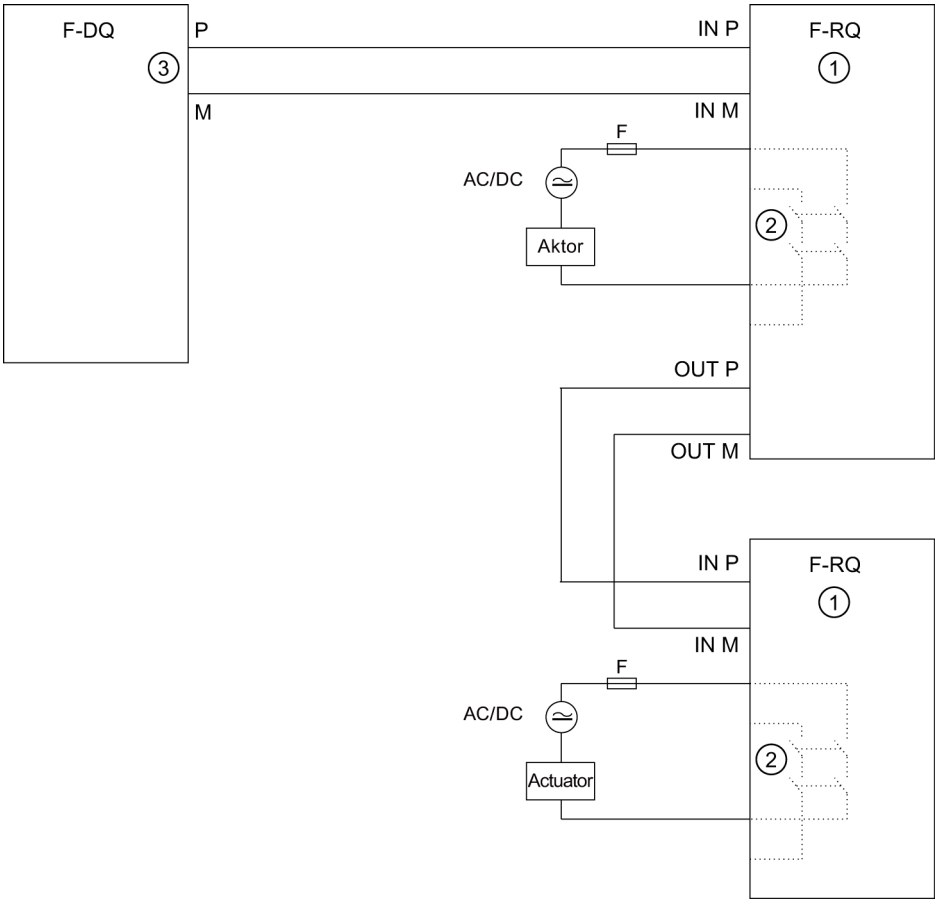
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-10 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

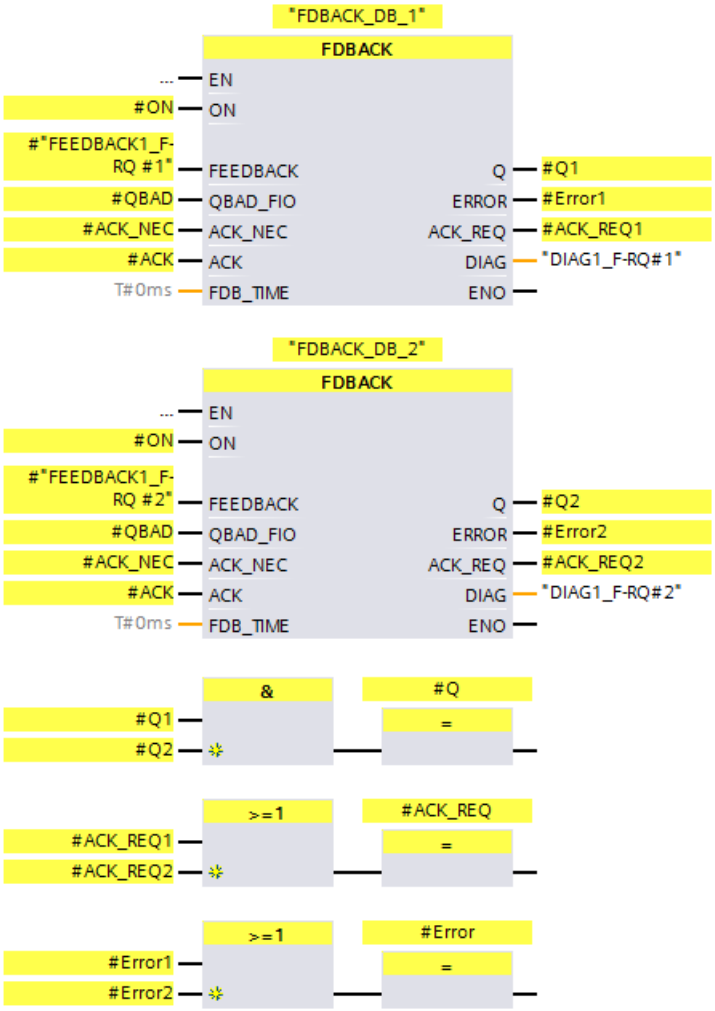
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:

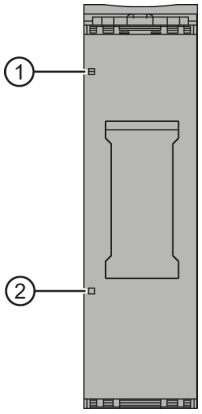


Status and error display

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays.

WARNING
The DIAG LED and the channel status LED of the output are not designed as safety-related LEDs and therefore must not be evaluated for safety-related activities.

DIAG LED

Table 6- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module parameters not set
On	Module parameters set and no module diagnostics

Channel status LED

Table 6- 2 Meaning of the channel status LED

Status	Meaning
Off	Process signal = 0
On	Process signal = 1

Technical specifications

7

7.1 Technical specifications

Technical specifications of F-RQ 1×24VDC/24...230VAC/5A

	6ES7136-6RA00-0BF0
Product type designation	F-RQ 1x24VDC/24 ... 230VAC/5A
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
Installation type/mounting	
Rail mounting possible	Yes; standard mounting rail
Supply voltage	
Type of supply voltage	24 VDC
Rated value (DC)	24 V; coil voltage
Low limit of permitted range (DC)	20.4 V
High limit of permitted range (DC)	28.8 V
Power	
Power consumption from the backplane bus	100 mW
Power loss	
Power loss, typ.	1 W
Address range	
Address space per module	
Input	1 byte
Digital outputs	
Number of outputs	1
Voltage induced on current interruption limited to	No
Control of a digital input	Yes
Switching capacity of outputs	
With resistive load, max.	5 A
With lamp load, max.	25 W

	6ES7136-6RA00-0BF0
Switching frequency	
With resistive load, max.	2 Hz
With inductive load, max.	0.1 Hz; see information in the manual
With inductive load (to IEC 60947-5-1, DC13), max.	0.1 Hz
With inductive load (to IEC 60947-5-1, AC15), max.	2 Hz
Total current of the outputs (per module)	
Horizontal installation	
• Up to 40 °C, max.	5 A; note derating information in the manual
• Up to 50 °C, max.	4 A; note derating information in the manual
• Up to 60 °C, max.	3 A; note derating information in the manual
Vertical installation	
• Up to 50 °C, max.	3 A; note derating information in the manual
Relay outputs	
Number of relay outputs	1; 2 NO contacts
Rated input voltage of relay coil L+ (DC)	24 V
Current consumption of relays (coil current of all relays), max.	70 mA
External fuse for relay outputs	Yes, 6 A, see information in the manual
Relay approved acc. to UL 508	Yes; Pilot Duty B300 R300
Switching capacity of contacts	
• With inductive load, max.	See additional description in the manual
• With resistive load, max.	See additional description in the manual
• Thermal continuous current, max.	5 A
• Contact rating, min.	1 mA
• Contact rating after exceeding 300 mA, min.	10 mA
• Contact rating after exceeding 300 mA, max.	5 A
• Rated switching voltage (DC)	24 V
• Rated switching voltage (AC)	230 V
Length of cable	
Cable length, shielded, max.	500 m; for load contacts
Cable length unshielded, max.	300 m; for load contacts
Control cable (input), max.	10 m
Interrupts/diagnostics/status information	
Diagnostics messages	
Diagnostics	Yes, firmware update
Diagnostics display LED	
RUN LED	Yes; green/red DIAG LED
Channel status display	Yes; green LED

	6ES7136-6RA00-0BF0
Electrical isolation	
Electrical isolation, channels	
Between channels	Yes; only with SELV / PELV
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between channels and backplane bus/supply voltage	250 VAC (reinforced insulation)
Between backplane bus and supply voltage	60 VAC/75 VDC
Insulation	
Insulation test voltage	2545 VDC 2 s (routine test)
Overvoltage category	III
Tested with	
Between channels and backplane bus/supply voltage	2545 VDC 2s (routine test), surge voltage test 7200 VDC/5 positive and 5 negative pulses (type test)
Between backplane bus and supply voltage	707 VDC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
Category according to ISO 13849-1:2008	4
SIL according to IEC 61508:2010	SIL 3
Low demand (PFD) acc. to SIL2	<1.00E-04, proof test interval 1 year
Low demand (PFD) acc. to SIL3	<1.00E-05, proof test interval 1 month
High demand (PFH) acc. to SIL2	<1.00E-08 1/h, proof test interval 1 year
High demand (PFH) acc. to SIL3	<6.00E-09 1/h, proof test interval 1 month
Dimensions	
Width	20 mm
Weights	
Weight, approx.	56 g

Supplement to the technical specifications

Technical specifications	
Relay outputs	
Current consumption of relays (coil current of all relays), min.	20 mA
Permitted potential difference	
• Between NO contacts	75 VDC / 60 VAC
Insulation tested	
• Between the NO contacts	707 VDC (type test)

Derating

Note

As the modules are small, you need to monitor the heat build-up between adjacent modules if output modules are subject to high loads. A temperature rise in an output module exposed to a high load can result in shutdown and reduce plant availability. If the operating voltage > 25 VDC, the average total current of the modules directly adjacent should not exceed 50% of the levels listed in the technical specifications, and the ambient temperature should not exceed 50 °C.

If the ambient temperature exceeds 50 °C, supply voltage L+ must not exceed 25 VDC.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

7.2 Mechanical and climatic ambient conditions

In contrast to the specifications for mechanical environmental conditions and mechanical environmental conditions testing in the "Mechanical and climatic ambient conditions" section of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual, the following applies to this F-module:

Mechanical ambient conditions

The following table shows the mechanical ambient conditions in the form of sinusoidal vibrations.

Table 7- 1 Mechanical ambient conditions

Frequency band	ET 200SP with BusAdapter BA 2×FC	ET 200SP with BusAdapter BA 2×RJ45/ BA 2xSCRJ
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude	
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration	

Tests of mechanical ambient conditions

The following table provides important information about the type and scope of the tests for ambient mechanical conditions.

Table 7- 2 Tests of mechanical ambient conditions

Check for ...	Test standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sinus)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

7.3 Switching capacity and service life of contacts

Switching capacity and service life of contacts

You can extend the service life beyond the value indicated in the tables below by installing an external protective circuit.

The tables below show the switching capacity and service life of the contacts.

Table 7- 3 Switching capacity and service life of contacts with resistive load

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	5.0 A	350000
	3.0 A	500000
	2.0 A	750000
	1.0 A	1800000
	0.5 A	4000000
230 VAC	5.0 A	100000
	3.0 A	150000
	2.0 A	200000
	1.0 A	400000
	0.5 A	800000

Table 7- 4 Switching capacity and service life of contacts **with inductive load according to IEC 947-5-1 DC 13/ AC15**

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	1.0 A	100000
	0.5 A	200000
230 VAC	1.0 A	200000
	0.5 A	350000

Table 7- 5 B10d values

AC	750000
DC	10000000

Response times

A

A.1 Response times

Introduction

The section below shows the response times of the digital output module F-RQ 1x24VDC/24..230VAC/5A. The response times of digital output module F-RQ 1x24VDC/24..230VAC/5A are included in the calculation of the F-system response time.

Definition of response time for fail-safe relay outputs

The response time defines the interval between controlling by means of a fail-safe digital output module until the signal change at the relay output.

Maximum response time without errors

The maximum response time for fail-safe relay outputs when there are no errors is equal to:

Max. response time = 16 ms

Readback response time

The readback response time for fail-safe relay outputs is equal to:

Readback response time = 30 ms

Maximum response time until error detection

Max. response time = cycle time of the safety program + max. readback time of the FDBACK instruction + max. response time of the F-DQ module + max. response time of the F-RQ module + 12.8 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual complements the ET 200SP distributed I/O system system manual. General functions of the ET 200SP are listed in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Safety instructions

2

Important safety instructions

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

For operation in Pollution Degree 2 environment.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or an enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 according to EN 60529.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Wires must not be connected to the device or disconnected from the device within a flammable or combustible environment.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect live wires from the device if it cannot be ensured that an explosive atmosphere is not present in the environment.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Replacement of components may impair suitability for Class I, Division 2 or Zone 2.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not open the device when the supply voltage is switched on.

WARNING

Connection only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in the Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

For this reason, you are only permitted to connect safety extra-low voltage (SELV) with limited power source (LPS) according to IEC 60950-1, EN 60950-1, VDE 0805-1 to the supply connections.

The supply of the device must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Take measures to prevent transient overvoltages of more than 40% of the rated voltage. You can ensure this by using only AS-i power supply units that meet the requirements indicated in Section Terminal assignment (Page 27) in "Power supply units for AS-Interface". Transient overvoltages are not permitted to exceed 119 V under any circumstances. This will ensure compliance with an ATEX requirement.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This device is only suitable for use in areas defined as Class I, Division 2, Groups A, B, C, and D and is not suitable for use in hazardous areas.

WARNING

To be operated by experienced users only

Improper operation may result in death, severe injury, and serious property damage. Users must be familiar with ASIsafe and the safety system used, e.g., SIMATIC, Distributed Safety, SIMATIC Safety Advanced.

Only an experienced user is permitted to teach the code sequences of safe AS-i slaves (organizational specification).

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is only suitable for use in areas defined as Class I, Zone 2, Group IIC and in non-hazardous areas.

NOTICE

Checking parameters

Check that all parameters are correctly set before final acceptance.

NOTICE

Reaction to faults in fail-safe modules

If you are using the module in safety-critical applications, the PROFIsafe mechanism of passivation and reintegration is enabled and must be used.

Observe the information concerning passivation and other fault reactions in the documentation for the ET 200SP Distributed I/O System, see Section Documentation guide (Page 7).

NOTICE

Single-channel use of safe AS-i input slaves

The values in the PROFIsafe process image input have Safety Integrity Level SIL 3.

If two-channel interconnection is not used for a safe AS-i input slave, the application has a maximum safety integrity level of SIL 2 or less. The configuration tool / STEP 7 cannot detect this.

You must ensure that the signals are correctly processed in the safety application.

NOTICE

Ensure that the plant is functioning correctly in productive operation

Carry out a function test before the system goes into productive operation.

Important note for maintaining the operational safety of the system

Note

Newsletter containing information on product development and product features

Owners of systems with safety-related characteristics must ensure compliance with special operational safety requirements. Suppliers are required to comply with special product monitoring measures. For this reason, Siemens publishes a special newsletter containing information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective. A newsletter keeps you constantly up to date in this regard. A subscription to the newsletter is necessary so that you can make any needed changes to your system. To sign up for the newsletter, go to:

Internet (https://www.industry.siemens.com/newsletter)

Select "Service & Support" > "Industry Online Support" > "Automation Technology" > "AS-Interface". Select the "Update" entry type.

Product overview

3

3.1 Properties of the F-CM AS-i Safety ST

Item number

3RK7136-6SC00-0BC1

View of the module

Figure 3-1 View of the F-CM AS-i Safety ST module

Use of the module

The F-CM AS-i Safety ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The F-CM AS-i Safety ST module features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The F-CM AS-i Safety ST module can be plugged in to:

- BaseUnit Type C0
- BaseUnit Type C1

The F-CM AS-i Safety ST fail-safe communication module expands a standard AS-Interface network to include safety-related communication.

The F-CM AS-i Safety ST module reads the input states of safety-related AS-Interface input modules and provides these states to a fail-safe F-CPU for further evaluation.

In the opposite direction, the F-CM AS-i Safety ST module receives safe output states of an F-CPU and outputs them for control of safety-related outputs on AS-Interface.

The F-CM AS-i Safety ST fail-safe module supports safety-related applications up to SIL 3 according to EN 62061 or safety category up to PL e according to EN 13849-1. The input and output values of the safety-related AS-i slaves are addressed using the safe cyclic process image. You need an F-CPU for safe processing.

The F-CM AS-i Safety ST module has no AS-i master functionality. For operation of the AS-i network, you need a CM AS-i Master ST module (3RK7137-6SA00-0BC1) or another AS-i master conforming to AS-i Specification V3.0.

You can plug several F-CM AS-i Safety ST modules into one SIMATIC ET 200SP station. An F-CM AS-i Safety ST occupies 16 input bytes and 8 output bytes in the I/O address space. The number of F-CM AS-i Safety ST modules that can be plugged in depends on:

- The maximum address space of the utilized interface module (IM) of the ET 200SP
- The amount of address space occupied by other modules

Up to five module combinations of CM AS-i Master ST (32 input bytes/32 output bytes) and F-CM AS-i Safety ST (16 input bytes/8 output bytes) can be plugged in to one SIMATIC ET 200SP station with standard interface module IM 155-6 PN ST having a maximum address space of 256 input bytes/256 output bytes. If other modules are present in the ET 200SP station, the available address space and the maximum number of AS-i modules are reduced.

In a SIMATIC ET 200SP station with High Feature Interface Module IM 155-6 PN HF and a maximum address space of 1 440 input bytes/1 440 output bytes, a correspondingly greater number of modules can be plugged in.

You can find additional information in ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

Properties

- Technical properties
  - Gateway between PROFIsafe and ASIsafe, without master functionality
  - Expands a standard AS-i network to include safety-related communication (ASIsafe)
  - Transfer of safety-related digital I/O values in the cyclic process image
  - Monitoring of up to 31 safety-related input slaves
  - Control of up to 16 safety-related AS-i output slaves or switch-off groups
  - Power supplied from the AS-i voltage
  - Use of various interconnection types (1oo1 and 1oo2) is possible
  - Input delay of 0 ms to 150 ms can be assigned for each channel
  - Startup test can be activated for each channel
  - Discrepancy monitoring can be configured for each channel
  - Sequence monitoring can be set for each channel
  - Channel-wise passivation
  - Test for 0 signal before reintegration
  - 8 LED displays for status and error diagnostics
- Supported functions
  - I&M identification data
  - PROFIsafe V2.4
  - Firmware update

NOTICE
Max. proof test interval When the proof test interval has expired, you must replace the device; see "Technical specifications (Page 93)".

- New properties as from FW V1.0.1
  As from product version 02, the module is shipped with FW V1.0.1 (or higher).
  - Extended functions (diagnostic texts)
  - New messages
  - New diagnostics data record 206

For more information, see Section "Parameterizing (Page 41)".

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

Ease of maintenance

The following features support maintenance:

- Code sequences are saved in the coding element. As a result, teaching of the code sequences does not have to be repeated after an F-CM AS-i Safety ST module is replaced.
- Use is automated to the greatest extent possible. This applies, in particular, to the teaching of the code sequences of safe AS-i slaves.
- An F-address that has already been assigned is stored in the coding element. This means that there is no need to repeat teaching-in after replacing the F-CM AS-i Safety ST module.
- The module/BaseUnit concept allows you to easily replace defective hardware. Remove the defective module from the rack and plug in the new module.

Further information can be found in the Section "Code sequences (Page 75)".

Certifications

More detailed information regarding certifications can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

3.2 Operating modes of the F-CM AS-i Safety ST

3.2.1 Standard mode

Self test during device startup

After the AS-i voltage is switched on (PWR LED shows steady green light), the F-CM AS-i Safety ST module performs a comprehensive self-test. During this test, all LEDs are lit for approximately 3 seconds. Exception: the "DIAG" LED is controlled directly by the ET 200SP backplane bus and indicates the communication status for the ET 200SP system.

Checking of the F-address

After the self-test, the module checks the F-address. If no valid F-address is available, the "DIAG" and "PROFIsafe" LEDs flash red (the status LED flashes green). You must then assign the F-address, see Section "F-parameters (Page 44).

Downloading of the module parameters

The F-CM AS-i Safety ST then begins to read in code sequences of the safe AS-i slaves on the connected AS-i bus. At the same time, the module downloads the module parameters that were stored in the PLC CPU. The module parameters can only be downloaded when the operating voltage is applied to the interface module of the ET 200SP and the parameters have been made available by the PLC CPU during startup of the ET 200SP station.

The "Status" LED flashes green until the module parameters are completely downloaded or the PLC CPU is in STOP state, or the PLC communication is interrupted.

Cyclic data exchange of safe input/output data

When a valid set of module parameters has been downloaded and the PLC CPU is in "RUN" state, the safe input/output data is evaluated according the parameter assignment and exchanged with the PLC CPU.

The PROFIsafe protocol is used for the data exchange.

The "Status" LED is lit green during cyclic data exchange.

If the F-CM AS-i Safety ST module starts cyclic data exchange directly after startup, but communication cannot yet be established on the AS-i bus, the F-CM AS-i Safety ST module supplies the substitute value "0" in the input image. Passivation is delayed by a maximum of 30 s in this case. As a result, communication can start on the AS-i bus within this time window without passivation. After this time window, the input/output channels are passivated if there is no AS-i communication.

3.2.2 Error statuses

Note

Statuses not considered to be errors

The F-CM AS-i Safety ST module does not consider the following statuses to be errors, i.e. no alarm and no passivation is triggered:

- Waiting for start-up test
- Input/output with value = 0 in the process image without error condition, e.g. normal opening of the input contacts by pressing an emergency stop button or opening a protective door.

Diagnostic information can be read out in the user program using data records. For information, please refer to Section "Data records for diagnostics (Page 57)".

3.2.2.1 Serious device fault

Description

Examples of conditions that trigger a serious device fault are:

- Fault in the electronics
- Repeated synchronization error

You can read the following pattern on the LEDs:

Table 3- 1 LED display for a serious device fault

LED	Display
"Status"	☐ "Off"
"Error"	■ Red "On"
"CFG"	■ Red "On"
"PSF"	■ Red "On"

In the event of a serious device fault, communication with the F-CM AS-i Safety ST module, e.g., reading a data record, is not possible. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

1. Switch off the module.
2. Wait for the module to cool down, if necessary.
3. Switch on the device again.
4. If the error persists after the module is switched on, the module must be replaced.

3.2.2.2 Device fault

Description

Examples of conditions that trigger a device fault are:

- Device fault (e.g. sporadic synchronization error, see also DS92)
- Configuration error (e.g. problem with contact to backplane bus, coding plug missing, see also DS92)

You can read the following pattern on the LEDs:

Table 3- 2 LED display for device faults

LED	Display
"Status"	☐ "Off"
"Error"	✳ Red "flashes"
"CFG"	☐ "Off"
"PSF"	☐ "Off"

In the event of a device fault of this type, communication with the F-CM AS-i Safety ST module is only possible. e.g., for reading out additional diagnostic information via data records. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

- Make sure that the station is properly grounded.
- Check whether the coding element is present or replace it if necessary.
- Plug the module into the BaseUnit in an untwisted position.

Switch off the module. If the error persists after the module is switched on and no external error cause can be found, the module must be replaced.

3.2.2.3 Process signal error

Description

Examples of conditions that trigger a process signal error are:

- Discrepancy error at the inputs of a safe AS-i input slave
- Sequence error at the inputs of a safe AS-i input slave
- Sporadic code sequence error (from FW V1.0.1), e.g. fault caused by EMC in the input circuit
- Code sequence error at a safe AS-i input slave, e.g. due to cross-circuit at the inputs
- Failure of a safe AS-i input slave

You can read the following pattern on the LEDs:

Table 3- 3 LED display for discrepancy error or sequence error

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	□ "Off"
"PSF"	✳ Red "flashes"

Table 3- 4 LED display for code sequence errors (e.g. due to cross-circuit) or for slave failure

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	✳ Red "flashes"
"PSF"	✳ Flashes red if the CPU is in RUN "off" if the CPU is in STOP.

In the event of a process signal error, the F-CM AS-i Safety ST module remains in cyclic data exchange. Only at the safe input slave involved in each case is the substitute value "0" processed and the channel passivated. After the cause of the error has been eliminated, the channel can be reintegrated via the safety program.

The "PSF" LED goes out only after all channels have been reintegrated.

The "DIAG" LED switches from flashing red to green as soon as all errors that led to a passivation of the individual channels have been cleared.

Communication with the F-CM AS-i Safety ST module is possible, for example, for reading out additional diagnostic information via data records.

Response to code sequence errors

- **Sporadic code sequence error**
  Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
  Behavior as from firmware V1.0.1:
  - Sporadic code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The resetting to the substitute value 0 takes place without any delay.
  - Diagnostic alarm is triggered (after a short delay, in order to distinguish between sporadic code sequence errors and general code sequence errors).
  - **Response to FW V1.0.0**
  - No message as diagnostic alarm in FW V1.0.0 and no passivation of the channel.
  - Safety input bit of the channel is reset to substitute value 0 without a delay and automatically switches to the process value 0 or 1 if there is no interference to the code sequence.
- **Code sequence error (general)**
  Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the fail-safe input module.
  Behavior (identical for firmware V1.0.0 and V1.0.1 or higher):
  - Code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The reset to the substitute value 0 takes place without a delay, while the diagnostic alarm is triggered after a short delay (delay necessary in order to distinguish between sporadic code sequence errors and general code sequence errors).

3.2.2.4 Parameter assignment error

Description

In the event of invalid configuration data, the cyclic data exchange will not start.

You can read the following pattern on the LEDs:

Table 3- 5 LED display for parameter assignment errors

LED	Display
"Status"	✳ Green "flashing"
"Error"	☐ "Off"
"CFG"	☐ "Off"
"PSF"	✳ Red "flashes"

1. Check the hardware configuration in *STEP 7*.
2. Perform a compilation.
3. Download the configuration data to the PLC CPU.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Noting the firmware version

After a firmware update, mark the current firmware version on the housing of the F-CM AS-i Safety ST.

Note

Requirement for the firmware update

Always perform the firmware update of the F-CM AS-i Safety ST in a separate ET 200SP rack. Ensure that no other modules besides the interface module (IM), the F-CM AS-i Safety ST, and the terminating server module are located in the ET 200SP rack.

During the firmware update of the F-CM AS-i Safety ST module, the associated CPU must be in the STOP operating state. To do this, switch the CPU to the STOP state before starting the firmware update.

Note

If the FW V1.0.0 is replaced by another FW version, then an intermediate step is necessary. If you would like to replace a higher FW version with FW version V1.0.0, then this intermediate step is also necessary.

As an intermediate step, the Bootloader Version (B1.0.0) of the firmware must be loaded before the actual firmware V1.x.x.

NOTICE

Observe references to the download page for executing the firmware change
Failure to do so can result in the destruction of the device.

The firmware versions are made available in the Online Support:
Online Support (https://support.industry.siemens.com/cs/ww/en/view/109743655)

NOTICE

Checking the firmware version for F-permission

Before using a new firmware version, check whether it is permitted for use in the respective module.

The permissible firmware version is specified in the appendices of the F-CM AS-i Safety ST Safety certificate.

See also:

Certificate for failsafe module F-CM AS-i Safety ST (3RK7136-6SC00-0BC1)
(https://support.industry.siemens.com/cs/ww/en/view/90477145)

Certificate for ET 200SP modules
(http://support.automation.siemens.com/WW/view/en/49368678/134200)

Handling of the F-address and the code sequences

Note

Saving of the F-address in the coding element

During a firmware update, the F-address that is saved in the coding element is retained. Observe the information in the description of the firmware version.

Note

Saving of the code sequences in the coding element

During a firmware update, the ASIsafe code sequences that are saved in the coding element are retained. Observe the information in the description of the firmware version.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- "DIAG" LED flashes red.
- "ADDR" LED flashes green.
- "PWR" LED lights up green.
- The rest of the LEDs are Off.

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

On successful completion of a firmware update, the module performs a hot restart. It is not necessary to switch off the voltage.

After the restart, the LEDs indicate the status of the F-CM AS-i Safety ST same as after a device startup.

If the firmware update cannot be completed, switch the AS-i voltage off and back on again and repeat the firmware update.

Error statuses (Page 17)

Connection 4

4.1 Terminal assignment

Requirement

For connecting, you require a BaseUnit:

- Type C1 (dark BaseUnit, e.g., item number 6ES7193-6BP20-0BC1)
- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to AS-i power supply units that meet the requirements given in Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

Variants

Use with light BaseUnit Type C0

If the F-CM AS-i Safety ST module is connected to an AS-i network whose AS-i master is located outside the ET 200SP station, use the light BaseUnit Type C0.

If the AS-i master is located within the ET 200SP station, you can also use the light BaseUnit. However, you must wire the AS-i network explicitly using the connecting terminals.

The light BaseUnit Type C0 has no internal connection to the module plugged in on the left.

Use with dark BaseUnit Type C1

If you are using a combination of CM AS-i Master ST and F-CM AS-i Safety ST on the same AS-i network, use the dark BaseUnit. In this case, plug the CM AS-i Master ST module into a light BaseUnit Type C0. Next to it on the right, plug the F-CM AS-i Safety ST module into a dark BaseUnit Type C1.

In this case, connect the AS-i network to the light BaseUnit. The dark BaseUnit does not have to be connected to the AS-i network because the connection is made automatically via the BaseUnit group.

In contrast to other BaseUnit types, for the BaseUnits Type C0 and Type C1, the P1 and P2 busbars of the BaseUnit are electrically isolated from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-). An electrical connection is made in each case via the plugged-in CM AS-i Master ST module or F-CM AS-i Safety ST module.

The AS-i voltage connected to the light BaseUnit Type C0 is applied through the plugged CM AS-i Master ST module to the busbars. The busbars of the BaseUnit group are connected-through. The F-CM AS-i Safety ST module is supplied with AS-i voltage via the busbars of the dark BaseUnit Type C1. It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload in the modules.

If you want to maintain the voltage supply of the F-CM AS-i Safety ST module when the CM AS-i Master ST module is unplugged from the light BaseUnit, you can wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and the dark BaseUnit Type C1.

Grouping of a light BaseUnit Type C0 with several dark BaseUnits Type C1

The use of a single F-CM AS-i Safety ST module on an AS-i network is generally sufficient. If several F-CM AS-i Safety ST modules are being used on an AS-i network by means of series connected dark BaseUnits Type C1, you must wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and a dark BaseUnit Type C1. This will prevent an overload of the modules. A current draw from the dark BaseUnit is not allowed. Additional information about this can be found in "Use with dark BaseUnit Type C1".

General terminal assignment

Table 4- 1 Terminal assignment of the F-CM AS-i Safety ST

Terminal	Assignment	Description
1	TEACH1	Connection of the "TEACH" button (optional) See Section Code sequences (Page 75).
2	TEACH2	
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L[1)]	ASI+	Dark BaseUnit Type C1: optional connection of the AS-i cable, positive polarity Light BaseUnit Type C0: connection of the AS-i cable, positive polarity
1N, 2N [1)]	ASI-	Dark BaseUnit Type C1: optional connection of the AS-i cable, negative polarity Light BaseUnit Type C0: connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "TEACH" button

You can connect a "TEACH" button to the "TEACH1" and "TEACH2" terminals of the F-CM AS-i Safety ST module. The "TEACH" button enables the transfer of code sequences of the connected safe AS-i input slaves. This function is activated by closing the button contact on the TEACH1 and TEACH2 terminals.

The maximum cable length between the terminal and "TEACH" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

Additional rules and instructions for operating the ET 200SP with fail-safe modules

Observe generally the information in Section "Connecting" in the following documentation:

- Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)
- Product Information ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/78361093/0/en)

The conditions for connecting sensors and actuators to the modules of the ET 200SP also apply generally to the connecting of sensors and actuators to the slaves and modules of the AS-i network.

In addition, the information in the documentation of the AS-i component applies.

Ensure that all components of the AS-i network are connected in such a way that the voltage applied to the safety-related AS-i modules is limited to a maximum of 40 V.

The ET 200SP modules CM AS-i Master ST and F-CM AS-i Safety ST have internal safe electrical isolation from the backplane bus of the ET 200SP.

Power supply units for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to a maximum of 40 V in the event of a fault, including a second fault.

The Siemens power supply units for AS-Interface meet these requirements. For additional information, refer to the operating instructions of the power supply unit.

Use an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit that meets the above-indicated requirements and an AS-i data decoupling unit.

In the following text, the expression "AS-i power supply unit" stands, unless described otherwise, for an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit and an AS-i data decoupling unit.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

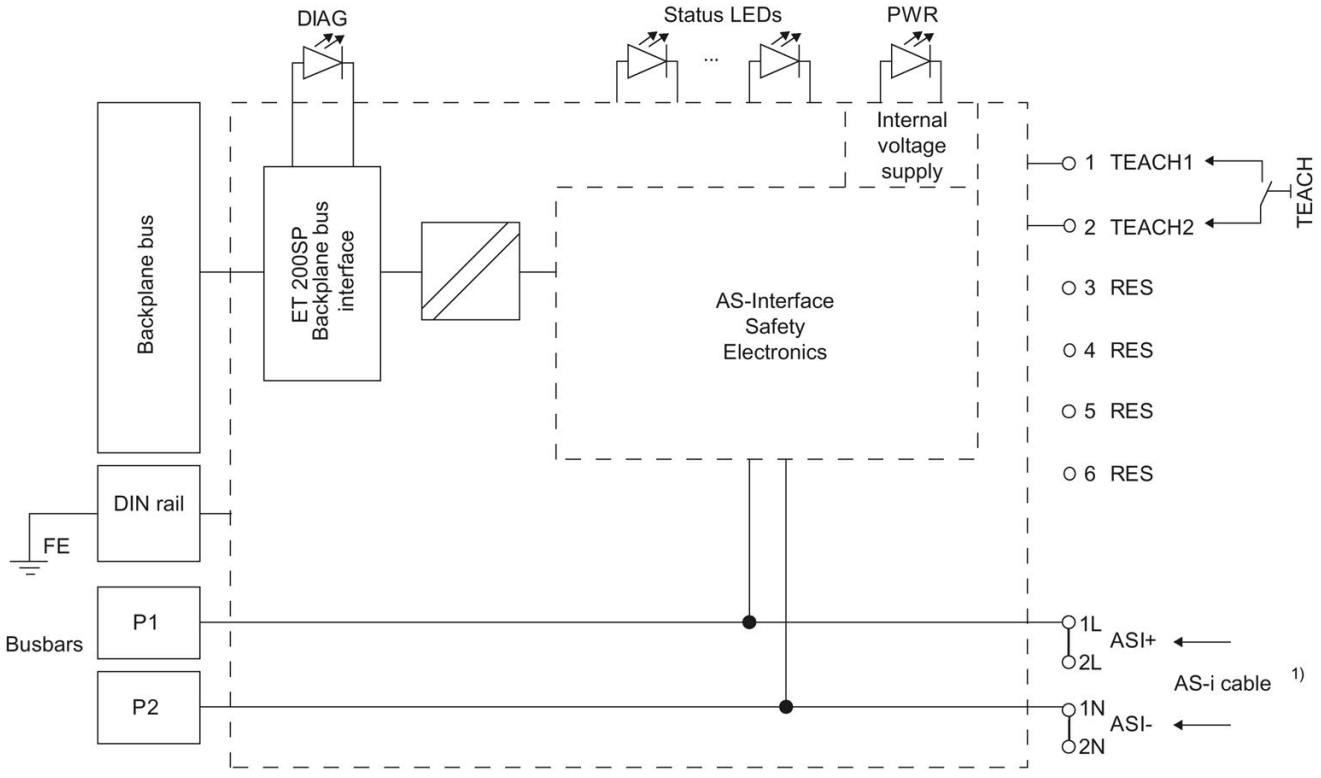
Use a PELV / SELV power supply when operating the F-CM AS-i Safety ST module on PROFIsafe.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/20025980/133000)

4.2 Schematic circuit diagram

Schematic circuit diagram



1) AS-i cable: Connection not applicable for dark BaseUnit

Figure 4-1 Schematic diagram of F-CM AS-i Safety ST

Connection to busbars

Requirement:

- An AS-i power supply unit is connected to the light BaseUnit Type C0 of the BaseUnit group.
- A CM AS-i Master ST module is plugged into the light BaseUnit.

If you plug an F-CM AS-i Safety ST module into a dark BaseUnit Type C1, the F-CM AS-i Safety ST module will be automatically supplied with AS-i voltage via the busbars.

It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload of the modules.

Note the additional explanations in Section Terminal assignment (Page 27).

Configuring

5

5.1 Configuring the F-CM AS-i Safety ST

Notes on configuration

You configure the ET 200SP station and its F-CM AS-i Safety ST module and assign their parameters with *STEP 7*.

There is currently no provision for configuration via a GSD file, because the GSD configuration procedure does not permit safety-related parameter assignment (according to PROFIsafe Specification V2.4).

Note

F-CM AS-i Safety ST in the hardware catalog of *STEP 7*

If the F-CM AS-i Safety ST module is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". This HSP can be obtained from the Internet using the corresponding function in *STEP 7*.

Note

Operation under S7 F systems is not approved.

Note

The data exchange with "F-DX-MOD" is not supported.

Software for configuration of the F-CM AS-i Safety ST

Configuration software	Requirements	Installation information
STEP 7 (classic) V5.5 SP3 HF4 or higher with Distributed Safety	Hardware Support Package HSP 2093[1)] Internet	Online Help for *STEP 7*
STEP 7 (classic) V5.5 SP4 or higher with Distributed Safety		
STEP 7 (TIA Portal) V13 or higher with Safety Advanced	Hardware Support Package HSP 70[1)] Internet (http://support.automation.siemens.com/WW/view/en/29156492/133100)	
STEP 7 (TIA Portal) V14 or higher with Safety Advanced / Basic		

[1)] Download optional, if not already contained in the hardware catalog

Note

Observe the online help on *STEP 7*.

The "S7 F-Configuration Pack" can be found on the Internet (http://support.automation.siemens.com/WW/view/en/15208817).

Procedure

1. Assign the parameters of the F-CM AS-i Safety ST module according to your safety application.
2. Configure the AS-i Master in such a way that it includes all AS-i slaves in the communication – including the control addresses for safe AS-i outputs that are activated in the F-CM AS-i Safety ST module.
3. Download the hardware configuration to the PLC-CPU.
4. Assign the associated F-address to the F-CM AS-i Safety ST module.
5. Start the teaching and transferring of the code sequences of the safe AS-i input slaves.
6. Create the safety program in the F-CPU.
7. Test your application.

Information concerning these steps can be found in the following sections and in the manuals of the utilized devices.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage
Observe instructions in the programming and operating manuals

Observe the instructions in the manuals.

5.2 Safety-related communication with AS-Interface

5.2.1 Operating principle of code sequences of safe AS-i slaves

For realization of safety-related communication, each safe AS-i input slave sends a code sequence over the AS-i bus. To prevent a mix-up of the AS-i input slaves on an AS-i bus, each AS-i input slave sends a different code sequence. The code sequences are permanently stored in the AS-i input slave.

The F-CM AS-i Safety ST module checks every code sequence for correct data content. Depending on the result of the evaluation, the module sets the the safe input image.

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

You will find more information about teaching code sequences, and the LED behavior, in Section "Code sequences (Page 75)".

You can find a description of the individual parameters in the Section "Process signal errors (Page 20)".

5.2.2 Operating principle of the safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe AS-i input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

For the function of a safe AS-i output, you need the following components:

- A control unit
- An evaluation unit

Control unit

The control unit outputs safety-related IN or OUT control commands to the AS-i bus. The control unit is integrated in the F-CM AS-i Safety ST module. The control unit assumes an active position in the communication. It acts like an AS-i slave and has an AS-i address that must be called by the AS-i master. The values in the output data of the AS-i master are not relevant in this case. The F-CM AS-i Safety ST module inserts the safety-related control data into the communication data.

Besides controlling the OFF state according to specification, a control unit can control up to four different output switching states: F-OUT 1, F-OUT 2, F-OUT 3, and F-OUT 4. The F-CM AS-i Safety ST module, however, makes available only the output switching state F-OUT 1, i.e., The OFF and ON states are controlled.

In addition to the switching states, a control unit can send out two different auxiliary signals: AUX1 and AUX2. You can use these auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, the AUX1 and AUX2 signals are mapped in the safe process image output. The auxiliary signals are not safety-related signals, however. During control by the safety program, the F-CM AS-i Safety ST module sends a sequence from each auxiliary signal one after the other on the AS-i bus. Up to 16 different control units can be activated in the F-CM AS-i Safety ST module. The control units are managed in the F-CM AS-i Safety ST module as switching group 0 to switching group 15.

If you want to use more than 16 different control units, you can plug two F-CM AS-i Safety ST modules into the ET 200SP station.

Observe the information on the bus configuration in Section AS-i bus configuration with multiple F-CM AS-i Safety ST modules (Page 38).

NOTICE
Uniqueness of the AS-i address on the AS-i bus
Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Evaluation unit

The evaluation unit reads the safety-related control commands ON or OFF on the AS-i bus and passes corresponding switching commands, e.g., to switching contacts. In case of error, e.g., communication error on the AS-i bus, the evaluation unit switches off. The evaluation unit is integrated in the safe AS-i output module to which, for example, drive contactor coils are connected. The evaluation unit behaves as a passive unit in the AS-i communication. The master does not detect the evaluation unit and does not call it. The evaluation unit monitors the communication of the AS-i address of the control unit and reacts to its safety-related control signals.

You set the AS-i address (see Section "Control unit") the evaluation unit is to monitor.

You can set multiple evaluation units to the same address so that a control unit can control multiple safe output modules simultaneously.

NOTICE
Bus cycle time for safe AS-i outputs An evaluation unit requires a minimum AS-i bus cycle time. Ensure that at least 5 AS-i addresses are present on the AS-i bus. Otherwise, the control unit goes to error state. When A/B slaves are used, at least 5 different numerical AS-i addresses must be present. That is, a combination of slave addresses 1A and 1B count as 1 numerical address. The F-CM AS-i Safety ST module does not have a monitoring function for this configuration rule.

5.3 AS-i bus configuration with multiple F-CM AS-i Safety ST modules

The F-CM AS-i Safety ST module generates an additional physical bus load on the AS-i cable.

To avoid faults due to too low levels of the communication signals on the AS-i cable, the entire bus load on the AS-i cable must not exceed a maximum value.

The following rules apply to the determination of the physical bus load on the AS-i cable:

Device type	Bus load value
Slave with A/B address	0.5
Slave with standard address	1.0
F-CM AS-i Safety ST module	2.5
---	---
Maximum value as sum of all devices	35.0
---	---

Determine the total bus load by adding the bus load values of the components connected to the AS-i cable. You do not have to include the standard AS-i master and AS-i power supply unit system components when calculating the bus load.

To avoid disturbances, the maximum bus load must not exceed the value 35.

The bus load value of the F-CM AS-i Safety ST module remains unchanged if switching groups are activated in the F-CM AS-i Safety ST module for control of safe outputs. In other words, the internally generated AS-i addresses do not influence the bus load value.

If you connect additional components, e.g., an MSS 3RK3 modular safety system, to the AS-i cable, you must take into consideration the bus load values of these components. For more detailed information, refer to the relevant manual.

When a repeater is used, this yields multiple cable segments for which the bus load can be determined separately.

The following configuration examples result from the table:

- In a fully expanded AS-Interface network configuration (with 31 slaves with standard address), you can install 1 F-CM AS-i Safety ST module.
- In an AS-Interface network configuration with 30 slaves with standard address, you can install 2 F-CM AS-i Safety ST modules.

5.4 Configuring with STEP 7 (classic)

With *STEP 7* (classic) the F-CM AS-i Safety ST module is configured independently of the configuration of further ET 200SP modules, e.g. CM AS-i Master ST.

If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM AS-i Safety ST module, then this configuration error is not recognized when compiling the configuration. The F-CM module does not report that the slave cannot be detected until operation is in progress or code sequences are being read.

5.5 Configuring with the TIA Portal

TIA Portal V13 SP1

With TIA Portal V13 SP1, an F-CM AS-i Safety module can only be configured in combination with an AS-i master, necessitating the configuration of the AS-i slaves in STEP 7.

The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.

The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.

TIA Portal V14 or higher

From TIA Portal V14 onwards, an F-CM AS-i Safety module can be configured:

- In combination with an AS-i Master, necessitating the configuration of the AS-i slaves in STEP 7. The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.
  The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.
- Regardless of an AS-i master, i.e. no configuration of the AS-i slaves in STEP 7 is required. In this case, the parameters of the AS-i input slaves are set in the properties window of the F-CM AS-i Safety ST module.

In the case of safe inputs/outputs, the "Configuration status" output field in the properties of the F-CM reports whether the configuration of the F-CM is compatible with the configuration of the connected AS-i subnet. If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM module, then the compilation of the configuration is nevertheless still possible. During operation or when reading the code sequences, however, the F-CM module reports that the slave cannot be detected.

The affected input address is passivated.

Configuration of safe AS-i outputs

The F-CM module contains a control unit for the safe AS-i outputs, see Section "Functional principle of the safe AS-i outputs (Page 36)".

TIA Portal V13 SP1

When configuring with TIA Portal V13 SP1, this control unit is not visible in the network view on the AS-Interface subnet of the AS-i master. The configuration of the F-CM module, however, is always combined with the AS-i master.

TIA Portal V14 or higher

In TIA Portal V14 or higher, the control unit must additionally be configured as a virtual slave on the AS-i subnet of the master, in the event that the AS-i slaves are configured in STEP 7.

A virtual slave is inserted automatically if a safe AS-i output is activated in the properties of the F-CM module and the F-CM module is already linked with the AS-i subnet. If necessary, by using the "Add AS-i Slave to AS-i network" button, the virtual slave can be inserted in the properties of the F-CM module under "Safe outputs". If no AS-i subnet is connected to the F-CM when the "Add AS-i slave to AS-i network" button is actuated, a subnet is automatically inserted.
The virtual slave can be managed like any other slave on the subnet, which means that all AS-i slave addresses existing in the AS-i subnet are visible. The virtual slave can be deleted if the control of the safe AS-i output is no longer required.

If necessary, the virtual slave can also be inserted straight from the hardware catalog (3RK7136-6SC00-0BC1F-DQ) into the subnet of the master.

Note

The virtual slave 3RK7136-6SC00-0BC1F-DQ is not a hardware module that is connected to the AS-i cable, but only a tool for the configuration of the AS-i master. The AS-i address assigned to the virtual slave 3RK7136-6SC00-0BC1F-DQ is emulated in the F-CM AS-i Safety module as soon as the corresponding safe output is activated in the properties of the F-CM.

If the AS-i master is engineered without configuring the AS-i slaves in STEP 7, i.e. either configuration of the AS-i slaves via the "SET" button or via the control panel in the TIA Portal, then the secure outputs in the F-CM must be configured and must have been loaded into the station before the configuration of the AS-i slaves is read into the master by means of the "SET" button or via the control panel in the TIA Portal.

Assigning parameters / Setting the address space 6

6.1 Parameters

List of parameters

Table 6- 1 F-parameters

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
F-monitoring time (ms)	1 … 65534 ms	150 ms	No	F-CM AS-i Safety ST
F-source address	1 … 65534	Assigned by the F-system	No	F-CM AS-i Safety ST
F-destination address	1 … 65534	Is suggested by the F-system	No	F-CM AS-i Safety ST

For information on the F-parameters and the assignment of the F-address, refer to the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

Table 6- 2 Potential group / AS-i network

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
BaseUnit with AS-i voltage supply	Potential group: The AS-i network of the left module (dark BaseUnit) is used New potential group: New AS-i network (light BaseUnit)	The AS-i network of the left module (dark BaseUnit) is used	No	F-CM AS-i Safety ST

Table 6- 3 Module parameters: Behavior after channel faults

Behavior after channel faults	Passivate the channel (setting cannot be changed).	Passivate the channel	-	F-CM AS-i Safety ST

Safe inputs

Up to 31 safe AS-i input slaves are monitored. Open the settings for each required AS-i address. Activate the input monitoring and assign the parameters.

Table 6- 4 Module parameters: Safe inputs, AS-i address 1 to 31

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate input monitoring	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
I address	Output field, value is calculated automatically	-	No	Channel / safe AS-i input slave
Input delay (ms)	0 ms, 50 ms … 150 ms[1)]	0 ms	No	Channel / safe AS-i input slave
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent	1oo2 evaluation	No	Channel / safe AS-i input slave
Startup test	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy monitoring	• Disable • Enable	• "Disable" if 1oo1 evaluation • "Enable" if 1oo2 evaluation	No	Channel / safe AS-i input slave
Discrepancy behavior	Supply "0" value[2)]	Supply "0" value	-	Channel / safe AS-i input slave
Discrepancy time infinite	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy time (ms)	0 ms … 60 000 ms	500 ms	No	Channel / safe AS-i input slave
Sequence monitoring	• Deactivated • In ascending order (input 1 before input 2 at HIGH state) • In descending order (input 2 before input 1 at HIGH state)	Deactivated	No	Channel / safe AS-i input slave

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Reintegration after discrepancy error	Test 0 signal necessary on both channels[2)]	Test 0 signal necessary on both channels	-	F-CM AS-i Safety ST
Configuration status	-	-	-	(read-only)

1) In increments of 10 ms

2) The setting cannot be changed.

Safe outputs

You can activate up to 16 safe AS-i switching groups Open the settings for each required switching group. Activate the output control and set the associated AS-i address.

Table 6- 5 Safe outputs: Switching group 0 to 15

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate output control	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
AS-i address	1 … 31		No	Channel / safe AS-i output slave
AS-i address switching output	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave
AS-i address error acknowledgement	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave
Configuration status	-	-	-	(read-only)

You will find additional information in the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

6.2 Explanation of the parameters

6.2.1 F-parameters

Specify F-destination address for F-I/O of the PROFIsafe address type 2

The F-destination address of F-I/O of the PROFIsafe address type 2 is automatically assigned for every F-CPU.

F-source address

With the parameter "Central F-source address" you specify the F-source address for the F-I/O of the PROFIsafe address type 2 assigned to this F-CPU. The F-source address must be unique throughout the network.

Note

A change to the parameter "Central F-source address" results in a modification to the safety program when it is recompiled. A new acceptance may therefore be required, as this centrally modifies the F-source address of all F-I/O devices of address type 2 retrospectively.

SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)

6.2.2 Potential group / AS-i network

Here, you set:

- The BaseUnit you are using.
- How the F-CM AS-i Safety ST I/O module is connected to the AS-i network.

The module can be connected to the AS-i cable by external wiring or automatically via the module plugged in on the left.

- Enable new AS-i network (light BaseUnit)
- Use AS-i network of the left module (dark BaseUnit)

BaseUnit with voltage supply

Enable new AS-i network (light BaseUnit)

Select this option if the module is plugged into a light BaseUnit.

Connect the module to the AS-i cable (ASI+ / ASI-) via the BaseUnit. The module is supplied with voltage from the AS-i cable. Connect the AS-i cable to an AS-i power supply unit or to a combination of a data decoupling unit and a suitable power supply unit.

There is no module-internal connection of the AS-i cable to the module plugged in on the left.

With TIA Portal or with STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (normally: CM AS-i Master ST).

WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

Use AS-i network of the left module (dark BaseUnit)

Select this option if the module is plugged into the dark BaseUnit.

The module inserted on the left must be a CM AS-i Master ST module (normal situation) or another F-CM AS-i Safety ST module (special case).

The module is connected to the AS-i cable of the module plugged in on the left and supplied with voltage via the module-internal connection.

The module-internal connection is designed only for supplying power to the F-CM AS-i Safety ST I/O module. If several dark BaseUnits are connected in series, a direct connection of the dark BaseUnits to the AS-i cable using external wiring is additionally recommended.

Supplying power to AS-i modules, e.g., AS-i slaves, via the terminals of the dark BaseUnit is not permitted.

With TIA Portal, the F-CM AS-i Safety ST module uses the same AS-Interface subnet as the module inserted on the left (normally: CM AS-i Master ST).

With STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (as a rule: CM AS-i Master ST).

WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

6.2.3 Module parameters - General

Behavior after channel faults

This parameter is permanently set to "Passivate the channel".

After channel faults have occurred, only the faulty PROFIsafe channels are passivated. The PROFIsafe channel corresponds to the safe input and output address in the process image.

6.2.4 Module parameters - Safe inputs

Configuration status

A valid evaluation is only possible if a compatible safe AS-i slave is actively operating on the network.
Input monitoring where there is a missing safe input or a missing AS-i slave causes a passivation of the input address. If no configuration of the slaves is saved in the STEP 7 project, the settings of the AS-i master must ensure that the connected compatible safe AS-i slave is actively operating, for example, using the "SET" button of the master.

Input monitoring activated

With activation of the input monitoring, you activate the corresponding AS-i slave as an input channel for signal processing in the safety program. The AS-i address must be assigned to a safe AS-i input slave.

When the input monitoring is activated, the value of the input channel is calculated based on the input states of the assigned safe AS-i input slave and the evaluation conditions specified by the parameter assignment. If a fault occurs, the substitute value "0" is transferred and the channel is passivated.

If input monitoring is deactivated, the substitute value "0" is transferred. The channel is not passivated.

If required, the AS-i slave can be monitored by another evaluation module, e.g., by another F-CM AS-i Safety ST module, the 3RK3 Modular Safety System. This applies both when input monitoring is deactivated and when it is activated.

Note

Call of the AS-i slave

The AS-i slave must be called by the AS-i master. Set up the configuration of the AS-i master in such a way that the communication of the AS-i master with the AS-i address functions properly.

Note

Slave profile

A safe AS-i input slave has the slave profile (IO.ID) = 0.B or 7.B.

I address

The input bit address of the input channel for the signal processing in the safety program is indicated here. It is calculated automatically from the start of the inputs entered on the "Addresses" tab.

Input delay

To suppress coupled-in interference or brief switching pulses, you can set an input delay for each AS-i slave. This will suppress interference pulses whose pulse time is less than the set input delay, in ms. The input delay applies to both channels of the channel pair of the AS-i slave.

Note

Time of fault suppression shortened by up to 75 ms

It can take 15 AS-i cycles until the valid code sequence is detected. As a result, the time of the fault suppression is shortened by up to 75 ms compared to the set value.

A long input delay suppresses longer interference pulses but results in a longer response time.

Range of values:	0 to 150 ms
Default	0 ms

The values 0, 50 to 150 ms can be selected in 10 ms increments.

The input delay time acts in addition to the system response time. Suppressed interference pulses are not visible in the safety program.

Evaluation of the sensors

This parameter specifies how the connected sensors are to be evaluated.

1oo1 evaluation

In 1oo1 evaluation, the sensor exists once and is connected to the first input of the safe AS-i slave via a single channel. You jumper the second input of the AS-i slave. Instead of the jumper, you can also connect another single-channel sensor to the second input. Only when both inputs supply an ON signal does the F-CM AS-i Safety ST module transfer the "1" value to the safety program (the two inputs are ANDed).

The individual states of the two inputs of the AS-i slave are not visible in the safety program.

A discrepancy analysis is not performed in 1oo1 evaluation.

1oo2 evaluation, equivalent

In 1oo2 (2v2) evaluation, equivalent, both inputs of the safe AS-i slave are occupied by one two-channel sensor or by two single-channel sensors. The two single-channel sensors then belong together functionally as a pair.

The input signals are compared internally for equivalence. The two inputs of the AS-i slave are combined to form a channel pair.

A discrepancy analysis is possible in 1oo2 evaluation, equivalent.

Discrepancy analysis

If you are using a two-channel sensor or two single-channel sensors that acquire the same physical process variable, the sensors will, for example, respond with a delay due to the limited accuracy of their arrangement to each other. For fail-safe inputs, the discrepancy analysis for equivalence is used to infer errors from the time characteristic of two signals of the same functionality. For two associated input signals, if different levels are detected after the input delay time has expired, the discrepancy analysis is started. A check is made to determine if the difference has disappeared after expiration of an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error.

Startup test

If the "Startup test" parameter is activated, after startup of the channel or after a cross-circuit error (code sequence error), the value transferred to the safety program is kept at the substitute value "0" until the connected sensor has been correctly actuated at least once. Afterwards, the value of the input channel is calculated according to the set functionality.

The actuation of the sensor is defined to mean that both inputs of the safe AS-i slave must supply an ON signal, e.g., both switching contacts of the sensor are closed. Then, they must supply an OFF signal, e.g., switching contacts open. Finally, an ON signal must be supplied again, e.g., switching contacts closed. During the sensor actuation phase, none of the following errors may occur:

- Discrepancy error
- Sequence error
- Cross-circuit error (code sequence error)

After reintegration is complete, you must perform a startup test. For this purpose, you actuate the sensor to be monitored once.

A discrepancy error or a sequence monitoring error does not trigger a new startup test.

Discrepancy monitoring

If the discrepancy monitoring is activated, a discrepancy analysis is performed. This is the normal setting for 1oo2 evaluation, equivalent, in order to achieve high error uncovering.

You can deactivate the discrepancy monitoring for special situations. This corresponds in principle to 1oo1 evaluation of sensors. Check whether the lower error uncovering is sufficient for the required safety level. You may possibly use a sensor with integrated error uncovering. If required, you can activate the sequence monitoring.

When 1oo2 evaluation of the sensors is set, discrepancies in signal states between input 1 and input 2 are monitored.

When discrepancy monitoring is activated, the discrepancy time starts to elapse as soon as a difference is detected between the signal on input 1 and the signal on input 2. If the set discrepancy time is exceeded and the difference continues to exist, a discrepancy error is triggered.

Before switch-on, the signal value 0 must be present at both inputs, even when a discrepancy error has not occurred or the discrepancy time has not been set to "infinite".

If the "Evaluation of the sensors" parameter has been assigned with 1oo1, discrepancy monitoring is not performed.

Discrepancy behavior

This parameter is permanently set to "Supply 0 value".

The discrepancy behavior determines the value that is made available to the safety program in the F-CPU during the discrepancy, i.e., while the discrepancy time is running.

After expiration of the set input delay time, once an "OFF" signal is detected at one of the two input channels of the channel pair involved, this parameter setting causes the value "0" to be provided to the safety program in the F-CPU. This setting does not affect the sensor-actuator response time as a result of the discrepancy time.

Discrepancy time infinite

If you activate "Discrepancy time infinite", the time period for the discrepancy analysis never expires. As a result, a time-related discrepancy error will not be detected.

Nevertheless, the following switch-on condition applies: After a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again.

If this condition is not satisfied, especially in the event of a single-channel switch-off (i.e., signal OFF at only one of the two input channels of the relevant channel pair) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) even though the time for the discrepancy analysis has not expired. In data record 202, the bit 0.2 "= 1" is set in the status of the input monitoring of AS-i address n.

A discrepancy error is only detected if both input channels of the affected channel pair have not received the "0" signal simultaneously.

If "Discrepancy time infinite" is deactivated, the discrepancy analysis uses the value set for the "Discrepancy time" parameter.

Discrepancy time

You can specify the discrepancy time in the range of 0 to 60 000 ms for each channel pair.

The following settings are required:

- "Sensor evaluation": 1oo2 evaluation, equivalent
- "Discrepancy monitoring": Active
- "Discrepancy time infinite": Deactivated

In most cases, the discrepancy time is started but does not completely elapse, because the signal differences are evened out again after a short time.

Select a large enough discrepancy time so that in error-free cases, the difference between the two signals always disappears before the discrepancy time expires.

If the input signals do not match after expiration of the assigned discrepancy time, e.g., due to a mechanical defect of the sensor or sensor wire break, a discrepancy error is detected.

When discrepancy time is running, the switch-on condition also applies that after a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again. If this condition is not satisfied, especially in the event of brief switch-off of a channel (due to signal OFF at only one of the two input channels) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) if the time for the discrepancy analysis has not expired.

A detected discrepancy error indicates to the user that the switch-on condition is not satisfied.

Assign a discrepancy time that is greater than the input delay time.

Sequence monitoring

Overview

The sequence monitoring monitors the sequence of the signals of the channel pair when there is a signal change OFF >>> ON at the inputs of the safe AS-i slave.

The following settings are possible:

- Deactivated: The sequence is not a condition that has to be satisfied for switching on the function output.
- Ascending order: Input 1 before input 2 at "HIGH" state
- Descending order: Input 2 before input 1 at "HIGH" state

If the sequence is violated, the "Sequence condition violated" error is detected. The value transferred to the safety program is kept at "0" until the "OFF" signal is read in at both input channels. Switch-on condition is, for example, both switching contacts of the sensor open. The inputs must be switched on one after the other in the assigned sequence and must not switch on simultaneously.

You can activate the sequence monitoring if 1oo2 evaluation, equivalent, is set for the sensor evaluation. In this case, the discrepancy monitoring can be activated or deactivated.

Deactivated

The sequence of the inputs is not monitored.

Ascending order: Input 1 before input 2 at "HIGH" state

For switch-on of the channel, input channel 1 must first read in and hold an "ON" signal followed by input channel 2.

When the channel is switched off, the sequence of the input channels is not monitored.

Descending order: Input 2 before input 1 at "HIGH" state

For switch-on of the channel, input channel 2 must first read in and hold an "ON" signal followed by input channel 1.

When the channel is switched off, the sequence of the input channels is not monitored.

Reintegration after discrepancy error

This parameter is permanently set to: "Test 0-signal necessary on both channels".

A discrepancy error is not considered to be rectified until an "OFF" signal is present again at both input channels. Reintegration of the PROFIsafe channel is then possible.

6.2.5 Module parameters - Safe outputs

Configuration status

For operation of the switching group the AS-i master must activate communication with the associated AS-i address of the control unit in the F-CM. For this reason the configuration of the AS-i network must include a virtual AS-i slave with the profile IO.ID.ID2 = 6.B.D and ID1 = 0. If the slaves are not configured, the AS-i master must be set such that the AS-i address of the control unit in the F-CM is actively operating, for example, using the "SET" button of the master while the F-CM module is being configured and connected to the AS-i master.

Activate output control

With this parameter, you activate the corresponding switching group and the associated AS-i address of the control unit in the F-CM AS-i Safety ST module.

You will find additional information in Section Operating principle of the safe AS-i outputs (Page 36), "Operating principle of the safe AS-i outputs."

When output control is activated, the control unit in the F-CM AS-i Safety ST module is switched on so that the F-CM AS-i Safety ST module generates an additional AS-i address on the AS-i Bus. The associated value is output from the safe process image via this AS-i address.

When output control is deactivated, the corresponding control unit in the F-CM AS-i Safety ST module is switched off, and an AS-i slave is not emulated on the AS-i bus.

AS-i address

Here, you set the AS-i address within the range of 1 to 31 that the F-CM AS-i Safety ST module is to use for control of a safe AS-i output.

WARNING

Uniqueness of the AS-i address on the AS-i bus

Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Note

Communication of the AS-i master with the AS-i address

The AS-i address of the control unit must be called by the AS-i master. Set up the communication of the AS-i master in such a way that communication with the AS-i address of the control unit functions properly.

Note

Slave profile of the control unit in the F-CM AS-i Safety ST module (control of a safe AS-i output)

The AS-i address of the control unit corresponds to a slave with slave profile (IO.ID.ID2) = 6.B.D and ID1 = 0.

Q address switching output

The output bit address is displayed here. It determines the switching state of the safe output (control signal F-OUT 1). Interconnect the "Q address switching output" in your safety program according to the required safety logic.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

Q address error acknowledgment

The output bit address that sends an acknowledgment signal to the safe output is displayed here.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

A positive edge (0 >>> 1) triggers the F-CM AS-i Safety ST module to first send the AUX1 auxiliary signal to the safe output followed by the AUX2 auxiliary signal. Another positive edge is necessary for sending another sequence of auxiliary signals.

The auxiliary signals are used, in general, for acknowledging an error state at the safe output. Refer to the AS-Interface (http://support.automation.siemens.com/WW/view/en/26250840/0/en) System Manual and the Operating Instructions of the safe output module (http://support.automation.siemens.com/WW/view/en/43666143/0/en) used to find out which functions the auxiliary signals are used for.

Note

"Q address error acknowledgment"

The "Q address error acknowledgment" does not trigger an error acknowledgment in the F-CM AS-i Safety ST module. Rather, as described above, it sends an acknowledgement signal to the safe output module on the AS-i bus.

6.3 Address space

6.3.1 Address assignment for user data and value status of the F-CM AS-i Safety ST module

Input and output address assignment

Of the assigned addresses of the F-CM AS-i Safety ST module, the user data occupy the following addresses in the F-CPU:

Table 6- 6 Input address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
x + 0	DI0.7 AS-i address 7	DI0.6 AS-i address 6	DI0.5 AS-i address 5	DI0.4 AS-i address 4	DI0.3 AS-i address 3	DI0.2 AS-i address 2	DI0.1 AS-i address 1	DI0.0 Reserved

x + 10	Reserved							
...								
x + 15	Reserved							

X = Module start address

NOTICE
Process value "0" is transmitted as a non-safety related value Based on the transfer principle of the code sequences, the process value "1" is transferred via AS-Interface as a safe value, so that the enable for switching on a machine can be issued in a safety-related manner. If an error occurs during transfer of the value "1", this error is detected and substitute value "0" is used. The process value "0" is transferred via AS-interface as an unsafe value. That is, a faulty transmission of the "0" value cannot be detected. The "0" value must therefore not be used as safety-related information that initiates a dangerous action (e.g. feedback "0" of a switch position).

Table 6- 7 Output address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**

x + 3	Error acknowledgment for DQ1.7	Error acknowledgment for DQ1.6	Error acknowledgment for D1.5	Error acknowledgment for DQ1.4	Error acknowledgment for DQ1.3	Error acknowledgment for DQ1.2	Error acknowledgment for DQ1.1	Error acknowledgment for DQ1.0
x + 4	Reserved							
...								
x + 7	Reserved							

X = Module start address

The error acknowledgment bit initiates the AUX1 and AUX2 signals one after the other.

Note

Use of the error acknowledgment bit of a safe AS-i output

The values in the PROFIsafe process output image have Safety Integrity Level SIL 3. In addition to the switching states, a control unit can send out two different auxiliary signals to a safe AS-i output: AUX1 and AUX2. These auxiliary signals are not safety-related signals. You can use the auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, these error acknowledgment bits are mapped in the safe process output image. If error acknowledgment bits are sent to a safe AS-i output, the *STEP 7* or SIMATIC Manager configuration tool is unable to detect that the error acknowledgment bits are not safe. This means: No warnings or faults will be output for it when the safety application is generated. The user is responsible for the correct processing of these signals in the safety application.

6.3.2 Value status

Properties

For each input signal and output signal, the F-CM AS-i Safety ST module provides information about the signal's validity, i.e., the "value status". Like the input signal, the value status is stored in the process image.

Value status for the digital input and output modules

The value status is binary supplementary information of a digital input or output signal. It is entered in the process input image simultaneously with the process signal. The value status provides information regarding the validity of the input or output signal.

The value status is influenced by the following:

- Code sequence errors, e.g, caused by a permanent fault on the AS-i bus, wiring error, etc.
- Missing safe AS-i input slaves
- Channel faults
- Replacement of a safe AS-i slave by a non-safe AS-i slave
- Discrepancy error
- Sequence error

Value status = 1: A valid process value is output for the channel.

Value status = 0: A substitute value is output for the channel or the channel is deactivated.

Assignment of the inputs and outputs to the value status in the process image

A value status is assigned to each channel of the F-CM AS-i Safety ST module in the process input image.

Additional information

A detailed description of the evaluation and processing of the value status can be found in the Programming and Operating Manual SIMATIC Safety - Programming and Configuring (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

See also

Address assignment for user data and value status of the F-CM AS-i Safety ST module (Page 54)

6.4 Data records for diagnostics

For diagnostic purposes, you can read out the following data records via your user program. In firmware V1.0.1 or higher the diagnostics data record 206 is available. This data record contains a summary of the information that is relevant for a comprehensive diagnosis via your user program.

Note

Use of the DS 206 for diagnostic purposes is recommended (firmware V1.0.1 or higher).

The data records 92, 202 and 204 are required for the diagnosis via the user program for a module with firmware V1.0.0. For reasons of compatibility, these data records also remain available in firmware V1.0.1 or higher.

See also

Firmware update (Page 24)

6.4.1 DS 92 Device-specific diagnostics

Meaning

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 92 contains device-specific messages and information on the device function states of the F-CM AS-i Safety ST module.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.0:

- The "Error code" column in the table below indicates which events are relevant here. If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- The text inside parentheses after the error code corresponds to the error text that is specified for the given error code according to the PROFIBUS Standard. Several error codes can be output. If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms in firmware V1.0.1 or higher are described in Section "DS 206 Diagnostic Data Record (Page 69)".

Table 6- 8 DS 92 device-specific diagnostics

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
0.0 … 0.7	Reserved	-	-
1.0 … 1.7	Reserved	-	-
2.0 … 2.7	Reserved	-	-

5.0 … 5.7	Reserved	-	-
6.0 … 6.7	Reserved	-	-
7.0 … 7.7	Reserved	-	-
8.0 … 8.7	Reserved	-	-
9.0 … 9.7	Reserved	-	-
10.0 … 10.7	Reserved	-	-
11.0 … 11.7	Reserved	-	-
12.0	Serious device fault	9 ("Error")	See Section Error statuses (Page 17)
12.1	Group error	24 ("Switch-off")	At least one error is present.
12.2	AS-i communication error	19 ("Communication error")	Failure of an AS-i slave configured in the F-CM AS-i Safety ST module or code sequence error
12.3	Group_Message_Device	-	At least one message about the device state is present, e.g., configuration missing.
12.4	Group_Message_Application	-	At least one message about the application state is present, e.g., startup test necessary, safety sensor tripped (Emergency Stop, protective door, etc.).

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
12.5 … 12.7	Reserved	-	-
13.0	Reserved	-	-
13.1	Device fault	24 ("Switch-off") 27 ("Unclear error")	See Section Error statuses (Page 17)
13.2	Parameter assignment error	24 ("Switch-off") 16 ("Parameter assignment error")	Parameter not permitted in configuration.
13.3	Process signal error	24 ("Switch-off") 27 ("Unclear error")	See Section Error statuses (Page 17)
13.4	Code sequence error	24 ("Switch-off") 26 ("External error")	A code sequence error can occur, for example, in case of: • Cross-circuit at the inputs • EMC problem Bit 18.0 is additionally set.
13.5	Logic error	24 ("Switch-off") 25 ("Safety-related switch-off")	A logic error can occur, for example, in case of: • Discrepancy error • Sequence error Bit 18.0 is additionally set.
13.6 … 13.7	Reserved	-	-
14.0	Downloading of module parameters is not yet complete	-	-
14.1	Reserved	-	-
14.2	Cyclic data exchange is active	-	-
14.3 … 14.7	Reserved	-	-
15 … 17	Reserved	-	-
18.0	Group error code sequence_Logic	24 ("Switch-off")	A code sequence error or logic error is present for at least one safe input. Bytes 90 … 91 contain the AS-i address of the first safe input for which the error is present.
18.1	Reserved	-	-
18.2	Group_Message_Input_Triggered	-	At least one monitored safe input has value status "0". Possible cause: • Startup test necessary • Safety sensor triggered Bytes 94 … 95 contain the AS-i address of the first safe input for which the value status "0" is present.
18.3 … 18.7	Reserved	-	-

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
19 … 21	Reserved	-	-
22.0 … 22.1	Reserved	-	-
22.2	Timeout	24 ("Switch-off") 8 ("Lower limit undershot")	An internal data processing error has occurred. The F-CM AS-i Safety ST module signals a device fault. Bit 13.2 is additionally set.
22.3 … 22.6	Reserved	-	-
22.7	AS-i slave failure	26 ("External error")	No communication is detected in the case of at least one monitored safe input slave or control unit for a safe AS-i output.
23.0 … 23.7	Reserved	-	-
24 … 25	Reserved	-	-
26.0 … 26.3	Reserved	-	-
26.4	Coding element error	24 ("Switch-off") 27 ("Unclear error")	A data error occurred or coding element is missing when a coding element is accessed. The F-CM AS-i Safety ST module signals a device fault.
26.5 … 26.7	Reserved	-	-
27 … 28	Reserved	-	-
29.0 … 29.7	Reserved	-	-
30 … 33	Reserved	-	-
34 … 35	Parameter assignment error object	-	Object number for which a parameter assignment error was detected. 0 = No error 1 … 31 = The number corresponds to the AS-i address of a safe input. 32 … 47 = A number 32 … 47 corresponds to the number of the switching group 0 … 15
36 … 37	Reserved	-	-
38.0	AS-i bus error	26 ("External error")	The AS-i data communication is interrupted, substitute values in the interconnection logic

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
38.1	AS-i parameter assignment error	26 ("External error")	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 55. If an AS-i address of an output switching group is not included by the AS-i master in the data communication, this bit is set. A substitute value will be used instead.
38.2	AS-i configuration error	-	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 39. This bit is set when SET ≠ ACTUAL on the AS-i bus, when, for example, an AS-i slave is missing. A substitute value will be used instead.
38.3	AS-i voltage too low	-	If the AS-i voltage is too low during operation, a serious device fault results.
38.4	Reserved	-	-
38.5	AS-i communication okay	-	-
38.6 … 38.7	Reserved	-	-
39	Incorrect AS-i address	-	AS-i address of the AS-i slave that the device has identified as faulty: 0 = No error 1 … 31 = AS-i slave address
40 … 47	Reserved	-	-
48.0	ASIsafe safe input active	-	As soon as safe AS-i slaves become monitored, this bit is set.
48.1	ASIsafe safe output active	-	If safe AS-i outputs are controlled, this bit is set.
48.2 … 48.7	Reserved	-	-
49.0	ASIsafe code sequences missing	26 ("External error")	Safe input In addition, the AS-i address is entered in byte 50.
49.1	ASIsafe code sequences duplicated	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.2	ASIsafe code sequences new	-	New code sequences are available for transfer. In addition, the AS-i address is entered in byte 50.
49.3	ASIsafe code sequences known	-	The code sequences are taught and saved in the coding element.
49.4	ASIsafe code sequence error	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
49.5	ASIsafe code sequence teaching active	-	The code sequences are being collected. When the code sequences for all safe AS-i input slaves detected on the bus are taught, this bit is reset.
49.6 … 49.7	Reserved	-	-
50	Code sequence error object	-	This bit contains the lowest AS-i address for which a code sequence problem has occurred. Code sequence problems are: • 49.0 ASIsafe code sequences missing (Prio 3) • 49.1 ASIsafe code sequences duplicated (Prio 1) • 49.2 ASIsafe code sequences new (Prio 4) • 49.4 ASIsafe code sequence error (Prio 2)
51 … 54	Reserved	-	-
55	Switching group error object	-	This byte contains the lowest AS-i address that is configured for an output switching group but is not addressed by the master. Correct the slave configuration of the master.
56 … 61	Reserved	-	-
62.0	F_Dest_Adr does not match	24 ("Switch-off") 19 ("Communication error") 64 ("Different destination address")	-
62.1	F_Dest_Adr invalid	24 ("Switch-off") 19 ("Communication error") 65 ("Invalid destination address")	The coding element does not contain an F-address.
62.2	F_Source_Adr invalid	24 ("Switch-off") 19 ("Communication error") 66 ("Invalid source address")	-
62.3	F_WD-Time_0	24 ("Switch-off") 19 ("Communication error") 67 ("Watchdog time is 0 ms")	F_WD-Time value is 0 ms.
62.4	F_SIL value	24 ("Switch-off") 19 ("Communication error") 68 ("Parameter 'F_SIL' exceeds the appl. SIL")	F_SIL value exceeds SIL value of the specified device application

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
62.5	F_CRC_Length	24 ("Switch-off") 19 ("Communication error") 69 ("Parameter 'F_CRC_Length' does not match …")	F_CRC_Length value does not match the actual CRC length.
62.6	F_Par_Version	24 ("Switch-off") 19 ("Communication error") 70 ("Incorrect F-parameter version or F_Block_ID")	F_Par_Version does not match the F-parameter set or F-Block_ID is invalid Block_ID
62.7	CRC1 error	24 ("Switch-off") 19 ("Communication error") 71 ("CRC1 error")	-
63.0 … 63.2	Reserved	-	-
63.3	iPAR_CRC error	24 ("Switch-off") 19 ("Communication error") 75 ("Inconsistent I-parameters [iParCRC error]")	-
63.4	Operator acknowledge requested	-	Channel is ready for reintegration
63.5 … 63.7	Reserved	-	-
64 … 65	Reserved	-	-
70 … 89	Reserved	-	-
90 … 91	Object_Code_Sequence_Logic	-	AS-i address of the first safe AS-i slave for which a code sequence error or logic error i present. See also bit 18.0. 0 = No error 0 = No error 1 … 31 = AS-i slave address ≥32 = Internal error numbers
92 … 93	Reserved	-	-
94 … 95	Object_input_triggered	-	AS-i address of the first safe AS-i slave for which the input_triggered message is present. See also bit 18.2. 0 = No error 1 … 31 = AS-i slave address ≥32 = Internal error numbers
96 … 199	Reserved	-	-

6.4.2 DS 202 Status safe inputs/outputs

Description

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

DS 202 contains non-safety-related status information for the safe input slaves and for the control of the safe output slaves.

The status information for the control of the safe output slaves relates either to the control units activated in the F-CM AS-i Safety ST module or to data of external control units for safe output slaves that is also read on the AS-i bus.

Table 6- 9 DS 202 Status safe inputs/safe outputs

Byte	Description
0 … 1	Reserved
2 … 5	Status input monitoring AS-i address 1
6 … 9	Status input monitoring AS-i address 2
10 … 13	Status input monitoring AS-i address 3
14 … 17	Status input monitoring AS-i address 4
18 … 21	Status input monitoring AS-i address 5
22 … 25	Status input monitoring AS-i address 6
26 … 29	Status input monitoring AS-i address 7
30 … 33	Status input monitoring AS-i address 8
34 … 37	Status input monitoring AS-i address 9
38 … 41	Status input monitoring AS-i address 10
42 … 45	Status input monitoring AS-i address 11
46 … 49	Status input monitoring AS-i address 12
50 … 53	Status input monitoring AS-i address 13
54 … 57	Status input monitoring AS-i address 14
58 … 61	Status input monitoring AS-i address 15
62 … 65	Status input monitoring AS-i address 16
66 … 69	Status input monitoring AS-i address 17
70 … 73	Status input monitoring AS-i address 18
74 … 77	Status input monitoring AS-i address 19
78 … 81	Status input monitoring AS-i address 20
82 … 85	Status input monitoring AS-i address 21
86 … 89	Status input monitoring AS-i address 22
90 … 93	Status input monitoring AS-i address 23
94 … 97	Status input monitoring AS-i address 24
98 … 101	Status input monitoring AS-i address 25

Byte	Description
102 … 105	Status input monitoring AS-i address 26
106 … 109	Status input monitoring AS-i address 27
110 … 113	Status input monitoring AS-i address 28
114 … 117	Status input monitoring AS-i address 29
118 … 121	Status input monitoring AS-i address 30
122 … 125	Status input monitoring AS-i address 31
126 … 129	Status output control switching group 0
130 … 133	Status output control switching group 1
134 … 137	Status output control switching group 2
138 … 141	Status output control switching group 3
142 … 145	Status output control switching group 4
146 … 149	Status output control switching group 5
150 … 153	Status output control switching group 6
154 … 157	Status output control switching group 7
158 … 161	Status output control switching group 8
162 … 165	Status output control switching group 9
166 … 169	Status output control switching group 10
170 … 173	Status output control switching group 11
174 … 177	Status output control switching group 12
178 … 181	Status output control switching group 13
182 … 185	Status output control switching group 14
186 … 189	Status output control switching group 15
190 … 199	Reserved

Table 6- 10 Input monitoring: Structure of the status information in DS 202

Byte.Bit	Message bit		Remark
0.0	Value = 1:	Startup test necessary	-
0.1	Value = 1:	Sequence condition violated	-
0.2	Value = 1:	Discrepancy condition violated	-
0.3	Value = 1:	Safety sensor triggered	-
0.4 … 0.7	Reserved		-
1.0	Value = 1:	Code sequence error	Cross-circuit at input
1.1 … 1.7	Reserved		-
2.0	Reserved		-
2.1	Value = 1:	Switch-on condition not met	-
2.2 … 2.7	Reserved		-
3.0 … 3.7	Reserved		

Table 6- 11 Output control: Structure of the status information in DS 202

Byte.Bit	Message bit	Remark
0.0	Output active	The control unit of the switching group sends the "F-OUT 1" control signal.
0.1 … 0.7	Reserved	-
1.0 … 1.3	Reserved	-
1.4	Auxiliary signal AUX1 sent	Auxiliary control signal AUX1 was transferred with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.5	Auxiliary signal AUX2 sent	Auxiliary control signal AUX2 was transmitted with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.6 … 1.7	Reserved	-
2.0 … 2.7	Reserved	-
3.0 … 3.7	Reserved	-

6.4.3 DS 204 Status code sequences

Description

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

The DS 204 contains the statuses of all AS-i slaves that are known to the F-CM AS-i Safety ST module.

Table 6- 12 DS 204: Status code sequence for an AS-i address in DS 204

Byte	Description
0 … 13	Reserved
14 … 17	Status code sequence for AS-i address 1
18 … 21	Status code sequence for AS-i address 2
22 … 25	Status code sequence for AS-i address 3
26 … 29	Status code sequence for AS-i address 4
30 … 33	Status code sequence for AS-i address 5
34 … 37	Status code sequence for AS-i address 6
38 … 41	Status code sequence for AS-i address 7
42 … 45	Status code sequence for AS-i address 8
46 … 49	Status code sequence for AS-i address 9
50 … 53	Status code sequence for AS-i address 10
54 … 57	Status code sequence for AS-i address 11

Byte	Description
58 … 61	Status code sequence for AS-i address 12
62 … 65	Status code sequence for AS-i address 13
66 … 69	Status code sequence for AS-i address 14
70 … 73	Status code sequence for AS-i address 15
74 … 77	Status code sequence for AS-i address 16
78 … 81	Status code sequence for AS-i address 17
82 … 85	Status code sequence for AS-i address 18
86 … 90	Status code sequence for AS-i address 19
90 … 91	Status code sequence for AS-i address 20
94 … 97	Status code sequence for AS-i address 21
98 … 101	Status code sequence for AS-i address 22
102 … 105	Status code sequence for AS-i address 23
106 … 109	Status code sequence for AS-i address 24
110 … 113	Status code sequence for AS-i address 25
114 … 117	Status code sequence for AS-i address 26
118 … 121	Status code sequence for AS-i address 27
122 … 125	Status code sequence for AS-i address 28
126 … 129	Status code sequence for AS-i address 29
130 … 133	Status code sequence for AS-i address 30
134 … 137	Status code sequence for AS-i address 31
138 … 199	Reserved

Table 6- 13 Assignment of the bits of an AS-i address in the "Status code sequence" data structure

Byte	Bit	Description	Setting	Meaning of the setting
0	0 … 2	Status of the slave	= 0	No slave present
			= 1	Standard slave (not safety-related)
			= 2	Safe slave, but the code sequence type safe input/safe output is not yet decoded.
			= 3	Code sequence type safe output
			= 4	Code sequence type safe input
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 6	Status of parameter assignment	= 0	No safe AS-i output slave or AS-i input slave is configured.
			= 1	Reserved
			= 2	Safe AS-i slave is configured The detected slave corresponds to the activation.
			= 3	Safe AS-i slave is configured The detected slave does not correspond to the activation.
			= 4 … 7	Reserved
	7	-	Reserved	-
1	0 … 2	Status of the code sequence	= 0	Code sequence irrelevant: No activation or no slave is present.
			= 1	Code sequence missing: No code sequence is taught or transferred.
			= 2	Code sequence duplicated: At least one other slave has the same code sequence.
			= 3	Code sequence new: The taught code sequence does not correspond to the transferred code sequence.
			= 4	Code sequence known: The taught code sequence does not correspond to the transferred code sequence.
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 5	Status of the safe input 1	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.
	6 … 7	Status of the safe input 2	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.

Byte	Bit	Description	Setting	Meaning of the setting
2	0 … 1	Status of the "F-OUT 1" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	2 … 3	Status of the "F-OUT 2" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	4 … 5	Status of the "F-OUT 3" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	6 … 7	Status of the "F-OUT 4" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
3	0 … 1	Status of the auxiliary signal 1	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	2 … 3	Status of the auxiliary signal 2	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	4 … 7	-	Reserved = 0	-

6.4.4 DS 206 Diagnostic data record

Meaning

Note

Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 206 contains a summary of the information that is relevant for a comprehensive diagnosis of the F-CM AS-i Safety ST module via your user program.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.1 or higher:

- The "Error code" column in the table below indicates which events are relevant here.
- If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms for firmware V1.0.0 are described in Section "DS 92 Device-specific diagnosis (Page 57)".

Table 6- 14 DS 206 Diagnosis

Byte.Bit	**Description** In the case of binary values, the description declares the status "1"	**FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm**	**Remark**
0	Version High	-	-
1	Version Low	-	-
2.0	Overtemperature	1048	Maximum operating temperature exceeded
2.1	Undertemperature	786	Ambient temperature too low
2.2	Incorrect parameter value	16	Configuration data contains errors
2.3	Incorrect or inconsistent firmware	283	Firmware is faulty Firmware update necessary
2.4	Supply voltage too high	1038	AS-i voltage too high
2.5	Supply voltage too low	1039	AS-i voltage too low
2.6	Program cycle time exceeded	259	Internal cycle time exceeded
2.7	Device fault	1059	Self-test has determined a device fault. For details, see further error messages.
3.0	Serious device fault	9	Serious device fault. No communication possible
3.1	Teaching necessary	1055	New code tables are available for transfer.
3.2	Normal operation	-	Cyclic I/O data exchange active
3.3	Startup	-	Parameters are loaded No cyclic I/O data exchange
3.4	Serious device fault	-	Serious device fault. No communication possible
3.5	I/O device signal error	-	One or more channels are passivated
3.6	Code sequence cannot be read correctly	-	A code sequence is non-existent or incomplete
3.7	Reintegration necessary	-	Error is cleared, but at least one channel is still passivated
4.0	Access to device settings	-	Assignment of the F-address Acceptance of the code sequences Firmware update

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
4.1	ASIsafe code table teaching active	-	Teach LED flashes yellow; code sequences are collected. Is reset when the code tables for all safe AS-i input slaves detected on the bus have been taught.
4.2	Diagnostic memory overflow	33	Too many simultaneous error messages
4.3	Change of parameters not permissible	-	Modification of parameter data is rejected in normal mode
4.4 ... 4.7	Reserved	-	-
5.0	Status LED flashes green	-	-
5.1	Status LED lit green	-	-
5.2	Error LED flashes red	-	-
5.3	CFG LED flashes red	-	-
5.4	PSF LED flashes red	-	-
5.5	Teach LED flashes yellow	-	-
5.6	Teach LED lit yellow	-	-
5.7	ADDR LED flashes green	-	-
6.0	No access possible to the retentive storage of the F-address	781	The coding element (type H) in the BaseUnit is missing or there is an access error
6.1	Different destination address (F_Dest_Add)	64	The PROFIsafe driver has detected a different F-destination address.
6.2	Invalid target address (F_Dest_Add)	65	The PROFIsafe driver has detected an inadmissible F-destination address.
6.3	Invalid source address (F_Source_Add)	66	The PROFIsafe driver has detected an inadmissible F-source address.
6.4	Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67	The PROFIsafe driver has detected an inadmissible watchdog time.
6.5	Parameter "F_SIL" exceeds the application-specific SIL	68	The PROFIsafe driver has detected a discrepancy between the communication SIL setting and the application SIL setting.
6.6	Parameter "F_CRC_Length" does not match the generation	69	The PROFIsafe driver has detected a discrepancy in the CRC length.
6.7	Incorrect F-parameter version or F_Block_ID	70	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.
7.0	CRC1 error	71	The PROFIsafe driver has detected inconsistent F-parameters.
7.1	Inconsistent i-parameters (iParCRC error)	75	The PROFIsafe driver has detected inconsistent i-parameters.
7.2	PROFIsafe communication error (timeout)	92	
7.3	PROFIsafe communication error (CRC)	F93	

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
7.4	PROFIsafe address assignment error	F94	Coding element contains inadmissible data
7.5 ... 7.7	Reserved	-	-
8	Configured AS-i address for output switching group 0	-	-
9	Configured AS-i address for output switching group 1	-	-
10	Configured AS-i address for output switching group 2	-	-
11	Configured AS-i address for output switching group 3	-	-

Table 6- 15 Status AS-i addresses: Structure of the status information

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0.0	Reserved	-	-
0.1	Discrepancy error, channel status 0/1	1041	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".
0.2	Discrepancy error, channel status 1/0	1042	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.3 ... 0.4	Reserved	-	-
0.5	Sequence error, channel status 0/1	1045	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0.6	Sequence error, channel status 1/0	1046	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.7	Sequence error, channel status 1/1	1047	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "1".
1.0	Input slave missing or of the incorrect type	1050	-
1.1	Control unit of the output switching group not in cyclic data exchange	1051	The AS-i master does not address the configured AS-i address of the output switching group.
1.2	Code sequence error (systematic fault)	1054	Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the safe input module.
1.3	Code sequence missing in the memory of the F-CM	1056	-
1.4	ASIsafe code sequences duplicated	1057	Identical code sequence occurs several times
1.5	Sporadic code sequence error	1058	Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
1.6 ... 1.7	Reserved	-	-
2.0	Safety sensor triggered	-	-
2.1	Switch-on condition not met		The safe input value has been reset to the status "0"
2.2	Startup test necessary	-	Test of the input is necessary: Both inputs of the channel pair must assume the status "0".
2.3	Status of process image (user data)	-	-
2.4	Value status	-	Value status = 1: A valid process value is output for the channel. Value status = 0: A substitute value is output for the channel (error on channel or the channel is deactivated).
2.5... 2.7	Reserved	-	-
3.0	Safe AS-i input slave configured	-	-
3.1	Safe AS-i output slave configured	-	-
3.2	Unsafe slave detected	-	-
3.3	Safe slave detected, type unknown	-	-
3.4	Safe slave detected, type input slave	-	-
3.5	Safe slave detected, type output slave	-	-
3.6	Slave is located in cyclic data exchange	-	-
3.7	Reserved	-	-

Code sequences

7

The principle of the ASIsafe code sequences is briefly explained in Section Safety-related communication with AS-Interface (Page 35).

The F-CM AS-i Safety ST module manages the code sequences of the safe AS-i slaves in two steps. First, the F-CM AS-i Safety ST module reads all code sequences on the AS-i bus and checks whether the respective code sequence is plausible. This operation is referred to as "teaching the code sequences". The code sequences taught in this way are in volatile memory. The taught code sequences are transferred to the non-volatile memory after a request by the user.

Initial commissioning

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

Replacement of a safe AS-i input slave

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

For the transfer of the code sequences to the non-volatile memory, you can open the "Teach ASIsafe" dialog by pressing the "Teach ..." button.

Alternatively, the transfer is also possible by pressing the optional "TEACH" button (at least 3 s).

Replacement of the F-CM AS-i Safety ST module

The non-volatile memory is located in the BaseUnit. The transferred code sequences are retained in this memory after replacement of the F-CM AS-i Safety ST module.

Below is a description of the options offered by the F-CM AS-i Safety ST module for transferring code sequences.

See also

Connection (Page 27)

7.1 Transferring code sequences via STEP 7 online access

When code sequence are managed via *STEP 7* online access, you have the option of monitoring the status of the existing code sequences in a graphic overview. In particular, the graphic overview offers advantages for initial commissioning. In addition, you can use the graphic overview for transferring the code sequences of replaced slaves during operation. You can open the graphic overview for diagnostic purposes without changing the saved code sequences. The transfer of taught code sequences is possible but not mandatory.

In order to open this dialog, there must be an online connection to the controller or to the F-CM AS-i Safety ST module. Load the hardware configuration into the modules of the controller before teaching the code sequences so that the online configuration of the F-CM AS-i Safety ST module matches the offline configuration.

7.1.1 "Teach ASIsafe code sequences" dialog

The "Teach ASIsafe code sequences" dialog contains an overview of the code sequences of the existing safety-related AS-i slaves. In this dialog, you start the transfer of the code sequences read in on the AS-i bus into the memory of the F-CM AS-i Safety ST module.

The "Teach ASIsafe code sequences" dialog does not make any changes to the module configuration. You can open the dialog for information purposes during operation. The information displayed in the dialog are obtained online from the F-CM AS-i Safety ST module. There is no comparison with the offline configuration in this case.

Within the "AS-i addresses 0…15" and "AS-i adresses 16…31", you see the following information for each AS-i address:

- Slave status
- Code sequence
- F-IN 1 … 2
- F-OUT 1 ... 4

For the AS-i address 0, only information about the slave status can be displayed because a slave with the address 0 does not exchange cyclic input/output data.

Below this information you see:

- The "Transfer taught code sequences" button
- The "Progress of teaching operation" display

By double-clicking the "Close" button, you can exit the dialog at any time. If the button is actuated, the data will not be changed. If the code sequences have not been transferred or have only been partially transferred, a corresponding notice appears.

"Slave Status" column

The "Slave status" column shows the following information about the AS-i address via a color code:

Gray	The address does not exist on the AS-i bus. It is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated)
Green (without check mark)	The address belongs to a slave that exists on the AS-i bus. However, the slave is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated). The slave on the AS-i bus is a safe slave or a standard slave. It is available for use by the AS-i master or another module.
Green (with check mark)	The address is present on the AS-i bus and corresponds to the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated).
Yellow	An error has been detected: The address is present on the AS-i bus but does not correspond to the configuration of the F-CM AS-i Safety ST module (input monitoring control or output monitoring control is activated). Check the slave. Replace the slave with the required slave or change the configuration.
Red	An error has been detected: The address is not present on the AS-i bus but is needed in the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated). • Check whether the slave exists on the AS-i bus and has been included in the communication by the AS-i master. • Check whether the slave is contained in the configuration of the AS-i master. Correct the configuration of the AS-i bus, if required.

"Code sequence" column

The "Code sequence" column shows the following information about the AS-i address via a color code:

Gray	No code sequence is needed for the address.
Green (without check mark)	A code sequence was taught but not transferred to the memory. Start the transfer of the code sequence by double-clicking the "Transfer taught code sequences" button.
Green (with check mark)	The code sequence was transferred to the non-volatile memory. Note: This status is also displayed when the output control is activated for this address. The code sequences for safe outputs are automatically predefined in the F-CM AS-i Safety ST module. They are not transferred to the non-volatile memory of the code sequences.
Yellow	An error has been detected: A code sequence was taught that is already being used by another slave. The code sequence cannot be used. Replace the slave with a different slave.
Red	Warning or error: The address is sending an incomplete or invalid code sequence. Check whether both inputs of the safe input slave are assigned with the "ON" signal. If required, actuate the associated safety contacts. The contacts must be closed. • Check whether a cross-circuit exists at the inputs. If necessary, correct the wiring of the inputs.

"F-IN 1 ... 2" column

The "F-IN 1 ... 2" column shows the following information about the AS-i address via a color code:

The numbers 1 to 2 designate the number of the input channel.

Gray	The input channel is not present. A safe input slave was not detected at the address.
Green	The input channel shows the value 1 ("ON" status).
White	The input channel shows the value 0 ("OFF" status).
Yellow	The input channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the input channel cannot be read in. Substitute value 0 is used.

"F-OUT 1 ... 4" column

The "F-OUT 1 ... 4" column shows the following information about the AS-i address via a color code:

The numbers 1 to 4 designate the number of the output channel.

Gray	The output channel is not present. A safe output channel was not detected at the address.
Green	The output channel shows the value 1 ("ON" status).
White	The output channel shows the value 0 ("OFF" status).
Yellow	The output channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the output channel cannot be read in.

If the output control is activated for the address, the F-CM AS-i Safety ST module can control the status for F-OUT 1. The F-CM AS-i Safety ST module cannot control F-OUT 2 … 4. The value 0 is output here.

If an external control unit uses the output address, the dialog shows the statuses for F-OUT 1 … 4 read in on the AS-i bus.

7.1.2 Transferring taught code sequences

In order for the input data of a safe AS-i input slave to be evaluated and made available to the safety program, the taught code sequences must be transferred to the non-volatile memory.

To do so, click the "Transfer taught code sequences..." button.

A dialog opens prompting you whether the code sequences are to be transferred. With "Yes" you confirm that you are addressing the correct module. For checking purposes, the "ADDR" LED flashes green on the front of the F-CM AS-i Safety ST module The code sequences are transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

With "No" you cancel the prompt without transferring the code sequence.

WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.

Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

The "Transfer taught code sequences" button is deactivated when all taught code sequences have already been transferred to the non-volatile memory.

7.1.3 "Progress of teaching operation" display

You can track the progress of the teaching operation.

Progress bar "Teaching in progress":

If at least one safe slave is detected on the AS-i bus whose code sequence has not yet been taught an active progress bar and the text "Teaching in progress" is displayed. Check the displays in the "Code sequences" column and ensure that the safe slaves send their code sequences.

For further information, refer to the "'Code sequence' column".

Taught slaves:

The "Taught slaves" output field shows the number of already transferred code sequences in relation to the number of code sequences that must still be transferred. You will additionally see the numerical ratio as a percentage. When 100% is indicated, all code sequences have been transferred to the non-volatile memory.

You will find additional information in the section "Accept taught code sequences".

7.2 Transferring code sequences with the "TEACH" button.

The use of the "TEACH" button provides an easy way of transferring taught code sequences.

The "TEACH" button can be used, for example, to transfer code sequences of replaced modules during operation. However, it is also suitable for initial commissioning.

To learn how to connect the button to the BaseUnit, refer to Section "Connecting". You can track the progress of the code sequence transfer via the LEDs.

Press the "TEACH" button for at least 3 s. This action causes all currently taught code sequences that are unique and consistent to be transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

⚠ WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.

Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

When the transfer of the code sequences has been ended successfully, the "TEACH" LED goes out and you can release the "TEACH" button.

If you press the "TEACH" button before all code sequences are taught, the code sequences received up to then will be transferred.

7.3 Final steps

7.3.1 Reintegrating passivated input channels

The input channels of the F-CM AS-i Safety ST module for which no valid code sequences are saved supply the substitute value "0" and are passivated.

After the transfer of the code sequences, the passivated channels must be reintegrated so that the application can work with the real process values.

The procedure for this can be found in the following Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

After transferring the code sequences, check the safety equipment for proper functioning.

Alarm, fault, and system events

8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the F-CM AS-i Safety ST module:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Diagnostic buffer
- Alarm messages in user program

See also

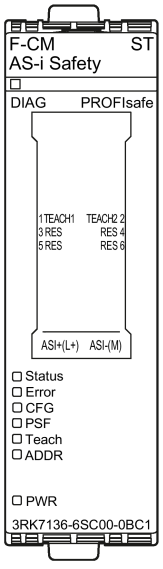
Meaning of the LEDs (Page 85)

8.2 LED statuses

8.2.1 Arrangement of the LEDs on the F-CM AS-i Safety ST

Introduction

LEDs on the front plate of the respective module display module-internal and module-external faults. The LEDs and their evaluation are described in the manuals for the relevant modules of the SIMATIC devices.



DIAG	Diagnosis
STATUS	Operating state of the module
Error	Operating state of the module
CFG	Fault on the AS-i bus
PSF	Process signal error, e.g.,channel fault on AS-i-F input slave
Teach	Teaching: Teaching of code sequences
ADDR	Addressing of the F-CM AS-i Safety ST module. F-addressing and teaching. The LED indicates whether the module is conducting safety-relevant communication with the software tool.
PWR	Supply voltage

Figure 8-1 LEDs of F-CM AS-i Safety ST

8.2.2 Meaning of the LEDs

The "F-CM AS-i Safety ST" module has 8 LEDs on the front:

LED "DIAG"

The "DIAG" LED displays the general status of the ET 200SP module

Table 8- 1 Meaning of the "DIAG" LED

"DIAG"	Meaning
☐ Off	The voltage is not OK.
✳ Green flashes	The F-CM AS-i Safety ST module is not ready for operation. The module parameters are not assigned.
■ Green ON	The F-CM AS-i Safety ST module is parameterized and error-free. No diagnostic alarms of the F-CM AS-i Safety ST are active.
✳ Red flashes	The F-CM AS-i Safety ST module is parameterized and indicates a diagnostic fault, or a firmware update is in progress.
✳✳ The two-color LED alternately flashes red/green	The position (ping) is displayed for 3 seconds.

LED "Status"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 2 Meaning of the "Status" LED

"Status"	Meaning
■ Green ON	• The F-CM AS-i Safety ST module is OK. • Cyclic I/O data exchange active
✳ Green flashes	• The system is powering up. • No cyclic I/O data exchange

LED "Error"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 3 Meaning of the "Error" LED

"Error"	Meaning
■ Red ON	**Serious device fault, e.g.,** • Fault in the electronics • Overtemperature
✳ Red flashes	**Device fault, e.g.,** • Intermittent data processing error (EMC problem) • Contact problem with the backplane bus • Missing coding element in the BaseUnit • Missing firmware update
□ Off	No error

LED "CFG"

The "CFG" LED indicates errors on the AS-i bus.

Table 8- 4 Meaning of the "CFG" LED

"CFG"	Meaning
■ Red ON	The AS-i bus is OK, but a code sequence error exists.
✳ Red flashes	Fault on the AS-i bus: • A code sequence does not exist or it is incomplete.
□ "Off"	All code sequences are completely transferred.

LED "PSF"

The "PSF" LED indicates process signal errors at one or more channels of the module.

Table 8- 5 Meaning of the "PSF" LED

LED "PSF"	Meaning
■ Red ON	PROFIsafe channel fault for the complete F-CM AS-i Safety ST module, e.g. fault on F-CM AS-i input slave
✳ Red "flashes"	• Discrepancy error at the inputs of a safe AS-i input slave • Sequence error at the inputs of a safe AS-i input slave • Code sequence error at a safe AS-i input slave, e.g., due to cross-circuit at inputs or an EMC problem • Failure of a safe AS-i input slave The channel involved is passivated. The "PSF" LED goes out only after all channels have been reintegrated.
□ "Off"	No process signal error

LED "TEACH"

This LED indicates teaching of safe AS-i slaves. The "TEACH" LED indicates the progress of the teaching operation.

Table 8- 6 Meaning of the "TEACH" LED

LED "TEACH"	Meaning
■ Yellow ON	The code sequences have been successfully taught, but have not yet been accepted. Transfer the code sequences either via the STEP 7 online dialog or by pressing the optional "TEACH" button (for at least 3 s). For more information, see the Section "Code sequences (Page 75)".
✳ Yellow flashes	Teaching of code sequences in progress.
□ "Off"	The code sequences are completely transferred.

LED "ADDR"

The "ADDR" LED indicates that the device is conducting safety-relevant communication with a software tool.

Table 8- 7 Meaning of the "ADDR" LED

LED "ADDR"	Meaning
✳ Green flashes	Feedback that the module is addressed: • For assignment of the F-address • For transfer of the code sequences • Firmware update in progress
☐ Off	Not relevant

LED "PWR"

The "PWR" LED indicates the status of the voltage supply.

Table 8- 8 Meaning of the "PWR" LED

LED "PWR"	Meaning
■ Green ON	AS-i voltage is applied.
☐ "Off"	Insufficient AS-i voltage is applied.

8.3 Diagnostic messages

The F-CM AS-i Safety ST module generates one or more alarms when various events occur.

Note

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the following must be observed:

With firmware V1.0.1 or higher, the F-CM AS-i Safety ST module generates a modified range of alarm messages compared with V1.0.0.

If the user program evaluates the error numbers of the generated alarms directly, the user program may have to be adapted if the firmware version is changed (e.g. when changing a device). If necessary, the firmware version of a replacement device can be modified to the previously used firmware version (see Section "Firmware update (Page 24)").

It is expected that the upgrading of the firmware version from V1.0.0 to V1.0.1 will not usually have any influence on the user program. The safety functionality of the F-CM AS-i Safety ST module does not change when the firmware is replaced.

If, after the replacement of a device, an alarm message of the F-CM AS-i Safety module appears in the message system (e.g. on an HMI panel), which contains an error code instead of a message text, then the assigned message texts are not known to the message system. In order to update the message texts, the project must be re-compiled with a current version of the TIA Portal / STEP 7 and loaded into the controller or into the message system. The function of the message system can be checked by generating an alarm (e.g. by removing an assigned AS-i safety slave).

Diagnostic messages for firmware V1.0.0

The following applies for firmware V1.0.0: Which events lead to which alarm messages is indicated in the description of data record DS 92 "Device-specific diagnostics" (Page 57).

The alarms use the diagnostic codes 0 to 31 according to the PROFIBUS Standard.

Diagnostic messages as from firmware V1.0.1

The following applies as from firmware V1.0.1: Which events lead to which alarm messages is indicated in the description of data record DS 206 "Data record diagnostics" (Page 69).

The alarms use diagnostic codes in the extended range of values according to the PROFINET Standard. The alarms allow a meaningful system diagnosis to be made, specifying the type of error and the AS-i address affected.

8.4 Replacement of defective devices

8.4.1 Replacing a safe AS-i input slave

Replace a failed safe AS-i input slave with a new device of the same type and assign the correct AS-i address to the slave. This address assignment can be performed automatically by the AS-i master (see manual of the AS-i master) or manually, e.g., with the AS-i addressing device (1904-2AB02).

Close the contacts on the inputs of the safe AS-i input slave so that the slave sends the code sequences.

The F-CM AS-i Safety ST module detects a new code sequence automatically and teaches it. For reintegration, the taught code sequence must be transferred.

The transfer can be started from the STEP 7 online dialog or by pressing the optional "TEACH" button (at least 3 s). For more information, see Section Code sequences (Page 75).

Observe the "CFG" and "TEACH" LEDs, see Section Meaning of the LEDs (Page 85).

To exclude impermissible duplicate code sequences for two safe input slaves, code sequences from all safe input slaves present on the AS-i bus must be transferred, regardless of whether the monitoring is activated or deactivated.

8.4.2 Replacing the safe AS-i output module (evaluation unit)

After replacement of a safe AS-i output module (evaluation unit), no setting is necessary on the F-CM AS-i Safety ST module.

Observe the operating instructions of the AS-i output module, and set the correct F-address for the AS-i output module and the AS-i address of any integrated standard slave.

An error acknowledgment for the affected output switching group must be performed, if necessary. See Section 6.3 Address space.

Non-safety related AS-i slaves (standard slaves) are not evaluated by the F-CM AS-i Safety ST module. Observe the replacement instructions in the operating instructions of the AS-i master or the slave.

8.4.3 Replacing the F-CM AS-i Safety ST module

When the F-CM AS-i Safety ST module is replaced, the new device automatically receives all necessary settings from the head module (IM) of the ET 200SP and the coding element in the BaseUnit.

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the instructions in Section "DS 206 Diagnostic data record (Page 69)" must be observed.

For more information, see Manual "ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293/0/en)

Total value for AS-i system with the F-CM AS-i Safety ST module[2)]		1.55×10^{-5}
Individual value for F-CM AS-i Safety ST	PFD	0.55×10^{-5}
Individual value for AS-Interface transfer procedure	PFD	1.00×10^{-5}
Individual value for AS-Interface slave[2)]	PFD	0
Mean Time To dangerous Failure	$MTTF_d$	≥100 years (37 000 years) High (according to EN ISO 13849-1)
Diagnostic Coverage level	DC	>99 %
Common Cause Failure	CCF	75 points (requirements met according to EN ISO 13849-1)

1) Probability of a dangerous failure in the case of an operating mode with high or continuous demand rate

2) Value "0" as an approximation for the individual value for AS-Interface slave applies only under the assumption that the PFH_D or PFD value of the AS-i slave is comparatively low and, thus, the PFH_D or PFD value of the AS-i slave does not contributed significantly to the PFH_D or PFD value of the total system. For this, observe the technical specifications of the safe AS-i slaves and use the specific values of the manufacturer.

3) Probability of a dangerous failure in the case of an operating mode with lower demand rate

9.4 Response times

The response times specified below represent worst case specifications. The response times relate to the switch-off operation (status change "1" → "0").

The response times for the switch-on operation (status change "0" → "1") can be longer but are not relevant for the given safety-related examination.

Maximum response time in the input direction

The maximum response time in the input direction results from the calculation of the response time from the safe AS-i input slave up to the head module (IM) of the ET 200SP:

max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	20 ms	Module-internal processing
max.	2 ms	Transfer ET 200SP backplane bus
max.	32 ms	Total response time in input direction (with 0 ms input delay)

WARNING

Increased response time

If an input delay time > 0 is assigned for a safe input, this input delay time must be added to the total response time.

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the sensor
- Additional response time in the safe AS-i input slave (see operating instructions)
- Bus response time between the head module (IM) of the ET 200SP and the controller
- Response time of the controller
- Timeout time (F-monitoring time) of the controller in case of PROFIsafe failure

These influencing variables must be taken into consideration when calculating the system response time of the total system.

In the above-indicated total response time, it is taken into consideration that a maximum of 4 AS-i bus cycle times elapse between a safe input slave failure and detection of an error.

Maximum response time in the output direction

The maximum response time in the output direction results from the calculation of the response time from the head module (IM) of the ET 200SP to the safe AS-i input slave (evaluation unit).

max.	2 ms	Transfer ET 200SP backplane bus
max.	20 ms	Module-internal processing
max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	32 ms	Total response time in output direction (for disturbance-free PROFIsafe transmission)

WARNING

Increased response time

In case of PROFIsafe failure, the total response time in the output direction increases by the set timeout time of the F-CM AS-i Safety ST module (see F-parameters, F-monitoring time).

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the controller
- Bus response time between the controller and the head module (IM) of the ET 200SP
- Response time in the safe AS-i output module (evaluation unit), see operating instructions
- For response time of the safe AS-i output module (evaluation unit) in case of AS-i failure, see operating instructions
- Response time of the actuator (e.g., contactor)

These influencing variables must be taken into consideration when calculating the system response time of the total system.

Additional information

Further information is provided in

System Manual SIMATIC Industrial Software Safety Engineering in SIMATIC S7 (http://support.automation.siemens.com/WW/view/en/12490443/0/en)

For calculation of response times, the following aid is available on the Internet:

- For S7 Distributed Safety, the Excel file S7fcotia.xls (http://support.automation.siemens.com/WW/view/en/25412441)

9.5 Calculation of monitoring times and response times

The Excel file S7fcotia.xls for S7 Distributed Safety is available on the Internet to aid the approximate calculation of the runtime of the F-runtime group, the minimum F-monitoring time, and the maximum response time of the safety program:

S7fcotia (http://support.automation.siemens.com/WW/view/en/25412441)

Additional information is available in Manual "Safety Engineering in SIMATIC S7".

You can download this free of charge on the Internet at:

Safety Engineering in SIMATIC S7
(http://support.automation.siemens.com/WW/view/en/12490443/0/en)

Notes on completing the Excel file S7fcotia.xls (when used without IE/PB Link)

Tab "max. runtime F-run-time group"

Enter the number of modules (in the relevant F-runtime group) in the "F-CM AS-i Safety ST" row under "ET 200SP fail-safe modules".

Tab "min. F-Monitoring times"

In the "Configuring the PROFIsafe monitoring time" section, select one of the following variants depending on which head module (IM) of the ET 200SP is being used.

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 3 Values for calculating the minimum F-monitoring times

Description	Designation	Value
Max. acknowledgment time of the F-CM AS-i Safety ST	T_DAT	20 ms
F-I/O with inputs and outputs	-	Yes

Tab "max. response times"

In the "Input" section, select one of the following variants for the relevant signal flow of the safety function depending on which head module (IM) of the ET 200SP is being used:

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 4 Values for calculating the max. response times

Description	Designation	Value
Max. discrepancy time (Note: The safe value 0 is supplied while the discrepancy time is running)	T_DIS	0
Maximum response time in error-free operation	T_WCDT	20 ms
Maximum response time when an error is present	T_OFDT	20 ms
Max. acknowledgment time of the F-I/O	T_DAT	20 ms
Configured PROFIsafe monitoring time	T_PSTO, conf.	F_WD_TIME (see the setting on the PROFISAFE tab of the properties dialog)
Max. response time of sensor Note: For T_Sensor_DLY, the part of the system starting from the F-CM AS-i Safety ST module up to the sensor, including the AS-i bus, is considered.	T_Sensor_DLY	10 ms (signal flow of AS-i Bus) + Assigned input delay + Response time of the sensor + Additional response time in the safe AS-i input slave

Glossary

1oo1 evaluation

Type of sensor evaluation. With 1oo1 evaluation, the sensor exists once. The sensor is connected to the F-module over a single channel.

1oo2 evaluation, equivalent

Type of sensor evaluation. With 1oo2 evaluation, two input channels are occupied by one two-channel sensor or by two single-channel sensors. The input signals are compared internally for equivalence.

AS-i (AS-Interface)

Actuator-sensor interface. A networking system for the lowest field level of the automation level. The networking system is suitable for networking sensors and actuators with control devices (previous designation: SINEC S1).

AS-i A/B slave

AS-i A/B slaves use the extended address range. You can assign two A/B slaves as a pair to an address on AS-Interface. Because of the address organization, you can therefore connect up to 62 AS-i A/B slaves to AS-Interface.

AS-i analog slave

AS-i analog slaves are AS-i slaves that exchange analog values with the AS-i master.

AS-i master

The AS-i master monitors and controls binary or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are distinguished according to their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing mode (AS-i standard slave and AS-i A/B slave with extended addressing mode).

AS-i standard slave

The AS-i standard slave occupies one address on AS-Interface; because of to the address organization, up to 31 AS-i standard slaves can therefore be connected to AS-Interface.

ASIsafe®

The AS-Interface Safety at Work concept allows the integration of safety-related components in an AS-Interface network, e.g.:

- EMERGENCY STOP switch
- Protective door switch
- Safety light grid

These safety-related components are fully compatible, according to EN 50 295, with the well-known AS-Interface components, e.g., master, slaves, power supply unit, etc. They can be operated together on the yellow AS-Interface cable. Siemens supplies all components for configuring a safe AS-Interface network.

CM

Communication Module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CRC

Cyclic Redundancy Check is a test procedure for checking the integrity of data. A generator polynomial is used to calculate a checksum over the data to be monitored. This checksum is, in the signature sense, characteristic of the data concerned. The generator polynomial can be calculated according to various algorithms.

DIAG

Diagnosis

Distributed Safety

Siemens-specific addition to PROFIsafe. The Distributed Safety fail-safe system with F-Configuration Pack supports implementation of safety concepts for machine and personal protection.

With Distributed Safety, passivation of selective channels has possible since PROFIsafe V2.0. The quality bits transferred in the process image are used to enter a substitute value in the process image for the channel concerned. The quality bits for the inputs and outputs are subsequently transferred in the process image to the actual process data. The same mechanism that PROFIsafe uses for reintegration of the module is used for reintegration of passivated channels.

F-address

Each fail-safe module has an F-address. For the F-CM AS-i Safety ST module, the F-address must initially be assigned online using *Step 7*. You specify the F-address in the configuration.

Fail-safe systems

Fail-safe systems are characterized in that, when certain failures occur, the system remains in a safe state or changes over directly to another safe state.

F-parameters

The fail-safe parameters are safety-relevant parameters. They are needed for communication via PROFIsafe.

I-parameters

Individual parameters for revising the AS-i functionality. The I-parameters are safety-relevant.

LED

A light-emitting diode that is used to display the signal status.

Nibble

A nibble is a unit of information that comprises four bits.

Passivation

When a fail-safe I/O device detects an error, it switches the affected channel, or all channels, to the safe state. That is, the channels of these fail-safe I/O devices are passivated. The fail-safe I/O device signals the detected fault to the F-CPU.

In the case of passivation of a fail-safe I/O device with inputs, the fail-safe system provides the safety program with substitute value "0" instead of the process values that are present at the fail-safe inputs.

In the case of passivation of a fail-safe I/O device with outputs, the fail-safe system transfers substitute value "0" to the fail-safe outputs instead of the output values supplied by the safety program.

PROFIsafe

Safety-related bus profile of PROFINET IO for communication between the safety program and the fail-safe I/Os in a fail-safe system.

Proof test interval

Time interval after which a component must be put into error-free state. The component is replaced or proof is furnished that it is entirely free of errors.

Safe state

The basis of the safety concept in fail-safe systems is that a safe state exists for all process variables.

Safety class

Safety Integrated Level (SIL) acc. to IEC 61508. The higher the safety integrity level, the stronger the measures for avoiding systematic failures as well as for overcoming intermittent failures and hardware failures.

Fail-safe modules used in safety mode can achieve up to safety class SIL 3.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

1.1 Documentation Guide for Power Module F-PM-E 24VDC/8A PPM ST

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

The table below lists additional documents that complement this description of the F-PM-E 24VDC/8A PPM ST fail-safe power module and are available on the Internet.

Table 1- 1 Documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate
BaseUnits	Manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)	Technical specifications
Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-PM-E 24VDC/8A PPM ST

Order number

6ES7136-6PA00-0BC0

View of the module

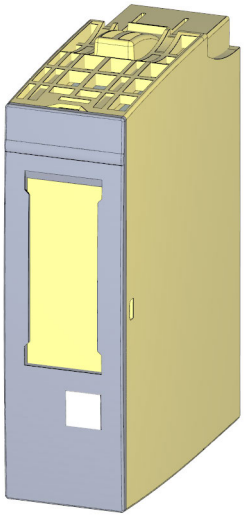

Figure 2-1 View of the F-PM-E 24VDC/8A PPM ST module

Properties

- Technical properties
  - Fail-safe digital module
  - 2 inputs (SIL3/Cat.4/PLe)
  - 1 output PM-switching or PP-switching, output current 8 A (SIL3/Cat.4/PLe)
  - 2 outputs for sensor supply
  - Sink input (P-reading)
  - Source output (PM/PP-switching)
  - Supply voltage L+
  - Suitable for connection of 2-wire sensors to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input or output (green LED)
  - Fault display for each input or output (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 69).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Safety-related shutdown of standard DQ modules by the F-PM-E 24VDC/8A PPM ST

This cost-effective solution allows for full and simultaneous shutdown of all affected outputs of the standard DQ modules when a fault is detected in the process or on the F-PM-E 24VDC/8A PPM ST power module.

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

You can use the F-PM-E 24VDC/8A PPM ST power module with all standard DQ modules within a potential group. Additional information is available in Applications for safety-related shutdown of standard modules (Page 59).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Connecting

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-PM-E 24VDC/8A PPM ST

Terminal assignment for F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit**[1]	**Color identification label (terminals 1 to 16)**
1	DI_0	**2**	DI_1	• DI_n: Input signal, channel n • VS_n: Internal sensor supply, channel n • DQ-P_0: Output signal, channel 0, P-switching • DQ-M_0: Ground for output signal, channel 0, M-switching • AUX: Protective conductor connection or voltage bus for SELV/PELV circuits	C0	 CC52 6ES7193-6CP52-2MC0
3	VS_0	**4**	VS_1			
5	DQ-P_0	**6**	DQ-M_0			
7	AUX	**8**	AUX			
L+	DC24V	**N**	M			
L+	DC24V	**N**	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

Make sure that you only use the power module with BaseUnit type C0 during commissioning.

Digital output

The digital output switches the voltage L+ and M using two electronic switches (see Block diagram (Page 16)). The switched voltage and chassis are conducted to the internal voltage buses P1 and P2. The switched voltage and chassis is also available at the BaseUnit at DQ-P_0 and DQ-M_0.

This results in two connection options that can be used at the same time, if desired:

- One load can be wired directly to the BaseUnit (see Applications for the output DQ/P1 and P2 (Page 39)).
- The standard modules can be supplied and switched off safety-related by means of the internal voltage buses P1 and P2. You can, in turn, connect loads to the standard modules (see Applications for safety-related shutdown of standard modules (Page 59)).

⚠ WARNING

It is no longer possible to shut down an actuator if a cross circuit has developed between L+ and DQ. To prevent cross circuits between L+ and DQ, you must route the cables used to connect the actuators in a cross-circuit proof manner (for example, as separate, sheathed cables or in separate cable ducts).

Redundant ground conductor required

⚠ WARNING

The ground conductor to the BaseUnit for F-PM-E 24VDC/8A PPM ST must be installed twice for safety reasons. Any interruption of a single ground conductor would prevent the safety-related shutdown of voltage bus P2.

Property of the individual shutdown of F-modules with fail-safe outputs

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Switching of loads with ground if the F-module is configured PM-switching

If the following two conditions are met, F-PM-E 24VDC/8A PPM ST detects a short circuit:

- If loads that have a connection between chassis and ground are switched by the F-PM-E 24VDC/8A PPM ST , for example, to improve the EMC properties.
- If chassis and ground are connected at the power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection (refer to the diagram below as an example for an F-PM-E 24VDC/8A PPM ST).

Remedy:

- Use the F-PM-E 24VDC/8A PPM ST configured as a PP-switching module.
- Increase the value of the resistance between chassis and ground at the load end to more than 100 kΩ.
- Reduce the capacitance value between chassis and ground at the load end to less than 2 µF.

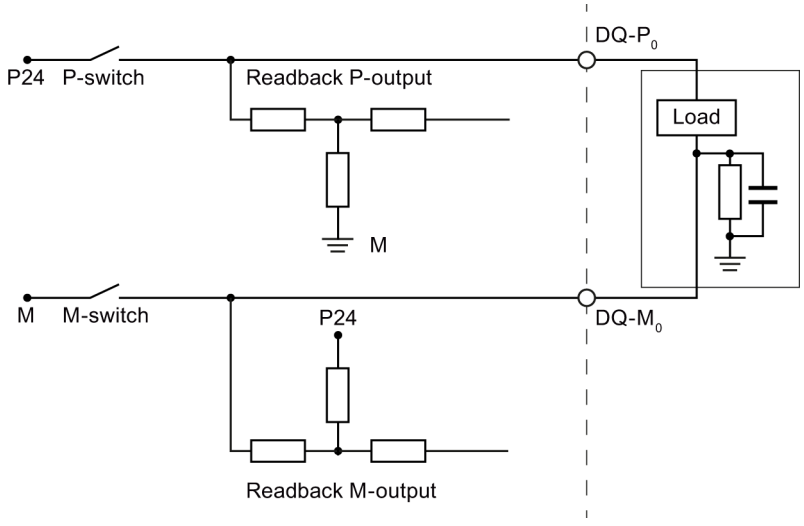

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

WARNING

During startup, the F-PM-E 24VDC/8A PPM ST carries out a switch-on test of approximately 3 ms. The capacitance between chassis and ground at the load end is charged by way of the load resistance. This low charging current may briefly trigger sensitive load circuits.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for power module

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
PM-parameters:			
Maximum test period	• 100 s • 1000 s	no	Module
Sensor supply:			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Inputs:			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent	no	Channel pair
Discrepancy behavior	• Supply last valid value • Supply 0 value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal necessary • Test 0-signal not necessary	no	Channel pair
Activated	• disable • enable	no	Channel
Sensor supply	• Sensor supply 0 • Sensor supply 1 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Output:			
Activated	• disable • enable	no	Channel
Control of the output	• F-CPU • F-CPU and onboard F-DI	no	Module
Output type	• PM switching • PP switching	no	Channel
Max. readback time dark test	0.8 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.8 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 PM-parameters

4.2.2.1 Maximum test period

Here you specify the time within which the light and dark tests (in all combinations) should be performed throughout the module. When this time expires, the tests are repeated.

The "Maximum test period" parameter is a module parameter, which means the test cycle for the entire fail-safe output module is performed within the configured maximum test time. If the bit pattern test is not performed within the configured time (or the shortened test time of 60 seconds in case of an error), the module goes into the error state.

4.2.3 Parameters of the sensor supply

4.2.3.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.3.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.3.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.4 Parameters of the inputs

4.2.4.1 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Sensor evaluation" parameter:

- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo2 evaluation equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One single-channel sensor
- One non-equivalent sensor
- One two-channel sensor
- Two single-channel sensors

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

Achievable safety class

The following safety class can be achieved depending on the selected sensor evaluation:

- SIL3/Cat.4/PLe with "1oo2 evaluation equivalent/non-equivalent"

4.2.4.2 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.4.3 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.4.4 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4.5 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.4.6 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 20)

4.2.4.7 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 77)

4.2.4.8 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.9 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

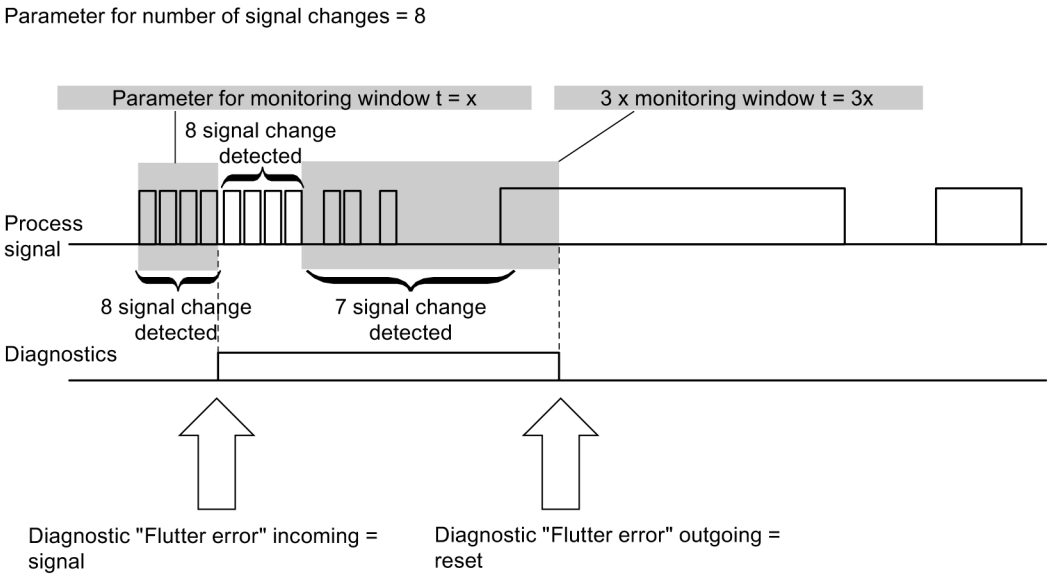

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.10 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.2.5 Parameters of the output

4.2.5.1 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

You can deactivate an unused channel with this parameter.

4.2.5.2 Controlling the output

Activates the internal evaluation.

Additional information on internal evaluation is available in the chapter "Application for internal evaluation" (Page 57).

4.2.5.3 Output type

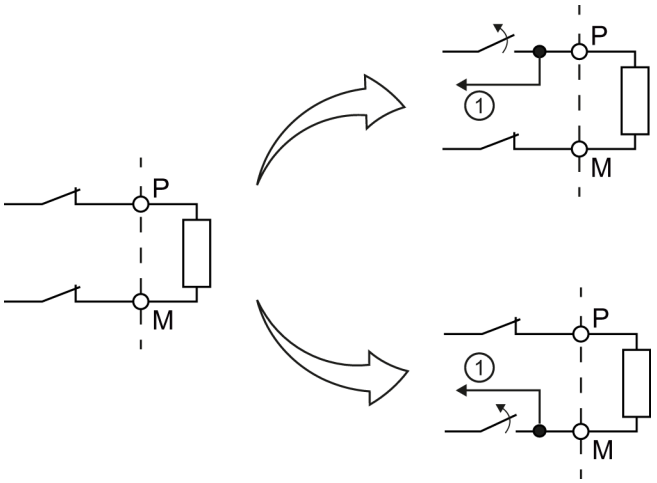
The parameter specifies if the output switches PM or PP.

4.2.5.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-2 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

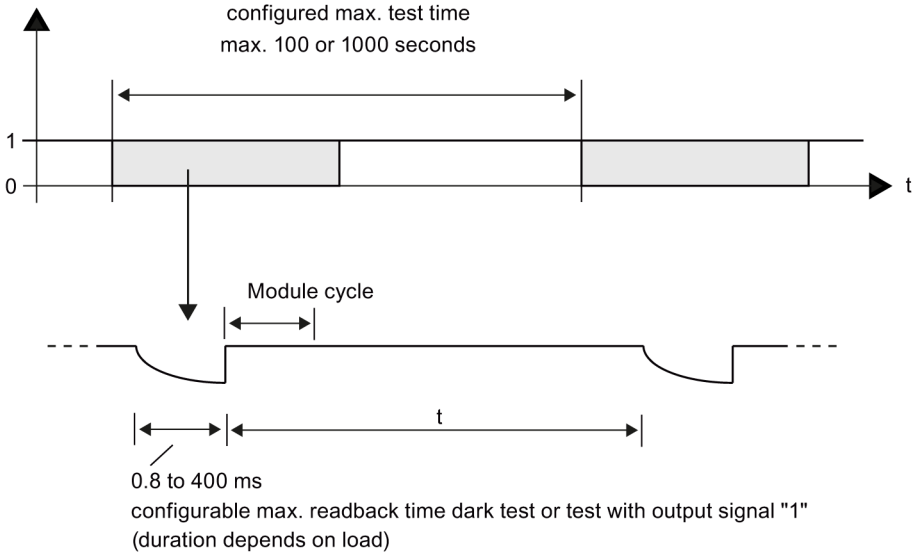


Figure 4-3 Test pulses of the dark test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

4.2.5.5 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, 2 dark test pulses (PP switching) or 3 dark test pulses (PM switching) are directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING

The output is passivated if an error caused by a short-circuit is recognized when the safety-function is executed (output turned off). This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.

If the channel can retain signal 0 for 48 hours and longer, the function "Disable dark test for 48 hours" must not be used.

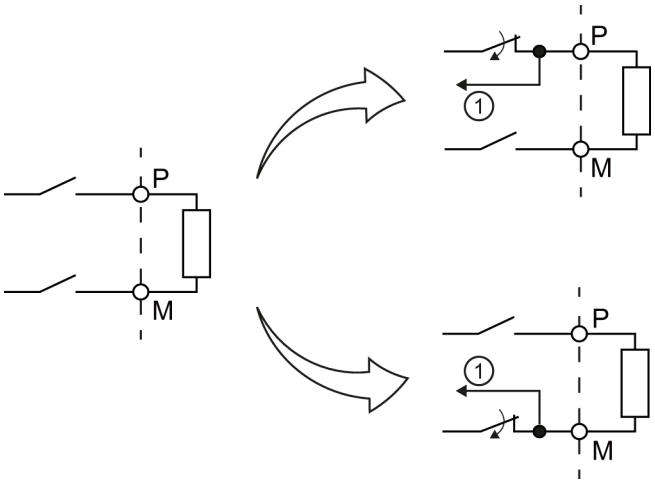
Consult the respective requirements of your product standards regarding error detection time.

4.2.5.6 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-4 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the required value for the readback time by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time switch on test is too small for a connected capacitive load. The charge of the capacitive load cannot take place within the configured readback time switch on test. Increase the readback time.

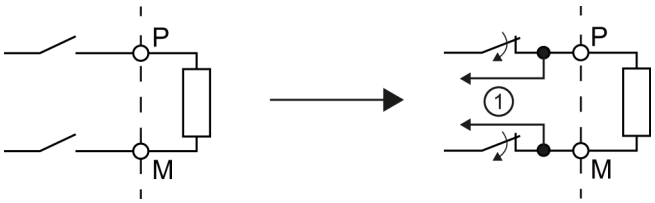
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.5.7 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, several test signals are switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-5 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

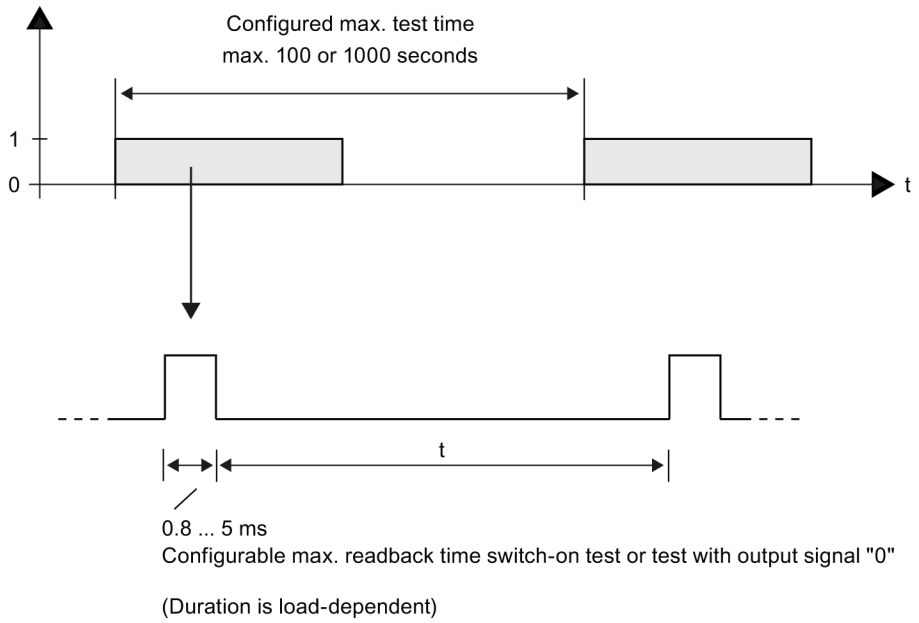


Figure 4-6 Test pulses of the light test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after t. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.5.8 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

Wire break is signaled when the following conditions are met:

- Wiring to the actuator is interrupted.
- A module that is disabled in fail-safe mode by the F-PM module has been removed.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of power module F-PM-E 24VDC/8A PPM ST

The F-PM-E 24VDC/8A PPM ST power module occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	In output range
x + 0 to x + 6	x + 0 to x + 4

x = Module start address

Address assignment of the user data and value status of power module F-PM-E 24VDC/8A PPM ST

Of the assigned addresses of power module F-PM E 24VDC/8A PPM ST, the user data occupy the following addresses in the F-CPU:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status for DI_1	Value status for DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

5

5.1 Applications for the output DQ/P1 and P2

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving the various safety categories.

Table 5- 1 Conditions for achieving SIL/Cat./PL

F-PM-E 24VDC/8A PPM ST		Achievable safety class
Digital output DQ	Without standard DQ modules	SIL3/Cat.4/PLe
	With standard DQ modules	SIL2/Cat.3/PLd

5.1.1 Applications: Safety mode up to SIL3/Cat.4/PLe

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

5.1.1.1 Application: Wiring a load to the digital output, PM switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. They connect the load between the P-switches DQ-P_0 and the M-switch DQ-M_0. The two P-switches and the M-switch are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

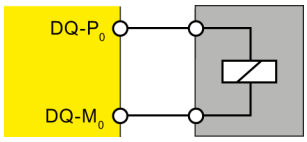

Figure 5-1 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 2 Parameters

Parameter	
Output type	PM switching

5.1.1.2 Application: Wiring a load to the digital output, PP switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. You connect the load between the P-switch DQ-P_0 and chassis in this case. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

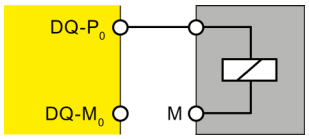

Figure 5-2 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 3 Parameters

Parameter	
Output type	PP switching

5.1.1.3 Application: Wiring two loads in parallel to the digital output, PM switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

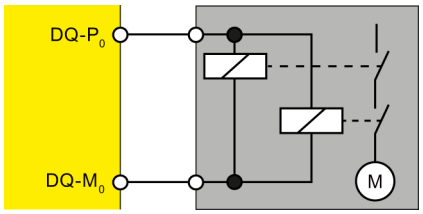

Figure 5-3 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 4 Parameters

Parameter	
Output type	PM switching

5.1.1.4 Application: Wiring two loads in parallel to the digital output, PP switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

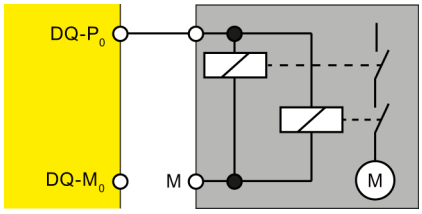

Figure 5-4 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 5 Parameters

Parameter	
Output type	PP switching

5.2 Applications for inputs

5.2.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

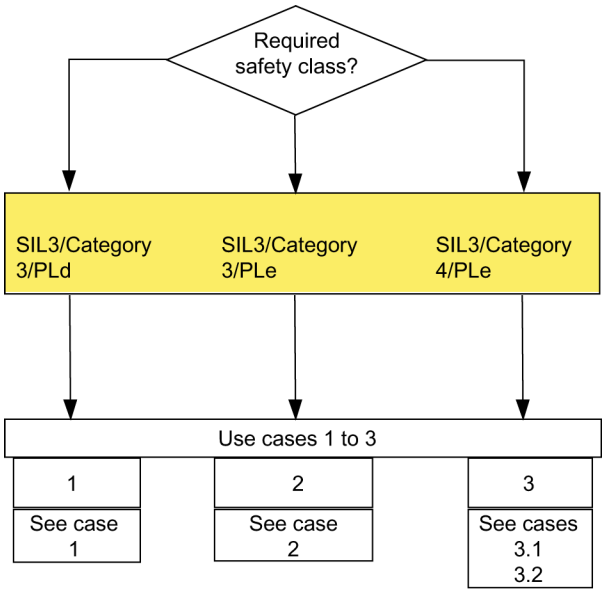

Figure 5-5 Selecting the application – digital inputs of the F-PM-E 24VDC/8A PPM ST

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 6 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

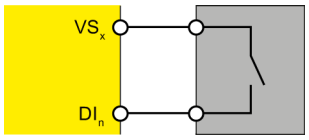

Figure 5-6 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

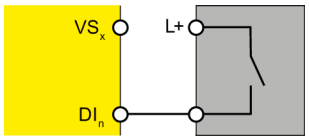

Figure 5-7 One sensor connected via one channel, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 7 Parameter assignment

Parameters	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 8 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

⚠ WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the wiring between the sensor and the input channel must be short circuit proof.

5.2.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

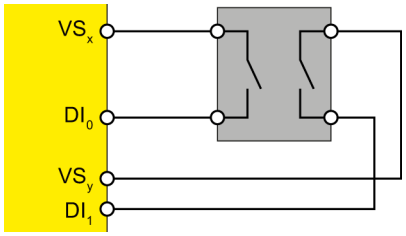

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

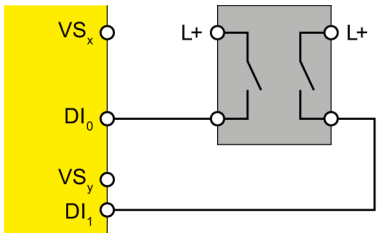

Figure 5-9 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

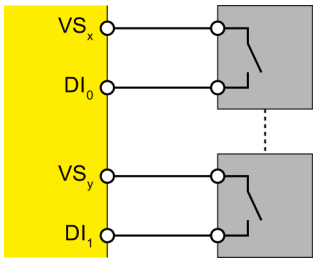

Figure 5-10 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

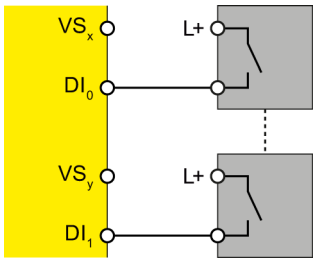

Figure 5-11 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 9 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 10 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair, with other channels or other sensor supplies	no	no
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied **internally** for application 3.1 (Page 52).

The sensor can be supplied internally or externally for application 3.2 (Page 54).

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- All short circuits listed in Table 5-12 Fault detection (Page 53) and Table 5-14 Fault detection (Page 56) must be detected. You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.2.4.1 Application 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to both inputs of the power module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

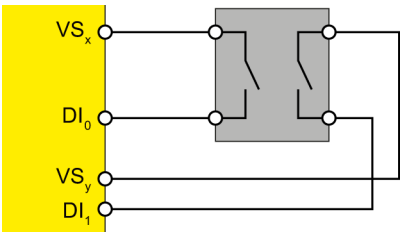

Figure 5-12 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

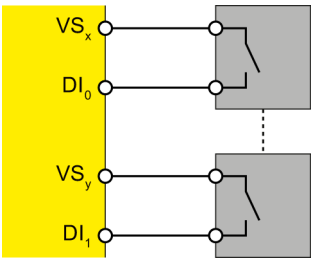

Figure 5-13 Two single-channel sensors connected via two channels, internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 11 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 12 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4.2 Application 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor nonequivalent via two channels

A nonequivalent sensor is connected nonequivalent via 2 channels to both inputs of the power module for each process signal (1oo2 evaluation, nonequivalent).

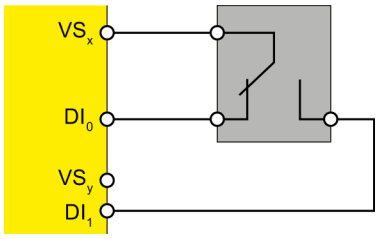

Figure 5-14 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

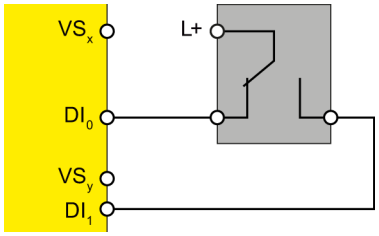

Figure 5-15 Nonequivalent sensor connected, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent via two channels

Two single-channel sensors are connected nonequivalent to both inputs of the power module for each process signal (1oo2 evaluation).

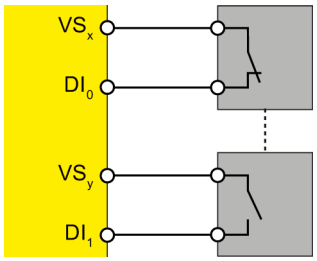

Figure 5-16 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

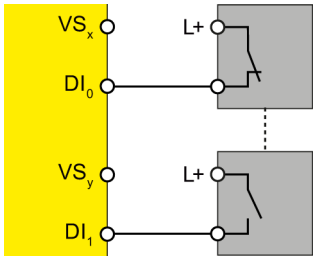

Figure 5-17 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 13 Parameter assignment

Parameters	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 14 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

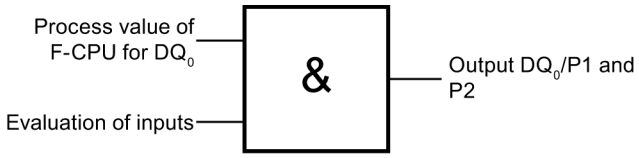
5.3 Application for internal evaluation

Function

The evaluation of the safety function takes place internally in the F-module.

You can choose between 1oo1 evaluation or nonequivalent/equivalent 1oo2 evaluation of the sensors.

- With 1oo1 evaluation, the activated inputs are logically ANDed with the process image of output DQ_0.
- With 1oo2 evaluation, the result of the inputs is logically ANDed with the process image of output DQ_0.



The acknowledgment in case of an error takes place by the safety program in the F-CPU.

Use the wiring diagrams Applications for the output DQ/P1 and P2 (Page 39) and Applications for inputs (Page 43).

You achieve SIL3/Cat.4/PLe.

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator and sensor, for example, in accordance with IEC 60947.

Note

If an error occurs at the inputs in this application, the F-module also outputs the error message "Safety-related shutdown" or "Safety event" for the output. Following elimination of the error at the inputs, a reintegration of the output is only possible after the bit pattern test (within the test time shortened to 60 s) has been performed.

Interconnection example

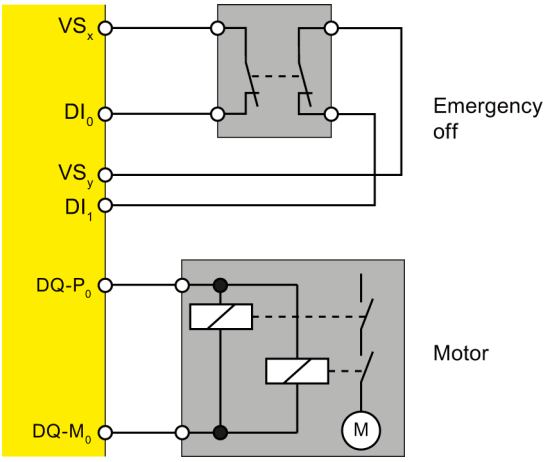


Figure 5-18 Emergency Off shutdown of a motor with equivalent 1oo2 evaluation

Parameter assignment

Assign the following parameters for the F-module:

Parameter	
Control of the output	F-CPU and onboard F-DI
Type of sensor interconnection	• 1-channel • 2-channel equivalent • 2-channel, non equivalent
Sensor supply	Sensor supply 0, Sensor supply 1, or External sensor supply

5.4 Applications for safety-related shutdown of standard modules

5.4.1 Safety-related shutdown of standard output modules, PM-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage buses P1 and P2.

Configure the power module parameters as described in section Terminal assignment (Page 13).

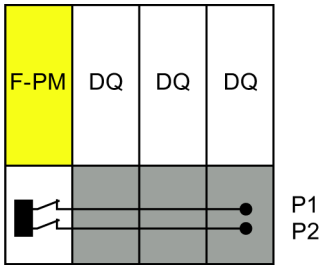

Figure 5-19 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:

In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.

Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.

It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.

Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.

The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.

The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

WARNING

Note the following for the "Safety-related shutdown of standard modules" application:

If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

5.4.2 Safety-related shutdown of standard output modules, PP-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage bus P1.

Configure the power module parameters as described in section Terminal assignment (Page 13).

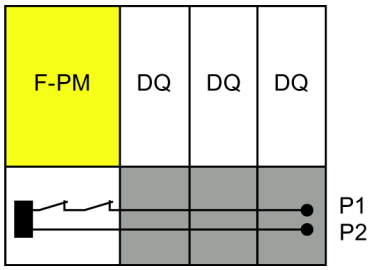

Figure 5-20 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:

In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.

Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.

It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.

Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.

The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.

The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

⚠ WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

⚠ WARNING

Note the following for the "Safety-related shutdown of standard modules" application:

If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 69).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs and outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-PM-E 24VDC/8A PPM ST fail-safe power module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 69).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 69).

Table 6- 5 Diagnostic interrupts of the F-PM-E 24VDC/8A PPM ST

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	—	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Output short-circuited to L+	261_D		Channel	Yes
Output short-circuited to ground	262_D			
Wire break	265_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			No
Discrepancy error, channel status 0/0	768_D	2, 3		
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D	1,2,3		No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D			
PROFIsafe communication error (timeout)	792_D			
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Output defective	797_D	—		No
Readback error	798_D			
Overload	800_D			
Supply voltage too high	802_D	1, 2, 3	F-module	
Supply voltage too low	803_D			

6.3 Diagnostic messages

Digital module error types

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-PM-E 24VDC/8A PPM ST

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	

Diagnostic message	Fault code	Meaning	Remedy
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The sensor cable is short-circuited to L+. • The output cable is short-circuited to L+.	Correct the process wiring.
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The sensor cable is short-circuited to ground. • The output cable is short-circuited to ground. • The output signal is short-circuited to ground.	Correct the process wiring.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.

Diagnostic message	Fault code	Meaning	Remedy
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.

Diagnostic message	Fault code	Meaning	Remedy
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.
No pulse detected	778_D	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too low. • The "Minimum pulse time" parameter setting is too high. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784_D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 77))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77))
Fault in input circuit	787_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • Short circuit to L+ or M • The F-module is defective.	• Check the wiring. • Replace the F-module.
Readback error	798_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	If the error persists, replace the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

In the case of a voltage dip in the supply voltage L+, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 77): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is disabled, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. The corresponding tables for fault detection for the applications are available under Applications of the F-I/O module (Page 39).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 36).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

7

Technical specifications of F-PM-E 24VDC/8A PPM ST

	6ES7136-6PA00-0BC0
Product type designation	F-PM-E PPM 24VDC
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	V2.3
PROFINET as of GSD version/GSD revision	V2.31
Operating mode	
Multi-output	No
Installation type/mounting	
Rack mounting possible	No
Front installation possible	No
Rail mounting possible	Yes; standard DIN rail
Wall mounting/direct mounting possible	No
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V

	6ES7136-6PA00-0BC0
Sensor supply	
Number of outputs	2
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 2.1 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	600 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	5 W
Address space	
Address space per module	
Input	7 bytes
Output	5 bytes
Digital inputs	
Number of inputs	2
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m

	6ES7136-6PA00-0BC0
Digital outputs	
Number of outputs	1
Digital outputs, configurable	Yes
Short circuit protection	Yes
• Response threshold, typ.	> 14.8 A
Wire break detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	8.8 A
Voltage induced on current interruption limited to	max 1.5 V
Switching capacity of outputs	
With resistive load, max.	8 A
With lamp load, max.	100 W
Load resistance range	
Low limit	3 Ω
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	8 A
For "0" signal, residual current, max.	1.5 mA; PP-switching: Max. 1.5 mA; PM-switching: Max. 1 mA
Switching frequency	
With resistive load, max.	10 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	4 Hz; symmetrical
Total current of outputs	
Max. current per channel	8 A; (note derating data in the manual)
Max. current per module	8 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual

	6ES7136-6PA00-0BC0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	60 V DC / 75 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C
Dimensions	
Width	20 mm
Height	72 mm
Depth	55 mm
Weights	
Weight, approx.	70 g

Temperature characteristic values (derating)

Mounting position	Maximum temperature	Maximum output current
Horizontal	40 °C	8 A
	50 °C	6 A
	60 °C	4 A
Vertical	50 °C	4 A

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times

A

A.1 Response times

Introduction

The next section shows the response times of power module F-PM-E 24VDC/8A PPM ST. The response times of the fail-safe modules are included in the calculation of the F-system response time.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 29 ms

Maximum cycle time: T_{cycle} = 14 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, dark test time, switch-on time, discrepancy time, and test time are configured in STEP 7.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Definition of response time for internal evaluation: Cycle time + Input delay + Short circuit test time + Maximum(readback time, switch-on time, light test time)

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel n1)

Maximum response time with external short circuits

Maximum response time = Input delay + (n × T_{cycle}) + Sum(all short circuit test times + all startup times of sensors with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel 1)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Maximum response time for fail-safe digital outputs

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

The maximum response time for fail-safe digital outputs in the presence of an error is equal to:

Maximum response time = T_{cycle} + 2 × Maximum(dark test time, switch-on time) + interval between test pulses

A.2 Minimum distance of test pulses

The minimum interval between two test pulses depends on the activation of the light test, the configured maximum test time, and whether the output has been specified as a PM-switching or PP-switching output.

You can find the dependencies in the table below:

Assigned maximum test time	PM switching, light test not active	PM switching, light test active	PP switching, light test not active	PP switching, light test active
1000 s	62.080 s	45.147 s	82.913 s	38.137 s
100 s	5.830 s	4.238 s	7.913 s	3.521 s

Switching of loads

B

B.1 Connecting capacitive loads

If the output of power module F-PM-E 24VDC/8A PPM ST is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The figure below shows typical curves for the assignable readback times representing the correlation between load resistance and switchable load capacitance at a supply voltage of 24 V DC.

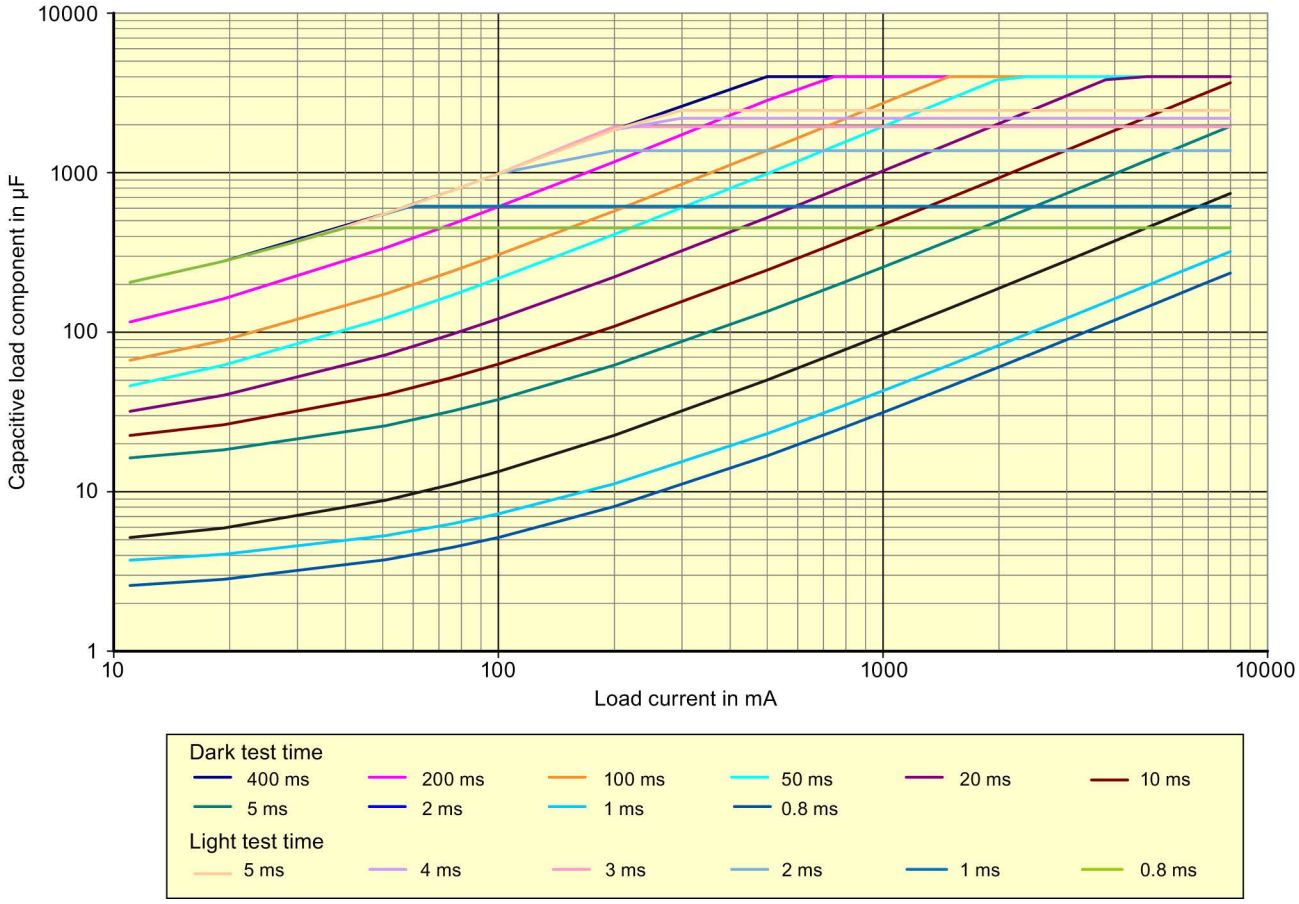

Figure B-1 Switching of capacitive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the configured dark and light test times

The curves shown were plotted using a SIMATIC PS 307 10A power supply unit with a cable length of 25 m (cable cross-section of 1.5 mm^2) between the output of the F-PM-E 24VDC/8A PPM ST power module and the load.

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

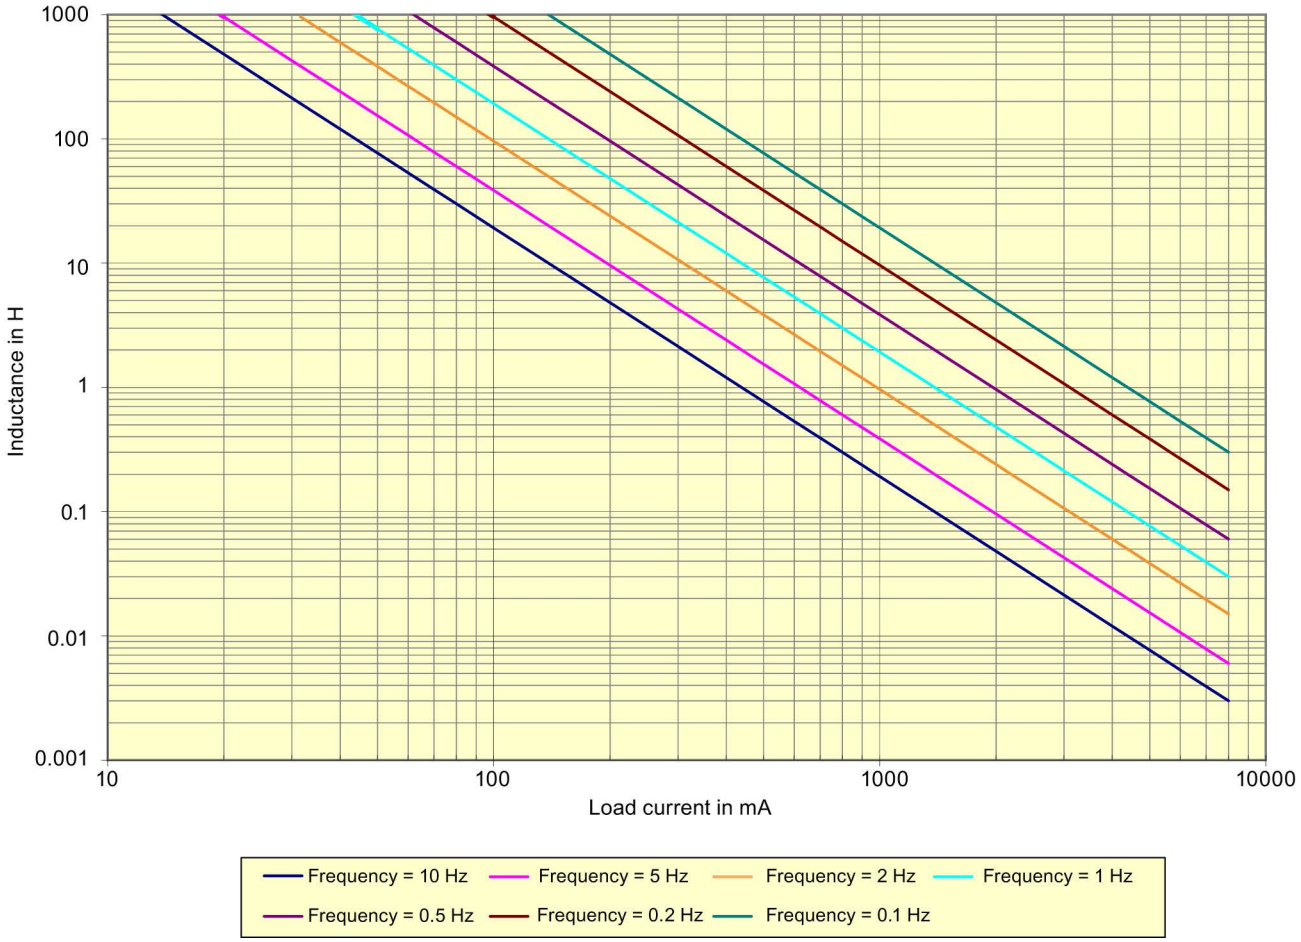

Figure B-2 Switching of inductive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the load current and switching frequency

Produktinformation

Security-Hinweise

Siemens bietet Produkte und Lösungen mit Industrial Security-Funktionen an, die den sicheren Betrieb von Anlagen, Lösungen, Maschinen, Geräten und/oder Netzwerken unterstützen. Sie sind wichtige Komponenten in einem ganzheitlichen Industrial Security-Konzept. Die Produkte und Lösungen von Siemens werden unter diesem Gesichtspunkt ständig weiterentwickelt. Siemens empfiehlt, sich unbedingt regelmäßig über Produkt-Updates zu informieren.

Für den sicheren Betrieb von Produkten und Lösungen von Siemens ist es erforderlich, geeignete Schutzmaßnahmen (z. B. Zellenschutzkonzept) zu ergreifen und jede Komponente in ein ganzheitliches Industrial Security-Konzept zu integrieren, das dem aktuellen Stand der Technik entspricht. Dabei sind auch eingesetzte Produkte von anderen Herstellern zu berücksichtigen. Weitergehende Informationen über Industrial Security finden Sie unter (http://www.siemens.com/industrialsecurity).

Um stets über Produkt-Updates informiert zu sein, melden Sie sich für unseren produktspezifischen Newsletter an. Weitere Informationen hierzu finden Sie unter (http://support.automation.siemens.com).

Allgemeine Ergänzungen zur Dokumentation

Inhalt

Diese Produktinformation enthält Ergänzungen und Korrekturen zur Dokumentation der F-Module ET 200SP.

Ergänzung der Kapitel 5.1.1.2 "*Anwendungsfall: Anschluss von einer Last am Digitalausgang, PP schaltend*", 5.1.1.4 "*Anwendungsfall: Anschluss von 2 Lasten parallel liegend am Digitalausgang, PP schaltend*" und 5.4.2 "*Sicherheitsgerichtete Abschaltung von Standard-Ausgabemodulen, PP schaltend*" des Gerätehandbuchs "Powermodul F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNUNG
Wenn der Ausgangskanal 100 Stunden, und länger, dauerhaft „0"-Signal führen kann, muss der Helltest aktiviert werden. Beachten Sie die jeweiligen Anforderungen Ihrer Produktnormen hinsichtlich der Fehleraufdeckungszeit.

Nicht unterstützte Parameter

Die Parameter "Impulsverlängerung" und "Dunkeltest für 48 Stunden deaktivieren" werden nicht unterstützt.

Abhängigkeiten zwischen den Parametern "Diskrepanzzeit" und "Eingangsverzögerung"

Die Diskrepanzzeit muss größer als die Eingangsverzögerung parametriert werden.

Abhängigkeiten zwischen den Parametern "Hochlaufzeit des Gebers nach Kurzschlusstest" und "Zeit für Kurzschlusstest"

Die Hochlaufzeit des Gebers nach Kurzschlusstest muss mindestens 1% der Zeit für den Kurzschlusstest betragen.

Einschalten der Versorgungsspannung L+ für F-Module ET 200SP und IM

Stellen Sie sicher, dass vor dem Einschalten der Versorgungsspannung L+ eines F-Moduls sowohl das F-Modul als auch die IM gleichzeitig spannungslos waren. Eine Einschaltreihenfolge müssen Sie dabei nicht beachten.

© Siemens AG 2013 - 2014. Alle Rechte vorbehalten

Zyklisches Lesen von I&M-Daten

Zyklisches Lesen von I&M-Daten kann das Timing der F-Module belasten. Vermeiden Sie deshalb schnelle Lesezyklen von unter 500 ms.

Drahtbrucherkennung F-Modul F-DQ 4x24VDC/2A PM HF

Die Ansprechschwelle der Drahtbrucherkennung beträgt < 15 mA.

Einsatz von nicht-fehlersicheren Modulen

Fehlersichere Module ET 200SP dürfen Sie in einem Dezentralen Peripheriesystem ET 200SP nur zusammen mit nicht-fehlersicheren Modulen einsetzen, die mit SELV/PELV betrieben werden. Außerdem darf das Digitalausgabemodul RQ 4x120VDC-230VAC/5A NO ST nicht mit der gleichen Spannung wie die fehlersicheren Module ET 200SP versorgt werden.

Quittierungzeit T_{DAT}

F-Modul	Quittierungszeit T_{DAT}
Digitaleingabemodul F-DI 8x24VDC HF	23 ms
Digitalausgabemodul F-DQ 4x24VDC/2A PM HF	31 ms
Powermodul F-PM-E 24VDC/8A PPM ST	30 ms

Product Information for the Documentation of ET 200SP Fail-safe Modules

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

General amendments to the documentation

Content

This product information contains amendments and corrections to the documentation of the ET 200SP fail-safe modules.

Amendment to chapter 5.1.1.2 "*Use case: Wiring a load to the digital output, PP switching*", 5.1.1.4 "*Use case: Wiring of two parallel loads to the digital output, PP switching*" and 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING
The light test must be activated if the output channel can permanently carry the "0" signal for 100 hours or more. Consult the respective requirements of your product standards regarding error detection time.

Unsupported parameters

The "Pulse stretching" and "Disable dark test for 48 hours" parameters are not supported.

Dependencies between the "Discrepancy time" and "Input delay" parameters

The configured discrepancy time must be greater than the configured input delay.

Dependencies between the "Startup time of the sensors after short circuit test" and "Time for short circuit test" parameters

The startup time of the sensor after a short circuit test must amount to at least 1% of the time for the short circuit test.

Switching on the supply voltage L+ for the ET 200SP F-modules and IM

Make sure that the F-module as well as the IM were de-energized at the same time before you switch on the supply voltage L+ for an F-module. You do not have to observe a switch-on sequence.

© Siemens AG 2013 - 2014. All rights reserved

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Open-circuit detection for F-DQ 4x24VDC/2A PM HF fail-safe module

The response threshold of the open-circuit detection is < 15 mA.

Using non-fail-safe modules

In an ET 200SP distributed I/O system, you can only use ET 200SP fail-safe modules together with non-fail-safe modules that are operated with SELV/PELV. In addition, the digital output module RQ 4x120VDC-230VAC/5A NO ST cannot be supplied with the same voltage as the ET 200SP fail-safe modules.

T_{DAT} acknowledgment time

F-Module	T_{DAT} acknowledgment time
Digital input module F-DI 8x24VDC HF	23 ms
Digital output module F-DQ 4x24VDC/2A PM HF	31 ms
Power module F-PM-E 24VDC/8A PPM ST	30 ms

Information produit

Notes relatives à la sécurité

Siemens commercialise des produits et solutions comprenant des fonctions de sécurité industrielle qui contribuent à une exploitation sûre des installations, solutions, machines, équipements et/ou réseaux. Ces fonctions jouent un rôle important dans un système global de sécurité industrielle. Dans cette optique, les produits et solutions Siemens font l'objet de développements continus. Siemens vous recommande donc vivement de vous tenir régulièrement informé des mises à jour des produits.

Pour garantir une exploitation fiable des produits et solutions Siemens, il est nécessaire de prendre des mesures de protection adéquates (par ex. concept de protection des cellules) et d'intégrer chaque composant dans un système de sécurité industrielle global et moderne. Veuillez également tenir compte des produits que vous utilisez et qui proviennent d'autres fabricants. Pour plus d'informations sur la sécurité industrielle, rendez-vous sur (http://www.siemens.com/industrialsecurity).

Veuillez vous abonner à la newsletter d'un produit particulier afin d'être informé des mises à jour dès qu'elles surviennent. Pour plus d'informations, rendez-vous sur (http://support.automation.siemens.com).

Addenda généraux à la documentation

Contenu

Cette information produit contient des addenda et des correctifs à la documentation des modules de sécurité ET 200SP.

Addendum au chapitre 5.1.1.2 "*Cas d'application : Connexion d'une charge à la sortie TOR, commutation PP*", 5.1.1.4 "*Cas d'application : Connexion de 2 charges parallèles à la sortie TOR, commutation PP*" et 5.4.2 "*Désactivation de sécurité de modules de sorties standard, commutation PP*" du manuel "Module de puissance F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ ATTENTION
Si la voie de sortie peut fournir un signal "0" en continu pendant 100 heures et plus, le test avec activation doit être activé. Tenez compte des exigences spécifiques aux normes de votre produit en ce qui concerne le temps de détection des erreurs.

Paramètres non pris en charge

Les paramètres "Impulsion prolongée" et "Désactivation du test avec désactivation pour 48 heures" ne sont pas pris en charge.

Dépendances entre les paramètres "Temps de discordance" et "Retard à l'entrée"

Le temps de discordance doit être supérieur au retard à l'entrée.

Dépendances entre les paramètres "Temps de démarrage du capteur après le test de court-circuit" et "Temps de test de court-circuit"

Le temps de démarrage du capteur après le test de court-circuit doit être égal au moins égal à 1% au temps de test de court-circuit.

© Siemens AG 2013 - 2014. Tous droits réservés

Mise en route de la tension d'alimentation L+ des modules F ET 200SP et IM

Assurez-vous que le module F et l'IM sont tous deux hors tension avant de mettre en route la tension d'alimentation L+ d'un module F. Pour ce faire, il n'est pas nécessaire de suivre un ordre d'activation.

Lecture cyclique des données I&M

La lecture cyclique des données I&M peut surcharger la synchronisation des modules F. Il convient donc d'éviter les cycles rapides de lecture inférieurs à 500 ms.

Détection de rupture de fil du module de sécurité F-DQ 4x24 V CC/2A PM HF

Le seuil de déclenchement de la détection de rupture de fil est < 15 mA.

Utilisation de modules non de sécurité

Les modules de sécurité ET 200SP ne doivent être utilisés dans un système de périphérie décentralisée ET 200SP qu'avec des modules non de sécurité fonctionnant avec une TBTS/TBTP. En outre, le module de sorties TOR RQ 4x120VDC-230VAC/5A NO ST ne doit pas être alimenté avec la même tension que les modules de sécurité ET 200SP.

Temps d'acquittement T_{DAT}

Module F	Temps d'acquittement T_{DAT}
Module d'entrées TOR F-DI 8x24 V CC HF	23 ms
Module de sorties TOR F-DQ 4x24 V CC/2A PM HF	31 ms
Module d'alimentation F-PM-E 24 V CC/8A PPM ST	30 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Product overview

1

1.1 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher-level safety requirements. F-systems serve to control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard ET 200SP modules is that they have an internal two-channel design. The two integrated processors monitor each other, automatically test the input and output circuits, and switch the F-I/O module to a safe state in the event of a fault.

The F-CPU communicates with the fail-safe modules via the fail-safe PROFIsafe bus profile.

Fail-safe power modules, together with the respective BaseUnit, serve the load voltage supply of the potential group and the safety-oriented tripping of the load voltage for standard output modules.

Fail-safe digital input modules detect the signal states of safety-oriented sensors and send the relevant safety message frames to the F-CPU.

Fail-safe digital output modules are suitable for safety-related shutdown procedures with short circuit and cross-circuit protection up to the actuator.

Possible uses of ET 200SP with fail-safe modules

The use of ET 200SP with fail-safe modules allows conventional configurations in safety engineering to be replaced with PROFNET IO components. This includes the replacement of switching devices for emergency STOP, protective door monitors, two-hand operation, etc.

ET 200SP fail-safe modules are supported with the STEP 7 Safety Advanced optional package V12 including HSP 54 or higher.

ET 200SP fail-safe modules are supported with IM155-6PN ST as of firmware V1.1.

Achievable safety classes

Fail-safe modules are equipped with integrated safety functions for safety mode.

The following safety classes can be achieved through appropriate parameter assignment of the safety functions in STEP 7 Professional V12 SP1 or higher with STEP 7 Safety Advanced optional package V12 or higher, through a specific combination of fail-safe and standard modules, and through a specific arrangement and wiring of sensors and actuators:

Safety class in safety mode		
According to IEC 61508	According to ISO 13849-1:2006	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

Use in SIMATIC Safety F-systems

ET 200SP fail-safe modules can be used with the STEP 7 Safety Advanced optional package, V12 or higher under PROFINET IO, together with an F-CPU.

SIMATIC Safety F-system with ET 200SP

The following figure shows a sample configuration for a SIMATIC Safety F-system with, among other things, an ET 200SP on a PROFINET IO. The PROFINET IO lines can be set up with copper cable, with fiber-optic cable or WLAN.

You will find further information on the Internet at Application planning (Page 13).

Tasks of the fail-safe IO controller (F-CPU) include the exchange of safety-related and non-safety-related data with fail-safe and standard ET 200SP modules.

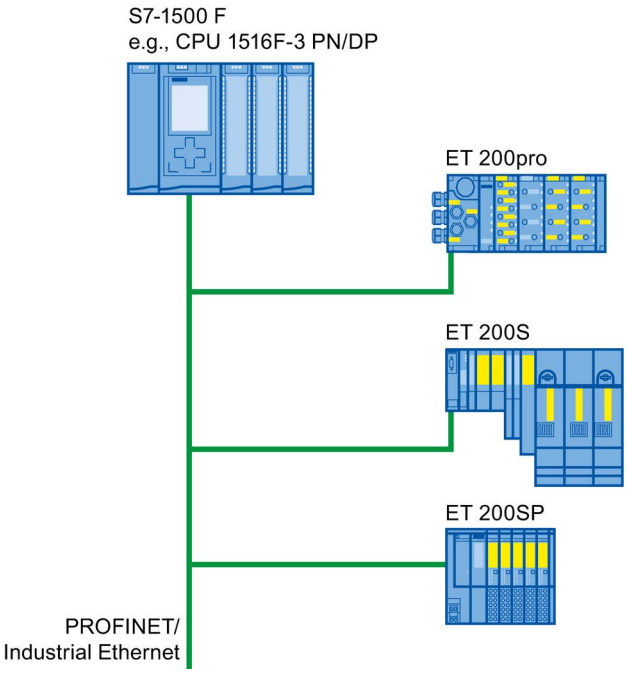

Figure 1-1 Fail-safe SIMATIC Safety automation system (sample configuration)

Use in safety mode only

Fail-safe modules can only be used in fail-safe mode. They cannot be used in non-fail-safe mode In this context, fail-safe mode/non-fail-safe mode refers to the operating mode of the F-I/O module, which either does or doesn't support safety-related communication via safety message frames.

Fail-safe modules and non-fail-safe modules can be combined within an ET 200SP.

1.2 Fault reactions with fail-safe modules

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

Note

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators.

Fault reactions and startup of the F-system

The safety function requires that fail-safe values (safe state) be applied to the fail-safe module instead of process values (**passivation of the fail-safe module**) in the following situations:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If F-I/O faults or channel faults are detected (e.g., wire break, discrepancy error)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. When the system is powered down and then restarted, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

⚠ WARNING

For channels that you set to "deactivated" in *STEP 7*, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnostic and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Fail-safe value output for F-modules

In the case of F-modules with inputs, the F-system provides fail-safe values (0) for the safety program instead of the process data pending at the fail-safe inputs in case of passivation.

In the case of F-modules with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program in case of passivation. The output channels are de-energized. This also applies when the F-CPU goes into STOP mode. The parameter assignment of fail-safe values is not possible.

Depending on which F-system you are using and the type of fault that occurred (F-I/O fault, channel fault or communication error), fail-safe values are used either for the relevant channel only or for all channels of the relevant fail-safe module.

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs are provided to the safety program
- In the case of an F-module with outputs, the output values provided in the safety program are again transferred to the fail-safe outputs

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Reaction of the F-module with inputs to communication errors

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

Application planning

2

2.1 Forming potential groups with fail-safe modules

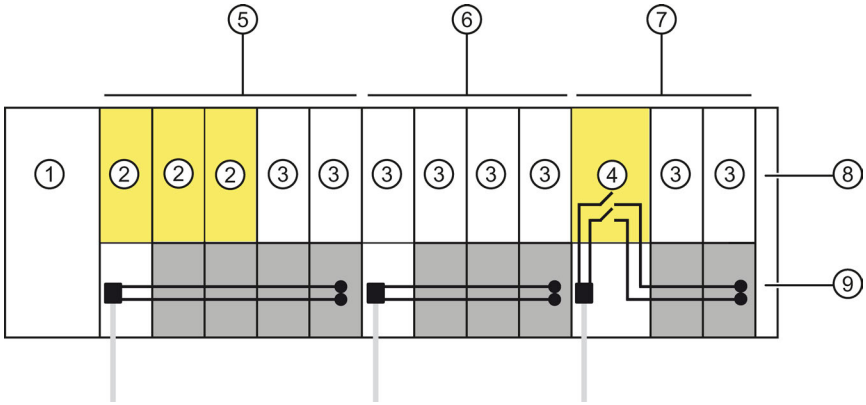
Introduction

ET 200SP distributed I/O systems can be configured using fail-safe and non-fail-safe modules. This chapter provides an example of a mixed configuration comprising fail-safe and non-fails-safe modules.

Assembly example for ET 200SP with fail-safe and non-fail-safe modules

Generally speaking, it is not necessary to operate fail-safe and non-fail-safe modules in separate potential groups. You can divide the modules into fail-safe and non-fail-safe potential groups and mount them.

The following diagram shows an assembly example with fail-safe and non-fail-safe modules within a single ET 200SP.



① Interface module IM 155-6 PN HF
② F-module
③ Non-fail-safe module
④ Power module F-PM-E 24VDC/8A PPM ST
⑤ Mixed fail-safe and non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
You achieve SIL3/Cat.4/PLe for the fail-safe modules.
⑥ Non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
⑦ Fail-safe potential group with BaseUnits BU20..D and BU15..B.
Through disconnection of the power bus, and thus of the non-fail-safe modules, up to SIL2/Cat.3/PLd is possible.
⑧ Server module
⑨ P1/P2 power buses

Figure 2-1 ET 200SP assembly example with fail-safe modules

Installation

3

3.1 Basics

The following applies to ET 200SP fail-safe modules:

⚠ WARNING
Protection from conductive contaminants In consideration of the environmental conditions, the devices must be protected from conductive contaminants. One way to accomplish this is by installing the devices in a control cabinet with an appropriate degree of protection.

Connecting

4

4.1 Additional rules and provisions for operation of the ET 200SP with fail-safe modules

4.1.1 Safe functional extra-low voltage (SELV) for fail-safe modules

⚠ WARNING

The fail-safe modules must be operated with safe functional extra low voltage (SELV, PELV).

You can find more information on safe functional extra-low voltage in the data sheets, for example, of the applicable power supplies.

The fail-safe modules work with a rated voltage of 24 V DC. The tolerance range is 20.4 V DC to 28.8 V DC.

Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.

Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g., use of an overvoltage protector.

All system components that can supply electrical energy in any form whatsoever must fulfill this condition.

Each additional circuit (24 V DC) used in the system must have a safe functional extra low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.

Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safe functional extra-low voltage as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.

⚠ WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.

An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the
fault voltage U_m to be exceeded.

Power supply requirements for compliance with NAMUR recommendations

Note

To ensure adherence to the NAMUR recommendation NE 21, IEC 61131-2 and EN 298, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least **20 ms**. The latest up-to-date information on PS components is available on the Internet (http://mall.automation.siemens.com).

It goes without saying that these requirements also apply to power packs/power supply units not constructed using ET 200SP / S7-300/-400/-1500 technology.

4.1.2 Requirements of sensors and actuators for fail-safe modules

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety.

The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".

To achieve the respective safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat.3/PLe, a single-channel sensor is all you need. However, to achieve SIL3/Cat.3/PLe with a single-channel sensor, the sensor itself must be SIL3/Cat.3/PLe-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat.4/PLe, sensors must be connected by two channels.

⚠ WARNING

In the case of fail-safe input modules, a "0" value is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.

Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the respective actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Duration requirements for sensor signals

⚠ WARNING

Observe the following requirements for sensor signals:

- In order to ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- In order for pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in section "Response times" of the respective F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

High-speed actuators may briefly drop out or be activated during this test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g., 230 V DC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (according to IEC 60664-1).

This is generally the case for relays and contactors. Particular attention must be paid to this issue for semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

4.1.3 Capacitive crosstalk of digital input/output signals

When fail-safe digital output and input signals are in a single cable, F-DQ modules and F-PM-E modules may experience readback errors.

Cause: Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short circuit and performs a safety-related shutdown.

Remedy:

- Separate cables for F-DI modules, F-DQ modules, and F-PM-E modules or non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels for the F-PM-E module
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce capacitive coupling of a strong magnetic field.

Remedy:

- Spatially disconnect the inductive loads or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

Configuring

5

5.1 Assigning the F-destination address for fail-safe modules

5.1.1 Assigning the F-destination address

The F-destination address is saved permanently on the coding element of the ET 200SP fail-safe modules.

Note

During assignment of the F-destination address, the F-modules must be supplied with supply voltage L+.

Note

Note the following in conjunction with configuration control:

Before you can use configuration control together with F-modules, you must assign the F-destination address to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the F-destination address, refer to the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) programming and operating manual.

Maintenance 6

6.1 Firmware update

Introduction

It may be necessary to update the firmware during operation (e.g. function expansions).

Update the firmware of the interface module and I/O modules using firmware files.

Options for the firmware update

Online via PROFINET IO/PROFIBUS DP (with STEP 7)

Requirements

The ET 200SP is accessible online via PROFINET IO/PROFIBUS DP.

Additional requirement for fail-safe modules

⚠ WARNING

Check of the firmware version for F-validity

When using a new firmware version, you must check whether the employed firmware version is approved for use in the respective module.

The approved firmware version is specified in the appendices of the Certificate for SIMATIC Safety.

Procedure

Connect the programming device or PC to the PROFINET IO or PROFIBUS DP interface of the ET 200SP.

Note

Firmware update of analog I/O modules

For analog I/O modules, L+ supply voltage must be present on the module at the start of and during the firmware update.

You can find additional information on the procedure in the online help for STEP 7.

Technical specifications

7

7.1 Electromagnetic compatibility of fail-safe modules

Protecting ET 200SP with fail-safe modules against overvoltages

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the BaseUnits to ensure surge immunity for the ET 200SP with fail-safe modules.

Note

Lightning protection measures always require a case-by-case examination of the entire system. An almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.

For detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure shows an example configuration with fail-safe modules. Voltage is supplied by 1 power supply unit. Note, however, that the total current of the modules fed by the power supply unit must not exceed the permissible limits. You can also use multiple power supply units.

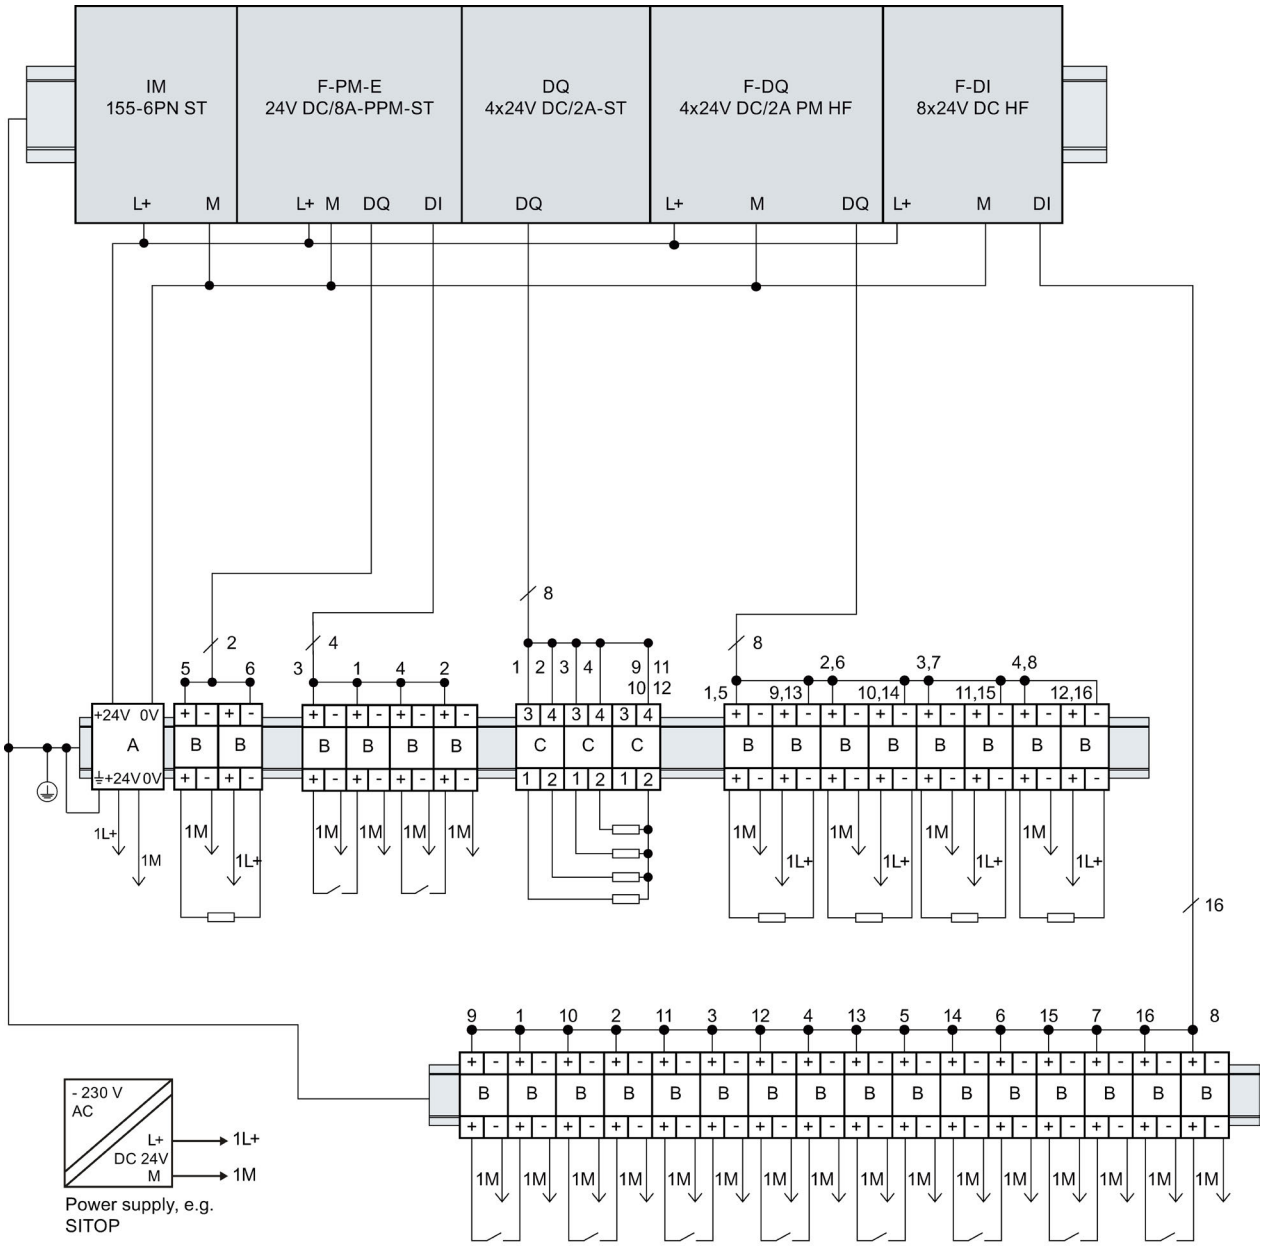

Figure 7-1 External protective circuit (surge filter) for ET 200SP with fail-safe modules

Name	Order number of Dehn Co.
A = BVT AD 24	918 402
B = DCO RK D 5 24	919 986
C = DEHNconnect DCO RK E 60	919 990

7.2 Standards and approvals

CE mark

The ET 200SP F distributed I/O system meets the requirements and safety objectives of the following EC directives and satisfies the harmonized European Standards (EN) for programmable logic controllers published in the official journals of the European Community:

- 2006/42/EC "Directive on Machinery" (Machinery Directive)
- 2006/95/EC "Electrical Equipment Designed for Use within Certain Voltage Limits" (Low-Voltage Directive)
- 2004/108/EC "Electromagnetic Compatibility" (EMC Directive)
- 94/9/EC "Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres" (Explosion Protection Directive)

The EC declarations of conformity are kept available for the relevant authorities at:

Siemens Aktiengesellschaft
Industry Sector
I IA AS FA DH AMB
PO Box 1963
D-92209 Amberg, Germany

These are also available for download on the Customer Support web page, keyword "Declaration of Conformity".

8

8.1 Lightning protection and overvoltage protection for fail-safe modules

Overvoltage suppressors for fail-safe electronic modules

Note

This section lists only those overvoltage suppressors that may be used for the protection of fail-safe modules.

Be sure to observe the detailed information on lightning protection and overvoltage protection of the ET 200SP distributed I/O device in ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Components for overvoltage protection of fail-safe modules (lightning protection zone transition 0_B to 1)

The table below lists overvoltage arresters you can use for fail-safe modules:

Table 8- 1 Components for the overvoltage protection (only for unshielded lines)

Fail-safe modules	Connecting of the lines to interface 0_B to 1 with:	Article number
Supply voltage 1L+, L+ (24 V DC)	BLITZDUCTOR BVT AD 24	918 402
Inputs/outputs of the F-modules (24 V DC)	DEHNconnect RK DCO RK D 5 24	919 986

Glossary

1oo1 evaluation

Type of → sensor evaluation – in the case of the 1oo1 evaluation, there → is one sensor with a 1-channel connection to the F module.

1oo2 evaluation

Type of → sensor evaluation – in the case of 1oo2 evaluation , two input channels are assigned one two-channel sensor or two one-channel sensors. The input signals are compared internally for equivalence or nonequivalence.

Acknowledgment time

During the acknowledgment time, the → F-I/O acknowledge the sign of life specified by the → F-CPU. The acknowledgment time is included in the calculation of the → monitoring time and → response time of the overall fail-safe system.

Actuator

Actuators can be power relays or contactors for switching on loads, or they can be loads themselves (e.g., directly controlled solenoid valves).

Availability

Availability is the probability that a system is functional at a specific point in time. Availability can be increased by redundancy, e.g., by using multiple -> sensors at thesame measuring point.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

In channel-specific passivation, the affected channel is either automatically reintegrated or the fail-safe module must be removed and reinserted after the fault has been eliminated.

Channel group

The channels of a module are grouped together in a channel group. Certain parameters in STEP 7 can only be assigned to channel groups, rather than to individual channels.

Channel number

Channel numbers are used to uniquely identify the inputs and outputs of a module and to assign channel-specific diagnostic messages.

Channel-specific passivation

With this type of passivation, only the affected channel is passivated in the event of a → channel fault. In the event of a → module fault, all channels of the → fail-safe module are passivated.

CRC

Cyclic Redundancy Check

CRC signature

The validity of the process values in the safety message frame, the accuracy of the assigned address references, and the safety-related parameters are validated by means of the CRC signature in the safety message frame.

Dark period

Dark periods occur during shutdown tests and complete bit pattern tests. The fail-safe output module switches test-related zero signals to the active output. This output is then briefly disabled (= dark period). An adequate carrier → actuator will not respond to this and will remain activated.

Derating

See temperature characteristics

Discrepancy analysis

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is performed to determine whether the difference (for nonequivalence testing: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

The discrepancy analysis compares the two input signals of the 1oo2 sensor evaluation in the fail-safe input module.

Discrepancy time

Configurable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are extended unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily since a discrepancy error is detected when, in reality, no error exists.

Fail-safe modules

ET 200SP modules with integrated safety functions that can be used for safety-related operation (safety mode).

Fail-safe systems

Fail-safe systems (F-systems) remain in a safe state or immediately assume another safe state as soon as particular failures occur.

Fault response time

The maximum fault response time of an F-system defines the interval between the occurrence of any fault and a safe reaction at all affected fail-safe outputs.

For → F-systems overall: The maximum fault response time defines the interval between the occurrence of any fault at any → F-I/O and the safe reaction at the corresponding fail-safe output.

For digital inputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the backplane bus.

For digital outputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the digital output.

Fault tolerance time

The fault tolerance time of a process is the time a process can be left unattended without risk to life and limb of the operating personnel, or damage to the environment.

Any type of F-system control is tolerated within this fault tolerance time, i.e. the → F-system can control its processes incorrectly or even not at all. The fault tolerance time depends on the type of process and must be determined on a case-by-case basis.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is permitted for use in SIMATIC Safety. A standard user program can also be run on the F-CPU.

F-I/O

Collective name for fail-safe inputs and outputs available in SIMATIC S7 for integration into the SIMATIC Safety F-system. Available F-I/O modules:

- Fail-safe I/O module for ET 200eco
- Fail-safe signal modules S7-300 (F-SMs)
- Fail-safe modules for ET 200S
- Fail-safe modules for ET 200SP
- Fail-safe DP standard slaves
- Fail-safe PA field devices
- Fail-safe IO devices

F-monitoring time

→ PROFIsafe monitoring time

F-Systems

→ fail-safe systems

Module fault

Module faults can be external faults (e.g. missing load voltage) or internal faults (e.g. processor failure). Internal faults always require module replacement.

Monitoring time

→ PROFIsafe monitoring time

M-switch

Each fail-safe digital output of ET 200SP F-modules consists of a P-switch DO-P_x (current sourcing) and an M-switch DO-M_x (current sinking). The load is connected between the P-switch and M-switch. The two switches are always activated so that voltage is applied to the load.

Nonequivalent sensor

A nonequivalent → sensor is a two-way switch that is connected to two inputs of an → F-I/O (via 2 channels) in → fail-safe systems (for → 1oo2 evaluation of sensor signals).

Passivation

If an → F-I/O module detects a fault it switches either the affected channel or all channels to a → safe state, i.e. the channels of this F-I/O module are passivated. The F-I/O module signals the detected faults to the → F-CPU.

When passivating channels at F-I/O with inputs, the → F-System provides fail-safe values for the → safety program instead of the process values pending at the fail-safe inputs.

When passivating channels at F-I/O with outputs, the F-system returns fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program.

Performance Level

Performance Level (PL) according to ISO 13849-1:2006 or EN ISO 13849-1:2008

PROFIsafe

Safety-oriented PROFINET I/O bus profile for communication between the → safety program and the → F-I/O module in a → fail-safe system.

PROFIsafe address

Every → fail-safe module has a PROFIsafe address. You have to configure the PROFIsafe address.

PROFIsafe monitoring time

Monitoring time for safety-related communication between the F-CPU and F-I/O

Proof-test interval

Period after which a component must be forced to fail-safe state, that is, it is either replaced with an unused component, or is proven faultless.

P-switch

→ M-switch

Redundancy, availability-enhancing

Multiple instances of components with the objective of maintaining component functionality in the event of hardware faults.

Redundancy, safety-enhancing

Multiple availability of components with the aim of exposing hardware faults based on comparison; such as → 1oo2 evaluation in → fail-safe modules.

Reintegration

After the elimination of a fault, it is necessary to ensure the reintegration (depassivation) of the → F-I/O. Reintegration (switchover from fail-safe values to process values) occurs either automatically or only after a user acknowledgment in the safety program.

In the case of a fail-safe input module, the process values pending at the fail-safe inputs are made available to thesafety program again after reintegration. In the case of a fail-safe output module, the → fail-safe system transfers the output values in the safety program to the fail-safe outputs again.

Safe state

The basic principle of the safety concept in F-systems is the existence of a safe state for all process variables. For the digital F-I/O, for example, the safe state is the value "0".

Safety class

Safety level (Safety Integrity Level) SIL according to IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and hardware failures.

The fail-safe modules support operation in safety mode up to safety class SIL3.

Safety function

A mechanism integrated in the → F-CPU and → F-I/O that enables their use in → the fail-safe system SIMATIC Safety.

According to IEC 61508:2010 A safety function is implemented by a safety system in order to maintain or force a system safe state in the event of a specific fault.

Safety message frame

In safety mode, data are transferred between the → F-CPU and → F-I/O in a safety message frame.

Safety mode

Operating mode of → F-I/O that enables → safety-related communication via → safety message frames.

→ ET 200SP fail-safe modules can only used in safety mode.

Safety program

Safety-related user program

Safety-related communication

Communication used to exchange fail-safe data.

Sensor evaluation

There are two types of sensor evaluation:

→ 1oo1 evaluation – sensor signal is read once

→ 1oo2 evaluation – sensor signal is read in twice by the same F-module and compared internally

Sensors

Sensors are used for accurate detection of digital and analog signals as well as routes, positions, velocities, rotational speeds, masses, etc.

SIL

Safety Integrated Level → safety class

Standard mode

Operating mode of F-I/O in which standard communication is possible by means of → safety message frames, but not → safety-related communication.

Fail-safe ET 200SP modules can only be operated in safety mode.

Value status

The value status is the binary additional information of a digital signal. The value status is entered in the process image of the input and provides information on the validity of the signal.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293). Functions affecting the system in general are described there.

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Changes compared to the previous version

In contrast to the previous version, the chapters "BaseUnits for motor starters" and "Dimension drawings for motor starters" have been added to this manual.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

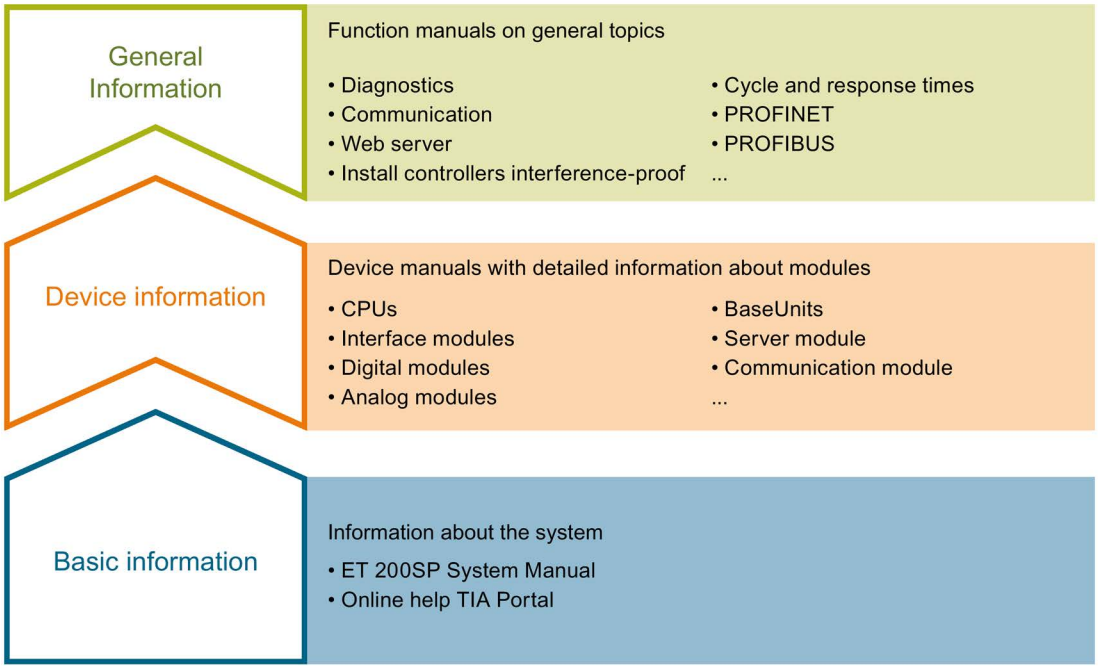
Guide to the documentation

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet.

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (http://support.industry.siemens.com/cs/ww/en/ps/ae).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

General properties of the BaseUnits

In the ET 200SP distributed I/O system, there are a number of different BaseUnits. The BaseUnit determines, among other things, the process connection, the suitable I/O modules/motor starters, and the infeed of the supply voltage. All properties can be identified by the short designation of the BaseUnit which is explained below.

Table 2- 1 Properties of the BaseUnits

Short description BU15-P16+A10+2D/T (example)			BaseUnit properties
Module width	BU	15	BaseUnit with width of 15 mm
		20	BaseUnit with width of 20 mm
		30	BaseUnit with width of 30 mm
Process connection	P	4	• Connection method: Push-in terminal • Number of terminals to the I/O module: 4
		8	• Connection method: Push-in terminal • Number of terminals to the I/O module: 8
		16	• Connection method: Push-in terminal • Number of terminals to the I/O module: 16
Connection to the AUX busbar	A	0	No connection to the AUX busbar
		10	n = number of AUX terminals, e.g. 10
Self-assembling voltage buses	2		2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B)
	12		• 2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B) • 2x5 push-in additional terminals (1B to 5B, 1C to 5C) for connecting further potential up to a maximum supply current of 24 V DC / 10 A
	0		No terminals with access to the self-assembling voltage buses P1, P2
		B	• Looping through the potential group • Tapping of the supply voltage for external components or looping through with a maximum total current of 10 A per potential group
		D	• Opening a new potential group • Feeding in of supply voltage up to a maximum supply current of 10 A
Additional functions	T		Integrated temperature sensor to compensate the reference junction temperature for thermocouples

Properties of the BaseUnits for motor starters

The following table lists the properties of the individual BaseUnits for motor starters:

BaseUnit	Properties
BU30-MS1	• Push-in terminals for opening a new potential group (24 V DC). • Feeding in of supply voltage up to a maximum supply current of 7 A DC. • Opening a new supply voltage potential group (500 V AC) • Feeding in of supply voltage up to a maximum supply current of 32 A AC.
BU30-MS2	• Looping through the potential group (24 V DC) • Push-in terminals for opening a new supply voltage potential group (500 V AC) • Feeding in of supply voltage up to a maximum supply current of 32 A AC.
BU30-MS3	• Push-in terminals for opening a new potential group (24 V DC). • Feeding in of supply voltage up to a max. supply current of 7 A DC • Looping through the supply voltage potential group (500 V AC)
BU30-MS4	• Looping through the supply voltage potential group (500 V AC) • Looping through the potential group (24 V DC)
BU30-MS5	• Looping through the potential group (24 V DC) • Push-in terminals for opening a new supply voltage potential group (500 V AC) • Feeding in of supply voltage up to a maximum supply current of 32 A AC. • One fail-safe digital input
BU30-MS6	• Looping through the potential group (24 V DC) • Looping through the supply voltage potential group (500 V AC) • Push-In terminals • One fail-safe digital input

Selecting, installing and connecting BaseUnits

See the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)

WARNING

Personal injury or damage to equipment is possible.

Connecting a rated supply voltage to the BaseUnit higher than the one given in the technical specifications may lead to dangerous situations in your plant or cause defects in ET 200SP components.

Therefore, only connect the rated supply voltage given in the technical specifications to the BaseUnit.

The connected rated supply voltage must correspond to the rated supply voltage of the I/O modules in the potential group.

When mains voltage is connected to the BaseUnit, you must ensure that all other supply voltages on this BaseUnit use the same phase as the mains.

The Totally Integrated Automation Selection Tool (TIA Selection Tool) (http://www.siemens.com/tia-selection-tool) supports you in selecting, configuring and ordering the ET 200SP modules. This tool can be downloaded free of charge from the Internet (http://support.automation.siemens.com/WW/view/en/58649293).

WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Proper use of hardware products

This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.

Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.

EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Machinery Directive 2006/42/EC.

WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Please take note of our latest information.

Systems with safety-related characteristics are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we publish a special newsletter containing information on product developments and features that are (or could be) relevant to operation of safety-related systems. By subscribing to the appropriate newsletter, you will ensure that you are always up-to-date and able to make changes to your system, when necessary:

BaseUnits for I/O modules

3

3.1 BU15-P16+A10+2D (BU type A0)

3.1.1 Product overview

Article number

6ES7193-6BP20-0DA0

View

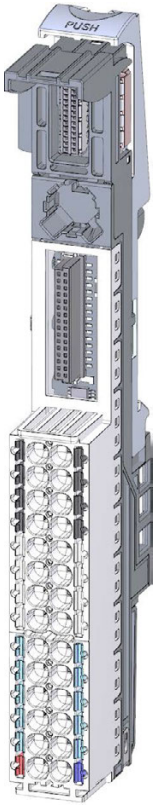

Figure 3-1 BaseUnit BU15-P16+A10+2D

Properties

- BaseUnit suitable for all I/O modules of the BaseUnit type "A0/A1". Can be recognized by the last two digits of the article number.
  - Supply voltage (L+ terminal, ground): Max. 24 VDC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 10 AUX terminals for connecting a protective conductor or potential. The AUX busbar is not connected to the I/O module.
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

3.1.2 Connecting up

Pin assignment

View

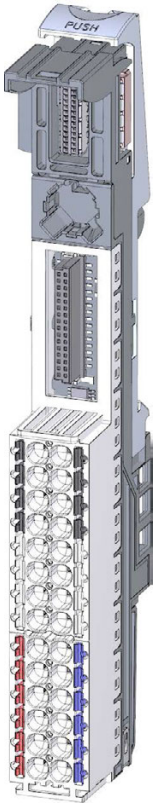

Figure 3-9 BaseUnit BU15-P16+A0+12D/T

Properties

- BaseUnit for all I/O modules of BaseUnit type "A1". Can be recognized by the last two digits of the order number.

  Note

  Using another I/O module can trigger an internal, non-exchangeable fuse and you must exchange the terminal box.

  - Supply voltage (L+ terminal, ground): Max. 24 VDC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- No access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 2x5 additional terminals for supplying a supply voltage up to 24 V DC/ 10 A. The additional terminals are not connected to the I/O module.
- Recording of the terminal temperature for internal temperature compensation at connected thermocouples
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

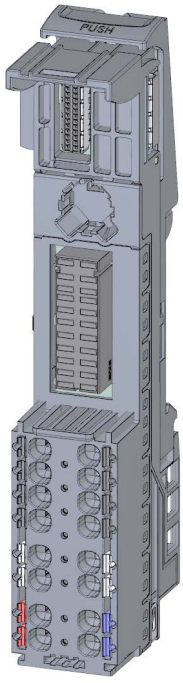

Figure 3-19 BaseUnit BU20-P12+A0+4B

Properties

- BaseUnit suitable for all I/O modules of the BaseUnit type "B1". Can be recognized by the last two digits of the article number.
  - Current-carrying capacity per process terminal (terminal 1 to 12): Max. 5 A
- The BaseUnit conducts the potential group further. The self-assembling voltage buses P1 and P2, and the AUX busbar are connected to the left-hand neighboring module (BaseUnit).
- No access to the power and AUX busbars via terminals
- 12 terminals to the process (assignment with the I/O module)
- Connection method using push-in terminals

View

Figure 3-21 BaseUnit BU20-P6+A2+4D

Properties

- BaseUnit suitable for all I/O modules of BaseUnit type "C0/C1". Can be recognized by the last two digits of the article number.
  - Supply voltage (terminal 1L, 2L / 1N, 2N): Max. 230 V AC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 4): Max. 5 A
  - Current carrying capacity per process terminal (terminal 5 and 6): Max. 10 A
- The BaseUnit opens up a new potential group by means of the inserted I/O module. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 6 terminals to the process (assignment with the I/O module)
- Two AUX terminals for connecting a PE terminal or potential. The AUX busbar is not connected to the I/O module.
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

3.11.2 Connecting

Pin assignment

BaseUnits for motor starters

4

4.1 Introduction

Properties of the infeed bus

- The infeed bus is set up by connecting the BaseUnits, and wiring takes place automatically
- The infeed bus distributes the energy to the SIMATIC ET 200SP motor starter within one load group
- The max. current carrying capacity is up to 32 A (3-phase)
  - With infeed (for one load group) and motor connection
  - Infeed bus: 3-pole + PE
  - The voltage range for power infeed is 48 … 500 V AC

You must observe the deratings depending on the configuration.

Properties of the self-assembling voltage bus (power bus)

- Maximum current: 7 A
- Rated voltage: 24 V DC

You must observe the deratings depending on the configuration.

AUX1 bus

The AUX1 bus is not supported in the BaseUnits of the SIMATIC ET 200SP motor starters.

You can find assembly rules of the BaseUnits for the SIMATIC ET 200SP motor starter in the System Manual SIMATIC ET 200SP motor starters.

4.2 BU30-MS1 - BaseUnit with 24 V DC and 500 V AC infeed

4.2.1 Product overview

Article number

3RK1908-0AP00-0AP0

View

Figure 4-1 BaseUnit with 24 V DC and 500 V AC infeed

Properties

- BaseUnit suitable for all fail-safe and non-fail-safe SIMATIC ET 200SP High Feature motor starters
- The BaseUnit opens a new potential group (24 V DC). The power buses P1 and P2 are interrupted to the left-hand neighboring module (BaseUnit, interface module/CPU).
- The BaseUnit opens a new potential group (500 V DC). The infeed bus L1 (L), L2 (N), L3, PE is interrupted to the left-hand BaseUnit of the ET 200SP motor starter.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus (3RK1908-1DA00-2BP0) is included in the scope of delivery.
- The fail-safe input F-DI of the fail-safe motor starter is connected to the power bus.

Maximum configuration per voltage group (24 V DC)

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total overall current calculated according to 1. and 2. must not exceed 7 A.

Maximum configuration of the infeed bus (500 V AC)

The number of motor starters that can be used per infeed group depends on the following factors:

1. Total current requirement of all motor starters operated on this infeed group.
2. Ambient temperature and installation type in which the motor starters are operated. You can find further information in the derating table in the Manual SIMATIC ET 200SP motor starters (https://support.industry.siemens.com/cs/ww/en/view/109479973).

4.6 BU30-MS5 BaseUnit with 500 V AC infeed and F-DI

4.6.1 Product overview

Article number

3RK1908-0AP00-0EP0

View

Figure 4-9 BaseUnit with 500 V AC and F-DI

Properties

- BaseUnit suitable for all fail-safe SIMATIC ET 200SP High Feature motor starters
- The BaseUnit handles the potential group (P1, P2) of the left-hand neighboring module.
- The BaseUnit opens a new 500 V AC infeed group. The potential group (24 V DC) is looped through.
- The BaseUnit has one F-DI input terminal for fail-safe control signals of the motor starter. This signal is not forwarded to neighboring motor starters.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus is included in the scope of delivery.

Maximum configuration of the infeed bus

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total overall current calculated according to 1. and 2. must not exceed 7 A.

Properties of the F-DI input

The fail-safe digital input "F-DI" has the following properties:

- Use of interconnection type 1oo1 possible
- Sink input
- Input delay 10 ms
- Status indication of input F-DI at motor starter module (green LED)

4.6.2 Connection

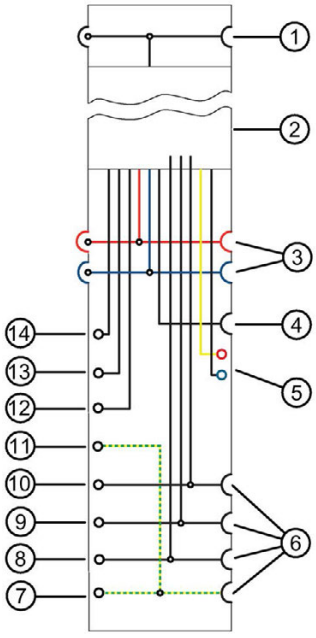
Pin assignment

Table 4- 5 Pin assignment for BaseUnit with 500 V AC infeed and F-DI

Pin assignment for BaseUnit with 500 V AC infeed and F-DI	
Terminal	**Descriptions**
T1, T2, T3, PE	Motor feeder
F-DI, M	F-DI: Connection of fail-safe signal M: Reference potential of fail-safe signal
L1(L), L2(N), L3, PE	Power supply Assignment is determined by the motor starter. See Manual ET 200SP motor starters (https://support.industry.siemens.com/cs/ww/en/view/109479973).

Block diagram

The figure below shows the two-phase connection with 500 V AC infeed and F-DI:



① Backplane bus
② Motor starter module
③ Connected power buses 24 V DC, M
④ Interrupted AUX bus

4.6.3 Technical specifications

Technical specifications of the BaseUnit with 500 V AC infeed and F-DI

	3RK1908-0AP00-0EP0
Product type designation	BU30-MS5
Galvanic isolation	
Galvanic isolation between backplane bus and supply voltage	Yes
Insulation tested with	2500 V AC
Rated operating voltage	24 V DC
Max. operating current	7 A (observe derating)
Galvanic isolation between fail-safe digital input and supply voltage	Yes
Rated insulation voltage in accordance with IEC 60947-1	500 V
Impulse withstand voltage/rated value U_{imp} according to IEC 60947-1	6 kV
Operating voltage range	48 ... 500 V AC
Max. current-carrying capacity	32 A (observe derating)
Isolating function between the infeed terminals L1(L), L2 (N), L3 and motor feeder terminals T1, T2, T3 for motor starters in parking position, or removed motor starters: impulse withstand voltage/rated value Uimp according to IEC 60947-1	6 kV
Wiring	
Push-in	Required tools for releasing: Standard screwdriver size 1 (SZF1 - 0.6x3.5)
Dimensions	
Width	30 mm
Height	215 mm
Weight, approx.	152 g

4.7 BU30-MS6 BaseUnit without infeed and with F-DI

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

The controller offers various options for program execution with different run priorities. Cyclic-driven and time-driven program execution have the largest share. The response times of a controller are therefore significantly determined by the processing cycles.

There is also the possibility of event-driven program execution. The event-driven program execution is normally limited to a few selected events.

This manual provides information on the following topics:

- Types of program execution
- Run priorities
- Cycle and response times, and the influences to which they are subject
- Configuration options for the optimization of your user program

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the SIMATIC industrial automation system
- Knowledge of the use of Windows-based computers
- Knowledge of working with STEP 7

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation mainly describes the CPU components of the cycle and response times of the S7-1500 automation system, the CPUs of the ET 200SP distributed I/O system, and the CPU 1516pro-2 PN of the ET 200pro distributed I/O system. You can find links to more information on the ET 200MP, ET 200SP and ET 200pro distributed I/O systems at the corresponding points in this manual.

What's new compared to the previous version of the function manual (02/2014 edition)?

What's new?		What are the customer benefits?	Where can I find information?
Changed contents	Scope of the function manual expanded to include the CPUs of the ET 200SP distributed I/O system and CPU 1516pro-2 PN of the ET 200pro distributed I/O system	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP 65, IP 66 and IP 67).	Starting from section Program execution (Page 12)

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

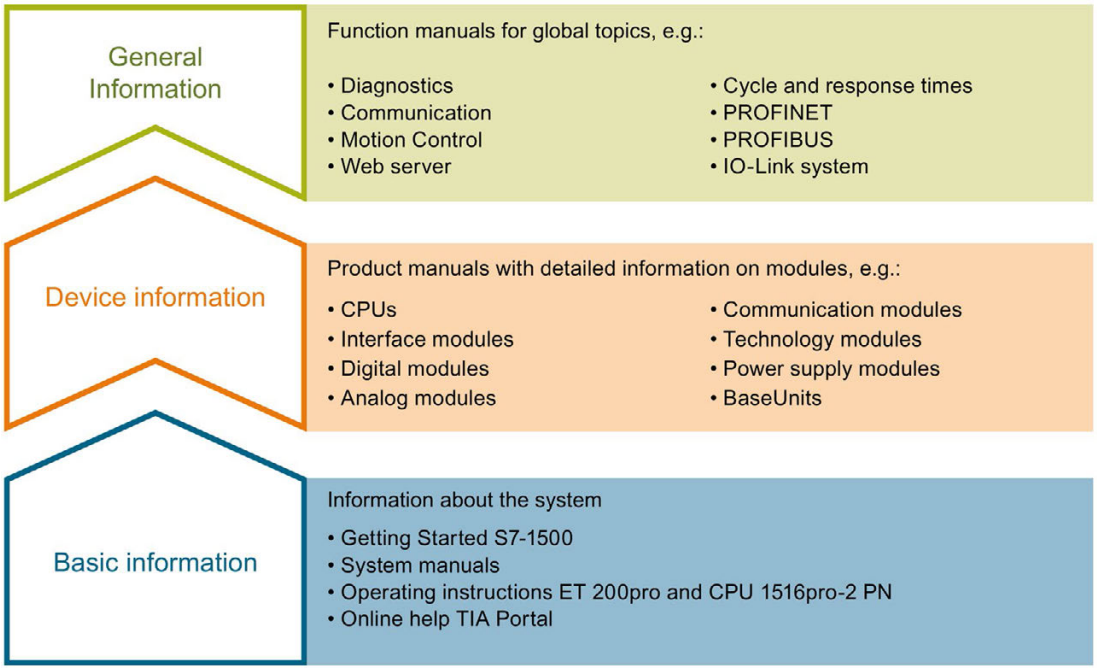
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Program execution 2

2.1 Principle of operation

Introduction

You often program your user program with a cyclic OB, usually in OB 1. With complex applications, problems are often encountered in complying with the response times required by the application. You can often meet the response time requirements by splitting the user program up into several parts with different response time requirements. The CPU offers a number of different OB types for this purpose, the properties (priority, frequency, etc.) of which can be adapted to meet your requirements.

Program organization

You can choose from the following types of program execution for running your user program:

Program execution in the cyclic program of the CPU:

The CPU executes the user program cyclically. When the execution has reached the end of a cycle, the program execution starts again in the next cycle. In the simplest case, you execute the entire user program in the cyclic program of the CPU. All tasks in the user program are then processed with equal rank. This also results in the same response times for all tasks.

In addition to program execution in the cyclic program, there is time-driven and event-driven program execution.

Time-driven execution:

In a complex user program, there are frequently portions with different response time requirements. You can optimize the response times by taking advantage of these differences in the requirements. To do so, you can move the program parts with higher response time requirements to higher-priority OBs with shorter cycles, for example cyclic interrupt OBs.

The execution of these parts can thus occur with different frequencies and priorities.

Event-driven execution:

Depending on the I/O modules used, you can configure hardware interrupts for specific process events (such as an edge change of a digital input) that result in the call of the assigned hardware interrupt OB. The hardware interrupts have a higher priority and interrupt the cyclic program of the CPU. You can achieve very short response time in the CPU with hardware interrupts by directly triggering program execution.

Keep in mind that the time characteristics of your application becomes less predictable with intense use of hardware interrupts. The reason for this is that the time at which the triggering events occur can result in drastically different response times.

Tip: Use hardware interrupts only for a few selected events.

Special consideration for hardware interrupts: If you have assigned an OB to an event (hardware interrupt), the OB then has the priority of the event.

Using process image partitions

If a program is distributed over various OBs, for example, due to differing response time requirements, it is advisable and often necessary to assign the update of the used I/O data directly to these OBs. You can use process image partitions for this purpose.

You group the input and output data in a process image partition according to their use in the program and assign the data to the OB.

A process image partition of the inputs (PIPI) permits the associated input data for an OB program to be updated immediately before the OB program starts.

A process image partition of the outputs (PIPQ) permits the output data associated with an OB program to become effective on the outputs immediately after the OB program runs.

You have 32 (0 … 31) process image partitions at your disposal. The I/O is assigned to the process image partition 0 by default (setting: "Automatic update"). Process image partition 0 is permanently assigned to cyclic execution.

You have to configure the "system-side update of process image partitions". You can find additional information on configuration of process image partitions in the online help for STEP 7 under the keyword "Assign process image/process image partition".

Interruptibility of program execution

Each organization block is processed according to the priority it has been assigned. You can adapt the priority according to the response time requirements for most organization blocks.

All cycle OBs always have the lowest priority of 1. The highest priority is 26.

Communication tasks always have priority 15. If necessary, you can change the priority of your blocks and select a higher priority than the communication.

Organization blocks or system activities with higher priority interrupt those with lower priority, and thus extend the runtime of the interrupted organization blocks or system activities. If two pending tasks have the same priority, these tasks are processed in the order in which the tasks occurred.

Note

Higher priority OBs

Communication functionality is strongly influenced by too many or runtime-intensive OBs with a priority > 15.

When using OBs with a priority > 15, you should consider the runtime load that they cause in order to keep communication functionality at a reasonable level.

Reference

You can find additional information on the subject of "priorities" in the section Events and OBs of the system manual S7-1500 Automation system (http://support.automation.siemens.com/WW/view/en/59191792), the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) and the operating instructions for CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416).

You can find additional information on organization blocks and their priorities for Motion Control in the function manual S7-1500T Motion Control V3.0 in the TIA Portal V14 (https://support.industry.siemens.com/cs/ww/en/view/109481326).

2.2 CPU overload behavior

Principle of CPU overload behavior

An occurring event triggers the execution of the associated OB. Depending on the OB priority and the current processor load, a time delay may occur before the OB is executed when there is an overload. The same event can therefore occur once or several times before the user program processes the OB belonging to the preceding event. The CPU handles such a situation as follows: The operating system queues the events in the queue associated with their priority in the order of their occurrence.

To control temporary overload situations, you can limit the number of queued events that originate from the same source. The next event is discarded as soon as the maximum number of pending triggers of a specific cyclic interrupt OB, for example, is reached.

An overload occurs when events which originate from the same source occur faster than they can be processed by the CPU.

Configuration of the overload response

In the properties of an organization block in which an overload can occur, you can select the response to an overload occurrence under "Attributes" and "Event queuing".

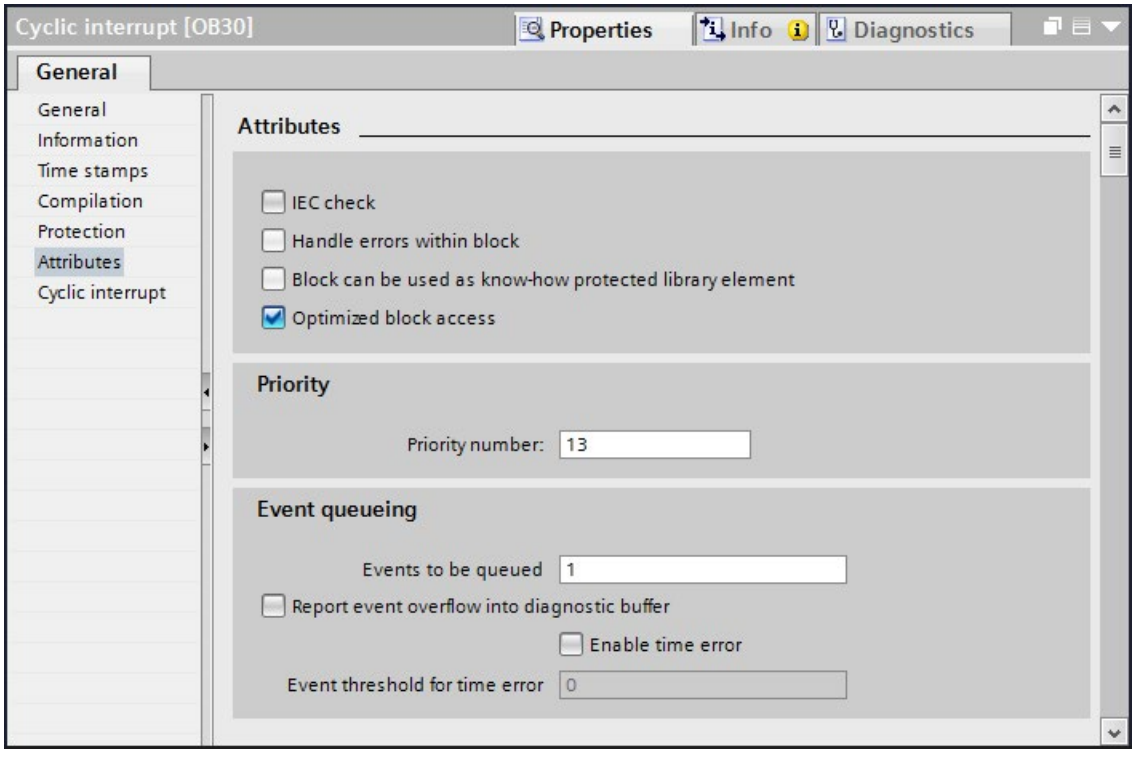


Figure 2-1 Configuration of the overload response in the block properties

Below, the term "similar events" refers to events from a single source, such as triggers for a specific cyclic interrupt OB.

The OB parameter "Events to be queued" is used to specify how many similar events the operating system places in the associated queue and therefore post-processes. If this parameter has the value 1, for example, exactly one event is stored temporarily.

Note

Post-processing of cyclic events is often not desirable, as this can lead to an overload with OBs of the same or lower priority. Therefore, it is generally advantageous to discard similar events and to react to the overload situation during the next scheduled OB execution. If the value of the "Events to be queued" parameter is low, this ensures that an overload situation is mitigated rather than aggravated.

If the maximum number of triggers is reached in the queue for a cyclic interrupt OB (Cyclic interrupt), for example, each additional trigger is only counted and subsequently discarded. During the next scheduled execution of the OB, the CPU provides the number of discarded triggers in the "Event_Count" input parameter (in the start information). You can then react appropriately to the overload situation. The CPU then sets the counter for lost events to zero.

If the CPU first discards a trigger for a cyclic interrupt OB, for example, its further behavior depends on the OB parameter "Report event overflow into diagnostic buffer": If the check box is selected, the CPU enters the event DW#16#0002:3507 once in the diagnostics buffer for the overload situation at this event source. The CPU suppresses additional diagnostics buffer entries of the event DW#16#0002:3507 until all events from this source have been post-processed.

The cyclic interrupt OB parameter "Enable time error" is used to specify whether the time error OB should be called when a specific overload level is reached for similar events. You can find the OB parameter "Enable time error" in the properties of the OB in the "Attributes" category.

When you enable the time error OB (check box selected), use the OB parameter "Event threshold for time error" to specify the number of similar events in the queue as of which the time error OB is called. If this parameter has the value 1, for example, the CPU enters the event DW#16#0002:3502 once in the diagnostics buffer and requests the time error OB when the second event occurs. The CPU suppresses additional diagnostics buffer entries of the event DW#16#0002:3502 until all events from this source have been post-processed.

Note

The "Enable time error" parameter is not enabled in the default setting. If a time error occurs due to a cyclic interrupt OB, for example, the CPU does not change to STOP mode.

In the event of an overload, you therefore have the option of programming a reaction well before the limit is reached for similar events and thus before events are discarded.

The following value range applies to the "Event threshold for time error" parameter:
1 ≤ "Event threshold for time error" ≤ "Events to be queued".

Cyclic program execution

3

3.1 Cycle

Definition of cycle

A cycle includes the following sections:

- Automatic update of the process image partition 0 of the inputs (PIPI 0)
- Execution of the cyclic program
- Update of process image partition 0 of the outputs (PIPQ 0)

The process image partition 0 is automatically updated in the cycle. You assign the I/O addresses to these process image partitions (PIPI 0 / PIPQ 0) when you configure the I/O modules via the "Automatic update" setting (default).

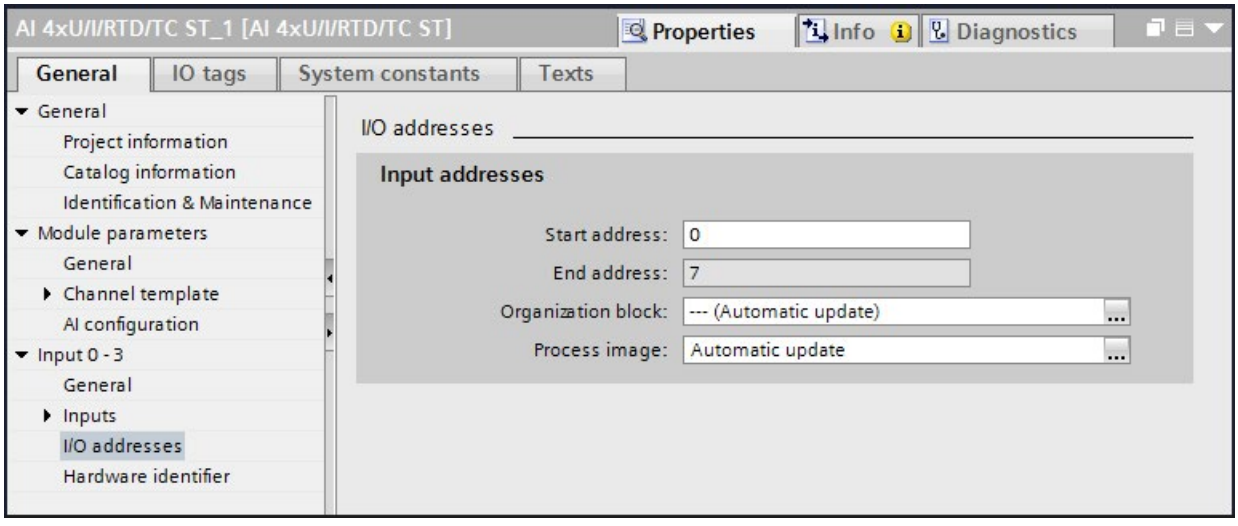

Figure 3-1 Assigning I/O addresses to process image partitions

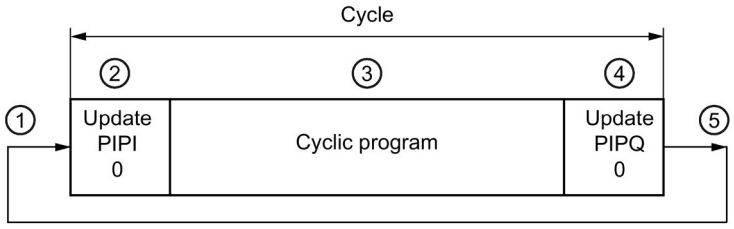
The figure below illustrates the phases that are passed through during a cycle.



① The operating system starts measurement of the cycle time.
② The CPU reads the status of the inputs at the input module and writes the input data to the process image input.
③ The CPU processes the user program and executes the instructions specified in the program.
④ The CPU writes the states from the process image output to the output modules.
⑤ The operating system evaluates the determined cycle time and starts the measurement again.

Figure 3-2 Cycle

3.2 Cycle time

Definition of cycle time

The cycle time is the time the CPU needs to execute the cyclic program and to update the process image input and output as well as for all program parts and system activities that interrupt this cycle.

3.2.1 Different cycle times

Introduction

The cycle time (T_{cyc}) is not the same length in each cycle because the execution times may vary. Causes of this include:

- Different program runtimes

  (e.g. program loops, conditional commands, conditional block calls, or different program paths)

- Lengthening due to interruptions

  (e.g. time-driven interrupt execution, execution of hardware interrupts or communication)

Causes of different cycle times

The cycle time T_{cyc2} is longer than T_{cyc1}, because the cyclic program is interrupted by a cyclic interrupt OB in this example (e.g. OB 30) The cyclic interrupt OB in turn is interrupted by Motion Control functions and communication.

The figure below shows the different cycle times T_{cyc1} and T_{cyc2}.

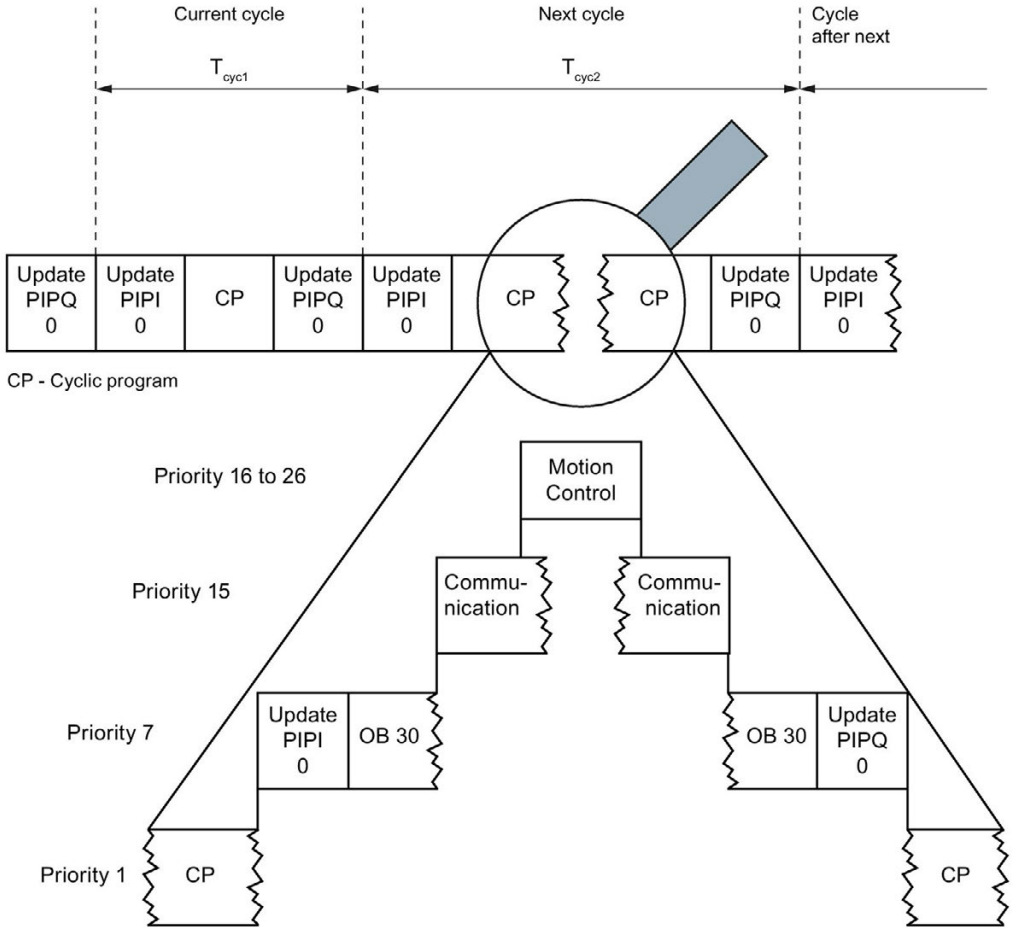


Figure 3-3 Possible causes of differing cycle times

Minimum cycle time

In STEP 7, you can set a minimum cycle time for a CPU. The default for the minimum cycle time is one millisecond. It may be advisable to increase this setting in the following cases:

- To reduce the cycle time's fluctuation range.
- To make remaining computing time available for communication tasks that the CPU can process until the expiry of the minimum cycle time, for example, when
  - The CPU is mainly used for communication purposes
  - The processing power of the communication is not enough because many organization blocks are set with a priority > 15 (e.g. for Motion Control functions)

Maximum cycle time

The cycle time is monitored by the CPU. By default, the maximum cycle time is 150 ms. You can set this value from 1 ms to 6000 ms when assigning parameters to the CPU. When the cycle time is longer than the maximum cycle time, the time error OB (OB 80) is called.

You have the option of restarting the maximum cycle time using the "RE_TRIGR" instruction, and thus extending it.

With the user program in OB 80 you specify how the CPU responds to the time error. The CPU goes to STOP under the following conditions.

- If you have not loaded an OB 80.
- If the cycle is still not completed after an additional maximum cycle time

Keep in mind that the cycle time is extended by interruptions as shown in the previous figure.

Cycle time statistics

You can read the cycle time statistics either directly from STEP 7 (Online tools task card) or with the "RT_INFO" instruction.

You can use the "RT_INFO" instruction to generate statistics in STEP 7 on the runtime of specific organization blocks, communication or the user program. For example, this includes

- The minimum and maximum cycle time
- The portions of runtime used for communication and the user program

---

Note

Showing the cycle time statistics on the display and Web server

With the S7-1500 CPUs, you also have the option of calling the cycle time statistics via the display of the CPU. As of firmware version 2.0 of the CPUs, the cycle time statistics are also displayed in the Web server.

To view the cycle time statistics directly in STEP 7, follow these steps:

1. Establish an online connection to the CPU with STEP 7.
2. Select the Online tools task card on the very right.

Result: The diagram of the cycle time statistics is displayed in the cycle time section.

The following figure shows an extract from STEP 7 with the cycle time statistics. In this example, the cycle time fluctuates between 7 ms and 12 ms. The current cycle time is 10 ms. The maximum cycle time that can be set in this example is 40 ms.

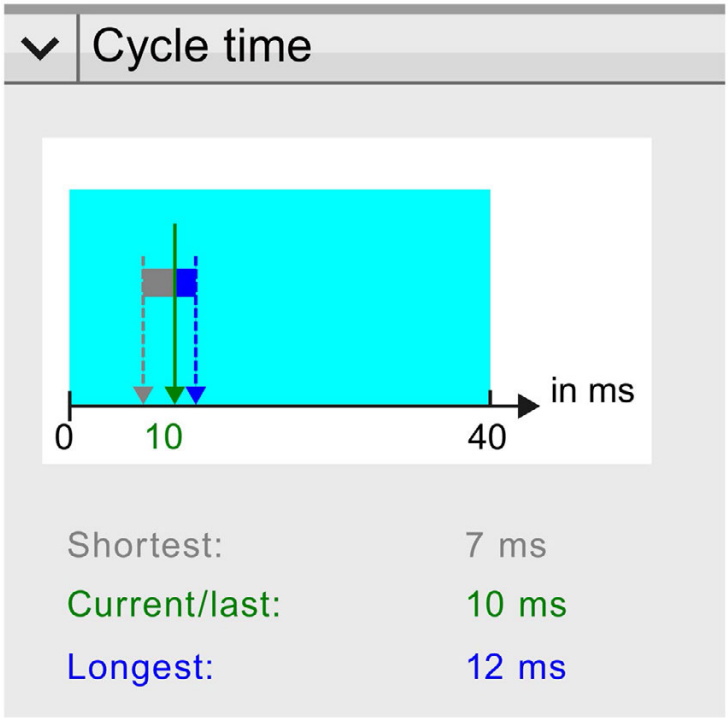

Figure 3-4 Cycle time statistics

You can find additional information on the runtime characteristics of the CPU with the "RT_INFO" instruction in the user program. You can read the utilization of the CPU by the user program and communication in percentage, and you can also read the runtime statistics of individual OBs.

Reference

You can find additional information on the "RT_INFO" instruction in the STEP 7 online help.

3.2.2 Influences on the cycle time

3.2.2.1 Update time for process image partitions

Estimating update time for process image partitions

The update time of the process image partitions depends on the volume of assigned central and distributed I/O module data.

You can estimate the update time using the following formula:

Base load for process image update
\+ Number of words in the process image x copy time for central I/O
\+ Number of words in the process image via DP x copy time for PROFIBUS I/O
\+ Number of words in the process image via PROFINET x copy time for PROFINET I/O

= Update time of the process image partition

Update times of the process image partitions

The following table contains the times for estimating the typical update times of the process image partitions.

Table 3- 1 Data for estimating the typical update time of the process image partition

Components	Update time of the CPU			
	S7-1500			
	1511(F)-1 PN 1511T-1 PN 1511C-1 PN 1512C-1 PN 1513(F)-1 PN	1515(F)-2 PN 1515T-2 PN 1516(F)-3 PN/DP	1517(F)-3 PN/DP 1517T(F)-3 PN/DP	1518(F)-4 PN/DP 1518(F)-4 PN/DP ODK

Note

Update time of the backplane bus for ET 200SP CPUs

For the update time of the ET 200SP CPUs, observe also the information in table "Update time of the ET 200SP CPUs" in the section Response time for cyclic and time-driven program execution (Page 33).

3.2.2.2 User program execution time

Introduction

Organization blocks or system activities with higher priority interrupt those with lower priority, and thus extend the runtime of the lower-priority organization blocks or system activities.

Program execution time without interruptions

The user program has a certain runtime without interruptions. The length of the runtime depends on the number of operations that are executed in the user program.

The following table contains the typical durations of operations.

Table 3- 2 Duration of an operation

	S7-1500						
CPU	**1511(F)-1 PN** **1511T-1 PN** **1511C-1 PN**	**1512C-1 PN**	**1513(F)-1 PN**	**1515(F)-2 PN** **1515T-2 PN**	**1516(F)-3 PN/DP**	**1517(F)-3 PN/DP** **1517T(F)-3 PN/DP**	**1518(F)-4 PN/DP** **1518(F)-4 PN/DP ODK**

Note
Instruction "RUNTIME"

You can measure the runtimes of program sequences with the instruction "RUNTIME".

Extension due to nesting of higher-priority OBs and/or interrupts

The interruption of a user program at the end of an instruction by a higher-priority OB causes a certain basic time expenditure. Take account of this basic time expenditure in addition to the update time of the assigned process image partitions and the execution time of the contained user program. The following tables contain the typical times for the various interrupts and error events.

Table 3- 3 Basic time expenditure for an interrupt

3.2.2.3 Extension of cycle time due to communication load

Impact of communication on the cycle time

In the sequence model of the CPU, communication tasks are processed with priority 15. All program parts with priority > 15 (e.g. for Motion Control functions) are unaffected by communication.

Configured communication load

The CPU operating system provides the maximum specified percentage of total CPU processing power for communication tasks. The communication load is preset in STEP 7 at 50%, for example, for the CPUs of the S7 series. If the processing power is not needed for communication, then the processing power is available to the operating system and the user program.

Communication is allocated the requisite computing time in 1 ms increments, with priority 15. At 50% communication load, 500 µs of each 1 millisecond are used for communication.

The following formula may be used to estimate the extension of the cycle time by communication.

$$\text{Actual cycle time} = \text{Cycle time without communication} \times \frac{100}{100 - \text{"configured communication load in \%"}}$$

Figure 3-5 Formula: Impact of communication load

With a complete use of the communication load of 50% (default), the following value results:

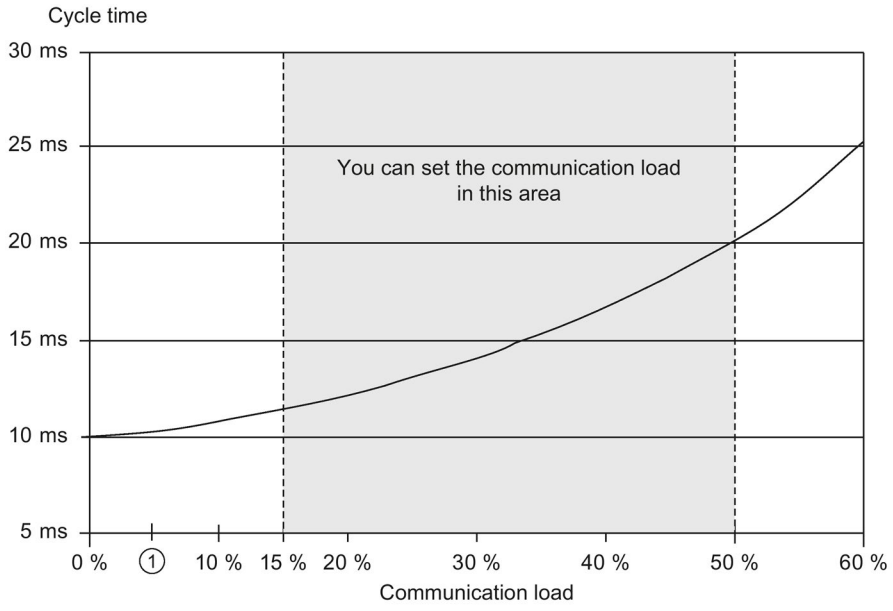
$$\text{Actual cycle time} = \text{Cycle time without communication} \times 2$$

Figure 3-6 Extension of cycle time due to communication load

The actual cycle time is up to twice as long as the cycle time without communication when you use the default communication load.

Dependency of maximum cycle time on the configured communication load

The diagram shows the nonlinear relationship between maximum cycle time and configured communication load with a pure cycle time of 10 ms, which means without interruptions.



① CPUs 1517(F)-3 PN/DP, CPU 1517T(F)-3 PN/DP, CPU 1518(F)-4 PN/DP, CPU 1518(F)-4 PN/DP ODK: The (minimum) communication load that can be set is 5%.

Figure 3-7 Maximum cycle time depending on the configured communication load

The shown influence of the communication load on the execution time applies to all OBs with a priority ≤ 15.

Reducing the cycle time with a lower communication load

You can reduce the setting for the communication load in the hardware configuration. If you set a communication load of 20% instead of the default 50%, for example, the cycle time extension due to the communication is reduced from a factor of 2 to 1.25.

Effect on the actual cycle time

Communication is only one cause of extension of the cycle time. All events that extend the cycle time (e.g. hardware interrupts) mean that more asynchronous events can occur within a cycle which additionally extend the cyclic program. This extension depends on the number of events that occur in the cyclic program and the time required to process these events.

Note

Checking parameter changes

- Check the effects of a value change on the "Cycle load due to communication" parameter during system operation. You can use the "RT_INFO" instruction to determine the portions of runtime used for communication and the user program.
- Take the communication load into consideration when setting the maximum cycle time to prevent time errors (for example, exceeding the cycle time within a cycle) from occurring.

Tips

Whenever possible, use the default setting for the configured communication load.

If you reduce the value of the communication load, keep in mind that communication tasks are interrupted by higher-priority OBs. This means it will also take longer to process the communication.

See also

Different cycle times (Page 18)

3.2.2.4 Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2)

Introduction

If you configure the PROFINET IO communication on the 2nd PROFINET interface (X2) (operated as IO controller or IO device) of the CPUs 1515(F)-2 PN, 1515T-2 PN, 1516(F)-3 PN/DP and 1516(F)pro-2 PN (as of firmware version 2.0), additional system load occurs.

This additional system load has priority 26 and extends the runtime of the program. The execution of synchronous cycle interrupts or hardware interrupts, for example, can be delayed as a result.

The additional system load depends on:

- The communication load on the 2nd PROFINET interface (X2)
- The number of IO devices that the CPU on the 2nd PROFINET interface (X2) updated within a millisecond

You determine the additional system load with the RT_INFO (read RUNTIME statistics) instruction at the Mode parameter with mode 10 or mode 20.

Reducing additional system load

Reduce the communication load on the 2nd PROFINET interface, e.g. with:

- Fewer HMI devices or slower update cycles of the HMI devices
- Less or slower communication with other CPUs

Increase the update times in STEP 7 for all IO devices that are assigned to the 2nd PROFINET interface (X2):

1. Select the "I/O communication" in the "Network view" of STEP 7.
2. Set the "Update mode" parameter to "Adjustable".
3. Select a higher value for the "Update time [ms]" parameter in the drop-down list.
4. Repeat this setting for the other IO devices.

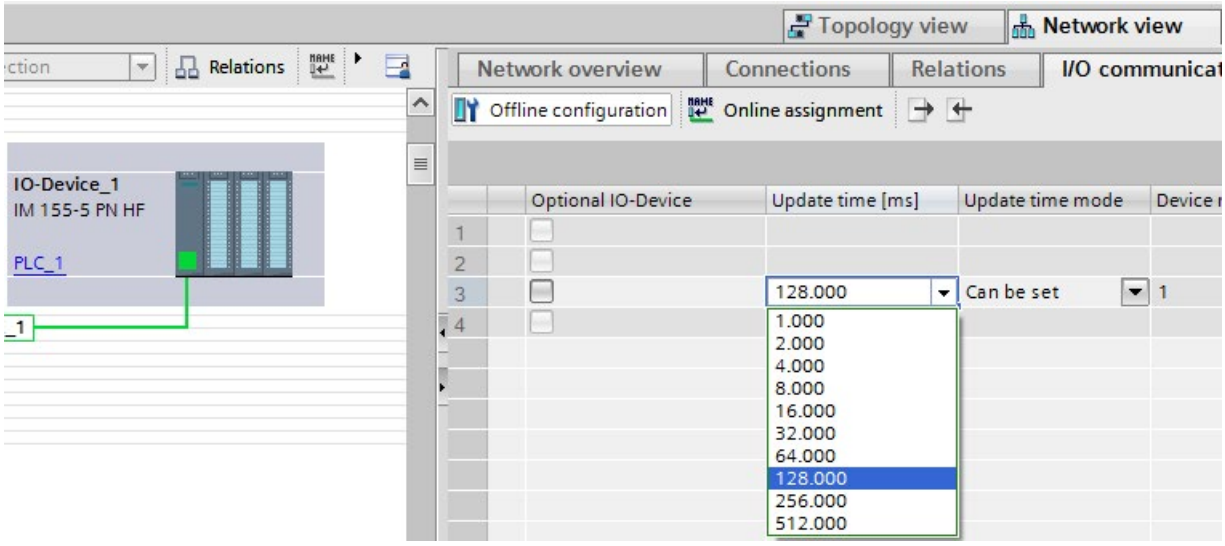


Figure 3-8 Increasing update times

3.3 Time-driven program execution in cyclic interrupts

With a cyclic interrupt, you can have a particular program processed in a defined cycle. A priority from 2 to 24 can be set for the cyclic interrupt. This makes the priority of cyclic interrupts higher than the priority of the cyclic program. A cyclic interrupt increases the execution time of the cyclic program.

Tip: By shifting program sections to cyclic interrupts, you can reduce the response times or better adapt them to your requirements.

In STEP 7, the organization blocks OB 30 to OB 38 are provided for the execution of cyclic interrupts. You can create additional cyclic interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Definition

A cyclic interrupt is an interrupt initiated according to a defined cycle that causes a cyclic interrupt OB to be processed.

Cycle of a cyclic interrupt

The cycle of a cyclic interrupt is defined as the time from the call of a cyclic interrupt OB to the next call of a cyclic interrupt OB.

The following figure shows an example of the cycle of a cyclic interrupt.

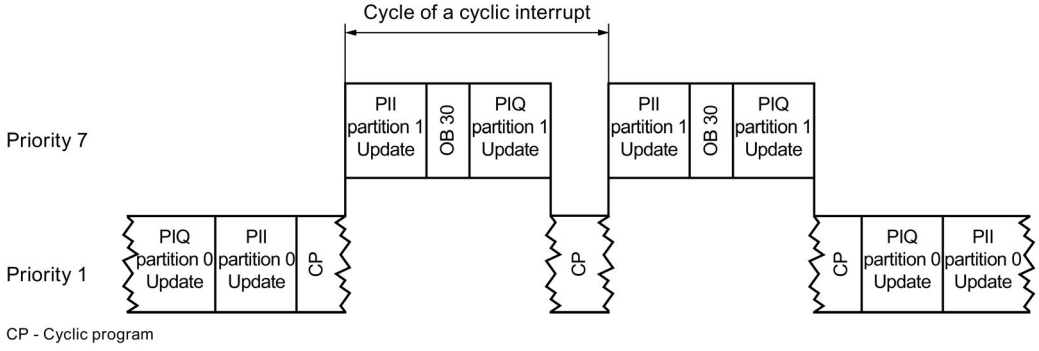

Figure 3-9 Call interval of a cyclic interrupt

Accuracy of a cyclic interrupt

If a cyclic interrupt is not delayed by a higher-priority OB or communication activities, the accuracy with which it is started is nevertheless subject to system-dependent fluctuations.

The following table shows the accuracy (typical times) with which a cyclic interrupt is triggered:

Table 3- 5 Accuracy of cyclic interrupts

	S7-1500			
CPU	**1511(F)-1 PN** **1511T-1 PN** **1511C-1 PN** **1512C-1 PN** **1513(F)-1 PN**	**1515(F)-2 PN** **1515T-2 PN** **1516(F)-3 PN/DP**	**1517(F)-3 PN/DP** **1517T(F)-3 PN/DP**	**1518(F)-4 PN/DP** **1518(F)-4 PN/DP ODK**

3.4 Response time for cyclic and time-driven program execution

Introduction

In this section you will learn about the concept of "response time", and how to calculate the response time.

Definition

The response time in the case of cyclic or time-controlled program execution is the time between the detection of an input signal and the change of a connected output signal.

Fluctuation in the response time of the CPU

The actual response time of the CPU fluctuates between one and two cycles for cyclic program execution and between one and two cyclic interrupt cycles for time-controlled program execution.

You should always assume the longest response time when configuring your system.

The following figure shows the shortest and longest response times of the CPU to an event.

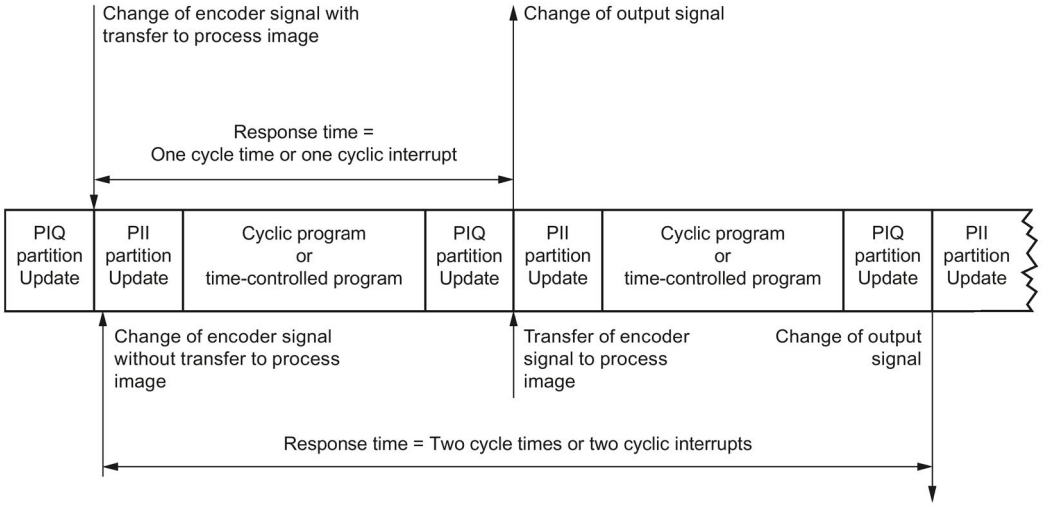

Figure 3-10 Shortest and longest response times of the CPU

Factors

To determine the process response time, you must take account of the following factors in addition to the CPU response time described above:

- Delay of the inputs and outputs on the input/output module
- Switching times of the sensors and actuators used
- Update times for PROFINET IO or DP cycle times on PROFIBUS DP, update time of the backplane bus for ET 200SP CPUs

Delay at the inputs and outputs of the modules

The delay and cycle times can be found in the technical specifications for the input/output modules.

Update times for PROFINET IO and DP cycle times on PROFIBUS DP

When distributed I/O is used, the maximum response time is additionally extended by the bus transmission times of PROFIBUS or PROFINET. These bus transmission times occur during both the reading and output of the process image partitions. The bus transmission times correspond to the bus update cycle of the distributed device.

PROFINET IO

If you use STEP 7 to configure your PROFINET IO system, STEP 7 calculates the update time. To display the update time, follow these steps:

- Select the PROFINET interface of the I/O module.
- In the General tab, select "Advanced options > Real time settings > IO cycle".

The update time is displayed in the "Update time" field and can be set for each IO device.

PROFIBUS DP

If you use STEP 7 to configure your PROFIBUS DP master system, STEP 7 calculates the DP cycle time. To display the DP cycle time, follow these steps:

- Select the PROFIBUS subnet in the network view.
- In the General tab of the Inspector window, navigate to the Bus parameters.

The DP cycle time is displayed in the "Parameters" field at "Typical Ttr".

The following figure illustrates the additional bus runtimes using distributed I/O.

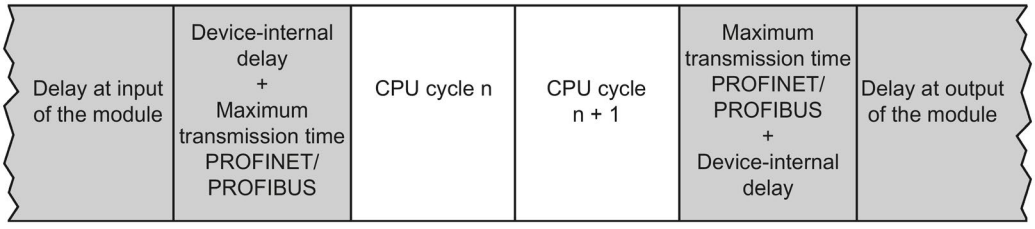

Figure 3-11 Additional bus runtimes with distributed I/O

You can achieve a further optimization of the response times using isochronous mode.

Update time of the backplane bus for ET 200SP CPUs

The following table shows the central (typical) update times of the backplane bus in the ET 200SP CPUs.

Table 3- 6 Update time of the ET 200SP CPUs

Components	Update time of the CPU		
	ET 200SP		
	1510SP(F)-1 PN	1512SP(F)-1 PN	1515SP(F)-PC
Update time for central I/O	250 µs to 1 ms, depending on number and type of central I/O modules[1]		

[1] The duration of the update time depends on the number of the I/O modules and their type (ST, HF, HS). The update time is set at 1 ms for a max. central I/O configuration with standard I/O modules. By using HF I/O modules, for example, and by reducing the number of modules, the update time can be reduced down to 250 µs.

3.5 Summary of response time with cyclic and time-controlled program execution

Estimation of the shortest and longest response time

The following formulas may be used to estimate the shortest and longest response time:

Estimation of the shortest response time

The shortest response time is the sum of:

1 x delay of the input/output module for inputs
+ 1 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for ET 200SP CPUs)
+ 1 x transfer time of the process image input
+ 1 x execution of the user program
+ 1 x transfer time of the process image output
+ 1 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for ET 200SP CPUs)
+ 1 x delay of the input/output module for outputs

= Shortest response time

* Time is dependent on the configuration and the extent of the network.

The shortest response time is equivalent to the sum of the cycle time plus the input and output delay times.

Estimation of the longest response time

The longest response time is the sum of:

1 x delay of the input/output module for inputs
+ 2 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for ET 200SP CPUs)
+ 2 x transfer time of the process image input
+ 2 x execution of the user program
+ 2 x transfer time of the process image output
+ 2 x (update PROFINET IO or PROFIBUS DP)*; (update time of the backplane bus for ET 200SP CPUs)
+ 1 x delay of the input/output module for outputs

= Longest response time

* Time is dependent on the configuration and the extent of the network.

The longest response time is equivalent to the sum of twice the cycle time plus the delay times of the inputs and outputs. The longest reaction time includes twice the update time for PROFINET IO or twice the DP cycle time on PROFIBUS DP.

Event-driven program execution

4

4.1 Response time of the CPUs when program execution is event-controlled

Introduction

In order to detect events in the process immediately in the user program and to react to them with an appropriate program, you use hardware interrupts. In STEP 7, organization blocks OB 40 to OB 47 are provided for processing a hardware interrupt. You can create additional hardware interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Definition

A hardware interrupt is an interrupt that occurs during the running program execution, due to an interrupt-triggering process event. The operating system calls the assigned interrupt OB; as a result, the execution of the program cycle or of lower priority program parts is interrupted.

Interrupt response times of the CPUs for hardware interrupts

The interrupt response times of the CPUs start with the occurrence of a hardware interrupt event in the CPU and end with the start of the assigned hardware interrupt OB.

This time is subject to system-inherent fluctuations, and this is expressed using a minimum and maximum interrupt response time.

The following table contains the length of the typical response times of the CPUs for hardware interrupts.

Table 4- 1 Response times of the CPUs for hardware interrupts

		S7-1500			
CPU		1511(F)-1 PN 1511T-1 PN 1511C-1 PN 1512C-1 PN 1513(F)-1 PN	1515(F)-2 PN 1515T-2 PN 1516(F)-3 PN/DP	1517(F)-3 PN/DP 1517T(F)-3 PN/DP	1518(F)-4 PN/DP 1518(F)-4 PN/DP ODK
Interrupt response times	Min.	100 µs	90 µs	30 µs	20 µs
	Max.	400 µs	360 µs	120 µs	90 µs

		ET 200SP		
CPU		**1510SP(F)-1 PN**	**1512SP(F)-1 PN**	**1515SP(F)-PC**
Interrupt response times	Min.	100 µs	100 µs	90 µs
	Max.	400 µs	400 µs	360 µs

		ET 200pro
CPU		**1516pro(F)-2 PN**
Interrupt response times	Min.	90 µs
	Max.	360 µs

Note that the times are extended if higher-priority interrupts are queued up for execution, and if the hardware interrupt OB is assigned to a process image partition. You can find these times in the 'Extension due to nesting of higher-priority OBs and/or interrupts' table in the section User program execution time (Page 23)

If you need fast interrupt response times, do not assign a process image partition to the hardware interrupt OB and use direct access in the hardware interrupt OB.

You can find additional information on determining response times for PROFINET in the application example with the entry ID 21869080 on the Service&Support (http://support.automation.siemens.com/WW/view/en/21869080) Internet page.

Influence of input modules on the interrupt response times of hardware interrupts

Digital input modules:

Interrupt response time of hardware interrupts = internal interrupt processing time + input delay (see section Technical specifications in the manual)

Analog input modules:

Interrupt response time of hardware interrupts = internal interrupt processing time + conversion time (see section Technical specifications in the manual)

Impact of communication on interrupts

Communication tasks are always processed by the CPU with priority 15. If you do not want the interrupt execution to be delayed or interrupted by communication, configure the interrupt execution with priority > 15. The default setting for interrupt execution is priority 16.

Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2)

You can find information in the section Special consideration when PROFINET IO communication is configured on the 2nd PROFINET interface (X2) (Page 29).

4.2 Process response time when program execution is event-driven

When program execution is event-driven, the process response time is determined by the following:

- Delay times of the input and output modules used
- Update times for PROFIBUS/PROFINET for distributed modules; update time of the backplane bus for ET 200SP CPUs
- Interrupt response time of CPU
- Runtimes of the interrupt OB including update of the process image partition

The following figure shows the individual execution steps for event-driven program execution.

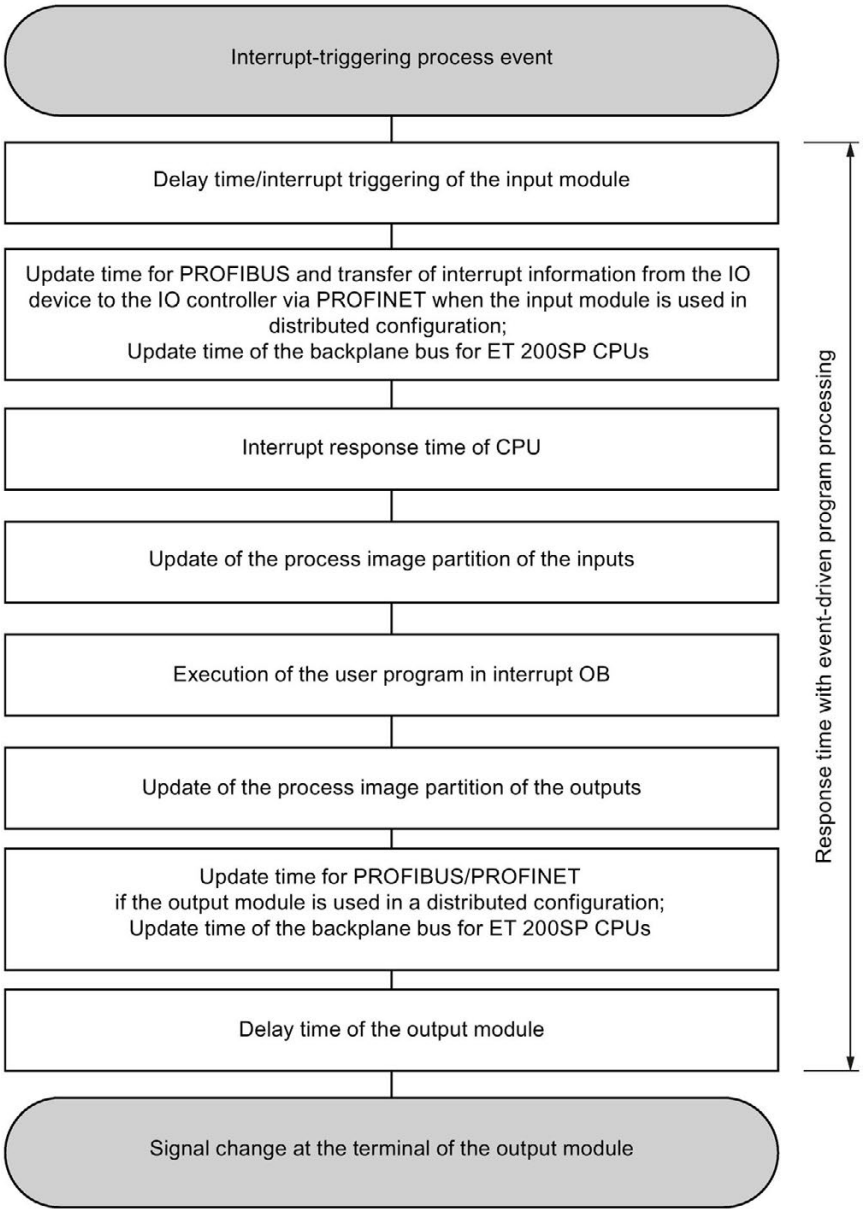

Figure 4-1 Schematic representation of event-driven program execution

Glossary

Automation system

An automation system in the context of SIMATIC S7 is a programmable logic controller.

Cyclic interrupt

A cyclic interrupt is generated periodically by the CPU in a configurable time pattern. At this point in time the corresponding organization block is processed.

Diagnostic interrupt

Diagnostics-capable modules signal detected system errors to the CPU using diagnostic interrupts.

Hardware interrupt

A hardware interrupt is started by interrupt-triggering modules when a specific event occurs in the process. The hardware interrupt is reported to the CPU. The assigned organization block is then processed according to the interrupt priority.

Interrupt

The CPU's operating system distinguishes between various priority classes that control the execution of the user program. These priority classes include interrupts, such as hardware interrupts. When an interrupt occurs, the operating system automatically calls an assigned organization block, in which the user programs the desired response.

Process image

The process image is part of the CPU system memory. At the start of the cyclic program, the signal states of the input modules are transmitted to the process image input. At the end of the cyclic program, the process image output is transmitted as signal state to the output modules.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation describes the various memory areas of the S7-1500 CPUs, ET 200SP CPUs and the ET 200pro CPU 1516pro-2 PN, and shows how you can optimally use these memory areas.

Additionally this manual shows how you can free work memory by using recipes and data logs.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the SIMATIC industrial automation system
- Knowledge about the use of computers
- Knowledge of working with the TIA Portal and STEP 7

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation is valid for all CPUs of the product families S7-1500 and ET 200SP and for the ET 200pro CPU 1516pro-2 PN.

What's new compared to the previous version of the function manual (01/2013 edition)

What's new?		What are the customer benefits?	Where can I find information?
New contents	Analyzing memory requirements and memory usage	You have various options for analyzing the memory requirements and the memory usage of the CPU: • with STEP 7 • with the display of the CPU • with the Web server of the CPU	Section Memory requirements and memory usage (Page 16)
	Memory behavior in load memory when loading software changes	When loading software changes to the SIMATIC memory card, the files in question are only deleted after creation of the new files. For this reason, the CPU requires adequate free memory space on the SIMATIC memory card. You have various options for creating memory space; these will be explained.	Section Memory behavior in load memory when loading software changes (Page 26)
	Service life of SIMATIC memory cards	Using calculation examples of the service life of a SIMATIC memory card, you can estimate which SIMATIC memory card is required for your automation task.	Section Service life of the SIMATIC memory card (Page 51)
Changed contents	Scope of the function manual expanded to include the CPUs of the distributed I/O system ET 200SP and the CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	Manual CPU 1510SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157130) Manual CPU 1512SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157013) Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet.

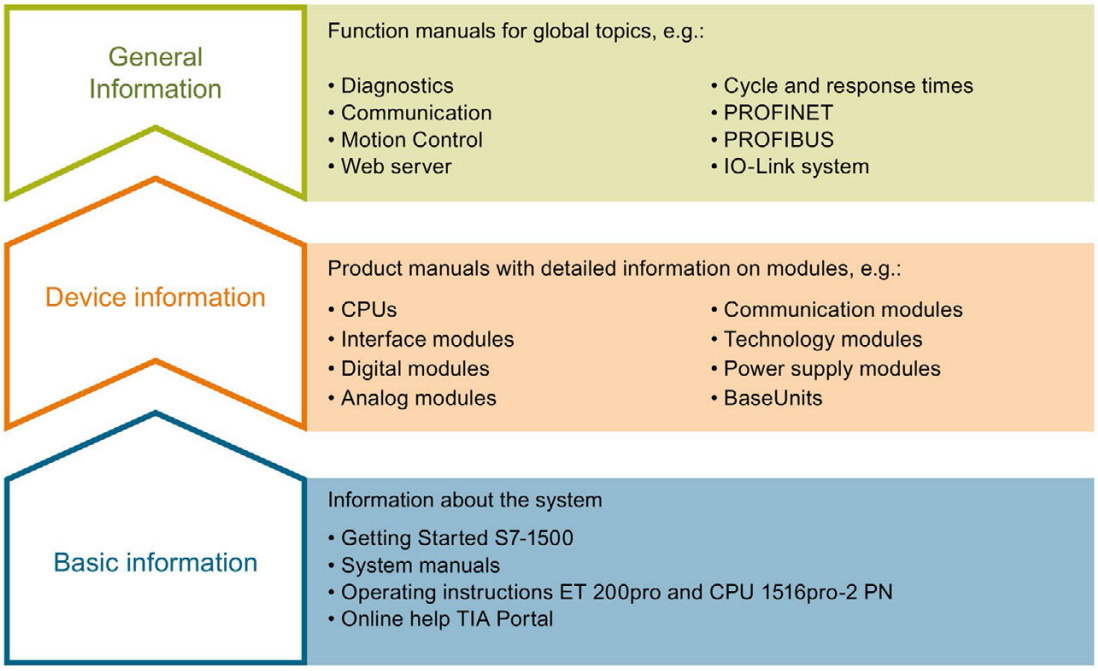
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Memory areas and retentive memory

2

Memory areas

The automation data is located in the automation system in different memory areas.

The offline data of the project created in STEP 7 is located on the hard disk of the programming device. The online data of the project is located in the load memory on the SIMATIC memory card. In addition, the work memory, retentive memory and other memory areas are located on the CPU.

The following figure shows an overview of the memory areas of the S7-1500 and ET 200SP CPUs and the ET 200pro CPU 1516pro-2 PN.

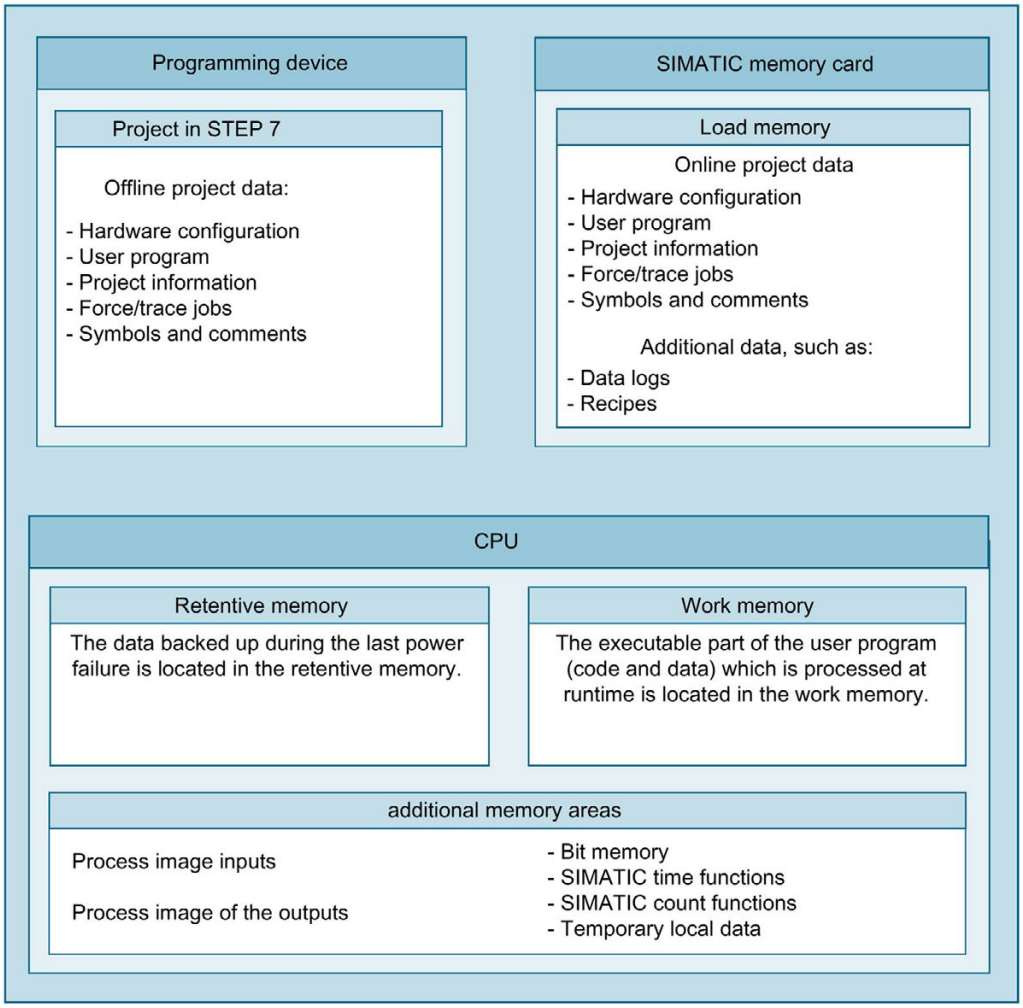


Figure 2-1 Memory areas

Load memory

Load memory is non-volatile memory for code blocks, data blocks, technology objects and the hardware configuration. The load memory is located on the SIMATIC memory card. STEP 7 transfers the project data from the programming device to the load memory.

If you have copied additional data (e.g. HMI backups or other files) via the CPU Web server or Explorer to the SIMATIC memory card, this data is also located in the load memory of the SIMATIC memory card.

Note

An inserted SIMATIC memory card is required to operate the CPU.

Work memory

The work memory is volatile memory that contains the code and data blocks. The work memory is integrated into the CPU and cannot be extended. The work memory is only used in operation of the CPU.

In the CPUs, the work memory is divided into two areas:

- Code work memory: The code work memory contains runtime-relevant parts of the program code.
- Data work memory: The data work memory contains the runtime-relevant parts of the data blocks and technology objects. At the operating mode transitions POWER ON to startup and STOP to startup, tags from global data blocks, instance data blocks and technology objects are initialized with their start values; retentive tags retain their actual values as saved in the retentive memory.

Retentive memory

The retentive memory is non-volatile memory for saving a limited amount of data in the event of power failure.

The following actions delete the content of the retentive memory:

- Memory reset
- Reset to factory settings

You can find additional information on memory reset and resetting to factory settings in the S7-1500 Automation system, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792) system manual, the ET 200MP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and the ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416) operating instructions.

Additional memory areas

Besides the memory areas that have been described for the user program and data, the CPU has additional memory areas available.

The additional memory areas include the following:

- Process images
- Temporary local data

The CPU-specific sizes can be found in the technical specifications for the respective CPU.

2.1 Memory requirements and memory usage

In STEP 7, you can retrieve information about the memory areas of the CPU on the display of the CPU (only applies to the S7-1500 CPUs) and via the Web server.

Memory requirements of the program in the offline project

The display of the memory usage in the program information of STEP 7 is intended to determine whether the project is becoming too big for a particular CPU or a particular memory card already during the creation or modification of a project. You can find this information under "Program information" in the project tree, for example. In the "Resources" tab you can find information about the total size of the memory areas of the respective CPU project (in the figure below in the line "Total"), and about the memory requirements of the program elements (blocks, data types, objects for motion control and PLC tags) and their percentages in the respective memory area of the offline project (in the figure below in the line "Used:"). In the overview table you can also find information about the assigned inputs and outputs.

For a CPU, you can select the total size of the load memory in a drop-down list. Select the size of the load memory in accordance with the size of the SIMATIC memory card you are using. The percentage shown in the Load memory column depends on the selected size of the load memory. As soon as the memory size exceeds the size of the load memory of the memory card you are using, the sizes indicated turn red. The drop-down list therefore only serves as a visual aid.

The following figure shows an overview of the usage of the different memory areas of the "Resources tab:

	Objects	Load memory	Code work-memory	Data work-memory	Retain memory
1		19 %	1 %	8 %	23 %
2					
3	Total:	0 kB	1048576 bytes	5242880 bytes	484000 bytes
4	Used:	0 kB	15293 bytes	411034 bytes	110592 bytes
5	Details	2 MB			
6	OB	4 MB	469 bytes		
7	FC	12 MB	410 bytes		
8	FB	24 MB	14414 bytes		
9	DB	256 MB		411034 bytes	110592 bytes
10	Data types	2 GB 6681 bytes	-		
11	PLC tags	32 GB			0 bytes

Figure 2-2 Display of the usage of the different memory areas

Note

Display of memory usage under "Program information"

The display of the memory usage in the program information is an offline display in STEP 7 and only shows the memory requirements of the program in the project. The program on the memory card of the CPU may vary, however, e.g.:

- if it is more recent
- if it contains blocks created via other projects
- if it contains blocks generated on the CPU

See the FAQ "How do you estimate the memory requirements of your user program in the load memory of an S7-1500 CPU and an ET 200SP CPU (Open Controller)?" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/97553417).

Data on the SIMATIC memory card

In addition to the program and the associated program elements (blocks, data types, objects for motion control and PLC tags), the following data is stored:

- Hardware configuration
- Project information
- Force/trace jobs
- Symbols and comments

The following further data may also be found on the memory card:

- Recipes, data logs and HMI backups
- Non-SIMATIC files which were copied to the memory card via the Web server of the CPU or offline via the Explorer (e.g. PDF files etc.)

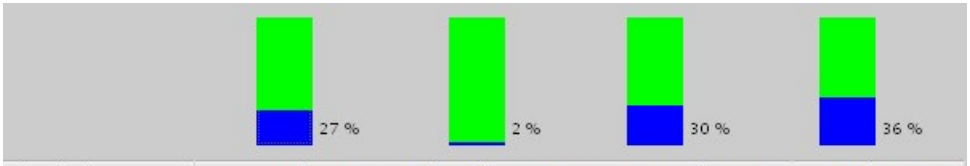
Display of the memory usage of the CPU

In online mode, the online function "Memory" provides you with the following up-to-date memory information:

- Size of the total free and already allocated load memory on the SIMATIC memory card.
- Size of the total free and already allocated work memory, separated by code and data.
- Size of the total free and already allocated retentive memory.

The online function "Memory" can be found in Online & Diagnostics under "Diagnostics > Memory". You can access the functions under Online & Diagnostics in various ways:

- In the project tree under every configured CPU.
- In the project tree under Online access > Accessible devices, to display the usage of CPUs which were not configured in the project.
- In all views of the device configuration (topology view, network view, device view) by selecting a CPU with the right mouse button.



Sizes in bytes	Load memory	Code work-memory	Data work-memory	Retain memory
Free:	6291456	1048576	5242880	524288
In use:	2316997	17355	2299642	301234
Total:	8608453	1065931	7542522	825522

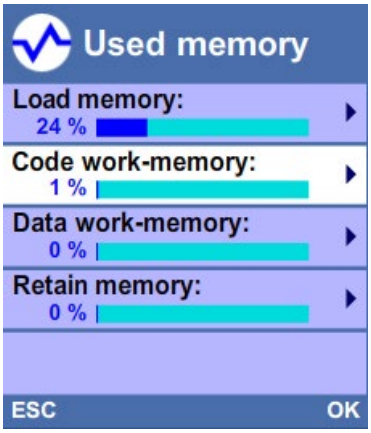
Figure 2-3 "Memory" online function

Display of the memory usage in the display of the CPU

To obtain information about the available memory via the display, proceed as follows:

- Select the "Diagnostics" menu on the display with the help of the arrow keys.
- Select the "Memory" command from the "Diagnostics" menu.

Under the "Memory" command you can find information about the usage of the various memory areas (see following figure). Please note that the memory allocation is queried at the time of the call and is not continuously updated.



To find out details about the respective memory areas (e.g. code work memory), select the required memory area with the help of the arrow keys (see following figure).

In the detail view, e.g. of the code work memory, the display provides you with the following information:

- Memory space which is still available in the code work memory.
- Memory space which is already allocated in the code work memory.
- Total available memory space in the code work memory.

Display of the memory usage in the Web server

On the Web server, you can find information about the current usage of the individual memory areas on the Web page "Diagnostics" in the "Memory" tab.

Detailed information about the use of the Web server can be found in the S7-1500 Web server (https://support.industry.siemens.com/cs/ww/en/view/59193560) function manual.

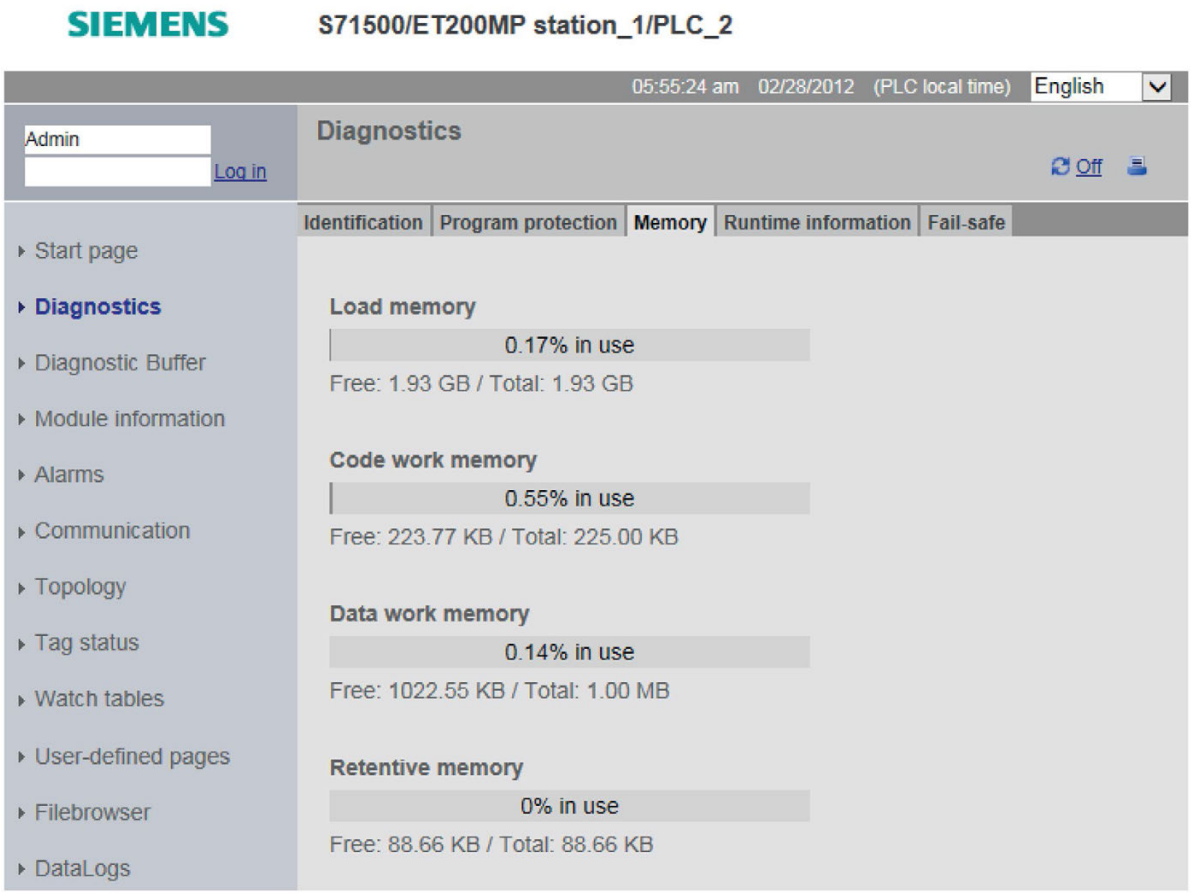


Figure 2-4 Display of the memory usage in the Web server

2.2 Retentive memory areas

Introduction

The CPUs have memory available for storing retentive data at POWER-OFF. Details about the size of the retentive memory can be found in the technical specifications for the respective CPU.

In STEP 7, you can find the configured CPU's retentive memory utilization offline at "Program information > Resources" or online at Online & Diagnostics under "Diagnostics > Memory".

If you define data as retentive, its content is retained beyond program startup after STOP or a power failure.

You can define the following data and objects as retentive:

- Tags of global data blocks
- Tags of instance data blocks of a function block
- Bit memories, timers and counters

Tags of technology objects are always retentive, for example, adjustment values of absolute encoders. The volume of retentive data of technology objects therefore is also included in the volume of retentive data which you can define as retentive in your project.

Tags of a global data block

In a global data block, you can define either individual tags from a block or all of its tags collectively as retentive, depending on the setting for the "Optimized block access" attribute:

- "Optimized block access" activated: In the declaration table of the data block, you can define individual tags as retentive.

	Name	Data type	Start value	Retain	Visible in HMI	Comment
1	Static			☐	☐	
2	var1	Bool	false	☑	☑	
3	var2	Bool	false	☐	☑	
4	var3	Bool	false	☑	☑

3	var7	Bool	...	false	☑	☑	
4	var8	Bool	...	false	☑	☑	
5	var9	Bool	...	false	☑	☑	
6	var10	Bool	...	false	☑	☑	

Figure 2-6 Retentivity setting "Optimized block access" not activated

You can find additional information on optimized and non-optimized data blocks in the Programming guideline for S7-1200/S7-1500 (https://support.industry.siemens.com/cs/de/de/view/90885040/en).

Tags of an instance data block of a function block

In STEP 7, you can define the tags from the instance data block of a function block as retentive. Depending on the setting for the "Optimized block access" attribute, you can define retentivity either for individual tags from a block or for all of its tags collectively:

- "Optimized block access" activated: In the interface of the function block, you can define individual tags as retentive.
- "Optimized block access" not activated: In the instance data block, you can only define the retentivity of all tags collectively.

Creation of a data block in the user program

The instruction "CREATE_DB" is used to create a new data block in the load and/or work memory. For data blocks which you create in the load memory, depending on the selection for the ATTRIB parameter, the generated data block either has the property "retentive" or the property "non-retentive". Setting the retentivity for individual tags is not possible here. The "Optimized block access" attribute is disabled.

You can find additional information on the "CREATE_DB" instruction in the STEP 7 online help under "PLC programming > Instructions > Extended instructions > Data block functions > CREATE_DB Create data block".

Tags of technology objects

Tags of technology objects are retentive, for example adjustment values of absolute encoders. STEP 7 automatically manages the retentivity of the tags of technology objects so that you do not have to configure any retentivity.

The retentive tags of technology objects are unaffected by a memory reset. They can only be deleted by resetting to factory settings.

Bit memories, timers and counters

In STEP 7, you can define the number of retentive bit memories, times and counters in the PLC tag table using the "Retentive memory" button.

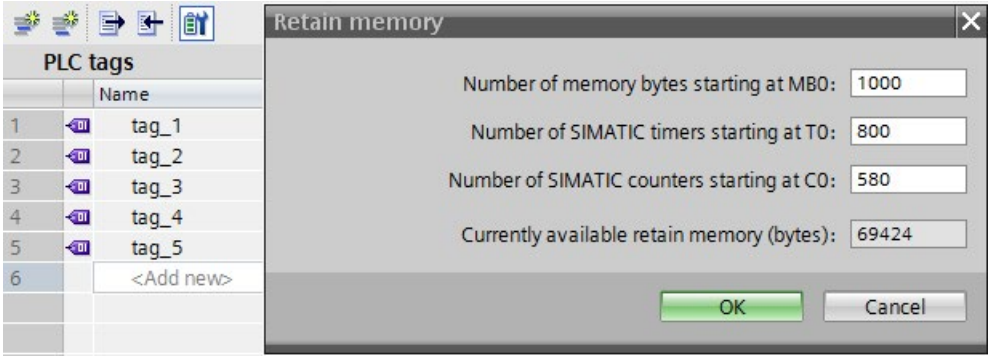

Figure 2-7 Definition of the number of retentive bit memories, timers and counters (beginning at 0, continuing without gaps) using the "Retentive memory" button

Reference

You can find additional information on configuring retentivity in the STEP 7 online help.

2.3 Summary of retentive behavior

Retentive behavior of the memory objects

This section gives an overview of the retentive behavior of memory objects for the CPUs. In addition to the retentive memory areas described, there are other objects with retentive characteristics, for example, the diagnostics buffer. These objects do not occupy any storage space in the retentive memory.

The following table shows the retentive behavior of the memory objects at the operating mode transitions STOP to startup and POWER ON to startup, as well as the memory-influencing functions "Memory reset" and "Reset to factory settings".

Table 2- 1 Retentive behavior of the memory objects

Memory object	Operating mode transitions		Memory reset	Reset to factory settings
	STOP → STARTUP	POWER ON → STARTUP		
Actual values of the data blocks, instance data blocks	Can be set in the Properties of the DB in STEP 7.[1].		-	-
Bit memories, timers and counters - configured as retentive	x	x	-	-
Bit memories, timers and counters - configured as non-retentive	-	-	-	-
Retentive tags of technology objects (e.g. adjustment values of absolute encoders)	x	x	x	-
Diagnostics buffer entries (retentive area)	x	x	x	-
Diagnostics buffer entries (non-retentive area)	x	-	-	-
Operating hours counter	x	x	x	-
Clock time	x	x	x	-
x = content is retained – = object is initialized				

1) For DBs with optimized access the retentive behavior is configurable for specific tags.

Diagnostics buffer

With the CPUs, a portion of the diagnostics buffer is retentive. The number of retentive diagnostics buffer entries depends on the type of CPU. The latest entries in the diagnostics buffer are retained after power failure, and are not affected by a memory reset. The retentive portion of the diagnostics buffer can only be deleted by resetting to factory settings. The entries in the diagnostics buffer do not occupy any storage space in the retentive memory.

Operating hours counter

The operating hours counters of the CPUs are retentive and are not affected by a memory reset. By resetting to factory settings, the operating hours counters are set to zero.

Clock time

The clock time of the CPUs is retentive and is not affected by a memory reset. By resetting to factory settings, the clock time is reset.

Reference

You can find additional information on memory reset and resetting to factory settings in the S7-1500 Automation system, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792) system manual, the ET 200MP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual and the ET 200pro CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416) operating instructions.

2.4 Memory behavior when loading software changes

Introduction

In the STOP and RUN modes of the CPU, you can load changes to the software without this affecting the actual values of tags already loaded.

In STEP 7, you load changes to the software (in the project tree and with selected PLC station) under "Download to device > Software (only changes)".

Impact of software changes on PLC tags

You can load the following software changes without affecting the actual values of PLC tags that have already been loaded:

- Name change
- Comment change
- Addition of new tags
- Deletion of tags
- Change of retentivity settings for Retentive memory areas (Page 21)

The actual values are affected by loading the following software changes:

- Data type change
- Address change

Memory reserve of global DBs and instance DBs

Each function block or data block with the "Optimized block access" attribute activated contains, by default, a memory reserve which you can use for subsequent interface changes. The memory reserve is initially not used. When you have compiled and loaded the block, and then observe that you want to reload interface changes, activate the memory reserve. All tags that you subsequently declare will be placed in the memory reserve. During the next load, the new tags are then initialized to their start values. Tags which have already been loaded are not reinitialized.

The setting for memory reserve can be found in STEP 7 in the data block properties in the category "Download without reinitialization".

Impacts of software changes on data blocks without memory reserve

If you are not using memory reserve, you can load the following software changes without this reinitializing the actual values of DB tags that have already been loaded:

- Change of initial value
- Comment change

Impacts of software changes on data blocks with memory reserve

If you are using memory reserve for data blocks ("Optimized block access" attribute and "Download without reinitialization" button activated), you can load the following software changes without this reinitializing the actual values of DB tags which have already been loaded:

- Change of initial value
- Comment change
- Addition of new tags

If the button "Enable download without reinitialization for retentive tags" is deactivated, then all actual values of the data block are reinitialized on the next loading of the following software changes:

- Name change
- Data type change
- Retentivity change
- Deletion of tags
- Changes to the memory reserve settings

Reference

You can find additional information on setting and activating the memory reserve, and on loading block changes, in the online help for STEP 7 under "PLC programming > Compile and download blocks > Download blocks for S7-1200/1500 > Download block extensions without reinitialization".

2.5 Memory behavior in load memory when loading software changes

Memory requirements in RUN mode

For the consistent and atomic handling of the entire load procedure, the CPU requires adequate free memory space on the SIMATIC memory card. The files affected by loading the software changes to the CPU are only deleted after the new files have been created. This SIMATIC memory card therefore requires memory space corresponding approximately to the space required for all program objects to be loaded on the memory card.

If this amount of memory is not available on your SIMATIC memory card, the following message is displayed in STEP 7 during the load procedure in the CPU: "There is insufficient memory on the memory card for this amount of data."

In order to still enable the loading of changes to the CPU in such a case, we recommend one or more of the following options:

- Load in RUN mode
  - Delete any files no longer required (e.g. CSV files, panel backups, etc.) on the memory card using the Web server.
  - If possible, load extensive changes in RUN mode in several steps, or load after every modification step.
- Load in STOP mode
  - If loading in several steps is not possible, load extensive changes in STOP mode. Please note that when loading in STOP mode, the actual values of non-retentive data are not initialized.
- Use a larger memory card
  - In order to perform extensive load processes in RUN mode of the CPU, use a larger memory card. A description of how to change the memory card can be found in the section "Changing the memory card without losing retained data".

Impact of minor program changes on the load procedure

There are dependencies between the objects of a program, e.g. of code blocks to called code blocks, of code blocks to data blocks and of data blocks to data types (PLC data types, FB types). This means that the load procedure for a minor change may be very time-consuming if the change affects a large number of dependent objects.

Example:

A STEP 7 program contains an organization block (OB), 20 functions (FC) and a data block (DB). The OB calls the 20 FCs and all FCs access the DB. If you change the program code in one of the FCs, the following load procedure only contains the changed FC. If you change the data type of a tag in the DB, however, the following load procedure then changes all the FCs and the DB.

The following figure shows the objects in the load procedure in a preview.

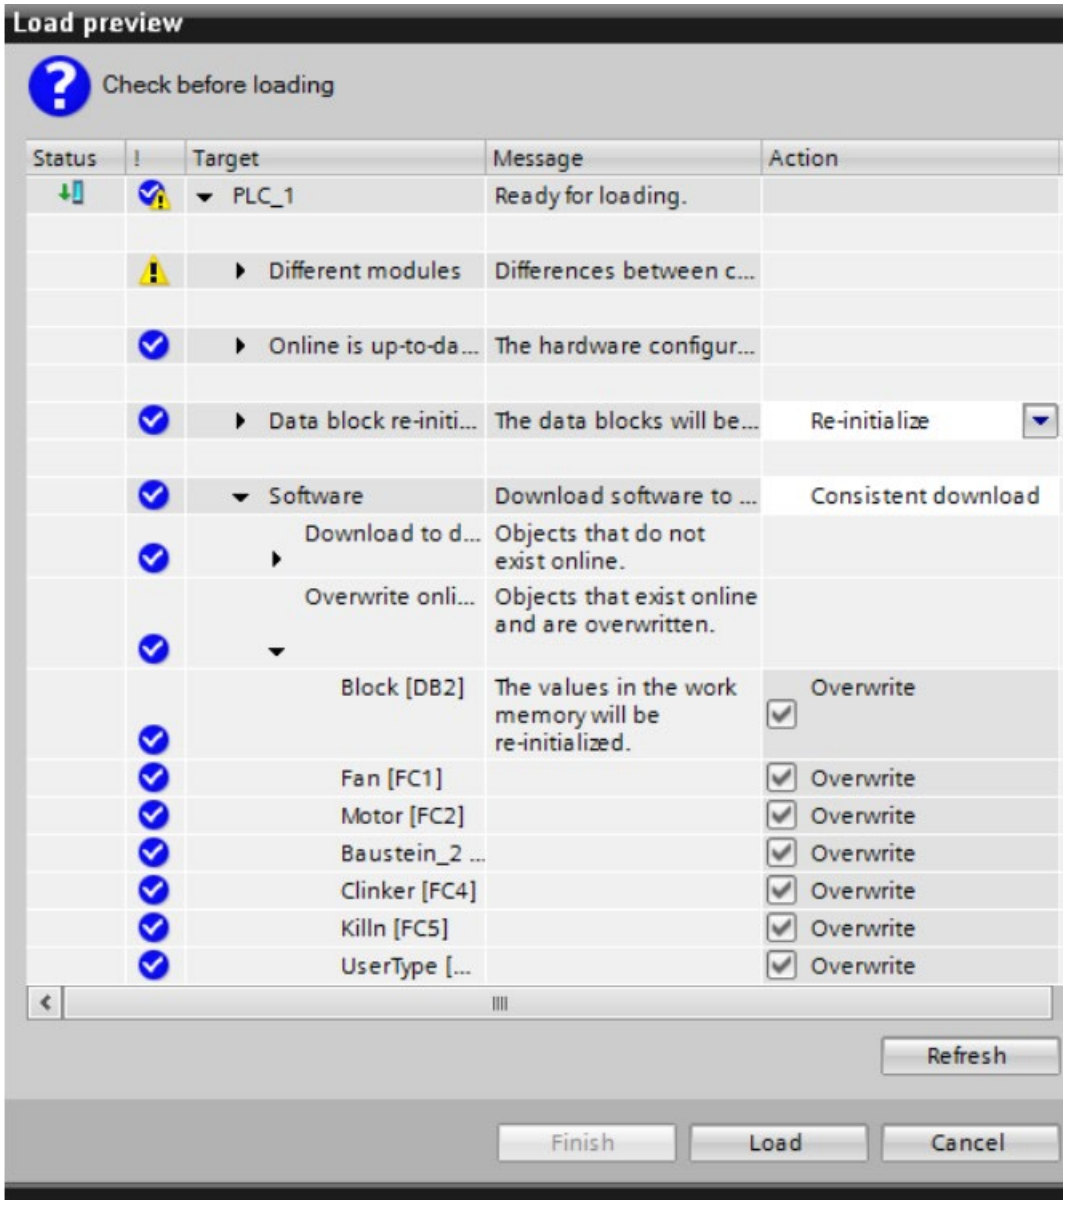

Figure 2-8 Preview for loading

To find the interdependencies of the individual objects, double-click in the project tree on "Program information" and in the dialog "Program information" change to the "Dependency structure" tab.

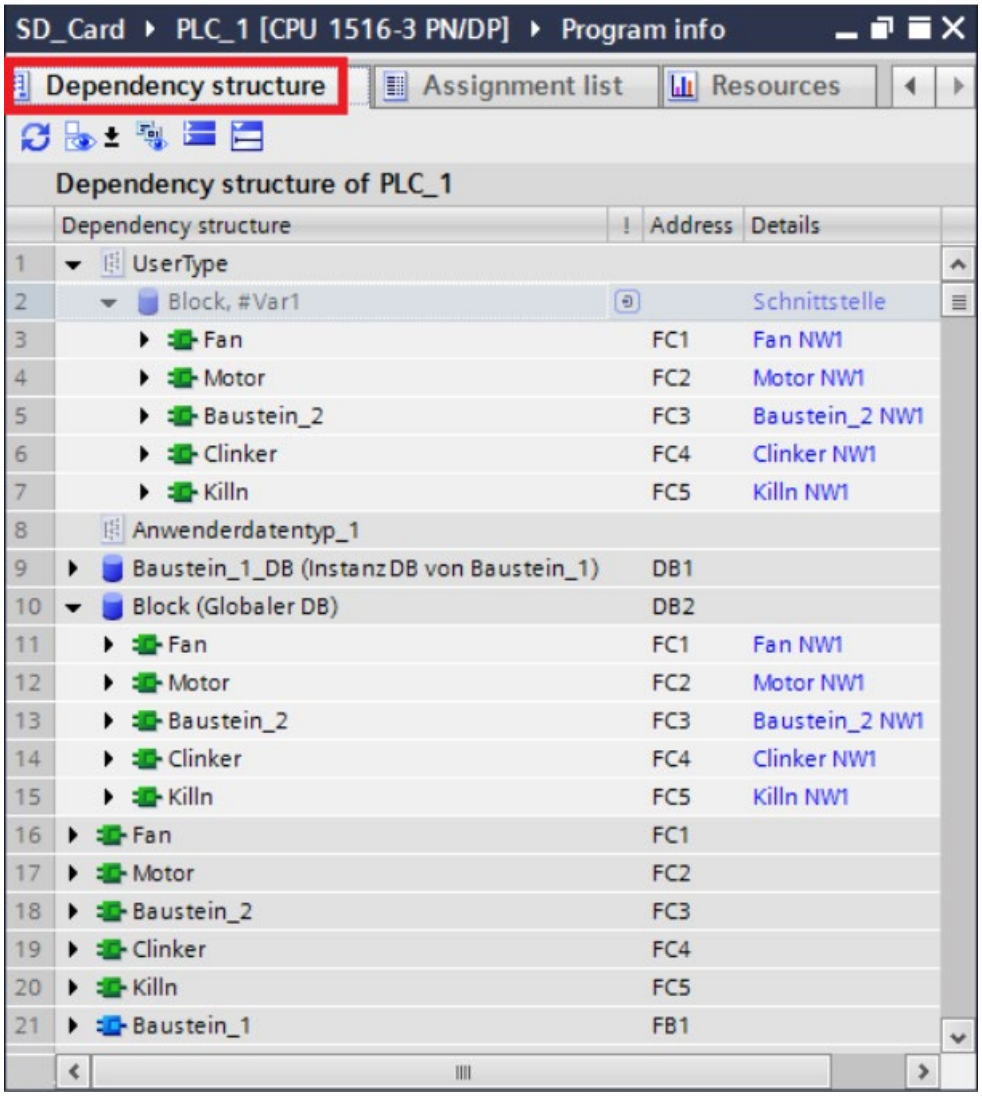

Figure 2-9 Dependency structure

Memory requirements for saving trace recordings

The "Save measurements on device (memory card)" function allows you to save trace recordings on your SIMATIC memory card.

Response when number reached

The parameter "Deactivate recording" repeats the measurements until the configured "Number of measurements" has been reached.

The parameter "Overwrite oldest recording" replaces the oldest measurement with the latest measurement when the configured "Number of measurements" has been reached. Keep in mind, however, that writing data to the SIMATIC memory card continuously will shorten its service life.

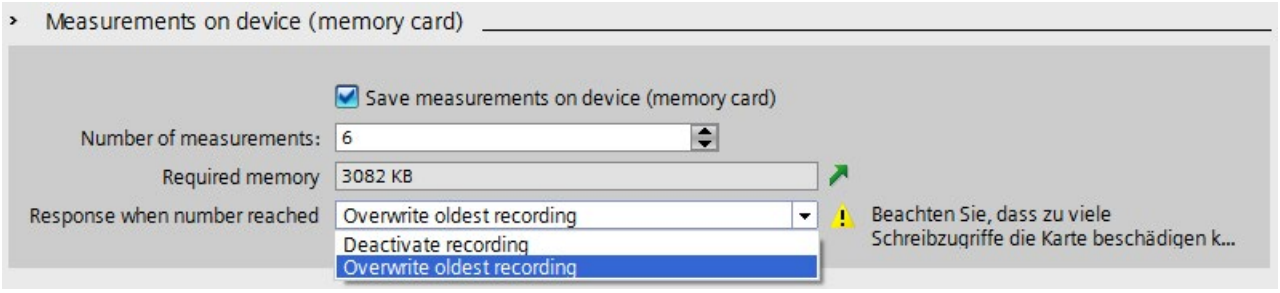

Figure 2-10 Dialog of settings for saving measurements on the memory card in STEP 7

Number of measurements

The CPU supports a maximum of 999 measurements. While the CPU writes the trace recordings to the load memory of the memory card, it pauses monitoring of the trigger conditions for the trace job. Once the CPU has finished saving the trace recordings, it resumes checking the trigger conditions.

NOTICE
Memory required on the SIMATIC memory card Keep in mind that the "Save measurements on device (memory card)" function requires free memory of more than 1024 KB on your SIMATIC memory card. This required memory is independent of the card size of the SIMATIC memory card you are using. If this space is no longer available, the CPU stops storing measurements on the memory card and writes a corresponding entry to the diagnostic buffer. Make sure that sufficient memory is available on the SIMATIC memory card before you execute the "Save measurements on device (memory card)" function. Delete any trace recordings no longer required from the SIMATIC memory card.

You can find additional information on trace recordings in the Using the trace and logic analyzer function (http://support.automation.siemens.com/WW/view/en/64897128) function manual, in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual and in the STEP 7 online help.

Memory requirements in STOP mode

Even when downloading in STOP mode a certain amount of reserve memory is required, because your memory card needs sufficient free memory for consistent downloading of individual data blocks. The files affected by loading the data blocks are only deleted after the new files have been created. Therefore, for the modifications you must have available at least the memory requirement of the largest data block.

Contrary to downloading in RUN mode, when downloading in STOP mode, modified code blocks in the CPU are deleted first prior to downloading of the modified code block. For this reason, when downloading code blocks in STOP mode, no additional memory is required on the memory card.

If insufficient reserve memory is available in your SIMATIC memory card when loading in STOP mode, the following message is displayed in STEP 7 during the load procedure: "There is insufficient memory on the memory card for this amount of data."

In order to still enable the loading of changes to the CPU in such a case, we recommend one or more of the following options:

- Delete any files no longer required (e.g. CSV files, panel backups, etc.) from the memory card using the Web server.
- Use a larger memory card. A description of how to change the memory card can be found in the section "Changing the memory card without losing retained data".

Note

Please note that retained data and possibly also project data is lost with the following three options. Therefore only use the following options described if the two options described previously did not lead to the desired result.

- In STEP 7, load your program with the menu command "Online > Download and reset PLC program" into the CPU.
- Remove the memory card from the slot of the CPU and delete the content of the memory card you no longer need with your programming device.
- Delete the entire contents, e.g. by formatting the memory card. A description of how to format the memory card can be found in the section "Formatting a SIMATIC memory card".

Also refer to the FAQ "When downloading to the S7-1500 CPU, why is the message "There is insufficient memory on the memory card for this amount of data" displayed although there is still enough memory available?" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/107108015).

Changing the memory card without losing retained data

You can change or use a larger SIMATIC memory card without losing the retained data. When you switch off the CPU, the retained data is backed up in the retentive memory of the CPU. While the CPU is switched off, you can remove the memory card and copy the contents to a larger memory card. After switching on the CPU, data backed up in the CPU when switched off is restored.

Formatting a SIMATIC memory card

To create storage space on your SIMATIC memory card, you can format the SIMATIC memory card. During formatting, the entire content of the memory card with the exception of the IP address is deleted.

The SIMATIC memory card may only be formatted in the CPU. With a SIMATIC memory card inserted, follow these steps:

Formatting with STEP 7:

- Establish an online connection.
- Double-click "Online & diagnostics" in the project tree.
- In the dialog window select "Functions > Format memory card" and then select the "Format" button.

Formatting via the display of the CPU

- In the display of the CPU, select the menu "Settings" > "Card functions" > "Format card" and confirm with OK.

NOTICE
Format the SIMATIC memory card Do **not** format the memory card with Windows tools. Formatting with Windows makes the memory card unusable for use in a CPU of the S7-1500 product family. If you have inadvertently formatted the card with Windows tools, you can restore the functioning of the card by reformatting the card in the CPU in SIMATIC format.

Memory usage and application examples 3

3.1 Memory usage for recipes

Introduction

A recipe represents a collection of parameter records with the same structure. These recipe data records are located in a non-runtime-relevant data block in the load memory, and do not occupy any storage space in the work memory. You have the option of reading individual recipe data records into a data block in the work memory and accessing the data in the user program. You can write a recipe data record that has been changed in the user program back to the recipe data block.

Recipes contain, for example, the related data of a specific batch in production. You can export recipe data records of a recipe DB as csv file. A Web browser can read data using the Web server in the CPU, even when the CPU is in STOP mode. You can also access the data directly on the SIMATIC memory card with a card reader on the programming device.

Processing sequence

- **Saving a recipe in load memory**

  STEP 7 stores the individual data records of a recipe in a non-runtime-relevant DB and loads it to the CPU. To configure a non-runtime-relevant DB, you must activate the "Only store in load memory" block attribute. The recipes then only use storage space in the load memory, and not in the work memory.

- **Working with recipe data in the user program**

  You can use the "READ_DBL" instruction to copy a data record belonging to the current recipe from the DB in the load memory to a runtime-relevant DB in the work memory. As a result, the work memory only has to accommodate the data for the currently required recipe data record. The user program can now access the data of the current data record.

- **Saving back changed recipe data records**

  You can use the "WRIT_DBL" instruction to write new or changed data records of a recipe from the user program back to the load memory. The data written to the load memory is portable and not affected by a memory reset. To back up changed data records (recipes), you have to upload the data blocks and back them up on the PG/PC. You can find information on uploading data blocks in the online help for STEP 7 under "PLC programming > Compile and download blocks > Download blocks for S7-1200/1500 > Download blocks from a memory card".

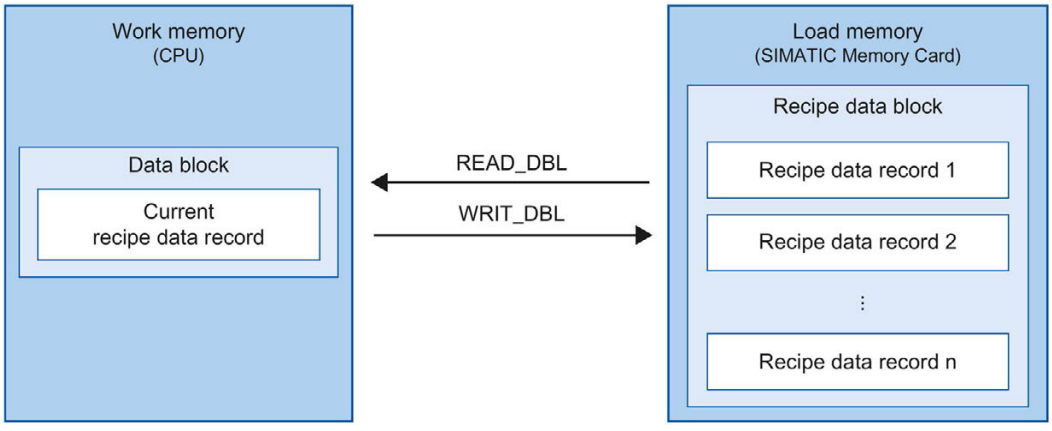

Figure 3-1 Processing sequence with "READ_DBL" and "WRIT_DBL"

Also see the FAQ "In STEP 7 (TIA Portal) how do you configure data blocks with the "Only store in load memory" attribute?" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/53034113).

Note

Instructions that access the SIMATIC memory card have a lower performance than instructions that access the work memory. The associated blocks (e.g. READ_DBL and WRIT_DBL) are therefore asynchronous. Their execution extends if necessary over several cycles.

NOTICE

Service life of the SIMATIC memory card

Only a limited number of delete and write operations are possible on the SIMATIC memory card. After expiration of the service life, there is a risk that the card can no longer be used. Therefore, use a SIMATIC memory card with sufficient memory for your particular purposes.

Additional information on the service life of the SIMATIC memory card can be found in the section Service life of the SIMATIC memory card (Page 51).

Import and export of recipe data

You have the option of exporting a recipe DB's recipe data records as a CSV file, and of importing them from a CSV file into a DB. The csv file is located in the "\recipes" directory on the SIMATIC memory card. You can open and process this file further with a spreadsheet program, e.g. Microsoft Excel.

You can easily manage the csv files on the SIMATIC memory card using the CPU's Web server (e.g. rename, save to hard disk, delete, etc.). In order to prevent unwanted tampering, configure the access privileges for the Web server in STEP 7. Additional information on the Web server can be found in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual, in the File browser section.

- **Export of recipe data**

  The "RecipeExport" instruction exports all of a recipe DB's recipe data records from the load memory to a csv file on the SIMATIC memory card. The csv file has the same name as the DB's recipe. The csv file is stored in the "\recipes" directory on the SIMATIC memory card.

  The "RecipeExport" instruction only exports valid and unencrypted recipe data records.

- **Import of recipe data**

  The "RecipeImport" instruction imports all recipe data records from the csv file into the recipe DB in the load memory. The name of the csv file must match the name of the recipe DB.

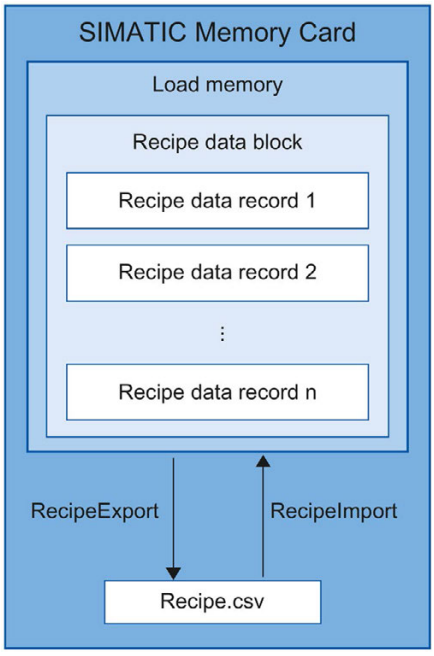

Figure 3-2 Import and export of recipe data

Note

Asynchronous instructions

Please note that the "RecipeExport" and "RecipeImport" instructions are asynchronous instructions.

In contrast to synchronous instructions, this means the execution of an asynchronous instruction can extend over multiple calls before execution is completed. The CPU processes asynchronous instructions in parallel with the cyclic user program.

A CPU can process several asynchronous instruction jobs in parallel. The CPU can process a maximum of 10 jobs of the instructions listed in parallel.

For more information on asynchronous instructions, refer to the S7-1500, ET 200MP system manual (http://support.automation.siemens.com/WW/view/en/59191792).

Reference

You can find additional information on the instructions for recipes in the online help for STEP 7 under "PLC programming > Instructions > Instructions (S7-1200, S7-1500) > Extended instructions > Recipes and data logging > Recipe functions".

Also see the FAQ "Using Recipe Functions for persistent Data with SIMATIC S7-1200 and S7-1500" on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109479727).

3.2 Memory usage for data logging

3.2.1 Overview of data logging

With data logging, you save selected process values from the user program in a file, the data log. The data logs are saved on the SIMATIC memory card in csv format and stored in the "\datalogs" directory. A Web browser can read data using the Web server in the CPU, even when the CPU is in STOP mode. You can also access the data directly on the SIMATIC memory card with a card reader on the programming device.

NOTICE
Service life of the SIMATIC memory card Only a limited number of delete and write operations are possible on the SIMATIC memory card. Cyclic write operations via the user program to the SIMATIC memory card reduce the service life of the SIMATIC memory card. After expiration of the service life, there is a risk that the card can no longer be used. Therefore, use a SIMATIC memory card with sufficient memory for your particular purposes. Information on the service life of the SIMATIC memory card can be found in the section Service life of the SIMATIC memory card (Page 51).

The "data logging" instructions may be used in your program to create, open, write, and close data logs. You decide which tags are logged by creating a data block that defines a single data log data record. Your data block is used as temporary storage for a new data log data record. New current values for the tags must be transferred into the data block during runtime by means of user program instructions. If all tag values have been updated, you can execute the "DataLogWrite" instruction, in order to transfer data from the data block into the data log.

You manage your data logs using the integrated Web server. On the standard "File browser" web page, you can download or delete data logs. After you have transferred a data log to your PC, you can analyze the data using popular spreadsheet programs, e.g. Microsoft Excel.

The following figure shows the basic sequence for creating a data log:

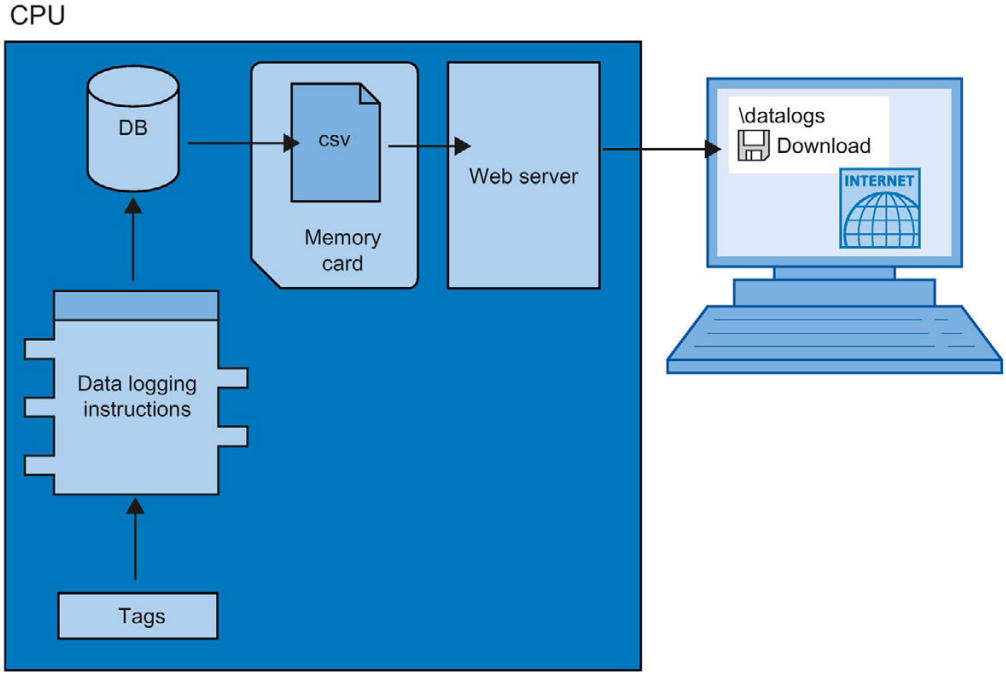

Figure 3-3 Basic sequence during the creation of a data log

3.2.2 Data structure of the data logs

Introduction

You use the "DataLogCreate" instruction to create a data log in STEP 7. The NAME parameter assigns the data log a name. The DATA and HEADER parameters specify the data type of all data elements in a data log data record, and the header line of the data log. The RECORDS parameter indicates the maximum number of records in the data log.

NAME parameter for the "DataLogCreate" instruction

You use the NAME parameter to assign a name for the data log. This is the name under which the data log is saved in the "\datalogs" directory of the SIMATIC memory card.

DATA parameter for the "DataLogCreate" instruction

The DATA block parameter specifies the structure of the data log's records. The columns and data types of a data record in the data log are determined by the elements of the structure declaration or array declaration of this data buffer. Each element of a structure or array corresponds to a column in a row in the data log.

HEADER parameter for the "DataLogCreate" instruction

Using the HEADER block parameter, you can assign a heading in the header row to each column in the data log.

RECORDS parameter for the "DataLogCreate" instruction

The RECORDS parameter specifies the maximum number of records that can be stored in a data log. If the specified maximum number of records in a data log is reached, the next write operation overwrites the oldest data record.

3.2.3 Instructions for data logging

Overview

The following table gives an overview of the instructions for data logging. You will find the data logging instructions in "STEP 7" in the "Instructions" task card, under "Extended instructions > Recipe and data logging > Data Logging".

Table 3- 1 Overview of the data logging instructions

Name of the instruction	Description
"DataLogCreate": Create data log	With the "DataLogCreate" instruction you create a data log. The data log is saved on the SIMATIC memory card in the "\datalogs" directory. You can use the data logging instructions to save process data. The amount of data that can be stored in a data log depends on the available storage space on the SIMATIC memory card.
"DataLogOpen": Open data log	With the "DataLogOpen" instruction, you open an existing data log on the SIMATIC memory card. A data log must be open before you can write new data records to it. The data log is automatically opened when the "DataLogCreate" and "DataLogNewFile" instructions are executed. A maximum of 10 data logs can be open at any one time. The data log to be opened can be selected using the ID or name of the data log. The maximum file size of data logs is 2 GB. A maximum number of 1000 data log files is possible with firmware version V2.0.
DataLogWrite": Write data log	With the "DataLogWrite" instruction you write a data record into an existing data log. Use the ID parameter to select the data log to which the data record is to be written. To write a new data record, the data log must be open.
DataLogClose": Close data log	With the "DataLogClose" instruction, you close an open data log. You select the data log using the ID parameter. At switch to STOP operating state, all open data logs are closed.
DataLogNewFile": Data log in new file	With the "DataLogNewFile" instruction you create a new data log with the same properties as an already existing data log. By creating a new data log, you prevent cyclic overwriting of existing data records. When the instruction is called it creates a new data log on the SIMATIC memory card using the name defined in the NAME parameter. You use the ID parameter to specify the ID of the old data log whose properties you want to apply to the new data log. The ID of the new data log is then output at the ID parameter.
DataLogClear": Clear data log	The "DataLogClear" instruction deletes all data records in an existing data log. The header of the data log is not deleted (see the description of the parameter Data structure of the data logs (Page 39)).
DataLogDelete": Delete data log	The "DataLogDelete" instruction is used to delete a data log from the SIMATIC memory card. Select the data log to be deleted using the NAME and ID parameters.

Note

Asynchronous instructions

Please note that the instructions listed in the table are asynchronous instructions.

In contrast to synchronous instructions, this means the execution of an asynchronous instruction can extend over multiple calls before execution is completed. The CPU processes asynchronous instructions in parallel with the cyclic user program.

A CPU can process several asynchronous instruction jobs in parallel. The CPU can process a maximum of 10 jobs of the instructions listed in the table in parallel.

For more information on asynchronous instructions, refer to the S7-1500, ET 200MP system manual (http://support.automation.siemens.com/WW/view/en/59191792).

3.2.4 Example program for data logging

This example program shows the storing of 3 process values for counter state, temperature, and pressure in a data log.

The example shows the basic functioning of the instructions for data logs. The complete program logic is not shown.

Note

General use of data logs

- Data logs are automatically opened after execution of the "DataLogCreate" and "DataLogNewFile" instructions.
- Data logs are automatically closed at a change of CPU from RUN to STOP, or during a restart of the CPU.
- A data log must be open in order to be able to write data to the data log with the "DataLogWrite" instruction.
- A maximum of 10 data logs can be open at any one time, even when more than 10 data logs exist.

Tags of the data block

The following figure shows the tags of the "My_Datalog_Vars" data block. These tags are used by the "Data logging" instructions "DataLogCreate" and "DataLogNewFile". The "MyDataLogName" and "MyNEWDataLogName" tags are called in the NAME block parameter, and give the data logs a name. The "MyData" structure is called in the DATA block parameter and specifies the structure of the csv file. The three MyData tags temporarily store new values. The tag values at these DB addresses are transferred to a data log using the "DataLogWrite" instruction. The "MyDataLogHeaders" tag is called in the HEADER block parameter and specifies a header for the data log.

My_Datalog_Vars

	Name	Data type	Start value
1	Static		
2	MyNEWDataLogName	String	'MyNEWDataLog'
3	MyDataLogName	String	'MyDataLog'
4	MyDataLogID	DWord	0
5	MyDataLogHeaders	String	'Count,Temperature,Pressure'
6	MyData	Struct	
7	MyCount	Int	0
8	MyTemperature	Real	0.0
9	MyPressure	Real	0.0

Figure 3-4 Declaration table with the data block's tags

Network 1

A rising edge at REQ starts the creation of the data log.

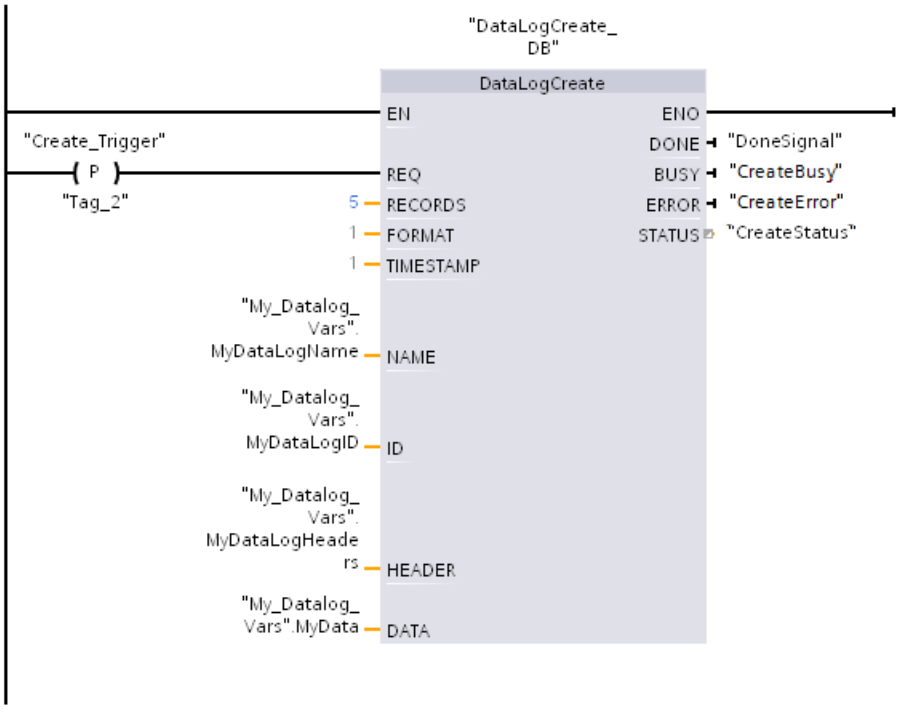

Figure 3-5 Network 1

Network 2

Detect the output DONE of "DataLogCreate", because after the execution of "DataLogCreate" it is only set to 1 for one cycle.

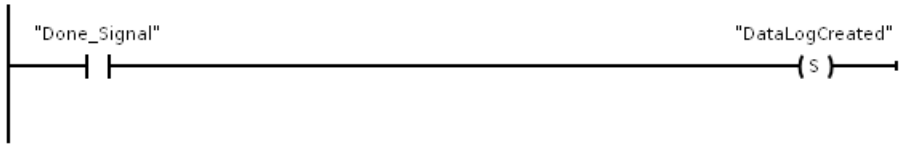

Figure 3-6 Network 2

Network 3

A rising edge triggers the point in time at which new process values are stored in the MyData structure.

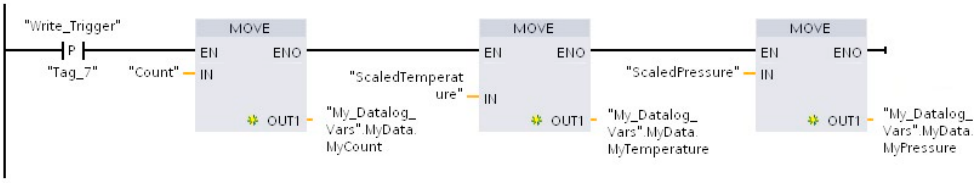

Figure 3-7 Network 3

Network 4

The state of the input EN is based on the point in time at which the execution of "DataLogCreate" was completed. One execution of "DataLogCreate" extends over multiple cycles, and must be completed before a write operation is executed. The rising edge at input REQ is the event that triggers an activated write operation.

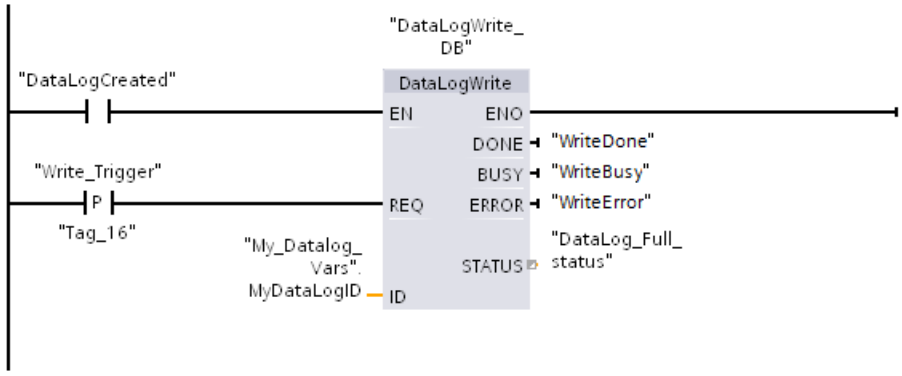

Figure 3-8 Network 4

Network 5

Close the data log after the last data record has been written. After execution of the "DataLogWrite" instruction, which writes the last data record, the STATUS output is set to "1".

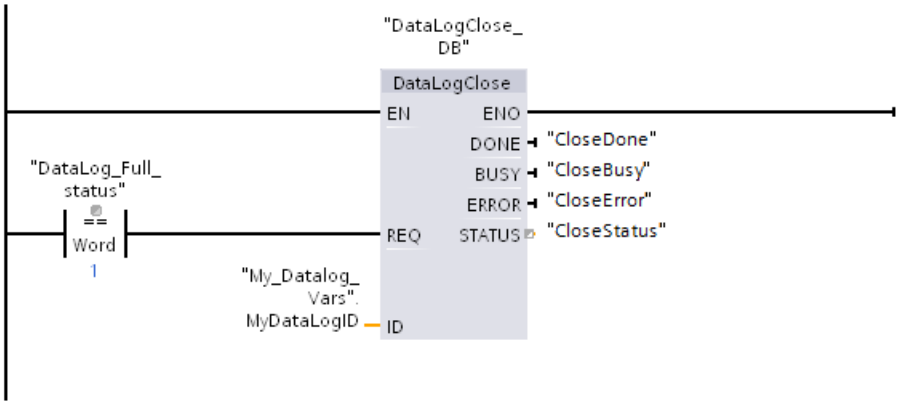

Figure 3-9 Network 5

Network 6

A rising edge at the input REQ of the instruction "DataLogOpen" simulates that the user presses a button on an HMI device, which opens a data log. If you open a data log in which all records are occupied by process data, then the next execution of the "DataLogWrite" instruction overwrites the oldest data record. You can however also preserve the old data log, and create a new data log instead. This is shown in network 7.

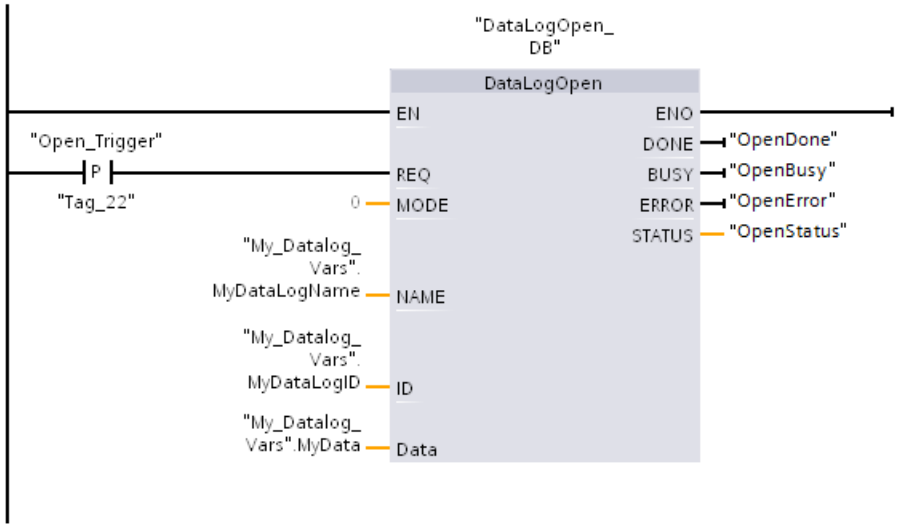

Figure 3-10 Network 6

Network 7

The ID parameter is an IN/OUT type. First you indicate the ID value of the existing data log whose structure you want to copy. After the "DataLogNewFile" instruction has been executed, a new and unique ID value for the new data log is written back into the address of the ID reference. The required detection DONE bit = TRUE is not shown. An example for the logic of the DONE bit can be found in networks 1, 2 and 4.

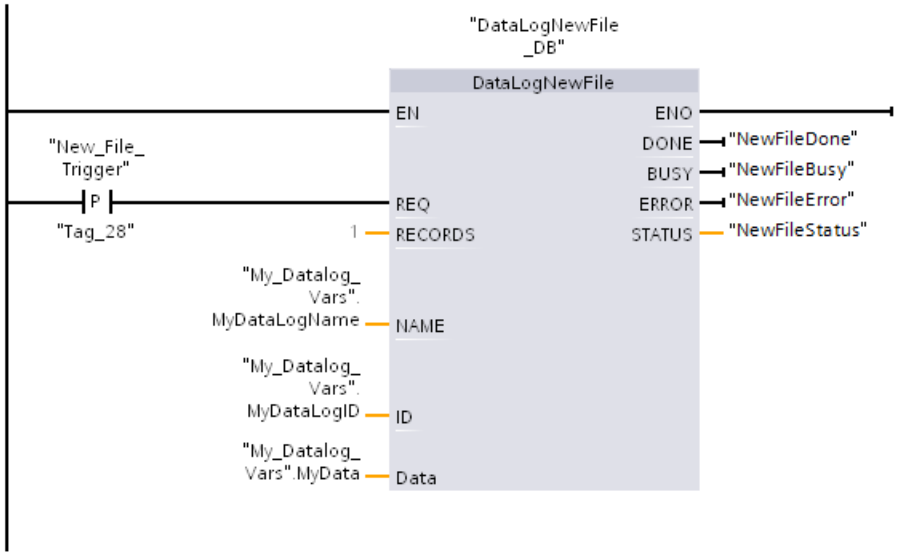

Figure 3-11 Network 7

The data logs created in the example program can be found on the CPU Web server's standard "File browser" Web page in the "\datalogs" folder.

The following figure shows the standard Web page of the Web server using the example of the CPU 1516-3 PN/DP.

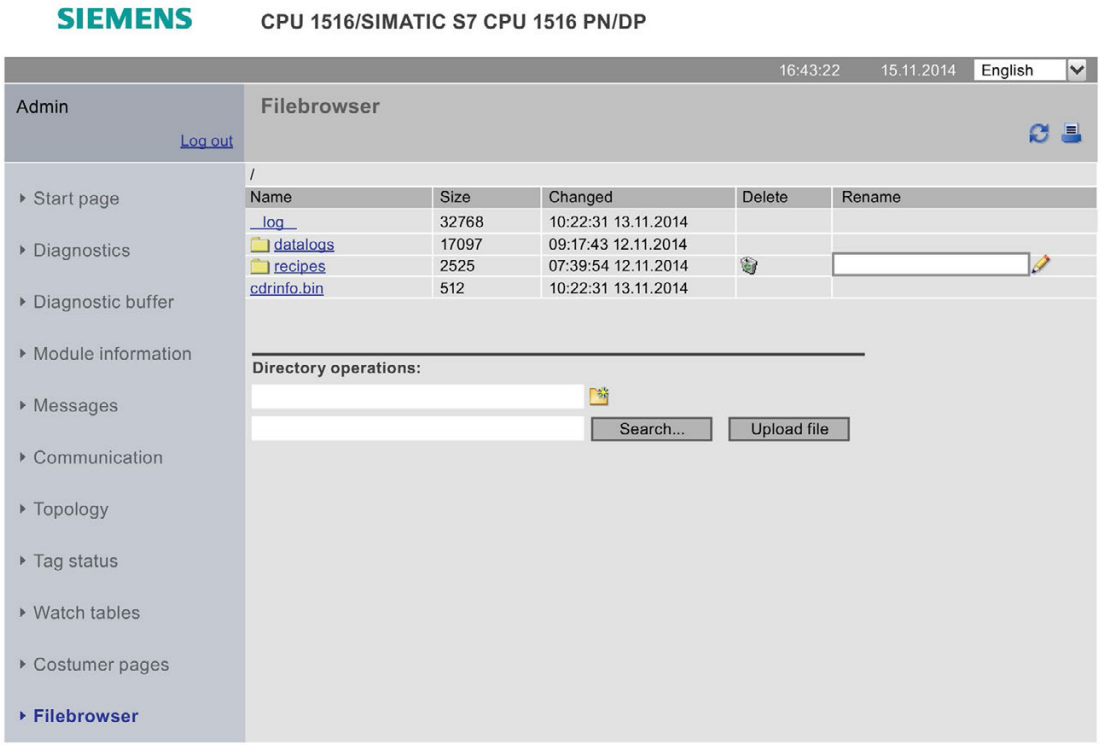

Figure 3-12 Standard "File browser" web page of the Web server

In the file browser, you can download the data logs created in the example program. It is not possible to delete or rename the data logs in the Web server. To delete a data log you either use the DataLogDelete instruction or you format the SIMATIC memory card.

On the DataLogs web page, you can have all the data logs that you created displayed. You can call and empty the relevant data log file by clicking the icon .

Note

Manipulation of the data logs using a card reader

Do not delete or change the data logs using a card reader on the PG/PC. You can copy the data logs on the SIMATIC memory card, however, using a card reader on the PG/PC.

The recommended medium for viewing, downloading (copying) and deleting data logs is the file browser of the Web server, however. Direct file access via the Windows Explorer carries a risk of the inadvertent deletion of or modification of data logs or system files. This may result, however, in files being damaged or the SIMATIC memory card becoming unusable.

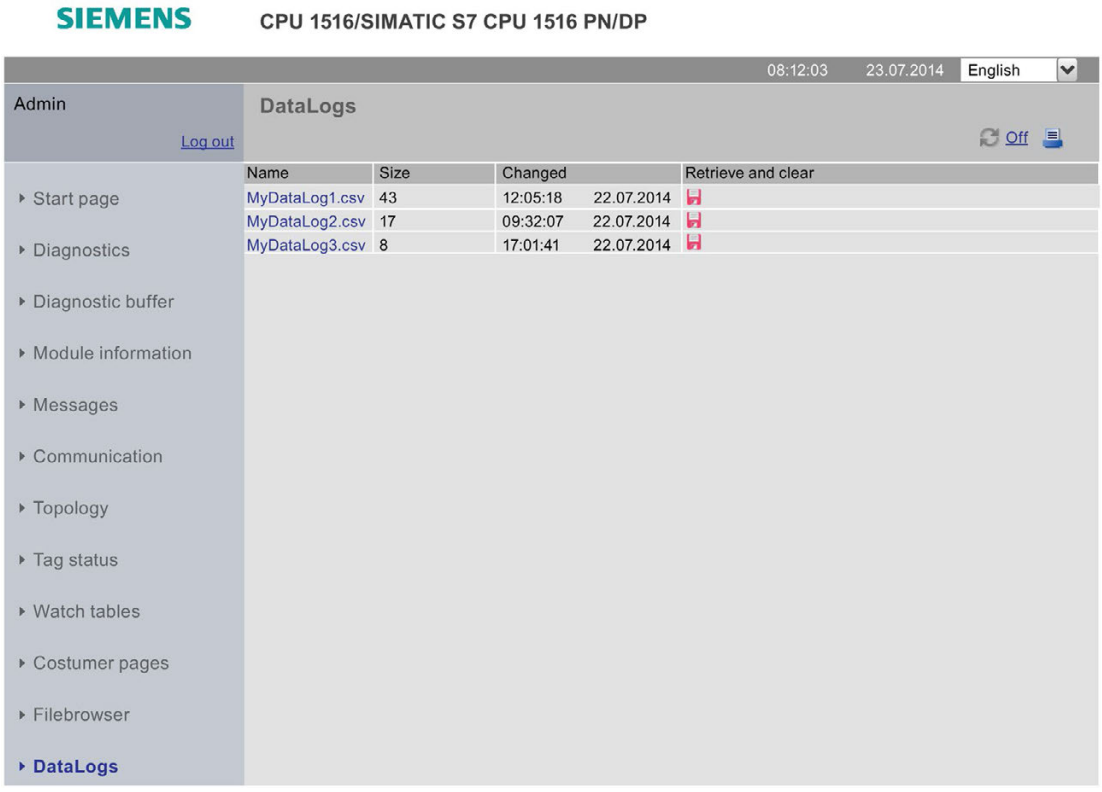

Figure 3-13 Example - Data logs in the folder "\datalogs" of the file browser

Table 3- 2 Downloaded examples of data logs displayed in Microsoft Excel

Two data records written in a data log which contains a maximum of five data records.	Five data records written in a data log which contains a maximum of five data records.	After another data record has been written, the 6th write operation overwrites the oldest data record (record 1) with data record 6. Another write operation overwrites data record 2 with data record 7, etc.	
3.2.5 Calculation of the data log size

The maximum memory size is allocated when you create the data log. In addition to the size required for all data records, you must take into consideration the memory required for a data log header (if used), a time stamp header (if used), a data record index header and the minimum block size for memory allocation.

The formula below represents a method to help you determine the estimated size of your data log. Make sure that you observe the rule for the maximum size.

Data bytes of the data log = ((data bytes in a data record + time stamp bytes + 12 bytes) * number of data records)

Header

Header bytes of the data log = header character bytes + 2 bytes

Header character bytes

- No data header and no time stamp = 7 bytes
- No data header and time stamp (with time stamp header) = 21 bytes
- Data header and no time stamp = Number of character bytes in all column headers including separating commas
- Data header and time stamp (with time stamp header) = Number of character bytes in all column headers including separating commas + 21 bytes

Data

Data bytes of the data log = ((data bytes in a data record + time stamp bytes + 12 bytes) * number of data records)

Data bytes in a data record

The DATA parameter of the "DataLogCreate" instruction points to a structure that assigns the number of data fields and the data type of each data field for a data log data record.

Multiply the number of the respective data type with the number of bytes required for this data type. Repeat the procedure for each data type in a data record and add all data bytes for the sum of all data elements in a data record.

Size of the individual data types

The data in data logs is saved as character bytes in csv format (comma separated values). The table below shows the number of bytes that are required to save each data type.

Data type	Bytes
Any	10
Bool	1
Byte	4
Char	1
Date	10
DInt	12
DTL	31
DWord	11
Int	7
LDT	31
LReal	25
Real	16
Sint	5
String	**Example 1:** MyString String[10] The maximum character string size is specified with 10 characters. • Text character + automatic filling with spaces = 10 bytes • Quotation marks at the start and end + comma character = 3 bytes 10 + 3 = 13 bytes total **Example 2:** Mystring2 String If no size is specified in square brackets, 254 bytes are assigned by default. • Text character + automatic filling with spaces = 254 bytes • Quotation marks at the start and end + comma character = 3 bytes 254 + 3 = 257 bytes total
Time	14
Tod	12
UDInt	12
UInt	7
USInt	5
WChar	1
Word	6

Number of data records in a data log

The RECORDS parameter of the "DataLogCreate" instruction specifies the maximum number of data records that can be stored in a data log.

Time stamp bytes in a data record

- No time stamp = 0 bytes
- Time stamp = 22 bytes

Example for size of a CSV file

The figure "Open CSV file" shows a CSV file opened in a spreadsheet program with five written data records in one data log.

The figure "Size of the header and the data records" shows the size of the header used in the CSV file and the size of the individual data records on the SIMATIC memory card.

The figure "Column size" shows the size of the respective columns depending on the data type used.

Open CSV file

	A	B	C	D	E	F
1						
2	Record	Date	UTC Time	Count	Temperature	Pressure
3	1	9/30/2010	20:26:56	1	9.86E+01	3.52E+01
4	2	9/30/2010	20:28:43	2	1.00E+02	3.73E+01
5	3	9/30/2010	20:29:03	3	9.99E+01	3.68E+01
6	4	9/30/2010	20:29:21	4	9.95E+01	3.64E+01
7	5	9/30/2010	20:30:19	5	9.92E+01	3.74E+01
8						

Size of the header and the data records

G
49 (42 characters + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
79 (72 + 5 commas + 2 line ending)
77 (72 + 5 commas)
Total = 442

Column size

9	Size of each column:					
10	index	Date	Time	int	real	real
11	11	10	12	7	16	16

As the example shows, each data record also consists of a separating comma (1 byte each) which must be taken into account when calculating the total size of the column.

Keep in mind that the calculation for the size of the header, the data records and the columns is not part of the opened CSV file. The size information was added manually to illustrate the elements that make up the size of a data log. You can display the total size of a data log you have created as CSV file in the Web server on the "DataLogs" website.

3.3 Service life of the SIMATIC memory card

Calculation of the theoretical service life of a SIMATIC memory serves as a decision aid for selecting which card you need for your automation task. The following examples only return a guide value, however. A precise calculation of the service life is not possible due to the fact that the description cannot cover all the theoretically possible scenarios.

Influences on the service life

You can influence the service life of SIMATIC memory cards by the following factors:

- Size of card
- Number and type of write operations

  The number of physical write operations to the memory blocks of the card results from the number and type of write operations from the application.

Structure of a SIMATIC memory card

The internal flash memory of the SIMATIC memory card is organized in memory blocks. A memory block is a memory area of a fixed size. A write operation always addresses entire memory blocks on the SIMATIC memory card. When a memory block has been written once it must be deleted before it can be written again. The number of delete/write operations per memory block is limited. The service life of the SIMATIC memory card is measured by the maximum number of supported delete or write operations per memory block.

In contrast to delete or write operations, read operations have a negligible impact on the service life. The influence of the read operations is reduced with progressive memory technology, so that the influence by read operations is not included in this calculation. A very high number of read operations can, however, influence the service life to a small extent.

Max. number of write/delete operations

In order to be able to carry out as many write operations as possible on the SIMATIC memory card, the internal controller of the memory card ensures that the available memory blocks are evenly used. Internal algorithms distribute the write accesses to the same logical memory area over changing physical memory areas in order to use the memory blocks evenly.

The following table shows the number of maximum possible write/delete operations based on the SIMATIC memory card. The number of maximum write/delete operations of the respective SIMATIC memory card is also available online in the technical specifications of the respective SIMATIC memory card.

Memory size of the SIMATIC memory card *	Article number	Max. number of write/delete operations per memory block
4 MB	6ES7954-8LCxx-0AA0	500 000
12 MB	6ES7954-8LExx-0AA0	500 000
24 MB	6ES7954-8LFxx-0AA0	500 000
256 MB	6ES7954-8LL02-0AA0	200 000
2 GB	6ES7954-8LP01-0AA0	100 000
2 GB	6ES7954-8LP02-0AA0	60 000
32 GB	6ES7954-8LT02-0AA0	50 000

* The memory size figures named in the table are theoretical values. The actual existing memory size in practice is below the theoretical value. The reason for this is that the internal controller of the card and the file system reserve part of the existing memory for internal memory management.

Note

Write or delete operations

Write or delete operations, particularly cyclic write/delete operations via the user program, to the SIMATIC memory card reduces its life.

Cyclic execution of the following instructions reduces the service life of the memory card depending on the number of write operations and data:

- "CREATE_DB" (with ATTRIB "Create DB in load memory")
- "DataLogWrite"
- "RecipeExport"
- "RecipeImport" (if target DB in load memory)
- "SET_TIMEZONE"

Please also note that, in addition to the cyclic write/delete operations, writing or deleting very large amounts of data also has a negative impact on the service life of the SIMATIC memory card.

Guaranteed data retention time

If you do not use your SIMATIC memory card for a longer period of time, there is the risk that data contained on the memory card may no longer be readable after a certain amount of time.

With proper storage, the guaranteed data retention time of a SIMATIC memory card is 10 years on delivery. With a number of ≤ 10% of the maximum write/delete operations, the data stored on the card has a retention time of 10 years.

Please note that increasing numbers of write/delete operations to the card reduces its data retention time. If 90% of the maximum write/delete operations is reached, the guaranteed data retention time is reduced to 1 year. If 100% of the maximum write/delete operations is reached, the retention time of the saved data can no longer be guaranteed.

Determining the current consumption status of a SIMATIC memory card in STEP 7

When you activate the "Aging of the SIMATIC memory card" option, you enter a threshold value as a percentage in the text box below. As soon as the service life of the SIMATIC memory card has reached the threshold value (e.g. 80%), the CPU outputs a diagnostics alarm.

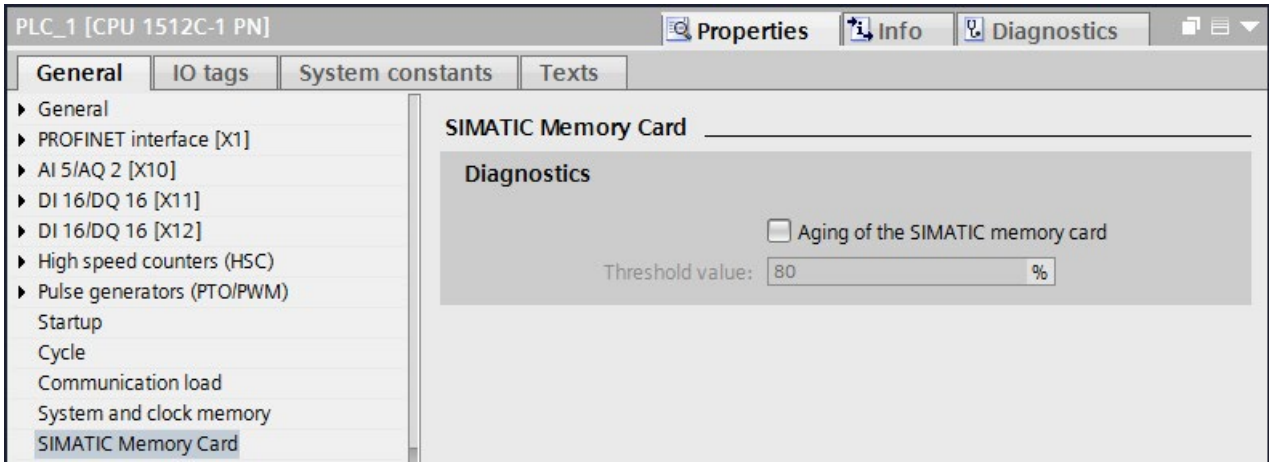

Figure 3-14 Enabled option "Aging of the SIMATIC memory card"

Calculation of the theoretical service life of a SIMATIC memory card

We will use the following example as a basis for calculation:

The user uses a new **256** MB memory card. In accordance with the table, this memory card type supports **200000** write operations. After parameter changes, the user would like to write **200** data blocks of **5** KB each to the SIMATIC memory card with a frequency of **50** times per day using the "RecipeExport" instruction.

Step 1: Calculating the write operations

First use the following formula to calculate the service life of the SIMATIC memory card:

$$\text{Write operations} = \frac{\text{Size of the memory card} \ * \ \text{Maximum number of write operations}}{\text{Number of written bytes}}$$

We first use the sizes from the example in the formula "Write operations" as a basis for calculating the service life:

- Size of the memory card: **256** MB = **268435456** byte
- Maximum number of write operations: **200000**
- Number of written bytes: **1024000** byte (**200** x **5** KB)

If we use the sizes from the example in the formula, we obtain the following result:

$$\text{Write operations} = \frac{268\,435\,456 \text{ byte} \ * \ 200\,000}{1\,024\,000 \text{ byte}} = 52\,428\,800 \text{ write operations}$$

Step 2: Calculating the service life

Use the following formula to calculate the service life in years:

$$\text{Service life} = \frac{\frac{\text{Write operations}}{\text{Write operations per day}}}{365 \text{ days}} : \text{Net-gross factor} = \text{years}$$

Note

Net-gross factor

With every write operation, internal data (metadata) is also written to the SIMATIC memory card. Due to this additional data, include the net-gross factor **10** when calculating the service life.

If we use the sizes from the example in the formula, we obtain the following result:

$$\text{Service life} = \frac{\frac{52\,428\,800}{50}}{365 \text{ days}} : 10 = 287 \text{ years}$$

Calculation with more frequent write accesses and a higher number of bytes written

If the frequency of write accesses and the number of bytes written per day increases, the service life of the SIMATIC memory card is reduced.

Using empirical values, the following table shows how the service life of a SIMATIC memory card with a size of 256 MB is reduced.

Write accesses per day	Number of bytes written per instruction	Service life of the SIMATIC memory card in years
50	1024000	287
100	1024000	143
400	1024000	36
400	2048000	18
400	4096000	9

The following table shows how the same values impact the service life of a SIMATIC memory card with a size of 2 GB (6ES7954-8LP01-0AA0).

Write accesses per day	Number of bytes written per instruction	Service life of the SIMATIC memory card in years
50	1024000	1149
100	1024000	575
400	1024000	144
400	2048000	72
400	4096000	36

The result shows that a high number of write accesses together with a high number of written bytes significantly shortens the service life of the SIMATIC memory card.

Reference

An alternative method for calculating the service life of a SIMATIC memory card is available in an FAQ on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109482591).

Glossary

Bit memory

Bit memory is a memory area of the CPU that can be addressed from any code block (FC, FB, OB). You have read/write access to this memory area. The bit memory area can be used to store temporary results, for example.

Counters

In STEP 7, counting tasks are performed using counters. You can modify the contents of the "counter cells" using STEP 7 instructions (for example, count up/down).

Data block

Data blocks store information for the program. They can be defined either in such a way that all code blocks can access them (global data block) or that they are assigned to a specific FB or SFB (instance data block).

Data log

Data logs are csv files for the storage of tag values. The data logs are saved on the SIMATIC memory card in the "\datalogs" directory. Data records of tag values are written to a data log by means of instructions in the user program.

Global data block (DB)

Every function block, every function, and every organization block can read the data from a global data block, or write its own data to a global data block. This data is retained in the data block, even when the data block is exited.

Instance data block (IDB)

A data block is assigned to each call of a function block in the STEP 7 user program. The instance data block stores the values of input, output and in/out parameters, as well as local block data.

Local data

This memory area accepts the temporary local data of a block for the duration of processing.

Memory reset

During memory reset the CPU is set to the configured initial state.

Optimized block access

Data blocks with optimized access have no fixed structure. In the declaration, the data elements only receive a symbolic name, and no fixed address within the block. The elements are automatically arranged in the block's available memory area in such a way that its capacity is optimally exploited.

In these data blocks, you can only address tags symbolically. For example, you would access the "FillState" tag in the "Data" DB as follows:

"Data".FillState

Optimized access offers the following advantages:

- The data is structured and saved in a manner that is optimal for the CPU used. This allows you to increase CPU performance.
- Access errors, e.g. from the HMI, are not possible.
- You can selectively define individual tags as retentive.

Process images (I/O)

The CPU transfers the values from the input and output modules in this memory area. At the start of the cyclic program, the signal states of the input modules are transmitted to the process image input. At the end of the cyclic program, the process image output is transmitted as signal state to the output modules.

Reset to factory setting

Resetting to factory settings restores the CPU settings to the delivery state.

Restart

Restart occurs at the transitions from STOP to STARTUP, and POWER ON to STARTUP. Before the cyclic program processing, the CPU first processes the startup OB or OBs.

Restart has the following effects on the memory areas of the CPU:

- The process images are deleted.
- The retentive tags of data blocks retain the values saved in retentive memory.
- All retentive bit memories, timers, and counters retain the values saved in retentive memory.
- All non-retentive user data is initialized:
  - Data blocks receive their start value
  - Bit memories, timers, and counters with "0"

SIMATIC memory card

Memory for the user program for programmable modules and communication processors. You can also use the SIMATIC memory card for changing user software and user data.

Standard access

Data blocks with standard access have a fixed structure. In the declaration, the data elements contain both a symbolic name and a fixed address within the block. The address is displayed in the "Offset" column.

In these data blocks, you can address tags both symbolically and absolutely:

"Data".FillState

DB1.DBW2

Timers

In STEP 7, programmed time processes are performed using timers. The content of timer cells is automatically updated by the operating system, asynchronously to the user program. STEP 7 instructions are used to define the precise function of the timer cell (for example, on-delay time) and to trigger its execution (for example, start).

User program

The user program contains all instructions, declarations and data for signal processing required to control a plant or a process. The user program is assigned to a programmable module (for example, CPU, CM) and can be structured in smaller units.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation supports you in the operation of the Web server.

The Web server offers, among other things, web page access to diagnostic data and to process data of the CPU.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge in the field of automation technology
- Knowledge of the industrial automation system SIMATIC
- Experience of working with Windows-based computers
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of the documentation

This documentation is valid for CPUs as of firmware version V2.0 and contains illustrations of the Web server user interface. The images used are identical for all CPUs of the S7-1500 automation system and distributed I/O system ET 200SP and the CPU 1516pro-2 PN of distributed I/O system ET 200pro.

The displayed illustrations can differ from the interface of the Web server in some details, e.g. depending on the browser used.

What's new compared to the previous version of the function manual (12/2014 edition)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Handling of certificate modified	You protect the Web server against tapping or distortion of the communication through access via the secure transmission protocol "HTTPS" including a special Web server certificate.	Section Configuring the Web server (Page 19)
	Four additional languages for the Web server interface	You can set the Web server interface to the following languages: • Korean • Russian • Turkish • Portuguese (Brazil)	Section Start page with general CPU information (Page 32)
	Assignment of different project languages extended	You can assign up to three different project languages for comments, alarm texts and diagnostic information to the user interface languages of the Web server.	Section Language settings (Page 29)
	"Start page" web page extended	The display of the TIA project name immediately indicates whether the desired project is selected.	Section Start page with general CPU information (Page 32)
	"Diagnostics" web page extended by one tab: • "Program protection" • "Runtime information" • "Fail-safe" (with an F-CPU)	Here you can find information about: • Know-how protection or copy protection of the PLC program • Program/communication load and cycle time • F-collective signatures, cycle times and runtimes of the F-runtime group(s)	Section Diagnostics (Page 36)
	"Alarms" web page extended	You can acknowledge alarms of the CPU via the Web server.	Section Alarms (Page 49)
	"Tag status" and "Watch tables" web pages extended	You can change the value of tags and write them to the CPU, also using the absolute address.	Section Tag status (Page 64) Section Watch tables (Page 66)
	New web page "Online backup"	You can back up and restore the CPU configuration to/from the SIMATIC memory card via the Web server.	Section Online backup (Page 99)
	New "Motion Control diagnostics" web page	You can monitor statuses, errors, technology alarms and the current values of configured technology objects (TOs) with the Web server without STEP 7.	Section Motion Control diagnostics (Page 103)
	New web page "Online backup"	You can read, view and save trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance without STEP 7.	Section Trace (Page 110)

What's new?		What are the customer benefits?	Where can I find the information?
Changed contents	Scope of the function manual expanded to include CPUs of the distributed I/O system ET 200SP and the CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in CPUs in other designs (ET 200SP) and in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	Manual CPU 1510SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157130) Manual CPU 1512SP-1 PN (https://support.industry.siemens.com/cs/ww/en/view/90157013) Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)
	Web page "Watch tables": Note added on the maximum configuration limits.		Section Watch tables (Page 66)
	Web page "User pages": Note added on the maximum size of the HTML pages.		Section User pages (Page 68)

Conventions

In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

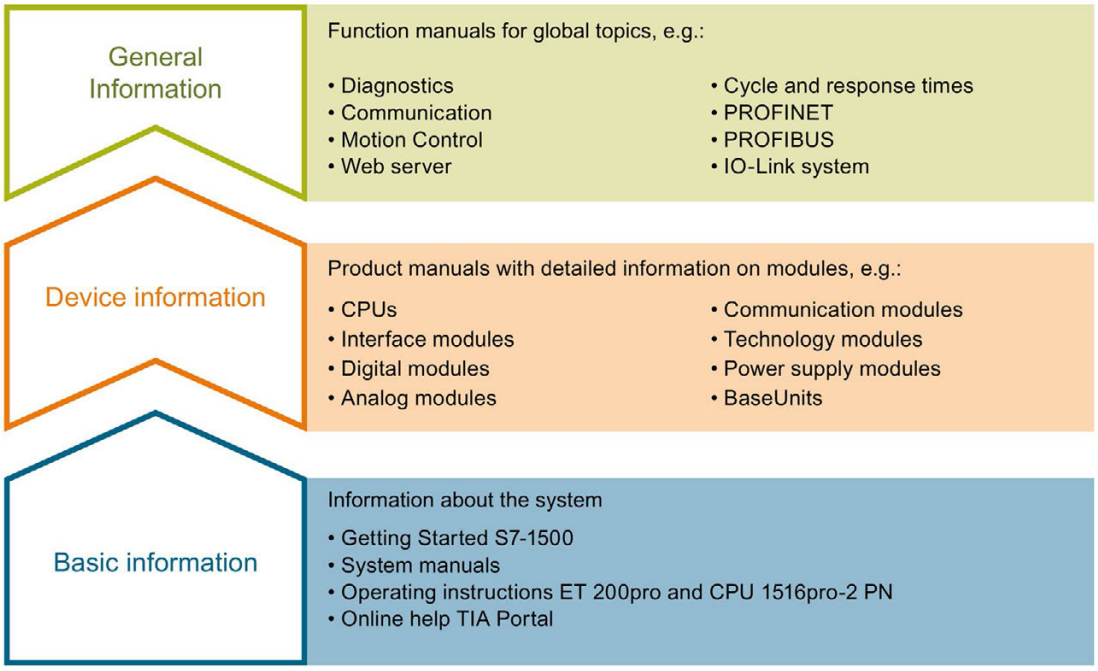
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

General information 2

2.1 Properties of the Web server

Benefits of the Web server

The Web server lets you monitor and administer the CPU through authorized users by means of a network. Evaluations, diagnostics, and modifications are thus possible over long distances. Monitoring and evaluation is possible without STEP 7; all you need is a web browser. Make sure that you take appropriate measures (e.g., limiting network access, using firewalls) to protect the CPU from being compromised.

Activating the Web server

The Web server is deactivated in the delivery state of the CPU. This means that you must load a project in which the Web server is activated to enable access using the Web browser.

Security functions

The Web server provides the following security functions:

- Access via the secure transmission protocol "HTTPS" using the CA-signed Web server certificate
- User authorizations you can configure by means of user list
- Activation for specific interfaces

Web browser

You need a web browser to access the HTML pages of the CPU.

The following web browsers have been tested for communication with the CPU. Other web browsers may also work, especially newer versions. However, if problems occur with web browsers not mentioned here that cannot be rectified, use one of the following tested web browsers:

- Internet Explorer (Version 11)
- Microsoft Edge (Windows 10)
- Mozilla Firefox (Version 42 to 47)
- Google Chrome (version 46, 47)
- Mobile Safari and Chrome for iOS (iOS 9)
- Android Browser and Android Chrome (Jelly Bean 4.3, KitKat 4.4, Lollipop 5.0 … 5.1.x, Marshmallow 6.0 operating system)

Note

If you are using Internet Explorer, disable "Compatibility view" in the settings ("Options" menu).

Note

For access to display devices with low screen resolution, we recommend the use of basic websites, see section Basic websites (Page 121).

Note

Older versions of the web browsers mentioned which previously supported access to the HTML pages of the CPU continue to do so. However, these older versions do not support the new functions and HTML pages described in this edition.

Note

Two reserved communication connections are available to the Web server for communication with the CPU.

Depending on the web browser used, different numbers of connections to the CPU are established. If more connections are available, more communication connections will be established.

If no more connections are available, display or functional problems may occur, because the Web server will reject all other communication connections apart from the two that are reserved.
For this reason, the web pages may not load fully.

Note

If you access the Web server of the CPU using a communication processor (CP), ensure that the cache (temporary Internet files) is enabled in your browser. Choose the "Automatically" option in the cache settings of your browser.

If the cache is disabled or if a setting other than "Automatically" is made in the cache settings of your browser, this may result in slow access times and incomplete display.

Reading out data

With the Web server, you can read out the following data from the CPU and, in some cases, modify and write back the data to the CPU:

- Start page with general CPU information (Page 32)
- Information on Diagnostics (Page 36)
  - Identification
  - Program protection
  - Memory
  - Runtime information
  - Fail-safe (with an F CPU)
- Contents of the diagnostics buffer (Page 40)
- Module information (Page 41)
- Firmware update (Page 47)
- Alarms (Page 49)
- Information on Communication (Page 50)
  - Important interface parameters
  - Port statistics
  - Display of the communication resources
  - Display of the communication connections
- PROFINET Topology (Page 55)
  - Graphical view (set and actual topology)
  - Table view (actual topology)
  - Status overview
- Tag status (Page 64)
- Watch tables (Page 66)
- User pages (Page 68)
- Filebrowser (Page 97)
- DataLogs (Page 98)
- Online backup and restoration of the configuration (Page 99)
- Diagnostic information for technology objects (Page 103)
- Evaluation of trace recordings (Page 110)
- Reading out service data (Page 120)
- Basic websites (Page 121)

On the following pages, you will find more detailed descriptions of the HTML pages.

Web access to the CPU via PG/PC, HMI devices and mobile terminal devices

Proceed as follows to access the Web server:

1. Use STEP 7 to download a project in which the Web server is enabled to the CPU.
2. Connect the display device (PG/PC, HMI, mobile terminal device) with the CPU or a communication module using a PROFINET interface.
   If you are working with WLAN, activate the WLAN on the display device and establish a connection to the access point (e.g. SCALANCE W788-1RR or SCALANCE W784-1), which is in turn connected to the CPU.
3. Open the web browser on the display device.
4. Enter the IP address of the interface of the CPU which is connected to the client in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (sample input: http://192.168.3.141).
   The CPU intro page opens. From the intro page you can navigate to additional information.

Additional information on access using the secure transmission protocol "HTTPS" is available in the section Configuring the Web server (Page 19) under "Permit access only with HTTPS".

Additional information

Using a smartphone, you can access the Web server of the CPU either via WLAN or access to the CPU via the SIMATIC S7 app (using Web server functionality). You can find additional information in the FAQ entry ID 103473392 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103473392) Internet page.

Note: The Web server must also be activated for access to the CPU via the SIMATIC S7 app.

The SIMATIC S7 app offers you additional functions. You can find a detailed application example with further documentation and example projects on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/84133612) Internet page.

2.2 Configuring the Web server

To use the full range of functions offered by the Web server, you need to make the settings in STEP 7 listed below:

Procedure

You have opened the properties dialog of the CPU in the STEP 7 project view.

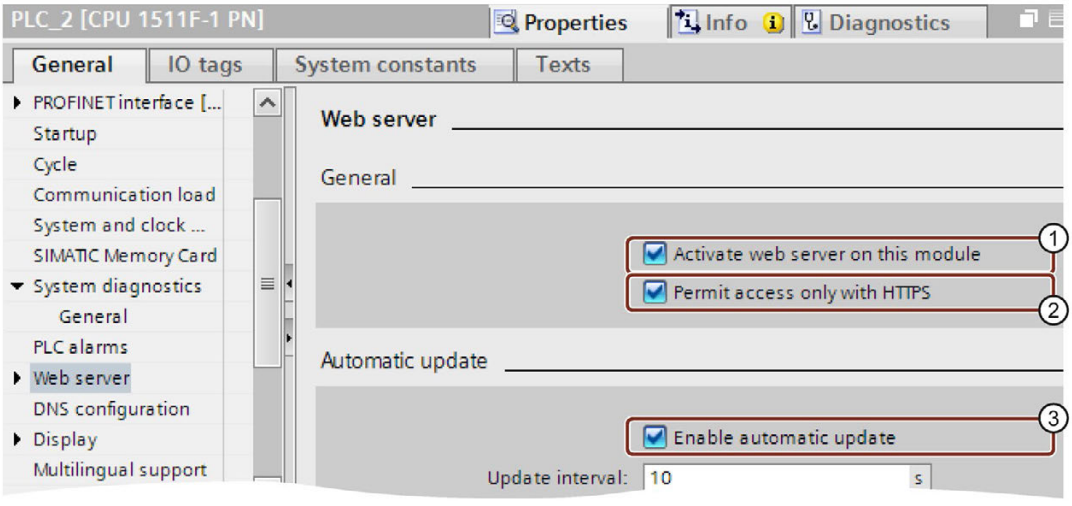


Figure 2-1 Web server settings in STEP 7

① Activate Web server

In the default setting of a configured CPU, the Web server is disabled. Proceed as follows to enable the Web server:

1. Open the "Devices & Networks" view with a double-click in the STEP 7 project tree.
2. Select the required CPU in the device view, network view or topology view.
3. Navigate to the "Web server" area in the Inspector window properties, "General" tab.
4. Select the "Activate web server on this module" check box.
   The following note is output:

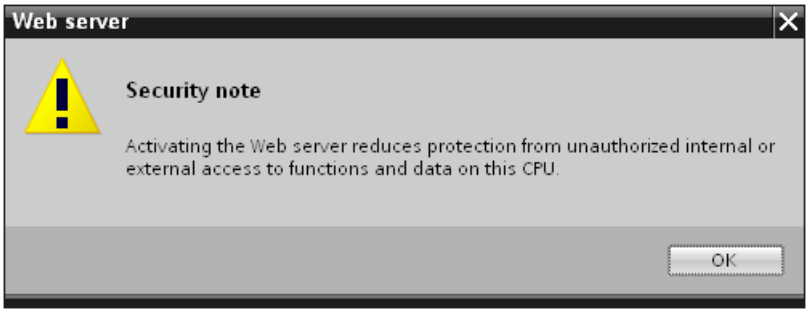

Figure 2-2 Security note upon activation of the Web server in STEP 7

Note

When projects from deliveries are applied in which the Web server was already activated and configured on the module, this security note is not shown.

Creating and assigning a Web server certificate

The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate.

With SIMATIC S7-1500 CPUs as of firmware V2.0, you have to create the certificate for the Web server of the CPU with STEP 7 yourself and assign it to the Web server in the CPU properties. When the hardware configuration is downloaded to the CPU, this certificate is also automatically downloaded. STEP 7 itself has a Certification Authority (CA) certificate, with which the device certificate (end-entity certificate) of the Web server is signed.

Note

If you update the firmware of a SIMATIC S7-1500 CPU or ET 200SP with firmware version < V2.0 to firmware version ≥ V2.0, a valid server certificate is automatically generated and used. The same applies to the replacement parts scenario in which a newer CPU replaces a CPU with firmware version < V2.0.

You can create different Web server certificates:

- If you use the certificate manager in the global security settings, the certificate authority of the project (CA certificate) signs the device certificate of the Web server. During loading, the CA certificate of the project is automatically loaded as well.
- If you do not use the certificate manager in the global security settings, STEP 7 generates the device certificate as a self-signed certificate.

NOTICE
Utilizing the full functionality of the Web server A valid CA-signed Web server certificate in the CPU is a requirement for: • User management with password-protected users • The use of safety-related functions (online backup and restore of the CPU configuration, saving and downloading diagnostic information in csv files) To use the full functionality of the Web server, we therefore recommend that you use the Certificate Manager to create a CA-signed server certificate in the global security settings and assign it to the CPU.

Creating a self-signed server certificate

To create a self-signed Web server certificate, follow these steps:

1. in the Inspector window Properties of the CPU, "General" tab, navigate to the "Web server > Security" area.
2. Click the "Add" button in the drop-down list to select a certificate.
   The "Create a new certificate" dialog opens.
3. Select the "Self-signed" check box in the subsequent dialog.

4. Enter the parameters for the new certificate or confirm the default settings.
   - Select "Web server" in the "Usage" box.
   - Enter the IP address(es) of the interface(s) or the domain name of the configured CPU in the "Subject Alternative Name" field.
5. Click "OK" to confirm.
6. Compile and load the configuration into the CPU.
   The device certificate of the Web server is a component of the configuration.

Creating and assigning a CA-signed Web server certificate

To create a CA-signed Web server certificate, follow these steps:

1. In the Inspector window Properties of the CPU, "General" tab, navigate to the "Protection & Security > Certificate Manager" area and select the "Use global security settings for certificate manager" option.
   The "Global security settings" appear in the project tree.

   Note

   To edit the Certificate Manager in the global security settings, you require the "Configure security" configuration permission.

2. Log on as a user in the project tree in the "Global security settings > User logon" area.
   The "Administrator" role is the default for the first logon for a new project.
3. in the Inspector window Properties of the CPU, "General" tab, navigate to the "Web server > Security" area.
4. Click the "Add" button in the drop-down list to select a certificate.
   The "Create a new certificate" dialog opens.
5. In the following dialog, select the "Signed by certificate authority" check box and select the certificate authority from the drop-down list.
6. Enter the parameters for the new certificate or confirm the default settings.
   - Select "Web server" in the "Usage" box.
   - Enter the IP address(es) of the interface(s) or the domain name of the configured CPU in the "Subject Alternative Name" field.
7. Click "OK" to confirm.
8. Compile and load the configuration in the CPU.
   The device certificate of the Web server and the CA certificate are components of the configuration.

NOTICE
Addressing the Web server of the CPU via domain names If you enter the IP address(es) of the interface(s) of the configured CPU in the "Subject Alternative Name" field, the generated certificate may not be accepted by all Internet browsers. You also need to create and load a new server certificate (end-entity certificate) every time you change the IP address of an Ethernet interface of the CPU, since the identity of the CPU changes along with the IP address. You can avoid this problem by addressing the Web server of the CPU using domain names instead of IP address(es), e.g. "myconveyer-cpu.room13.myfactory.com". For this purpose, you have to manage the domain names of your CPU via a DNS server.

Additional information

Detailed information on local self-signed certificates and global CA certificates, on the "Public Key Infrastructure" (PKI) and on certificate management can be found in the Communication function manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and in the online help for STEP 7, keyword "Secure communication".

② Permit access only with HTTPS

Note: The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate in the CPU. See "Creating and assigning a Web server certificate" in the section above.

The web pages are transmitted by default via non-secure connection and are not protected from attacks by third parties. If you always want to transmit web pages to the browser in secure form, enable the "Permit access only with HTTPS" option in the CPU properties. Note that the URL of the CPU starts with "https://" in this case.

For error-free HTTPS access to the CPU, the following conditions must be met:

- The current date/time must be set in the CPU.

  Note

  When using secure communication (e.g. HTTPS), make sure that the corresponding modules have the current time of day and the current date. Otherwise, the modules evaluate the used certificates as invalid and the secure connection will not be established.

- The IP address of the CPU must be set.

- A valid server certificate offered by the CPU is installed in the Web browser.

NOTICE
Safety-related functions only possible with CA-signed Web server certificate Online backup and restore of the CPU configuration, see section Online backup (Page 99), as well as saving and downloading diagnostic information to csv files are only possible with a CA-signed Web server certificate. A valid CA-signed Web server certificate in the CPU is also required for user administration with password-protected users. To use the full functionality of the Web server, we therefore recommend that you use the Certificate Manager to create a CA-signed server certificate in the global security settings and assign it to the CPU.

If no CA-signed Web server certificate is installed, a warning is output recommending that you do not use the page. To view the page, you may need to "Add an exception", depending on the Web browser used.

A valid CA certificate is available for download from the "Intro" web page under "Download certificate".

You can find instructions for installing the certificate in the help system of your Web browser and in the FAQ with the entry ID 103528224 at the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103528224) website.

Note

To protect against manipulation from the outside, download the certificate only in an environment that is guaranteed not to be compromised. Installation of the CA certificate has to be carried out once for each display device you wish to use.

Access protection

The certificate establishes an encrypted connection that prevents tapping or distortion of the communication but does not provide access protection. This means you have to protect your CPU from unauthorized access with the corresponding configuration in the user management.

You can find additional information on access protection in the online help for STEP 7, keyword: "Protection".

③ Automatic update

Automatic updating is activated in the default setting of a configured CPU.

The following web pages are updated automatically:

- Start page
- Diagnostics (memory, runtime information, fail-safe)
- Diagnostics buffer
- Module information
- Alarms
- Communication
- Topology
- Tag status
- Watch tables
- Filebrowser
- DataLogs
- Motion Control diagnostics
- Trace

Note

The preset activation interval is 10 seconds.
Larger amounts of data or several HTTP-/HTTPS connections increase the update time.

Setting the language for the Web

In total, you can assign up to three different project languages to the user interface languages of the Web server.

In STEP 7, activate the project languages you wish to use and then assign one of the activated project languages to each interface language of the Web server.

You can find additional information about the language settings and a description of how to assign a project language to the interface languages in the section Language settings (Page 29).

Amending user management

Note: A valid CA-signed Web server certificate in the CPU along with a secure HTTPS connection are required for user administration with password-protected users. See "Creating and assigning a Web server certificate" and "Permit access only with HTTPS" in this section.

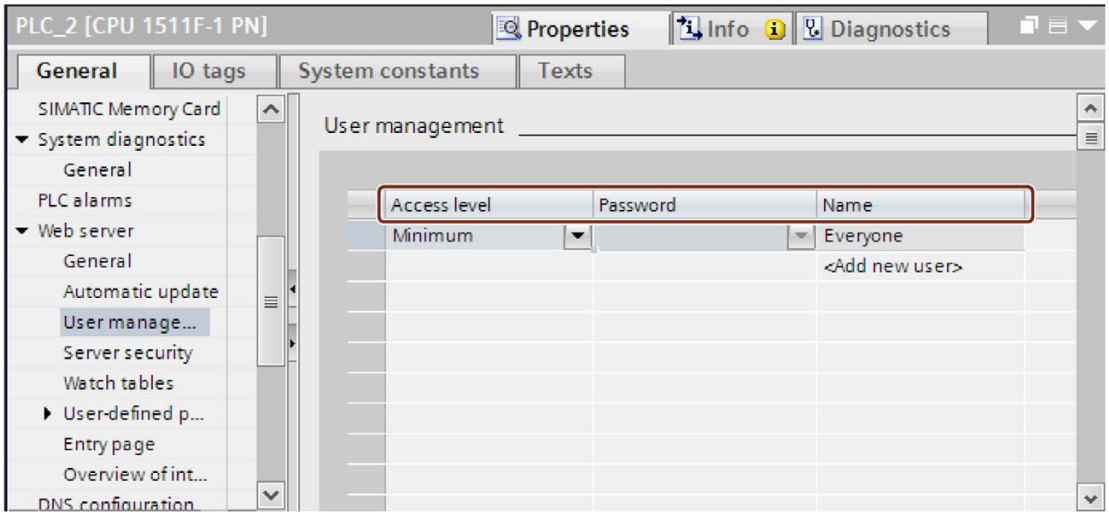

Figure 2-3 User management in STEP 7

In STEP 7, you can manage the user list in the "Web server > User management" area.

The user list provides the following options:

- Create users
- Specify access permissions
- Assign passwords

Users only have access to the options that are permanently linked to the access rights.

You can assign different user rights depending on the used CPU and firmware.

The available user rights can be available for selection as follows in STEP 7:

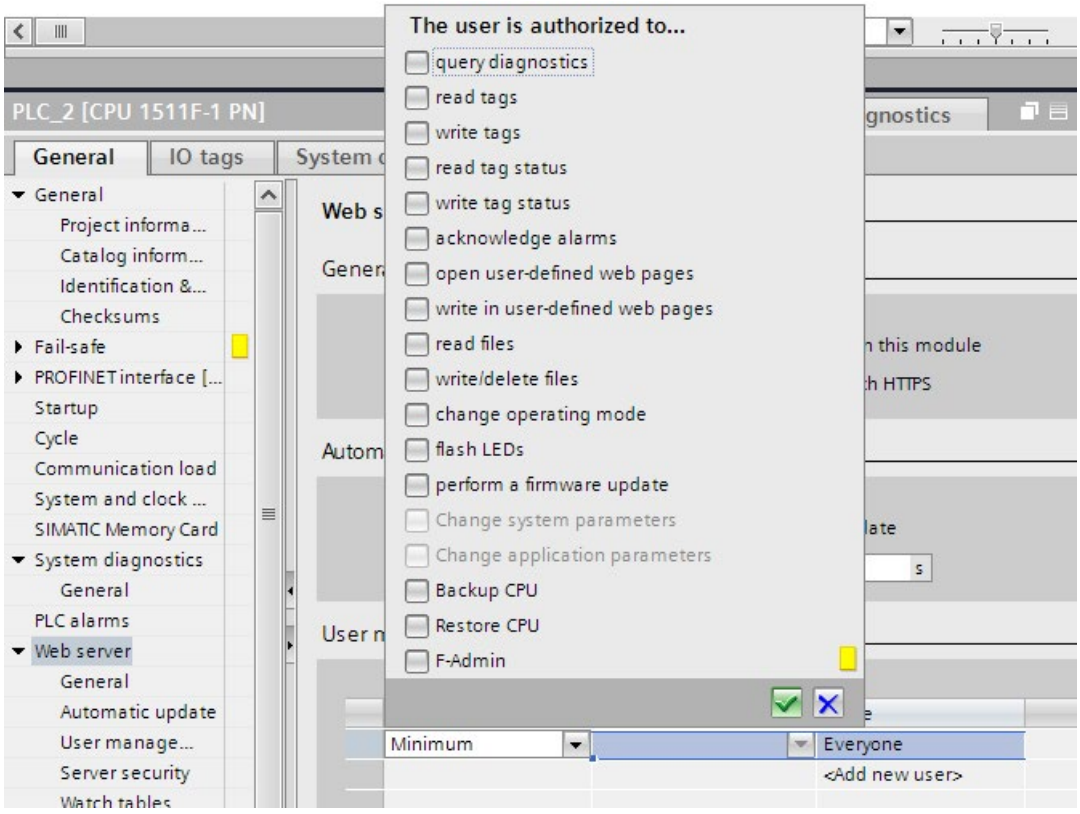

Figure 2-4 Assignment of user rights in STEP 7

If you are not logged in, you automatically access the Web server as the user "Everybody".

It does not matter in this case whether you have configured additional users.

User "Everybody"

A user with the name "Everybody" is preset in the user list; this user has minimum access rights. These are read-only access to the intro page and start page. The user "Everybody" is defined without a password. However, you can assign all access authorizations available in STEP 7 to this user.

You can create a maximum of 20 users and a user "Everybody".

Because the user "Everybody" is defined in STEP 7 without assignment of a password, be careful of the access authorizations that you assign to this user.
Certain authorizations, such as the possibility of changing the operating mode, could represent a security risk.
For the assignment of security-relevant authorizations, we recommend that you create a user with password protection in STEP 7.

WARNING

With an F-CPU, do **not** assign the access authorization "F-Admin" to the user "Everybody".

Make sure that you observe the warnings relating to this in the section "Restoring a backup of the safety program to an S7-300/1500 F-CPU" in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

Passwords should always be more than 8 characters in length and contain uppercase and lowercase characters as well as special characters and numbers (?!+%$1234...). Computer keyboard character strings and words from the dictionary are unsuitable. Change the password regularly.

Note

When assigning rights, note that read or write access to the watch tables and tag status is retained even if you have disabled the "Accessible from HMI/OPC UA" attribute in the PLC tag table when configuring the data block in STEP 7.

User pages

In the "User pages" area you can download your own web pages to the CPU and make your own web applications available via the web browser.

You can find additional information in section User pages (Page 68).

Activation of the Web server for specific interfaces

In the area "Overview of interfaces", you have the option to enable or disable access to the Web server.

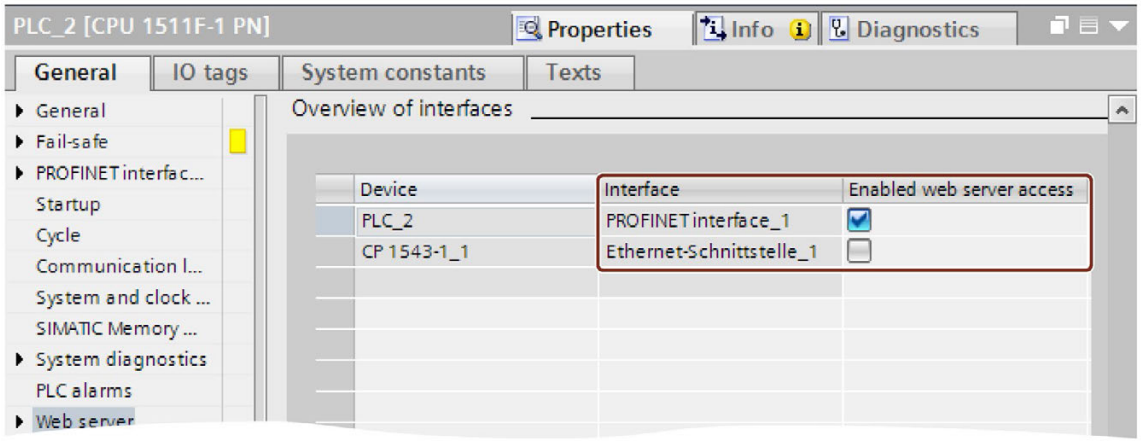

Figure 2-5 Activation of access to the Web server via the interfaces

2.3 Language settings

Introduction

The Web server provides the user interface in the following languages:

- German (Germany)
- English (U.S.)
- French (France)
- Italian (Italy)
- Spanish (traditional sort)
- Japanese
- Chinese (Simplified)
- Korean
- Russian
- Turkish
- Portuguese (Brazil)

Requirements for the availability of the East Asian languages

The following requirements must be met for the East Asian languages:

- The corresponding support package for East Asian languages is installed on the display device (e.g., PC).
  For this purpose, activate the "Install files for East Asian languages" option in the "Regional and Language Options > Languages" tab of the Windows Control Panel.
- STEP 7 for East Asian languages is installed on the programming device used to configure the CPU.

Note

East Asian languages are not supported for SIMATIC HMI devices with Windows CE operating system.

Requirements for multilingual output of text

To ensure that the Web server displays alarms, comments and diagnostic information correctly in the various project languages, you have to assign a project language of the Web server to each required interface language in STEP 7.

Note

The project languages of the STEP 7 project you want to assign must be activated and the corresponding texts (translations) must be available in the project. The project languages selection is available in the project tree under "Languages & Resources".

Setting the language for the Web

Once you have activated the Web server on your module, assign a project language of the STEP 7 project from the drop-down list to each interface language.

1. Navigate to the "Multilingual support" area in the Inspector window Properties of the CPU, "General" tab.
2. Assign a project language from the drop-down list to each interface language of the Web server.

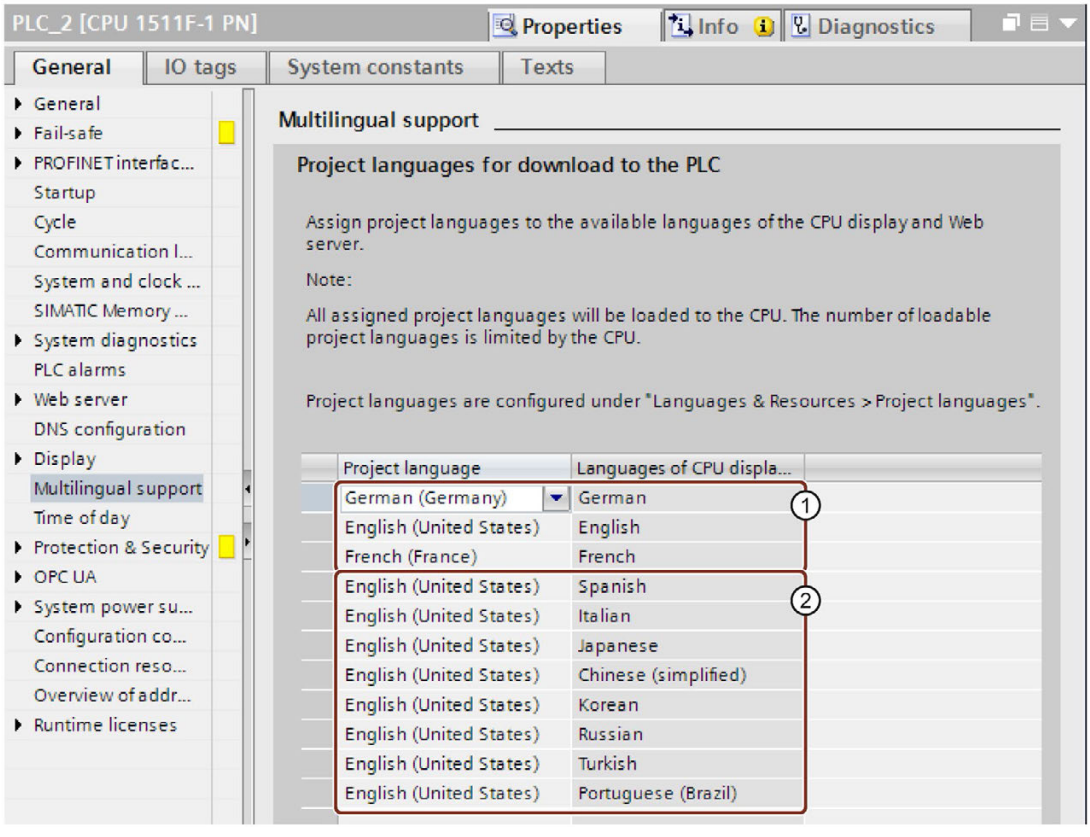

Figure 2-6 Language settings for the Web server in STEP 7

You can also assign interface languages the same project language, for example:

- ① Project language German for user interface language German, English (US) for English, French for French.
- ② Project language English (US) for all other available interface languages of the Web server.

In total, you can assign up to three different project languages of the STEP 7 project to the user interface languages of the Web server.

Reference

You can find additional information on how to set the project language in STEP 7 in the online help for STEP 7, keyword: "Selecting project languages".

See also

Configuring the Web server (Page 19)

2.4 Updating and saving information

Updating the screen content

Automatic updating is activated in the default setting. The preset update time is 10 s.

You update the web pages manually with the <F5> function key.

Disabling automatic updating for an individual web page

Click Off to temporarily deactivate automatic updating for a web page.
Note that the deactivation affects only the currently visited web page. Automatic updating is activated again when you change to a different web page.

You reactivate automatic updating by clicking On.

Note

If the load on the CPU is very high during operation, for example, due to a large number of PROFINET interrupts or extensive communication jobs, the updating of web pages may be significantly delayed for the duration of this high CPU load.

Printing web pages

The Web server offers you a print preview on most web pages. Click the symbol to open it.

Created printouts always contain the current information in the CPU. This means that it is possible that the information in the print preview is more up-to-date than the information in the standard view.

Web pages

3

3.1 Start page with general CPU information

Connecting to the Web server

Establish a connection to the Web server by entering the IP address of the interface of the configured CPU which is connected to the client in the address bar of the web browser, for example, http://192.168.3.141 or https://192.168.3.141. The connection is set up and the "Intro" page opens.

The examples in the next section provide information about the different web pages.

Intro

The figure below shows the first page (Intro) called by the Web server.

Figure 3-1 Intro page of the Web server of the CPU 1516-3 PN/DP

Click the NEXT link to go to the Web server pages.

Note

Select the "Skip Intro" check box in order to skip the intro. The Web server will then take you directly to its start page in future. This setting is saved in the user profile of the current PC user.

You can undo the setting "Skip Intro" by clicking the "Intro" link in the left-hand navigation bar of a web page.

Setting the user interface language

You can change the language for the Web server interface, e.g., from English to German, in the upper right corner. This option is available to you on all web pages of the Web server.

Start page

The start page before login offers information as shown in the figure below. The CPU image with LEDs returns the actual CPU status at the time of the data request.

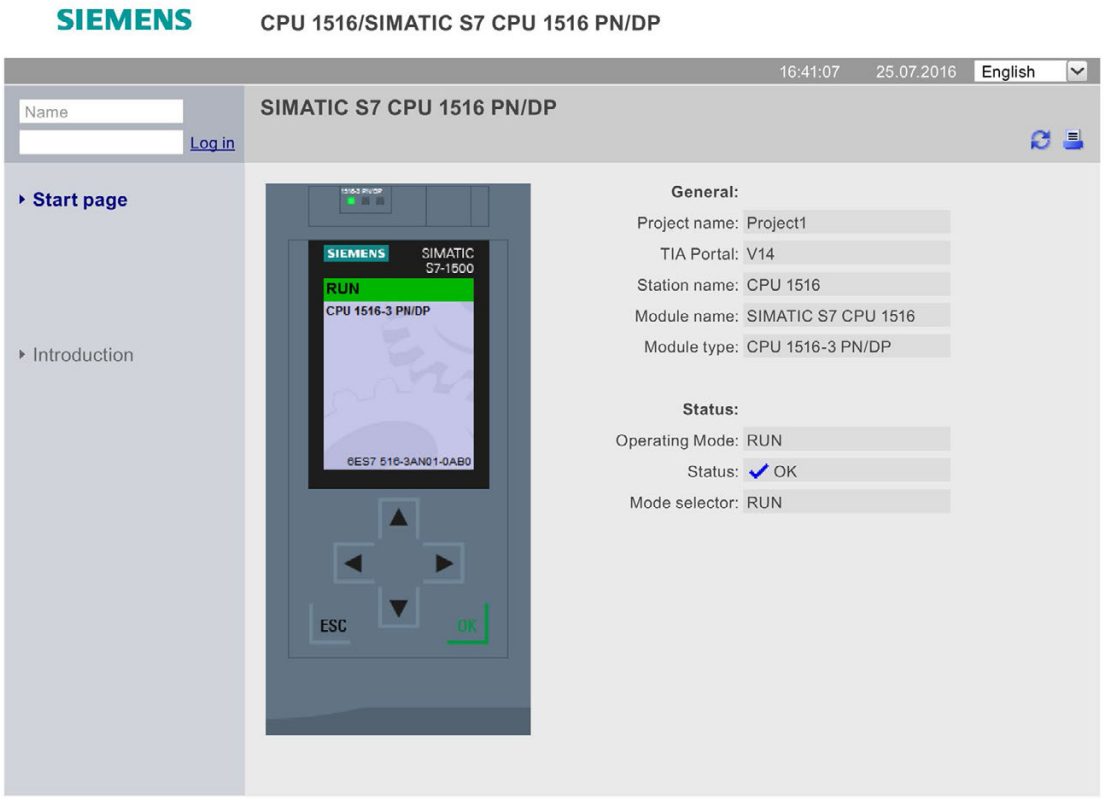

Figure 3-2 Start page before login

Log in

To use the full functionality of the web pages, you must be logged in. Log in with a user name and password specified in the Web configuration in STEP 7. You now have corresponding permissions to access the web pages released for this user. If you have not configured a user, read-only access is granted to intro and start pages by default.

Note

After carrying out your required actions, log out explicitly from the Web server by clicking "Logout" in order to minimize the risk of unauthorized external access.

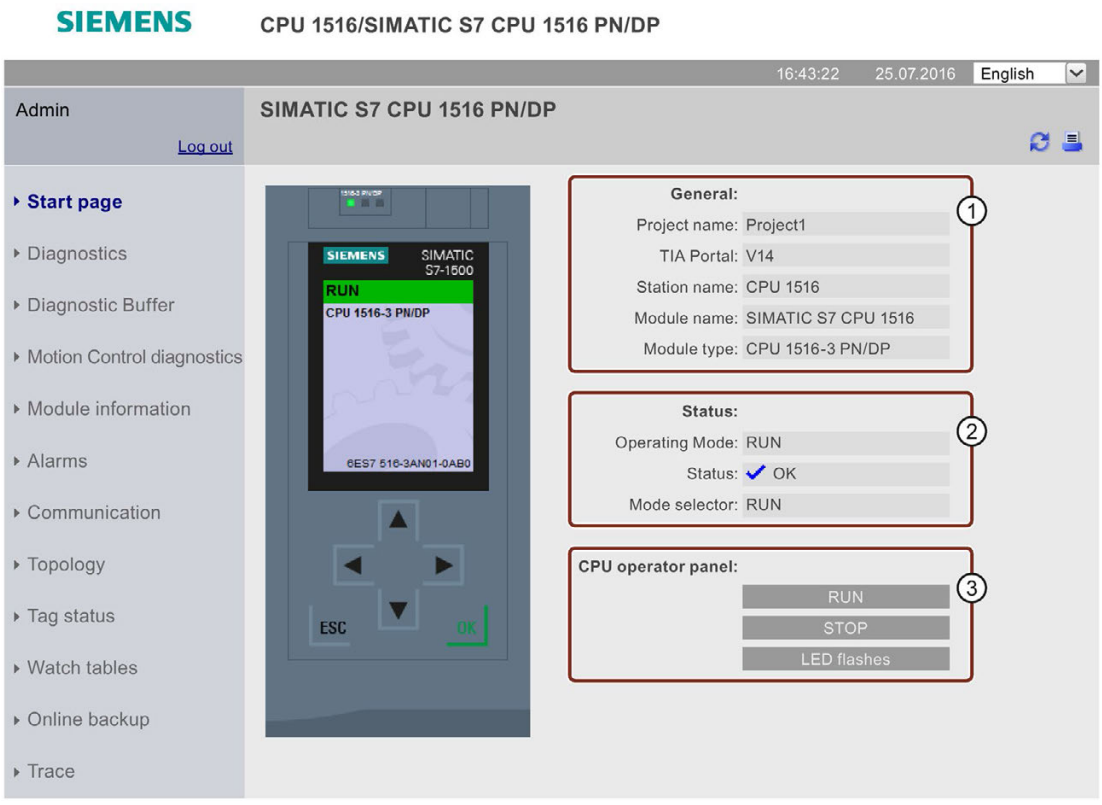

Figure 3-3 Start page after login

① "General"

"General" contains information on the CPU with the Web server to which you are currently connected, as well as the version of the TIA Portal with which the CPU was configured.

② "Status"

"Status" contains information about the CPU at the moment of the query.

③ "CPU operator panel"

If you have the necessary access permissions, you can change the operating mode of the CPU ("RUN"/"STOP" buttons) or have the LEDs flash ("Flash LED" button) in the "CPU operator panel" area.

Additional information for F-CPUs

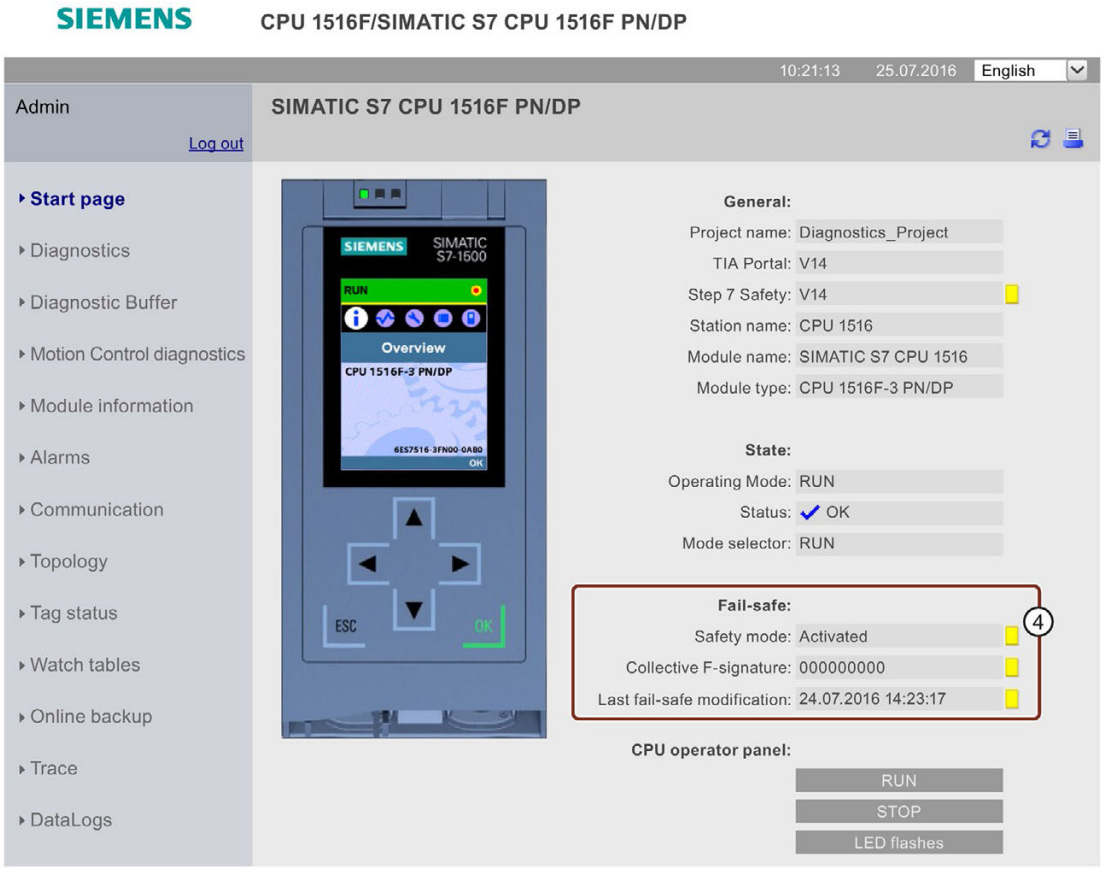

Figure 3-4 Start page after login to an F-CPU

④ "Fail-safe"

"Fail-safe" contains additional information on the F-CPU.

Reference

You can find additional information in the section Configuring the Web server (Page 19).

3.2 Diagnostics

Overview

The "Diagnostics" web page provides more information about the tabs:

- Identification
- Program protection
- Memory
- Runtime information
- Fail-safe (with an F CPU)

"Identification" tab

The CPU characteristics are available in the "Identification" tab.

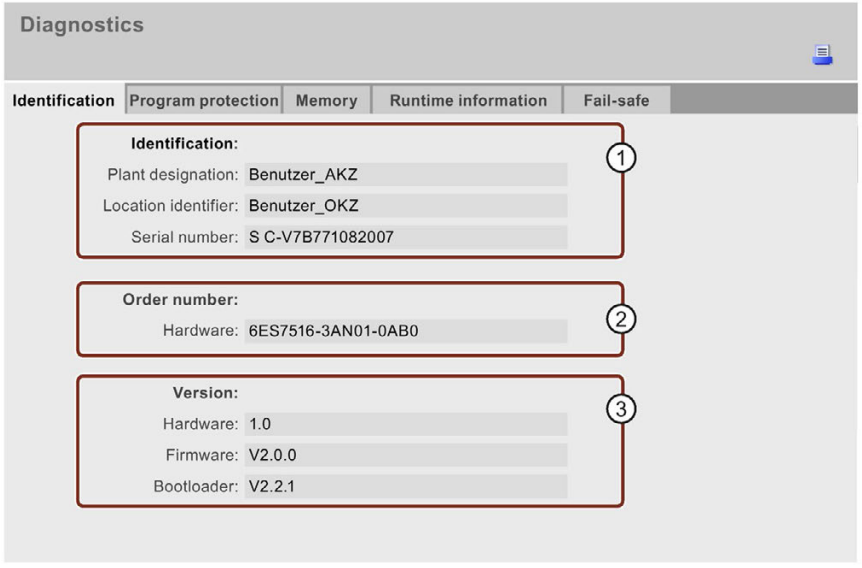

Figure 3-5 Identification tab

① "Identification"

The "Identification" info box contains the plant and location designation and the serial number. Plant and location designations can be configured in STEP 7 in the properties dialog box of the CPU, in the "General" tab.

② "Order number"

The "Order number" info box contains the order number for the hardware.

③ "Version"

You can find the hardware, firmware and bootloader versions in the "Version" info box.

"Program protection" tab

The "Program protection" tab provides information on whether the PLC program contains know-how protection or copy protection.

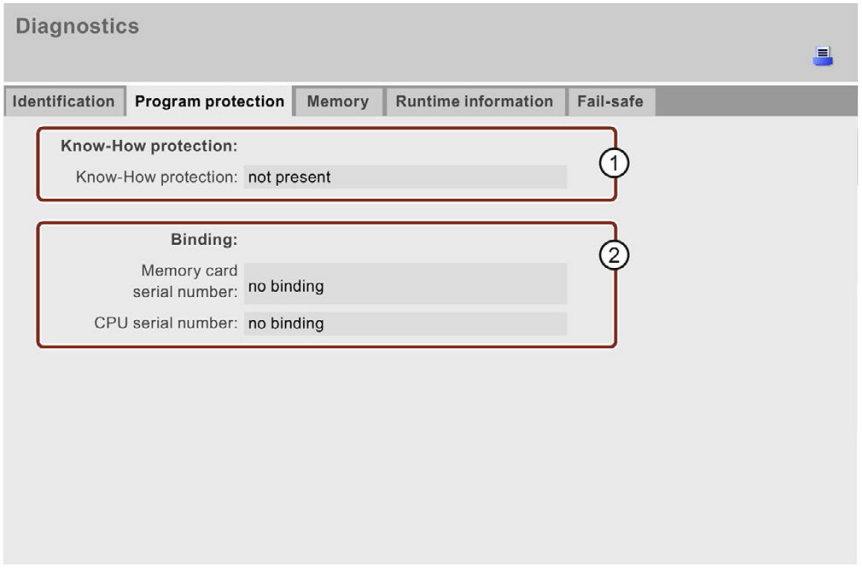

Figure 3-6 "Program protection" tab

① "Know-how protection"

Information on whether the PLC program contains at least one block with know-how protection or not can be found in the info field "Know-how protection".

② "Binding"

In the info field "Binding" you can find information on whether copy protection has been activated by binding at least one program block of the PLC program to the serial number of the CPU or memory card.

- "Binding"
- "No binding"
- "No matching binding": At least one block is bound to a different serial number (load process is rejected)

"Memory" tab

The "Memory" tab contains current values on the memory currently in use.

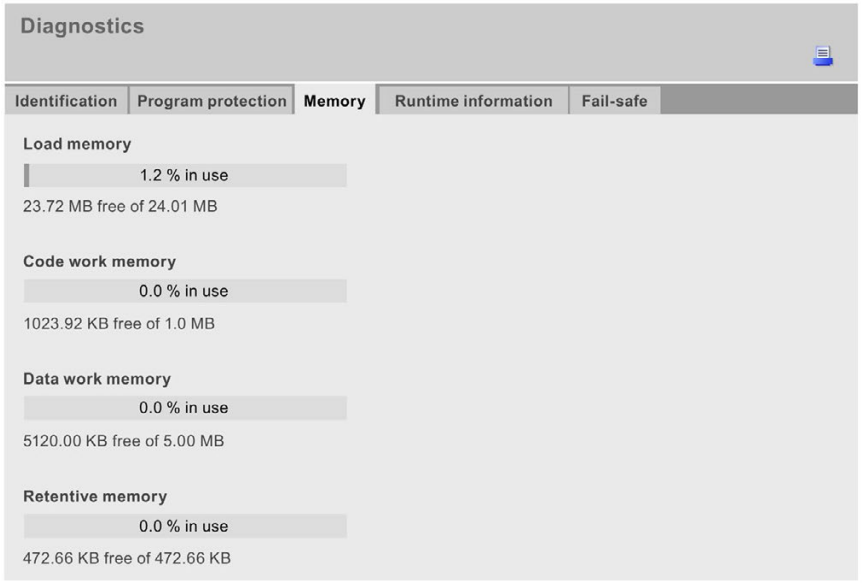

Figure 3-7 "Memory" tab

"Runtime information" tab

Current information on program/communication load and cycle time can be found in the "Runtime information" tab. This enables you to see whether there may be runtime problems during execution of your user program.

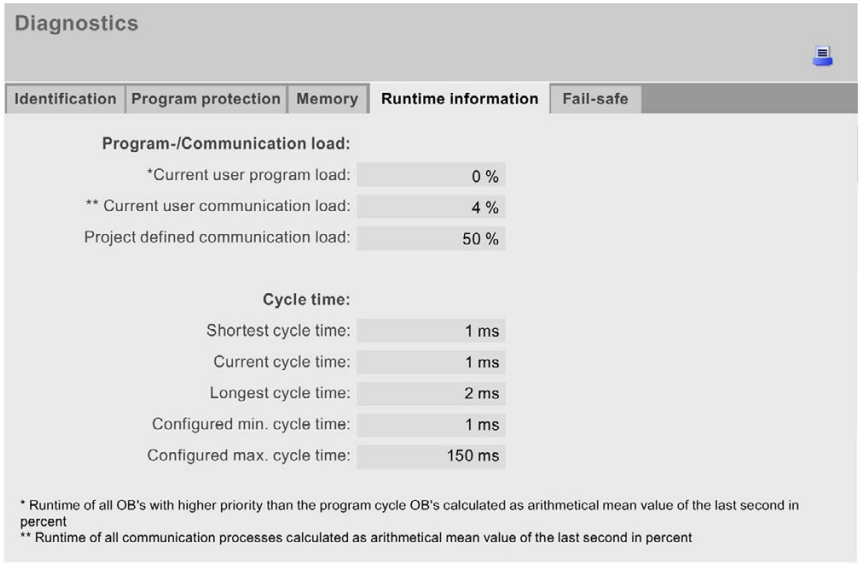

Figure 3-8 "Runtime information" tab

"Fail-safe" tab (with an F-CPU)

The safety program of an F-CPU consists of one or two F-runtime groups. You can find their F-collective signatures, cycle times (F-monitoring time) and runtimes in the "Fail-safe" tab.

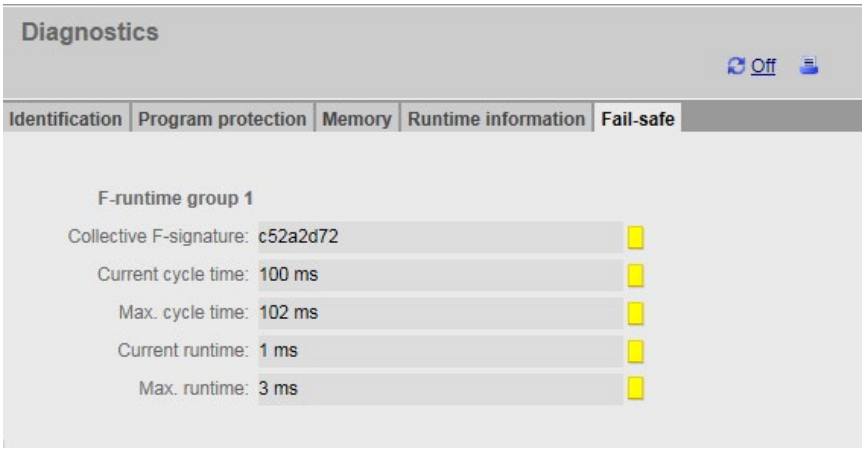

Figure 3-9 "Fail-safe" tab

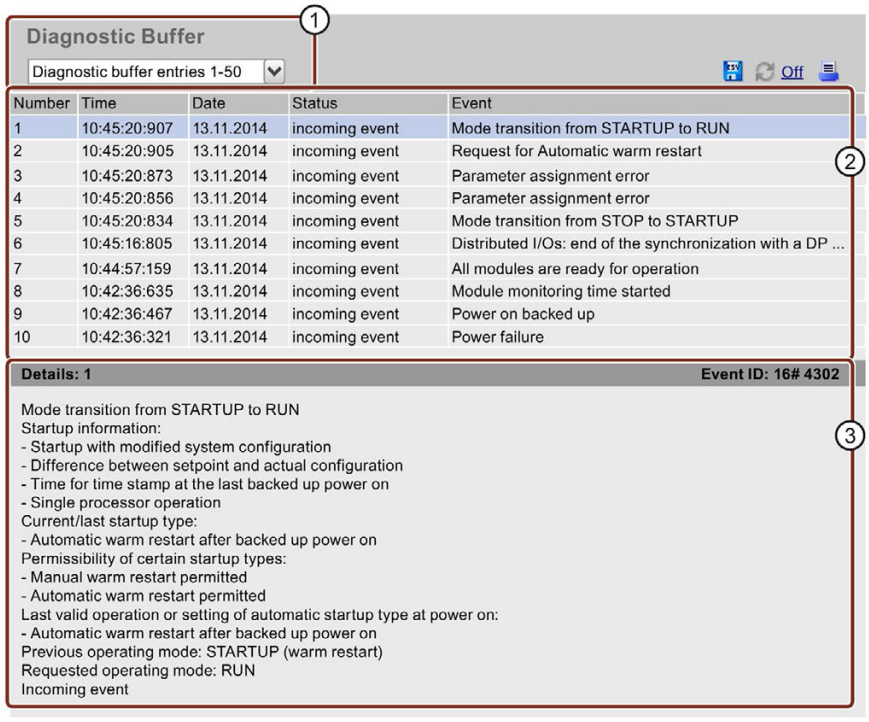
3.3 Diagnostics buffer

Requirements

The Web server is activated, languages are set, the text libraries are loaded and the project has been compiled and downloaded with STEP 7.

Diagnostics buffer

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" web page.



Number	Time	Date	Status	Event
1	10:45:20:907	13.11.2014	incoming event	Mode transition from STARTUP to RUN
2	10:45:20:905	13.11.2014	incoming event	Request for Automatic warm restart
3	10:45:20:873	13.11.2014	incoming event	Parameter assignment error
4	10:45:20:856	13.11.2014	incoming event	Parameter assignment error
5	10:45:20:834	13.11.2014	incoming event	Mode transition from STOP to STARTUP
6	10:45:16:805	13.11.2014	incoming event	Distributed I/Os: end of the synchronization with a DP ...
7	10:44:57:159	13.11.2014	incoming event	All modules are ready for operation
8	10:42:36:635	13.11.2014	incoming event	Module monitoring time started
9	10:42:36:467	13.11.2014	incoming event	Power on backed up
10	10:42:36:321	13.11.2014	incoming event	Power failure

Figure 3-10 Diagnostics buffer

① "Diagnostics buffer entries 1-50"

The diagnostics buffer can accommodate different numbers of alarms depending on the CPU used.
For information on the maximum number of diagnostics buffer entries, refer to the technical specifications of the CPU used.

Select an interval for the entries from the drop-down list. Each interval comprises 50 entries.

② "Event"

The "Event" info box contains the diagnostics interrupts with date and time.

Note that the diagnostics events are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 29).

③ "Details"

This field outputs detailed information about a selected event. Select the corresponding event from the ② "Event" info field.

Saving diagnostics buffer entries

You can save diagnostics buffer entries to a csv file for further processing in a spreadsheet program or database program.
Save the data by clicking the icon.

A dialog opens in which you can specify the file name and target directory.

3.4 Module information

Module information

The status of a device is indicated by means of symbols and comments on the "Module information" web page.

Figure 3-11 Module information

Meaning of the symbols in the "Status" column

Table 3- 1 Meaning of symbols

Symbol	Symbol color	Meaning
	Green	Component is OK
	Gray	Deactivated PROFIBUS slaves or PROFINET devices.
	Gray	State cannot be determined • "State cannot be determined" is displayed during system diagnostics for all configured I/O modules and I/O systems after restart of the CPU. • However, this state can also be displayed temporarily during operation if a diagnostics interrupt burst occurs for all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	Red	Component "not reachable" "Not reachable" is displayed when a module has been removed or a module has been configured but does not exist.
	Black	No input or output data available. Input or output channels of the (sub)module are disabled.
	Green	Maintenance required (Maintenance Required)
	Yellow	Maintenance demanded (Maintenance Demanded)
	Red	Error - component faulty or not available due to an incorrect type
	Red	A module in a lower module level does not have the status "Component OK"

Navigation to further module levels

The status of individual components/modules/submodules is displayed when you navigate to the further module levels:

- To the next higher module level using the links in the display of the module levels
- To the next lower module level using the links in the "Name" column

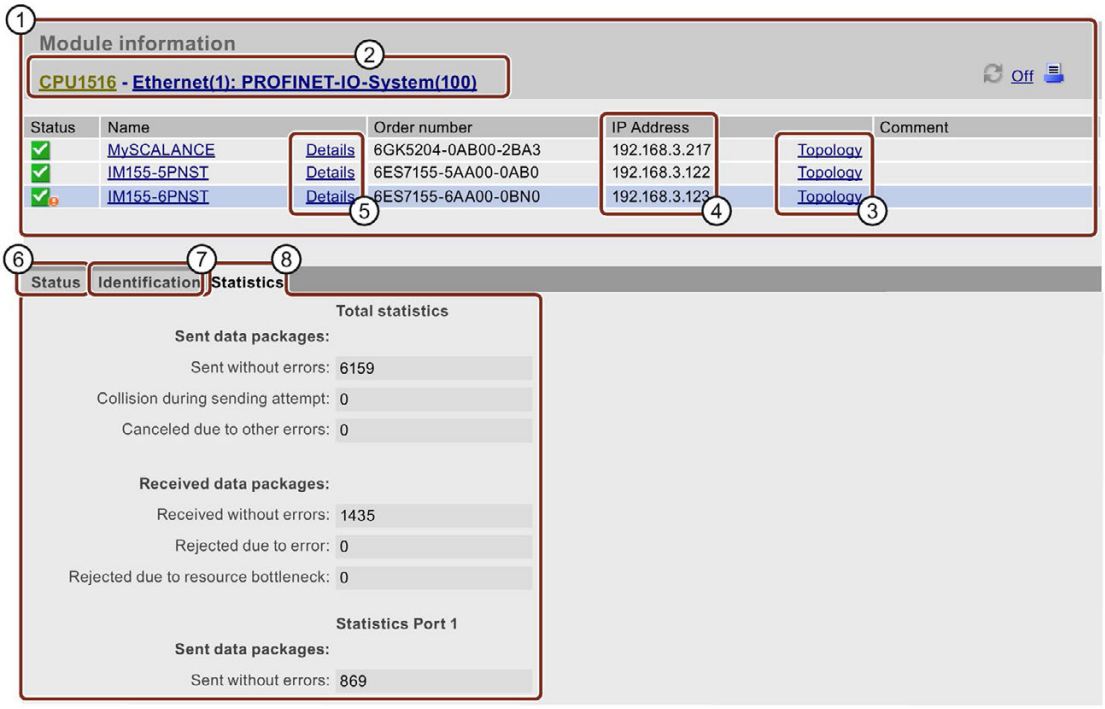


Figure 3-12 Navigation to further module levels

① "Module information"

Depending on the selected level, the table contains information about the rack, the DP master system, the PROFINET IO master system, about the devices, the individual modules, as well as the modules or submodules of the device.

② "Display of the module levels"

The links are used to access the "Module information" of the higher module levels.

③ "Topology"

The two web pages, "Topology" and "Module information", are linked. A click on "Topology" of the selected module automatically takes you to this module in the graphic view of the set topology on the "Topology" web page. The module is displayed in the visible area of the "Topology" web page. The device header of the selected module flashes for a few seconds.

④ "IP address"

If a link is available, you can use it to access the Web server of the configured device you selected.

⑤ "Details"

Additional information about the selected module is provided in the "Status" and "Identification" tabs via the "Details" link.

⑥ "Status" tab

The tab contains information about the status of the selected module when a fault or alarm exists.

⑦ "Identification" tab

The tab contains data on the identification of the selected module.

Note

This tab displays only the data configured offline of the module.

⑧ "Statistics" tab

The tab is only displayed for PROFINET IO devices and includes the following information on communication statistics of the selected IO device:

- "Total statistics - Sent data packages"

  You can assess the data transmission on the transmit line based on the key data in this info box.

- "Total statistics - Received data packages"

  You can assess the data transmission on the receive line based on the key data in this info box.

- "Statistics port x - Sent data packages"

  You can assess the data transmission on the transmit line for each port based on the key data in this info box.

- "Statistics port x - Received data packages"

  You can assess the data transmission on the receive line for each port based on the key data in this info box.

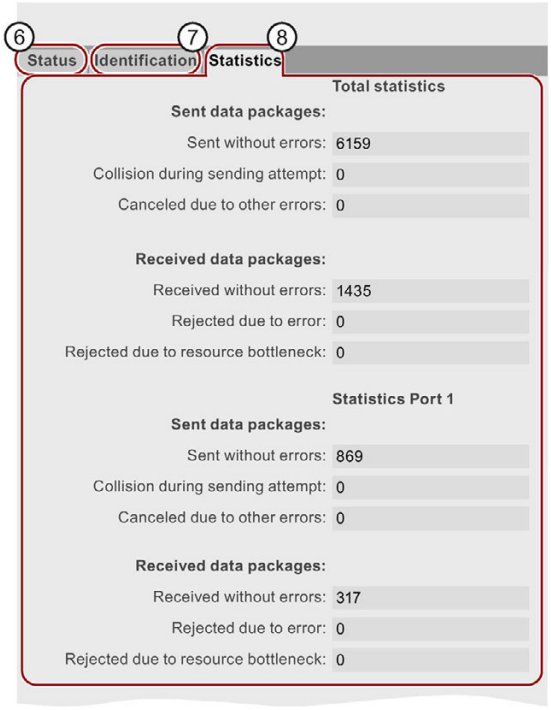

Figure 3-13 "Statistics" tab

Reference

You can find additional information in the "Statistics" tab in the section Communication (Page 50).

Example: Module information - module

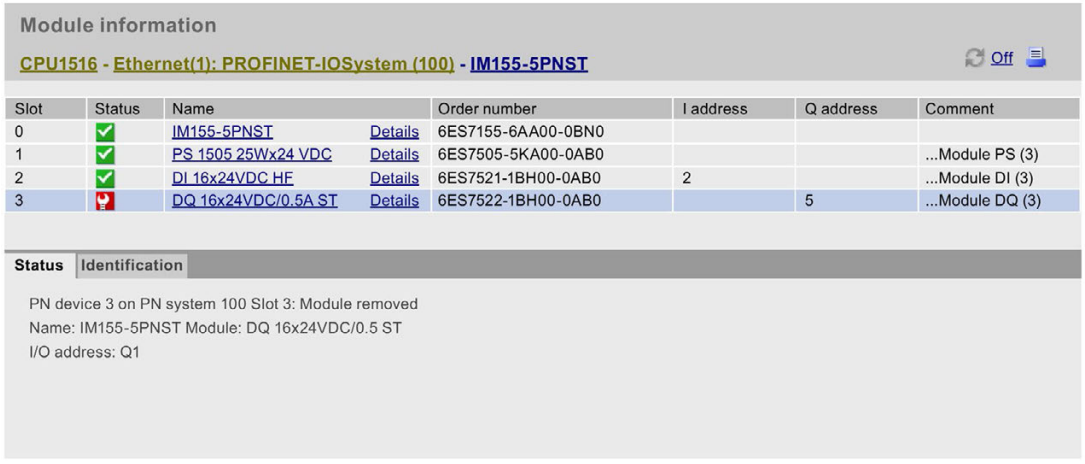

Figure 3-14 Example: Module information - module

Note

If you are using the function Configuration control (option handling) in the central configuration of your plant, the information text in the headings area of the web page informs you that the status of the I/O modules may be displayed inconsistently. No corresponding text is displayed for the distributed I/O.

Example: Module information - submodule

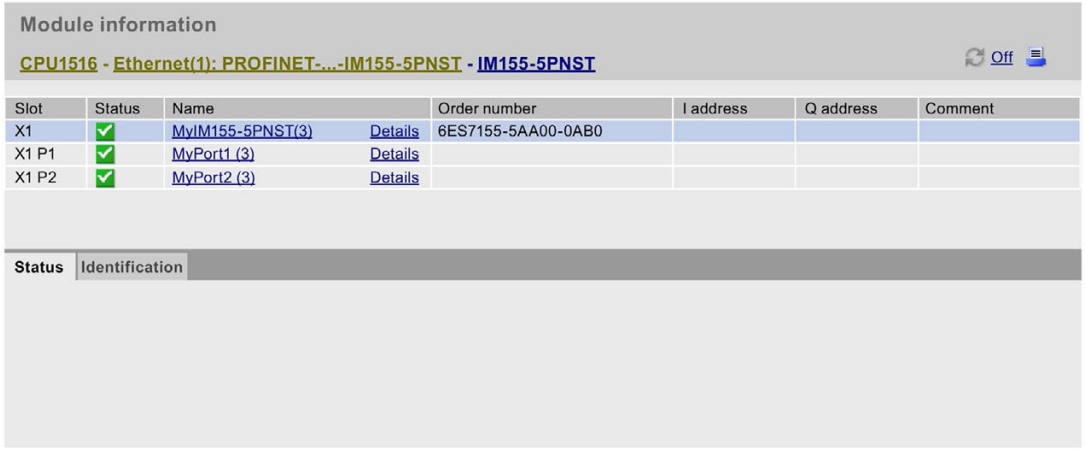

Figure 3-15 Example: Module information - submodule

Reference

You can find additional information on the "Module information" in the online help for STEP 7, keyword: "Module information".

3.5 Firmware update

Introduction

You update the firmware as a user with the corresponding access rights on the "Module information" web page at the module level. You will find information on user management in section Configuring the Web server (Page 19) under "Amending user management".
You use an update file to update the firmware of the CPU, the display of the CPU, or the individual central or distributed modules. Note that all modules you want to update must be compatible with the TIA Portal as of V12.0.

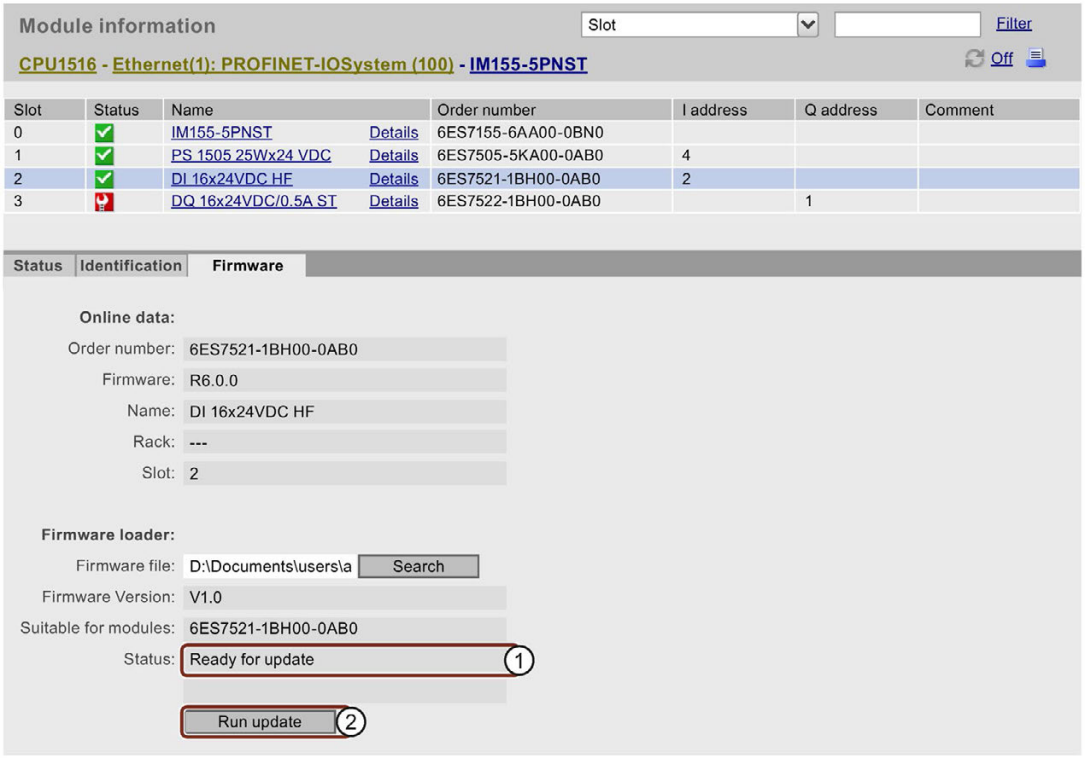
Note

A firmware update is not possible if access is via a mobile terminal device with the "iOS" operating system.

Procedure

The following steps are required to perform a firmware update:

- Click on "Browse" in the Firmware Loader area.
- Select the file you would like to use for the firmware update. You can find the available firmware updates on the Service&Support page on the Internet (http://support.automation.siemens.com).



① Status of the selected firmware file

② Button to execute the update

Figure 3-16 Module information, "Firmware" tab, "Ready for update" status

The Firmware Loader checks the file name of the selected firmware file and outputs the alarm "Firmware is not suitable" or "Ready for update" in the "Status" line.

- If the status is "Ready for update", click "Run update". If the CPU is in RUN mode during the update, the following alarm is output:

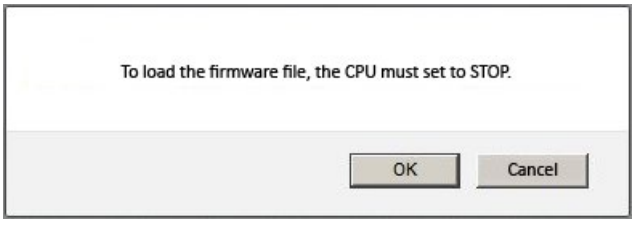


Figure 3-17 Alarm after clicking "Run update"

Acknowledge the alarm output by clicking "OK". The CPU is set to STOP mode and the firmware update is executed.
If you click "Cancel", the CPU remains in the current mode and the firmware update is canceled.

- A alarm informs you about the order number and version ID of the updated firmware once the update is complete.
The CPU is automatically placed in RUN mode when the mode selector of the CPU is in RUN and when you acknowledge the alarm with "OK". This may take a few minutes; there is no progress indicator.
If you click "Cancel", the CPU remains in STOP mode and you can run additional updates.

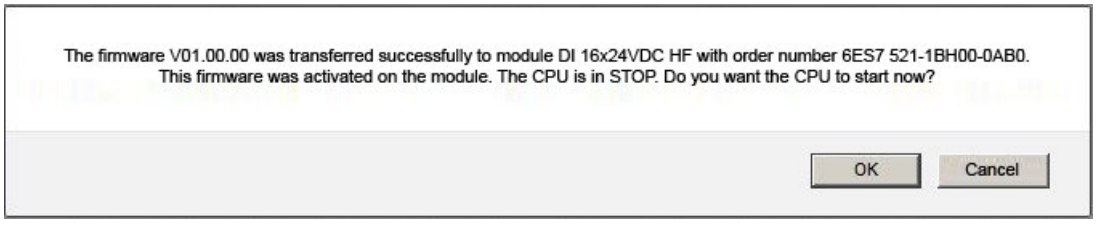

Figure 3-18 Alarm: Firmware successfully transferred

3.6 Alarms

Requirements

The alarm texts were configured in the user-specific languages. For information about configuring alarm texts, refer to STEP 7 and to the Service&Support pages (http://www.siemens.com/automation/service&support).

Alarms

To receive compact information on fault analysis, we recommend that you always first read out the content of the alarm buffer. This is the most effective method to get an overview of the pending faults.

The browser displays the content of the alarm buffer on the "Alarms" web page.

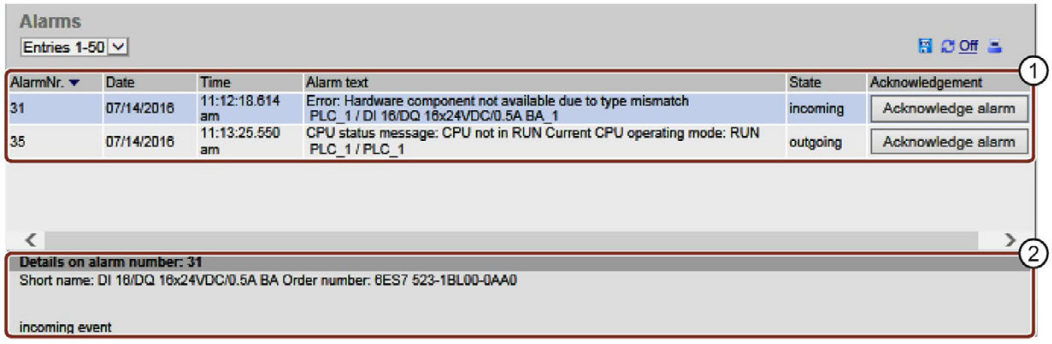

Figure 3-19 Alarms

① "Alarms"

CPU alarms are displayed in descending chronological order with **date** and **time** in info box ①.

The **alarm text** parameter is an entry which contains the alarm texts configured for the corresponding fault definitions.

Note that the alarm texts are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 29).

Sorting

You also have the option to display the individual parameters of the currently displayed web page (max. 50 entries) sorted in ascending or descending order. For this purpose, click on one of the parameters in the column header:

- Alarm number
- Date
- Time (of the CPU)
- Alarm text
- Status
- Acknowledgment

The alarms are returned in chronological order when you click the "Date" entry. Incoming and outgoing events are output at the **Status** parameter.

If you have the appropriate user rights (see section Configuring the Web server (Page 19)), for alarms which can be acknowledged, a button is available to you in the "Acknowledgment" column with which you can acknowledge the alarm.

② "Details on alarm number"

You can view detailed alarm information in this info box. Select the corresponding alarm from the info field ②.

Saving alarms

You can save alarms to a csv file for further processing in a spreadsheet program or database program.
Save the data by clicking the icon.

A dialog opens in which you can specify the file name and target directory.

3.7 Communication

Overview

The "Communication" web page provides detailed information about the following tabs:

- Parameters
- Statistics
- Resources
- Connections

① "Parameter" tab

A summary of the information on the PROFINET and Ethernet interfaces of the selected CPU is available in the "Parameter" tab.

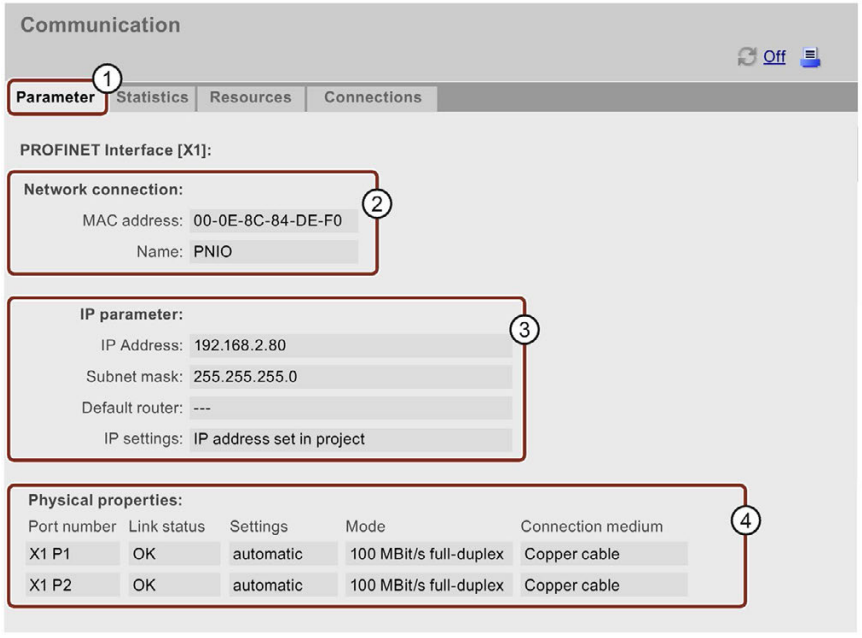

Figure 3-20 Parameters of the integrated PROFINET and Ethernet interfaces

② "Network connection"

The item "Network connection" includes information for identification of the integrated PROFINET and Ethernet interfaces of the corresponding CPU. The MAC address is located on the CPU above the respective PROFINET or Ethernet interface.

③ "IP parameter"

This parameter includes information on the configured IP address and number of the subnet in which the corresponding CPU is located.

④ "Physical properties"

The following information on the interface hardware is available in the "Physical properties" field:

- Port number
- Link status
- Settings
- Mode
- Connection medium

① "Statistics" tab

Information on the data transmission can be found on the "Statistics" tab.

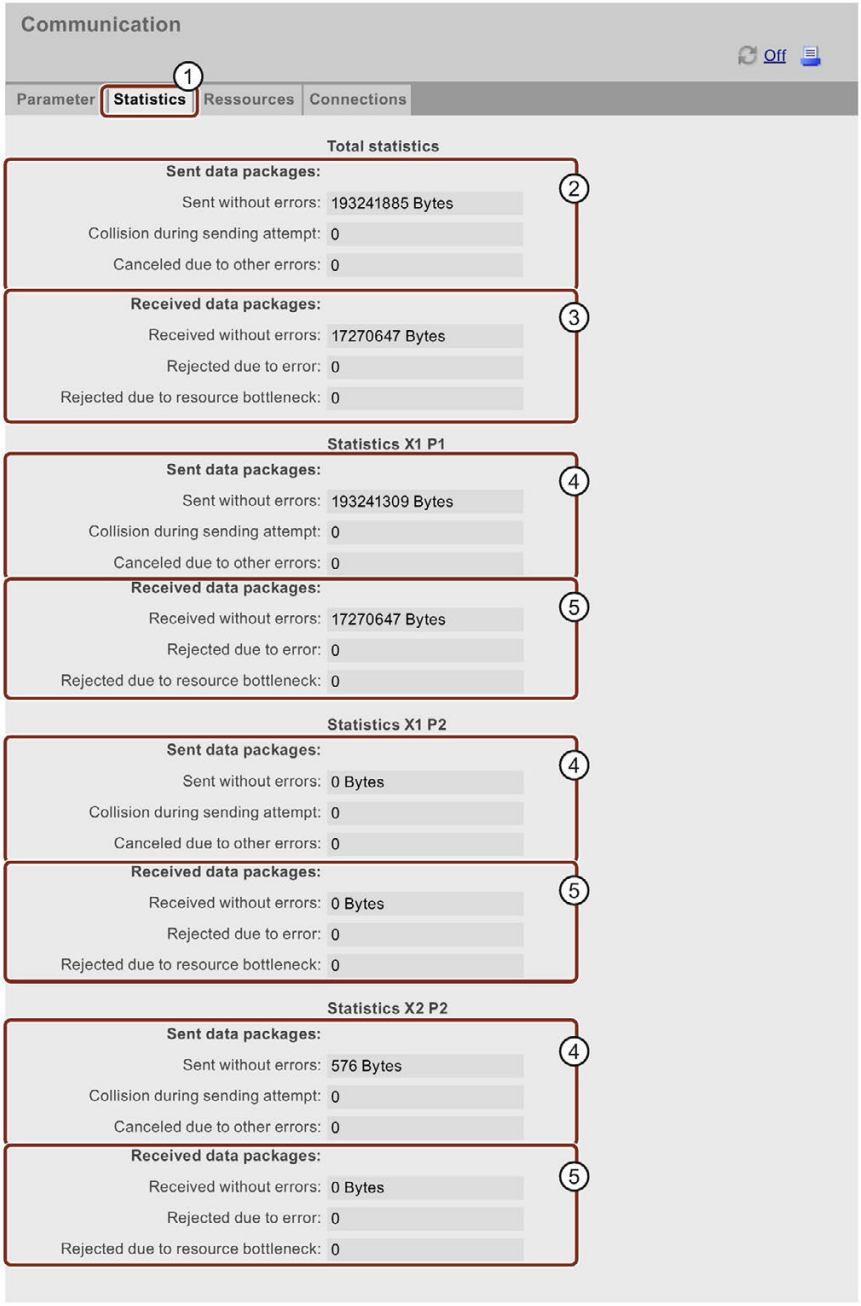

Figure 3-21 "Statistics" tab with key data on data transmission

② "Total statistics - Sent data packages"

You can assess the data transmission on the transmit line based on the key data in this info box.

③ "Total statistics - Received data packages"

You can assess the data transmission on the receive line based on the key data in this info box.

④ "Statistics Port x - Sent data packages"

You can assess the data transmission on the transmit line for each port based on the key data in this info box.

⑤ "Statistics port x - Received data packages"

You can assess the data transmission on the receive line for each port based on the key data in this info box.

① The "Resources" tab

For information about the resource consumption of the connections, refer to the "Resources" tab.

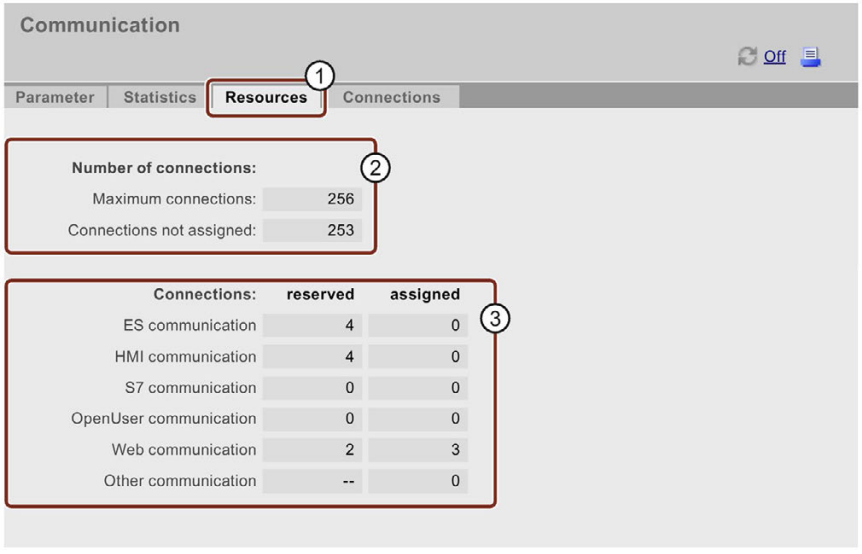

Figure 3-22 "Resources" tab

② Number of connections

Under "Number of connections", you will find information on the maximum number of connections and the number of connections not assigned.

③ Connections

The item "Connections" provides information on the number of connections reserved or used for ES, HMI, S7, OpenUser, web communication and other communication functions.

① "Connections" tab

The "Connections" tab contains information on the status of the communication connections.

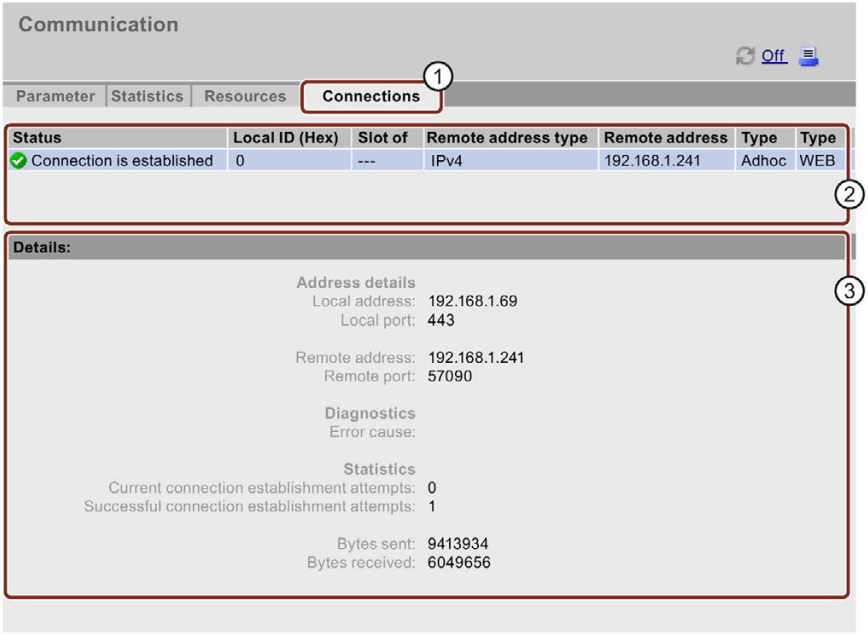

Figure 3-23 "Connections" tab

② Status

Under "Status", you will find an overview of the communication connections being established and the already established communication connections.

For each connection, the table contains the following information: status of the connection, local ID, slot of gateway, remote address (IP address), the corresponding remote address type, method of connection, and type of connection.

③ Details

Under "Details", you will find detailed information about the selected connection.

Reference

For an explanation of the error message displayed when a connection is interrupted or an attempt to establish a connection fails, refer to the STEP 7 online help.

3.8 Topology

3.8.1 Introduction

Topology of the PROFINET devices

The "Topology" web page provides information on the topological configuration and status of the PROFINET devices on your PROFINET IO system.

There are three tabs for the following views:

- Graphical view (set and actual topology)
- Table view (actual topology only)
- Status overview (excluding topological correlations)

You can print the table view and status overview. Before printing, use the print preview of your browser and, if necessary, correct the format.

Set topology

The set topology is displayed if you have topologically interconnected the connections in the configuration with STEP 7.

This view identifies the topological assignment of PROFINET devices that have failed, the differences between the set and actual topology, and interchanged ports.

Note

The configured set topology is always displayed by default in the following scenarios:

- When the "Topology" web page is called via the navigation bar
- When you change from the overview of PROFINET IO devices on the "Module information" web page to the "Topology" web page by means of the "Topology" link.

If a set topology was not configured, the actual topology is displayed.

Actual topology

Displays the current topological structure of the "configured" PROFINET devices of a PROFINET IO system and the directly adjacent, non-configured PROFINET devices (display of the neighbor relationships, provided these can be determined; but the status of these adjacent PROFINET devices is not displayed).

3.8.2 Graphical view

Requirements

For error-free operation of the topology, the following conditions must be met:

- You have made the Language settings (Page 29).
- In the Topology Editor of STEP 7, you configured the topological interconnection of ports (requirement for display of the set topology and the corresponding topological target connections).
- The project has been compiled in STEP 7.
- The project is completely loaded.

Set and actual topology - graphical view

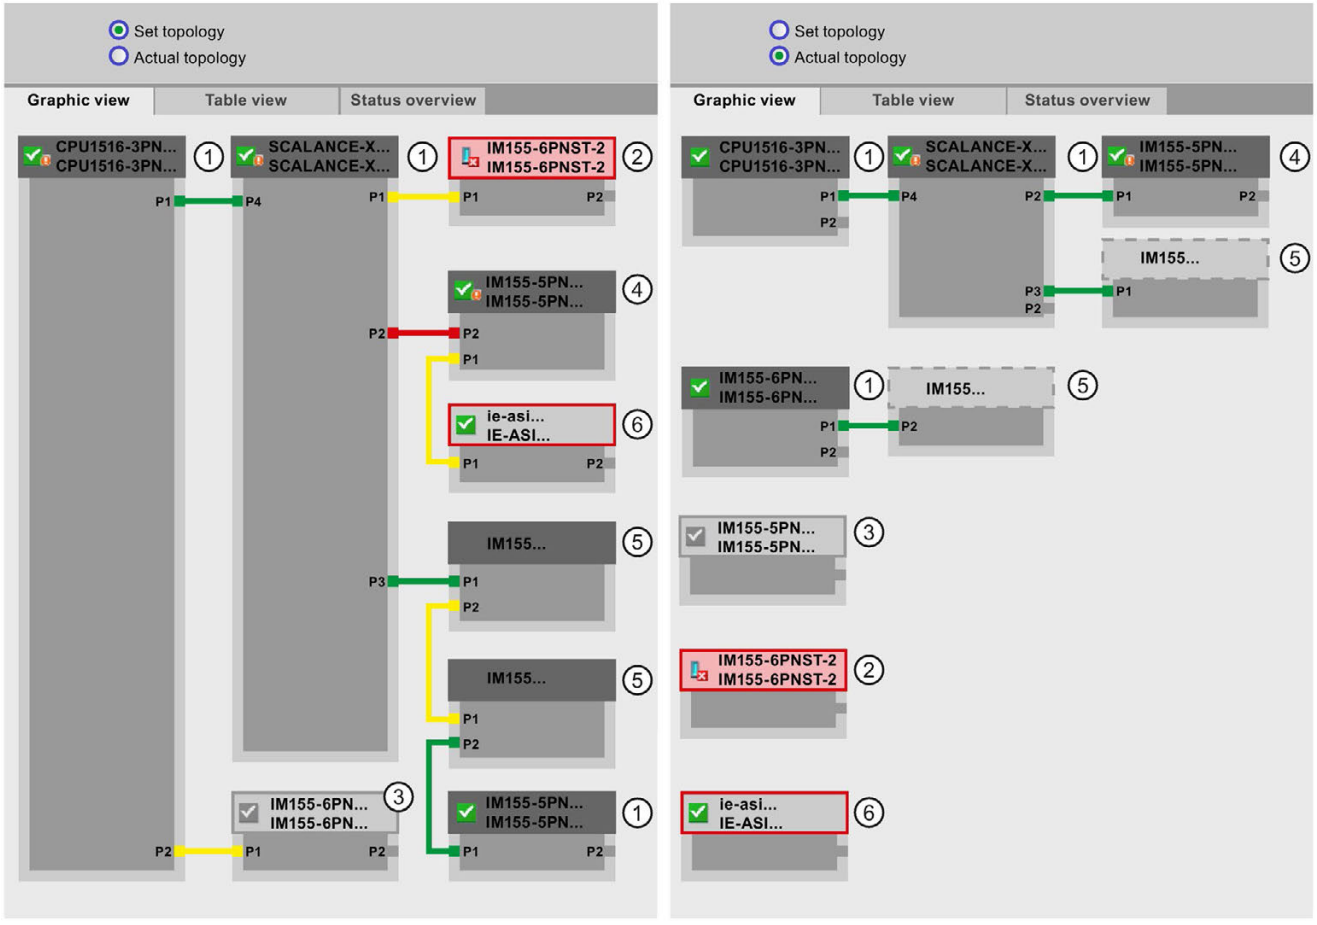

Figure 3-24 Graphical view - Set and actual topology

Meaning of the colored connections in the set/actual topology:

Table 3- 2 Meaning of the colored connections in the set/actual topology

Connection	Meaning	
	Set topology	Actual topology
Green	The current actual connection matches the configured target connection.	Connections detected
Red	Mismatch between the current actual connection and the configured target connection (e.g., port interchanged).	-
Yellow	Connection diagnostics not possible. Causes: • Malfunction of communication with a device (e.g., cable was removed) • Connection to a passive component (e.g., switches or cables) • Connection to devices/PROFINET devices on a different IO controller or IO subsystem.	-

① Configured and accessible PROFINET devices

Configured and accessible PROFINET devices are displayed in dark gray. Connections indicate the ports used to connect the PROFINET devices of a station.

② Configured but inaccessible PROFINET devices

Configured but inaccessible PROFINET devices are indicated in pink with red frame (e.g., device failure, cable disconnected).

③ Deactivated devices

All deactivated, configured PROFINET devices are displayed in light gray.

④ Interchanged ports

Interchanged ports are highlighted in red in the set topology view. The actual topology view indicates the actually connected ports, while the set topology view displays the configured target connections.

⑤ PROFINET devices of a different PROFINET IO subsystem

- In the set topology:

  A PROFINET device of a different PROFINET IO subsystem is indicated by means of a green link (or red link for interchanged ports) if it is available on the bus and directly adjacent to an accessible configured PROFINET device ①. If the PROFINET device of a different PROFINET IO subsystem is inaccessible, it is identified by means of a yellow connecting line.
  The connection between two PROFINET devices which both belong to a different PROFINET IO subsystem cannot be identified and is always indicated in yellow color.

- In the actual topology:

  The PROFINET device of a different PROFINET IO subsystem is not displayed unless it is directly adjacent to a configured PROFINET device. The PROFINET device is shown in light gray with a dashed line around the device header.

The status of PROFINET devices of a different PROFINET IO subsystem is **not** displayed in the device header.

⑥ Displaying faulty neighbor relationships

Devices from which the relation data could not be read completely or with error are highlighted in light gray with a red frame.

Note

Displaying faulty neighbor relationships

If a device does not have the matching firmware, the relationships cannot be displayed correctly. This means a firmware update of the respective device is required in case a faulty neighbor relationship is displayed.

Views after changes to the configuration

- If a device fails, it remains at the same position in the "Set topology" view. This error state is indicated with a red border around the device header and the icon .
- If a device fails, it is displayed in the "Actual topology" view. This error state is indicated separately in the bottom area with a red border around the device header and the icon .

Link between the "Topology" and "Module information" web pages

The two web pages, "Topology" and "Module information", are linked. A click on the header of a selected module in the topology view automatically takes you to this module on the "Module information" web page.

You can find additional information on this in the section Module information (Page 41).

Reference

Additional examples for graphical topology view are available in the section Examples for graphical topology views (Page 61).

3.8.3 Tabular view

Topology - tabular view

The "Tabular view" always shows the "Actual topology".

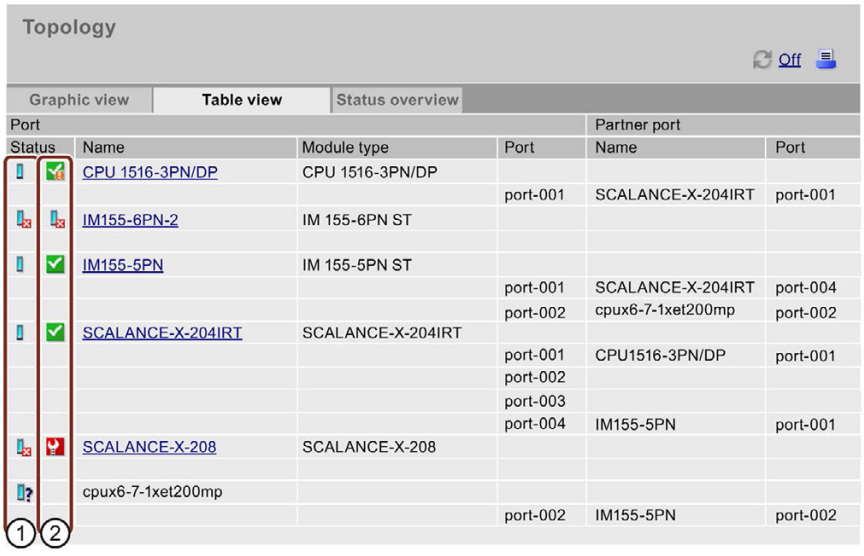

Figure 3-25 Topology - tabular view

① Meaning of the symbols relating to the status of the PROFINET devices

Table 3- 3 Meaning of the symbols relating to the status of the PROFINET devices

Symbol	Meaning
	Configured and accessible PROFINET devices
	Unconfigured and accessible PROFINET devices
	Configured but inaccessible PROFINET devices
	Devices for which neighbor relations cannot be determined, or for which the neighbor relationship could not be read out completely, or only with errors

② Meaning of the symbols relating to the module status of the PROFINET devices

Table 3- 4 Meaning of the symbols relating to the module status of the PROFINET devices

Symbol	Color	Meaning
	green	Component is OK.
	gray	Deactivated PROFIBUS slaves or PROFINET devices
	black	State cannot be determined • For example, "Status cannot be determined" is always displayed while the CPU is in STOP mode, or during startup evaluation of "Report system error" for all configured I/O modules and I/O systems after a CPU restart. • However, this status can also be displayed temporarily during operation if a diagnostics interrupt burst occurs at all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	red	Component failed or is not reachable • "Not reachable" is displayed for e.g. a module that has been removed or a module that has been configured but does not exist.
	green	Maintenance required (Maintenance Required)
	yellow	Maintenance demanded (Maintenance Demanded)
	red	Error - component faulty or not available due to an incorrect type.
	-	A module in a lower module level does not have the status "Component OK".

Reference

For additional information on the "Report System Error" function, refer to the STEP 7 online help, keyword: "System diagnostics".

3.8.4 Status overview

Topology - status overview

The "Status overview" provides a clear presentation of all PROFINET IO devices/PROFINET devices (without connection relations) on one page. A quick error diagnostics is possible based on the symbols that show the module statuses.

The overview also provides a link of the modules to the "Module information (Page 41)" website.

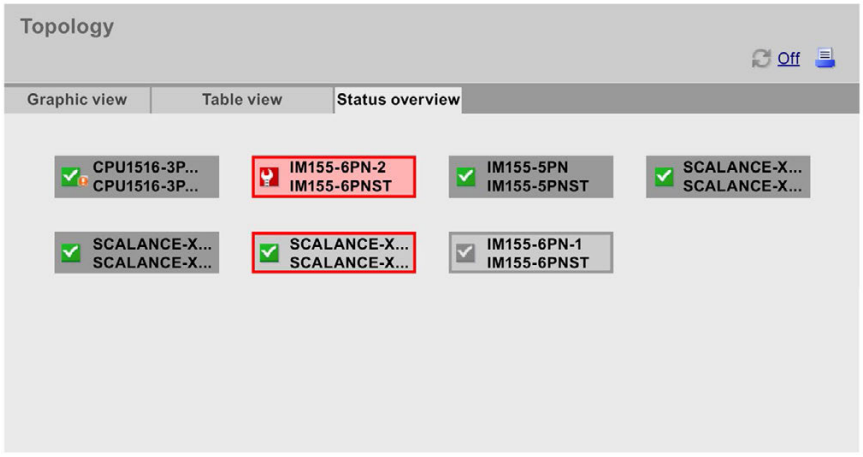

Figure 3-26 Topology - status overview

3.8.5 Examples for graphical topology views

The following section shows, as an example, some displays of the different topology views for a simple project.

"Set topology" is OK

Here you see the connections as they are configured in the topology editor by STEP 7. The configuration and wiring match.

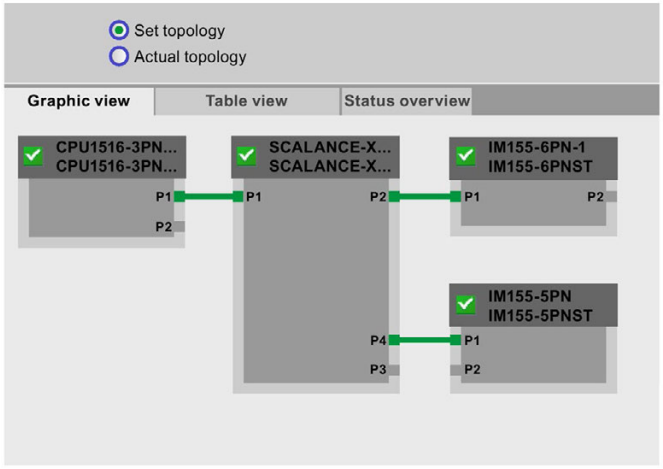

Figure 3-27 "Set topology" is OK

"Actual topology" is OK

Shows the actual layout of all configured devices that can be reached topologically.

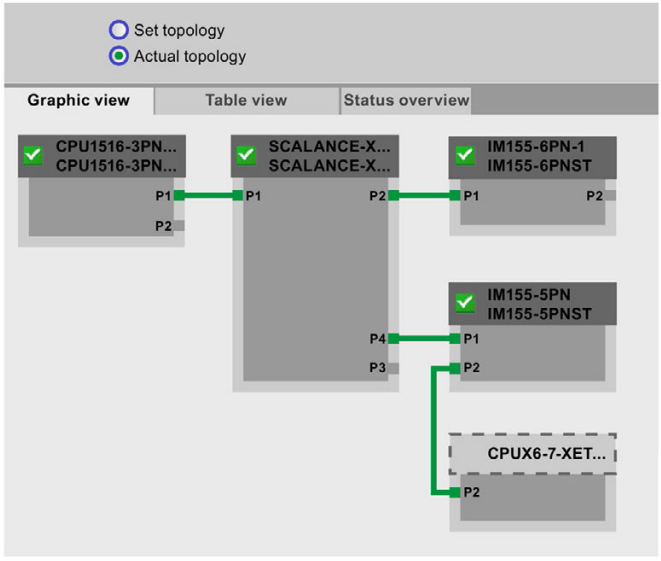

Figure 3-28 "Actual topology" is OK

"Set topology" with failed device

If a device has failed in the meantime, this device remains in the same place in the "Set topology" view. The failed device is displayed with a red border around the device header and the icon.

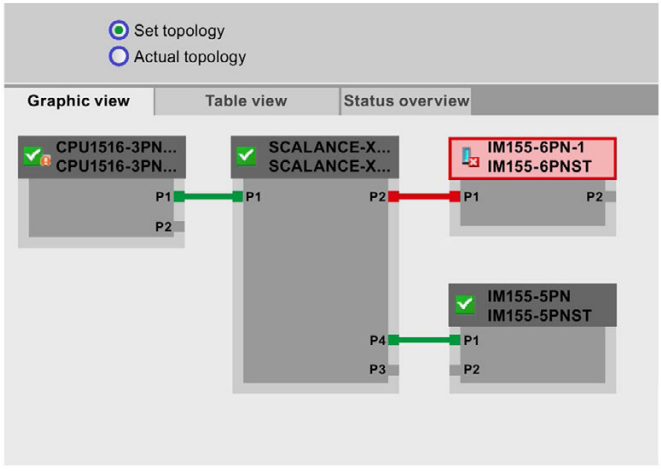

Figure 3-29 "Set topology" with failed device

"Actual topology" with failed device

In the "Actual topology" view, the device that has failed in the meantime is displayed separately in the bottom area of the view. The failed device is displayed with a red border around the device header and the icon.

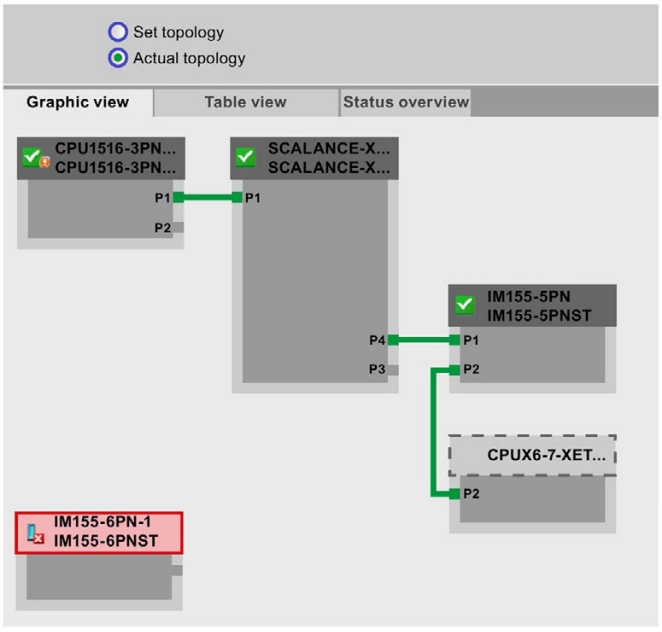

Figure 3-30 "Actual topology" with failed device

"Set topology" with interchanged ports

If a port was interchanged for a configured, directly adjacent PROFINET device, this device remains in the same place in the "Set topology" view. The interchanged connection is indicated by a red line.

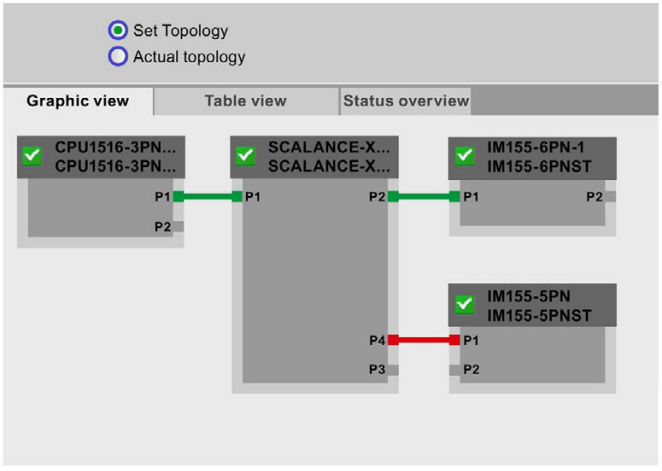

Figure 3-31 "Set topology" with interchanged ports

3.9 Tag status

Tag status

The browser outputs the tag status on the web page of the same name.

Note

Saving the tag status as a bookmark

When the page is exited, the entries made on it are not saved. If you want to monitor the same entered tags again later on, then create a bookmark in your Web browser for the "Tag status" page. Otherwise, you will have to enter the tags again when the page is reopened.

If you have defined your user page as start page of the Web server, you cannot access the tag status via the saved bookmarks. You can find additional information in section Defining the user page as start page (Page 85).

Note

Selected tag addresses are copied to the URL

The maximum number of characters for the URL of the tag status page is 2083. You can see the URL which corresponds to your current tag status page in the address bar of your Web browser.

To monitor several tags, we recommend the use of the watch tables (Page 66).

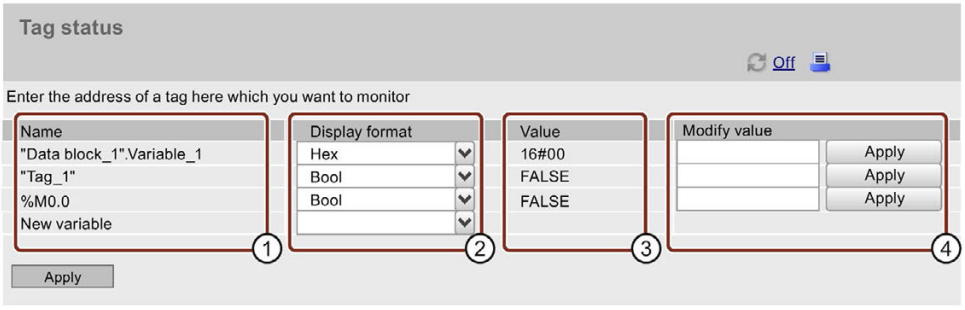

Figure 3-32 Tag status

① "Name"

In the "Name" text box, enter the address of the tag whose behavior you want to monitor. This may be a symbolic or absolute address.

- PLC tags (inputs and outputs, bit memories, times and counters) and DB tags in blocks with standard access have an absolute and a symbolic address.
- DB tags in blocks with optimized access have a symbolic address and no absolute address.

Example for access to the absolute address of a data block with standard access:
The absolute address consists of the preceding address ID %, the number of the data block and the absolute address of the tags in the data block, separated by a period: `%DB1.DBX1.0` = absolute addressing of the tags "DBX1.0" in the global data block "DB1".

Invalid entries are displayed in red font.

② "Display format"

Using the drop-down list box, select the desired display format of the respective tag. If the tag cannot be displayed in the desired format, it will be displayed in hexadecimal format.

③ "Value"

Under "Value", the value of the corresponding operand is displayed in the selected format.

④ "Modify value"

You can change the value of tags and write them to the CPU in this column. To transfer several changed values in one operation, click the "Apply" button below the table.

To be able to read values and write values to the CPU, you need to have configured a user with the appropriate access rights in STEP 7.

To write F-tags, you must also have assigned the access authorization "F-Admin"; see "Amending user management" in the section Configuring the Web server (Page 19).

If the value you entered is not valid (e.g. binary value in a BOOL field), the entry is not applied and the corresponding input field remains empty. A specific message relating to this is not output.

You can change the values of the following data types:

- Bool, Byte
- DWord, LWord, Word
- Int, DInt, LInt, SInt, UDInt, UInt, ULInt, USInt
- Real, LReal
- LDT
- Counter, Date
- Time, LTime, Time_Of_Day, LTime_Of_Day, Timer
- S5Time
- Char, WChar, String

Note

The following generally applies: To be able to write data, the "Referrer" transfer must be activated in your Web browser (this is the default in all common browsers).

Special considerations when changing languages

You can change the language, e.g., from German to English, in the upper right corner. Note that the German mnemonics differ from those of the other languages.

For monitoring available data types

In principle, all data types of PLC tags that can be monitored in STEP 7 can also be monitored via the Web server.

Note that structured data types such as ARRAY, STRUCT and DTL are not available as data types for PLC tags because of their data volume.

Reference

You can find additional information on the available data types in the STEP 7 online help, keyword: "Overview of the valid data types".

3.10 Watch tables

Watch tables

The browser displays the content of the configured, web-enabled watch tables on the web page of the same name.

Note

Please note that you can observe a maximum of 50 of the watch tables configured in STEP 7 in the Web server.

Each of these tables is displayed in the Web server with a maximum of 200 entries.

If you are monitoring many large watch tables in the Web server, the update time may increase due to the large data volumes.

The number of watch tables you can monitor also depends on the size of the SIMATIC memory card used.
If the available memory is exceeded by the configured alarms and tags, only incomplete watch tables will be displayed in the Web browser.

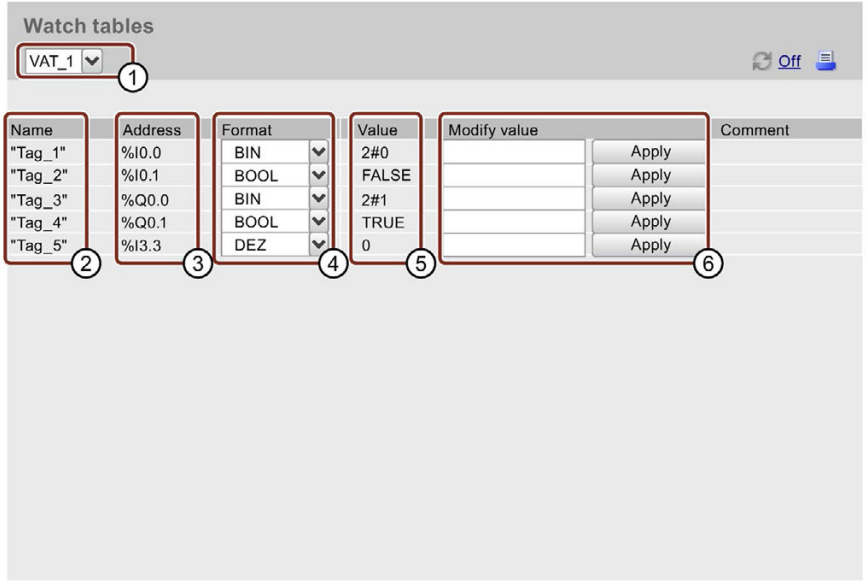

Figure 3-33 Watch tables

① Selection

Select one of the configured watch tables from the drop-down list.

② "Name"

The symbolic name of the tag is shown in this info box.

③ "Address"

The absolute address of the tags is displayed within this info field (if present, e.g. for inputs or outputs; DB tags in blocks with optimized access have no absolute address).

③ "Format"

Select the display format of the respective tag from the drop-down list.

⑤ "Value"

This column shows the values in the corresponding display format.

⑥ "Modify value"

You can change the value of tags and write them to the CPU in this column.

To be able to read values and write values to the CPU, you need to have configured a user with the appropriate access rights in STEP 7.

To write F-tags, you must also have assigned the access authorization "F-Admin"; see "Amending user management" in the section Configuring the Web server (Page 19).

If the value you entered is not valid (e.g. binary value in a BOOL field), the entry is not applied and the corresponding input field remains empty. A specific message relating to this is not output.

Note

The following generally applies: To be able to write data, the "Referrer" transfer must be activated in your Web browser (this is the default in all common browsers).

Note that the comments are displayed in the project language of the STEP 7 project that is assigned to the current user interface language of the Web server. You can find out how to assign project languages to interface languages in section Language settings (Page 29).

Reference

You can find additional information on the available data types in the STEP 7 online help, keyword: "Overview of the valid data types".

3.11 User pages

User pages

In the "User pages" area of the Web server you can upload HTML pages you have created yourself for reading out data of the target system.

Figure 3-34 User pages

You create the pages with an HTML editor of your choice from which you generate data blocks (Web control DB and Fragment DBs) in STEP 7 and download them to the CPU. The "WWW" instruction synchronizes the user program with the Web server on the CPU and initializes the Web server. With the first call of the "WWW" instruction, the link to the user page is displayed on the web page of the CPU. A click on the link opens the user page in a new window.

Note

Write access to user pages allows the process parameters and, thus, the operation of the CPU to be influenced.
To prevent external manipulation, always assign a password for users with write access to user pages in the user management. You will find information on user management in section Configuring the Web server (Page 19) under "Amending user management".

Requirements

- You have assigned symbolic names to the tags you want to use on your web page in STEP 7 .
- In the Inspector window under "Properties > General > Web server", you have at least:
  - Activated the Web server
  - Assigned read-only or read and write permissions to the users for user pages (see section Configuring the Web server (Page 19))
- You have completed all necessary communication settings (IP address parameter, subnet mask, etc.).
- You have downloaded the configuration.
- You have created your user page in an HTML editor of your choice:
  - Automatic HTML pages, if you want to **disable** control of the page layout by means of the user program (requires at least one call of SFC 99).
    Changes in mode from RUN to STOP do not affect the call of the user pages.
  - Manual HTML pages, if you want to **enable** control of the page layout by means of the user program (cyclic call of SFC 99 required).

Creating user pages

You can use any HTML editor to create your own user page(s). Make sure that your HTML code complies with the standards of the W3C (World Wide Web Consortium), because STEP 7 does not check the HTML syntax in any way. In addition to the simple HTML code, you can also use JavaScript commands in your user pages.

Proceed as follows:

1. Create the HTML file for your user page with an HTML editor.
   To allow data from the CPU to be output on your web page, integrate the AWP commands as HTML comments (see section AWP commands (Page 70)).
2. Store the HTML file and all associated source files (e.g., *.gif, *.jpg, *.js, etc.) in a directory on your PG/PC and note the storage path.
3. Call the "WWW" instruction in STEP 7 and program it (see section Programming the WWW instruction (Page 83)).
4. Configure the user page in STEP 7 (see section Configuring user pages (Page 82)). In this way, you compile the contents of your HTML files, among other things, into data blocks.
5. Download the configuration and the user program to the CPU.
6. Open your user page with your display device by means of a web browser in the Web server of the CPU.

Note

Extensive HTML pages, especially those with a lot of images, take up a lot of space in the load memory. Make sure you select a SIMATIC memory card with enough memory to provide sufficient load memory.

If the **sum of the HTML pages >** 1 MB, performance losses may occur as only 1 MB data is saved in the cache.

We recommend that you create **each individual file of an HTML page** with a size not exceeding 512 KB; otherwise, problems can occur when sending the file from the Web server to the browser. You can view the size of the respective file in the file explorer of the directory.

Updating user pages

User pages are not updated automatically in the browser. You can program the HTML code so that the pages are updated automatically.

Pages which read out data from the controller are always up-to-date due to regular updates.

Note

If the HTML page contains form fields for data input, automatic update can impair the correct data input by the user.

To update the entire page automatically, you can add the following instruction to the **<head>** area of your HTML page, whereby the number "10" stands for the update interval in seconds:

```
<meta http-equiv="refresh" content="10">
```

References

The description of a user page is available in the section Example of a user page (Page 87).

Additional help for visualization with user pages is available in the application examples on the Internet:

- S7-1200 and STEP 7 V11 (http://support.automation.siemens.com/WW/view/en/58862931)
- S7-1200 / S7-1500 and STEP 7 as of V13 SP1 (https://support.industry.siemens.com/cs/de/en/view/68011496)
- S7-300 / S7-400 and STEP 7 as of V5.5 (http://support.automation.siemens.com/WW/view/en/44212999)

You will find more information on JavaScript commands in the ECMAScript specification on the Internet (http://www.ecma-international.org/ecma-262/5.1/).

For more information about how to automatically update web pages and how to incorporate user pages with relative path names, refer to the FAQ with entry ID 62543256 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/62543256) Internet page.

Properties of the Web server (Page 15)

3.11.1 AWP commands

Overview

Automation Web Programming (AWP) commands are a special command syntax for data exchange between CPU and user page (HTML file).

AWP commands are entered as HTML comments and offer the following options for your user pages:

- Reading PLC tags
- Writing PLC tags
- Reading special tags
- Writing special tags
- Defining enum types
- Assigning enum types to tags
- Defining data block fragments
- Importing data block fragments
- Accessing the values of an array
- Accessing the values of a PLC tag of STRUCT data type

General syntax

All AWP commands, except for the command for reading a PLC tag, have this structure:
`<!-- AWP_< command name and parameter> -->`

Files including AWP commands:

- must be UTF-8 encoded.
  To define UTF-8 as character set of the page, add the following line to your HTML code:
  `<meta http-equiv="content-type" content="text/html; charset utf-8">`

  Note
  Saving the HTML page
  Make sure that you save the file in the editor in UTF 8 character encoding as well.

- may not include the following sequence:]]>
- may not include the following sequence outside "read tag areas" (:="<Varname>":):
- depending on the use, must identify special characters in tag names or data block names with character escape sequences or quotation marks
- are case-sensitive
- should be additionally enclosed by JavaScript comments ("/*...*/") in JavaScript files

Overview of AWP commands

Table 3- 5 AWP commands

Function	Representation
Reading PLC tags	`:=<Varname>:`
Writing PLC tags	`<!-- AWP_In_Variable Name='<Varname1>' -->`
Reading special tags	`<!-- AWP_Out_Variable Name='<Typ>:<Name>' -->`
Writing special tags	`<!-- AWP_In_Variable Name='<Typ>:<Name>' -->`
Defining enum types	`<!-- AWP_Enum_Def Name='<Name Enum-Typ>' Values='0: "<Text 1>",1:"<Text 2>",...,x:"<Text y>"' -->`
Assigning enum types to tags	`<!-- AWP_Enum_Ref Name='<Varname>' Enum='<Name Enum-Typ>' -->`
Defining data block fragments	`<!-- AWP_Start_Fragment Name='<Name>'[Type=<Typ>] [ID=<Id>] -->`
Importing data block fragments	`<!-- AWP_Import_Fragment Name='<Name>' -->`

Accessing the values of an array	`<!-- AWP_Start_Array Name='"<DB name>".<array name>' -->`
	`...`
	`<!-- AWP_End_Array -->`

Accessing the values of a PLC tag of STRUCT data type	`<!-- AWP_Start_Struct Name='"<DB name>".<struct name>' --> ...` `<!-- AWP_End_Struct -->`

3.11.1.1 PLC tags

Introduction to PLC tags

User pages can read PLC tags from the CPU and write data to the CPU.

To do so, PLC tags must:

- be enclosed by double quotation marks ("...").
- also be enclosed by single quotation marks ('" ... "') or with quotation marks masked with a backslash ("\" ... "\").
- be specified by a PLC tag name.
- if the PLC tag name includes the characters \ (backslash) or ', identify these characters with the escape sequence \\ or \' as normal characters of the PLC tag name.
- be enclosed with single quotation marks ('...'), if an absolute address (input, output, bit memory) is used in the AWP command.

Reading PLC tags

These out-tags (output direction as seen from the controller) are inserted at any place in the HTML text with the syntax described below.

Syntax

```
:=<Varname>:
```

<Varname> corresponds to the tag to be read from your STEP 7 project and can be a simple shared tag or a complete tag path to a structural element. Make sure that you use the name of the data block and not its number when you use data blocks.

Examples

```
:="Conveying speed":
:="My_datablock".bitmemory1:
:=%MW100:
```

Reading tags of the String and Character type

Below, these types of quotation marks are used in the explanation: single quotation marks ('), double quotation marks (").

As of firmware V1.6, with the "Read PLC tags" function, the CPU outputs tags of the String or Character type enclosed in single quotation marks to the browser.
For example:

- "Varname".MyString = ABC string tag
- You read the tag in HTML using the function :="Varname".MyString:
- The Web server outputs the character string 'ABC' to the browser

Using String or Character tags in expressions

On your HTML page, you use an expression in which the character string for reading a tag is enclosed in quotation marks, for example in forms.

Possible HTML code used:
```
<input type="text" name="appfield" value="myvalue">
```

If you read the displayed value for the "value" attribute from a PLC tag in this expression, the HTML code appears as follows:
```
<input type="text" name="appfield" value=":="Varname".MyString:">
```

By reading the PLC tag, the Web server outputs the value 'ABC'. In HTML, the code is then represented as follows:
```
<input type="text" name="appfield" value=" 'ABC' ">
```

If you have used single quotation marks instead of double quotation marks in your HTML code to enclose the attributes, the Web server passes on the content of the tags enclosed in two single quotation marks to the browser. As a result of this, the browser does not output the content of the String or Character tag, since two consecutive single quotation marks each form a closed sequence. The values to be read are located between these sequences and are not output by the browser.

In this context, note in particular that the character string with double quotation marks is not identical to two single quotation marks even if they appear to be identical.

Note

The code is not adapted automatically during an update to firmware as of V1.6.
Adapt your HTML code if you have used single quotation marks to enclose attributes for the "Read PLC tags" function.

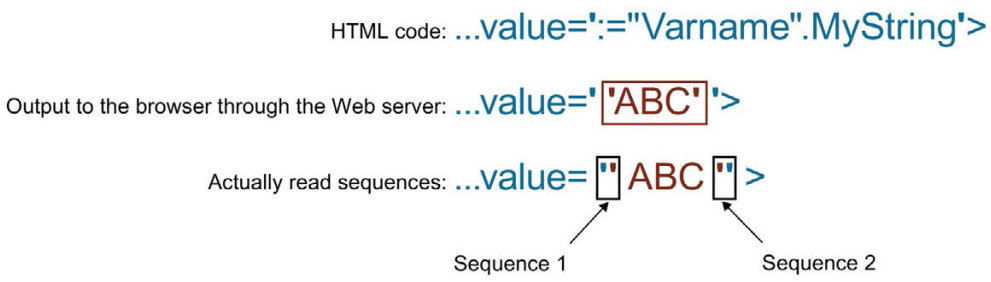

Figure 3-35 Example of HTML code with attribute in single quotation marks

Writing PLC tags

These in-tags (input direction as seen from the controller) are set on the browser page. This can take place in a form on your HTML page, for example, with text input or list selection boxes that correspond to the tags that can be written.

The tags are either set in the HTTP Header (per cookie or POST method) or in the URL (GET method) by the browser in the HTTP request and are then written by the Web server into the respective PLC tag.

Note

Write access during operation

For data to be written from a user page to the CPU, a user must have the required write permissions and be logged on as this user. This applies to all write accesses of web pages to the CPU.

Syntax

```
<!-- AWP_In_Variable Name='"<Varname1>"' Name='"<Varname2>"'
Name='"<Varname3>"' -->
```

If the name of the tag that you are using for the web application is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter.

```
<!-- AWP_In_Variable Name='<Varname_Webapp>' Use='<PLC_Varname>' -->
```

Examples with HTML input boxes

```
<!-- AWP_In_Variable Name='"Target_Level"' -->
<form method="post">
<p>Input Target Level: <input name='"Target_Level"'
type="text"><input type="submit" value="Write to PLC"> </p>
</form>

<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->
<form method="post">
<p>Braking: <input name='"Data_block_1".Braking' type="text"> <input
type="submit" value="Write to PLC"></p>
</form>
```

Examples with HTML drop-down list

```
<!-- AWP_In_Variable Name='"Data_block_1".ManualOverrideEnable' -->
<form method="post">
<select name='"Data_block_1".ManualOverrideEnable'>
<option value=1>Yes</option>
<option value=0>No</option>
</select><input type="submit" value="submit setting"> </form>
```

3.11.1.2 Special tags

Special tags

Special tags are mainly the HTTP tags specified in the definitions of the World Wide Web Consortium (W3C). Special tags are also used for cookies and server tags.

Reading special tags

The Web server can read PLC tags and transfer them to special tags in the HTTP response header. You can, for example, read out a path name from a PLC tag to redirect the URL to another storage location with the special tag "HEADER:Storage location".

Syntax

```
<!-- AWP_Out_Varible Name='<Type>:<Name>' Use='<Varname>' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- COOKIE_VALUE
- COOKIE_EXPIRES

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Status: HTTP status code (if no other value was set, status code 302 is returned).
  - Location: path for redirection to another page. Status code 302 must be set.
  - Retry-After: time for which the service is most likely not available. Status code 503 must be set.
- COOKIE_VALUE:name: value of the named cookie.
- COOKIE_EXPIRES:name: expiration time of the named cookie in seconds.

Examples

The HTTP HEADER tag is written to the PLC tag of the same name:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' -->
```

If the name of the special tag is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' Use='"Status"' -->
```

Writing special tags

The Web server gives you the option to write values of special tags written in the HTTP header in the CPU. You can, for example, save information on the cookie of a user page or on the user that accesses a page in STEP 7.

Syntax

```
<!-- AWP_In_Variable Name='<Type>:<Name>' Use='Varname' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- SERVER
- COOKIE_VALUE

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Accept-Language: accepted or preferred language
  - User-Agent: information on the browser
  - Authorization: credentials for a requested resource
- SERVER tags:
  - current_user_id: Indicates whether a user is logged on:
    current_user_id=0: No user is logged on / access by "Everybody" user.
    current_user_id=1: At least one user is logged on.
  - current_user_name: user name of the logged-on user
- COOKIE_VALUE:name: value of the named cookie.

Examples

The HTTP-SERVER tag is written to the PLC tag of the same name:

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"' -->
```

The HTTP-SERVER tag is written to the PLC tag "My_userID":

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"'
Use='"My_userID"' -->
```

3.11.1.3 Enum types

Enumeration types (enum types)

Enum types convert numerical values from the PLC program into texts or vice versa. The numerical values may also be assigned for use with several languages.

Define enum types

You can define enum types in your user pages and assign the values in an AWP command.

Syntax

```
<!-- AWP_Enum_Def_Name='<Name Enum-Typ>' Values='0:"<Text_1>",
1:"<Text_2>",...,x:"<Text_y>"' -->
```

Examples

To store German values as HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"Fault"' -
->
```

To store English values as HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -
->
```

Assigning enum types to tags

The assignment of tags from the user program to the individual enum types takes place by means of a separate AWP command. The used tag can be used at a different location of the user pages in a read operation or in a write operation.

For a read operation, the Web server replaces the value read from the CPU with the enum text value defined correspondingly. For a write operation, the Web server replaces the defined enum text value with the corresponding integer value of the enumeration before the value is written to the CPU.

Syntax

```
<!-- AWP_Enum_Ref_Name='<Varname>' Enum="<Enum-Type>" -->
```

<Varname> is the symbolic tag name from the user program; <Enum-Type> the previously specified name of the enum type.

Example for a declaration

```
<!-- AWP_Enum_Ref_Name='"Alarm"' Enum="AlarmEnum" -->
```

Example for use when reading a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<p> The current value of "Alarm" is :="Alarm": </p>
```

If the value of "Alarm" in the CPU is 2, the HTML page shows 'The current value of "Alarm" is container is empty' because the definition of the enum type assigns the numerical value 2 to the character sequence "Container is empty".

Example for use when writing a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_In_Variable_Name='"Alarm"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<form method="post">
<p><input type="hidden" name ='"Alarm"' value='Container is full'
/></p>
<p><input type="submit" value='Set container is full' /></p>
</form>
```

The value 1 is written to the PLC tag "Alarm" because the definition of the enum type assigns the numerical value 1 the text "Container is full".

Keep in mind that the name specified in "AWP_In_Variable" must be exactly the same in "AWP_Enum_Ref".

3.11.1.4 Fragments

Fragments

Fragments are "short paragraphs" of a website that the CPU processes separately.

Fragments are usually entire pages, but they can be individual elements, such as files (e.g. images) or documents.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned to the enum type name with the appropriate AWP command.

Defining fragments

A fragment extends to the beginning of the next fragment or to the end of the file.

Syntax

```
<!-- AWP_Start_Fragment_Name='<Name>' [Type="<Typ>"] [ID="<Id>"] -->
```

This command specifies the start of a fragment.

- <Name> Specifies the name of the fragment. The name must start with a letter [a-zA-Z] or an underscore (_). This first character can be followed by letters, underscores or numbers [0-9].
- <Type> Specifies the type of the fragment.
  - "manual": The user program is notified of the request for a fragment and can react accordingly. The function of the fragment must be controlled with STEP 7 and the tags of the control DB.
  - "automatic": The page is automatically processed (default)

- <Id> You can specify a numerical ID for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual), the fragment can be addressed with this ID in the user program of the CPU.

  Note
  ID assignment

  Set the ID as low as possible because the highest ID influences the size of the Web control DB.

- <Modus>
  - "visible": The contents of the fragment are displayed on the user page (default).
  - "hidden": The contents of the fragment are **not** displayed on the user page.

Importing fragments

You can specify a fragment in an HTML page and import this fragment into other websites.

Note

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage, because this import can result in the enum assignment being located in a different fragment than the enum usage.

Example

A company logo is to be displayed on all websites of a web application.

The HTML code for the fragment that displays the company logo exists only once. You can import the fragment as often and into as many HTML files as necessary.

Syntax

```
<!-- AWP_Import_Fragment_Name='<Name>' -->
```

<Name> corresponds to the name of the fragment to be imported.

Example

HTML code within a website that creates a fragment for displaying an image:

```
<!-- AWP_Start_Fragment Name='My_company_logo' -->
<p><img src="Company logo.jpg"></p>
```

HTML code that imports the created fragment into another website:

```
<!-- AWP_Import_Fragment Name='My_company_logo' -->
```

3.11.1.5 Arrays

Arrays

The Web server provides the user program commands AWP_Start_Array and AWP_End_Array for accessing all values of an array.

Only one-dimensional arrays are supported.

Multidimensional arrays of the form array[x][y] are not supported.

Syntax

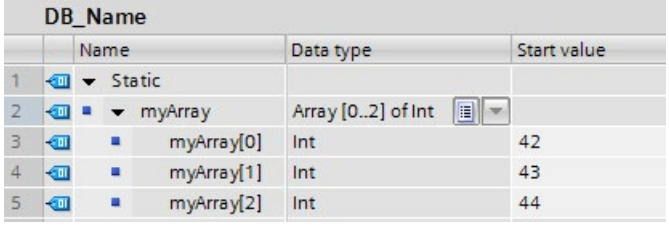
```
<!-- AWP_Start_Array Name='"<DB name>".<array name>' -->
... Content of the array, utilized keywords: ArrayIndex and value..
<!-- AWP_End_Array -->
```

Parameter

- <Name> defines the name of the array with the elements you want to access.
  - You require the DB name and the name of the array corresponding to the data block structure defined in STEP 7.
  - The name must be within single or double quotation marks.
  - The DB name is within double quotation marks.
- <ArrayIndex> Index of an array element
- <value> Value of an array element

Example

The example reads all elements of the "MyArray" structure in the "DB_Name" data block of the CPU and displays the index and the values of the tags on the user-defined web page.



DB_Name

	Name	Data type	Start value
1	Static		
2	myArray	Array [0..2] of Int	
3	myArray[0]	Int	42
4	myArray[1]	Int	43
5	myArray[2]	Int	44

```
<!-- AWP_Start_Array Name='"DB_Name".MyArray' -->
Index: :=ArrayIndex: Value: :=value:
<!-- AWP_End_Array -->
```

The code indicated above generates the following display:

Index: 1 Value: 42

Index: 2 Value: 43

Index: 3 Value: 44

Representation of arrays of the BOOL data type

The output of arrays of the BOOL type is always filled to the next full 8 bits. This particular feature only occurs with BOOL arrays.

Example:

```
"DB_1".bitArray is a BOOL array with 5 elements.
<!-- AWP_Start_Array Name='"DB_1".bitArray' -->
:=ArrayIndex: -> :=value:
<!-- AWP_End_Array -->
```

Edition:

0 -> Value from "DB_1".bitArray[0]

1 -> Value from "DB_1".bitArray[1]

2 -> Value from "DB_1".bitArray[2]

3 -> Value from "DB_1".bitArray[3]

4 -> Value from "DB_1".bitArray[4]

5 -> 0

6 -> 0

7 -> 0

3.11.1.6 Structures

Structures

The Web server provides user program commands for accessing structures in order to access the values of a PLC tag of the STRUCT data type.

Syntax

```
<!-- AWP_Start_Struct Name='"<DB name>".<struct name>' -->
... Content of structure ...
<!-- AWP_End_Struct -->
```

Parameter

- <Name> defines the name of the structure with the elements you want to access.
  - You require the DB name and the name of the structure corresponding to the data block structure defined in STEP 7.
  - The name must be within single or double quotation marks.
  - The DB name is within double quotation marks.

Example

The example reads elements of the "MyStruct" structure in the "DB_Name" data blocks of the CPU and displays the value of the tag on the user-defined web page.

DB_Name1

	Name	Data type	Start value
1	Static		
2	myStruct	Struct	
3	A	Int	0
4	B	Word	16#0
5	C	Bool	false

```
<!-- AWP_Start_Struct Name='"DB_Name".MyStruct' -->
:=A:
:=B:
:=C:
<!-- AWP_End_Struct -->
```

The code indicated above corresponds to the following commands:

```
:="DB_Name".MyStruct.A:
:="DB_Name".MyStruct.B:
:="DB_Name".MyStruct.C:
```

3.11.2 Configuring user pages

Configuring user pages

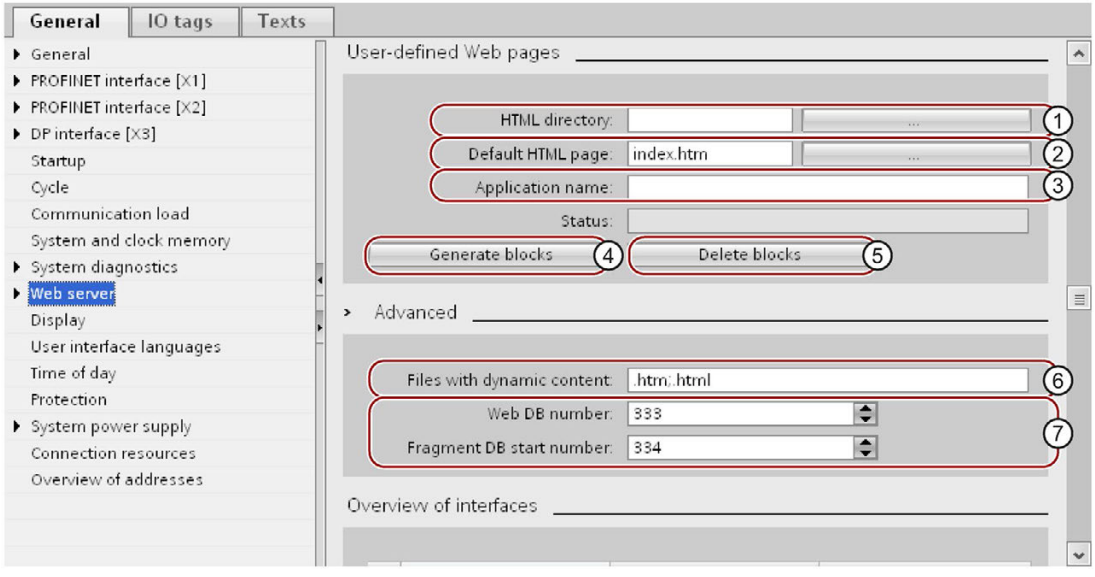


Figure 3-36 Configuring user pages in STEP 7

Proceed as follows to configure the user pages in STEP 7:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. In the area "User pages" under ① "HTML directory", select the folder on your display device in which you have saved your HTML page.
4. Enter the name of the HTML page under ② "Start HTML page" that is to open when you start the application.
5. You can also specify a name for your application under ③ "Application name". This name is used to further divide or group the webpages. If an application name already exists, the URL is displayed in the following format: http://a.b.c.d/awp/<application name>/<page name>.html
6. In the "Extended" area, enter the file extensions that have to be checked for AWP commands in input box ⑥ "Files with dynamic contents". By default, STEP 7 analyses files with the extensions ".js", ".htm" and ".html". Here you can enter other file extensions that you have used when creating your user page.
7. You can accept the number for the Web DB ⑦ and the fragment DB start number ⑦ or you can assign a new number of your choice that is not assigned.
8. Click the button ④ "Create blocks" to create data blocks from the source files. The created data blocks are stored in the STEP 7 project tree in the folder "System blocks > Web server". These data blocks consist of a control data block (Web control DB) that controls the display of the webpages and one or several data block fragments (fragment DBs) with the compiled webpages.
9. In the network view, select the CPU you want to download and select the command "Download to device" in the "Online" menu to download the blocks. The compilation of the blocks is implicitly triggered before the download. If errors are signaled during this process, they must be remedied before you can download the configuration.

Deleting data blocks

Click the "Delete block" button ⑤ to delete previously generated data blocks. STEP 7 deletes the Web Control DB and all fragment DBs from the project containing your user pages.

3.11.3 Programming the WWW instruction

The WWW instruction

The WWW instruction initializes the Web server of the CPU or synchronizes the user pages with the user program in the CPU. The Web control DB is the input parameter for the WWW instruction and specifies the content of the pages as they are displayed in the fragment DBs as well as the status and control information. STEP 7 creates the Web control DB when you click the button "Create blocks".

Programming the WWW instruction

The user program must execute the WWW instruction so that the user pages can be accessed in the Web server.

Table 3- 6 WWW instruction

LAD/FBD	SCL	Description
	`ret_val :=WWW(ctrl_db:=uint_in_) ;`	Access to user pages by means of the Web server

Parameters

The table below shows the parameters of the WWW instruction.

Table 3- 7 Parameters

Parameters	Declaration	Data type	Description
CTRL_DB	Input	DB_WWW	Data block that describes the user pages (Web control DB)
RET_VAL	Output	INT	Error information

RET_VAL parameter

Table 3- 8 RET_VAL

Error code (W#16#...)	Explanation
0000	No error has occurred. There are no pending website requests that must be released by the user program.
00xy	x: indicates if an error occurred during initialization of the Web control DB (CTRL_DB): x=0: no errors. x=1: errors occurred. The error is encoded in the "CTRL_DB.last_error" byte of the Web control DB. y: Number of the pending request. Several requests are possible (e.g., request "0" and "1" are pending: y="3"). y="1": Request "0" y="2": Request "1" y="4": Request "2" y="8": Request "3"
803A	The specified Web Control DB does not exist on the CPU.
8081	Incorrect version or incorrect format of the Web Control DB.
80C1	There are no resources available to initialize the Web application.

3.11.4 Defining the user page as start page

Defining the user page as start page

In addition to the default intro page, you can also define the start page of your user pages as the start page of the Web server.

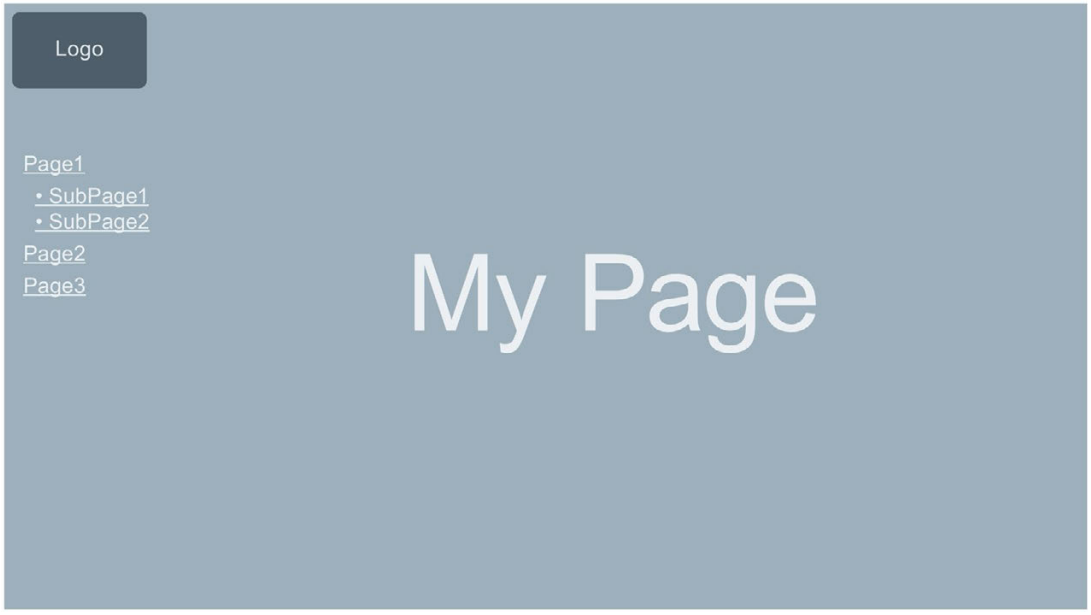

Figure 3-37 Example of user page as start page of the Web server

Requirements

The following requirements must be met before the user page is displayed as the start page of the Web server:

- You have configured the user page as the start page.
- You have configured a user in STEP 7 whom you have assigned at least the authorization "... open user-defined web pages".
- The CPU is in RUN mode.

Procedure

Proceed as follows to define the user pages in STEP 7 as start page of the Web server:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. Select the entry "AWP1" in the area "Entry page" under "Select entry page".

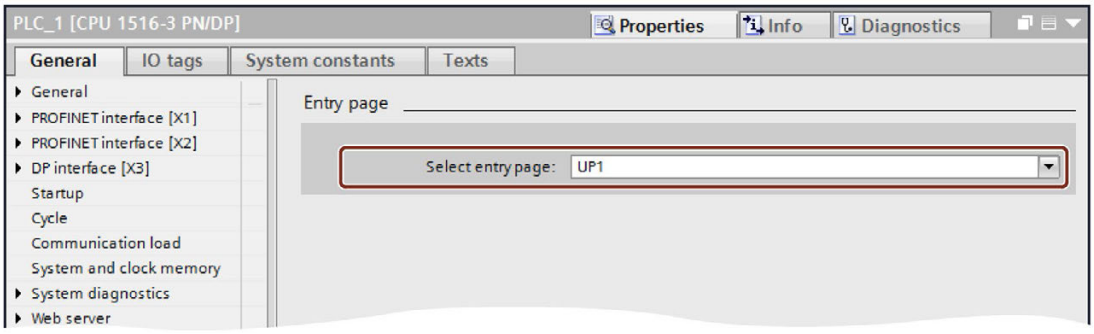

Figure 3-38 Setting user page in STEP 7 as start page

4. Download the configuration to the CPU.

If you now enter the IP address of the CPU in the browser, a connection is automatically established to your user pages.

If you want to access the web pages of your CPU again, link the web pages from your user pages, via the URL "http://a.b.c.d./Portal/Portal.mwsl?PriNav=Start" or "https://a.b.c.d/Portal/Portal.mwsl?PriNav=Start" for example. In this case, the information "a.b.c.d" represents, as an example, the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/Portal/Portal.mwsl?PriNav=Start">SIMATIC web pages</a>
```

Note

If you define your user page as start page of the Web server, all direct access to the web pages of the CPU is disabled. This applies also to the bookmarks you saved for the web pages of the CPU as well as the page for reading out the service data.

Reading out service data

If you define your user page as start page of the Web server, all direct access to the web pages for reading out the service data is also disabled.
If you want to continue to read out service data via the Web server when servicing is required, here is how you can link the service data page directly to your user page.
Just as for the web pages of the CPU, link the service data page e.g. via the URL "http://a.b.c.d/save_service_data" or "https://a.b.c.d/save_service_data", the "a.b.c.d" here is an example of the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/save_service_data">Service data</a>
```

Reference

You can find additional information on the topic of user page as start page in the FAQ with entry ID 67184104 on the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/67184104) Internet page.

3.11.5 Example of a user page

3.11.5.1 Website for monitoring and controlling a wind turbine

Example of a user page

Here you see a user page for monitoring and controlling a wind turbine:

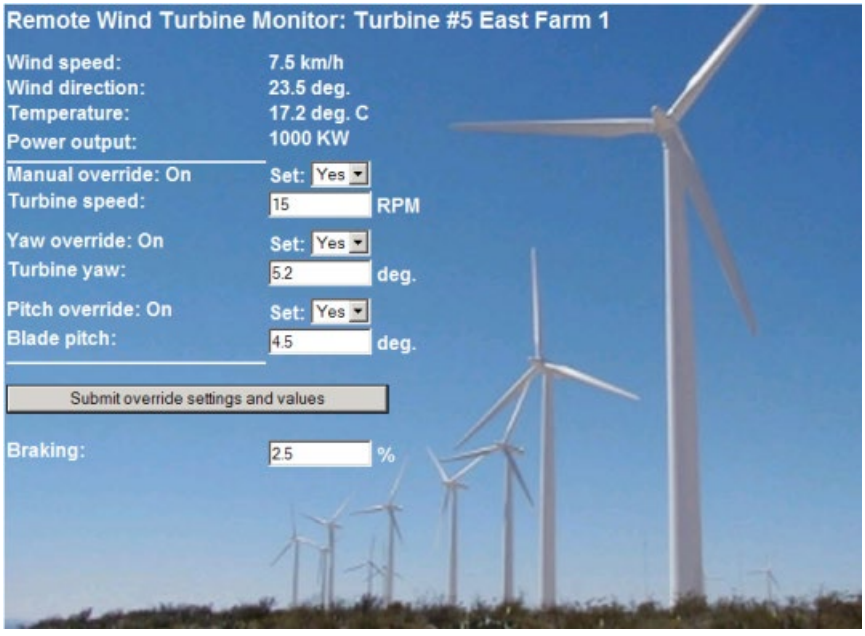

Figure 3-39 Overview of user page wind turbine

The user page was created in English in this example, but you can select any language you wish when you create your own user page.

In this application, each wind turbine of the wind farm has a data block in STEP 7 with specific data for the respective location and the turbine.

The user page gives you the option to access the turbine remotely with a display device. A user can open the standard websites for a CPU of a specific wind turbine and go to the "Remote Wind Turbine Monitor" user page to view the turbine data. A user with the corresponding access permissions can also set the turbine into the manually controlled mode and thus control the tags for speed, orientation and angle of attack of the turbine by means of the website. The user can also specify a brake value regardless of manual or automatic control of the turbine.

STEP 7 checks the Boolean values for override of the automatic control and, if set, uses the values for speed, orientation and angle of attack of the turbine as defined by the user.

Files used

Three files are used in the application example:

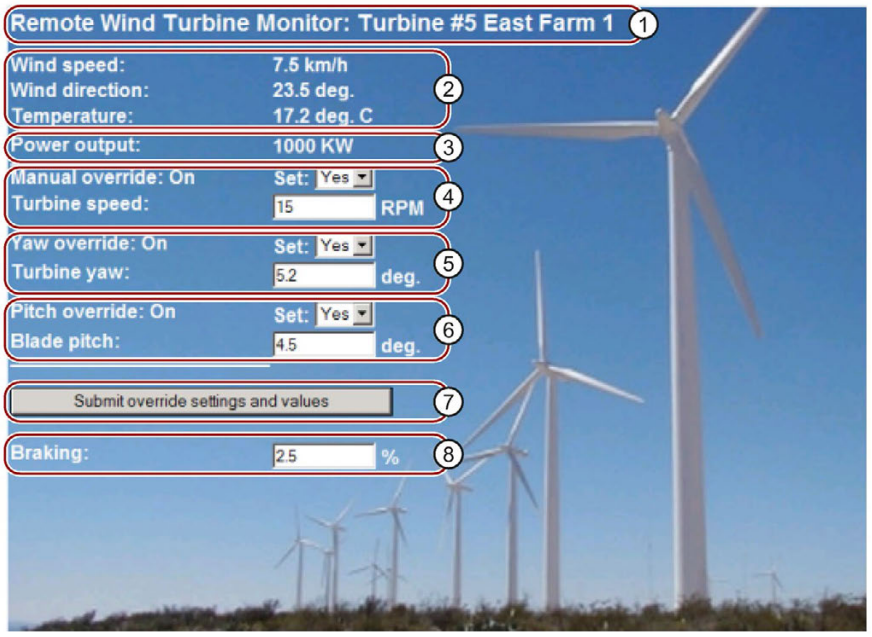
- Wind_turbine.html: The user page in the figure shown above. The control data is accessed by AWP commands.
- Wind_turbine.css: The Cascading Style Sheet which includes the formatting specifications of the user page. The use is optional but can simplify the design of the user page.
- Wind_turbine.jpg: The background image displayed on the user page. The use of images is optional, user pages with lots of images require a lot more memory in the load memory.

These files are not part of your installation but they are described as an example below.

Implementation

The user page uses AWP commands to read out values from the CPU as well as writing values to it. The user page also uses AWP commands for the definition of enum types, such as the assignment of tags to enum types for handling the ON/OFF settings.

The user page is structured as follows:



① Header of the website with number and location of the wind turbine.

② Atmospheric conditions at the turbine, wind speed, wind direction and current temperature are displayed.

③ Read-out power output.

④ Manual override: Activates manual override of the turbine. To make manual settings for speed, orientation and angle of attack, the STEP 7 user program requires that manual override has been activated.

⑤ Override of the orientation: Activates manual override of the turbine orientation.

⑥ Override of the angle of attack: Activates manual override of the angle of attack of the rotor blades.

⑦ By clicking this button, you transfer the override settings to the CPU.

⑧ Manual setting of a percentage value for braking. The setting "Manual override" is not required to enter a brake value.

Figure 3-40 Overview of user page wind turbine

The user page also uses an AWP command which writes the special tag into the tag table; it includes the user ID of the user who currently accesses the page.

3.11.5.2 Reading and displaying data from the CPU

Example HTML code for reading out and displaying data from the CPU

This part of the HTML code is used for displaying the power output on the user side.

The text "Power Output:" is displayed on the left-hand side; on the right-hand side, the value of the tags for the power output including the unit ("KW") is displayed.

The AWP command `:="Data_block_1".PowerOutput` executes the reading operation. The data block is referenced by its symbolic name here and not by its number ("Data_block_1" instead of "DB1").

The code used in the example is:

```
<tr style="height:2%;">
<td>
<p>Power output:</p>
</td>
<td>
<p style="margin-bottom:5px;"> :="Data_block_1".PowerOutput: KW</p>
</td>
</tr>
```

PLC tags (Page 72)

3.11.5.3 Using enum types

Definition of enum types

The described user page uses enum types in three locations. "On" or "Off" is displayed for a Boolean value at these locations.

The enum type for "On" results in a value of 1; the enum type for "Off" results in a value of 0. The following excerpts from the HTML code of the user page show the declaration of an enum type with the name "OverrideStatus" and the values "0" and "1" for "Off" or "On" as well as the specification of an enum type reference of "OverrideStatus" for the tag "ManualOverrideEnable" in the data block "Data_block_1".

Note

Assignment of enum types

If the user page writes into a tag by using an enum type, there has to be a declaration "AWP_In_Variable" for each "AWP_Enum_Ref" declaration.

The code used in the example is:

```
<!-- AWP_In_Variable_Name='"Data_block_1".ManualOverrideEnable' -->
<!-- AWP_Enum_Def_Name="OverrideStatus" Values='0: "Off",1:"On"' -->
<!-- AWP_Enum_Ref_Name='"Data_block_1".ManualOverrideEnable'
Enum="OverrideStatus" -->
```

The following code describes a display box for displaying the current status of "ManualOverrideEnable". A normal read command for tags is used but because of the declared and referenced enum type, the website displays the values "On" and "Off" instead of "1" and "0".

```
<td style="width:24%; border-top-style: Solid; border-top-width:
2px; border-top-color: #ffffff;">
<p>Manual override: :="Data_block_1".ManualOverrideEnable:</p>
</td>
```

The following code describes a drop-down list for changing "ManualOverrideEnable" by the user. The drop-down list consists of the "Yes" and "No" options that are assigned to the "On" or "Off" values by means of the enum type reference. If you make no selection, the status remains the same.

```
<select name='"Data_block_1"ManualOverrideEnable'>
<option value=':"Data_block_1".ManualOverrideEnable:'> </option>
<option value="On">Yes</option>
<option selected value="Off">No</option>
</select>
```

The drop-down list is included in the form on the website. The form is uploaded, when the user clicks on the "Send" button. If the user has selected "Yes", the value "1" is written in the tag "ManualOverrideEnable" in the "Data_block_1" data block; if the user has selected "No", the value "0" is written.

3.11.5.4 Writing user inputs into the controller

Setting options

The user page "Remote Wind Turbine Monitor" includes different AWP commands for writing data into the controller. A user with the corresponding access permissions can control the wind turbine manually, activate the override for the turbine speed and the turbine orientation as well as the angle of attack of the rotor blades with the declaration of different "AWP_In_Variable" write commands. The user can also specify floating-point numbers for turbine speed, orientation angle of attack and percentage of braking. The user page uses an HTTP command in the format "POST" to write the tags into the controller.

The code used in the example for setting the brake value is:

```
<!-- AWP_In_Variable Name='"Data_block_1"' -->
...
<tr syte="vertical-align: top; height: 2%;">
<td style="width: 22%;"><p>Braking:</p></td>
<td>
<form method="POST">
<p><input name='"Data_block_1".Braking' size="10" type ="text">
%</p>
</form>
</td>
</tr>
```

This excerpt from the HTML code first defines a "AWP_In_Variable" for the "Data_block_1" data block which enables the user page to write any number of tags into the data block. The text "Braking:" is displayed on the left-hand side; on the right-hand side is a box in which the user can make entries for the "Braking" tag in the data block.

The user page reads out the actual braking value from the controller and displays it in the text box. A user with the corresponding access permissions can then write a brake value that controls the braking process into the data block of the CPU.

Note

Declaration of data blocks

If you declare an entire data block by means of a "AWP_In_Variable", each tag in the data block can be written by means of the user page. If only certain tags in the data block are to be writable, you declare this specifically using `<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->`, for example.

3.11.5.5 Writing special tags

Using special tags

The user page "Remote Wind Turbine Monitor" writes the special tag "Server:current_user_id" into a tag of the CPU. The tag value contains the value "1" if a user is logged on and "0" if a user is not logged on. In this example, a user is logged on, so the tag value is set to "1". The special tag is written into the CPU by the user page and does not need a user interface.

The code used in the example is:

```
<!-- AWP_in_variable Name="SERVER:current_user_id" Use="User_ID" -->
```

3.11.5.6 HTML code of the user page "Remote Wind Turbine Monitor"

The complete HTML code of the example user page "Remote Wind Turbine Monitor" as well as the used Cascading Style Sheet (CSS) is listed below.

Wind_turbine.html

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd"><!--
This test program simulates a website for monitoring and operating a
wind turbine.
Required PLC tags and data block tags in STEP 7:
PLC tag:
User_ID: Int
Data blocks:
Data_block_1
Tags in Data_Block_1:
TurbineNumber: Int
WindSpeed: Real
WindDirection: Real
Temperature: Real
PowerOutput: Real
ManualOverrideEnable: Bool
TurbineSpeed: Real
YawOverride: Bool
Yaw: Real
PitchOverride: Bool
Pitch: Real
Braking: Real
The user-defined website shows the current values for the PLC data
and offers a drop-down list to specify the three Boolean values with
the assigned enumeration type. The selected Boolean values as well
as the data text boxes for speed, orientation and angle of attack of
the turbine are uploaded with the "Send" button. The brake value can
be specified without the "Send" button.
```

```
No actual STEP 7 program is required for using this page. The STEP 7
program would theoretically only respond to the values for speed,
orientation and angle of attack of the turbine, if the assigned
Boolean values were specified. The only requirement for STEP 7 is
that the WWW instruction is called with the DB number of the
generated data blocks for this page.
-->
-->
<!-- AWP_In_Variable Name='"Data_block_1"' -->
<!-- AWP_In_Variable Name='"Data_block_1".ManualOverrideEnable'
Enum="OverrideStatus" -->
<!-- AWP_In_Variable Name='"Data_block_1".PitchOverride'
Enum="OverrideStatus" -->
<!-- AWP_In_Variable Name='"Data_block_1".YawOverride'

```

3.12 Filebrowser

Requirements

Access rights must be assigned for the user in the user management.

Filebrowser

The browser displays the content of the SIMATIC memory card on the "Filebrowser" web page. This means, for example, that you can read and edit the log files generated by the CPU without having to use STEP 7.

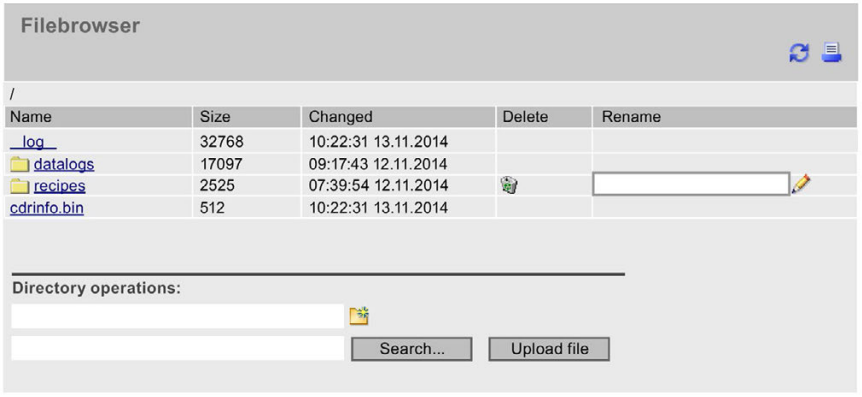

Figure 3-41 Filebrowser view

The Filebrowser lists all existing files and directories on the SIMATIC memory card. The files can be downloaded, deleted, renamed and uploaded; the directories can be created, deleted and renamed.

Note

The Filebrowser only grants you read access to the "DataLogs" and "Backups" directories.

Exception system files

The system files include the job file and all special directories including their contents to which the job file refers. System files are not displayed, and cannot be changed or deleted.

3.13 DataLogs

DataLogs

On the DataLogs web page, you can view all the DataLogs that you have created.

You can sort the DataLogs according to the individual parameters in ascending or descending order.
For this purpose, click on one of the parameters in the column header:

- Name
- Size
- Changed

You can download the relevant DataLog file by clicking the file name.

You can call (download) and empty the relevant DataLog file by clicking the icon . The file must be closed. The empty DataLog file is still maintained in the list of DataLogs.

Figure 3-42 DataLogs

NOTICE
If you open a large DataLog file via this web page, the processing times of the DataLog instructions that process this DataLog file can increase considerably. Although the processing time of the priority class (OB in which the DataLog instruction is called) does not increase, the output parameter BUSY is set for the duration of the processing.

3.14 Online backup

Backing up and restoring the CPU configuration

You can back up a CPU configuration using the Web server with the corresponding access rights. If necessary, you can also restore this configuration at a later time using the Web server.

You can create as many backups as you want and store a variety of configurations for a CPU.

NOTICE
Prior to every restoration of the CPU configuration, always first perform an online backup of the current CPU configuration and save this backup file to a local directory of your PC. This ensures that you can undo a restoration which failed (e.g. due to a damaged backup file) or which does not show the desired result.

Note

You can also perform online backup and restoration of the CPU configuration in STEP 7 (see online help for STEP 7, keyword: "Creating a backup of an S7 CPU").

With a backup using STEP 7, the backup file is saved within the STEP 7 project. With a backup using the Web server, the backup file is saved to a local directory of your PG/PC (e.g. "Downloads" directory). Web server backup files cannot be restored via STEP 7, nor can STEP 7 backup files be restored directly using the Web server.

To restore a STEP 7 backup file using the Web server, first save the STEP 7 backup file to a local directory of your PG/PC (e.g. "Downloads" directory). From there, you can restore the backup with the Web server.

Requirements

- You access the CPU via the secure transmission protocol "HTTPS".
- A valid CA-signed certificate is installed in the Web browser; see section Configuring the Web server (Page 19).

Online backup

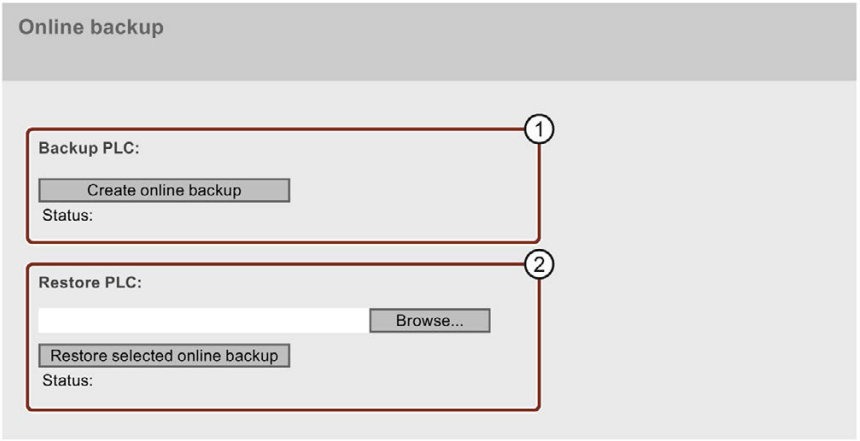

Figure 3-43 Online backup

① Perform online backup of the configuration

To perform an online backup of the CPU configuration, proceed as follows:

1. Click the "Create online backup" button in the "PLC backup" area.
2. If the CPU is in RUN mode, the following alarm is output:
   "Creation of an online backup requires PLC STOP. Do you want to set the PLC to STOP mode?"

   Acknowledge the alarm output by clicking "OK". The CPU is set to STOP mode and online backup is performed. (If you click "Cancel", the CPU remains in the current mode and the online backup is canceled.)
3. Save the backup file to a local directory of your PC.
4. Set the CPU back to RUN mode ("RUN" button in the "CPU operator panel" area of the start page).

Scope of the backup

The backup includes all data needed to restore a particular state of a CPU, i.e. the specific combination of the configuration of the CPU with the current values of the user-related retentive data.

The following data of the configuration of the CPU is backed up:

- The contents of the SIMATIC memory card, e.g. configuration, program code, recipes and archives, DataLogs

The following user-relevant retentive data is backed up:

- Retentive memory areas of data blocks, bit memories, counters and timers
- Front-panel settings, dynamic IP configuration data, operating hours counters, retentive Motion Control sensor data

Note:

- Entries in the diagnostic buffer are not included in the backup.
- The current time of day is not backed up for a SIMATIC S7-1500 CPU.
- The entire contents of the SIMATIC memory card are backed up, i.e. any data stored on the card (e.g. PDF files, GSD files).
- The backup file is assigned the name of the CPU and the project with the time and date of the backup, e.g. "2015-09-10_11-01_03_online backup_PLC69_machineControl.s7pbkp".
- The backup file of an F-CPU also contains the collective signature of the safety program in the file name. Check whether it is the expected F-collective signature.
- You can rename the backup, but you cannot make any changes to the contents of the backup.

② Restore the configuration

To restore the CPU configuration, follow these steps:

1. Enter the password of the currently logged-in user in the "PLC restore" area.
2. Click the "Browse" button and select the backup file of the configuration that you want to restore.
3. Click "Load online backup".
4. If the CPU is in RUN mode, the following alarm is output:
   "Download online backup to device. The CPU is set to STOP and the contents of the CPU will be overwritten. Do you want to continue?"

   If the CPU is already in STOP mode, the following alarm is output:
   "Download online backup to device. The contents of the CPU will be overwritten. Do you want to continue?"

   Acknowledge the alarm output by clicking "OK". The CPU is set to "STOP" mode if required, and the online backup is downloaded. (If you click "Cancel", the CPU remains in the current mode and downloading is canceled.)
5. An alarm informs you that you must not leave the web page during the "restore procedure". Acknowledge the alarm output by clicking "OK".

   The restoration of the CPU configuration starts and you will be continuously informed of the current status:

   – "Download of online backup has been started."
   – "Checking backup file."
   – "Formatting memory card and resetting CPU."

6. If you have started the restoration procedure with a user name and password defined in the Web server configuration, you will be asked to enter these again after restoration of the CPU. Enter the required information and click "Login".

   If you have started the restoration procedure as the user "Everybody" without a password (but with appropriate access rights), this prompt is not displayed.

   Note

   To restore the configuration of an F-CPU whose security program and/or password has been changed for the F-CPU in the meantime, you also need the access authorization "F-Admin"; see "Amending user management" in the section Configuring the Web server (Page 19).

   ⚠ WARNING

   The authorization "F-admin" for the Web server without password protection (User "Everybody") is only for test purposes, commissioning etc. i.e. only when the system is in productive operation. In this case, you have to ensure the security of the plant through other organizational measures, e.g. through spatial protection.

   Prior to the transition to productive operation, you must remove the right "F-Admin" for the user "Everybody".

   The password of the user of the Web server with the right "F-Admin" should only be accessible to authorized persons.

   The restoration of the CPU configuration starts and you will be continuously informed of the current status:

   – "Loading configuration."
   – "Resetting CPU."

   This may take a few minutes.

7. When the procedure is complete, you will be logged out and the "Reload page..." button will be displayed.

   If you did not receive an error message during the restoration procedure, the restoration of the CPU configuration was successfully completed and you will receive a corresponding message.

   Click the "Reload page..." button and log on to the newly downloaded CPU configuration with your user name and password.

   You will receive the following error message if:

   – the newly downloaded CPU configuration does not contain the same IP address as the former one
   – the Web server is deactivated in the newly downloaded CPU configuration
   – the browser does not receive a response from the CPU after 3 minutes

   Error message: "The CPU is not reachable anymore. Please check the IP address and the Web server configuration. The result of the restore can be checked in the ASLog."

3.15 Motion Control diagnostics

Overview

The Web server displays statuses, errors, technology alarms and the current values of the configured technology objects (TOs):

- Speed-controlled axis (TO_SpeedAxis)
- Positioning axis (TO_PositioningAxis)
- Synchronous axis (TO_SynchronousAxis)
- External encoder (TO_ExternalEncoder)
- Measuring input (TO_MeasuringInput)
- Output cam (TO_OutputCam)
- Cam track (TO_CamTrack)

The "Motion Control Diagnostics" web page provides detailed information on the configured technology objects in the following views:

- Diagnostics
- Service overview

Diagnostics

The "Diagnostics" view offers you:

- ① An overview list of the configured technology objects
- ② The status and error messages of a selected technology object
- ③ Values and limits of the status of a selected axis/cam

① "Diagnostics" view

Under "Status", you will find an overview list of the configured technology objects with the designation and type, which indicates whether the technology object in question is "released" and "referenced".

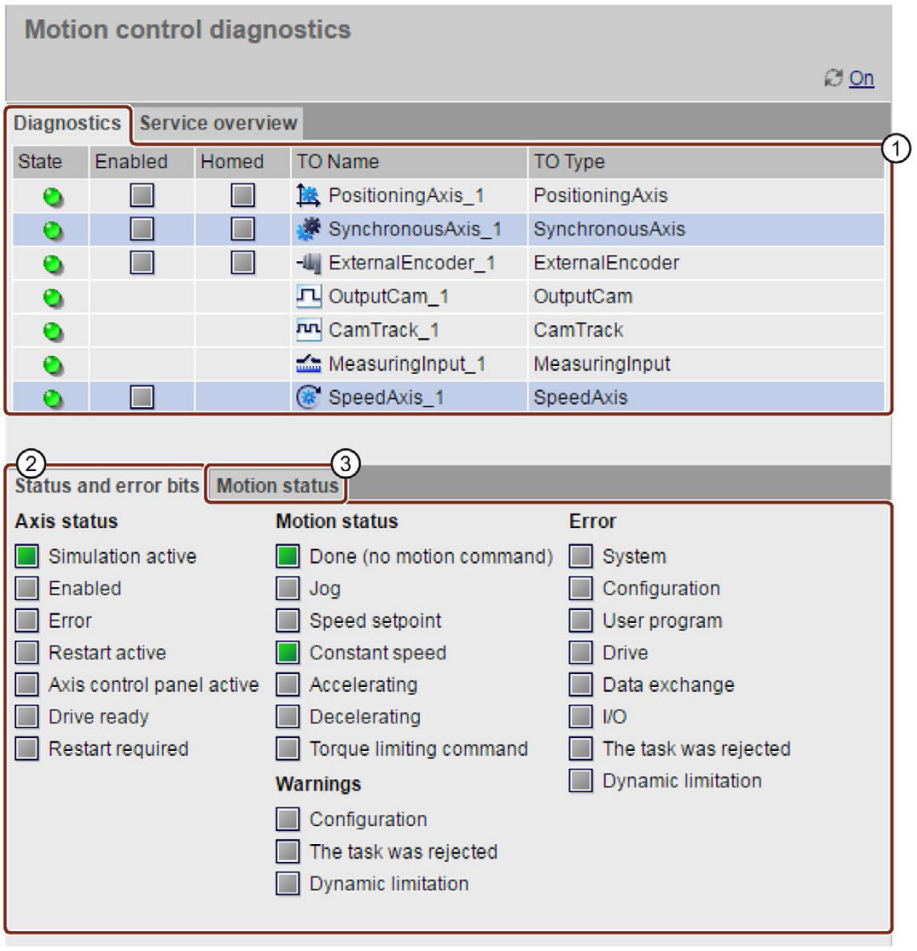

Figure 3-44 Motion Control diagnostics: Status and error bits

Meaning of the symbols in the "Status" column

Table 3- 9 Meaning of symbols

Symbol	Symbol color	Meaning
	Green	Component is OK
	Yellow	Warning pending
	Red	Error - component faulty or not available

Select the required technology object. The related diagnostics information is shown in the bottom tabs.

② "Status and error bits" tab

You use the "Status and error bits" tab to monitor the status and error messages for the technology object as in STEP 7.

③ "Motion status"/"Cam track status" tab

You use the "Motion status" tab to monitor the motion status of the axis as in STEP 7.

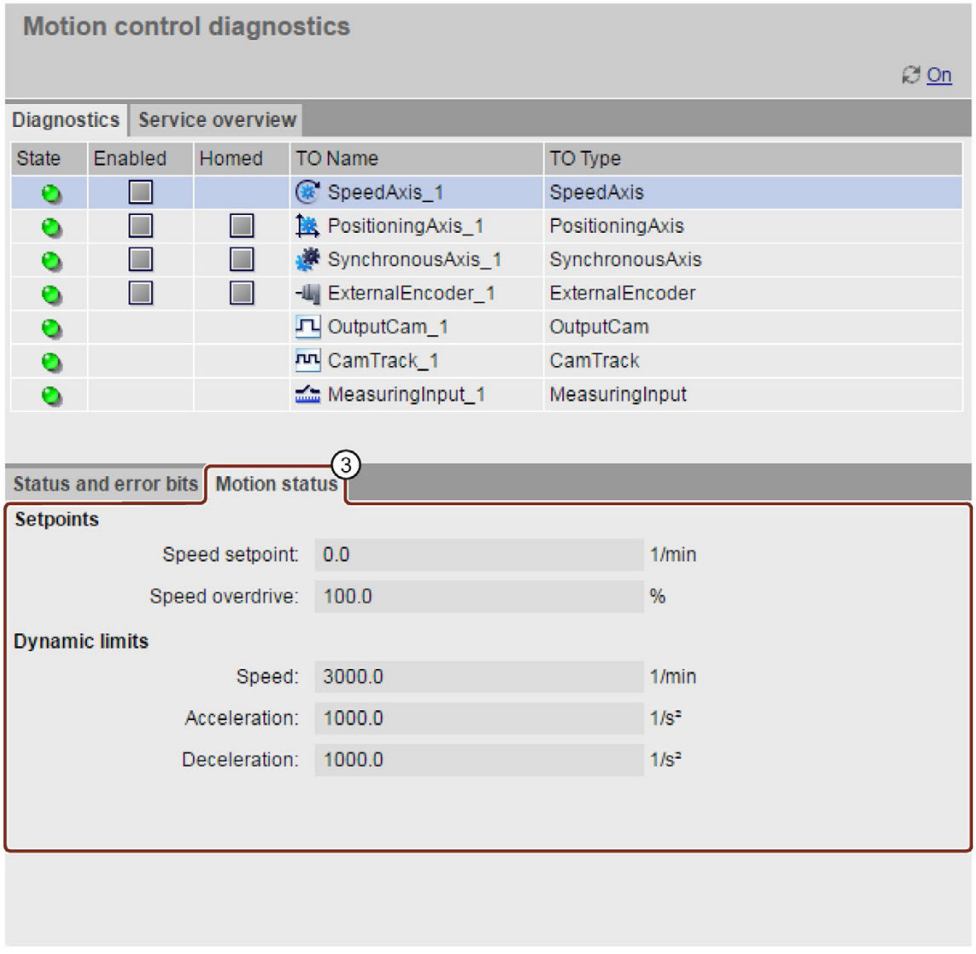

Figure 3-45 Motion Control diagnostics: Motion status

You use the "Cam track status" tab to monitor the cam track status as in STEP 7.

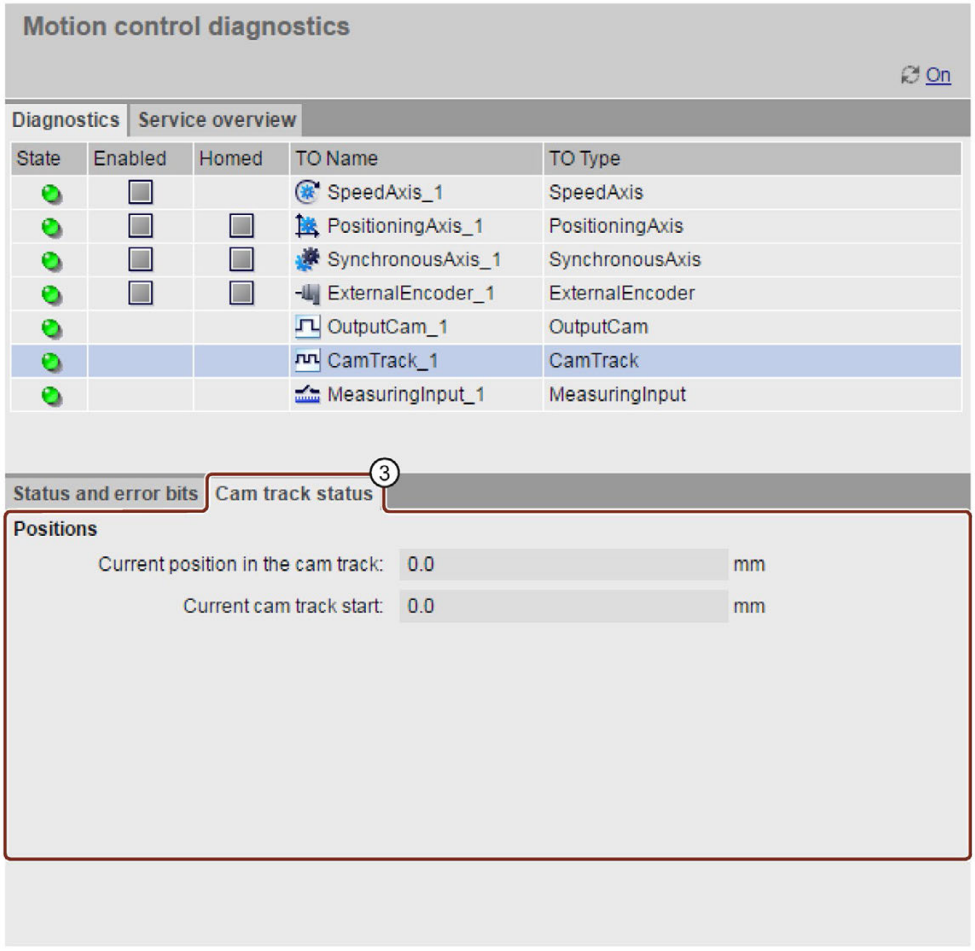

Figure 3-46 Motion Control diagnostics: Cam track status

Service overview

The "Service overview" view offers you:

- ① Diagnostics information for several technology objects
- ② A filter option for selecting the displayed technology objects

① "Service overview" view

The "Service overview" shows the diagnostics information for several technology objects in table form.

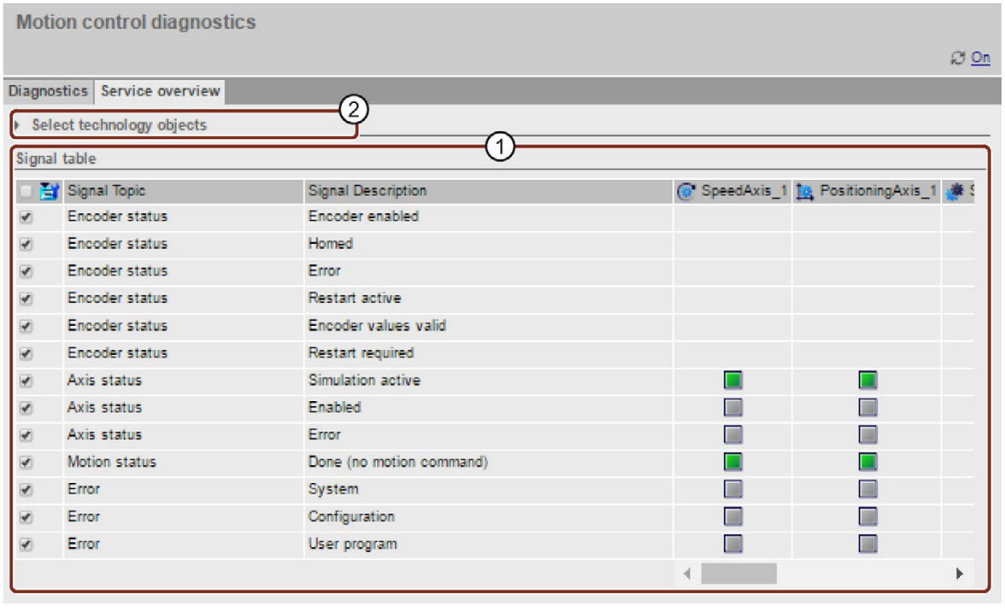

Figure 3-47 Motion Control diagnostics, service overview: Status and error information

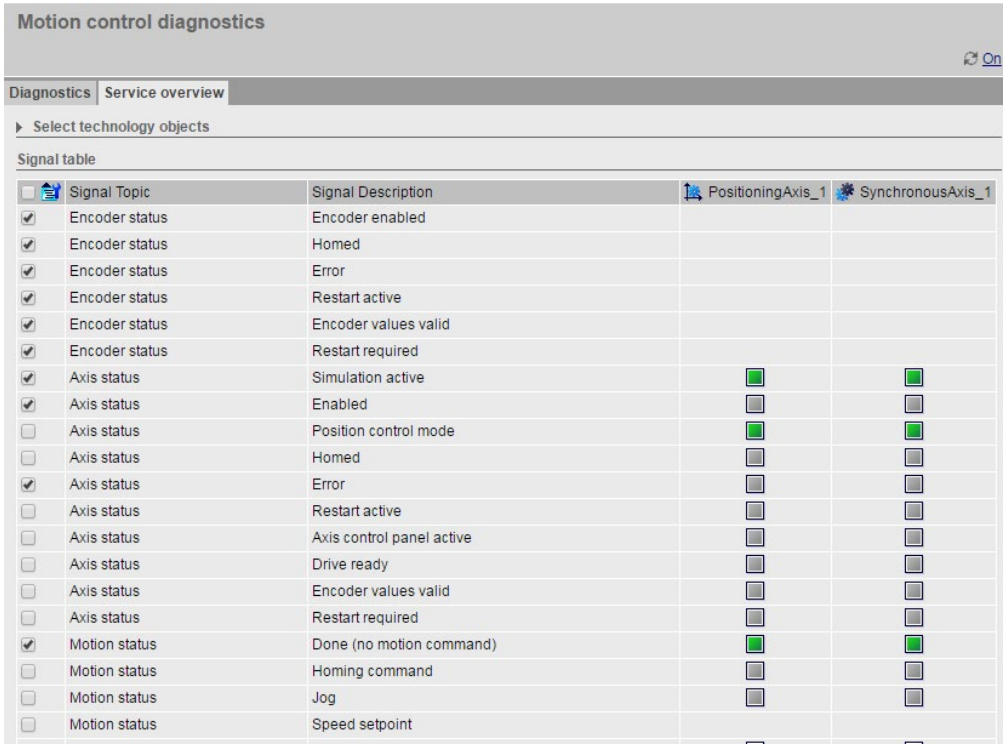
To select the information to be displayed, click the list symbol in the first column of the table. Make your selection in the next window. Click the list symbol again to leave the selection window.



Signal Topic	Signal Description	PositioningAxis_1	SynchronousAxis_1
Encoder status	Encoder enabled		
Encoder status	Homed		
Encoder status	Error		
Encoder status	Restart active		
Encoder status	Encoder values valid		
Encoder status	Restart required		
Axis status	Simulation active		
Axis status	Enabled		
Axis status	Position control mode		
Axis status	Homed		
Axis status	Error		
Axis status	Restart active		
Axis status	Axis control panel active		
Axis status	Drive ready		
Axis status	Encoder values valid		
Axis status	Restart required		
Motion status	Done (no motion command)		
Motion status	Homing command		
Motion status	Jog		
Motion status	Speed setpoint		

Figure 3-48 Motion Control diagnostics, service overview: Configuring the status and error information

② Selection "Select technology objects"

You can make a selection of the displayed technology objects with the selection "Select technology objects".

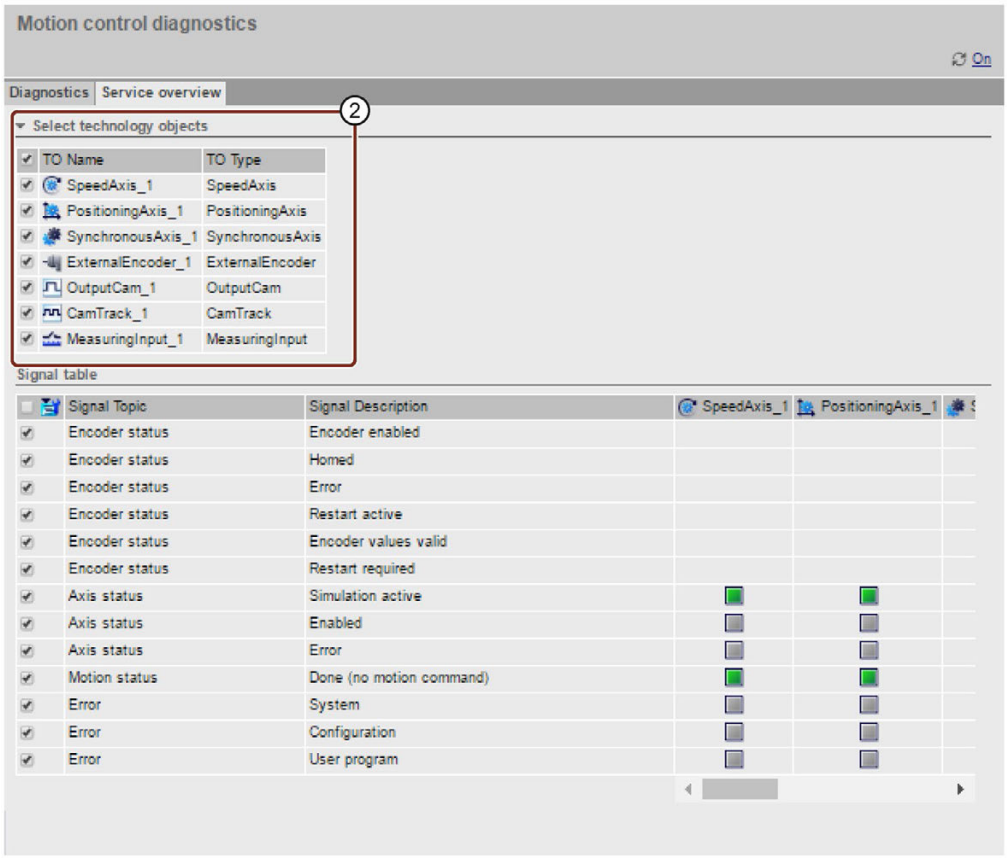


Figure 3-49 Motion Control diagnostics, service overview: Status and error information - Select technology objects

Reference

You can find explanations of the diagnostics functions "Status and error bits" and "Motion status"/Cam track status" of the individual technology objects in the online help for STEP 7.

3.16 Trace

Trace and logic analyzer function

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU.

The recordings are saved on the device and can be read out by users with appropriate access rights via the Web server and saved. The trace and logic analyzer function is therefore suitable for monitoring highly dynamic processes in the Web server.

Requirements

- A trace configuration has been created, i.e. you have defined the recording and trigger conditions and selected the signals to be recorded.
  - Note: Only measurements which are saved on the SIMATIC memory card can be displayed on the "Trace" web page.

    For the CPU to save the measurements on the SIMATIC memory card, you must make the following settings for the trace configuration in STEP 7:

    1. Set the "Trigger mode" to "Trigger on tag".
    2. Select the "Save measurements on device (memory card)" check box.
- You have transferred the trace configuration to the device and activated it there.
- You have assigned the access right "Query diagnostics"; see section Configuring the Web server (Page 19).

Space requirements for storing trace recordings

You can use the "Save measurements on device (memory card)" function in STEP 7 to save trace recordings on your SIMATIC memory card.

Response when number reached

The "Deactivate recording" parameter repeats the measurements until the configured "Number of measurements" is reached.

The "Overwrite oldest recording" parameter replaces the oldest measurement with the latest measurement when the configured "Number of measurements" is reached. Note, however, that continuously writing data to the SIMATIC memory card shortens its service life.

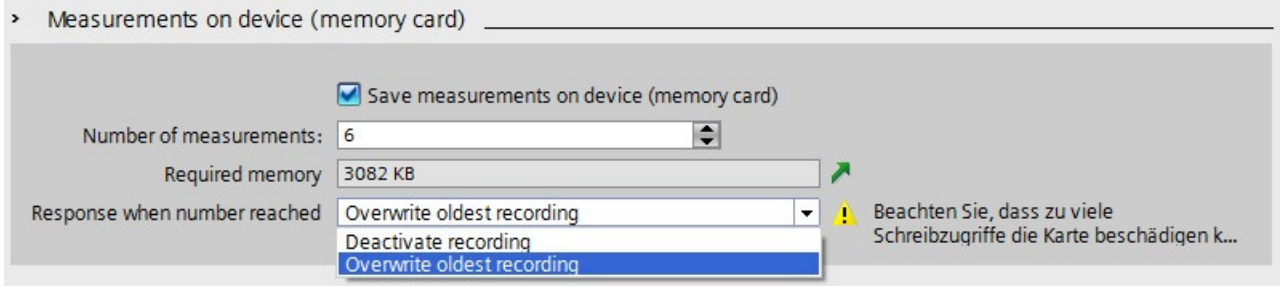

Figure 3-50 Dialog of settings for storing measurements on the memory card in STEP 7

Number of measurements

The CPU supports a maximum of 999 measurements. While the CPU writes the trace recordings to the load memory of the memory card, it pauses monitoring of the trigger conditions for the trace job. Once the CPU has finished saving the trace recordings, it continues with the monitoring of the trigger conditions.

NOTICE
Required memory on the SIMATIC memory card Note that the "Save measurements on device (memory card)" function needs >1024 KB of free space on your SIMATIC memory card. This amount of required space is independent of the size of the SIMATIC memory card you are using. If this space is no longer available, the CPU stops storing measurements on the memory card and writes a corresponding entry to the diagnostic buffer. Therefore, ensure that there is enough space on the SIMATIC memory card before running the "Save measurements on device (memory card)" function. Delete trace recordings no longer required from the SIMATIC memory card.

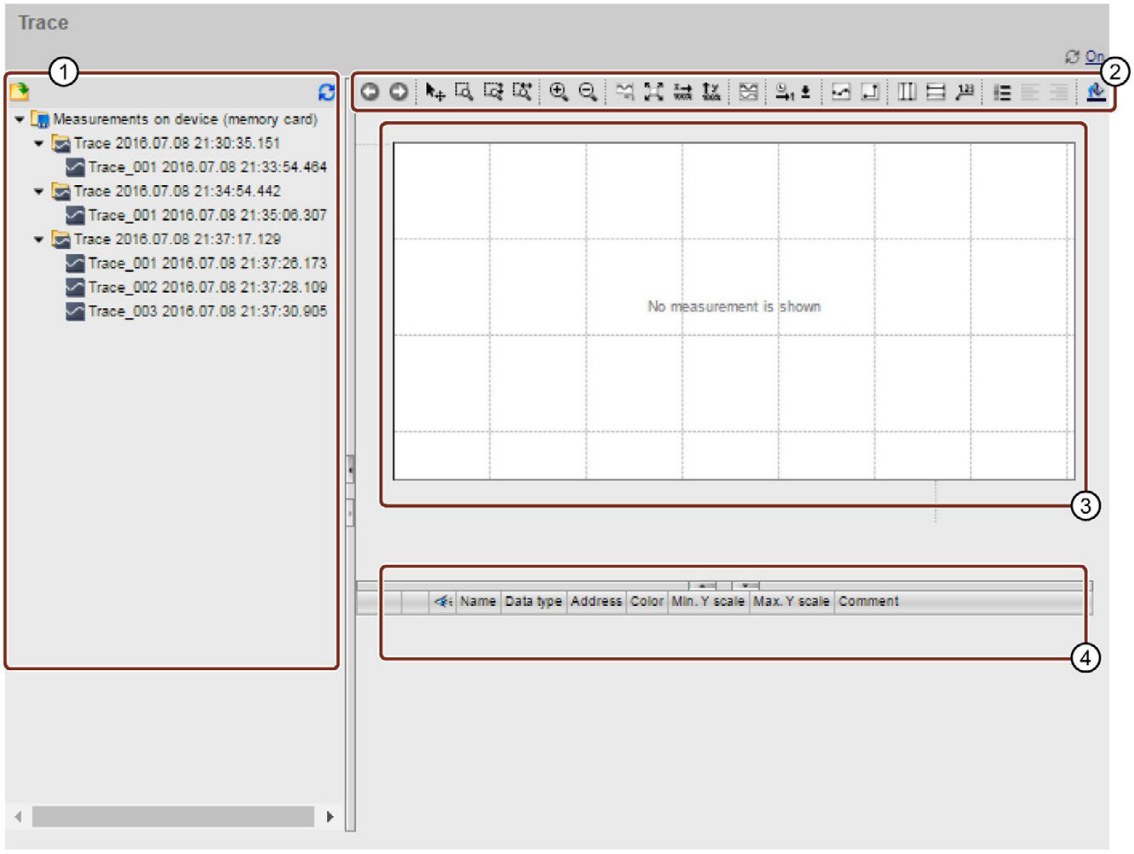
You can view the current values on the currently used space in the load memory in the "Memory" tab on the "Diagnostics" web page.

Additional information

The operation of the interface of the "Trace" web page largely corresponds to the operation of the trace function in STEP 7. See the Using the trace and logic analyzer function manual (https://support.industry.siemens.com/cs/ww/en/view/64897128) and the online help for STEP 7 for more on this.

Displaying the trace recordings

The web page of the trace and logic analyzer function consists of several areas. The example in the figure below shows how the Web server user interface is divided when the "Trace" web page is first called.



① Trace recordings
② Toolbar of the trend diagram
③ Trend diagram and bit track
④ Signal table

Figure 3-51 Trace start page without measurement

① Trace recordings

List of existing measurements, sorted by date and time of the trace recordings. A measurement always consists of a trace configuration with an associated recording.

The following table shows the special Web server shortcut menu commands in the Trace recordings area:

Table 3- 10 Web server shortcut menu commands in the trace recordings area

Shortcut menu command	Description
"Delete"	Deletes the selected measurement on the memory card of the CPU. A confirmation dialog opens. After deletion, the display in the trend diagram area is not automatically overwritten.
"Save as"	Saves the selected measurement in a csv file. The "Save as" dialog opens.
"Show chart"	Loads the selected measurement to the display area of the Web server.

1. Select a measurement and display it using the shortcut menu command "Show chart" or with a double click.

All signals of the measurement are displayed.

Some data types offer the display of individual bit tracks. You need to enable the individual bit tracks of the signal opened in the signal table using the icon.

You can adjust the display of the signals in the signal table and with the aid of the toolbar of the trend diagram.

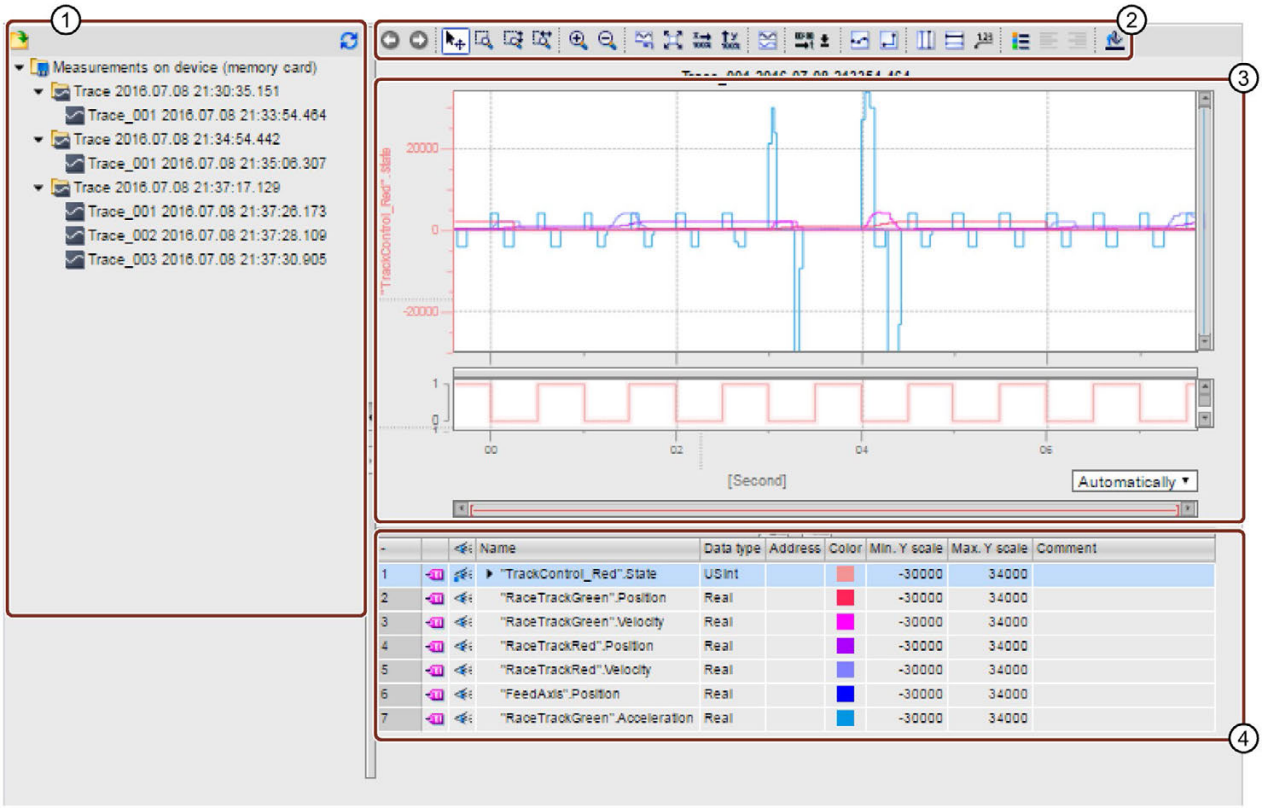


Figure 3-52 Trace measurement - All areas visible

You can increase or decrease the size of the three display areas:

- ① Trace recordings (you can minimize/maximize the area by clicking on the two small arrows)
- ② Toolbar of the trend diagram
- ③ Trend diagram and bit track (size can be changed)
- ④ Signal table (you can minimize/maximize the area by clicking on the two small arrows)

② Toolbar of the trend diagram

As in STEP 7, tools are available for adapting the display via buttons.

The following table shows the special Web server buttons in the trend diagram toolbar:

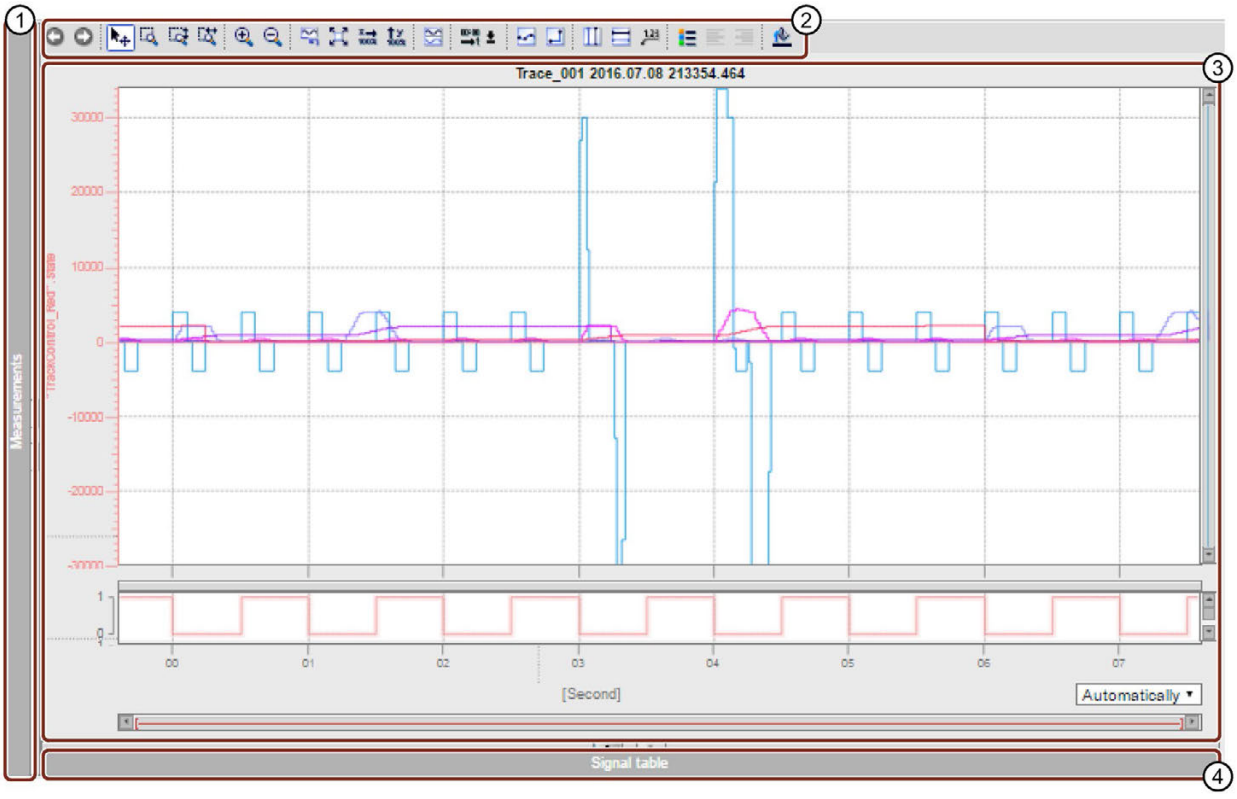
Table 3- 11 Web server symbols in the trend diagram toolbar

Symbol	Function	Description
	Move view	Moves the display with the mouse button pressed - corresponds to the symbol in STEP 7
	Restore standard view	Scaling and moves are canceled, the view is reset to the status at the time of loading of the measurement. (Hidden signals are also reset but remain disabled.)
	Display all	All signals are fully moved to the display area without changing the relative positions of the signals to each other.
	Scale X automatically	Automatic scaling of all visible signals in the horizontal X area
	Scale Y automatically	Automatic scaling of all visible signals of the current X area in vertical Y direction
/	Interpolation on/off	The data of the trend diagram is interpolated or not.
	Difference of the measurement cursor	Display of the difference of the horizontal and vertical measurement cursors and the Y values at the intersections with the vertical measurement cursors

All icons in the toolbar are equipped with tooltips.

③ Trend diagram

The trend diagram displays the selected signals of a recording. Bits are shown in the lower diagram as a bit track.



① Trace recordings (minimized)
② Toolbar of the trend diagram
③ Trend diagram and bit track
④ Signal table (minimized)

Figure 3-53 Trace measurement - only trend diagram visible

The following table shows the special Web server shortcut menu commands of a selected signal in the trend diagram:

Table 3- 12 Web server shortcut menu commands in the trend diagram area

Shortcut menu command	Description
"Scale Y automatically"	Automatic scaling of the selected signal in Y direction.
"Hide signal"	Hides the selected signal in the trend diagram.

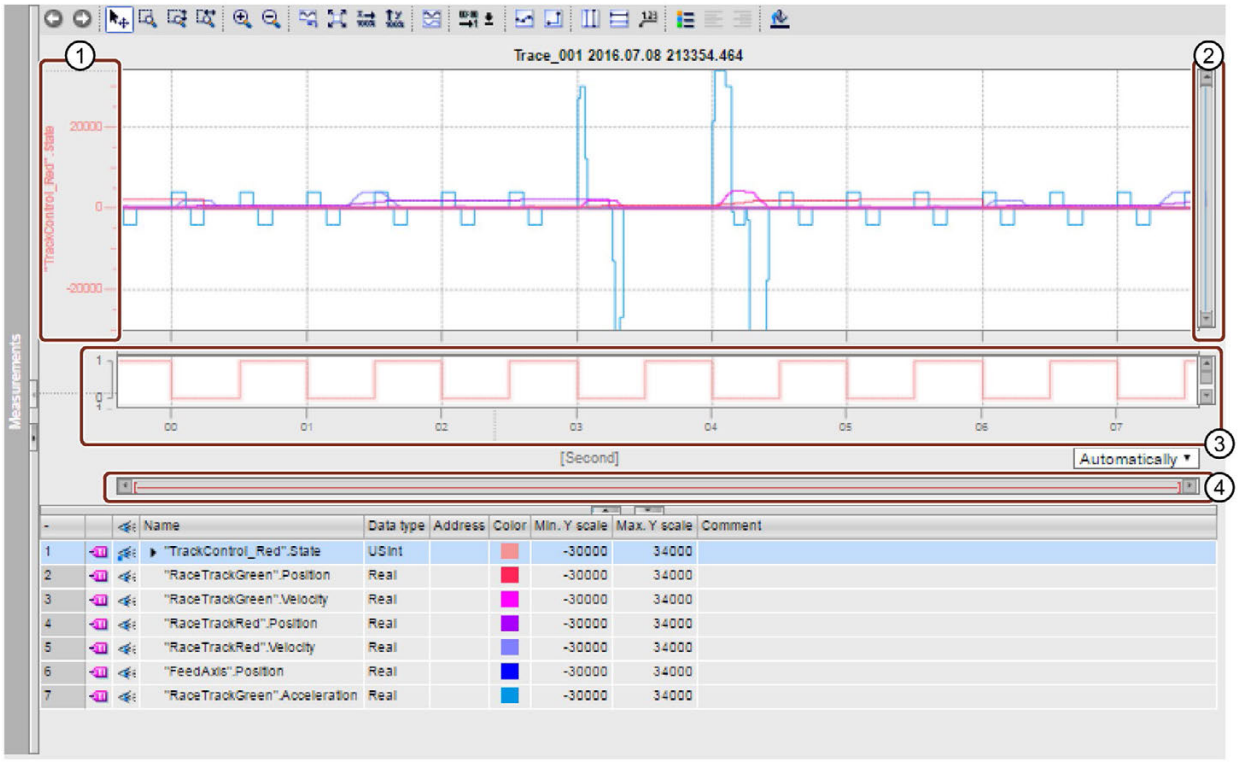
Use of the trend diagram

The display area can be zoomed as required. Measurement cursors can be used to select individual values for display in the signal table.

Table 3- 13 Measurement cursor symbols in the toolbar of the trend diagram

Symbol	Function	Description
	Vertical measurement cursor	Display of vertical measurement cursor The vertical position of the two measurement cursors can be moved with the mouse. The values of the signals and the difference between two measuring points are displayed in the signal table for all displayed signals and also in the trend diagram for the selected signal. The measuring point or the relative/absolute time to the measurement cursors is displayed depending on the set unit of the time axis in the movable pop-up window "Measuring points/Time values".
	Horizontal measurement cursor	Display of the horizontal measurement cursors The horizontal position of the two measurement cursors can be moved with the mouse. The Y values of the measurement cursor for the selected signal are displayed in the movable pop-up window "Y values".
	Unit switching of the time axis	Switching the unit of the time axis You can set the following units: • Measuring points • Time (relative time related to the trigger time) • Absolute time

The following image shows how you can change the display area of the trend diagram as required with rulers and scroll bars.



① Vertical ruler
② Vertical scroll bar
③ Horizontal ruler
④ Horizontal scroll bar

Figure 3-54 Trace measurement - rulers and scroll bars

Using the vertical ruler

- If you click the vertical ruler at the top or the bottom, you increase the size of the display at the top or bottom.
- If you click the vertical ruler at the top or the bottom while keeping the shift key pressed, you scale both ends.
- If you click the vertical ruler at the top or the bottom while keeping the Ctrl key pressed, you move the display up or down.

Using the horizontal ruler

- If you click the horizontal ruler on the left or the right, you increase the size of the display on the left or right.
- If you click the horizontal ruler on the left or right while keeping the shift key pressed, you scale both ends.
- If you click the horizontal ruler on the left or the right while keeping the Ctrl key pressed, you move the display to the left or right.

Using the mouse wheel

- If you activate the mouse wheel in the display, you move the display up or down.
- If you activate the mouse wheel in the display while keeping the shift key pressed, you move the display to the left or right.
- If you activate the mouse wheel in the display while keeping the Ctrl key pressed, you increase/reduce the size of the display at the position of the mouse pointer.

④ Signal table

The signal table lists the signals of the selected measurement and provides setting options for some properties.

Please note the different setting options between the Web server and STEP 7:

- More setting options for the color of the signal are available in the Web server than in STEP 7. For this purpose, click in the "Color" table column of a signal. The color selection dialog opens and you can select from several colors other than the TIA standard colors.
- Unlike in STEP 7, the "Signal group" table column for combining signals to form groups is **not** available in the Web server.

		Name	Data type	Address	Color	Min. Y scale	Max. Y scale	Y(t1)	Y(t2)	ΔY	Comment
1		"TrackControl_Red".State	USInt			-55	14	9	5	4	
1.0		"TrackControl_Red".State.Bit0	Boolean								
1.1		"TrackControl_Red".State.Bit1	Boolean								
1.2		"TrackControl_Red".State.Bit2	Boolean								
1.3		"TrackControl_Red".State.Bit3	Boolean								
1.4		"TrackControl_Red".State.Bit4	Boolean								
1.5		"TrackControl_Red".State.Bit5	Boolean								
1.6		"TrackControl_Red".State.Bit6	Boolean								
1.7		"TrackControl_Red".State.Bit7	Boolean								
2		"RaceTrackGreen".Position	Real			-13960	5352	138	2118	-1980	
3		"RaceTrackGreen".Velocity	Real			-22839	16304	378	378	0	
4		"RaceTrackRed".Position	Real			-8576	10736	1856	258	1598	
5		"RaceTrackRed".Velocity	Real			-11221	25609	2591	378	2212	
6		"FeedAxis".Position	Real			-89	448	18	18	0	
7		"RaceTrackGreen".Acceleration	Real			-44803	527382	4000	4000	0	

① Trace recordings (minimized)
② Toolbar of the trend diagram
③ Trend diagram and bit track (minimized)
④ Signal table

Figure 3-55 Trace measurement - only signal table visible

The following table shows the possible Web server shortcut menu commands in the signal table:

Table 3- 14 Web server shortcut menu commands in the signal table area

Shortcut menu command	Description
"Scale Y automatically"	Automatic scaling of the selected signal in Y direction.
"Show signal"	Shows the signal in the trend diagram.
"Hide signal"	Hides the signal in the trend diagram.
"Show all bits"	Displays all the bits of a signal.
"Hide all bits"	Hides all the bits of a signal.

3.17 Reading out service data

The Web server gives you the option to save service data. In addition to the content of the diagnostic buffer, they include additional information on the internal status of the CPU. If you should encounter a problem with the CPU that cannot be resolved otherwise, you therefore have the option to submit the service data to the Service&Support team.

Procedure

1. Enter the following address in the address bar of your web browser:
   "http://<CPU IP address>/save_service_data", e.g.,
   "http://192.168.3.141/save_service_data"
2. Your screen displays the service data page with a button for saving the service data.

3. Save the service data locally on your display device by clicking "Save ServiceData".

Result

The data is saved into a .dmp file with the following naming convention: "<MLFB><serial number><time stamp>.dmp". The user can change the file name at a later time.

Note

If you have defined your user page as the start page, observe the note on reading out service data in section Defining the user page as start page (Page 85).

3.18 Basic websites

Web pages with reduced contents

Basic websites are offered for display devices with smaller screens, for example HMI, on the Web server.
Basic websites are web pages with reduced content that are adapted to the requirements of small screens with low resolution.
These sites do not support JavaScript for the sake of fast access. This means that not all standard websites are available as basic websites. The basic website can also have fewer functions than the standard website.

The switch to basic websites takes place automatically for HMI devices.
You access basic websites from other end devices by entering the IP address of the configured and the extension "/basic" in the address bar of the Web browser, for example http://192.168.3.141/basic or https://192.168.3.141/basic.

The following standard websites are also available as basic websites:

- Start page (in Basic: "Status")
- Diagnostics (without the "Program protection", "Runtime information" and "Fail-safe" tabs)
- Diagnostics buffer
- Memory usage
- Module information
- Alarms (without acknowledgment option)
- Communication
- Tag status
- Watch tables
- User pages
- Filebrowser (read access only)
- DataLogs
- Intro

The basic websites are displayed as follows:

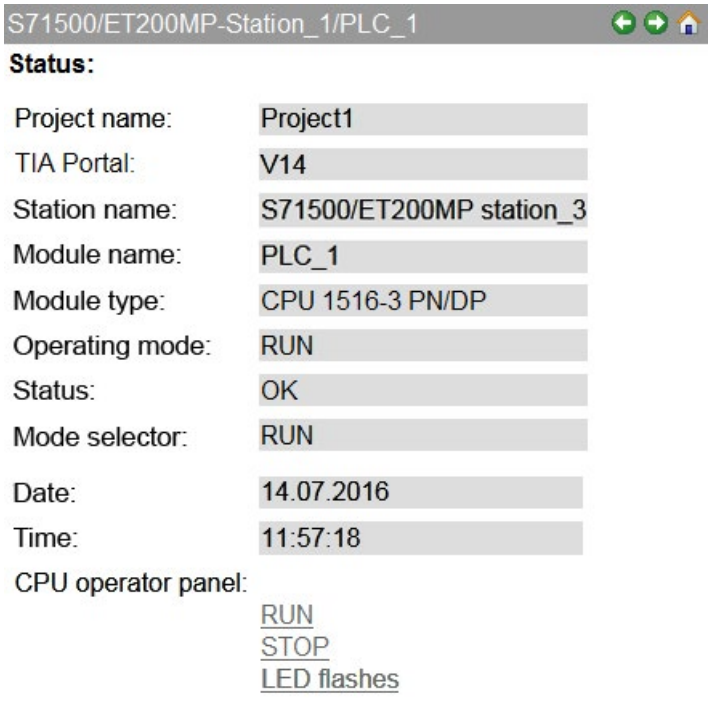


Figure 3-56 Example basic websites, "Status" web page

Glossary

Automation system

An automation system is a programmable logic controller that consists of at least one CPU, various input and output modules, as well as operating and monitoring devices.

AWP

Automation Web Programming

AWP commands

Special command syntax for data exchange between CPU and HTML file.

Configuration

Systematic arrangement of individual modules (design).

CSS

A CSS (Cascading Style Sheet) specifies how an area or content marked up in HTML is displayed.

Device

Device that can send, receive or amplify data via the bus, e.g., IO controller.

Diagnostics

The detection, localization, classification, visualization and further evaluation of errors, malfunction and alarms.

Diagnostics provides monitoring functions that run automatically during plant operation. This increases the availability of plants by reducing commissioning times and downtimes.

Firewall

A firewall is used to restrict the network access based on sender or target address of the used services. The firewall decides based on specified rules which of the network packets it handles are forwarded and which are not. This way the firewall tries to prevent unauthorized network access.

It is not the function of a firewall to detect attacks. It only implements rules for network communication.

HTTP

Hypertext Transfer Protocol (HTTP). Protocol for data transmission across a network.

HTTPS

Hypertext Transfer Protocol Secure (HTTPS). Protocol for tap-proof transmission of sensitive data across a network.

Identification data

Identification data is stored on a module, and contains information which supports the user in

- Checking the system configuration
- Locating hardware changes in a system
- Correcting errors in a system

Modules can be clearly identified online using the identification data.

Master

The master in possession of the token is an active device. This master has the option to receive data from other devices and to send data to other devices.

PROFIBUS

PROcess **FI**eld **BUS**, process and field bus standard specified in standard IEC 61784-1:2002 Ed1 CP 3/1. It specifies functional, electrical, and mechanical properties for a bit-serial field bus system.

PROFIBUS is available with the protocols DP (= Distributed I/O), FMS (= Fieldbus Message Specification), PA (= Process Automation), or TF (= Technological Functions).

PROFINET

Within the framework of Totally Integrated Automation (TIA), PROFINET represents the consistent continuation of:

- PROFIBUS DP, the established field bus
- Industrial Ethernet, the communications bus for the cell level

Experience gained from both systems was and is being integrated into PROFINET.

PROFINET as an Ethernet-based automation standard from PROFIBUS International (previously PROFIBUS User Organization) defines a vendor-independent communication, automation, and engineering model.

PROFINET component

A PROFINET component includes the entire data of the hardware configuration, the parameters of the modules, and the corresponding user program. The PROFINET component is made up as follows:

- Technological Function

  The (optional) technological (software) function includes the interface to other PROFINET components in the form of interconnectable inputs and outputs.

- Device

  The device is the representation of the physical programmable controller or field device including the I/O, sensors and actuators, mechanical parts, and the device firmware.

PROFINET IO

As part of PROFINET, PROFINET IO is a communication concept that is used to implement modular, distributed applications.

PROFINET IO allows you to create automation solutions which are familiar to you from PROFIBUS.

PROFINET IO is implemented by the PROFINET standard for automation devices on the one hand, and on the other hand by the engineering tool STEP 7.

That is, you have the same application view in STEP 7, regardless of whether you configure PROFINET or PROFIBUS devices. Programming your user program is essentially the same for PROFINET IO and PROFIBUS DP if you use the extended blocks and system status lists for PROFINET IO.

PROFINET IO controller

Device used to address connected I/O devices. This means that the IO controller exchanges input and output signals with assigned field devices. The IO controller is often the controller on which the automation program runs.

PROFINET IO device

A distributed field device that is assigned to one of the IO controllers (e.g., remote IO, valve terminals, frequency converters, switches).

URL

Uniform Resource Locator (URL). Identifies and localizes a source, such as a web page, uniquely via the method of access used and the location of the source in computer networks.

UTF-8

Abbreviation for 8-bit UCS (Universal Character Set) transformation format. Most popular coding of Unicode characters.

Each Unicode character is assigned a specially coded byte string of variable length in this format. UTF-8 supports up to four bytes on which all Unicode characters can be mapped.

Web browser

Web browsers are visualization programs for web pages and can communicate with Web servers.

Typical web browsers are, for example:

- Microsoft Internet Explorer
- Mozilla Firefox

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual describes the simulation software, S7-PLCSIM Advanced V1.0. It enables you to test your CPU programs on a simulated, virtual S7-1500 controller.

You can obtain updates to the function manual as downloads on the Internet (https://support.industry.siemens.com/cs/us/en/view/109739154).

Scope

This function manual is valid for the following order versions

- 6ES7823-1FA00-0YA5 - S7-PLCSIM Advanced V1.0 DVD
- 6ES7823-1FE00-0YA5 - S7-PLCSIM Advanced V1.0 Download

The articles each contain one license for one instance.

Basic knowledge required

The system may only be used by qualified staff.
The following knowledge is required:

- Industrial Automation and Automation Technology
- Programming with STEP 7 (TIA Portal)
- SIMATIC CPUs and CPU programming
- PC-based automation using S7-1500 and WinCC Runtime Advanced
- Development of software in C++ and C#
- PC technology
- Windows operating system

Conventions

Conventions STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

We also use abbreviate SIMATIC S7-PLCSIM Advanced V1.0 as "PLCSIM Advanced".

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Guide

1

1.1 Documentation Guide S7 PLCSIM Advanced

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200SP systems. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500 (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500 (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (https://support.industry.siemens.com/My/ww/en/).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

The TIA Selection Tool can be used to select, configure and order devices for Totally Integrated Automation (TIA). It assembles the configuration editors for automation technology already familiar into a single tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

1.2 S7 PLCSIM products

S7 PLCSIM Advanced

The version of S7-PLCSIM Advanced supports the following SIMATIC CPU series:

- S7-1500, S7-1500F, S7-1500C, S7-1500T and S7-1500TF
- ET 200SP and ET 200SP F

Communication

S7-PLCSIM Advanced supports communication via Softbus or TCP/IP.

S7 PLCSIM Advanced enables C++ and C# programs and simulation software to access SIMATIC CPU series supported by S7-PLCSIM Advanced via the user interface (API).

S7-PLCSIM Advanced and S7-PLCSIM V12 cannot be installed on the same PC or the same virtual machine. The communication between the two applications cannot be simulated.

S7-PLCSIM V5.4 SP7 is automatically installed with S7-PLCSIM Advanced. The communication between the two applications can be simulated.

S7-PLCSIM V14

The version of S7-PLCSIM supports the following SIMATIC CPU series:

- S7-1200 and S7-1200F
- S7-1500, S7-1500F, S7-1500C, S7-1500T and S7-1500TF
- ET 200SP and ET 200SP F

Communication

S7-PLCSIM V14 supports communication via Softbus.

S7-PLCSIM V5.x

S7-PLCSIM V5.x simulates the following SIMATIC CPU series:

- S7-300 and S7-300F
- S7-400 and S7-400F

S7-PLCSIM V5.x cannot be installed on the same PC or the same virtual machine S7-PLCSIM as of V12.

S7-PLCSIM V5.4 SP7 is automatically installed with S7-PLCSIM Advanced.

Communication

S7 PLCSIM V5.x can communicate via Softbus with instances of S7-PLCSIM as of V12.

S7-PLCSIM V5.4 SP7 can communicate via Softbus with instances of S7-PLCSIM Advanced.

Product overview

2

2.1 What is PLCSIM Advanced?

Simulation systems support the development of programs and the deployment in production that follows. In the automation world, a simulated test environment shortens commissioning times. It is possible to test the program after program changes in the virtual controller before it is loaded into the corresponding real controller and the plant is put into operation.

S7 PLCSIM Advanced

Using S7-PLCSIM Advanced, you can simulate your CPU programs on a virtual controller. You do not need a real controller for this. You can configure your CPU in STEP 7 V14, program your application logic and then load the hardware configuration and the program into the virtual controller. From there you can run your program logic, observe the effects of simulated inputs and outputs and adapt your programs.

In addition to communicating via Softbus, S7-PLCSIM Advanced provides a full Ethernet connection and can thus also communicate distributed.

User interface (API)

S7 PLCSIM Advanced enables interaction with native C++/C# programs or software via the user interface.

Application areas

- Software in the Loop-Simulation for virtual commissioning of machine tools
- In combination with third-party software:
  - Simulation of production machines and plants
  - Combined simulation of automation and mechanics

Advantages

The use of S7 PLCSIM Advanced offers numerous advantages:

- Improve quality of automation projects
- Accelerate time to market
- Reduce production times
- Reduce risk for commissioning
- Avoid costs for hardware in simulation environments
- Increase efficiency in maintenance

2.2 Security for PLCSIM Advanced

Restrictions for security

Note the following restrictions when using PLCSIM Advanced:

Authentication

- The user interfaces (API) do not have options for authentication and authorization. There is no protection using user accounts and passwords.
- The Runtime Manager communication is not protected by authentication.

Communication

- The multi-computer simulation communication is not encrypted.
- A TCP/IP port is opened on the PC for cross-network communication.
- The installed WinPCap component provides access to TCP/IP network communication.

Note

For cross-computer communication, it is recommended to use a closed simulation network that is not connected to a production network.

Know-how protection

Note

If know-how-protected blocks for the simulation support are enabled, the know-how protection is limited.

2.3 Simulations support

Requirement for simulation

Note

Enable simulation capability

To use a STEP 7 project with simulation, you must select the "Support simulation during block compilation" option in the "Protection" tab in the project properties.

Figure 2-1 Enable simulation capability

Know-how protection

If a know-how-protected block is to be used for the simulation, it must be unlocked by entering a password, to enable the "Simulation with SIMATIC S7-PLCSIM Advanced" option to be unlocked in the properties of the block in the tab "General > Compilation".

Global libraries

You cannot use know-how protection with global libraries, because the libraries are write-protected.

The "Simulation with SIMATIC S7-PLCSIM Advanced" option must be set when generating the blocks (source of the blocks).

2.4 Supported CPUs

Supported CPUs from the S7-1500 family

S7-PLCSIM Advanced V1.0 supports the simulation of the following CPUs (all firmware versions, V2.0 recommended):

Type		Article number
Standard CPUs	CPU 1511-1 PN	6ES7511-1AK01-0AB0
	CPU 1513-1 PN	6ES7513-1AL01-0AB0
	CPU 1515-2 PN	6ES7515-2AM01-0AB0
	CPU 1516-3 PN/DP	6ES7516-3AN01-0AB0
	CPU 1517-3 PN/DP[3]	6ES7517-3AP00-0AB0
	CPU 1518-4 PN/DP[3]	6ES7518-4AP00-0AB0
	CPU 1518-4 PN/DP ODK[2, 3]	6ES7518-4AP00-3AB0
Fail-safe CPUs	CPU 1511F-1 PN	6ES7511-1FK01-0AB0
	CPU 1513F-1 PN	6ES7513-1FL01-0AB0
	CPU 1515F-2 PN	6ES7515-2FM01-0AB0
	CPU 1516F-3 PN/DP	6ES7516-3FN01-0AB0
	CPU 1517F-3 PN/DP[3]	6ES7517-3FP00-0AB0
	CPU 1518F-4 PN/DP[3]	6ES7518-4FP00-0AB0
	CPU 1518F-4 PN/DP ODK[2, 3]	6ES7518-4FP00-3AB0
Compact CPUs[1]	CPU 1511C-1 PN	6ES7511-1CK00-0AB0
	CPU 1512C-1 PN	6ES7512-1CK00-0AB0
ET 200SP CPUs	CPU 1510SP-1 PN	6ES7510-1DJ01-0AB0
	CPU 1510SP F-1 PN	6ES7512-1SJ01-0AB0
	CPU 1512SP-1 PN	6ES7512-1DK01-0AB0
	CPU 1512SP F-1 PN	6ES7512-1SK01-0AB0
Technology CPUs	CPU 1511T-1 PN	6ES7511-1TK01-0AB0
	CPU 1515T-2 PN	6ES7515-2TM01-0AB0
	CPU 1517T-3 PN/DP[3, 4]	6ES7517-3TP00-0AB0
	CPU 1517TF-3 PN/DP[3, 4]	6ES7517-3UP00-0AB0

1 The on-board I/O within the compact CPUs is not simulated. The simulation interface corresponds to the process image.

2 The ODK functionality of this CPU is not simulated.

3 The simulation of this CPU only supports 5120 Motion Control resources.

4 The simulation of this CPU supports only 64 cams.

Unsupported CPUs

S7-PLCSIM Advanced V1.0 does not support the simulation of the following CPUs:

- S7-1200 CPUs
- ET 200pro, ET 200pro F CPUs
- ET 200SP Open Controller CPU 1515SP PC
- Software Controller

2.5 Differences between a simulated and a real CPU

The virtual controller cannot fully simulate a real CPU down to the individual details. Even if a program is downloaded without errors to the CPU and running successfully, this does not necessarily mean that the virtual controller in the simulation behaves exactly like a real CPU.

Deterministic

S7-PLCSIM Advanced runs on a PC with the Windows operating system. Therefore, the scan cycle time and the exact time of actions in S7-PLCSIM Advanced are not the same as when these actions run on physical hardware. This is because that several programs share the processing resources on your PC.

If your program depends heavily on the time required to execute actions, then make sure that you do not evaluate your program based only on the results of the simulation time.

Know-how protection

Projects with know-how protected blocks can only be simulated when they are enabled for simulation. You need the block password for this purpose.

Instructions

Instructions are simulated with a few exceptions, for example, interrupts. Programs that are based on the instructions behave different than real CPUs in the simulation.

See also

Restrictions for instructions (Page 306)

2.5.1 Restrictions for all supported CPUs

I/O

S7-PLCSIM Advanced simulates the real CPU, but not configured I/O modules and the on-board I/O of the compact CPUs.

Bus systems

S7-PLCSIM Advanced does not simulate bus systems (PROFINET IO, PROFIBUS DP, backplane bus).

Process image partitions

S7-PLCSIM Advanced always updates the address areas of the process image at the cycle control point. Process image partitions between two cycle control points are not updated.

Diagnostics

S7-PLCSIM Advanced cannot simulate the complete range of all the possible diagnostic buffer entries, for example, no entries that affect the real hardware. Most I/O and program errors are simulated.

Online and diagnostic functions

Some online and diagnostic functions are not very useful in the simulation and are therefore not supported. These include, for example, the functions "Format memory card" and "Firmware update".

Status indicators LED flashing

In STEP 7, you can have the LED displayed on an CPU flash using the "Extended download to device" dialog. S7-PLCSIM Advanced does not simulate this function.

Data logging

S7-PLCSIM Advanced does not simulated data logging, because this function writes all output to the SD memory card and S7-PLCSIM Advanced does not support the use of an SD memory card.

Recipes

S7-PLCSIM Advanced does not simulate the use of recipes.

Backup and Restore

S7-PLCSIM Advanced does not simulate the product property "Backup and Restore".

Limited support

S7-PLCSIM Advanced simulates some functions to a limited extent. You can find an overview in the section Restrictions (Page 302).

2.6 Simulating Motion Control

Restrictions

PLCSIM Advanced supports STEP 7 projects with configurations and functions for motion control for the CPUs S7-1500, S7-1500F, S7-1500C, S7-1500T, S7-1500T F, ET 200SP and ET 200SP F.

PLCSIM Advanced provides only limited support for technology objects in some CPUs, see Restrictions with Motion Control (Page 307).

Simulation with external simulation software

In a virtual S7-1500 controller, the technology objects are connected to the process image. Simulation software can thus access the process image via the user interfaces (API) of S7-PLCSIM Advanced and simulate the behavior of the other connected axes.

Simulation mode in STEP 7

The simulation mode is a standard function of the technology objects.

If you want to move an axis in simulation mode, select the "Activate simulation" check box in STEP 7 under "Technology Object > Configuration> Basic Parameters > Simulation". No additional setting is required for a virtual axis.

Feedback of the axis position

The speed setpoint of the simulated drive is integrated into the actual position value with a time delay (PT1). The result of this calculation is returned to the technology object as position actual value of the axis.

Reference point approach of the axis

If you selected "Use zero mark via PROFIdrive frame" in STEP 7 for the reference point approach, PLCSIM Advanced responds immediately to any active (mode 2, 3, 8) or passive (mode 4, 5) reference point approach command (MC_Home). The actual position is predefined as the reference point.

Additional information

Information on "Setting in the drive and encoder connection" for actual value calculation of a virtual axis and on the topic "Virtual axis/Simulation" is available in the S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326) function manual.

Installing

3

3.1 Introduction

3.1.1 System requirements

You need high-performance computer hardware if you intend to run multiple instances of PLCSIM Advanced at the same time or to simulate communication between PLCSIM Advanced V1.0 and HMI devices as of version 14.0.

Minimum requirements for hardware and software

Preferably, you should install PLCSIM Advanced on a stand-alone PC, independent of STEP 7. Alternatively, you can install PLCSIM Advanced on the configuration PC on which STEP 7 is already installed.

For PLCSIM Advanced to operate efficiently, the computer hardware and software must meet minimum requirements.

Table 3- 1 Minimum requirements for hardware and software

Hardware / software	Requirement
Processor	2.2 GHz Intel® Celeron® Dual Core
RAM	• 4 GB for one instance • 8 GB for 4 instances
Free hard disk space	5 GB
Operating system 64-bit version	• Windows 7 Home Premium SP1 • Windows 7 Professional SP1 • Windows 7 Enterprise SP1 • Windows 7 Ultimate SP1 • Windows Server 2012 R2 StdE (full installation)
Screen resolution	1024 x 768

Note

Make sure that the Windows operating system you are using is up to date.

Virtualization platforms

You can install STEP 7 and PLCSIM Advanced on a virtual machine. For this purpose, use one of the following virtualization platforms in the specified version or a newer version:

- VMware vSphere Hypervisor (ESXi) 6.0
- VMware Workstation 12 Pro
- VMware Workstation Player 12
- Microsoft Windows Server 2012 R2 Hyper-V

Guest operating systems

You can use the following guest operating systems on the selected virtualization platform for the installation of STEP 7 V14 and PLCSIM Advanced:

- Windows 7 Professional SP1 / Ultimate SP1 / Enterprise SP1 (64-Bit)
- Windows Server 2012 R2 (64-Bit)

3.1.2 Licenses

Floating license

S7 PLCSIM Advanced is supplied with a floating type license. These can be stored locally and shared for a network.

Note

A floating license is valid for **one** instance of a virtual controller within a PLCSIM Advanced installation.

Handling licenses

You can learn how to handle the licenses for S7 PLCSIM Advanced instances on the DVD in the description of the SIMATIC Automation License Manager (ALM).

API functions for licenses

- Return values for API function PowerOn() (Page 127) and callback function OnOperatingStateChanged (Page 228)
  - `SREC_OK` when a license is available.
  - `SREC_WARNING_TRIAL_MODE_ACTIVE` when no license is available, and an instance is started in a mode that allows unrestricted use of the instance for one hour.
- Return value for callback function `OnOperatingStateChanged`
  - `SREC_LICENSE_NOT_FOUND` when the instance is automatically shut down after expiration of the Trial mode.

Warning in spite of existing license

Note

A check is made for the presence of a license at power-up and after one hour during which you can test an instance without restriction (Trial Mode). When you import a license in the meantime, `SREC_WARNING_TRIAL_MODE_ACTIVE` is returned nevertheless.

3.1.3 Installation log

The log files contains automatically recorded information on the following installation processes:

- Installation of S7-PLCSIM Advanced
- Change or update of installation of S7-PLCSIM Advanced
- Repair of an existing installation of S7-PLCSIM Advanced
- Uninstallation of S7-PLCSIM Advanced

You can evaluate installation errors and warnings using the log files. You can troubleshoot the installation yourself or contact Siemens Technical Support. Product Support personnel need information from the installation log to analyze the problem. Send the folder with the log files as a ZIP file to Support.

Memory location of the installation log

The memory location of the log file depends on the operating system. To open the folder with the log files, enter the environment variable "%autinstlog%" in the address bar in Windows Explorer. Alternatively, you reach the appropriate directory by entering "cd %autinstlog%" in the command line.

The log files are named as follows:

- SIA_S7-PLCSIM_Advanced_V01@<DATE_TIME>.log
- SIA_S7-PLCSIM_Advanced_V01@<DATE_TIME>_summary.log

Setup_Report (CAB file)

An archive file with the installation log and all other required files is stored in CAB format. This archive file can be found at "%autinstlog%\Reports\Setup_report.cab".

If you need help during installation, send this CAB file to SIEMENS Technical Support. Technical Support personnel can troubleshoot your installation based on the information in the CAB file.

A separate CAB file with a date ID is saved for each installation.

3.2 Installation medium

After installing S7-PLCSIM Advanced, keep the installation medium in a secure, easily accessible place.

You can use the installation medium to change, repair or uninstall, if necessary.

3.3 Installing PLCSIM Advanced

S7-PLCSIM Advanced starts the installation automatically when you insert the installation medium in your DVD drive.

Installation requirements

Make sure that the following conditions are met before you begin the installation process:

- The hardware and software of the PC or Siemens Field PG meet the system requirements.
- The person who performs the installation has administrator rights on the respective computer.
- No other programs are active. This also applies to the Siemens Automation License Manager and other Siemens applications.
- All S7-PLCSIM versions V12 and higher are uninstalled.

Note

Security settings

For licensing via the ALM, when installing PLCSIM Advanced you must agree that port 4410 for TCP can be entered as an exception in the Windows Firewall (procedure step 7).

Installing S7-PLCSIM Advanced

To install PLCSIM Advanced, follow these steps:

1. Insert the installation medium into the DVD drive of your computer. The setup program is automatically started, provided you have not deactivated the Autostart function on the Field PG or PC. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file. The "General settings" window is displayed.
2. The check box for the English is selected.
3. Click the "Read installation notes" button to display installation information. After you have read the notes, close the file.
4. Click the "Read Product Information" button to display the "Readme file". After you have read the information, close the file.
5. Click the "Browse" button if you want to change the default installation path. The installation path must not exceed 89 characters. The path name must not contain any UNICODE characters. If you select a different installation path than the default installation path, the desktop icon may not be displayed correctly.
6. Click "Next". The window with the security settings is displayed. To continue the installation, select the check box at the bottom of the screen to accept changes to the security and permissions settings of your system.
7. Click "Next". The window with the installation settings is displayed. You can save or print a report of the settings by clicking "Save report" or "Print report". Check the settings for correctness. If you want to make any changes, click "Back" until you reach the point in the installation process where you want to make changes. Once you have completed your changes, click "Next".
8. Your installation details are displayed in the overview screen. Click the "Install" button. The installation is then started and PLCSIM Advanced is installed on your computer.
9. After completion of the setup program, you must restart your computer. Select "Yes, I want to restart the computer now" to restart the computer immediately or select "No, I will restart computer later" to restart the computer later.
10. Click "Restart". If the computer is not restarted, click "Finish".

Error during installation of S7-PLCSIM Advanced

When S7-PLCSIM Advanced is installed, any existing installation of S7-PLCSIM is displayed.

A requirement for installation of S7-PLCSIM Advanced is that no other S7-PLCSIM installation is located on the same computer.

Even though no installation of S7-PLCSIM is displayed in the "Programs and Features" list, it is still possible that the computer has an existing installation.

Remedy

Run the setup for S7-PLCSIM V12 or V12 SP1 and uninstall the program.

When the setup is not available, download the setup files for S7-PLCSIM via Siemens Mall (https://support.industry.siemens.com/cs/document/65601780).

3.4 Changing PLCSIM Advanced

Requirements for changing the installation

The following conditions must be met before you can start changing the installation:

- The hardware and software of the computer meet the system requirements.
- You have administrator rights on the installation computer.
- No other programs are active.

Procedure for changing the installation

To change your PLCSIM Advanced installation, follow these steps:

1. Insert the installation medium into the drive. The setup program starts up automatically, provided you have not deactivated the Autostart function on the Field PG or PC.
   If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
2. Follow the prompts until you reach the "Configuration" window.
3. Select the "Change upgrade" check box.
4. Follow the remaining prompts to change your installation.
5. Complete the installation operation by restarting your computer.

Note

Target directory

You cannot change the target directory because you are changing an existing installation.

3.5 Repairing PLCSIM Advanced

If your installation becomes damaged, you can repair it with the PLCSIM Advanced data storage medium.

Requirements for repairing the installation

The following conditions must be met before you can start repairing the installation:

- The hardware and software meet the system requirements.
- You have administrator rights on the installation computer.
- No other programs are active.

Procedure for repairing the installation

To repair your installation, follow these steps:

1. Insert the installation medium into the drive. The setup program is automatically started, provided you have not deactivated the Autostart function on the Field PG or PC. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.
2. Follow the prompts until you reach the "Configuration" window. Select the "Repair" check box.
3. Follow the remaining prompts to repair your installation.
4. Complete the repair operation by restarting your computer.

3.6 Uninstalling PLCSIM Advanced

You have two options for uninstalling S7-PLCSIM Advanced on your computer:

- You uninstall the program using the Windows Control Panel.
- You uninstall the full product using the installation medium.

Uninstalling PLCSIM Advanced using the Windows Control Panel

To uninstall PLCSIM Advanced using the Windows Control Panel, follow these steps:

1. Double-click the "Programs and Features" option in the Windows Control Panel.
2. Right-click on "Siemens S7-PLCSIM Advanced V1.0" and select "Uninstall".
3. Follow the prompts for uninstallation.
4. Complete the uninstallation operation by restarting your computer.

   If you do not perform a restart, the Runtime Manager continues running.

If problems occur when uninstalling PLCSIM Advanced using the Windows Control Panel, use the installation medium for uninstalling.

Uninstalling PLCSIM Advanced using the installation medium

To uninstall PLCSIM Advanced using the installation medium, follow these steps:

1. Insert the installation medium into the drive. The setup program is started automatically, provided you have not deactivated the Autostart function on the programming device or PC. If the setup program does not start up automatically, start it manually by double-clicking the "Start.exe" file.

   If you do not perform a restart, the Runtime Manager continues running.
2. Follow the prompts until you reach the "Configuration" window. Your previous installation is detected. Select the "Uninstall" check box.
3. Follow the prompts to uninstall PLCSIM Advanced.
4. Complete the uninstallation operation by restarting your computer.

   If you do not perform a restart, the Runtime Manager continues running.

Uninstalling additional software

When PLCSIM Advanced is uninstalled, the following software remains installed:

- Automation License Manager
- S7-PLCSIM V5.4
- .NET Framework
- WinPcap

If you also want to uninstall this software, use the Windows Control Panel.

Communication paths

4

Local and distributed communication

The following paths are open for communication between STEP 7 V14 and the instances of PLCSIM Advanced user interfaces:

Communication paths	Local	Local	Distributed
Protocol	Softbus	TCP/IP	TCP/IP
Communication interface in PLCSIM Advanced	PLCSIM	PLCSIM Virtual Ethernet Adapter	PLCSIM Virtual Ethernet Adapter
STEP 7 and instances	on a PC / VM	on a PC / VM	distributed
Communication...			
between STEP 7 and instances	Yes	Yes	Yes
among instances	Yes	Yes	Yes
possible via OPC UA server and Web server	No	Yes	Yes
between an instance and a real hardware CPU	No	No	Yes
between an instance and a real HMI V14	No	No	Yes
between an instance and a simulated HMI V14	Yes	Yes	No

Softbus

Softbus is a communication path via a virtual software interface.

The communication is limited to a local PC or a virtual machine. The advantage here is that no data can be accidentally downloaded to a hardware CPU or communicate with real hardware.

Select communication interface

You program the communication interface via the user interface (API) or select it in the Control Panel under "Online Access". The setting is valid for all generated instances. The default setting is the communication via "PLCSIM" (Softbus).

Additional network settings are necessary for the distributed communication via the "PLCSIM Virtual Ethernet Adapter" (TCP/IP).

API functions for selecting the communication interface

- GetCommunicationInterface() (Page 116)
- SetCommunicationInterface() (Page 116)
- CommunicationInterface { get; set; } (Page 117)

See also

Interfaces - Information and settings (Page 113)

S7 PLCSIM Advanced Control Panel (Page 46)

4.1 Local communication

Local communication can be performed via the Softbus protocol or TCP/IP.

For local communication, the PLCSIM Advanced instance is on the same PC or on the same virtualization platform (VMware) as STEP 7 or another communication partner.

Local communication via Softbus

For security reasons, the local communication is performed via Softbus in PLCSIM Advanced by default.

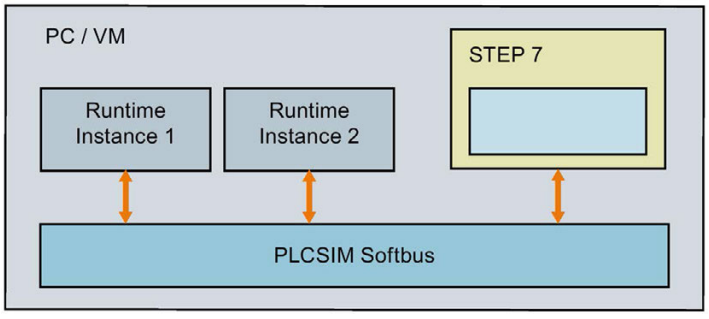

Figure 4-1 Local communication via Softbus

Local communication via TCP/IP

Communication is performed via the PLCSIM Virtual Ethernet Adapter, a virtual network interface that behaves like a real network interface.

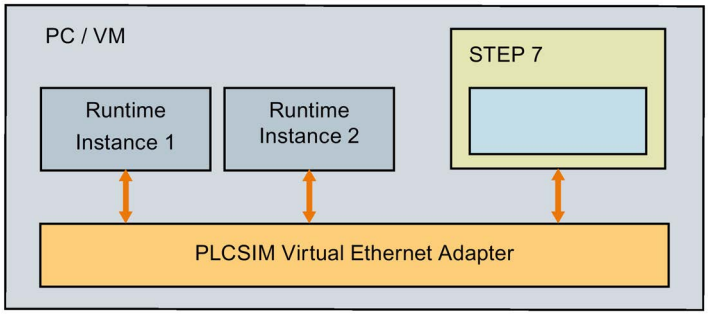

Figure 4-2 Local communication via TCP/IP

4.2 Communication via TCP / IP

Distributed communication

Distributed communication via TCP/IP means that the PLCSIM Advanced instances communicate with the other devices via the Virtual Switch . Communication is possible with real or simulated CPUs, real or simulated HMIs.

The PLCSIM Virtual Switch must be activated on the PLCSIM Virtual Ethernet Adapter for instances on the network to be visible.

Example 1: Distributed communication

In the following example, STEP 7 is on a PC and the PLCSIM Advanced instances are on another PC. The PCs are connected via the Ethernet adapter.

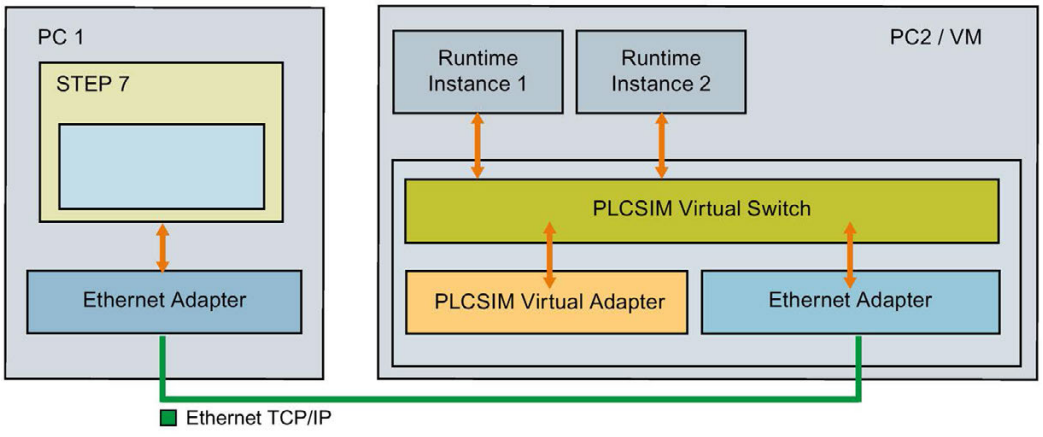

Figure 4-3 Distributed communication via Ethernet

Example 2: Distributed communication

In the following example, STEP 7 is on a PC and the PLCSIM Advanced instances are on a virtual machine on the same PC. PC and virtual machine are connected via the network adapters.

Recommendation

Use to ensure the VMware settings as the network adapter type for the Bridged Mode to ensure error-free operation.

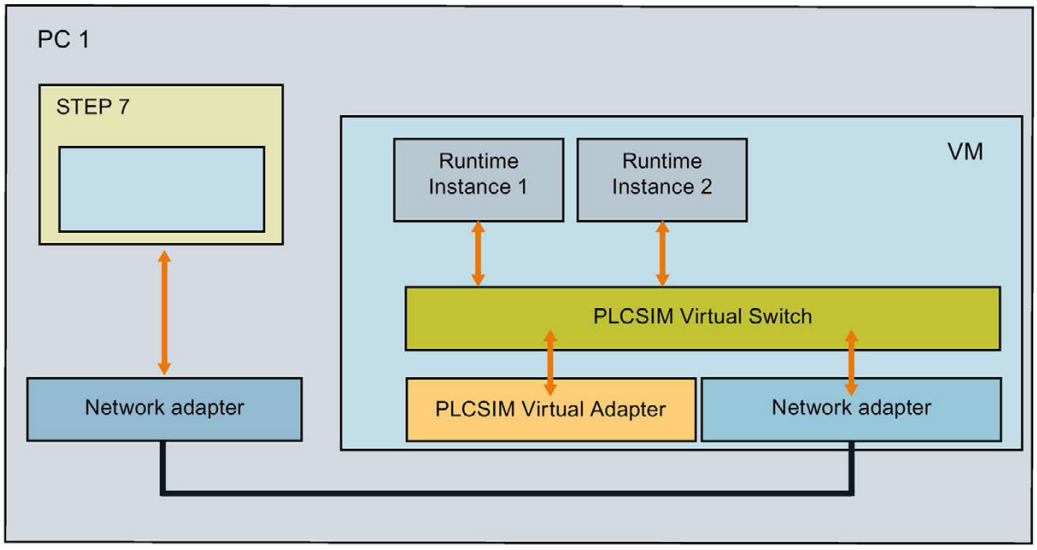

Figure 4-4 Distributed communication via network adapters

4.3 Enable distributed communication

By default, the PLCSIM Virtual Switch can only communicate locally. For a distributed, i.e. multi-computer, communication to be possible, you must activate the PLCSIM Virtual Switch for a real network adapter.

Note

Network adapter

Make sure that only one network adapter of the PLCSIM Virtual Switch is activated.

The Control Panel of PLCSIM Advanced checks the activation and may report an incorrect configuration (error code -50).

Activate PLCSIM Virtual Switch

To make the PLCSIM instances visible on the network and to reach other devices, activate the PLCSIM Virtual Switch in the Control Panel of PLCSIM Advanced or under Windows:

1. To do this, open the "Network and Sharing Center" in the Windows Control Panel.
2. Open the properties of the desired network adapter, for example, for the "Local Area Connection".
3. Select the check box for the "Siemens PLCSIM Virtual Switch" and confirm with OK.

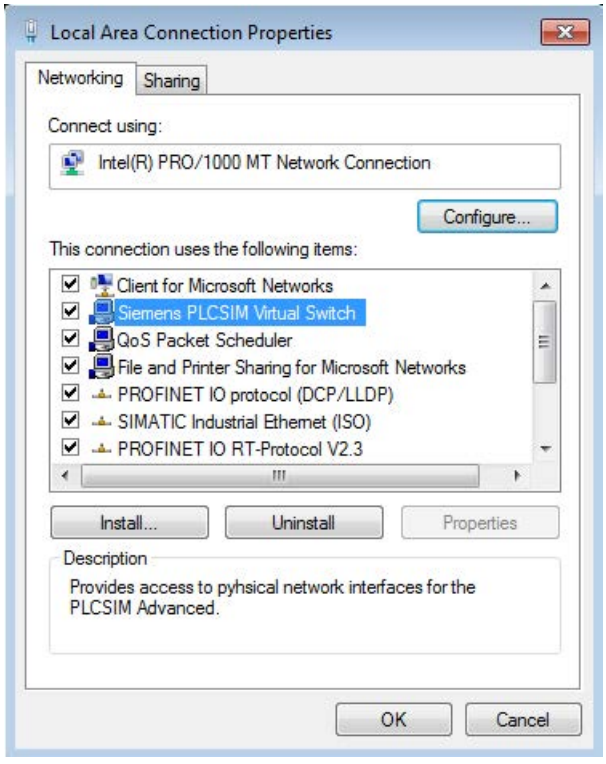

Figure 4-5 Activate PLCSIM Virtual Switch

Accessible devices

When the PLCSIM Virtual Switch is activated, STEP 7 shows the devices available on the Virtual Ethernet Adapter in the project tree.

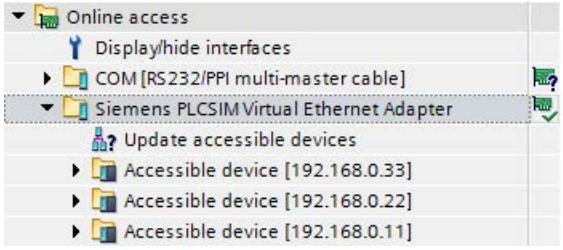

Figure 4-6 Accessible devices on the Virtual Ethernet Adapter

Simulate CPU 5

5.1 Basic procedure for the simulation

The following overview shows the basic steps to perform simulation with an instance of a virtual controller.

Requirements

The following requirements must be met for starting simulation via local communication:

- STEP 7 V14 and S7 PLCSIM V1.0 Advanced are installed on the same PC.
- The CPU hardware is configured in STEP 7.

Note

Enable simulation support

In the "Protection" tab in the properties of the project in STEP 7, select the check box "Support simulation during block compilation".

Create and activate an instance via the Control Panel

- Open PLCSIM Advanced Control Panel
- Open the "Start Virtual S7-1500 PLC" options
- Enter a name for an instance
- Select CPU type
- Create an instance using the "Start" button

In STEP 7, perform the download and start the simulation

- Download the program to the virtual controller
- Switch the controller to RUN to start the simulation
- Perform diagnostics
- ...

See also

Simulations support (Page 27)

5.2 User interface

5.2.1 S7 PLCSIM Advanced Symbol

After installing PLCSIM Advanced, the following icons are on the Windows desktop:

Figure 5-1 PLCSIM Advanced Symbol

After double-clicking the icon, the icon appears in the taskbar of the information area.

You can use Windows functions to permanently display the icon in the information area of the taskbar.

Opening a graphical interface

Right-clicking on the icon in the taskbar opens the graphical interface of PLCSIM Advanced, the Control Panel.

If the Control Panel is open, you can use the mouse-over function to display messages about the current status of the instances.

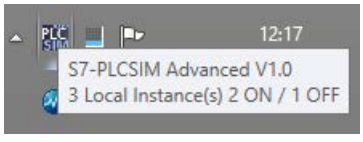

Figure 5-2 Example: Message in the taskbar

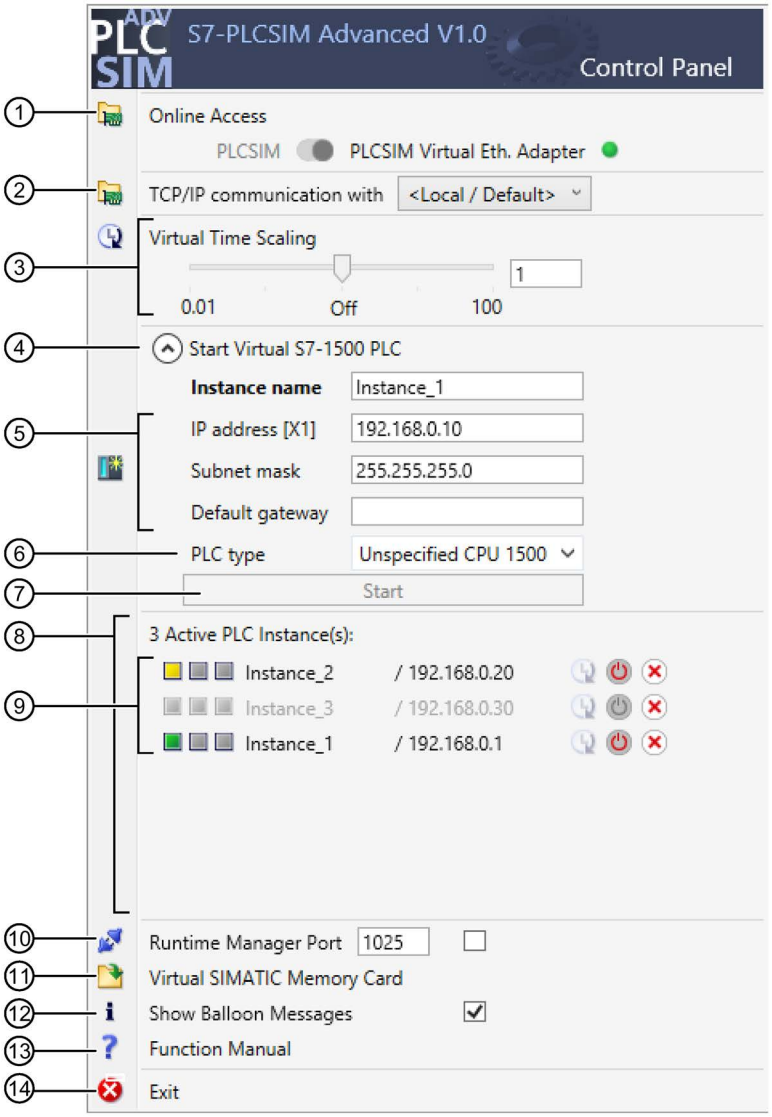
5.2.2 S7 PLCSIM Advanced Control Panel

Control Panel

The Control Panel is optional and is not needed to use PLCSIM Advanced via the API. It is available in English in version 1.0.



①	Online access	Switch to select the communication interface
②	TCP/IP communication	Selection of network adapter for distributed communication
③	Virtual time	Slider to adjust the scaling factor
④	**Start Virtual S7-1500 PLC**	
	Name of the instance	Here you enter a unique name for the instance. Enter a minimum of 3, a maximum of 64 characters. If the name is unique in the network, the "Start" button is enabled.
⑤	• IP address • Subnet mask • Standard gateway	The input boxes are visible when you switch the communication interface to "PLCSIM Virtual Ethernet Adapter".
⑥	CPU type	Here you select the type of CPU to be simulated.
⑦	"Start" button	Create with the button and start an instance with the entered name.
⑧	Instance list	The list shows the available **local** instances.
⑨	LED displays	The meaning of the LED is displayed when you move the mouse over it.

⑩	Runtime Manager Port	Here you open a port on the local PC.
⑪	Virtual SIMATIC Memory Card	Open an Explorer window here with the path to the virtual memory card.
⑫	Display messages	Here you disable the PLCSIM Advanced messages in the Windows task bar for the duration of the operation.
⑬	Function manual	This is where you open the S7 PLCSIM Advanced Function Manual in a standard PDF viewer.
⑭	Exit	Exit switches all instances off and closes the Control Panel.

Figure 5-3 Control Panel

Switch for communication interface

Use the switch to select the communication interface for all instances to be created:

- "PLCSIM corresponds to the local communication via Softbus (default).
- "PLCSIM Virtual Ethernet Adapter corresponds to the communication via TCP/IP.

The setting applies to all other instances. The selected communication interface for starting an instance is maintained until all instances are shut down.

When an instance is already started, it sets "its" communication interface as the default for other instances.

Change communication interface

To change the communication interface, switch off all instances and enable the other interface.

TCP/IP communication

You can select a real network adapter from the drop-down list during operation. You thus activate the PLCSIM Virtual Switch and establish TCP/IP communication between the instances and the real network.

The <Local> setting disables the PLCSIM Virtual Switch and disconnects the instances from the real network. Only local TCP/IP communication over virtual adapter is possible in this case.

Virtual time

Use the slider or the mouse wheel to select the scaling factor for the virtual time.

The selected scaling factor applies to the instances for which the virtual time is enabled.

Clicking on "Off" restores the default (1) again. For more information, seeVirtual time response (Page 58).

Create instance (local)

To create an instance, enter a unique name under "Instance Name". If the name already exists in the directory of the Virtual SIMATIC Memory Card, the existing instance is started.

In the "PLC-Type" drop-down list, select the Unspecified CPU 1500 or Unspecified ET 200SP CPU type. The CPU is named with the first download of the TIA Portal.

Recommendation: Create up to 4 local instances on your PC or visualization platform. Remote instances cannot be created through the Control Panel.

Instance list

The instance list contains the instances that are started locally on the PC or virtualization platform. Instances that have already been started on the runtime API are detected and displayed in the list.

The LED displays show the status of the instance that corresponds to those of the hardware CPU.
RUN and STOP are displayed depending on the current operating state of the instance.

You can "operate" the instance with icons:

Apply scaling factor for the virtual time, disable virtual time,

Switch on instance, Switch off instance,

Switch off instance and log out of the Runtime Manager

Runtime Manager Port

A remote connection can be established to another Runtime Manager via the specified port. The value must be greater than 1024.

If you select the check box, the port remains stored. You can use the remote connection without having to make this setting every time you start the Control Panel. To use this functionality, the Control Panel must be started and running in the background.

Virtual SIMATIC Memory Card

The user program, the hardware configuration and the retentive data are stored on the Virtual SIMATIC Memory Card. Click the link to open the directory.

Default path: ...\Documents\Siemens\Simatic\Simulation\Runtime\Persistence

Display messages

Each time the panel starts, help information and messages relating to the Control Panel are displayed, for example, when changing the IP address or when a license is missing. Disable the display if you do not need the messages.

Exit

- The command switches off all local instances on the PC or the VM and logs them off from the Runtime Manager.
- This command closes the Runtime Manager if there is no remote connections to other Runtime Managers.
- If the Runtime Manager has remote connections to instances on additional PCs, these instances and the Runtime Manager continue to run.

Minimize Control Panel

Clicking on an empty area on the desktop minimizes the Control Panel. The instances are not affected.

5.3 Download

Requirements

You can download the STEP 7 project to the virtual controller when the following conditions are met:

- The instance is created via the Control Panel.
- The check box "Support simulation during block compilation" is selected.

Select communication interface

In the Download dialog box, select the PG/PC interface:

- "PLCSIM" for download via Softbus
- "Siemens PLCSIM Virtual Ethernet Adapter" for download via TCP/IP

Display in the download dialog

The dialog in STEP 7 at the first download of the CPU shows the compatible PLCSIM Advanced instances.

If the instance has not yet been configured after the first download only **one** interface is visible and it appears with the device type "CPU-1500 Simulation".

If the instance has been configured, the number of interfaces visible is determined my the number the CPU type has.

The lifelist shows the interfaces of an instance with their IP addresses.

Perform download

1. Select the PG/PC interface.
2. Click "Download".

   → In the "Load preview" window, STEP 7 shows the message "The downloads are performed on a simulated CPU".

   → After the first download, the PLCSIM Advanced instance displays the CPU type.

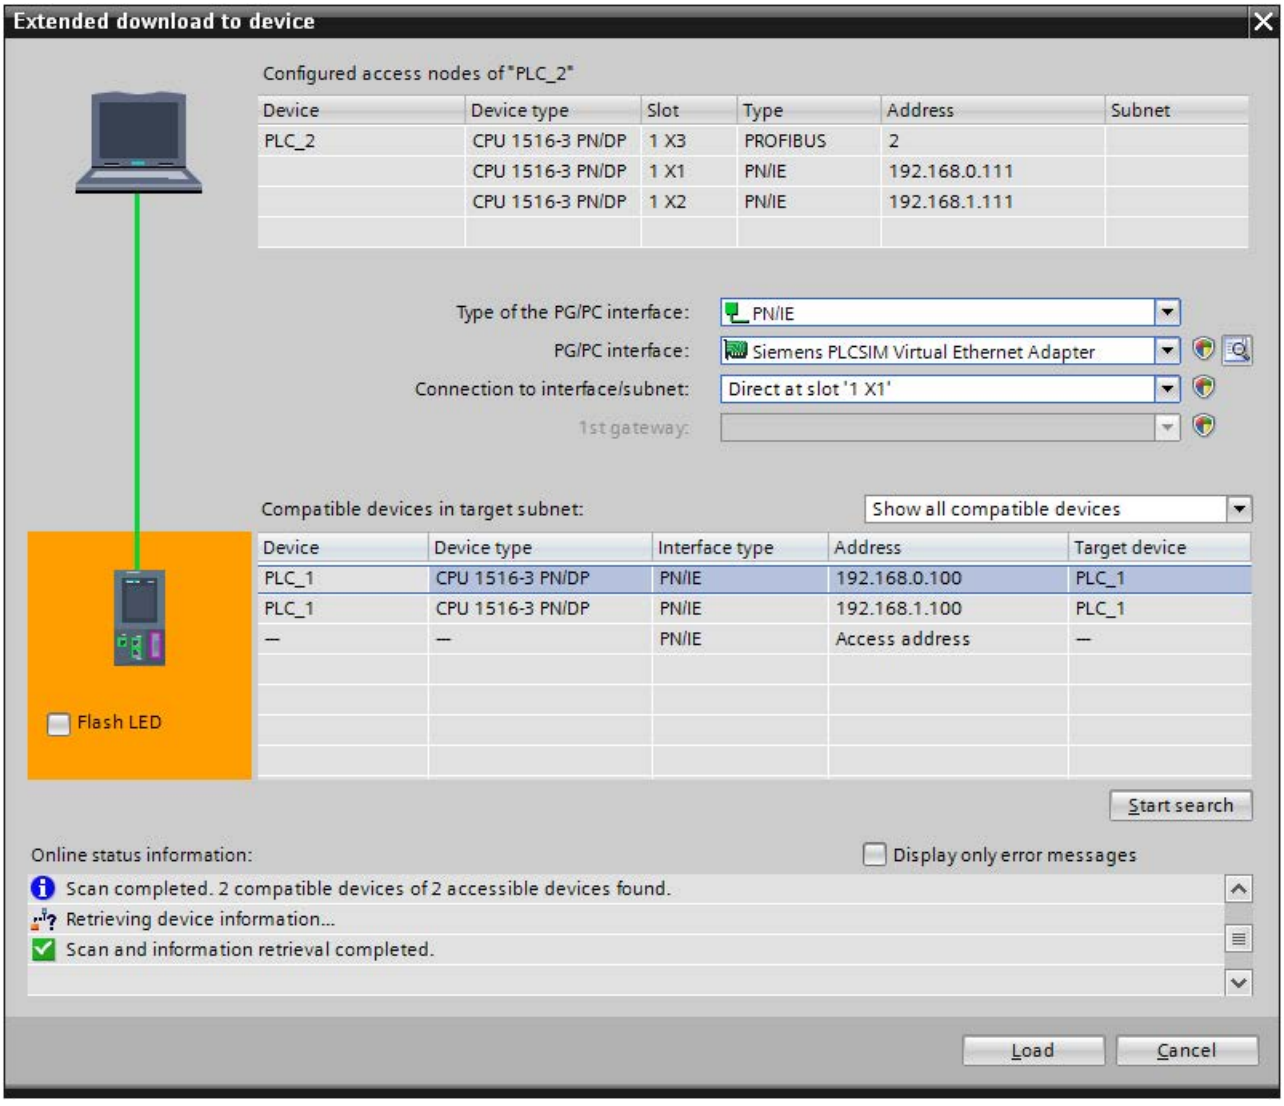


Figure 5-4 Example: Download via the "PLCSIM Virtual Ethernet Adapter" (TCP/IP) after naming

5.4 MAC address of the instances

Detect CPUs and instances

If Ethernet interfaces of CPUs and PLCSIM Advanced instances are mixed in a network, the instances can be recognized by the "PLCSIM" suffix on the station type.

Structure of the MAC address for an instance

The following figure shows the structure of the dynamically generated, locally managed MAC address:

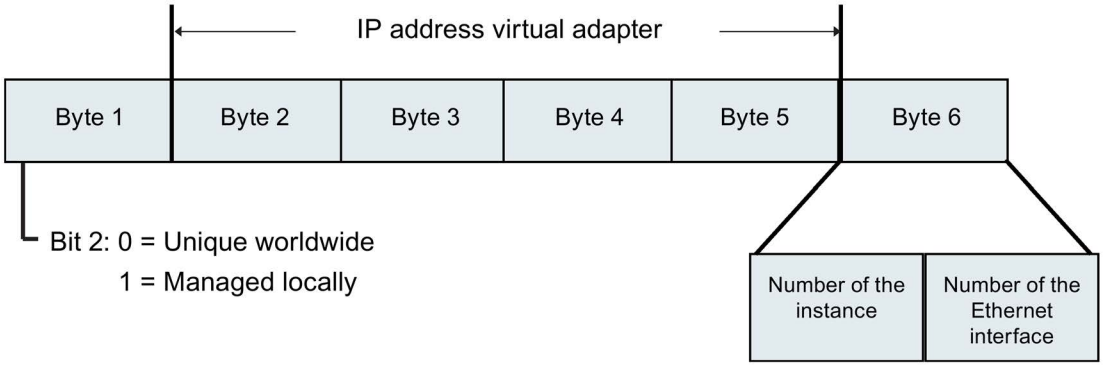

Figure 5-5 Structure of the MAC address for an instance

The MAC address tells you the PC on which a PLCSIM Advanced instance has been started.

Assignment of the Ethernet interfaces

Port configurations of the Ethernet interfaces cannot be simulated in PLCSIM Advanced V1.0. Topological interconnection is not supported. A MAC address for a port is reserved internally for each Ethernet interface.

Table 5- 1 Assignment of the Ethernet interfaces, for example, a CPU 1518-4 PN/DP

Ethernet interface	Last digit of the MAC Address
IE 1 IE 1 / Port 1	.....0 1
IE 2 IE 2 / Port 1	.....2 3
IE 3 IE 3 / Port 1	.....4 5

Example

02-C0-A8-00-83-10 means:

02 → locally managed MAC address of a PLCSIM Advanced instance

C0-A8-00-83 → IP of the Siemens PLCSIM Virtual Ethernet adapter = 192.168.0.131

1 → Instance 1

0 → Ethernet interface IE 1

If no Virtual SIMATIC Memory Card is loaded during startup of PLCSIM Advanced, the interfaces of PLCSIM Advanced display instances with their locally managed MAC address.

5.5 Simulate peripheral I/O

The Runtime API writes to and reads from a memory area. This memory is synchronized with the internal process image of the virtual S7-1500 controller at the cycle control point. The direct I/O accesses are made to this memory area. Only one process can access this memory at a given time.

The virtual controller must be in RUN to apply changes made by the API.

Note

Dominance of the API when synchronizing

The API dominates when synchronizing. If the user program writes to the same address range as the API, the changes of the API overwrite those of the virtual controller.

See also

Deviating I/O values in the STEP 7 user program (Page 310)

5.6 Simulate communication

5.6.1 Communication services that can be simulated

S7-PLCSIM Advanced V1.0 supports the following communication options:

Table 5- 2 Supported communication options

Communications options	Functionality / instructions
PG communication	On commissioning, testing, diagnostics
Open communication using TCP/IP	• TSEND_C / TRCV_C • TSEND / TRCV • TCON[1] • T_DISCON
Open communication using ISO-on-TCP	• TSEND_C / TRCV_C • TSEND / TRCV • TCON • T_DISCON
Open communication via UDP[2]	• TUSEND / TURCV • TCON • T_DISCON
Communication via Modbus TCP	• MB_CLIENT • MB_SERVER
E-mail[2]	• TMAIL_C
S7 communication	• PUT / GET • BSEND / BRCV • USEND / URCV
OPC UA Server[2]	Data exchange with OPC UA clients
Web server[2]	Data exchange via HTTP

[1] When the "PLCSIM" interface (Softbus) is set, communication is performed **internally** via ISO-on-TCP.

[2] Only via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP)

Special conditions apply when communicating with TUSEND/TURCV, see Restrictions for communications services (Page 305).

5.6.2 Communication between instances

PLCSIM Advanced supports communication between instances. An instance may be a simulation in PLCSIM Advanced V1.0 or a simulation in WinCC Runtime as of V14.

You can run two instances of PLCSIM Advanced, which then communicate with each other. To enable instances to communicate with each other, they must have a unique IP address.

Each simulated CPU requires a unique IP address

If the CPUs have the same IP address, you cannot run multiple simulations. Each simulated CPU requires a unique IP address.

Make sure that the IP addresses in STEP 7 are unique before you start your simulations.

T-block instructions and UDP

S7-PLCSIM Advanced simulates T-block connections for which the UDP protocol is configured only via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP).

T-block instructions and data segmentation

S7-PLCSIM Advanced implements T-block instructions with a data segmentation of 4 KB. A real CPU has data segmentation of 8192 bytes.

If you send more than 4 KB in a single TSEND instruction and receive data in ad hoc mode with a TRCV instruction, the TRCV instruction generates new data with only 4 KB. You must perform the TRCV instruction several times to receive additional bytes.

5.7 Provide project data offline for simulation

Simulations regardless of STEP 7

To perform simulations independent of STEP 7, you can save the user program and the hardware configuration in STEP 7 in a directory.

Provide project data offline

1. Create a "User-defined Card Reader" for your project data under Card Reader/USB storage in the project tree of STEP 7 for the CPU.
2. In the "Load preview" dialog for the target device, select "PLC Simulation Advanced" as an action, click in the selection field for this.
   → The project is saved to the <Virtual Memory Card>\SIMATIC.S7S\OMSSTORE directory.
3. Save the folder \SIMATIC.S7S with the project data to a medium of your choice.

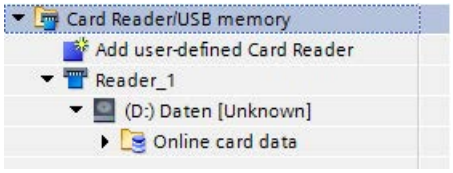

Figure 5-6 Add card reader

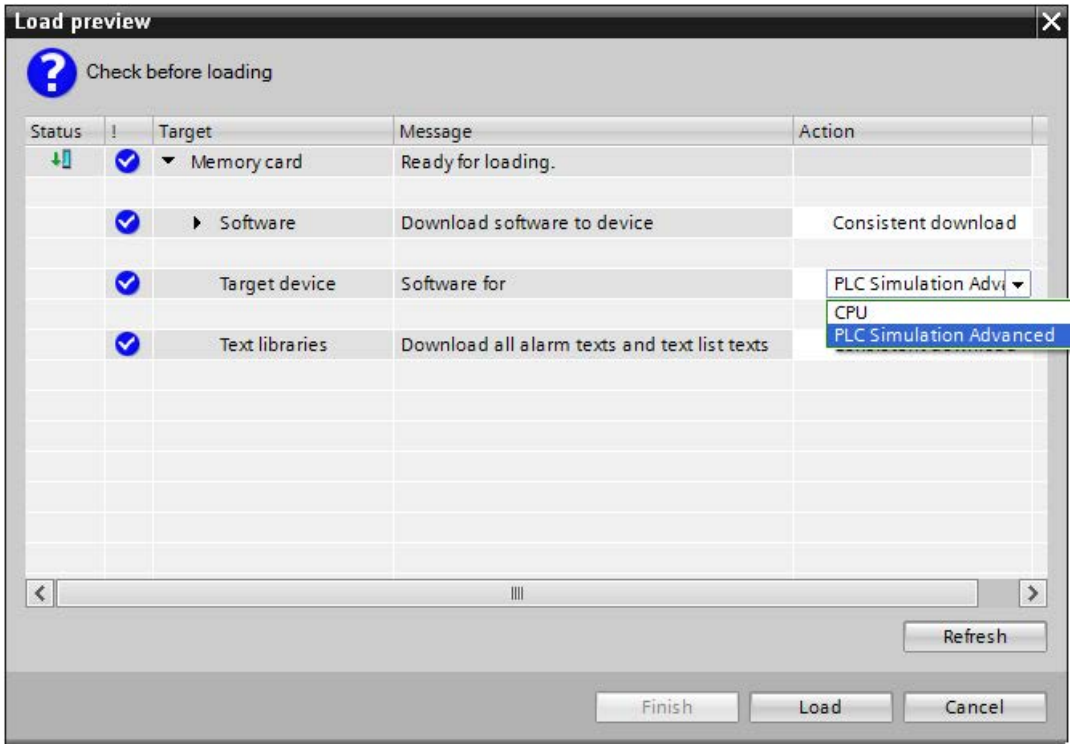

Figure 5-7 Preview of download dialog

Provide project data for simulation

1. On the PC on which PLCSIM Advanced is installed, create the directory \SIMATIC_MC in the directory in which the instance saves its data.
2. Move the \SIMATIC.S7S folder to the directory you have created.
   → The instances can be started with the project data.

API functions

The project data can be used for an instance via the user interface. Use of the following functions for this:

API functions

- GetStoragePath() (Page 123)
- StoragePath { get; set; } (Page 124)

See also

Controller - Information and settings (Page 119)

Virtual time response

6

The virtual controller uses internally two types of clocks for simulation: A virtual clock and a real clock. The virtual clock is always the basis for the user program. It is used by components that are relevant for running the STEP 7 user program, such as cyclic OBs, cycle time monitoring, minimum cycle time, virtual system time and time calculations. Also, the time between two cycle control points is measured in virtual time.

The virtual time can be accelerated or slowed for test purposes.

The real clock always runs unchanged. It is used by components that are not subject to control processes, for example, communication with STEP 7.

Virtual system time

When you start PLCSIM Advanced, the virtual system time of the virtual controller starts with the system time of Windows.

The virtual system time is based on the virtual clock, i.e. if a scaling factor is used, the system time runs correspondingly faster or slower.

All events that the virtual controller sends to the API provides a time stamp based on the system time.

Note

Difference between system time and local time

- System time: UTC ± 0 with daylight saving / standard time
- Local time: UTC ± time zone with daylight saving time / winter time

---

API functions

- GetSystemTime() (Page 218)
- SetSystemTime() (Page 218)
- SystemTime { get; set; } (Page 218)

Time offset

Note

Keep in mind that the time information of virtual system time and real local time differs by the time offset that is formed in addition to the selected scaling factor from the time zone offset and the daylight saving time/standard time offset.

Scaling factor

Using a scaling factor, you can speed up or slow down the virtual clock of the virtual controller for simulations.

- The default is 1, i.e. the course of the virtual time corresponds to the course of real time.
- **Fast forward:** A scaling factor greater than 1 accelerates the virtual clock.

  Example: Scaling factor 2.0 → The virtual time is running twice as fast.
- **Slow motion**: A scaling factor less than 1 decelerates the virtual clock.

  Example: Scaling factor 0.5 → The progress of the virtual time slows down to 50%.

API functions

- GetScaleFactor() (Page 219)
- SetScaleFactor() (Page 219)
- ScaleFactor { get; set; } (Page 220)

See also

Settings for the virtual time (Page 218)

6.1 Speed up and slow down simulation

Influence of fast forward and slow motion

Simulations can be accelerated and slowed down. Fast forward and slow motion only affects time-based components, for example, cyclic OBs. Compared to the real time, they are performed more frequently with fast forward and less frequently with slow motion.

Fast forward and slow motion do not change the execution speed of the CPU machine codes. For example, the speed at which all operations of an OB1 cycle are executed does not change. The execution speed depends on the processor of the PC on which the virtual controller running. If you change the scaling factor, more or fewer cycle control points are reached in a given period of virtual time.

Fast forward

To speed up the virtual time, select a scaling factor greater than 1 in the Control Panel or in the API.

Note

CPU load of the PC

If the scaling factor is greater than 1, the CPU load of the PC on which the virtual controller is simulated increases considerably.

Note

Performance

The performance is depends on the size of your project, among other things.

If the scaling factor is too high and the cycle-time monitoring indicates that the PC was incapable of calculating the OB1 or cyclic OBs in the specified time, the virtual controller goes to STOP.

Recommendation: To avoid this, start with a small scaling factor and gradually increase it step-by-step while keeping the virtual controller in RUN.

Slow motion

To slow down the virtual time, select a scaling factor less than 1 in the Control Panel or in the API.

API functions

- GetScaleFactor() (Page 219)
- SetScaleFactor() (Page 219)
- ScaleFactor { get; set; } (Page 220)

See also

Cycle control (Page 221)

Settings for the virtual time (Page 218)

Error with overflow cyclical events (Page 309)

6.2 Stop simulation

Freeze state of the virtual controller

To stop a simulation and to synchronize a simulation partner, a virtual controller can be set to a freeze state via the user interface.

A triggered freeze state stops the virtual controller on the next cycle control point. The following occurs:

- The virtual time is stopped.
- No OBs running, not counters.
- The user program is no longer executed.
- The virtual controller is still accessible from the TIA Portal.
- The virtual controller is in a state consistent with input and output data.

Note

Freeze-state ≠ operating state

The freeze state is an internal operating state of the virtual controller. It does not correspond to RUN/STOP mode of a CPU. In the freeze state, the virtual controller maintains the last operating state.

- The LED display on the Control Panel and on the Web server accordingly shows RUN or STOP for instance.
- The instance shows `SROS_FREEZE` / `Freeze`, see EOperatingState (Page 288).

Trigger freeze state

To trigger the freeze state, following modes are available for the virtual controller:

- **Cycle-controlled operating mode** SingleStep and ExtendedSingleStep

  See Synchronize simulation partner cycle-controlled (Page 62).
- **Time-controlled mode** TimespanSynchronized

  See Synchronize simulation partner time-controlled (Page 64).

In **Default** mode, the virtual controller does not go into a freeze state.

API functions

- Settings for the cycle control (Page 221)
- GetOperatingMode() (Page 221)
- SetOperatingMode() (Page 221)
- OperatingMode { get; set; } (Page 221)

6.3 Synchronize simulation partner

6.3.1 Synchronize simulation partner cycle-controlled

Introduction

The virtual controller must be set to the freeze state for synchronization.

The SingleStep and ExtendedSingleStep modes of the virtual controller provides one way to synchronize several simulation partners (clients).

SingleStep operating mode

In this operating mode, the virtual controller at the cycle control point goes into a freeze state and sends an event to the API clients.

The freeze state is terminated when the virtual controller issues an API command, performs the next step or changes to the default mode.

API functions

- RunNextCycle() (Page 225)

ExtendedSingleStep operating mode

In this operating mode, the virtual controller at the cycle control point goes into a freeze state and sends an event to the API clients.

Compared to the SingleStep operating mode, an API function in this mode also overwrites the minimum cycle time of the OB1 cycle. When you define a minimum cycle time of 200 ms, the minimum distance between two cycle control points is 200 virtual milliseconds. The default mode is 100 ms.

The freeze state is terminated when the virtual controller issues an API command, performs the next step or changes to the default mode.

API functions

- GetOverwrittenMinimalCycleTime_ns() (Page 223)
- SetOverwrittenMinimalCycleTime_ns() (Page 223)
- OverwrittenMinimalCycleTime_ns { get; set; } (Page 224)
- RunNextCycle() (Page 225)

See also

Cycle control (Page 221)

6.3.2 Synchronize simulation partner time-controlled

Introduction

The TimespanSynchronized mode of the virtual controller provides one way to synchronize several simulation partners (clients).

TimespanSynchronized operating mode

At least two simulation clients synchronize based on a virtual time period for this mode. A simulation client can be an instance of a virtual controller or an API client (an application that uses the Runtime API). The synchronization must be performed by a synchronization master.

The synchronization master signals a simulation client that it is his turn to run over certain time period. The time period is specified by the master in nanoseconds. The client then runs for the expected length of time before he goes into the freeze state at the next cycle control point. Before switching to the freeze state, the client sends the master the exact amount of time that he currently needed. Thereafter, the master signals the next client to catch up.

API client as master

The API client as master signals each client when it should start. The master receives events from the clients when they occur.

An API client can only "time manage" instances of a virtual controller. The API client does not receive events from other API clients. It cannot send messages to other API clients.

API functions

- Settings for cycle control (Page 221)
- StartProcessing() (Page 226)
- RunNextCycle() (Page 225)

User interfaces (API) 7

7.1 Introduction

Components of the Simulation Runtime

The following components are relevant for handling the Simulation Runtime of PLCSIM Advanced:

- Runtime
  - Siemens.Simatic.Simulation.Runtime.Manager.exe
  - Siemens.Simatic.Simulation.Runtime.Instance.exe
- Libraries
  - Siemens.Simatic.Simulation.Runtime.Api.x86.dll
  - Siemens.Simatic.Simulation.Runtime.Api.x64.dll
  - SimulationRuntimeApi.h
- Documentation of interfaces with examples in native C++ and .NET (Managed Code)

Description

Runtime and libraries	Description
Siemens.Simatic.Simulation. Runtime.Manager.exe	A Windows process that runs in the background. Main component of Runtime that manages all other Runtime components. The process is started automatically as soon as an application attempts to initialize the Runtime API. It is ended automatically as soon as there is no longer any application running that initialized the Runtime API.
Siemens.Simatic.Simulation. Runtime.Instance.exe	The process of the instance that loads a DLL of a virtual controller. Each virtual controller generates its own process.
Siemens.Simatic.Simulation. Runtime.Api.x86.dll Siemens.Simatic.Simulation. Runtime.Api.x64.dll	API libraries that must load an application to use the Simulation Runtime. The libraries contain interfaces for native code and managed code. The "Runtime.Api.x86.dll" is loaded exclusively by 32-bit applications, and the "Runtime.Api.x64.dll" by 64-bit applications.
SimulationRuntimeApi.h	Header file that describes all data types that require a native C++ application to use the API library.

External applications and Simulation Runtime

The following figure schematically presents the access of external applications to Simulation Runtime via the Runtime API. The Simulation Runtime Manager manages the Runtime instances. These load the libraries of the virtual controllers.

An external application can be other simulation software or a GUI, for example.

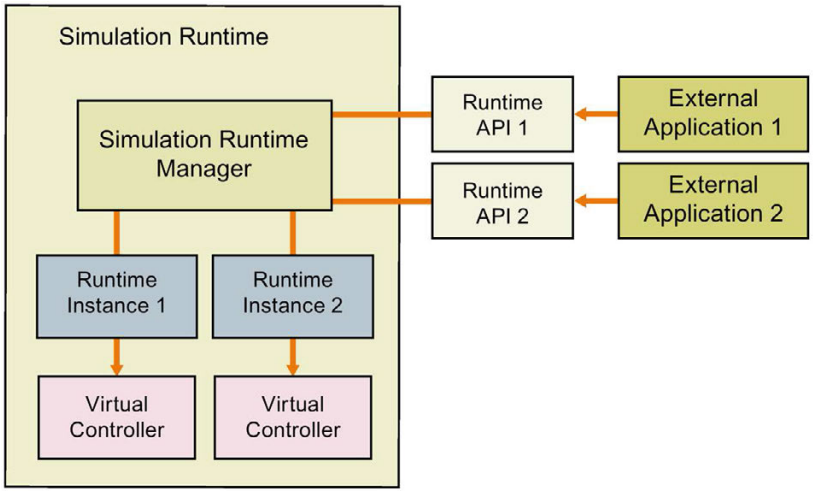

Figure 7-1 External applications and Simulation Runtime

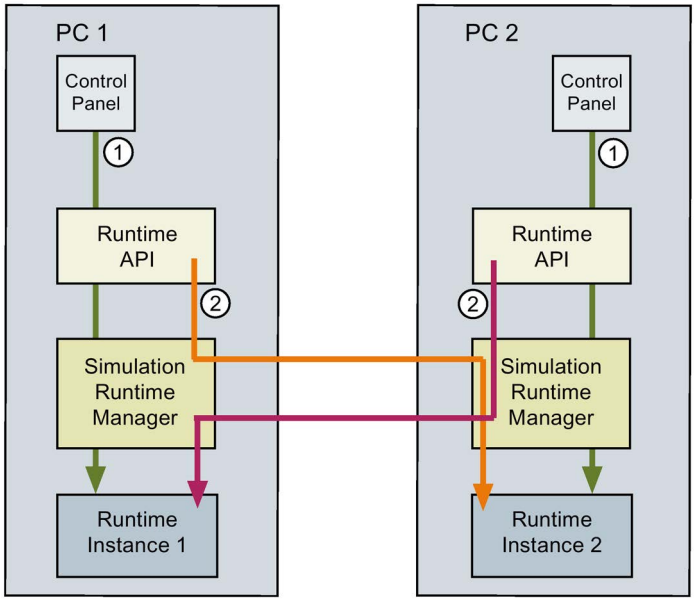
7.1.1 Access to instances

Access via the Control Panel and the API

You can access only one instance that is available locally on the PC via the Control Panel. It does not matter on which PC an instance was created and started. With distributed communication, the Runtime API accesses the instance of the other PCs via the Simulation Runtime Manager.



① Access to a local instance via the Control Panel
② Access to a remote instance on the Runtime API

Figure 7-2 Access to instances with distributed communication

API functions

- Table 7-5 Overview of IRemoteRuntimeManager functions - Native C++ (Page 72)
- Table 7-9 Overview of IRemoteRuntimeManager functions - .NET (C#) (Page 75)
- Table 7-4 Overview of IInstances functions - Native C++ (Page 70)
- Table 7-8 Overview of IInstances functions - .NET (C#) (Page 74)

7.1.2 User interfaces (API)

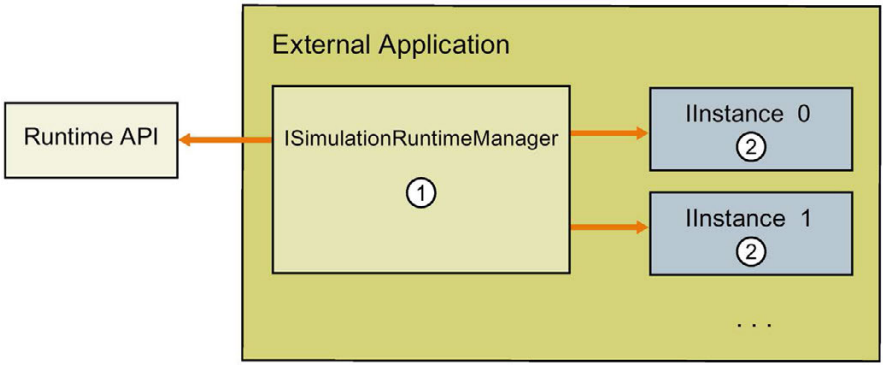
The user interfaces of Simulation Runtime include functions you use, for example, to create instances, to change the operating state of a virtual controller, or to exchange I/O data.

Simulation Runtime has the following user interfaces:

- ISimulationRuntimeManager
- IInstances
- IRemoteRuntimeManager

API and external applications

The Runtime API makes the interfaces available to an external application.



① **ISimulationRuntimeManager**

Interface of the Runtime Manager. It is used to register new Runtime instances, to search through existing Runtime instances, and to receive an interface of a registered instance.

Up to 16 instances can be registered in one Runtime Manager.

② **IInstances**

Interface of a Runtime instance. It is used to change the operating state of a virtual controller and to exchange I/O data.

Each instance has a unique name and an ID.

Figure 7-3 API and external applications

Access to API functions and data types

Required functions and data types are available for native C++ and .NET (C#).

- Overview of user interfaces for native C++ (Page 69)
- Overview of data types for native C++ (Page 76)
- Overview of user interfaces for managed code (Page 73)
- Overview of data types for managed code (Page 77)

Note

The list of tables in this manual gives you direct access to the description of the individual functions and data types.

7.1.3 Overview of user interfaces for native C++

Initializing and shutting down API

The following table shows which functions are available for initializing and shutting down the API for native C++.

Table 7- 1 Overview of initializing and shutting down API - Native C++

Actions	Functions
Initialize API	InitializeApi (Page 78) RuntimeApiEntry_Initialize (Page 79)
Shut down API (Page 81)	`DestroyInterface` `RuntimeApiEntry_DestroyInterface`
Unregister DLL API (Page 84)	`FreeApi` `ShutdownAndFreeApi`

Global functions

Table 7- 2 Overview of global functions - Native C++

Actions	Functions

7.2 Initialize API

7.2.1 Native C++

7.2.1.1 InitializeApi()

Description

The `InitializeApi` function loads the API library (DLL) and initializes the API. The function loads the version of the DLL that is compatible with the architecture of your application. The DLL is loaded from the Startup directory of each application that calls this function or from the directory that provides the path parameter.

The function returns an interface to the Simulation Runtime Manager. Use this interface to create a new instance of the virtual controller or to obtain access to an existing instance.

Table 7- 12 InitializeApi() - Native C++

Syntax	`ERuntimeErrorCode InitializeApi(`
	`  ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface`
	`);`
	`ERuntimeErrorCode InitializeApi(`
	`  WCHAR* in_SimulationRuntimeApiDllPath,`
	`  ISimulationRuntimeManager** in-`
	`out_SimulationRuntimeManagerInterface`
	`);`	

Parameters	• `ISimulationRuntimeManager**` `out_SimulationRuntimeManagerInterface:` Pointer to a Runtime Manager interface pointer. The pointer must be initialized with `ZERO`. The interface is created within the function. See Data types (Page 257). • `WCHAR* in_SimulationRuntimeApiDllPath`: The path to the Runtime API library (DLL).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the Runtime Manager interface does not equal `ZERO`.
	`SREC_WRONG_VERSION`	The required version of the interface is incompatible with the version used to compile the API.
	`SREC_CONNECTION_ERROR`	Unable to establish a connection to the Runtime Manager.
	`SREC_ERROR_LOADING_DLL`	The API library (DLL) cannot be loaded.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// Prepare The Variables`
	`ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;`
	`ISimulationRuntimeManager* api = ZERO;`
	
	`// Initialize The API And Get The RuntimeManager Interface`
	`result = InitializeApi(&api);`

Note

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

7.2.1.2 RuntimeApiEntry_Initialize

Description

Use the `RuntimeApiEntry_Initialize` function only if the API library (DLL) is to be loaded from a different directory than the Startup directory of the application that calls this function.

When the API is initialized, the API library is first loaded and the `Initialize` function is then imported and called.

The function returns an interface to the Simulation Runtime Manager. Use this interface to create a new instance of the virtual controller or to obtain access to an existing instance.

Table 7- 13 RuntimeApiEntry_Initialize - Native C++

Syntax	`__declspec(dllexport) ERuntimeErrorCode RuntimeApiEntry_Initialize(`
	`ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface,`
	`UINT32 in_InterfaceVersion`
	`);`	

Parameters	• `ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface:` Pointer to a Runtime Manager interface pointer. The pointer must be initialized with `NULL`. The interface is created within the function. See Data types (Page 257). • `UINT32 in_InterfaceVersion:` Version of the API interface to be downloaded: `DAPI_DLL_INTERFACE_VERSION`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the Runtime Manager interface does not equal `NULL`.
	`SREC_WRONG_VERSION`	The required version of the interface is incompatible with the version used to compile the API.

	SREC_CONNECTION_ERROR	Unable to establish a connection to the Runtime Manager.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// Prepare The Variables`
	`ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;`
	`HMODULE dllHandle = NULL;`
	`ApiEntry_Initialize Initialize = NULL;`
	`ISimulationRuntimeManager* api = NULL;`
	
	`// Load The DLL And Import The "Initialize" Function (using the Win32 API)`
	`dllHandle = LoadLibrary(DAPI_DLL_NAME_X86);`
	`if ( dllHandle != NULL )`
	`{`
	`Initialize = (ApiEntry_Initialize)GetProcAddress(dllHandle, DAPI_ENTRY_INITIALIZE);`
	`}`
	
	`// Initialize The API And Get The RuntimeManager Interface`
	`if ( Initialize != NULL )`
	`{`
	`result = Initialize(&api, DAPI_DLL_INTERFACE_VERSION);`
	`}`	

Note

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

7.2.2 .NET (C#)

7.2.2.1 Initialize

Description

The entry point to the API is the static class
`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeManager`.
The API is initialized when a function of this class is used the first time.

Table 7- 14 Initialize - .NET (C#)

Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationInitializationException`	
	Runtime error code	Condition
	`ERuntimeError-Code.ConnectionError`	Unable to establish a connection to the Runtime Manager.

7.3 Shut down API

7.3.1 Native C++

Basic procedure for deleting the user interfaces

To delete all user interfaces, generally follow these steps:

1. Delete the interfaces IInstances and IRemoteRuntimeManager.
2. Call the `Shutdown()` function of the ISimulationRuntimeManager interface.
3. Delete the ISimulationRuntimeManager interface.
4. Unload the API library (DLL) with the Win32 API-Funktion `FreeLibrary()`.

Deleting the user interfaces via functions

Deleting the user interfaces is also possible via functions.

If the API was initialized using the `InitializeApi()` function, you delete the user interfaces using the following functions:

- FreeApi() (Page 84)
- ShutdownAndFreeApi() (Page 85)

7.3.1.1 DestroyInterface()

Description

A function pointer to the `RuntimeApiEntry_DestroyInterface` function. The function pointer `DestoyInterface()` is only valid if the `InitializeApi` function has been successfully called.

The function unloads the memory of an ISimulationRuntimeManager, IRemoteRuntimeManager or IInstance interface.

Table 7- 15 DestroyInterface() - Native C++

Syntax	`ERuntimeErrorCode DestroyInterface(`
	`  IBaseInterface* in_Interface`
	`);`	

Parameters	• `IBaseInterface* in_Interface:` The interface to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is `NULL`.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// The Interfaces`
	`ERuntimeErrorCode result;`
	`ISimulationRuntimeManager* api = NULL;`
	`IInstance* instance = NULL;`
	
	`// Init the DLL and create an instance`
	`result = InitializeApi(&api);`
	`result = api->RegisterInstance(&instance);`
	
	`// Destroy Instance Interfaces`
	`result = DestroyInterface(instance);`
	`instance = NULL;`	

7.3.1.2 RuntimeApiEntry_DestroyInterface

Description

Use the `RuntimeApiEntry_DestroyInterface` function only if the API library (DLL) is to be loaded from a different directory than the Startup directory of the application that calls this function.

If the API was initialized using the `InitializeApi` function, you select the DestroyInterface() (Page 82) function.

The function unloads the memory of an ISimulationRuntimeManager, IRemoteRuntimeManager or IInstance interface.

Table 7- 16 RuntimeApiEntry_DestroyInterface() - Native C++

Syntax	`__declspec(dllexport) ERuntimeErrorCode RuntimeApiEntry_DestroyInterface( IBaseInterface* in_Interface );`	
Parameters	• `IBaseInterface* in_Interface:` The interface to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is `NULL`.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// Prepare The Variables`
	`ERuntimeErrorCode result = SREC_INVALID_ERROR_CODE;`
	`HMODULE dllHandle = NULL;`
	`ApiEntry_DestroyInterface Destroy = NULL;`
	`IInstance* instance = NULL;`
	
	`// Load The DLL And Import The "DestroyInterface" Function (using the Win32 API)`
	`dllHandle = LoadLibraryA(DAPI_DLL_NAME_X86);`
	`if ( dllHandle != NULL )`
	`{`
	`Destroy = (ApiEntry_DestroyInterface)GetProcAddress(dllHandle, DAPI_ENTRY_DESTROY_INTERFACE);`
	`}`
	`…`
	`// Frees the memory of an IInstance interface`
	`result = Destroy(instance);`	

7.3.1.3 FreeApi()

Description

The `FreeApi()` function unloads the library of the Runtime API.

This function can only be called after the successful call of the `InitializeApi` function. If the `InitializeApi` function was not called, the library must be unloaded using the Win32 API function `FreeLibrary()`.

Table 7- 17 FreeApi() - Native C++

Syntax	`ERuntimeErrorCode FreeApi();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_API_NOT_INITIALIZED`	The `InitializeApi` function was not called successfully.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// The Interfaces`
	`ERuntimeErrorCode result;`
	`ISimulationRuntimeManager* api = NULL;`
	`IInstance* instance = NULL;`
	
	`// Init the API`
	`result = InitializeApi(&api);`
	
	`…`
	
	`// Shutdown The API`
	`api->Shutdown();`
	`result = DestroyInterface(api);`
	`api = NULL;`
	`result = FreeApi();`	

7.3.1.4 ShutdownAndFreeApi()

Description

The `ShutdownAndFreeApi()` function shuts down the Runtime API, deletes the IRuntimeManager interface and unloads the library of the Runtime API.

This function can only be called after the successful call of the `InitializeApi` function. If the `InitializeApi` function was not called, the library must be unloaded using the Win32 API-Funktion `FreeLibrary()`.

Table 7- 18 ShutdownAndFreeApi() - Native C++

Syntax	`ERuntimeErrorCode ShutdownAndFreeApi( ISimulationRuntimeManager* in_SimulationRuntimeManagerInterface );`	
Parameters	• `ISimulationRuntimeManager* in_SimulationRuntimeManagerInterface:` The interface of the Runtime Manager to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_API_NOT_INITIALIZED`	The `InitializeApi` function was not called successfully.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is `NULL`.

Example C++	`// Include The Headerfile Of The API`
	`#include "SimulationRuntimeApi.h"`
	
	`// The Interfaces`
	`ERuntimeErrorCode result;`
	`ISimulationRuntimeManager* api = NULL;`
	`IInstance* instance = NULL;`
	
	`// Init the API`
	`result = InitializeApi(&api);`
	
	…
	
	`// Shutdown The API`
	`result = ShutdownAndFreeApi(api);`
	`api = NULL;`	

7.3.2 .NET (C#)

7.3.2.1 Shut down API

You can end the .NET components of the API in the following ways:

- By a clearing operation using the .NET Garbage Collector.
- For the IInstance and IRemoteRuntimeManager interfaces, by calling the Dispose (Page 113) function.

Manually clearing the API

To manually clear the API, follow these steps:

1. Delete all interfaces. Interfaces - Information and settings (Page 113)
2. Call the Shutdown() (Page 90) function of the ISimulationRuntimeManager interface.

7.4 Global functions (Native C++)

GetNameOfAreaSection()

Returns the name of the enumeration entry.

Table 7- 19 GetNameOfAreaSection() - Native C++

Syntax	`const WCHAR* GetNameOfAreaSection(`
	`  EArea in_AreaSection`
	`);`

Parameters	• `EArea in_AreaSection:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfCPUType()

Returns the name of the enumeration entry.

Table 7- 20 GetNameOfCPUType() - Native C++

Syntax	`const WCHAR* GetNameOfCPUType(`
	`  ECPUType in_CPUType`
	`);`

Parameters	• `ECPUType in_CPUType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfCommunicationInterface()

Returns the name of the enumeration entry.

Table 7- 21 GetNameOfCommunicationInterface() - Native C++

Syntax	`const WCHAR* GetNameOfCommunicationInterface( ECommunicationInterface in_CommunicationInterface );`
Parameters	• `ECommunicationInterface in_CommunicationInterface:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfDataType()

Returns the name of the enumeration entry.

Table 7- 22 GetNameOfDataType() - Native C++

Syntax	`const WCHAR* GetNameOfDataType( EDataType in_DataType );`
Parameters	• `EDataType in_DataType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfErrorCode()

Returns the name of the enumeration entry.

Table 7- 23 GetNameOfErrorCode() - Native C++

Syntax	`const WCHAR* GetNameOfErrorCode( ERuntimeErrorCode in_ErrorCode );`
Parameters	• `ERuntimeErrorCode in_ErrorCode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfLEDMode()

Returns the name of the enumeration entry.

Table 7- 24 GetNameOfLEDMode() - Native C++

Syntax	`const WCHAR* GetNameOfLEDMode( ELEDMode in_LEDMode );`
Parameters	• `ELEDMode in_LEDMode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfLEDType()

Returns the name of the enumeration entry.

Table 7- 25 GetNameOfLEDType() - Native C++

Syntax	`const WCHAR* GetNameOfLEDType( ELEDType in_LEDType );`
Parameters	• `ELEDType in_LEDType:` Enumeration entry.
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfOperatingMode()

Returns the name of the enumeration entry.

Table 7- 26 GetNameOfOperatingMode() - Native C++

Syntax	`const WCHAR* GetNameOfOperatingMode( EOperatingMode in_OperatingMode );`
Parameters	• `EOperatingMode in_OperatingMode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfErrorCode()

Returns the name of the enumeration entry.

Table 7- 27 GetNameOfErrorCode() - Native C++

Syntax	`const WCHAR* GetNameOfErrorCode( ERuntimeErrorCode in_ErrorCode );`
Parameters	• `ERuntimeErrorCode in_ErrorCode:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfOperatingState

Returns the name of the enumeration entry.

Table 7- 28 GetNameOfOperatingState() - Native C++

Syntax	`const WCHAR* GetNameOfOperatingState( EOperatingState in_OperatingState );`
Parameters	• `EOperatingState in_OperatingState:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfPrimitiveDataType

Returns the name of the enumeration entry.

Table 7- 29 GetNameOfPrimitiveDataType() - Native C++

Syntax	`const WCHAR* GetNameOfPrimitiveDataType( EPrimitiveDataType in_DataType );`
Parameters	• `EPrimitiveDataType in_DataType:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfTagListDetails

Returns the name of the enumeration entry.

Table 7- 30 GetNameOfTagListDetails() - Native C++

Syntax	`const WCHAR* GetNameOfTagListDetails( ETagListDetails in_TagListDetails );`
Parameters	• `ETagListDetails in_TagListDetails:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfRuntimeConfigChanged()

Returns the name of the enumeration entry.

Table 7- 31 GetNameOfRuntimeConfigChanged() - Native C++

Syntax	`const WCHAR* GetNameOfRuntimeConfigChanged( ERuntimeConfigChanged in_RuntimeConfigChanged); );`
Parameters	• `ERuntimeConfigChanged in_RuntimeConfigChanged:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

GetNameOfInstanceConfigChanged()

Returns the name of the enumeration entry.

Table 7- 32 GetNameOfInstanceConfigChanged() - Native C++

Syntax	`const WCHAR* GetNameOfInstanceConfigChanged( EInstanceConfigChanged in_InstanceConfigChanged); );`
Parameters	• `EInstanceConfigChanged in_InstanceConfigChanged:` Enumeration entry
Return values	`const WCHAR*:` Name of the enumeration entry

EPrimitiveDataType (Page 294)

EDataType (Page 296)

7.5 API ISimulationRuntimeManager

7.5.1 Interfaces - Information and settings

GetVersion() / Version { get; }

Returns the version of Runtime Manager. If the function fails, version 0.0 is returned.

Table 7- 33 GetVersion() - Native C++

Syntax	`UINT32 GetVersion();`
Parameters	None
Return values	`UINT32`: Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

Table 7- 34 Version { get; } - .NET (C#)

Syntax	`UInt32 Version { get; }`
Parameters	None
Return values	`Uint32`: Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

IsInitialized() / IsInitialized { get; }

Returns a value that indicates whether the API was successfully initialized.

Table 7- 35 IsInitialized() - Native C++

Syntax	`bool IsInitialized();`
Parameters	None
Return values	• `false`: If the API was not initialized. • `true`: If the API was initialized.

Table 7- 36 IsInitialized { get; } - .NET (C#)

Syntax	`bool IsInitialized { get; }`
Parameters	None
Return values	• `false`: If the API was not initialized. • `true`: If the API was initialized.

IsRuntimeManagerAvailable() / IsRuntimeManagerAvailable { get; }

The function returns `false` when the connection to Runtime Manager is interrupted. This happens only when the Runtime Manager process is closed.

Subscribe to the `OnRuntimeManagerLost()` event to find out whether the connection is interrupted. See Events (Page 106).

Table 7- 37 IsRuntimeManagerAvailable() - Native C++

Syntax	`bool IsRuntimeManagerAvailable();`
Parameters	None
Return values	• `false`: If the connection is interrupted. • `true`: If the connection is active.

Table 7- 38 IsRuntimeManagerAvailable { get; } - .NET (C#)

Syntax	`bool IsRuntimeManagerAvailable{ get; }`
Parameters	None
Return values	• `false`: If the connection is interrupted. • `true`: If the connection is active.

Shutdown()

Ends communication with Runtime Manager and clears the interfaces.

Call this function in the following cases:

- Immediately before the API library (DLL) is unregistered (native C++).
- When your application is no longer using Runtime Manager.

Table 7- 39 Shutdown() - Native C++

Syntax	`ERuntimeErrorCode Shutdown()`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.

Table 7- 40 Shutdown() - .NET (C#)

Syntax	`void Shutdown()`
Parameters	None
Return values	None

7.5.2 Simulation Runtime instances

GetRegisteredInstancesCount()

Returns the number of instances that are registered in Runtime Manager. If the function fails, the return value is 0.

Table 7- 41 GetRegisteredInstancesCount() - Native C++

Syntax	`UINT32 GetRegisteredInstancesCount();`
Parameters	None
Return values	`UINT32`: Number of available instances.

GetRegisteredInstanceInfoAt()

Returns information about an already registered instance. You can use the ID or name to create an interface of this instance, see `CreateInterface()`.

Table 7- 42 GetRegisteredInstanceInfoAt() - Native C++

Syntax	`ERuntimeErrorCode GetRegisteredInstanceInfoAt(`
	`  UINT32 in_Index,`
	`  SInstanceInfo* out_InstanceInfo`
	`);`	

Parameters	• `UINT32 in_Index:` Index of the created instance from which you want to receive the information. The index must be less than the value you receive when you call `GetRegisteredInstanceCount()`. • `SInstanceInfo* out_InstanceInfo:` The information with name and ID of the instance. See Data types (Page 271).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX OUT_OF_RANGE`	There is no instance information for this index.

RegisteredInstanceInfo { get; }

Returns information about all already registered instances. Use the ID or name of this instance to create an interface of this instance, see `CreateInterface()`.

Table 7- 43 RegisteredInstanceInfo { get; } - .NET (C#)

Syntax	`SInstanceInfo[] RegisteredInstanceInfo { get; }`	
Parameters	None	
Return values	`SInstanceInfo[]`: An array of information about all registered instances.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RegisterInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 44 RegisterInstance() - Native C++

Syntax	`ERuntimeErrorCode RegisterInstance(`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  WCHAR* in_InstanceName,`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  ECPUType in_CPUType,`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  ECPUType in_CPUType,`
	`  WCHAR* in_InstanceName,`
	`  IInstance** out_InstanceInterface`
	`);`	

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is `"SRCT_1500_Unspecified"`. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `WCHAR* in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271). • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with `ZERO`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name or the IInstance pointer is invalid.
	`SREC_LIMIT_REACHED`	There are already 16 instances registered in Runtime Manager.
	`SREC_ALREADY_EXISTS`	An instance with this name already exists.

Example C++	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`// Example: How To Create And Register An Instance`
	`IInstance* psa = ZERO;`
	`if (result == SREC_OK)`
	`{`
	`  result = api->RegisterInstance(&psa);`
	`}`	

Note
Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 45 RegisterInstance() - .NET (C#)

Syntax	`IInstance RegisterInstance();`
	`IInstance RegisterInstance(`
	`  string in_InstanceName`
	`);`
	`IInstance RegisterInstance(`
	`  ECPUType in_CPUType`
	`);`
	`IInstance RegisterInstance(`
	`  ECPUType in_CPUType`
	`  string in_InstanceName`
	`);`	

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is `"ECPUType.Unspecified"`. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `string in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271).	
Return values	If the function is successful, an interface of a virtual controller, otherwise a null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name is invalid.
	`ERuntimeErrorCode.LimitReached`	There are already 16 instances registered in Runtime Manager.
	`ERuntimeErrorCode.AlreadyExists`	An instance with this name already exists.

RegisterCustomInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 46 RegisterCustomInstance() - Native C++

Syntax	ERuntimeErrorCode RegisterCustomInstance(WCHAR* in_VplcDll, IInstance** out_InstanceInterface); ERuntimeErrorCode RegisterCustomInstance(WCHAR* in_VplcDll, WCHAR* in_InstanceName, IInstance** out_InstanceInterface);	
Parameters	• WCHAR* in_VplcDll: The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn. • WCHAR* in_InstanceName: Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name "Instance_#" (# is the ID of the instance). If this name already exists, the name "Instance_#.#" is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than DINSTANCE_NAME_LENGTH. See Data types (Page 271). • IInstance** out_InstanceInterface: Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with ZERO. The interface is created within the function.	
Return values	Runtime error code	Condition
	SREC_OK	The function is successful.
	SREC_TIMEOUT	The function does not return on time.
	SREC_WRONG_ARGUMENT	The DLL name, the instance name or the IInstance pointer is invalid.
	SREC_LIMIT_REACHED	There are already 16 instances registered in Runtime Manager.
	SREC_ALREADY_EXISTS	An instance with this name already exists.

Example C++	ISimulationRuntimeManager * api = ZERO;
	ERuntimeErrorCode result = Initialize(&api);
	
	// Example: How To Create And Register An Instance
	IInstance* psa = ZERO;
	if (result == SREC_OK)
	{
	result = api->**RegisterCustomInstance**("C:\\Temp\\vplc.dll");
	}	

Note
Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 47 RegisterCustomInstance() - .NET (C#)

Syntax	`IInstance RegisterCustomInstance(`
	` string in_VplcDll`
	`);`
	`IInstance RegisterCustomInstance(`
	` string in_VplcDll,`
	` string in_InstanceName`
	`);`	

Parameters	• `string in_VplcDll:` The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn. • `string in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271).	
Return values	If the function is successful, an interface of a virtual controller; otherwise a Null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name or the ID is invalid.
	`ERuntimeErrorCode.LimitReached`	There are already 16 instances registered in Runtime Manager.
	`ERuntimeErrorCode.AlreadyExists`	An instance with this name already exists.

CreateInterface()

Creates and returns an interface of an already registered instance of a virtual controller.

The instance could have been registered via the application or another application that uses the Simulation Runtime API.

Table 7- 48 CreateInterface() - Native C++

Syntax	`ERuntimeErrorCode CreateInterface(`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode CreateInterface(`
	` INT32 in_InstanceID,`
	` IInstance** out_InstanceInterface`
	`);`	

Parameters	• `INT32 in_InstanceID:` The ID of the registered instance from which you want to receive the interface. • `WCHAR* in_InstanceName:` The name of the registered instance from which you want to receive the interface. • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer **must** be initialized with `ZERO`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name, the ID or the IInstance pointer is invalid.
	`SREC_DOES_NOT_EXIST`	The instance is not registered in Runtime Manager.

Example C++	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa1 = ZERO;`
	`IInstance* psa2 = ZERO;`
	`if (result == SREC_OK)`
	`{`
	` result = api->CreateInterface(0, &psa1);`
	` result = api->CreateInterface(0, &psa2); // psa2 will be the same as psa1`
	`}`	

Example C++	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = ZERO;`
	`if (result == SREC_OK)`
	`{`
	` result = api->CreateInterface(L"My SimulationRuntime Instance", &psa);`
	`}`	

Note
Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 49 CreateInterface() - .NET (C#)

Syntax	`IInstance CreateInterface(`
	` string in_InstanceName`
	`);`
	`IInstance CreateInterface(`
	` INT32 in_InstanceID`
	`);`	

Parameters	• `INT32 in_InstanceID:` The ID of the registered instance from which you want to receive the interface. • `string in_InstanceName:` The name of the registered instance from which you want to receive the interface.	
Return values	If the function is successful, an interface of a virtual controller; otherwise a Null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name or the ID is invalid.
	`ERuntimeErrorCode.DoesNotExists`	The instance is not registered in Runtime Manager.

7.5.3 Remote connections

OpenPort()

Opens a port to which another Runtime Manager can connect.

Table 7- 50 OpenPort() - Native C++

Syntax	`ERuntimeErrorCode OpenPort( UINT16 in_Port );`	
Parameters	• `UINT16 in_Port:` The port. The value must be greater than 1024.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_ALREADY_EXISTS`	A port is already open.
	`SREC_WRONG_ARGUMENT`	The port is invalid.
	`SREC_CONNECTION_ERROR`	The port cannot be opened.

Table 7- 51 OpenPort() - .NET (C#)

Syntax	`void OpenPort( UInt16 in_Port );`	
Parameters	• `UInt16 in_Port:` The port. The value must be greater than 1024.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.AlreadyExists`	A port is already open.
	`ERuntimeErrorCode.WrongArgument`	The port is invalid.
	`ERuntimeError-Code.ConnectionError`	The port cannot be opened.

ClosePort()

Closes an open port and all open connections that another Runtime Manager has created to this open port.

Table 7- 52 ClosePort() - Native C++

Syntax	`ERuntimeErrorCode ClosePort();`	
Parameters	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WARNING_INVALID_CALL`	No port is open.

Table 7- 53 ClosePort() - .NET (C#)

Syntax	`void ClosePort(`
	`  UInt16 in_Port`
	`);`

Parameters	None
Return values	None
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`
	Runtime error code / Condition
	`ERuntimeErrorCode.Timeout` — The function does not return on time.

GetPort() / Port { get; }

Returns the open port. If no port is open or the function fails, the return value is 0.

Table 7- 54 GetPort() - Native C++

Syntax	`UINT16 GetPort();`
Parameters	None
Return values	`UINT16`: The open port. 0, if no port is open.

Table 7- 55 Port { get; } - .NET (C#)

Syntax	`UInt16 Port { get; }`
Parameters	None
Return values	`UInt16`: The open port. 0, if no port is open.
Exceptions	None

GetRemoteConnectionsCount()

Supplies the number of open remote connections.

Table 7- 56 GetRemoteConnectionsCount() - Native C++

Syntax	`UINT32 GetRemoteConnectionsCount();`
Parameters	None
Return values	`UINT32`: Number of open remote connections.

GetRemoteConnectionInfoAt()

Returns information about an open connection.

Table 7- 57 GetRemoteConnectionInfoAt()- Native C++

Syntax	`ERuntimeErrorCode GetRemoteConnectionInfoAt(`
	`  UINT32 in_Index,`
	`  SConnectionInfo* out_ConnectionInfo`
	`);`	

Parameters	• `UINT32 in_Index:` Index of the connection information that is expected. • `SConnectionInfo* out_ConnectionInfo:` The connection information for this index.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	Connection information for this index does not exist.

RemoteConnectionInfo { get; }

Returns an array of information about all open connections.

Table 7- 58 RemoteConnectionInfo { get; } - .NET (C#)

Syntax	`SConnectionInfo[] RemoteConnectionInfo { get; }`	
Parameters	None	
Return values	`SConnectionInfo[]`: An array of information about all open connections.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RemoteConnect()

Creates a new connection to a remote Runtime Manager or uses an existing connection to create an IRemoteRuntimeManager interface.

Table 7- 59 RemoteConnect() - Native C++

Syntax	`ERuntimeErrorCode RemoteConnect(`
	` UINT8 in_IP3,`
	` UINT8 in_IP2,`
	` UINT8 in_IP1,`
	` UINT8 in_IP0,`
	` UINT16 in_Port,`
	` IRemoteRuntimeManager** out_RemoteRuntimeManagerInterface`
	`ERuntimeErrorCode RemoteConnect(`
	` UIP in_IP,`
	` UINT16 in_Port,`
	` IRemoteRuntimeManager** out_RunTimeManagerInterface`
	`);`	

Parameters	• `UINT8 in_IP3:` First part of the IP address of the remote PC. • `UINT8 in_IP2:` Second part of the IP address of the remote PC. • `UINT8 in_IP1:` Third part of the IP address of the remote PC. `UINT8 in_IP0:` Last part of the IP address of the remote PC. • `UIP in_IP:` IP address of the remote PC. • `UINT16 in_Port:` The port that is open on the remote PC. • `IRemoteRuntimeManager** out_RemoteRuntimeManagerInterface:` Pointer to a remote Runtime Manager interface pointer. The pointer **must** be initialized with `ZERO`. The interface is created in the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_CONNECTION_ERROR`	The connection to the remote Runtime Manager cannot be established.
	`SREC_WRONG_ARGUMENT`	IP, port or IInstance pointer is invalid.

Example C++	`ISimulationRuntimeManager* api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IRemoteRuntimeManager * client = ZERO;`
	
	`if (result == SREC_OK)`
	`{`
	` result = api->RemoteConnect(192,203,145,144, 4444, &client);`
	`}`	

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 60 RemoteConnect() - .NET (C#)

Syntax	`IRemoteRuntimeManager RemoteConnect(`
	`  string in_ConnectionString`
	`);`
	`IRemoteRuntimeManager RemoteConnect(`
	`  SIP in_IP,`
	`  UInt16 in_Port`
	`);`
	`IRemoteRuntimeManager RemoteConnect(`
	`  Byte in_IP3,`
	`  Byte in_IP2,`
	`  Byte in_IP1,`
	`  Byte in_IP0,`
	`  UInt16 in_Port`
	`);`	

Parameters	• `Byte in_IP3:` First part of the IP address of the remote PC. • `Byte in_IP2:` Second part of the IP address of the remote PC. • `Byte in_IP1:` Third part of the IP address of the remote PC. • `Byte in_IP0:` Last part of the IP address of the remote PC. • `string in_ConnectionString:` A string in the form of "<IP3>.<IP2>.<IP1>.<IP0>:<Port>" Example: "182.203.145.144:4444". • `SIP in_IP:` IP address of the remote PC. • `UInt16 in_Port:` The port that is open on the remote PC.	
Return values	`IRemoteRuntimeManager:` Interface to the remote Runtime Manager.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.ConnectionError`	Connection to the remote Runtime Manager cannot be established.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	IP or port is invalid.

7.5.4 Events

Events for the ISimulationRuntimeManager interface

The following events are differentiated in the API:

Table 7- 61 Events for the ISimulationRuntimeManager interface

Event	Cause
OnConfigurationChanged (Page 106)	This event is triggered at a change of the Runtime Manager configuration. For example, when a new instance is registered, an instance is removed or a connection to a client is established. The Control Panel uses such an event to update the list of available instances.
OnRuntimeManagerLost (Page 110)	The event is triggered when the connection to Runtime Manager is interrupted.

7.5.4.1 OnConfigurationChanged

OnConfigurationChanged

Registers or unregisters an event handler method.

Table 7- 62 OnConfigurationChanged - .NET (C#)

Syntax	`event Delegate_SRCC_UINT32_UINT32_INT32 OnConfigurationChanged;`
Parameters	None. See Delegate_SRCC_UINT32_UINT32_INT32 (Page 269).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. The registration of a new callback function causes the previous callback function to be deleted.

Table 7- 63 RegisterOnConfigurationChangedCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangedCallback(`
	`  EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction`
	`);`

Parameters	• `EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction`: A callback function to subscribe to an event. See EventCallback_SRCC_UINT32_UINT32_INT32 (Page 263).
Return values	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 64 RegisterOnConfigurationChangedEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangedEvent();`
	`void RegisterOnConfigurationChangedEvent(`
	`  HANDLE* in_Event`
	`);`

Parameters	• `None`: An internal event object is registered. • `HANDLE* in_Event`: A handle for a user-specific event object. The event object is registered.
Return values	None

Table 7- 65 RegisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void RegisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 66 UnregisterOnConfigurationChangedCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangedCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedEvent()

Unregisters the event object.

Table 7- 67 UnregisterOnConfigurationChangedEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

Table 7- 68 UnregisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangedEvent()

The function blocks the program until the registered event object is set to the signaled state or the timeout interval is exceeded.

Table 7- 69 WaitForOnConfigurationChangedEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 70 WaitForOnConfigurationChangedEvent - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.5.4.2 OnRuntimeManagerLost

OnRuntimeManagerLost

Registers or unregisters an event handler method.

Table 7- 71 OnRuntimeManagerLost - .NET (C#)

Syntax	`event Delegate_Void OnRuntimeManagerLost;`
Parameters	None. See Delegate_Void (Page 265).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnRuntimeManagerLostCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. The registration of a new callback function causes the previous callback function to be deleted.

Table 7- 72 RegisterOnRuntimeManagerLostCallback() - Native C++

Syntax	`void RegisterOnRuntimeManagerLostCallback(`
	`  EventCallback_VOID in_CallbackFunction`
	`);`

Parameters	• `EventCallback_VOID in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_VOID (Page 259).
Return values	None
Note	The event handler method runs in a separate thread.

RegisterOnRuntimeManagerLostEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 73 RegisterOnRuntimeManagerLostEvent() - Native C++

Syntax	`void RegisterOnRuntimeManagerLostEvent();`
	`void RegisterOnRuntimeManagerLostEvent(`
	`  HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event handle is registered. • `HANDLE* in_Event:` A user-specific event handle is registered.
Return values	None

Table 7- 74 RegisterOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`void RegisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

UnregisterOnRuntimeManagerLostCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 75 UnregisterOnRuntimeManagerLostCallback() - Native C++

Syntax	`void UnregisterOnRuntimeManagerLostCallback();`
Parameters	None
Return values	None

UnregisterOnRuntimeManagerLostEvent()

Unregisters the event object.

Table 7- 76 UnregisterOnRuntimeManagerLostEvent() - Native C++

Syntax	`void UnregisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

Table 7- 77 UnregisterOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`void UnregisterOnRuntimeManagerLostEvent();`
Parameters	None
Return values	None

WaitForOnRuntimeManagerLostEvent()

The function will block the program until the registered event object is set to the signaled state or the timeout interval is exceeded.

Table 7- 78 WaitForOnRuntimeManagerLostEvent() - Native C++

Syntax	`bool WaitForOnRuntimeManagerLostEvent();`
	`bool WaitForOnRuntimeManagerLostEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined timeout interval.

Table 7- 79 WaitForOnRuntimeManagerLostEvent() - .NET (C#)

Syntax	`bool WaitForOnRuntimeManagerLostEvent();`
	`bool WaitForOnRuntimeManagerLostEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined timeout interval.

7.6 API IInstances

7.6.1 Interfaces - Information and settings

Dispose()

Deletes the managed interface and unloads the native components of the user interfaces.

Table 7- 80 Dispose() - .NET (C#)

Syntax	`void Dispose()`
Parameters	None
Return values	None

GetID() / ID { get; }

Returns the instance ID. The ID is assigned by Runtime Manager when the instance is registered.

Table 7- 81 GetID() - Native C++

Syntax	`INT32 GetID();`
Parameters	None
Return values	`INT32`: Instance ID

Table 7- 82 ID { get; } - .NET (C#)

Syntax	`UInt32 ID { get; }`
Parameters	None
Return values	`Uint32`: Instance ID
Exceptions	None

GetName() / Name { get; }

Returns the name of the instance.

Table 7- 83 GetName() - Native C++

Syntax	`ERuntimeErrorCode GetName(`
	` WCHAR inout_Name[],`
	` UINT32 in_ArrayLength`
	`);`	

Parameters	• `WCHAR inout_Name[]:` A user-allocated storage for the name of the instance. The field length should be at least as long as `DINSTANCE_NAME_MAX_LENGTH`. See Definitions and constants (Page 271). • `UINT32 in_ArrayLength:` Field length (Wide character)	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_WRONG_ARGUMENT`	The name does not fit in the storage.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	` result = api->RegisterInstance(&psa);`
	`}`
	
	`WCHAR name[DINSTANCE_NAME_MAX_LENGTH];`
	`if (result == SREC_OK)`
	`{`
	` result = psa->GetName(name, DINSTANCE_NAME_MAX_LENGTH);`
	`}`	

Table 7- 84 Name { get; } - .NET (C#)

Syntax	`string Name { get; }`	
Parameters	None	
Return values	Name of the instance.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.

GetCPUType()

Returns the CPU type of the virtual controller.

Table 7- 85 GetCPUType() - Native C++

Syntax	`ECPUType GetCPUType();`
Parameters	None
Return values	An enumeration element that defines the CPU type. See ECPUType (Page 289).

SetCPUType()

Sets the CPU type of the virtual controller. A change of CPU type occurs only when the controller is restarted.

Table 7- 86 SetCPUType() - Native C++

Syntax	`void SetCPUType(ECPUType in_Value);`
Parameters	• `ECPUType in_Value:` Defines which CPU type is simulated at the start of the instance. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.
Return values	None

CPUType { get; set; }

Returns or sets the CPU type of the virtual controller. A change of CPU type occurs only when the controller is restarted.

When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies.

Table 7- 87 CPUType { get; set; } - .NET (C#)

Syntax	`ECPUType CPUType { get; set; }`
Parameters	None
Return values	An enumeration element that defines the CPU type.
Exceptions	None

GetCommunicationInterface()

Returns the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 88 GetCommunicationInterface() - Native C++

Syntax	`ECommunicationInterface GetCommunicationInterface();`
Parameters	None
Return values	• `SRCI_NONE` Cannot be selected. Is returned if the instance interface is no longer valid. • `SRCI_SOFTBUS` Is returned if the virtual controller uses the Softbus. • `SRCI_TCPIP` Is returned if the virtual controller communicates over the virtual adapter.

SetCommunicationInterface()

Sets the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 89 SetCommunicationInterface() - Native C++

Syntax	`void SetCommunicationInterface(ECommunicationInterface in_Value);`
Parameters	• `SRCI_NONE` Cannot be selected. • `SRCI_SOFTBUS` Is set to activate communication via Softbus. • `SRCI_TCPIP` Is set to activate communication over the virtual adapter.
Return values	None

CommunicationInterface { get; set; }

Sets or returns the communication interface of the virtual controller: Local communication (Softbus) or TCPIP. A change of communication interface occurs only when the controller is restarted. All instances that are started must use the same communication interface.

PowerOn is prevented if a communication interface that is not used by the started instances is selected.

Table 7- 90 CommunicationInterface { get; set; } - .NET (C#)

Syntax	`ECommunicationInterface CommunicationInterface { get; set; }`
Parameters	None
Return values	• `ECommunicationInterface.None` Cannot be selected. Is returned if the instance interface is no longer valid. • `ECommunicationInterface.Softbus` Is returned if the virtual controller uses the Softbus. • `ECommunicationInterface.TCPIP` Is returned if the virtual controller communicates over the virtual adapter.
Exceptions	None

GetInfo() / Info { get; }

Returns a structure that provides information about the instance.

Table 7- 91 GetInfo() - Native C++

Syntax	`SInstanceInfo GetInfo();`
Parameters	None
Return values	`SInstanceInfo`: A structure that provides information about the instance. See SInstanceInfo (Page 278).

Table 7- 92 Info { get; } - .NET (C#)

Syntax	`SInstanceInfo Info { get; }`
Parameters	None
Return values	`SInstanceInfo`: A structure that provides information about the instance.
Exceptions	None

UnregisterInstance()

Unregisters this instance from Runtime Manager.

Note

Loss of the interfaces

Other applications that are connected to this instance will lose their interface to this instance.

Table 7- 93 UnregisterInstance() - Native C++

Syntax	`ERuntimeErrorCode UnregisterInstance();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 94 UnregisterInstance() - .NET (C#)

Syntax	`void UnregisterInstance();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.6.2 Controller - Information and settings

GetControllerName() / ControllerName { get; }

Returns the downloaded name of the virtual controller.

Table 7- 95 GetControllerName() - Native C++

Syntax	`ERuntimeErrorCode GetControllerName( WCHAR inout_Name[], UINT32 in_ArrayLength );`	
Parameters	• `WCHAR inout_Name[]:` A user-allocated storage for the name. • `UINT32 in_ArrayLength:` The length of the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The name does not fit in the storage.

Table 7- 96 ControllerName { get; } - .NET (C#)

Syntax	`string ControllerName { get; }`	
Parameters	None	
Return values	`string:` The downloaded name of the virtual controller.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetControllerShortDesignation() / ControllerShortDesignation { get; }

Returns the downloaded short designation of the virtual controller.

Table 7- 97 GetControllerShortDesignation() - Native C++

Syntax	`ERuntimeErrorCode GetControllerShortDesignation( WCHAR inout_ShortDesignation[], UINT32 in_ArrayLength );`	
Parameters	• `WCHAR inout_ShortDesignation[]:` A user-allocated storage for the short designation. • `UINT32 in_ArrayLength:` The length of the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The name does not fit in the storage.

Table 7- 98 ControllerShortDesignation { get; } - .NET (C#)

Syntax	`string ControllerShortDesignation { get; }`	
Parameters	None	
Return values	`string:` The downloaded short designation of the virtual controller.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetControllerIPCount()

Returns the number of configured IP addresses of the virtual controller. If the function fails, the return value is 0.

Table 7- 99 GetControllerIPCount() - Native C++

Syntax	`UINT32 GetControllerIPCount();`
Parameters	None
Return values	`INT32:` Number of configured IP addresses of the virtual controller.

GetControllerIP() / ControllerIP { get; }

Returns a configured IP address of the instance.

Table 7- 100 GetControllerIP() - Native C++

Syntax	`UIP GetControllerIP();`
	`UIP GetControllerIP(`
	`  UINT32 in_Index`
	`);`

Parameters	• `WCHAR in_Index:` The index of the IP address you want to receive. The index must be less than the value you receive from `GetControllerIPCount()`. The default setting is 0.
Return values	`UIP`: IP address of the virtual controller. If the function fails, the return value is 0.

Table 7- 101 ControllerIP { get; } - .NET (C#)

Syntax	`string[] ControllerIP { get; }`
Parameters	None
Return values	`string`: All downloaded IP addresses of the virtual controller. If the function fails, the field is empty.
Exceptions	None

GetControllerIPSuite4() / ControllerIPSuite4 { get; }

Returns the IP suite instance. If the "Softbus" communication interface is used, the subnet mask and default gateway are 0.

Table 7- 102 GetControllerIPSuite4() Native C++

Syntax	`SIPSuite4 GetControllerIPSuite4();`
	`SIPSuite4 GetControllerIPSuite4(`
	`  UINT32 in_Index`
	`);`

Parameters	• `WCHAR in_Index:` The index of the IP address you want to receive. The index must be less than the value you receive from `GetControllerIPCount()`. The default setting is 0.
Return values	`SIPSuite4`: The IP suite of the virtual controller. If the function fails, the return values are 0.

Table 7- 103 ControllerIPSuite4 { get; } - .NET (#)

Syntax	`SIPSuite4[] ControllerIPSuite4 { get; };`
Parameters	None
Return values	`SIPSuite4[]`: All downloaded IP suites of the virtual controller. If the function fails, the field is empty.
Exceptions	None

SetIPSuite()

Sets the IP suite of the network interface of a virtual controller.

Table 7- 104 SetIPSuite() - Native C++

Syntax	`ERuntimeErrorCode SetIPSuite(`
	` UINT32 in_InterfaceID,`
	` SIPSuite4 in_IPSuite,`
	` bool in_IsRemanent`
	`);`	

Parameters	• `UINT32 in_InterfaceID:` The ID of the network interface. • `SIPSuite4 in_IPSuite:` The IP suite that is to be assigned to the network interface. The IP suite contains the IP address, the subnet mask and the standard gateway. If the communication interface is "Softbus", the subnet mask and standard gateway are ignored. • `bool in_IsRemanent:` If `true`, the IP suite is saved after restart of the virtual controller. If the communication interface is "Softbus", this flag is ignored.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	There is no network interface with this ID.
	`SREC_INVALID_OPERATING_STATE`	The virtual controller has not yet completed the boot process or is already in the shutdown phase.

Table 7- 105 SetIPSuite() - .NET (C#)

Syntax	`void SetIPSuite(`
	` UInt32 in_InterfaceID,`
	` SIPSuite4 in_IPSuite,`
	` bool in_IsRemanent );`

Parameters	• `UInt32 in_InterfaceID:` The ID of the network interface. • `SIPSuite4 in_IPSuite:` If the communication interface is "Softbus", the subnet mask and standard gateway are ignored. • `bool in_IsRemanent:` If `true`, the IP suite is saved after restart of the virtual controller. If the communication interface is "Softbus", this flag is ignored.

Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	There is no network interface with this ID.
	`ERuntimeError-Code.InvalidOperatingState`	The virtual controller has not yet completed the boot process or is already in the shutdown phase.

GetStoragePath()

Returns the full directory in which the instance stores its data.

Table 7- 106 GetStoragePath() - Native C++

Syntax	`ERuntimeErrorCode GetStoragePath( WCHAR inout_StoragePath[], UINT32 in_ArrayLength );`	
Parameters	• `WCHAR inout_StoragePath[]:` A user-allocated storage for the storage path. The length of the array should be at least as long as `DSTORAGE_PATH_MAX_LENGTH`. See Data types (Page 257). • `UINT32 in_ArrayLength:` Length of the array (Wide character)	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The path does not fit in the storage.

SetStoragePath()

Sets the full path of the directory in which the instance stores its data. This can also be a network share.

Set the path before you start the instance. A change to the path takes effect only when the controller is restarted.

If no path is set, the default setting:
<My Documents>>\Siemens\Simatic\Simulation\Runtime\Persistence\<Instance Name> is used.

Table 7- 107 SetStoragePath() - Native C++

Syntax	`ERuntimeErrorCode SetStoragePath( WCHAR* in_StoragePath );`	
Parameters	• `WCHAR* in_StoragePath:` Full name of the storage path. The length of the name must be less than `DSTORAGE_PATH_MAX_LENGTH`. See Data types (Page 257).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX_OUT_OF_RANGE`	The length of the path exceeds the limit.
	`SREC_WRONG_ARGUMENT`	The path contains invalid characters.

StoragePath { get; set; }

Returns or sets the full path of the directory in which the instance stores its retentive data. This can also be a network share.

Set the path before you start the instance. A change to the path takes effect only when the controller is restarted.

If no path is set, the default setting:
<My Documents>>\Siemens\Simatic\Simulation\Runtime\Persistence\<Instance Name> is used.

Table 7- 108 StoragePath { get; set; } - .NET (C#)

Syntax	`string StoragePath { get; set; }`	
Parameters	None	
Return values	`string`: The configured storage path.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.IndexOutOfRange`	The length of the path exceeds the limit.
	`ERuntimeErrorCode.WrongArgument`	The path contains invalid characters.

ArchiveStorage()

The user program, the hardware configuration and the retentive data are stored in a file, the Virtual SIMATIC Memory Card. `ArchiveStorage()` stores this file as a ZIP file. The instance of the virtual controller must be in OFF operating state for this.

Table 7- 109 ArchiveStorage() - Native C++

Syntax	`ERuntimeErrorCode ArchiveStorage(`
	`  WCHAR* in_FullFileName`
	`);`	

Parameters	• `WCHAR in_FullFileName:` The full path to the ZIP file.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INVALID_OPERATING_STATE`	The instance is not in OFF operating state.
	`SREC_INVALID_ARCHIVE_PATH`	The archive path is invalid.
	`SREC_CREATE_DIRECTORIES_FAILED`	The directory for the ZIP file could not be created.
	`SREC_ARCHIVE_STORAGE_FAILED`	The ZIP file could not be created.

Table 7- 110 ArchiveStorage() - .NET (C#)

Syntax	`void ArchiveStorage(`
	`  string in_ArchiveStorageFile`
	`);`	

Parameters	• `string in_ArchiveStorageFile:` The full path to the ZIP file. The path relates to directories of the computer on which the instance runs.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InvalidOperatingState`	The instance is not in OFF operating state.
	`ERuntimeError-` `Code.InvalidArchivePath`	The archive path is invalid.
	`ERuntimeError-` `Code.CreateDirectoriesFailed`	The directory for the ZIP file could not be created.
	`ERuntimeError-` `Code.ArchiveStorageNotCreated`	The ZIP file could not be created.

RetrieveStorage()

`RetrieveStorage()` creates a Virtual SIMATIC Memory Card from the archived ZIP file. The virtual controller must be in OFF operating state for this.

Table 7- 111 RetrieveStorage() - Native C++

Syntax	`ERuntimeErrorCode RetrieveStorage( WCHAR* in_FullFileName );`	
Parameters	• `WCHAR* in_FullFileName:` The full path to the ZIP file. The path relates to directories of the computer on which the instance runs.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INVALID_OPERATING_STATE`	The instance is not in OFF operating state.
	`SREC_INVALID_ARCHIVE_PATH`	The archive path is invalid.
	`SREC_DELETE_EXISTING_STORAGE_FAILED`	The old storage cannot be deleted.
	`SREC_RETRIEVE_STORAGE_FAILURE`	The ZIP file cannot be unzipped.

Table 7- 112 RetrieveStorage() - .NET (C#)

Syntax	`void RetrieveStorage( string in_ArchiveStorageFile );`	
Parameters	• `string in_ArchiveStorageFile:` The full path to the ZIP file.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InvalidOperatingState`	The instance is not in OFF operating state.
	`ERuntimeError-Code.InvalidArchivePath`	The archive path is invalid.
	`ERuntimeError-Code.DeleteExistingStorageFailed`	The old storage cannot be deleted.
	`ERuntimeError-Code.RetrieveStorageFailure`	The ZIP file cannot be unzipped.

7.6.3 Operating state

GetOperatingState() / OperatingState { get; }

Returns the operating state of the virtual controller. If the operating state changes, the event OnOperatingStateChanged() (Page 228) is triggered. For details about the operating state, see Data types (Page 287).

Table 7- 113 GetOperatingState() - Native C++

Syntax	`EOperatingState GetOperatingState();`
Parameters	None
Return values	• `SROS_INVALID_OPERATING_STATE:` If the function fails. • `SROS_OFF:` If the Simulation Runtime instance is not running. • `SROS_BOOTING:` If `PowerOn()` was called while in this state and the virtual controller is not yet ready to start the user program. • `SROS_STOP:` If the virtual controller is in STOP state. • `SROS_STARTUP:` If the user program is currently changing from STOP to RUN. • `SROS_RUN:` If the user program is running. • `SROS_FREEZE:` If the user program is being stopped (Freeze status). • `SROS_SHUTTING_DOWN:` If `PowerOff()` was called but the virtual controller is still in the Shutdown phase.

Table 7- 114 OperatingState { get; } - .NET (C#)

Syntax	`EOperatingState OperatingState { get; }`
Parameters	None
Return values	• `EOperatingState.InvalidOperatingState:` If the function fails. • `EOperatingState.Off:` If the Simulation Runtime instance is not running. • `EOperatingState.Booting:` If `PowerOn()` was called while in this state and the virtual controller is not yet ready to start the user program. • `EOperatingState.Stop:` If the virtual controller is in STOP state. • `EOperatingState.Startup:` If the user program is currently changing from STOP to RUN. • `EOperatingState.Run:` If the user program is running. • `EOperatingState.Freeze:` If the user program is being stopped (Freeze status). • `EOperatingState.ShuttingDown`: If `PowerOff()` was called but the virtual controller is still in the Shutdown phase.

PowerOn()

The function creates the process for the Simulation Runtime instance and starts the firmware of the virtual controller.

Table 7- 115 PowerOn() - Native C++

Syntax	`ERuntimeErrorCode PowerOn();`
	`ERuntimeErrorCode PowerOn(`
	`  UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. – Expected operating states if this function is successful: `{ SROS_STOP , SROS_RUN }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_ERROR_LOADING_DLL`	The Siemens.Simatic.Simulation.Runtime.Instance.exe cannot load the Siemens.Simatic.PlcSim.Vplc1500.dll.
	`SREC_STORAGE_PATH_ALREADY_IN_USE`	The selected path for this instance is already being used by another instance.
	`SREC_NO_STORAGE_PATH_SET`	The path could not be created. The length of the `DSTORAGE_PATH_MAX_LENGTH` characters may be exceeded.
	`SREC_WARNING_ALREADY_EXISTS`	Only one warning. The instance is started.
	`SREC_WARNING_TRIAL_MODE_ACTIVE`	No license available. You can use the instance without restrictions for a period of one hour. Afterwards, the instance is shut down. The warning occurs even when you import a license within this hour. The instance is then not shut down.
	`SREC_VIRTUAL_SWITCH_MISCONFIGURED`	The virtual switch is configured incorrectly.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is no longer running.

Table 7- 116 PowerOn() - .NET (C#)

Syntax	`ERuntimeErrorCode PowerOn();`
	`ERuntimeErrorCode PowerOn(`
	`  UInt32 in_Timeout_ms`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Run, EOperatingState.Stop }`	
Return values	Runtime error code	Condition
	`ERuntimeErrorCode.OK`	The function is successful.
	`ERuntimeError-Code.WarningAlreadyExists`	Only one warning. The instance is started.
	`ERuntimeError-Code.WarningTrialModeActive`	No license available. You can use the instance without restrictions for a period of one hour. Afterwards, the instance is shut down. The warning occurs even when you import a license within this hour. The instance is then not shut down.
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-Code.ErrorLoadingDll`	The Siemens.Simatic.Simulation. Runtime.Instance.exe cannot load the Siemens.Simatic.PlcSim.Vplc1500.dll.
	`ERuntimeError-Code.StoragePathAlreadyInUse`	The selected path for this instance is already being used by another instance.
	`ERuntimeError-Code.NoStoragePathSet`	The path could not be created. The length of the `DSTORAGE_PATH_MAX_LENGTH` characters may be exceeded.
	`ERuntimeError-Code.VirtualSwitchMisconfigured`	The virtual switch is configured incorrectly.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is no longer running.

PowerOff()

Shuts down the Simulation Runtime and closes its process.

Table 7- 117 PowerOff() - Native C++

Syntax	`ERuntimeErrorCode PowerOff();`
	`ERuntimeErrorCode PowerOff(`
	`  UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ SROS_OFF }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 118 PowerOff() - .NET (C#)

Syntax	`void PowerOff();`
	`void PowerOff(`
	`  UInt32 in_Timeout_ms`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Off }`	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.

MemoryReset()

Shuts down the virtual controller, closes its processes and performs a restart.

Table 7- 119 MemoryReset() - Native C++

Syntax	`ERuntimeErrorCode MemoryReset();`
	`ERuntimeErrorCode MemoryReset(`
	`  UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ SROS_STOP , SROS_RUN }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 120 MemoryReset() - .NET (C#)

Syntax	`void MemoryReset();`
	`void MemoryReset(`
	`  UInt32 in_Timeout_ms`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Run, EOperatingState.Stop }`	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.

Run()

Calls on the virtual controller to change to RUN operating state.

Table 7- 121 Run() - Native C++

Syntax	`ERuntimeErrorCode Run();`
	`ERuntimeErrorCode Run(`
	`  UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ SROS_STOP , SROS_RUN }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 122 Run() - .NET (C#)

Syntax	`void Run();`
	`void Run(`
	`  Uint32 in_Timeout_ms`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Run }`	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.

Stop()

Calls on the virtual controller to change to STOP operating state.

Table 7- 123 Stop() - Native C++

Syntax	`ERuntimeErrorCode Stop();`
	`ERuntimeErrorCode Stop(`
	`  UINT32 in_Timeout_ms`
	`);`	

Parameters	• `UINT32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ SROS_STOP }`	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The expected operating state does not occur on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 124 Stop() - .NET (C#)

Syntax	`void Stop();`
	`void Stop(`
	`  bool in_IsSynchronous`
	`);`	

Parameters	• `UInt32 in_Timeout_ms:` A timeout value in milliseconds. – If no timeout value is set, the function returns immediately. Subscribe to the `OnOperatingStateChanged()` event to find out when the operation has been completed. – If the value is greater than 0 (a value of 60000 is recommended), the function returns when the operation has been completed or after a timeout. Expected operating states when this function is successful: `{ EOperatingState.Stop }`	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The expected operating state does not occur on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.

7.6.4 Tag list

UpdateTagList()

The function reads the tags from the virtual controller and writes them to the shared storage arranged by name.

If the tag is an array or a structure, there are multiple entries.

In the case of a structure, there is an entry for the structure itself and an additional entry for each structure element.

Entry_1: "StructName"

Entry_2: "StructName.ElementName_1"

..

Entry_N: "StructName.ElementName_n"

In the case of an array, in this example a two-dimensional array, there is an entry for the array itself and an additional entry for each array element.

Entry_1: "ArrayName"

Entry_2: "ArrayName[a,b]", where {a} and {b} correspond to the first index of the respective dimension

..

Entry_N: "ArrayName[x,y]", where {x} and {y} correspond to the last index of the respective dimension

Memory for up to 500000 entries (not PLC tags) is reserved for the list. If the list becomes too large, the function returns the error/exception "NOT_ENOUGH_MEMORY".

If there are problems with the maximum number of entries and not all tags are needed, two filters can be used when refreshing the tag table.

Table 7- 125 UpdateTagList() - Native C++

Syntax	`ERuntimeErrorCode UpdateTagList();`
	`ERuntimeErrorCode UpdateTagList(`
	`  ETagListDetails in_TagListDetails`
	`);`
	`ERuntimeErrorCode UpdateTagList(`
	`  ETagListDetails in_TagListDetails,`
	`  bool in_IsHMIVisibleOnly`
	`);`	

Parameters	• `ETagListDetails in_TagListDetails:` Every combination of the following four areas: **IO**: Inputs and Outputs **M**: Bit memory **CT**: Counters and Timers **DB**: Data Blocks **Example: IOM** reads only the tags from the area Inputs / Outputs and Bit memory. The default setting is **IOMCTDB**. • `bool in_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are read. The default setting is `true`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_NOT_ENOUGH_MEMORY`	More than 500000 entries are requested.

Table 7- 126 UpdateTagList() - .NET (C#)

Syntax	`void UpdateTagList();`
	`void UpdateTagList(`
	`  ETagListDetails in_TagListDetails`
	`);`
	`void UpdateTagList(`
	`  ETagListDetails in_TagListDetails,`
	`  bool in_IsHMIVisibleOnly`
	`);`	

Parameters	• `ETagListDetails in_TagListDetails:` Every combination of the following four areas: **IO**: Inputs and Outputs **M**: Bit memory **CT**: Counters and Timers **DB**: Data Blocks **Example: IOM** reads only the tags from the area Inputs / Outputs and Bit memory. The default setting is **IOMCTDB**. • `bool in_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are read. The default setting is `true`.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.NotEnoughMemory`	More than 500000 entries are requested.

GetTagListStatus()

Returns the current update status of the tag list storage.

"`inout_TagListDetails`" is `NONE`, if the list needs to be updated.

Table 7- 127 GetTagListStatus() - Native C++

Syntax	`ERuntimeErrorCode GetTagListStatus(`
	` ETagListDetails* out_TagListDetails,`
	` bool* out_IsHMIVisibleOnly`
	`);`	

Parameters	• `ETagListDetails out_TagListDetails:` Status of the tag list details. `SRTLD_NONE` when an update of the list is required. • `bool out_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are available in the list.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 128 GetTagListStatus() - .NET (C#)

Syntax	`void GetTagListStatus(`
	` out ETagListDetails out_TagListDetails,`
	` out bool out_IsHMIVisibleOnly`
	`);`	

Parameters	• `out ETagListDetails out_TagListDetails:` Status of the tag list details. `ETagListDetails.None` when an update of the list is required. • `out bool out_IsHMIVisibleOnly:` If `true`, only tags marked with "HMI Visible" are available in the list.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetTagInfoCount()

Returns the number of entries in the tag list storage. If the function fails, the return value is 0.

Table 7- 129 GetTagInfoCount() - Native C++

Syntax	`UINT32 GetTagInfoCount();`
Parameters	None
Return values	Number of entries in the tag list storage.

GetTagInfos() / TagInfos { get; }

Returns a list of all tags.

Table 7- 130 GetTagInfos() - Native C++

Syntax	`ERuntimeErrorCode GetTagInfos(`
	`  UINT32 in_BufferLength,`
	`  STagInfo* inout_TagInfos,`
	`  UINT32* out_TagCount`
	`);`	

Parameters	• `UINT32 in_BufferLength:` The number of elements that the storage can accommodate. • `STagInfo* inout_TagInfos:` The user-allocated storage that accommodates the tags. • `UINT32* out_TagCount:` Returns the number of tags that were written to the storage.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	The elements do not fit in the storage.

Table 7- 131 TagInfos { get; } - .NET (C#)

Syntax	`STagInfo[] TagInfos { get; }`	
Parameters	None	
Return values	An array that contains all available entries of the storage.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.

CreateConfigurationFile()

Writes all entries from the tag list to an XML file.

Table 7- 132 CreateConfigurationFile() - Native C++

Syntax	`ERuntimeErrorCode CreateConfigurationFile( WCHAR* in_FullFileName );`	
Parameters	• `WCHAR* in_FullFileName:` Full file name of the XML file: <Path> + <File name> + <File extension>.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The file name is invalid.

Table 7- 133 CreateConfigurationFile() - .NET (C#)

Syntax	`void CreateConfigurationFile( string in_FullFileName );`	
Parameters	None	
Return values	• `string in_FullFileName:` File name of the XML file that is to be written to: <Path> + <File name> + <File extension>.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The file name is invalid.

7.6.5 I/O access

7.6.5.1 I/O access via address - Reading

InputArea { get; }, MarkerArea { get; }, OutputArea { get; }

Returns an interface that you use to call the following .NET functions of section "I/O access via address".

Table 7- 134 InputArea { get; } MarkerArea { get; } OutputArea { get; } - .NET (C#)

Syntax	`IIOArea InputArea { get; }`
	`IIOArea MarkerArea { get; }`
	`IIOArea OutputArea { get; }`

Parameters	None
Return values	`IIOArea`: The interface is used to call the "I/O access via address" functions.

GetAreaSize() / AreaSize { get; }

Returns the size of the area in bytes.

Table 7- 135 GetAreaSize() - Native C++

Syntax	`UINT32 GetAreaSize(`
	`  EArea in_Area`
	`);`

Parameters	• `EArea in_Area:` The area whose size you want to receive. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286).
Return values	`UINT32`: Size of the area in bytes. If the function was successful, the value is not equal to 0.

Table 7- 136 AreaSize { get; } - .NET (C#)

Syntax	`UInt32 InputArea.AreaSize { get; }`
	`UInt32 MarkerArea.AreaSize { get; }`
	`UInt32 OutputArea.AreaSize { get; }`

Parameters	None
Return values	`Uint32`: Size of the area in bytes. If the function was successful, the value is not equal to 0.

ReadBit()

Reads an individual bit from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 137 ReadBit() - Native C++

Syntax	`ERuntimeErrorCode ReadBit(`
	` EArea in_Area,`
	` UINT32 in_Offset,`
	` UINT8 in_Bit,`
	` bool* out_Value`
	`);`	

Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT8 in_Bit:` The bit offset within the byte. The value must be between 0 and 7. • `bool* out_Value:` Returns the bit value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invaid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 138 ReadBit() - .NET (C#)

Syntax	`bool InputArea.ReadBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit`
	`);`
	`bool MarkerArea.ReadBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit`
	`);`
	`bool OutputArea.ReadBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `Byte in_Bit:` The bit offset within the byte. The value must be between 0 and 7.	
Return values	`bool:` Bit value	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset or bits are invaid.

ReadByte()

Reads an individual bit from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 139 ReadByte() - Native C++

Syntax	`ERuntimeErrorCode ReadByte( EArea in_Area, UINT32 in_Offset, BYTE* out_Value);`	
Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `BYTE* out_Value:` Returns the byte value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset is invalid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 140 ReadByte() - .NET (C#)

Syntax	`Byte InputArea.ReadByte(`
	`  UInt32 in_Offset`
	`);`
	`Byte MarkerArea.ReadByte(`
	`  UInt32 in_Offset`
	`);`
	`Byte OutputArea.ReadByte(`
	`  UInt32 in_Offset`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns.	
Return values	`Byte:` Byte value.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset is invalid.

ReadBytes()

Reads a byte array from the area.

Note

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 141 ReadByte() - Native C++

Syntax	`ERuntimeErrorCode ReadBytes(`
	` EArea in_Area,`
	` UINT32 in_Offset,`
	` UINT32 in_BytesToRead,`
	` UINT32* out_BytesRead,`
	` BYTE inout_Values[]`
	`);`	

Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT32 in_BytesToRead:` Contains the size of the value storage. • `UINT32* out_BytesRead:` Returns the number of bytes that were just written to the value storage. • `BYTE inout_Values[]:` The storage for the bytes that are read from the area.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	The offset is outside the area size. No byte could be read.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 142 ReadBytes() - .NET (C#)

Syntax	`Byte[] InputArea.ReadBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToRead`
	`);`
	`Byte[] MarkerArea.ReadBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToRead`
	`);`
	`Byte[] OutputArea.ReadBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToRead`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `UInt32 in_BytesToRead:` The number of bytes to be read.	
Return values	`Byte[]:` The read bytes.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	The offset is outside the area size. No byte could be read.

ReadSignals()

Reads a signal list altogether (structures and arrays). The function also takes into consideration the byte order (Endianness).

Only primitive data type signals are supported, but the function is not typical.

Note

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 143 ReadSignals() - Native C++

Syntax	`ERuntimeErrorCode ReadSignals(`
	` EArea in_Area,`
	` SDataValueByAddress* inout_Signals,`
	` UINT32 in_SignalCount`
	`);`	

Parameters	• `EArea in_Area:` The area from which you want to read. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `SDataValueByAddress* inout_Signals:` The signal list to be read. The result is stored in the structure. • `UINT32 in_SignalCount:` Number of signals in the list.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invaid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 144 ReadSignals() - .NET (C#)

Syntax	`void ReadSignals(`
	` ref SDataValueByAddress[] inout_Signals`
	`);`	

Parameters	• `ref SDataValueByAddress[] inout_Signals:` The signal list to be read.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-` `Code.IndexOutOfRange`	Offset or bits are invaid.

7.6.5.2 I/O access via address - Writing

WriteBit()

Writes an individual bit to the area.

Note
Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 145 WriteBit() - Native C++

Syntax	`ERuntimeErrorCode WriteBit(`
	` EArea in_Area,`
	` UINT32 in_Offset,`
	` UINT8 in_Bit,`
	` bool in_Value`
	`);`	

Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT8 in_Bit:` The bit offset within the byte. The value must be between 0 and 7. • `bool in_Value:` Bit value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invaid.
	`SREC_WRONG_ARGUMENT`	Area is invalid.

Table 7- 146 WriteBit() - .NET (C#)

Syntax	`void InputArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`
	`void MarkerArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`
	`void OutputArea WriteBit(`
	` UInt32 in_Offset,`
	` Byte in_Bit,`
	` bool in_Value`
	`);`	

Parameters	• `UInt32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `Byte in_Bit:` The bit offset within the byte. The value must be between 0 and 7. • `bool in_Value:` Bit value.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset or bits are invaid.

WriteByte()

Writes an individual byte to the area.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 147 WriteByte() - Native C++

Syntax	`ERuntimeErrorCode WriteByte( EArea in_Area, UINT32 in_Offset, BYTE in_Value);`	
Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `BYTE in_Value:` Byte value.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset is invalid.
	`SREC_WRONG_ARGUMENT`	Area is invalid.

Table 7- 148 WriteByte() - .NET (C#)

Syntax	`void InputArea.WriteByte(`
	` UInt32 in_Offset,`
	` Byte in_Value`
	`);`
	`void MarkerArea.WriteByte(`
	` UInt32 in_Offset,`
	` Byte in_Value`
	`);`
	`void OutputArea.WriteByte(`
	` UInt32 in_Offset,`
	` Byte in_Value`
	`);`	

Parameters	• `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `BYTE in_Value:` Byte value.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-Code.IndexOutOfRange`	Offset is invalid.

WriteBytes()

Writes a byte array to the area.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 149 WriteBytes() - Native C++

Syntax	`ERuntimeErrorCode WriteBytes(`
	` EArea in_Area,`
	` UINT32 in_Offset,`
	` UINT32 in_BytesToWrite,`
	` UINT32* out_BytesWritten,`
	` BYTE in_Values[])`
	`;`	

Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `GetAreaSize()` returns. • `UINT32 in_BytesToWrite:` Contains the size of the array value to be written. • `UINT32* out_BytesWritten:` Contains the number of bytes that were just written. • `BYTE in_Values[]:` Byte array that is to be written to the area.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	The offset is outside the area size. No byte could be written.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 150 WriteBytes() - .NET (C#)

Syntax	`UInt32 InputArea.WriteBytes(`
	` UInt32 in_Offset,`
	` Byte[] in_Values`
	`);`
	`UInt32 InputArea.WriteBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToWrite,`
	` Byte[] in_Values`
	
	`);`
	`UInt32 MarkerArea.WriteBytes(`
	` UInt32 in_Offset,`
	` Byte[] in_Values`
	`);`
	`UInt32 MarkerArea.WriteBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToWrite,`
	` Byte[] in_Values`
	`);`
	`UInt32 OutputArea.WriteBytes(`
	` UInt32 in_Offset,`
	` Byte[] in_Values`
	`);`
	`UInt32 OutputArea.WriteBytes(`
	` UInt32 in_Offset,`
	` UInt32 in_BytesToWrite,`
	` Byte[] in_Values`
	`);`

Parameters	• `UINT32 in_Offset:` The byte offset within the area. The value must be between 0 and the value that `AreaSize` returns. • `UInt32 in_BytesToWrite:` Contains the number of bytes to be written. The value must be between 1 and the size of the array value. • `BYTE in_Value:` Byte value.
Return values	`Uint32:` Contains the number of bytes that were just written.
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`

Runtime error code	Condition
`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
`ERuntimeErrorCode.Timeout`	The function does not return on time.
`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
`ERuntimeError-Code.IndexOutOfRange`	The offset is outside the area size. No byte could be written.

WriteSignals()

Writes a signal list altogether (structures and arrays). The function also takes into consideration the byte order (Endianness).

The function supports only primitive data type signals. The function is not typical, however.

Note

Data can be overwritten

The function allows access to the entire storage area of the virtual controller.

Recommendation: Therefore, use access via the tag name and not via the address areas.

Table 7- 151 WriteSignals() - Native C++

Syntax	`ERuntimeErrorCode WriteSignals(`
	` EArea in_Area,`
	` SDataValueByAddress* in_Signals,`
	` UINT32 in_SignalCount`
	`);`	

Parameters	• `EArea in_Area:` The area that is to be written. Permissible values: `{SRA_INPUT, SRA_MARKER, SRA_OUTPUT}`. See EArea (Page 286). • `SDataValueByAddress* inout_Signals:` The signal list to be written. • `UINT32 in_SignalCount:` Number of signals in the list.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_INDEX_OUT_OF_RANGE`	Offset or bits are invaid.
	`SREC_WRONG_ARGUMENT`	The area is invalid.

Table 7- 152 WriteSignals() - .NET (C#)

Syntax	`void InputArea.WriteSignals(`
	`  SDataValueByAddress[] in_Signals`
	`);`
	`void MarkerArea.WriteSignals(`
	`  SDataValueByAddress[] in_Signals`
	`);`
	`void OutputArea.WriteSignals(`
	`  SDataValueByAddress[] in_Signals`
	`);`	

Parameters	• `SDataValueByAddress[] in_Signals:` The signal list to be written.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeError-` `Code.IndexOutOfRange`	Offset or bits are invaid.

7.6.5.3 I/O access via tag name - Reading

Read()

Reads the value of a PLC tag.

Table 7- 153 Read() - Native C++

Syntax	`ERuntimeErrorCode Read(`
	`  WCHAR* in_Tag,`
	`  SDataValue* inout_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `SDataValue* inout_Value:` Contains the value and the expected type of the PLC tag. If the expected type is `UNSPECIFIC`, it is set to the stored type when the function was successful. The `STRUCT` type is not supported. Structures and arrays can be read altogether with ReadSignals().	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 154 Read() - .NET (C#)

Syntax	`SDataValue Read(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`SDataValue:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types.
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadBool()

Reads the value of a PLC tag.

Table 7- 155 ReadBool() - Native C++

Syntax	`ERuntimeErrorCode ReadBool(`
	` WCHAR* in_Tag,`
	` bool* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `bool* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 156 ReadBool() - .NET (C#)

Syntax	`bool ReadBool(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`bool:` Contains the value of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt8()

Reads the value of a PLC tag.

Table 7- 157 ReadInt8() - Native C++

Syntax	`ERuntimeErrorCode ReadInt8(`
	` WCHAR* in_Tag,`
	` INT8* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT8* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 158 ReadInt8() - .NET (C#)

Syntax	`Int8 ReadInt8(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int8:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt16()

Reads the value of a PLC tag.

Table 7- 159 ReadInt16() - Native C++

Syntax	`ERuntimeErrorCode ReadInt16(`
	`  WCHAR* in_Tag,`
	`  INT16* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT16* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 160 ReadInt16() - .NET (C#)

Syntax	`Int16 ReadInt16(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int16:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt32()

Reads the value of a PLC tag.

Table 7- 161 ReadInt32() - Native C++

Syntax	`ERuntimeErrorCode ReadInt32(`
	`  WCHAR* in_Tag,`
	`  INT32* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT32* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 162 ReadInt32() - .NET (C#)

Syntax	`Int32 ReadInt32(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int32:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadInt64()

Reads the value of a PLC tag.

Table 7- 163 ReadInt64() - Native C++

Syntax	`ERuntimeErrorCode ReadInt64(`
	`  WCHAR* in_Tag,`
	`  INT64* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `INT64* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 164 ReadInt64() - .NET (C#)

Syntax	`Int64 ReadInt64(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Int64:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt8()

Reads the value of a PLC tag.

Table 7- 165 ReadUInt8() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt8(`
	` WCHAR* in_Tag,`
	` UINT8* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT8* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 166 ReadUInt8() - .NET (C#)

Syntax	`UInt8 ReadUInt8(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt8:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt16()

Reads the value of a PLC tag.

Table 7- 167 ReadUInt16() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt16(`
	` WCHAR* in_Tag,`
	` UINT16* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT16* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 168 ReadUInt16() - .NET (C#)

Syntax	`UInt16 ReadUInt16(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt16:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt32()

Reads the value of a PLC tag.

Table 7- 169 ReadUInt32() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt32(`
	` WCHAR* in_Tag,`
	` UINT32* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT32* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 170 ReadUInt32() - .NET (C#)

Syntax	`UInt32 ReadUInt32(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`Uint32:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadUInt64()

Reads the value of a PLC tag.

Table 7- 171 ReadInt64() - Native C++

Syntax	`ERuntimeErrorCode ReadUInt64(`
	`  WCHAR* in_Tag,`
	`  UINT64* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `UINT64* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 172 ReadUInt64() - .NET (C#)

Syntax	`UInt64 ReadUInt64(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`UInt64:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadFloat()

Reads the value of a PLC tag.

Table 7- 173 ReadFloat() - Native C++

Syntax	`ERuntimeErrorCode ReadFloat(`
	` WCHAR* in_Tag,`
	` float* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `float* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 174 ReadFloat() - .NET (C#)

Syntax	`float ReadFloat(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`float:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadDouble()

Reads the value of a PLC tag.

Table 7- 175 ReadDouble() - Native C++

Syntax	`ERuntimeErrorCode ReadDouble(`
	` WCHAR* in_Tag,`
	` double* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `double* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 176 ReadDouble() - .NET (C#)

Syntax	`double ReadDouble(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`double:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadChar()

Reads the value of a PLC tag.

Table 7- 177 ReadChar() - Native C++

Syntax	`ERuntimeErrorCode ReadChar(`
	` WCHAR* in_Tag,`
	` char* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `char* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 178 ReadChar() - .NET (C#)

Syntax	`sbyte ReadChar(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`sbyte:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadWChar()

Reads the value of a PLC tag.

Table 7- 179 ReadWChar() - Native C++

Syntax	`ERuntimeErrorCode ReadWChar(`
	` WCHAR* in_Tag,`
	` WCHAR* out_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be read. • `WCHAR* out_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 180 ReadWChar() - .NET (C#)

Syntax	`char ReadWChar(`
	`  string in_Tag`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be read.	
Return values	`char:` Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

ReadSignals()

Reads multiple signals within an API call.

Reads multiple signals within a single API call.

Table 7- 181 ReadSignals() - Native C++

Syntax	`ERuntimeErrorCode ReadSignals(`
	` SDataValueByName* inout_Signals,`
	` UINT32 in_SignalCount`
	`);`	

Parameters	• `SDataValueByName* inout_Signals:` Contains the name, the value and the expected type of the PLC tag. If the expected type is `UNSPECIFIC`, it is set to the stored type when the function was successful. The `STRUCT` type is not supported. • `UINT32 in_SignalCount:` The number of signals to be read.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 182 ReadSignals() - .NET (C#)

Syntax	`void ReadSignals(`
	`  ref SDataValueByName[] inout_Signals`
	`)`	

Parameters	• `ref SDataValueByName[] inout_Signals:` Contains the name, the value and the expected type of the PLC tag. If the expected type is `UNSPECIFIC`, it is set to the stored type when the function was successful. The `STRUCT` type is not supported.	
Return values	`SDataValue`: Contains the value and the type of the PLC tag.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

7.6.5.4 I/O access via tag name - Writing

Write()

Writes the value of a PLC tag.

Table 7- 183 Write() - Native C++

Syntax	`ERuntimeErrorCode Write(`
	` WCHAR* in_Tag,`
	` SDataValue* in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `SDataValue* in_Value:` Contains the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported. Structures and arrays can be written altogether with `WriteSignals()`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.
	`SREC_WRONG_ARGUMENT`	The expected type is `UNSPECIFIC`.

Table 7- 184 Write() - .NET (C#)

Syntax	`void Write(`
	` string in_Tag`
	` SDataValue in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `SDataValue in_Value:` Contains the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported. Structures and arrays can be written altogether with `WriteSignals()`.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.
	`ERuntimeErrorCode.WrongArgument`	The expected type is `UNSPECIFIC`.

WriteBool()

Writes the value of a PLC tag.

Table 7- 185 WriteBool() - Native C++

Syntax	`ERuntimeErrorCode WriteBool(`
	` WCHAR* in_Tag,`
	` bool in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `bool in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 186 WriteBool() - .NET (C#)

Syntax	`void WriteBool(`
	` string in_Tag`
	` bool in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `bool in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types.
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt8()

Writes the value of a PLC tag.

Table 7- 187 WriteInt8() - Native C++

Syntax	`ERuntimeErrorCode WriteInt8(`
	` WCHAR* in_Tag,`
	` INT8 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT8 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 188 WriteInt8() - .NET (C#)

Syntax	`void WriteInt8(`
	` string in_Tag`
	` Int8 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int8 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt16()

Writes the value of a PLC tag.

Table 7- 189 WriteInt16() - Native C++

Syntax	`ERuntimeErrorCode WriteInt16(`
	`  WCHAR* in_Tag,`
	`  INT16 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT16 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 190 WriteInt16() - .NET (C#)

Syntax	`void WriteInt16(`
	` string in_Tag`
	` Int16 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int16 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt32()

Writes the value of a PLC tag.

Table 7- 191 WriteInt32() - Native C++

Syntax	`ERuntimeErrorCode WriteInt32(`
	`  WCHAR* in_Tag,`
	`  INT32 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT32 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 192 WriteInt32() - .NET (C#)

Syntax	`void WriteInt32(`
	` string in_Tag`
	` Int32 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int32 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt64()

Writes the value of a PLC tag.

Table 7- 193 WriteInt64() - Native C++

Syntax	`ERuntimeErrorCode WriteInt64(`
	` WCHAR* in_Tag,`
	` INT64 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `INT64 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 194 WriteInt64() - .NET (C#)

Syntax	`void WriteInt64(`
	` string in_Tag`
	` Int64 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `Int64 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteInt8()

Writes the value of a PLC tag.

Table 7- 195 WriteUInt8() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt8(`
	` WCHAR* in_Tag,`
	` UINT8 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT8 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 196 WriteUInt8() - .NET (C#)

Syntax	`void WriteUInt8(`
	` string in_Tag`
	` UInt8 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt8 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteUInt16()

Reads the value of a PLC tag.

Table 7- 197 WriteUInt16() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt16(`
	` WCHAR* in_Tag,`
	` UINT16 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT16 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 198 WriteUInt16() - .NET (C#)

Syntax	`void WriteUInt16(`
	` string in_Tag`
	` UInt16 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt16 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteUInt32()

Writes the value of a PLC tag.

Table 7- 199 WriteUInt32() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt32(`
	`  WCHAR* in_Tag,`
	`  UINT32 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT32 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 200 WriteUInt32() - .NET (C#)

Syntax	`void WriteUInt32(`
	` string in_Tag`
	` UInt32 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt32 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteUInt64()

Writes the value of a PLC tag.

Table 7- 201 WriteUInt64() - Native C++

Syntax	`ERuntimeErrorCode WriteUInt64(`
	`  WCHAR* in_Tag,`
	`  UINT64 in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `UINT64 in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 202 WriteUInt64() - .NET (C#)

Syntax	`void WriteUInt64(`
	` string in_Tag`
	` UInt64 in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `UInt64 in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteFloat()

Writes the value of a PLC tag.

Table 7- 203 WriteFloat() - Native C++

Syntax	`ERuntimeErrorCode WriteFloat(`
	` WCHAR* in_Tag,`
	` float in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `float in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 204 WriteFloat() - .NET (C#)

Syntax	`void WriteFloat(`
	` string in_Tag`
	` float in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `float in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteDouble()

Writes the value of a PLC tag.

Table 7- 205 WriteDouble() - Native C++

Syntax	`ERuntimeErrorCode WriteDouble(`
	` WCHAR* in_Tag,`
	` double in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `double in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 206 WriteDouble() - .NET (C#)

Syntax	`void WriteDouble(`
	` string in_Tag`
	` double in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `double in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteChar()

Writes the value of a PLC tag.

Table 7- 207 WriteChar() - Native C++

Syntax	`ERuntimeErrorCode WriteChar(`
	` WCHAR* in_Tag,`
	` char in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `char in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 208 WriteChar() - .NET (C#)

Syntax	`void WriteChar(`
	` string in_Tag`
	` sbyte in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `sbyte in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteWChar()

Writes the value of a PLC tag.

Table 7- 209 WriteWChar() - Native C++

Syntax	`ERuntimeErrorCode WriteWChar(`
	`  WCHAR* in_Tag,`
	`  WCHAR in_Value`
	`);`	

Parameters	• `WCHAR* in_Tag:` The name of the PLC tag that is to be written. • `WCHAR in_Value:` Contains the value of the PLC tag.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.

Table 7- 210 WriteWChar() - .NET (C#)

Syntax	`void WriteWChar(`
	` string in_Tag`
	` char in_Value`
	`)`	

Parameters	• `string in_Tag:` The name of the PLC tag that is to be written. • `char in_Value:` Contains the value of the PLC tag.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMissmatch`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.

WriteSignals()

Writes multiple signals within an API call.

Table 7- 211 WriteSignals() - Native C++

Syntax	`ERuntimeErrorCode WriteSignals(`
	`  SDataValueByName* inout_Signals,`
	`  UINT32 in_SignalCount`
	`);`	

Parameters	• `SDataValueByName* inout_Signals:` Contains the name, the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported. • `UINT32 in_SignalCount:` Number of signals.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_DOES_NOT_EXIST`	The entry does not exist in the stored tag list.
	`SREC_NOT_SUPPORTED`	Access to entire structures or arrays is not supported.
	`SREC_TYPE_MISMATCH`	The expected type does not match the stored type. See Compatible primitive data types (Page 294).
	`SREC_NOT_UP_TO_DATE`	The stored tag list must be updated.
	`SREC_WRONG_ARGUMENT`	The expected type is `UNSPECIFIC`.

Table 7- 212 WriteSignals() - .NET (C#)

Syntax	`void WriteSignals(`
	` SDataValueByName[] in_Signals`
	`)`	

Parameters	• `SDataValueByName:` Contains the name, the value and the expected type of the PLC tag. The `UNSPECIFIC` and `STRUCT` types are not supported.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.DoesNotExist`	The entry does not exist in the stored tag list.
	`ERuntimeErrorCode.NotSupported`	Access to entire structures or arrays is not supported.
	`ERuntimeErrorCode.TypeMismatch`	The expected type does not match the stored type. See Compatible primitive data types.
	`ERuntimeErrorCode.NotUpToData`	The stored tag list must be updated.
	`ERuntimeErrorCode.WrongArgument`	The expected type is `UNSPECIFIC`.

7.6.6 Settings for the virtual time

GetSystemTime()

Returns the virtual system time of the virtual controller. Returns an empty structure when the function fails.

Table 7- 213 GetSystemTime() - Native C++

Syntax	`SYSTEMTIME GetSystemTime();`
Parameters	None
Return values	`SYSTEMTIME`: System time of the virtual controller.

SetSystemTime()

Sets the virtual system time of the virtual controller. A system time between "Jan 1 1970 00:00:00:000" and "Dec 31 2200 23:59:59:999" is valid.

Table 7- 214 SetSystemTime() - Native C++

Syntax	`ERuntimeErrorCode SetSystemTime( SYSTEMTIME in_SystemTime );`	
Parameters	• `SYSTEMTIME in_SystemTime:` System time that is to be set for the virtual controller.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

SystemTime { get; set; }

Sets or returns the virtual system time of the virtual controller. A system time between "Jan 1 1970 00:00:00:000" and "Dec 31 2200 23:59:59:999" is valid.

Table 7- 215 SystemTime { get; set; } - .NET (C#)

Syntax	`DateTime SystemTime { get; set; }`	
Parameters	None	
Return values	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

GetScaleFactor()

Returns the scaling factor with which the virtual time advances.

Table 7- 216 GetScaleFactor() - Native C++

Syntax	`double GetScaleFactor();`
Parameters	None
Return values	`double`: Scaling factor of the virtual time.

SetScaleFactor()

Sets the scaling factor with which the virtual time advances.

Start with a small scaling factor and incrementally approach a scaling factor at which the virtual controller remains in RUN.

A value between 0.01 and 100 is valid. The default setting is 1.

- If the value is less than 1, the virtual time of the virtual controller runs X-times slower than the real time.
- If the value is greater than 1, the virtual time of the virtual controller runs X-times faster than the real time.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 217 SetScaleFactor() - Native C++

Syntax	`ERuntimeErrorCode SetScaleFactor ( double in_Value );`	
Parameters	• `double in_Value:` Scaling factor of the virtual time.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

ScaleFactor { get; set; }

Sets or returns the scaling factor with which the virtual time advances.

Start with a small scaling factor and incrementally approach a scaling factor at which the virtual controller remains in RUN.

A value between 0.01 and 100 is valid. The default setting is 1.

- If the value is less than 1, the virtual time of the virtual controller runs X-times slower than the real time.
- If the value is greater than 1, the virtual time of the virtual controller runs X-times faster than the real time.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 218 ScaleFactor { get; set; } - .NET (C#)

Syntax	`double ScaleFactor { get; set; }`	
Parameters	None	
Return values	`double`: Scaling factor of the virtual time.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

7.6.7 Cycle control

GetOperatingMode()

Returns the operating mode of the virtual controller.

Table 7- 219 GetOperatingMode() - Native C++

Syntax	`EOperatingMode GetOperatingMode();`
Parameters	None
Return values	`EOperatingMode`: Operating mode of the virtual controller

SetOperatingMode()

Sets the operating mode of the virtual controller.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 220 SetOperatingMode() - Native C++

Syntax	`void SetOperatingMode( EOperatingMode in_OperatingMode );`	
Parameters	• `EOperatingMode in_OperatingMode:` Operating mode of the virtual controller	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

OperatingMode { get; set; }

Returns or sets the operating mode of the virtual controller.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 221 OperatingMode { get; set; } - .NET (C#)

Syntax	`EOperatingMode OperatingMode { get; set; }`	
Parameters	None	
Return values	`EOperatingMode`: Operating mode of the virtual controller	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

SetAlwaysSendOnEndOfCycleEnabled()

Sets the `AlwaysSendOnEndOfCycle` *mode.* If the mode is set, the `OnEndOfCycle` event is triggered after every cycle end for each operating mode. If the event is also to be received in `Default` operating mode, set the return value to `true`. See OnEndOfCycle (Page 232).

Table 7- 222 SetAlwaysSendOnEndOfCycleEnabled() - Native C++

Syntax	`ERuntimeErrorCode SetAlwaysSendOnEndOfCycleEnabled( bool in_Enable );`	
Parameters	• `bool in_Enable:` If `true`, the `OnEndOfCycle` event is triggered after every cycle.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

IsAlwaysSendOnEndOfCycleEnabled()

Returns the `AlwaysSendOnEndOfCycle` mode. When the function fails, the return value is `false`.

Table 7- 223 IsAlwaysSendOnEndOfCycleEnabled() - Native C++

Syntax	`bool IsAlwaysSendOnEndOfCycleEnabled();`
Parameters	None
Return values	• `false`: The event is not triggered (unless the Sync-Freeze mode is active). • `true`: The event is triggered after every cycle.

IsAlwaysSendOnEndOfCycleEnabled { get; set; }

Returns or sets the `AlwaysSendOnEndOfCycle` *mode.* If the mode is set, the `OnEndOfCycle` event is triggered after every cycle end for each operating mode. If the event is also to be received in `Default` operating mode, set the return value to `true`. See OnEndOfCycle (Page 232).

Table 7- 224 IsAlwaysSendOnEndOfCycleEnabled { get; set; } - .NET (C#)

Syntax	`bool IsAlwaysSendOnEndOfCycleEnabled { get; set;}`	
Parameters	None	
Return values	• `false`: The event is not triggered (unless the Sync-Freeze mode is active). • `true`: The event is triggered after every cycle.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

GetOverwrittenMinimalCycleTime_ns()

Returns the overwritten minimum cycle time (in nanoseconds) that is used in the `ExtendedSingleStep` operating mode.

Table 7- 225 GetOverwrittenMinimalCycleTime_ns() - Native C++

Syntax	`INT64 GetOverwrittenMinimalCycleTime_ns();`
Parameters	None
Return values	`INT64`: The overwritten minimum cycle time in nanoseconds.

SetOverwrittenMinimalCycleTime_ns()

Sets the overwritten minimum cycle time (in nanoseconds) that is used in the `ExtendedSingleStep` operating mode.

A value between 0 and 6000000000 is valid. The default setting is 100 ms.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 226 SetOverwrittenMinimalCycleTime_ns() - Native C++

Syntax	`ERuntimeErrorCode SetOverwrittenMinimalCycleTime_ns( INT64 in_CycleTime_ns );`	
Parameters	• `INT64 in_CycleTime_ns:` The overwritten minimum cycle time in nanoseconds.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The value is outside the limits.

OverwrittenMinimalCycleTime_ns { get; set; }

Returns or sets the overwritten minimum cycle time in nanoseconds that is used in the `ExtendedSingleStep` operating mode.

A value between 0 and 6000000000 is valid. The default setting is 100 ms.

A change in the value during runtime only takes effect at the cycle control point.

Table 7- 227 OverwrittenMinimalCycleTime_ns { get; set; } - .NET (C#)

Syntax	`Int64 OverwrittenMinimalCycleTime_ns { get; set; }`	
Parameters	None	
Return values	`Int64:` The overwritten minimum cycle time in nanoseconds.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The value is outside the limits.

RunNextCycle()

If the virtual controller is being operated in `SingleStep` or `ExtendedSingleStep` operating mode, it is stopped at the cycle control point (Freeze state). The `RunNextCycle()` function is used to trigger the next cycle.

Table 7- 228 RunNextCycle() - Native C++

Syntax	`ERuntimeErrorCode RunNextCycle();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.

Table 7- 229 RunNextCycle() - .NET (C#)

Syntax	`void RunNextCycle();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-Code.InstanceNotRunning`	The process of the virtual controller is not running.

StartProcessing()

If the virtual controller is running in `TimespanSynchronized` operating mode, it is stopped at the cycle control point (Freeze state). The `StartProcessing()` function wakes up the virtual controller from the Freeze state. The virtual controller will now run for at least the requested time before it changes to Freeze state (stops) at the next cycle control point.

Table 7- 230 StartProcessing() - Native C++

Syntax	`ERuntimeErrorCode StartProcessing(`
	`  INT64 in_MinimalTimeToRun_ns`
	`);`	

Parameters	• `INT64 in_CycleTime_ns:` The minimum virtual time (in nanoseconds) that the virtual controller runs before it changes to Freeze state.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The instance is not registered in Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INSTANCE_NOT_RUNNING`	The process of the virtual controller is not running.
	`SREC_WRONG_ARGUMENT`	The value is less than 0.

Table 7- 231 StartProcessing() - .NET (C#)

Syntax	`void StartProcessing(`
	`  Int64 in_MinimalTimeToRun_ns`
	`);`	

Parameters	• `Int64 in_CycleTime_ns:` The minimum virtual time (in nanoseconds) that the virtual controller runs before it changes to Freeze state.	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The instance is not registered in Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeError-` `Code.InstanceNotRunning`	The process of the virtual controller is not running.
	`ERuntimeErrorCode.WrongArgument`	The value is less than 0.

Additional information

For more information, please refer to the section titled Time response (Page 58), Stopping the simulation (Page 61)

OnOperatingStateChanged (Page 228)

7.6.8 Events

Events for IInstances

The following events are differentiated in the API:

Table 7- 232 Events for the IInstances interface

Event	Cause
OnOperatingStateChanged (Page 228)	This event is always triggered when the operating state of the virtual controller has changed.
OnEndOfCycle (Page 232)	This event is triggered when the virtual controller reaches the end of the main cycle. If the virtual controller is being operated in Default operating mode, the `AlwaysSendOnEndOfCycle` flag must be set to receive the event. See AlwaysSendOnEndOfCycle (Page 221).
OnConfigurationChanging (Page 234)	This event is triggered when changing of the configuration of the virtual controller starts. • During power up from the Virtual SIMATIC Memory Card • At the start of a download When this event is triggered, the stored tag list is reset.
OnConfigurationChanged (Page 237)	This event is triggered when the configuration of the virtual controller has changed: • After power up from the Virtual SIMATIC Memory Card • At the end of a download • When the IP address changes
OnLedChanged (Page 239)	This event is triggered when the LED display of the virtual controller has changed.

7.6.8.1 OnOperatingStateChanged

OnOperatingStateChanged

Registers or unregisters an event handler method.

Table 7- 233 OnOperatingStateChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_EOS_EOS OnOperatingStateChanged;`
Parameters	None. See Delegate_II_EREC_DT_EOS_EOS (Page 266).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnOperatingStateChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 234 RegisterOnOperatingStateChangedCallback() - Native C++

Syntax	`void RegisterOnOperatingStateChangedCallback(`
	`  EventCallback_II_SREC_ST_SROS_SROS in_CallbackFunction`
	`);`

Parameters	• `EventCallback_II_SREC_ST_SROS_SROS in_CallbackFunction:` A callback function that subscribes to the event. See EventCallback_II_SREC_ST_SROS_SROS (Page 260).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnOperatingStateChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 235 RegisterOnOperatingStateChangedEvent() - Native C++

Syntax	`void RegisterOnOperatingStateChangedEvent();`
	`void RegisterOnOperatingStateChangedEvent(`
	`HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

Example C++	`// Thread 1 ----------`
	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = ZERO;`
	`if (result == SREC_OK)`
	`{`
	`result = api->RegisterInstance(&psa);`
	`}`
	
	`// Register the internal event object`
	`psa->RegisterOnOperatingStateChangedEvent();`
	
	`// Thread 2 ----------`
	`while (condition)`
	`{`
	`// Wait for the event to be set (timeout after 10s)`
	`bool isEventSet = psa->WaitForOnOperatingStateChangedEvent(10000);`
	`if (isEventSet)`
	`{`
	`// Do Something`
	`…`
	`}`
	`}`

Example C++	`// Thread 1 ----------------------------------------------------`
	`ISimulationRuntimeManager * api = ZERO;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = ZERO;`
	`if (result == SREC_OK)`
	`{`
	` result = api->RegisterInstance(&psa);`
	`}`
	
	`// Create an event object`
	`HANDLE eventHandle = CreateEvent(ZERO, FALSE, FALSE, ZERO);`
	
	`// Register the user created event object`
	`psa->RegisterOnOperatingStateChangedEvent(&eventHandle);`
	
	`// Do Something`
	`…`
	`// Clean up the handle`
	`CloseHandle(eventHandle);`
	
	`// Thread 2 ----------------------------------------------------`
	`while (condition)`
	`{`
	` // Wait for the event to be set //OR:`
	` WaitForSingleObject(eventHandle, INFINITE); //psa->WaitForOnOperatingStateChangedEvent();`
	
	` // Do Something`
	` …`
	`}`

UnregisterOnOperatingStateChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 236 UnregisterOnOperatingStateChangedCallback() - Native C++

Syntax	`void UnregisterOnOperatingStateChangedCallback();`
Parameters	None
Return values	None

UnregisterOnOperatingStateChangedEvent()

Unregisters the event object.

Table 7- 237 UnregisterOnOperatingStateChangedEvent() - Native C++

Syntax	`void UnregisterOnOperatingStateChangedEvent();`
Parameters	None
Return values	None

Table 7- 238 UnregisterOnOperatingStateChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnOperatingStateChangedEvent();`
Parameters	None
Return values	None

WaitForOnOperatingStateChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 239 WaitForOnOperatingStateChangedEvent() - Native C++

Syntax	`bool WaitForOnOperatingStateChangedEvent();`
	`bool WaitForOnOperatingStateChangedEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true`: If the event object was set to the signaled state. • `false`: If no event was received during the defined time limit.

Table 7- 240 WaitForOnOperatingStateChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnOperatingStateChangedEvent();`
	`bool WaitForOnOperatingStateChangedEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true`: If the event object was set to the signaled state. • `false`: If no event was received during the defined time limit.

7.6.8.2 OnEndOfCycle

OnEndOfCycle

Registers or unregisters an event handler method.

Table 7- 241 OnEndOfCycle - .NET (C#)

Syntax	`event Delegate_II_EREC_DT OnEndOfCycle;`
Parameters	None. See Delegate_II_EREC_DT (Page 265).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnEndOfCycleCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 242 RegisterOnEndOfCycleCallback() - Native C++

Syntax	`void RegisterOnEndOfCycleCallback(`
	`  EventCallback_II_SREC_ST in_CallbackFunction`
	`);`

Parameters	• `EventCallback_II_SREC_ST in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST (Page 259).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnEndOfCycleEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 243 RegisterOnEndOfCycleEvent() - Native C++

Syntax	`void RegisterOnEndOfCycleEvent();`
	`void RegisterOnEndOfCycleEvent(`
	`  HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnEndOfCycleCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 244 UnregisterOnEndOfCycleCallback() - Native C++

Syntax	`void UnregisterOnEndOfCycleCallback();`
Parameters	None
Return values	None

UnregisterOnEndOfCycleEvent()

Unregisters the event object.

Table 7- 245 RegisterOnEndOfCycleEvent() - Native C++

Syntax	`void UnregisterOnEndOfCycleEvent();`
Parameters	None
Return values	None

Table 7- 246 UnregisterOnEndOfCycleEvent() - .NET (C#)

Syntax	`void UnregisterOnEndOfCycleEvent();`
Parameters	None
Return values	None

WaitForOnEndOfCycleEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 247 WaitForOnEndOfCycleEvent() - Native C++

Syntax	`bool WaitForOnEndOfCycleEvent();`
	`bool WaitForOnEndOfCycleEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 248 WaitForOnEndOfCycleEvent() - .NET (C#)

Syntax	`bool WaitForOnEndOfCycleEvent();`
	`bool WaitForOnEndOfCycleEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.8.3 OnConfigurationChanging

OnConfigurationChanging

Registers or unregisters an event handler method.

Table 7- 249 OnConfigurationChanging - .NET (C#)

Syntax	`event Delegate_II_EREC_DT OnConfigurationChanging;`
Parameters	None. See Delegate_II_EREC_DT (Page 265).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangingCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 250 RegisterOnConfigurationChangingCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangingCallback( EventCallback_II_SREC_ST in_CallbackFunction );`
Parameters	• `EventCallback_II_SREC_ST in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST (Page 259).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConfigurationChangingEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 251 RegisterOnConfigurationChangingEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangingEvent();` `void RegisterOnConfigurationChangingEvent( HANDLE* in_Event );`
Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnConfigurationChangingCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 252 UnregisterOnConfigurationChangingCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangingCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangingEvent()

Unregisters the event object.

Table 7- 253 UnregisterOnConfigurationChangingEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangingEvent();`
Parameters	None
Return values	None

Table 7- 254 UnregisterOnConfigurationChangingEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangingEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangingEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 255 WaitForOnConfigurationChangingEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangingEvent();`
	`bool WaitForOnConfigurationChangingEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 256 WaitForOnConfigurationChangingEvent() - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangingEvent();`
	`bool WaitForOnConfigurationChangingEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.8.4 OnConfigurationChanged

OnConfigurationChanged

Registers or unregisters an event handler method.

Table 7- 257 OnConfigurationChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_SRICC_UINT32_UINT32_UINT32_UINT32 OnConfigurationChanged;`
Parameters	None. See Delegate_II_EREC_DT_SRICC_UINT32_UINT32_UINT32_UINT32 (Page 270).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConfigurationChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 258 RegisterOnConfigurationChangedCallback() - Native C++

Syntax	`void RegisterOnConfigurationChangedCallback( EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction );`
Parameters	• `EventCallback_SRCC_UINT32_UINT32_INT32 in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_SRCC_UINT32_UINT32_INT32 (Page 263).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConfigurationChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 259 RegisterOnConfigurationChangedEvent() - Native C++

Syntax	`void RegisterOnConfigurationChangedEvent();` `void RegisterOnConfigurationChangedEvent( HANDLE* in_Event );`
Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnConfigurationChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 260 UnregisterOnConfigurationChangedCallback() - Native C++

Syntax	`void UnregisterOnConfigurationChangedCallback();`
Parameters	None
Return values	None

UnregisterOnConfigurationChangedEvent()

Unregisters the event object.

Table 7- 261 UnregisterOnConfigurationChangedEvent() - Native C++

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

Table 7- 262 UnregisterOnConfigurationChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnConfigurationChangedEvent();`
Parameters	None
Return values	None

WaitForOnConfigurationChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 263 WaitForOnConfigurationChangedEvent() - Native C++

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 264 WaitForOnConfigurationChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnConfigurationChangedEvent();`
	`bool WaitForOnConfigurationChangedEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.6.8.5 OnLedChanged

OnLedChanged

Registers or unregisters an event handler method.

Table 7- 265 OnLedChanged - .NET (C#)

Syntax	`event Delegate_II_EREC_DT_ELT_ELM OnLedChanged;`
Parameters	None. See Delegate_II_EREC_DT_ELT_ELM (Page 267).
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnLedChangedCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be deleted.

Table 7- 266 RegisterOnLedChangedCallback() - Native C++

Syntax	`void RegisterOnLedChangedCallback(`
	`  EventCallback_II_SREC_ST_SRLT_SRLM in_CallbackFunction`
	`);`

Parameters	• `EventCallback_II_SREC_ST_SRLT_SRLM in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_II_SREC_ST_SRLT_SRLM (Page 261).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnLedChangedEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registering a new event object causes the previous event object to be deleted.

Table 7- 267 RegisterOnLedChangedEvent() - Native C++

Syntax	`void RegisterOnLedChangedEvent();`
	`void RegisterOnLedChangedEvent(`
	`  HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

UnregisterOnLedChangedCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 268 UnregisterOnLedChangedCallback() - Native C++

Syntax	`void UnregisterOnLedChangedCallback();`
Parameters	None
Return values	None

UnregisterOnLedChangedEvent()

Unregisters the event object.

Table 7- 269 UnregisterOnLedChangedEvent() - Native C++

Syntax	`void UnregisterOnLedChangedEvent();`
Parameters	None
Return values	None

Table 7- 270 UnregisterOnLedChangedEvent() - .NET (C#)

Syntax	`void UnregisterOnLedChangedEvent();`
Parameters	None
Return values	None

WaitForOnLedChangedEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 271 WaitForOnLedChangedEvent() - Native C++

Syntax	`bool WaitForOnLedChangedEvent();`
	`bool WaitForOnLedChangedEvent(`
	`  UINT32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 272 WaitForOnLedChangedEvent() - .NET (C#)

Syntax	`bool WaitForOnLedChangedEvent();`
	`bool WaitForOnLedChangedEvent(`
	`  UInt32 in_Time_ms`
	`);`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.7 API IRemoteRuntimeManager

7.7.1 Interfaces - Information and settings

Dispose()

Deletes the managed interface and unloads the native components of the user interfaces.

Table 7- 273 Dispose() - .NET (C#)

Syntax	`void Dispose()`
Parameters	None
Return values	None

GetVersion()

Returns the version of the remote Runtime Manager. If the function fails, version 0.0 is returned.

Table 7- 274 GetVersion() - Native C++

Syntax	`UINT32 GetVersion();`
Parameters	None
Return values	`UINT32`: Remote Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

Table 7- 275 Version { get; } - .NET (C#)

Syntax	`UInt32 Version { get; }`
Parameters	None
Return values	`Uint32`: Remote Runtime Manager Version (`HIWORD` = Major, `LOWORD` = Minor)

GetIP() / IP { get; }

Returns the IP address of the PC on which the remote Runtime Manager is running. If the function fails, the return value is 0.

Table 7- 276 GetIP() - Native C++

Syntax	`UIP GetIP();`
Parameters	None
Return values	`UIP`: Returns the IP address of the PC on which the Runtime Manager is running.

Table 7- 277 IP { get; } - .NET (C#)

Syntax	`SIP IP { get; }`
Parameters	None
Return values	`SIP`: Returns the IP address of the PC on which the Runtime Manager is running.

GetPort() / Port { get; }

Returns the open port of the PC on which the remote Runtime Manager is running. If the function fails, the return value is 0.

Table 7- 278 GetPort() - Native C++

Syntax	`UINT16 GetPort();`
Parameters	None
Return values	`UINT16`: Open port of the PC on which the remote Runtime Manager is running.

Table 7- 279 Port { get; } - .NET (C#)

Syntax	`UInt16 Port { get; }`
Parameters	None
Return values	`UInt16`: Open port of the PC on which the remote Runtime Manager is running.

GetRemoteComputerName() / RemoteComputerName { get; }

Returns the name of the PC on which the remote Runtime Manager is running.

Table 7- 280 GetRemoteComputerName() - Native C++

Syntax	`ERuntimeErrorCode GetRemoteComputerName(`
	`  WCHAR* inout_Name,`
	`  UINT32 in_ArrayLength`
	`);`	

Parameters	• `WCHAR* inout_Name:` A user-allocated array for the computer name. • `UINT32 in_ArrayLength:` The array length. The array should be longer than `MAX_COMPUTERNAME_LENGTH`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_INDEX_OT_OF_RANGE`	The array is too small to accommodate the computer name.

Table 7- 281 RemoteComputerName { get; } - .NET (C#)

Syntax	`string RemoteComputerName { get; }`	
Parameters	None	
Return values	`string`: Name of the PC on which the remote Runtime Manager is running.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeError-` `Code.IndexOutOfRange`	The array is too small to accommodate the computer name.

Disconnect()

Closes the connection to the remote Runtime Manager.

Note

All applications that are connected to the remote Runtime Manager lose this connection.

Table 7- 282 Disconnect() - Native C++

Syntax	`ERuntimeErrorCode Disconnect();`	
Parameters	None	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.

Table 7- 283 Disconnect() - .NET (C#)

Syntax	`void Disconnect();`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

7.7.2 Simulation Runtime instances

7.7.2.1 Simulation Runtime instances (remote)

GetRegisteredInstancesCount()

Returns the number of instances that are registered in Runtime Manager. If the function fails, the return value is 0.

Table 7- 284 GetRegisteredInstancesCount() - Native C++

Syntax	`UINT32 GetRegisteredInstancesCount();`
Parameters	None
Return values	`UINT32`: Number of available instances.

GetRegisteredInstanceInfoAt()

Returns information about an already registered instance.

You can use the ID or name to create an interface of this instance (see `CreateInterface()`).

Table 7- 285 GetRegisteredInstanceInfoAt() - Native C++

Syntax	`ERuntimeErrorCode GetRegisteredInstanceInfoAt(`
	`  UINT32 in_Index,`
	`  SInstanceInfo* out_InstanceInfo`
	`);`	

Parameters	• `UINT32 in_Index:` Index of the created instance from which you want to receive the information. The index must be less than the value you receive when you call `GetRegisteredInstanceCount()`. • `SInstanceInfo* out_InstanceInfo:` The information with name and ID of the instance. See SInstanceInfo (Page 278).	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_INDEX OUT_OF_RANGE`	There is no instance information for this index.

RegisteredInstanceInfo { get; }

Returns information about an already registered instance. You can use the ID or name of this instance to create an interface of this instance, see `CreateInterface()`.

Table 7- 286 RegisterInstanceInfo { get; } - .NET (C#)

Syntax	`SInstanceInfo[] RegisteredInstanceInfo { get; }`	
Parameters	None	
Return values	None	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.

RegisterInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 287 RegisterInstance() - Native C++

Syntax	`ERuntimeErrorCode RegisterInstance(`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  WCHAR* in_InstanceName,`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  ECPUType in_CPUType,`
	`  IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterInstance(`
	`  ECPUType in_CPUType,`
	`  WCHAR* in_InstanceName,`
	`  IInstance** out_InstanceInterface`
	`);`	

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is `"SRCT_1500_Unspecified"`. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `WCHAR* in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271). • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer **must** be initialized with `NULL`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name or the IInstance pointer is invalid.
	`SREC_LIMIT_REACHED`	There are already 16 instances registered in Runtime Manager.
	`SREC_ALREADY_EXISTS`	An instance with this name already exists.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`// Example: How To Create And Register An Instance`
	`// And To Get An Interface Of The Instance The Same Time`
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	`result = api->RegisterInstance(&psa);`
	`}`

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 288 RegisterInstance() - .NET (C#)

Syntax	`IInstance RegisterInstance();`
	`IInstance RegisterInstance(`
	`string in_InstanceName`
	`);`
	`IInstance RegisterInstance(`
	`ECPUType in_CPUType`
	`);`
	`IInstance RegisterInstance(`
	`ECPUType in_CPUType`
	`string in_InstanceName`
	`);`

Parameters	• `ECPUType in_CPUType:` Defines which CPU type is simulated at the start of the instance. The default setting is `"ECPUType.Unspecified"`. When a different CPU type is loaded via STEP 7 or from the Virtual Memory Card, this CPU type applies. • `string in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271).
Return values	If the function is successful, an interface of a virtual controller. Otherwise, a Null pointer.

Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name is invalid.
	`ERuntimeErrorCode.LimitReached`	There are already 16 instances registered in Runtime Manager.
	`ERuntimeErrorCode.AlreadyExists`	An instance with this name already exists.

RegisterCustomInstance()

Registers a new instance of a virtual controller in Runtime Manager. Creates and returns an interface of this instance.

Table 7- 289 RegisterCustomInstance() - Native C++

Syntax	`ERuntimeErrorCode RegisterCustomInstance(`
	` WCHAR* in_VplcDll,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode RegisterCustomInstance(`
	` WCHAR* in_VplcDll,`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`	

Parameters	• `WCHAR* in_VplcDll:` The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn. • `WCHAR* in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271). • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with `NULL`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The DLL name, the instance name or the IInstance pointer is invalid.
	`SREC_LIMIT_REACHED`	There are already 16 instances registered in Runtime Manager.
	`SREC_ALREADY_EXISTS`	An instance with this name already exists.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`// Example: How To Create And Register An Instance`
	`// And To Get An Interface Of The Instance The Same Time`
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	`result = api->RegisterCustomInstance("C:\\Temp\\vplc.dll");`
	`}`

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82).

Table 7- 290 RegisterCustomInstance() - .NET (C#)

Syntax	`IInstance RegisterCustomInstance(`
	`string in_VplcDll`
	`);`
	`IInstance RegisterCustomInstance(`
	`string in_VplcDll,`
	`string in_InstanceName`
	`);`	

Parameters	• `string in_VplcDll:` The complete path to the DLL of the virtual controller that Siemens.Simatic.Simulation.Runtime.Instance.exe loads at PowerOn. • `string in_InstanceName:` Name to be assigned to the instance. Every instance must have a unique name. If no name is assigned when registering a new instance, the instance is given the name `"Instance_#"` (# is the ID of the instance). If this name already exists, the name `"Instance_#.#"` is used, in which the second # is a counter that is incremented until the name is unique. The length of the name must be less than `DINSTANCE_NAME_LENGTH`. See Data types (Page 271).	
Return values	If the function is successful, an interface of a virtual controller; otherwise a Null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name or the ID is invalid.
	`ERuntimeErrorCode.LimitReached`	There are already 16 instances registered in Runtime Manager.
	`ERuntimeErrorCode.AlreadyExists`	An instance with this name already exists.

CreateInterface()

Creates and returns an interface of an already registered instance of a virtual controller.

The instance could have been registered via the application or another application that uses the Simulation Runtime API.

Table 7- 291 CreateInterface() - Native C++

Syntax	`ERuntimeErrorCode CreateInterface(`
	` WCHAR* in_InstanceName,`
	` IInstance** out_InstanceInterface`
	`);`
	`ERuntimeErrorCode CreateInterface(`
	` INT32 in_InstanceID,`
	` IInstance** out_InstanceInterface`
	`);`	

Parameters	• `INT32 in_InstanceID:` The ID of the registered instance from which you want to receive the interface. • `WCHAR* in_InstanceName:` The name of the registered instance from which you want to receive the interface. • `IInstance** out_InstanceInterface:` Pointer to a Simulation Runtime interface pointer. The pointer must be initialized with `NULL`. The interface is created within the function.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_INTERFACE_REMOVED`	The interface is disconnected from the remote Runtime Manager.
	`SREC_TIMEOUT`	The function does not return on time.
	`SREC_WRONG_ARGUMENT`	The name, the ID or the IInstance- pointer is invalid.
	`SREC_DOES_NOT_EXIST`	The instance is not registered in Runtime Manager.

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa1 = NULL;`
	`IInstance* psa2 = NULL;`
	`if (result == SREC_OK)`
	`{`
	` result = api->CreateInterface(0, &psa1);`
	` result = api->CreateInterface(0, &psa2); // psa2 will be the same as psa1`
	`}`	

Example C++	`ISimulationRuntimeManager * api = NULL;`
	`ERuntimeErrorCode result = Initialize(&api);`
	
	`IInstance* psa = NULL;`
	`if (result == SREC_OK)`
	`{`
	` result = api->CreateInterface(L"My SimulationRuntime Instance", &psa);`
	`}`	

Note

Native C++

If you no longer require the interface, delete it.

See DestroyInterface() (Page 82)

Table 7- 292 CreateInterface() - .NET (C#)

Syntax	`IInstance CreateInterface(`
	`  string in_InstanceName`
	`);`
	`IInstance CreateInterface(`
	`  INT32 in_InstanceID`
	`);`	

Parameters	• `INT32 in_InstanceID:` The ID of the registered instance from which you want to receive the interface. • `string in_InstanceName:` The name of the registered instance from which you want to receive the interface.	
Return values	If the function is successful, an interface of a virtual controller; otherwise a Null pointer.	
Exceptions	`Siemens.Simatic.Simulation.Runtime.SimulationRuntimeException`	
	Runtime error code	Condition
	`ERuntimeError-` `Code.InterfaceRemoved`	The interface is disconnected from the remote Runtime Manager.
	`ERuntimeErrorCode.Timeout`	The function does not return on time.
	`ERuntimeErrorCode.WrongArgument`	The name or the ID is invalid.
	`ERuntimeErrorCode.DoesNotExists`	The instance is not registered in Runtime Manager.

7.7.3 Events

7.7.3.1 OnConnectionLost

Description

The event is triggered when the connection to the Remote Runtime Manager has been terminated.

OnConnectionLost

Registers or unregisters an event handler method.

Table 7- 293 OnConnectionLost - .NET (C#)

Syntax	`event Delegate_IRRTM OnConnectionLost;`
Parameters	None. See Delegate_IRRTM (Page 269)
Return values	None
Exceptions	None
Note	The event handler method runs in a separate thread.

RegisterOnConnectionLostCallback()

When the event occurs, the registered callback function is called. Only one callback function can be registered for the event. Registering a new callback function causes the previous callback function to be unregistered.

Table 7- 294 RegisterOnConnectionLostCallback() - Native C++

Syntax	`void RegisterOnConnectionLostCallback(`
	`  EventCallback_IRRTM in_CallbackFunction`
	`);`

Parameters	• `EventCallback_IRRTM in_CallbackFunction:` A callback function that subscribes to an event. See EventCallback_IRRTM (Page 263).
Return values	None
Note	The callback function runs in a separate thread.

RegisterOnConnectionLostEvent()

When the event occurs, the registered event object is set to the signaled state. Only one event object can be registered for the event. Registration of a new event object causes the previous event object to be deleted.

Table 7- 295 RegisterOnConnectionLostEvent() - Native C++

Syntax	`void RegisterOnConnectionLostEvent();`
	`void RegisterOnConnectionLostEvent(`
	`  HANDLE* in_Event`
	`);`

Parameters	• `None:` An internal event object is registered. • `HANDLE* in_Event:` A handle for a user-specific event object. The event object is registered.
Return values	None

Table 7- 296 RegisterOnConnectionLostEvent() - .NET (C#)

Syntax	`void RegisterOnConnectionLostEvent();`
Parameters	None
Return values	None

UnregisterOnConnectionLostCallback()

Unregisters the callback function. When the event occurs, no callback function is called.

Table 7- 297 UnregisterOnConnectionLostCallback() - Native C++

Syntax	`void UnregisterOnConnectionLostCallback();`
Parameters	None
Return values	None

UnregisterOnConnectionLostEvent()

Unregisters the event object.

Table 7- 298 UnregisterOnConnectionLostEvent() - Native C++

Syntax	`void UnregisterOnConnectionLostEvent();`
Parameters	None
Return values	None

Table 7- 299 UnregisterOnConnectionLostEvent() - .NET (C#)

Syntax	`void UnregisterOnConnectionLostEvent();`
Parameters	None
Return values	None

WaitForOnConnectionLostEvent()

The function blocks the program until the registered event object is in the signaled state or the timeout interval is exceeded.

Table 7- 300 WaitForOnConnectionLostEvent() - Native C++

Syntax	`bool WaitForOnConnectionLostEvent();`
	`bool WaitForOnConnectionLostEvent(`
	`  UINT32 in_Time_ms )`
	`;`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UINT32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

Table 7- 301 WaitForOnConnectionLostEvent() - .NET (C#)

Syntax	`bool WaitForOnConnectionLostEvent();`
	`bool WaitForOnConnectionLostEvent(`
	`  UInt32 in_Time_ms )`
	`;`

Parameters	• `None:` The time limit is set to `INFINITE`. • `UInt32 in_Time_ms:` Value for the time limit in milliseconds.
Return values	• `true:` If the event object was set to the signaled state. • `false:` If no event was received during the defined time limit.

7.8 Data types

Note

Unsupported data types

The Runtime API does not support the `STRING` and `WSTRING` data types.

Supported data types

In S7-PLCSIM Advanced V1.0, the Runtime API supports the data types of the S7-1500 CPUs.

Converting data types

When writing, data types are not transferred BCD-coded but mapped onto primitive data types.

The data types Counter, Date and Time must be transferred to the API BDC-coded so that the values are written to the counter and no incorrect values are returned when reading.

For these data types, you must perform a BCD conversion before writing and a BCD back-conversion after reading.

Example:

If the value 999 is transferred to the API as 2457_H, then `Write` modifies the value 2457_H to 999. Without BCD conversion, there is no `UInt16` value and `Write` writes no value at all.

Additional information

For information on data types and conversion, refer to section "Data types" in the STEP 7 V14 System Manual (https://support.industry.siemens.com/cs/document/109011420/step-7-professional-v13-1?dti=0&lc=en-WW // XmlEditor.InternalXmlClipboard:d59d29c4-ec28-6b28-3f63-754735fb2e2a).

7.8.1 DLL import functions (Native C++)

7.8.1.1 ApiEntry_Initialize

Description

Type of the central entry point for the API DLL.

Table 7- 302 ApiEntry_Initialize - Native C++

Syntax	`typedef ERuntimeErrorCode(*ApiEntry_Initialize)( ISimulationRuntimeManager** out_RuntimeManagerInterface );`	
Parameters	• `ISimulationRuntimeManager** out_SimulationRuntimeManagerInterface:` Pointer to a Runtime Manager interface pointer. The pointer must be initialized with ZERO. The interface is created within the function. • `UINT32 in_InterfaceVersion:` Version of the API interface to be downloaded: `API_DLL_INTERFACE_VERSION`.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the Runtime Manager interface is ZERO.
	`SREC_WRONG_VERSION`	The version of the interface in use does not match the version of the API DLL.
	`SREC_CONNECTION_ERROR`	Unable to establish a connection to the Runtime Manager.

7.8.1.2 ApiEntry_DestroyInterface

Description

Type of the entry point for DestroyInterface (Page 82).

Table 7- 303 ApiEntry_DestroyInterface - Native C++

Syntax	`typedef ERuntimeErrorCode(*ApiEntry_DestroyInterface)( IBaseInterface* in_Interface );`	
Parameters	• `IBaseInterface* in_Interface:` The interface to be deleted.	
Return values	Runtime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WRONG_ARGUMENT`	The pointer to the interface is ZERO.

7.8.2 Event callback functions (Native C++)

7.8.2.1 EventCallback_VOID

Description

Table 7- 304 EventCallback_VOID - Native C++

Syntax	`typedef void (*EventCallback_VOID)();`
Parameters	None
Return values	None

7.8.2.2 EventCallback_II_SREC_ST

Description

Table 7- 305 EventCallback_II_SREC_ST - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered.
Return values	None

7.8.2.3 EventCallback_II_SREC_ST_SROS_SROS

Description

Table 7- 306 EventCallback_II_SREC_ST_SROS_SROS - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_SROS_SROS)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` EOperatingState in_PrevState,`
	` EOperatingState in_OperatingState`
	`);`	

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `EOperatingState in_PrevState:` The operating state before the change. • `EOperatingState in_OperatingState:` The current operating state.	
Return values	None	
Error codes	Runntime error code	Condition
	`SREC_OK`	The function is successful.
	`SREC_WARNING_TRIAL_MODE_ACTIVE`	No license available. You can use the instance without restrictions for a period of one hour. Afterwards, the instance is shut down.
	`SREC_LICENSE_NOT_FOUND`	Test mode has expired.
	`SREC_COMMUNICATION_INTERFACE_NOT_AVAILABLE`	A problem has occurred with the selected communication interface. Check your settings.

7.8.2.4 EventCallback_II_SREC_ST_SRLT_SRLM

Description

Table 7- 307 EventCallback_II_SREC_ST_SRLT_SRLM - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_SRLT_SRLM)(`
	` IInstance* in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` SYSTEMTIME in_SystemTime,`
	` ELEDType in_LEDType,`
	` ELEDMode in_LEDMode,`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `ELEDType in_LEDType:` The LED type that changed its state. • `ELEDMode in_LEDMode:` The new state of the LED display.
Return values	None

7.8.2.5 EventCallback_II_SREC_ST_INT64_UINT32

Description

Table 7- 308 EventCallback_II_SREC_ST_INT64_UINT32 - Native C++

Syntax	`typedef void (*EventCallback_II_SREC_ST_INT64_UINT32)(`
	`  IInstance* in_Sender,`
	`  ERuntimeErrorCode in_ErrorCode,`
	`  SYSTEMTIME in_SystemTime,`
	`  INT64 in_CycleTime_ns,`
	`  UINT32 in_CycleCount,`
	`);`

Parameters	• `IInstance* in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `SYSTEMTIME in_SystemTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `INT64 in_CycleTime_ns:` The virtual time (in nanoseconds) since the last cycle control point. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, the value contains the virtual time (in nanoseconds) since the last event was received. • `UINT32 in_CycleCount:` The number of cycles since the last cycle control point. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.
Return values	None

7.8.2.6 EventCallback_IRRTM

Description

Table 7- 309 EventCallback_IRRTM - Native C++

Syntax	`typedef void (*EventCallback_IRRTM)( IRemoteRuntimeManager* in_Sender );`
Parameters	• `IRemoteRuntimeManager* in_Sender:` An interface of the remote Runtime Manager that receives this event.
Return values	None

7.8.2.7 EventCallback_SRCC_UINT32_UINT32_INT32

Description

Table 7- 310 EventCallback_SRCC_UINT32_UINT32_INT32 - Native C++

Syntax	`ERuntimeConfigChanged in_RuntimeConfigChanged, UINT32 in_Param1, UINT32 in_Param2, INT32 in_Param3 );`			
Parameters	`ERuntimeConfigChanged in_RuntimeConfigChanged`	`UInt32 in_Param1`	`UInt32 in_Param2`	`Int32 in_Param3`
	`SRCC_INSTANCE_REGISTERED`	-	-	ID of the registered instance
	`SRCC_INSTANCE_UNREGISTERED`	-	-	ID of the unregistered instance
	`SRCC_CONNECTION_OPENED`	IP of the remote Runtime Manager	Port of the remote Runtime Manager	-
	`SRCC_CONNECTION_CLOSED`	IP of the remote Runtime Manager	Port of the remote Runtime Manager	-
	`SRCC_PORT_OPENED`	The open port	-	-
	`SRCC_PORT_CLOSED`	-	-	-
Return values	None			

7.8.2.8 EventCallback_II_SREC_ST_SRICC_UINT32_UINT32_UINT32_UINT32

7.8.3 Delegate definitions (managed code)

7.8.3.1 Delegate_Void

Description

Table 7- 312 Delegate_Void - .NET (C#)

Syntax	`delegate void Delegate_Void();`
Parameters	None
Return values	None

7.8.3.2 Delegate_II_EREC_DT

Description

Table 7- 313 Delegate_II_EREC_DT - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT (`
	`  IInstance in_Sender,`
	`  ERuntimeErrorCode in_ErrorCode,`
	`  DateTime in_DateTime`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered.
Return values	None

7.8.3.3 Delegate_II_EREC_DT_EOS_EOS

Description

Table 7- 314 Delegate_II_EREC_DT_EOS_EOS - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_EOS_EOS(`
	`  IInstance in_Sender,`
	`  ERuntimeErrorCode in_ErrorCode,`
	`  DateTime in_DateTime,`
	`  EOperatingState in_PrevState,`
	`  EOperatingState in_OperatingState`
	`);`	

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `EOperatingState in_PrevState:` The operating state before the change. • `EOperatingState in_OperatingState:` The current operating state.	
Return values	None	
Error codes	Runntime error code	Condition
	`ERuntimeErrorCode.OK`	The function is successful.
	`ERuntimeError-Code.WarningTrialModeActive`	No license available. You can use the instance without restrictions for a period of one hour. Afterwards, the instance is shut down.
	`ERuntimeError-Code.LicenseNotFound`	Test mode has expired.
	`ERuntimeError-Code.CommunicationInterfaceNotAvailable`	A problem has occurred with the selected communication interface. Check your settings.

7.8.3.4 Delegate_II_EREC_DT_ELT_ELM

Description

Table 7- 315 Delegate_II_EREC_DT_ELT_ELM - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_ELT_ELM(`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` ELEDType in_LEDType,`
	` ELEDMode in_LEDMode,`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `ELEDType in_LEDType:` The LED type that changed its state. • `ELEDMode in_LEDMode:` The new state of the LED display.
Return values	None

7.8.3.5 Delegate_II_EREC_DT_INT64_UINT32

Description

Table 7- 316 Delegate_II_EREC_DT_INT64_UINT32 - .NET (C#)

Syntax	`delegate void Delegate_II_EREC_DT_INT64_UINT32(`
	` IInstance in_Sender,`
	` ERuntimeErrorCode in_ErrorCode,`
	` DateTime in_DateTime,`
	` Int64 in_CycleTime_ns,`
	` UInt32 in_CycleCount,`
	`);`

Parameters	• `IInstance in_Sender:` An interface of the instance that receives this event. • `ERuntimeErrorCode in_ErrorCode:` A possible error code. • `DateTime in_DateTime:` The virtual system time of the virtual controller at the time when this event was triggered. • `Int64 in_CycleTime_ns:` The virtual time (in nanoseconds) since the last cycle control point. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, the value contains the virtual time (in nanoseconds) since the last event was received. • `UInt32 in_CycleCount:` The number of cycles since the last cycle control point. If the events are triggered faster than they are received, multiple events are combined into one event. In this case, this value contains the number of cycles since the last event was received.
Return values	None

7.8.3.6 Delegate_IRRTM

Description

Table 7- 317 Delegate_IRRTM - .NET (C#)

Syntax	`delegate void Delegate_IRRTM(`
	`  IRemoteRuntimeManager in_Sender,`
	`);`

Parameters	• `IRemoteRuntimeManager in_Sender:` An interface of the remote Runtime Manager that receives this event.
Return values	None

7.8.3.7 Delegate_SRCC_UINT32_UINT32_INT32

Description

Table 7- 318 Delegate_SRCC_UINT32_UINT32_INT32 - .NET (C#)

Syntax	`delegate void Delegate_SRCC_UINT32_UINT32_INT32(`
	`  ERuntimeConfigChanged in_RuntimeConfigChanged,`
	`  UInt32 in_Param1,`
	`  UInt32 in_Param2,`
	`  Int32 in_Param3`
	`);`			

Parameters	`ERuntimeConfigChanged in_RuntimeConfigChanged`	`UInt32 in_Param1`	`UInt32 in_Param2`	`Int32 in_Param3`
	`InstanceRegistered`	-	-	ID of the registered instance
	`InstanceUnregistered`	-	-	ID of the unregistered instance
	`ConnectionOpened`	IP of the Remote Runtime Manager	Port of the remote Runtime Manager	-
	`Connection-Closed`	IP of the Remote Runtime Manager	Port of the remote Runtime Manager	-
	`PortOpened`	The open port	-	-
	`PortClosed`	-	-	-
Return values	None

7.8.4 Definitions and constants

The following identifiers are used in the API:

Table 7- 320 Definitions and constants - Native C++

Identifier	Value	Description
DINSTANCE_NAME_MAX_LENGTH	64	The unique name of an instance must be less than this value.
DSTORAGE_PATH_MAX_LENGTH	130	The maximum path length to the virtual memory card. Including ZERO termination.
DTAG_NAME_MAX_LENGTH	300	The maximum length of the name of a PLC tag. Including ZERO termination.
DTAG_ARRAY_DIMENSION	6	The maximum number of dimension for a multi-dimensional field.
DCONTROLLER_NAME_MAX_LENGTH	128	The maximum length of the controller name. Including ZERO termination.
DCONTROLLER_SHORT_DESIGNATION_MAX_LENGTH	32	The maximum length of the abbreviation of the controller (CPU type). Including ZERO termination.

Table 7- 321 Definitions and constants - .NET (C#)

Identifier	Value	Description
RuntimeConstants.InstanceNameLength	64	The unique name of an instance must be less than this value.
RuntimeConstants.StoragePathMaxLength	130	The maximum path length to the virtual memory card. Including ZERO termination.
RuntimeConstants.TagNameMaxLength	300	The maximum length of the name of a PLC tag. Including ZERO termination.
RuntimeConstants.TagArrayDimension	6	The maximum number of dimension for a multi-dimensional field.
RuntimeConstants.ControllerNameMaxLength	128	The maximum length of the controller name. Including ZERO termination.
RuntimeConstants.ControllerShortDesignationMaxLength	32	The maximum length of the abbreviation of the controller (CPU type). Including ZERO termination.

7.8.5 Unions (Native C++)

7.8.5.1 UIP

Description

Contains an IPv4 address.

Table 7- 322 UIP - Native C++

Syntax	`union UIP`
	`{`
	`DWORD IP;`
	`BYTE IPs[4];`
	`};`

Member	• `DWORD IP:` The IP address in a single DWORD • `BYTE IPs[4]:` The four elements of IP in descending order
Example	Example for an IP address: 192.168.0.1 UIP.IP = 0xC0A80001 UIP.IPs[3] = 192, UIP.IPs[2] = 168, UIP.IPs[1] = 0, UIP.IPs[0] = 1

7.8.5.2 UDataValue

Description

Contains the value of a PLC tag.

Table 7- 323 UDataValue - Native C++

Syntax	`union UDataValue`
	`{`
	`bool Bool;`
	`INT8 Int8;`
	`INT16 Int16;`
	`INT32 Int32;`
	`INT64 Int64;`
	`UINT8 UInt8;`
	`UINT16 UInt16;`
	`UINT32 UInt32;`
	`UINT64 UInt64;`
	`float Float;`
	`double Double;`
	`CHAR Char;`
	`WCHAR WChar;`
	`};`

Member	• `bool Bool:` 1 byte boolean value • `INT8 Int8:` 1 byte integer with sign • `INT16 Int16:` 2 byte integer with sign • `INT32 Int32:` 4 byte integer with sign • `INT64 Int64:` 8 byte integer with sign • `UINT8 UInt8:` 1 byte integer without sign • `UINT16 UInt16:` 2 byte integer without sign • `UINT32 UInt32:` 4 byte integer without sign • `UINT64 UInt64:` 8 byte integer without sign • `float Float:` 4 byte floating-point value • `double Double:` 8 byte floating-point value • `CHAR Char:` 1 byte value character • `WCHAR WChar:` 2 byte value character

7.8.6 Structures

7.8.6.1 SDataValue

Description

The structure contains the value and type of a PLC tag.

Table 7- 324 SDataValue - Native C++

Syntax	`struct SDataValue`
	`{`
	`UDataValue Value;`
	`EDataType Type;`
	`};`

Member	• `UDataValue Value:` The value of the PLC tags • `EPrimitiveDataType Type:` Type of PLC tag

Table 7- 325 SDataValue - .NET (C#)

Syntax	`struct SDataValue`
	`{`
	`bool Bool { get; set; }`
	`Int8 Int8 { get; set; }`
	`Int16 Int16 { get; set; }`
	`Int32 Int32 { get; set; }`
	`Int64 Int64 { get; set; }`
	`UInt8 UInt8 { get; set; }`
	`UInt16 UInt16 { get; set; }`
	`UInt32 UInt32 { get; set; }`
	`UInt64 UInt64 { get; set; }`
	`float Float { get; set; }`
	`double Double { get; set; }`
	`sbyte Char { get; set; }`
	`char WChar { get; set; }`
	`EPrimitiveDataType Type { get; set; }`
	`}`

Member	• `bool Bool:` 1 byte boolean value • `Int8 Int8:` 1 byte integer with sign • `Int16 Int16:` 2 byte integer with sign • `Int32 Int32:` 4 byte integer with sign • `Int64 Int64:` 8 byte integer with sign • `UntT8 UInt8:` 1 byte integer without sign • `UInt16 UInt16:` 2 byte integer without sign • `UInt32 UInt32:` 4 byte integer without sign • `UInt64 UInt64:` 8 byte integer without sign • `float Float:` 4 byte floating-point value • `double Double:` 8 byte floating-point value • `sbyte Char:` 1 byte value character • `char WChar:` 2 byte value character • `EPrimitiveDataType Type:` Type of PLC tag

7.8.6.2 SDataValueByAddress

Description

This structure represents a PLC tag that can be accessed via its address.

Table 7- 326 SDataValueByAddress - Native C++

Syntax	`struct SDataValueByAddress`
	`{`
	` UINT32 Offset;`
	` UINT8 Bit;`
	` SDataValue DataValue;`
	`};`

Table 7- 327 SDataValueByAddress - .NET (C#)

Syntax	`struct SDataValueByAddress`
	`{`
	` UInt32 Offset;`
	` UInt8 Bit;`
	` SDataValue DataValue;`
	`}`

7.8.6.3 SDataValueByName

Description

This structure represents a PLC tag that can be called by name.

Table 7- 328 SDataValueByName - Native C++

Syntax	`struct SDataValueByName`
	`{`
	` WCHAR Name[DTAG_NAME_MAX_LENGTH];`
	` SDataValue DataValue;`
	`};`

Table 7- 329 SDataValueByName - .NET (C#)

Syntax	`struct SDataValueByName`
	`{`
	` String Name;`
	` SDataValue DataValue;`
	`}`

7.8.6.4 SConnectionInfo

Description

This structure contains the IP address and port of a TCP/IP connection.

Table 7- 330 SConnectionInfo - Native C++

Syntax	`struct SConnectionInfo`
	`{`
	`  UIP IP;`
	`  WORD Port;`
	`};`

Table 7- 331 SConnectionInfo - .NET (C#)

Syntax	`struct SConnectionInfo`
	`{`
	`  SIP IP;`
	`  UInt16 Port;`
	`}`

7.8.6.5 SInstanceInfo

Description

This structure contains an IPv4 address.

Table 7- 332 SInstanceInfo - Native C++

Syntax	`struct SInstanceInfo`
	`{`
	`  INT32 ID;`
	`  WCHAR Name[DINSTANCE_NAME_MAX_LENGTH];`
	`};`

Member	• `INT32 ID:` The ID of the instance • `WCHAR Name[DINSTANCE_NAME_MAX_LENGTH]:` The name of the instance

Table 7- 333 SInstanceInfo - .NET (C#)

Syntax	`struct SInstanceInfo`
	`{`
	`  Int32 ID;`
	`  String Name;`
	`}`

Member	• `Int32 ID:` The ID of the instance • `String name:` The name of the instance

7.8.6.6 SDimension

Description

This structure contains information about the dimension of a field.

Table 7- 334 SDimension - Native C++

Syntax	`struct SDimension`
	`{`
	`  INT32 StartIndex;`
	`  UINT32 Count;`
	`};`

Table 7- 335 SDimension - .NET (C#)

Syntax	`struct SDimension`
	`{`
	`  Int32 StartIndex;`
	`  UInt32 Count;`
	`}`

7.8.6.7 STagInfo

Description

This structure contains information about a PLC tag.

Table 7- 336 STagInfo - Native C++

Syntax	`struct STagInfo`
	`{`
	` WCHAR Name[DTAG_NAME_MAX_LENGTH];`
	` EArea Area;`
	` EDataType DataType;`
	` PrimitiveDataType PrimitiveDataType;`
	` UINT16 Size;`
	` UINT32 Offset;`
	` UINT8 Bit;`
	` UINT8 DimensionCount;`
	` UINT32 Index;`
	` UINT32 ParentIndex;`
	` SDimension Dimension[DTAG_ARRAY_DIMENSION];`
	`};`

Member	• `WCHAR Name[DTAG_NAME_MAX_LENGTH]:` The name of the tag • `EArea area:` The CPU area where the tag is located. • `EDataType DataType:` The CPU data type of the tag • `EPrimitiveDataType PrimitiveDataType:` The primitive data type of the tag • `UINT16 size:` The size of the tag in bytes • `UINT32 offset:` The byte offset of the tag if it is not located in a data block. • `UINT8 bit:` The bit offset of the tag if it is not located in a data block. • `UINT8 DimensionCount:` The number of dimensions of the array. 0 if it is not a field for the tag. • `UINT32 index:` The index of the tag • `UINT32 ParentIndex:` If this tag is embedded in another tag (for example, an element of a structure), this value then displays the index of the parent tag. The value is 0 if the tag has no parent tag. • `SDimension Dimension[DTAG_ARRAY_DIMENSION]:` Information about each dimension of the field

Table 7- 337 STagInfo - .NET (C#)

Syntax	`public struct STagInfo`
	`{`
	`String Name;`
	`EArea Area;`
	`EDataType DataType;`
	`EPrimitiveDataType PrimitiveDataType;`
	`UInt16 Size;`
	`UInt32 Offset;`
	`UInt8 Bit;`
	`UInt32 Index;`
	`UInt32 ParentIndex;`
	`SDimension[] Dimension;`
	`}`

Member	• `String name:` The name of the tag • `EArea area:` The CPU area where the tag is located. • `EDataType DataType:` The CPU data type of the tag • `EPrimitiveDataType PrimitiveDataType:` The primitive data type of the tag • `UInt16 size:` The size of the tag in bytes. • `UInt32 offset:` The byte offset of the tag if it is not located in a data block. • `UInt8 bit:` The bit offset of the tag if it is not located in a data block. • `UInt32 index:` The index of the tag • `UInt32 ParentIndex:` If this tag is embedded in another tag (for example, an element of a structure), this value then displays the index of the parent tag. The value is 0 if the tag has no parent tag. • `SDimension[] Dimension:` Information about each dimension of the field. Empty, if the tag is not an array.

7.8.6.8 SIP

Description

This structure contains an IPv4 address.

Table 7- 338 SIP - .NET (C#)

Syntax	`struct SIP`
	`{`
	` byte[] IPArray { get; set; }`
	` UInt32 IPDWord { get; set; }`
	` string IPString { get; set; }`
	`}`

Member	• `UInt32 IPDWord`: The IP address in a single DWORD • `byte[] IPArray`: The four elements of IP in descending order • `string IPString`: The IPv4 address as a string
Example	Example for an IP address: 192.168.0.1 SIP.IPDWord = 0xC0A80001 SIP.IPArray[3] = 192, SIP.IPArray[2] = 168, SIP.IPArray[1] = 0, SIP.IPArray[0] = 1 SIP.IPString = "192.168.0.1"

7.8.6.9 SIPSuite4

Description

This structure contains an IPv4 suite.

Table 7- 339 SIPSuite4 - Native C++

Syntax	`struct SIPSuite4`
	`{`
	`  UIP IPAddress;`
	`  UIP SubnetMask;`
	`  UIP DefaultGateway;`
	`};`

Member	• `UIP IPAddress:` The IP address • `UIP SubnetMask:` The subnet mask • `UIP DefaultGateway:` The standard gateway

Table 7- 340 SIPSuite4 - .NET (C#)

Syntax	`struct SIPSuite4`
	`{`
	`  SIP IPAddress;`
	`  SIP SubnetMask;`
	`  SIP DefaultGateway;`
	`}`

Member	• `SIP IPAddress:` The IP address • `SIP SubnetMask:` The subnet mask • `SIP DefaultGateway:` The standard gateway

7.8.7 Enumerations

7.8.7.1 ERuntimeErrorCode

Description

This enumeration contains all error codes that are used by the Simulation Runtime API. Most API functions return one of these error codes. If the function is successful, the return value is always `SREC_OK`. Errors are returned with negative values, and alarms with positive values.

Table 7- 341 ERuntimeErrorCode - Native C++

Syntax	

```
enum ERuntimeErrorCode
{
 SREC_OK = 0,
 SREC_INVALID_ERROR_CODE = -1,
 SREC_NOT_IMPLEMENTED = -2,
 SREC_INDEX_OUT_OF_RANGE = -3,
 SREC_DOES_NOT_EXIST = -4,
 SREC_ALREADY_EXISTS = -5,
 SREC_UNKNOWN_MESSAGE_TYPE = -6,
 SREC_INVALID_MESSAGE_ID = -7,
 SREC_WRONG_ARGUMENT = -8,
 SREC_WRONG_PIPE = -9,
 SREC_CONNECTION_ERROR = -10,
 SREC_TIMEOUT = -11,
 SREC_MESSAGE_CORRUPT = -12,
 SREC_WRONG_VERSION = -13,
 SREC_INSTANCE_NOT_RUNNING = -14,
 SREC_INTERFACE_REMOVED = -15,
 SREC_SHARED_MEMORY_NOT_INITIALIZED = -16,
 SREC_API_NOT_INITIALIZED = -17,
 SREC_WARNING_ALREADY_EXISTS = 18,
 SREC_NOT_SUPPORTED = -19,
 SREC_WARNING_INVALID_CALL = 20,

	` IOMCTDB = 15`
	`}`

7.8.7.12 ERuntimeConfigChanged

Description

This list contains all possible causes of a OnConfigurationChanged event that the Runtime Manager sends.

Table 7- 365 ERuntimeConfigChanged - Native C++

Syntax	`enum ERuntimeConfigChanged`
	`{`
	` SRCC_INSTANCE_REGISTERED = 0,`
	` SRCC_INSTANCE_UNREGISTERED = 1`
	` SRCC_CONNECTION_OPENED = 2,`
	` SRCC_CONNECTION_CLOSED = 3,`
	` SRCC_PORT_OPENED = 4,`
	` SRCC_PORT_CLOSED = 5`
	`};`

Table 7- 366 ERuntimeConfigChanged - .NET (C#)

Syntax	`enum ERuntimeConfigChanged`
	`{`
	` InstanceRegistered = 0,`
	` InstanceUnregistered = 1,`
	` ConnectionOpened = 2,`
	` ConnectionClosed = 3,`
	` PortOpened = 4,`
	` PortClosed = 5`
	`}`

7.8.7.13 EInstanceConfigChanged

Description

This list contains all possible causes for a OnConfigurationChanged event that the virtual controller sends.

Table 7- 367 EInstanceConfigChanged - Native C++

Syntax	`enum EInstanceConfigChanged`
	`{`
	` SRICC_HARDWARE_SOFTWARE_CHANGED = 0,`
	` SRICC_IP_CHANGED = 1`
	`};`

Table 7- 368 EInstanceConfigChanged - .NET (C#)

Syntax	`enum EInstanceConfigChanged`
	`{`
	` HardwareSoftwareChanged = 0,`
	` IPChanged = 1`
	`}`

Restrictions

8

8.1 Overview

Certain actions or events may lead to behavior in S7-PLCSIM Advanced or in STEP 7 which deviates from that of a hardware CPU. Restrictions and possible remedies can be found in the following sections:

- OPC UA server (Page 302)
- Web server (Page 304)
- Restrictions for communications services (Page 305)
- Restrictions for instructions (Page 306)
- Restrictions with Motion Control (Page 307)
- Restrictions to local communication via Softbus (Page 308)
- Error with overflow cyclical events (Page 309)
- Deviating I/O values in the STEP 7 user program (Page 310)
- Multiple simulations and possible collision of IP addresses (Page 310)
- Simulation in standby mode (Page 310)
- Error installing the antivirus software from Kaspersky (Page 311)

8.2 OPC UA server

With OPC UA, data exchange is performed through an open, standardized and manufacturer-independent communication protocol. The CPU acting as the OPC UA server can communicate with OPC UA clients, for example, with HMI panels V14 and SCADA systems.

For technical reasons, the security settings in PLCSIM Advanced differ from a hardware CPU. Some features are disabled for simulations or are available to a limited extent.

Configuring OPC UA server

Start the instances via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP) to use the OPC UA server.

The OPC UA server functionality is not available if communication takes place via the Softbus.

OPC UA security settings

Based on the OPC UA security settings, the same settings can be made in STEP 7 for the hardware CPU. The data is not further processed by PLCSIM Advanced. This ensures that the user does not have his project change to perform a simulation.

Certificate

- **Server certificate**

  PLCSIM Advanced uses its own certificate in the firmware and not that of STEP 7. The certificate need not be changed for simulations. However, it does not have the same security level as a downloaded server certificate and cannot be used for secure connections!

- **Server Security Endpoints**

  PLCSIM Advanced only supports Security Endpoint "none".

- **Client certificate**

  PLCSIM Advanced does not evaluate certificates the imported and configured in STEP 7 . PLCSIM Advanced accepts all client certificates automatically. This setting cannot be changed.

- **User authentication**

  PLCSIM Advanced does not use the user name configured in STEP 7.

  Only one logon is possible as "guest" or "anonymous".

8.3 Web server

The Web server integrated in a CPU enables monitoring and administering of the CPU by authorized users over a network. This permits evaluation and diagnostics over long distances.

The simulation of the Web server is restricted under S7-PLCSIM V1.0 Advanced.

Each PLCSIM Advanced instance can simulate its own Web server.

The freeze state of a virtual controller is not shown as an internal operating state.

Configuring the Web server

S7 PLCSIM Advanced

Start the instances via the communication interface "PLCSIM Virtual Ethernet Adapter" (TCP/IP) to use the Web server.

The Web server functionality is not available if the communication is performed via the Softbus.

STEP 7

Configure the Web server in STEP 7 in the CPU properties.

Restricted Web server functionality

- Logon

  "PLCSIM" is preset as the user. There is no logon for users.

  A user configured in STEP 7 and his rights have no effect on the "PLCSIM" user.
- There is no access via the secure transmission protocol "HTTPS".
- The information may not be fully displayed on some websites due to different data handling.
- There is no topology information.
- "Online Backup&Restore" is not available.
- FW updates are not supported.

8.4 Restrictions for communications services

TUSEND / TURCV

When you run the UDP blocks TUSEND and TURCV via the "PLCSIM" communication interface (Softbus), you get error code 0x80C4 at the transmission end and receiving end:

Temporary communications error. The specified connection is temporarily down.

Remedy

Set "PLCSIM Virtual Ethernet Adapter" (TCP/IP) as the communication interface in PLCSIM Advanced.

8.5 Restrictions for instructions

S7-PLCSIM Advanced simulates instructions for CPUs S7-1500 and ET 200SP with a few exceptions, such as interrupts.

Some instructions are partially supported. For these, S7-PLCSIM Advanced checks the input parameters for validity and returns outputs that are valid but do not necessarily correspond to those that a real CPU with physical inputs/outputs would return.

Instructions not supported

Unsupported instructions are handled as not ready by S7-PLCSIM Advanced, their value is always "OK".

S7PLCSIM Advanced does not support the following instructions:

Table 8- 1 Instructions not supported

Instruction	Description
DIS_AIRT	Delay interrupts with higher priority and asynchronous errors
EN_AIRT	Activate interrupts with higher priority and asynchronous errors
DIS_IRT	Call new interrupts and disable asynchronous error
RE_TRIGR	Start time monitoring
WR_DPARM	Transfer data record
GETIO	Read process image
SETIO	Transfer process image
GETIO_PART	Read a part of the outputs of a DP standard slave / PROFINET IO device
SETIO_PART	Write a part of the outputs of a DP standard slave / PROFINET IO device
DPRD_DAT	Read consistent data of a standard DP slave
DPWR_DAT	Write consistent data to a standard DP slave
RD_OBINF	Read OB start information
DP_TOPOL	DP bus topology
PORT_CFG	Safety function
ATTACH	Assigning a hardware interrupt to an OB
DETACH	Removing the mapping between hardware interrupt and OB

8.6 Restrictions with Motion Control

8.6.1 Motion Control resources

There are motion control resources on each CPU that can be distributed to the technology objects.

Note

Maximum 5120 Motion Control resources

PLCSIM Advanced supports a maximum of 5120 motion control resources. The simulation of motion control is therefore restricted for the following CPUs:

Table 8- 2 CPUs with limited Motion Control resources

Type		Article number
Standard CPUs	CPU 1517-3 PN/DP	6ES7517-3AP00-0AB0
	CPU 1518-4 PN/DP	6ES7518-4AP00-0AB0
	CPU 1518-4 PN/DP ODK[1]	6ES7518-4AP00-3AB0
Fail-safe CPUs	CPU 1517F-3 PN/DP	6ES7517-3FP00-0AB0
	CPU 1518F-4 PN/DP	6ES7518-4FP00-0AB0
	CPU 1518F-4 PN/DP ODK[1]	6ES7518-4FP00-3AB0
Technology CPUs	CPU 1517T-3 PN/DP[2]	6ES7517-3TP00-0AB0
	CPU 1517TF-3 PN/DP[2]	6ES7517-3UP00-0AB0

1 The ODK functionality of this CPU is not simulated.

2 The simulation of this CPU supports only 64 cams.

Exceeding the quantity structure

STEP 7 checks whether the quantity structure for a configured CPU is complied with, and alerts you when it is exceeded. When you load a project into a CPU, another message appears.

Note

A project that uses more than 5120 motion control resources can be downloaded to a virtual controller. However, there is no message indicating that the quantity structure has been exceeded.

Only when the user program accesses the technology objects do you recognize by the error message at the block and the value 0 of the object that motion control objects cannot be used due to an overrun of the quantity structure.

8.6.2 Technology modules

PLCSIM Advanced simulates the real CPU, but not configured, connected technology modules or other I/O devices.

It is possible to download a project with technology modules for operation of motion control. However, the built-in logic of the technology modules is not part of the simulation, which is why the associated Motion Control instructions are not supported.

Additional information

For more information on Motion Control, refer to the following manuals:

- Device manuals to support SIMATIC controllers (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx)
- Function manual S7-1500 Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109739589)
- Function manual S7-1500T Motion Control (https://support.industry.siemens.com/cs/ww/en/view/109481326)

8.7 Restrictions to local communication via Softbus

Identical IP addresses for instances

If the "PLCSIM" communication interface (Softbus) is set, then identical IP addresses are created automatically for all instances when creating the instances through the Control Panel.

In STEP 7, only one instance is therefore displayed in the lifelist.

Remedy

Use the API function `SetIPSuite()` to assign a unique address for each instance, then all instances are displayed in STEP 7 with their IP addresses.

API function

- SetIPSuite() (Page 122)

Online and diagnostics

If the "PLCSIM" (Softbus) communication interface is set, no details are displayed for the "Online and Diagnostics" function under the PROFINET interface (IP address, MAC address, etc.).

See also

Controller - Information and settings (Page 119)

8.8 Restrictions of security with VMware vSphere Hypervisor (ESXi)

When you use the virtualization platform VMware vSphere Hypervisor (ESXi), you must change the policy exception to communicate over TCP/IP.

Remedy

Accept the "Promiscuous mode and "Forged transmit" options for the Virtual Switch of the ESXi.

NOTICE
Restrictions of security For security reasons, Promiscuous mode is disabled by default. If you accept the Promiscuousmode, the real Ethernet adapter even receives telegrams that are not addressed to it.

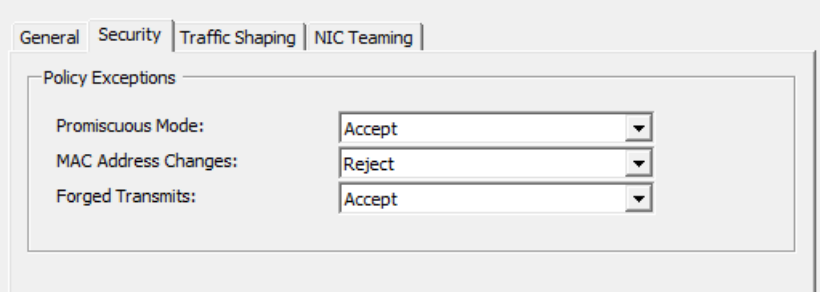

Figure 8-1 Policy exceptions for VMware vSphere Hypervisor (ESXi)

8.9 Error with overflow cyclical events

If your simulation contains cyclic interrupts, the queue of PLCSIM Advanced may overflow for cyclic events. Due to the execution speed of PLCSIM Advanced compared to real hardware, the time required to create the diagnostics buffer entry may be longer than the time until the next cyclic interrupt.

In this case, an additional entry is placed in the queue, causing another overflow. In the event of an overflow, PLCSIM Advanced provides visual information in the form of diagnostics buffer messages and a red error icon in the project tree.

See also

Speed up and slow down simulation (Page 60)

8.10 Deviating I/O values in the STEP 7 user program

Updated values

Each value change made by a STEP 7 user program in the I/O address areas is overwritten in the cycle control point with the updated value that was written via the API functions `Write...()`. The API functions `Read...()` only return this updated value and not the value from STEP 7 **for the input range**.

Non-updated values

If the value was not updated via the API functions `Write...()`, the API functions `Read...()` return the value from STEP 7 **for the output range**.

See also

Simulate peripheral I/O (Page 53)

8.11 Multiple simulations and possible collision of IP addresses

You can simultaneously simulate multiple CPUs, but each simulated CPU interface requires a unique IP address.

Make sure your CPUs have different IP addresses before starting the simulation.

8.12 Lacking access to an IP address

Special feature of distributed communication

If you use multiple network nodes on the same subnet through different virtual or real adapters, the operating system may search for the node on the wrong adapter.

Remedy

Repeat your requests or enter "arp -d <IP address>" in the command line editor of Windows.

8.13 Simulation in standby mode

If your computer or programming device goes into standby or hibernation mode, the simulation may be stopped. In this case, the communication between STEP 7 and S7-PLCSIM Advanced is stopped. When your computer or programming device starts up again, the communication may need to be reestablished. In some cases, it may also be necessary to open the simulation project again.

To prevent this situation, disable the standby mode on your computer or programming device.

8.14 Error installing the antivirus software from Kaspersky

When using the Anti-Virus virus scanner from Kaspersky, network settings may not be correctly during installation of PLCSIM Advanced. The result is that communication via TCP/IP cannot be used (error code -50 in the Control Panel).

Remedy

Check your network settings as described in the sectionEnable distributed communication (Page 43).

List of abbreviations

A

Abbreviation	Term
ALM	Automation License Manager Tool for managing license keys in STEP 7
API	Application Programming Interface user interface
arp	Address resolution protocol
BCD	Binary Coded Decimal
CPU	Central Processing Unit (Synonym for PLC)
ES	Engineering System
HMI	Human Machine Interface user interface
IE	Industrial Ethernet
GUI	Graphical User Interface
LAN	Local Area Network Computer network that is limited to a local area.
OB	Organization Block
ODK	Open Development Kit
OPC UA	Open Platform Communications Unified Architecture
PG	Programming device
PLC	Programmable Logic Controller
PN	PROFINET
RAM	Random Access Memory
RT	Runtime
TIA	Totally Integrated Automation
UTC	Coordinated Universal Time
VM	Virtual Machine
VPLC	Virtual Programmable Logic Controller
WinCC	Windows Control Center

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Preface

Purpose of the documentation

This function manual provides an overview of the diagnostics options for the automation system SIMATIC S7-1500, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL.

The documentation covers the following:

- Illustration of the uniformity and consistency of system diagnostics
- Overview of the options for establishing system diagnostics information

Basic knowledge required

The following knowledge is required in order to understand the function manual:

- General knowledge in the field of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge of working with STEP 7 and WinCC
- Knowledge about the use of Microsoft Windows operating systems

Scope of the documentation

This documentation is the basic documentation for all products of the S7-1500, ET 200MP, ET 200SP and ET 200AL systems, as well as for CPU 1516pro-2 PN. The product documentation is based on this documentation.

What's new compared to the previous version of the function manual (06/2014 edition)

What's new?		What are the customer benefits?	Where can I find the information?
New contents	Extended functionality of the Web server	• You obtain information about: – Know-how protection or copy protection of the PLC program – Program/communication load and cycle time – F-collective signatures, cycle times and runtimes of the F-runtime group(s) (with an F-CPU) • You can monitor statuses, errors, technology alarms and the current values of technology objects (TOs) with the Web server. • You can read, view and save trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance without STEP 7. • You can set four additional languages for the Web interface.	Section Diagnostics information using the web server (Page 49), Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual, Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/ww/en/view/64897128) function manual
	Assignment of different project languages extended	You can assign up to three different project languages for comments and alarm texts to the user interface languages of display devices.	Section Editing alarms in the alarm editor (Page 78)
Changed contents	Scope of the function manual expanded to include CPU 1516pro-2 PN	Functions that you will be familiar with from the SIMATIC S7-1500 CPUs are implemented in the CPU 1516pro-2 PN (degree of protection IP65, IP66 and IP67).	Operating instructions CPU 1516pro-2 PN (https://support.industry.siemens.com/cs/ww/en/view/109482416)
	Security events added	You know which types of events are registered as security events in the diagnostics buffer and can configure group alarms for them.	Section CPU diagnostics buffer (Page 43)
	Influence of the value status explained	You know which factors influence the bit in the value status and can take this into account during configuration.	Section System diagnostics using process image inputs (Page 72)
	Note added on the maximum configuration limits of program alarms.		Section Creating alarms with the "Program_Alarm" instruction (Page 76).

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

This document contains illustrations of the described devices. The illustrations may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Catalog (http://mall.automation.siemens.com)

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

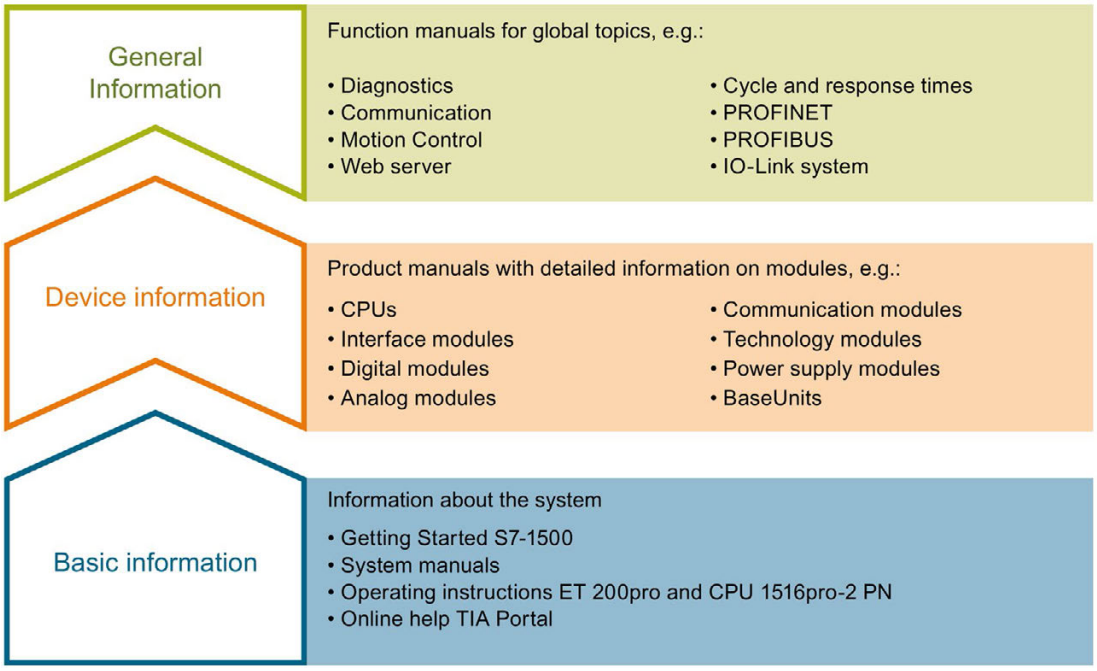
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

Overview of system diagnostics

2

2.1 Properties of system diagnostics

Introduction

In the SIMATIC environment, the term "system diagnostics" refers to diagnostics of devices and modules.

All SIMATIC products have integrated diagnostic functions that you can use to detect and remedy faults. The components automatically flag a potential fault in the operation and provide detailed information. You can minimize unscheduled standstill times with plant-wide diagnostics.

The SIMATIC automation system monitors the following states in the running plant:

- Device failure/recovery
- Insert/remove event
- Module fault
- I/O access error
- Channel fault
- Parameter assignment error
- Failure of the external auxiliary voltage

Properties ofSIMATIC system diagnostics

- Integrated as standard in the hardware
- System-wide across bus limits
- Automatic localization of the error source
- Automatic output of the cause of the error in plain text
- Plant-wide diagnostics of all components
- Archiving and logging of alarms
- Configurability of alarms

Consistent diagnostics from the field level all the way to the management level

The various diagnostics media give you a uniform view of maintenance-related information of every automation component in the plant: System status (module and network status, alarms for system errors) are available plant-wide in a uniform display.

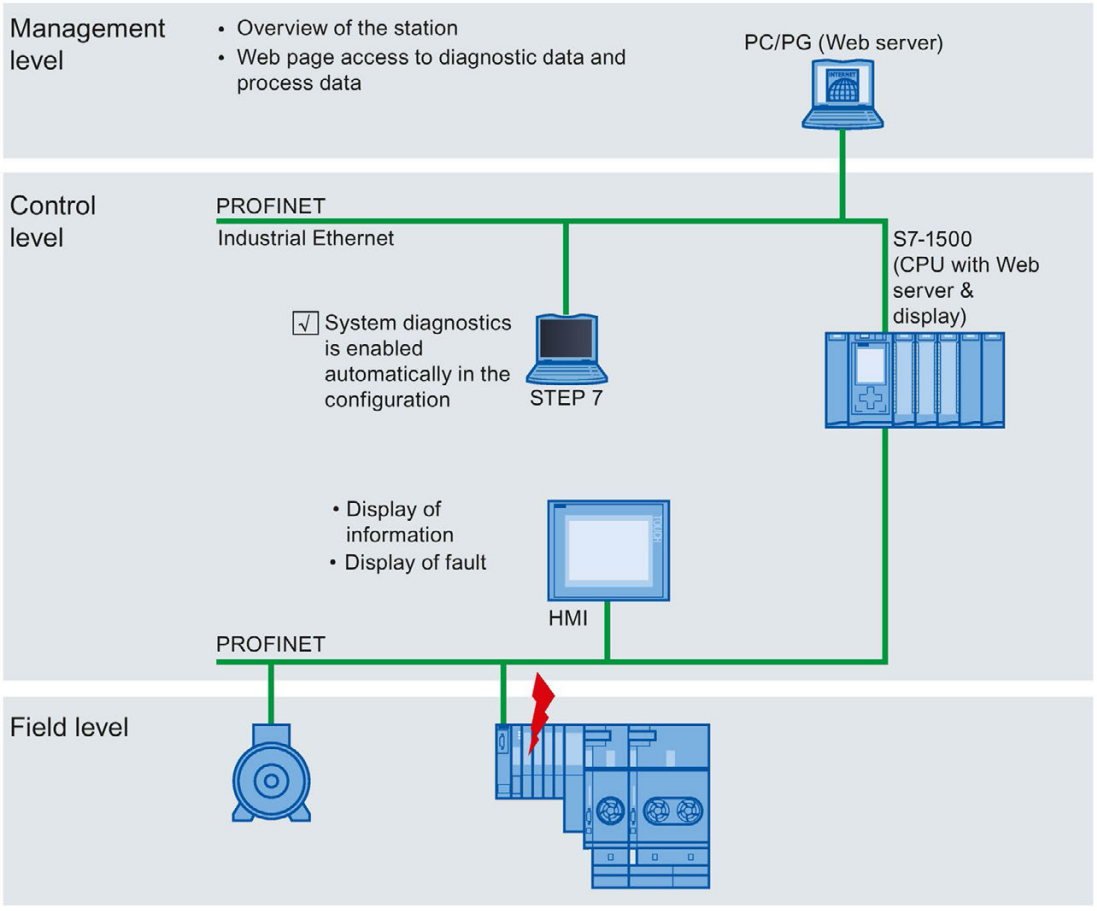


Figure 2-1 Overview of system diagnostics in a plant

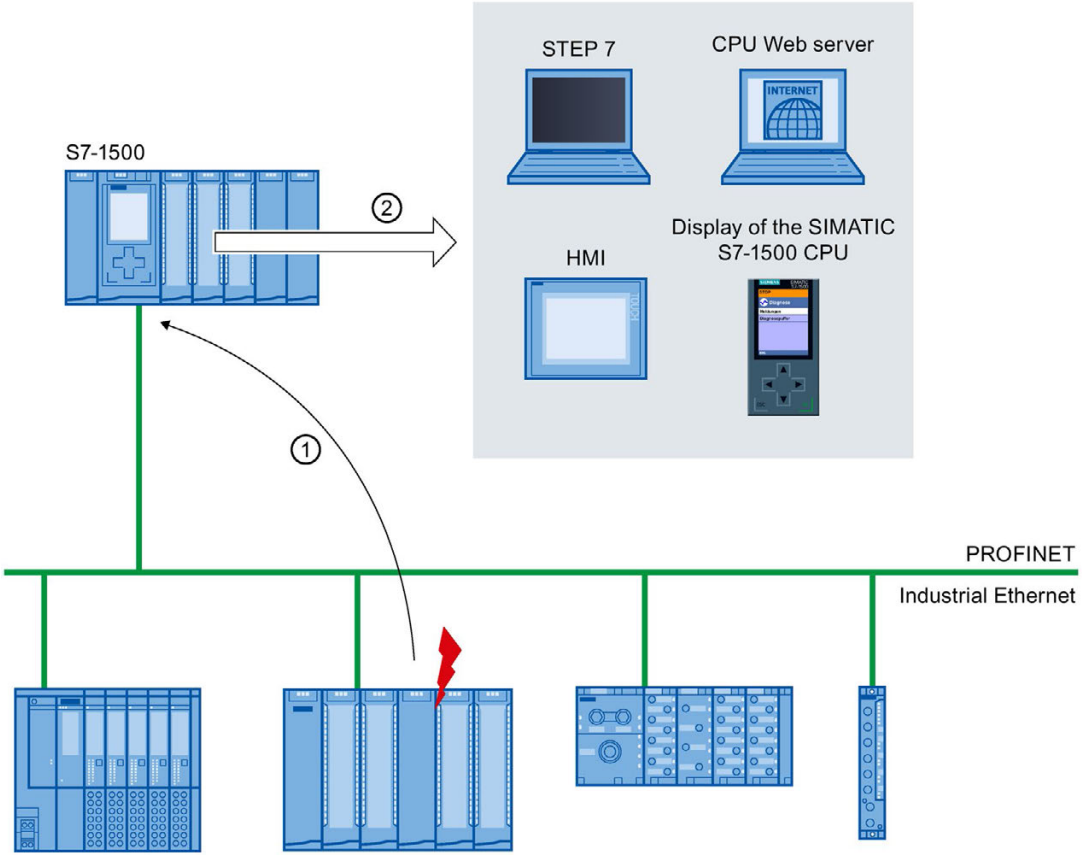
2.2 Benefits of innovative system diagnostics

System diagnostics is also possible in STOP

The system diagnostics is integrated in the firmware of the CPU and works independently of the cyclic user program. This means it is also available in the STOP CPU operating mode. Faults are detected immediately and signaled to the higher-level HMI devices, the Web server and the display of the SIMATIC S7-1500 CPU, even in STOP mode. This makes system diagnostics consistent with the actual plant state at all times.

Uniform display concept

All clients of a system are provided with diagnostics information by a uniform mechanism. The same system diagnostics information is used regardless of the display medium.



Step	Description
①	The device detects an error and sends diagnostics data to the assigned CPU.
②	The CPU informs the connected display media. The display of the system diagnostics is updated.

Figure 2-2 Sequence of the system diagnostics

Quick start

3

Introduction

The following chapters of this documentation describe the different options for establishing system diagnostics. All described options can be used independently of one another.

This chapter gives you an overview of the basic procedure to get initial diagnostics information fast.

Note

System diagnostics is generally available for the devices of the SIMATIC series.

3.1 Using the display of the CPU

The display of the SIMATIC S7-1500 CPU offers a fast and direct option to get diagnostics information. You can call up status information in different menus on the display.

Requirements

- A project has been created.
- The project has been downloaded to the CPU.

Determining diagnostics information using the display of the SIMATIC S7-1500 CPU

To determine diagnostics information using the display, follow these steps:

1. Select the "Diagnostics" menu on the display.
2. Select the "Diagnostics buffer" command from the "Diagnostics" menu.

Figure 3-1 Display of SIMATIC S7-1500 CPU

Result

The diagnostics events are displayed in the diagnostics buffer in the sequence in which they occur.

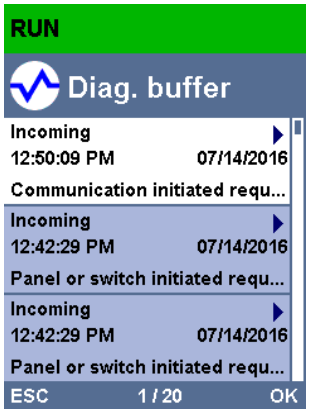


Figure 3-2 Display of the diagnostics buffer in the display of the SIMATIC S7-1500 CPU

Note

Automatic updating of diagnostics information

You set automatic updating of the diagnostics information under: "Display" > "DiagnosticRefresh".

Additional information

You can find information about the configuration of alarms in the section Configuring alarms for system diagnostics (Page 24).

3.2 Using STEP 7

Getting started with STEP 7 gives you fast access to detailed diagnostics information.

Requirements

- A project has been created.
- The project has been downloaded to the CPU.
- An error has occurred.
- The programming device must be able to establish a connection to the CPU via an interface.

Determining diagnostics information using STEP 7

To determine diagnostics information using STEP 7, follow these steps:

1. Open the respective project in STEP 7.
2. Open the portal view of STEP 7.
3. Select the "Online & Diagnostics" portal.
4. Select the "Online status" action.

   The "Select device" dialog opens. The dialog is an image of the configured devices in the project.

Figure 3-3 Device selection for online connection in the portal view

5. Activate the "Go online" option button for the device that you want to use to establish an online connection.
6. Click on the "Go online" button.

7. The "Go online" dialog opens.

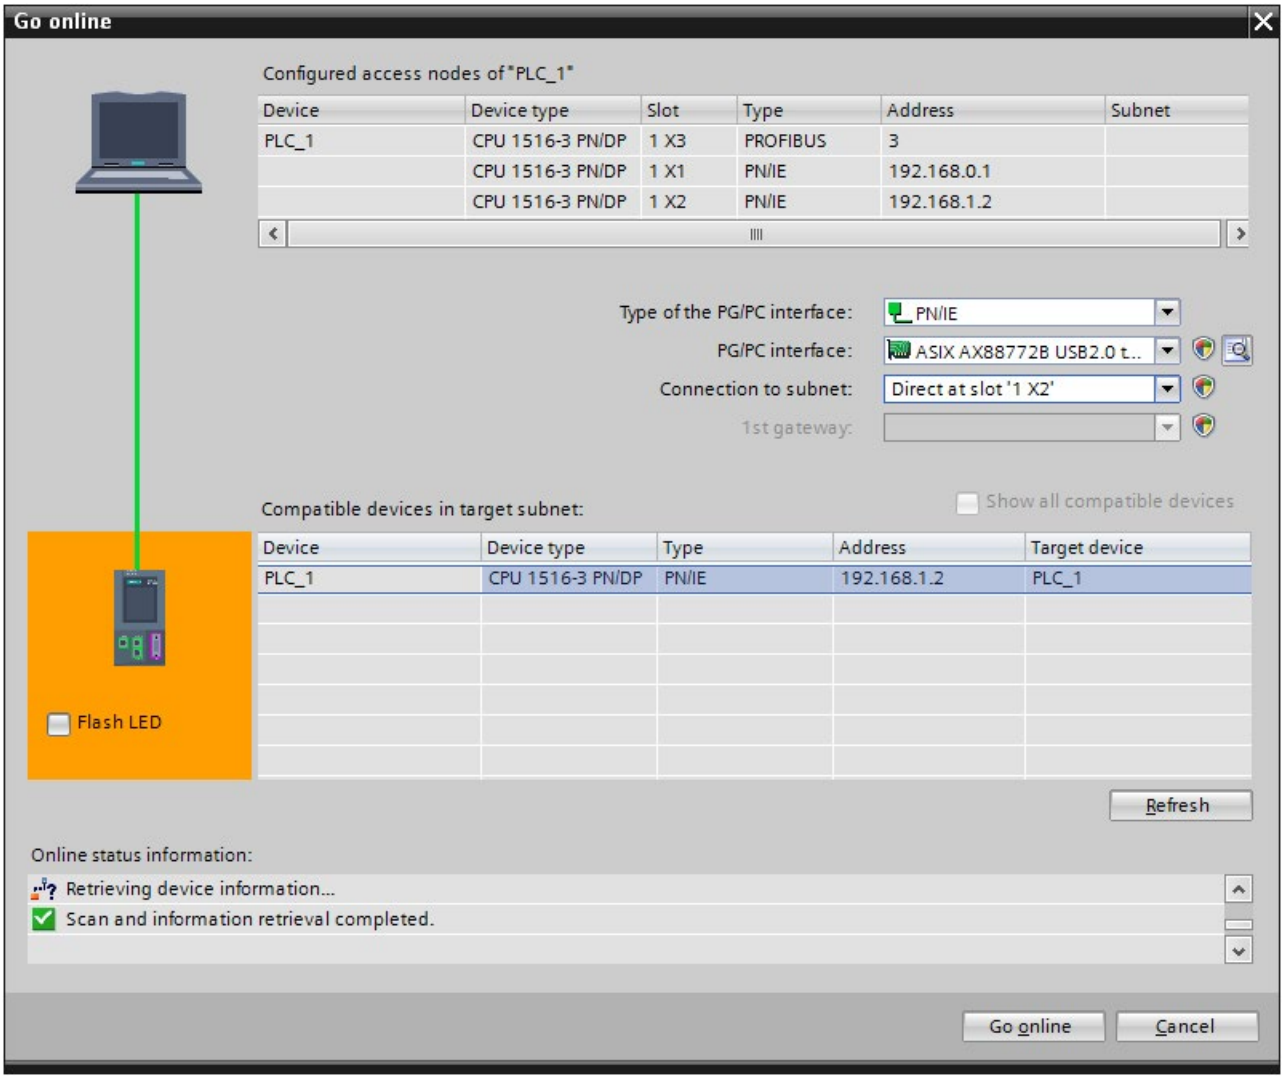

Figure 3-4 Establishing an online connection

8. Make the settings for the interface.

9. Click on the "Go online" button.

   The project view of STEP 7 opens. The network view is opened in the work area.

   The symbols in the project tree provide initial information about the faulty modules.

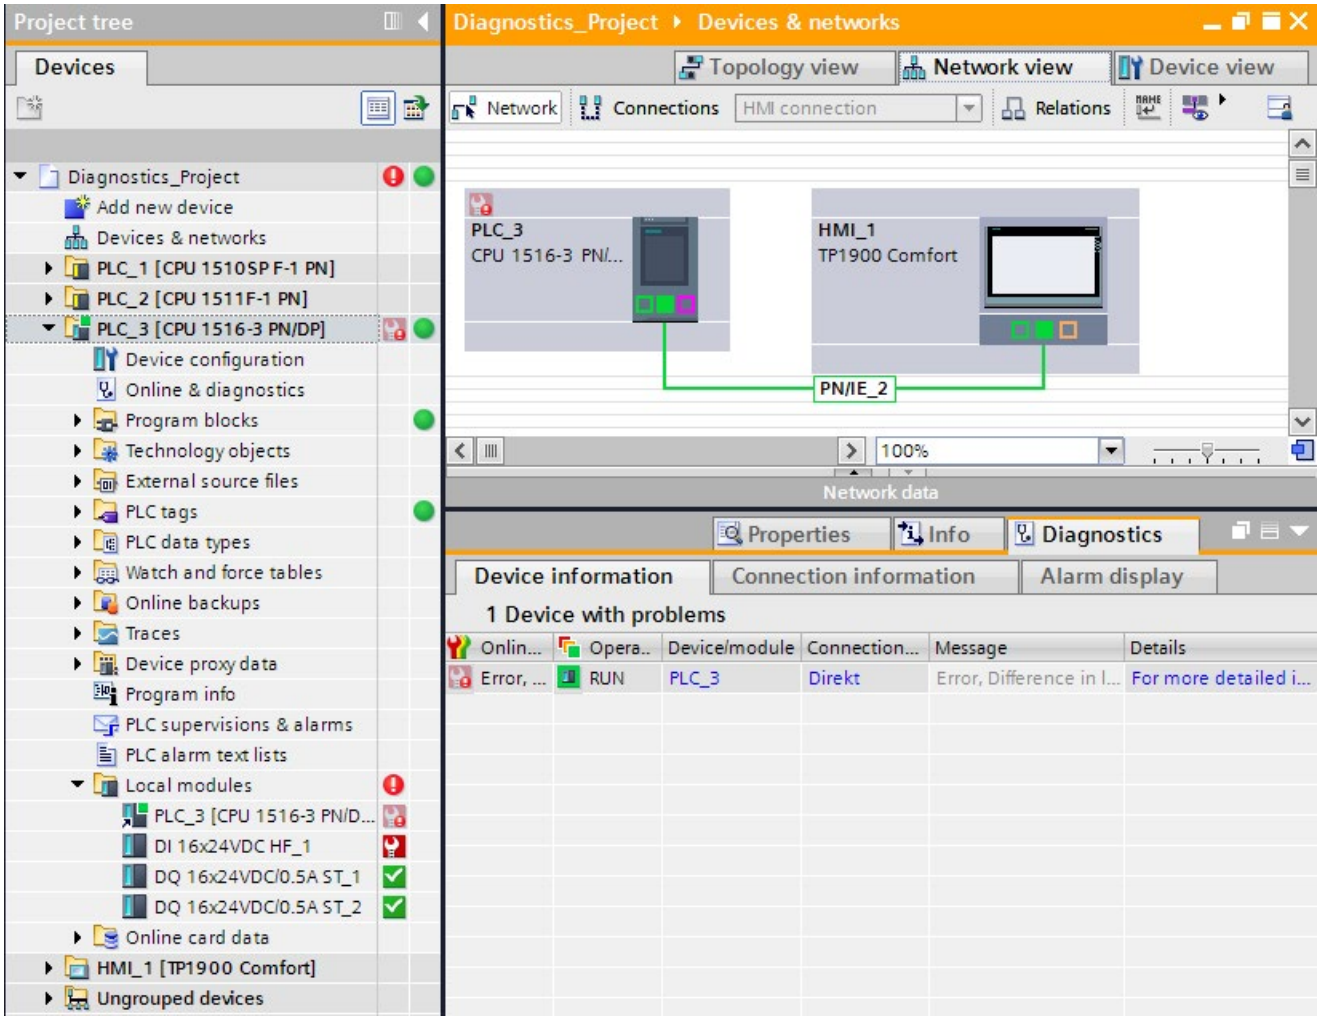

Figure 3-5 Display of the fault in the network view

10. Double-click the device which displays an alarm message to access the faulty module directly. This is the CPU in the example.

    The device view of the CPU is opened in the work area. In this view you can see directly in which module the error has occurred.

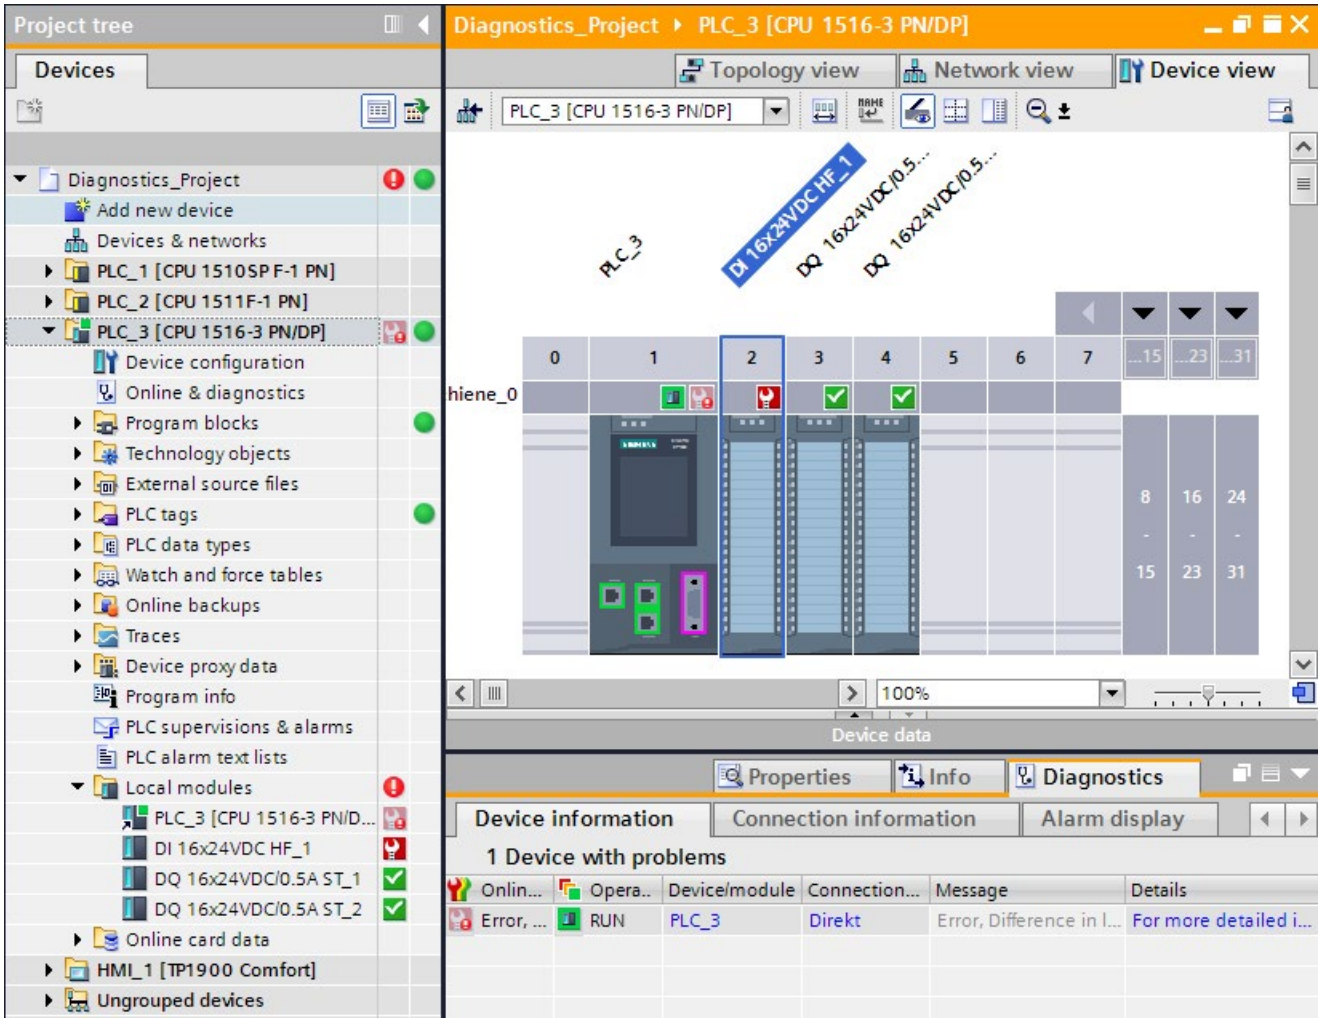

Figure 3-6 Display of the faulty module in the device view

11. Open the "Diagnostics" tab and the subordinate "Device information" tab in the Inspector window for a more detailed error description.

Result

The link in the "Details" table column takes you to the online and diagnostics view of the device and to the diagnostics buffer there, for example. This includes more information on all diagnostics events in the order in which they occurred.

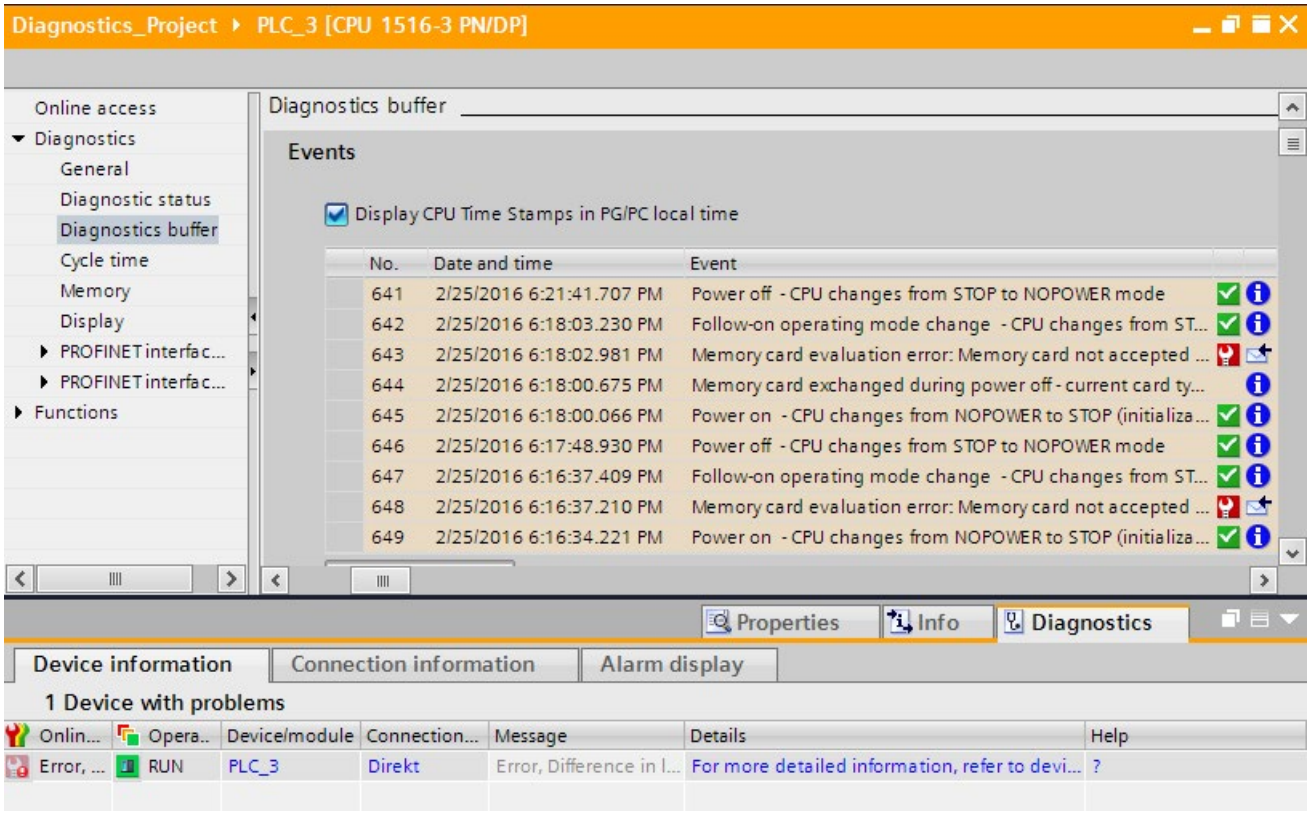

Figure 3-7 Diagnostics buffer with detailed error description

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 30) and in the online help for STEP 7.

Setting and determining system diagnostics

4

Introduction

System diagnostics is generally available for the devices of the SIMATIC series.

In the properties of each individual CPU, you can specify if you want to receive alarms for system diagnostics on your display device. Alarms are provided on the display of the SIMATIC S7-1500 CPU, the CPU Web server and the HMI device. Alarms are enabled by default. If you do not want to receive alarms for system diagnostics on your display devices, you can disable the sending of alarms.

4.1 Configuring alarms for system diagnostics

Predefined alarm texts are available for establishing the system diagnostics.

Requirements

- STEP 7 is open.
- A project is open.

Procedure

To make alarm settings for system diagnostics of the project in STEP 7, follow these steps:

1. Open the "Common data" folder in the project tree.
2. Double-click the "System diagnostics settings" entry.

   You now have access to the alarm settings. System diagnostics is enabled by default. System diagnostics cannot be disabled for the use of a CPU from the SIMATIC S7-1500 product series.

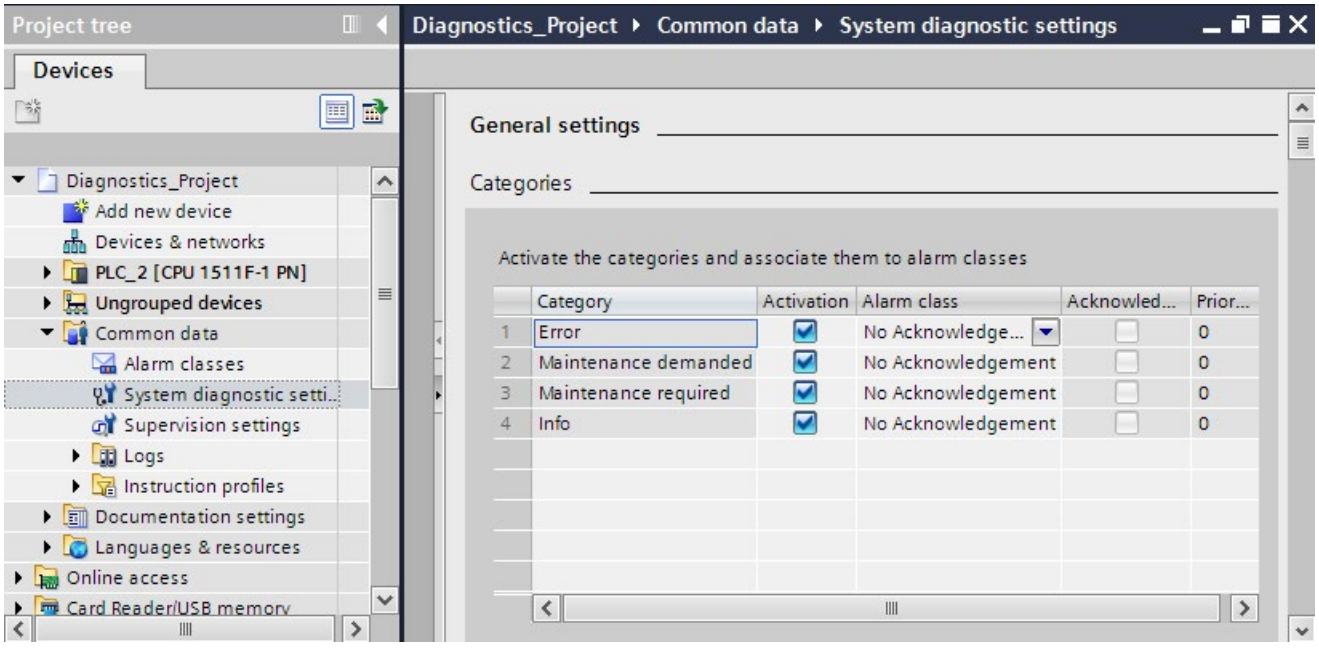

Figure 4-1 Properties of system diagnostics and alarm settings

3. In the settings, specify the alarm category that is to be displayed and if it needs to be acknowledged.

   The check boxes in the "Activation" column are enabled by default. When you disable all check boxes, the status of the HMI system diagnostics view is still updated with the "Info Report" functionality.

Result

You have configured the alarms for system diagnostics of the project in STEP 7.

The settings are saved with the project and become effective after the compiling and downloading of the hardware configuration to the involved components.

Maintenance events (maintenance demanded, maintenance required) are entered in the alarm buffer of the CPU just like any other event.

4.2 Options for displaying system diagnostics

Example

This section includes a diagnostics example to show how system diagnostics is established with the help of different display options. The example includes a CPU from the SIMATIC S7-1500 product series that is connected to an ET 200S distributed I/O system and an HMI Comfort Panel via PROFINET.

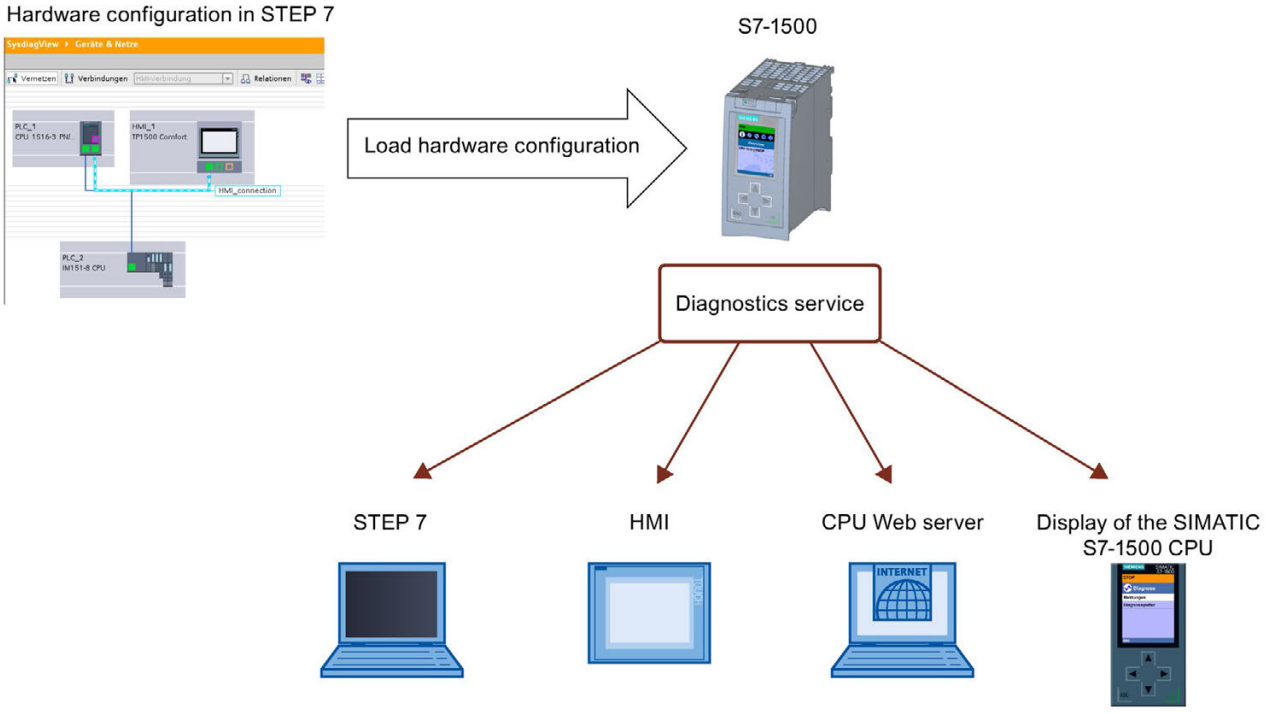

Figure 4-2 System diagnostics display options

The following sections include figures that illustrate how diagnostics information is displayed with the help of different display options.

- Using the LEDs on the hardware (Page 27)
- Local error analysis via the display of the CPU (Page 28)
- Using STEP 7 as of V12 (Page 30)
- Remote diagnostics using the Web server (Page 49)
- Stationary system diagnostics using the HMI diagnostics view (Page 59)

4.2.1 Diagnostics information at the devices

4.2.1.1 LEDs

Overview

All hardware components, such as CPUs, interface modules and modules, provide information about their operating mode as well as internal and external errors through their LEDs. Diagnostics by means of LEDs is an initial tool for error localization.

The graphics below include examples for the arrangement of LEDs on some modules.

Table 4- 1 LED displays on the modules

	CPU 1516-3 PN/DP	IM 155-5 PN ST	DI 32x24VDC HF	PS 25W 24VDC
				①	RUN/STOP LED (two-colored LED: green/yellow)	RUN LED (two-colored LED: green/yellow)	RUN LED (single-colored LED: green)	RUN LED (single-colored LED: green)
②	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)
③	MAINT LED (single-colored LED: yellow)	MAINT LED (single-colored LED: yellow)	without function	MAINT LED (single-colored LED: yellow)
④	X1 P1 (two-colored LED: green/yellow)	X1 P1 (single-colored LED: green)	LED CHx (two-colored LED: green/red)	
⑤	X1 P2 (two-colored LED: green/yellow)	X1 P2 (single-colored LED: green)		
⑥	X2 P1 (two-colored LED: green/yellow)			

Additional information

The meaning of the individual LED displays, their different combinations and the remedial measures resulting from them in case of errors are device-specific. The explanation can be found in the manuals of the modules.

4.2.1.2 Display of the CPU

Introduction

Each CPU in the S7-1500 automation system has a front cover with a display and operating keys. You can display status information in various menus on the display of the CPU. You use the operating keys to navigate through the menus.

Figure 4-3 Display - diagnostics screen

Display options

The display of the SIMATIC S7-1500 CPU shows the following diagnostics information:

- CPU operating mode

"Diagnostics" menu

- Active diagnostic alarms
- Information entered in the diagnostics buffer
- Error and alarm texts (system diagnostics alarms)
- Watch tables
- Information on the cycle times of the user program
- Utilization of the CPU memory

"Modules" menu

- Information on modules and the network
- Detailed device view with diagnostics symbols
- Order number, CPU version and central I/O modules
- Module status for central and distributed modules
- Information about the currently installed firmware

Additional information

For additional information on the topic "Functions and operation of the display of the SIMATIC S7-1500 CPU", see the documentation for the S7-1500 automation system (http://support.automation.siemens.com/WW/view/en/59191792).

You can find detailed information on the individual options, a training course and a simulation of the available menu commands of the display for the CPU in the SIMATIC S7-1500 Display Simulator (http://www.automation.siemens.com/salesmaterial-as/interactive-manuals/getting-started_simatic-s7-1500/disp_tool/start_en.html).

4.2.2 Diagnostics information in STEP 7

4.2.2.1 Explanation of diagnostics symbols

Diagnostics symbols for modules and devices

When the online connection to a device is established in STEP 7, the diagnostics status of the device and its lower-level components and, if applicable, the device operating mode are also determined. The following table shows the possible symbols and their meaning.

Table 4- 2 Diagnostics symbols for modules and devices

Symbol	Meaning
	The connection with a CPU is being established.
	The CPU is not reachable at the set address.
	The configured CPU and the CPU actually present are of incompatible types. Example: An existing CPU 315-2 DP is incompatible with a configured CPU 1516-3 PN/DP.
	On establishment of the online connection to a protected CPU, the password dialog was terminated without specification of the correct password.
	No fault
	Maintenance required
	Maintenance demanded
	Error
	The module or device is deactivated.
	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
	Diagnostics data is not available because the current online configuration data differ from the offline configuration data.
	The configured module or device and the module or device actually present are incompatible (valid for modules or devices under a CPU).
	The configured module does not support display of the diagnostics status (valid for modules under a CPU).
	The connection is established, but the module status has not yet been determined or is unknown.
	Hardware error in lower-level component: A hardware fault has occurred in at least one lower-level hardware component (occurs as a separate symbol only in the project tree).

Symbols for the comparison status

The diagnostics symbols can be combined at the bottom right with additional smaller symbols that indicate the result of the online/offline comparison. The following table shows the possible comparison symbols and their meaning.

Table 4- 3 Symbols for the comparison status

Symbol	Meaning
	Hardware error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level hardware component.
	Software error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level software component.
	Online and offline versions of the object are different
	Object only exists online
	Object only exists offline
	Online and offline versions of the object are the same

Operating mode symbols for CPUs and CPs

The following table shows the possible symbols and their respective operating states.

Table 4- 4 Operating mode symbols for CPUs and CPs

Symbol	Operating mode
	RUN
	STOP
	STARTUP
	DEFECTIVE
	Unknown operating mode
	The configured module does not support display of the operating mode.

Event table

The following information is displayed in the table for each diagnostics event:

- Sequential number of the entry

  The first entry contains the latest event.
- Date and time of the diagnostics event

  If no date and time are shown, the module has no integrated clock.
- Short designation of the event and, if applicable, the reaction of the CPU
- Symbol for information on incoming/outgoing status

The following table shows the possible symbols and their meaning.

Table 4- 5 Symbols in the event table

Symbol	Meaning
	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

Additional information

For additional information on the individual symbols, please refer to the online help for STEP 7.

4.2.2.2 Accessible devices (without project)

Accessible devices

Accessible devices are all devices that are connected to a PG/PC either directly by an interface or by means of a subnet and that are switched on. These devices can display diagnostic information even without an offline project.

Requirements

- STEP 7 is open.
- The portal view or project view is open.

Procedure

To display diagnostic information for specific devices even without an offline project, follow these steps:

1. Establish a connection to the respective CPU.
2. Select the command "Accessible devices" from the "Online" menu.

   The "Accessible devices" dialog opens.

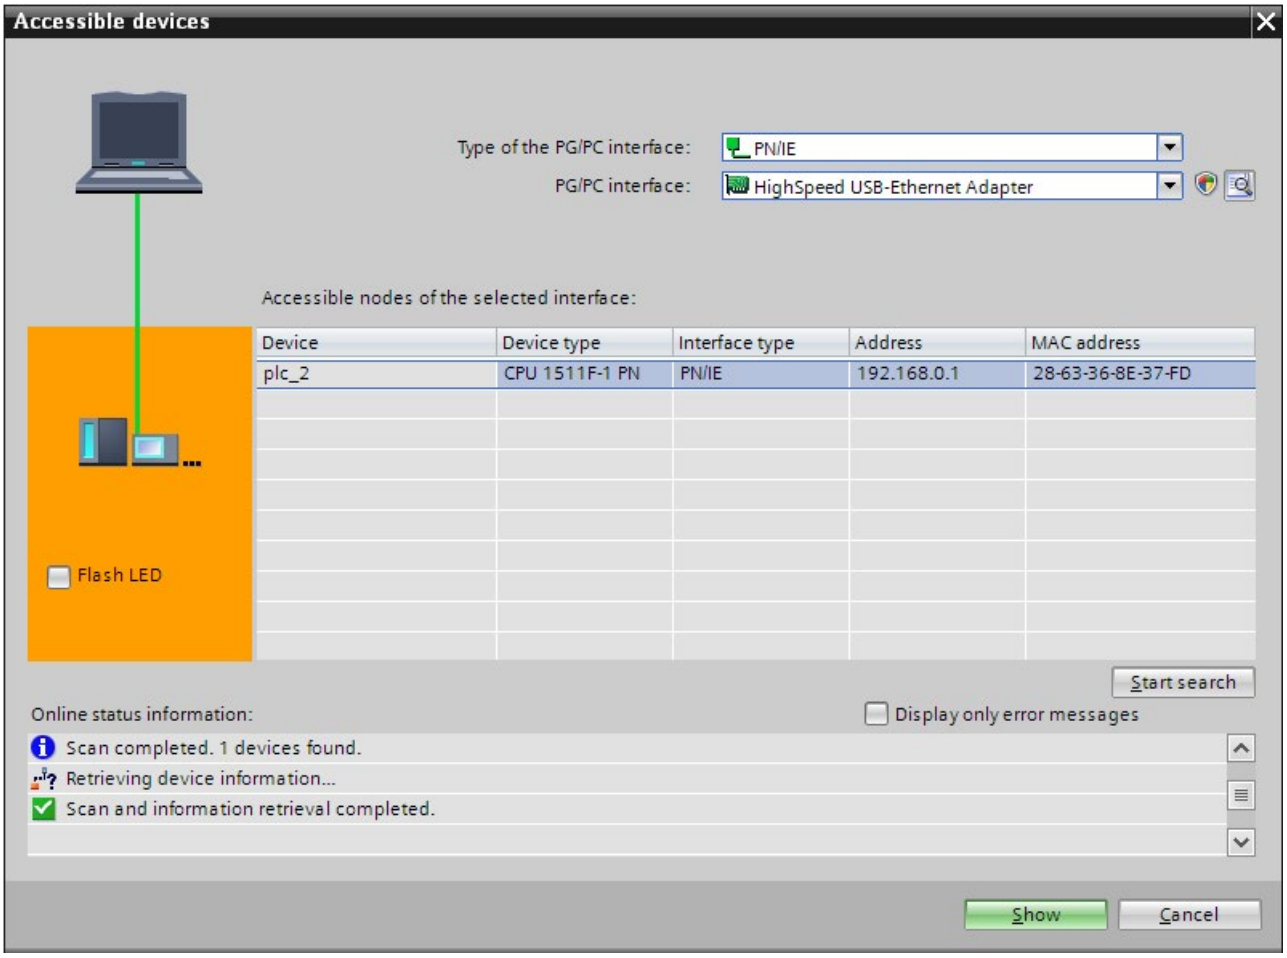

Figure 4-4 "Accessible devices" dialog

3. Make the settings for the interface.
4. Select the respective device under "Accessible nodes of the selected interface".
5. Confirm the dialog with the "Display" button.

Result

The device is displayed in the project tree. You open the diagnostic information in the work area with a double-click on "Online & Diagnostics".

Information is available on the diagnostic status, cycle times, memory usage and the diagnostics buffer.

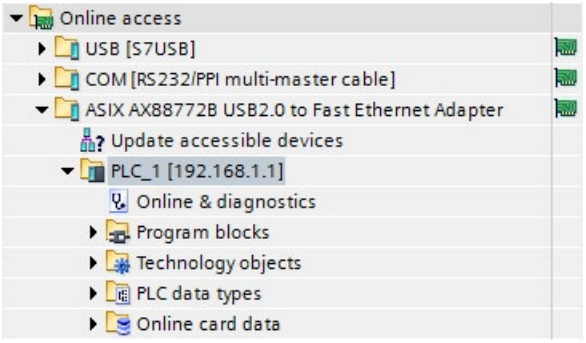

Figure 4-5 Device in the project tree

4.2.2.3 Devices & networks

Devices & networks - Go online

You can get an overview of the current state of your automation system in the device view or network view.

You implement the following tasks in the device view:

- Device configuration and parameter assignment
- Module configuration and parameter assignment

You implement the following tasks in the network view:

- Device configuration and parameter assignment
- Networking devices

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To get an overview of the current state of your automation system, follow these steps:

1. Open the "Network view" in the working area.
2. Select the CPU.
3. Click the "Go online" Go online button in the toolbar.

   The "Go online" dialog opens.

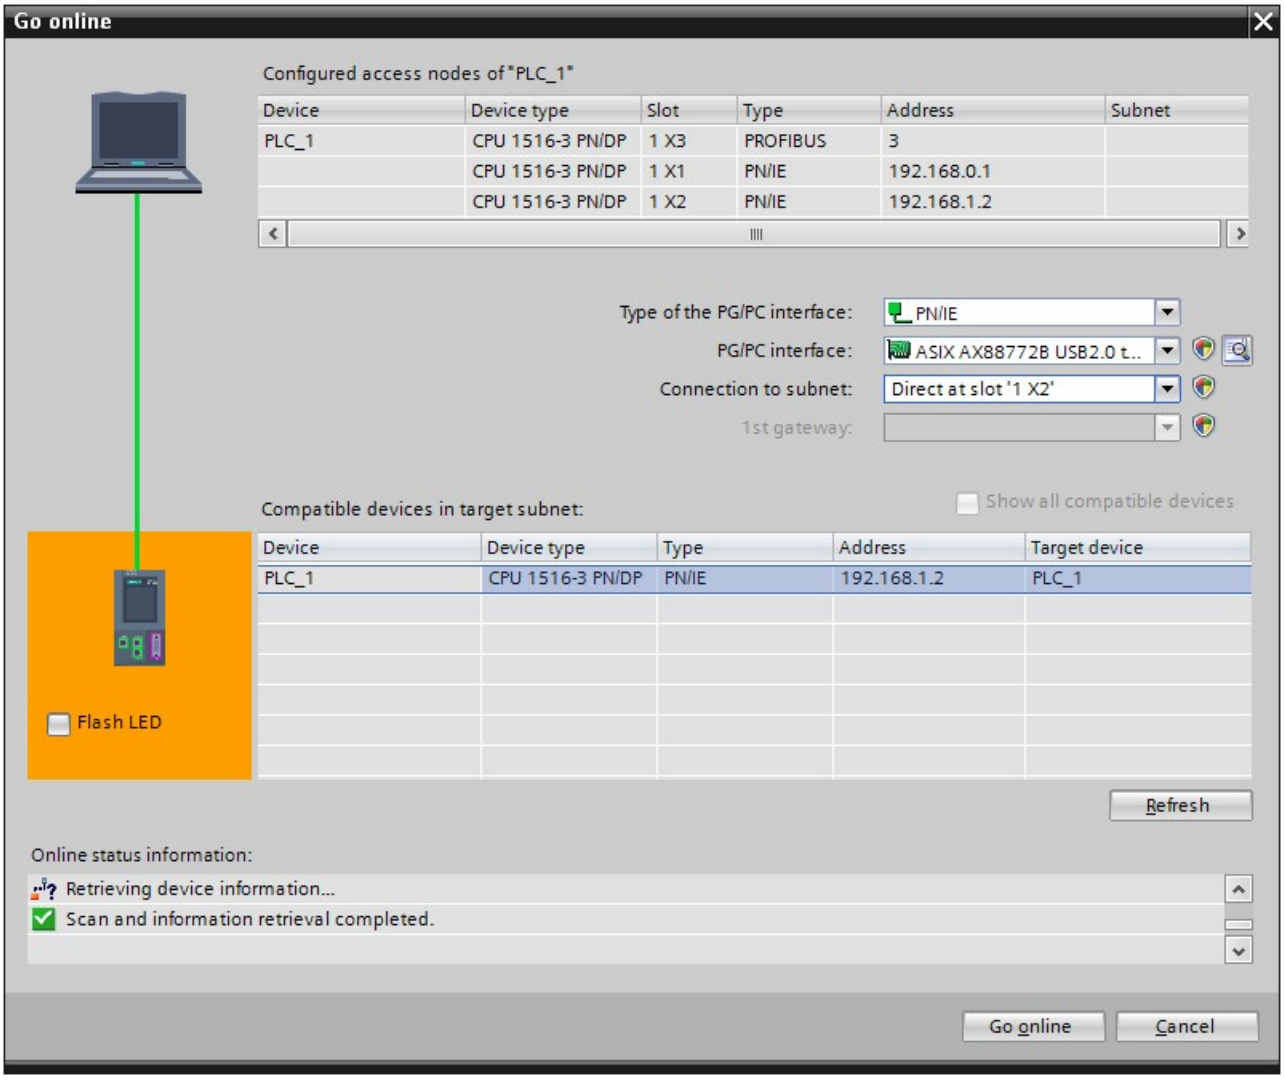

Figure 4-6 Go online

4. Make the settings for the interface.
5. Select the respective device under "Compatible devices in the target subnet".
6. Confirm the dialog with the "Connect" button.

   The online mode is started.

Result

The connected devices are now displayed with diagnostic information in the network view in the working area. Here you get an overview of the current state of your automation device.

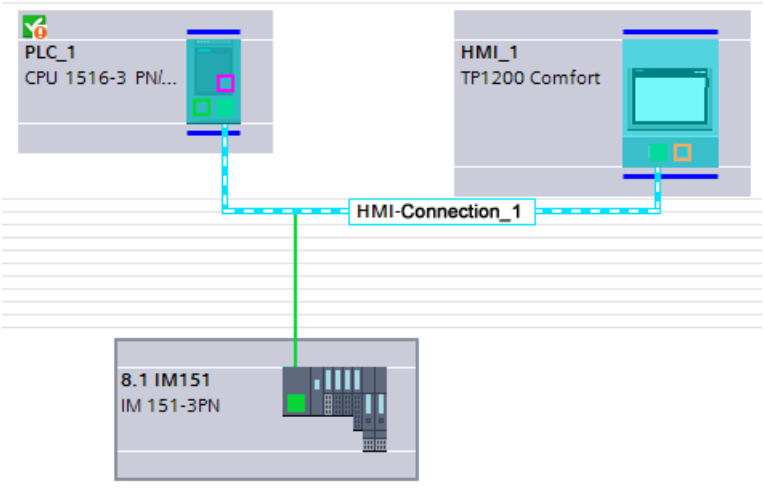

Figure 4-7 CPU with diagnostic information

You get to the "Device view" with a double-click on the device. The diagnostic information for the individual modules is displayed in this view.

Note

Symbols and their meaning

You will find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 30) and in the online help for STEP 7.

4.2.2.4 Online & diagnostics

Online mode

In online mode there is an online connection between your PG/PC and one or several devices. Depending on the properties of a device, you are offered specific diagnostics options and certain functions in online mode.

- Diagnostics
  - General module information
  - Diagnostics status
  - Cycle time
  - Memory
  - Diagnostics buffer
  - Display
  - Interface information (e.g. IP parameter, port information)
- Functions
  - Assign IP address
  - Set time and date of the CPU
  - Firmware update (e.g. for PLC, display)
  - Assign device name
  - Reset to factory settings
  - Format memory card
  - Save service data

To establish an online connection at least one PG/PC interface must be installed that is physically connected with a device, for example, with an Ethernet cable. The current online status of a device is indicated by a symbol to the right of the device in the project tree.

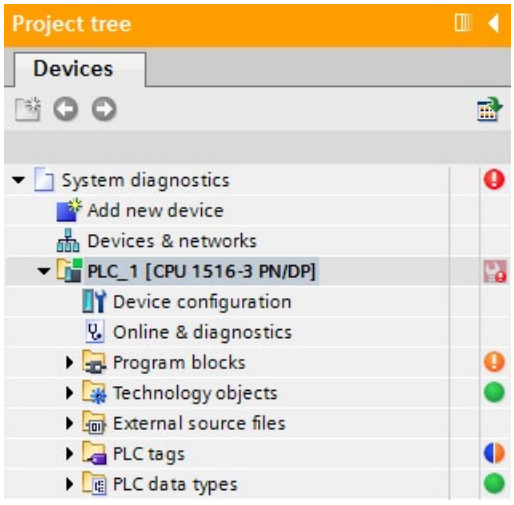

Figure 4-8 Partial view of network view

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To display an overview of the faulty devices, follow these steps:

1. Select the affected device folder in the project tree.
2. Select the shortcut menu command "Online & Diagnostics".

   The online and diagnostics view of the module to be diagnosed is started.

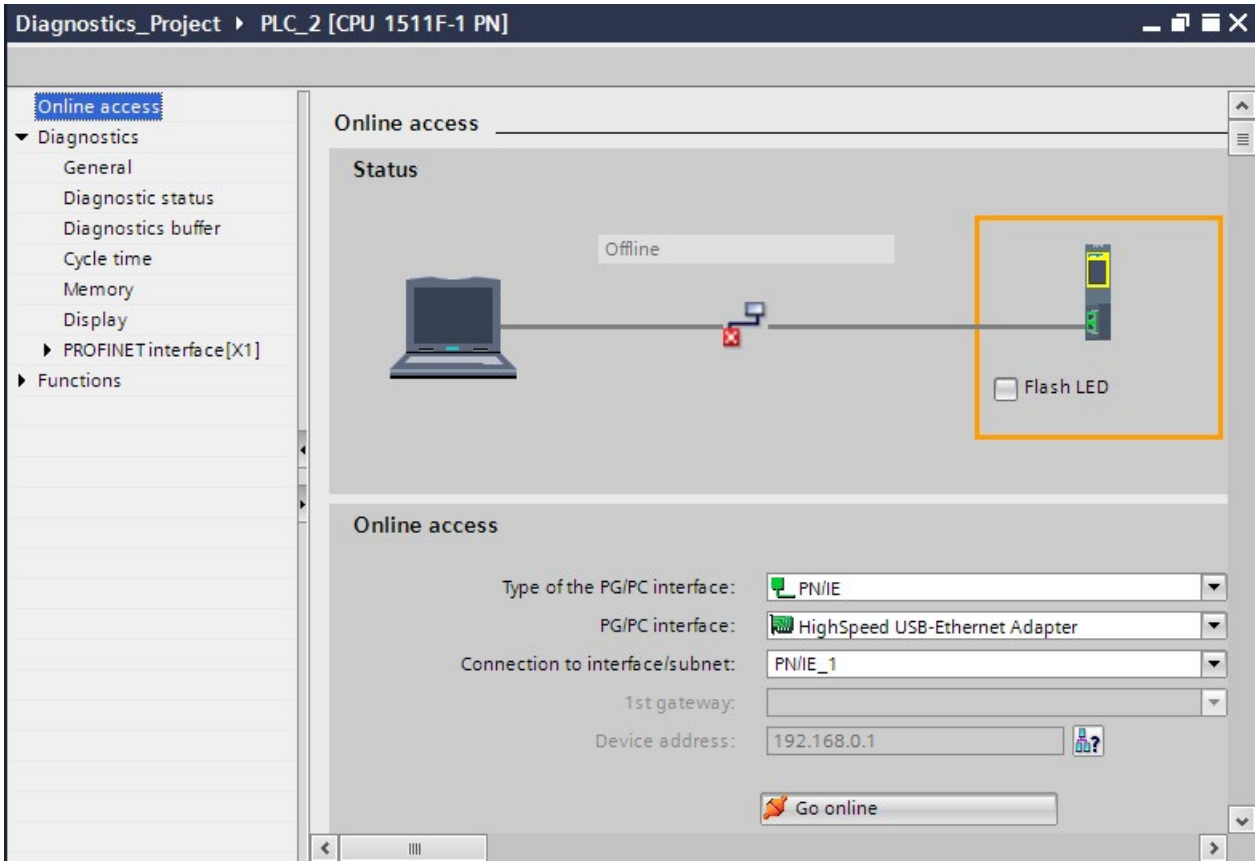

Figure 4-9 Setting online access

3. Make the settings for the interface.

   Here you can change an interface access that has already been set for an online connection that was successfully established previously.
4. Click on the "Go online" button.

   The online connection is established.

Result

You can find detailed diagnostics information on each device in the Inspector window, in the "Diagnostics" section of the area navigation on the "Properties" tab.

4.2.2.5 "Diagnostics" tab in the Inspector window

"Diagnostics" tab in the Inspector window

The "Diagnostics" tab of the Inspector window includes information on diagnostics events and configured alarm events.

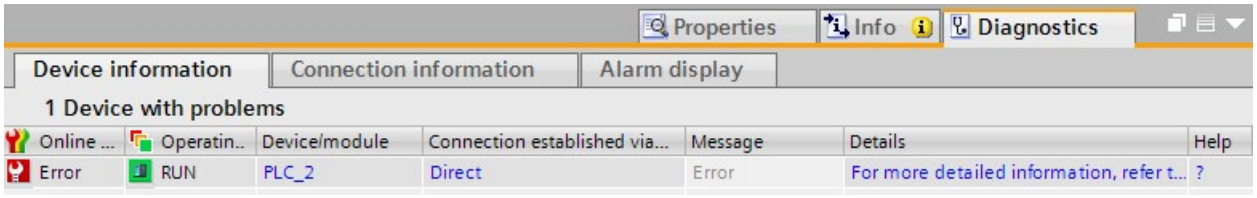

Figure 4-10 Diagnostics in the Inspector window, "Device information" tab

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 30) and in the online help for STEP 7.

Subordinate "Device information" tab

This tab gives you an overview of faulty devices to which an online connection exists or has existed. The table provides the following diagnostics information on the faulty devices:

- Online status: Includes the online status as diagnostics symbol and in words
- Operating mode: Includes the operating mode as symbol and in words
- Device/module: Name of the affected device or the affected module
- Connection established via ...: Specifies the path used to establish the connection to the failed device.
- Alarm: This explains the entry in the previous columns and displays an alarm, if necessary
- Details: The link opens the online and diagnostics view associated with the device or puts it in the foreground.
  If the device cannot be reached, the link opens the "Go online" dialog.
- Help: The link provides additional information on the fault.

Note

Communication and access errors

Errors that occur in the user program (e.g., communication errors, access errors) are not reported in the "Diagnostics" tab of the device information. You must read out the diagnostics buffer of the CPU in the online and diagnostics view to get this information. The link in the "Details" column opens the diagnostics buffer.

Subordinate "Connection information" tab

The "Connection information" tab displays detailed diagnostics information for connections.

There will only be information on the "Connection information" tab if there is an active online connection to at least one end point of the relevant connection.

If a connection has been selected (connection table), the tab contains the following groups:

- Connection details
- Address details of the connection

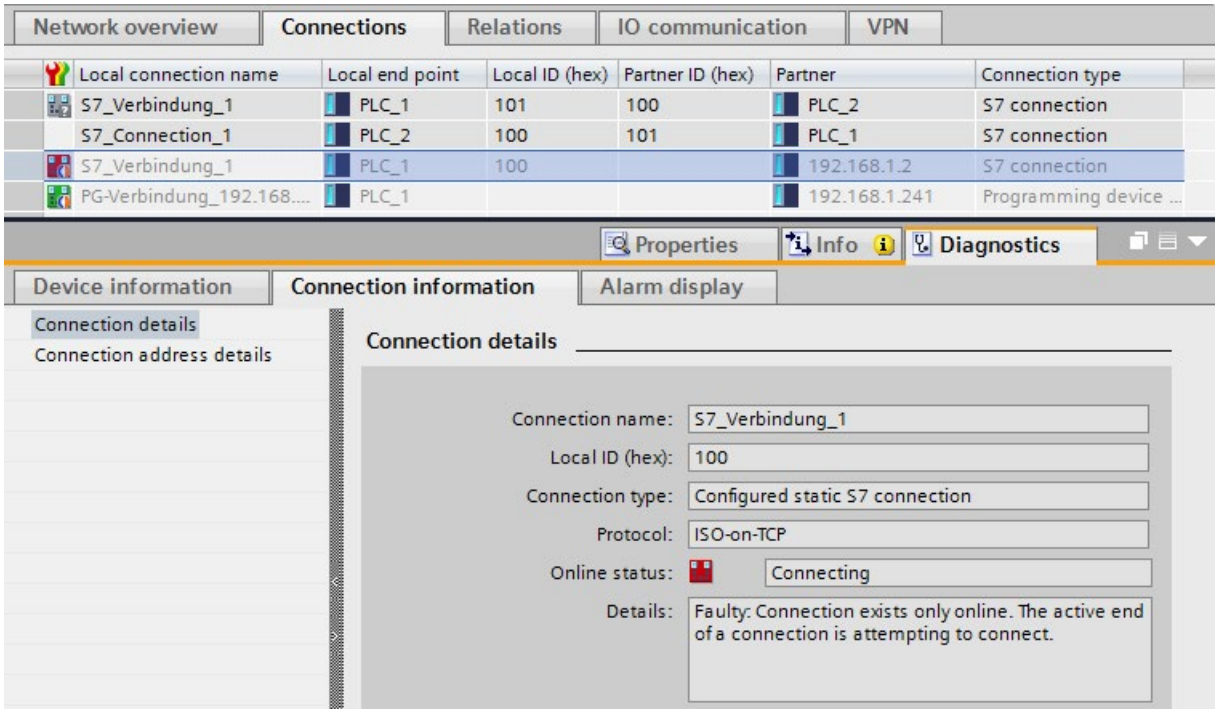

Figure 4-11 "Connection information" tab and open connection overview

If a module has been selected (network view), the tab contains the following group:

- Connection resources

Subordinate "Alarm display" tab

System diagnostics alarms are output in the "Alarm display" tab.

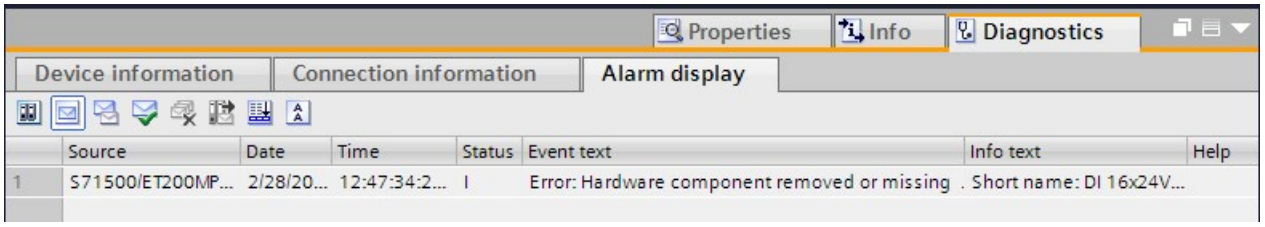

Figure 4-12 "Alarm display" tab

To receive alarms in STEP 7, follow these steps:

1. Open the project view.
2. Select the required CPU in the project tree.
3. To connect online with the respective CPU, select the shortcut menu command "Go online".
4. Select the required CPU once again in the project tree and select the shortcut menu command "Receive alarms".

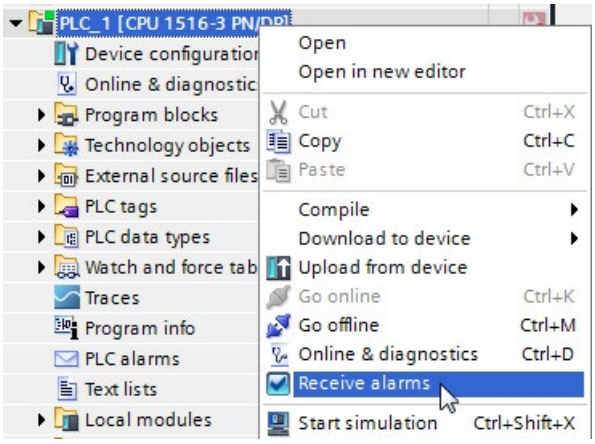

Figure 4-13 Receive alarms

5. Alarms are now displayed in the alarm display. "Archive view" is enabled by default.
6. To display the latest alarms, click the "Active alarms" icon .

4.2.2.6 CPU diagnostics buffer

Definition

Each CPU and some other modules have their own diagnostics buffer, in which detailed information on all diagnostic events is entered in the order in which they occurred.

The CPU diagnostics buffer can be displayed on all display media (STEP 7, SIMATIC HMI devices, SIMATIC S7-1500 Web server and display of the CPU).

Diagnostic events

The entries available in the diagnostics buffer include:

- Internal and external errors on a module
- System errors in the CPU
- Operating mode transitions (e.g., from RUN to STOP)
- Errors in the user program
- Removal/insertion of modules
- Security events

The contents of the diagnostics buffer are stored in the retentive memory in case of a memory reset of the CPU. Errors or events can be evaluated even after a longer period of time thanks to the diagnostics buffer to determine the cause of a STOP or to trace the occurrence of a single diagnostic event and to be able to assign it.

Procedure

To display the diagnostics buffer of a CPU in STEP 7, follow these steps:

1. Select the respective CPU.
2. Select the shortcut menu command "Online & Diagnostics".

   The "Online access" view is opened in the work area.

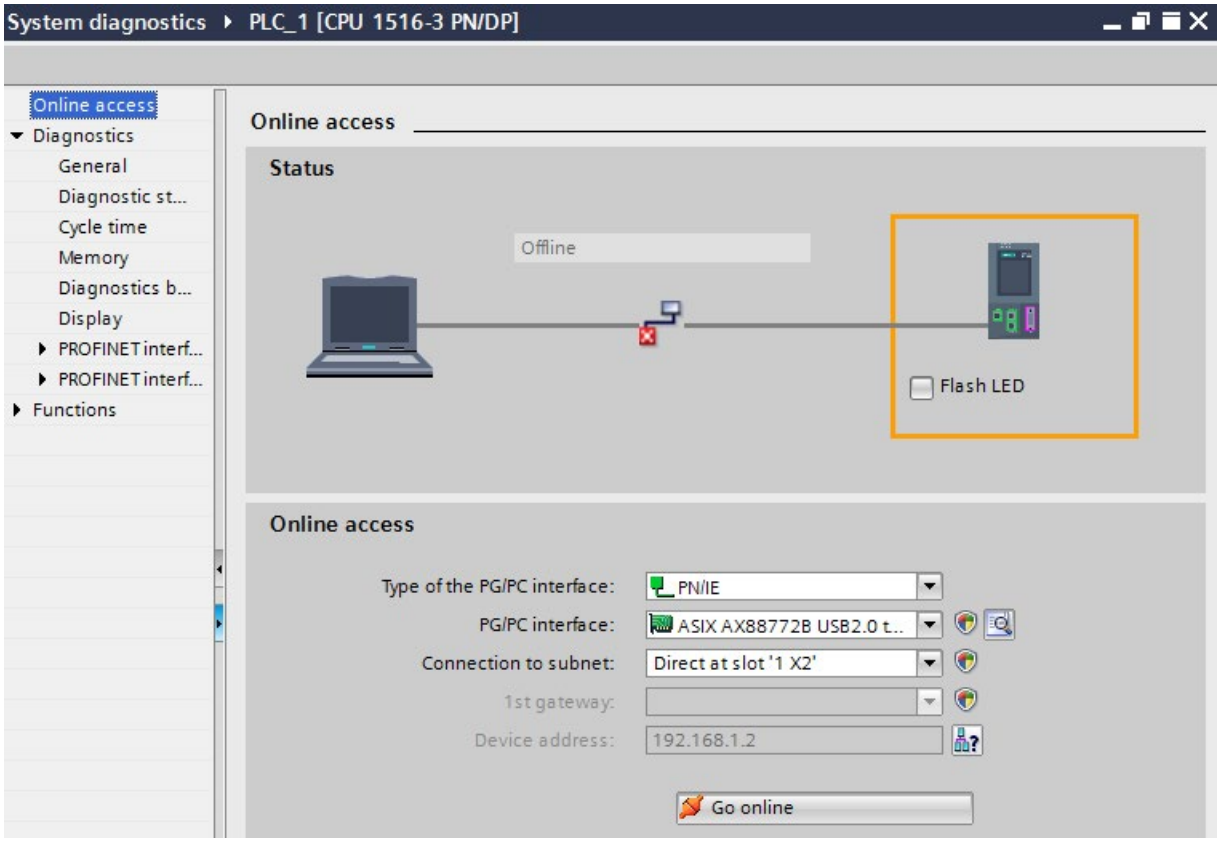

Figure 4-14 Setting up online access

3. Set the interface.

4. Click Go online.
5. Select the area "Diagnostics buffer".

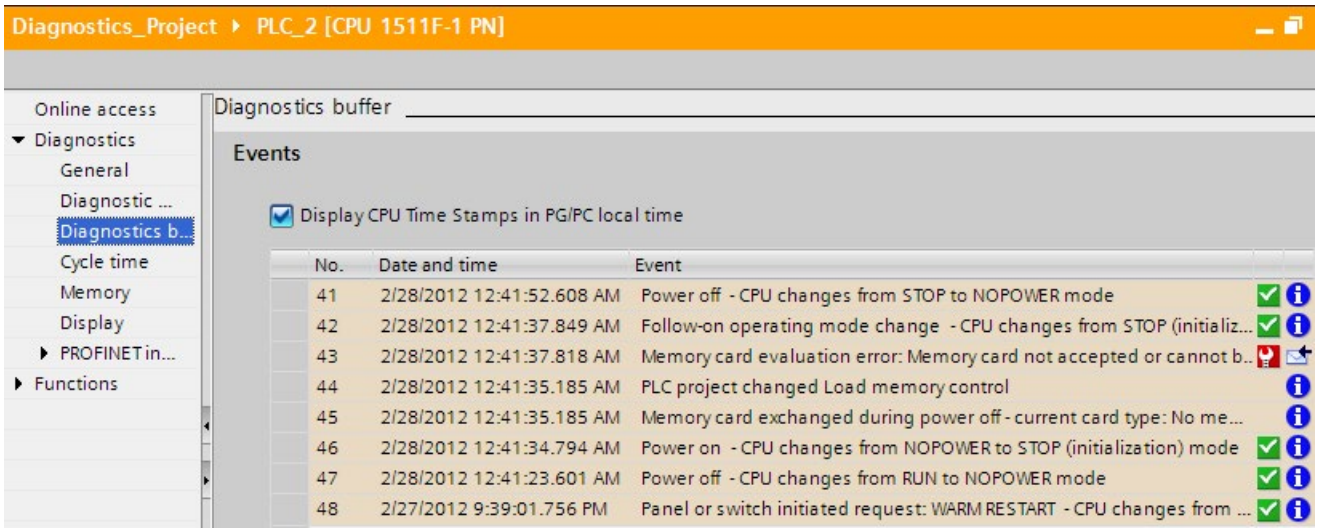

Figure 4-15 Diagnostics buffer in STEP 7

Note

Filtering events

You can filter the entries in the diagnostics buffer in the settings of the "Diagnostics buffer" area to only display specific types of events. This means that specific events, such as "CPU and configuration-internal events" or "Connection diagnostics events", can be displayed separately.

Security events

The following security events (event types) result in an entry in the diagnostics buffer.

- Going online with the correct or incorrect password
- Manipulated communications data detected
- Manipulated data detected on memory card
- Manipulated firmware update file detected
- Changed protection level (access protection) downloaded to the CPU
- Password legitimization restricted or enabled (by instruction or CPU display)
- Online access denied due to the possible number of simultaneous access attempts being exceeded
- Timeout when an existing online connection is inactive
- Logging on to the Web server with the correct or incorrect password
- Creating a backup of the CPU
- Restoring the CPU configuration (Restore)

To prevent the diagnostics buffer being "swamped" by large numbers of identical security events, you can set parameters so that these events are entered in the diagnostics buffer as a group alarm. For every interval (monitoring time), the CPU then only generates one group alarm per event type.

Configuring a group alarm for security events

To configure group alarms for security events, follow these steps:

1. Click on the CPU icon in the network view.

   The properties of the CPU are displayed in the Inspector window.
2. Navigate to the "Protection" > "Security event" area.
3. Click "Security event".
4. Select the option "Summarize security events in case of high message volume" to enable group alarms for security events.
5. Set the duration of an interval (monitoring period); the default is 20 seconds.

4.2.2.7 "Online tools" task card

Online view in the "Online tools" task card

The following requirements must be met to display the online view of the "Online tools" task card in STEP 7:

- An online connection to the CPU is available.
- You have selected the CPU in the topology view, network view or device view.

The "Online tools" task card provides an overview of the CPU state, the cycle time and the memory usage.

- The "CPU operator panel" pane displays the current state of some LEDs and the mode selector of a CPU.
- The "Cycle time" pane displays the cycle time diagram and below it the measured cycle times as absolute values.
- The "Memory" pane contains the current memory usage of the associated CPU. The free memory is shown both as a bar graph and as a numerical value (percentage).
  The display for "Load memory" contains, in addition to the online project data (program code, data blocks, hardware configuration etc.), all other data that may be on the SIMATIC memory card, such as recipes, data logs, HMI backups or non-SIMATIC files that have been copied to the memory card via the Web server of the CPU or offline in Explorer (for example, PDF files).

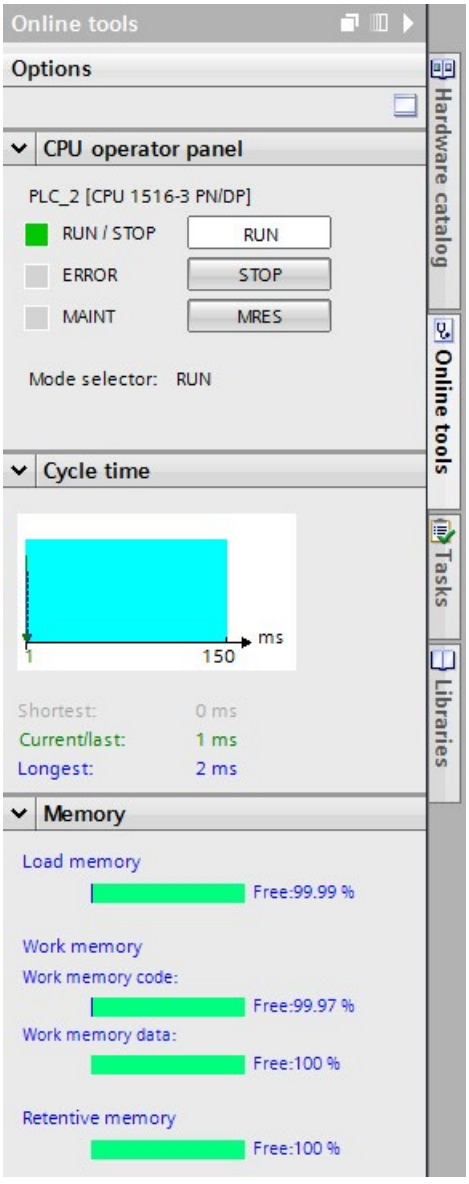

Figure 4-16 "Online tools" task card

4.2.2.8 Configuring the settings for I/O modules in STEP 7

You can also make settings for system diagnostics in STEP 7 for I/O modules. The parameters you have to configure depend on the I/O module.

The settings are optional.

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.
- A design with I/O modules has been configured.

Procedure

To make settings for system diagnostics of I/O modules in STEP 7, follow these steps:

1. Select the respective I/O module in the device view.
2. Open the "Properties" tab in the Inspector window.
3. Select the area "Inputs", for example.

   You have access to the settings for system diagnostics of the I/O module. If you select "Wire break", for example, a possible wire break for the channel is signaled during operation.

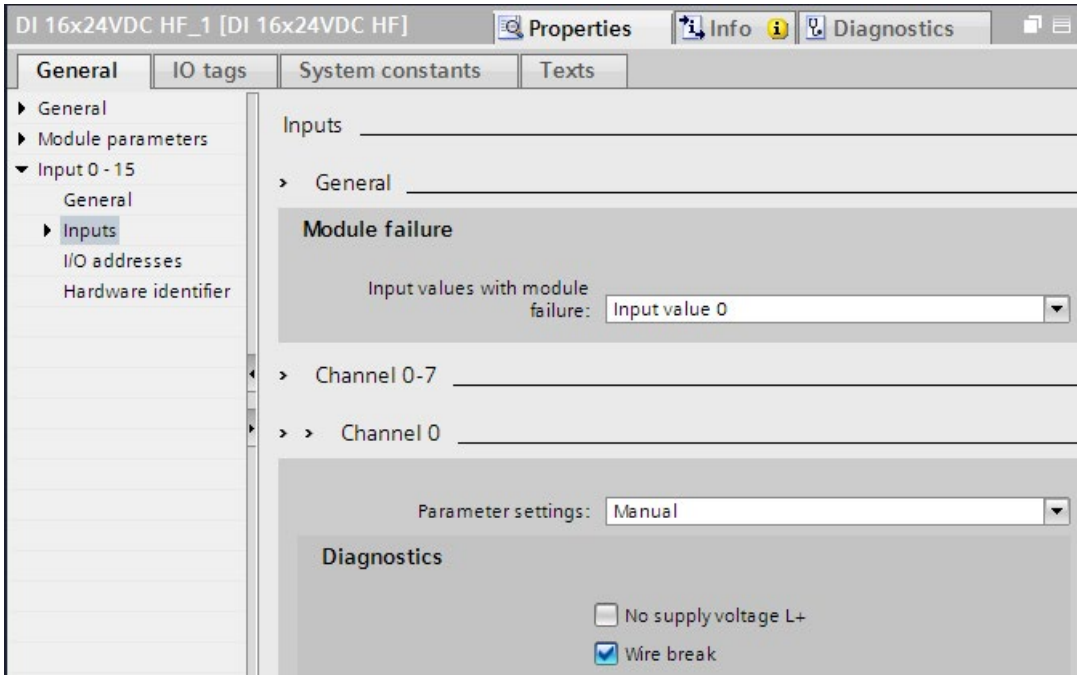

Figure 4-17 I/O setting with a digital input module

4. Save the hardware configuration.
5. Download the new hardware configuration to the CPU.

Additional information

The documentation for the respective module includes additional information on parameter assignment of I/O modules.

4.2.3 Diagnostics information using the web server

System diagnostics using the CPU Web server

The CPUs of the SIMATIC series have an integrated Web server and let you display the system diagnostics information by means of PROFINET. Any terminal devices, such as PCs or smartphones, can thus access module data, user program data and diagnostics data of a CPU by using an Internet browser. This means access to CPUs is possible without installed STEP 7.

In addition to normal websites, the Web server provides so-called basic websites with reduced content that are adapted to the requirements of small screens with low resolution.

Using CPU 1516-3 PN/DP as an example, the following figure shows the start page of the Web server:

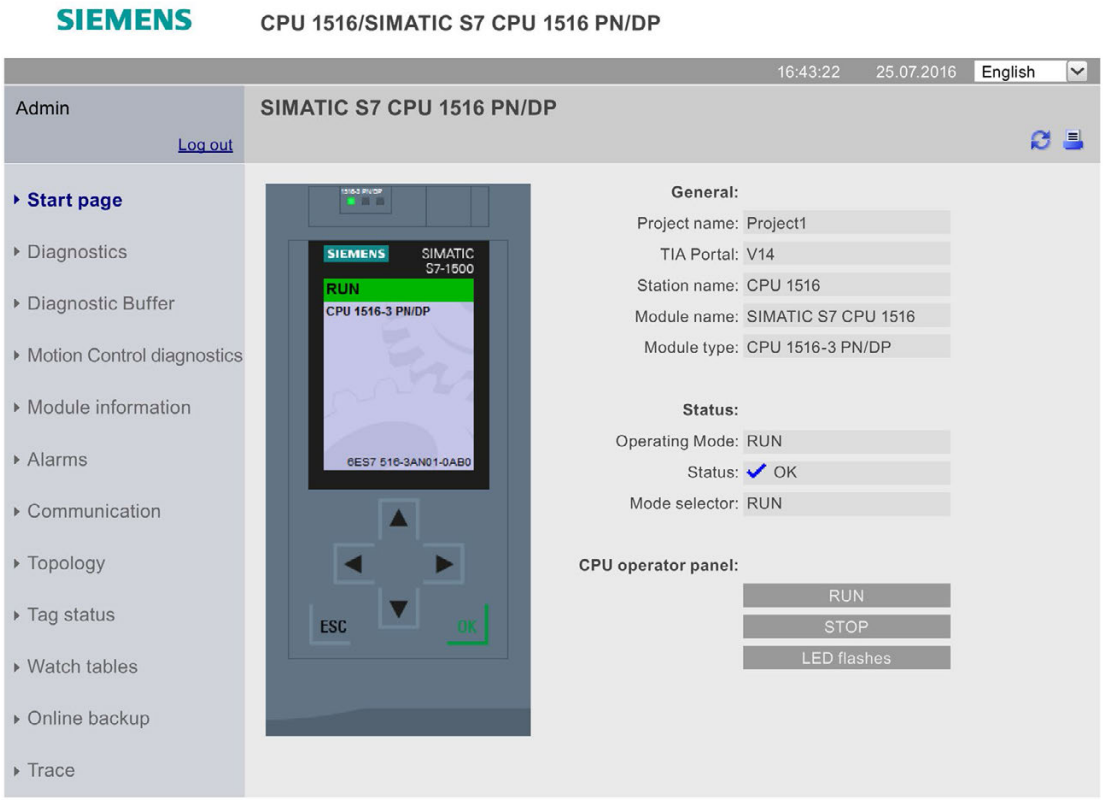

Figure 4-18 Web server, Start page

The following diagnostics options are available with the integrated Web server:

- Start page with general CPU information
- Information on diagnostics
- Contents of the diagnostics buffer
- Module information
- Alarms
- Information about communication
- PROFINET topology
- Motion Control diagnostics
- Trace

Configuring the Web server in STEP 7

Proceed as follows to activate the Web server:

Requirements

- You have opened STEP 7.
- You have added a CPU to the project.
- You have opened the project view.

Procedure

1. Open the network view.
2. Select the CPU.
3. Open the "Properties" tab in the Inspector window.
4. Select the entry "Web server" in the "General" area navigation.

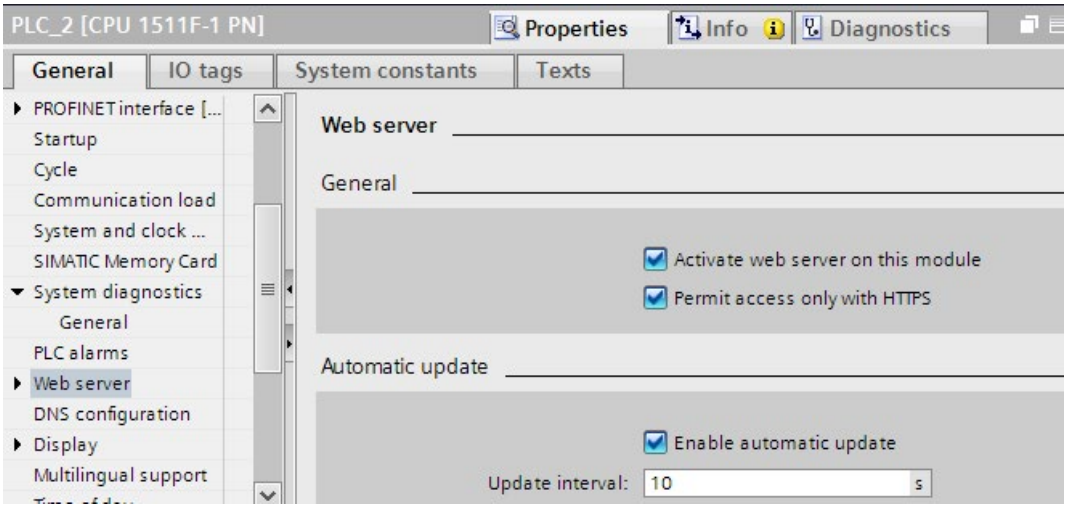

Figure 4-19 Activate the Web server

5. Select the "Activate web server on this module" check box.
6. If possible, always enable the option "Permit access only with HTTPS".
   Note the following: The activation of the Web server using the secure transmission protocol "HTTPS" requires a valid Web server certificate in the CPU.

NOTICE
Utilizing the full functionality of the Web server A valid CA-signed Web server certificate in the CPU is a requirement for: • User management with password-protected users • The use of safety-related functions (online backup and restore of the CPU configuration, saving and downloading diagnostic information in csv files) To use the full functionality of the Web server, we recommend that you create a CA-signed server certificate and assign it to the CPU. To create a CA-signed Web server certificate, you must enable the Certificate Manager in the global security settings of STEP 7 and assign a CA-signed server certificate to the Web server in the properties of the CPU. You can find additional information on handling Web server certificates in the "Configuring the Web server" section of the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560). Detailed information on Certification Authority (CA) certificates, device certificates (End Entity certificate), "Public Key Infrastructure" (PKI) and certificate management can be found in the Communication function manual (https://support.industry.siemens.com/cs/ww/en/view/59192925) and in the online help for STEP 7, keyword "Secure communication".

7. Automatic updating is activated in the default setting of a configured CPU.
8. Activate the Web server also for each interface via which you want to access the Web server.
   To do this, open the "Properties" tab in the Inspector window and select the "Web server" entry in the "General" area navigation. In the "Overview of interfaces" area, select the "Enabled web server access" check box for the corresponding interface.
9. Compile and load the configuration into the CPU.

Accessing the Web server

To access the Web server, proceed as follows:

1. Connect the display device (PG/PC, HMI, mobile terminal device) with the CPU or a communication module using a PROFINET interface.
   If you are working with WLAN, activate the WLAN on the display device and establish a connection to the access point (e.g. SCALANCE W788-1RR or SCALANCE W784-1), which is in turn connected to the CPU.
2. Open the web browser on the display device.
3. Enter the IP address of the interface of the CPU which is connected to the client in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (example input: http://192.168.3.141).
   The intro page of the CPU opens.
4. You need to perform the installation of the CA certificate again for each display device you want to use. A valid CA certificate is available for download from the "Intro" web page under "Download certificate". You can find instructions for installing the certificate in the help system of your Web browser and in the FAQ with the entry ID 103528224 at the Service&Support (https://support.industry.siemens.com/cs/ww/en/view/103528224) website.
5. Click the NEXT link to go to the Web server pages.

Note

Managing access rights

In STEP 7, you can create users, define access rights and assign passwords under "Web server > User management". Users only have access to the options that are permanently linked to the access rights.

You can find additional information on managing access rights in the "Configuring the Web server" section of the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

"Diagnostics" option

The "Diagnostics" web page provides more information about the tabs:

- Identification

  This tab contains the characteristics of the CPU (serial number, article number, hardware and firmware version, etc.).

- Program protection

  This tab provides information on whether the PLC program contains know-how protection or copy protection.

- Memory

  This tab contains current values on the memory currently in use.

- Runtime information

  Current information on program/communication load and cycle time can be found in this tab.

- F-runtime groups (only with an F CPU)

  The safety program of an F-CPU consists of one or two F-runtime groups. You can find their cycle time (F-monitoring time) and runtime in this tab.

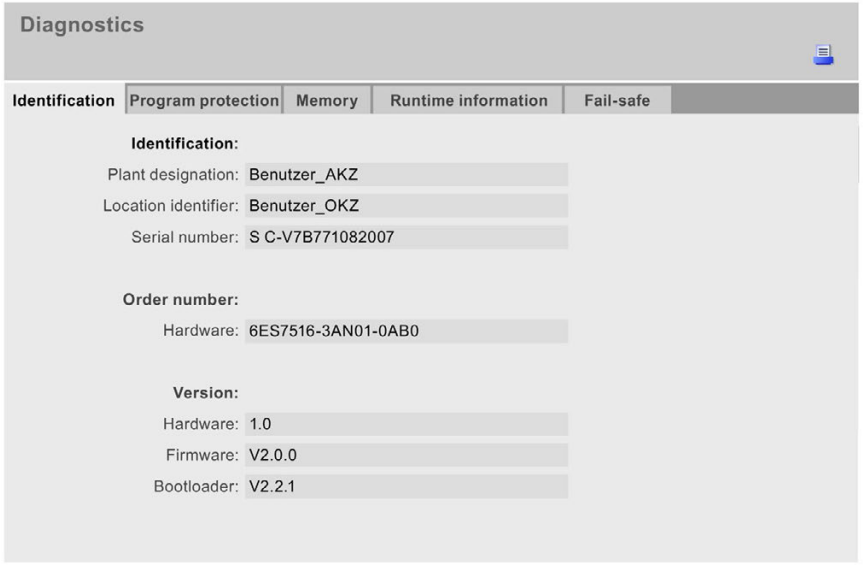

Figure 4-20 Web server, "Diagnostics" Web page

Diagnostics option "Diagnostics buffer"

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" Web page.

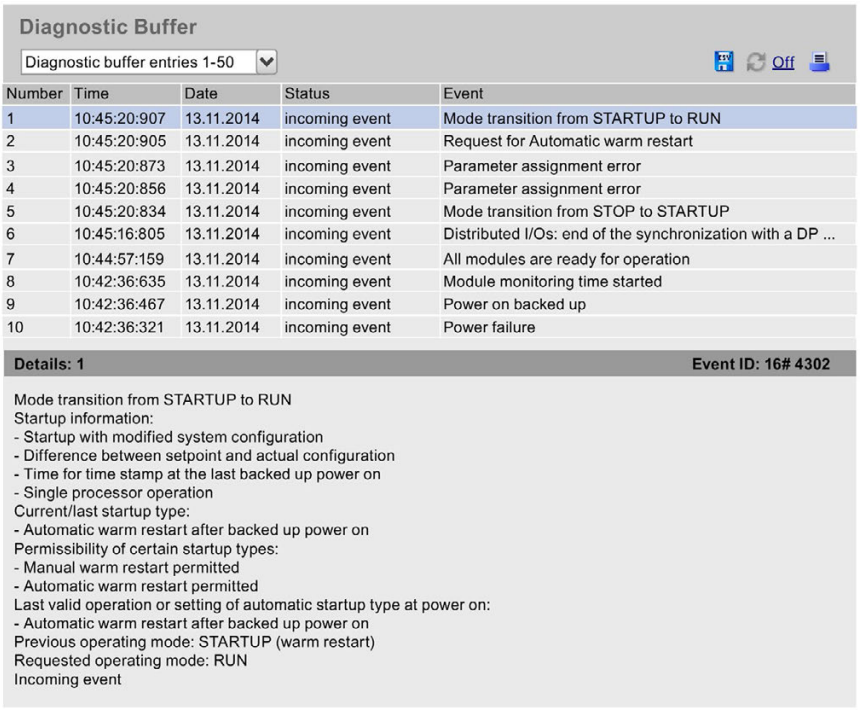

Figure 4-21 Web server, "Diagnostics buffer" Web page

Diagnostics option "Module information"

The status of a device is indicated by the Web browser with symbols and comments on the "Module information" Web page.

Modules are displayed on the "Module information" Web page in the "Name" column with a link. You can thus get to the faulty module in hierarchical order.

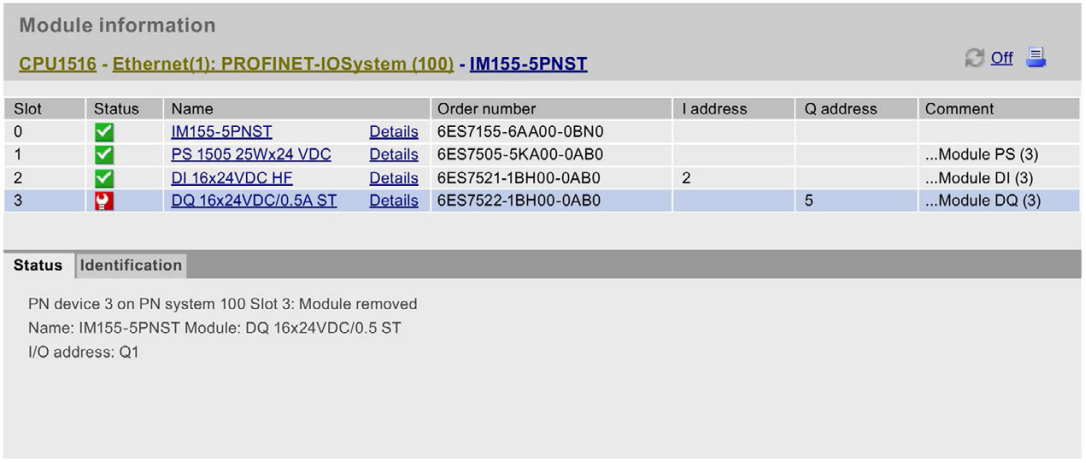

Figure 4-22 Web server, "Module information" Web page

Diagnostics option "Messages"

The Web browser displays the content of the message buffer on the "Messages" Web page. The messages can be acknowledged via the Web server if you have the appropriate user rights.

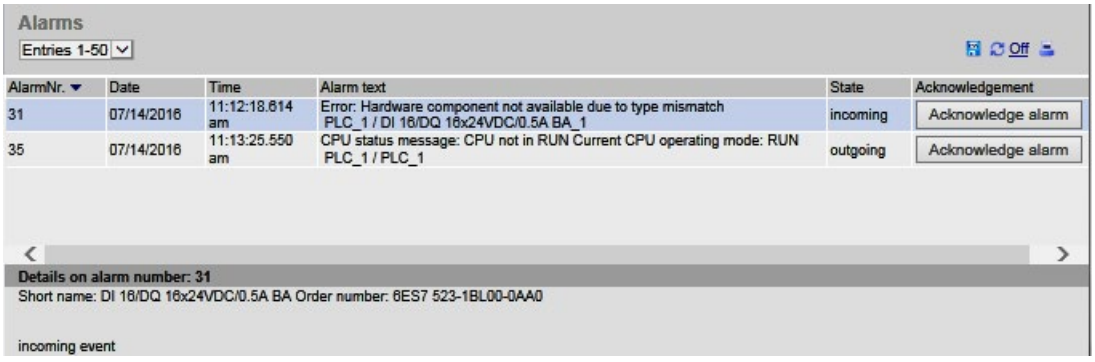

Figure 4-23 Web server, "Messages" Web page

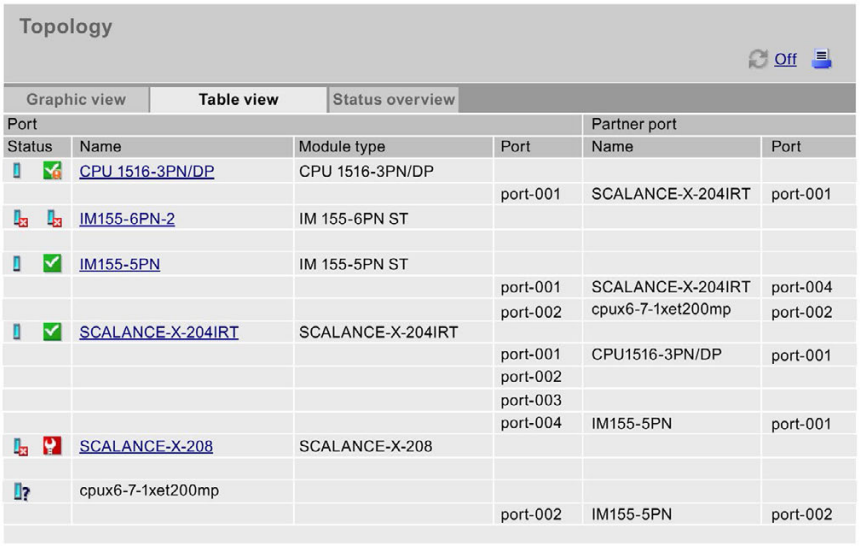
"Topology" diagnostics option

The "Topology" Web page provides information on the topological configuration and status of the PROFINET devices in your PROFINET IO system.



Port				Partner port	
Status	Name	Module type	Port	Name	Port
	CPU 1516-3PN/DP	CPU 1516-3PN/DP			
			port-001	SCALANCE-X-204IRT	port-001
	IM155-6PN-2	IM 155-6PN ST			
	IM155-5PN	IM 155-5PN ST			
			port-001	SCALANCE-X-204IRT	port-004
			port-002	cpux6-7-1xet200mp	port-002
	SCALANCE-X-204IRT	SCALANCE-X-204IRT			
			port-001	CPU1516-3PN/DP	port-001
			port-002		
			port-003		
			port-004	IM155-5PN	port-001
	SCALANCE-X-208	SCALANCE-X-208			
	cpux6-7-1xet200mp				
			port-002	IM155-5PN	port-002

Figure 4-24 Web server, "Topology" Web page

"Motion Control Diagnostics" diagnostic option

The Web server displays statuses, errors, technology alarms and the current values of the configured technology objects (TOs).

The "Motion Control Diagnostics" web page provides detailed information on the configured technology objects in the following views:

- Diagnostics

  This view provides an overview list of configured technology objects, the status and error messages of a selected technology object, as well as values and limits of the movement status for a selected axis.

- Service overview

  This view contains diagnostic information for multiple technology objects and a filter option for selecting the displayed technology objects.

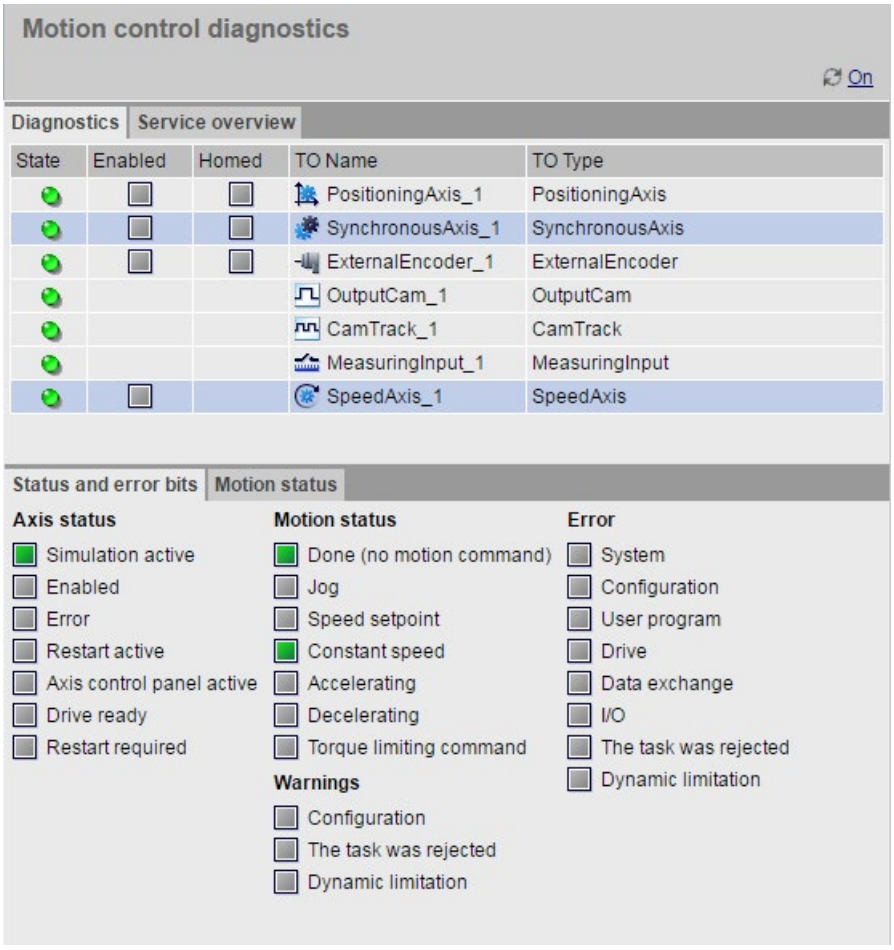


Figure 4-25 Web server, "Motion Control diagnostics" webpage

"Trace" diagnostic options

You can read, view and save the trace recordings via the Web server and thus obtain plant and project information for diagnostics and maintenance.

The web page of the trace and logic analyzer function consists of several areas. The example in the figure below shows how the Web server user interface is divided when the "Trace" web page is first called.

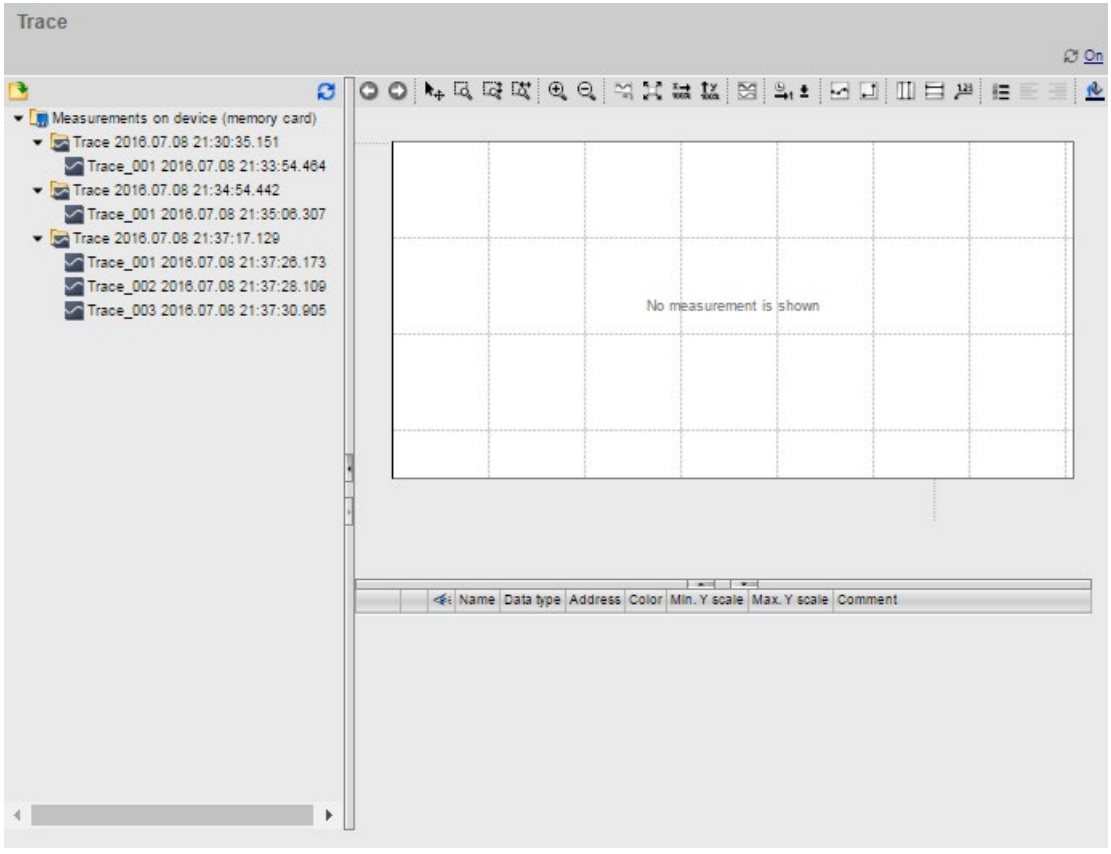

Figure 4-26 Web server, "Trace" home page (without measurement)

Additional information

Additional information on the topic is available in the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

You can find additional information on the trace function in the Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/ww/en/view/64897128) function manual.

4.2.4 Diagnostics information using the HMI diagnostics view

Objects for system diagnostics

The full functionality of the HIM diagnostics view is only available with Comfort Panels and WinCC RT Advanced . Basic Panels do not support the complete range of system diagnostics functions.

Two objects are available for system diagnostics on an HMI device.

System diagnostics view

The system diagnostics view reflects the current status of all accessible devices in your plant. You navigate directly to the cause of the error and the associated device. You have access to all diagnostics-capable devices that you have configured in the STEP 7 hardware and network editor.

System diagnostics window

The system diagnostics window is an operating element and display object.

The functions of the system diagnostics window are the same as for the system diagnostics view. Because the system diagnostics window is configured in the "Global screen", you can also specify, for example, if the object can be closed in WinCC Runtime.

Note

Compatibility with Basic Panels

Only the "System diagnostics view" object is available with Basic Panels.

Basic Panels do not support the "System diagnostics window" object or the graphic symbol "System diagnostics indicator".

4.2.4.1 Configuring system diagnostics

Introduction

You add a system diagnostics view or a system diagnostics window to your project to get an overview of all devices available in your plant.

The system diagnostics window behaves like the system diagnostics view but is only available in the global screen.

Requirements

- At least one CPU has been set up in the project.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- CPU and the HMI device are connected with each other by an HMI connection.
- You have created a screen (for the system diagnostics view).
- The global screen is open (for the system diagnostics window).
- The Inspector window is open.

Procedure

Proceed as follows to configure the system diagnostics:

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.

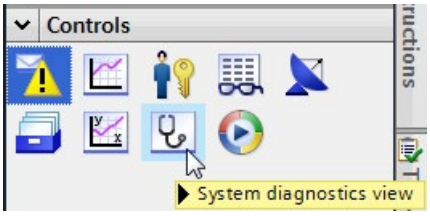

Figure 4-27 Adding a system diagnostics view

2. Select the "Properties" tab in the Inspector window.
3. Select the area "Columns".
4. Enable the columns that you require in the device view for WinCC Runtime, for example:
   - Status
   - Name
   - Operating mode
   - Slot
   - Address
5. Enable the columns that you require in the detail view for WinCC Runtime, for example:
   - Status
   - Name
   - Operating mode
   - Plant designation
   - Address
6. You can change the column headers in the "Columns" area, if necessary.
7. Select the "Display" area.
8. Enable "Column settings > Columns moveable" to move the columns in WinCC Runtime.
9. To close the system diagnostics window in WinCC Runtime, select "Properties > Window > Closable" in the "Properties" tab of the Inspector window.

Result

The system diagnostics view has been added to the screen. The diagnostics status of the entire plant is displayed in the system diagnostics view in WinCC Runtime.

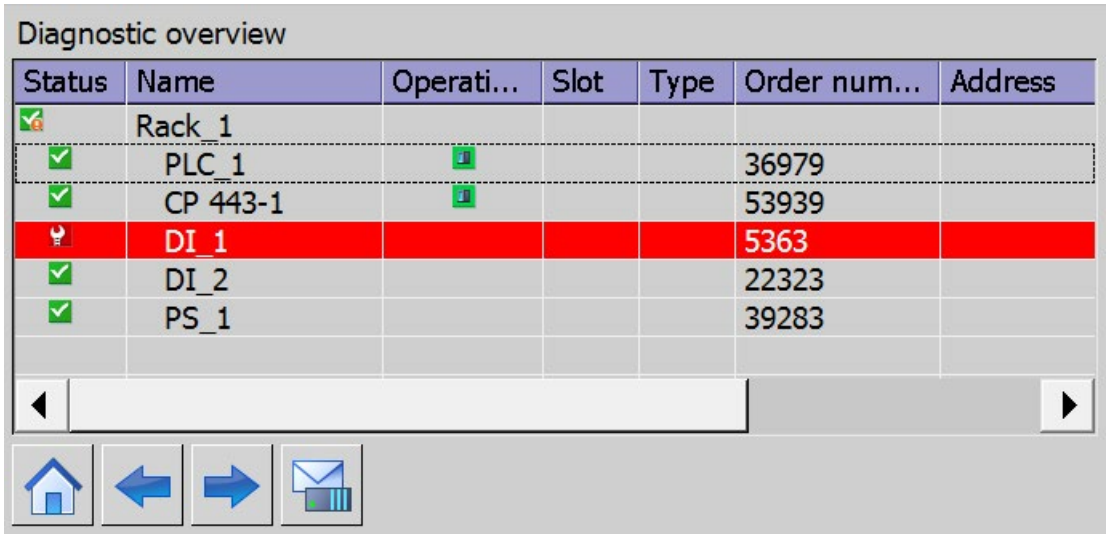

Figure 4-28 System diagnostics view in the screen

The system diagnostics window has been added to the global screen. If there is an error message in the plant, the system diagnostics window responds and displays the affected device.

4.2.4.2 Different views of the HMI diagnostics view

Introduction

There are three different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Details view
- Matrix view (for master/IO systems only, PROFIBUS, PROFINET)

Device view

The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the lower-level devices or the detail view. Symbols in the first column provide information about the current state of the device.

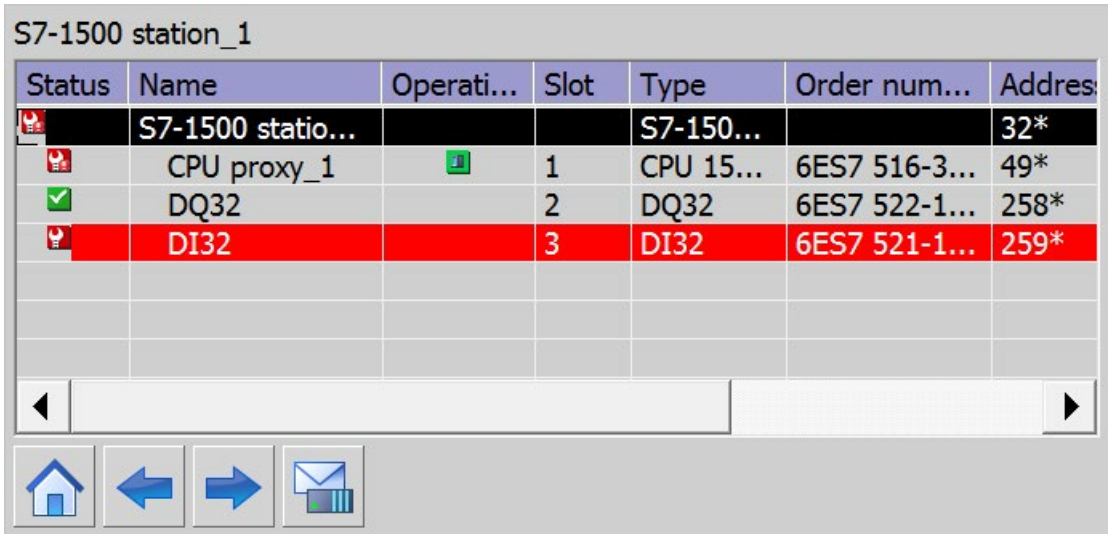

Figure 4-29 Device view

Details view

The detail view gives detailed information about the selected device and any pending errors. Check whether the data is correct in the detail view.

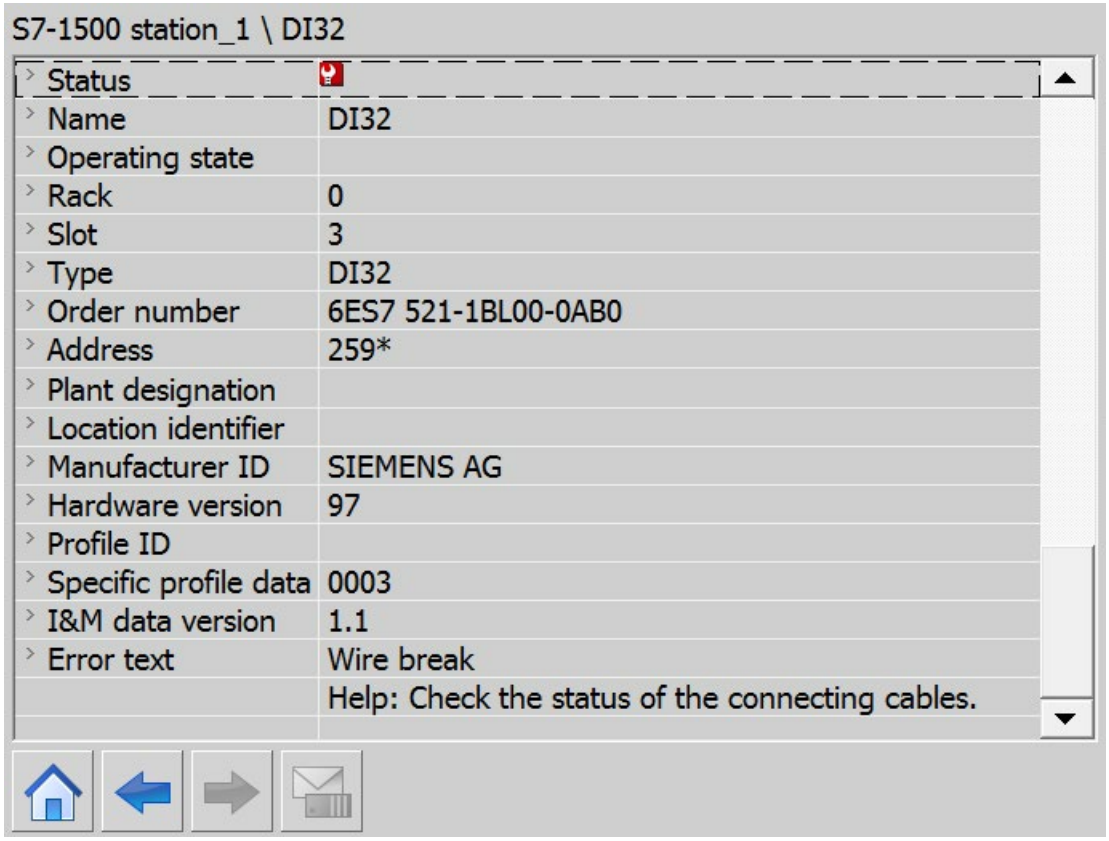

Figure 4-30 Details view

Matrix view

The matrix view is only available for distributed I/O systems. The matrix view shows the status of the devices of the PROFIBUS/PROFINET subnet.

- In PROFIBUS, the numbers assigned by PROFIBUS are used for identification (DP station number).
- In PROFINET, the IO devices are numbered consecutively from 1.

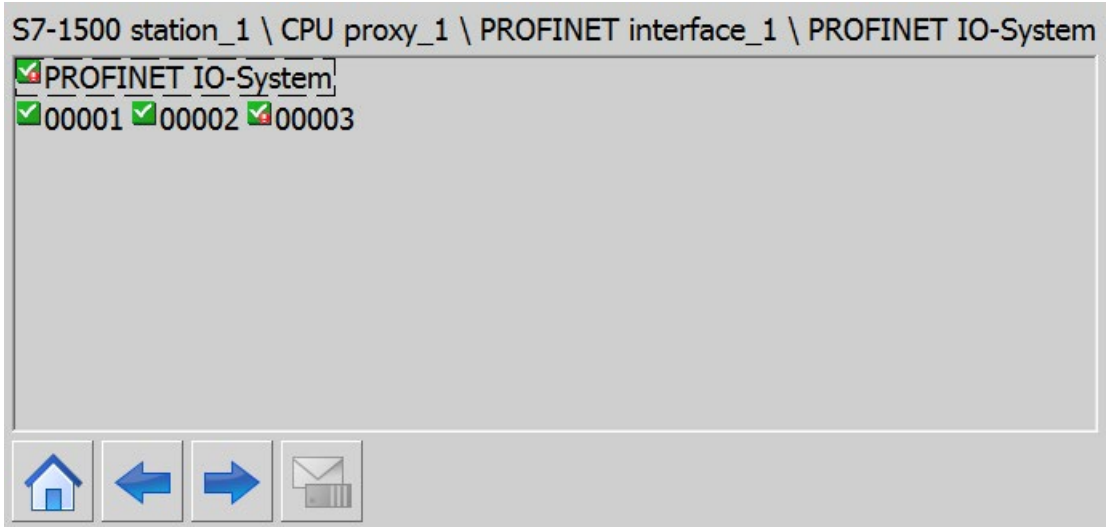

Figure 4-31 Matrix view

Navigation buttons

Button	Function
	Opens the lower-level devices or the detail view if there are no lower-level devices.
	Opens the higher-level device or the device view if there is no higher-level device.
	Opens the device view.

4.2.4.3 Inserting system diagnostics indicator

Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your plant.

The library object shows two different states:

- No error
- Error

Requirements

- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Libraries" task card is opened.
- The global library "Buttons and Switches > DiagnosticsButtons" is open.
- A screen is open.
- The system diagnostics window has been set up in the global screen.

Procedure

1. Select the "DiagnosticsIndicator" object in the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.

   The library object is added.

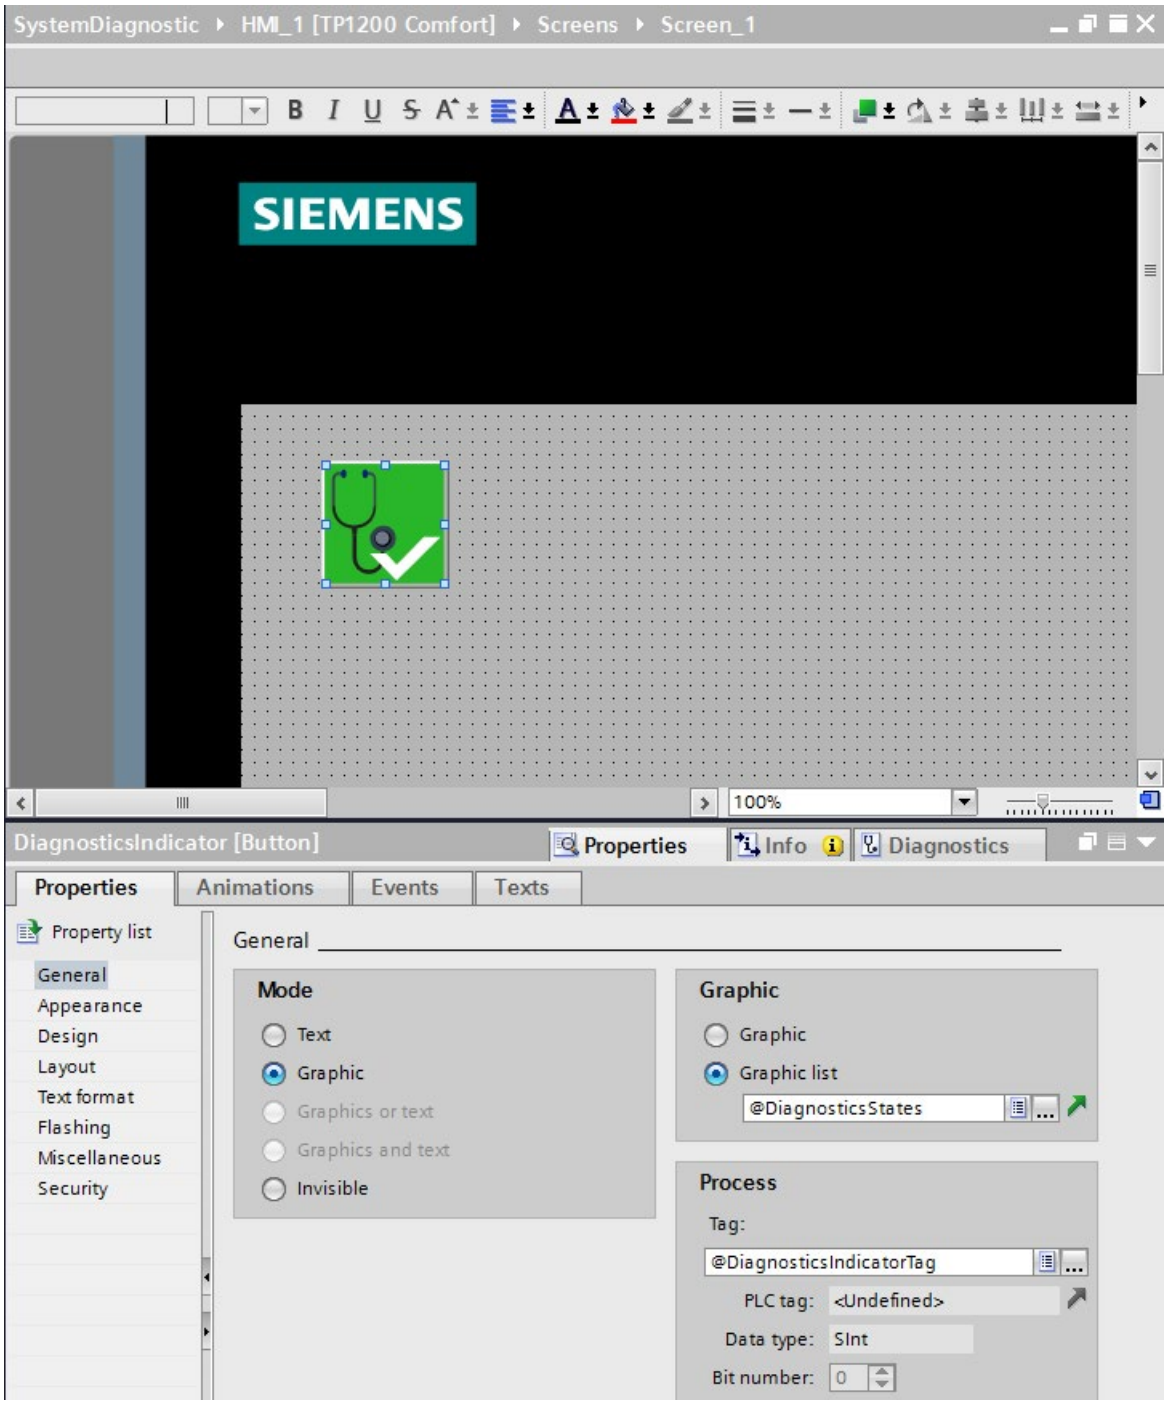

Figure 4-32 Inserting library object in the work area

3. Select the library object.
4. Open the "Events" tab in the Inspector window.

   The "ShowSystemDiagnosticsWindow" is preset for the event "Click".

Result

The system diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in WinCC Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics windows.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Open the "Properties" tab in the Inspector window.
3. Select an authorization in the "Security in Runtime" area.

A logon dialog opens when you click on the system diagnostics indicator in WinCC Runtime. The system diagnostics window does not open unless you have the required authorization.

4.2.4.4 Configuring button as system diagnostics indicator

Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can, for example, configure a button in "Graphic" mode to indicate errors in your plant.

Requirements

- At least one CPU has been created.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the states.
- A screen is open.
- You have created a system diagnostics view.

Procedure

Follow these steps to configure a button as system diagnostics indicator:

1. Double-click the "Button" object in the "Tools" task card. A button is added to the screen.
2. Enable the "Properties" tab in the Inspector window and the "Graphic" mode in the "General" area.
3. Select the bit graphics list as graphics list.
4. Select the "Properties" tab in the Inspector window and select the tag @DiagnosticsIndicatorTag under "Tag" in the "General" area.
5. To assign a function to the button, select the "Events" tab in the Inspector window.
6. Select the "Click" event.
7. Click on "Add function" in the table.
8. Select "EnableSystemDiagnosticsView".
9. Select the system diagnostics view.

Result

You have configured an interface that reacts to error events from the CPU. The button changes when an error event occurs in Runtime.

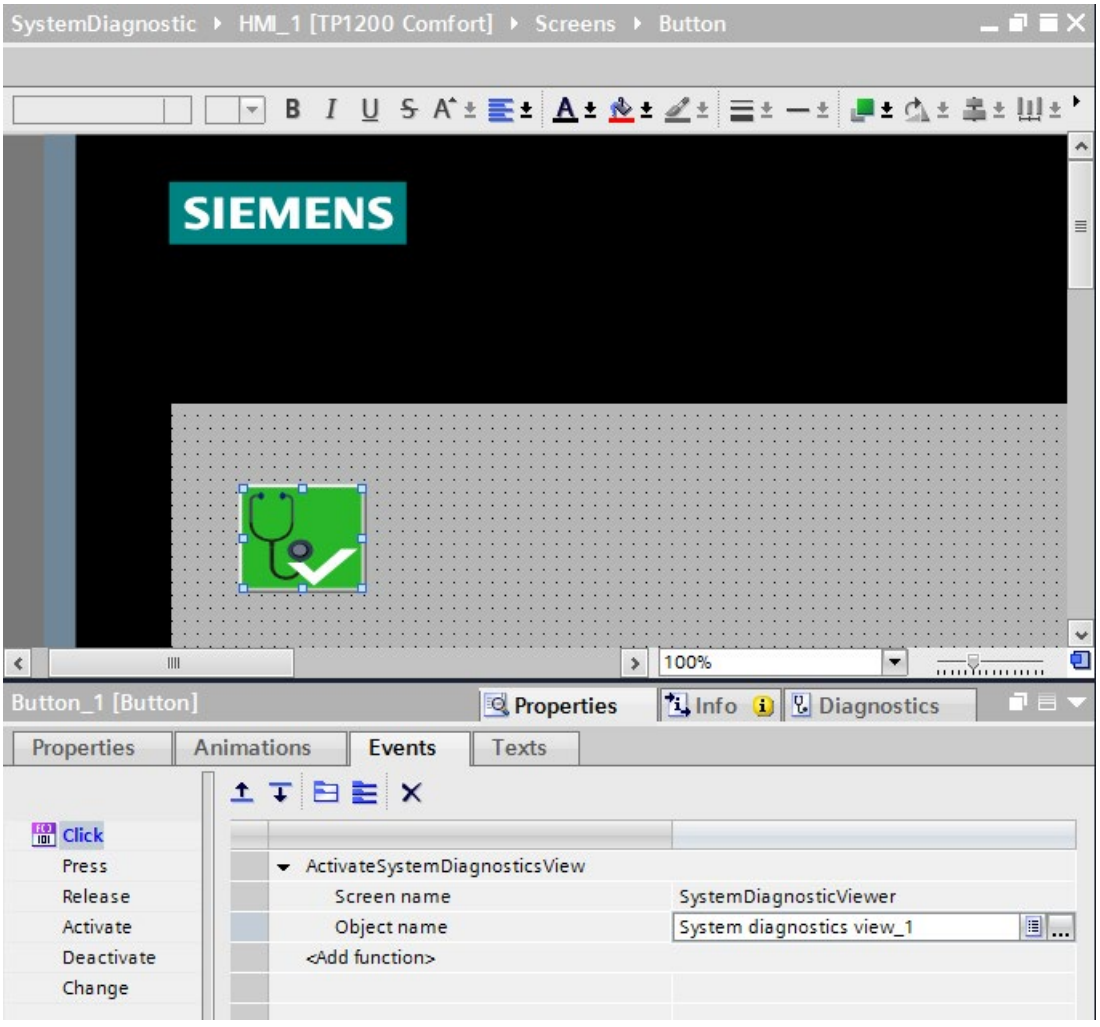

Figure 4-33 Configured button

The button has two states.

- Error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the detail view of the affected device.

- No error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the device view.

System diagnostics by means of the user program 5

5.1 Options of system diagnostics in the user program

Introduction

You can configure responses to diagnostics alarms in the user program. You can, for example, specify that your plant is stopped in case of specific diagnostics alarms.

Instructions

A vendor-independent structure of data records with diagnostics information applies. The following instructions are available for determining the system diagnostics of a device:

Table 5- 1 Instructions for determining the system diagnostics

Instruction	Description
RDREC	• Reads data records of a component (module or submodule) of a DP slave/IO device that may contain error information • Works asynchronously, which means processing takes place across several calls
RALRM	• Reads the start information of the OB when calling the diagnostics interrupt OB (OB 82) • Provides information on cause and location of error
DPNRM_DG	• Reads the current diagnostics data of a DP slave (DP standard diagnostics)
GEN_DIAG	• Generates diagnostics information • To generate diagnostics information, the module or submodule is identified with its logical address
Gen_UsrMsg	• Generates an alarm that is entered in the diagnostics buffer
GET_DIAG	• Provides diagnostics information • To provide diagnostics information, the module or submodule is selected
GET_NAME	• Reads the name of an IO device
T_DIAG	• Provides diagnostics and status information on a connection • Works asynchronously, which means processing takes place across several calls
RD_SINFO	• Reads the start information of the OB called last that has not been processed completely and the startup OB started last • Provides general error information
LED	• Reads the status of the module LED
Get_IM_Data	• Reads the Information&Maintenance data of the CPU • Works asynchronously, which means processing takes place across several calls
Transfer_IM_Data	• Transmits the Information&Maintenance data of the CPU
DeviceStates	• Outputs the state of all devices of an IO system
ModuleStates	• Outputs the state of all modules of a device

Additional information

Online help

In the online help for STEP 7, you can find:

- Additional information on instructions for system diagnostics
- Information about further options for evaluating diagnostic information in the user program (e.g. with the "RDREC", "RALRM", "GET_DIAG" instructions)
- Information on SIMATIC ProDiag. This functionality enables targeted and fast machine and plant diagnostics for SIMATIC S7-1500 and SIMATIC HMI:
  - Standardized diagnostics concept for different SIMATIC components
  - No additional configuration work for diagnostics functionality
  - Reduces the load on PLC memory and program run time

  You can find details in the online help under "Supervising machinery and plants with ProDiag".

Manuals

You can find additional information about evaluating diagnostic information in the user program in the following manuals:

- PROFINET with STEP 7 V14 (http://support.automation.siemens.com/WW/view/en/49948856) function manual
- From PROFIBUS DP to PROFINET IO (https://support.industry.siemens.com/cs/ww/en/view/19289930) programming manual
- Manual for the respective module

Application examples

You can find detailed application examples with further documentation and example projects on the Service&Support Website:

- Diagnostics in the user program with S7-1500 (https://support.industry.siemens.com/cs/ww/en/view/98210758)
- System diagnostics with S7-1500 and TIA Portal (https://support.industry.siemens.com/cs/ww/en/view/68011497)

FAQ

For more information about how to realize channel diagnostics in the user program of the SIMATIC S7-1500, refer to the FAQ with entry ID 109480387 on the Service&Support Website (https://support.industry.siemens.com/cs/ww/en/view/109480387).

5.2 System diagnostics using process image inputs

Introduction

In addition to event-driven system diagnostics, the input and output modules of the SIMATIC series provide diagnostics information using the process image input.

The system diagnostics described in the preceding sections is made available asynchronously to the program processing. To ensure the correct processing of the input and output data in the case of faults while reading the input and output data, some modules offer the so-called value status (QI = Quality Information) for evaluation.

Requirement for evaluation of the value status

The diagnostics information about the process image input is transmitted synchronized with the user data. Select the "Value status" check box in the properties of the I/O module in STEP 7 if you want to evaluate the value status of the channel.

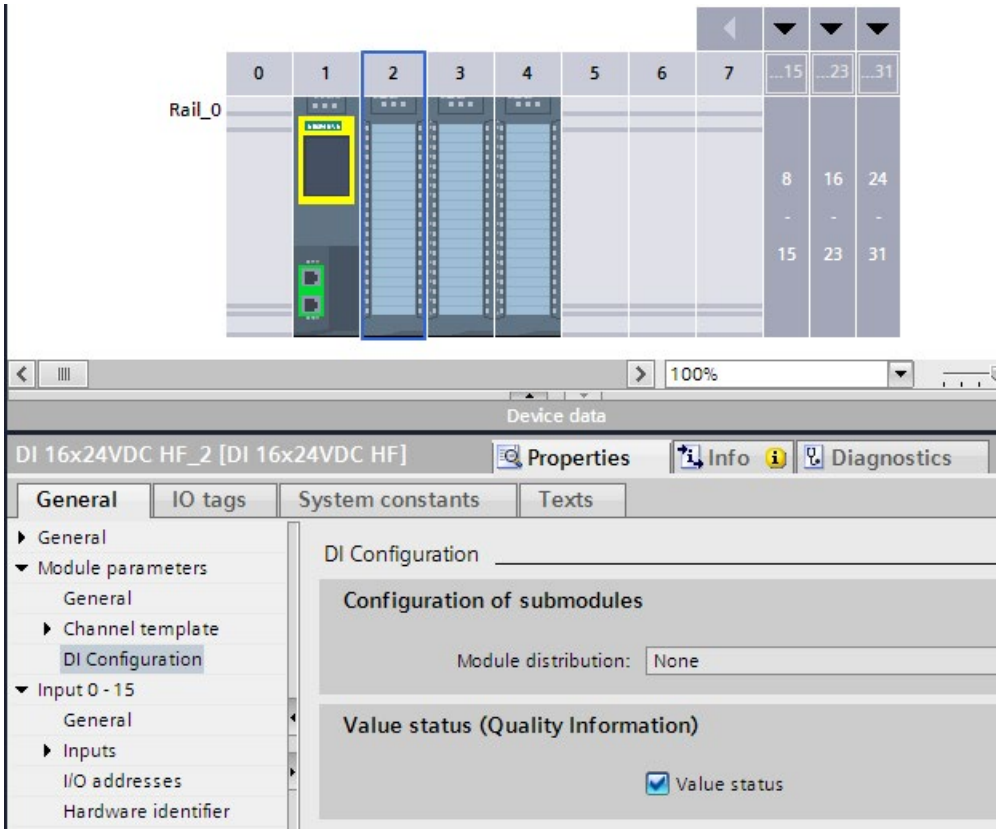

Figure 5-1 Enable value status

Evaluation of the value status

If you have enabled the value status for an I/O module, this module provides additional information on the value status in addition to the user data. This information is directly available in the process image input and can be called with simple binary operations.
