For information on how to add a technology object, refer to the section
Add technology object (Page 176).

Result

The technology object is connected to the drive and the "MC Servo" organization block can be checked / configured.

The telegram of the configured drive is assigned to the "PIP OB Servo" process image.

Checking/configuring the properties of the MC Servo

1. Open the "Program blocks" folder in the project navigator.
2. Select the "MC Servo" organization block.
3. Select the "Properties" command in the shortcut menu.
4. Select the "Cycle time" entry in the area navigation.
5. The option "Synchronous to the bus" must be selected in the dialog box.
6. A "PROFINET DP system" must be selected in the "Distributed I/O" drop-down list.
7. The application cycle of "MC-Servo" must correspond to the send clock of the bus or be reduced by an integral factor relative to the send clock of the bus.

You can select a drive connected to the CPU via a communications processor/communications module (CP/CM) in the configuration of the technology object. You cannot select the DP master system of the CP/CM as the source clock for MC-Servo [OB91].

Result

The PROFIBUS DP drive is configured in such a way that it can be controlled in the PROFIBUS network in isochronous mode.

The properties of the SINAMICS drive must be configured according to the configuration of the axis with a separate STARTER program.

Checking isochronous mode on the drive

If the configuration sequence described above is not adhered to during configuration of the axis, and drive-specific error occurs when the project is compiled, isochronous mode can be checked on the drive.

1. Open the device view of the drive.
2. Select standard telegram in the device overview.
3. Select the properties dialog "General > I/O Addresses".
4. The following settings apply for the input and output addresses:
   - "MC Servo" must be select the "Organization block".
   - "PIP OB Servo" must be select the "Process image".

Add technology object (Page 176)

6.1.3 Adding and configuring drives with analog connections

A description is provided below of how to add and configure a drive with an analog drive connection and an encoder. The connection is made for example as a positioning axis with an incremental encoder and using a technology module in the rack of the PLC.

Requirements

The SIMATIC S7-1500 device is created in the project.

Adding and configuring an analog output module in the device configuration

1. Open the device configuration of the PLC.
2. Select an analog output module from the hardware catalog and drag the module to the rack of the PLC.
3. Select the analog output module in the device view.
4. Open the "General" tab in the properties dialog and select there "Name of the Analog Output Module > I/O Addresses".
5. Enter the desired start address.
6. In the properties dialog, select the tab "General > IO Tags".
7. Enter the tag name for the desired analog output.

Adding and configuring a technology module

1. Switch to the device view of the PLC.
2. In the hardware catalog, open the folder "TM > Count > TM Count 2X24V".
3. Drag the counter module to a free slot in the rack.
   (When inserted in the rack of the PLC, the technology module cannot be operated in isochronous mode.)
4. Select the technology module in the device view.
5. In the properties dialog, open the "General" tab and select there "Count 2x24V > Basic Parameters > Channel X > Operating Mode" of the channel to be used.
6. Select "Position input for Motion Control" option for "Selection of the operating mode for the channel".
7. Under "Module parameters", adapt the parameters of the incremental encoder (steps per revolution = increments per revolution).
8. Under "Reaction to CPU STOP", select the item "Continue working".

Selecting the drive and encoder in the configuration of the technology object

1. Add a new positioning axis/synchronous axis technology object, or open the configuration of an existing positioning axis/synchronous axis.
2. Open the configuration "Hardware interface > Drive".
3. Select "Analog drive connection" from the "Drive type" drop-down list.
4. Select the previously defined tag name of the analog output from the "Output" list.
5. Open the configuration "Hardware interface > Encoder".
6. Under "Select encoder connection" select "Encoder on technology module (TM)".
7. Select the channel of the incremental encoder from the "Technology module" list under "local modules".
8. Open the configuration "Hardware interface > Data exchange with encoder > Fine resolution" and enter the "0" value for "bits in the incr. actual value".

For information on how to add a technology object, refer to the section
Add technology object (Page 176)

Result

The analog drive connection and the encoder connection are configured.

The analog addresses and the addresses of the TM module are assigned to the process image "PIP OB Servo".

Checking the encoder connection / drive connection

The encoder data are applied to the position control cycle clock. If in doubt, check the following settings:

1. Switch to the device view of the PLC.
2. Select the module technology.
3. Open the properties dialog "Basic Parameters > I/O Addresses".
4. The following settings apply for the input and output addresses:
   - "MC Servo" must be select the "Organization block".
   - "PIP OB Servo" must be select the "Process image".
5. Select the analog module.
6. Open the properties dialog "Name of the Analog Module > I/O Addresses".
7. The settings from Step 4 apply for the input and output addresses

See also

Add technology object (Page 176)

6.2 Add technology object

To add a technology object in the project navigator, proceed as follows:

Requirements

A project with a CPU S7-1500 has been created.

Procedure

1. Open the CPU's folder in the project navigator.
2. Open the "Technology Objects" folder.
3. Double-click "Add new object".

   The "Add new object" dialog opens.
4. Select the "Motion Control" technology.
5. Open the folder "Motion Control" > "SIMATIC S7-1500".
6. Select the desired technology object. You can infer the function of the technology object from the displayed description.
7. In the "Name" field, adapt the name of the axis to your requirements.
8. Select the "Manual" option if you want to change the suggested data block number.
9. Click on "Further Information" if you want to add your own information to the technology object.
10. Click on the "Cancel" button if you want to discard the entries.

    Activate the "Add new and open" check box if you want to open the configuration after adding the technology object.

    Click on the "OK" button if you want to add the technology object.

Result

The new technology object was created and saved in the project navigator in the folder "Technology objects".

If the organization blocks "MC-Servo" and "MC-Interpolator" had not yet been added, they have now been added.

6.3 Working with the configuration editor

You configure the properties of a technology object in the configuration window. To open the configuration window of the technology object in the project view, follow these steps:

1. Open the device "Technology objects" group in the project navigator.
2. Select the technology object and double-click on "Configuration".

The configuration is divided into categories which depend on the object type, for example: Basic parameters, hardware interface, extended parameters.

Configuration editor icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values you can use the technology object without additional changes.
	The configuration contains user-defined or automatically adapted values and is complete. All input fields of the configuration contain valid values and at least one preset value has changed.
	The configuration is incomplete or incorrect. At least one input field or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the field shows you the roll-out error message that indicates the cause of error.

6.4 Compare values

If there is an online connection to the CPU, the "Compare values" function appears in the configuration of the technology object.

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

Icons and operator controls

If there is an online connection to the CPU, the actual values are displayed at the parameters.

In addition to the actual values of the parameters, the following symbols appear:

Symbol	Description
	Start value in CPU matches the configured Start value in project
	Start value in CPU does not match the configured Start value in project
	The comparison of the Start value in CPU with the configured Start value in project cannot be performed
	The value is not comparable with any significance since it is not relevant in one of configurations.
	Use the button to show the start value of the CPU and the start value of the project for the respective parameter.

You can change the start value of the CPU directly and then download it to the CPU. For directly editable parameters, the actual value can also be changed and the change will be transferred directly to the CPU.

6.5 Configuring the Speed-Control Axis technology object

6.5.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the speed axis in this field. The technology object is listed under this name in the project tree. The tags of the speed axis can be used in the user program under this name.

Axis type

Select the "Virtual axis" check box if you want to move the axis in simulation mode without hardware configuration. (See also the description of "Simulation" below.)

Speed measuring unit

Select the desired measuring unit for speed in the drop-down list.

Simulation

Select the "Activate simulation" check box if you want to move the axis in simulation mode with hardware configuration.

In simulation mode, speed, positioning and synchronous axes can be simulated in the CPU without connected drives and encoders. Simulation mode is possible starting from technology version 3.0 even without configured drives (virtual axis).

For simulation mode without hardware connected to the CPU, the startup time of the CPU can be influenced using the "Parameter assignment time for centralized and distributed I/O" parameter. You can find the parameter in the CPU properties in the "Startup" area navigation.

See also

Measuring units (Page 30)

Virtual axis/simulation (Page 48)

6.5.2 Hardware interface

6.5.2.1 Configuration - Drive

In the "Drive" configuration window, configure which drive type and which drive you want to use.

Drive type

In the drop-down list, select whether you want to deploy a PROFIdrive drive or a drive with an analog drive connection.

PROFIdrive drives are connected to the controller by means of a digital communication system (PROFINET or PROFIBUS). The communication occurs via PROFIdrive telegrams.

Drives with an analog drive connection receive the speed setpoint via an analog output signal (e.g. from -10 V to +10 V) from the PLC.

Drive type: PROFIdrive

Data connection

In the drop-down list, select whether the data connection is to be made directly with the drive device or via an editable data block in the user program.

Drive / data block

In the "Drive" field, select an already configured PROFIdrive drive / slot. If a PROFIdrive drive was selected, then it can be configured using the "Device configuration" button.

Switch to the device configuration, and add a PROFIdrive drive in the network view, in the event that no PROFIdrive drive can be selected.

If "Data block" was selected for the data connection, a previously created data block ("Optimized block access" disabled) containing a tag structure of data type "PD_TELxyz" must be selected here ("xyz" stands for the telegram number used).

Drive type: Analog drive connection

Analog output

In the "Output" field, select the PLC tag of the analog output over which the drive is to be controlled.

In order to be able to select an output, an analog output module must have been added in the device configuration, and the PLC tag name for the analog output must be defined.

Activating enable output

In the "Enable output" field, select the PLC tag of the digital output to enable the drive. With the enable output, the speed controller in the drive is enabled, or disabled.

In order to be able to select an enable output, a digital output module must have been added in the device configuration, and the PLC tag name for the digital output must be defined.

Note

If you do not use an enable output, the drive cannot be immediately disabled on the part of the system due to error reactions or monitoring functions. A controlled stop of the drive is not guaranteed.

Enable ready input

In the "Ready input" field, select the PLC tag of the digital input with which the drive is to report its operational readiness to the technology object. The power unit is switched on and the analog speed setpoint input is active.

In order to be able to select a ready input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Note

The enable output and the ready input can be separately enabled.

The following boundary conditions apply to the activated ready input:

- The axis is only enabled (MC_PowerStatus = TRUE) when a signal is present at the ready input.
- If the signal at the ready input goes away for an enabled axis, the axis is disabled with an error.
- If the axis is disabled with the instruction MC_Power (Enable = FALSE), the axis is disabled even when a signal is present at the ready input.

Configuration - Data exchange with the drive (Page 182)

Drive and encoder connection (Page 32)

6.5.2.2 Configuration - Data exchange with the drive

You configure the data transmission to the drive in this configuration window.

Selected drive type: PROFIdrive

Drive telegram

In the drop-down list, select the telegram for the drive. The specification must match the setting in the device configuration.

Automatic transfer of drive parameter values

Select the check box if you want the drive parameters "Reference speed", "Reference torque" and "Maximum speed" to be transferred as values from the drive configuration to the CPU. The drive parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the drives and the CPU.

Alternatively, you must synchronize the following parameters manually:

- **Reference speed**

  Configure the reference speed of the drive in accordance with the manufacturer's specifications in this field. The specification of the drive speed is a percentage of the reference speed in the range -200% to +200%.

- **Maximum speed**

  Configure the maximum speed of the drive in this field.

- **Reference torque**

  Configure the reference torque of the drive corresponding to its configuration in this field.

  The reference torque is needed for force/torque reduction, which is supported with telegram 10x.

Note

Automatic transfer of drive parameters is only possible with SINAMICS drives as of V4.x. For this, "Drive" must be selected for the data connection in configuration window "Hardware interface > Drive".

Selected drive type: Analog drive connection

Reference speed

The reference speed of the drive is the speed at which the drive rotates when there is an output of 100% at the analog output. The reference speed must be configured for the drive and transferred in the configuration of the technology object.

The analog value that is output at 100% depends on the type of the analog output.
For example, for an analog output with +/- 10 V, the value 10 V is output at 100%.

Analog outputs can be overdriven by about 17%. This means that an analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.

See also

Automatic transfer of drive and encoder parameters in the device (Page 40)

Drive and encoder connection (Page 32)

6.5.3 Extended Parameters

6.5.3.1 Configuration - Mechanics

Configure the connection of the load to the drive in the "Mechanics" configuration window.

Invert drive direction

Select the check box if the direction of rotation of the drive is to be inverted.

Load gear

Number of motor revolutions / number of load revolutions

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

See also

Mechanics (Page 53)

6.5.3.2 Configuration - Dynamic Defaults

In the "Dynamic default values" configuration window, configure the default values for speed, acceleration, deceleration jerk of the axis.

The default values have an effect, when values < 0 are specified in Motion Control instructions for the "Velocity", "Acceleration", "Deceleration" or "Jerk" parameters. The default values can be applied separately for each of the parameters just listed.

Speed

In this field, define the default value for the speed of the axis.

Acceleration / Deceleration - Ramp-up time / Ramp-down time

Set the desired default value for acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The following equations show the relationship between the ramp-up time and acceleration and the ramp-down time and deceleration:

$$\text{Ramp-up time} = \frac{\text{Speed}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Speed}}{\text{Deceleration}}$$

Note

A change in the velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration and deceleration ramp in the "Jerk" field.
  The value 0 means that jerk limiting is deactivated.
- Set the desired smoothing time for the acceleration ramp in the "Smoothing time" field.

Note

The jerk value is identical for the acceleration and deceleration ramp. The smoothing time in effect for the deceleration ramp results from the following relationships:

- **Acceleration > Deceleration**
  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**
  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**
  The smoothing times of the acceleration and deceleration ramp are equal.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Smoothing time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Smoothing time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Motion jobs started in the user program are performed with the selected jerk.

See also

Velocity profile (Page 60)

6.5.3.3 Configuration - Emergency stop

In the "Emergency stop" configuration window, you can configure the emergency stop deceleration of the axis. In the event of an error, and when disabling the axis, the axis is brought to a standstill with this deceleration using the Motion Control instruction "MC_Power" (input parameter StopMode = 0).

Emergency stop deceleration / Emergency stop ramp-down time

Configure the deceleration value for emergency stop in the "Emergency stop deceleration" field or the "Emergency stop ramp-down time" field.

The relationship between emergency stop ramp-down time and emergency stop deceleration can be seen in the following equation:

$$\textit{Emergency stop ramp-down time} = \frac{\textit{Maximum speed}}{\textit{Emergency stop deceleration}}$$

The configuration of the emergency stop deceleration is related to the configured maximum speed of the axis. If the maximum speed of the axis changes, then the value of the emergency stop deceleration also changes (the emergency stop ramp-down time remains unchanged).

See also

Emergency stop deceleration (Page 61)

6.5.3.4 Limits

Configuration - Dynamic limits

In the "Dynamic limits" configuration window, configure the maximum values for speed, acceleration, deceleration and jerk of the axis.

Maximum speed

In this field, define the maximum permitted speed of the axis.

Maximum acceleration / maximum deceleration - ramp-up time / ramp-down time

Set the desired acceleration in the "Ramp-up time" or "Acceleration" fields.
The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The following equations show the relationship between the ramp-up time and acceleration and the ramp-down time and deceleration:

$$\text{Ramp-up time} = \frac{\text{Maximum velocity}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Maximum speed}}{\text{Deceleration}}$$

Note

A change in the maximum speed influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration ramp and the deceleration ramp in the "Maximum jerk" box. The value 0 means that the jerk is not limited.
- Set the desired smoothing time for the acceleration ramp in the "Smoothing time" field.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration and deceleration ramp are equal.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Smoothing time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Smoothing time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Motion jobs started in the user program are performed with the selected jerk.

See also

Velocity profile (Page 60)

Configuration - Torque limits

Configure the torque limiting of the drive in the "Torque limits" configuration window.

The configuration is now available if a drive that supports force/torque limiting is selected and a telegram 10x is used.

Effective

In the drop-down list, select whether the limit value is to be in effect "on load side" or "on motor side".

Torque limiting

Enter a default value for the torque limit in the specified measuring unit in this field.

The default value is in effect when the torque limiting is specified using Motion Control instruction "MC_TorqueLimiting", input parameter "Limit" < 0.

If the gear efficiency is critical, this can be set in the <TO>.Actor.Efficiency tag.

See also

Force/torque limiting (Page 63)

6.6 Configuring the positioning axis/synchronous axis technology object

6.6.1 Configuration - Basic Parameters

Name

Define the name of the positioning axis/synchronous axis in this field. The technology object is listed under this name in the project tree. The variables of the technology object can be used in the user program under this name.

Axis type

Select the "Virtual axis" check box if you want to move the axis in simulation mode without hardware configuration. (See also the description of "Simulation" below.)

In this selection, configure whether the axis should perform linear or rotary motions.

Measuring units

In the drop-down list, select the desired measuring units for the position, velocity, torque and force of the axis.

Modulo

Select the "Enable modulo" check box if you want to use a recurring system of units for the axis (e.g. 0 to 360° for an axis of the "rotary" axis type).

- **Modulo start value**

  In this field, define the position at which the modulo range should begin (e.g. 0° for an axis of the "rotary" axis type).

- **Modulo length**

  In this field, define the length of the modulo range (e.g. 360° for an axis of the "rotary" axis type).

Simulation

Select the "Activate simulation" check box if you want to move the axis in simulation mode with hardware configuration.

In simulation mode, speed, positioning and synchronous axes can be simulated in the CPU without connected drives and encoders. Simulation mode is possible starting from technology version 3.0 even without configured drives (virtual axis).

For simulation mode without hardware connected to the CPU, the startup time of the CPU can be influenced using the "Parameter assignment time for centralized and distributed I/O" parameter. You can find the parameter in the CPU properties in the "Startup" area navigation.

Synchronous axis technology object (Page 107)

6.6.2 Hardware interface

6.6.2.1 Configuration - Drive

In the "Drive" configuration window, configure which drive type and which drive you want to use.

Drive type

In the drop-down list, select whether you want to deploy a PROFIdrive drive or a drive with an analog drive connection.

PROFIdrive drives are connected to the controller by means of a digital communication system (PROFINET or PROFIBUS). The communication occurs via PROFIdrive telegrams.

Drives with an analog drive connection receive the speed setpoint via an analog output signal (e.g. from -10 V to +10 V) from the PLC.

Drive type: PROFIdrive

Data connection

In the drop-down list, select whether the data connection is to be made directly with the drive device or via an editable data block in the user program.

Drive / data block

In the "Drive" field, select an already configured PROFIdrive drive / slot. If a PROFIdrive drive was selected, then it can be configured using the "Device configuration" button.

Switch to the device configuration, and add a PROFIdrive drive in the network view, in the event that no PROFIdrive drive can be selected.

If "Data block" was selected for the data connection, a previously created data block ("Optimized block access" disabled) containing a tag structure of data type "PD_TELx" must be selected here ("x" stands for the telegram number used).

Drive type: Analog drive connection

Analog output

In the "Analog output" field, select the PLC tag of the analog output via which the drive is to be controlled.

In order to be able to select an output, an analog output module must have been added in the device configuration, and the PLC tag name for the analog output must be defined.

Activating enable output

Select the "Activate enable output" check box if the drive supports an enable.

Select the PLC tag of the digital output for the drive enable in the corresponding field. With the enable output, the speed controller in the drive is enabled, or disabled.

In order to be able to select an enable output, a digital output module must have been added in the device configuration, and the PLC tag name for the digital output must be defined.

Note

If you do not use an enable output, the drive cannot be immediately disabled on the part of the system due to error reactions or monitoring functions. A controlled stop of the drive is not guaranteed.

Enable ready input

Select the "Enable ready input" check box if the drive can signal its readiness.

Select the PLC tag of the digital input via which the drive is to signal its operational readiness to the technology object in the corresponding field. The power unit is switched on and the analog speed setpoint input is active.

In order to be able to select a ready input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Note

The enable output and the ready input can be separately enabled.

The following boundary conditions apply to the activated ready input:

- The axis is only enabled (MC_Power Status = TRUE) when a signal is present at the ready input.
- If the signal at the ready input goes away for an enabled axis, the axis is disabled with an error.
- If the axis is disabled with the instruction MC_Power (Enable = FALSE), the axis is disabled even when a signal is present at the ready input.

Data connection of drive/encoder via data block (Page 49)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

6.6.2.2 Configuration - Encoder

For closed loop position control, positioning axes/synchronous axes require an actual position value in the form of an encoder position. The encoder position is transmitted to the controller by means of a PROFIdrive telegram.

Configure the encoder and encoder type in the "Encoder" configuration window.

Data connection

In the drop-down list, select whether the data connection should be established directly with the encoder or via a data block that can be edited in the user program.

The selection is only possible for encoders that are connected via PROFIdrive and support parameter P979.

Encoder / Data block

Select a previously configured encoder in this configuration field.

The following encoders can be selected:

- **Connection to the drive (not with analog drive connection)**

  The encoder is configured using the configuration of the PROFIdrive drive.
  The drive evaluates the encoder signals and sends them to the controller in the PROFIdrive telegram.

- **Encoder on technology module (TM)**

  Select a previously configured technology module and the channel to be used.
  Only technology modules set to the "Position input for Motion Control" mode are displayed for selection.

  If no technology module is available for selection, change to the device configuration and add a technology module. If you have selected a technology module, you can access the configuration of the technology module using the "Device configuration" button.

  You can operate the technology module centrally on an S7-1500 CPU or decentrally on a distributed I/O. Isochronous mode is not possible with central operation in the CPU.

  You can identify the technology modules suitable for position detection for Motion Control in the documentation for the technology module and the catalog data.

- **PROFIdrive encoder on PROFINET/PROFIBUS (PROFIdrive)**

  In the "PROFIdrive encoder" field, select a previously configured encoder on PROFINET/PROFIBUS. If an encoder was selected, it can be configured using the "Device configuration" button.

  Switch to the device configuration in the network view, and add an encoder, in the event that no encoder can be selected.

If "Data block" was selected for the data connection, a previously created data block ("Optimized block access" disabled) containing a tag structure of data type "PD_TELx" must be selected here ("x" stands for the telegram number used).

Encoder type

Select the encoder type of the encoder in the drop-down list. The following encoder types are available:

- Incremental
- Absolute
- Cyclic absolute

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Data connection of drive/encoder via data block (Page 49)

6.6.2.3 Configuration - Data exchange with the drive

Configure the data exchange with the drive in the "Data exchange with the drive" configuration window.

The configuration differs according to the selected drive type:

Drive type: PROFIdrive

Drive telegram

In the drop-down list, select the telegram for the drive.

The specification must match the setting in the device configuration.

Automatic transfer of drive parameter values

Select the check box if you want the drive parameters "Reference speed", "Maximum speed" and "Reference torque" to be transferred as values from the drive configuration to the CPU. The drive parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the drives and the CPU.

Alternatively, you must synchronize the following parameters manually:

- **Reference speed**

  Configure the reference speed of the drive in accordance with the manufacturer's specifications in this field. The specification of the drive speed is a percentage of the reference speed in the range -200% to +200%.

- **Maximum speed**

  Configure the maximum speed of the drive in this field.

- **Reference torque**

  Configure the reference torque of the drive corresponding to its configuration in this field.

  The reference torque is needed for force/torque reduction, which is supported with telegram 10x.

Note

Automatic transfer of drive parameters is only possible with SINAMICS drives as of V4.x. For this, "Drive" must be selected for the data connection in configuration window "Hardware interface > Drive".

Drive type: Analog drive connection

Reference speed

The reference speed of the drive is the speed at which the drive rotates when there is an output of 100% at the analog output. The reference speed must be configured for the drive and transferred in the configuration of the technology object.

The analog value that is output at 100% depends on the type of the analog output.
For example, for an analog output with +/- 10 V, the value 10 V is output at 100%.

Analog outputs can be overdriven by about 17%. This means that an analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.

Maximum speed

Specify the maximum speed of the drive in this field.

Automatic transfer of drive and encoder parameters in the device (Page 40)

6.6.2.4 Configuration - Data exchange with encoder

Configure detailed encoder parameters and the data exchange with the encoder in the "Data exchange with encoder" configuration window.

The display and selection of the configuration parameters described here is dependent on the following parameters:

- Configuration window "Basic parameters": Drive type (linear/rotary)
- Configuration window "Hardware interface > Encoder": Encoder type (incremental/absolute/cyclic absolute)
- Configuration window - "Extended parameters > Mechanics": Encoder mounting type

Encoder telegram

In the drop-down list, select the telegram via which the encoder is to be connected.

The telegram must match the device configuration.

Automatic transfer of encoder parameter values

Select the check box if you want to transfer the encoder parameters from the encoder configuration to the CPU. The encoder parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the encoder and the CPU.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

Alternatively, you must synchronize the following parameters manually:

Measuring system

In the drop-down list, select whether a linear or rotary measuring system is to be used.

You can obtain the basic system from the representation in the "Extended parameters > Mechanics" configuration window.

Increments per revolution

In this configuration field, configure the number of increments that the encoder resolves per revolution.

Number per revolution:

In this configuration field, configure the number of revolutions that the absolute encoder can detect.

Distance between two increments

In this configuration field, configure the distance between two increments of the encoder.

Fine resolution

Bits in the incremental actual value (Gx_XIST1)

Configure the number of reserved bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Bits in the absolute actual value (Gx_XIST2)

Configure the number of reserved bits for fine resolution within the absolute value (Gx_XIST2) in this field.

Automatic transfer of drive and encoder parameters in the device (Page 40)

6.6.3 Configuration - leading value interconnections (synchronous axis only)

You can interconnect a synchronous axis with multiple leading value-capable technology objects. Leading value-capable technology objects are:

- Positioning axes
- Synchronous axes
- External encoders (only with S7-1500T CPU)

You can select only one leading value during runtime of your user program.

All interconnection required during operation must be set up during configuration of the technology object.

Possible leading values

In the "Possible leading values" column of the "Leading value interconnections" list, add all leading value-capable technology objects that you need during operation as a leading value for the synchronous axis.

You can interconnect the axes added in the list with the synchronous axis as a leading value with the corresponding Motion Control instruction.

All configured leading value interconnections for the technology object are displayed in the cross-reference list of the technology object.

Coupling type

In the "Type of coupling" column, configure whether the leading value is to be coupled via setpoint or actual value.

"Actual value" is available only for the S7-1500T CPU.

See also

Leading value coupling (Page 109)

Synchronous axis technology object (Page 107)

6.6.4 Extended Parameters

6.6.4.1 Configuration - Mechanics

Configuration - Mechanics

In the "Mechanics" configuration window, configure the mounting type of the encoder, and the adaptation of the actual encoder value to the mechanical conditions.

Settings for

In the drop-down list, select the encoder for which the following configurations are to apply.

Encoder mounting type

In the drop-down list, select how the encoder is mounted to the mechanics.

The configuration differs depending on the axis type and the encoder mounting type selected in the "Basic parameters" configuration window.

Axis type: Linear

- Linear - On motor shaft (Page 202)
- Linear - On load side (Page 203)
- Linear - External Measuring System (Page 204)

Axis type: Rotary

- Rotary - On motor shaft (Page 205)
- Rotary - On load side (Page 206)
- Rotary - External Measuring System (Page 207)

Invert encoder direction

Select this check box if you must invert the direction of rotation of the encoder.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Axis type: Linear

Linear - On motor shaft

The encoder is connected to the motor shaft in a mechanically fixed manner.
Motor and encoder form a unit.

Invert drive direction

Select the check box if the direction of rotation of the drive is to be inverted.

Load gear

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions.

Number of motor revolutions

In this configuration field, configure the integer number of motor revolutions.

Number of load revolutions

In this configuration field, configure the integer number of load revolutions.

Position parameters

Leadscrew pitch

In this configuration field, configure the distance by which the load is moved when the leadscrew makes one revolution.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Linear - On load side

The encoder is mechanically connected to the load side of the gear.

Invert drive direction

Select the check box if the direction of rotation of the drive is to be inverted.

Load gear

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions.

Number of motor revolutions

In this configuration field, configure the integer number of motor revolutions.

Number of load revolutions

In this configuration field, configure the integer number of load revolutions.

Position parameters

Leadscrew pitch

In this configuration field, configure the distance by which the load is moved when the leadscrew makes one revolution.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Linear - External Measuring System

An external measuring system provides the position values of the linear load motion.

Distance per encoder revolution

In this configuration field, configure the linear load travel per encoder revolution.

Invert drive direction

Select the check box if the direction of rotation of the drive is to be inverted.

Load gear

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions.

Number of motor revolutions

In this configuration field, configure the integer number of motor revolutions.

Number of load revolutions

In this configuration field, configure the integer number of load revolutions.

Position parameters

Leadscrew pitch

In this configuration field, configure the distance by which the load is moved when the leadscrew makes one revolution.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Axis type: Rotary

Rotary - On motor shaft

The encoder is connected to the motor shaft in a mechanically fixed manner.
Motor and encoder form a unit.

Invert drive direction

Select the check box if the direction of rotation of the drive is to be inverted.

Load gear

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions.

Number of motor revolutions

In this configuration field, configure the integer number of motor revolutions.

Number of load revolutions

In this configuration field, configure the integer number of load revolutions.

See also

Positioning axis technology object (Page 106)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

6.6.4.2 Configuration - Dynamic Defaults

In the "Dynamic default values" configuration window, configure the default values for velocity, acceleration, deceleration and jerk of the axis.

The default values take effect, when values < 0 are specified in Motion Control instructions for the "Velocity", "Acceleration", "Deceleration" or "Jerk" parameters. The default values can be applied separately for each of the parameters just listed.

The default values for acceleration and deceleration also act on the traversing motions of active homing.

Velocity

In this field, define the default value for the velocity of the axis.

Acceleration / Deceleration - Ramp-up time / Ramp-down time

Configure the desired default value for acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The following equations show the relationship between the ramp-up time and acceleration and the ramp-down time and deceleration:

$$\text{Ramp-up time} = \frac{\text{Velocity}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Velocity}}{\text{Deceleration}}$$

Note

A change in the velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration and deceleration ramp in the "Jerk" field. The value 0 means that jerk limiting is deactivated.
- Set the desired smoothing time for the acceleration ramp in the "Smoothing time" field.

Note

The jerk value is identical for the acceleration and deceleration ramp. The smoothing time in effect for the deceleration ramp results from the following relationships:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration and deceleration ramp are equal.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Smoothing time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Smoothing time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Motion jobs started in the user program are performed with the selected jerk.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Velocity profile (Page 60)

6.6.4.3 Configuration - Emergency stop

In the "Emergency stop" configuration window, you can configure the emergency stop deceleration of the axis. In the event of an error, and when disabling the axis, the axis is brought to a standstill with this deceleration using the Motion Control instruction "MC_Power" (input parameter StopMode = 0).

Emergency stop deceleration / Emergency stop ramp-down time

Configure the deceleration value for emergency stop in the "Emergency stop deceleration" field or the "Emergency stop ramp-down time" field.

The relationship between emergency stop ramp-down time and emergency stop deceleration can be seen in the following equation:

$$\textit{Emergency stop ramp-down time} = \frac{\textit{Maximum velocity}}{\textit{Emergency stop deceleration}}$$

The configuration of the emergency stop deceleration is related to the configured maximum velocity of the axis. If the maximum velocity of the axis changes, then the value of the emergency stop deceleration also changes (the emergency stop ramp-down time remains unchanged).

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Emergency stop deceleration (Page 61)

6.6.4.4 Limits

Configuration - Position limits

Configure the hardware and software limit switches of the axis in the "Position limits" configuration window.

Enable HW limit switches

The check box activates the function of the negative and positive hardware limit switches. The negative hardware limit switch is located on the side in the negative direction of travel, and the positive hardware limit switch on the side in the positive direction of travel.

If a hardware limit switch is reached, technology alarm 531 is output, and the technology object is disabled (alarm response: remove enable).

Exception: If a hardware limit switch is crossed during an active home position approach with activated direction reversal at the hardware limit switch, the axis stops with the configured maximum deceleration and continues the home position approach in the opposite direction.

Note

Only use hardware limit switches that remain permanently switched after the approach. This switching state may only be canceled after the return into the permitted traversing range.

The digital inputs of the hardware limit switches are evaluated by default in cyclic data exchange. In the settings for the input module under "I/O addresses", select the entry "MC-Servo" for "Organization block" and the entry "TPA OB Servo" for "Process image" if the hardware limit switches are to be evaluated in the position control cycle clock of the drive.

Negative / positive HW limit switch input

In these fields, select the PLC tag of the digital input for the negative and positive HW limit switches.

In order to be able to select an input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

CAUTION

During installation of hardware limit switches, attention must be paid to the filter times of the digital inputs.

Based on the time for one position control cycle clock and the filter time of the digital inputs, the resulting delay times must be taken into account.

The filter time is configurable in individual digital input modules in the device configuration.

The digital inputs are set to a filter time of 6.4 ms by default. If these are used as hardware limit switches, undesired decelerations may occur. If this occurs, reduce the filter time for the relevant digital inputs.

The filter time can be set under "Input filter" in the device configuration of the digital inputs.

Negative / positive HW limit switch level selection

In the drop-down list, select the triggering signal level ("Low level" / "High level") of the hardware limit switch. With "Low level", the input signal is FALSE after the axis has reached or crossed the hardware limit switch. With "High level", the input signal is TRUE after the axis has reached or crossed the hardware limit switch.

Enable software limit switch

This check box activates the high and low software limit switches. When software switches are activated, an active motion comes to a stop at the position of the software limit switch. The technological object signals an error. After acknowledgment of the error, the axis can again be moved in the direction of its operating range.

Note

Activated software limit switches act only on a homed axis.

Position of negative / positive SW limit switch

Configure the operating range of the axis with the positions of the negative and positive software limit switches.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Configuration - Dynamic limits

In the "Dynamic limits" configuration window, configure the maximum values for velocity, acceleration, deceleration and jerk of the axis.

Maximum velocity

In this field, define the maximum permitted velocity of the axis.

Maximum acceleration / maximum deceleration - ramp-up time / ramp-down time

Set the desired acceleration in the "Ramp-up time" or "Acceleration" fields.
The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The following equations show the relationship between the ramp-up time and acceleration and the ramp-down time and deceleration:

$$\textit{Ramp-up time} = \frac{\textit{Maximum velocity}}{\textit{Acceleration}}$$

$$\textit{Ramp-down time} = \frac{\textit{Maximum velocity}}{\textit{Deceleration}}$$

Note

A change in the maximum velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

The "maximum deceleration" for active homing with change of direction at the hardware limit switch must be set sufficiently large, to brake the axis before reaching the mechanical endstop.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration and deceleration ramp in the "Jerk" field. The value 0 means that the jerk is not limited.
- Set the desired smoothing time for the acceleration ramp in the "Smoothing time" field.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration and deceleration ramp are equal.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Smoothing time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Smoothing time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Motion jobs started in the user program are performed with the selected jerk.

Velocity profile (Page 60)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Configuration - Torque limiting

Configure the force/torque limiting of the drive in the "Torque limiting" configuration window.

The configuration is now available if a drive that supports force/torque limiting is selected and a telegram 10x is used. Telegram 101 cannot be used.

Effective

In the drop-down list, select whether the limit value is to be in effect "on load side" or "on motor side".

Torque limiting

Enter a default value for the force/torque limit in the specified measuring unit in this field.

The default value is in effect when the torque limiting is specified using Motion Control instruction "MC_TorqueLimiting", input parameter "Limit" < 0.

Torque limiting applies to the following axis configurations:

- Axis type is "Rotary" and limit value is in effect "On load side" or "On motor side"
- Axis type is "Linear" and limit value is in effect "On motor side"

Force limit

Enter a default value for the force limit in the specified measuring unit in this field.

The default value is in effect when the force limit is specified using Motion Control instruction "MC_TorqueLimiting", input parameter "Limit" < 0.

The force limit applies to the following axis configuration: Axis type is "Linear" and limit value is in effect "On load side"

If the gear and leadscrew efficiency is crucial, this can be set in the <TO>.Actor.Efficiency tag.

Deactivating/activating position-related monitoring

As a result of the force/torque limiting on the drive, a larger following error may occur or the axis standstill may not be detected reliably in positioning monitoring.

Deactivate "Position-related monitoring" in order to deactivate monitoring of the following error and the positioning monitoring during force/torque limiting.

See also

Force/torque limiting (Page 63)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Configuration - Fixed stop detection

Configure the fixed stop detection in the configuration window.

A "Travel to fixed stop" can be realized by activating fixed stop detection using the Motion Control instruction "MC_TorqueLimiting" and a position-controlled motion job. The operation is also referred to as clamping.

Positioning tolerance

In this configuration field, configure the positioning tolerance that is regarded as a breaking away or turning back of the fixed stop when exceeded. To detect the breaking away or turning back of the fixed stop, the position setpoint must be located outside the positioning tolerance. The configured position tolerance must be less than the configured following error.

Following error

If the drive is stopped by a mechanical fixed stop during a motion job, the following error is increased. The accumulating following error serves as a criterion for fixed stop detection. In the "Following error" configuration field, configure the value of the following error starting from which the fixed stop detection is to take effect. The configured following error must be greater than the configured position tolerance.

Note

If the following error monitoring was activated in the position monitoring configuration, the "Maximum following error" configured there must be greater than the "Following error" of the fixed stop detection.

See also

Fixed stop detection (Page 65)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

6.6.4.5 Homing

Homing means matching the position value of a technology object to the real, physical location of the drive. Absolute target positions of the axis can only be approached with a homed axis.

In S7-1500 Motion Control, the axis is homed with the Motion Control instruction, "MC_Home". A distinction is made between the following operating modes of the Motion Control instruction:

Operating modes of the Motion Control instruction "MC_Home"

- **Active homing**

  With active homing, the Motion Control instruction "MC_Home" performs the configured home position approach. Active traversing motions are aborted. When the homing mark is detected, the position of the axis is set according to the configuration.

- **Passive homing**

  With passive homing, the Motion Control instruction "MC_Home" instruction does not carry out any homing motion. The traversing motion required for this must be implemented by the user with other Motion Control instructions. Active traversing motions are not aborted upon start of passive homing. When the homing mark is detected, the axis is set according to the configuration.

- **Direct homing absolute**

  The axis position is set without taking into consideration the home position switch. Active traversing motions are not aborted. The value of input parameter "Position" of Motion Control instruction "MC_Home" is set immediately as the actual position of the axis.

- **Direct homing relative**

  The axis position is set without taking into consideration the home position switch. Active traversing motions are not aborted. The following statement applies to the axis position after homing:

  New axis position = Current axis position + Value of parameter "Position" of instruction "MC_Home".

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Homing (Page 69)

Active homing

Configuration - Active homing

In the "Active Homing" configuration window, configure the parameters for active homing. "Active homing" is performed using the Motion Control instruction "MC_Home " Mode = 3 and 5.

Note

Parameter "MC_Home.Mode" (S7-1500 CPU)

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.
A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Settings for

In the drop-down list, select the encoder for which the homing settings are to apply (only for S7-1500T).

Select the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive telegram and reference cam (Page 219)
- Zero mark via PROFIdrive frame (Page 221)
- Homing mark via digital input (Page 222)

See also

Homing (Page 69)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Zero mark via PROFIdrive telegram and reference cam

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and the direction is then reversed. The reference cam is then searched for in the reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Approach direction

Select the approach direction for the reference cam search.

"Positive" is the approach direction in the direction of positive position values; "negative" in the direction of negative position values.

Homing direction

Select the direction in which the zero mark should be approached for homing.

Approach velocity

In this field, specify the velocity at which the reference cam is searched for during the homing procedure. Any configured home position offset is traversed at the same velocity.

Homing velocity

In this field, specify the velocity at which the axis approaches the zero mark for homing. For zero mark detection, the reference cam must be exited.

Home position offset

In the case of a differing zero mark position and home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Homing (Page 69)

Zero mark via PROFIdrive frame

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and the direction is then reversed. The zero mark is then sought in the reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Homing direction

Select the direction in which the next zero mark should be approached for homing.

"Positive" is the homing direction in the direction of positive position values; "negative" in the direction of negative position values.

Approach velocity

In the "Zero mark via PROFIdrive frame" homing mode, the approach velocity for traversing the home position offset is used.

Homing velocity

In this field, specify the velocity at which the axis approaches the zero mark for homing.

Home position offset

In the case of a differing zero mark position and home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Homing (Page 69)

Homing mark via digital input

If a digital input is used as a homing mark, the accuracy of the homing process is not as high as with hardware-supported homing using zero marks.

You can improve the accuracy by using a low homing velocity.

Pay attention to the setting of short filter times for the digital input as well.

Digital input homing mark/cam

In this configuration field, select the PLC tag of the digital input that is to act as a homing mark (reference cam). Also select the level at which the homing mark is to be detected.

In order to be able to select an input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and then reversed. The homing mark is then sensed in reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Approach direction

Select the approach direction for the homing mark search.

"Positive" is the approach direction in the direction of positive position values; "negative" in the direction of negative position values.

Homing direction

Select the direction in which the homing mark for homing is to be approached.

Homing mark

Select the switch position of the "digital input" that is to be used as the homing mark.

When a "digital input" is crossed, two switching edges that are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated at the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Approach velocity

In this field, specify the velocity at which the axis searches for the "digital input" during the home position approach. Any configured home position offset is traversed at the same velocity.

Homing velocity

In this field, specify the velocity at which the axis approaches the home position for homing.

Home position offset

If the homing mark position is different from the home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Homing (Page 69)

Passive homing

Configuration - Passive homing

Configure the parameters for passive homing in the "Passive Homing" (homing on the fly) configuration window. Passive homing is performed using the Motion Control instruction "MC_Home" Mode = 2, 8 and 10.

Note

Parameter "MC_Home.Mode" (S7-1500 CPU)

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.
A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Settings for

In the drop-down list, select the encoder for which the homing settings are to apply (only for S7-1500T).

Select the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive telegram and reference cam (Page 225)
- Zero mark via PROFIdrive frame (Page 226)
- Homing mark via digital input (Page 227)

See also

Homing (Page 69)

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Zero mark via PROFIdrive telegram and reference cam

Homing direction

Select the direction in which the zero mark should be approached for homing. The next zero mark after leaving the reference cam is used.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.
A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Homing (Page 69)

Zero mark via PROFIdrive frame

Homing direction

Select the direction in which the next zero mark should be approached for homing.
The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.
A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Homing (Page 69)

Homing mark via digital input

Digital input homing mark/cam

In this dialog field, select a digital input that is to act as a homing mark (reference cam). Also select the level at which the homing mark is to be detected.

Homing direction

Select the direction in which the homing mark for homing is to be approached.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Homing mark

Select which switch position of the "digital input" is to be used as the homing mark.

When a "digital input" is crossed, two switching edges that are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated at the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

6.6.4.6 Position monitoring functions

Configuration - Positioning monitoring

In the "Positioning monitoring" configuration window, configure the criteria for monitoring the target position.

Positioning window:

Configure the size of the positioning window in this field. If the axis is located within this window, the position is considered to be "reached".

Positioning tolerance time:

Configure the positioning tolerance time within which the position value must reach the positioning window in this field.

Minimum dwell time in positioning window:

Configure the minimum dwell time in this field. The current position value must be located in the positioning window for at least the "minimum dwell time".

If one of the criteria is violated, then the axis is stopped and a positioning alarm is displayed.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Position monitoring functions (Page 89)

Configuration - Following error

In the "Following Error" configuration window, configure the permissible deviation of the actual position of the axis from the set position. The following error can be dynamically adapted to the current velocity of the axis.

Enable following error monitoring

Select this check box, if you want to enable following error monitoring. When following error monitoring is enabled, the axis will be stopped in the error range (orange); in the warning range an alarm will be displayed.

When following error monitoring is disabled, the configured limits have no effect.

Maximum following error:

Configure the following error that is permissible at maximum velocity in this field.

Warning level:

Configure a percentage of the current following error limit, above which a following error warning should be output in this field.

Example: The current maximum following error is 100 mm; the warning level is configured at 90%. If the current following error exceeds a value of 90 mm, then a following error warning will be output.

Following error:

In this field, configure the permissible following error for low velocities (without dynamic adjustment of the following error).

Start of dynamic adjustment:

Configure the velocity starting from which the following error is to be dynamically adjusted in this field. Starting from this velocity, the following error up to the maximum velocity will be adjusted to the maximum following error.

See also

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Position monitoring functions (Page 89)

Configuration - Standstill signal

In the "Standstill signal" configuration window, configure the criteria for standstill detection.

Standstill window:

Configure the size of the standstill window in this field. For standstill to be indicated, the velocity of the axis must be within this window.

Minimum dwell time in standstill window:

Configure the minimum dwell time in the standstill window in this field. The velocity of the axis must also be in the standstill window for the specified duration.

If both criteria are met, then the standstill of the axis is indicated.

Positioning axis technology object (Page 106)

Synchronous axis technology object (Page 107)

Position monitoring functions (Page 89)

6.6.4.7 Configuration - Control loop

In the "Control loop" configuration window, configure the precontrol and the gain Kv of the position control loop.

The Kv factor affects the following parameters:

- Positioning accuracy and stop control
- Uniformity of motion
- Positioning time

The better the mechanical conditions of the axis are (high stiffness), the higher the Kv factor can be configured. This reduces the following error, and a higher dynamic response is achieved.

For basic information, refer to the section Closed-loop control (Page 94).

Precontrol

Configure the velocity precontrol as a percentage in this field.

Speed control loop equivalent time

Configure the speed control loop substitute time in this field.

When velocity precontrol is activated, the position setpoint is delayed by the speed control loop substitute time before generating the control deviation. This prevents an overshoot or a leading of the actual value compared with the position setpoint. The speed control loop substitute time is a simplified substitute model of the dynamic behavior of the speed control loop. The speed control loop substitute time is figured into the balancing filter.

Gain (Kv factor)

In the input field, enter the gain Kv of the position control loop.

Dynamic Servo Control (DSC):

For position-controlled axes (positioning axes/synchronous axes), the closed loop position control can occur either in the CPU or in the drive, provided the drive supports Dynamic Servo Control (DSC). Select your preferred control process:

- **Position control in the drive (DSC enabled)**
  With the Dynamic Servo Control (DSC) function, the position controller is executed in the drive in the cycle clock of the speed control loop. This enables you to set a much larger position controller gain factor Kv. This increases the dynamics for setpoint sequence and disturbance variable correction for highly dynamic drives.
- **Position control in the PLC**

Note

Dynamic Servo Control (DSC) is only possible with one of the following PROFIdrive telegrams:

- Standard telegram 5 or 6
- SIEMENS telegram 105 or 106

6.7 Configuring the technology object external encoder

6.7.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the external encoder in this field. The technology object is listed under this name in the project tree. The tags of the external encoder can be used in the user program under this name.

External encoder type

In this selection, configure whether the external encoder records linear or rotary motions.

Measuring units

In the drop-down list, select the desired measuring units for the position and velocity of the external encoder.

Modulo

Select the check box "Enable modulo", if you want to use a recurring measuring system for the external encoder (e.g. 0-360° for an external encoder of the "rotary" type).

- **Modulo start value**

  In this field, define the position at which the modulo range should begin (e.g. 0° for an external encoder of the "rotary" type).

- **Modulo length**

  In this field, define the length of the modulo range (e.g. 360° for an external encoder of the "rotary" type).

See also

Measuring units (Page 30)

Modulo setting (Page 31)

Technology object external encoder (Page 113)

6.7.2 Hardware interface

6.7.2.1 Configuration - Encoder

The external encoder records the position of an externally controlled drive. The encoder required for this purpose communicates the encoder position to the controller by means of a PROFIdrive telegram. Configure the encoder and encoder type in the "Encoder" configuration window.

Data connection

In the drop-down list, select whether the data connection should be established directly with the encoder or via a data block that can be edited in the user program.

The selection is only possible for encoders that are connected via PROFIdrive and support parameter P979.

Encoder / Data block

Select the encoder you have configured in the device configuration in this area.

The following encoders can be used:

- **Encoder on technology module (TM)**

  In the "Encoder" configuration field, select a previously configured technology module and the channel to be used. Only technology modules set to the "Position input for Motion Control" mode are displayed for selection.

  You can operate the technology module centrally on an S7-1500 PLC or decentrally on a distributed I/O. Isochronous mode is not possible with central operation in the CPU.

  You can identify the technology modules suitable for position detection for Motion Control in the documentation for the technology module and the catalog data.

- **Connection via PROFINET/PROFIBUS (PROFIdrive)**

  In the "Encoder" configuration field, select a previously configured encoder connected to PROFINET/PROFIBUS.

If "Data block" was selected for the data connection, a previously created data block ("Optimized block access" disabled) containing a tag structure of data type "PD_TELx" must be selected here ("x" stands for the telegram number used).

Encoder type

Select the encoder type in this configuration field. The following encoder types are available for selection:

- Incremental encoder
- Absolute encoder
- Absolute encoder cyclic absolute

Technology object external encoder (Page 113)

Data connection of drive/encoder via data block (Page 49)

6.7.2.2 Configuration - Data exchange

Configuration - Data exchange

Configure detailed encoder parameters and the data exchange with the encoder in the "Data exchange with encoder" configuration window. The configuration varies according to the encoder connection:

- Encoder to technology module (Page 237)
- Encoder to PROFINET/PROFIBUS (Page 240)

See also

Technology object external encoder (Page 113)

Encoder to technology module

Data exchange with encoder

In this area, you can configure the encoder telegram and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder telegram

In the drop-down list for the technology module, select the telegram that you have configured in the technology module.

Automatic transfer of encoder parameter values

Select the check box if you want to transfer the encoder parameters from the encoder configuration to the CPU. The encoder parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the encoder and the CPU.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

As an alternative, you must synchronize the following parameters ("Data exchange with encoder" configuration window) manually.

Encoder type

Configure how the encoder data are to be evaluated in this area. The specifications must match those in the device configuration.

Encoder type	Rotary incremental
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Rotary absolute
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Rotary cyclic absolute
Increments per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear incremental
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Linear absolute
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder to PROFINET/PROFIBUS

Data exchange with encoder

In this area, you can configure the encoder telegram and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder telegram

In the drop-down list, select the telegram of the encoder. The specification must match the setting in the device configuration.

Automatic transfer of encoder parameter values

Select the check box if you want to transfer the encoder parameters from the encoder configuration to the CPU. The encoder parameters are transferred from the bus after the (re-)initialization of the technology object and (re)start of the encoder and the CPU.

Note

Automatic transfer of encoder parameters is only possible with PROFIdrive encoders as of product version A16. For this, "Hardware interface > Encoder" must be selected as the "Encoder" data connection in the configuration window.

As an alternative, you must synchronize the following parameters ("Data exchange with encoder" configuration window) manually.

Encoder type

Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Rotary absolute
Steps per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Rotary cyclic absolute
Steps per revolution:	Configure the number of increments that the encoder resolves per revolution in this field.
Number of revolutions:	Configure the number of revolutions that the absolute encoder can detect in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Encoder type	Linear incremental
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.

Encoder type	Linear absolute
Distance between two increments:	Configure the distance between two increments of the encoder in this field.
Bits for fine resolution in the incremental actual value (Gx_XIST1)	Configure the number of bits for fine resolution within the incremental actual value (Gx_XIST1) in this field.
Bits for fine resolution in the absolute actual value (Gx_XIST2)	Configure the number of bits for fine resolution within the absolute actual value (Gx_XIST2) in this field.

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

6.7.3.2 Homing

Configuration - Homing

Configure the parameters for homing the external encoder in the "Homing" configuration window. Homing is performed using the Motion Control instruction "MC_Home" Mode = 2, 8 and 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Select the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive telegram and reference cam (Page 247)
- Zero mark via PROFIdrive frame (Page 248)
- Homing mark via digital input (Page 249)

See also

Technology object external encoder (Page 113)

Zero mark via PROFIdrive telegram and reference cam

Homing direction

Select the direction in which the zero mark should be approached for homing.
The next zero mark after leaving the reference cam is used.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.
A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 161).

Technology object external encoder (Page 113)

Homing mark via digital input

Digital input homing mark

In this configuration field, select a digital input that is to act as a homing mark (reference cam). Also select the level at which the homing mark is to be detected.

Homing direction

Select the direction in which the homing mark for homing is to be approached.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Homing mark

Select which switch position of the "digital input" is to be used as the homing mark.

When a "digital input" is crossed, two switching edges that are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated at the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. 6.8 Configuring the technology object measuring input

6.8.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the measuring input in this field. The technology object is listed under this name in the project tree. The tags of the measuring input can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the measuring input is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Measuring unit

The indicated measuring unit for the position of the measuring input corresponds to the measuring unit of the higher-level technology object.

See also

Measuring units (Page 30)

Technology object measuring input (Page 115)

6.8.2 Configuration - Hardware interface

Input of measuring input

Measuring input type

Select the measuring input type.

- **Measuring using TM Timer DIDQ**

  Select a measurement input for a measurement using a Timer DI.
  The selection box shows all channels that are configured correctly.

- **Measuring using SINAMICS measuring input**

  Select a measurement input for a measurement using an input of a SINAMICS measuring input. The selection box shows all compatible telegram types. All terminals that can potentially be used as measuring inputs are shown.

- **Measuring using PROFIdrive telegram (drive or external encoder)**

  Select the measuring input number in the telegram for a measurement using PROFIdrive telegram. The text field contains the default value "1".

  Two communication channels are available in the PROFIdrive telegram for measured value transfer. These are assigned to one measurement input/digital input each.
  For the connection, you first configure which of the two channels is to be used by the measuring input at the technology object measuring input with the parameter <TO>Parameter.PROFIdriveProbeNumber. To do this, you use the PROFIdrive parameters to configure the digital input on the drive that is to be used for the configured communication channel.

  – Measurement input for the first communication channel

    (<TO>Parameter.PROFIdriveProbeNumber = 1)

    Via P488[0] related to the first encoder in the telegram and via P488[1] related to the second encoder in the telegram.

  – Measurement input for the second communication channel

    (<TO>Parameter.PROFIdriveProbeNumber = 2)

    Via P489[0] related to the first encoder in the telegram and via P489[1] related to the second encoder in the telegram.

  – With P728.8 to P728.15, you configure all DI/DOs used as a measurement input on the control unit. Use P680 of the control unit to specify the terminals for the global measuring inputs.

    Note that the measuring inputs and the inputs of the measurement must be assigned in the telegram without gaps and in ascending order.

Then enter a correction time if possible delay times in the measured signal are to be compensated for.

Automatic transfer of drive and encoder parameters in the device (Page 40)

6.8.3 Configuration - Extended parameters

Adjustment for activation time of the measuring range

To adjust the activation time defined on the system side, enter an additional activation time here.

The configuration window also displays the following times calculated on the system side:

- Time after the measuring job request until the measuring event can be recoreded
- Time after the measuring event until the measurement result is displayed (for measuring of one or two edges)

See also

Measuring with measuring range (Page 123)

Time-related boundary conditions (Page 125)

Technology object measuring input (Page 115)

6.9 Configuring the cam technology object

6.9.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the output cam in this field. The technology object is listed under this name in the project tree. The tags of the output cam can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the output cam is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Output cam type

Select based on the desired switching behavior of an output cam type:

- Distance output cam (position-dependent switch-on/switch-off)
- Time-based output cam (position-dependent switch-on and position-independent or time-dependent switch-off)

Output cam reference

Configure in this selection whether the switching points of the output cam are to reference the actual position or the position setpoint.

Measuring unit

The indicated measuring unit for the position of the output cam corresponds to the measuring unit of the higher-level technology object.

When a time-based output cam is selected as the output cam type, the measuring unit for the switch-on duration and other times is also indicated. For output cams, this is always ms.

See also

Measuring units (Page 30)

Technology object output cam (Page 129)

6.9.2 Configuration - Hardware interface

Output cam output

Select whether the generated switching signals are to be output at the digital output.

- **Output activated**

  Select one of the following two output options for the output cam output:

  – **Output by TM Timer DIDQ**

    For output by TM Timer DIDQ, select a previously configured technology module and the channel to be used in the "Output" field.

    If no technology module is available for selection, change to the device configuration and add a technology module.

  – **Output by digital output module**

    For output by a digital output module, select this in the "Cam output" field.
    Only the digital outputs with previously defined PLC tags are displayed for selection.

  Select the logical operation of the output cam signal at the output.
  The logic operation relates to the last signal to be output after the set inversion, if any.

  All output cams that use the selected output are shown graphically.

- **Output deactivated**

  When the output is deactivated, the output cam is evaluated only in the software.

6.9.3 Extended parameters

6.9.3.1 Configuration - Activation time

The specified output cam type is indicated in the upper area of the "Activation time" configuration window.

Activation time and deactivation time

For a time shift of the switch-on and switch-off times of an output cam, enter an activation time and a deactivation time.

Compensation of actuator switching times (Page 142)

Technology object output cam (Page 129)

6.9.3.2 Configuration - Hysteresis

To prevent unwanted changes in the switching state of the output cam of a cam track, enter a hysteresis value.

When using an output cam with reference to actual position, always enter a hysteresis value (> 0.0).

Hysteresis (Page 140)

Technology object output cam (Page 129)

6.10 Configuring the cam track technology object

6.10.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name

Define the name of the cam track in this field. The technology object is listed under this name in the project tree. The tags of the cam track can be used in the user program under this name.

Assigned axis or external encoder

The axis or external encoder assigned to the cam track is displayed. You can use the link to directly access the configuration of the basic parameters of the higher-level technology object.

Output cam type

Select based on the desired switching behavior of an output cam type for the cam track:

- Distance output cam (position-dependent switch-on/switch-off)
- Time-based output cam (position-dependent switch-on and position-independent or time-dependent switch-off)

Output cam reference

In this selection, configure whether the switching points of the cam track are to reference the actual position or the position setpoint.

Measuring unit

The indicated measuring unit for the position of the cam track corresponds to the measuring unit of the higher-level technology object.

When a time-based output cam is selected as the output cam type, the measuring unit for the switch-on duration and other times is also indicated. For output cams, this is always ms.

See also

Measuring units (Page 30)

Cam track technology object (Page 145)

6.10.2 Configuration - Hardware interface

Output cam track

Select whether the generated switching signals are to be output at the digital output.

- **Output activated**

  Select one of the following two output options for the output track:

  – **Output by TM Timer DIDQ**

    For output by TM Timer DIDQ, select a previously configured technology module and the channel to be used in the "Output" field.

    If no technology module is available for selection, change to the device configuration and add a technology module.

  – **Output by digital output module**

    For output by a digital output module, select this in the "Cam output" field.
    Only the digital outputs with previously defined PLC tags are displayed for selection.

- **Output deactivated**

  When the output is deactivated, the cam track is evaluated only in the software.

Configuring technology modules for Motion Control (Page 262)

6.10.3 Extended parameters

6.10.3.1 Track data

Configuration - Activation time

The specified output cam type is displayed.

Activation time and deactivation time

Enter the activation time and the deactivation time.

For a time shift of the switch-on and switch-off times of the output cam of a cam track, enter an activation time and a deactivation time.

See also

Time offset of cam switching points (Page 157)

Cam track technology object (Page 145)

Configuration - Hysteresis

To prevent unwanted changes in the switching state of the output cam of a cam track, enter a hysteresis value.

When using an output cam with reference to actual position, always enter a hysteresis value (> 0.0).

See also

Hysteresis (Page 157)

Cam track technology object (Page 145)

Configuration - Track dimensions

Track length

Enter the corresponding track length.

Also take into account the output cam data of the individual output cams when defining the track length. Output cams, the start position of which lies outside the cam track length are not included. They become active only if the cam track length is increased so that at least the respective start position of an output cam is within the new track length.

Axis reference position

Enter the position of an axis or external encoder starting from which the output of the cam track is to occur. The start of the cam track is placed at the entered position.

You can enter a negative or positive value for the reference position.

Modulo length of the axis

When an axis with modulo function is used, the modulo length of the axis is displayed.

See also

Cam track technology object (Page 145)

6.10.3.2 Configuration - Output cam data

The specified output cam type is displayed.

Enter the properties for the output cams of the cam track that are to be output. You can set up to 32 individual output cams on a cam track.

Also take into account any previously defined track length when defining the output cam data. Output cams, the start position of which lies outside the cam track length are not included. They become active only if the cam track length is increased so that at least the respective start position of an output cam is within the new track length.

The input options described below are displayed in the Output cam data configuration window according to the configured output cam type.

- **Valid**

  Only output cams set as "valid" are output and have a status display.

- **Start position**
  - The start position may not be greater than the end position for distance output cams.
  - If the start position is equal to the end position, the distance output cam does not switch.
  - The switching ranges of individual output cams are permitted to overlap.

- **End position**
  - The "End position" column is only displayed when distance output cam is set for the output cam type.
  - The end position must not be less than the start position.

- **Switch-on duration**

  The "Switch-on duration" column is only displayed when time-based output cam is set for the cam type.

6.11 Configuring technology modules for Motion Control

6.11.1 Overview

Use of technology modules with Motion Control

You can use technology modules as well as compact CPUs with Motion Control. To use the technology functions for Motion Control, the parameters of the device configuration of the technology module or the compact CPU and the parameters of the configuration of the technology object must be configured accordingly. Which parameters are relevant for the function is described below. You can set additional parameters that are not listed here. The description of the parameters is found in the documentation of the respective technology module.

The following technology modules support Motion Control functionalities:

S7-1500/ET 200MP	ET 200 SP
TM Count 2x24V (Page 263)	TM Count 1x24V (Page 263)
TM PosInput 2 (Page 265)	TM PosInput 1 (Page 265)
TM Timer DIDQ 16x24V (Page 268) *	TM Timer DIDQ 10x24V (Page 268) *
–	TM Pulse 2x24V (Page 269)
TM PTO 4 (Page 270)	
CPU 1511C-1 PN / CPU 1512C-1 PN (Page 272)	–

* ET 200MP and ET 200SP: Isochronous mode is only possible with PROFINET interface modules.

Isochronous mode

Technology modules can be used centrally or distributed in the system. However, isochronous mode is supported only with decentralized use.

6.11.2 TM Count 1x24V / TM Count 2x24V

For use with Motion Control, the following parameters must be configured:

Configuration		
Technology module **TM Count 1x24V / TM Count 2x24V**	**Technology object**	
	Axis	**External encoder**
TM Count 1x24V / TM Count 2x24V > Channel 0/1 > Operating mode	–	–
Select "Position input for Motion Control" mode		
TM Count 1x24V / TM Count 2x24V > Channel 0/1 > Module parameters	**Hardware interface > Encoder**	**Hardware interface > Encoder**
–	Select "Encoder" data connection and the channel configured for Motion Control on the technology module as encoder	Select "Encoder" data connection and the channel configured for Motion Control on the technology module as encoder
Signal type • Incremental encoder	Select encoder type corresponding to configuration for technology module • Incremental	Select encoder type corresponding to configuration for technology module • Incremental
–	**Hardware interface > Data exchange with encoder**	**Hardware interface > Data exchange**
	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"	Disable "Automatic transfer of encoder parameter values"
	Select rotary or linear measuring system type	Select rotary or linear measuring system type
Signal evaluation • Single • Double • Quadruple	Select fine resolution corresponding to configuration for technology module • 0 = Single • 1 = Double • 2 = Quadruple	Select fine resolution corresponding to configuration for technology module • 0 = Single • 1 = Double • 2 = Quadruple
• Rotary type: Enter increments per revolution • Linear type: Configuration not relevant	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments

Configuration		
Technology module **TM Count 1x24V / TM Count 2x24V**	**Technology object**	
	Axis	**External encoder**
–	**Hardware interface > Data exchange with the drive**	–
• Rotary type: Enter reference speed corresponding to configuration for technology object (1:1) • Linear type: Configuration not relevant	Enter reference speed	
–	**Homing**	**Homing**
Select the homing signal for homing mark 0: • Signal N of the incremental encoder • DI0	Use the homing mode "Use zero mark via PROFIdrive telegram".	Use the homing mode "Use zero mark via PROFIdrive telegram".
TM Count 2x24V > I/O addresses	–	–
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the channel in the encoder configuration at the technology object.		
Process image: PIP OB servo		

6.11.3 TM PosInput 1 / TM PosInput 2

For use with Motion Control, the following parameters must be configured:

Configuration		
Technology module **TM PosInput 1 / TM PosInput 2**	**Technology object**	
	Axis	**External encoder**
TM PosInput 1/2 > Channel 0/1 > Operating mode Select "Position input for Motion Control" mode	–	–
TM PosInput 1/2 > Channel 0/1 > Module parameters You set the parameters for the encoder signals of the channel under "Module parameters" in the "Position input for Motion Control" mode. The parameters must be set depending on the encoder used. The configuration of the encoder is required for use with an SSI absolute encoder. Information on the configuration is available in the documentation for the respective technology module.	**Hardware interface > Encoder**	**Hardware interface > Encoder**
–	Select "Encoder" data connection and the channel activated and configured as encoder on the technology module	Select "Encoder" data connection and the channel activated and configured as encoder on the technology module
Signal type • Incremental encoder • Absolute encoder	Select encoder type corresponding to configuration for technology module • Incremental • Absolute / cyclic absolute	Select encoder type corresponding to configuration for technology module • Incremental • Absolute / cyclic absolute

Configuration		
Technology module **TM PosInput 1 / TM PosInput 2**	**Technology object**	
	Axis	**External encoder**
–	**Hardware interface > Data exchange with encoder**	**Hardware interface > Data exchange**
	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"	Disable "Automatic transfer of encoder parameter values"
	Select rotary or linear measuring system type	Select rotary or linear measuring system type
Signal evaluation • Single • Double • Quadruple	Select fine resolution corresponding to configuration for technology module • Incremental encoder: – 0 = Single – 1 = Double – 2 = Quadruple • Absolute encoder: – 0 = Single	Select fine resolution corresponding to configuration for technology module • Incremental encoder: – 0 = Single – 1 = Double – 2 = Quadruple • Absolute encoder: – 0 = Single
• Rotary type: Enter increments per revolution • Linear type: Configuration not relevant	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments	• Rotary type: Enter increments per revolution corresponding to configuration at technology module (1:1) • Linear type: Enter distance between increments
–	**Hardware interface > Data exchange with the drive**	–
• Rotary type: Enter reference speed corresponding to configuration for technology object (1:1) • Linear type: Configuration not relevant	Enter reference speed	

Configuration		
Technology module **TM PosInput 1 / TM PosInput 2**	**Technology object**	
	Axis	**External encoder**
–	**Homing**	**Homing**
Select the homing signal for homing mark 0: • Signal N of the incremental encoder • DI0	Use the homing mode "Use zero mark via PROFIdrive telegram".	Use the homing mode "Use zero mark via PROFIdrive telegram".
TM PosInput 1/2 > I/O addresses	–	–
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the channel in the encoder configuration at the technology object.		

"–" No configuration for technology module/technology object is required for these parameters

6.11.4 TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V

You can operate the TM Timer DIDQ technology module centrally on an S7-1500 CPU or decentrally on a distributed I/O. For use with a measuring input, output cam or cam track, the technology module must be used decentrally and with isochronous mode.

For use with Motion Control, the following parameters must be configured:

Use with output cam / cam track technology object

Configuration	
Technology module **TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V**	**Technology object** **Output cam / Cam track**
Basic parameters	–
Select desired number of outputs under channel configuration	
Channel parameters	**Hardware interface > Output cam output / Output cam track**
–	Activate output
	Select output by TM Timer DIDQ
Select "Timer DQ" mode for the respective output	Select output cam output
I/O addresses	–
Select "Isochronous mode"	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are updated automatically for the input and output addresses by selecting the channel in the encoder configuration at the technology object.	

"–" No configuration for technology module/technology object is required for these parameters

Use with technology object measuring input

Configuration	
Technology module **TM Timer DIDQ 10x24V / TM Timer DIDQ 16x24V**	**Technology object** **Measuring input**
Basic parameters	–
Select desired number of inputs under channel configuration	
Channel parameters	**Hardware interface > Measuring input**
Configuration of DI group: Use inputs individually	–
Select "Timer DI" mode for the respective input	Select measuring using TM Timer DIDQ
–	Select measuring input
Select application-dependent input delay	–
I/O addresses	
Select "Isochronous mode"	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are updated automatically for the input and output addresses by selecting the channel in the input configuration at the technology object.	

"–" No configuration for technology module/technology object is required for these parameters

6.11.5 TM Pulse 2x24V

For use with Motion Control, the parameters described below must each be configured:

Drive connection using PWM (pulse width modulation)

Configuration	
TM Pulse 2x24V	**Technology object** **Axis**
TM Pulse 2x24V > Channel configuration	–
Select if you want to use 1 or 2 channels.	
TM Pulse 2x24V > Channel > Operating mode	
Select "Pulse width modulation PWM" or "PWM with DC motor" operating mode	
TM Pulse 2x24V > Channel > Parameters	**Hardware interface > Drive**
Select "S7 analog output" output format	Select analog drive connection For the selection of the analog output, create a PLC tag of the "Int" type with corresponding address. The offset for the PLC tag to the start address is 2. To activate the output of the PWM signal, set the following two bits of the control interface of the PWM channel in the user program: • SW_ENABLE (= Bit 0 in Byte 9) • TM_CTRL_DQ (= Bit 1 in Byte 9) The offset for byte 9 to the start address of the PWM channel is 9.
TM Pulse 2x24V > Channel > I/O addresses	–
Select the organization block "MC-Servo" for the input and output addresses. The "TPA OB Servo" process image is selected automatically for the input and output addresses by selecting the organization block.	

"–" No configuration for technology object is required for these parameters

6.11.6 TM PTO 4

For use with Motion Control, the following parameters must be configured.

Configuration	
Technology module **TM PTO 4**	**Technology object** **Axis**
TM PTO 4 > Channel configuration	–
Configure the number of channels (1 to 4) you want to use.	
TM PTO 4 > Channel 0…3 > Operating mode	
Select signal type: • PTO (pulse (A) and direction (B)) • PTO (count up (A) and count down (B)) • PTO (A, B phase-shifted) • PTO (A, B phase-shifted - quadruple)	
Select signal evaluation: • Single • Quadruple	
Select signal interface: • 5V difference signal (RS 422) • 24V asymmetric	
Configure the input delay.	
–	**Hardware interface > Drive**
	Select drive type "PROFIdrive" and "Drive" data connection. Select the pulse output configured at the technology module as drive.
	Hardware interface > Encoder
	The encoder of the actuator telegram (simulated encoder) is automatically selected. Alternatively, an existing encoder interface can be selected.

Configuration	
Technology module **TM PTO 4**	**Technology object** **Axis**
TM PTO 4 > Channel 0…3 > Axis parameters	**Data exchange with the drive**
–	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the drive.
	Deselect "Automatic transfer of drive parameter values"
Enter reference speed corresponding to configuration for technology object (1:1)	Enter reference speed of the drive
Enter maximum speed corresponding to configuration for technology object (1:1)	Enter maximum speed of the drive. If the maximum speed is exceeded, technology alarm 102 is triggered and displayed.
–	**Data exchange with encoder**
	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"
	Select rotary measuring system type.
Enter increments per revolution	Enter increments per revolution corresponding to configuration at technology module (1:1)
Configure fine resolution • 0 = Single • 2 = Quadruple	Configure fine resolution corresponding to configuration for technology module. • 0 = Single • 2 = Quadruple
TM PTO 4 > Channel 0…3 > Hardware inputs/outputs	**Homing**
If you want to use a hardware output to enable the drive, activate this function. Next select one of the two hardware outputs DQ0 or DQ2.	–
Activate the hardware input (DI0) for the reference cam.	Use the homing mode "Use zero mark via PROFIdrive telegram".
Select the edge of the hardware input for triggering the reference cam function.	
When using a measuring input, activate the hardware input (DI1) for the measuring input.	–
Select the hardware input that is used to display whether the drive is ready.	
TM PTO 4 > I/O addresses	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the PTO channel for the technology object.	

"–" No configuration for technology module / technology object is required for these parameters

6.11.7 CPU 1511C-1 PN / CPU 1512C-1 PN

For use with Motion Control, the parameters described below must be configured.

Drive connection via PTO (Pulse Train Output)

Configuration	
CPU 1511C-1 PN / CPU 1512C-1 PN	**Technology object**
	Axis
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > General	–
To activate a channel for PTO mode, select one of the following operating modes: • PTO (pulse (A) and direction (B)) • PTO (count up (A), count down (B)) • PTO (A,B phase shifted) • PTO (A,B phase shifted, quadruple)	
–	**Hardware interface > Drive**
	Select drive type "PROFIdrive" and "Drive" data connection. Select the pulse generator of the CPU configured for PTO mode as drive.
	Hardware interface > Encoder
	The encoder of the actuator telegram (simulated encoder) is automatically selected. Alternatively, an existing encoder interface can be selected.
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Axis parameters	**Hardware interface > Data exchange with the drive**
–	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the drive.
	Deselect "Automatic transfer of drive parameter values"
Enter reference speed corresponding to configuration for technology object (1:1)	Enter reference speed of the drive
Enter reference speed corresponding to configuration for technology object (1:1)	Enter maximum speed of the drive. If the maximum speed is exceeded, technology alarm 102 is triggered and displayed.
–	**Hardware interface > Data exchange with encoder**
	Telegram "DP_TEL3_STANDARD" is automatically selected after the selection of the encoder.
	Disable "Automatic transfer of encoder parameter values"
	Select rotary measuring system type.
Enter increments per revolution	Enter increments per revolution corresponding to configuration for CPU (1:1)
The fine resolution has the fixed value "0 bit" (= single) and cannot be changed.	Enter the fine resolution corresponding to the configuration for CPU Bits in incr. actual value (G1_XIST1): 0 (= single)

Configuration	
CPU 1511C-1 PN / CPU 1512C-1 PN	Technology object Axis
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Hardware inputs/outputs	**Homing**
Select the hardware input for the reference switch In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Use the homing mode "Use zero mark via PROFIdrive telegram" for drive connection via PTO.
Select the edge of the hardware input for triggering the reference cam function.	
When using a measuring input, select the hardware input of the measuring input. The following table includes the configuration description.	–
Select the hardware input that is used to display whether the drive is ready. In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	
With selected "PTO (PTO (pulse (A) and direction (B))" mode, the hardware output for the PTO signal A ("Pulse output (A)") is automatically selected through the device configuration and cannot be changed. For PTO signal B ("Direction output (B)") select one of the hardware outputs offered in the selection box. The hardware outputs for the PTO signals are selected through the device configuration for the following operating modes and cannot be changed: • PTO (count up (A), count down (B)) • PTO (A,B phase shifted) • PTO (A,B phase shifted, quadruple)	
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > I/O addresses	
The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the PTO channel for the technology object.	

"–" No configuration for CPU/technology object is required for these parameters

Additional configuration for use with the technology object measuring input

Configuration	
Technology module CPU 1511C-1 PN / CPU 1512C-1 PN	Technology object Measuring input
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Hardware inputs/outputs	**Hardware interface > Measuring input**
Select the hardware input of the measuring input. In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Measuring using PROFIdrive telegram (drive or external encoder)
	In the "Number of the measuring input" selection box, select "1" (measuring input 1).

Drive connection using PWM (pulse width modulation)

Note that only travel in the positive direction is possible with a drive connection using the integrated PWM function of the compact CPU.

Configuration	
CPU 1511C-1 PN / CPU 1512C-1 PN	**Technology object**
	Speed axis
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > General	–
Select "Pulse width modulation PWM" mode	
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Hardware inputs/outputs	
Select the hardware output to be used for pulse output.	
Select whether the set hardware output is to work as a fast push-pull switch or as P switch.	
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > Parameters	**Hardware interface > Drive**
Select "S7 analog output" output format	Select analog drive connection For the selection of the analog output, create a PLC tag of the "Int" type with corresponding address. The offset for the PLC tag of the control interface of the PWM channel is 2. To activate the output of the PWM signal, set the following two bits of the control interface of the PWM channel in the user program: • SW_ENABLE (= Bit 0 in Byte 9) • TM_CTRL_DQ (= Bit 1 in Byte 9) The offset for byte 9 to the start address of the PWM channel is 9.
Select minimum pulse width of 0 µs	–
Select required period duration (e.g. 100 µs)	
Pulse generators (PTO/PWM) > PTO1…4/PWM1…4 > I/O addresses	
Select the organization block "MC-Servo" for the input and output addresses. The "TPA OB Servo" process image is selected automatically for the input and output addresses by selecting the organization block.	

"–" No configuration for technology object is required for these parameters

Encoder connection via HSC (High-speed counter)

Configuration		
CPU 1511C-1 PN / CPU 1512C-1 PN	Technology object	
	Axis	External encoder
High-speed counter (HSC) > HSC 1…6 > General > Enable	–	–
Enable high-speed counter		
High-speed counter (HSC) > HSC 1…6 > Basic parameters > Operating mode		
Select "Position input for Motion Control" mode		
High-speed counter (HSC) > HSC 1…6 > Basic parameters > Module parameters	**Hardware interface > Encoder**	**Hardware interface > Encoder**
–	Select "Encoder" data connection and the high-speed counter activated and configured as encoder on the CPU	Select "Encoder" data connection and the high-speed counter activated and configured as encoder on the CPU
Signal type • Incremental encoder	Select encoder type according to the device configuration of the CPU • Incremental	Select encoder type according to the device configuration of the CPU • Incremental
–	**Hardware interface > Data exchange with encoder**	**Hardware interface > Data exchange**
	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.	Telegram "DP_TEL83_STANDARD" is automatically selected after the selection of the encoder.
	Deselect "Automatic transfer of encoder parameter values"	Deselect "Automatic transfer of encoder parameter values"
	Select rotary measuring system type.	Select rotary measuring system type.
Signal evaluation • Single • Double • Quadruple	Set fine resolution according to the configured signal evaluation set for the high-speed counter (HSC) • 0 = Single • 1 = Double • 2 = Quadruple	Set fine resolution according to the configured signal evaluation set for the high-speed counter (HSC) • 0 = Single • 1 = Double • 2 = Quadruple
Enter increments per revolution	Enter increments per revolution corresponding to device configuration for CPU (1:1)	Enter increments per revolution corresponding to device configuration for CPU (1:1)
–	**Hardware interface > Data exchange with the drive**	–
Enter reference speed corresponding to configuration for technology object (1:1)	Enter reference speed	

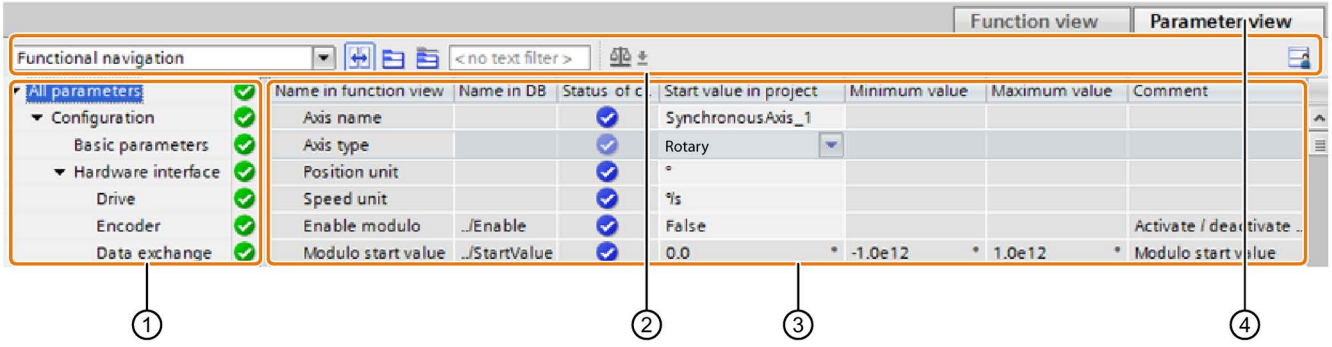
Configuration		
CPU 1511C-1 PN / CPU 1512C-1 PN	**Technology object**	
	Axis	**External encoder**
–	**Homing**	**Homing**
Select the homing signal for homing mark 0: • Signal N of the incremental encoder • DI0 (can be set with the hardware inputs/outputs) In addition, configure the input delay for the selected hardware input. You configure the input delay in the device configuration at the corresponding DI channel (DI 16/DQ 16 > Inputs > Channel > Input parameters > Input delay).	Use the homing mode "Use zero mark via PROFIdrive telegram".	Use the homing mode "Use zero mark via PROFIdrive telegram".
High-speed counter (HSC) > HSC 1…6 > I/O addresses The organization block ("MC-Servo") and the process image ("TPA OB Servo") are selected automatically for the input and output addresses by selecting the HSC channel for the technology object.	–	–

"–" No configuration for CPU/technology object is required for these parameters

6.12 Parameter view

6.12.1 Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.



① Navigation (Page 281)
② Toolbar (Page 280)
③ Parameter table (Page 282)
④ "Parameter view" tab

Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies
- Display of all memory values of a parameter: Start value PLC, Start value in project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

6.12.2 Structure of the parameter view

6.12.2.1 Toolbar

The following functions can be selected in the toolbar of the parameter view.

Symbol	Function	Explanation
	Select navigation structure	Toggle between function-based navigation and the view of the data structure of the technology data block.
	Couples the function view and parameter view for the objects selected in the navigation	Enables the targeted toggling between the parameter view and function-based view.
	Collapse/expand all nodes and objects	Collapses or expands all nodes and objects of the navigation or the data structure in the currently active view.
	Collapse/expand the nodes below the marked nodes	Collapses or expands the marked nodes and objects of the navigation or the data structure in the currently active view.
	Text filter...	After entry of a character string: Display of all parameters containing the entered string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value in project, Start value PLC) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g. selected navigation structure, activated table columns, etc.)

6.12.2.2 Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation		In the functional navigation, the structure of the parameters is based on the structure in the configuration window ("Function view" tab), commissioning window and diagnostics window.
Data structure		In the "Data structure" navigation, the structure of the parameters is based on the structure of the technology data block.

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

6.12.2.3 Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in function view	Name of the parameter in the function view. The display field is empty for parameters that are not configured via the technology object.	X	X
Name in DB	Name of the parameter in the technology data block. If the parameter is part of a structure or UDT, the prefix "../" is added. The display field is empty for parameters that are not contained in the technology data block.	X	X
Full name in DB	Complete path of the parameter in the instance DB. The display field is empty for parameters that are not contained in the technology data block.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols.	X	
Compare result	Result of the "Compare values" function. This column is displayed when there is an online connection.		X
Start value in project	Configured start value in project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Start value PLC	Start value in the CPU. This column is displayed when there is an online connection.		X
Monitor value	Current value in the CPU. This column is displayed when there is an online connection.		X
Modify value	Value that is to be used to change the monitor value. This column is displayed when there is an online connection.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: • Offline: by the start value in the project. • Online: by the monitor values.	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: • Offline: by the start value in the project. • Online: by the monitor values.	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X

Column	Explanation	Offline	Online
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

6.12.3 Opening the parameter view

Requirement

The technology object was added in the project navigator.

Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

6.12.4 Working with the parameter view

6.12.4.1 Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 285)	X	X
Sorting the parameter table (Page 286)	X	X
Transferring parameter data to other editors (Page 287)	X	X
Indicating errors (Page 287)	X	X
Editing start values in the project (Page 288)	X	X
Monitoring values online in the parameter view (Page 290)		X
Modifying values (Page 291)		X
Comparing values (Page 293)		X

6.12.4.2 Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

With the text filter

Texts that are visible in the parameter table can be filtered. This means only texts in displayed parameter rows and columns can be filtered.

1. Enter the desired character string for filtering in the “Text filter...” input box.

   The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".

   The parameter table only shows the static parameters.
   You can select further subgroups for some groups of the navigation.

2. Click “All parameters” in the navigation if all parameters are to be shown again.

6.12.4.3 Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

Sorting by column

1. Position the cursor in the header cell of the desired column.

   The background of this cell turns blue.

2. Click the column header.

Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol "▲": Parameter table is sorted in ascending order.
- Symbol "▼": Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The "../" prefix in the "Name in DB" column is ignored when sorting.

6.12.4.4 Transferring parameter data to other editors

You can paste parameters of the parameter view in the following editors:

- Program editor
- Watch table
- Signal table for Trace

The following options are available for pasting:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

6.12.4.5 Indicating errors

Error display

Parameter assignment errors that result in compilation errors (e.g. limit violation) are indicated in the Parameter view.

Every time a value is entered in the Parameter view, a check is made for process-related and syntax errors and displayed with the following indicators:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns
- Table field with red background

  If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration window.

6.12.4.6 Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the "Start value in project" column of the parameter table.
- In the "Status of configuration" column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration window of the technology object.

Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value in project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter.
   The limits of the value range can be seen in the "Maximum value" and "Minimum value" columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive ("Retain" column).

Error display

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the "Start value in project" field
  If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Correcting bad start values

1. Correct bad start values using information from the roll-out error message.

   Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

6.12.4.7 Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

As soon as the Parameter view is online, the following columns are additionally displayed:

- Compare result
- Start value PLC
- Monitor value
- Modify value
- Selection for transmission

The "Monitor value" column shows the current parameter values on the CPU.

Display

All columns that are only available online have an orange background:

- Values in light-orange cells can be changed.
- Values in cells with a dark orange background cannot be changed.

See also

Parameter table (Page 282)

6.12.4.8 Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

⚠ DANGER

Danger when modifying:

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you use the "Modify" function.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

Procedure

To modify parameters immediately, follow these steps:

- Enter the desired modify values in the “Modify values” column of the parameter table.

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Monitor values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

Error display

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field

and

- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

6.12.4.9 Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value in project
- Start value PLC

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon .

   A selection list containing the comparison options opens:

   – Start value in project - Start value PLC (default setting)

2. Select the desired comparison option.

   The selected comparison option is executed as follows:

   – A scales symbol appears in the header cells of the two columns selected for comparison.

   – Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two compare values is not available (e.g., snapshot).

Symbol in the navigation

The symbols are shown in the same way in the navigation if the compare result applies to at least one of the parameters below the displayed navigation structure.

Programming 7

7.1 Introduction

The "Programming" section contains general information on supplying and evaluating the Motion Control instructions and on technology data blocks.

You can find an overview of the Motion Control instructions in the Functions (Page 26) section.

You can use Motion Control instructions in the user program to assign jobs to the technology object. You define the job using the input parameters of the Motion Control instructions. The current job status is indicated in the output parameters.

The technology data block is available to you as an additional interface to the technology object.

7.2 Technology data block

7.2.1 Introduction

The properties of real objects (e.g. drives) are configured by means of the technology objects and saved in a technology data block. The technology data block contains all configuration data, setpoint and actual values, and status information of the technology object. The TIA Portal automatically creates the technology data block when the technology object is created. You access the data of the technology data block (read/write access) with your user program.

A listing and description of the tags can be found in the Appendix (Page 442).

7.2.2 Evaluating the technology data block

Description

Access to data in the technology data block occurs in accordance with the access to standard data blocks.

Reading values from the technology data block

In your user program you can read actual values (e.g. current position) and status information, or detect error messages in the technology object. When you program a query in your user program (e.g. current velocity), the value is directly read from the technology object.

Reading values from the technology data block takes longer than for other data blocks.
If you use these tags several times in a single cycle of your user program, it is recommended to copy the tag values to local tags, and use the local tags in your program.

Writing values to the technology data block

The configuration of the technology object in the TIA Portal is used to write the corresponding data to the technology data block. After they have been loaded into the CPU, these data are stored in the CPU on the SIMATIC Memory Card (load memory).

In the following cases, it may be necessary for the user program to write values to the technology data block:

- Adaptation of the configuration of the technology object (e.g. dynamic limits, software limit switches)
- Use of overrides
- Adaptation of position control (e.g. "Kv" parameter)

Changes to values in the technology data block by the user program can take effect at various points in time. The relevant property of the individual tags can be found in their descriptions in the Appendix (Page 442):

Effectiveness of changes	Description	
Direct (DIR)	You write changes using direct assignments. The changes are applied only at the start of the next MC-Servo [OB91]. The changes are retained until the next POWER OFF of the CPU or restart of the technology object.	
	LREAL (e.g. <TO>.Override.Velocity)	The technology object performs a range check on the written value, and immediately starts using the new value. If range limits are violated when writing, the technology object automatically corrects the values. If the value is below the range, then the value is set to the low limit of the range; if the range is exceeded, then the value is set to the high limit of the range.
	DINT/BOOL (e.g. <TO>.PositionLimits_SW.Active)	Changes are only permitted in the defined value range. Value changes outside the value range are not applied. If you enter invalid values, the programming error OB (OB 121) is started.
When Motion Control instruction is called (CAL) (e.g. <TO>.Sensor[n].ActiveHoming.HomePositionOffset)	You write changes using direct assignments. The changes are applied at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program. The changes are retained until the next POWER OFF of the CPU or restart of the technology object.	
Restart (RES) (e.g. <TO>.Homing.AutoReversal)	Since restart-relevant tags have dependencies on other tags, value changes cannot be applied at any arbitrary time. The changes are only used after reinitialization (restart) of the technology object. During a restart the technology object is reinitialized with the data in load memory. You therefore write changes to the start value in the load memory with the extended instruction "WRIT_DBL" (write to data block in load memory). You trigger the restart in your user program using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE. Additional information regarding the restart can be found in the Restarting technology objects (Page 324) section.	
Read only (RON) (e.g. <TO>.Position)	The tag cannot and must not be changed during runtime of the user program.	

Note

Save changes with "WRIT_DBL"

Changes to tags immediately in effect are lost on POWER OFF of the CPU, or restart of the technology object.

If changes in the technology data block should also be retained after POWER OFF of the CPU, or restart of the technology object, you must write the changes to the start value in the load memory with the extended instruction "WRIT_DBL".

Note

Using the "READ_DBL" and "WRIT_DBL" data block functions

The "READ_DBL" and "WRIT_DBL" data block functions may only be used on individual tags in conjunction with the tags of the technology object. The "READ_DBL" and "WRIT_DBL" data block functions must not be applied to data structures of the technology object.

Isochronous evaluation of data

If you want to process data of the technology data block in isochronous mode from a Motion Control application cycle, there is the option of evaluating this data in the MC-PreServo [OB67]/MC-PostServo [OB95] as of technology version V3.0.

See also

Organization Blocks for Motion Control (Page 97)

7.2.3 Evaluate StatusWord, ErrorWord and WarningWord

To be able to symbolically use individual status and error information from the "StatusWord", "ErrorWord" and "WarningWord" data double words, you can evaluate them as described below. For consistent evaluation, you should avoid using bit addressing to access these data double words in the technology data block. Access to an individual bit in the technology data block only lasts as long as the access to the entire data word.

When required, copy the required data double word to a tag of a data structure and query the individual bits of the tag.

The allocation of the individual bits in the data double words can be found in the Appendix (Page 442) in the description of the tags of the corresponding technology object.

Requirements

The technology object has been created.

Procedure

To evaluate the individual bits in the data word "StatusWord", follow these steps:

1. Crate a global data structure. Name the data structure, e.g. as "Status".
2. Create a double word (DWORD) in the data structure "Status".
   Name the double word, e.g. as "Temp".
3. Create 32 Boolean tags in the "Status" data structure. You can obtain a clearer overview by giving the individual Boolean tags identical names as the bits in the technology DB (e.g. name the fifth Boolean tag "HomingDone").
4. Copy the tag <TO>.StatusWord as needed from the technology data block to the double word "Temp" in your data structure.
5. Copy the individual bits of double word "Temp" to the corresponding Boolean tags with bit accesses.
6. Use the Boolean tags to query the status bits.

Evaluate the data words "ErrorWord" and "WarningWord" as specified in steps 1 to 6.

Example

The following example shows how you can read out and save the fifth bit "HomingDone" of the data word "StatusWord":

```
SCL                                          Explanation
#Status.Temp := "TO".StatusWord;             //Copy status word
#Status.HomingDone := #Status.Temp.%X5;      //Copy individual bits per bit access
```

```
STL                                          Explanation
L "TO".StatusWord                            //Copy status word
T #Status.Temp
U #Status.Temp.%X5                           //Copy individual bits per bit access
= #Status.HomingDone
```

7.2.4 Change restart-relevant data

In order to change restart-relevant data in the technology data block, write to the starting values of the tags in load memory using the extended instruction "WRIT_DBL". In order for the changes to be applied, a restart of the technology object must be performed.

Whether changes to the value of a tag are relevant for the restart can be found in the description of the tags in the Appendix (Page 456).

Requirement

The technology object has been created.

Procedure

To change restart-relevant data, proceed as follows:

1. Create a data block and fill it with the restart-relevant values, that you want to change in the technology data block. In doing so, the data types must match the tags to be changed.
2. Write the values from your data block to the starting values of the tags of the technology data block in load memory, using the extended instruction "WRIT_DBL".

   If restart-relevant data were changed, this will be indicated in the <TO>.StatusWord.X3 (OnlineStartValuesChanged) tag of the technology object.
3. Perform a restart of the technology object using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE.

After the restart of the technology object, the new value is transferred into the technology data block in work memory, and is effective.

7.3 Motion Control instructions

7.3.1 Motion Control instruction parameters

Description

The individual Motion Control instructions are described in detail in the section S7-1500 Motion Control V3 (Page 371).

When creating your user program, take the following explanations of the Motion Control instruction parameters into account.

Reference to the technology object

The technology object is specified for the Motion Control instruction as follows:

- **Parameter "Axis"**

  The "Axis" input parameter of a Motion Control instruction contains a reference to the technology object that is to execute the corresponding job.

  The corresponding technology object is also referenced in the following parameters:

  – Parameter "Master"

  – Parameter "Slave"

  – Parameter "Cam"

  – Parameter "MeasuringInput"

  – Parameter "OutputCam"

  – Parameter "CamTrack"

  As of technology version V3.0, the reference to the technology object can also be specified with the data type DB_ANY.

Job start and transfer of input parameters of a Motion Control instruction

For the start of jobs and the transfer of modified parameter values, a distinction is made between the following Motion Control instructions:

- **Motion Control instructions with "Execute" parameter**

  With a positive edge at the "Execute" parameter, the job is started and the existing values for the input parameters are transferred.

  Subsequently changed parameter values are not transferred until the next job start.

  Resetting the "Execute" parameter does not end the job, but it does affect the display duration of the job status. As long as "Execute" is set to TRUE, the output parameters will be updated. If "Execute" is reset before the completion of a job, the parameters "Done", "Error" and "CommandAborted" are correspondingly set for only one call cycle.

- **Motion Control instructions with "Enable" parameter**

  The job is started by setting the "Enable" parameter.

  As long as "Enable" = TRUE, the job remains active and changed parameter values will be transferred each time the instruction is called in the user program.

  The job is ended by resetting the "Enable" parameter.

  The input parameters "JogForward" and "JogBackward" of the Motion Control instruction "MC_MoveJog" correspond in their behavior to the "Enable" parameter.

Job status

The following output parameters indicate the status of the job execution:

- **Motion Control instructions with "Done" parameter**

  The normal completion of a job is indicated with parameter "Done" = TRUE.

- **Motion Control instructions without "Done" parameter**

  The achievement of the job objective is indicated by other parameters (e.g. "Status", "InVelocity"). For more information, refer to the section Tracking running jobs (Page 312).

- **Parameter "Busy"**

  As long as a job is being processed, the "Busy" parameter shows the value TRUE.
  If a job was ended or aborted, "Busy" shows the value FALSE.

- **Parameter "CommandAborted"**

  If a job was aborted by another job, the CommandAborted parameter shows the value "TRUE".

- **Parameter "Error"**

  If a Motion Control instruction error occurs, the "Error" parameter shows the value TRUE. The ErrorID parameter indicates the cause of the error.

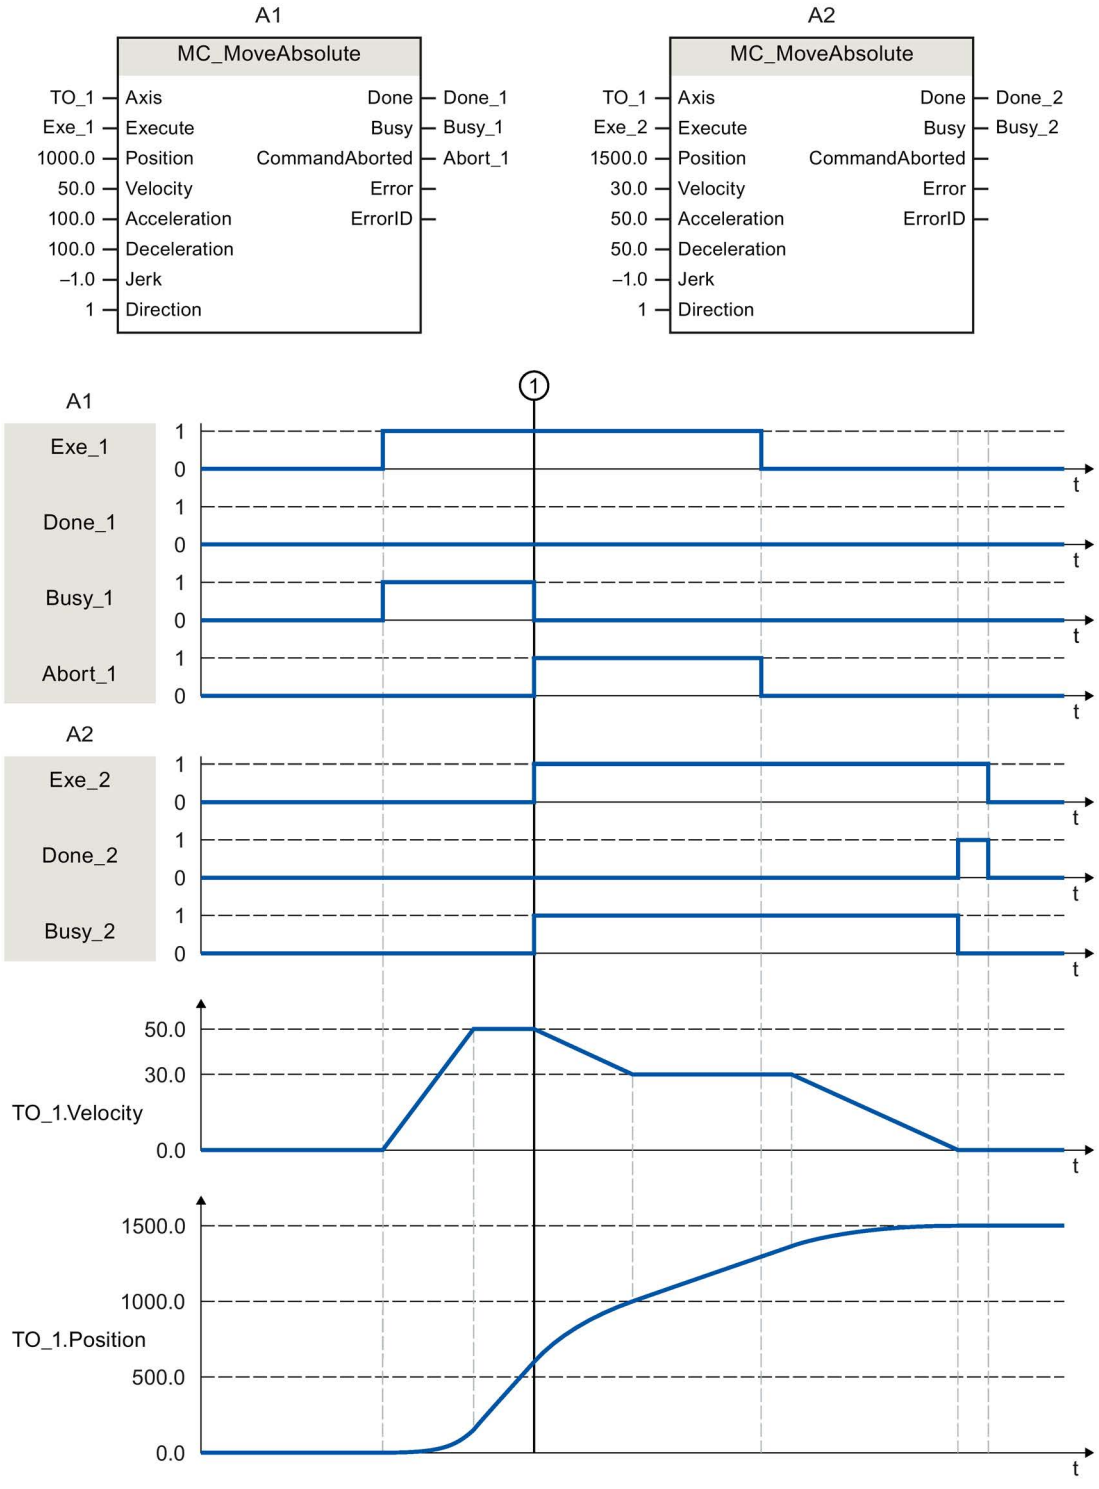
As long as the "Execute" or "Enable" parameter is set to TRUE, the output parameters will be updated. Otherwise the parameters "Done", "Error" and CommandAborted" are correspondingly set for only one cycle.

Abort of running jobs

An active Motion Control job is aborted by the start of a new Motion Control job. In the process, the current dynamic setpoints (acceleration, deceleration, jerk, velocity) are set to the values of the overriding job.

Example of parameter behavior

The behavior of the parameters of Motion Control instructions is shown in the following chart using the example of two "MC_MoveAbsolute" jobs.



Using "Exe_1", an "MC_MoveAbsolute" job (A1) with target position 1000.0 is initiated. "Busy_1" is set to TRUE. The axis is accelerated to the specified velocity and moved to the target position (see TO_1.Velocity and TO_1.Position). Before the target position is reached, the job is overridden at time ① by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1", and "Busy_1" is set to FALSE. The axis is braked to the velocity specified in A2 and moved to the new target position 1500.0. When the axis reaches the target position, this is signaled via "Done_2".

Non position-controlled operation

The position control of the axis can be deactivated with the following parameters:

- MC_Power.StartMode = 0
- MC_MoveVelocity.PositionControlled = FALSE
- MC_MoveJog.PositionControlled = FALSE

For more information, refer to the section " Non position-controlled operation (Page 308).

7.3.2 Add Motion Control instructions

You add Motion Control instructions to a program block in the same way as other instructions. You control all available functions of the technology object using the Motion Control instructions.

Requirements

The technology object was created.

Procedure

To add Motion Control instructions in your user program, proceed as follows:

1. Double click your program block in the project tree (the program block must be called in the cyclical program).

   The program block is opened in the programming editor, and the available instructions are displayed.

2. In the "Instructions" task card, open the "Technology > Motion Control" folder.
3. Using drag-and-drop, move the Motion Control instruction, e.g. "MC_Power", to the desired segment of the program block.

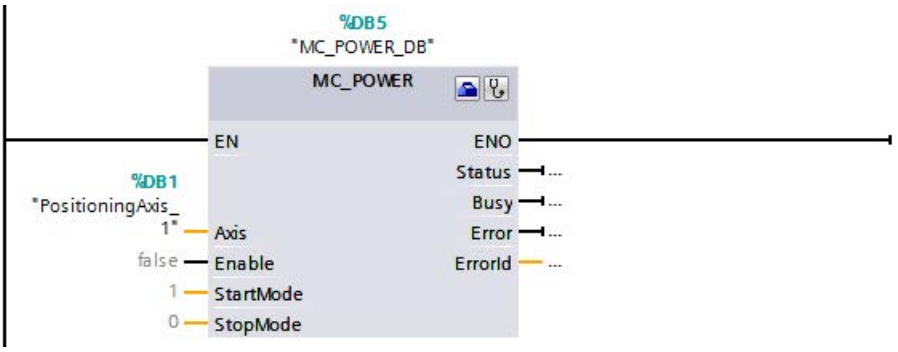
   The "Call options" dialog opens.

4. In the dialog, specify a name and a number for the instance data block of the Motion Control instruction.
5. Click "OK".

   The Motion Control instruction "MC_Power" is inserted into the network.

   The instance data block is automatically created under "Program Blocks > System Blocks > Program Resources".

6. Input parameters without a default value (e.g. "Axis"), must be assigned. Select the technology object in the project tree and move it onto <...> in the "Axis" parameter using drag-and-drop.



Once the technology object is specified in the "Axis" parameter, the following buttons are available to you:

	To open the configuration of the technology object, click on the toolbox icon.
	To open the diagnostics of the technology object, click on the stethoscope icon.

7. Add additional Motion Control instructions in accordance with steps 3 through 6.

See also

Tracking active jobs (Page 312)

Tags of the positioning axis/synchronous axis technology object (Page 456)

7.3.3 Parameter transfer for function blocks

If you want to reuse a function block with Motion Control instructions for different technology objects, create an input parameter of the data type of the respective technology object in the block interface of the calling function block. You assign the data type in the block interface with direct input. The parameter is then transferred as reference to the technology object to the "Axis" parameter of the Motion Control instructions. The data types of technology objects correspond to the structure of the associated technology data block.

By specifying the data type, you can address the tags of the technology object in the function block (<parameters of the block interface>.<tag of the technology object>).

If you do not need access to the tags of the technology object, you can use the data type DB_ANY.

The following table shows the data types for reference to the technology objects:

Technology object	Data type for reference to the technology object
Speed axis	TO_SpeedAxis
Positioning axis	TO_PositioningAxis
Synchronous axis	TO_SynchronousAxis
External encoder	TO_Encoder
Output cam	TO_OutputCam
Cam track	TO_CamTrack
Measuring input	TO_MeasuringInput
Cam (S7-1500T)	TO_Cam

Example

The following table shows the definition of the tags used:

Operand	Declaration	Data type	Description
Axis	Input	TO_PositioningAxis	Reference to the technology object
On	Input	BOOL	Signal to enable the axis
Act_Position	Output	LReal	Query of the actual position from the technology data block
MC_POWER_I	Static	MC_POWER	Multi-instance of the Motion Control instruction MC_Power

The following SCL program shows how to implement this task:

SCL	Explanation
`#MC_POWER_I(Axis := #Axis, Enable := #On);`	`//Call of the Motion Control instruction MC_Power with enable of the axis`
`#Act_Position := #Axis.ActualPosition;`	`//Query of the actual position from the technology data block`

7.3.4 Non position-controlled operation

The closed loop position control of an axis can be switched off/switched with the following Motion Control instructions:

- MC_Power
- MC_MoveVelocity
- MC_MoveJog

The non-position-controlled operation is displayed with <TO>.StatusWord.X28 (NonPositionControlled) = TRUE.

MC_Power

The axis is enabled without closed loop position control with "MC_Power" and the parameter "StartMode" = 0. The closed loop position control remain switched off until a different Motion Control instruction changes the status of the closed loop position control.

MC_MoveVelocity and MC_MoveJog

A "MC_MoveVelocity" or "MC_MoveJog" job with "PositionControlled" = FALSE forces non-position-controlled operation.

A "MC_MoveVelocity" or "MC_MoveJog" job with "PositionControlled" = TRUE forces position-controlled operation.

The selected mode remains in effect after the job is completed.

Influence of additional Motion Control instructions

Starting the following Motion Control instructions forces position-controlled operation of the axis:

- MC_Home with "Mode" = 3, 5
- MC_MoveAbsolute
- MC_MoveRelative
- MC_MoveSuperimposed
- MC_GearIn
- MC_GearInPos (S7-1500T)
- MC_CamIn (S7-1500T)

The closed loop position control remains active after completing the corresponding jobs.

The Motion Control instruction MC_Halt is executed in position-controlled and non-position-controlled operation. The status of the closed loop position control is not changed by "MC_Halt".

A torque limiting activated with "MC_TorqueLimiting" is in effect even with non-position-controlled operation.

Synchronous operation with setpoint coupling

A following axis is set into position-controlled operation with the start of a synchronous operation job. If the leading axis is in non-position-controlled operation at the start of the synchronous operation, the synchronous operation job remains waiting. Synchronization is not started until closed loop position control is activated and the start position of the synchronization has been reached.

Note

If the leading axis is set to non-position-controlled operation during active synchronous operation, the setpoint at the following axis is set to 0.0. This corresponds to a setpoint step change on the following axis. The following axis compensates for the step change according to the synchronous operation function and limited only to the maximum speed of the drive.

Synchronous operation with actual value coupling (S7-1500T)

A following axis is set into position-controlled operation with the start of a synchronous operation job. If the leading axis is in non-position-controlled operation at the start of the synchronous operation and the actual values are valid, synchronization is started.

If the leading axis is set to non-position-controlled operation during active synchronous operation, the synchronous operation remains active.

7.4 Starting Motion Control jobs

Description

Motion Control jobs are started by setting the "Execute" or "Enable" parameter of the Motion Control instruction. The call of the Motion Control instructions for a technology object should occur in an execution level.

When executing Motion Control jobs, you should also take note of the status of the technology object.

Starting Motion Control jobs should be performed in the following steps:

1. Query the status of the technology object.
2. Initiate new job for the technology object.
3. Check job status.

These steps are explained using the example of a job for absolute positioning.

1. Query the status of the technology object

Make sure that the technology object is in the appropriate status to perform the desired job:

- **Has the technology object been released?**

  To execute motion jobs, the technology object must be enabled.

  Enabling is performed using the Motion Control instruction "MC_Power".

  The "MC_Power.Status" parameter (<TO>.StatusWord.X0 (Enable)) must show the value TRUE.

- **Is a technology alarm pending?**

  To perform motion commands, no technology alarms or alarm responses may be pending. The tags of the technology objects <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction must show the value zero. After resolving the error, acknowledge any pending alarms using the Motion Control instruction "MC_Reset".

  A list of the technology alarms and alarm reactions can be found in the appendix, Technology alarms (Page 530).

- **Has the technology object been homed?**

  In order to perform a job for absolute positioning, the positioning axis/synchronous axis technology object must be homed. The referencing occurs via the Motion Control instruction "MC_Home". The "<TO>.StatusWord.X5 (HomingDone) " tag of the technology object must show the value TRUE .

2. Initiate new command for the technology object

In the "Position" parameter of the "MC_MoveAbsolute" instruction, specify the position to which the axis should be moved. Start the job with a positive edge at the "Execute" parameter.

3. Check command status

Parameter "Done" of the Motion Control instruction indicates successful completion of a job (target reached, in this case).

If an error is detected, the "Error" parameter of the Motion Control instruction is set to TRUE, and the job is rejected.

You can program an error handling routine for the Motion Control job. For this purpose, evaluate the error indicated in the "Error" parameter. The cause of the error is indicated in the ErrorID parameter. After resolving the cause of the error, restart the job.

Output of the "Error" = TRUE and "ErrorID" = 16#8001 status information during job processing indicates that a technology alarm was triggered.

You can find a list of the ErrorIDs in the Error detection (Page 559) appendix.

Additional information

An option for the evaluation of the individual status bits, error bits, and warning bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

7.5 Tracking active jobs

7.5.1 Introduction

The current status of the job processing is made available via the output parameters of the Motion Control instruction. These parameters are updated with each call of the Motion Control instruction.

When tracking jobs, a distinction is made between three groups:

- Motion Control instructions with "Done" parameter (Page 312)
- Motion Control instructions without "Done" parameter (Page 316)
- Motion Control instruction "MC_MoveJog" (Page 320)

7.5.2 Motion Control instructions with "Done" parameter

Description

Jobs of Motion Control instructions with the "Done" parameter are started with a positive edge at the "Execute" parameter. If the job was completed without errors or interruption by another job (e.g. "MC_MoveAbsolute": Target position reached), the "Done" parameter shows the value TRUE.

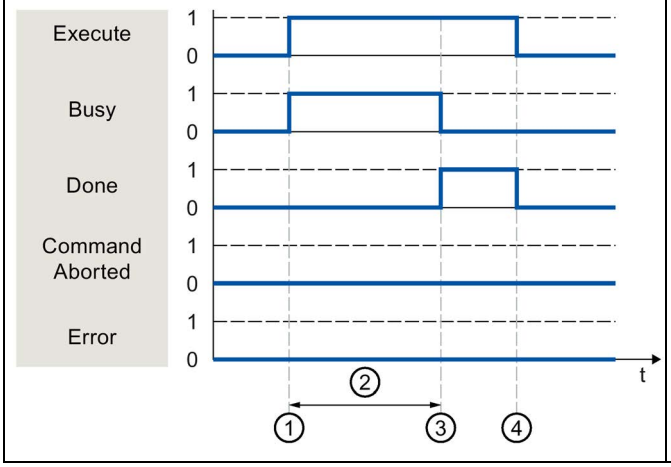
The following Motion Control instructions have a "Done" parameter:

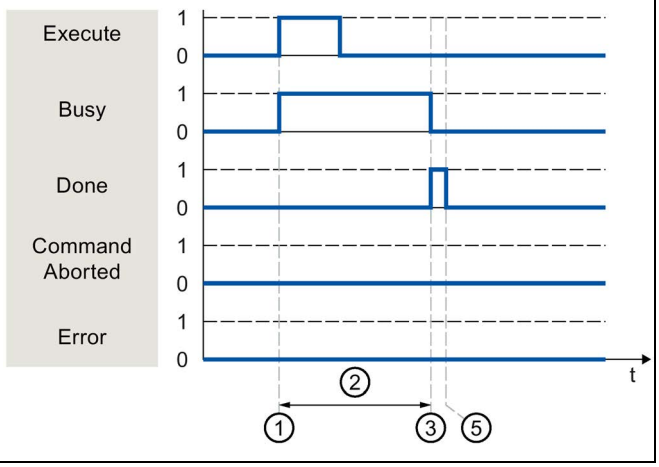
- MC_Home
- MC_MoveRelative
- MC_MoveAbsolute
- MC_MoveSuperimposed
- MC_Halt
- MC_Reset
- MC_MeasuringInput
- MC_AbortMeasuringInput

The behavior of the parameters is shown below by way of example for various situations:

Complete execution of the job

If the Motion Control job has been completely executed all the way to the end, this is indicated with parameter "Done" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Done" parameter:

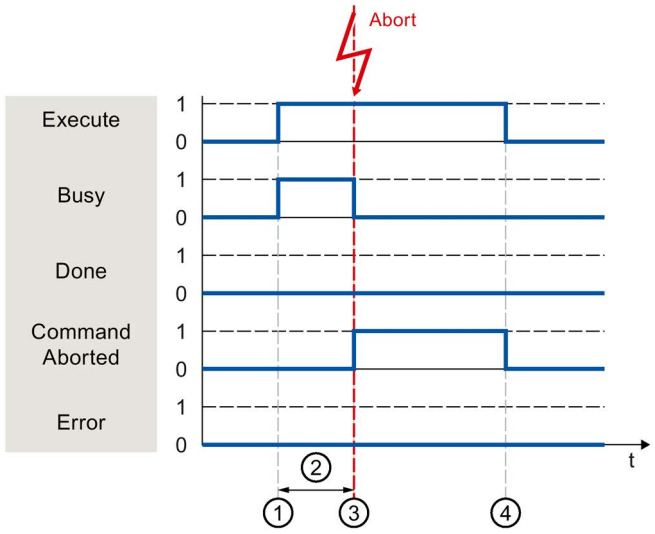
You set "Execute" **after completion** of the job to FALSE.	You set "Execute" **during processing** of the job to FALSE.
	


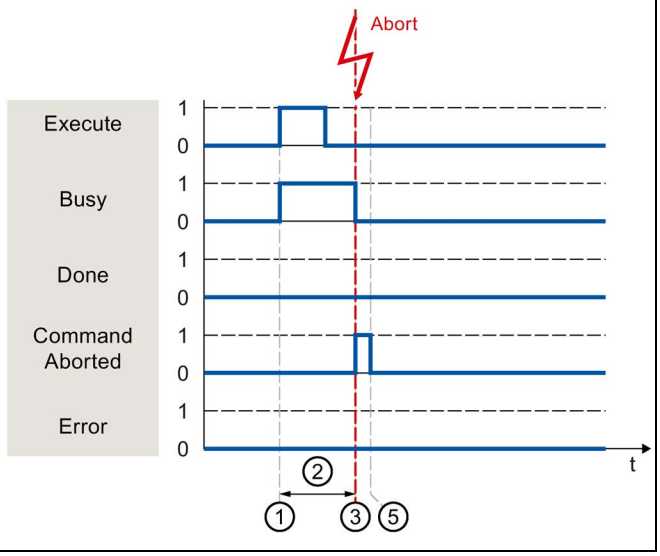


①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	At the completion of the job (for example, with Motion Control instruction "MC_MoveAbsolute": Target position reached), the "Busy" parameter changes to FALSE and the "Done" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Done" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before completion of the job, the "Done" parameter shows the value TRUE for only one execution cycle.

Job abort

If the Motion Control job is aborted during processing by another job, this is indicated in the "CommandAborted" parameter with the value TRUE. The signal state of the "Execute" parameter influences the display duration for the "CommandAborted" parameter:

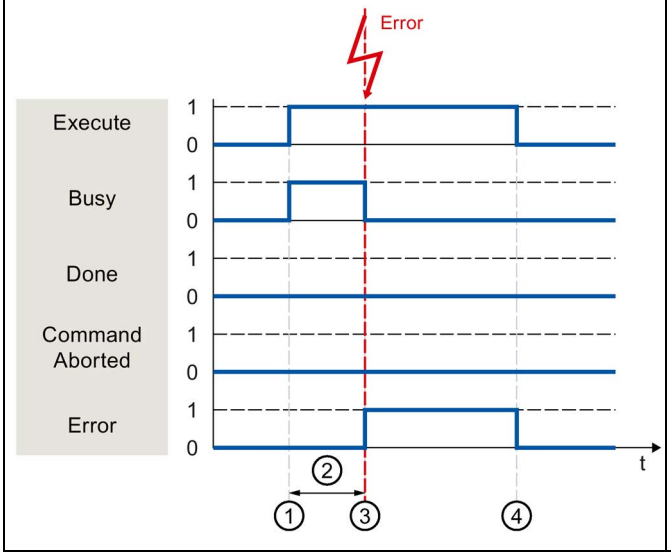
You set "Execute" **after** the job is aborted to FALSE.	You set "Execute" **before** the job is aborted to FALSE.
	


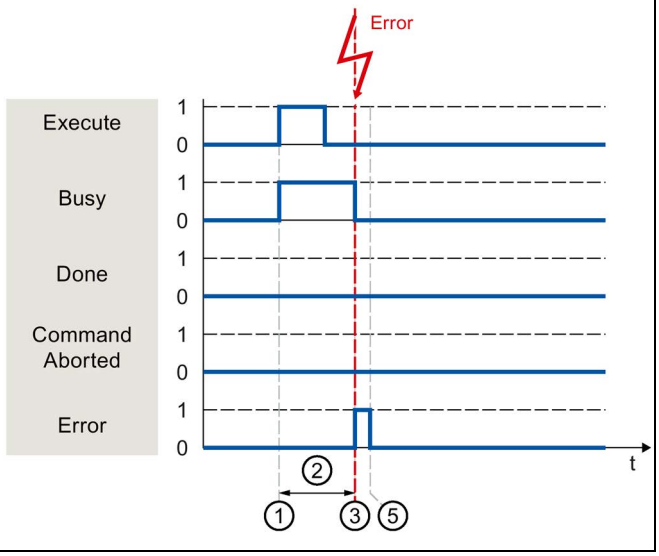


①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the parameter "Busy" shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "CommandAborted" parameter shows the value TRUE for only one execution cycle.

Error during job execution

If an error occurs during execution of the Motion Control job, this is indicated with parameter "Error" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Error" parameter:

You set "Execute" **after** the occurrence of the error to FALSE.	You set "Execute" **before** the occurrence of the error to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after completion of the job.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after the occurrence of the error, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the occurrence of the error, the "Error" parameter shows the value TRUE for only one execution cycle.

7.5.3 Motion Control instructions without "Done" parameter

Description

Motion Control instructions without the "Done" parameter use a special parameter to indicate that the command objective (e.g. "InVelocity", "InGear") has been achieved. The target state or motion is stopped until the job is aborted or an error occurs.

The following Motion Control instructions have a special parameter for indicating the job status:

- MC_Power ("Status" parameter)
- MC_MoveVelocity ("InVeloctity" parameter)
- MC_GearIn ("InGear" parameter)
- MC_MoveJog ("InVelocity" parameter)

  The special behavior of "MC_MoveJog" is described in the section Motion Control instruction MC_MoveJog (Page 320).
- MC_TorqueLimiting ("InClamping" and "InLimitation") parameters

The following Motion Control instructions have no special parameter for indicating the job status: Feedback is provided via the following tags:

- MC_MeasuringInputCyclic

  The execution of a measuring job is indicated with parameter "Busy" = TRUE. Completed measuring events are indicated in the corresponding event counters <TO>.MeasuredValues.MeasuredValue1Counter and <TO>.MeasuredValues.MeasuredValue2Counter of the technology data block.
- MC_OutputCam

  The execution of a job is indicated with parameter "Busy" = TRUE. The CamOutput tag in the associated technology data block indicates the switching state of the output cam.
- MC_CamTrack

  The execution of a job is indicated with parameter "Busy" = TRUE. The TrackOutput tag in the associated technology data block indicates the switching state of the output cam.

The behavior of the parameter is shown for various situations using the Motion Control instruction "MC_MoveVelocity" as an example:

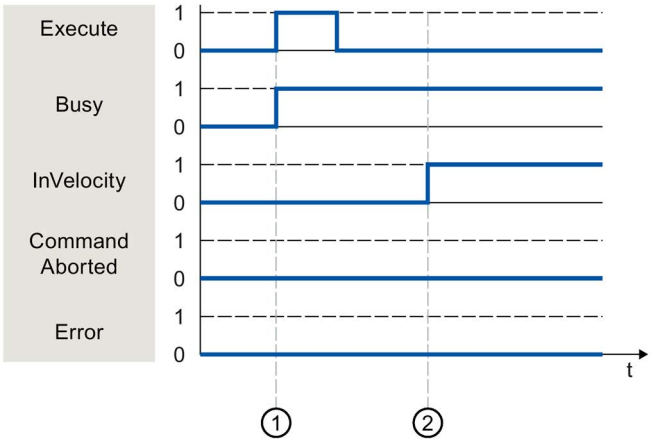
Example "MC_MoveVelocity"

An "MC_MoveVelocity" job is started with a positive edge at the "Execute" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

The motion of the axis can, for example, be stopped with an "MC_Halt" job.

The assigned velocity is reached and maintained

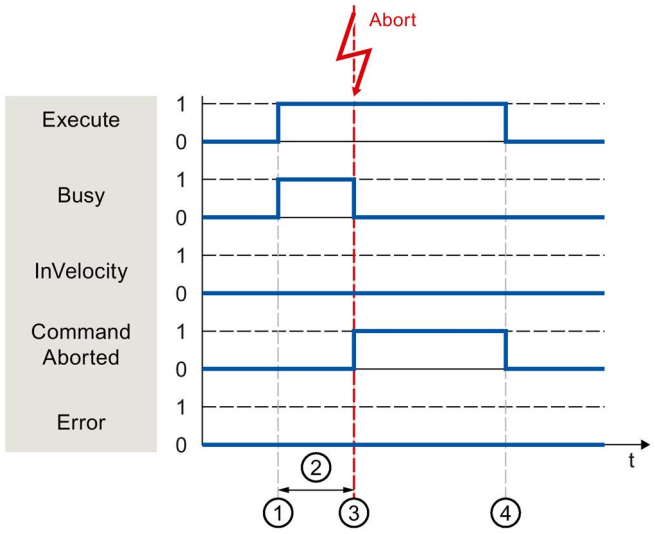
The achievement of the assigned velocity is indicated with parameter "InVelocity" = TRUE. The "Execute" parameter has no effect on the display duration for the "InVelocity" parameter.

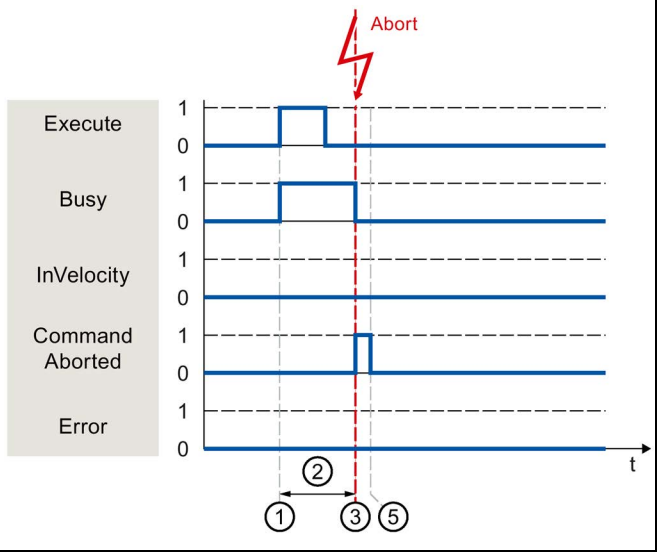


①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE before or after the assigned velocity has been reached. While the job is being executed, the parameter "Busy" shows the value TRUE.
②	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE. The "Busy" and "InVelocity" parameters retain the value TRUE until another Motion Control job overrides the "MC_MoveVelocity" job.

The job is aborted before the assigned velocity is reached

If the Motion Control job is aborted by another job before the assigned velocity is reached, this is indicated with parameter "CommandAborted" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "CommandAborted" parameter.

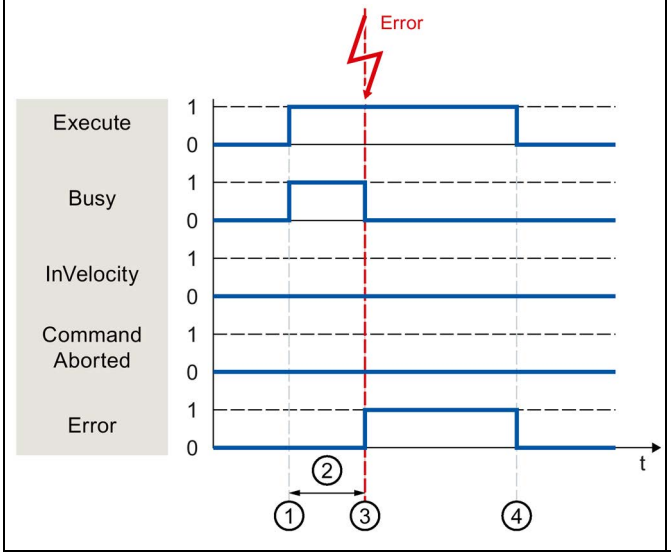
You set "Execute" **after** the job is aborted to FALSE.	You set "Execute" **before** the job is aborted to FALSE.
	


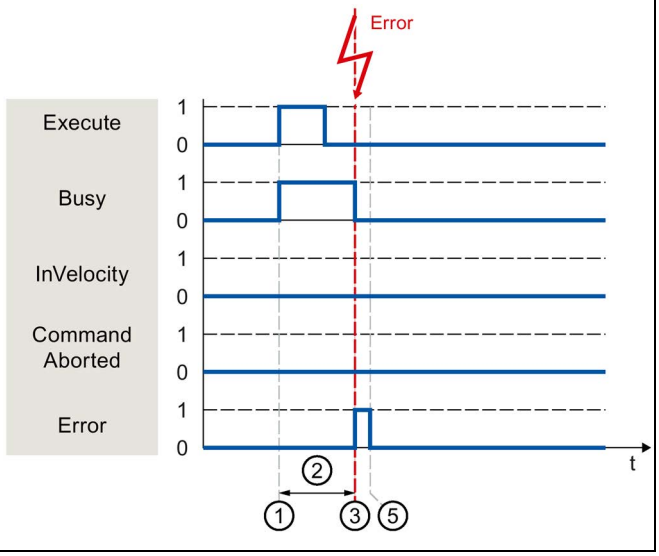


①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after the job is aborted.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "CommandAborted" parameter shows the value TRUE for only one execution cycle.

An error has occurred prior to reaching the assigned velocity

If an error occurs during execution of the Motion Control job before the assigned velocity has been reached, this is indicated with parameter "Error" = TRUE. The signal state of the "Execute" parameter influences the display duration for the "Error" parameter.

You set "Execute" **after** the occurrence of the error to FALSE.	You set "Execute" **before** the occurrence of the error to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the programming, "Execute" can be reset to the value FALSE during the job or the value TRUE can be retained until after the error has occurred.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE, and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter was already set to FALSE before the job is aborted, the "Error" parameter shows the value TRUE for only one execution cycle.

7.5.4 Motion Control instruction "MC_MoveJog"

Description

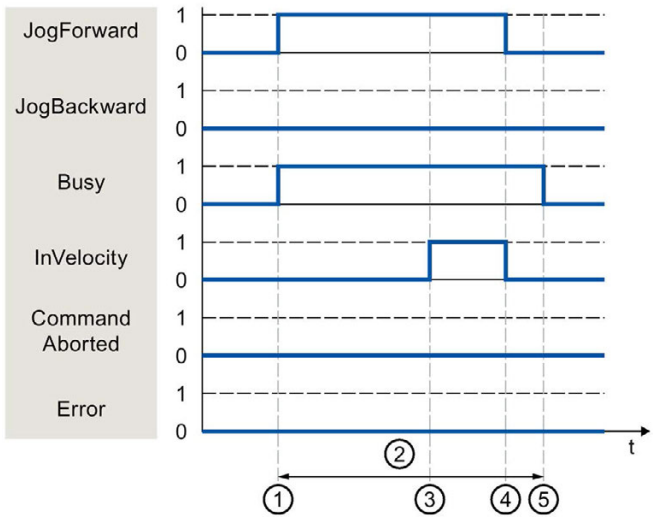
An "MC_MoveJog" job is started by setting the "JogForward" or "JogBackward" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

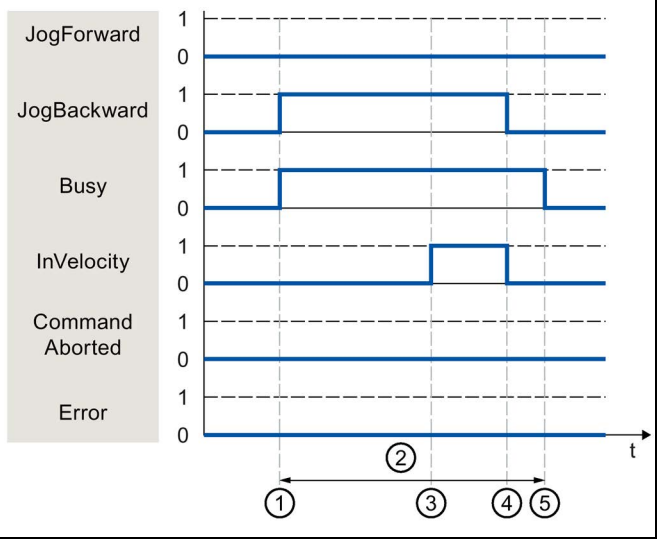
The job is complete when the "JogForward" or "JogBackward" parameter has been set to the value FALSE and the axis has come to a standstill.

The behavior of the parameters is presented below for various example situations:

The assigned velocity is reached and maintained

If the Motion Control job has been performed up to the point of reaching the assigned velocity, then this is indicated in the "InVelocity" parameter with the value TRUE.

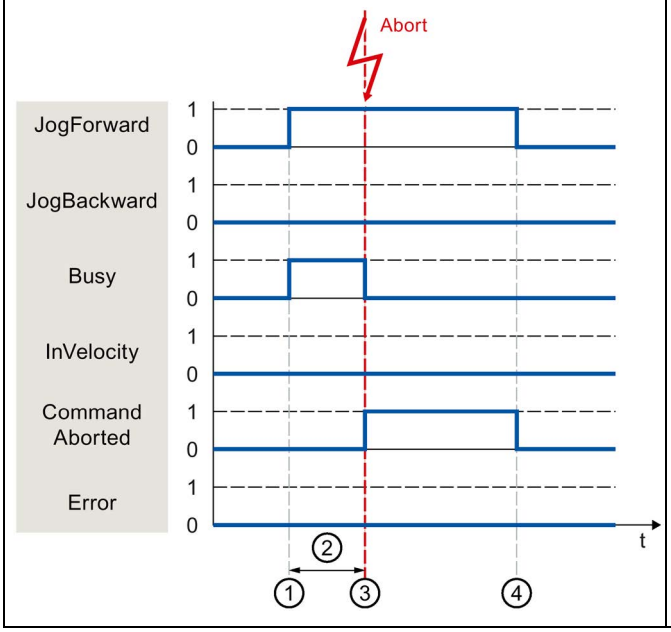
Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


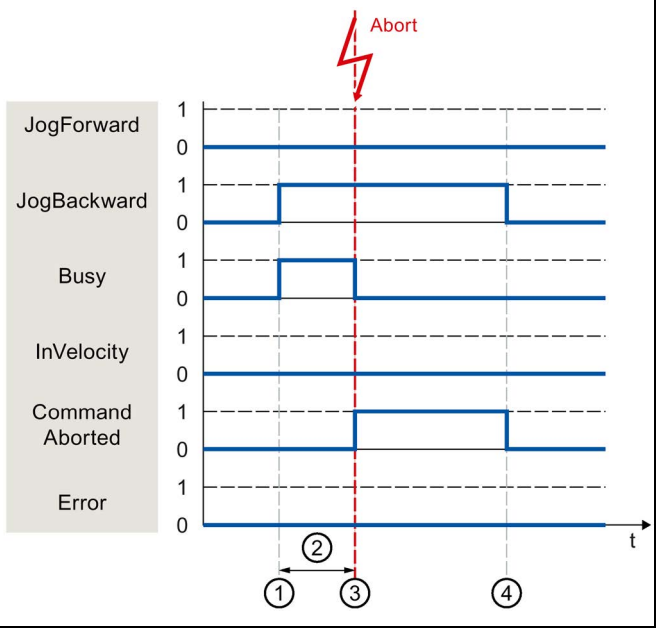


①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE.
④	When the "JogForward" or "JogBackward" parameter is reset, the motion of the axis ends. The axis decelerates. The "InVelocity" parameter changes to FALSE.
⑤	If the axis has come to a standstill, then the Motion Control job is complete and the "Busy" parameter changes to FALSE.

The job is aborted during execution

If the Motion Control job is aborted during processing by another job, this is indicated in the "CommandAborted" parameter with the value TRUE. The behavior of the "CommandAborted" parameter is independent of reaching the assigned velocity.

Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


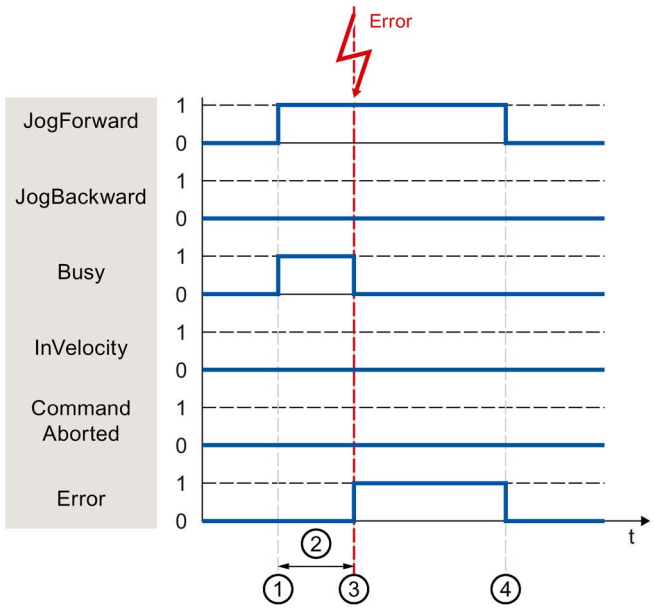


①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is processing, the "Busy" parameter shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	When the "JogForward" or "JogBackward" parameter is reset, the "CommandAborted" parameter likewise changes to FALSE.

An error occurs during the execution of the job

If an error occurs during execution of the Motion Control job, this is indicated in the "Error" parameter with the value TRUE. The behavior of the "Error" parameter is independent of reaching the assigned velocity.

Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	



①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is being executed, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to "FALSE", and "Error" changes to TRUE.
④	When the "JogForward" or "JogBackward" is reset to the value FALSE, the "Error" parameter likewise changes to FALSE.

7.6 Ending Motion Control jobs

When a job is ended, a distinction is made between error-free completion of the job and a motion abort.

Completion of job

The completion of a Motion Control job is indicated as described in the Tracking running jobs (Page 312) section.

Motion abort

If a motion must be aborted, you can perform the following measures:

- Execute "MC_Halt (Page 385)"

  To abort a motion and stop the axis, you can use the "MC_Halt" instruction.

- Deactivate "MC_Power (Page 371)"

  In an emergency, you can stop the axis via an emergency stop ramp. To do so, set the "Enable" parameter of the "MC_Power" instruction to FALSE. The axis is decelerated according to the selected "StopMode" and all jobs for the technology object are aborted.

Measuring job abort

With the Motion Control instruction "MC_AbortMeasuringInput", an active one-time or cyclic measuring job is aborted.

Cancellation of an active output cam/cam track

- "MC_OutputCam (Page 426)"

  An active output cam is disabled when the "Enable" parameter of Motion Control instruction "MC_OutputCam" is set to FALSE.

- "MC_CamTrack (Page 430)"

  An active cam track is disabled when the "Enable" parameter of Motion Control instruction "MC_CamTrack" is set to FALSE.

7.7 Restart of technology objects

Description

After the CPU is switched on, or after technology objects are downloaded into the CPU, the system automatically initializes the technology objects with the start values from the technology data blocks. If restart-relevant changes are detected during a reload into the CPU, a restart of the technology object is automatically performed.

If restart-relevant data have been changed in RUN mode by the user program, then the technology object must be reinitialized by the user in order for the changes to be used. At a RUN → STOP transition, the CPU automatically performs a restart of technology objects with restart-relevant changes.

If changes in the technology data block should also be retained after the restart of the technology object, then you must write the changes to the start value in load memory using the extended instruction "WRIT_DBL".

Restart required

A necessary TO restart is indicated at "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Online start value changed", as well as in the tag of technology object <TO>.StatusWord.X3 (OnlineStartValuesChanged).

Restarting a technology object

A restart of the technology object is triggered by the user by means of the "MC_Reset" Motion Control instruction, with parameter "Restart" = TRUE.

During a restart, all configuration data of the technology object are loaded from load memory into work memory. In the process, the actual values in the technology data block are overwritten.

Note the following during a restart of the technology object:

- A restart resets the "Referenced" status of a technology object with incremental actual values (<TO>.StatusWord.X5 (HomingDone).
- While a restart is being performed, the technology object cannot perform any jobs. An active restart will be indicated under "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Restart active", and in the <TO>.StatusWord.X2 (RestartActive) tag of the technology object.
- Motion Control jobs are rejected during a restart with the "Error" = TRUE and "ErrorID" = 16#800D parameters (job not executable, because a restart is active).
- While a restart is being executed, you cannot access the technology data block.

See also

Change restart-relevant data (Page 299)

Downloading to CPU

8

Description

When downloading to the CPU S7-1500, it is always verified that the project files are consistent online and offline after the download.

The data of the technology objects are saved in technology data blocks. The conditions for downloading blocks thus apply when loading new or modified technology objects.

Load in RUN mode

When loading in the CPU's RUN mode, it is checked whether a load without restart of the technology objects is possible.

If restart-relevant configuration values were changed, then a restart of the technology object is automatically performed after the load into the CPU.

Loading a technology object is only possible if the technology object is disabled.

You **cannot** download the following changes to the CPU in RUN mode:

- Changes to the MC-Servo clock speeds
- Changes to the hardware interface of the technology object in "Technology object > Configuration > Hardware interface"

Commissioning 9

9.1 Introduction

The following guidelines describe the steps that you should note when commissioning the Motion Control-specific components of your equipment.

The commissioning of other components of your automation system depends on the particular equipment configuration. Commissioning (not Motion Control) is described in the Automation System S7-1500 (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

9.2 Commissioning guidelines

These guidelines serve as recommendations for commissioning equipment with Motion Control. The procedure is described using the example of a positioning axis technology object.

Requirement

- The configuration of the following components is complete:
  - CPU
  - BUS communication
  - Drives
  - Technology objects
- The user program has been created.
- The wiring of the CPU and of the associated I/O is complete.
- The commissioning and optimization of the drive is complete.

Procedure

Proceed as follows to commission the Motion Control-specific components of your equipment:

Step	Action to be performed	Supported by TIA Portal
Turn on CPU	Turn on the power supply and the CPU.	-
"Disable" position controller	Set the gain (Kv factor) of the position control loop to zero. (This setting avoids unwanted drive movements that may be caused by incorrect parameterization of the position control loop.)	"Technology object > Configuration > Extended parameters > Control loop"
Load project into the CPU	Bring the CPU to the STOP mode. Download your project to the CPU (load hardware and software).	• "Toolbar > Stop CPU" • "Toolbar > Download to device"
Create online connection to the CPU	Select the "Receive messages" check box under "Online & Diagnostics > Online Access". Configure the interface of the TIA Portal, and create an online connection with the CPU.	• Device configuration • "Online & Diagnostics > Online Access"
Disable Motion Control specific user program	In order to avoid conflicts with the axis control panel, lock the enabling of technology objects in your user program (MC_Power.Enable = FALSE).	• PLC programming • Motion Control instructions
Evaluating pending messages	Evaluate the message display in the inspector window. Resolve the causes of pending technology alarms. Acknowledge the technology alarms (Page 342).	"Inspector window > Diagnostics > Message display"
Check hardware limit switches	Click the hardware limit switches. Check for correct message display (technology alarm 531). Acknowledge the technology alarm.	"Inspector window > Diagnostics > Message display"
Check the connection and configuration of the drive (setpoint)	Bring the CPU into the RUN mode. Open the Axis control panel (Page 329) and take over control. Perform the following steps: • Enable the technology object. ⇒ The drive must turn itself on, and where applicable release the brake. The position is held. • Move the axis in jog mode at low velocity in the positive direction. ⇒ The drive must move. The actual position value must increase (positive direction). • Disable the technology object. ⇒ The drive must turn itself off, and where applicable apply the brake.	"Technology object > Commissioning > Axis control panel"
Check the connection and configuration of the encoder (actual value)	Check the scaling of the actual values (rotation direction, distance evaluation, and resolution of the encoder) ⇒ The change in the actual mechanical position must match the change in the actual values.	• "Technology object > Diagnostics > PROFIdrive frame" • "Technology object > Commissioning > Axis control panel"

Step	Action to be performed	Supported by TIA Portal
Checking the reference speed	Traverse the axis in jog mode at low velocity in the positive direction. ⇒ The displayed current velocity must match the velocity setpoint. If the displayed current velocity deviates significantly from the velocity setpoint, adjust the reference speed.	• "Technology object > Hardware interface > Data exchange" • "Technology object > Commissioning > Axis control panel"
Optimize position controller	Use the Optimization (Page 334) commissioning function to optimize the gain (Kv) of the position control loop. For this purpose, adapt following error limits as needed.	"Technology object > Commissioning > Optimization"
Transfer the gain Kv to the project.	Enter the gain Kv that you determined by means of the optimization function in your configuration data. Load your project into the CPU.	"Technology object > Configuration > Extended parameters > Control loop"
Enable Motion Control specific user program	Unlock the enabling technology objects lock in your user program (MC_Power.Enable = TRUE).	• PLC programming • Motion Control instructions
Check the functioning of the user program	Check the programmed functions of your user program.	• Watch and force tables • Online and diagnostic functions
End of commissioning for a positioning axis technology object	To commission additional technology objects, perform the corresponding steps again.	See above.

9.3 Axis control panel

9.3.1 Function and structure of the axis control panel

Description

You traverse individual axes with the axis control panel.

A user program is not necessary for the operation of the axis control panel. With the axis control panel, you take over master control for a technology object and control the movements of the axis.

⚠ WARNING

Uncontrolled axis motions

During operation with the axis control panel, the axis can execute uncontrolled motions (e.g. due to erroneous configuration of the drive, or of the technology object). Furthermore, any synchronized following axis is moved as well when moving a leading axis with the axis control panel.

Therefore, perform the following protective measures before operation with the axis control panel:

- Ensure that the EMERGENCY OFF switch is within the reach of the operator.
- Enable the hardware limit switches.
- Enable the software limit switches.
- Ensure that following error monitoring is enabled.
- Make sure that no following axis is coupled to the axis to be moved.

The axis control panel of the speed axis, positioning axis and synchronous axis can be found in the project tree under "Technology object > Commissioning".

The axis control panel is divided into the following areas:

- Master control
- Axis
- Operating mode
- Modify
- Axis status
- Current values

The following table lists the elements of the axis control panel:

Area	Element	Description
Master control		In the "Master control" area, you take over master control of the technology object, or return it to your user program.
	"Activate" button	With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. • To take over master control, the technology object must be disabled in the user program. • Any synchronized following axis is moved as well when moving a leading axis with the axis control panel. • If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program. • When you click the "Activate" button, a warning message is displayed. In the warning, you can adapt the sign-of-life monitoring (100 to 60000 ms). If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the message "Error during commissioning" is entered in the message display log. Sign-of-life failure between controller and TIA Portal" is displayed. To eliminate this error, adapt the sign-of-life monitoring in the warning. • Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with error ("ErrorID" = 16#8012: axis control panel active). • When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not take effect until master control has been returned. For this reason, make any necessary changes before master control is taken over. • If master control has been taken over for the technology object, the axis control panel is blocked for access by another installation of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object
Operating mode		Select the required mode in the "Operating mode" drop-down list.

Area	Element	Description
Modify		The "Control" area displays the parameters for traversing with the axis control panel according to the selected operating mode.
	Position	Position to which the axis is homed. (Homing and set home position modes only)
	Distance	Distance the axis is traversed. (Relative positioning mode only)
	Target position	Position to which the axis is traversed. (Absolute positioning mode only)
	Velocity/ Velocity setpoint	Velocity or speed at which the axis is traversed. Default: 10% of the default value (Velocity/speed setpoint, Jog and Positioning modes only)
	Acceleration	Acceleration with which the axis is traversed. Default: 10% of the default value
	Deceleration	Deceleration with which the axis is traversed. Default: 10% of the default value
	Jerk	Jerk with which the axis is traversed. Default: 100% of default value
	"Start" button	With the "Start" button, you start a job according to the selected operating mode.
	"Forward" button	With the "Forward" button, you start a motion in the positive direction according to the selected operating mode.
	"Backward" button	With the "Backward" button, you start a motion in the negative direction according to the selected operating mode.
	"Stop" button	With the "Stop" button, you cancel a job or stop the axis.
Axis status		The "Axis status" area displays the status of the axis and the status of the drive.
	Drive ready	Drive is ready to execute setpoints.
	Error	An error occurred at the technology object.
	Enabled	The technology object has been enabled. The axis can be moved with motion jobs.
	Homed	The technology object is homed.
	More	The "More" link takes you to the window "Technology object > Diagnostics > Status and error bits".
	Active errors	The error that occurred most recently is displayed in the "Active errors" text field.
	"Confirm" button	With the "Confirm" button, you acknowledge pending errors.
Current values		The "Current values" area shows the actual values of the axis.
	Position	Actual position of the axis
	Velocity	Actual velocity of the axis

Note

No transfer of the parameters

The configured parameter values are discarded when master control is returned. Transfer the values as needed into your configuration.

If you have changed configuration values with the axis control panel during operation, they have no effect on the operation of the axis control panel.

Operating mode

The following table shows the operating modes of the axis control panel:

Operating mode	Description
Homing	This function corresponds to active homing. The parameters for homing (Page 69) must be configured. Homing is not possible with an absolute encoder. The technology object is not referenced when this mode is used with an absolute encoder.
Set home position	This function corresponds to direct homing (absolute). With the "Start" button, you set the actual position to the value specified in "Position" and the "Homed" status is set.
Jog	Motion commands occur by means of jogging. With the "Forward" or "Backward" button you start motion in the positive or negative direction. The motion runs for as long as you hold down the left mouse button.
Velocity specification/speed setpoint	The axis is moved at the specified velocity or speed until you stop the movement. The motion commands are performed according to the setpoints assigned under "Controller".
Positioning relative	The positioning is executed as a controlled, relative traversing motion according to the defaults assigned under "Controller".
Positioning absolute	The positioning is executed as a controlled, absolute traversing motion according to the defaults assigned under "Controller". If you have enabled the "Modulo" setting of the technology object, the buttons "Forward" and "Backward" are shown in the "Controller" area. The axis is positioned within the modulo range. Position settings outside the modular range are recalculated to the modulo range. If you have not enabled the "Modulo" setting of the technology object, only the "Start" button is shown in the "Controller" area. You can directly approach the entered position.

9.3.2 Using the axis control panel

Requirement

- The CPU must be in RUN mode.
- The project has been created and downloaded to the CPU.
- The technology object is disabled by your user program (MC_Power.Enable = FALSE).
- The axis control panel for the technology object is not used by another installation of the TIA Portal (Team Engineering as of CPU V1.5).

Procedure

Proceed as follows to enable control the axis using the axis control panel:

1. Click "Activate" in the "Master control" area to assume master control over the technology object and to set up an online connection to the CPU.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and confirm with "OK".
3. In the "Axis" area, click the "Enable" button to enable the technology object.
4. In the drop-down list in the "Operation mode" area, select the desired function of the axis control panel.
5. In the "Control" area, specify the parameter values for your job.
6. Click the "Start", "Forward" or "Backward" button to start the job.
7. Click the "Stop" button to stop the job.
8. Repeat steps 3 through 6 for additional jobs.
9. In the "Axis" area, click the "Disable" button to disable the technology object.
10. In the "Master control" area, click the "Deactivate" button to return master control to your user program.

9.4 Optimization

9.4.1 Function and structure of the optimization

Description

The "Optimization" function supports you in determining the optimal precontrol and gain (Kv factor) for the closed loop position control of the axis. The axis velocity profile is recorded by means of the Trace function for this purpose for the duration of a configurable positioning movement. You can then evaluate the recording, and adjust the precontrol and gain accordingly.

The "Optimization" function for the positioning axis and synchronous axis technology objects can be found in the project tree under "Technology object > Commissioning".

The "Tuning" dialog is divided into the following areas:

- Master control
- Axis
- Measurement configuration
- Optimize position controller
- Run measurement
- Trace

The following table lists the elements of optimization:

Area	Element	Description
Master control		In the "Master control" area, you take over master control of the technology object, or return it to your user program.
	"Activate" button	With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. • To take over master control, the technology object must be disabled in the user program. • Any synchronized following axis is moved as well when moving a leading axis with the axis control panel. • If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program. • When you click the "Activate" button, a warning message is displayed. You can adapt the sign-of-life monitoring here (100 to 60000 ms). If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the message "Error during commissioning" is entered in the message display log. Sign-of-life failure between controller and TIA Portal" is displayed. To eliminate this error, adapt the sign-of-life monitoring in the warning. • Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with error ("ErrorID" = 16#8012: axis control panel active). • When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not take effect until master control has been returned. For this reason, make any necessary changes before master control is taken over. • If master control has been taken over for the technology object, the axis control panel is blocked for access by another installation of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object

Area	Element	Description
Measurement configuration		In the "Measurement configuration" area, you configure the settings for a test step.
	Distance	Travel distance for a test step
	Measurement duration	Time for a test step
	"Adapt dynamic values" check box	With the "Adapt dynamic values" check box, you enable adaptation of the acceleration and the maximum velocity.
	Acceleration	Presetting of the acceleration for a test step
	Maximum velocity	Presetting of the maximum velocity for a test step
Optimize position controller		In the "Optimize position controller" area, you make the settings for optimization of the controller characteristics. You open a list of values using the symbol next to the field. The list of values contains the following values of the respective parameter: • Online actual value • Online start value • Project start value Enter the new value in the text field for the actual value. The new value is applied by clicking the "Forward" or "Backward" button in the "Run measurement" area.
	Precontrol	Current percentage velocity precontrol of the position controller
	Speed control loop substitute time	Current speed control loop substitute time With velocity precontrol, a simplified speed control loop model can be generated using the speed control loop substitute time. This prevents overmodulation by the position controller of the manipulated variable for velocity during the acceleration and deceleration phases. To accomplish this, the position setpoint of the position controller is delayed by the amount of the speed control loop substitute time in relation to the velocity precontrol.
	Gain	Current gain of the position controller (Kv)
Run measurement		In the "Run measurement" area, you perform the test steps.
	"Forward" button	With the "Forward" button, you start a test step for optimization in the positive direction.
	"Backward" button	With the "Backward" button, you start a test step for optimization in the negative direction.
	"Stop" button	You stop a test step with the "Stop" button.
Trace		The Trace function is displayed in the lower area of the "Tuning" dialog. With each test step, a Trace recording of the required parameters is automatically started and displayed after completion of the test step. After master control has been returned, the Trace recording is deleted. You can find a full description of the trace function in the section on using the trace and logic analyzer function.

Note

No transfer of the parameters

The configured parameter values are discarded after master control is returned.

Transfer the values as needed into your configuration. You can apply the values for the gain, precontrol and speed control loop substitute time in your configuration using the "Project start value" value.

See also

Closed-loop control (Page 94)

9.4.2 Optimize position controller

Requirements

- The CPU must be in the RUN mode.
- The project has been created and downloaded to the CPU.
- The technology object is disabled by your user program (MC_Power.Enable = FALSE).
- The axis control panel for the technology object is not used by another installation of the TIA Portal (Team Engineering as of CPU V1.5).

Optimizing position control gain (Kv)

Proceed as follows to optimize the gain (Kv):

1. In the "Master control" area, click the "Activate" button to activate master control for the technology object, and to establish an online connection to the CPU.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and confirm with "OK".
3. In the "Axis" area, click the "Enable" button to enable the technology object.
4. If necessary, configure values for the distance, duration, and dynamics of a test step in the "Measurement configuration" area.
5. If necessary, configure values for the precontrol and speed control loop substitute time of a test step in the "Configure position controller" area.
6. Enter a start value for the gain. Start with a low value.
7. Click the "Forward" or "Start" button to start a test step for the optimization.
   For the specified duration, a setpoint is output according to the specified distance.
   The axis moves by the specified distance. A trace recording of the motion (setpoint and actual values) is created automatically.

   You can find a full description of the trace function in the section on using the trace and logic analyzer function.

   Note

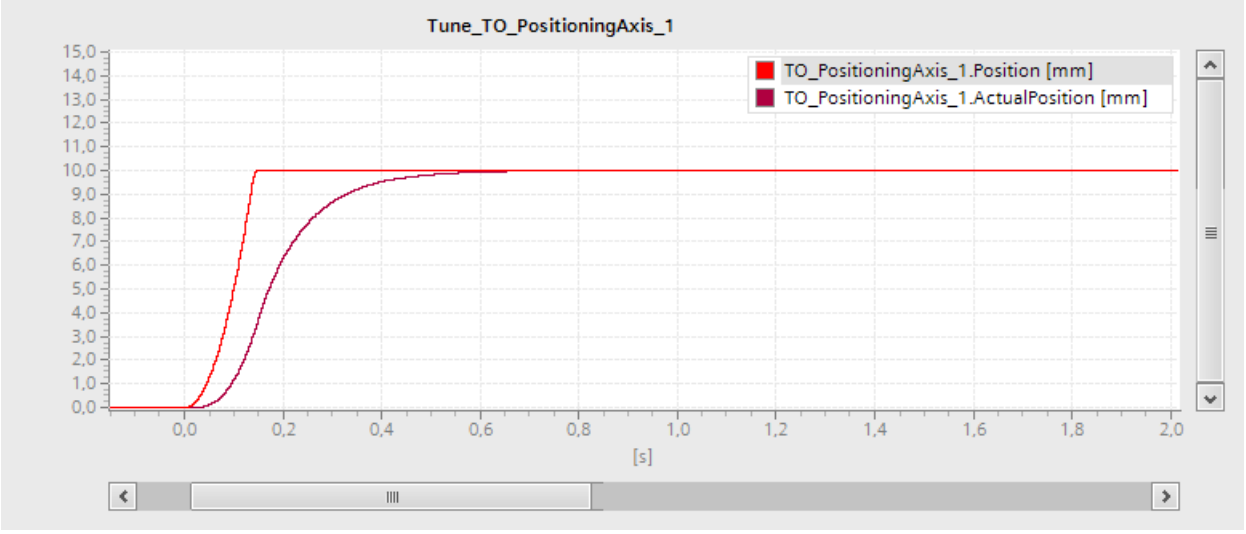
   Adapt following error limits

   If error messages from following error monitoring are repeatedly displayed during optimization, temporarily adapt the following error limits.
8. Evaluate the curve of the trace recording. Adapt the gain incrementally. Click the "Forward" or "Backward" button after each value you enter. This applies the value and start a new movement and trace recording each time.

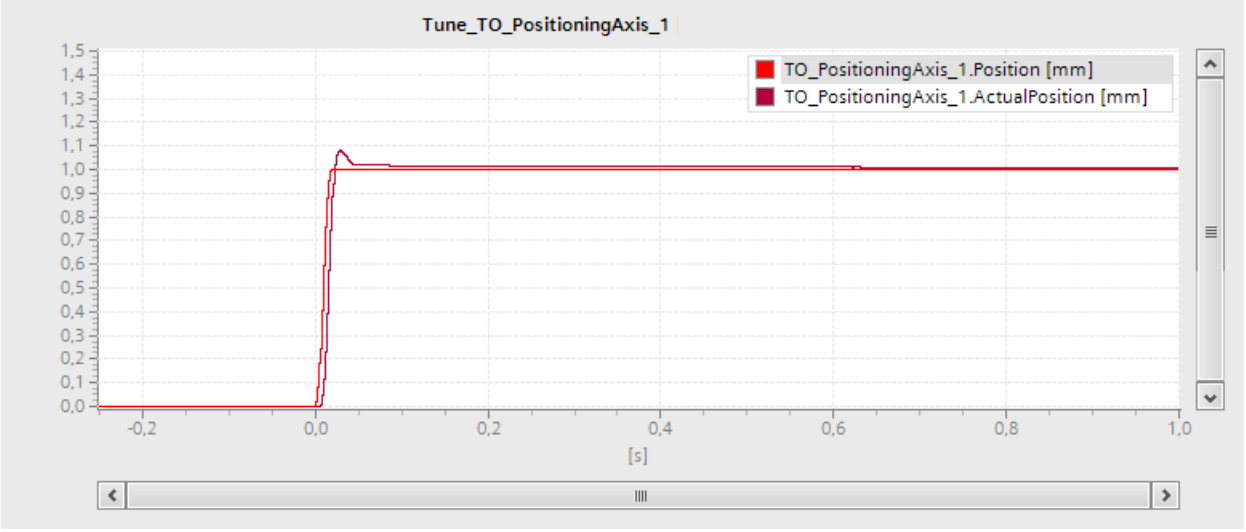
When adjusting the gain, pay attention to the following properties of the curve:

- The curve shows a brief compensation time.
- The curve does not show any motion reversal of the actual position.
- When approaching the position setpoint, no overshoot occurs.
- The curve shows a stable overall behavior (oscillation-free curve).

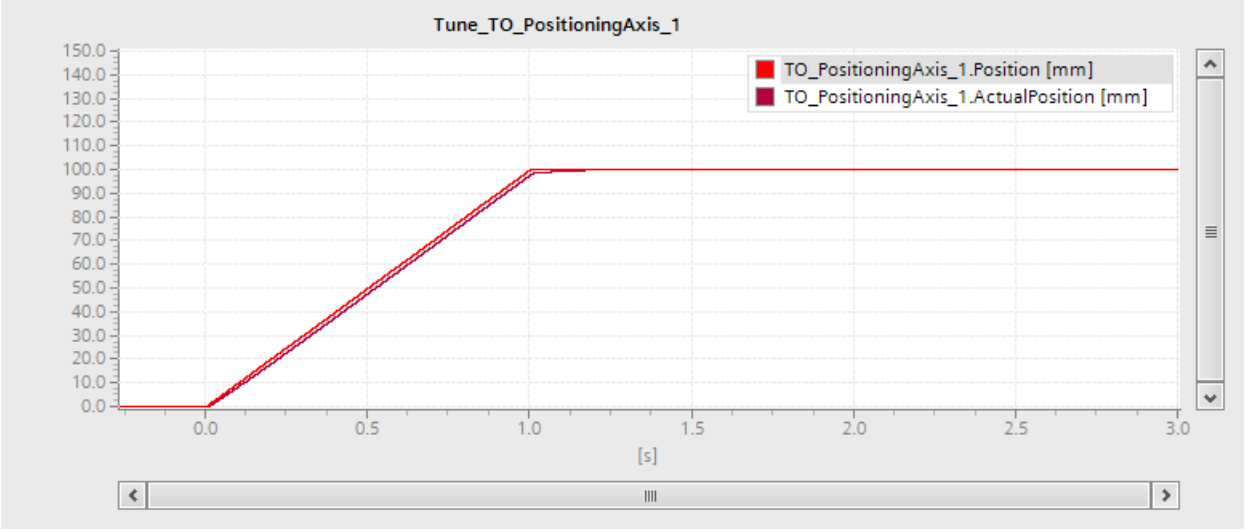
The following trace recording shows a curve with a long settling time:



The following trace recording shows a curve with overshoot when approaching the setpoint:



The following trace recording shows a curve in which the gain is optimal and the overall response is steady:



Transferring the parameter values of the position controller to the project

To transfer the determined parameter values of the position controller to your project, follow these steps:

1. Click the icon next to the field of the respective parameter.

   A list of values is displayed.
2. Enter the measured value in the "Project start value" field of the value list.
3. In the "Axis" area, click the "Disable" button to disable the technology object.
4. In the "Master control" area, click the "Deactivate" button to return master control to your user program.
5. Load your project into the CPU.

10 Diagnostics

10.1 Introduction

The Diagnostics chapter is limited to describing the diagnostic concept for Motion Control, and describing the Diagnostics view of the individual technology objects in the TIA Portal.

For more information about system diagnostics with the S7-1500 CPU, refer to the "Diagnostics" (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

10.2 Diagnostic concept

The diagnostic concept encompasses alarms and associated messages, as well as error messages in the Motion Control instructions. The TIA Portal also supports you with consistency checks during configuration of the technology objects, and during the creation of your user program.

All alarms in runtime (from the CPU, technology, hardware etc.) are displayed in the Inspector window of the TIA Portal. Diagnostic information that relates to technology objects (technology alarms, status information) are additionally displayed in the Diagnostics window of the respective technology object.

During motion control, if an error occurs at a technology object (e.g. approaching a hardware limit switch), then a technology alarm (Page 342) is triggered, and a corresponding message is displayed in the TIA Portal as well as on HMI devices.

In your user program, technology alarms are generally signaled via error bits in the technology data block. The number of the technology alarm with the highest priority is also displayed. In order to simplify error evaluation, the "Error" and "ErrorID" parameters of the Motion Control instructions also indicate that a technology alarm is pending.

Program errors (Page 346) can occur during parameter assignment or during the processing sequence of the Motion Control instructions (e.g. invalid parameter specification when calling the instruction, initiation of a job without enable via MC_Power). Motion Control instruction errors are indicated at the call of instructions using the "Error" and "ErrorID" parameters.

10.3 Technology alarms

Description

If an error occurs at a technology object (e.g. approaching a hardware limit switch), a technology alarm is triggered and indicated. The impact of a technology alarm on the technology object is specified by the alarm reaction.

Alarm classes

Technology alarms are divided into three classes:

- **Acknowledgeable warning**

  The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.

- **Alarm requiring acknowledgment**

  Motion jobs are aborted in accordance with the alarm reaction. You must acknowledge the alarms in order to continue execution of new jobs after eliminating the cause of the error.

- **Fatal error**

  Motion jobs are aborted in accordance with the alarm reaction.

  To be able to use the technology object again after eliminating the cause of the error, you must restart the technology object (Page 324).

Display of technology alarms

A technology alarm is displayed in the following locations:

- **TIA Portal**
  - **"Technology object > Diagnostics > Status and error bits"**

    Display of pending technology alarms for each technology object.
  - **"Technology object > Commissioning > Axis control panel"**

    Display of the last pending technology alarm for each technology object.
  - **"Inspector window > Diagnostics > Message display"**

    Select the "Receive messages" check box under "Online & Diagnostics > Online Access" in order to display technology alarms via the message display.

    With an online connection to the CPU, the pending technology alarms for all technology objects are displayed. Additionally, the archive view is available to you.

    The message display can also be activated and displayed on a connected HMI.
  - **"CPU > Online & diagnostics"**

    Display of the technology alarms that have been entered in the diagnostic buffer.
- **User program**
  - **Tags <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction**

    Indication of the number and the reaction of the technology alarm with the highest priority.
  - **Tag <TO>.StatusWord**

    A pending technology alarm is indicated with bit 1 ("Error").
  - **Tag <TO>.ErrorWord**

    Indication of alarms and fatal errors.
  - **Tag <TO>.WarningWord**

    Indication of warnings.
  - **Parameter "Error" and "ErrorID"**

    In a Motion Control instruction, the parameters "Error" = TRUE and "ErrorID" = 16#8001 indicate that a technology alarm is pending.
- **Display of the CPU**

  In order to show technology alarms on the CPU display, make the following setting when loading to the CPU:
  In the "Load preview" dialog, select the action "Consistent download" for the "Text libraries" entry.

Alarm reaction

A technology alarm always contains an alarm reaction, which describes the impact on the technology object. The alarm reaction is specified by the system.

The following table shows possible alarm reactions:

Alarm reaction	Description
Axes (speed axis, positioning axis, synchronous axis)	
No reaction (warnings only) <TO>.ErrorDetail.Reaction = 0	The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.
Stop with current dynamic values <TO>.ErrorDetail.Reaction = 1	Active motion commands are aborted. The axis is braked with the dynamic values that present in the Motion Control instruction and brought to a standstill.
Stop with maximum dynamic values <TO>.ErrorDetail.Reaction = 2	Active motion commands are aborted. The axis is braked with the dynamic values configured under "Technology object > Extended parameters > Dynamic limits", and brought to a standstill. The configured maximum jerk is hereby taken into account.
Stop with emergency stop ramp <TO>.ErrorDetail.Reaction = 3	Active motion commands are aborted. The axis is braked with the emergency stop deceleration configured under "Technology object > Extended parameters > Emergency stop ramp", without any jerk limit, and brought to a standstill.
Remove enable <TO>.ErrorDetail.Reaction = 4	Active motion commands are aborted. The setpoint zero is output and the enable is removed. The axis is braked to a standstill according to the configuration in the drive.
Track setpoints <TO>.ErrorDetail.Reaction = 5	Active motion commands are aborted. The setpoint zero is output and the enable is removed. The actual values supplied by the drive are automatically tracked as setpoints.
Other technology objects (output cam, cam track, measuring input, cam, external encoder)	
No reaction (warnings only) <TO>.ErrorDetail.Reaction = 0	The processing of Motion Control job is continued. The current motion of the axis can be influenced, e.g. by limiting the current dynamic values to the configured limit values.
Terminate processing of the technology object: • Output cam <TO>.ErrorDetail.Reaction = 6 • Cam track <TO>.ErrorDetail.Reaction = 7 • Measuring input <TO>.ErrorDetail.Reaction = 8 • Cam <TO>.ErrorDetail.Reaction = 9 • External encoder <TO>.ErrorDetail.Reaction = 10	Processing of the technology object is terminated. All running Motion Control jobs are aborted.

Acknowledging technology alarms

You can acknowledge technology alarms as follows:

- **TIA Portal**
  - **"Technology object > Commissioning > Axis control panel"**

    Click "Confirm" to acknowledge all alarms and warnings pending for the selected technology object.
  - **"Inspector window > Diagnostics > Message display"**

    You can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **HMI**

  At an HMI with enabled message display, you can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **User program**

  Acknowledge pending technology alarms for a technology object with the Motion Control instruction "MC_Reset".

Additional information

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

10.4 Errors in Motion Control instructions

Description

Errors in Motion Control instructions (e.g. invalid parameter value setting) are indicated by the "Error" and "ErrorID" output parameters.

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated for the Motion Control instruction:

- Illegal status of the technology object, which prevents the execution of the job.
- Invalid parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm reaction for a technology object error.

Error display

If there is a Motion Control instruction error, the "Error" parameter shows the value TRUE. The cause of the error is given in the "ErrorID" parameter.

Jobs to the technology object are rejected when "Error" = TRUE. Running jobs are not influenced by rejected jobs.

If "Error" = TRUE and "ErrorID" = 16#8001 is indicated during job execution, a technology alarm has occurred. In this case, evaluate the indication of the technology alarm.

If "Error" = TRUE is displayed during execution of a "MC_MoveJog" job, the axis is braked and brought to a standstill. In this case, the deceleration configured for the "MC_MoveJog" instruction takes effect.

Acknowledge error

Acknowledging errors in Motion Control instructions is not required.

Restart a job after resolving the error.

Additional information

You can find a list of the ErrorIDs in the Error detection (Page 559) appendix.

10.5 Speed-controlled axis technology object

10.5.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Simulation active	The axis is simulated in the CPU. Setpoints are not output to the drive.
Enabled	The technology object has been enabled. The axis can be moved with motion jobs. (<TO>.StatusWord.X0 (Enable))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel active	The axis control panel is active. The axis control panel has master control over the technology object. The axis cannot be controlled from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	Drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Restart required	Data relevant for the restart has been changed. The changes will not be applied until the technology object is restarted. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no job running)	No motion job is running for the technology object. (<TO>.StatusWord.X6 (Done))
Jog	The axis is being moved with a job for jog mode of Motion Control instruction "MC_MoveJog" or from the axis control panel. (<TO>.StatusWord.X9 (JogCommand))
Speed setpoint	The axis is traversed with a job with speed setpoint of the Motion Control instruction "MC_MoveVelocity" or using the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Constant speed	The axis is moved with constant speed or is stationary. (<TO>.StatusWord.X12 (ConstantVelocity))
Accelerating	Axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))
Torque limit active	The configured threshold for the force/torque affects the axis. (<TO>.StatusWord.X27 (InLimitation))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration	One or several configuration parameters are adjusted internally at a certain time. (<TO>.WarningWord.X1 (ConfigWarning))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values are restricted to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Drive	Error in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Data exchange	Communication with a connected device is faulty. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met (e.g. technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values are restricted to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

See also

StatusWord tag (speed axis) (Page 450)

ErrorWord tag (speed axis) (Page 452)

WarningWord tag (speed axis) (Page 454)

10.5.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Speed setpoint	Speed setpoint of the axis (<TO>.Velocity)
Speed override	Speed setpoint correction as percentage The speed setpoint specified in motion control instructions or set by the axis control panel are superimposed with an override signal and corrected as a percentage. Valid speed correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Speed	Configured maximum speed (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)

10.5.3 PROFIdrive telegram

Description

The "Technology object > Diagnostics > PROFIdrive telegram" diagnostics function is used in the TIA Portal to monitor the PROFIdrive telegram that the drive returns to the controller. The Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive telegram from the drive to the controller:

- Status words "ZSW1" and "ZSW2"
- The speed setpoint (NSET) that was output to the drive
- The actual speed that was signaled from the drive (NACT)

10.6 Positioning axis/synchronous axis technology object

10.6.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Simulation active	The axis is simulated in the CPU. Setpoints are not output to the drive. (<TO>.StatusWord.X25 (AxisSimulation))
Enabled	The technology object has been enabled. The axis can be moved with motion jobs. (<TO>.StatusWord.X0 (Enable))
Position-controlled mode	The axis is in position-controlled mode. (Inversion of <TO>.StatusWord.X28 (NonPositionControlled))
Homed	The technology object is homed. The relationship between the position in the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel active	The axis control panel is active. The axis control panel has master control over the technology object. The axis cannot be controlled from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	Drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Encoder values valid	The actual encoder values are valid. (<TO>.StatusSensor[n].State)
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Status limit switch

The following table shows the possibilities for enabling the software and hardware limit switches:

Status	Description
Negative SW limit switch approached.	The negative software limit switch was reached. (<TO>.StatusWord.X15 (SWLimitMinActive))
Positive SW limit switch approached.	The positive software limit switch was reached. (<TO>.StatusWord.X16 (SWLimitMaxActive))
Negative HW limit switch approached.	The negative hardware limit switch has been approached or overtraveled. (<TO>.StatusWord.X17 (HWLimitMinActive))
Positive HW limit switch approached.	The positive hardware limit switch has been approached or overtraveled. (<TO>.StatusWord.X18 (HWLimitMaxActive))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no job running)	No job active at technology object. (<TO>.StatusWord.X6 (Done))
Homing job	The technology object executes a homing job of the Motion Control instruction "MC_Home" or from the axis control panel. (<TO>.StatusWord.X11 (HomingCommand))
Jog	The axis is being moved with a command for jog mode of Motion Control instruction "MC_MoveJog". (<TO>.StatusWord.X9 (JogCommand))
Velocity specification	The axis is traversed with a job with velocity specification of the Motion Control instruction "MC_MoveVelocity" or from the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Positioning job	The axis is traversed with a positioning job of Motion Control instruction "MC_MoveAbsolute" or "MC_MoveRelative" or from the axis control panel. (<TO>.StatusWord.X8 (PositioningCommand))
Constant velocity	The axis is moved with constant velocity or is stationary. (<TO>.StatusWord.X12 (ConstantVelocity))
Standstill	The axis is in standstill. (<TO>.StatusWord.X7 (StandStill))
Accelerating	Axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))
Torque limit active	The configured threshold for the force/torque affects the axis. (<TO>.StatusWord.X27 (InLimitation))
Synchronization	Synchronous axis only The axis is synchronized to the leading value of a leading axis. (<TO>.StatusWord.X21 (Synchronizing))
Synchronous operation	Synchronous axis only The axis is synchronized and moves synchronously to the leading axis. (<TO>.StatusWord.X22 (Synchronous))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration	One or several configuration parameters are adjusted internally at a certain time. (<TO>.WarningWord.X1 (ConfigWarning))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values are restricted to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))
Synchronization	Synchronous axis only Error during synchronous operation. The leading axis specified for the corresponding Motion Control instruction was not configured as a possible leading axis. (<TO>.WarningWord.X14 (SynchronousError))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Drive	Error in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Encoder	Error in encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Communication with a connected device is faulty. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met (e.g. technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Homing	Error during homing process. (<TO>.ErrorWord.X10 HomingFault))
Positioning	The positioning axis was not positioned correctly at the end of a positioning motion. (<TO>.ErrorWord.X12 (PositioningFault))
Dynamic limitation	Dynamic values are restricted to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))
Following error	The maximum permitted following error has been exceeded. (<TO>.ErrorWord.X11 (FollowingErrorFault))
SW limit switch	A software limit switch has been reached. (<TO>.ErrorWord.X8 (SwLimit))
HW limit switch	A hardware limit switch has been reached or overtraveled. (<TO>.ErrorWord.X9 (HWLimit))
Synchronization	Synchronous axis only Error during synchronous operation. The leading axis specified for the corresponding Motion Control instruction was not configured as a possible leading axis. (<TO>.ErrorWord.X14 (SynchronousError))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

See also

StatusWord tag (positioning axis/synchronous axis) (Page 485)

ErrorWord tag (positioning axis/synchronous axis) (Page 488)

WarningWord tag (positioning axis/synchronous axis) (Page 491)

Additional displays for the technology CPU (Page 360)

10.6.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Operative encoder	Operative encoder of the axis
Target position	Current target position of an active positioning job The target position value is only valid during execution of a positioning job. (<TO>.StatusPositioning.TargetPosition)
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)
Velocity override	Percentage correction of the velocity specification The velocity setpoint specified in Motion Control instructions or set by the axis control panel is superimposed with an override signal and corrected as a percentage. Valid velocity correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Velocity	Configured maximum velocity (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)

10.6.3 PROFIdrive telegram

Description

The "Technology object > Diagnostics > PROFIdrive telegram" diagnostics function is used in the TIA Portal to monitor the PROFIdrive telegrams returned by the drive and encoder. The display of the Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive telegram from the drive to the controller:

- Status words "ZSW1" and "ZSW2"
- The speed setpoint (NSET) that was output to the drive
- The actual speed that was signaled from the drive (NACT)

"Encoder" area

This area displays the following parameters contained in the PROFIdrive telegram from the encoder to the controller:

- Status word "Gx_ZSW"
- The actual position value "Gx_XIST1" (cyclic actual encoder value)
- The actual position value "Gx_XIST2" (absolute encoder value)

See also

Additional displays for the technology CPU (Page 360)

10.6.4 Additional displays for the technology CPU

The diagnostic functions contain expanded/additional displays for the S7-1500T technology CPU.

Status and error bits

The following table shows the expanded/additional displays of the status and error bits (Page 352):

Axis status	
Encoder values valid	The actual encoder values (encoder 1, encoder 2, encoder 3 or encoder 4) are valid. (<TO>.StatusSensor[n].State)
Active encoder	The encoder in effect operationally is encoder 1, encoder 2, encoder 3 or encoder 4. (<TO>.OperativeSensor)

Motion status

The following table shows the expanded/additional displays for the status of the motion (Page 358):

Current values	Description
Operative encoder	Operative encoder of the axis

PROFIdrive telegram

The "Encoder 1" to "Encoder 4" areas display the following parameters from the PROFIdrive telegram (Page 359) of the corresponding encoder to the controller:

- Status word "Gx_ZSW"
- The actual position value "Gx_XIST1" (cyclic actual encoder value)
- The actual position value "Gx_XIST2" (absolute encoder value)

10.7 Technology object external encoder

10.7.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Encoder status

The following table shows the possible external encoder status values:

Status	Description
Enabled	The technology object has been enabled. (<TO>.StatusWord.X0 (Enable))
Homed	The technology object is homed. The relationship between the position in the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Encoder values valid	The actual encoder values are valid. (<TO>.StatusSensor[n].State)
Online start value changed	Data relevant for the restart has been changed. The changes will not be applied until the technology object is restarted. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible states of the job execution:

Status	Description
Done (no job running)	No Motion Control job is running for the technology object. (Enable by "MC_Power" job excepted) (<TO>.StatusWord.X6 (Done))
Homing job	The technology object executes a homing job of the Motion Control instruction "MC_Home". (<TO>.StatusWord.X11 (HomingCommand))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 UserFault))
Encoder	Error in encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Missing or faulty communication. (<TO>.ErrorWord.X7 (CommunicationFault))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

See also

StatusWord tag (external encoder) (Page 502)

10.7.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the actual encoder values. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)

10.7.3 PROFIdrive frame

Description

The "Technology object > Diagnostics > PROFIdrive interface" diagnostic function is used in the TIA Portal to monitor the PROFIdrive frame of the encoder. The display of the diagnostics function is available in the online mode TO.

"Encoder" area

This area displays the following parameters contained in the PROFIdrive frame that the encoder returns to the controller:

- Status word "G1_ZSW"
- The actual position value "G1_XIST1" (cyclic actual encoder value)
- The actual position value "G1_XIST2" (absolute value of the encoder)

10.8 Technology object measuring input

10.8.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Measuring input status

The following table shows the possible states of the measuring input:

Status	Description
Active	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Waiting for measuring event	The measuring input is waiting for a measuring event. The technology data block tag "<TO>.Status" has the value "1" ("WAITING_FOR_TRIGGER").
Measured value present	The measuring input has acquired one or more measured values. The technology data block tag "<TO>.Status" has the value "2" ("TRIGGER_OCCURRED").
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Measuring input ready	The measuring input is synchronized with the measuring module and can be used. (<TO>.StatusWord.X5 (CommunicationOK))
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the measuring input is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

10.9 Technology object output cam

10.9.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Output cam status

The following table shows the possible states of the output cam:

Status	Description
Active	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Switched	The output cam is switched. (<TO>.CamOutput)
Inverted output cam output	The output cam output is inverted. (<TO>.StatusWord.X4 (OutputInverted))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Output cam output ready	The cam is synchronized with the output module and available for use. (<TO>.StatusWord.X5 (CommunicationOk))
Restart required	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the output cam is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

10.10 Cam track technology object

10.10.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object.
The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables.
The associated technology object tag is given in parentheses.

Cam track status

The following table shows the possible states of the cam track:

Status	Description
Effective	The technology object is in operation. (<TO>.StatusWord.X0 (Control))
Switched	A cam of cam track is switched. (<TO>.TrackOutput)
Inverted output cam output	The output cam output is inverted. (<TO>.StatusWord.X4 (OutputInverted))
Error	An error occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. The tags of the technology data block are not updated with active restart. (<TO>.StatusWord.X2 (RestartActive))
Cam track output ready	The cam track is synchronized with the output module and available for use. (<TO>.StatusWord.X5 (CommunicationOk))
Online start value changed	Data relevant for the restart has been changed. The changes are applied only after a restart of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))
Cam data changed	The data of individual output cams has been changed but not yet taken effect with Motion Control instruction "MC_CamTrack". (<TO>.StatusWord.X6 (CamDataChanged))

Error

The following table shows the possible errors:

Error	Description
System	A system-internal error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigFault))
User program	Error in user program at a Motion Control instruction or its use. (<TO>.ErrorWord.X2 (UserFault))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions are not met (e.g. axis assigned to the cam track is not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

See also

StatusWord tag (cam track) (Page 526)

WarningWord tag (cam track) (Page 529)

10.10.2 Cam track status

Description

You use the "Technology object > Diagnostics > Cam track status" diagnostics function in the TIA Portal to monitor the status of the cam track. The Diagnostics function is available in online operation.

"Validity and masking of the output cams" area

The individual cams of a cam track are shown in this area along with the status for the following properties:

Status	Description
Valid	Validity of the individual cams of the cam track (<TO>.Parameter.Cam[1 … 32].Existent)
Masked	Bit masking of the individual cams of the cam track (<TO>.Parameter.CamMasking)
Effective	Switched on output cam (bit-masked) (<TO>.SingleCamState)

"Positions" area

The following status values are displayed in this area:

Status	Description
Current position within cam track	Position during cam track processing within a cam track cycle The distance to the current reference position of the current cam track (<TO>.MatchPosition) is displayed. (<TO>.TrackPosition)
Current cam track start	Reference position of the current cam track During cyclic processing of the cam track, the continued reference position of the current cam track is displayed. The unique detection and output of the position is only possible when the assigned technology object is in motion. (<TO>.MatchPosition)

Instructions 11

11.1 S7-1500 Motion Control V3

11.1.1 MC_Power V3

11.1.1.1 MC_Power: Enable, disable technology object V3

Description

With the Motion Control instruction "MC_Power", a technology object is enabled or disabled.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis
- External encoder

Requirements

- The technology object has been configured correctly.

Override response

- An "MC_Power" job cannot be aborted by any other Motion Control job.
- An "MC_Power" job with parameter "Enable" = TRUE enables a technology object but does not thereby abort any other Motion Control instructions.
- Disabling the technology object (parameter "Enable" = FALSE) aborts all Motion Control jobs on the corresponding technology object in accordance with the selected "StopMode". This process cannot be canceled by the user.

Parameters

The following table shows the parameters of the "MC_Power" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The technology object is enabled.
				FALSE	The technology object is disabled. All current jobs at the technology object are aborted in accordance with the configured "StopMode".
StartMode	INPUT	DINT	1	0	Enable positioning axis/synchronous axis not position-controlled
				1	Enable positioning axis/synchronous axis position-controlled
				The parameter acts initially when the positioning axis is enabled (Enable changes from FALSE to TRUE) and when the axis is enabled after successful acknowledgment of an alarm that caused the axis to be disabled. This parameter is ignored when a speed axis or external encoder is used.	
StopMode	INPUT	INT	0	Not applicable to the technology object external encoder If you disable a technology object with a negative edge at parameter "Enable", the axis decelerates in accordance with the selected "StopMode".	
				0	Emergency stop When the technology object is disabled, the axis brakes to a standstill without jerk limit, using the emergency stop deceleration configured in "Technology object > Configuration > Extended parameters > Emergency stop ramp". The enable is then canceled. (<TO>.DynamicDefaults. EmergencyDeceleration)
				1	Immediate stop When a technology object is disabled, the setpoint zero is output, and the enable is canceled. The axis is braked to a standstill according to the configuration in the drive.
				2	Stop with maximum dynamic values When the technology object is disabled, the axis is braked to a standstill using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits". The configured maximum jerk is hereby taken into account. The enable is then canceled. (<TO>.DynamicLimits.MaxDeceleration; <TO>.DynamicLimits.MaxJerk)

Parameters	Declaration	Data type	Default value	Description	
Status	OUTPUT	BOOL	FALSE	Technology object enable status	
				FALSE	Disabled - A positioning axis, synchronous axis or speed axis does not accept any Motion Control jobs. - Speed control and position control are not active. - The actual values of the technology object are not checked for validity.
				TRUE	Enabled - An enabled positioning axis, synchronous axis or speed axis accepts Motion Control jobs. - Speed control and position control are active. - The actual values of the technology object are valid.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction MC_Power. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Enabling technology objects

To enable a technology object, set the "Enable" parameter to TRUE.

When the Status parameter shows the value TRUE , the technology object is enabled.

If an axis is in motion when the technology object is enabled (actual velocity is present), the axis brakes to the setpoint zero, using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits" (<TO>.DynamicLimits.MaxDeceleration). This braking ramp can be overridden by Motion Control jobs.

Note

Automatic enable after acknowledgment of a technology alarm

If the technology object is disabled due to a technology alarm, it will automatically be enabled again after the cause has been eliminated and the alarm has been acknowledged. This requires the "Enable" parameter to have retained the value TRUE during this process.

Disabling technology objects

To disable a technology object, set the "Enable" parameter to FALSE.

If an axis is in motion, it is braked to a standstill according to the selected "StopMode".

When the "Busy" and "Status" parameters show the value FALSE , the disabling of the technology object is complete.

Drive connection by means of PROFIdrive

When a drive is connected using PROFIdrive, the setpoint, enable and drive status are transmitted via the PROFIdrive telegram.

- **Enable technology object and activate drive**

  With parameter "Enable" = TRUE, the technology object is enabled. The drive is enabled according to the PROFIdrive standard.

  When the tag <TO>.StatusDrive.InOperation shows the value TRUE , the drive is ready to execute setpoints. The "Status" parameter is set to the value TRUE .

- **Disable technology object and deactivate drive**

  With parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". The drive is disabled according to the PROFIdrive standard.

Analog drive connection

The setpoint is output via an analog output. Optionally, you can configure an enabling signal via digital output (<TO>.Actor.Interface.EnableDriveOutput), and a readiness signal via digital input (<TO>.Actor.Interface.DriveReadyInput).

- **Enable technology object and activate drive**

  With parameter "Enable" = TRUE, the enable output ("Enable drive output") is set.

  When the drive returns the readiness signal via the ready input ("Drive ready input"), the "Status" parameter and the technology object's <TO>.StatusDrive.InOperation tag are set to TRUE, and the setpoint is switched to the analog output.

- **Disable technology object and deactivate drive**

  With parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". When the setpoint zero is reached, the enable output is set to FALSE.

Additional information

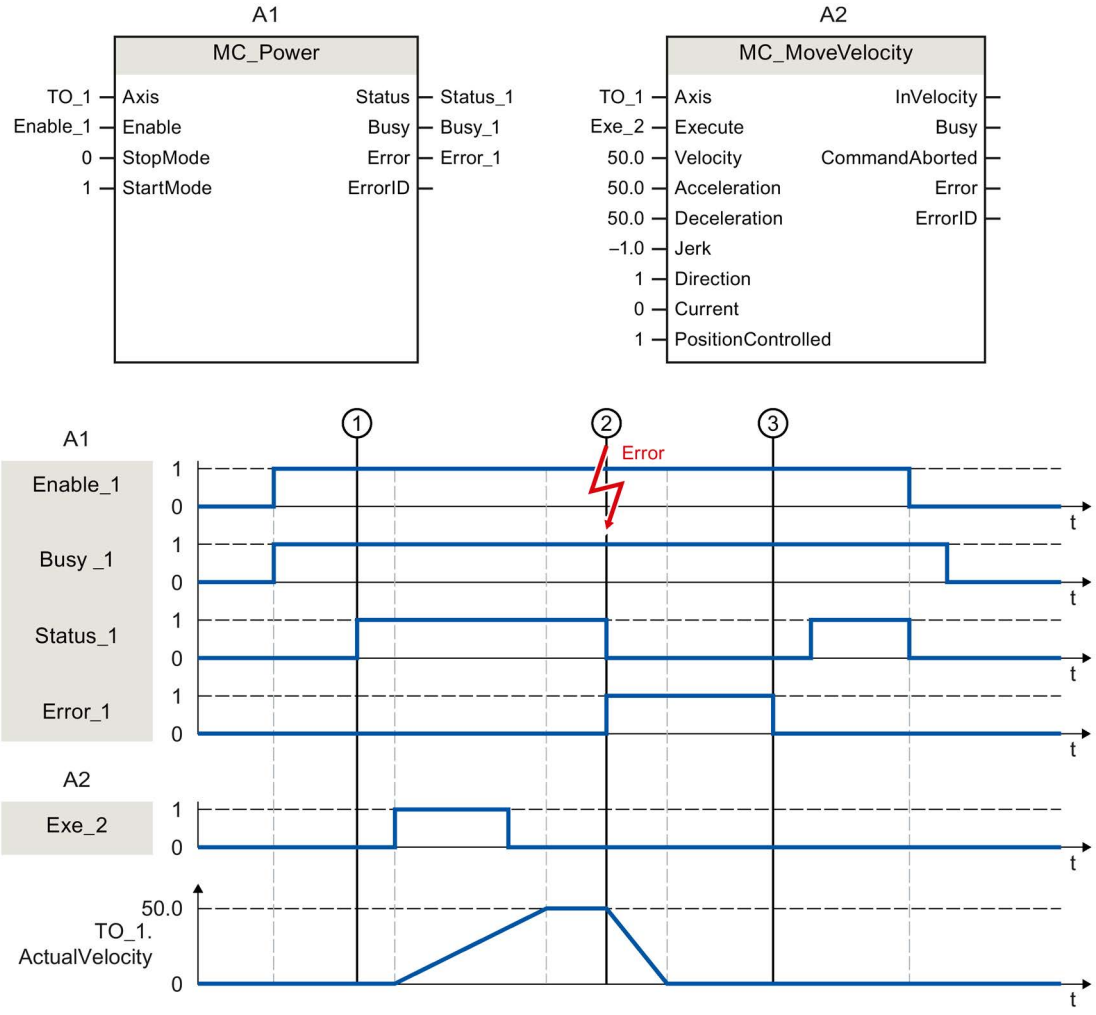
Additional information on enabling and disabling technology objects and drives can be found in the appendix, MC_Power Function Charts (Page 564).

See also

Error ID for Motion Control instructions (Page 559)

11.1.1.2 MC_Power: Function chart V3

Function chart: Enabling a technology object and example of alarm response



A technology object is enabled with "Enable_1= TRUE". The successful enable can be read from "Status_1" at time ①. The axis will then move with an "MC_MoveVelocity" job (A2). The velocity profile of the axis can be read from "Velocity Axis_1".

At time ② an error occurs in the technology object, which results in the disabling of the technology object (alarm response: remove enable). The axis is braked to a standstill according to the configuration in the drive. When the technology object is disabled, "Status_1" is reset. Since the axis was not disabled using "Enable_1" = FALSE, the selected "StopMode" does not apply. The cause of the error is corrected and the alarm is acknowledged at time ③.

Since "Enable_1" is still set, the technology object is enabled again. The successful enable can be read from "Status_1". Finally, the technology object is disabled with "Enable_1" = FALSE.

11.1.2 MC_Reset V3

11.1.2.1 MC_Reset: Acknowledge alarms, restart technology object V3

Description

With the Motion Control instruction "MC_Reset", you acknowledge all technology alarms that can be acknowledged in the user program. Acknowledgment also resets the "Error" and "Warning" bits in the technology data block.

With the Motion Control instruction "MC_Reset" with "Restart" = TRUE, you start reinitialization (restart) of technology objects. Upon restart of the technology object, the new configuration data are applied in the technology data block.

Applies to

- All technology objects

Requirements

- Positioning/synchronous axis, speed axis and external encoder technology objects:

  For a restart, the technology object must be disabled.

  ("MC_Power.Status" = FALSE and "MC_Power.Busy" = FALSE)

Override response

- Parameter "Restart" = FALSE:

  The MC_Reset job does not abort any running Motion Control jobs.

- Parameter "Restart" = TRUE:

  Processing of the "MC_Reset" instruction with parameter "Restart" = TRUE cannot be aborted by any other Motion Control job.

Parameters

The following table shows the parameters of the "MC_Reset" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Object	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Restart	INPUT	BOOL	FALSE	TRUE	"Restart" Reinitialization of the technology object and acknowledgment of pending technology alarms. The technology object is reinitialized with the configured start values.
				FALSE	Acknowledgment of queued technology alarms.
Done	OUTPUT	BOOL	FALSE	TRUE	Error has been acknowledged. Restart has been executed.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Command-Aborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Acknowledging technology alarms

To acknowledge technology alarms, follow these steps:

1. Check the requirements indicated above.
2. Set parameter "Restart" = FALSE.
3. Start the acknowledgment of the error with a positive edge at parameter "Execute".

When the Done parameter shows the value TRUE, the error has been acknowledged.

Note

Acknowledging with "Restart" = FALSE

If only the technology alarms are to be acknowledged, set "Restart" = FALSE.
The technology object cannot be used during a restart.

Restarting a technology object

To restart a technology object, follow these steps:

1. Check the requirements indicated above.
2. Set parameter "Restart" = TRUE.
3. Perform the restart with a positive edge at parameter "Execute".

When the "Done" parameter shows the value TRUE, the restart of the technology object is complete.

Additional information regarding the restart can be found in the Restarting technology objects (Page 324) section.

See also

Error ID for Motion Control instructions (Page 559)

11.1.3 MC_Home V3

11.1.3.1 MC_Home: Home technology object, set home position V3

Description

With the Motion Control instruction "MC_Home", you create the relationship between the position in the technology object and the mechanical position. The actual position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

Homing is performed according to the mode selected with the "Mode" parameter and the configuration under "Technology object > Configuration > Extended parameters > Homing".

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and ≥ V2.0 is available in section Version overview (Page 161).

The preset values under "Technology object > Configuration > Extended parameters > Dynamic default values" are used for the dynamic values Acceleration, Deceleration and Jerk.

Applies to

- Synchronous axis
- Positioning axis
- External encoder

The following table shows which modes are possible with each of the technology objects:

Operating mode	Positioning axis/synchronous axis with incremental encoder	Positioning axis/synchronous axis with absolute encoder	External incremental encoder	External absolute encoder
Active homing ("Mode" = 3, 5)	X	-	-	-
Passive homing ("Mode" = 2, 8, 10)	X	-	X	-
Set actual position ("Mode" = 0)	X	X	X	X
Relative shift of the actual position ("Mode" = 1)	X	X	X	X
Absolute encoder adjustment ("Mode" = 6, 7)	-	X	-	X

Requirements

- The technology object has been configured correctly.
- "Mode" = 2, 3, 5, 8, 10
  The technology object must be enabled.
- "Mode" = 0, 1, 6, 7, 8
  The actual encoder values must be valid. (<TO>.StatusSensor[n].State = 2)

Override response

The override characteristics for "MC_Home" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the "MC_Home" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Position	INPUT	LREAL	0.0	The specified value is used according to the selected "Mode".	
Mode	INPUT	INT	0	Operating mode	
				0	Direct homing (absolute) The current position of the technology object is set to the value of parameter "Position".
				1	Direct homing (relative) The current position of the technology object is shifted by the value of parameter "Position".
				2	Passive homing (without reset) Functions like "Mode" 8, with the difference that the "homed" status is **not** reset when the function is enabled.
				3	Active homing The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After the completion of the movement, the axis is positioned at the value of the "Position" parameter.
				4	Reserved
				5	Active homing ("Position" parameter has no effect) The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After completion of the movement, the axis is positioned at the home position configured under "Technology object > Configuration > Extended parameters > Homing > Active homing". (<TO>.Homing.HomePosition)
				6	Absolute encoder adjustment (relative) The current position is shifted by the value of parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n]. AbsEncoderOffset)

Parameters	Declaration	Data type	Default value	Description	
				7	Absolute encoder adjustment (absolute) The current position is set to the value of parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				8	Passive homing When the homing mark is detected, the actual value is set to the value of the "Position" parameter.
				9	Abort passive homing An active job for passive homing is aborted.
				10	Passive homing ("Position" parameter has no effect) When the homing mark is detected, the actual value is set to the home position configured under "Technology object > Configuration > Extended parameters > Homing > Passive homing". (<TO>.Homing.HomePosition)
ReferenceMark-Position	OUTPUT	LREAL	0.0	Display of the position at which the technology object was homed (valid when "Done" = TRUE)	
Done	OUTPUT	BOOL	FALSE	TRUE	Job is completed.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Resetting the "Homed" status

The "Homed" status of a technology object is reset under the following conditions (<TO>.StatusWord.X5 (HomingDone)):

- **Technology objects with incremental actual values:**
  - Starting an "MC_Home" job with "Mode" = 3, 5, 8, 10

    (After successful completion of the homing operation, the "Homed" status is reset.)
  - Error in the encoder system, or encoder failure
  - Restart of the technology object
  - After POWER OFF -> POWER ON of the CPU
  - Memory reset
  - Modification of the encoder configuration
- **Technology objects with absolute actual values:**
  - Error in sensor system/encoder failure
  - Replacement of the CPU
  - Modification of the encoder configuration
  - Restoration of the CPU factory settings
  - Transfer of a different project into the controller

Homing a technology object with "Mode" = 1..8, 10

To home a technology object, follow these steps:

1. Check the requirements indicated above.
2. Specify the desired homing function in the "Mode" parameter.
3. Initialize the necessary parameters with values, and start the homing operation with a positive edge at the "Execute" parameter.

When the "Done" parameter shows the value TRUE, the "MC_Home" job has been completed according to the selected "Mode". The "Homed" status of the technology object is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Homed" (<TO>.StatusWord.X5 (HomingDone)).

Abort of a passive homing process with "Mode" = 9

With "Mode" = 9, the technology object is not homed. When an active "MC_Home" job for passive homing ("Mode" = 2, 8, 10) is overridden by another "MC_Home" job with "Mode" = 9, the running job is aborted with parameter "CommandAborted" = TRUE. The overriding job with "Mode" = 9 signals successful execution with parameter "Done" = TRUE.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

11.1.4 MC_Halt V3

11.1.4.1 MC_Halt: Stop axis V3

Description

With the Motion Control instruction "MC_Halt", you brake an axis until it comes to a standstill.

You define the dynamic behavior of the braking operation with parameters "Jerk" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.

Override response

The override characteristics for "MC_Halt" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the "MC_Halt" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
AbortAcceleration	INPUT	BOOL	FALSE	FALSE	The current acceleration at the start of the job is reduced using the configured jerk. Afterwards, the deceleration builds up
				TRUE	The acceleration is set to 0.0 at the start of the job, and the deceleration immediately builds up.
Done	OUTPUT	BOOL	FALSE	TRUE	Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Braking an axis with "MC_Halt"

Proceed as follows to decelerate an axis to a standstill:

1. Check the requirements indicated above.
2. Supply the parameters "Deceleration", "Jerk" and "AbortAcceleration" with the desired values.
3. Start the "MC_Halt" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error". The standstill of the axis is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Standstill" (<TO>.StatusWord.X7 (Standstill)).

Braking an axis with active force/torque limit

With active force/torque limiting the permitted torque may not be sufficient to move the calculated braking ramp. The "MC_Halt" command does not signal "Done" = TRUE.

To brake an axis with active force/torque limiting, use the Motion Control instruction "MC_MoveVelocity" with "MC_MoveVelocity.Velocity" = 0.0 and "MC_MoveVelocity.PositionControlled" = FALSE.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

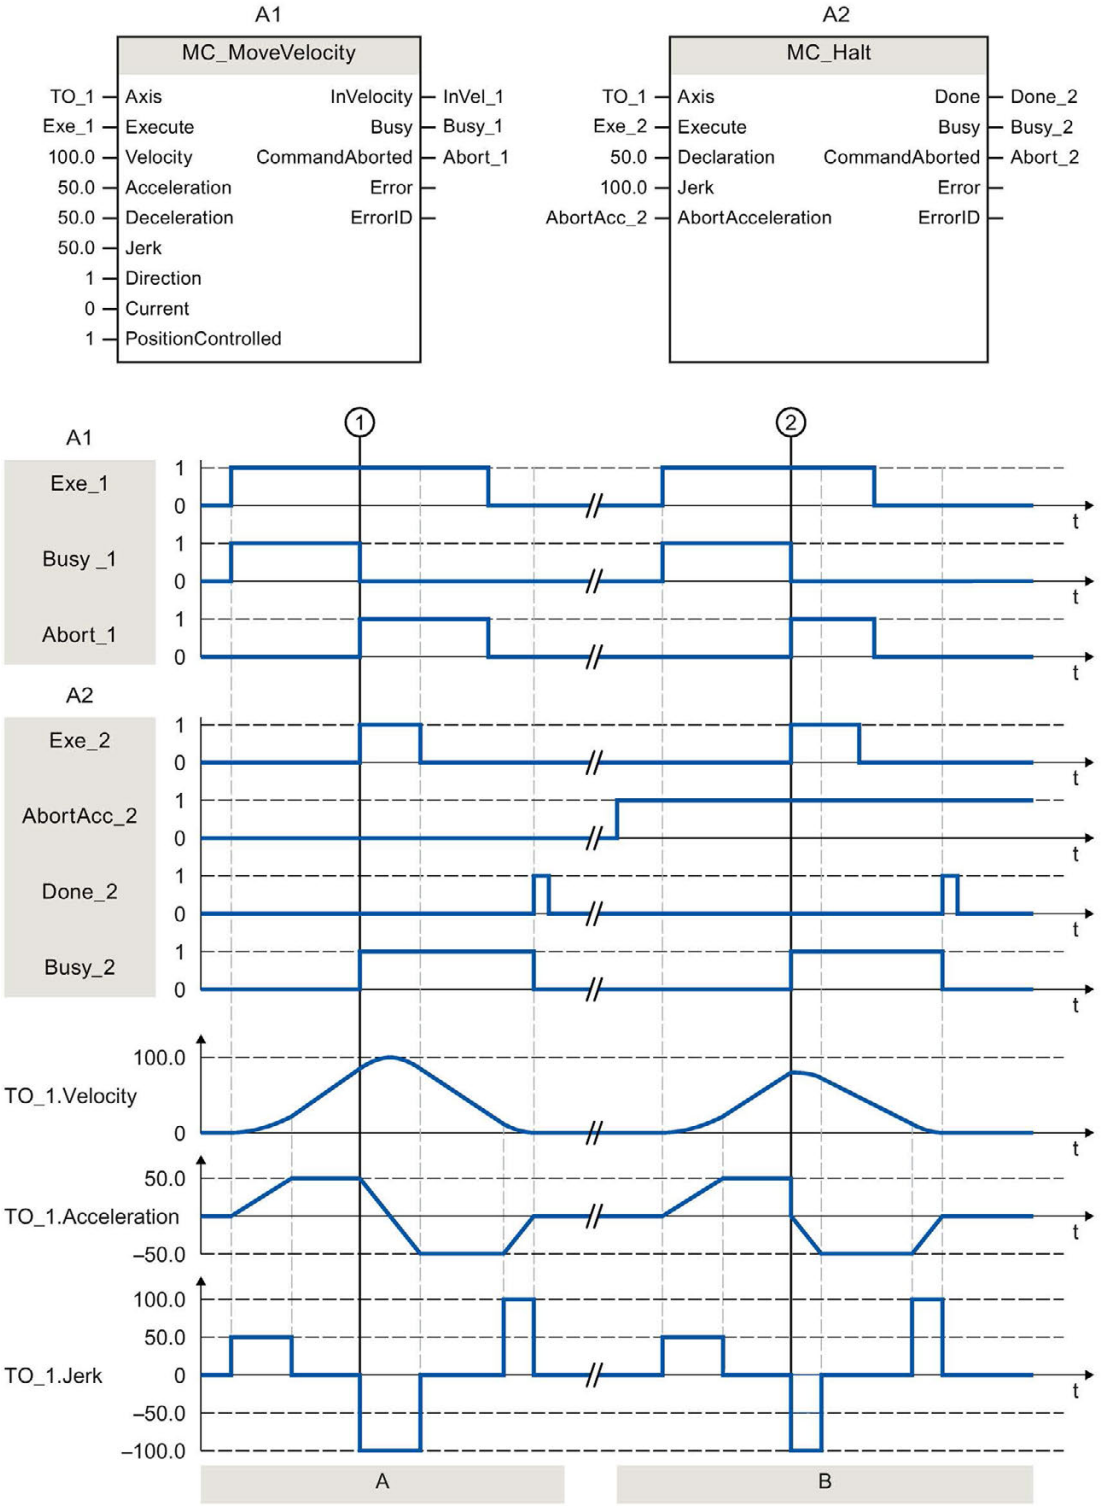
11.1.4.2 MC_Halt: Function chart V3

Function chart: Stopping an axis and the overriding job characteristics



Section A	An axis is moved with an "MC_MoveVelocity" job (A1). At time ①, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job abort is signaled via "Abort_1". With "AbortAcc_2" = FALSE, the current acceleration is reduced with the specified jerk. Afterward, the deceleration builds up and the axis is braked to a standstill. Successful completion of the "MC_Halt" job is signaled via "Done_2".
Section B	The axis is moved with an "MC_MoveVelocity" job (A1). At time ②, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job abort is signaled via "Abort_1". With "AbortAcc_2" = TRUE, the current acceleration is set to zero immediately and the deceleration builds up. The axis is braked to a standstill. Successful completion of the "MC_Halt" job is signaled via "Done_2".

11.1.5 MC_MoveAbsolute V3

11.1.5.1 MC_MoveAbsolute: Absolute positioning of axis V3

Description

With the Motion Control instruction "MC_MoveAbsolute", you can move an axis to an absolute position.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.
- The technology object is homed.

Override response

The override characteristics for "MC_MoveAbsolute" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the "MC_MoveAbsolute" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description
Axis	INPUT	TO_Positioning-Axis	-	Technology object
Execute	INPUT	BOOL	FALSE	Start job with a positive edge
Position	INPUT	REAL	0.0	Absolute target position
Velocity	INPUT	LREAL	-1.0	Velocity setpoint for the positioning Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Direction	INPUT	INT	1	Motion direction of the axis Is only evaluated with "modulo" enabled. "Technology object > Configuration > Basic parameters > Enable modulo
				1 Positive direction
				2 Negative direction
				3 Shortest path

Parameters	Declaration	Data type	Default value	Description	
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Moving an axis to an absolute position

Proceed as follows to move an axis to an absolute position:

1. Check the requirements indicated above.
2. Specify the desired target position in the "Position" parameter.
3. Start the "MC_MoveAbsolute" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

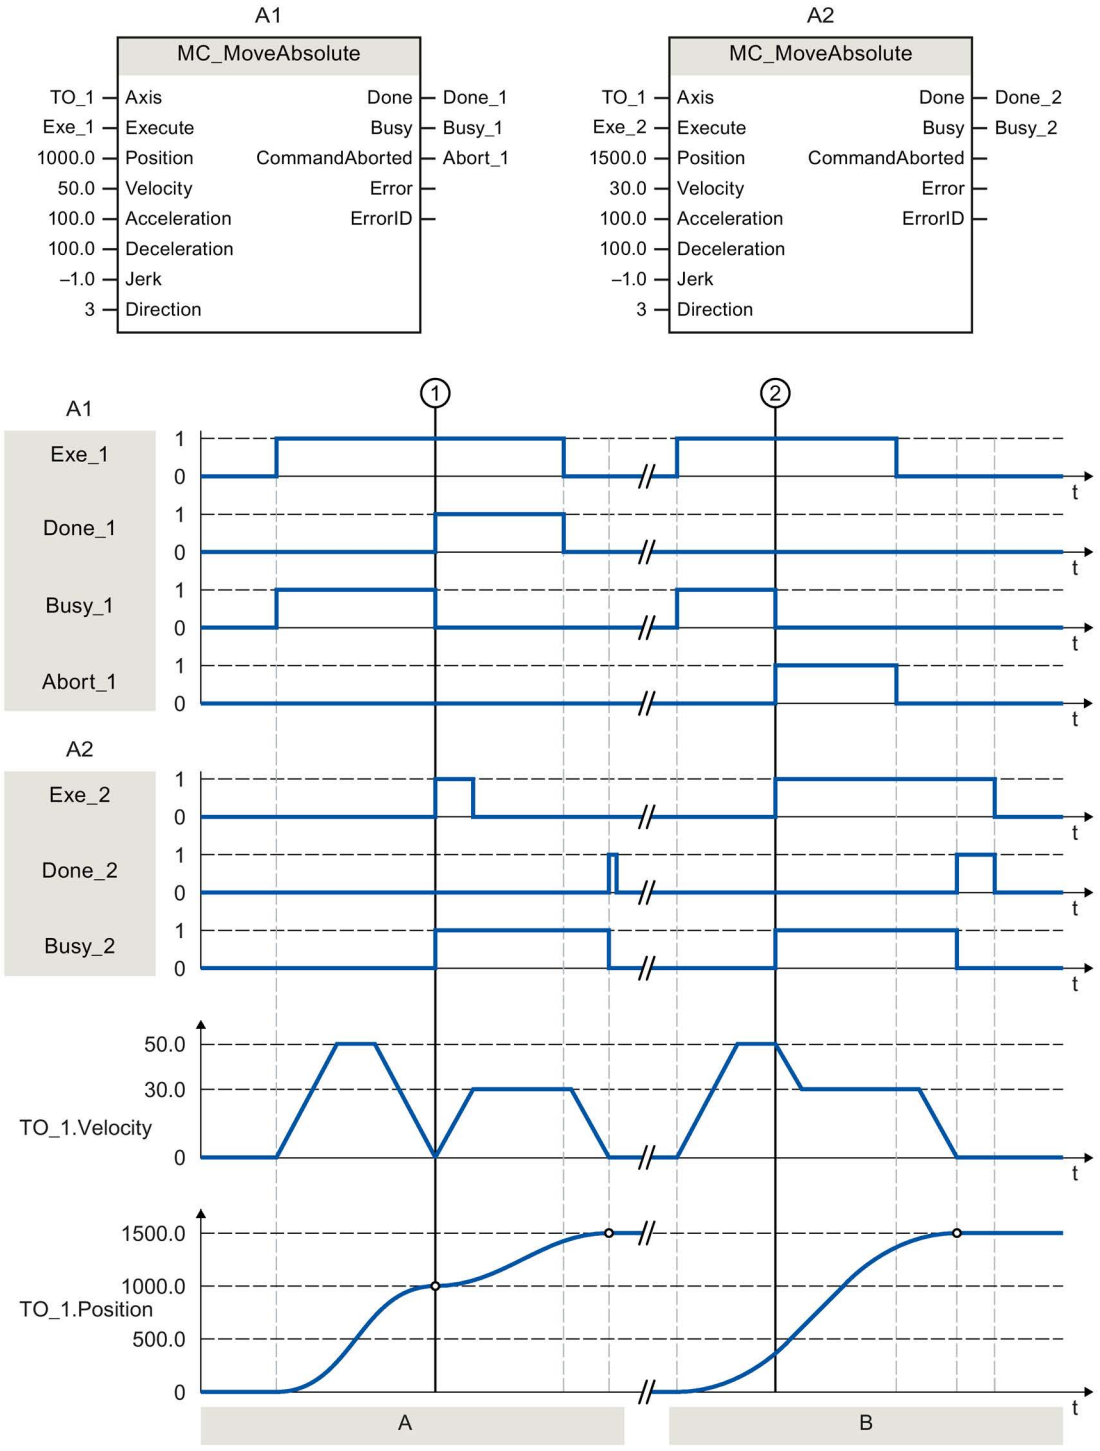
See also

Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

11.1.5.2 MC_MoveAbsolute: Function chart V3

Function chart: Absolute positioning of an axis, and the response to an overriding job



Section A	An axis is moved to absolute position 1000.0 with an "MC_MoveAbsolute" job (A1). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveAbsolute" job (A2) with target position 1500.0 is started. When the axis reaches the target position 1500.0, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	An active "MC_MoveAbsolute" job (A1) is overridden at time ② by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1". The axis is braked to the changed velocity and moved to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

11.1.6 MC_MoveRelative V3

11.1.6.1 MC_MoveRelative: Relative positioning of axis V3

Description

With the Motion Control instruction "MC_MoveRelative", you move an axis relative to its position when execution of the job began.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.

Override response

The override characteristics for "MC_MoveRelative" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the "MC_MoveRelative" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description
Axis	INPUT	TO_PositioningAxis	-	Technology object
Execute	INPUT	BOOL	FALSE	Start job with a positive edge
Distance	INPUT	LREAL	0.0	Distance for the positioning process (negative or positive)
Velocity	INPUT	LREAL	-1.0	Velocity setpoint for the positioning Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)

Parameters	Declaration	Data type	Default value	Description	
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Moving an axis relative to the starting position

Proceed as follows to move an axis relative to the starting position:

1. Check the requirements indicated above.
2. Specify distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveRelative" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

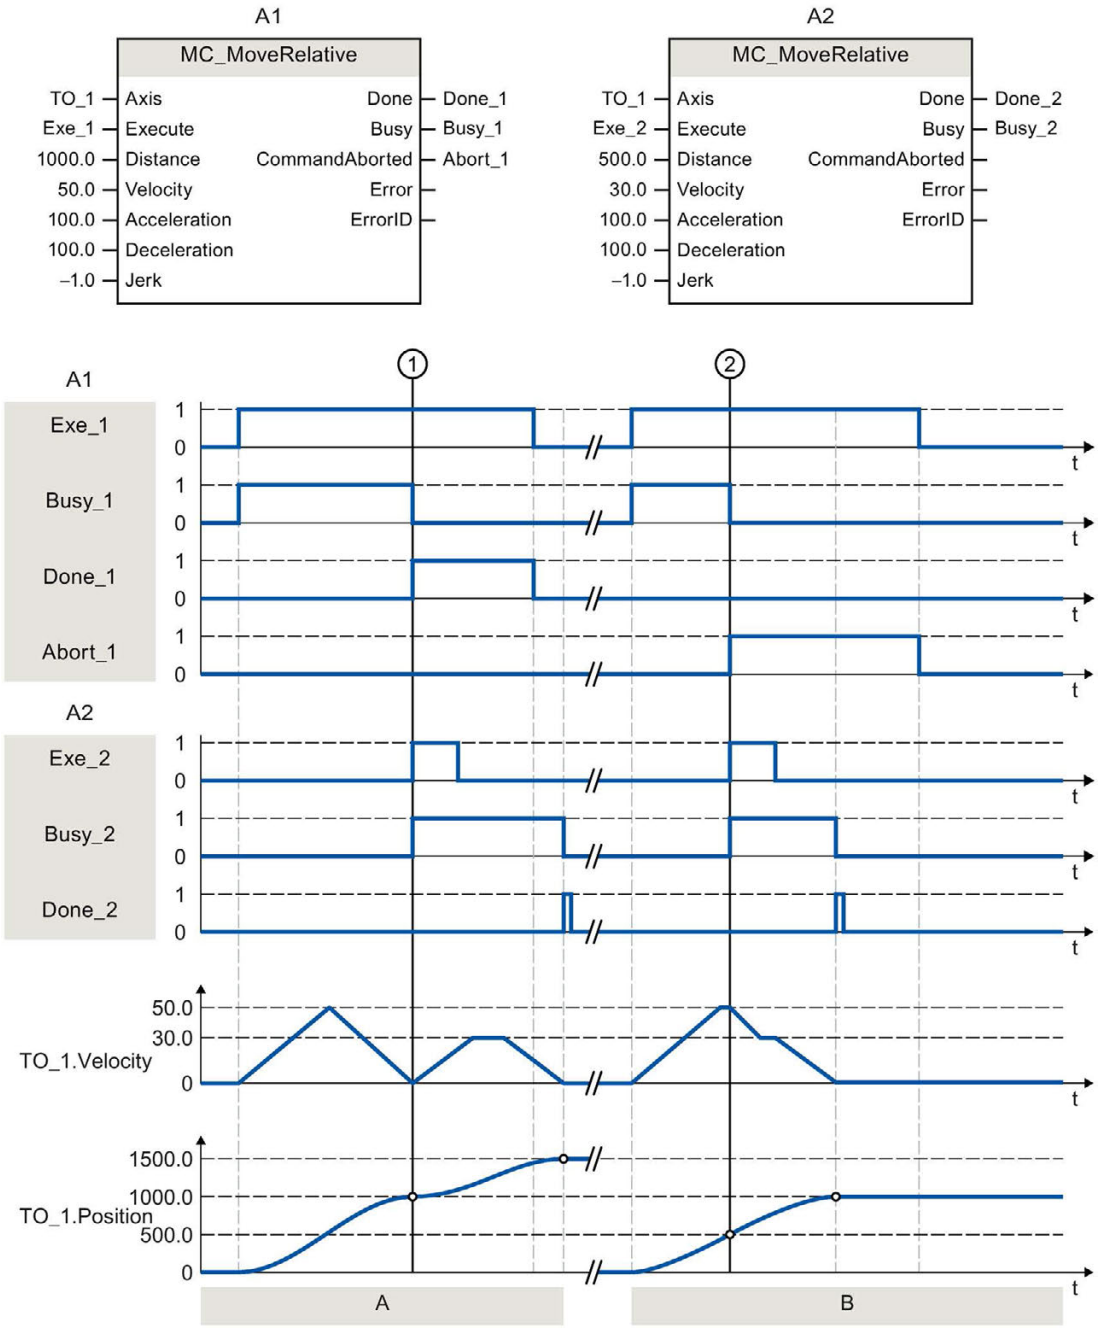
Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

11.1.6.2 MC_MoveRelative: Function chart V3

Function chart: Relative positioning of an axis, and the overriding job characteristics



Section A	The axis is moved by an "MC_MoveRelative" job (A1) by the distance ("Distance") 1000.0 (the starting position here is 0.0). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveRelative" job (A2) with distance 500.0 is started. When the axis reaches the new target position, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	An active "MC_MoveRelative" job (A1) is overridden by another "MC_MoveRelative" job (A2). The abort is signaled at time ② via "Abort_1". The axis is then moved at the new velocity by the distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

11.1.7 MC_MoveVelocity V3

11.1.7.1 MC_MoveVelocity: Move axis at velocity/speed setpoint V3

Description

With the Motion Control instruction "MC_MoveVelocity", you move an axis at constant velocity/speed.

You define the dynamic behavior of the motion with parameters"Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.

- Speed axis:

  A speed is specified in the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.

Override response

The override characteristics for "MC_MoveVelocity" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the "MC_MoveVelocity" Motion Control instruction:

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Velocity	INPUT	LREAL	100.0	Velocity/speed setpoint for the motion process ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Direction	INPUT	INT	0	Direction of rotation of the axis	
				0	The sign of the velocity specified at the "Velocity" parameter defines the direction of rotation.
				1	Positive direction of rotation Value of "Velocity" is used.
				2	Negative direction of rotation Value of "Velocity" is used.

Parameters	Declaration	Data type	Default value	Description	
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	Deactivated The values of parameters "Velocity" and "Direction" are taken into account.
				TRUE	activated The values at the parameters "Velocity" and "Direction" are **not** taken into account. The current velocity and direction at function start are retained. When the axis resumes motion at the velocity that was current at function start, the "InVelocity" parameter returns the value TRUE.
PositionControlled	INPUT	BOOL	TRUE	FALSE	Non position-controlled operation
				TRUE	Position-controlled mode
				The parameter applies as long as the MC_MoveVelocity command is executed. After this, the setting of MC_Power applies again. This parameter is ignored when a speed axis is used.	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The velocity setpoint / speed setpoint was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Behavior with velocity setpoint / speed setpoint zero ("Velocity" = 0.0)

An "MC_MoveVelocity" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the velocity setpoint / speed setpoint zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

The parameters "InVelocity" and "Busy" show the value TRUE until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Moving an axis with constant velocity / speed

Proceed as follows to move an axis with constant velocity / speed:

1. Check the requirements indicated above.
2. At the parameter "Velocity", specify the velocity / speed, with which the axis should be moved.
3. Start the "MC_MoveVelocity" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

If the "InVelocity" parameter shows the value TRUE, then the velocity setpoint / speed setpoint was reached. The axis continues moving at this constant velocity. The parameters "InVelocity" and "Busy" show the value TRUE until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Note

Response to a change in the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity / speed is reached ("Velocity" × "Override" %), then "InVelocity" is reset.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

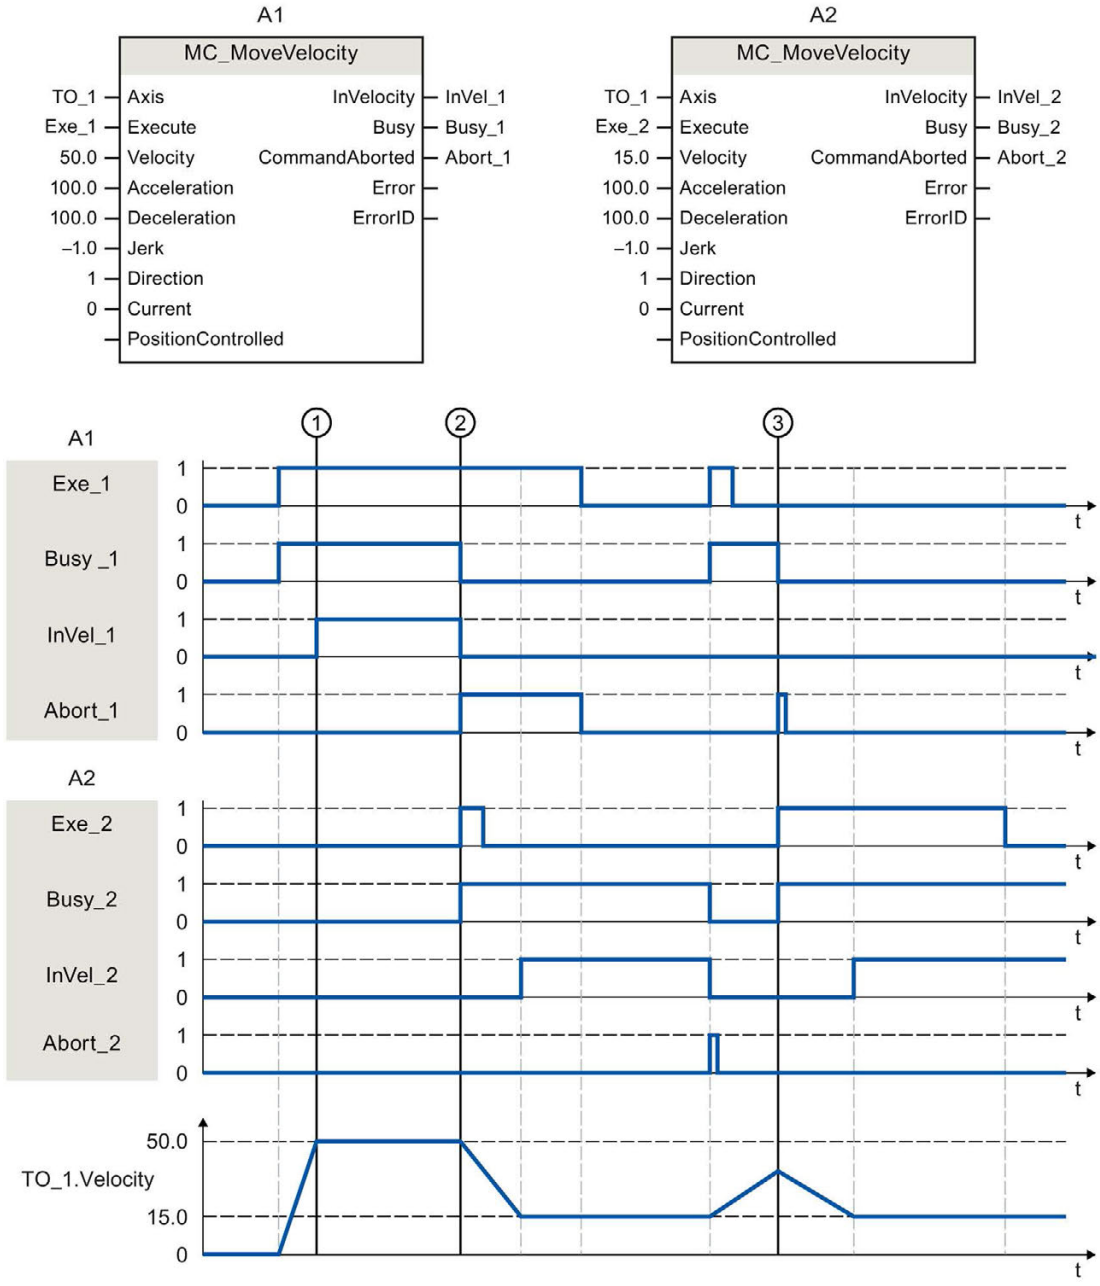
See also

Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

11.1.7.2 MC_MoveVelocity: Function chart V3

Function chart: Moving an axis with velocity specification, and the response to an overriding job



An "MC_MoveVelocity" job (A1) initiated via "Exe_1" accelerates the axis and signals at time ① via "InVel_1" that the velocity setpoint 50.0 has been reached.

At time ②, the job is overridden by another "MC_MoveVelocity" job (A2). The abort is signaled via "Abort_1". When the new velocity setpoint 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

The running "MC_MoveVelocity" job (A2) is overridden by another "MC_MoveVelocity" job (A1). The abort is signaled via "Abort_2". The axis is accelerated to the new velocity setpoint 50.0. Before the velocity setpoint is reached, the current "MC_MoveVelocity" job A1) is overridden at time ③ by another "MC_MoveVelocity" job A2). The abort is signaled via "Abort_1". When the new velocity setpoint 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

11.1.8 MC_MoveJog V3

11.1.8.1 MC_MoveJog: Move axis in jog mode V3

Description

With the Motion Control instruction "MC_MoveJog", you move an axis in jog mode.

You define the dynamic behavior of the motion with parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified in the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.

Override response

The override characteristics for "MC_MoveJog" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of the Motion Control instruction "MC_MoveJog":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
JogForward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".	
JogBackward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".	
Velocity	INPUT	LREAL	100.0	Velocity setpoint / speed setpoint for the motion Value > 0.0: The specified value is used. Value < 0.0: The absolute value of the specified value is used. ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
PositionControlled	INPUT	BOOL	TRUE	FALSE	Non position-controlled operation
				TRUE	Position-controlled mode
				The parameter applies as long as the MC_MoveJog command is executed. After this, the setting of MC_Power applies again. This parameter is ignored when a speed axis is used.	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The velocity setpoint / speed setpoint was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.

Parameters	Declaration	Data type	Default value	Description	
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Behavior with velocity setpoint / speed setpoint zero ("Velocity" = 0.0)

An "MC_MoveJog" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the velocity setpoint / speed setpoint zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", " constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

Moving an axis in jog mode

Proceed as follows to move an axis in jog mode:

1. Check the requirements indicated above.
2. Move the axis in the positive direction with "JogForward", or in the negative direction with "JogBackward".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

Note

Response to a change in the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity is reached ("Velocity" × "Override" %), then "InVelocity" is set again.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

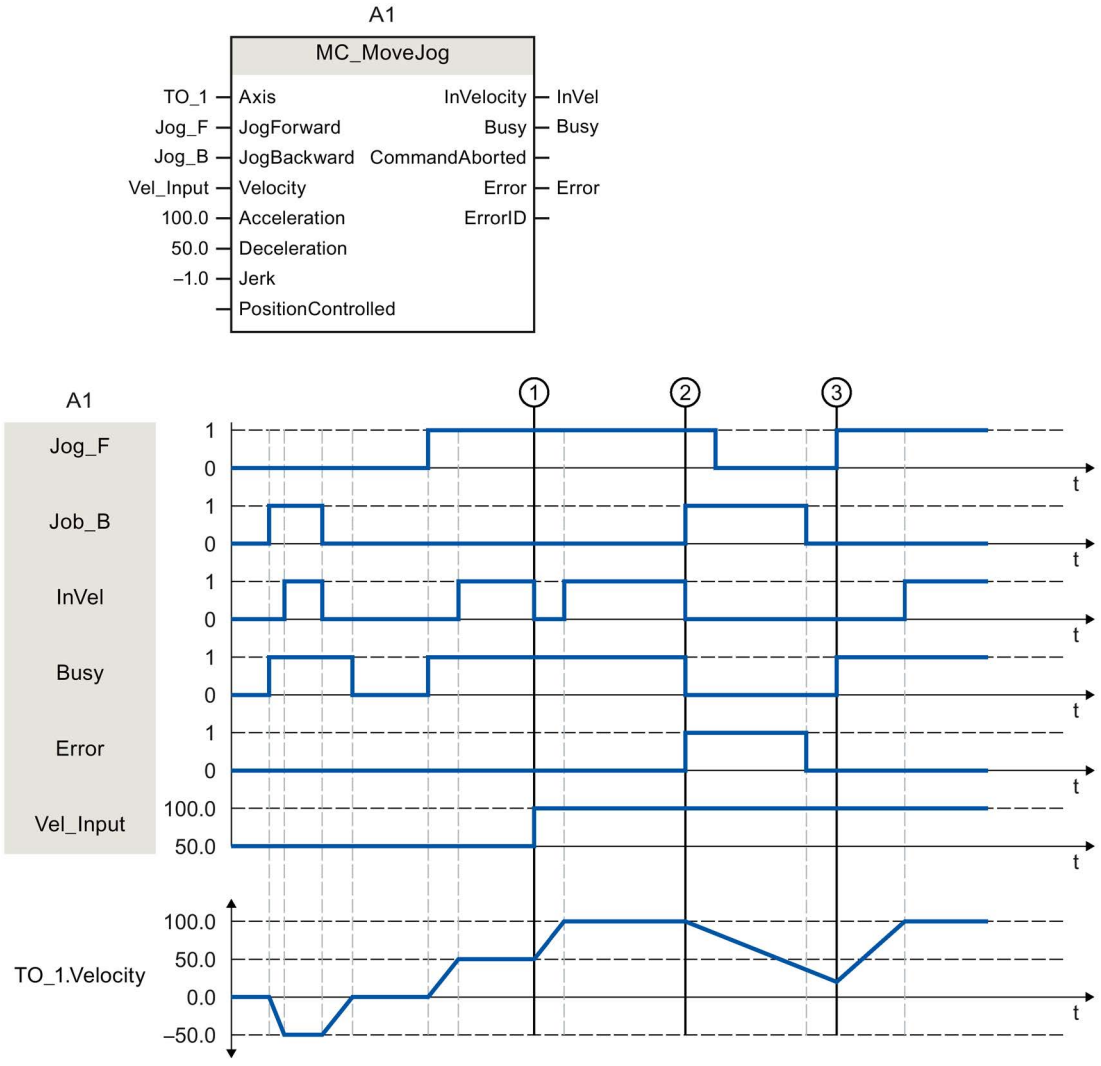
See also

Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

11.1.8.2 MC_MoveJog: Function chart V3

Function chart: Moving an axis in jog mode



The axis is moved in the negative direction in jog mode via "Jog_B". When the velocity setpoint -50.0 is reached, this is signaled via "InVel" = TRUE. After "Jog_B" is reset, the axis is braked and brought to a standstill. Then the axis is moved in the positive direction via "Jog_F". When the velocity setpoint 50.0 is reached, this is signaled via "InVel" = TRUE.

At time ①, if "Jog_F" is set, the velocity setpoint is changed to 100.0 by means of "Vel_Input". Alternatively, you can also change the velocity setpoint using the velocity override. "InVel" is reset. Axis is being accelerated. When the new velocity setpoint 100.0 is reached, this is signaled via "InVel" = TRUE.

If "Jog_F" is set, "Jog_B" is likewise set at time ②. If both "Jog_F" and "Jog_B" are set, then the axis is braked with the last applicable deceleration. An error is indicated via "Error", and the "ErrorID" of the error 16#8007 (incorrect direction specification) is output.

This error is resolved by resetting the two inputs "Jog_F" and "Jog_B".

During the braking ramp, "Jog_F" is set at time ③. The axis is accelerated to the last configured velocity. When the velocity setpoint 100.0 is reached, this is signaled via "InVel" = TRUE.

11.1.9 MC_MoveSuperimposed V3

11.1.9.1 MC_MoveSuperimposed: Superimposed positioning of axis V3

Description

With the Motion Control instruction "MC_MoveSuperimposed", you start a relative positioning motion that is superimposed on a active basic motion.

You define the dynamic behavior of the motion with parameters "VelocityDiff", "Jerk", "Acceleration" and "Deceleration" . The dynamic values are added to the values of the basic motion. The duration of the basic motion is not extended by a superimposed motion.

The dynamics of the total axis motion is the sum of the dynamic values of the basic motion and the superimposed motion.

The behavior of the total motion depends on the type of basic motion:

- The basic motion is a single-axis motion:
  - The maximum dynamics of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The entire motion is limited to the configured dynamic limits.
- The basic motion is a synchronous motion:
  - The maximum dynamics of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The synchronous motion of the following axis is not limited to the dynamic limits of the following axis.
  - An "MC_MoveSuperimposed" job on a leading axis in synchronous operation affects the leading axis and the following axis.
  - An "MC_MoveSuperimposed" job on a following axis in synchronous operation only affects the following axis.

It is always the dynamics of the total motion that is displayed in the technology data block and in the TIA Portal.

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object has been enabled.

Override response

The override characteristics for "MC_MoveSuperimposed" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MoveSuperimposed":

Parameters	Declaration	Data type	Default value	Description
Axis	INPUT	TO_PositioningAxis	-	Axis technology object
Execute	INPUT	BOOL	FALSE	Start job with a positive edge
Distance	INPUT	LREAL	0.0	Additional travel distance for the superimposing positioning operation (negative or positive)
VelocityDiff	INPUT	LREAL	-1.0	Maximum velocity deviation compared to the active motion Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)

Parameters	Declaration	Data type	Default value	Description	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Superimposed positioning complete
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 559) for parameter "ErrorID"	

Starting superimposed positioning motion

To start a superimposed positioning motion with Motion Control instruction "MC_MoveSuperimposed", follow these steps:

1. Check the requirements indicated above.
2. Specify the additional distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveSuperimposed" job with a positive edge at parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

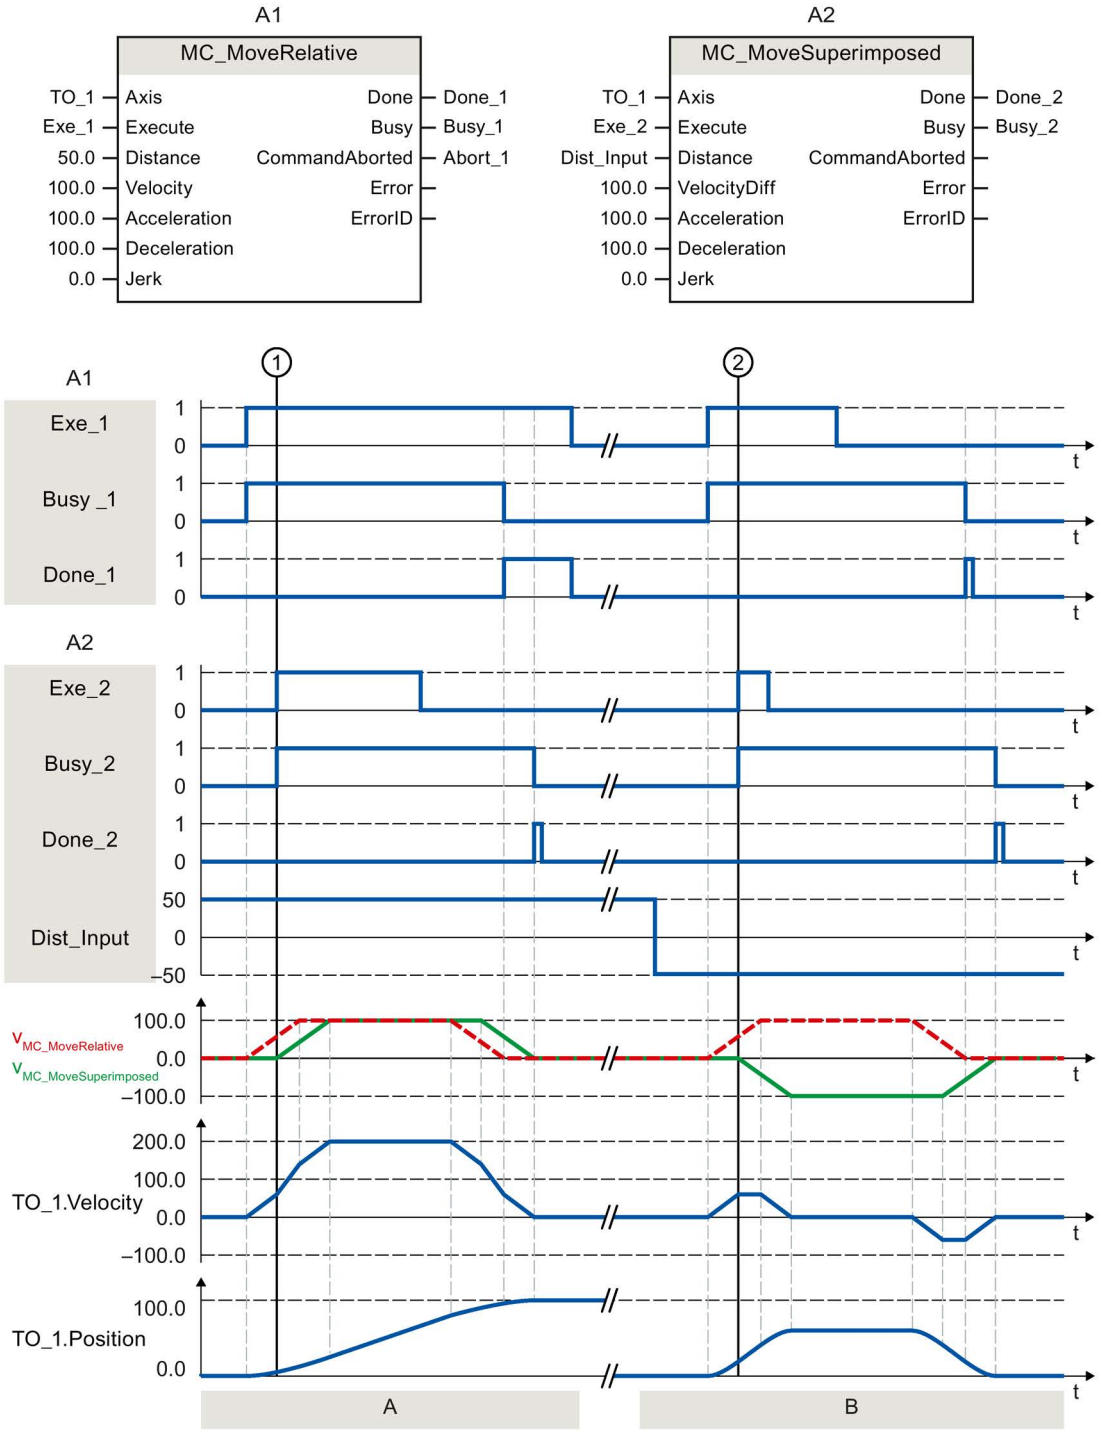
11.1.9.2 MC_MoveSuperimposed: Function chart V3

Function chart: Positioning axes overlapping



Section A	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At time ①, using "Exe_2", an MC_MoveSuperimposed job with a distance of 50.0 is initiated. The axis is moved with the added dynamic values of both jobs by the distance 50 + 50 = 100.0. When the axis reaches the target position, this is signaled via "Done_2".
Section B	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At time ②, using "Exe_2", a MC_MoveSuperimposed job with a distance of -50.0 is initiated. The axis reverses and is moved with the added dynamic values of both jobs by the distance 50.0 - 50.0 = 0.0. When the axis reaches the target position, this is signaled via "Done_2".

11.1.10 MC_TorqueLimiting V3

11.1.10.1 MC_TorqueLimiting: Activate and deactivate force/torque limit / fixed stop detection

Description

With the Motion Control instruction "MC_TorqueLimiting", you activate and assign parameters for force/torque limiting and fixed stop detection.

Together with a position-controlled motion job, a "Travel to fixed stop" can be realized with the fixed stop detection.

In the axis configuration, you can configure whether the force/torque limiting is to relate to the drive side or the load side.

The functions of the Motion Control instruction "MC-TorqueLimiting" can be activated and deactivated before and during a motion job.

Force/torque limiting applies to

- Speed axis
- Positioning axis
- Synchronous axis

Requirements for force/torque limiting

- The technology object and the reference torque of the drive have been configured correctly.
- The drive must support force/torque reduction. Only PROFIdrive drives with SIEMENS telegram 10x support force/torque limiting.
- No enable-preventing errors are pending for the technology object (the technology object does not have to be enabled).

Fixed stop detection applies to

- Positioning axis
- Synchronous axis

Requirement for fixed stop detection

- The fixed stop detection can only be applied to position-controlled axes. For fixed stop detection, the axis must be enabled as position-controlled axis; motion commands must be executed as position-controlled motion commands.
- The technology object has been configured correctly.
- When a drive and telegram that support force/torque limiting is used, the reference torque of the drive must be correctly configured for the technology object.
- No enable-preventing errors are pending for the technology object (the technology object does not have to be enabled).

Override response

- An MC_TorqueLimiting job cannot be aborted by another Motion Control job.
- A new MC_TorqueLimiting job does not abort active Motion Control jobs.

Parameters

The following table shows the parameters of Motion Control instruction "MC_TorqueLimiting":

Parameters	Declaration	Data type	Default value	Description	
Axis	INPUT	TO_SpeedAxis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	Activate function corresponding to input parameter Mode
Limit	INPUT	LREAL	-1.0	Value of force/torque limiting (in the configured unit of measurement) If drive and telegram do not support force/torque limiting, the specified value is irrelevant.	
				≥ 0	Use the value specified in the parameter ("0" value is permissible)
				< 0	Use the value configured in the "Torque limiting" configuration window". Tag Torque Limit: <TO>.TorqueLimiting.LimitDefaults.Torque Tag Force Limit: <TO>.TorqueLimiting.LimitDefaults.Force
Mode	INPUT	DINT	0	0	Force/torque limiting
				1	Fixed stop detection If drive and telegram support force/torque limiting, this is applied.
InClamping	OUTPUT	BOOL	FALSE	TRUE	Mode = 1: The drive is kept at the fixed stop (clamping), the axis position is within the positioning tolerance.
InLimitation	OUTPUT	BOOL	FALSE	TRUE	Mode = 0 and 1: Drive is operating at the force/torque limit.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

Changes to input parameters "Limit" and "Mode" are also transferred at the cyclic call of the Motion Control instruction when "Enable = TRUE".

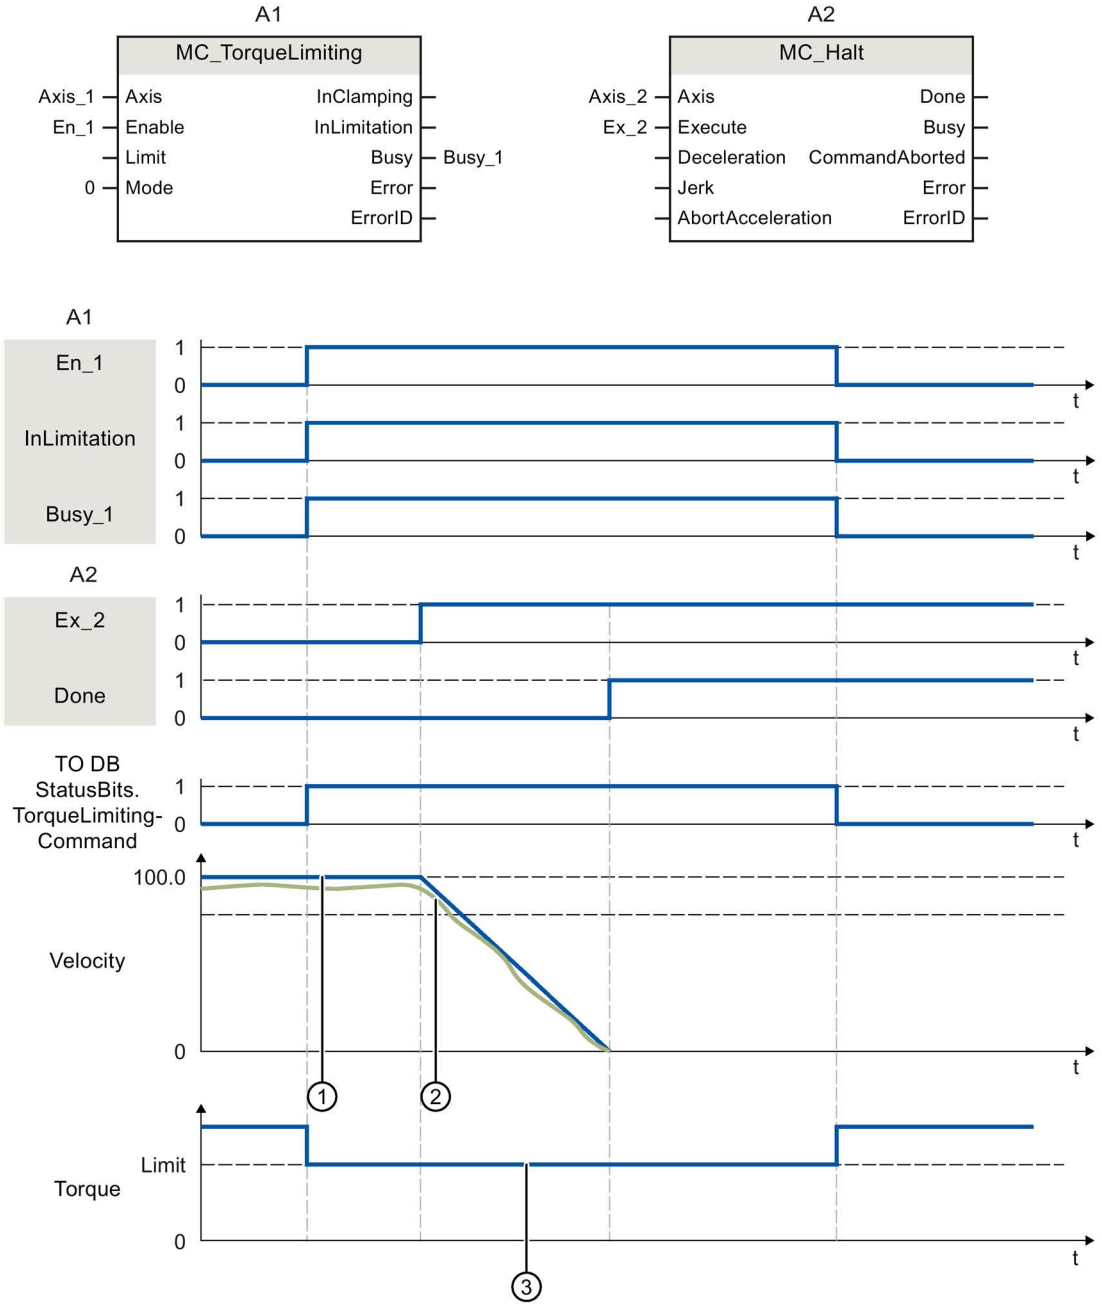
11.1.10.2 MC_TorqueLimiting: Function chart V3

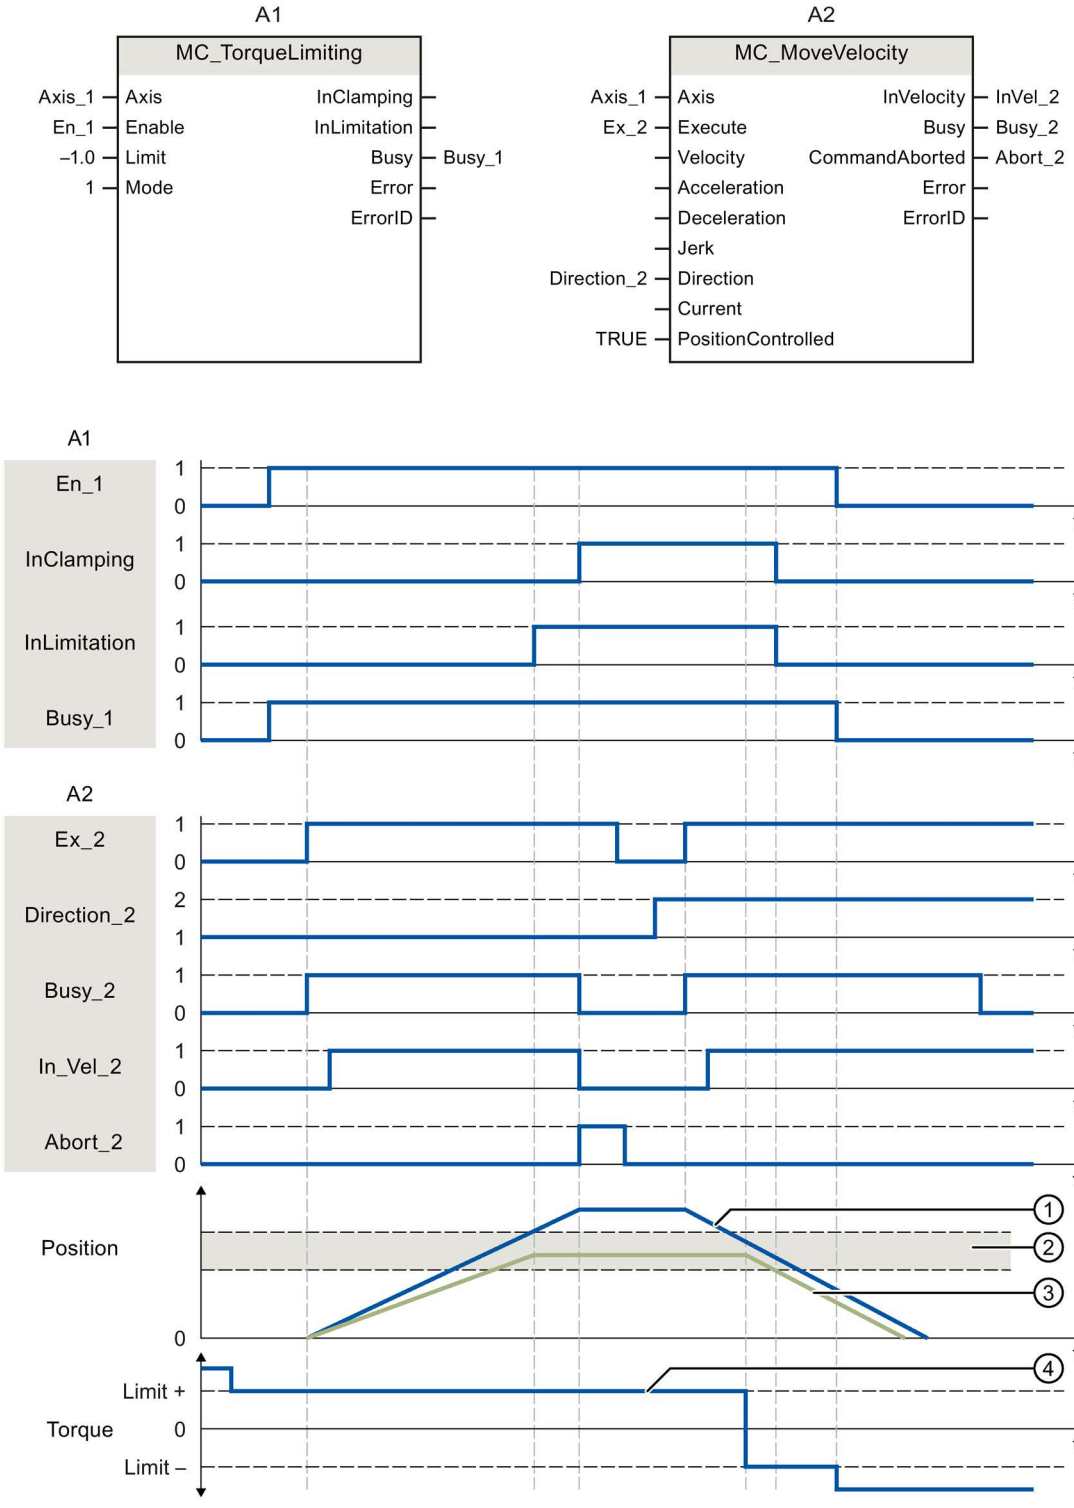
Function chart: Stopping an axis when the torque limit is reached



① Velocity setpoint
② Actual velocity
③ Torque

A "MC_Halt" Motion Control instruction is executed for an axis with active torque limiting "MC_TorqueLimiting". Torque limiting still "MC_TorqueLimiting.Enable" remains TRUE (active) and any accumulated following error is retained and will be reduced. When the actual velocity is "0.0" and the minimum dwell time in the standstill window has expired, "MC_Halt.Done" = TRUE". When position monitoring is activated, reaching of the target position is also monitored.

Function chart: Torque limiting with fixed stop detection (mode = 1)



① Actual position remains
② Target position reached (position setpoint)

③ Positioning tolerance
④ Torque

A "MC_MoveVelocity" Motion Control instruction is executed for an axis with active torque limiting "MC_TorqueLimiting". The torque limiting "MC_TorqueLimiting.Enable" is still TRUE (active) and the configured following error is reduced. When reaching the following error limit, the Motion Control instruction "MC_MoveVelocity" is canceled with "Abort" = TRUE. The drive is kept at the fixed stop (clamping), the axis position is within the positioning tolerance. The Motion Control instruction "MC_MoveVelocity" is called again with "Execute" = TRUE, and the axis is moved with constant velocity.

11.1.11 Measuring input, output cam, cam track

11.1.11.1 MC_MeasuringInput V3

MC_MeasuringInput: Start measuring once V3

With the Motion Control instruction "MC_MeasuringInput", a one-time measuring is started.

With the one-time measuring, one or two edges can be detected with one measuring job. The position of the respective technology object axis or external encoder is assigned to the measuring event. The measurement result is indicated in the function block and in the technology data block and can be further processed in the user program. This completes the measuring job.

Another measuring job must be started again using "MC_MeasuringInput.Execute" = TRUE.

Applies to

- Measuring input

Requirements

- The technology object has been configured correctly.
- The encoder of the axis must have "valid" status (StatusSensor[1..4].State = valid). Otherwise, the measuring job is rejected in the function block with an error indication.
- Measuring using PROFIdrive is not possible during active or passive homing.

Override response

The override characteristics for "MC_MeasuringInput" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MeasuringInput":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_Measuring-Input	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Mode	INPUT	DINT	0	Type of measurement	
				0	Measurement of next positive edge
				1	Measurement of next negative edge
				2	Measurement of next two edges
				3	Measurement of two edges, beginning with the positive edge • Positive edge = "MeasuredValue1" (measured value 1) • Negative edge = "MeasuredValue2" (measured value 2)
				4	Measurement of two edges, beginning with the negative edge • Negative edge = "MeasuredValue1" • Positive edge = "MeasuredValue2"
MeasuringRange	INPUT	BOOL	FALSE	Acquisition of measured values Observe the time-related boundary conditions (Page 125).	
				FALSE	Always acquire measured values
				TRUE	Acquire measured values only within the measuring range
StartPosition	INPUT	LREAL	0.0	Start position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
EndPosition	INPUT	LREAL	0.0	End position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Done	OUTPUT	BOOL	FALSE	TRUE	The block has been completely processed. Measured values are valid.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The measuring job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.

Parameters	Declaration	Data type	Default value	Description
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"
MeasuredValue1	OUTPUT	LREAL	0.0	First measured value
MeasuredValue2	OUTPUT	LREAL	0.0	Second measured value (for measurement of two edges)

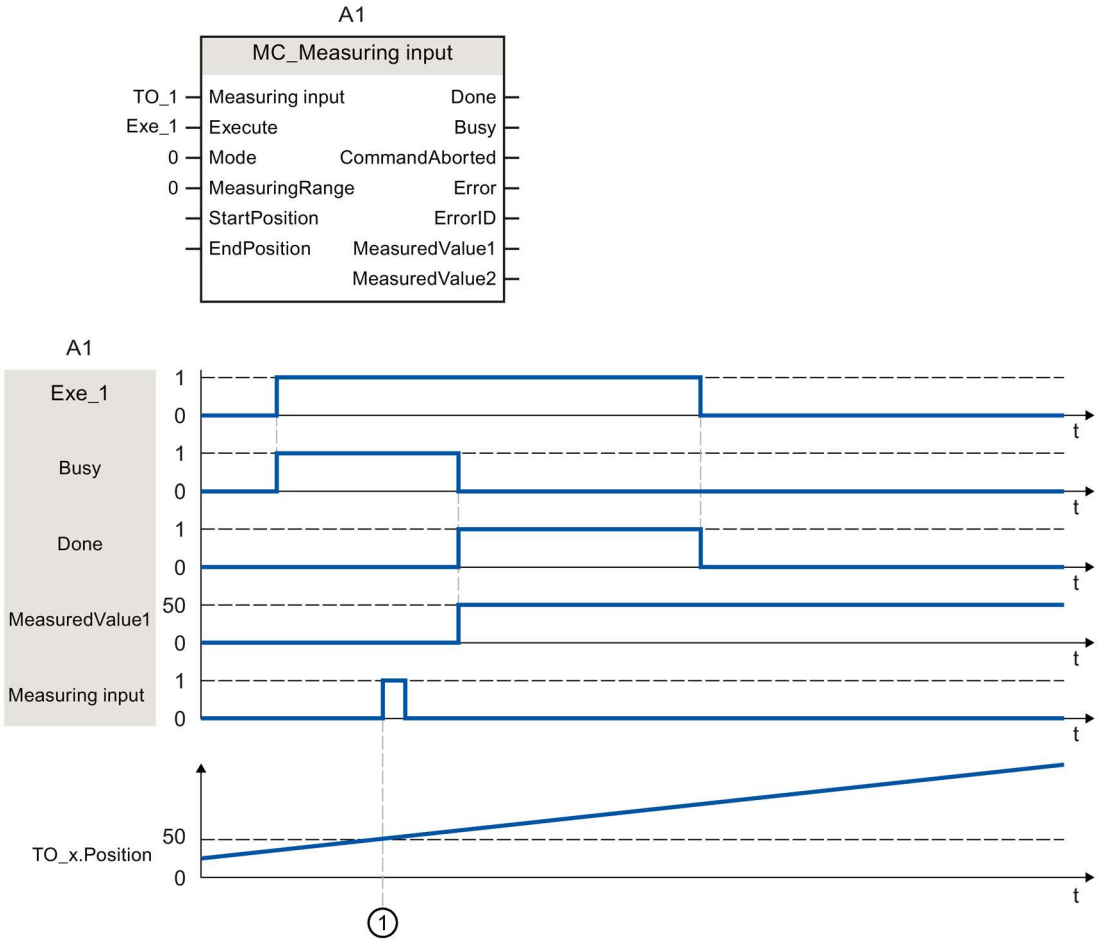
MC_MeasuringInput: Function chart V3

Function chart: Start measuring job once



A "MC_MeasuringInput" job with "Mode" = 0 initiated using "Execute" performs a measurement of the next positive edge. A successfully completed measurement is signaled with "Done" = TRUE. The determined measured value ① (in example: 50) is output using "MeasuredValue1".

11.1.11.2 MC_MeasuringInputCyclic V3

MC_MeasuringInputCyclic: Start cyclic measuring V3

With the Motion Control instruction "MC_MeasuringInputCyclic", a cyclic measuring is started.

With cyclic measuring, up to two measuring events are detected by the system and the associated measuring positions displayed. The measurements are continued cyclically until they are ended per command.

Applies to

- Measuring input

Requirements

- The technology object has been configured correctly.
- Cyclic measuring is only possible when measuring using TM Timer DIDQ.
- The operationally active encoder of the axis must have "valid" status (StatusSensor[1..4].State = valid). Otherwise, the measuring job is rejected in the function block with an error indication.

Override response

The override characteristics for "MC_MeasuringInputCyclic" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of Motion Control instruction "MC_MeasuringInputCyclic":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_Measuring-Input	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Mode	INPUT	DINT	0	Type of measurement	
				0	Measurement of positive edges
				1	Measurement of negative edges
				2	Measurement of both edges
MeasuringRange	INPUT	BOOL	FALSE	Acquisition of measured values Observe the time-related boundary conditions (Page 125).	
				FALSE	Always acquire measured values

Parameters	Declaration	Data type	Default value	Description	
				TRUE	Acquire measured values only within the measuring range
StartPosition	INPUT	LREAL	0.0	Start position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
EndPosition	INPUT	LREAL	0.0	End position of the measuring range For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The measuring job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	
MeasuredValue1	OUTPUT	LREAL		First measured value	
MeasuredValue2	OUTPUT	LREAL		Second measured value (when measuring multiple edges in one position control cycle)	
Meas-uredValue1Counter	OUTPUT	UDINT	0	Count value for the first measured value	
Meas-uredValue2Counter	OUTPUT	UDINT	0	Count value for the second measured value	
LostEdgeCounter1	OUTPUT	UDINT	0	Count value for the lost edges in the cycle clock of the first measured value acquisition	
LostEdgeCounter2	OUTPUT	UDINT	0	Count value for the lost edges in the cycle clock of the second measured value acquisition

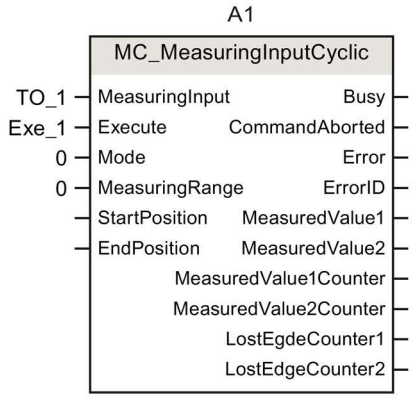
Cyclic measuring (Page 119)

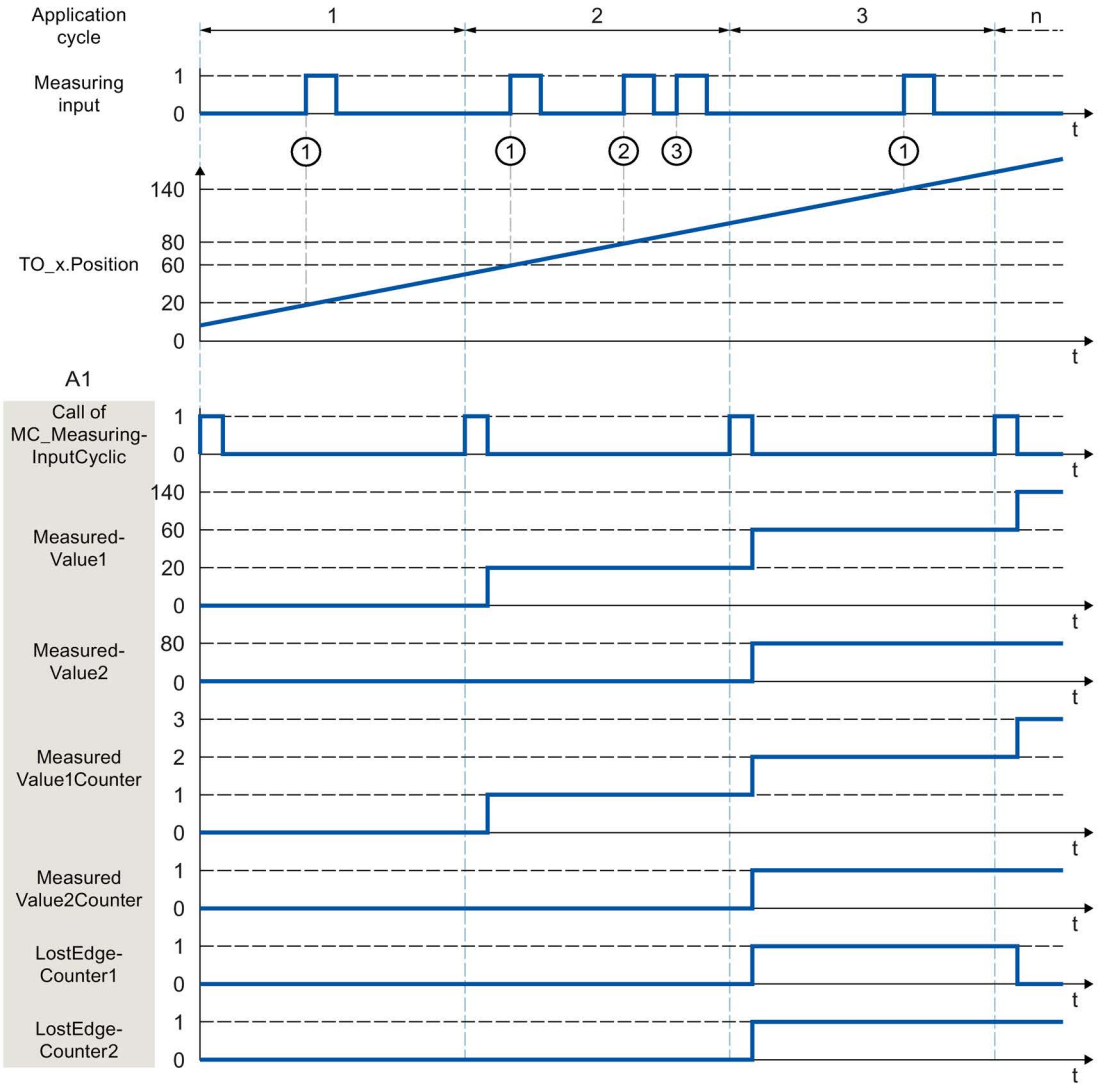
Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

MC_MeasuringInputCyclic: Function chart V3

Function chart: Start cyclic measuring job





A "MC_MeasuringInputCyclic" command initiated using "Execute" (signal and start point not shown) (e.g. call in MC-PreServo [OB67]) with "Mode" = 0 and without specified measuring range "MeasuringRange" = FALSE performs a measurement of the positive edges. By

calling the Motion Control instruction "MC_MeasuringInputCyclic" in MC-PreServo [OB67] or MC-PreServo [OB67], the measuring command as well as the measurement itself is called in the same application cycle.

The actual position determined at the time of the first positive edge ① in the position control cycle is output using "MeasuredValue1", and count tag "MeasuredValue1Counter" is incremented by "1".

The actual position determined at the time of the second positive edge ② in the position control cycle is output using "MeasuredValue2", and count tag "MeasuredValue2Counter" is incremented by "1".

If additional positive edges occur in the same position control cycle ③, these are recorded in LostEdgeCounter1 and LostEdgeCounter2.

11.1.11.3 MC_AbortMeasuringInput V3

MC_AbortMeasuringInput: Abort active measuring V3

With the Motion Control instruction "MC_AbortMeasuringInput", an active one-time or cyclic measuring job is aborted.

Applies to

- Measuring input

Requirements

- The technology object has been configured correctly.

Override response

The override characteristics for "MC_AbortMeasuringInput" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Parameters

The following table shows the parameters of Motion Control instruction "MC_AbortMeasuringInput":

Parameters	Declaration	Data type	Default value	Description	
MeasuringInput	INPUT	TO_Measuring-Input	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start job with a positive edge	
Done	OUTPUT	BOOL	0	The function block has been processed. The measuring job has been deactivated.	
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job has been aborted.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"

Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

11.1.11.4 MC_OutputCam V3

MC_OutputCam: Activate/deactivate cam V3

Description

You use Motion Control instruction "MC_OutputCam" to activate the specified cam.

Depending on the cam type, the following input parameters are in effect:

- Distance output cam
  - "OnPosition"
  - "OffPosition"
- Time-based output cam
  - "OnPosition"
  - "Duration"

You define the operating mode and the effective direction of the cam with parameters "Mode" and "Direction".

When "MC_OutputCam.Enable" = TRUE, the input parameters are always read and take effect at the next position control cycle.

When a technological alarm occurs, the cam is processed again after error acknowledgment.

Applies to

- Output cam

Requirements

- The technology object has been configured correctly.
- The higher-level technology object must have a valid position.
- Setpoint output cams are not output for an axis in non-position-controlled operation.
- A setpoint output cam with the setting "MC_OutputCam.OnPosition" = 0 switches at position setpoint = 0.

Override response

The "MC_OutputCam" is canceled by:

- Disabling of the cam with "MC_OutputCam.Enable" = FALSE
- Only one instance of the "MC_OutputCam" function block can be active on an output cam in the user program. A second instance of the "MC_OutputCam" function block on a currently active output cam is rejected with an error.

Parameters

The following table shows the parameters of Motion Control instruction "MC_OutputCam":

Parameters	Declaration	Data type	Default value	Description	
OutputCam	INPUT	TO_OutputCam	-	Technology object	
Enable	INPUT	BOOL	FALSE	FALSE	Cam is disabled
				TRUE	Cam is being processed
OnPosition	INPUT	LREAL	0.0	Start position of the cam [unit of measurement of the interconnected technology object] For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
OffPosition	INPUT	LREAL	0.0	End position of the distance output cam [unit of measurement of the interconnected technology object] For an axis or external encoder with active modulo function, position data outside the modulo range is mirrored in the modulo range.	
Duration	INPUT	LREAL	0.0	Switch-on duration of the time-based output cam [unit of measurement: ms] The value for the switch-on duration of a time-based output cam must be greater than 0.0.	
Mode	INPUT	DINT	1	Operating mode	
				1	Standard Cam functionality (output not inverted)
				2	Cam functionality with inverted output
				3	Cam always ON (while "Enable" = TRUE)
Direction	INPUT	DINT	1	Activation direction of the cam	
				1	Positive direction
				2	Negative direction
				3	Both directions
CamOutput	OUTPUT	BOOL	-	Status display based on last call of Motion Control instruction "MC_OutputCam"	
Busy	OUTPUT	BOOL	FALSE	TRUE	Processing of the cam is active.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"	

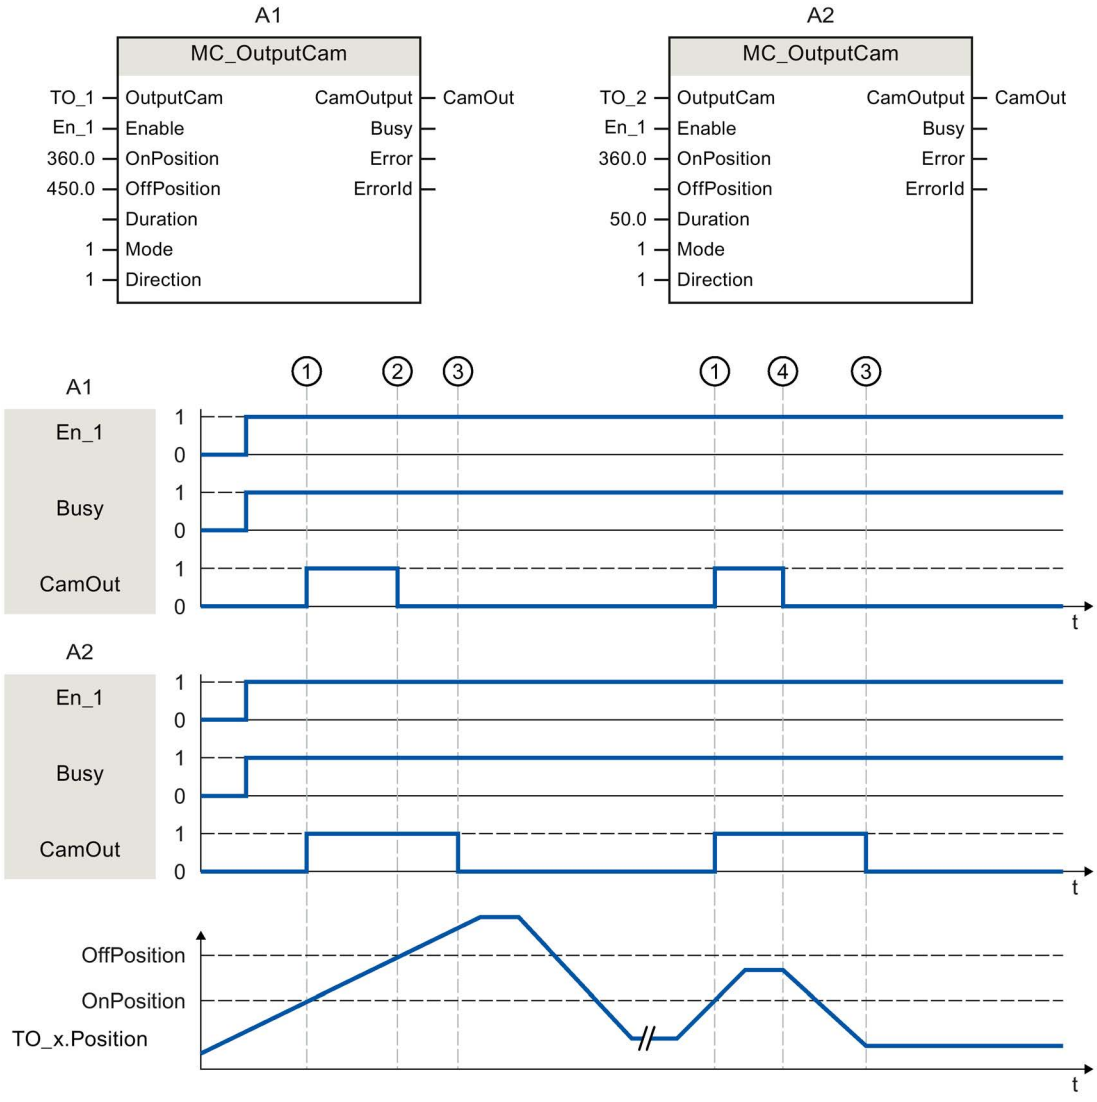
See also

Technology object output cam (Page 129)

Error ID for Motion Control instructions (Page 559)

MC_OutputCam: Function chart V3

Function chart: Activate the specified cam type



A1 Distance output cam

A2 Time-based output cam

A cam is activated with "Enable" = TRUE. The cam is output corresponding to the parameters.

The processing of the cam is indicated with "Busy" = TRUE.

When activation direction "Direction" = 1 (positive) is set, the cam behaves as follows, regardless of the cam type setting:

- The distance output cam switches on at "OnPosition" ① and switches off again at "OffPosition" ②. At a direction reversal the cam is switched off ④.
- The time-based output cam switches on at "OnPosition" ① and switches off again after expiration of the specified time "Duration" ③. A switched on time-based output cam remains active for the specified switch-on duration "Duration", even if overtravel of the start position occurs again in the reverse direction.

The switching state of the cam is output using "CamOutput".

With "Enable" = FALSE, the specified cam type is deactivated. "Busy" = FALSE shows that the cam is not being processed.

11.1.11.5 MC_CamTrack V3

MC_CamTrack: Activate/deactivate cam track V3

Description

With the Motion Control instruction "MC_CamTrack", the processing of a cam track is enabled.

Applies to

- Cam track

Requirements

- The technology object has been configured correctly.
- The higher-level technology object must have a valid position.
- Setpoint output cams are not output for an axis in non-position-controlled operation.

Override response

- The "MC_CamTrack" is aborted by the disabling of the cam track with "MC_CamTrack.Enable" = FALSE.
- Only one instance of the "MC_CamTrack" function block can be active on a cam track in the user program. A second instance of the "MC_CamTrack" function block on a currently active cam track is rejected with an error.
- The cam track is recalculated at a change of the parameters of the Motion Control instruction "MC_CamTrack" or in the technology data block. The cam track is processed in accordance with all parameter settings.

Parameters

The following table shows the parameters of Motion Control instruction "MC_OutputCam":

Parameters	Declaration	Data type	Default value	Description		
CamTrack	INPUT	TO_CamTrack	-	Technology object		
Enable	INPUT	BOOL	FALSE	FALSE	Cam track is disabled	
				TRUE	Cam track is processed	
Mode	INPUT	INT	1	0	"Enable" = TRUE	Cam track processing is activated immediately Cam track data takes effect immediately Previously activated distance output cams are aborted if their track signal is not still set due to the changed cam track data. Previously activated time-based output cams are always aborted.
					"Enable" = FALSE	Cam track processing is stopped immediately, distance output/time-based output cams are aborted immediately.
				1	"Enable" = TRUE	Cam track processing is activated immediate-ly/with the next track cycle: • When a cam track is activated for the first time, the cam track processing begins immediately. • If the cam track processing is already active, the current cam track is output up to the end of the track cycle. The new cam track data then takes effect.
					"Enable" = FALSE	Cam track processing is ended at the end of the cam track

Parameters	Declaration	Data type	Default value	Description		
				2	"Enable" = TRUE	Cam track output is switched on immediately and remains switched on
					"Enable" = FALSE	Cam track output is switched off immediately
InvertOutput	INPUT	BOOL	FALSE	Inverted output		
				TRUE	Track output is output inverted	
				FALSE	Track output is output not inverted	
TrackOutput	OUTPUT	BOOL	-	Indicates the switching state of the cam track.		
Busy	OUTPUT	BOOL	FALSE	TRUE	Processing of the cam track is active.	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The cause of the error can be found in the "ErrorID" parameter.	
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 559) for parameter "ErrorID"

① Axis reference position
② Cam configured as invalid
③ Start of cyclically continued cam track

A cam track is activated with "Enable" = TRUE. The cam track is output in accordance with the parameters set in the technology data block.

Tag		Value	Description
<TO>Parameter.			
	CamTrackType	0	Specified cam type for the cam track is distance output cam
	ReferencePosition	20.0	Specified axis reference position for the cam track
	CamTrackLength	100.0	Specified length of the cam track
	CamTrack[1].Existent	TRUE	The first distance output cam of the cam track is specified as valid
	CamTrack[1].OnPosition	10.0	Start position for the first cam of the cam track
	CamTrack[1].OffPosition	20.0	End position for the first cam of the cam track
	CamTrack[2].Existent	FALSE	The second distance output cam of the cam track is specified as invalid
	CamTrack[2].OnPosition	30.0	Start position for the second cam of the cam track
	CamTrack[2].OffPosition	50.0	End position for the second cam of the cam track
	CamTrack[3].Existent	TRUE	The third distance output cam of the cam track is specified as valid
	CamTrack[3].OnPosition	60.0	Start position for the third cam of the cam track
	CamTrack[3].OffPosition	90.0	End position for the third cam of the cam track

11.1.12 Synchronous motion

11.1.12.1 MC_GearIn V3

MC_GearIn: Start gear synchronization V3

Description

With the Motion Control instruction "MC_GearIn, you start a gearing (Page 110) operation between a leading axis and a following axis.

You define the dynamic behavior of the following axis for synchronization with parameters "Jerk", "Acceleration" and "Deceleration".

The synchronization duration and distance are dependent on the following parameters:

- Start time of the "MC_GearIn" job
- Dynamics of the following axis at the start time
- Dynamic settings for synchronization
- Dynamics of the leading axis

You specify the gear ratio as the relationship between two integers (numerator/denominator) with the parameters "RatioNumerator" and "RatioDenominator".

The numerator of the gear ratio is specified as positive or negative. This yields the following behavior:

- **Positive gear ratio:**

  The leading and following axes move in the same direction.

- **Negative gear ratio**:

  The following axis moves in the opposite direction of the leading axis.

You can start synchronous operation when the leading axis is at a standstill or when it is in motion.

Applies to

- Synchronous axis

Requirements

- The technology objects of the leading axis and the following axis have been configured correctly.
- The leading axis is a positioning axis, synchronous axis, or external encoder.
- The following axis is a synchronous axis.
- The leading axis is specified as possible leading axis in the configuration of the following axis in "Technology object > Configuration > Leading value interconnections".
- The following axis is enabled.

Override response

The override characteristics for "MC_GearIn" jobs are described in section Override response of Motion Control commands V3 (Page 439).

Disabling the leading axis with "MC_Power.Enable" = FALSE does not abort synchronous operation. The following axis follows the leading axis even during the braking ramp and after the leading axis is enabled again.

Parameters

The following table shows the parameters of Motion Control instruction "MC_GearIn":

Parameters	Declaration	Data type	Default value	Description
Master	INPUT	TO_Axis	-	Leading axis technology object
Slave	INPUT	TO_SynchronousAxis	-	Following axis technology object
Execute	INPUT	BOOL	FALSE	Start job with a positive edge
RatioNumerator	INPUT	DINT	1	Gear ratio numerator Permitted integer values: -2147483648 to 2147483648 (value 0 not permitted)
RatioDenominator	INPUT	DINT	1	Gear ratio denominator Permitted integer values: 1 to 2147483648
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: Not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)

Parameters	Declaration	Data type	Default value	Description	
InGear	OUTPUT	BOOL	FALSE	TRUE	Synchronous operation reached The following axis is synchronized and moves synchronously to the leading axis.
Busy	OUTPUT	BOOL	FALSE	TRUE	Job is running.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	The job was aborted by another job during execution.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred while processing the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 559) for parameter "ErrorID"	

Starting synchronous operation

To start synchronous operation with the Motion Control instruction "MC_GearIn", follow these steps:

1. Check the requirements indicated above.
2. Specify the leading axis, the following axis and the gear ratio at the corresponding parameters.
3. Start the "MC_GearIn" job with a positive edge at parameter "Execute".

The following axis is synchronized to the leading value of the leading axis. If the "InGear" parameter shows the value TRUE, the following axis is synchronized and moves synchronously to the leading axis. The parameters "InGear" and "Busy" show the value TRUE until the "MC_GearIn" job is overridden by another Motion Control job.

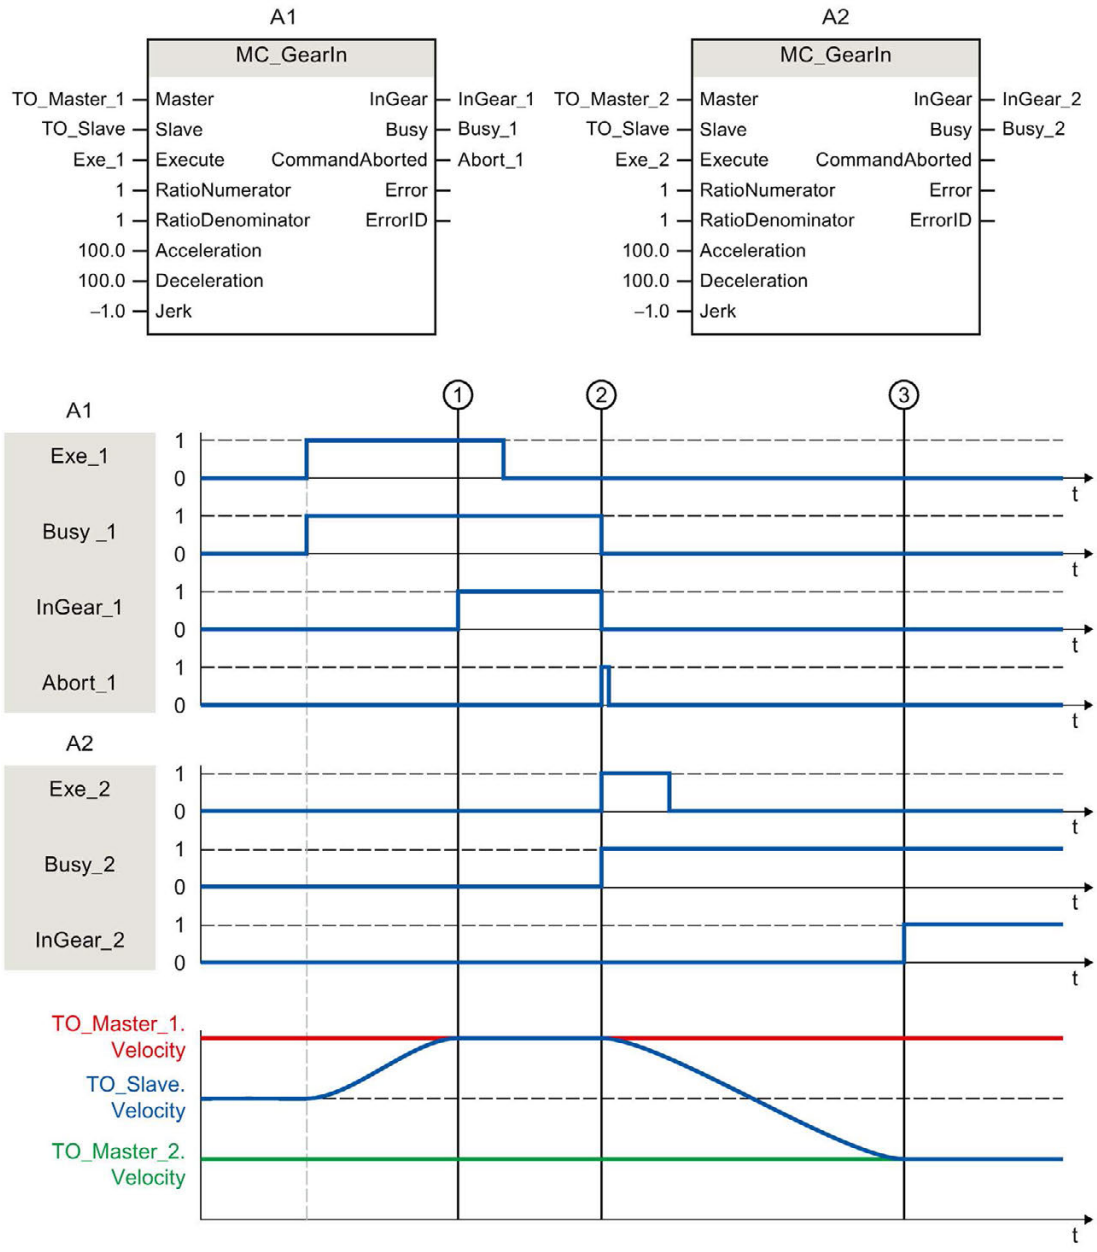
Override response of Motion Control commands V3 (Page 439)

Error ID for Motion Control instructions (Page 559)

MC_GearIn: Function chart V3

Function chart: Synchronizing and switching the leading value



Using "Exe_1", an "MC_GearIn" job (A1) is initiated. The following axis (TO_Slave) is synchronized to the leading axis (TO_Master_1). "InGear_1" signals at time ① that the following axis is synchronized and moves synchronously to the leading axis.

At time ②, synchronous operation is overridden by another "MC_GearIn" job (A2). The abort is signaled via "Abort_1". The following axis is synchronized to the new leading axis (TO_Master_2). "InGear_2" signals at time ③ that the following axis is synchronized and moves synchronously to the leading axis.

11.1.13 Override response of Motion Control commands V3

Homing and motion jobs

The following table shows how a new Motion Control job affects active homing and motion jobs:

⇒ Active job ⇓ New job	MC_Home Mode = 2, 8, 10	MC_Home Mode = 3, 5	MC_Halt	MC_Move Absolute	MC_Move Relative	MC_Move Velocity	MC_Move Jog	MC_Move Super imposed

MC_GearInPos active (Busy = TRUE, StartSync or InSync = TRUE)	-	A	A	A	A	A	A	A
MC_CamIn pending (Busy = TRUE, StartSync = FALSE, InSync = FALSE)	-	-	-	-	-	-	-	-
MC_CamIn active (Busy = TRUE, StartSync or InSync = TRUE)	-	A	A	A	A	A	A	A

A The running job is aborted with "JobAborted" = TRUE. The current dynamics is smoothly transitioned to the dynamic values of the new job.

- No effect, running job continues to be executed

Synchronous operation jobs

The following table shows how a new Motion Control job affects the motion of the axis on active synchronous operation jobs:

⇒ Active job ⇓ New job	MC_ GearIn	MC_GearIn-Pos pending (Busy = TRUE, InSync = FALSE, StartSync = FALSE)	MC_GearIn Pos active (Busy = TRUE, StartSync or InSync = TRUE)	MC_ Phasing Absolute	MC_ Phasing Relative	MC_CamIn pending (Busy = TRUE, InSync = FALSE, StartSync = FALSE)	MC_CamIn active (Busy = TRUE, StartSync or InSync = TRUE)
MC_Home Mode = 3, 5	A	-	A	A	A	-	A
MC_Halt	A	-	A	A	A	-	A
MC_MoveAbsolute	A	-	A	A	A	-	A
MC_MoveRelative	A	-	A	A	A	-	A
MC_MoveVelocity	A	-	A	A	A	-	A
MC_MoveJog	A	-	A	A	A	-	A
MC_MoveSuperimposed	-	-	-	-	-	-	-
MC_GearIn	A	A	A	A	A	A	A
MC_GearInPos pending (Busy = TRUE, StartSync = FALSE, InSync = FALSE)	-	A	-	-	-	A	-
MC_GearInPos active (Busy = TRUE, StartSync or InSync = TRUE)	A	A	A	A	A	A	A
MC_PhasingAbsolute	-	-	-	A	A	-	-
MC_PhasingRelative	-	-	-	A	A	-	-
MC_CamIn pending (Busy = TRUE, StartSync = FALSE, InSync = FALSE)	-	A	-	-	-	A	-
MC_CamIn active (Busy = TRUE, StartSync or InSync = TRUE)	A	A	A	A	A	A	A

A The running job is aborted with "JobAborted" = TRUE. The current dynamics is smoothly transitioned to the dynamic values of the new job.

- No effect, running job continues to be executed

A pending synchronous operation (Busy = TRUE, StartSync = FALSE, InSync = FALSE) does not cancel active commands. Only a pending synchronous operation command is permitted. A second pending synchronous operation command cancels the first pending synchronous operation command.

When one synchronous operation command is active and one synchronous operation command is pending, a new motion command cancels the active as well as the pending synchronous operation command.

Measuring input

The following table shows which new Motion Control jobs will override active measuring input jobs:

⇒ Active job ⇓ New job	MC_MeasuringInput	MC_MeasuringInputCyclic
MC_Home Mode = 2, 3, 5, 8, 9, 10	A	A
MC_Home Mode = 0, 1, 6, 7	-	-
MC_MeasuringInput	A	A
MC_MeasuringInputCyclic	A	A
MC_AbortMeasuringInput	A	A

A The running job is aborted with "JobAborted" = TRUE. The new job will be executed.

- No effect, running job continues to be executed

Appendix A

A.1 Tags of the speed axis technology object

A.1.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.1.2 Actual values and setpoints (speed axis)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 442)

Tag	Data type	Values	W	Description
Velocity	LREAL	-	RON	Setpoint velocity / setpoint speed
ActualSpeed	LREAL	-	RON	Actual speed of the motor (with analog setpoint = 0.0)
Acceleration	LREAL	-	RON	Setpoint acceleration

A.1.3 Variable simulation (speed axis)

The tag structure <TO>.Simulation.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
Simulation.		STRUCT			
	Mode	UDINT	-	RES[1)]	Simulation mode 0: No simulation, normal operation 1: Simulation mode

1) Technology version V2.0: RON

A.1.4 VirtualAxis tag (speed axis)

The tag structure <TO>.VirtualAxis.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
VirtualAxis.		STRUCT			
	Mode	UDINT	-	RON	Virtual axis 0: No virtual axis 1: Axis is always and exclusively operated in simulation

A.1.5 Actor tags (speed axis)

The tag structure <TO>.Actor.<tag name> contains the controller-side configuration of the drive.

Tags

Legend (Page 442)

Tag	Data type	Values	W	Description
Actor.	STRUCT			
Type	DINT	-	RON	Drive connection 0: Analog output 1: PROFIdrive telegram
InverseDirection	BOOL	-	RES	Inversion of the setpoint FALSE: no TRUE: Yes
DataAdaption	DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque in the device 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
Efficiency	LREAL	0.0 to 1.0	RES	Efficiency of gear
Interface.	STRUCT			
AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
AdressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram or the analog setpoint
EnableDriveOutput	BOOL	-	RES	"Enable output" for analog drives FALSE: disabled TRUE: Activated
EnableDriveOutput-Address	VREF	0 to 65535	RON	Address for the "Enable output" for analog setpoint
DriveReadyInput	BOOL	-	RES	"Ready input" for analog drives The analog drive signals its readiness to receive speed setpoints. FALSE: disabled TRUE: Activated
DriveReadyIn-putAddress	VREF	0 to 65535	RON	Address for the "Enable input" for analog setpoint

Tag			Data type	Values	W	Description
	DriveParameter.					
		ReferenceSpeed	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the speed setpoint (N-set) of the drive The speed setpoint is transferred in the PROFIdrive telegram as a normalized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, provided the drive permits this.
		MaxSpeed	LREAL	0.0 to 1.0E12	RES	Maximum value for the speed setpoint of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)
		ReferenceTorque	LREAL	0.0 to 1.0E12	RES	Reference torque of drive (p2003). Valid for standard motor setting.

A.1.6 Torque Limiting tag (speed axis)

The tag structure <TO>.TorqueLimiting.<tag name> contains the configuration of the torque limiting.

Tags

Legend (Page 442)

Tag			Data type	Values	W	Description
TorqueLimiting.			STRUCT			
	LimitBase		DINT	-	RES	Torque limiting 0: Motor side 1: Load side
	PositionBased-Monitorings		DINT	-	RES	Positioning and following error monitoring 0: Monitoring deactivated 1: Monitoring activated
	LimitDefaults.		STRUCT			
		Torque	LREAL	0.0 to 1.0E12	CAL	Limiting torque
		Force	LREAL	0.0 to 1.0E12	CAL	Limiting force

A.1.7 LoadGear tags (speed axis)

The tag structure <TO>.LoadGear.<tag name> contains the configuration of the load gear.

Tags

Legend (Page 442)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear numerator
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.1.8 Units tags (speed axis)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	VelocityUnit	UDINT	-	RON	Unit for velocity	
					1082	1/s
					1083	1/min
					1528	1/h
	TimeUnit	UDINT	-	RON	Unit for time	
					1054	s
	TorqueUnit	UDINT	-	RON	Unit for torque	
					1126	Nm
					1128	kNm
					1529	lbf in (pound-force-inch)
					1530	lbf ft
					1531	ozf in (ounce-force-inch)
					1532	ozf ft
					1533	pdl in (poundal-inch)
					1534	pdl ft
	ForceUnit	UDINT	-	RON	Unit for force	
					1120	N
					1122	kN
					1094	lbf (pound-force)
					1093	ozf (ounce-force)
					1535	pdl (poundals)

A.1.9 DynamicLimits tags (speed axis)

The tag structure <TO>.DynamicLimits.<tag name> contains the configuration of the dynamic limits. During Motion Control, no dynamic values greater than the dynamic limits are permitted. If you have specified greater values in a Motion Control instruction, then motion is performed using the dynamic limits, and a warning is indicated (alarm 501 to 503 - Dynamic values were limited).

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
DynamicLimits.		STRUCT			
	MaxVelocity	LREAL	0.0 to 1.0E12	RES	Maximum permissible velocity of the axis
	MaxAcceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible acceleration of the axis
	MaxDeceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible deceleration of the axis
	MaxJerk	LREAL	0.0 to 1.0E12	DIR	Maximum permissible jerk on the axis

A.1.10 DynamicDefaults tags (speed axis)

The tag structure <TO>.DynamicDefaults.<tag name> contains the configuration of the dynamic defaults. These settings will be used when you specify a dynamic value less than 0.0 in a Motion Control instruction (exceptions: MC_MoveJog.Velocity, MC_MoveVelocity.Velocity). Changes to the default dynamic values will be applied at the next positive edge at the "Execute" parameter of a Motion Control instruction.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
DynamicDefaults.		STRUCT			
	Velocity	LREAL	0.0 to 1.0E12	CAL	Default velocity
	Acceleration	LREAL	0.0 to 1.0E12	CAL	Default acceleration
	Deceleration	LREAL	0.0 to 1.0E12	CAL	Default deceleration
	Jerk	LREAL	0.0 to 1.0E12	CAL	Default jerk
	EmergencyDeceleration	LREAL	0.0 to 1.0E12	DIR	Emergency stop deceleration

A.1.11 Override tags (speed axis)

The tag structure <TO>.Override.<tag name> contains the configuration for the override parameters. The override parameters are used to apply a correction percentage to default values. An override change takes effect immediately, and is performed with the dynamic settings in effect in the Motion Control instruction.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

A.1.12 StatusDrive tags (speed axis)

The tag structure <TO>.StatusDrive.<tag name> indicates the status of the drive.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
StatusDrive.		STRUCT			
	InOperation	BOOL	-	RON	Operational status of the drive FALSE: Drive not ready. Setpoints will not be executed. TRUE: Drive ready. Setpoints can be executed.
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and drive FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No drive error TRUE: Drive error
	AdaptionState	DINT	-	RON	Status of automatic data transfer of drive parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

A.1.13 StatusWord tag (speed axis)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 0 "Enable") can be found in the section Evaluating StatusWord, ErrorWord and WarningWord (Page 298).

Tag

Legend (Page 442)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"ControlPanelActive" Axis control panel 0: Deactivated 1: Activated
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"Done" 0: Motion job is running, or axis control panel active 1: No motion job is running and axis control panel deactivated
Bit 7	-	-	-	Reserved
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	"JogCommand" 0: No "MC_MoveJog" job running 1: "MC_MoveJog" job running
Bit 10	-	-	-	"VelocityCommand" 0: No "MC_MoveVelocity" job running 1: "MC_MoveVelocity" job running
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	"ConstantVelocity" 0: Axis is accelerating or decelerating. 1: Velocity setpoint reached. The axis is traversing at this constant velocity or is at a standstill.

Tag	Data type	Values	W	Description
Bit 13	-	-	-	"Accelerating" 0: No acceleration process active 1: Acceleration process active
Bit 14	-	-	-	"Decelerating" 0: No deceleration process active 1: Deceleration process active
Bit 15... Bit 24	-	-	-	Reserved
Bit 25	-	-	-	"AxisSimulation" 0: No simulation 1: Simulation is active
Bit 26	-	-	-	"TorqueLimitingCommand" 0: No "MC_TorqueLimiting" job is running 1: "MC_TorqueLimiting" job is running
Bit 27	-	-	-	"InLimitation" 0: Drive is not operating at the torque limit 1: Drive is operating at the torque limit
Bit 28... Bit 31	-	-	-	Reserved

A.1.14 ErrorWord tag (speed axis)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 442)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" System error
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveFault" Error in drive
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14	-	-	-	Reserved
Bit 15	-	-	-	"AdaptionError" Error during data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.1.15 ErrorDetail tags (speed axis)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0 to 5	RON	Effective alarm reaction 0: No reaction 1: Stop with current dynamic values 2: Stop with maximum dynamic values 3: Stop with emergency stop ramp 4: Remove enable 5: Track setpoints

A.1.16 WarningWord tag (speed axis)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 13 "PeripheralWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 442)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveWarning" Error in drive
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicWarning" Specified dynamic values are limited to permissible values.
Bit 7				"CommunicationWarning" Communication error Missing or faulty communication.
Bit 8... Bit 12				Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14				Reserved
Bit 15				"AdaptionWarning" Error in automatic data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.1.17 ControlPanel tags (speed axis)

The tag structure <TO>.ControlPanel.<tag name> contains no user-relevant data. This tag structure is internally used.

Tags

Legend (Page 442)

A.1.18 InternalToTrace tags (speed axis)

The tag structure <TO>.InternalToTrace.<tag name> contains no user-relevant data. This tag structure is internally used.

Tags

Legend (Page 442)

Tag		Data type	Values	W	Description
InternalToTrace.		ARRAY [1..4] OF STRUCT			
	Id	DINT	-	DIR	-
	Value	LREAL	-	DIR	-

A.2 Tags of the positioning axis/synchronous axis technology object

A.2.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value (L - linear specification R - rotary specification) If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.2.2 Actual values and setpoints (positioning axis/synchronous axis)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 456)

Tag	Data type	Values	W	Description
Position	LREAL	-	RON	Position setpoint
Velocity	LREAL	-	RON	Velocity setpoint / speed setpoint
ActualPosition	LREAL	-	RON	Actual position
ActualVelocity	LREAL	-	RON	Actual velocity
ActualSpeed	LREAL	-	RON	Actual speed of the motor (with analog setpoint = 0.0)
Acceleration	LREAL	-	RON	Setpoint acceleration
ActualAcceleration	LREAL	-	RON	Actual acceleration
OperativeSensor	UDINT	1 to 4	RON	Operative encoder

A.2.3 Simulation tag (positioning axis / synchronous axis)

The tag structure <TO>.Simulation.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
Simulation.		STRUCT			
	Mode	UDINT	-	RES[1])	Simulation mode 0: No simulation, normal operation 1: Simulation mode

1) Technology version V2.0: RON

A.2.4 VirtualAxis tag (positioning axis/synchronous axis)

The tag structure <TO>.VirtualAxis.<tag name> contains the configuration of the simulation mode. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
VirtualAxis.		STRUCT			
	Mode	UDINT	-	RON	Virtual axis 0: No virtual axis 1: Axis is always and exclusively operated in simulation

A.2.5 Actor tags (positioning axis/synchronous axis)

The tag structure <TO>.Actor.<tag name> contains the controller-side configuration of the drive.

Tags

Legend (Page 456)

Tag	Data type	Values	W	Description
Actor.	STRUCT			
Type	DINT	-	RON	Drive connection 0: Analog output 1: PROFIdrive telegram
InverseDirection	BOOL	-	RES	Inversion of the setpoint FALSE: no TRUE: Yes
DataAdaption	DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
Efficiency	LREAL	0.0 to 1.0	RES	Efficiency of mechanics (gear and leadscrew)
Interface.	STRUCT			
AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
AdressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram or the analog setpoint
EnableDriveOutput	BOOL	-	RES	"Enable output" for analog drives FALSE: disabled TRUE: Activated
EnableDriveOutput-Address	VREF	0 to 65535	RON	Address for the "Enable output" for analog setpoint
DriveReadyInput	BOOL	-	RES	"Ready input" for analog drives The analog drive signals its readiness to receive speed setpoints. FALSE: disabled TRUE: Activated
DriveReadyIn-putAddress	VREF	0 to 65535	RON	Address for the "Enable input" for analog setpoint

Tag			Data type	Values	W	Description
	DriveParameter.					
		ReferenceSpeed	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the speed setpoint (N-set) of the drive The speed setpoint is transferred in the PROFIdrive telegram as a normalized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, provided the drive permits this.
		MaxSpeed	LREAL	0.0 to 1.0E12	RES	Maximum value for the speed setpoint of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)
		ReferenceTorque	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the drive torque

Tag			Data type	Values	W	Description
	Parameter.					
		Resolution	LREAL	1.0E-12 to 1.0E12	RES	Resolution of a linear encoder (offset between two encoder pulses)
		StepsPer-Revolution	UDINT	1 to 8388608	RES	Increments per rotary encoder revolution
		FineResolution-Xist1	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST1 (cyclic actual encoder value)
		FineResolution-Xist2	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST2 (absolute value of encoder)
		Determinable-Revolutions	UDINT	0 to 8388608	RES	Number of differentiable encoder revolutions for a multi-turn absolute encoder (For a single-turn absolute encoder = 1; for an incremental encoder = 0)
		DistancePer-Revolution	LREAL	0.0 to 1.0E12	RES	Load distance per revolution of an externally mounted encoder
	ActiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of the digital input for active homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction
		DigitalInput-Address	VREF	0 to 65535	RON	Address of digital input
		HomePosition-Offset	LREAL	-1.0E12 to 1.0E12	CAL	Home position offset
		SwitchLevel	BOOL	-	RES	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level

Tag			Data type	Values	W	Description
	PassiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of digital input during passive homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction 2: Current homing direction
		DigitalInput-Address	VREF	0 to 65535	RON	Address of digital input
		SwitchLevel	BOOL	-	RES	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level

A.2.9 Extrapolation tag (positioning axis/synchronous axis)

The tag structure <TO>.Extrapolation.<tag name> contains the configuration of the actual value extrapolation.

Tags

Legend (Page 456)

Tag	Data type	Values	W	Description
Extrapolation.	STRUCT			
LeadingAxis-DependentTime	LREAL	-	RON	Extrapolation time component (caused by leading axis) Results from the following times: • Time of actual value acquisition for the leading axis • Ipo cycle • Time of actual position filter of leading axis (T1 + T2)
FollowingAxis-DependentTime	LREAL	0.0 to 1.0E12	DIR	Extrapolation time component (caused by following axis) Results from the following times: • For a following axis with set velocity precontrol: – Communication cycle – Ipo cycle – Speed control loop substitute time for the following axis – Output time of the setpoint for the following axis • For a following axis without velocity precontrol: – Communication cycle – Ipo cycle – Position control loop equivalent time (1/Kv from <TO>.PositionControl.Kv) – Output time of the setpoint for the following axis
PositionFilter.	STRUCT			
T1	LREAL	0.0 to 1.0E12	DIR	Position filter time constant T1
T2	LREAL	0.0 to 1.0E12	DIR	Position filter time constant T2
VelocityFilter.	STRUCT			
T1	LREAL	0.0 to 1.0E12	DIR	Velocity filter time constant T1
VelocityTolerance.	STRUCT			
Range	LREAL	0.0 to 1.0E12	DIR	Tolerance band width for velocity
Hysteresis.	STRUCT			
Value	LREAL	0.0 to 1.0E12	DIR	Hysteresis value

A.2.10 LoadGear tags (positioning axis/synchronous axis)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 456)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.2.11 Properties tags (positioning axis/synchronous axis)

The tag structure <TO>.Properties.<tag name> contains the configuration of the type of axis or motion.

Tags

Legend (Page 456)

Tag		Data type	Value range	W	Description
Properties.		STRUCT			
	MotionType	DINT	-	RON	Indication of axis or motion type: 0: Linear axis or motion 1: Rotary axis or motion

A.2.12 Units tag (positioning axis/synchronous axis)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m

					1122	kN
					1094	lbf (pound-force)
					1093	ozf (ounce-force)
					1535	pdl (poundals)

A.2.13 Mechanics tags (positioning axis/synchronous axis)

The tag structure <TO>.Mechanics.<tag name> contains the configuration of the mechanics.

Tags

Legend (Page 456)

Tag		Data type	Value range	W	Description
Mechanics.		STRUCT			
	LeadScrew	LREAL	0.0 to 1.0E12	RES	Leadscrew pitch

A.2.14 Modulo tags (positioning axis/synchronous axis)

The tag structure <TO>.Modulo.<tag name> contains the configuration of the modulo function.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
Modulo.		STRUCT			
	Enable	BOOL	-	RES	FALSE: Modulo conversion disabled TRUE: Modulo conversion enabled When modulo conversion is enabled, a check is made for modulo length > 0.0
	Length	LREAL	0.001 to 1.0E12	RES	Modulo length
	StartValue	LREAL	-1.0E12 to 1.0E12	RES	Modulo start value

Evaluating the technology data block (Page 295)

A.2.15 DynamicLimits tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicLimits.<tag name> contains the configuration of the dynamic limits. During Motion Control, no dynamic values greater than the dynamic limits are permitted. If you have specified greater values in a Motion Control instruction, then motion is performed using the dynamic limits, and a warning is indicated (alarm 501 to 503 - Dynamic values were limited).

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
DynamicLimits.		STRUCT			
	MaxVelocity	LREAL	0.0 to 1.0E12	RES	Maximum permissible velocity of the axis
	MaxAcceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible acceleration of the axis
	MaxDeceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible deceleration of the axis
	MaxJerk	LREAL	0.0 to 1.0E12	DIR	Maximum permissible jerk on the axis

See also

Evaluating the technology data block (Page 295)

A.2.16 DynamicDefaults tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicDefaults.<tag name> contains the configuration of the dynamic defaults. These settings will be used when you specify a dynamic value less than 0.0 in a Motion Control instruction (exceptions: MC_MoveJog.Velocity, MC_MoveVelocity.Velocity). Changes to the default dynamic values will be applied at the next positive edge at the "Execute" parameter of a Motion Control instruction.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
DynamicDefaults.		STRUCT			
	Velocity	LREAL	0.0 to 1.0E12	CAL	Default velocity
	Acceleration	LREAL	0.0 to 1.0E12	CAL	Default acceleration
	Deceleration	LREAL	0.0 to 1.0E12	CAL	Default deceleration
	Jerk	LREAL	0.0 to 1.0E12	CAL	Default jerk
	EmergencyDeceleration	LREAL	0.0 to 1.0E12	DIR	Emergency stop deceleration

Evaluating the technology data block (Page 295)

A.2.20 Override tags (positioning axis/synchronous axis)

The tag structure <TO>.Override.<tag name> contains the configuration for the override parameters. The override parameters are used to apply a correction percentage to default values. An override change takes effect immediately, and is performed with the dynamic settings in effect in the Motion Control instruction.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

See also

Evaluating the technology data block (Page 295)

A.2.21 PositionControl tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionControl.<tag name> contains the settings of closed loop position control.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
PositionControl.		STRUCT			
	Kv	LREAL	0.0 to 2147480.0	DIR	Proportional gain of the closed loop position control("Kv" > 0.0)
	Kpc	LREAL	0.0 to 150.0%	DIR	Velocity precontrol of the closed loop position control Recommended setting: • Isochronous drive connection via PROFIdrive: 100.0% • Non-isochronous drive connection via PROFIdrive: 0.0 to 100.0% • Analog drive connection: 0.0 to 100.0%
	EnableDSC	BOOL	-	RES	Dynamic Servo Control (DSC) FALSE: DSC disabled TRUE: DSC enabled DSC is only possible with one of the following PROFIdrive telegrams: • Standard telegram 5 or 6 • SIEMENS telegram 105 or 106
	SmoothingTimeBy-ChangeDifference	LREAL	0.0 to 1.0E+12	DIR	Manipulated variable ramp at step change of control deviation due to encoder switchover.
	InitialOperativeSensor	UDINT	-	RES	Active encoder after initialization of the axis. (encoder number 1 to 4) This encoder is used after startup of the CPU and after a restart of the technology object (Page 324). At an operating mode transition from STOP → RUN of the CPU (without restart of the technology object), the encoder that was also active before the STOP is still being used.

Tag			Data type	Values	W	Description
	ControlDifference-Quantization.		STRUCT			
		Mode	DINT	-	RES	Type of quantification Configuration of a quantization when a drive with stepper motor interface is connected 0: No quantification 1: Quantization corresponding to encoder resolution 2: Quantization to a direct value (configuration is performed using the parameter view (data structure))
		Value	LREAL	0.001 to 1.0E+12	RES	Value of quantification Configuration of a value for quantization to a direct value (<TO>.PositionControl.-ControlDifferenceQuantization.Mode = 2) (configuration is performed using the parameter view (data structure))

Evaluating the technology data block (Page 295)

A.2.22 DynamicAxisModel tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicAxisModel.<tag name> contains the settings of the balancing filter.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
DynamicAxisModel.		STRUCT			
	VelocityTimeConstant	LREAL	0.0 to 1.0E12	DIR	Speed control loop substitute time [s]

A.2.23 FollowingError tags (positioning axis/synchronous axis)

The tag structure <TO>.FollowingError.<tag name> contains the configuration for following error monitoring.

If the permissible following error is exceeded, then technology alarm 521 is output, and the technology object is disabled (alarm reaction: remove enable).

When the warning level is reached, a warning is output (technology alarm 522).

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
FollowingError.		STRUCT			
	EnableMonitoring	BOOL	-	RES	FALSE: Following error monitoring disabled TRUE: Following error monitoring enabled
	MinValue	LREAL	L: 0.0 to 1.0E12 R: 0.001 to 1.0E12	DIR	Permissible following error at velocities below the value of "MinVelocity".
	MaxValue	LREAL	L: 0.0 to 1.0E12 R: 0.002 to 1.0E12	DIR	Maximum permissible following error, which may be reached at the maximum velocity.
	MinVelocity	LREAL	0.0 to 1.0E12	DIR	"MinValue" is permissible below this velocity and is held constant.
	WarningLevel	LREAL	0.0 to 100.0	DIR	Warning level: Percentage value relative to the valid maximum following error.

Evaluating the technology data block (Page 295)

A.2.24 PositionMonitoring tags (positioning axis/synchronous axis)

The tag structure <TO>.PositioningMonitoring.<tag name> contains the configuration for position monitoring at the end of a positioning motion.

If the actual position value at the end of a positioning motion is reached within the tolerance time and remains in the positioning window for the minimum dwell time, then <TO>.StatusWord.X5 (Done) is set in the technology data block. This completes a Motion Control job.

If the tolerance time is exceeded, then technology alarm 541 "Positioning monitoring" with supplemental value 1: "Target area not reached within the positioning tolerance time" will be indicated.

If the minimum dwell time is not met, then technology alarm 541 "Positioning monitoring" with supplemental value 2: "Target area exited within the minimum dwell time" will be indicated.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
PositioningMonitoring.		STRUCT			
	ToleranceTime	LREAL	0.0 to 1.0E12	DIR	Tolerance time Maximum permitted duration from reaching velocity setpoint zero, until entrance into the positioning window.
	MinDwellTime	LREAL	0.0 to 1.0E12	DIR	Minimum dwell time in the positioning window:
	Window	LREAL	0.0 to 1.0E12	DIR	Positioning window

A.2.30 StatusExtrapolation tag (positioning axis/synchronous axis)

The tag structure <TO>.StatusExtrapolation.<tag name> indicates the status of the actual value extrapolation.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
Extrapolation.		STRUCT			
	FilteredPosition	LREAL	-1.0E12 to 1.0E12	RON	Position after position filter
	FilteredVelocity	LREAL	-1.0E12 to 1.0E12	RON	Velocity according to tolerance band
	ExtrapolatedPosition	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated position
	ExtrapolatedVelocity	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated velocity

A.2.31 StatusSynchronizedMotion tags (synchronous axis)

The tag structure <TO>.StatusSynchronizedMotion.<tag name> indicates the status of the synchronous operation.

Tags

Legend (Page 456)

Tag			Data type	Value range	W	Description
StatusSynchronizedMotion.			STRUCT			
	FunctionState		DINT	-	RON	Indication of which synchronous operation function is active 0: No synchronous operation active 1: Gearing (MC_GearIn) 2: Gearing with specified synchronous positions (MC_GearInPos) 3: Camming (MC_CamIn)
	PhaseShift		LREAL	-1.0E12 to 1.0E12	RON	Current absolute leading value shift
	ActualMaster		DB_ANY	0 to 65535	RON	At the start of a "MC_GearIn" job, the number of the technology data block of the currently used leading axis is displayed. "ActualMaster" = 0 when synchronous operation is inactive
	ActualCam		DB_ANY	0 to 65535	RON	Cam that is currently being used for camming
	MasterOffset		LREAL	-1.0E12 to 1.0E12	RON	Current shift of the leading value range of the cam
	MasterScaling		LREAL	-1.0E12 to 1.0E12	RON	Current scaling of the leading value range of the cam
	SlaveOffset		LREAL	-1.0E12 to 1.0E12	RON	Current shift of the following value range of the cam
	SlaveScaling		LREAL	-1.0E12 to 1.0E12	RON	Current scaling of the following value range of the cam
	StatusWord.		STRUCT			
	Bit 0	MaxVelocity-Exceeded	BOOL	-	RON	Configured maximum velocity is exceeded during synchronous operation.
	Bit 1	MaxAcceleration-Exceeded	BOOL	-	RON	Configured maximum acceleration is exceeded during synchronous operation.
	Bit 2	MaxDeceleration-Exceeded	BOOL	-	RON	Configured maximum deceleration is exceeded during synchronous operation.
	Bit 3	InSimulation	BOOL	-	RON	FALSE: Synchronous operation not simulated TRUE: Synchronous operation is being simulated
	Bit 4... Bit 31	-	BOOL	-	RON	Reserved

Bit 16	-	-	-	"SWLimitMaxActive" 0: Positive software limit switch not reached 1: Positive software limit switch reached or overtraveled
Bit 17	-	-	-	"HWLimitMinActive" 0: Negative hardware limit switch not reached 1: Negative hardware limit switch reached or overtraveled
Bit 18	-	-	-	"HWLimitMaxActive" 0: Positive hardware limit switch not reached 1: Positive hardware limit switch reached or overtraveled
Bit 19	-	-	-	Reserved
Bit 20	-	-	-	Reserved
Bit 21	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronizing" 0: Axis is not being synchronized to a leading value. 1: Axis is being synchronized to a leading value.
Bit 22	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronous" 0: Axis is not moving synchronously to a leading value. 1: Axis is moving synchronously to a leading value.

Tag	Data type	Values	W	Description
Bit 23	-	-	-	"SuperimposedMotionCommand" 0: No superimposed motion active 1: Superimposed motion active
Bit 24	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "PhasingCommand" 0: No Motion Control instruction for leading value shift is active 1: Motion Control instruction for leading value shift is active
Bit 25	-	-	-	"AxisSimulation" 0: No simulation 1: Simulation is active
Bit 26	-	-	-	"TorqueLimitingCommand" 0: No "MC_TorqueLimiting" job is running 1: "MC_TorqueLimiting" job is running
Bit 27	-	-	-	"InLimitation" 0: Drive is not operating at the torque limit 1: Drive is operating at the torque limit
Bit 28	-	-	-	"NonPositionControlled" 0: Axis is in position-controlled mode 1: Axis is in non-position-controlled mode
Bit 29	-	-	-	Reserved
Bit 30	-	-	-	"InClamping" 0: Axis is not clamped at a fixed stop. 1: Axis is clamped at a fixed stop.
Bit 31	-	-	-	Reserved

A.2.33 ErrorWord tag (positioning axis/synchronous axis)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 456)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveFault" Error in drive
Bit 5	-	-	-	"SensorFault" Error in encoder system
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	"SWLimit" Software limit switch reached or overtraveled.
Bit 9	-	-	-	"HWLimit" Hardware limit switch reached or overtraveled.
Bit 10	-	-	-	"HomingError" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	"FollowingErrorFault" Following error limits exceeded
Bit 12	-	-	-	"PositioningFault" Positioning error

Tag	Data type	Values	W	Description
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "SynchronousError" Error during synchronous operation The leading axis specified for the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis.
Bit 15	-	-	-	"AdaptionError" Error in automatic data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.2.34 ErrorDetail tags (positioning axis/synchronous axis)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 456)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0 to 5	RON	Effective alarm reaction 0: No reaction 1: Stop with current dynamic values 2: Stop with maximum dynamic values 3: Stop with emergency stop ramp 4: Remove enable 5: Track setpoints

A.2.35 WarningWord tag (positioning axis/synchronous axis)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 13 "PeripheralWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 456)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	"DriveWarning" Error in drive
Bit 5	-	-	-	"SensorWarning" Error in encoder system
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationWarning" Communication error Missing or faulty communication.
Bit 8	-	-	-	"SWLimitMin"
Bit 9	-	-	-	"SWLimitMax"
Bit 10	-	-	-	"HomingWarning" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	"FollowingErrorWarning" Warning limit of following error monitoring reached/exceeded
Bit 12	-	-	-	"PositioningWarning" Positioning error
Bit 13	-	-	-	"PeripheralWarning" Error accessing a logical address

Tag	Data type	Values	W	Description
Bit 14	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "SynchronousWarning" Error during synchronous operation The leading axis specified for the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis.
Bit 15	-	-	-	"AdaptionWarning" Error in automatic data transfer
Bit 16... Bit 31	-	-	-	Reserved

A.3 Tags of the technology object external encoder

A.3.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.3.2 Actual values and setpoints (external encoder)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 493)

Tag	Data type	Values	W	Description
ActualPosition	LREAL	-	RON	Actual position
ActualVelocity	LREAL	-	RON	Actual velocity
ActualAcceleration	LREAL	-	RON	Actual acceleration

A.3.3 Sensor tags (external encoder)

The tag structure <TO>.Sensor.<tag name> contains the controller-end configuration for the encoder, and the configuration for active and passive homing.

Tags

Legend (Page 493)

Tag			Data type	Values	W	Description
Sensor.			STRUCT			
	Type		DINT	-	RES	Encoder type 0: "INCREMENTAL" (incremental) 1: "ABSOLUTE" (absolute) 2: "CYCLIC_ABSOLUTE" (cyclic absolute)
	InverseDirection		BOOL	-	RES	Inversion of the actual value FALSE: no TRUE: Yes
	System		DINT	-	RES	Encoder system 0: "LINEAR" (linear encoder) 1: "ROTATORY" (rotary encoder)
	MountingMode		DINT	-	RES	Mounting type of encoder 0: On motor shaft 1: On load side 2: External measuring system
	DataAdaption		DINT	-	RES	Automatic transfer of the drive values reference speed, maximum speed and reference torque in the device 0: No automatic transfer, manual configuration of values 1: Automatic transfer of values configured in the drive to the configuration of the technology object
	Interface.					
		AddressIn	VREF	0 to 65535	RON	Input address for the PROFIdrive telegram
		AddressOut	VREF	0 to 65535	RON	Output address for the PROFIdrive telegram
		Number	UDINT	1 to 2	RON	Number of the encoder in the telegram

Tag			Data type	Values	W	Description
	Parameter.					
		Resolution	LREAL	-1.0E12 to 1.0E12	RES	Resolution of a linear encoder (offset between two encoder pulses)
		StepsPerRevolution	UDINT	1 to 8388608	RES	Increments per rotary encoder revolution
		FineResolutionXist1	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST1 (cyclic actual encoder value)
		FineResolutionXist2	UDINT	0 to 31	RES	Number of bits for fine resolution Gx_XIST2 (absolute value of encoder)
		Determinable-Revolutions	UDINT	0 to 8388608	RES	Number of differentiable encoder revolutions for a multi-turn absolute encoder (For a single-turn absolute encoder = 1; for an incremental encoder = 0)
		DistancePer-Revolution	LREAL	0.0 to 1.0E12	RES	Load distance per revolution of an externally mounted encoder
	PassiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Use zero mark via PROFIdrive telegram 1: Use zero mark via PROFIdrive telegram and reference cam 2: Use homing mark via digital input
		SideInput	BOOL	-	CAL	Side of digital input during passive homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	CAL	Homing direction / homing mark approach direction 0: Positive homing direction 1: Negative homing direction 2: Current homing direction
		DigitalInputAddress	VREF	0 to 65535	RES	Address of the digital input
		SwitchLevel	BOOL	-	RON	Signal level that is present at the digital input when homing mark is approached FALSE: Low level TRUE: High level

A.3.4 Extrapolation tag (external encoder)

The tag structure <TO>.Extrapolation.<tag name> contains the configuration of the actual value extrapolation.

Tags

Legend (Page 493)

Tag			Data type	Values	W	Description
Extrapolation.			STRUCT			
	LeadingAxis-DependentTime		LREAL	-	RON	Extrapolation time component (caused by leading axis) Results from the following times: • Time of actual value acquisition for the leading axis • Ipo cycle • Time of actual position filter of leading axis (T1 + T2)
	FollowingAxis-DependentTime		LREAL	0.001 to 1.0E12	DIR	Extrapolation time component (caused by following axis) Results from the following times: • For a following axis with set velocity precontrol: – Communication cycle – Ipo cycle – Speed control loop substitute time for the following axis – Output time of the setpoint for the following axis • For a following axis without velocity precontrol: – Communication cycle – Ipo cycle – Position control loop equivalent time (1/Kv from <TO>.PositionControl.Kv) – Output time of the setpoint for the following axis
	PositionFilter.		STRUCT			
		T1	LREAL	0.001 to 1.0E12	DIR	Position filter time constant T1
		T2	LREAL	0.001 to 1.0E12	DIR	Position filter time constant T2
	VelocityFilter.		STRUCT			
		T1	LREAL	0.001 to 1.0E12	DIR	Velocity filter time constant T1
	VelocityTolerance.		STRUCT			
		Range	LREAL	0.001 to 1.0E12	DIR	Tolerance band width for velocity
	Hysteresis.		STRUCT			
		Value	LREAL	0.001 to 1.0E12	DIR	Hysteresis value

A.3.5 LoadGear tags (external encoder)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 493)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.3.6 Properties tags (external encoder)

The tag structure <TO>.Properties.<tag name> contains the configuration of the type of axis or motion.

Tags

Legend (Page 493)

Tag		Data type	Value range	W	Description
Properties.					
	MotionType	DINT	-	RON	Indication of axis or motion type: 0: Linear axis or motion 1: Rotary axis or motion

A.3.7 Units tag (external encoder)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	VelocityUnit	UDINT	-	RON	Unit for velocity	
					1521	°/s
					1522	°/min
					1086	rad/s
					1523	rad/min
					1062	mm/s
					1061	m/s
					1524	mm/min
					1525	m/min
					1526	mm/h
					1063	m/h
					1527	km/min
					1064	km/h
					1066	in/s
					1069	in/min
					1067	ft/s
					1070	ft/min
					1075	mi/h
	TimeUnit	UDINT	-	RON	Unit for time	
					1054	s

A.3.8 Mechanics tags (external encoder)

The tag structure <TO>.Mechanics.<tag name> contains the configuration of the mechanics.

Tags

Legend (Page 493)

Tag		Data type	Value range	W	Description
Mechanics.					
	LeadScrew	LREAL	0.0 to 1.0E12	RES	Leadscrew pitch

A.3.9 Modulo tags (external encoder)

The tag structure <TO>.Modulo.<tag name> contains the configuration of the modulo function.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
Modulo.		STRUCT			
	Enable	BOOL	-	RES	FALSE: Modulo conversion disabled TRUE: Modulo conversion enabled When modulo conversion is enabled, a check is made for modulo length > 0.0
	Length	LREAL	0.001 to 1.0E12	RES	Modulo length
	StartValue	LREAL	-1.0E12 to 1.0E12	RES	Modulo start value

A.3.10 Homing tags (external encoder)

The tag structure <TO>.Homing.<tag name> contains the configuration for homing the TO.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
Homing.		STRUCT			
	HomePosition	LREAL	-1.0E12 to 1.0E12	CAL	Home position

A.3.11 StatusSensor tags (external encoder)

The tag structure <TO>.StatusSensor.<tag name> indicates the status of the measuring system.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
StatusSensor.		STRUCT			
	State	DINT	-	RON	Status of actual encoder value 0: "NOT_VALID" (not valid) 1: "WAITING_FOR_VALID" (waiting for valid status) 2: "VALID" (valid)
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and encoder FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No error in the measuring system TRUE: Error in the measuring system.
	AbsEncoderOffset	LREAL	-	RON	Home point offset to the value of an absolute value encoder. The value will be retentively stored in the CPU.
	Control	BOOL	-	RON	FALSE: Encoder is not active TRUE: Encoder is active
	Position	LREAL	-	RON	Encoder position
	Velocity	LREAL	-	RON	Encoder velocity
	AdaptionState	DINT	-	RON	Status of automatic data transfer of encoder parameters 0: "NOT_ADAPTED" (Data not transferred) 1: "IN_ADAPTION" (Data transfer in progress) 2: "ADAPTED" (Data transfer complete) 3: "NOT_APPLICABLE" (Data transfer not selected, not possible) 4: "ADAPTION_ERROR" (Error during data transfer)

A.3.12 StatusExtrapolation tag (external encoder)

The tag structure <TO>.StatusExtrapolation.<tag name> indicates the status of the actual value extrapolation.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
Extrapolation.		STRUCT			
	FilteredPosition	LREAL	-1.0E12 to 1.0E12	RON	Position after position filter
	FilteredVelocity	LREAL	-1.0E12 to 1.0E12	RON	Velocity according to tolerance band
	ExtrapolatedPosition	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated position
	ExtrapolatedVelocity	LREAL	-1.0E12 to 1.0E12	RON	Extrapolated velocity

A.3.13 StatusWord tag (external encoder)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 5 "HomingDone") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 493)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"HomingDone" Homing status 0: Technology object not homed 1: Technology object homed
Bit 6	-	-	-	"Done" 0: Motion job is running, or axis control panel active 1: No motion job is running and axis control panel deactivated
Bit 7	-	-	-	Reserved
Bit 8	-		-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	"HomingCommand" 0: No "MC_Home" job is running 1: "MC_Home" job is running
Bit 12... Bit 31	-	-	-	Reserved

A.3.14 ErrorWord tag (external encoder)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 493)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"SensorFault" Error in encoder system
Bit 6	-	-	-	Reserved
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	"HomingError" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.3.15 ErrorDetail tags (external encoder)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 10	RON	Effective alarm reaction 0: No reaction 10: Remove enable For the technology object external encoder, only alarm reactions 0 and 4 are possible.

A.3.16 WarningWord tag (external encoder)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 13 "PeripheralWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 493)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"SensorWarning" Error in encoder system
Bit 6	-	-	-	Reserved
Bit 7	-	-	-	"CommunicationWarning" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	"HomingWarning" Error during homing operation The homing cannot be completed.
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.3.17 InternalToTrace tags (external encoder)

The tag structure <TO>.InternalToTrace.<tag name> contains no application-relevant data. This tag structure is internally used.

Tags

Legend (Page 493)

Tag		Data type	Values	W	Description
InternalToTrace.		ARRAY [1..4] OF STRUCT			
	Id	DINT	-	DIR	-
	Value	LREAL	-	RON	-

A.4 Tags of the measuring input technology object

A.4.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.4.2 Display data (measuring input)

The <TO>.Status and <TO>.InputState tags show the status of the measuring input function and the input of the measuring input.

Tags

Legend (Page 507)

Tag	Data type	Values	W	Description
Status	DINT	-	RON	Measuring input function status 0: "INACTIVE" (measurement is not active) 1: "WAITING_FOR_TRIGGER" (measuring input is waiting for measuring event) 2: "TRIGGER_OCCURRED" (one or more measured values have been acquired) 3: "MEASURING_ERROR" (error during the measurement)
InputState	BOOL	-	RON	Measuring input input status FALSE: Input of measuring input not active TRUE: Input of measuring input active

A.4.3 Parameter tags (measuring input)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the measuring input technology object.

Tags

Legend (Page 507)

Tag		Data type	Values	W	Description
Parameter.		STRUCT			
	MeasuringInputType	DINT	-	RON	Measuring input type 0: "TIME_BASED" (measurement using time stamp) 1: "PROFIDRIVE" (measuring event using PROFIdrive telegram)
	PROFIdrive ProbeNumber	UDINT	1, 2	RES	Number of the measuring input to be used for a measurement using PROFIdrive telegram
	MeasuringRange ActivationTime	LREAL	0.0 to 1.0E12	RON	System share for activation time of measuring range
	MeasuringRange-AdditionalActivation-Time	LREAL	0.0 to 1.0E12	RES	Additional activation time when using measuring range limits [ms]
	CorrectionTime	LREAL	0.0 to 1.0E12	RES	Correction time for the measurement result [ms]

A.4.4 Interface tags (measuring input)

The tag structure <TO>.Interface.<tag name> contains the configuration of the input properties for the technology object measuring input.

Tags

Legend (Page 507)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	Address	VREF	-	RON	I/O address for the digital measuring input

A.4.5 Units tags (measuring input)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 507)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.4.6 MeasuredValues tags (measuring input)

The tag structure <TO>.MeasuredValues.<tag name> displays the measurement results.

Tags

Legend (Page 507)

Tag		Data type	Values	W	Description
MeasuredValues.		STRUCT			
	MeasuredValue1	LREAL	-1.0E12 to 1.0E12	RON	First measured value
	MeasuredValue2	LREAL	-1.0E12 to 1.0E12	RON	Second measured value
	Measured-Value1Counter	UDINT	0 to 2147483647	RON	Count value for the first measured value
	Measured-Value2Counter	UDINT	0 to 2147483647	RON	Count value for the second measured value
	LostEdgeCounter1	UDINT	0 to 7	RON	LEC for measured value 1 (zero in the case of one-time measurement)
	LostEdgeCounter2	UDINT	0 to 7	RON	LEC for measured value 2 (zero in the case of one-time measurement)

A.4.7 StatusWord tag (measuring input)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 507)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"CommunicationOK" Communication between measuring input and measuring module 0: Not established 1: Established
Bit 6... Bit 31	-	-	-	Reserved

A.4.8 ErrorWord tag (measuring input)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 507)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.4.9 ErrorDetail tags (measuring input)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 507)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 8	RON	Effective alarm reaction 0: No reaction 8: End measuring input processing

A.4.10 WarningWord tag (measuring input)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 507)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.5 Tags of the cam technology object

A.5.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.5.2 Display data (cam)

The <TO>.CamOutput tag indicates the switching state of the cam.

Tags

Legend (Page 515)

Tag	Data type	Values	W	Description
CamOutput	BOOL	-	RON	Switching state of output cam FALSE: not interconnected TRUE: Switched

A.5.3 Parameter tags (cam)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the output cam technology object.

Tags

Legend (Page 515)

Tag		Data type	Values	W	Description
Parameter.		STRUCT			
	OutputCamType	DINT	-	RES	Output cam type 0: Distance output cam 1: Time-based output cam
	PositionType	DINT	-	RES	Position reference 0: Position setpoint 1: Actual position
	OnCompensation	LREAL	0.0 to 1.0E12	DIR	Activation time Lead time for the switch-on edge
	OffCompensation	LREAL	0.0 to 1.0E12	DIR	Deactivation time Lead time for the switch-off edge
	Hysteresis	LREAL	0.0 to 1.0E12	DIR	Hysteresis value For output cams with reference to actual position, always enter a hysteresis value (> 0.0).

A.5.4 Interface tags (cam)

The tag structure <TO>.Interface.<tag name> contains the configuration of the output properties for the output cam technology object.

Tags

Legend (Page 515)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	EnableOutput	BOOL	-	RES	Activation of the output cam output FALSE: Output is deactivated TRUE: Output is activated
	Address	VREF	-	RON	I/O address of the output cam
	LogicOperation	DINT	-	RON	Logical operation of the output cam signals at the output 0: OR operation 1: AND operation

A.5.5 Units tags (cam)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 515)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.5.6 StatusWord tag (output cam)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 515)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"OutputInverted" 0: Output cam output not inverted 1: Output cam output inverted
Bit 5	-	-	-	"CommunicationOK" Communication between output cam and output module 0: Not established 1: Established
Bit 6... Bit 31	-	-	-	Reserved

A.5.7 ErrorWord tag (output cam)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 515)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.5.8 ErrorDetail tags (cam)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 515)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 6	RON	Effective alarm reaction 0: No reaction 6: Output cam processing is complete.

A.5.9 WarningWord tag (output cam)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 515)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.6 Tags of the cam track technology object

A.6.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Direct: Values are changed directly and take effect at the start of the next MC-Servo [OB91].
	CAL	At call of Motion Control instruction: Values are changed directly and take effect at the start of the next MC-Servo [OB91] after the call of the corresponding Motion Control instruction in the user program.
	RES	Restart: Changes to the start value in the load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed during runtime of the user program.
Description	Description of the tag	

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.6.2 Display data (cam track)

The following tags indicate the status of the cam track:

Tags

Legend (Page 522)

Tag	Data type	Values	W	Description
Status	DINT	-	RON	0: "INACTIVE" (inactive) 1: "ACTIVE" (active) 2: "ACTIVE_WAITING_FOR_NEXT_CYCLE" (active and waiting for next track)
TrackOutput	BOOL	-	RON	FALSE: Cam track is not output. TRUE: Cam track is output.
SingleCamState	DWORD	16#0 to 16#FFFF_FFFF	RON	Switched on output cam (bit-masked) 0: Output cam is not switched on 1: Output cam is switched on
TrackPosition	LREAL	-1.0E12 to 1.0E12	RON	Display of the current position within the cam track
MatchPosition	LREAL	-1.0E12 to 1.0E12	RON	Reference position of the current cam track During cyclic processing of the cam track, the continued reference position of the current cam track is displayed. The unique detection and output of the position is only possible when the assigned technology object is in motion.

A.6.3 Parameter tags (cam track)

The tag structure <TO>.Parameter.<tag name> contains the configuration of the basic parameters of the cam track technology object.

Tags

Legend (Page 522)

Tag			Data type	Values	W	Description
Parameter.			STRUCT			
	CamTrackType		DINT	-	RES	Output cam type 0: Distance output cam 1: Time-based output cam
	PositionType		DINT	-	RES	Position reference 0: Position setpoint 1: Actual position
	ReferencePosition		LREAL	-1.0E12 to 1.0E12	DIR	Reference position
	CamTrackLength		LREAL	0.001 to 1.0E12	DIR	Track length
	CamMasking		DWORD	16#0 to 16#FFFF_FFFF	DIR	Bit masking of individual output cams
	OnCompensation		LREAL	0.0 to 1.0E12	DIR	Activation time Lead time for the switch-on edge
	OffCompensation		LREAL	0.0 to 1.0E12	DIR	Deactivation time Lead time for the switch-off edge
	Hysteresis		LREAL	0.0 to 1.0E12	DIR	Hysteresis value For output cams with reference to actual position, always enter a hysteresis value (> 0.0).
	Cam[1 … 32].		STRUCT			
		OnPosition	LREAL	0.0 to 1.0E12	CAL	Start position (distance and time-based output cams)
		Offposition	LREAL	0.0 to 1.0E12	CAL	End position (distance output cam)
		Duration	LREAL	0.001 to 1.0E12	CAL	Switch-on duration (time-based output cam)
		Existent	BOOL	-	CAL	FALSE: Output cam not used TRUE: Output cam is used

A.6.4 Interface tags (cam track)

The tag structure <TO>.Interface.<tag name> contains the configuration of the output properties for the cam track technology object.

Tags

Legend (Page 522)

Tag		Data type	Values	W	Description
Interface.		STRUCT			
	EnableOutput	BOOL	-	RES	Output cam output at the bit specified under "<TO>.Interface.Address" FALSE: No output TRUE: Output
	Address	VREF	-	RON	I/O address for digital cam output

A.6.5 Units tags (cam track)

The tag structure <TO>.Units.<tag name> shows the set technological units.

Tags

Legend (Page 522)

Tag		Data type	Values	W	Description	
Units.		STRUCT				
	LengthUnit	UDINT	-	RON	Unit for position	
					1010	m
					1013	mm
					1011	km
					1014	µm
					1015	nm
					1019	in
					1018	ft
					1021	mi
					1004	rad
					1005	°
	TimeUnit	UDINT	-	RON	Unit for time	
					1056	ms

A.6.6 StatusWord tag (cam track)

The <TO>.StatusWord tag contains the status information of the technology object.

Information on the evaluation of the individual bits (e.g. bit 2 "RestartActive") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 522)

Tag	Data type	Values	W	Description
StatusWord	DWORD	-	RON	Status information of the technology object
Bit 0	-	-	-	"Control" 0: Technology object not in operation 1: Technology object in operation
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tags unchanged 1: Change to "Restart" tags. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"OutputInverted" 0: Output cam output not inverted 1: Output cam output inverted
Bit 5	-	-	-	"CommunicationOK" Communication between cam track and output module 0: Not established 1: Established
Bit 6	-	-	-	"CamDataChanged" The data of individual output cams has been changed but not yet taken effect with Motion Control instruction "MC_CamTrack".
Bit 7... Bit 31	-	-	-	Reserved

A.6.7 ErrorWord tag (cam track)

The <TO>.ErrorWord tag indicates technology object errors (technology alarms).

Information on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tags

Legend (Page 522)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.6.8 ErrorDetail tags (cam track)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction for the technology alarm that is currently pending for the technology object.

You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.

Tags

Legend (Page 522)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0, 7	RON	Effective alarm reaction 0: No reaction 7: Cam track processing Is complete.

A.6.9 WarningWord tag (cam track)

The <TO>.WarningWord tag indicates pending warnings for the technology object.

Information on the evaluation of the individual bits (e.g. bit 1 "ConfigWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 298) section.

Tag

Legend (Page 507)

Tag	Data type	Values	W	Description
WarningWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemWarning" A system-internal error has occurred.
Bit 1	-	-	-	"ConfigWarning" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	"UserWarning" Error in user program at a Motion Control instruction or its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control instruction cannot be executed because necessary requirements have not been met.
Bit 4... Bit 12	-	-	-	Reserved
Bit 13				"PeripheralWarning" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.7 Technology alarms

A.7.1 Overview

The following table shows an overview of the technology alarms and the corresponding alarm reactions. When a technology alarm occurs, evaluate the entire indicated alarm text, in order to find the precise cause.

Legend

No.	Number of the technology alarm (corresponds to <TO>.ErrorDetail.Number)
Reaction	Effective alarm reaction (corresponds to <TO>.ErrorDetail.Reaction)
Error bit	Bit that is set in <TO>.ErrorWord when the technology alarm occurs A description of the bits can be found in the appendix (Page 488).
Warning bit	Bit that is set in <TO>.WarningWord when the technology alarm occurs A description of the bits can be found in the appendix (Page 491).
Restart	To acknowledge the technology alarm, the technology object must be reinitialized (Restart).
Diagnostic buffer	The alarm is entered in the diagnostics buffer.
Alarm text	Displayed alarm test (limited)

List of the technology alarms

No.	Reaction	Error bit	Warning bit	Restart	Diagnostic buffer	Alarm text
101	Remove enable	X1	-	X	X	Configuration error.
102	Remove enable	X15	-	X	X	Drive configuration adaptation error.
103	Remove enable	X15	-	X	X	Encoder configuration adaptation error.
104	Stop with maximum dynamic values	X1	-	-	-	SW limit switch specification error.
105	Remove enable	X1	-	X	X	Drive configuration error.
106	Remove enable	X1	-	-	X	Drive connection configuration error.
107	Remove enable	X1	-	X	X	Encoder configuration error.
108	Remove enable	X1	-	-	X	Encoder connection configuration error.
109	Remove enable	X1	-	X	-	Configuration error.
110	No reaction	-	X1	-	-	Configuration is adjusted internally.
111	No reaction	-	X15	-	X	TO and drive configuration inconsistent.
112	No reaction	-	X15	-	X	TO and encoder configuration inconsistent.
113	Remove enable	X2	-	X	-	Isochronous mode not possible.
201	Remove enable	X0	-	X	X	Internal error.
202	No reaction	X0	-	X	-	Internal configuration error.
203	Remove enable	X0	-	X	-	Internal error.
204	Remove enable	X0	-	-	-	Commissioning error.
304	Stop with emergency stop ramp	X2	-	-	-	Velocity limit is zero.
305	Stop with emergency stop ramp	X2	-	-	-	• Acceleration limit is zero. • Deceleration limit is zero.
306	Stop with emergency stop ramp	X2	-	-	-	Jerk limit is zero.
307	Stop with maximum dynamic values	X2	-	-	X	• Negative numerical value range of the position reached. • Positive numerical value range of the position reached.
308	Remove enable	X2	-	-	X	• Negative numerical value range of the position exceeded. • Positive numerical value range of the position exceeded.
321	Stop with emergency stop ramp	X3	-	-	-	Axis not homed.
322	No reaction	-	X3	-	-	Restart not executed.
323	Remove enable	X3	-	-	-	MC_Home could not be performed.
341	Stop with maximum dynamic values	X10	-	-	-	Error in homing data.
342	Stop with emergency stop ramp	X10	-	-	-	Reference cam/encoder zero mark not found.
343	Remove enable	X1	-	-	-	Homing function not supported by device.

No.	Reaction	Error bit	Warning bit	Restart	Diagnostic buffer	Alarm text
401	Remove enable	X13	-	-	X	Error accessing logical address.
411	Remove enable	X5	-	-	X	Faulty encoder at the logical address.
412	Remove enable	X5	-	-	-	Permitted actual value range exceeded.
421	Remove enable	X4	-	-	X	Faulty drive at the logical address.
431	Remove enable	X7	-	-	X	Faulty communication with device at logical address.
501	No reaction	-	X6	-	-	Programmed velocity is limited.
502	No reaction	-	X6	-	-	• Programmed acceleration is being limited. • Programmed deceleration is being limited.
503	No reaction	-	X6	-	-	Programmed jerk is limited.
504	No reaction	-	X6	-	-	Speed setpoint monitoring active.
521	Remove enable	X11	-	-	-	Following error.
522	No reaction	-	X11	-	-	Warning following error tolerance.
531	Remove enable	X9	-	-	-	• Positive HW limit switch approached. • Negative HW limit switch approached. • Illegal free travel direction of active hardware limit switch. • HW limit switch polarity reversed, free travel not possible. • Both hardware limit switches active, retraction not possible.
533	Stop with maximum dynamic values	X8	-	-	-	• Negative SW limit switch approached. • Positive SW limit switch approached.
534	Remove enable	X8	-	-	-	• Negative SW limit switch is crossed. • Positive SW limit switch is crossed.
541	Remove enable	X12	-	-	-	Position monitoring error.
542	Remove enable	X2	-	-	-	Clamping monitoring error: Axis leaving clamping tolerance window.
550	Track setpoints	X4	-	-	-	Drive-autonomous motion is being executed.
551	No reaction	X2	X6	-	-	Maximum velocity cannot be reached with drive/axis parameters.
552	Remove enable	X15	-	-	-	Adaptation error of encoder during power-up.
601	Stop with maximum dynamic values	X14	-	-	-	Leading axis is not assigned or defective.
603	No reaction	-	X14	-	-	Leading axis is not in position-controlled mode.
608	Stop with maximum dynamic values	X14	-	-	-	Error during synchronization.
611	Remove enable	X2	-	-	-	The cam specified in the MC_CamIn.Cam parameter has not been configured or is not available or is not interpolated.
612	Remove enable	X2	-	-	-	Specified cam has not been interpolated.

No.	Reaction	Error bit	Warning bit	Restart	Diagnostic buffer	Alarm text
700	Remove enable	X2	-	-	-	Output cam limiting error.
701	Remove enable	X13	-	-	-	I/O output error.
702	Remove enable	X2	-	-	-	Position value valid.
703	Remove enable	X2	-	-	-	Cam track data faulty.
704	Remove enable	X2	-	-	-	Output cam data faulty.
750	Remove enable	X2	-	-	-	Measuring job not possible during homing of assigned axis.
752	Remove enable	X2	-	-	-	Validity range of measuring job not recognized.
753	Remove enable	X2	-	-	-	Only one measuring input can access an encoder at a time.
754	Remove enable	X2	-	-	-	Measuring input configuration in external device is not correct.
755	Remove enable	X13	-	-	-	Measuring job not possible.
758	No reaction	X2	-	-	-	A measuring edge was not evaluated.

Technology alarm 102

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Drive configuration adaptation error.	
Drive is not assigned to a SINAMICS device.	The drive adaptation is only available for SINAMICS drives.
Drive is not interconnected directly to I/O area.	During configuration of the axis, the log addresses were set to a data block or bit memory, for example. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.
Adaptation canceled due to insufficient resources.	Check whether your device supports acyclic data communication according to PROFIdrive.
Parameter does not exist, value unreadable or invalid.	
Maximum speed	
Maximum torque	
Torque resolution	
Rated speed	
Rated torque	
Motor type	

Technology alarm 103

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Encoder configuration adaptation error.	
Encoder is not assigned to a SINAMICS device.	The encoder adaptation is only available for SINAMICS devices and external Siemens encoders.
Encoder is not interconnected directly to I/O area.	During configuration of the axis, the log addresses were set at a data block or bit memory. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.
Adaptation canceled due to insufficient resources.	Check whether your device supports acyclic data communication according to PROFIdrive.
Parameter does not exist, value unreadable or invalid.	
Encoder system	
Encoder resolution	
Encoder fine resolution	
Encoder revolutions	

Technology alarm 104

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
SW limit switch specification error.	
Neg. SW limit switch greater than pos. SW limit switch.	Change the position of the software limit switches.

Technology alarm 105

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Drive configuration error.	
HW Configuration.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
The TO needs a smaller servo cycle clock.	
Error in internal communication.	• Check the project for consistency and download it to the controller again. • Contact customer service.
Address for drive data does not exist in project.	Check the project for consistency and download it to the controller again.

Technology alarm 106

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Drive connection configuration error.	
System has no communication with drive.	Internal system error. • Check the project for consistency and download it to the controller again. • Contact customer service.
Drive not initialized during ramp-up.	To enable a technology object, the drive initialization must be complete. Trigger the job again later.

Technology alarm 107

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Encoder configuration error.	
HW Configuration	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
The TO needs a smaller servo cycle clock.	
Error internal communication.	• Check the project for consistency and download it to the controller again. • Contact customer service.

Technology alarm 108

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Encoder connection configuration error.	
System without communication to encoder.	Internal system error. • Check the project for consistency and download it to the controller again. • Contact customer service.
Encoder not initialized during ramp-up.	To enable a technology object, the encoder initialization must be complete. Trigger the job again later.
Encoder data address missing in project.	Check the project for consistency and download it to the controller again.

Technology alarm 109

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Configuration error.	
Neg. HW limit switch.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.
Pos. HW limit switch	
Reference cam "Active homing".	
Reference cam "Passive homing".	
Enable bit for the analog drive interface.	
DriveReady bit of the analog drive interface.	
Measurement sensing input is faulty.	
Output cam output faulty.	

Technology alarm 110

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Configuration is adjusted internally.	
Actor.DriveParameter.MaxSpeed is limited.	• Correct the reference value in the drive and in the configuration of the technology object to <TO>.Actor.MaxSpeed /2. • With analog drive connection, correct the reference value in the drive and in the configuration of the technology object to <TO>.Actor.MaxSpeed /1.17. • The value can be set in the drive, for example, in p2000 = p1082.
PositioningMonitoring.ToleranceTime is limited.	Change the configuration data.
DynamicDefaults.EmergencyDeceleration is limited.	
DriveParameter.ReferenceTorque is too low.	

Technology alarm 111

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
TO and drive configuration inconsistent.	
Different telegram.	Match the telegram configuration for the technology object with the telegram configuration in the drive. (P922 in drive)
Incompatible torque resolution.	Adjust the high torque resolution for the drive.
Master application cycle and servo clock unequal.	Adjust the cycle of the master application in the device configuration for the PROFIBUS slave.
Servo cycle clock and drive cycle clock not equal.	
Linear motor configured.	Set round-frame motor (P300) in the drive.

Technology alarm 112

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
TO and encoder configuration inconsistent.	
Different telegram type.	Match the telegram configuration for the technology object with the telegram configuration in the drive. (P922 in drive)
Encoder is not an absolute encoder.	Configure the encoder for the technology object as an incremental encoder.
Master application cycle and servo clock unequal.	Adjust the cycle of the master application in the device configuration for the PROFIBUS slave.
Servo cycle clock and drive cycle clock not equal.	

Technology alarm 113

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Isochronous mode not possible.	• The configured output for the cam or cam track technology object or the input for the technology object measuring input cannot be used in isochronous mode. Configure the I/O in the device configuration as isochronous I/O. • Make sure that the organization block MC_Servo [OB91] is called synchronously with the bus system.

A.7.3 Technology alarms 201-204

Technology alarm 201

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Internal error.	Contact customer service.

Technology alarm 202

Alarm reaction: No reaction

Restart: Required

Alarm text	Solution
Internal configuration error.	Contact customer service.

Technology alarm 203

Alarm reaction: Remove enable

Restart: Required

Alarm text	Solution
Internal error.	Contact customer service.

Technology alarm 204

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Commissioning error.	
Connection to the TIA Portal interrupted.	Check the connection properties.

A.7.4 Technology alarms 304-343

Technology alarm 304

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Velocity limit is zero.	Enter a non-zero value for the maximum speed (DynamicLimits.MaxVelocity) in the dynamic limits.

Technology alarm 305

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text		Solution
Acceleration/deceleration limit is zero.		
	Acceleration	Enter a non-zero value for the maximum acceleration (DynamicLimits.MaxAcceleration) in the dynamic limits.
	Deceleration	Enter a non-zero value for the maximum deceleration (DynamicLimits.MaxDeceleration) in the dynamic limits.

Technology alarm 306

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Jerk limit is zero.	Enter a non-zero value for the maximum jerk (DynamicLimits.MaxJerk) in the dynamic limits.

Technology alarm 307

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text		Solution
Negative/positive numerical value range of the position reached.		
	Negative	Enable the "Modulo" setting for the technology object.
	Positive	

Technology alarm 308

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Negative/positive numerical value range of the position exceeded.	
Negative	Enable the "Modulo" setting for the technology object.
Positive	

Technology alarm 321

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Axis not homed.	To perform an absolute positioning motion, you must home the technology object.

Technology alarm 322

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Restart not executed.	
TO is not ready for restart.	Download the project again.
Condition for TO restart not satisfied.	Disable the technology object.

Technology alarm 323

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
MC_Home could not be performed.	• Enable the "Modulo" setting for the technology object. • Adjust the position value for use of the Motion Control instruction "MC_Home".

Technology alarm 341

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Error in homing data.	
Approach velocity is zero.	Check the configuration for homing (Homing.ApproachVelocity).
Homing velocity is zero.	Check the configuration for homing (Homing.ReferencingVelocity).

Technology alarm 342

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Reference cam/encoder zero mark not found.	The reference cam configured for homing was not found in the traversing range of the axis.

Technology alarm 343

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Homing function not supported by device.	Configure a reference switch input for the pulse generator output used in the properties of the C-CPU. ("Pulse generators (PTO/PWM) > PTO[n]/PWN[n] > Hardware inputs/outputs") When homing across a zero mark, the CPU transfers the reference switch input as zero mark.

A.7.5 Technology alarms 401-431

Technology alarm 401

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Error accessing logical address.	
Invalid address. Input address is invalid. Output address is invalid.	• Connect a suitable device. • Check the device (I/Os). • Check the topology of the project. • Compare the device configuration and the configuration of the technology object. • Contact customer service.

Technology alarm 411

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Faulty encoder at the logical address.	
Alarm message from encoder. HW error encoder. Encoder dirty.	Check the function, connections and I/Os of the encoder.
Read error encoder absolute value.	Compare the encoder type in the drive or encoder parameter P979 with the configuration data of the technology object.
Zero mark monitoring encoder.	Encoder signals error in zero mark monitoring (fault code 0x0002 in Gx_XIST2, see PROFIdrive profile).
Encoder in Parking state.	• Search for the cause of the error in the connected drive or encoder. • Check whether the alarm was possibly triggered by a commissioning action involving the drive or encoder.

Technology alarm 412

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Permitted actual value range exceeded.	
Positive.	Home the axis/encoder in a valid actual value range.
Negative.	
Modulo length.	Adjust the modulo length to the utilized encoder.

Technology alarm 421

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Faulty encoder at the logical address.	
Alarm message from drive.	• Check the functions and connections of the drive. • Enable and acknowledge safety function in the drive.
No drive control required.	
Drive has shut down.	
Drive enable not possible.	

Technology alarm 431

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Faulty communication with device at logical address.	
Drive failed.	Check the function, connections and I/Os of the drive .
Signs of life of drive faulty.	• Check the function, connections and I/Os of the drive . • Compare the clock parameters in the device configuration (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be set to the same cycle time. (Incorrect parameter assignment is indicated by reason 0x0080.)
Encoder failed.	Check the function, connections and I/Os of the encoder.
Signs of life of encoder faulty.	• Check the function, connections and I/Os of the encoder. • Compare the clock parameters in the device configuration (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be set to the same cycle time.

A.7.6 Technology alarms 501-552

Technology alarm 501

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Programmed velocity is limited.	• Check the value for the velocity of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 502

Alarm reaction: No reaction

Restart: Not required

Alarm text		Remedy
Programmed acceleration/deceleration is being limited.		
	Acceleration	• Check the value for the acceleration of the Motion Control instruction. • Check the configuration of the dynamic limits.
	Deceleration	• Check the value for the deceleration of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 503

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Programmed jerk is limited.	• Check the value for the jerk of the Motion Control instruction. • Check the configuration of the dynamic limits.

Technology alarm 504

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Speed setpoint monitoring active.	• Check the mechanical configuration. • Check the encoder connection. • Check the configuration of the speed setpoint interface. • Check the configuration of the control loop. • Check the value for the maximum velocity DynamicLimits.MaxVelocity.

Technology alarm 521

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Following error.	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of the following error monitoring.

Technology alarm 522

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Warning following error tolerance.	• Check the configuration of the control loop. • Check the direction signal of the encoder. • Check the configuration of the following error monitoring.

Technology alarm 531

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Pos. HW limit switch reached.	Acknowledge the alarm. After the acknowledgment, motions in the negative direction are allowed.
Neg. HW limit switch reached.	Acknowledge the alarm. After the acknowledgment, motions in the positive direction are allowed.
Illegal free travel direction of active hardware limit switch.	The programmed direction of movement is disabled due to the active hardware limit switch. Retract the axis in the opposite direction.
HW limit switch polarity reversed, free travel not possible.	• Check the mechanical configuration of the hardware limit switch. • Check the limit switches. • The error can be acknowledged by switching the controller off and on or using "MC_Reset" with "Restart" = TRUE.
Both hardware limit switches active, retraction not possible.	

Technology alarm 533

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Negative/positive SW limit switch approached.	
Negative	The software limit switch was reached from an active motion. Move the axis away from the software limit switch in the positive direction.
Positive	The software limit switch was reached from an active motion. Move the axis away from the software limit switch in the negative direction.

Technology alarm 534

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Negative/positive SW limit switch is crossed.	
Negative	The SW limit switch was crossed. Acknowledge the alarm. After the acknowledgment, motions in the positive direction are allowed.
Positive	The SW limit switch was crossed. Acknowledge the alarm. After the acknowledgment, motions in the negative direction are allowed.

Technology alarm 541

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Position monitoring error.	
Target range not reached.	Target range was not reached within the positioning tolerance time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.
Exit target range again.	The target range was exited within the minimum dwell time. • Check the configuration of the position monitoring. • Check the configuration of the control loop.

Technology alarm 542

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Clamping monitoring error: Axis leaving clamping tolerance window.	The axis has executed a motion greater than the permissible tolerance at the fixed stop. Check whether the fixed stop has broken away.

Technology alarm 550

Alarm reaction: Track setpoints

Restart: Not required

Alarm text	Solution
Drive-autonomous motion is being executed.	The drive is performing a motion that was not specified by the technology object. Check whether there is an active safety function in the drive.

Technology alarm 551

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Maximum velocity cannot be reached with drive/axis parameters.	The configured maximum velocity cannot be reached with the configured mechanics of the axis. Check the configuration of the mechanics and the set reference speed.

Technology alarm 552

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Solution
Adaptation error of encoder during power-up.		
	Encoder is not assigned to a SINAMICS device.	The encoder set as the operationally active encoder could not be adapted. Specify a different sensor for the initialization of the technology object.
	Encoder is not interconnected directly to I/O area.	During configuration of the axis, the log addresses were set to a data block area or bit memory area. The adaptation is only possible when the encoder has been directly interconnected to an I/O area.
	Adaptation canceled due to insufficient resources.	Check whether your device supports acyclic data communication according to PROFIdrive.
	Parameter does not exist, value unreadable or invalid.	
	Encoder system	
	Encoder resolution	
	Encoder fine resolution	
	Encoder revolutions	

A.7.7 Technology alarms 601-618

Technology alarm 601

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Leading axis is not assigned or defective.	Configure the possible leading value axes for the following axis under Configuration > Leading value interconnections.

Technology alarm 603

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Leading axis is not in position-controlled mode.	The following axis must be operated in position-controlled mode for synchronous operation functionality.

Technology alarm 608

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Error during synchronization.	Prevent a reversing leading value motion during the synchronization operation.

Technology alarm 611

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
The cam specified in the MC_CamIn.Cam parameter has not been configured or is not available.	Configure and interpolate the cam. Restart the job.

Technology alarm 612

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Specified cam has not been interpolated.	Interpolate the cam used for camming with the Motion Control instruction "MC_InterpolateCam".

A.7.8 Technology alarms 700-758

Technology alarm 700

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Remedy
Output cam limiting error.		
	Cam position: OnPosition	The position for the OnPosition could not be calculated. Invalid positions (e.g. OnPosition > OffPosition) were calculated due to lead times. The output cam cannot be switched due to the axis dynamics and compensation times.
	Cam position: OffPosition	The position for the OffPosition could not be calculated. Invalid positions (e.g. OffPosition < OnPosition) were calculated due to lead times. The output cam cannot be switched due to the axis dynamics and compensation times.

Technology alarm 701

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
I/O output error.	The digital output for the output cam or cam track technology object cannot be addressed. Download the device configuration again.

Technology alarm 702

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Position value valid.	• A Motion Control job "MC_Reset" is being executed on the axis. Wait until the "Restart" of the technology object is complete. • The encoder values are invalid due to an encoder error. Check the encoder and adjust the configuration if necessary.

Technology alarm 703

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Output cam data faulty.	
Output cam: Output cam number	Check the configuration of the relevant output cam in the cam track and adjust the values if necessary. Examples of a correct configuration: • <TO>.Parameter.Cam[].OnPosition < <TO>.Parameter.Cam[].OffPosition • <TO>.Parameter.Cam[].Duration > <TO>.Parameter.OffCompensation - <TO>.Parameter.OnCompensation

Technology alarm 704

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Output cam data faulty.	Check the configuration of the output cam and adjust the values if necessary. Examples of a correct configuration: • MC_OutputCam.OnPosition < MC_OutputCam.OffPosition • MC_OutputCam.Duration > <TO>.Parameter.OffCompensation - <TO>.Parameter.OnCompensation

Technology alarm 750

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring job not possible during homing of assigned axis.	Do not use the motion instructions "MC_Home" and "MC_MeasuringInput" simultaneously.

Technology alarm 752

Alarm reaction: No reaction

Restart: Not required

Alarm text	Remedy
Validity range of measuring job not recognized.	The measuring range specified in Motion Control instruction "MC_MeasuringInput" was not recognized. Adjust the measuring range.

Technology alarm 753

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Only one measuring input can access an encoder at a time.	Use only one Motion Control instruction "MC_MeasurinInput" for an encoder.

Technology alarm 754

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring input configuration in external device is not correct.	Check the configuration of the measuring inputs on the external device.

Technology alarm 755

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Remedy
Measuring job not possible.	
Device has reported an error.	The measurement was aborted with error. Check the measuring input functionality in the utilized device
Cyclic measuring is not possible with telegram 39x.	• Use the Motion Control instruction "MC_MeasuringInput" for starting a one-time measurement. • Cyclic measuring is only possible when measuring using TM Timer DIDQ. Change the configuration of the measuring input type to "TM Timer DIDQ".

Technology alarm 758

Alarm reaction: None

Restart: Not required

Alarm text	Remedy
A measuring edge was not evaluated.	An edge was already detected at the input of the measuring input even though the module was not yet ready. The measured value is provided at the next edge.

A.8 Error ID for Motion Control instructions

Errors in Motion Control instructions are signaled using the parameters "Error" and "ErrorID".

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated for the Motion Control instruction:

- Illegal status of the technology object, which prevents the execution of the job.
- Illegal parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm reaction for a technology object error.

The following tables list all "ErrorIDs" that can be indicated for Motion Control instructions. Besides the cause of the error, remedies for eliminating the error are also listed:

16#0000 - 16#800F

ErrorID	Description	Remedy
16#0000	No error	-
16#8001	A technology alarm (technology object error) occurred while processing the Motion Control instruction.	In the technology data block, an error message is output in the "ErrorDetail.Number" tag. You can find a list of the technology alarms and alarm reactions in the Technology alarms (Page 530) appendix.
16#8002	Illegal specification of the technology object	• Check the specification of the technology object for the "Axis", "Master", "SlaveOutputCamCamTrack-MeasuringInput" or "Cam" parameter. • For MC_MeasuringInputCyclic: Specify a valid measuring input type for parameter "MeasuringInputType".
16#8003	Illegal velocity specification	Specify a permissible value for the velocity for parameter "Velocity".
16#8004	Illegal acceleration specification	Specify a permissible value for the acceleration for parameter "Acceleration".
16#8005	Illegal deceleration specification	Specify a permissible value for the deceleration for parameter "Deceleration".
16#8006	Illegal jerk specification	Specify a permissible value for the jerk for parameter "Jerk".
16#8007	Illegal direction specification	Specify a permissible value for the rotation direction for parameter "Direction" or "SyncDirection".
	Invalid entry Both the "JogForward" and "JogBackward" parameters are set to TRUE at the same time. The axis is braked at the last valid deceleration.	Reset both the "JogForward" parameter and the "JogBackward" parameter.
16#800A	Illegal operating mode	Specify a permissible operating mode for parameter "Mode".
16#800C	Only one instance of the instruction is allowed per technology object.	The instruction is called at multiple points in the user program with identical value for parameter "Axis", "Master", "Slave" or "Cam". Ensure that only one instruction with the value for parameter "Axis", "Master", "Slave" or "Cam" is called.

ErrorID	Description	Remedy
16#800D	Job is not permitted in the current state. "Restart" is executed.	Wait until the "Restart" of the technology object is complete.
16#800E	If the technology object is enabled, a "Restart" is not possible.	Before a "Restart", deactivate the technology object with "MC_Power.Enable"FALSE.
16#800F	The technology object is disabled. Job cannot be executed.	Enable the technology object with "MC_Power.Enable" = TRUE. Restart the job.

16#8010 - 16#802F

ErrorID	Description	Remedy
16#8010	Invalid homing mode for incremental encoder.	Absolute value adjustment is not possible with an incremental encoder ("Mode" = 6, 7). Start a homing process for an incremental encoder using parameter "Mode" = 0, 1, 2, 3, 5, 8, 10.
16#8011	Invalid homing mode for absolute encoder.	Passive and active homing ("Mode" = 2, 3, 5, 8, 10) are not possible for an absolute value encoder. Start a homing process for an absolute encoder using parameter "Mode" = 0, 1, 6, 7.
16#8012	Job cannot be executed because axis control panel is active.	Return master control to your user program. Restart the job.
16#8013	The online connection between the CPU and the TIA Portal is down.	Check the online connection to the CPU.
16#8014	No internal job memory available.	The maximum possible number of Motion Control job has been reached. Reduce the number of jobs to be executed (parameter "Execute" = FALSE).
16#8015	Error acknowledgment with "MC_Reset" not possible. Error in the configuration of the technology object.	Check the configuration of the technology object.
16#8016	The actual values are not valid.	To execute a "MC_Home" command, the actual values must be valid. Check the status of the actual values. The technology object tag "<TO>.StatusSensor[n].State" must show the value 2 (valid).
16#8017	Illegal value for gear ratio numerator.	Specify a permissible value for the gear ratio numerator for parameter "RatioNumerator". Permitted integer values: -2147483648 to 2147483648 (value 0 not permitted)
16#8018	Illegal value for gear ratio denominator.	Specify a permissible value for the gear ratio denominator for parameter "RatioDenominator". Permitted integer values: 1 to 2147483648
16#8019	Command cannot be executed. The specified following axis is the original leading value for the synchronous operation chain.	Recursive interconnections are not possible. A leading axis cannot be interconnected as a following axis to its own leading value. Specify a permissible following axis for parameter "Slave".

ErrorID	Description	Remedy
16#8021	Illegal value for shift of the leading value range.	Specify a permissible value for the shift of the leading value range for parameter "MasterOffset".
16#8022	Illegal value for shift of the following value range.	Specify a permissible value for the shift of the leading value range for parameter "SlaveOffset".
16#8023	Illegal value for scaling of the leading value range.	Specify a permissible value for the scaling of the leading value range for parameter "MasterScaling".
16#8024	Illegal value for scaling of the following value range.	Specify a permissible value for the scaling of the following value range for parameter "SlaveScaling".
16#8026	Illegal value for leading value distance.	Specify a permissible value for the leading value distance for parameter "MasterStartDistance".
16#8027	Illegal value for use of cam.	Specify a permissible value for cyclic/acyclic use of the cam for parameter "ApplicationMode".

16#8030 - 16#807F

ErrorID	Description	Remedy
16#8034	Illegal value for synchronous position of the leading axis.	Specify a permissible value for the synchronous position of the leading axis for parameter "MasterSyncPosition".
16#8035	Illegal value for synchronous position of the following axis.	Specify a permissible value for the synchronous position of the following axis for parameter "SlaveSyncPosition".
16#8036	Illegal value for type of synchronization.	Specify a permissible value for the type of synchronization for parameter "SyncProfileReference".
16#8040	Illegal value for start position of output cam	Specify a permissible value for the start position of the output cam for parameter "OnPosition".
16#8041	Illegal value for end position of distance output cam	Specify a permissible value for the end position of the distance output cam for parameter "OffPosition".
16#8042	Illegal value for switch-on duration of time-based output cam	Specify a permissible value for the switch-on duration of the time-based output cam for parameter "Duration".
16#8043	Illegal value for parameter "Limit".	Select a value within the permitted value range. Permitted integer values: -2147483648 to 2147483648
16#8044	The axis is not configured for torque reduction.	Select drive telegram 102, 103, 105 or 106
16#8045	The job cannot be executed because travel to fixed stop job is active.	Switchover to non-position-controlled mode is not possible during active travel to fixed stop.
16#8046	The "MC_TorqueLimiting" job cannot be deactivated in the "InClamping" state.	Retract the axis and deactivate "MC_TorqueLimiting".
16#8047	Motion is towards the fixed stop.	Only motions away from the fixed stop are permitted.
16#8050	Illegal encoder number	Specify a permissible number of the new encoder (1 to 4) for parameter "MC_SetSensor.Sensor".
16#8051	Illegal number of the reference encoder	Specify a permissible number of the reference encoder for parameter "MC_SetSensor.ReferenceSensor".
16#8062	Illegal approach value.	Specify a permissible approach value for the searched for leading value for parameter "ApproachLeadingValue".

ErrorID	Description	Remedy
16#8063	A valid mapping to the definition range (leading values) does not exist for the specified following value.	Specify a permissible following value for parameter "FollowingValue".
16#8064	A valid mapping to the range of the function (following values) does not exist for the specified leading value.	Specify a permissible leading value for parameter "LeadingValue".
16#8070	Illegal value for leading value shift.	Specify a permissible value for the leading value shift for parameter "PhaseShift".
16#8071	The axis is not in position-controlled mode. The job cannot be executed.	Activate position-controlled mode.
16#8074	An "MC_Home" is active. The job cannot be executed.	During active or passive homing, an encoder switchover is rejected. Wait until the "MC_Home" job is complete. Restart the job.
16#8075	The job cannot be executed because synchronous operation is not active on the axis.	Switch on the synchronous operation function. Restart the job.
16#8076	Command cannot be executed. Synchronous operation is being simulated on the specified axis.	End the simulation of the synchronous operation. Restart the job.

16#80A0 - 16#80FF

ErrorID	Description	Remedy
16#80A1	Job cannot be executed because a synchronous operation job is active.	A "MC_Home" job on a following axis is not executed when a "MC_CamIn" or "MC_GearInPos" job is active. Exit the synchronous operation job. Restart the job.
16#80A2	For one-time measuring with measuring range, the measuring range was run without a measuring edge being detected.	Check and adjust the measuring input and adjust the measuring range positions, if necessary.
16#80A3	The measuring input job via PROFIdrive telegram could not be started because a homing job is active.	Simultaneous execution of a homing job and a measuring input job via PROFIdrive telegram is not possible. Wait until the homing job has ended. Restart the measuring job via PROFIdrive telegram.
16#80A5	Illegal value for start position of measuring range	Specify a permissible value for the start position of the measuring range for parameter "MC_MeasuringInput.StartPosition" or MC_MeasuringInputCyclic.StartPosition.
16#80A6	Illegal value for end position of measuring range	Specify a permissible value for the end position of the measuring range for parameter "MC_MeasuringInput.EndPosition" or MC_MeasuringInputCyclic.EndPosition.
16#80A7	A measurement took place during measuring with measuring range, but the calculated position is outside the specified measuring range. The measured value is discarded.	Check and adjust the measuring input and adjust the measuring range positions, if necessary.

ErrorID	Description	Remedy
16#80A8	Job cannot be executed because camming is active on the axis.	The Motion Control instructions "MC_PhasingRelative" and "MC_PhasingAbsolute" can only be applied to active gearing with "MC_GearIn" or "MC_GearInPos" ("MC_GearIn.InGear" = TRUE or "MC_GearInPos.InSync" = TRUE).
16#80A9	Job cannot be executed because the following axis is synchronized ("MC_GearInPos.StartSync" = TRUE).	The Motion Control instructions "MC_PhasingRelative" and "MC_PhasingAbsolute" can only be applied to active gearing with "MC_GearIn" or "MC_GearInPos" ("MC_GearIn.InGear" = TRUE or "MC_GearInPos.InSync" = TRUE).
16#80AA	The cam contains no points or segments and cannot be interpolated.	Fill the cam with points/segments. Restart the job.
16#80AB	The cam is currently being used and cannot be interpolated.	End the current use of the cam. Restart the job.
16#80AC	The cam contains incorrect points or segments and cannot be interpolated. (for example, the cam contains only one point.)	Fill the cam with permissible points/segments. Restart the job.
16#80AD	The specified synchronous position is outside the definition range of the cam.	Specify a permissible synchronous position for parameter "MasterSyncPosition". Restart the job.
16#8FFF	Unspecified error	Contact your local Siemens representative or support center. You will find contact information at: Contact information for Industry Automation and Drive Technologies (http://www.siemens.com/automation/partner)

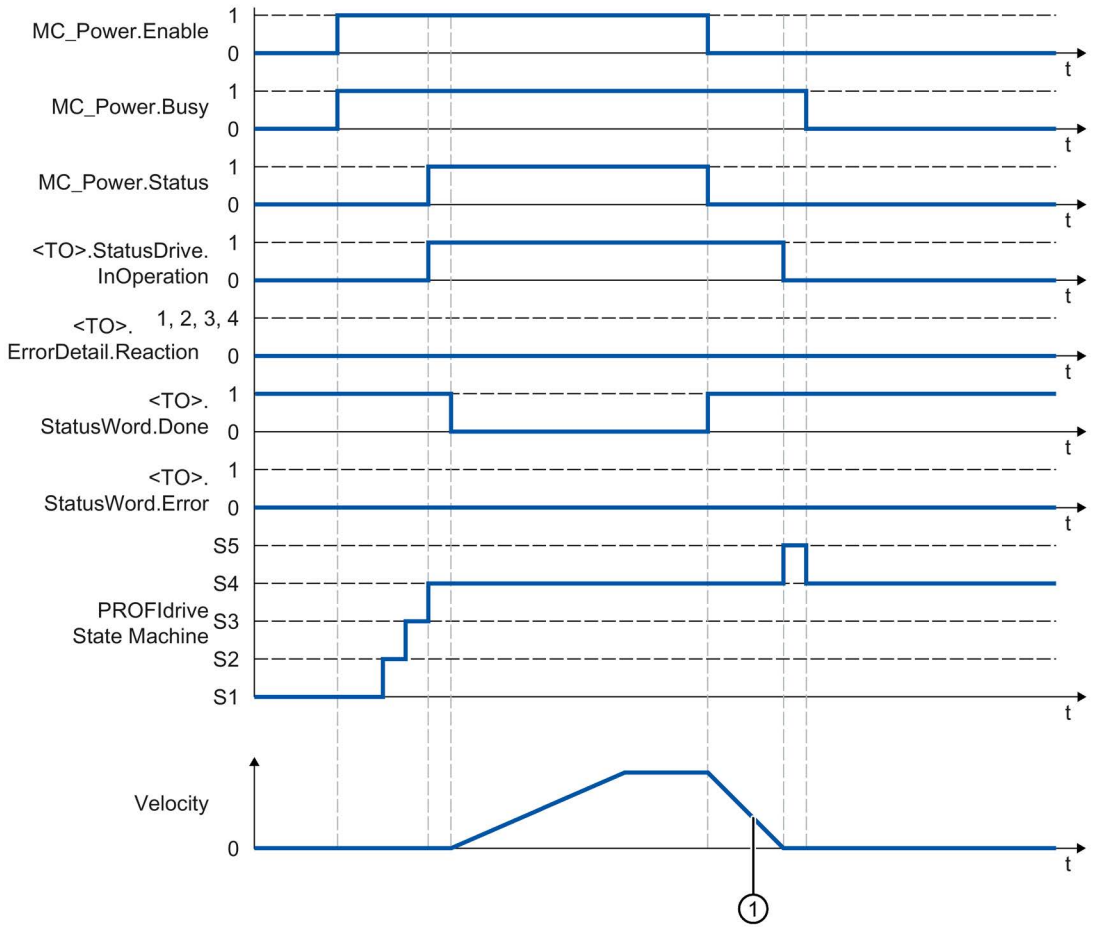
A.9 MC_Power function chart

A.9.1 Drive connection via PROFIdrive

A.9.1.1 StopMode 0, 2

Function chart: Enabling a technology object and disabling with "StopMode" = 0, 2



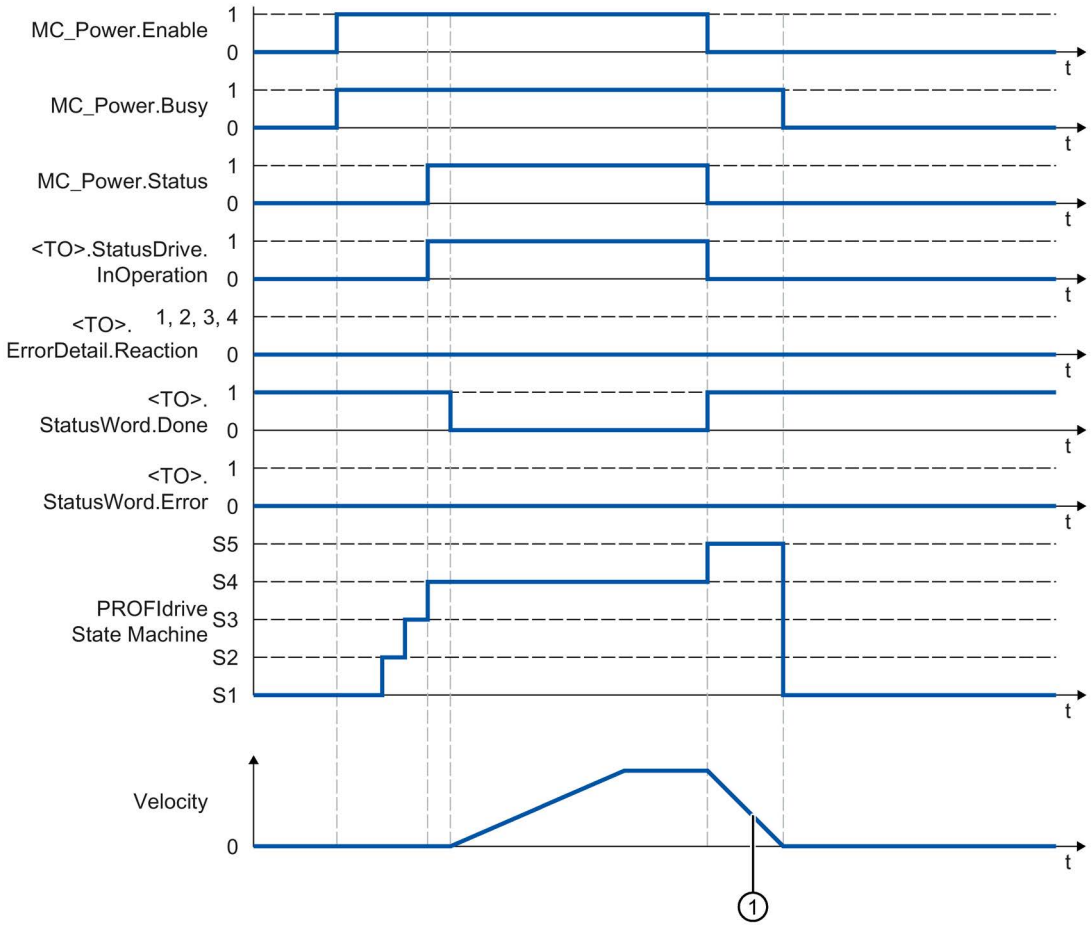
①
- "StopMode" = 0

  The axis is braked with the configured emergency stop deceleration.
- "StopMode" = 2

  The axis decelerates with the configured maximum deceleration.

A.9.1.2 StopMode 1

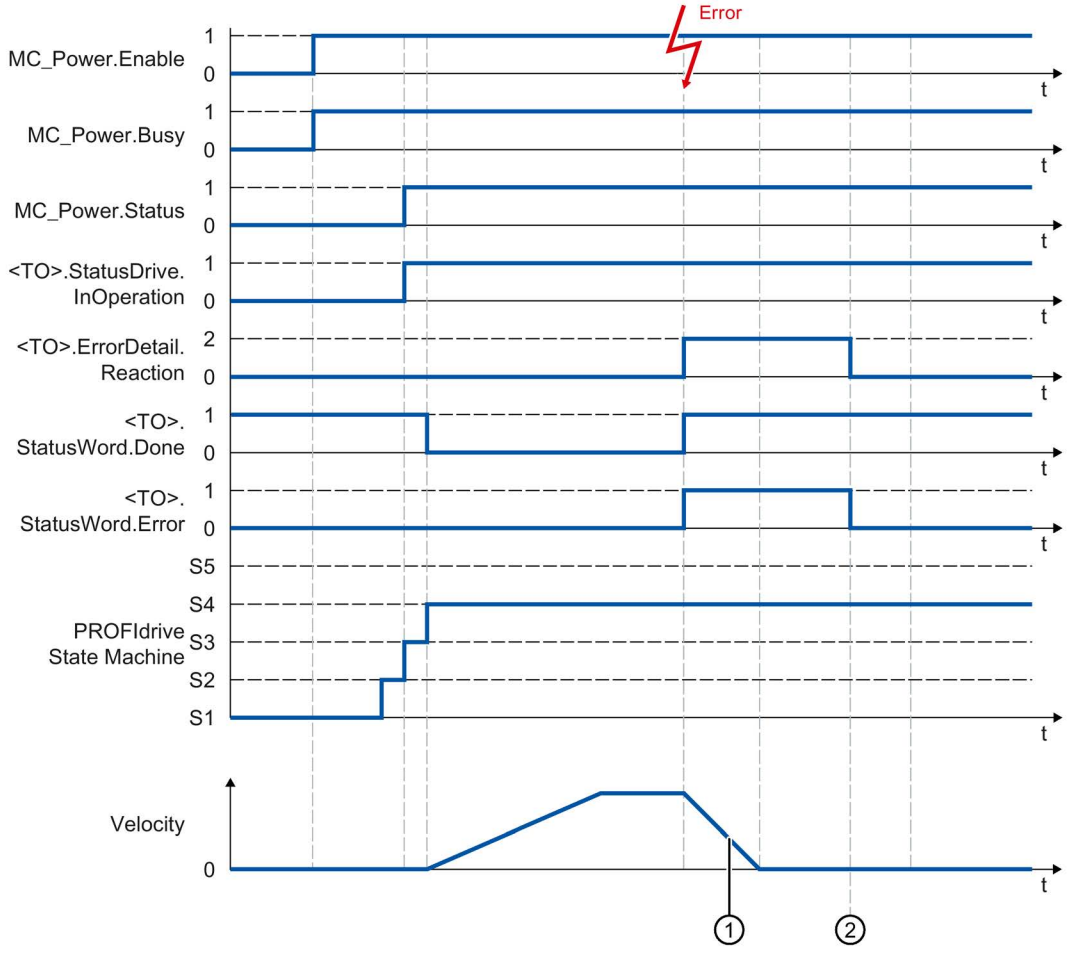
Function chart: Enabling a technology object and disabling with "StopMode" = 1



① The deceleration ramp depends on the configuration in the drive.

A.9.1.3 Alarm reactions with braking ramp via the technology object

Function chart: Enabling a technology object and occurrence of a technology alarm with braking ramp via the technology object



① The axis is braked based on the alarm reaction:

- Stop with current dynamic values (<TO>.ErrorDetail.Reaction = 1)

  The axis is braked with the deceleration in the Motion Control instruction.
- Stop with maximum dynamic values (<TO>.ErrorDetail.Reaction = 2)

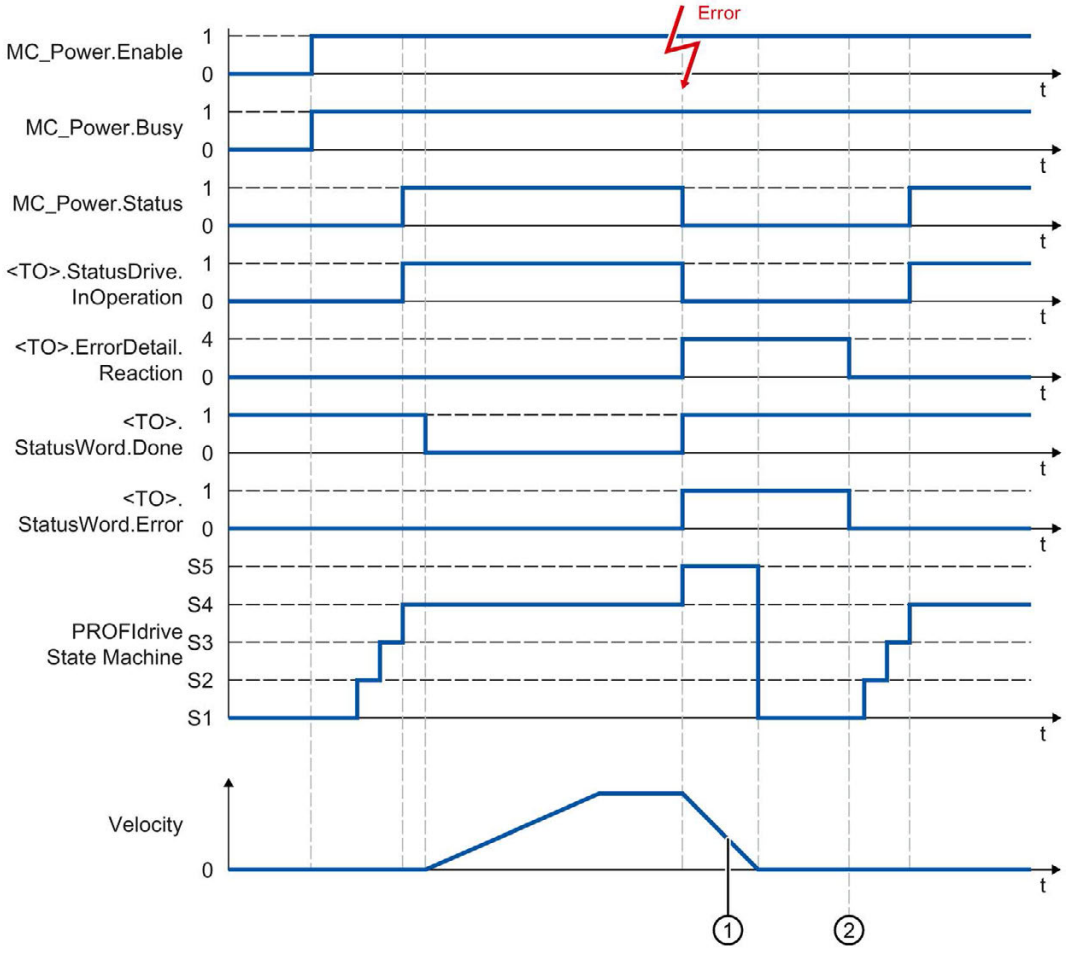
  The axis decelerates with the configured maximum deceleration.
- Stop with emergency stop ramp (<TO>.ErrorDetail.Reaction = 3)

  The axis is braked with the configured emergency stop deceleration.

② The technology alarm is acknowledged.

A.9.1.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm reaction "Remove enable"



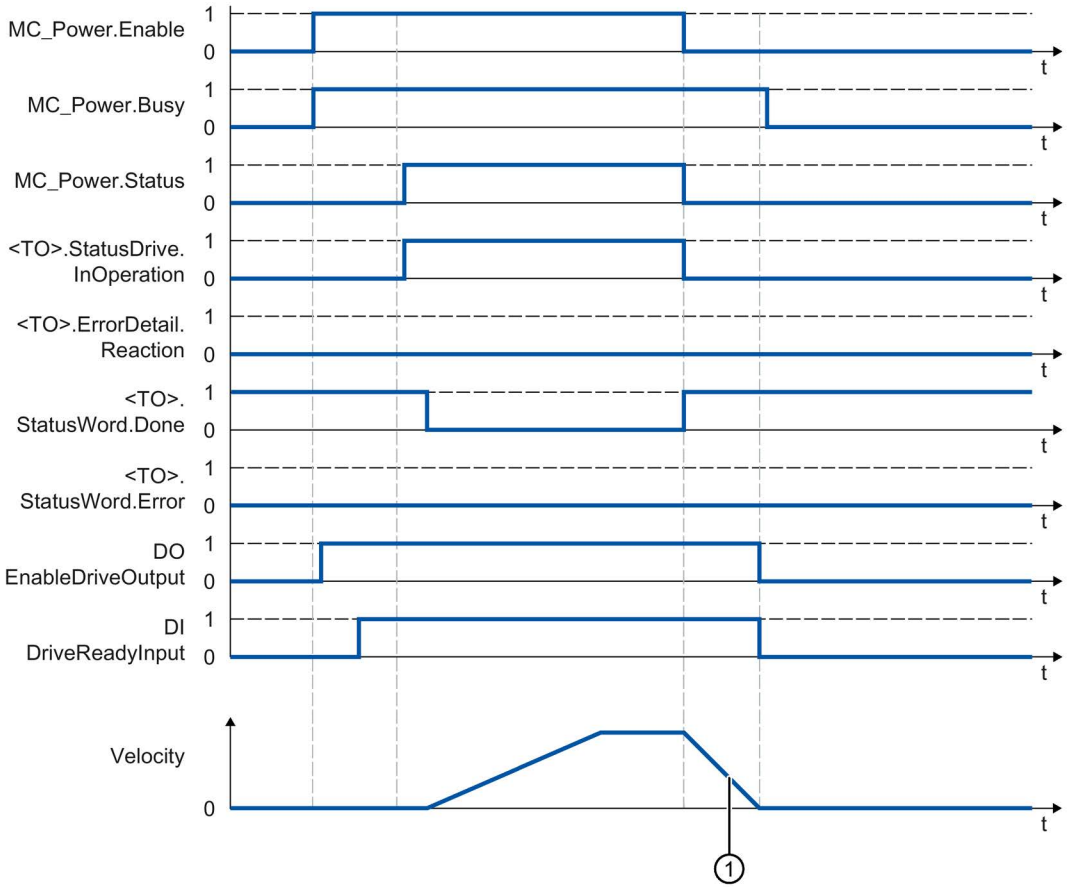
① The deceleration ramp depends on the configuration in the drive.

② The technology alarm is acknowledged at time ②.

A.9.2 Analog drive connection

A.9.2.1 StopMode 0, 2

Function chart: Enabling a technology object and disabling with "StopMode" = 0, 2



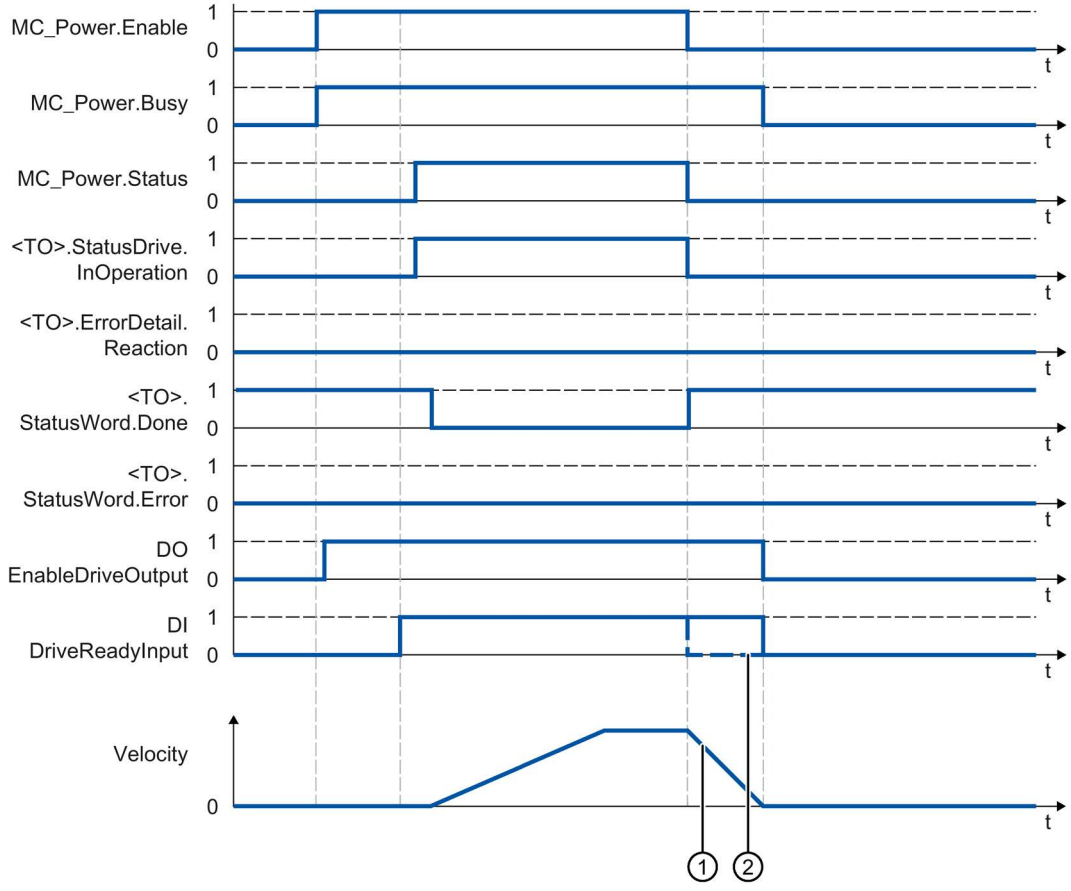
①
- "StopMode" = 0

  The axis is braked with the configured emergency stop deceleration.
- "StopMode" = 2

  The axis decelerates with the configured maximum deceleration.

A.9.2.2 StopMode 1

Function chart: Enabling a technology object and disabling with "StopMode" = 1

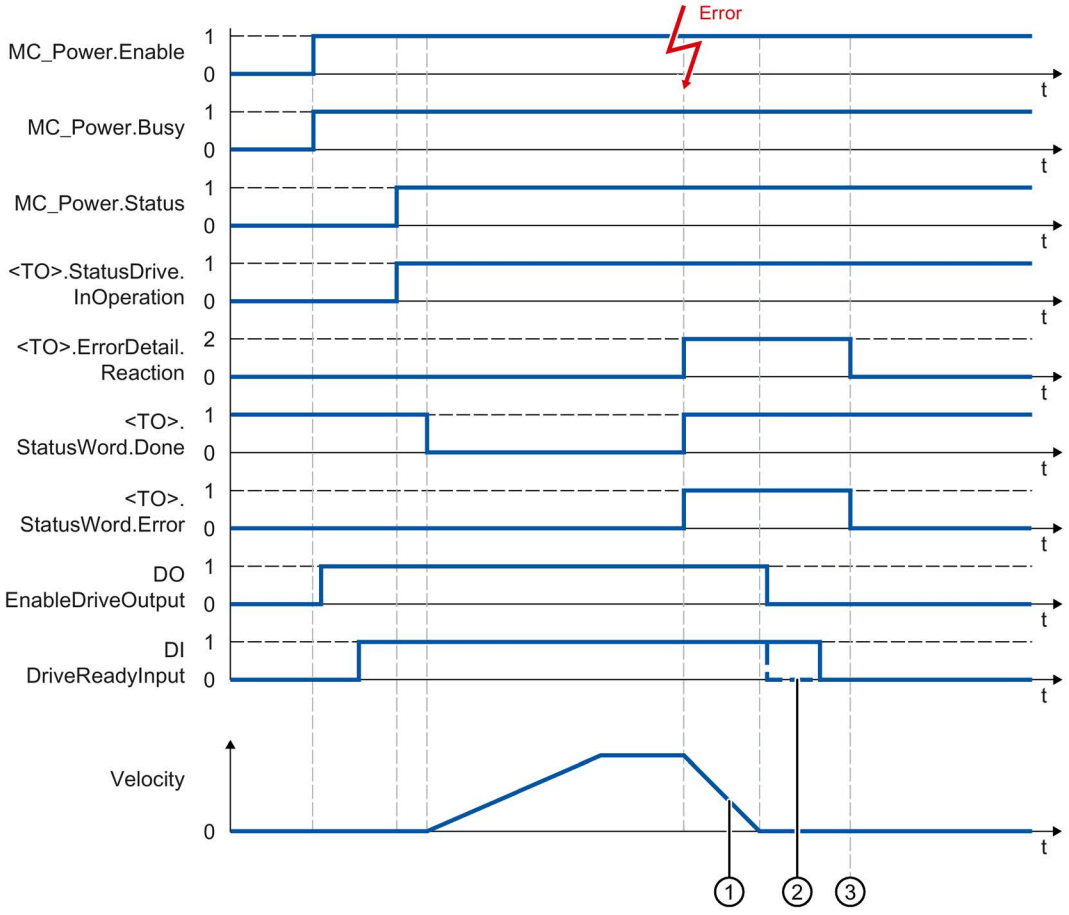


① The deceleration ramp depends on the configuration in the drive.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

A.9.2.3 Alarm reactions with braking ramp via the technology object

Function chart: Enabling a technology object and occurrence of a technology alarm with braking ramp via the technology object



① The axis is braked based on the alarm reaction:

- Stop with current dynamic values (<TO>.ErrorDetail.Reaction = 1)

  The axis is braked with the deceleration in the Motion Control instruction.
- Stop with maximum dynamic values (<TO>.ErrorDetail.Reaction = 2)

  The axis decelerates with the configured maximum deceleration.
- Stop with emergency stop ramp (<TO>.ErrorDetail.Reaction = 3)

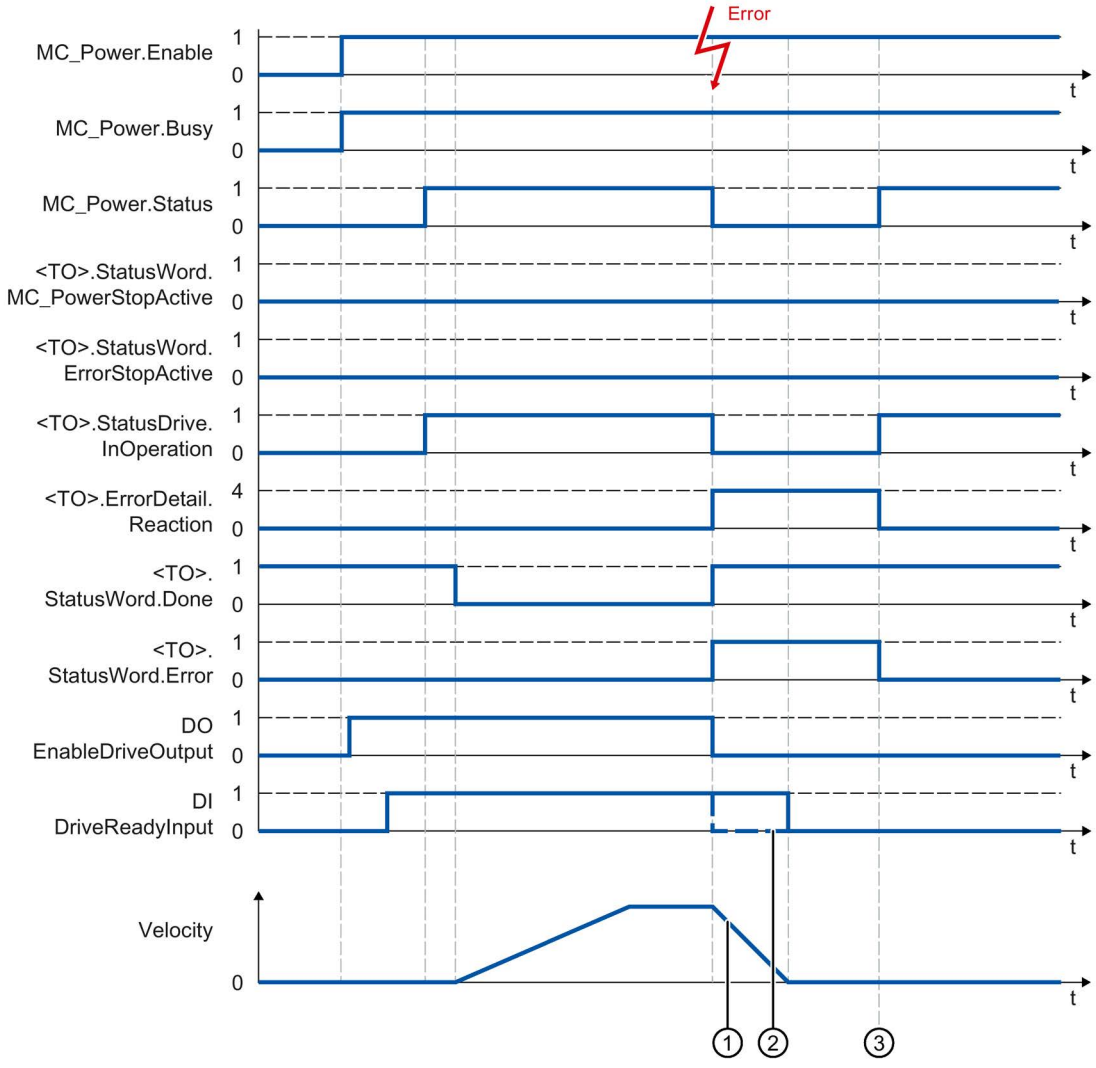
  The axis is braked with the configured emergency stop deceleration.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

③ The technology alarm is acknowledged at time ③.

A.9.2.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm reaction "Remove enable"



① The deceleration ramp depends on the configuration in the drive.

② The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

③ The technology alarm is acknowledged at time ③.

A.10 SINAMICS drives

A.10.1 Homing SINAMICS drives with external zero marks

For SINAMICS drives with external zero marks, synchronization during homing must always occur on the left side of the external zero mark's signal. That is to say, with a positive direction of travel synchronization is done on a positive edge, and with a negative direction of travel synchronization is done on a negative edge.

By inverting the signal, synchronization can also be done on the right sight of the signal of the external zero mark. The inversion can be configured in the drive using SINAMICS parameter P490.

Homing to an encoder zero mark or an external zero mark is configured in SINAMICS parameter P495.

Glossary

Absolute synchronous operation

Function corresponds to the Motion Control instruction MC_GearInPos or MC_CamIn.

Absolute value encoder

Position encoder which outputs the position in the form of a digital numerical value. This numerical value is unique within the entire measuring range of the absolute value encoder.

Axis control panel

The axis control panel allows you to move the axis in manual mode, optimize the axis settings, and test the operation of the axis in your system.

Axis type

The axis type differs depending on the unit of measurement according to which the axis is positioned.

Depending on the execution of the mechanics, an axis is implemented as a linear axis or rotary axis:

- For linear axes, the position of the axis is specified as a linear measure, e.g. millimeters (mm).
- For rotary axes, the position of the axis is specified as an angular measure, e.g. degrees (°).

Communication processor (CP)

Module for expanded communications tasks covering special applications, for example in the area of security.

Communications module (CM)

Module for communications tasks which is used as an interface expansion of the CPU (for example PROFIBUS) or provides additional communications options (e.g. PtP) in an automation system.

Drive

The combination of motor (electric or hydraulic), actuator (converter, valve), control system, measuring system and supply (infeed, accumulator).

Dynamic Servo Control (DSC)

In drives that support DSC, you can optionally use the position controller in the drive. The position controller in the drive is usually implemented with a rapid speed-control cycle. This improves the control performance for digitally coupled drives.

Following error

The following error is the difference between the position setpoint and the actual position value. The transmission times of the setpoint to the drive, and of the actual position value to the controller, are taken into account in the calculation of the following error.

GSD file

As a Generic Station Description, this file contains all properties of a PROFINET or PROFIBUS device that are necessary for its configuration.

Hardware limit switch

Mechanical limit position switch that limits the maximum permissible traversing range of the axis.

Homing

With homing, you create the relationship between the position in the technology object and the mechanical position of the axis. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

Incremental encoder

Position encoder which outputs the position change incrementally in the form of a digital numerical value.

Kv factor

Gain factor of the position controller

Master value

Input value for synchronous operation

Motion Control instruction

Use the Motion Control instructions to start Motion Control jobs at technology objects in your user program and thus execute the desired functionality at the technology objects. You track the status of running jobs with the output parameters of the Motion Control instructions.

Override

Percentage correction of the velocity/speed

Processing cycle clock

The processing of a technology object in the servo cycle clock.

PROFIdrive

PROFIdrive is a profile specified by the PNO (PROFIBUS user organization) for PROFIBUS DP and PROFINET IO for speed- and position-controlled drives.

PROFIdrive frame

Frame for communication according to PROFIdrive.

Proximity switch

Position switch which is activated with the moving part without mechanical contact.

Relative gearing

Function corresponds to the Motion Control instruction MC_GearIn.

Restart

The technology object is reinitialized with the current configuration parameters.

Safe Stop 1 (SS1)

The Safe Stop 1 (SS1) safety function brings a drive to standstill quickly and safely via an internal rapid stop ramp. Safe Torque Off (STO) is activated after standstill. STO ensures that no more torque generating energy acts on a drive. This prevents unintended startup of the drive.

You can use the SS1 safety function when a fast stop of the drive with a subsequent transition to STO is required. SS1 is used, for example, to quickly stop high inertia loads or to brake drives quickly and safely at high speeds

Safe Stop 2 (SS2)

The Safe Stop 2 (SS2) safety function brings a drive to standstill quickly and safely via an internal rapid stop ramp. After standstill is reached, the standstill position is monitored on the drive side. The drive can deliver full torque to maintain the standstill.

SS2, for example, is used for processing machines and machine tools.

Safe Torque Off (STO)

The Safe Torque Off (STO) safety function is the most commonly used and most basic drive-internal safety function. STO ensures that no more torque generating energy acts on a drive. This prevents unintended startup of the drive. The pulses of the drive are eliminated. The drive is reliably torque-free. This state is monitored internally in the drive.

You can use STO when the drive comes to a standstill in a sufficiently short time on its own due to the load torque or due to friction. Other areas of use are where "coasting" of the drive has no relevance for safety.

Software limit switch

A programmable position which limits the traversing range of an axis.

Synchronization

The phase of the following axis to reach synchronous movement.

Synchronous operation

Defined synchronous movement after synchronization of a following axis to a leading axis.

Technology alarm

If an error occurs at a technology object (e.g. approaching a hardware limit switch), a technology alarm is triggered and indicated.

The impact of a technology alarm on the technology object is specified by the alarm reaction (e.g. remove enable). The alarm reaction is specified by the system.

Technology data block

The technology data block represents the technology object and contains all configuration data, setpoint and actual values, and status information of the technology object.

Technology module (TM)

Module for technological tasks, e.g. counting, measuring and positioning.

Zero mark

Position reference for the movement of rotary and linear incremental encoders. The zero mark of an incremental encoder is used as a homing mark, for example.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation supports you in configuring and programming modules for counting and measurement tasks of the S7-1500, ET 200MP and ET 200SP, as well as in position feedback and position input.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7

Validity of the documentation

This documentation applies to the use of the following modules:

- S7-1500 modules
  - TM Count 2x24V
  - TM PosInput 2
  - TM Timer DIDQ 16x24V
  - CPU 1511C-1 PN
  - CPU 1512C-1 PN
  - DI 32x24VDC HF (as of firmware version V2.1.0)
  - DI 16x24VDC HF (as of firmware version V2.1.0)
- ET 200SP modules
  - TM Count 1x24V
  - TM PosInput 1
  - TM Timer DIDQ 10x24V
  - DI 8x24VDC HS

TM Count, TM PosInput and compact CPU are suitable for complex counting and measuring tasks and for position detection. TM Timer DIDQ and digital input modules are suitable for simple counting tasks.

Conventions

Please observe notes marked as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

Additional assistance

- You can find information about the technical support offerings in the appendix Service & Support (Page 196).
- The range of technical documentation for the individual SIMATIC products and automation systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (https://mall.industry.siemens.com).

Table of contents

Preface **4**

1 Documentation guide **10**

2 The basics of counting, measurement and position detection **14**

2.1 Overview of modules and properties 14

2.2 Basics of counting, measuring and position input (TM Count, TMPosInput, Compact CPU) 18

2.2.1 Convention 18

2.2.2 Overview of applications 18

2.2.3 Recording of count signals 21

2.2.3.1 Counting with incremental or pulse encoder 21

2.2.3.2 Position input with SSI absolute encoder 23

2.2.4 Behavior at the counting limits 24

2.2.5 Gate control with incremental or pulse encoder 26

2.2.5.1 Software gate 26

2.2.5.2 Hardware gate 26

2.2.5.3 Internal gate 27

2.2.5.4 Counter behavior at gate start 28

2.2.6 Capture (Latch) 29

2.2.6.1 Capture with incremental or pulse encoder 29

2.2.6.2 Capture with SSI absolute encoder 32

2.2.7 Synchronization 34

2.2.7.1 Synchronization by digital input 37

2.2.7.2 Synchronization at signal N 39

2.2.8 Comparison values 42

2.2.8.1 Comparison values and outputs 42

2.2.8.2 Switching at comparison values with counter value as reference 43

2.2.8.3 Switching at comparison values with position value (SSI absolute value) as reference 47

2.2.8.4 Switching at comparison values with measured value as reference 51

2.2.9 Measured value determination 53

2.2.9.1 Overview of measuring functions 53

2.2.9.2 Measured value determination with incremental or pulse encoder 54

2.2.9.3 Measured value determination with SSI absolute encoder 58

2.2.10 Hysteresis 61

2.2.10.1 Hysteresis with incremental or pulse encoder 61

2.2.10.2 Hysteresis with SSI absolute encoder 63

2.2.11 Interrupts 64

2.2.12 Position detection for Motion Control 65

2.2.13 Encoder signals 65

2.2.13.1 24 V and TTL count signals 65

2.2.13.2 RS422 count signals 67

2.2.13.3 SSI signals 69

2.2.14 Signal evaluation of incremental signals....70
2.2.14.1 Overview....70
2.2.14.2 Single evaluation....70
2.2.14.3 Double evaluation....71
2.2.14.4 Quadruple evaluation....72
2.2.15 Clock synchronization (TM Count and TM PosInput)....73

2.3 Basics of counting (TM Timer DIDQ)....74
2.3.1 Overview of applications....74
2.3.2 Counting with incremental encoder....75
2.3.3 Counting with pulse encoder....76
2.3.4 24 V count signals....77
2.3.5 Isochronous mode....78

2.4 Basics of counting (digital input modules)....79
2.4.1 Overview of applications....79
2.4.2 Counting with pulse encoders....80
2.4.3 Behavior at the counting limits....81
2.4.4 Gate control....83
2.4.4.1 Software gate....83
2.4.4.2 Hardware gate....83
2.4.4.3 Internal gate....84
2.4.5 Comparison values....85
2.4.6 Interrupts....87
2.4.7 24 V count signals....88
2.4.8 Isochronous mode....89

3 Using the High_Speed_Counter technology object....90

3.1 Convention....90

3.2 High_Speed_Counter technology object....90

3.3 Overview of the configuration steps....91

3.4 Add technology object....92

3.5 Configuring the High_Speed_Counter....94
3.5.1 Working with the configuration dialog....94
3.5.2 Basic parameters....96
3.5.3 Counter inputs (High_Speed_Counter)....97
3.5.4 Counter behavior....102
3.5.4.1 Counting limits and start value....102
3.5.4.2 Counter behavior at limits and gate start....103
3.5.5 Behavior of a DI (High_Speed_Counter)....104
3.5.6 Behavior of a DQ (High_Speed_Counter)....108
3.5.7 Specify measured value (High_Speed_Counter)....113

3.6 Programming the High_Speed_Counter....115
3.6.1 High_Speed_Counter instruction....115
3.6.2 Call instruction in the user program....116
3.6.3 Description High_Speed_Counter....117
3.6.4 High_Speed_Counter input parameters....122
3.6.5 High_Speed_Counter output parameters....123
3.6.6 Error codes of parameter ErrorID....125
3.6.7 High_Speed_Counter static variables....127

3.7 Commissioning the High_Speed_Counter 129
3.7.1 Commissioning the technology object 129
3.8 High_Speed_Counter diagnostics 131
3.8.1 Monitoring counter values, measured values, DIs and DQs 131
4 Using the SSI_Absolute_Encoder technology object 133
4.1 Technology object SSI_Absolute_Encoder 133
4.2 Overview of the configuration steps 134
4.3 Add technology object 135
4.4 Configuring SSI_Absolute_Encoder 137
4.4.1 Working with the configuration dialog 137
4.4.2 Basic parameters 138
4.4.3 SSI absolute encoder 139
4.4.4 Behavior of a DI (SSI_Absolute_Encoder) 142
4.4.5 Behavior of a DQ (SSI_Absolute_Encoder) 144
4.4.6 Specify measured value (SSI_Absolute_Encoder) 148
4.4.7 Examples of the frame format 150
4.5 Programming the SSI_Absolute_Encoder 153
4.5.1 Instruction SSI_Absolute_Encoder 153
4.5.2 Call instruction in the user program 154
4.5.3 DescriptionSSI_Absolute_Encoder 155
4.5.4 Input parameter SSI_Absolute_Encoder 158
4.5.5 Output parameter SSI_Absolute_Encoder 159
4.5.6 Error codes of parameter ErrorID 161
4.5.7 Static tags SSI_Absolute_Encoder 162
4.6 Commissioning SSI_Absolute_Encoder 163
4.6.1 Commissioning the technology object 163
4.7 SSI_Absolute_Encoder diagnostics 164
4.7.1 Monitoring counter values, measured values, DIs and DQs 164
5 Using the module 166
5.1 Using the technology module 166
5.1.1 Convention 166
5.1.2 Configuring a module 166
5.1.2.1 Adding a technology module for hardware configuration (TM Count and TM PosInput) 166
5.1.2.2 Adding a technology module to hardware configuration (Compact CPU) 168
5.1.2.3 Parameter assignment options 169
5.1.2.4 Basic parameters 170
5.1.2.5 Additional parameters for Compact CPU 178
5.1.3 Parameter assignment of module 180
5.1.3.1 Parameter setting (hardware configuration) Opening (TM Count and TM PosInput) 180
5.1.3.2 Parameter setting (hardware configuration) Opening (Compact CPU) 180
5.1.4 Online & diagnostics module 181
5.1.4.1 Displaying and evaluating diagnostics 181
5.1.5 Control and feedback interface (TM Count, TM PosInput) 182
5.1.5.1 Assignment of the control interface 182
5.1.5.2 Assignment of the feedback interface 185

5.2 Using the digital input module....189
5.2.1 Configuring and assigning parameters to the module....189
5.2.1.1 Adding a module to the hardware configuration....189
5.2.1.2 Open hardware configuration....189
5.2.1.3 Counting operating mode....190
5.2.2 Online & diagnostics module....195
5.2.2.1 Displaying and evaluating diagnostics....195

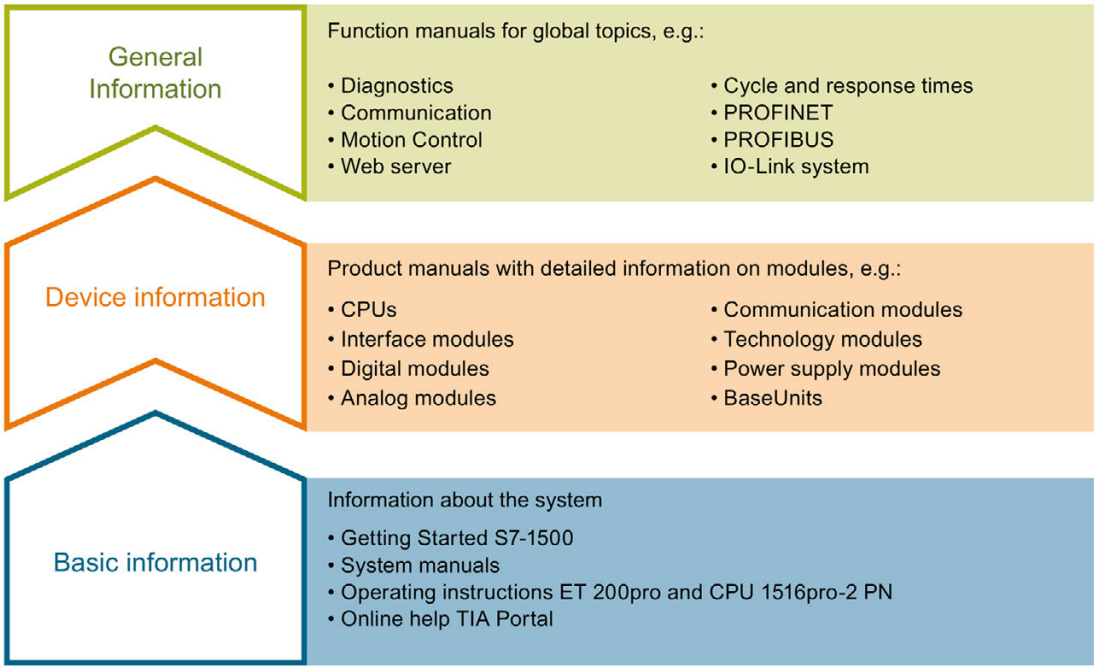
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system, for CPU 1516pro-2 PN based on SIMATIC S7-1500, and for the distributed I/O systems SIMATIC ET 200MP, ET 200SP and ET 200AL is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started manuals describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems; use the corresponding operating instructions for CPU 1516pro-2 PN. The STEP 7 online help supports you in configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server, OPC UA.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

You will find the product information on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/us/en/view/68052815)
- ET 200SP (https://support.industry.siemens.com/cs/us/en/view/73021864)
- ET 200AL (https://support.industry.siemens.com/cs/us/en/view/99494757)

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (https://support.industry.siemens.com/cs/ww/en/view/86140384)
- ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/84133942)
- ET 200AL (https://support.industry.siemens.com/cs/ww/en/view/95242965)

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area in "mySupport" you can combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area in "mySupport", you can access the current product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on different SIMATIC S7 stations as a bulk operation, independently of the TIA Portal.

The SIMATIC automation tool provides a variety of functions:

- Scanning of a PROFINET/Ethernet plant network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- CPU localization by means of LED flashing
- Reading out CPU error information
- Reading of CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

The basics of counting, measurement and position detection

2

2.1 Overview of modules and properties

Modules

The table below summarizes the performance features of the modules for counting, measuring and position input for the S7-1500 and ET 200MP systems.

Property	S7-1500 / ET 200MP				
	Technology module			Digital input module	Compact CPU
	TM Count 2x24V	TM PosInput 2	TM Timer DIDQ 16x24V	DI 32x24VDC HF, DI 16x24VDC HF	CPU 1511C-1 PN, CPU 1512C-1 PN
Number of counters	2	2	4[1]	2	6
Use of counters can be activated/deactivated	—	—	X	X	X
Maximum signal frequency	200 kHz	1 MHz	50 kHz	1 kHz	100 kHz
Maximum count frequency for incremental encoders with quadruple evaluation (Page 70)	800 kHz	4 MHz	200 kHz	—	400 kHz
Maximum counting range	32 bits (Page 21)	32 bits (Page 21)	32 bits (Page 75)	32 bits (Page 80)	32 bits (Page 21)
Maximum position value range (Page 23)	—	31 bits	—	—	—
RS422/TTL incremental and pulse encoder (Page 67) connection	—	X	—	—	—
24 V incremental encoder connection	X (Page 65)	—	X (Page 77)	—	X (Page 65)
24 V pulse encoder connection	X (Page 65)	—	X (Page 77)	X (Page 88)	X (Page 65)
SSI absolute encoder (Page 69) connection	—	X	—	—	—
Position input for Motion Control (Page 65)	X	X	—	—	X

Property	S7-1500 / ET 200MP				
	Technology module			Digital input module	Compact CPU
	TM Count 2x24V	TM PosInput 2	TM Timer DIDQ 16x24V	DI 32x24VDC HF, DI 16x24VDC HF	CPU 1511C-1 PN, CPU 1512C-1 PN
5 V encoder supply	—	X	—	—	—
24 V encoder supply	X	X	X	—	X
Number of additional digital inputs per counter	3	2	—	—	2
Number of physical digital outputs per counter	2	2	—	—	1
Number of logical digital outputs per counter	2	2	—	1	2
Hysteresis (Page 61)	X	X	—	—	X
Software gate	X (Page 26)	X (Page 26)	—	X (Page 83)	X (Page 26)
Hardware gate	X (Page 26)	X (Page 26)	—	—	X (Page 26)
Capture function (Latch) (Page 29)	X	X	—	—	X
Synchronization (Page 34)	X	X	—	—	X
Comparison functions	X (Page 42)	X (Page 42)	—	X (Page 85)	X (Page 42)
Frequency, velocity and period duration measurement (Page 53)	X	X	—	—	X
Support for isochronous mode on PROFINET	X (Page 73)	X (Page 73)	X (Page 78)	X (Page 89)	—
Support for diagnostic interrupts for sensor signals	X (Page 64)	X (Page 64)	—	—	X (Page 64)
Hardware interrupt support	X (Page 64)	X (Page 64)	—	X (Page 87)	X (Page 64)
Configurable filter for count signals and digital inputs	X	X	—	X	X

[1] The number of available counters is dependent on the channel configuration. In order to use four counters, you must choose the use of eight inputs in the channel configuration. If you choose the use of three inputs, you can use one counter. Other channel configurations do not allow any counter use.

The following table provides an overview of the performance features of the modules for counting, measuring and position input for the ET 200SP system.

Property	ET 200SP			
	Technology module			Digital input module
	TM Count 1x24V	TM PosInput 1	TM Timer DIDQ 10x24V	DI 8x24VDC HS
Number of counters	1	1	3[1]	4
Use of counters can be activated/deactivated	—	—	X	X
Maximum signal frequency	200 kHz	1 MHz	50 kHz	10 kHz
Maximum count frequency for incremental encoders with quadruple evaluation (Page 70)	800 kHz	4 MHz	200 kHz	—
Maximum counting range	32 bits (Page 21)	32 bits (Page 21)	32 bits (Page 75)	32 bits (Page 80)
Maximum position value range (Page 23)	—	31 bits	—	—
RS422/TTL incremental and pulse encoder (Page 67) connection	—	X	—	—
24 V incremental encoder connection	X (Page 65)	—	X (Page 77)	—
24 V pulse encoder connection	X (Page 65)	—	X (Page 77)	X (Page 88)
SSI absolute encoder (Page 69) connection	—	X	—	—
Position input for Motion Control (Page 65)	X	X	—	—
5 V encoder supply	—	—	—	—
24 V encoder supply	X	X	X	X
Number of additional digital inputs per counter	3	2	—	1
Number of physical digital outputs per counter	2	2	—	—
Number of logical digital outputs per counter	2	2	—	1
Hysteresis	X	X	—	—
Software gate	X (Page 26)	X (Page 26)	—	X (Page 83)
Hardware gate	X (Page 26)	X (Page 26)	—	X (Page 83)
Capture function (Latch) (Page 29)	X	X	—	—
Synchronization (Page 34)	X	X	—	—
Comparison functions	X (Page 42)	X (Page 42)	—	X (Page 85)

Property	ET 200SP			
	Technology module			Digital input module
	TM Count 1x24V	TM PosInput 1	TM Timer DIDQ 10x24V	DI 8x24VDC HS
Frequency, velocity and period duration measurement (Page 53)	X	X	—	—
Support for isochronous mode on PROFINET	X (Page 73)	X (Page 73)	X (Page 78)	X (Page 89)
Support for diagnostic interrupts for sensor signals	X (Page 64)	X (Page 64)	—	—
Hardware interrupt support	X (Page 64)	X (Page 64)	—	—
Configurable filter for count signals and digital inputs	X	X	—	X

[1] One counter for incremental encoder (A, B phase-shifted) and two counters for pulse encoder

2.2 Basics of counting, measuring and position input (TM Count, TMPosInput, Compact CPU)

2.2.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

2.2.2 Overview of applications

Introduction

The technology module is configured and assigned parameters using the configuration software.

The technology module functions are controlled and monitored via the user program.

System environment for TM Count and TM PosInput

The technology modules can be used in the following system environments:

Application scenarios	Components required	Configuration software	In the user program
Central operation an S7-1500 system or distributed operation in an S7-1500 system with a corresponding ET 200 system	• S7-1500 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter settings with High_Speed_Counter technology object	Counting and measuring functions: High_Speed_Counter instruction for the technology object Position input with SSI absolute encoder: Direct access to technology module control and feedback interface in the I/O data
		STEP 7 (TIA Portal): Device configuration with hardware configuration in operating mode "Position input for Motion Control"	Control by a technology object

Application scenarios	Components required	Configuration software	In the user program
Distributed operation in an S7-300/400 or S7-1200 system	• S7-300/400 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): Device configuration and parameter setting with hardware configuration STEP 7: Device configuration and parameter settings with HSP	Direct access to technology module control and feedback interface in the I/O data
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Technology module	Third-party configuration software: Device configuration and parameter settings with GSD file	Direct access to technology module control and feedback interface in the I/O data

System environment for a Compact CPU

The Compact CPUs can be used in the following system environments:

Application scenarios	Components required	Configuration software	In the user program
Central operation in an S7-1500 system	• S7-1500 automation system • Compact CPU	STEP 7 (TIA Portal): • Device configuration with hardware configuration • Parameter settings with High_Speed_Counter technology object	Counting and measuring functions: High_Speed_Counter instruction for the technology object
		STEP 7 (TIA Portal): Device configuration with hardware configuration in operating mode "Position input for Motion Control"	Control by the technology object

Parameter assignment options

In an S7-1500 system, you have two options for parameter assignment and control of technology module functions:

- Configuration using the High_Speed_Counter technology object and control with the corresponding High_Speed_Counter instruction
  The technology module control and feedback interface is accessed with the technology object.
- Parameter setting via hardware configuration
  The control and feedback interface of the technology module is accessed using direct access to the I/O data.

Configuration via technology object

For central and distributed use in an S7-1500 system, we recommend simple configuration with graphic support using a High_Speed_Counter technology object. A detailed description of this configuration can be found in section AUTOHOTSPOT and below.

You can define "Operating with technology object" for the technology module in the device configuration: see section Operating mode (Page 172).

You can assign the technology module and counting channel in the basic parameters of the technology object: see section Basic parameters (Page 96).

Parameter setting via hardware configuration

Additional support for parameter setting via hardware configuration is available in the context-sensitive help for the parameters in STEP 7 (TIA Portal). A description of the control and feedback interface is available in the following sections:

Assignment of the control interface (Page 182)

Assignment of the feedback interface (Page 185)

2.2.3 Recording of count signals

2.2.3.1 Counting with incremental or pulse encoder

Counting refers to the recording and adding up of events. The counters of the technology modules capture and evaluate pulse and incremental signals. The count direction can be specified using encoder or pulse signals or through the user program.

You can control counting processes using the digital inputs of the technology module. You can switch the digital outputs exactly at defined counter values, regardless of the user program.

You can configure the response of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program.

The highest counter limit that can be set is 2147483647 (2^{31}–1). The lowest counter limit that can be set is –2147483648 (–2^{31}).

You can configure the response of the counter at the counter limits:

- Continue or stop counting upon violation of a counter limit (automatic gate stop)
- Set counter value to start value or to opposite counter limit upon violation of a counter limit

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime by the user program.

The technology module can, as configured, set the current counter value to the start value upon synchronization, upon Capture function activation, upon violation of a counter limit or when the gate is opened.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are captured.

The hardware gate is controlled externally via a digital input of the technology module. The software gate is controlled via the user program. The hardware gate can be enabled through parameter assignment. The software gate (bit in the control interface of the cyclic I/O data) cannot be disabled.

Capture (Latch)

You can configure an external reference signal edge that triggers the saving of the current counter value or position value as a Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input
- Rising edge of signal N at the encoder input (for incremental and pulse encoders)

For incremental and pulse encoders, you can configure whether counting continues from the current counter value or from the start value after the Capture function.

Synchronization

You can configure an external reference signal edge to load the counter with the specified start value. The following external signals can load the counter with the start value:

- Rising or falling edge of a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input depending on the level of the assigned digital input

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the counter value fluctuate around this position. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output will be switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

2.2.3.2 Position input with SSI absolute encoder

Description

You can use the TM PosInput technology modules with an SSI absolute encoder for position detection. The technology module reads the position value via a synchronous serial interface from the SSI absolute encoder and makes it available to the controller.

You can switch the digital outputs of the technology module exactly at defined position values, regardless of the user program. Position input with an SSI absolute encoder does not involve gate control. Due to system constraints, synchronization is not possible with an SSI absolute encoder.

Gray-dual conversion

Gray-code and dual-code SSI absolute encoders are supported.

Capture (Latch)

You can configure one or both edges of a digital input that triggers a saving of the current position value as Capture value.

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the position value fluctuate around this position. If a comparison value or a limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

Range for position value

You can specify a frame length of 10 bits to 40 bits for the SSI absolute encoder. The configurable bit numbers of the LSB and the MSB of the position value in the frame define the value range. The technology module can read a position value with a maximum length of31 bits and communicate it to the controller. The position value is treated as unsigned positive value and can assume values between 0" and "$2^{(MSB-LSB+1)-1}$".

Complete SSI frame

Instead of having a measured variable returned, you can choose to have the least significant 32 bits of the current unprocessed SSI frame returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface.

2.2.4 Behavior at the counting limits

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another upward count pulse is received. The counter low limit is violated when the current counter value is equal to the counter low limit and another downward count pulse is received.

The appropriate status bit is set in the feedback interface in the event of limit violation:

Counting limit violated	Status bit
High counting limit	EVENT_OFLW is set
Low counting limit	EVENT_UFLW is set

You can reset the status bits with RES_EVENT .

You can configure whether or not and from which counter value counting is to continue following counting limit violation.

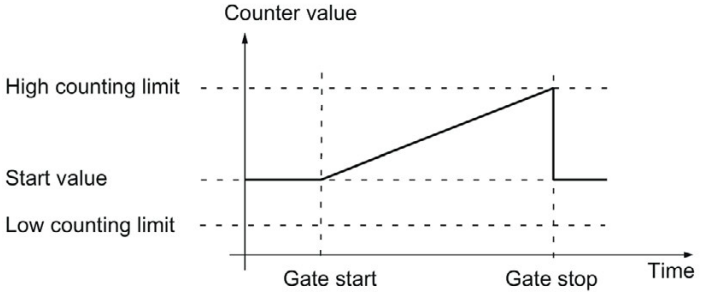
Note

The high counting limit and the start value define the value range of the counter:

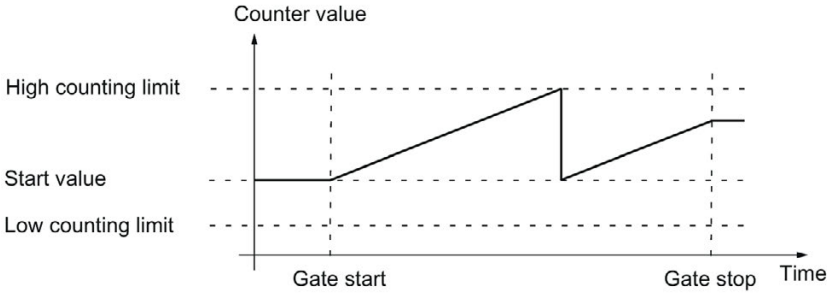
Value range of the counter = (high limit – start value) + 1

Examples

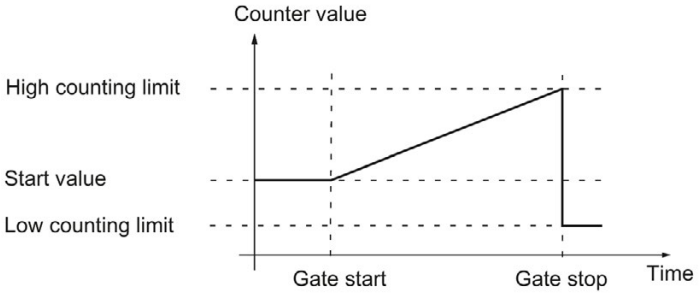
The figure below shows an example for terminating the counting process (automatic gate stop) after an overflow and setting the counter to the start value:



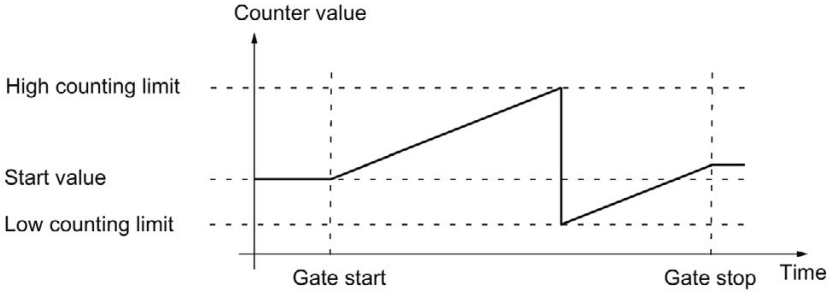
The figure below shows an example for continuing the counting process after an overflow and setting the counter to the start value:



The figure below shows an example for terminating counting after an overflow and setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.2.5 Gate control with incremental or pulse encoder

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The technology modules have two gates for each channel. These define the resulting internal gate:

- Software gate
- Hardware gate

2.2.5.1 Software gate

The software gate of the channel is opened and closed with the control bit (Page 182) SW_GATE. The status of the software gate is indicated by the feedback bit (Page 185) STS_SW_GATE .

2.2.5.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate by means of signals at the configured digital inputs of the channel.

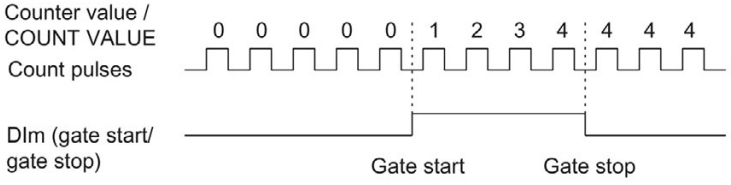
Note

The configured input filters delay the control signal of the digital input.

The status of a DIm digital input is indicated by the respective feedback bit (Page 185) STS_DIm .

Level-triggered opening and closing of the hardware gate with a digital input

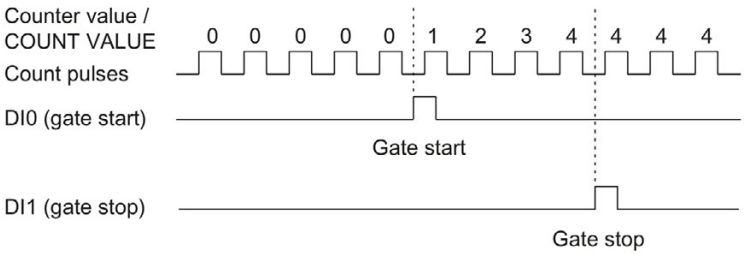
The figure below shows an example of level-triggered opening and closing with a digital input. The digital input is configured to be active with high level:



As long as the digital input is active, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input becomes inactive. The counter value stays constant and ignores any further count pulses.

Edge-triggered opening and closing of the hardware gate with two digital inputs

The figure below shows an example of opening and closing with two digital inputs. The two digital inputs are configured so that the rising edge of the hardware gate opens:



The hardware gate is opened with the configured edge at the digital input that is configured for opening. The hardware gate is closed with the configured edge at the digital input that is configured for closing.

2.2.5.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the feedback bit (Page 185) STS_GATE.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

When you configure the counter behavior, you can specify whether the counting process is to start from the start value or from the current counter value when the internal gate is opened.

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.2.5.4 Counter behavior at gate start

You have the following configuration options for counter behavior upon gate start:

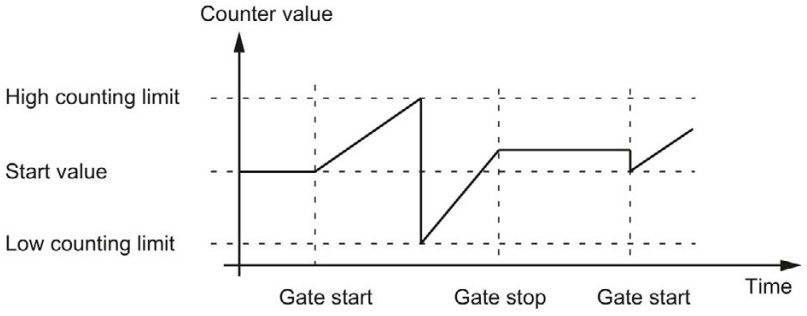
- Setting counter to start value
- Continuing with the current counter value

Setting counter to start value

Counter behavior is as follows for this configuration:

Each counting process starts with the start value when the internal gate is opened.

The figure below shows an example for continuing the counting process after counter is set to the start value:

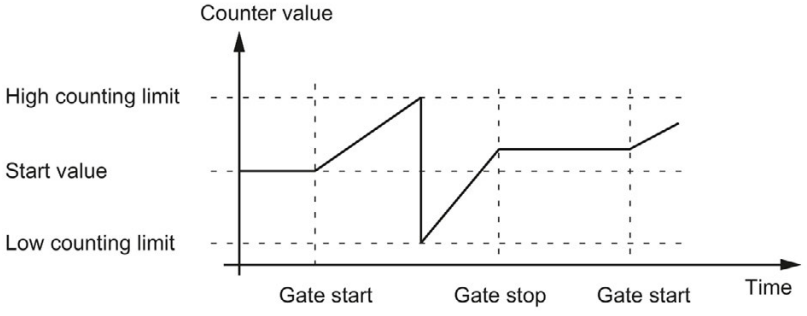


Continuing with the current counter value

Counter behavior is as follows for this configuration:

Each counting process starts from the current counter value after the internal gate is reopened.

The figure below shows an example for continuing the counting process with the current counter value:



2.2.6 Capture (Latch)

2.2.6.1 Capture with incremental or pulse encoder

Description

The "Capture" function is used to save the current counter value with an external reference signal. You can configure the Capture function for the following reference signals:

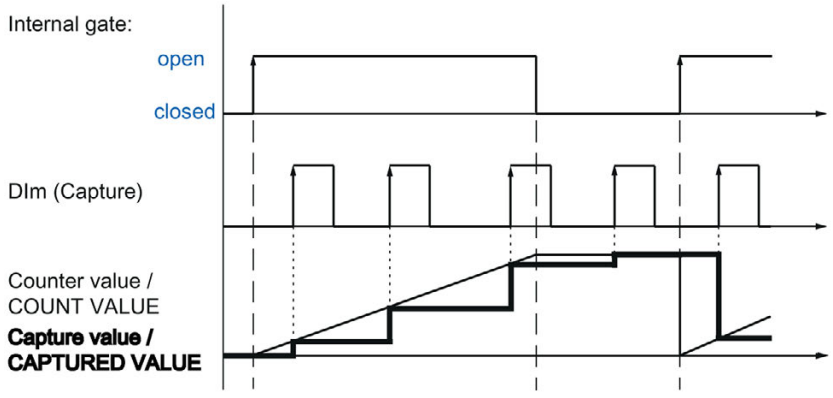
- Rising or falling edge at a digital input
- Rising and falling edge at a digital input
- Rising edge of signal N at the encoder input

Function principle

The Capture value is always the exact counter value at the time of the edge in question (delayed by the configured input filter time). The Capture function is effective regardless of the status of the internal gate. The unchanged counter value is saved when the gate is closed.

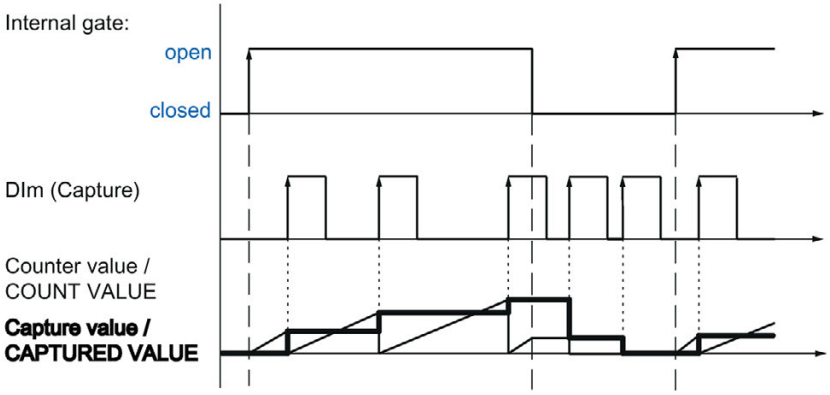
The figure below shows an example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Continue counting after Capture event



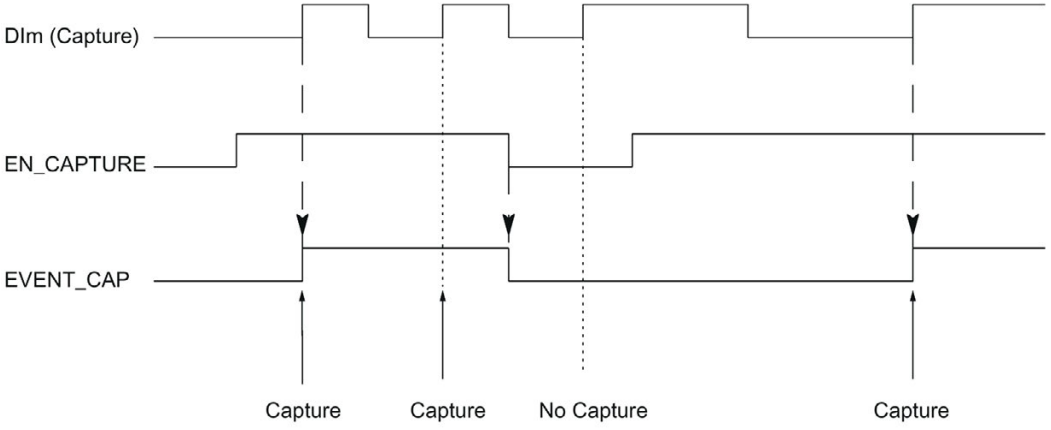
The figure below shows another example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Reset counter value to start value after Capture event and continue counting.



The control bit (Page 182) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 185) EVENT_CAP indicates that a counter value has been saved as a Capture in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 185) STS_DIm .

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

The Capture function has no effect on the feedback bit STS_CNT and the LEDs UP and DN.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. Individual hardware interrupts may be lost if the hardware interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.6.2 Capture with SSI absolute encoder

Description

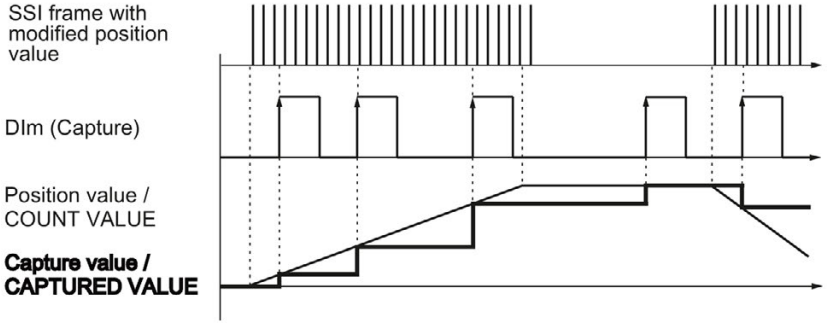
The "Capture" function is used to save the current position value using an external reference signal. You can configure the Capture function for the following reference signals:

- Rising or falling edge at a digital input
- Rising and falling edge at a digital input

Function principle

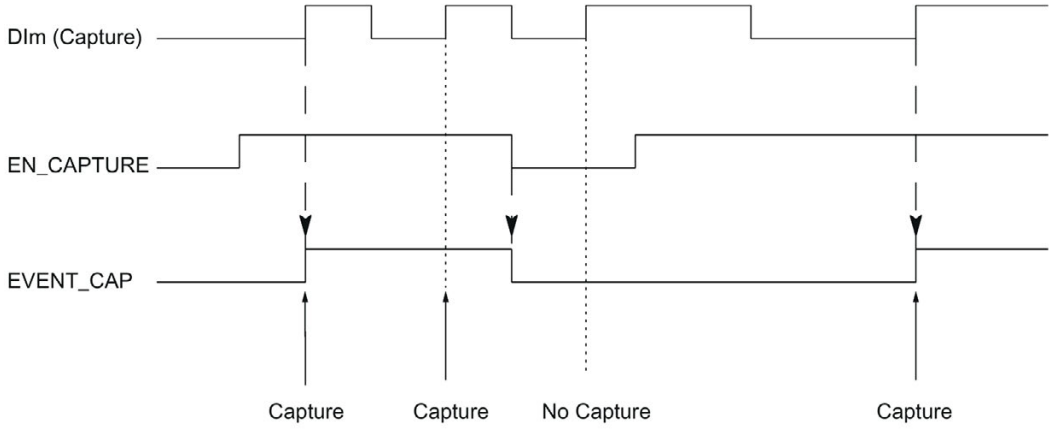
At the time of each edge, the position value of the last valid SSI frame is stored in the Capture value.

The figure below shows an example of the Capture event by a rising edge at the configured digital input:



The control bit (Page 182) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 185) EVENT_CAP indicates that a position value has been saved as Capture value in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 185) STS_DIm .

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. Individual hardware interrupts may be lost if the hardware interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.7 Synchronization

Description

You use the "Synchronization" function to set the counter to the pre-defined start value with an external reference signal. You can configure synchronization for the following reference signals:

- Rising or falling edges at a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input defined by the level of a digital input

Function principle

Synchronization always takes place exactly at the time of the reference signal. Synchronization is effective regardless of the status of the internal gate.

You use the control bit (Page 182) EN_SYNC_UP to enable synchronization for counting in an upwards direction. Use the control bit (Page 182) EN_SYNC_DN to enable synchronization for counting down. The feedback bit (Page 185) EVENT_SYNC indicates that synchronization has been performed. Resetting EN_SYNC_UP or EN_SYNC_DN also resets EVENT_SYNC.

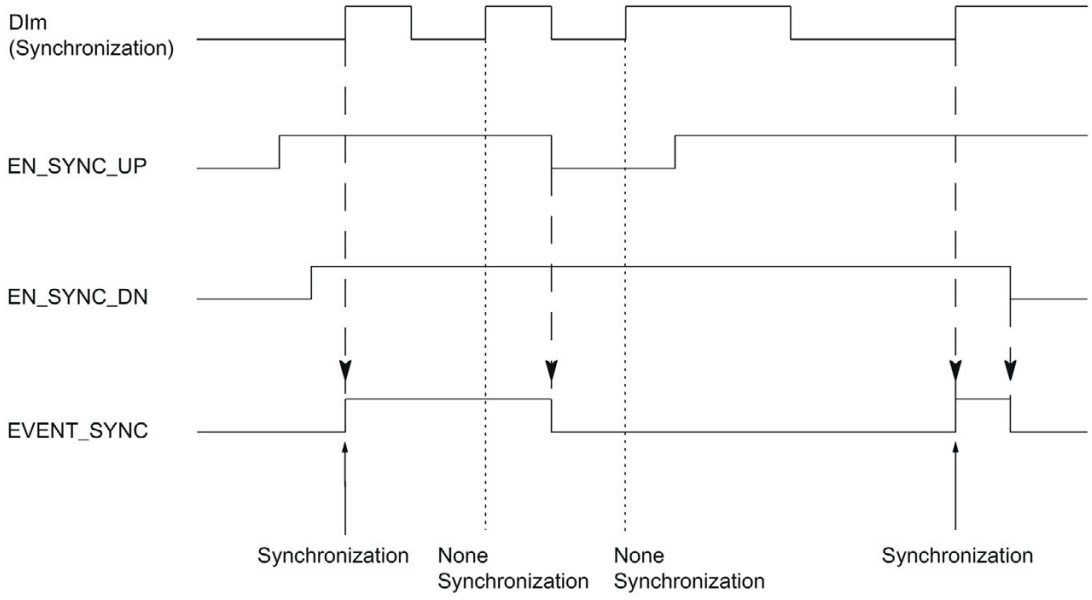
Note

The configured input filters delay the control signal of the corresponding digital input.

Synchronization has no effect on the feedback bit (Page 185) STS_CNT and the LEDs UP and DN.

Single synchronization

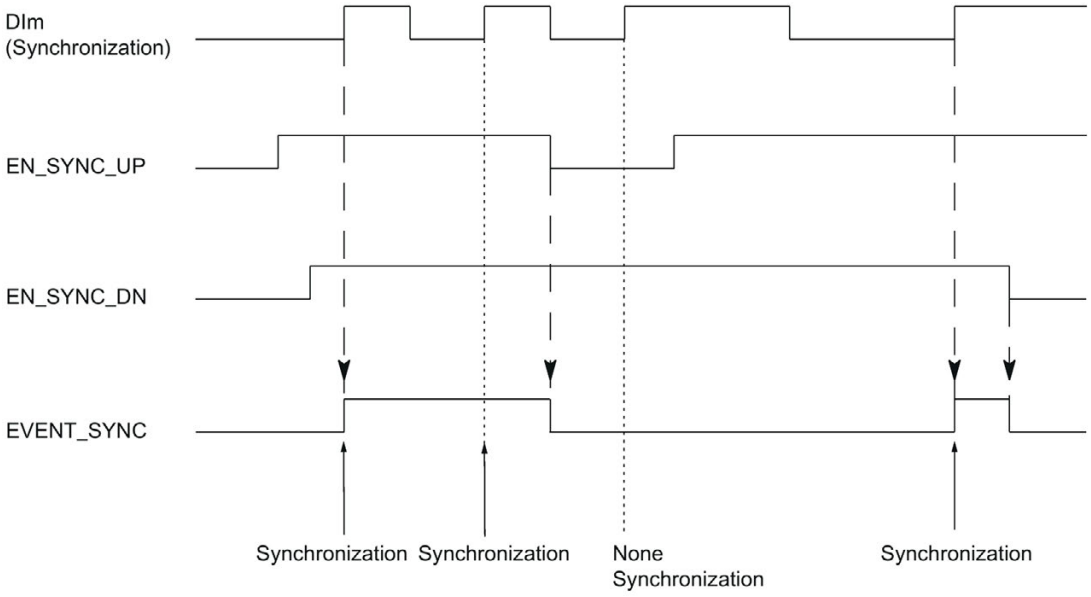
The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DNand EVENT_SYNC bits with single synchronization by an edge at a digital input for count pulses in an upwards direction:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. The counter can only be synchronized again once the control bit (Page 182) EN_SYNC_UP has been reset and set again.

Periodic synchronization

The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DN and EVENT_SYNC bits with periodic synchronization by an edge at a digital input for count pulses in an upwards direction:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

Hardware interrupt

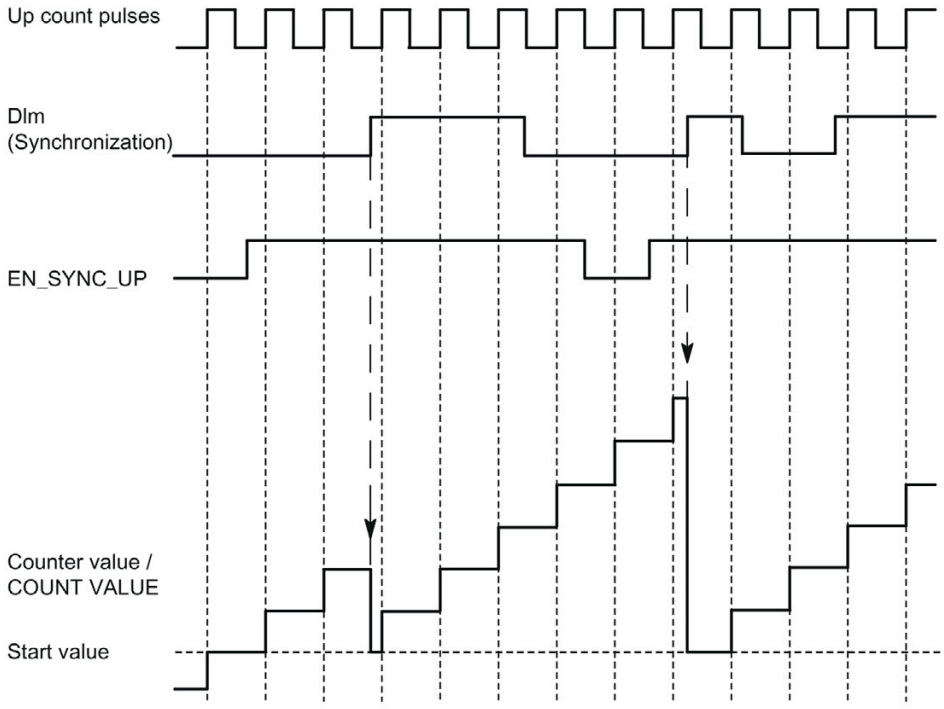
You can configure a hardware interrupt for the synchronization. The hardware interrupts will be lost if the interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.7.1 Synchronization by digital input

You can trigger synchronization by edges at a digital input.

Single synchronization

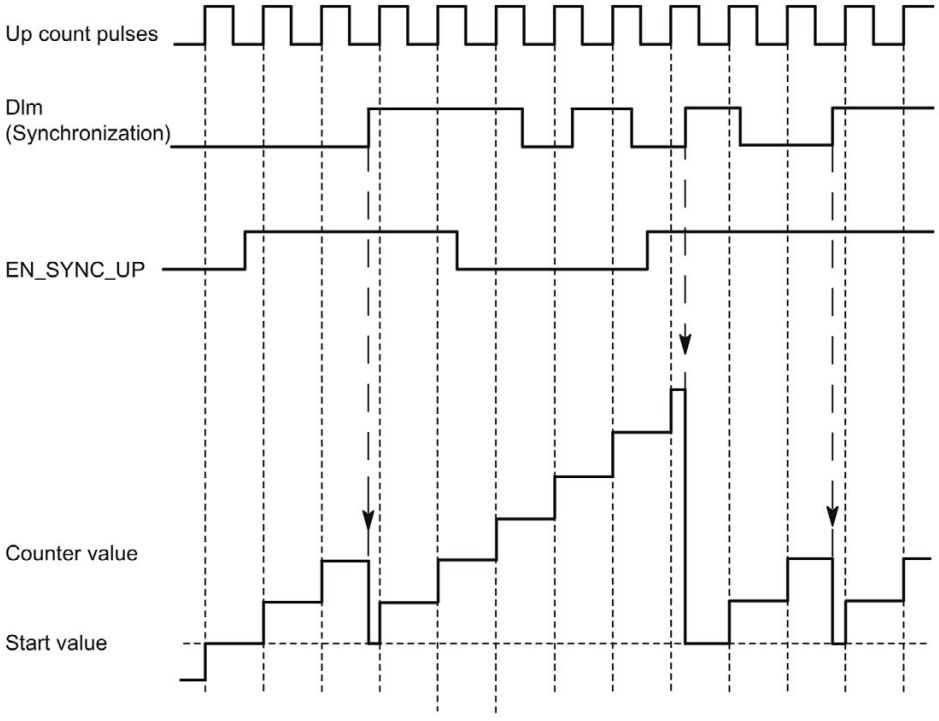
The figure below shows an example for single synchronization by an edge at a digital input:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. Until the control bit (Page 182) EN_SYNC_UP has been reset and set again, any additional rising edge at the digital output is ignored. The counter can then be synchronized again.

Periodic synchronization

The figure below shows an example for periodic synchronization by an edge at a digital input:



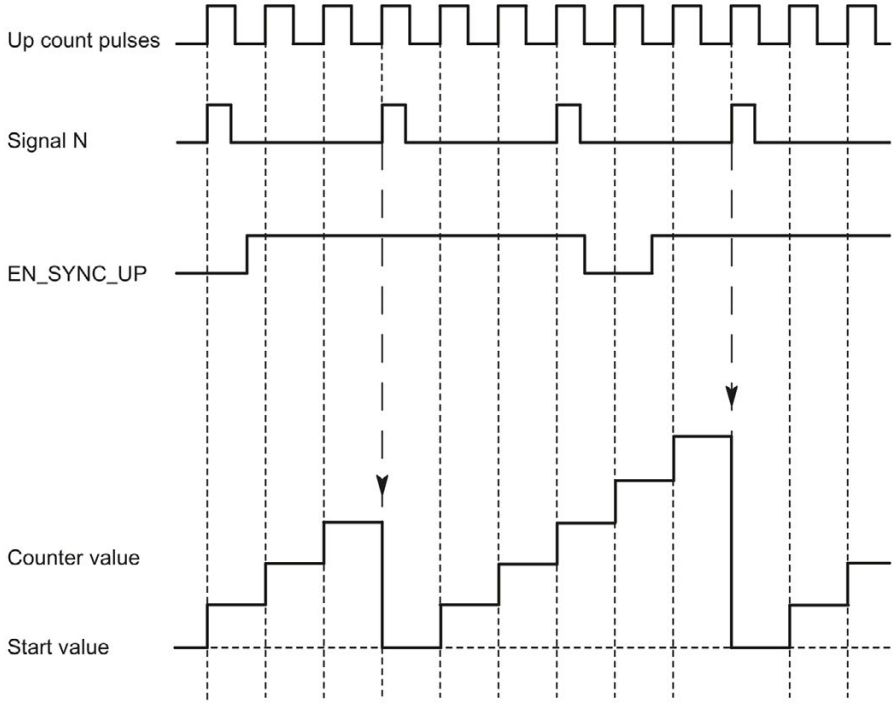
As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

2.2.7.2 Synchronization at signal N

You can trigger synchronization at signal N at the encoder input either directly or depending on the status of a digital input.

Single synchronization

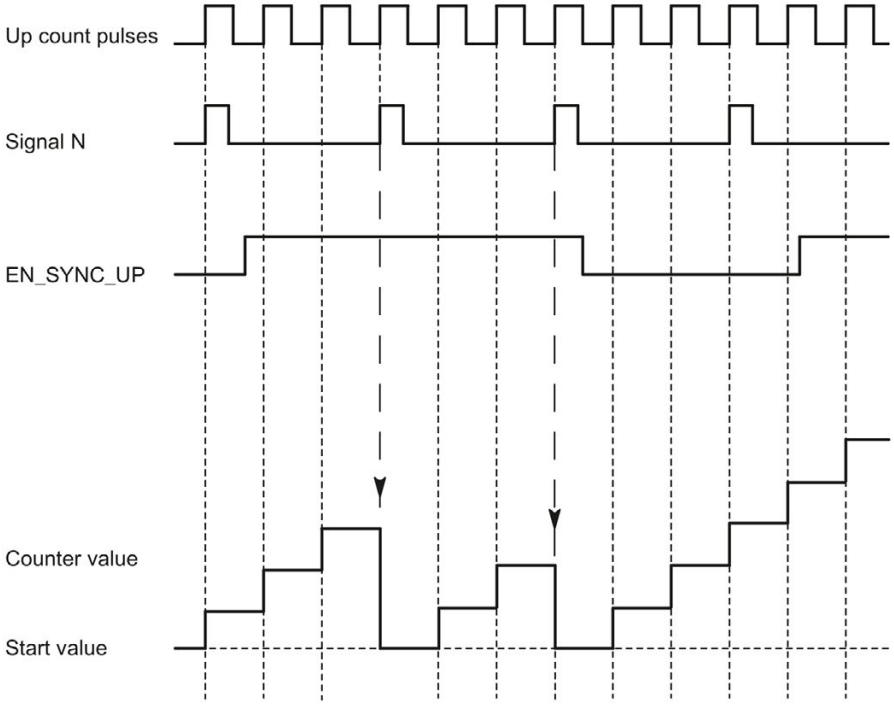
The figure below shows an example of single synchronization at signal N (not dependent on a digital input):



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first signal N. After resetting and setting the control bit (Page 182) EN_SYNC_UP once again, the counter can be synchronized again.

Periodic synchronization

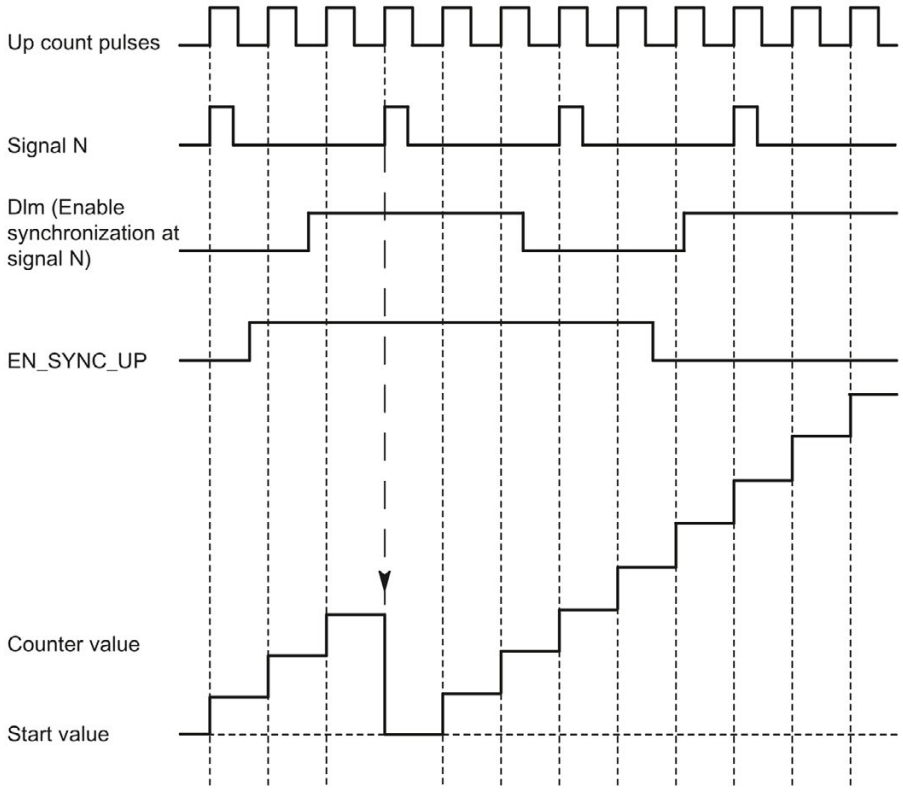
The figure below shows an example for periodic synchronization at signal N:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each signal N.

Enable by a digital input

The figure below shows an example for periodic synchronization at signal N depending on the status of a digital input:



As long as synchronization for counting up is enabled and the corresponding digital input is active, the counter is synchronized at each signal N. If one of the conditions is not met, the counter is not synchronized at the signal N.

2.2.8 Comparison values

2.2.8.1 Comparison values and outputs

Description

You can specify two comparison values to control both digital outputs of the channel independently of the user program:

- Comparison value 0 for digital output DQ0
- Comparison value 1 for digital output DQ1

Depending on the operating mode and the encoder used, define two position, counter or measured values as comparison value. Comparison value 1 must be greater than comparison value 0. The comparison values are configurable and can be modified during runtime using the user program.

Note

DQ0 of a counter of a Compact CPU

With a Compact CPU, the respective digital output DQ0 is available via the feedback interface, but not as a physical output.

Switching digital outputs from the user program

The control bits (Page 182) TM_CTRL_DQ0 and TM_CTRL_DQ1 are used to control use of the digital outputs.

If TM_CTRL_DQm is set to 0, you can control the relevant digital output from the user program with the control bit SET_DQm regardless of the configured technological function. If TM_CTRL_DQm is set to 1, the technological function of the controller of the respective digital output is enabled.

The status of a digital output is indicated by the respective STS_DQm feedback bit.

2.2.8.2 Switching at comparison values with counter value as reference

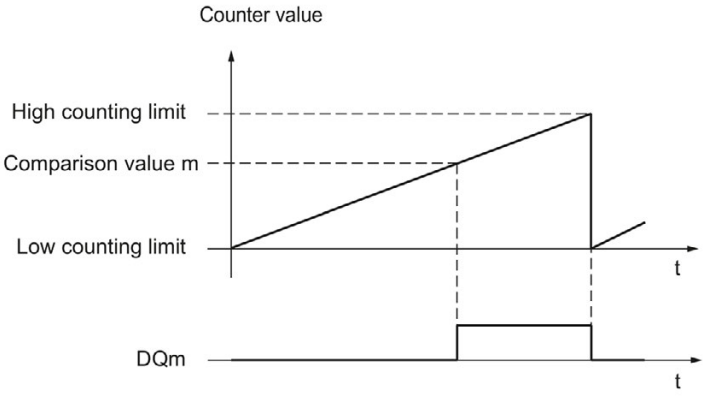
The comparison values are compared with the current counter value. If the counter value meets the assigned comparison condition and the technological function of the associated digital output is enabled, the digital output is set. If you assign "Between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high counting limit

The digital output is set to 1 if:

Comparison value <= counter value <= high counting limit

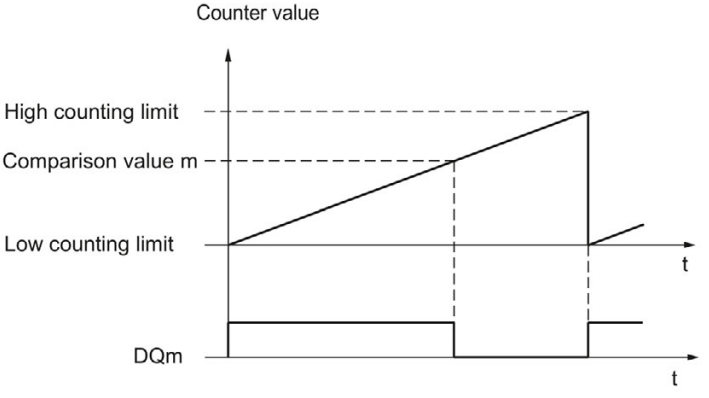


The comparison event is independent of the count direction.

Setting between comparison value and low limit

The digital output is set to 1 if:

Low counting limit <= counter value <= comparison value



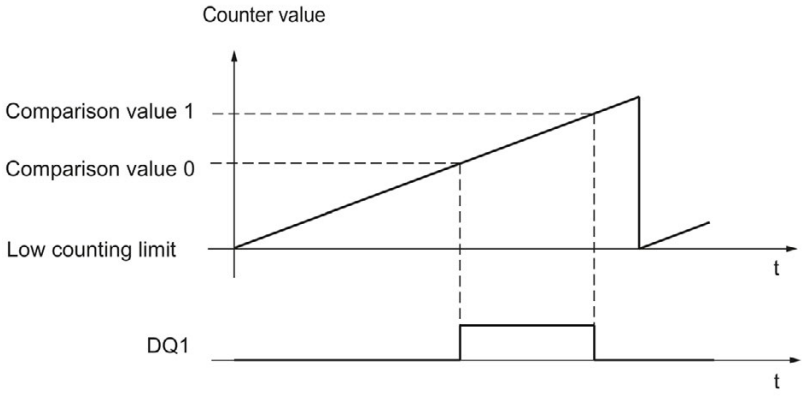
The comparison event is independent of the count direction.

Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= counter value <= comparison value 1



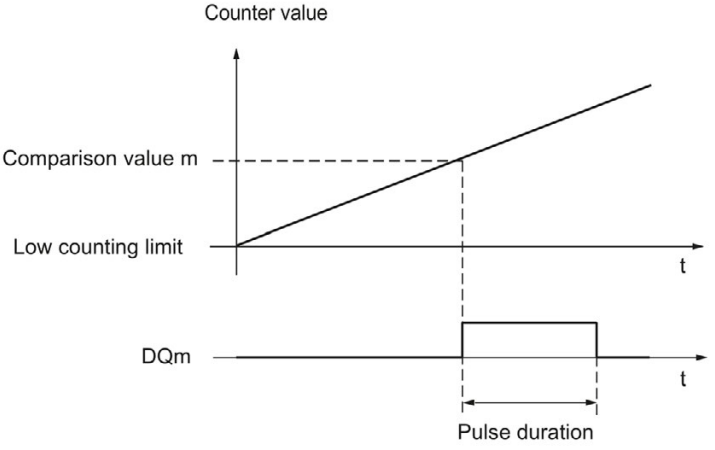
The comparison event is independent of the count direction.

Setting at comparison value for one pulse duration

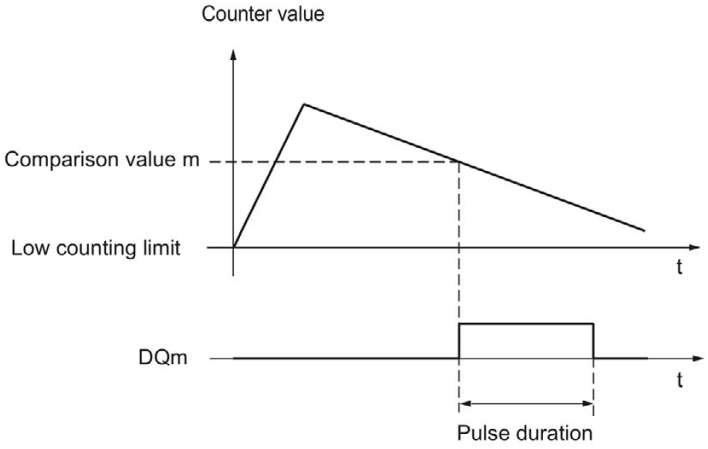
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Counter value = comparison value
- Current count direction = configured count direction for the comparison event

The figure below shows an example of the comparison event when counting in an upwards direction:

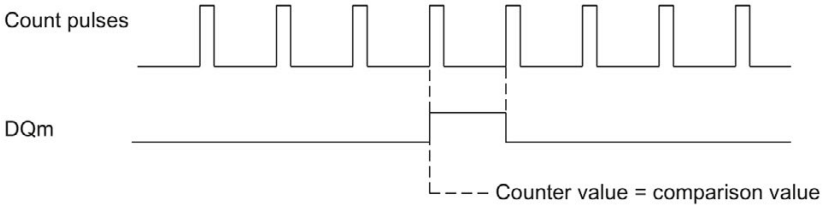


The figure below shows an example of the comparison event when counting in a downward direction:



To repeat the comparison event, the counter value must change and then correspond to the respective comparison value again.

If the pulse duration has been defined as "0" and the counter value is equal to the comparison value, the digital output is set to 1 until the next count pulse:



Note

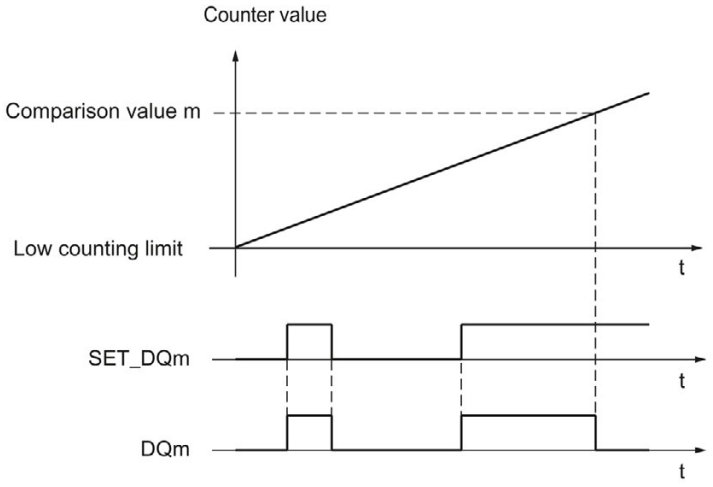
This comparison event switches the relevant digital output if a count pulse reaches the comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

Setting by the user program up to comparison value

You can set the respective digital output to 1 (edge) by setting the control bit (Page 182) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Match of the counter value and the comparison value in the configured direction of the comparison event
- Reset of the corresponding SET_DQm control bit.

The figure below shows an example of the comparison event when counting in an upwards direction:



You can disable the digital output before the counter value reaches the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached in the configured count direction, the feedback bit EVENT_CMPm is set independently of the state of the control bit SET_DQm.

The comparison event switches a digital output when a count pulse reaches the respective comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

2.2.8.3 Switching at comparison values with position value (SSI absolute value) as reference

The comparison values are compared with the current position value. If the position value meets the assigned comparison condition and the technological function of the associated digital output is enabled, the digital output is set. If you assign "Between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

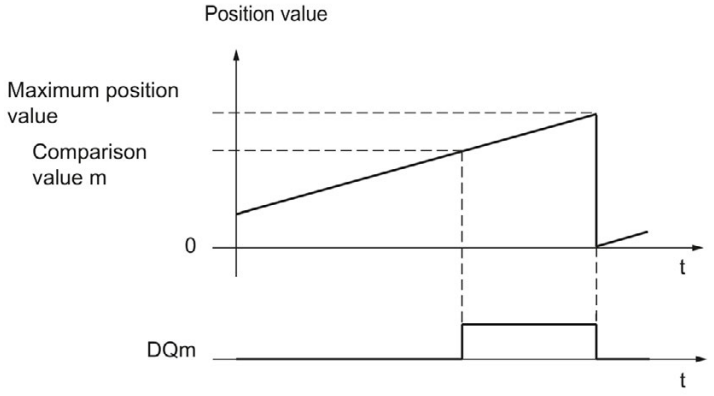
You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high limit

The high limit corresponds to the maximum position value.

The digital output is set to 1 if:

Comparison value <= position value <= maximum position value



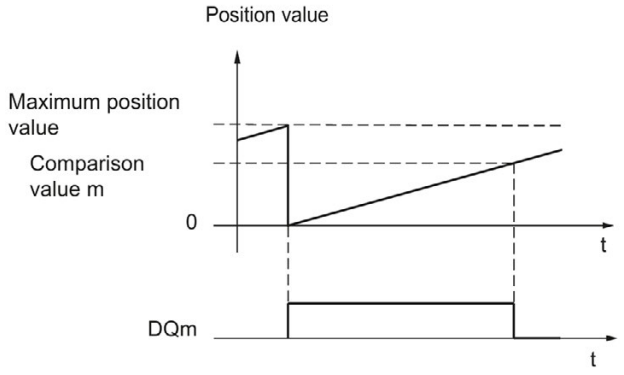
The comparison event is independent of the direction of the position value change. The maximum position value depends on the resolution of the SSI absolute encoder.

Setting between comparison value and low limit

The low limit corresponds to the position value "0".

The digital output is set to 1 if:

0 <= position value <= comparison value



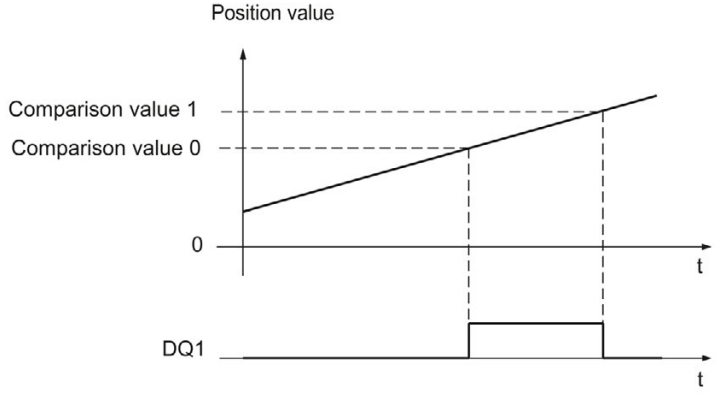
The comparison event is independent of the direction of the position value change.

Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= position value <= comparison value 1



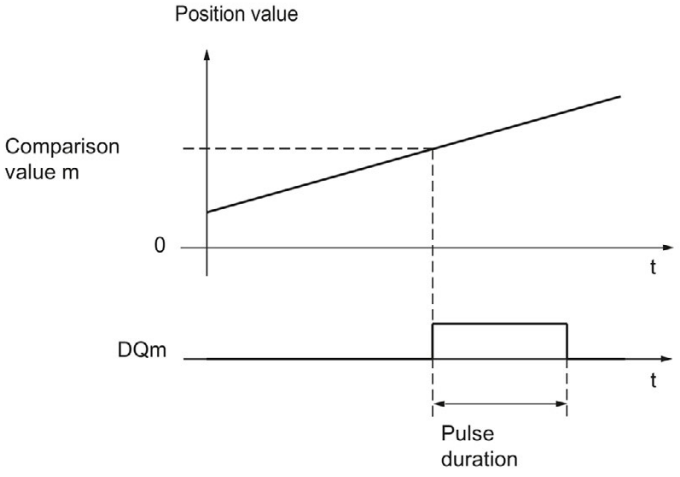
The comparison event is independent of the direction of the position value change.

Setting at comparison value for one pulse duration

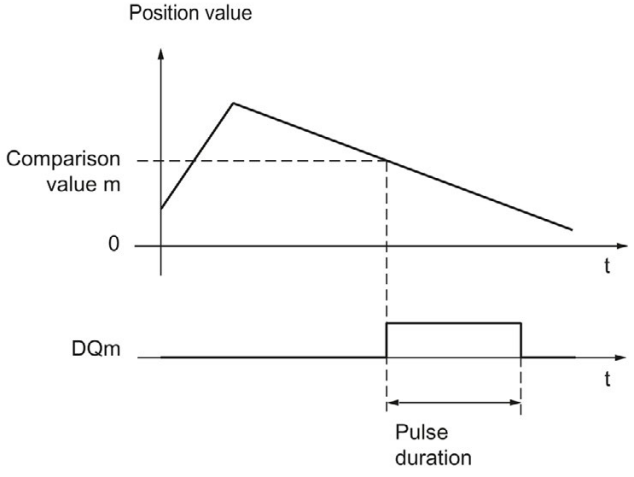
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Matching of the position value and comparison value or crossing of the comparison value
- Current direction of the position value change = assigned direction for the comparison event

The figure below shows an example of the comparison event when counting up:



The figure below shows an example of the comparison event when counting down:



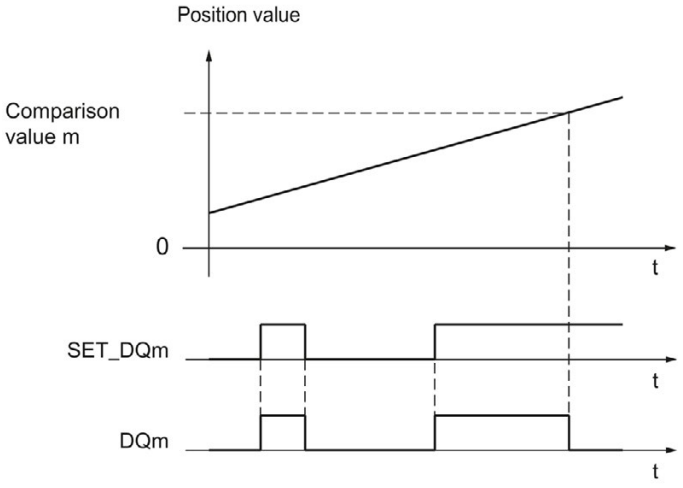
To repeat the comparison event, the position value must change and then correspond to or cross the respective comparison value again.

Setting by the user program up to comparison value

You can set each digital output to 1 (edge) by setting the control bit (Page 182) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Matching of the position value and the comparison value or crossing of the comparison value in the configured direction of the comparison event
- Resetting of the SET_DQm control bit.

The figure below shows an example of the comparison event when counting up:



You can disable the digital output before the position value corresponds to or exceeds the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached or exceeded in the assigned direction, feedback bit EVENT_CMPm is set independently of the status of control bit SET_DQm.

2.2.8.4 Switching at comparison values with measured value as reference

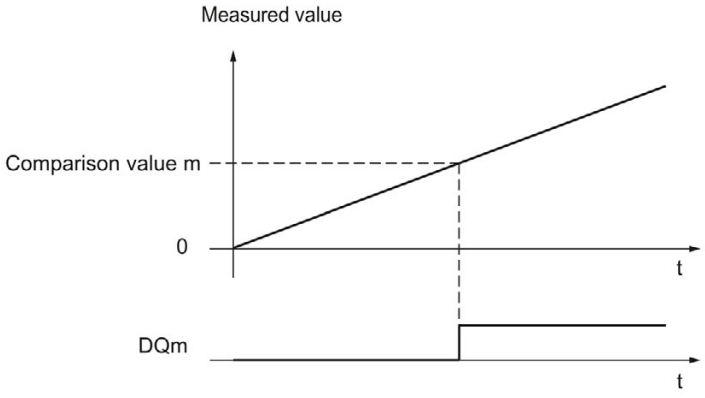
The comparison values are compared with the current measured value. If the measured value meets the configured comparison condition and the technological function of the corresponding digital output is enabled, the digital output is set. If you configure "Between comparison value 0 and 1" or "Not between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

You can make switching for a digital output dependent on one of the following comparison events:

Setting above the comparison value

The digital output is set to 1 if:

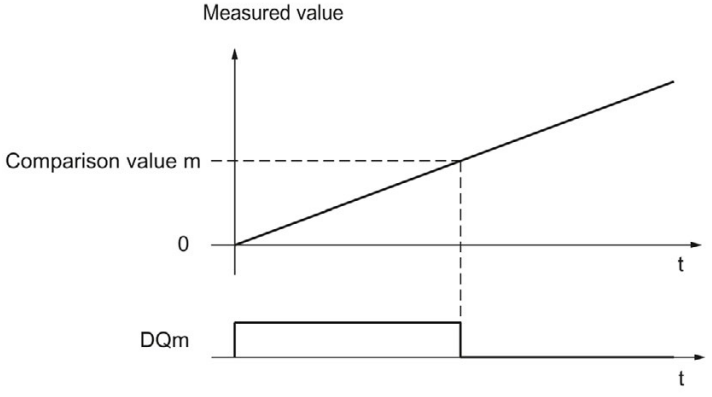
Measured value >= comparison value



Setting below the comparison value

The digital output is set to 1 if:

Measured value <= comparison value

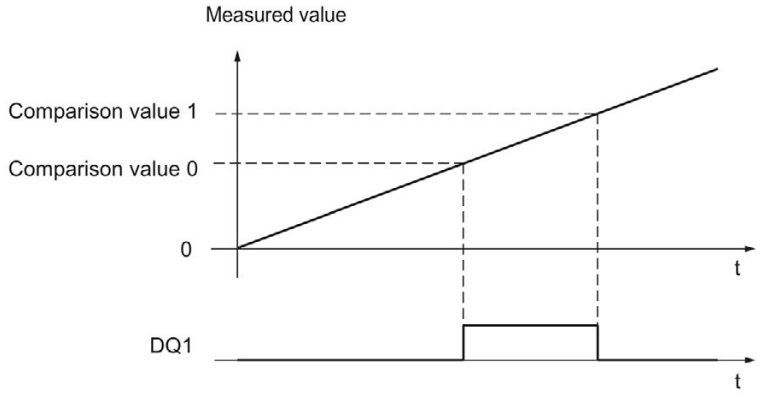


Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= measured value <= comparison value 1

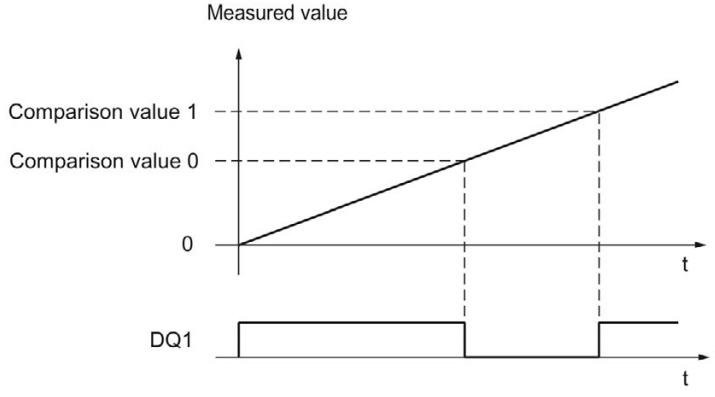


Not setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 1 <= measured value <= comparison value 0



2.2.9 Measured value determination

2.2.9.1 Overview of measuring functions

The following measuring functions are available:

Measurement type (Page 56)	Description
Frequency measurement	The mean frequency is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in Hertz as floating point number.
Period measurement	The mean period duration is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in seconds as floating point number.
Velocity measurement	The mean velocity is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and other parameters, and returned in the configured unit of measurement.

Measured values and counter values are available concurrently in the feedback interface.

Update time

You can configure the interval at which the technology module updates the measured values cyclically as the update time. Setting longer update time intervals allows uneven measured variables to be smoothed and increases measuring accuracy.

Gate control for incremental and pulse encoders

Opening and closing the internal gate defines the period of time during which the count pulses are captured. The update time is asynchronous to the opening of the gate, which means that the update time is not started when the gate is opened. After the internal gate is closed, the last measured value captured is still returned.

2.2.9.2 Measured value determination with incremental or pulse encoder

Measuring ranges

Measuring range (TM Count and TM PosInput)

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0.04 Hz	800 kHz* / 4 MHz**
Period measurement	1.25 µs* / 0.25 µs**	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

* Applies to 24 V incremental encoders and "quadruple" signal evaluation.

** Applies to RS422 incremental encoders and "quadruple" signal evaluation.

All measured values are returned as signed values. The sign indicates whether the counter value increased or decreased during the relevant time period.

Measuring range (Compact CPU)

The measuring functions have the following measuring range limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0.04 Hz	400 kHz*
Period measurement	2.5 µs*	25 s
Velocity measurement	Depends on the configured number of "Increments per unit" and the "Time base for velocity measurement"	

* Applies to 24 V incremental encoders and "quadruple“ signal evaluation.

All measured values are returned as signed values. The sign indicates whether the counter value increased or decreased during the relevant time period.

Measuring intervals

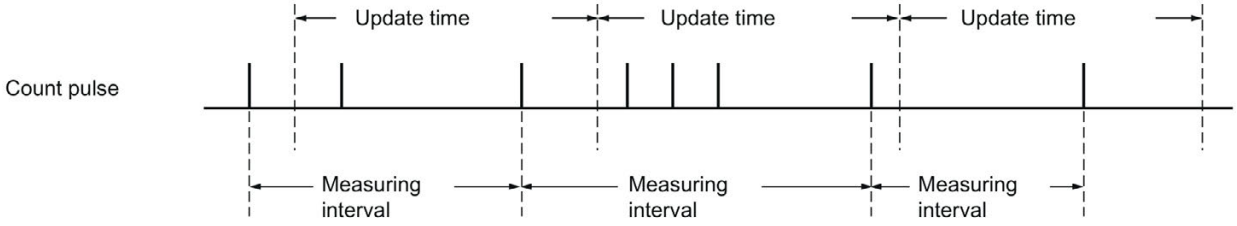
Measuring principle

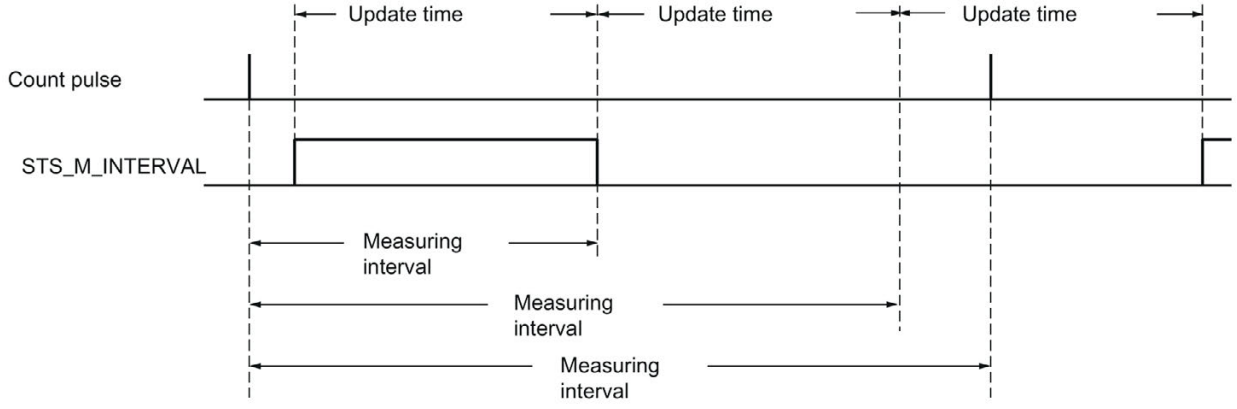
The technology module assigns a time value to each count pulse. The measuring interval is defined as the time between each last count pulse before and during the previous update time. The measuring interval and the number of pulses in the measuring interval are evaluated to calculate measured variables.

If there is no count pulse within an update time, the measuring interval is dynamically adjusted. In this case, a pulse is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last pulse which occurred. The number of pulses is then 1.

The feedback bit STS_M_INTERVAL indicates whether a count pulse occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual count pulse.

The following figures show the principle of measurement and the dynamic adjustment of the measuring interval:





Measuring types

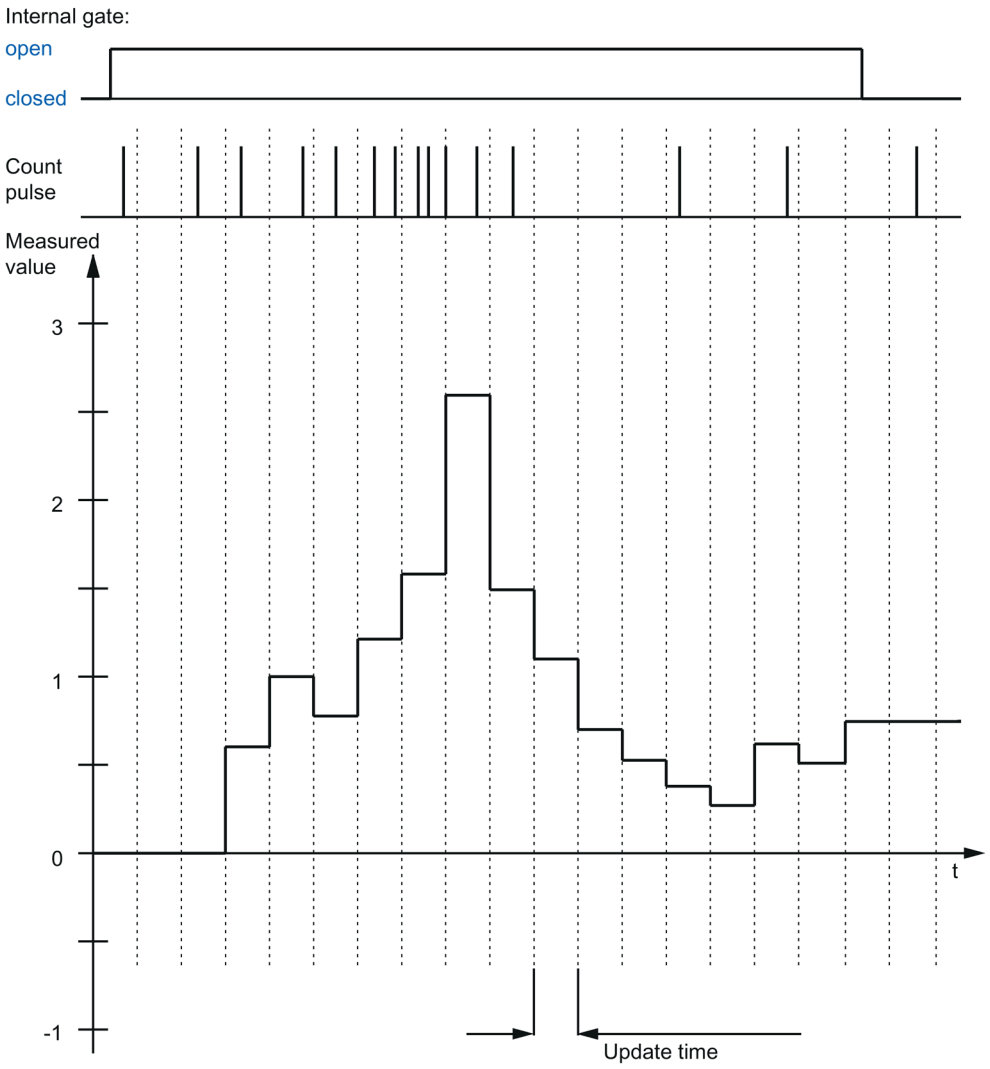
Frequency measurement

A value "0" is returned until the first measured value is available.

The measurement process begins with the first pulse detected once the internal gate has been opened. The first measured value can be calculated after the second pulse at the earliest.

The measured value is updated in the feedback interface (Page 185) upon completion of each update time. If the internal gate is closed, measuring stops and the measured value is no longer updated.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your encoder delivers 4000 increments per meter. The velocity is to be measured in meters per minute.

In this case, you need to configure 4000 Increments per unit and a time basis of one minute.

2.2.9.3 Measured value determination with SSI absolute encoder

Measuring ranges

Measuring range SSI absolute encoder

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0,04 Hz	4 MHz
Period measurement	0,25 µs	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

All measured values are returned as signed values. The sign indicates whether the position value increased or decreased during the relevant time period.

Measuring intervals

Measuring principle

The technology module assigns a time value to each SSI frame. The measuring interval is defined as the time between the last SSI frame with a change of position value before and during the previous update time. The measuring interval and the total change in position value in the measuring interval are evaluated to calculate a measured variable. The total change in position value in a measuring interval corresponds to the number of encoder increments in the same measuring interval.

If there is no change in position value within an update time, the measuring interval is dynamically adjusted. In this case, a change in position value is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last SSI frame with a change in position value. The change in position value is then 1.

The feedback bit STS_M_INTERVAL indicates whether a change in position value occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual change in position value. If the technology module cannot calculate measured values because the measuring range limit has been violated, the feedback bit STS_M_INTERVAL is not set.

Measuring types

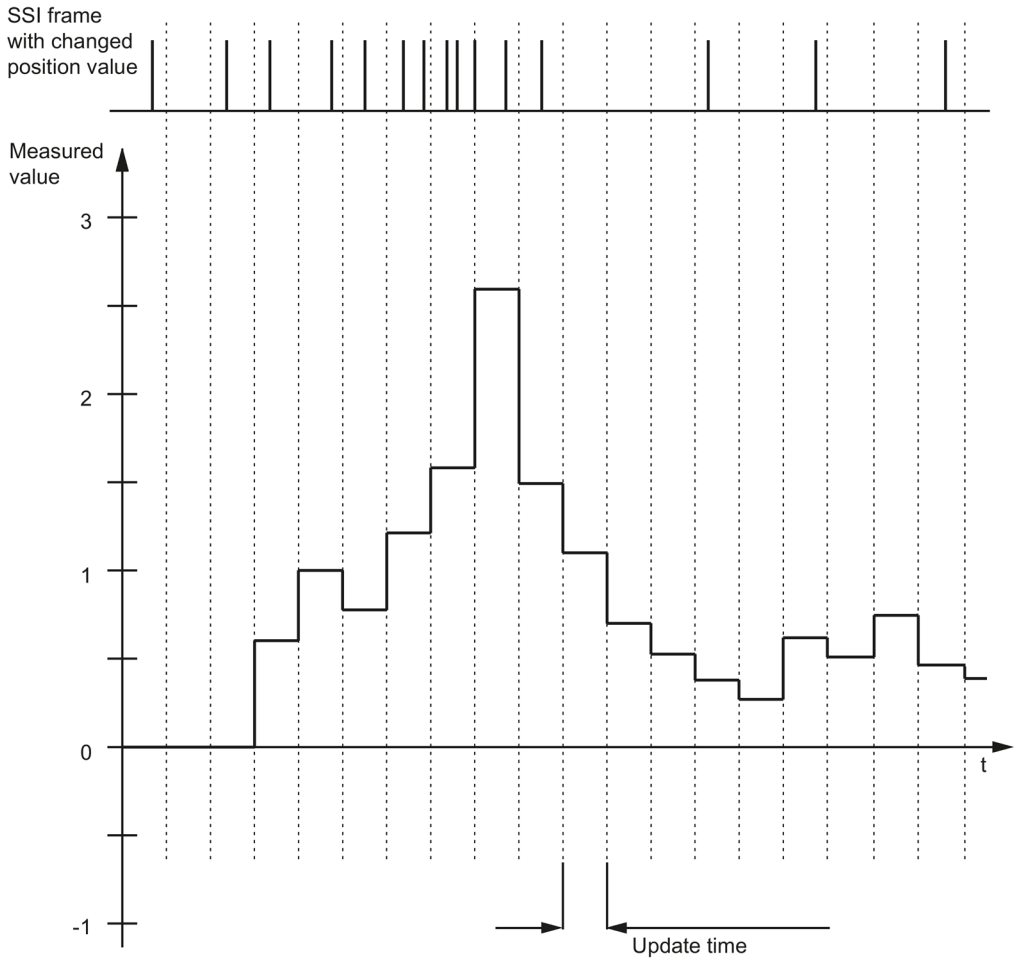
Frequency measurement

The value "0.0" is reported in the time up to the first available measured value.

The measuring process begins with the first detected change in position value. The first measured value can be calculated after the second detected change in position value at the earliest.

The measured value is updated in the feedback interface (Page 185) upon completion of each update time.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your SSI absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to configure 4096 Increments per unit and a time basis of one minute.

2.2.10 Hysteresis

2.2.10.1 Hysteresis with incremental or pulse encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the counter value has gone outside this range.

Slight movements by the encoder can result in the counter value fluctuating around a certain value. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a comparison event occurs.

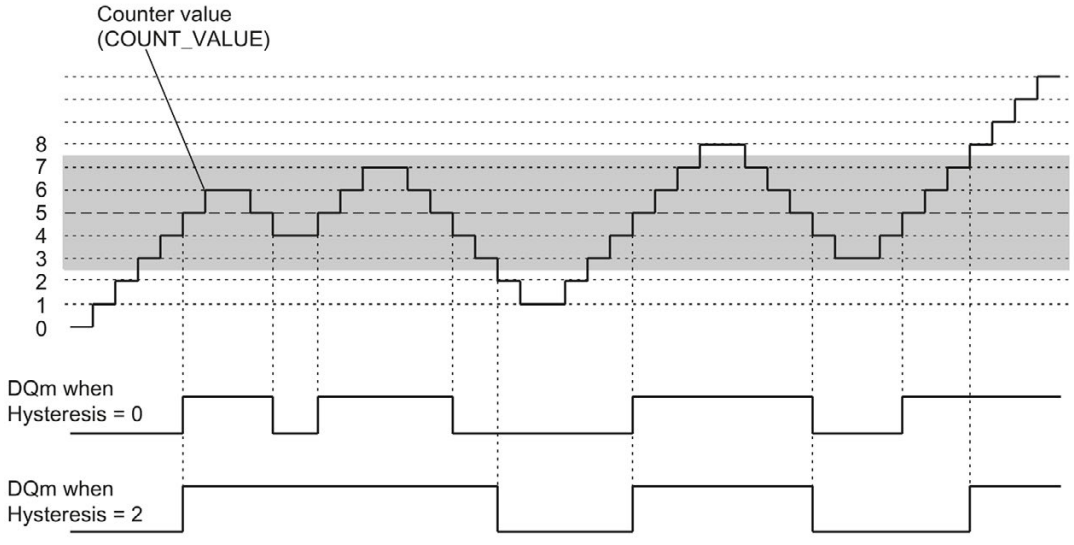
The hysteresis becomes active when the respective comparison value is reached by a count pulse. If the counter value is set to the start value during an active hysteresis, the hysteresis becomes inactive.

Regardless of the hysteresis value, the hysteresis range ends at the low/high counting limits.

Function principle

The figure below shows an example for the hysteresis with the following configuration:

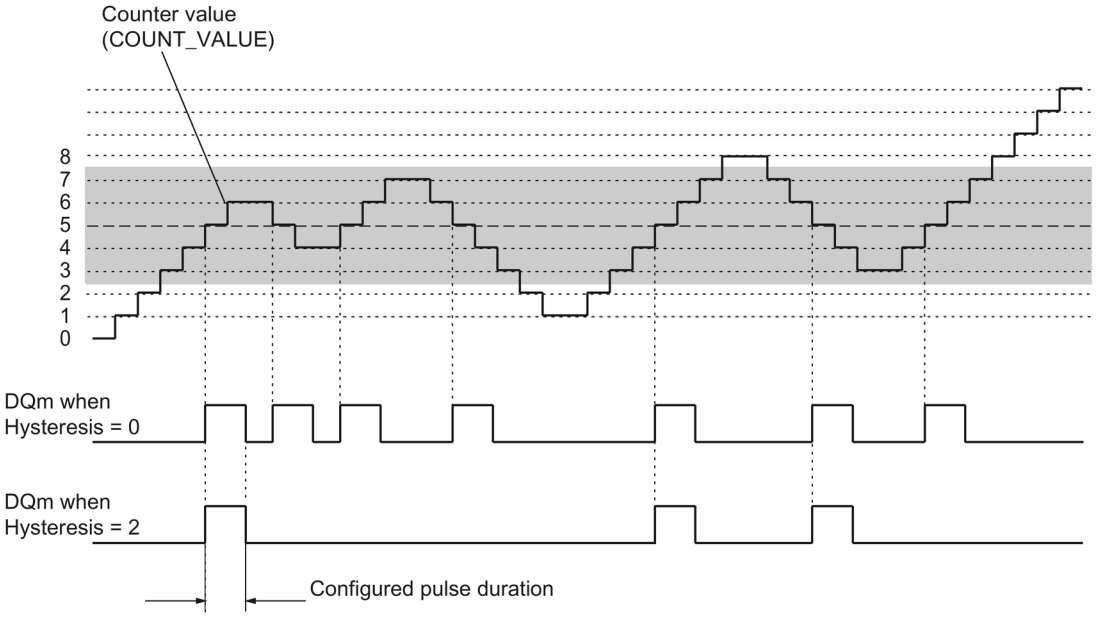
- Setting of a digital output between comparison value and high counting limit
- Comparison value = 5
- Hysteresis = 0 or 2 (gray background)



Hysteresis is enabled when the counter value 5 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the counter value 2 or 8 is reached.

The figure below shows an example for the hysteresis with the following configuration:

- Setting at comparison value for one pulse duration
- Comparison value = 5
- Comparison in both count directions
- Hysteresis = 0 or 2 (gray background)



2.2.10.2 Hysteresis with SSI absolute encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the position value has gone outside this range.

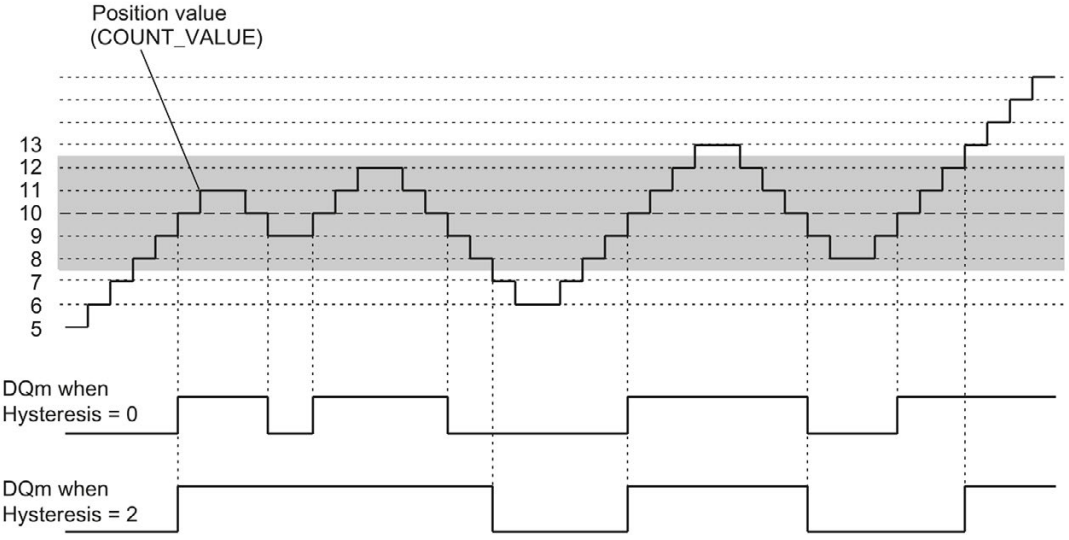
Slight movements by the encoder can result in the position value fluctuating around a certain value. If a comparison value, "0", or the respective maximum position value lies within this fluctuation range, the associated digital output is switched on and off with corresponding frequency if a hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a compare event occurs.

Regardless of the hysteresis value, the hysteresis range ends at "0" and at the respective maximum position value.

Function principle

The figure below shows an example for the hysteresis with the following parameter assignment:

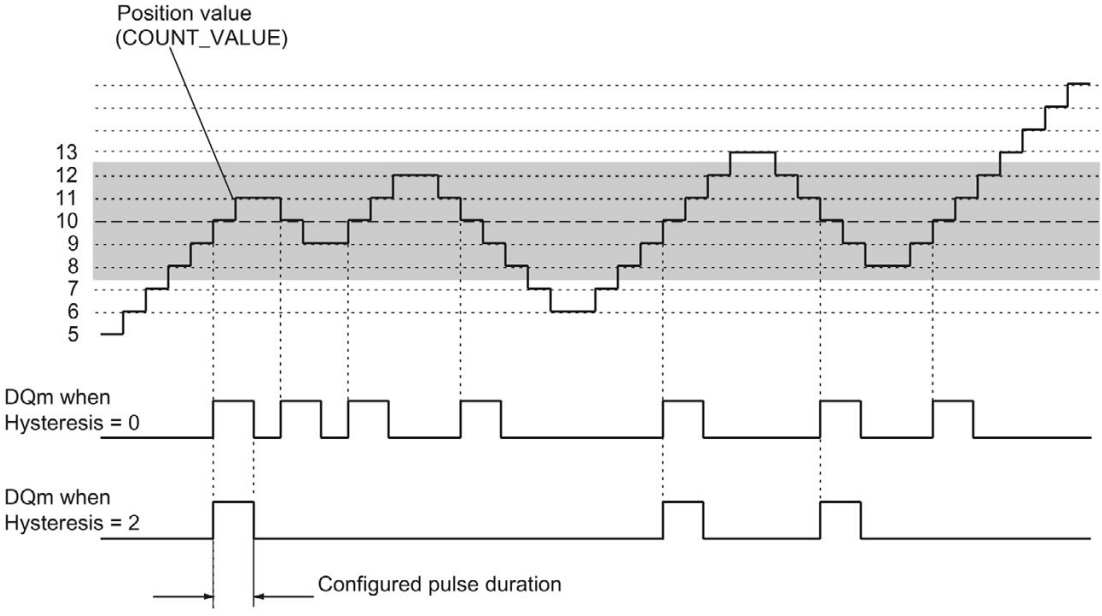
- Setting of a digital output between comparison value and high limit
- Comparison value = 10
- Hysteresis = 0 or 2 (gray background)



Hysteresis is enabled when the position value 10 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the position values 7 or 13 are reached.

The figure below shows an example for the hysteresis with the following parameter assignment:

- Setting at comparison value for one pulse duration
- Comparison value = 10
- Comparison in both directions of position value changes
- Hysteresis = 0 or 2 (gray background)



2.2.11 Interrupts

Hardware interrupt

The technology module can trigger a hardware interrupt in the CPU if, for example, a comparison event occurs; in the event of overflow or underflow; in the event of a zero crossing of the counter and/or of a change in count direction (direction reversal). You can specify which events are to trigger a hardware interrupt during operation.

Diagnostic interrupt

The technology module can trigger diagnostic interrupts in the event of errors. You enable the diagnostic interrupts for certain errors in the device configuration. Refer to the device manual for the technology module to learn about the events that can trigger a diagnostic interrupt during operation.

2.2.12 Position detection for Motion Control

Description

You can use the technology module with S7-1500 Motion Control for position detection.

In the Device configuration of the technology module in STEP 7 (TIA Portal), select "Position input for Motion Control" mode. This reduces the configuration options to the parameters that are essential. For TM Count or TM PosInput, the mode automatically applies to all channels of the technology module. For a Compact CPU, the mode automatically applies to the respective channel.

When using an incremental or pulse encoder, the position input is based on the counting function of the technology module. With an SSI absolute encoder, the absolute value is read in via a synchronous, serial interface and prepared according to the parameter assignment and made available for S7-1500 Motion Control.

You can find information about the remaining configuring steps in the help for the axis technology objects of S7-1500 Motion Control.

2.2.13 Encoder signals

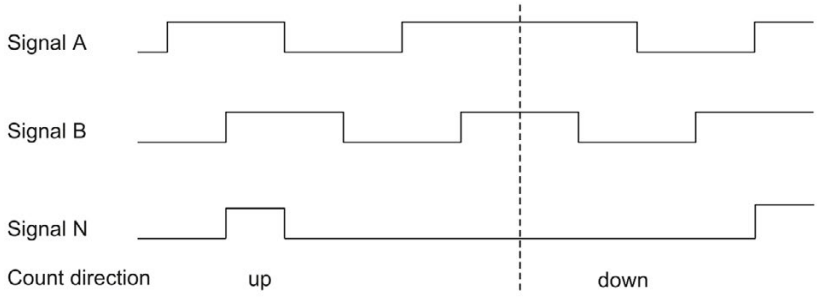
2.2.13.1 24 V and TTL count signals

24 V and TTL incremental encoder count signals

The 24 V incremental encoder returns the 24 V signals A, B, and N to the technology module. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

A 24 V incremental encoder uses the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value to the Capture value.

The figure below shows an example of the time profile of the signals of an 24 V incremental encoder:



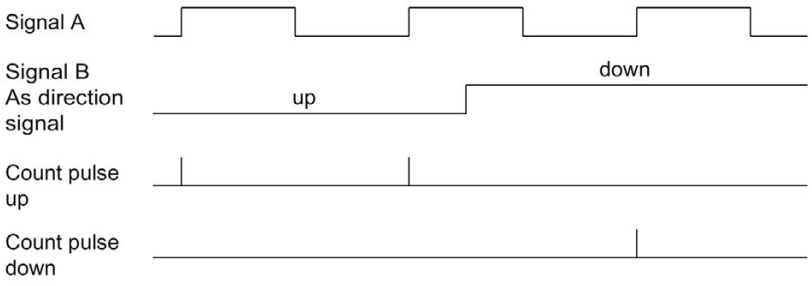
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

24 V and TTL pulse encoder count signals without/with direction signal

The encoder, for example an initiator (BERO) or a light barrier, returns only a count signal that is connected to terminal A of the counter.

In addition, you can connect a signal for direction detection to terminal B of the counter. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

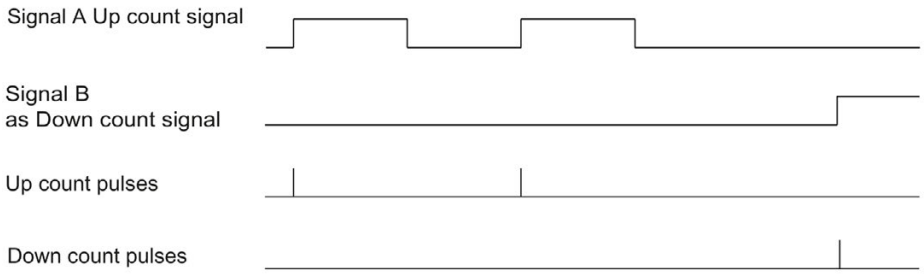
The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



24 V and TTL pulse encoder count signals with Up/Down count signal

The Up count signal is connected to terminal A. The Down count signal is connected to terminal B.

The figure below shows an example of the time profile of the signals of a pulse encoder with Up/Down count signal and the resulting count pulses:



Sourcing output/sinking output for 24 V counter signals (TM Count)

You can connect the following encoders/sensors to the counter inputs:

- Sourcing output:
  The A, B, and N inputs are wired to 24VDC .
- Sinking output:
  The A, B, and N inputs are wired to ground M .
- Push-pull (sourcing and sinking output):
  The A, B, and N inputs are wired alternately to 24VDC and ground M .

Sourcing output for 24 V counter signals (Compact CPU)

You can connect the sourcing output and push-pull encoders or sensors to the counter inputs.

Monitoring of the encoder signals (TM Count and TM PosInput)

The signals of push-pull 24 V sensors are monitored for wire breaks by the technology module. TTL signal are monitored for offset voltage by the technology module.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.13.2 RS422 count signals

RS422 incremental encoder count signals

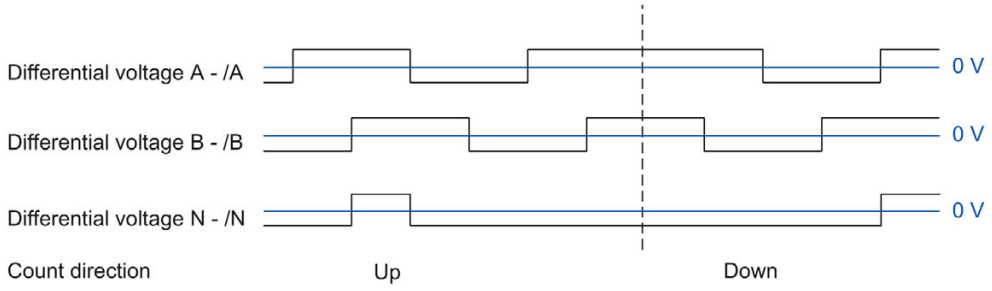
The RS422 incremental encoder sends the following differential signals to the technology module:

- A and /A
- B and /B
- N and /N

The signal information for RS422 signals is encoded in the differential voltage between A and /A, B and /B or N and /N. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

RS422 incremental encoders use the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value as the Capture value.

The figure below shows an example of the time profile of the signals of an RS422 incremental encoder:



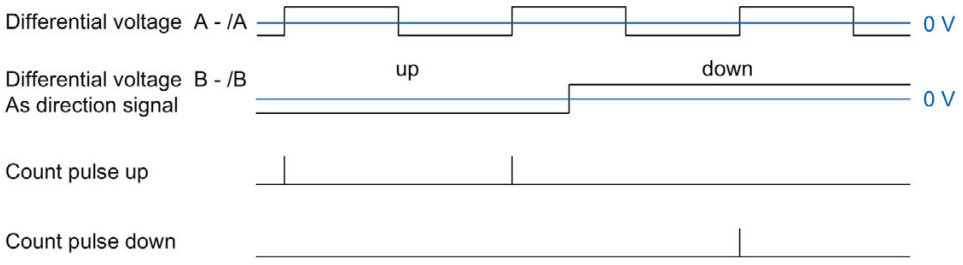
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

Count signals of RS422 pulse encoders without/with direction signal

The encoder, for example a light barrier, only returns a count signal that is connected to terminal A.

You can also connect a signal for direction detection to terminal B. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

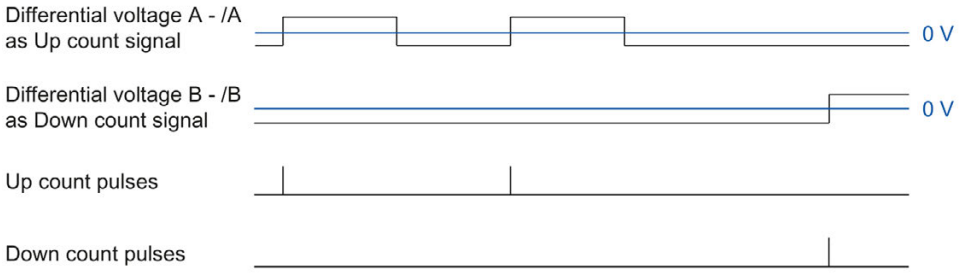
The figure below shows an example of the time profile of the signals of a RS422 pulse encoder with direction signal and the resulting count pulses:



Count signals of RS422 pulse encoders with Up/Down count signal

The Up count signal is connected to the A terminals. The Down count signal is connected to the B terminals.

The figure below shows an example of the time profile of the signals of an RS422 pulse encoder with Up/Down count signal and the resulting count pulses:



Monitoring of encoder signals

The technology module monitors RS422 signals for wire breaks, short-circuits, and offset voltages.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.13.3 SSI signals

Signals from SSI absolute encoders

The SSI absolute encoder and the technology module communicate via SSI data signals DAT and /DAT (D) and the SSI clock signals CLK and /CLK (C). SSI uses the RS422 signal standard. The signal information is coded in the respective differential voltage between C and /C as well as D and /D.

Monitoring of the encoder signals and the SSI frames

The technology module monitors the signals of an SSI absolute encoder for wire breaks, short-circuits, and offset voltages. The technology module also monitors SSI frames for errors.

If you enable the diagnostic interrupts in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal or SSI frame errors.

2.2.14 Signal evaluation of incremental signals

2.2.14.1 Overview

The technology module counter counts the edges of encoder signals A and B. For incremental encoders with phase-shifted signals A and B, you can select either single or multiple evaluation to improve the resolution.

You can configure the following signal evaluations:

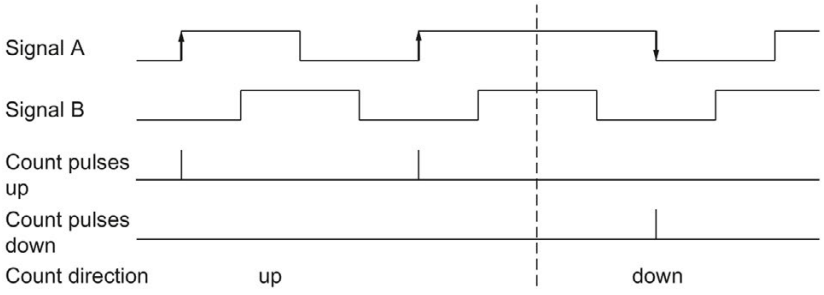
- Single evaluation (Page 70)
- Double evaluation (Page 71)
- Quadruple evaluation (Page 72)

2.2.14.2 Single evaluation

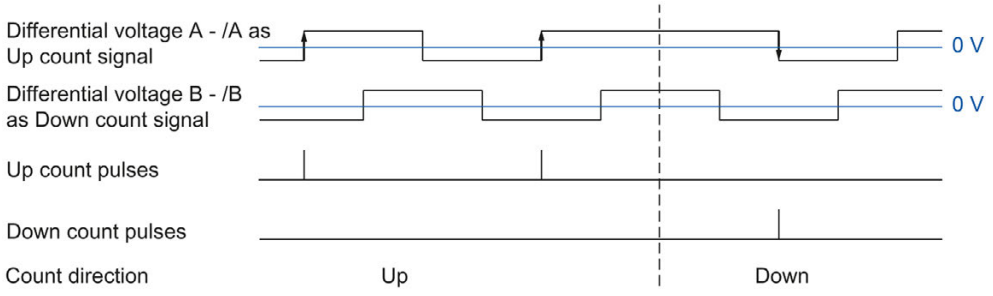
Single evaluation evaluates the rising and falling edge at signal A when signal B has a low level.

Count pulses in an upwards direction are generated with a rising edge at signal A during a low level at signal B. Count pulses in a downwards direction are generated with a falling edge at signal A during a low level of signal B.

The following figure shows an example for single evaluation of 24 V and TTL count signals:



The following figure shows an example for single evaluation of RS422 count signals:

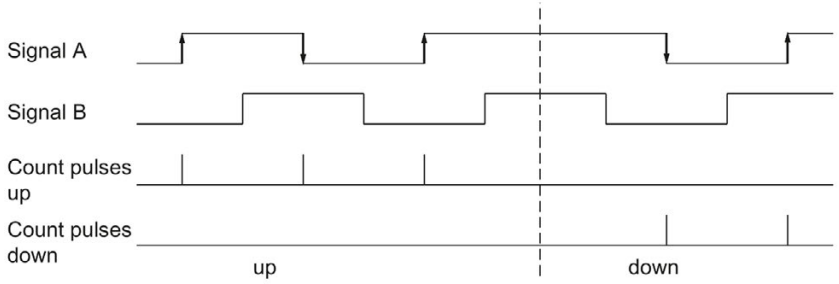


2.2.14.3 Double evaluation

With double evaluation, the rising and falling edges of signal A are evaluated.

The edge direction of signal A and the level at signal B determines whether count pulses are generated in an upward or downward direction.

The following figure shows an example for double evaluation of 24 V and TTL count signals:



The following figure shows an example for double evaluation of RS422 count signals:

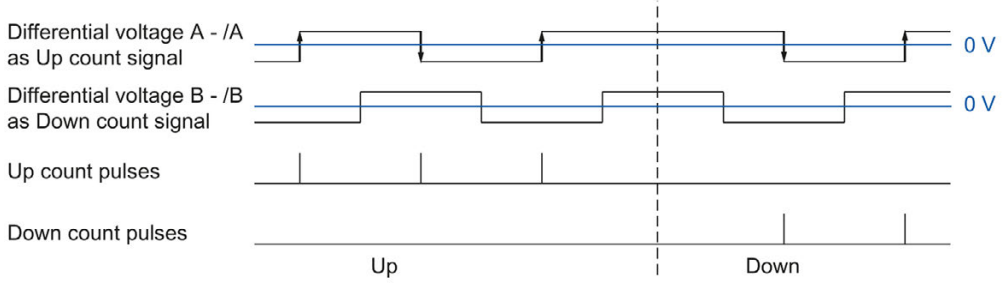


Figure 2-1 Double

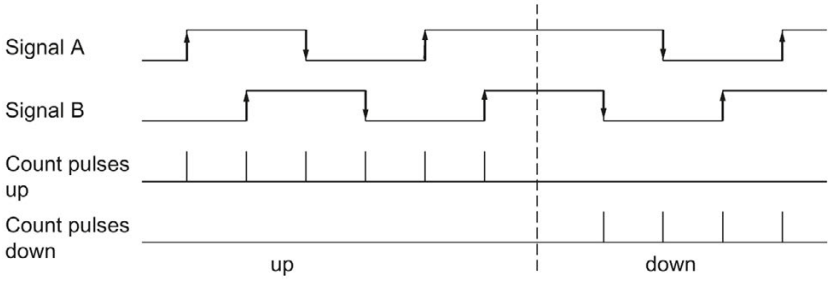
2.2.14.4 Quadruple evaluation

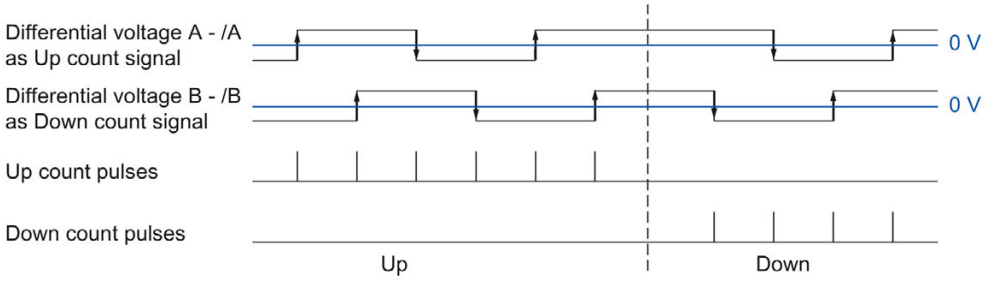
With quadruple evaluation, the rising and falling edges of signals A and B are evaluated.

The edge direction of one signal and the level of the other signal determines whether count pulses are generated in an upward or downward direction.

The figure below shows an example for quadruple evaluation of 24 V and TTL count signals:



The figure below shows an example for quadruple evaluation of RS422 count signals:



2.2.15 Clock synchronization (TM Count and TM PosInput)

The technology module supports the "isochronous mode" system function in distributed mode. This system function enables position, count and measured values to be recorded in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A change in the state of a digital input immediately affects the planned reaction of the technology module and changes the status bit of the digital input in the feedback interface.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. The position or counter value and, if required, the measured value and the status bits as well are captured at the time T_i and made available in the feedback interface for retrieval in the current bus cycle.

Additional information

For a detailed description of isochronous mode, refer to the PROFINET with STEP 7 function manual, which is available as download at Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

2.3 Basics of counting (TM Timer DIDQ)

2.3.1 Overview of applications

Introduction

You configure the TM Timer DIDQ and assign its parameters with the configuration software.

The module's functions are controlled and monitored via the user program.

System environment

The respective module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central and distributed mode in an S7-1500 system with a corresponding ET 200 system	• S7-1500 automation system • ET 200 distributed I/O system • TM Timer DIDQ	STEP 7 (TIA Portal) and STEP 7: Device configuration and parameter setting with hardware configuration	Direct access to feedback interface of the technology module in the I/O data
Distributed operation in an S7-300/400 system	• S7-300/400 automation system • ET 200 distributed I/O system • TM Timer DIDQ		
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • TM Timer DIDQ	Third-party configuration software: Device configuration and parameter settings with GSD file	

Note

A description of the control and feedback interface is available in the device manual for the TM Timer DIDQ.

2.3.2 Counting with incremental encoder

You can use a few channels of a TM Timer DIDQ for simple counting tasks with an incremental encoder. Counting refers to the recording and adding up of events. The channels configured as counters each acquire the two incremental signals and evaluate these accordingly.

Count direction

The technology module can count up and down with an incremental encoder. You change the count direction by inverting it.

Counting limits

The counting limits define the counter value range used.

The minimum counter value is -2147483648 (-2^{31}). The maximum counter value is 2147483647 ($2^{31}-1$). The respective counter counts continuously. At an overflow, the counter jumps to the other counting limit in each case and continues counting.

The counter value cannot be influenced by the user program.

Parameter assignment

For use of a counter for an incremental encoder, two digital inputs each of a channel group are combined. For this purpose, you choose the configuration "Incremental encoder (A, B phase-shifted)" in the channel parameters for the respective group.

Note

Counters of the TM Timer DIDQ 16x24V

The number of available counters of the TM Timer DIDQ 16x24V is dependent on the channel configuration. In order to use 4 counters, you must choose the use of 8 inputs in the channel configuration. If you choose the use of 3 inputs, you can use 1 counter. Other channel configurations do not allow any counter use.

Counter value feedback

The current counter value is indicated in the feedback interface in the TEC_IN value (DIm). DIm corresponds to the first of the two grouped digital inputs in each case. For the second digital input, "0" is returned in the value TEC_IN (DIm+1).

2.3.3 Counting with pulse encoder

You can use a few channels of a TM Timer DIDQ for simple counting tasks with a pulse encoder. Counting refers to the recording and adding up of events. The channels configured as counters each acquire one pulse signal and evaluate this accordingly.

Count direction

The technology module can count up and down with a pulse encoder.

Counting limits

The counting limits define the counter value range used.

The minimum counter value is -2147483648 (-2^{31}). The maximum counter value is 2147483647 ($2^{31}-1$). The respective counter counts continuously. At an overflow, the counter jumps to the other counting limit in each case and continues counting.

The counter value cannot be influenced by the user program.

Parameter assignment

For use of a counter for a pulse encoder, you choose the configuration "Use inputs individually" or "Use input/output individually" in the channel parameters for the respective group. You can configure the first digital input of a group as a counter.

Note

Counters of the TM Timer DIDQ 16x24V

The number of available counters of the TM Timer DIDQ 16x24V is dependent on the channel configuration. In order to use 4 counters, you must choose the use of 8 inputs in the channel configuration. If you choose the use of 3 inputs, you can use 1 counter. Other channel configurations do not allow any counter use.

Counter value feedback

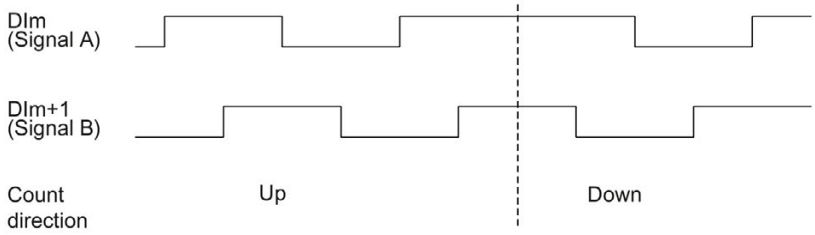
The current counter value is indicated in the feedback interface in the TEC_IN value (DIm). DIm corresponds to the respective digital input.

2.3.4 24 V count signals

Count signals of 24 V incremental encoders

The 24 V incremental encoder returns the 24 V signals A and B to the technology module. The A and B signals are phase-shifted by 90°.

The figure below shows an example of the time profile of the signals of an 24 V incremental encoder:



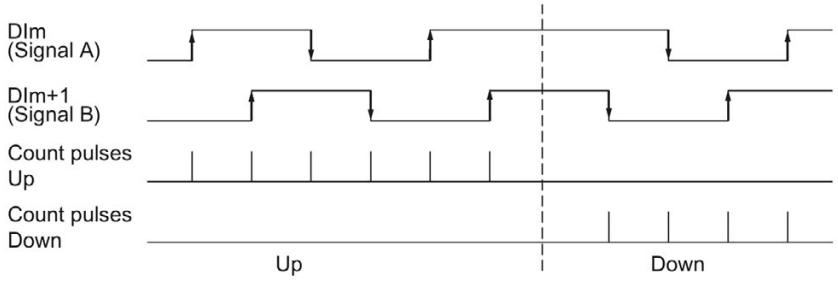
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

Signal evaluation

The two phase-shifted signals of an incremental encoder are evaluated four times. With quadruple evaluation, the positive and negative edges of signal A and signal B are evaluated.

Whether count pulses are generated in an upward or downward direction depends on the edge direction of the one signal and the level of the other signal in the meantime.

The figure below shows an example of the quadruple evaluation of 24 V count signals:



Count signals of 24 V pulse encoders

The encoder, for example, a proximity switch (BERO) or a light barrier, returns only a count signal that is connected to the digital input of a counter.

You can count the positive or the negative edges of the signal.

2.3.5 Isochronous mode

The TM Timer DIDQ supports the "Isochronous mode" system function in decentralized operation. This system function enables counter values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the module are synchronized.

Data processing

The data that was transmitted to the module in the current bus cycle via the control interface takes effect when it is processed in the module's internal cycle. The counter value and status bits are detected at time T_i and made available in the feedback interface for retrieval in the current bus cycle.

Additional information

For a detailed description of isochronous mode, refer to the PROFINET with STEP 7 function manual, which is available as download at Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

2.4 Basics of counting (digital input modules)

2.4.1 Overview of applications

Introduction

The digital input module is configured and assigned parameters using the configuration software.

The module's functions are controlled and monitored via the user program.

System environment

The respective module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central and distributed mode in an S7-1500 system with a corresponding ET 200 system	• S7-1500 automation system • ET 200 distributed I/O system • Digital input module	STEP 7 (TIA Portal) and STEP 7: Device configuration and parameter setting with hardware configuration	Direct access to technology module control and feedback interface in the I/O data
Distributed operation in an S7-300/400 system	• S7-300/400 automation system • ET 200 distributed I/O system • Digital input module		
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Digital input module	Third-party configuration software: Device configuration and parameter settings with GSD file	

Note

A description of the control and feedback interface is available in the device manual for the digital input module.

2.4.2 Counting with pulse encoders

Counting refers to the detection and summation of events. The modules' counters record and evaluate pulse signals. The counting direction can be specified using encoder or pulse signals or through the configuration.

You can use feedback bits to switch the digital outputs of digital output modules exactly at defined counter values, independent of the user program.

You can configure the characteristics of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program. See the module's device manual for the maximum and minimum configurable counter limits.

You can configure whether the counting processes are terminated or continue when a counter limit is violated (automatic gate stop).

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime with the user program.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are recordd.

The hardware gate is controlled externally via a digital input of the technology module. The hardware gate can be enabled through parameter assignment. The software gate is controlled via the user program. A description of the control and feedback interface is available in the device manual for the digital input module.

2.4.3 Behavior at the counting limits

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another upward count pulse is received. The counter low limit is violated when the current counter value is equal to the counter low limit and another downward count pulse is received.

With digital input modules for ET 200SP, the corresponding event bit is set in the feedback interface when the limit is violated. You can reset an event bit with the respective control bit:

Counting limit violated	Event bit	Reset bit
High counting limit	EVENT_OFLW	RES_EVENT_OFLW
Low counting limit	EVENT_UFLW	RES_EVENT_UFLW

Note

A description of the control and feedback interface is available in the device manual for the digital input module.

You can configure whether or not you want to continue counting to another counter limit after a counting limit violation.

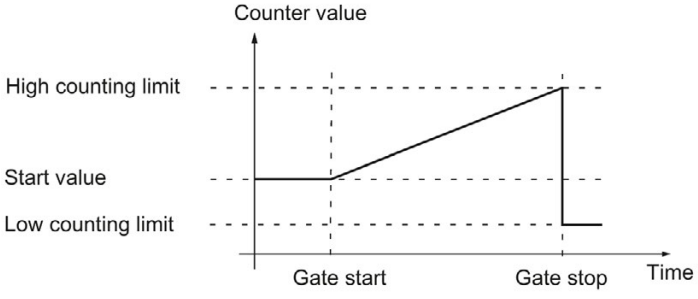
Note

The high counting limit and the start value define the value range of the counter:

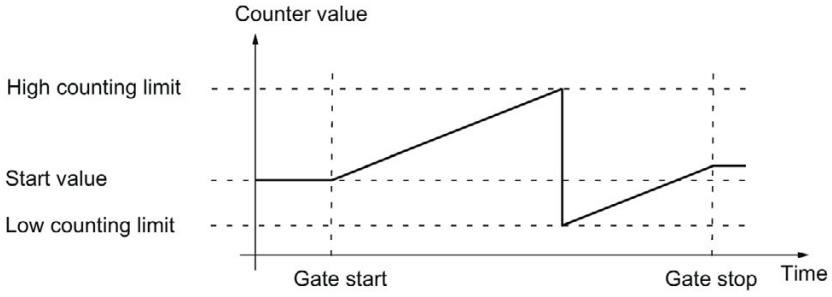
Value range of the counter = (high limit – start value) + 1

Examples

The figure below shows an example for terminating counting after overflow and setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.4.4 Gate control

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The digital input modules have two gates for each counting channel. These define the resulting internal gate:

- Software gate
- Hardware gate

Note

The hardware gate is not configurable for all digital input modules.

2.4.4.1 Software gate

The software gate of the channel is opened and closed with the SW_GATEcontrol bit.

See the module's device manual for information on the design of the control and feedback interface.

2.4.4.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate using signals at the corresponding digital input.

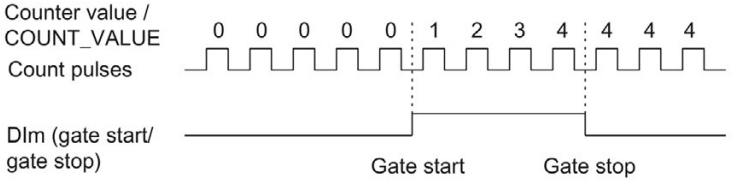
Note

A configurable input delay delays the control signal of the digital input.

The status of a DIm digital input is indicated by the respective STS_DIm feedback bit. A description of the control and feedback interface is available in the device manual for the digital input module.

Opening and closing the hardware gate

The figure below shows an example of opening and closing with a digital input:



As long as the digital input is set, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input is reset. The counter value stays constant and ignores any further count pulses.

2.4.4.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the STS_GATE feedback bit. See the module's device manual for information on the design of the control and feedback interface.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.4.5 Comparison values

Depending on the module, you can define up to two comparison values that control a reset bit for the channel, independent of the user program.

When there are two comparison values, comparison value 1 must be greater than comparison value 0. The comparison values are configurable and can be changed at runtime by the user program.

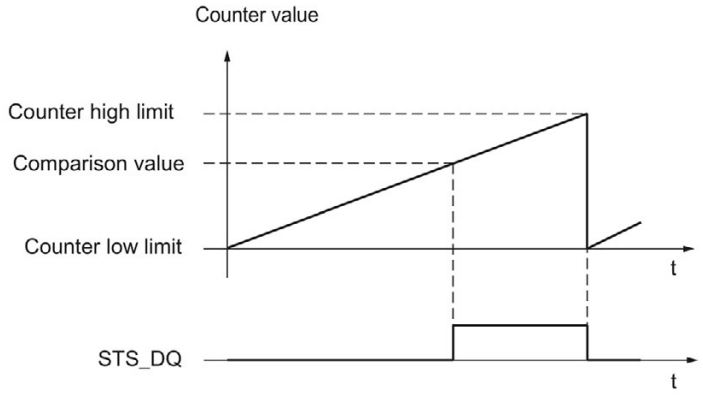
The comparison values are compared with the current counter value. If the counter value meets the configured comparison condition, the respective STS_DQ reset bit is set.

You can use the respective reset bit in order to switch a digital output module's digital output. You can make setting the respective STS_DQ reset bit dependent on one of the following comparison events. See the device manual for the technology module to find out which comparison events can be configured.

Setting between comparison value and high counter limit

The respective STS_DQ feedback bit is set to 1 when:

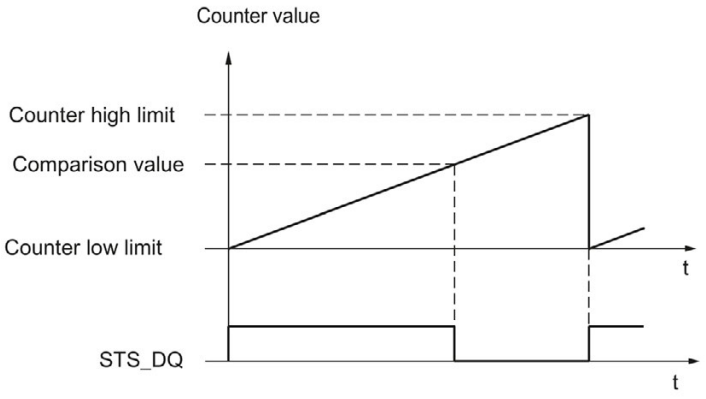
Comparison value <= counter value <= high counter limit



Setting between comparison value and low counter limit

The respective STS_DQ feedback bit is set to 1 when:

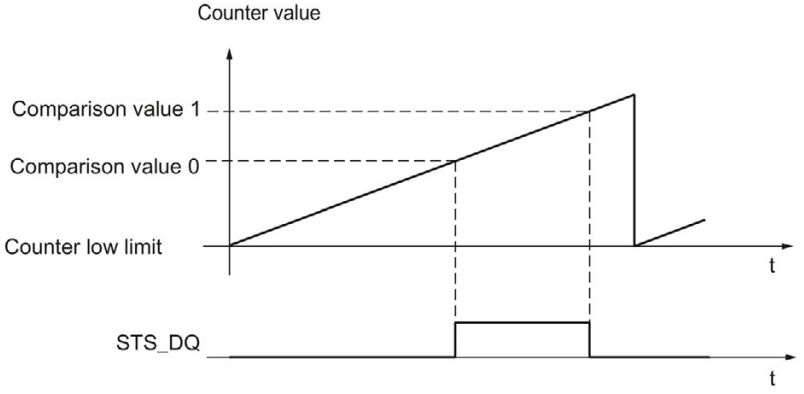
Low counter limit <= counter value <= comparison value



Setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

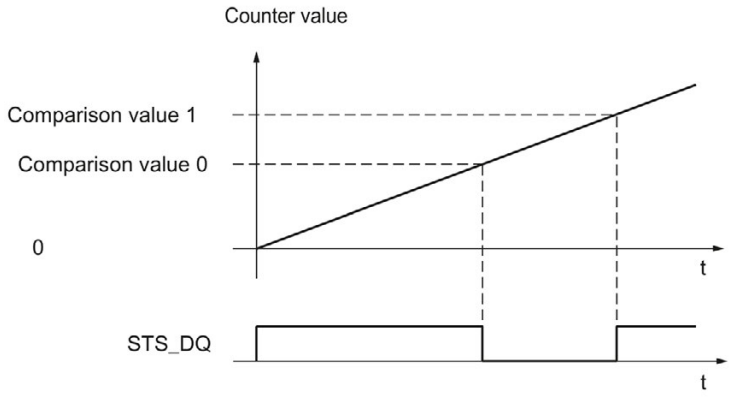
Comparison value 0 <= counter value <= comparison value 1



Not setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

Comparison value 0 <= counter value <= comparison value 1



2.4.6 Interrupts

Hardware interrupt

The module can trigger a hardware interrupt in the CPU during operation for certain events. The hardware interrupts can be enabled in the configuration. Refer to the device manual for the module to learn about the events that can trigger a hardware interrupt during operation.

Note

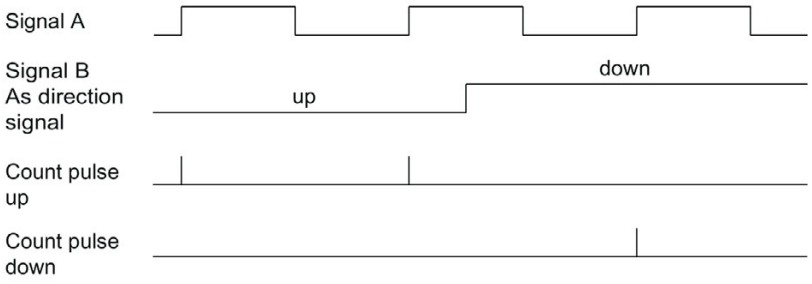
Hardware interrupts for counting are not configurable for all digital input modules.

2.4.7 24 V count signals

24 V pulse encoder count signals

The encoder, for example an initiator (BERO) or a light barrier, returns a count signal that is connected to the terminal (signal A) of the counter. You can also connect a signal for direction detection (signal B).

The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



Note

A signal for direction detection cannot be connected for all digital input modules.

Monitoring of encoder signals

If you enable the respective diagnostic interrupt in the device configuration, the module triggers a diagnostic interrupt in the event of an encoder signal error.

2.4.8 Isochronous mode

The digital input module supports the "isochronous mode" system function in distributed mode. This system function enables counter values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the module are synchronized.

Data processing

The data that was transmitted to the module in the current bus cycle via the control interface takes effect when it is processed in the module's internal cycle. The counter value and status bits are detected at time T_i and made available in the feedback interface for retrieval in the current bus cycle.

Additional information

For a detailed description of isochronous mode, refer to the PROFINET with STEP 7 function manual, which is available as download at Internet (https://support.industry.siemens.com/cs/ww/en/view/49948856).

Using the High_Speed_Counter technology object 3

3.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

3.2 High_Speed_Counter technology object

STEP 7 (TIA Portal) supports you in the configuration, commissioning and diagnostics of counting and measuring functions for the following technology modules with the "Technology objects" function:

- You configure the High_Speed_Counter technology object in STEP 7 (TIA Portal) with the settings for the counting and measuring functions.
- The corresponding High_Speed_Counter instruction is programmed in the user program. This instruction supplies the control and feedback interface of the technology module.

The High_Speed_Counter technology object corresponds to the instance DB of the High_Speed_Counter instruction. The configuration of the counting and measuring functions is saved in the technology object. The technology object is located in the folder "PLC > Technology objects".

The High_Speed_Counter technology object can be used for technology modules of both the S7-1500 and ET 200SP systems.

Operating mode

In order to assign the technology module parameters using a technology object, you specify the operating mode (Page 172) "Operating with technology object" in the hardware configuration of the technology module. This selection is already preset.

3.3 Overview of the configuration steps

Introduction

The overview below shows the basic procedure for configuring the counting and measuring functions of the technology module with the High_Speed_Counter technology object.

Requirement (TM Count and TM PosInput)

Before you can use the High_Speed_Counter technology object, a project with an S7-1500 CPU or an ET 200SP CPU must be created in STEP 7 (TIA Portal) .

Requirement (Compact CPU)

Before you can use the High_Speed_Counter technology object, a project with a Compact CPU S7-1500 must be created in STEP 7 (TIA Portal).

Procedure

Proceed in the recommended sequence outlined below:

Step	Description
1	Configure a technology module (Page 166)
2	Add technology object (Page 92)
3	Configure a technology object according to your application (Page 94)
4	Call instruction in the user program (Page 116)
5	Load to CPU
6	Commissioning the technology object (Page 129)
7	Diagnostics of the technology object (Page 131)

3.4 Add technology object

Add technology object in the project navigator

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement (TM Count and TM PosInput)

A project with a CPU S7-1500 has been created.

Requirement (Compact CPU)

A project with a Compact CPU S7-1500 has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click on "Add new object".
   The "Add new object" dialog opens.
4. Select the "Counting and measurement" technology.
5. Select the "High_Speed_Counter" object.
6. Enter an individual name for the technology object in the "Name" text box.
7. Click "Additional information" if you want to add your own information to the technology object.
8. Confirm with "OK".

Result

The new technology object has now been created and stored in the project tree in the "Technology objects" folder.

	Object	Description
①	Configuration (Page 94)	In the configuration dialog: • Assignment of technology module and channel • Technology object parameter settings for counting and measurement functions When you change the configuration of the technology object, you must download the technology object **and** the hardware configuration to the CPU.
②	Commissioning (Page 129)	Commissioning and function test of the technology object: Simulating parameters of the High_Speed_Counter instruction and monitoring the effects
③	Diagnostics (Page 131)	Monitoring the counting and measuring functions

3.5 Configuring the High_Speed_Counter

3.5.1 Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click on the "Configuration" object.

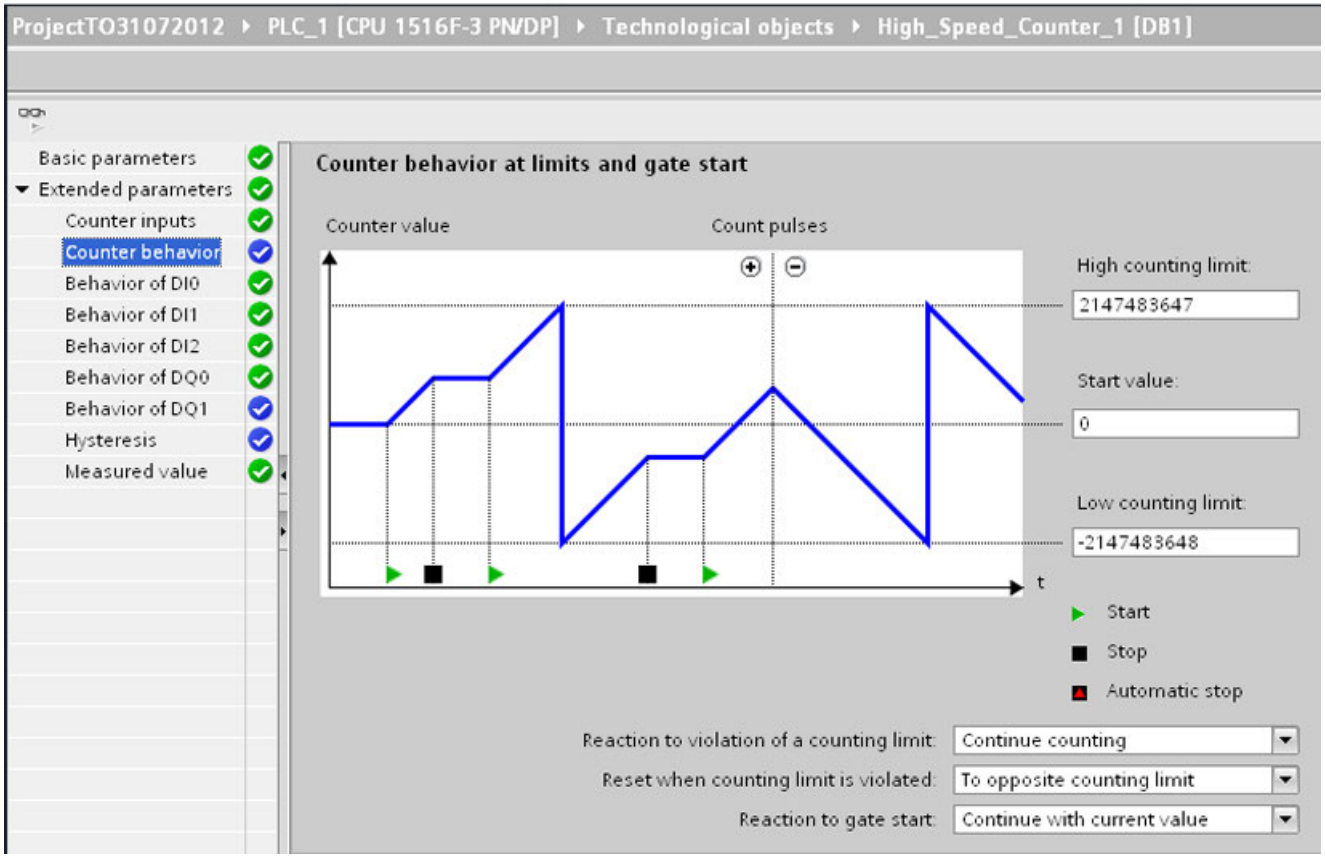
The configuration is divided into the following categories:

- **Basic parameters**

  The basic parameters include the selection of the technology module and the number of the counting channel for which the technology object is configured.

- **Extended parameters**

  The extended parameters include the parameters for adapting the counting and measuring functions and for setting the characteristics of the digital inputs and digital outputs.



Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	The configuration contains values set by the user or automatically adapted values and is complete All text boxes of the configuration contain valid values and at least one default value was changed.
	The configuration is incomplete or incorrect At least one text box or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.

3.5.2 Basic parameters

You can establish the connection between the High_Speed_Counter technology object and the technology module under "Basic parameters".

Module (TM Count and TM PosInput)

You select the technology module in a subsequent dialog box. You can choose any of the technology modules (central or distributed) which are configured in the S7-1500 CPU for use with a technology object from "Counting and measuring".

After selecting the technology module, you can open the device configuration associated with the technology module by clicking the"Device configuration" button.

The technology module parameter settings required for the use of the technology object are made in the "Extended parameters" of the technology object.

Module (Compact CPU)

You can select a high-speed counter for the Compact CPU in a subsequent dialog. You can choose any of the high-speed counters which are enabled and configured for use with a technology object from "Counting and measuring".

After selecting the high-speed counter, you can open the device configuration associated with the Compact CPU by clicking the"Device configuration" button.

The parameter settings of the high-speed counter required for the use of the technology object are made in the "Extended parameters" of the technology object.

Channel

For a technology module with several counting channels, you can also select the number of the counting channel for which the High_Speed_Counter technology object is to be valid.

Note

A channel can be assigned to only *one* technology object. A channel that is already assigned to a technology object can no longer be selected.

Synchronization of the parameter values

If, after assignment of the channel to the technology object, there is an inconsistency between the parameter values under "Parameters" and in the technology object, a button with a corresponding inquiry appears. When you click the button, the parameter values under "Parameters" are overwritten by the parameter values of the technology object within STEP 7 (TIA Portal). The current parameter values of the technology object are displayed under "Parameters".

3.5.3 Counter inputs (High_Speed_Counter)

Signal type

You can choose from the following signal types (Page 65):

Symbol	Signal type	Meaning	Additional option-specific parameters
	Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.	• Invert direction • Signal evaluation • Filter frequency • Sensor type or Interface standard
	Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.	• Invert direction • Signal evaluation • Filter frequency • Sensor type or Interface standard • Reaction to signal N • Frequency
	Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.	• Filter frequency • Sensor type or Interface standard
	Pulse (A)	A pulse encoder (signal A) without direction signal is connected. You can specify the count direction by means of the control interface (Page 182).	• Filter frequency • Sensor type or Interface standard
	Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.	• Filter frequency • Sensor type or Interface standard

Invert direction

You can invert the counting direction to adapt it to the process.

The inverting of the direction is configurable and active for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Signal evaluation

By configuring signal evaluation (Page 70), you can specify which edges of the signals are counted.

You can select from the following options:

Symbol	Signal evaluation	Meaning
	Single (Page 70) (default)	The edges of signal A are evaluated during a low level of signal B.
	Double (Page 71)	Each edge of signal A is evaluated.
	Quadruple (Page 72)	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counting inputs A, B and N.

The selected filter frequency is based on a pulse-break ratio of between 40:60 and 60:40. This results in a specific minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Filter frequency	Minimum pulse/break time
100 Hz	4.0ms
200 Hz	2.0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8.0 µs
100 kHz (preset for Compact CPU)	4.0 µs

Filter frequency	Minimum pulse/break time
200 kHz** (preset for TM Count)	2.0 µs
500 kHz*	0.8 µs
1 MHz* (default at TM PosInput)	0.4 µs

* Only available with TM PosInput

*** Only available with TM Count and TM PosInput

Sensor type (TM Count)

By configuring the sensor type, you specify how the counter inputs are switched for the TM Count.

You can select from the following options:

Sensor type	Meaning
Sourcing output (default)	The encoder/sensor switches the inputs A, B and N to 24VDC.
Sinking output	The encoder/sensor switches the inputs A, B and N to M.
Push-pull (sinking and sourcing output)	The encoder/sensor alternately switches the inputs A, B and N to M and 24VDC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull encoder and the sensor type "Push-pull (sinking and sourcing output)" is configured, you can monitor the encoder signals for wire break.

Sensor type (Compact CPU)

The "Sourcing output" sensor type is set for the Compact CPU and cannot be changed. The encoder or sensor switches the inputs A, B and N to 24V DC.

You can operate both sourcing output encoders as well as push-pull encoders on the Compact CPU. You can find additional information on the sensor type in the data sheet for the encoder.

Interface Standard (TM PosInput)

You use this parameter to specify whether the encoder outputs symmetric (RS422) or asymmetric (TTL) signals for the TM PosInput.

You can select from the following options:

Interface standard	Meaning
RS422, symmetrical	The encoder outputs symmetric signals according to the RS422 standard (Page 67).
TTL (5 V), asymmetrical	The encoder outputs asymmetric 5 V signals according to the TTL standard (Page 65).

Note

The RS422 standard provides greater interference immunity than the TTL standard. If your incremental or pulse encoder supports the RS422 standard **and** the TTL standard, we recommend using the RS422 standard.

Reaction to signal N

You use this parameter to specify which reaction is triggered to signal N.

You can select from the following options:

Option	Meaning
No reaction to signal N (default)	The counter is not affected by signal N.
Synchronization at signal N (Page 39)	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.
Capture at signal N (Page 29)	The counter value is stored in the Capture value at signal N.

Note

You can only select the reaction to signal N if you have selected the "Incremental encoder (A, B, N)" signal type.

Note

If "Synchronization at signal N" is selected, you can select the function "Enable synchronization at signal N" for a digital input (Page 104).

Note

For High_Speed_Counter as of V3.0, the following applies:

You can choose "Capture at signal N" only in operating mode "Use count value as reference":

Frequency

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

3.5.4 Counter behavior

3.5.4.1 Counting limits and start value

High counting limit

You limit the counting range by setting the high counting limit. You can enter a value up to 2147483647 (2^{31}-1). You must enter a value that lies above the low counting limit.

The default setting is "2147483647".

Low counting limit

You limit the counting range by setting the low counting limit. You can enter a value up to -2147483648 (-2^{31}). You must enter a value below the high counting limit.

The default setting is "-2147483648".

Start value

By configuring the start value, you specify the value at which counting is to start and where it is to continue in the case of defined events. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Additional information

For more information, see Behavior at the counting limits (Page 24) and Counter behavior at gate start (Page 28).

3.5.4.2 Counter behavior at limits and gate start

Reaction to violation of a counting limit

You can configure the following characteristics for violation of a counting limit (Page 24):

Reaction	Meaning
Stop counting	If a counting limit is violated, counting is stopped and the internal gate is closed. To restart counting, you must also close and reopen the software/hardware gate.
Continue counting (default)	Counting continues either with the start value or at the opposite counting limit, depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter to the following values when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit (default)	The counter value is set to the opposite counting limit.

Reaction to gate start

You can set the following Reaction to gate start (Page 28):

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value (default)	When the gate is opened, counting is continued with the last counter value.

3.5.5 Behavior of a DI (High_Speed_Counter)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the hardware gate (Page 26).	• Input delay • Select level
Gate start (edge-triggered)	The configured edge at the respective digital input opens the hardware gate (Page 26).	• Input delay • Edge selection
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the hardware gate (Page 26).	• Input delay • Edge selection
Synchronization (Page 34)	The configured edge at the respective digital input sets the counter to the start value. The technology object indicates whether a synchronization has occurred at the output parameter SyncStatus.	• Input delay • Edge selection
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N (Page 39).	• Input delay • Select level
Capture	The configured edge at the respective digital input saves the current counter value (Page 29) as a Capture value. The technology object displays the Capture value at the output parameter CapturedValue.	• Input delay • Edge selection • Behavior of counter value after Capture
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective static variable of the technology object: • UserStatusFlags.StatusDI0 • UserStatusFlags.StatusDI1 • UserStatusFlags.StatusDI2	• Input delay

Note

With the exception of "Digital input without function", each function can only be used once for each counter, and if used for one digital input is not available to the others.

Note

For High_Speed_Counter as of V3.0, the following applies:

You can choose the "Capture" function only in operating mode "Use count value as reference".

Input delay (TM Count and TM PosInput)

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Input delay (Compact CPU)

By configuring the input delay, you suppress faults at the digital inputs of the DIn signal. Signals with a pulse duration below the configured input delay are suppressed.

You can configure the input delay for a digital input of a Compact CPU in the Inspector window of the device configuration under "Properties > DI 16/DQ 16 > Inputs > Channel n".

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms
- 0.4 ms
- 1.6 ms
- 3.2 ms (default)
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level (default)	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be set for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered.

The following options may be available depending on the function selected:

- At rising edge (default)
- At falling edge
- At rising and falling edge

The parameter can be set for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization
- Capture

Note

At rising and falling edge" can only be configured for the "Capture" function.

Behavior of counter value after Capture

You can configure the following characteristics for the counter after a capture event (Page 29):

	Meaning
Continue counting (default)	After saving the current counter value as Capture value, counting is continued unchanged.
Set to start value and continue counting	After saving the current counter value as Capture value, counting is continued with the start value.

Note

This parameter can be assigned only for the "Capture" function.

See also

Assignment of the feedback interface (Page 185)

3.5.6 Behavior of a DQ (High_Speed_Counter)

Operating mode (High_Speed_Counter V3.0 or higher)

The operating mode determines which value comparison functions work.

Operating mode	Meaning
Use count value as reference (default)	The comparison functions and hardware interrupts for compare events work with the counter value. This functionality corresponds to the functionality of the High_Speed_Counter in versions before V3.0.
Use measured value as reference	The comparison functions and hardware interrupts for compare events work with the measured value.

Note

You configure the operating mode under "Behavior of DQ0" for both digital outputs together. The operating mode is also displayed under "Behavior of DQ1".

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options:

Function of a digital output (Page 43) in operating mode "Use count value as reference"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= counter value <= high counting limit	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: Low counting limit <= counter value <= comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= counter value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the counter value reaches the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)

Function of a digital output (Page 43) in operating mode "Use count value as reference"	Meaning	Additional option-specific parameters
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active until the counter value is equal to the comparison value.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 42).	—

Note

DQ0 of a counter of a Compact CPU

With a Compact CPU, the respective digital output DQ0 is available via the feedback interface, but not as a physical output.

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Note

The "At comparison value for a pulse duration" and "After set command from CPU until comparison value" functions only switch the digital output in question if a count pulse reaches the comparison value. When the counter value is set, e.g. by synchronization, the digital output does not switch.

Function of a digital output (Page 51) in operating mode "Use measured value as reference"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 42).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0(TM Count und TM PosInput)

Operating mode "Use count value as reference"

With the parameter assignment of the comparison value (Page 43), you specify the counter value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than or equal to the low counting limit and less than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 51), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL) that is less than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 0(Compact CPU)

Operating mode "Use count value as reference"

With the parameter assignment of the comparison value (Page 43), you specify the counter value at which the STS_DQ0 bit is set in the feedback interface. The digital output DQ0 is not available as a physical output in a Compact CPU.

You must enter an integer (DINT) that is greater than or equal to the low counting limit and less than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 51), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL) that is less than comparison value 1. The minimum value is -7.922816 x 10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Use count value as reference"

With the parameter assignment of the comparison value (Page 43), you specify the counter value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than comparison value 0 and less than or equal to the high counting limit. The default setting is "10".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 51), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL) that is greater than comparison value 0. The maximum value is 7.922816 x 10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the count direction for which the selected function is valid.

You can select from the following options:

Count direction	Meaning
In both directions (default)	The comparison and switching of the respective digital output take place regardless of the count direction.
Up	The comparison and switching of the respective digital output only takes place when the counter counts up.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

If you enter "0" and the counter value corresponds to the comparison value, the digital output remains active until the next count pulse.

You can enter a value between 0.0 and 6553.5.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 61), you can define a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again until the counter value is outside the range.

Regardless of the hysteresis value, the hysteresis range ends at the low/high counting limits. If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

For High_Speed_Counter as of V3.0, the following applies:

You configure the hysteresis under "Behavior of DQ0" for both digital outputs together. The hysteresis is also displayed under "Behavior of DQ1".

The hysteresis is only available in operating mode "Use count value as reference".

3.5.7 Specify measured value (High_Speed_Counter)

Measured variable

This parameter is used to specify the measured variable (Page 56) to be provided by the technology module. The technology object displays the measured value at the output parameter MeasuredValue.

You can select from the following options:

Measured variable	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second. The value is a floating point number (REAL). The unit is Hz.	• Update time
Period	The measured variable is the average period between two increments. The value is an integer (DINT). The unit is s.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter.	• Update time • Time base for velocity measurement • Increments per unit

Update time

By configuring the update time (Page 55) in milliseconds, you can specify the time interval between two measured value updates.

The update time and the signal type effect the accuracy of the measurement. In the case of update times of at least 100 ms, the effect of the signal type is negligible.

In the case of update times of less than 100 ms, you achieve maximum measurement accuracy using the following signal types:

- Incremental encoder (A, B phase-shifted) with Signal evaluation "Single"
- Incremental encoder (A, B, N) with Signal evaluation "Single"
- Pulse (A) and direction (B)
- Pulse (A)

In the case of other signal types, measurement accuracy depends on the encoder and cable used.

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s/1 min
- The default setting is "60 s/1 min".

Increments per unit

You can use this parameter to define the number of count pulses per relevant unit that the incremental or absolute encoder supplies for the velocity measurement.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example 1:

You encoder delivers 4000 count pulses for travel over one meter. The velocity is to be measured in meters per second. "Double" is configured as signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 8000
- Time base for velocity measurement: 1 s

Example 2:

Your encoder delivers 4096 count pulses per revolution. The velocity is to be measured in revolutions per minute. "Single" is configured as the signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s/1 min

3.6 Programming the High_Speed_Counter

3.6.1 High_Speed_Counter instruction

High_Speed_Counter

The High_Speed_Counter instruction is part of the High_Speed_Counter technology object. It supplies the control and feedback interface of the technology module.

The High_Speed_Counter instruction thereby forms the software interface between the user program and the technology module. It must be called cyclically from the user program in order to synchronize the input and output data.

The High_Speed_Counter instruction can be used for the technology modules of both S7-1500 and ET 200SP. The modules can be used centrally and decentrally. The instruction applies in each case to the channel of the technology module that was assigned to the associated technology object.

Additional information

Description High_Speed_Counter (Page 117)

High_Speed_Counter input parameters (Page 122)

High_Speed_Counter output parameters (Page 123)

Error codes of parameter ErrorID (Page 125)

High_Speed_Counter static variables (Page 127)

3.6.2 Call instruction in the user program

The High_Speed_Counter instruction can be called once for each counter in the cycle or, alternatively, in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the OB for cyclic program execution.
   The block is opened in the work area.
4. In the "Instructions" window, open the "Technology" group and the "Counting and measurement" folder.
   The instructions are located in the folder.
5. Select an instruction and drag it to your OB.
   The "Call options" dialog opens.
6. Select a technology object from the "Name" list or enter the name for a new technology object.
7. Confirm with "OK".

Result

If the technology object does not exist yet, it is added. The instruction is added in the OB. The technology object is assigned to this call of the instruction.

Note

If you click one of the buttons "Configuration", "Commissioning" or "Diagnostics" in the user interface of the instruction, the respective editor opens.

3.6.3 Description High_Speed_Counter

Description

The High_Speed_Counter instruction is used to control the technology module counting and measuring functions via the user program.

Call

The instruction High_Speed_Counter must be called once per counter, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Operating principle

Counter value: The counter value is available at the output parameter CountValue. The counter value is updated at every call of the High_Speed_Counter instruction.

Measured value: The technology module updates the measured value asynchronously to the instruction call based on the configured update time. The measured value last determined by the technology module is updated at the output parameter MeasuredValue each time the instruction is called.

The measured value and the counter value are available in parallel in the feedback interface.

Capture: The output parameter CaptureStatus = TRUE indicates a valid Capture value at the output parameter CapturedValue.

- A Capture value is captured under the following conditions:
  - A digital input has the parameter assignment "Capture"
  - CaptureEnable = TRUE
  - Edge at digital input with the Capture function
- The output parameter CaptureStatus is reset by a negative edge at the input parameter CaptureEnable.

Synchronization: The output parameter SyncStatus = TRUE indicates that a synchronization has occurred.

- The counter value is synchronized under the following conditions:
  - A digital input has the parameter assignment "Synchronization" **or** the incremental encoder has the parameter assignment "Synchronization at signal N"
  - SyncEnable = TRUE
  - SyncUpDirection (or SyncDownDirection) = TRUE
  - Edge at the digital input with the synchronization function **or** positive edge of the signal N at the encoder input

- The output parameter SyncStatus is reset by a negative edge at
  - the input parameter SyncEnable or
  - the static tag SyncDownDirection or
  - the static tag SyncUpDirection

Parameter changes via the user program

Proceed as follows to modify parameters using the user program:

1. Check based on the respective Set tag to determine whether the technology object is ready for the parameter change (Set tag = FALSE) or whether a change job is still running (Set tag = TRUE).
   The following Set tags in UserCmdFlags are available for this in the static tags of the technology object instance DB:
   - SetReferenceValue0
   - SetReferenceValue1
   - SetUpperLimit
   - SetLowerLimit
   - SetCountValue
   - SetStartValue
   - SetNewDirection
2. If the technology object is ready for the parameter change, modify the relevant static tag.
   The following static tags of the technology object instance DB are available for this:
   - NewReferenceValue0 / NewReferenceValue0_M (for SetReferenceValue0)
   - NewReferenceValue1 / NewReferenceValue1_M (for SetReferenceValue1)
   - NewUpperLimit
   - NewLowerLimit
   - NewCountValue
   - NewStartValue
   - NewDirection
3. Set the relevant Set tag for execution of the change command.
4. Use the output parameter Error to check whether an error has occurred.
   If no errors have occurred and the Set tag has been automatically reset by the technology object, the parameter change was successful.

Note

Changed counting limit

If the new high counting limit is less than the current counter value, the counter value is set to the low counting limit or the start value according on the parameter assignment. If the new low counting limit is greater than the current counter value, the counter value is set to the high counting limit or the start value according to the parameter assignment.

Operating mode (High_Speed_Counter V3.0 or higher)

Configure the operating mode in the technology object under "Behavior of DQ0".

The operating mode is indicated by the output parameter CompareMeasuredValue:

State	Description
FALSE	Operating mode "Use count value as reference" The comparison functions work with the counter value. The following static variables are specifically used in this operating mode: • NewReferenceValue0 • NewReferenceValue1 • CurReferenceValue0 • CurReferenceValue1 The four specific static variables of operating mode "Use measured value as reference" are ignored.
TRUE	Operating mode "Use measured value as reference": The comparison functions work with the measured value. The following static variables are specifically used in this operating mode: • NewReferenceValue0_M • NewReferenceValue1_M • CurReferenceValue0_M • CurReferenceValue1_M The four specific static variables of operating mode "Use count value as reference" are ignored.

Acknowledgment of events

You acknowledge signaled events using the positive edge of the input parameter EventAck . EventAck must stay set until the technology object has reset the status bits of the following events of the count channel:

- CompResult0
- CompResult1
- ZeroStatus
- PosOverflow
- NegOverflow

Status of the digital inputs (TM Count and TM PosInput)

You can obtain the status of the digital inputs with the static tags StatusDI0, StatusDI1 or StatusDI2.

Status of the digital inputs (Compact CPU)

You can obtain the status of the digital inputs with the static tags StatusDI0 and StatusDI1. When a digital input of the Compact CPU is not used for a counter, you can use it via the user program.

Use of digital outputs by the user program (TM Count and TM PosInput)

You can set the digital outputs with the High_Speed_Counter instruction,

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- if you set the corresponding static tag ManualCtrlDQm (temporary overwrite).

The static tags SetDQ0 and SetDQ1 only have an effect in these cases. In the first and third case, DQm follows the value of SetDQm. In the second case, DQm is set with a positive edge of SetDQm. DQm is reset when the counter value corresponds to the comparison value or at a negative edge of SetDQm.

Use digital outputs by user program (Compact CPU)

You can set the DQ1 digital output with the High_Speed_Counter instruction.

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- if you set the corresponding static tag ManualCtrlDQ1 (temporary overwrite).

The static tag SetDQ1 only has an effect in these cases. In the first and third case, DQ1 follows the value of SetDQ1. In the second case, DQ1 is set and reset with a positive edge of SetDQ1 when the counter value corresponds to the comparison value or at a negative edge of SetDQ1.

Note

Before you can set a physical digital output of the Compact CPU with the High_Speed_Counter instruction, you have to assign the DQ1 signal to the desired digital output.

You can set the DQ0 signal using the High_Speed_Counter instruction with the static tag StatusDQ0.

- If the "Use by user program" setting is configured for "Set output".
- If the "After set command from CPU until comparison value" setting is configured for "Set output".
- If you set the static tag ManualCtrlDQ0 (temporary overwrite).

The static tag SetDQ0 only has an effect in these cases. In the first and third case, DQ0 follows the value of SetDQ0. In the second case, StatusDQ0 is set and reset with an edge (positive or negative) by SetDQ0 and is reset when the counter value corresponds to the comparison value.

Note

The digital output DQ0 is not available as a physical output.

Reaction to error

If an error has occurred during the call of the instruction or in the technology module, the output parameter Error is set. More detailed error information can be read at the output parameter ErrorID.

Eliminate the cause of the error and acknowledge the error message by setting the input parameter ErrorAck. When no more errors are pending, the technology object resets the output parameter Error . No new error is signaled until you acknowledge the previous error.

Changing the count direction

The count direction can only be changed by the user program if "Pulse (A)" is configured as the signal type. In all other cases, the count direction is determined by the input signals of the technology module. The count direction is controlled by the static tag NewDirection:

- +1: Upward count direction
- -1: Downward count direction

To execute the change command, you need to set the tag SetNewDirection = TRUE.

3.6.4 High_Speed_Counter input parameters

Parameter	Declaration	Data type	Default	Description
SwGate	INPUT	BOOL	FALSE	Control software gate: • Positive edge: Software gate opens • Negative edge: Software gate closes Together with the hardware gate, the SwGate enables the internal gate.
SetCountValue	INOUT	BOOL	FALSE	A positive edge starts the transfer of the new counter value in the static tag NewCountValue to the technology module. The counter value takes effect immediately after the transfer.
CaptureEnable	INPUT	BOOL	FALSE	Enable Capture function After the enable, a Capture event occurs at the next configured edge at the relevant digital input. A negative edge at CaptureEnable resets the output parameter CaptureStatus. A negative edge at CaptureEnable resets the enable even if no Capture event has occurred. Irrespective of CaptureEnable the last value is retained at the output parameter CapturedValue until the next Capture event.
SyncEnable	INPUT	BOOL	FALSE	Enable synchronization The direction enabled for synchronization is indicated in the static tags SyncUpDirection and SyncDownDirection. A negative edge at SyncEnable resets the output parameter SyncStatus .
ErrorAck	INPUT	BOOL	FALSE	A positive edge acknowledges the error status reported.
EventAck	INPUT	BOOL	FALSE	A positive edge resets the following output parameters: • CompResult0 • CompResult1 • ZeroStatus • PosOverflow • NegOverflow

3.6.5 High_Speed_Counter output parameters

Parameter	Declaration	Data type	Default	Description
StatusHW	OUTPUT	BOOL	FALSE	Status bit technology module: The module is configured and ready for operation. The module data is valid.
StatusGate	OUTPUT	BOOL	FALSE	Status bit: Internal gate is released if parameter is set
StatusUp	OUTPUT	BOOL	FALSE	Status bit: The last count pulse incremented the counter and took place no more than 0.5 s ago
StatusDown	OUTPUT	BOOL	FALSE	Status bit: The last count pulse decremented the counter and took place no more than 0.5 s ago
CompResult0	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ0 occurred (status change) based on the selected comparison condition. If the counter value is set to the start value in operating mode "Use count value as reference", CompResult0 is not set. The positive edge of the input parameter EventAck is used to reset CompResult0 .
CompResult1	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ1 occurred (status change) based on the selected comparison condition. If the counter value is set to the start value in operating mode "Use count value as reference", CompResult1 is not set. The positive edge of the input parameter EventAck is used to reset CompResult1 .
SyncStatus	OUTPUT	BOOL	FALSE	Status bit: Synchronization event occurred If the input parameter SyncEnable is set, the configured edge sets the status bit SyncStatus at the respective digital input . SyncStatus is reset by a negative edge at • SyncEnable (input parameter) or • SyncUpDirection (static tag) or • SyncDownDirection (static tag)
CaptureStatus	OUTPUT	BOOL	FALSE	Status bit: Capture event occurred, the output parameter CapturedValue has a valid Capture value If the input parameter CaptureEnable is set, the configured edge sets the status bit CaptureStatus. at the respective digital input. You reset CaptureStatus using the negative edge of the input parameter CaptureEnable .
ZeroStatus	OUTPUT	BOOL	FALSE	Status bit: CountValue has reached the value "0" irrespective of the count direction You reset ZeroStatus using the positive edge of the input parameter EventAck.
PosOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated high counting limit in the positive direction You reset PosOverflow using the positive edge of the input parameter EventAck.

Parameter	Declaration	Data type	Default	Description
NegOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated low counting limit in the negative direction You reset NegOverflow using the positive edge of the input parameter EventAck.
Error	OUTPUT	BOOL	FALSE	An error has occurred. Refer to the output parameter ErrorID for the cause of the error.
ErrorID	OUTPUT	WORD	0	The ErrorID (Page 125) parameter displays the number of the error message. ErrorID = 0000_H: There is no error.
CountValue	OUTPUT	DINT	0	Current counter value
CapturedValue	OUTPUT	DINT	0	The last acquired Capture value The value is retained until the next Capture event, irrespective of the input parameter CaptureEnable. If a new Capture event has occurred, CaptureStatus is set and is reset by you using the negative edge of the input parameter CaptureEnable .
MeasuredValue	OUTPUT	REAL	0.0	Current measured value for frequency, period duration or velocity (depending on configuration)
CompareMeaspareMeasuredValue[1]	OUTPUT	BOOL	FALSE	Status bit: FALSE: Operating mode "Use count value as reference"; comparison functions work with counter value TRUE: Operating mode "Use measured value as reference"; comparison functions work with measured value

[1] Available for High_Speed_Counter version V3.0 or higher

3.6.6 Error codes of parameter ErrorID

Error code (W#16#...)	Description
0000	No error
Error messages from technology module	
80A1	POWER_ERROR from feedback interface: Incorrect supply voltage L+
80A2	ENC_ERROR from feedback interface: Incorrect encoder signal
80A3	LD_ERROR from feedback interface: Error when loading via control interface
Error messages of the instruction High_Speed_Counter	
80B1	Invalid count direction
80B4	For operating mode "Use count value as reference", the following applies: New low counting limit does not meet the following conditions: • Low counting limit < high counting limit • Low counting limit <= comparison value/start value For operating mode "Use measured value as reference", the following applies: New low counting limit does not meet the following conditions: • Low counting limit < high counting limit • Low counting limit <= start value
80B5	For operating mode "Use count value as reference", the following applies: New high counting limit does not meet the following conditions: • Low counting limit < high counting limit • High counting limit >= comparison value/start value For operating mode "Use measured value as reference", the following applies: New high counting limit does not meet the following conditions: • Low counting limit < high counting limit • High counting limit >= start value
80B6	New start value does not meet the following condition: • Low counting limit <= start value <= high counting limit
80B7	New counter value does not meet the following condition: • Low counting limit <= counter value <= high counting limit
80B8	For operating mode "Use count value as reference", the following applies: New comparison value 0 does not meet the following conditions: • Low counting limit <= comparison value 0 <= high counting limit • Comparison value 0 < comparison value 1 For operating mode "Use measured value as reference", the following applies: New comparison value 0 does not meet the following conditions: • Comparison value 0 < comparison value 1

Error code (W#16#...)	Description
80B9	For operating mode "Use count value as reference", the following applies: New comparison value 1 does not meet the following conditions: • Low counting limit <= comparison value 1 <= high counting limit • Comparison value 0 < comparison value 1 For operating mode "Use measured value as reference", the following applies: New comparison value 1 does not meet the following conditions: • Comparison value 0 < comparison value 1
80C0	Instruction High_Speed_Counter was called multiple times with the same instance (DB)
80C1	Communication with technology module failed (read data records): Error information of internal instruction RDREC saved in static tag AdditionalErrorID
80C2	Communication with technology module failed (write data records): Error information of internal instruction WRREC saved in static tag AdditionalErrorID
80C3	Access to input data (feedback interface) failed: Error information of internal instruction GETIO_PART saved in static tag AdditionalErrorID
80C4	Access to output data (control interface) failed: Error information of internal instruction SETIO_PART saved in static tag AdditionalErrorID
80C5	Reading of the current start information of the OB failed: Error information of internal instruction RD_SINFO saved in static tag AdditionalErrorID
80C6	Failed to get I/O addresses of the technology module: Error information of internal instruction RD_ADDR saved in static tag AdditionalErrorID

3.6.7 High_Speed_Counter static variables

Tag	Data type	Default	Access	Description
NewCountValue	DINT	L#0	Write	New counter value
NewReferenceValue0	DINT	L#0	Write	New comparison value 0
NewReferenceValue1	DINT	L#10	Write	New comparison value 1
NewReferenceValue0_M[1]	REAL	L#0.0	Write	New comparison value 0 in measuring mode
NewReferenceValue1_M[1]	REAL	L#10.0	Write	New comparison value 1 in measuring mode
NewUpperLimit	DINT	L#2147483647	Write	New high counting limit
NewLowerLimit	DINT	L#-2147483648	Write	New low counting limit
NewStartValue	DINT	L#0	Write	New start value
CurReferenceValue0	DINT	L#0	Read	Current comparison value 0
CurReferenceValue1	DINT	L#10	Read	Current comparison value 1
CurReferenceValue0_M[1]	REAL	L#0.0	Read	Current comparison value 0 in measuring mode
CurReferenceValue1_M[1]	REAL	L#10.0	Read	Current comparison value 1 in measuring mode
CurUpperLimit	DINT	L#2147483647	Read	Current high counting limit
CurLowerLimit	DINT	L#-2147483648	Read	Current low counting limit
CurStartValue	DINT	L#0	Read	Current start value
NewDirection	INT	0	Write	New count direction: +1: Upward count direction -1: Downward count direction
AdditionalErrorID	DWORD	W#16#0000	Read	Error information of an internal instruction, e.g.,RDREC

Tag		Data type	Default	Access	Description
UserCmdFlags		STRUCT	-		
	SetNewDirection	BOOL	FALSE	Write	Set new count direction
	SetUpperLimit	BOOL	FALSE	Write	Set high counting limit
	SetLowerLimit	BOOL	FALSE	Write	Set low counting limit
	SetReferenceValue0	BOOL	FALSE	Write	Set comparison value 0
	SetReferenceValue1	BOOL	FALSE	Write	Set comparison value 1
	SetCountValue	BOOL	FALSE	Write	Set new counter value
	SetStartValue	BOOL	FALSE	Write	Set start value
	SyncDownDirection	BOOL	TRUE	Write	Enable synchronization in downward count direction
	SyncUpDirection	BOOL	TRUE	Write	Enable synchronization in upward count direction
	SetDQ0	BOOL	FALSE	Write	Set digital output DQ0
	SetDQ1	BOOL	FALSE	Write	Set digital output DQ1
	ManualCtrlDQ0	BOOL	FALSE	Write	Enable setting of digital output DQ0: TRUE: • SetDQ0 sets DQ0 • Control bit TM_CTRL_DQ0 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ0 = TRUE
	ManualCtrlDQ1	BOOL	FALSE	Write	Enable setting of digital output DQ1: TRUE: • SetDQ1 sets DQ1 • Control bit TM_CTRL_DQ1 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ1 = TRUE
UserStatusFlags		STRUCT	-		
	StatusDI0	BOOL	FALSE	Read	Current status of digital input DI0
	StatusDI1	BOOL	FALSE	Read	Current status of digital input DI1
	StatusDI2	BOOL	FALSE	Read	Current status of digital input DI2
	StatusDQ0	BOOL	FALSE	Read	Current status of digital output DQ0
	StatusDQ1	BOOL	FALSE	Read	Current status of digital output DQ1

[1] Available for High_Speed_Counter version V3.0 or higher

3.7 Commissioning the High_Speed_Counter

3.7.1 Commissioning the technology object

A graphic display of the block in the commissioning editor helps you with commissioning and the function test for the technology object. You can change specific parameters of the High_Speed_Counter instruction in CPU/IM online mode and monitor their effects.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The corresponding High_Speed_Counter instruction is called cyclically from the user program.
- The parameters of the technology object are not overwritten by the user program.

Procedure

To open the commissioning editor of a technology object and to simulate a parameter value change, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Commissioning" object.
   The functions for commissioning the High_Speed_Counter technology object are displayed.
4. In the commissioning dialog, click on the "Monitor all" button.
   The parameters (online values) of the High_Speed_Counter technology object are loaded and displayed.
5. If the parameter you want to change has a text box, enter the new value there.
6. Select the check box of the parameter.
   The new parameter value becomes effective and the effects of the change are simulated.

Online mode

In online mode, you can modify the following parameters to test the technology object function:

- New counter value (NewCountValue)
- New high counting limit (NewUpperLimit)
- New low counting limit (NewLowerLimit)
- New comparison value 0 (NewReferenceValue0 or NewReferenceValue0_M)
- New comparison value 1 (NewReferenceValue1 or NewReferenceValue1_M)
- New start value (NewStartValue)
- Start and stop counter (SwGate)
- Enable Capture (CaptureEnable)
- Enable synchronization (SyncEnable)
- Acknowledgment of signaled error states (ErrorAck)
- Resetting the status flag (EventAck)

3.8 High_Speed_Counter diagnostics

3.8.1 Monitoring counter values, measured values, DIs and DQs

You use the diagnostic functions to monitor the counting and measuring functions.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the display editor for the diagnostic functions, follow these steps:

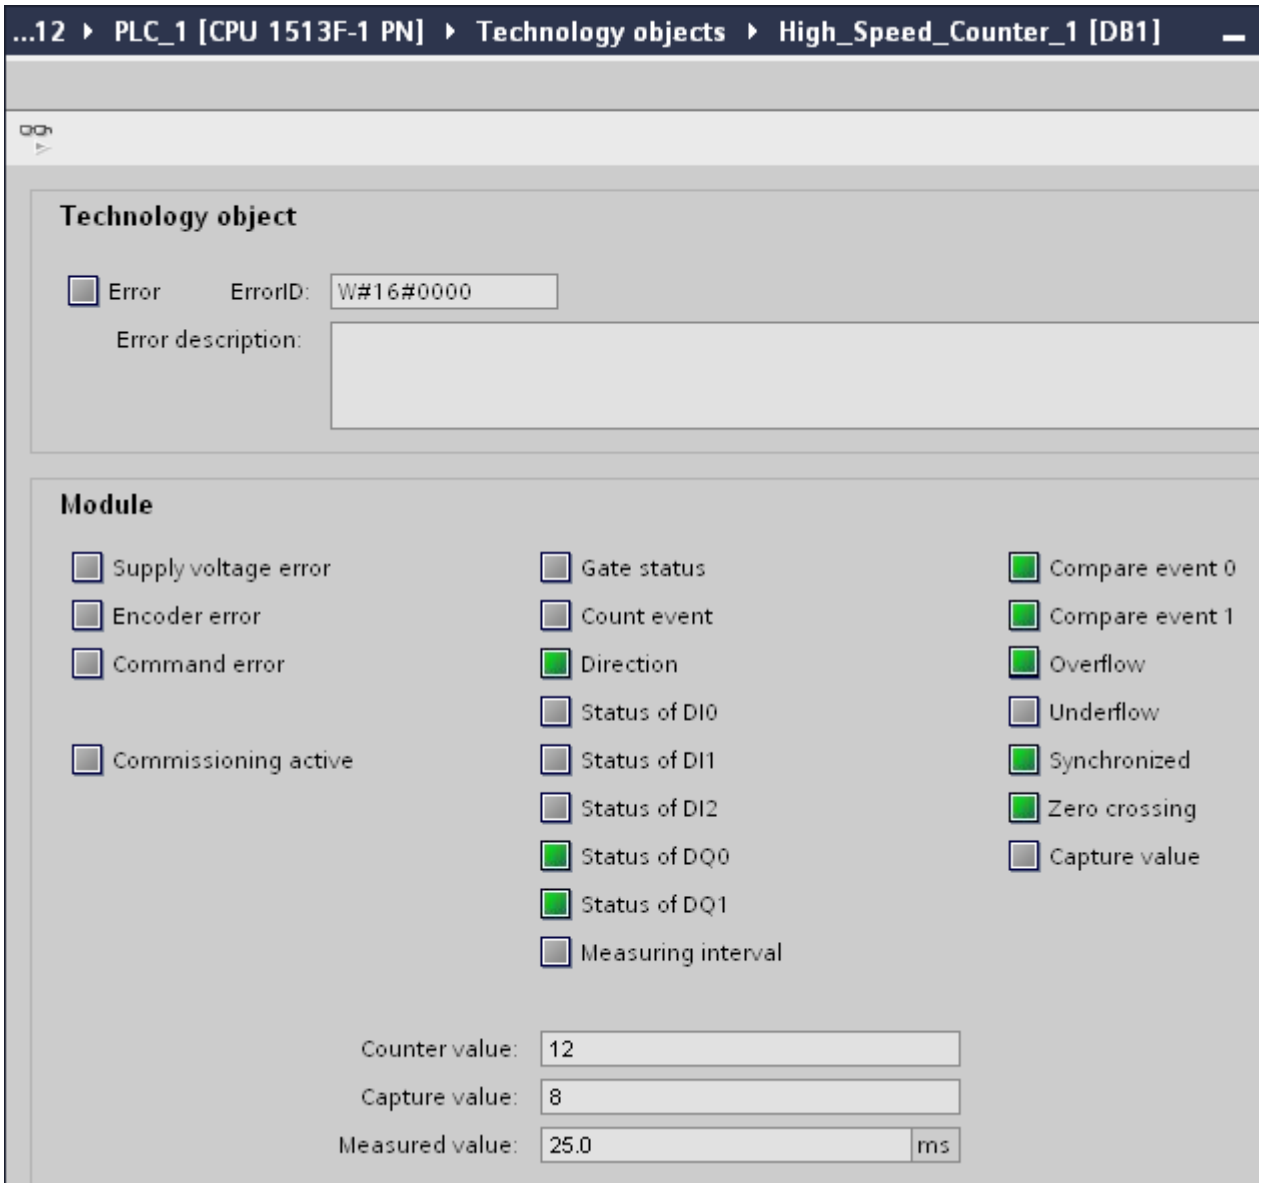
1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Diagnostics" object.

Display

The following values are read by the technology object from the feedback interface and displayed:

- Event display/diagnostics information
- Signal states of the digital inputs and digital outputs
- Counter value
- Capture value
- Measured value

Additional information on status displays is available in the context-sensitive help for each event in STEP 7 (TIA Portal). When the CPU is in STOP, the status display is not updated.



Using the SSI_Absolute_Encoder technology object 4

4.1 Technology object SSI_Absolute_Encoder

STEP 7 (TIA Portal) supports you in the configuration, commissioning and diagnostics of counting and measuring functions for the technology module TM PosInput: with the "Technology objects" function

- In STEP 7 (TIA Portal), you configure the SSI_Absolute_Encoder technology object with the settings for the position input with an SSI absolute encoder.
- The corresponding SSI_Absolute_Encoder instruction is programmed in the user program. This instruction supplies the control and feedback interface of the technology module.

The SSI_Absolute_Encoder technology object corresponds to the instance DB of the SSI_Absolute_Encoder instruction. The configuration of the position input and measuring functions is saved in the technology object. The technology object is located in the folder "PLC > Technology objects".

The SSI_Absolute_Encoder technology object can be used for the TM PosInput of both the S7-1500 and ET 200SP systems alike.

Operating mode

In order to configure a TM PosInput using the technology object, you specify the operating mode (Page 172) "Operating with technology object" in the hardware configuration of the TM PosInput. This selection is already preset.

4.2 Overview of the configuration steps

Introduction

The overview below shows the basic procedure for configuring the position input and measuring functions of the technology module with the SSI_Absolute_Encoder technology object.

Requirement

Before you can use the technology object, a project with an S7-1500 CPU or an ET 200SP CPU must be created in STEP 7 (TIA Portal).

Procedure

Proceed in the recommended sequence outlined below:

Step	Description
1	Configure a technology module (Page 166)
2	Add technology object (Page 135)
3	Configure a technology object according to your application (Page 137)
4	Call instruction in the user program (Page 154)
5	Load to CPU
6	Commissioning the technology object (Page 163)
7	Diagnostics of the technology object (Page 164)

4.3 Add technology object

Add technology object in the project navigator

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement

A project with a CPU S7-1500 has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click on "Add new object".
   The "Add new object" dialog opens.
4. Select the "Counting and measurement" technology.
5. Select the "SSI_Absolute_Encoder" object.
6. Enter an individual name for the technology object in the "Name" text box.
7. Click "Additional information" if you want to add your own information to the technology object.
8. Confirm with "OK".

Result

The new technology object has now been created and stored in the project tree in the "Technology objects" folder.

	Object	Description
①	Configuration (Page 137)	In the configuration dialog: • Assignment of technology module and channel • Technology object parameter settings for position input and measurement functions When you change the configuration of the technology object, you must download the technology object **and** the hardware configuration to the CPU.
②	Commissioning (Page 163)	Commissioning and function test of the technology object: Simulating parameters of the SSI_Absolute_Encoder instruction and monitoring the effects
③	Diagnostics (Page 164)	Monitoring of the position input and measurement functions

4.4 Configuring SSI_Absolute_Encoder

4.4.1 Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click on the "Configuration" object.

The configuration is divided into the following categories:

- **Basic parameters**

  The basic parameters include the selection of the technology module and the number of the channel for which the technology object is configured.

- **Extended parameters**

  The extended parameters include the parameters for adapting the position input and measuring functions and for setting the characteristics of the digital inputs and digital outputs.

Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	The configuration contains values set by the user or automatically adapted values and is complete All text boxes of the configuration contain valid values and at least one default value was changed.
	The configuration is incomplete or incorrect At least one text box or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.

4.4.2 Basic parameters

Under "Basic parameters", you can establish the connection between the technology object and the TM PosInput technology module.

Module

You select the technology module in a subsequent dialog box. You can choose any of the TM PosInput technology modules (central or distributed) under the CPU S7-1500 that are configured for use with a technology object from "Counting and measurement" in operating mode "Operating with technology object"

After selecting the technology module, you can open the device configuration associated with the technology module by clicking the"Device configuration" button.

The technology module parameter settings required for the use of the technology object are made in the "Extended parameters" of the technology object.

Channel

For a technology module with several channels, you select the number of the channel for which the technology object is valid.

Note

A channel can be assigned to only *one* technology object. A channel that is already assigned to a technology object can no longer be selected.

Synchronization of the parameter values

If, after assignment of the channel to the technology object, there is an inconsistency between the parameter values under "Parameters" and in the technology object, a button with a corresponding inquiry appears. When you click the button, the parameter values under "Parameters" are overwritten by the parameter values of the technology object within STEP 7 (TIA Portal). The current parameter values of the technology object are displayed under "Parameters".

4.4.3 SSI absolute encoder

Frame length

With the parameter assignment of the frame length, you specify the number of bits of an SSI frame of the SSI absolute encoder (Page 23) used. You can find the frame length of your SSI absolute encoder in the data sheet of the encoder. Special bits are also included in the frame length. A parity bit does not count in the frame length.

A frame length of between 10 bits and 40 bits is permitted. The default setting is "13 Bit".

You can find two examples of the SSI frame format at Examples of the frame format (Page 150).

Code type

You use the parameter assignment of the code type to specify whether the encoder supplies Dual code or Gray code.

You can select from the following options:

Code type	Meaning
Gray (default)	The gray-coded position value returned by the SSI absolute encoder is converted to dual code.
Dual	The value returned by the SSI absolute encoder is not converted.

Transmission rate

With the parameter assignment of the transmission rate, you specify the data transmission rate between the technology module and the SSI absolute encoder. You can select from several options between 125 kHz and 2 MHz. The default setting is "125 kHz".

The maximum transmission rate depends on the cable length and the technical specifications of the SSI absolute encoder. For additional information, refer to the product manual of the TM PosInput and the encoder description.

Monoflop time

With the parameter assignment of the monoflop time, you specify the idle time between two SSI frames.

The configured monoflop time must be at least equal to the monoflop time of the SSI absolute encoder used. You can find this value in the technical specifications of the SSI absolute encoder.

You can select from the following options:

- Automatically (default)
- 16 µs
- 32 µs
- 48 µs
- 64 µs

Note

If you select the "Automatic" option, the monoflop time automatically adapts to the encoder used.

In isochronous mode, the "Automatic" option corresponds to a monoflop time of 64 µs. If the monoflop time of the employed SSI absolute value encoder is less than 64 µs, you can select the value of the encoder to achieve faster isochronous times.

Parity

With the parameter assignment of the parity, you specify whether the SSI absolute encoder transfers a parity bit.

If, for example, a 25-bit encoder with parity is assigned, the technology module reads 26 bits. The bit following the LSB (least significant bit) in the SSI frame is evaluated as a parity bit. A parity error is reported in the feedback interface (Page 185) by means of the ENC_ERROR bit.

Bit number LSB of the position value

This parameter is used to specify the bit number of the LSB (least significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the bit number of the MSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 31.

The default setting is "0".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Bit number MSB of the position value

This parameter is used to specify the bit number of the MSB (most significant bit) of the position value in the frame of the SSI absolute encoder. In this way you limit the range in the frame that supplies the position value.

The value must be less than the frame length and higher than the bit number of the LSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 31.

The default setting is "12".

Note

If you have selected the Code type "Gray", only the range from the LSB to the MSB of the position value is converted to binary code.

Invert direction

You can use this parameter to invert the values supplied by the SSIabsolute encoder. This allows you to adapt the detected direction of the encoder to the motor's direction of rotation.

Note

This parameter acts only on the range from the LSB to the MSB of the position value in the frame.

SSI frame

You can also set the following parameters in the graphic with drag-and-drop:

- Frame length
- Bit number LSB of the position value
- Bit number MSB of the position value

Complete SSI frame

If the "Complete SSI frame" measured variable is selected, the module returns the least significant 32 bits of the unprocessed current SSI frame. The graphic shows the corresponding meaning of a supplied bit. The following abbreviations are used:

V	Value: Position value as gray or dual code
S	Special: Special bit
P	Parity: Parity bit When you have configured a parity bit, the module returns the least significant 31 bits of the SSI frame *and* the parity bit.

4.4.4 Behavior of a DI (SSI_Absolute_Encoder)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning	Additional option-specific parameters
Capture (Page 32)	The configured edge at the respective digital input saves the current position value as a Capture value. The technology object displays the Capture value at the output parameter CapturedValue. The function can only be used for one of the two digital inputs.	• Input delay • Edge selection
Digital input without function	No technological function is assigned to the respective digital input. You can read the signal state of the digital input via the respective static variable of the technology object: • UserStatusFlags.StatusDI0 • UserStatusFlags.StatusDI1	• Input delay

Note

You can choose the "Capture" function only in operating mode "Use position value (SSI absolute value) as reference".

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You configure the input delay under "Behavior of DI0" for all digital inputs together. The input delay is also displayed under "Behavior of DI1".

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered for the "Capture" function.

You can select from the following options:

- At rising edge (default)
- At falling edge
- At rising and falling edge

4.4.5 Behavior of a DQ (SSI_Absolute_Encoder)

Operating mode

With the operating mode, you specify the reference value with which the comparison functions work.

Operating mode	Meaning
Use position value (SSI absolute value) as reference (default)	The comparison functions and hardware interrupts for compare events work with the position value.
Use measured value as reference	The comparison functions and hardware interrupts for compare events work with the measured value.

Note

You configure the operating mode under "Behavior of DQ0" for both digital outputs together. The operating mode is also displayed under "Behavior of DQ1".

Set output

With the parameter assignment of a digital output, you specify the condition upon which the digital output switches.

You can select from the following options depending on the operating mode:

Function of a digital output (Page 47) in operating mode "Use position value (SSI absolute value) as reference"	Meaning	Additional option-specific parameters
Between comparison value and high limit (default)	The respective digital output is active if: Comparison value <= position value <= maximum position value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value and low limit	The respective digital output is active if: 0 <= position value <= comparison value	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= position value <= comparison value 1	• Comparison value 0 • Comparison value 1 • Hysteresis (in increments)
At comparison value for a pulse duration	The respective digital output is active once for the assigned time and direction of the position value change when the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Pulse duration • Hysteresis (in increments)

Function of a digital output (Page 47) in operating mode "Use position value (SSI absolute value) as reference"	Meaning	Additional option-specific parameters
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active for the assigned direction of the position value change until the position value is equal to the comparison value or has fallen below or exceeded it.	• Comparison value 0 • Comparison value 1 • Count direction • Hysteresis (in increments)
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 42).	—

Note

You can only select the "Between comparison value 0 and 1" function for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Function of a digital output (Page 51) in operating mode "Use measured value as reference"	Meaning	Additional option-specific parameters
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Measured value <= comparison value	The respective digital output is active if the measured value is less than or equal to the comparison value.	• Comparison value 0 • Comparison value 1
Between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 0 <= measured value <= comparison value 1	• Comparison value 0 • Comparison value 1
Not between comparison value 0 and 1	The digital output DQ1 is active if: Comparison value 1 <= measured value <= comparison value 0	• Comparison value 0 • Comparison value 1
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 42).	—

Note

You can select the "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" functions only for digital output DQ1 and only if you have selected the "Use by user program" function for digital output DQ0.

Comparison value 0

Operating mode "Use position value (SSI absolute value) as reference"

With the parameter assignment of the comparison value (Page 47), you specify the position value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a positive integer (DINT) that is less than comparison value 1. The default setting is "0".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 51), you specify the measured value at which the digital output DQ0 switches as a result of the selected comparison event.

You must enter a floating point number (REAL) that is less than comparison value 1. The minimum value is -7.922816×10^{28}. The default setting is "0.0". The unit of the comparison value depends on the measured variable.

Comparison value 1

Operating mode "Use position value (SSI absolute value) as reference"

With the parameter assignment of the comparison value (Page 47), you specify the position value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter an integer (DINT) that is greater than comparison value 0 and less than or equal to the high counting limit (maximum position value) The default setting is "10".

Operating mode "Use measured value as reference"

With the parameter assignment of the comparison value (Page 51), you specify the measured value at which the digital output DQ1 switches as a result of the selected comparison event.

You must enter a floating point number (REAL) that is greater than comparison value 0. The maximum value is 7.922816×10^{28}. The default setting is "10.0". The unit of the comparison value depends on the measured variable.

Count direction

You use this parameter to specify the direction of position value change for which the selected function is valid.

You can select from the following options:

Direction of position value change	Meaning
In both directions (default)	The comparison and switching of the respective digital output is carried out regardless of whether the position value increases of decreases.
Up	The comparison and switching of the respective digital output only takes place when the position value increases.
Down	The comparison and switching of the respective digital output only takes place when the position value decreases.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

A value from 0.1 to 6553.5 ms is permissible.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Hysteresis (in increments)

By configuring the hysteresis (Page 63), you can define a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again until the position value has left this range once.

If you enter "0", the hysteresis is turned off. You can enter a value between 0and 255. The default setting is "0".

Note

You configure the hysteresis under "Behavior of DQ0" for both digital outputs together. The hysteresis is also displayed under "Behavior of DQ1".

Note

The hysteresis is only available in operating mode "Use position value (SSI absolute value) as reference".

4.4.6 Specify measured value (SSI_Absolute_Encoder)

Measured variable

With this parameter you specify whether the technology module is to provide a certain measured variable (Page 59) or the complete SSI frame.

You can select from the following options:

Option	Meaning	Additional option-specific parameters
Frequency (default)	The measured variable shows the number of increments per second, where each increment corresponds to one position value change. The value is a floating point number (REAL). The unit is Hz. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Period	The measured variable is the average period between two increments of the position value. The value is an integer (DINT). The unit is s. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time
Velocity	The measured variable is a velocity. Examples of a velocity measurement can be found in the explanation of the "Increments per unit" parameter. The technology object displays the measured value at the output parameter MeasuredValue.	• Update time • Time base for velocity measurement • Increments per unit
Complete SSI frame	Instead of a measured variable, the first 32 bits of the SSI frame are returned (bit 0 to bit 31). In so doing, special bits that do not belong to the position information are also supplied. A configured inversion of the direction is ignored. The technology object displays the value at the output parameter CompleteSSIFrame. You can find examples under Examples of the frame format (Page 150). This option is only available in operating mode "Use position value (SSI absolute value) as reference".	—

Update time

By configuring the update time (Page 58) in milliseconds, you can specify the time interval between two measured value updates. Unsteady measured variables can be smoothed through longer update times

If you enter "0", the measured value is updated once per module-internal cycle. Up to three decimal places can be entered. A value from 0.0 to 25000.0 is permissible. The default setting is "10.0".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s/1 min

The default setting is "60 s/1 min".

Increments per unit

With this parameter you define the number of increments per relevant unit that the SSI absolute encoder supplies for the velocity measurement.

You can enter a value between 1 and 65535.

Example 1:

Your absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s/1 min

Example 2:

You encoder delivers 10000 increments for travel over one meter. The velocity is to be measured in meters per second.

In this case, you need to assign the following parameters:

- Increments per unit: 10000
- Time base for velocity measurement: 1 s

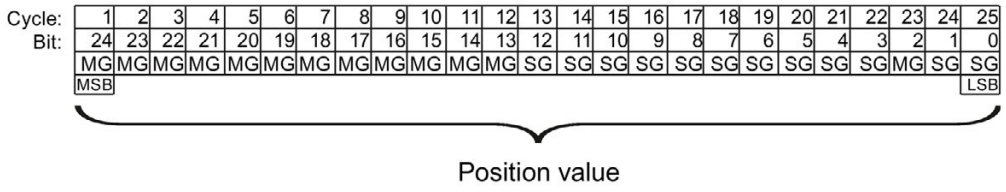
4.4.7 Examples of the frame format

Example 1

In this example the SSI absolute encoder has the following specification:

- The encoder has a resolution of 13 bits per revolution and a value range of 12 bits of revolutions. The SSI frame has a length of 25 bits.
- The MSB of the position value is bit 24.
- The LSB of the position value is bit 0.
- The position value is Gray coded.
- A parity bit is not available.

The frame has the following format:



MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Complete SSI frame

If you configure "Complete SSI frame", the technology module returns the unprocessed SSI frame in the return interface right-justified:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Position value feedback value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD

MD Multiturn bit as binary code

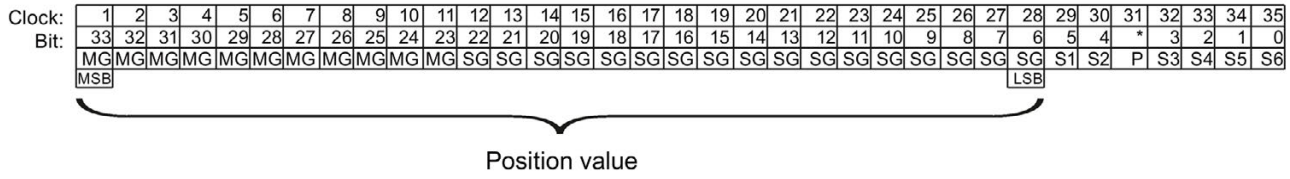
SD Singleturn bit as binary code

Example 2

In this example the SSI absolute encoder has the following specification:

- The encoder has a resolution of 17 bits per revolution and a value range of 11 bits of revolutions. The SSI frame has a length of34 bits.
- The MSB of the position value is bit 33.
- The LSB of the position value is bit 6.
- The position value is Gray coded.
- The SSI frame has six special bits.
- A parity bit is available. A parity bit does not count in the frame length.

The frame has the following format:



MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Sn Special bit n

P Parity bit

Complete SSI frame

If you configure "Complete SSI frame", the technology module returns the least significant 32 bits of the SSI frame as an unprocessed bit string. The technology module returns the bit following the LSB as parity bit. In this example, the technology module therefore returns only the least significant 31 bits of the SSI frame. With the complete SSI frame, you can evaluate the additional special bits in your application.

The returned bit string is structured as follows:

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Sn Special bit n

P Parity bit

Position value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface: The special bits are ignored in this case. The parity bit is evaluated but is not returned with the position value:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD

MD Multiturn bit as binary code

SD Singleturn bit as binary code

4.5 Programming the SSI_Absolute_Encoder

4.5.1 Instruction SSI_Absolute_Encoder

SSI_Absolute_Encoder

The SSI_Absolute_Encoder instruction is part of the SSI_Absolute_Encoder technology object. It supplies the control and feedback interface of the TM PosInput technology module.

The SSI_Absolute_Encoder instruction thereby forms the software interface between the user program and the technology module. It must be called cyclically from the user program in order to synchronize the input and output data.

The SSI_Absolute_Encoder instruction can be used for the TM PosInput of both the S7-1500 and ET 200SP systems alike. The TM PosInput modules can be used centrally and decentrally. The instruction applies in each case to the channel of the technology module that was assigned to the associated technology object.

Additional information

DescriptionSSI_Absolute_Encoder (Page 155)

Input parameter SSI_Absolute_Encoder (Page 158)

Output parameter SSI_Absolute_Encoder (Page 159)

Error codes of parameter ErrorID (Page 161)

Static tags SSI_Absolute_Encoder (Page 162)

4.5.2 Call instruction in the user program

The SSI_Absolute_Encoder instruction can be called once per channel, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the OB for cyclic program execution.
   The block is opened in the work area.
4. In the "Instructions" window, open the "Technology" group and the "Counting and measurement" folder.
   The instructions are located in the folder.
5. Select an instruction and drag it to your OB.
   The "Call options" dialog opens.
6. Select a technology object from the "Name" list or enter the name for a new technology object.
7. Confirm with "OK".

Result

If the technology object does not exist yet, it is added. The instruction is added in the OB. The technology object is assigned to this call of the instruction.

Note

If you click one of the buttons "Configuration", "Commissioning" or "Diagnostics" in the user interface of the instruction, the respective editor opens.

4.5.3 DescriptionSSI_Absolute_Encoder

Description

The SSI_Absolute_Encoder instruction is used to control the position input and measuring functions of the technology module TM PosInput via the user program.

Call

The instruction must be called once per channel, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Operating principle

Position value: The position value is available at the output parameter PositionValue. The position value is updated every time the instruction is called.

Measured value: The technology module updates the measured value asynchronously to the instruction call based on the configured update time. The measured value last determined by the technology module is updated at the output parameter MeasuredValue each time the instruction is called.

Measured value and position value are available in parallel as output parameters.

Instead of a measured value, the complete SSI frame can be returned at the output parameter CompleteSSIFrame. Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment.

Capture: The output parameter CaptureStatus = TRUE indicates a valid Capture value at the output parameter CapturedValue.

- A Capture value is captured under the following conditions:
  - A digital input has the parameter assignment "Capture"
  - CaptureEnable = TRUE
  - Edge at digital input with the Capture function
- The output parameter CaptureStatus is reset by a negative edge at the input parameter CaptureEnable.

Parameter changes via the user program

Proceed as follows to modify parameters using the user program:

1. Check the relevant Set tag to establish whether the technology object is ready for the parameter change (Set tag = FALSE) or whether a change job is still running (Set tag = TRUE).
   The following Set tags in UserCmdFlags are available for this in the static tags of the technology object instance DB:
   - SetReferenceValue0
   - SetReferenceValue1
2. If the technology object is ready for the parameter change, modify the relevant static tag.
   The following static tags of the technology object instance DB are available for this:
   - NewReferenceValue0 / NewReferenceValue0_M (for SetReferenceValue0)
   - NewReferenceValue1 / NewReferenceValue1_M (for SetReferenceValue1)
3. Set the relevant Set tag for execution of the change job.
4. Use the output parameter Error to check whether an error has occurred.
   If no errors have occurred and the Set tag has been automatically reset by the technology object, the parameter change was successful.

Operating mode

Configure the operating mode in the technology object under "Behavior of DQ0".

The operating mode is indicated by the output parameters CompareMeasuredValue:

State	Description
FALSE	Operating mode "Use position value (SSI absolute value) as reference": The comparison functions work with the position value. The following static variables are specifically used in this operating mode: • NewReferenceValue0 • NewReferenceValue1 • CurReferenceValue0 • CurReferenceValue1 The four specific static variables of operating mode "Use measured value as reference" are ignored.
TRUE	Operating mode "Use measured value as reference": The comparison functions work with the measured value. The following static variables are specifically used in this operating mode: • NewReferenceValue0_M • NewReferenceValue1_M • CurReferenceValue0_M • CurReferenceValue1_M The four specific static tags of operating mode "Use position value (SSI absolute value) as reference" are ignored.

Acknowledgment of events

You acknowledge signaled events using the positive edge of the input parameter EventAck . EventAck must stay set until the technology object has reset the status bits of the following events of the count channel:

- CompResult0
- CompResult1
- ZeroStatus
- PosOverflow
- NegOverflow

Status of the digital inputs

You obtain the status of the digital inputs via the static tags StatusDI0 and StatusDI1.

Using digital outputs with user program

In the following cases you can set the digital outputs via the instruction:

Case	Description
The setting "Use by user program" is configured for "Set output".	The respective digital output DQM follows the value of SetDQm.
The setting "After set command from CPU until comp. value" is configured for "Set output".	The respective digital output DQm is set with a negative edge of SetDQm. DQm is reset when the position value corresponds to the comparison value or at a negative edge of SetDQm.
Set the respective static variable ManualCtrlDQm (temporary overwrite).	The respective digital output DQM follows the value of SetDQm.

Reaction to error

If an error has occurred during the call of the instruction or in the technology module, the output parameter Error is set. More detailed error information can be read at the output parameter ErrorID (Page 161).

Eliminate the cause of the error and acknowledge the error message by setting the input parameter ErrorAck. When no more errors are pending, the technology object resets the output parameter Error . No new error is signaled until you acknowledge the previous error.

4.5.4 Input parameter SSI_Absolute_Encoder

Parameter	Declaration	Data type	Default	Description
CaptureEnable	INPUT	BOOL	FALSE	Enable Capture function After the enable, a Capture event occurs at the next configured edge at the relevant digital input. A negative edge at CaptureEnable resets the output parameter CaptureStatus. A negative edge at CaptureEnable resets the enable even if no Capture event has occurred. Irrespective of CaptureEnable the last value is retained at the output parameter CapturedValue until the next Capture event.
ErrorAck	INPUT	BOOL	FALSE	A positive edge acknowledges the error status reported.
EventAck	INPUT	BOOL	FALSE	A positive edge resets the following output parameters: • CompResult0 • CompResult1 • ZeroStatus • PosOverflow • NegOverflow

4.5.5 Output parameter SSI_Absolute_Encoder

Parameter	Declaration	Data type	Default	Description
StatusHW	OUTPUT	BOOL	FALSE	Status bit technology module: The module is configured and ready for operation. The module data is valid.
StatusUp	OUTPUT	BOOL	FALSE	Status bit: Last position value has changed in the positive direction and took place no more than 0.5 s ago.
StatusDown	OUTPUT	BOOL	FALSE	Status bit: Last position value has changed in the negative direction and took place no more than 0.5 s ago.
CompResult0	OUTPUT	BOOL	FALSE	Status bit: Comparison event for DQ0 (change of state) occurs as a result of the selected comparison condition. The positive edge of the input parameter EventAck is used to reset CompResult0 .
CompResult1	OUTPUT	BOOL	FALSE	Status bit: Comparison event for DQ1 (change of state) occurs as a result of the selected comparison condition. The positive edge of the input parameter EventAck is used to reset CompResult1 .
CaptureStatus	OUTPUT	BOOL	FALSE	Status bit: Capture event occurred, the output parameter CapturedValue has a valid Capture value If the input parameter CaptureEnable is set, the configured edge sets the status bit CaptureStatus. at the respective digital input. You reset CaptureStatus using the negative edge of the input parameter CaptureEnable .
ZeroStatus	OUTPUT	BOOL	FALSE	Status bit: PositionValue has reached or exceeded the value "0" irrespective of the count direction. You reset ZeroStatus using the positive edge of the input parameter EventAck.
PosOverflow	OUTPUT	BOOL	FALSE	Status bit: PositionValue has exceeded the high limit of the position value range of the encoder in the positive direction. You reset PosOverflow using the positive edge of the input parameter EventAck.
NegOverflow	OUTPUT	BOOL	FALSE	Status bit: PositionValue has exceeded the low limit of the position value range of the encoder in the negative direction. You reset NegOverflow using the positive edge of the input parameter EventAck.
Error	OUTPUT	BOOL	FALSE	An error has occurred. Refer to the output parameter ErrorID for the cause of the error.
ErrorID	OUTPUT	WORD	0	The ErrorID (Page 161) parameter displays the number of the error message. ErrorID = 0000_H: There is no error.
PositionValue	OUTPUT	DINT	0	Current position value
CapturedValue	OUTPUT	DINT	0	The last acquired Capture value The value is retained until the next Capture event, irrespective of the input parameter CaptureEnable. If a new Capture event has occurred, CaptureStatus is set and is reset by you using the negative edge of the input parameter CaptureEnable .

Parameter	Declaration	Data type	Default	Description
MeasuredValue	OUTPUT	REAL	0.0	Current measured value for frequency, period duration or velocity (depending on configuration) Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment in the technology object under "Measured value".
CompleteSSIFrame	OUTPUT	DWORD	0	Last received complete SSI frame (least significant 32 bits) Either MeasuredValue or CompleteSSIFrame is valid, depending on the parameter assignment in the technology object under "Measured value".
CompareMeasuredValue	OUTPUT	BOOL	FALSE	Status bit: FALSE: Operating mode "Use position value (SSI absolute value) as reference"; position value is used as reference TRUE: Operating mode "Use measured value as reference"; measured value is used as reference

4.5.6 Error codes of parameter ErrorID

Error code (W#16#...)	**Description**
0000	No error
Error messages from technology module	
80A1	POWER_ERROR from feedback interface: Incorrect supply voltage L+
80A2	ENC_ERROR from feedback interface: Incorrect encoder signal
80A3	LD_ERROR from feedback interface: Error when loading via control interface
Error messages of the instruction SSI_Absolute_Encoder	
80B8	New comparison value 0 does not meet the following conditions: • Low counting limit <= comparison value 0 <= high counting limit • Comparison value 0 < comparison value 1
80B9	New comparison value 1 does not meet the following conditions: • Low counting limit <= comparison value 1 <= high counting limit • Comparison value 0 < comparison value 1
80C0	Instruction was called multiple times with the same instance (DB)
80C1	Communication with technology module failed (read data records): Error information of internal instruction RDREC saved in static tag AdditionalErrorID
80C2	Communication with technology module failed (write data records): Error information of internal instruction WRREC saved in static tag AdditionalErrorID
80C5	Reading of the current start information of the OB failed: Error information of internal instruction RD_SINFO saved in static tag AdditionalErrorID
80C6	Failed to get I/O addresses of the technology module: Error information of internal instruction RD_ADDR saved in static tag AdditionalErrorID

4.5.7 Static tags SSI_Absolute_Encoder

Tag		Data type	Default	Access	Description
NewReferenceValue0		DINT	L#0	Write	New comparison value 0 in position input mode
NewReferenceValue1		DINT	L#10	Write	New comparison value 1 in position input mode
NewReferenceValue0_M		REAL	L#0.0	Write	New comparison value 0 in measuring mode
NewReferenceValue1_M		REAL	L#10.0	Write	New comparison value 1 in measuring mode
CurReferenceValue0		DINT	L#0	Read	Current comparison value 0 in position input mode
CurReferenceValue1		DINT	L#10	Read	Current comparison value 1 in position input mode
CurReferenceValue0_M		REAL	L#0.0	Read	Current comparison value 0 in measuring mode
CurReferenceValue1_M		REAL	L#10.0	Read	Current comparison value 1 in measuring mode
AdditionalErrorID		DWORD	W#16#0000	Read	Error information of an internal instruction, e.g.,RDREC
UserCmdFlags		STRUCT	-		
	SetReferenceValue0	BOOL	FALSE	Write	Set comparison value 0
	SetReferenceValue1	BOOL	FALSE	Write	Set comparison value 1
	SetDQ0	BOOL	FALSE	Write	Set digital output DQ0
	SetDQ1	BOOL	FALSE	Write	Set digital output DQ1
	ManualCtrlDQ0	BOOL	FALSE	Write	Enable setting of digital output DQ0. TRUE: SetDQ0 sets DQ0[1] FALSE: Setting not enabled
	ManualCtrlDQ1	BOOL	FALSE	Write	Enable setting of digital output DQ1: TRUE: SetDQ1 sets DQ1[1] FALSE: Setting not enabled
UserStatusFlags		STRUCT	-		
	StatusDI0	BOOL	FALSE	Read	Current status of digital input DI0
	StatusDI1	BOOL	FALSE	Read	Current status of digital input DI1
	StatusDQ0	BOOL	FALSE	Read	Current status of digital output DQ0
	StatusDQ1	BOOL	FALSE	Read	Current status of digital output DQ1

[1] The instruction sets the TM_CTRL_DQm bit to FALSE. in the control interface of the module. The static tag SetDQm acts on the control bit SET_DQm.

4.6 Commissioning SSI_Absolute_Encoder

4.6.1 Commissioning the technology object

A graphic display of the block in the commissioning editor helps you with commissioning and the function test for the technology object. You can change specific parameters of the SSI_Absolute_Encoder instruction in CPU/IM online mode and monitor their effects.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The corresponding SSI_Absolute_Encoder instruction is called cyclically from the user program.
- The parameters of the technology object are not overwritten by the user program.

Procedure

To open the commissioning editor of a technology object and to simulate a parameter value change, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the SSI_Absolute_Encoder technology object in the project tree.
3. Double-click on the "Commissioning" object.
   The functions for commissioning the SSI_Absolute_Encoder technology object are displayed.
4. In the commissioning dialog, click on the "Monitor all" button.
   The parameters (online values) of the SSI_Absolute_Encoder technology object are loaded and displayed.
5. If the parameter you want to change has a text box, enter the new value there.
6. Select the check box of the parameter.
   The new parameter value becomes effective and the effects of the change are simulated.

Online mode

In online mode, you can modify the following parameters to test the technology object function:

- New comparison value 0 (NewReferenceValue0 or NewReferenceValue0_M)
- New comparison value 1 (NewReferenceValue1 or NewReferenceValue1_M)
- Enable Capture (CaptureEnable)
- Acknowledgment of signaled error states (ErrorAck)
- Resetting the status flag (EventAck)

4.7 SSI_Absolute_Encoder diagnostics

4.7.1 Monitoring counter values, measured values, DIs and DQs

The diagnostic functions are used to monitor the position input and measuring functions.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the display editor for the diagnostic functions, follow these steps:

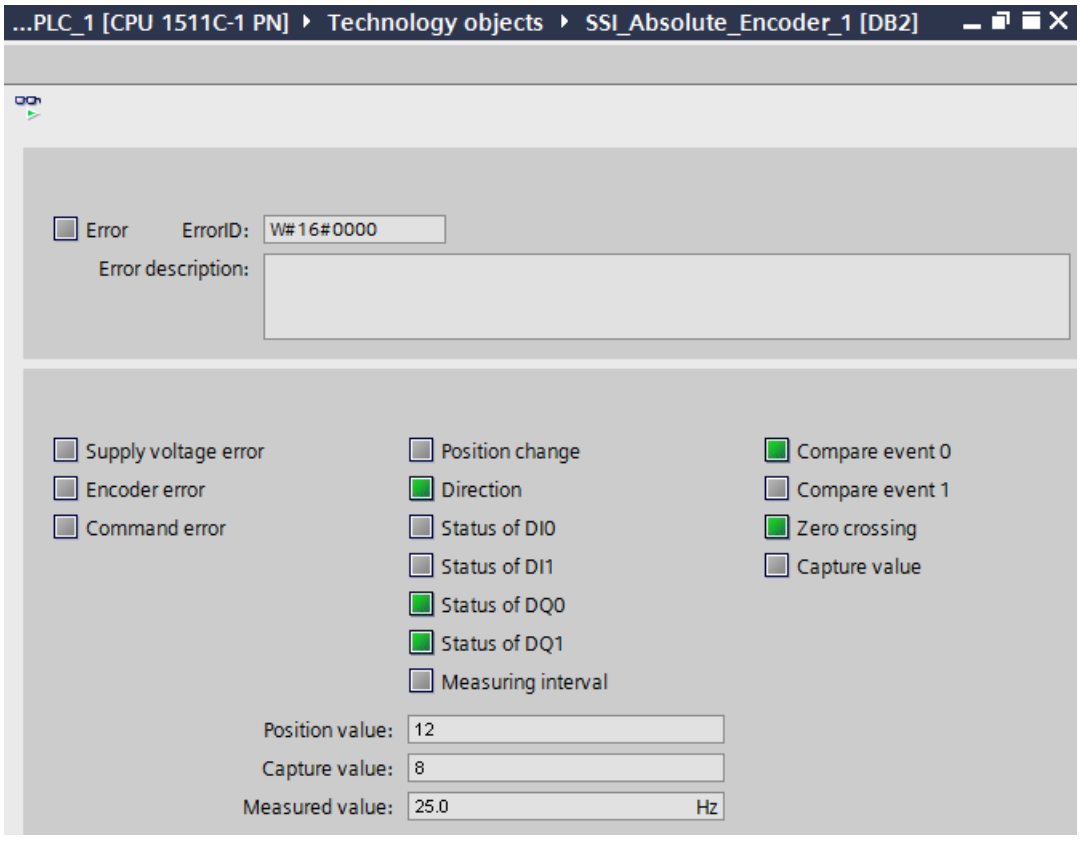
1. Open the "Technology objects" folder in the project tree.
2. Open the SSI_Absolute_Encoder technology object in the project tree.
3. Double-click on the "Diagnostics" object.

Display

The following values are read by the technology object from the feedback interface and displayed:

- Event display/diagnostics information
- Signal states of the digital inputs and digital outputs
- Position value
- Capture value
- Measured value

Additional information on status displays is available in the context-sensitive help for each event in STEP 7 (TIA Portal). When the CPU is in STOP, the status display is not updated.



Using the module

5

5.1 Using the technology module

5.1.1 Convention

Technology module: We use the term "technology module" in this documentation both for the technology modules TM Count and TM PosInput and the technology component of the compact CPUs.

5.1.2 Configuring a module

5.1.2.1 Adding a technology module for hardware configuration (TM Count and TM PosInput)

Requirement

A project with a CPU S7-1500 has been created.

Procedure

To add a technology module to the hardware configuration, proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the technology module from the module catalog:
   "Technology module > Counting or Position input > Technology module > Article number"
4. Drag the technology module to the required slot in the module rack.

Result

The new technology module is now displayed with the following objects under "Local modules" or "Distributed I/O" in the project tree. Double-click to open the required editor.

	Object	Description
①	Device configuration (Page 170)	In the Inspector window (per channel): • Setting the reaction to CPU STOP (Page 170) • Enable diagnostic interrupts (Page 171) • Setting the operating mode (Page 172) • Enable hardware interrupts (Page 175) • Setting the module addresses
②	Online & Diagnostics (Page 181)	• Hardware diagnostics • Obtain information on technology module • Run firmware update
③	Parameter (Page 180)	Display and, if applicable, parameter settings for the counting and measuring functions in the hardware configuration, if parameter assignment and control are not implemented using the technology object.

5.1.2.2 Adding a technology module to hardware configuration (Compact CPU)

Procedure

To add a Compact CPU to the project tree, follow these steps:

1. Double-click "Add new device".
   The "Add new object" dialog opens.
2. Select Controller".
3. Select the Compact CPU:
   "SIMATIC S7-1500 > CPU > Compact CPU > Article number"
4. Confirm with "OK".

Result

The new Compact CPU is displayed with the following objects in the project tree. Double-click to open the required editor.

	Object	Description
①	Device configuration (Page 170)	In the Inspector window (per channel): • Activation of the counter (Page 178) • Assign signals to inputs and outputs (Page 179) • Setting the reaction to CPU STOP (Page 170) • Enable diagnostic interrupts (Page 172) • Setting the operating mode (Page 172) • Enable hardware interrupts (Page 175) • Setting the module addresses
②	Online & Diagnostics (Page 181)	• Hardware diagnostics • Obtain information about the Compact CPU • Run firmware update
③	Parameter (Page 180)	Display and, if applicable, parameter settings for the counting and measuring functions in the hardware configuration, if parameter assignment and control are not implemented using the technology object.

5.1.2.3 Parameter assignment options

Counting, measuring and position input with SSI absolute encoder

For the counting and measuring function and the position input with an SSI absolute encoder, you have two options for parameter assignment and control of the technology module:

- Configuration of a technology object and control using the related instruction:

  When using an incremental or pulse encoder, we recommend the simple configuration with graphic support using thee High_Speed_Counter technology object. A detailed description of this configuration can be found in section High_Speed_Counter technology object (Page 90) and below.

  When using an SSI absolute value encoder, we recommend the simple configuration with graphic support using the SSI_Absolute_Encoder technology object. A detailed description of this configuration can be found in section AUTOHOTSPOT and below.

  For configuration of a technology object, select the operating mode (Page 172) "Operating with technology object".

- Parameter setting via hardware configuration (Page 180) and control via the control and feedback interface of the technology module:

  Select the operating mode (Page 172) "Manual operation" for this.

  A description of the control and feedback interface for TM Count and TM PosInput is available in the following sections:

  Assignment of the control interface (Page 182)

  Assignment of the feedback interface (Page 185)

Position input for Motion Control

Alternatively, you have the option of using the technology module for position input for Motion Control.

Select the operating mode (Page 172) "Position input for Motion Control" and assign the parameters of the encoder using themodule parameters (Page 173) in the device configuration of the technology module. You perform the rest of the configuration of this application using an axis technology object of S7-1500 Motion Control .

Feedback from the technology module is returned by means of the feedback interface.

5.1.2.4 Basic parameters

Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module for each channel to CPU STOP in the basic parameters of the device configuration.

Table 5- 1 Reaction of the technology module to CPU STOP depending on parameter assignment (by channel)

Basic parameters	Reaction to CPU STOP
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the actual position is read. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "In case of comparison value for a pulse duration" is set at CPU stop, the digital output is reset after expiry of pulse duration. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

Substitute value for DQ0 (TM Count und TM PosInput)

This parameter lets you specify which value the technology module is to output to the digital output DQ0 in the event of a CPU STOP under "Output substitute value".

Note

In "Operation with technology object" mode you define this parameter using the technology object.

Substitute value for DQ0 (Compact CPU)

You can use this parameter to specify the value to be output for a STOP of the Compact CPU in the feedback interface for DQ0 in the context of the "Substitute value for DQ0" behavior.

Note

In "Operation with technology object" mode, you can define this parameter using the technology object.

Substitute value for DQ1

This parameter lets you specify which value the technology module is to output to the digital output DQ1 in the event of a CPU STOP under "Output substitute value".

Note

In "Operation with technology object" mode you define this parameter using the technology object.

Diagnostic interrupts (TM Count and TM PosInput)

The technology module can trigger additional diagnostic interrupts when you enable the diagnostic interrupts in the basic parameters. These diagnostic interrupts are processed in an interrupt OB.

Enable diagnostic interrupt on wire break

You use this parameter to specify whether a diagnostic interrupt is to be triggered in the event of wire breaks of the utilized signals for the following encoders:

- Push-pull 24 V encoder (Page 65)
- RS422 encoder (Page 67) (also monitored for short-circuits and offset voltages)
- SSI absolute encoder (Page 69) (also monitored for short-circuits and faulty voltages)

Note

If you use an encoder with a different sensor type or interface standard, wire break cannot be detected.

Enable additional diagnostic interrupts

You use this parameter to specify whether diagnostic interrupts are to be triggered for additional errors.

See the device manual for the technology module to find out which errors during operation can trigger a diagnostic interrupt.

Diagnostics interrupts (Compact CPU)

Enable diagnostic interrupts

A Compact CPU can trigger diagnostic interrupts for certain faults if you have enabled diagnostic interrupts. These diagnostic interrupts are processed in an interrupt OB.

You use this parameter to determine if the Compact CPU should trigger diagnostic interrupts when a given error occurs.

See the device manual for the Compact CPU to find out which errors can trigger a diagnostic interrupt during operation. The diagnostic interrupts are not enabled in the default setting.

Operating mode

Selection of the operating mode for the channel

This setting defines how the channel counting and measuring functions are to be configured and controlled.

Operating mode	Description
Operating with technology object	A technology object is used for the parameter assignment of the channel. The related instruction in the user program provides the access to the control and feedback interfaces of the technology module. You specify the assignment between the technology module/channel and technology object in the basic parameters of the technology object.
Position input for Motion Control	The technology module is used for position input for a higher-level Motion Control controller. This operating mode effects all channels of the technology module for TM Count and TM PosInput. Setting the operating mode only effects the given channel of the Compact CPU. Parameter assignment is implemented via the Device configuration of the technology module. Parameter assignment of the encoder signals is implemented by means of the Module parameters (Page 173).
Manual operation	The channel is configured using the parameter setting (hardware configuration) (Page 180) of the technology module. You have direct access to the control and feedback interface of the channel through the user program.
Fast Mode	The technology module is used for very fast detection of the count or position value. No control interface is available. The parameter setting (hardware configuration) of the module is used for the parameter assignment of the channel. This operating mode is not supported by every technology module.

Selection of the operating mode for the channel

You use this parameter in "Manual operation" to specify the main task for which the channel of the technology module is used. This defines the setting options under "Parameters" (hardware configuration).

Operating mode	Description
Counting (Page 21) / Position input (Page 23)	The main function of the channel is counting or position input. The comparison functions and hardware interrupts work with the counter value or position value. The measured values are available concurrently.
Measuring (Page 53)	The main function of the channel is counting. The comparison functions (Page 51) and hardware interrupts for compare events work with the measured value. The counter value is available concurrently.

Module parameters (position input for Motion Control)

In the operating mode "Position input for Motion Control" mode, the parameters for the encoder signals of the channel are assigned under "Module parameters". The parameters depend on the encoder used.

Module parameters for incremental encoders and pulse encoders

If you use an incremental or pulse encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Signal evaluation
- Filter frequency
- Sensor type (for TM Count)
- Interface standard (for TM PosInput)
- Signal selection for reference mark 0
- Steps per revolution and
- Reference speed

You can find a description of the first six parameters in section AUTOHOTSPOT.

Module parameters for SSI absolute encoders

If you use an TM PosInput with an SSI absolute encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Frame length
- Code type
- Transmission rate
- Monoflop time
- Parity
- Bit number LSB of the position value
- Bit number MSB of the position value
- Steps per revolution and
- Reference speed

You can find additional information on the first new parameters in section AUTOHOTSPOT.

Signal selection for reference mark 0

You can use this parameter to specify the external reference signal upon which a new reference mark is saved for the encoder position.

You can select from the following options:

Option	Meaning
None[1]	No external reference signal is used.
DI0 (preset for TM Count and TM PosInput)	The current counter value is saved as the new encoder position reference mark upon a positive edge at digital input DI0.
Signal N of incremental encoder (default for Compact CPU[2])	The current counter value is saved as the new encoder position reference mark upon a positive edge of the signal N of incremental encoder.

1 Only available with Compact CPU

2 Exceptions: "DI0" is the default for HSC 3 and HSC 6 on the 1511C as well as on the 1512C in compatibility mode

Steps per revolution

When using an incremental encoder or pulse encoder, you specify the number of count pulses per encoder revolution with this parameter. When you use an SSI absolute encoder, you use this parameter to specify the number of increments the encoder delivers per revolution.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example of an incremental or pulse encoder:

Your incremental or pulse encoder delivers 2048 increments per revolution. Depending on the signal evaluation, you need to assign the following in this case:

Signal evaluation	Increments per unit
Single	2048
Double	4096
Quadruple	8192

Reference speed

The encoder transmits the process value of the speed as a percentage of the reference speed. This parameter defines the speed in rpm which is to be correspond to the value 100 % . The reference speed must be identical to the setting in the controller.

You can enter a value between 6.00 and 210000.00. The default setting is "3000.00".

Further configuring

You can perform additional configuration using an axis technology object of S7-1500 Motion Control . See the S7-1500 Motion Control (http://support.automation.siemens.com/WW/view/en/59381279) function manual for further details on configuring and commissioning position input.

Hardware interrupts

You can set for each channel the events which are to trigger a hardware interrupt during operation when assigning the basic parameters of the technology module.

In an S7-1500 system, you enter a matching event name for each enabled hardware interrupt and assign a corresponding hardware interrupt OB to each hardware interrupt. If a hardware interrupt is triggered, the corresponding OB is started to evaluate the hardware interrupt data.

A hardware interrupt is triggered if the condition for changing the respective status bit or event bit in the feedback interface is fulfilled.

Lost hardware interrupt

If an event occurs which is supposed to trigger a hardware interrupt but the previous, identical event has not yet been processed, no further hardware interrupt is triggered. The hardware interrupt is lost. This may lead to the "Hardware interrupt lost" diagnostic interrupt, depending on the parameter assignment.

Hardware interrupts that can be activated

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in position input for Motion Control mode	Description	EventType number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
New Capture value available	Yes	Yes	No	No	No	Hardware interrupt when current counter value or position value is saved as Capture value	8
Synchronization of the counter by an external signal	Yes	No	Yes	No	No	Hardware interrupt upon synchronization of the counter by signal N or DI edge	9
Gate start	Yes	No	Yes	No	No	Hardware interrupt when internal gate opens	1
Gate stop	Yes	No	Yes	No	No	Hardware interrupt when internal gate closes	2
Overflow (high counting limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value exceeds high counting limit	3
Underflow (low counting limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value falls below low counting limit	4
Direction reversal*	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt when counter value or position value changes direction	10
Zero crossing	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt with zero crossing of counter value or position value	7

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in position input for Motion Control mode	Description	EventType number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
Comparison event for DQ0 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ0 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	5
Comparison event for DQ1 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ1 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	6

* The feedback bit STS_DIR has the default value "0". A hardware interrupt is not triggered when the first change to the counter value or position value immediately after the technology module is switched on is in the down direction.

Default setting

No hardware interrupts are enabled in the default setting.

5.1.2.5 Additional parameters for Compact CPU

Introduction

When using a Compact CPU, the following parameters are additionally available for the signals of the high-speed counter.

Compatibility 1511C (high-speed counters of Compact CPU 1512C-1 PN)

Front connector assignment same as CPU 1511C

You can use this parameter to specify if the pin assignment for the front connector of the CPU 1511C-1 PN is to be used for the high-speed counter of the CPU 1512C-1 PN:

Option	Meaning
Disabled (default)	CPU 1512C-1 PN uses the pin assignment of the onboard front connector. 1512C-1 PN supports the use of the connections of both front connectors of the digital onboard I/Os for the high-speed counter. The assignment of hardware inputs and outputs for the HSC channels is described in the CPU 1512C-1 PN manual.
Enabled	CPU 1512C-1 PN uses the pin assignment of the front connector of the CPU 1511C-1 PN. 1511C-1 PN supports the use of the connections of the first front connector of the digital onboard I/Os for the high-speed counter. The assignment of hardware inputs and outputs for the HSC channels is described in the CPU 1511C-1 PN manual.

General

Activate this high-speed counter

You can use this parameter to specify whether the respective high speed counter is to be used:

Option	Meaning
Disabled (default)	The high-speed counter is not used. The counter uses no connections of the onboard front connector and can not trigger interrupts. Writing to its control interface is ignored and its feedback interface returns zero values.
Enabled	The high-speed counter is used. The assignment of HSC addresses to the connections of the onboard front connector is described in the device manual of the Compact CPU.

Hardware inputs/outputs

Clock generator input (A) / Pulse input (A) / Clock generator forward (A)

This parameter specifies which input is used for the encoder signal A for the respective counter. The value cannot be changed.

Clock generator input (B) / Pulse input (B) / Clock generator forward (B)

If you use an encoder with multiple signals for the respective counter, this parameter specifies which input is used for the encoder signal B. The value cannot be changed.

Reset input (N)

If you use an incremental encoder for the respective counter, this parameter specifies which input is used for the reset input (encoder signal N). The value cannot be changed.

HSC DI0 / HSC DI1

This parameter determines which digital input of the Compact CPU is to be used as the DIm of the counter.

Note

You can configure the input delay for a digital input in the Inspector window of the device configuration under "Properties > DI 16/DQ 16 > Inputs > Channel n".

HSC DQ0

You can read the status of the DQ0 via the feedback interface. You cannot assign DQ0 to a physical digital output of the Compact CPU.

HSC DQ1

This parameter determines which digital output of the Compact CPU is to be used as DQ1. You can select an output with an output delay of 5 µs or 500 µs.

You can find an overview of the output delay for all digital outputs in the device manual of the Compact CPU.

5.1.3 Parameter assignment of module

5.1.3.1 Parameter setting (hardware configuration) Opening (TM Count and TM PosInput)

Opening via the project tree

Proceed as follows:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Open the technology module in the project tree.
3. Double-click on the "Parameters" object.

Opening from the device view

Proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click on the technology module and select "Parameters".

5.1.3.2 Parameter setting (hardware configuration) Opening (Compact CPU)

Opening via the project tree

Proceed as follows:

1. Open the Compact CPU folder in the project tree.
2. Double-click on the "Parameters" object.

Opening from the device view

Proceed as follows:

1. Open the device configuration of the Compact CPU.
2. Select the device view.
3. Right-click on the CPU section of the Compact CPU and select "Parameters".

5.1.4 Online & diagnostics module

5.1.4.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the technology module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure (TM Count and TM PosInput)

To open the display editor for the diagnostic functions, follow these steps:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Open the technology module in the project tree.
3. Double-click on the "Online & diagnostics" object.
4. Select the required display in the diagnostics navigation.

Procedure (Compact CPU)

To open the display editor for the diagnostic functions, follow these steps:

1. Open the Compact CPU folder in the project tree.
2. Double-click on the "Online & diagnostics" object.
3. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the technology module device manual.

Note

Position input for Motion Control

In the operating mode "Position input for Motion Control", channel diagnostics is not available for the technology module.

5.1.5 Control and feedback interface (TM Count, TM PosInput)

Information on using the control and feedback interface can be found under Overview of application options (Page 18).

5.1.5.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface per channel

The following table shows control interface assignment:

Offset to the start address	Parameter	Meaning				
Bytes 0 to 3	Slot 0	Load value (significance of the value is specified in LD_SLOT_0)				
Bytes 4 to 7	Slot 1	Load value (significance of the value is specified in LD_SLOT_1)				
Byte 8	LD_SLOT_0*	Specifies the significance of the value in Slot 0				
		Bit 3	**Bit 2**	**Bit 1**	**Bit 0**	
		0	0	0	0	No action, idle
		0	0	0	1	Load count value (with incremental or pulse encoder)
		0	0	1	0	Reserve
		0	0	1	1	Load start value (with incremental or pulse encoder)
		0	1	0	0	Load comparison value 0
		0	1	0	1	Load comparison value 1
		0	1	1	0	Load low counter limit (with incremental or pulse encoder)
		0	1	1	1	Load high counter limit (with incremental or pulse encoder)
		1	0	0	0	Reserve
		to				
		1	1	1	1	

Offset to the start address	Parameter	Meaning				
Byte 8	LD_SLOT_1*	Specifies the significance of the value in Slot 1				
		Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	
		0	0	0	0	No action, idle
		0	0	0	1	Load count value (with incremental or pulse encoder)
		0	0	1	0	Reserve
		0	0	1	1	Load start value (with incremental or pulse encoder)
		0	1	0	0	Load comparison value 0
		0	1	0	1	Load comparison value 1
		0	1	1	0	Load low counting limit (with incremental or pulse encoder)
		0	1	1	1	Load high counting limit (with incremental or pulse encoder)
		1	0	0	0	Reserve
		to				
		1	1	1	1	
Byte 9	EN_CAPTURE	Bit 7: Capture function enable				
	EN_SYNC_DN	Bit 6: Enable downward synchronization (with incremental or pulse encoder)				
	EN_SYNC_UP	Bit 5: Enable upward synchronization (with incremental or pulse encoder)				
	SET_DQ1	Bit 4: Set DQ1				
	SET_DQ0	Bit 3: Set DQ0				
	TM_CTRL_DQ1	Bit 2: enable technological function DQ1				
	TM_CTRL_DQ0	Bit 1: Enable technological function DQ0				
	SW_GATE	Bit 0: Software gate (with incremental or pulse encoder)				
Byte 10	SET_DIR	Bit 7: Count direction (for encoders without direction signal)				
	–	Bits 2 to 6: Reserve; bits must be set to 0				
	RES_EVENT	Bit 1: Reset of saved events				
	RES_ERROR	Bit 0: Reset of saved error states				
Byte 11	–	Bits 0 to 7: Reserve; bits must be set to 0				

* If values are loaded simultaneously via LD_SLOT_0 and LD_SLOT_1, the first value is taken internally from Slot 0 and then the value from Slot 1 is taken. This may lead to unexpected intermediate states.

Notes on the control bits

Control bit	Notes
EN_CAPTURE	Use this bit to enable the Capture function. Resetting this bit resets a set EVENT_CAP in the feedback interface.
EN_SYNC_DN	Use this bit to enable the synchronization of the counter when counting in downward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
EN_SYNC_UP	Use this bit to enable the synchronization of the counter when counting in upward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
RES_EVENT	Use this bit to trigger the reset of the saved events in the EVENT_ZERO, EVENT_OFLW, EVENT_UFLW, EVENT_CMP0, EVENT_CMP1 feedback bits.
RES_ERROR	Use this bit to trigger the reset of the saved error states LD_ERROR and ENC_ERROR .
SET_DIR	Use this bit to specify the count direction for signal type "Pulse (A)". 0 means: Up 1 means: Down
SET_DQ0	Use this bit to set digital output DQ0 when TM_CTRL_DQ0 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ0 is effective regardless of TM_CTRL_DQ0 as long as the counter value is not equal to the comparison value.
SET_DQ1	Use this bit to set digital output DQ1 when TM_CTRL_DQ1 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ1 is effective regardless of TM_CTRL_DQ1 as long as the counter value is not equal to the comparison value.
SW_GATE	Use this bit to open and close the software gate when using an incremental encoder or pulse encoder. Together, the software gate and the hardware gate form the internal gate. The technology module only counts when the internal gate is open. 0 means: Software gate closed 1 means: Software gate open
TM_CTRL_DQ0	Use this bit to enable the technological function of digital output DQ0. 0 means: SET_DQ0 defines the state of DQ0 1 means: assigned function defines the state of DQ0
TM_CTRL_DQ1	Use this bit to enable the technological function of digital output DQ1. 0 means: SET_DQ1 defines the state of DQ1 1 means: assigned function defines the state of DQ1

5.1.5.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module via the feedback interface.

Feedback interface per channel

The following table shows the assignment of the feedback interface:

Offset to the start address	Parameter	Meaning
Bytes 0 to 3	COUNT_VALUE	DINT: Current counter value or position value
Bytes 4 to 7	CAPTURED_VALUE	DINT: The last acquired Capture value
Bytes 8 to 11	MEASURED_VALUE	REAL: Current measured value or DWORD: Full SSI frame
Byte 12	–	Bits 3 to 7: Reserve; set to 0
	LD_ERROR	Bit 2: Error when loading via control interface
	ENC_ERROR	Bit 1: Faulty encoder signal or SSI frame
	POWER_ERROR	Bit 0: S7-1500 module: Incorrect supply voltage L+ / ET 200SP module: Supply voltage L+ too low
Byte 13	–	Bits 6 to 7: Reserve; set to 0
	STS_SW_GATE	Bit 5: Software gate status (with incremental or pulse encoder)
	STS_READY	Bit 4: Technology module started up and configured
	LD_STS_SLOT_1	Bit 3: Load request for Slot 1 detected and executed (toggling)
	LD_STS_SLOT_0	Bit 2: Load request for Slot 0 detected and executed (toggling)
	RES_EVENT_ACK	Bit 1: Reset of event bits active
	–	Bit 0: Reserve; set to 0
Byte 14	STS_DI2	Bit 7: TM Count: Status DI2 / TM PosInput, Compact CPU: Reserve; set to 0
	STS_DI1	Bit 6: Status DI1
	STS_DI0	Bit 5: Status DI0
	STS_DQ1	Bit 4: Status DQ1
	STS_DQ0	Bit 3: Status DQ0
	STS_GATE	Bit 2: Internal gate status (with incremental or pulse encoder)
	STS_CNT	Bit 1: Count pulse or position value change detected within the last ca. 0.5 s
	STS_DIR	Bit 0: Direction of last counter value or position value change
Byte 15	STS_M_INTERVAL	Bit 7: Count pulse or position value change detected in previous measurement interval
	EVENT_CAP	Bit 6: Capture event occurred
	EVENT_SYNC	Bit 5: Synchronization has occurred (with incremental or pulse encoder)
	EVENT_CMP1	Bit 4: Comparison event for DQ1 has occurred
	EVENT_CMP0	Bit 3: Comparison event for DQ0 has occurred
	EVENT_OFLW	Bit 2: An overflow has occurred
	EVENT_UFLW	Bit 1: An underflow has occurred
	EVENT_ZERO	Bit 0: A zero pass has occurred

Notes on the feedback bits

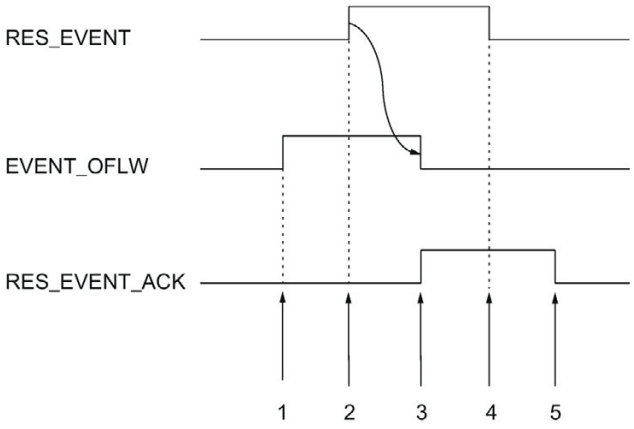
Feedback bit	Notes
ENC_ERROR	This bit indicates that one of the following errors has occurred at the encoder signals (retentive) for the respective technology module: TM Count: • Wire break of digital input A, B, or N (with push-pull encoder) • Invalid transition of A/B signals (with incremental encoder) TM PosInput: • Invalid transition of A/B signals (with incremental encoder) • RS422/TTL error • SSI encoder error or SSI frame error (with SSI absolute encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the manual for the respective technology module. The bit is reset once you have acknowledged the error with RES_ERROR .
EVENT_CAP	This bit indicates that a Capture event has occurred and a counter value has been saved in CAPTURED_VALUE . You reset the status by resetting EN_CAPTURE .
EVENT_CMP0	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ0 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP0 is not set.
EVENT_CMP1	This bit indicates the saved status that a comparison event (status change) has occurred for the digital output DQ1 based on the selected comparison condition. You reset the status by acknowledgment with RES_EVENT. If the counter value is set to the start value in counting mode, EVENT_CMP1 is not set.
EVENT_OFLW	This bit indicates the saved state which shows that there was a counter value overflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_SYNC	This bit indicates the saved status for which the counter was loaded with the start value by an external reference signal (synchronization) when using an incremental or pulse encoder. You reset the state by resetting EN_SYNC_UP or EN_SYNC_DN .
EVENT_UFLW	This bit indicates the saved state which shows that there was a counter value underflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_ZERO	This bit indicates the saved status with which the counter value or position value experienced a zero crossing. You reset the status by acknowledgment with RES_EVENT.
LD_ERROR	This bit indicates that an error occurred (latching) during loading via the control interface. The loaded values were not applied. When using an incremental or pulse encoder, one of the following conditions is not fulfilled: • Low counting limit <= counter value <= high counting limit • Low counting limit <= start value <= high counting limit • Low counting limit <= comparison value 0/1 <= high counting limit • Comparison value 0 < comparison value 1 When using an SSI absolute encoder, one of the following conditions is not fulfilled: • 0 <= position value <= maximum position value • 0 <= comparison value 0/1 <= maximum position value • Comparison value 0 < comparison value 1 The bit is reset once you have acknowledged the error with RES_ERROR .

Feedback bit	Notes
LD_STS_SLOT_0	This bit indicates by a status change (toggling) that the load request for Slot 0 (LD_SLOT_0) has been detected and executed.
LD_STS_SLOT_1	This bit indicates by a status change (toggling) that the load request for Slot 1 (LD_SLOT_1) has been detected and executed.
POWER_ERROR	For an S7-1500 technology module, this bit indicates that the supply voltage L+ is not available or too low or that the front plug is not plugged in. For an ET 200SP technology module, this bit indicates that the supply voltage L+ is too low. If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of errors in the supply voltage. For details on the diagnostic interrupts and the corrective measures they require, refer to the device manual for the respective technology module. If the supply voltage L+ is available at a sufficient level once again, POWER_ERROR is automatically set to 0.
RES_EVENT_ACK	This bit indicates that the reset of event bit EVENT_SYNC, EVENT_CMP0, EVENT_CMP1, EVENT_OFLW, EVENT_UFLW, EVENT_ZERO is active.
STS_CNT	This bit indicates that at least one count pulse or a position value change has occurred in the last ca. 0.5 s.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DI2	This bit indicates the status of digital input DI2 of the TM Count .
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. 0 means: Down 1 means: Up The LED stays illuminated for around 0.5 s after a standstill.
STS_DQ0	This bit indicates the status of digital output DQ0.
STS_DQ1	This bit indicates the status of digital output DQ1.
STS_GATE	This bit indicates the status of the internal gate when using an incremental or pulse encoder. 0 means: Gate closed 1 means: Gate open
STS_M_INTERVAL	This bit indicates that at least one count pulse or a position value change was detected in the previous measurement interval.
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.
STS_SW_GATE	This bit indicates the status of the software gate. 0 means: Gate closed 1 means: Gate open

Complete acknowledgment principle

Saving bits are acknowledged according to the complete acknowledgment principle.

The figure below shows an example of the sequence of the complete acknowledgment principle in the event of an overflow:



① The EVENT_OFLW feedback bit is set as a saving event upon overflow.
② You set the RES_EVENT control bit to trigger EVENT_OFLW reset.
③ The RES_EVENT_ACK feedback bit is set when reset of EVENT_OFLW is detected.
④ You then rest the control bit RES_EVENT .
⑤ The RES_EVENT_ACK feedback bit is reset.

5.2 Using the digital input module

5.2.1 Configuring and assigning parameters to the module

5.2.1.1 Adding a module to the hardware configuration

Requirements

- The project has been created.
- The CPU has been created.
- The ET 200 distributed I/O has been created.

Procedure

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the digital input module from the module catalog:
   "DI > Digital input module > Article number"
4. Drag the module to the required slot in the module rack.

Result

The new module is displayed under "Local modules" or "Distributed I/O" in the project tree.

5.2.1.2 Open hardware configuration

Opening via the project tree

Proceed as follows:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Double-click the module in the project tree.

Opening from the device view

Proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Click on the module.

5.2.1.3 Counting operating mode

In counting operating mode, you can set the following parameters for each channel.

Note

Some of the parameters and options are not available for all digital input modules. See the module's device manual for the associated parameters and options.

Channel enabled

You use this parameter to specify whether the respective channel is enabled or disabled.

Each channel is enabled by default.

Input delay

By configuring the input delay, you suppress signal errors at the digital inputs. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Isochronous configuration is only possible if there is an input delay of 0.05 ms configured for at least one channel. In isochronous mode, the feedback interface is updated at the time T_i (time for reading the input data).

You can select from the following options:

- 0.05 ms
- 0.1 ms
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms (default)
- 12.8 ms
- 20 ms

Note

If you select the "0.05 ms" option for the input delay, you have to use shielded cables for connection of the digital inputs.

Reaction to violation of a counting limit

The following behavior can be configured for Violation of the counter high limit in the upward direction or the counter low limit in the downward direction (Page 81):

Reaction	Meaning
Stop counting (default)	After a counting limit is violated, the internal gate is closed (automatic gate stop). As a result, the counting process is stopped and the module ignores any further counting signals. The counter value is set to the opposite counting limit. To restart counting, you must close and reopen the software/hardware gate.
Continue counting	After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

Edge selection

This parameter is used to specify which edge the respective counter counts:

Edge selection	Meaning
At rising edge (default)	The respective counter counts all rising edges at the digital input.
At falling edge	The respective counter counts all falling edges at the digital input.
At rising and falling edge	The respective counter counts all edges at the digital input.

Count direction

Use this parameter to specify the counting direction of the respective counter.

You can select from the following options:

- Up
- Down

Note

This parameter has no effect if the "Invert direction" option is selected in "Set function of DI".

Set output

Use this parameter to specify the Function (Page 85) that controls the STS_DQ feedback bit. You can use the STS_DQ reset bit in order to control a digital output module's digital output.

You can select from the following options:

Option	Meaning
Off (DQ = 0)	Regardless of the counter value, STS_DQ is permanently not set.
Off (DQ = 1)	Regardless of the counter value, STS_DQ is permanently set.
Between comparison value 0 and 1	STS_DQ is set if the counter value between comparison values 0 and 1.
Not between comparison value 0 and 1	STS_DQ is set if the counter value is outside the range between comparison values 0 and 1.
Between comparison value and counter high limit	STS_DQ is set if the counter value is between the comparison value and the counter high limit.
Between comparison value and counter low limit	STS_DQ is set if the counter value is between the comparison value and the counter low limit.

Setting function of the DI

Use this parameter to specify which function the respective digital input DI_{n+4} triggers.

You can select from the following options:

Option	Meaning
Digital input without function	No function is assigned to the respective digital input DI_{n+4}. The signal status of DI_{n+4} can be read by the CPU using the feedback interface.
Gate start/stop	Setting the respective digital input DI_{n+4} opens the hardware gate (Page 83) for DI_n. Resetting the respective digital input DI_{n+4} closes the hardware gate for DI_n.
Invert direction	The respective DI_{n+4} digital input reverses the counting direction at DI_n, in order to adjust it to the process. If DI_{n+4} is not set, DI_n counts up. If DI_{n+4} is set, DI_n counts down.

Note

If "Invert direction" is selected and the counting direction in the process changes, the counting edge is automatically adjusted (opposite edges).

High counting limit

You limit the counting range by setting the counter high limit. The maximum value for the counter high limit depends on the module:

High counting limit	DI 8x24VDC HS	DI 32x24VDC HF, DI 16x24VDC HF
Maximum value	2147483647 (2^{31}–1)	4294967295 (2^{32}–1)
Default	2147483647	4294967295

You must enter a value that lies above the counter low limit.

Counter low limit

You limit the counting range by setting the counter low limit. The minimum value for the counter low limit depends on the module:

Counter low limit	DI 8x24VDC HS	DI 32x24VDC HF, DI 16x24VDC HF
Minimum value	–2147483648 (–2^{31})	0 (not configurable)
Default	–2147483648	0

You must enter a value below the counter high limit.

Start value

By configuring the start value, you specify the value at which counting is to start. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Comparison value 0

By configuring a comparison value (Page 85), you specify the counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than or equal to the counter low limit and less than comparison value 1.

The default setting is "0".

Comparison value 1

By configuring the second comparison value (Page 85), you specify the additional counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than comparison value 0 and less than or equal to the counter high limit.

The default setting is "10".

Hardware interrupt: Comparison event for DQ occurred

This parameter specifies whether a hardware interrupt is generated when a comparison event occurs based on the comparison function that was selected under "Set output".

The hardware interrupt is not enabled in the default setting.

5.2.2 Online & diagnostics module

5.2.2.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure

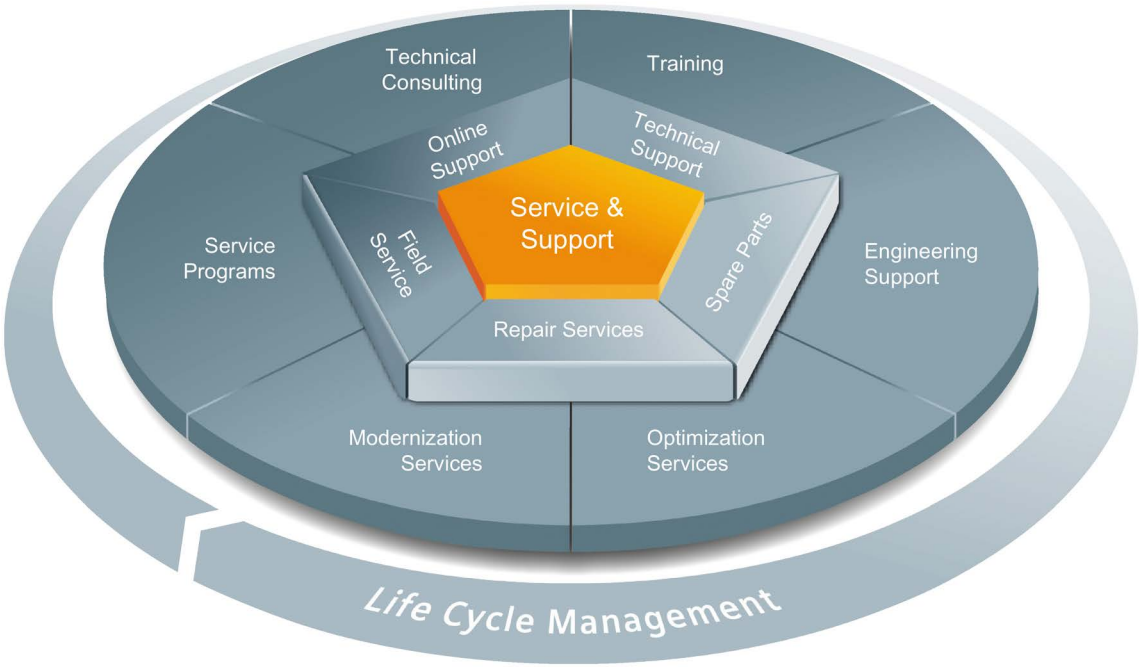
To open the display editor for the diagnostic functions, follow these steps:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click on the module and select "Online & Diagnostics".
4. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the module's device manual.

Service & Support



Unmatched complete service for the entire life cycle

For machine manufacturers, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address on the Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses at the following address on the Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are select service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a service program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Benefits at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products from Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet (http://www.siemens.com/automation/partner).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Important notes

Purpose of this documentation

The information in this documentation enables you to configure (Page 39) and program (Page 90) SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance (Page 308) of a SIMATIC Safety F-system.

Note

The Programming and Operating Manual "SIMATIC Safety - Configuring and Programming" in its latest version (possibly including product information for the manual) is the relevant source of all information on functional safety regarding configuring and programming. This also applies in the event of discrepancies between this manual and other documentation on functional safety regarding configuring and programming

You must heed all warnings in the Programming and Operating manual "SIMATIC Safety - Configuring and Programming".

Basic knowledge requirements

General basic knowledge of automation engineering is needed to understand this documentation. Basic knowledge of the following is also necessary:

- Fail-safe automation systems
- Automation systems S7-300/400/1200/1500/1500 Software Controller/WinAC RTX F
- Distributed I/O systems on PROFIBUS DP/PROFINET IO
- Totally Integrated Automation Portal, including:
  - Hardware configuration with the *hardware and network editor*
  - Programming in the LAD and FBD programming languages using the *program editor*.
  - Communication between CPUs

Scope of this documentation

This documentation is valid for the optional packages *STEP 7 Safety Advanced V14* and *STEP 7 Safety Basic V14*.

The optional packages *STEP 7 Safety Advanced V14* and *STEP 7 Safety Basic V14* are used for configuration and programming of the fail-safe SIMATIC Safety system.

In this context, integration of the fail-safe I/O listed below in SIMATIC Safety is also addressed:

- S7-1500/ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200eco fail-safe I/O modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules
- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- Fail-safe GSD based DP slaves
- Fail-safe GSD based I/O devices

Approvals

The SIMATIC Safety F-system is certified for use in safety mode up to:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Incorporation in the information landscape

Depending on your application, you will need the following supplementary documentation when working with *STEP 7 Safety*.

This documentation includes references to the supplementary documentation where appropriate.

Documentation	Brief description of relevant content
For the SIMATIC Safety F-system	Depending on which F-CPU you are using, you will need the following documentation: • For the F-CPUs S7-1200/1500, a Product Information (http://support.automation.siemens.com/WW/view/en/109478599) describes all deviations from the respective standard CPUs. • Each F-CPU S7-300/400 that can be used has its own product information. The product information describes the deviations from the respective standard CPUs. • The Device manuals (http://support.automation.siemens.com/WW/view/en/67295862/133300) describe the S7-1500 CPUs. • The "S7-300, CPU 31xC and CPU 31x: Installation" (http://support.automation.siemens.com/WW/view/en/13008499) operating instructions describe the installation and wiring of S7-300 systems. • The "CPU 31xC and CPU 31x, Technical Data" (http://support.automation.siemens.com/WW/view/en/12996906) device manual describes the CPUs 315-2 DP and PN/DP, the CPU 317-2 DP and PN/DP, and the CPU 319-3 PN/DP. • The "S7-400 Automation System, Installation (http://support.automation.siemens.com/WW/view/en/1117849) installation manual describes the installation and wiring of S7-400 systems. • The "S7-400 Automation System, CPU Data" (http://support.automation.siemens.com/WW/view/en/23904550) reference manual describes the CPUs 414-3 PN/DP, the CPU 416-2, and the CPU 416-3 PN/DP. • The "ET 200S Interface Module IM 151-7 CPU" (http://support.automation.siemens.com/WW/view/en/12714722) manual describes the IM 151-7 CPU. • The "ET 200S, Interface Module IM 151-8 PN/DP CPU" (http://support.automation.siemens.com/WW/view/en/47409312) manual describes the IM 151-8 PN/DP CPU. • The "ET 200S, Interface Module IM 154-8 CPU" (http://support.automation.siemens.com/WW/view/de/24363739/0/en) manual describes the IM 154-8 CPU. • The Manual "Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176)" describes the WinAC RTX 2010 and the WinAC RTX F 2010. • The "S7-1500 Software Controller CPU 1505SP, CPU 1507S (http://support.automation.siemens.com/WW/view/en/109249299)" manual describes the SIMATIC S7-1500 Software Controller 1505SP and CPU 1507S.

Documentation	Brief description of relevant content
"S7-1200 Functional Safety manual (http://support.automation.siemens.com/WW/view/en/104547552)" system manual	Describes the F-CPUs S7-1200 and the fail-safe modules S7-1200 (including installation, wiring, and technical specifications)
"S7-1500/ET200MP system manual (http://support.automation.siemens.com/WW/view/en/59191792)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/14141/man) for the corresponding S7-1500/ET 200MP fail-safe modules	Describes the hardware of the S7-1500 systems and the S7-1500/ET 200MP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)" system manual and the product manuals (https://support.industry.siemens.com/cs/ww/en/ps/14059/man) for the corresponding ET 200SP fail-safe modules	Describes the hardware of the ET 200SP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200eco Distributed I/O Station Fail-safe I/O Block (http://support.automation.siemens.com/WW/view/en/19033850)" manual	Describes the hardware of the ET 200eco fail-safe I/O module (including installation, wiring, and technical specifications)
"Distributed I/O System ET 200S, Fail-Safe Modules (http://support.automation.siemens.com/WW/view/en/27235629)" operating instructions	Describes the hardware of the ET 200S fail-safe modules (including installation, wiring, and technical specifications)
"S7-300 Automation System, ET 200M Distributed I/O System, Fail-safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151)" manual	Describes the hardware of the S7-300 fail-safe signal modules (including installation, wiring, and technical specifications)
"Distributed I/O system ET 200pro, fail-safe I/O modules (http://support.automation.siemens.com/WW/view/en/22098524)" operating instructions	Describes the hardware of the ET 200pro fail-safe modules (including installation, wiring, and technical specifications)
"ET 200iSP distributed I/O device - Fail-safe modules (http://support.automation.siemens.com/WW/view/en/47357221)" operating instructions	Describes the hardware of the ET 200iSP fail-safe modules (including installation, wiring, and technical specifications)
Online help for *STEP 7*	• Describes the operation of the standard tools in *STEP 7* • Contains information regarding configuration and parameter assignment of hardware • Contains a description of the FBD and LAD programming languages

The complete *SIMATIC S7* documentation is available on DVD. You can find more information on the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/manual-collection/Pages/Default.aspx).

Guide

This documentation describes how to work with the optional packages *STEP 7 Safety.* It includes instructions and reference sections (description of the instructions for the safety program).

The following topics are addressed:

- Configuration of SIMATIC Safety
- Access protection for SIMATIC Safety
- Programming of the safety program (safety-related user program)
- Safety-related communication
- Instructions for the safety program
- Support for the system acceptance
- Operation and maintenance of SIMATIC Safety
- Monitoring and response times

Conventions

In this documentation, the terms "safety engineering" and "fail-safe engineering" are used synonymously. The same applies to the terms "fail-safe" and "F-".

When *"STEP 7 Safety Advanced V14", "STEP 7 Safety Basic V14"* appears in italics, it refers to the optional package for the "SIMATIC Safety" F-system.

"STEP 7 Safety V14" stands for the optional package *"STEP 7 Safety Advanced V14"* and the optional package *"STEP 7 Safety Basic V14"*.

"(S7-300)" indicates that the section **only** applies to S7-300 F-CPUs. S7-300 F-CPUs also includes the F-CPUs ET 200S and ET 200pro (IM F-CPUs).

"(S7-400)" indicates that the section **only** applies to S7-400 as well as WinAC RTX F.

"(S7-1200)" indicates that the section **only** applies to S7-1200 F-CPUs.

"(S7-1500)" indicates that the section **only** applies to S7-1500 F-CPUs. S7-1500 F-CPUs also includes ET 200SP F-CPUs, the CPU 1516pro F-2 PN and the S7-1500 F Software Controller.

The scopes can be combined.

The term "Safety program" refers to the fail-safe portion of the user program and is used instead of "fail-safe user program," "F-program," etc. For purposes of contrast, the non-safety-related part of the user program is referred to as the "standard user program".

All fail-safe modules and instructions are highlighted in yellow to distinguish them from the modules and instructions of the standard user programs on the software interface (e.g., in the project tree). Similarly, the fail-safe parameters of F-CPUs and F-I/O are highlighted in yellow in the hardware configuration.

Each warning is marked with a unique number at the end of the text. This enables you to easily reference other documents, for example, to obtain an overview of the safety requirements for the system.

Additional support

If you have further questions about the use of products presented in this manual, contact your local Siemens representative.

You can find information on whom to contact on the Web (http://www.siemens.com/automation/partner).

A guide to the technical documentation for the various SIMATIC products and systems is available on the Web (http://www.siemens.com/simatic-tech-doku-portal).

You can find the online catalog and online ordering system on the Web (www.siemens.com/industrymall).

Training center

We offer courses to help you get started with the S7 automation system. Contact your regional training center or the central training center in Nuremberg (90327), Federal Republic of Germany.

You can find more information on the Internet (http://www.sitrain.com).

Technical Support

To contact Technical Support for all Industry Automation products, use the Support Request Web form (http://www.siemens.com/automation/support-request).

You can find additional information about our Technical Support on the Web (http://www.siemens.com/automation/service).

Important note for maintaining the operational safety of your system

Note

The operators of systems with safety-related characteristics must adhere to operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Log in in the Industry Online Support. Follow the links below and click on "Email on update" on the right-hand side in each case:

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit (http://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (http://www.siemens.com/industrialsecurity).

Siemens Industry Online Support

You can find current information on the following topics quickly and easily here:

- **Product support**

  All the information and extensive know-how on your product, technical specifications, FAQs, certificates, downloads, and manuals.

- **Application examples**

  Tools and examples to solve your automation tasks – as well as function blocks, performance information and videos.

- **Services**

  Information about Industry Services, Field Services, Technical Support, spare parts and training offers.

- **Forums**

  For answers and solutions concerning automation technology.

- **mySupport**

  Your personal working area in Industry Online Support for messages, support queries, and configurable documents.

This information is provided by the Siemens Industry Online Support in the Internet (http://www.siemens.com/automation/service&support).

Industry Mall

The Industry Mall is the catalog and order system of Siemens AG for automation and drive solutions on the basis of Totally Integrated Automation (TIA) and Totally Integrated Power (TIP).

Catalogs for all the products in automation and drives are available on the Internet (https://mall.industry.siemens.com).

Table of contents

Important notes **4**

1 Product Overview **21**

1.1 Overview 21

1.2 Hardware and Software Components 22

1.3 Installing/uninstalling the STEP 7 Safety Basic V14 optional package 27

1.4 Installing/uninstalling the STEP 7 Safety Advanced V14 optional package 28

1.5 Installing/uninstalling STEP 7 Safety PowerPack 29

1.6 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced 30

1.7 Migrating PLC programs to a n F-CPU S7-1500 33

1.8 Upgrading projects to STEP 7 Safety V14 34

1.8.1 Upgrading projects from STEP 7 Safety V13 SP1 to V14 34

1.8.2 Upgrading projects from STEP 7 Safety prior to V13 SP1 36

1.9 First steps 37

2 Configuring **39**

2.1 Overview of Configuration 39

2.2 Particularities for configuring the F-System 42

2.3 Configuring an F-CPU 44

2.4 Configuring F-I/O 49

2.5 Configuring shared device 52

2.6 Recommendation for PROFIsafe address assignment 53

2.7 Configurations supported by the SIMATIC Safety F-system 54

2.8 PROFIsafe addresses for F-I/O of PROFIsafe address type 1 56

2.9 PROFIsafe addresses for F-I/O of PROFIsafe address type 2 58

2.10 Setting the F-destination address for F-I/O with DIP switches 60

2.11 Assigning PROFIsafe address to fail-safe modules with SIMATIC Safety 60

2.11.1 Identifying F-modules 61

2.11.2 Assign PROFIsafe address 63

2.11.3 Assign PROFIsafe address to an F-module 63

2.11.4 Changing the PROFIsafe address 65

2.12 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices 65

3 Safety Administration Editor 68

3.1 Opening the Safety Administration Editor 70
3.2 "General" area 70
3.3 "F-blocks" area 73
3.4 "F-compliant PLC data types" area (S7-1200, S7-1500) 74
3.5 “Web server F-Admins” area (S7-1200, S7-1500) 75
3.6 "Settings" area 75

4 Access protection 80

4.1 Overview of access protection 81
4.2 Access protection for the safety program 83
4.3 Access protection for the F-CPU 86
4.4 Access protection through organizational measures 88

5 Programming 90

5.1 Overview of Programming 90
5.1.1 Program structure of the safety program (S7-300, S7-400) 91
5.1.2 Program structure of the safety program (S7-1200, S7-1500) 93
5.1.3 Fail-Safe Blocks 95
5.1.4 Restrictions in the programming languages FBD/LAD 97
5.1.5 F-compliant PLC data types (UDT) (S7-1200, S7-1500) 103
5.1.5.1 Grouping PLC tags for inputs and outputs of F-I/O in structures (S7-1200, S7-1500) 104
5.1.5.2 Example of structured PLC tags for inputs and outputs of F-I/O (S7-1200, S7-1500) 105
5.1.6 Editing PLC tags with external editors 108
5.1.7 Using Multiuser engineering 108

5.2 Defining F-Runtime Groups 109
5.2.1 Rules for F-Runtime Groups of the Safety Program 109
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400) 110
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500) 112
5.2.4 Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400) 115
5.2.5 F-shared DB (S7-300, S7-400) 118
5.2.6 F-runtime group information DB (S7-1200, S7-1500) 118
5.2.7 Deleting an F-runtime group 120
5.2.8 Changing the F-runtime group (S7-300, S7-400) 120
5.2.9 Changing the F-runtime group (S7-1200, S7-1500) 121

5.3 Creating F-blocks in FBD / LAD 122
5.3.1 Creating F-blocks 122
5.3.2 Know-how protection 123
5.3.3 Reuse of F-blocks 125

5.4 Programming startup protection 127

6 F-I/O access 128

6.1 Addressing F-I/O 128
6.2 Value status (S7-1200, S7-1500) 130
6.3 Process Data or Fail-Safe Values 133
6.4 F-I/O DB 135
6.4.1 Tags of the F-I/O DB 136
6.4.1.1 PASS_ON 137
6.4.1.2 ACK_NEC 138
6.4.1.3 ACK_REI 138
6.4.1.4 IPAR_EN 139
6.4.1.5 PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status 141
6.4.1.6 ACK_REQ 141
6.4.1.7 IPAR_OK 142
6.4.1.8 DIAG 143
6.4.2 Accessing tags of the F-I/O DB 144
6.5 Passivation and reintegration of F-I/O 145
6.5.1 After startup of F-system 145
6.5.2 After communication errors 148
6.5.3 After F-I/O or channel faults 150
6.5.4 Group passivation 154

7 Implementation of user acknowledgment 156

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller 156
7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device 162

8 Data exchange between standard user program and safety program 165

8.1 Data Transfer from the Safety Program to the Standard User Program 166
8.2 Data Transfer from Standard User Program to Safety Program 167

9 Safety-related communication 170

9.1 Configuring and programming communication (S7-300, S7-400) 170
9.1.1 Overview of communication 170
9.1.2 Safety-related IO controller-IO controller communication 173
9.1.2.1 Configure safety-related IO controller-IO controller communication 173
9.1.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP 177
9.1.2.3 Program safety-related IO controller-IO controller communication 178
9.1.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer 181
9.1.3 Safety-related master-master communication 182
9.1.3.1 Configure safety-related master-master communication 182
9.1.3.2 Safety-related master-master communication via SENDDP and RCVDP 187
9.1.3.3 Program safety-related master-master communication 187
9.1.3.4 Safety-related master-master communication:Limits for data transfer 190

9.1.4 Safety-related IO controller-I-device communication....191
9.1.4.1 Configuring safety-related communication between IO controller and I-device....191
9.1.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP....194
9.1.4.3 Programming safety-related IO controller I-device communication....195
9.1.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer....197
9.1.5 Safety-related master-I-slave communication....197
9.1.5.1 Configuring safety-related master-I-slave communication....197
9.1.5.2 Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP....200
9.1.5.3 Program the safety-related master-I-slave or I-slave-I-slave communication....201
9.1.5.4 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication....203
9.1.6 Safety-related I-slave-I-slave communication....204
9.1.6.1 Configure safety-related I-slave-I-slave communication....204
9.1.6.2 Safety-related I-slave-I-slave communication via SENDDP and RCVDP....208
9.1.6.3 Programming safety-related I-slave-I-slave communication....208
9.1.6.4 Limits for data transfer of safety-related I-slave-I-slave communication....208
9.1.7 Safety-Related I-Slave-Slave Communication....209
9.1.7.1 Configuring Safety-Related I-Slave-Slave Communication....209
9.1.7.2 Safety-Related I-Slave-Slave Communication - F-I/O Access....214
9.1.7.3 Limits for data transfer of safety-related I-slave-I-slave communication....214
9.1.8 Safety-related IO controller-I-slave communication....215
9.1.9 Safety-related communication via S7 connections....215
9.1.9.1 Configuring safety-related communication via S7 connections....215
9.1.9.2 Communication via SENDS7, RCVS7, and F-Communication DB....217
9.1.9.3 Programming safety-related communication via S7 connections....218
9.1.9.4 Safety-related communication via S7 connections - Limits of data transfer....222
9.1.10 Safety-related communication with S7 F-systems....222
9.1.10.1 Introduction....222
9.1.10.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)....223
9.1.10.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)....224
9.1.10.4 Communication with S7 Distributed Safety via S7 connections....225
9.1.10.5 Communication with S7 F/FH Systems via S7 connections....227

9.2 Configuring and programming communication (S7-1200, S7-1500)....229
9.2.1 Overview of communication....229
9.2.2 Safety-related IO controller-IO controller communication....231
9.2.2.1 Configure safety-related IO controller-IO controller communication....231
9.2.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP....236
9.2.2.3 Program safety-related IO controller-IO controller communication....237
9.2.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer....241
9.2.3 Safety-related master-master communication....241
9.2.3.1 Configure safety-related master-master communication....241
9.2.3.2 Safety-related master-master communication via SENDDP and RCVDP....246
9.2.3.3 Program safety-related master-master communication....247
9.2.3.4 Safety-related master-master communication:Limits for data transfer....251
9.2.4 Safety-related IO controller-I-device communication....251
9.2.4.1 Configuring safety-related communication between IO controller and I-device....251
9.2.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP....254
9.2.4.3 Programming safety-related IO controller I-device communication....255
9.2.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer....257

9.2.5 Safety-related master-I-slave communication ... 258
9.2.5.1 Configuring safety-related master-I-slave communication ... 258
9.2.5.2 Safety-related master-I-slave communication via SENDDP and RCVDP ... 261
9.2.5.3 Programming safety-related master-I-slave communication ... 261
9.2.5.4 Limits for data transfer of safety-related master-I-slave communication ... 264
9.2.6 Safety-related IO controller-I-slave communication ... 264
9.2.6.1 Safety-related IO controller-I-slave communication ... 264
9.2.7 Safety-related communication with S7 F-systems ... 265
9.2.7.1 Introduction ... 265
9.2.7.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication) ... 266
9.2.7.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication) ... 267
9.3 Configuring and programming communication between S7-300/400 and S7-1200/1500 F-CPUs ... 268
9.3.1 Overview of communication ... 268
10 Compiling and commissioning a safety program ... 269
10.1 Compiling the safety program ... 269
10.2 Safety program work memory requirements (S7-300, S7-400) ... 270
10.3 Downloading project data ... 271
10.3.1 Downloading project data to an F-CPU ... 271
10.3.1.1 Downloading project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card or flash card) ... 275
10.3.1.2 Downloading project data to an S7-400 F-CPU without flash card inserted ... 275
10.3.1.3 Downloading project data to a WinAC RTX F ... 276
10.3.1.4 Downloading individual F-blocks to an S7-300/400 F-CPU ... 276
10.3.1.5 Downloading project data to an S7-1200 F-CPU without program card inserted ... 277
10.3.1.6 Downloading project data to an S7-1200 F-CPU with program card inserted ... 278
10.3.1.7 Downloading project data to an S7-1500 F-CPU ... 279
10.3.1.8 Downloading project data to an S7-1500 F Software Controller ... 280
10.3.2 Downloading project data to a memory card and inserting a memory card ... 281
10.3.2.1 Inserting a SIMATIC Micro Memory Card or flash card into an S7-300/400 F-CPU ... 282
10.3.2.2 Inserting a transfer card into an S7-1200 F-CPU ... 283
10.3.3 Downloading project data of an S7-1200 F-CPU from the internal load memory to an empty SIMATIC Memory Card ... 284
10.3.4 Updating project data on an S7-1200 F-CPU using a transfer card ... 285
10.3.5 Restoring a backup of the safety program to an S7-300/1200/1500 F-CPU ... 285
10.3.6 Uploading project data from an F-CPU ... 286
10.4 Program identification ... 286
10.5 Comparing Safety Programs ... 289
10.6 Printing project data ... 291

10.7 Testing the safety program 293
10.7.1 Overview of Testing the Safety Program 293
10.7.2 Disabling safety mode 294
10.7.3 Testing the safety program 297
10.7.4 Testing the safety program with S7-PLCSIM 300
10.7.5 Changing the safety program in RUN mode (S7-300, S7-400) 302
10.7.6 Changing the standard user program in RUN mode (S7-1200, S7-1500) 305
10.7.7 Deleting the safety program 305
10.8 F-change history 307
11 System acceptance 308
11.1 Overview of System Acceptance 308
11.2 Correctness of the safety program including hardware configuration (including testing) 309
11.3 Completeness of the safety summary 310
11.4 Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate 311
11.5 Compliance of the know-how protected F-blocks used in the safety program with their safety documentation. 312
11.6 Completeness and correctness of the hardware configuration 314
11.7 Correctness of the communication configuration 320
11.8 Consistency of the online safety program 321
11.9 Other characteristics 322
11.10 Acceptance of Changes 323
12 Operation and Maintenance 326
12.1 Notes on Safety Mode of the Safety Program 326
12.2 Replacing Software and Hardware Components 328
12.3 Special features when creating and importing images of an S7-1500 F Software Controller 331
12.4 Guide to diagnostics (S7-300, S7-400) 332
12.5 Guide to diagnostics (S7-1500) 334
12.6 Guide to diagnostics (S7-1200) 334
13 STEP 7 Safety V14 instructions 335
13.1 General 335
13.1.1 LAD 335
13.1.1.1 New network (STEP 7 Safety V14) 335
13.1.1.2 Empty box (STEP 7 Safety V14) 336
13.1.1.3 Open branching (STEP 7 Safety V14) 337
13.1.1.4 Close branching (STEP 7 Safety V14) 338
13.1.2 FBD 339
13.1.2.1 New network (STEP 7 Safety V14) 339
13.1.2.2 Empty box (STEP 7 Safety V14) 339
13.1.2.3 Open branching (STEP 7 Safety V14) 340
13.1.2.4 Insert binary input (STEP 7 Safety V14) 340
13.1.2.5 Invert RLO (STEP 7 Safety V14) 341

13.2 Bit logic operations ... 342
13.2.1 LAD ... 342
13.2.1.1 ---| |---: NO contact (STEP 7 Safety V14) ... 342
13.2.1.2 ---| / |---: NC contact (STEP 7 Safety V14) ... 343
13.2.1.3 --|NOT|--: Invert RLO (STEP 7 Safety V14) ... 344
13.2.1.4 ---( )---: Assignment (STEP 7 Safety V14) ... 344
13.2.1.5 ---(R)---: Reset output (STEP 7 Safety V14) ... 345
13.2.1.6 ---(S)---: Set output (STEP 7 Safety V14) ... 346
13.2.1.7 SR: Set/reset flip-flop (STEP 7 Safety V14) ... 348

13.3.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V14) (S7-300, S7-400) ... 379
13.3.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V14) ... 382
13.3.4 MUTING: Muting (STEP 7 Safety Advanced V14) (S7-300, S7-400) ... 388
13.3.5 MUT_P: Parallel muting (STEP 7 Safety V14) ... 399
13.3.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V14) ... 410
13.3.7 FDBACK: Feedback monitoring (STEP 7 Safety V14) ... 419
13.3.8 SFDOOR: Safety door monitoring (STEP 7 Safety V14) ... 426
13.3.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V14) ... 432

13.4 Timer operations ... 434
13.4.1 TP: Generate pulse (STEP 7 Safety V14) ... 434
13.4.2 TON: Generate on-delay (STEP 7 Safety V14) ... 439
13.4.3 TOF: Generate off-delay (STEP 7 Safety V14) ... 444

13.5 Counter operations ... 449
13.5.1 CTU: Count up (STEP 7 Safety V14) ... 449
13.5.2 CTD: Count down (STEP 7 Safety V14) ... 451
13.5.3 CTUD: Count up and down (STEP 7 Safety V14) ... 453

13.6 Comparator operations 456
13.6.1 CMP ==: Equal (STEP 7 Safety V14) 456
13.6.2 CMP <>: Not equal (STEP 7 Safety V14) 457
13.6.3 CMP >=: Greater or equal (STEP 7 Safety V14) 458
13.6.4 CMP <=: Less or equal (STEP 7 Safety V14) 459
13.6.5 CMP >: Greater than (STEP 7 Safety V14) 461
13.6.6 CMP <: Less than (STEP 7 Safety V14) 462

13.7 Math functions 463
13.7.1 ADD: Add (STEP 7 Safety V14) 463
13.7.2 SUB: Subtract (STEP 7 Safety V14) 465
13.7.3 MUL: Multiply (STEP 7 Safety V14) 467
13.7.4 DIV: Divide (STEP 7 Safety V14) 469
13.7.5 NEG: Create twos complement (STEP 7 Safety V14) 471

13.8 Move operations 473
13.8.1 MOVE: Move value (STEP 7 Safety V14) 473
13.8.2 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety V14) (S7-300, S7-400) 474
13.8.3 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V14) (S7-300, S7-400) 476

13.9 Conversion operations 478
13.9.1 CONVERT: Convert value (STEP 7 Safety V14) 478
13.9.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V14) 479
13.9.3 W_BO: Convert a data element of data type WORD to 16 data elements of data type BOOL (STEP 7 Safety V14) 481
13.9.4 SCALE: Scale values (STEP 7 Safety Advanced V14) 483

13.10 Program control operations 486
13.10.1 JMP: Jump if RLO = 1 (STEP 7 Safety V14) 486
13.10.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V14) 488
13.10.3 LABEL: Jump label (STEP 7 Safety V14) 490
13.10.4 RET: Return (STEP 7 Safety V14) 491
13.10.5 OPN: Open global data block (STEP 7 Safety Advanced V14) (S7-300, S7-400) 492

13.11 Word logic operations 494
13.11.1 AND: AND logic operation (STEP 7 Safety V14) 494
13.11.2 OR: OR logic operation (STEP 7 Safety V14) 495
13.11.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V14) 497

13.12 Shift and rotate 498
13.12.1 SHR: Shift right (STEP 7 Safety V14) 498
13.12.2 SHL: Shift left (STEP 7 Safety V14) 501

13.13 Operating 503
13.13.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V14) 503

13.14 Additional instructions 511
13.14.1 LAD 511
13.14.1.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) 511
13.14.1.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) 512
13.14.2 FBD 514
13.14.2.1 OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) 514

13.15 Communication 515
13.15.1 PROFIBUS/PROFINET 515
13.15.1.1 SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) 515
13.15.2 S7 communication 523
13.15.2.1 SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V14) (S7-300, S7-400) 523

A Monitoring and response times 530

A.1 Configuring monitoring times 531
A.1.1 Minimum monitoring time for the F-runtime group cycle time 532
A.1.2 Minimum monitoring time for safety-related communication between F-CPU and F-I/O 533
A.1.3 Minimum monitoring time of safety-related CPU-CPU communication 534
A.1.4 Monitoring time for safety-related communication between F-runtime groups (S7-300, S7-400) 535

A.2 Response Times of Safety Functions 535

B Checklist 536

Glossary 542

Index 554

Product Overview

1

1.1 Overview

SIMATIC Safety fail-safe system

The SIMATIC Safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency STOP devices for machining and processing equipment) and in the process industry (for example, for implementation of protection functions for safety devices of instrumentation and controls and of burners).

⚠ WARNING

The SIMATIC Safety F-system is used to control processes and to force the system into a safe state after shutdown.

SIMATIC Safety can only be used for controlling processes in which an immediate shutdown does not pose a danger to persons or the environment.*(S062)*

Achievable safety requirements

SIMATIC Safety F-systems can satisfy the following safety requirements:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

Principles of safety functions in SIMATIC Safety

Functional safety is implemented principally through safety functions in the software. Safety functions are executed by the SIMATIC Safety system in order to bring the system to a safe state or maintain it in a safe state in case of a dangerous event. Safety functions are contained mainly in the following components:

- In the safety-related user program (safety program) in the F-CPU
- In the fail-safe inputs and outputs (F-I/O)

The F-I/O ensure the safe processing of field information (sensors: e.g. emergency STOP pushbutton, light barriers; actuators, e.g. for motor control). They have all of the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level. The user only has to program the user safety function. The safety function for the process can be provided through a user safety function or a fault reaction function. In the event of an error, if the F-system can no longer execute its actual user safety function, it executes the fault reaction function; for example, the associated outputs are shut down, and the F-CPU switches to STOP mode, if necessary.

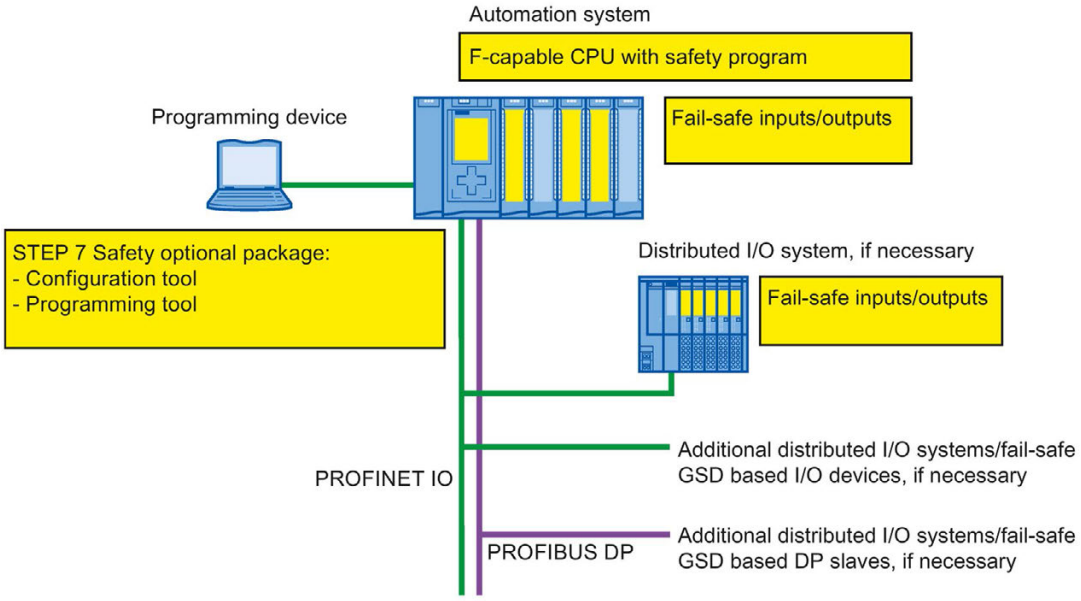
Example of user safety function and fault reaction function

In the event of overpressure, the F-system will open a valve (user safety function). In the event of a dangerous malfunction of the F-CPU, all outputs are shut down (fault reaction function). This means that the valve opens in the event of overpressure and the other actuators also switch to safe mode. For a non-faulty F-system, only the valve would be opened.

1.2 Hardware and Software Components

Hardware and software components of SIMATIC Safety

The following figure provides an overview of the hardware and software components required to configure and operate a SIMATIC Safety F-system.



Hardware components for PROFIBUS DP

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFIBUS DP:

- F-CPUs with DP interface, such as CPU 1516F-3 PN/DP
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe I/O modules ET 200eco (S7-300, S7-400)
  - Fail-safe GSD based DP slaves (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFIBUS DP for connection to distributed F-I/O:

- CP 443-5 Extended
- CM 1243-5
- CM 1542-5
- CP 1542-5
- SP CM DP

Hardware components for PROFINET IO

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFINET IO:

- F-CPUs with PN interface, e.g., CPU 1214FC DC/DC/DC
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - S7-1500/ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe GSD based I/O devices (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFINET IO for connection to distributed F-I/O:

- CP 443-1
- CP 443-1 Advanced-IT
- CM 1542-1

Hardware components for central configuration

You can use the following fail-safe components in SIMATIC Safety F-systems centrally on an F-CPU:

- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- S7-1500 fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules (can also be used with CPU 1516proF-2)

You have the option to expand the configuration with standard I/O.

Required software components

You require the following software components:

- *SIMATIC STEP 7 Basic V14* with the *STEP 7 Safety Basic V14* optional package

  or

- *SIMATIC STEP 7 Professional V14* with the *STEP 7 Safety Basic V14* optional package

  or

- *SIMATIC STEP 7 Professional V14* with the *STEP 7 Safety Advanced V14* optional package

STEP 7 Safety optional packages

This documentation describes the optional packages *STEP 7 Safety Advanced V14* and *STEP 7 Safety Basic V14*. The *STEP 7 Safety* optional packages are the configuration and programming software for the SIMATIC Safety F-system. With *STEP 7 Safety*, you receive the following:

- Support for configuring the F-I/O in the *hardware and network editor* of the TIA Portal
- Support for creating the safety program using LAD and FBD and integrating error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your safety program in LAD and FBD with special safety functions

Moreover, *STEP 7 Safety* offers functions for comparing safety programs and for assisting you with the system acceptance.

⚠ WARNING

The F-CPU and F-I/O must be configured in the *hardware and network editor* of the TIA Portal as described in this documentation. F-blocks must be created with the *program editor* of the TIA Portal as described in this documentation. For system acceptance, you have to use the safety summary created according to this documentation. Any other procedures are not permitted. *(S056)*

Additional optional packages

In addition to the *STEP 7 Safety* optional packages, you can use additional optional packages with F-I/O and F-CPUs and use instructions for programming your safety program with special safety functions within the SIMATIC Safety F-system. For example, SINUMERIK or Failsafe HMI Mobile Panels.

The installation, parameter assignment and programming as well as what is important to note during system acceptance, is described in the documentation for the specific optional packages.

Please also read the notes in Configurations supported by the SIMATIC Safety F-system (Page 54).

TIA Portal Cloud Connector

⚠ WARNING

Use of the TIA Portal Cloud Connector is only intended for engineering work with the TIA Portal. This means online access in productive operation (e.g. SCADA) is not permitted. This is particularly true for safety programs. *(S068)*

Openness

In *STEP 7 Safety*, as in the standard version, you can use the Openness set of commands. Requirement for this is that no password is created for the safety-related project data. The use of Openness in productive operation is not permitted.

⚠ WARNING

Also when using Openness, you must recognize and document the correctness of the security-related project data provided via Openness (e.g. F-blocks) on the basis of the safety summary. *(S070)*

Virtual environments

⚠ WARNING

Use of virtual environments in the engineering system

Note that a HYPERVISOR or a client software of a HYPERVISOR is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior in the network with accessible systems.

Make sure that this condition is met, for example, when using the following functions:

- Reset of captured statuses (snapshots) of the virtual machines (VMs)
- Suspending and resuming the virtual machines
- Replay of recorded sequences in the virtual machines
- Moving VMs between hosts in productive operation (e.g. Fault Tolerance (FT))
- Digital twins of VMs in the virtual environment

If in doubt, disable these functions in the settings (HYPERVISOR administration console). *(S067)*

Safety program

You can create a safety program using the *program editor*. You can program fail-safe FBs and FCs in the FBD or LAD programming languages using the instructions from the optional package and create fail-safe DBs.

Safety checks are automatically performed and additional fail-safe blocks for error detection and fault reaction are inserted when the safety program is compiled. This ensures that failures and errors are detected and appropriate reactions are triggered to maintain the F-system in the safe state or bring it to a safe state.

In addition to the safety program, a standard user program can be run on the F-CPU. A standard program can coexist with a safety program in an F-CPU because the safety-related data of the safety program are protected from being affected unintentionally by data of the standard user program.

Data can be exchanged between the safety program and the standard user program in the F-CPU by means of bit memory or data of a standard DB or by accessing the process image input and output.

See also

Data Transfer from the Safety Program to the Standard User Program (Page 166)

1.3 Installing/uninstalling the STEP 7 Safety Basic V14 optional package

Software requirements for *STEP 7 Safety Basic V14*

At a minimum, one of the following software packages must be installed on the programming device or PC:

- *SIMATIC STEP 7 Basic V14*
- *SIMATIC STEP 7 Professional V14*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Basic V14*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Basic V14"* or *"SIMATIC STEP 7 Professional V14*" software package has been installed, and make sure that *SIMATIC STEP 7 Basic V14 or SIMATIC STEP 7 Professional V14* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Basic V14* is completely integrated into the information system of *SIMATIC STEP 7 Basic V14 or SIMATIC STEP 7 Professional V14*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Basic V14*

To uninstall *STEP 7 Safety Basic V14*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Basic V14* optional package, you can still open projects with F-CPUs whose F-capability is enabled but you can no longer edit the safety program. F-I/O is no longer supported.

1.4 Installing/uninstalling the STEP 7 Safety Advanced V14 optional package

Software requirements for *STEP 7 Safety Advanced V14*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Professional V14*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Advanced V14*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Professional V14"* software package has been installed, and make sure that *SIMATIC STEP 7 Professional V14* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Advanced V14* is completely integrated into the information system of *SIMATIC STEP 7 Professional V14*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Advanced V14*

To uninstall *STEP 7 Safety Advanced V14*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Advanced V14* optional package, you can still open projects with F-CPUs whose F-capability is enabled but you can no longer edit the safety program. F-I/O is no longer supported

1.5 Installing/uninstalling STEP 7 Safety PowerPack

After the installation of the *STEP 7 Safety PowerPack* the functional scope of *STEP 7 Safety Advanced V14* is available to you.

Software requirements for *STEP 7 Safety PowerPack*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Safety Basic V14*
- *SIMATIC STEP 7 Professional V14*

Installing *STEP 7 Safety PowerPack*

1. Start the *Automation License Manager* on the programming device/PC on which the *"SIMATIC STEP 7 Professional V14"* software package is installed.
2. Install the license included in the *STEP 7 Safety PowerPack* as described in the *Automation License Manager help*.

Uninstalling *STEP 7 Safety PowerPack*

To uninstall the license included in the *STEP 7 Safety PowerPack*, proceed as described in the *Automation License Manager help*.

1.6 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced

Introduction

In *STEP 7 Safety Advanced*, you can continue to use projects with safety programs that you created with *S7 Distributed Safety V5.4 SP5*.

Requirement

STEP 7 Safety Advanced, *S7 Distributed Safety V5.4 SP5*, and the *F-Configuration Pack* used to create the project must all be installed on the computer you are using for migration. The *F-Configuration Pack V5.4 SP5* to *V5.5 SP12* is supported.

To that end, the projects must have been compiled in *S7 Distributed Safety V5.4 SP5* and with the *F-Configuration Pack*.

Prior to migration

Delete all F-blocks not required by the safety program in your *S7 Distributed Safety V5.4 SP5* project prior to migration.

Procedure as in *STEP 7 Professional*

Proceed just as you would for standard projects to migrate projects from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced*. Once the migration is complete, you should verify using the collective F-signature whether the project was migrated unchanged.

Note

If you use the safety program to migrate F-blocks with know-how protection, remove the know-how protection prior to migration.

You can assign the F-blocks know-how protection again once the migration is completed.

This migration approach is described in the "Migration" section of the *STEP 7 Professional* Help. Special considerations about *STEP 7 Safety Advanced* are described below.

Note

We recommend that you enable the "Include hardware configuration" option in the "Migrating project" window.

Older hardware versions

Older versions of F-hardware may not be supported by *STEP 7 Safety Advanced*.

If you have used and configured versions of F-CPUs and F-I/O in S7 Distributed Safety projects that are not approved for *STEP 7 Safety Advanced*, you will need to upgrade this hardware to the new version in *S7 Distributed Safety V5.4 SP5* and the corresponding *F-Configuration Pack*. Once the upgrade is completed, migration to *STEP 7 Safety Advanced* is feasible. A Product Information with a list of approved hardware is available on the Internet (https://support.industry.siemens.com/cs/ww/de/view/109481784):

Particularities for safety-related CPU-CPU communication via S7 connections

You can find information about the special considerations for migrated projects with safety-related CPU-CPU communication via S7 connections in Safety-related communication via S7 connections (Page 215). Please also note Communication with S7 Distributed Safety via S7 connections (Page 225).

Particularities for ESTOP1 or FDBACK instructions

Information on the special considerations when using the ESTOP1 and FDBACK instructions can be found in the "Instruction versions" section in ESTOP1: Emergency STOP/OFF up to stop category 1 (STEP 7 Safety V14) (Page 373) and FDBACK: Feedback monitoring (STEP 7 Safety V14) (Page 419).

Post-migration procedures

Once migration is complete, you have a complete project with a safety program which has retained the program structure of *S7 Distributed Safety* and the collective F-signature. F-blocks from the S7 Distributed Safety F-library (V1) are converted into instructions that are provided by *STEP 7 Safety Advanced*.

The migrated project therefore does not need to be re-accepted; it can be loaded as is to the F-CPU as long as it has not been modified or compiled since migration.

Note

Safety summary

You cannot create a safety summary in *STEP 7 Safety Advanced* for a migrated project. The printout of the project created with *S7 Distributed Safety V5.4 SP5* and the corresponding acceptance documents are still valid, because the collective F-signature has been retained.

Compiling of the migrated hardware configuration

If you receive an error message after migration and subsequent compilation of the hardware configuration stating that the F-source address does not match the "Central F-source address" parameter of the F-CPU, change the "Central F-source address" parameter. The F-source addresses of all F-I/Os assigned to the F-CPU are reassigned in the process.

If after migration of an SM 326; DI 24 x DC 24V (6ES7 326-1BK01-0AB0 and 6ES7 326-1BK02-0AB0) and subsequent compilation of the hardware configuration, the error message "F_IParam_ID_1: Value outside the permitted range" is displayed, delete the F-SM and reinsert it.

In both cases, subsequent compilation of the safety program is required.

Compiling the migrated safety programs

As a result of compilation of the migrated project with *STEP 7 Safety Advanced*, the existing program structure (with F-CALL) is converted to the new program structure of *STEP 7 Safety Advanced* (with main safety block). This changes the collective F-signature and a new acceptance for the safety program may be required.

Note

Changing the Safety system version

Before compiling with *STEP 7 Safety Advanced* for the first time, you must change the safety system version to a version which is not equal to 1.0 in the "Settings" area of the *Safety Administration Editor*. We recommend that you use the highest available version.

Note

Using the latest version of instructions

If you want to expand the migrated safety program, we recommend that you update to the latest version of the instructions used before compiling with *STEP 7 Safety Advanced* for the first time. Read the information on instruction versions for each instruction.

Note

Note that compiling the migrated safety program extends the runtime of the F-runtime group(s) and increases the memory requirements of the safety program (see also Excel file for calculating response time (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

See also

Application example "Migration of a safety program to TIA Portal" (https://support.industry.siemens.com/cs/ww/en/view/109475826)

1.7 Migrating PLC programs to a n F-CPU S7-1500

To migrate an F-CPU S7-300/400 onto an F-CPU S7-1500, proceed as with the migration of a standard CPU S7-300/400 onto a CPU S7-1500.

Points to note after migration:

- Non-automatable actions
  - Creating an F-runtime group and assigning it to the main safety block.
  - The hardware configuration including the I/O of the initial F-CPU is not automatically transferred to an S7-1500 F-CPU. Implement the hardware configuration of the new CPU manually after migration.

    Please also read the sections "Specify F-destination address for F-I/O of PROFIsafe address type 1" and "Specify F-destination address for F-I/O of PROFIsafe address type 2“ in chapter "Configuring an F-CPU (Page 44)“. Otherwise, this can lead to a reassignment of the F-destination addresses in the configuration.
  - When using S7-1500/ET200MP F-modules keep in mind that you need one byte more in the address area of S7-1200/1500 F-CPUs than in S7-300/400 F-CPUs.
- Instructions not supported:
  - OV
  - MUTING
  - TWO_HAND
  - WR_FDB
  - RD_FDB
  - OPN
  - SENDS7
  - RCVS7
- Data types not supported
  - DWORD
- Changes to safety program programming
  - F_GLOBDB.VKE0/1 replaced by FALSE/TRUE (Page 97).
  - Readable values from the F_GLOBDB replaced by the F-runtime group information DB. Additional information is available under F-shared DB (S7-300, S7-400) (Page 118) and F-runtime group information DB (S7-1200, S7-1500) (Page 118).
  - Replacement of the QBAD_I_xx or QBAD_O_xx tag by the value status. Additional information is available under Value status (S7-1200, S7-1500) (Page 130) and F-I/O DB (Page 135).
- F-runtime group communication is not supported.
- New naming convention when naming the F-I/O DBs
- Modified behavior of QBAD and PASS_OUT (Page 141) tags for F-I/O with "RIOforFA-Safety" profile.

Compile the safety program and eliminate any compilation errors displayed.

Note

A new acceptance must be carried out following F-CPU migration.

Programming (Page 90)

1.8 Upgrading projects to STEP 7 Safety V14

If you want to upgrade from a project **prior to** *STEP 7 Safety V13 SP1*, you must first upgrade the project to *STEP 7 Safety V13 SP1* via an intermediate step.

1.8.1 Upgrading projects from STEP 7 Safety V13 SP1 to V14

If you want to continue to work with a project from *STEP 7 Safety V13 SP1*, you must first upgrade the project to *STEP 7 Safety V14*.

Perform the upgrade following the usual procedure for *STEP 7*. After upgrading to V14, you have to compile your safety program.

(S7-300/400): After compilation, the safety program is consistent and the collective F-signature of the migrated safety program corresponds to the collective F-signature of the safety program from V13 SP1. Acceptance of changes is not required

(S7-1200/1500): After compiling, your safety program is consistent and the collective F-signature of the migrated safety program has changed for system reasons. The new collective F-signature of the safety program with *STEP 7 Safety V14* replaces the former collective F-signature of the safety program with *STEP 7 Safety V13 SP1*.

You can find an overview of all system-related changes under "Common data/Protocols/F-Convert Log+CPU name+time stamp". One of the system-related changes is that *STEP 7 Safety V14* automatically replaces versions of instructions no longer supported with new, functionally identical versions. The overview contains a comparison of the previous signatures with *STEP 7 Safety V13 SP1* to the new signatures with *STEP 7 Safety V14* and displays the automatically changed instruction versions. Print out the overview and store this printout with your acceptance documents or your machine documentation. Change acceptance is not required, since the "Collective F-signature with *STEP 7 Safety V13 SP1"* contained in the overview matches the collective F-signature in your current acceptance documents.

Keep in mind that existing change histories are not upgraded. All previous entries are deleted after the upgrade. If necessary, print out the change log before you upgrade.

Special features for user acknowledgment and reintegration of F-I/O after F-I/O or channel faults and PASS_ON = 1 (S7-1200, S7-1500)

The following applies to F-I/Os:

- S7-300 fail-safe signal modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules

Keep in mind the changed behavior for user acknowledgment and reintegration when configuring "Behavior after channel fault" = "Passivation of the channel" and tag ACK_NEC (F-I/O DB) = 1. The behavior was adapted to the behavior when configuring "Behavior after channel fault" = "Passivate the entire module":

As of *STEP 7 Safety V14* or higher, user acknowledgment of a corrected F-I/O or channel fault is **possible** even when the tag PASS_ON (F-I/O DB) = 1. A reintegration (provision of process values) takes place **as soon as the tag PASS_ON = 0**.

Until *STEP 7 Safety V13 SP1*, user acknowledgment of a corrected F-I/O or channel fault was **not possible** as long as the tag PASS_ON (F-I/O DB) = 1. A user acknowledgment was only possible once the tag PASS_ON = 0. The reintegration (provision of process values) took place immediately after the user acknowledgment.

Special features when using instruction profiles

If you want to use an instruction profile in your project from *STEP 7 Safety V13 SP1*, delete the instruction profile before you upgrade to *STEP 7 Safety V14*. Before deleting, make a note of your settings. After upgrading create a new instruction profile, if required, and enter the noted settings there, if applicable. Please note that some instruction versions are no longer supported under *STEP 7 Safety V14*. You will find additional information about the supported instruction versions in the description of the respective instruction.

1.8.2 Upgrading projects from STEP 7 Safety prior to V13 SP1

If you want to upgrade from a project **prior to** *STEP 7 Safety V13 SP1* to STEP 7 Safety V14, you must upgrade the project, as in standard, to *STEP 7 Safety V13 SP1* via an intermediate step.

The safety program signature does not change after upgrading the safety program to *STEP 7 Safety V13 SP1*. Acceptance of changes is therefore not required.

Perform the upgrade following the usual procedure for *STEP 7 Professional*.

When upgrading a project that was created with *STEP 7 Safety Advanced V11* . please note the following information:

Note

Adjustments are required before you can continue working on a project upgraded from *STEP 7 Safety Advanced V11*:

There was a product warning for *STEP 7 Safety Advanced V11* regarding setting the parameters "Discrepancy behavior" and "Reintegration after discrepancy error" for the fail-safe digital input and output modules 4F-DI/3F-DO DC24V/2A (6ES7138-4FC01-0AB0, 6ES7138-4FC00-0AB0). These parameters could be displayed incorrectly in certain combinations.

Based on the handling instructions in this product warning, you used a conversion table to set the affected parameters so that they were displayed incorrectly in the safety summary and hardware configuration in order for them to have the correct effect in the F-module. You also corrected the safety summary by hand to document the actual behavior of F-modules.

To reverse these changes, follow these steps:

1. Compile the upgraded project with *STEP 7 Safety Advanced V13 SP1*. An error message is displayed for each F-module in *STEP 7 Safety Advanced V11* the parameters of which you have corrected: "The CRC (F_Par_CRC) of the module (xxx) does not match the calculated value (yyy)."
2. Adapt the parameter assignment of each F-module for which this error message is displayed to match your handwritten corrections in the safety summary.
3. Do this for each F-CPU and then compile the safety program.
4. If the collective F-signature following compiling corresponds to the collective F-signature on the safety summary, you have made all the necessary corrections.

Use of CPs

F-I/Os operated downstream from a CP443-5 Extended, CP443-1 or CP 443-1 Advanced-IT were not automatically assigned a unique F-destination address.

As soon as you compile the hardware in a project with such F-I/Os in *STEP 7 Safety V13 SP1*, you are notified for the affected F-I/Os. You have to assign new, unique F-destination addresses for the reported F-I/Os. Additional information is available under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 56), PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 58) and Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 65).

This changes the collective F-signature of the safety program. However, you can verify that only the changed F-destination addresses have caused this change:

- The F-parameter signature (without address) for each changed F-I/O remains the same.
- Only the affected F-I/O DBs are listed in the comparison editor of the safety program with the filter set to "Compare only F-blocks relevant for certification".

1.9 First steps

Getting Started in SIMATIC Safety

Three Getting Started documents are available to help you begin using SIMATIC Safety.

The Getting Started documentation is an instruction manual that provides a step-by-step description of how to create a project with SIMATIC Safety. It gives you the opportunity to quickly become familiar with the scope of features of SIMATIC Safety.

Contents

The Getting Started documentation describes the creation of a single, continuous project that is extended with each section. Based on the configuration, you program a fail-safe shutdown, make changes to the programming, and accept the system.

In addition to the step-by-step instructions, the Getting Started documentation also gives you background information for every new topic, which explains the functions used in more detail and how they interrelate.

Target audience

The Getting Started documentation is intended for beginners but is also suitable for users who are switching from *S7 Distributed Safety*.

Download

Three Getting Started documents are available as PDF files for free download in the Industry Online Support:

- STEP 7 Safety Advanced V11 with S7-300/400 F-CPUs (http://support.automation.siemens.com/WW/view/en/49972838)
- STEP 7 Safety Basic V13 SP1 with S7-1200 F-CPUs (http://support.automation.siemens.com/WW/view/en/34612486/133300) (part of the manual "S7-1200 Functional Safety manual")
- STEP 7 Safety Advanced V13 with S7-1500 F-CPUs (http://support.automation.siemens.com/WW/view/en/101177693)

Configuring

2

2.1 Overview of Configuration

Introduction

You configure a SIMATIC Safety F-system basically in the same way as a standard S7-300, S7-400, S7-1200, S7-1500 or ET 200MP, ET 200SP, ET 200S, ET 200iSP, ET 200eco or ET 200pro automation system in *STEP 7.*

This section presents only the essential differences compared to standard configuration you encounter when configuring a SIMATIC Safety F-system.

This documentation distinguishes between two groups of F-I/O:

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, S7-1500/ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

Which F-components can you configure with the *STEP 7 Safety* optional package?

The table below shows you which F-CPUs you can configure with *STEP 7 Safety Basic* and which with *STEP 7 Safety Advanced*:

F-CPUs	*STEP 7 Safety Basic*	*STEP 7 Safety Advanced*
S7-300	—	x
S7-400	—	x
S7-1200	x	x
S7-1500	—	x
WinAC RTX F	—	x
S7-1500 F Software Controller	—	x

The table below shows you which F-I/Os you can configure with *STEP 7 Safety Basic* and which with *STEP 7 Safety Advanced* as well as which PROFIsafe address type they support:

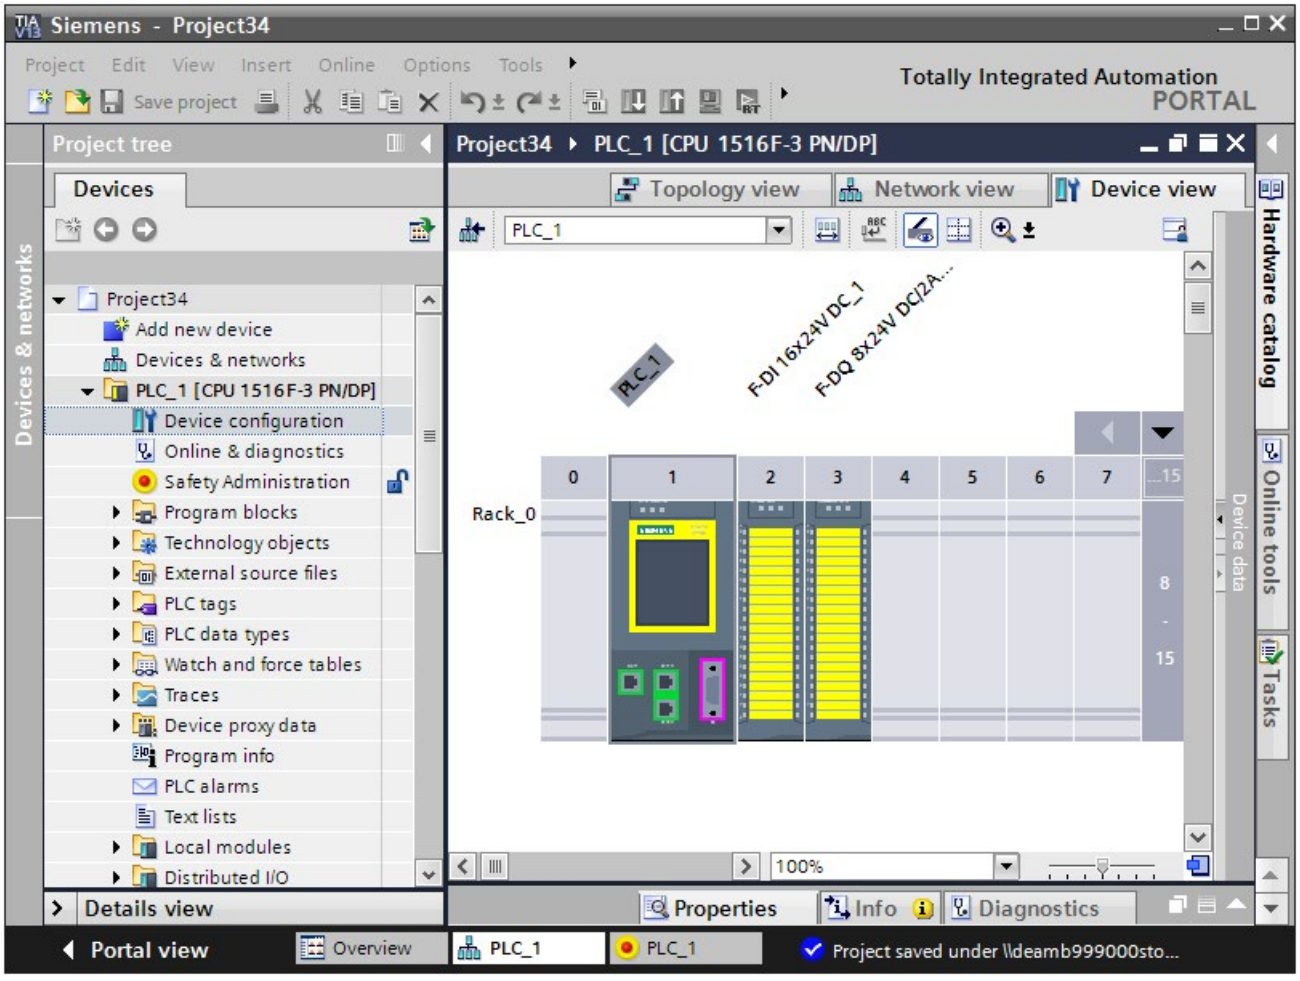
F-I/O	*STEP 7 Safety Basic*	*STEP 7 Safety Advanced*	*PROFIsafe address type*
S7-300 F-SMs	x**	x**	1
ET 200S F-modules	x	x	1
ET 200pro F-modules	x	x	1
ET 200iSP F-modules	x	x	1
ET 200eco F-I/O modules	—	with S7-300/400 F-CPUs	1
S7-1200 F-modules (centrally on S7-1200 F-CPUs)	x	x	2
ET 200SP F-modules	x	x	2
S7-1500/ET 200MP F-modules	x	x	2
fail-safe GSD based DP slaves	x	x	*
fail-safe GSD based I/O devices	x	x	*

* Consult the respective documentation to determine the PROFIsafe address type of a GSD based DP slave/GSD based I/O device. If in doubt, assume that the PROFIsafe address is type 1.

*** F-SMs that only support PROFIsafe V1 mode can only be used on F-CPUs S7-300/400.

Example: Configured F-system in *STEP 7 Professional*

The following figure presents a configured F-system. You choose the fail-safe components in the "Hardware catalog" task card as you would do with standard components and place them in the work area of the network or device view. F-components are shown in yellow.



Additional information

For detailed information on F-I/O, refer to the *manuals for the relevant F-I/O*.

Which safety-related communication options can you configure?

You need to use the *hardware and network editor* to configure the following safety-related communication options (see Configuring and programming communication (S7-300, S7-400) (Page 170) or Configuring and programming communication (S7-1200, S7-1500) (Page 229)):

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related I-slave-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication
- Safety-related communication via S7 connections
- Safety-related communication via S7 connections for S7 Distributed Safety or S7 F Systems

2.2 Particularities for configuring the F-System

Configuring is the same as for standard components

You configure a SIMATIC Safety F-system in the same way as a standard S7 system. This means that you configure and assign parameters for the hardware in the *hardware and network editor* in a centralized system (F-CPU and F-IO if required e.g. CPU 1516F-3 PN/DP and F-module S7-1500/ET 200MP) and/or as distributed system (F-CPU, F-SMs in ET 200M, F-module ET 200MP, F-module ET 200SP, ET 200S, ET 200pro, ET 200iSP, ET 200eco, fail-safe GSD based DP slaves and fail-safe GSD based I/O devices).

Special F-parameters

For the F-functionality there are special F-parameters that you can review and set in the "Properties" of the fail-safe components (F-CPU and F-I/O). F-parameters are marked in yellow.

F-parameters are explained in "Configuring an F-CPU (Page 44)" and "Configuring F-I/O (Page 49)".

Compiling the hardware configuration

You must compile the hardware configuration of the SIMATIC Safety F-system (shortcut menu "Compile > Hardware configuration"). A configured F-CPU with enabled F-capability is the only prerequisite for programming the safety program.

Note

Inconsistencies are possible when configuring the hardware and can also be saved. A full consistency check of the hardware configuration and possible connection data is performed only during compilation. Therefore, perform "Edit > Compile" regularly.

Changing safety-related parameters

Note

If you change a safety-related parameter (marked in yellow) for an F-I/O or an F-CPU, you must then compile the modified hardware configuration and the Compiling the safety program (Page 269) (shortcut menu "Compile > Hardware and software (only changes)") and download. This also applies for changes to the F-I/O which are not used in the safety program. F-I/O in standard operation is not affected by this.

2.3 Configuring an F-CPU

Introduction

You configure the F-CPU basically in the same way as a standard automation system.

F-CPUs are always configurable in *STEP 7*, regardless of whether or not the *STEP 7 Safety* optional package is installed. Without an installed optional package, however, the F-CPU can only be used as a standard CPU.

If the *STEP 7 Safety* optional package is installed, you can enable or disable the F-capability for the F-CPU.

If you want to use the F-I/O in safety mode or in safety-related communication, the F-capability of the F-CPU must be enabled.

F-capability is enabled by default after the *STEP 7 Safety* optional package is installed.

Enabling/disabling F-capability

If you want to modify the F-capability setting, proceed as follows:

1. Select the F-CPU in the device or network view, and select the "Properties" tab in the inspector window.
2. Select "Fail-safe" in the area navigation.
3. Use the appropriate button to enable/disable the F-capability.
4. If you want to disable F-capability, confirm the "Disable F-activation" dialog with "Yes".

Disabling F-capability for an existing safety program

If you want to disable the F-capability for an F-CPU because you intend to use the F-CPU as a standard CPU although a safety program is installed, you must note the following:

- You need the password for the safety program, if assigned.
- The Safety Administration Editor (Page 68) is deleted from the project tree.
- The F-OBs are deleted. (S7-1200, S7-1500)
- All F-blocks in the "Program blocks" folder are marked as not supported in the project tree ⊘. They can no longer be opened or compiled.

  All F-blocks within the "System blocks" folder are deleted.

  A warning is issued during the next compilation.
- From now on you cannot use F-I/O in safety mode with this F-CPU.

Configuring the F-parameters of the F-CPU

In the "Properties" tab of the F-CPU, you can change or apply the default settings for the following parameters:

- The F-destination address range
  - Low limit for F-destination addresses
  - High limit for F-destination addresses
- The default F-monitoring time for central or distributed F-I/O at the F-CPU

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

Specify F-destination address for F-I/O of PROFIsafe address type 1

With the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" you specify a range for this F-CPU in which the F-destination address of newly inserted F-I/Os of PROFIsafe address type 1 (Page 56) is assigned automatically. An F-destination address that is not within the F-destination address range yet, is also reassigned when you reassign a DP slave/IO device with the F-CPU or switch on the F-activation of the F-CPU.

The F-destination address is assigned in ascending order starting at the "Low limit for F-destination addresses". When no free F-destination address is available in the F-destination address range, the next available free F-destination address outside the F-destination address range is assigned and a warning is output during compilation.

The maximum possible F-destination address for ET 200S, ET 200eco, ET 200pro, ET 200iSP F-modules and S7-300 F-SMs is 1022.

The F-destination addresses for F-I/O of PROFIsafe address type 1 must be unique network-wide and CPU-wide.

By selecting different F-destination address ranges for different F-CPUs, you can define different ranges for the automatic assignment of the F-destination address. This is useful when you are operating multiple F-CPUs in one network. Subsequent manual address changes are possible. (see also Recommendation for PROFIsafe address assignment (Page 53))

Example:

You have configured the F-destination address range as follows:

- Low limit for F-destination addresses = 100
- High limit for F-destination addresses = 199

When inserting the first F-I/O of PROFIsafe address type 1, the F-destination address 100 is assigned. When inserting an additional F-I/O of PROFIsafe address type 1, the F-destination address 101 is assigned.

Note

The parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" have no effect on the following F-I/Os:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 bit (article number 6ES7336-1HE00-0AB0)

Specify F-destination address for F-I/O of PROFIsafe address type 2

The F-destination address of F-I/O of PROFIsafe address type 2 (Page 58) is assigned automatically for each F-CPU in descending order starting with 65534. The low limit is the value configured with the parameter "Low limit for F-destination addresses" (for F-I/O of PROFIsafe address type 1) + 1.

When the value configured with the "High limit for F-destination addresses" parameter is reached, a warning is output during compilation. (See also Recommendation for PROFIsafe address assignment (Page 53))

Specify F-source address for F-I/O of PROFIsafe address type 2

You specify the F-source address for F-I/O of PROFIsafe address type 2 (Page 58) assigned to this F-CPU with the "Central F-source address" parameter. The F-source address must be unique throughout the network. (see also Recommendation for PROFIsafe address assignment (Page 53))

Note

A change to the "Central F-source address" parameter results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required because the F-source addresses of all F-I/Os of address type 2 are changed centrally by this step.

"Default F-monitoring time" parameter

Configure the "Default F-monitoring time" for monitoring the communication between the F-CPU and F-I/O.

You can adjust the F-monitoring time via the following parameters:

- "Default F-monitoring time for central F-I/O"
- "Default F-monitoring time for F-I/O of this interface"

The **default F-monitoring time for the central F-I/O** acts on the F-I/O that is arranged centrally, i.e. near the F-CPU. You set this parameter in the properties of the F-CPU (select F-CPU, then select "Properties > Fail-safe > F-parameters").

The **default F-monitoring time for the F-I/O of this interface** acts on the F-I/O that is assigned to this interface of the F-CPU (PROFIBUS or PROFINET). You change this parameter in the properties of the relevant interface (selection of the interface in the "Device view" tab, then "F-parameters").

The various settings available allow you to flexibly adapt the F-monitoring time to the conditions of your F-system, for example to take account of different bus cycles.

You can also change the F-monitoring time individually for each F-I/O in the F-I/O properties (see Configuring F-I/O (Page 49) or Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 65)).

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 530).

Automatic generation of the safety program

The safety program of an F-CPU consists of one or two F-runtime groups that contain the F-blocks (see also Defining F-Runtime Groups (Page 109)). When the F-CPU (with activated F-capability) is inserted into the work area of the device view or network view, a safety program with an F-runtime group is generated automatically.

You can define in *STEP 7 Safety* that no F-runtime group is generated while inserting the F-CPU (with activated F-capability).

Proceed as follows:

1. Select the "Options > Settings" menu command.
2. Select the "STEP 7 Safety" area.
3. If it is not already disabled, disable automatic generation of an F-runtime group by deselecting the "Generate default fail-safe program" option.

This change has no influence on any existing safety programs; it only defines whether an F-runtime group is automatically generated for each one of the subsequently inserted F-CPUs.

Configuring the protection level of the F-CPU

WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. For this purpose, configure at least the protection level "Full access (no protection)" and assign a password under "Full access incl. fail-safe (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".

Assign different passwords for the individual protection levels. *(S041)*

You configure the protection level following the same procedure as for standard CPUs.

For information on the password for the F-CPU, refer to Access protection (Page 80). Pay special attention to the warnings in Access protection for the F-CPU (Page 86).

2.4 Configuring F-I/O

Introduction

You configure the S7-1500/ET 200MP, ET 200SP, ET 200S, ET 200eco (S7-300, S7-400), ET 200pro and ET 200iSP F-modules, the S7-300 F-SMs and the S7-1200 F-modules as usual in *STEP 7*.

After you have inserted the F-I/O in the work area of the *device or network view*, you access the configuration dialogs by selecting the relevant F-I/O and the "Properties" tab.

Note

Changes to the parameter assignment result in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

The use of ET 200SP F-modules is possible with IM155-6PN ST as of firmware V1.1, IM155-6PN HF and IM155-6DP HF.

The distributed use of S7-1500/ET 200MP F-modules is possible with IM 155-5 PN ST as of firmware V3.0, IM 155-5 PN HF as of firmware V2.0 and IM 155-5 DP ST as of firmware V3.0.

The central use of S7-1500/ET 200MP F-modules is possible with S7-1500 F-CPUs as of firmware V1.7, distributed use as of firmware V1.5.

(S7-1200) We recommend you limit the total number of F-I/Os that are used centrally or distributed in an S7-1200 F-CPU to 12. Depending on the volume of project data, the maximum number of F-I/Os can be smaller.

⚠ WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test.

Examples for such changes are:

- Adding F-I/O
- Changing the start address of F-I/O
- Changing the slot position of F-I/O
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Channel-granular passivation after channel faults

You can configure how the F-I/O will respond to channel faults, such as a short-circuit, overload, discrepancy error, or wire break, provided the F-I/O supports this parameter (e.g. for ET 200S or ET 200pro F-modules). You configure this response in the properties for the relevant F-I/O ("Behavior after channel fault" parameter). This parameter is used to specify whether the entire F-I/O or just the faulty channel(s) are passivated in the event of channel faults.

Note

(S7-300, S7-400) Note that channel-granular passivation increases the runtime of the F-runtime group(s) compared to passivation of the entire F-I/O (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

"Channel failure acknowledge" parameter (S7-1200, S7-1500)

For S7-1500/ET 200MP F-modules and S7-1200 F-modules, the "Channel failure acknowledge" parameter replaces the ACK_NEC tag of the F-I/O DB.

If an F-I/O fault is detected by the F-I/O, passivation of all channels of the relevant F-I/O occurs. If channel faults are detected, the relevant channels are passivated if "Passivate channel" is configured. If "Passivate the entire module" is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, reintegration of the relevant F-I/O occurs in line with the "Channel failure acknowledge" parameter.

- Automatically
- Manually

⚠ WARNING

The parameter assignment "Channel failure acknowledge = Automatic" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint.*(S045)*

Note

The default assignment for the "Channel failure acknowledge" parameter when the F-module is created is "Manually".

Organization block/Process image (S7-1200, S7-1500)

If you use F-I/O in standard mode, you can select the organization block/process image as you do for standard I/O.

If you use F-I/O in safety mode, no selection is possible. The process image is updated at the beginning or end of the F-OB (see section Program structure of the safety program (S7-1200, S7-1500) (Page 93)).

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB (Page 135) are assigned automatically when the F-I/O is configured. The name of the F-I/O DB contains the start address and the name of the F-I/O. You can change the number in the properties of the F-I/O. You can change the name of the F-I/O DB indirectly by changing the name of the F-I/O.

You can find information on the assignment of number ranges in *Safety Administration Editor*, "Settings" area (Page 75).

Customizing the F-monitoring time for F-I/O

You can customize the F-monitoring time in the properties of the F-I/O under "F-parameters". This may be necessary to prevent a timeout being triggered when no error occurs and the F-I/O requires a longer F-monitoring time or assignment with a default F-monitoring time is not possible. For this purpose, activate the corresponding check box and assign an F-monitoring time.

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 530).

Group diagnostics for fail-safe S7-300 signal modules

By disabling a channel of the fail-safe signal module in the module properties, you also disable the group diagnostics for this channel.

Exception for S7-300/400 F-CPUs:

For the following S7-300 fail-safe signal modules

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0) and
- SM 336; AI 6 x 13Bit (article number 6ES7336-1HE00-0AB0)

the "Group diagnostics" parameter enables and disables the monitoring of channel-specific diagnostic messages of F-SMs (such as wire break and short-circuit) to the F-CPU. You should disable group diagnostics for **unused** input or output channels.

WARNING

(S7-300, S7-400) For the following S7-300 fail-safe signal modules (F-SMs) with activated safety mode, "Group diagnostics" must be enabled for all connected channels:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

Check to verify that you have only disabled group diagnostics for these F-SMs for input and output channels that are actually unused. *(S003)*

Diagnostic interrupts can be enabled optionally.

Additional information

For detailed description of the **parameters**, refer to the help on the properties of the respective F-I/O and in the respective *manual for the F-I/O*.

2.5 Configuring shared device

To configure shared devices follow the procedure as in the standard. The configuration is described in the STEP 7 online help under "Configuring shared devices".

F-destination addresses

Please also read the chapter "Recommendation for PROFIsafe address assignment (Page 53)“ for assigning the F-destination address.

See also

Assign PROFIsafe address to an F-module (Page 63)

2.6 Recommendation for PROFIsafe address assignment

Before inserting the F-I/O, specify an address range for each F-CPU for the F-destination addresses of the F-I/O of PROFIsafe address type 1 (Page 56) that does not overlap with the address range of any other F-CPU network-wide or CPU-wide (system-wide). You define the range for F-I/Os of PROFIsafe address type 1 with the parameters "Low limit for F-destination addresses" and "High limit for F-destination addresses" (see also section Configuring an F-CPU (Page 44)).

The F-destination addresses of F-I/O of PROFIsafe address type 2 (Page 58) must not overlap with any address range of the F-I/O of PROFIsafe address type 1. The ranges of the F-destination addresses of the F-I/O of PROFIsafe address type 2 may overlap if the F-source addresses are different. This is the case for supported configurations (Page 54) if the "Central F-source address" parameter has been set differently for each F-CPU.

Assign relatively low F-destination addresses for F-I/O of PROFIsafe address type 1 and relatively high F-destination addresses for F-I/O of PROFIsafe address type 2.

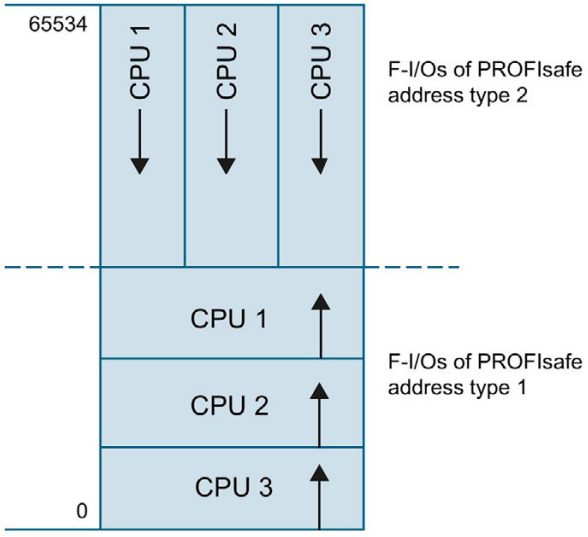


Figure 2-1 Address assignment for F-I/O of PROFIsafe address types 1 and 2

The safety summary (Page 310) lists the following information for each F-CPU:

- "Central F-source address" parameter (F-source address for F-I/O of PROFIsafe address type 2)
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 1
- Actually used range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 2

Any F-I/O configured using I-slave-slave communication is taken into consideration in the safety summary as part of the F-destination address range of the I-slave.

Any F-I/O configured in a shared device is taken is specified in the safety summary as part of the F-destination address range of the F-CPU to which this F-I/O is assigned.

2.7 Configurations supported by the SIMATIC Safety F-system

Supported configurations

F-I/Os (see Overview of Configuration (Page 39)) are supported in the following configurations:

central configuration (also I-slave):

- The F-I/O is in the same rack as the associated F-CPU.
- The F-I/O is located in a subrack of the rack of the associated F-CPU.

distributed configuration (at integrated DP-/PN interface of the CPU or at CP/CM):

- PROFIBUS (also after IE/PB link)
  - The F-I/O is located on a DP Slave.
  - The F-I/O is located on a DP Slave and is addressed via I-slave-slave communication. The assigned DP master (of the assigned IO controller of the IE/PB link) can be a standard CPU or an F-CPU.
- PROFINET IO
  - The F-I/O is located on an IO Device.
  - The F-I/O is located in a shared device.

For F-I/O not listed in "Overview of Configuration (Page 39)", please check the relevant documentation to see whether it is supported by the SIMATIC Safety F-system. If in doubt, treat these F-I/Os as part of a configuration that is not supported.

Checks performed by the SIMATIC Safety F-system

For supported configuration, the F-system checks:

- Whether the PROFIsafe operating mode parameter (F_Par_Version) is set to V2 mode in the PROFINET IO environment**.
- Whether the F-destination addresses have been assigned uniquely CPU-wide.
  You yourself must ensure the network-wide uniqueness of the PROFIsafe address.
- Whether the F-source address for the F-I/O of PROFIsafe address type 2 corresponds to the "Central F-source address" parameter of the F-CPU.

⚠ WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Check the correctness of the PROFIsafe addresses with the help of the safety summary.
  - Use the safety summary to check that the F-source address corresponds to the "Central F-source address" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1 or if you cannot set the F-source address in accordance with the "Central F-source address" parameter of the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported. (see Completeness and correctness of the hardware configuration (Page 314)) *(S050)*

* "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

2.8 PROFIsafe addresses for F-I/O of PROFIsafe address type 1

F-destination address

The uniqueness of the PROFIsafe address is ensured solely with the F-destination address. The F-source address has no effect on whether or not the PROFIsafe address is unique.

Therefore, the F-destination address must be unique network-wide and CPU-wide (see the following rules for address assignment).

To prevent incorrect parameter assignment, an F-destination address which is unique CPU-wide is automatically assigned during placement of the F-I/O in the work area of the device or network view as long as you only configure supported configurations (Page 54).

To ensure a network-wide unique F-destination address assignment when multiple DP master systems and PROFINET IO systems are operated on one network, you must set the "Low limit for F-destination addresses" and "High limit for F-destination addresses" in the properties of the F-CPU in SIMATIC Safety F-systems appropriately, before placing the F-I/O (see section "Recommendations for address assignment") so that the F-destination address ranges do not overlap.

When you change the F-destination address of an F-I/O, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations. You yourself must ensure the network-wide uniqueness of the F-destination address.

For ET 200S, ET 200eco (S7-300, S7-400), ET 200pro, and ET 200iSP F-modules and S7-300 F-SMs:
You must set the F-destination address at the F-I/O with the DIP switch before you install the F-I/O. You can assign up to 1022 different F-destination addresses.

Note

(S7-300, S7-400) For the following fail-safe S7-300 signal modules, the F-destination address is the start address of the F-SM divided by 8:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

⚠ WARNING

F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).

The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 53).

See also

Completeness of the safety summary (Page 310)

2.9 PROFIsafe addresses for F-I/O of PROFIsafe address type 2

F-source address and F-destination address

The uniqueness of the PROFIsafe address is ensured by the combination of F-source address and F-destination address.

The PROFIsafe address must be unique network-wide and CPU-wide. This is the case if the following two conditions are met:

- The F-source address ("Central F-source address" parameter) of the F-CPU is unique network-wide. Keep this in mind for changes.
- The F-destination address of the F-module is unique CPU-wide.

You define the F-source address using the "Central F-source address" parameter in the F-CPU. Provided you only configure supported configurations (Page 54), this parameter is automatically applied as the F-source address and a CPU-wide unique F-destination address is assigned (usually in descending order starting with 65534).

When you change the F-destination address, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations.

You must assign the F-source address and F-destination address to the F-I/O before you commission the F-I/O. You can find additional information in Assigning PROFIsafe address to fail-safe modules with SIMATIC Safety (Page 60).

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-source and F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

⚠ WARNING

FI/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

To ensure that addresses are unique across F-CPUs for supported configurations (Page 54), you need to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Central F-source address" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 53).

Completeness of the safety summary (Page 310)

2.10 Setting the F-destination address for F-I/O with DIP switches

Information on how to set the F-destination address for F-I/O with DIP switches is available in the documentation of the respective F-I/O.

2.11 Assigning PROFIsafe address to fail-safe modules with SIMATIC Safety

Introduction

Fail-safe ET 200SP modules, fail-safe S7-1500/ET 200MP modules and fail-safe S7-1200 modules do not have a DIP switch that allows you to set the unique F-destination address for each module. Instead, you assign the PROFIsafe address (Page 54) consisting of F-source address and F-destination address directly from *STEP 7 Safety* for fail-safe ET 200SP modules and fail-safe S7-1500/ET 200MP modules. The PROFIsafe addresses for S7-1200 F-modules are automatically assigned during download of the hardware configuration.

In the following cases it is necessary to reassign the addresses of the fail-safe ET 200SP and fail-safe S7-1500/ET 200MP modules:

- Later placement of a fail-safe module during initial commissioning
- Intentional modification of the F-destination address
- Modification of the "Central F-source address" parameter for the associated F-CPU (changes the F-source address).
- Replacement of the coding element
- Commissioning of a mass-produced machine

In the following cases it is not necessary to reassign the addresses of the fail-safe ET 200SP and fail-safe S7-1500/ET 200MP modules:

- Power On/Off
- Replacement of an F-module (repair) without PG/PC
- Replacement of the BaseUnit
- Replacement of a BaseUnit without coding element
- Changes in the design in case a new BaseUnit is inserted in front of a fail-safe module
- Repair/replacement of the interface module

Basic procedure

Note

Assigning the PROFIsafe address for S7-1200 fail-safe modules

The procedure described below for identifying and assigning the PROFIsafe addresses is not required for S7-1200 fail-safe modules.

Note that an S7-1200 F-CPU must not include an additional unconfigured F-module.

1. Configure the F-destination address (Page 58) and F-source address in the hardware configuration in *STEP 7 Safety*.
2. Identify the ET 200SP or S7-1500/ET 200MP F-modules to which you want to assign the configured F-destination addresses (together with the F-source address).
3. Assign the PROFIsafe address to the F-modules.

2.11.1 Identifying F-modules

Requirement

The following requirements must be met:

- The F-CPU and fail-safe modules are configured.
- The hardware configuration has been downloaded.
- When using an ET 200SP Open Controller, the hardware configuration of the ET 200SP Open Controller **and** of the fail-safe software controller must be downloaded.
- The F-CPU and fail-safe modules can be reached online.

⚠ WARNING

Make sure that the latest hardware configuration has been downloaded to the F-CPU before identification.

Clicking "Identification" confirms the fail-safe correctness of the PROFIsafe addresses for the fail-safe modules.

Therefore, proceed carefully when confirming the F-modules by LED flashing or the serial number of the F-CPU with central fail-safe modules or the serial number of the interface module with fail-safe modules. *(S046)*

Procedure

Proceed as follows to identify the F-modules:

1. Establish an online connection to the F-CPU with which the fail-safe modules are operated.
2. In the network view, select the F-CPU with fail-safe modules or the interface module with the fail-safe modules to which you want to assign the PROFIsafe address.
3. Select "Assign PROFIsafe address" from the shortcut menu.
4. Under "Assign PROFIsafe address by", select the method to be used for identifying the F-modules.
   - "Identification by LED flashing"

     This is the default setting. The DIAG and STATUS LEDs of the F-modules to be identified flash upon identification.
   - "Identification by serial number"

     If you cannot see the fail-safe modules directly, you can identify the fail-safe modules by the serial number of the F-CPU or interface module.

     Note

     The displayed serial number may be amended with a year number compared to the serial number printed on the interface module. The serial numbers are nevertheless identical.

     Note

     Determining the serial number of an ET 200SP Open Controller

     When you use the ET 200SP F-modules centrally on an ET 200SP Open Controller and identify them by the serial number, then read the serial number in the display of the fail-safe S7-1500 software controller in the menu "Overview > CPU".
5. In the "Assign" column, select all the F-modules to which you want to assign the PROFIsafe address.

   If you select the F-CPU or the interface module in the "Assign" column, all F-modules of the station are selected.
6. Click the "Identification" button. Check whether the DIAG and STATUS LEDs for the F-modules whose PROFIsafe address you want to assign are flashing green. If you identify using the serial number, compare the displayed serial number to the serial number of the F-CPU with central fail-safe modules or the interface module with fail-safe modules.
7. If you have configured more S7-1500/ET 200MP fail-safe modules than exist online, a dialog is displayed. Enter the number of S7-1500/ET 200MP fail-safe modules actually existing in this dialog and confirm the dialog.

   If you have configured fewer S7-1500/ET 200MP fail-safe modules than exist online, the online-offline difference is shown and the assignment of the PROFIsafe address is not possible.

2.11.2 Assign PROFIsafe address

Requirement

The F-modules have been successfully identified.

Procedure

To assign an F-destination address, proceed as follows:

1. Use the "Assign PROFIsafe address" button to assign the PROFIsafe address to the fail-safe modules. You may have to enter the password of the F-CPU.

   You must acknowledge the "Acknowledge assignment" dialog within 60 seconds to assign the PROFIsafe address.

2.11.3 Assign PROFIsafe address to an F-module

Introduction

In the "Assign PROFIsafe address" dialog only the F-modules which are assigned to an F-CPU of this project are offered, as the PROFIsafe address of an F-module in a shared device can only be assigned from a project in which the F-CPU to which the F-modules are assigned is located.

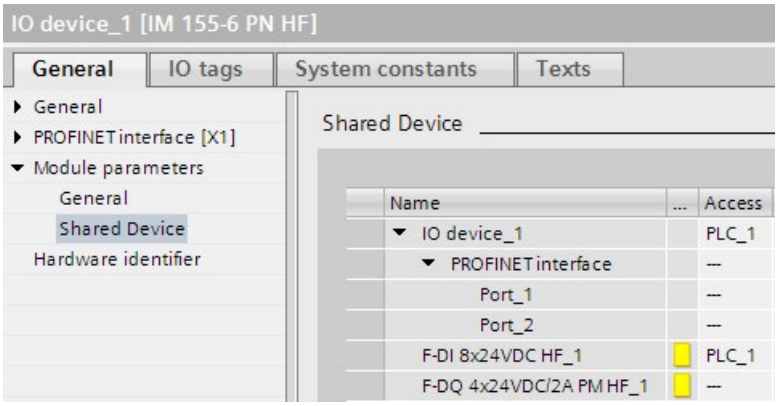
Requirement

Requirement for assignment of the PROFIsafe address is that you have downloaded the hardware configuration completely to the F-CPU. When you have assigned the F-modules in a shared device to multiple F-CPUs, you must first download the hardware configuration of all F-CPUs involved before you assign the PROFIsafe addresses.

For the assignment of the PROFIsafe addresses of the F-modules to work, the associated interface module must be assigned to the corresponding F-CPU during assignment.

Procedure for assignment of the PROFIsafe addresses with the "Shared Device" function.

1. Switch all F-CPUs in the shared device to STOP.
2. Assign the interface module to the F-CPU to which the F-modules to which you want to assign the PROFIsafe address are assigned.



3. Compile the hardware configuration.
4. Download the hardware configuration **without** starting the F-CPU.
5. Assign the PROFIsafe addresses to the F-modules assigned to the F-CPU.
6. If you want to assign additional PROFIsafe addresses to F-modules that are assigned to other F-CPUs, proceed as follows:
   - Undo the assignment you made under 2.
   - Then compile the hardware configuration.
   - Download the hardware configuration **without** starting the F-CPU.
7. Repeat steps 2 to 6 to assign the PROFIsafe addresses to the F-modules that are assigned to other F-CPUs.
8. Restore the original configuration, compile and download it.

Identifying F-modules (Page 61)

Assign PROFIsafe address (Page 63)

Configuring shared device (Page 52)

2.11.4 Changing the PROFIsafe address

Changing the PROFIsafe address

Note

Keep in mind that after changing the PROFIsafe address of an F-I/O you must also conduct an acceptance (Page 314) including check of your change (Page 323) per safety summary (Page 291).

1. You change the PROFIsafe address (F-destination address, F-source address) in the hardware configuration.
2. Compile the hardware configuration.
3. Download the hardware configuration to the F-CPU.
4. Select "Assign PROFIsafe address" from the shortcut menu.
5. Proceed as described under Identifying F-modules (Page 61) and Assign PROFIsafe address (Page 63).

2.12 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices

Requirement

In order to use fail-safe GSD based DP slaves for SIMATIC Safety, these GSD based slaves must be operated on PROFIBUS DP and support the PROFIsafe bus profile. When used in an S7-1200/1500 F-CPU, they must support the PROFIsafe bus profile in V2 mode.

Fail-safe GSD based DP slaves used in hybrid configurations on PROFIBUS DP and PROFINET IO downstream from a IE/PB link must support the PROFIsafe bus profile in V2 mode.

In order to use fail-safe GSD based I/O devices for SIMATIC Safety, the GSD based devices must be operated on PROFINET IO and support the PROFIsafe bus profile in V2 mode.

Configuration with GSD files

As is the case in a standard system, the basis for configuring fail-safe GSD based DP slaves/IO devices is the device specification in the GSD file (device master file).

A GSD file contains all of the properties of a GSD based DP slave or GSD based I/O device. For fail-safe GSD based DP slaves/GSD based I/O devices, certain parts are protected by a CRC.

The GSD files are supplied by the device manufacturers.

Protection of the data structure of the device in GSD files

The only GSD files supported are those that satisfy the requirements for protection defined as of *PROFIsafe Specification* V2.0 using a CRC stored in this file ("desired value" for F_IO_StructureDescCRC).

The data structure described in the GSD file is checked when the F-I/O is added to the hardware configuration and when the hardware configuration is compiled. When an error is detected, you should clarify whether the GSD file provided by the device manufacturer contains the desired value for F_IO_StructureDescCRC.

Assignment and setting of the PROFIsafe address

⚠ WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 56) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 58).

Set the PROFIsafe source address for fail-safe GSD based DP slaves / GSD based I/O devices according to the manufacturer's specifications. If the F-source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Central F-source address" parameter matches the value of the F-source address of the fail-safe GSD based DP slave / fail-safe GSD based I/O device. *(S053)*

Configuration procedure with GSD files

You import the GSD files to your project (see *Help on STEP 7 "GSD files"*).

1. Select the fail-safe GSD based DP slave / GSD based I/O device in the "Hardware catalog" task card and connect it to the relevant subnet in the network view.
2. Select the fail-safe GSD based DP slave/GSD based I/O device and insert the necessary F-modules, if this does not occur automatically.
3. Select the relevant F-module and open the "Properties" tab in the inspector window.

For fail-safe GSD based DP slaves/GSD based I/O devices (contrary to other F-I/O), the "Manual assignment of the F-monitoring time" parameter is enabled. The result is that the value specified in the GSD file for the F-monitoring time is used as default value when the slaves/devices are plugged. You can change both values (time and type of assignment) later manually.

F-parameter "F_CRC_Seed" and "F_Passivation" for fail-safe GSD based I/O devices

The F-parameters "F_CRC_Seed" and "F_Passivation" influence the behavior of a fail-safe GSD based I/O device. The combination of the F-parameters cannot be set but is specified by selecting a corresponding F-module. Up to three F-module variants can be used, depending on the S7-300/400 or S7-1200/1500 F-CPU used.

F-module variant	F_CRC_Seed	F_Passivation	Behavior of the fail-safe GSD based I/O device	Can be used with F-CPU
1	Parameter does not exist	Parameter does not exist	The GSD based I/O device works with the Basic Protocol (BP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-300/400/1200/1500*
2	CRC-Seed24/32	Device/module	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is not supported.	S7-1200/1500
3	CRC-Seed24/32	Channel	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The "RIOforFA-Safety" profile is supported.	S7-1200/1500

* Only use the F-module variant 1 with S7-1200/1500 F-CPUs if neither F-module variant 2 nor 3 exists.

Additional information

You can find the description of the parameters in the Help on fail-safe GSD based DP slaves and GSD based I/O devices.

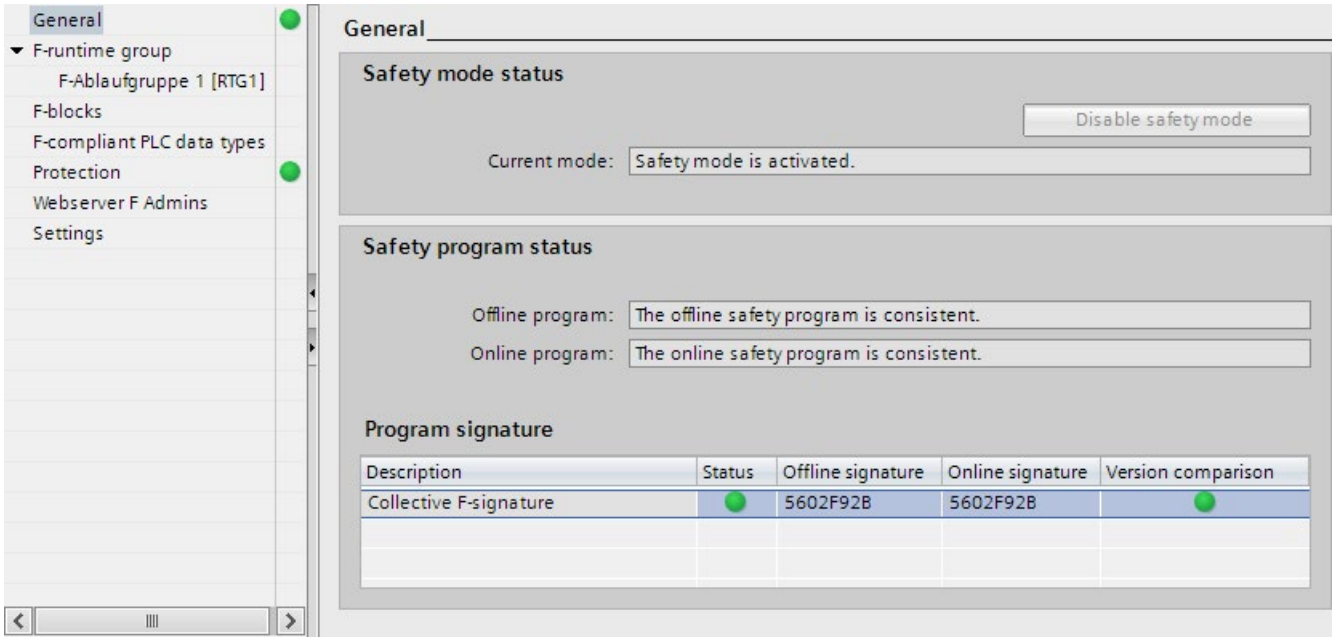
Safety Administration Editor

3

Overview

The *Safety Administration Editor* supports you as follows:

- Displaying of status of the safety program
- Displaying of collective F-signature
- Displaying of status of safety mode
- Creating and organizing of F-runtime groups
- Displaying information on the F-blocks
- Displaying information about F-compliant PLC data types (UDT)
- Information for users with F-Admin permission
- Specifying/changing access protection
- Set/modify settings for the safety program, e.g. Enable F-change history



The *Safety Administration Editor* is divided into the following areas:

- General

  Under "General", the status of safety mode, the safety program, and the collective F-signature are displayed to you. Additional information on the "General" area can be obtained in ""General" area (Page 70)".

- F-runtime groups

  A safety program consists of one or two F-runtime groups. Under "F-runtime groups", you determine the blocks and properties of an F-runtime group.

  General information on F-runtime groups can be found in "Program structure of the safety program (S7-1200, S7-1500) (Page 93)" and "Program structure of the safety program (S7-300, S7-400) (Page 91)".

  Information on the creation of F-runtime groups can be obtained under "Defining F-Runtime Groups (Page 109)".

- F-blocks

  Under "F-blocks", you can find information on the F-blocks used in your safety program and their properties . Additional information on the "F-blocks" area can be obtained in ""F-blocks" area (Page 73)".

- F-compliant PLC data types

  Under "F-compliant PLC data types", you obtain information on the created F-compliant PLC data types (UDT). There you also obtain information whether or not an F-compliant PLC data type (UDT) is used in the safety program. Additional information on "F-compliant PLC data types" can be found in ""F-compliant PLC data types" area (S7-1200, S7-1500) (Page 74)".

- Access protection

  Under "Access protection", you can set up, change, or revoke the password for the safety program. Access protection is mandatory for productive operation. Additional information on access protection can be found in "Access protection for the safety program (Page 83)".

- Web server F-Admins

  Under "Web server F-admins", you obtain information on users with the F-Admin attribute for the Web server of the F-CPU. Additional information on the "Web server F-Admins" area can be obtained in ""Web server F-Admins" area (S7-1200, S7-1500) (Page 75)".

- Settings

  Under "Settings", you set the parameters for the safety program. Information on the settings for your safety program can be found in ""Settings" area (Page 75)".

3.1 Opening the Safety Administration Editor

Requirement

The *Safety Administration Editor* is visible as an element in the project tree, if you have configured a CPU as an F-CPU in the project, which means the "F-capability activated" option must be selected (in the properties of the F-CPU).

Procedure

To open the *Safety Administration Editor*, follow these steps:

1. Open the folder for your F-CPU in the project tree.
2. Double-click on "Safety administration" or right-click and select the corresponding shortcut menu for the *Safety Administration Editor*.

Result

The *Safety Administration Editor* for your F-CPU opens in the work area.

3.2 "General" area

"Safety mode status"

The "Safety mode status" shows the current status of safety mode. The prerequisite is an existing online connection to the selected F-CPU.

The following statuses are possible:

- "Safety mode is activated"
- "The safety mode is not activated"
- "F-CPU is in STOP"
- "F-CPU is in RUN but no safety program exists"
- "No active F-CPU available"
- "Unknown"
- "F-runtime group was not called"
- "The safety program is not called"
- "Safety program status changing"
- "(No online connection)"

"Disable safety mode"

For existing online connection and active safety mode operation, you have the option of using the "Disable safety mode" button to disable safety mode for the selected F-CPU. Safety mode can be deactivated only for the entire safety program and not for individual F-runtime groups.

Requirement: "Safety mode can be disabled" is selected in the "Settings" area.

Proceed as follows:

1. Click the "Disable safety mode" button.
2. Enter the password for the safety program in the dialog window and confirm with "OK".
3. A corresponding dialog will display the collective F-signature.
4. Using the displayed collective F-signature, verify that you have selected the desired F-CPU.
5. If you have selected the correct F-CPU, confirm the dialog with "Yes".

Result: Safety mode for the F-CPU is disabled.

"Safety program status"

"Safety program status" displays the current status of your online and offline program.

The following statuses are possible:

- Consistent (with information if no password has been assigned.)
- Inconsistent
- Modified

If no connection to the online program could been established, the message "(no online connection) " will be shown.

"Program signature"

For a non-existing online connection

"Program signature" displays the collective F-signature offline and the "Time stamp" displays the time of the last compilation process.

For an existing online connection

For an existing online connection, the following is displayed under the "Program signature":

- The status of safety program

Status	Meaning
	The online and offline collective F-signatures match, and a password was assigned for the online and offline safety programs.
	The online and offline collective F-signatures do *not* match or no password was assigned for one of the safety programs.
—	The safety program status could not be determined.

- The online and offline collective F-signatures
- Information on whether the safety system versions are consistent online and offline.

Version comparison	Meaning
	The online and offline safety system versions match one another.
	The online and offline safety system versions do *not* match one another.
—	The safety system versions could not be determined.

Disabling safety mode (Page 294)

Program identification (Page 286)

3.3 "F-blocks" area

Overview

The "F-Blocks" area helps you in the following tasks:

- Displaying the F-blocks used in your safety programs.
- Displaying the F-blocks used in the F-runtime groups.
- Displaying additional information about the F-blocks.

A description of the F-blocks is available in "Creating F-blocks in FBD / LAD (Page 122)".

Displayed information

The following information is displayed for F-blocks in offline mode:

- Has the F-block been compiled and used?
- Function of F-block in the safety program
- Offline signature
- Time stamp of the last change

The following information is displayed for F-blocks in online mode:

- Status (whether block has the same time stamp online and offline)
- Function of F-block in the safety program
- Offline signature
- Online signature

The F-blocks are hierarchically displayed as in the "Program blocks" folder.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 289)".

Note

During the offline-online comparison, the comparison statuses may occasionally differ between the *comparison editor* and status display in the *Safety Administration Editor*. The decisive status is the result of the comparison in the *comparison editor*, since this is the only comparison that takes into account the contents of the F-blocks.

Filter function

Using the filter function, you can select whether you want to view all F-blocks of a certain Fruntime group or the entire safety program.

- Select "All F-blocks " from the drop-down list to view all F-blocks.
- Select an F-runtime group from the drop-down list to see all F-blocks of this F-runtime group.

3.4 "F-compliant PLC data types" area (S7-1200, S7-1500)

Overview

Under "F-compliant PLC Data Types" you obtain information on the F-compliant PLC data types (UDT) you have defined.

You can delete F-compliant PLC data types (UDT) from the shortcut menu.

A description of F-compliant PLC data types (UDT) is available in "F-compliant PLC data types (UDT) (S7-1200, S7-1500) (Page 103)".

Displayed information

The following information is displayed for F-compliant PLC data types (UDT) in offline mode:

- Is the F-compliant PLC data type used in the safety program?
- Time stamp of the last change.

The following information is displayed for F-compliant PLC data types (UDT) in online mode:

- Status (whether the F-compliant PLC data types (UDT) have the same time stamp online and offline)

The F-compliant PLC data types (UDT) are displayed hierarchically as in the folder "PLC Data Types".

Double-click the F-compliant PLC data type (UDT) to open it for editing.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 289)".

Note

During offline-online comparison, the comparison statuses between the *comparison editor* and status display in the *Safety Administration Editor* can be different under certain circumstances. The comparison result in the *comparison editor* is decisive, since this is the only comparison that takes into account the contents of the F-compliant PLC data types (UDT).

3.5 "Web server F-Admins" area (S7-1200, S7-1500)

You require the "F-admin" right in order to carry out restoration of a backup (Page 285) via the Web server of your F-CPU. You assign the "F-admin" right in the hardware configuration of the F-CPU under the user management of the Web server.

In this section, you obtain information on which users have the "F-admin" right online or offline for F-CPUs that support this right. You can see from this whether a change to the "F-admin" right is active on the F-CPU. In order to make a change to the "F-admin" right effective, you have to load the configuration to the F-CPU.

See also

Completeness and correctness of the hardware configuration (Page 314)

3.6 "Settings" area

"Number ranges of the generated F-system blocks"

The number ranges assigned here are used by the F-System for new, automatically generated F-blocks.

At this point, you can select whether the number ranges are managed by the F-system or if a fixed range specified by you is used.

- "F-system managed"

  The number ranges are managed automatically by the F-system, depending on the F-CPU used. The F-system selects an available number range. The start and end ranges of the number ranges are displayed.

- "Fixed range"

  You can select the start and end ranges of the number ranges from the available range. The available range depends on the F-CPU used.

  An invalid number range selection is indicated by an error message.

  The only check performed during configuration is whether the configured low limit is less than or equal to the high limit and within the available range of the F-CPU. The check as to whether the configured range is sufficient is first made during compiling. You need to ensure a sufficiently large range. Where the available range is insufficient, a compiling error occurs. Not all blocks are generated and the safety program is not executable.

Changes will become valid only during the next compilation. The automatically created F-blocks may be moved into the new area during compilation. The F-I/O DBs are an exception. They always retain their original number that you may change in the properties of the F-I/O.

"Safety system version"

This parameter is used to specify the safety system version (including version of the F-system blocks and automatically generated F-blocks, see Overview of Programming (Page 90)).

A number of versions are available:

Version[3]	S7-300/400	S7-1200	S7-1500	Function
1.6	—	x	x	These versions have identical functions.
2.0	x	x[1]	x[2]	Depending on the set version, the result may be different runtimes of the F-runtime group(s) (see Excel file for response time calculation on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

1 supported for Firmware version V4.2 or higher

2 supported for Firmware version V2.0 or higher

3 After the migration of projects that were created with S7 Distributed Safety V5.4 SP5, version 1.0 is set automatically in order to identify migrated projects which have not yet been compiled with STEP 7 Safety Advanced.

Usually, you do not need to make any settings for this parameters.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

"Local data used in safety program" (S7-300, S7-400)

You use this parameter to specify the amount of temporary local data (in bytes) that is available for the call hierarchy below the main safety block.

The setting applies to each F-runtime group of a safety program. Additional information on F-runtime groups can be found in "Program structure of the safety program (S7-1200, S7-1500) (Page 93)" and "Program structure of the safety program (S7-300, S7-400) (Page 91)".

The **minimum possible amount** is determined by the local data requirement of the F-blocks generated automatically when the safety program is compiled.

For this reason, you must provide at least 440 bytes. However, the local data requirement for the automatically added F-blocks may be higher depending on the local data requirement of the F-blocks you created with FBD or LAD.

Therefore, provide as much local data as possible. If there is not enough local data available for the automatically added F-blocks (440 bytes or more), the safety program will be compiled nevertheless.

Data in automatically added F-DBs are then used instead of local data. However, this increases the runtime of the F-runtime group(s). You will receive a notice when the automatically added F-blocks require more local data than configured.

⚠ WARNING

The calculated maximum runtime of the F-runtime group using the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is no longer correct in this case because the calculation assumes sufficient availability of F-local data.

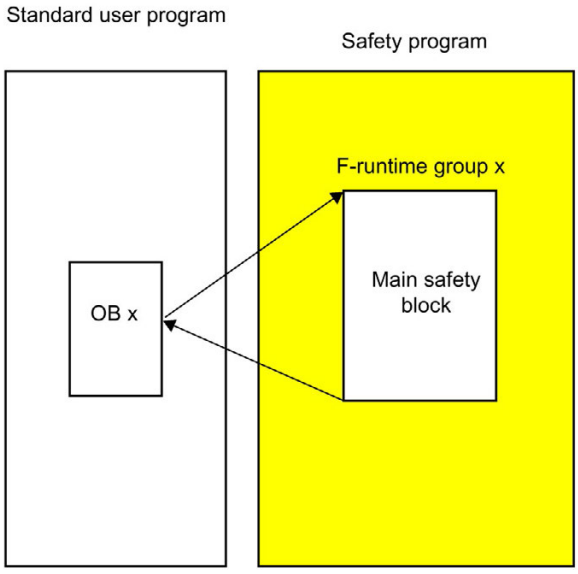
In this case, use the value you configured for the maximum cycle time of the F-runtime group (F-monitoring time) as the maximum runtime of the F-runtime group when calculating the maximum response times in the event of an error and for any runtimes of the standard system using the above-mentioned Excel file. *(S004)*

The maximum possible amount depends on:

- Local data requirement of the main safety block and the higher-level standard user program. For this reason, you should call the main safety blocks directly in OBs (cyclic interrupt OBs, whenever possible), and additional local data should not be declared in these cyclic interrupt OBs.
- Maximum volume of local data of the utilized F-CPU (see Technical Specifications in the product information for the utilized F-CPU). For S7-400 F-CPUs, you can configure the local data for each priority class. Therefore, assign the largest possible local data volume for the priority classes in which the safety program (the main safety blocks) is called (e.g., OB 35).

Maximum possible amount of local data as a function of local data requirement of main safety block and higher-level standard user program (S7-300, S7-400):

Case 1: Main safety block called directly from OBs

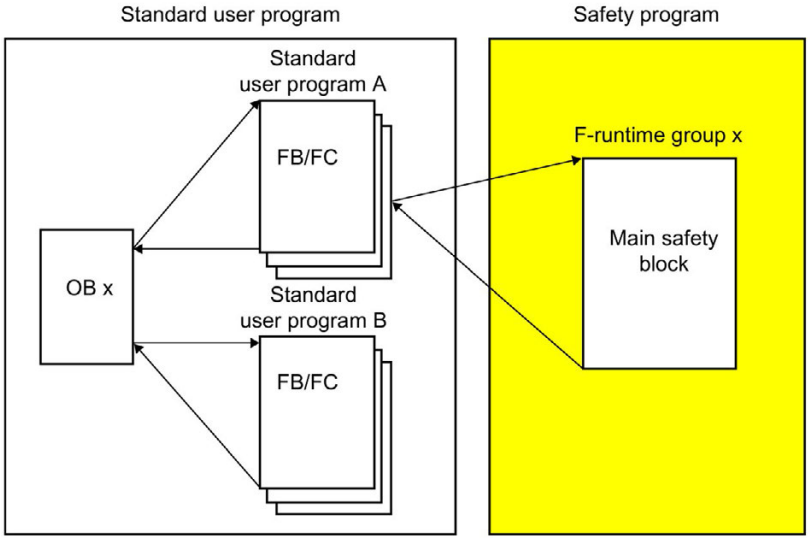


Set the "Local data used in safety program" parameter to the maximum amount of local data of the utilized F-CPU minus the local data requirement of the main safety block (if the main safety block has 2 F-runtime groups, use the largest local data requirement) and minus the local data requirement of the calling OBx (if there are 2 F-runtime groups, use the OB with the largest local data requirement).

Note: If you have not declared any temporary local data in the main safety blocks and calling OBx, the local data requirement of the main safety blocks is 6 bytes and the local data requirement of the calling OBx is 26 bytes. You can derive the local data requirement of the main safety blocks and calling OBx from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

Case 2: Main safety block not called directly from OBs



Set the "Local data settings" parameter to the value calculated for Case 1, minus the local data requirement of standard user program A (if standard user program A has 2 F-runtime groups, use the largest local data requirement).

Note: You can derive the local data requirement of the standard user program A from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

"Advanced settings"

"Safety mode can be disabled"

If you deselect the "Safety mode can be disabled" option, you can prevent the disabling of safety mode for a safety program.

When you change the setting for this option, you need to recompile the safety program and download it to the F-CPU for the change to become effective. This changes the collective F-signature of your safety program.

We recommend that you disable this option before you start production and before acceptance of the safety program to prevent an unintentional disabling of the safety mode.

"Enable F-change history"

Enable the logging of changes to the safety program by using the "Enable F-change history" option. For more information, refer to the section "F-change history (Page 307)".

"System-generated objects" (S7-1200, S7-1500)

The "Debug" button is provided for service and support purposes.

Access protection

4

Access protection is necessary for productive operation

Access protection to the SIMATIC Safety F-system is mandatory for productive operation.

No access protection is initially necessary for test purposes, commissioning, etc. This means you can execute all offline and online actions without access protection, i.e., without password prompt.

⚠ WARNING

Access to the SIMATIC Safety F-system without access protection is intended for test purposes, commissioning, etc., when the system is not in productive operation. You must guarantee the safety of the system through other organizational measures, for example, restricted access to certain areas.

Before you transition into productive operation, you must have set up and activated access protection. *(S005)*

Note

(S7-300/400) If you also want to download an F-CPU with *STEP 7 Distributed Safety*, you must specify the password for the F-CPU because assignment of a password is mandatory for the F-CPU in *STEP 7 Distributed Safety* .

4.1 Overview of access protection

Introduction

You can protect access to the SIMATIC Safety F-system by two password prompts: one for the safety program and another for the F-CPU.

Password for the safety program

The password for the safety program is available in two forms:

- The offline password is part of the safety program in the offline project on the programming device or PC.
- The online password is part of the safety program in the F-CPU.

Password for the F-CPU

The access protection is set at the F-CPU level. This password is also used to identify the F-CPU and must therefore be unique network-wide.

Overview of password assignment and prompt

The following table provides an overview of the access permissions for the F-CPU and the safety program.

The sections below show you how to assign the passwords and how to set up, change, and cancel access permissions for the F-CPU and the safety program.

	Password for F-CPU	Password for safety program
Assignment	In the *hardware and network editor*, during configuration of the F-CPU, inspector window, in "Settings" tab under "Protection", corresponding safety level, e.g., "Write protection for fail-safe blocks" (S7-300, S7-400). Select at least the access level "Full access (no protection)" for S7-1200/1500 F-CPUs and assign a password for "Full access incl. fail-safe (no protection)". If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".	In the *Safety Administration Editor* under "Access Protection".
Prompt	If you do not have access permission for the safety program (Page 83): For example • When the safety program is downloaded in its entirety • (S7-300, S7-400) When the hardware configuration is downloaded • (S7-1200, S7-1500) When a hardware configuration is downloaded that includes safety-related changes • When PROFIsafe address is assigned • When F-blocks that are used in the safety program are downloaded and deleted • When disabling safety mode • When restoring a backup of the F-CPU. Exception with S7-1200/1500 F-CPUs: If neither the safety program nor the F-CPU password is changed by the restore process, you are not prompted for the F-CPU password.	If you have assigned a password and this has not yet been entered since the project was opened, or you do not have access permission for the safety program (Page 83): **Offline password** e.g.: • When the password is changed • When modifying the safety program • When changing and deleting F-runtime groups • When changing safety-related parameters of F-I/O **Online password** e.g., when disabling safety mode (the password must always be entered, even if access permission for the safety program is still valid)

Safety program recompilation is required after changes to standard DBs to which the safety program has read or write access (Page 165). These standard DBs are not governed by the safety program access protection.

Please note that you also require the online password to download the safety-relevant changes to the hardware configuration. This is also true for changes to F-I/O not used in the safety program.
You have to also recompile and download the safety program for the download to be consistent.

4.2 Access protection for the safety program

Setting up access protection for the safety program

To set up access protection for the safety program, assign a password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Access protection" in the area navigation.
3. Under "Offline safety program protection", click "Setup" and enter the password (max. 30 characters) for the safety program in the following dialog in the "New password" and "Confirm password" fields.
4. Confirm the assigned password with "OK".

You have set up access protection for the safety program and have gained access permission for the safety program.

Note

You cannot define the online password separately; the offline password assigned during the next download is applied. After a change to the offline password, the online and offline passwords may differ until the next time the offline safety program is downloaded to the F-CPU.

Note

Use different passwords for the F-CPU and the safety program to optimize access protection.

⚠ WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the password protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

Changing the password for the safety program

You may change the safety program password as long as you have the necessary access permissions. It takes place likewise in the "Access protection" area (via "Change" button) and is carried out as usual under Windows through entry of the old and double entry of the new password.

Deleting access protection for the safety program

To delete access protection for the safety program, delete the password for the safety program. Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Access protection" in the area navigation.
4. Click the "Change" button.
5. Under "Old password", enter the password for the safety program.
6. Click "Revoke" and then on "OK".

Gaining access permission through login to the safety program

Log in to the safety program as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to access protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Access protection" in the area navigation.
4. Enter the password for the safety program in the "Password" input field.
5. Select the "Login" button.

Validity of access permission for a safety program

If access permission for a safety program was obtained through the entry of the password, this remains until the project is closed. If *STEP 7* is closed, any project that is still open is automatically closed and any access permission granted is canceled.

Canceling access permission through logoff

The access permission for the safety program can be canceled as follows:

- By clicking the "Log off" button in the "Access protection" area in the "*Safety Administration Editor*".
- In the shortcut menu for the *Safety Administration Editor* shortcut menu (access by right-clicking).
- By using the lock symbol in the line of the *Safety Administration Editor*.

The user will then be prompted to enter the password for the safety program again the next time an action requiring a password is performed. To "cancel" access permission when using the Modify function, the connection to the F-CPU must first be terminated (e.g. with the "Online > Go offline" menu command or the corresponding icon in the toolbar).

Access permission for the safety program is canceled automatically, if the project or *STEP 7* has been closed.

Displaying the validity of access permission

The validity of the access permission is displayed in the project tree as follows:

- The access permission is valid, if the lock symbol in the line of the *Safety Administration Editor* is shown unlocked.
- The access permission is not available, if the lock symbol shows a closed lock.
- If no lock symbol is shown, no password was assigned.

4.3 Access protection for the F-CPU

Setting up access protection for the F-CPU

To set up access protection for the F-CPU, assign a password for the F-CPU in the F-CPU configuration.

You arrive there directly, if you click the link "Go to the "Protection" area of the F-CPU" in the "Access protection" area in the *Safety Administration Editor*. Proceed as described in the *STEP 7* help under "Configuring access levels".

⚠ WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

⚠ WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. For this purpose, configure at least the protection level "Full access (no protection)" and assign a password under "Full access incl. fail-safe (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".

Assign different passwords for the individual protection levels. *(S041)*

You enable access protection by downloading (Page 271) the hardware configuration to the F-CPU.

⚠ WARNING

If **multiple F-CPUs** can be reached over a network (e.g. Industrial Ethernet) by **one programming device or PC**, you must take the following actions to ensure that the project data is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.

Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- The last download of the safety program prior to switching to productive operation must be made with enabled access protection. *(S021)*

⚠ WARNING

The use of tools for the automation/operation of user interfaces (e.g. TIA Portal, Web server) which allow access protection for the F-CPU to be bypassed (e.g. saving or automatic entry of an F-CPU password or Web server password), is not permitted. *(S078)*

Changing the password for the F-CPU

For the new password to become valid after a password change for the F-CPU, you must download the changed configuration into the F-CPU. If necessary, you must enter the "old" password for the F-CPU for this load operation. The F-CPU must be in STOP mode.

Deleting access protection for the F-CPU

To delete access protection for the F-CPU, delete the password for the F-CPU. To do this, proceed as in the standard.

Obtaining access permission for the F-CPU

You obtain access permission for the F-CPU - depending on the configured protection level - by entering the password for the F-CPU prior to performing an action requiring a password.

Obtaining access permission for the F-CPU

Access permission for the F-CPU remains valid until the project is closed in *STEP 7* or access permission is canceled.

Canceling access permission for the F-CPU

You cancel the access permission with the menu command "Online > Delete access rights" auf.

⚠ WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the access protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

4.4 Access protection through organizational measures

To prevent that a safety program is swapped without authorization by exchanging removable media (e.g. flash card, SIMATIC Micro Memory Card or hard disk with WinAC RTX F), you must observe the following warning:

⚠ WARNING

You must limit access to the F-CPU to persons who are entitled for plugging removable media through access protection. *(S079)*

To prevent that a WinAC RTX F or an S7-1500 F Software Controller is accidentally uninstalled or installed, you must observe the following warning:

⚠ WARNING

You must limit access to a WinAC RTX F or an S7-1500 F Software Controller through access protection to persons who are authorized to uninstall or install a WinAC RTX F or an S7-1500 F Software Controller (e.g. by using Windows administrator rights (ADMIN)). *(S075)*

The "Delete Configuration" function is only offered in the panel of the PC station with an S7-1500 F Software Controller when no access protection is set up on the F-CPU. We therefore recommend that you do not set up F-access protection until after commissioning.

To prevent unauthorized restoration of the safety program, formatting of the F-CPU and deleting program folders using the display of an S7-1500 F-CPU, you must observe the following warning:

WARNING

The display password may only be given to persons who are authorized to restore safety programs, format the F-CPU and delete program folders. If a password is not set up for the display, you must protect the display through organizational measures against unauthorized operation. For example by setting up access protection for specific rooms. *(S063)*

To prevent unauthorized restoration of the safety program with the Web server in an S7-1200/1500 F-CPU, you must observe the following warning:

WARNING

The "F-admin" authorization for Web server without password protection (user "Everybody" or "Anyone") is only intended for test purposes, maintenance, etc. This means only when the system is not in productive operation. In this case you must ensure the safety of the system through other organizational measures. For example by setting up access protection for specific rooms.

Before you transition into productive operation, you must remove the "F-admin" right for the user "Everybody".

Only authorized personnel may have access to the password of the Web server user with the "F-admin" right. After downloading the hardware configuration, check whether only permitted users of the Web server have the "F-admin" right on the F-CPU. To do so, use the online view of the *Safety Administration Editor* (see also Safety Administration Editor (Page 68)).

Saving the login file and the password of the Web server in the browser is only permitted when use by unauthorized persons is prevented through other organizational measures (e.g. access protection to the PG/PC). *(S064)*

Programming

5

5.1 Overview of Programming

Introduction

A safety program consists of F-blocks that you create using the FBD or LAD programming language and F-blocks that are automatically added. Fault detection and reaction measures are automatically added to the safety program you create, and additional safety-related tests are performed. Moreover, you have the option to incorporate special ready-made safety functions in the form of instructions into your safety program.

An overview of the following is given below:

- The structure of the safety program
- The fail-safe blocks
- Differences in the programming of the safety program with FBD/LAD compared to programming of standard user programs

5.1.1 Program structure of the safety program (S7-300, S7-400)

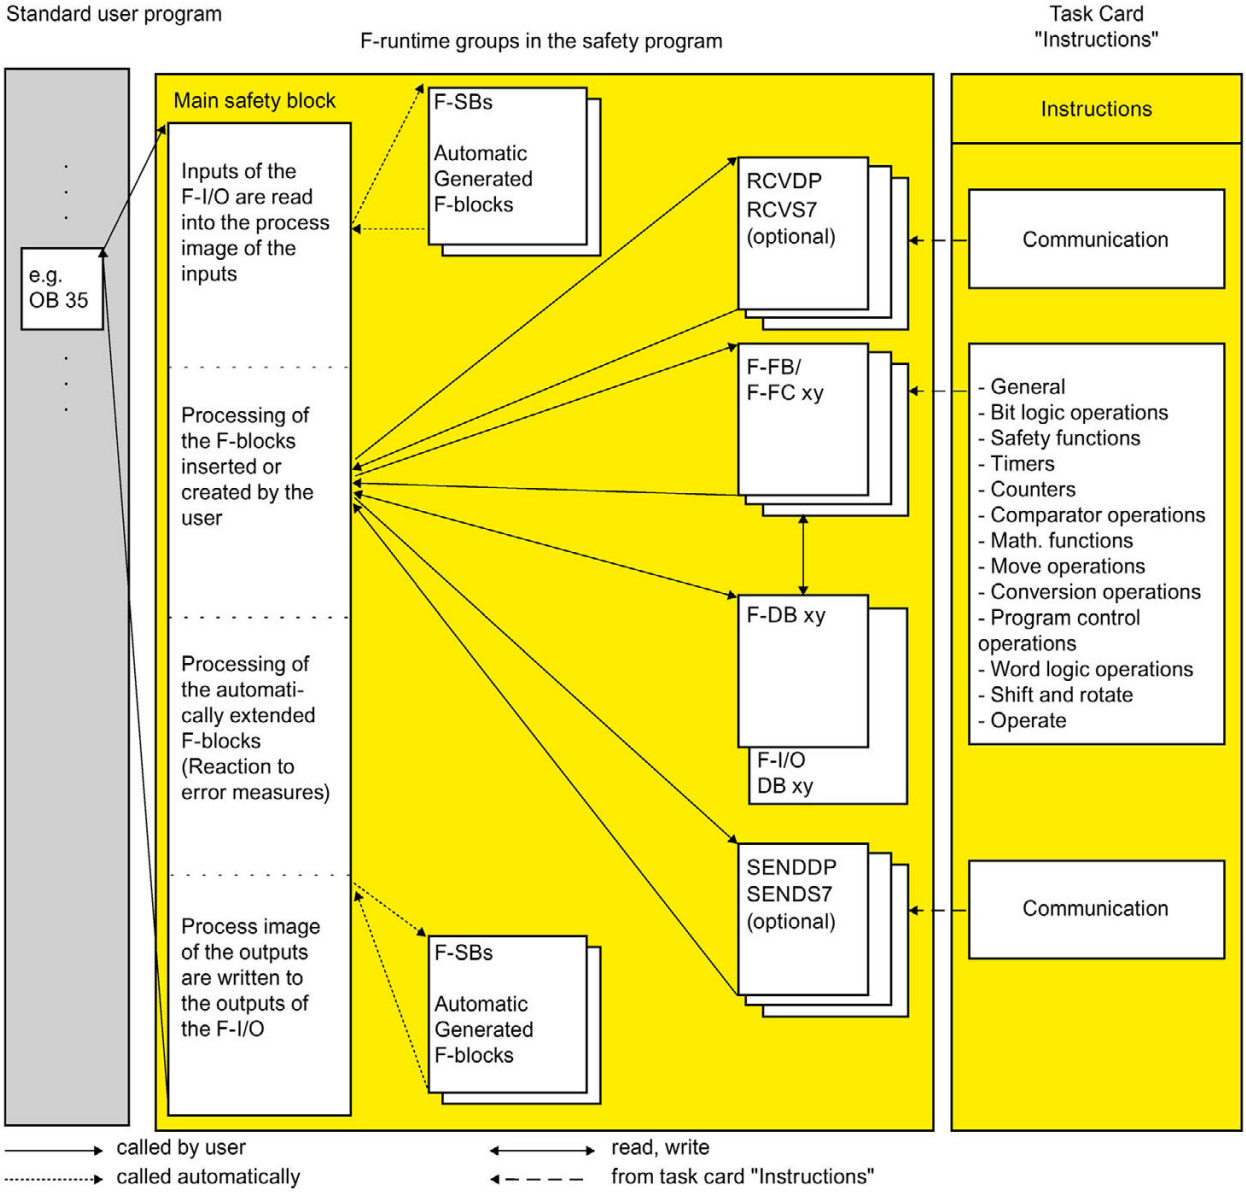
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks, automatically generated F-blocks, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-300/400 F-CPU.

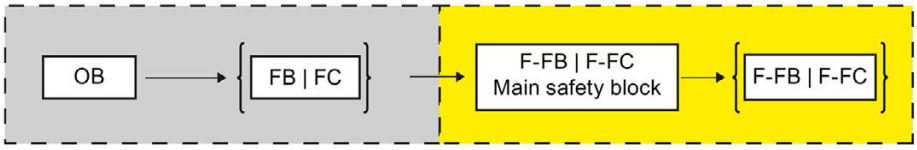


Main safety block

The main safety block is the first F-block of the safety program that you program yourself. During compiling, it is supplemented by additional invisible calls of F-system blocks.

You must assign the main safety block to an F-runtime group (Page 109).

The main safety block in an S7-300/400 F-CPU is called from any block in the standard user program. We recommend a call from an OB 3x.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- a main safety block (an F-FB/F-FC that you assign to the OB)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

5.1.2 Program structure of the safety program (S7-1200, S7-1500)

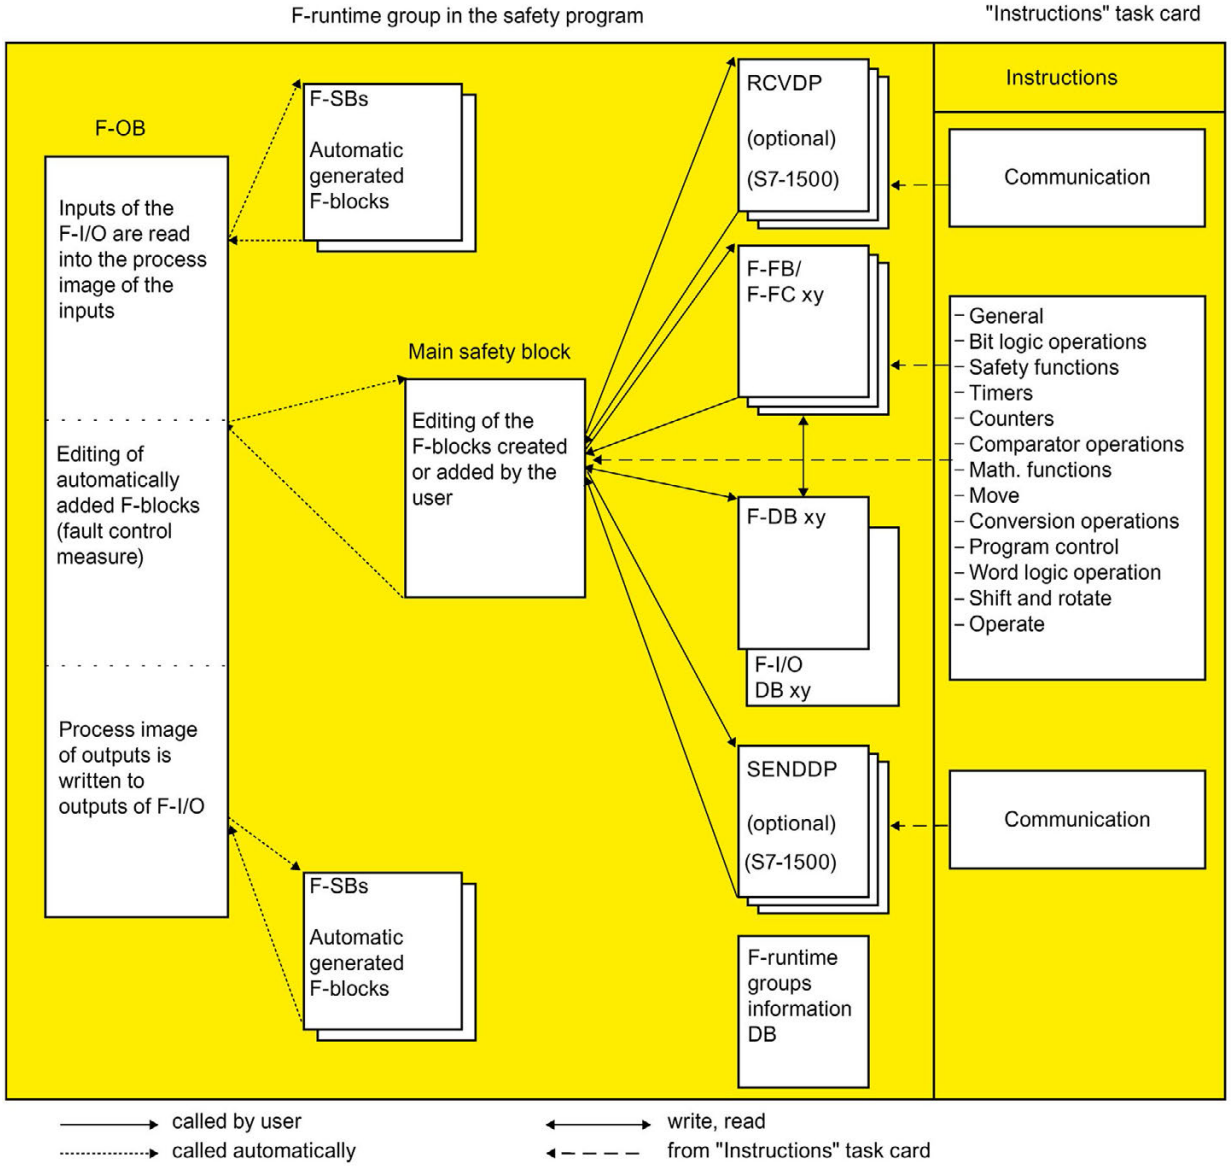
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks F-SBs, automatically generated F-blocks, F-runtime DB, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-1200/1500 F-CPU.

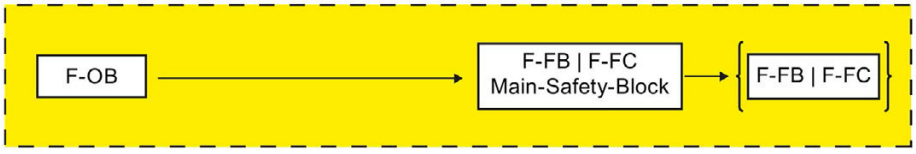


Main safety block

The main safety block is the first F-block of the safety program that you program yourself.

You must assign the main safety block to an F-runtime group (Page 109).

The main safety block in an S7-1200/1500 F-CPU is called by the F-OB assigned to the F-runtime group.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- An F-OB which calls the main safety block
- A main safety block (an F-FB/F-FC that you assign to the F-OB)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-runtime group information DB
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

See also

F-runtime group information DB (S7-1200, S7-1500) (Page 118)

5.1.3 Fail-Safe Blocks

F-blocks of an F-runtime group

The following table shows the F-blocks that you use in an F-runtime group:

F-block	Function	S7-300/400 F-CPUs	S7-1200/1500 F-CPUs
Main safety block	The first step in programming of the safety program is the main safety block. The main safety block in S7-300/400 F-CPUs is an F-FC or F-FB (with instance DB), which is called by a standard block (recommendation: OB 35) from the standard user program. The main safety block in S7-1200/1500 F-CPUs is an F-FC or F-FB (with instance DB), which is called by the F-OB.	X	X
F-FB/F-FC	Both in the main safety block as well as additional F-FBs and F-FCs, you can perform the following: • Program the safety program with the instructions available for F-blocks in FBD or LAD • Call other created F-FBs/F-FCs for structuring the safety program • Insert F-blocks from the project library or global libraries	X	X
F-DB	Optional fail-safe data blocks that can be read- and write-accessed within the entire safety program.	X	X
F-I/O DB	An F-I/O DB is automatically generated for each F-I/O when it is configured. You can or you must access the tags of the F-I/O DB in conjunction with F-I/O accesses.	X	X
F-shared DB	The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system.	X	—
F-runtime group information DB	An F-runtime group information DB is created when you create an F-runtime group. The F-runtime group information DB provides information on the F-runtime group and on the safety program as a whole.	—	X

Note

You are not permitted to insert F-system blocks from the "System blocks" folder in a main safety block/F-FB/F-FC.

Instructions for the safety program

In the "Instructions" task card, you can find instructions for the F-CPU used and which you can to use program the safety program.

You can find instructions that you know from the standard user program, such as bit logic operations, mathematical functions, functions for program control, and word logic operations.

Moreover, there are instructions with safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, feedback monitoring and instructions for safety-related communication between F-CPUs.

Additional information

For a detailed description of the instructions for the safety program, refer to Overview of instructions (Page 335).

Using instruction versions

As with the instructions for the standard user program, there may also be different versions of the instructions for the safety program.

Additional information on instruction versions can be found in the help on STEP 7 in "Basics for instruction versions".

Further information on the differences of the individual versions of the instructions for the safety program can be found in the relevant chapter of the instructions.

Note

Note the following:

- If you change the version of an instruction used in the safety program in the task card “Instructions” to a version which does not have identical functions, the functioning of your safety program may change after recompiling the safety program. In addition to the signature of the F-block which uses the instruction, the collective F-signature of your safety program also changes. You may have to perform an acceptance test (Page 323).
- If you use a know-how protected F-block in your safety program which uses an instruction which is not the same version as that set in the task card “Instructions”, when the program is compiled without entering the password for the know-how protected F-block, it is adjusted to the version set in the task card “Instructions”. If the instruction versions do not have identical functions, the functioning of the know-how protected F-block may change and always its signature.

5.1.4 Restrictions in the programming languages FBD/LAD

LAD and FBD programming languages

The user program in the F-CPU typically consists of a standard user program and a safety program.

The standard user program is created using standard programming languages such as SCL, STL, LAD, or FBD.

For the safety program, LAD or FBD may be used with certain restrictions in the instructions and the applicable data types and operand areas. Please also note the restrictions for the individual instructions.

Supported instructions

The instructions available depend on the F-CPU used. You can find the supported instructions in the description of the instructions (starting from STEP 7 Safety V14 instructions (Page 335)).

Note

Preconnection of enable input EN or evaluation of enable output ENO is not possible.

Supported data types and parameter types

Only the following data types are supported:

- BOOL
- INT
- WORD
- DINT
- DWORD (S7-300, S7-400)
- TIME
- F-compliant PLC data type (UDT) (S7-1200, S7-1500)

Note

If the result of an instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
You must therefore ensure that the permitted range for the data type is observed when creating the program or select a matching data type.

Non-permitted data and parameter types

The following types are **not** permitted:

- All types not listed in the section "Supported data types and parameters types" (e.g. BYTE, REAL)
- Complex data types (e.g., STRING, ARRAY, STRUCT, PLC data type (UDT) (S7300/400))
- Parameter types (e.g. BLOCK_FB, BLOCK_DB, ANY)

Supported operand areas

The system memory of an F-CPU is divided into the same operand areas as the system memory of a standard CPU. You can access the operand areas listed in the table below from within the safety program.

Table 5- 1 Supported operand areas

Operand area	Access via units of the following size:	S7 Notation	Description
Process image of the inputs			
• Of F-I/O	Input (bit) Input word Input double-word	I IW ID	Only read-only access to input channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. The process image of the inputs of F-I/O is updated prior to the start of the main safety block.
• Of standard I/O	Input (bit) Input word Input double-word	I IW ID	Input channels of standard I/O can only be accessed read-only. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In addition, a process-specific validity check is required. See the *STEP 7 help* for the update times of the process image of the inputs of standard I/O.
Process image of the outputs			
• Of F-I/O	Output (bit) Output word Output double-word	Q QW QD	Only write-only access to output channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the F-I/O are calculated and stored in the process image of the outputs. The process image of the outputs for F-I/O is updated after the end of the main safety block.

Operand area	Access via units of the following size:	S7 Notation	Description
• Of standard I/O	Output (bit) Output word Output double-word	Q QW QD	Output channels of standard I/O are write-only channels. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the standard I/O are also calculated and stored in the process image of the outputs, if needed. See the *STEP 7 help* for the update times of the process image of the outputs of standard I/O.
Bit memory	Bit memory (bit) Memory word Memory double word	M MW MD	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. A particular element of the bit memory can be either read- or write-accessed in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Note that it is only permitted to use bit memory for connecting the standard user program and the safety program; it must not be used as a buffer for F-data.
Data blocks			
• F-DB	Data bit Data word Data double word	DBX DBW DBD	Data blocks store information for the program. They can either be defined as global data blocks such that all F-FBs, F-FCs, or main safety blocks can access them or assigned to a particular F-FB or main safety block (instance DB). A tag of a shared DB can only be accessed from one F-runtime group, and an instance DB only from the F-runtime group in which the corresponding F-FB/instruction is called.
• DB	Data bit Data word Data double word	DBX DBW DBD	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. For a tag of a DB, either read access or write access is possible in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Please note that the tags of a DB can only be used for transferring data between the standard user program and the safety program; DBs must not be used as a buffer for F-data.
Temporary local data	Local data bit Local data word Local data double word	L LW LD	This memory area holds the temporary tags of a block (or F-block) while the (F-) block is being executed. The local data stack also provides memory for transferring block parameters and for saving intermediate results.

File type conversion

Just as with the standard user program, there are two possibilities for file type conversion in the safety program.

- Implicit conversion

  The implicit conversion is executed as in the standard user program with the following restrictions: The bit length of the source data type has to match the bit length of the destination data type.

- Explicit conversion

  You use an explicit conversion instruction (Page 478) before the actual instruction is executed.

Slice access

Slice access is not possible in the safety program.

Non-permitted operand areas

Access via units other than those listed in the table above is **not** permitted. The same applies to access to operand areas not listed, in particular:

- Data blocks that were automatically added

  Exception: Certain tags in the F-I/O DB (Page 135) and in the F-shared DB (S7-300, S7-400) (Page 118) or F-runtime group information DB (S7-1200, S7-1500) (Page 118)

- I/O area: Inputs
- I/O area: Outputs

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-300, S7-400)

The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-300/400 F-CPUs as "Tags" "RLO0" and "RLO1" in the F-shared DB. You access them through a fully qualified DB access ("F_GLOBDB".RLO0 or "F_GLOBDB".RLO1).

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-1200, S7-1500)

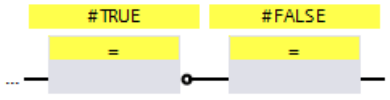
The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-1200/1500 F-CPUs to assign parameters during block calls.

You can also create "1" or "TRUE" in a tag with the help of the "Assignment (Page 344)" instruction.

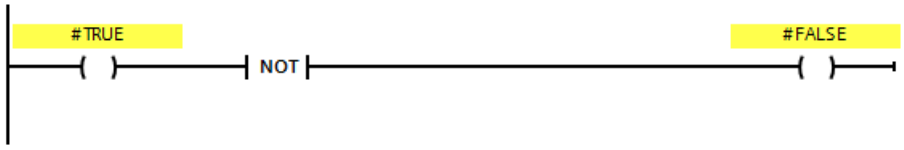
To do so, do not interconnect the box input of the "Assignment" instruction in FBD. In LAD, you interconnect the input directly with the power rail.

You obtain a tag with "0" or "FALSE" by subsequent inversion with the instruction "Invert RLO (Page 341)".

Example FBD:



Example LAD:



Operand area of temporary local data: Particularities

Note

Note when using the operand area of temporary local data that the first access of a local data element in a main safety block/F-FB/F-FC must always be a write access. This initializes the local data element.

Make sure that a temporary local data element is initialized prior to the first JMP, JMPN, or RET instruction.

The "local data bit" should be initialized with the Assign ("=") (FBD) or ("--( )") (LAD) instruction. Assign the local data bit a signal state of "0" or "1" as a Boolean constant.

Local data bits cannot be initialized with the Flip Flop (SR, RS), Set Output (S) or Reset Output (R) instructions.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

"Fully qualified DB access"

Access to tags of a data block in an F-FB/F-FC is "fully qualified DB access". This also applies to initial access to tags of a data block after a jump label.

For S7-300/400 F-CPUs, only initial access needs to be "fully qualified DB access". Alternatively, you can use the instruction "OPN".

Example of "fully qualified DB access":

Assign a name for the F-DB, e.g. "F_Data_1". Use the names assigned in the declaration of the F-DB instead of the absolute addresses.

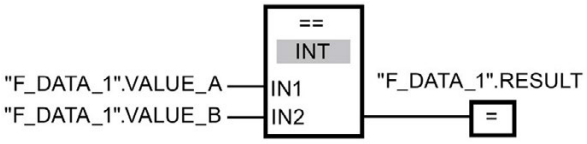


Figure 5-1 Example with fully-qualified access

Example of "non-fully qualified DB access" (S7-300, S7-400):

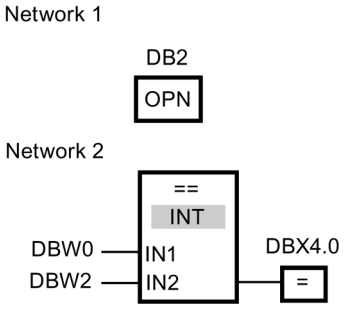

Figure 5-2 Example without fully-qualified access

Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

5.1.5 F-compliant PLC data types (UDT) (S7-1200, S7-1500)

Introduction

You declare and use F-compliant PLC data types (UDT) as you would standard PLC data types (UDT). You can use F-compliant PLC data types (UDT) in the safety program as well as in the standard user program.

Differences to standard PLC data types (UDT) are described in this chapter.

Information on the use and declaration of standard PLC data types (UDT) is available in the *STEP 7 online help* under "Declaring PLC data types".

Declaring F-compliant PLC data types (UDT)

You declare F-compliant PLC data types (UDT) as you would PLC data types (UDT).

In F-compliant PLC data types (UDT), you can use all data types (Page 97) that you can also use in safety programs.

Nesting of F-compliant PLC data types (UDT) within F-compliant PLC data types (UDT) is not supported.

Proceed as follows for declaration:

1. Click on "Add new PLC data type" in the "PLC Data Types" folder in the project tree.
2. To create an F-compliant PLC data type (UDT), enable the option "Create F-compliant PLC data type" in the "Add new PLC data type" dialog.
3. Proceed as described in the *STEP 7 online help* under "Programming structure of PLC data types".

You specify default values for F-compliant PLC data types (UDT) during the declaration.

Using F-compliant PLC data types (UDT)

You use F-compliant PLC data types as you would standard PLC data types (UDT).

Changes to F-compliant PLC data types (UDT)

You need the password for the safety program to change F-compliant PLC data types (UDT). Regardless if you are using the F-compliant PLC data type (UDT) in an F-block, in a standard block or not at all.

See also

"F-compliant PLC data types" area (S7-1200, S7-1500) (Page 74)

5.1.5.1 Grouping PLC tags for inputs and outputs of F-I/O in structures (S7-1200, S7-1500)

You group PLC tags for inputs and outputs of F-I/O in structures (structured PLC tag) as you would for inputs and outputs of standard I/O.

Use F-compliant PLC data types (UDT).

Rules

When creating structured PLC tags for inputs and outputs of F-I/O, you must also observe the following rules in addition to the rules in the standard:

- You must not group inputs/outputs of standard I/O and F-I/O at the same time in a structured PLC tag.
- You may only group inputs/outputs of actually existing channels (channel value and value status) in a structured PLC tag.

  See also Addressing F-I/O (Page 128)
- You may only group inputs/outputs of channels (channel value and value status) that are enabled in the hardware configuration in a structured PLC tag.

  See also Addressing F-I/O (Page 128)
- You may only group inputs of channels (channel value and value status) that provide the result of the "1oo2 sensor evaluation" with set "1oo2 sensor evaluation".

  See also Addressing F-I/O (Page 128)
- In a structured PLC tag for an F-I/O with outputs, you must either group all outputs of this F-I/O or an output range with multiples of 16 bits.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
- A structured PLC tag that groups outputs of an F-I/O must not overlap with other PLC tags.

  The F-CPU can go to STOP mode if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

To observe these rules, you must declare the F-compliant PLC data type that is used for the structured PLC tag accordingly.

You can find the addresses allocated to a structured PLC tag in the "IO tags" tab of an F-I/O configuration.

5.1.5.2 Example of structured PLC tags for inputs and outputs of F-I/O (S7-1200, S7-1500)

Introduction

This example uses the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation to demonstrate how you use structured PLC tags for access to F-I/O.

Channel structure of the 4 F-DI/3 F-DO DC24V/2A F-module

The table below sets out the channel structure and address assignment of the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation. You may only access existing and enabled channels (addresses I11.0 to I11.3 and I12.0 to I12.3). These channels provide the result of 1oo2 evaluation generated internally in the F-module.

Table 5- 2 Channel structure and addresses of the channel values of inputs with 1oo2 evaluation

Channel	Address
DI channel 0 channel value	I11.0
DI channel 1 channel value	I11.1
DI channel 2 channel value	I11.2
DI channel 3 channel value	I11.3
—	I11.4
—	I11.5
—	I11.6
—	I11.7

Table 5- 3 Channel structure and addresses of the value status of the inputs with 1oo2 evaluation

Channel	Address
DI channel 0 value status	I12.0
DI channel 1 value status	I12.1
DI channel 2 value status	I12.2
DI channel 3 value status	I12.3
—	I12.4
—	I12.5
—	I12.6
—	I12.7

Table 5- 4 Channel structure and addresses of the value status of outputs

Channel	Address
DO channel 0 value status	I13.0
DO channel 1 value status	I13.1
DO channel 2 value status	I13.2
DO channel 3 value status	I13.3

Table 5- 5 Channel structure and addresses of the channel values of outputs

Channel	Address
DO channel 0 channel value	Q11.0
DO channel 1 channel value	Q11.1
DO channel 2 channel value	Q11.2
DO channel 3 channel value	Q11.3

Creating F-compliant PLC data types (UDT)

Create two F-compliant PLC data types (UDT), for example, for access to all channels.

The figure below shows an F-compliant PLC data type (UDT) for access to the channel values and value status of the inputs with 1oo2 evaluation:

4 F-DI/3 F-DO DC24V/2A_DI

	Name	Data type	Comment
1	CH_DI_0	Bool	Channel 0 (DI)
2	CH_DI_1	Bool	Channel 1 (DI)
3	CH_DI_2	Bool	Channel 2 (DI)
4	CH_DI_3	Bool	Channel 3 (DI)

Figure 5-3 F-compliant PLC data type (UDT) "4 F-DI/3 F-DO DC24V/2A_DI"

The figure below shows the F-compliant PLC data type (UDT) for access to the channel values and value status of the outputs:

4 F-DI/3 F-DO DC24V/2A_DO

	Name	Data type	Comment
1	CH_DO_0	Bool	Channel 0 (DQ)
2	CH_DO_1	Bool	Channel 1 (DQ)
3	CH_DO_2	Bool	Channel 2 (DQ)

Figure 5-4 F-compliant PLC data type (UDT) "4 F-DI/3 F-DO DC24V/2A_DO"

Using F-compliant PLC data types (UDT)

As demonstrated in the figure below, you can use the two F-compliant PLC data types (UDT) that you have created in an F-FC (e.g. "Motor"):

Motor

	Name	Data type	Default value	Comment
1	Input			
2	Motor SS DI	"4 F-DI/3 F-DO DC24V/2A_DI"		Motor interface channel values DI
3	CH_DI_0	Bool		Channel 0 (DI)
4	CH_DI_1	Bool		Channel 1 (DI)
5	CH_DI_2	Bool		Channel 2 (DI)
6	CH_DI_3	Bool		Channel 3 (DI)
7	Motor SS DI VS	"4 F-DI/3 F-DO DC24V/2A_DI"		Motor interface value status DI
8	CH_DI_0	Bool		Channel 0 (DI)
9	CH_DI_1	Bool		Channel 1 (DI)
10	CH_DI_2	Bool		Channel 2 (DI)
11	CH_DI_3	Bool		Channel 3 (DI)
12	Motor SS DO VS	"4 F-DI/3 F-DO DC24V/2A_DO"		Motor interface value status DQ
13	CH_DO_0	Bool		Channel 0 (DQ)
14	CH_DO_1	Bool		Channel 1 (DQ)
15	CH_DO_2	Bool		Channel 2 (DQ)
16	Output			
17	Motor SS DO	"4 F-DI/3 F-DO DC24V/2A_DO"		Motor interface channel values DQ
18	CH_DO_0	Bool		Channel 0 (DQ)
19	CH_DO_1	Bool		Channel 1 (DQ)
20	CH_DO_2	Bool		Channel 2 (DQ)
21	InOut			

Creating structured PLC tag for the F-module 4 F-DI/3 F-DO DC24V/2A

Create structured PLC tags for the F-module 4 F-DI/3 F-DO DC24V/2A:

Tag table_1

	Name	Data type	Address	Comment
1	TagDI_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DI"	%I11.0	Motor 1 DI
2	TagDI_VS_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DI"	%I12.0	Motor 1 DI VS
3	TagDO_VS_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DO"	%I13.0	Motor 1 DQ VS
4	TagDO_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DO"	%Q11.0	Motor 1 DQ

Accessing the F-FC

Transfer the structured PLC tags you have created when you call the F-FC (e.g. "Motor"):

Addressing F-I/O (Page 128)

Value status (S7-1200, S7-1500) (Page 130)

5.1.6 Editing PLC tags with external editors

To edit PLC tags with external editors follow the procedure as in the standard. Additional information can be found in the *STEP 7* help in "Editing PLC tags with external editors".

Note the following:

Note

After importing a tag table which contains tags used in the safety program, the collective F-signature of the safety program is reset.

To form the collective F-signature again you have to recompile the project data. For this, with access protection set up for the safety program, you need a valid access authorization for the safety program.

If you would like to edit PLC tags with external editors, we therefore recommend that you store PLC tags to be used in the safety program in a separate tag table.

5.1.7 Using Multiuser engineering

If you want to use Multiuser engineering, proceed as described in the STEP 7 help under "Using Multiuser engineering".

5.2 Defining F-Runtime Groups

5.2.1 Rules for F-Runtime Groups of the Safety Program

Rules

Note the following:

- The channels (channel values and value status) of an F-I/O can only be accessed from a single F-runtime group.
- Tags of the F-I/O DB of an F-I/O can only be accessed from one F-runtime group and only from that F-runtime group from which the channels or value status of this F-I/O are also accessed (if access is made).
- F-FBs can be used in more than one F-runtime group but they must be called with different instance DBs.
- Instance DBs of F-FB can only be accessed from the F-runtime group in which the associated F-FB is called.
- A tag of a global F-DB (except the F-global DB) can only be accessed from one F-runtime group (however, a global F-DB can be used in more than one F-runtime group).
- (S7-300, S7-400) A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", but only read-accessed by the "receiver" F-runtime group.
- (S7-300, S7-400) An F-communication DB can only be accessed from one F-runtime group.
- (S7-1200, S7-1500) You must not call the main safety block yourself. It is automatically called by the assigned F-OB.
- (S7-1200, S7-1500). The F-OB should be created with the highest priority of all OBs.
- (S7-300, S7-400) The main safety block may only be called once from a standard block. Multiple calls can cause the F-CPU to go to STOP mode.
- (S7-300, S7-400) For optimal use of temporary local data, you must call the F-runtime group (the main safety block) directly in an OB (cyclic interrupt OB, if possible); you should not declare any additional temporary local data in this cyclic interrupt OB.
- (S7-300, S7-400) Within a cyclic interrupt OB, the F-runtime group should be executed **before** the standard user program; i.e. it should be called at the very beginning of the OB, so that the F-runtime group is always called at fixed time intervals, regardless of how long it takes to process the standard user program.

For this reason, the cyclic interrupt OB should also not be interrupted by higher priority interrupts.

- The process image of the inputs and outputs of standard I/O, bit memory, and tags of DBs in the standard user program may be accessed either as read-only or read/write from more than one F-runtime group. (see also Data exchange between standard user program and safety program (Page 165))
- F-FCs can generally be called in more than one F-runtime group.

Note

You can improve performance by writing sections of the program that are not required for the safety function in the standard user program.

When determining which elements to include in the standard user program and which to include in the safety program, you should keep in mind that the standard user program can be modified and downloaded to the F-CPU more easily. In general, changes in the standard user program do not require an acceptance.

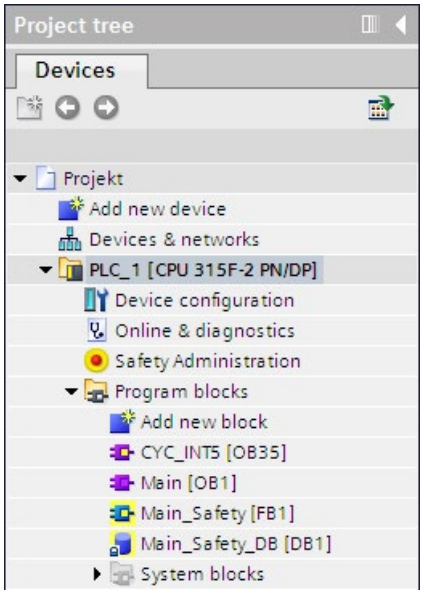
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400)

Requirements

In your project, you have selected an S7-300 or S7-400 F-CPU from the "Hardware catalog" task card and inserted it into the *hardware and network editor*. In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default. You see the (F-)blocks of the F-runtime group (CYC_INT5 [OB 35], Main_Safety [FB 1], and Main_Safety_DB [DB1]) in the project tree when you open the "Program blocks" folder.

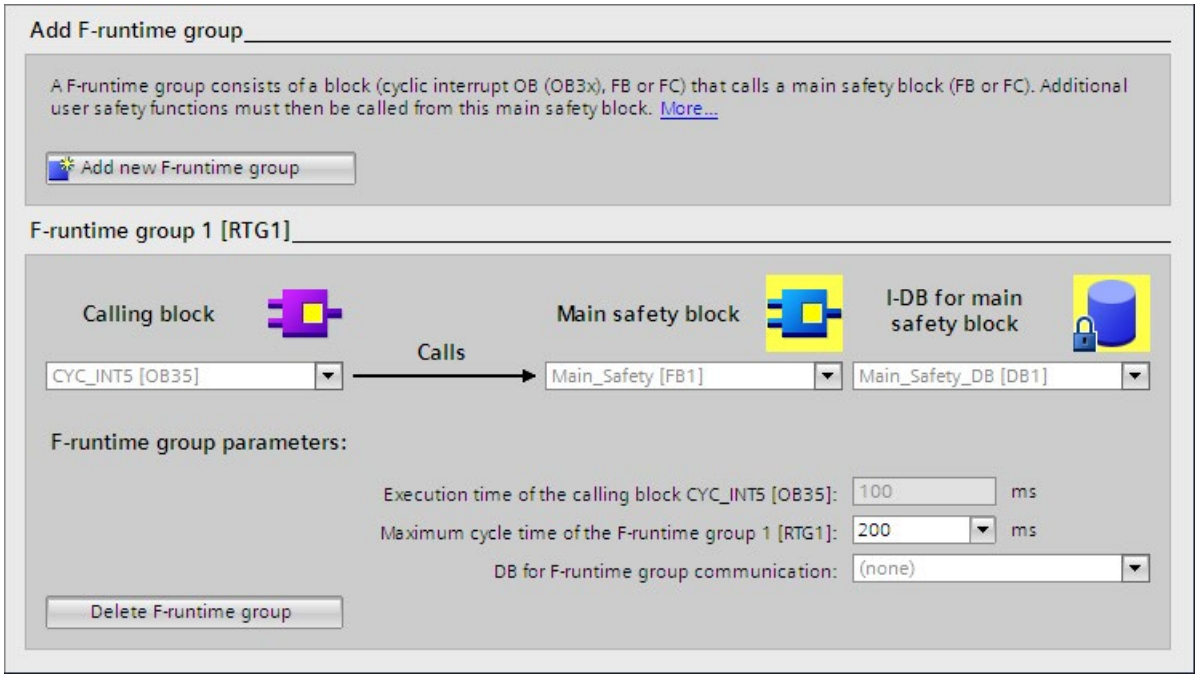


Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Specify the block in which the main safety block is to be called.

   Cyclic interrupt OB 35 is suggested here by default. The advantage of using cyclic interrupt OBs is that they interrupt the cyclic program execution in OB 1 of the standard user program at fixed time intervals; that is, the safety program is called and executed at fixed time intervals in a cyclic interrupt OB.

   In this input field, you can select only those blocks that were created in the LAD, FBD, or STL programming language. If you select a block here, the call is inserted automatically into the selected block and, if necessary, removed from a previously selected block.

   If you want to call the main safety block in a block that was created in another programming language, you must program this call itself. The input field is then not editable (grayed out), and you can change the call only in the calling block and not the *Safety Administration Editor*.

4. Assign the desired main safety block to the F-runtime group. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety [FB1] and Main_Safety_DB [DB1]) are suggested by default.

5. The F-CPU monitors the F-cycle time in the F-runtime group. For "Maximum cycle time of F-runtime group", enter the maximum permitted time between two calls of this F-runtime group.

> **⚠ WARNING**
>
> The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 434) from the "Instructions" task card and not using counters (OB calls). *(S007)*

6. If one F-runtime group is to provide tags for evaluation to another F-runtime group of the safety program, assign a DB for F-runtime group communication. Select an F-DB for "DB for F-runtime group communication". (See also Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400) (Page 115))
7. **Create an additional F-runtime group** by clicking the "Add new F-runtime group" button.
8. Assign an F-FB or F-FC as the main safety block to a calling block. This F-FB or F-FC is automatically generated in the project tree, if not already present.
9. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
10. Follow steps 3 and 4 above to complete generation of the second F-runtime group.

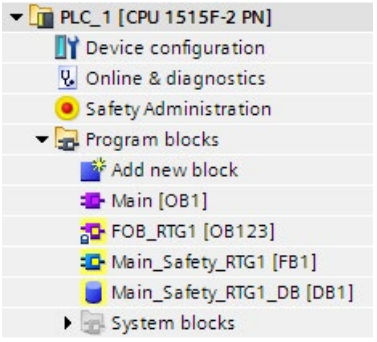
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500)

Requirements

In your project, you have selected an S7-1200/1500 F-CPU from the "Hardware catalog" task card and inserted it into the *hardware and network editor*. In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default. The (F-)blocks of the F-runtime group (FOB_RTG1 [OB123], Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1]) are shown in the project tree when you open the "Program blocks" folder.

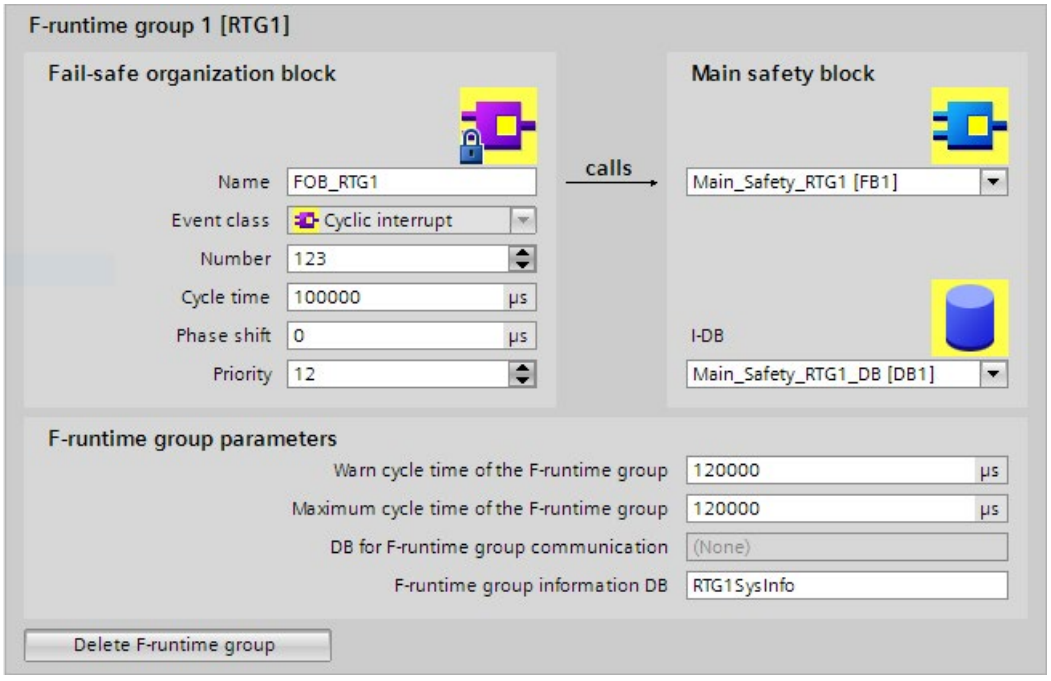


Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Assign a name for the F-OB under "F-OB". The F-OB calls the main safety block.

   By default, the F-OB is created with the event class "cyclic interrupt OB". The advantage of the event class "cyclic interrupt OB" is that the F-OB calls the main safety block, and therefore the safety program, at set intervals.

4. Assign the F-OB a number.

5. Assign parameters for the cycle time, phase shifting and priority of the F-OB.

   Select a cycle time which is less than the "Maximum cycle time of F-runtime group" and less than the "Warn cycle time of the F-runtime group".

   Select a phase shift which is less than the cycle time.

   Note

   You can also specify the event class "cyclic" for the F-OB. Keep in mind that the F-OB has the lowest priority in this case and that the runtime as well as the reaction time of the safety program are also influenced by the standard user program.

   Note

   We recommend creating the F-OB with the highest priority of all OBs. This will ensure:
   - Defined response times
   - Guaranteed data consistency during data communication between the standard and safety program. See also Data exchange between standard user program and safety program (Page 165).

6. Assign the calling main safety block to the F-OB. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1] are suggested by default.

7. The F-CPU monitors the F-cycle time in the F-runtime group. Two parameters are available:
   – If "Warn cycle time of the F-runtime group" is exceeded, an entry is written to the diagnostics buffer of the F-CPU. This parameter can, for example, be used to determine whether the cycle time exceeds a required value without the F-CPU switching to STOP mode.
   – If "Maximum cycle time of F-runtime group" is exceeded, the F-CPU switches to STOP mode. For "Maximum cycle time of F-runtime group", select the maximum permitted time between two calls of this F-runtime group (maximum of 20000000 µs).

   ⚠ WARNING

   The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 434) from the "Instructions" task card and not using counters (OB calls). *(S007)*

   "Warn cycle time of the F-runtime group" must be configured as less than or equal to the "Maximum cycle time of F-runtime group".

8. Assign a name for the F-runtime group information DB (Page 118) under "F-runtime group DB".
9. **Create an additional F-runtime group** by clicking the "Add new F-runtime group" button.
10. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
11. Follow steps 3 to 6 above to complete generation of the second F-runtime group.

5.2.4 Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400)

Safety-related communication between F-runtime groups

Safety-related communication can take place between the two F-runtime groups of a safety program. This means fail-safe tags can be provided by one F-runtime group in an F-DB and read in another F-runtime group.

Note

A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", while it can only be read-accessed by the "receiver" F-runtime group.

Tip: You can improve performance by structuring your safety program in such a way that as few tags as possible are exchanged between the F-runtime groups.

Procedure for defining a DB for F-runtime group communication

You define the DB for F-runtime group communication in the work area "F-runtime groups". Proceed as follows:

1. Click "F-runtime groups" in "*Safety Administration Editor*".
2. Select an existing F-DB in the "DB for F-runtime group communication" field or assign a new one.
3. Assign a name to the F-DB.

Up-to-dateness of tags read from another F-runtime group

Note

Tags read are up-to-date as at the time of the last completed processing cycle of the F-runtime group providing the tags prior to start-up of the F-runtime group reading the tags.

If the tags supplied undergo multiple changes during runtime of the F-runtime group supplying the tags, the F-runtime group reading the tags only receives the last change (see figure below).

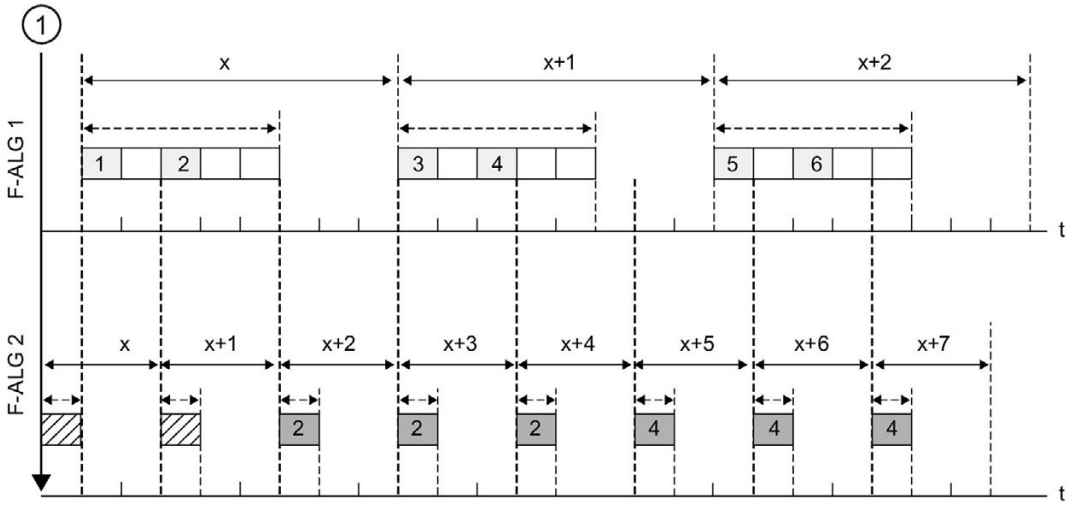
Assignment of fail-safe values

After F-system start-up, fail-safe values are supplied to the F-runtime group which has read access to tags in the DB for F-runtime group communication of another F-runtime group (for example, F-runtime group 2). These are the values you specified as initial values in the DB for F-runtime group communication of F-runtime group 1.

F-runtime group 2 reads the fail-safe values the first time it is called. The second time the F-runtime group 2 is called, it reads the latest tags if F-runtime group 1 has been processed completely between the two calls of F-runtime group 2. If F-runtime group 1 has not been processed completely, F-runtime group 2 continues to read the fail-safe values until F-runtime group 1 is completely processed.

The behavior is illustrated in the two figures below.

Reading tags from F-runtime group 1, which has a longer OB cycle and lower priority than F-runtime group 2



① Startup of F-system

Cycle time of the (F-)OB in which the F-runtime group is called.

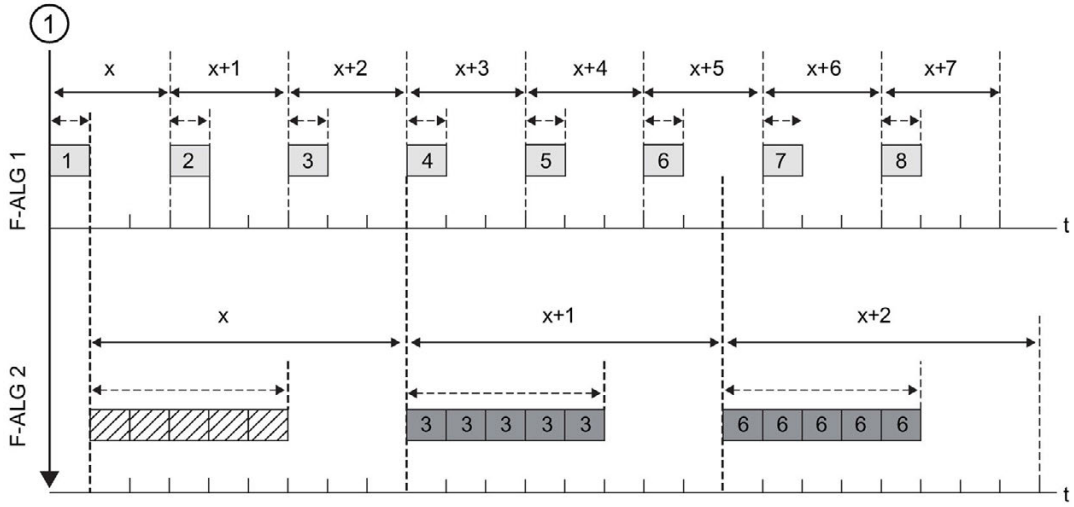
Runtime of the F-runtime group

1 ... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1

2 ...Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1

Initial value in the DB for F-runtime group communication

Reading tags from F-runtime group 1, which has a shorter OB cycle and higher priority than F-runtime group 2



① Startup of F-system

Cycle time of the (F-)OB in which the F-runtime group is called.

Runtime of the F-runtime group

1 ... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1

2 ... Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1

Initial value in the DB for F-runtime group communication

F-runtime group supplying tags is not processed

Note

If the F-runtime group whose DB for F-runtime group communication is to supply the tags is not processed (the main safety block of the F-runtime group is not called), the F-CPU goes to STOP mode. One of the following diagnostics events is then entered in the diagnostics buffer of the F-CPU:

- Error in safety program: cycle time exceeded
- Number of the relevant main safety block (of F-runtime group that is not processed)
- Current cycle time in ms: "0"

5.2.5 F-shared DB (S7-300, S7-400)

Function

The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system. The F-shared DB is automatically inserted when the hardware configuration is compiled.

Using its name F_GLOBDB, you can evaluate certain data elements of the safety program in the standard user program.

Reading an F-shared DB in the standard user program

You can read out the following information in the F-shared DB in the standard user program or on an operator control and monitoring system:

- Operating mode: safety mode or disabled safety mode ("MODE" tag)
- Error information "Error occurred when executing safety program" ("ERROR" tag)
- Collective F-signature ("F_PROG_SIG" tag)
- Compilation date of the safety program ("F_PROG_DAT" tag, DATE_AND_TIME data type)

You use fully qualified access to access these tags (e.g. ""F_GLOBDB".MODE").

5.2.6 F-runtime group information DB (S7-1200, S7-1500)

Introduction

The F-runtime group information DB provides key information on the corresponding F-runtime group and on the safety program as a whole.

The F-runtime group information DB is generated automatically when an F-runtime group is created. A symbol, for example, "RTG1SysInfo", is assigned for the F-runtime group information DB. You can change the name in the *Safety Administration Editor*.

Information in the F-runtime group information DB

The F-runtime group information DB provides the following information:

Name		Data type	For processing in the safety program	For processing in the standard user program	Description
MODE		BOOL	x	x	1 = Disabled safety mode
F_SYSINFO					
	MODE	BOOL	—	x	1 = Disabled safety mode
	TCYC_CURR	DINT	—	x	Current cycle time of the F-runtime group, in ms
	TCYC_LONG	DINT	—	x	Longest cycle time of the F-runtime group, in ms
	TRTG_CURR	DINT	—	x	Current runtime of the F-runtime group, in ms
	TRTG_LONG	DINT	—	x	Longest runtime of the F-runtime group, in ms
	T1RTG_CURR	DINT	—	x	Not supported by STEP 7 Safety V14.
	T1RTG_LONG	DINT	—	x	Not supported by STEP 7 Safety V14.
	F_PROG_SIG	DWORD	—	x	Collective F-signature of the safety program
	F_PROG_DAT	DTL	—	x	Compilation date of the safety program
	F_RTG_SIG	DWORD	—	x	Collective F-signature of the F-runtime group
	F_RTG_DAT	DTL	—	x	Compilation date of the F-runtime group
	VERS_S7SAF	DWORD	—	x	Version identifier for *STEP 7 Safety*

You access the content of the F-runtime group information DB with fully qualified addressing. Either collectively with the F_SYSINFO PLC data type (UDT), for example, "RTG1SysInfo.F_SYSINFO", provided by the F-system or individual information, for example, "RTG1SysInfo.F_SYSINFO.MODE".

Program identification (Page 286)

5.2.7 Deleting an F-runtime group

Deleting an F-runtime group

To delete an F-runtime group, proceed as follows:

1. In the area navigation of the *Safety Administration Editor*, click on the F-runtime group to be deleted.
2. Select the "Delete F-runtime group" button in the work area.
3. Confirm the dialog with "Yes".
4. Compile the safety program (Page 269) (menu command "Edit > Compile") to put your changes into effect.

The assignment of the F-blocks to an F-runtime group (to the calling block of the main safety block) is deleted. However, the F-blocks continue to exist.

Note

If you want to delete your safety program, delete all F-blocks outside the System blocks folder in the project tree.

F-blocks that do not allow deletion are deleted by recompiling the safety program or deactivating F-capability for the F-CPU (see Configuring an F-CPU (Page 44)).

5.2.8 Changing the F-runtime group (S7-300, S7-400)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Specify another block as the calling block of the main safety block.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time of the F-runtime group
- Specify another DB as a data block for F-runtime group communication.

5.2.9 Changing the F-runtime group (S7-1200, S7-1500)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Change the name, number, cycle time, phase shift and priority of the F-OB.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time and the cycle time warning limit of the F-runtime group.
- Assign another name for the F-runtime group information DB.

Copying F-OB

You may not copy an F-OB.

5.3 Creating F-blocks in FBD / LAD

5.3.1 Creating F-blocks

Introduction

In order to create F-FBs, F-FCs, and F-DBs for the safety program, you should follow the same basic procedure as for standard blocks. In the following, only the deviations from the procedure for standard blocks are presented.

Creating F-FBs, F-FCs, and F-DBs

You create F-blocks in the same way as for standard blocks. Proceed as follows:

1. Double-click on "Add new block" under "Program blocks" in the project tree.
2. In the dialog that appears, specify the type, name, and language and select the "Create F-block" check box. (If you do not select the check box, a standard block is created.)
3. After the dialog is confirmed, the F-block is opened in the *Program editor*.

Note the following

Note the following important instructions:

Note

You may not declare block parameters in the block interface of the main safety block because they cannot be supplied.

Note

You may not edit initial values in instance DBs of F-FBs online and offline. Editing can cause the F-CPU to go to STOP mode.

Note

You may not access static local data in single instances or multi-instances of other F-FBs.

Note

You must always initialize outputs of F-FCs.

The F-CPU can go to STOP mode if the information above is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If you wish to assign an address from the data area (data block) to a formal parameter of an F-FC as an actual parameter, you have to use fully qualified DB access. (S7-300, S7-400)

Note

Access to the inputs in an F-FB/F-FC is read-only, while access to the outputs is write-only.

Use an in/out if you wish to have both read and write access.

Note

For greater clarity, assign meaningful names to the F-blocks you have created.

Copying/pasting F-blocks

You can copy F-FBs, F-FCs, and F-DBs in exactly the same was as blocks of the standard user program.

(S7-1200, S7-1500) Information on copying an F-OB is provided in Changing the F-runtime group (S7-1200, S7-1500) (Page 121).

Exception:

You cannot copy blocks from the folder "Program blocks > System blocks".

5.3.2 Know-how protection

For know-how protection of F-blocks, proceed as described in the *STEP 7* help under "Protecting blocks".

Requirements

Note the following with regard to know-how protection of F-blocks:

- An F-block to which you wish to assign know-how protection must be called in the safety program.
- Before you can set up the know-how protection for an F-block, the safety program must be consistent. For this purpose, compile (Page 269) the safety program.

Note

No source code is output for know-how protected F-blocks in the safety summary. Therefore, create the safety summary (for example to carry out a code review or accept the F-block) before you set up the know-how protection.

Note

If you want to edit the program code and/or the block interface of a know-how protected F-block, we recommend that you do not open the F-block by entering a password, but rather remove the know-how protection completely and set it up again after compiling.

Note

(S7-1200, S7-1500) When a know-how protected F-block or F-blocks called by it are renamed, the signature of the know-how protected F-block is not changed until the password is entered when opening or removing the know-how protection.

Note

When know-how protected F-blocks are used, warnings and error messages whose cause can lie in the know-how protected F-blocks can be displayed during compilation of the safety program. The warnings and error messages contain corresponding information. Example: In a know-how protected F-block, you perform read access to a tag of the standard user program to which write access is taking place in a different (know-how protected) F-block.

For S7-1200/1500 F-CPUs, you can obtain additional information from the safety summary in the section "Know-how protected F-blocks in the safety program".

See also

Reuse of F-blocks (Page 125)

5.3.3 Reuse of F-blocks

Introduction

You can reuse F-blocks that you have already tested and, if applicable, approved, in other safety programs – without having to test and approve them again.

You can protect the content of the F-block by setting up the know-how protection.

Like standard blocks, you can store F-blocks as master copies or types in global libraries or in the project library.

Additional information can be found in the *STEP 7 help* under "Using libraries".

Creating safety documentation for the F-block to be reused

Create safety documentation with the following information for F-blocks that you want to reuse.

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-blocks

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version when setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-blocks

The safety documentation should also contain a description of the functionality of the F-block, in particular if it is know-how protected.

The required information is obtained by creating a safety summary of the safety program in which you originally created, tested and approved the F-block to be reused.

This safety summary can also serve directly as the safety documentation for the F-block to be reused.

Checks when using the F-block to be reused

When reusing the F-block, ensure the following:

- The signature and initial value signature (S7-300/400) of the F-block are unchanged.
- (SIMATIC S7-1200, S7-1500) The documented safety system version is set.
- The documented (or functionally identical) versions of the versioned LAD/FBD instructions are set. You will find information on the instruction versions in the online help for the instructions.
- The called F-blocks with the documented signatures and initial value signatures (S7-300/400) are used.

If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

Compliance of the know-how protected F-blocks used in the safety program with their safety documentation. (Page 312)

5.4 Programming startup protection

Introduction

⚠ WARNING

STOP, for example, via programming device/PC, mode switch, communication function or "STP" instruction

Initiating STOP, for example by means of programming device/PC operation, mode switch, communication function or "STP" instruction as well as maintaining the STOP state are not safety-oriented. This STOP state can be easily (and unintentionally) be revoked, for example, by programming device/PC operation.

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost. The F-system automatically reintegrates the F-I/O.

If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S031)*

Example of restart/startup prevention

In order to implement a restart/startup prevention, it must be possible to detect a startup. To detect a startup, you declare a tag of data type BOOL with initial value "TRUE" in an F-DB.

Block the output of process data when this tag has the value "1," for example, by passivating F-I/O using the PASS_ON tag in the F-I/O DB.

To manually enable the output of process data, you reset this tag by means of a user acknowledgment.

F-I/O DB (Page 135)

F-I/O access

6

6.1 Addressing F-I/O

Overview

Below you will find a description of how to address the F-I/O in the safety program and which rules must be observed in the process.

Addressing via the process image

As with standard I/O, you access F-I/O (e.g., S7-1500/ET 200MP fail-safe modules) via the **process image** (PII and PIQ).

Direct reading (with I/O identification ":P") of inputs or writing of outputs is not possible in the safety program.

Updating the process image

The process image of the inputs of F-I/O is updated at the start of the F-runtime group. The process image of the outputs of F-I/O is updated at the end of the F-runtime group (see Program structure of the safety program (S7-300, S7-400) (Page 91) or Program structure of the safety program (S7-1200, S7-1500) (Page 93)). For additional information on updating the process image, refer to the note in Data Transfer from the Safety Program to the Standard User Program (Page 166).

The communication required between the F-CPU (process image) and the F-I/O to update the process image uses a special safety protocol in accordance with PROFIsafe.

Rules

- You may only address a channel (channel value and value status) of an F-I/O in **one** F-runtime group. The first programmed addressing defines the assignment for the F-runtime group.
- You may only address a channel (channel value and value status) of an F-I/O with a unit that matches the data type of the channel.
  Example: To access input channels of data type BOOL, you must use the "input (bit)" (I x.y) unit. Access to the 16 consecutive input channels of the data type BOOL via the unit "input word" (IW x) is not possible.
- Address only inputs and outputs that reference an actually existing channel (channel value and value status) (e.g. for an F-DO 10xDC24V with start address 10 only the outputs Q10.0 to Q11.1 for the channel values and the inputs I10.0 to I11.1 for the value status). Keep in mind that due to the special safety protocol, the F-I/O occupies a larger area of the process image than is required for the existing and enabled channels on the F-I/O (channel values and value status). To find the area of the process image where the channels (channel values and value status) are stored (channel structure), refer to the relevant manuals for the F-I/O.
- Channels can be disabled for certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules). Address only channels (channel value and value status) that are enabled in the hardware configuration. When you address channels that are disabled in the hardware configuration, a warning may be output when compiling the safety program.
- For certain F-I/O (such as ET 200SP fail-safe modules or S7-1500/ET 200MP fail-safe modules), a "1oo2 (2v2) sensor evaluation" can be specified. Two channels are grouped into one channel pair in this case, and the result of the "1oo2 sensor evaluation" is usually provided under the address of the channel with the lower channel number (see relevant manuals of the F-I/O). Address only this channel (channel value and value status) of the channel pair. When you address a different channel, a warning may be output when compiling the safety program.

⚠ WARNING

If you use an additional component between the F-CPU (S7-300/400) and the F-I/O that copies the safety message frame in accordance with PROFIsafe between the F-CPU (S7-300/400) and F-I/O per user program, you must test all safety functions affected by the copy function whenever you change the user-programmed copy function. *(S049)*

See also

Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 214)

Value status (S7-1200, S7-1500) (Page 130)

6.2 Value status (S7-1200, S7-1500)

Properties

The value status is additional binary information for the channel value of an F-I/O. The value status is entered in the process image input (PII).

The value status is supported by S7-1500/ET 200MP, ET 200SP, ET 200S, ET 200iSP, ET 200pro, S7-1200 fail-safe modules or S7-300 F-SMs fail-safe GSD based I/O devices as well as fail-safe GSD based DP slaves which support the "RIOforFA-Safety" profile.

We recommend you amend the name of the channel value with "_VS" for the value status, for example, "TagIn_1_VS".

The value status provides information on the validity of the corresponding channel value:

- 1: A valid process value is output for the channel.
- 0: A fail-safe value is output for the channel.

The channel value and value status of an F-I/O can only be accessed from the same F-runtime group.

Location of value status bits in the PII for F-I/O with digital inputs

The value status bits come straight after the channel values in the PII.

Table 6- 1 Example: Address assignment in PII for F-I/O with 16 digital input channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	DI_{15}	DI_{14}	DI_{13}	DI_{12}	DI_{11}	DI_{10}	DI_9	DI_8

x + 3	Value status DI_{15}	Value status DI_{14}	Value status DI_{13}	Value status DI_{12}	Value status DI_{11}	Value status DI_{10}	Value status DI_9	Value status DI_8

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs

The value status bits in the PII are mapped with the same structure as the channel values in the PIQ.

Table 6- 2 Example: Address assignment in PIQ for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Table 6- 3 Example: Address assignment in PII for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs and digital inputs

The value status bits come directly after the channel values in the PII in the following order:

- Value status bits for the digital inputs
- Value status bits for the digital outputs

Table 6- 4 Example: Address assignment in PIQ for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bit in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Table 6- 5 Example: Address assignment in PII for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status DI_1	Value status DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

The location of the channel values in the PII and PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog inputs

The value status bits come directly after the channel values in the PII.

Table 6- 6 Example: Address assignment in PII for F-I/O with 6 analog input channels (data type INT)

Byte in the F-CPU	Assigned bytes/bits in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AI_0							
...	...							
x + 10	Channel value AI_5							
x + 12	—	—	Value status AI_5	Value status AI_4	Value status AI_3	Value status AI_2	Value status AI_1	Value status AI_0

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog outputs

The value status bits are mapped in the PII.

Table 6- 7 Example: Address assignment in PIQ for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bytes in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AO_0							
...	...							
x + 10	Channel value AO_5							

x = Module start address

Table 6- 8 Example: Address assignment in PII for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	Value status AO_5	Value status AO_4	Value status AO_3	Value status AO_2	Value status AO_1	Value status AO_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

6.3 Process Data or Fail-Safe Values

When are fail-safe values used?

The safety function requires that fail-safe values (0) be used instead of process data for passivation of the entire F-I/O or individual channels of an F-I/O in the following cases. This applies both to digital channels (data type BOOL) as well as for analog channels (data type INT or DINT):

- When the F-system starts up
- When errors occur during safety-related communication (communication errors) between the F-CPU and F-I/O using the safety protocol in accordance with PROFIsafe
- When F-I/O faults and channel faults occur (such as wire break, short circuit, and discrepancy errors)
- As long as you enable passivation of the F-I/O with PASS_ON = 1 in the F-I/O DB (see below)

Fail-safe value output for F-I/O/channels of an F-I/O

When **passivation** occurs for an **F-I/O with inputs**, the F-system provides the safety program with fail-safe values (0) in the PII instead of the process data pending at the fail-safe inputs of the F-I/O.

The overflow or underflow of a channel of the **SM 336; AI 6 x 13Bit** or **SM 336; F-AI 6 x 0/4 ... 20 mA HART** is recognized by the F-system as an F-I/O/channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If you want to process fail-safe values other than "0" in the safety program for an F-I/O with inputs **for analog channels of data type INT or DINT**, you can assign individual fail-safe values for QBAD = 1 and value status = 0 or QBAD_I_xx/QBAD_O_xx = 1 (instructions JMP/JMPN, LABEL and MOVE). For details about the characteristics go to PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 141).

⚠ WARNING

For an F-I/O with digital input channels (data type BOOL), the value provided in the PII must always be processed in the safety program, regardless of the value status or QBAD/QBAD_I_xx. *(S009)*

When **passivation** occurs in an **F-I/O with outputs**, the F-system outputs fail-safe values (0) at the fail-safe outputs instead of the output values provided by the safety program in the PIQ.

State of associated PAA/PIQ by ...	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs	F-I/O without "RIOforFA-Safety" profile with S7-1200/1500 F-CPUs	F-I/O with S7-300/400 F-CPUs
Startup of F-system	The F-system overwrites the PII/PIQ with fail-safe values (0).		
Communication errors			
F-I/O faults	The F-system overwrites the PII with fail-safe values (0). In the PII the values formed in the safety program are retained.	The F-system overwrites the PII/PIQ with fail-safe values (0).	
Channel faults in configuration of passivation for complete F-I/O			
Channel faults during configuration of channel-granular passivation		For the affected channels: The F-system overwrites the PII/PIQ with fail-safe values (0).	
As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1	The F-system overwrites the PII/PIQ with fail-safe values (0).		

Reintegration of F-I/O/channels of an F-I/O

The switchover from fail-safe values (0) to process data (**reintegration of an F-I/O**) takes place **automatically** or following **user acknowledgment** in the F-I/O DB. The reintegration method depends on the following:

- The reason for passivation of the F-I/O or channels of the F-I/O
- The parameter assignment to be implemented by you in the F-I/O DB (Page 135) or the parameter assignment for the S7-1500/ET 200MP/F-Module S7-1200 and possibly fail-safe GSD based DP slaves/GSD based I/O devices in accordance with "RIOforFA-Safety" profile

Note

Note that for channel faults in the F-I/O, channel-granular passivation takes place if configured accordingly in the *hardware and network editor*. For the concerned channels, fail-safe values (0) are output.

Reintegration after channel faults reintegrates all channels whose faults were eliminated; faulty channels remain passivated.

Configuring F-I/O (Page 49)

6.4 F-I/O DB

Introduction

An F-I/O DB is automatically generated for each F-I/O (in safety mode) when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that you can evaluate or can/must write to in the safety program. It is not permitted to change the initial values of the tags directly in the F-I/O DB. When an F-I/O is deleted, the associated F-I/O DB is also deleted.

Access to an F-I/O DB

You access tags of the F-I/O DB for the following reasons:

- For reintegration of F-I/O after communication errors, F-I/O faults, or channel faults
- If you want to passivate the F-I/O depending on particular states of your safety program (for example, group passivation)
- For changing parameters for fail-safe GSD based DP slaves/GSD based I/O devices
- If you want to evaluate whether fail-safe values or process data are output

6.4.1 Tags of the F-I/O DB

The following table presents the variables of an F-I/O DB:

	Tag	Data type	Function	Initial value
Tags that you can or must write	PASS_ON	BOOL	1=enable passivation	0
	ACK_NEC	BOOL	1=acknowledgment for reintegration required in the event of F-I/O or channel faults	1
	ACK_REI	BOOL	1=acknowledgment for reintegration	0
	IPAR_EN	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
Tags that you can evaluate	PASS_OUT	BOOL	Passivation output	1
	QBAD	BOOL	1=Fail-safe values are output	1
	ACK_REQ	BOOL	1=Acknowledgment request for reintegration	0
	IPAR_OK	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DIAG	BYTE	Non-fail safe service information	
	QBAD_I_xx	BOOL	1=fail-safe values are output to input channel xx (S7-300/400)	1
	QBAD_O_xx	BOOL	1=fail-safe values are output to output channel xx (S7-300/400)	1

Differences in evaluation in S7-1200/1500 F-CPUs and S7-300/400

The following table describes the differences in the evaluation of tags of the F-I/O DB and the value status depending on the F-I/O and F-CPU used.

Tag in the F-I/O DB or value status	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	F-I/O with S7-300/400 F-CPU
ACK_NEC	—[2]	x	x
QBAD	x[3]	x	x
PASS_OUT	x[3]	x	x
QBAD_I_xx[1]	—	—	x
QBAD_O_xx[1]	—	—	x
Wertstatus[1]	x	x	—

1 QBAD_I_xx and QBAD_O_xx display the validity of the channel value channel-granular and thus correspond to the inverted value status with S7-1200/1500. Value status or QBAD_I_xx and QBAD_O_xx are not available with fail-safe DP GSD based slaves or fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

2 Via F-I/O configuration; for S7-1500/ET 200MP or S7-1200 F-modules using the "Channel failure acknowledge" parameter.

3 For details about the characteristics, see "PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status"

6.4.1.1 PASS_ON

The PASS_ON tag allows you to enable passivation of an F-I/O, for example, depending on particular states in your safety program.

Using the PASS_ON tag in the F-I/O DB, you can passivate F-I/O; channel-granular passivation is not possible.

As long as PASS_ON = 1, **passivation** of the associated F-I/O occurs.

6.4.1.2 ACK_NEC

If an F-I/O fault is detected by the F-I/O, **passivation** of the relevant F-I/O occurs. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, **reintegration** of the relevant F-I/O occurs, depending on ACK_NEC:

- With ACK_NEC = 0, you can assign an **automatic reintegration**.
- With ACK_NEC = 1, you can assign a **reintegration** by **user acknowledgment**.

⚠ WARNING

The parameter assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

Note

The initial value for ACK_NEC is 1 after creation of the F-I/O DB. If you do not require automatic reintegration, you do not have to write ACK_NEC.

See also

After F-I/O or channel faults (Page 150)

6.4.1.3 ACK_REI

When the F-system detects a communication error or an F-I/O fault for an F-I/O, the relevant F-I/O is passivated. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. **Reintegration** of the F-I/O/channels of the F-I/O after the fault has been eliminated requires a **user acknowledgment** with a positive edge at variable ACK_REI of the F-I/O DB:

- After every communication error
- After F-I/O or channel faults only with parameter assignment "Channel failure acknowledgement = manual" or ACK_NEC = 1

Reintegration after channel faults reintegrates all channels whose faults were eliminated.

Acknowledgment is not possible until tag ACK_REQ = 1.

In your safety program, you must provide a user acknowledgment by means of the ACK_REI tag for each F-I/O.

⚠ WARNING

For the user acknowledgement, you must interconnect the ACK_REI tag of the F--I/O DB with a signal generated by an operator input. An interconnection with an automatically generated signal is not permitted. *(S011)*

Note

Alternatively, you can use the "ACK_GL" instruction to carry out reintegration of the F-I/O following communication errors or F-I/O/channel faults (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V14) (Page 432)).

6.4.1.4 IPAR_EN

The IPAR_EN tag corresponds to the iPar_EN_C tag in the PROFIsafe bus profile as of PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out when this tag must be set or reset when parameters of fail-safe GSD based DP slaves/GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Note that IPAR_EN = 1 does not trigger passivation of the relevant F-I/O.

If passivation is to occur when IPAR_EN = 1, you must also set tag PASS_ON = 1.

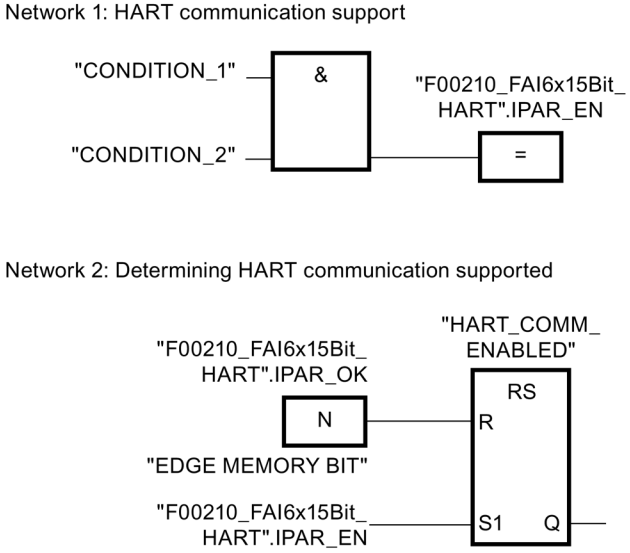
HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART

If you set the IPAR_EN tag to "1" while parameter "HART_Tor" = "switchable" is assigned, the HART communication for the SM 336; F-AI 6 x 0/4 ... 20 mA HART is enabled. Setting this tag to "0" disables the HART communication. The F-SM acknowledges the enabled or disabled HART communication with tag IPAR_OK = 1 or 0.

Enable HART communication only when your system is in a status, in which any reassignment of parameters for an associated HART device can be done without any risk.

If you want to evaluate the "HART communication enabled" status in your safety program, e.g., for the purpose of programming interlocks, you must build up the information as shown in the following example. This is necessary to ensure that the information is properly available even if communication errors occur while the HART communication is enabled with IPAR_EN = 1. Only change the status of the IPAR_EN tag during this evaluation if there is no passivation due to a communication error or F-I/O or channel fault.

Example of enabling HART communication



Additional information on HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART can be found in the Automation System S7-300, ET 200M Distributed I/O System manual, Fail-Safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151) manual and in the online help on the module.

6.4.1.5 PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status

The following table set outs differences in the reaction of the channel values and PASS_OUT, QBAD, QBAD_I_xx/QBAD_O_xx tags and of the value status depending on the F-I/O and F-CPU used.

Fail-safe value output after...	**F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU**	**F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPUs**	**F-I/O with S7-300/400 F-CPU**
Startup of F-system Communication errors F-I/O faults Channel faults in configuration of passivation for complete F-I/O	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
Channel faults during configuration of channel-granular passivation	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1	QBAD = 1, PASS_OUT **unchanged** For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD = 1, PASS_OUT **unchanged** For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

6.4.1.6 ACK_REQ

When the F-system detects a communication error or an F-I/O fault or channel fault for an F-I/O, the relevant F-I/O or individual channels of the F-I/O are passivated. ACK_REQ = 1 signals that **user acknowledgment** is required for reintegration of the relevant F-I/O or channels of the F-I/O.

The F-system sets ACK_REQ = 1 as soon as the fault has been eliminated and user acknowledgment is possible. For channel-granular passivation, the F-system sets ACK_REQ = 1 as soon as the channel fault is corrected. User acknowledgment is possible for this fault. Once acknowledgment has occurred, the F-system resets ACK_REQ to 0.

Note

For F-I/O with outputs, acknowledgment after F-I/O or channel faults may only be possible some minutes after the fault has been eliminated, until the necessary test signal is applied (see *F-I/O manuals*).

6.4.1.7 IPAR_OK

The IPAR_OK tag corresponds to the iPar_OK_S tag in the PROFIsafe bus profile, PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out how to evaluate this tag when parameters of fail-safe GSD based DP slaves or GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

For HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART see Chapter IPAR_EN (Page 139).

6.4.1.8 DIAG

The DIAG tag provides non-fail-safe information (1 byte) about errors or faults that have occurred for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you perform an acknowledgment with the ACK_REI tag or until automatic reintegration takes place.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Timeout detected by F-I/O	The PROFIBUS/PROFINET connection between F-CPU and F-I/O is faulty. The value of the F-monitoring time for the F-I/O is set too low. The F-I/O are receiving invalid parameter assignment data or	• Check the PROFIBUS/PROFINET connection and ensure that there are no external sources of interference. • Check the parameter assignment of the F-I/O. If necessary, set a higher value for the monitoring time. Recompile the hardware configuration, and download it to the F-CPU. Recompile the safety program. • Check the diagnostics buffer of the F-I/O. • Turn the power of the F-I/O off and back on.
		Internal F-I/O fault or	Replace F-I/O
		Internal F-CPU fault	Replace F-CPU
Bit 1	F-I/O fault or channel fault detected by F-I/O[1]	See *F-I/O manuals*	See *F-I/O manuals*
Bit 2	CRC error or sequence number error detected by F-I/O	See description for bit 0	See description for bit 0
Bit 3	Reserved	—	—
Bit 4	Timeout detected by F-system	See description for bit 0	See description for bit 0
Bit 5	Sequence number error detected by F-system[2]	See description for bit 0	See description for bit 0
Bit 6	CRC-error detected by F-system	See description for bit 0	See description for bit 0
Bit 7	Addressing error[3]	—	Contact Service & Support

[1] Not for F-I/O that support the "RIOforFA-Safety" profile.

[2] For S7-300/400 F-CPUs only

[3] For S7-1200/1500 F-CPUs only

6.4.2 Accessing tags of the F-I/O DB

Name of the F-I/O DB

An F-I/O DB is automatically generated for each F-I/O when the F-I/O is configured in the *hardware and network editor* and a name is generated at the same time.

The name is formed by combining the fixed prefix "F", the start address of the F-I/O, and the names entered in the properties for the F-I/O in the *hardware and network editor* (example: F00005_4_8_F_DI_DC24V_1).

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB are assigned automatically when the F-I/O are configured. You change the number in the "Properties" tab of the associated F-I/O. You change the name by renaming the F-I/O.

Rule for accessing tags of the F-I/O DB

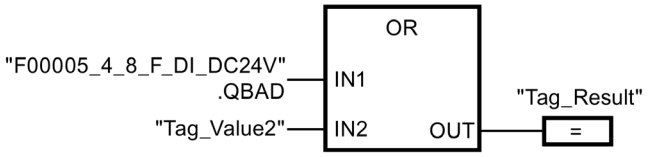
Tags of the F-I/O DB of an F-I/O can only be accessed from the F-runtime group from which the channels of this F-I/O are accessed (if access is made).

"Fully qualified DB access"

You can access the tags of the F-I/O DB via a "fully qualified DB access" (that is, by specifying the name of the F-I/O DB and by specifying the name of the tag).

Example of evaluating the QBAD tag

Network 4: fully qualified access to the QBAD tag



6.5 Passivation and reintegration of F-I/O

Overview

In the following you can find information on passivation and reintegration of F-I/O.

Signal sequence charts

The signal sequences presented below represent typical signal sequences for the indicated behavior.

Actual signal sequences and, in particular, the relative position of the status change of individual signals can deviate from the given signal sequences within the scope of known "fuzzy" cyclic program execution factors, depending on the following:

- The F-I/O used
- The F-CPU used
- The cycle time of the (F-)OB in which the associated F-runtime group is called
- The target rotation time of the PROFIBUS DP or the update time of the PROFINET IO

Note

The signal sequences shown refer to the status of signals in the user's safety program.

6.5.1 After startup of F-system

Behavior after a startup

Fail-safe value output after startup of the F-system	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
Passivation of the entire F-I/O occurs during startup.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the F-I/O, i.e. the provision of process values in the PII or the output of process values provided in the PIQ at the fail-safe outputs, takes place **automatically**, regardless of the setting at the ACK_NEC tag or the configuration "Channel failure acknowledge", no sooner than the second cycle of the F-runtime group after startup of the F-system.

You can find additional information on pending F-communication, F-I/O or channel errors during startup of the F-system in the sections After communication errors (Page 148) and After F-I/O or channel faults (Page 150).

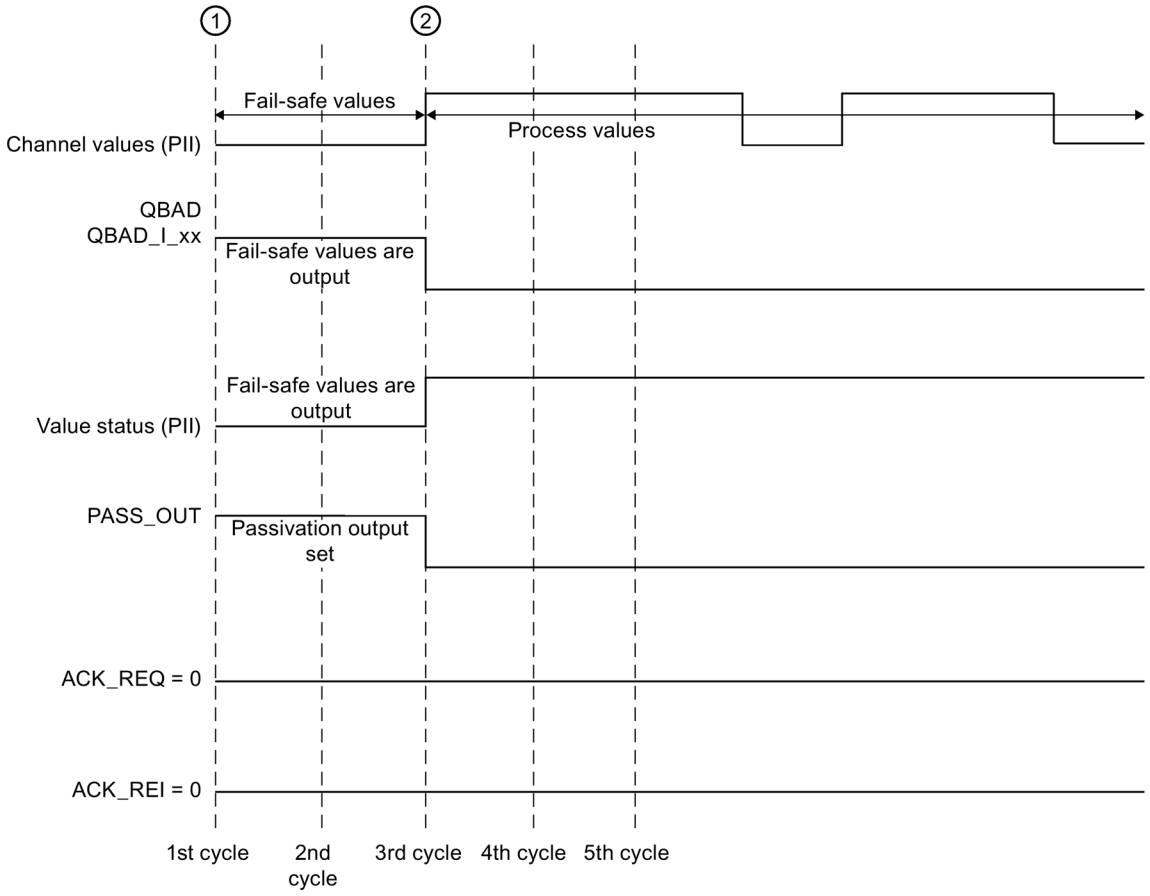
For fail-safe GSD based DP slaves/GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Depending on the F-I/O you are using and the cycle time of the F-runtime group and PROFIBUS DP/PROFINET IO, several cycles of the F-runtime group can elapse before reintegration occurs.

If communication between the F-CPU and F-I/O takes longer to establish than the F-monitoring time set in the properties for the F-I/O, automatic reintegration does not take place.

Signal sequence for passivation and reintegration of F-I/O after F-system startup

Example for an F-I/O with inputs:



① Startup of F-system/passivation

② Automatic reintegration (e.g. third cycle)

⚠ WARNING

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The F-system automatically reintegrates the F-I/O, as described above.

An operating error or an internal error can also trigger a startup of the safety program with the values from the load memory. If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S008)*

6.5.2 After communication errors

Behavior after communication errors

Fail-safe value output after communication errors	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If a communication error between the F-CPU and the F-I/O is detected, all channels of the entire F-I/O are passivated.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

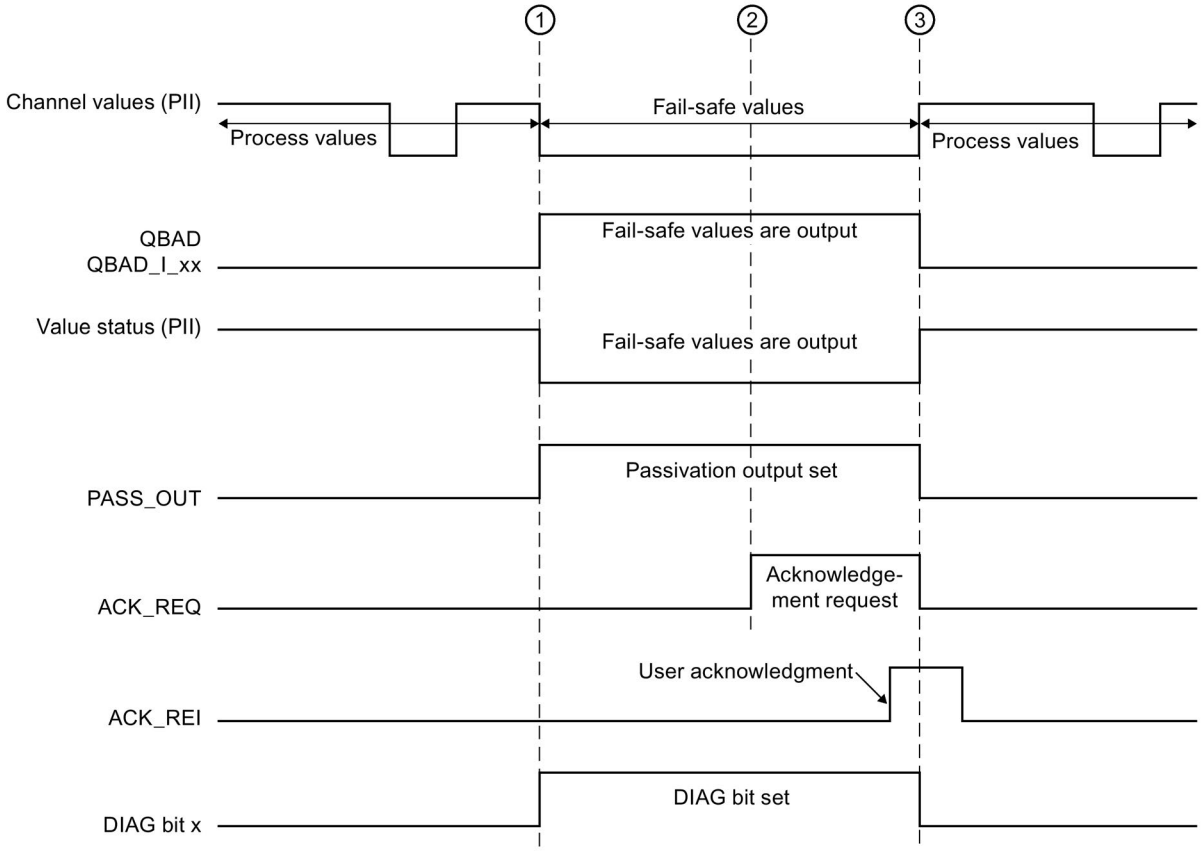
Reintegration of F-I/O

Reintegration of the relevant F-I/O, that is, provision of process data in the PII or output of process data provided in the PIQ at the failsafe outputs, takes place only when the following occurs:

- All communication errors have been eliminated and the F-system has set tag ACK_REQ = 1
- A **user acknowledgment** with a positive edge has occurred:
  - At the ACK_REI tag of the F-I/O DB (Page 138) or
  - At the ACK_REI_GLOB input of the "ACK_GL" instruction (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V14) (Page 432))

Signal sequence for passivation and reintegration of F-I/O after communication errors

Example for an F-I/O with inputs:



① Communication error/passivation
② All communication errors have been eliminated
③ Reintegration

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 162)

6.5.3 After F-I/O or channel faults

Behavior after F-I/O faults

Fail-safe value output after F-I/O faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If an F-I/O fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Behavior after channel fault

Fail-safe value output after channel faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1200/1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
When passivation for **complete** F-I/O is configured: If a channel fault is detected by the F-system, passivation of all channels of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
With configuration of **channel-granular** passivation: If a channel fault is detected by the F-system, passivation of all the affected channels of the entire F-I/O occurs.	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the relevant F-I/O or the relevant channels of the F-I/O, that is, provision of process data in the PII or output of process data provided in the PIQ at the failsafe outputs, takes place only when the following occurs:

- All F-I/O or channel faults have been eliminated.

If you have configured channel-granular passivation for the F-I/O, the relevant channels are reintegrated once the fault is corrected; any faulty channels remain passivated.

Reintegration is performed depending on your setting for the ACK_NEC tag or the "Channel failure acknowledge" parameter (configuration of the S7-1500/ET 200MP F-module and S7-1200 F-module)

- With ACK_NEC = 0 or the configuration "Channel failure acknowledge = automatic", **automatic reintegration** is performed as soon as the F-system detects that the fault has been corrected. For F-I/O with inputs, reintegration takes place right away. For F-I/O with outputs or F-I/O with inputs and outputs, depending on the F-I/O you are using, reintegration can take several minutes, first after the necessary test signals have been applied, which are used by the F-I/O to determine that the fault has been eliminated.
- With ACK_NEC = 1 or the configuration "Channel failure acknowledge = manual", reintegration is performed only as a result of user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB or at the ACK_REI_GLOB input of the "ACK_GL" instruction. Acknowledgment can be made as soon as the F-system detects that the fault has been eliminated and tag ACK_REQ = 1 has been set.

  For fail-safe GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based I/O device .

⚠ WARNING

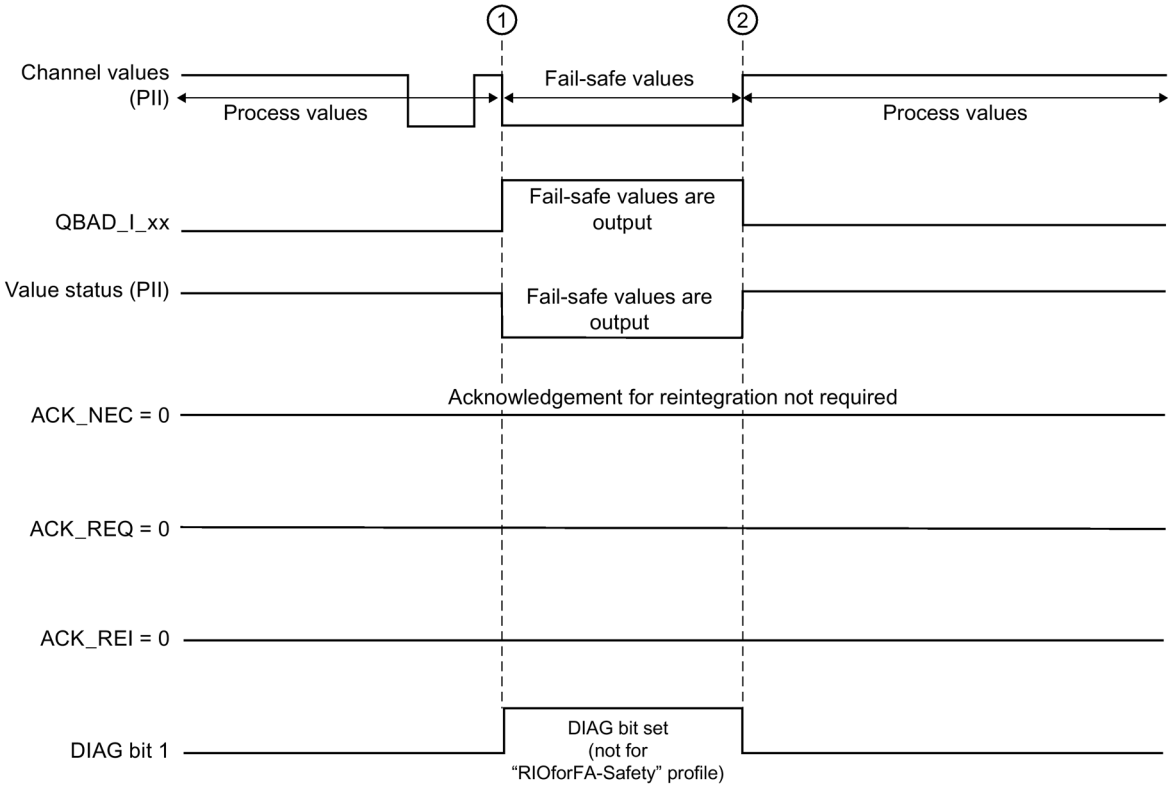
Following a power failure of the F-I/O lasting less than the assigned F-monitoring time for the F-I/O, automatic reintegration can occur regardless of your setting for the ACK_NEC tag, as described for the case when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic".

If automatic reintegration is not permitted for the relevant process in this case, you must program startup protection by evaluating tags QBAD or QBAD_I_xx and QBAD_O_xx or value status or PASS_OUT.

In the event of a power failure of the F-I/O lasting longer than the specified F-monitoring time for the F-I/O, the F-system detects a communication error. *(S012)*

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic" (for passivation of entire F-I/O after channel faults)

Example for an F-I/O with inputs:



① F-I/O or channel faults
Passivation

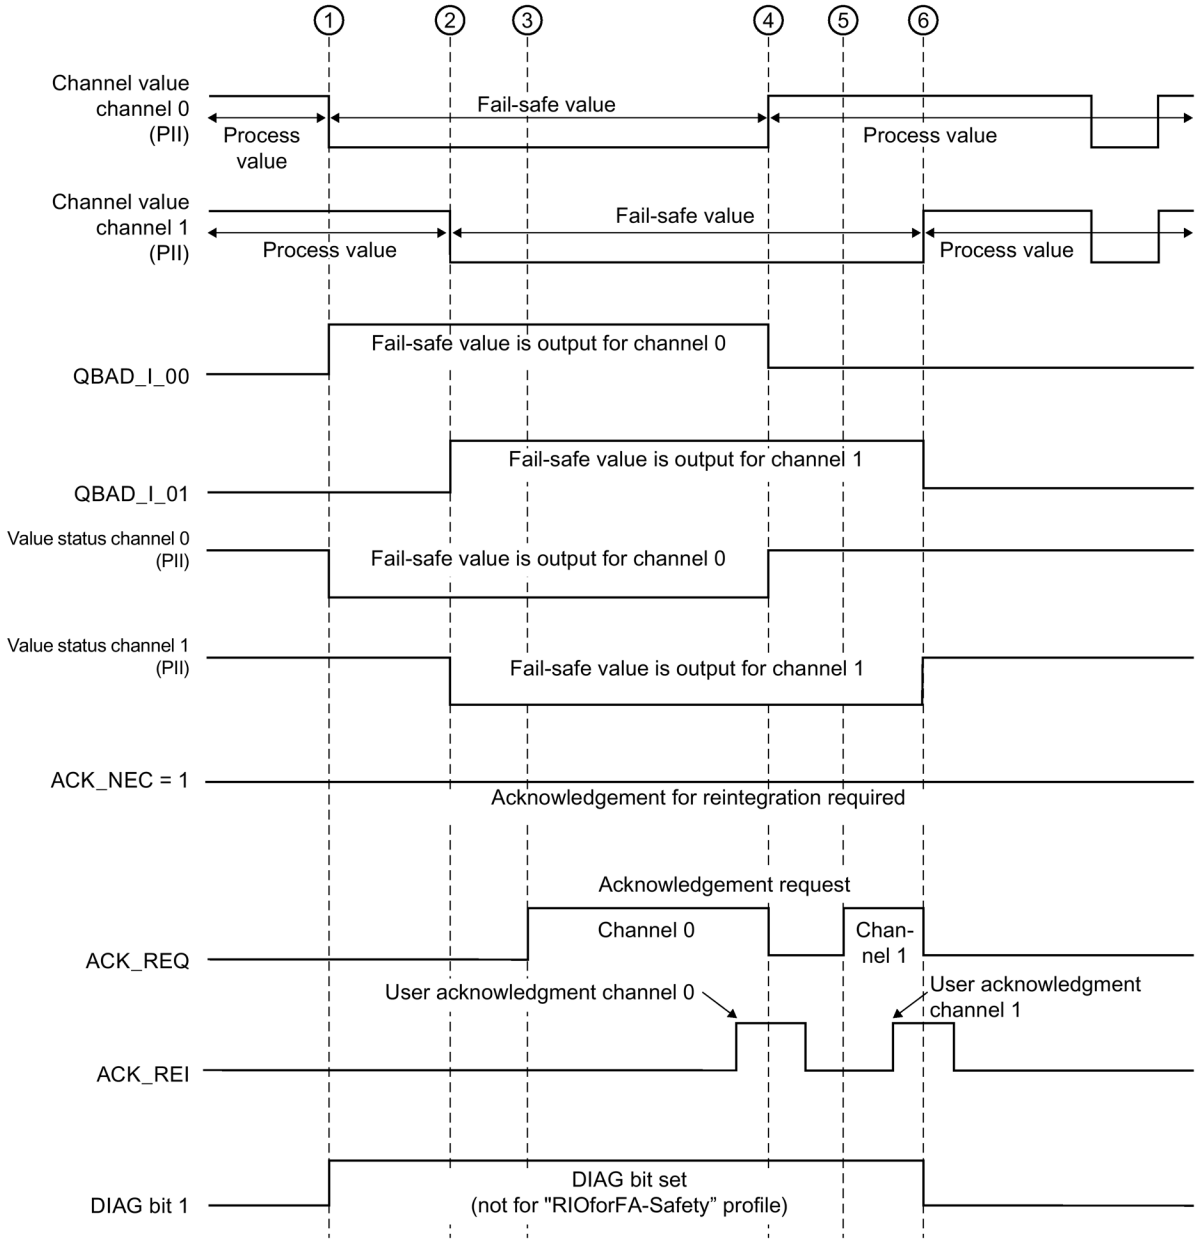
② F-I/O or channel faults corrected
Automatic reintegration

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for passivation of entire F-I/O after channel faults)

For the signal sequence for passivation and reintegration of F-I/O after F-I/O or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (initial value), see After communication errors (Page 148).

Signal sequence for passivation and reintegration of F-I/O after channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for channel-granular passivation)

Example for an F-I/O with inputs:



① Channel fault for channel 0/passivation of channel 0
② Channel fault for channel 1/passivation of channel 1
③ Channel fault eliminated for channel 0
④ Reintegration of channel 0
⑤ Channel fault eliminated for channel 1
⑥ Reintegration of channel 1

6.5.4 Group passivation

Programming a group passivation

If you want to enable passivation of additional F-I/O when an F-I/O or a channel of an F-I/O is passivated by the F-system, you can use the PASS_OUT/PASS_ON tags to perform **group passivation** of the associated F-I/O.

Group passivation by means of PASS_OUT/PASS_ON can, for example, be used to force simultaneous reintegration of all F-I/O after startup of the F-system.

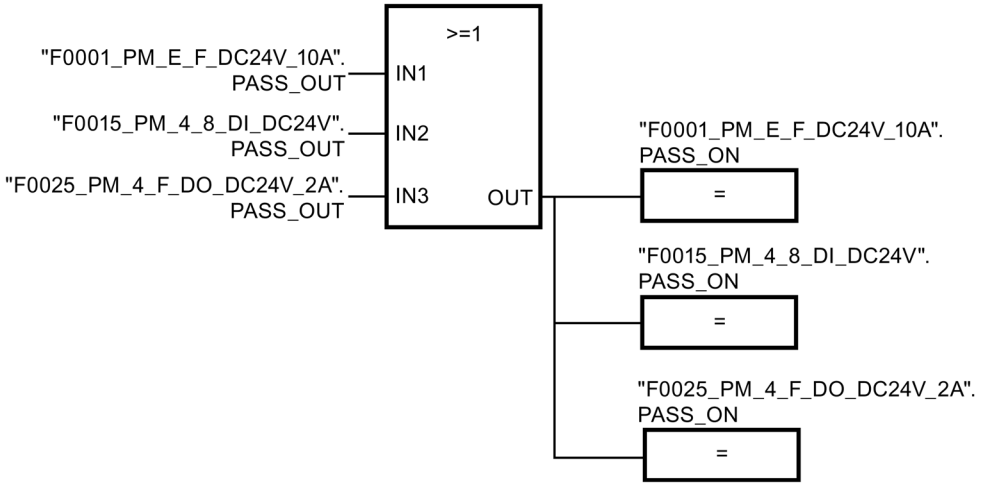
For group passivation, you must OR all PASS_OUT tags of the F-I/O in the group and assign the result to all PASS_ON tags of the F-I/O in the group.

During use of fail-safe values (0) due to group passivation by means of PASS_ON = 1, the QBAD tag of the F-I/O of this group = 1.

Note

Note the different behavior of PASS_OUT for F-I/O with/without "RIOforFA-Safety" profile (see table in section PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 141)).

Example of group passivation

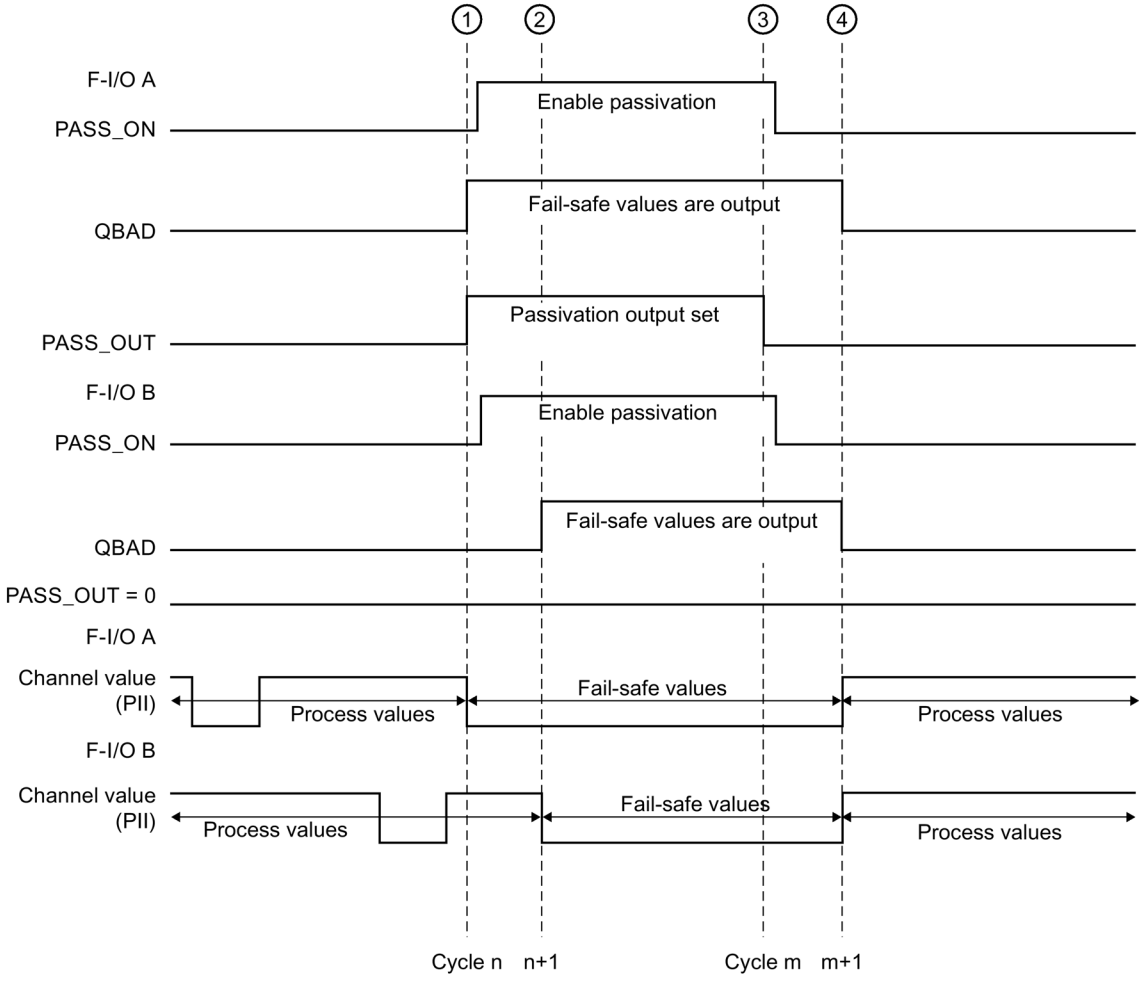


Reintegration of F-I/O

Reintegration of F-I/O passivated by group passivation occurs **automatically**, if a reintegration (**automatic** or **through user acknowledgment**) occurs for the F-I/O that triggered the group passivation (PASS_OUT = 0).

Signal sequence for group passivation following communication error

Example for two F-I/O with inputs:



① Communication error in F-I/O A
Passivation of F-I/O A
② Passivation of F-I/O B
③ Communication error in F-I/O A corrected and acknowledged
④ Reintegration F-I/O A and B

Implementation of user acknowledgment 7

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller

Options for user acknowledgment

You have the following options for implementing a user acknowledgment:

- An acknowledgment key that you connect to an F-I/O with inputs
- An HMI system

User acknowledgment by means of acknowledgment key

Note

When you implement user acknowledgment by means of acknowledgment key, and a communication error, an F-I/O fault, or a channel fault occurs in the F-I/O to which the acknowledgment key is connected, then it will not be possible to acknowledge the reintegration of this F-I/O.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected.

A user acknowledgment may be issued using an acknowledgment key connected to a standard I/O with inputs if this risk analysis allows this.

User acknowledgment by means of an HMI system

For implementation of a user acknowledgment by means of an HMI system, the ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V14) (Page 503) instruction is required.

Procedure for programming user acknowledgment by means of an HMI system (S7-300, S7-400)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and an "acknowledgment value" of "9" (2nd step in acknowledgment).

   or

   Assign function key 1 to transfer an "acknowledgment value" of "6" (1st step in acknowledgment) once, and function key 2 to transfer an "acknowledgment value" of "9" (2nd step in acknowledgment) once. You need to assign the in/out IN (in the data area of the ACK_OP instruction) to the field or the function keys.
3. Optional: In your HMI system, evaluate output Q in the instance DB of ACK_OP to see the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

If you want to perform a user acknowledgment exclusively from a programming device or PC using the watch table (monitor/modify tag) without having to disable safety mode, then you must transfer an operand (memory word or DBW of a DB of the standard user program) at in/out IN when calling ACK_OP. You can then transfer "acknowledgment values" "6" and "9" on the programming device or PC by modifying the memory word or DBW of a DB once. The memory word or DBW of a DB must not be written by the program.

Note

If you connect the in/out IN to a memory word or DBW of a DB, you have use a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction at the in/out IN.

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

The configuration of your operator control and monitoring system does not have any effect on the collective F-signature.

Changes to the configuration of your operator control and monitoring system therefore do not result in a changed collective F-signature.

Procedure for programming user acknowledgment by means of an HMI system (S7-1200, S7-1500)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. Assign the ACK_ID input an identifier between 9 and 30000 for the acknowledgment.
3. Assign the in/out IN a memory word or DBW of a DB of the standard user program.

   Note

   You need to provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction.

4. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and the "Identifier" configured at the ACK_ID input (2nd step in acknowledgment).

   or

   Allocate a function key 1 for a one-time transfer of the "acknowledgment value" of "6" (1st step in acknowledgment) and a function key 2 for a one-time transfer of the "Identifier" set at the ACK_ID input (2nd step in acknowledgment).
   You need to assign memory word or the DBW of the DB of the standard user program assigned to the in/out IN to the field or the function keys.
5. Optional: In your HMI system, evaluate output Q in the instance DB of ACK_OP to see the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

The supply of the IN input/output of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the collective F-signature or of the signature of the block that calls the ACK_OP instruction.

Changes to the supply of the IN input/output or to the configuration of your operator control and monitoring system therefore do not result in a changed collective F-signature/signature of the calling block.

Example of procedure for programming a user acknowledgment for reintegrating an F-I/O

1. Optional: set the ACK_NEC tag in the respective F-I/O DB (Page 138) to "0" if automatic reintegration (without user acknowledgment) is to take place after an F-I/O fault or a channel fault.

   ⚠ WARNING

   The parameter assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

2. Optional: Evaluate the QBAD or QBAD_I_xx/QBAD_O_xx (S7-300/400) tags or value status (S7-1200, S7-1500) or DIAG in the respective F-I/O DB to trigger an indicator light in the event of an error, and/or generate error messages on the HMI system in your standard user program by evaluating the above tags or the value status. These messages can be evaluated before performing the acknowledgment operation. Alternatively, you can evaluate the diagnostic buffer of the F-CPU.
3. Optional: Evaluate the ACK_REQ tag in the respective F-I/O DB, for example, in the standard user program or on the HMI system, to query or to indicate whether user acknowledgment is required.
4. Assign the input of the acknowledgment key or the OUT output of the ACK_OP instruction to the ACK_REI tag in the respective F-I/O DB or the ACK_REI_GLOB input of the ACK_GL instruction (see above).

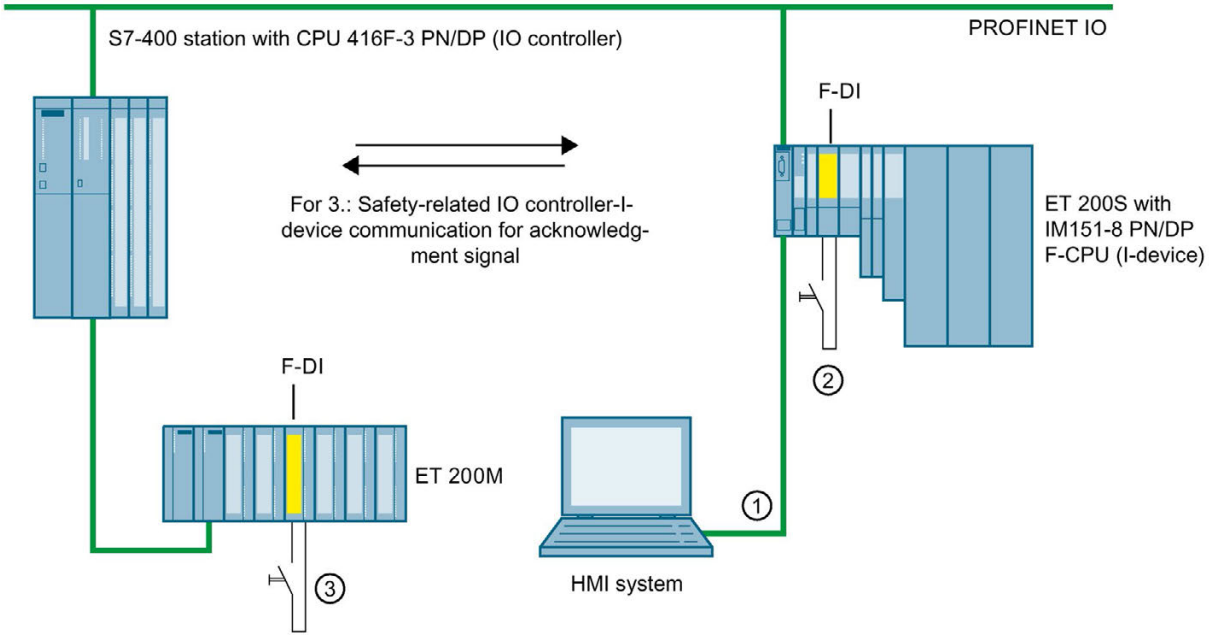
7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device

Options for user acknowledgment

You can implement a user acknowledgment by means of:

- An HMI system that you can use to access the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the DP master/IO controller

These three options are illustrated in the figure below.



1. User acknowledgment by means of an HMI system with which you can access the F-CPU of the I-slave/I-device

The ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V14) (Page 503) instruction is required to implement user acknowledgment with an HMI system that you can use to access the F-CPU of the I-slave/I-device.

Programming procedure

Follow the procedure described in "Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 156)" under "Programming procedure ...".

From your HMI system, you can then directly access the instance DB of ACK_OP in the I-slave/I-Device.

2. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the I-slave/I-device

Note

In the event of a communication error, F-I/O fault, or channel fault in the F-I/O to which the acknowledgment key is connected, an acknowledgment for reintegration of this F-I/O is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected (see 1).

3. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that are assigned to the F-CPU of the DP master/IO controller

If you want to use the acknowledgment key that is assigned to the F-CPU at the DP master/IO controller to perform user acknowledgment in the safety program of the F-CPU of an I-slave/I-device as well, you must transmit the acknowledgment signal from the safety program in the F-CPU of the DP master/IO controller to the safety program in the F-CPU of the I-slave/I-device using safety-related master-I-slave/IO controller-I-device communication.

Programming procedure

1. Place the SENDDP (Page 515) instruction in the safety program in the F-CPU of the DP master/IO controller.
2. Place the RCVDP (Page 515) instruction in the safety program in the F-CPU of the I-slave/I-Device.
3. Supply an input SD_BO_xx of SENDDP with the input of the acknowledgment key.
4. The acknowledgment signal for evaluating user acknowledgments is now available at the corresponding RD_BO_xx output of RCVDP.

   The acknowledgment signal can now be read in the program sections in which further processing is to take place with fully qualified access directly in the associated instance DB (for example, "RCVDP_DB".RD_BO_02).

5. Supply the corresponding input SUBBO_xx of RCVDP with FALSE (fail-safe value 0) to ensure that user acknowledgment is not accidentally triggered before communication is established for the first time after startup of the sending and receiving F-systems, or in the event of a safety-related communication error.

Note

If a communication error, an F-I/O error, or a channel fault occurs at the F-I/O to which the acknowledgment key is connected, then an acknowledgment for reintegration of this F-I/O will no longer be possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the DP master/IO controller.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the DP master/IO controller, in order to acknowledge reintegration of the F-I/O to which an acknowledgment key is connected.

If a safety-related master-I-slave/IO controller-I-Device communication error occurs, the acknowledgment signal cannot be transmitted, and an acknowledgment for reintegration of safety-related communication is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of the safety-related communication for transmission of the acknowledgment signal (see 1).

Data exchange between standard user program and safety program

8

You have the option of transferring data between the safety program and the standard user program. Tags can be transferred using DBs, F-DBs and bit memory:

	From the standard user program		From the safety program	
	Read access	Write access	Read access	Write access
Tag from DB	Permitted	Permitted	A tag from the DB can be read-accessed *or* write-accessed	
Tag from F-DB	Permitted	**Not permitted**	Permitted	Permitted
Bit memory	Permitted	Permitted	Bit memory can be read-accessed *or* write-accessed	

You can also access the process image of the standard I/O and F-I/O:

		From the standard user program		From the safety program	
		Read access	Write access	Read access	Write access
Process image of standard I/O	PII	Permitted	Permitted	Permitted	**Not permitted**
	PIQ	Permitted	Permitted	**Not permitted**	Permitted
Process image of F-I/O	PII	Permitted	**Not permitted**	Permitted	**Not permitted**
	PIQ	Permitted	**Not permitted**	**Not permitted**	Permitted

Decoupling of the safety program from the standard program

For data exchange between standard user program and safety program, we recommend that you define special data blocks (transfer data blocks) in which the data to be exchanged is stored. This action allows you to decouple the blocks of the standard and the safety program. The changes in the standard program do not affect the safety program (and vice versa) provided these data blocks are not modified.

8.1 Data Transfer from the Safety Program to the Standard User Program

Data transfer from the safety program to the standard user program

The standard user program can read all data of the safety program, for example using symbolic (fully qualified) accesses to the following:

- The instance DBs of the F-FBs ("Name of instance DB".Signal_x)
- F-DBs (for example "Name of F_DB".Signal_1)
- The process image input and output of F-I/O (for example "Emergency_Stop_Button_1" (I 5.0))

Note

For S7-300/400 F-CPUs

The process image input of F-I/O is updated not only at the start of the main safety block, but also by the standard operating system.

To find the standard operating system update times, refer to the *Help on STEP 7* under "Process image input and output". For F-CPUs that support process image partitions, also bear in mind the update times when process image partitions are used. For this reason, when the process image input of F-I/O is accessed in the standard user program, it is possible to obtain different values than in the safety program. The differing values can occur due to:

- Different update times
- Use of fail-safe values in the safety program

To obtain the same values in the standard user program as in the safety program, you must not access the process image input in the standard program until after execution of an F-runtime group. In this case, you can also evaluate the QBAD or QBAD_I_xx tag in the associated F-I/O DB in the standard user program, in order to find out whether the process image input is receiving fail-safe values (0) or process data. When using process image partitions, also make sure that the process image is not updated by the standard operating system or by the UPDAT_PI instruction between execution of an F-runtime group and evaluation of the process image input in the standard user program.

Note

For S7-1200/1500 F-CPUs

The process image input of F-I/O is updated prior to processing the main safety block.

You can also write safety program data directly to the standard user program (see also the table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 97)):

Data block/bit memory

In order to write safety program data directly to the standard user program (e.g., DIAG output of the SENDDP instruction), you can write to data blocks of the standard user program from the safety program. However, a written tag must not be read in the safety program itself.

You can also write to bit memory in the safety program. However, written bit memory must not be read in the safety program itself.

Process image output

You can write to the process image output (PIQ) of standard I/O in the safety program, for example for display purposes. The PIQ must not be read in the safety program.

8.2 Data Transfer from Standard User Program to Safety Program

Data transfer from standard user program to safety program

As a basic principle, only fail-safe data or fail-safe signals from F-I/O and other safety programs (in other F-CPUs) can be processed in the safety program, as standard tags are unsafe.

If you have to process tags from the standard user program in the safety program, however, you can evaluate either bit memory from the standard user program, tags from a standard DB, or the process image input (PII) of standard I/O in the safety program (see table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 97)).

Note that structural changes to standard data blocks which are used in the safety program lead to inconsistencies of the safety program and possibly to the password being requested. In this case the collective F-signature is the same as the original again after compilation. To prevent this effect, use “interprocess communication blocks” between the standard user program and the safety program.

⚠ WARNING

Because these tags are not generated safely, you must carry out additional process-specific validity checks in the safety program to ensure that no dangerous states can arise. If bit memory, a tag of a standard DB, or an input of standard I/O is used in both F-runtime groups, you must perform the validity check separately in each F-runtime group. *(S015)*

To facilitate checks, all PLC tags from the standard user program that are evaluated in the safety program are included in the safety summary (Page 291).

Bit memory

In order to process tags of the standard user program in the safety program, you can also read bit memory in the safety program. However, read bit memory must not be written in the safety program itself.

Data block

In order to process tags of the standard user program in the safety program, you can read tags from data blocks of the standard user program in the safety program. However, a read tag must not be written in the safety program itself.

Note

It is not possible to access static local data in single/multi-instances of FBs of the standard user program.

Process image input

You can read the process image input (PII) of standard I/O in the safety program. The PII must not be written in the safety program.

Examples: Programming validity checks

- Use Comparison (Page 456) instructions to check whether tags from the standard user program exceed or fall below permitted high and low limits. You can then influence your safety function with the result of the comparison.
- Use the ---(S)---: Set output (STEP 7 Safety V14) (Page 346), ---(R)---: Reset output (STEP 7 Safety V14) (Page 345) or SR: Set/reset flip-flop (STEP 7 Safety V14) (Page 348) instructions, for example, with tags from the standard user program to allow a motor to be switched off, but not switched on.
- For switch-on sequences, use the AND logic operation instruction, for example, to logically combine tags from the standard user program with switch-on conditions that you derive from fail-safe tags.

If you want to process tags from the standard user program in the safety program, please bear in mind that there is not a sufficiently simple method of checking validity for all tags.

Reading tags from the standard user program that can change during the runtime of an F-runtime group

If you want to read tags from the standard user program (bit memory, tags of a standard DB, or PII of standard I/O) in the safety program, and these tags can be changed - either by the standard user program or an operator control and monitoring system - during runtime of the F-runtime group in which they are read (for example because your standard user program is being processed by a higher-priority cyclic interrupt), you must use bit memory or tags of a standard DB for this purpose. You must write the bit memory or tags of a standard DB with the tags from the standard user program immediately before calling the F-runtime group. You are then permitted to access only this bit memory or these tags of a standard DB in the safety program.

Also note that **clock memory** that you defined when configuring your F-CPU in the "Properties" tab can change during runtime of the F-runtime group, since clock memory runs asynchronously to the F-CPU cycle.

Note

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Safety-related communication

9

9.1 Configuring and programming communication (S7-300, S7-400)

9.1.1 Overview of communication

Introduction

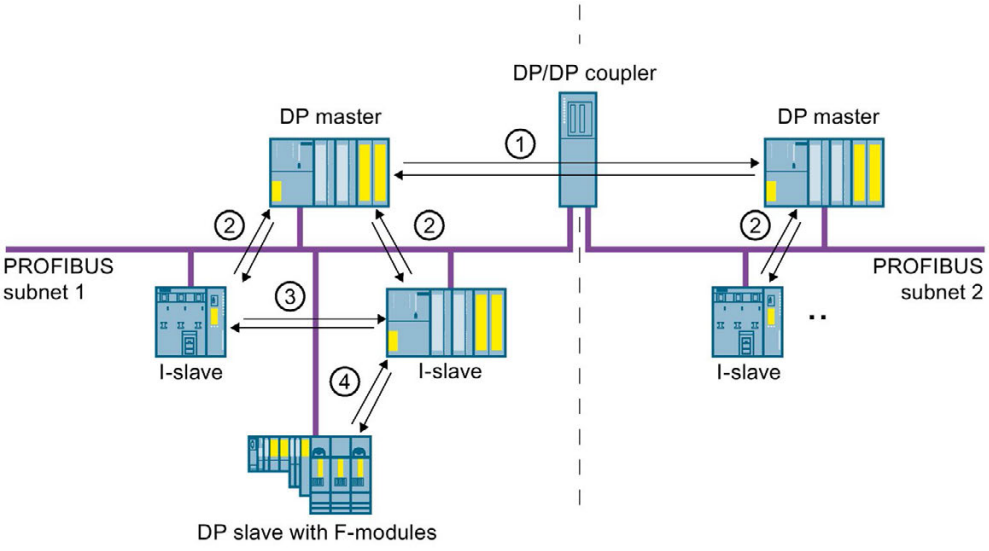
This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	On subnet	Additional hardware required
I-slave-slave communication	PROFIBUS DP	—
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
I-slave-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
Safety-related communication via S7 connections	Industrial Ethernet	—
IO controller-IO controller communication for S7 Distributed Safety	PROFINET IO	PN/PN coupler
Master-master communication for S7 Distributed Safety	PROFIBUS DP	DP/DP coupler
Safety-related communication to S7 Distributed Safety or S7 F Systems via S7 connections	Industrial Ethernet	—

Overview of safety-related communication via PROFIBUS DP

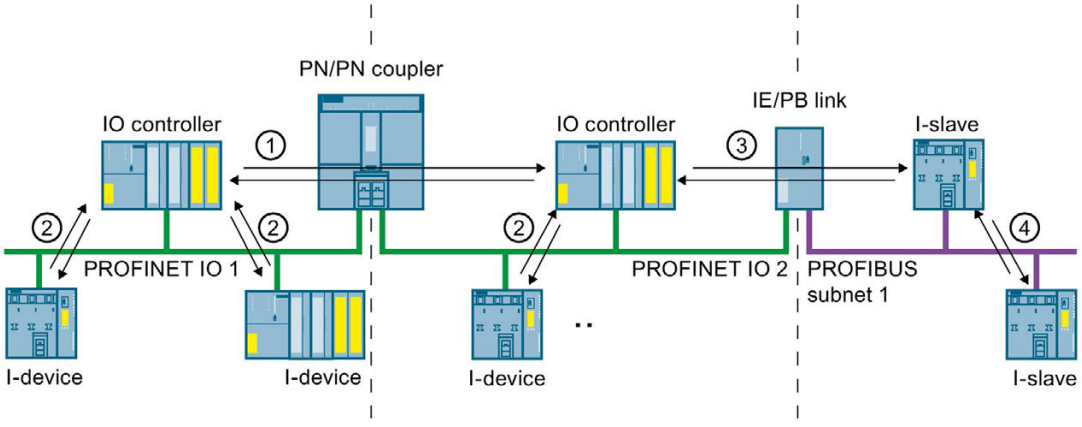
The figure below presents an overview of the 4 options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-300/400 F-CPUs.



① Safety-related master-master communication
② Safety-related master-I-slave communication
③ Safety-related I-slave-I-slave communication
④ Safety-related I-slave-slave communication

Overview of safety-related communication via PROFINET IO

The figure below presents an overview of the four options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-300/400 F-CPUs. If an IE/PB-link is used, safety-related communication is possible between assigned I-slaves.



① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication
④ Safety-related I-slave-I-slave communication integrating an IO controller

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of fail-safe data of the data type INT or BOOL is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. Each transfer area consists of one input and one output address area.

Safety-related I-slave-slave communication via PROFIBUS DP

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware version > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware version > V4.0.0.

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O of a DP slave takes place using direct data exchange, as in the standard program. The process image is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave.

Safety-related CPU-CPU communication via Industrial Ethernet

Safety-related CPU-CPU communication via Industrial Ethernet is possible using S7 connections, both from and to the following:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

In safety-related communication via S7 connections, a specified amount of fail-safe data of data type BOOL, INT, WORD, DINT, DWORD, or TIME is transferred fail-safe between the safety programs of the F-CPUs linked by the S7 connection.

The data transfer makes use of the SENDS7 instruction for sending and the RCVS7 instruction for receiving. Data are exchanged using one F-DB ("F-communication DB") each at the sender and receiver ends.

Safety-related CPU-CPU communication to *S7 Distributed Safety* or *F-systems*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety* or *S7 F-systems*.

9.1.2 Safety-related IO controller-IO controller communication

9.1.2.1 Configure safety-related IO controller-IO controller communication

Introduction

Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

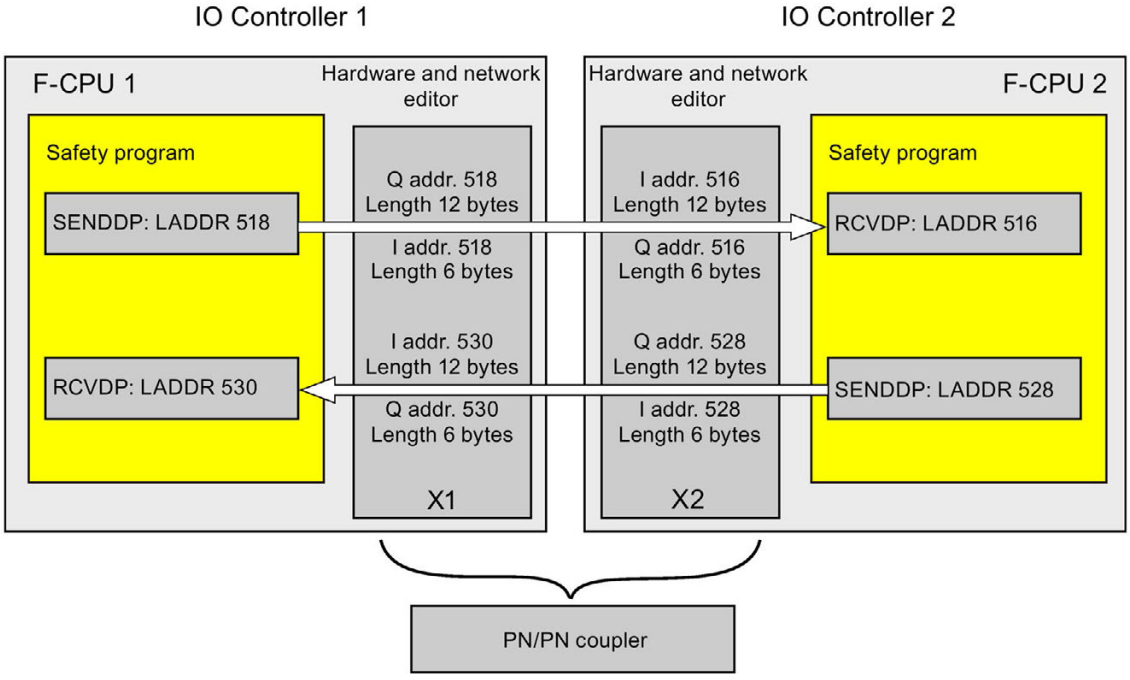
For 416F-2 DP CPUs without an integrated PROFINET interface, use a CP 443-1 or CP 443-1 Advanced-IT.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the PN/PN coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for output data and the transfer area for input data for the **data to be sent** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

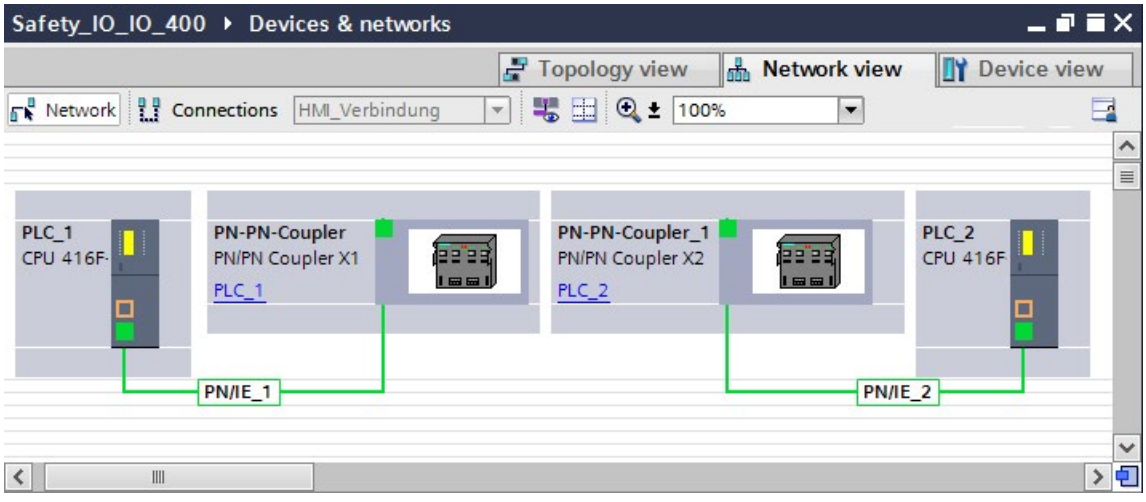
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

6. In the properties of the modules, assign the addresses outside the process image as follows:

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:

   – Input addresses: Start address 518

   – Output addresses: Start address 518

   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:

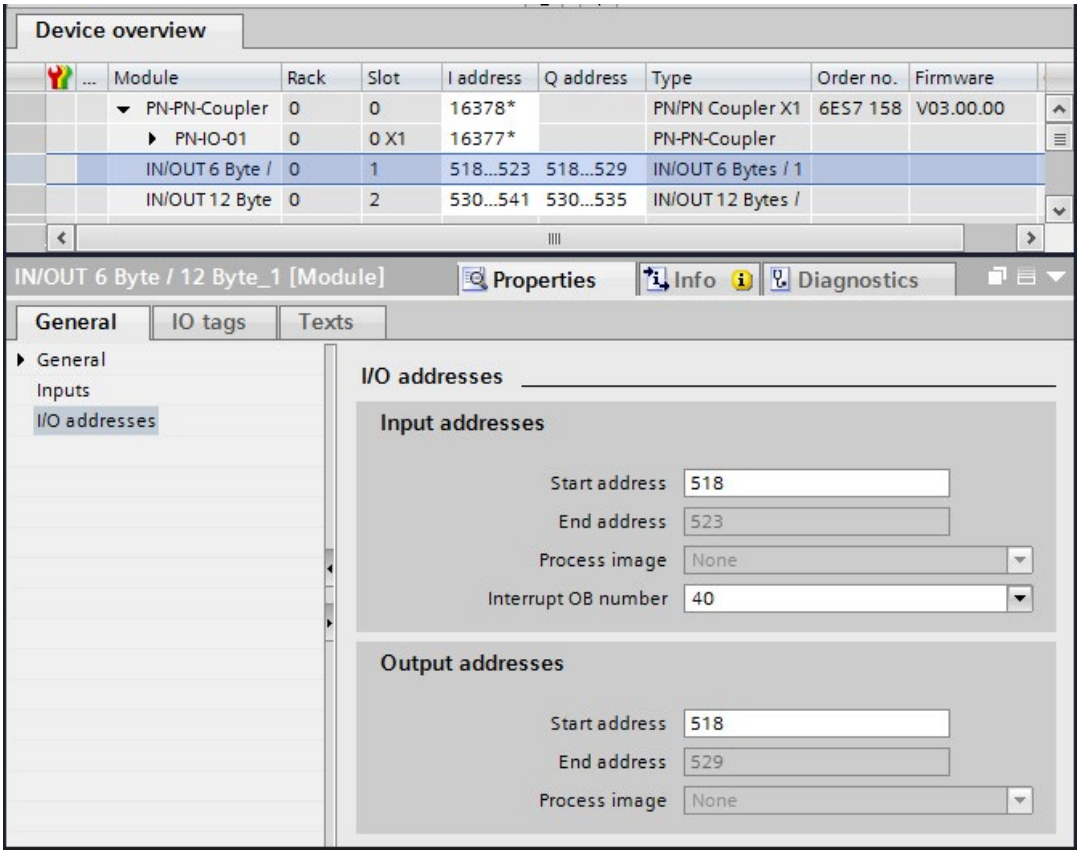
   – Input addresses: Start address 530

   – Output addresses: Start address 530

Note

Make sure that you assign identical start addresses for the address areas of the output and input data.

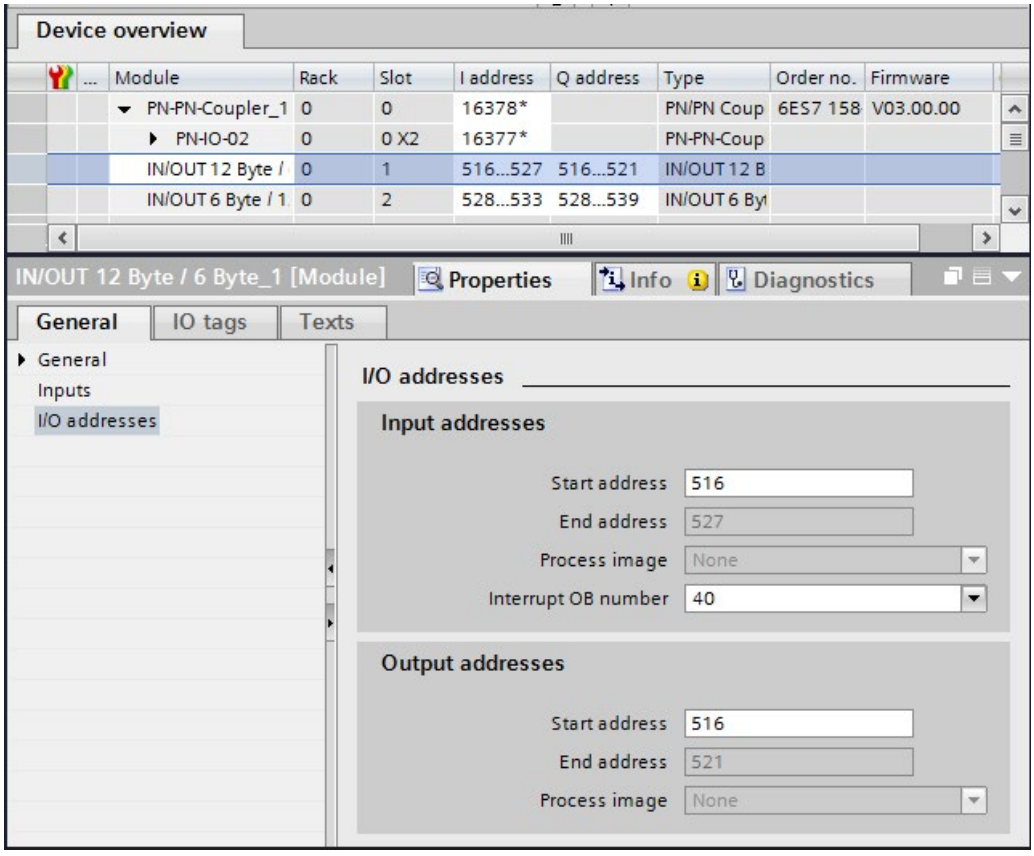
Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



7. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   - One "IN/OUT 12 bytes / 6 bytes" module and
   - One "IN/OUT 6 bytes / 12 bytes" module
8. In the properties of the modules, assign the addresses outside the process image as follows:

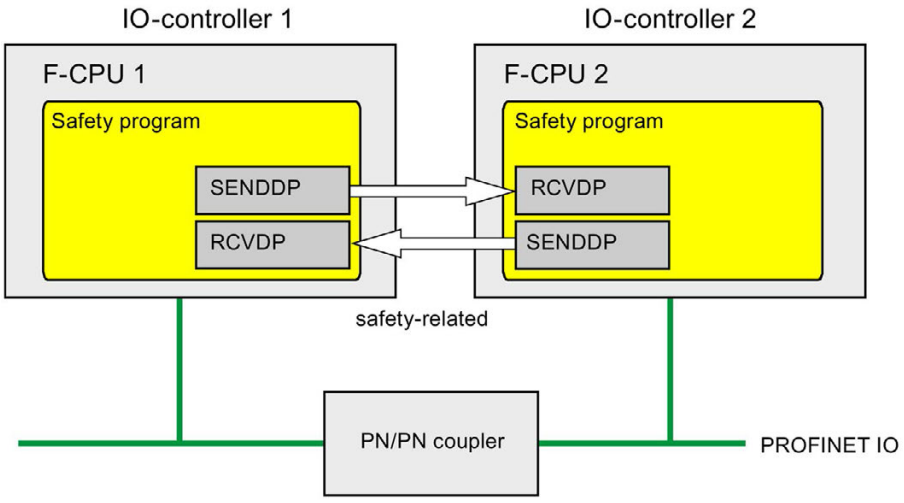
   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:
   - Input addresses: Start address 516
   - Output addresses: Start address 516

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:
   - Input addresses: Start address 528
   - Output addresses: Start address 528



9.1.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.1.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

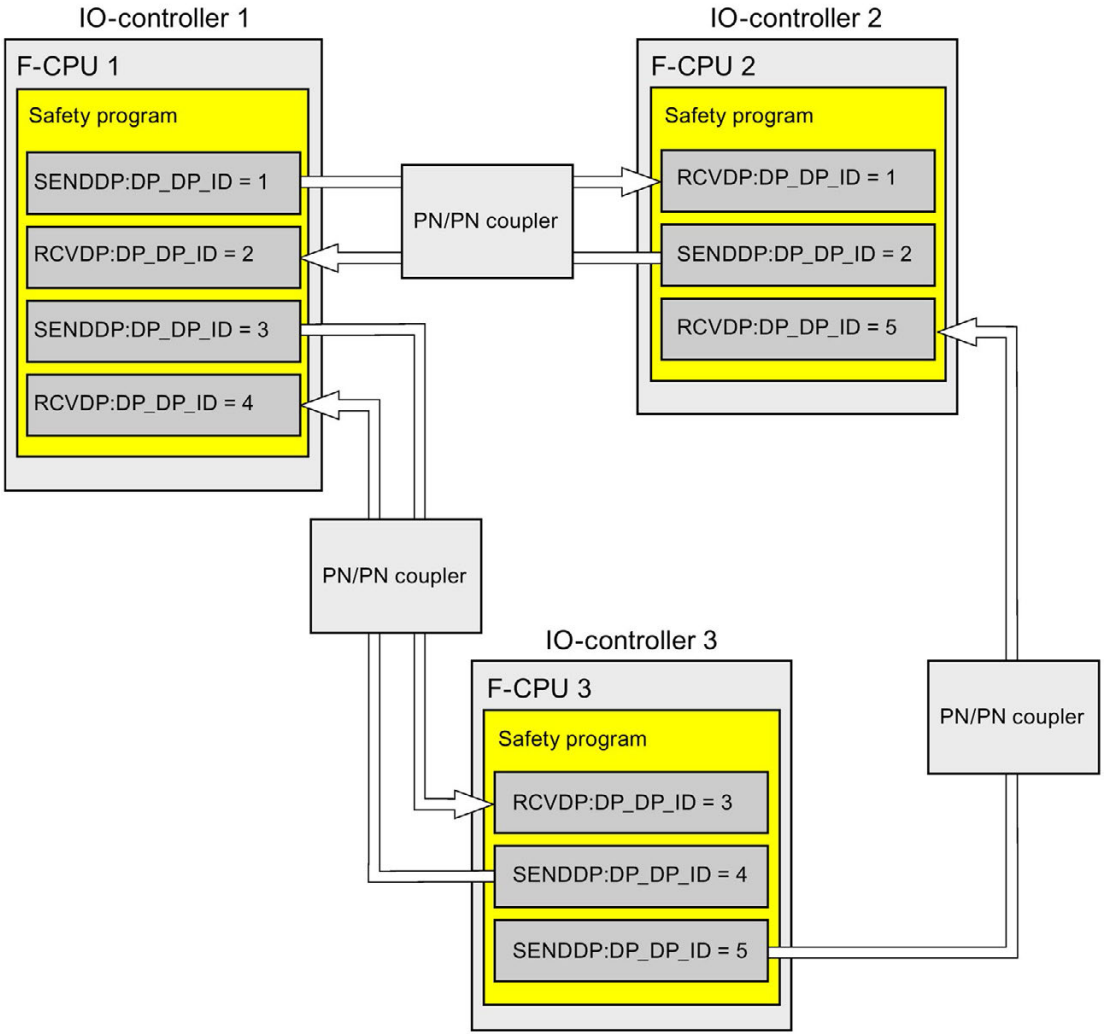
Programming procedure

You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 515) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 515) for receiving at the start of the main safety block.
3. Assign the start addresses of the output and input data transfer areas of the PN/PN coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.
4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for five safety-related IO controller-IO-controller communication relationships.



WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, provide the tag "F_GOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*
8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).
9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.

11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 294).

9.1.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.1.3 Safety-related master-master communication

9.1.3.1 Configure safety-related master-master communication

Introduction

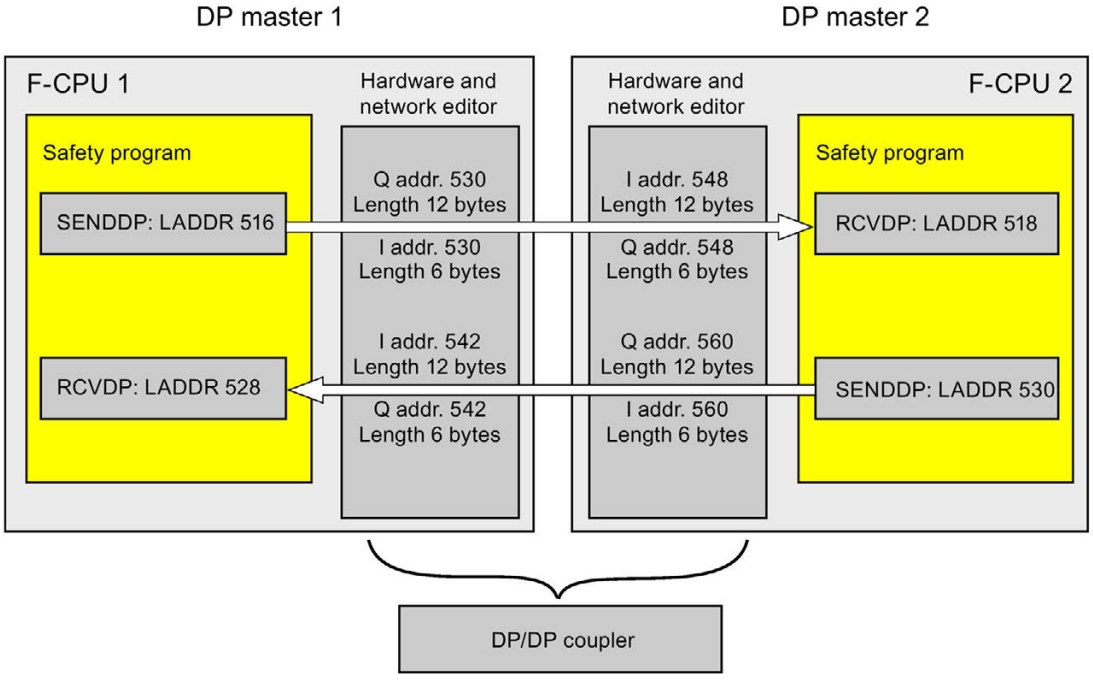
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the DP/DP coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for input data and the transfer area for output data for the **data to be sent** must begin with the same start address. A total of 6 bytes (consistent) is required for the transfer area for input data; 12 bytes (consistent) are required for the transfer area for output data.

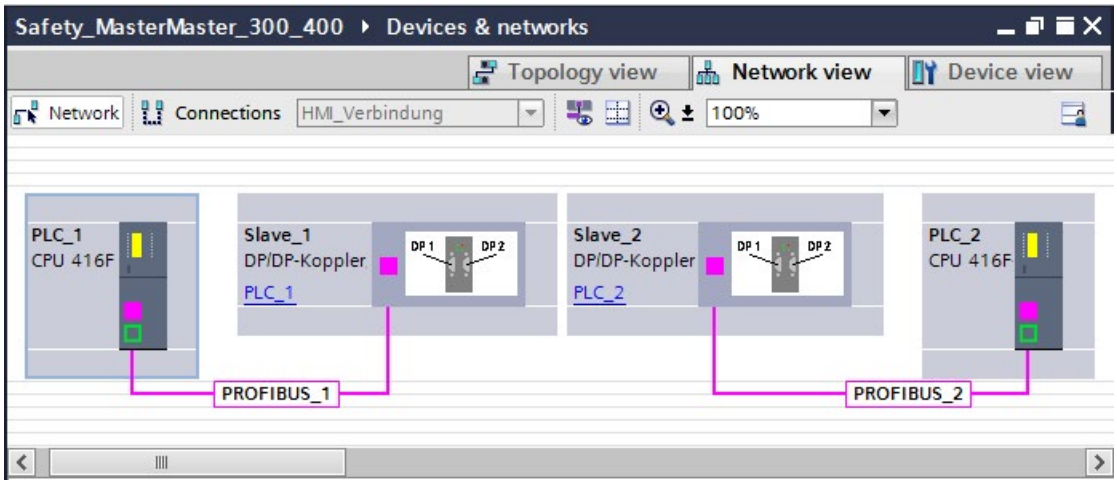
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.



6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler of PLC 1, either using the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).
7. Switch to the device view of the DP/DP coupler for PLC1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "6 bytes I/12 bytes Q consistent" module, and
   - One "12 bytes I/6 bytes Q consistent" module

8. In the properties of the modules, assign the addresses outside the process image as follows:

   For "6 bytes I/12 bytes Q consistent" module for sending data for example:

   – Input addresses: Start address 530

   – Output addresses: Start address 530

   For "12 bytes I/6 bytes Q consistent" module for receiving data for example:

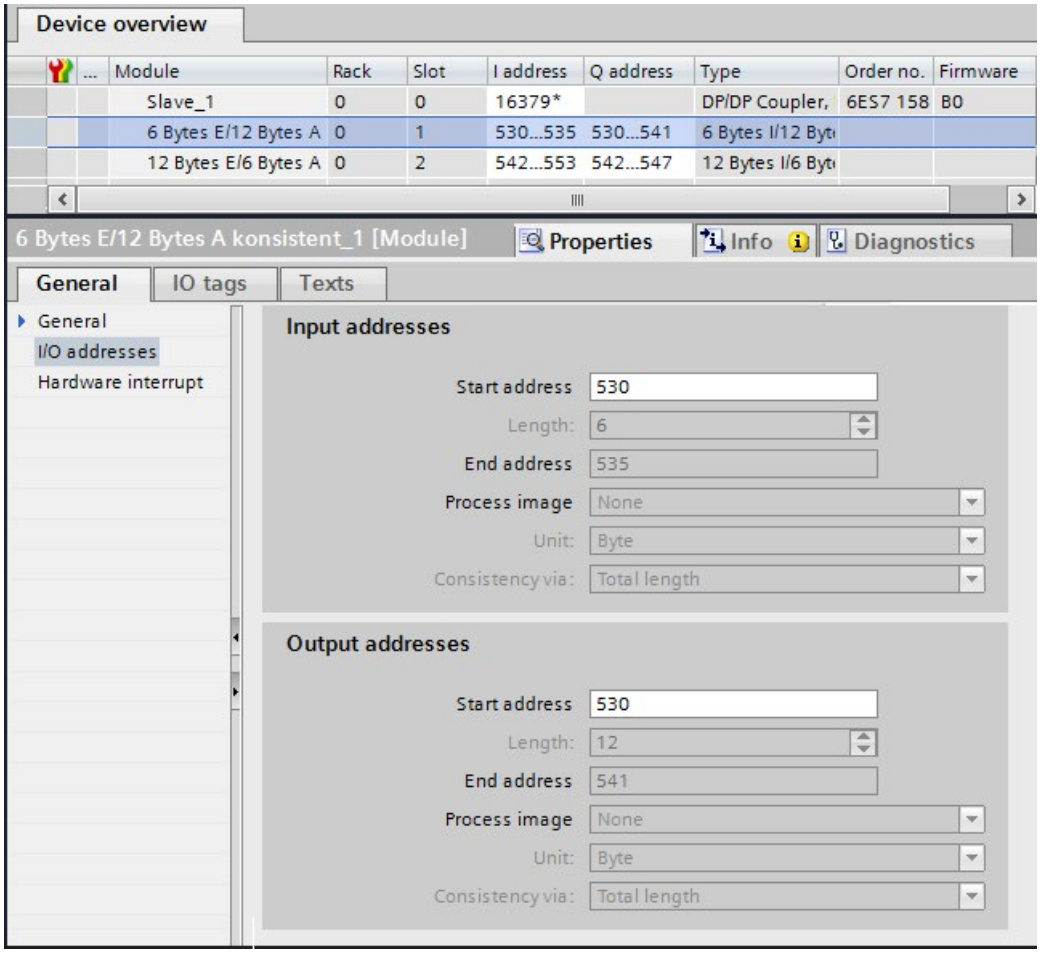
   – Input addresses: Start address 542

   – Output addresses: Start address 542

   Note

   Make sure that you assign identical start addresses for the address areas of the output and input data.

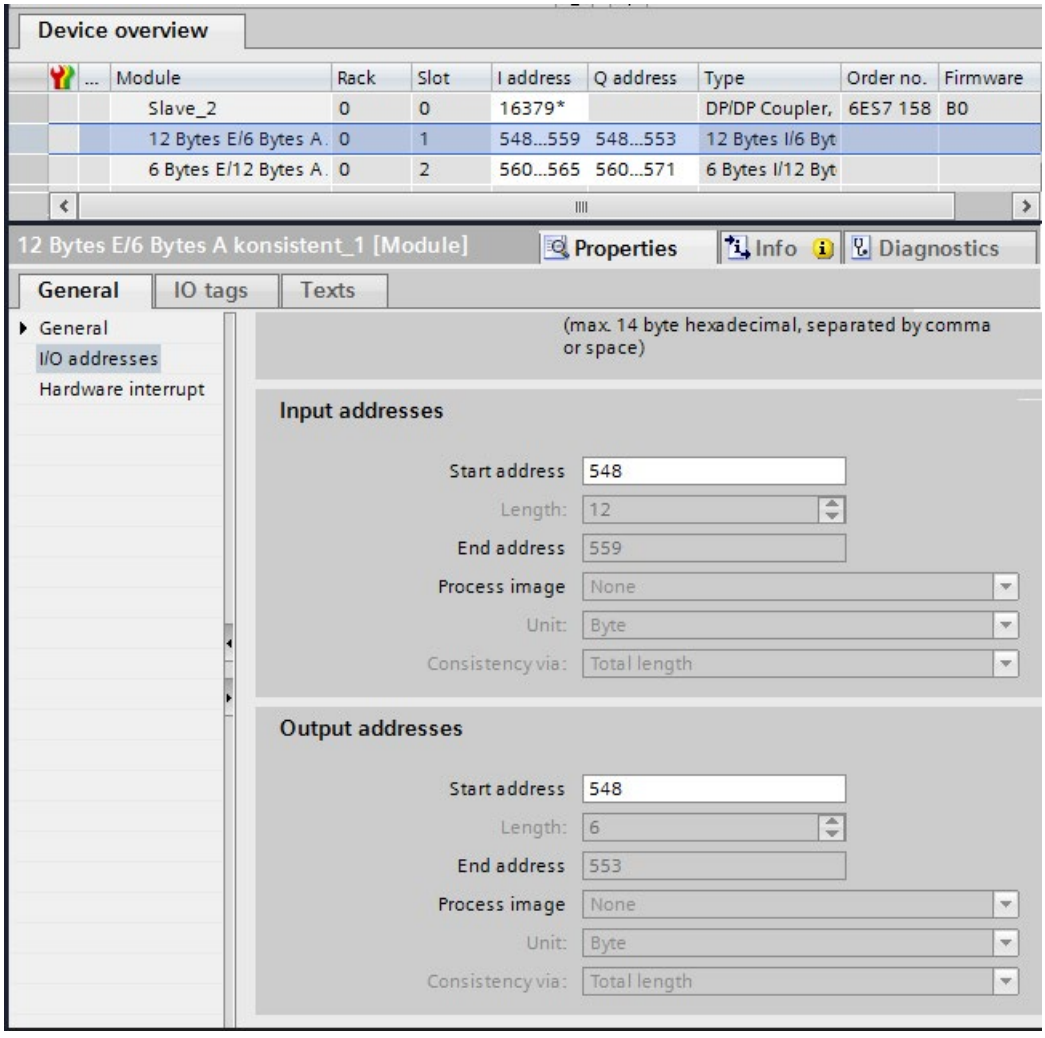
   Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



9. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module
10. In the properties of the modules, assign the addresses outside the process image as follows:

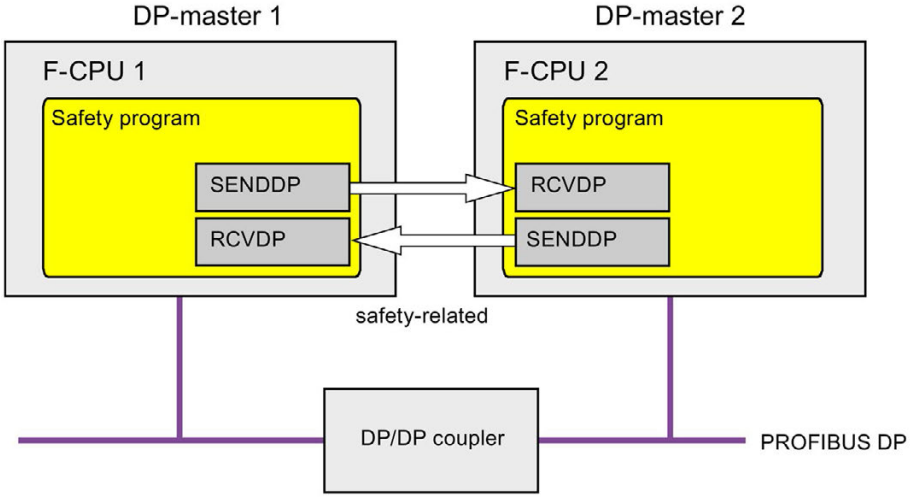
    For "12 bytes I/6 bytes Q consistent" module for receiving data for example:
    - Input addresses: Start address 548
    - Output addresses: Start address 548

    For "6 bytes I/12 bytes Q consistent" module for sending data for example:
    - Input addresses: Start address 560
    - Output addresses: Start address 560



9.1.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.1.3.3 Program safety-related master-master communication

Requirement for programming

The transfer areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

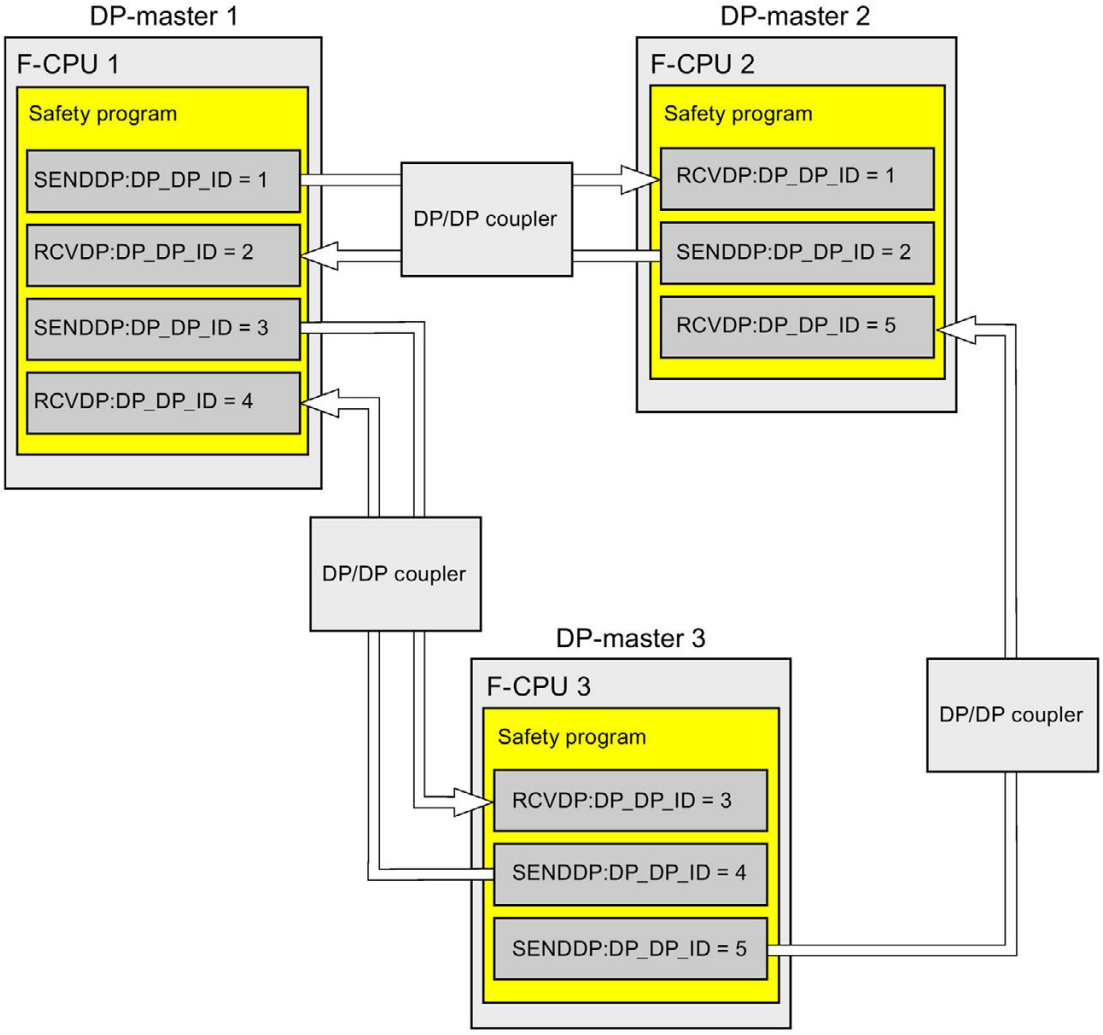
You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 515) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 515) for receiving at the start of the main safety block.
3. Assign the start addresses of the transfer areas for output and input data of the DP/DP coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for five safety-related master-master communications relationships.



⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g. "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value for data of the data type BOOL, provide the tag "F_GLOBDB".VKE1 for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 294).

9.1.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.1.4 Safety-related IO controller-I-device communication

9.1.4.1 Configuring safety-related communication between IO controller and I-device

Introduction

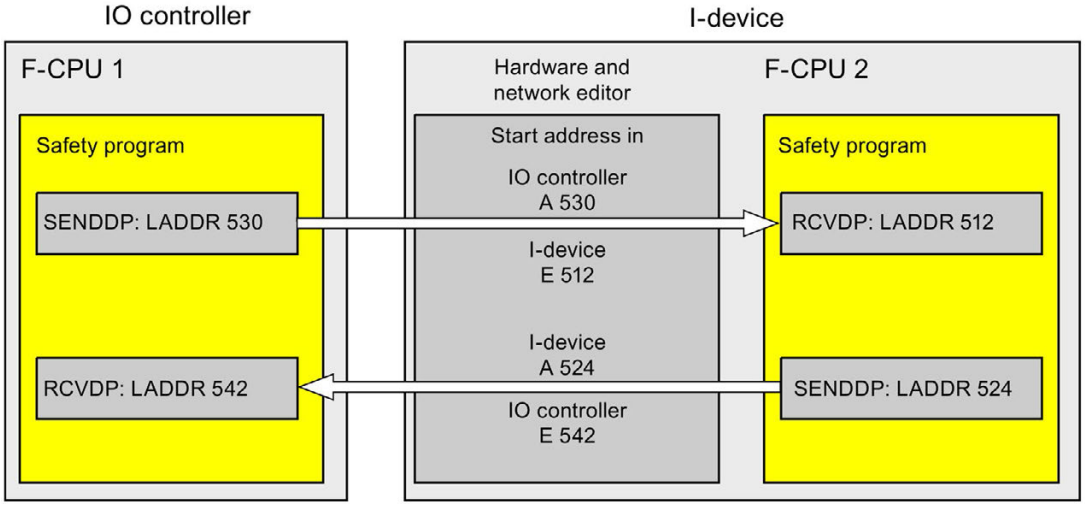
Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (**F**-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

The F-CPU to be used as an I-device must support the "IO-device" operating mode.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

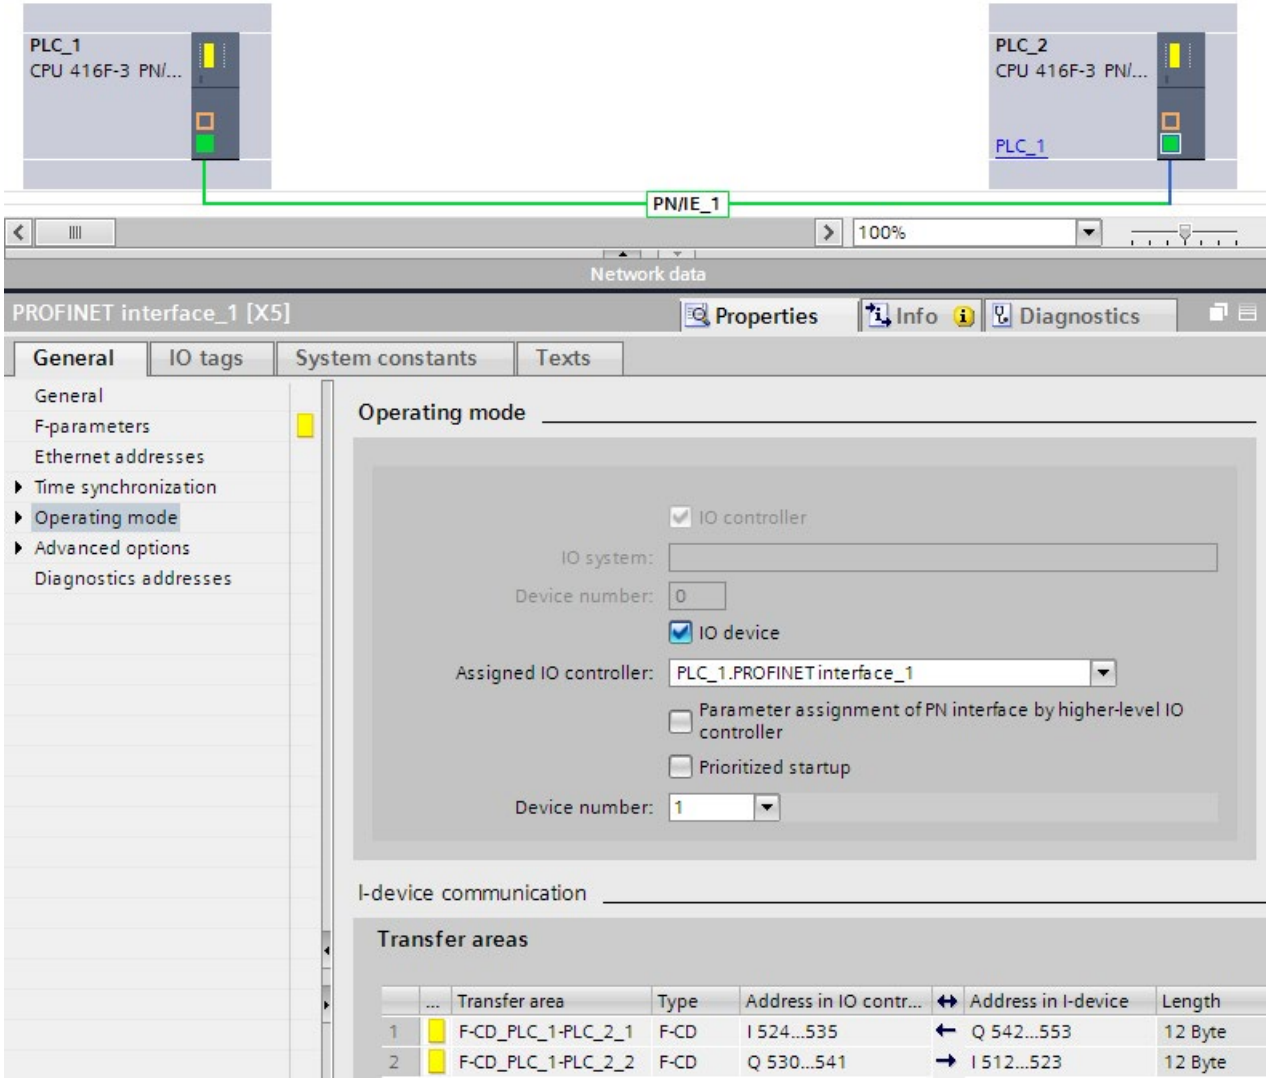
The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for sending to the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned outside of the process image are displayed.

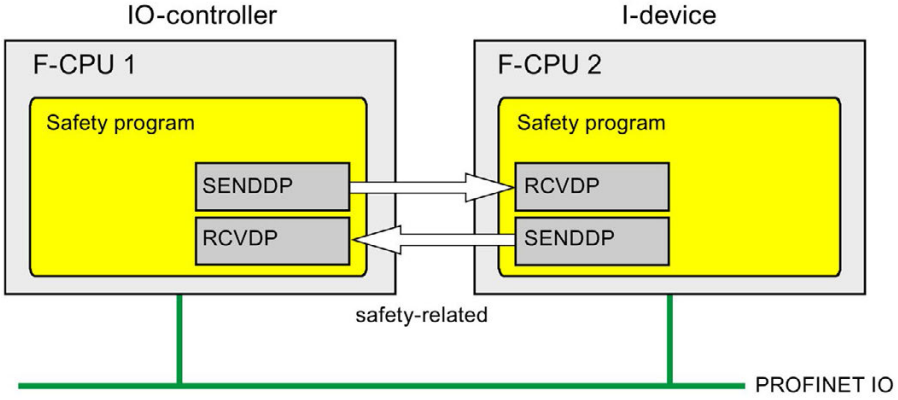
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").
4. Create an additional F-CD connection for receiving from the IO controller.

5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from IO controller (→).



9.1.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.1.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

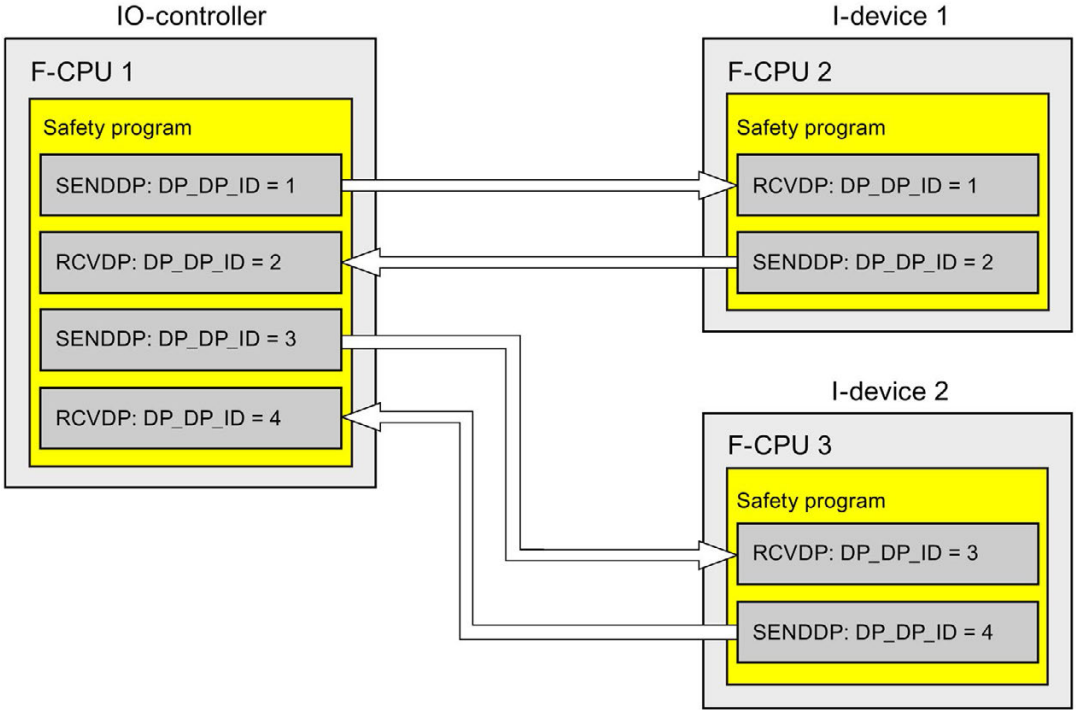
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 178)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the IO controller	→	Address in the IO controller
RCVDP in the IO controller	←	Address in the IO controller
SENDDP in the I-device	←	Address in the IO device
RCVDP in the I-device	→	Address in the IO device

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for four safety-related IO controller-I-device communication relationships.



⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

9.1.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.1.5 Safety-related master-I-slave communication

9.1.5.1 Configuring safety-related master-I-slave communication

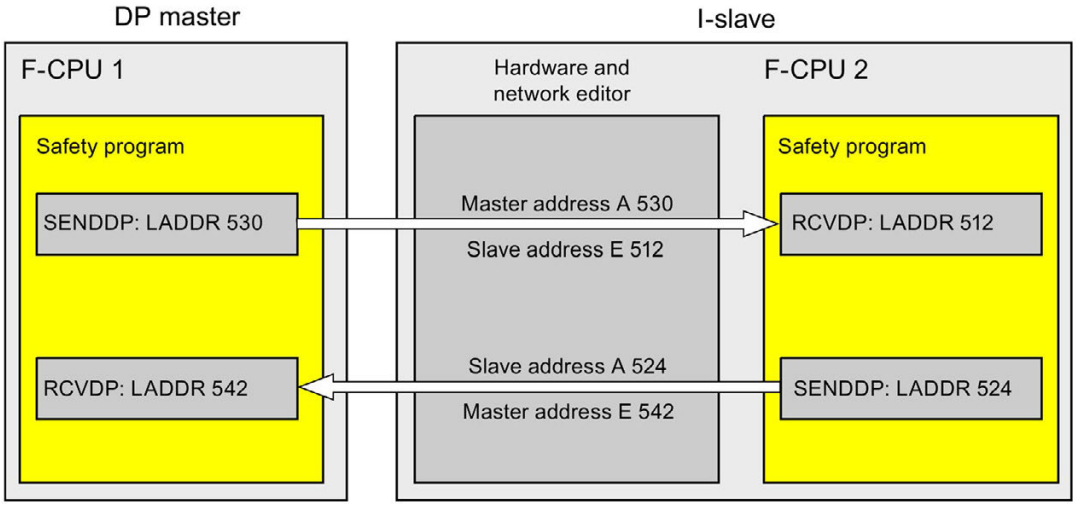
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

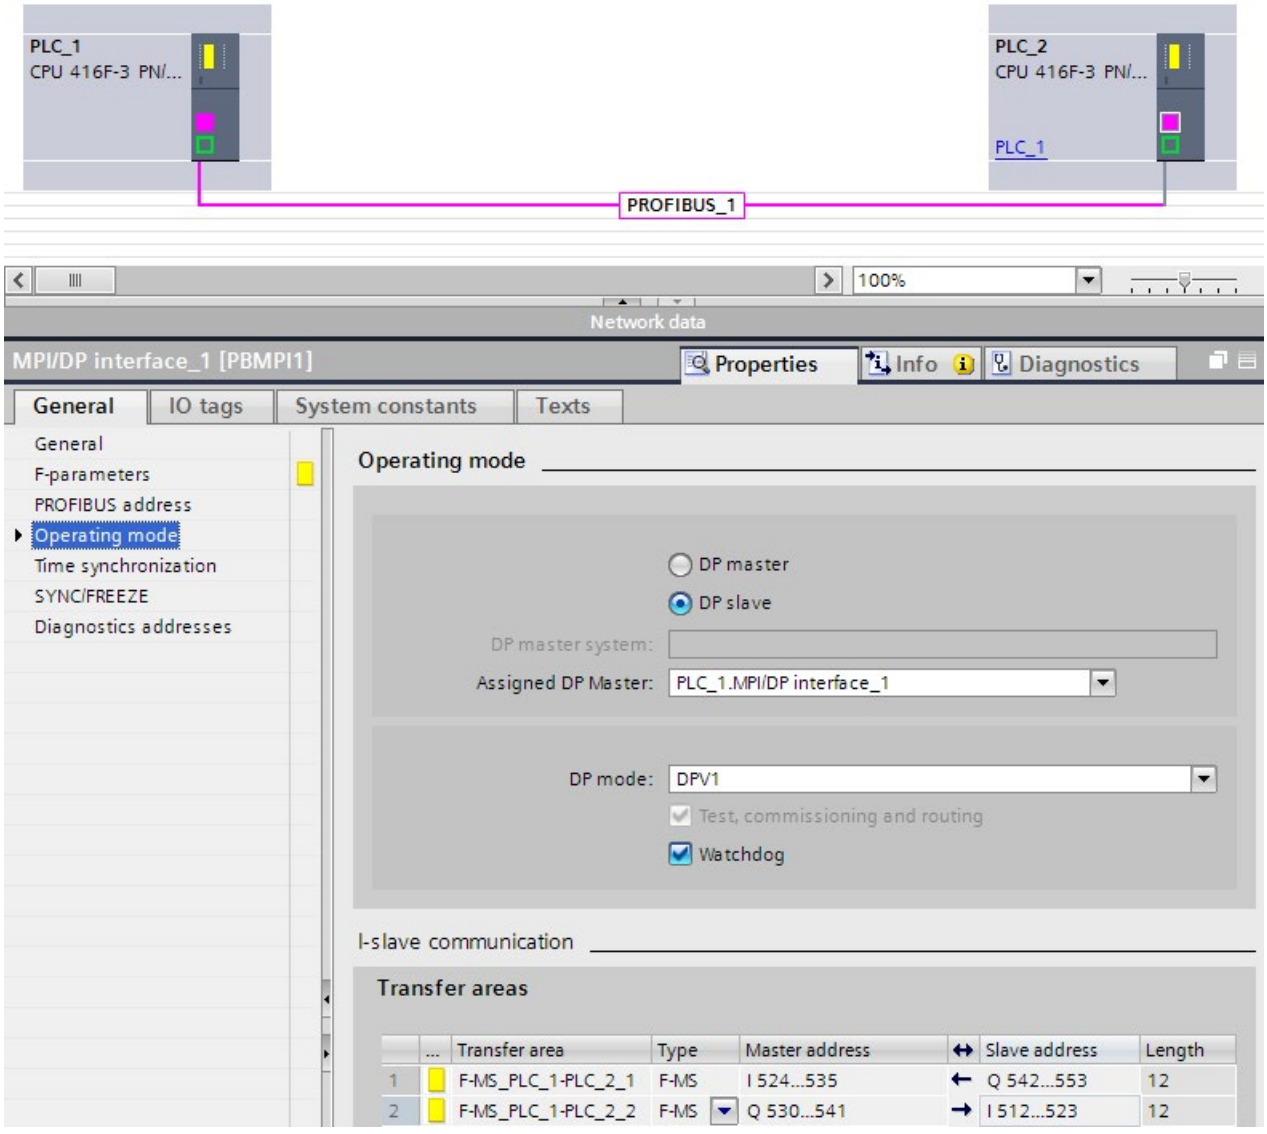
The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Activate the "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this DP interface to a DP interface of F-CPU 1.
3. Select the PROFIBUS interface of F-CPU 2. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the transfer areas in the I-slave and DP master assigned outside of the process image are displayed.

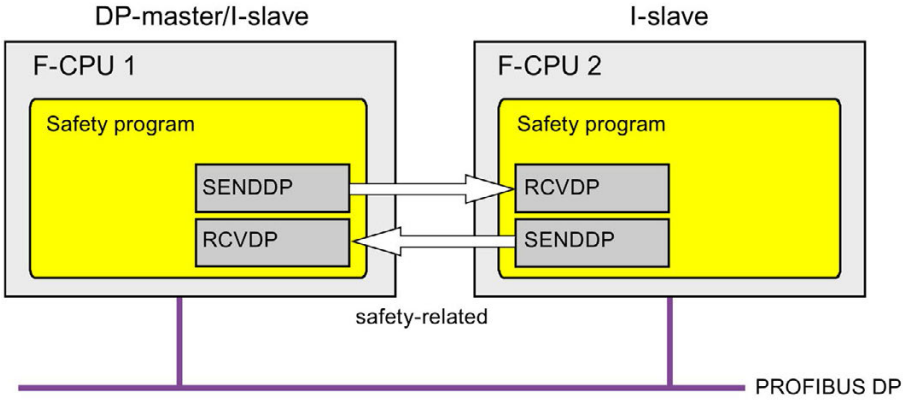
   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").

4. Create an additional F-MS connection for receiving from the DP master.
5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.1.5.2 Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave or between the F-CPUs of multiple I-slaves makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.1.5.3 Program the safety-related master-I-slave or I-slave-I-slave communication

Requirements

The transfer areas must be configured.

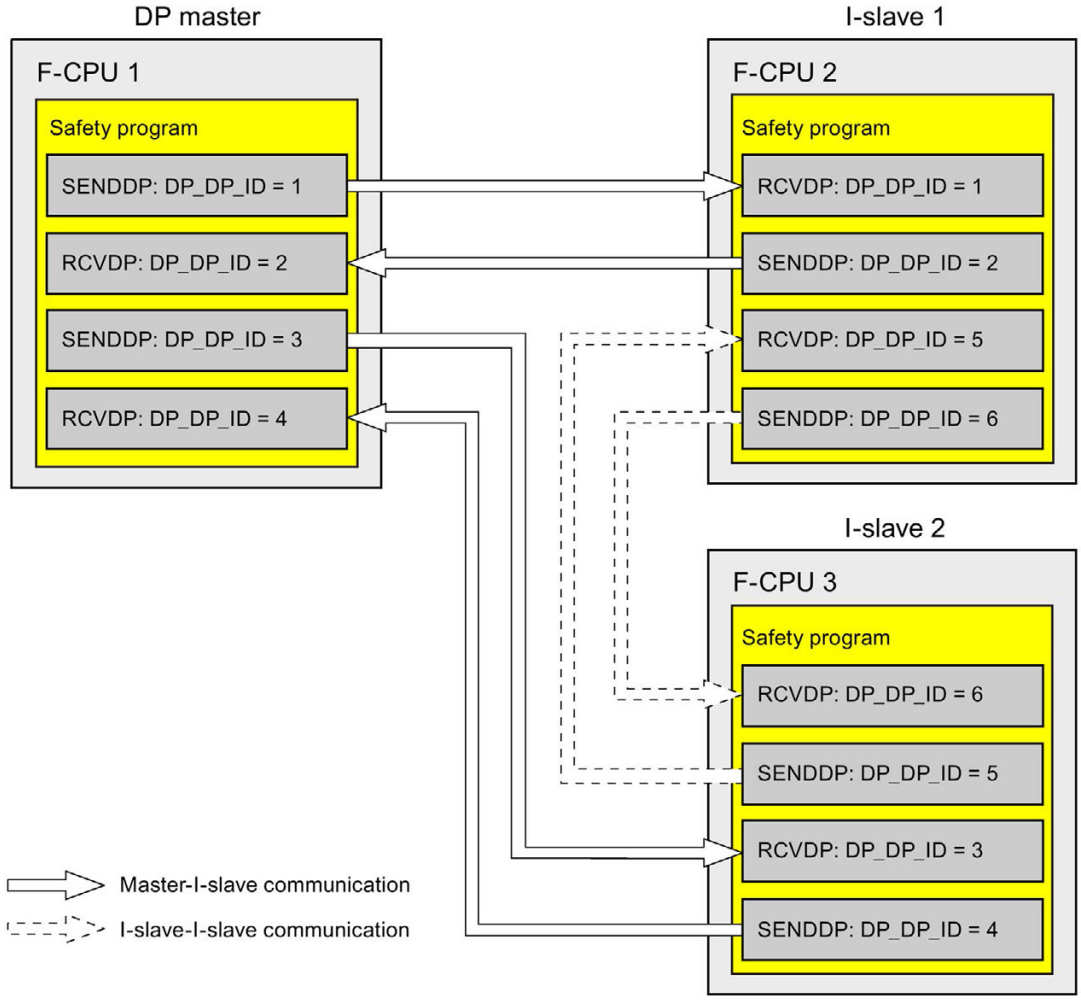
Programming procedure

The procedure for programming safety-related master-I-slave communication or I-slave-I-slave communication is the same as that for programming safety-related master-master communication (see Program safety-related master-master communication (Page 187)).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the DP master	→	Master address
RCVDP in the DP master	←	Master address
SENDDP in the I-slave	←	Slave address
RCVDP in the I-slave	→	Slave address

The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave and two I-slave-I-slave communications relationships.



WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

9.1.5.4 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data					
		DP master		I-slave 1		I-slave 2	
		Output data	Input data	Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes	—	—
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes	—	—
I-slave-I-slave	**Sending:** I-slave 1 to I-slave 2	—	18 bytes	12 bytes	6 bytes	6 bytes	12 bytes
	Receiving: I-slave 1 from I-slave 2	—	18 bytes	6 bytes	12 bytes	12 bytes	6 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS, F-DX, F-DX-Mod., MS, DX). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.6 Safety-related I-slave-I-slave communication

9.1.6.1 Configure safety-related I-slave-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPUs of I-slaves takes place using direct data exchange (**F-**DX) – same as in standard programs.

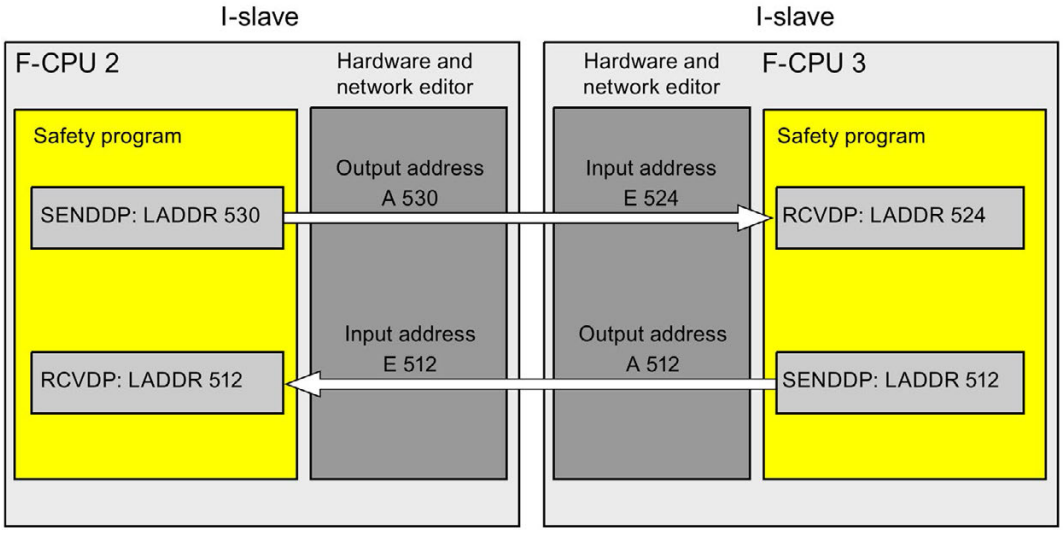
You do not need any additional hardware for I-slave-I-slave communication.

I-slave-I-slave communication is also possible:

- If the assigned DP master is a standard CPU that supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

Configuring transfer areas

For every safety-related communication connection between two I-slaves, you must configure transfer areas in the *hardware and network editor*. In the figure below, both of the I-slaves are to be able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX_PLC_2-PLC_1_1" for the first F-DX connection between F-CPU 1 and F-CPU 2.

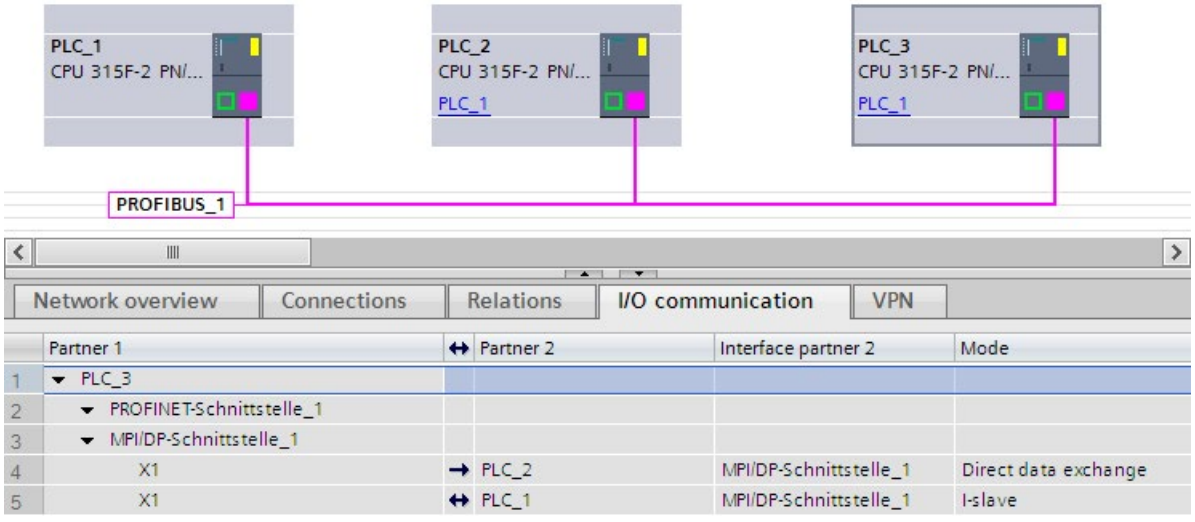
You assign the start addresses of the transfer areas to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

The procedure for configuring safety-related I-slave-I-slave communication is identical to that in the standard system. Proceed as follows:

1. Insert three F-CPUS from the "Hardware catalog" task card in the project.
2. Activate "DP slaves" mode (I-slave) for F-CPU 2 and F-CPU 3 in the properties of their DP interfaces and assign these DP interfaces to a DP interface of F-CPU 1.
3. Select the DP interface of F-CPU 3 in the network view.
4. Select the "I/O communication" tab.
5. Use a drag-and-drop operation in the network view to move F-CPU 2 to the "Partner 2" column on the "I/O-communication" tab.

   This creates a line with "Direct data exchange" mode for sending to the I-slave (F-CPU 2) (→).



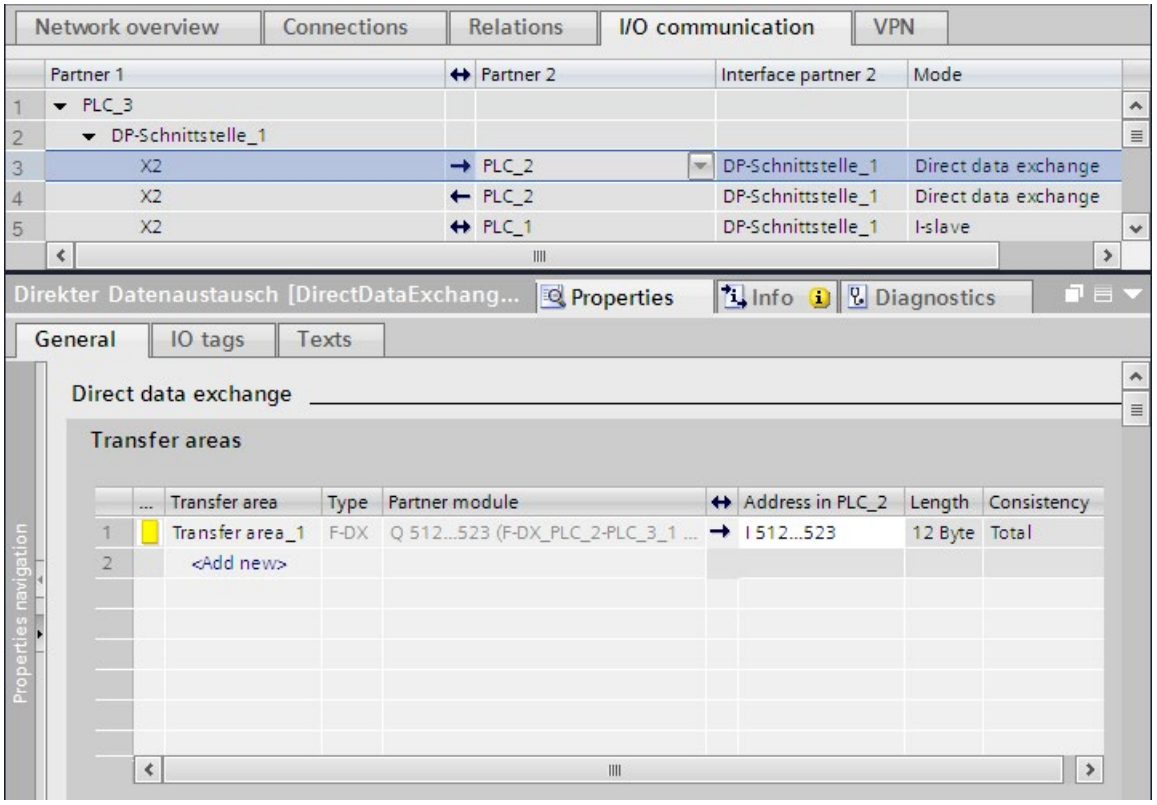
6. Click in the newly created line (→).

7. In "Transfer areas" ("Direct data exchange" table), create an F-DX connection (type "F-DX") for sending to the I-slave (F-CPU 2) (→). The F-DX connection is shown in yellow in the table and the transfer areas in the I-slaves assigned outside of the process image (PLC_2 and PLC_3) are displayed.

   In addition, a line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 2) (→) is created automatically in the "I/O communication" tab, and an acknowledgment connection (←, transfer area x_Ack) is created automatically in the associated "Direct data exchange" table.

   One transfer area (type F-MS) for the master CPU (disabled in display) is created for in the "I-slave communication table" of each I-slave.

   This completes the configuration for sending to F-CPU 2.

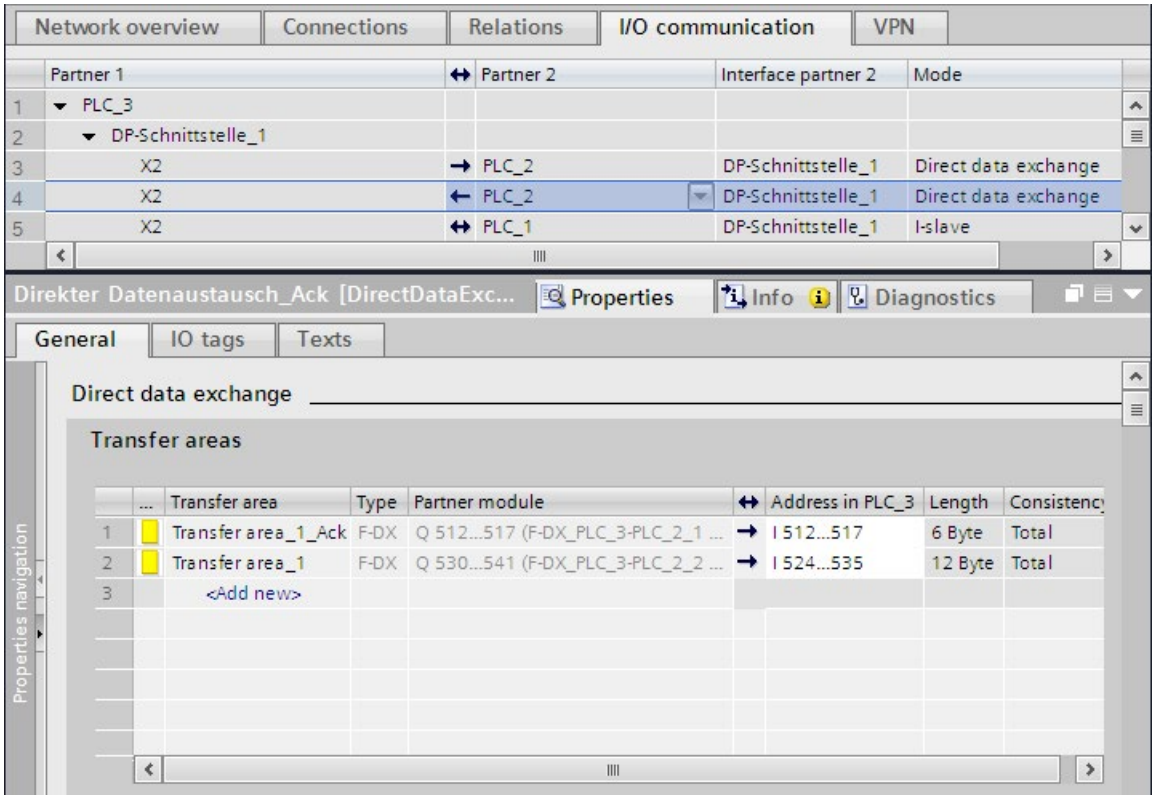


8. In the "I/O communication" tab, select the automatically created line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 3) (←).

9. In "Transfer areas" ("Direct data exchange" table), create another F-DX connection for receiving from the I-slave (F-CPU 3).

   In this case, as well, an acknowledgment connection (←, transfer area x_Ack) is created automatically in the "Direct data exchange table" and two transfer areas (type F-MS) for the master CPU (disabled in display) are created in the "I-slave communication" table of both I-slaves.

   This completes the configuration for receiving from F-CPU 2.



Changing disabled local address areas of the transfer areas

In order to change the disabled local address area of "Transfer area x", you must change the address area of the corresponding acknowledgment connection "Transfer area x_Ack".

1. In "I/O communication", select the line with the arrow pointing in the same direction as the arrow of "Transfer area x" in the "Direct data exchange" table.
2. Then select the line with "Transfer area x_Ack" in the "Direct data exchange" table.
3. Change the address area there.

9.1.6.2 Safety-related I-slave-I-slave communication via SENDDP and RCVDP

Reference

The description of the communication via SENDDP and RCVDP for safety-related I-slave-I-slave communication can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.1.6.3 Programming safety-related I-slave-I-slave communication

Reference

The description of the programming of safety-related I-slave-I-slave communication can be found in Program the safety-related master-I-slave or I-slave-I-slave communication (Page 201).

The assignment of the start addresses of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the 1st I-slave	→	Address in the <1st I-slave> (in example column "Address in PLC_2")
RCVDP in the 1st I-slave	←	Address in the <1st I-slave> (in example column "Address in PLC_2")
SENDDP in the 2nd I-slave	←	Address in the <2nd I-slave> (in example column "Address in PLC_3")
RCVDP in the 2nd I-slave	→	Address in the <2nd I-slave> (in example column "Address in PLC_3")

9.1.6.4 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

The description of the limits for the data transfer of safety-related I-slave-I-slave communication can be found in Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication (Page 203).

9.1.7 Safety-Related I-Slave-Slave Communication

9.1.7.1 Configuring Safety-Related I-Slave-Slave Communication

Introduction

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O in a DP slave takes place using direct data exchange (**F-**DX-Mod), same as in standard programs.

You do not need any additional hardware for I-slave-slave communication.

I-slave-slave communication is also possible:

- when the assigned DP master is a standard CPU, if the standard CPU supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

An F-I/O DB is automatically generated for each F-I/O when it is configured in the *hardware and network editor*; this is required for the F-I/O access via safety-related I-slave-slave communication. The F-I/O DB is initially created in the safety program of the DP master, provided it is an F-CPU with F-activation. Only with the setup of the F-DX-Mod connection is the F-I/O DB created in the safety program of the I-slave and deleted in the safety program of the DP master.

The process image input is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave (see description in Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 214)).

Restrictions

Note

Safety-related I-slave-slave communication with F-I/O is possible in a DP slave that supports safety-related I-slave-slave communication, for example with all ET 200SP F-modules with IM 155-6 DP HF, firmware version > V3.1, with all ET 200S F-modules with IM 151-1 HF, with all fail-safe S7-300 signal modules with IM 153-2, as of article number 6ES7153-2BA01-0XB0, firmware version > V4.0.0.

Note

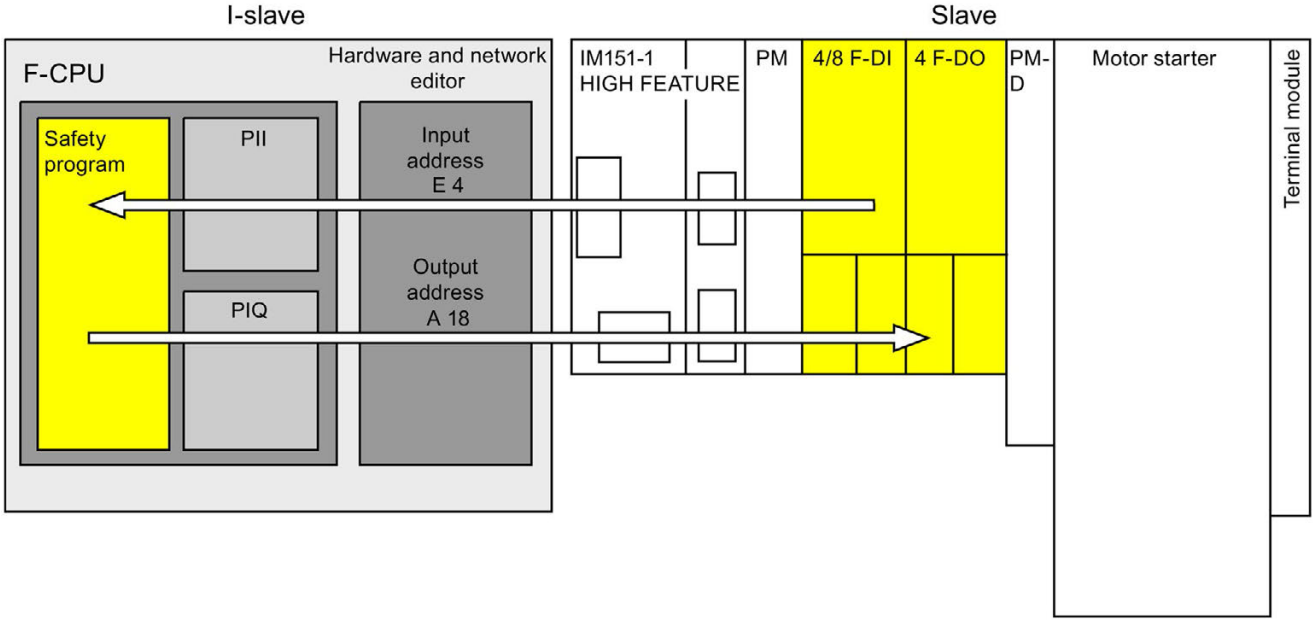
With safety-related I-slave-slave communication, make sure that the CPU of the DP master is powered up before the F-CPU of the I-slave.

Otherwise, depending on the F-monitoring time specified for the F-I/O, the F-system can detect an error in safety-related communication (communication error) between the F-CPU and the F-I/O assigned to the I-slave. This means that the F-I/O are not reintegrated automatically after F-system startup. They are instead only reintegrated after a user acknowledgment with a positive edge in the ACK_REI tag of the F-I/O DB (see also After communication errors (Page 148) and After startup of F-system (Page 145)).

Configuring transfer areas

For every safety-related communication connection between an I-slave and slave, you must configure transfer areas in the *hardware and network editor*.

The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-DX-Mod_PLC_2-PLC_1_1" for the first F-DX-Mod connection between F-CPU 1 and F-CPU 2.



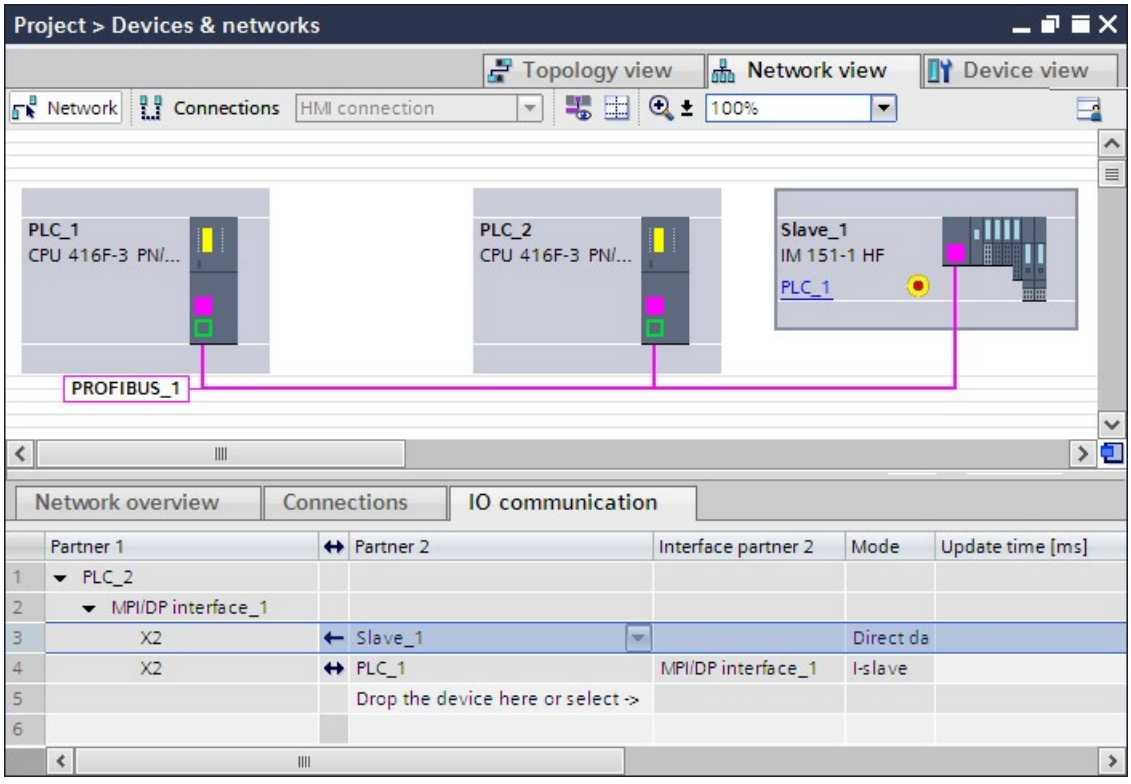
Configuration procedure using the example of an ET 200S with F-modules in the slave

The procedure for configuring safety-related I-slave-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Insert a suitable DP slave, e.g. IM 151-1 HF, article no. 6ES7151-1BA0... from the "Hardware catalog" task card into the network view of the *hardware and network editor*.
3. Insert a power module, a 4/8 F-DI module and a 4 F-DQ module in the device view of the ET 200S.
4. Activate "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this to F-CPU 1.
5. Assign the DP interface of the IM 151-1 HF to the DP master (F-CPU 1).
6. Select the DP interface of F-CPU 2 (I-slave) in the network view.
7. Select the "I/O communication" tab.

8. Use a drag-and-drop operation in the network view to move the ET 200S to the "Partner 2" column in the "I/O-communication" tab.

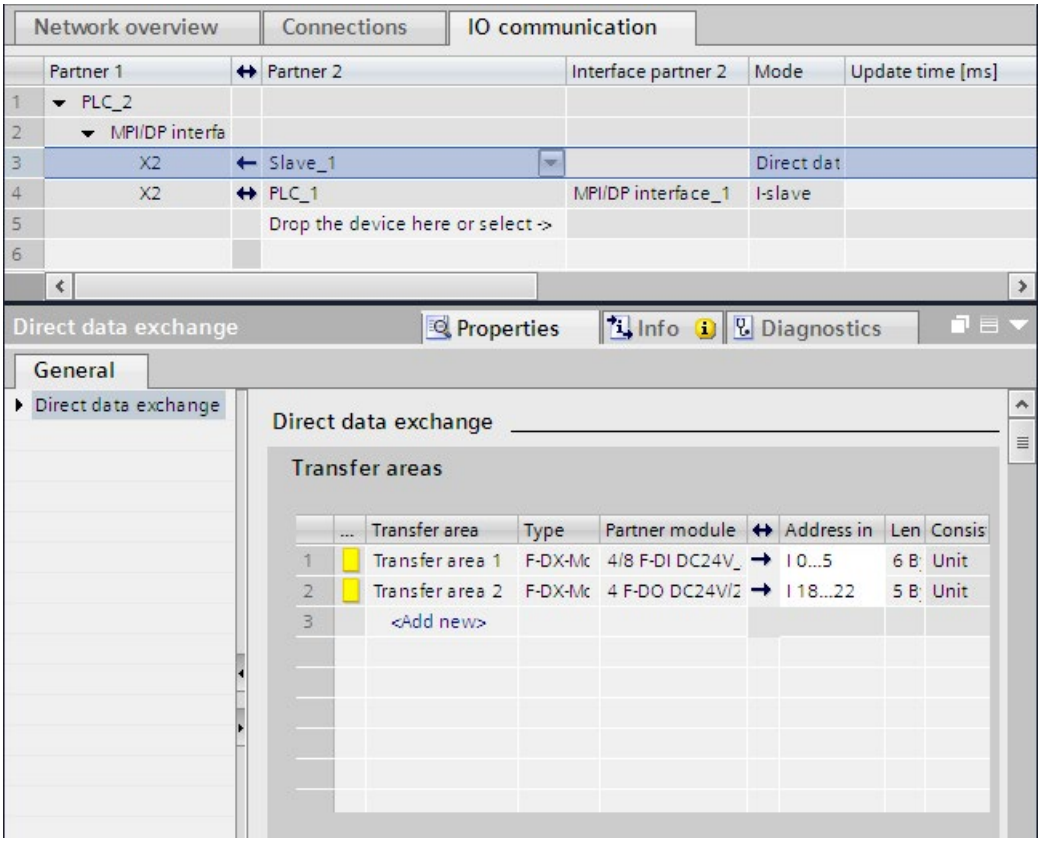


9. Click in the newly created line (←).
10. In "Transfer areas", create an F-DX-Mod connection (type "F-DX-Mod"). The F-DX-Mod connection is marked in yellow in the table. The addresses for the "partner module" 4/8 F-DI in the I-Slave (PLC_2) are displayed. You can change the addresses directly in the table, if required.

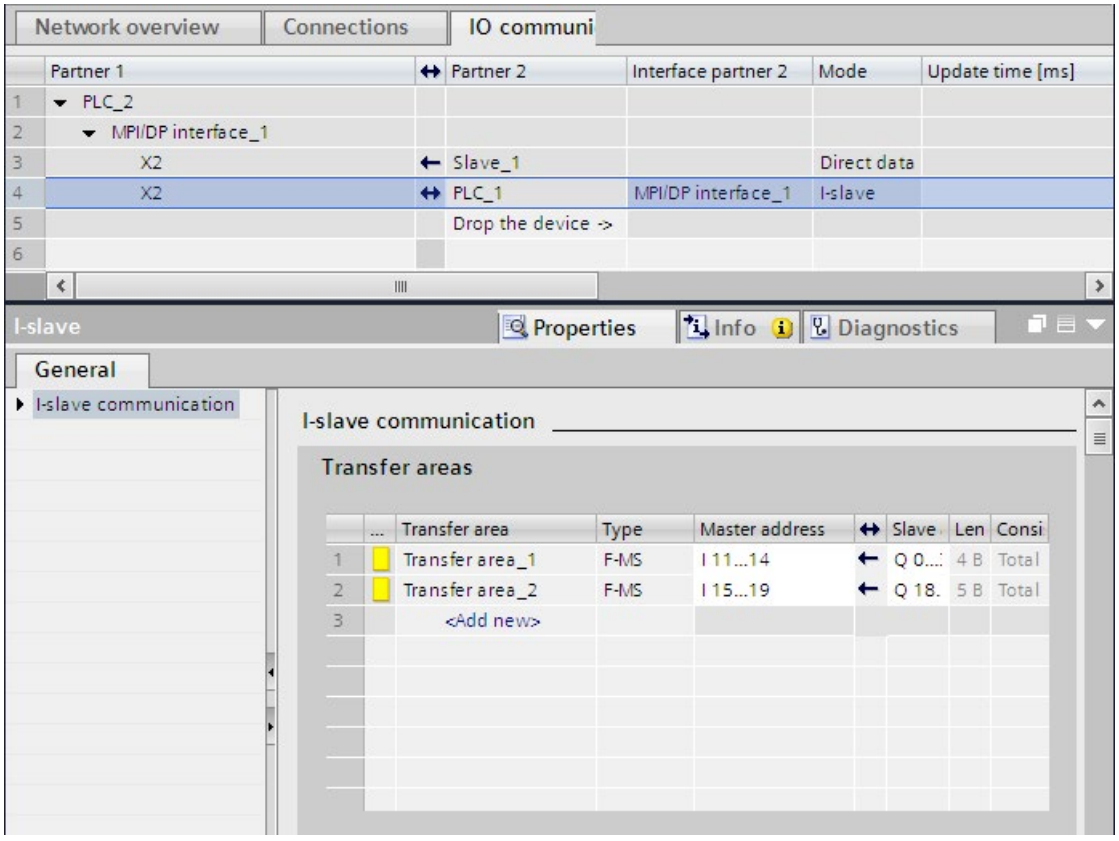
    This completes the configuration for the 4/8 F-DI module.

11. In "Transfer areas", create another F-DX-Mod connection.
12. Change the partner module to the 4 F-DO module, either directly in the "Transfer areas" table or in the details of transfer area 2, if the 4 F-DO module was not already selected.

    This completes the configuration for the 4 F-DO module.



In the "I-slave communication table" of the I-slave, a transfer area (type F-MS) for the master CPU (disabled in display) is created for each F-DX-Mod connection:



Change in configuration of I-slave-slave communication

⚠ WARNING

If you have reconfigured I-slave-slave communication for an F-I/O or have deleted an existing I-slave-slave communication, you must compile the hardware configuration of the DP master as well as the hardware configuration of the I-slave and download them to the DP master and I-slave, respectively.

The collective F-signature in the F-CPU of the I-slave and the collective F-signature in the F-CPU of the DP master (if a safety program exists there, too) are set to "0". You must then recompile the safety program(s). *(S019)*

9.1.7.2 Safety-Related I-Slave-Slave Communication - F-I/O Access

Access via the process image

In safety-related I-slave-slave communication, you use the process image (PII or PIQ) to access the F-I/O in the safety program of the F-CPU of the I-slave. This is the same as F-I/O access to F-I/O that are directly assigned to an I-slave or DP master. In the I-slave you access the F-I/O with the addresses that were assigned for the F-DX-Mod connection in "Transfer areas" ("Direct data exchange" table).

In this case, ignore the displayed operand area. Access F-I/O with inputs using the PII and F-I/O with outputs using PIQ.

Information on I/O access can be found in F-I/O access (Page 128).

9.1.7.3 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

An example of the amount of output data and input data that are assigned for safety-related communication is shown in the table below for an ET 200S 4/8 F-DI and an ET 200S 4 F-DO:

Safety-related communication	Communication connection	Assigned input and output data*	
		Between I-slave and DP master	
		Output Data in the I-slave	Input data in the I-slave
I-slave-slave	I-slave-slave communication with 4/8 F-DI	4 bytes	6 bytes
	I-slave-slave communication with 4 F-DO	5 bytes	5 bytes

* Example for 4/8 F-DI and 4 F-DO of ET 200S

Consider all additional configured safety-related and standard communication connections (F-MS, F-DX, F-DX-Mod., MS and DX connections) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master. If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.8 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 530)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 197) also applies.

9.1.9 Safety-related communication via S7 connections

9.1.9.1 Configuring safety-related communication via S7 connections

Introduction

Safety-related communication between the safety programs of F-CPUs via S7 connections takes place by means of established S7 connections that you create in the network view of the *hardware and network editor* - same as in standard programs.

Restrictions

Note

In SIMATIC Safety, S7 connections are generally permitted only via Industrial Ethernet.

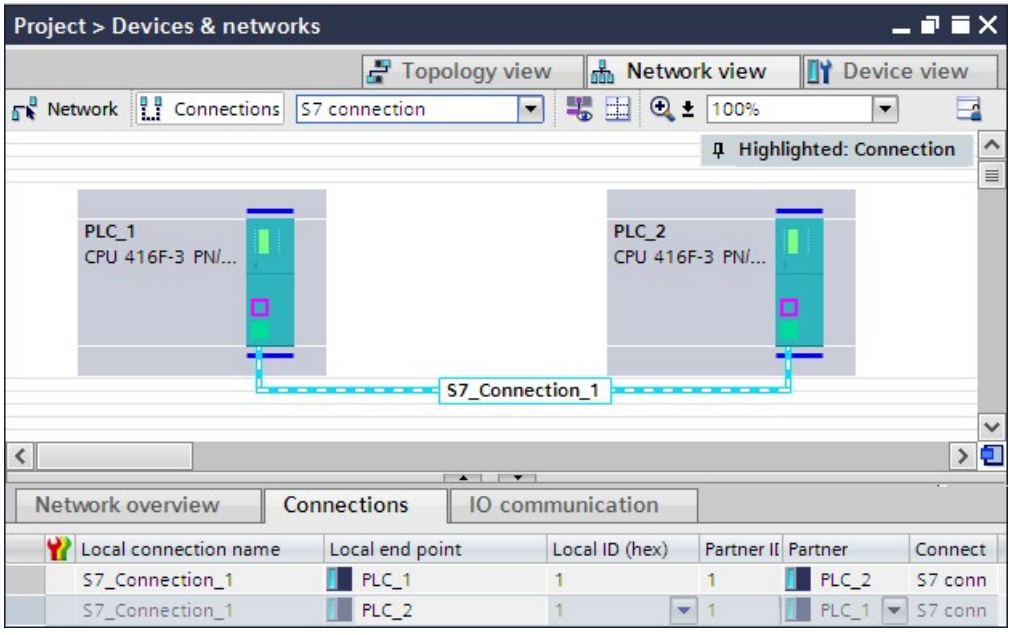
Safety-related communication via S7 connections is possible from and to the following CPUs:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 or CP 443-1 Advanced-IT

Creating S7 connections

For each connection between two F-CPUs, you must create an S7 connection in the network view of the *hardware and network editor*.

For every end-point of a connection, a local and a partner ID is automatically assigned from the perspective of the end-point (the F-CPU). If necessary, you can change both IDs in the "Connections" tab. You assign the local ID to the "ID" input of the SENDS7 and RCVS7 instructions in the safety programs.

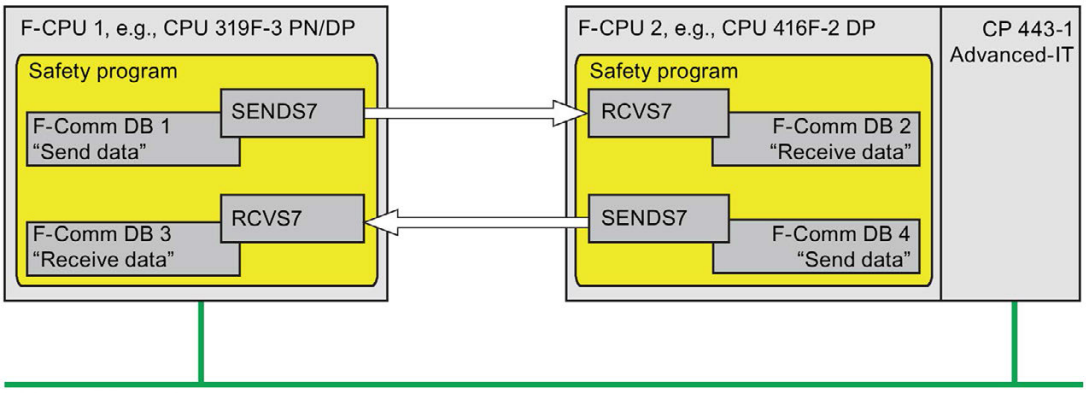


Procedure for configuring S7 connections

You configure the S7 connections for safety-related CPU-to-CPU communication in the same way as in *STEP 7 Professional* (see *Help on STEP 7 Professional* "S7 connections").

9.1.9.2 Communication via SENDS7, RCVS7, and F-Communication DB

Communication via the SENDS7 and RCVS7 instructions



You use the **SENDS7 and RCVS7** instructions for fail-safe sending and receiving of data via S7 connections.

These instructions can be used to transmit a specified amount of fail-safe data of data types BOOL, INT, WORD, DINT, DWORD, and TIME in a fail-safe manner. The fail-safe data are stored in F-DBs (F-communication DBs) that you have created.

You can find these instructions in the "Instructions" task card under "Communication". The RCVS7 instruction **must** be called at the start of the main safety block. The SENDS7 instruction **must** be called at the end of the main safety block.

Note that the send signals are sent only after calling the SENDS7 instruction at the end of the relevant F-runtime group execution.

A detailed description of the SENDS7 and RCVS7 instructions is found in SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V14) (S7-300, S7-400) (Page 523).

F-communication DB

For each connection, send data are stored in an F-DB (F-communication DBx) and receive data are stored in an F-DB (F-communication DBy).

You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

9.1.9.3 Programming safety-related communication via S7 connections

Introduction

The programming of safety-related CPU-CPU communication via S7 connections is described below. You must set up the following in the safety programs of the relevant F-CPUs:

- Create F-DBs (F-Communication-DBs) in which send/receive data for communication are stored.
- Call and assign parameters for instructions for communication from the "Instructions" Task Card in the safety program.

Requirement for programming

The S7 connections between the relevant F-CPUs must be configured in the network view in the "Connections" tab of the *hardware and network editor*.

Creating and Editing an F-Communication DB

F-communication DBs are F-DBs that you create and edit in the same way as other F-DBs in the project tree. You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

Note

The length and structure of the F-communication DB on the receiver side must match the length and structure of the associated F-communication DB on the sender side.

If the F-communication DBs do not match, the F-CPU can go to STOP mode. A diagnostics event is entered in the diagnostics buffer of the F-CPU.

For this reason, we recommend that you use the following procedure:

1. Create an F-communication DB in the project tree in or below the "Program blocks" folder of the F-CPU at the sender end.
2. Specify the appropriate structure of the F-communication DB, taking into account the data to be transferred.
3. Copy this F-communication DB to the project tree in or below the "Program blocks" folder of the F-CPU at the receiver end, and change the name, if necessary.

Other requirements for F-communication DBs

F-communication DBs must also conform to the following properties:

- They are not permitted to be instance DBs.
- Their length is not permitted to exceed 100 bytes.
- In F-communication DBs, only the following data types may be declared: BOOL, INT, WORD, DINT, DWORD, and TIME.
- The data types must be arranged block-wise and in the following order: BOOL, data types with bit length of 16 bits (INT, WORD), and data types with bit length of 32 bits (DINT, DWORD, and TIME). Within the data blocks with lengths of 16 bits and 32 bits, the data types can be arranged in any order.
- No more than 128 data elements of data type BOOL are permitted to be declared.
- The amount of data of data type BOOL must always be an integer multiple of 16 (word limit). Reserve data must be added, if necessary.

If these criteria are not fulfilled, *STEP 7 Safety Advanced* outputs an error message during compilation.

Assignment of fail-safe values

Fail-safe values are made available at the receiver end:

- While the connection between the communication partners is being established the first time after startup of the F-systems
- Whenever a communication error occurs

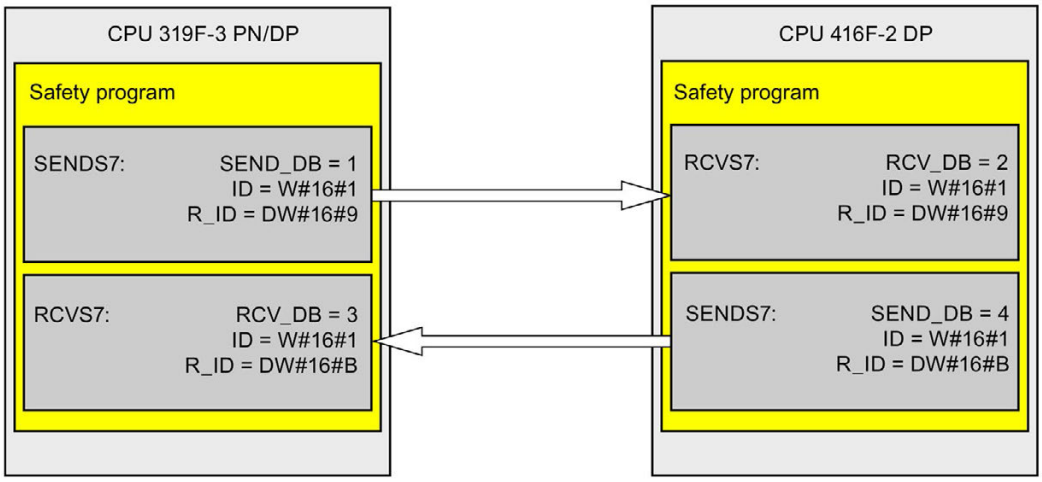
The values you specified as initial values in the F-communication DB at the receiver end are made available as initial values.

Programming procedure

You program safety-related communication via S7 connections as follows:

1. Supply the tags in the F-communication DB at the sender end with send signals using fully qualified access (e.g., "Name of F-communication DB".tag name).
2. Read the tags in the F-communication DB at the receiver end (receive signals) that you want to process further in other sections of the program using fully qualified access (e.g., "Name of F-communication DB".tag name).
3. In the safety program from which data are to be sent, call the SENDS7 instruction for sending at the end of the main safety block.
4. In the safety program in which data are to be received, call the instruction RCVS7 for receiving at the start of the main safety block.
5. Assign F-communication DB numbers to the SEND_DB input of SENDS7 and the RCV_DB input of RCVS7.
6. Assign the local ID of the S7 connection (data type: WORD) from the perspective of the F-CPU that was configured in the "Connections" tab of the network view to the ID input of SENDS7.

7. Assign the local ID of the S7 connection (data type: WORD) that was configured in the "Connections" tab of the network view to the ID input of RCVS7.
8. Assign an odd number (data type: DWORD) to the R_ID inputs of SENDS7 and RCVS7. This serves to specify that a SENDS7 instruction belongs to an RCVS7 instruction. The associated instructions receive the same value for R_ID.



WARNING

The value for each address association (R_ID input; data type: DWORD) is user-defined; however, it must be odd for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

9. Assign the TIMEOUT inputs of the SENDS7 and RCVS7 instructions with the required monitoring time.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

10. To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND (initial value = "TRUE") with 0. In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction and the receiver RCVS7 provides fail-safe values for this period (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.
11. Optional: Evaluate the ACK_REQ output of RCVS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
12. Supply the ACK_REI input of RCVS7 with the signal for the acknowledgment for reintegration.
13. Optional: evaluate the SUBS_ON output of RCVS7 or SENDS7 in order to query whether the RCVS7 instruction is outputting the fail-safe values you specified as initial values in the F-communication DB.
14. Optional: Evaluate the ERROR output of RCVS7 or SENDS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
15. Optional: evaluate the SENDMODE output of RCVS7 in order to query whether the F-CPU with the associated SENDS7 instruction is in disabled safety mode (Page 294).

Particularities for migrated projects

If you have migrated a project from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced* in which safety-related communication via S7 connections is programmed, you must note the following:

- Do not delete migrated instance DBs for the SENDS7 and RCVS7 instructions in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks".

Otherwise, communication errors may occur in the relevant communication connections.

A migrated instance DB for the SENDS7 and RCVS7 instructions has been deleted if, after compiling the safety program, the "User-defined ID" in the newly generated is not identical to "FRCVS7CL" or "FSNDS7CL".

You can find the "User-defined ID" of a block in its properties in the "Information" area.

9.1.9.4 Safety-related communication via S7 connections - Limits of data transfer

Note

If the amount of data to be transmitted exceeds the permitted length for the F-communication DB (100 bytes), you can create another F-communication DB that you transfer to additional SENDS7/RCVS7 instructions with modified R_ID.

Note that USEND and URCV instructions are called internally at each SENDS7 or RCVS7 call and use connection resources in the F-CPU. This affects the maximum number of communication connections available (*see manuals for F-CPUs*).

Additional information on the data transfer limits for S7 connections of individual F-CPUs is available on the Internet (http://support.automation.siemens.com/WW/view/en/38549114).

9.1.10 Safety-related communication with S7 F-systems

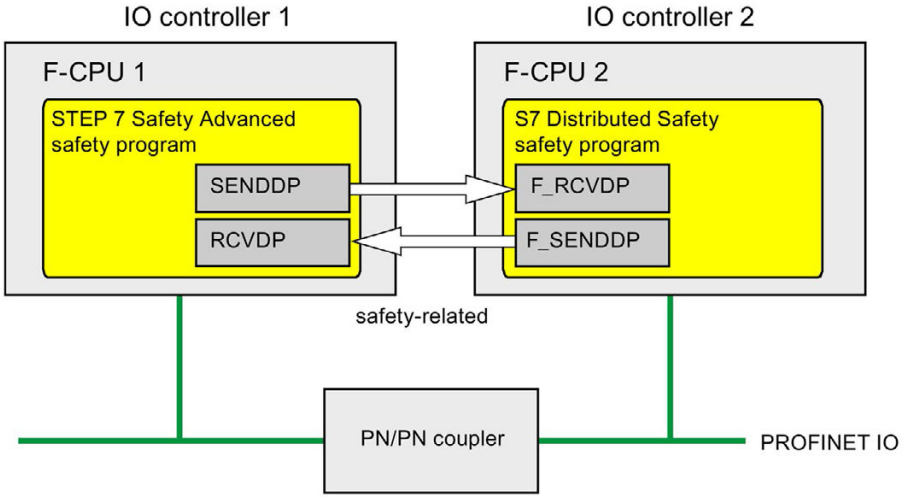
9.1.10.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs as IO controller-IO controller communication, master-master communication or communication via established S7 connections.

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 F/FH Systems F-systems is possible via established S7 connections.

9.1.10.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

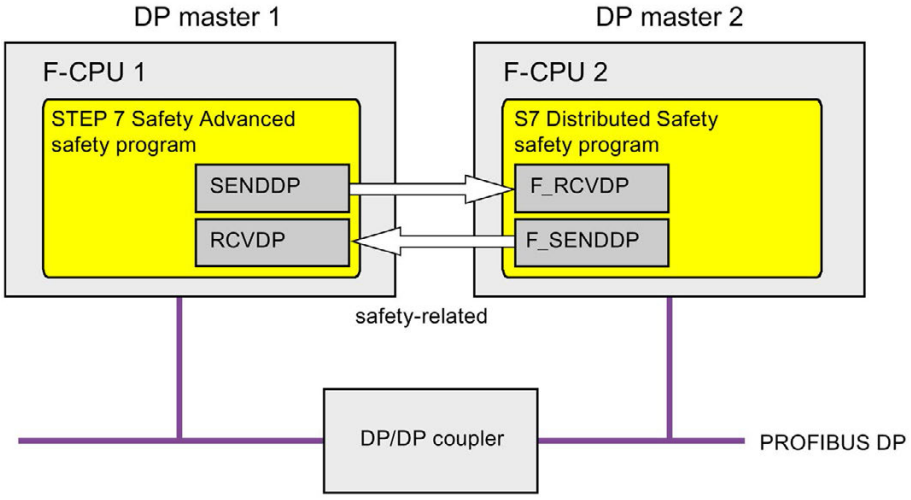
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related IO controller-IO controller communication (Page 173).

9.1.10.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

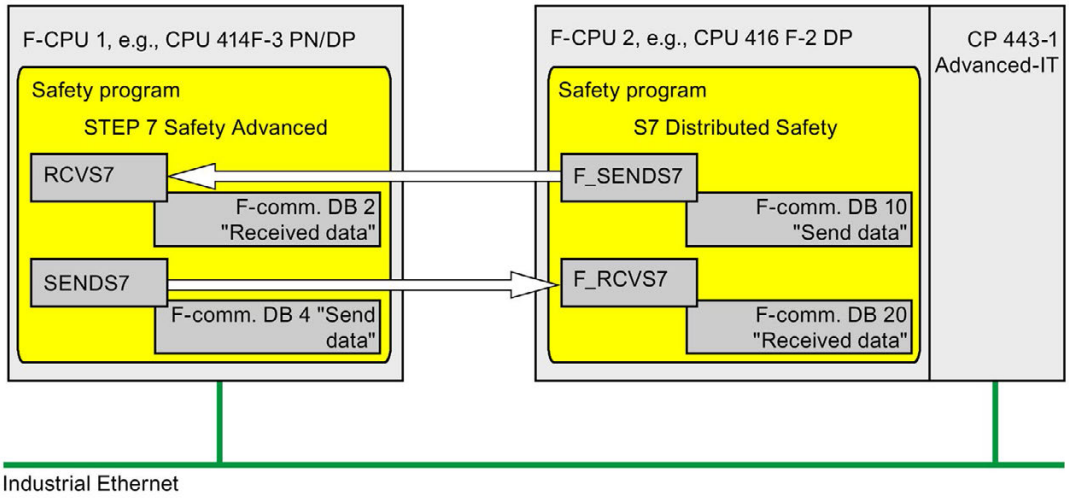
At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related master-master communication (Page 182).

9.1.10.4 Communication with S7 Distributed Safety via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SENDS7/F_RCVS7 F-application blocks at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

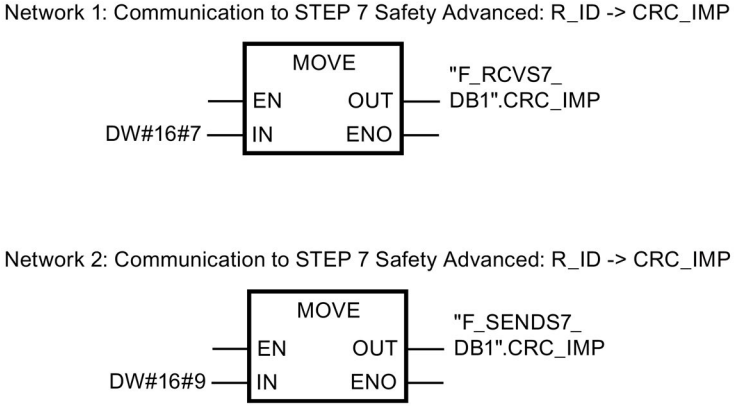
At the *S7 Distributed Safety* end, proceed as described in section "Safety-related communication via S7 communications" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Because safety-related communication via S7 connections is not possible with unspecified partners in S7 Distributed Safety, you must first create a "virtual" SIMATIC station in *S7 Distributed Safety* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Professional*.

In addition, for all communication connections to this F-CPU, you must transfer the address relationship that you assigned in the R_ID input of the associated calls of the F_SENDS7 and F_RCVS7 F-application blocks additionally to the CRC_IMP tag in the instance DB of F_SENDS7 and F_RCVS7, respectively, in the standard user program immediately before calling the F-CALL.

Program example:



Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related communication via S7 connections (Page 215).

For the F-CPU in *S7 Distributed Safety*, you must create and specify an unspecified S7 connection (see also standard online help under: Creating an unspecified connection and Specifying and unspecified connection).

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 Distributed Safety*.

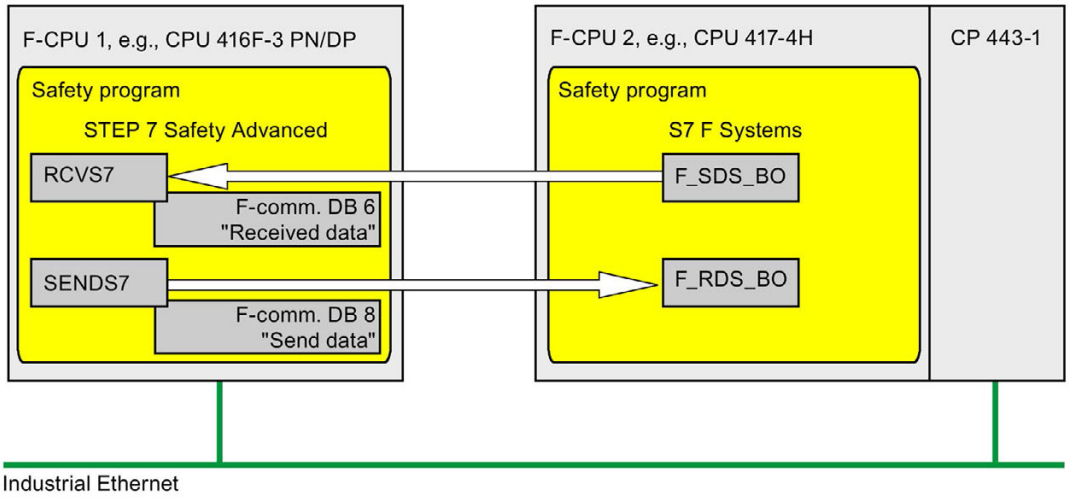
If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

If the instance DBs of the SENDS7 and RCVS7, instructions that you want to use for communication with *S7 Distributed Safety* were migrated from *S7 Distributed Safety*, you must delete them in the project tree in the "STEP 7 Safety" folder, under "Program blocks > System blocks" (contrary to the information in Programming safety-related communication via S7 connections (Page 218), section "Particularities for migrated projects").

9.1.10.5 Communication with S7 F/FH Systems via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SDS_BO/F_RDS_BO F-blocks at the *S7 F Systems* end.

A maximum of 32 data elements of data type BOOL can be exchanged.



Procedure at the *S7 F Systems* end

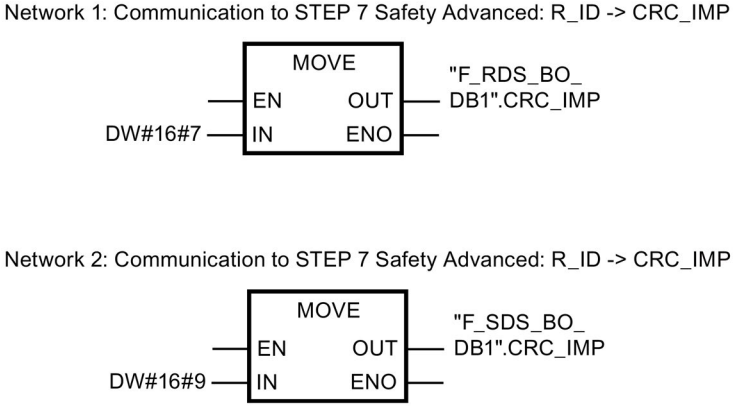
At the *S7 F-systems* end, proceed as described in section "Safety-related communication between F-CPUs" in the S7 F/FH Systems - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/16537972) manual.

Because safety-related communication via S7 connections is not possible with unspecified partners in *S7 F/FH Systems*, you must first create a "virtual" SIMATIC station in *S7 F/FH Systems* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Safety Advanced*.

In addition, you must insert a function in your S7 program (in the area reserved in CFC for other applications), in which, for all communication connections for this F-CPU, you transfer the address relationship that you assigned in the R_ID input of the associated calls of the F_SDS_BO and F_RDS_BO F-blocks additionally to the CRC_IMP tag in the instance DB of the F_SDS_BO and F_RDS_BO, respectively. You obtain the number of the instance DB from the object properties of the block in CFC. Assign descriptive names for these instance DBs. If you perform a compress operation in CFC, you must check whether the numbers of these instance DBs have changed.

Program example:



You must then import the function in CFC as block type and insert your standard user program in a chart. In the run sequence, make sure that the associated standard runtime group is processed before the F-runtime group.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in "Safety-related communication via S7 connections" (Page 215).

Particularity: In *STEP 7 Safety Advanced*, you must create the F-communication DB with exactly 32 data elements of data type BOOL.

For the F-CPU in *S7 F/FH Systems*, you must create and specify an unspecified S7 connection (see online help for *STEP 7* under "Creating an unspecified connection" and "Specifying an unspecified connection").

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 F Systems*.

If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

9.2 Configuring and programming communication (S7-1200, S7-1500)

9.2.1 Overview of communication

Introduction

This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

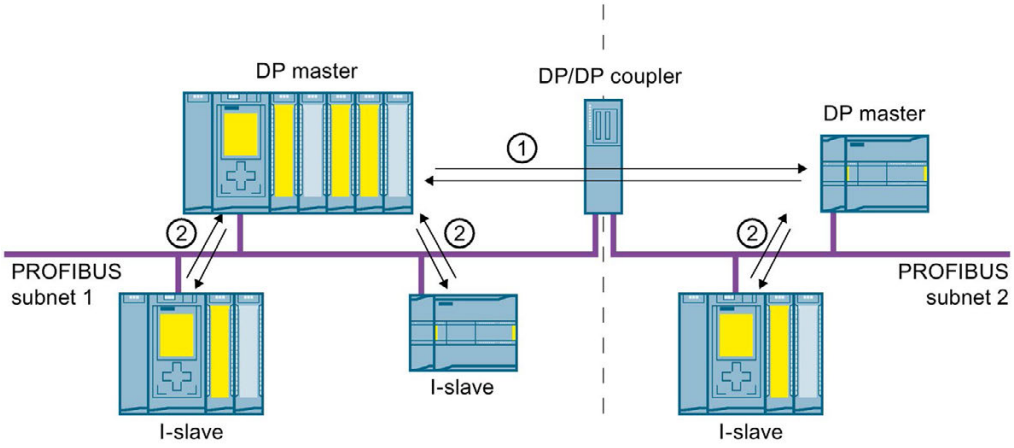
Safety-related communication	On subnet	Additional hardware required
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
IO controller-IO controller communication for *S7 Distributed Safety*	PROFINET IO	PN/PN coupler
Master-master communication for *S7 Distributed Safety*	PROFIBUS DP	DP/DP coupler

Note

Safety-related communication with S7-1200 F-CPUs is only permitted as of firmware version V4.1.2.

Overview of safety-related communication via PROFIBUS DP

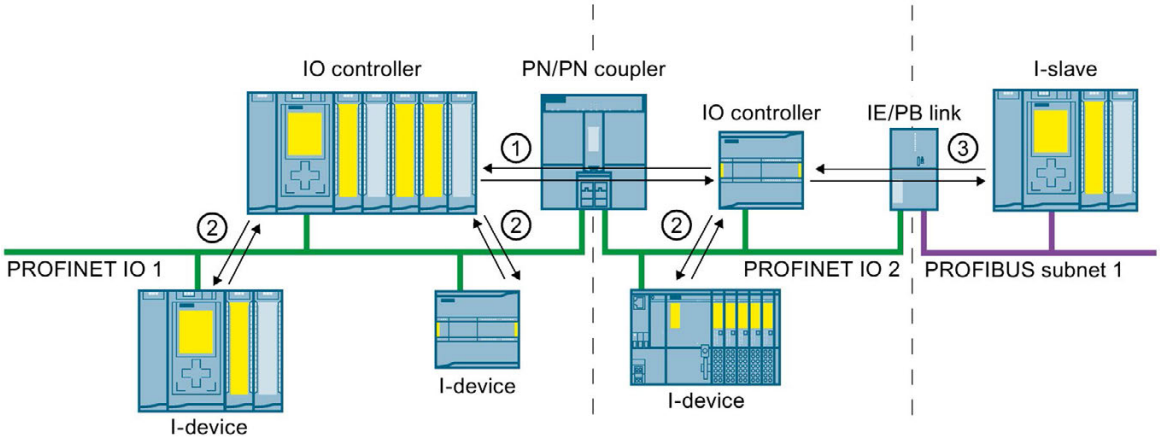
The figure below provides an overview of the options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.



① Safety-related master-master communication
② Safety-related master-I-slave communication

Overview of safety-related communication via PROFINET IO

The figure below provides an overview of the options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-1200/1500 F-CPUs.



① Safety-related IO controller-IO controller communication
② Safety-related IO controller-I-device communication
③ Safety-related IO controller-I-slave communication

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of data of the data type BOOL or INT (DINT as alternative) is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. The hardware identifier (HW identifier) defines the transfer areas configured.

Safety-related CPU-CPU communication for *S7 Distributed Safety*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety*.

9.2.2 Safety-related IO controller-IO controller communication

9.2.2.1 Configure safety-related IO controller-IO controller communication

Introduction

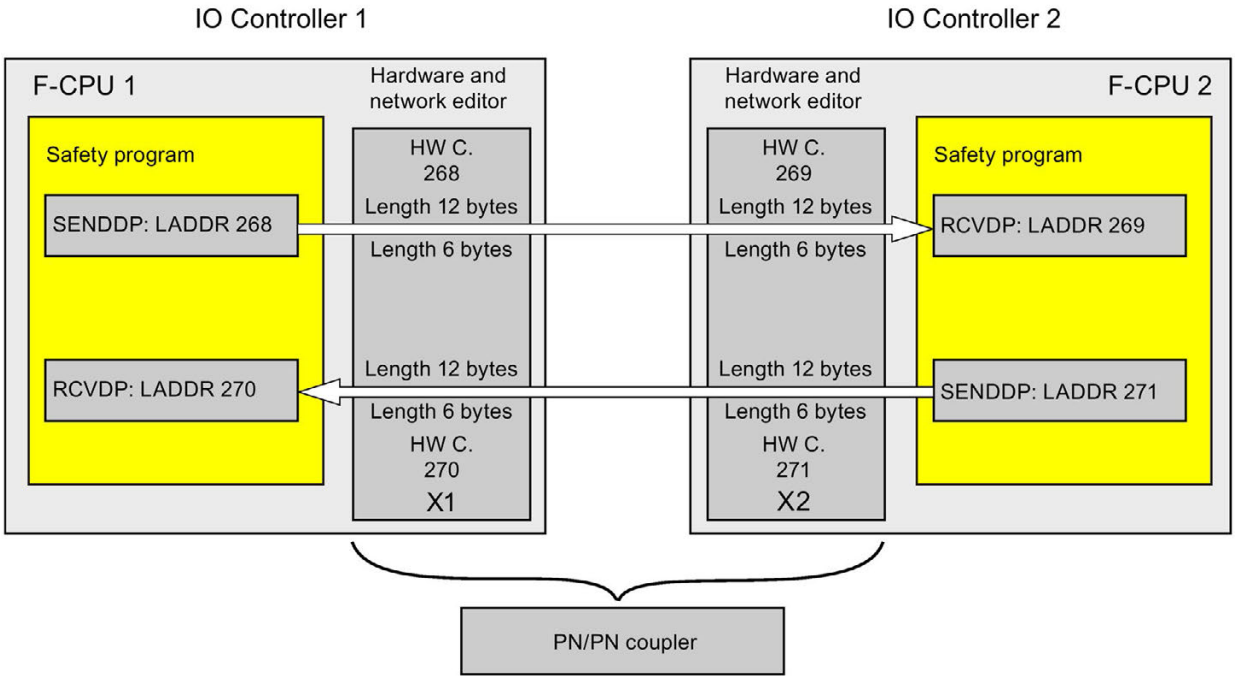
Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

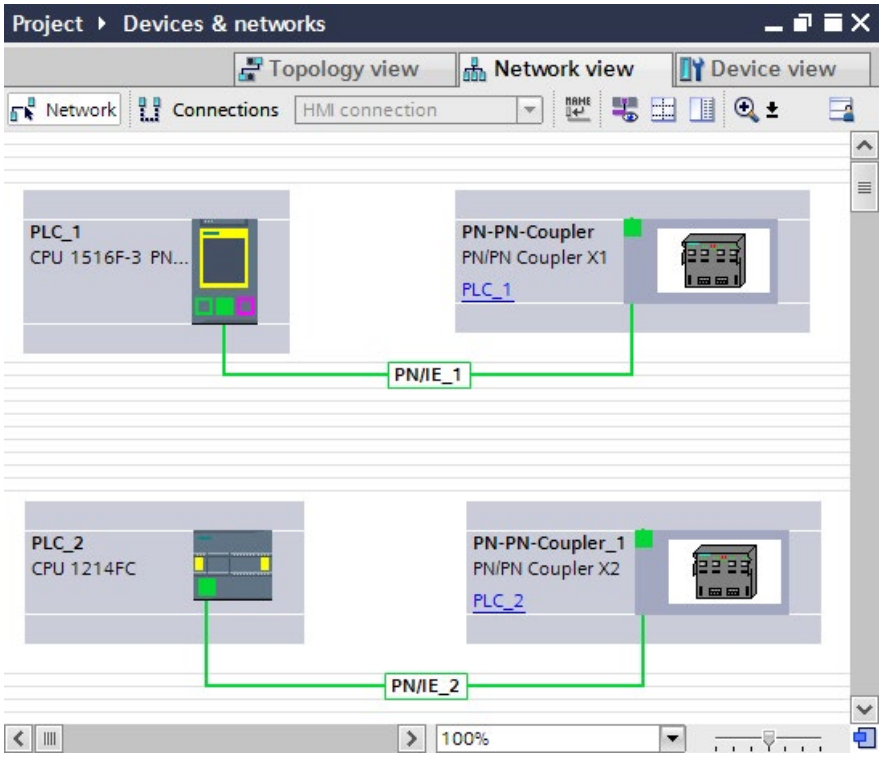
Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a PN/PN Coupler X1 and a PN/PN Coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card and insert them into the network view of the hardware and network editor.

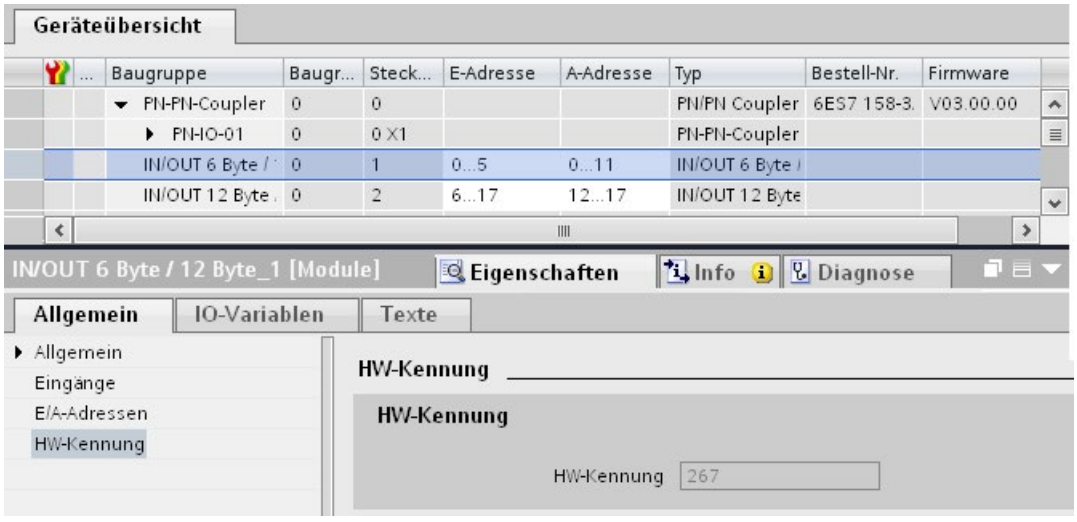
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



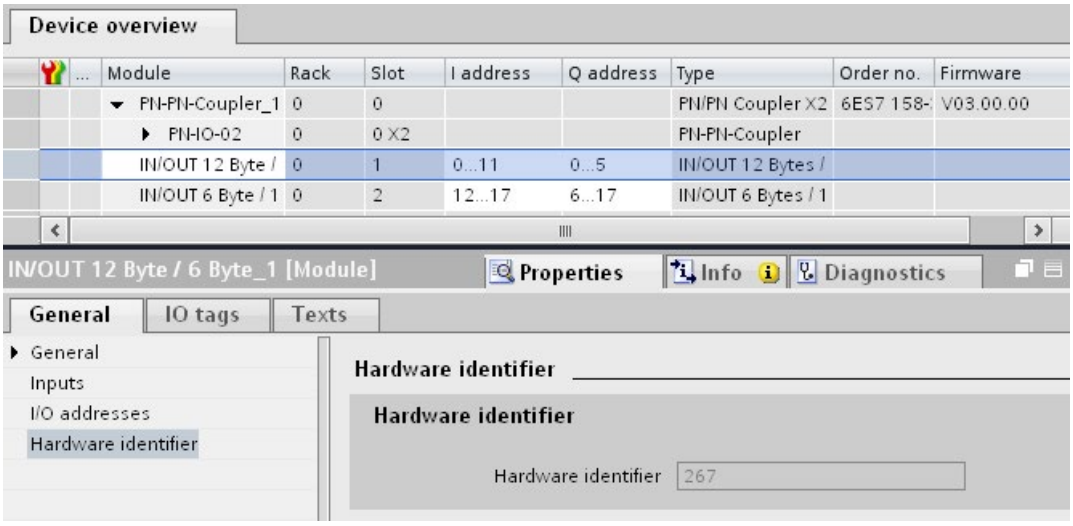
5. Switch to the device view of PN/PN Coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

Note

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

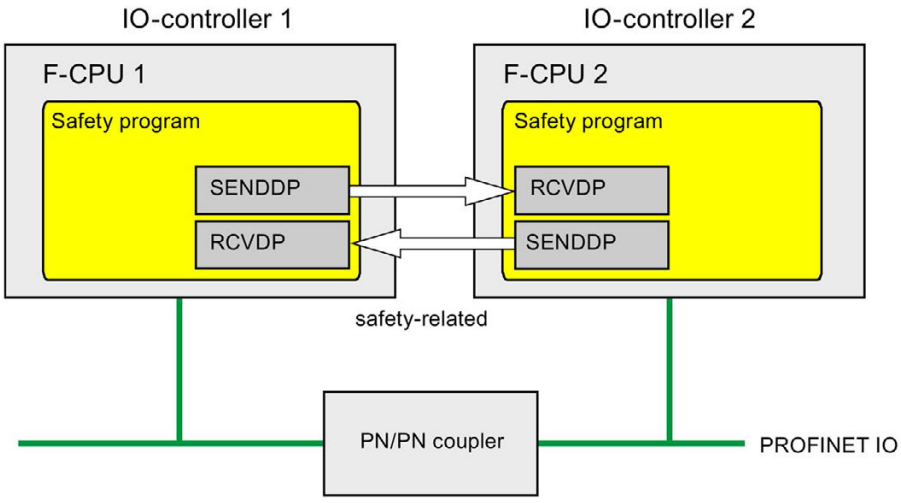


6. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   - One "IN/OUT 12 bytes / 6 bytes" module and
   - One "IN/OUT 6 bytes / 12 bytes" module



9.2.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.2.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

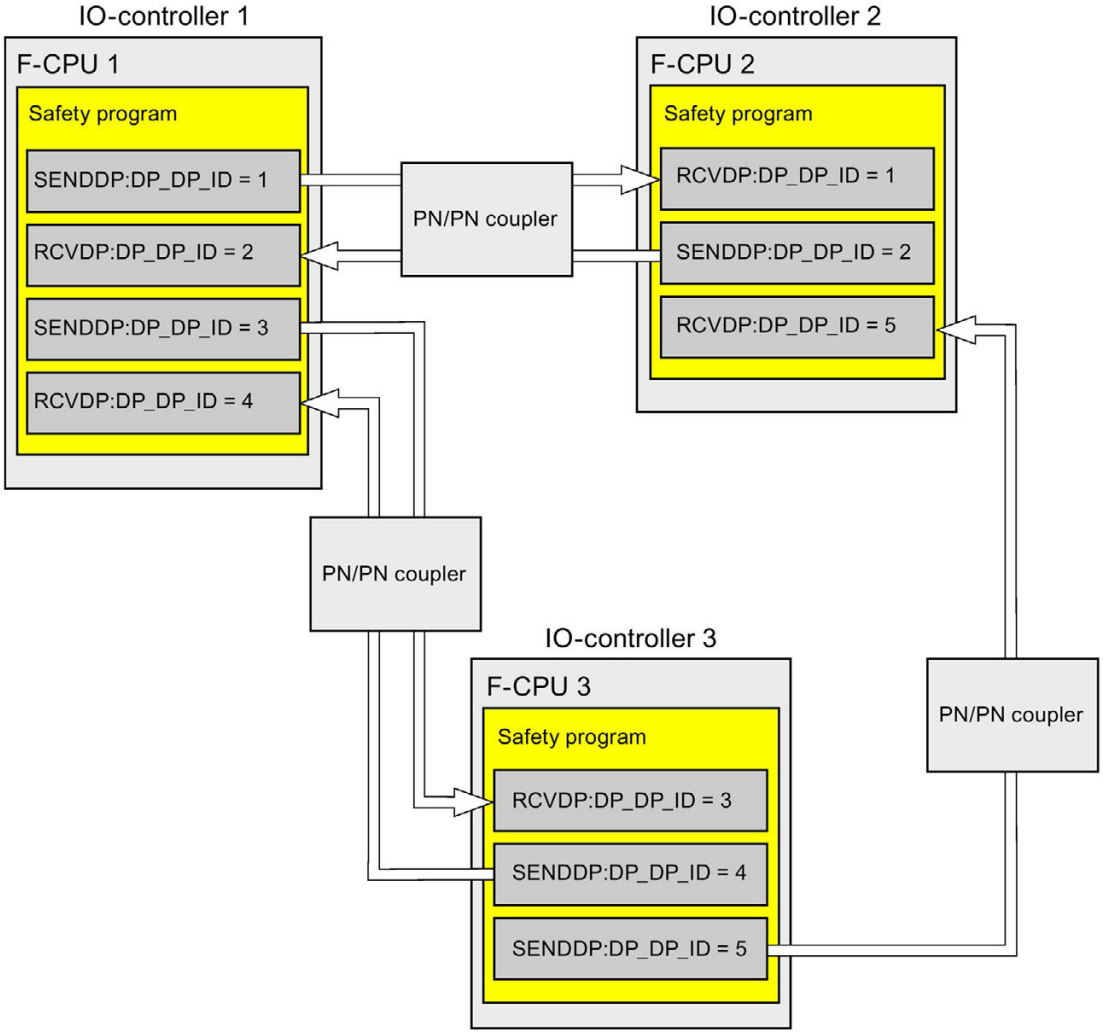
Programming procedure

You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 515) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 515) for receiving at the start of the main safety block.
3. Assign the respective LADDR inputs HW identifiers (system constants in the default tag table) for the transfer areas for output and input data of the PN/PN coupler that are configured in the hardware and network editor.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.
4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for five safety-related IO controller-IO-controller communication relationships.



⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.

8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.

13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 294).

9.2.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.2.3 Safety-related master-master communication

9.2.3.1 Configure safety-related master-master communication

Introduction

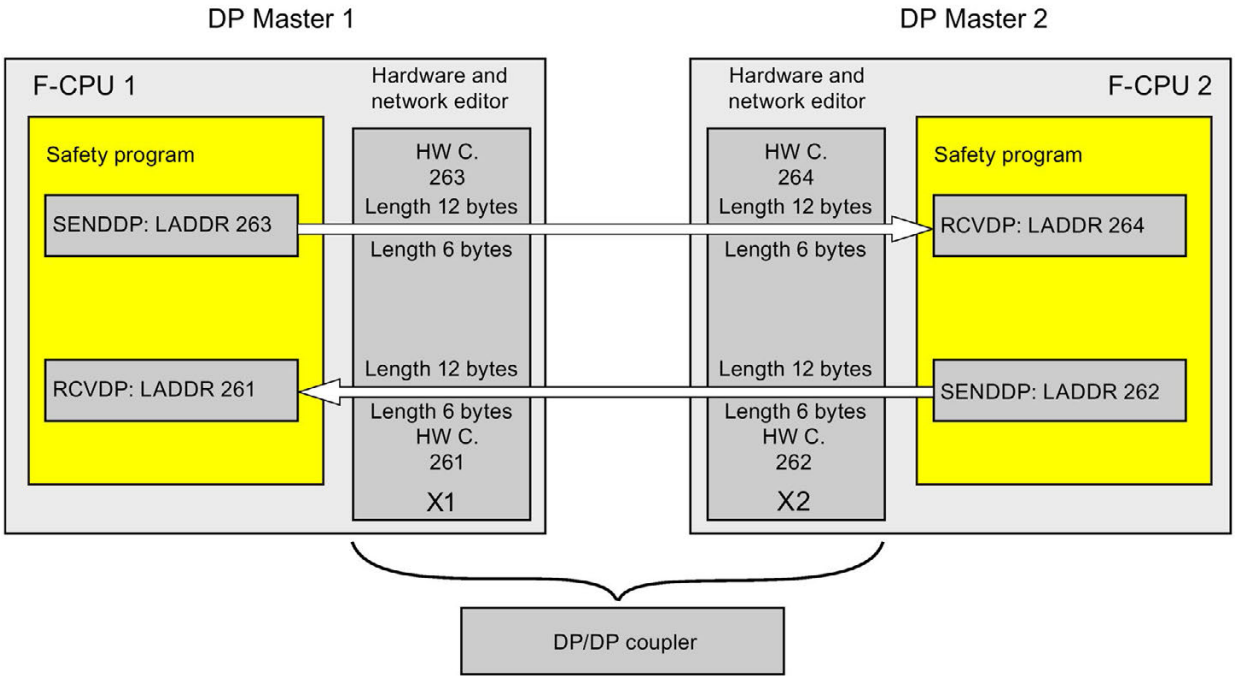
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

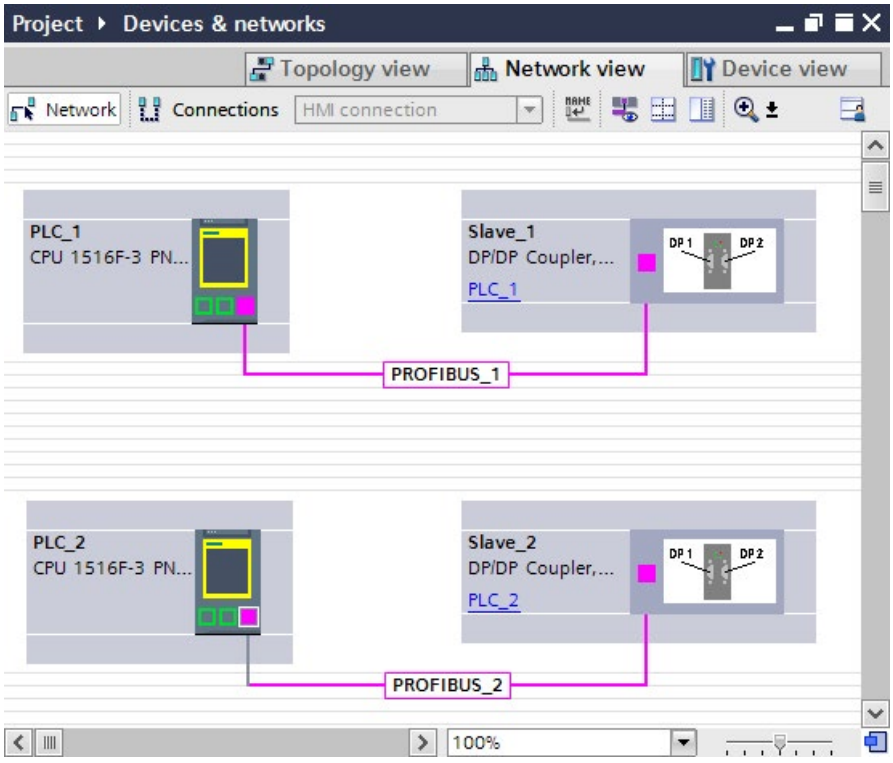
Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.

4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.

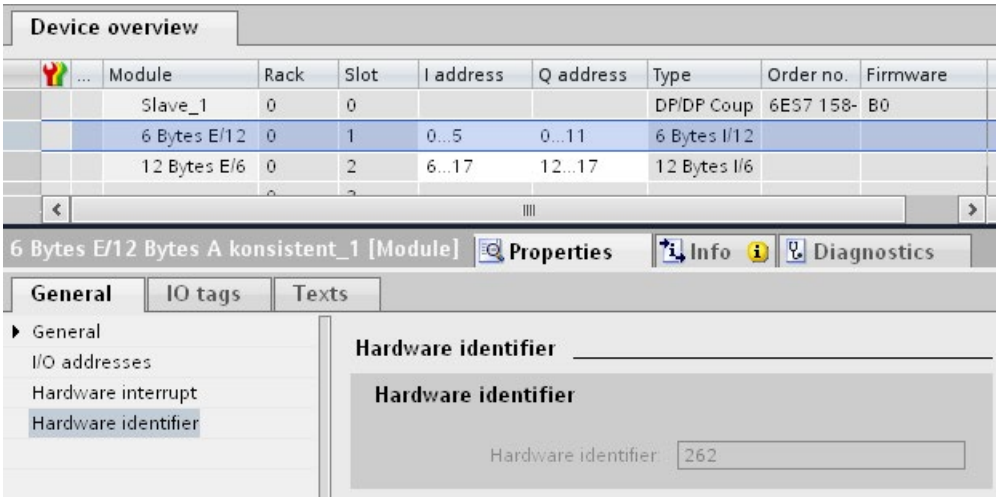


6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler, either via the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).

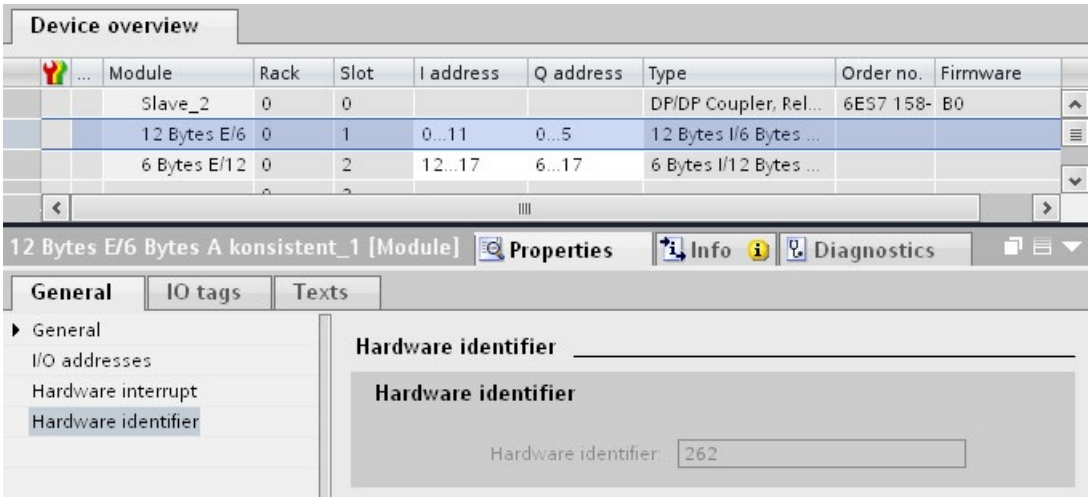
7. Switch to the device view of the DP/DP coupler PLC1 for bidirectional communication connections i.e. where each F-CPU should both send and receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab of the DP/DP coupler:
   - One "6 bytes I/12 bytes Q consistent" module, and
   - One "12 bytes I/6 bytes Q consistent" module

Note

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

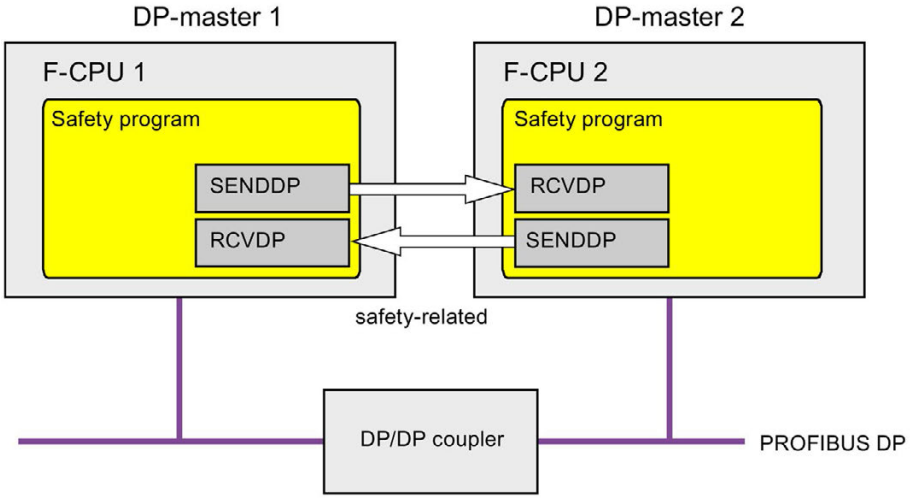


8. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module



9.2.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master uses the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.2.3.3 Program safety-related master-master communication

Requirement for programming

The address areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

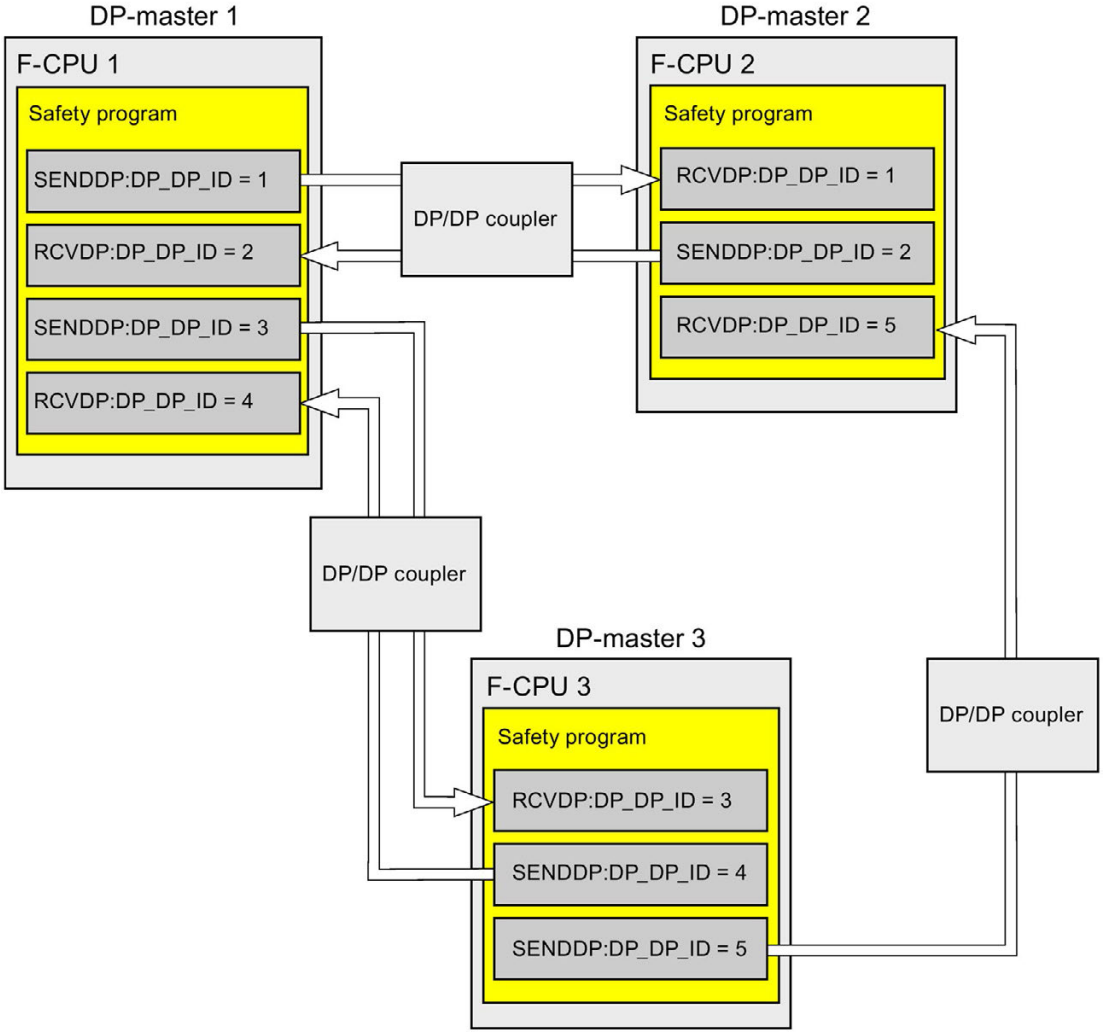
You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 515) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 515) for receiving at the start of the main safety block.
3. Assign the HW identifiers for the output and input data of the DP/DP coupler configured in the *hardware and network editor* (constant in the tag table) to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for five safety-related master-master communications relationships.



⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring block parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.

8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.

13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 294).

9.2.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.2.4 Safety-related IO controller-I-device communication

9.2.4.1 Configuring safety-related communication between IO controller and I-device

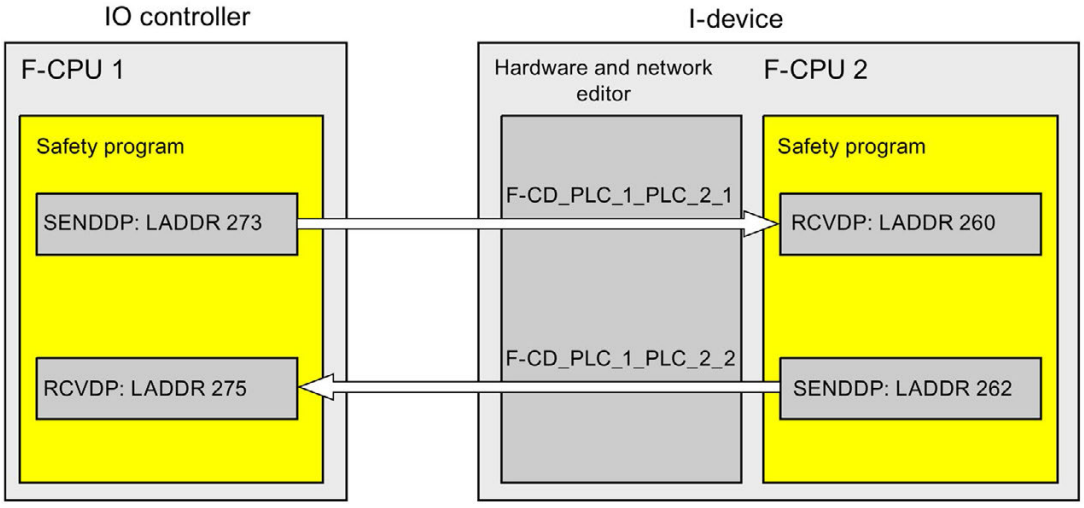
Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (F-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO controller F-CPU 1 and I-device F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the IO controller and in the F-CPU of the I-device. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

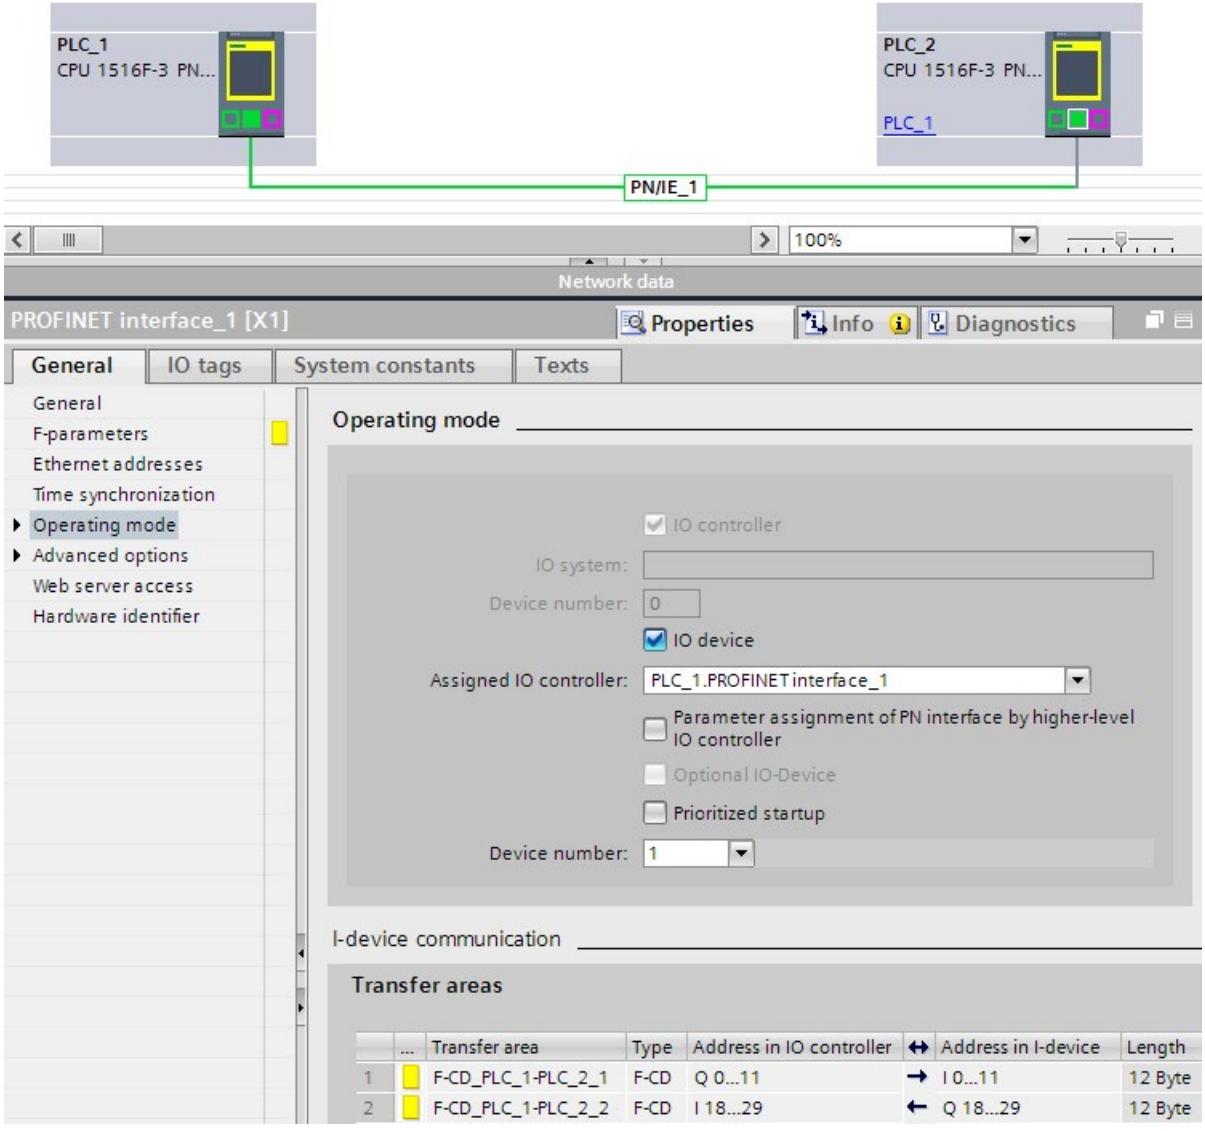
Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.

3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for receiving from the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned are displayed.

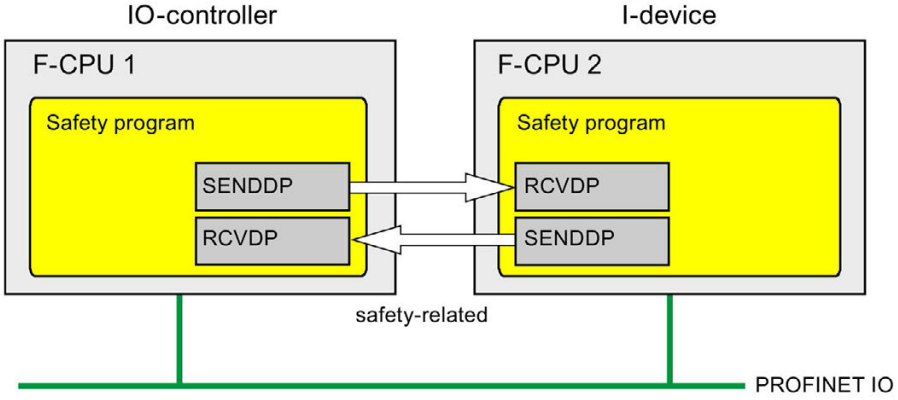
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").

4. Create an additional F-CD connection for sending to the IO controller.
5. In the transfer area you just created, click on the arrow to change the transfer direction to sending to the IO controller (←).



9.2.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.2.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

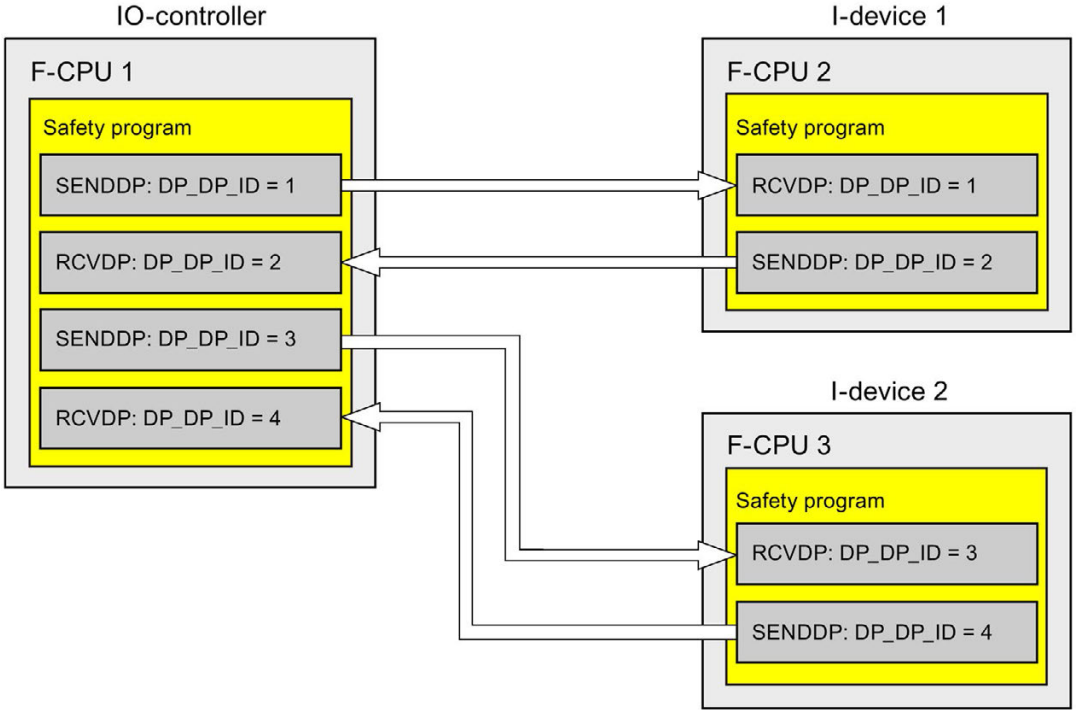
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 237)).

The assignment of the HW identifiers (system constants in the standard tag table) of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table:

Instruction	HW identifier
SENDDP in the IO controller	Hardware identifier of the transfer area in the IO controller
RCVDP in the IO controller	Hardware identifier of the transfer area in the IO controller
SENDDP in the I-device	Hardware identifier of the transfer area in the I-device
RCVDP in the I-device	Hardware identifier of the transfer area in the I-device

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for four safety-related IO controller-I-device communication relationships.



WARNING

The value for each address association (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

9.2.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller. In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.2.5 Safety-related master-I-slave communication

9.2.5.1 Configuring safety-related master-I-slave communication

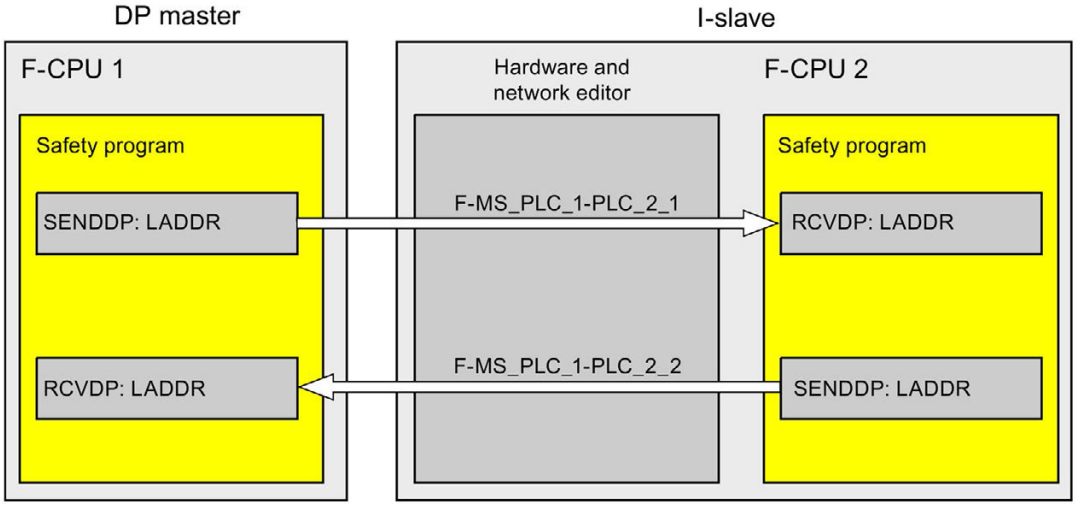
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship. For example, "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the DP master and in the F-CPU of the I-slave. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR input of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

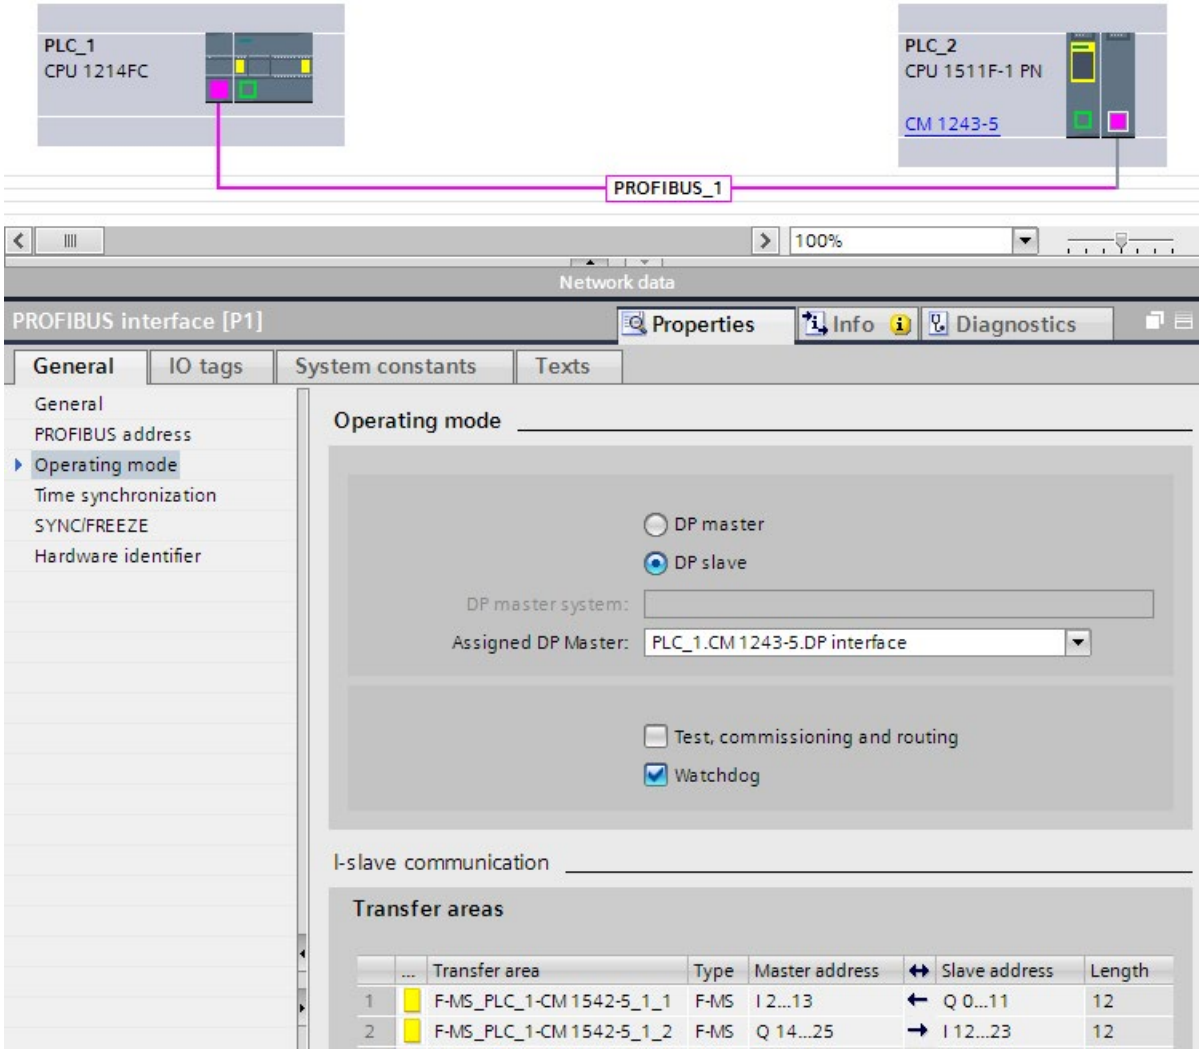
The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. If the F-CPU which is to be operated as DP master (F-CPU 1) does not have an integrated PROFIBUS DP interface, insert an PROFIBUS-CM, for example.
3. From the device view of the F-CPUs which are to be operated as I-slaves (F-CPU 2), insert a suitable CM DP module or CP DP module.
4. If necessary, enable "DP-slave" (I-slave) mode in the properties for the CM/CP DP module.
5. Assign the DP interface of the CM/CP to a DP interface of F-CPU 1.
6. Select the PROFIBUS interface of F-CPU 2 or of the CM. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the assigned transfer areas in the I-slave and DP master are displayed.

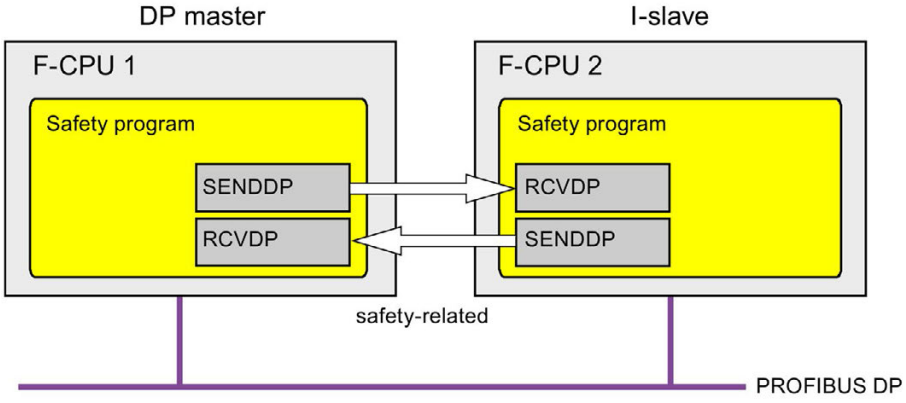
   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").

7. Create an additional F-MS connection for receiving from the DP master.
8. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.2.5.2 Safety-related master-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14) (Page 515).

9.2.5.3 Programming safety-related master-I-slave communication

Requirements

The transfer areas must be configured.

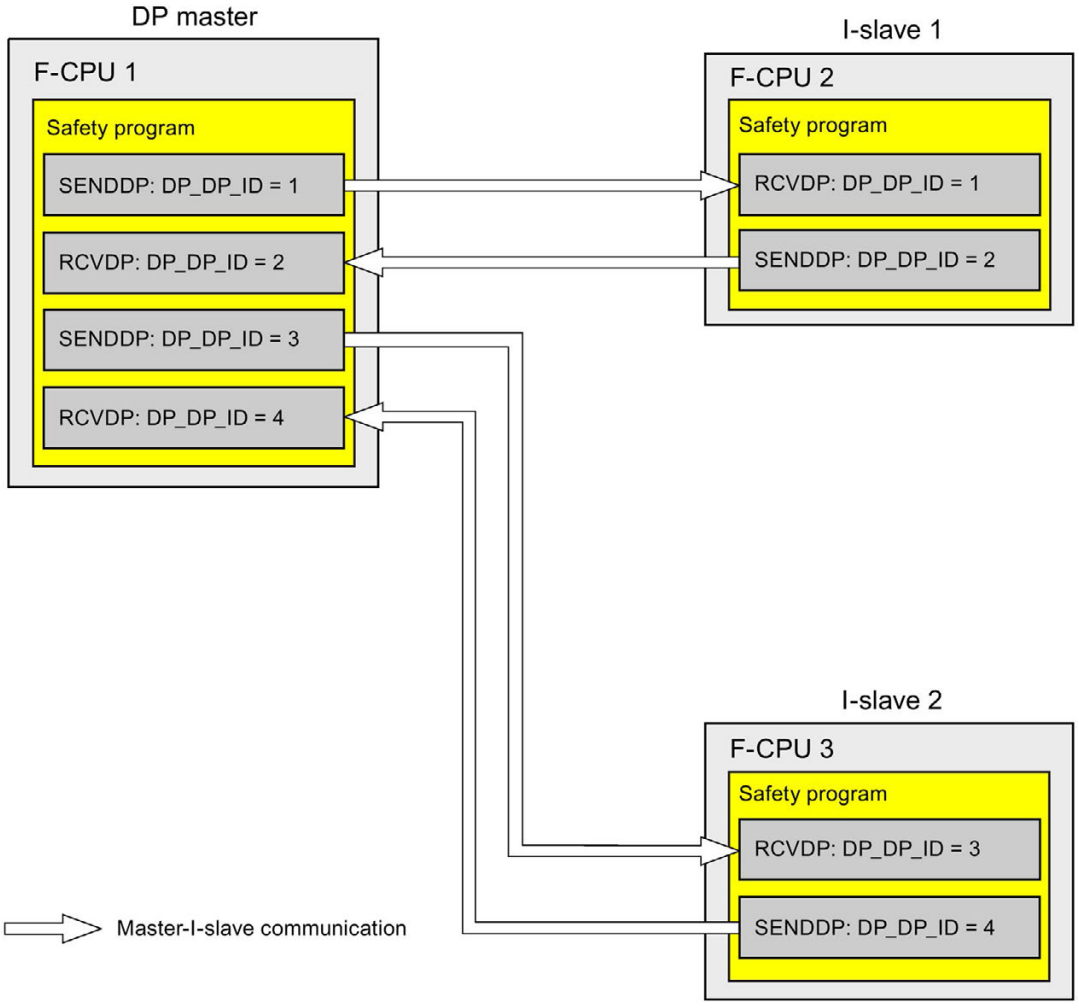
Programming procedure

The procedure for programming safety-related master-I-slave communication is the same as that for programming safety-related master-master communication (see Safety-related master-master communication (Page 241)).

The assignment of the HW identifiers of the transfer areas to the LADDR input of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	HW identifier
SENDDP in the DP master	Hardware identifier of the respective transfer area in the DP master
RCVDP in the DP master	Hardware identifier of the respective transfer area in the DP master
SENDDP in the I-slave	Hardware identifier of the transfer area in the I-slave
RCVDP in the I-slave	Hardware identifier of the transfer area in the I-slave

The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave communication relationships.



⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 530).

9.2.5.4 Limits for data transfer of safety-related master-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		DP master		I-slave	
		Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS and MS). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.2.6 Safety-related IO controller-I-slave communication

9.2.6.1 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 530)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 258) also applies.

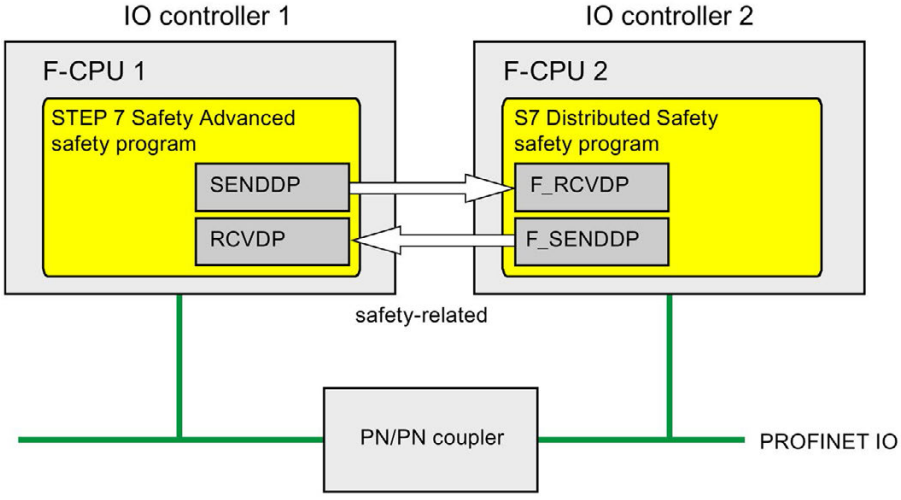
9.2.7 Safety-related communication with S7 F-systems

9.2.7.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible, via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs, as IO controller-IO controller communication or master-master communication.

9.2.7.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

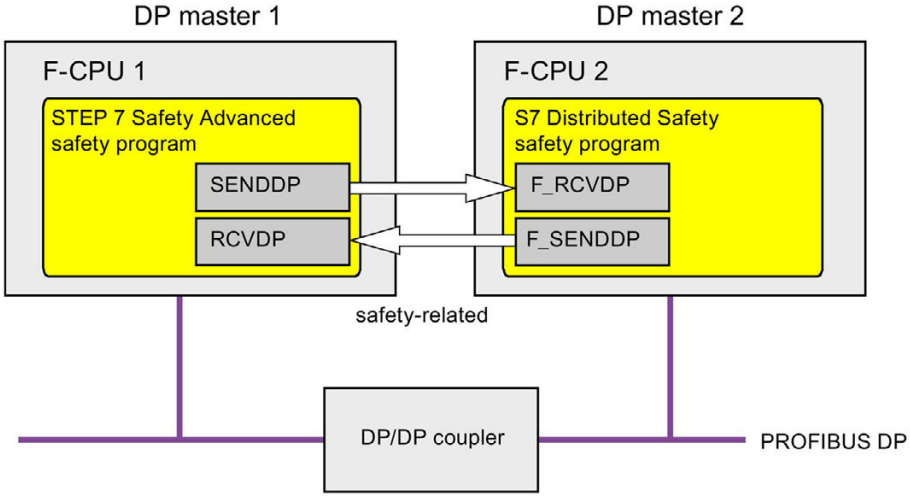
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related IO controller-IO controller communication (Page 231).

9.2.7.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related master-master communication (Page 241).

9.3 Configuring and programming communication between S7-300/400 and S7-1200/1500 F-CPUs

9.3.1 Overview of communication

Introduction

This section provides an overview of the options for safety-related communication between S7-300/400 and S7-1200/1500 F-CPUs in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	On subnet	Additional hardware required
Safety-related CPU-CPU communication:		
Master-master communication	PROFIBUS DP	DP/DP coupler
Master-I-slave communication	PROFIBUS DP	—
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
IO controller-I-device communication	PROFINET IO	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link

Basic procedure for configuring and programming

Configure and program safety-related communication between S7-300/400 F-CPUs and S7-1200/1500 F-CPUs as described in Configuring and programming communication (S7-300, S7-400) (Page 170) and Configuring and programming communication (S7-1200, S7-1500) (Page 229) for your application.

To program an S7-300/400 F-CPU, use the start addresses of the transfer areas. To program an S7-1200/1500 F-CPU, use the HW identifiers of the transfer areas.

Compiling and commissioning a safety program 10

10.1 Compiling the safety program

To compile a safety program, follow the same basic procedure as for compiling a standard user program. You can start at various points to accomplish this in *STEP 7*. The basics for compiling user programs can be found in the *Help on STEP 7*.

Note

Please note that following a safety-related change to the hardware configuration that not only this, but also the safety program has to be recompiled and downloaded. This also applies for changes to the F-I/O which are not used in the safety program.

Note

The safety program is not compiled consistently with the menu command "Edit > Compile" or the "Compile" icon under the following conditions:

- When you select a user-created folder in the project tree.
- When you select one or more (F-)blocks in the "Program blocks" folder in the project tree.

Use this procedure to test if modified F-blocks can be compiled.

Note

The following applies for S7-300/400 F-CPUs:

If you want to compile an F-FB with know-how protection after a modification, you must remove the know-how protection for this F-FB before compiling.

Reporting compiling errors

You can recognize whether or not the compilation was successful based on the message in the inspector window under "Info > Compile", error messages and warnings are output.

For information on the procedure you must follow to eliminate compiling errors, see "Eliminating compiling errors" in the *Help on STEP 7*.

See also

Safety Administration Editor (Page 68)

10.2 Safety program work memory requirements (S7-300, S7-400)

Estimation

You can estimate the work memory requirement for the safety program as follows:

Work memory required for the safety program

32 KB for F-system blocks

+ 4.4 KB for safety-related communication between F-runtime groups
+ 4.5 x work memory requirement for all F-FB/F-FCs/main safety blocks
+ 4.5 x work memory requirement of all utilized instructions, which are shown in the "Instructions" task card with the block icon.
  (except SENDDP, RCVDP, SENDS7, and RCVS7)
+ Work memory requirement of the utilized SENDDP and RCVDP instructions
  (4.3 KB each)
+ Work memory requirement of the utilized SENDS7 and RCVS7 instructions
  (8.5 KB each)

Work memory required for data

5 x work memory requirement for all F-DBs (including F-communication DB, but excluding DB for F-runtime group communication) and I-DBs for main safety block/F-FB

+ 24 x work memory requirement for all DBs for F-runtime group communication
+ 2.3 x work memory requirement for all I-DBs of instructions (except SENDDP, RCVDP, SENDS7 and RCVS7)
+ Work memory requirement of all I-DBs of instructions SENDDP (0.2 KB), RCVDP(0.3 KB), SENDS7 (0.6 KB), and RCVS7 (1.0 KB)
+ 0.7 KB per F-FC
+ 0.7 KB per F-I/O (for F-I/O DBs, etc.)
+ 4.5 KB

Block size of automatically generated F-blocks

Do not utilize the entire maximum size of an F-block, because the automatically generated F-blocks are larger and as a result, the maximum possible size may be exceeded in the F-CPU. If the block size is exceeded, this triggers a corresponding error message with information on which F-blocks are too large. These must be divided up, if necessary.

10.3 Downloading project data

10.3.1 Downloading project data to an F-CPU

Introduction

Once you have successfully compiled your safety program, you can download it to the F-CPU. To download a safety program, you follow essentially the same approach as for downloading a standard user program, via different starting points in *STEP 7*.

- In the "Load preview" dialog, enter data (e.g. password for the F-CPU) and set the requirements for downloading (e.g. that the F-CPU is switched to STOP mode before downloading).
- The "Load results" dialog shows the results after downloading.

We will show you the options for downloading the safety program later. For basic information on downloading, refer to the *Help on STEP 7*.

Rules for downloading the safety program to an F-CPU

⚠ WARNING

If **multiple F-CPUs** can be reached over a network (e.g. Industrial Ethernet) by **one programming device or PC**, you must take the following actions to ensure that the project data is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a uniform password for the F-CPUs with attached Ethernet address for each.

Note the following:

- A point-to-point connection must be used to activate the access protection of an F-CPU when the hardware configuration is loaded for the first time (similar to assigning an MPI address to an F-CPU for the first time).
- Before downloading the safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- The last download of the safety program prior to switching to productive operation must be made with enabled access protection. *(S021)*

Note

You can perform the downloading of a consistent safety program only in STOP mode.

Note

If *STEP 7 Safety* detects an inconsistent safety program during startup of the F-CPU, the F-CPU cannot be started, provided the F-CPU supports this detection function (see product information for the particular S7-300/400 F-CPU). This is always supported with S7-1200/1500 F-CPUs). A corresponding diagnostics event is entered in the diagnostics buffer of the F-CPU.

If the F-CPU does not support this detection function, the F-CPU can go to STOP mode if an inconsistent safety program is executed in activated safety mode.

The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

When downloading the safety program, ensure that the "Consistent download" action is set for the "Safety program" selection in the "Load preview" dialog.

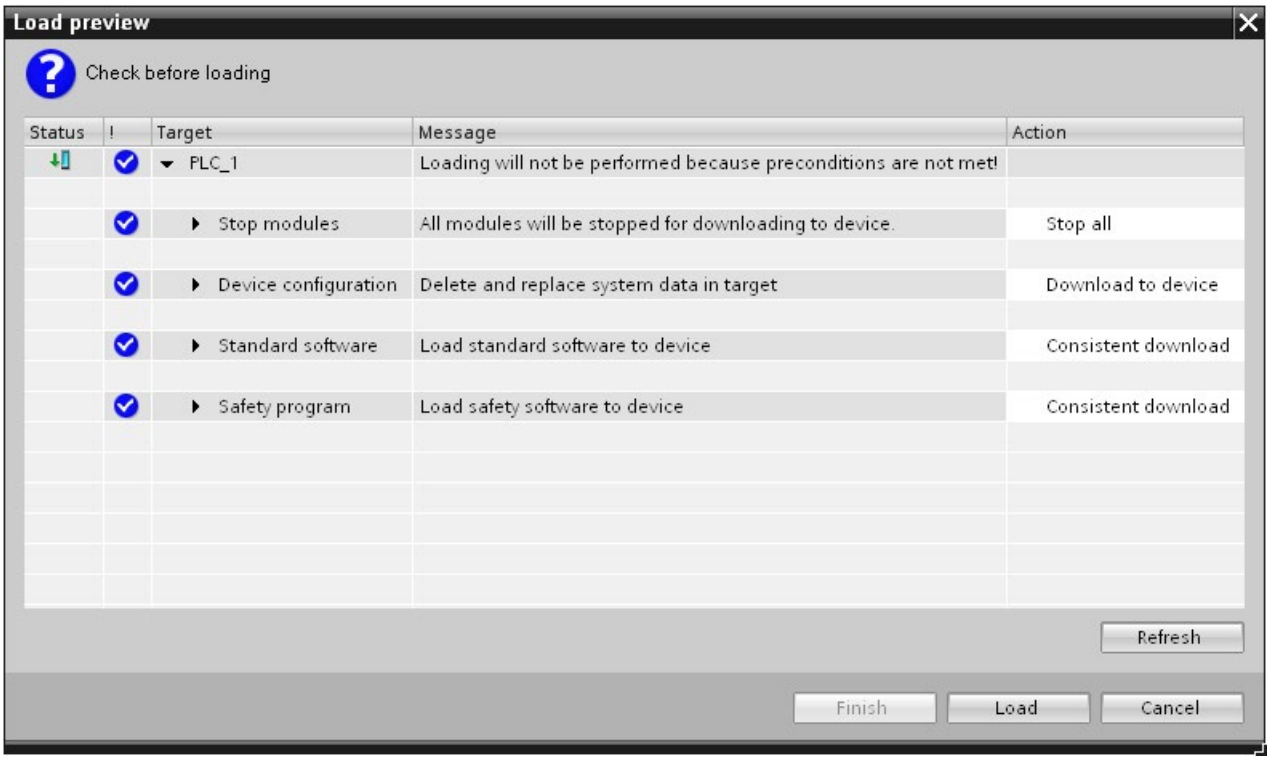
Inconsistent downloading is only possible in disabled safety mode.

Password prompt before downloading to an F-CPU

If you have assigned a protection level for the F-CPU (Page 86) (in the properties of the F-CPU in the "Protection" tab), the corresponding password is prompted in "Load preview" dialog. Without entry of password, only actions that are allowed without password are possible. As soon as the conditions for downloading are met, the "Load" button becomes active.

"Load preview" dialog

For an F-CPU, the "Load preview" dialog also contains the section "Safety program".



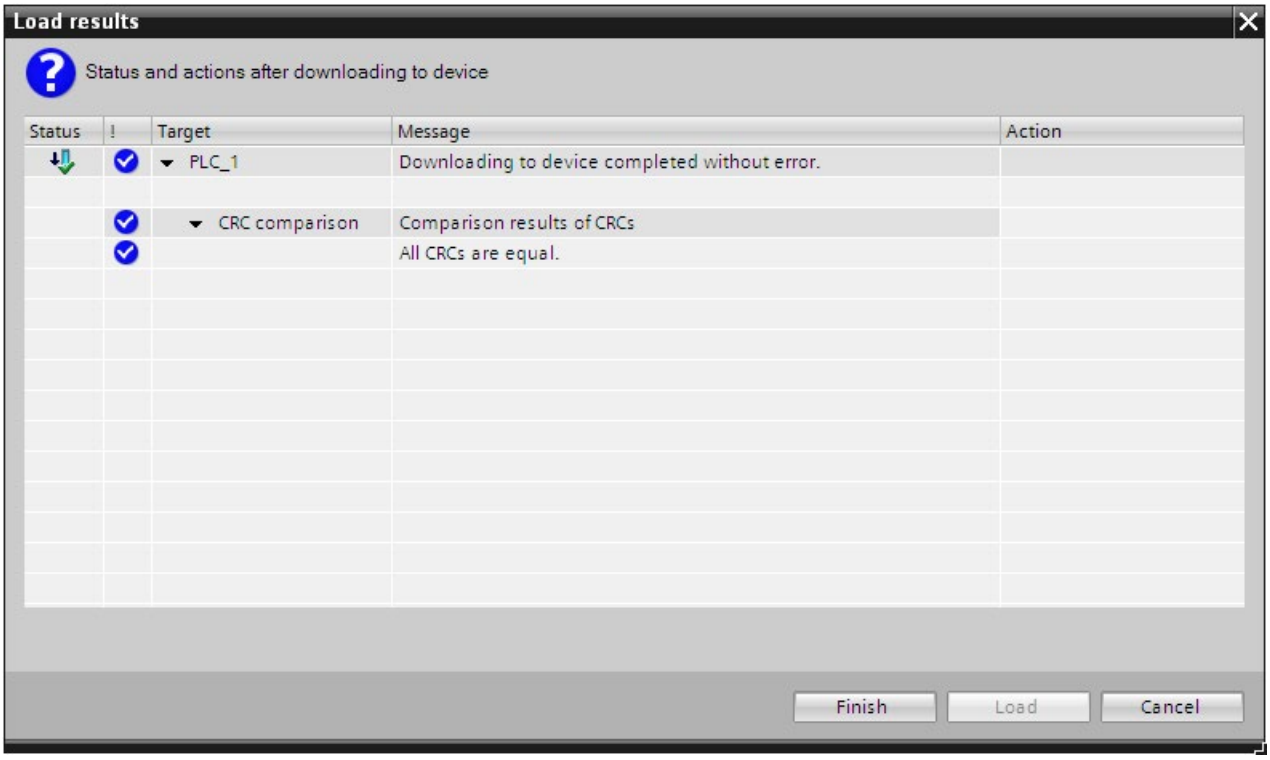
Make the following selection:

- In order to download a consistent safety program, select the "Consistent download" action under target "Safety program".
- (S7-300, S7-400) To download individual F-blocks selectively (Page 276), select the "Download selection" action under the target "Safety program", and then select the required F-blocks. If necessary, you will be prompted to disable safety mode under "Disable safety mode". This setting is only suitable for the online test of individual F-blocks.
- (S7-300, S7-400) In order to download the safety program only, select the "Consistent download" action under target "Safety program" and the "Download selection" action under target" Standard software", and then select only the standard blocks that call the main safety block.
- (S7-300, S7-400) To download no safety program, for example, because you do not know the password of the F-CPU, select the "No action" action under target "Safety program".

For S7-1200/1500 F-CPUs, only the "Consistent download" value is possible as an action in the "Load preview" dialog. It is not possible to select separate loading of standard program or safety program. The complete user program is automatically consistently downloaded as soon as changes have been made in both the standard program and in the safety program. Refer also to the section entitled Data exchange between standard user program and safety program (Page 165).

"Load results" Dialog

After downloading into the F-CPU, the dialog "Load results" is opened. This dialog shows you the status and the necessary actions after downloading.



Verify that the "Downloading of safety program completed without errors." message appears in the "Load results" dialog. If not, repeat the download operation.

10.3.1.1 Downloading project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card or flash card)

When you download project data to an S7-300/400 F-CPU with memory card inserted (SIMATIC Micro memory card for S7-300 or flash card for S7-400), you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline).
- Perform a memory reset of the F-CPU using the mode switch or via the programming device/PC. Once the work memory has been deleted, the safety program is again transferred from the load memory (memory card, SIMATIC Micro memory card for S7-300 F-CPUs,flash card for S7-400 F-CPUs) to the work memory. *(S022)*

10.3.1.2 Downloading project data to an S7-400 F-CPU without flash card inserted

When you download project data to an S7-400 F-CPU without flash card inserted, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Perform a memory reset of the F-CPU using the **mode switch** or via the **programming device/PC**.
- Download the configuration and the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S023)*

10.3.1.3 Downloading project data to a WinAC RTX F

When you download project data to a WinAC RTX F, you must observe the following warning:

⚠ WARNING

You must adhere to the following procedure when downloading the safety program to the WinAC RTX F with a programming device/PC to ensure that the WinAC RTX F does not contain an "old" safety program:

1. Perform a memory reset of the WinAC RTX F (see Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176) manual).
2. Download the project data (Page 271) to the WinAC RTX F.

   If the function test of the safety program does not take place in the destination WinAC RTX F, you must also follow points 3. and 4:
3. Perform a program identification. This means you check whether the collective F-signatures match online and offline.
4. Perform the F-system startup.

Between the online program identification and the startup of the F-system, the WinAC RTX F must not be closed (for example, as a result of POWER OFF/POWER ON or booting). *(S024)*

10.3.1.4 Downloading individual F-blocks to an S7-300/400 F-CPU

Download F-blocks in disabled safety mode.

You can download F-blocks and standard blocks simultaneously to the F-CPU via the project tree. However, as soon as F-blocks are to be downloaded, a check is carried out to determine whether or not the F-CPU is in STOP mode or disabled safety mode. If not, you have the option of switching to disabled safety mode or placing the F-CPU in STOP mode.

If you want to download individual F-blocks to the F-CPU, for example, to test changes, make sure that you have not selected the folder "Program blocks" or the F-CPU in the project tree but only the blocks you want to download.

Only then will you be prompted in the "Load preview" dialog to disable safety mode once you have changed the option from "Consistent download" to "Download selection" and have changed the option “Stop modules” to “No action”.

If you fail to observe this prompt, the blocks are downloaded without deactivation of the safety mode which will STOP the F-CPU.

You can also deactivate the safety mode explicitly in the *Safety Administration Editor* before you start the download.

Be aware that the consistency of the safety program in the F-CPU cannot be guaranteed when individual F-blocks are downloaded. For a consistent safety program, always download the entire safety program to the F-CPU.

Rules for downloading individual F-blocks

The following rules apply to downloading of individual F-blocks:

- Downloading is only possible in disabled safety mode or when the F-CPU is in STOP mode.
- F-blocks can only be downloaded to an F-CPU to which a safety program has already been downloaded.
- Only an offline safety program is permitted to be used as a source program.

Consequently, you have to download the entire safety program when initially downloading the safety program and after changing the password for the safety program.

Note

If you are downloading F-blocks only, the blocks in which the main safety blocks are called (e.g., cyclic interrupt OB 35) are not downloaded. To do so, select the "Selection" option under "Standard software" in the preview dialog, and select the necessary blocks.

Note

Downloading of individual F-blocks is only suitable for testing F-blocks. Prior to the transition to productive mode, you must download the safety program consistently to the F-CPU.

10.3.1.5 Downloading project data to an S7-1200 F-CPU without program card inserted

When you download project data to an S7-1200 F-CPU without program card inserted, you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.6 Downloading project data to an S7-1200 F-CPU with program card inserted

When you download project data to an S7-1200 F-CPU with program card inserted, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory of the F-CPU when you insert a program card into an S7-1200 F-CPU:

1. Check to see whether **the STOP/RUN LED (orange) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**.
   If this is the case, the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as external load memory) and you can skip step 3.
2. Insert the program card into the F-CPU.
   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program card is being evaluated or that the internal load memory must be deleted.
3. Use one of the following methods to delete the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program.
4. Use one of the following methods to evaluate the program card:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S061)*

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Orange/Green	ERROR Red	MAINT Orange
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (orange) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

WARNING

If you use a programming device/PC to download F-blocks to an S7-1200 F-CPU with inserted program card (external load memory), you must ensure that the transfer takes place to the external load memory. This can be accomplished by the following measures:

- Check to see if the program card is inserted correctly.
- Insert a program card whose memory size is different than the size of the internal load memory. Check in the project tree under "Online & Diagnostics > Diagnostics > Memory" if the memory size displayed for the load memory matches the memory size of the program card. *(S058)*

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.7 Downloading project data to an S7-1500 F-CPU

When you download project data to an S7-1500 F-CPU, you must observe the following warning:

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

10.3.1.8 Downloading project data to an S7-1500 F Software Controller

When you download project data to an S7-1500 F Software Controller, you must observe the following warnings:

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when downloading the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Download the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

⚠ WARNING

For security reasons, the password of an S7-1500 F Software Controller is also stored in a separate memory in addition to the load memory.

Unlike the load memory, this separate memory is not deleted. This means the previous passwords are once again active after deleting the S7-1500 F Software Controller followed by a run-up.

For this reason, note the following:

- The S7-1500 F Software Controller is deleted in case of the following download scenarios of the PC station:
  - Downloading a PC station with revised interface assignment.
  - Downloading a PC station with revised storage location for retentive data.
- We recommend that you do not set up F-access protection until after commissioning. If you still have to change the interface assignment of the PC station or the storage location for retentive data, you do not have to enter the F-password during the subsequent mandatory download of the S7-1500 F Software Controller.
- We recommend that you remove the F-access protection from an S7-1500 F Software Controller that is no longer in use. If you forget the F-password when you want to operate the S7-1500 F Software Controller later, you can remove it by uninstalling/installing or loading a new image. *(S076)*

See also

Downloading project data to an F-CPU (Page 271)

Software Controller (http://support.automation.siemens.com/WW/view/en/109249299)

10.3.2 Downloading project data to a memory card and inserting a memory card

Proceed as you would with standard blocks to download project data from an F-CPU to a memory card (flash card for S7-400, SIMATIC Micro Memory Card for S7-300 or SIMATIC Memory Card for S7-1200/1500). You must also observe the following warning:

⚠ WARNING

If the function test of the project data is not performed in the destination F-CPU, you must ensure that the correct project data are on the memory card after downloading the project data to the memory card.

Follow these steps:

1. Make sure that you are using an empty memory card.
2. Download the project data to the memory card.
3. If necessary, clearly label the memory card (e.g. with the collective F-signature).

The procedure outlined must be ensured through organizational measures. *(S043)*

When inserting a memory card (flash card for S7-400, SIMATIC Micro Memory Card for S7-300 or SIMATIC Memory Card for S7-1200/1500) with project data from an F-CPU, you observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you must ensure through online program identification or other suitable measures (e.g. by checking the labeling of the memory card) that the memory card inserted has the correct safety program. *(S025)*

10.3.2.1 Inserting a SIMATIC Micro Memory Card or flash card into an S7-300/400 F-CPU

When you insert a memory card (flash card for S7-400 or SIMATIC Micro memory card for S7-300) into an S7-300/400 F-CPU , you must observe the following warning:

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you must adhere to the following procedure when inserting the memory card to ensure that the F-CPU does not contain an "old" safety program:

- Switch off the power to the F-CPU. For F-CPUs with battery backup (e.g. CPU 416F-2), remove any battery. (To ensure that the F-CPU is de-energized, wait for the buffer time of the power supply you are using or, if this is not known, remove the F-CPU.)
- Remove the memory card with the old safety program from the F-CPU.
- Insert the memory card with the new safety program into the F-CPU.
- Switch on the F-CPU again. For F-CPUs with battery backup (e.g. CPU 416F-2), reinsert the battery, if one was removed.

(S026)

10.3.2.2 Inserting a transfer card into an S7-1200 F-CPU

When you insert a transfer card into an S7-1200 F-CPU, you must observe the following warning:

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory when you copy the project data to an S7-1200 F-CPU using a transfer card:

1. Check to see whether **the STOP/RUN LED (orange) and the maintenance LED flash during startup for 3 seconds on an F-CPU without memory card**.
   If this is the case, the internal load memory of the F-CPU has already been deleted and you can skip step 3.
2. Insert the transfer card into the F-CPU.
   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the transfer card is being evaluated or that the internal load memory must be deleted.
3. Use one of the following methods to delete the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program.
4. Use one of the following methods to evaluate the transfer card (transfer from the transfer card to the internal load memory):
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   After restart and evaluation of the SIMATIC Memory Card, the F-CPU copies the project data to the internal load memory of the F-CPU. Once the copy process is complete, the maintenance LED on the F-CPU is flashing to indicate that you can remove the transfer card.
5. Remove the transfer card from the F-CPU.
6. Use one of the following methods to evaluate the internal load memory:
   – Turn the F-CPU off and back on.
   – Switch the F-CPU from STOP to RUN.
   – Execute the "Memory reset" (MRES) function.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S059)*

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Orange/Green	ERROR Red	MAINT Orange
Internal load memory deleted and SIMATIC Memory Card **not** inserted.	Flashing (orange) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

10.3.3 Downloading project data of an S7-1200 F-CPU from the internal load memory to an empty SIMATIC Memory Card

When you download project data from the internal load memory of an S7-1200 F-CPU to an empty SIMATIC Memory Card, you must observe the following warning:

⚠ WARNING

To ensure that the safety program is downloaded from the internal load memory of the F-CPU to the SIMATIC Memory Card when plugging an empty SIMATIC Memory Card into an S7-1200 F-CPU and that the internal load memory of the F-CPU is deleted afterward, you must observe the following procedure:

1. Make sure that you are using an empty SIMATIC Memory Card, for example, by checking in the Windows Explorer that the "SIMATIC.S7S" folder and the "S7_JOB.S7S" file are deleted.
2. Insert the empty SIMATIC Memory Card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program can be copied from the internal load memory to the SIMATIC Memory Card and that the internal load memory is deleted afterward.
3. Use one of these methods to trigger copying from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart and copying of the program from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store the safety program. The SIMATIC Memory Card is now a program card.
4. Use one of the following methods to evaluate the program card:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S057)*

Note

Also observe the setting "Disable copying from internal load memory to external load memory" in the hardware configuration of your F-CPU.

10.3.4 Updating project data on an S7-1200 F-CPU using a transfer card

When you want to update the project data on an S7-1200 F-CPU using a transfer card, you must observe the following warning:

⚠ WARNING

If you run an update of the safety program on an S7-1200 F-CPU with the help of a transfer card, you must ensure that the transfer to the internal load memory took place correctly by means of a subsequent program identification. *(S060)*

10.3.5 Restoring a backup of the safety program to an S7-300/1200/1500 F-CPU

You have the option of backing up an F-CPU in the same way as a standard CPU and then restoring it. You can find information on backing up a CPU in the *online help on STEP 7* under "Creating a backup of an S7 CPU".

Note the following warnings when restoring the software and hardware configuration of an F-CPU:

⚠ WARNING

Once you have restored a backup of an F-CPU, you must perform a program identification. *(S055)*

Note

We recommend that you use the collective F-signature that is included in the name of the backup file for program identification. You must not change the collective F-signature in the name in this case.

⚠ WARNING

(S7-1200/1500) If multiple F-CPUs with Web server can be reached by a programming device or PC, you must take additional actions to ensure that the safety program is downloaded to the correct F-CPU by restoring it.

Use CPU-specific passwords for the "F-Admin" right on the Web server. For example, select a uniform password with attached IP address (e.g. Password_192.168.0.8) for each F-CPU. *(S065)*

10.3.6 Uploading project data from an F-CPU

Uploading the safety program to a programming device or PC (S7-300, S7-400)

To upload a safety program to a programming device or PC, proceed as for standard blocks.

Note

In principle, it is possible to upload a safety program from the F-CPU to a programming device or PC. Note, however, that any symbols used in the safety program are deleted and cannot be recreated, since no symbol information is saved in the F-CPU. Symbols are available only if you are using an offline project.

A safety program uploaded from the F-CPU to a programming device / PC may not be loaded again into the F-CPU.

Uploading the safety program to a programming device or PC (S7-1200, S7-1500)

The "Load from device" function is not possible for S7-1200/1500 F-CPUs for safety programs. You can download individual F-blocks to a PG-PC. This also applies to standard CPUs with F-I/O in standard mode.

Uploading to a PG/PC (S7-300, S7-400)

You upload a safety program from an F-CPU to a programming device/PC using menu command "Online> Upload from device" or the "Upload from device" button in the toolbar.

You can only upload the hardware configuration if F-capability is not enabled for the F-CPU. You can only upload F-I/O if these are operated in standard mode.

10.4 Program identification

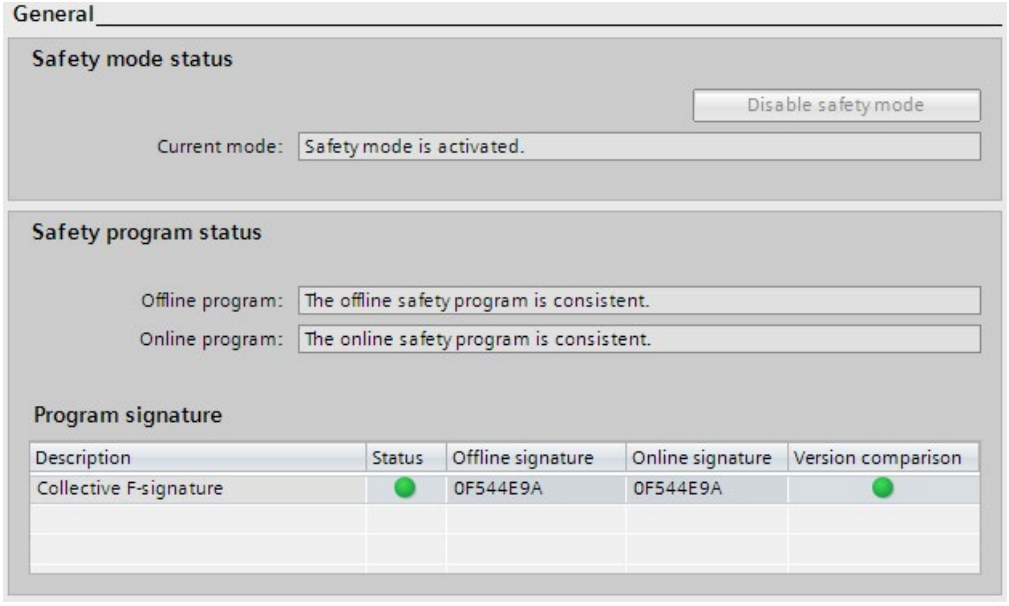
You use the program identification to determine that the correct safety program was downloaded to the F-CPU To do so, you compare the collective F-signatures of the safety program and the assignment of the "F-admin" rights online with the expected value. The expected value can be, for example, the collective F-signature of the safety program offline from the *Safety Administration Editor* or from the safety summary. Check the assignment of the "F-admin" right in the *Safety Administration Editor*.

Use organizational measures to ensure that the safety program is not downloaded by any other TIA Portal (on a separate programming device or PC) while you perform the program identification.

With the *Safety Administration Editor*

For a program identification using the *Safety Administration Editor*, follow these steps:

1. Open the *Safety Administration Editor* of the F-CPU you want to check.
2. Connect online with the F-CPU you want to check.
3. Compare the collective F-signature displayed online with the expected value in the "General" section.
4. Check whether the offline and online program are consistent (Page 321).
5. Check whether the green symbol is displayed in the column "status" and "Version comparison".



6. Check in the "Web server F-admins" section whether only authorized users have the "F-admin" right offline and online.

With HMI

For a program identification using the HMI, follow these steps:

1. Read the collective F-signature of the safety program from the F_PROG_SIG tag of the F-global DB (Page 118) (S7-300, S7-400) or the tag F_SYSINFO.F_PROG_SIG of the F-runtime group information DB (Page 118) (S7-1200, S7-1500).
2. Compare the value of the F_PROG_SIG tag with the expected value.

With the display of an S7-1500 F-CPU

For a program identification using the display of an F-CPU, follow these steps:

1. In the display menu, go to "Overview > Fail-safe".
2. Compare the displayed collective F-signature with the expected value.

With the Web server of an S7-1200/1500 F-CPU

For a program identification using the Web server of an S7-1200/1500 F-CPU, follow these steps:

1. Read the collective F-signature on the homepage of the Web server.
2. Compare the displayed collective F-signature with the expected value.

See also

Safety Administration Editor (Page 68)

10.5 Comparing Safety Programs

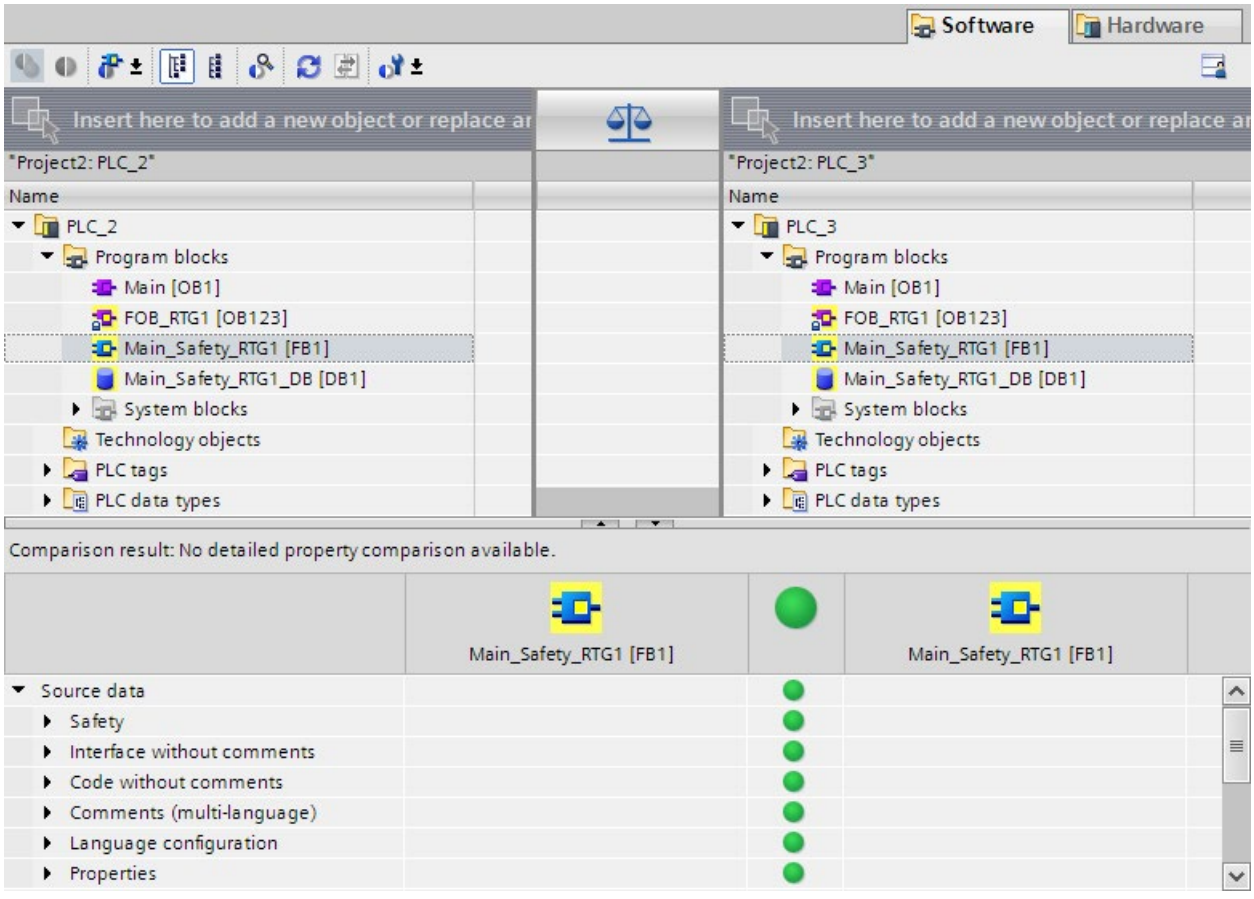
Compare safety programs as in standard

You can use the *comparison editor* in *STEP 7* for offline-online or offline-offline comparison of safety programs. The procedure is the same as for standard user programs. The contents of F-blocks are also compared for the comparison of safety programs. As a result, an offline-offline comparison can also be used for an acceptance of changes (Page 323). You enable this comparison by selecting the "Safety" comparison criterion and disabling all other comparison criteria.

Comparison result for safety programs

The representation of the comparison result corresponds to the representation of *STEP 7*.

If you click the "Program blocks" folder on the left of the comparison editor, you can see the collective F-signature of the safety program displayed under "Comparison result". You also receive information about whether the safety program is consistent.



If you click on an F-block, you can see the respective signatures and interface signatures in addition to the standard information.

Note

If you interrupt the connection to the F-CPU during the online/offline comparison, the comparison result will be incorrect.

Comparison filter options

You can use filters in the *comparison editor* to limit the comparison result to the following block groups:

- Compare only F-blocks
- Compare only F-blocks relevant for certification
- Compare only standard blocks

You also have the *STEP 7* filter options "Show only objects with differences" and "Show identical and different objects".

For comparison of safety programs, F-blocks in the "System blocks" folder are also relevant.

Comparison criteria

Make sure that under only the comparison criterion "Safety" is enabled.

Classification of displayed changes

Regardless of whether you carried out an offline/online or offline/offline-comparison, the following changes could account for the indicated changes to the automatically generated F-blocks:

- Change in the maximum cycle time of F-runtime group and warn cycle time of F-runtime group
- Change in F-parameters of the F-CPU
- changed safety system version or change to the hardware configuration (S7-1200/1500: Displayed as change of the "F_SystemInfo_DB" block).
- (S7-300/400) Change in the F-runtime group communication, for example, change in the number of a DB for F-runtime group communication
- Change in main safety block, F-FB, F-FC, F-DB
- Change of the hardware configuration for the F-I/O addressed in the safety program

It is possible that a block is displayed as changed, but no changes are displayed in the detailed comparison of the block content. This is not a display problem but means that changes of addresses in the tag table, for example, have an effect on this block. Test this block in case of doubt.

Printing result of comparison

The comparison result can be printed via "Project > Print" in the menu bar or the print button in the toolbar. Select "Print objects/area" "All" and "Properties" "All".

Make sure that all pages were printed completely. Incomplete printouts (e.g. due to low on toner) must not be used for the acceptance of changes.

10.6 Printing project data

Printing

You can print all important project data (hardware configuration of the F-CPU and F-I/O, safety program). You obtain a "safety summary" that, alongside the documentation, serves as a basis for testing the correctness of the individual components of the system. Correctness is a prerequisite for system acceptance.

The collective F-signature specifications in the footer of the printout ensure that the printout is explicitly associated with a safety program.

Safety summary

The safety summary provides documentation of the safety-related project data which supports you during acceptance of the system.

Procedure for creating a safety summary

To create a safety summary, follow these steps:

1. In the project tree, select the *Safety Administration Editor* of the F-CPU whose safety summary you want to create.
2. Select "Print" in the shortcut menu or "Project > Print" in the menu bar or the print button in the toolbar.

   In the displayed dialog, you can make layout settings for the printout and specify the scope of the printout (all/subset), among other things.
3. Under "Document information", select one of the ISO formats, e.g. "DocuInfo_ISO_A4_Portait".
4. Select the "All" option, if the F-blocks and F-compliant PLC data types are to be shown in the printout. This is necessary, for example, to document the program code for the acceptance(see Acceptance of system (Page 308)). Select the "Compact" option to exclude the source code from the printout.
5. Click the "Print" button.

As a result, you receive the safety summary for the F-CPU.

Make sure that all pages were printed completely. Incomplete printouts (e.g. due to low on toner) must not be used for the acceptance of changes.

Contents of the summary in overview

The topics that are considered in the summary are summarized in the following:

- General information on program identification, software versions, access protection, settings (from the "Settings" work area of the *Safety Administration Editor*), e.g. safety system version.
- System library elements used in safety program (from the "Instructions" task card) along with their versions
- Information about the F-runtime groups (e.g. cycle time warning limit of the F-runtime group, maximum cycle time of the F-runtime group)
- List of the F-blocks within the "Program blocks" folder (e.g. name, function, associated F-runtime group, signature)
- (S7-1200, S7-1500) List of the know-how protected F-blocks used in the safety program (for example name, signature, used safety system version, used versioned instructions or called F-blocks).
- (S7-1200, S7-1500) List of F-compliant PLC data types (UDT)
- Data from the standard user program that are evaluated in the safety program
- Block parameters of the safety-related CPU-CPU communication
- (S7-300, S7-400) Absolute addresses and names of the F-shared DB tags that can be accessed from the standard user program
- Information on hardware (used F-I/O, CPU version, addresses)
- Information on the printout (print date, number of pages)

Content of the footer of the printouts

On the basis of the footer of the printout, you can find out:

- whether the printout is consistent and whether all pages of the printout belong to the same safety program and the same version (the same collective F-signature in the footer of every page means that the printout belongs to the safety program with this collective F-signature).

The footer is added to the source code of the F-blocks only if the "All" option was selected for the safety summary.

If F-blocks are printed by other means, the footer is omitted, and you can no longer easily identify whether the block printout belongs to the current safety program version.

Printing a migrated project

You can only print a safety summary for a project migrated from *S7 Distributed Safety* V5.4 SP5 if the project was compiled with *STEP 7 Safety Advanced* and the new program structure for safety programs (main safety block) has therefore been applied. Otherwise, the printout is not possible and you will receive a corresponding error message.

We recommend that you print out your project in *S7 Distributed Safety V5.4 SP5* before the migration.

10.7 Testing the safety program

10.7.1 Overview of Testing the Safety Program

Complete function test or test of changes

After creating a safety program, you must carry out a complete function test in accordance with your automation task.

For changes made to a safety program that has already undergone a complete function test, only the changes and that there is no effect on the parts of the safety program that were not changed need be tested.

Monitoring

Read-only test functions (such as monitoring tags of the safety program) are available for safety programs as in the standard.

Modifying

Read and write test functions (such as controlling tags of the safety program) are only available to a limited extent for safety programs and only in disabled safety mode.

Simulation via *S7-PLCSIM*

You can test the safety program using *S7-PLCSIM*. You use *S7-PLCSIM* in the same way as for standard user programs.

You start the simulation with *S7-PLCSIM* using menu item "Online > Simulation > Start".

Rules for testing

- Forcing of F-I/O inputs and F-I/O outputs is not possible.
- Controlling F-I/O outputs in connection with the function “Enabling F-I/O outputs" is not possible.
- Setting breakpoints in the standard user program will cause the following errors in the safety program:
  - Expiration of F-cycle time monitoring
  - Error during communication with the F-I/O
  - Error during safety-related CPU-CPU communication
  - Internal CPU fault

  If you nevertheless want to use breakpoints for testing, you must first disable safety mode (Page 294). This will result in the following errors:
  - Error during communication with the F-I/O
  - Error during safety-related CPU-CPU communication
- Changes in the configuration of F-I/O or safety-related CPU-CPU communication can only be tested after the hardware configuration has been saved and downloaded, and after the safety program has been compiled and downloaded to the F-CPU.

10.7.2 Disabling safety mode

Introduction

The safety program generally runs in the F-CPU in safety mode. This means that all fault control measures are activated. The safety program cannot be modified during operation (in RUN mode) in safety mode. You must disable safety mode of the safety program to, for example, modify tags in the safety program in RUN mode. Safety mode remains disabled until the F-CPU is next switched from STOP to RUN mode.

Rules for disabling safety mode

⚠ WARNING

Because changes to the safety program can be made in RUN mode when safety mode is deactivated, you must take the following into account:

- Disabling safety mode is intended for test purposes, commissioning, etc. Whenever safety mode is disabled, the safety of the system must be ensured by other organizational measures, such as monitored operation, manual safety shutdown, and access restrictions to certain areas.
- Disabling of safety mode must be displayed.

  Use the MODE tag in the F-global DB ("F_GLOBDB".MODE) for S7-300/400 F-CPUs or in the F-runtime group information DB (e.g. RTG1SysInfo.F_SYSINFO.MODE) for S7-1200/1500 F-CPUs, which you can evaluate to read the operating mode (1 = Disabled safety mode). This means not only is the disabled safety mode displayed on the programming device or PC in the dialog box for disabling safety mode, but it can also be indicated by means of an indicator light controlled by the standard user program or a message to an HMI system generated by evaluating the above-mentioned "Disabled safety mode" variable in the F-shared DB.
- It must be possible to verify that safety mode has been disabled. A log is required, if possible by recording and, if applicable. archiving alarms to the operator control and monitoring system or, if need be, through organizational measures. In addition, it is recommended that disabling of safety mode be indicated on the HMI system.
- Safety mode is disabled F-CPU-wide. You must, however, take the following into account for safety-related CPU-CPU communication: If the F-CPU with the SENDDP or SENDS7 instruction is in disabled safety mode, you can no longer assume that the data sent by this F-CPU are generated safely. You must then implement organizational measures such as operation monitoring and manual safety shutdown to ensure safety in those portions of the system that are affected by the sent data. Alternatively, you must output fail-safe values instead of the received data in the F-CPU with the instruction RCVDP or RCVS7 (Page 515) or by evaluating SENDMODE. *(S027)*

Procedure for disabling safety mode

To disable safety mode, follow these steps:

1. Open the *Safety Administration Editor* of the corresponding F-CPU.
2. Open the work area "General (Page 70)" in the area navigation.
3. Check to see whether the safety mode status is displayed as activated.

   If so, continue with the next step; if not, stop the process, because safety mode is already disabled or cannot be disabled.
4. Click the "Disable safety mode" button.
5. Enter the password for the online safety program.

   If you enter the correct password, another prompt will appear, which also contains the collective F-signature in the F-CPU. Check to see whether this is the collective F-signature you expected. If there is a match, acknowledge the dialog.
6. Enter the password for the F-CPU.

   After correctly entering the password for the F-CPU, safety mode is disabled.

   If the password is not valid, safety mode is not deactivated and remains active.

   (S7-300, S7-400) When individual F-blocks are downloaded, the condition "Disable safety mode" is listed automatically in the "Load preview" dialog. For this reason, it is not necessary to explicitly disable safety mode before every F-block download.

Note

If the collective F-signature or the passwords do not agree for the safety program online and offline, this means:

- The offline safety program was modified after the last downloading, or
- An incorrect F-CPU was addressed. Check the latter based on the online collective F-signature.

Enabling safety mode

Note

To enable safety mode, the F-CPU must be switched from STOP to RUN mode.

Switching the F-CPU from STOP to RUN mode always enables safety mode, even if the safety program has been modified or is not consistent. The MODE tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB is set to "0" for S7-1200/1500 F-CPUs.

If you have changed your safety program, but have not recompiled and downloaded it, the F-CPU can revert to STOP mode.

Evaluating safety mode/disabled safety mode

If you wish to evaluate safety mode/disabled safety mode in the safety program, you can evaluate the "MODE" tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB for S7-1200/1500 F-CPUs (1 = Disabled safety mode). You use fully qualified access to access this tag (e.g. "F_GLOBDB".MODE or RTG1SysInfo.MODE).

You can use this evaluation, for example, to passivate F-I/O when the safety program is in disabled safety mode. To do so, assign the "MODE" tag in the F-shared DB or F-runtime group information DB to all "PASS_ON" tags in the F-I/O DBs of the F-I/O that you wish to passivate.

⚠ WARNING

When the safety program is in disabled safety mode, the "MODE" tag in the F-shared DB or F-runtime group information DB is also evaluated in disabled safety mode.

Even if the F-I/O are passivated in disabled safety mode as a result of evaluation of the "MODE" tag, system safety must be ensured in disabled safety mode through other organizational measures, such as operation monitoring and manual safety shutdown. *(S028)*

F-runtime group information DB (S7-1200, S7-1500) (Page 118)

10.7.3 Testing the safety program

Introduction

Tags of he safety program can be monitored at any time.

Controlling tags of the safety program is only possible in deactivated safety mode as some fault control measures of the safety program have to be disabled for this.

You can control the following tags of the safety program:

- Inputs and outputs of the F-I/O (channel values and value status (S7-1200, S7-1500))
- Tags in F-global DB (except DB for F-runtime group communication)
- Tags in instance DBs of F-FBs
- Tags in F-I/O DBs (for permitted tags see F-I/O DB (Page 135))

Note

A modify function controlled by the F-system is only possible if the *STEP 7 Safety* optional package is installed. Modification of tags by means of an HMI system as well as modification without an installed *STEP 7 Safety* optional package can cause the F-CPU to go into STOP.

Procedure for monitoring tags of the safety program

Monitor the required tags of the safety program from an open watch table or from the *program editor* (program status).

1. Proceed as in the standard. Additional information can be found in the *STEP 7 help* in “Testing user programs".

Procedure for controlling tags of the safety program

Control the required tags of the safety program from an open watch table:

1. For modifying, deactivate the safety mode (Page 294) in the automatically shown dialog.
2. Terminate existing modify requests after testing is complete before activating safety mode.

Values in F-DBs can only be modified online in the F-CPU. If the value is also to be changed offline, you must do this by editing the start value offline and compiling the safety program.

Proceed as follows to control tags of F-I/O:

1. Create a separate row for each channel value and value status (S7-1200, S7-1500) to be modified. The control value must correspond to the channel value or value status.
2. Set “start of scan cycle" or “end of scan cycle" and "permanent" or “once".

   Regardless of the trigger point setting, requests to modify inputs (PII) of F-I/O always become effective before the main safety block is executed and requests to modify outputs (PIQ) always become effective after execution of the main safety block.
3. (S7-300, S7-400) Create an additional watch table if you want to control more than 5 inputs/outputs.

Note

F-I/O can only be modified in RUN mode of the F-CPU.

You cannot modify a configured F-I/O from which neither a channel value or a value status (S7-1200, S7-1500), nor any tag from the associated F-I/O DB has been used. In your safety program, you should therefore always use at least one tag from the associated F-I/O DB or at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be modified.

For inputs (PII), modify requests take priority over fail-safe value output, while for outputs (PIQ), fail-safe value output takes priority over modify requests. For outputs (channels) that are not activated in the properties for the F-I/O, modify requests affect the PIQ only, and not the F-I/O.

Note

The following applies for S7-1200/1500 F-CPUs:

To avoid invalid combinations of channel value and status value:

- The value status is set by the F-system automatically to 1 when setting a channel value to a value <> fail-safe value 0
- The fail-safe value 0 is automatically output when setting the value status to 0 for the associated channel value

WARNING

You need to specifically reset constant modify requests in the watch table in disabled safety mode.

Please note that constant modify requests that are not correctly reset can remain active in the background even after a STOP/RUN transition on the F-CPU.

Because the F-CPU is in safety mode again after a STOP/RUN transition, the constant modify requests are no longer effective and are not shown in the watch table.

The requests become active again as soon as you disable safety mode again.

With a memory reset of the F-CPU, you can make sure that no constant modify requests are active in the background on the F-CPU. *(S029)*

Wiring test using watch table

You can carry out a wiring test for an input by changing an input signal and verifying whether or not the new value arrives in the PII.

You can carry out a wiring test for an output by changing the output with the Modify function and verifying whether the required actuator responds.

For the wiring test, note that a safety program must be running on the F-CPU, in which at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be monitored or modified or one tag from the associated F-I/O DB has been used.

For F-I/O that can also be operated as standard I/O (e.g., S7-300 fail-safe signal modules), you can also carry out the wiring test for outputs using the Modify function in STOP mode by operating the F-I/O as standard I/O rather than in safety mode.

Downloading project data to an F-CPU (Page 271)

10.7.4 Testing the safety program with S7-PLCSIM

You can test your safety program together with your standard program on a simulated CPU with *S7-PLCSIM* and without the need for hardware.

You use *S7-PLCSIM* for SIMATIC Safety F-systems as you would for S7 standard systems. Note the following special features:

Safety mode/disabled safety mode

We recommend that you test your safety program in safety mode to detect whether the F-CPU goes into STOP as early as in the test phase of your safety program in *S7-PLCSIM* as a result of, for example, that the results of instructions were outside the permitted range for the data type.

The following simulations can be run in *S7-PLCSIM*, just as on an actual F-CPU, in disabled safety mode only.

- Modifying tags in F-DBs and F-I/O DBs.

The F-CPU can go to STOP mode in *S7-PLCSIM* if this is disregarded. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

(S7-1200, S7-1500) To prevent unintentional modification of tags in F-DBs and F-I/O DBs in safety mode, we recommend that you do not select the "Activate/deactivate modification of non-inputs" button in *S7-PLCSIM*

During the simulation with *S7-PLCSIM* , monitoring of the maximum cycle time of the F-runtime group and the cycle time warning limit of the F-runtime group (S7-1200, S7-1500) are disabled.

Input simulation of F-I/O

Modification of inputs (channel values) in *S7-PLCSIM:*

You modify inputs (channel values) of F-I/O as you would inputs (channel values) of standard I/O in *S7-PLCSIM*.

Modification of inputs (value status) in *S7-PLCSIM:*

(S7-1200, S7-1500) By modifying inputs (value status) of F-I/O you can simulate the incoming and outgoing F-I/O/channel faults. Keep in mind the following notes/restrictions:

- To realistically simulate the behavior of the F-I/O, you must note the connection between channel value and value status on the real F-I/O. The combination value status = 0 and channel value **<>** fail-safe value (0) is invalid and can result in the simulation deviating from the behavior of the real F-CPU.
- During the transition from "STOP" to "RUN" of the CPU in *S7-PLCSIM*, all F-I/O inputs (value status) are initialized with 1. This means you can start with the modification of inputs (channel values) without simulation of the inputs (value status).
- The modification of inputs (value status) in *S7-PLCSIM* does not have an effect on the tags QBAD and PASS_OUT in the F-I/O DB. Note that with real F-I/O QBAD and PASS_OUT can be 1 as soon as the value status is 0 for at least one channel of the F-I/O. (see tags of the F-I/O DB: PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 141)).
- For F-I/O configured with "Behavior after channel fault" = "Passivation of the complete F-I/O", use the tag PASS_ON in the F-I/O DB for simulation of the passivation of the complete F-I/O for F-I/O / channel faults. If you only passivate individual inputs (channel value including value status) for the simulation, the behavior of the simulation will deviate from the real F-CPU.
- You can also use the PASS_ON tag in the F-I/O DB for F-I/O without value status to simulate the passivation of the entire F-I/O in case of F-I/O or channel faults.
- You must modify the inputs (channel values) to $7FFF_H$ (for overflow) or 8000_H (for underflow) to simulate an F-I/O/channel fault of the SM 336; AI 6 x 13Bit or the SM 336; F-AI 6 x 0/4...20 mA HART with configuration "Behavior after channel fault" = "Passivate channel".
- For F-I/O which does not support the "RIOforFA-Safety" profile, you must run a user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB as with a real F-I/O for reintegration after the value status has changed from 0 to 1 or when the channel value has changed from $7FFF_H$/8000_H to unequal $7FFF_H$/8000_H (see above) when ACK_NEC = 1 of the F-I/O DB. Reintegration takes place automatically in all other cases possibly deviating from the real F-I/O.

Update times

Keep in mind that the status of the inputs (channel values or value status (S7-1200/1500)) which you are monitoring in the SIM table in *S7-PLCSIM* is only identical to the status being processed in the safety program if there is no passivation of the associated F-I/O.

With passivation of the F-I/O, the safety program operates with fail-safe values (channel value and value status (S7-1200/1500) =0).

Instructions for communication between F-CPUs

You cannot simulate communication between F-CPUs with the SENDDP and RCVDP instructions in *S7-PLCSIM*. You can, however, use the SENDDP and RCVDP instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVDP instruction outputs the fail-safe values pending at its inputs SUBBO_xx and SUBI_xx ((S7-1200/1500) or alternatively SUBDI_00). The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON.

(S7-300, S7-400) You cannot simulate communication between F-CPUs with the SENDS7 and RCVS7 instructions in *S7-PLCSIM*. You can, however, use the SENDS7 and RCVS7 instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVS7 instruction outputs the initial values specified in the communication DB as fail-safe values. The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON.

Inconsistent safety program (S7-1200, S7-1500)

If the CPU goes into STOP in *S7-PLCSIM* with the diagnostic entry "Safety program: inconsistent", the F-CPU is not initialized correctly in *S7-PLCSIM* yet. Perform a memory reset of the F-CPU in *S7-PLCSIM* and download the program once again to the CPU in *S7-PLCSIM*.

10.7.5 Changing the safety program in RUN mode (S7-300, S7-400)

Introduction

Changes to the safety program during operation (in RUN mode) can only be made in disabled safety mode (Page 294). You make changes to F-blocks offline in the *program editor* in the same way as for a standard program. F-blocks cannot be changed online.

Note

If you do **not** want to make changes to the safety program during operation, see Creating F-blocks in FBD/LAD (Page 122).

Procedure for changing the safety program in RUN mode

To change the safety program, follow these steps:

1. Change the main safety block or F-FB and its associated instance DB, F-FC, or F-DB in the *Program editor*.
2. Download the changed F-block(s) to the F-CPU (for procedure, see Downloading project data to an F-CPU (Page 271)). The entire program is then automatically compiled.
3. If safety mode is active, the "Load preview" dialog will prompt you to deactivate it and to enter the password for the safety program.

Note

When downloading in disabled safety mode, you can only download the fail-safe blocks created by you (main safety blocks, F-FB, F-FC, or F-DB), F-application blocks, or standard blocks and their associated instance DBs. If you download automatically added F-blocks (F-SBs or automatically generated F-blocks and associated instance DBs, F-shared DB), the F-CPU can go to STOP mode or safety mode can be activated.

Therefore, always select individual blocks only when downloading in disabled safety mode.

Sequence for downloading changes

Changes in the safety program in RUN mode when safety mode is disabled can, for example, cause the status of an actuator to change as a result of program changes.

After changes, start by downloading the safety program and then the function of the standard user program monitored by the safety program.

Restrictions on safety-related CPU-CPU communication

During operation (in RUN mode), you cannot establish new safety-related CPU-CPU communication by means of new SENDDP/RCVDP or SENDS7/RCVS7 instructions.

To establish new safety-related CPU-CPU communication you must always download the relevant safety program consistently to the F-CPU while in STOP mode after inserting a new SENDDP, SENDS7, RCVDP, or RCVS7 instruction.

Restrictions on F-runtime group communication

You cannot make any changes to the safety-related communication between F-runtime groups in RUN mode. This means that you cannot assign, delete, or change any DBs for F-runtime group communication of an F-runtime group.

Following changes in the F-runtime group communication, you must always download the safety program consistently to the F-CPU while in STOP mode.

Restrictions on F-I/O access

If during operation (in RUN mode), you insert an F-I/O access to an F-I/O of which no single channel value or tag from the associated F-I/O DB has yet been used in the safety program, the F-I/O access only becomes effective when the safety program is downloaded consistently to the F-CPU.

Changing the standard user program

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

⚠ WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

Procedure for applying changes to the safety program

If you download individual F-blocks to the F-CPU during operation (in RUN mode), the F-system blocks (F-SBs) and the automatically generated F-blocks are neither updated nor downloaded, resulting in an inconsistent safety program in the F-CPU. Use the following procedure to apply changes to the safety program:

1. Download the safety program consistently to the F-CPU, and activate safety mode by switching the F-CPU from STOP to RUN mode (for procedure, see Downloading project data to an F-CPU (Page 271)).
2. Follow the steps described in Acceptance of Changes (Page 323).

10.7.6 Changing the standard user program in RUN mode (S7-1200, S7-1500)

Changing the standard user program

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

10.7.7 Deleting the safety program

Deleting individual F-blocks

To delete an F-block, follow the same procedure as in *STEP 7*.

Deleting an F-runtime group

See Deleting an F-runtime group (Page 120)

(S7-300, S7-400) Remove all calls that you have used to call the safety program (Main_Safety).

Deleting the entire safety program for S7-300/400 F-CPUs *with* inserted memory card (SIMATIC Micro memory card or flash card)

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
4. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.
5. To delete a safety program on the Memory Card (SIMATIC Micro Memory Card or Flash Card), insert the Memory Card (SIMATIC Micro Memory Card or Flash Card) in the programming device or PC or in a SIMATIC USB prommer.
6. Select the menu command "Project > SIMATIC Card Reader/USB memory > Show SIMATIC Card Reader/USB memory" in the menu bar.
7. Open the "SIMATIC Card Reader" folder and delete the Memory Card.
8. Insert the Memory Card into the F-CPU.

You can then download the offline standard user program to the F-CPU.

Deleting the entire safety program for S7-400 F-CPUs *without* inserted flash card

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Remove all calls that you have used to call the safety program (Main_Safety).
3. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
4. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.
5. Perform a memory reset on the F-CPU (in the "Online tools" task card of the F-CPU).

You can then download the offline standard user program to the F-CPU.

Delete the entire safety program for SIMATIC S7-1200/1500 F-CPUs

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Compile the project data of the F-CPU

   The offline project no longer contains a safety program.

You can then download the offline standard user program to the F-CPU.

10.8 F-change history

Enable the logging of changes to the safety program by using the option "Enable F-change history" in the *Safety Administration Editor*. The F-change history behaves like the standard change history.

An F-change history is created for each F-CPU in the project navigation under "Common data/logs".

The following is logged in the F-change history:

- Collective F-signature
- User name
- Compile time stamp
- Download of the safety program with time stamp
- Compiled F-blocks with signature and time stamp

The F-change history can contain a maximum of 5000 entries per F-CPU. When the 5000 entries are exceeded, a new F-change history is created using the name pattern "F-change history <CPU name> YYYY-MM-DD hh:mm:ss".

NOTICE
The connection between the F-CPU and the associated F-change history is made through the name of the F-change history. Therefore, do not rename the F-CPU and the F-change history. If you rename the F-CPU or the F-change history, a new F-change history with the current name of the F-CPU is started.

Note

You may not use the F-change history to recognize changes in the safety program/in the configuration of the F-I/Os during the acceptance of changes.

To accept changes, proceed as described under Acceptance of Changes (Page 323).

Note

We recommend activating the F-change history before changing over to productive operation.

System acceptance 11

11.1 Overview of System Acceptance

Introduction

During a system acceptance test, all the standards and guidelines (for example PROFINET Installation Guidelines) relevant to the specific application must be complied with. This also applies to systems that are not "subject to acceptance". For the acceptance, you must consider the requirements in the Certification Report (http://support.automation.siemens.com/WW/view/en/49368678/134200).

As a general rule, the acceptance of an F-System is performed by an independent expert. The independence required of the expert must be defined in the safety plan and depends on the required PL/SIL.

Observe all warnings in this manual.

WARNING

The F-CPU and F-I/O must be configured in the hardware and network editor of the TIA Portal as described in this documentation. F-blocks must be created with the program editor of the TIA Portal as described in this documentation. For system acceptance, you have to use the safety summary created according to this documentation. Any other procedures are not permitted. *(S056)*

Proof of correctness of components

In order for a system acceptance to be granted, you must recognize and document the correctness of the individual components. For documentation of the component properties, you must create a safety summary.

The following characteristics must be covered:

- Correctness of the safety program including hardware configuration (including testing) (Page 309)
- Completeness of the safety summary (Page 310)
- Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate (Page 311)
- Compliance of the know-how protected F-blocks used in the safety program with their safety documentation. (Page 312)
- Completeness and correctness of the hardware configuration (Page 314)
- Correctness of the communication configuration (Page 320)
- Consistency of the online safety program (Page 321)
- Other characteristics (Page 322) such as software version, use of data from the standard user program

After the acceptance, you should archive all relevant documents and also the project data so as to make the accepted project available as a reference for a subsequent acceptance.

Safety summary

The safety summary (Page 291) is the project documentation required for acceptance of the system.

11.2 Correctness of the safety program including hardware configuration (including testing)

Verification/function test

Already during the creation, you will test (Page 293) your safety program and the associated hardware configuration. You must carry out tests with regard to the specification of your safety functions and document them before you seek acceptance for the system.

To allow you to perform a code review of your safety program and document the accepted program code, the source code of all F-blocks is printed as a part of the safety summary (Page 291), provided you have selected the "All" property for the printout.

If you want to carry out a function test after loading, you have to carry out program identification after loading. Additional information is available in "Downloading project data (Page 271)".

The correct function of the safety program must be guaranteed by verification and complete function tests before it may be used productively. You should archive the test reports along with the safety summary and the acceptance documents.

Times, for example monitoring times (Page 530) and delay times, are extremely hard to verify with functional tests (Page 271). You should check these times selectively to determine whether they are dimensioned correctly, for example, on the basis of the safety summary.

Some of these times are itemized specially in the safety summary, for example, the F-monitoring time (for communication between F-CPU and F-I/O) and the monitoring time of the safety-related CPU-CPU communication (TIMEOUT input). For the approximate determination of these monitoring times, the Excel file for response time calculation is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100). Note that these monitoring times have an impact on the response times of your safety functions.

Consistency of the safety program

Check in the "General information" section of the safety summary to determine whether the safety program was recognized as "consistent".

This is the case for S7-300/400 F-CPUs only if the following signatures are also identical:

- Collective F-signature ("General information" section, "Collective F-signature")
- "Signature of F-blocks with F-attribute" ("General information" section, "Current compilation")

Consistency of the safety program is required for the acceptance. If the signatures are not identical, you should recompile the safety program and regenerate the safety summary.

11.3 Completeness of the safety summary

Introduction

If your safety program status including hardware configuration is ready for acceptance, you must carry out and document additional checks on the basis of the safety summary. The safety summary must be complete and belong to the safety program undergoing acceptance.

Procedure for creation of safety summary

To generate the safety summary, follow the procedure described in Printing project data (Page 291).

In so doing, use the "All" property in order to include the source code of your F-blocks in the printout.

Checking the safety summary for completeness

If you want to use an existing summary, whose completeness is not exactly known, you must check to determine whether the same collective F-signature is contained in the footer on all pages of the printout. This allows you to prove that all printed sheets belong to the same project.

In section "Supplementary information", you can find the number of pages in the safety summary, among other things. With this, you can prove that all pages of the safety summary are printed. Incomplete printouts (e.g. due to low on toner) must not be used for the acceptance of changes.

If you created the safety summary with the "All" option, the source code of all F-blocks will also be printed. The printout of this source code also contains the footer to enable you to easily assign the source code to a particular safety summary.

Association with the safety program

In the "General information" section of the safety summary, check whether the collective F-signature corresponds to the collective F-signature of the safety program to be accepted in the work area of the *Safety Administration Editor* under "General". If they are not the same, then the summary and safety program do not match.

11.4 Compliance of the system library elements used in the safety program with Annex 1 of the Report for the TÜV certificate

Introduction

The *STEP 7 Safety* optional package contains LAD/FBD instructions for programming of your safety program as well as F-system blocks that have been created and tested by SIEMENS and certified by TÜV for creating an executable safety program. In the process, the F-system blocks used are automatically defined by the F-system based on the set safety system version (see section "Settings" area (Page 75)).

To allow you to check whether the used versioned LAD/FBD instructions and F-system blocks correspond to Annex 1 of the Report for the TÜV certificate and to the versions you intend to use, these are listed in the safety summary.

Procedure

To check, download the current Annex 1 of the report for the TÜV certificate "SIMATIC Safety" from the Internet (http://support.automation.siemens.com/WW/view/en/49368678/134200).

Proceed as follows for the check:

WARNING

- (S7-1200, S7-1500) The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions in Annex 1 of the Report for the TÜV Certificate.
- (S7-300, S7-400) The versions, signatures and initial value signatures of the versioned LAD/FBD instructions and F-system blocks listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions, signatures and initial value signatures in Annex 1 of the Report for the TÜV Certificate.
- The versions of the versioned LAD/FBD instructions listed in the safety summary must meet the safety requirements of your application.

  Keep in mind possible differences in functionality of different versions specified in the section for the respective instruction.
- The safety system version listed in the safety summary under "Safety program settings" must match the versions in Annex 1 of the Report for the TÜV Certificate. *(S054)*

In case of discrepancies, recheck whether you have the correct versions.

11.5 Compliance of the know-how protected F-blocks used in the safety program with their safety documentation.

If you use know-how protected F-blocks for the programming of your safety program (e.g. from libraries), the source code for these is not printed in the safety summary.

Therefore, the author of the know-how protected F-block must already carry out acceptance of the F-block and provide the following information:

S7-300/400 F-CPUs

- Signature and initial value signature of the know-how protected F-block
- Versions of all the used versioned LAD/FBD instructions
- Signatures and initial value signatures of all called F-blocks

During a system acceptance test, you have to carry out the following checks using the safety summary:

- The signature and initial value signature of each know-how protected F-block listed in the safety summary in the section "F-blocks in the safety program" must agree with the signature and initial value signature documented by the author.
- The versions of the versioned LAD/FBD instructions listed in the safety summary in the section "System library elements used in safety program" must correspond to the versions of each know-how protected F-block documented by the author or must be functionally identical with these.
- The signatures and initial value signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "F-blocks in the safety program" must correspond to the signatures and initial value signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures and initial value signatures. If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

S7-1200/1500 F-CPUs

- Signature of the know-how protected F-block
- Safety system version when setting up the know-how protection
- Versions of all the used versioned LAD/FBD instructions
- Signatures of all called F-blocks

During a system acceptance test, you have to carry out the following checks using the safety summary:

- The signature of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must agree with the signature documented by the author.
- The safety system version of each know-how protected F-block listed in the safety summary under "Know-how protected F-blocks in the safety program" must match the versions in Annex 1 of the Report for the TÜV Certificate.
- The versions of the versioned LAD/FBD instructions of each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must correspond to the versions documented by the author or must be functionally identical with these.
- The signatures of the F-blocks called in each know-how protected F-block listed in the safety summary in the section "Know-how protected F-blocks in the safety program" must correspond to the signatures (of the called F-blocks) documented by the author.

In case of differences, set the documented (or functionally identical) versions and use the F-blocks with the documented signatures. If the version conflicts cannot be eliminated due to other dependencies, please contact the author of the know-how protected block in order to obtain a compatible approved version.

11.6 Completeness and correctness of the hardware configuration

Introduction

The hardware configuration is an essential component of the project to be accepted. With the configuration of the hardware, you have set properties that can influence the safety of signals. You must document these settings with the safety summary to prove that you fulfill the safety requirements for your application.

The section "Hardware configuration of F-I/O" is available in the safety summary for this. This section consists of several tables:

- A table with information about the F-CPU and the ranges of F-destination addresses used and of the Central F-source address of the F-CPU.
- An overview table with the F-I/O used.
- A table for each F-I/O with information about the F-I/O and all parameters of the F-I/O with the configured values.

Check whether only authorized users have the "F-admin" right in the *Safety Administration Editor* or in the standard printout of the project data.

Note

Note that you will find F-I/O that you address via safety-related I-slave-slave communication in the safety summary of the I-slave F-CPU and not in the F-CPU of the assigned DP master.

The safety summary of the F-CPU of the DP master includes a note for this F-I/O in the overview table indicating that the F-I/O is not assigned to this F-CPU.

Note

When using shared devices:

Note that you will find F-I/O that you address in a shared device in the safety summary of the F-CPU of the IO controller to which it is assigned.

The safety summary of the F-CPUs of the other IO controllers between which the shared device is divided, includes a note in the overview table for this F-I/O that it is not assigned to this F-CPU.

Procedure for checking that the hardware configuration is complete

Check whether the safety summary contains the complete configured F-I/O. Also make sure that there is no F-I/O that you have not configured as belonging to this F-CPU.

Procedure for checking the correctness of the hardware configuration using the safety summary

To check the hardware configuration for correctness, proceed as follows:

1. Check in the “F-hardware configuration“ section to verify the uniqueness of the PROFIsafe addresses.

   Please see sections PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 56) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 58), Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 65) and Recommendation for PROFIsafe address assignment (Page 53).

   – Check if the "Central F-source address" parameter of the individual F-CPUs differs network-wide. F-CPUs to which solely F-IOs of the PROFIsafe address type 1 are assigned do not have to be considered during the check.

   – For F-I/Os of PROFIsafe address type 1 check whether the F-destination addresses comply with the following warning:

   ⚠ WARNING

   F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).

   The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

   * A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

   ** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

– For F-I/Os of PROFIsafe address type 2 check whether the F-destination addresses comply with the following warning:

WARNING

FI/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Central F-source address" parameter of the assigned F-CPU) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

To ensure that addresses are unique across F-CPUs for supported configurations (Page 54), you need to ensure that the "Central F-source address" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Central F-source address" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

– fail-safe GSD based DP slaves / GSD based I/O devices check whether the PROFIsafe addresses comply with the following warning:

WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 56) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 58).

Set the PROFIsafe source address for fail-safe GSD based DP slaves / fail-safe GSD based I/O devices according to the manufacturer's specifications. If the PROFIsafe source address needs to correspond to the "Central F-source address" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Central F-source address" parameter matches the value of the PROFIsafe source address of the fail-safe GSD based DP slave / fail-safe GSD based I/O device. *(S053)*

2. Check the safety-related parameters (including F-monitoring time or F_WD_Time) of all configured F-I/O.

   You can find these parameters in the "Hardware configuration of F-I/O" section in the detailed tables for the F-I/O.

   The table consists of two parts:

   – The left part contains the parameters which refer to the F-I/O itself ("Module data").
   – The right part contains the parameters of the individual channels ("Channel parameters")

   These parameters must be set as prescribed by the safety requirements of your application.

   When using fail-safe GSD based DP slaves/GSD based I/O devices, note the relevant documents for the possible additional safety-related (technical) parameters.

   Note

   F-I/O that are to be assigned the same safety-related parameters (except for PROFIsafe addresses) can be copied during configuration. Except for the PROFIsafe addresses, you no longer have to check the safety-related parameters individually. It is sufficient to compare the "Signature of F-parameters (without addresses)" in the "Hardware configuration of the F-I/O" section in the overview table. This also applies to fail-safe GSD based DP slaves/GSD based I/O devices without i-parameters. For GSD based DP slaves / GSD based I/O devices with i-parameters, it may be that "F-parameter signature (w/o addresses)" does not match, even though all safety-related parameters, except for the PROFIsafe addresses, do match. In this case, you need to compare all safety-related parameters.

3. Check whether the article numbers of the F-I/O in the safety summary correspond to the article numbers of the actual F-I/O in the system. If the article numbers do not match, the F-I/O in the system must be spare-part compatible with the F-I/O listed in the safety summary.

4. For non-supported configuration, please see Configurations supported by the SIMATIC Safety F-system (Page 54).

⚠ WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O of this configuration appears in the safety summary and that an F-I/O DB has been created for it. Otherwise, you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Check the correctness of the PROFIsafe addresses with the help of the safety summary.
  - Use the safety summary to check that the F-source address corresponds to the "Central F-source address" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1 or if you cannot set the F-source address in accordance with the "Central F-source address" parameter of the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported.

  (S050)

* "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Check that only authorized persons have the "F-admin" right.

⚠ WARNING

The "F-admin" authorization for Web server without password protection (user "Everybody" or "Anyone") is only intended for test purposes, maintenance, etc. This means only when the system is not in productive operation. In this case, you must ensure the safety of the system through other organizational measures, for example through protected access to certain areas.

Before you transition into productive operation, you must remove the "F-admin" right for the user "Everybody".

Only authorized personnel may have access to the password of the Web server user with the "F-admin" right. After downloading the hardware configuration, check whether only permitted users of the Web server have the "F-admin" right on the F-CPU. To do so, use the online view of the *Safety Administration Editor* (see also Safety Administration Editor (Page 68)).

Saving the login file and the password of the Web server in the browser is only permitted when use by unauthorized persons is prevented through other organizational measures (e.g. access protection to the PG/PC). *(S064)*

11.7 Correctness of the communication configuration

Introduction

Safety-related communication is based on the mechanisms of the standard communication of *STEP 7*.

To ensure that errors which standard communication does not discover are detected, safety-related communication connections between F-CPUs are secured. Further parameters are required for this, which you have to document and check on acceptance.

For this purpose, the "Block parameters for safety-related CPU-CPU-communication" section is available in the safety summary. In this section, there are up to two tables (for communication via PROFIBUS DP or PROFINET IO and for communication via S7 connections).

Procedure for testing for correctness of the communication configuration

To check the communication configuration for correctness, proceed as follows:

- In the "Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO" table, check to determine whether you have assigned a unique DP_DP_ID input network-wide* for all safety-related communication connections (e.g., master-master, master-I-slave and IO controller-IO controller communication).
- In the "Safety-related CPU-CPU communication via S7 connections" table, check to determine whether you have assigned a unique R_ID input network-wide* for all safety-related communication via S7 connections.

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

11.8 Consistency of the online safety program

Once you have checked all properties of the offline safety program you must ensure that the safety program is identical on the F-CPU on which it is supposed to be run.

The signatures must match the signature from the safety summary online and offline. To do so, open the *Safety Administration Editor* and go to online view.

In the "General" area, check the information for

- Online collective signature
- Offline collective signature
- Information on whether safety programs are consistent online and offline.
- Version check view

Use the output information to check which situation you are dealing with and, if necessary, execute the recommended measure:

collective F-signatures online/offline	Consistency online to offline	Statement	Measure
	(n/a)	The safety programs are different.	Download the safety program to the F-CPU.
		The safety programs are identical but different versions of F-blocks are used.	The safety program must be downloaded to the F-CPU for the latest versions to become effective.
		The safety programs are identical.	None

Keep in mind that only a change comparison will provide reliable information as to whether the safety programs are identical. The display of signatures is used for quick identification of changes.

11.9 Other characteristics

Introduction

In addition, you must check a few more characteristics that are also relevant for the acceptance of the project.

Validity check for data transfer from the standard program to the safety program

Check to determine whether a validity check was programmed for all data transferred from the standard user program to the safety program. For this purpose, the "Data from the standard user program" section lists all tags of the standard user program that you are reading in the safety program. Tags of the safety program that you are writing in the safety program are not listed here because a plausibility check is not required for them.

Checking the program version

Check whether the version of *STEP 7 Safety* used to create the summary (in the footer of the printout) is as least as high as the version used to compile the safety program. The latter version can be found in the "General information" section of the safety summary under "Used Versions". Both versions must be listed in Annex 1 of the Report for the TÜV certificate.

Ability to disable safety mode

Make sure that safety mode cannot be disabled. For information about this, refer to section "General information" under "Safety program settings". This setting ensures that the safety mode of the safety program cannot be disabled inadvertently.

Access protection

Check in the "General information" section under "Access protection" to determine whether the setting for access protection is permitted. Note the following warning.

Otherwise, the project must not be accepted, because the safety program in the F-CPU is not protected against unauthorized accesses.

⚠ WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would also allow changes to the safety program. To rule out this possibility, you must configure the protection level "Write protection for fail-safe blocks" and configure a password for the F-CPU. If only one person is authorized to change the standard user program and the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs).*(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. You therefore need to configure at least the protection level "Full access (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)". *(S041)*

See also

Data Transfer from Standard User Program to Safety Program (Page 167)

11.10 Acceptance of Changes

Introduction

In general, you can adopt the same approach for the acceptance of changes as the initial acceptance (see Overview of System Acceptance (Page 308)).

You must check the entire safety program including the HW configuration for changes.

WARNING

In case of acceptance of changes, you must check whether the intended changes were made correctly.

You must also check whether unintentional changes may have been made at another location (for example, I/O or instructions that were added).*(S072)*

To avoid the acceptance of the entire system in case of negligible changes, *STEP 7 Safety* helps you to identify those parts of your safety program that have changed.

For an acceptance of changes, it is sufficient to check the following:

- Checking the changed or newly added F-blocks.
- Checking the changed or newly added instructions and F-system blocks.
- Checking the safety-related parameters of the changed or newly added F-I/O.

You then perform a function test of the changed or newly added F-blocks/F-I/O.

Check that the changes have no impact on the unchanged parts of the safety program, in particular for deleted F-blocks or deleted F-I/O.

Note

Acceptance of changes is not possible after CPU migration.

WARNING

When you make changes in which the assignment of input/output addresses and wiring can change, then you must perform a wiring test (Page 297).

Examples for such changes are:

- Adding F-I/O
- Changing the start address of F-I/O
- Changing the slot position of F-I/O
- Changing
  - the rack
  - the slave/device address
  - the PROFIBUS DP/PROFINET IO subnet
  - the IP address
  - the device name

(S071)

Detection of changes in the safety program

To detect changes in the safety program, proceed as follows:

1. Perform an offline-offline comparison between the changed safety program and the accepted safety program (see Comparing Safety Programs (Page 289)). Use filter setting "Compare only F-blocks relevant for certification". This limits the output of the comparison to exactly those F-blocks that must be considered for the acceptance of changes.

   WARNING

   Make sure that the comparison criterion "Safety" is enabled so that the criteria relevant for an acceptance of changes are taken into consideration in the comparison. *(S069)*

   By disabling the remaining comparison criteria, you can deselect those differences that are irrelevant for the acceptance of changes (e.g. time stamp).

   The status of the comparison helps you to identify which F-blocks were changed.

Detection of safety-related changes in the configuration of the F-I/O

There are two possible ways of detecting safety-related changes in the configured F-I/O:

- Comparison in the comparison editor
- Comparison based on two safety summaries

Comparison in the comparison editor

If you have saved the project with the accepted F-CPU, you can also perform an offline-offline comparison of the changed project and the accepted project to detect changes in the configuration of the F-I/O (see Comparing Safety Programs (Page 289)). Both projects must be consistent and compiled.

1. Navigate in the comparison result to the "System blocks > STEP 7 Safety > F-I/O DBs" folder. All data blocks listed in this folder are F-I/O-DBs and are each assigned to an F-I/O.
   - If the F-I/O-DBs in the comparison result are identical, this means that the safety-related configuration of the assigned F-I/O was also not changed. Standard-parameters may have changed.
   - If the F-I/O-DBs in the comparison result are not identical, this means that the safety-related configuration of the assigned F-I/O was also changed.
   - If the F-F-I/O DBs in the comparison result are marked as “not existing”, associated F-I/O may be deleted or the name or start addresses were changed. In this case you can find the assignment of an F-I/O DB to a specific F-I/O in the safety summary under "Hardware configuration of F-I/O".
2. If you have found changed F-I/O, you can check the changed parameters in the safety summary as described below.

Comparison based on two safety summaries

Carry out a comparison based on two safety summaries as follows:

1. In the section "Hardware configuration of the F-I/O" compare the start addresses (I/O addresses), the parameter "Behavior after channel fault" and the slot of the F-I/O.
2. In the overview table of the utilized F-I/O in the "Hardware configuration of F-I/O" section, compare the parameter CRCs of the F-I/O with those in the safety summary of the accepted F-CPU.
   - If the "Parameter signature (without addresses)" is different for an F-I/O, this indicates the existence of a safety-related change of safety-related parameters of the F-I/O. In addition, the PROFIsafe addresses may also be changed.

     In this case, in the “F-I/O hardware configuration“ section check the safety-related parameters of the F-I/O and verify the uniqueness of the PROFIsafe addresses.
   - If the "Parameter signature (w/o addresses) is identical, it is possible that only the PROFIsafe addresses were changed.

     In this case it is sufficient to verify the uniqueness of the PROFIsafe addresses.

Check as described in section “Completeness and correctness of the hardware configuration (Page 314)“.

Operation and Maintenance 12

12.1 Notes on Safety Mode of the Safety Program

Introduction

Pay attention to the following important notes on safety mode of the safety program.

Use of simulation devices/simulation programs

⚠ WARNING

Use of simulation devices/simulation programs

If you operate simulation devices or simulation programs that generate safety message frames, e.g., based on PROFIsafe, and make them available to the SIMATIC Safety F-system via the bus system (such as PROFIBUS DP or PROFINET IO), you must ensure the safety of the F-system using organizational measures, such as operational monitoring and manual safety shutdown.

If you use the S7-PLCSIM (Page 293) to simulate safety programs, these measures are not necessary because S7-PLCSIM cannot establish an online connection to a real component.

Note, for example, that a protocol analyzer is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior. *(S030)*

Switching F-CPU to STOP mode

⚠ WARNING

STOP via programming device/PC, mode switch, communication function or "STP" instruction

Initiating STOP by means of programming device/PC operation, mode switch, communication function or "STP" instruction as well as maintaining the STOP state is not safety-oriented. This STOP state can be easily (and unintentionally) be revoked by programming device/PC operation.

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost. The F-system automatically reintegrates the F-I/O.

If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected (see Programming startup protection (Page 127)). *(S031)*

CRC error in safety-related communication

Note

CRC error in safety-related communication

If you observe that an F-CPU requests manual acknowledgement of a CRC error more than once within the space of 100 hours, and this occurs repeatedly, check whether the PROFINET or PROFIBUS installation guidelines have been followed.

There is a CRC error if:

- The ACK_REQ tag of the F-I/O DB is set and the DIAG tag of the F-I/O DB (bit 2 or bit 6) indicates CRC errors
  or
- A CRC error is entered in the diagnostic buffer of the F-CPU

In this case, the failure probability values (https://support.industry.siemens.com/cs/ww/en/view/109481784) (PFD_{avg}/PFH) for safety-related communication no longer apply.

Information on installation guidelines for PROFINET and PROFIBUS can be found in:

- PROFIBUS Installation Guidelines (www.profibus.com/PBInstallationGuide)
- PROFIBUS Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profibus-interconnection-technology/display/)
- PROFINET Installation Guidelines (www.profibus.com/PNInstallationGuide)
- PROFINET Cabling and Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profinet-cabling-and-interconnection-technology/display/)
- PROFIsafe Environment Requirements (www.profibus.com/PROFIsafeRequirements)

When your review indicates that the configuration guidelines for PROFIBUS and PROFINET have been met, contact Customer Support.

12.2 Replacing Software and Hardware Components

Replacement of software components

When replacing software components on your programming device or PC, e.g. with a new version of *STEP 7*, you must adhere to the information regarding upward and downward compatibility in the documentation and readme files for these products (e.g. *STEP 7 Safety*).

When replacing *STEP 7 Safety*, check whether the version of *STEP 7 Safety* is listed in Annex 1 of the Report for the TÜV certificate.

Replacement of hardware components

Hardware components for SIMATIC Safety (F-CPU, F-I/O, batteries, etc.) are replaced in the same way as in standard automation systems.

Replacement of S7-1500 F software Controllers

⚠ WARNING

After replacing a CPU module (e.g. new PC with data storage medium of old PC) or replacement of the data storage medium (e.g. data storage medium with safety program 1 is replaced with data storage medium with safety program 2), you must use the Panel to check if the correct collective F-signature is displayed or whether a program identification is carried out. *(S066)*

Removing and inserting F-I/O during operation

If removing and inserting is possible for standard I/O during operation, it is also possible for the respective F-I/O. However, be aware that replacing an F-I/O module during operation can cause a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 135) or, alternatively, by using the "ACK_GL (Page 432)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

CPU firmware update

Check of the CPU operating system for F-approval: When using a new CPU operating system (firmware update), you must check to see if the CPU operating system you are using is approved for use in an F-system.

The minimum CPU operating system versions with guaranteed F-capability are specified in the appendix of the Certificate. This information and any notes on the new CPU operating system must be taken into account.

Firmware update for interface module

When using a new operating system for an interface module, e.g. IM 151-1 HIGH FEATURE ET 200S (firmware update), you must observe the following:

If you have selected the "Activate firmware after update" option for the firmware update (see *Help on STEP 7*, "Online & Diagnostics"), the IM will be automatically reset following a successful download operation and will then run on the new operating system. Note that the firmware update for interface modules during operation generates a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 135) or, alternatively, by using the "ACK_GL (Page 432)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

Preventive maintenance (proof test)

Proof test for complex electronic components generally means replacement with new, unused components.

PFD_{avg} and PFH values for S7-300/400 F-CPUs and F-I/O

You will find a list of the failure probability values (PFD_{avg}, PFH values) for components that can be used in SIMATIC Safety on the Internet.

PFD_{avg} and PFH values for S7-1200/1500 F-CPUs

Below are the probability of failure values (PFD_{avg}, PFH values) for S7-1200/1500 F-CPUs with a service life of 20 years and an MTTR of 100 hours:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 2E-05	< 1E-09

PFD_{avg} and PFH values for safety-related communication

Below you will find the failure probability values (PFD_{avg}, PFH values) for safety-related communication:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 1E-05*	< 1E-09*

*** Note on S7-300/400 F-CPUs:**
The PFH value is valid under the assumption that a maximum of 100 F-I/Os are involved in a safety function. If you use more than 100 F-I/Os, you have to also add 4E-12 per F-I/O for the safety function.
The PFD_{avg} value is valid for a service life of 20 years and under the assumption, that a maximum of 25 F-I/Os are involved in a safety function. If more than 25 F-I/OS are used, you need to add 3.5E-7 per F-I/O for this safety function.

12.3 Special features when creating and importing images of an S7-1500 F Software Controller

Creating an image

⚠ WARNING

You must comply with the following points when creating an image with a safety program:

- You must limit access to an S7-1500 F Software Controller through access protection to persons who are authorized to create images.
- Before creating the image, you must use program identification to ensure that the correct safety program is installed on the S7-1500 F Software Controller.
- Images with safety programs must be created on an empty data carrier (deleted or formatted) or an existing image must be explicitly deleted.
- After creating the image, remove the data carrier containing the image.
- Clearly label the data storage medium (e.g. with the collective F-signature). *(S073)*

NOTICE

If the safety program in the image and the old safety program on the S7-1500 F Software Controller are not identical, the imported safety program would not start. In this case, you must download the safety program to the F-CPU once again. For example, with the TIA Portal. Therefore, you should always keep your image backups up-to-date.

Import image

⚠ WARNING

You must comply with the following points when importing an image with a safety program:

- You must limit access to an S7-1500 F Software Controller through access protection to persons who are authorized to import images.
- When importing an image via LAN, remote access or comparable accesses, you have to ensure access protection (e.g. via Windows administrator permission (ADMIN)). Note, however, that only authorized persons are set up as users.
- To ensure that the images are written to the correct S7-1500 F software controller, when importing an image via LAN you must ensure that only one S7-1500 F software controller can be accessed. For example, by removing the physical connections and routing options to other S7-1500 F software controllers.
- You must ensure that the correct safety program is on the image, for example, through unique identification of the data storage medium.
- After importing the image, remove the image and copies thereof.
- After importing the image, you must use program identification to ensure, for example with the Panel, that the correct safety program is installed on the S7-1500 F software controller.*(S074)*

12.4 Guide to diagnostics (S7-300, S7-400)

Introduction

Here you find a compilation of diagnostic capabilities that can be evaluated for your system when an error occurs. Most of the diagnostic capabilities are the same as those in standard automation systems. The sequence of steps represents a recommendation.

Steps for evaluating diagnostic capabilities

The following table shows the steps you take to evaluate diagnostic capabilities.

Step	Procedure	Reference
1	**Evaluate LEDs on the hardware (F-CPU, F-I/O):** • BUSF LED on the F-CPU: Flashes when a communication error occurs on PROFIBUS DP/PROFINET IO; On if a programming error occurs when OB 85 and OB 121 are programmed (e.g. instance DB is not loaded) • STOP LED on the F-CPU: illuminates when the F-CPU is in STOP mode • Fault LEDs on the F-I/O: e.g. SF-LED (group error LED) on if any fault occurs in the individual F-I/O	*Manuals for F-CPU and F-I/O*
2	**Evaluate diagnostic buffer of the modules:** You read the diagnostic buffer of a module (F-CPU, F-I/O, CP) in its online and diagnostic view in the "Diagnostic buffer" group under the "Online & Diagnostics" folder.	*Help on STEP 7 and manuals for the F-CPU and F-I/O*
3	**Evaluate stacks of the F-CPU:** when the F-CPU is in STOP mode, read the following successively: • Block stack: Check whether STOP mode of the F-CPU was triggered by an F-block of the safety program • Interruption stack • Local data stack	*Help on STEP 7*

Step	Procedure	Reference
4	**Evaluate diagnostic tag of the F-I/O DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** Evaluate the DIAG tag in the F-I/O DB	F-I/O access (Page 128)
5	**Evaluate diagnostic outputs of the instance DBs of instructions using testing and commissioning functions, using an operator control and monitoring system, or in the standard user program:** • Evaluate the following for MUTING, EV1oo2DI, TWO_H_EN, MUT_P, ESTOP1, FDBACK, SFDOOR in the assigned instance DB: – Output DIAG • Evaluate the following for SENDDP or RCVDP in the assigned instance DB: – Output RET_DPRD/RET_DPWR – Output DIAG • Evaluate the following for SENDS7 or RCVS7 in the assigned instance DB: – Output STAT_RCV – Output STAT_SND – Output DIAG	Instructions

Tip on RET_DPRD/RET_DPWR

The diagnostic information of the RET_DPRD/RET_DPWR outputs of the SENDDP or RCVDP instructions corresponds to the diagnostic information of the RETVAL return value of the "DPRD_DAT" and "DPWR_DAT" instructions. You can find the description in the help on *STEP 7* for the "DPRD_DAT" and "DPWR_DAT" instructions.

Tip: STAT_RCV and STAT_SND

The diagnostic information of the STAT_RCV output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "URCV" instruction. The diagnostic information of the STAT_SND output of the SENDS7 or RCVS7 instructions corresponds to the diagnostic information of the STATUS output of the "USEND" instruction. You can find the description in the help on *STEP 7* for the instruction "UCRV" or "USEND" .

12.5 Guide to diagnostics (S7-1500)

Detailed information on diagnostics for an S7-1500 F-CPU can be found in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

12.6 Guide to diagnostics (S7-1200)

Detailed information on diagnostics for an S7-1200 F-CPU can be found in the S7-1200 Functional Safety manual (http://support.automation.siemens.com/WW/view/en/104547552).

STEP 7 Safety V14 instructions 13

Overview of instructions for the safety program

When programming an F-block, you can find all instructions available for programming an F-block in LAD or FBD with the configured F-CPU in the "Instructions" task card.

In addition to the instructions that are familiar to you from programming a standard block, there are also special safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP/emergency OFF, safety door monitoring, and feedback monitoring and instructions for safety-related CPU-CPU communication.

Note the following

Note

Preconnection of enable input EN or evaluation of enable output ENO is not possible.

13.1 General

13.1.1 LAD

13.1.1.1 New network (STEP 7 Safety V14)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an LAD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.1.1.2 Empty box (STEP 7 Safety V14)

Requirement

A network is available.

Procedure

To insert an LAD instruction into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the required instruction from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.1.1.3 Open branching (STEP 7 Safety V14)

Description

Use branches to program parallel connections with the Ladder Logic (LAD) programming language. Branches are inserted into the main current path. You can insert several contacts into the branch, thereby creating a parallel connection from series connections. You can program complex ladder diagrams in this way.

Requirement

- A network is available.
- The network contains elements.

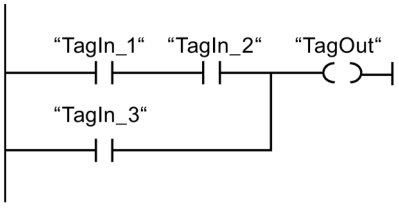
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Open branch".
3. Use a drag-and-drop operation to move the element to the desired place in the network.
4. If you want to connect the new branch directly to the power rail, drag the element to the power rail.

Example

The following figure provides an example of how to use branches:



13.1.1.4 Close branching (STEP 7 Safety V14)

Description

Branches must be closed again at suitable places. If necessary, branches will be arranged so that they do not cross each other.

Requirement

A branch is available.

Procedure

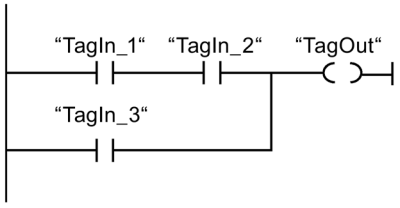
To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.

   A dashed line will appear as soon as the cursor is moved.
3. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
4. Release the left mouse button.

Example

The figure below provides an example of how to use branches:



13.1.2 FBD

13.1.2.1 New network (STEP 7 Safety V14)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an FBD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.1.2.2 Empty box (STEP 7 Safety V14)

Requirement

A network is available.

Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.1.2.3 Open branching (STEP 7 Safety V14)

Description

You use branches, which you insert between the boxes, to program parallel connections with the Function Block Diagram (FBD) programming language You can insert additional boxes in the branch, thereby programming complex function block diagrams.

Requirement

A network is available.

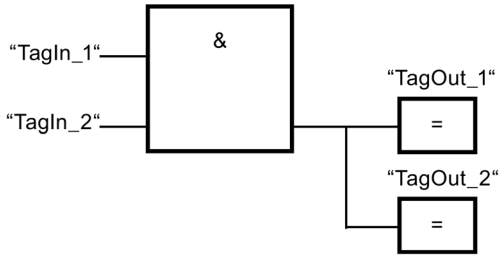
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate in the pane to "Basic instructions > General > Branch".
3. Use a drag-and-drop operation to move the element to the desired place to a connecting line between two boxes.

Example

The following figure provides an example of how to use branches:



13.1.2.4 Insert binary input (STEP 7 Safety V14)

Description

Use the "Insert binary input" instruction to expand the box of one of the following instructions by a binary input:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by expanding the instruction box.

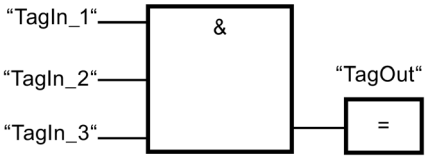
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



The box of instruction "AND logic operation" has been expanded by an additional binary input at which the signal state of operand "TagIn_3" is queried. Output "TagOut" is set when the signal state of operands "TagIn_1", "TagIn_2", and "TagIn_3" is "1".

See also

AND logic operation (STEP 7 Safety V14) (Page 356)

OR logic operation (STEP 7 Safety V14) (Page 357)

X: EXCLUSIVE OR logic operation (STEP 7 Safety V14) (Page 358)

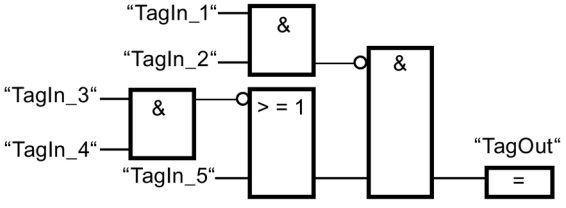
13.1.2.5 Invert RLO (STEP 7 Safety V14)

Description

You can use the "Invert RLO" instruction to invert the result of logic operation (RLO).

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Input "TagIn_1" or "TagIn_2" has signal state "0".
- Input "TagIn_3" or "TagIn_4" has the signal state "0" or input "TagIn_5" has the signal state "1".

13.2 Bit logic operations

13.2.1 LAD

13.2.1.1 ---| |---: NO contact (STEP 7 Safety V14)

Description

The activation of the normally open contact depends on the signal state of the associated operand. If the operand has signal state "1," the normally open contact is closed. Power flows from the left power rail through the normally open contact into the right power rail and the signal state at the output of the instruction is set to "1".

If the operand has signal state "0," the normally open contact is not activated. The power flow to the right power rail is interrupted and the signal state at the output of the instruction is reset to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

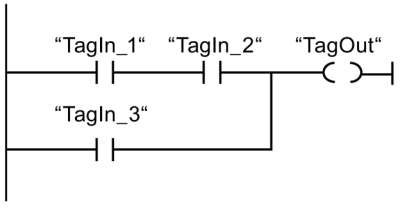
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "1".

13.2.1.2 ---| / |---: NC contact (STEP 7 Safety V14)

Description

The activation of the normally closed contact depends on the signal state of the associated operand. If the operand has signal state "1", the normally closed contact is opened and the signal state at the output of the instruction is reset to "0".

If the operand has signal state "0", the normally closed contact is not activated and the signal state at the output of the instruction is set to "1".

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

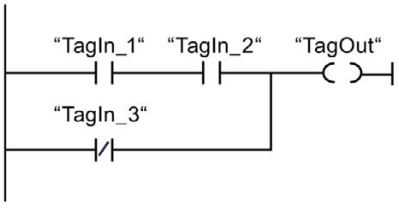
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

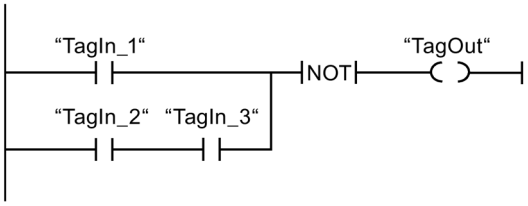
13.2.1.3 --|NOT|--: Invert RLO (STEP 7 Safety V14)

Description

You can use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). When the signal state is "1" at the input of the instruction, the output of the instruction has the signal state "0". When the signal state is "0" at the input of the instruction, the output has the signal state "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operands "TagIn_2" and "TagIn_3" have signal state "1".

13.2.1.4 ---( )---: Assignment (STEP 7 Safety V14)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. When the result of logic operation (RLO) at the input of the coil is "1," the specified operand is set to signal state "1". When the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent immediately to the output.

The "Assignment" instruction can be placed at any position in the network.

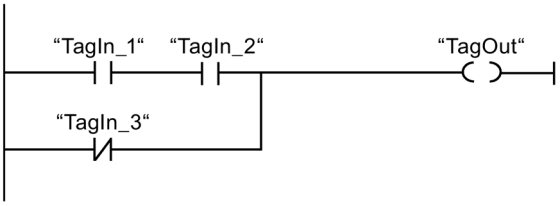
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

13.2.1.5 ---(R)---: Reset output (STEP 7 Safety V14)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If power flows to the coil (RLO is "1"), the specified operand is set to "0". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

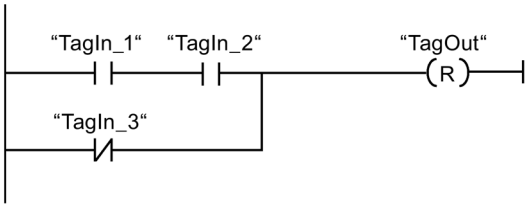
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.1.6 ---(S)---: Set output (STEP 7 Safety V14)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If power flows to the coil (RLO is "1"), the specified operand is set to "1". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

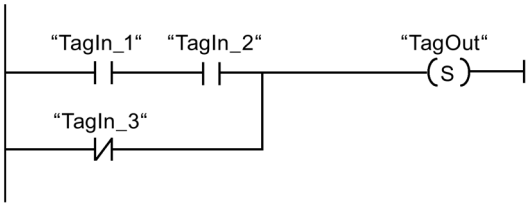
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.1.7 SR: Set/reset flip-flop (STEP 7 Safety V14)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

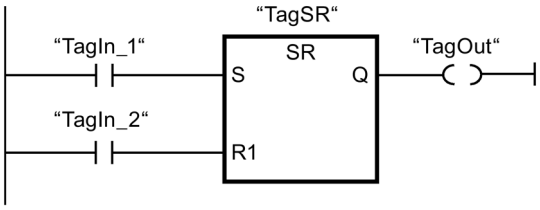
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.1.8 RS: Reset/set flip-flop (STEP 7 Safety V14)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

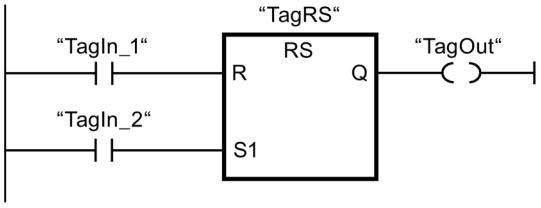
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.1.9 --|P|--: Scan operand for positive signal edge (STEP 7 Safety V14)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation so that the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

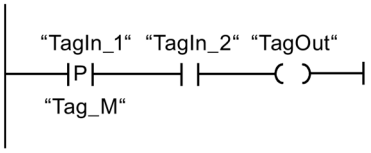
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1". The signal state of the previous query is saved at edge memory bit "Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.2.1.10 --|N|--: Scan operand for negative signal edge (STEP 7 Safety V14)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation so that the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

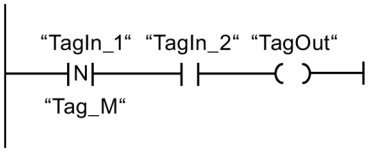
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at operand "TagIn_1". The signal state of the previous query is saved at edge memory bit "Tag_M".
- The signal state of operand "TagIn_2" is "1".

13.2.1.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V14)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation (RLO) with the signal state of the previous query, which is saved in the edge bit memory (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation so that the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

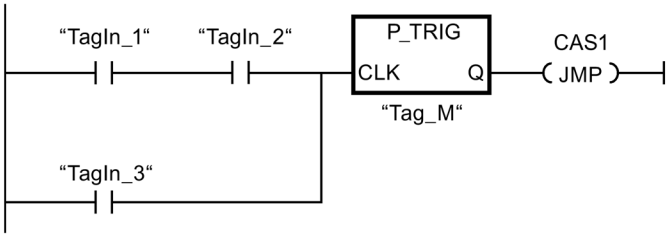
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit "Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.2.1.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V14)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation so that the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

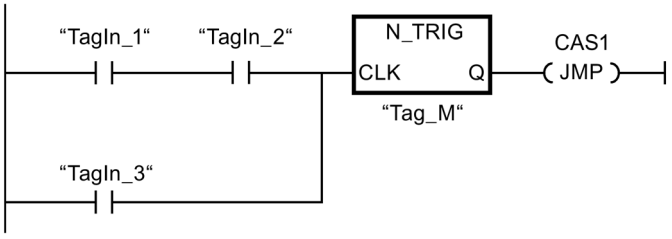
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory "Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.2.2 FBD

13.2.2.1 AND logic operation (STEP 7 Safety V14)

Description

You can use the "AND logic operation" instruction to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "AND logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "AND logic operation" instruction that is not the first instruction in the logic string logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the AND truth table.

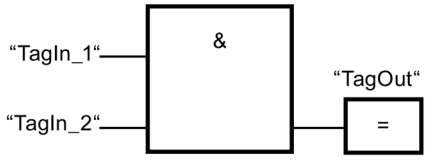
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of operands "TagIn_1" and "TagIn_2" is "1".

AND truth table

The following table shows the results when linking two operands by an AND logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	1	1
0	1	0
1	0	0
0	0	0

See also

Insert binary input (STEP 7 Safety V14) (Page 340)

13.2.2.2 OR logic operation (STEP 7 Safety V14)

Description

You can use the "OR logic operation" instruction to get the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of at least one of the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of all of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "OR logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "OR logic operation" instruction that is not the first instruction in the logic string, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the OR truth table.

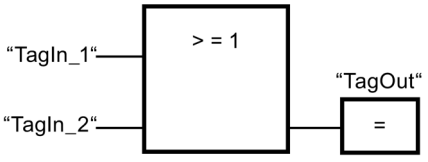
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of operand "TagIn_1" or "TagIn_2" is "1".

OR truth table

The following table shows the results when linking two operands by an OR logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	1
0	0	0

See also

Insert binary input (STEP 7 Safety V14) (Page 340)

13.2.2.3 X: EXCLUSIVE OR logic operation (STEP 7 Safety V14)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to get the result of a signal state query according to the the EXCLUSIVE OR truth table.

With an "EXCLUSIVE OR logic operation" instruction, the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the overall result of logic operation is "1" if an odd-numbered quantity of queried operands returns the result "1".

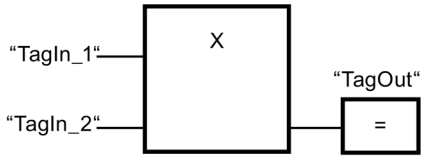
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of one of the two operands "TagIn_1" and "TagIn_2" is "1". When both operands have signal state "1" or "0" then output "TagOut" is reset.

EXCLUSIVE OR truth table

The following table shows the results when two operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	0
0	0	0

The following table shows the results when three operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Signal state of the third operand	Result of logic operation
1	0	0	1
0	1	1	0
0	1	0	1
1	0	1	0
0	0	1	1
1	1	0	0
1	1	1	1
0	0	0	0

See also

Insert binary input (STEP 7 Safety V14) (Page 340)

13.2.2.4 =: Assignment (STEP 7 Safety V14)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand located above the Assign box.

The "Assignment" instruction can be placed at any position in the logic operation sequence.

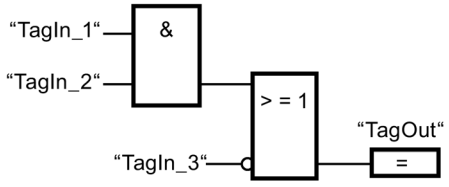
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut" at the output of the "Assignment" instruction is set when one of the following conditions is fulfilled:

- Inputs "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at input "TagIn_3" is "0".

13.2.2.5 R: Reset output (STEP 7 Safety V14)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is reset to "0". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

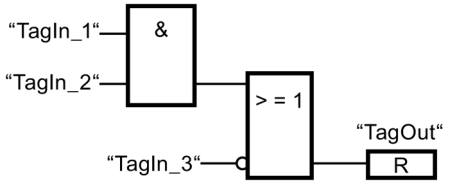
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.6 S: Set output (STEP 7 Safety V14)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to "1". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

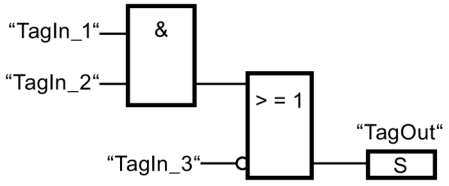
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.7 SR: Set/reset flip-flop (STEP 7 Safety V14)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

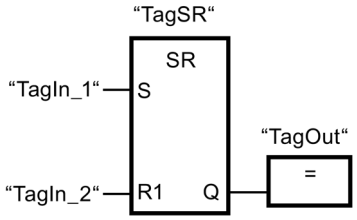
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable set
R1	Input	BOOL	Enable reset
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.8 RS: Reset/set flip-flop (STEP 7 Safety V14)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

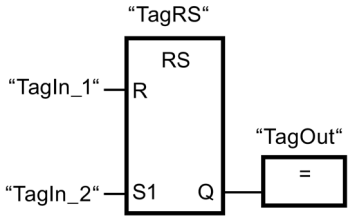
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable reset
S1	Input	BOOL	Enable set
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.9 P: Scan operand for positive signal edge (STEP 7 Safety V14)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

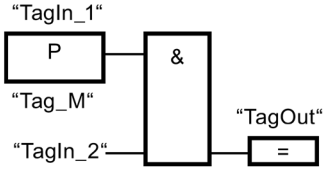
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



"TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.2.2.10 N: Scan operand for negative signal edge (STEP 7 Safety V14)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

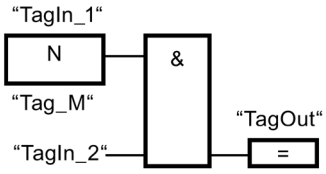
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.2.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V14)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

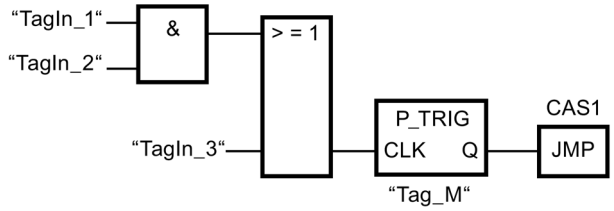
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit "Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.2.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V14)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

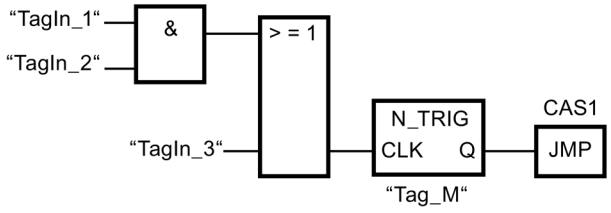
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory "Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.3 Safety functions

13.3.1 ESTOP1: Emergency STOP/OFF up to stop category 1 (STEP 7 Safety V14)

Description

This instruction implements an emergency STOP/emergency OFF shutdown with acknowledgment for Stop Categories 0 and 1.

Enable signal Q is reset to 0, as soon as input E_STOP takes a signal state of 0 (Stop category 0). Enable signal Q_DELAY is reset to 0 after the time delay set at input TIME_DEL (Stop Category 1).

Enable signal Q is reset to 1 not before input E_STOP takes a signal state of 1 and an acknowledgment occurs. The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets output ACK_REQ to 1, as soon as input E_STOP = 1.

Following an acknowledgment, the instruction resets ACK_REQ to 0.

Every call of the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ESTOP1_DB_1) or a multi-instance (e.g., ESTOP1_Instance_1) for the "Emergency STOP/Emergency OFF up to Stop Category 1" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note: In case of two channels according to category 3,4 of ISO 13849-1:2015 or EN ISO 13849-1:2015, the discrepancy monitoring of the two NC contacts of the EMERGENCY STOP/EMERGENCY OFF must already take place in the F-I/O. The F-I/O has to be configured accordingly (sensor evaluation: two-channel, equivalent), and the result of the evaluation interconnected with the E_STOP input. In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
E_STOP	Input	BOOL	EMERGENCY STOP/EMERGENCY OFF
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	1=Acknowledgment
TIME_DEL	Input	TIME	Time delay
Q	Output	BOOL	1=Enable
Q_DELAY	Output	BOOL	Enable is OFF delayed
ACK_REQ	Output	BOOL	1=Acknowledgment necessary
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	-—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	o	o	
1.5	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After an F-system startup, when ACK_NEC = 1, you must acknowledge the instruction using a rising edge at input ACK.

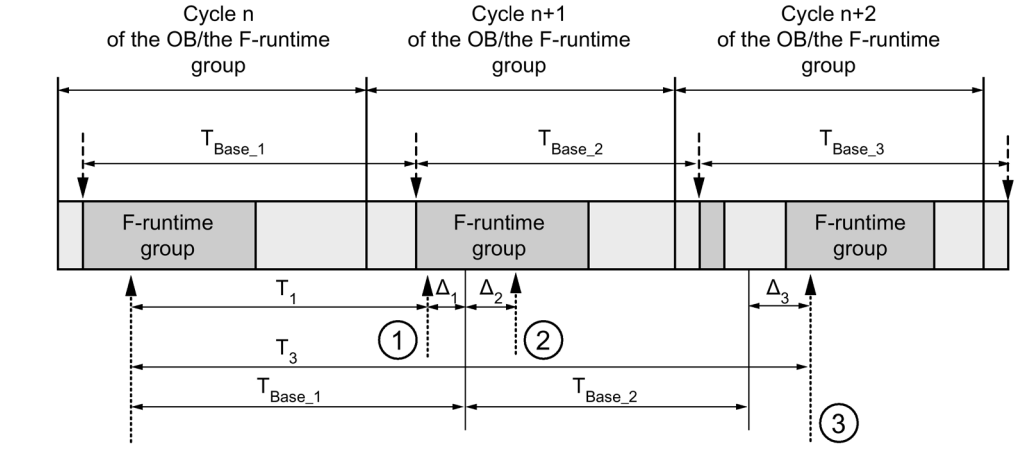
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 1 to 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect TIM_DEL setting	Time delay setting < 0	Set time delay > 0
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Acknowledgment not possible because emergency STOP/emergency OFF is still active	Emergency STOP/Emergency OFF pushbutton is locked	Release Emergency STOP/Emergency OFF pushbutton
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of emergency STOP/emergency OFF pushbutton	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
		Emergency STOP/Emergency OFF pushbutton is defective	Check emergency STOP/emergency OFF pushbutton
		Wiring fault	Check wiring of the emergency STOP/emergency OFF pushbutton
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



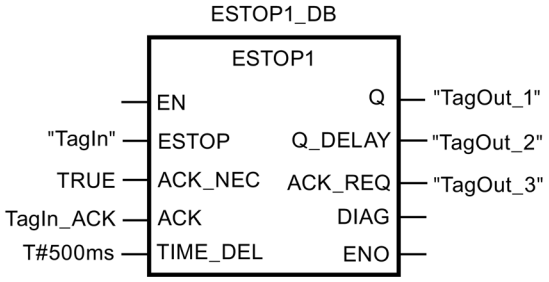
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

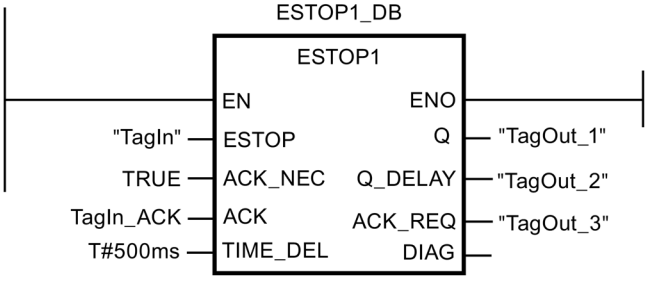
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

This instruction implements two-hand monitoring.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Two-hand monitoring with enable". The application "Two-hand monitoring with enable" replaces the instruction "Two-hand monitoring" with compatible functions.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN2 = 0). Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time. Enable signal Q can never be set to 1 if the discrepancy time is set to values less than 0 or greater than 500 ms.

Every call of the "Two-hand monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_HAND_DB_1) or a multi-instance (e.g., TWO_HAND_Instance_1) for the "Two-hand monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration. If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 is set in the relevant F-I/O DB. (See also F-I/O access (Page 128))

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

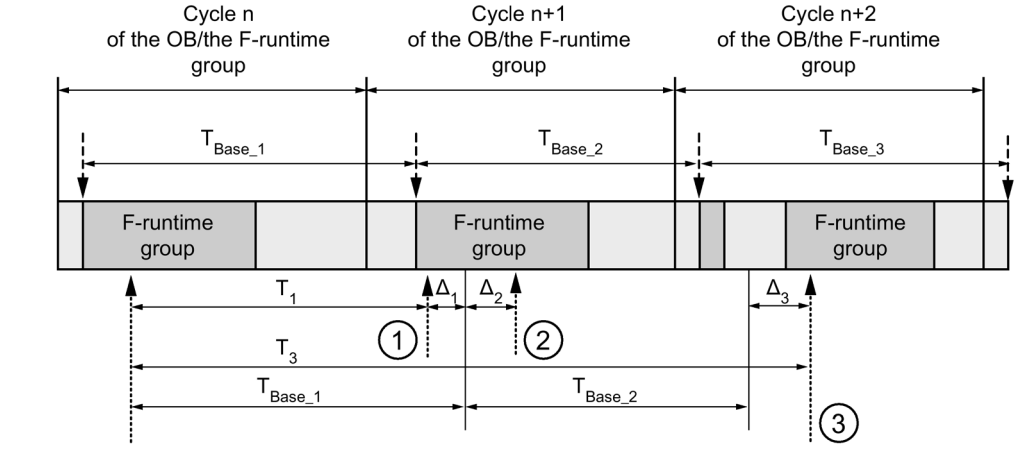
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

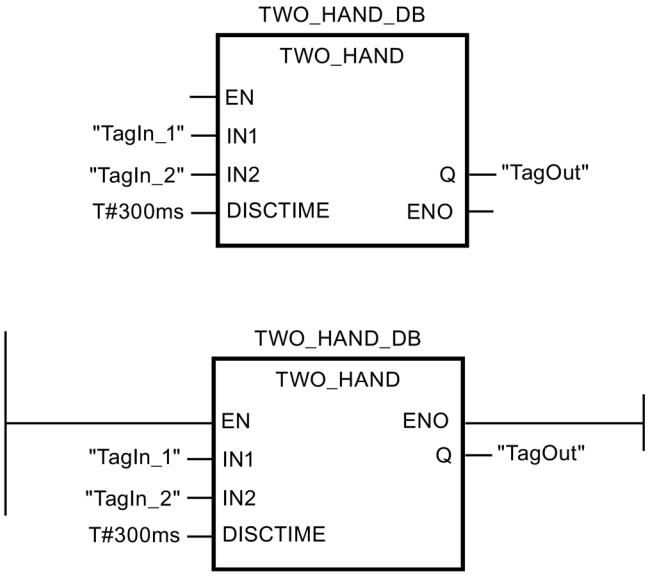
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.3.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V14)

Description

This instruction implements two-hand monitoring with enable.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1 when existing ENABLE = 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN 2 = 0) or ENABLE = 0. Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time when existing ENABLE = 1.

Every call of the "Two-hand monitoring with enable" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_H_EN_DB_1) or a multi-instance (e.g., TWO_H_EN_Instance_1) for the "Two-hand monitoring with enable" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (sensor evaluation: 1oo2 evaluation, non-equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

If a discrepancy is detected, a fail-safe value of 0 is entered in the process image input (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
ENABLE	Input	BOOL	Enable input
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

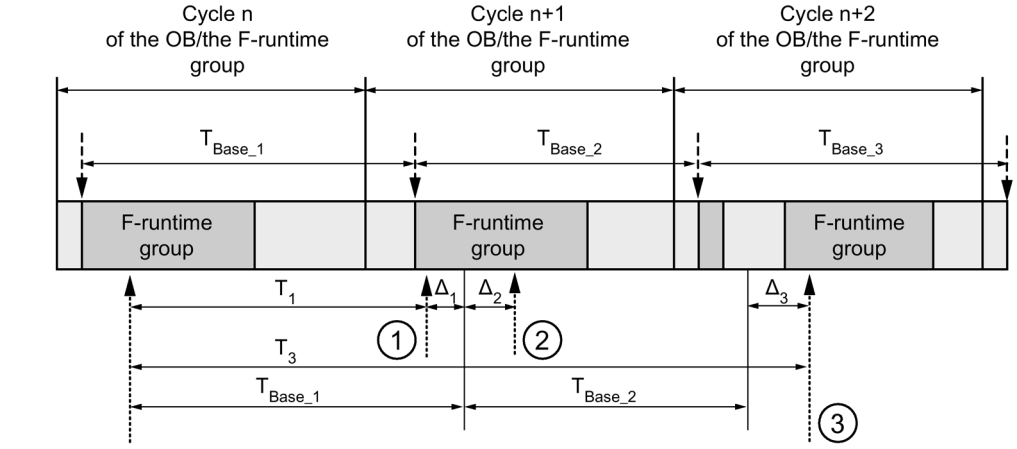
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 5 are saved until the cause of the error has been eliminated.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect discrepancy time DISCTIME setting	Discrepancy time setting is <0 or > 500 ms	Set discrepancy time in range of 0 to 500 ms
Bit 1	Discrepancy time elapsed	Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Pushbuttons were not activated within the discrepancy time	Release pushbuttons and activate them within the discrepancy time
		Wiring fault	Check wiring of pushbuttons
		Pushbuttons defective	Check pushbuttons
		Pushbuttons are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Incorrect activation sequence	One pushbutton was not released	Release pushbuttons and activate them within the discrepancy time
		Pushbuttons defective	Check pushbuttons
Bit 5	ENABLE does not exist	ENABLE = 0	Set ENABLE = 1, release pushbutton and activate it within the discrepancy time
Bit 6	Reserved	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

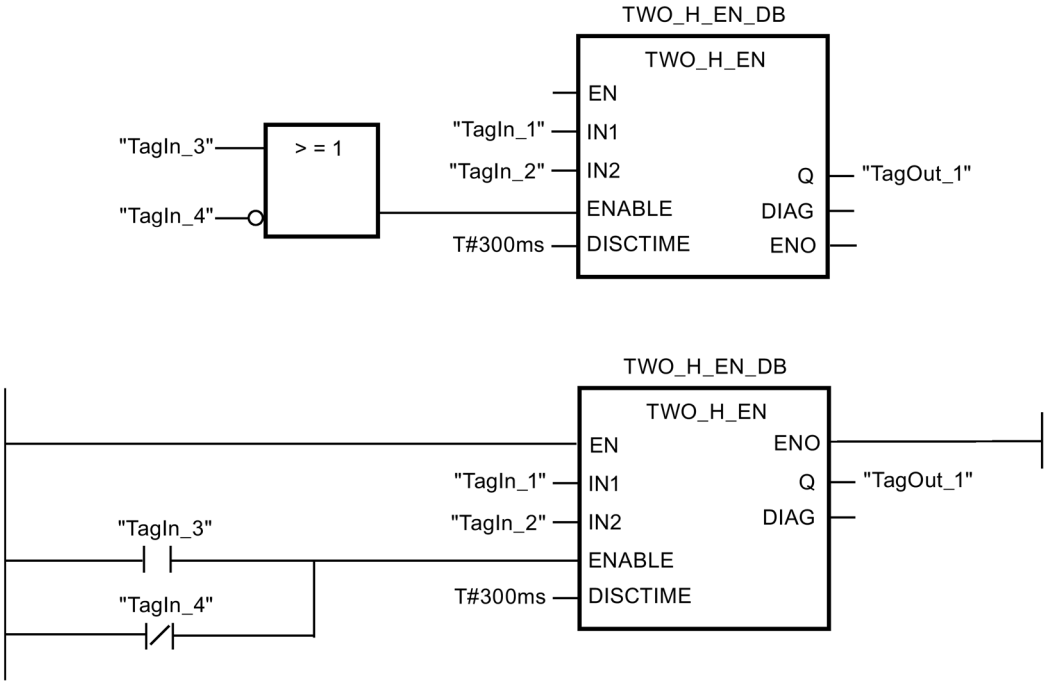
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.3.4 MUTING: Muting (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

This instruction performs parallel muting with two or four muting sensors.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Parallel muting (Page 399)". The instruction "Parallel muting" replaces the instruction "Muting" with compatible functions.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUTING_DB_1) or a multi-instance (e.g., MUTING_Instance_1) for the "Muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

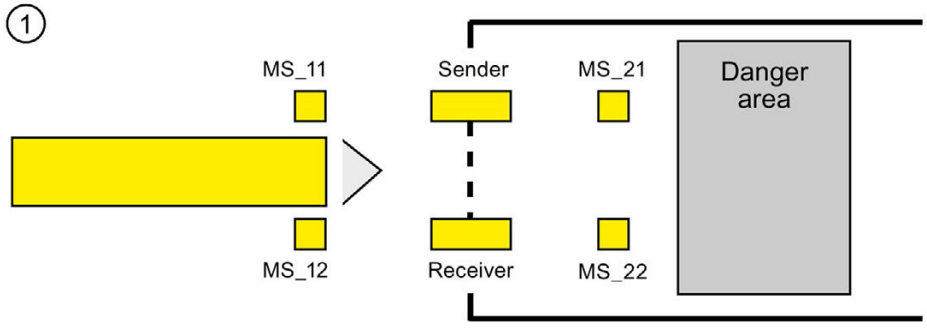
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 1 of sensor pair 1
MS_12	Input	BOOL	Muting sensor 2 of sensor pair 1
MS_21	Input	BOOL	Muting sensor 1 of sensor pair 2
MS_22	Input	BOOL	Muting sensor 2 of sensor pair 2
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal of the muting lamp channel
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
ACK	Input	BOOL	Acknowledgment of restart inhibit
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	BYTE	Non-fail safe service information

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)



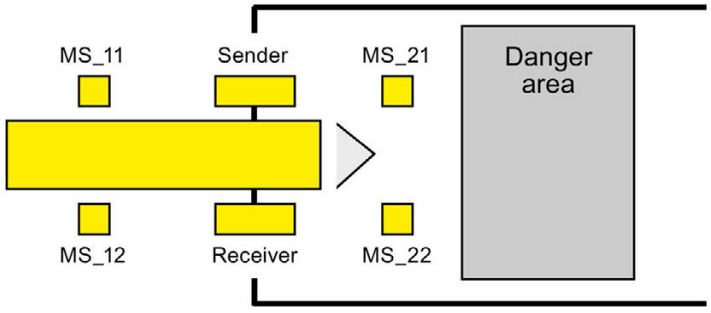
- If both muting sensors MS_11 and MS_12 are activated by the product within DISCTIM1 (apply signal state = 1), the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

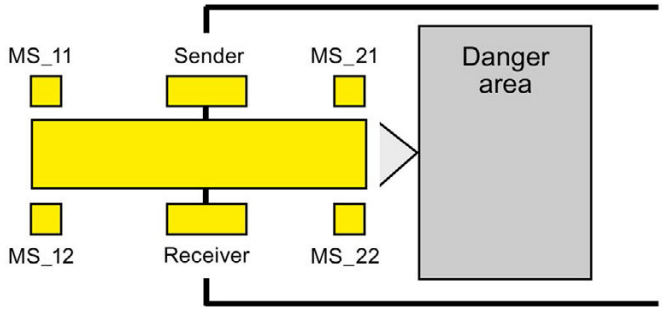
F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).

②



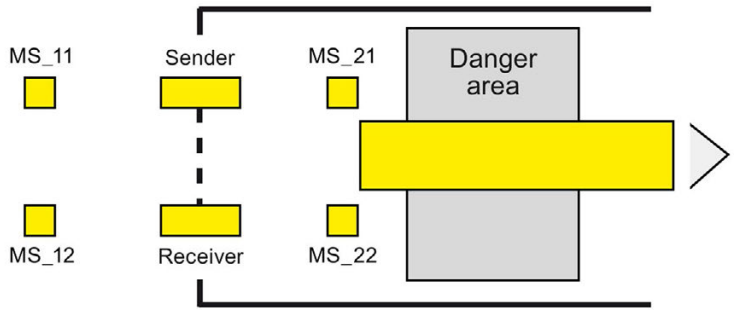
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop).

③



- The two muting sensors MS_21 and MS_22 must be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

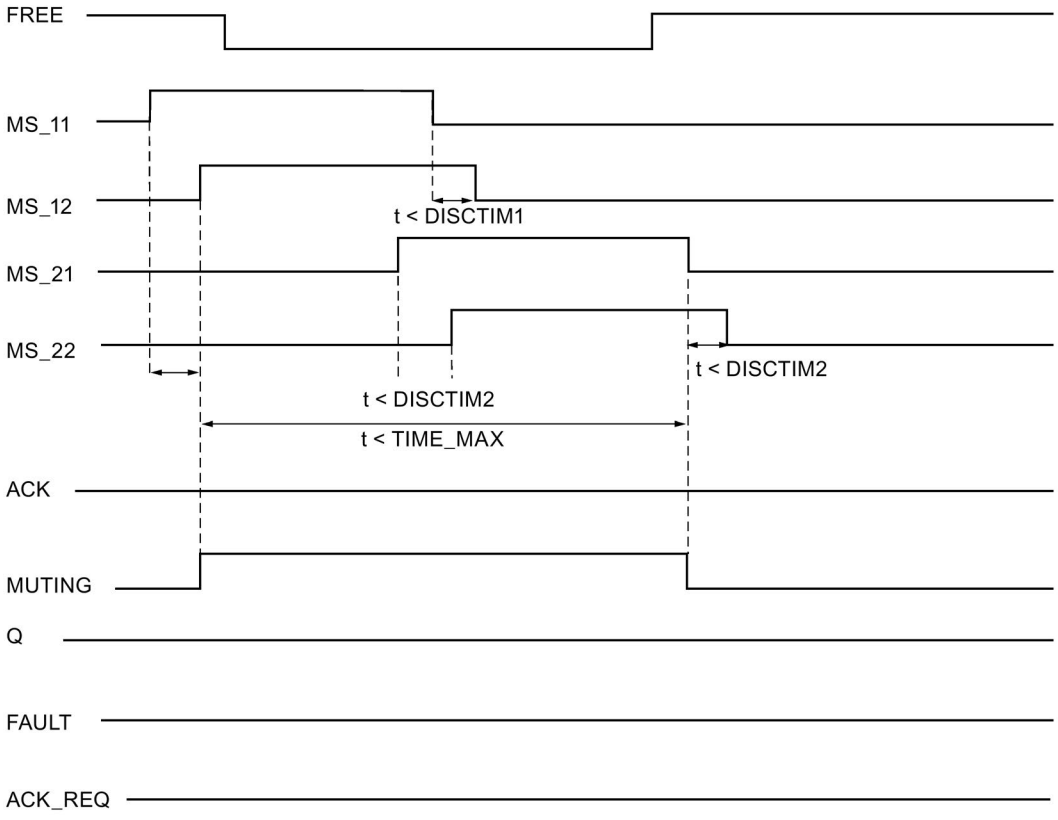


- Only if one of the two muting sensors MS_21 and MS_22 is switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

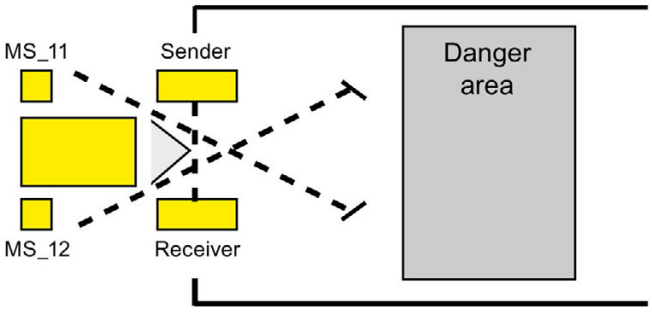


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (if MUTING is not active), when errors occur, and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- The muting lamp monitoring function responds at input QBAD_MUT
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

WARNING

When a valid combination of muting sensors is immediately detected at startup of the F-system (for example, because the muting sensors are interconnected to inputs of a standard I/O that immediately provide process values during the F-system startup), the MUTING function is immediately started and the MUTING output and enable signal Q are set to 1. The FAULT output (group error) is not set to 1 (no restart inhibit!). *(S035)*

Acknowledgment of restart inhibit

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)

  and

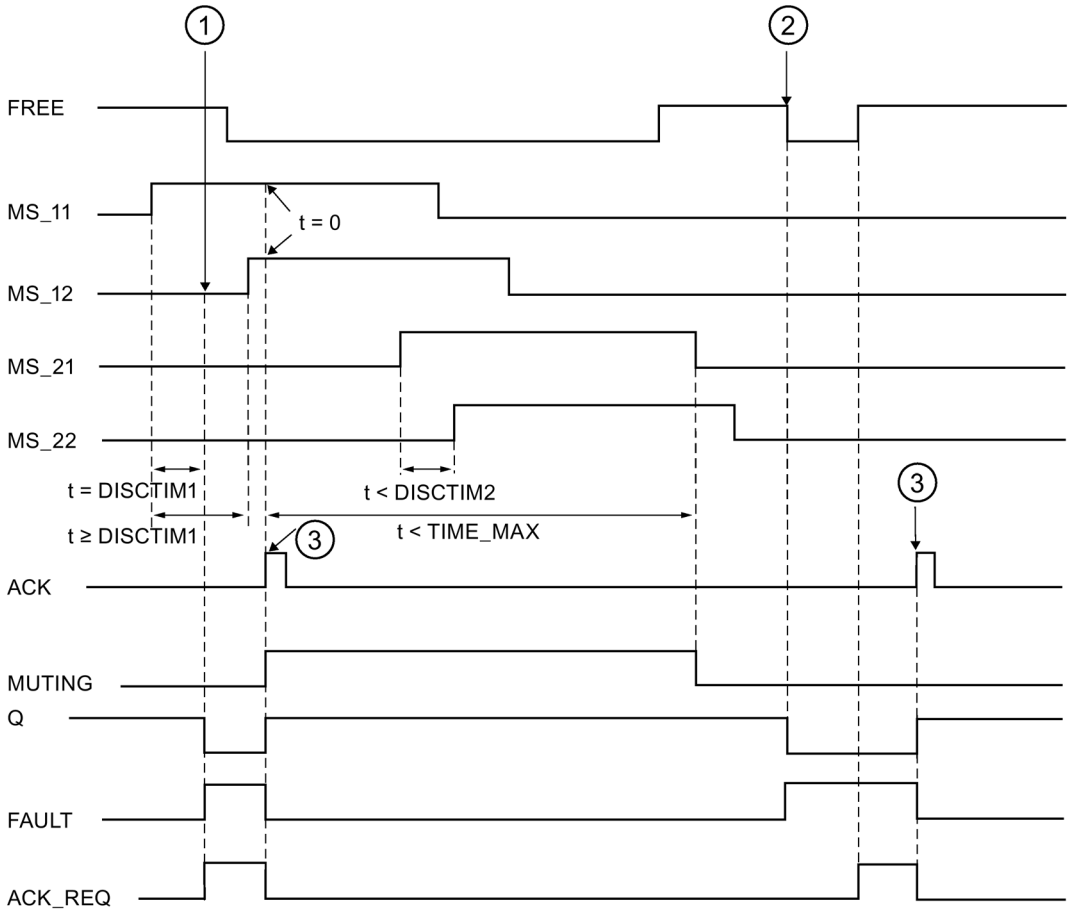
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 156)).

The FAULT output is set to 0. Output ACK_REQ = 1 signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK-REQ = 1 as soon as the light curtain is no longer interrupted or errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

Note

Following discrepancy errors and once the maximum muting time has been exceeded, ACK_REQ is immediately set to 1. As soon as a user acknowledgment has taken place at input ACK, discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (if MUTING is not active)



① Sensor pair 1 (MS_11 and MS_12) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though the MUTING function is not active.

③ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

you must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

When STOP = 1, the discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the error is not detected and the MUTING function can be started unintentionally. *(S036)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time

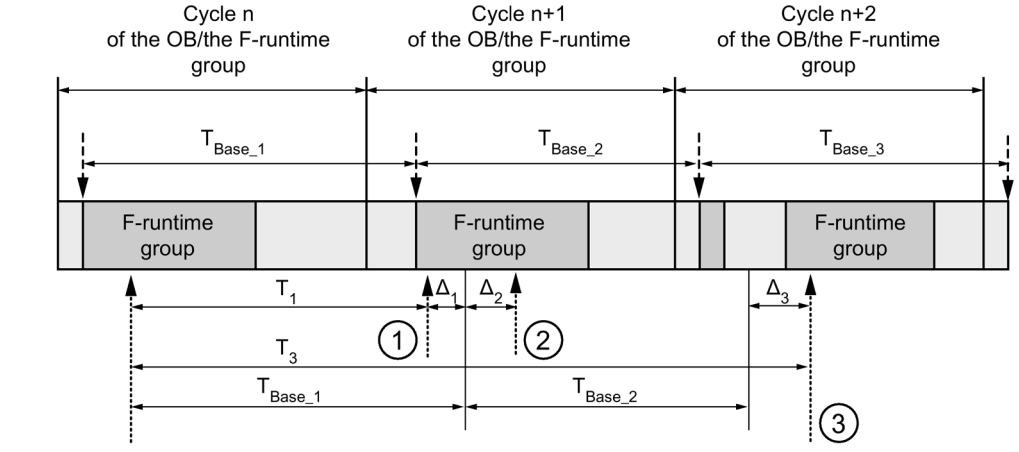
Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

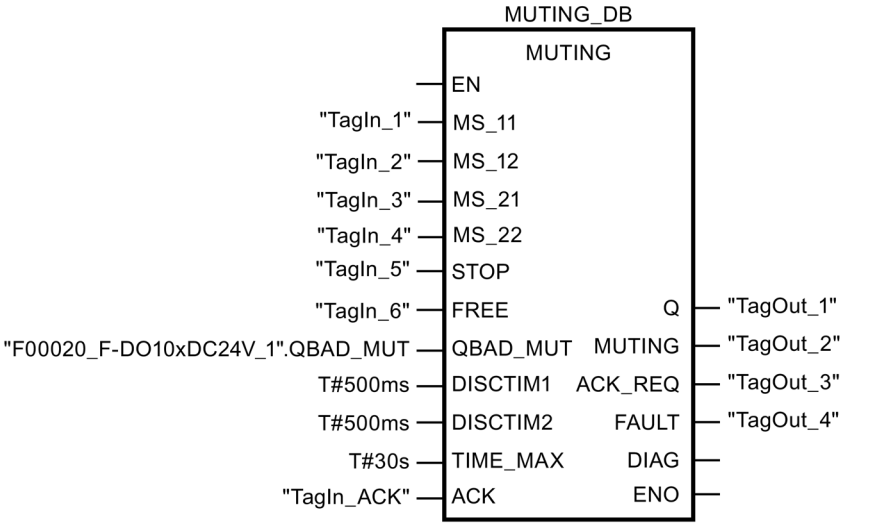
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

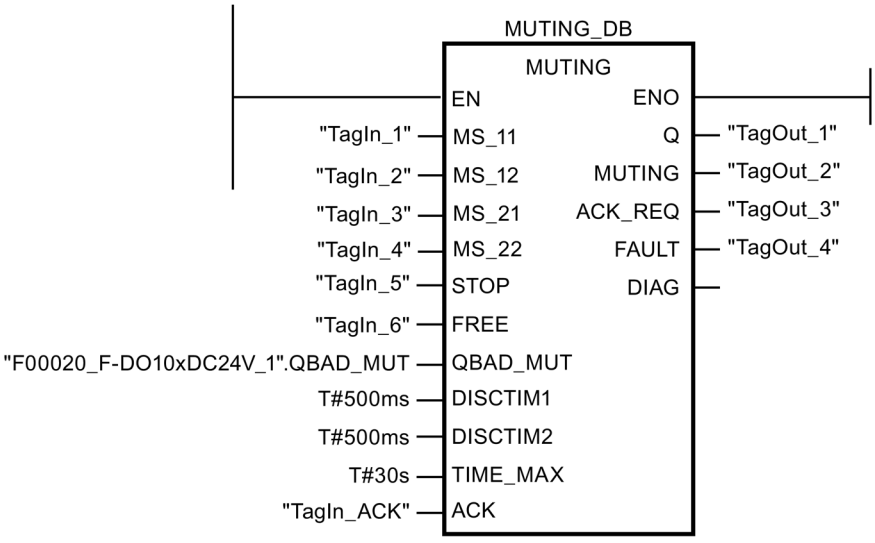
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.5 MUT_P: Parallel muting (STEP 7 Safety V14)

Description

This instruction performs parallel muting with two or four muting sensors.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Parallel muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUT_P_DB_1) or a multi-instance (e.g., MUT_P_Instance_1) for the "Parallel muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 11
MS_12	Input	BOOL	Muting sensor 12
MS_21	Input	BOOL	Muting sensor 21
MS_22	Input	BOOL	Muting sensor 22
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
ENABLE	Input	BOOL	1=Enable MUTING
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the muting lamp channel
ACK	Input	BOOL	Acknowledgment of restart inhibit
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	WORD	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x*	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x*	—	—	These versions have identical functions to version V1.0. The output DIAG can now be correctly interconnected with the operand of data type WORD.
1.2	x*	—	o	
1.3	x*	o	o	
1.4	x	x	x	

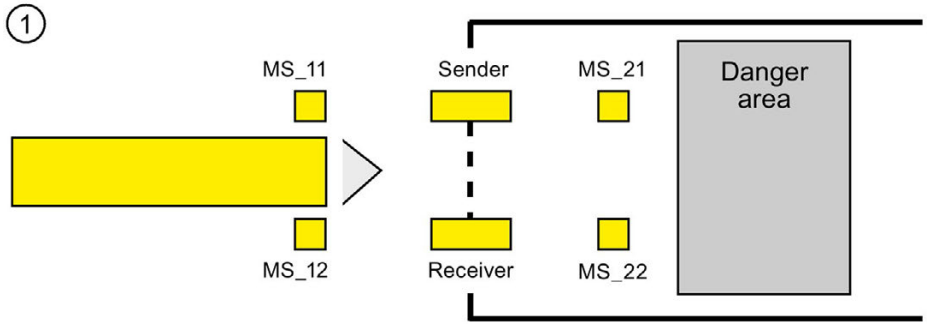
o This version is no longer supported.

* S7-300/400: When a restart inhibit (output FAULT = 1) and ENABLE = 1 is present, output ACK_REQ is set to 1 even if not at least one muting sensor is activated. Use the DIAG bits 5 and 6 for additional information.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

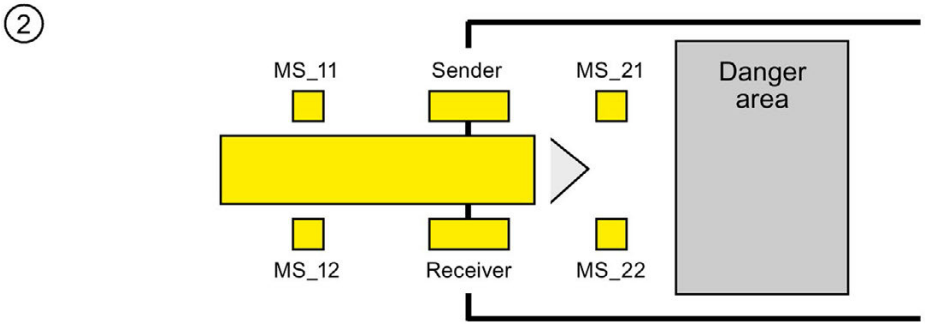


- If muting sensors MS_11 and MS_12 are both activated by the product within DISCTIM1 (apply signal state = 1) and MUTING is enabled by setting the ENABLE input to 1, the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

  Note

  The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / with inverted value statues of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

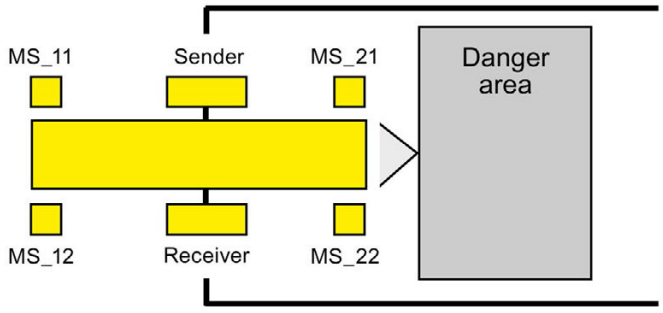
  F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop). Each of

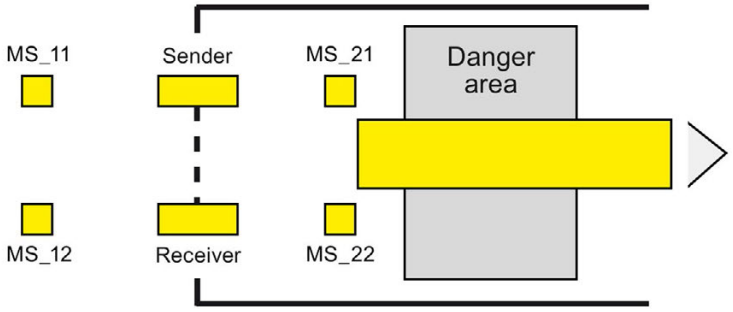
the two muting sensors MS_11 and MS_12 may be switched to inactive (t < DISCTIM1) for a short time (apply signal state 0).

③



- Muting sensors MS_21 and MS_22 must both be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

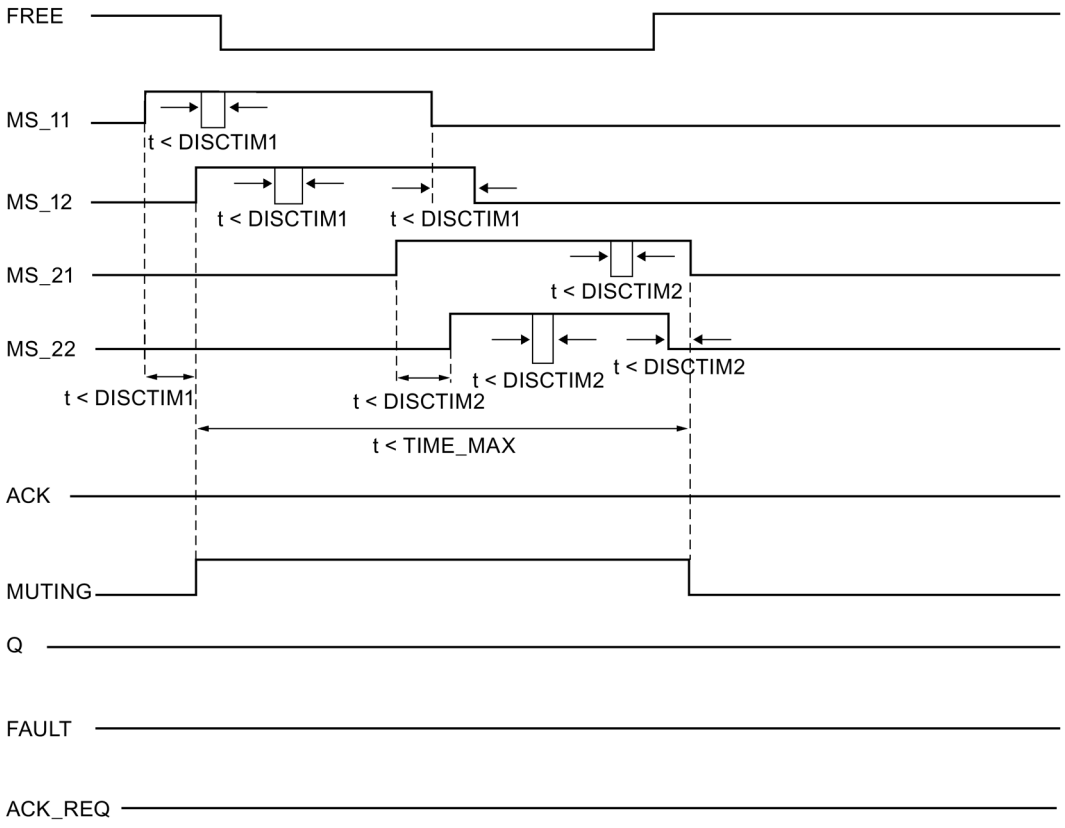


Only if muting sensors MS_21 and MS_22 are both switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

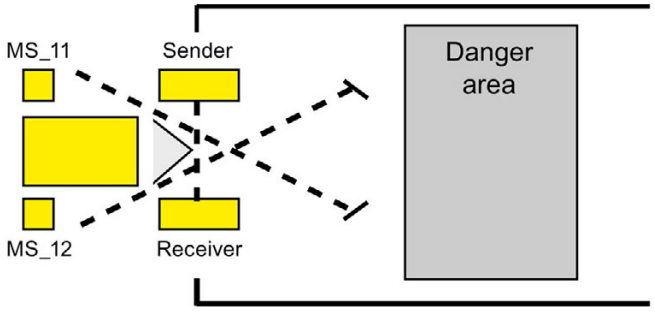


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (MUTING is not active), as well as when errors occur and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- Light curtain is (being) interrupted and the muting lamp monitoring at input QBAD_MUT is set to 1
- Light curtain is (being) interrupted and the MUTING function is not enabled by setting input ENABLE to 1
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min
- The F-system starts up (regardless of whether or not the light curtain is interrupted, because the F-I/O is passivated after F-system startup and, thus, the FREE input is initially supplied with 0)

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

User acknowledgment of restart inhibit (no muting sensor is activated or ENABLE = 0)

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- If present, errors are eliminated (see output DIAG)

  and

- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 156)).

The FAULT output is set to 0. Output ACK_REQ = 1 (and DIAG bit 6) signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

User Acknowledgment of restart inhibit (at least one muting sensor is activated and ENABLE = 1)

Enable signal Q becomes 1 again, when:

- If present, errors are eliminated (see output DIAG)
- FREE occurs until a valid combination of muting sensors is detected

The FAULT output is set to 0. The MUTING function is restarted, if necessary, and the MUTING output becomes 1 if a valid combination of muting sensors is detected. When ENABLE = 1, output ACK_REQ = 1 (and DIAG bit 5) signals that FREE is necessary for error elimination and for removal of the restart inhibit.*After successful FREE, ACK_REQ is reset to 0 by the instruction.

Note

Once the maximum muting time is exceeded, TIME_MAX is reset as soon as the MUTING function is restarted.

FREE function

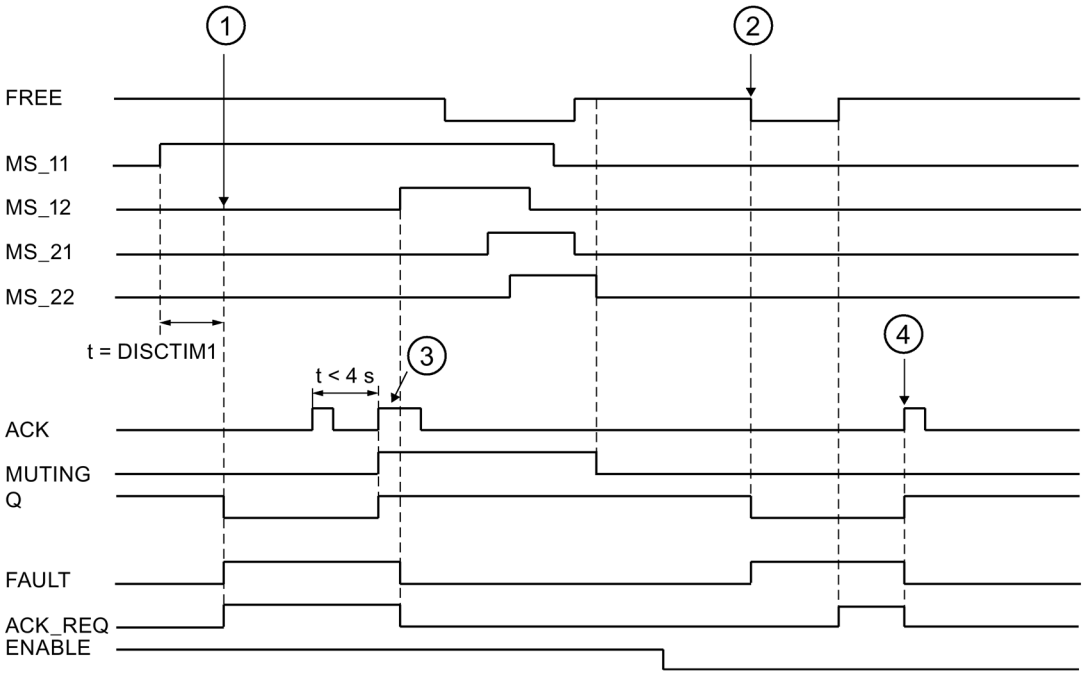
If an error cannot be corrected immediately, the FREE function can be used to free the muting range. Enable signal Q and output MUTING =1 temporarily. The FREE function can be used if:

- ENABLE = 1
- At least one muting sensor is activated
- A user acknowledgment with rising edge at input ACK occurs twice within 4 s, and the second user acknowledgment at input ACK remains at a signal state of 1 (acknowledgment button remains activated)

⚠ WARNING

When using the FREE function, the action must be observed. A dangerous situation must be able to be interrupted at any time by releasing the acknowledgment button. The acknowledgment button must be mounted in such a way the entire danger area can be observed. *(S037)*

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (MUTING is not active)



① Sensor pair 1 (MS_11 and MS_22) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though there is no enable (ENABLE=0)

③ FREE function

④ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

When STOP = 1 or ENABLE = 0, discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the fault is not detected and the MUTING function can be started unintentionally (when ENABLE =1). *(S038)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 6 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	ENABLE = 0	Set ENABLE = 1
		Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
		Startup of F-system	For FREE, see DIAG Bit 5
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)

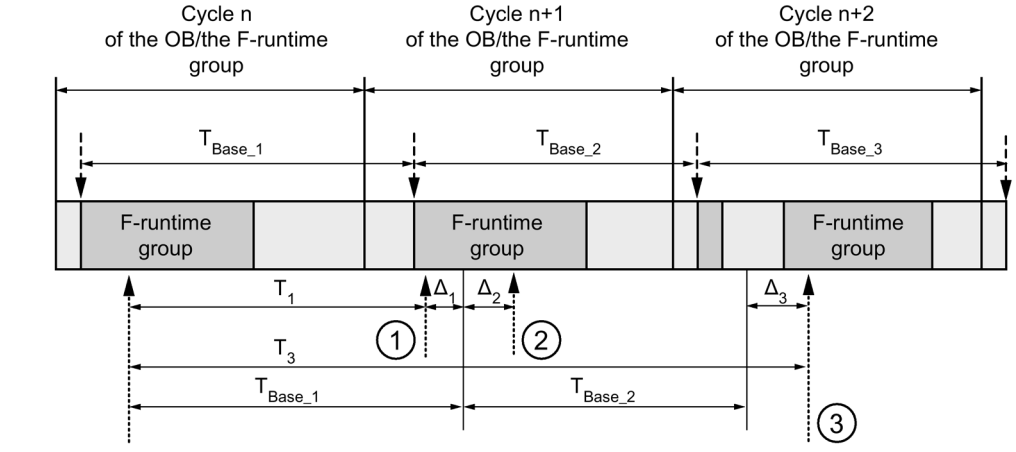
Bit 15	Reserved	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

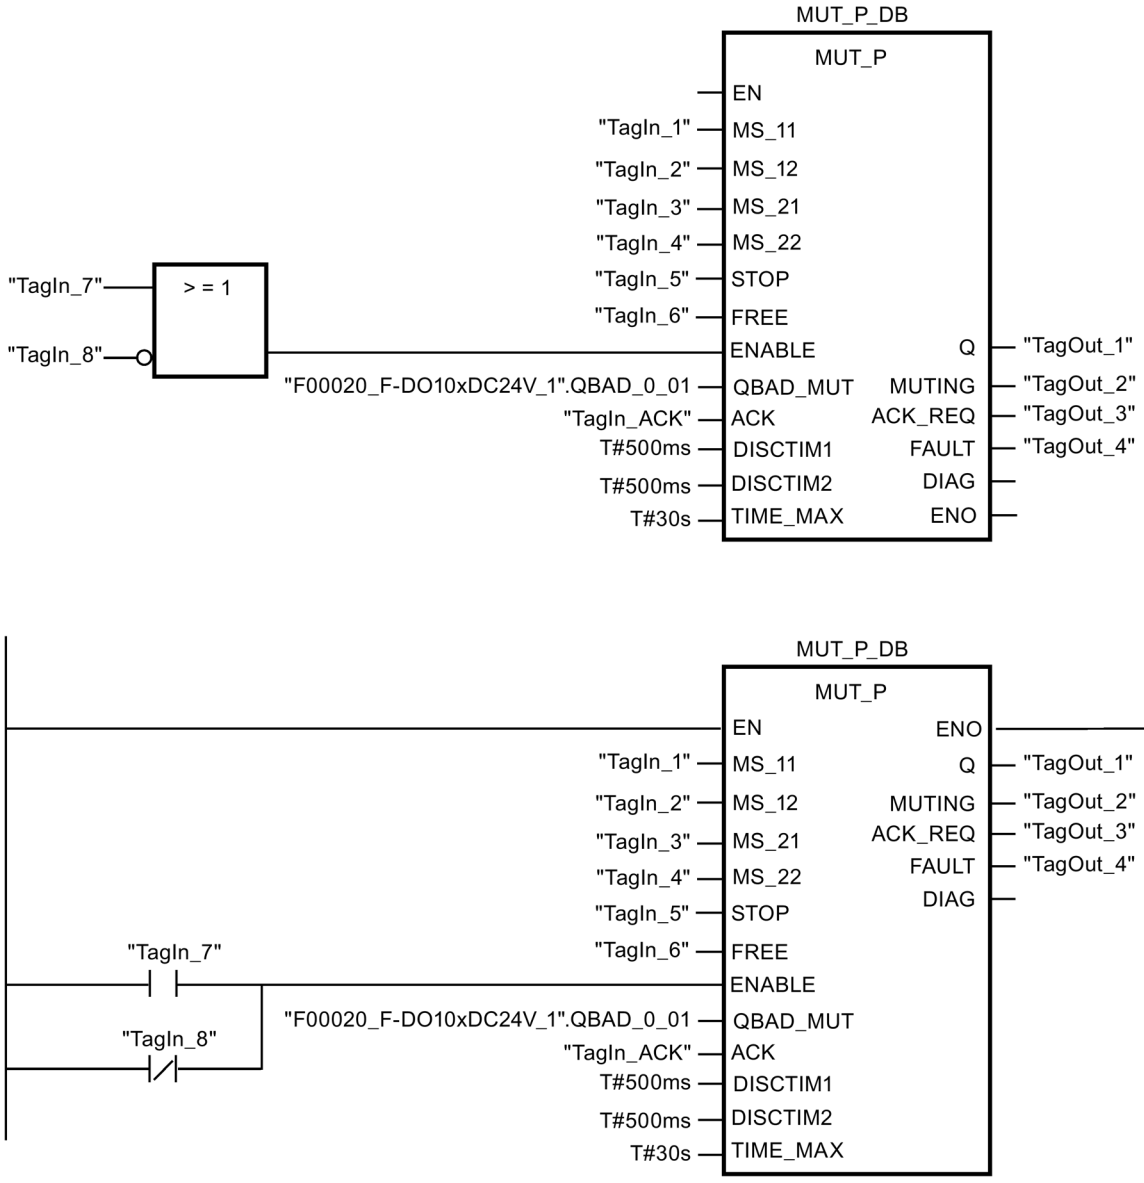
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.3.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V14)

Description

This instruction implements a 1oo2 evaluation of two single-channel sensors combined with a discrepancy analysis.

Output Q is set to 1, if the signal states of inputs IN1 and IN2 both equal 1 and no discrepancy error DISC_FLT is stored. if the signal state of one or both inputs is 0, output Q is set to 0.

As soon as the signal states of inputs IN1 and IN2 are different, the discrepancy time DISCTIME is started. If the signal states of the two inputs are still different once the discrepancy time expires, a discrepancy error is detected and DISC_FLT is set to 1 (restart inhibit).

If the discrepancy between inputs IN1 and IN2 is no longer detected, the discrepancy error is acknowledged according to the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK to acknowledge the discrepancy error.

The output ACK_REQ = 1 signals that a user acknowledgment at input ACK is necessary to acknowledge the discrepancy error (cancel the restart inhibit). The instruction sets ACK_REQ = 1 as soon as discrepancy is no longer detected. After acknowledgment or if, prior to acknowledgment, there is once again a discrepancy between inputs IN1 and IN2, the instruction resets ACK_REQ to 0.

Output Q can never be set to 1 if the discrepancy time setting is < 0 or > 60 s. In this case, output DISC_FLT is also set to 1 (restart inhibit). The call interval of the safety program (e.g., OB 35) must be less than the discrepancy time setting.

Every call of the "1oo2 evaluation with discrepancy analysis" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., EV1oo2DI_DB_1) or a multi-instance (e.g., EV1oo2DI_Instance_1) for the "1oo2 evaluation with discrepancy analysis" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Sensor 1
IN2	Input	BOOL	Sensor 2
DISCTIME	Input	TIME	Discrepancy time (0 to 60 s)
ACK_NEC	Input	BOOL	1 = acknowledgment necessary for discrepancy error
ACK	Input	BOOL	Acknowledgment of discrepancy error
Q	Output	BOOL	Output
ACK_REQ	Output	BOOL	1 = acknowledgment required
DISC_FLT	Output	BOOL	1 = discrepancy error
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

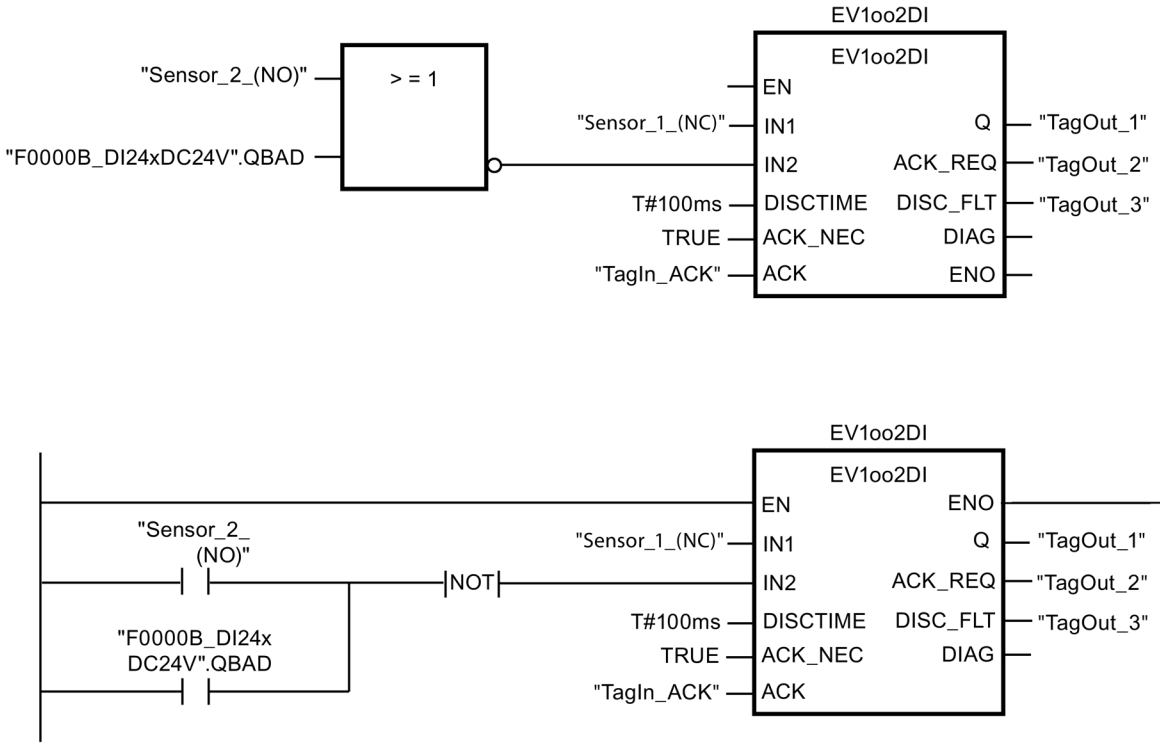
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Activating inputs IN1 and IN2

Inputs IN1 and IN2 must both be activated in such a way that their safe state is 0.

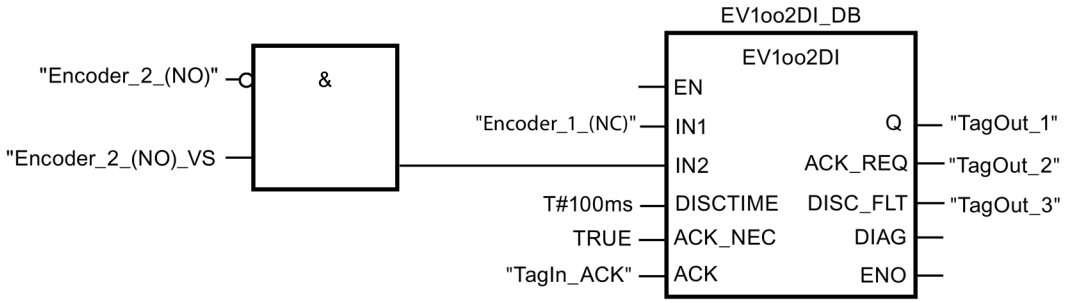
Example with QBAD or QBAD_I_xx signal

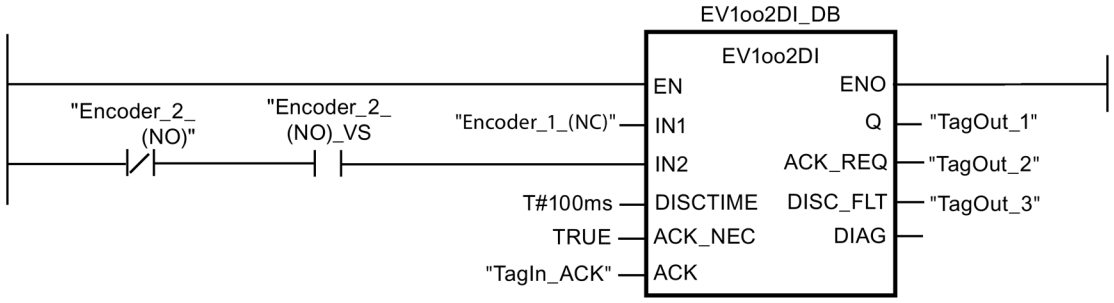
For non-equivalent signals you need to OR the input (IN1 and IN2) with which you assign the encoder signal to the safe state 1, with the QBAD signal of the associated F-I/O or the QBAD_I_xx signal of the associated channel (with S7-300/400 F-CPUs) and negate the result. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.



Example with value status

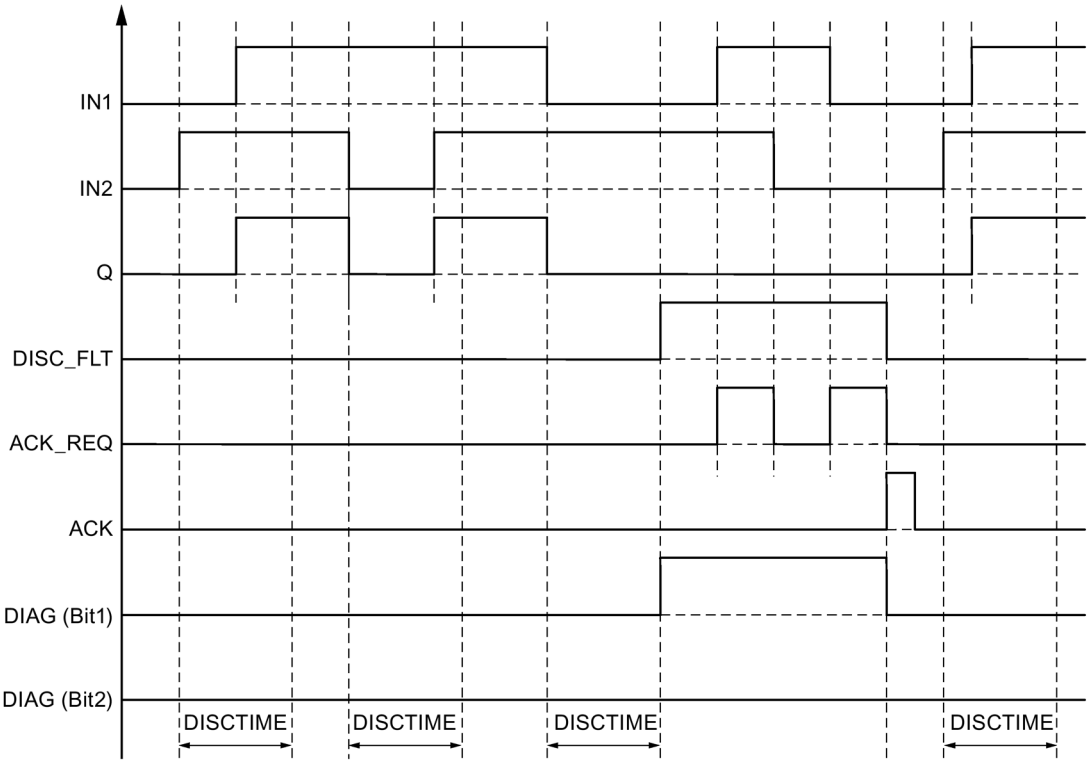
For nonequivalent signals, you have to negate the input (IN1 or IN2) with which you have assigned the encoder signal to a safe state of 1 and AND it with the value status of the associated channel. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.





Timing diagrams EV1oo2DI

If ACK_NEC = 1:



Startup characteristics

Note

If the sensors at inputs IN1 and IN2 are assigned to different F-I/O, it is possible that the fail-safe values are output for different lengths of time following startup of the F-system due to different startup characteristics of the F-I/O. If the signal states of inputs IN1 and IN2 remain different after the discrepancy time DISCTIME has expired, a discrepancy error is detected after the F-system starts up.

If ACK_NEC = 1 you must acknowledge the discrepancy error with a rising edge at input ACK.

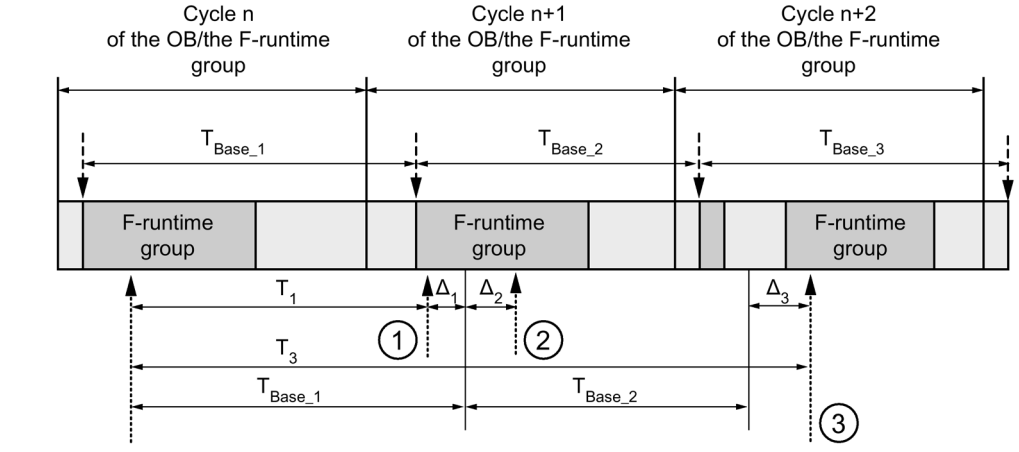
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time setting (= status of DISC_FLT)	Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 60 s	Set discrepancy time in range between 0 s and 60 s
Bit 1	For discrepancy errors: last signal state change was at input IN1	—	—
Bit 2	For discrepancy errors: last signal state change was at input IN2	—	—
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For discrepancy errors: input ACK has a permanent signal state of 1	Acknowledgment button defective	Replace acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

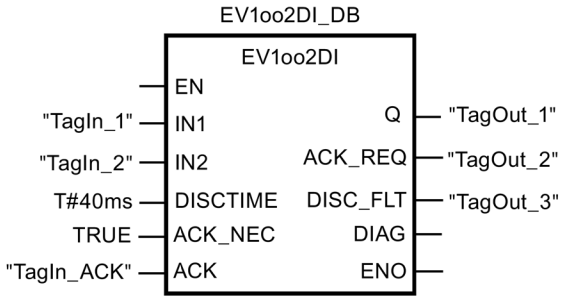
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

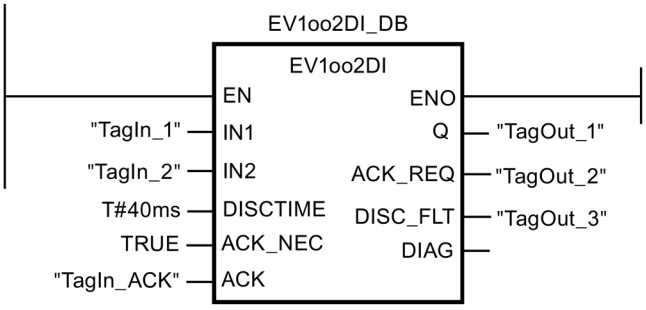
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.7 FDBACK: Feedback monitoring (STEP 7 Safety V14)

Description

This instruction implements feedback monitoring.

The signal state of output Q is checked to see whether it corresponds to the inverse signal state of the feedback input FEEDBACK.

Output Q is set to 1 as soon as input ON = 1. Requirement for this is that the feedback input FEEDBACK = 1 and no feedback error is saved.

Output Q is reset to 0, as soon as input ON = 0 or if a feedback error is detected.

A feedback error ERROR = 1 is detected if the inverse signal state of the feedback input FEEDBACK (to input Q) does not follow the signal state of output Q within the maximum tolerable feedback time. The feedback error is saved.

If a discrepancy is detected between the feedback input FEEDBACK and the output Q after a feedback error, the feedback error is acknowledged in accordance with the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must acknowledge the feedback error with a rising edge at input ACK.

The ACK_REQ = 1 output then signals that a user acknowledgment is necessary at input ACK to acknowledge the feedback error. Following an acknowledgment, the instruction resets ACK_REQ to 0.

To avoid a feedback errors from being detected and acknowledgment from being required when the F-I/O controlled by the Q output are passivated, you need to supply input QBAD_FIO with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / inverted value status of the associated channel.

Every call of the "Feedback monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., FDBACK_DB_1) or a multi-instance (e.g., FDBACK_Instance_1) for the "Feedback monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision *(S034)*.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ON	Input	BOOL	1= Enable output
FEEDBACK	Input	BOOL	Feedback input
QBAD_FIO	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the Q output
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
FDB_TIME	Input	TIME	Feedback time
Q	Output	BOOL	Output
ERROR	Output	BOOL	Feedback error
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

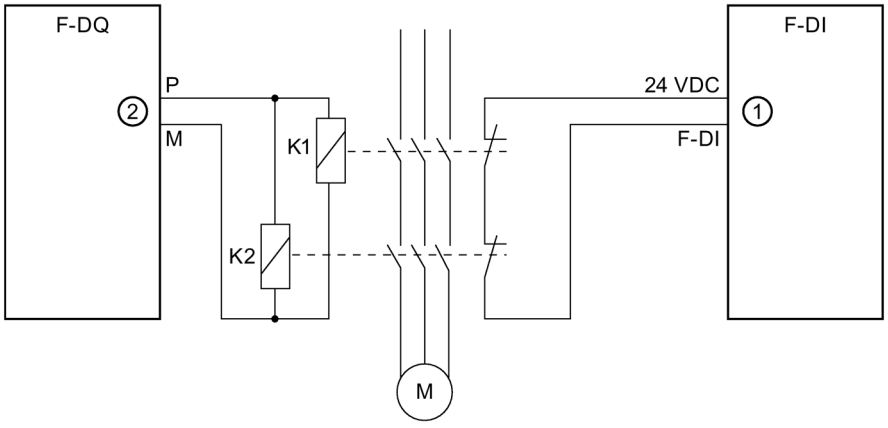
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	o	o	
1.5	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Interconnection example



① Sent to the FEEDBACK input of the instruction
② from output Q of the instruction

Startup characteristics

After an F-system startup, the instruction does not have be acknowledged when no errors are present.

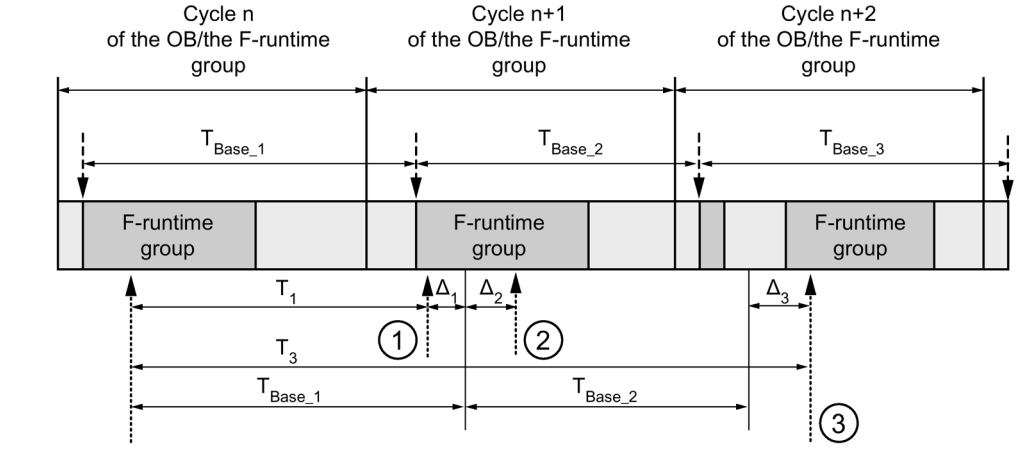
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0, 2, and 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Feedback error or incorrect feedback time setting (= state of ERROR)	Feedback time setting < 0	Set feedback time > 0
		Feedback time setting is too low	If necessary, set a higher feedback time
		Wiring fault	Check wiring of actuator and feedback contact
		Actuator or feedback contact is defective	Check actuator and feedback contact
		I/O fault or channel fault of feedback input	Check I/O
Bit 1	Passivation of F-I/O/channel controlled by output Q (= state of QBAD_FIO)	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
Bit 2	After feedback error: feedback input has permanent signal state of 0	F-I/O fault or channel fault of feedback input	Check I/O
		Feedback contact is defective	Check feedback contact
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of feedback input	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For feedback error: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

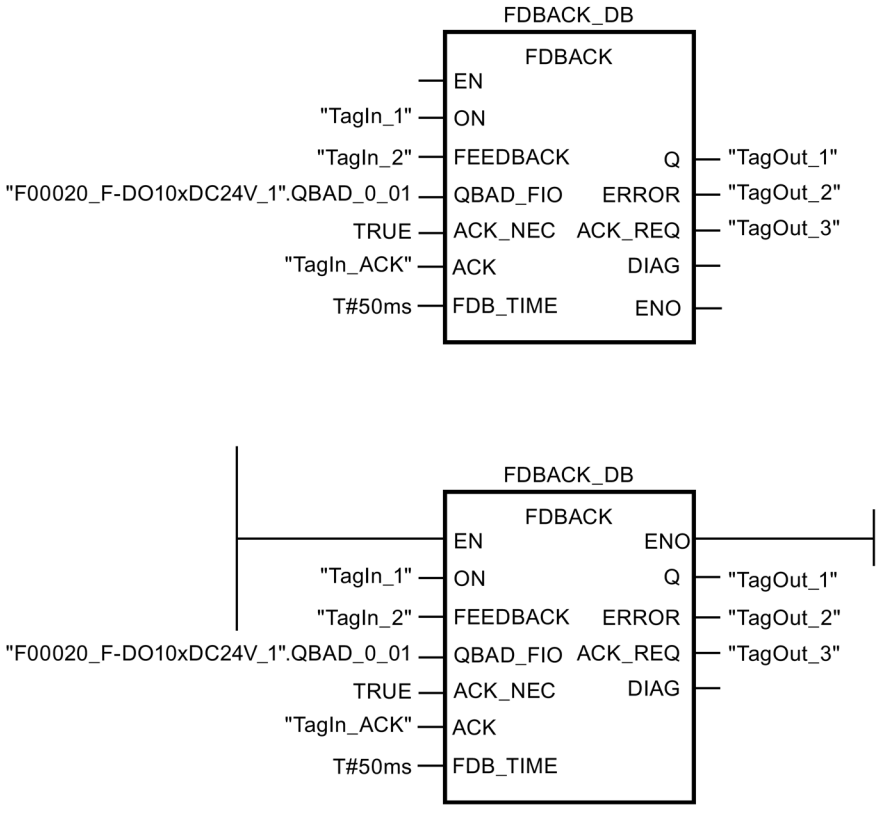
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

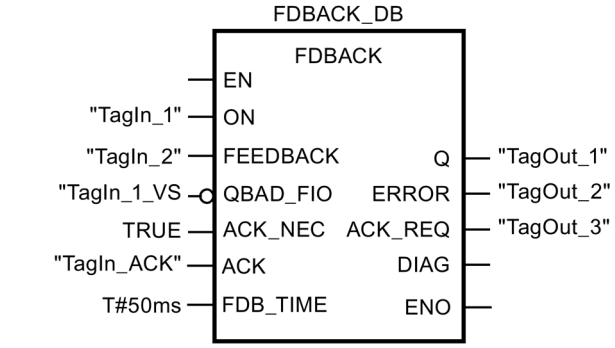
③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

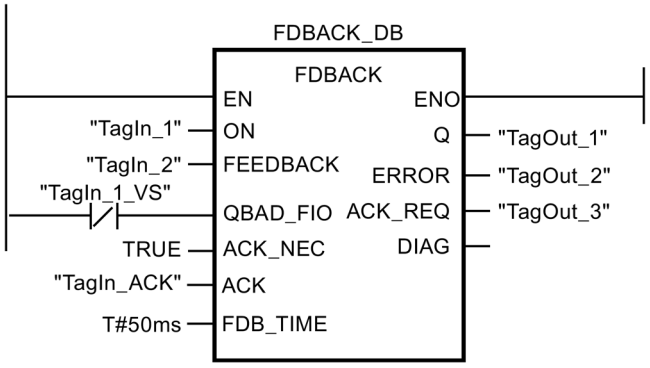
Example

The following example shows how the instruction for S7-300/400 F-CPUs works:



The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.3.8 SFDOOR: Safety door monitoring (STEP 7 Safety V14)

Description

This instruction implements safety door monitoring.

Enable signal Q is reset to 0 as soon as one of the inputs IN1 or IN2 take a signal state of 0 (safety door is opened). The enable signal can be reset to 1, only if:

- Inputs IN1 and IN2 both take a signal state of 0 prior to opening the door (safety door has been completely opened)
- Inputs IN1 and IN2 then both take a signal state of 1 (safety door is closed)
- An acknowledgment occurs

The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ = 1 is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets ACK_REQ = 1 as soon as the door is closed. Following an acknowledgment, the instruction resets ACK_REQ to 0.

In order for the instruction to recognize whether inputs IN1 and IN2 are 0 merely due to passivation of the associated F-I/O, you need to supply inputs QBAD_IN1 or QBAD_IN2 with the QBAD signal of the associated F-I/O or QBAD_I_xx signal / inverted value status of the associated channel. Among other things, this will prevent you from having to open the safety door completely prior to an acknowledgment in the event the F-I/O are passivated.

Every call of the "Safety door monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SFDOOR_DB_1) or a multi-instance (e.g., SFDOOR_Instance_1) for the "Safety door monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Input 1
IN2	Input	BOOL	Input 2
QBAD_IN1	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN1
QBAD_IN2	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN2
OPEN_NEC	Input	BOOL	1= Open necessary at startup
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
Q	Output	BOOL	1= Enable, safety door closed
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

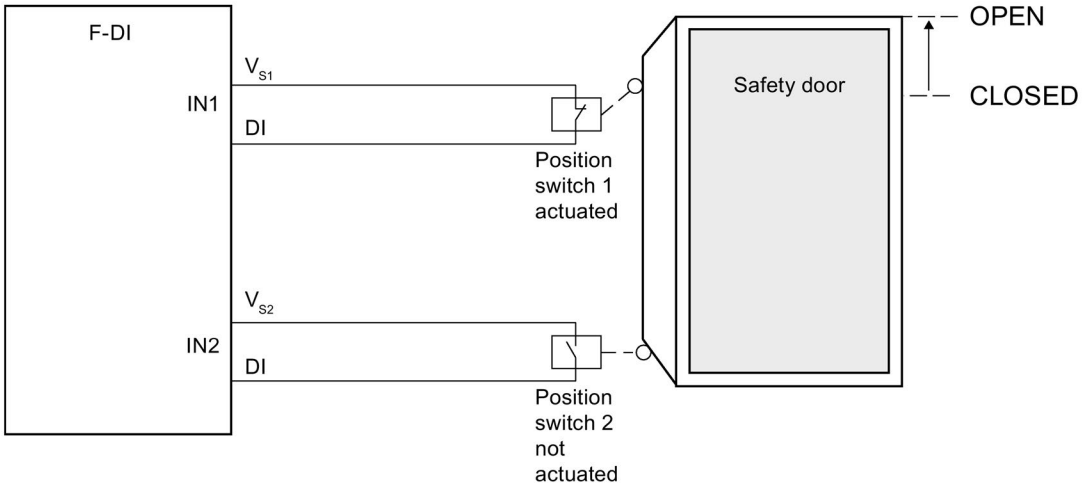
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

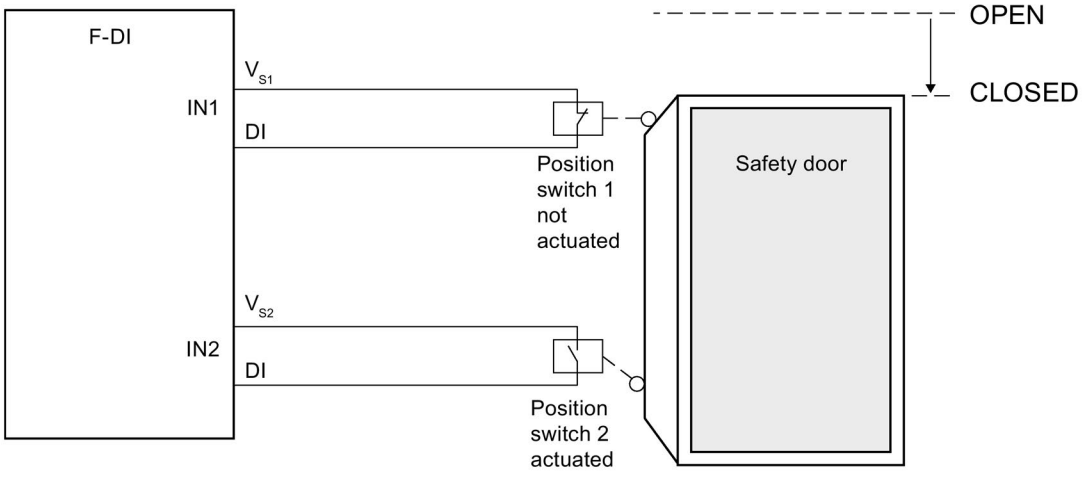
Interconnection example

You must interconnect the NC contact of position switch 1 of the safety door at input IN1 and the NO contact of position switch 2 at input IN2. Position switch 1 must be mounted in such a way that it is positively operated when the safety door is open. Position switch 2 must be mounted in such a way that it is operated when the safety door is closed.

Safety door open:



Safety door closed:



Startup characteristics

After an F-system startup, enable signal Q is reset to 0. The acknowledgment for the enable takes place according to the parameter assignment at inputs OPEN_NEC and ACK_NEC:

- When OPEN_NEC = 0, an automatic acknowledgment occurs **independently** of ACK_NEC, as soon as the two inputs IN1 and IN2 take signal state 1 for the first time following reintegration of the associated F-I/O (safety door is closed).
- When OPEN_NEC = 1 **or** if at least one of the IN1 and IN2 inputs still has a signal state of 0 after reintegration of the associated F-I/O, an automatic acknowledgment occurs **according** to ACK_NEC or you have to use a rising edge at input ACK for the enable. Prior to acknowledgment, inputs IN1 and IN2 both have to take a signal state of 0 (safety door has been completely opened) followed by a signal state of 1 (safety door is closed).

⚠ WARNING

The OPEN_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S039)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.

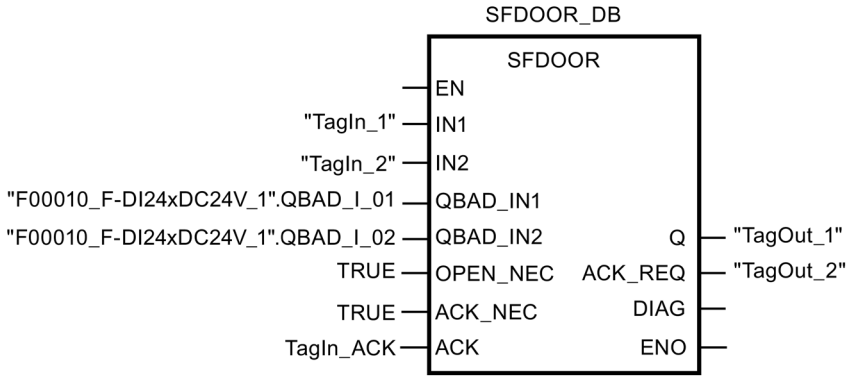
Structure of DIAG

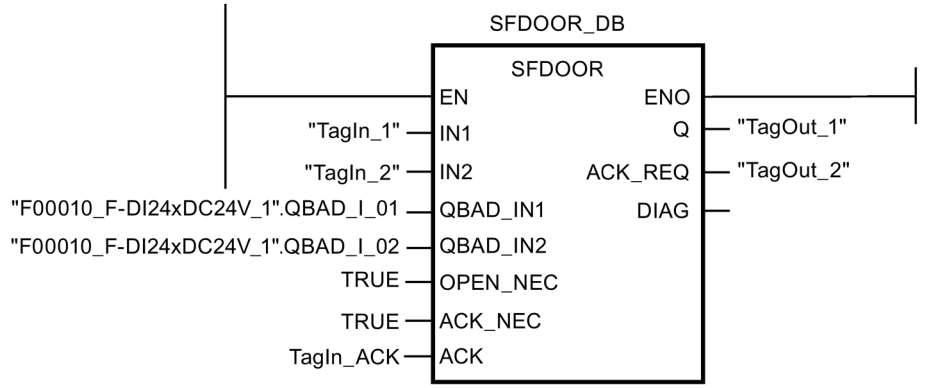
Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Signal state 0 is missing at both IN1 and IN2 inputs	Safety door was not completely opened when OPEN_NEC = 1 after F-system startup	Open safety door completely
		Open safety door was not completely opened	Open safety door completely
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 2	Signal state 1 is missing at both IN1 and IN2 inputs	Safety door was not closed	Close safety door
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 3	QBAD_IN1 and/or QBAD_IN2 = 1	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O or channel of IN1 and/or IN2	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 143)

Bit no.	Assignment	Possible error causes	Remedies
Bit 4	Reserved	—	—
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

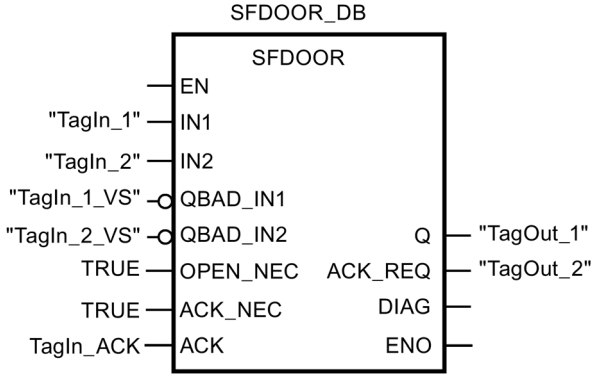
Example

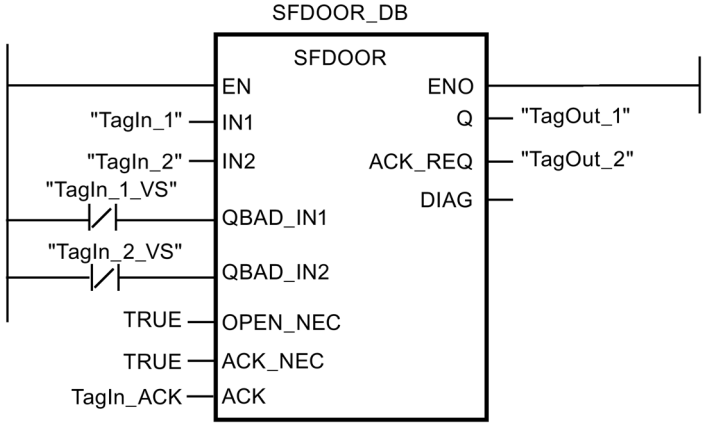
The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.3.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V14)

Description

This instruction creates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F-I/O of an F-runtime group after communication errors, F-I/O errors, or channel faults.

A user acknowledgment (Page 156) with a positive edge at input ACK_GLOB is required for reintegration. The acknowledgment occurs analogously to the user acknowledgment via the ACK_REI tag of the F-I/O DB (Page 138), but it acts simultaneously on all F-I/O of the F-runtime group in which the instruction is called.

If you use the instruction ACK_GL, you do not have to provide a user acknowledgment for each F-I/O of the F-runtime group via the ACK_REI tag of the F-I/O DB.

Every call of the "Global acknowledgment of all F-I/O of a runtime group" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_GL_DB_1) or a multi-instance (e.g., ACK_GL_Instance_1) for the "Global acknowledgment of all F-I/O of a runtime group" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

An acknowledgment via the ACK_GL instruction is only possible if the tag ACK_REI of the F-I/O DB = 0. Accordingly, an acknowledgment via the tag ACK_REI of the F-I/O DB is only possible if the input ACK_GLOB of the instruction = 0.

The instruction is only allowed to be called once per F-runtime group.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_GLOB	Input	BOOL	1=acknowledgment for reintegration

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

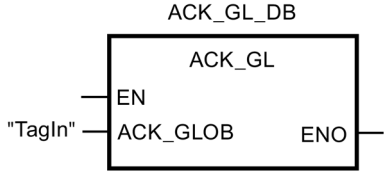
o This version is no longer supported.

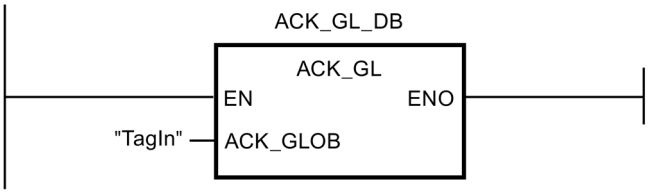
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





13.4 Timer operations

13.4.1 TP: Generate pulse (STEP 7 Safety V14)

Description

You can use the "Generate pulse" instruction to set output Q for a programmed period. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. Output Q is set for period PT, regardless of the subsequent sequence of the input signal. Also the detection of a new positive signal edge does not influence the signal state at output Q as long as period PT runs.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. If period PT is reached and the signal state at input IN is "0", output ET is reset.

Every call of the "Generate pulse" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate pulse" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction").
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate pulse" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TP instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of pulse; must be positive.
Q	Output	BOOL	Pulse output
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

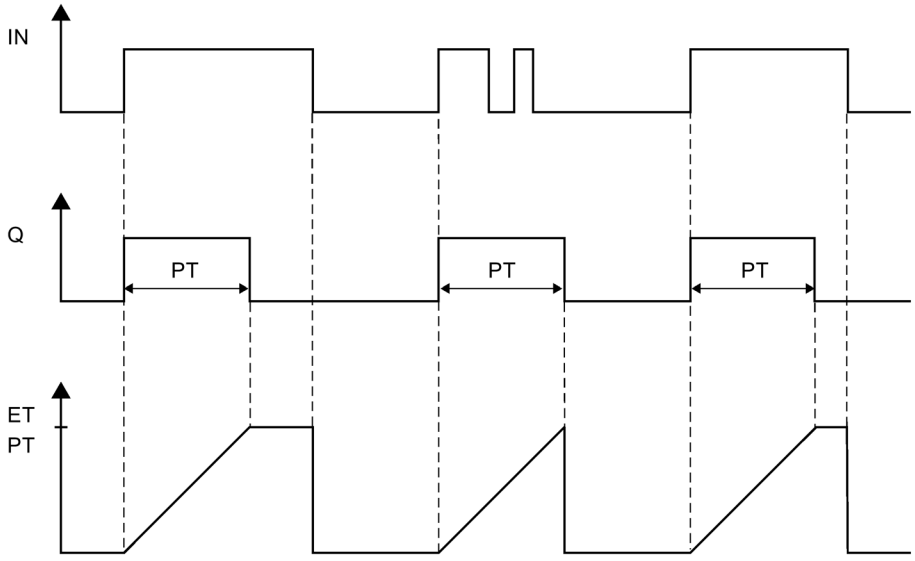
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

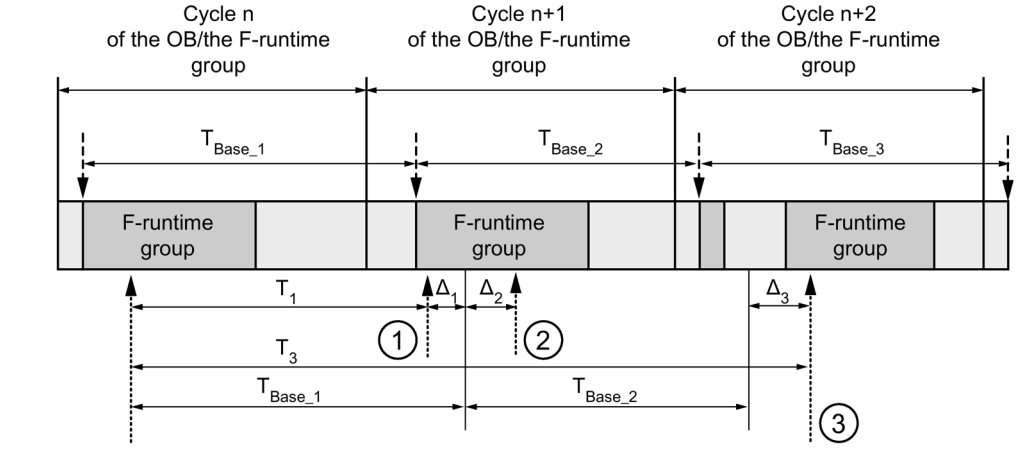
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate pulse":



Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

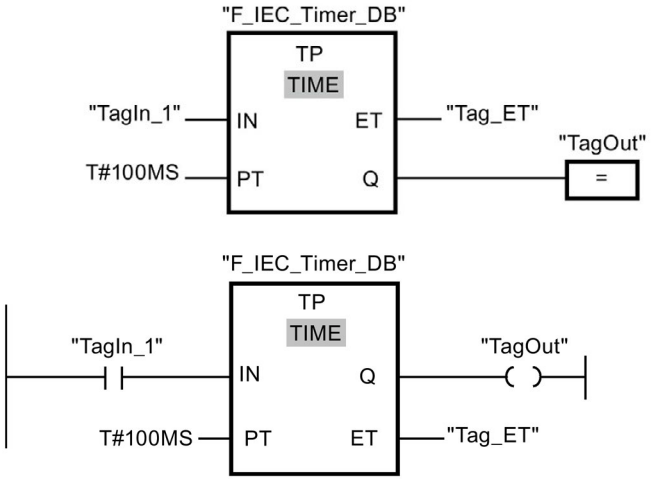
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate pulse" instruction is started and the period assigned at input PT (100 ms) runs, regardless of the further course of operand "TagIn_1".

Operand "TagOut" at output Q has signal state "1" as long as the period is running. Operand "Tag_ET" contains the current time value.

13.4.2 TON: Generate on-delay (STEP 7 Safety V14)

Description

You use the "Generate on-delay" instruction to delay the setting of output Q by the assigned period PT. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The programmed period PT starts running when the instruction starts. When period PT has expired, output Q is set to signal state "1". Output Q remains set as long as the start input is set to "1". When the signal state at the start input changes from "1" to "0", output Q is reset. The time function is restarted when a new positive signal edge is detected at the start input.

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. Output ET is reset, as soon as the signal state at input IN changes to "0".

Every call of the "Generate on-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate on-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate on-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TON instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the output ET is reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of on-delay; must be positive.
Q	Output	BOOL	Output that is set after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

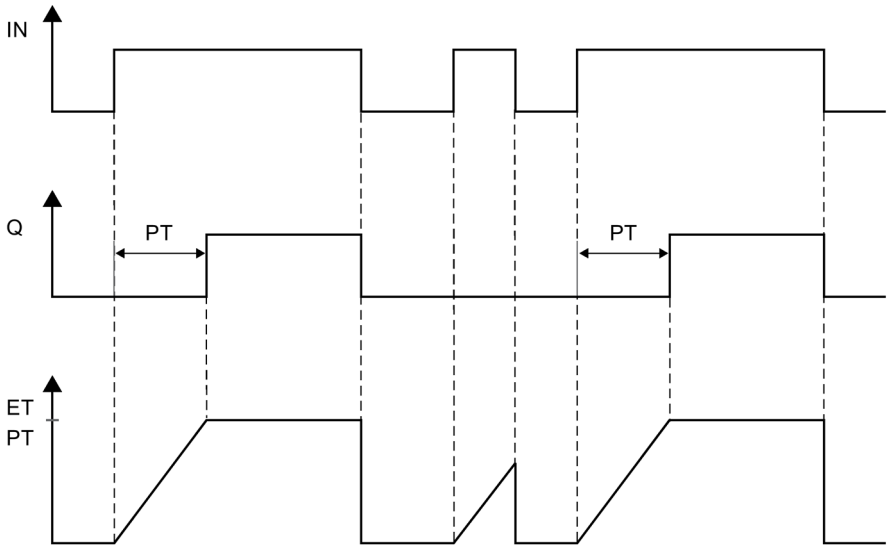
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

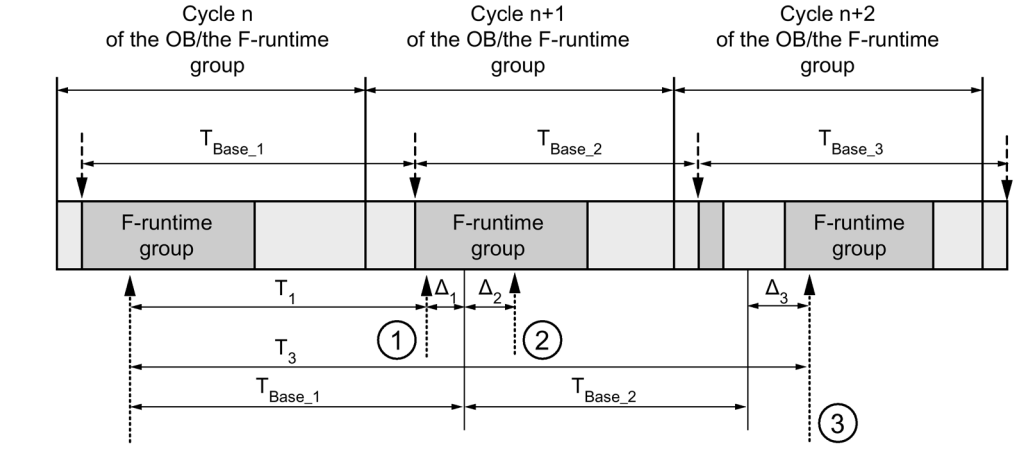
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate on-delay":



Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

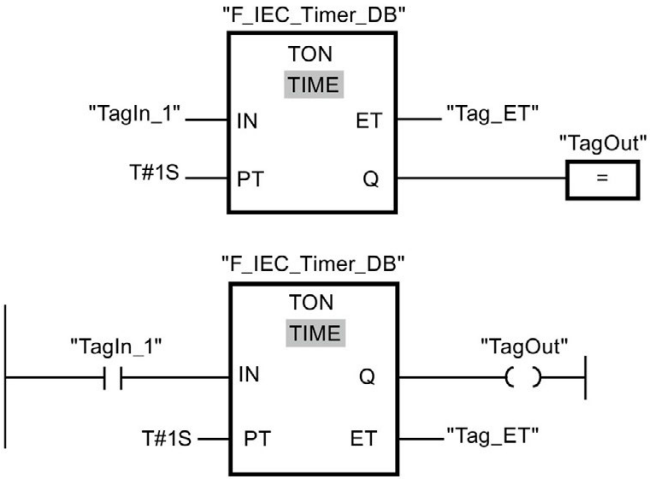
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



When the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate on-delay" instruction is started and the period assigned at input PT (1 s) runs.

Operand "TagOut" at output Q feeds signal state "1" when the period has elapsed and remains set as long as operand "TagIn_1" still feeds signal state "1". Operand "Tag_ET" contains the current time value.

13.4.3 TOF: Generate off-delay (STEP 7 Safety V14)

Description

You use the "Generate off-delay" instruction to delay the resetting of output Q by the assigned period PT. Output Q is set if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. When the signal state at input IN changes back to "0", the programmed period PT starts. Output Q remains set as long as period PT runs. After period PT expires, output Q is reset. If the signal state at input IN changes to "1" before period PT has expired, then the time is reset. The signal state at output Q remains at "1".

You can query the current time value at the output ET. The time value begins at T#0s and ends when the value of period PT is reached. After time PT has elapsed, output ET remains at its current value until input IN changes back to "1". If input IN changes to "1" before time PT has expired, the output ET is reset to value T#0.

Every call of the "Generate off-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is in inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate off-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate off-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TOF instruction in the following points:

- If the instruction is called while the time is running with PT = 0 ms, the outputs Q and ET are reset.
- If the instruction is called with PT < 0 ms, the outputs Q and ET are reset.

To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of off delay; must be positive.
Q	Output	BOOL	Output that is reset after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	o	o	
1.4	x	x	x	

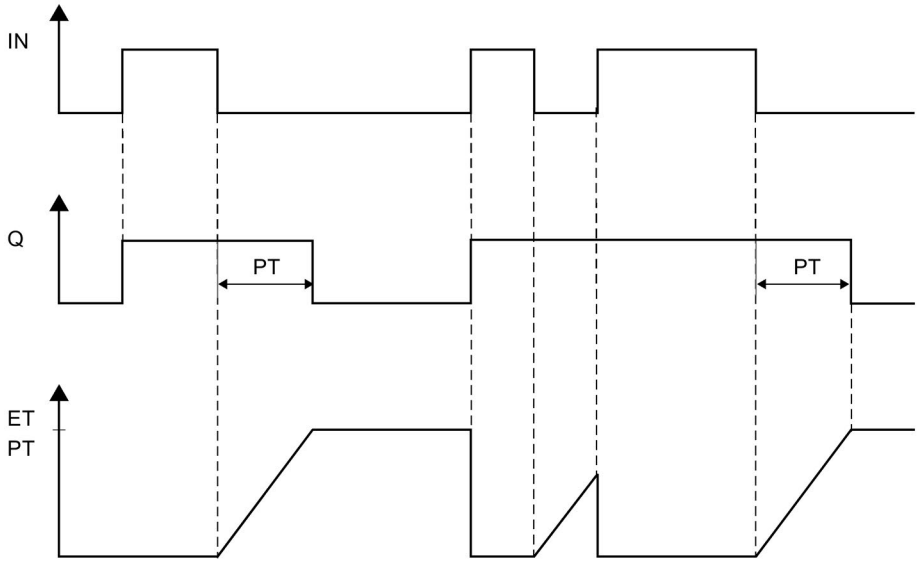
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

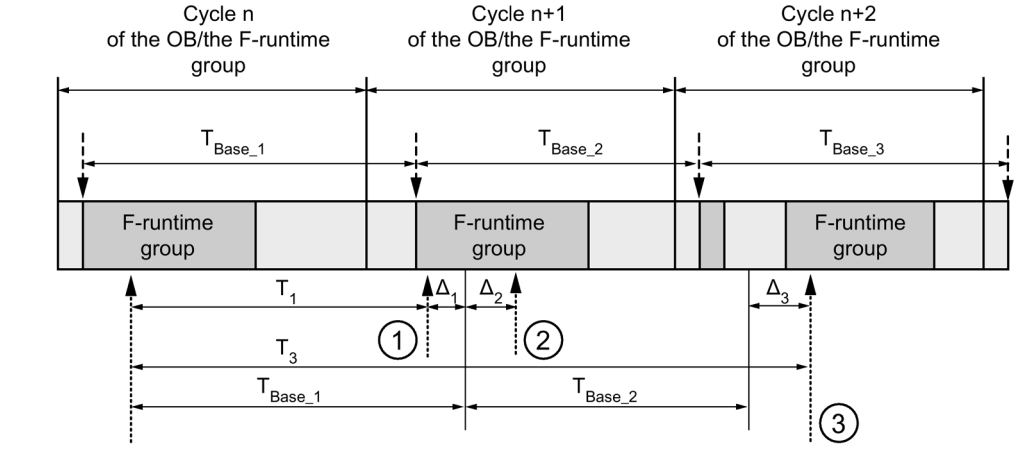
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction "Generate off-delay":



Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

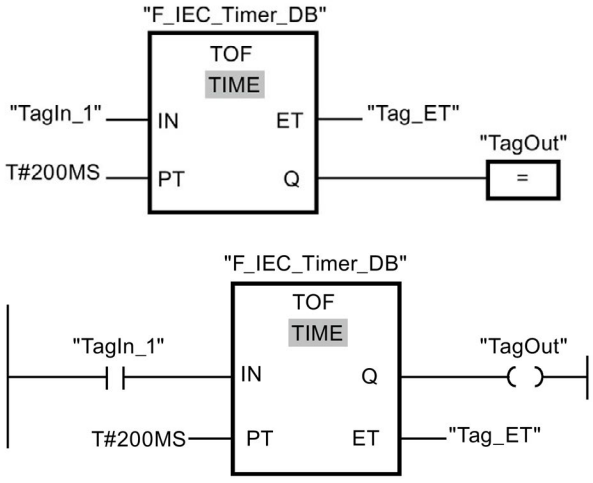
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the signal state of operand"TagOut" at output Q is set to "1".

If the signal state of operand "TagIn_1" changes back to "0", the period assigned at input PT (200 ms) runs.

The "TagOut" operand at output Q is set back to "0" when the period expires. Operand "Tag_ET" contains the current time value.

13.5 Counter operations

13.5.1 CTU: Count up (STEP 7 Safety V14)

Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at input CU changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is increased by one. The count value is increased on each detection of a positive signal edge until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the signal state at input CU no longer affects the instruction.

The counter status can be queried at output Q. The signal state at output Q is determined by parameter PV. When the current count value is greater than or equal to the value of parameter PV, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is reset to zero when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at input CU has no effect on the instruction.

Every call of the "Count up" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Counter input
R	Input	BOOL	Reset input
PV	Input	INT	Value for which output Q is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

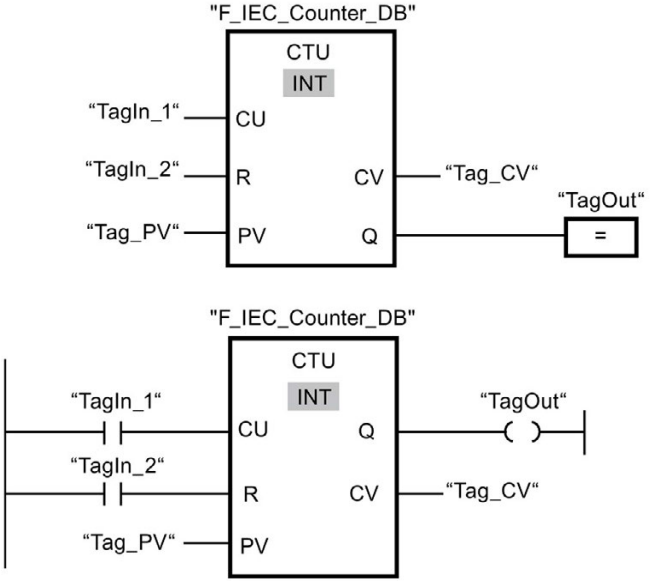
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count up" instruction is executed and the current count value of the "Tag_CV" operand is increased by one. The count value is increased on every additional positive signal edge until the high limit of the specified data type (32767) is reached.

The value at parameter PV is taken as the limit for the determination of output "TagOut". Output "TagOut" delivers the signal state "1" as long as the current count value is greater than or equal to the value of operand "Tag_PV". In all other cases, output TagOut has signal state "0".

13.5.2 CTD: Count down (STEP 7 Safety V14)

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at input CD changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is decreased by one. The count value is decreased on each detection of a positive signal edge until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at input CD no longer affects the instruction.

The counter status can be queried at output Q. When the current count value is less than or equal to zero, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is set to the value of parameter "PV" when the signal state at input LD changes to "1". As long as signal state "1" exists at input LD, the signal state at input CD has no effect on the instruction.

Every call of the "Count down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count down" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Counter input
LD	Input	BOOL	Load input
PV	Input	INT	Value at the output CV when LD = 1 is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

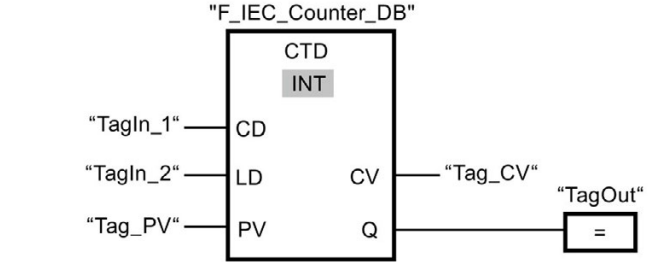
o This version is no longer supported.

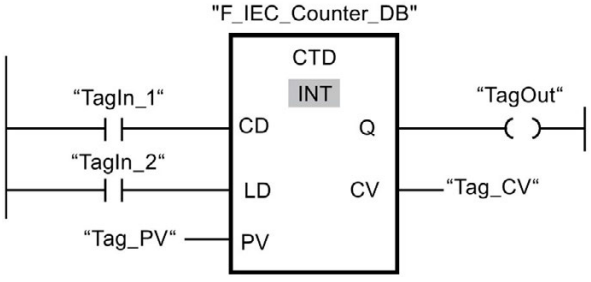
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





If the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count down" instruction is executed and the current count value at output "Tag_CV" is decreased by one. The count value is decreased on each additional positive signal edge until the low limit of the specified data type (-32768) is reached.

Output "TagOut" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut has signal state "0".

13.5.3 CTUD: Count up and down (STEP 7 Safety V14)

Description

You can use the "Count up and down" instruction to increment and decrement the count value at output CV. If the signal state at input CU changes from "0" to "1" (positive signal edge), the current count value at output CV is increased by one. If the signal state at input CD changes from "0" to "1" (positive signal edge), the count value at output CV is decreased by one. If a positive signal edge is present at inputs CU and CD in one program cycle, the current count value at output CV remains unchanged.

The count value can be increased until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is no longer decreased.

When the signal state at input LD changes to "1", the count value at output CV is set to the value of parameter PV. As long as signal state "1" exists at input LD, the signal state at inputs CU and CD has no effect on the instruction.

The count value is set to zero, when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at inputs CU, CD, and LD has no effect on the "Count up and down" instruction.

The status of the up counter can be queried at output QU. When the current count value is greater than or equal to the value of parameter PV, output QU delivers signal state "1". In all other cases, the signal state at output QU is "0".

The status of the down counter can be queried at output QD. When the current count value is lesser than or equal to zero, output QD delivers signal state "1". In all other cases, the signal state at output QD is "0".

Every call of the "Count up and down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up and down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up and down" instruction when the F-system is started up.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input
PV	Input	INT	Value set at the output QU/ at which the output CV is set at LD = 1.
QU	Output	BOOL	Status of up counter
QD	Output	BOOL	Status of down counter
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	o	o	
1.3	x	x	x	

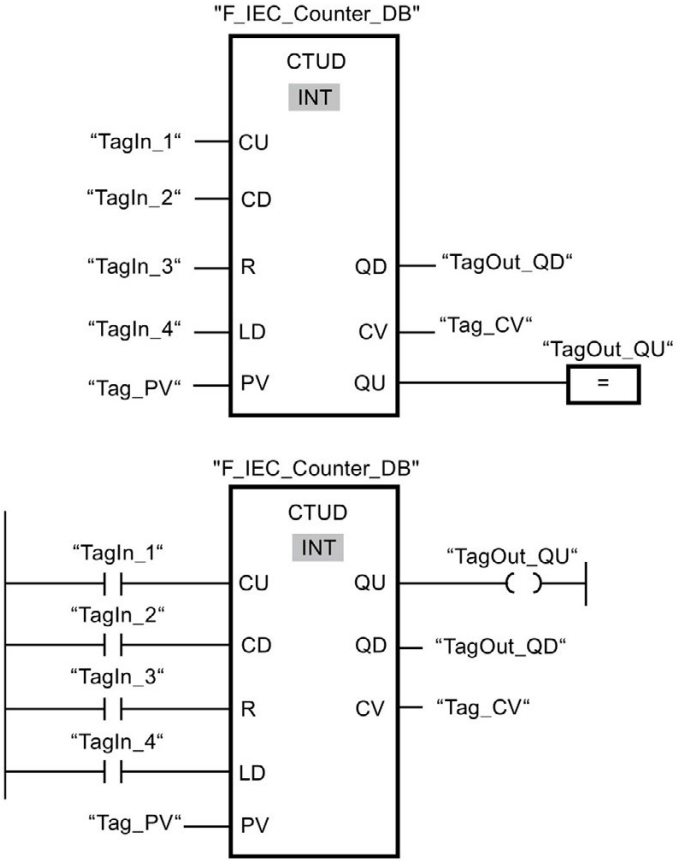
o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state at input "TagIn_1" or at input "TagIn_2" changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When a positive signal edge is present at input "TagIn_1", the current count value of the "Tag_CV" operand is increased by one. When a positive signal edge is present at input "TagIn_2", the current count value at output "Tag_CV" is decreased by one. The count value is increased on each positive signal edge at input CU until it reaches the high limit of 32767. The count value is decreased on each positive signal edge at input CD until it reaches the low limit of -32768.

Output "TagOut_QU" delivers the signal state "1" as long as the current count value is greater than or equal to the value at input "Tag_PV". In all other cases, output TagOut_QU has signal state "0".

Output "TagOut_QD" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut_QD has signal state "0".

13.6 Comparator operations

13.6.1 CMP ==: Equal (STEP 7 Safety V14)

Description

You can use the "Equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

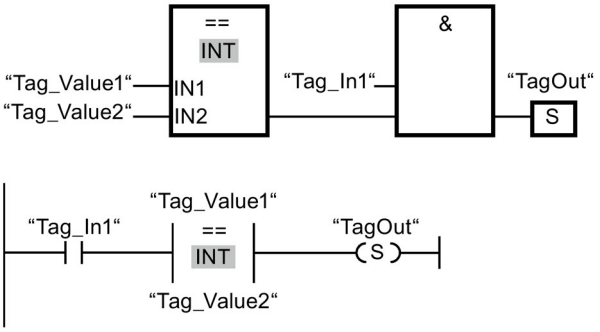
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" = "Tag_Value2").

13.6.2 CMP <>: Not equal (STEP 7 Safety V14)

Description

You can use the "Not equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is not equal to the second comparison value (IN2 or <Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

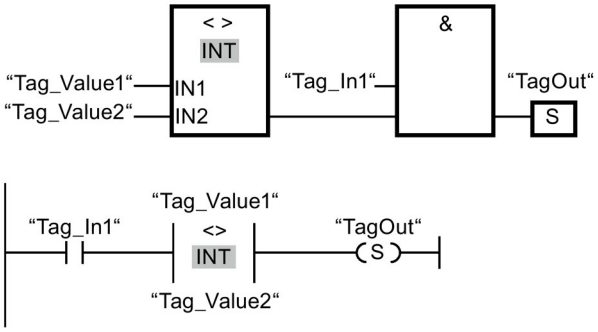
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME, WORD, (S7-300/400) DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <> "Tag_Value2").

13.6.3 CMP >=: Greater or equal (STEP 7 Safety V14)

Description

You can use the "Greater or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

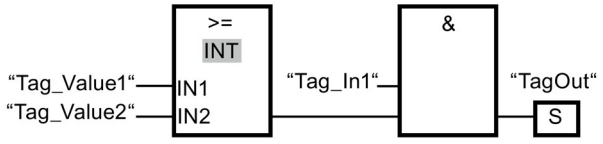
The following table shows the parameters of the instruction:

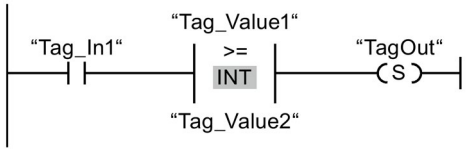
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" >= "Tag_Value2").

13.6.4 CMP <=: Less or equal (STEP 7 Safety V14)

Description

You can use the "Less or equal" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than or equal to the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

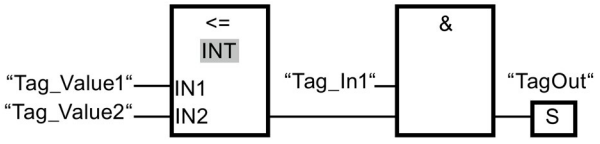
The following table shows the parameters of the instruction:

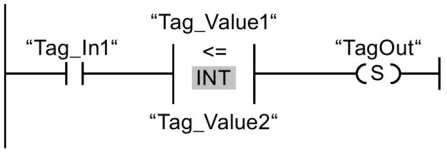
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <= "Tag_Value2").

13.6.5 CMP >: Greater than (STEP 7 Safety V14)

Description

You can use the "Greater than" instruction to determine if the first comparison value (IN1 or <Operand1>) is greater than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

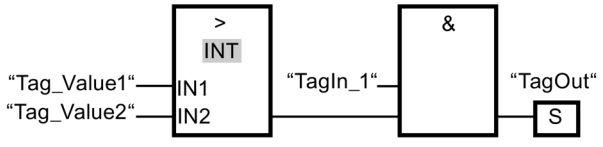
The following table shows the parameters of the instruction:

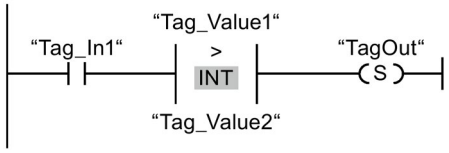
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" > "Tag_Value2").

13.6.6 CMP <: Less than (STEP 7 Safety V14)

Description

You can use the "Less than" instruction to determine if the first comparison value (IN1 or <Operand1>) is less than the second comparison value (IN2 or <Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

For LAD:

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

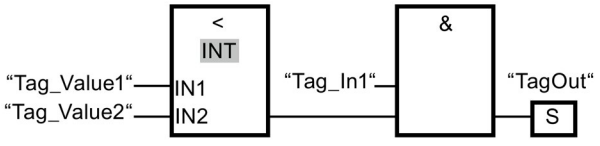
The following table shows the parameters of the instruction:

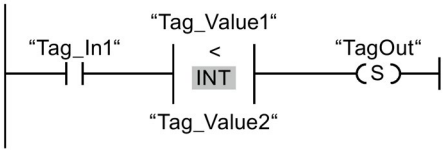
Parameter	Declaration	Data type	Description
FBD: IN1 LAD: <Operand1>	Input	INT, DINT, TIME	First value to compare
FBD: IN2 LAD: <Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:





Output "TagOut" is set when the following conditions are fulfilled:

- "Tag_In1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" < "Tag_Value2").

13.7 Math functions

13.7.1 ADD: Add (STEP 7 Safety V14)

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at the OUT output (OUT = IN1 + IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

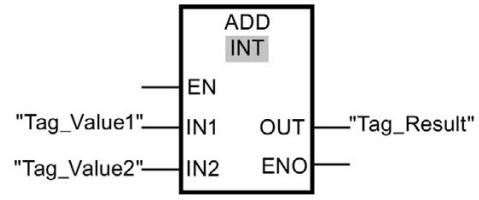
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	First addend
IN2	Input	INT, DINT	Second addend
OUT	Output	INT, DINT	Total

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

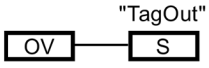
Example

The following example shows how the instruction works:

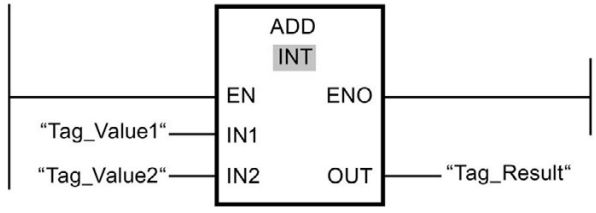
Network 1:



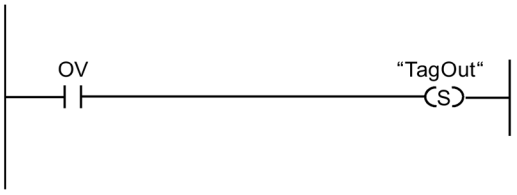
Network 2: (S7-300, S7-400)



Network 1:



Network 2: (S7-300, S7-400)



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) (Page 512)

13.7.2 SUB: Subtract (STEP 7 Safety V14)

Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at the OUT output (OUT = IN1 – IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

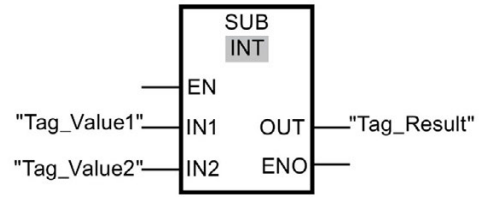
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Minuend
IN2	Input	INT, DINT	Subtrahend
OUT	Output	INT, DINT	Difference

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

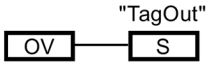
Example

The following example shows how the instruction works:

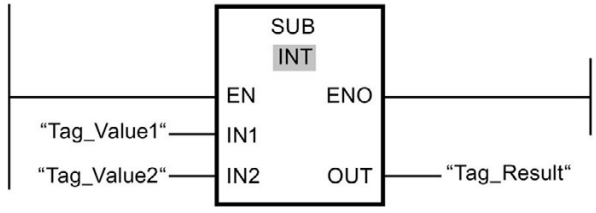
Network 1:



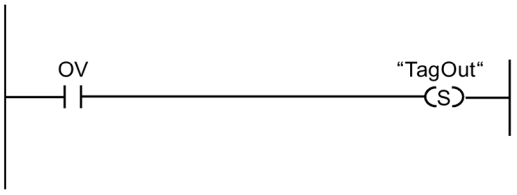
Network 2: (S7-300, S7-400)



Network 1:



Network 2: (S7-300, S7-400)



The "Subtract" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value2" operand is subtracted from the value of the "Tag_Value1" operand. The result of the addition is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Subtract" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) (Page 512)

13.7.3 MUL: Multiply (STEP 7 Safety V14)

Description

You can use the "Multiply" instruction to multiply the value at input IN1 by the value at input IN2 and query the product at output OUT (OUT = IN1 × IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

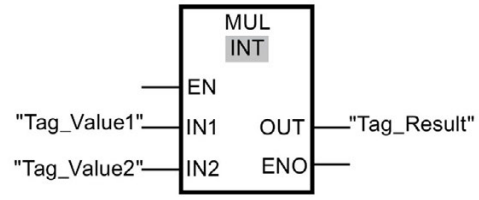
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Multiplier
IN2	Input	INT, DINT	Multiplicand
OUT	Output	INT, DINT	Product

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

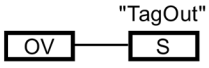
Example

The following example shows how the instruction works:

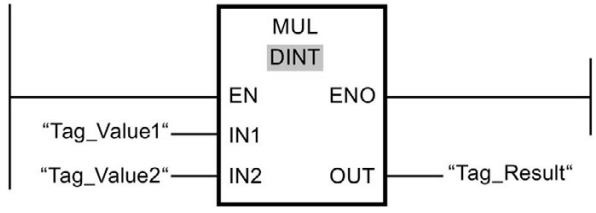
Network 1:



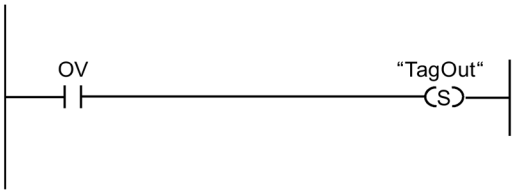
Network 2: (S7-300, S7-400)



Network 1:



Network 2: (S7-300, S7-400)



The "Multiply" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is multiplied by the value of the "Tag_Value2" operand. The result of the multiplication is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Multiply" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) (Page 511)

---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400) (Page 512)

13.7.4 DIV: Divide (STEP 7 Safety V14)

Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at the OUT output (OUT = IN1 / IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Note

S7-300/400:

If the divisor (input IN2) of a DIV instruction = 0, the quotient of the division (result of division at output OUT) = 0. The result reacts like the corresponding instruction in a standard block. The F-CPU does *not* go to STOP mode.

S7-1200/1500:

If the divisor (input IN2) of a DIV instruction = 0, the F-CPU goes to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU. We recommend that you rule out a divisor (input IN2) = 0 when creating the program.

Parameters

The following table shows the parameters of the instruction:

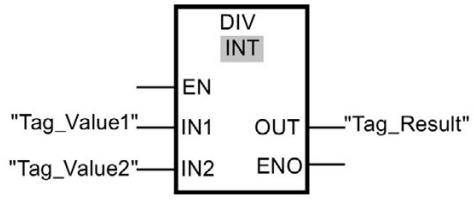
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Dividend
IN2	Input	INT, DINT	Divisor
OUT	Output	INT, DINT	Quotient

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

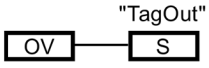
Example

The following example shows how the instruction works:

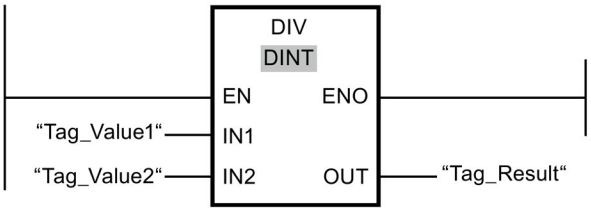
Network 1:



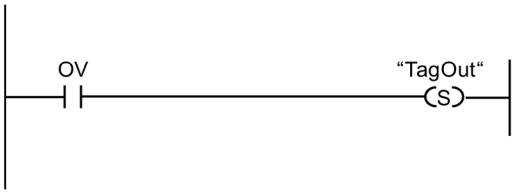
Network 2: (S7-300, S7-400)



Network 1:



Network 2: (S7-300, S7-400)



The "Divide" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is divided by the value of the "Tag_Value2" operand. The result of the division is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Divide" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.7.5 NEG: Create twos complement (STEP 7 Safety V14)

Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN input and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

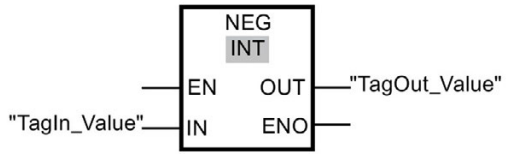
Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Twos complement of the input value

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

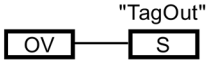
Example

The following example shows how the instruction works:

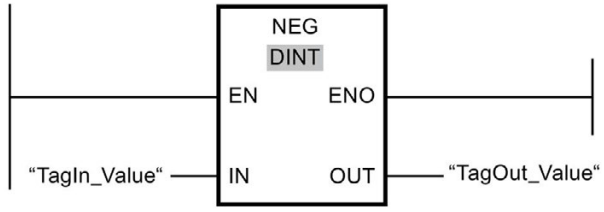
Network 1:



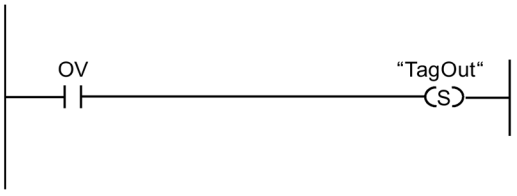
Network 2: (S7-300, S7-400)



Network 1:



Network 2: (S7-300, S7-400)



The "Create twos complement" instruction is always executed (regardless of the signal state at enable input EN).

The sign of the "TagIn_Value" operand is changed and the result is stored in the "TagOut_Value" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Create twos complement" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.8 Move operations

13.8.1 MOVE: Move value (STEP 7 Safety V14)

Description

You can use the "Move value" instruction to transfer the content of the operand at input IN to the operand at output OUT1.

Only operands with identical operand width and identical data structure can be specified for input IN and output OUT1.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

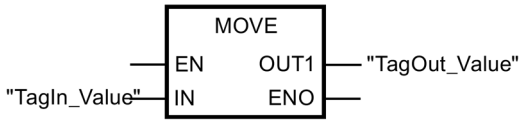
Parameters

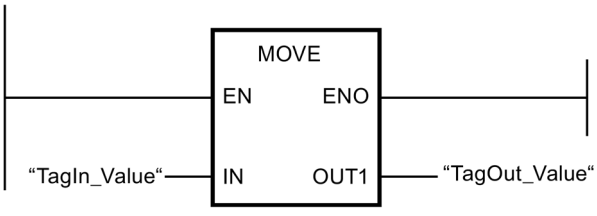
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT, WORD, (S7-300/400) DWORD, TIME, F-compliant PLC data type (UDT)	Source value
OUT1	Output	INT, DINT, WORD, (S7-300/400) DWORD, TIME, F-compliant PLC data type (UDT)	Destination address

Example

The following example shows how the instruction works:





The instruction is always executed regardless of the signal state at enable input "EN". The instruction copies the content of operand "TagIn_Value" to operand "TagOut_Value".

13.8.2 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety V14) (S7-300, S7-400)

Description

This instruction writes the value specified in input IN to the tag addressed by INI_ADDR and OFFSET in an F-DB.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB to which the value at input IN is to be written is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

As shown in the following example, the INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Value to be written to the F-DB
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset

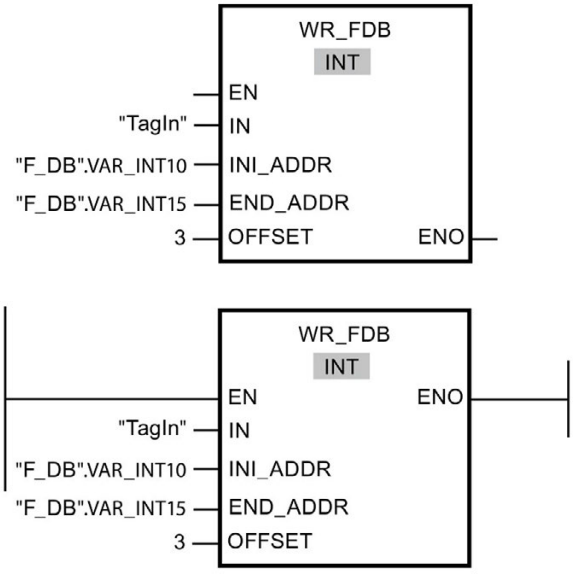
You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFS

Name	Data type	Initial value	Comment
Static			
VAR_BOOL10	BOOL	false	
VAR_BOOL11	BOOL	false	
VAR_BOOL12	BOOL	false	
VAR_BOOL13	BOOL	false	
VAR_TIME10	TIME	T#0MS	
VAR_TIME11	TIME	T#0MS	
VAR_INT10	INT	0	<- INI_ADDR = "F-DB".VAR_INT10 Example 1
VAR_INT11	INT	0	
VAR_INT12	INT	0	
VAR_INT13	INT	0	<- OFFSET = 3
VAR_INT14	INT	0	
VAR_INT15	INT	0	<- END_ADDR = "F-DB".VAR_INT15
VAR_BOOL20	BOOL	false	
VAR_BOOL21	BOOL	false	
VAR_BOOL22	BOOL	false	
VAR_BOOL23	BOOL	false	
VAR_INT20	INT	0	<- INI_ADDR = "F-DB".VAR_INT20 Example 2
VAR_INT21	INT	0	
VAR_INT22	INT	0	
VAR_INT23	INT	0	<- END_ADDR = "F-DB".VAR_INT23
VAR_INT30	INT	0	<- INI_ADDR = "F-DB".VAR_INT30 Example 3
VAR_INT31	INT	0	<- OFFSET = 1
VAR_INT32	INT	0	
VAR_INT33	INT	0	
VAR_INT34	INT	0	<- END_ADDR = "F-DB".VAR_INT34
VAR_TIME20	TIME	T#0MS	
VAR_DINT10	DINT	0	<- INI_ADDR = "F-DB".VAR_DINT10 Example 4
VAR_DINT11	DINT	0	
VAR_DINT12	DINT	0	<- OFFSET = 2
VAR_DINT13	DINT	0	<- END_ADDR = "F-DB".VAR_DINT13

Example

The following example shows how the instruction works:



13.8.3 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

This instruction reads the tag addressed via INI_ADDR and OFFSET in an F-DB and provides it at output OUT.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostics event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB from which the tag is to be read is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

The INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted. Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFSET are contained in WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety V14) (S7-300, S7-400) (Page 474).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

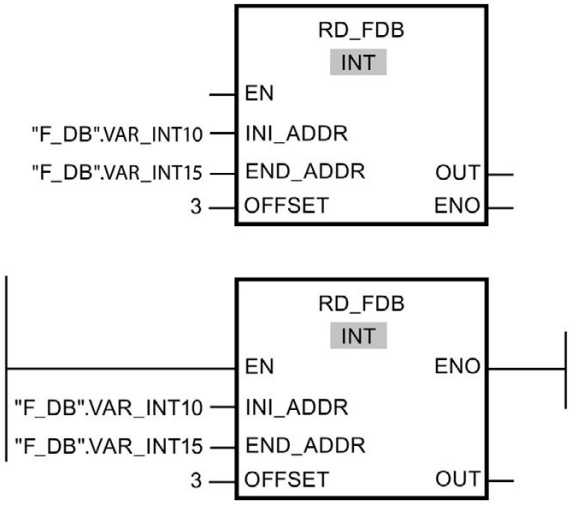
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset
OUT	Output	INT, DINT	Value to be read from the F-DB

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



13.9 Conversion operations

13.9.1 CONVERT: Convert value (STEP 7 Safety V14)

Description

The "Convert value" instruction reads the content of parameter IN and converts it according to the data types selected in the instruction box. The converted value is output at output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

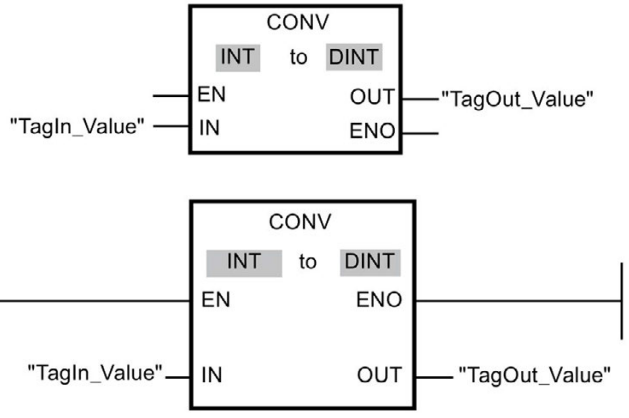
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Value to be converted.
OUT	Output	DINT	Result of the conversion

Example

The following example shows how the instruction works:



The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is read and converted to an integer (32 bit). The result is stored in operand "TagOut_Value".

13.9.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V14)

Description

This instruction converts the 16 values of data type BOOL at inputs IN0 to IN15 to a value of data type WORD, which is made available at output OUT. The conversion takes place as follows: The i-th bit of the WORD value is set to 0 (or 1), if the value at input INi = 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN0	Input	BOOL	Bit 0 of WORD value
IN1	Input	BOOL	Bit 1 of WORD value
...			...
IN15	Input	BOOL	Bit 15 of WORD value
OUT	Output	WORD	WORD value consisting of IN0 to IN15

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

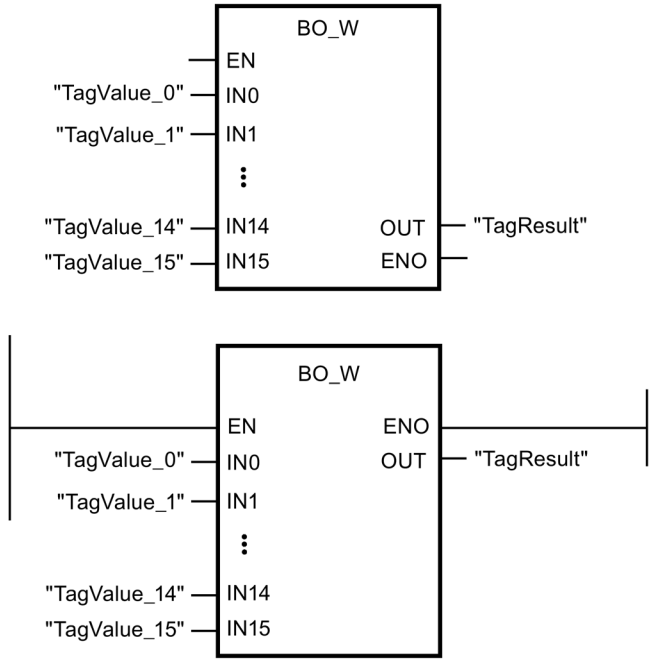
[2] supported for Firmware version V2.0 or higher

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN0	TagValue_0	FALSE
IN1	TagValue_1	FALSE
...		...
IN13	TagValue_13	FALSE
IN14	TagValue_14	TRUE
IN15	TagValue_15	TRUE
OUT	TagResult	W#16#C000

The values of operands "TagValue_0" to " TagValue_15" are combined to form data type WORD and assigned to operand "TagResult".

13.9.3 W_BO: Convert a data element of data type WORD to 16 data elements of data type BOOL (STEP 7 Safety V14)

Description

This instruction converts the value of data type WORD at input IN to 16 values of data type BOOL, which are provided at outputs OUT0 to OUT15. The conversion takes place as follows: Output OUTi is set to 0 (or 1), if the i-th bit of the WORD value is 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	WORD value
OUT0	Output	BOOL	Bit 0 of WORD value
OUT1	Output	BOOL	Bit 1 of WORD value
...			...
OUT15	Output	BOOL	Bit 15 of WORD value

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

1 supported for Firmware version V4.2 or higher

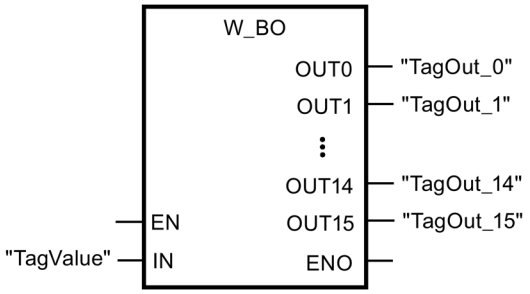
2 supported for Firmware version V2.0 or higher

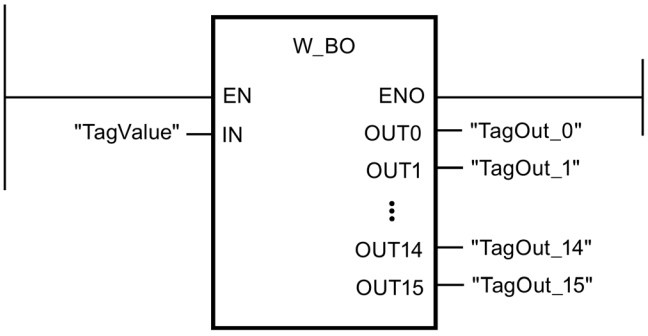
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagValue	W#16#C000
OUT0	TagOUT_0	FALSE
OUT1	TagOUT_1	FALSE
...		...
OUT13	TagOUT_13	FALSE
OUT14	TagOUT_14	TRUE
OUT15	TagOUT_15	TRUE

The value of operand "TagValue" of data type WORD is converted to the 16 values "TagOUT_0" to "TagOUT_15" of data type BOOL.

13.9.4 SCALE: Scale values (STEP 7 Safety Advanced V14)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale values" instruction must be assigned a data area in which the instruction data are stored. In addition, when the instruction is inserted in the program, the "Call options" dialog is automatically opened, where you can create a data block (single instance) (e.g., SCALE_DB_1) or a multi-instance (e.g., SCALE_Instance_1) for the "Scale values" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	INT	High limit value of value range of OUT
LO_LIM	Input	INT	Low limit value of value range of OUT
OUT	Output	INT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions have identical functions to version V1.0.
1.2	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

Note

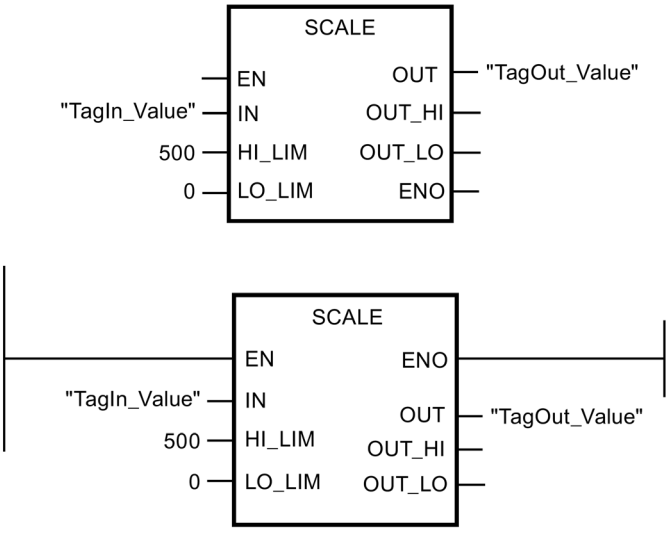
If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If other fail-safe values should be output in this case, you need to evaluate the QBAD signal of the associated F-I/O or QBAD_I_xx signal / value status of the corresponding channel.

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:



When operand "TagIn_Value" = 20000, the result is "TagOut_Value" 361.

13.10 Program control operations

13.10.1 JMP: Jump if RLO = 1 (STEP 7 Safety V14)

Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (Page 490) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1" or the input is not connected, the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "0", the program continues executing in the next network.

Note

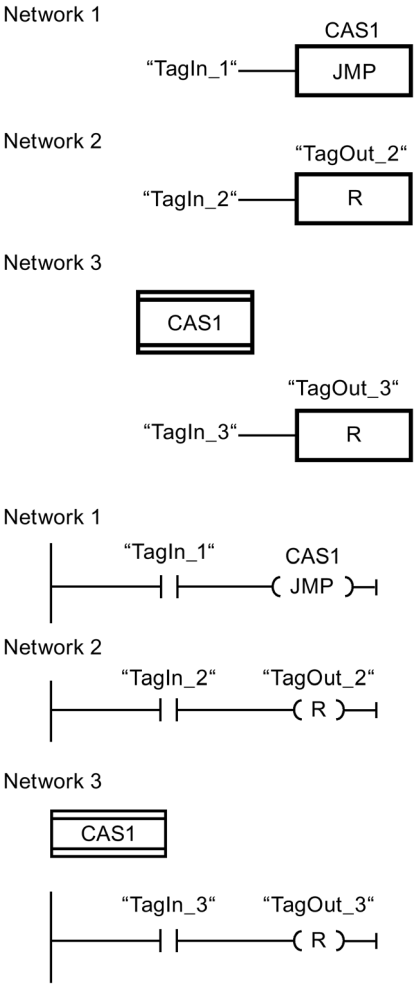
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.10.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V14)

Description

You can use the "Jump if RLO = 0" instruction to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (Page 490) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "1", the program continues executing in the next network.

Note

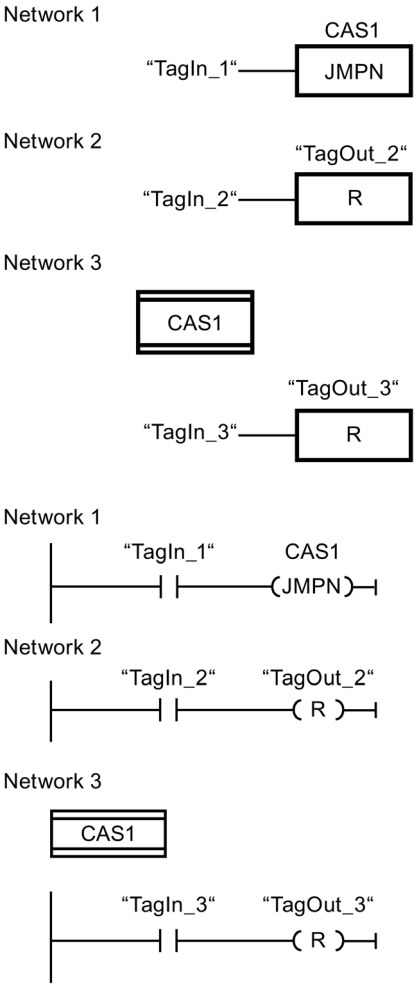
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the F-CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "0", the "Jump if RLO = 0" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.10.3 LABEL: Jump label (STEP 7 Safety V14)

Description

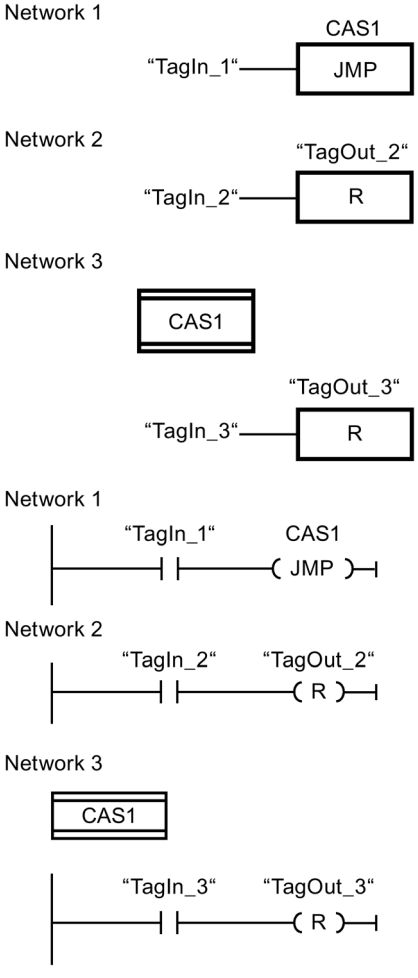
You can use a jump label to specify a destination network, in which the program execution should resume after a jump.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. To each jump label can be jumped from several locations.

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

See also

JMP: Jump if RLO = 1 (STEP 7 Safety V14) (Page 486)

JMPN: Jump if RLO = 0 (STEP 7 Safety V14) (Page 488)

RET: Return (STEP 7 Safety V14) (Page 491)

13.10.4 RET: Return (STEP 7 Safety V14)

Description

You can use the "Return" instruction to stop the processing of a block.

If the result of logic operation (RLO) at the input of the "Return" instruction is "1" or the box input of the S7-1200/1500 F-CPUs is not connected in FBD, program execution is terminated in the currently called block and continued in the calling block (for example, in the main safety block) after the call function. If the RLO at the input of the "Return" instruction is "0", the instruction is not executed. Program execution continues in the next network of the called block.

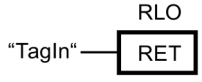
Influencing the status of the call function (ENO) is irrelevant, because the enable output "ENO" cannot be connected.

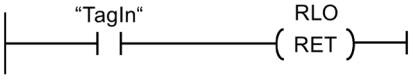
Note

You cannot program a RET instruction before a main safety block call.

Example

The following example shows how the instruction works:





When the "TagIn" operand delivers signal state "1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block.

JMP: Jump if RLO = 1 (STEP 7 Safety V14) (Page 486)

JMPN: Jump if RLO = 0 (STEP 7 Safety V14) (Page 488)

LABEL: Jump label (STEP 7 Safety V14) (Page 490)

13.10.5 OPN: Open global data block (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

You can use the "Open global data block" instruction to open a data block. The number of the data block is transferred to the DB register. Subsequent DB commands access the relevant blocks depending on the register contents.

Note

Note when using the "Open global data block" instruction that the content of the DB register can be changed after calls of F-FB/F-FC and "fully qualified DB accesses", such that there is no guarantee that the last data block you opened with "Open global data block" is still open.

You should therefore use the following method for addressing data to avoid errors when accessing data of the DB register:

- Use symbolic addressing.
- Use only fully qualified DB accesses.

If you still want to use the "Open global data block" operation, you must ensure that the DB register is restored by repeating the "Open global data block" instruction following calls of F-FB/F-FC and "fully qualified DB accesses." Otherwise, a malfunction could result.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Data block>	Input	BLOCK_DB	Data block that is opened

"Fully qualified DB access"

The initial access to data of a data block in an F-FB/F-FC must always be a "fully qualified DB access," or it must be preceded by the "Open global data block" instruction. This also applies to the initial access to data of a data block after a jump label.

An example of "fully qualified DB access" and "non-fully qualified DB access" is provided in Restrictions in the programming languages FBD/LAD (Page 97).

Access to instance DBs

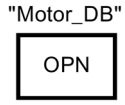
You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

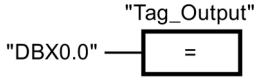
Example

The following example shows how the instruction works:

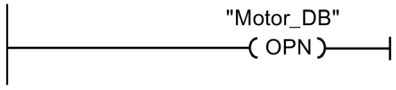
Network 1:



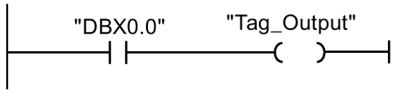
Network 2:



Network 1:



Network 2:



The "Motor_DB" data block is called in network 1. The number of the data block is transferred to the DB register. The "DBX0.0" operand is queried in network 2. The signal state of the "DBX0.0" operand is assigned to the "Tag_Output" operand.

13.11 Word logic operations

13.11.1 AND: AND logic operation (STEP 7 Safety V14)

Description

You can use the "AND logic operation" instruction to combine the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

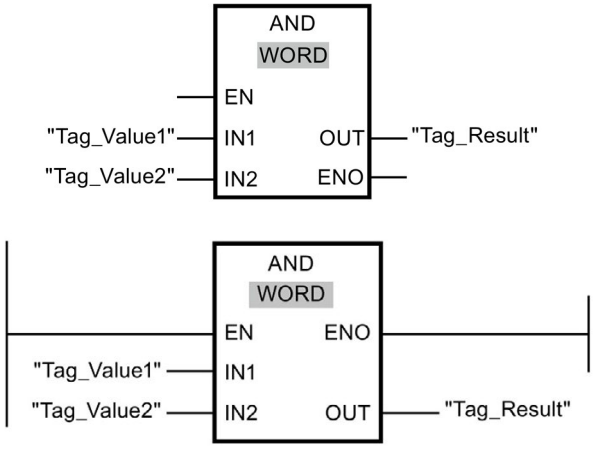
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 00000000 00000101

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ANDed. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.11.2 OR: OR logic operation (STEP 7 Safety V14)

Description

You can use the "OR logic operation" instruction to connect the value at input IN1 input to the value at input IN2 bit-by-bit by OR logic and query the result at output OR.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ORed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The result bit has signal state "1" when at least one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

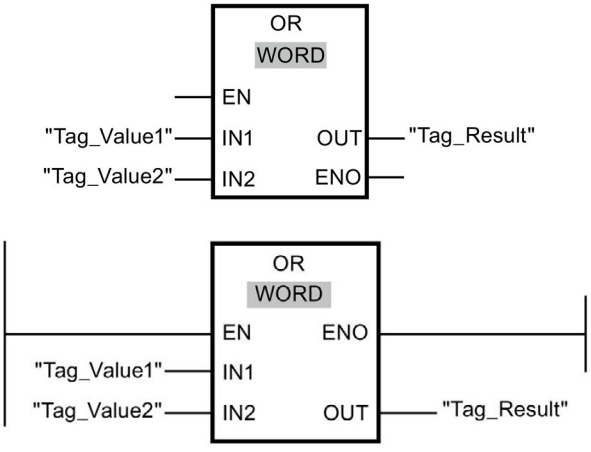
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 01010101 01011111

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ORed. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.11.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V14)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at input IN1 and the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 input and bit 0 of the value at input IN2 are logically combined by EXCLUSIVE OR. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The result bit has signal state "1" when one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

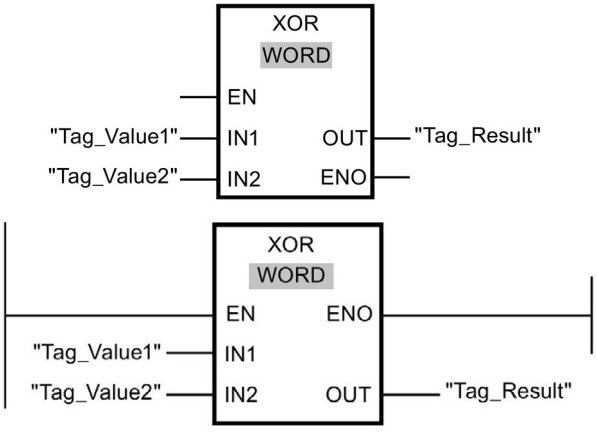
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 01010101 01011010

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are logically combined by EXCLUSIVE OR. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.12 Shift and rotate

13.12.1 SHR: Shift right (STEP 7 Safety V14)

Description

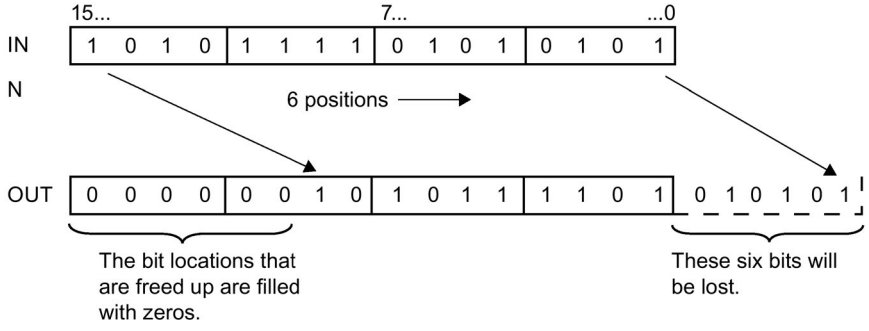
Use the "Shift right" instruction to shift the content of the operand at input IN bit-by-bit to the right and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The bit locations that are freed up in the left area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the right:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

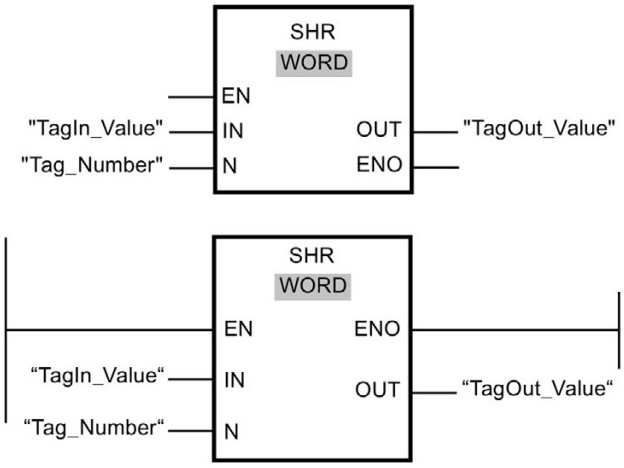
[2] supported for Firmware version V2.0 or higher

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	TagOut_Value	0000 0111 1111 0101

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved three bit positions to the right. The result is output at output "TagOut_Value".

13.12.2 SHL: Shift left (STEP 7 Safety V14)

Description

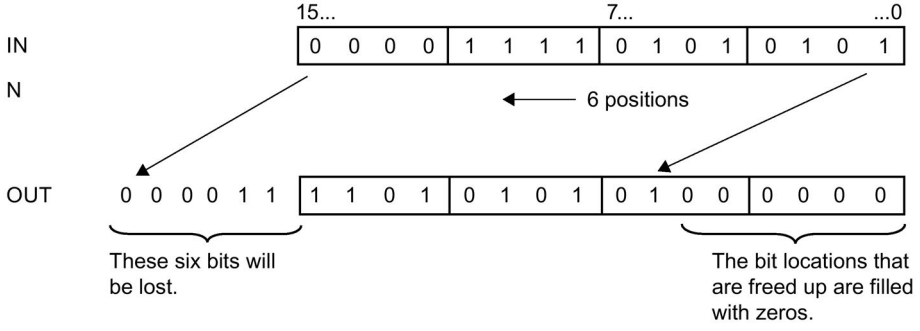
Use the "Shift left" instruction to shift the content of the operand at input IN bit-by-bit to the left and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions that are freed up in the right area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the left:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.3	x	o	o	
1.4	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

1 supported for Firmware version V4.2 or higher

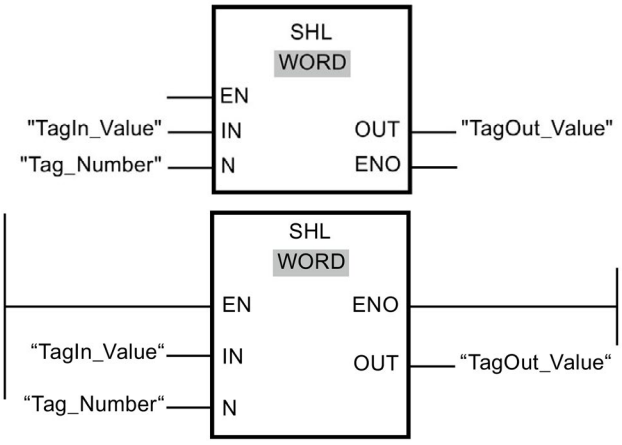
2 supported for Firmware version V2.0 or higher

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	TagOut_Value	1111 1010 1111 0000

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved four bit positions to the left. The result is output at output "TagOut_Value".

13.13 Operating

13.13.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V14)

Description (S7-300, S7-400)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to a value of 9 within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value of 9 after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value 9 within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value 9, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name.*(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.

You can provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Note

The configuration of your operator control and monitoring system does not have any effect on the collective F-signature.

Changes to the configuration of your operator control and monitoring system therefore do not result in a changed collective F-signature.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Description (S7-1200, S7-1500)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to the value at the ACK_ID input within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value at the ACK_ID input after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value at the ACK_ID input within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value at the ACK_ID input, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored designation. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

You can read out output Q by means of operator control and monitoring systems or, if applicable, evaluate it in your standard user program.

You need to provide the in/out parameter IN with a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction.

Note

The supply of the IN input/output of the ACK_OP instruction as well as the configuration of your operator control and monitoring system do not have any effect on the collective F-signature or of the signature of the block that calls the ACK_OP instruction.

Changes to the supply of the IN input/output or to the configuration of your operator control and monitoring system therefore do not result in a changed collective F-signature/signature of the calling block.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 200 ms, a maximum of 4 ms
  - For time values greater than or equal to 200 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters (S7-300, S7-400)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Parameters (S7-1200, S7-1500)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_ID	Input	INT	Identifier of the acknowledgment (9 to 30000)
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Instruction versions

A number of versions are available for this instruction:

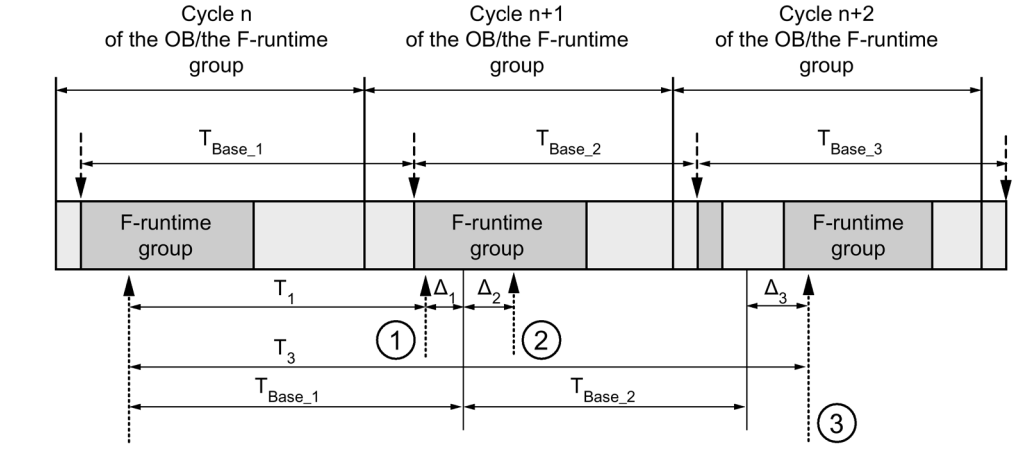
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	o	These versions are identical in function to version V1.0 for S7-300/400 F-CPUs. The input ACK_ID must also be taken into consideration for S7-1200/1500 F-CPUs.
1.2	x	o	o	
1.3	x	x	x	

o This version is no longer supported.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

An example how the instruction is used is available under Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 156).

See also

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (Page 162)

13.14 Additional instructions

13.14.1 LAD

13.14.1.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" instruction functions like a normally open contact. If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

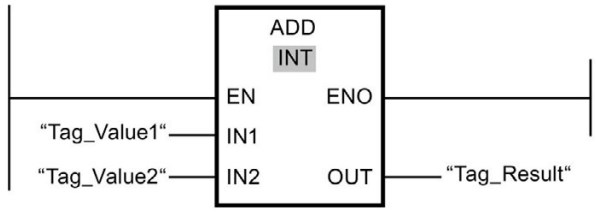
Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

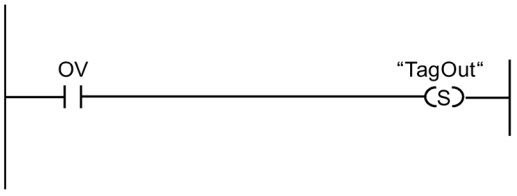
Example

The following example shows how the instruction works:

Network 1:



Network 2:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.14.1.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

You can use the "Get negated status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed. This instruction is only available in LAD.

The "Get negated status bit OV" instruction functions like a normally closed contact. If the query is satisfied, the instruction has signal state "0". If the query is not satisfied, the instruction has signal state "1".

The "Get negated status bit OV" evaluation must be inserted in the network following the instruction that influences the OV. This network must not contain any jump labels.

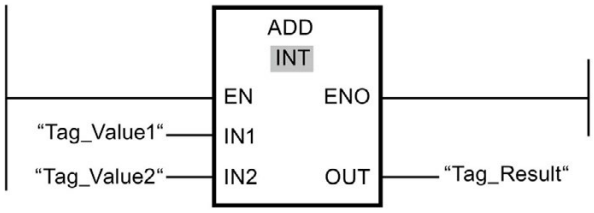
Note

The execution time of the OV-affecting instruction is extended when the "Get negated status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

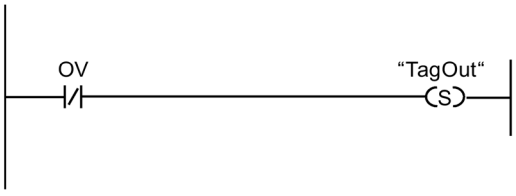
Example

The following example shows how the instruction works:

Network 1:



Network 2:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

If an overflow does *not* occur during execution of the "Add" instruction, the status bit OV is reset to "0". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.14.2 FBD

13.14.2.1 OV: Get negated status bit OV (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

If the query is fulfilled, the instruction has signal state "1". If the query is not fulfilled, the instruction has signal state "0".

You can program a query of status bit OV for "0" with the "Invert RLO" instruction.

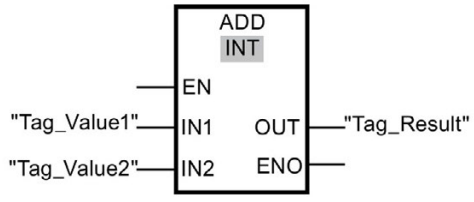
Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

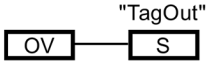
Example

The following example shows how the instruction works:

Network 1:



Network 2:



The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.15 Communication

13.15.1 PROFIBUS/PROFINET

13.15.1.1 SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety V14)

Introduction

You use the SENDDP and RCVDP instructions for fail-safe sending and receiving of data using:

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication

Description

The SENDDP instruction sends 16 data elements of data type BOOL and 2 data elements of data type INT or one data element of the data type DINT (S7-1200, S7-1500) in a fail-safe manner to another F-CPU via PROFIBUS DP/PROFINET IO. The data can be received there by the related RCVDP instruction.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., RCVDP_DB_1) for these instructions. Once it is created, the new data block can be found in the "STEP 7 Safety" folder in the project tree under "Program blocks > System blocks". For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

With the SENDDP instruction, the data to be sent (for example, outputs of other F-blocks/instructions) are available at input SD_BO_xx or SD_I_xx or SD_DI_00 as alternative.

With the RCVDP instruction, the data received are available at outputs RD_BO_xx and RD_I_xx or RD_DI_00 as alternative for additional processing by other F-blocks/instructions.

(S7-1200, S7-1500) At the DINTMODE input of the SENDDP instruction you specify if the data at the inputs SD_I_00 and SD_I_01 or the data at the input SD_DI_00 is sent.

The operating mode of the F-CPU with the SENDDP instruction is provided at output SENDMODE. If the F-CPU with the SENDDP instruction is in disabled safety mode, output SENDMODE = 1.

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define the communication relationship between a SENDDP instruction in one F-CPU and a RCVDP instruction in the other F-CPU by specifying an address relationship at the DP_DP_ID inputs of the SENDDP and RCVDP instructions. Associated SENDDP and RCVDP instructions are assigned the same value for DP_DP_ID.

⚠ WARNING

The value for each address association (input DP_DP_ID; data type: INT) is user-defined; however, it must be unique from all other safety-related communication connections network-wide* and CPU-wide. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 320).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Note

Within a safety program, you must assign a different start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) for every call of the SENDDP and RCVDP instructions at input LADDR.

A separate instance DB must be used for each call of the SENDDP and RCVDP instructions. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVDP instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVDP instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVDP or RCVS7 instruction called in an upstream network.

The RD_D_00 output must not be evaluated for DINTMODE = 0; the RD_I_xx outputs of the RCVDP instruction must not be evaluated for DINTMODE = 1.

(S7-1200, S7-1500) The outputs of the SENDDP and RCVDP instructions must not be supplied with tags from the standard user program. Exception: RET_DPRD, RET_DPWR and DIAG outputs.

You cannot use an actual parameter for an output of an RCVDP instruction, if it is already being used for an input of the same or another RCVDP or RCVS7 instruction.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You are not permitted to insert any SENDDP instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

You cannot insert a RET instruction prior to a SENDDP instruction.

SENDDP parameter

The following table shows the parameters of the SENDDP instruction:

Parameter	Declaration	Data type	Description
SD_BO_00	Input	BOOL	Send data BOOL 00
...			...
SD_BO_15	Input	BOOL	Send data BOOL 15
SD_I_00	Input	INT	Send data INT 00
SD_I_01	Input	INT	Send data INT 01
SD_DI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Send data DINT 00
DINTMODE	Input	DINT	(S7-1200, S7-1500) (hidden) 0=SD_I_00 u. SD_I_01 are sent 1=SD_DI_00 is sent
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 530))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=RCVDP outputs fail-safe values
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Non-fail safe service information

RCVDP parameter:

The following table shows the parameters of the RCVDP instruction:

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	1=Acknowledgment for reintegration of send data following communication error
SUBBO_00	Input	BOOL	Fail-safe value for receive data BOOL 00
...			...
SUBBO_15	Input	BOOL	Fail-safe value for receive data BOOL 15
SUBI_00	Input	INT	Fail-safe value for receive data INT 00
SUBI_01	Input	INT	Fail-safe value for receive data INT 01
SUBDI_00	Input	DINT	(S7-1200, S7-1500) (hidden) Fail-safe value for receive data DINT 00
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 530))
LADDR	Input	INT (S7-300, S7-400) HW_SUBMODULE (S7-1200, S7-1500)	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with SENDDP instruction in disabled safety mode
RD_BO_00	Output	BOOL	Receive data BOOL 00
...			...
RD_BO_15	Output	BOOL	Receive data BOOL 15
RD_I_00	Output	INT	Receive data INT 00
RD_I_01	Output	INT	Receive data INT 01
RD_DI_00	Output	DINT	(S7-1200, S7-1500) (hidden) Receive data DINT 00
RET_DPRD	Output	WORD	Non-fail-safe error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for the DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))

Parameter	Declaration	Data type	Description
RET_DPWR	Output	WORD	Non-fail-safe error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for the DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	o	—	o	These versions have identical functions to version V1.0.
1.2	x	—	o	
1.4	x	—	x	
1.3	x	—	o	S7-300/400: These versions have identical functions to version V1.0. S7-1200/1500: Instead of 2 data of data type INT, one data of data type DINT can be sent/received as alternative. Otherwise identical function as version V1.0.
1.5	x	x	x	
2.0	x	x[1]	x[2]	

o This version is no longer supported.

[1] supported for Firmware version V4.2 or higher

[2] supported for Firmware version V2.0 or higher

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

The RCVDP instruction must be inserted at the start of the main safety block and the SENDDP instruction at the end.

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDDP and RCVDP instructions). During this time, the receiver (RCVDP instruction) outputs the fail-safe values present at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00.

The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON. The SENDMODE output has default setting "0" and is not updated as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVDP instruction) then outputs the fail-safe values assigned at its SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs. Output SENDMODE is not updated while output SUBS_ON = 1.

The send data of the SENDDP instruction present at inputs SD_BO_xx and SD_I_xx, SD_DI_00 as alternative, are only output again when communication errors are no longer detected (ACK_REQ = 1) and you acknowledge (Page 156) the RCVDP instruction with a positive edge at input ACK_REI.

⚠ WARNING

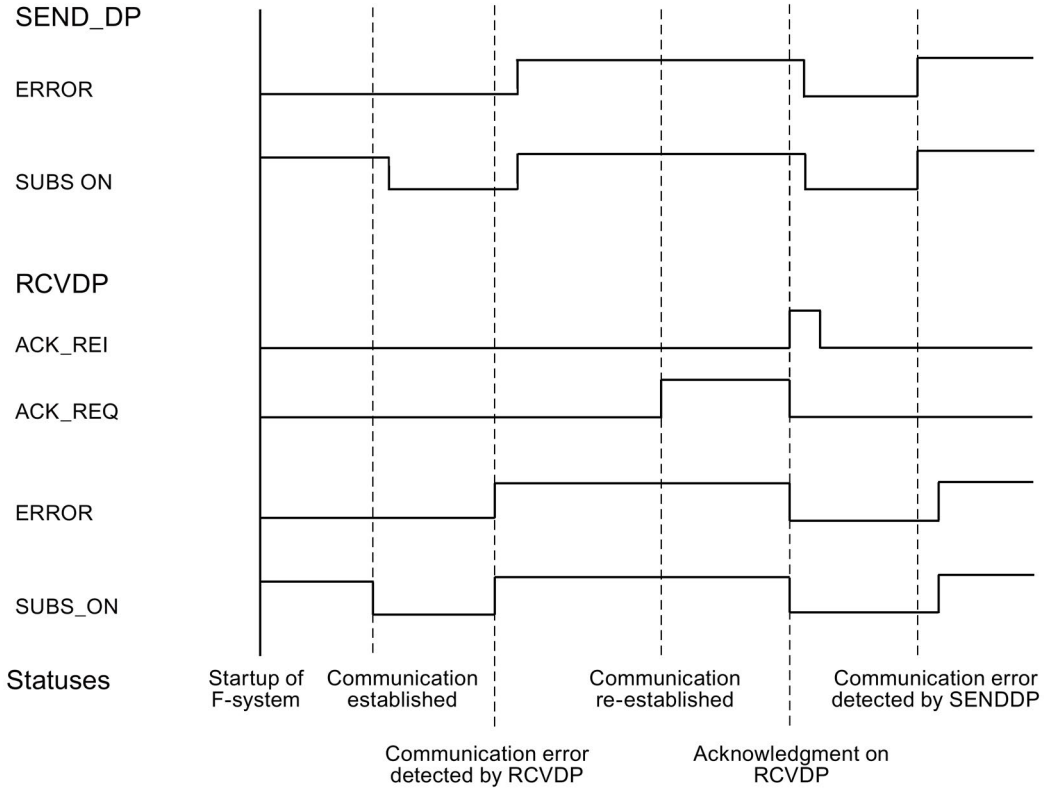
For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) for a communication error will not be set unless communication between the connection partners (SENDDP and RCVDP instructions) has been previously established. If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDDP and the RCVDP instructions, and the bus connection. You also obtain information on possible error causes by evaluating outputs RET_DPRD and RETDP_WR.

In general, always evaluate RET_DPRD and RETDP_WR, since it is possible that only one of the two outputs will contain error information.

Timing diagrams SENDDP/RCVDP



Output DIAG

In addition, non-fail-safe information about the type of communication errors that occurred is provided at output DIAG of the SENDDP and RCVDP instructions for service purposes.

You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge the errors at input ACK_REI of the RCVDP instruction.

Structure of DIAG of the SENDDP/RCVDP instruction

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout of SENDDP/RCVDP detected	Interference in bus connection to partner F-CPU.	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low.	Check assigned monitoring time TIMEOUT for SENDDP and RCVDP of both F-CPUs. If possible, set a higher value. Recompile safety program
		DP/DP coupler or PN/PN coupler configuration is invalid.	Check DP/DP coupler or PN/PN coupler configuration
		Internal fault of DP/DP coupler or PN/PN coupler	Replace DP/DP coupler or PN/PN coupler
		CP in STOP mode, or internal fault in CP	Switch CP to RUN mode, check diagnostic buffer of CP, and replace CP, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	Switch F-CPUs to RUN mode, check diagnostic buffer of F-CPUs, and replace F-CPUs, if necessary
Bit 5	Sequence number error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 6	CRC-error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 7	Reserved	—	—

13.15.2 S7 communication

13.15.2.1 SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V14) (S7-300, S7-400)

Introduction

You use the SENDS7 and RCVS7 instructions for fail-safe sending and receiving of data using S7 connections.

Note

In *STEP 7 Safety Advanced*, S7 connections are generally permitted over Industrial Ethernet only.

Safety-related communication via S7 connections is possible from and to F-CPUs with PROFINET interface or S7-400 F-CPUs with PROFINET-capable CPs. See also Safety-related communication via S7 connections (Page 215).

Description

The SENDS7 instruction sends the send data contained in an F-communication DB to the F-communication DB of the associated RCVS7 instruction of another F-CPU in a fail-safe manner using an S7 connection.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SENDS7_DB_1) or a multi-instance (e.g., SENDS7_Instance_1) for this instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Information on the F-communication DB is contained in "Programming safety-related communication via S7 connections (Page 218)".

An F-communication DB is an F-DB for safety-related CPU-CPU communication with special properties. You must specify the numbers of the F-communication DBs at inputs SEND_DB and RCV_DB of instructions SENDS7 and RCVS7.

The operating mode of the F-CPU with the SENDS7 instruction is provided at output SENDMODE of the RCVS7 instruction. If the F-CPU with the SENDS7 instruction is in disabled safety mode, then output SENDMODE = 1.

To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND with "0" (default = "1"). In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction, and the receiver provides fail-safe values for this period of time (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.

You must specify the local ID - from the perspective of the F-CPU - of the S7 connection (from the connection table in the network view) at input ID of the SENDS7 instruction (see also Configuring (Page 39)).

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define a communication relationship between an SENDS7 instruction in one F-CPU and a communication relationship between an RCVS7 instruction and the other F-CPU by assigning an odd number at input R_ID (of the SENDS7 and RCVS7 instructions). Associated SENDS7 and RCVS7 instructions receive the same value for R_ID.

⚠ WARNING

The value for each address association (R_ID input; data type: DWORD) is user-defined; however, it must be odd for all safety-related communication connections network-wide* and CPU-wide. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program. *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Note

A separate instance DB must be used for each call of the SENDS7 and RCVS7 instructions within a safety program. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVS7 instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVS7 instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVS7 or RCVDP instruction called in an upstream network.

You cannot use an actual parameter for an output of an RCVS7 instruction, if it is already being used for an input of the same or another RCVS7 or RCVDP instruction. The F-CPU can go to STOP if this is not observed. A diagnostics event is entered in the diagnostics buffer of the F-CPU.

Note

You must not program any SENDS7 instruction between a JMP or JMPN instruction and the associated destination network of the JMP or JMPN instruction.

You cannot program a RET instruction prior to a SENDS7 instruction.

SENDS7 parameter

The following table shows the parameters of the SENDS7 instruction:

Parameter	Declaration	Data type	Description
SEND_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 530))
EN_SEND	Input	BOOL	1= Send enable
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Receiving block outputs fail-safe values
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail safe service information

RCVS7 parameter

The following table shows the parameters of the RCVS7 instruction.

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	Acknowledgment for reintegration of send data after communication error
RCV_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 530))
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required

Parameter	Declaration	Data type	Description
SENDMODE	Output	BOOL	1=F-CPU with the SENDS7 instruction in disabled safety mode
STAT_RCV	Output	WORD	Non-fail-safe status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Non-fail-safe status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Non-fail safe service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1500	Function
1.0	x	—	
1.1	x	—	This version has identical functions to version V1.0. It also supports later versions of internally called instructions. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.1 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.2	x	—	This version has identical functions to version V1.0/1.1. It also supports later versions of internally called instructions.

When a new F-CPU is created with *STEP 7 Safety Advanced*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDS7 and RCVS7 instructions). The receiver (RCVS7 instruction) provides fail-safe values for this time period (initial values in its F-communication DB).

The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON. The SENDMODE output (RCVS7 instruction) has default setting "0" and is not updated as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVS7 instruction) then provides fail-safe values (initial values in its F-communication DB). Output SENDMODE is not updated while output SUBS_ON = 1.

The send data present in the F-communication DB (SENDS7 instruction) are not output before the communication error is no longer detected (ACK_REQ = 1) and you acknowledge (Page 156) with a positive edge at input ACK_REI of the RCVS7 instruction.

⚠ WARNING

For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

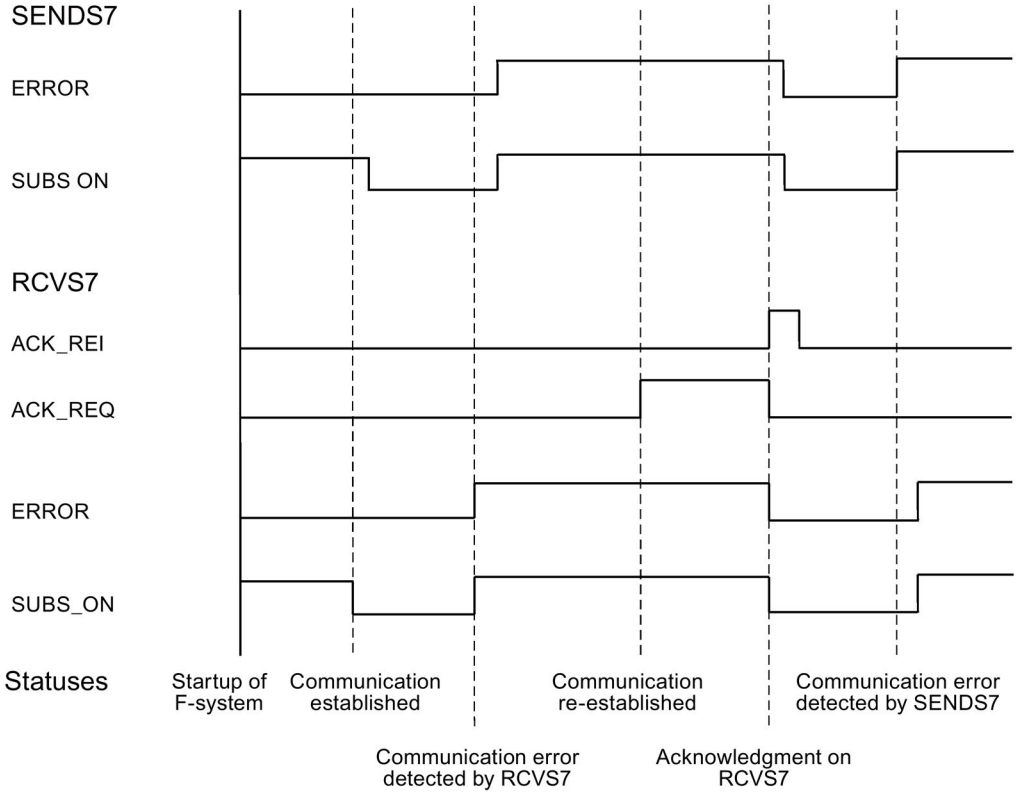
An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) will be set for the first time on a communication error if communication has already been established between the connection partners (SENDS7 and RCVS7 instructions). If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions, and the bus connection. You can also receive information on possible error causes by evaluating the STAT_RCV and STAT_SND outputs.

In general, always evaluate STAT_RCV and STAT_SND, since it is possible that only one of the two outputs will contain error information.

If one of the DIAG bits is set at output DIAG, also check whether the length and structure of the associated F-communication DB on both the sending and receiving ends match.

Timing diagrams SENDS7 and RCVS7



Output DIAG

Non-fail-safe information on the type of communication errors that have occurred is made available at output DIAG for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge them at input ACK_REI of the associated RCVS7 instruction.

Structure of DIAG

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout detected by SENDS7 and RCVS7	Fault in bus connection to partner F-CPU	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low	Check assigned monitoring time TIMEOUT for SENDS7 and RCVS7 of both F-CPUs. If possible, set a higher value. Recompile safety program
		CPs in STOP mode, or internal fault in CPs	• Switch CPs to RUN mode • Check diagnostic buffer of CPs • Replace CPs, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	• Switch F-CPUs to RUN mode • Check diagnostic buffer of F-CPUs • Replace F-CPUs, if necessary
		Communication was shut down with EN_SEND = 0.	Enable communication again at the associated SENDS7 with EN_SEND = 1
		S7 connection has changed, the IP address of the CP has changed, for example	Recompile the safety programs and download them to the F-CPUs
Bit 5	Sequence number error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 6	CRC-error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 7	RCVS7: Communication cannot be established	Configuration of the safety-related CPU-CPU communication is incorrect, parameter assignment of the SENDS7 and RCVS7 instructions is incorrect See also description for Bit 4	Check configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions is incorrect See also description for Bit 4
	SENDS7: Reserved	—	—

Monitoring and response times

A

Introduction

In the following, you will learn:

- Which F-specific monitoring times you must configure
- Which rules must be followed when specifying monitoring times
- Where you enter the F-specific monitoring times
- Which rules must be followed with regard to the maximum response time of a safety function

Support for calculations

An Excel file is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100) to assist you in calculating approximately the runtimes of the F-runtime groups, the minimum F-specific monitoring times, and the maximum response times of your F-System.

Additional information

The monitoring and response times for the standard part are calculated in SIMATIC Safety in exactly the same way as for standard S7-300, S7-400, S7-1200 and S7-1500 automation systems and are not addressed here. For a description of this calculation, refer to the *hardware manuals for the CPUs*.

A.1 Configuring monitoring times

Monitoring times to be configured

You must configure the following monitoring times:

Monitoring...	Setting...	Parameters	See
F-cycle time or cycle time warning limit of the F-runtime groups that contain the safety program	in *Safety Administration Editor*: • Dialog for definition of an F-runtime group	Maximum cycle time of the F-runtime group	• Procedure for defining an F-runtime group (S7-300, S7-400) (Page 110) • Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 112)
of the safety-related communication between F-CPU and F-I/O via PROFIsafe (PROFIsafe monitoring time)	In the *hardware and network editor*: • Centrally when configuring the F-CPU; properties of the F-CPU; or • when configuring the F-I/O; properties of the F-I/O	F-monitoring time F_WD_TIME	• Configuring an F-CPU (Page 44) • Configuring F-I/O (Page 49) • Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 65)
of the safety-related CPU-CPU communication	At the TIMEOUT input of the instructions: • SENDDP; RCVDP; SENDS7; RCVS7	TIMEOUT	• Communication (Page 515)

You do not have to configure the monitoring time for safety-related communication between F-runtime groups.

Rules for configuring monitoring times

When configuring monitoring times, you must take into account the availability as well as the safety of the F-system as follows:

- Availability: To ensure that the time monitoring is not triggered when there is no error, the monitoring times selected must be sufficiently long.
- Safety: To ensure that the process safety time is not exceeded for the process, the monitoring times selected must be sufficiently short.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned F-monitoring time. *(S018)*

General procedure for configuring monitoring times

Use the following procedure for configuring monitoring times:

1. Configure the standard system.

   Refer to the applicable *hardware manuals* and *Help on STEP 7* for the necessary information.

2. Configure the specific monitoring times of the F-System with respect to availability. You use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to calculate the approximate minimum monitoring time.

3. Use the Excel file for response time calculation to calculate the maximum response time and then verify that the process safety time of the process is not exceeded. If necessary, you must reduce the specific monitoring times of the F-System.

A.1.1 Minimum monitoring time for the F-runtime group cycle time

Parameter "Maximum cycle time of the F-runtime group"

You configure the monitoring time for the F-runtime group cycle time in the *Safety Administration Editor* in the work area for definition of the F-runtime group (Page 109).

The specified maximum cycle time of the F-runtime group must be high enough to prevent F-runtime group cycle time monitoring from being triggered when there are no pending faults and causing the F-CPU to go to STOP. For S7-1200/1500 F-CPUs, you can use the "F-runtime group cycle time warning limit (Page 112)" and the TCYC_CURR (Page 118) and TCYC_LONG (Page 118) tags for dimensioning.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to determine the minimum monitoring time for the F-runtime group cycle time. Note also the comments in the Excel file.

A.1.2 Minimum monitoring time for safety-related communication between F-CPU and F-I/O

Parameter "F-monitoring time"

You have two options for configuring the monitoring time of safety-related communication between the F-CPU and F-I/O:

- Centrally in the *hardware and network editor* during parameter assignment of the F-CPU (Page 44); in the properties of the F-CPU, or
- During parameter assignment of the F-I/O (Page 49) in the *hardware and network editor*; in the properties of the F-I/O

"F-monitoring time" = PROFIsafe monitoring time T_{PSTO}

The specified PROFIsafe monitoring time T_{PSTO} must be high enough to prevent tripping the F-cycle time monitoring when no faults are present.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) available for SIMATIC Safety to calculate the minimum monitoring time for safety-related communication between the F-CPU and F-I/O.

Note also the comments in the Excel file.

Check to determine whether configured PROFIsafe monitoring time is too short

Note

During commissioning of the F-system, you can perform a check while safety mode is active to determine whether the configured PROFIsafe monitoring time is too short.

This check of the PROFIsafe monitoring time is useful if you want to ensure that the configured monitoring time exceeds the minimum monitoring time by a sufficient amount. In this way, you can avoid the possible occurrence of sporadic monitoring time errors.

Procedure:

1. Insert an F-I/O (one that will not be needed later for system operation).
2. Assign a shorter monitoring time for this F-I/O than for the F-I/O of the system.
3. If the additional F-I/O fails and the "Monitoring time for safety message frame exceeded" diagnostic is signaled, you have fallen below the minimum possible PROFIsafe monitoring time.
4. Increase the monitoring time for the added F-I/O just to the point where it no longer fails. This monitoring time corresponds approximately to the minimum possible monitoring time.

Conditions:

The F-I/O to be inserted additionally and the F-I/O whose PROFIsafe monitoring time is to be checked must have the following properties in common:

- They must be inserted in the same rack
- They must be nodes in the same subnet

Tip:

It may be useful to leave the additional F-I/O in place for systems that will be modified or expanded during operation after commissioning. This F-I/O will then provide an early warning in the event of changes in the time behavior, enabling you to avoid a process shutdown triggered by the F-I/O in the process.

A.1.3 Minimum monitoring time of safety-related CPU-CPU communication

TIMEOUT input at SENDDP and RCVDP or SENDS7 and RCVS7

The time monitoring is performed in the SENDDP and RCVDP (Page 515) or SENDS7 and RCVS7 (Page 523) instructions of the communication partner. You must assign the time monitoring with identical monitoring time for both instructions at the TIMEOUT input.

The specified monitoring time TIMEOUT must be high enough to prevent tripping the monitoring when no faults are present.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) available for SIMATIC Safety to determine the minimum value for TIMEOUT.

Note also the comments in the Excel file.

A.1.4 Monitoring time for safety-related communication between F-runtime groups (S7-300, S7-400)

The monitoring time for safety-related communication between F-runtime groups is determined automatically from the values for the "Maximum cycle time of F-runtime group" (work area for Definition of the F-runtime group (Page 109) in the *Safety Administration Editor*).

Monitoring time = (maximum cycle time of the 1st F-runtime group) + (maximum cycle time of the 2nd F-runtime group)

A.2 Response Times of Safety Functions

Definition of response time

The response time is the time from detection of an input signal until the linked output signal changes.

Fluctuation range

The actual response time lies between a minimum response time and maximum response time. You must always take the maximum response time into account in your system configuration.

Rules for maximum response time of a safety function

The maximum response time of a safety function must be less than the process safety time of the process.

Definition of process safety time of a process

The process safety time of a process is the time interval within which the process can be left on its own without causing injury to operating personnel or damage to the environment.

Within the process safety time, any type of F-system process control is tolerated. That is, during this time, the F-system can control its process incorrectly or it can even execute no control at all. The process safety time of a process depends on the process type and must be determined on a case-by-case basis.

Procedure for response time calculation

The Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is available for calculating the maximum response time of a safety function.

Use the Excel file to calculate the approximate maximum response time of the safety function and then check that the process safety time of the process is not exceeded.

If necessary, you must reduce the specific monitoring times of the F-system (see Minimum monitoring time for safety-related communication between F-CPU and F-I/O (Page 533)).

Checklist

B

Life cycle of fail-safe automation systems

The following table contains a checklist summarizing all activities in the life cycle of a fail-safe SIMATIC Safety system, including requirements and rules that must be observed for each activity.

Checklist

Glossary

Access protection

→ Fail-safe systems must be protected against dangerous, unauthorized access. Access protection for F-systems is implemented by assigning two passwords (one for the → F-CPU, and one for the → safety program).

Automatically generated F-blocks

→ F-blocks that are automatically generated and, if necessary, called when the → safety program is compiled, in order to generate an executable safety program from the safety program programmed by the user.

Category

Category in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

With SIMATIC Safety, use in → safety mode up to category 4 is possible.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

Collective F-signatures

The collective F-signatures uniquely identify a particular state of the → safety program and the safety-related parameters of the F-CPU and F-I/O. They are important for the on-site acceptance of the safety program, e.g., by → experts.

CPU-wide

In the context of F-I/Os, "CPU-wide" means all F-I/Os assigned to an F-CPU: Central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller and assigned F-I/O in a shared device. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

In the context of safety-related CPU-CPU communication, "CPU-wide" encompasses all the safety-related communication connections that are configured in an F-CPU.

CRC

Cyclic Redundancy Check → CRC signature

CRC signature

The validity of the process data in the → safety message frame, the correctness of the assigned address relationships, and the safety-related parameters are validated by means of a CRC signature contained in the safety message frame.

DB for F-runtime group communication

-> F-DB for safety-related communication between F-runtime groups of a safety program.

Depassivation

→ Reintegration

Disabled safety mode

Temporary deactivation of → safety mode for test purposes, commissioning, etc.

The following actions are possible only in disabled safety mode:

- Downloading changes of the → safety program to the -> F-CPU during ongoing operation (in RUN mode)
- Test functions such as "Modify" or other write access to data of the → safety program (with limitations)

Whenever safety mode is deactivated, the safety of the system must be ensured by other organizational measures, such as operation monitoring and manual safety shutdown.

Discrepancy analysis

Discrepancy analysis for equivalence or non-equivalence is used for fail-safe inputs to detect errors caused by the time characteristic of two signals with the same functionality. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same level). On expiration of an assignable period (→ discrepancy time), a check is made to determine whether the difference in levels (for non-equivalence testing, the same level) has disappeared after an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error. The discrepancy analysis is performed between the two input signals of the 1oo2 evaluation of the sensors (→ sensor evaluation) in the fail-safe input.

Discrepancy time

Assignable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are prolonged unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily because a discrepancy error is detected when, in reality, no error exists.

DP/DP coupler

Device for coupling two PROFIBUS DP subnets required for master-master communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

Expert

The acceptance of a system, i.e., the safety-related acceptance test of the system, is usually carried out by an independent expert (for example, from TÜV).

Fail-safe GSD based DP slaves

Fail-safe GSD based DP slaves are standard slaves that are operated on PROFIBUS with the DP protocol. They must operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile. A GSD file is used for their configuration.

Fail-safe GSD based I/O devices

Fail-safe GSD based I/O devices are standard devices that are operated on PROFINET with the I/O protocol. They must operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile in V2-MODE. A GSD file is used for their configuration.

Fail-safe I/O modules

ET 200eco modules that can be used for safety-related operation (-> safety mode). These modules are equipped with integrated → safety functions. They operate in accordance with IEC 61784-1:2010 (Fieldbus profiles) and the PROFIsafe bus profile.

Fail-safe modules

Fail-safe modules ET 200SP, ET 200S, ET 200pro, ET 200iSP that can be used in the ET 200SP, ET 200S, ET 200pro or ET 200iSP distributed I/O systems.

Fail-safe modules S7-1500/ET 200MP, which can be used centrally in an S7-1500 or in a distributed I/O ET 200MP system.

Fail-safe module S7-1200 which can be used centrally in an S7-1200 system.

These modules are equipped with integrated safety functions (→ Safety mode) for fail-safe operation (→ Fail-safe operation). They operate in accordance with the → PROFIsafe bus profile.

Fail-safe systems

Fail-safe systems (F-systems) are systems that remain in a safe state or immediately switch to another safe state as soon as particular failures occur.

Fault reaction function

→ User safety function

Fault reaction time

The maximum fault reaction time for an F-system specifies the time between the occurrence of any error and a safe reaction at all affected fail-safe outputs.

F-blocks

The following fail-safe blocks are designated as F-blocks:

- those created by the user in LAD or FBD
- those created by the user as → F-DBs
- those selected by the user from a global library
- those added automatically in the → safety program (→ F-SBs, → automatically generated F-blocks, → F-shared DB, → F-I/O DBs; instance DBs of F-FBs)

All F-blocks are shown in yellow in the project tree.

F-CALL

"F-call blocks" for the → safety program in *S7 Distributed Safety*.

F-communication DBs

Fail-safe data blocks for the safety-related CPU-CPU communication via S7 connections.

F-compliant PLC data type (UDT)

An F-compliant PLC data type (UDT) is a PLC data type (UDT) in which you can use all data types that can be used in safety programs.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is approved for use in SIMATIC Safety and in which a → safety program can run in addition to the → standard user program.

F-DBs

Optional fail-safe data blocks that can be read-/write-accessed from anywhere within the safety program (exception: DBs for F-runtime group communication).

F-destination address

→ PROFIsafe address

F-FBs

Fail-safe function blocks (with instance DBs), in which the user programs the → safety program in FBD or LAD.

F-FCs

Fail-safe FCs, in which the user programs the → safety program in → FBD or → LAD.

F-I/O

Collective name for fail-safe inputs and outputs available in *SIMATIC S7* for integration in SIMATIC Safety, among others. The following are available:

- → ET 200eco fail-safe I/O module
- → S7-300 fail-safe signal modules
- → Fail-safe modules for S7-1200
- → Fail-safe modules for ET 200MP
- → Fail-safe modules for ET 200SP
- → Fail-safe modules for ET 200S
- → Fail-safe modules for ET 200pro
- → Fail-safe modules for ET 200iSP
- → Fail-safe GSD based DP slaves
- → Fail-safe GSD based I/O devices

F-I/O DB

Fail-safe data block for F-CPUs to an → F-I/O in *STEP 7 Safety*. An F-I/O DB is automatically created for each F-I/O when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that the user can or must evaluate or write in the safety program as follows:

- For reintegration of the F-I/O after communication errors
- For reintegration of F-I/O after F-I/O or channel faults
- If the F-I/O must be passivated as a result of particular states of the safety program (for example, group passivation)
- For reassignment of parameters for fail-safe GSD based DP slaves/GSD based I/O devices or enabling HART communication for the F-I/O with the corresponding functionality
- In order to evaluate whether fail-safe values or process data are output

F-I/O faults

Module-related F-I/O fault, such as a communication error or parameter assignment error

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, S7-1500/ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

F-modules

→ Fail-safe modules

F-OB

The F-OB calls the main safety block of an F-runtime group in S7-1200/1500 F-CPUs.

F-runtime group

The → safety program consists of one or two F-runtime groups. An F-runtime group is a logical construct of several associated → F-blocks. It is generated internally by the F-system. An F-runtime group consists of the following F-blocks:

→ Main safety block, F-OB (S7-1200, S7-1500), if applicable → F-FBs/ → F-FCs, if applicable → F-DBs, → F-I/O DBs, F-blocks of global libraries, instance DBs, → F-SBs, and → automatically generated F-blocks.

F-runtime group information DB

The F-runtime group information DB provides key information on the corresponding → F-runtime group and on the → safety program as a whole.

F-shared DB

(S7-300, S7-400) Fail-safe data block that contains all of the shared data of the → safety program and additional information needed by the F-system. The F-shared DB is automatically inserted and expanded when the hardware configuration is compiled. Using its name F_GLOBDB, the user can evaluate certain data of the → safety program.

F-SMs

→ S7-300 fail-safe signal modules

F-source address

→ PROFIsafe address

F-system blocks

Fail-safe system blocks that are automatically inserted and called when the → safety program is compiled in order to generate an executable safety program from the user's safety program.

F-systems

→ Fail-safe systems

I-device

The functionality of the "I-device" (intelligent I/O-device) of a CPU allows data exchange with an I/O-controller and thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-device is connected as an I/O-device to a "parent" I/O-controller.

IE/PB link

Device for coupling PROFINET IO and PROFIBUS DP-systems required, among other things, for IO-controller-I-slave communication between -> safety programs in different → F-CPUs in SIMATIC Safety.

i-parameter

Individual parameters of → fail-safe GSD based DP slaves and → fail-safe GSD based I/O devices

I-slave

The functionality of the "I-slave" (intelligent DP slave) of a CPU allows data exchange with a DP master and, thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-slave is connected as a DP slave to a "parent" DP master.

Main safety block

"Introductory F-block" for fail-safe programming of the → safety program in *STEP 7 Safety*. The main safety block is an → F-FB or → F-FC that the user assigns to the calling F-OB (S7-1200, S7-1500) or block (OB, FC, FB) (S7-300, S7-400) of an → F-runtime group.

The main safety block contains the safety program and any calls of other → F-FBs/F-FCs for program structuring.

Network-wide

A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/32 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Passivation

When passivation occurs in an → F-I/O with inputs, the → F-system provides the safety program with fail-safe values (0) instead of the process data pending at the fail-safe inputs in the PII.

When passivation occurs in an F-I/O with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values in the PIQ provided by the safety program.

PL

Performance Level (PL) in accordance with ISO 13849-1:2015 or EN ISO 13849-1:2015

With SIMATIC Safety, use up to Performance Level (PL) e is possible in → safety mode.

PN/PN coupler

Device for coupling two PROFINET IO systems required for IO controller-IO controller communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

PROFIsafe

Safety-related bus profile of PROFIBUS DP and PROFINET IO for communication between the → safety program and the → F-I/O in an → F-system. See IEC 61784-3-3:2010 or PROFIsafe – Profile for Safety Technology on PROFIBUS DP and PROFINET IO; Order No: 3.192 (V2.6.1).

PROFIsafe address

The PROFIsafe address (code name according to IEC 61784-3-3:2010) is used for protection of standard addressing mechanisms, such as IP addresses. The PROFIsafe address consists of an F-source address and an F-destination address. Each → F-I/O therefore has two address parts, an F-source address and an F-destination address.

The F-source address is automatically assigned and is displayed for fail-safe DP standard slaves/GSD-based I/O devices and ET 200SP, ET 200MP and S7-1200 fail-safe modules. The F-source address for F-modules ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 is always 1. For F-modules ET 200SP/ET 200MP, the F-source address corresponds to the "Central F-source address" parameter of the assigned F-CPU.

You need to configure the F-destination address in the *hardware and network editor*. You assign the F-destination address for the ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 F-modules with a switch. For ET 200SP F-modules and ET 200MP F-modules, assign the PROFIsafe address in the *hardware and network editor*. For S7-1200 F-modules, the F-destination address is automatically assigned by the F-system.

Program signature

→ collective F-signature

Project data

The project data includes the hardware configuration and the → user program.

Reintegration

The switchover from fail-safe values (0) to process data (reintegration of an → F-I/O) takes place automatically or following user acknowledgment in the F-I/O DB. The reintegration method depends on the following:

- The reason for → passivation of the F-I/O/channels of the F-I/O
- The parameter assignment in the → F-I/O DB or in the configuration itself (for example, ET 200MP fail-safe modules on an S7-1500 F-CPU and S7-1200 fail-safe modules on an S7-1200 F-CPU)

Following reintegration for an → F-I/O module with inputs, the process data pending at the inputs in the PII are provided again for the safety program. For an F-I/O with outputs, the F-system again transfers the output values provided in the PIQ in the safety program to the fail-safe outputs.

RIOforFA Safety

Remote IO for Factory Automation with PROFIsafe; profile for F-I/O

S7-300 fail-safe signal modules

Fail-safe signal modules of the S7-300 module series that can be used for safety-related operation (→ Safety mode) as centralized modules in an S7-300 or as distributed modules in the ET 200M distributed I/O system. The fail-safe signal modules are equipped with integrated → safety functions. They operate in accordance with the → PROFIsafe bus profile.

S7-PLCSIM

The *S7-PLCSIM* application enables you to execute and test your program on a simulated automation system on your programming device or PC. Because the simulation takes place completely in your programming device or PC, you do not need any hardware (CPU, I/O).

Safe state

The basic principle of the safety concept in → fail-safe systems is the existence of a safe state for all process variables. For digital → F-I/O that conform to IEC 61508:2010, this is always the value "0".

Safety Administration Editor

The *Safety Administration Editor* provides support for the main tasks of your safety program.

Safety function

Mechanism integrated in the → F-CPU and → F-I/O that allows them to be used in -> fail-safe systems.

According to IEC 61508:2010, a function that is implemented by a safety device in order to maintain the system in the safe state or bring the system to a safe state in the event of a specific fault. (fault reaction function -> user safety function)

Safety message frame

In → safety mode, data are transferred in a safety message frame between the → F-CPU and → F-I/O, or between the F-CPUs in safety-related CPU-CPU communication.

Safety mode

1. Operating mode of → F-I/O in which → safety-related communication can take place using → safety message frames.
2. Operating mode of the safety program. In safety mode of the safety program, all safety mechanisms for error detection and fault reaction are enabled. In safety mode, the safety program cannot be modified during operation. Safety mode can be disabled by the user (→ disabled safety mode).

Safety program

Safety-related user program

Safety protocol

→ Safety message frame

Safety summary

The safety summary provides documentation of the safety-related project data which supports you during acceptance of the system.

Safety-related communication

Safety-related communication is used to exchange fail-safe data.

Safety-related project data

The safety-related project data includes the hardware configuration of the F-CPUs and the → F-I/O and the → safety program.

Sensor evaluation

There are two types of sensor evaluation:

- 1oo1 evaluation – sensor signal is read once
- 1oo2 evaluation - sensor signal is read twice by the same → F-I/O and compared internally

Shared device

The "Shared Device" functionality enables distribution of the submodules of an IO-device between different IO-controllers.

Signature

→ collective F-signatures

SIL

Safety integrity level SIL in accordance with IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and random hardware failures.

With SIMATIC Safety, up to Safety Integrity Level SIL3 is possible in safety mode.

Standard communication

Communication used to exchange non-safety-related data

Standard mode

Operating mode of → F-I/O in which → safety-related communication between the F-CPU and the F-I/O by means of → safety message frames is not possible; only → standard communication is possible in this operating mode.

Standard user program

Non-safety-related user program

Startup of F-system

In the STOP/RUN transition of an → F-CPU, the → standard user program starts up in the normal way. When the → safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The → F-system performs an automation → reintegration of the → F-I/O.

User program

The user program comprises the → standard user program and the → safety program.

User safety function

The → safety function for the process can be provided through a user safety function or a fault reaction function. The user only has to program the user safety function. In the event of an error, if the → F-system can no longer execute its actual user safety function, it executes the fault reaction function: for example, the associated outputs are disabled, and the → F-CPU switches to STOP mode, if necessary.

Value status

The value status is additional binary information for a channel value. The value status is entered in the process image input and provides information on the validity of the channel value.

1: A valid process data is output for the channel value.

0: A fail-safe value is output for the channel value.

Versioned instruction

Instruction for which a version is displayed in the "Version" column of the "Instructions" task card:

Safety requirements, 10, 21
Safety summary, 65, 291, 309
Safety-related communication between F-runtime groups, 115
Safety-related communication via S7 connections
  Configuring, 215
  Data transfer limits, 222
Safety-related CPU-CPU communication, 39, 170, 229, 268, 523
  Checking for correctness, 320
  F-communication DB, 218
  Options, 39
  RCVDP, 515
  Restrictions in RUN mode, 302
  SENDDP, 515

Safety-related IO controller-I-device communication
Configuring, 191, 251
Data transfer limits, 197, 257
Programming, 195, 255
Safety-related IO controller-IO controller communication
Configuring, 173, 231
Data transfer limits, 181, 241
Programming, 178, 237
Safety-related IO controller-I-slave communication, 215, 264
Safety-related I-slave-I-slave communication
Configuring, 204
Data transfer limits, 203
Programming, 201
Safety-related I-slave-slave communication
Configuring, 209
Data transfer limits, 214
Safety-related master-I-slave communication
Configuring, 197, 258
Data transfer limits, 203, 264
Programming, 201, 261
Safety-related master-master communication
Configuring, 182, 241
Data transfer limits, 190, 251
Programming, 187, 247
Safety-related parameters, 43
Scale
Values, 483
SCALE, 483
SENDDP, 177, 178, 187, 187, 194, 195, 200, 201, 236, 237, 246, 247, 254, 255, 261, 261, 295, 515
Behavior in the event of communication errors, 515
Sending data, 515
Structure of DIAG, 515
Timing diagrams, 515
Sending and receiving data via S7 connections, 523
SENDS7, 217, 218, 295, 523
SFDOOR, 426
Shared device
Configuring, 52
