	14	R (B) + T(B)/R(B)	Input Input/output	Receive data (four-wire mode) Receive/send data (two-wire mode)
	15+16	PE Ground	-	GND functional ground (isolated)
Front view				

Note

Ensure the power supply is disconnected before you wire the communication module.

Additional information

Information on connecting the modules can be found in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

3.2 Installation guidelines

To take into consideration

The general installation guidelines must be taken into consideration (see function manual EMC/EMI compatible installation of control systems (http://support.automation.siemens.com/WW/view/en/59193566)).

The cable shield must be installed on a grounding rail to maintain the EMC values (electromagnetic compatibility).

Parameters/address space 4

4.1 Parameter assignment

Introduction

You configure and assign the parameters of the communication module with STEP 7 (TIA Portal V12 or later) or with STEP 7 with integration of a GSD file.

Additional information

The device manual of the communication module is supplemented by the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) and the TIA Portal information system.

There you will find information on the following topics:

- Operating modes
- Receive buffer
- Data flow control
- Transmission integrity
- Data transmission - protocol specific
- Programming/configuring in STEP 7 (TIA Portal)
- Module-specific instructions
- Diagnostics

4.2 Reaction to CPU STOP

Ongoing transmissions are aborted when the higher-level control (CPU) goes to STOP.

Frames in the receive buffer are retained. With a corresponding configuration in the properties dialog of the communication module, you can automatically clear the receive buffer on the communication module during CPU startup.

4.3 Address space

Address space of the communication module

The input addresses of the communications module total 8 bytes. The input addresses are automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal). Output addresses are not required.

Hardware identification (not freely configurable)

The hardware identification (HW ID) is automatically assigned for each communications module when you specify the device configuration in STEP 7 (TIA Portal).

The hardware ID is issued along with the diagnostic messages to localize the module. In addition, the HW identification is required for S7-1500 at the communication instructions in order to identify the communication module. For S7-300/400, the communication module is identified by the start address of the input data.

Programming

5

Overview of the instructions

Communication between the CPU, the communication module and a communication partner takes place by means of special instructions and protocols that support the corresponding communication modules. The instructions process the exchange of data between the CPU and the communication module. They must be called cyclically from the user program. Data transmission takes place asynchronously across several cycles.

The transmission protocols are implemented on the communication module. The protocol is used to adapt the interface of the communication module to the interface of the communication partner.

Instruction	Meaning
Port_Config	You use the Port_Config instruction to dynamically assign basic interface parameters.
Send_Config	You use the Send_Config (send configuration) instruction to dynamically assign serial send parameters of a protocol.
Receive_Config	You use the Receive_Config (receive configuration) instruction to dynamically assign serial receive parameters of a protocol.
P3964_Config	You use the P3964_Config (protocol configuration) instruction to dynamically assign the parameters of the 3964(R) procedure.
Send_P2P	You use the Send_P2P instruction to send data to a communication partner.
Receive_P2P	You use the Receive_P2P instruction to receive data from a communication partner.
Receive_Reset	You use the Receive_Reset instruction to delete the receive buffer of the communication module.
Signal_Get	You use the Signal_Get instruction to read the RS232 accompanying signals.
Signal_Set	You use the Signal_Set instruction to set the RS232 accompanying signals.
Get_Features	You use the Get_Features instruction to read expanded functions supported by the communication module.
Set_Features	You use the Set_Features instruction to set expanded functions supported by the communication module.
USS_Port_Scan	You use the USS_Port_Scan instruction to communicate using the USS.
USS_Drive_Control	You use the USS_Drive_Control instruction to exchange data with a drive.
USS_Read_Param	You use the USS_Read_Param instruction to read parameters from the drive.
USS_Write_Param	You use the USS_Write_Param instruction to change parameters in the drive.
Modbus_Comm_Load	The instruction Modbus_Comm_Load allows you to configure the port of the communication module for Modbus RTU.

Instruction	Meaning
Modbus_Master	The instruction Modbus_Master allows you to communicate as Modbus master by means of the PtP port.
Modbus_Slave	The instruction Modbus_Slave allows you to communicate as Modbus slave by means of the PtP port.

The instructions are part of STEP 7 (TIA Portal). The instructions are available in the "Instructions" task card under Communication > Communication processor.

Additional information

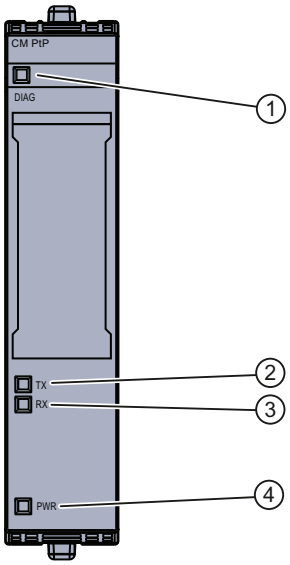
Additional information on programming the communication modules can be found in the function manual CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).

Error and system messages

6

LED displays of the communication module

The figure below shows the LED displays of the CM PtP communication module.



① LED display DIAG
② LED display TX
③ LED display RX
④ LED display PWR

Figure 6-1 View of CM PtP (without BaseUnit)

Meaning of DIAG LED display

LED DIAG	Meaning	Solution
■ On	CM configured and ready for operation	---
☼ Flashes	CM in startup, parameters not assigned yet	---
☼ Flashes	Error information; diagnostic interrupt (break)	Evaluate the diagnostics data and eliminate the error. [1)]

1) Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual

Meaning of the TXD/RXD LED displays

LED		Meaning	Solution
TX	RX		
☼ Flashes	□ Off	Interface is transmitting	---
□ Off	☼ Flashes	Interface is receiving	---

Meaning of PWR LED display

LED PWR	Meaning	Solution
■ On	Power ON (supply voltage present)	---
□ Off	Power OFF (supply voltage missing)	Check the voltage supply of the load group

Additional information

Information on communication module startup and diagnostics is available in the CM PtP - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093) function manual.

Technical specifications

7

Technical specifications of the CM PtP communication module

	6ES7137-6AA00-0BA0
Product type designation	ET 200SP CM PtP
General information	
• I&M data	Yes: I&M 0
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V12.0 / V12.0
STEP 7 can be configured/integrated as of version	V5.5 SP2 or higher with a GSD file
PROFIBUS as of GSD version/GSD revision	- / -
PROFINET as of GSD version/GSD revision	V2.3
Installation type/mounting	
• Rail mounting possible	Yes; standard - DIN rail
Supply voltage	
Voltage type of supply voltage	24 V DC
• Rated value (DC)	24 V
• Low limit of valid range (DC)	19.2 V
• High limit of valid range (DC)	28.8 V
• Reverse polarity protection	Yes
Input current	
• Current consumption (rated value)	29 mA
Power loss	
• Power loss, typ.	0.7 W
Address area	
Occupied address area	
• Inputs	8 bytes

	6ES7137-6AA00-0BA0
Interfaces	
1. Interface	
Interface hardware	
• RS 232	Yes
• RS 422	Yes
• RS 485	Yes
Interface hardware	
RS 232	
• Transmission rate, max.	115.2 kbps
• Max. cable length	15 m
RS-232 accompanying signals	RTS, CTS, DTR, DSR, RI, DCD
RS 485	
• Transmission rate, max.	115.2 kbps
• Max. cable length	1200 m
RS 422	
• Transmission rate, max.	115.2 kbps
• Max. cable length	1200 m
• 4-wire full duplex connection	Yes
• 4-wire multipoint connection	Yes
Protocols	
Integrated protocols	
Freeport	
• Frame length, max.	2 kbyte
• Bits per character	7 or 8
• Number of stop bits	1 or 2 bits
• Parity	None, even, odd, always 1, always 0, any
3964 (R)	
• Frame length, max.	2 kbyte
• Bits per character	7 or 8
• Number of stop bits	1 or 2 bits
• Parity	None, even, odd, always 1, always 0, any
Modbus RTU master	
Address area	1 to 247, extended 1 to 65,535
• Max. number of slaves	32

	6ES7137-6AA00-0BA0
Modbus RTU slave	
Address area	1 to 247, extended 1 to 65,535
Frame buffer	
• Buffer memory for frames	4 kbyte
• Number of frames which can be buffered	255
Interrupts/diagnostics/status information	
Interrupts	
• Diagnostic interrupt	Yes
• Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes
• Wire break	Yes
Diagnostics display LED	
• Monitoring of supply voltage	Yes; green PWR-LED
• For module diagnostics	Yes; green/red DIAG-LED
• Receive RxD	Yes; green LED
• Send TxD	Yes; green LED
Electrical isolation	
• between backplane bus and interface	Yes
Permitted potential difference	
Between the different circuits	75 V DC / 60 V AC (Basic insulation)
Insulation	
Insulation tested with	707 V DC (Type Test)
Ambient conditions	
Operating temperature	
• Horizontal installation, min.	0 °C
• Horizontal installation, max.	60 °C
• Vertical installation, min.	0 °C
• Vertical installation, max.	50 °C
Distributed operation	
• At SIMATIC S7-300	Yes
• At SIMATIC S7-400	Yes
• At SIMATIC S7-1200	No
• At SIMATIC S7-1500	Yes
• At Standard Profinet Controller	Yes

	6ES7137-6AA00-0BA0
Dimensions	
• Width	15 mm
• Height	73 mm
• Depth	58 mm
Weights	
• Weight, approx.	30 g

Additional general technical specifications for SIMATIC ET 200SP can be found in the system manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792).

Dimensional drawing

A

In this appendix, you will find the dimensional drawing of the communication module, inserted into a BaseUnit and mounted on a DIN rail. You have to consider the dimensions during installation in control cabinets, control rooms, etc (BaseUnit: 6ES7193-6BP00-0xA0).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This manual supplements the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual. It describes functions that generally affect the ET 200SP distributed I/O system.

The information provided in this manual and in the system manual and function manuals supports you in commissioning the ET 200SP distributed I/O system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

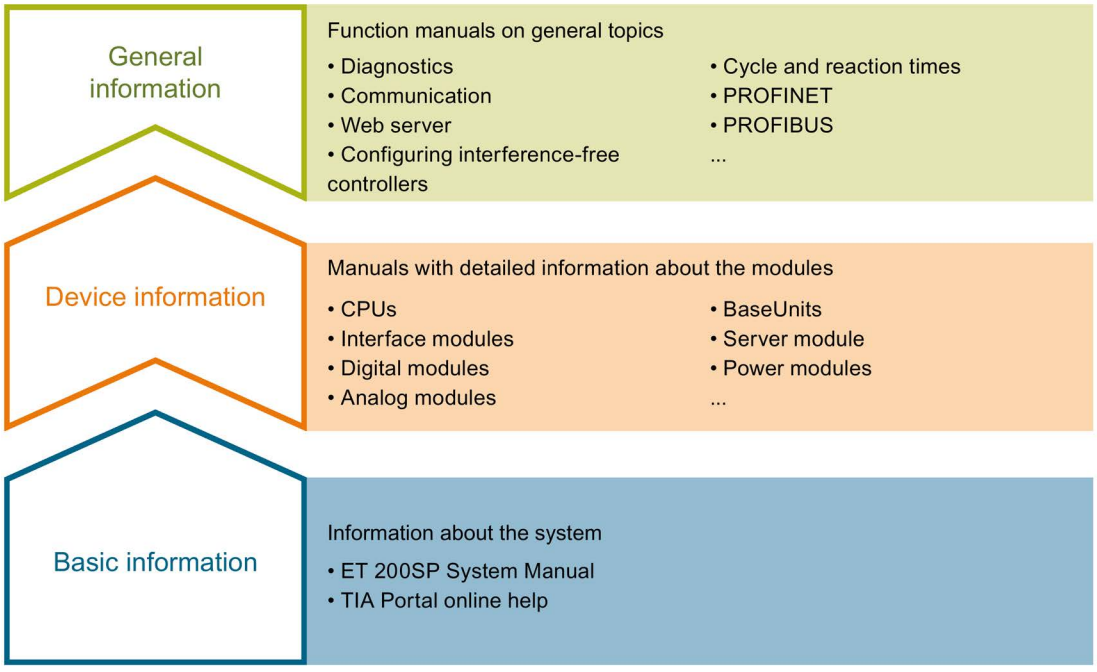
Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Figure 2-1 View of the IO-Link Master CM 4xIO-Link communication module

Properties

The module has the following technical properties:

- IO-Link master according to IO-Link specification V1.1
- Serial communication module with 4 ports (channels)
- Data transmission rate COM1 (4.8 kbaud), COM2 (38.4 kbaud), COM3 (230.4 kbaud)
- SIO mode (standard IO mode)
- Suitable for connecting up to 4 IO-Link devices (3-wire connection) or 4 standard actuators or encoders
- Programmable diagnostics function by port

The module supports the following functions:

Table 2- 1 Version dependencies of the module functions

Function	Firmware version of the module
Firmware update	V1.0 or higher
Identification and maintenance data (I&M)	V1.0 or higher
PROFIenergy	V1.0 or higher
Parameter assignment of the IO-Link parameters by means of S7-PCT	V1.0 or higher
Module replacement with automatic data recovery without engineering for IO-Link master and IO-Link device	V1.0 or higher
Time-based IO (time stamping)	V2.0 or higher
Variable address area of I/O data with up to 32 bytes inputs and 32 bytes outputs	V2.0 or higher
Variable address area of I/O data with up to 144 bytes inputs and 128 bytes outputs	V2.1 or higher

The module can be used with the following engineering tools:

Table 2- 2 Engineering tools depending on the firmware version of the module

Firmware version of the module	S7-PCT	STEP 7 (TIA Portal)	STEP 7 V5.5	GSD file
V1.0 (in PROFINET station)	V3.0 or higher	V12 SP1 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V1.0.3 (in PROFIBUS station)	V3.1 or higher	V13 or higher	As of V5.5 SP3 with HSP0231 as of V1.0	X
V2.0	V3.2 or higher	As of V13 (Time-based IO only with CPU S7-1500)	As of V5.5 SP3 with HSP0231 as of V1.0 (without Time-based IO)	X (without Time-based IO)
V2.1	As of V3.3 and SupportedModules.xml V1.2	As of V13 SP1 with HSP0136 as of V1.0 (Time-based IO only with CPU S7-1500)	As of V5.5 SP4 with HSP0231 as of V4.0 (without Time-based IO)	X (without Time-based IO)

Accessories

The following accessories can be used with the module and are not included in the scope of delivery:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector

See also

You can find more information on accessories in the ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) system manual in the Accessories/Spare parts section.

2.2 Functions

IO-Link is a point-to-point connection between a master and a device. Both conventional and intelligent sensors/actuators can be used as devices at the IO-Link via unshielded standard cables using proven 3-wire technology. IO-Link is backward compatible with conventional digital sensors and actuators. The circuit state and data channel are designed in proven 24 V DC technology.

Reference

Additional information can be found in the IO-Link System (http://support.automation.siemens.com/WW/view/en/65949252) function manual.

2.3 Replacement of the IO-Link Master CM 4xIO-Link communication module with an electronic coding element

If you remove the communication module from the BaseUnit, part of the electronic coding element remains in the BaseUnit. The parameters of the IO-Link Master CM 4xIO-Link and of the IO-Link devices are stored in this part. A newly inserted (but not yet configured) IO-Link master takes over the parameters from the electronic coding element.

⚠ CAUTION

Removal and insertion

Plugging in the IO-Link Master CM 4xIO-Link communication module when the load is switched on can result in dangerous conditions in your plant.

The ET 200SP distributed I/O system may be damaged as a result.

The IO-Link Master CM 4xIO-Link communication module should only be plugged in or pulled out when the load is switched off.

Reference

For more information on the topic of "Coding element", refer to the Changing the type of an I/O module chapter of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

2.4 Time-based IO

Time-based IO ensures that signals are output with a precisely defined response time. A combination of inputs and outputs allows, for example, passing products to be measured precisely or liquids to be dosed optimally.

As of firmware version V2.0.0, the IO-Link master supports the Time-based IO function. You configure the connected IO-Link devices with time stamp functionality as normal with the SIMATIC S7 Port Configuration Tool (S7-PCT). In the "Ports" tab in S7-PCT, set the necessary parameters in the "Operating mode" section:

- IO-Link_Time_based_IO_IN
- IO-Link_Time_based_IO_OUT
- IO-Link_Time_based_IO_INOUT

The Time-based IO function can be used for IO-Link master with 32 bytes I/O data. Larger I/O data ranges are not supported by Time-based IO.

Note

Time stamp function

The time stamp function requires defined address assignment (mapping).

If the address area you require is already occupied, you must modify the user data arrangement of the IO-Link devices in the address space of the IO-Link master.

The "High-precision input/output with Time-based IO" function manual describes how to move user data in the address space.

Reference

You can find more information about Time-based IO in the High-precision input/output with Time-based IO (http://support.automation.siemens.com/WW/view/en/82527590) function manual.

2.5 Reset communication module to factory settings

Effects of resetting to the factory settings

Use the "Reset to factory settings" function to restore the parameter assignments of your IO-Link Master CM 4xIO-Link communication module made with S7-PCT to the factory state.

After a "Reset to factory settings", the parameters of the IO-Link Master CM 4xIO-Link communication module are assigned as follows:

- The ports are in DI mode
- The ports are mapped to the relative addresses 0.0 ... 0.3
- The PortQualifier is disabled
- I&M data 1 to 3 is deleted
- The electronic coding element (if it exists) is deleted

Note

The device parameters are deleted and the factory state is restored.

You should reset a removed IO-Link Master CM 4xIO-Link communication module to the factory settings before you place it in storage.

Procedure

To perform a "Reset to factory settings", proceed as described in the S7-PCT online help.

NOTICE

Internal encoder supply

Use only the supply voltage (US_n/M) made available by the IO-Link Master CM 4xIO-Link communication module to supply the IO-Link device (L+/L-).

3.2 Block diagram

The following figure shows the block diagram of the IO-Link Master CM 4xIO-Link communication module.

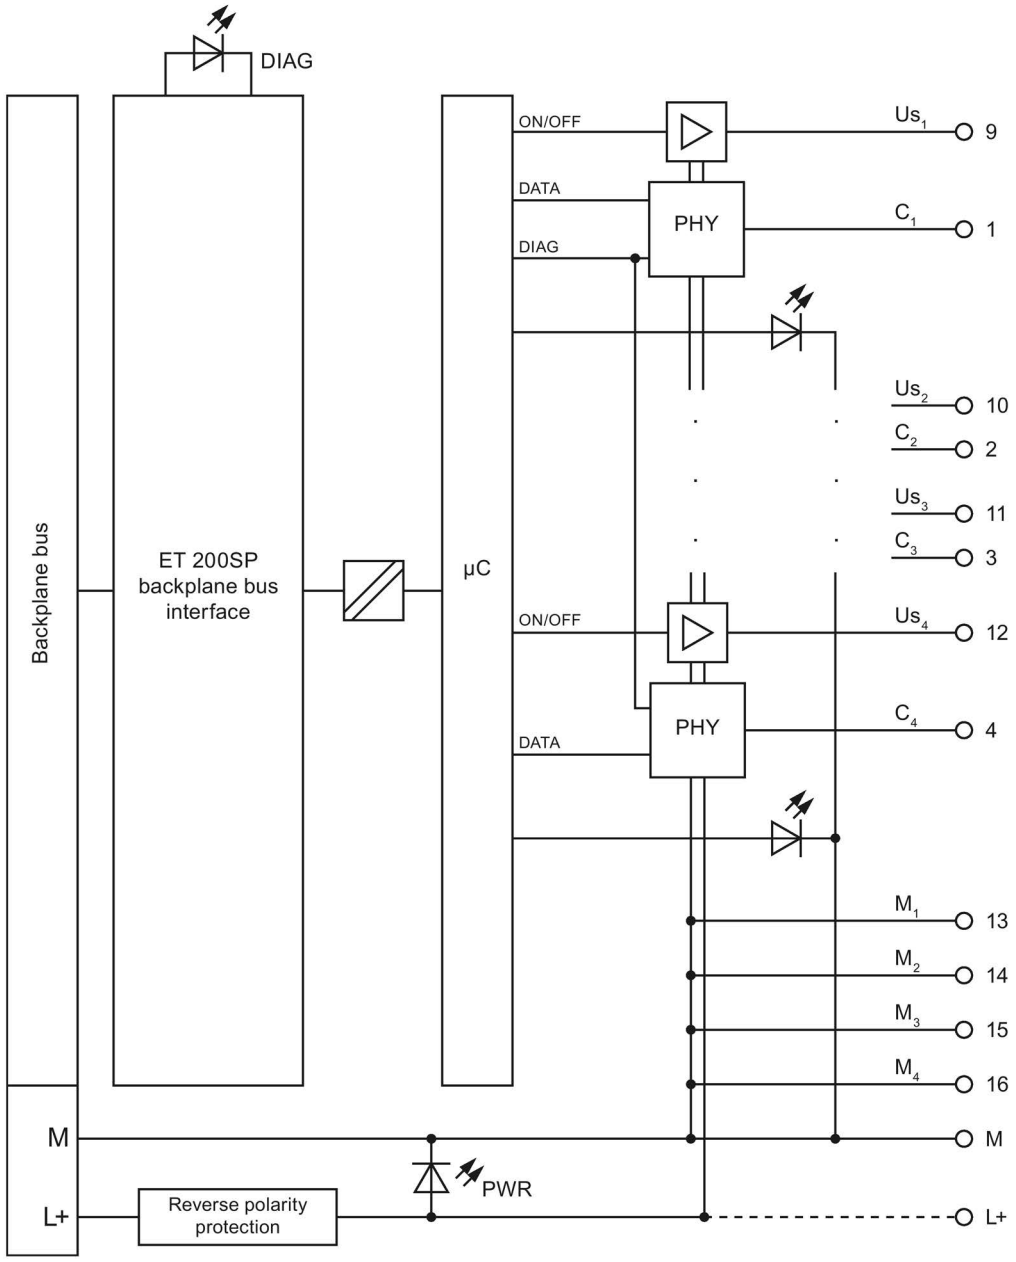

Figure 3-1 Block diagram

Parameters/address space

4

4.1 Parameters

GSD file parameters

The following table shows the parameters for the IO-Link Master CM 4xIO-Link communication module.

Table 4- 1 Parameters (GSD file)

Parameters	Value range	Default	Configuration in RUN	Efficiency range
Diagnostics missing supply voltage L+	• disable • enable	disable	Yes	Module
Diagnostics port 1	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 2	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 3	• disable • enable	disable	Yes	Port (channel)
Diagnostics port 4	• disable • enable	disable	Yes	Port (channel)
Potential group	• Use potential group of the left module • Enable new potential group	Use potential group of the left module	No	Module

4.2 Declaration of parameters

Diagnostics Supply voltage L+ missing

Enabling the diagnostic alarm for missing or insufficient supply voltage L+.

Diagnostics port 1 to port 4

This parameter allows diagnostics to be individually enabled for the four IO-Link ports.

The following assignment applies here:

- Port 1 → Channel 1
- Port 2 → Channel 2
- Port 3 → Channel 3
- Port 4 → Channel 4

Potential group

With the "Potential group" parameter, you specify whether the module is inserted on a light-colored or dark-colored BaseUnit.

A potential group always starts with an I/O module that is inserted on a light-colored BaseUnit. All modules inserted to the right of this on dark-colored BaseUnits belong to the same potential group, because the black BaseUnits are supplied via the light-colored BaseUnits.

The potential group ends with a new light-colored BaseUnit or the end of the station.

See also

ET 200SP distributed I/O system
(http://support.automation.siemens.com/WW/view/en/58649293)

4.3 Address space

Address space of the IO-Link Master CM 4xIO-Link communication module

The size of the input and output addresses of the IO-Link Master CM 4xIO-Link communication module with firmware version V1.0 is 32 bytes in each case. As of firmware version V2.0, the modules support a variable address space for I/O data. You specify the assignment of the IO-Link devices in S7-PCT.

The following table lists the possible settings of the supported address spaces for I/O data:

Supported address space for I/O data	IO-Link master with firmware V1.0	IO-Link master with firmware V2.0	IO-Link master with firmware V2.1
1 byte input/1 byte output		X	X
2 bytes inputs/2 bytes outputs		X	X
8 bytes inputs/8 bytes outputs		X	X
16 bytes inputs/16 bytes outputs		X	X
32 bytes inputs/32 bytes outputs	X	X	X
64 bytes inputs/64 bytes outputs			X
144 bytes inputs[1]/128 bytes outputs			X

[1] The address area 144 bytes inputs comprises additional quality information (port qualifier) as well as the 128 bytes process data.

Note

Use of the IO-Link Master CM 4xIO-Link with I/O data > 32 bytes

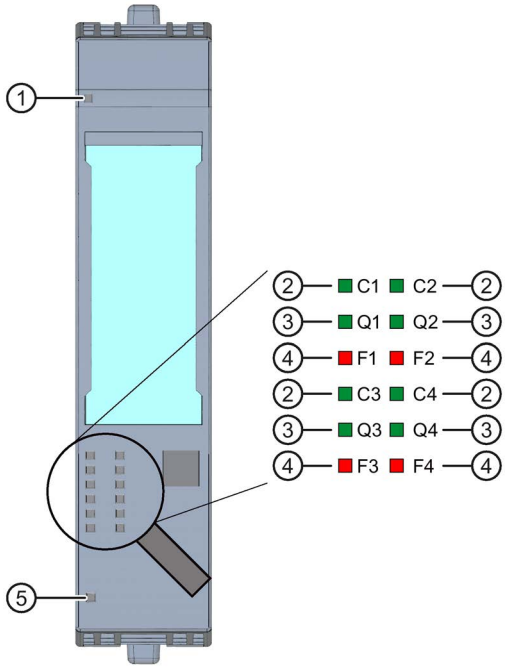
IM 155-6 PN HF/ST interface modules with firmware versions up to V3.0 only support I/O data up to 32 bytes. If you are using IO-Link Master CM 4xIO-Link with I/O data > 32 bytes, you need the IM 155-6 PN HF/ST interface module with firmware version as of V3.1.

Diagnostic alarms

5

5.1 Status and error displays

LED display



①	Diagnostics (DIAG)	(green/red)
②	Port status (Cn)	(green)
③	Channel status (Qn)	(green)
④	Port error (Fn)	(red)
⑤	Supply voltage L+ (PWR)	(green)

n - Channel number

Figure 5-1 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in the Diagnostic alarms (Page 22) chapter.

LED DIAG

Table 5- 1 DIAG LED fault display

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashes	Module is not configured
On	Module parameterized and no module diagnostics
Flashes	Module parameterized and module diagnostics

Cn LEDs

Table 5- 2 Status displays of C1, C2, C3 and C4 LEDs

C1, C2, C3 or C4	Meaning
Off	Port disabled or in SIO mode
Flashes	Port in IO-Link mode, device not connected or port not connected with the configured device
On	Port in IO-Link mode, device not connected

Qn LEDs

Table 5- 3 Status displays of Q1, Q2, Q3 and Q4 LEDs

Q1, Q2, Q3 or Q4	Meaning
Off	Process signal = 0 in SIO mode, deactivated or in IO-Link mode
On	Process signal = 1 in SIO mode

Fn LEDs

Table 5- 4 F1, F2, F3 and F4 LED error displays

F1, F2, F3 or F4	Meaning
☐ Off	No error
■ On	Error

LED PWR

Table 5- 5 Status display of the PWR LED

PWR	Meaning
☐ Off	Supply voltage L+ missing
■ On	Supply voltage L+ present

5.2 Diagnostic alarms

Module errors are indicated as diagnostics (module status) only in IO-Link mode.

Table 5- 6 Error types

Diagnostic alarm	Error code	Meaning (IO-Link error code)	IO-Link master	IO-Link device
Short-circuit	1_H	• Short-circuit in the process cables on the IO-Link device (1804_H)	X	
		• Short-circuit on IO device (7710_H)		X
Undervoltage	2_H	• Supply voltage too low (5111_H, 5112_H)		X
Overvoltage	3_H	• Supply voltage too high (5110_H)		X
Overheating	5_H	• Temperature exceeded on master (1805_H)	X	
		• Temperature exceeded on device (4000_H, 4210_H)		X
Wire break	6_H	• No IO-Link device connected • There is a break in the signal line to the IO-Link device • IO-Link device cannot communicate due to another error (1800_H)	X	
Overflow	7_H	• Process tag range exceeded ($8C10_H$) • Measuring range exceeded ($8C20_H$)		X
Underflow	8_H	• Process tag range too low ($8C30_H$)		X
Error	9_H	• All IO-Link error codes which are not listed here are mapped to this PROFIBUS DP error		X
Configuration error	10_H	• Cannot configure IO-Link master (1882_H, 1883_H) • Incorrect device (1802_H) • Storage error (1886_H)	X	
		• Device was not configured correctly (6320_H, 6321_H, 6350_H)		X
Supply voltage missing	11_H	• L+ supply voltage for device missing (1806_H) • L+ supply voltage for device too low (<20 V) (1807_H)	X	
Defective fuse	12_H	• Fuse on device is defective (5101_H)		X
Safety shutdown	19_H	• Serious error (master has to be replaced) (1880_H)	X	
External fault	$1A_H$	• Error in data storage (1809_H, $180A_H$, $180B_H$, $180C_H$, $180D_H$) • Consistency error in electronic coding element (1885_H) • More than 6 errors are pending simultaneously on the IO-Link device (1808_H)	X	

Technical specifications

6

Technical specifications of the IO-Link Master CM 4xIO-Link communication module

	6ES7137-6BD00-0BA0
Product type designation	ET 200SP, CM 4xIO-Link
General information	
Firmware version	V2.1
Product function	
I&M data	Yes
Engineering with	
STEP 7 TIA Portal can be configured/integrated as of version	V13 SP1 / -
STEP 7 can be configured/integrated as of version	V5.5 SP3 / V5.5 SP4 (in compatibility mode Firmware V1.0)
PROFIBUS as of GSD version/GSD revision	- / GSD as of revision 5
PROFINET as of GSD version/GSD revision	V2.3 / -
Supply voltage	
Rated value (DC)	24 V
Valid range low limit (DC)	19.2 V; 20.5 V if IO-Link is used, because the supply voltage for IO-Link devices on the master must be at least 20 V.
Valid range high limit (DC)	28.8 V
Polarity reversal protection	Yes
Input current	
Current consumption, max.	45 mA; without load
Encoder supply	
Number of outputs	4
Output current, rated value	200 mA
Power loss	
Power loss, typ.	1 W
Digital outputs	
Cable length	
Cable length unshielded, max.	20 m; also applies to shielded cables

	6ES7137-6BD00-0BA0
IO-Link	
Number of ports	4
Number of ports	
• of which can be controlled at the same time	4
IO-Link protocol 1.0	Yes
IO-Link protocol 1.1	Yes
Transmission rate	4.8 kBd (COM1); 38.4 kBd (COM2), 230.4 kBd (COM3)
Cycle time, min.	2 ms; dynamic, dependent on the user data length
Size of process data, input per port	32 byte; max.
Size of process data, input per module	144 byte; max.
Size of process data, output per port	32 byte; max.
Size of process data, output per module	128 byte; max.
Memory size for device parameters	2 Kbyte; for each port
Cable length unshielded, max.	20 m; max.
Operating modes	
IO-Link	Yes
DI	Yes
DO	Yes; max. 100 mA
Connection of IO-Link devices	
Port type A	Yes
Isochronous mode	
Isochronous mode (application synchronized up to terminal)	Yes; only for PROFINET
Constant bus cycle time	Yes
Bus cycle time (TDP), min.	250 µs
Jitter, max.	36 µs; typical +/-
Interrupts/diagnostics/status information	
Status display	Yes
Interrupts	
Diagnostic interrupt	Yes; the port diagnostics is only available in IO-Link mode.
Diagnostic alarms	
Diagnostics	Yes
Monitoring of supply voltage	Yes
Diagnostic indicator LED	
Monitoring of supply voltage	Yes, green PWR LED
Channel status display	Yes; per channel one green LED for channel status Qn (SIO mode) and PORT status Cn (IO-Link mode)
For channel diagnostics	Yes; red Fn LED
For module diagnostics	Yes; green / red DIAG LED

	6ES7137-6BD00-0BA0
Electrical isolation	
Electrical isolation channels	
Between the channels	No
Between the channels and the backplane bus	Yes
Permitted potential difference	
Between the different circuits	75 V DC / 60 VAC (basic insulation)
Insulation	
Insulation tested with	707 V DC (type test)
Dimensions	
Width	15 mm
Weights	
Weight, approx.	30 g

Overview of the response time

The following figure shows the response time for IO-Link without Time-based IO.

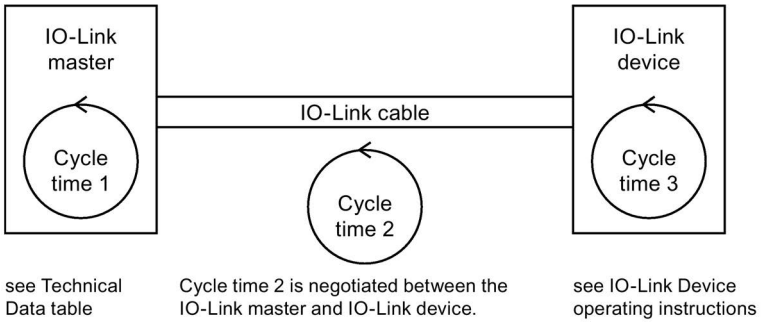


Figure 6-1 Cycle time for IO-Link without Time-based IO

Dimensional drawing

See manual ET 200SP BaseUnits
(http://support.automation.siemens.com/WW/view/en/58532597/133300)

Appendix A

A.1 Parameter data record

Configuration in the user program

You can configure the modules in runtime.

Changing parameters in runtime

The module parameters are included in data record 128. You can transmit the modifiable parameters to the module with the WRREC instruction. The parameters set with STEP 7 are not changed in the CPU by this action.

Instruction for configuration

The following instruction is provided for configuring the IO-Link Master CM 4xIO-Link communication module in the user program:

Table A- 1 Instruction for configuration

Instruction	Application
SFB 53 "WRREC"	Transfer of the alterable parameters to the selected module of the ET 200SP.

Note

If you transfer invalid parameters to the module with the SFB 53 "WRREC" instruction, the module discards the transferred parameters and works with the last valid parameter assignment.

Error message

In the event of an error the following return value is reported:

Table A- 2 Error message

Error code	Meaning
$80B1_H$	Error in data length
$80E0_H$	Error in header information
$80E1_H$	Parameter error

Structure of data record 128

Table A- 3 IO-Link parameters

Offset	Description	Type	Default	Description
0	Version	1 byte	0x02	Shows the structure of the record 0x02 for the IO-Link master in accordance with IO-Link V1.1
1	Parameter length	1 byte	0x02	Parameter length (2 bits + 2 headers)
IO-Link start parameters				
2	Port diagnostics (Port1 1 to n)	1 byte	0x00	Activating the diagnostics for port 1 to n
3	Module properties	1 byte	0x00	Load voltage diagnostics

Table A- 4 Data record: Version

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved		Major version (00)		Minor version (0010)			

Table A- 5 Data record: Port diagnostics

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved				EN_Port4	EN_Port3	EN_Port2	EN_Port1

EN_Portx:

0 = Diagnostics deactivated

1 = Diagnostics activated

Table A- 6 Data record: Module properties

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Reserved						EN_L+	Reserved

EN_L+:

0 = No diagnostics, if no voltage is applied

1 = Diagnostics, if L+ connected

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Foreword

Purpose of the documentation

This device manual supplements the "ET 200SP Distributed I/O System" System Manual. Functions that pertain generally to the ET 200SP can be found in the "ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)" System Manual.

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

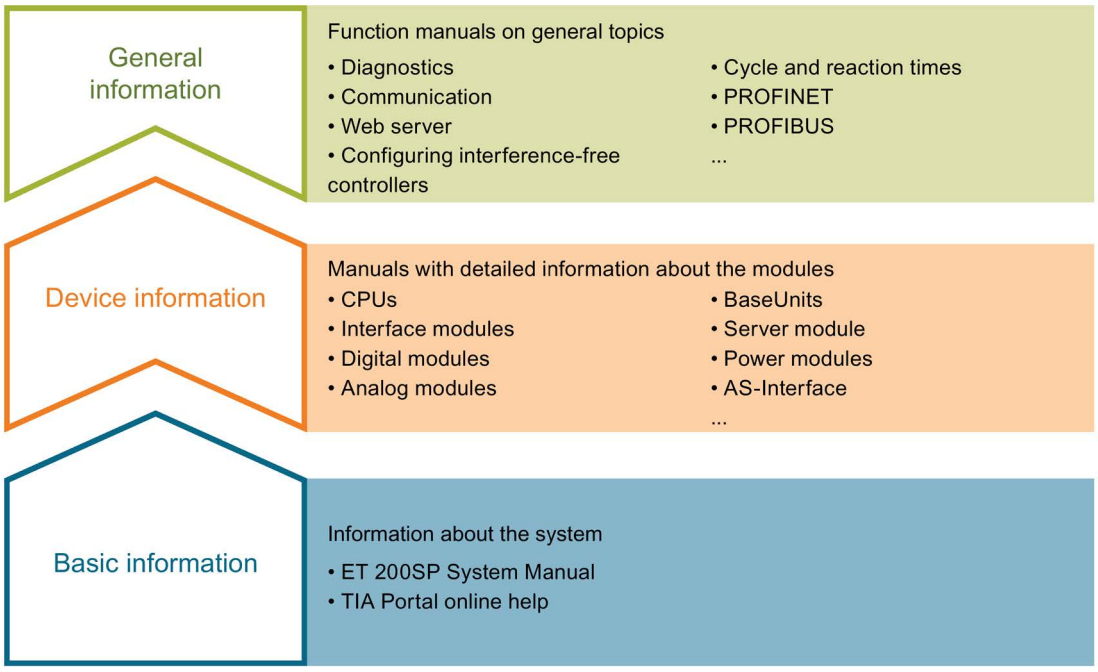
Documentation guide

1

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

The documentation for the SIMATIC ET200 SP distributed I/O system is subdivided into three areas.

This enables you to access the required content quickly.



Basic information

The System Manual describes configuration, assembly, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The *STEP 7* online help supports you with configuration and programming.

Device information

Manuals contain a compact description of the module-specific information, such as properties, connection diagrams, characteristics and technical specifications.

General information

The Function Manuals contain detailed descriptions on topics relating to the SIMATIC ET 200SP environment, such as configuring diagnostics, communications, web servers and controllers for problem-free operation.

The following paragraph gives you an overview of the additional documentation you need to use the CM AS-i Master ST.

Documentation for the ET 200SP distributed I/O system with the CM AS-i master ST

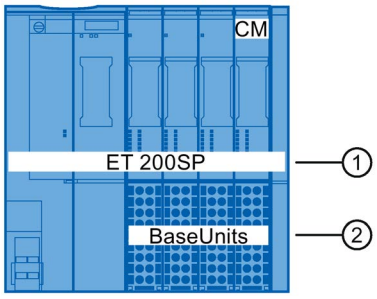


Figure 1-1 Example of a system structure

Table 1- 1 Documentation for the ET 200SP distributed I/O system with the CM AS-i master ST

No.	Component	Documentation	Most important contents
①	System	SIMATIC ET 200SP ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en) SIMATIC distributed I/O (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx)	• Application planning • Installation • Connecting • Commissioning • Technical specifications
②	BaseUnits	SIMATIC ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521)	• Connecting • Technical specifications

Changes and additions to the manuals are documented in the Product Information.

Safety instructions

2

Important safety instructions

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

For use in Pollution Degree 2 Environment.

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

When used in hazardous hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or a suitable enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 in compliance with EN 60529.

⚠ WARNING

Explosion Hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect equipment when a flammable or combustible atmosphere is present.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect while circuit is live unless area is known to be non-hazardous.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Substitution of components may impair suitability for class I, division 2 or zone 2.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not open when energized.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

The equipment is designed for operation with Safety Extra-Low Voltage (SELV) by a Limited Power Source (LPS).

This means that only SELV / LPS complying with IEC 60950-1, EN 60950-1, VDE 0805-1 must be connected to the power supply terminals.

The power supply unit for the equipment power supply must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 40 %. This criteria is fulfilled if supples are derived from SELV (Safety Extra-Low Voltage) only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Division 2, Groups A, B, C, and D or non-hazardous locations only.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is suitable for use in Class I, Zone 2, Group IIC or non-hazardous locations only.

Product overview

3

3.1 Characteristics of the CM AS-i Master ST

Article number

3RK7137-6SA00-0BC1

Brief introduction to AS-Interface

AS-Interface or Actuator-Sensor-Interface (AS-i for short) is a fieldbus system for industrial use that is used to transmit digital and analog signals between a controller and machine or process in real-time. The system can be used for standard signals as well as for safety-related signals.

AS-Interface is designed to connect actuators and sensors to the controller as easily, flexibly and efficiently as possible.

The system consists of an AS-i master and up to 62 AS-i slaves that are simply plugged onto the yellow AS-i flat ribbon cable at any point or connected via terminals. The AS-i cable can be up to 100 m long with free choice of topology. A length of up to 200 m is possible with an additional extension plug. The system can be extended beyond that through the use of repeaters.

In addition, an AS-i power supply unit is connected to the cable such that the slaves and their connected sensors are supplied with operating voltage without additional cabling. Actuators are usually supplied with voltage by means of a 24 V cable, because they generally need more power than sensors.

A typical digital AS-i slave has up to 4 inputs and 4 outputs. The slaves are installed directly in the plant as close as possible to the sensors or actuators so that the connecting cables can be kept very short. The insulation displacement method is the preferred method for connection to the AS-i flat ribbon cable so that assembly can be completed without errors in the least amount of time. For safety-related signals, safety slaves and modules are available for safety-related processing of signals. In addition, analog slaves and complete switchgear with integrated AS-i slave are offered.

The default voltage fed in from the AS-i power supply unit is 30 V DC. As a result, sensors with a rated voltage of 24 V can be used without any problems despite the voltage drop on a longer AS-i cable. Because the AS-i cable transmits both operating DC voltage and modulated communication signals, the AS-i power supply unit contains a data decoupling unit for separating the two voltage waveforms.

A standard power supply can be used in place of the easy-to-use AS-i power supply if the AS-i cable is connected via a separate data decoupling module. When a standard power supply with 24 V DC is used, it must be ensured that the connected AS-i components and sensors are designed for operation with the corresponding lower voltage.

You will find further information on the Internet at: AS-Interface (http://www.siemens.com/as-interface).

Use of the module

The CM AS-i Master ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The CM AS-i Master ST features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The CM AS-i Master ST can be plugged into C0-type BaseUnits (BU).

You can plug several CM AS-i Master ST modules into one SIMATIC ET 200SP station. Each CM AS-i Master with firmware version V1.0 occupies 32 bytes of I/O address space. From firmware version V1.1 onwards, the CM AS-i Master ST supports up to 288 bytes of I/O address space. The number of possible AS-i master modules depends on the maximum address space of the utilized Interface Module (IM) of the ET 200SP or the utilized ET 200SP CPU.

In a SIMATIC ET 200SP station with an IM 155-6 PN ST standard interface module and a maximum address space of 256 bytes, up to eight CM AS-i Master ST modules can be plugged in (when the I/O address space is configured as 32 bytes).

Significantly more modules can be plugged into a SIMATIC ET 200SP station with High Feature Interface Module IM 156-6 PN HF and a maximum address space of 1440 bytes.

If the ET 200SP contains other modules, the available address space is reduced and the maximum number of AS-i master modules is reduced accordingly. The maximum number of modules can be increased by shortening the I/O address space of the CM AS-i Master ST module.

For further information, see the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/84133942).

The CM AS-i Master ST module can generally be combined with all ET 200SP interface modules. Any exceptions to this are documented in the delivery release product announcement(s) of the interface module.

The CM AS-i Master ST module (Firmware V1.1 and higher) can generally be combined with all ET 200SP CPU modules (Firmware V1.8 and higher). Any exceptions to this are documented in the delivery release product announcement(s) for a CPU module.

The interface modules und CPU modules differ, among other things, in terms of the maximum number of I/O modules, the length of the I/O process image in the station and the length of the I/O process image for each I/O module. The technical specifications of the interface modules and CPU modules can limit the selection of possible parameters of the CM AS-i Master ST module. Note, in particular, that the length of the I/O process image of the CM AS-i Master ST module must be selected in such a way that the maximum length of the I/O process image of the interface module or CPU module is not exceeded.

View of the module

Figure 3-1 View of the CM AS-i Master ST

Properties

- Technical properties
  - AS-i master acc. to AS-Interface Specification 3.0
  - Transmission of digital I/O values to cyclic process image
  - Transmission of analog I/O values in the cyclic process image (Firmware V1.1 and higher) or via acyclic data record communication.
  - Configuration button can be connected to terminals
- Supported functions
  - I&M identification data
  - Firmware update
  - Configuration of the AS-i master and AS-i slaves via data records (Read / Write or command interface)

The module can be used with the following engineering versions:

Table 3- 1 Version dependence of the CM AS-i Master ST engineering versions

Firmware version of the module	*STEP 7* (TIA portal)	*STEP 7* V5.5	GSD file
V1.0	V12 and higher	V5.5 SP3 HF5 and higher	X
V1.1	V13 SP1 and higher	V5.5 SP3 HF5 and higher	X

For additional information, see product announcement for: CM AS-i Master ST (https://support.industry.siemens.com/cs/ww/en/view/72865595)

Table 3- 2 Version dependence of the CM AS-i Master ST functions

Function	Firmware version of the module
Configuring in *STEP 7* (TIA Portal) V12 and higher	V1.0 and higher
GSD file (PROFIBUS)	V1.0 and higher
GSD file (PROFINET)	V1.0 and higher
Access via command data records	V1.0 and higher
Structure of the process image: 32 bytes	V1.0 and higher
Transmission of digital I/O values in the cyclic process image	V1.0 and higher
Transmission of analog I/O values via data record transfer	V1.0 and higher
Firmware update	V1.0 and higher
Duplicate address detection	V1.0 and higher
Automatic address programming with manual writing of the ID1 code	V1.0 and higher
Write ID1 code to AS-i address "0"	V1.0 and higher
Configuring in *STEP 7* (TIA Portal) V13 SP1 and higher	V1.1 and higher
Status information for all slaves of the AS-i master system (TIA Portal)	V1.1 and higher
Detailed, device-specific diagnostics (TIA Portal)	V1.1 and higher
Configuring in *STEP 7* V5.5 and higher	V1.1 and higher
Option handling	V1.1 and higher
Proxy slave	V1.1 and higher
Structure of the process image: Up to 288 bytes, adjustable length	V1.1 and higher
Transmission of analog I/O values via process data	V1.1 and higher
Variable address area for I/O data	V1.1 and higher
Automatic address programming with automatic writing of the ID1 code	V1.1 and higher
AS-i slave_ID1_write_with_target_address	V1.1 and higher
Automatic duplicate address detection for AS-i voltage of either 24 V or 30 V	V1.1 and higher

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

3.2 Operating modes of the CM AS-i Master ST

The AS-i master has two operating modes:

- "Configuration mode"
- "Protected operation"

"Configuration mode"

"Configuration mode" can be used for commissioning an AS-i installation. You can also use "configuration mode" for productive operation. The AS-i bus configuration is not defined in this case. This means that error messages for a change of bus configuration are not possible.

You switch the AS-i master from "protected operation" to "configuration mode" in *STEP 7*. The "CM" LED (Configuration Mode) then lights up green.

In "configuration mode", the AS-i master can exchange data with every AS-i slave that is connected to the AS-i cable. This does not apply to AS-i slaves with the address "0". The AS-i master immediately detects and activates newly added AS-i slaves and includes them in cyclic data exchange. The digital process data of the connected AS-i slaves are stored according to a fixed scheme in the process image starting from a configurable start address. See "Transmitting AS-i digital values (Page 50)". The digital process image for the inputs of non-existent slaves is filled with the substitute value "0". Analog process data can only be accessed by means of data record communication.

In "configuration mode", configuration errors of AS-i slaves are not signaled to the higher-level station via an alarm and are not indicated by the "DIAG" LED.

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. In case of changes to the bus configuration, error messages are automatically generated if diagnostics is enabled. See "Parameter assignment/addressing (Page 47)".

Configuration can be performed:

- By configuring the AS-i slaves in the *STEP 7* project (Configuration of the AS-i slaves in STEP 7 (Page 32))
- By transferring the slave configuration with the online "ACTUAL → CONF" function in *STEP 7* (Applying the slave configuration (Page 39))
- By calling the command interface in the SIMATIC user program with the following commands:
  - Store_Actual_Configuration (Page 113)
  - Write_overall_configuration (Page 130)
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 35))

If you have configured the AS-i slave in the *STEP 7* project, the changeover to "protected operation" occurs automatically.

Changeover between "configuration mode" and "protected operation"

- By switching the operating mode using the "Online functions in the TIA Portal (Page 38)".
- By calling the command interface in the user program of SIMATIC with command "Set_Operation_Mode (Page 118)".
- Using the connected "SET" button (Configuration of the AS-i slaves using the "SET" button (Page 35)).

Changeover is not possible if the AS-i slaves have been configured in the *STEP 7* project and the CPU is in RUN operating mode.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Following a firmware update, mark the current firmware version on the housing of the CM AS-i Master ST.

Current firmware updates are available on the Internet for download (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Pay careful attention to the information on performing the firmware update contained in the download entry.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs are off

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

LED behavior after a successfully completed firmware update

When the TIA Portal is used, an error-free firmware update is indicated by the message that the firmware was successfully transferred. You must confirm the message using the button before you continue. Without confirmation, the LED status remains unchanged so that the firmware update is incomplete and must be repeated.

When *STEP 7* V5.5 (classic) is used, there is no concluding message and the LED status changes autonomously.

If the firmware is updated without errors, the LED status is updated:

- DIAG flashes red until the AS-i voltage is switched off and back on again
- PWR is lit green
- Remaining AS-i LEDs are lit

⚠ WARNING

Required intermediate step for firmware update of a CM AS-i Master ST with FW V1.0 using an ET 200SP CPU.

Failure to perform this step causes the CM AS-i Master ST to become permanently inoperable.

If you want to perform an update to a higher firmware version for a CM AS-i Master ST module with FW V1.0 and are using an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), you must always perform the following intermediate step:

After the update of the LED status, the CM AS-i Master ST module must be removed from the ET 200SP BaseUnit. Instead of removing the module, it is also sufficient to switch off the AS-i voltage and the 24 V voltage of the ET 200SP. A TIA Portal error message appears approximately one minute after the module has been removed indicating that online access to the module is no longer possible. Confirm the error message. Then plug the module onto the BaseUnit again or switch the voltages back on.

Now repeat the firmware update. In this case, the intermediate step described here can be skipped.

The intermediate step is not required for:

- Firmware update of a CM AS-i Master ST module with active FW V1.1 or higher
- Use of an ET 200SP configuration with a PROFINET interface module (IM) and PROFINET connection to a released SIMATIC CPU
- Use of an ET 200SP configuration with a PROFIBUS interface module (IM) and PROFIBUS connection to a released SIMATIC CPU.

Note

For operation of the CM AS-i Master ST module in an ET 200SP configuration with an ET 200SP CPU in place of an interface module (IM), the following minimum requirements of the firmware and software versions apply:

- CM AS-i Master ST with FW V1.1 or higher, and
- ET 200SP CPU with FW V1.8 or higher (CPU 1510SP-1 PN, CPU 1510SP F-1 PN, CPU 1512SP-1 PN, CPU 1512SP F-1 PN, Open Controller CPU 1515SP PC)
- Configuration with *STEP 7* V13 SP 1 Update 4 or higher

Note

Restart after a firmware update

Following a firmware update, the AS-i voltage must be switched off and back on again in order for the new firmware to be activated.

Wait for the LED status to update before performing the restart. Otherwise the firmware update is not complete and must be repeated.

LED behavior in the event of an error during a firmware update

If an error occurs during the firmware update, the LEDs assume the following status:

- DIAG flashes red
- PWR is lit green
- Remaining AS-i LEDs indicate the status of the AS-i and are not relevant here.

In this case, switch the AS-i voltage off and back on again and repeat the firmware update.

Connection

4

4.1 Terminal assignment

Requirements

For connecting, you require a BaseUnit:

- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other I/O module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

Exception:

BaseUnits with power busbars without connection to the terminals of the plug-in I/O module can be used within a BaseUnit group for AS-i. These BaseUnits include the following dark BaseUnits with 20 mm width:

- BU20-P12+A0+4B (BU type B1)
- BU20-P12+A0+0B (BU type D0)
- BU20-P8+A4+0B (BU type F0)

Make sure that external voltage from adjacent BaseUnits cannot under any circumstances be connected to the AS-i modules.

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in Section "Schematic circuit diagram (Page 27)", "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

General terminal assignment

Table 4- 1 Terminal assignment of the CM AS-i Master ST

Terminal	Assignment	Description
1	SET1	Connection of the "SET" button (optional),
2	SET2	see "Configuration of the AS-i slaves using the "SET" button (Page 35)"
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L [1)]	ASI+	Connection of the AS-i cable, positive polarity
1N, 2N [1)]	ASI-	Connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "SET" button

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This enables you to apply the ACTUAL configuration of the connected AS-i slaves as the CONFIGURED configuration. This function is activated by closing the button contact on the SET1 and SET2 terminals.

The maximum cable length between the terminal and "SET" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

See also

"ET 200SP Distributed I/O System" System Manual
(http://support.automation.siemens.com/WW/view/en/58649293/0/en)

4.2 Schematic circuit diagram

Schematic circuit diagram

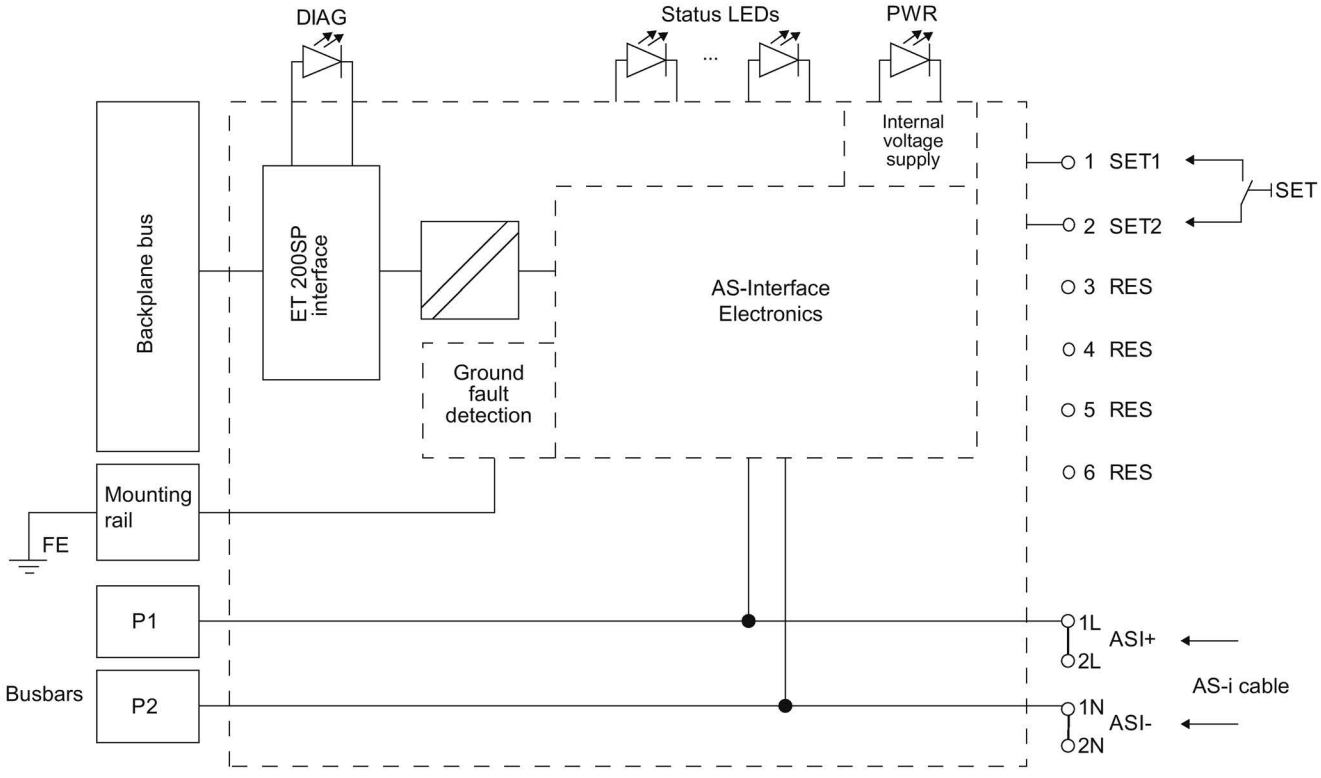

Figure 4-1 Circuit diagram of the CM AS-i Master ST

1L, 2L are connected through in the BaseUnit.

1N, 2N are connected through in the BaseUnit.

Connection to power busbars

The following are connected via the CM AS-i Master ST:

- 1L and power busbar P1
- 1N and power busbar P2

The maximum permitted current here is 4 A. For a conducted current of 4 A, the reduced ambient temperature range applies:

- Max. 55 °C for a horizontally mounted rail
- Max. 50 °C for a vertically mounted rail

If safety-related signals are to be processed on the AS-i cable, you can arrange a dark BaseUnit type C1 to the right of the light BaseUnit type C0 with the CM AS-i Master ST module and plug a safety-related F-CM AS-i Safety ST module onto this dark BaseUnit. The AS-i cable is continued from the light BaseUnit to the dark BaseUnit via the power busbars so that the F-CM AS-i Safety ST module is connected to the AS-i network of the master without additional wiring.

It is not permitted to transmit the AS-i voltage from the connecting terminals on the front of the dark BaseUnit because a current draw of this type may cause an overload in the modules.

Connect the AS-i cable with AS-i power supply unit and AS-i slaves only to terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the light BaseUnit.

You can find additional information on safety-related processing in the "Fail-safe module F-CM AS-i Safety ST (https://support.industry.siemens.com/cs/ww/en/view/90265988)" manual.

Power supply units supported for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to max. 40 V in the event of a fault

The Siemens power supply units for AS-Interface meet these requirements (see operating instructions of the power supply unit).

Use an AS-Interface power supply unit (with integrated data decoupling) or a combination of a standard power supply unit and a data decoupling module.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/42806066)

Power supply

The CM AS-i Master ST is fully powered from the AS-i voltage. Only the internal backplane bus interface for the ET 200SP station (including the DIAG LED) is powered from the operating voltage of the ET 200SP station.

If the operating voltage of the ET 200SP station fails, the communication between the AS-i master and AS-i slaves continues without interruption, in which case the outputs of the AS-i slave are reset to zero.

Configuring

5

5.1 Requirements

Introduction

You configure the ET 200SP station and its CM AS-i Master ST and assign their parameters using *STEP 7* or the configuration software of another manufacturer.

Configuring the CM AS-i Master ST

Configuring in *STEP 7* or another configuration software is required in order to use the CM AS-i Master ST in an ET 200SP. A distinction is made here between the necessary basic configuration of the AS-i master and the optional configuration of the AS-i slaves.

You can configure the module using *STEP 7* or with a GSD file. Version dependencies:

Table 3-1 Version dependence of the CM AS-i Master ST engineering versions (Page 17)

Note

CM AS-i Master ST in the hardware catalog of *STEP 7*

If the CM AS-i Master ST module in the applicable firmware version is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". You can install this HSP from the Internet using the corresponding function in *STEP 7*.

Further information can be found in the documentation and in the online help for *STEP 7*.

Installing the HSP in *STEP 7* V5.5 (classic)	"HW Config" > "Options" menu > "Install HW Updates"
Installing the HSP in *STEP 7* V13 (TIA Portal):	"Options" menu > "Support packages"

You can find additional information on the HSP and download it in Internet (https://support.industry.siemens.com/cs/ww/en/view/108742051).

Download the GSD file from the internet:

PROFINET GSD file (https://support.industry.siemens.com/cs/ww/en/view/57138621)

PROFIBUS GSD file (https://support.industry.siemens.com/cs/ww/en/view/73016883)

Observe the *STEP 7* online help or the documentation of the configuration software manufacturer.

Configuring the AS-i system requires two steps:

1. Basic configuration of the AS-i master (Basic configuration of the CM AS-i Master ST (Page 31))
2. Configuration of the AS-i slaves

Configuring the AS-i slaves includes defining the slave modules and, if necessary, assigning the slave operating parameters.

See also

Configuration of the AS-i slaves in STEP 7 (Page 32)

Configuration of the AS-i slaves using the "SET" button (Page 35)

Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 37)

Configuration of the AS-i slaves using the PLC program (Page 37)

Characteristics of the CM AS-i Master ST (Page 15)

5.2 Basic configuration of the CM AS-i Master ST

The following is carried out as a result of the basic configuration:

- The AS-i master is made known with the system.
- The length of the cyclic process image is made known (length can be set in FW V1.1 and higher).
- The operating parameters of the AS-i master are assigned.

Procedure

The basic configuration is performed by inserting the AS-i master module into the project of the configuration software.

Change the operating parameters according to their use. You will find information on operating parameters in the Sections:

- Parameters (Page 47)
- Explanation of the parameters (Page 47)

Should the need arise, you can change the size of the process image to be transferred as follows:

- In *STEP 7* in the "Properties" dialog of the AS-i master
- When the GSD file is used, by selecting the respective module variant from the GSD selection list

Further information on the process image:

- Address space (Page 48)

See also

Configuration of the AS-i slaves in STEP 7 (Page 32)

5.3 Configuration of the AS-i slaves

5.3.1 Configuration of the AS-i slaves in STEP 7

During configuration of the AS-i slaves, you specify the stations that the AS-i master is to communicate with in *STEP 7*.

Configuration in *STEP 7* provides the following advantages:

- AS-i slaves are displayed graphically in the network view along with their AS-i addresses (*STEP 7* (TIA Portal)) or displayed as a list (*STEP 7* V5.5 and higher).
- The assigned I/O addresses of an AS-i slave are displayed in the Properties window of the AS-i slave.
- The slave parameters can be configured in the *STEP 7* user interface.
- The configuration of the slaves is stored in the *STEP 7* project, which makes documentation easier.
- The configuration data is stored in the PLC and transferred automatically when the AS-i master is replaced.
- During power-up, the AS-i master switches automatically to "protected operation".
- The diagnostic status of the slave is displayed in *STEP 7* (TIA portal) in the network view as a symbol (currently only in combination with S7-300 / S7-400 CPU).

Note

If you do not configure any AS-i slaves in *STEP 7* or if you configure using a GSD file, AS-Interface uses the CONFIGURED configuration saved in the AS-i master. The following sections describe how you can create the CONFIGURED configuration:

- Configuration of the AS-i slaves using the "SET" button (Page 35)
- Configuration of the AS-i slaves via the control panel in the TIA Portal (Page 37)
  This does not apply when configuring with a GSD file.
- Configuration of the AS-i slaves using the PLC program (Page 37)

Procedure

You activate configuration of the AS-i slaves in *STEP 7*:

- In *STEP 7* (TIA Portal) by connecting at least one AS-i slave to the AS-i master over an AS-i network in the network view.
- In *STEP 7* V5.5, by inserting at least one AS-i slave in the configuration table of the AS-i master (FW V1.1 and higher).

When the AS-i slaves are configured in *STEP 7*, configuration is not possible using the "SET" button, via the online function or the PLC program.

This configuration switches the AS-i master automatically to "protected operation".

Option 1: Selection from the hardware catalog

To configure the AS-i slaves, open the hardware catalog in *STEP 7*.

STEP 7 (TIA Portal).

In *STEP 7* (TIA Portal), you will find the AS-i slaves under "Field devices".

1. Select a module from the hardware catalog.
2. Drag the module to the network view.
3. Connect the AS-i interface of the module (yellow square in the slave symbol) to the AS-i interface of the AS-i master (yellow square in the master) or directly to the yellow line of the AS-i subnet. When a connection is made to the AS-i subnet, a free AS-i address is automatically assigned in the configuration.

   You can change this AS-i address in the properties dialog of the AS-i slave in the "AS-Interface" area.

STEP 7 V5.5:

1. Open the "Object properties" dialog of the CM AS-i Master ST in the ET 200SP. To do so, select "Object properties" in the shortcut menu.
2. Click the "Slave configuration" tab (FW V1.1 and higher) in the "Properties..." dialog of the CM AS-i Master ST (FW V1.1 and higher) to open it.
3. Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.
4. Click the "Select" button to open the "Slave selection dialog".
5. Select a slave in this dialog.

   Alternatively: Select a slave from the "Module" list box.

Option 2: Reading out an existing AS-i configuration

If an AS-i cable with AS-i slaves is connected to the AS-i master, you can transfer the connected slaves to the configuration of *STEP 7*. The connected AS-i slaves must have addresses other than "0".

Procedure:

1. Switch on the AS-i voltage.
2. Compile the project and download it to the station.
3. *STEP 7* (TIA Portal):
   - Right click the AS-i master.
   - Select "Hardware detection" in the shortcut menu.

   STEP 7 V5.5:
   - Select the ET 200SP.
   - Open the "Properties" dialog of the CM AS-i Master ST by double-clicking the slot of the CM AS-i Master ST, for example.
   - Change to the "Options AS-i slaves" tab.
   - Click the "Upload to PG" button.

4. The detected slaves are applied as universal slaves in the project.

   Note

   Automatic reading out of article numbers is not possible.

   Slave addresses already present in the project are not overwritten. If you want to transfer a slave address that is already present, you must delete the existing slave in the hardware detection before the readout.

5. You can now edit the slaves applied to the project as if you had taken them directly from the hardware catalog.

The following basic types are available:

- Siemens AS-i slave
- Universal slave with the following forms:
  - AS-i F Slave Universal for safety-related applications
  - AS-i Standard Slave Universal, for configuring with standard address or extended address (A/B slaves)
  - Universal AS-i Proxy Slave

The article numbers for the slaves are only saved in the offline project. Comparison of the article numbers in the offline project with those of the slaves on the AS-i cable is not performed. The AS-i master uses the configuration data of the slave profile (IO.ID.ID2) and ID1 code of the AS-i slave for comparison of the actual status with the configured status.

Configuring the properties of Siemens AS-i slaves

When you use an AS-i slave from Siemens, you select the slave directly from the hardware catalog.

This selection offers the following properties:

- The device type is represented in *STEP 7* (TIA Portal) using an image.
- The meaning of the slave parameters is displayed as text.
- The underlying slave profile is already set. The IO, ID and ID2 identifiers do not need to be entered.

Parameter bits that are irrelevant for the Siemens slave are set to the default value "1". They cannot be changed.

The ID1 code is preassigned according to the factory setting of the Siemens slave. If you change the ID1 code of the slave, you must also change the setting in the slave configuration.

See also the command "AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address) (Page 159)".

Configuring the properties of universal AS-i slaves

When configuring with the universal AS-i slave or universal AS-i F slave, you must make the following settings:

- Profile identification of the AS-i slave (IO, ID, ID2)
- Parameters of the AS-i slave

You will find the profile identification, the ID1 code, and the meaning of the AS-i slave parameters in the documentation for the AS-i slave.

The I/O assignment of the slave is shown, depending on the specified profile identification, in the "Configuration" section.

See also

Applying the slave configuration (Page 39)

Store_Actual_Configuration (Page 113)

5.3.2 Configuration of the AS-i slaves using the "SET" button

Functional principle

You can connect a "SET" button to terminals "SET1" and "SET2" of the AS-i master. This supports the teaching procedure for the connected AS-i slaves. This function is activated by closing the button contact on the SET1 and SET2 terminals.

Behavior in "configuration mode" and in "protected operation"

Table 5- 1 "Configuration mode"/"Protected operation"

Mode of the CM AS-i Master ST	Behavior of the "CM" LED
"Configuration mode"	The "CM" LED lights up.
"Protected operation"	The "CM" LED does not light up.

When the AS-i master is in "configuration mode", the AS-i master is configured automatically when the "SET" button is pressed. Configuration is carried out as follows:

1. The CM AS-i Master ST saves the AS-i slave configuration present on the AS-i cable as the CONF configuration in non-volatile memory.
2. The AS-i master then switches over to "protected operation".

If the AS-i master is in "protected operation", it will switch to "configuration mode" when the "SET" button is pressed.

The "SET" button is only activated when the CPU is in "STOP" state or after disconnecting the bus from the IM module of the ET 200SP.

Requirements

Ensure the following states exist:

1. The CPU is in "STOP" state or the bus is disconnected from the IM module of the ET 200SP.
2. The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
3. No AS-i slave with address 0 is connected to AS-Interface. The AS-i slaves have unique addresses that differ from one another.

Procedure

1. Check whether the AS-i master is in "configuration mode". (The "CM" LED lights up.)

   If the "CM" LED does not light up, switch the AS-i master to "configuration mode" by pressing the "SET" button once.
2. Press the "SET" button. This configures the AS-i master. In so doing, the ACTUAL configuration detected is saved as the CONF configuration in non-volatile memory in the CM AS-i Master ST. At the same time, the AS-i master switches over to "protected operation". The "CM" LED goes out.

Note

Parameter setting when configuring with the "SET" button

If no AS-i slaves are connected, all internal lists are set to default values. In particular, the following are set: all AS-i parameters = F_{Hex} and bit "AutoAdress_Enable = 1".

When configuring is performed using the "SET" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the Set_Permanent_Parameter (Page 107) command.

Note

The existing configuration can be overwritten using the "SET" button

Note regarding the CM AS-i Master ST:

A configuration of AS-i slaves specified using *STEP 7* and downloaded to the S7 station is transferred to the AS-i master again during S7 station start-up or after station recovery of the head module. Any configuration implemented using the "SET" button will be overwritten.

When configuring with the "SET" button, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 45)"). The AS-i voltage must be present.

See also

Terminal assignment (Page 25)

5.3.3 Configuration of the AS-i slaves via the control panel in the TIA Portal

You can also execute the functionality of the "SET" button described in Section "Configuration of the AS-i slaves using the "SET" button (Page 35)" via the control panel in *STEP 7*.

When configuring the AS-i slaves over the control panel in TIA Portal, if no slaves are connected to AS-Interface, the CONFIGURED configuration in the master is deleted along with the profile definition for proxy slaves (see Section "AS-i proxy slave (Page 45)"). The AS-i voltage must be present.

5.3.4 Configuration of the AS-i slaves using the PLC program

You can use the PLC program to completely define the configuration of the AS-i slaves.

The command interface of the AS-i master is available for this. You use the Write_overall_configuration (Page 130) command to specify the CONF configuration of the AS-i slaves in the AS-i master, similarly as when configuring the slave in the TIA Portal.

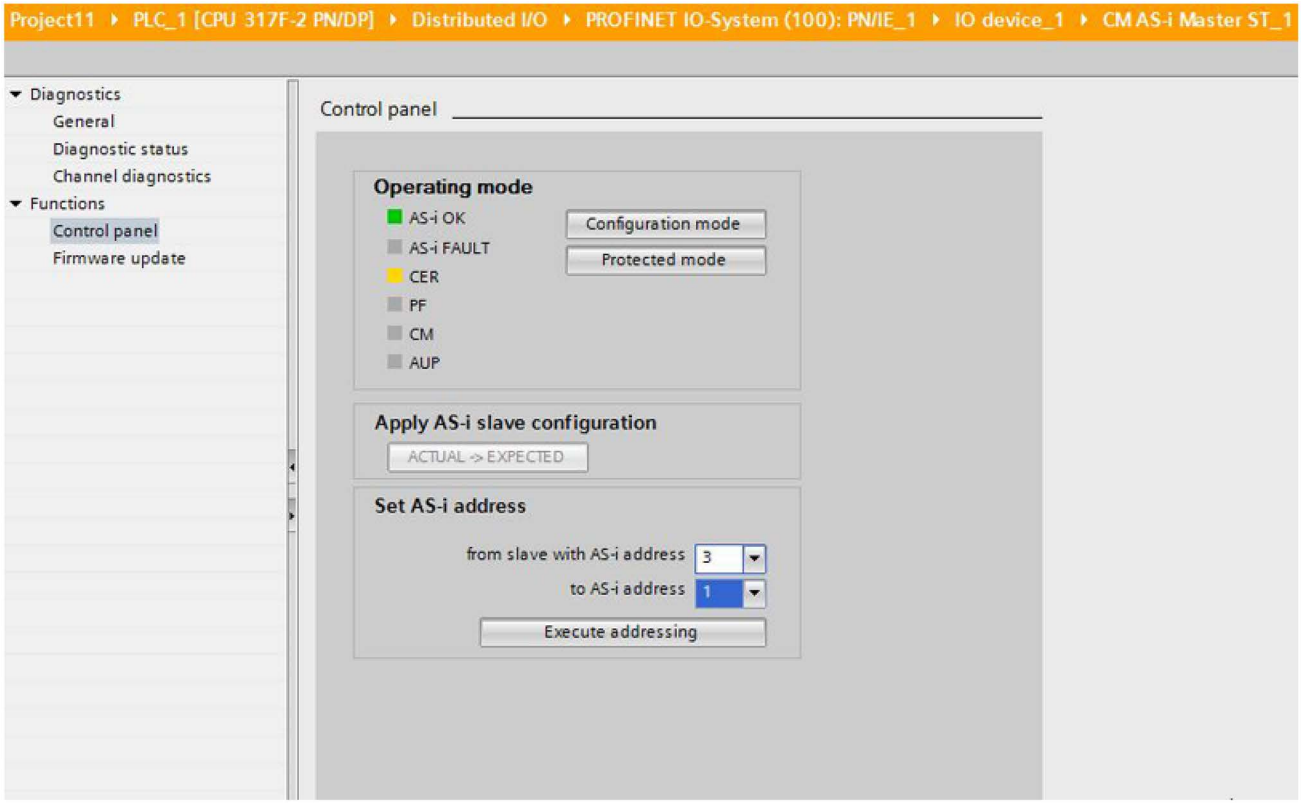
The Store_Actual_Configuration (Page 113) command allows you to save the ACTUAL configuration as the CONF configuration in the AS-i master, similarly as when using the "SET" button for this.

5.4 Online functions in the TIA Portal

5.4.1 Switching from one operating mode to another

In *STEP 7* "Online" > "Diagnostics", you can switch between "protected operation" and "configuration mode" under "Functions". There are two buttons:

- "Configuration mode"
- "Protected operation"



The LEDs on the AS-i master and in *STEP 7* indicate the current operating mode of the AS-i master. You will find additional information in Section "Meaning of the LEDs (Page 64)".

The operating mode can only be switched when the CPU is in "STOP" state.

Note

Online functions

The online functions can only be performed when at least the basic configuration has been completed and the configuration has been loaded into the ET 200SP station.

5.4.2 Applying the slave configuration

Application

This step is only necessary if AS-i slaves have not been configured in *STEP 7* and the configuration of the AS-i slaves is not performed using the "SET" button.

If AS-i slaves have already been configured in *STEP 7* and the slave configuration has been downloaded to the AS-i master, the system deactivates the function for applying the slave configuration. It is then no longer possible for this function to be called.

Requirements

The following requirements must be satisfied to do this:

- The CPU is in "STOP" state.
- The AS-i master and all AS-i slaves are connected to the AS-Interface and supplied with voltage.
- No AS-i slave with addess 0 is connected to the AS-Interface. The AS-i slaves have unique addresses that differ from one another.
- The AS-i master is in "configuration mode".

Applying the slave configuration

The "ACTUAL → CONF" button in the "Online" > "Diagnostics" window can be used to apply the configuration of slaves connected to the master.

The following data of the AS-i slaves is saved in non-volatile memory in the AS-i master:

- AS-i addresses
- The slave profile for each AS-i slave: IO code, ID code, ID2 code
- ID1 code for each AS-i slave

It is not possible to apply the slave configuration via the "ACTUAL -> CONF" button if AS-i slaves have already been configured in *STEP 7* and downloaded to the AS-i master or if the CPU is in "RUN" state. You reactivate the "ACTUAL -> CONF" function by downloading only the basic configuration – that is, the configuration without configured AS-i slaves – in *STEP 7* again.

Note

Parameter setting when applying the slave configuration

When configuring is performed using the "ACTUAL→CONF" button, the parameter value in the volatile memory of the AS-i master for each slave applied to the CONF configuration is saved as a non-volatile parameter. For slaves that are not present, the default value F_H is applied to the non-volatile memory. This corresponds to the function of the Set_Permanent_Parameter (Page 107) command.

5.4.3 Setting the address of an AS-i slave

In the "Online" > "Diagnostics" window, you can assign a new address to an AS-i slave using a selection menu and the "Execute addressing" button. Only free AS-i addresses are available here.

5.5 Variable configuration

Option handling and proxy slaves can be combined.

5.5.1 Option handling

A machine consists of a basic configuration and several expansion stages. The overall configuration is configured in the *STEP 7* project. The slaves that belong to an expansion stage are configured as optional slaves. When the system is commissioned, the user program (PLC) defines which expansion stages are installed. The configuration in *STEP 7* remains unchanged.

You can use option handling to activate and deactivate AS-i slaves that you have defined in HW Config in the user program during operation.

You configure the AS-i slaves in the AS-i master as described in Section "Configuration of the AS-i slaves in STEP 7 (Page 32)":

1. Activate option handling.

   STEP 7 (TIA Portal):

   – Select "Options > Option handling" in the slave properties dialog.

   – Select the "Option handling" check box.

   STEP 7 V5.5:

   – Select the "Slave configuration" tab in the "Properties..." dialog of the CM AS-i Master ST.

   – Double-click the desired AS-i address (1A, B, 2A, B, etc.) to open the "Configuration" of the AS-i slave.

   – Select the "Option handling" check box.

   This activates the option handling for this slave.

2. Activate the slave using the user program (PLC).

   You can also deactivate the slave in the user program.

The AS-i master treats an optional slave that is not activated like a slave that is not configured. The AS-i master treats an activated optional slave like a slave that is configured without option handling.

Procedure

1. Define the AS-i slaves in *STEP 7* (TIA Portal) > Network view or in *STEP 7* V5.5 > "HW Config".
2. Specify whether option handling is enabled for each AS-i slave.
3. In the user program, you can activate or deactivate AS-i slaves for which option handling is activated during runtime. To do this, a combination of 2 bits must be set or reset in data record DS 131.

Note

Option handling and safe AS-i slaves

When data record DS 131 is written to the CM AS-i Master ST module, the signals of the safety-related slaves on the same bus are reset. Before transferring the option data record DS 131, ensure that the system is in an operating state in which a safety signal reset will not adversely affect the course of operation. Before restarting, error acknowledgement or reintegration must be performed for the safe AS-i inputs and, where applicable, the safe AS-i outputs. The correct procedure for the fail-safe evaluation system used must be observed.

DS 131 Read status of option handling (Page 44)

Set_Configuration_Online (Page 158)

5.5.1.1 DS 131 Activate/deactivate optional slaves

Description

By writing this data record, you activate or deactivate slaves configured as optional on the AS-i bus.

Table 5- 2 Structure of DS 131 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2 … 9	List of slaves to be activated							
	Bit = 0	No action						
	Bit = 1	The slave will be activated.						
10 ... 17	List of slaves to be deactivated							
	Bit = 0	The slave will not be deactivated.						
	Bit = 1	The slave will be deactivated.						

Note

Identical entries in each list

If a "1" is entered for an AS-i slave in both lists, the slave will be deactivated.

Note

Activated/deactivated status of the optional slaves

The activated/deactivated status of the optional slaves is stored in non-volatile memory of the master and is retained even if a new configuration is downloaded to the master. The status of an optional slave is set to deactivated if the slave is not set as optional in a configuration.

If a configuration contains slaves without option handling, the status stored internally in the master for these slaves is reset (bit = 0).

See also

Address space (Page 48)

Option handling (Page 41)

5.5.1.2 DS 131 Read status of option handling

Description

The current status of the slaves configured as optional is returned by reading this data record.

Table 5- 3 Structure of DS 131 read

Byte	Meaning							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0 … 1	Reserved							
2 … 9	List of activated, optional slaves							
	Bit = 0	The optional slave is deactivated or the optional slave is not an optional slave.						
	Bit = 1	The optional slave is activated.						
10 ... 17	List of configured, optional slaves							
	Bit = 0	The slave is not configured as an optional slave or it is not contained in the configuration.						
	Bit = 1	The slave is configured as an optional slave.						

If a slave is configured as not optional, then the associated bit in the list of activated optional slaves in the non-volatile memory of the master is reset to the value 0.

See also

Option handling (Page 41)

5.5.2 AS-i proxy slave

Description

A proxy slave is used to represent any given slave. This means you define the I/O addresses in the PLC program in advance. You define the slave itself at runtime.

Procedure

- Configure a proxy slave in "*STEP 7* > HW Config" with the associated digital and / or analog I/O addresses. You can then use these I/O addresses in the user program to access the data of the proxy slave once you have defined the slave profile at runtime.

  To do this, select the proxy slave from the universal AS-i slaves in the hardware catalog.
- At runtime, specify in the PLC program which slave type should be operated under this address.
- You define the slave profile of the proxy slave by changing the overall configuration ("Set_Configuration_Online (Page 158)" command). In this case, the AS-i branch is not reset.
- The slave type defined in the user program is retained in the CM AS-i Master ST module, even after the power supply has been switched off.
- The slave type of a proxy slave defined in the user program is retained in the CM AS-i Master ST module, even after the hardware configuration has been reloaded into the station.

Applications

- Variable machine configurations that can be changed at runtime.
- Flexible expansion of the system in the future, without the need to specify the actual type of slave beforehand.

Parameter assignment/addressing

6

6.1 Parameters

Parameters of the AS-i master

Table 6- 1 Assignable parameters and their default setting (GSD file)

Parameters	Value range	Default
Diagnostic interrupt in case of errors in AS-i configuration	• Enable • Disable	Enable
Diagnostic interrupt in case of AS-i cable fault	• Enable • Disable	Enable
Automatic address programming	• Enable • Disable	Enable
Ground-fault monitoring activated	• Enable • Disable	Enable
Automatic ID1 code assignment (Firmware V1.1 and higher)	• Enable • Disable	Disable
Duplicate address detection[1)]	• Enable for AS-i voltage 24 V • Enable for AS-i voltage 30 V • Disable	Disable

1) This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.2 Explanation of the parameters

Diagnostic interrupt if AS-i configuration error:

With this parameter, you specify whether AS-i configuration errors will be signaled to the higher-level system. The following are signaled as a configuration error:

- A surplus slave
- A missing slave
- A slave of the wrong type

Diagnostic interrupt if AS-i cable fault:

This parameter is used to specify whether faults concerning the AS-i cable should be reported to the higher-level system. Possible AS-i cable faults are:

- Ground fault
- Insufficient AS-i voltage
- Peripheral fault of an AS-i slave

Automatic address programming:

When a defective AS-i slave is being replaced, you use this parameter to specify whether the configured AS-i address will be automatically assigned to the new device.

For details on this functionality, see Section "Replacing a defective AS-i slave / automatic address programming (Page 74)"

Ground-fault monitoring activated:

This parameter is used to specify whether ground faults on the AS-i cable should be detected by the AS-i master. Deactivate this setting if you are using an external unit for ground fault detection.

Automatic ID1 code assignment:

When you activate this parameter, in the case of automatic address programming the ID1 code of a slave is written to the value specified during configuring.

Duplicate address detection:

The duplicate address detection function can identify inadvertent duplicate addressing. When you activate it, you must select the AS-i line voltage in use.

This parameter is divided into "Deactivate duplicate address detection" and "Duplicate address detection for 24 V" depending on the GSD variant.

6.3 Address space

The assignment of the address space is described in the following Section:

Data exchange between the user program and AS-i slaves (Page 49)

Data exchange between the user program and AS-i slaves

7

7.1 Access to AS-Interface

The distributed I/O system communicates with the AS-i slaves via the CM AS-i Master ST. The AS-i communication objects are mapped onto a continuous data area for input and output data.

Firmware V1.1 and higher

From Firmware V1.1 and higher, you can flexibly arrange the process image:

- Shortening the process image for a process image with maximum length of 288 bytes.
- Map analog values and digital values in one process image
- Variable division of the process image:
  - The slave address is not bound to a specific position in the process image.
  - The number of bits per slave can vary.

    For example, the digital input data of the slave at address 1 can be one bit long and the analog data of the slave at address 5 can be two bytes long.

If your configuration contains fewer AS-i slaves, you may reduce the length of the reserved I/O area (depending on the configuration software version).

This reduces the volume of data to be transmitted on PROFIBUS or PROFINET. You set the length of the I/O area in *STEP 7* (TIA Portal) in the properties of the AS-i master. This does not change the assignment of the slave address to the offset. This means:

When the length is reduced, the higher AS-i bus addresses can no longer be addressed.

7.2 Transmitting AS-i digital values

If there are no slaves, the input data is filled with 0 values. In the output direction, the non-assigned values have no effect.

Special characteristics of AS-i Safety slaves

The AS-i master performs a non-safe evaluation for the data of safe input slaves. The evaluation is represented in the process image of a Safety input slave as follows:

Table 7- 1 Process image of a Safety input slave

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	All contacts are open.
0	0	0	1	F-IN1 is closed.
0	1	0	0	F-IN2 is closed.
0	1	0	1	F-IN1 and F-IN2 are closed.

Likewise, the AS-i master evaluates in a non-safe manner to determine whether a safe AS-i output is to be addressed. The information is in the input process image of the PLC:

Table 7- 2 Process image of the "safety module"

Bit 3	Bit 2	Bit 1	Bit 0	Meaning
0	0	0	0	The safe AS-i output is deactivated.
1	1	1	1	The safe AS-i output is switched on.

Note

This involves a non-safe evaluation of the safe signals.

Addressing of slaves by the controller

Input data and output data of the AS-i slaves are exchanged with the controller via an I/O area of 32 bytes. As a result, the digital values of up to 62 AS-i slaves are transmitted.

In doing so, 4 bits are assigned to each digital slave. The offset for accessing this data depends on the AS-i address of the AS-i slave.

Configuration example

The following graphic shows an example of addressing 4 digital slaves. In the example, you configure the start addresses n = 40 for the I/O data in *STEP 7* .

The bits with a gray background are relevant for the user program. The bits with a white background are not relevant for the user program, because AS-i slave bits are not assigned here.

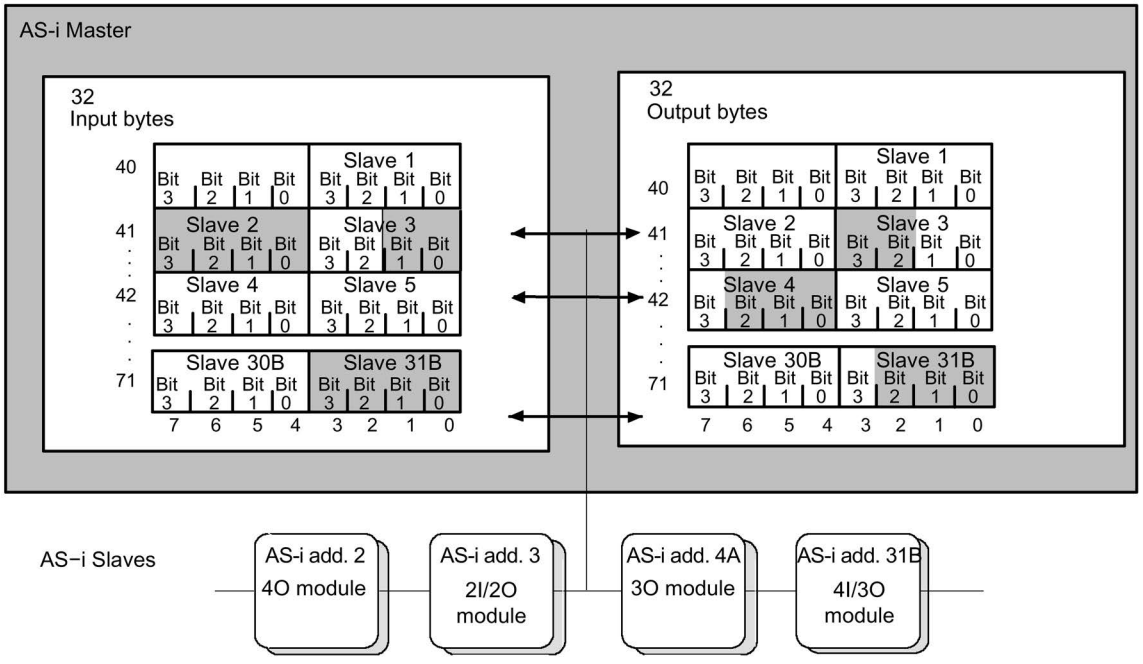

Figure 7-1 Example of addressing 4 digital slaves

The AS-i slave with address 3 and with two inputs and two outputs, referred to as a 2I/2O module, occupies bits 0 and 1 in input byte 41 and bits 2 and 3 in output byte 41 in the graphic, for example.

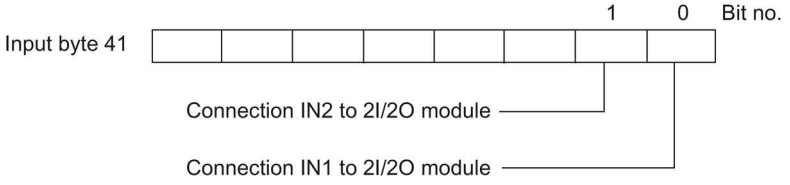

Figure 7-2 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the input bytes for slave with address 3

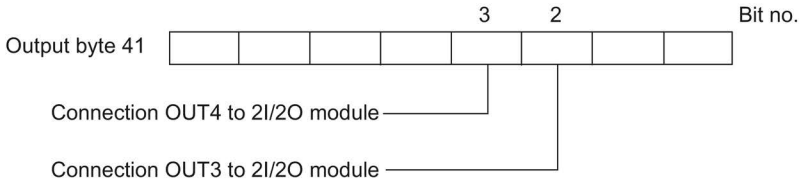

Figure 7-3 Example to show assignment of the AS-i connections of the 2I/2O modules to the data bits of the output bytes for slave with address 3

List of abbreviations (Page 175)

7.2.1 CM AS-i Master ST with configured AS-i slaves

Boundary conditions:

- The larger the process image, the longer it takes to transmit it.

CM AS-i Master ST with configured AS-i slaves

If you configure the AS-i slaves according to Section "Configuration of the AS-i slaves in STEP 7 (Page 32)", you set the I/O addresses of the slaves using the properties dialog of the AS-i slave. The I/O address can be set individually in the area of the defined process image of the AS-i master. The input bits x.4 to x.7 in the first byte of the process image of the AS-i master cannot be used for AS-i slaves. The process image can contain input/output data of digital and analog slaves.

The bit length of a slave depends on the configured profile. It is defined in the AS-i specification and cannot be changed.

7.2.2 CM AS-i Master ST without configured AS-i slaves

Addressing of slaves by the controller

If you configure according to Sections "Configuration of the AS-i slaves using the "SET" button (Page 35)" to "Configuration of the AS-i slaves using the PLC program (Page 37)", the I/O addresses of digital slaves in the process image of the AS-i master are located at a fixed position according to the following table. The I/O data of digital slaves can be accessed via a data record.

Input data and output data of the AS-i slaves are exchanged with the controller via an I/O area with a size of 32 bytes. As a result, the digital values of up to 62 AS-i slaves are transmitted. In doing so, 4 bits are assigned to each digital slave. The offset for accessing this data depends on the AS-i address of the AS-i slave.

If you configure a project without AS-i slaves, you can specify a digital address area that is 32 or 16 bytes long.

Default setting: 32 bytes long

In an I/O address area of 16 bytes, you can only assign standard addresses or A addresses for slaves. In an I/O address area of 32 bytes, you can also assign B addresses for slaves.

Table 7- 3 Bit assignment per digital slave

Byte number [1]		**Bit 7 … 4**				**Bit 3 … 0**			
n+0		Reserved				Slave 1 or 1A			
						Bit 3	Bit 2	Bit 1	Bit 0
n+1		Slave 2 or 2A				Slave 3 or 3A			
n+2		Slave 4 or 4A				Slave 5 or 5A			
n+3		Slave 6 or 6A				Slave 7 or 7A			
n+4		Slave 8 or 8A				Slave 9 or 9A			
n+5		Slave 10 or 10A				Slave 11 or 11A			
n+6		Slave 12 or 12A				Slave 13 or 13A			
n+7		Slave 14 or 14A				Slave 15 or 15A			
n+8		Slave 16 or 16A				Slave 17 or 17A			
n+9		Slave 18 or 18A				Slave 19 or 19A			
n+10		Slave 20 or 20A				Slave 21 or 21A			
n+11		Slave 22 or 22A				Slave 23 or 23A			
n+12		Slave 24 or 24A				Slave 25 or 25A			
n+13		Slave 26 or 26A				Slave 27 or 27A			
n+14		Slave 28 or 28A				Slave 29 or 29A			
n+15		Slave 30 or 30A				Slave 31 or 31A			
n+16	V1.0	Reserved				Slave 1B			
	V1.1.0 and higher	EFD[2]	CM[2]	CFGOK[2]	DIAG[2]				
n+17		Slave 2B				Slave 3B			
n+18		Slave 4B				Slave 5B			
n+19		Slave 6B				Slave 7B			
n+20		Slave 8B				Slave 9B			
n+21		Slave 10B				Slave 11B			
n+22		Slave 12B				Slave 13B			
n+23		Slave 14B				Slave 15B			
n+24		Slave 16B				Slave 17B			
n+25		Slave 18B				Slave 19B			
n+26		Slave 20B				Slave 21B			
n+27		Slave 22B				Slave 23B			
n+28		Slave 24B				Slave 25B			
n+29		Slave 26B				Slave 27B			
n+30		Slave 28B				Slave 29B			
n+31		Slave 30B				Slave 31B			
		Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0

1) n = Start address

2) You can activate and deactivate these status bits in *STEP 7* (TIA Portal).

List of abbreviations (Page 175)

7.3 Transferring AS-i analog values

The following information only applies to AS-i slaves whose data is stored in the analog area.

Note

The CM AS-i Master ST does not support the transmission of analog values in accordance with AS-i Slave Profile 7.1 / 7.2. Transmission of analog values must be implemented in the software for these slaves.

Analog interface between the CPU and the CM AS-i Master ST

In the user program, you use the process image (Firmware V1.1 and higher) or data records to access I/O data of analog slaves.

For more detailed information, refer to Section "Accessing AS-i analog data via the process image (Page 57)".

Representation of the analog values or the transparent values

The analog values are to be interpreted as 16-bit values in two's complement.

The transparent/digital values must be interpreted as two independent bytes.

In the case of AS-i slave profiles for transparent/digital data, the AS-i master passes through the data of the AS-i slave to the controller without interpreting the content.

For universal AS-i slaves, the following is displayed in the "Configuration" field in *STEP 7*:

- Information about the number of channels
- Information about the resolution
- Information about the data frame of transparent I/O data

In the documentation for the respective AS-i slave, you will find further information about:

- Value range
- Measuring range
- Accuracy of analog slaves
- Meaning of transparent data

Special cases in analog value transfer

- In the input direction, the AS-i master sends a substitute value in the event of a slave failure or AS-i communication error:
  - For slaves with analog transmission, the AS-i master always supplies the substitute value $7FFF_H$, if the slave fails after power-up of the master.

    "Transparent" mode exception:

    For slaves according to the following profiles, the AS-i master supplies the substitute value 0000_H:

    7.3.0 to 7.3.3 (Type CTT1, output slave 16 DO in "Transparent" mode)

    7.3.8 to 7.3.A (Type CTT1, input slave 16 DI in "Transparent" mode)

    7.A.A (CTT3, 8 DI / 8 DO slave with A/B address)

    7.A.8 (ID1 = 3, 4, 5) (Type CTT4, max. 16 DI slave with A/B address)

    7.A.5, 7.5.5 and B.A.5, if you have transparent input (Type CTT2)

    6.0.x where x = 2 … 7 (Type CTT5, in "Transparent" mode)
- In the output direction, the AS-i master sends logic "0" to all slaves in the event of a failure or in "STOP" state.
- If the AS-i master or the communication between the AS-i master and PLC fails, data record access to the analog values or transparent/digital input values is not possible. Note that the analog input values and transparent/digital input values are not updated in your user program in this case, and ensure a substitute value processing via the program.

NOTICE
Behavior in the event of a slave failure If the slave fails prior to or during the power-up of the AS-i master, the substitute value $7FFF_H$ may also be supplied. That is, the input bits of these transparent or digital slaves have the substitute value 1. For this reason, check whether the diagnostic data of these slaves indicate a slave failure and, if required, ensure an appropriate substitute value processing via the program.

Special characteristics of combined transaction type slaves

When using slaves in accordance with CTT 1 to 5, all or some I/O bits are used for special transfer functions in the process image for AS-i digital values. For further details, please refer to the documentation of the respective AS-i slave.

The following applies to these protocol bits:

- In the input direction, the AS-i master sets the value "0".
- In the output direction, the AS-i master ignores the bits.

7.3.1 Accessing AS-i analog data via the process image

If you assigned I/O addresses to the analog slaves when configuring, you can access the AS-i analog values with word commands (Firmware V1.1 and higher).

Analog and transparent I/O addresses for configured AS-i slaves

The analog and transparent I/O addresses of an AS-i slave can be freely assigned within the overall process image of the CM AS-i Master ST. This is regardless of the size of the process image. If you only require a few analog inputs and outputs in the process image and want to save space, you can change the length of the I/O data of an AS-i slave. If the set length is less than the actual length of the I/O data of the AS-i slaves, you cannot access the data at addresses greater than the set length via the process image. You can also deactivate the process image for analog inputs/outputs.

Access to analog I/O data is also possible via data records independent of the process image. You can find more detailed information on this in Section "Accessing AS-i analog data via acyclic services (Page 57)".

7.3.2 Accessing AS-i analog data via acyclic services

Representation of the analog values in the data records

Analog values are transferred in the data records numbered from 140 to 147.

- You access the analog input values using system functions for reading data records.
- You output analog values using system functions for writing data records.

In combination with SIMATIC S7, system function blocks SFB 52 "RDREC" and SFB 53 "WRREC" enable this.

Access to analog data via acyclic services can also be selected, for example, if there is a need to save I/O address space in SIMATIC S7.

NOTICE
Simultaneous write access via cyclic and acyclic services not possible Simultaneous write access to analog data of a slave is not permissible with different process values either via cyclic or acyclic services. If both services are used the analog output values that are output via cyclic and acyclic services to the same slave address must be synchronized with each other via the user program.

You can use data record lengths ranging from 2 bytes to 240 bytes for each data record number. For each slave address, an area of 8 bytes is available to address 4 analog channels.

The table below shows which data record is used by each AS-i slave to transfer the analog values. The subsequent table shows the assignment of analog values to the respective analog slaves.

The tables are applicable to analog inputs and analog outputs.

Table 7- 4 Access to analog values via data records

AS-i address of the slave	Start addresses for analog values in the data record							
	DS 140	DS 141	DS 142	DS 143	DS 144	DS 145	DS 146	DS 147
1	0	—	—	—	—	—	—	—
2	8	—	—	—	—	—	—	—
3	16	—	—	—	—	—	—	—
4	24	—	—	—	—	—	—	—

31	—	208	176	144	112	80	48	16

Examples / notes on reading this table:

The subsequent table shows the assignment of analog values to the respective analog slaves.

For additional information, refer to the operating instructions of the slaves.

Table 7- 5 Address range for the analog values of an AS-i slave

Byte no. (start address + offset)	Analog value channel
Start address + 0	Channel 1 / high byte
Start address + 1	Channel 1 / low byte
Start address + 2	Channel 2 / high byte
Start address + 3	Channel 2 / low byte
Start address + 4	Channel 3 / high byte
Start address + 5	Channel 3 / low byte
Start address + 6	Channel 4 / high byte
Start address + 7	Channel 4 / low byte

Analog A/B slaves with 2 channels only reserve half the address range. A slaves occupy bytes 0 to 3 and B slaves bytes 4 to 7.

Examples of the configuration:

1. Configuration:

   Analog slaves have the AS-i addresses 1 to 6.

   You use data record 140 and enter 48 as data record length.

2. Configuration:

   1 analog slave with AS-i address 7 is used.

   You use data record 141 and enter 24 as data record length. Only bytes 16 to 23 are relevant.

3. Configuration:

   The full address range for 31 analog slaves is used.

   You use data record 140 and enter 224 as data record length. You can then address analog slaves 1 to 28.

   For the remaining analog slaves 29 to 31, you use data record 147 in a second job and enter 24 as data record length.

4. Configuration:

   Analog slaves have the addresses 29 to 31.

   You use data record 147 and enter 24 as data record length.

Mixed access:

- Configuration:

  You want to access slaves 1 to 12 using I/O commands and slaves 13 to 31 using data records.

  You use data record 143 for slaves 13 to 31.

Alarms, faults and system events

8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the AS-i master:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Online presentation of the network and device view
  - Diagnostic buffer
- Alarm messages in user program
- Creation of user-specific web pages via the web server of a connected SIMATIC controller

You will find information on the LEDs in Section "Meaning of the LEDs (Page 64)".

The diagnostic possibilities in *STEP 7* and in the user program are described in the following sections.

8.2 Diagnostics in STEP 7

Diagnostics in STEP 7

For diagnostics of the AS-i master and the AS-i slave, use the "Go online" function to switch *STEP 7* to "Online" status.

If you have configured AS-i slaves in *STEP 7*, the diagnostic information about slaves can be displayed in *STEP 7*.

The diagnostics of the AS-i slaves in STEP 7 V13 SP1 (TIA Portal) are not displayed via the online network view function. The information of the AS-i master is displayed symbolically in the device view. The status of these devices will also be displayed to the right of the device in the project navigation by means of a symbol. For an explanation of the different status symbols, please refer to the relevant tool tip.

STEP 7 offers several possibilities for requesting the diagnostic information of the AS-i master:

- Special diagnostic symbols indicate the status of the AS-i master in the network view of the device configuration. Red symbols signal an error, and green symbols indicate that the devices are OK.
- In *STEP 7* V13 SP1 (TIA Portal), you can call up information about the status of the AS-i master and AS-i slaves. To do so, open the diagnostics as follows:
  - Select the AS-i master.
  - Select "Online & diagnostics" in the shortcut menu.
  - In the "Online & diagnostics" view, select "Detailed diagnostics > Error overview".

    Here you see the current status of every AS-i slave address.

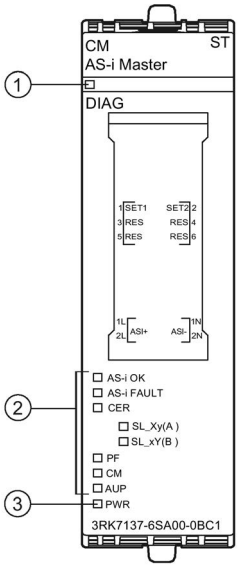
  To analyze sporadic errors, you can read out the error counter for the AS-i network.

  Diagnostics are also available in *STEP 7* V5.5 HSP 2092 V3.0 and higher.
- The control panel of the AS-i master can also be called up in this display. This shows the status of the LEDs.
- All the relevant events are stored in the diagnostic buffer of the CPU. You can display the diagnostic buffer in the "Online & Diagnostics" window for a selected CPU.

8.3 LED statuses

8.3.1 Arrangement of the LEDs on the CM AS-i Master ST

Introduction



① DIAG (green/red)
② Status LEDs (AS-Interface)
③ PWR (green)

Figure 8-1 Arrangement of the LEDs on the CM AS-i Master ST

8.3.2 Meaning of the LEDs

Meaning of the LEDs

The tables below explain the status and fault indications. Remedies for the diagnostic messages are in Section "Diagnostic messages (Page 69)".

"PWR" LED

Table 8- 1 Meaning of the "PWR" LED

PWR	Meaning
☐ OFF	The AS-i voltage is not provided (terminals L+, M).
■ Green ON	The AS-i voltage is provided (terminals L+, M).

"DIAG" LED

Table 8- 2 Meaning of the DIAG LED

DIAG	Meaning
☐ OFF	The supply voltage for the interface module of the ET 200SP is not provided.
✳ Green flashes	The AS-i master parameters have not been assigned.
■ Green ON	The AS-i master parameters have been assigned and are error-free. No diagnostic message of the AS-i master is pending.
✳ Red flashes	The AS-i master parameters have been assigned and the AS-i master signals diagnostic errors for the AS-i master or an AS-i slave or an active firmware update.

"AS-i OK" LED

Table 8- 3 Meaning of the AS-i OK LED

AS-i OK	Meaning
☐ OFF	An error has occurred (see AS-i FAULT LED) or the AS-i master is offline. This means: No I/O data exchange is taking place, e.g., during power-up.
■ Green ON	The AS-i bus is fault-free. I/O data exchange takes place.

"AS-i FAULT" LED

Table 8- 4 Meaning of the AS-i FAULT LED

AS-i FAULT	Meaning
☐ Red OFF	No AS-i cable faults have occurred. The AS-i master is in "Offline" mode.
■ Red ON	The AS-i bus has failed, e.g. the supply voltage for AS-Interface is too low, ground fault.
✻ Red "flashes"	A fault has occurred, e.g. a duplicate address or parameterization error has been detected.

"PF" LED

This LED indicates peripheral faults.

Table 8- 5 Meaning of the "PF" LED

PF	Meaning
Red OFF	No peripheral fault is being signaled.
Red ON	At least one AS-i slave is signaling a peripheral fault. Refer to the operating instructions for the respective slave for the meaning of the peripheral fault, e.g., overload at the standard outputs and/or overload of the sensor power supply of the standard inputs.

Firmware update (Page 21)

"CER" LED

This LED indicates configuration errors. It lights when the slave configuration detected on the AS-i cable does not match the CONFIGURED configuration in the AS-i master.

Table 8- 6 Meaning of the "CER" LED

CER	Meaning
Yellow OFF	No AS-i configuration error.
Yellow ON	Failure of an AS-i slave: • A configured AS-i slave is not present on the AS-i cable. • An excess slave not configured beforehand is present on the AS-i cable. • A connected slave has different configuration data (IO, ID, ID1, ID2) than the slave configured in the AS-i master. • A slave with address "0" is in "Configuration mode" on the AS-i bus.

"CM" LED

This LED indicates the operating status (Configuration Mode).

Table 8- 7 Meaning of the "CM" LED

CM	Meaning
☐ Green OFF	The AS-i master is in "protected operation".
■ Green ON	The AS-i master is in "configuration mode".
✻ Green flashes	During a firmware update: Errors have occurred during the firmware update.

"AUP" LED

This LED indicates whether automatic address programming is possible or not.

Table 8- 8 Meaning of the "AUP" LED

AUP	Meaning
☐ Green OFF	Automatic address programming is not possible. This LED is always off in configuration mode.
■ Green ON	When the AS-i master is in "protected operation", this LED indicates that automatic address programming of an AS-i slave is possible. Automatic address programming makes it easier to replace a defective AS-i slave on the AS-i cable. For more detailed information, refer to Section "Replacing a defective AS-i slave / automatic address programming (Page 74)".

"SL_Xy(A)" and "SL_xY(B)" LEDs

These LEDs indicate the slave addresses to which an error is signaled. The following states are taken into account:

- The slave has failed.
- The slave is an excess slave.
- The slave type is incorrect.
- Double addressing detected.

The following diagram shows the indication sequence:

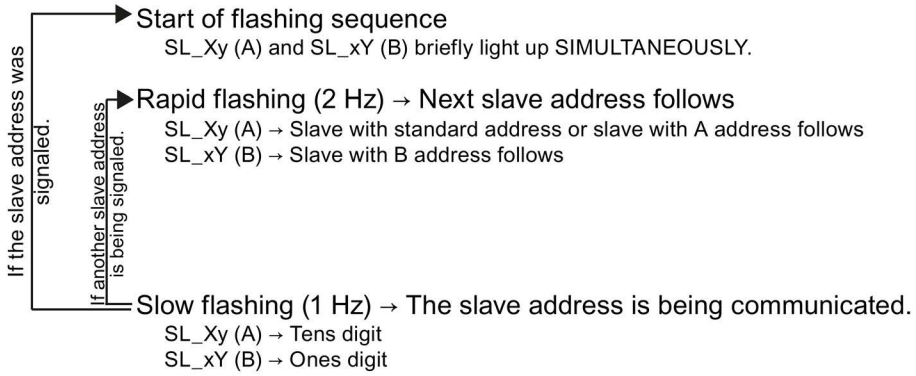


Figure 8-2 Indication sequence

Example: Slave 15 and 21B have failed

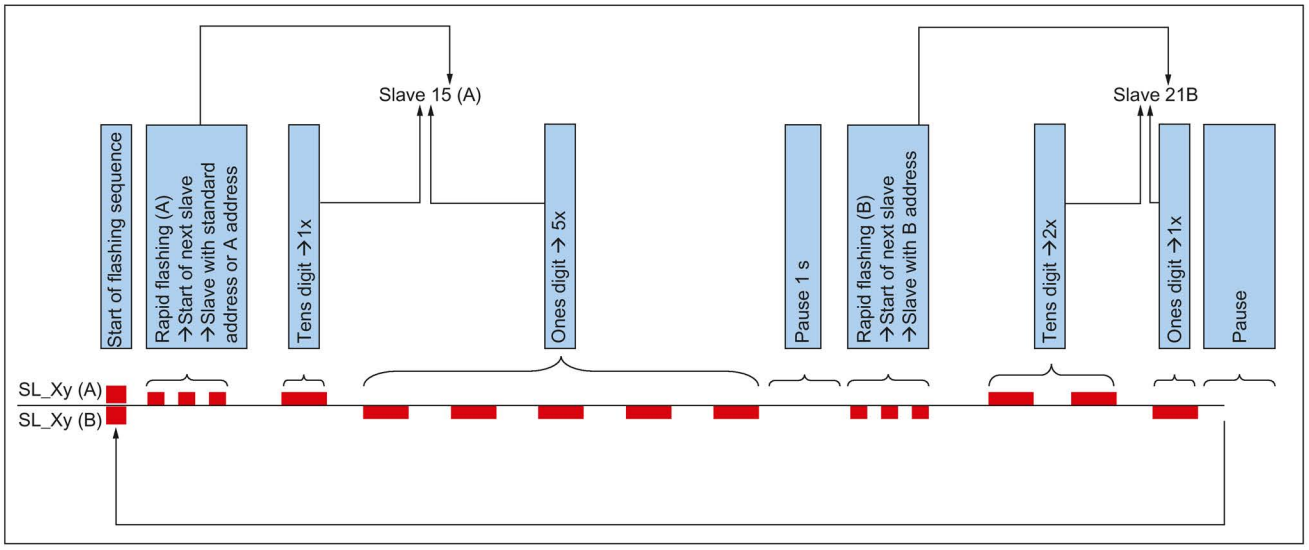

Figure 8-3 Example: Slave 15 and 21B have failed

8.4 Diagnostic messages

8.4.1 Alarms

The AS-i master sends a diagnostic interrupt request to the CPU in the following situations:

- The AS-i master has detected a problem, e.g. failure of a slave (incoming event).
- The problem was rectified or no longer exists (outgoing event).

If there is no OB 82 in the user program, a CPU of the S7-300 / S7-400 product range will switch to "STOP".

If an OB 82 exists, the operating system responds to an incoming event by calling the OB 82. The S7 CPU then interrupts the cyclic user program and enters the event in the system diagnostic buffer as a "Module fault" message.

Some diagnostic information is made available to the user in the local data of the OB 82, e.g.: Which module triggered the interrupt? What type of error has occurred?

Following execution of the OB 82, the S7 CPU continues the cyclic program from the point of interruption.

When parameterizing the CM AS-i Master ST, you can specify whether and in what cases a diagnostics interrupt should be triggered.

See Section "Parameter assignment/addressing (Page 47)"

See Section "Fault indications/fault remedies (Page 80)" for a list of possible error cases.

8.4.2 Possible response to the diagnostic interrupt

Diagnostic events of the AS-i master and all AS-i slaves are signaled by means of OB82, e.g. No voltage on AS-Interface, peripheral fault

Note

Diagnostic buffer

Please note that OB 82 is only called for the first error event. If an error caused by an AS-i slave is already active, subsequent AS-i slave errors will only be noted in the diagnostic buffer of the CPU.

The cause of the interrupt can be determined by reading out data records with diagnostic data during execution of the OB 82 block or during cyclic program execution. See Section "Data records for diagnostics (Page 82)".

8.4.3 Error messages

AS-i-specific faults

The following AS-i-specific faults are possible:

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0400_H	1024	AS-i slave failed	An AS-i slave on an A address or a slave with standard address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • There is a break in the cable • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators
0401_H	1025	AS-i slave on B address failed	An AS-i slave on a B address has failed. The channel number of the message shows the address of the affected AS-i slave. Possible causes: • The slave is defective. • The cable is interrupted. • An overload of the sensor supply at the input slave or an overload of the actuator supply • Overload at the output for some slaves	Check: • AS-i slave • Connecting cables • Overload • EMC environment • Connected sensors and actuators

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0402_H	1026	Peripheral fault in AS-i slave	An AS-i slave on an A address or a slave with a standard address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave. Possible cause: • An overload at the output of a digital slave or an overload at the actuator • Measuring range exceeded for analog input slaves • Overload of the sensor supply at the input slave (only for some slave types) • Group fault message for M200D motor starters	Note the information in the manual for the AS-i slave. Check: • Slave • Overload • Connected sensors and actuators
0403_H	1027	Peripheral fault in AS-i slave on B address	An AS-i slave on a "B" address signals a peripheral fault. The channel number of the message shows the address of the affected AS-i slave. Possible cause: • An overload at the output of a digital slave or an overload at the actuator • Measuring range exceeded for analog input slaves • Overload of the sensor supply at the input slave (only for some slave types) • Group fault message for M200D motor starters	Note the information in the manual for the AS-i slave. Check: • Slave • Overload • Connected sensors and actuators
0404_H	1028	AS-i address used multiple times	Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a standard address or A address. The channel number of the message shows the address of the affected AS-i slave.	Change the addresses of the AS-i slaves to addresses that are unique in the network.
0405_H	1029	AS-i B address used multiple times	Multiple AS-i slaves with the same profile and address are located on the AS-i bus. The affected slaves have a B address. The channel number of the message shows the address of the affected AS-i slave.	Change the addresses of the AS-i slaves to addresses that are unique in the network.

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
0406_H	1030	No or erroneous voltage on the AS-i cable	The AS-i master has detected insufficient voltage on the AS-i cable. Data exchange on the AS-Interface has been stopped.	Check: • Voltage • Polarity on AS-i cable • Power supply
0407_H	1031	AS-i configuration error (CER)	The ACTUAL configuration of the AS-i slaves on the AS-i cable differs from the CONFIGURED configuration saved in the AS-i master. Possible causes of short-term failures: • High levels of electromagnetic interference are affecting the AS-i installation. Other possible causes: • The functional ground connection to the AS-i power supply unit or AS-i data decoupling module is not connected to ground potential. • Protected operation: A configured slave has failed or there is an excess slave on the bus. • Configuration mode: A slave with address "0" has been detected on the bus.	Check: • AS-i slave failure • Overload • Excess slave • Incorrect address • Incorrect slave type • EMC environment Remove the electromagnetic interference.
0408_H	1032	Ground fault on AS-i cable	A ground fault is present between AS-i+ and ground or between AS-i- and ground. Possible consequences: • Disruption of communication • Slave failure • Configuration error • Hazard as a result of secondary faults	Check: • Insulation fault on AS-i cable • Sensor/actuator cable Ensure that the ground fault is rectified.
$040A_H$	1034	Excess AS-i slave	There is an unconfigured AS-i slave with a default address or an A address on the AS-i bus. The channel number of the message shows the address of the affected AS-i slave.	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.
$040B_H$	1035	Excess AS-i slave at B address	On the AS-i bus there is an unconfigured AS-i slave with a B address. The channel number of the message indicates the B address of the affected AS-i slave	Change the CONFIGURED configuration in the AS-i master or remove the AS-i slave.

Channel / Fault type	Fault		Cause	Remedial measures
	No.	Message		
$040C_H$	1036	Incorrect AS-i slave	On the AS-i bus there is an incorrect AS-i slave with a default address or an A address. The channel number of the message shows the address of the AS-i slave involved.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.
$040D_H$	1037	Incorrect AS-i slave at B address	There is an incorrect AS-i slave with a B address on the AS-i bus. The channel number indicates the B address of the affected slave.	• Use the correct slave type. • Set the ID1 code on the slave in accordance with the CONFIGURED configuration.

8.5 Replacing a defective AS-i slave / automatic address programming

Automatic address programming after failure of one or more AS-i slaves - replacement of AS-i slave

The "Automatic address programming" function allows you to easily replace defective AS-i slaves.

Note

Automatic address programming

Automatic address programming is only possible if the AS-i master is operating in "protected operation" and **one or more** AS-i slaves have failed.

If several AS-i slaves have failed, you must uniquely identify the failed slaves in the configuration using the slave profile:

- IO code
- ID code
- ID2 code
- ID1 code

The automatic address programming function also supports slaves with the "CTT5" profile (multi-address slaves) and AS-i devices that contain multiple internal slave addresses. This requires each internal slave to have different identifications (IO code, ID code, ID2 code, and ID1 code).

Note

The automatic address programming function does not work if two identical slaves have failed.

Examples of devices with multiple internal slave addresses which support automatic address programming:

- Module K60 with 8DI/2DO (3RK2400-1HQ00-0AA3)
- Motor Starter M200D AS-i Standard (3RK1325-...).

If no address has yet been assigned to these devices (delivery state), only **one** address "0" is visible on the bus. The device automatically suppresses the other internal "0" addresses.

Note

Exceptions

The automatic address programming function is not available for the following devices, because the identifications of each internal slave are identical (IO code, ID code, ID2 code, and ID1 code).

- Module K60 with 8 DI (3RK1200-0DQ00-0AA3, 3RK2200-0DQ00-0AA3, 3RK2200-1DQ00-1AA3)
- Safety-related module K45 with 4 F-DI (3RK1205-0CQ00-0AA3).

Detection of a defective AS-i slave

An illuminated "AUP" LED signals the following in "protected operation":

- Slave failure was detected:
  - Exactly **one** slave has failed, or
  - A device containing multiple different slaves has failed, **or**
  - Multiple slaves or devices have failed, each of the failed slaves having a different configuration
- Automatic address programming by the AS-i master is possible.

If an AS-i slave fails, the AS-i master indicates the address of the failed slave via the "SL_Xy (A)" and "SL_xY (B)" LEDs.

If a device with multiple internal slave addresses fails, the AS-i master indicates the failure of multiple slaves.

Replacement of a defective AS-i slave

- Replace the defective AS-i slave with an **identical** AS-i slave with address "0" (setting in delivery state).
- Replace the defective AS-I device containing multiple internal slave addresses with an identical AS-i device with address "0" on all internal slaves (setting in delivery state).

> **Note**
>
> **Replacement of a defective AS-i slave**
>
> Only one address "0" may be configured on the bus at any one time. If you want to replace several slaves or devices, you must replace them one after the other with the AS-i master switched on.

For the new slave or device, the AS-i master programs the address or addresses of the original failed device.

The LEDs "AUP" and "CER" go out once all slaves have been correctly replaced.

8.6 Duplicate address detection

To ensure that the AS-Interface system functions correctly, all the AS-i slaves must have a unique AS-i address on the bus.

If the same AS-i address is assigned to one or more slaves, this incorrect assignment is referred to herein as a duplicate address.

As part of standard operation, the AS-i master monitors the data exchange for errors and thus often excludes slaves with a duplicate address automatically from the cyclic data exchange. This is the case for duplicate addresses in which the slave types are different (profile identification IO code, ID code, ID2 code, and ID1 code) and duplicate addresses for slaves having a different status at their inputs.

In "protected operation", this fault condition is displayed on the AS-i master as a configuration error with the relevant AS-i address and the affected slaves detect a communication error.

The duplicate address detection function of the CM AS-i Master ST also detects cases of slaves with duplicate address in which the cyclic data exchange is not excluded by standard mechanisms. Such cases include duplicate addresses in which the slave types are identical (profile identification, IO code, ID code, ID2 code, and ID1 code) and in which the slaves either have the same status at their inputs or have no inputs (output slaves).

When a duplicate address is detected, the AS-i master signals a duplicate address error and automatically resets the output data of the address concerned to "0" so that the outputs of the affected slaves are switched off. Communication with the affected slaves is not interrupted, i.e. the slaves do not signal a communication error.

For slaves without cyclic data communication, the duplicate address detection function of the CM AS-i Master ST cannot be executed.

Note

System behavior according to AS-i specification

If you connect a slave with duplicate address to the AS-i cable while the bus is operating, the added slave is initially excluded from cyclic data communication and its LEDs indicate a communication error. According to the specification, the AS-i master does not activate an AS-i slave until its address is recognized as a new address on the bus, e.g., when a power-up of the bus takes place. If the bus contains an active slave, no further automatic slave activation occurs on the same address during operation, even if an additional slave with the same address (duplicate address) is added.

However, manual activation of the the slave can be initiated via the command interface by writing parameters to the slave address.

For physical reasons, the duplicate address detection function of the CM AS-i Master ST cannot detect a duplicate address during cyclic data exchange in every configuration. Therefore, like for any AS-i system, it is essential to ensure when assigning AS-i addresses that each AS-i slave contains a unique AS-i address on the bus, e.g., by using addressing device 3RK1904-32AB02.

The duplicate address detection function can assist in identifying inadvertent duplicate addressing.

The duplicate address detection of the CM AS-i Master ST from firmware V1.1 and higher has been optimized for an AS-i cable length up to 100 m without branches.

The duplicate address detection function of firmware V1.0 is designed for shorter cable lengths.

The duplicate address detection function can be used in the specified and additional configurations, but it cannot be guaranteed that duplicate addresses will be uniquely detected in every case.

For configurations with an AS-i repeater, the duplicate address detection function does not work due to the separation of the cable into multiple segments.

Enabling the duplicate address detection function

For the CM AS-i Master ST with firmware V1.1 and higher, the duplicate address detection function is activated in the configuration via HW Config or the GSD setting. After a start or restart of the CM AS-i Master ST V1.1 and higher, the setting is accepted from HW Config or the GSD setting.

For the CM AS-i Master ST with firmware V1.0 and higher, the duplicate address detection function is deactivated when the AS-i Master is switched on and can be set by writing data record DS 100, see Chapter "DS 100 Switch duplicate address detection on/off (Page 173)". The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST V1.0, the duplicate address detection function must be activated via the user program, if required.

Function description

The duplicate address detection function assists you in identifying inadvertent duplicate addressing.

When commissioning the AS-i system, check that duplicate address detection can be used for the AS-i configuration used.

- Install the complete AS-i system and ensure that the specified addresses of the slaves are correct and unique.
- Enable the duplicate address detection function. In firmware V1.1 and higher you can do this for AS-i voltages of either 24 V or 30 V.
- Check whether the CM AS-i Master ST signals a duplicate address in spite of correct slave address assignment. If a duplicate address is signaled on the AS-i master even though the bus configuration is correct, this means that duplicate address detection cannot be used for this bus configuration. Should this occur, disable the duplicate address detection function.
- Note that when the duplicate address detection function is enabled, the presence of a duplicate address may not be detected, depending on the bus configuration.

Note

The activation status is saved in volatile memory of the AS-i master. After a startup or restart of the CM AS-i Master ST, duplicate address detection must be activated again via the user program, if required.

The CM AS-i Master ST signals a detected duplicate address as follows:

- The "CER" LED lights up to indicate a configuration error.
- The "SL_Xy (A)" and "SL_xY (B)" LEDs signal the AS-i address concerned.
- The message "AS-i address used multiple times" is output.

To rectify the fault, check and change the address of the affected AS-i slave, e.g. using the addressing unit. Via the online function of *STEP 7* it is not possible to change the AS-i address of an individual slave if there are multiple slaves with the same address on the AS-i cable.

See also

DS 100 Read setting for duplicate address detection (Page 174)

8.7 Diagnosis via the web server

Web server functionality

Many SIMATIC controllers provide integrated web server functionality. This enables access via a web browser to the data of the CPU and its connected components, e.g. the AS-i master.

A *STEP 7* library is available as a download for diagnosing the AS-i master via a web browser. It presents the most important diagnostic information in a clear overview. The package is based on the concept of user-defined web pages. You can obtain the package from the Siemens Service & Support Portal under the following link:

Service and support portal (http://support.automation.siemens.com/WW/view/en/50897766)

8.8 Fault indications/fault remedies

Fault indications/remedies for faults on the CM AS-i Master ST

Below are possible fault indications during operation of the AS-i master and potential remedial measures.

Table 8- 9 Fault indications and remedies for faults on the AS-i Master

Fault	Possible cause	Remedy
"AS-i fault" LED lights up red	The current consumption of the AS-i slaves is too high. Result: Voltage on the AS-i cable is too low.	Check the current consumption of the AS-i slaves.
	No voltage is present on the AS-i cable or the voltage is too low.	Check the connection with the AS-i power supply unit.
	Short-circuit on the AS-i cable	Check the AS-i cable and the connected AS-i slaves.
"DIAG" LED not lit	There is no supply over the communications bus.	Check whether the module is inserted correctly.
"DIAG" LED flashes green, but does not switch to constant green light	The AS-i master is not configured.	Configure the AS-i master in *STEP 7*.
"CER" LED is lit.	A configured AS-i slave has failed. • Evaluate the slave indication.	Replace the defective AS-i slave or configure the AS-i master again if the AS-i slave is not required.
	A non-configured AS-i slave was connected to the AS-i cable.	Remove the AS-i slave or configure the AS-i master again.
	An AS-i slave has been connected whose configuration data, e.g., IO code, ID codes, does not match the values of the configured AS-i slave.	Check whether an incorrect AS-i slave has been connected. Configure the AS-i master again, if necessary.
"CER" LED flashes erratically , i.e. a configured AS-i slave fails sporadically.	Loose connection	Check the connections of the AS-i slaves.
	Injection of interference on the AS-i cable.	Check that the grounding of the AS-i master and routing of the AS-i cable are correct. Check whether the shield of the AS-i power supply unit is connected correctly.
	The connected sensor is causing an overload.	Check the sensor and the sensor cable for damage.
The AS-i master does not switch from "configuration mode" to "protected operation".	An AS-i slave with address 0 is connected to the AS-i cable. The AS-i master is unable to switch to "protected operation" as long as this slave is connected.	Remove the AS-i slave with address 0 or set the correct address using the AS-i addressing device.
In *STEP 7* it is not possible to switch between "configuration mode" and "protected operation"	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.
The AS-i master does not switch from "protected operation" to "configuration mode".	The automation system is in the "RUN" state.	Switch the automation system to the "STOP" state.

Fault	Possible cause	Remedy
Automatic address programming does not take place.	The configuration data, e.g., IO code, ID code, ID2 code, and ID1 code, of the replaced AS-i slave does not match the values of the original slave.	Check that the correct replacement slave was used. Compare the manufacturer's information with regard to configuration data. If the original slave is to be replaced by a different type, assign the address with the AS-i addressing device and configure the AS-i master again.
	Replaced AS-i slave does not have the address "0".	Set the address of the replaced slave with the AS-i addressing device.
	Replaced AS-i slave is not correctly connected or is defective.	Check the connections of the slave. Replace the slave, if necessary.
	The AS-i master is in "configuration mode".	Program the address of the new AS-i slave with the AS-i addressing device or via the command interface of the AS-i master.
	Several slaves with the same profile have failed.	Program the addresses of the new AS-i slaves with the AS-i addressing device.
No LEDs are lit, except possibly for the "DIAG" LED	The AS-i voltage is missing.	
"PF" LED is lit	One or more AS-i slaves signal a fault in the connected I/O.	Check the I/O components connected to the AS-i slaves and the cabling for wire break or short-circuit.

Reference

You will find further information about the LEDs on the AS-i master in Section "Meaning of the LEDs (Page 64)".

8.9 Data records for diagnostics

8.9.1 DS 92 Diagnostic data record (FW V1.1 and higher)

The operating status of the AS-i master, the connected AS-i network and the AS-i slave is stored as diagnostic data record DS 92 in the CM AS-i Master ST module.

Description

This data record provides information about the status of an AS-i network.

Table 8- 10 Structure of diagnostic data record DS 92, read

Byte	Description							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0 … 1	Reserved							
2	MA30V	MA24V	Res.	Res.	Res.	MADDR	PF	CER
3	Reserved				EFD	CM	CFGOK	DIAG
4	**Flags_1** (See Table "AS-i master flags")							
5	**Flags_2** (See Table "AS-i master flags")							
6	Reserved							
7	Reserved							
Slave diagnostics								
8 … 15	List of active slaves (see Table "Structure of bit fields")							
	Bit = 0	Slave is not in the list of active slaves.						
	Bit = 1	Slave is in the list of active slaves.						
16 … 23	List of failed slaves (see Table "Structure of bit fields")							
	Bit = 0	The configured slave has not failed.						
	Bit = 1	The configured slave has failed.						
24 … 31	List of incorrect slaves (see Table "Structure of bit fields")							
	Bit = 0	The profile of the connected slave is correct.						
	Bit = 1	The profile of the connected slave is incorrect.						
32 … 39	List of excess slaves (see Table "Structure of bit fields")							
	Bit = 0	The connected slave is configured or no slave is connected.						
	Bit = 1	The connected slave is not configured.						
40 … 47	List of multiple addressing (see Table "Structure of bit fields")							
	Bit = 0	The AS-i address is not assigned or is only assigned once.						
	Bit = 1	The AS-i address is assigned more than once.						
48 … 55	List of I/O errors (see Table "Structure of bit fields")							
	Bit = 0	The slave at the AS-i address does not have an I/O error.						
	Bit = 1	The slave at the AS-i address°has an I/O error.						

Byte	Description							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
56 … 63	List of configured ID = A (see Table "Structure of bit fields")							
	Bit = 0	A standard slave is configured at the AS-i address.						
	Bit = 1	An A/B slave is configured at the AS-i°address.						
64 … 71	List of actual ID = A (see Table "Structure of bit fields")							
	Bit = 0	A standard slave is connected at the AS-i address.						
	Bit = 1	An A/B slave is connected at the AS-i°address.						
72 … 79	List of detected slaves (see Table "Structure of bit fields")							
	Bit = 0	No slave detected at the AS-i°address.						
	Bit = 1	Slave detected at the AS-i°address.						
80 … 87	List of configured slaves (see Table "Structure of bit fields")							
	Bit = 0	No slave configured at the AS-i°address.						
	Bit = 1	Slave configured at the AS-i°address.						

Structure of the bit fields:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	SLAVE 7/7A	SLAVE 6/6A	SLAVE 5/5A	SLAVE 4/4A	SLAVE 3/3A	SLAVE 2/2A	SLAVE 1/1A	SLAVE 0/Reserved
1	SLAVE 15/15A	SLAVE 14/14A	SLAVE 13/13A	SLAVE 12/12A	SLAVE 11/11A	SLAVE 10/10A	SLAVE 9/9A	SLAVE 8/8A

6	SLAVE 23B	SLAVE 22B	SLAVE 21B	SLAVE 20B	SLAVE 19B	SLAVE 18B	SLAVE 17B	SLAVE 16B
7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of status bits:

MA30V	= 0	Multiple address detection for AS-i 30 V is deactivated.
	= 1	Multiple address detection for AS-i 30 V is activated.
MA24V	= 0	Multiple address detection for Power24V is deactivated.
	= 1	Multiple address detection for Power24V is activated.
MADDR	= 0	No multiple addresses detected on the AS-i°cable.
	= 1	Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.
PF	= 0	No I/O errors detected.
	= 1	I/O errors detected.
CER	= 0	No AS-i configuration errors detected.
	= 1	AS-i configuration errors detected.
EFD	0 =	No ground fault detected
	1 =	Ground fault detected
CM	0 =	Master in protected operation
	1 =	Master in configuration mode
CFGOK	0 =	Configuration not OK or slave exists with address°0.
	1 =	Configuration OK
DIAG	0 =	No diagnostics pending
	1 =	Diagnostics pending. It is set when:

- The AS-i master is in "offline" mode.
- The AS-i voltage is not OK.
- Multiple addresses were detected.
- An I/O error was detected.
- A configuration error was detected.
- A slave with address°0 exists.

AS-i master flags:

Flag	Bit	Name of the bit	Meaning
Flag_1	0	Config_OK	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
	1	LDS.0	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
	2	Auto_Address_Assign	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves is connected to AS-Interface.
	3	Auto_Address_Available	The flag is set when automatic address programming is performed as soon as a slave with a valid configuration is connected at address zero.
	4	Configuration_Active	The flag is set in "configuration mode" and reset in "protected operation".
	5	Normal_Operation_Active	The flag is set when the AS-i master is in "protected operation".
	6	APF	The flag is set when the voltage on the AS-i cable is too low, or a power down was detected during data transmission (AS-i Power Fail).
	7	Offline_Ready	The flag is set if the offline phase is active.
Flag_2	0	Periphery_OK	The flag is set if none of the AS-i slaves signal a peripheral fault. All bits in the LPF are zero.
	1	Data_Exchange_Active	Controlling: When the flag is set, data transfer starts between the master and slave.
	2	Off_Line	Controlling: When the flag is set, the device is switched "OFFLINE" or is "Offline".
	3	AUTO_ADDR_ENABLE	The flag is set when automatic address programming is enabled by the user.
	4	GROUND FAULT	The flag is set if a ground fault has been detected on the AS-i cable.
	5	EEPROM_OK	The flag is set if the test of the internal EEPROM was successful.
	6	EFD_Disable	The flag indicates whether ground fault detection is switched on (BIT = 0) or off (BIT = 1).
	7	Reserved	--

8.9.2 DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher)

Meaning

This data record reads out error counters that pertain to the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The count starts again each time the device is powered up.

Table 8- 11 Meaning of error counter

Count value / Information	Meaning
AS-i Power Fail	The count value is incremented when the AS-i power supply drops to a value that is too low.
Ground fault	The count value is increased when a ground fault has been detected on the AS-i cable.
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave message frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Process data transmission is not interrupted in this case.
Erroneous slave message frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Process data transmission is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Process data transmission is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 12 Structure of the data record

Byte	Meaning		
0	Reserved		High byte
1			Low byte
2	Summation counter: AS-i Power Fail		High byte
3			Low byte
4	Summation counter: Ground fault		High byte
5			Low byte
6	Summation counter: Slave failure		High word, high byte
7			High word, low byte
8			Low word, high byte
9			Low word, low byte
10	Summation counter: Missing slave frame		High word, high byte
11			High word, low byte
12			Low word, high byte
13			Low word, low byte
14	Summation counter: Erroneous slave frame		High word, high byte
15			High word, low byte
16			Low word, high byte
17			Low word, low byte
18	Summation counter: Slave peripheral fault		High word, high byte
19			High word, low byte
20			Low word, high byte
21			Low word, low byte
22	Summation counter: Slave protocol error (for slaves according to CTT1 ... CTT5)		High word, high byte
23			High word, low byte
24			Low word, high byte
25			Low word, low byte
26	Summation counter: Erroneous master frame		High word, high byte
27			High word, low byte
28			Low word, high byte
29			Low word, low byte
30 … 37	List of count values > 0 (see "Structure of bit fields")		
	Bit = 0	Count value = 0 for all error counters of the AS-i address	
	Bit = 1	Count value > 0 for at least one error counter of the AS-i address	
38	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)		High word, high byte
39			High word, low byte
40			Low word, high byte
41			Low word, low byte
42	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)		High word, high byte
43			High word, low byte
44			Low word, high byte
45			Low word, low byte

Byte	Meaning	
46	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word, high byte
47		High word, low byte
48		Low word, high byte
49		Low word, low byte
50	Reserved	Bit 0 = MADDR
51	Reserved	
52 … 59	List of multiple addressing (see Table "Structure of bit fields")	
	Bit = 0	The AS-i address is assigned once or is not present.
	Bit = 1	The AS-i address is assigned more than once.

The counters are integer values (2 bytes or 4 bytes).

Structure of the bit fields:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	SLAVE 7/7A	SLAVE 6/6A	SLAVE 5/5A	SLAVE 4/4A	SLAVE 3/3A	SLAVE 2/2A	SLAVE 1/1A	SLAVE 0/Reserved
1	SLAVE 15/15A	SLAVE 14/14A	SLAVE 13/13A	SLAVE 12/12A	SLAVE 11/11A	SLAVE 10/10A	SLAVE 9/9A	SLAVE 8/8A
2	SLAVE 23/23A	SLAVE 22/22A	SLAVE 21/21A	SLAVE 20/20A	SLAVE 19/19A	SLAVE 18/18A	SLAVE 17/17A	SLAVE 16/16A
3	SLAVE 31/31A	SLAVE 30/30A	SLAVE 29/29A	SLAVE 28/28A	SLAVE 27/27A	SLAVE 26/26A	SLAVE 25/25A	SLAVE 24/24A
4	SLAVE 7B	SLAVE 6B	SLAVE 5B	SLAVE 4B	SLAVE 3B	SLAVE 2B	SLAVE 1B	Reserved
5	SLAVE 15B	SLAVE 14B	SLAVE 13B	SLAVE 12B	SLAVE 11B	SLAVE 10B	SLAVE 9B	SLAVE 8B
6	SLAVE 23B	SLAVE 22B	SLAVE 21B	SLAVE 20B	SLAVE 19B	SLAVE 18B	SLAVE 17B	SLAVE 16B
7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

Explanation of the status bits

MADDR= 0 No multiple addressing detected on the AS-i°cable.

= 1 Multiple addressing detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.

8.9.3 DS 97 Read and reset AS-i master error counters (FW V1.1 and higher)

Description

This data record functions in the same manner as the "DS 96 Read AS-i slave error counters" data record. After the DS 97 data record is read, all error counters in the AS-i master are reset to "0".

The structure of the DS 97 data record is identical to the structure of the DS 96 data record. For the meaning of the error counters, refer to Section "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)".

8.9.4 DS 150 to DS 153 Read AS-i error counters

These data records read the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153.

Error counter

The CM AS-i Master ST module manages several counters internally which log the number of master frames sent and the number of different error occurrences.

These counter values can be read out using data records DS 150 to DS 153:

- DS 150 contains counter values for slave addresses 1(A) to 16(A).
- DS 151 contains counter values for slave addresses 16(A) to 31(A).
- DS 152 contains counter values for slave addresses 1B to 16B
- DS 153 contains counter values for slave addresses 16B to 31B

Each data record also contains the total count of master frames sent. To determine a relative error rate, divide the count of error occurrences by the number of master frames sent.

The bus system allows the automatic sending of repeat message frames. This ensures that the process data is reliably transferred between master and slave in the industrial environment, even in the case of brief interruptions in transmission, e.g. due to switching operations. If the fault limit value is exceeded, or the slave is not functioning correctly due to a defect, communication to the slave cannot be performed within the defined time period. In this case, transmission of the process data is interrupted. The master signals failure of the slave address and tries to establish communication again.

Under error-free conditions, one master frame is sent to every available slave address for cyclic data transfer per AS-i bus cycle. The addressed slave responds with a corresponding slave frame. Depending on the configuration of the bus, between 1 and 31 slaves are addressed in each AS-i bus cycle. This results in a maximum bus cycle time of 5 ms. When two slaves with extended addressing have the same numerical address, but one is the A address and one the B address, these two slaves are automatically addressed in two consecutive bus cycles. It can be assumed that around 64 000 master frames are sent per second.

Table 8- 13 Meaning of error counter

Count value / Information	Meaning
Slave failure	The count value is increased when an active slave fails, that is, when process data transmission has been interrupted. An active slave only fails when it does not respond to six consecutive master calls.
Missing slave frame	The count value is increased when a slave does not respond to a master call or the master does not receive the response. Transmission of process data is not interrupted in this case.
Erroneous slave frame	The count value is increased when the master receives an incomplete slave response, such as when slaves are added during operation. Transmission of process data is not interrupted in this case.
I/O fault	The count value is increased when a slave signals an I/O error.
Protocol error	The count value is increased when the master detects a transmission error for a slave that needs multiple cycles for transmission of data, e.g. for analog data.
Erroneous master frame	The count value is incremented when a master call cannot be sent correctly, e.g. in the event of strong interfering signals on the AS-i cable. Transmission of process data is not interrupted in this case.
Sent master frames	Number of master frames This counter counts all frames sent by the master, regardless of whether or not a slave response was received. The total number of master frames is calculated as follows: MT_CNT_TOTAL = (MT_CNT_HIGH x MT_CNT_BASE) + MT_CNT_LOW The error count starts over each time the device is powered up. By dividing the absolute values of the error counters by the number of master frames, it is possible to calculate the percentage of errors and thus the error frequency.

Table 8- 14 Slave address structure of the counters

Byte	Counter	
0	Counter: Slave failure	High byte
1		Low byte
2	Counter: Missing slave frame	High byte
3		Low byte
4	Counter: Erroneous slave frame	High byte
5		Low byte
6	Counter: I/O fault	High byte
7		Low byte
8	Counter: Protocol error	High byte
9		Low byte
10	Counter: Erroneous master frame	High byte
11		Low byte

The counters are integer values (2 bytes).

Table 8- 15 Master frame structure of the counters

Byte	Meaning	
0	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)	High word, high byte
1		High word, low byte
2		Low word, high byte
3		Low word, low byte
4	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)	High word, high byte
5		High word, low byte
6		Low word, high byte
7		Low word, low byte
8	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word, high byte
9		High word, low byte
10		Low word, high byte
11		Low word, low byte

The counters are integer values (4 bytes).

8.9.4.1 DS 150 Read AS-i slave error counters 1/1A to 16/16A

Using the command interface

9

9.1 Introduction

You control the behavior of the AS-i master in your user program entirely through the command interface.

This chapter contains the information you need for accessing the command interface of the CM AS-i Master ST.

9.2 Command interface with SIMATIC S7

Instruction "ASI_CTRL"

The instruction "ASI_CTRL" is available for controlling the command interface. You will find this instruction in *STEP 7* in the task card "Instructions" under "Advanced instructions" > "Distributed I/O" > "Others" > "ASI".

For detailed instructions on using the instruction "ASI_CTRL", see: ASI_CTRL (http://support.automation.siemens.com/WW/view/en/51678777).

9.3 Command interface with controllers of other manufacturers

Functional principle

AS-i commands are read and written via the acyclic services of PROFINET/PROFIBUS. You use the "Read_data_record" and "Write_data_record" (data record 2) services in the user program of the IO controller/DP master for this.

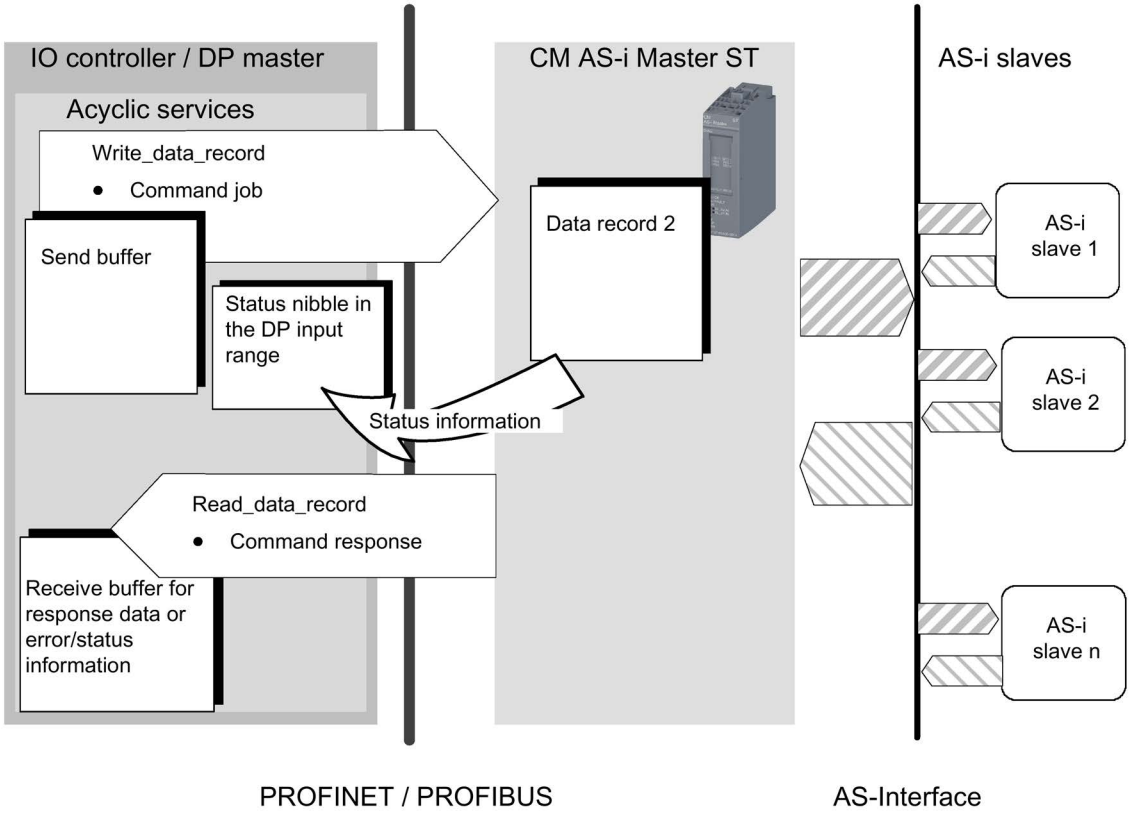

Figure 9-1 Functional principle

Job parameters

You assign parameters for the "Read_data_record" and "Write_data_record" jobs. The following parameters control the issuance of the commands:

- Index:

  Defines the data record number = 2

- Length:
  - With "Write_data_record", you specify the length of the send data depending on the command.
  - With "Read_data_record", the CM AS-i Master ST signals the length of the receive data via the status nibble.

Command processing in the user program

Structure the command processing in the user program as follows:

1. Specify the command call (Page 103) in a send buffer in the user program.
2. Send this data record call to the CM AS-i Master ST with Write_data_record (data record 2).
3. Then, query the status of the command processing in the input range for digital values (cyclic services). The status information is stored in the first byte reserved for it (byte 0) in bits 4 to 7 of the input range (status nibble).
4. Different reactions occur depending on the result of the status evaluation. You can find these in the following sequence chart. Details on the meaning of the status nibble can be found in the "Coding of the status nibble" table.

   To complete the command processing, you must always issue a Read_data_record (data record 2) job either to obtain further information or to apply the response data.

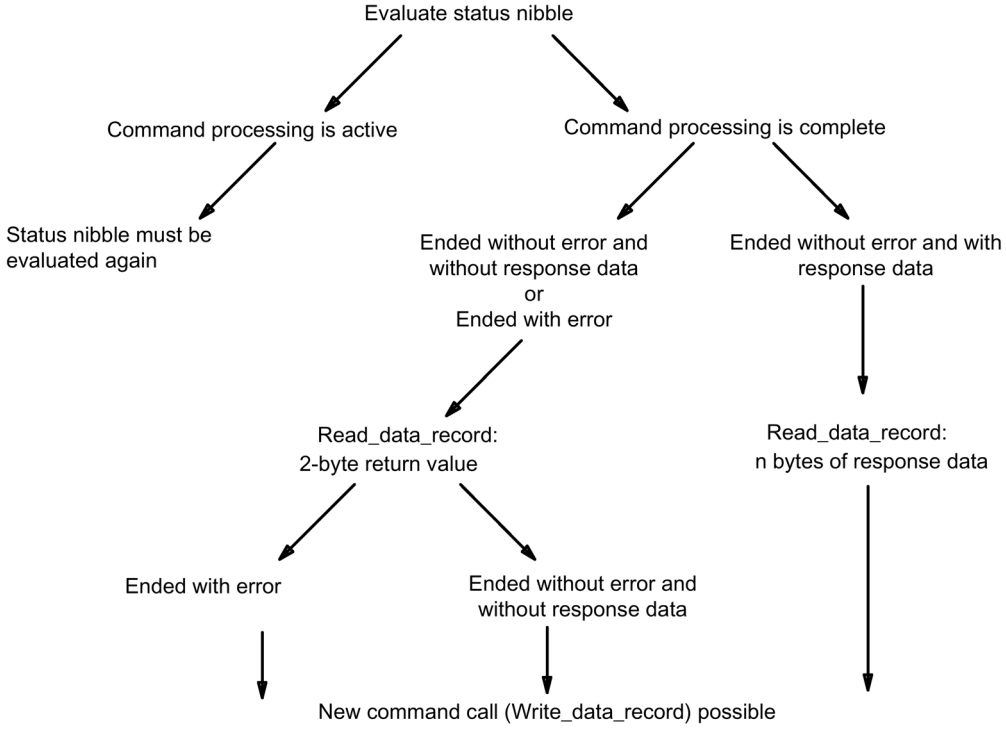

Figure 9-2 Flowchart

Table 9- 1 Coding of the status nibble

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	
1	0	0	0	Startup detection 1: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	1	0	Startup detection 2: The status nibble switches between the values 1000_B and 1110_B following a startup/restart of the AS-i master. Initiation of a command by the user program is possible.
1	1	0	0	Reserved for SIMATIC S7 use FB ASI_CTRL Initiation of a command by the user program is possible.
0	0	1	0	The command processing is active Initiation of a command by the user program is not possible.
0	0	0	1	Command processing has ended. An asynchronous read access can be used to retrieve a **2-byte** return value from the AS-i master. Two cases are distinguished here: • The return value is 0: A command without response data has been ended without errors. • The return value is a value **other than 0**: The command has been ended **with error** (see "Return value in response buffer" table). Initiation of a new command by the user program is possible.
0	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **1 byte** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **4 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **14 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **16 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	0	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **32 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
1	1	0	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **56 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.

Status nibble (byte 1 of the digital input data)				Meaning
Bit 7	Bit 6	Bit 5	Bit 4	
1	1	1	1	Command processing has been ended without errors. An asynchronous read access can be used to retrieve **221 bytes** of response data from the AS-i master. Initiation of a new command by the user program is possible.
0	1	0	0	Job processing is complete. The response data or return value of the previous job has already been read by the user. Initiation of a new command by the user program is possible.

Example

The table below indicates the behavior of the status nibble display as a result of the device status and the command processing in the user program:

	Action	Response in the status nibble
1.	Switching on the AS-i voltage of the CM AS-i Master ST.	1110_B … 1000_B … 1110_B …
2.	The user program transfers a command (e.g., Write_parameter) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly; dependent on command)
3.	The AS-i master ends the command. The user program can read the return value	0001_B
4.	The user program reads the 2-byte return value with an asynchronous read access.	0100_B
5.	... Further program processing ...	…
6.	The user program transfers a command (e.g., Read_expanded_lists_and_flags) to the CM AS-i Master ST with an asynchronous write access.	0010_B (briefly, dependent on command)
7.	The AS-i master ends the command without errors. The user program can read the response data.	1011_B
8.	The user program reads 32 bytes of response data with an asynchronous read access.	1011_B

Return value

Processing errors are itemized in the return value of the response buffer, if necessary. An error indication exists when "ended without error and without response data or ended with error" is displayed in the status nibble (coding: 0001_H).

Table 9- 2 Return value in the response buffer

STATUS	Meaning
0000_H	**Job completed without errors**
8381_H	The AS-i slave address is incorrect.
8382_H	The AS-i slave is not activated (not in LAS).
8383_H	Error on the AS-Interface
8384_H	The command is not permitted in the current state of the AS-i master.
8385_H	An AS-i slave with address 0 exists.
8386_H	The AS-i slave has impermissible configuration data (IO, ID, ID2, or ID1 code).
$83A1_H$	The referenced AS-i slave was not found on the AS-Interface.
$83A2_H$	An AS-i slave with address 0 exists.
$83A3_H$	An AS-i slave with the new address already exists on the AS-Interface.
$83A4_H$	The AS-i slave address cannot be deleted.
$83A5_H$	The AS-i slave address cannot be set.
$83A6_H$	The AS-i slave address cannot be permanently saved.
$83A7_H$	Error while reading the ID1 code
$83A8_H$	The destination address is not plausible: e.g. a B slave address is used for a standard slave.
$83B1_H$	A length error occurred during the string transfer in accordance with Profile 7.4.
$83B2_H$	A protocol error occurred during the string transfer in accordance with Profile 7.4.
$83C0_H$	The AS-i slave has an invalid profile, e.g. the standard slave or A slave is configured at a B address.
$83C1_H$	The standard slave cannot be configured, because the B address is already assigned.
$83F8_H$	The job number or the job parameter is not known.
$83F9_H$	The AS-i master has detected an EEPROM error.

Note

Errors that occur during processing of acyclic services and are reported via call parameters, such as "Return Value", can be found in the documentation of the relevant programming interface.

9.4 Description of the AS-i commands

Overview

The commands that the user program can issue to the CM AS-i Master ST are described below. With these commands, the AS-i master makes available the complete functionality of the M4 master profile of the AS-i master specification.

Note

Adaptations when using existing user programs

Please observe the following adaptations when using existing user programs:

For some commands of the CM AS-i Master ST, the command numbers have been changed and the data structures belonging to the command have been optimized compared to other AS-i masters (e.g., DP/AS-i LINK Advanced).

The following table provides an overview of the modified command numbers:

Command name	Coding for DP/AS-i LINK Advanced	Coding for CM AS-i Master ST
Set_Permanent_Configuration (Page 111)	25_H	$A5_H$
Get_Permanent_Configuration (Page 112)	26_H	$A6_H$
Read_Actual_Configuration (Page 114)	28_H	$A8_H$
Set_LPS (Page 115)	29_H	$A9_H$
Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)	30_H	$B0_H$
Read_overall_configuration (Page 124)	39_H	$B9_H$
Write_overall_configuration (Page 130)	$3A_H$	BA_H
Get_LPF (Page 146)	$3E_H$	BE_H
Read_Error_Counter (Page 151)	$4A_H$	CA_H
Read_and_Delete_AS-i-Master_Error_Counter (Page 154)	$4B_H$	CB_H
Read_AS-i_error_counter (Page 154)	$4C_H$	CC_H
Read_and_delete_AS-i_Slave_error_counter (Page 156)	$4D_H$	CD_H

The following table lists the commands that can be executed with the CM AS-i Master ST.

Table 9- 3 AS-i commands

Name	Parameters	Return value	Coding
Set_Permanent_Parameter (Page 107)	Slave address, parameter	—	00_H
GET_Permanent_Parameter (Page 108)	Slave address	Parameter	01_H
Write_Parameter (Page 109)	Slave address, parameter	Optional: Parameter echo	02_H
Read_Parameter (Page 110)	Slave address	Parameter value	03_H
Store_Actual_Parameters (Page 110)	—	—	04_H
Set_Permanent_Configuration (Page 111)	Slave address, configuration data to be configured	—	$A5_H$
Get_Permanent_Configuration (Page 112)	Slave address	Configured configuration data	$A6_H$
Store_Actual_Configuration (Page 113)	—	—	07_H
Read_Actual_Configuration (Page 114)	Slave address	ACTUAL configuration	$A8_H$
Set_LPS (Page 115)	LPS	—	$A9_H$
SET_Offline_Mode (Page 116)	Mode	—	$0A_H$
Set_Auto_Address_Enable (Page 117)	Mode	—	$0B_H$
Set_Operation_Mode (Page 118)	Mode	—	$0C_H$
Change_AS-i-Slave_Address (Page 119)	Address 1, Address 2	—	$0D_H$
Read_Status (Page 120)	Slave address	Error data record of AS-i slave	$0F_H$
Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)	—	LDS, LAS, LPS, flags	$B0_H$
Read_overall_configuration (Page 124)	—	ACTUAL configuration data, actual parameters, LAS, flags	$B9_H$
Write_overall_configuration (Page 130)	Overall configuration	—	BA_H
Set_PI (Page 136)	Parameter list	—	$3C_H$
AS-i Parameter Echolist (Page 138)	—	Parameter echo list	33_H
Read_Write_CTT2_String (Page 140)	Slave address CTT2 string	CTT2 string	44_H
Read_Version (Page 141)	—	Version string	14_H
Read ID_Code (Page 142)	Slave address	ID code	17_H
Read_ID1-Code (Page 143)	Slave address	ID1 code	37_H
Write ID1-Code (Page 143)	ID1 code	—	$3F_H$
Read_ID2-Code (Page 144)	Slave address	ID2 code	38_H
Read_IO-Code (Page 145)	Slave address	IO code	18_H
Get_LPF (Page 146)	—	LPF	BE_H
Write_Parameter_String (Page 147)	Slave address, parameter string	—	40_H
Read_String (Page 148)	Slave address	Parameter string	41_H
Read_String (Page 149)	Slave address	Identification string	42_H
Read_String (Page 150)	Slave address	Diagnostics string	43_H

Name	Parameters	Return value	Coding
Read_Error_Counter (Page 151)	—	—	CA_H
Read_and_Delete_AS-i-Master_Error_Counter (Page 154)	—	—	CB_H
Read_AS-i_error_counter (Page 154)	Slave address	—	CC_H
Read_and_delete_AS-i_Slave_error_counter (Page 156)	Slave address	—	CD_H
Activate_ground fault detection (reset EFD) (Page 157)	Mode	—	13_H
Set_Configuration_Online (Page 158)	Slave address, configuration data to be configured, parameters	—	$D0_H$
AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address) (Page 159)	Address, ID1 code	—	$D1_H$

General structure of the send buffer

The basic structure of the send buffer for commands is shown below.

The length of the job data depends on the respective command. Some commands do not require any job data. In this case, the send buffer only has one byte (byte 0).

Table 9- 4 Basic structure of the send buffer for commands

Byte	Meaning
0	Number of the command
1	**Job data**
…	**Job data**

General structure of the receive buffer

The basic structure of the receive buffer for commands is shown below. The length of the response data depends on the respective command.

Some commands do not supply any response data. In this case, there is no receive buffer.

Table 9- 5 Basic structure of the receive buffer

Byte	Meaning
0	**Response data**
1	**Response data**
…	**Response data**

General operating state of the AS-i slave address

If an AS-i slave must be addressed in a command or in a response, it must be addressed as follows:

Table 9- 6 Structure of the AS-i slave address

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0	Select bit	Slave address				

The Select bit for the selection of the slave type is specified as follows:

- Select bit = 0

  AS-i slave with standard-address (0 to 31) or AS-i slave with extended address in address area A (1A to 31A)

- Select bit = 1:

  AS-i slave with extended address in address area B (1B to 31B)

9.4.1 Set_Permanent_Parameter

Meaning

This command configures a parameter value for the specified AS-i slave in the AS-i master. The value is stored in the non-volatile EEPROM of the CM AS-i Master ST. The parameter value is additionally forwarded to the addressed AS-i slave.

However, the "parameter echo" of the AS-i slave cannot be read out with this command (see Write_Parameter (Page 109) command).

Note

Use of other Siemens AS-i masters

Other Siemens AS-i masters do not transfer the configured parameters to the AS-i slave immediately.

For AS-i slaves that meet the AS-i standard slave profile 7.4, this command is not permitted. For these slaves, the AS-i master itself administers the parameter assignment of the AS-i slave. In this case, the configured parameters are always equal to F_H.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

Structure of the job data in the send buffer

Table 9- 7 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: 00_H			
1	Slave address			
2	0		Parameters	

9.4.2 GET_Permanent_Parameter

Significance

This command reads a slave-specific parameter value that has been saved in EEPROM of the CM AS-i Master ST.

Structure of the job data in the send buffer

Table 9- 8 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 01_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 9 Structure of the reply data in the receive buffer

Byte	Significance			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Configured parameters	

9.4.3 Write_Parameter

Meaning of the command

The command transfers an AS-i slave parameter value. This is transferred to the addressed AS-i slave.

The parameter is only stored in volatile memory in the AS-i master and it is not transferred to the EEPROM as a configured parameter!

The AS-i slave transfers its current "Parameter echo" parameter value in the response. In accordance with the AS-i master specification "AS-Interface Complete Specification", this value can deviate from the value just written. The response from the AS-i slave is supplied in the response data as a parameter echo.

For AS-i slaves that meet the AS-i standard slave profile 7.4, this command is not permitted. For these slaves, the AS-i master itself administers the parameter assignment of the AS-i slave.

Structure of the job data in the send buffer

Table 9- 10 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: 02_H			
1	Slave address			
2	0		Parameters	

Structure of the response data in the receive buffer

Table 9- 11 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameter echo	

9.4.4 Read_Parameter

Meaning

This command returns the current "ACTUAL parameter" parameter value of an AS-i slave sent by the AS-i master.

You must not confuse this value with the parameter echo that the AS-i slave supplies as reply to Write_Parameter.

Structure of the job data in the send buffer

Table 9- 12 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 03_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 13 Structure of the reply data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	0		Parameters	

9.4.5 Store_Actual_Parameters

Significance

This command overwrites the configured parameters stored on EEPROM with the current ACTUAL parameters stored in non-volatile memory. That is, the parameters of all AS-i slaves are configured.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that meet AS-i slave standard profile 7.4. The configured parameters for these AS-i slaves are always equal to F_H.

Structure of the job data in the send buffer

Table 9- 14 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 04_H

9.4.6 Set_Permanent_Configuration

Meaning

With this command, the following configuration data are configured for the addressed AS-i slave:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses these configuration data as the specified expected configuration data for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

If the addressed AS-i slave does not support ID code 1 or ID code 2, the value F_H must be specified for this in the command.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 15 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command number: $A5_H$			
1	Slave address			
2	IO code		ID code	
3	ID1 code		ID2 code	

9.4.7 Get_Permanent_Configuration

Meaning

The configuration data (configured CONF data) of an addressed AS-i slave stored on the EEPROM of the AS-i master are read with this command:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

Structure of the job data in the send buffer

Table 9- 16 Structure of the job data in the send buffer

Byte	Meaning
0	Command number $A6_H$
1	Slave address

Structure of the response data in the receive buffer

Table 9- 17 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	IO code		ID code	
1	ID1 code		ID2 code	
2	0			
3	0			

9.4.8 Store_Actual_Configuration

Meaning

The following ACTUAL configuration data of all AS-i slaves is obtained from the AS-i master:

- Slave profile (IO, ID, ID2 codes)
- ID1 code

This command saves the obtained ACTUAL configuration data as CONF configuration data in the non-volatile EEPROM. The List of activated AS-i slaves (LAS) is also loaded into the List of configured AS-i slaves (LPS).

When this command is executed, the AS-i master switches to the offline phase and then switches back to "protected operation". The AS-i master restarts.

This command is not executed in "protected operation".

The slave parameter values in volatile memory of the AS-i master and the content of the non-volatile memory for the parameters are not changed. The "Set_Permanent_Parameter" command must be executed, if necessary.

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 18 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 07_H

9.4.9 Read_Actual_Configuration

Meaning

This command reads the following configuration data of an addressed AS-i slave obtained from the AS-i master on the AS-Interface:

- IO code
- ID code
- ID1 code
- ID2 code

The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification".

Structure of the job data in the send buffer

Table 9- 19 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $A8_H$
1	Slave address

Structure of the response data in the receive buffer

Table 9- 20 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	IO code		ID code	
1	ID1 code		ID2 code	
2	Reserved			
3	Reserved			

9.4.10 Set_LPS

Meaning

This command transfers the list of configured AS-i slaves for non-volatile storage in the EEPROM of the master.

When this command is executed, the AS-i master switches to the offline phase and then switches back to "normal operation". The AS-i master restarts.

This command is not executed in "protected operation".

Note

Configuration data are overwritten

If you configure the AS-i slaves using HW Config, there is normally no need to use the command described here.

If you use this command, you will overwrite the respective configuration data that resulted from SET button configuration or HW Config configuration.

Structure of the job data in the send buffer

Table 9- 21 Structure of the job data in the send buffer

Byte	Meaning							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
0	Command number: $A9_H$							
1	00_H							
2	Slave 7(A)	Slave 6(A)	Slave 5(A)	Slave 4(A)	Slave 3(A)	Slave 2(A)	Slave 1(A)	0
3	Slave 15(A)	Slave 14(A)	Slave 13(A)	Slave 12(A)	Slave 11(A)	Slave 10(A)	Slave 9(A)	Slave 8(A)
4	Slave 23(A)	Slave 22(A)	Slave 21(A)	Slave 20(A)	Slave 19(A)	Slave 18(A)	Slave 17(A)	Slave 16(A)
5	Slave 31(A)	Slave 30(A)	Slave 29(A)	Slave 28(A)	Slave 27(A)	Slave 26(A)	Slave 25(A)	Slave 24(A)
6	Slave 7B	Slave 6B	Slave 5B	Slave 4B	Slave 3B	Slave 2B	Slave 1B	0
7	Slave 15B	Slave 14B	Slave 13B	Slave 12B	Slave 11B	Slave 10B	Slave 9B	Slave 8B
8	Slave 23B	Slave 22B	Slave 21B	Slave 20B	Slave 19B	Slave 18B	Slave 17B	Slave 16B
9	Slave 31B	Slave 30B	Slave 29B	Slave 28B	Slave 27B	Slave 26B	Slave 25B	Slave 24B

The bits have the following meanings in the LPS data:

0: AS-i slave is not configured

1: AS-i slave is configured

9.4.11 SET_Offline_Mode

Meaning

This command switches between online and offline mode.

Online mode is the normal mode for the AS-i master. The following jobs are processed in online mode:

1. In the data exchange phase, the fields of the output data are transferred to the slave outputs for all AS-i slaves of the LAS. In error-free transmission, the addressed AS-i slaves transfer the values of the slave inputs to the master.
2. In the loading phase, a search is conducted for the existing AS-i slaves. Newly added AS-i slaves are inserted in the LDS or LAS.
3. In the management phase, jobs forwarded by the user, such as writing parameters, are executed.

In offline mode, the AS-i master only processes jobs from the user. Jobs that immediately activate an AS-i slave are rejected with an error. Cyclic data exchange is not performed with the AS-i slaves.

The bit OFFLINE=TRUE is not stored permanently. This means that after startup or restart, the AS-i master is in online mode again.

Structure of the job data in the send buffer

Table 9- 22 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0A_H$		
1	0		Mode 0 = Online 1 = Offline

9.4.12 Set_Auto_Address_Enable

Meaning

This command enables or disables the "Automatic address programming" function.

The bit AUTO_ADDR_ENABLE is stored in non-volatile memory. It is retained even after startup or warm restart of the AS-i master.

Structure of the job data in the send buffer

Table 9- 23 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0B_H$		
1	0		Value for AUTO_ADDR_ENABLE 1 = Automatic address programming enabled 0 = Automatic address programming disabled

9.4.13 Set_Operation_Mode

Meaning

This command chooses between "configuration mode" and "protected operation".

In **"protected operation"**, only the AS-i slaves that are flagged in the LPS and whose CONFIGURED and ACTUAL configurations match are activated. This is the case when the I/O code and the ID codes of the detected AS-i slaves are identical to the configured values.

In **"configuration mode"**, all the detected AS-i slaves are activated - with the exception of AS-i slave "0". This also applies to AS-i slaves that differ in their CONFIGURED and ACTUAL configurations.

The "OPERATING MODE" bit is saved in **non-volatile** memory. As a result, this bit is retained in the event of startup or restart.

On switching from "configuration mode" to "protected operation", the AS-i master restarts. It enters the offline phase and then switches to online mode.

Note

AS-i slave with address 0 prevents switchover to "protected operation"

If an AS-i slave with address 0 is present on the AS-i bus, the AS-i master cannot switch from "configuration mode" to "protected operation".

Structure of the job data in the send buffer

Table 9- 24 Structure of the job data in the send buffer

Byte	Meaning		
	Bit 7	Bit 1	Bit 0
0	Command number: $0C_H$		
1	0		Operating mode 0 = "Protected operation" 1 = "Configuration mode"

9.4.14 Change_AS-i-Slave_Address

Meaning of the command

This command changes the AS-i slave address of an AS-i slave.

This command is used predominantly for adding a new AS-i slave with the default address "0". In this case, the address is changed from "AS-i slave address, old" = 0 to "AS-i slave address, new".

The change is only executed if the following conditions are met:

1. An AS-i slave with "AS-i slave address, old" must exist.
2. If "AS-i address, old" is not equal to "0", an AS-i slave with the address "0" must not be connected at the same time.
3. "AS-i slave address, new" must have a valid value.
4. An AS-i slave with "AS-i slave address, new" must not already exist.

Note

When changing the AS-i slave address, the AS-i slave is not reset. The output data of the AS-i slave are retained until new data arrive for the new address.

Structure of the job data in the send buffer

Table 9- 25 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: $0D_H$
1	Slave address, old
2	Slave address, new

9.4.15 Read_Status

Meaning

This command reads the status register for the addressed AS-i slave. The flags of the status register have the following meaning depending on the type of the AS-i slave:

Table 9- 26 Meaning of the flags of the status register depending on the type of the AS-i slave

Status bit	AS-i slave according to standard 2.0	AS-i slave according to standard 2.1
S0	**Address volatile**	**Address/ID code volatile**
	This flag is set if • The internal routine of the AS-i slave for permanent storage of the AS-i slave address is running. This can last up to 15 ms and must not be interrupted by another addressing call. • The internal address comparison of the AS-i slave determines that the permanently saved address is not identical to the entry in the address register.	
S1	**Parity error detected** This flag is set if the AS-i slave has detected a parity error in a receive frame since the last "Read and delete status" job.	**Peripheral fault detected** An AS-i slave can set this flag if it detects a fault, e.g. wire break, on the connected I/O.
S2	**End bit error detected** This flag is set if the AS-i slave has detected an end bit error in a message frame since the last "Read and delete status" job.	Reserved
S3	**Read error in non-volatile memory (EEPROM)** This bit is set if the AS-i slave has discovered a read error when reading the non-volatile memory.	

Structure of the job data in the send buffer

Byte	Meaning					
	Bit 7	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0		S 3	S 2	S 1	S 0

9.4.16 Get_LPS, Get_LAS, Get_LDS, Get_Flags

Meaning

This command reads the following entries from the AS-i master:

- List of activated AS-i slaves, LAS
- List of detected AS-i slaves, LDS
- List of configured AS-i slaves, LPS
- The flags in accordance with the AS-i slave specification

24	Flag 1							
25	Flag 2							
26 … 31	Reserved							

Meaning of the bits in Byte 0 to 23

- Bit = 0:

  The AS-i slave is **not** activated, detected or configured.

- Bit = 1:

  The AS-i slave **is** activated, detected or configured.

Table 9- 31 Structure of flag 1 and flag 2

Flag 1			**Flag 2**	
Bit	**Meaning**		**Bit**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

Table 9- 32 Meaning of the flags

Flag	**Meaning**
Config_OK	The flag is set when the CONFIGURED configuration and the ACTUAL configuration match.
LDS.0	The flag is set when an AS-i slave with address 0 is present. (List of Detected Slaves)
Auto_Address_Assign	The flag is set if automatic address programming is possible. This means that AUTO_ADDR_ENABLE = 1 and no "incorrect" AS-i slaves are connected to AS-Interface.
Auto_Address_Available	The flag is set if automatic address programming can be performed. This means that one AS-i slave has failed.
Configuration_Active	The flag is set in "configuration mode" and reset in "protected operation".
Normal_Operation_Active	The flag is set when the AS-i master is in "protected operation".
APF	The flag is set when the voltage on the AS-i cable is too low (AS-i Power Fail).
Offline_Ready	The flag is set if the offline phase is active.
Periphery_OK	The flag is set if none of the AS-i slaves signal a peripheral fault.
Data_Exchange_Active	The "Data_Exchange_Active" flag is set when cyclic data exchange is in "protected operation".
Off_Line	The flag is set if the "OFFLINE" operating status is to be adopted or has already been adopted.
AUTO_ADDR_ENABLE	The flag indicates whether automatic address programming is disabled (BIT = 0) or enabled (BIT = 1) by the user.
Earth_Fault	The flag is set if a ground fault has been detected on the AS-i cable.
EEPROM_OK	The flag is set if the test of the internal EEPROM was successful.
EFD Disable	The flag indicates whether ground fault detection is enabled (BIT = 0) or disabled (BIT = 1) by the user.

9.4.17 Read_overall_configuration

Meaning

This command reads the following data from the AS-i master:

- List of activated AS-i slaves (LAS).

  It specifies which of the connected AS-i slaves are activated
- The current configuration data for the connected AS-i slaves:
  - IO code
  - ID code
  - ID1 code
  - ID2 code
- The current parameters of the AS-i slaves (ACTUAL parameters)
- The current status of the AS-i master (Flag 1, Flag 2)

After commissioning, you can use this command, for example, to determine the configuration of the stations connected to the AS-i cable. You can modify this read-in configuration data if required and store it as the CONFIGURED configuration in the AS-i master with the "Write_overall_configuration" command.

Flag 1			Flag 2	
Bit number	**Meaning**		**Bit number**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		3	AUTO_ADDR_ENABLE
4	Configuration_Active		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

For the meanings of flags, refer to Chapter:

Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)

9.4.18 Write_overall_configuration

Meaning

This command transfers the desired overall configuration of AS-Interface to the AS-i master and saves it as the CONFIGURED configuration in the non-volatile EEPROM. This configures the AS-i master.

When this command is executed, the AS-i master changes to the offline phase and then switches back over to "normal operation". The AS-i master restarts.

The "Protected operation" or "Configuration mode" operating mode of the AS-i master after execution of the command is determined by the "Configuration_Active" flag (see Table "Structure of Flag 1 and Flag 2").

This command is permissible both in "Protected operation" and "Configuration mode.

Note

Configuration data are overwritten

If you configure the AS-i slaves using *STEP 7*, there is normally no need to use the command described here. If you have configured proxy slaves, you can specify the configuration data of the proxy slaves with this command. To avoid the offline changeover, the configuration data of the proxy slaves can be specified preferentially with the "Set_Configuration_Online (Page 158)" command.

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring the AS-i master using the "SET" button or configuring using *STEP 7*.

Specifically, the following data are transferred:

- List of configured AS-i slaves

  This specifies which AS-i slaves are permitted to be activated by the AS-i master in "protected operation".

- List of configuration data.

  This specifies the ID codes and the IO code that the connected AS-i slaves must have.

- The list of the AS-i slave parameters that have been configured in the AS-i master and stored in non-volatile memory. These parameters are transferred to the AS-i slaves when the AS-i master starts up.

- The flags that determine the operating state of the AS-i master after startup.

The AS-i master parameterizes the AS-i slaves itself in the case of AS-i slaves that comply with standard profile 7.4. For slaves in accordance with standard profile 7.4, the AS-i master ignores the parameter values specified in the command.

NOTICE
Note the size of the I/O image If you have configured the AS-i slaves in *STEP 7*, the size of the I/O image of the individual slaves is defined using *STEP 7*. When using this command, ensure that the I/O image of the individual slaves corresponds to the slaves configured using the command. If the size of the I/O image does not match, only the lower-order data will be transferred. The data that do not fit into the image are truncated or are filled with substitute value "0" in the case of digital values and with substitute value 7FFF (Hex) in the case of analog values.

Table 9- 37 Structure of flag 1 and flag 2

Flag 1			Flag 2	
Bit number	**Meaning**		**Bit number**	**Meaning**
0	Config_OK		0	Periphery_OK
1	LDS.0		1	Data_Exchange_Active
2	Auto_Address_Assign		2	Off_Line
3	Auto_Address_Available		**3**	**AUTO_ADDR_ENABLE** 1)
4	**Configuration_Active** 1)		4	Earth_Fault
5	Normal_Operation_Active		5	EEPROM_OK
6	APF		6	EFD-ENABLE
7	Offline_Ready		7	Reserved

1) The "Configuration_Active" and "AUTO_ADDR_ENABLE" flags change the operating mode of the AS-i master. The values of the remaining flags are insignificant for the command "Set_LPS, Set_PCD, Set_PP, Set_Flags" and cannot be modified in the AS-i master by this call.

Configuration_Active	"0" means: After the command has been executed, the AS-i master will switch to "protected operation". "1" means: The AS-i master runs in "configuration mode" after completion of the job.
AUTO_ADDR_ENABLE	"0" means: Automatic address programming is disabled. "1" means: Automatic address programming is enabled.

For the meanings of flags, refer to Chapter:

Get_LPS, Get_LAS, Get_LDS, Get_Flags (Page 121)

9.4.19 Set_PI

Meaning

This command transfers parameters for all AS-i slaves to the AS-i master. It only transfers those parameters that have changed to the AS-i slaves, i.e. those that differ from the previously sent ACTUAL parameters.

9.4.20 AS-i Parameter Echolist

Meaning

This command outputs the echo values for all AS-i slaves. The echo values of an AS-i slave originate in the last parameter call sent to this AS-i slave.

9.4.21 Read_Write_CTT2_String

Meaning

This command sends a CTT2 request according to the AS-i slave profile "CombinedTransactionType2" to the AS-i master with a byte string. The master forwards the string bytes to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 222 bytes to the AS-i master. The AS-i master calculates the actual number of string bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The addressed AS-i slave answers the CTT2 request with a CTT2 response. The AS-i master communicates this response as a byte string in the receive buffer. The strings are transmitted by the AS-i master with the response.

The structure of the CTT2 request or CTT2 response (code, index, etc.) starts with string byte 1 in each case. You will find details about this in the respective AS-i slave description.

Note

While transmission of the strings is being executed on AS-i, there is no cyclic data transfer with the addressed AS-i slave. The type of protocol used means that transfer of up to 200 bytes can take up to half a minute.

Structure of the job data in the send buffer

Table 9- 41 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 44_H
1	Slave address
2	Number of string bytes
3	String byte 1
4	String byte 2
…	—
n + 1	String byte n-1
n + 2	String byte n

Maximum value for n = 220

Structure of the response data in the receive buffer

Table 9- 42 Structure of the response data in the receive buffer

Byte	Meaning
0	Number of string bytes
1	String byte 1
2	String byte 2
…	…
m - 1	String byte m - 1
m	String byte m

Maximum value for m = 220

9.4.22 Read_Version

Meaning

This command reads the version ID for the firmware of the AS-i master.

Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 14_H

Structure of the reply data in the receive buffer

Table 9- 43 Structure of the reply data in the receive buffer

Byte	Meaning
0 … 31	Versions string [1)]

1) "Siemens AG CM ASi M V aa.bb.cc.dd"

9.4.23 Read ID_Code

Significance

This command reads the ID code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 44 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 17_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 45 Structure of the reply data in the receive buffer

Byte	Significance			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		ID code	

9.4.24 Read_ID1-Code

Meaning

This command reads the ID1 code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 46 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 37_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 47 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		ID1 code	

9.4.25 Write ID1-Code

Meaning

This command writes the ID1 code of an AS-i slave with the address "0" directly over the AS-i cable.

The AS-i master forwards the ID1 code to the AS-i slave without a plausibility check.

Structure of the job data in the send buffer

Table 9- 48 Structure of the job data in the send buffer

Byte	Meaning	
0	Command number: $3F_H$	
1	Not relevant	ID1 code

9.4.26 Read_ID2-Code

Meaning

This command reads the ID2 code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 49 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 38_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 50 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		ID2 code	

9.4.27 Read_IO-Code

Meaning

This command reads the IO code of an AS-i slave directly over the AS-i cable.

Structure of the job data in the send buffer

Table 9- 51 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 18_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 52 Structure of the response data in the receive buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Reserved		IO code	

9.4.28 Get_LPF

Meaning

This command reads the list of I/O faults (periphery faults) (LPF) signaled by the AS-i slaves from the AS-i master. The AS-i master updates the LPF cyclically. Refer to the description of the AS-i slave to learn whether the slave can detect a fault in the connected I/O, e.g. wire break, and when it signals the fault.

Structure of the job data in the send buffer

Table 9- 53 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: BE_H

Structure of the responses in the receive buffer

Table 9- 54 Structure of the responses in the receive buffer

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Slave 7(A)	Slave 6(A)	Slave 5(A)	Slave 4(A)	Slave 3(A)	Slave 2(A)	Slave 1(A)	Reserved
1	Slave 15(A)	Slave 14(A)	Slave 13(A)	Slave 12(A)	Slave 11(A)	Slave 10(A)	Slave 9(A)	Slave 8(A)
2	Slave 23(A)	Slave 22(A)	Slave 21(A)	Slave 20(A)	Slave 19(A)	Slave 18(A)	Slave 17(A)	Slave 16(A)
3	Slave 31(A)	Slave 30(A)	Slave 29(A)	Slave 28(A)	Slave 27(A)	Slave 26(A)	Slave 25(A)	Slave 24(A)
4	Slave 7B	Slave 6B	Slave 5B	Slave 4B	Slave 3B	Slave 2B	Slave 1B	Reserved
5	Slave 15B	Slave 14B	Slave 13B	Slave 12B	Slave 11B	Slave 10B	Slave 9B	Slave 8B
6	Slave 23B	Slave 22B	Slave 21B	Slave 20B	Slave 19B	Slave 18B	Slave 17B	Slave 16B
7	Slave 31B	Slave 30B	Slave 29B	Slave 28B	Slave 27B	Slave 26B	Slave 25B	Slave 24B
8 … 13	Reserved							

The bits have the following meanings in the LPF data:

Bit = 0: The slave signals no I/O fault.

Bit = 1: The slave signals I/O fault.

9.4.29 Write_Parameter_String

Meaning

This command sends a parameter string in accordance with AS-i slave profile 7.4 to the AS-i master. The master forwards the parameter string to the AS-i slave address specified in the send buffer.

This command transfers a send buffer with up to 223 bytes to the AS-i master. The AS-i master calculates the actual number of parameter bytes to be sent to the AS-i slave from byte 2 of the send buffer.

The AS-i master does not evaluate any other information in the parameter string. It transfers this to the AS-i slave transparently. While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 55 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 40_H
1	Slave address
2	Number of parameter bytes
3	Parameter string byte 1
4	Parameter string byte 2
…	…
n + 1	Parameter string byte n - 1
n + 2	Parameter string byte n

Maximum value for n = 220

9.4.30 Read_String

Meaning

This command causes the AS-i slave to read a parameter string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer.

The AS-i master supplies up to 221 bytes of response data. The AS-i master signals the actual number of parameter bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a parameter string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the job program.

While transmission of the parameter string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 56 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 41_H
1	Slave address

Structure of the response data in the receive buffer

Table 9- 57 Structure of the response data in the receive buffer

Byte	Meaning
0	Number of parameter bytes
1	Parameter string byte 1
2	Parameter string byte 2
…	…
n - 1	Parameter string byte n - 1
n	Parameter string byte n

Maximum value for n = 220

9.4.31 Read_String

Meaning

This command causes the AS-i slave to read an identification string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of ID bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends an ID string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

As long as the transmission of the identification string is running, there is no transfer of user/analog data with the addressed AS-i slave.

Note

In a deviation from normal procedure, this command also transfers the bytes that contain the bits "Follows" and "Valid".

For further details, refer to AS-i slave profile 7.4

Structure of the job data in the send buffer

Table 9- 58 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: 42_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 59 Structure of the reply data in the receive buffer

Byte	Meaning
0	Number of ID bytes
1	ID string byte 1
2	ID string byte 2
…	…
n - 1	ID string byte n - 1
n	ID string byte n

Maximum value for n = 220

9.4.32 Read_String

Significance

This command causes the AS-i slave to read a diagnostics string in accordance with AS-i slave profile 7.4 with the AS-i slave address specified in the send buffer. The AS-i master supplies up to 221 bytes of reply data. The AS-i master signals the actual number of diagnostics bytes sent by the AS-i slave in Byte 0 of the receive buffer.

If the AS-i slave sends a diagnostics string longer than 220 bytes, the AS-i master aborts string transfer and terminates the job with an error. The received data is not made available to the user program.

While transmission of the diagnostics string is being executed, there is no transfer of user data / analog data with the addressed AS-i slave.

Structure of the job data in the send buffer

Table 9- 60 Structure of the job data in the send buffer

Byte	Significance
0	Command number: 43_H
1	Slave address

Structure of the reply data in the receive buffer

Table 9- 61 Structure of the reply data in the receive buffer

Byte	Significance
0	Number of diagnostics bytes
1	Diagnostic string byte 1
2	Diagnostic string byte 2
…	…
n - 1	Diagnostic string byte n - 1
n	Diagnostic string byte n

Maximum value for n = 220

9.4.33 Read_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 96 Read AS-i master error counters and status messages (FW V1.1 and higher) (Page 86)" for reading out the error counters. The Read_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out error counters that concern the overall AS-i network.

If the AS-i power supply is missing, the overall device fails. This leads to all counters being reset. The counting starts over each time the device is powered up.

For the meaning of the error counters, refer to Table "Table 8-11 Meaning of error counter (Page 86)".

Structure of the job data in the send buffer

Table 9- 62 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CA_H

Structure of the responses in the receive buffer

Table 9- 63 Structure of the data record

Byte	Meaning	
0	Summation counter: AS-i Power Fail	High byte
1		Low byte
2	Summation counter: Ground fault	High byte
3		Low byte
4	Summation counter: Slave failure	High word, high byte
5		High word, low byte
6		Low word, high byte
7		Low word, low byte
8	Summation counter: Missing slave frame	High word, high byte
9		High word, low byte
10		Low word, high byte
11		Low word, low byte

Byte	Meaning		
12	Summation counter: Erroneous slave frame		High word, high byte
13			High word, low byte
14			Low word, high byte
15			Low word, low byte
16	Summation counter: Slave peripheral fault		High word, high byte
17			High word, low byte
18			Low word, high byte
19			Low word, low byte
20	Summation counter: Slave protocol error (for slaves according to CTT1 ... CTT5)		High word, high byte
21			High word, low byte
22			Low word, high byte
23			Low word, low byte
24	Summation counter: Erroneous master frame		High word, high byte
25			High word, low byte
26			Low word, high byte
27			Low word, low byte
28 … 35	List of count values > 0 (see Table "Structure of bit fields")		
	Bit = 0	Count value = 0 for all error counters of the AS-i address	
	Bit = 1	Count value > 0 for at least one error counter of the AS-i address	
36	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)		High word, high byte
37			High word, low byte
38			Low word, high byte
39			Low word, low byte
40	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)		High word, high byte
41			High word, low byte
42			Low word, high byte
43			Low word, low byte
44	Summation counter: Sent master frames, factor (MT_CNT_BASE)		High word, high byte
45			High word, low byte
46			Low word, high byte
47			Low word, low byte
48	Reserved		Bit 0 = MADDR
49	Reserved		
50 … 57	List of multiple addressing (see Table "Structure of bit fields")		
	Bit = 0	The AS-i address is assigned once or is not present.	
	Bit = 1	The AS-i address is assigned more than once.	
58 ... 220	Reserved		

The counters are integer values (2 bytes or 4 bytes).

Multiple addressing has been detected for at least one AS-i address on the AS-i cable. This means that multiple slaves have the same AS-i address.

Structure of the bit fields

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	SLAVE 7/7A	SLAVE 6/6A	SLAVE 5/5A	SLAVE 4/4A	SLAVE 3/3A	SLAVE 2/2A	SLAVE 1/1A	Reserved

6	SLAVE 23B	SLAVE 22B	SLAVE 21B	SLAVE 20B	SLAVE 19B	SLAVE 18B	SLAVE 17B	SLAVE 16B
7	SLAVE 31B	SLAVE 30B	SLAVE 29B	SLAVE 28B	SLAVE 27B	SLAVE 26B	SLAVE 25B	SLAVE 24B

9.4.34 Read_and_Delete_AS-i-Master_Error_Counter

Note

With Firmware V1.1 or higher, use data record "DS 97 Read and reset AS-i master error counters (FW V1.1 and higher) (Page 89)" for reading out the error counters. The Read_and_Reset_AS-i_Master_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command functions like the "Read_AS-i-Master_Error_Counter" command. In addition, the AS-i master then sets all error counters to 0.

Structure of the job data in the send buffer

Table 9- 64 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CB_H

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "Read_Error_Counter (Page 151)" command.

9.4.35 Read_AS-i_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)". The Read_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out AS-i slave-specific error counters. For the meaning of the error counters, refer to Section "Table 8-13 Meaning of error counter (Page 90)".

Structure of the job data in the send buffer

Table 9- 65 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CC_H
1	AS-i slave address

Structure of the responses in the receive buffer

Table 9- 66 Structure of the responses in the receive buffer

Byte	Meaning	
0	Counter: Slave failure	High byte
1		Low byte
2	Counter: Missing slave frame	High byte
3		Low byte
4	Counter: Faulty slave frame	High byte
5		Low byte
6	Counter: Peripheral fault	High byte
7		Low byte
8	Counter: Protocol error	High byte
9		Low byte
10	Counter: Faulty master frame	High byte
11		Low byte
12	Summation counter: Sent master frames, less significant part (MT_CNT_LOW)	High word / high byte
13		High word / low byte
14		Low word / high byte
15		Low word / low byte
16	Summation counter: Sent master frames, more significant part (MT_CNT_HIGH)	High word / high byte
17		High word / low byte
18		Low word / high byte
19		Low word / low byte
20	Summation counter: Sent master frames, factor (MT_CNT_BASE)	High word / high byte
21		High word / low byte
22		Low word / high byte
23		Low word / low byte
24 … 31	Reserved	

9.4.36 Read_and_delete_AS-i_Slave_error_counter

Note

With Firmware V1.1 or higher, use data records "DS 150 to DS 153 Read AS-i error counters (Page 89)" and "DS 154 Delete AS-i error counters (from V1.1) (Page 96)". The Read_and_Reset_AS-i_Slave_Error_Counters command continues to exist for compatibility reasons.

Meaning

This command reads out the error counters of the AS-i slaves. Data records DS 150 and DS 151 access the standard addresses and the A addresses. Data records DS 152 and DS 153 access the B addresses. The counters for addresses 16 / 16A exist identically in data records DS 150 and DS 151. The counters for address 16B exist identically in data records DS 152 and DS 153. Data record DS 154 resets all AS-i slave error counters.

Structure of the job data in the send buffer

Table 9- 67 Structure of the job data in the send buffer

Byte	Meaning
0	Command number: CD_H
1	AS-i slave address

Structure of the responses in the receive buffer

The receive buffer is identical to the receive buffer of the "Read_AS-i_error_counter (Page 154)" command.

9.4.37 Activate_ground fault detection (reset EFD)

Meaning

The setting for enabling the integrated ground fault detection is always made when configuring the CM AS-i Master.
This command is used to enable or disable the ground fault detection via the user program so as to overwrite the configured setting.
After a startup or restart, the configured setting is applied again.

Structure of the job data in the send buffer

Table 9- 68 Structure of the job data in the send buffer

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Command number 13_H							
1	0							0 = Ground fault detection is enabled 1 = Ground fault detection is disabled

9.4.38 Set_Configuration_Online

Meaning

The following configuration data for the addressed AS-i slave is configured with this command:

- IO code
- ID code
- ID1 code
- ID2 code
- Parameter value

The configuration data is stored in the non-volatile EEPROM of the CM AS-i Master ST. The AS-i master uses this configuration data as the specified expected configuration for "protected operation". The configuration data are defined by the manufacturer of the AS-i slave. The meaning of the configuration data is described in the "AS-Interface Complete Specification". If the addressed AS-i slave does not support ID code 1 or ID code 2, the command must be specified in the value FH for this. When this command is executed, the AS-i master remains in the online phase. This means that the AS-i master is not restarted. The command can be executed in "Protected operation".

The command can be executed for any slaves including proxy slaves. Ensure that you have defined an adequate length for the I/O image when configuring the slave. If the the I/O image for the slave is not long enough, surplus input data are truncated and surplus output data are transmitted with substitute value 0. This applies to a digital I/O image and an analog I/O image.

If the value F (hex) is written to a proxy slave for all four codes (IO code, ID code, ID1 code and ID2 code), any slave type at this AS-i address is activated by the AS-i master.

Note

Configuration data are overwritten

If you use this command, you will overwrite the corresponding configuration data that resulted from configuring using the "SET" button or configuring using HW Config.

Note

The configuration data for all proxy slaves can be reset to value F (hex) in the CM AS-i Master ST module by configuring the AS-i slaves using the "SET" button with no slaves connected (see Section "Configuration of the AS-i slaves using the "SET" button (Page 35)").

Structure of the job data in the send buffer

Table 9- 69 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D0_H$			
1	Slave address			
2	IO code		ID code	
3	ID1 code		ID2 code	
4	0		Parameter	

9.4.39 AS-i-Slave_ID1_schreiben_mit_Zieladresse (Write ID1 code with destination address)

Meaning

This command writes the ID1 code of an AS-i slave with the specified address directly via the AS-i cable.

The AS-i master forwards the ID1 code to the AS-i slave without a plausibility check.

Requirements

- The AS-i slave at the target address must support writing of the ID1 code.
- There are no AS-i slaves on the AS-i bus with address "0".

Structure of the job data in the send buffer

Table 9- 70 Structure of the job data in the send buffer

Byte	Meaning			
	Bit 7	Bit 4	Bit 3	Bit 0
0	Command: $D1_H$			
1	AS-i slave address			
2	0		ID1 code	

Technical data

10

10.1 Technical specifications

Technical specifications of CM AS-i Master ST

		3RK7137-6SA00-0BC1
product designation		AS-Interface Master
Product-type designation		CM AS-i Master ST
Protection class IP		IP20
Design of the electrical connection of the AS-Interface		ET 200SP BaseUnit (Type C0), 20 mm
Type of voltage supply		Via AS-i and backplane bus
Operating condition separate power supply 24 V		No
Current consumed		
• from shaped cables of AS-Interface		
– at 24 V with AS-i Power24V maximum	A	0.07
– with external 24 V-supply voltage maximum	A	0.07
• from backplane bus		0.02
Resistive loss	W	1.7
Insulation voltage rated value	V	500
Product function adapted for AS-i Power24V		Yes
Product feature redundancy capability		No
Product function web-based management		No
Product function diagnosis via E-mail		No
Product function galvanic isolation		Yes
Type of projection of the AS-interface		Set pushbutton on device, STEP7, GSD, command interface
Version of the AS-interface specification		V 3.0
AS-interface masterprofile is supported		M4 (in acc. with AS-interface specification V 3.0)
Type of data transmission		ET 200SP backplane bus
Transfer rate of the AS-interface maximum	bit/s	167 000

		3RK7137-6SA00-0BC1
Number of interfaces		
• as AS-interface		1
• according to Industrial Ethernet		0
• according to PROFINET		0
• according to RS 485		0
• according to USB		0
• according to wireless		0
• others		1
Product component optical interface		No
Protocol is supported		
• ASIsafe(Safety at work) protocol		No
• PROFIBUS protocol		No
• PROFINET CBA protocol		No
• PROFINET IO protocol		No
• PROFIsafe protocol		No
• SNMP		No
• other bus systems		No
• TCP/IP		No
Standard for wireless communication IEEE 802.11		No
Number of inputs for AS Interface maximum		496
Number of outputs for AS Interface maximum		496
Number of AS-i slaves per AS-Interface maximum		62
Bus cycle time of the AS-interface		
• at 31 slaves	s	0.005
• at 62 slaves	s	0.01
Access to digital I/O data		via process diagram/peripheral addresses and data record transfer
Access to analog I/O data		via data record transfer
Width	mm	20
Height	mm	69.2
Depth	mm	53.6
Type of mounting		Pluggable in BaseUnit

		3RK7137-6SA00-0BC1
Ambient temperature		
• if installed on horizontal mounting rail		
– during operation	°C	0 60
• if installed on vertical mounting rail		
– during operation	°C	0 50
• during storage	°C	-40 70
• during transport	°C	-40 70
Relative humidity at 25 °C during operating maximum	%	95
Installation altitude at a height over sea level maximum	m	2 000
Module format		IP20
Type of display as status display by LED		DIAG, AS-i OK, AS-i FAULT, PF, CER, CM, AUP, PWR, SL_Xy (A), SL_xY (B)
Acceptability for application safety-related function		No
Explosion protection labeling for intrinsic safety of related operating resources		
• EEX ia		No
• EEX ib		No
Explosion protection category for gas		none
Explosion protection category for dust		none

Data sets

C

C.1 DS 100 Switch duplicate address detection on/off

Description

The duplicate address detection function can be activated/deactivated via the user program by means of write access to data record DS 100.

For the CM AS-i Master firmware V1.0 the status is stored in the AS-i Master volatile memory, i.e. if the AS-i voltage fails, duplicate address detection is deactivated.

For the CM AS-i Master firmware V1.0 and higher, duplicate address detection is adopted according to the setting in HW Config or GSD after failure of the AS-i voltage.

Note

From firmware V1.1 onwards use the setting option via HW Config or GSD to activate duplicate address detection. Data record DS 100 continues to exist for compatibility reasons.

Table C- 1 Structure of DS 100 write

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	0							
1	0							
2	0							0 / 1
3	0							

Bit 0 = 0 Duplicate address detection is activated.

= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be changed in this case.

See also

Duplicate address detection (Page 76)

C.2 DS 100 Read setting for duplicate address detection

Description

Via read access to data record DS 100 the enable status of duplicate address detection can be read back.

Table C- 2 Structure of DS 100 read

Byte	Meaning							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 … 1	Reserved							
2	Reserved							0 / 1
3	Reserved							

Bit 0 = 0 Duplicate address detection is activated

= 1 Duplicate address detection is deactivated (default setting for FW V1.0).

The setting for which AS-i voltage duplicate address detection is activated (possible for FW V1.1 and higher) cannot be read out in this case.

TCP/IP	Transmission Control Protocol / Internet Protocol
TIA	Totally Integrated Automation
USB	Universal Serial Bus
WRREC	Write record

Glossary

"Protected operation"

In "protected operation", the AS-i master only exchanges data with the configured AS-i slaves. "Configured" means that the slave addresses and configuration data stored in the AS-i master agree with the values of existing AS-i slaves.

APF

AS-i Power Fail. Flag or LED display that indicates that the supply voltage on the AS-i cable is too low or has failed, e.g., failure of the AS-i power supply unit.

AS-i (AS-Interface)

Actuator-Sensor-Interface. A networking system for the plant-floor automation layer. It is suitable for networking sensors and actuators with controllers.

AS-i analog slave

AS-i analog slaves are special AS-i standard slaves that exchange analog values with the AS-i master; see also CTT.

AS-i master

The AS-i master monitors and controls simple digital or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are distinguished according to their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing type (AS-i slave with standard address in the range 0 ... 31 and AS-i slave with A/B address in the range 0, 1A ... 31A, 1B, 31B) or their functionality (standard slave for non-safety-related data transmission and ASIsafe slave for safety-related data).

AS-i slave with A/B address

AS-i slaves with A/B address use extended addressing. A (numerical) address can thus be used by two slaves with A/B address, e.g., 1A and 1B. Based on the address organization, up to 62 slaves with A/B address can be connected to the AS-Interface.

For cyclic data transmission, the master accesses each (numerical) address once per AS-i cycle (max. 5 ms). If two slaves use a (numerical) address on the bus both as an A address and a B address, two consecutive AS-i cycles are required for their data transmission (max. 10 ms rms). If a (numerical) address is used only as an A address or as a B address on the bus, the data transmission for these slaves occurs in every AS-i cycle.

AS-i slave with standard address

Each AS-i slave with standard address occupies one address on the AS-Interface; based on the address organization, up to 31 AS-i slaves with standard address can therefore be connected to the AS-Interface. If a slave with standard address occupies an address, this address is no longer available for slaves with A/B address.

For cyclic data transmission, the master accesses each address once per AS-i cycle (max. 5 ms).

CER

Configuration Error (Indication of configuration errors). The configuration error is indicated by an LED if the actual bus configuration does not match the specified configuration.

CM

Communication module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CTT

Combined Transaction Type. Special AS-i slave profile:

CTT slaves require several AS-i cycles or several AS-i addresses for updating process data between an AS-I slave and AS-i master.

The following CTT variants are defined:

CTT1: Slave profiles S-7.3, S-7.4

For cyclic data transmission of analog values or transparent data (up to 16 bits per channel).

Depending on the slave, the data transmission is in the direction of the input or output.

The S-7.1 and S-7.2 profiles are outdated profiles that are not managed automatically by the AS-i master (function blocks are required for decoding the process data).

CTT2: Slave profiles S-7.5.5, S-7.A.5, S-B.A.5

For transmission of data blocks similar to data record transmission in PROFIBUS/PROFINET.

The transmission can be initiated individually via the user program (acyclically, see "CTT2-Request_lesen_schreiben (Read_Write_CTT2_String)") or automatically by the master (cyclically, same as for analog values). Refer to the slave documentation.

The transmission process is managed automatically by the master and corresponds to a serial data transmission with approximately 12 bytes (or 6 bytes for A/B address with maximum configuration).

Depending on the slave, in parallel to the data block transmission, digital data of up to 2 DI / DO are also transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT3: Slave profiles S-7.A.7, S-7.A.A

For cyclic transmission of digital data.

Slave profile S-7.A.7 transmits 4 DI / 4 DO using a slave with A/B address. Like for standard slaves, the inputs are transmitted in each AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration). The outputs require double the transmission time.

Slave profile S-7.A.A transmits 8 DI / 8 DO using a slave with A/B address. The inputs and outputs are transmitted using four AS-i cycles.

CTT4: Slave profiles S-7.A.8, S-7.A.9

For cyclic transmission of analog values or transparent data (up to 16 bits per channel) in the input direction using a slave with A/B address.

Depending on the slave, in parallel to the data block transmission, digital data of up to 1 DO can also be transmitted per AS-i cycle (5 ms or 10 ms for A/B address with maximum configuration).

CTT5: Slave profile S-6.0.x, where x = 2 … 7, A … C

For cyclic transmission of analog values or transparent data (up to 16 bits) in the input and output direction.

The CTT5 types each occupy 2, 3, or 4 slave addresses simultaneously, depending on the data record, so that consistent transmission of the full data width occurs in each AS-i cycle (5 ms).

DIAG

Diagnosis

EFD

Ground fault detection

GSD file

Generic station description file for PROFIBUS or PROFINET devices

GSDML file

GSD file for PROFINET devices. As a generic station description, this file contains all of the properties of a PROFINET device necessary for its configuration.

HSP

The Hardware Support Package supplements the hardware catalog of *STEP 7*.

ID code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

ID1 code

Also called: Extended ID1 code

Fixed or editable identification code saved in the AS-i slave.

See also: Slave profile

ID2 code

Also called: Extended ID2 code

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

Inspector window

The inspector window of *STEP 7* / TIA Portal displays additional information about a selected object or executed actions. The indicated properties and parameters of the selected object can be edited within the inspector window.

IO code

Also called: I/O configuration

Fixed identification code saved in the AS-i slave; part of the slave profile.

See also: Slave profile

LAS

List of Activated Slaves

LDS

List of Detected Slaves

LED

A light-emitting diode that is used to display the signal status.

LPF

List of periphery faults This list in the AS-i master designates the status of the peripheral fault of the activated slaves.

LPS

List of Projected Slave (list of configured slaves)

Nibble

A nibble is a unit of information that comprises four bits.

Option handling

Option handling allows the user program to activate optional functions during normal operation without the need for reconfiguration.

PF

Peripheral fault: Error message of an active AS-i slave to the master, e.g., overload at output (depending on slave, see documentation of the AS-i slave).

Slave profile

The slave profile classifies the basic properties of an AS-i slave. The slave profile consists of the IO code, ID code, and ID2 code, which are stored as fixed, uneditable codes in each slave. In addition, a slave has an ID1 code, which is saved in the slave as a fixed code or a code that is editable by the user (e.g., with an addressing device). The value of the ID1 code usually has no effect on the operating characteristics of the slave. In this case, the user should not change the value, so that compatibility problems do not occur if the device is replaced. Note the documentation of the slave for the ID1 setting.

Each of the four identification codes consists of a 4-bit value that is usually written in hexadecimal notation with a value range of 0 to F. On power-up, the AS-i master reads the codes automatically from each slave and saves this ACTUAL configuration in the volatile memory of the AS-i master.

If the AS-i master is in “protected operation”, it compares the ACTUAL configuration with a CONFIGURED configuration, which is normally stored in non-volatile memory in the AS-i master. Slaves whose ACTUAL configuration matches the CONFIGURED configuration are activated and then participate in the cyclic data exchange. Slaves without a match are not activated and do not exchange cyclic data. A configuration error is also signaled.

ID2 and ID1 are optional codes. That is, some slaves do not have these two codes. In this case, the master enters the hexadecimal value “F” as a substitute value in the ACTUAL configuration.

Slaves with extended addressing, the so-called A/B slaves, use only the three less significant bits of the ID1 code as the slave identification. The most significant bit of the ID1 code is reserved and is used by the AS-i system to distinguish between an A address or B address. The effective value range of the ID1 code is thus 0 ... 7. For the read-out of the ID code, only the 3 less significant bits or all 4 bits are displayed, depending on the system, so that the displayed ID1 code can be within the value range 8 to F for slaves with B address. The user or programmer can ignore the most significant bit of the ID1 code for A/B slaves since it is managed automatically by the system.

The slave profile is usually shown in the documentation with the S prefix and a hyphen (in some cases), followed by the IO, ID, and ID2 codes, each separated by a dot.

Example: S-7.0.F

Since the ID1 code is usually editable, the value is often not documented or documented only as a default value.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://www.siemens.com/industrialsecurity)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://support.automation.siemens.com)

Documentation guide

1

1.1 Documentation guide for the F-DI 8x24VDC HF digital input module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital input module F-DI 8×24VDC HF

The table below lists additional documents that complement this description of the fail-safe digital input module F-DI 8×24VDC HF and are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital input module F-DI 8×24VDC HF

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-DI 8x24VDC HF

Order number

6ES7136-6BA00-0CA0

View of the module

Figure 2-1 View of the F-DI 8×24VDC HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 8 inputs (SIL3/Cat.4/PLe)
  - 8 outputs for sensor supply
  - Use of various interconnection types (1oo1, 1oo2) is possible
  - Supply voltage L+
  - Sink input (P-reading)
  - Suitable for connection of 3/4-wire sensors according to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Internal short circuit proof sensor supplies for each input
  - External sensor supply possible
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input (green LED)
  - Error display for each input (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 47).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

The first BaseUnit must be a light BaseUnit.

Note

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for F-DI 8×24VDC HF

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
DI parameters:			
Sensor supply			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters			
Channel n, n+4			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non equivalent	no	Channel pair
Discrepancy behavior	• Supply 0 value • Supply last valid value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal not necessary • Test 0-signal necessary	no	Channel pair
Channel n			
Activated	• enable • disable	no	Channel
Sensor supply	• Sensor supply 0 to 7 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the sensor supply

4.2.2.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.2.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.2.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.3 Parameters of the channel pairs

4.2.3.1 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.3.2 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Evaluation of the sensors" parameter:

- 1oo1 evaluation
- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo1 evaluation

The sensor is available once for 1oo1 evaluation.

1oo2 evaluation, equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One two-channel sensor
- Two single-channel sensors
- One non-equivalent sensor

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

4.2.3.3 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.3.4 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.3.5 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4 Parameters of the channels

4.2.4.1 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 19)

4.2.4.2 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 53)

Response times (Page 57)

4.2.4.3 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.4 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

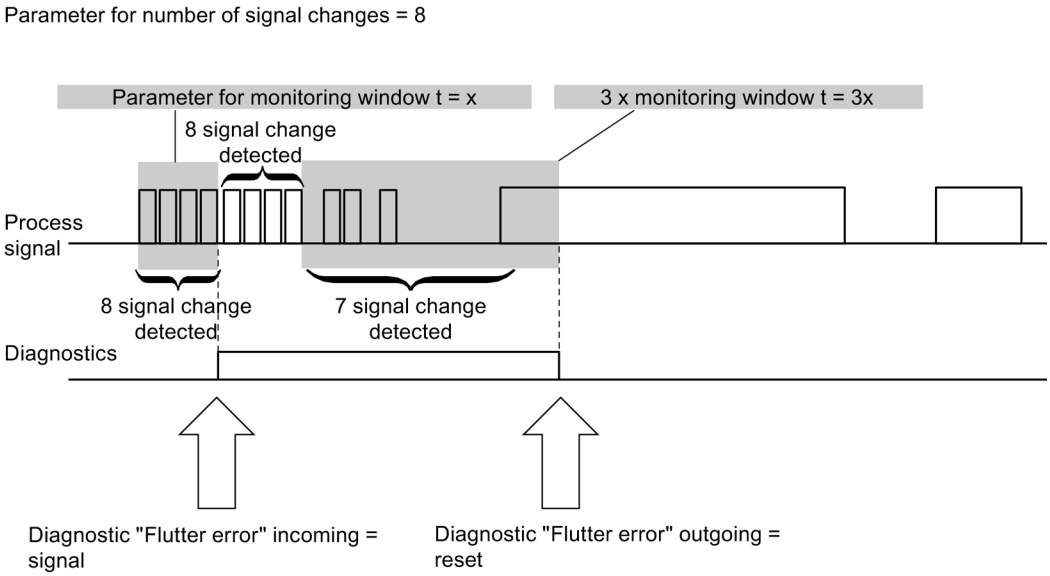

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.5 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.3 Address space

Address assignment of the digital input module F-DI 8×24VDC HF

The digital input module F-DI 8×24VDC HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 5	x + 0 to x + 3

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 4- 3 Address assignment through user data

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	Value status for DI_7	Value status for DI_6	Value status for DI_5	Value status for DI_4	Value status for DI_3	Value status for DI_2	Value status for DI_1	Value status for DI_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

5.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

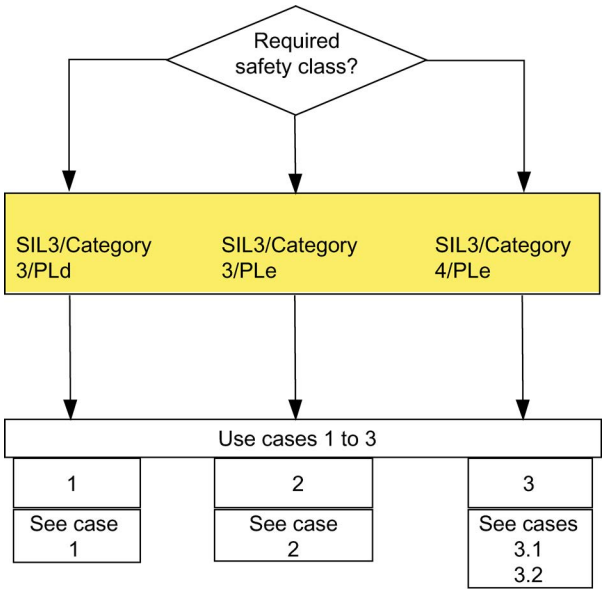

Figure 5-1 Selecting the application – digital input module F-DI 8×24VDC HF

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 1 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Note

You can operate the various inputs of an F-DI module simultaneously in SIL3/Cat.3/PLd **and** in SIL3/Cat.3 or Cat.4/PLe. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

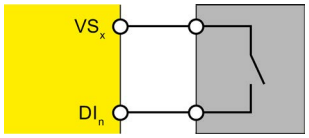

Figure 5-2 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

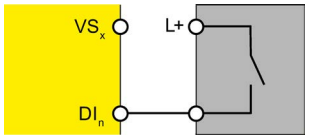

Figure 5-3 One sensor connected via one channel, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 2 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n • External sensor supply	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 3 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit of the input with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

⚠ WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the cable must be routed short circuit proof.

5.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 and DI_4
- DI_1 and DI_5
- DI_2 and DI_6
- DI_3 and DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor equivalent

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

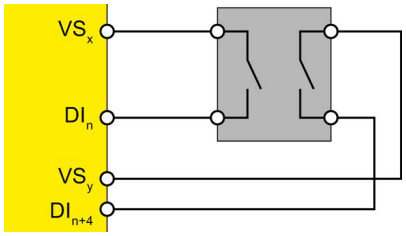

Figure 5-4 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

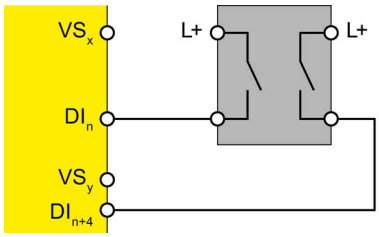

Figure 5-5 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

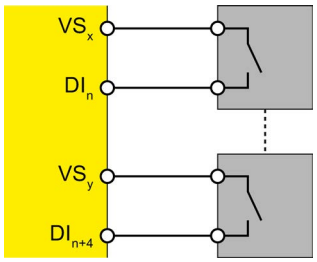

Figure 5-6 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

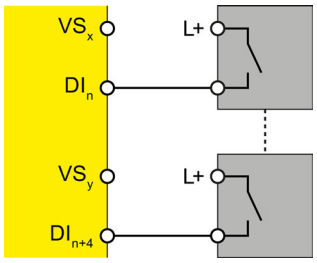

Figure 5-7 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 4 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 5 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair	no	no
Short circuit with other channels or other sensor supplies	yes*	yes
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs each to one input.

You can combine the following inputs:

- DI_0 with DI_4
- DI_1 with DI_5
- DI_2 with DI_6
- DI_3 with DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied internally by at least one channel for application 3.1.

The sensor can be supplied internally or externally for application 3.2.

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- The actuators must be wired as seen in sections Use case 3.1 (SIL3/Cat.4/PLe) (Page 38) or Use case 3.2 (SIL3/Cat.4/PLe) (Page 40). You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.4.1 Use case 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

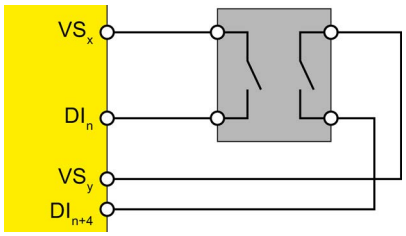

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

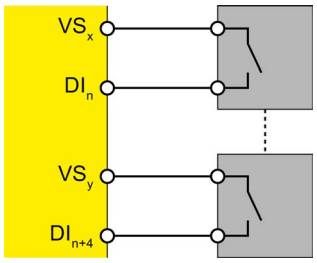

Figure 5-9 Two single-channel sensors connected via two channels, internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 6 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n (internally by at least one channel) • External

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 7 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.4.2 Use case 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor

A nonequivalent sensor is connected to two inputs of the F-module for each process signal (1oo2 evaluation, non equivalent).

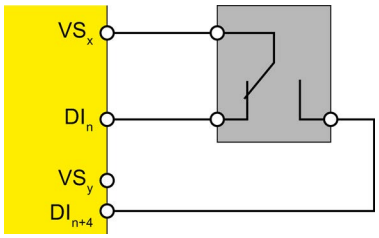

Figure 5-10 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

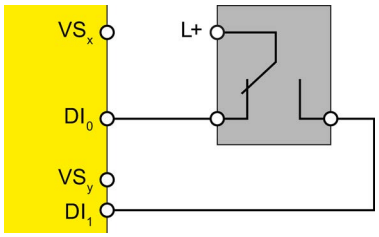

Figure 5-11 Nonequivalent sensor connected, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent

Two single-channel sensors are connected nonequivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

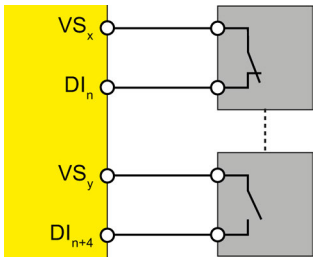

Figure 5-12 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

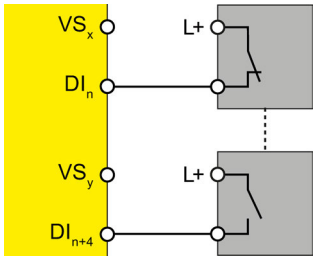

Figure 5-13 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 8 Parameter assignment

Parameter	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 9 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

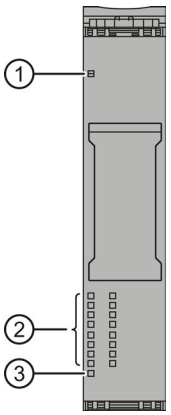
*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Interrupts/diagnostic messages

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 47).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DI 8×24VDC HF fail-safe digital input module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 47).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

Table 6- 5 Diagnostic interrupts of the F-DI 8×24VDC HF

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	1, 2, 3	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			
Discrepancy error, channel status 0/0	768_D	2, 3	Channel	
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D			No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D		Channel	
PROFIsafe communication error (timeout)	792_D		F-module	
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Supply voltage too high	803_D		F-module	No
Supply voltage too low	804_D			

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DI 8×24VDC HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	

Diagnostic message	Fault code	Meaning	Remedy
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		

Diagnostic message	Fault code	Meaning	Remedy
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.

Diagnostic message	Fault code	Meaning	Remedy
No pulse detected	778$_D$	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too high. • The "Minimum pulse time" parameter setting is too low. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784$_D$	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor/switch is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785$_D$	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 53))
Undertemperature	786$_D$	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 53))
Fault in input circuit	787$_D$	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.
PROFIsafe communication error (timeout)	792$_D$	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 53) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is deactivated, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. For this reason, tables on fault detection for the applications are presented under Applications of the F-I/O module (Page 29).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all F-modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of inputs and outputs for the value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the value status can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

Technical specifications of F-DI 8×24VDC HF

	6ES7136-6BA00-0CA0
Product type designation	F-DI 8x24VDC HF
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFINET as of GSD version/GSD revision	V2.31
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Sensor supply	
Number of outputs	8
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 1.8 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	800 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	4 W

	6ES7136-6BA00-0CA0
Address space	
Address space per module	
Input	6 bytes
Output	4 bytes
Digital inputs	
Number of inputs	8
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED

Response times

A

Introduction

The next section shows the response times of the digital input module F-DI 8×24VDC HF. The response time of the digital input module F-DI 8×24VDC HF is included in the calculation of the F-system response time.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 20 ms

Maximum cycle time: T_{cycle} = 11.5 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, and discrepancy time are configured in STEP 7.

If you have configured "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Maximum response time with external short circuits

Maximum response time = input delay + (n × T_{cycle}) + sum ("Time for short circuit test" + "Startup time after short circuit test" for sensor with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel n, short circuit test time for the sensor supply configured for channel n+4)

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

Documentation guide

1

1.1 Documentation guide for F-DQ 4x24VDC/2A PM HF digital output module

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the fail-safe digital output module F-DQ 4×24VDC/2A PM HF

The table below lists additional documents that complement this description of the fail-safe digital output module DQ 4×24VDC/2A PM HF and are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital output module F-DQ 4×24VDC/2A PM HF

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-DQ 4x24VDC/2A PM HF

Order number

6ES7136-6DB00-0CA0

View of the module

Figure 2-1 View of the F-DQ 4×24VDC/2A PM HF module

Properties

- Technical properties
  - Fail-safe digital module
  - 4 outputs, PM-switching (SIL3/Cat.4/PLe)
  - Supply voltage L+
  - Output current per output 2 A
  - Source output (PM-switching)
  - Suitable for solenoid valves, DC contactors and signal lamps
  - Diagnostic display (DIAG red/green LED)
  - Status display for each output (green LED)
  - Fault display for each output (red LED)
  - Diagnostics, e.g., short circuit/wire break/load voltage missing, channel-specific
  - Channel-specific or passivation throughout the module
  - Direct interconnection to F-DI possible (single channel: SIL1, two-channel: SIL3)
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 38).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting

L+	DC24V	**M**	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

The first BaseUnit must be a light BaseUnit.

Note

The fuse integrated in BaseUnit type A1 can trigger with the digital output module which renders the terminals useless.

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.

Switching of grounded loads

The F-DQ 4×24VDC/2A PM HF can switch loads with a connection between chassis and ground of at least 100 kΩ. Otherwise a short circuit is detected.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection.

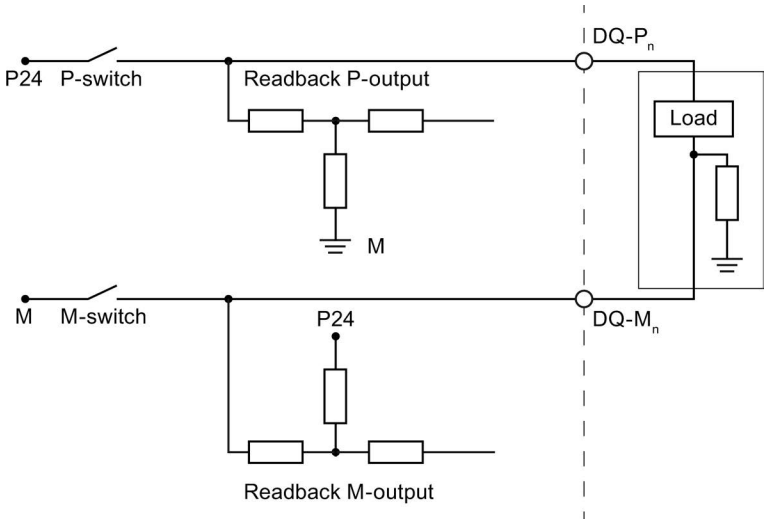

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

Alternatively, you can use F-PM-E 24VDC/8A PPM ST power module in which the output is configured as a PP-switching output.

Parameter	Value range	Parameter reassignment in RUN	Scope
Channel parameters:			
Channel n			
Activated	• disable • enable	no	Channel
Max. readback time dark test	0.6 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.6 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 Parameters of the channels

4.2.2.1 Maximal test period

With this parameter, you specify the time within which the light, dark and switch on tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test time is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

4.2.2.2 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

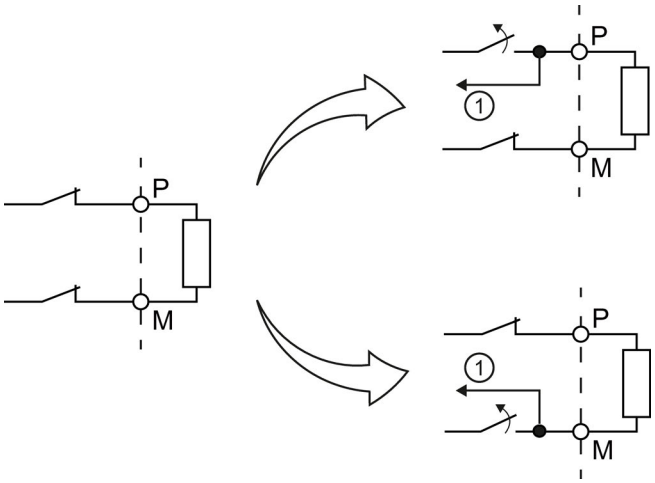
You can deactivate an unused channel with this parameter.

4.2.2.3 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-1 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads.

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

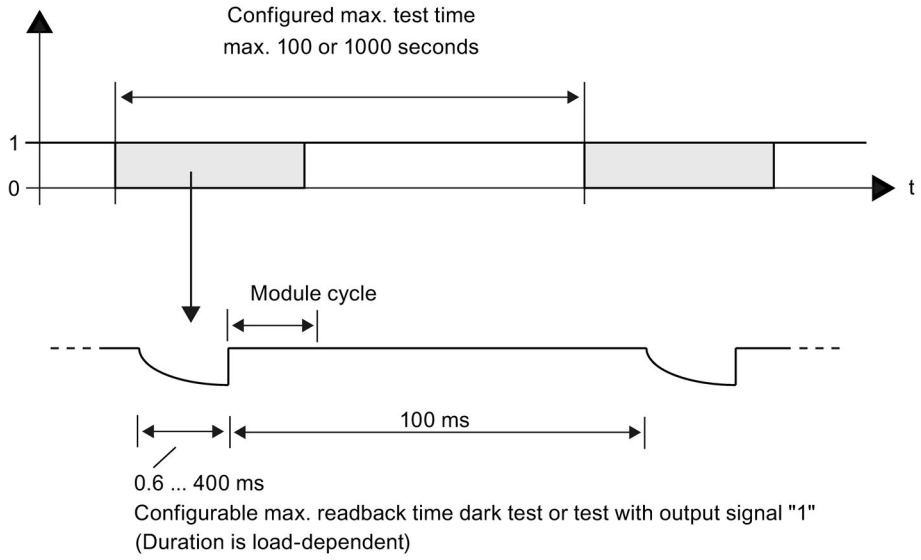


Figure 4-2 Test pulses of the dark test

The interval between two test pulses is 100 ms.

4.2.2.4 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, a single dark test pulse is directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. This also applies to the operating time if the operating time is < 48 hours. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING

If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated but all outputs are shut down and the module is passivated. This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.

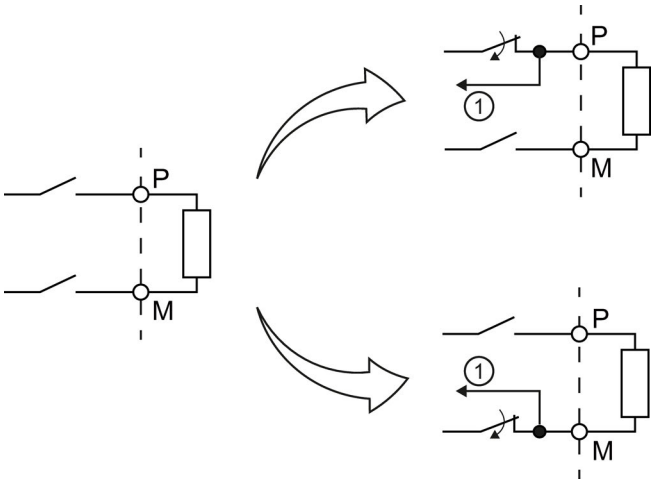
Consult the respective requirements of your product standards regarding error detection time.

4.2.2.5 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-3 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads.

If the capacitance of the actuator is not known, you may have to determine the required value for the readback time switch-on test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time is too small for a connected capacitive load. The charge of the capacitive load cannot take place during the configured readback time. Increase the readback time.

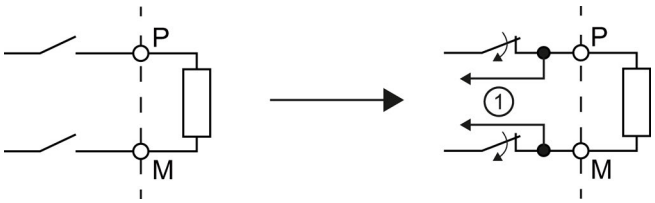
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.2.6 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, a test signal is switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-4 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

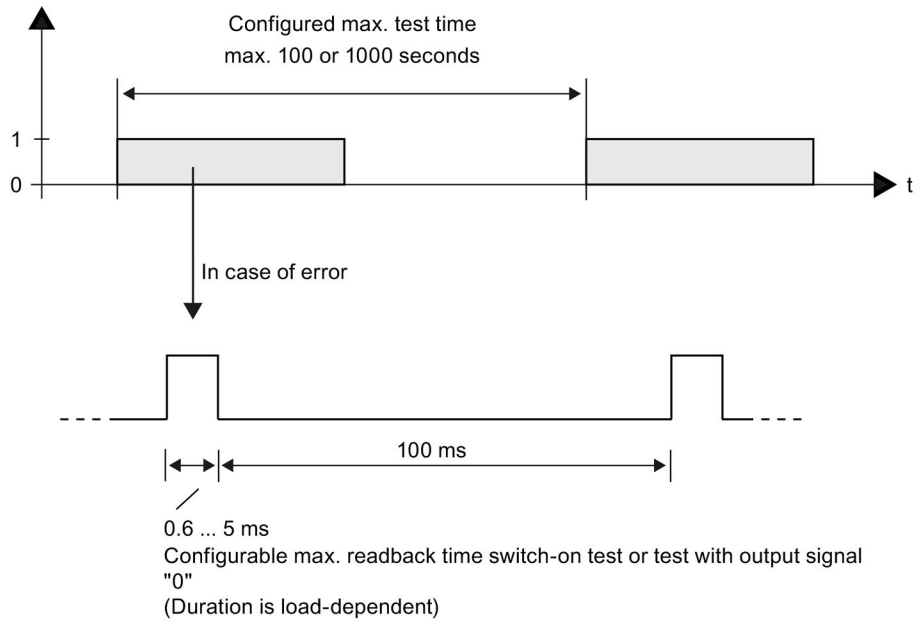


Figure 4-5 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test time per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 100 ms. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.2.7 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of the digital output module F-DQ 4×24VDC/2A PM HF

The digital output module F-DQ 4×24VDC/2A PM HF occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 4	x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 4×24VDC/2A PM HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 4×24VDC/2A PM HF:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Value status (Page 42)

Applications of the F-I/O module

5

5.1 Applications of the F-DQ 4x24VDC/2A PM HF

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is carried out on the matching BaseUnit (Page 13).

5.2 Application: Wiring a load to each digital output

Each of the four fail-safe digital output consists of a P-switch DQ-P_n and an M-switch DQ-M_n. You connect the load between the P-switch and the M-switch. The two switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

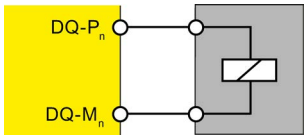

Figure 5-1 Wiring diagram for 1 relay each at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

5.3 Application: Connection of loads to L+ and M at each digital output

You can connect two relays using one fail-safe digital output. The following conditions should be kept in mind:

- Same reference potential
- The normally open contacts of the two relays must be connected in series.

This configuration achieves SIL3/Cat.4/PLe (process status readback required).

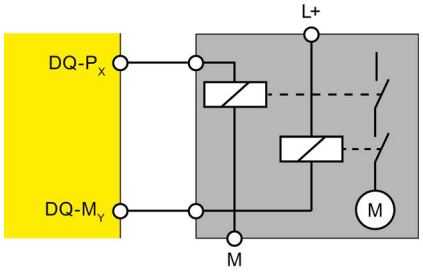

Figure 5-2 Wiring diagram for connecting 2 relays each to 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

When two relays are connected to one digital output, as shown in the figure above, the "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).

WARNING

With a cross circuit between P-switch and M-switch of the output, the module detects the fault and switches off the output. But the actuator is still supplied with power due to the external fault.

To avoid cross circuits between the P-switch and M-switch of a fail-safe digital output, you should always install the cables for the connection of the relays to the P-switch and M-switch separately to prevent any cross circuits (for example, as separately sheathed cables or in separate cable ducts).

Note

The digital output module F-DQ 4×24VDC/2A PM HF performs a bit pattern test depending on the parameter assignment. For this, the module outputs up to 5 ms pulses depending on the parameter assignment. This test (switch-on test) is run with a time offset between the P-switch and M-switch to prevent the actuator from being activated. This pulse may cause the corresponding relay to operated, which may reduce its service life.

We therefore recommend adhering to the wiring scheme described below.

5.4 Application: Wiring two loads in parallel to each digital output

To protect against cross-circuits between P-switch and M-switch in fail-safe digital outputs, we recommend the following wiring scheme. This circuit achieves SIL3/Cat.4/PLe.

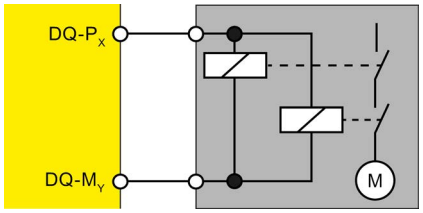

Figure 5-3 Wiring diagram for 2 relays each parallel at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

Note

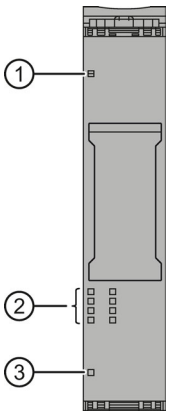
With a parallel connection of two relays on one digital output (as shown above) the "wire break" fault is only detected if the wire break disconnects both relays from P or M. This diagnostics is not safety-related.

Interrupts/diagnostic messages

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 38).

WARNING
The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-DQ 4x24VDC/2A PM HF fail-safe digital output module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 38).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 38).

Table 6- 5 Diagnostic interrupts of the F-DQ 4x24VDC/2A PM HF

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	F-module	No
Parameter assignment error	16_D		
Load voltage missing	17_D		
Access to retentive storage of F-address not possible	30_D		
Different destination address (F_Dest_Add)	64_D		
Invalid destination address (F_Dest_Add)	65_D		
Invalid source address (F_Source_Add)	66_D		
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D		
"F_SIL" parameter exceeds the application-specific SIL	68_D		
"F_CRC_Length" parameter does not match the generated CRC	69_D		
Incorrect F-parameter version or F_Block_ID	70_D		
CRC1 error	71_D		
Inconsistent iParameters (iParCRC error)	75_D		
F_Block_ID not supported	76_D		

Diagnostic interrupt	Fault code	Scope of diagnostic interrupt	Configurable
Internal error	256_D		
Time monitoring activated	259_D		
Internal supply voltage of the module failed	260_D		
Output short-circuited to L+	261_D	Channel	Yes
Output short-circuited to ground	262_D		
Wire break	265_D		
Incorrect/inconsistent firmware present. Firmware update required	283_D	F-module	No
Switching frequency too high	785_D	Channel	
Undertemperature	786_D	F-module	
PROFIsafe communication error (timeout)	792_D	F-module	
PROFIsafe communication error (CRC)	793_D	F-module	
PROFIsafe address assignment error	794_D	F-module	
		Channel	No
Output defective	797_D		
Readback error	798_D	Channel	
Overload	800_D	Channel	
Supply voltage too high	802_D	F-module	
Supply voltage too low	803_D	F-module	

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Note

You can connect two actuators per output.

The diagnostics of the two actuators influenced each other in the case of duplicate wiring.

This means:

- a wire break is only signaled if both actuators are affected
- a single short circuit affects both actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-DQ 4×24VDC/2A PM HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type

Diagnostic message	Fault code	Meaning	Remedy
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).

Diagnostic message	Fault code	Meaning	Remedy
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • There is a short circuit between two output channels. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 43))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 43))
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • The capacitive load is too high. • Short circuit to L+ or M • The F-module is defective	• Increase the test times (dark, light, switch-on tests). • Check the wiring. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Readback error	798D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The capacitive load is too high. • The F-module is defective.	• Increase the test times (dark, light, switch-on tests). • If the error persists, replace the F-module.
Overload	800D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 43) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 27).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications of F-DQ 4×24VDC/2A PM HF

	6ES7136-6DB00-0CA0
Product type designation	F-DQ 4x24VDC HF
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFINET as of GSD version/GSD revision	V2.31
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	4 W
Address space	
Address space per module	
Input	5 bytes
Output	5 bytes

	6ES7136-6DB00-0CA0
Digital outputs	
Number of outputs	4
Digital outputs, configurable	Yes
Short circuit protection	Yes
• Response threshold, typ.	> 3.3 A
Wire break detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	2.9 A
Voltage induced on current interruption limited to	typ. 2*47V
Switching capacity of outputs	
With resistive load, max.	2 A
With lamp load, max.	10 W
Load resistance range	
Low limit	12 Ω
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	2 A
For "0" signal, residual current, max.	0.5 mA
Switching frequency	
With resistive load, max.	30 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	10 Hz; symmetrical
Total current of outputs	
Max. current per channel	2 A; (note derating data in the manual)
Max. current per module	6 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual

	6ES7136-6DB00-0CA0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	75 V DC / 60 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C

Dimensions	
Width	15 mm
Weights	
Weight, approx.	57 g

Temperature characteristic values

Mounting position	Maximum temperature	Total current across all channels
Horizontal	40 °C	6 A
	50 °C	5 A
	60 °C	4 A
Vertical	50 °C	4 A

Note

Because of the small size of the modules, pay attention to the development of heat between adjacent modules when output modules are exposed to elevated loads. If overtemperature occurs in an output module exposed to an elevated load, shutdown may result and reduce the plant availability. If you fully load an output module, the average total current of the modules directly adjacent to it should not exceed 75% of the values listed in the technical specifications. If you load directly adjacent modules with their maximum total current, reduce the maximum total current of the output module by 1 A (e.g., for horizontal installation up to 60 °C → total current of 3 A across all channels).

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times

A

Introduction

The next section shows the response times of the digital output moduleF-DQ 4×24VDC HF. The response times of digital output module F-DQ 4×24VDC HF are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

Maximum cycle time: T_{cycle} = 15.5 ms

You assign the dark test time and switch-on time in STEP 7.

Maximum response time in the error-free case

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 4×24VDC HF digital output module is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load impedance and maximum switched load capacitance at a supply voltage of 24 V DC.

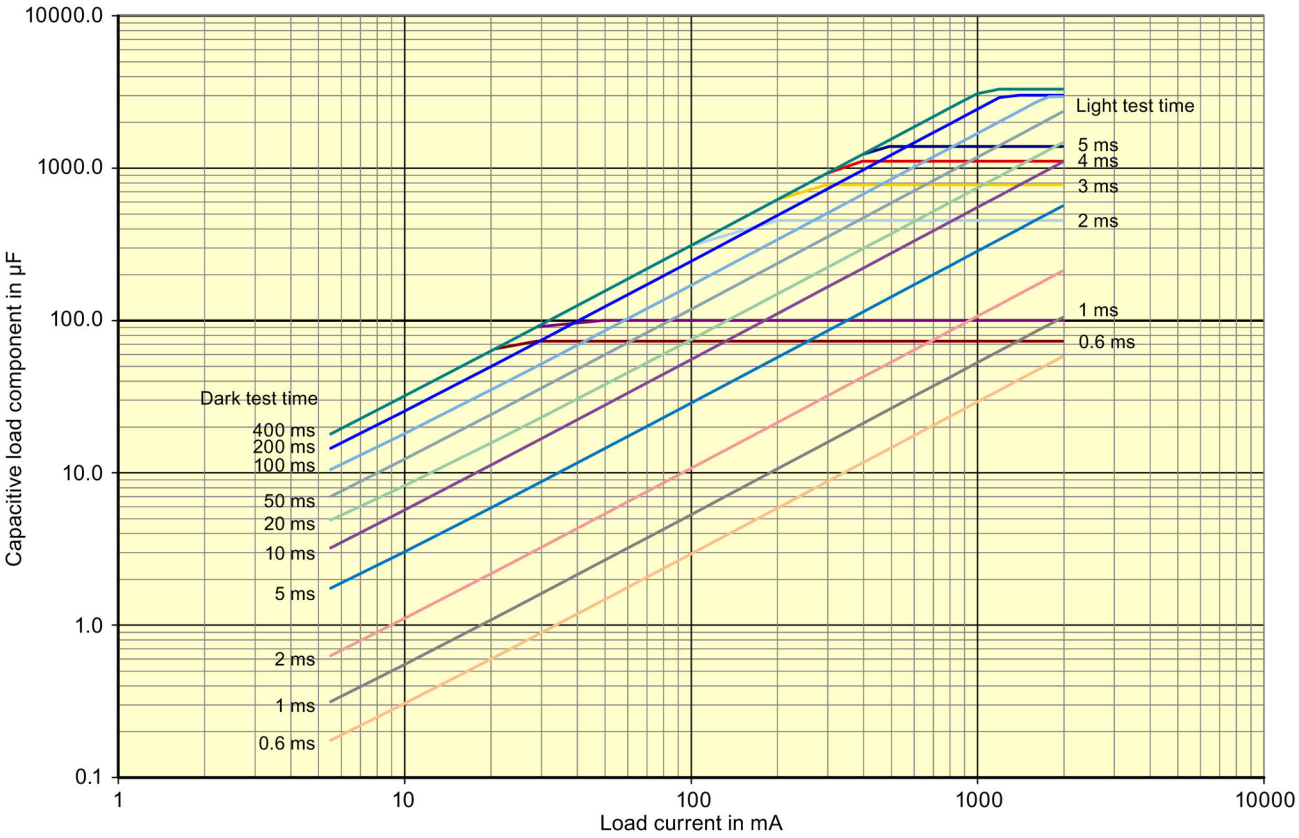

Figure B-1 Switching of capacitive loads for the F-DQ 4×24VDC HF digital output module depending on the configured dark and light test times

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

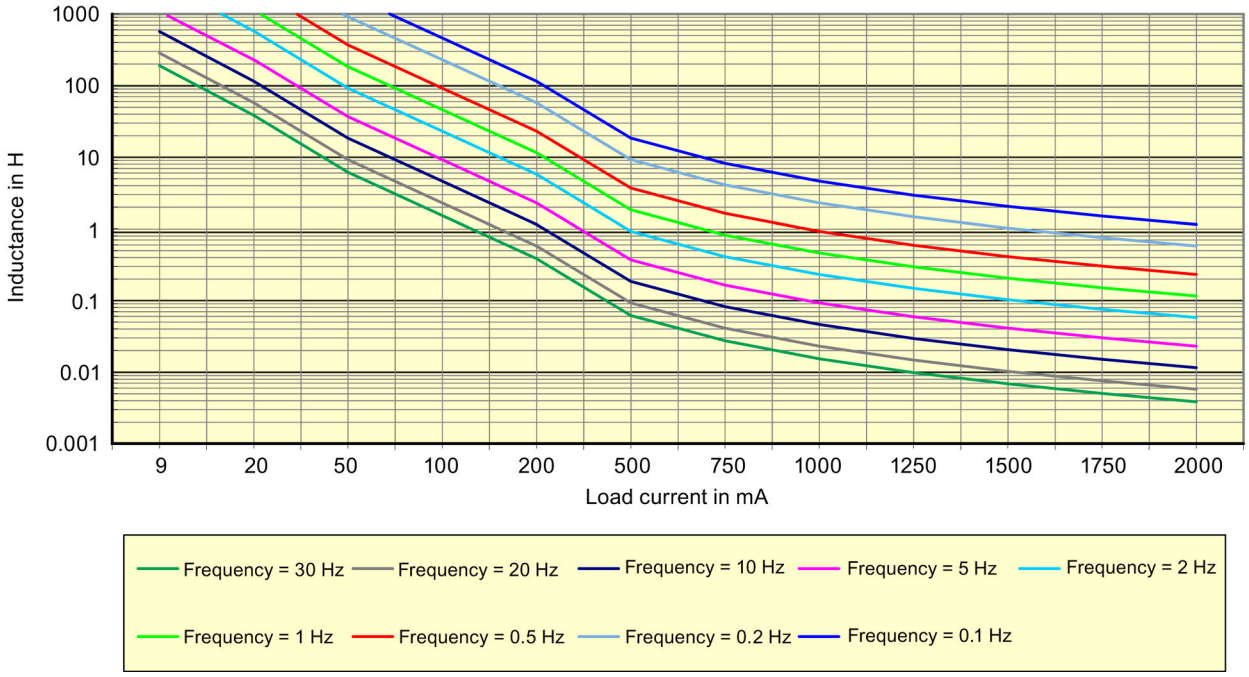

Figure B-2 Switching of inductive loads for the F-DQ 4x24VDC/2A PM HF digital output module depending on the load current and switching frequency

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of this documentation

This manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information in this manual and the system manual supports you when commissioning the ET 200SP system.

Conventions

Pay particular attention to notes highlighted as follows::

Note

A note contains important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Guide to the documentation

1

1.1 Guide to the documentation for the digital output module F-RQ 1x24VDC/24..230VAC/5A

Introduction

The documentation of the SIMATIC products has a modular structure and includes topics relating to your automation system.

The complete documentation of the ET 200SP system consists of different modules made up of system manuals, function manuals and device manuals.

The STEP 7 (online help) information system supports you when configuring and programming your automation system.

Overview of the documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

The table below lists additional documents that complement this description of the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A and that are available on the Internet.

Table 1- 1 Documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

Article number

6ES7136-6RA00-0BF0

View of the module

Figure 2-1 View of the F-RQ 1x24VDC/24..230VAC/5A module

Properties

- Technical properties
  - Digital module with 1 relay output (2 isolated NO contacts)
  - Safety class SIL3/category 4/PLecan be achieved if the F-RQ module is controlled by a fail-safe output (for example F-module F-DQ 4x24VDC/2A PM HF)
  - Control voltage 24 VDC
  - Total current for both NO contacts 5 A max.
  - Isolated from control voltage
  - Suitable for solenoid valves, DC contactors and signal lamps
- Supported system functions
  - I&M identification data
  - Firmware update

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a service life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the module in question from the BaseUnit or switch off its supply voltage before 100 hours are up.

Accessories

The following components can be used with the module:

- Labeling strips
- Color identification labels
- Reference identification labels

Connecting up

3

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A

Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)						
Terminal	**Assignment**	**Terminal**	**Assignment**	**Description**	**BaseUnit**	**Color identification label (terminals 1 to 16)**

Addressing

4

4.1 Address space

Address assignment of the digital output module F-RQ 1x24VDC/24..230VAC/5A

The digital output module F-RQ 1x24VDC/24..230VAC/5A occupies the following address ranges in the F-CPU:

Table 4- 1 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
in input range	in output range
x.0 and x.1	—

x = Module start address

Address assignment of the user data of the digital output module F-RQ 1x24VDC/24..230VAC/5A

Of the occupied addresses of the digital output module F-RQ 1x24VDC/24..230VAC/5A, the user data occupies the following addresses in the F-CPU:

Table 4- 2 User data address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-RQ module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	RQ_1 Inverted readback channel (corresponds to process signal at IN)	RQ_0 Readback channel

x = Module start address

The user data is in the standard process image of the inputs and is not transferred to the F-CPU in safety-related communication. The readback channel in the user program is therefore displayed as a non-failsafe variable.

Note

With migration projects from the ET 200S product family, note the following:

The readback channel RQ_0 (bit 0) allows direct interconnection with the FDBACK instruction (F-block F_FDBACK) to its FEEDBACK input without additional inversion.

The readback channel RQ_1 (bit 1) is inverted.

Additional information

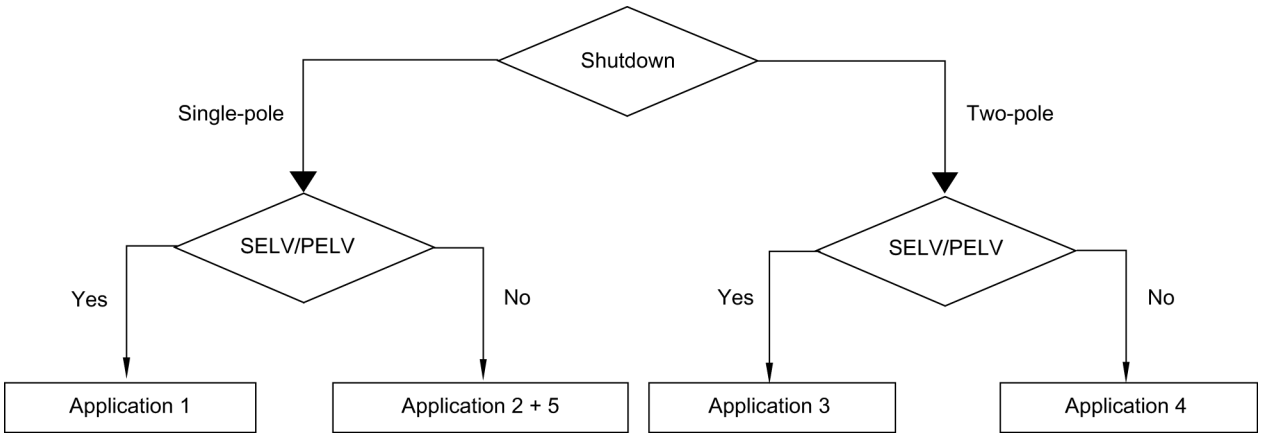
For detailed information about F-I/O access, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

5.1 Applications of the F-RQ 1x24VDC/24..230VAC/5A

You can achieve SIL3/category 4/PLe in the following applications if the activating F-module supports SIL3/category 4/PLe.



The wiring is carried out on the suitable BaseUnit (http://support.automation.siemens.com/WW/view/en/58532597/133300).

Wiring the 24 VDC power supply

Apply the 24 VDC control voltage to IN P (terminal 9) and IN M (terminal 11). The 24 VDC supply line is usually connected via a sourcing/sinking fail-safe output (e.g. digital output module F-DQ 4x24VDC/2A PM HF). Wire the P output (sourcing) of the F-DQ to the IN P of the F-RQ module and the M output (sinking)to the IN M of the F-RQ module.

As an alternative, you can also connect to a sourcing-sourcing fail-safe output. However, note that external short-circuits to P at the P input cannot be controlled. In this case, IN M would be connected directly to the control voltage ground.

NOTICE
Connecting the control voltage to the IN P and IN M inputs with the reverse polarity will destroy the F-module.

Wiring the load voltage and the load

The connectors of the relay output are electrically isolated NO contacts. This means that power must be supplied to these contacts from an external source. Connect the load supply (supply 1) and the load (load 1) in series to the RQ_{01} connectors (terminals 1;2). This ensures that the NO contacts of the relay interrupt the current flow of the power supply through the load. Due to the two relay contacts connected in series, the current flow can still be interrupted if one of the two relays has a fault..

The second circuit is independent of the first. They are logically interconnected by the common control. This means that the potential in the RQ_{02} (terminals 3;4), supply 2 and load 2 circuit may be different.

⚠ WARNING
If you connect a non-SELV/PELV power supply to one channel, you must not use the other channel.

Parameter assignment of the digital output module F-DQ 4x24VDC/2A PM HF

Assign the following parameters for the channel of the F-DQ 4x24VDC/2A PM HF digital output module to be activated:

Table 5- 1 Parameter assignment

Parameter	
Max. readback time dark test	1 ms
Max. readback time switch on test	1 ms

As the relays are highly inductive, you have the option of activating "Diagnostics: wire break" *or "*enable light test".

5.2 Application 1: 2 loads, single-pole switch-off

Wiring diagram

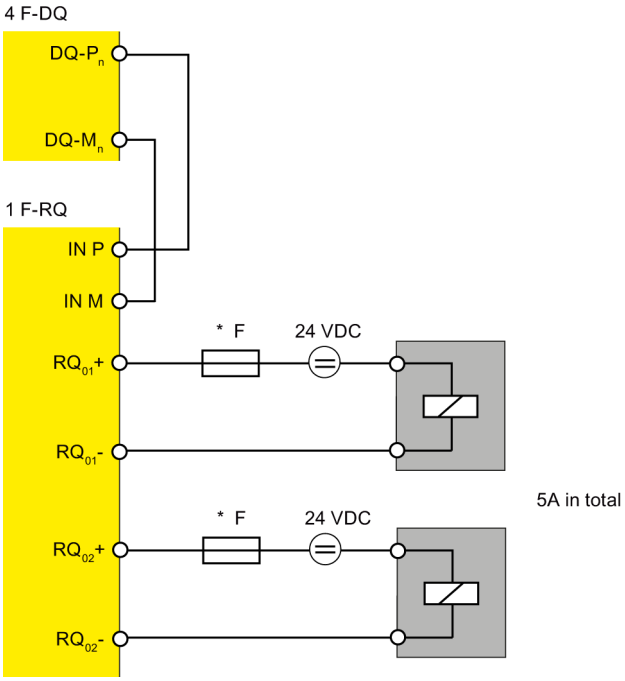


Figure 5-1 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

In this application, you can use one F-RQ module for single-pole switching of two loads with a total of 5A and one/two SELV/PELV power supplies.

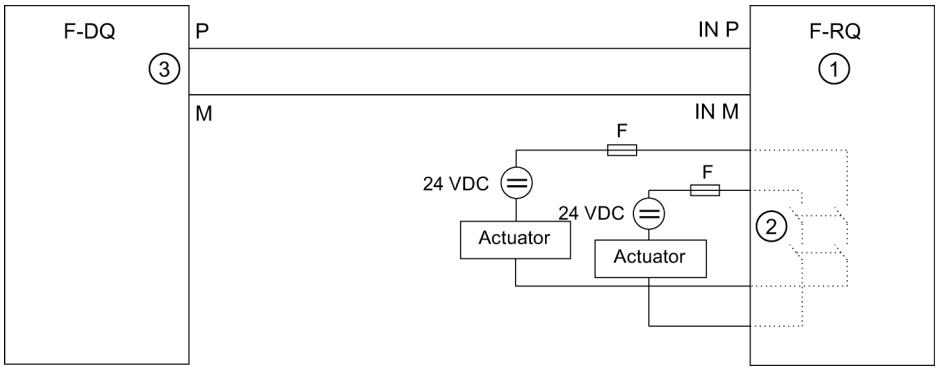
⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-2 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.3 Application 2: 1 load, single-pole switch-off

Wiring diagram

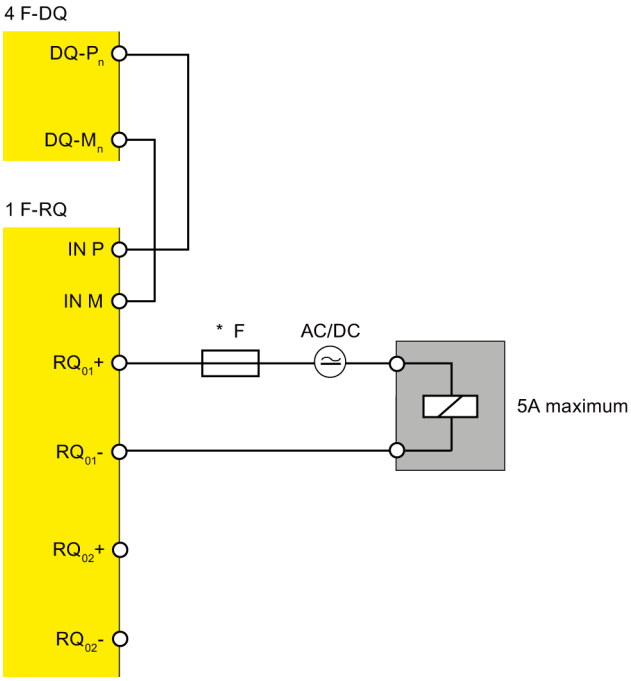


Figure 5-3 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

This application allows single-pole switching of one load with a total of 5A with one F-RQ module.

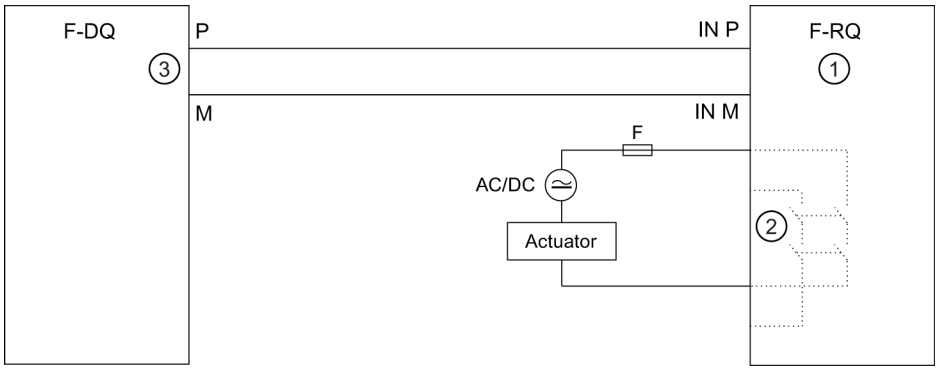
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Please note that for applications in accordance with EN 50156-1, the specified rated current of the overcurrent protective device must be multiplied by the safety factor 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-4 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.4 Application 3: 1 load, two-pole switch-off with 1 F-RQ module

Wiring diagram

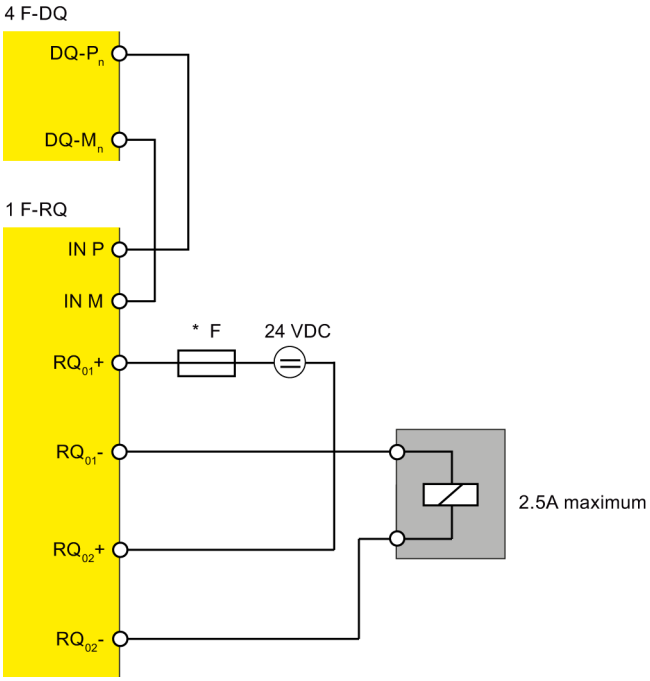


Figure 5-5 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows two-pole switching with one F-RQ module of one load with a maximum of 2.5A and an SELV/PELV power supply.

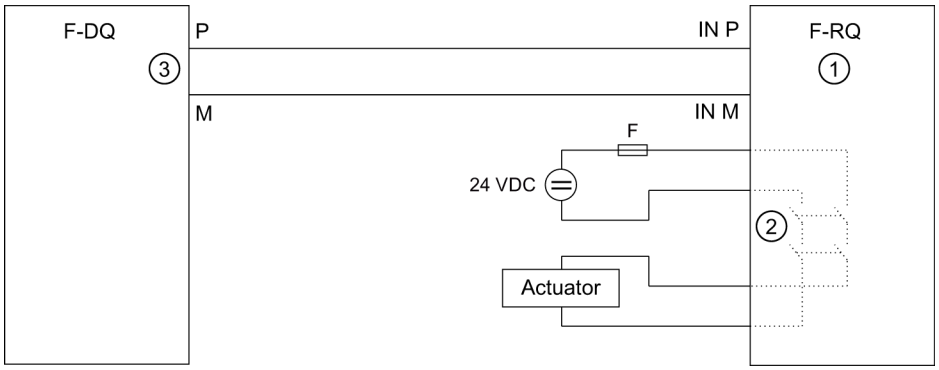
⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-6 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.5 Application 4: 1 load, two-pole switch-off with 2 F-RQ modules

Wiring diagram

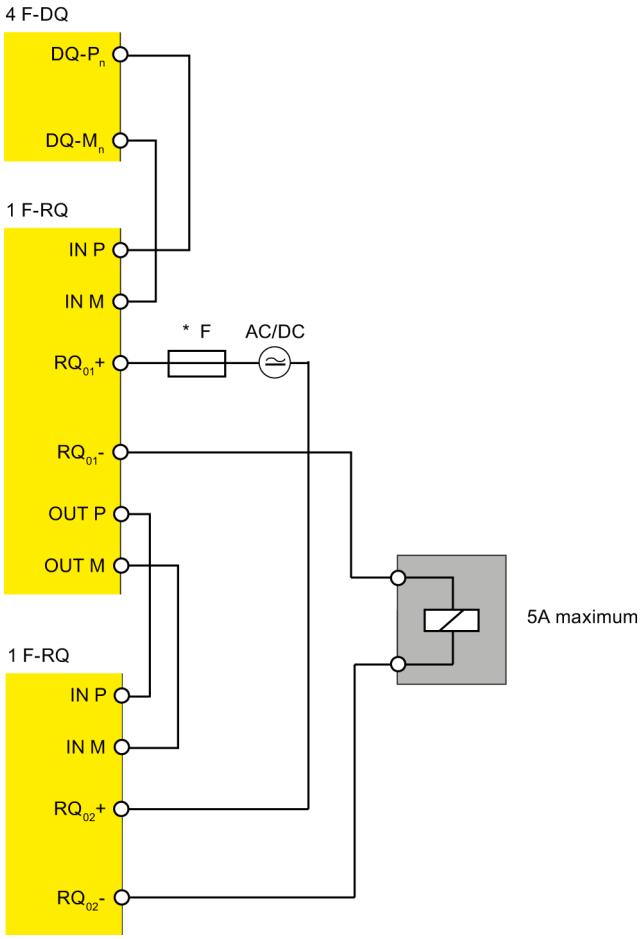


Figure 5-7 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows two-pole switching of one load with a max. of 5A with two F-RQ modules.

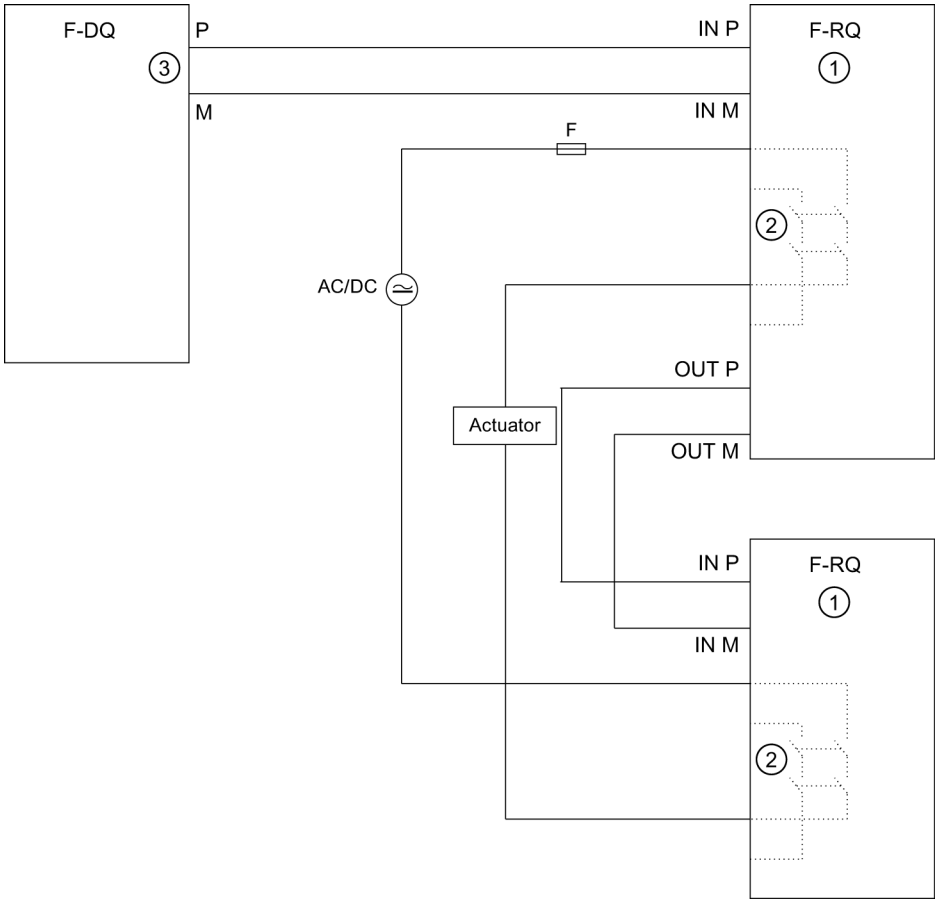
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-8 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

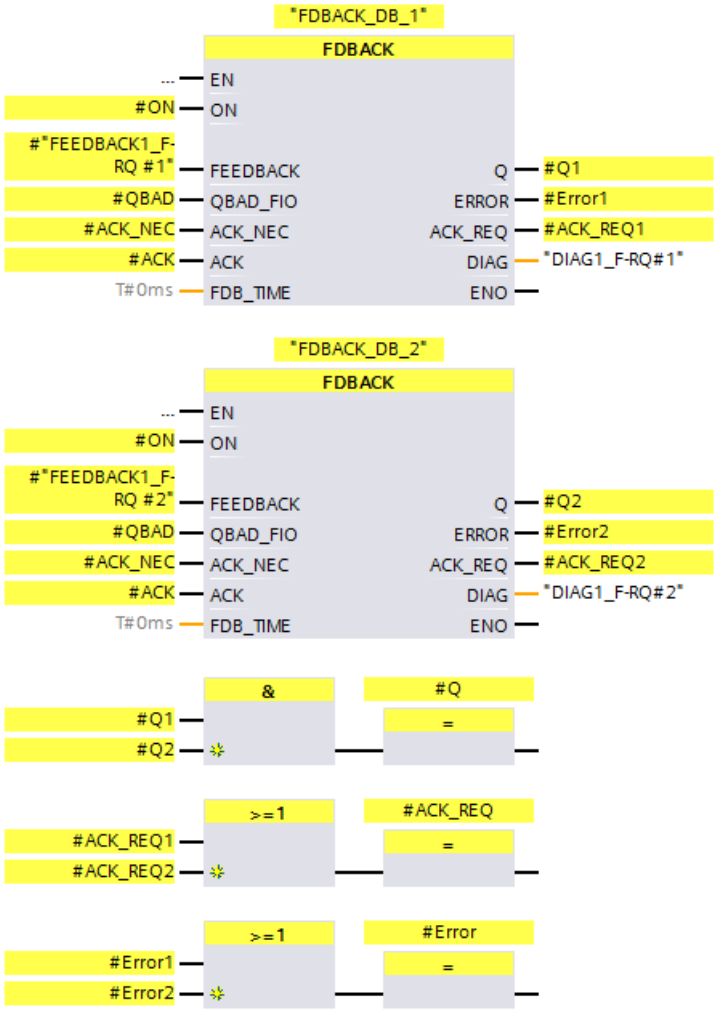
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:



5.6 Application 5: 2 loads, single-pole switch-off with 2 F-RQ modules

Wiring diagram

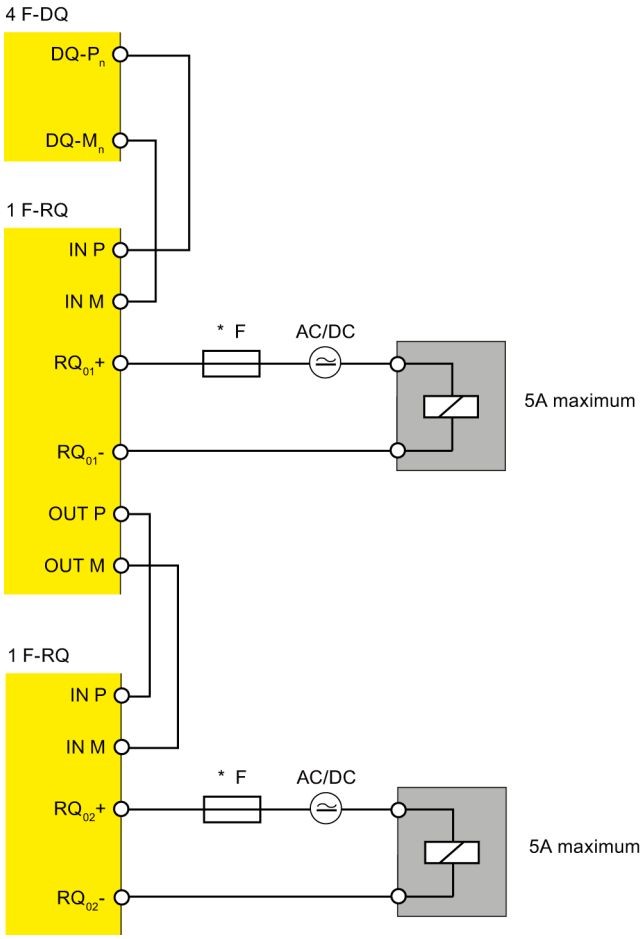


Figure 5-9 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

This application allows the single-pole switching of two loads with 5A each with two F-RQ modules. One power supply is not SELV/PELV.

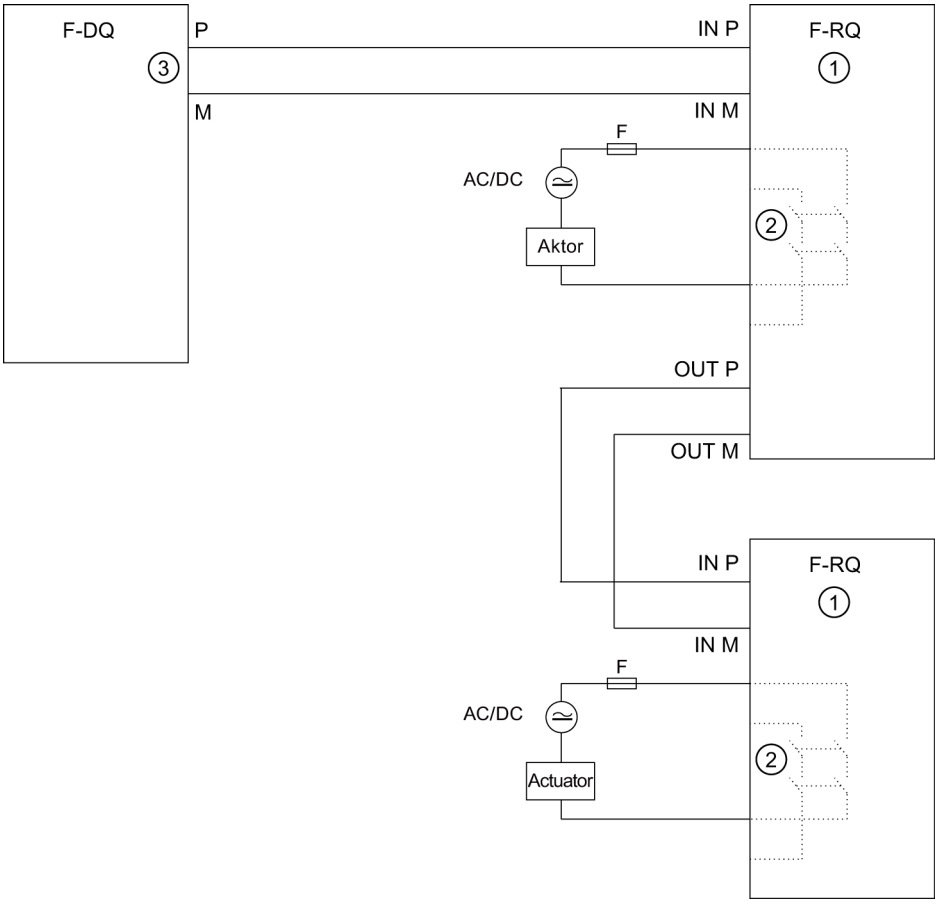
WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.

Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).



① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 5-10 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

Note

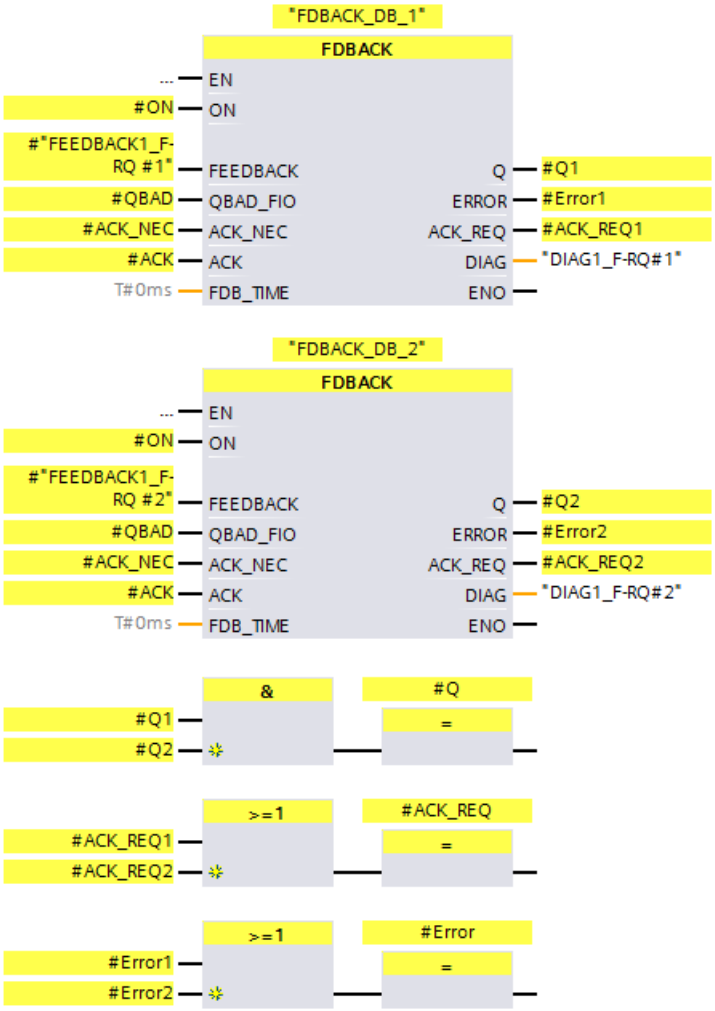
SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:

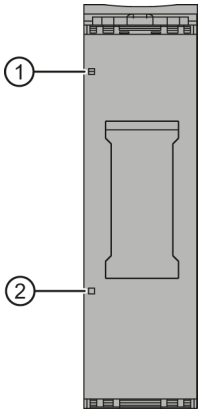


Status and error display

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays.

WARNING
The DIAG LED and the channel status LED of the output are not designed as safety-related LEDs and therefore must not be evaluated for safety-related activities.

DIAG LED

Table 6- 1 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not OK
Flashing	Module parameters not set
On	Module parameters set and no module diagnostics

Channel status LED

Table 6- 2 Meaning of the channel status LED

Status	Meaning
Off	Process signal = 0
On	Process signal = 1

Technical specifications

7

7.1 Technical specifications

Technical specifications of F-RQ 1×24VDC/24...230VAC/5A

	6ES7136-6RA00-0BF0
Product type designation	F-RQ 1x24VDC/24 ... 230VAC/5A
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
Installation type/mounting	
Rail mounting possible	Yes; standard mounting rail
Supply voltage	
Type of supply voltage	24 VDC
Rated value (DC)	24 V; coil voltage
Low limit of permitted range (DC)	20.4 V
High limit of permitted range (DC)	28.8 V
Power	
Power consumption from the backplane bus	100 mW
Power loss	
Power loss, typ.	1 W
Address range	
Address space per module	
Input	1 byte
Digital outputs	
Number of outputs	1
Voltage induced on current interruption limited to	No
Control of a digital input	Yes
Switching capacity of outputs	
With resistive load, max.	5 A
With lamp load, max.	25 W

	6ES7136-6RA00-0BF0
Switching frequency	
With resistive load, max.	2 Hz
With inductive load, max.	0.1 Hz; see information in the manual
With inductive load (to IEC 60947-5-1, DC13), max.	0.1 Hz
With inductive load (to IEC 60947-5-1, AC15), max.	2 Hz
Total current of the outputs (per module)	
Horizontal installation	
• Up to 40 °C, max.	5 A; note derating information in the manual
• Up to 50 °C, max.	4 A; note derating information in the manual
• Up to 60 °C, max.	3 A; note derating information in the manual
Vertical installation	
• Up to 50 °C, max.	3 A; note derating information in the manual
Relay outputs	
Number of relay outputs	1; 2 NO contacts
Rated input voltage of relay coil L+ (DC)	24 V
Current consumption of relays (coil current of all relays), max.	70 mA
External fuse for relay outputs	Yes, 6 A, see information in the manual
Relay approved acc. to UL 508	Yes; Pilot Duty B300 R300
Switching capacity of contacts	
• With inductive load, max.	See additional description in the manual
• With resistive load, max.	See additional description in the manual
• Thermal continuous current, max.	5 A
• Contact rating, min.	1 mA
• Contact rating after exceeding 300 mA, min.	10 mA
• Contact rating after exceeding 300 mA, max.	5 A
• Rated switching voltage (DC)	24 V
• Rated switching voltage (AC)	230 V
Length of cable	
Cable length, shielded, max.	500 m; for load contacts
Cable length unshielded, max.	300 m; for load contacts
Control cable (input), max.	10 m
Interrupts/diagnostics/status information	
Diagnostics messages	
Diagnostics	Yes, firmware update
Diagnostics display LED	
RUN LED	Yes; green/red DIAG LED
Channel status display	Yes; green LED

	6ES7136-6RA00-0BF0
Electrical isolation	
Electrical isolation, channels	
Between channels	Yes; only with SELV / PELV
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between channels and backplane bus/supply voltage	250 VAC (reinforced insulation)
Between backplane bus and supply voltage	60 VAC/75 VDC
Insulation	
Insulation test voltage	2545 VDC 2 s (routine test)
Overvoltage category	III
Tested with	
Between channels and backplane bus/supply voltage	2545 VDC 2s (routine test), surge voltage test 7200 VDC/5 positive and 5 negative pulses (type test)
Between backplane bus and supply voltage	707 VDC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
Category according to ISO 13849-1:2008	4
SIL according to IEC 61508:2010	SIL 3
Low demand (PFD) acc. to SIL2	<1.00E-04, proof test interval 1 year
Low demand (PFD) acc. to SIL3	<1.00E-05, proof test interval 1 month
High demand (PFH) acc. to SIL2	<1.00E-08 1/h, proof test interval 1 year
High demand (PFH) acc. to SIL3	<6.00E-09 1/h, proof test interval 1 month
Dimensions	
Width	20 mm
Weights	
Weight, approx.	56 g

Supplement to the technical specifications

Technical specifications	
Relay outputs	
Current consumption of relays (coil current of all relays), min.	20 mA
Permitted potential difference	
• Between NO contacts	75 VDC / 60 VAC
Insulation tested	
• Between the NO contacts	707 VDC (type test)

Derating

Note

As the modules are small, you need to monitor the heat build-up between adjacent modules if output modules are subject to high loads. A temperature rise in an output module exposed to a high load can result in shutdown and reduce plant availability. If the operating voltage > 25 VDC, the average total current of the modules directly adjacent should not exceed 50% of the levels listed in the technical specifications, and the ambient temperature should not exceed 50 °C.

If the ambient temperature exceeds 50 °C, supply voltage L+ must not exceed 25 VDC.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

7.2 Mechanical and climatic ambient conditions

In contrast to the specifications for mechanical environmental conditions and mechanical environmental conditions testing in the "Mechanical and climatic ambient conditions" section of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual, the following applies to this F-module:

Mechanical ambient conditions

The following table shows the mechanical ambient conditions in the form of sinusoidal vibrations.

Table 7- 1 Mechanical ambient conditions

Frequency band	ET 200SP with BusAdapter BA 2×FC	ET 200SP with BusAdapter BA 2×RJ45/ BA 2xSCRJ
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude	
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration	

Tests of mechanical ambient conditions

The following table provides important information about the type and scope of the tests for ambient mechanical conditions.

Table 7- 2 Tests of mechanical ambient conditions

Check for ...	Test standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sinus)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

7.3 Switching capacity and service life of contacts

Switching capacity and service life of contacts

You can extend the service life beyond the value indicated in the tables below by installing an external protective circuit.

The tables below show the switching capacity and service life of the contacts.

Table 7- 3 Switching capacity and service life of contacts with resistive load

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	5.0 A	350000
	3.0 A	500000
	2.0 A	750000
	1.0 A	1800000
	0.5 A	4000000
230 VAC	5.0 A	100000
	3.0 A	150000
	2.0 A	200000
	1.0 A	400000
	0.5 A	800000

Table 7- 4 Switching capacity and service life of contacts **with inductive load according to IEC 947-5-1 DC 13/ AC15**

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	1.0 A	100000
	0.5 A	200000
230 VAC	1.0 A	200000
	0.5 A	350000

Table 7- 5 B10d values

AC	750000
DC	10000000

Response times

A

A.1 Response times

Introduction

The section below shows the response times of the digital output module F-RQ 1x24VDC/24..230VAC/5A. The response times of digital output module F-RQ 1x24VDC/24..230VAC/5A are included in the calculation of the F-system response time.

Definition of response time for fail-safe relay outputs

The response time defines the interval between controlling by means of a fail-safe digital output module until the signal change at the relay output.

Maximum response time without errors

The maximum response time for fail-safe relay outputs when there are no errors is equal to:

Max. response time = 16 ms

Readback response time

The readback response time for fail-safe relay outputs is equal to:

Readback response time = 30 ms

Maximum response time until error detection

Max. response time = cycle time of the safety program + max. readback time of the FDBACK instruction + max. response time of the F-DQ module + max. response time of the F-RQ module + 12.8 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. Preface

Purpose of the documentation

This manual complements the ET 200SP distributed I/O system system manual. General functions of the ET 200SP are listed in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Safety instructions 2

Important safety instructions

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

For operation in Pollution Degree 2 environment.

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or an enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 according to EN 60529.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Wires must not be connected to the device or disconnected from the device within a flammable or combustible environment.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not disconnect live wires from the device if it cannot be ensured that an explosive atmosphere is not present in the environment.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Replacement of components may impair suitability for Class I, Division 2 or Zone 2.

WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.

Do not open the device when the supply voltage is switched on.

WARNING

Connection only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

For this reason, you are only permitted to connect safety extra-low voltage (SELV) with limited power source (LPS) according to IEC 60950-1, EN 60950-1, VDE 0805-1 to the supply connections.

The supply of the device must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Take measures to prevent transient overvoltages of more than 40% of the rated voltage. You can ensure this by using only AS-i power supply units that meet the requirements indicated in Section Terminal assignment (Page 27) in "Power supply units for AS-Interface". Transient overvoltages are not permitted to exceed 119 V under any circumstances. This will ensure compliance with an ATEX requirement.

CAUTION

Failure to observe this information may result in property damage and bodily injury

This device is only suitable for use in areas defined as Class I, Division 2, Groups A, B, C, and D and is not suitable for use in hazardous areas.

WARNING

To be operated by experienced users only

Improper operation may result in death, severe injury, and serious property damage. Users must be familiar with ASIsafe and the safety system used, e.g., SIMATIC, Distributed Safety, SIMATIC Safety Advanced.

Only an experienced user is permitted to teach the code sequences of safe AS-i slaves (organizational specification).

⚠ CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is only suitable for use in areas defined as Class I, Zone 2, Group IIC and in non-hazardous areas.

NOTICE

Checking parameters

Check that all parameters are correctly set before final acceptance.

NOTICE

Reaction to faults in fail-safe modules

If you are using the module in safety-critical applications, the PROFIsafe mechanism of passivation and reintegration is enabled and must be used.

Observe the information concerning passivation and other fault reactions in the documentation for the ET 200SP Distributed I/O System, see Section Documentation guide (Page 9).

NOTICE

Single-channel use of safe AS-i input slaves

The values in the PROFIsafe process image input have Safety Integrity Level SIL 3.

If two-channel interconnection is not used for a safe AS-i input slave, the application has a maximum safety integrity level of SIL 2 or less. The configuration tool / STEP 7 cannot detect this.

You must ensure that the signals are correctly processed in the safety application.

NOTICE

Ensure that the plant is functioning correctly in productive operation

Carry out a function test before the system goes into productive operation.

Important note for maintaining the operational safety of the system

Note

Newsletter containing information on product development and product features

Owners of systems with safety-related characteristics must ensure compliance with special operational safety requirements. Suppliers are required to comply with special product monitoring measures. For this reason, Siemens publishes a special newsletter containing information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective. A newsletter keeps you constantly up to date in this regard. A subscription to the newsletter is necessary so that you can make any needed changes to your system. To sign up for the newsletter, go to:

Internet (https://www.industry.siemens.com/newsletter)

Select "Service & Support" > "Industry Online Support" > "Automation Technology" > "AS-Interface". Select the "Update" entry type.

Product overview

3

3.1 Properties of the F-CM AS-i Safety ST

Item number

3RK7136-6SC00-0BC1

View of the module

Figure 3-1 View of the F-CM AS-i Safety ST module

Use of the module

The F-CM AS-i Safety ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The F-CM AS-i Safety ST module features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The F-CM AS-i Safety ST module can be plugged in to:

- BaseUnit Type C0
- BaseUnit Type C1

The F-CM AS-i Safety ST fail-safe communication module expands a standard AS-Interface network to include safety-related communication.

The F-CM AS-i Safety ST module reads the input states of safety-related AS-Interface input modules and provides these states to a fail-safe F-CPU for further evaluation.

In the opposite direction, the F-CM AS-i Safety ST module receives safe output states of an F-CPU and outputs them for control of safety-related outputs on AS-Interface.

The F-CM AS-i Safety ST fail-safe module supports safety-related applications up to SIL 3 according to EN 62061 or safety category up to PL e according to EN 13849-1. The input and output values of the safety-related AS-i slaves are addressed using the safe cyclic process image. You need an F-CPU for safe processing.

The F-CM AS-i Safety ST module has no AS-i master functionality. For operation of the AS-i network, you need a CM AS-i Master ST module (3RK7137-6SA00-0BC1) or another AS-i master conforming to AS-i Specification V3.0.

You can plug several F-CM AS-i Safety ST modules into one SIMATIC ET 200SP station. An F-CM AS-i Safety ST occupies 16 input bytes and 8 output bytes in the I/O address space. The number of F-CM AS-i Safety ST modules that can be plugged in depends on:

- The maximum address space of the utilized interface module (IM) of the ET 200SP
- The amount of address space occupied by other modules

Up to five module combinations of CM AS-i Master ST (32 input bytes/32 output bytes) and F-CM AS-i Safety ST (16 input bytes/8 output bytes) can be plugged in to one SIMATIC ET 200SP station with standard interface module IM 155-6 PN ST having a maximum address space of 256 input bytes/256 output bytes. If other modules are present in the ET 200SP station, the available address space and the maximum number of AS-i modules are reduced.

In a SIMATIC ET 200SP station with High Feature Interface Module IM 155-6 PN HF and a maximum address space of 1 440 input bytes/1 440 output bytes, a correspondingly greater number of modules can be plugged in.

You can find additional information in ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

Properties

- Technical properties
  - Gateway between PROFIsafe and ASIsafe, without master functionality
  - Expands a standard AS-i network to include safety-related communication (ASIsafe)
  - Transfer of safety-related digital I/O values in the cyclic process image
  - Monitoring of up to 31 safety-related input slaves
  - Control of up to 16 safety-related AS-i output slaves or switch-off groups
  - Power supplied from the AS-i voltage
  - Use of various interconnection types (1oo1 and 1oo2) is possible
  - Input delay of 0 ms to 150 ms can be assigned for each channel
  - Startup test can be activated for each channel
  - Discrepancy monitoring can be configured for each channel
  - Sequence monitoring can be set for each channel
  - Channel-wise passivation
  - Test for 0 signal before reintegration
  - 8 LED displays for status and error diagnostics
- Supported functions
  - I&M identification data
  - PROFIsafe V2.4
  - Firmware update

NOTICE
Max. proof test interval When the proof test interval has expired, you must replace the device; see "Technical specifications (Page 87)".

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

Ease of maintenance

The following features support maintenance:

- Code sequences are saved in the coding element. As a result, teaching of the code sequences does not have to be repeated after an F-CM AS-i Safety ST module is replaced.
- Use is automated to the greatest extent possible. This applies, in particular, to the teaching of the code sequences of safe AS-i slaves.
- The module/BaseUnit concept allows you to easily replace defective hardware. Remove the defective module from the rack and plug in the new module.

Certifications

More detailed information regarding certifications can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

3.2 Operating modes of the F-CM AS-i Safety ST

3.2.1 Standard mode

Self test during device startup

After the AS-i voltage is switched on, the F-CM AS-i Safety ST module performs a comprehensive self-test. During this test, all LEDs are lit for approximately 3 seconds. Exception: the "DIAG" LED is controlled directly by the ET 200SP backplane bus and indicates the communication status for the ET 200SP system.

Checking of the F-address

After the self-test, the module checks the F-address. If a valid F-address is not present, the "DIAG" LED flashes red and you must assign the F-address; see Section "F-parameters (Page 42).

Downloading of the module parameters

The F-CM AS-i Safety ST then begins to read in code sequences of the safe AS-i slaves on the connected AS-i bus. At the same time, the module downloads the module parameters that were stored in the PLC CPU. The module parameters can only be downloaded when the operating voltage is applied to the interface module of the ET 200SP and the parameters have been made available by the PLC CPU during startup of the ET 200SP station.

The "Status" LED flashes green until the module parameters are completely downloaded or the PLC CPU is in STOP state, or the PLC communication is interrupted.

Cyclic data exchange of safe input/output data

When a valid set of module parameters has been downloaded and the PLC CPU is in "RUN" state, the safe input/output data is evaluated according the parameter assignment and exchanged with the PLC CPU.

The PROFIsafe protocol is used for the data exchange.

The "Status" LED is lit green during cyclic data exchange.

If the F-CM AS-i Safety ST module starts cyclic data exchange directly after startup, but communication cannot yet be established on the AS-i bus, the F-CM AS-i Safety ST module supplies the substitute value "0" in the input image. Passivation is delayed by approximately 30 s in this case. As a result, communication can start on the AS-i bus within this time window without passivation. After this time window, the input/output channels are passivated if there is no AS-i communication.

3.2.2 Error statuses

Note

Statuses not considered to be errors

The F-CM AS-i Safety ST module does not consider the following statuses to be errors:

- Waiting for start-up test
- Channel with value = 0 without error condition, e.g., when EMERGENCY STOP button is pressed

Other diagnostic functions can be read out using data records.

3.2.2.1 Process signal error

Description

Examples of conditions that trigger a process signal error are:

- Discrepancy error at the inputs of a safe AS-i input slave
- Sequence error at the inputs of a safe AS-i input slave
- Code sequence error at a safe AS-i input slave, e.g., due to cross-circuit at the inputs or an EMC problem
- Failure of a safe AS-i input slave

You can read the following pattern on the LEDs:

Table 3- 1 LED display for discrepancy error or sequence error

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	□ "Off"
"PSF"	✳ Red "flashes"

Table 3- 2 LED display for code sequence errors, e.g., due to cross-circuit or slave failure

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	✲ Red "flashes"
"PSF"	✲ Red "flashes"

In the event of a process signal error, the F-CM AS-i Safety ST module remains in cyclic data exchange. Communication with the F-CM AS-i Safety ST module is only possible. e.g., for reading out additional diagnostic information via data records. Only at the safe input slave involved in each case is the substitute value "0" processed and the channel passivated. After the cause of the error has been eliminated, the channel can be reintegrated via the safety program.

The "PSF" LED goes out only after all channels have been reintegrated.

3.2.2.2 Parameter assignment error

Description

In the event of invalid configuration data, the cyclic data exchange will not start.

You can read the following pattern on the LEDs:

Table 3- 3 LED display for parameter assignment errors

LED	Display
"Status"	✳ Green "flashing"
"Error"	☐ "Off"
"CFG"	☐ "Off"
"PSF"	✳ Red "flashes"

1. Check the hardware configuration in *STEP 7*.
2. Perform a compilation.
3. Download the configuration data to the PLC CPU.

3.2.2.3 Device fault

Description

Examples of conditions that trigger a device fault are:

- Intermittent data processing errors, e.g., an EMC problem
- A contact problem with the backplane bus
- An incorrect coding element in the Base Unit
- An incorrect firmware update

You can read the following pattern on the LEDs:

Table 3- 4 LED display for device faults

LED	Display
"Status"	☐ "Off"
"Error"	✲ Red "flashes"
"CFG"	☐ "Off"
"PSF"	☐ "Off"

In the event of a device fault of this type, communication with the F-CM AS-i Safety ST module is only possible. e.g., for reading out additional diagnostic information via data records. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

- Make sure that the station is properly grounded.
- Check whether the coding element is present or replace it if necessary.
- Plug the module into the BaseUnit in an untwisted position.

Switch off the module. If the error persists after the module is switched on and no external error cause can be found, the module must be replaced.

3.2.2.4 Serious device fault

Description

Examples of conditions that trigger a serious device fault are:

- Fault in the electronics
- Excessive temperature rise
- Overvoltage

You can read the following pattern on the LEDs:

Table 3- 5 LED display for a serious device fault

LED	Display
"Status"	☐ "Off"
"Error"	■ Red "On"
"CFG"	■ Red "On"
"PSF"	■ Red "On"

In the event of a serious device fault, communication with the F-CM AS-i Safety ST module, e.g., reading a data record, is not possible. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

1. Switch off the module.
2. Wait for the module to cool down, if necessary.
3. Switch on the device again.
4. If the error persists after the module is switched on, the module must be replaced.

3.2.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

Note

Noting the firmware version

After a firmware update, mark the current firmware version on the housing of the F-CM AS-i Safety ST.

Note

Requirement for the firmware update

Always perform the firmware update of the F-CM AS-i Safety ST in a separate ET 200SP rack. Ensure that no other modules besides the interface module (IM), the F-CM AS-i Safety ST, and the terminating server module are located in the ET 200SP rack.

NOTICE
Checking the firmware version for F-permission Before using a new firmware version, always check whether it is permitted for use in the respective module. The permissible firmware version is specified in the appendices of the SIMATIC Safety certificate.

See also:

Certificate (http://support.automation.siemens.com/WW/view/en/49368678/134200)

Handling of the F-address and the code sequences

Note

Saving of the F-address in the coding element

During a firmware update, the F-address that is saved in the coding element is retained. Observe the information in the description of the firmware version.

Note

Saving of the code sequences in the coding element

During a firmware update, the ASIsafe code sequences that are saved in the coding element are retained. Observe the information in the description of the firmware version.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- "DIAG" LED flashes red.
- "ADDR" LED flashes green.
- "PWR" LED lights up green.
- The rest of the LEDs are Off.

Note

Supply voltage during a firmware update

The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

LED behavior after a successfully completed firmware update

On successful completion of a firmware update, the module performs a hot restart. It is not necessary to switch off the voltage.

After the restart, the LEDs indicate the status of the F-CM AS-i Safety ST same as after a device startup.

LED behavior in the event of an error during a firmware update

If an error occurred during the firmware update, a device fault is triggered (see Section (Page 20)). The LEDs take on the following status:

- "DIAG" LED flashes red.
- "Error" LED flashes red.
- "PWR" LED lights up green.
- The rest of the LEDs are Off.

In this case, switch the AS-i voltage off and back on again and repeat the firmware update.

Connection

4

4.1 Terminal assignment

Requirement

For connecting, you require a BaseUnit:

- Type C1 (dark BaseUnit, e.g., item number 6ES7193-6BP20-0BC1)
- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

Variants

Use with light BaseUnit Type C0

If the F-CM AS-i Safety ST module is connected to an AS-i network whose AS-i master is located outside the ET 200SP station, use the light BaseUnit Type C0.

If the AS-i master is located within the ET 200SP station, you can also use the light BaseUnit. However, you must wire the AS-i network explicitly using the connecting terminals.

The light BaseUnit Type C0 has no internal connection to the module plugged in on the left.

Use with dark BaseUnit Type C1

If you are using a combination of CM AS-i Master ST and F-CM AS-i Safety ST on the same AS-i network, use the dark BaseUnit. In this case, plug the CM AS-i Master ST module into a light BaseUnit Type C0. Next to it on the right, plug the F-CM AS-i Safety ST module into a dark BaseUnit Type C1.

In this case, connect the AS-i network to the light BaseUnit. The dark BaseUnit does not have to be connected to the AS-i network because the connection is made automatically via the BaseUnit group.

In contrast to other BaseUnit types, for the BaseUnits Type C0 and Type C1, the P1 and P2 busbars of the BaseUnit are electrically isolated from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-). An electrical connection is made in each case via the plugged-in CM AS-i Master ST module or F-CM AS-i Safety ST module.

The AS-i voltage connected to the light BaseUnit Type C0 is applied through the plugged CM AS-i Master ST module to the busbars. The busbars of the BaseUnit group are connected-through. The F-CM AS-i Safety ST module is supplied with AS-i voltage via the busbars of the dark BaseUnit Type C1. It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload in the modules.

If you want to maintain the voltage supply of the F-CM AS-i Safety ST module when the CM AS-i Master ST module is unplugged from the light BaseUnit, you can wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and the dark BaseUnit Type C1.

Grouping of a light BaseUnit Type C0 with several dark BaseUnits Type C1

The use of a single F-CM AS-i Safety ST module on an AS-i network is generally sufficient. If several F-CM AS-i Safety ST modules are being used on an AS-i network by means of series connected dark BaseUnits Type C1, you must wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and a dark BaseUnit Type C1. This will prevent an overload of the modules. A current draw from the dark BaseUnit is not allowed. Additional information about this can be found in "Use with dark BaseUnit Type C1".

General terminal assignment

Table 4- 1 Terminal assignment of the F-CM AS-i Safety ST

Terminal	Assignment	Description
1	TEACH1	Connection of the "TEACH" button (optional) See Section Code sequences (Page 69).
2	TEACH2	
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L[1)]	ASI+	Dark BaseUnit Type C1: optional connection of the AS-i cable, positive polarity Light BaseUnit Type C0: connection of the AS-i cable, positive polarity
1N, 2N [1)]	ASI-	Dark BaseUnit Type C1: optional connection of the AS-i cable, negative polarity Light BaseUnit Type C0: connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "TEACH" button

You can connect a "TEACH" button to the "TEACH1" and "TEACH2" terminals of the F-CM AS-i Safety ST module. The "TEACH" button enables the transfer of code sequences of the connected safe AS-i input slaves. This function is activated by closing the button contact on the TEACH1 and TEACH2 terminals.

The maximum cable length between the terminal and "TEACH" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

Additional rules and instructions for operating the ET 200SP with fail-safe modules

Observe generally the information in Section "Connecting" in the following documentation:

- Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)
- Product Information ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/78361093/0/en)

The conditions for connecting sensors and actuators to the modules of the ET 200SP also apply generally to the connecting of sensors and actuators to the slaves and modules of the AS-i network.

In addition, the information in the documentation of the AS-i component applies.

Ensure that all components of the AS-i network are connected in such a way that the voltage applied to the safety-related AS-i modules is limited to a maximum of 40 V.

The ET 200SP modules CM AS-i Master ST and F-CM AS-i Safety ST have internal safe electrical isolation from the backplane bus of the ET 200SP.

Power supply units for AS-Interface

A connected power supply unit must have the following properties:

- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to a maximum of 40 V in the event of a fault, including a second fault.

The Siemens power supply units for AS-Interface meet these requirements. For additional information, refer to the operating instructions of the power supply unit.

Use an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit that meets the above-indicated requirements and a data decoupling unit.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.

4.2 Schematic circuit diagram

Schematic circuit diagram

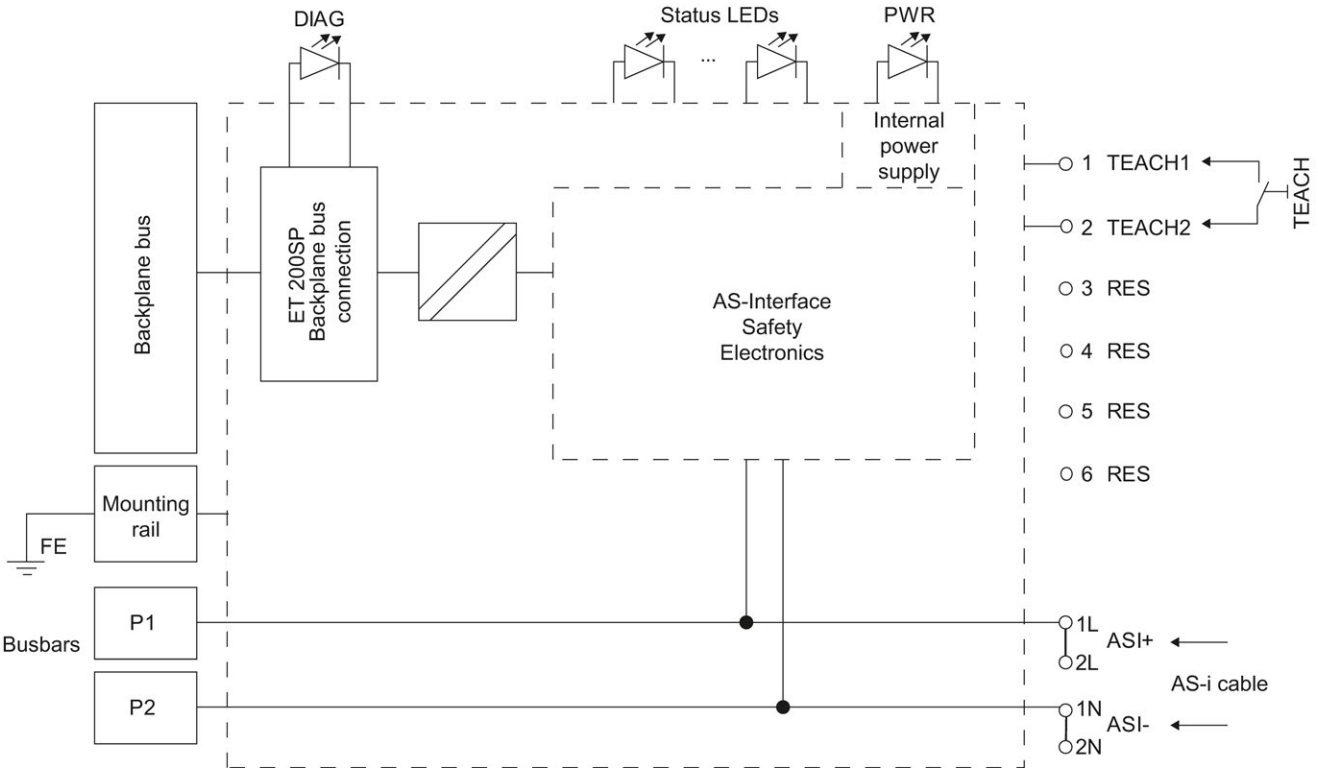

Figure 4-1 Schematic diagram of F-CM AS-i Safety ST

Connection to busbars

Requirement:

- An AS-i power supply unit is connected to the light BaseUnit Type C0 of the BaseUnit group.
- A CM AS-i Master ST module is plugged into the light BaseUnit.

If you plug an F-CM AS-i Safety ST module into a dark BaseUnit Type C1, the F-CM AS-i Safety ST module will be automatically supplied with AS-i voltage via the busbars.

It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload of the modules.

Note the additional explanations in Section Terminal assignment (Page 27).

Configuring

5

5.1 Requirements

Configuration

You configure the ET 200SP station and its F-CM AS-i Safety ST module and assign their parameters with *STEP 7*.

There is currently no provision for configuration via a GSD file, because the GSD configuration procedure does not permit safety-related parameter assignment.

Note

F-CM AS-i Safety ST in the hardware catalog of *STEP 7*

If the F-CM AS-i Safety ST module is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". This HSP can be obtained from the Internet using the corresponding function in *STEP 7*.

Configuring the F-CM AS-i Safety ST

Configuration software	Requirements	Installation information
STEP 7 (classic) V5.5 SP4 or higher with Distributed Safety	_	*STEP 7* online help
STEP 7 (classic) V5.5 SP3 HF4 or higher with Distributed Safety	Hardware Support Package HSP 2093[1)] Internet (http://support.automation.siemens.com/WW/view/en/23183356)	

1) Download optional, if not already contained in the hardware catalog

Observe the online help on *STEP 7*.

The S7 F-Configuration Pack can be found at Internet (http://support.automation.siemens.com/WW/view/en/15208817).

Procedure

1. Assign the parameters of the F-CM AS-i Safety ST module according to your safety application.
2. Configure the AS-i Master in such a way that it includes all AS-i slaves in the communication – including the control addresses for safe AS-i outputs that are activated in the F-CM AS-i Safety ST module.
3. Download the hardware configuration to the PLC-CPU.
4. Assign the associated F-address to the F-CM AS-i Safety ST module.
5. Start the teaching and transferring of the code sequences of the safe AS-i input slaves.
6. Create the safety program in the F-CPU.
7. Test your application.

Information concerning these steps can be found in the following sections and in the manuals of the utilized devices.

⚠ WARNING

Observing the instructions in the programming and operating manuals

Observe the instructions in the manuals.

- Programming and Operating Manual SIMATIC Safety - Programming and Configuring (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- Programming and Operating Manual S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

Failure to observe the instructions may result in death, severe injury, and serious property damage.

5.2 Safety-related communication with AS-Interface

5.2.1 Operating principle of code sequences of safe AS-i slaves

For realization of safety-related communication, each safe AS-i input slave sends a code sequence over the AS-i bus. To prevent a mix-up of the AS-i input slaves on an AS-i bus, each AS-i input slave sends a different code sequence. The code sequences are permanently stored in the AS-i input slave.

The F-CM AS-i Safety ST module checks every code sequence for correct data content. Depending on the result of the evaluation, the module sets the the safe input image.

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

5.2.2 Operating principle of the safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe AS-i input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

For the function of a safe AS-i output, you need the following components:

- A control unit
- An evaluation unit

Control unit

The control unit outputs safety-related IN or OUT control commands to the AS-i bus. The control unit is integrated in the F-CM AS-i Safety ST module. The control unit assumes an active position in the communication. It acts like an AS-i slave and has an AS-i address that must be called by the AS-i master. The values in the output data of the AS-i master are not relevant in this case. The F-CM AS-i Safety ST module inserts the safety-related control data into the communication data.

Besides controlling the OFF state according to specification, a control unit can control up to four different output switching states: F-OUT 1, F-OUT 2, F-OUT 3, and F-OUT 4. The F-CM AS-i Safety ST module, however, makes available only the output switching state F-OUT 1, i.e., The OFF and ON states are controlled.

In addition to the switching states, a control unit can send out two different auxiliary signals: AUX1 and AUX2. You can use these auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, the AUX1 and AUX2 signals are mapped in the safe process image output. The auxiliary signals are not safety-related signals, however. During control by the safety program, the F-CM AS-i Safety ST module sends a sequence from each auxiliary signal one after the other on the AS-i bus. Up to 16 different control units can be activated in the F-CM AS-i Safety ST module. The control units are managed in the F-CM AS-i Safety ST module as switching group 0 to switching group 15.

If you want to use more than 16 different control units, you can plug two F-CM AS-i Safety ST modules into the ET 200SP station.

Observe the information on the bus configuration in Section AS-i bus configuration with multiple F-CM AS-i Safety ST modules (Page 38).

NOTICE
Uniqueness of the AS-i address on the AS-i bus
Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Evaluation unit

The evaluation unit reads the safety-related control commands ON or OFF on the AS-i bus and passes corresponding switching commands, e.g., to switching contacts. In case of error, e.g., communication error on the AS-i bus, the evaluation unit switches off. The evaluation unit is integrated in the safe AS-i output module to which, for example, drive contactor coils are connected. The evaluation unit behaves as a passive unit in the AS-i communication. The master does not detect the evaluation unit and does not call it. The evaluation unit monitors the communication of the AS-i address of the control unit and reacts to its safety-related control signals.

You set the AS-i address (see Section "Control unit") the evaluation unit is to monitor.

You can set multiple evaluation units to the same address so that a control unit can control multiple safe output modules simultaneously.

NOTICE
Bus cycle time for safe AS-i outputs An evaluation unit requires a minimum AS-i bus cycle time. Ensure that at least 5 AS-i addresses are present on the AS-i bus. Otherwise, the control unit goes to error state. When A/B slaves are used, at least 5 different numerical AS-i addresses must be present. That is, a combination of slave addresses 1A and 1B count as 1 numerical address. The F-CM AS-i Safety ST module does not have a monitoring function for this configuration rule.

5.3 AS-i bus configuration with multiple F-CM AS-i Safety ST modules

The F-CM AS-i Safety ST module generates an additional physical bus load on the AS-i cable.

To avoid faults due to too low levels of the communication signals on the AS-i cable, the entire bus load on the AS-i cable must not exceed a maximum value.

The following rules apply to the determination of the physical bus load on the AS-i cable:

Device type	Bus load value
Slave with A/B address	0.5
Slave with standard address	1.0
F-CM AS-i Safety ST module	2.5
---	---
Maximum value as sum of all devices	35.0
---	---

Determine the total bus load by adding the bus load values of the components connected to the AS-i cable. You do not have to include the standard AS-i master and AS-i power supply unit system components when calculating the bus load.

To avoid disturbances, the maximum bus load must not exceed the value 35.

The bus load value of the F-CM AS-i Safety ST module remains unchanged if switching groups are activated in the F-CM AS-i Safety ST module for control of safe outputs. In other words, the internally generated AS-i addresses do not influence the bus load value.

If you connect additional components, e.g., an MSS 3RK3 modular safety system, to the AS-i cable, you must take into consideration the bus load values of these components. For more detailed information, refer to the respective manual.

When a repeater is used, this yields multiple cable segments for which the bus load can be determined separately.

The following configuration examples result from the table:

In a fully expanded AS-Interface network configuration (with 31 slaves with standard address), you can install 1 F-CM AS-i Safety ST module.

In an AS-Interface network configuration with 30 slaves with standard address, you can install 2 F-CM AS-i Safety ST modules.

Assigning parameters / Setting the address space 6

6.1 Parameters

List of parameters

Table 6- 1 F-parameters

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
F_Monitoring_Time (ms)	1 to 65 534 ms	150 ms	No	F-CM AS-i Safety ST
F_Source_Address	1 … 65534	Assigned by the F-system	No	F-CM AS-i Safety ST
F_Destination_Address	1 … 65534	-	No	F-CM AS-i Safety ST

For information on the F-parameters and the assignment of the F-address, refer to the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

Table 6- 2 Potential group / AS-i network

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
BaseUnit with AS-i voltage supply	Potential group: The AS-i network of the left module (dark BaseUnit) is used New potential group: New AS-i network (light BaseUnit)	The AS-i network of the left module (dark BaseUnit) is used	No	F-CM AS-i Safety ST

Table 6- 3 Module parameters: Behavior after channel faults

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Behavior after channel faults	Passivate the channel (setting cannot be changed).	Passivate the channel	-	F-CM AS-i Safety ST

Safe inputs

Up to 31 safe AS-i input slaves are monitored. Open the settings for each required AS-i address. Activate the input monitoring and assign the parameters.

Table 6- 4 Module parameters: Safe inputs, AS-i address 1 to 31

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate input monitoring	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
I address	Output field, value is calculated automatically	-	No	Channel / safe AS-i input slave
Input delay (ms)	0 ms, 50 ms … 150 ms[1)]	0 ms	No	Channel / safe AS-i input slave
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent	1oo2 evaluation	No	Channel / safe AS-i input slave
Startup test	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy monitoring	• Disable • Enable	• "Disable" if 1oo1 evaluation • "Enable" if 1oo2 evaluation	No	Channel / safe AS-i input slave
Discrepancy behavior	Supply "0" value[2)]	Supply "0" value	-	Channel / safe AS-i input slave
Discrepancy time infinite	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy time (ms)	0 ms … 60 000 ms	500 ms	No	Channel / safe AS-i input slave

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Sequence monitoring	• Deactivated • In ascending order (input 1 before input 2 at HIGH state) • In descending order (input 2 before input 1 at HIGH state)	Deactivated	No	Channel / safe AS-i input slave
Reintegration after discrepancy error	Test 0 signal necessary on both channels[2)]	Test 0 signal necessary on both channels	-	F-CM AS-i Safety ST

1) In increments of 10 ms

2) The setting cannot be changed.

Safe outputs

You can activate up to 16 safe AS-i switching groups Open the settings for each required switching group. Activate the output control and set the associated AS-i address.

Table 6- 5 Safe outputs: Switching group 0 to 15

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate output control	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
AS-i address	1 … 31		No	Channel / safe AS-i output slave
AS-i address switching output	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave
AS-i address error acknowledgement	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave

You will find additional information in the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

6.2 Explanation of the parameters

6.2.1 F-parameters

F_Source_Address

The F_Source_Address is the PROFIsafe start address of the assigned CPU. The F_Source_Address indicates the source relationship. The F_Source_Address is assigned automatically. This prevents an incorrect parameter assignment. Ensure that the F_Source_Address is unique within the network.

F_Destination_Address

The F_Destination_Address identifies the F-I/O uniquely.

Ensure that the F_Destination_Address is unique within the network.

When the F-I/O are placed in the HW Config, a unique F_Destination_Address within the station is automatically assigned. This prevents an incorrect parameter assignment.

A network-wide check of the addresses by *STEP 7* is only then automatically possible if the entire network is present in the project.

You must assign the F_Destination_Address to the F-I/O before you commission the F-I/O.

F_Monitoring_Time (ms)

For safety mode, you set the monitoring time for the safety-related communication between the F-CPU and the F-CM AS-i Safety ST module (PROFIsafe monitoring time).

Information on setting the PROFIsafe monitoring time can be found in the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

6.2.2 Potential group / AS-i network

Here, you set:

- The BaseUnit you are using.
- How the F-CM AS-i Safety ST I/O module is connected to the AS-i network.

The module can be connected to the AS-i cable by external wiring or automatically via the module plugged in on the left.

- Enable new AS-i network (light BaseUnit)
- Use AS-i network of the left module (dark BaseUnit)

BaseUnit with voltage supply

Enable new AS-i network (light BaseUnit)

Select this option if the module is plugged into a light BaseUnit.

Connect the module to the AS-i cable (ASI+ / ASI-) via the BaseUnit. The module is supplied with voltage from the AS-i cable. Connect the AS-i cable to an AS-i power supply unit or to a combination of a data decoupling unit and a suitable power supply unit.

There is no module-internal connection of the AS-i cable to the module plugged in on the left.

⚠ WARNING
Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

Use AS-i network of the left module (dark BaseUnit)

Select this option if the module is plugged into the dark BaseUnit.

The module plugged in on the left must be an AS-i slave.

The module is connected to the AS-i cable of the module plugged in on the left and supplied with voltage via the module-internal connection.

The module-internal connection is designed only for supplying power to the F-CM AS-i Safety ST I/O module. If several dark BaseUnits are connected in series, a direct connection of the dark BaseUnits to the AS-i cable using external wiring is recommended.

Supplying power to AS-i modules, e.g., AS-i slaves, via the terminals of the dark BaseUnit is not permitted.

⚠ WARNING
Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition
Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 27), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

6.2.3 Module parameters - General

Behavior after channel faults

This parameter is permanently set to "Passivate the channel".

After channel faults have occurred, only the faulty PROFIsafe channels are passivated. The PROFIsafe channel corresponds to the safe input and output address in the process image.

6.2.4 Module parameters - Safe inputs

Input monitoring activated

With activation of the input monitoring, you activate the corresponding AS-i slave as an input channel for signal processing in the safety program. The AS-i address must be assigned to a safe AS-i input slave.

When the input monitoring is activated, the value of the input channel is calculated based on the input states of the assigned safe AS-i input slave and the evaluation conditions specified by the parameter assignment. If a fault occurs, the substitute value "0" is transferred and the channel is passivated.

If input monitoring is deactivated, the substitute value "0" is transferred. The channel is not passivated.

If required, the AS-i slave can be monitored by another evaluation module, e.g., by another F-CM AS-i Safety ST module, the 3RK3 Modular Safety System. This applies both when input monitoring is deactivated and when it is activated.

Note

Call of the AS-i slave

The AS-i slave must be called by the AS-i master. Set up the configuration of the AS-i master in such a way that the communication of the AS-i master with the AS-i address functions properly.

Note

Slave profile

A safe AS-i input slave has the slave profile (IO.ID) = 0.B or 7.B.

I address

The input bit address of the input channel for the signal processing in the safety program is indicated here. It is calculated automatically from the start of the inputs entered on the "Addresses" tab.

Input delay

To suppress coupled-in interference or brief switching pulses, you can set an input delay for each AS-i slave. This will suppress interference pulses whose pulse time is less than the set input delay, in ms. The input delay applies to both channels of the channel pair of the AS-i slave.

Note

Time of fault suppression shortened by up to 75 ms

It can take 15 AS-i cycles until the valid code sequence is detected. As a result, the time of the fault suppression is shortened by up to 75 ms compared to the set value.

A long input delay suppresses longer interference pulses but results in a longer response time.

Range of values: 0 to 150 ms

Default 0 ms

The values 0, 50 to 150 ms can be selected in 10 ms increments.

The input delay time acts in addition to the system response time. Suppressed interference pulses are not visible in the safety program.

Evaluation of the sensors

This parameter specifies how the connected sensors are to be evaluated.

1oo1 evaluation

In 1oo1 evaluation, the sensor exists once and is connected to the first input of the safe AS-i slave via a single channel. You jumper the second input of the AS-i slave. Instead of the jumper, you can also connect another single-channel sensor to the second input. Only when both inputs supply an ON signal does the F-CM AS-i Safety ST module transfer the "1" value to the safety program (the two inputs are ANDed).

The individual states of the two inputs of the AS-i slave are not visible in the safety program.

A discrepancy analysis is not performed in 1oo1 evaluation.

1oo2 evaluation, equivalent

In 1oo2 evaluation, equivalent, both inputs of the safe AS-i slave are occupied by one two-channel sensor or by two single-channel sensors. The two single-channel sensors then belong together functionally as a pair.

The input signals are compared internally for equivalence. The two inputs of the AS-i slave are combined to form a channel pair.

A discrepancy analysis is possible in 1oo2 evaluation, equivalent.

Discrepancy analysis

If you are using a two-channel sensor or two single-channel sensors that acquire the same physical process variable, the sensors will, for example, respond with a delay due to the limited accuracy of their arrangement to each other. For fail-safe inputs, the discrepancy analysis for equivalence is used to infer errors from the time characteristic of two signals of the same functionality. For two associated input signals, if different levels are detected after the input delay time has expired, the discrepancy analysis is started. A check is made to determine if the difference has disappeared after expiration of an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error.

Startup test

If the "Startup test" parameter is activated, after startup of the channel or after a cross-circuit error (code sequence error), the value transferred to the safety program is kept at the substitute value "0" until the connected sensor has been correctly actuated at least once. Afterwards, the value of the input channel is calculated according to the set functionality.

The actuation of the sensor is defined to mean that both inputs of the safe AS-i slave must supply an ON signal, e.g., both switching contacts of the sensor are closed. Then, they must supply an OFF signal, e.g., switching contacts open. Finally, an ON signal must be supplied again, e.g., switching contacts closed. During the sensor actuation phase, none of the following errors may occur:

- Discrepancy error
- Sequence error
- Cross-circuit error (code sequence error)

After reintegration is complete, you must perform a startup test. For this purpose, you actuate the sensor to be monitored once.

A discrepancy error or a sequence monitoring error does not trigger a new startup test.

Discrepancy monitoring

If the discrepancy monitoring is activated, a discrepancy analysis is performed. This is the normal setting for 1oo2 evaluation, equivalent, in order to achieve high error uncovering.

You can deactivate the discrepancy monitoring for special situations. This corresponds in principle to 1oo1 evaluation of sensors. Check whether the lower error uncovering is sufficient for the required safety level. You may possibly use a sensor with integrated error uncovering. If required, you can activate the sequence monitoring.

When 1oo2 evaluation of the sensors is set, discrepancies in signal states between input 1 and input 2 are monitored.

When discrepancy monitoring is activated, the discrepancy time starts to elapse as soon as a difference is detected between the signal on input 1 and the signal on input 2. If the set discrepancy time is exceeded and the difference continues to exist, a discrepancy error is triggered.

Before switch-on, the signal value 0 must be present at both inputs, even when a discrepancy error has not occurred or the discrepancy time has not been set to "infinite".

If the "Evaluation of the sensors" parameter has been assigned with 1oo1, discrepancy monitoring is not performed.

Discrepancy behavior

This parameter is permanently set to "Supply 0 value".

The discrepancy behavior determines the value that is made available to the safety program in the F-CPU during the discrepancy, i.e., while the discrepancy time is running.

After expiration of the set input delay time, once an "OFF" signal is detected at one of the two input channels of the channel pair involved, this parameter setting causes the value "0" to be provided to the safety program in the F-CPU. This setting does not affect the sensor-actuator response time as a result of the discrepancy time.

Discrepancy time infinite

If you activate "Discrepancy time infinite", the time period for the discrepancy analysis never expires. As a result, a time-related discrepancy error will not be detected.

Nevertheless, the following switch-on condition applies: After a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again.

If this condition is not satisfied, especially in the event of a single-channel switch-off (i.e., signal OFF at only one of the two input channels of the relevant channel pair) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) even though the time for the discrepancy analysis has not expired. In data record 202, the bit 0.2 "= 1" is set in the status of the input monitoring of AS-i address n.

A discrepancy error is only detected if both input channels of the affected channel pair have not received the "0" signal simultaneously.

If "Discrepancy time infinite" is deactivated, the discrepancy analysis uses the value set for the "Discrepancy time" parameter.

Discrepancy time

You can specify the discrepancy time in the range of 0 to 60 000 ms for each channel pair.

The following settings are required:

- "Sensor evaluation": 1oo2 evaluation, equivalent
- "Discrepancy monitoring": Active
- "Discrepancy time infinite": Deactivated

In most cases, the discrepancy time is started but does not completely elapse, because the signal differences are evened out again after a short time.

Select a large enough discrepancy time so that in error-free cases, the difference between the two signals always disappears before the discrepancy time expires.

If the input signals do not match after expiration of the assigned discrepancy time, e.g., due to a mechanical defect of the sensor or sensor wire break, a discrepancy error is detected.

When discrepancy time is running, the switch-on condition also applies that after a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again. If this condition is not satisfied, especially in the event of brief switch-off of a channel (due to signal OFF at only one of the two input channels) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) if the time for the discrepancy analysis has not expired.

A detected discrepancy error indicates to the user that the switch-on condition is not satisfied.

Assign a discrepancy time that is greater than the input delay time.

Sequence monitoring

Overview

The sequence monitoring monitors the sequence of the signals of the channel pair when there is a signal change OFF >>> ON at the inputs of the safe AS-i slave.

The following settings are possible:

- Deactivated: The sequence is not a condition that has to be satisfied for switching on the function output.
- Ascending order: Input 1 before input 2 at "HIGH" state
- Descending order: Input 2 before input 1 at "HIGH" state

If the sequence is violated, the "Sequence condition violated" error is detected. The value transferred to the safety program is kept at "0" until the "OFF" signal is read in at both input channels. Switch-on condition is, for example, both switching contacts of the sensor open. The inputs must be switched on one after the other in the assigned sequence and must not switch on simultaneously.

You can activate the sequence monitoring if 1002 evaluation, equivalent, is set for the sensor evaluation. In this case, the discrepancy monitoring can be activated or deactivated.

Deactivated

The sequence of the inputs is not monitored.

Ascending order: Input 1 before input 2 at "HIGH" state

For switch-on of the channel, input channel 1 must first read in and hold an "ON" signal followed by input channel 2.

When the channel is switched off, the sequence of the input channels is not monitored.

Descending order: Input 2 before input 1 at "HIGH" state

For switch-on of the channel, input channel 2 must first read in and hold an "ON" signal followed by input channel 1.

When the channel is switched off, the sequence of the input channels is not monitored.

Reintegration after discrepancy error

This parameter is permanently set to: "Test 0-signal necessary on both channels".

A discrepancy error is not considered to be rectified until an "OFF" signal is present again at both input channels. Reintegration of the PROFIsafe channel is then possible.

6.2.5 Module parameters - Safe outputs

Activate output control

With this parameter, you activate the corresponding switching group and the associated AS-i address of the control unit in the F-CM AS-i Safety ST module.

You will find additional information in Section Operating principle of the safe AS-i outputs (Page 35), "Operating principle of the safe AS-i outputs."

When output control is activated, the control unit in the F-CM AS-i Safety ST module is switched on so that the F-CM AS-i Safety ST module generates an additional AS-i address on the AS-i Bus. The associated value is output from the safe process image via this AS-i address.

When output control is deactivated, the corresponding control unit in the F-CM AS-i Safety ST module is switched off, and an AS-i slave is not emulated on the AS-i bus.

AS-i address

Here, you set the AS-i address within the range of 1 to 31 that the F-CM AS-i Safety ST module is to use for control of a safe AS-i output.

⚠ WARNING

Uniqueness of the AS-i address on the AS-i bus

Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Note

Communication of the AS-i master with the AS-i address

The AS-i address of the control unit must be called by the AS-i master. Set up the communication of the AS-i master in such a way that communication with the AS-i address of the control unit functions properly.

Note

Slave profile of the control unit in the F-CM AS-i Safety ST module (control of a safe AS-i output)

The AS-i address of the control unit corresponds to a slave with slave profile (IO.ID.ID2) = 6.B.D and ID1 = 0.

Q address switching output

The output bit address is displayed here. It determines the switching state of the safe output (control signal F-OUT 1). Interconnect the "Q address switching output" in your safety program according to the required safety logic.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

Q address error acknowledgment

The output bit address that sends an acknowledgment signal to the safe output is displayed here.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

A positive edge (0 >>> 1) triggers the F-CM AS-i Safety ST module to first send the AUX1 auxiliary signal to the safe output followed by the AUX2 auxiliary signal. Another positive edge is necessary for sending another sequence of auxiliary signals.

The auxiliary signals are used, in general, for acknowledging an error state at the safe output. Refer to the AS-Interface (http://support.automation.siemens.com/WW/view/en/26250840/0/en) System Manual and the Operating Instructions of the safe output module (http://support.automation.siemens.com/WW/view/en/43666143/0/en) used to find out which functions the auxiliary signals are used for.

Note

"Q address error acknowledgment"

The "Q address error acknowledgment" does not trigger an error acknowledgment in the F-CM AS-i Safety ST module. Rather, as described above, it sends an acknowledgement signal to the safe output module on the AS-i bus.

6.3 Address space

6.3.1 Address assignment for user data and value status of the F-CM AS-i Safety ST module

Input and output address assignment

Of the assigned addresses of the F-CM AS-i Safety ST module, the user data occupy the following addresses in the F-CPU:

Table 6- 6 Input address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
x + 0	DI0.7 AS-i address 7	DI0.6 AS-i address 6	DI0.5 AS-i address 5	DI0.4 AS-i address 4	DI0.3 AS-i address 3	DI0.2 AS-i address 2	DI0.1 AS-i address 1	DI0.0 Reserved
x + 1	DI1.7 AS-i address 15	DI1.6 AS-i address 14	DI1.5 AS-i address 13	DI1.4 AS-i address 12	DI1.3 AS-i address 11	DI1.2 AS-i address 10	DI1.1 AS-i address 9	DI1.0 AS-i address 8
x + 2	DI2.7 AS-i address 23	DI2.6 AS-i address 22	DI2.5 AS-i address 21	DI2.4 AS-i address 20	DI2.3 AS-i address 19	DI2.2 AS-i address 18	DI2.1 AS-i address 17	DI2.0 AS-i address 16
x + 3	DI3.7 AS-i address 31	DI3.6 AS-i address 30	DI3.5 AS-i address 29	DI3.4 AS-i address 28	DI3.3 AS-i address 27	DI3.2 AS-i address 26	DI3.1 AS-i address 25	DI3.0 AS-i address 24
x + 4	Value status for DI0.7	Value status for DI0.6	Value status for DI0.5	Value status for DI0.4	Value status for DI0.3	Value status for DI0.2	Value status for DI0.1	Reserved
x + 5	Value status for DI1.7	Value status for DI1.6	Value status for DI1.5	Value status for DI1.4	Value status for DI1.3	Value status for DI1.2	Value status for DI1.1	Value status for DI1.0
x + 6	Value status for DI2.7	Value status for DI2.6	Value status for DI2.5	Value status for DI2.4	Value status for DI2.3	Value status for DI2.2	Value status for DI2.1	Value status for DI2.0

x + 8	Value status for DQ0.7	Value status for DQ0.6	Value status for DQ0.5	Value status for DQ0.4	Value status for DQ0.3	Value status for DQ0.2	Value status for DQ0.1	Value status for DQ0.0
x + 9	Value status for DQ1.7	Value status for DQ1.6	Value status for DQ1.5	Value status for DQ1.4	Value status for DQ1.3	Value status for DQ1.2	Value status for DQ1.1	Value status for DQ1.0

X = Module start address

NOTICE
Process value "0" is transmitted as a non-safety related value Based on the transfer principle of the code sequences, the process value "1" is transferred via AS-Interface as a safe value, so that the enable for switching on a machine can be issued in a safety-related manner. If an error occurs during transfer of the value "1", this error is detected and substitute value "0" is used. The process value "0" is transferred via AS-interface as an unsafe value. That is, a faulty transmission of the "0" value cannot be detected. The "0" value must therefore not be used as safety-related information that initiates a dangerous action (e.g., feedback "0" of a switch position).

Table 6- 7 Output address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module

x + 4	Reserved							
x + 5	Reserved							
x + 6	Reserved							
x + 7	Reserved							

X = Module start address

The error acknowledgment bit initiates the AUX1 and AUX2 signals one after the other.

Note

Use of the error acknowledgment bit of a safe AS-i output

The values in the PROFIsafe process output image have Safety Integrity Level SIL 3. In addition to the switching states, a control unit can transfer two different auxiliary signals to a safe AS-i output: AUX1 and AUX2. These auxiliary signals are not safety-related signals. You can use the auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, these error acknowledgment bits are mapped in the safe process output image. If error acknowledgment bits are sent to a safe AS-i output, the *STEP 7* or SIMATIC Manager configuration tool is unable to detect that the error acknowledgment bits are not safe. This means: No warnings or faults will be output for it when the safety application is generated. The user is responsible for the correct processing of these signals in the safety application.

6.3.2 Value status

Properties

For each input signal and output signal, the F-CM AS-i Safety ST module provides information about the signal's validity, i.e., the "value status". Like the input signal, the value status is stored in the process image.

Value status for the digital input and output modules

The value status is binary supplementary information of a digital input or output signal. It is entered in the process input image simultaneously with the process signal. The value status provides information regarding the validity of the input or output signal.

The value status is influenced by the following:

- Code sequence errors, e.g, caused by a permanent fault on the AS-i bus, wiring error, etc.
- Missing safe AS-i input slaves
- Channel faults
- Replacement of a safe AS-i slave by a non-safe AS-i slave
- Discrepancy error
- Sequence error

Value status = 1: A valid process value is output for the channel.

Value status = 0: A substitute value is output for the channel or the channel is deactivated.

Assignment of the inputs and outputs to the value status in the process image

A value status is assigned to each channel of the F-CM AS-i Safety ST module in the process input image.

Additional information

A detailed description of the evaluation and processing of the value status can be found in the Programming and Operating Manual SIMATIC Safety - Programming and Configuring (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

Address assignment for user data and value status of the F-CM AS-i Safety ST module (Page 53)

6.4 Data records for diagnostics

For diagnostic purposes, you can read out the following data records via your user program.

6.4.1 DS 92 Device-specific diagnostics

Meaning

All device-specific messages and information regarding the device function states are collected centrally and stored in the message memory of the F-CM AS-i Safety ST module. The message memory is read out using DS 92.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The "Error code" column in the table below indicates which events are relevant here. If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").

The text inside parentheses after the error code corresponds to the error text that is specified for the given error code according to the PROFIBUS Standard. Several error codes can be output. If no error code is specified ("-"), a diagnostic alarm is not generated.

Table 6- 8 DS 92 Device messages: Device status byte 12.0 to 199

Byte.Bit	Description	Error code[1)] (decimal value) in the diagnostic alarm	Remark
0.0 … 0.7	Reserved	-	-
1.0 … 1.7	Reserved	-	-
2.0 … 2.7	Reserved	-	-
3.0 … 3.7	Reserved	-	-
4.0 … 4.7	Reserved	-	-
5.0 … 5.7	Reserved	-	-
6.0 … 6.7	Reserved	-	-
7.0 … 7.7	Reserved	-	-
8.0 … 8.7	Reserved	-	-
9.0 … 9.7	Reserved	-	-
10.0 … 10.7	Reserved	-	-
11.0 … 11.7	Reserved	-	-

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark
12.0	Serious device fault	9 ("Error")	See Section Error statuses (Page 20)
12.1	Group error	24 ("Switch-off")	At least one error is present.
12.2	AS-i communication error	19 ("Communication error")	Failure of an AS-i slave configured in the F-CM AS-i Safety ST module or code sequence error
12.3	Group_Message_Device	-	At least one message about the device state is present, e.g., configuration missing.
12.4	Group_Message_Application	-	At least one message about the application state is present, e.g., startup test necessary, safety sensor tripped (Emergency Stop, protective door, etc.).
12.5 … 12.7	Reserved	-	-
13.0	Reserved	-	-
13.1	Device fault	24 ("Switch-off") 27 ("Unclear error")	See Section Error statuses (Page 20)
13.2	Parameter assignment error	24 ("Switch-off") 16 ("Parameter assignment error")	Parameter not permitted in configuration.
13.3	Process signal error	24 ("Switch-off") 27 ("Unclear error")	See Section Error statuses (Page 20)
13.4	Code sequence error	24 ("Switch-off") 26 ("External error")	A code sequence error can occur, for example, in case of: • Cross-circuit at the inputs • EMC problem Bit 18.0 is additionally set.
13.5	Logic error	24 ("Switch-off") 25 ("Safety-related switch-off")	A logic error can occur, for example, in case of: • Discrepancy error • Sequence error Bit 18.0 is additionally set.
13.6 … 13.7	Reserved	-	-
14.0	Downloading of module parameters is not yet complete	-	-
14.1	Reserved	-	-
14.2	Cyclic data exchange is active	-	-
14.3 … 14.7	Reserved	-	-
15 … 17	Reserved	-	-

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark
18.0	Group error code sequence_Logic	24 ("Switch-off")	A code sequence error or logic error is present for at least one safe input. Byte 90 … 91 contains the AS-i address of the first safe input for which the error is present.
18.1	Reserved	-	-
18.2	Group_Message_Input_Triggered	-	At least one monitored safe input has value status "0". Possible cause: • Startup test necessary • Safety sensor triggered Byte 94 … 95 contains the AS-i address of the first safe input for which the value status "0" is present.
18.3 … 18.7	Reserved	-	-
19 … 21	Reserved	-	-
22.0 … 22.1	Reserved	-	-
22.2	Timeout	24 ("Switch-off") 8 ("Lower limit undershot")	An internal data processing error has occurred. The F-CM AS-i Safety ST module signals a device fault. Bit 13.2 is additionally set.
22.3 … 22.6	Reserved	-	-
22.7	AS-i slave failure	26 ("External error")	No communication is detected in the case of at least one monitored safe input slave or control unit for a safe AS-i output.
23.0 … 23.7	Reserved	-	-
24 … 25	Reserved	-	-
26.0 … 26.3	Reserved	-	-
26.4	Coding element error	24 ("Switch-off") 27 ("Unclear error")	A data error occurred or coding element is missing when a coding element is accessed. The F-CM AS-i Safety ST module signals a device fault.
26.5 … 26.7	Reserved	-	-
27 … 28	Reserved	-	-
29.0 … 29.7	Reserved	-	-
30 … 33	Reserved	-	-

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark		
34 … 35	Parameter assignment error object	-	Object number for which a parameter assignment error was detected.		
			0	=	No error
			1 … 31	=	The number corresponds to the AS-i address of a safe input.
			32 … 47	=	A number 32 … 47 corresponds to the number of the switching group 0 … 15
36 … 37	Reserved	-	-		
38.0	AS-i bus error	26 ("External error")	The AS-i data communication is interrupted, substitute values in the interconnection logic		
38.1	AS-i parameter assignment error	26 ("External error")	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 55. If an AS-i address of an output switching group is not included by the AS-i master in the data communication, this bit is set. A substitute value will be used instead.		
38.2	AS-i configuration error	-	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 39. This bit is set when SET ≠ ACTUAL on the AS-i bus, when, for example, an AS-i slave is missing. A substitute value will be used instead.		
38.3	AS-i voltage too low	-	If the AS-i voltage is too low during operation, a serious device fault results.		
38.4	Reserved	-	-		
38.5	AS-i communication okay	-	-		
38.6 … 38.7	Reserved	-	-		
39	Incorrect AS-i address	-	AS-i address of the AS-i slave that the device has identified as faulty:		
			0	=	No error
			1 … 31	=	AS-i slave address
40 … 47	Reserved	-	-		

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark
48.0	ASIsafe safe input active	-	As soon as safe AS-i slaves become monitored, this bit is set.
48.1	ASIsafe safe output active	-	If safe AS-i outputs are controlled, this bit is set.
48.2 … 48.7	Reserved	-	-
49.0	ASIsafe code sequences missing	26 ("External error")	Safe input In addition, the AS-i address is entered in byte 50.
49.1	ASIsafe code sequences duplicated	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.2	ASIsafe code sequences new	-	New code sequences are available for transfer. In addition, the AS-i address is entered in byte 50.
49.3	ASIsafe code sequences known	-	The code sequences are taught and saved in the coding element.
49.4	ASIsafe code sequence error	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.5	ASIsafe code sequence teaching active	-	The code sequences are being collected. When the code sequences for all safe AS-i input slaves detected on the bus are taught, this bit is reset.
49.6 … 49.7	Reserved	-	-
50	Code sequence error object	-	This bit contains the lowest AS-i address for which a code sequence problem has occurred. Code sequence problems are: • 49.0 ASIsafe code sequences missing (Prio 3) • 49.1 ASIsafe code sequences duplicated (Prio 1) • 49.2 ASIsafe code sequences new (Prio 4) • 49.4 ASIsafe code sequence error (Prio 2)
51 … 54	Reserved	-	-
55	Switching group error object	-	This byte contains the lowest AS-i address that is configured for an output switching group but is not addressed by the master. Correct the slave configuration of the master.
56 … 61	Reserved	-	-

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark
62.0	F_Dest_Adr does not match	24 ("Switch-off") 19 ("Communication error") 64 ("Different destination address")	-
62.1	F_Dest_Adr invalid	24 ("Switch-off") 19 ("Communication error") 65 ("Invalid destination address")	The coding element does not contain an F-address.
62.2	F_Source_Adr invalid	24 ("Switch-off") 19 ("Communication error") 66 ("Invalid source address")	-
62.3	F_WD-Time_0	24 ("Switch-off") 19 ("Communication error") 67 ("Watchdog time is 0 ms")	F_WD-Time value is 0 ms.
62.4	F_SIL value	24 ("Switch-off") 19 ("Communication error") 68 ("Parameter 'F_SIL' exceeds the appl. SIL")	F_SIL value exceeds SIL value of the specified device application
62.5	F_CRC_Length	24 ("Switch-off") 19 ("Communication error") 69 ("Parameter 'F_CRC_Length' does not match …")	F_CRC_Length value does not match the actual CRC length.
62.6	F_Par_Version	24 ("Switch-off") 19 ("Communication error") 70 ("Incorrect F-parameter version or F_Block_ID")	F_Par_Version does not match the F-parameter set or F-Block_ID is invalid Block_ID
62.7	CRC1 error	24 ("Switch-off") 19 ("Communication error") 71 ("CRC1 error")	-
63.0 … 63.2	Reserved	-	-
63.3	iPAR_CRC error	24 ("Switch-off") 19 ("Communication error") 75 ("Inconsistent I-parameters [iParCRC error]")	-
63.4	Operator acknowledge requested	-	Channel is ready for reintegration
63.5 … 63.7	Reserved	-	-
64 … 65	Reserved	-	-
70 … 89	Reserved	-	-

Byte.Bit	Description	Error code[1] (decimal value) in the diagnostic alarm	Remark		
90 … 91	Object_Code_Sequence_Logic	-	AS-i address of the first safe AS-i slave for which a code sequence error or logic error is present. See also bit 18.0. 0 = No error		
			0	=	No error
			1 … 31	=	AS-i slave address
			≥32	=	Internal error numbers
92 … 93	Reserved	-	-		
94 … 95	Object_input_triggered	-	AS-i address of the first safe AS-i slave for which the input_triggered message is present. See also bit 18.2.		
			0	=	No error
			1 … 31	=	AS-i slave address
			≥32	=	Internal error numbers
96 … 199	Reserved	-	-		

1) Error code (decimal value) in the diagnostic alarm = also set "Fieldbus diagnostic bit"

6.4.2 DS 202 Status safe inputs/outputs

Description

DS 202 contains non-safety-related status information for the safe input slaves and for the control of the safe output slaves.

The status information for the control of the safe output slaves relates either to the control units activated in the F-CM AS-i Safety ST module or to data of external control units for safe output slaves that is also read on the AS-i bus.

Table 6- 9 DS 202 Status safe inputs/safe outputs

Byte	Description
0 … 1	Reserved
2 … 5	Status input monitoring AS-i address 1
6 … 9	Status input monitoring AS-i address 2
10 … 13	Status input monitoring AS-i address 3
14 … 17	Status input monitoring AS-i address 4
18 … 21	Status input monitoring AS-i address 5

186 … 189	Status output control switching group 15
190 … 199	Reserved

Table 6- 10 Input monitoring: Structure of the status information

Byte.Bit	Message bit		Remark
0.0	Value = 1:	Startup test necessary	-
0.1	Value = 1:	Sequence condition violated	-
0.2	Value = 1:	Discrepancy condition violated	-
0.3	Value = 1:	Safety sensor triggered	-
0.4 … 0.7	Reserved		-
1.0	Value = 1:	Code sequence error	Cross-circuit at input
1.1 … 1.7	Reserved		-
2.0	Reserved		-
2.1	Value = 1:	Switch-on condition not met	-
2.2 … 2.7	Reserved		-
3.0 … 3.7	Reserved		

Table 6- 11 Output control: Structure of the status information

Byte.Bit	Message bit	Remark
0.0	Output active	The control unit of the switching group sends the "F-OUT 1" control signal.
0.1 … 0.7	Reserved	-
1.0 … 1.3	Reserved	-
1.4	Auxiliary signal AUX1 sent	Auxiliary control signal AUX1 was transferred with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.5	Auxiliary signal AUX2 sent	Auxiliary control signal AUX2 was transmitted with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.6 … 1.7	Reserved	-
2.0 … 2.7	Reserved	-
3.0 … 3.7	Reserved	-

6.4.3 DS 204 Status code sequences

Description

The DS 204 contains the statuses of all AS-i slaves that are known to the F-CM AS-i Safety ST module.

Table 6- 12 DS 204: Status code sequences

Byte	Description
0 … 13	Reserved
14 … 17	Status code sequence for AS-i address 1
18 … 21	Status code sequence for AS-i address 2
22 … 25	Status code sequence for AS-i address 3
26 … 29	Status code sequence for AS-i address 4
30 … 33	Status code sequence for AS-i address 5
34 … 37	Status code sequence for AS-i address 6

x + 3	Status code sequence for AS-i address n	Byte 3

Table 6- 14 Assignment of the bits of an AS-i address in the "Status code sequence" data structure

Byte	Bit	Description	Setting	Meaning of the setting
0	0 … 2	Status of the slave	= 0	No slave present
			= 1	Standard slave (not safety-related)
			= 2	Safe slave, but the code sequence type safe input/safe output is not yet decoded.
			= 3	Code sequence type safe output
			= 4	Code sequence type safe input
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 6	Status of parameter assignment	= 0	No safe AS-i output slave or AS-i input slave is configured.
			= 1	Reserved
			= 2	Safe AS-i slave is configured The detected slave corresponds to the activation.
			= 3	Safe AS-i slave is configured The detected slave does not correspond to the activation.
			= 4 … 7	Reserved
	7	-	Reserved	-
1	0 … 2	Status of the code sequence	= 0	Code sequence irrelevant: No activation or no slave is present.
			= 1	Code sequence missing: No code sequence is taught or transferred.
			= 2	Code sequence duplicated: At least one other slave has the same code sequence.
			= 3	Code sequence new: The taught code sequence does not correspond to the transferred code sequence.
			= 4	Code sequence known: The taught code sequence does not correspond to the transferred code sequence.
			= 5 … 7	Reserved
	3	-	Reserved	-
	4 … 5	Status of the safe input 1	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.

Byte	Bit	Description	Setting	Meaning of the setting
1	6 … 7	Status of the safe input 2	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.
2	0 … 1	Status of the "F-OUT 1" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	2 … 3	Status of the "F-OUT 2" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	4 … 5	Status of the "F-OUT 3" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	6 … 7	Status of the "F-OUT 4" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
3	0 … 1	Status of the auxiliary signal 1	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	2 … 3	Status of the auxiliary signal 2	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	4 … 7	-	Reserved = 0	-

Code sequences

7

The principle of the ASIsafe code sequences is briefly explained in Section Safety-related communication with AS-Interface (Page 35).

The F-CM AS-i Safety ST module manages the code sequences of the safe AS-i slaves in two steps. First, the F-CM AS-i Safety ST module reads all code sequences on the AS-i bus and checks whether the respective code sequence is plausible. This operation is referred to as "teaching the code sequences". The code sequences taught in this way are in volatile memory. The taught code sequences are transferred to the non-volatile memory after a request by the user.

Initial commissioning

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

Replacement of a safe AS-i input slave

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

For the transfer of the code sequences to the non-volatile memory, you can open the "Teach ASIsafe" dialog by pressing the "Teach ..." button.

Alternatively, the transfer is also possible by pressing the optional "TEACH" button (at least 3 s).

Replacement of the F-CM AS-i Safety ST module

The non-volatile memory is located in the BaseUnit. The transferred code sequences are retained in this memory after replacement of the F-CM AS-i Safety ST module.

Below is a description of the options offered by the F-CM AS-i Safety ST module for transferring code sequences.

See also

Connection (Page 27)

7.1 Transferring code sequences via STEP 7 online access

When code sequence are managed via *STEP 7* online access, you have the option of monitoring the status of the existing code sequences in a graphic overview. In particular, the graphic overview offers advantages for initial commissioning. In addition, you can use the graphic overview for transferring the code sequences of replaced slaves during operation. You can open the graphic overview for diagnostic purposes without changing the saved code sequences. The transfer of taught code sequences is possible but not mandatory.

In order to open this dialog, there must be an online connection to the controller or to the F-CM AS-i Safety ST module. Load the hardware configuration into the modules of the controller before teaching the code sequences so that the online configuration of the F-CM AS-i Safety ST module matches the offline configuration.

7.1.1 "Teach ASIsafe code sequences" dialog

The "Teach ASIsafe code sequences" dialog contains an overview of the code sequences of the existing safety-related AS-i slaves. In this dialog, you start the transfer of the code sequences read in on the AS-i bus into the memory of the F-CM AS-i Safety ST module.

The "Teach ASIsafe code sequences" dialog does not make any changes to the module configuration. You can open the dialog for information purposes during operation. The information displayed in the dialog are obtained online from the F-CM AS-i Safety ST module. There is no comparison with the offline configuration in this case.

Within the "AS-i addresses 0…15" and "AS-i adresses 16…31", you see the following information for each AS-i address:

- Slave status
- Code sequence
- F-IN 1 … 2
- F-OUT 1 ... 4

For the AS-i address 0, only information about the slave status can be displayed because a slave with the address 0 does not exchange cyclic input/output data.

Below this information you see:

- The "Transfer taught code sequences" button
- The "Progress of teaching operation" display

By double-clicking the "Close" button, you can exit the dialog at any time. If the button is actuated, the data will not be changed. If the code sequences have not been transferred or have only been partially transferred, a corresponding notice appears.

"Slave Status" column

The "Slave status" column shows the following information about the AS-i address via a color code:

Gray	The address does not exist on the AS-i bus. It is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated)
Green (without check mark)	The address belongs to a slave that exists on the AS-i bus. However, the slave is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated). The slave on the AS-i bus is a safe slave or a standard slave. It is available for use by the AS-i master or another module.
Green (with check mark)	The address is present on the AS-i bus and corresponds to the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated).
Yellow	An error has been detected: The address is present on the AS-i bus but does not correspond to the configuration of the F-CM AS-i Safety ST module (input monitoring control or output monitoring control is activated). Check the slave. Replace the slave with the required slave or change the configuration.
Red	An error has been detected: The address is not present on the AS-i bus but is needed in the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated). • Check whether the slave exists on the AS-i bus and has been included in the communication by the AS-i master. • Check whether the slave is contained in the configuration of the AS-i master. Correct the configuration of the AS-i bus, if required.

"Code sequence" column

The "Code sequence" column shows the following information about the AS-i address via a color code:

Gray	No code sequence is needed for the address.
Green (without check mark)	A code sequence was taught but not transferred to the memory. Start the transfer of the code sequence by double-clicking the "Transfer taught code sequences" button.
Green (with check mark)	The code sequence was transferred to the non-volatile memory. Note: This status is also displayed when the output control is activated for this address. The code sequences for safe outputs are automatically predefined in the F-CM AS-i Safety ST module. They are not transferred to the non-volatile memory of the code sequences.
Yellow	An error has been detected: A code sequence was taught that is already being used by another slave. The code sequence cannot be used. Replace the slave with a different slave.
Red	Warning or error: The address is sending an incomplete or invalid code sequence. Check whether both inputs of the safe input slave are assigned with the "ON" signal. If required, actuate the associated safety contacts. The contacts must be closed. • Check whether a cross-circuit exists at the inputs. If necessary, correct the wiring of the inputs.

"F-IN 1 ... 2" column

The "F-IN 1 ... 2" column shows the following information about the AS-i address via a color code:

The numbers 1 to 2 designate the number of the input channel.

Gray	The input channel is not present. A safe input slave was not detected at the address.
Green	The input channel shows the value 1 ("ON" status).
White	The input channel shows the value 0 ("OFF" status).
Yellow	The input channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the input channel cannot be read in. Substitute value 0 is used.

"F-OUT 1 ... 4" column

The "F-OUT 1 ... 4" column shows the following information about the AS-i address via a color code:

The numbers 1 to 4 designate the number of the output channel.

Gray	The output channel is not present. A safe output channel was not detected at the address.
Green	The output channel shows the value 1 ("ON" status).
White	The output channel shows the value 0 ("OFF" status).
Yellow	The output channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the output channel cannot be read in.

If the output control is activated for the address, the F-CM AS-i Safety ST module can control the status for F-OUT 1. The F-CM AS-i Safety ST module cannot control F-OUT 2 … 4. The value 0 is output here.

If an external control unit uses the output address, the dialog shows the statuses for F-OUT 1 … 4 read in on the AS-i bus.

7.1.2 Transferring taught code sequences

In order for the input data of a safe AS-i input slave to be evaluated and made available to the safety program, the taught code sequences must be transferred to the non-volatile memory.

To do so, click the "Transfer taught code sequences..." button.

A dialog opens prompting you whether the code sequences are to be transferred. With "Yes" you confirm that you are addressing the correct module. For checking purposes, the "ADDR" LED flashes green on the front of the F-CM AS-i Safety ST module The code sequences are transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

With "No" you cancel the prompt without transferring the code sequence.

⚠ WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.

Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

The "Transfer taught code sequences" button is deactivated when all taught code sequences have already been transferred to the non-volatile memory.

7.1.3 "Progress of teaching operation" display

You can track the progress of the teaching operation.

Progress bar "Teaching in progress":

If at least one safe slave is detected on the AS-i bus whose code sequence has not yet been taught an active progress bar and the text "Teaching in progress" is displayed. Check the displays in the "Code sequences" column and ensure that the safe slaves send their code sequences.

For further information, refer to the "'Code sequence' column".

Taught slaves:

The "Taught slaves" output field shows the number of already transferred code sequences in relation to the number of code sequences that must still be transferred. You will additionally see the numerical ratio as a percentage. When 100% is indicated, all code sequences have been transferred to the non-volatile memory.

For further information, refer to "Transfer taught code sequences".

7.2 Transferring code sequences with the "TEACH" button.

The use of the "TEACH" button provides an easy way of transferring taught code sequences.

The "TEACH" button can be used, for example, to transfer code sequences of replaced modules during operation. However, it is also suitable for initial commissioning.

To learn how to connect the button to the BaseUnit, refer to Section "Connecting". You can track the progress of the code sequence transfer via the LEDs.

Press the "TEACH" button for at least 3 s. This action causes all currently taught code sequences that are unique and consistent to be transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

⚠ WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.

Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

When the transfer of the code sequences has been ended successfully, the "TEACH" LED goes out and you can release the "TEACH" button.

If you press the "TEACH" button before all code sequences are taught, the code sequences received up to then will be transferred.

7.3 Final steps

7.3.1 Reintegrating passivated input channels

The input channels of the F-CM AS-i Safety ST module for which no valid code sequences are saved supply the substitute value "0" and are passivated.

After the transfer of the code sequences, the passivated channels must be reintegrated so that the application can work with the real process values.

The procedure for this can be found in the following Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

After transferring the code sequences, check the safety equipment for proper functioning.

Alarm, fault, and system events

8

8.1 Overview

Diagnostics options

The following diagnostics options are available for the F-CM AS-i Safety ST module:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Diagnostic buffer
- Alarm messages in user program

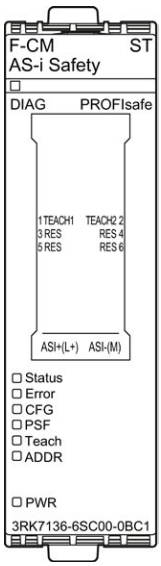
Meaning of the LEDs (Page 79)

8.2 LED statuses

8.2.1 Arrangement of the LEDs on the F-CM AS-i Safety ST

Introduction

LEDs on the front plate of the respective module display module-internal and module-external faults. The LEDs and their evaluation are described in the manuals for the relevant modules of the SIMATIC devices.



DIAG	Diagnosis
STATUS	Operating state of the module
Error	Operating state of the module
CFG	Fault on the AS-i bus
PSF	Process signal error, e.g.,channel fault on AS-i-F input slave
Teach	Teaching: Teaching of code sequences
ADDR	Addressing of the F-CM AS-i Safety ST module. F-addressing and teaching. The LED indicates whether the module is conducting safety-relevant communication with the software tool.
PWR	Supply voltage

Figure 8-1 LEDs of F-CM AS-i Safety ST

8.2.2 Meaning of the LEDs

The "F-CM AS-i Safety ST" module has 8 LEDs on the front:

LED "DIAG"

The "DIAG" LED displays the general status of the ET 200SP module

Table 8- 1 Meaning of the "DIAG" LED

"DIAG"	Meaning
☐ Off	The voltage is not OK.
✳ Green flashes	The F-CM AS-i Safety ST module is not ready for operation. The module parameters are not assigned.
■ Green ON	The F-CM AS-i Safety ST module is parameterized and error-free. No diagnostic alarms of the F-CM AS-i Safety ST are active.
✳ Red flashes	The F-CM AS-i Safety ST module is parameterized and indicates a diagnostic fault, or a firmware update is in progress.
✳✳ The two-color LED alternately flashes red/green	The position (ping) is displayed for 3 seconds.

LED "Status"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 2 Meaning of the "Status" LED

"Status"	Meaning
■ Green ON	• The F-CM AS-i Safety ST module is OK. • Cyclic I/O data exchange active
✳ Green flashes	• The system is powering up. • No cyclic I/O data exchange

LED "Error"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 8- 3 Meaning of the "Error" LED

"Error"	Meaning
■ Red ON	**Serious device fault, e.g.,** • Fault in the electronics • Excessive temperature rise
✳ Red flashes	**Device fault, e.g.,** • Intermittent data processing error (EMC problem) • Contact problem with the backplane bus • Missing coding element in the BaseUnit • Missing firmware update
□ Off	No error

LED "CFG"

The "CFG" LED indicates errors on the AS-i bus.

Table 8- 4 Meaning of the "CFG" LED

"CFG"	Meaning
■ Red ON	The AS-i bus is O. K., but a code sequence error exists.
✻ Red flashes	Fault on the AS-i bus: • A code sequence does not exist or it is incomplete.
□ "Off"	All code sequences are completely transferred.

LED "PSF"

The "PSF" LED indicates process signal errors at one or more channels of the module.

Table 8- 5 Meaning of the "PSF" LED

LED "PSF"	Meaning
■ Red ON	PROFIsafe channel fault for the complete F-CM AS-i Safety ST module, e.g. fault on F-CM AS-i input slave
✻ Red "flashes"	• Discrepancy error at the inputs of a safe AS-i input slave • Sequence error at the inputs of a safe AS-i input slave • Code sequence error at a safe AS-i input slave, e.g., due to cross-circuit at inputs or an EMC problem • Failure of a safe AS-i input slave The channel involved is passivated. The "PSF" LED goes out only after all channels have been reintegrated.
□ "Off"	No process signal error

LED "TEACH"

This LED indicates teaching of safe AS-i slaves. The "TEACH" LED indicates the progress of the teaching operation.

Table 8- 6 Meaning of the "TEACH" LED

LED "TEACH"	Meaning
■ Yellow ON	Teaching of code sequences successfully completed. The taught code sequences are being transferred.
✳ Yellow flashes	Teaching of code sequences in progress.
□ "Off"	The code sequences are completely transferred.

LED "ADDR"

The "ADDR" LED indicates that the device is conducting safety-relevant communication with a software tool.

Table 8- 7 Meaning of the "ADDR" LED

LED "ADDR"	Meaning
✳ Green flashes	Feedback that the module is addressed: • For assignment of the F-address • For transfer of the code sequences • Firmware update in progress
□ Off	Not relevant

LED "PWR"

The "PWR" LED indicates the status of the voltage supply.

Table 8- 8 Meaning of the "PWR" LED

LED "PWR"	Meaning
■ Green ON	AS-i voltage is applied.
□ "Off"	Insufficient AS-i voltage is applied.

8.3 Diagnostic messages

General

The F-CM AS-i Safety ST module generates one or more alarms when various events occur.

Which events lead to which alarm messages is indicated in the description of data record DS 92 "Device-specific diagnostics".

The alarms use the diagnostic fault codes F0 to F31 according to the PROFIBUS Standard.

See also

DS 92 Device-specific diagnostics (Page 57)

8.4 Replacement of defective devices

8.4.1 Replacing a safe AS-i input slave

Replace a failed safe AS-i input slave with a new device of the same type and assign the correct AS-i address to the slave. This address assignment can be performed automatically by the AS-i master (see manual of the AS-i master) or manually, e.g., with the AS-i addressing device (1904-2AB02).

Close the contacts on the inputs of the safe AS-i input slave so that the slave sends the code sequences.

The F-CM AS-i Safety ST module detects a new code sequence automatically and teaches it. For reintegration, the taught code sequence must be transferred.

The transfer can be started from the STEP 7 online dialog or by pressing the optional "TEACH" button (at least 3 s). For more information, see Section Code sequences (Page 69).

Observe the "CFG" and "TEACH" LEDs, see Section Meaning of the LEDs (Page 79).

To exclude impermissible duplicate code sequences for two safe input slaves, code sequences from all safe input slaves present on the AS-i bus must be transferred, regardless of whether the monitoring is activated or deactivated.

8.4.2 Replacing the safe AS-i output module (evaluation unit)

After replacement of a safe AS-i output module (evaluation unit), no setting is necessary on the F-CM AS-i Safety ST module.

Observe the operating instructions of the AS-i output module, and set the correct F-address for the AS-i output module and the AS-i address of any integrated standard slave.

An error acknowledgment for the affected output switching group must be performed, if necessary. See Section 6.3 Address space.

Non-safety related AS-i slaves (standard slaves) are not evaluated by the F-CM AS-I Safety ST module. Observe the replacement instructions in the operating instructions of the AS-i master or the slave.

8.4.3 Replacing the F-CM AS-i Safety ST module

When the F-CM AS-i Safety ST module is replaced, the new device automatically receives all necessary settings from the head module (IM) of the ET 200SP and the coding element in the BaseUnit.

For more information, see Manual

ET 200SP Distributed I/O System
(http://support.automation.siemens.com/WW/view/en/58649293/0/en)

Common Cause Failure	CCF	75 points (requirements met according to EN ISO 13849-1)

1) Probability of a dangerous failure in the case of an operating mode with high or continuous demand rate

2) Value "0" as an approximation for the individual value for AS-Interface slave applies only under the assumption that the PFH_D or PFD value of the AS-i slave is comparatively low and, thus, the PFH_D or PFD value of the AS-i slave does not contributed significantly to the PFH_D or PFD value of the total system. For this, observe the technical specifications of the safe AS-i slaves and use the specific values of the manufacturer.

3) Probability of a dangerous failure in the case of an operating mode with lower demand rate

9.3 Response times

The response times specified below represent worst case specifications. The response times relate to the switch-off operation (status change "1" → "0").

The response times for the switch-on operation (status change "0" → "1") can be longer but are not relevant for the given safety-related examination.

Maximum response time in the input direction

The maximum response time in the input direction results from the calculation of the response time from the safe AS-i input slave up to the head module (IM) of the ET 200SP:

max. 5 ms AS-i bus cycle with maximum configuration
max. 5 ms Disturbance in AS-i bus cycle with maximum configuration
max. 20 ms Module-internal processing
max. 2 ms Transfer ET 200SP backplane bus

---

max. 32 ms Total response time in input direction (with 0 ms input delay)

⚠ WARNING

Increased response time

If an input delay time > 0 is assigned for a safe input, this input delay time must be added to the total response time.

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the sensor
- Additional response time in the safe AS-i input slave (see operating instructions)
- Bus response time between the head module (IM) of the ET 200SP and the controller
- Response time of the controller
- Timeout time (F-monitoring time) of the controller in case of PROFIsafe failure

These influencing variables must be taken into consideration when calculating the system response time of the total system.

In the above-indicated total response time, it is taken into consideration that a maximum of 4 AS-i bus cycle times elapse between a safe input slave failure and detection of an error.

Maximum response time in the output direction

The maximum response time in the output direction results from the calculation of the response time from the head module (IM) of the ET 200SP to the safe AS-i input slave (evaluation unit).

max.	2 ms	Transfer ET 200SP backplane bus
max.	20 ms	Module-internal processing
max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	32 ms	Total response time in output direction (for disturbance-free PROFIsafe transmission)

⚠ WARNING

Increased response time

In case of PROFIsafe failure, the total response time in the output direction increases by the set timeout time of the F-CM AS-i Safety ST module (see F-parameters, F-monitoring time).

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the controller
- Bus response time between the controller and the head module (IM) of the ET 200SP
- Response time in the safe AS-i output module (evaluation unit), see operating instructions
- For response time of the safe AS-i output module (evaluation unit) in case of AS-i failure, see operating instructions
- Response time of the actuator (e.g., contactor)

These influencing variables must be taken into consideration when calculating the system response time of the total system.

Additional information

Further information is provided in

System Manual SIMATIC Industrial Software Safety Engineering in SIMATIC S7 (http://support.automation.siemens.com/WW/view/en/12490443/0/en)

For calculation of response times, the following aid is available on the Internet:

- For S7 Distributed Safety, the Excel file S7fcotia.xls (http://support.automation.siemens.com/WW/view/en/25412441)

9.4 Calculation of monitoring times and response times

The Excel file S7fcotia.xls for S7 Distributed Safety is available on the Internet to aid the approximate calculation of the runtime of the F-runtime group, the minimum F-monitoring time, and the maximum response time of the safety program:

S7fcotia (http://support.automation.siemens.com/WW/view/en/25412441)

Additional information is available in Manual "Safety Engineering in SIMATIC S7".

You can download this free of charge on the Internet at:

Safety Engineering in SIMATIC S7
(http://support.automation.siemens.com/WW/view/en/12490443/0/en)

Notes on completing the Excel file S7fcotia.xls (when used without IE/PB Link)

Tab "max. runtime F-run-time group"

Enter the number of modules (in the relevant F-runtime group) in the "F-CM AS-i Safety ST" row under "ET 200SP fail-safe modules".

Tab "min. F-Monitoring times"

In the "Configuring the PROFIsafe monitoring time" section, select one of the following variants depending on which head module (IM) of the ET 200SP is being used.

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 3 Values for calculating the minimum F-monitoring times

Description	Designation	Value
Max. acknowledgment time of the F-CM AS-i Safety ST	T_DAT	20 ms
F-I/O with inputs and outputs	-	Yes

Tab "max. response times"

In the "Input" section, select one of the following variants for the relevant signal flow of the safety function depending on which head module (IM) of the ET 200SP is being used:

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 9- 4 Values for calculating the max. response times

Description	Designation	Value
Max. discrepancy time (Note: The safe value 0 is supplied while the discrepancy time is running)	T_DIS	0
Maximum response time in error-free operation	T_WCDT	20 ms
Maximum response time when an error is present	T_OFDT	20 ms
Max. acknowledgment time of the F-I/O	T_DAT	20 ms
Configured PROFIsafe monitoring time	T_PSTO, conf.	F_WD_TIME (see the setting on the PROFISAFE tab of the properties dialog)
Max. response time of sensor Note: For T_Sensor_DLY, the part of the system starting from the F-CM AS-i Safety ST module up to the sensor, including the AS-i bus, is considered.	T_Sensor_DLY	10 ms (signal flow of AS-i Bus) + Assigned input delay + Response time of the sensor + Additional response time in the safe AS-i input slave

Glossary

1oo1 evaluation

Type of sensor evaluation. With 1oo1 evaluation, the sensor exists once. The sensor is connected to the F-module over a single channel.

1oo2 evaluation, equivalent

Type of sensor evaluation. With 1oo2 evaluation, two input channels are occupied by one two-channel sensor or by two single-channel sensors. The input signals are compared internally for equivalence.

AS-i (AS-Interface)

Actuator-sensor interface. A networking system for the lowest field level of the automation level. The networking system is suitable for networking sensors and actuators with control devices (previous designation: SINEC S1).

AS-i A/B slave

AS-i A/B slaves use the extended address range. You can assign two A/B slaves as a pair to an address on AS-Interface. Because of the address organization, you can therefore connect up to 62 AS-i A/B slaves to AS-Interface.

AS-i analog slave

AS-i analog slaves are AS-i slaves that exchange analog values with the AS-i master.

AS-i master

The AS-i master monitors and controls binary or analog sensors and actuators via AS-i modules or AS-i slaves.

AS-i slave

All devices that can be addressed by an AS-i master are referred to as AS-i slaves. AS-i slaves are differentiated based on their design (AS-i modules as well as sensors or actuators with integrated AS-i connection) and their addressing range (AS-i standard slave and AS-i A/B slave with extended addressing range).

AS-i standard slave

The AS-i standard slave occupies one address on AS-Interface; because of to the address organization, up to 31 AS-i standard slaves can therefore be connected to AS-Interface.

ASIsafe®

The AS-Interface Safety at Work concept allows the integration of safety-related components in an AS-Interface network, e.g.:

- EMERGENCY STOP switch
- Protective door switch
- Safety light grid

These safety-related components are fully compatible, according to EN 50 295, with the well-known AS-Interface components, e.g., master, slaves, power supply unit, etc. They can be operated together on the yellow AS-Interface cable. Siemens supplies all components for configuring a safe AS-Interface network.

CM

Communication Module

Module for communication tasks that is used in an automation system as an interface expansion for the CPU.

CPU

Central Processing Unit

CRC

Cyclic Redundancy Check is a test procedure for checking the integrity of data. A generator polynomial is used to calculate a checksum over the data to be monitored. This checksum is, in the signature sense, characteristic of the data concerned. The generator polynomial can be calculated according to various algorithms.

DIAG

Diagnosis

Distributed Safety

Siemens-specific addition to PROFIsafe. The Distributed Safety fail-safe system with F-Configuration Pack supports implementation of safety concepts for machine and personal protection.

With Distributed Safety, passivation of selective channels has possible since PROFIsafe V2.0. The quality bits transferred in the process image are used to enter a substitute value in the process image for the channel concerned. The quality bits for the inputs and outputs are subsequently transferred in the process image to the actual process data. The same mechanism that PROFIsafe uses for reintegration of the module is used for reintegration of passivated channels.

F-address

Each fail-safe module has an F-address. For the F-CM AS-i Safety ST module, the F-address must initially be assigned online using *Step 7*. You specify the F-address in the configuration.

Fail-safe systems

Fail-safe systems are characterized in that, when certain failures occur, the system remains in a safe state or changes over directly to another safe state.

F-parameters

The fail-safe parameters are safety-relevant parameters. They are needed for communication via PROFIsafe.

I-parameters

Individual parameters for revising the AS-i functionality. The I-parameters are safety-relevant.

LED

A light-emitting diode that is used to display the signal status.

Nibble

A nibble is a unit of information that comprises four bits.

Passivation

When a fail-safe I/O device detects an error, it switches the affected channel, or all channels, to the safe state. That is, the channels of these fail-safe I/O devices are passivated. The fail-safe I/O device signals the detected fault to the F-CPU.

In the case of passivation of a fail-safe I/O device with inputs, the fail-safe system provides the safety program with substitute value "0" instead of the process values that are present at the fail-safe inputs.

In the case of passivation of a fail-safe I/O device with outputs, the fail-safe system transfers substitute value "0" to the fail-safe outputs instead of the output values supplied by the safety program.

PROFIsafe

Safety-related bus profile of PROFINET IO for communication between the safety program and the fail-safe I/Os in a fail-safe system.

Proof test interval

Time interval after which a component must be put into error-free state. The component is replaced or proof is furnished that it is entirely free of errors.

Safe state

The basis of the safety concept in fail-safe systems is that a safe state exists for all process variables.

Safety class

Safety integrity level SIL in accordance with IEC 61508. The higher the safety integrity level, the stronger the measures for avoiding systematic failures as well as for overcoming intermittent failures and hardware failures.

Fail-safe modules used in safety mode can achieve up to safety class SIL 3.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

Note

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

1.1 Documentation Guide for Power Module F-PM-E 24VDC/8A PPM ST

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

The table below lists additional documents that complement this description of the F-PM-E 24VDC/8A PPM ST fail-safe power module and are available on the Internet.

Table 1- 1 Documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate
BaseUnits	Manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)	Technical specifications
Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-PM-E 24VDC/8A PPM ST

Order number

6ES7136-6PA00-0BC0

View of the module

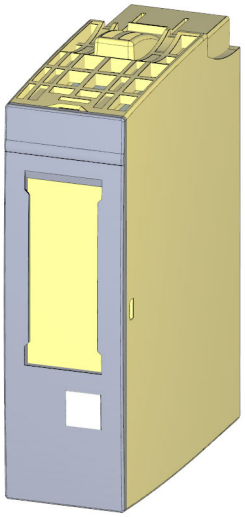

Figure 2-1 View of the F-PM-E 24VDC/8A PPM ST module

Properties

- Technical properties
  - Fail-safe digital module
  - 2 inputs (SIL3/Cat.4/PLe)
  - 1 output PM-switching or PP-switching, output current 8 A (SIL3/Cat.4/PLe)
  - 2 outputs for sensor supply
  - Sink input (P-reading)
  - Source output (PM/PP-switching)
  - Supply voltage L+
  - Suitable for connection of 2-wire sensors to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input or output (green LED)
  - Fault display for each input or output (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.

Follow the repair procedure described in section Diagnostic messages (Page 69).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Safety-related shutdown of standard DQ modules by the F-PM-E 24VDC/8A PPM ST

This cost-effective solution allows for full and simultaneous shutdown of all affected outputs of the standard DQ modules when a fault is detected in the process or on the F-PM-E 24VDC/8A PPM ST power module.

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

You can use the F-PM-E 24VDC/8A PPM ST power module with all standard DQ modules within a potential group. Additional information is available in Applications for safety-related shutdown of standard modules (Page 59).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs

If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.

Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.

One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.

The required measures are standardized for plants with product standards.

For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Connecting

3.1 Terminal assignment

General terminal assignment

Table 3- 1 Terminal assignment for F-PM-E 24VDC/8A PPM ST

Terminal assignment for F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit**[1]	**Color identification label (terminals 1 to 16)**
1	DI_0	**2**	DI_1	• DI_n: Input signal, channel n • VS_n: Internal sensor supply, channel n • DQ-P_0: Output signal, channel 0, P-switching • DQ-M_0: Ground for output signal, channel 0, M-switching • AUX: Protective conductor connection or voltage bus for SELV/PELV circuits	C0	 CC52 6ES7193-6CP52-2MC0
3	VS_0	**4**	VS_1			
5	DQ-P_0	**6**	DQ-M_0			
7	AUX	**8**	AUX			
L+	DC24V	**N**	M			
L+	DC24V	**N**	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System*system manual

Note

Make sure that you only use the power module with BaseUnit type C0 during commissioning.

Digital output

The digital output switches the voltage L+ and M using two electronic switches (see Block diagram (Page 16)). The switched voltage and chassis are conducted to the internal voltage buses P1 and P2. The switched voltage and chassis is also available at the BaseUnit at DQ-P_0 and DQ-M_0.

This results in two connection options that can be used at the same time, if desired:

- One load can be wired directly to the BaseUnit (see Applications for the output DQ/P1 and P2 (Page 39)).
- The standard modules can be supplied and switched off safety-related by means of the internal voltage buses P1 and P2. You can, in turn, connect loads to the standard modules (see Applications for safety-related shutdown of standard modules (Page 59)).

⚠ WARNING

It is no longer possible to shut down an actuator if a cross circuit has developed between L+ and DQ. To prevent cross circuits between L+ and DQ, you must route the cables used to connect the actuators in a cross-circuit proof manner (for example, as separate, sheathed cables or in separate cable ducts).

Redundant ground conductor required

⚠ WARNING

The ground conductor to the BaseUnit for F-PM-E 24VDC/8A PPM ST must be installed twice for safety reasons. Any interruption of a single ground conductor would prevent the safety-related shutdown of voltage bus P2.

Property of the individual shutdown of F-modules with fail-safe outputs

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Switching of loads with ground if the F-module is configured PM-switching

If the following two conditions are met, F-PM-E 24VDC/8A PPM ST detects a short circuit:

- If loads that have a connection between chassis and ground are switched by the F-PM-E 24VDC/8A PPM ST , for example, to improve the EMC properties.
- If chassis and ground are connected at the power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection (refer to the diagram below as an example for an F-PM-E 24VDC/8A PPM ST).

Remedy:

- Use the F-PM-E 24VDC/8A PPM ST configured as a PP-switching module.
- Increase the value of the resistance between chassis and ground at the load end to more than 100 kΩ.
- Reduce the capacitance value between chassis and ground at the load end to less than 2 µF.

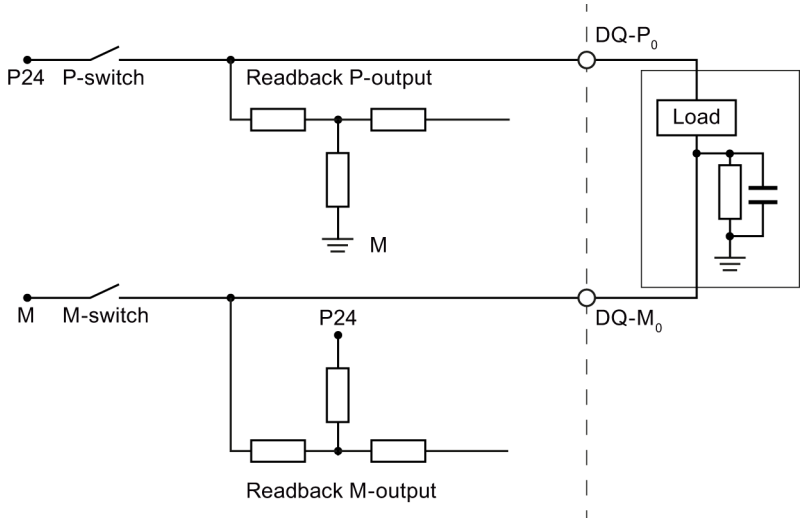

Figure 3-1 Switching of grounded loads (resistance between chassis and ground)

WARNING

During startup, the F-PM-E 24VDC/8A PPM ST carries out a switch-on test of approximately 3 ms. The capacitance between chassis and ground at the load end is charged by way of the load resistance. This low charging current may briefly trigger sensitive load circuits.

4.1 Parameters

Parameters

⚠ WARNING
Diagnostic functions should be activated or deactivated in accordance with the application.

Table 4- 1 Parameters for power module

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
PM-parameters:			
Maximum test period	• 100 s • 1000 s	no	Module
Sensor supply:			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Inputs:			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent	no	Channel pair
Discrepancy behavior	• Supply last valid value • Supply 0 value	no	Channel pair
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal necessary • Test 0-signal not necessary	no	Channel pair
Activated	• disable • enable	no	Channel
Sensor supply	• Sensor supply 0 • Sensor supply 1 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel

Parameter	Value range	Parameter reassignment in RUN	Scope
Output:			
Activated	• disable • enable	no	Channel
Control of the output	• F-CPU • F-CPU and onboard F-DI	no	Module
Output type	• PM switching • PP switching	no	Channel
Max. readback time dark test	0.8 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.8 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 PM-parameters

4.2.2.1 Maximum test period

Here you specify the time within which the light and dark tests (in all combinations) should be performed throughout the module. When this time expires, the tests are repeated.

The "Maximum test period" parameter is a module parameter, which means the test cycle for the entire fail-safe output module is performed within the configured maximum test time. If the bit pattern test is not performed within the configured time (or the shortened test time of 60 seconds in case of an error), the module goes into the error state.

4.2.3 Parameters of the sensor supply

4.2.3.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.3.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.3.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.4 Parameters of the inputs

4.2.4.1 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Sensor evaluation" parameter:

- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo2 evaluation equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One single-channel sensor
- One non-equivalent sensor
- One two-channel sensor
- Two single-channel sensors

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

Achievable safety class

The following safety class can be achieved depending on the selected sensor evaluation:

- SIL3/Cat.4/PLe with "1oo2 evaluation equivalent/non-equivalent"

4.2.4.2 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.4.3 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.4.4 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4.5 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.4.6 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.

The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 20)

4.2.4.7 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.

Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

Note

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).

Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 77)

4.2.4.8 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.

The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.9 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

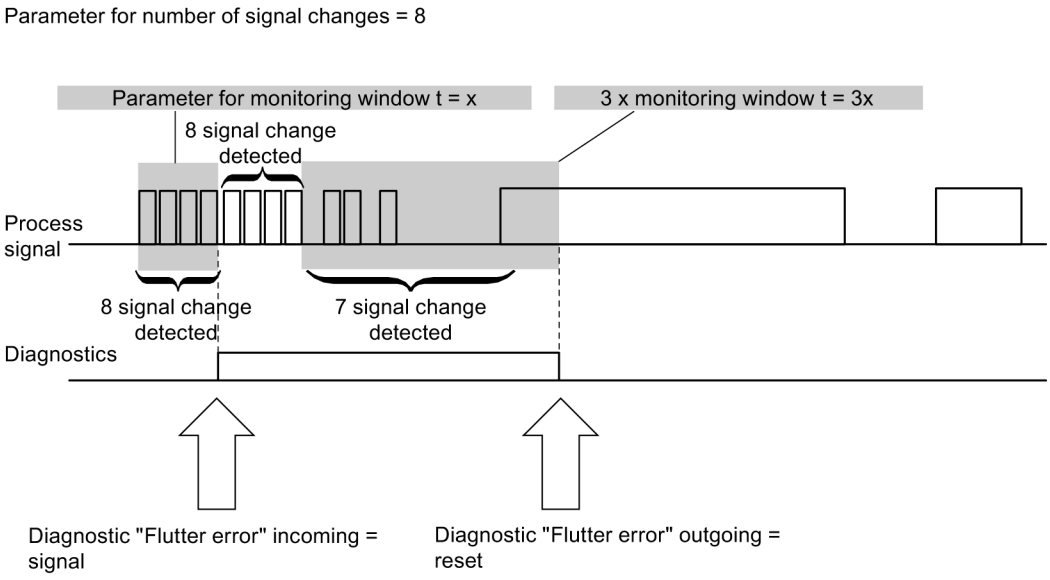

Figure 4-1 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.10 Monitoring window

Sets the time for the monitoring window of flutter monitoring.

You can set times of 1 s to 100 s in whole seconds for the monitoring window.

You can configure a monitoring window of 0.5 s when you set 0 s.

4.2.5 Parameters of the output

4.2.5.1 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

You can deactivate an unused channel with this parameter.

4.2.5.2 Controlling the output

Activates the internal evaluation.

Additional information on internal evaluation is available in the chapter "Application for internal evaluation" (Page 57).

4.2.5.3 Output type

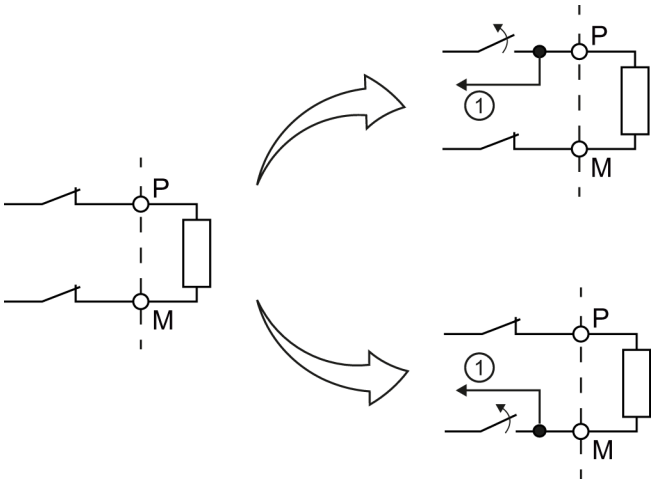
The parameter specifies if the output switches PM or PP.

4.2.5.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.



① Readback

Figure 4-2 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

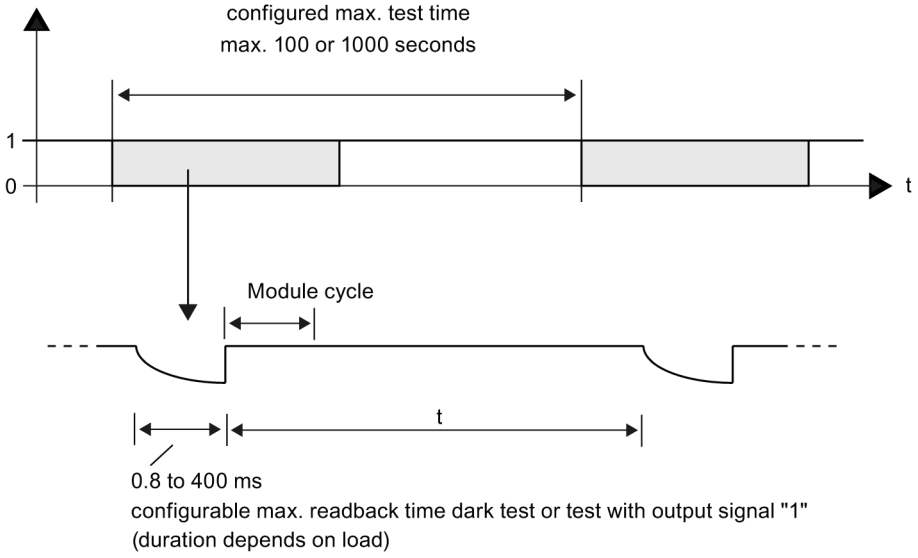


Figure 4-3 Test pulses of the dark test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

4.2.5.5 Disable dark test for 48 hours

This option allows you to suppress the dark test.

If the channel is permanently active (1) for 48 hours, 2 dark test pulses (PP switching) or 3 dark test pulses (PM switching) are directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING

The output is passivated if an error caused by a short-circuit is recognized when the safety-function is executed (output turned off). This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.

If the channel can retain signal 0 for 48 hours and longer, the function "Disable dark test for 48 hours" must not be used.

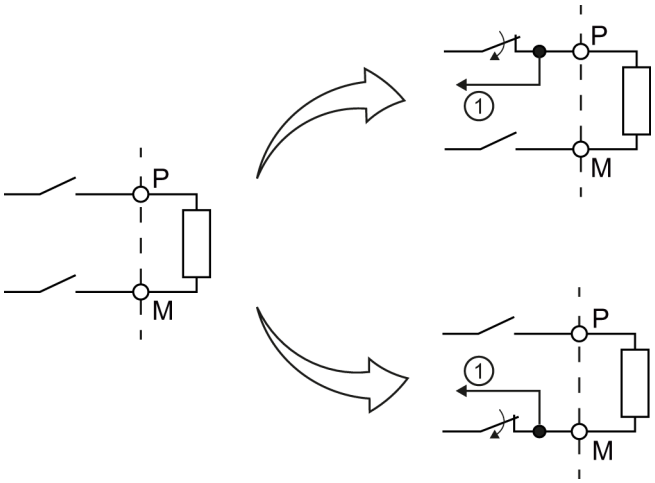
Consult the respective requirements of your product standards regarding error detection time.

4.2.5.6 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.



① Readback

Figure 4-4 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).

Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the chapter Switching capacitive loads (Page 85).

If the capacity of the actuator is not known, it may be necessary for you to determine the required value for the readback time by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time switch on test is too small for a connected capacitive load. The charge of the capacitive load cannot take place within the configured readback time switch on test. Increase the readback time.

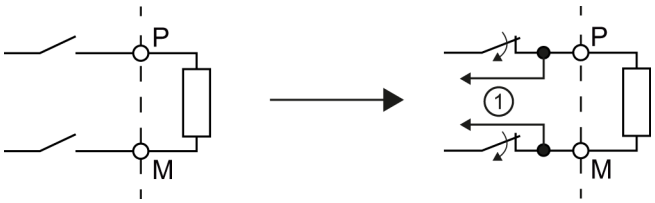
If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.5.7 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, several test signals are switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 4-5 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

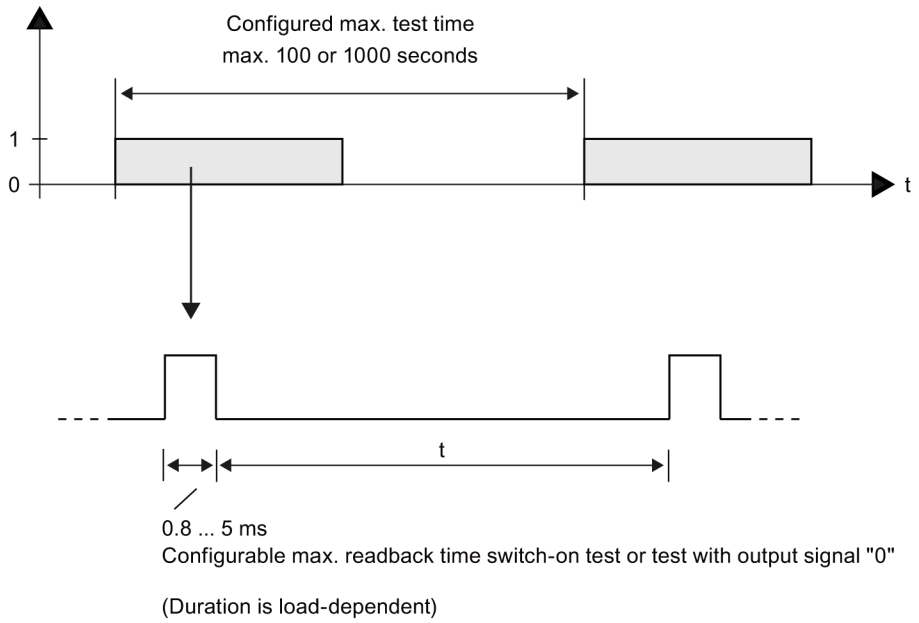


Figure 4-6 Test pulses of the light test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 84).

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after t. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.5.8 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

Wire break is signaled when the following conditions are met:

- Wiring to the actuator is interrupted.
- A module that is disabled in fail-safe mode by the F-PM module has been removed.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of power module F-PM-E 24VDC/8A PPM ST

The F-PM-E 24VDC/8A PPM ST power module occupies the following address areas in the F-CPU:

Table 4- 2 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	In output range
x + 0 to x + 6	x + 0 to x + 4

x = Module start address

Address assignment of the user data and value status of power module F-PM-E 24VDC/8A PPM ST

Of the assigned addresses of power module F-PM E 24VDC/8A PPM ST, the user data occupy the following addresses in the F-CPU:

Table 4- 3 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status for DI_1	Value status for DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

Table 4- 4 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Note

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

5

5.1 Applications for the output DQ/P1 and P2

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving the various safety categories.

Table 5- 1 Conditions for achieving SIL/Cat./PL

F-PM-E 24VDC/8A PPM ST		Achievable safety class
Digital output DQ	Without standard DQ modules	SIL3/Cat.4/PLe
	With standard DQ modules	SIL2/Cat.3/PLd

5.1.1 Applications: Safety mode up to SIL3/Cat.4/PLe

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

5.1.1.1 Application: Wiring a load to the digital output, PM switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. They connect the load between the P-switches DQ-P_0 and the M-switch DQ-M_0. The two P-switches and the M-switch are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

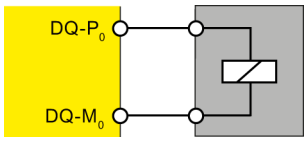

Figure 5-1 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 2 Parameters

Parameter	
Output type	PM switching

5.1.1.2 Application: Wiring a load to the digital output, PP switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. You connect the load between the P-switch DQ-P_0 and chassis in this case. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

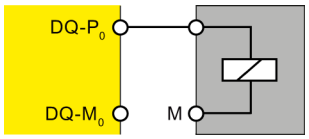

Figure 5-2 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 3 Parameters

Parameter	
Output type	PP switching

5.1.1.3 Application: Wiring two loads in parallel to the digital output, PM switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

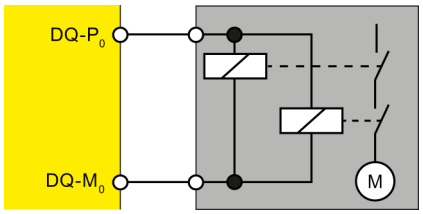

Figure 5-3 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 4 Parameters

Parameter	
Output type	PM switching

5.1.1.4 Application: Wiring two loads in parallel to the digital output, PP switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

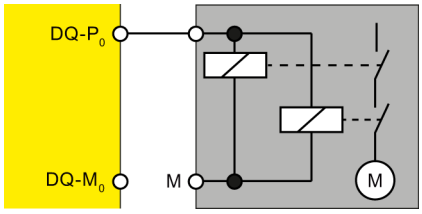

Figure 5-4 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

Note

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 5- 5 Parameters

Parameter	
Output type	PP switching

5.2 Applications for inputs

5.2.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

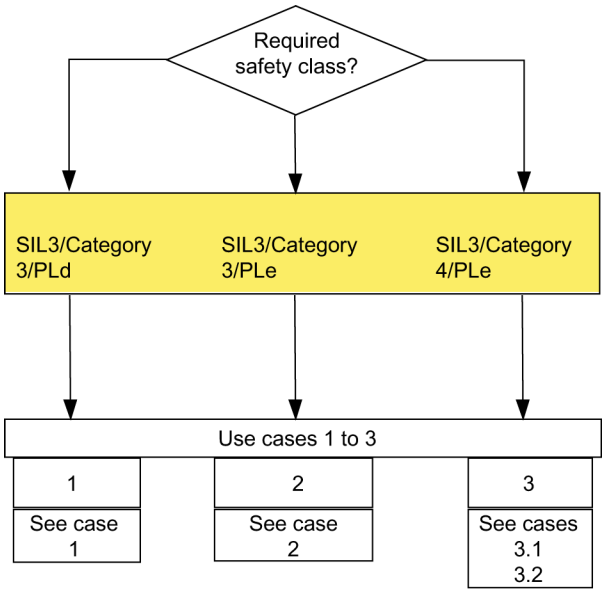

Figure 5-5 Selecting the application – digital inputs of the F-PM-E 24VDC/8A PPM ST

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 5- 6 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

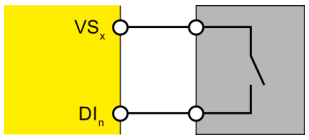

Figure 5-6 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

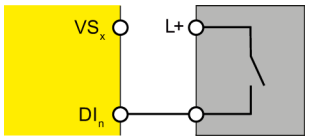

Figure 5-7 One sensor connected via one channel, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 7 Parameter assignment

Parameters	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 8 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI_n	yes	no	no
Short circuit with M to DI_n	yes*	yes*	no
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

⚠ WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the wiring between the sensor and the input channel must be short circuit proof.

5.2.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

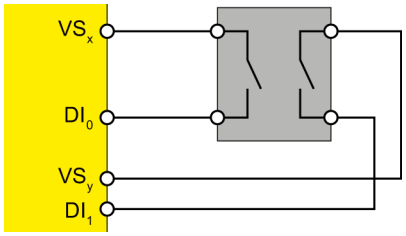

Figure 5-8 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

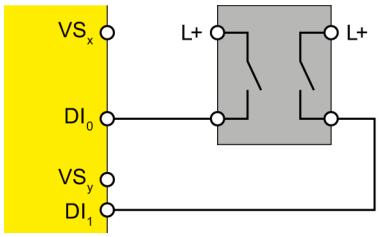

Figure 5-9 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

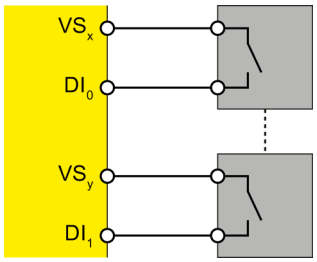

Figure 5-10 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

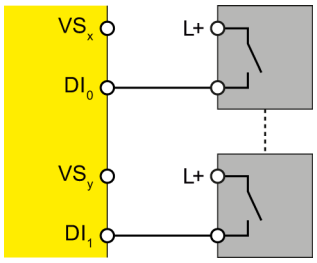

Figure 5-11 Two single-channel sensors connected via two channels, external sensor supply

WARNING
To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 9 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 10 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair, with other channels or other sensor supplies	no	no
Short circuit with L+ to DI_n	yes*	yes*
Short circuit with M to DI_n	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS_n	no	no
Short circuit with M to VS_n or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 13).

Sensor supply

The sensor must be supplied **internally** for application 3.1 (Page 52).

The sensor can be supplied internally or externally for application 3.2 (Page 54).

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- All short circuits listed in Table 5-12 Fault detection (Page 53) and Table 5-14 Fault detection (Page 56) must be detected. You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.2.4.1 Application 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to both inputs of the power module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

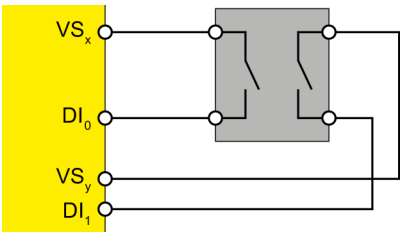

Figure 5-12 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

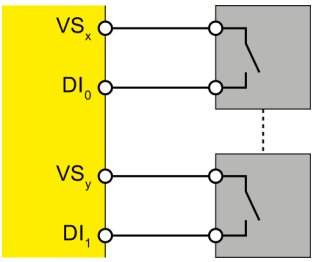

Figure 5-13 Two single-channel sensors connected via two channels, internal sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 11 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 12 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4.2 Application 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor nonequivalent via two channels

A nonequivalent sensor is connected nonequivalent via 2 channels to both inputs of the power module for each process signal (1oo2 evaluation, nonequivalent).

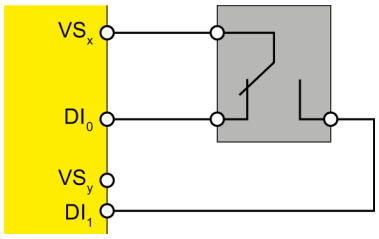

Figure 5-14 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

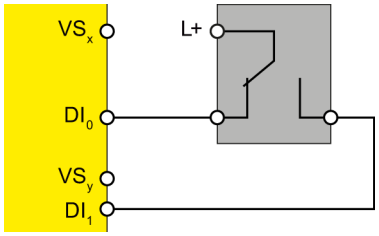

Figure 5-15 Nonequivalent sensor connected, external sensor supply

⚠ WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent via two channels

Two single-channel sensors are connected nonequivalent to both inputs of the power module for each process signal (1oo2 evaluation).

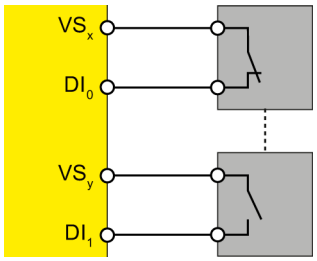

Figure 5-16 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

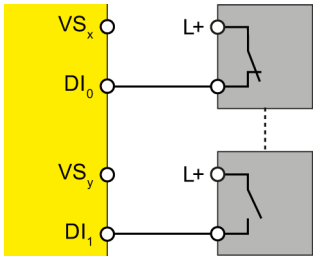

Figure 5-17 Two single-channel sensors connected nonequivalent, external sensor supply

WARNING
To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 5- 13 Parameter assignment

Parameters	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 5- 14 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

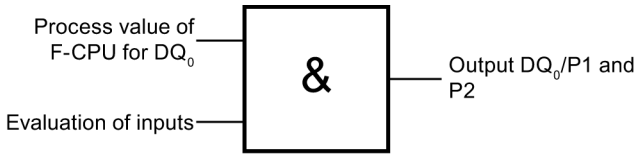
5.3 Application for internal evaluation

Function

The evaluation of the safety function takes place internally in the F-module.

You can choose between 1oo1 evaluation or nonequivalent/equivalent 1oo2 evaluation of the sensors.

- With 1oo1 evaluation, the activated inputs are logically ANDed with the process image of output DQ_0.
- With 1oo2 evaluation, the result of the inputs is logically ANDed with the process image of output DQ_0.



The acknowledgment in case of an error takes place by the safety program in the F-CPU.

Use the wiring diagrams Applications for the output DQ/P1 and P2 (Page 39) and Applications for inputs (Page 43).

You achieve SIL3/Cat.4/PLe.

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator and sensor, for example, in accordance with IEC 60947.

Note

If an error occurs at the inputs in this application, the F-module also outputs the error message "Safety-related shutdown" or "Safety event" for the output. Following elimination of the error at the inputs, a reintegration of the output is only possible after the bit pattern test (within the test time shortened to 60 s) has been performed.

Interconnection example

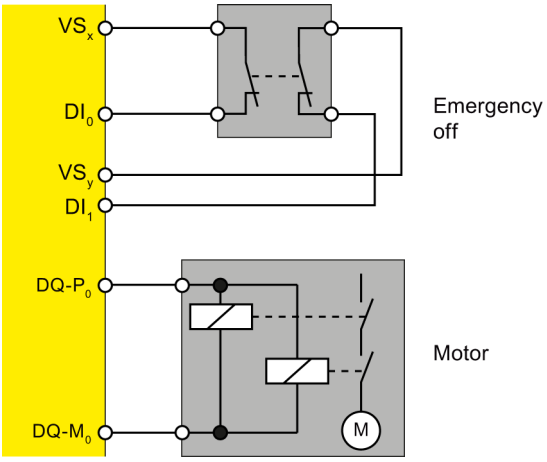


Figure 5-18 Emergency Off shutdown of a motor with equivalent 1oo2 evaluation

Parameter assignment

Assign the following parameters for the F-module:

Parameter	
Control of the output	F-CPU and onboard F-DI
Type of sensor interconnection	• 1-channel • 2-channel equivalent • 2-channel, non equivalent
Sensor supply	Sensor supply 0, Sensor supply 1, or External sensor supply

5.4 Applications for safety-related shutdown of standard modules

5.4.1 Safety-related shutdown of standard output modules, PM-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage buses P1 and P2.

Configure the power module parameters as described in section Terminal assignment (Page 13).

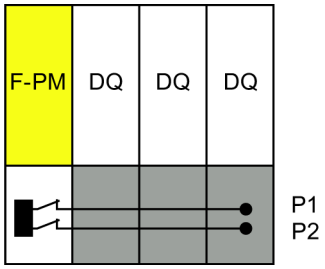

Figure 5-19 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:

In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.

Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.

It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.

Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.

The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.

The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

WARNING

Note the following for the "Safety-related shutdown of standard modules" application:

If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

5.4.2 Safety-related shutdown of standard output modules, PP-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage bus P1.

Configure the power module parameters as described in section Terminal assignment (Page 13).

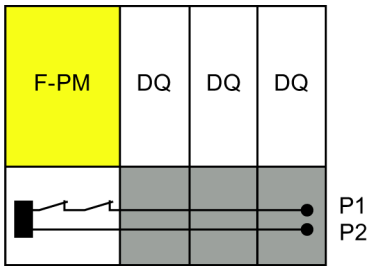

Figure 5-20 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:

In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.

Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.

It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.

Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.

The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.

The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

⚠ WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).

See also Terminal assignment (Page 13).

⚠ WARNING

Note the following for the "Safety-related shutdown of standard modules" application:

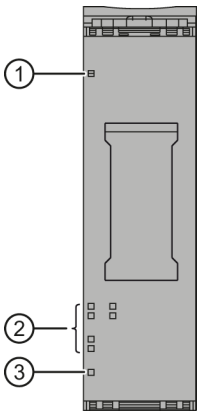
If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

Interrupts/diagnostic messages

6

6.1 Status and error display

LED display



① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 6-1 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 69).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs and outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 6- 1 Meaning of the PWR LED

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

DIAG LED

Table 6- 2 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 6- 3 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 6- 4 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-PM-E 24VDC/8A PPM ST fail-safe power module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 69).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 69).

Table 6- 5 Diagnostic interrupts of the F-PM-E 24VDC/8A PPM ST

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	—	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Output short-circuited to L+	261_D		Channel	Yes
Output short-circuited to ground	262_D			
Wire break	265_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			No
Discrepancy error, channel status 0/0	768_D	2, 3		
Discrepancy error, channel status 0/1	769_D			
Discrepancy error, channel status 1/0	770_D			
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D	1,2,3		No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D			
PROFIsafe communication error (timeout)	792_D			
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Output defective	797_D	—		No
Readback error	798_D			
Overload	800_D			
Supply voltage too high	802_D	1, 2, 3	F-module	
Supply voltage too low	803_D			

6.3 Diagnostic messages

Digital module error types

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 6- 6 Diagnostic messages of the F-PM-E 24VDC/8A PPM ST

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	

Diagnostic message	Fault code	Meaning	Remedy
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The sensor cable is short-circuited to L+. • The output cable is short-circuited to L+.	Correct the process wiring.
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The sensor cable is short-circuited to ground. • The output cable is short-circuited to ground. • The output signal is short-circuited to ground.	Correct the process wiring.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.

Diagnostic message	Fault code	Meaning	Remedy
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.

Diagnostic message	Fault code	Meaning	Remedy
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.
No pulse detected	778_D	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too low. • The "Minimum pulse time" parameter setting is too high. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784_D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 77))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 77))
Fault in input circuit	787_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • Short circuit to L+ or M • The F-module is defective.	• Check the wiring. • Replace the F-module.
Readback error	798_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	If the error persists, replace the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

In the case of a voltage dip in the supply voltage L+, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 77): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is disabled, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. The corresponding tables for fault detection for the applications are available under Applications of the F-I/O module (Page 39).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 36).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

7

Technical specifications of F-PM-E 24VDC/8A PPM ST

	6ES7136-6PA00-0BC0
Product type designation	F-PM-E PPM 24VDC
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	V2.3
PROFINET as of GSD version/GSD revision	V2.31
Operating mode	
Multi-output	No
Installation type/mounting	
Rack mounting possible	No
Front installation possible	No
Rail mounting possible	Yes; standard DIN rail
Wall mounting/direct mounting possible	No
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V

	6ES7136-6PA00-0BC0
Sensor supply	
Number of outputs	2
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 2.1 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	600 mA; total current of all sensors
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	5 W
Address space	
Address space per module	
Input	7 bytes
Output	5 bytes
Digital inputs	
Number of inputs	2
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
• Assignable	Yes
• For "0" to "1", min.	0.4 ms
• For "0" to "1", max.	20 ms
• For "1" to "0", min.	0.4 ms
• For "1" to "0", max.	20 ms
For counter/technological functions	
• Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m

	6ES7136-6PA00-0BC0
Digital outputs	
Number of outputs	1
Digital outputs, configurable	Yes
Short circuit protection	Yes
• Response threshold, typ.	> 14.8 A
Wire break detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	8.8 A
Voltage induced on current interruption limited to	max 1.5 V
Switching capacity of outputs	
With resistive load, max.	8 A
With lamp load, max.	100 W
Load resistance range	
Low limit	3 Ω
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	8 A
For "0" signal, residual current, max.	1.5 mA; PP-switching: Max. 1.5 mA; PM-switching: Max. 1 mA
Switching frequency	
With resistive load, max.	10 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	4 Hz; symmetrical
Total current of outputs	
Max. current per channel	8 A; (note derating data in the manual)
Max. current per module	8 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual

	6ES7136-6PA00-0BC0
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	60 V DC / 75 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C
Dimensions	
Width	20 mm
Height	72 mm
Depth	55 mm
Weights	
Weight, approx.	70 g

Temperature characteristic values (derating)

Mounting position	Maximum temperature	Maximum output current
Horizontal	40 °C	8 A
	50 °C	6 A
	60 °C	4 A
Vertical	50 °C	4 A

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

Response times

A

A.1 Response times

Introduction

The next section shows the response times of power module F-PM-E 24VDC/8A PPM ST. The response times of the fail-safe modules are included in the calculation of the F-system response time.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 29 ms

Maximum cycle time: T_{cycle} = 14 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, dark test time, switch-on time, discrepancy time, and test time are configured in STEP 7.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Definition of response time for internal evaluation: Cycle time + Input delay + Short circuit test time + Maximum(readback time, switch-on time, light test time)

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel n1)

Maximum response time with external short circuits

Maximum response time = Input delay + (n × T_{cycle}) + Sum(all short circuit test times + all startup times of sensors with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel 1)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Maximum response time for fail-safe digital outputs

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

The maximum response time for fail-safe digital outputs in the presence of an error is equal to:

Maximum response time = T_{cycle} + 2 × Maximum(dark test time, switch-on time) + interval between test pulses

A.2 Minimum distance of test pulses

The minimum interval between two test pulses depends on the activation of the light test, the configured maximum test time, and whether the output has been specified as a PM-switching or PP-switching output.

You can find the dependencies in the table below:

Assigned maximum test time	PM switching, light test not active	PM switching, light test active	PP switching, light test not active	PP switching, light test active
1000 s	62.080 s	45.147 s	82.913 s	38.137 s
100 s	5.830 s	4.238 s	7.913 s	3.521 s

Switching of loads

B

B.1 Connecting capacitive loads

If the output of power module F-PM-E 24VDC/8A PPM ST is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The figure below shows typical curves for the assignable readback times representing the correlation between load resistance and switchable load capacitance at a supply voltage of 24 V DC.

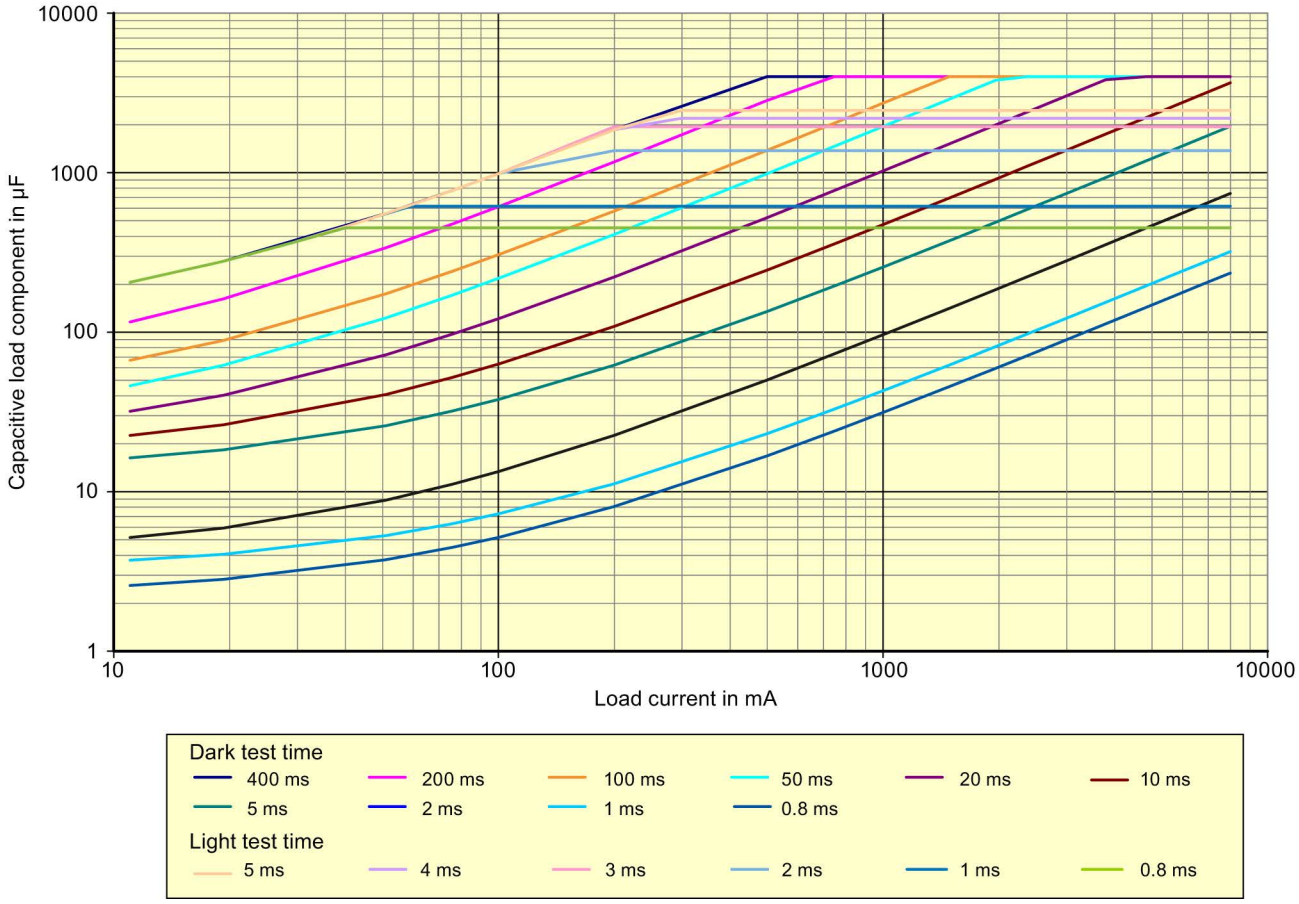


Figure B-1 Switching of capacitive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the configured dark and light test times

The curves shown were plotted using a SIMATIC PS 307 10A power supply unit with a cable length of 25 m (cable cross-section of 1.5 mm^2) between the output of the F-PM-E 24VDC/8A PPM ST power module and the load.

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

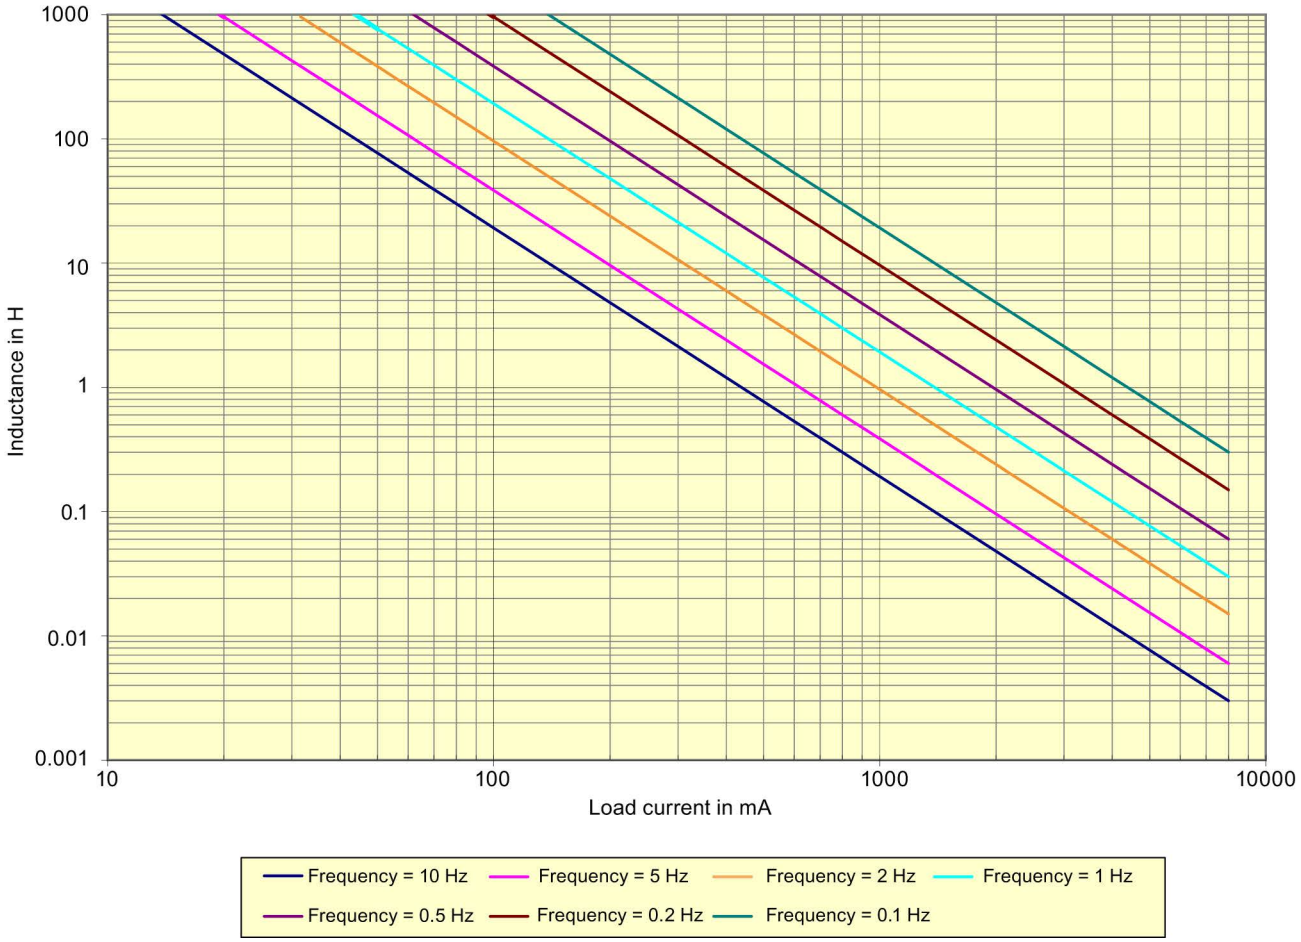

Figure B-2 Switching of inductive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the load current and switching frequency

Produktinformation

Security-Hinweise

Siemens bietet Produkte und Lösungen mit Industrial Security-Funktionen an, die den sicheren Betrieb von Anlagen, Lösungen, Maschinen, Geräten und/oder Netzwerken unterstützen. Sie sind wichtige Komponenten in einem ganzheitlichen Industrial Security-Konzept. Die Produkte und Lösungen von Siemens werden unter diesem Gesichtspunkt ständig weiterentwickelt. Siemens empfiehlt, sich unbedingt regelmäßig über Produkt-Updates zu informieren.

Für den sicheren Betrieb von Produkten und Lösungen von Siemens ist es erforderlich, geeignete Schutzmaßnahmen (z. B. Zellenschutzkonzept) zu ergreifen und jede Komponente in ein ganzheitliches Industrial Security-Konzept zu integrieren, das dem aktuellen Stand der Technik entspricht. Dabei sind auch eingesetzte Produkte von anderen Herstellern zu berücksichtigen. Weitergehende Informationen über Industrial Security finden Sie unter (http://www.siemens.com/industrialsecurity).

Um stets über Produkt-Updates informiert zu sein, melden Sie sich für unseren produktspezifischen Newsletter an. Weitere Informationen hierzu finden Sie unter (http://support.automation.siemens.com).

Allgemeine Ergänzungen zur Dokumentation

Inhalt

Diese Produktinformation enthält Ergänzungen und Korrekturen zur Dokumentation der F-Module ET 200SP.

Ergänzung der Kapitel 5.1.1.2 "*Anwendungsfall: Anschluss von einer Last am Digitalausgang, PP schaltend*", 5.1.1.4 "*Anwendungsfall: Anschluss von 2 Lasten parallel liegend am Digitalausgang, PP schaltend*" und 5.4.2 "*Sicherheitsgerichtete Abschaltung von Standard-Ausgabemodulen, PP schaltend*" des Gerätehandbuchs "Powermodul F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNUNG
Wenn der Ausgangskanal 100 Stunden, und länger, dauerhaft „0"-Signal führen kann, muss der Helltest aktiviert werden. Beachten Sie die jeweiligen Anforderungen Ihrer Produktnormen hinsichtlich der Fehleraufdeckungszeit.

Nicht unterstützte Parameter

Die Parameter "Impulsverlängerung" und "Dunkeltest für 48 Stunden deaktivieren" werden nicht unterstützt.

Abhängigkeiten zwischen den Parametern "Diskrepanzzeit" und "Eingangsverzögerung"

Die Diskrepanzzeit muss größer als die Eingangsverzögerung parametriert werden.

Abhängigkeiten zwischen den Parametern "Hochlaufzeit des Gebers nach Kurzschlusstest" und "Zeit für Kurzschlusstest"

Die Hochlaufzeit des Gebers nach Kurzschlusstest muss mindestens 1% der Zeit für den Kurzschlusstest betragen.

Einschalten der Versorgungsspannung L+ für F-Module ET 200SP und IM

Stellen Sie sicher, dass vor dem Einschalten der Versorgungsspannung L+ eines F-Moduls sowohl das F-Modul als auch die IM gleichzeitig spannungslos waren. Eine Einschaltreihenfolge müssen Sie dabei nicht beachten.

Zyklisches Lesen von I&M-Daten

Zyklisches Lesen von I&M-Daten kann das Timing der F-Module belasten. Vermeiden Sie deshalb schnelle Lesezyklen von unter 500 ms.

Drahtbrucherkennung F-Modul F-DQ 4x24VDC/2A PM HF

Die Ansprechschwelle der Drahtbrucherkennung beträgt < 15 mA.

Einsatz von nicht-fehlersicheren Modulen

Fehlersichere Module ET 200SP dürfen Sie in einem Dezentralen Peripheriesystem ET 200SP nur zusammen mit nicht-fehlersicheren Modulen einsetzen, die mit SELV/PELV betrieben werden. Außerdem darf das Digitalausgabemodul RQ 4x120VDC-230VAC/5A NO ST nicht mit der gleichen Spannung wie die fehlersicheren Module ET 200SP versorgt werden.

Quittierungzeit T_{DAT}

F-Modul	Quittierungszeit T_{DAT}
Digitaleingabemodul F-DI 8x24VDC HF	23 ms
Digitalausgabemodul F-DQ 4x24VDC/2A PM HF	31 ms
Powermodul F-PM-E 24VDC/8A PPM ST	30 ms

Product Information for the Documentation of ET 200SP Fail-safe Modules

Product Information

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

General amendments to the documentation

Content

This product information contains amendments and corrections to the documentation of the ET 200SP fail-safe modules.

Amendment to chapter 5.1.1.2 "*Use case: Wiring a load to the digital output, PP switching*", 5.1.1.4 "*Use case: Wiring of two parallel loads to the digital output, PP switching*" and 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING
The light test must be activated if the output channel can permanently carry the "0" signal for 100 hours or more. Consult the respective requirements of your product standards regarding error detection time.

Unsupported parameters

The "Pulse stretching" and "Disable dark test for 48 hours" parameters are not supported.

Dependencies between the "Discrepancy time" and "Input delay" parameters

The configured discrepancy time must be greater than the configured input delay.

Dependencies between the "Startup time of the sensors after short circuit test" and "Time for short circuit test" parameters

The startup time of the sensor after a short circuit test must amount to at least 1% of the time for the short circuit test.

Switching on the supply voltage L+ for the ET 200SP F-modules and IM

Make sure that the F-module as well as the IM were de-energized at the same time before you switch on the supply voltage L+ for an F-module. You do not have to observe a switch-on sequence.

© Siemens AG 2013 - 2014. All rights reserved

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Open-circuit detection for F-DQ 4x24VDC/2A PM HF fail-safe module

The response threshold of the open-circuit detection is < 15 mA.

Using non-fail-safe modules

In an ET 200SP distributed I/O system, you can only use ET 200SP fail-safe modules together with non-fail-safe modules that are operated with SELV/PELV. In addition, the digital output module RQ 4x120VDC-230VAC/5A NO ST cannot be supplied with the same voltage as the ET 200SP fail-safe modules.

T_{DAT} acknowledgment time

F-Module	T_{DAT} acknowledgment time
Digital input module F-DI 8x24VDC HF	23 ms
Digital output module F-DQ 4x24VDC/2A PM HF	31 ms
Power module F-PM-E 24VDC/8A PPM ST	30 ms

Information produit sur la documentation des modules de sécurité ET 200SP

Information produit

Notes relatives à la sécurité

Siemens commercialise des produits et solutions comprenant des fonctions de sécurité industrielle qui contribuent à une exploitation sûre des installations, solutions, machines, équipements et/ou réseaux. Ces fonctions jouent un rôle important dans un système global de sécurité industrielle. Dans cette optique, les produits et solutions Siemens font l'objet de développements continus. Siemens vous recommande donc vivement de vous tenir régulièrement informé des mises à jour des produits.

Pour garantir une exploitation fiable des produits et solutions Siemens, il est nécessaire de prendre des mesures de protection adéquates (par ex. concept de protection des cellules) et d'intégrer chaque composant dans un système de sécurité industrielle global et moderne. Veuillez également tenir compte des produits que vous utilisez et qui proviennent d'autres fabricants. Pour plus d'informations sur la sécurité industrielle, rendez-vous sur (http://www.siemens.com/industrialsecurity).

Veuillez vous abonner à la newsletter d'un produit particulier afin d'être informé des mises à jour dès qu'elles surviennent. Pour plus d'informations, rendez-vous sur (http://support.automation.siemens.com).

Addenda généraux à la documentation

Contenu

Cette information produit contient des addenda et des correctifs à la documentation des modules de sécurité ET 200SP.

Addendum au chapitre 5.1.1.2 "*Cas d'application : Connexion d'une charge à la sortie TOR, commutation PP*", 5.1.1.4 "*Cas d'application : Connexion de 2 charges parallèles à la sortie TOR, commutation PP*" et 5.4.2 "*Désactivation de sécurité de modules de sorties standard, commutation PP*" du manuel "Module de puissance F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ ATTENTION
Si la voie de sortie peut fournir un signal "0" en continu pendant 100 heures et plus, le test avec activation doit être activé. Tenez compte des exigences spécifiques aux normes de votre produit en ce qui concerne le temps de détection des erreurs.

Paramètres non pris en charge

Les paramètres "Impulsion prolongée" et "Désactivation du test avec désactivation pour 48 heures" ne sont pas pris en charge.

Dépendances entre les paramètres "Temps de discordance" et "Retard à l'entrée"

Le temps de discordance doit être supérieur au retard à l'entrée.

Dépendances entre les paramètres "Temps de démarrage du capteur après le test de court-circuit" et "Temps de test de court-circuit"

Le temps de démarrage du capteur après le test de court-circuit doit être égal au moins égal à 1% au temps de test de court-circuit.

Mise en route de la tension d'alimentation L+ des modules F ET 200SP et IM

Assurez-vous que le module F et l'IM sont tous deux hors tension avant de mettre en route la tension d'alimentation L+ d'un module F. Pour ce faire, il n'est pas nécessaire de suivre un ordre d'activation.

Lecture cyclique des données I&M

La lecture cyclique des données I&M peut surcharger la synchronisation des modules F. Il convient donc d'éviter les cycles rapides de lecture inférieurs à 500 ms.

Détection de rupture de fil du module de sécurité F-DQ 4x24 V CC/2A PM HF

Le seuil de déclenchement de la détection de rupture de fil est < 15 mA.

Utilisation de modules non de sécurité

Les modules de sécurité ET 200SP ne doivent être utilisés dans un système de périphérie décentralisée ET 200SP qu'avec des modules non de sécurité fonctionnant avec une TBTS/TBTP. En outre, le module de sorties TOR RQ 4x120VDC-230VAC/5A NO ST ne doit pas être alimenté avec la même tension que les modules de sécurité ET 200SP.

Temps d'acquittement T_{DAT}

Module F	Temps d'acquittement T_{DAT}
Module d'entrées TOR F-DI 8x24 V CC HF	23 ms
Module de sorties TOR F-DQ 4x24 V CC/2A PM HF	31 ms
Module d'alimentation F-PM-E 24 V CC/8A PPM ST	30 ms

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Product overview

1

1.1 What are fail-safe automation systems and fail-safe modules?

Fail-safe automation systems

Fail-safe automation systems (F-systems) are used in systems with higher-level safety requirements. F-systems serve to control processes and ensure that they are in a safe state immediately after shutdown. In other words, F-systems control processes in which an immediate shutdown does not endanger persons or the environment.

Fail-safe modules

The key difference between fail-safe modules (F-modules) and standard ET 200SP modules is that they have an internal two-channel design. The two integrated processors monitor each other, automatically test the input and output circuits, and switch the F-I/O module to a safe state in the event of a fault.

The F-CPU communicates with the fail-safe modules via the fail-safe PROFIsafe bus profile.

Fail-safe power modules, together with the respective BaseUnit, serve the load voltage supply of the potential group and the safety-oriented tripping of the load voltage for standard output modules.

Fail-safe digital input modules detect the signal states of safety-oriented sensors and send the relevant safety message frames to the F-CPU.

Fail-safe digital output modules are suitable for safety-related shutdown procedures with short circuit and cross-circuit protection up to the actuator.

Possible uses of ET 200SP with fail-safe modules

The use of ET 200SP with fail-safe modules allows conventional configurations in safety engineering to be replaced with PROFNET IO components. This includes the replacement of switching devices for emergency STOP, protective door monitors, two-hand operation, etc.

ET 200SP fail-safe modules are supported with the STEP 7 Safety Advanced optional package V12 including HSP 54 or higher.

ET 200SP fail-safe modules are supported with IM155-6PN ST as of firmware V1.1.

Achievable safety classes

Fail-safe modules are equipped with integrated safety functions for safety mode.

The following safety classes can be achieved through appropriate parameter assignment of the safety functions in STEP 7 Professional V12 SP1 or higher with STEP 7 Safety Advanced optional package V12 or higher, through a specific combination of fail-safe and standard modules, and through a specific arrangement and wiring of sensors and actuators:

Safety class in safety mode		
According to IEC 61508	According to ISO 13849-1:2006	
SIL2	Category 3	(PL) Performance Level d
SIL3	Category 3	(PL) Performance Level e
SIL3	Category 4	(PL) Performance Level e

Use in SIMATIC Safety F-systems

ET 200SP fail-safe modules can be used with the STEP 7 Safety Advanced optional package, V12 or higher under PROFINET IO, together with an F-CPU.

SIMATIC Safety F-system with ET 200SP

The following figure shows a sample configuration for a SIMATIC Safety F-system with, among other things, an ET 200SP on a PROFINET IO. The PROFINET IO lines can be set up with copper cable, with fiber-optic cable or WLAN.

You will find further information on the Internet at Application planning (Page 13).

Tasks of the fail-safe IO controller (F-CPU) include the exchange of safety-related and non-safety-related data with fail-safe and standard ET 200SP modules.

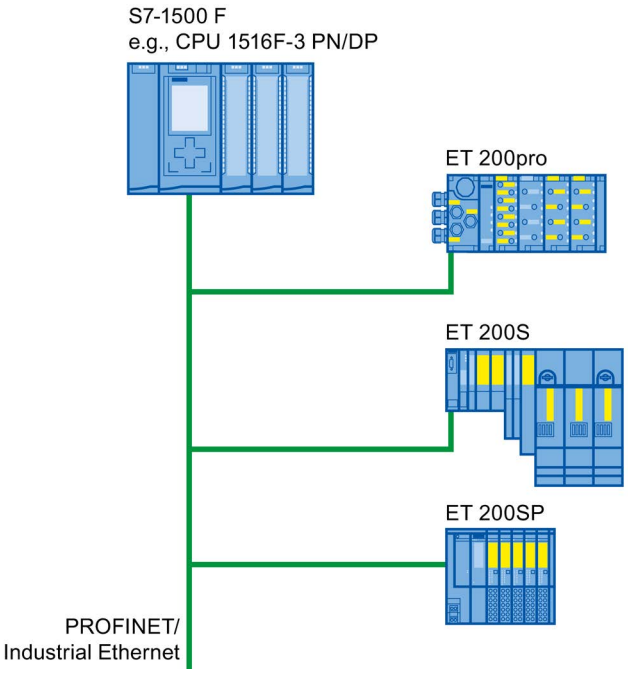

Figure 1-1 Fail-safe SIMATIC Safety automation system (sample configuration)

Use in safety mode only

Fail-safe modules can only be used in fail-safe mode. They cannot be used in non-fail-safe mode In this context, fail-safe mode/non-fail-safe mode refers to the operating mode of the F-I/O module, which either does or doesn't support safety-related communication via safety message frames.

Fail-safe modules and non-fail-safe modules can be combined within an ET 200SP.

1.2 Fault reactions with fail-safe modules

Safe state (safety concept)

The basic principle behind the safety concept is the existence of a safe state for all process variables.

Note

For digital F-modules, this safe state is the value "0". This applies to both sensors and actuators.

Fault reactions and startup of the F-system

The safety function requires that fail-safe values (safe state) be applied to the fail-safe module instead of process values (**passivation of the fail-safe module**) in the following situations:

- When the F-system is started up
- If errors are detected during safety-related communication between the F-CPU and the F-module via the PROFIsafe safety protocol (communication error)
- If F-I/O faults or channel faults are detected (e.g., wire break, discrepancy error)

Detected faults are written to the diagnostic buffer of the F-CPU and communicated to the safety program in the F-CPU.

F-modules cannot save errors as retentive data. When the system is powered down and then restarted, any faults still existing are detected again during startup. However, you have the option of saving faults in your safety program.

⚠ WARNING

For channels that you set to "deactivated" in *STEP 7*, no diagnostic response or error handling is triggered when a channel fault occurs, not even when such a channel is affected indirectly by a channel group fault ("Channel activated/deactivated" parameter).

Remedying faults in the F-system

To remedy faults in your F-system, follow the procedure described in IEC 61508-1:2010 section 7.15.2.4 and IEC 61508-2:2010 section 7.6.2.1 e.

The following steps must be performed:

1. Diagnostic and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Fail-safe value output for F-modules

In the case of F-modules with inputs, the F-system provides fail-safe values (0) for the safety program instead of the process data pending at the fail-safe inputs in case of passivation.

In the case of F-modules with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program in case of passivation. The output channels are de-energized. This also applies when the F-CPU goes into STOP mode. The parameter assignment of fail-safe values is not possible.

Depending on which F-system you are using and the type of fault that occurred (F-I/O fault, channel fault or communication error), fail-safe values are used either for the relevant channel only or for all channels of the relevant fail-safe module.

Reintegration of a fail-safe module

The system changes from fail-safe to process values (reintegration of an F-module) either automatically or only after user acknowledgment in the safety program. If channel faults occur, it may be necessary to remove and reinsert the F-module. A detailed listing of faults requiring removal and insertion of the F-module can be found in the section Diagnostic messages of the respective F-module.

After reintegration, the following occurs:

- In the case of an F-module with inputs, the process data pending at the fail-safe inputs are provided to the safety program
- In the case of an F-module with outputs, the output values provided in the safety program are again transferred to the fail-safe outputs

Additional information on passivation and reintegration

For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Reaction of the F-module with inputs to communication errors

F-modules with inputs respond differently to communication errors compared to other errors.

If a communication error is detected, the current process values remain set at the inputs of the F-module. There is no passivation of the channels. The current process values are passivated in the F-CPU.

Application planning

2

2.1 Forming potential groups with fail-safe modules

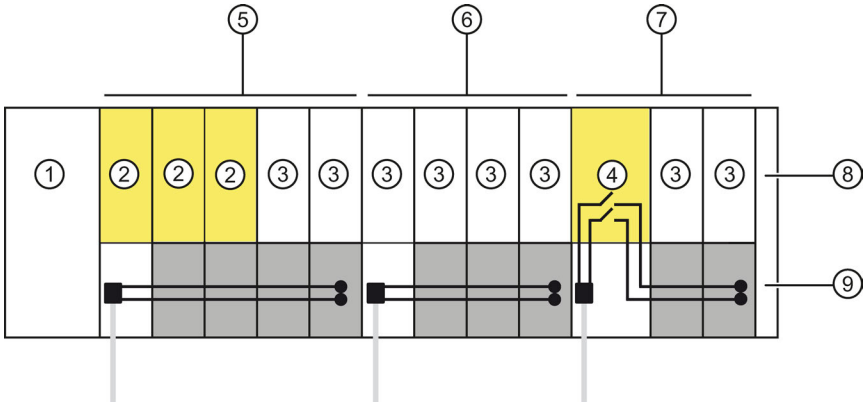
Introduction

ET 200SP distributed I/O systems can be configured using fail-safe and non-fail-safe modules. This chapter provides an example of a mixed configuration comprising fail-safe and non-fails-safe modules.

Assembly example for ET 200SP with fail-safe and non-fail-safe modules

Generally speaking, it is not necessary to operate fail-safe and non-fail-safe modules in separate potential groups. You can divide the modules into fail-safe and non-fail-safe potential groups and mount them.

The following diagram shows an assembly example with fail-safe and non-fail-safe modules within a single ET 200SP.



① Interface module IM 155-6 PN HF
② F-module
③ Non-fail-safe module
④ Power module F-PM-E 24VDC/8A PPM ST
⑤ Mixed fail-safe and non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
You achieve SIL3/Cat.4/PLe for the fail-safe modules.
⑥ Non-fail-safe potential group with BaseUnits BU15..D and BU15..B.
⑦ Fail-safe potential group with BaseUnits BU20..D and BU15..B.
Through disconnection of the power bus, and thus of the non-fail-safe modules, up to SIL2/Cat.3/PLd is possible.
⑧ Server module
⑨ P1/P2 power buses

Figure 2-1 ET 200SP assembly example with fail-safe modules

Installation

3

3.1 Basics

The following applies to ET 200SP fail-safe modules:

⚠ WARNING
Protection from conductive contaminants In consideration of the environmental conditions, the devices must be protected from conductive contaminants. One way to accomplish this is by installing the devices in a control cabinet with an appropriate degree of protection.

Connecting

4

4.1 Additional rules and provisions for operation of the ET 200SP with fail-safe modules

4.1.1 Safe functional extra-low voltage (SELV) for fail-safe modules

⚠ WARNING

The fail-safe modules must be operated with safe functional extra low voltage (SELV, PELV).

You can find more information on safe functional extra-low voltage in the data sheets, for example, of the applicable power supplies.

The fail-safe modules work with a rated voltage of 24 V DC. The tolerance range is 20.4 V DC to 28.8 V DC.

Within the overvoltage range from 32 V DC to 36 V DC, the F-modules react in a fail-safe manner and the inputs and outputs are passivated. For overvoltages greater than 36 V DC, the F-modules are permanently de-energized.

Use a power supply unit that does not exceed U_m = 36 V DC even in the event of a fault. For more on this, refer to the information in the data sheet on overvoltage protection in the case of an internal error. Or implement appropriate measures to limit the voltage, e.g., use of an overvoltage protector.

All system components that can supply electrical energy in any form whatsoever must fulfill this condition.

Each additional circuit (24 V DC) used in the system must have a safe functional extra low voltage (SELV, PELV). Refer to the relevant data sheets or contact the manufacturer.

Sensors and actuators with an external power supply can also be connected to F-modules. Make sure that power is supplied to these components from safe functional extra-low voltage as well. The process signal of a 24 V DC digital module may not exceed a fault voltage U_m in the event of a fault.

⚠ WARNING

Even when a fault occurs, the permissible potential difference between the supply of the interface module (bus voltage) and the load voltage must not be exceeded.

An external direct electrical connection is one way to meet this requirement. This also prevents potential differences from causing voltage additions at the individual voltage sources, which would cause the
fault voltage U_m to be exceeded.

Power supply requirements for compliance with NAMUR recommendations

Note

To ensure adherence to the NAMUR recommendation NE 21, IEC 61131-2 and EN 298, only use power packs/power supply units (230 V AC → 24 V DC) with a mains buffering time of at least **20 ms**. The latest up-to-date information on PS components is available on the Internet (http://mall.automation.siemens.com).

It goes without saying that these requirements also apply to power packs/power supply units not constructed using ET 200SP / S7-300/-400/-1500 technology.

4.1.2 Requirements of sensors and actuators for fail-safe modules

General requirements for sensors and actuators

Note the following important warning regarding safety-related use of sensors and actuators:

⚠ WARNING

Note that instrumentation with sensors and actuators bears a considerable **safety responsibility**. Also bear in mind that sensors and actuators generally do not have proof-test intervals of 20 years as defined in IEC 61508:2010 without considerable loss of safety.

The probability of hazardous faults and the rate of hazardous faults of safety functions must comply with an SIL-defined high limit. A listing of values achieved by F-modules in the technical specifications of the F-modules is available under "Fail-safe performance characteristics".

To achieve the respective safety class, suitably qualified sensors and actuators are necessary.

Additional sensor requirements

General rule: To achieve SIL3/Cat.3/PLe, a single-channel sensor is all you need. However, to achieve SIL3/Cat.3/PLe with a single-channel sensor, the sensor itself must be SIL3/Cat.3/PLe-capable; otherwise the sensor must be connected by two channels to achieve this safety level.

To achieve SIL3/Cat.4/PLe, sensors must be connected by two channels.

⚠ WARNING

In the case of fail-safe input modules, a "0" value is output to the F-CPU after detection of faults. You therefore need to make sure that the sensors are implemented in such a way as to ensure the reliable reaction of the safety program when the sensor is in the "0" state.

Example: In its safety program, an EMERGENCY-STOP sensor must achieve the shutdown of the respective actuator when it is in the "0" state (EMERGENCY-STOP button pressed).

Duration requirements for sensor signals

⚠ WARNING

Observe the following requirements for sensor signals:

- In order to ensure the correct detection of the sensor signals via fail-safe modules with inputs, you need to make sure that the sensor signals are output for a minimum duration.
- In order for pulses to be detected with certainty, the time between two signal changes (pulse duration) must be greater than the PROFIsafe monitoring time.

Reliable detection by F-modules with inputs

The minimum duration of sensor signals for F-modules with inputs depends on the configured input delay, the parameters of the short circuit test of the sensor supplies, and the configured discrepancy behavior for 1oo2 evaluation. The signal must be greater than the maximum response time of the configured application. Information on calculating the maximum response time can be found in section "Response times" of the respective F-module.

The maximum permitted switching frequency of the sensor signals results from the minimum duration.

Additional requirements for actuators

The fail-safe output modules test the outputs at regular intervals. The F-module briefly switches off the activated outputs and, if necessary, switches on the deactivated outputs. You can assign the maximum duration of the test pulses (dark and light period) with parameters.

High-speed actuators may briefly drop out or be activated during this test. If your process does not tolerate this, set the pulse duration of the light or dark test correspondingly or use actuators that have sufficient lag.

⚠ WARNING

If the actuators switch voltages greater than 24 V DC (e.g., 230 V DC), the outputs of a fail-safe output module and the parts carrying a higher voltage must be electrically isolated (according to IEC 60664-1).

This is generally the case for relays and contactors. Particular attention must be paid to this issue for semiconductor switching devices.

Technical specifications of sensors and actuators

Refer to the manuals of the fail-safe modules for technical specifications to assist you in selecting sensors and actuators.

4.1.3 Capacitive crosstalk of digital input/output signals

When fail-safe digital output and input signals are in a single cable, F-DQ modules and F-PM-E modules may experience readback errors.

Cause: Capacitive crosstalk

During the bit pattern test of the outputs or the sensor supply of the inputs, the steep switching edge of the output drivers caused by the coupling capacitance of the line may result in crosstalk to other non-activated output or input channels. This may then lead to a response of the readback circuit in these channels. The module detects a cross circuit/short circuit and performs a safety-related shutdown.

Remedy:

- Separate cables for F-DI modules, F-DQ modules, and F-PM-E modules or non-fail-safe DQ modules
- Separate cables for F-DQ channel and F-DI channels for the F-PM-E module
- Coupling relay or diodes in the outputs
- Disable the sensor supply test if safety class requirements allow it

Cause: magnetic crosstalk

Note that an inductive load connected to the F-DQ channels can induce capacitive coupling of a strong magnetic field.

Remedy:

- Spatially disconnect the inductive loads or shield against the magnetic field.
- Configure the readback time to 50 ms or higher.

Configuring

5

5.1 Assigning the F-destination address for fail-safe modules

5.1.1 Assigning the F-destination address

The F-destination address is saved permanently on the coding element of the ET 200SP fail-safe modules.

Note

During assignment of the F-destination address, the F-modules must be supplied with supply voltage L+.

Note

Note the following in conjunction with configuration control:

Before you can use configuration control together with F-modules, you must assign the F-destination address to the F-modules at the designated slots. For this, each F-module must be inserted in the slot configured for it. The actual configuration can then differ from the specified configuration.

For additional information on assigning the F-destination address, refer to the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) programming and operating manual.

Maintenance 6

6.1 Firmware update

Introduction

It may be necessary to update the firmware during operation (e.g. function expansions).

Update the firmware of the interface module and I/O modules using firmware files.

Options for the firmware update

Online via PROFINET IO/PROFIBUS DP (with STEP 7)

Requirements

The ET 200SP is accessible online via PROFINET IO/PROFIBUS DP.

Additional requirement for fail-safe modules

⚠ WARNING

Check of the firmware version for F-validity

When using a new firmware version, you must check whether the employed firmware version is approved for use in the respective module.

The approved firmware version is specified in the appendices of the Certificate for SIMATIC Safety.

Procedure

Connect the programming device or PC to the PROFINET IO or PROFIBUS DP interface of the ET 200SP.

Note

Firmware update of analog I/O modules

For analog I/O modules, L+ supply voltage must be present on the module at the start of and during the firmware update.

You can find additional information on the procedure in the online help for STEP 7.

Technical specifications

7

7.1 Electromagnetic compatibility of fail-safe modules

Protecting ET 200SP with fail-safe modules against overvoltages

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the BaseUnits to ensure surge immunity for the ET 200SP with fail-safe modules.

Note

Lightning protection measures always require a case-by-case examination of the entire system. An almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.

For detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure shows an example configuration with fail-safe modules. Voltage is supplied by 1 power supply unit. Note, however, that the total current of the modules fed by the power supply unit must not exceed the permissible limits. You can also use multiple power supply units.

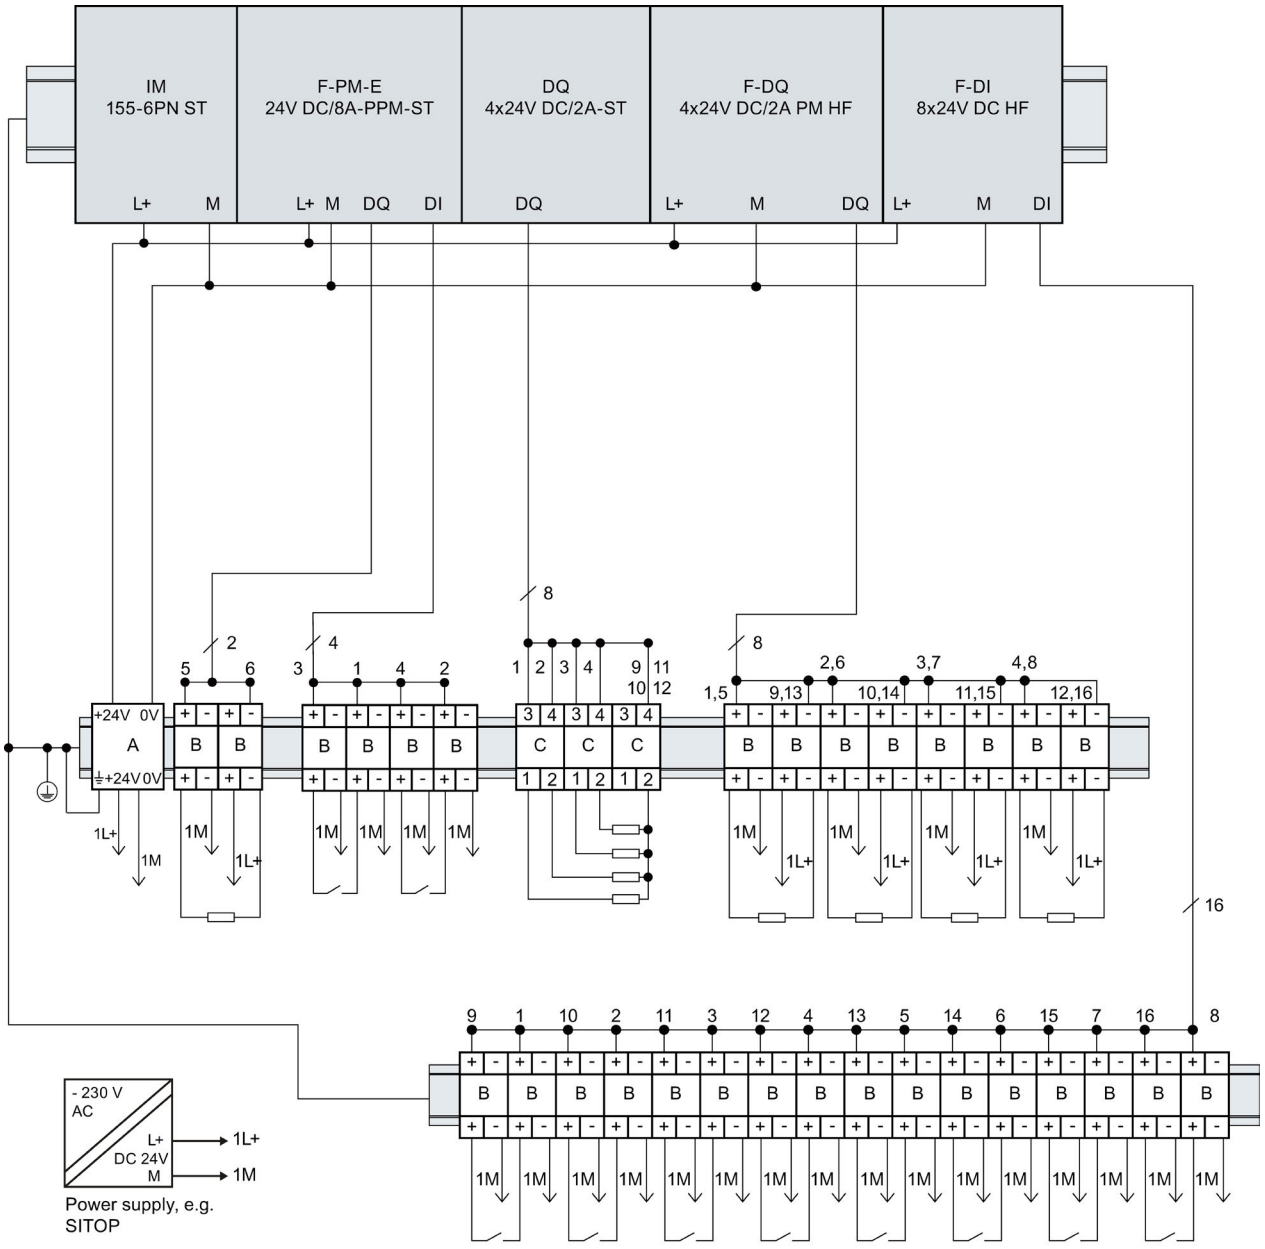

Figure 7-1 External protective circuit (surge filter) for ET 200SP with fail-safe modules

Name	Order number of Dehn Co.
A = BVT AD 24	918 402
B = DCO RK D 5 24	919 986
C = DEHNconnect DCO RK E 60	919 990

7.2 Standards and approvals

CE mark

The ET 200SP F distributed I/O system meets the requirements and safety objectives of the following EC directives and satisfies the harmonized European Standards (EN) for programmable logic controllers published in the official journals of the European Community:

- 2006/42/EC "Directive on Machinery" (Machinery Directive)
- 2006/95/EC "Electrical Equipment Designed for Use within Certain Voltage Limits" (Low-Voltage Directive)
- 2004/108/EC "Electromagnetic Compatibility" (EMC Directive)
- 94/9/EC "Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres" (Explosion Protection Directive)

The EC declarations of conformity are kept available for the relevant authorities at:

Siemens Aktiengesellschaft
Industry Sector
I IA AS FA DH AMB
PO Box 1963
D-92209 Amberg, Germany

These are also available for download on the Customer Support web page, keyword "Declaration of Conformity".

Accessories/spare parts

8

8.1 Lightning protection and overvoltage protection for fail-safe modules

Overvoltage suppressors for fail-safe electronic modules

Note

This section lists only those overvoltage suppressors that may be used for the protection of fail-safe modules.

Be sure to observe the detailed information on lightning protection and overvoltage protection of the ET 200SP distributed I/O device in ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

Components for overvoltage protection of fail-safe modules (lightning protection zone transition 0_B to 1)

The table below lists overvoltage arresters you can use for fail-safe modules:

Table 8- 1 Components for the overvoltage protection (only for unshielded lines)

Fail-safe modules	Connecting of the lines to interface 0_B to 1 with:	Article number
Supply voltage 1L+, L+ (24 V DC)	BLITZDUCTOR BVT AD 24	918 402
Inputs/outputs of the F-modules (24 V DC)	DEHNconnect RK DCO RK D 5 24	919 986

Glossary

1oo1 evaluation

Type of → sensor evaluation – in the case of the 1oo1 evaluation, there → is one sensor with a 1-channel connection to the F module.

1oo2 evaluation

Type of → sensor evaluation – in the case of 1oo2 evaluation , two input channels are assigned one two-channel sensor or two one-channel sensors. The input signals are compared internally for equivalence or nonequivalence.

Acknowledgment time

During the acknowledgment time, the → F-I/O acknowledge the sign of life specified by the → F-CPU. The acknowledgment time is included in the calculation of the → monitoring time and → response time of the overall fail-safe system.

Actuator

Actuators can be power relays or contactors for switching on loads, or they can be loads themselves (e.g., directly controlled solenoid valves).

Availability

Availability is the probability that a system is functional at a specific point in time. Availability can be increased by redundancy, e.g., by using multiple -> sensors at thesame measuring point.

Channel fault

Channel-specific fault, such as a wire break or short circuit.

In channel-specific passivation, the affected channel is either automatically reintegrated or the fail-safe module must be removed and reinserted after the fault has been eliminated.

Channel group

The channels of a module are grouped together in a channel group. Certain parameters in STEP 7 can only be assigned to channel groups, rather than to individual channels.

Channel number

Channel numbers are used to uniquely identify the inputs and outputs of a module and to assign channel-specific diagnostic messages.

Channel-specific passivation

With this type of passivation, only the affected channel is passivated in the event of a → channel fault. In the event of a → module fault, all channels of the → fail-safe module are passivated.

CRC

Cyclic Redundancy Check

CRC signature

The validity of the process values in the safety message frame, the accuracy of the assigned address references, and the safety-related parameters are validated by means of the CRC signature in the safety message frame.

Dark period

Dark periods occur during shutdown tests and complete bit pattern tests. The fail-safe output module switches test-related zero signals to the active output. This output is then briefly disabled (= dark period). An adequate carrier → actuator will not respond to this and will remain activated.

Derating

See temperature characteristics

Discrepancy analysis

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is performed to determine whether the difference (for nonequivalence testing: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

The discrepancy analysis compares the two input signals of the 1oo2 sensor evaluation in the fail-safe input module.

Discrepancy time

Configurable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are extended unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily since a discrepancy error is detected when, in reality, no error exists.

Fail-safe modules

ET 200SP modules with integrated safety functions that can be used for safety-related operation (safety mode).

Fail-safe systems

Fail-safe systems (F-systems) remain in a safe state or immediately assume another safe state as soon as particular failures occur.

Fault response time

The maximum fault response time of an F-system defines the interval between the occurrence of any fault and a safe reaction at all affected fail-safe outputs.

For → F-systems overall: The maximum fault response time defines the interval between the occurrence of any fault at any → F-I/O and the safe reaction at the corresponding fail-safe output.

For digital inputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the backplane bus.

For digital outputs: The maximum fault response time defines the interval between the occurrence of the fault and the safe reaction at the digital output.

Fault tolerance time

The fault tolerance time of a process is the time a process can be left unattended without risk to life and limb of the operating personnel, or damage to the environment.

Any type of F-system control is tolerated within this fault tolerance time, i.e. the → F-system can control its processes incorrectly or even not at all. The fault tolerance time depends on the type of process and must be determined on a case-by-case basis.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is permitted for use in SIMATIC Safety. A standard user program can also be run on the F-CPU.

F-I/O

Collective name for fail-safe inputs and outputs available in SIMATIC S7 for integration into the SIMATIC Safety F-system. Available F-I/O modules:

- Fail-safe I/O module for ET 200eco
- Fail-safe signal modules S7-300 (F-SMs)
- Fail-safe modules for ET 200S
- Fail-safe modules for ET 200SP
- Fail-safe DP standard slaves
- Fail-safe PA field devices
- Fail-safe IO devices

F-monitoring time

→ PROFIsafe monitoring time

F-Systems

→ fail-safe systems

Module fault

Module faults can be external faults (e.g. missing load voltage) or internal faults (e.g. processor failure). Internal faults always require module replacement.

Monitoring time

→ PROFIsafe monitoring time

M-switch

Each fail-safe digital output of ET 200SP F-modules consists of a P-switch DO-P_x (current sourcing) and an M-switch DO-M_x (current sinking). The load is connected between the P-switch and M-switch. The two switches are always activated so that voltage is applied to the load.

Nonequivalent sensor

A nonequivalent → sensor is a two-way switch that is connected to two inputs of an → F-I/O (via 2 channels) in → fail-safe systems (for → 1oo2 evaluation of sensor signals).

Passivation

If an → F-I/O module detects a fault it switches either the affected channel or all channels to a → safe state, i.e. the channels of this F-I/O module are passivated. The F-I/O module signals the detected faults to the → F-CPU.

When passivating channels at F-I/O with inputs, the → F-System provides fail-safe values for the → safety program instead of the process values pending at the fail-safe inputs.

When passivating channels at F-I/O with outputs, the F-system returns fail-safe values (0) to the fail-safe outputs instead of the output values provided by the safety program.

Performance Level

Performance Level (PL) according to ISO 13849-1:2006 or EN ISO 13849-1:2008

PROFIsafe

Safety-oriented PROFINET I/O bus profile for communication between the → safety program and the → F-I/O module in a → fail-safe system.

PROFIsafe address

Every → fail-safe module has a PROFIsafe address. You have to configure the PROFIsafe address.

PROFIsafe monitoring time

Monitoring time for safety-related communication between the F-CPU and F-I/O

Proof-test interval

Period after which a component must be forced to fail-safe state, that is, it is either replaced with an unused component, or is proven faultless.

P-switch

→ M-switch

Redundancy, availability-enhancing

Multiple instances of components with the objective of maintaining component functionality in the event of hardware faults.

Redundancy, safety-enhancing

Multiple availability of components with the aim of exposing hardware faults based on comparison; such as → 1oo2 evaluation in → fail-safe modules.

Reintegration

After the elimination of a fault, it is necessary to ensure the reintegration (depassivation) of the → F-I/O. Reintegration (switchover from fail-safe values to process values) occurs either automatically or only after a user acknowledgment in the safety program.

In the case of a fail-safe input module, the process values pending at the fail-safe inputs are made available to thesafety program again after reintegration. In the case of a fail-safe output module, the → fail-safe system transfers the output values in the safety program to the fail-safe outputs again.

Safe state

The basic principle of the safety concept in F-systems is the existence of a safe state for all process variables. For the digital F-I/O, for example, the safe state is the value "0".

Safety class

Safety level (Safety Integrity Level) SIL according to IEC 61508:2010. The higher the Safety Integrity Level, the more rigid the measures for prevention of systematic faults and for management of systematic faults and hardware failures.

The fail-safe modules support operation in safety mode up to safety class SIL3.

Safety function

A mechanism integrated in the → F-CPU and → F-I/O that enables their use in → the fail-safe system SIMATIC Safety.

According to IEC 61508:2010 A safety function is implemented by a safety system in order to maintain or force a system safe state in the event of a specific fault.

Safety message frame

In safety mode, data are transferred between the → F-CPU and → F-I/O in a safety message frame.

Safety mode

Operating mode of → F-I/O that enables → safety-related communication via → safety message frames.

→ ET 200SP fail-safe modules can only used in safety mode.

Safety program

Safety-related user program

Safety-related communication

Communication used to exchange fail-safe data.

Sensor evaluation

There are two types of sensor evaluation:

→ 1oo1 evaluation – sensor signal is read once

→ 1oo2 evaluation – sensor signal is read in twice by the same F-module and compared internally

Sensors

Sensors are used for accurate detection of digital and analog signals as well as routes, positions, velocities, rotational speeds, masses, etc.

SIL

Safety Integrated Level → safety class

Standard mode

Operating mode of F-I/O in which standard communication is possible by means of → safety message frames, but not → safety-related communication.

Fail-safe ET 200SP modules can only be operated in safety mode.

Value status

The value status is the binary additional information of a digital signal. The value status is entered in the process image of the input and provides information on the validity of the signal.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

The present manual supplements the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) and the System Manual SIMATIC ET 200SP motor starters. Functions affecting the system in general are described there. ((Link for motor starters still to be added))

The information provided in this manual and in the system/function manuals supports you in commissioning the system.

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Changes compared to the previous version

In contrast to the previous version, the chapters "BaseUnits for motor starters" and "Dimension drawings for motor starters" have been added to this manual.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

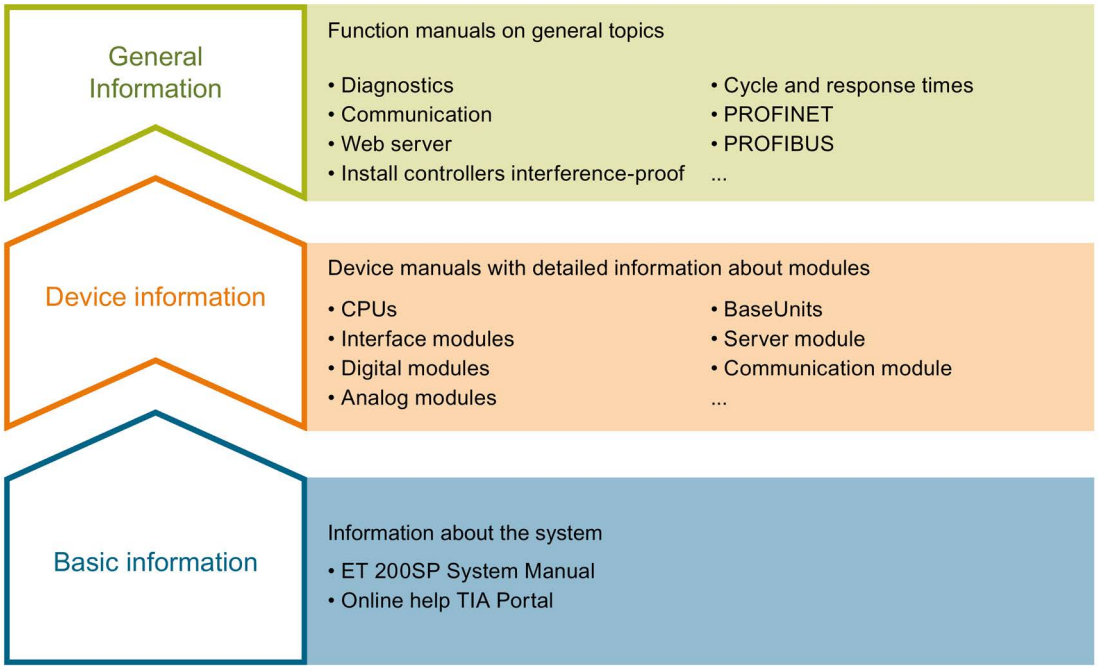
Guide to the documentation

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, designing interference-free controllers.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-et200/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet.

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet.

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (http://support.industry.siemens.com/cs/ww/en/ps/ae).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Product overview

2

General properties of the BaseUnits

In the case of the distributed I/O system, there are different BaseUnits. The BaseUnit determines, among other things, the process connection, the suitable I/O modules/motor starters, and the infeed of the supply voltage. All properties can be identified by the short designation of the BaseUnit which is explained below.

Table 2- 1 Properties of the BaseUnits

Short description BU15-P16+A10+2D/T (example)			BaseUnit properties
Module width	BU	15	BaseUnit with width of 15 mm
		20	BaseUnit with width of 20 mm
		30	BaseUnit with width of 30 mm
Process connection	P	4	• Connection method: Push-in terminal • Number of terminals to the I/O module: 4
		8	• Connection method: Push-in terminal • Number of terminals to the I/O module: 8
		16	• Connection method: Push-in terminal • Number of terminals to the I/O module: 16
Connection to the AUX busbar	A	0	No connection to the AUX busbar
		10	n = number of AUX terminals, e.g. 10
Self-assembling voltage buses	2		2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B)
	12		• 2 push-in terminals for supplying or tapping the supply voltage via the self-assembling voltage buses P1, P2 (see D, B) • 2x5 push-in additional terminals (1B to 5B, 1C to 5C) for connecting further potential up to a maximum supply current of 24 V DC / 10 A
	0		No terminals with access to the self-assembling voltage buses P1, P2
		B	• Looping through the potential group • Tapping of the supply voltage for external components or looping through with a maximum total current of 10 A per potential group
		D	• Opening a new potential group • Feeding in of supply voltage up to a maximum supply current up to 10 A
Additional functions	T		Integrated temperature sensor to compensate the reference junction temperature for thermocouples

Selecting, installing and connecting BaseUnits

See the System Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)

⚠ WARNING

Personal injury or damage to equipment is possible.

Connecting a rated supply voltage to the BaseUnit higher than the one given in the technical specifications may lead to dangerous situations in your plant or cause defects in ET 200SP components.

Therefore, only connect the rated supply voltage given in the technical specifications to the BaseUnit.

The connected rated supply voltage must correspond to the rated supply voltage of the I/O modules in the potential group.

When mains voltage is connected to the BaseUnit, ensure that all other supply voltages on this BaseUnit use the same phase as the mains.

The Totally Integrated Automation Selection Tool (TIA Selection Tool) (http://www.siemens.com/tia-selection-tool) supports you in selecting, configuring and ordering the ET 200SP modules. This tool can be downloaded free of charge from the Internet (http://support.automation.siemens.com/WW/view/en/58649293).

⚠ WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Proper use of hardware products

This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.

Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.

EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Machinery Directive 2006/42/EC.

⚠ WARNING

Hazardous Voltage (when using ET 200SP motor starters)
Can Cause Death, Serious Injury, or Property Damage.

Please take note of our latest information

Systems with safety-related characteristics are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we publish a special newsletter containing information on product developments and features that are (or could be) relevant to operation of safety-related systems. By subscribing to the appropriate newsletter, you will ensure that you are always up-to-date and able to make changes to your system, when necessary:

Siemens Newsletter (http://www.industry.siemens.com/newsletter)

3.1.1 Product overview

Article number

6ES7193-6BP20-0DA0

View

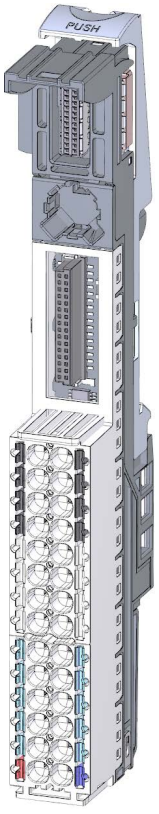

Image 3-1 BaseUnit BU15-P16+A10+2D

Properties

- BaseUnit suitable for all I/O modules of the BaseUnit type "A0/A1". Can be recognized by the last two digits of the article number.
  - Supply voltage (L+ terminal, ground): Max. 24 VDC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 10 AUX terminals for connecting a protective conductor or potential. The AUX busbar is not connected to the I/O module.
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

3.1.2 Connecting up

Pin assignment

3.1.3 Technical specifications

Technical specifications of the BaseUnit BU15-P16+A10+2D

	6ES7193-6BP20-0DA0
Product type designation	BU15-P16+A10+2D
Supply voltage	
Rated value (DC)	24 V
External fuse for power supply lines	Yes: 24 VDC / 10 A miniature circuit breaker with type B or C tripping characteristic
Current carrying capacity	
Current carrying capacity up to 60 °C, max.	10 A
Electrical isolation	
between backplane bus and supply voltage	Yes
between the potential groups	Yes
Isolation	
Isolation tested with	707 VDC (type test)
Dimensions	
Width	15 mm
Height	141 mm
Weights	
Weight, approx.	50 g

3.5.1 Product overview

Order number

6ES7193-6BP40-0DA1

View

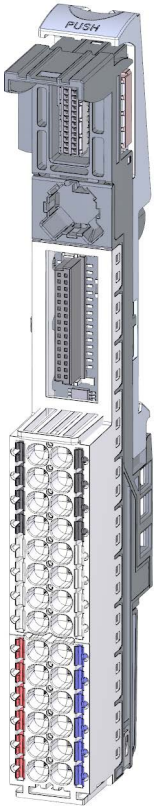

Image 3-9 BaseUnit BU15-P16+A0+12D/T

Properties

- BaseUnit for all I/O modules of BaseUnit type "A1". Can be recognized by the last two digits of the order number.

  Note

  Using another I/O module can trigger an internal, non-exchangeable fuse and you must exchange the terminal box.

  - Supply voltage (L+ terminal, ground): Max. 24 VDC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 16): Max. 2 A
- The BaseUnit opens up a new potential group. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- No access to the AUX busbar via terminals
- 16 terminals to the process (assignment through the I/O module)
- 2x5 additional terminals for supplying a supply voltage up to 24 V DC/ 10 A. The additional terminals are not connected to the I/O module.
- Recording of the terminal temperature for internal temperature compensation at connected thermocouples
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

3.11 BU20-P6+A2+4D (BU type C0)

3.11.1 Product overview

Article number

6ES7193-6BP20-0DC0

View

Image 3-21 BaseUnit BU20-P6+A2+4D

Properties

- BaseUnit suitable for all I/O modules of BaseUnit type "C0/C1". Can be recognized by the last two digits of the article number.
  - Supply voltage (terminal 1L, 2L / 1N, 2N): Max. 230 V AC/10 A
  - Current-carrying capacity per process terminal (terminal 1 to 4): Max. 5 A
  - Current carrying capacity per process terminal (terminal 5 and 6): Max. 10 A
- The BaseUnit opens up a new potential group by means of the inserted I/O module. The self-assembling voltage buses P1 and P2, and the AUX busbar are interrupted to the left-hand neighboring module (BaseUnit, interface module).
- Access to the AUX busbar via terminals
- 6 terminals to the process (assignment with the I/O module)
- Two AUX terminals for connecting a PE terminal or potential. The AUX busbar is not connected to the I/O module.
- Connection method using push-in terminals

Maximum configuration per potential group

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total current calculated from the sum of 1 and 2 may not exceed 10 A.

3.11.2 Connecting

Pin assignment

Table 3- 11 Pin assignment for BaseUnit BU20-P6+A2+4D

Pin assignment for BaseUnit BU20-P12+A2+4D	
Terminal	**Descriptions**
1 to 6	Assignment is determined by the I/O module. See manual I/O Module (http://support.automation.siemens.com/WW/view/en/55679691/133300).
1A, 2A, AUX	Protective conductor connection or voltage bus freely usable up to 230 V AC/ DC with max 10 A. If you connect a voltage, it must belong to the same potential group as the rated supply voltage.
1L, 2L, (P1) / 1N, 2N, (P2)	1L, 2L: Rated supply voltage up to 230 V AC with max. 10 A 1N, 2N: Neutral/ground

3.14 BU20-P8+A4+0B (BU type F0)

3.14.1 Product overview

Note when you use the AUX terminals as a PE busbar:

NOTICE
If AUX is used as PE, AUX must be identified as green-yellow (e.g., gn/ye color-coded labels). These identifications must be removed if the terminals are no longer used as PE.

Article number

BaseUnits for motor starters

4

4.1 Introduction

Properties of the infeed bus

- The infeed bus is set up by connecting the BaseUnits, and wiring takes place automatically
- The infeed bus distributes the energy to the SIMATIC ET 200SP motor starter within one load group
- The max. current carrying capacity is up to 32 A (3-phase)
  - With energy bus infeed (for one load group) and motor connection
  - Infeed bus: 3-pole + PE
  - The voltage range for power infeed is 48 … 500 V AC

You must observe the deratings depending on the configuration.

Properties of the self-assembling voltage bus (power bus)

- Maximum current: 7 A
- Rated voltage: 24 V

You must observe the deratings depending on the configuration.

AUX1 bus

The AUX1 bus is not supported in the BaseUnits of the SIMATIC ET 200SP motor starters.

You can find assembly rules of the BaseUnits for the SIMATIC ET 200SP motor starter in the System Manual SIMATIC ET 200SP motor starters.

⚠ WARNING

Infeed bus - electric shock

You must provide the infeed bus with a touch protection cover on the right (Article No.: 3RK1308-1DA00-2BP0).

Failure to do so will result in the danger of electric shock.

⚠ WARNING

BaseUnit without motor starter - electric shock

If you install a BaseUnit without motor starter in the ET 200SP system (e.g. options handling), you must provide the BaseUnit with a cover (Article No: 3RK1908-1CA00-0BP0).

Failure to do so will result in the danger of electric shock.

4.2 BU30-MS1 - BaseUnit with 24 V DC and 500 V AC infeed

4.2.1 Product overview

Article number

3RK1908-0AP00-0AP0

View

Image 4-1 BaseUnit with 24 V DC and 500 V AC infeed

Properties

- BaseUnit suitable for all SIMATIC ET 200SP High Feature motor starters
- The BaseUnit opens a new potential group (24 V DC). The power buses P1 and P2 are interrupted to the left-hand neighboring module (BaseUnit, interface module/CPU).
- The BaseUnit opens a new potential group (500 V DC). The infeed bus L1 (L), L2 (N), L3, PE is interrupted to the left-hand BaseUnit of the ET 200SP motor starter.
- Connection method using push-in terminals
- The touch protection cover for the infeed bus is not included in the scope of delivery.

Maximum configuration per voltage group (24 V DC)

The number of I/O modules that can be used per potential group depends on the following factors:

1. Total power requirement of all I/O modules operated on this potential group
2. Total power requirement of all loads connected externally to this potential group

The total overall current calculated according to 1. and 2. must not exceed 7 A.

Maximum configuration of the infeed bus (500 V AC)

The number of motor starters that can be used per infeed group depends on the following factors:

1. Total current requirement of all motor starters operated on this infeed group.
2. Ambient temperature and installation type in which the motor starters are operated. You can find further information in the derating table in the Manual SIMATIC ET 200SP motor starters (https://support.industry.siemens.com/cs/ww/en/view/109479973).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

The control system offers various options for program execution with different run priorities. Cyclic and time-driven program execution have the largest share. The response times of a control system are therefore significantly determined by the processing cycles.

Additionally there is also the possibility of event-driven program execution. The event-driven program execution is normally limited to a few selected events.

This manual provides information on the following topics:

- Types of program execution
- Run priorities
- Cycle and response times, and the influences to which they are subject
- Configuration options for the optimization of your user program

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Knowledge about how to use STEP 7/TIA Portal

Conventions

STEP 7: We refer to the configuration and programming software as "STEP 7" in this documentation synonymously for "STEP 7 V12 (TIA Portal)" and subsequent versions.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation mainly includes the CPU components of the cycle and reaction times of the S7-1500 automation system. You can find references at the corresponding instances for more information on the ET 200MP and ET 200SP distributed I/O systems.

Additional support

Additional information on SIMATIC products is available on the Internet. The associated documentation is likewise available on the Internet.

- You can find the available technical documentation for the individual SIMATIC products and systems in the internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Documentation guide

1

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-1500 system consists of a system manual, function manuals and device manuals.

The STEP 7 information system (Online Help) also helps you configure and program your automation system.

Overview of the additional documentation on the topic of cycle and response times

The following table lists additional documentation which supplements this description of cycle and response times.

Table 1- 1 Documentation of cycle and response times

Topic	Documentation	Most important contents
System description	System manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792)	• Application planning • Installation • Wiring • Commissioning

SIMATIC manuals

All current manuals for the SIMATIC products are available for download free of charge from the Internet (http://www.siemens.com/automation/service&support).

Program processing 2

Introduction

You often program your user program with a cyclic OB, usually in OB 1. With complex applications, problems are often encountered in complying with the response time required by the application. You can often solve the response time requirements by splitting the user program up into several parts with different response time requirements. The CPU offers a number of different OB types for this purpose, the properties (priority, frequency, etc.) of which can be adapted to meet the requirements.

Program organization

You can choose from the following types of program execution for running your user program:

Program execution in the cyclic program of the CPU:

In the simplest case, you execute the entire user program in the cyclic program of the CPU. All tasks in the user program are then processed with equal rank. This also results in the same response times for all tasks.

In addition to program execution in the cyclic program, there is time-driven and event-driven program execution.

Time-driven processing:

In a complex user program, there are frequently portions with different response time requirements. You can optimize the response times by taking advantage of these differences in the requirements. To do so you can move the program parts with higher response time requirements to higher-priority OBs with shorter cycles, for example cyclic interrupt OBs.

The processing of these parts can thus occur with different frequencies and priorities.

Event-driven processing:

Depending on the I/O modules used, you can configure hardware interrupts for specific process events (such as an edge change of a digital input) that result in the call of the assigned hardware interrupt OB. The hardware interrupts have a higher priority and interrupt the cyclic program of the CPU. You can achieve very short response time in the CPU with hardware interrupts by directly triggering program execution.

Keep in mind that the time characteristics of your application becomes less predictable with intense use of hardware interrupts. The reason being that the time at which the triggering events occur can result in drastically different response times.

Tip: Use hardware interrupts only for a few, select events.

Using process image partitions

If a program is distributed to various OBs, for example, due to differing response time requirements, it is advisable and often necessary to assign the update of the used I/O data directly to these OBs. You can use process image partitions for this purpose.

You group the input and output data in a process image partition according to their use in the program and assign the data to the corresponding OB.

You optimize the response times this way, because the update of the affected I/O modules is directly synchronized with the processing in the program.

A process image partition of the inputs (PIPI) permits the associated input data for an OB program to be updated immediately before the OB program starts.

A process image partition of the outputs (PIPQ) permits the output data associated with an OB program to become effective on the outputs immediately after the OB program runs.

You have 32 (0 … 31) process image partitions at your disposal. The default assignment for the I/O is process image partition 0 (setting: "Automatic updating"). Process image partition 0 is permanently assigned to cyclic processing.

You have to configure this "system-side update of process image partitions". You can find additional information on configuration of process image partitions in the online help for STEP 7 under the keyword "Assign process image/process image partition".

Interruptability of program run

Each organization block is processed with a priority. You can adapt the priority according to the response time requirements for most organization blocks.

All cycle OBs always have the lowest priority of 1. The highest priority is 26.

Communication tasks always have priority 15. If necessary, you can change the priority of your blocks and select a higher priority than the communication.

Organization blocks or system activities with higher priority interrupt those with lower priority, and thus extend the run time of the interrupted organization blocks or system activities. If two pending tasks have the same priority, these tasks are processed in the order in which the tasks occurred.

Note

Higher priority OBs

Communication functionality is strongly influenced by too many or runtime-intensive OBs with a priority > 15.

When using OBs with a priority > 15, you should consider the runtime load that they cause in order to keep communication functionality at a reasonable level.

Reference

You can find additional information on the subject of priorities in the system manual for the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792), in the Events and OBs section.

Cyclic program processing

3

3.1 Cycle

Introduction

In this section, you will learn about the concept of the "cycle".

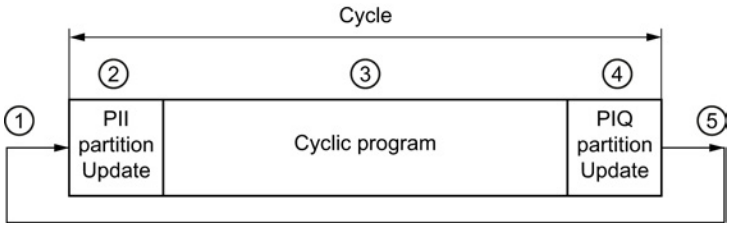
Definition of cycle

A cycle in the S7-1500 automation system encompasses the following:

- Update of process image partition 0 of the inputs (PIPI 0)
- Processing of the cyclic program
- Update of process image partition 0 of the outputs (PIPQ 0)

The process image partition 0 is permanently assigned to the cycle. You assign I/O addresses to this process image partition using the "Automatic updating" setting (default) in the TIA Portal in HW Config for the I/O modules.

The figure below illustrates the phases that are passed through during a cycle.



① The operating system starts measurement of the cycle time.
② The CPU reads the status of the inputs at the input module and writes the input data to the process image partition of the inputs.
③ The CPU processes the user program and executes the instructions specified in the program.
④ The CPU writes the states from the process image outputs to the output modules.
⑤ The operating system evaluates the determined cycle time and starts the measurement again.

Figure 3-1 Cycle

3.2 Cycle time

Introduction

In this section you will learn about the concept of "cycle time", and how to estimate the cycle time.

Definition of cycle time

The cycle time is the time the CPU need to execute the cyclic program, to update the process image of the inputs and outputs as well as for all program parts and system activities that interrupt this cycle.

3.2.1 Different cycle times

Introduction

The cycle time (T_{cyc}) is not equally long for every cycle, because the processing times can vary. Causes for this are, for example:

- Different program runtimes

  (e.g. program loops, conditional commands, conditional block calls, or different program paths)

- Lengthening due to interruptions

  (e.g. time-driven interrupt processing, processing of hardware interrupts or communication)

Causes for different cycle times

The cycle time T_{cyc2} is longer than T_{cyc1}, because the cyclic program is interrupted by a cyclic interrupt OB in this example (e.g: OB 30). The cyclic interrupt OB in turn is interrupted by communication.

The figure below shows the different cycle times T_{cyc1} and T_{cyc2}.

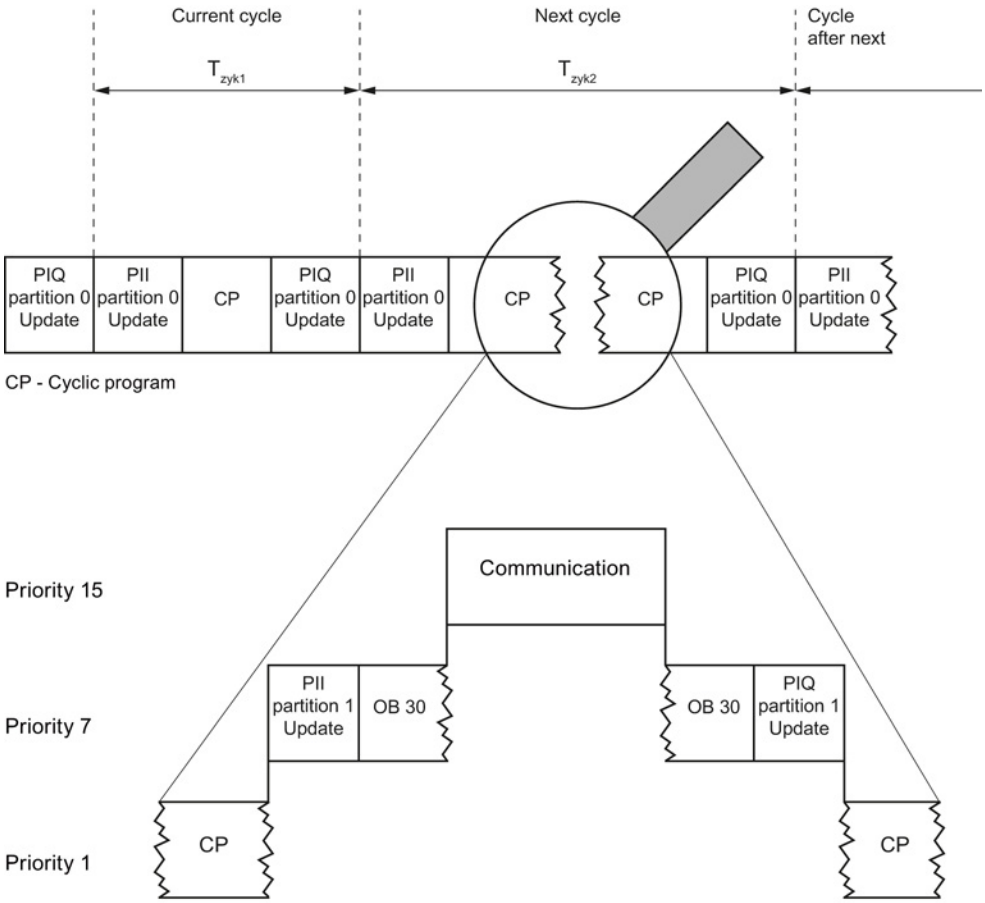


Figure 3-2 Possible causes of differing cycle times

Minimum cycle time

In STEP 7, you can set a minimum cycle time for a CPU. The default for the minimum cycle time is one millisecond. It may be advisable to increase this setting in the following cases:

- To reduce the cycle time's fluctuation range.
- To make remaining computing time available for communication tasks.

Maximum cycle time

The cycle time is monitored by the CPU. By default, the maximum cycle time is 150 ms. This value can be changed by setting CPU parameters. When the cycle time is longer than the maximum cycle time, the time error OB (OB 80) is called.

You have the option of restarting the maximum cycle time using the "RE_TRIGR" instruction, and thus extending it.

With the user program in OB 80 you specify how the CPU responds to the time error. Under the following conditions the CPU goes to STOP.

- If you have not loaded an OB 80.
- If the cycle is still not completed after an additional maximum cycle time

Keep in mind that the cycle time is extended by interruptions as shown in the previous figure.

Cycle time statistics

In STEP 7 and in the TIA Portal, you have the option of viewing the cycle time statistics, and of determining the minimum and maximum cycle time with the instruction "RT_INFO". You need this information to determine the response times of the user program in the cycle.

To view the cycle time statistics, follow these steps:

1. Establish an online connection with the TIA Portal.
2. Select the Online tools task card on the very right.

Result: The diagram of the cycle time statistics is displayed in the cycle time section.

The following figure shows an extract from the TIA Portal with the cycle time statistics. In this example, the cycle time ranges from 7 ms to 12 ms. The current cycle time is 10 ms. The maximum cycle time that can be set in this example is 40 ms.

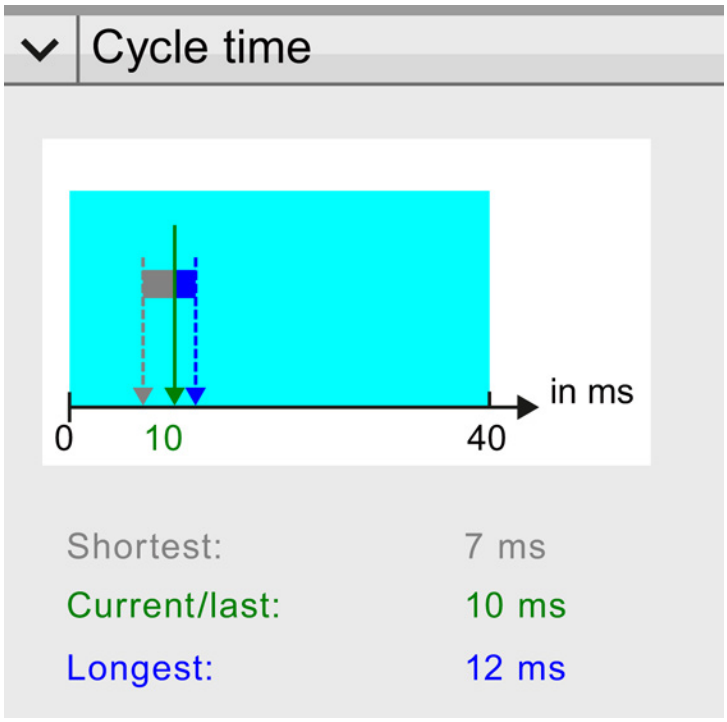

Figure 3-3 Cycle time statistics

You can find additional information on the runtime characteristics of the CPU with the "RT_INFO" instruction in the user program. You can read the utilization of the CPU in percentage with the control program and communication, and you can also read the runtime statistics of individual OBs.

Reference

You can find additional information on the "RT_INFO" instruction in the STEP 7 online help.

3.2.2 Influences on the cycle time

3.2.2.1 Update time for process images

Introduction

In this section, you will learn how you can estimate the update time of process image partitions.

Update time for process image partitions

The update time of the process image partitions depends on the quantity of assigned central and distributed I/O module data.

You can estimate the update time using the following formula:

Base load for process image update
\+ Number of words in the process image x copy time for central I/O modules
\+ Number of words in the process image via DP x copy time for PROFIBUS I/O
\+ Number of words in the process image via PROFINET x copy time for PROFINET I/O

= Update time of the process image partition

The following table includes the times for estimating the typical update time of the process image partitions.

Table 3- 1 Data for estimating the typical update time of the process image partition

Components	Update time of the CPU				
	1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Base load for process image partition update	35 µs	35 µs	30 µs	30 µs	5 µs
Copy time for central I/O modules	9 µs/word	9 µs/word	8 µs/word	8 µs/word	4 µs/word
Copy time for distributed I/O modules via PROFIBUS	0.5 µs/word	0.5 µs/word	0.5 µs/word	0.5 µs/word	0.3 µs/word
Copy time for distributed I/O modules via PROFINET	0.5 µs/word	0.5 µs/word	0.5 µs/word	0.5 µs/word	0.3 µs/word

3.2.2.2 User program processing time

Introduction

Organization blocks or system activities with higher priority interrupt those with lower priority, and thus extend the run time of the lower-priority organization blocks or system activities.

Program execution time without interruptions

The user program has a certain runtime without interruptions. The length of the run time depends on the number of operations that are executed in the user program.

The following table contains the times for how long an operation lasts.

Table 3- 2 Duration of an operation

CPU	1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Bit operations, typ.	60 ns	40 ns	30 ns	10 ns	1 ns
Word operations, typ.	72 ns	48 ns	36 ns	12 ns	2 ns
Fixed-point arithmetic, typ.	96 ns	64 ns	48 ns	16 ns	2 ns
Floating-point arithmetic, typ.	384 ns	256 ns	192 ns	64 ns	6 ns

Note

Instruction "RUNTIME"

You can measure the run times of program sequences with the instruction "RUNTIME".

Extension due to nesting of higher-priority OBs and/or interrupts

The interruption of a user program by a higher-priority OB causes a certain basic time expenditure. Take account of this basic time expenditure in addition to the update time of the assigned process image partitions and the processing time of the contained user program. The following tables include the corresponding times for the various interrupts and error events.

Table 3- 3 Basic time expenditure for an interrupt

CPU	1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Hardware interrupt	90 µs	90 µs	80 µs	80 µs	12 µs
Time-of-day interrupt	90 µs	90 µs	80 µs	80 µs	12 µs
Time-delay interrupt	90 µs	90 µs	80 µs	80 µs	12 µs
Cyclic interrupt	90 µs	90 µs	80 µs	80 µs	12 µs

Table 3- 4 Basic time expenditure for an error OB

CPU	1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Programming error	90 µs	90 µs	80 µs	80 µs	12 µs
I/O access error	90 µs	90 µs	80 µs	80 µs	12 µs
Time error	90 µs	90 µs	80 µs	80 µs	12 µs
Diagnostic interrupt	90 µs	90 µs	80 µs	80 µs	12 µs
Module failure/recovery	90 µs	90 µs	80 µs	80 µs	12 µs
CPU stop/ recovery	90 µs	90 µs	80 µs	80 µs	12 µs

Reference

You can find additional information on the subject of error handling in the system manual for the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792), in the Events and OBs section.

3.2.2.3 Extension of cycle time due to communication load

Impact of communication on the cycle time

In the sequence model of the CPU, communication tasks are processed with priority 15. All program parts with priority > 15 are not influenced by communication.

Configured communication load

The CPU operating system provides the maximum specified percentage of total CPU processing power for communication tasks. The default setting for the communication load of the S7-1500 automation system is 50% in the TIA Portal. If the processing power is not needed for communication, then the processing power is available to the operating system and the user program.

Communication is allocated the requisite processing time in 1-ms increments, with priority 15. At 50% communication load, 500 µs of each 1 millisecond are used for communication.

The following formula may be used to estimate the extension of the cycle time by communication.

$$\text{Actual cycle time} = \text{Cycle time without communication} \times \frac{100}{100 - \text{"configured communication load in \%"}}$$

Figure 3-4 Formula: Impact of communication load

With a complete use of the communication load of 50% (default), the following value results:

$$\text{Actual cycle time} = \text{Cycle time without communication} \times 2$$

Figure 3-5 Extension of cycle time due to communication load

The actual cycle time is up to twice as long as the cycle time without communication when you use the default communication load.

Dependency of maximum cycle time on the configured communication load

The diagram shows the nonlinear relationship between maximum cycle time and configured communication load with a pure cycle time of 10 ms, which means without interruptions.

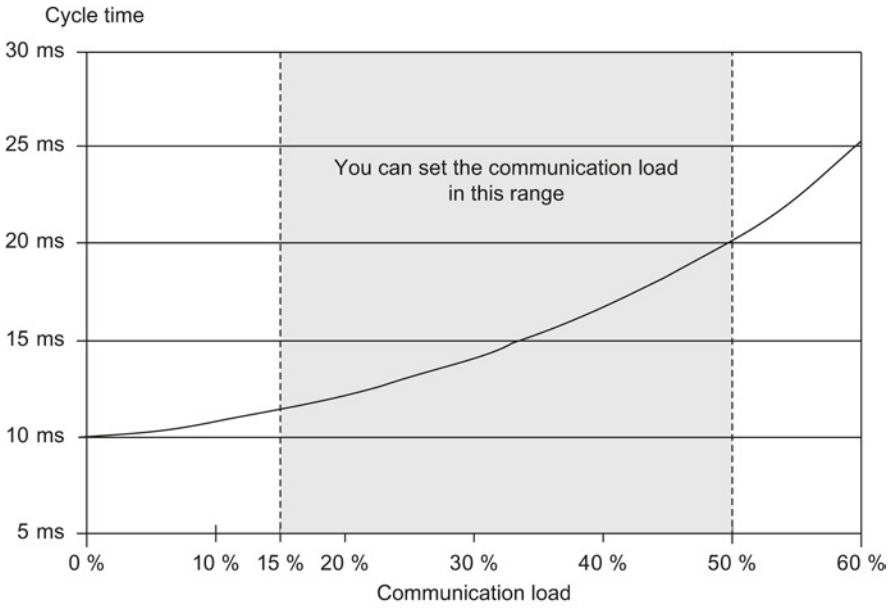

Figure 3-6 Maximum cycle time depending on the configured communication load

The shown influence of the communication load on the processing time applies to all OBs with a priority ≤ 15.

Reducing the cycle time through low communication load

You can reduce the setting for the communication load in the hardware configuration. If you set a communication load of 20%, for example, instead of the default 50%, the cycle time is reduced from 2 x cycle time without communication to 1.25 x cycle time without communication.

Effect on the actual cycle time

Communication is only one cause for extension of the cycle time. All cycle time extending settings lead to the result that more asynchronous events can occur within a cycle, which additionally extend the cyclic program. This extension depends on the number of events that occur in the cyclic program and the time required to process these events.

Note

Checking parameter changes

- Check the effects of a value change on the "Cycle load due to communication" parameter during system operation.
- To prevent time errors, take account of the communication load when setting the maximum cycle time.

Tips

Whenever possible, use the default setting for the configured communication load.

If you reduce the value of the communication load, keep in mind that communication tasks are interrupted by higher-priority OBs. This means it will also take longer to process the communication.

3.3 Time-driven program processing in cyclic interrupts

With a cyclic interrupt, you can have a particular program processed in a defined cycle. This program is run at a higher priority (user-assigned) and is thus independent of the execution time of the cyclic program.

Tip: By shifting program sections to cyclic interrupts, you can reduce the corresponding response times or better adapt them to your requirements.

In STEP 7, the organization blocks OB 30 to OB 38 are provided for the processing of cyclic interrupts. You can create additional cyclic interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Definition

A cyclic interrupt is an interrupt initiated according to a defined cycle that causes a cyclic interrupt OB to be processed.

Cycle of a cyclic interrupt

The cycle of a cyclic interrupt is defined as the time from the call of a cyclic interrupt OB to the next call of a cyclic interrupt OB.

The following figure shows an example of the cycle of a cyclic interrupt.

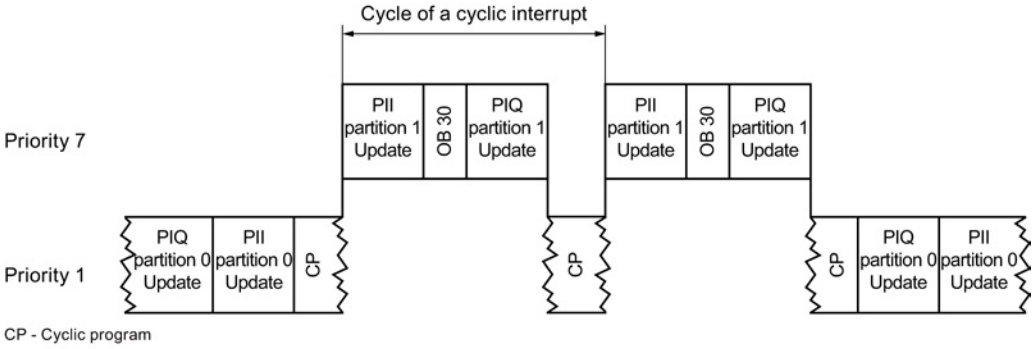

Figure 3-7 Call interval of a cyclic interrupt

Accuracy of a cyclic interrupt

If a cyclic interrupt is not delayed by a higher-priority OB or communication activities, the accuracy with which it is started is nevertheless subject to system-dependent fluctuations.

The following table shows the accuracy with which a cyclic interrupt is triggered:

Table 3- 5 Accuracy of cyclic interrupts

CPU	1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Cyclic interrupt	±90 µs	±90 µs	±80 µs	±80 µs	±25 µs

3.4 Response time for cyclic and time-driven program processing

Introduction

In this section you will learn about the concept of "response time", and how to calculate the response time.

Definition

The response time in the case of cyclic or time-controlled program execution is the time between the detection of an input signal and the change of a connected output signal.

Fluctuation of the response time of the CPU

The actual response time of the CPU fluctuates between one and two cycle times for cyclic program execution and between one and two cyclic interrupt cycles for time-controlled program execution.

You must always reckon with the longest response time when configuring your system.

The following figure shows the shortest and longest response times of the CPU to an event.

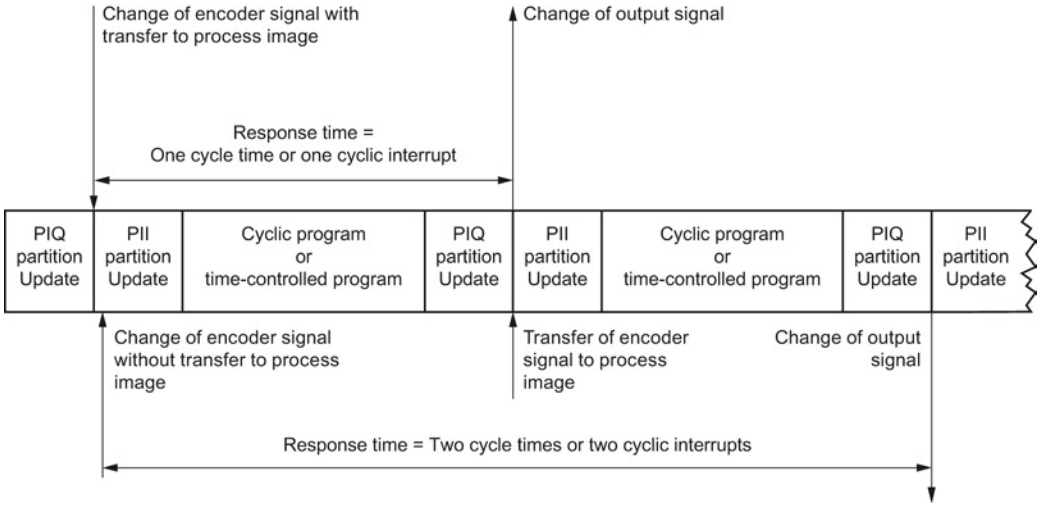

Figure 3-8 Shortest and longest response times of the CPU

Factors

To determine the process response time, you must take account of the following factors in addition to the CPU response time described above:

- Delay of the inputs and outputs at the I/O module
- Update times for PROFINET IO or DP cycle times on PROFIBUS DP
- Switching times of the sensors and actuators used

Delay at the inputs and outputs of the modules

Delays in the response time occur at the inputs and outputs of the modules and as a result of device-internal delays (e.g., interface modules).

The delay and cycle times can be found in the technical specifications for the I/O modules.

Update time with distributed I/O

When distributed I/O are used, the maximum response time is also extended by the bus transmission times of PROFIBUS or PROFINET. These bus transmission times occur when process image partitions are read in and output. The bus transmission times correspond to the bus update cycle of the distributed device.

PROFINET IO

If you use STEP 7 to configure your PROFINET IO system, STEP 7 calculates the update time. Select the PROFINET interface of the I/O module. In the General tab, select "Advanced options > Real time settings > I/O cycle". The update time is displayed in the field "Update time".

PROFIBUS DP

If you use STEP 7 to configure your PROFIBUS DP master system, STEP 7 calculates the DP cycle time. Select the PROFIBUS subnet in the network view. In the Inspector window, navigate to the bus parameter in the General tab. The DP cycle time is typically displayed in the "Parameters" field at "Ttr typical".

The following figure illustrates the additional bus runtimes using distributed I/O.

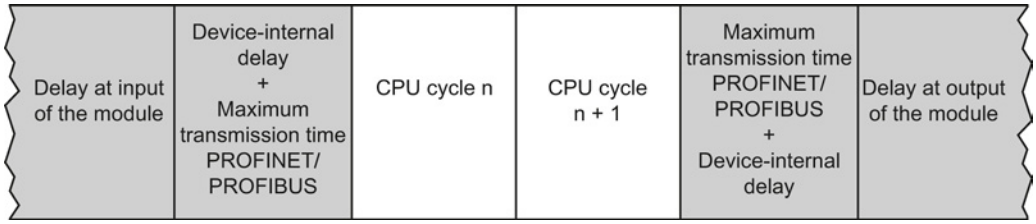

Figure 3-9 Additional bus runtimes with distributed I/O

You can achieve a further optimization of the response times using isochronous mode.

- Transmission times and isochronous mode in Function Manual PROFINET with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/49948856); note also the chapter "Tips on assembly"
- Transmission times and isochronous mode in Function Manual PROFIBUS with STEP 7 V13 (http://support.automation.siemens.com/WW/view/en/59193579); note also the chapter "Network settings"
- Delays at the input or output of the modules can be found in the manual for the respective device.
- Device-internal delays can be found in the manuals for the ET 200MP and ET 200SP distributed I/O systems.

3.5 Summary of response time with cyclic and time-controlled program execution

Estimation of the shortest and longest response time

The following formulas may be used to estimate the shortest and longest response time:

Estimation of the shortest response time

The shortest response time is the sum of:

1 x delay in the I/O module for inputs
\+ 1 x (update PROFINET IO or PROFIBUS DP)*
\+ 1 x transfer time of the process image inputs
\+ 1 x processing of the user program
\+ 1 x transfer time of the process image outputs
\+ 1 x (update PROFINET IO or PROFIBUS DP)*
\+ 1 x delay in the I/O module for outputs

= Shortest response time

* Time is dependent on the configuration and the extent of the network.

The shortest response time is equivalent to the sum of the cycle time plus the input and output delay times.

Estimation of the longest response time

The longest response time is comprised of:

1 x delay in the I/O module for inputs
\+ 2 x (update PROFINET IO or PROFIBUS DP)*
\+ 2 x transfer time of the process image inputs
\+ 2 x processing of the user program
\+ 2 x transfer time of the process image outputs
\+ 2 x (update PROFINET IO or PROFIBUS DP)*
\+ 1 x delay in the I/O module for outputs

= Longest response time

* Time is dependent on the configuration and the extent of the network.

The longest response time is equivalent to the sum of twice the cycle time plus the delay times of the inputs and outputs. The longest reaction time includes twice the update time for PROFINET IO or twice the DP cycle time on PROFIBUS DP.

Event-driven program processing

4

4.1 Response time of the CPUs when program execution is event-controlled

Introduction

In order to detect events in the process immediately in the user program and to react to them with an appropriate program, you use hardware interrupts. In STEP 7, organization blocks OB 40 to OB 47 are provided for processing a hardware interrupt. You can create additional hardware interrupts starting with organization block OB 123. The number of available organization blocks depends on the CPU used.

Definition

A hardware interrupt is an interrupt that occurs during the running program processing, due to an interrupt-triggering process event. The operating system calls the assigned interrupt OB; as a result, the processing of the program cycle or of lower priority program parts is interrupted.

Interrupt response times of the CPUs

The interrupt response times of the CPUs start with the occurrence of a hardware interrupt event in the CPU and end with the start of the assigned hardware interrupt OB.

This time is subject to system-inherent fluctuations, and this is expressed using a minimum and maximum interrupt response time.

The following table contains the length of the response times of the CPUs for hardware interrupts.

Table 4- 1 Response times of the CPUs for hardware interrupts

CPU		1511-1 PN	1513-1 PN	1515-2 PN	1516-3 PN/DP	1518-4 PN/DP
Interrupt response times	Min.	100 µs	100 µs	90 µs	90 µs	20 µs
	Max.	400 µs	400 µs	360 µs	360 µs	90 µs

Note that the times are extended if higher-priority interrupts are queued up for processing, and if the hardware interrupt OB is assigned to a process image partition. You can find these times in the table Times for interrupts (Page 18).

Impact of communication on interrupts

Communication tasks are always processed by the CPU with priority 15. If you do not want the interrupt processing to be delayed or interrupted by communication, configure the interrupt processing with priority > 15. The default setting for interrupt processing is priority 16.

Reference

You can find additional information on the number of available organization blocks in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual, in the Events and OBs chapter.

You can find additional information on the topic of "Configuring hardware interrupts" in the STEP 7 online help.

See also

User program processing time (Page 17)

4.2 Process response time when program execution is event-driven

When program execution is event-driven, the process response time is determined by the following:

- Delay times of the input and output modules used
- Update times for PROFIBUS/PROFINET, if distributed modules are used
- Interrupt response time of CPU
- Runtimes of the interrupt OB including update of the process image partition

The following figure shows the individual processing steps for event-driven program processing.

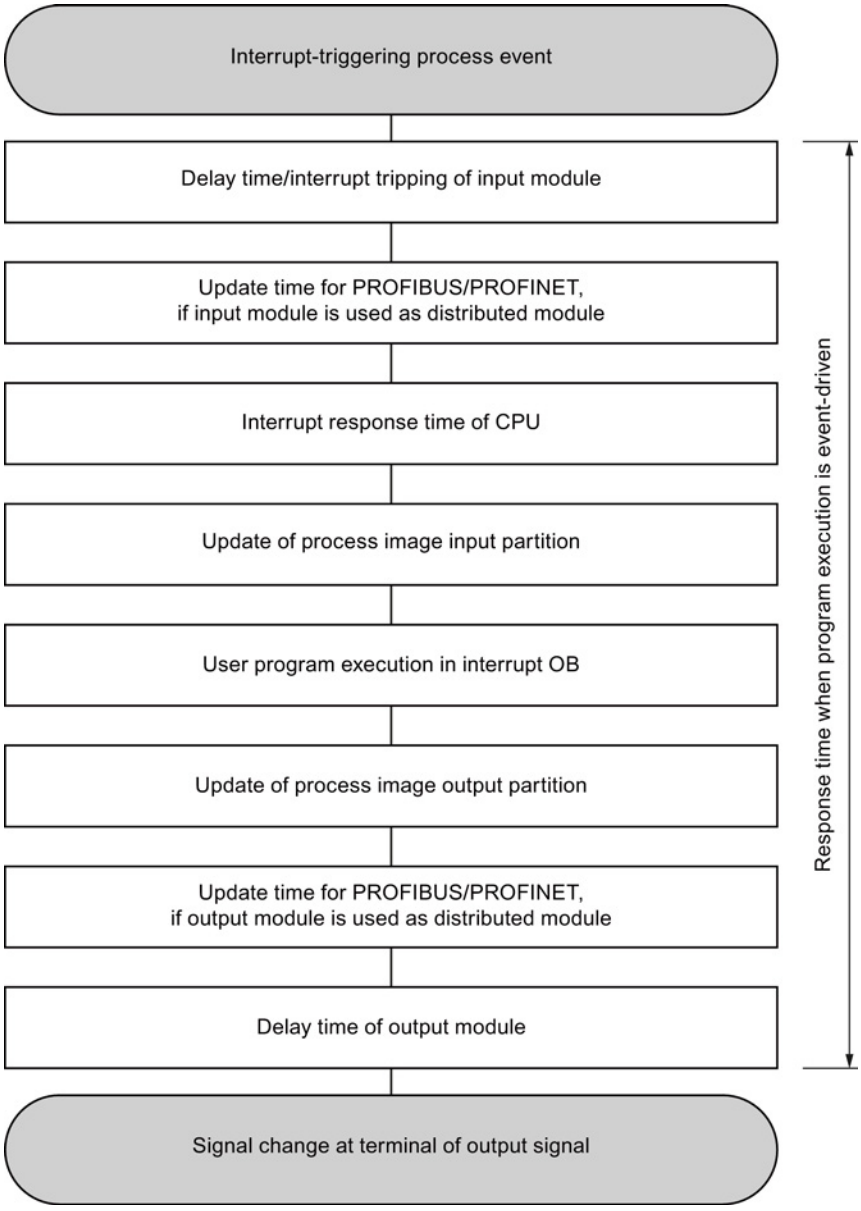

Figure 4-1 Schematic representation of event-driven program processing

Glossary

Automation system

An automation system in the context of SIMATIC S7 is a programmable logic controller.

Cycle time

The cycle time represents the time a CPU requires to process the user program once.

Cyclic interrupt

A cyclic interrupt is generated periodically by the CPU in a configurable time pattern. At this point in time the corresponding organization block is processed.

Diagnostic interrupt

Modules capable of diagnostics operations report detected system errors to the CPU by means of diagnostic interrupts.

Hardware interrupt

A hardware interrupt is started by interrupt-triggering modules when a specific event occurs in the process. The hardware interrupt is reported to the CPU. The assigned organization block will be processed according to interrupt priority.

Interrupt

The CPU's operating system distinguishes between various priority classes that control the processing of the user program. These priority classes include interrupts, e.g. hardware interrupts. When an interrupt occurs, the operating system automatically calls an assigned organization block, in which the user programs the desired response.

Process image

The process image is part of CPU system memory. At the start of the cyclic program the signal states of the input modules are transmitted to the process image of the inputs. At the end of the cyclic program the process image of the outputs is transmitted as signal state to the output modules.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation describes the various memory areas of the S7-1500 CPU, and shows you how to make the best use of these memory areas.

The manual also shows you how to free work memory by using recipes and Data Logs.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the SIMATIC industrial automation system
- Knowledge about the use of computers
- Knowledge of working with the TIA Portal and STEP 7

Conventions

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation is valid for all CPUs of the S7-1500 product family.

Additional support

- The range of technical documentation for the individual SIMATIC products and automation systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (www.siemens.com/industrymall).

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-1500 system consists of a system manual, function manuals and device manuals.

The STEP 7 information system (Online Help) also helps you configure and program your automation system.

Overview of the documentation on the structure and use of the CPU memory

The following table lists additional documentation which supplements this description of the structure and use of CPU memory.

Table 1- 1 Documentation on the structure and use of the CPU memory

All current manuals for the SIMATIC products are available for download free of charge from the Internet (http://www.siemens.com/automation/service&support).

Memory areas and retentive memory

2

2.1 CPU memory areas

Introduction

This chapter describes the memory structure of S7-1500 CPUs.

CPU memory areas

The following figure shows the CPU memory areas and the load memory on the SIMATIC memory card. In addition to the load memory, the SIMATIC memory card may also contain other data, such as recipes, Data Logs and HMI backups.

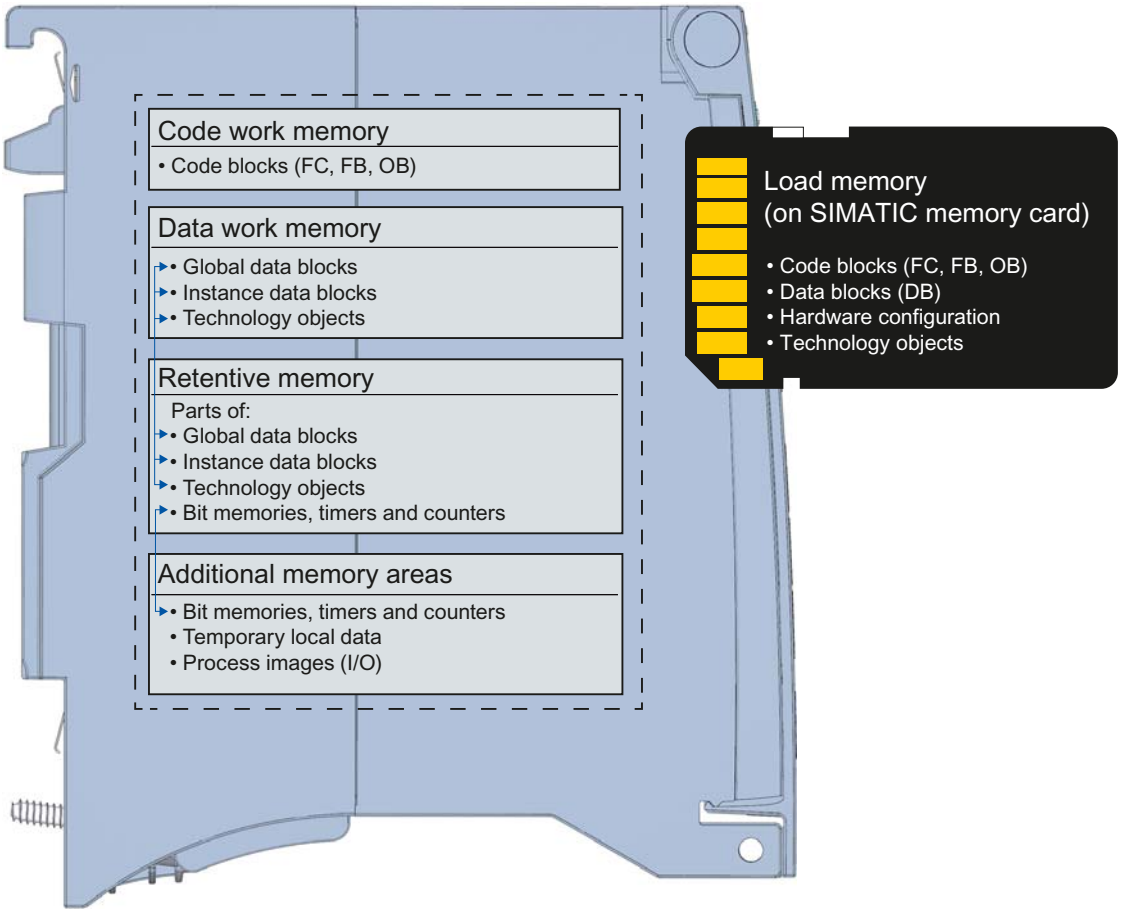

Figure 2-1 CPU memory areas

Load memory

The load memory is a non-volatile memory for code blocks, data blocks, technology objects, and hardware configuration. When these objects are downloaded to the CPU they are first saved into load memory. This memory is located on the SIMATIC memory card.

Note

To run the CPU, a SIMATIC memory card must be inserted.

Work memory

The work memory is volatile memory that contains the code and data blocks. The work memory is integrated into the CPU and cannot be extended.

In the S7-1500 CPUs, the work memory is divided into two areas:

- Code work memory: The code work memory contains runtime-relevant parts of the program code.
- Data work memory: The data work memory contains the runtime-relevant parts of the data blocks and technology objects. At the operating mode transitions POWER ON to startup and STOP to startup, tags from global data blocks, instance data blocks and technology objects are initialized with their start values; retentive tags retain their actual values as saved in the retentive memory.

Retentive memory

Retentive memory is non-volatile memory for saving a limited quantity of data in the event of power failure. The tags and operand areas that have been defined as retentive are saved in retentive memory. These data is retained beyond a power-off or power failure. All other program tags are lost under these conditions and are set to their start values upon the operating mode transitions POWER ON to startup, and STOP to startup.

The content of retentive memory is deleted by the following actions:

- Memory reset
- Reset to factory settings

Specified tags from technology objects are also stored in retentive memory. These tags are not deleted during memory reset.

You can find additional information on the "Memory reset" topic in the Commissioning chapter of the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual .

Information on memory areas in STEP 7

In STEP 7 you can view the offline and online information about the memory areas of your S7-1500 CPU.

Offline: When you are creating or modifying a program, you can determine whether it is too large for a specific CPU. You can find this information under "Program information" in the project tree, for example. On the Resources tab, you can find information about the total size of the memory areas, and the storage space that has already been allocated. In this location you can also find information about the assigned inputs and outputs. With a S7-1500 CPU, you can select the total size of the load memory in a drop-down list.

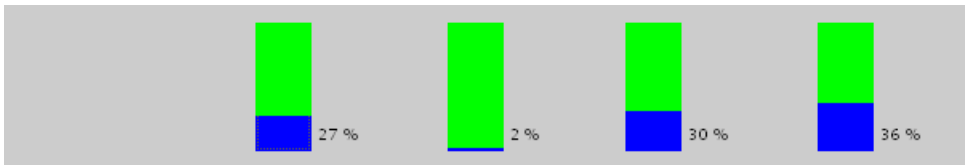
The following figure shows the drop-down list for selecting the size of the load memory:

	Objects	Load memory	Code work-memory	Data work-memory	Retain memory
1		19 %	1 %	8 %	23 %
2					
3	Total:	24 MB	1048576 bytes	5242880 bytes	484000 bytes
4	Used:	0 kB 2 MB 12 MB 24 MB 2 GB	15293 bytes	411034 bytes	110592 bytes
5	Details				
6	OB		469 bytes		
7	FC		410 bytes		
8	FB	39890 bytes	14414 bytes		
9	DB	4621700 bytes		411034 bytes	110592 bytes
10	Data types	6681 bytes	-		
11	PLC tags				0 bytes

Figure 2-2 Drop-down list for the load memory

Online: While you are online, you can check the memory utilization of your CPU in STEP 7. The online function "Memory" can be found in Online & Diagnostics under "Diagnostics > Memory".

The image below shows CPU memory utilization in the online function "Memory":



Sizes in bytes	Load memory	Code in load mem...	Data in load m...	Retentive memory
Free:	6291456	1048576	5242880	524288
In use:	2316997	17355	2299642	301234
Total:	8608453	1065931	7542522	825522

Figure 2-3 "Memory" online function

You can find additional information on your CPU's memory in the following locations in STEP 7:

- In Program information, on the Assignment list and Call structure tabs
- PLC tag table

Additional memory areas

Besides the memory areas that have been described for the user program and data, the CPU has additional memory areas available.

The additional memory areas include the following:

- Bit memories, timers and counters
- Temporary local data
- Process images

The CPU-specific sizes can be found in the technical specifications for the respective CPU.

Reference

You can find additional information on the SIMATIC memory card in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual in the SIMATIC memory card chapter.

2.2 Retentive memory areas

Introduction

The S7-1500 CPUs have memory available for storing retentive data at POWER-OFF. Details about the size of the retentive memory can be found in the technical specifications for the CPU.

In STEP 7, you can find the configured CPU's retentive memory utilization offline at "Program information > Resources" or online at Online & Diagnostics under "Diagnostics > Memory".

If you define data as retentive, its content is retained beyond program startup after STOP, or a power failure.

You can define the following data and objects as retentive:

- Bit memories, timers and counters
- Tags from global data blocks
- Tags from instance data blocks of a function block

Certain tags of technology objects are always retentive, for example, adjustment values of absolute encoders.

Bit memories, timers and counters

In STEP 7, you can define the number of retentive bit memories, timers and counters in the PLC tag table using the "Retentive memory" button.

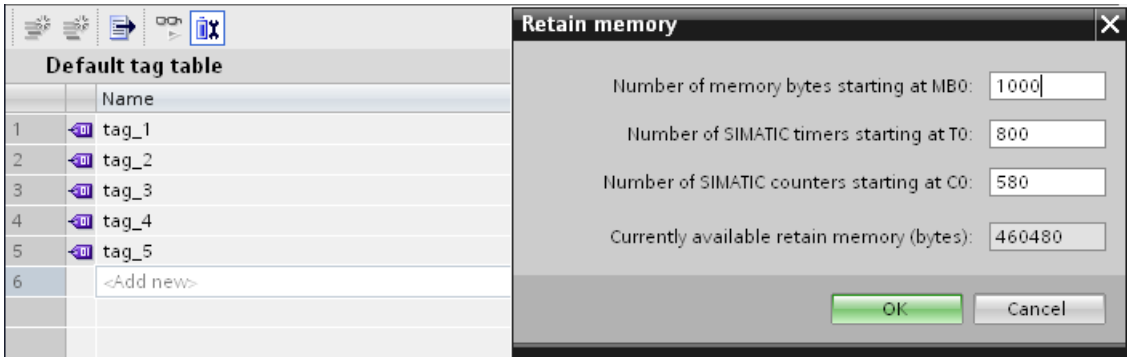


Figure 2-4 Definition of the number of retentive bit memories, timers and counters using the "Retentive memory" button

Tags from a global data block

In a global data block, you can define either individual tags from a block or all of its tags collectively as retentive, depending on the setting for the "Optimized block access" attribute:

- "Optimized block access" activated: In the declaration table of the data block, you can define individual tags as retentive.

	Name	Data type	Start value	Retain	Visible in HMI	Comment
1	Static					
2	var1	Bool	false	☑	☑	
3	var2	Bool	false	☐	☑	
4	var3	Bool	false	☑	☑	
5	var4	Bool	false	☐	☑	
6	var5	Bool	false	☑	☑	

Figure 2-5 Retentivity setting "Optimized block access" activated

- "Optimized block access" not activated: In the declaration table of the data block, you can only define the Retentivity for all tags collectively.

	Name	Data type	Offset	Start value	Retain	Visible in HMI	Comment
1	Static						
2	var6	Bool	...	false	☑	☑	
3	var7	Bool	...	false	☑	☑	
4	var8	Bool	...	false	☑	☑	
5	var9	Bool	...	false	☑	☑	
6	var10	Bool	...	false	☑	☑	

Figure 2-6 Retentivity setting "Optimized block access" not activated

Tags from an instance data block of a function block

In STEP 7, you can define the tags from the instance data block of a function block as retentive. Depending on the setting for the "Optimized block access" attribute, you can define retentivity either for individual tags from a block or for all of its tags collectively:

- "Optimized block access" activated: In the interface of the function block, you can define individual tags as retentive.
- "Optimized block access" not activated: In the instance data block, you can only define the retentivity of all tags collectively.

Creation of a data block in the user program

You use the "CREATE_DB" instruction to create a data block in the user program. Depending on the selection for the ATTRIB parameter, the generated data block either has the property "retentive" or the property "non-retentive". Setting the retentivity for individual tags is not possible here.

You can find additional information on the "CREATE_DB" instruction in the STEP 7 online help under "PLC programming > References > References (S7-1200/1500) > Extended instructions > Data block functions > CREATE_DB".

Tags of technology objects

Certain tags of technology objects are retentive, for example adjustment values of absolute encoders. STEP 7 automatically manages the retentivity of technology object tags, so you do not have to configure their retentivity.

The retentive tags of technology objects are unaffected by a memory reset. They can only be deleted by resetting to factory settings.

Reference

You can find additional information on configuring retentivity in the STEP 7 online help.

2.3 Summary of retentive behavior

Retentive behavior of the memory objects

This chapter gives an overview of the retentive behavior of memory objects for S7-1500 CPUs. Besides the retentive memory areas described so far, there are additional objects with retentive behavior, such as the diagnostic buffer. These objects do not allocate any storage space in the retentive memory.

The following table shows the retentive behavior of the memory objects at the operating mode transitions STOP to startup and POWER ON to startup, as well as the memory-influencing functions Memory Reset and Reset to Factory Settings.

Table 2- 1 Retentive behavior of the memory objects

Memory object	Operating mode transitions		Memory reset	Reset to factory settings
	STOP → STARTUP	POWER ON → STARTUP		
Actual values of the data blocks, instance data blocks	Can be set in the Properties of the DB in STEP 7.[1]		-	-
Bit memories, timers and counters -configured as retentive data	x	x	-	-
Bit memories, timers and counters - configured as non-retentive	-	-	-	-
Certain retentive tags from technology objects (for example, adjustment values of absolute encoders)	x	x	x	-
Diagnostic buffer entries (retentive area)	x	x	x	-
Diagnostic buffer entries (non-retentive area)	x	-	-	-
Operating hours counter	x	x	x	-
Clock time	x	x	x	-
x = content is retained – = object is initialized				

1) For DBs with optimized access the retentive behavior is configurable for specific tags.

Diagnostic buffer

With the S7-1500 CPUs, a portion of the diagnostic buffer is retentive. The number of retentive diagnostic buffer entries depends on the type of CPU. The latest entries in the diagnostic buffer are retained after power failure, and are not affected by a memory reset The retentive portion of the diagnostic buffer can only be deleted by resetting to factory settings. The entries in the diagnostic buffer allocate no storage space in the retentive memory.

Operating hours counter

The operating hours counters of the S7-1500 CPUs are retentive and are not affected by a memory reset. By resetting to factory settings, the clock time is set to zero.

Clock time

The clock time of the S7-1500 CPUs is retentive and is not affected by a memory reset. By resetting to factory settings, the operating hours counters are set to 01/01/2012 00:00:00.

Reference

You can find additional information on Memory Reset and Resetting to Factory Settings in the S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

2.4 Memory behavior when loading software changes

Introduction

In the STOP and RUN modes of the S7-1500 CPU, you can load changes to the software without this affecting the actual values of tags already loaded.

In STEP 7, you load changes to the software under "Download to device > Software (only changes)".

Impact of software changes on PLC tags

You can load the following software changes without affecting the actual values of tags that have already been loaded:

- Name change
- Comment change
- Addition of new tags
- Deletion of tags
- Change of retentivity settings for Bit memories, times, and counters (Page 13)

The actual values are affected by loading the following software changes:

- Data type change
- Address change

Impacts of software changes on data blocks with memory reserve

If you are using memory reserve for data blocks ("Optimized block access" attribute and "Download without reinitialization" button activated), you can load the following software changes without this reinitializing the actual values of tags which have already been loaded:

- Start value change
- Comment change
- Addition of new tags

To load the following software changes, you must deactivate the "Download without reinitialization" button. During the next load, all actual values of the data block will be reinitialized:

- Name change
- Data type change
- Retentivity change
- Deletion of tags
- Changes to the memory reserve settings

Impacts of software changes on data blocks without memory reserve

If you are not using memory reserve, you can load the following software changes without this reinitializing the actual values of tags that have already been loaded:

- Start value change
- Comment change

When loading the following software changes, all actual values of the data block will be reinitialized:

- Name change
- Data type change
- Retentivity change
- Addition of new tags
- Deletion of tags

Memory reserve of data blocks

Each function block or data block with the "Optimized block access" attribute activated contains, by default, a memory reserve which you can use for subsequent interface changes. The memory reserve is initially not used. When you have compiled and loaded the block, and then observe that you want to reload interface changes, activate the memory reserve. All tags that you subsequently declare will be placed in the memory reserve. During the next load, the new tags are then initialized to their start values. Tags which have already been loaded are not reinitialized.

The setting for memory reserve can be found in STEP 7 in the data block properties under "Download without reinitialization".

Reference

You can find additional information on setting and activating the memory reserve, and on loading block changes, in the online help for STEP 7 under "PLC programming > Create user program > Compile and download blocks > Download blocks > Download block extensions without reinitialization".

Memory usage and application examples

3

3.1 Memory usage for recipes

Introduction

A recipe represents a collection of parameter records with the same structure. These recipe data records are located in a non-runtime-relevant data block in the load memory, and do not occupy any storage space in the work memory. You have the option of reading individual recipe data records into a data block in work memory, and to access the data in the user program. You can write a recipe data record that has been changed in the user program back to the recipe data block.

Processing sequence

- **Saving a recipe in load memory**

  The various data records of a recipe are filled in a non-runtime-relevant DB in STEP 7 and then loaded to the CPU. In order to configure a non-runtime-relevant DB, you must activate the Only store in load memory" block attribute. Thus the recipes only use storage space in load memory, and not in work memory.

- **Working with recipe data in the user program**

  The "READ_DBL" instruction reads a data record belonging to the current recipe from the DB in the load memory to a runtime-relevant DB in the work memory. As a result, the work memory only has to accommodate the data for the currently required recipe data record. The user program can now access the data of the current data record.

- **Saving back changed recipe data records**

  You can use the "WRIT_DBL" instruction to write new or changed data records of a recipe from the user program back to the load memory. The data written to load memory are portable and not affected by a memory reset. If you back up changed data records (recipes) on the PG/PC, data blocks must be uploaded and saved on the PG/PC.
  You can find information on uploading data blocks in the online help for STEP 7 under "PLC programming > Compile and download blocks > Download blocks > Download blocks from a memory card".

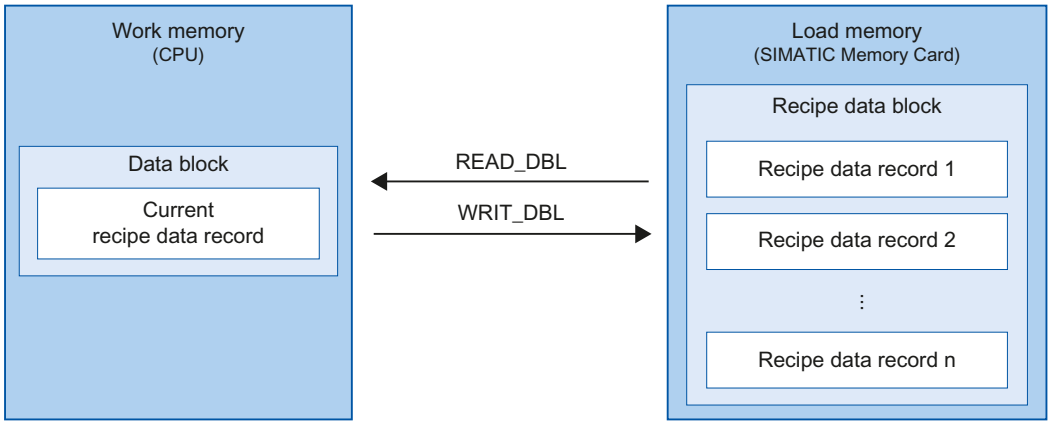

Figure 3-1 Processing sequence with "READ_DBL" and "WRIT_DBL"

Note

Instructions that access the SIMATIC memory card have a lower performance than instructions that access the work memory. The associated blocks (e.g. READ_DBL and WRIT_DBL) are therefore asynchronous. Their execution extends if necessary over several cycles.

Note

Service life of the SIMATIC memory card

Only a limited number of delete and write operations are possible on the SIMATIC memory card. Avoid repeated (cyclic) write operations by the user program

Import and export of recipe data

You have the option of exporting a recipe DB's recipe data records as a csv file, and of importing them from a csv file into a DB. The csv file is located in the "\recipes" directory of the SIMATIC memory card, and can be opened and processed further with a spreadsheet program such as Microsoft Excel.

You can easily manage the csv files on the SIMATIC memory card using the CPU's web server (e.g. renaming, saving to hard disk, deleting, ...). In order to prevent unwanted tampering, configure the access privileges for the web server in STEP 7. Additional information on the web server can be found in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) function manual, in the File Browser chapter.

- **Export of recipe data**

  The "RecipeExport" instruction exports all of a recipe DB's recipe data records from load memory to a csv file on the SIMATIC memory card. The csv file has the same name as the DB's recipe. The csv file is stored in the "\recipes" directory on the SIMATIC memory card.

  Only valid and unencrypted recipe data records are exported.

- **Import of recipe data**

  The "RecipeImport" instruction imports all recipe data records from the csv file into the recipe DB in load memory. The name of the csv file must match the name of the recipe DB.

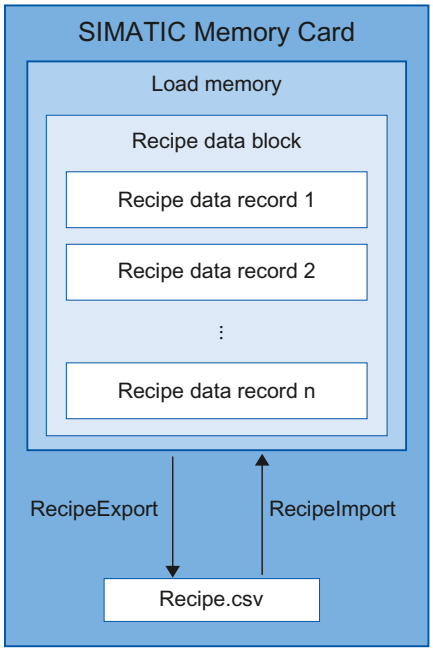

Figure 3-2 Import and export of recipe data

Reference

You can find further information on the instructions for recipes in the online help for STEP 7 under "PLC programming > References > References (S7-1200/1500) > Extended instructions > Recipes and data logging > Recipe functions".

3.2 Memory usage for data logging

3.2.1 Overview of data logging

Your controller program can store process values in Data Logs using the "Data Logging" instructions. The Data Logs are saved in csv format in the "\datalogs" directory of the SIMATIC memory card. The data records are organized in a circular Data Log of a predefined size.

The "Data Logging" instructions are used in your program to create, open and write Data Logs and to close Data Logs. You decide which tags are to be logged by creating a data block that defines a single Data Log data record. Your data block is used as temporary storage for a new Data Log data record. New actual values for the tags must be transferred into the data block during runtime by means of user program instructions. Once all tag values have been updated, you can execute the "DataLogWrite" instruction to transfer data from the data block to the Data Log.

You manage your Data Logs with the integrated Web server. On the standard "File browser" Web page, you can download or delete Data Logs. Once you have transferred a Data Log to your PC, you can analyze the data using a standard spreadsheet program such as Microsoft Excel.

The following figure shows the basic sequence for creating Data Logs:

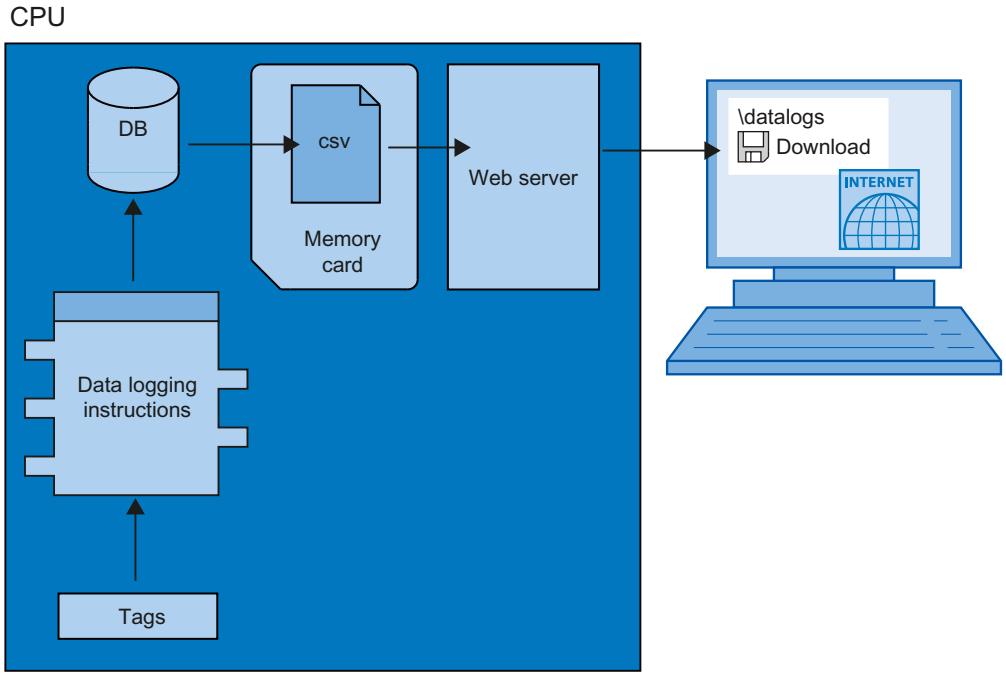

Figure 3-3 Basic procedure for creating Data Logs

3.2.2 Data structure of the data logs

Introduction

You use the "DataLogCreate" instruction to create a Data Log in STEP 7. The NAME parameter assigns the Data Log a name. The DATA and HEADER parameters specify the data type of all data elements in a Data Log data record and the header of the Data Logs. The RECORDS parameter indicates the maximum number of data records in the Data Logs.

NAME parameter for the "DataLogCreate" instruction

You use the NAME parameter to assign a name for the Data Log. This is the name under which the Data Log is saved in the "\datalogs" directory of the SIMATIC memory card.

DATA parameter for the "DataLogCreate" instruction

The DATA block parameter specifies the structure of the Data Log data records. The columns and data types of a data record in the Data Log are determined by the elements of the structure declaration or array declaration of this data buffer. Each element of a structure or an array corresponds to a column in a row in the Data Log.

HEADER parameter for the "DataLogCreate" instruction

Using the HEADER block parameter, you can assign a heading in the header row to each column in the Data Log.

RECORDS parameter for the "DataLogCreate" instruction

The RECORDS parameter specifies the maximum number of data records that can be stored in a Data Log. If the specified maximum number of data records in a Data Log is reached, the next write operation will overwrite the oldest data record.

3.2.3 Instructions for data logging

Overview

The following table gives an overview of the instructions for Data Logging. You will find the "Data Logging" instructionsin STEP 7 in the "Instructions" task card, under "Extended instructions > Recipe and data logging > Data Logging".

Table 3- 1 Overview of the "Data Logging" instructions

Name of the instruction	Description
"DataLogCreate": Create data log	You use the "DataLogCreate" instruction to create a Data Log. The Data Log is saved on the SIMATIC memory card in the "\datalogs" directory. You can use the data logging instructions to save process data. The amount of data that can be stored in a Data Log depends on the storage space available on the SIMATIC memory card.
"DataLogOpen": Open data log	You use the "DataLogOpen" instruction to open an existing Data Log on the SIMATIC memory card. Before you can write new data records to a Data Log, the Data Log must be open. The Data Log is automatically opened when the "DataLogCreate" and "DataLogNewFile" instructions are executed. A maximum of 10 Data Logs can be open at any one time. You can select the Data Log to be opened using either the ID or the name of the Data Log.
"DataLogWrite": Write data log	You use the "DataLogWrite" instruction to write a data record to an existing Data Log. Use the ID parameter to select the Data Log to which the data record is to be written. Before a new data record can be written, the Data Log must be opened.
"DataLogClose": Close data log	You use the "DataLogClose" instruction to close an open Data Log. You use the ID parameter to select the Data Log. All open Data Logs are closed when the CPU switches to STOP.
"DataLogNewFile": Data log in new file	You use the "DataLogNewFile" instruction to create a new Data-Log with the same properties as an existing Data Log. By creating new Data Logs, you prevent cyclic overwriting of existing data records. When the instruction is called, it creates a new Data Log on the SIMATIC memory card with the name defined at the NAME parameter. Use the ID parameter to specify the ID of the existing Data Log whose properties you want to apply to the new Data Log. The ID of the new Data Log is then output at the ID parameter.
"DataLogClear": Clear data log	Use the "DataLogClear" instruction to delete all data records from an existing Data Log. The header of the Data Log is not deleted (see the description of the parameter HEADER of the "DataLogCreate" instruction (Page 26)).
"DataLogDelete": Delete data log	You use the "DataLogDelete" instruction to delete a Data Log from the SIMATIC memory card. Select the Data Log to be deleted using the NAME and ID parameters.

Reference

You can find further information on "Data Logging" instructions in the online help for STEP 7 under "PLC programming > References > References (S7-1200/1500) > Extended instructions > Recipes and data logging > Data Logging".

3.2.4 Example program for data logging

This example program shows the storing of 3 process values for counter state, temperature, and pressure in a Data Log.

The example shows the basic function of the instructions for Data Logs. The complete program logic is not shown.

Note

General use of Data Logs

- Data Logs are automatically opened after execution of the "DataLogCreate" and "DataLogNewFile" instructions.
- Data Logs are automatically closed when the CPU switches from RUN to STOP and upon CPU restart.
- Before data can be written to a Data Log with the "DataLogWrite" instruction, the Data Log must be open.
- No more than ten Data Logs can be open simultaneously, even if there are more than ten Data Logs.

Tags of the data block

The following figure shows the tags of the "My_Datalog_Vars" data block. These tags are used by the "Data Logging" instructions "DataLogCreate" and "DataLogNewFile". The "MyDataLogName" and "MyNEWDataLogName" tags are called in the NAME block parameter, and give the Data Logs a name. The "MyData" structure is called in the DATA block parameter and specifies the structure of the csv file. The three MyData tags temporarily store new values. The tag values at these DB addresses are transferred to a Data Log using the "DataLogWrite" instruction. The "MyDataLogHeaders" tag is called in the HEADER block parameter and specifies a header for the Data Log.

My_Datalog_Vars

	Name	Data type	Start value
1	Static		
2	MyNEWDataLogName	String	'MyNEWDataLog'
3	MyDataLogName	String	'MyDataLog'
4	MyDataLogID	DWord	0
5	MyDataLogHeaders	String	'Count,Temperature,Pressure'
6	MyData	Struct	
7	MyCount	Int	0
8	MyTemperature	Real	0.0
9	MyPressure	Real	0.0

Figure 3-4 Declaration table with the data block's tags

Network 1

A rising edge at REQ starts the creation of the Data Log.

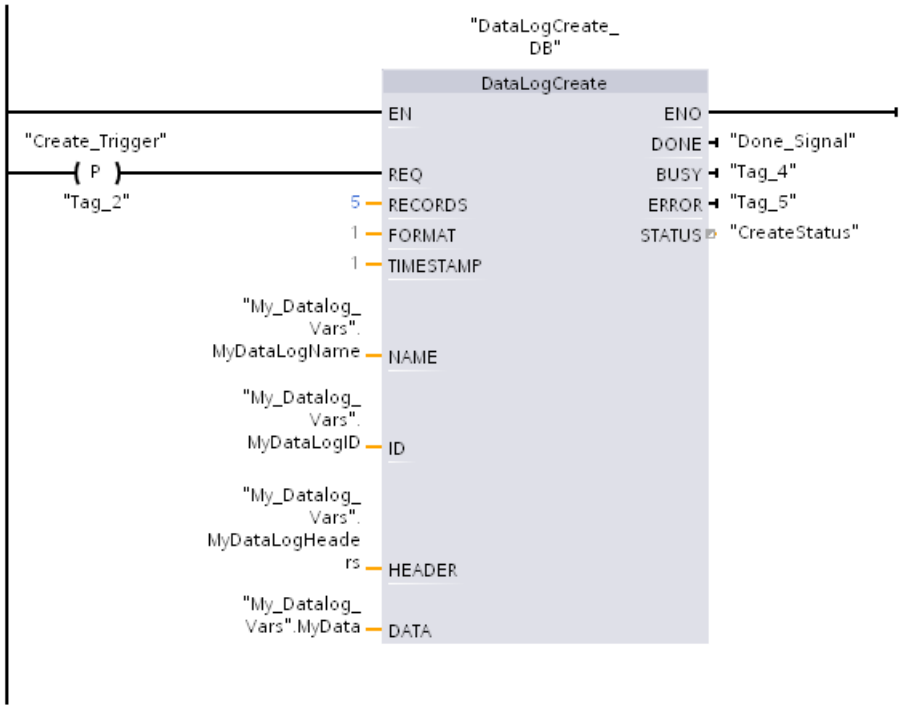

Figure 3-5 Network 1

Network 2

Detect the output DONE from "DataLogCreate", because after the execution of "DataLogCreate" it is only set to 1 for a call.

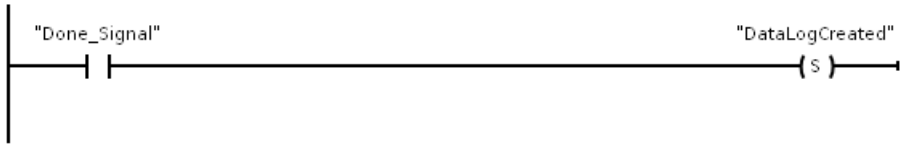

Figure 3-6 Network 2

Network 3

A rising edge triggers the point in time at which new process values are stored in the MyData structure.

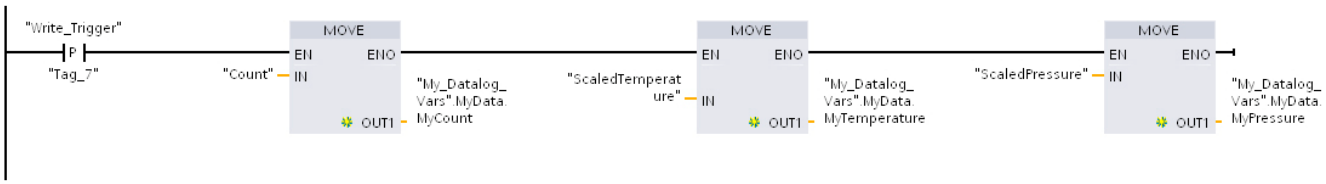

Figure 3-7 Network 3

Network 4

The state of the input EN is based on the point in time at which the execution of "DataLogCreate" was completed. One execution of "DataLogCreate" extends over multiple cycles, and must be completed before a write operation is executed. The rising edge at input REQ is the event, that triggers an activated write operation.

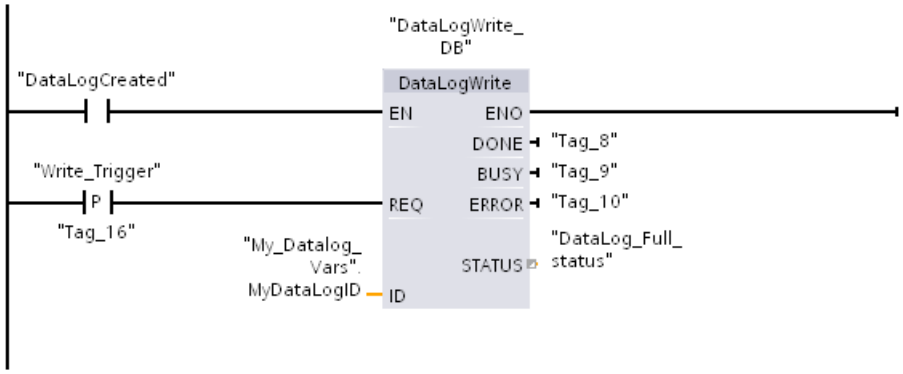

Figure 3-8 Network 4

Network 5

Close the Data Log once the last data record has been written. After execution of the "DataLogWrite" instruction, which writes the last data record, the STATUS output is set to "1".

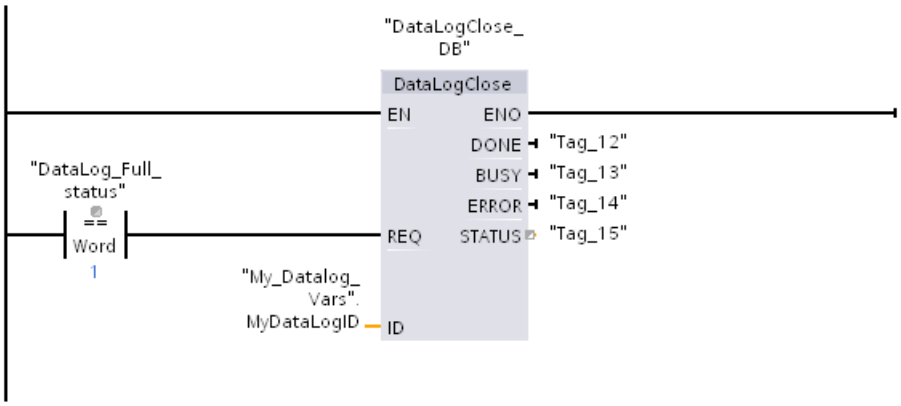

Figure 3-9 Network 5

Network 6

A rising edge at the REQ input of the instruction "DataLogOpen" simulates the user pressing a button on an HMI device which opens a Data Log. If you open a Data Log in which all data records have been allocated process data, the next execution of the "DataLogWrite" instruction will overwrite the oldest data record. You can, however, also retain the old Data Log and instead create a new Data Log. This is shown in network 7.

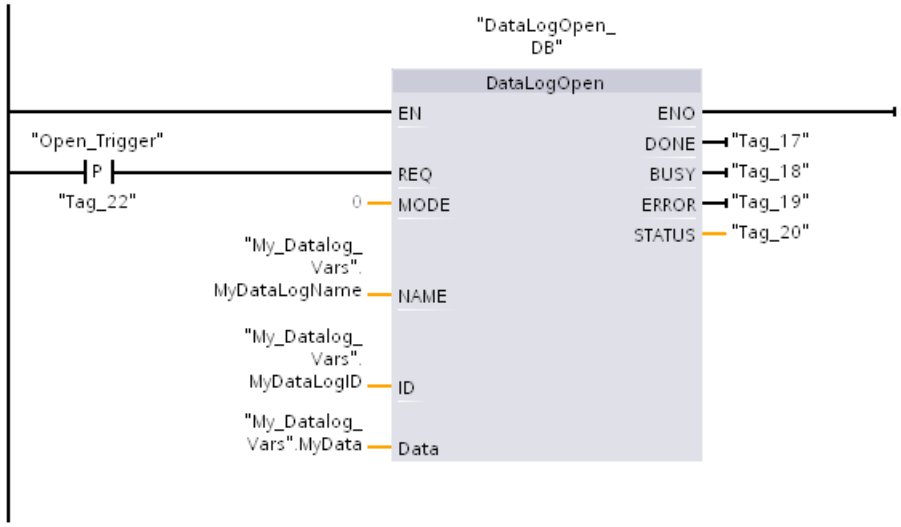

Figure 3-10 Network 6

Network 7

The ID parameter is an IN/OUT type. First, you enter the ID value of the existing Data Log whose structure you want to copy. Once the "DataLogNewFile" instruction has been executed, a new and unique ID value for the new Data Log will be written back to the address of the ID reference. The required detection DONE bit = TRUE is not shown. An example for the logic of the DONE bit can be found in networks 1, 2 and 4.

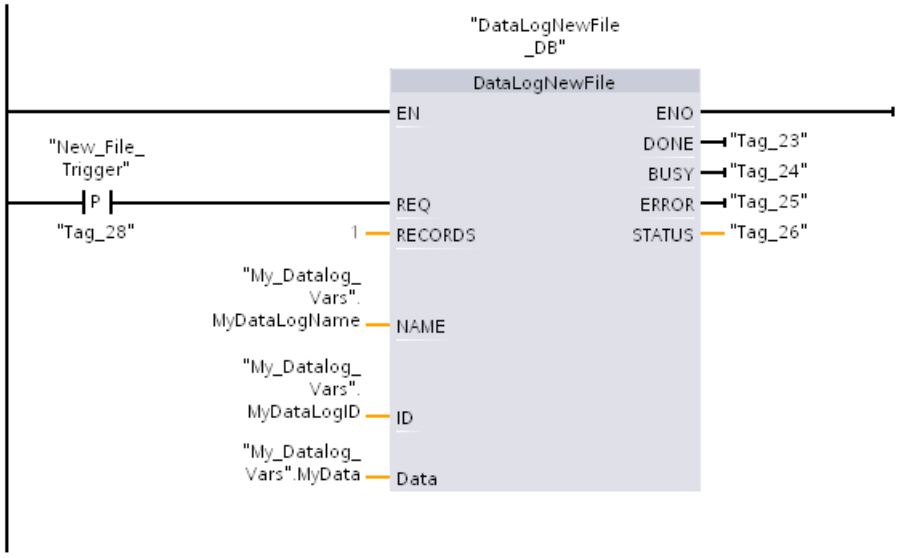

Figure 3-11 Network 7

The Data Logs created in the example program can be found on the S7-1500 CPU Web server standard "File browser" Web page in the "\datalogs" folder.

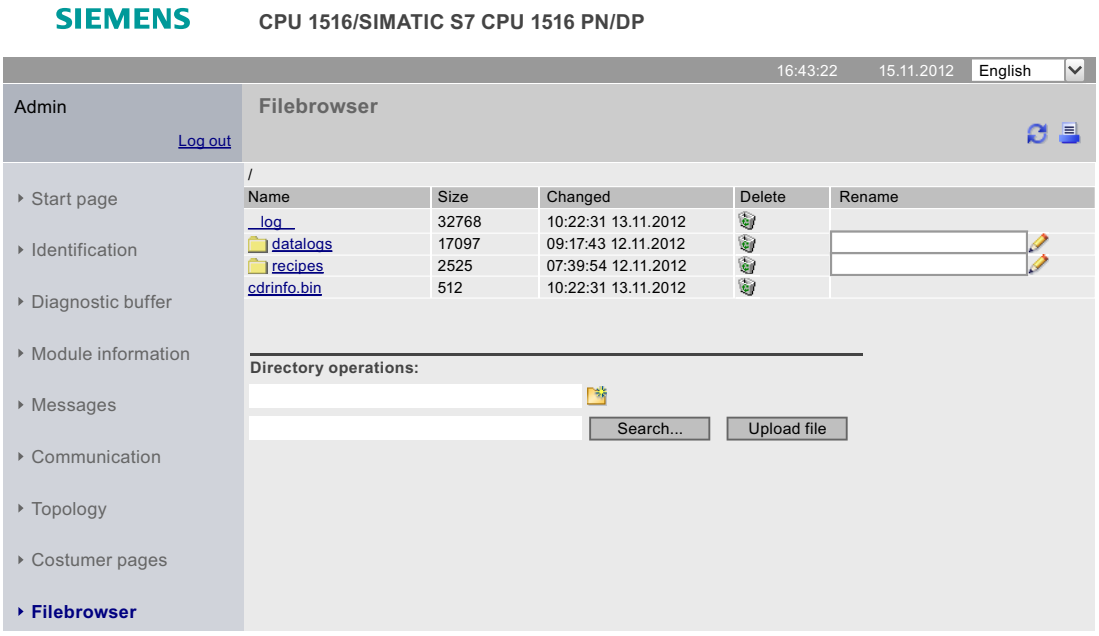

Figure 3-12 Standard "File browser" web page of the web server

In the file browser, you can download, delete or rename the Data Logs created in the example program.

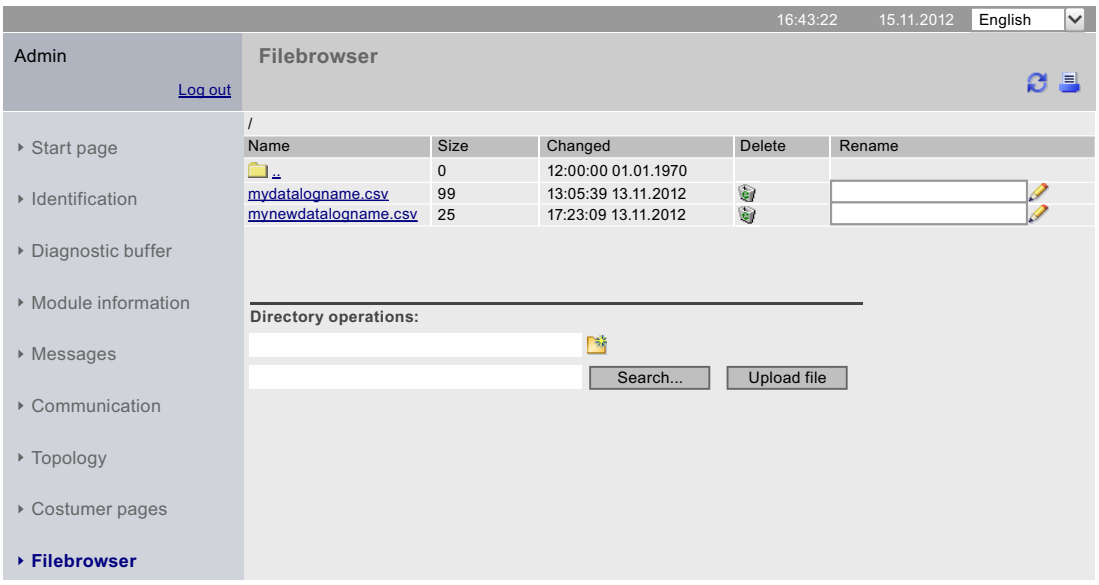

Figure 3-13 Sample Data Logs in the "\datalogs" folder of the file browser

Table 3- 2 Downloaded examples of data logs displayed in Microsoft Excel

Two data records written in a Data Log which contains a maximum of five data records.	Five data records written in a Data Log which contains a maximum of five data records.	After another data record has been written, the 6th write operation overwrites the oldest data record (record 1) with data record 6. Another write operation overwrites data record 2 with data record 7, etc.	
	A	B	C	D	E	F

Glossary

Bit memory

Bit memory is a memory area of the CPU, which can be addressed from any code block (FC, FB, OB). You have read/write access to this memory area. The bit memory area can be used to store temporary results, for example.

Counters

In STEP 7, counting tasks are performed using counters. You can modify the contents of the "counter cells" using STEP 7 instructions (for example, count up/down).

Data block

Data blocks store information for the program. They can be defined in two ways: either that all code blocks can access them (global data block), or that they are assigned to a specific FB or SFB (instance data block).

Data log

Data logs are csv files for the storage of tag values. The data logs are saved on the SIMATIC memory card in the "\datalogs" directory. Data records of tag values are written to a data log by means of instructions in the user program

Global data block (DB)

Every function block, every function, and every organization block can read the data from a global data block, or write its own data to a global data block. This data is retained in the data block, even when the data block is exited.

Instance data block (IDB)

A data block is assigned to each call of a function block in the STEP 7 user program. The instance data block stores the values of input, output and in/out parameters, as well as local block data.

Local data

This memory area accepts the temporary local data of a block for the duration of processing.

Memory reset

During memory reset the CPU is shifted into the configured initial state.

Optimized block access

Data blocks with optimized access have a no fixed defined structure. In the declaration, the data elements only receive a symbolic name, and no fixed address within the block. The elements are automatically so arranged in the block's available memory area, that its capacity is optimally exploited.

In these data blocks, you can only address tags symbolically. For example, you would access the "FillState" tag in the "Data" DB as follows:

"Data".FillState

Optimized access offers the following advantages:

- The data is structured and saved in a manner that is optimal for the CPU used. This allows you to increase CPU performance.
- Access errors, from HMI, for example, are not possible.
- You can selectively define individual tags as retentive.

Process images (I/O)

The CPU transfers the values from the input and output modules in this memory area. At the start of the cyclic program the signal states of the input modules are transmitted to the process image of the inputs. At the end of the cyclic program the process image of the outputs is transmitted as signal state to the output modules.

Reset to factory setting

Resetting to factory settings restores the CPU settings to the delivery state.

Restart

Restart occurs at the transitions from STOP to STARTUP, and POWER ON to STARTUP. Before processing the cyclic program processing, the CPU first processes the startup OB or OBs.

Restart has the following effects on the memory areas of the CPU:

- The process images are deleted.
- The retentive tags of data blocks retain the values saved in retentive memory.
- All retentive bit memories, timers, and counters retain the values saved in retentive memory.
- All non-retentive user data is initialized:
  - Data blocks receive their start value
  - Bit memories, timers, and counters with "0"

SIMATIC memory card

Memory for the user program for programmable modules and communication processors. You can also use the SIMATIC memory card for changing user software and user data.

Standard access

Data blocks with standard access have a fixed structure. In the declaration, the data elements receive both a symbolic name and a fixed address within the block. The address is displayed in the "Offset" column.

In these data blocks, you can address tags both symbolically and absolutely.

"Data".FillState

DB1.DBW2

Timers

In STEP 7, programmed time processes are performed using timers. The content of timer cells is automatically updated by the operating system, asynchronously to the user program. STEP 7 instructions are used to define the precise function of the timer cell (for example, on-delay time) and to trigger their execution (for example, start).

User program

The user program contains all instructions, declarations and data for signal processing required to control a plant or a process. The user program is assigned to a programmable module (for example, CPU, CM) and can be structured in smaller units.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation supports you in the operation of the Web server.

The Web server of the S7-1500 CPU and the ET 200SP CPU offer, among other things, web page access to diagnostics data and to process data of the CPU.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge in the field of automation technology
- Knowledge of the industrial automation system SIMATIC
- Experience of working with Windows-based computers
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of validity of the documentation

This documentation is valid for CPUs as of firmware version V1.7 and contains illustrations of the Web server user interface. The illustrations used were prepared for the CPU 1516-3 PN/DP and are applicable to all S7-1500 and ET 200SP CPUs.

The displayed illustrations can differ in their details depending on the browser used.

Changes compared to previous version

Compared to the previous version, this documentation contains the following amendments:

- Information on the use of the Web server for safety-related central processing units
- Integration of a customized home page
- Rules for reading and writing PLC tags when creating user pages

Conventions

- In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".
- This documentation uses the term "User pages" for the designation "User-defined web pages" that is used in STEP 7 (TIA Portal).

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Additional support

- The range of technical documentation for the individual SIMATIC products and SIMATIC systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

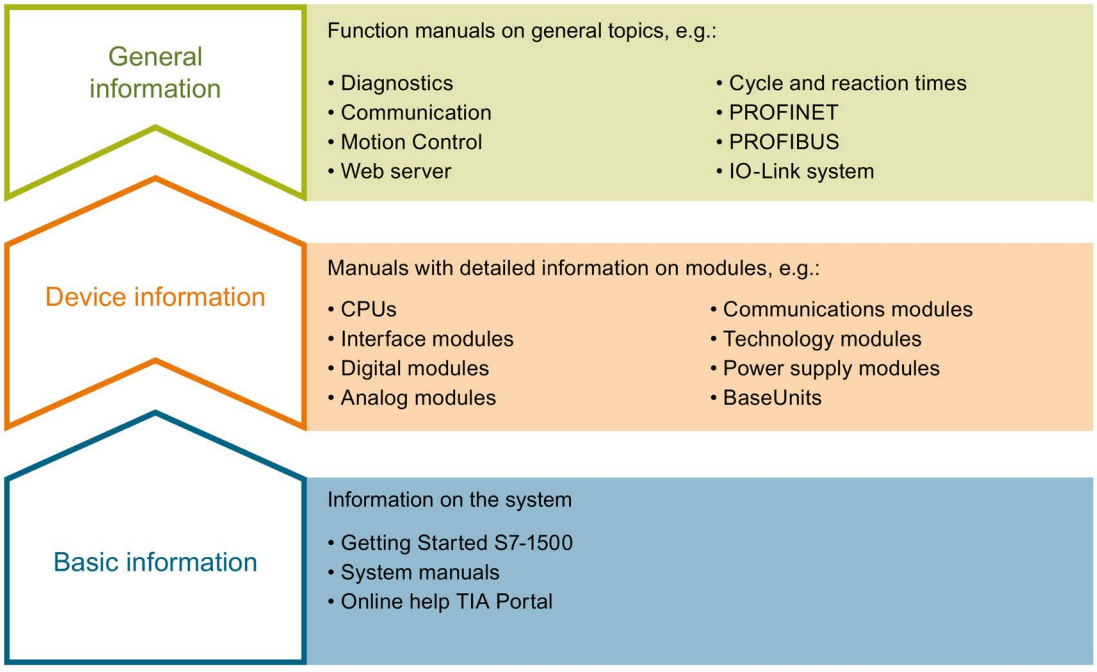
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP, ET 200SP and ET 200AL distributed I/O systems is divided into three areas. This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/86140384)
- ET 200SP (http://support.automation.siemens.com/WW/view/en/84133942)
- ET 200AL (http://support.automation.siemens.com/WW/view/en/95242965)

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

General information 2

2.1 Properties of the Web server

Benefits of the Web server

The Web server lets you monitor and administer the CPU through authorized users by means of a network. This permits evaluation and diagnostics over long distances. Monitoring and evaluation is possible without STEP 7; all you need is a web browser. Make sure that you take appropriate measures (e.g., limiting network access, using firewalls) to protect the CPU from being compromised.

Activating the Web server

The Web server is deactivated in the delivery state of the CPU. This means that you must load a project in which the Web server is activated to enable access using the web browser.

Safety functions

The Web server provides the following security functions:

- Access via secure transmission protocol "https"
- User authorizations you can configure by means of user list
- Enabling for specific interfaces

Web browser

You need a web browser to access the HTML pages of the CPU.

The following web browsers have been tested for communication with the CPU:

- Internet Explorer (Version 8 to 11)
- Mozilla Firefox (Version 22 to 32)
- Google Chrome (version 33 to 38)
- Mobile Safari and Chrome for iOS (iOS 8)
- Android Browser and Android Chrome (JellyBean operating system)

Note

If you access the Web server of the CPU using a communication processor (CP), ensure that the cache (temporary Internet files) is enabled in your browser. Choose the "Automatically" option in the cache settings of your browser.

If the cache is disabled or if a setting other than "Automatically" is made in the cache settings of your browser, this may result in slow access times and incomplete display.

Reading out information

The following information can be read out from the CPU with the Web server:

- Start page with general CPU information (Page 21)
- Information on Diagnostics (Page 25)
  - Identification
  - Memory usage
- Content of the diagnostics buffer (Page 27)
- Module information (Page 28)
- Alarms (Page 37) (without acknowledgment option)
- Information on Communication (Page 39)
  - Important interface parameters
  - Port statistics
  - Display of the communication resources
  - Display of the communication connections
- PROFINET-Topology (Page 45)
  - Display of the actual topology
  - Display of the set topology specified in configuration data
- Tag status (Page 55)
- Watch tables (Page 57)
- User pages (Page 59)
- File browser (Page 88)
- DataLogs (Page 89)
- Reading out service data (Page 90)
- Basic websites (Page 91)

On the following pages you will find detailed information on the HTML pages.

Web access to the CPU via PG/PC, HMI devices and mobile terminal devices

Proceed as follows to access the Web server:

1. Use STEP 7 to download a project to the CPU in which the Web server is enabled.
2. Enable WLAN on the display device and establish a connection to the access point (e.g., SCALANCE W788-1RR or SCALANCE W784-1, etc.).
   If you are not working with WLAN, connect the display device (PG/PC, HMI, mobile terminal device, such as tablet PC or smartphone) with the CPU or a communication module using a PROFINET interface.
3. Open the web browser on the display device.
4. Enter the IP address of the CPU in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (input example: http://192.168.3.141).
   The CPU intro page opens. From the intro page you can navigate to additional information. Additional information on access using the secure transmission protocol "https" is available in the section Configuring the Web server (Page 12) in the section "Permit access only with HTTPS only".

For HMI devices operating with the preinstalled Windows CE operating system (V 5.x or earlier), the CPU information is processed in a browser especially developed for Windows CE. The information appears in a simplified format in this browser.

2.2 Configuring the Web server

Requirements

You have opened the properties dialog of the CPU in the STEP 7 project view.

Procedure

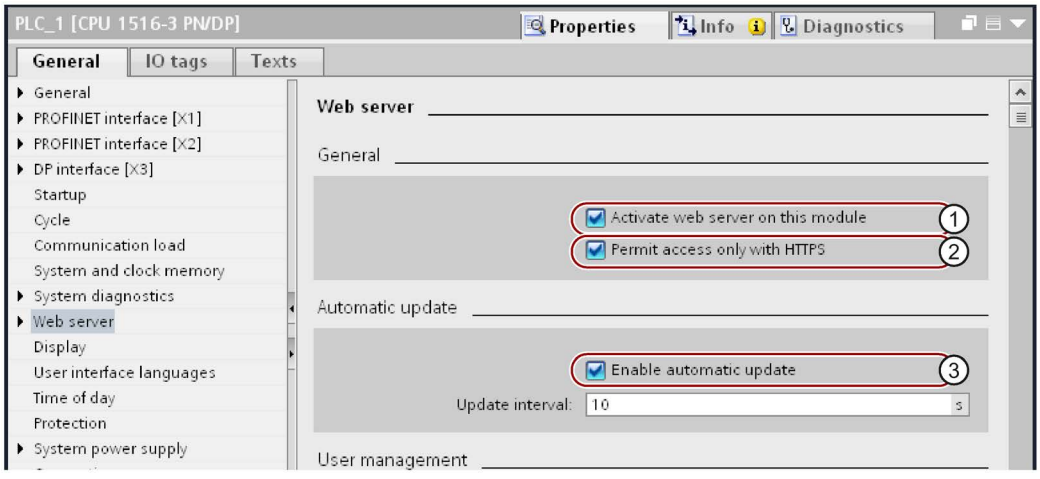


Figure 2-1 Web server settings in STEP 7

To use the full range of functions offered by the Web server, you need to make the following listed settings in STEP 7:

- **① Activating the Web server**

  In the basic setting of a configured CPU, the Web server is disabled. Proceed as follows to enable the Web server:

  – Open the "Devices & Networks" view with a double-click in the STEP 7 project tree.

  – Select the required CPU in the device view, network view or topology view.

  – Navigate to the "Web server" area in the Inspector window properties, "General" tab.

  – Select the "Enable Web server on this module" check box.
  The following notice is output:

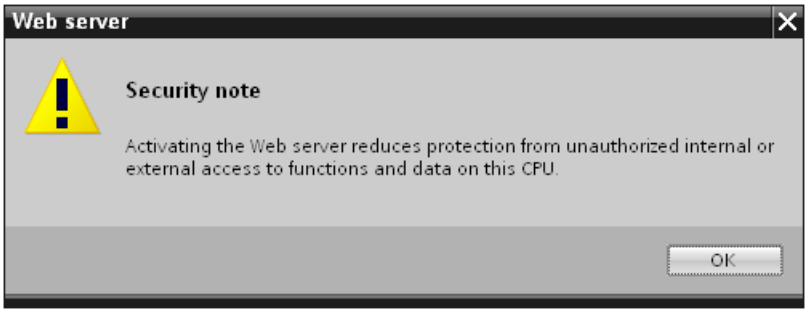

Figure 2-2 Security notice upon activation of the Web server in STEP 7

Note

When projects from deliveries are applied in which the Web server was already activated and configured on the module, this security notice is not shown.

- **② Permit access only with HTTPS**

  The web pages are transmitted by default via insecure connection and are not protected from attacks by third parties. If you always want to transmit web pages and login information to the browser in secure form, enable the "Permit access only with HTTPS" option in the CPU properties. Note that the URL of the CPU starts with "https://" in this case.

  For error-free https access to the CPU, the following conditions must be met:

  – The current time is set on the CPU.

  – The IP address of the CPU is set (example: https://192.168.3.141).

  – A valid certificate is installed in the Web browser.

    If no certificate is installed, a warning is output recommending that you do not use the page. To view this page, you must explicitly "Add an exception".

    A valid certificate (Certification Authority) is available for download from the "Intro" web page, "Download certificate". Instructions for installing the certificate are available in the help system of your Web browser.

Note

To protect against manipulation from the outside, download the certificate only in an environment that is guaranteed not to be compromised. You have to download the certificate once for each display device you are going to use.

- **Access protection**
  The certificate establishes an encrypted connection that prevents wiretapping or distortion of the communication but does not provide access protection. This means you have to protect your CPU from unauthorized access with the corresponding configuration in the user administration.
- **③ Automatic updating**

  Automatic updating is activated in the basic setting of a configured CPU.

  The following web pages are updated automatically:

  – Home page
  – Memory usage
  – Diagnostics buffer
  – Module information
  – Alarms
  – Information about communication
  – Topology
  – Tag status
  – Watch tables
  – File browser
  – Data logs

  Note

  The preset update interval is 10 seconds.
  Larger amounts of data or several http-/https connections increase the update time.

- **Setting the language for the web**

  Activate the project languages you want to use and then select up to two languages for the web. Assign one of the activated project languages to each of the languages for the web.

  You can find additional information in section Language settings (Page 18).

- **Amending user administration**

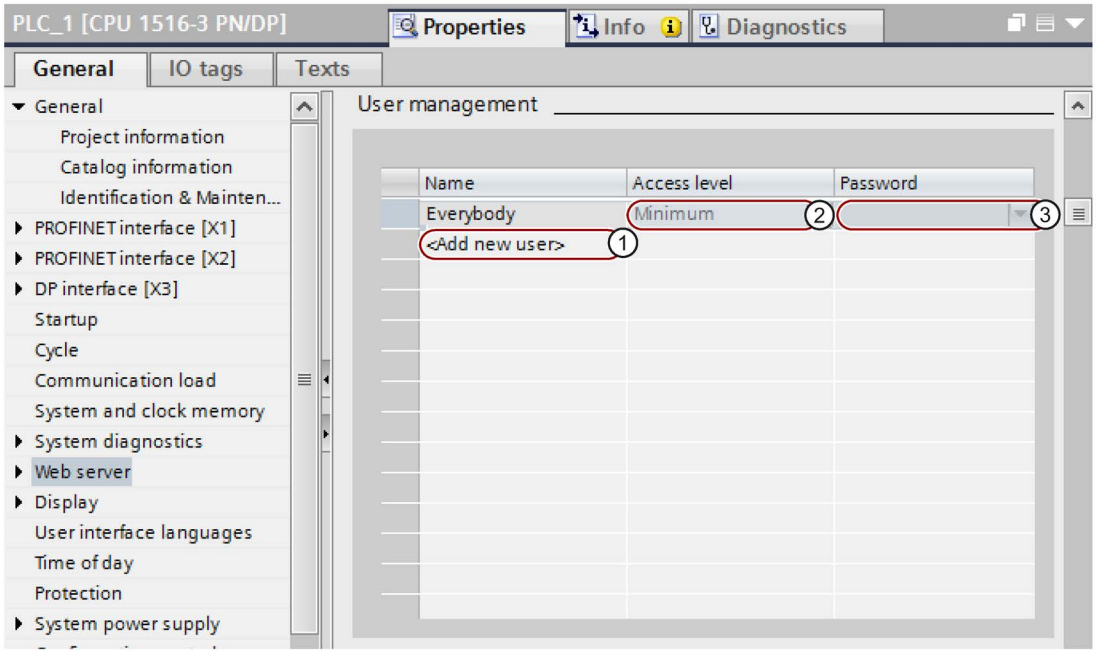

Figure 2-3 User administration in STEP 7

In STEP 7, you can manage the user list in the "Web server > User administration" area.

The user list provides the following options:

– ① Create user
– ② Specify access permissions
– ③ Assign passwords

Users only have access to the options that are permanently linked to the access permissions.

You can assign different user rights depending on the used CPU and firmware.

The available user rights can be available for selection as follows in STEP 7:

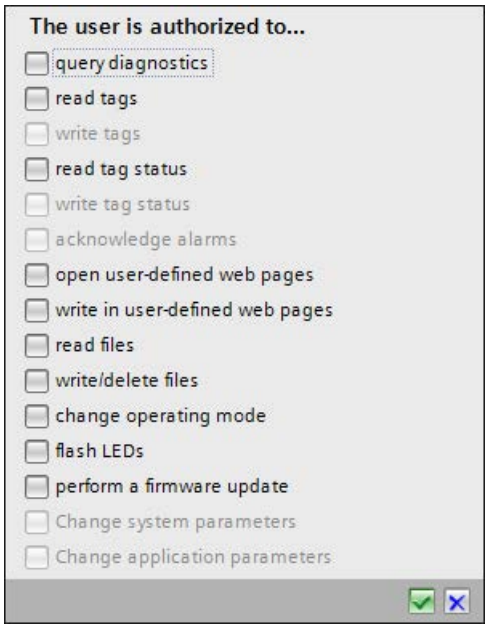

Figure 2-4 Assignment of user rights in STEP 7

If you are not logged in, you automatically access the Web server as the user "Everybody".

It does not matter in this case whether you have configured additional users.

User "Everybody"

A user with the name "Everybody" is preset in the user list; this user has minimum access rights. These are read-only access to the intro page and home page. The user "Everybody" is defined without a password. However, you can assign all access authorizations available in STEP 7 to this user.

You can create a maximum of 20 users and a user "Everybody".

Because the user "Everybody" is defined in STEP 7 without assignment of a password, be careful of the access authorizations which you assign to this user.
Certain authorizations, such as the possibility of changing the operating state, could represent a security risk.
For the assignment of security-relevant authorizations, we recommend that you create a user with password protection in STEP 7.

Passwords should always be more than 8 characters in length and contain uppercase and lowercase characters as well as special characters and numbers (?!+%$1234...). Computer keyboard character strings and words from the dictionary are unsuitable. Change the password regularly.

If possible, always enable the option "Only permit access via HTTPS".

Note

When assigning rights, note that read access to the watch tables and tag status is retained even if you have cleared the "Permit access with HMI" check box when configuring the data block in STEP 7.

- **User pages**

  In the "User pages" area you can download your own web pages to the CPU and make available your own web applications by means of the web browser.

  You can find additional information in section User pages (Page 59).

- **Activation of the Web server for specific interfaces**

  In the area "Overview of interfaces", you have the option to enable or disable access to the Web server.

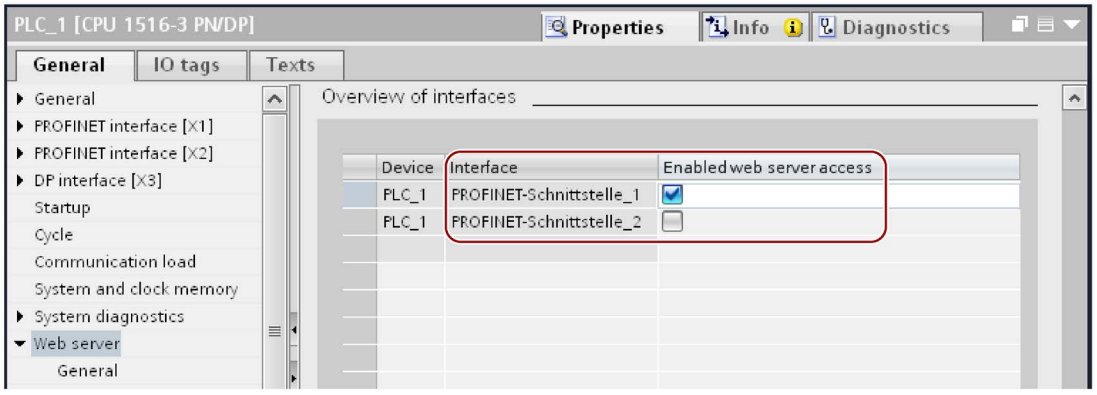

Figure 2-5 Activation of access to the Web server via the interfaces

2.3 Language settings

Introduction

The Web server provides alarms and diagnostic information in the following languages:

- German (Germany)
- English (U.S.)
- French (France)
- Italian (Italy)
- Spanish (traditional sorting)
- Japanese
- Chinese (Simplified)
- Korean
- Russian
- Turkish
- Portuguese (Brazil)

The two Asian languages can be combined as follows:

- Chinese with English
- Japanese with English

Requirements for the availability of the Asian languages

The following requirements must be met for the Chinese and Japanese languages:

- The corresponding support package for East Asian languages is installed on the display device (e.g., PC).
  For this purpose, activate the "Install files for East Asian languages" option in the "Regional and Language Options > Languages" tab of the Windows Control Panel.
- STEP 7 for Asian languages is installed on the programming device used to configure the CPU.

Note

Asian languages are not supported for SIMATIC HMI devices with Windows CE operating system.

Requirements for multilingual output of text

The following two language settings must be made in STEP 7 to permit that the Web server displays the different languages correctly:

- Set the Web server interface languages in the properties dialog of the CPU
- Assign one project language each to the selected languages

Note

The project languages you want to assign must be activated and the corresponding texts (translations) must be available in the project. The project languages selection is available in the project tree under "Languages & Resources".

Setting the language for the web

Once you have activated the Web server on your module, set up the interface languages for the Web server and assign them a project language from the drop-down list.

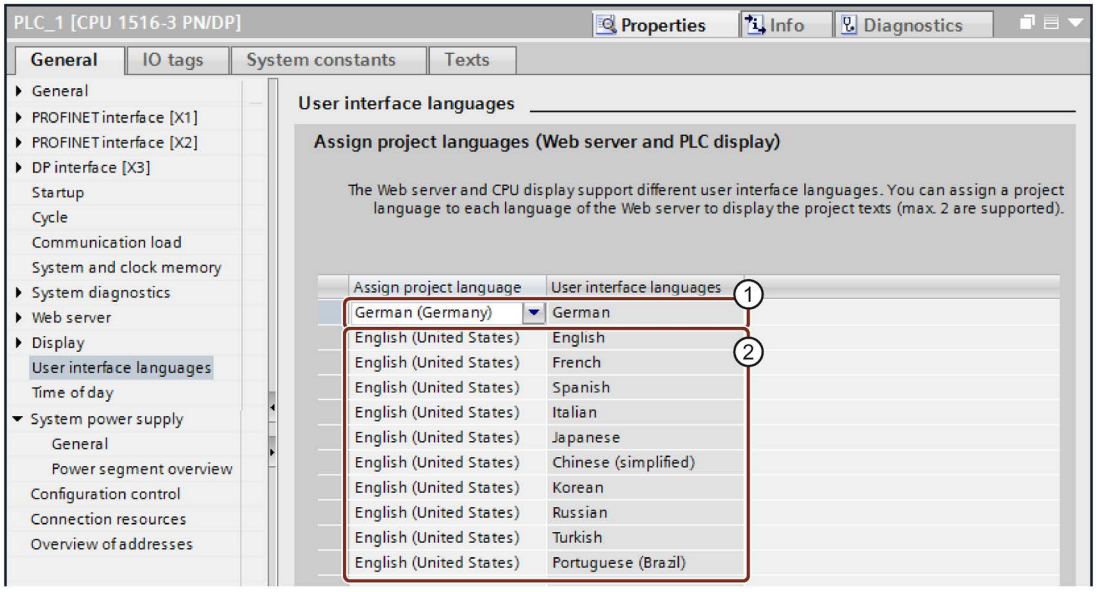

Figure 2-6 Language settings for the Web server in STEP 7

You can also assign all relevant interface languages the same project language:

- ① Project language German for the interface language: German.
- ① Project language English (USA) for the interface language: English (USA), French and all other existing interface languages.

Reference

Additional information on how to set the project language in STEP 7, is available in the online help for STEP 7, keyword: "Selecting project languages".

See also

Configuring the Web server (Page 12)

2.4 Updating and saving information

Updating the screen content

Automatic updating is activated in the default setting. The preset update time is 10 s.

You update the web pages manually with the <F5> function key.

Disabling automatic updating for an individual web page

Click Off to temporarily deactivate automatic updating for a web page.
Note that the deactivation affects only the currently visited web page. Automatic updating is activated again when you change to a different web page.

You reactivate automatic updating by clicking On.

Note

If the CPU usage is very high during operation, for example, due to a large number of PROFINET interrupts or extensive communication jobs, the updating of web pages may be significantly delayed for the duration of this high CPU usage.

Saving alarms and diagnostics buffer entries

You can save alarms and diagnostics buffer entries to a csv file for further processing in a spreadsheet calculation program or database program.
Save the data by clicking .

A dialog opens in which you can specify the file name and target directory.

Printing web pages

The Web server offers you a print preview. Click to open it.

Created printouts always contain the current information in the CPU. This means that is possible that the information in the print preview is more up-to-date than the information in the standard view.

Websites

3

3.1 Start page with general CPU information

Connecting to the Web server

Set up a connection to the Web server by entering the IP address of the configured CPU in the address bar of the web browser, for example, http://192.168.3.141 or https://192.168.3.141. The connection is set up and the "Intro" page opens.

The examples in the next section provide information about the different web pages.

Intro

The figure below shows the first page (Intro) called by the Web server.

Figure 3-1 Welcome page of the Web server of the CPU 1516-3 PN/DP

Click the ENTER link to go to the Web server pages.

Note

Select the "Skip Intro" check box in order to skip the Intro. As of now, the Web server will take you directly to its home page. You can undo the setting "Skip Intro" by clicking the "Intro" link on the home page.

Home page

Before the log in, the home page offers information as shown in the figure below. The CPU image with LEDs returns the actual CPU status at the time of the data request.

Figure 3-2 Home page before log in

Log in

To use the full functionality of the web pages, you must be logged in. Log in with a user name and password specified in the web configuration in STEP 7. You now have corresponding permissions to access the web pages released for this user. If you have not configured a user, read-only access is granted to welcome and home pages by default.

Note

After carrying out your required actions, log out explicitly from the Web server by clicking "Logout" in order to minimize the risk of unauthorized external access.

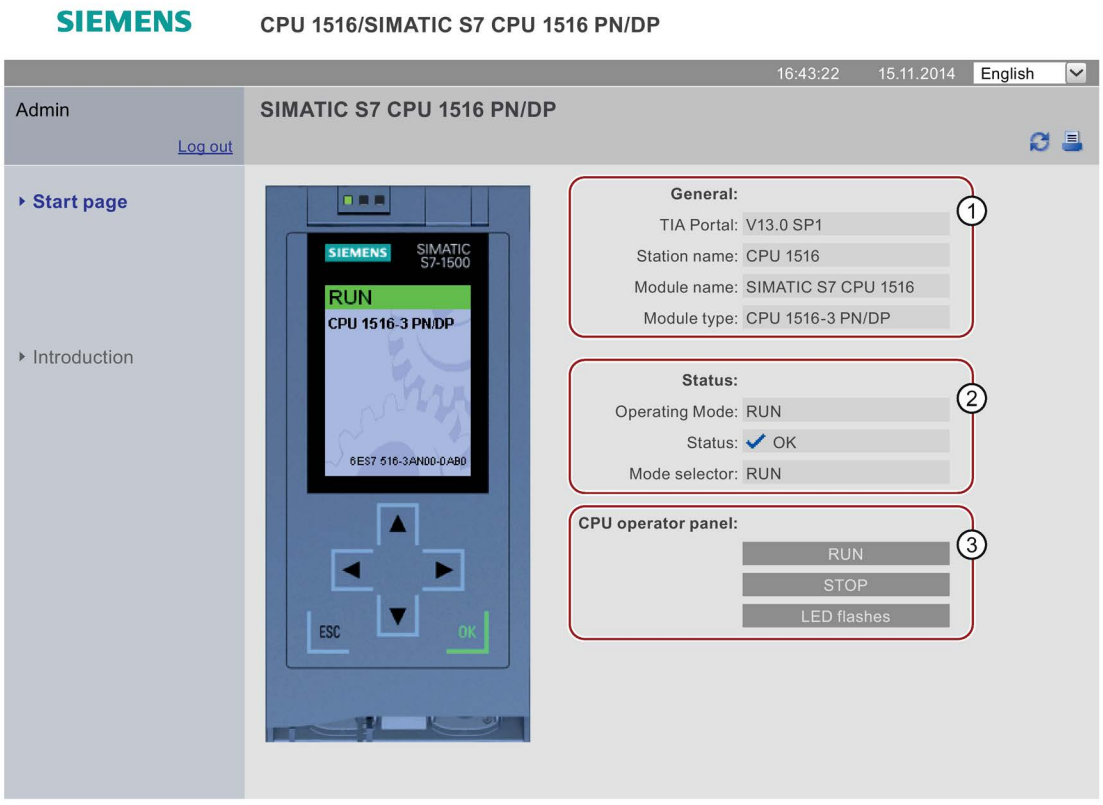

Figure 3-3 Home page after login

① "General"

"General " contains information on the CPU with whose Web server you are currently connected, as well as the version of the TIA Portal with which the CPU was configured.

② "Status"

"Status" contains information about the CPU at the moment of the query.

③ "CPU operator panel"

If you have the necessary access permissions, you can change the operating mode of the CPU ("RUN"/"STOP" buttons) or have the LEDs flash ("Flash LED" button) in the section "CPU operator panel".

Additional information for F-CPUs

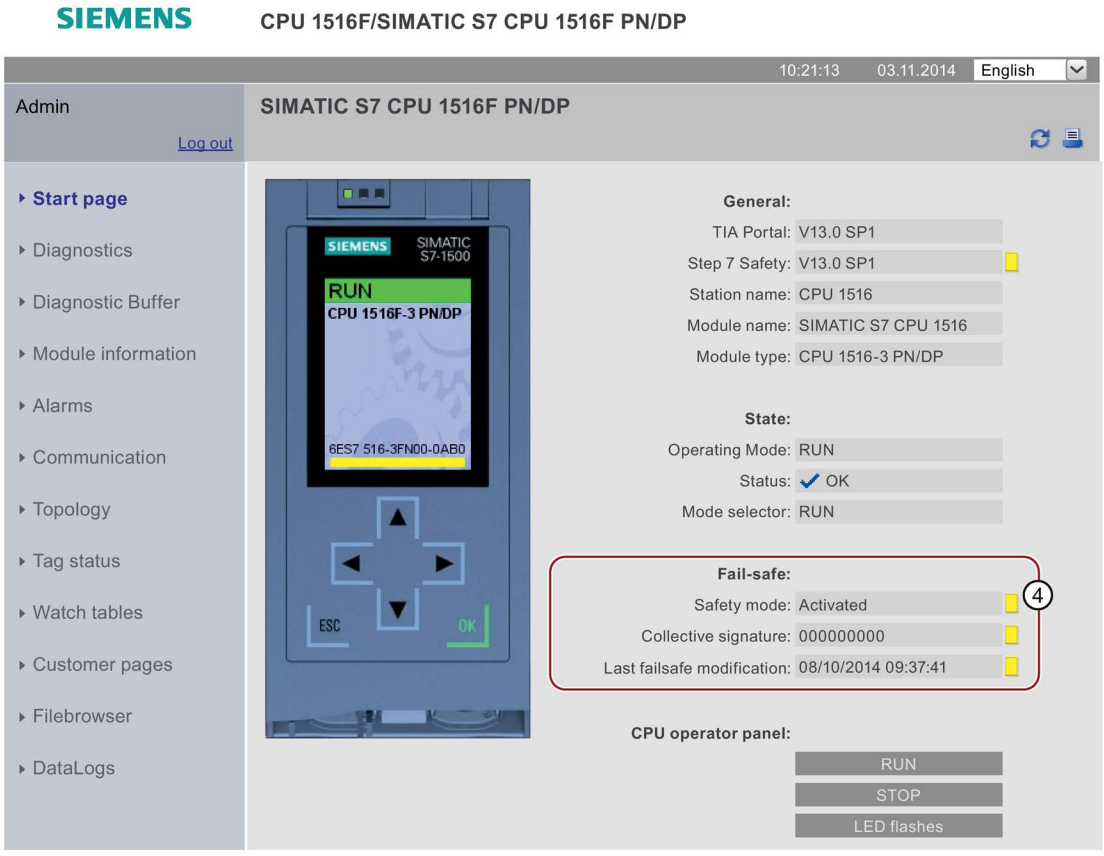

Figure 3-4 Home page after login to the F-CPU

④ Fail-safe

"Fail-safe" contains additional information on the F-CPU.

Reference

You can find additional information in the section Configuring the Web server (Page 12).

3.2 Diagnostics

Overview

The "Diagnostics" web page provides more information about the tabs:

- Identification
- Memory

"Identification" tab

The CPU characteristics are available in the "Identification" tab.

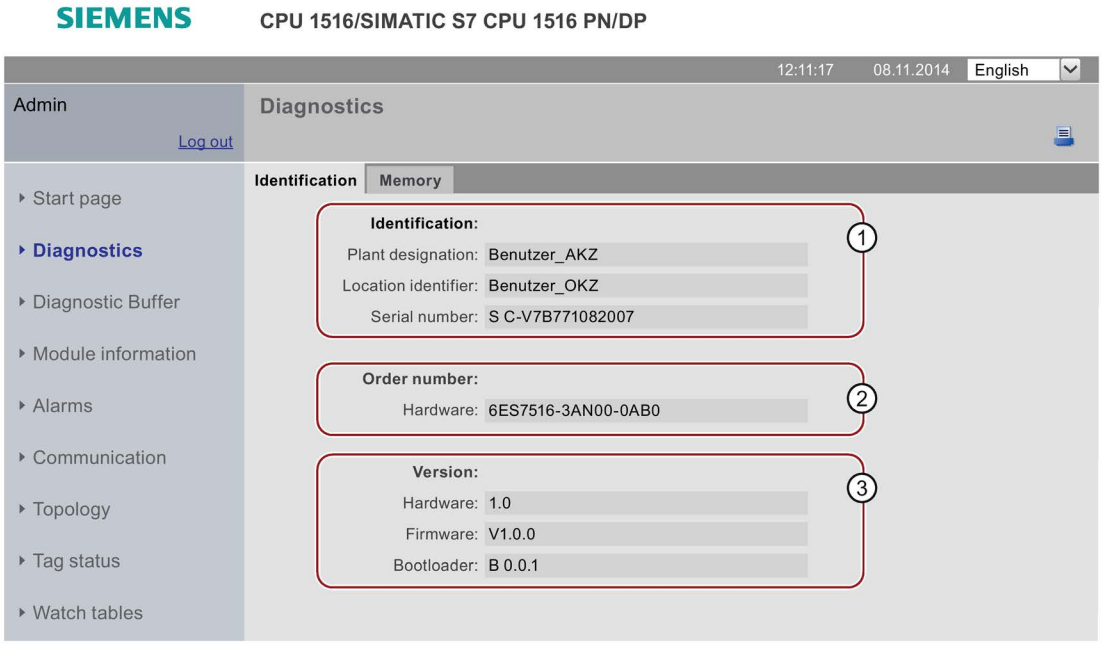

Figure 3-5 Identification

① "Identification"

The "Identification" info box contains the plant and location designation and the serial number. Plant and location designations can be configured in STEP 7 in the properties dialog box of the CPU, in the "General" tab.

② "Order number"

The "Order number" info box contains the order number for the hardware.

③ "Version"

You can find the hardware, firmware and bootloader versions in the "Version" info box.

"Memory" tab

The "Memory" tab contains current values on the memory currently in use.

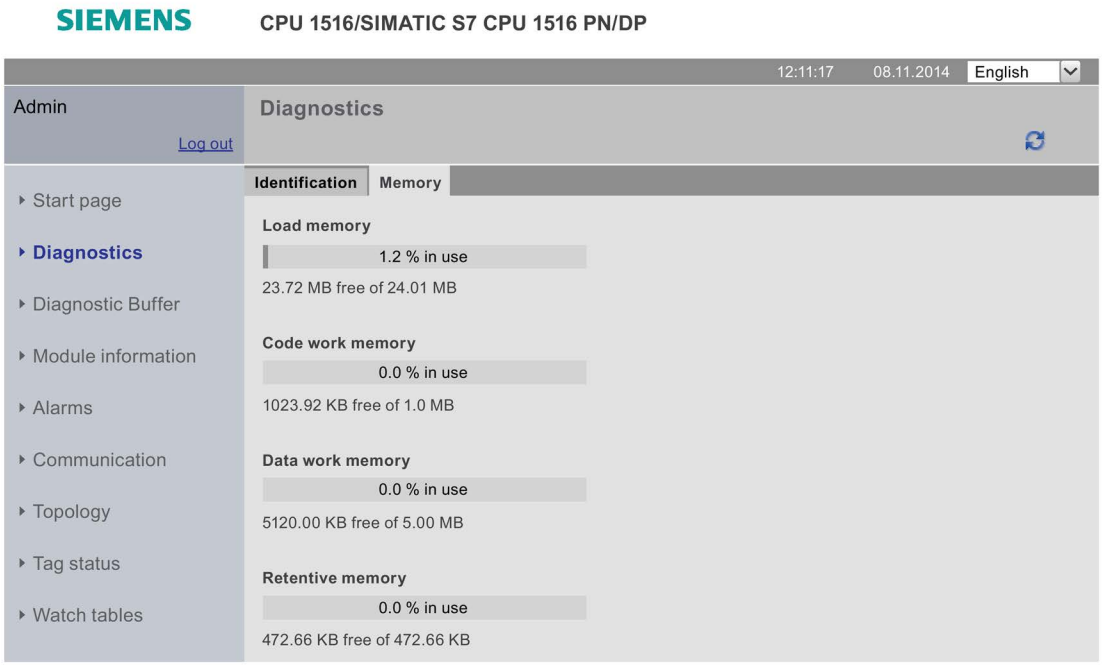

Figure 3-6 "Memory" tab

3.3 Diagnostics buffer

Diagnostics buffer

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" web page.

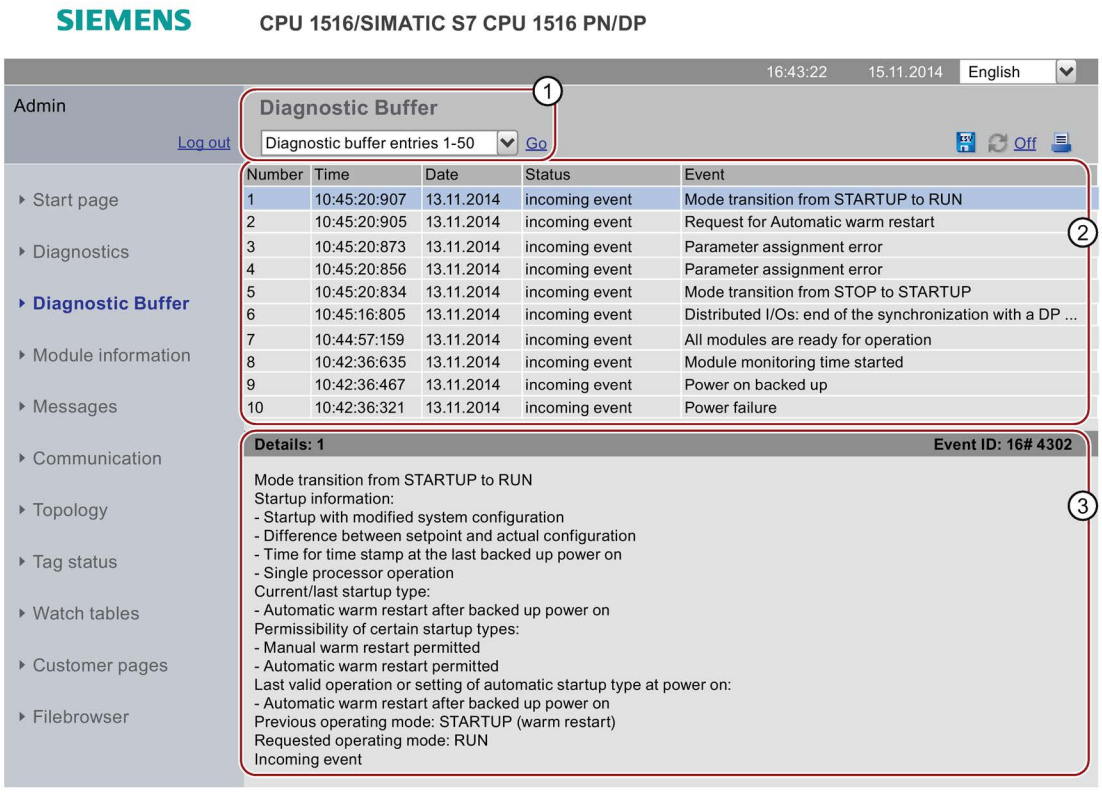

Figure 3-7 Diagnostics buffer

Requirements

The Web server is activated, languages are set, the text libraries are loaded and the project has been compiled and downloaded with STEP 7.

① "Diagnostics buffer entries 1-50"

The diagnostics buffer can accommodate different numbers of alarms depending on the CPU used.
For information on the maximum number of diagnostics buffer entries, refer to the technical specifications of the relevant CPU.

Select an interval for the entries from the drop-down list. Each interval comprises 50 entries.

② "Event"

The "Event" info box contains the diagnostics interrupts with date and time.

③ "Details"

This field outputs detailed information about a selected event. Select the corresponding event from the ② "Event" info field.

3.4 Module information

Module information

The status of a device is indicated by means of symbols and comments on the "Module information" web page.

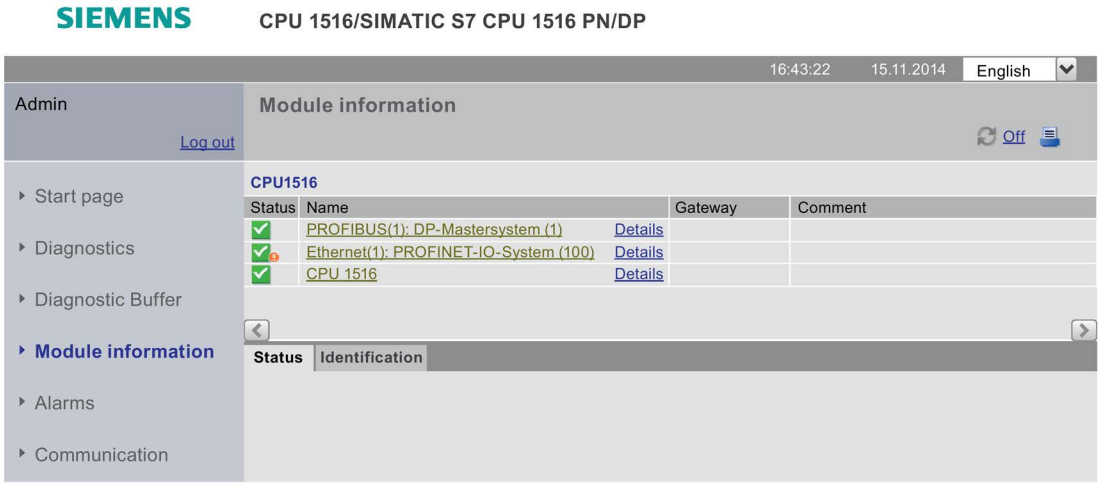

Figure 3-8 Module information

Meaning of the symbols in the "Status" column

Table 3- 1 Meaning of symbols

Symbol	Symbol color	Meaning
	green	Component is OK
	gray	Deactivated PROFIBUS slaves or PROFINET devices.
	gray	State cannot be determined • "Status cannot be determined" is displayed during system diagnostics for all configured I/O modules and I/O systems after restart of the CPU. • However, this status can also be displayed temporarily during operation if a diagnostics interrupt burst occurs for all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	red	Components "not reachable" "Not reachable" is displayed when a module has been removed or a module has been configured but does not exist.
	black	No input or output data available. Input or output channels of the sub(module) are disabled.
	green	Maintenance required (Maintenance Required)
	yellow	Maintenance demanded (Maintenance Demanded)
	red	Error - component faulty or not available due to an incorrect type
	red	A module in a lower module level does not have the status "Component OK"

Navigation to further module levels

The status of individual components/modules/submodules is displayed when you navigate to the further module levels:

- To the next higher module level using the links in the display of the module levels
- To the next lower module level using the links in the "Name" column

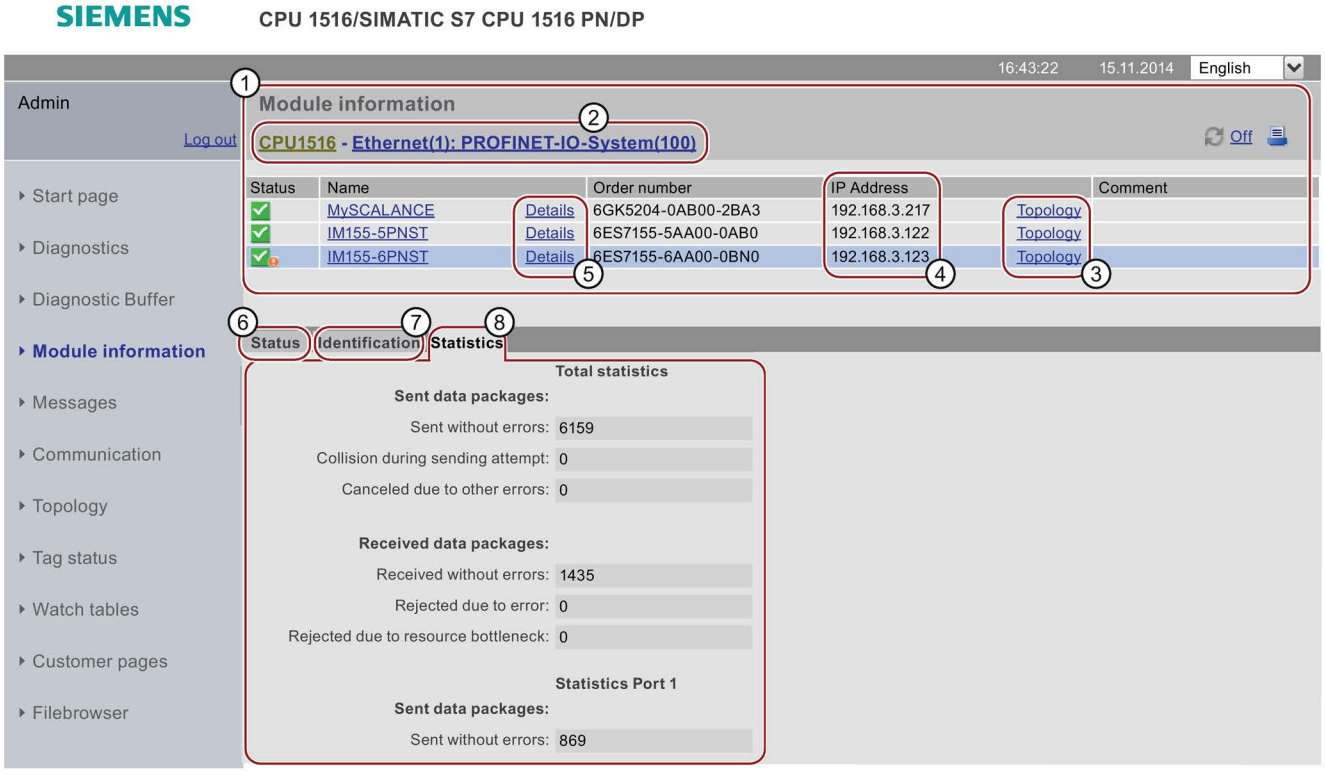

Figure 3-9 Navigation to further module levels

① "Module information"

Depending on the selected level, the table contains information about the rack, the DP master system, the PROFINET IO master system, about the devices, the individual modules, as well as the modules or submodules of the device.

② "Display of the module levels"

The links are used to access the "Module information" of the higher module levels.

③ "Topology"

The two web pages, "Topology" and "Module information", are linked. A click on "Topology" of the selected module automatically takes you to this module in the graphic view of the target topology on the "Topology" web page. The module is displayed in the visible area of the "Topology" web page. The device header of the selected module flashes for a few seconds.

④ "IP address"

If a link is available, you can use it to access this Web server of the configured device you selected.

⑤ "Details"

Further information about the selected module is provided in the "Status" and "Identification" tabs via the "Details" link.

⑥ "Status" tab

The tab contains information about the status of the selected module when a fault or alarm exists.

⑦ "Identification" tab

The tab contains data on the identification of the selected module.

Note

This tab displays only the data configured offline of the module.

⑧ "Statistics" tab

The tab is only displayed for PROFINET IO devices and includes the following information on communication statistics of the selected IO device:

- "Total statistics - Sent data packages"

  You can assess the quality of the data transmission on the transmit line based on the key data in this info box.

- "Total statistics - Received data packages"

  You can assess the quality of the data transmission on the receive line based on the key data in this info box.

- "Statistics port x - Sent data packages"

  You can assess the quality of the data transmission on the transmit line based on the key data in this info box.

- "Statistics port x - Received data packages"

  You can assess the quality of the data transmission on the receive line based on the key data in this info box.

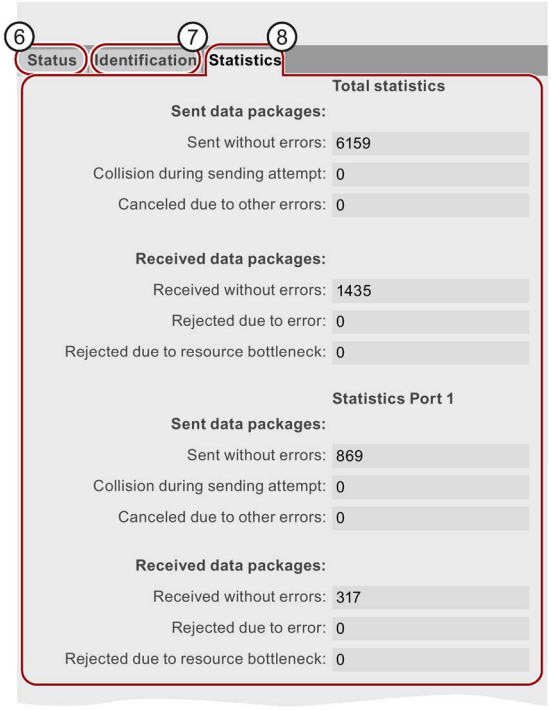

Figure 3-10 Tabs

Reference

You can find additional information in "Statistics" tab in section Communication (Page 39).

Example: Module information - module

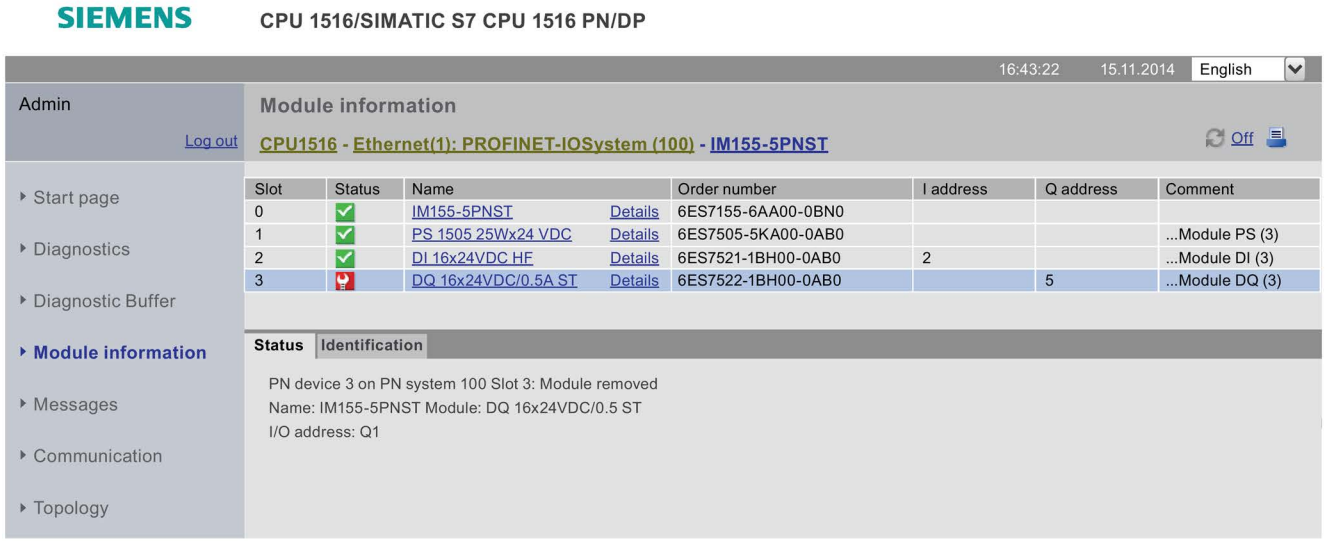

Figure 3-11 Example: Module information - module

Example: Module information - submodule

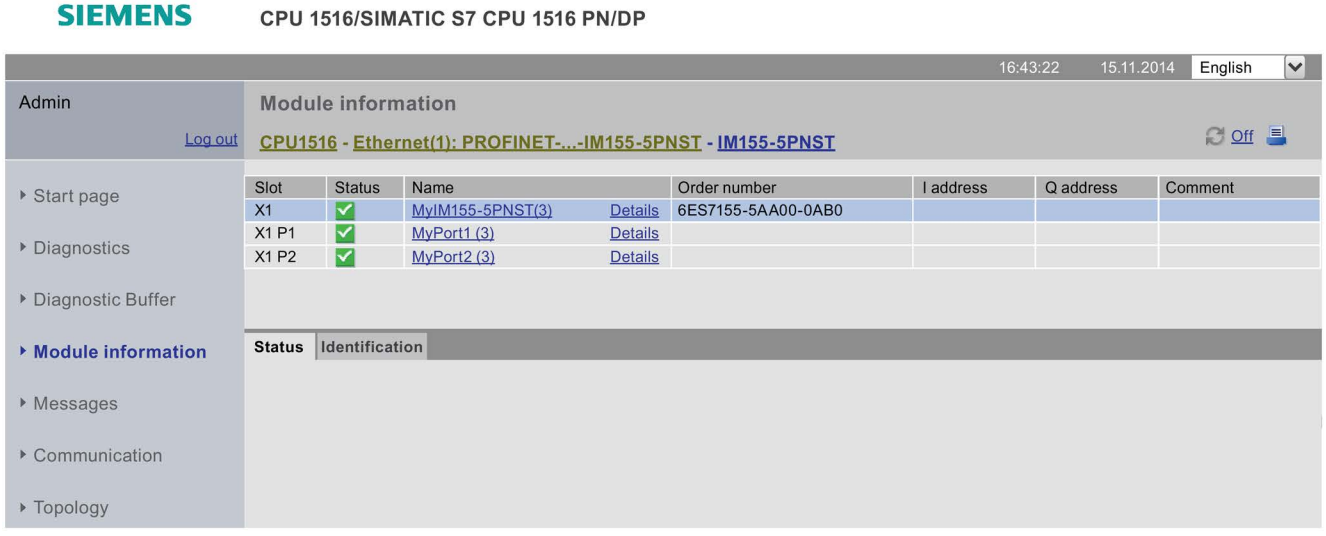

Figure 3-12 Example: Module information - submodule

Reference

You can find additional information on the "Module information" in the online help for STEP 7, keyword: "Module information".

3.5 Firmware update

Introduction

You update the firmware as a user with the corresponding access rights on the "Module information" web page at the module level. You will find information on user administration in section Configuring the Web server (Page 12), section "Amending user administration".
You use an update file to update the firmware of the CPU, the display of the CPU, or the individual central or distributed modules. Note that all modules you want to update must be compatible with the TIA Portal as of V12.0.

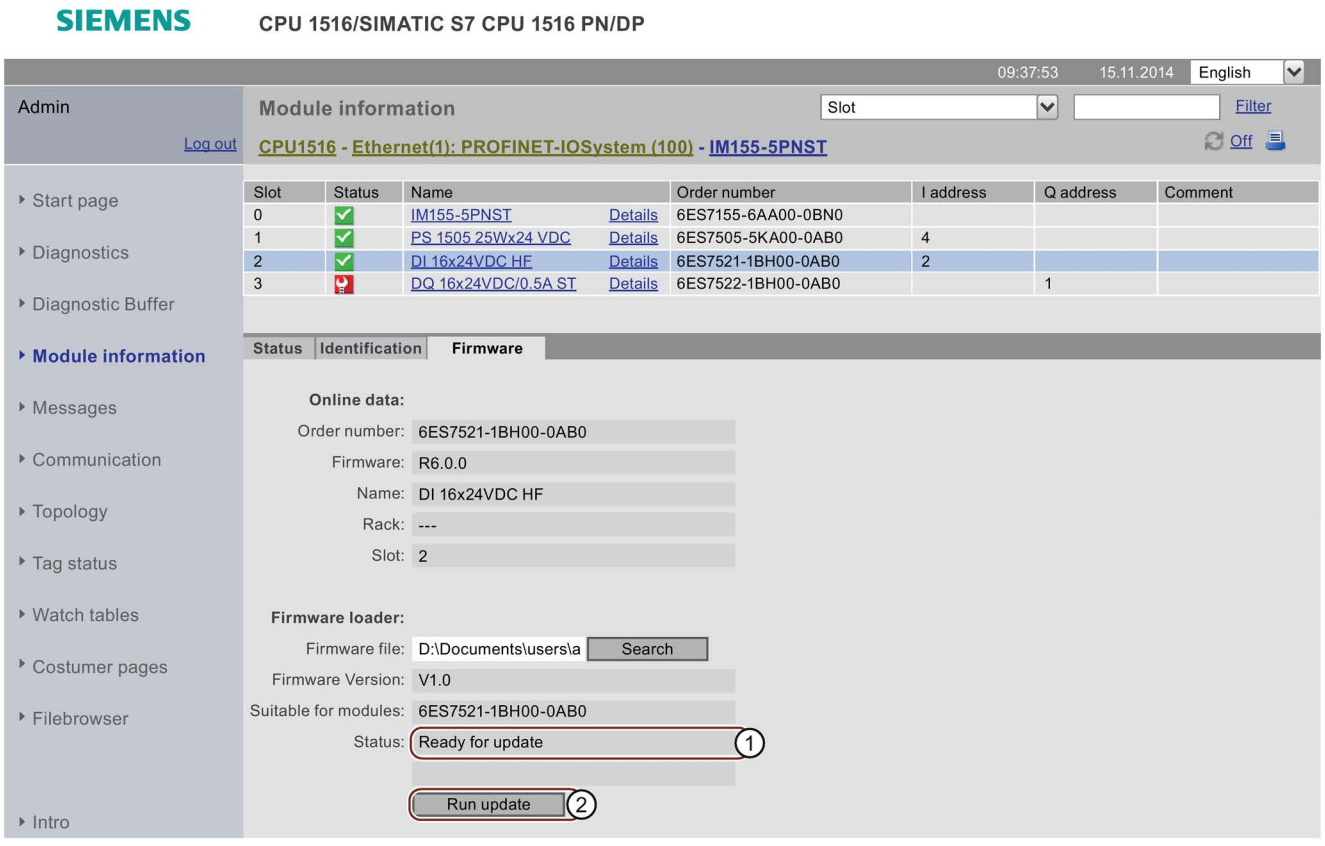
Note

A firmware update is not possible if access is via a mobile terminal device with the "iOS" operating system.

Procedure

The following steps are required to perform a firmware update:

- Click on "Browse" in the Firmware Loader area.
- Select a file on your display device or a storage medium that holds the firmware update to be loaded. The available firmware updates are available on the Service&Support page on the Internet (http://support.automation.siemens.com).



① Status of the selected firmware file
② Button to execute the update

Figure 3-13 Module information, "Firmware" tab, "Ready for update" status

The Firmware Loader checks the file name of the selected firmware file and outputs the message "Firmware is not suitable" or "Ready for update" in the "Status" line.

- If the status is "Ready for update", click "Run update". If the CPU is in RUN mode during the update, the following message is output:

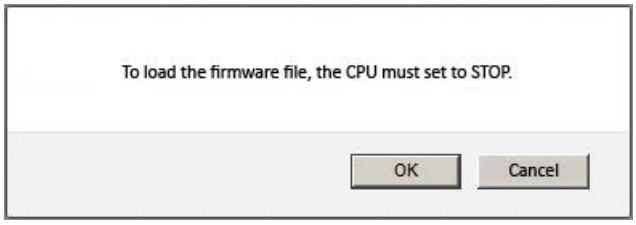


Figure 3-14 Message after clicking "Run update"

Acknowledge the message output by clicking "OK". The CPU is set to STOP mode and the firmware update is executed.
If you click "Cancel", the CPU remains in the current mode and the firmware update is canceled.

- A message informs you about the order number and version ID of the updated firmware once the update is complete.
  The CPU is automatically started when the mode selector of the CPU is in RUN and when you acknowledge the message with "OK".
  If you click "Cancel", the CPU remains in STOP mode and you can run additional updates.

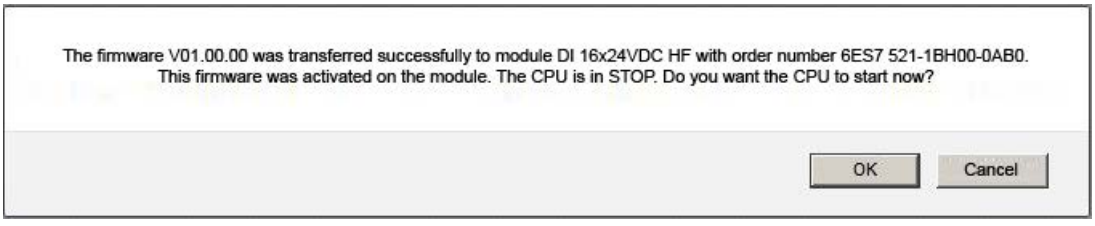

Figure 3-15 Message: Firmware successfully transferred

3.6 Alarms

Alarms

To receive compact information on fault analysis, we recommend that you first read out the content of the alarm buffer. This is the most effective method to get an overview of the pending faults.

The browser displays the content of the alarm buffer on the "Alarms" web page.
The alarms cannot be acknowledged on the Web server.

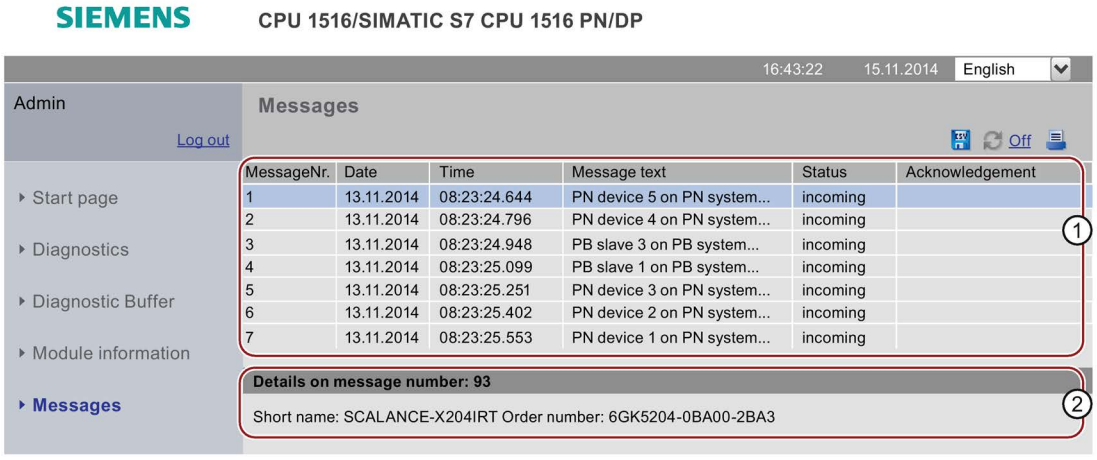

Figure 3-16 Alarms

Requirements

The alarm texts were configured in the user-specific languages. For information about configuring alarm texts refer to STEP 7 and to the Service&Support pages (http://www.siemens.com/automation/service&support).

① "Alarms"

CPU alarms are displayed in chronological order in info box ②, including **date** and **time**.

The **alarm text** parameter is an entry which contains the alarm texts configured for the corresponding fault definitions.

Sorting

You can also view the individual parameters in ascending or descending order. For this purpose, click on one of the parameters in the column header:

- Alarm number
- Date
- Time (of the CPU)
- Alarm text
- Status
- Acknowledgment

The alarms are returned in chronological order when you click the "Date" entry. Incoming and outgoing events are output at the **Status** parameter.

② "Details on alarm number"

You can view detailed alarm information in this info box. Select the corresponding alarm from the info field ②.

3.7 Communication

Overview

The "Communication" web page provides more information about the following tabs:

- Parameters
- Statistics
- Resources
- Connections

① "Parameters" tab

A summary of the information on the PROFINET and Ethernet interfaces of the selected CPU is available in the "Parameters" tab.

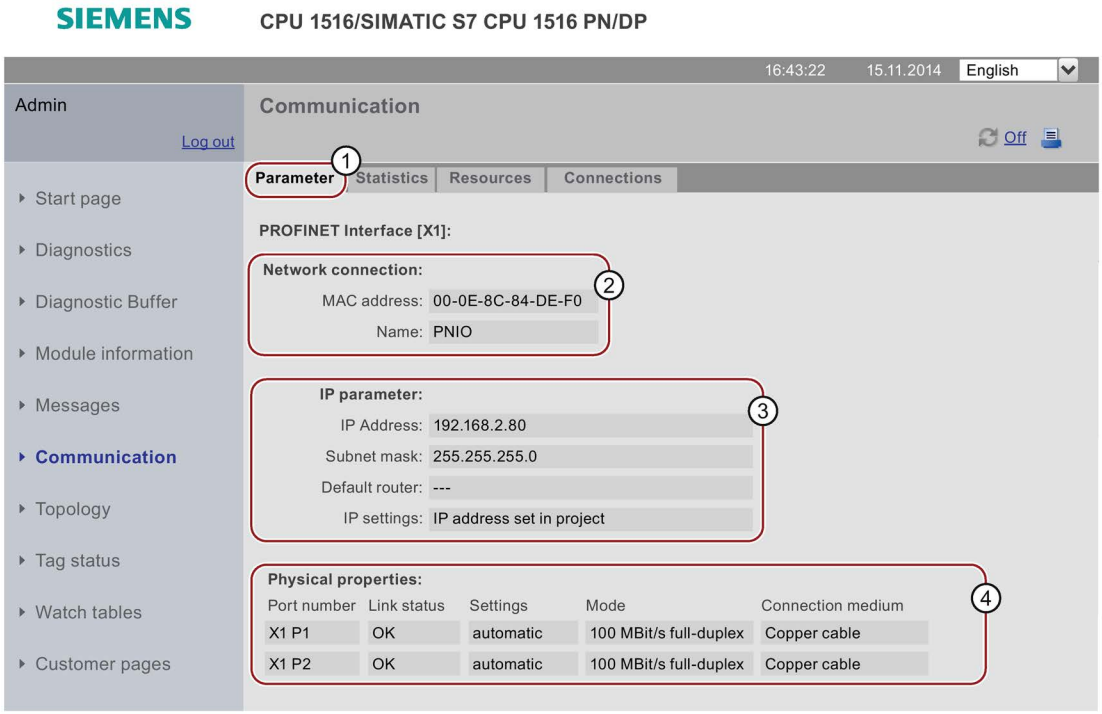

Figure 3-17 Parameters of the integrated PROFINET and Ethernet interfaces

② "Network connection"

The item "Network connection" includes information for identification of the integrated PROFINET and Ethernet interfaces of the corresponding CPU. The MAC address is located on the CPU above the respective PROFINET or Ethernet interface.

③ "IP parameters"

This parameter includes information on the configured IP address and number of the subnet in which the corresponding CPU is located.

④ "Physical properties"

The following information on the interface hardware is available in the "Physical properties" field:

- Port number
- Link status
- Settings
- Mode
- Connection medium

① "Statistics" tab

Information on the data transmission can be found on the "Statistics" tab.

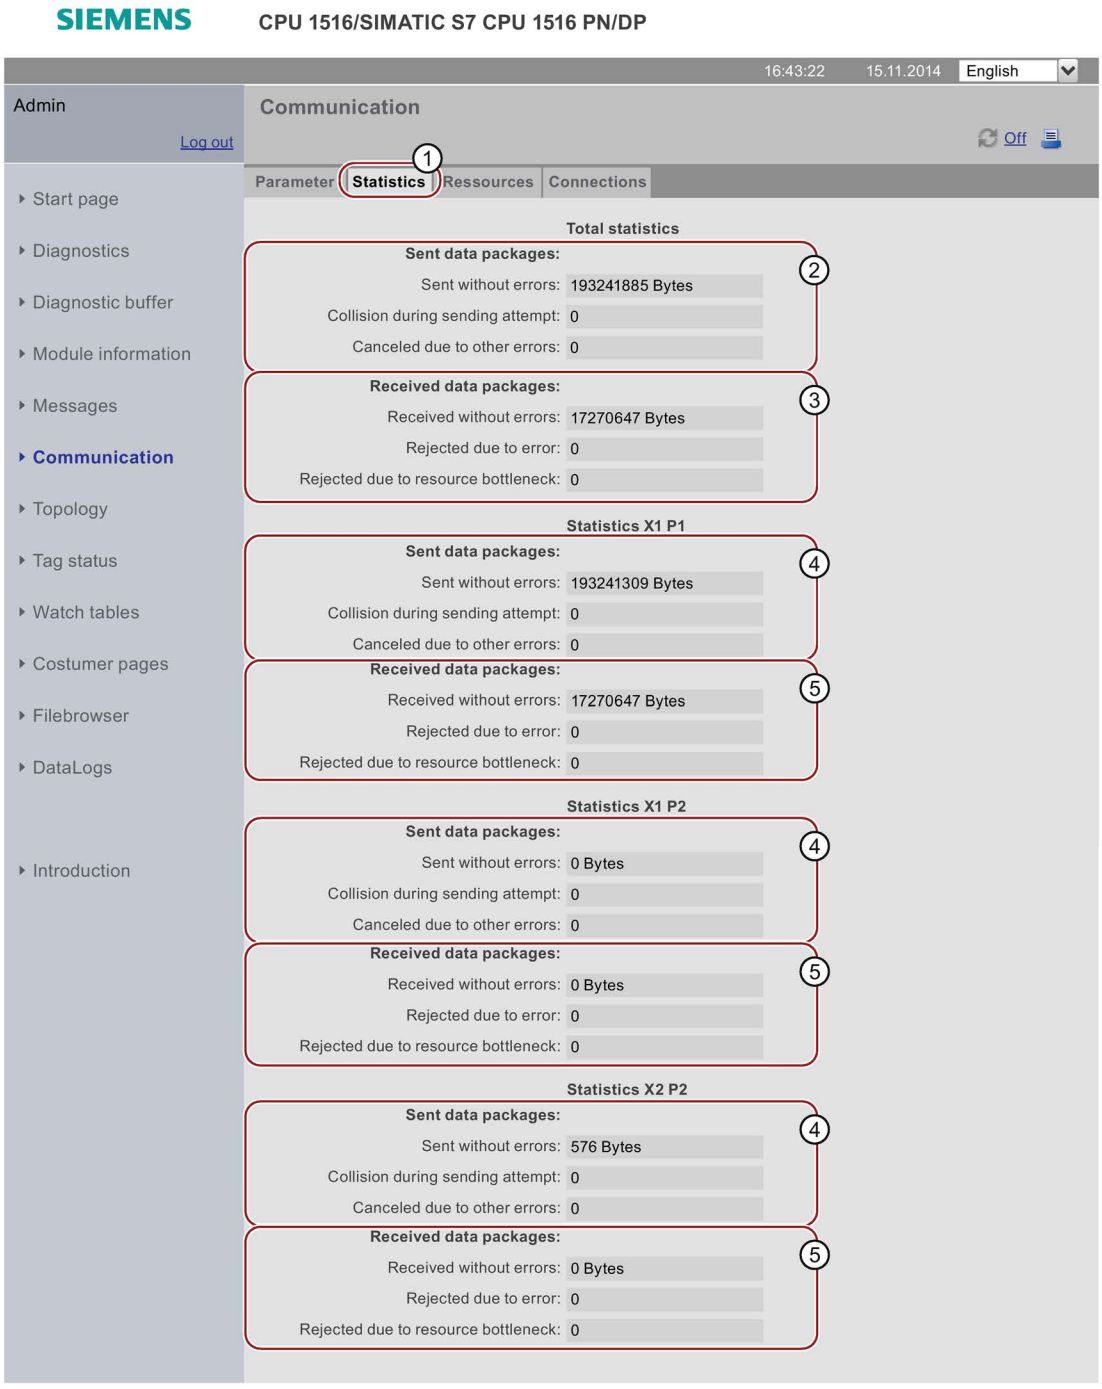

Figure 3-18 "Statistics" tab with key data on data transmission

② "Total statistics - Sent data packages"

You can assess the data transmission on the transmit line based on the key data in this info box.

③ "Total statistics - Received data packages"

You can assess the data transmission on the receive line based on the key data in this info box.

④ "Statistics Port x - Sent data packages"

You can assess the data transmission on the transmit line for each port based on the key data in this info box.

⑤ "Statistics port x - Received data packages"

You can assess the data transmission on the receive line for each port based on the key data in this info box.

① The "Resources" tab

For information about the load of connections on resources, refer to the "Resources" tab.

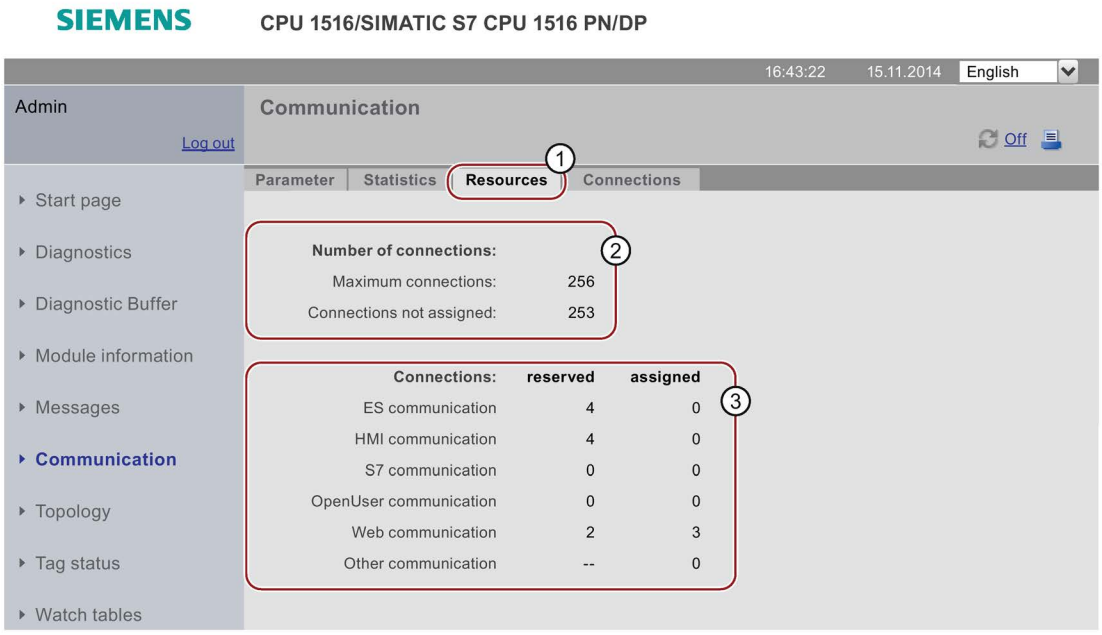

Figure 3-19 "Resources" tab

② Number of connections

Under "Number of connections", you will find information on the maximum number of connections and the number of connections not assigned.

③ Connections

The item "Connections" provides information on the number of connections reserved or used for ES, HMI, S7, OpenUser, web communication and other communication functions.

① "Connections" tab

The "Connections" tab contains information on the status of the communication connections.

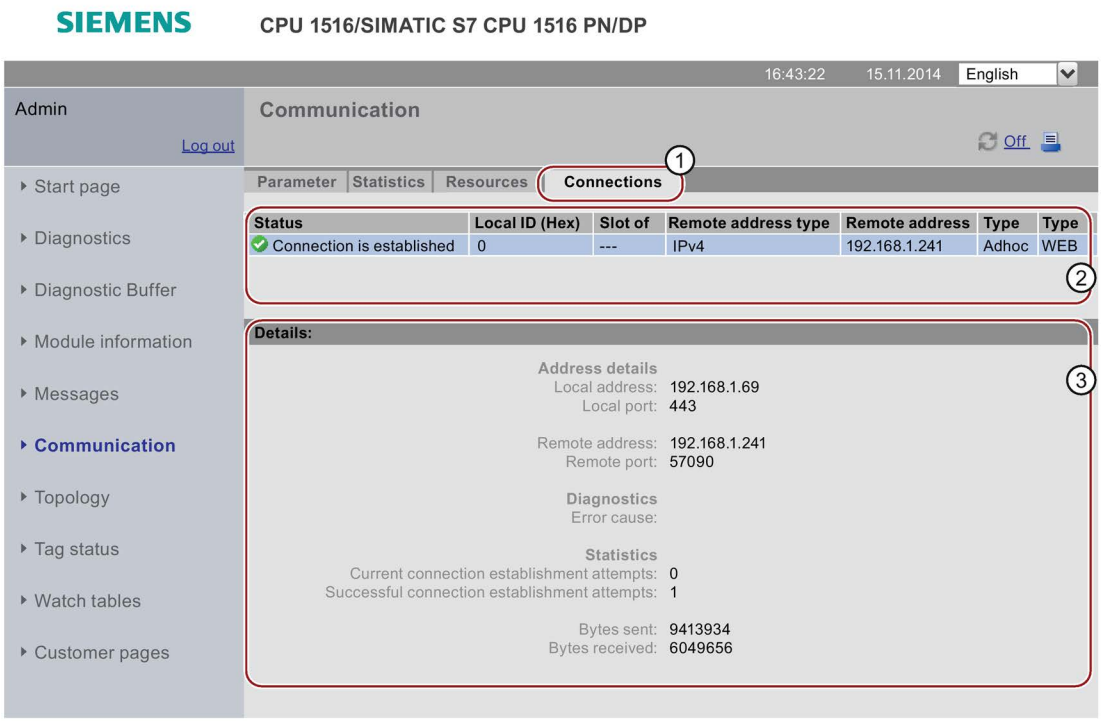

Figure 3-20 "Connections" tab

② Status

Under "Status", you will find an overview of the communication connections being set up and the already set-up communication connections.

For each connection, the table contains the following information: status of the connection, local ID, slot of gateway, remote address (IP address), the corresponding remote address type, method of connection, and type of connection.

③ Details

Under "Details", you will find detailed information about the selected connection.

Reference

For an explanation of the error message displayed when a connection is interrupted or an attempt to establish a connection fails, refer to the STEP 7 online help.

3.8 Topology

3.8.1 Introduction

Topology of the PROFINET devices

The "Topology" web page provides information on the topological configuration and status of the PROFINET devices on your PROFINET IO system.

There are three tabs for the following views:

- Graphical view (target and actual topology)
- Tabular view (actual topology only)
- Status overview (excluding topological correlations)

The tabular view and status overview can be printed. Before printing, use the print preview of your browser and, if necessary, correct the format.

Set topology

The target topology is displayed if you have topologically interconnected the connections in the configuration with STEP 7.

This view identifies the topological assignment of PROFINET devices that have failed, the differences between the target and actual topology, and interchanged ports.

Note

The configured set topology is always displayed by default in the following scenarios:

- When the "Topology" web page is called via the navigation bar
- When you change from the overview of PROFINET IO devices on the "Module information" web page to the "Topology" web page by means of the "Topology" link.

If a set topology was not configured, the actual topology is displayed.

Actual topology

Displays the actual topological layout of the "configured" PROFINET devices of a PROFINET IO system and the directly adjacent, non-configured PROFINET devices (display of the relations, provided these can be determined; but the status of these adjacent PROFINET devices is not displayed).

3.8.2 Graphical view

Requirements

For error-free operation of the topology, the following conditions must be met:

- You completed the Language settings (Page 18).
- In the Topology Editor of STEP 7, you configured the topological interconnection of ports (requirement for display of the set topology and the corresponding topological target connections).
- You compiled the project in STEP 7.
- The project is completely loaded.

Target and actual topology - graphical view

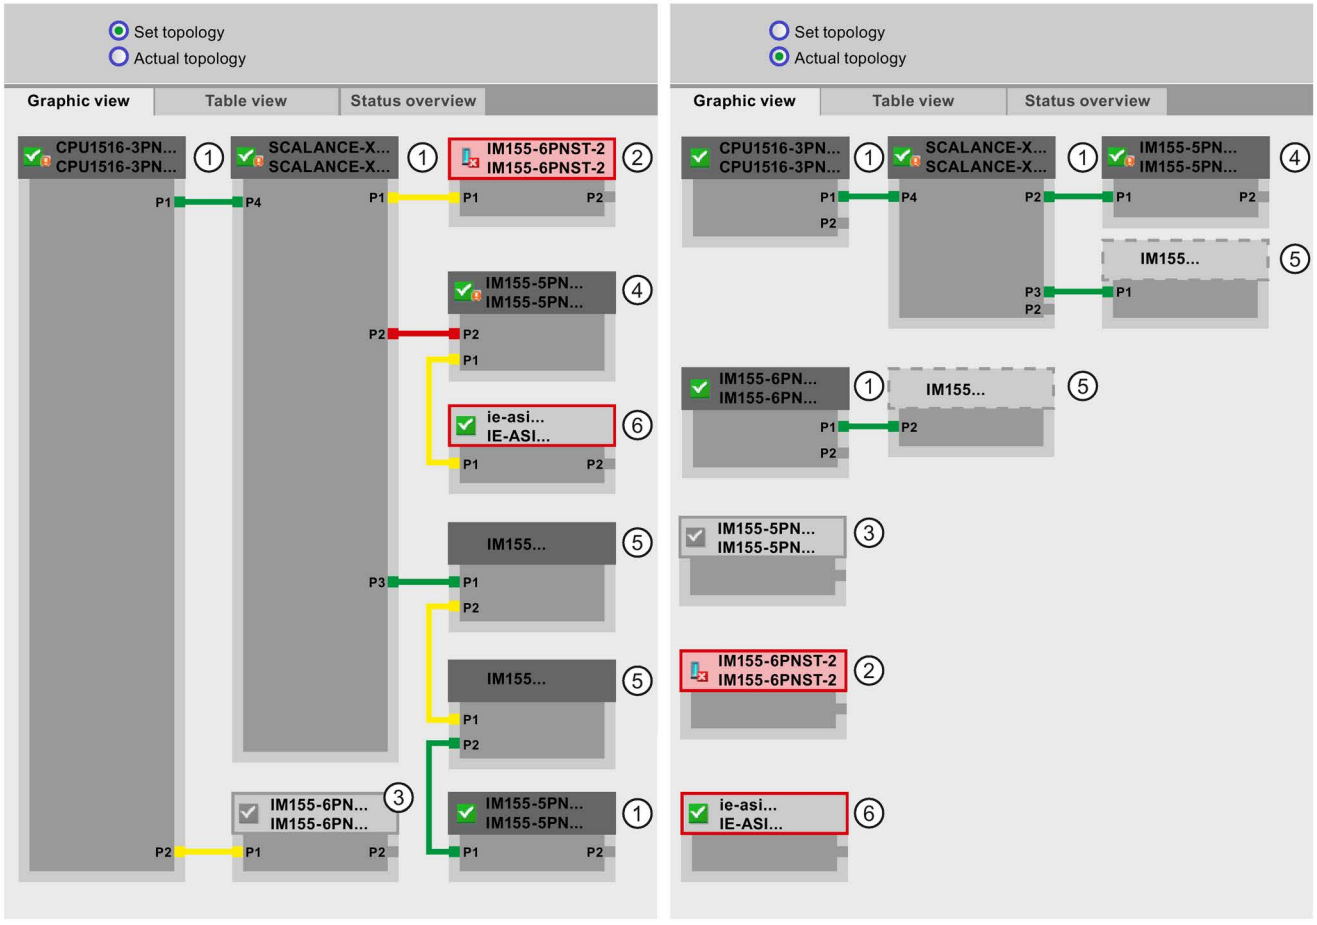

Figure 3-21 Graphical view - Target and actual topology

Meaning of the colored connections in the target/actual topology:

Table 3- 2 Meaning of the colored connections in the target/actual topology

Connection	Meaning	
	Set topology	Actual topology
green	The current actual connection matches the configured target connection.	Connections detected
red	Mismatch between the current actual connection and the configured target connection (e.g., port interchanged).	-
yellow	Connection diagnostics not possible. Causes: • Malfunction of communication with a device (e.g., cable was removed) • Connection to a passive component (e.g., switches or cables) • Connection to devices/PROFINET devices on a different IO controller or IO subsystem.	-

① Configured and accessible PROFINET devices

Configured and accessible PROFINET devices are displayed in dark gray. Connections indicate the ports used to connect the PROFINET devices of a station.

② Configured but inaccessible PROFINET devices

Configured but inaccessible PROFINET devices are indicated in pink color with red frame (e.g., device failure, cable disconnected).

③ Deactivated devices

All deactivated, configured PROFINET devices are displayed in light gray.

④ Interchanged ports

Interchanged ports are highlighted in red color in the set topology view. The actual topology view indicates the actually connected ports, while the set topology view displays the configured target connections.

⑤ PROFINET devices of a different PROFINET IO subsystem

- In the set topology:

  A PROFINET device of a different PROFINET IO subsystem is indicated by means of a green link (or red link for interchanged ports) if it is available on the bus and directly adjacent to an accessible configured PROFINET device ①. If the PROFINET device of a different PROFINET IO is inaccessible, it is identified by means of a yellow connecting line.
  The connection between two PROFINET devices which both belong to a different PROFINET IO subsystem cannot be identified and is always indicated in yellow color.

- In the actual topology:

  The PROFINET device of a different PROFINET IO subsystem is not displayed unless it is directly adjacent to a configured PROFINET device. The PROFINET device is shown in light gray with a dashed line around the device header.

The status of PROFINET devices of a different PROFINET IO subsystem is **not** displayed in the device header.

⑥ Displaying faulty neighbor relationships

Devices from which the relation data could not be read completely or with error are highlighted in light gray with a red frame.

Note

Displaying faulty neighbor relationships

If a device does not have the matching firmware, the relationships cannot be displayed correctly. This means a firmware update of the respective device is required in case a faulty neighbor relationship is displayed.

Views after changes to the configuration

- If a device fails, it remains at the same position in the "Set topology" view. This error state is indicated with a red border around the device header and the icon .
- If a device fails, it is displayed in the "Actual topology" view. This error state is indicated separately in the bottom area with a red border around the device header and the icon .

Link between the "Topology" and "Module information" websites

The two websites, "Topology" and "Module information", are linked. A click on the header of a selected module in the topology view automatically takes you to this module on the "Module information" website.

You can find additional information on this in the chapter Module information (Page 28).

Reference

Additional examples for graphical topology view are available in the chapter Examples for graphical topology views (Page 52).

3.8.3 Tabular view

Topology - tabular view

The "Tabular view" always shows the "Actual topology".

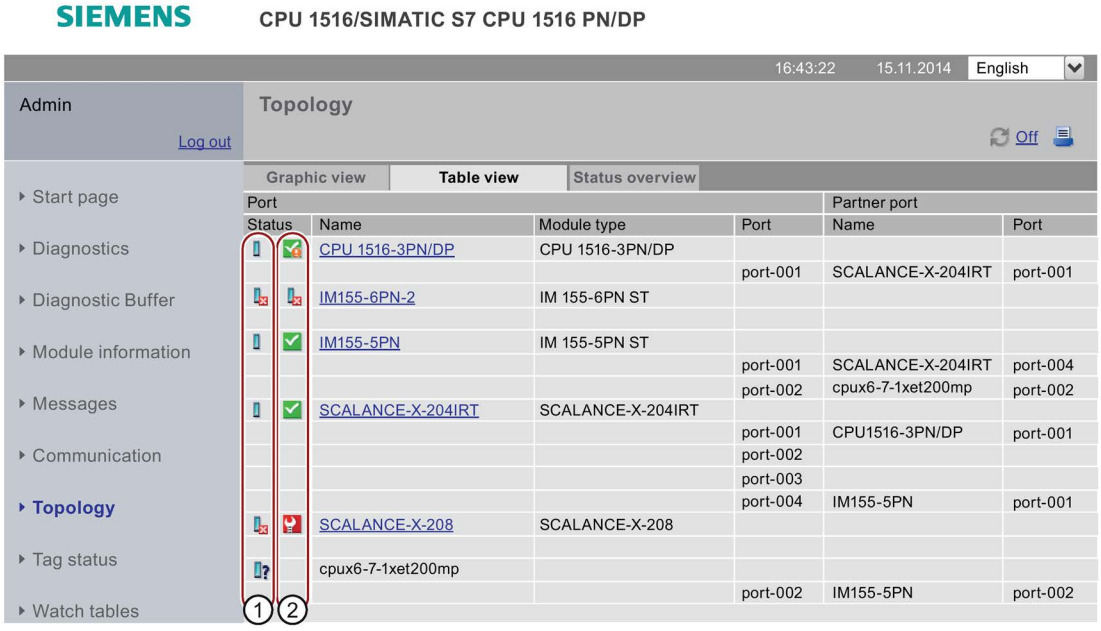

Figure 3-22 Topology - tabular view

① Meaning of the symbols relating to the status of the PROFINET devices

Table 3- 3 Meaning of the symbols relating to the status of the PROFINET devices

Symbol	Meaning
	Configured and accessible PROFINET devices
	Unconfigured and accessible PROFINET devices
	Configured but inaccessible PROFINET devices
	Devices for which neighbor relations cannot be determined, or for which the neighbor relationship could not be read out completely, or only with errors

② Meaning of the symbols relating to the module status of the PROFINET devices

Table 3- 4 Meaning of the symbols relating to the module status of the PROFINET devices

Symbol	Color	Meaning
	green	Component is OK.
	gray	Deactivated PROFIBUS slaves or PROFINET devices
	black	State cannot be determined • For example, "Status cannot be determined" is always displayed while the CPU is in STOP mode, or during startup evaluation of "Report system error" for all configured I/O modules and I/O systems after a CPU restart. • However, this status can also be displayed temporarily during operation if a diagnostics interrupt burst occurs at all modules. • It is not possible to determine the status of modules on a subsystem that is connected to a CP.
	red	Component failed or is not reachable • "Not reachable" is displayed for e.g. a module that has been removed or a module that has been configured but does not exist.
	green	Maintenance required (Maintenance Required)
	yellow	Maintenance demanded (Maintenance Demanded)
	red	Error - component faulty or not available due to an incorrect type.
	-	A module in a lower module level does not have the status "Component OK".

Reference

For additional information on the "Report System Error" function, refer to the STEP 7 online help, keyword: "System diagnostics".

3.8.4 Status overview

Topology - status overview

The "Status overview" provides a clear presentation of all PROFINET IO devices/PROFINET devices (without connection relations) on one page. A quick error diagnostics is possible based on the symbols that show the module statuses.

The overview also provides a link of the modules to the "Module information (Page 28)" website.

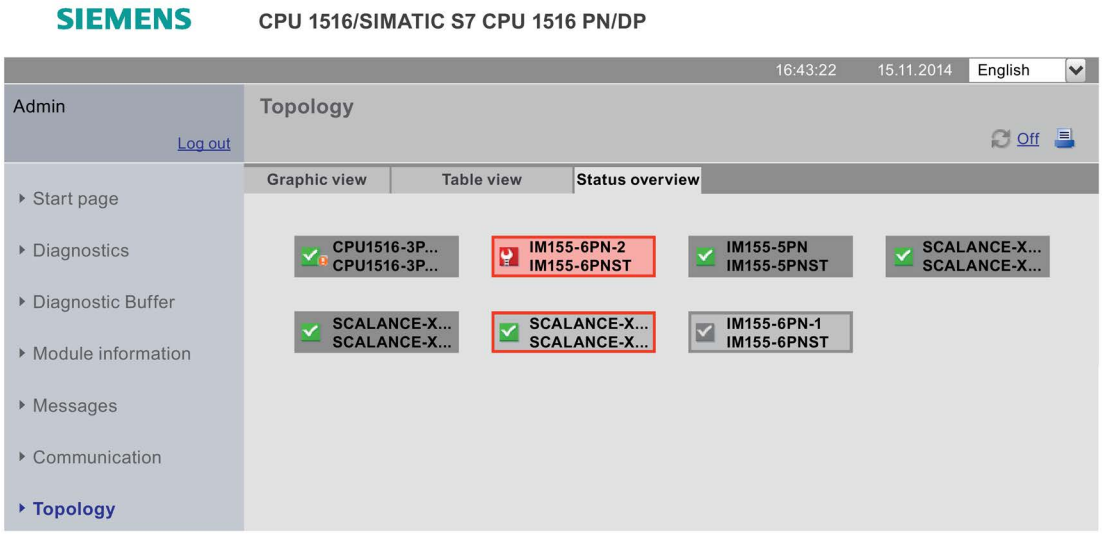

Figure 3-23 Topology - status overview

3.8.5 Examples for graphical topology views

The following section shows, as an example, some displays of the different topology views for a simple project.

"Set topology" is OK

Here you see the connections as they are configured in the topology editor by STEP 7. The configuration and wiring match.

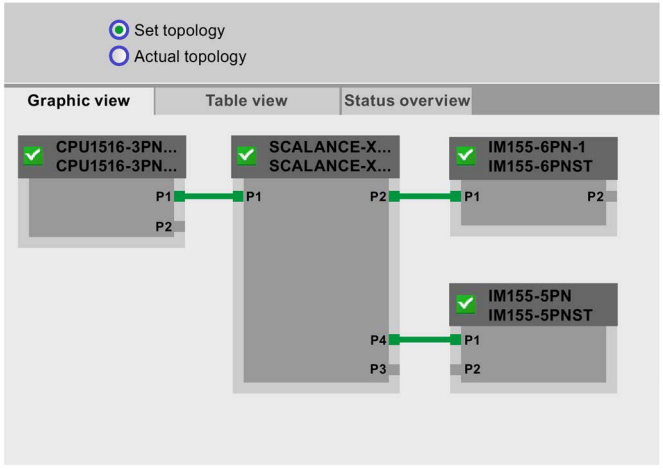

Figure 3-24 "Set topology" is OK

"Actual topology" is OK

Shows the actual layout of all configured devices that can be reached topologically.

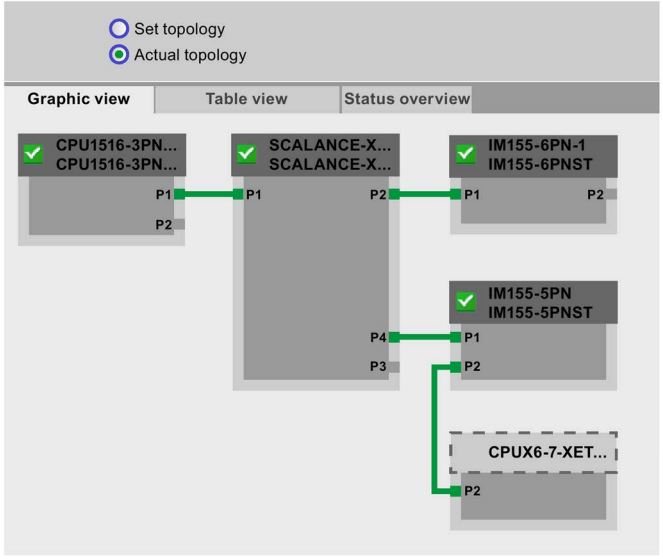

Figure 3-25 "Actual topology" is OK

"Set topology" with failed device

If a device has failed in the meantime, this device remains in the same place in the "Set topology" view. The failed device is displayed with a red border around the device header and the icon.

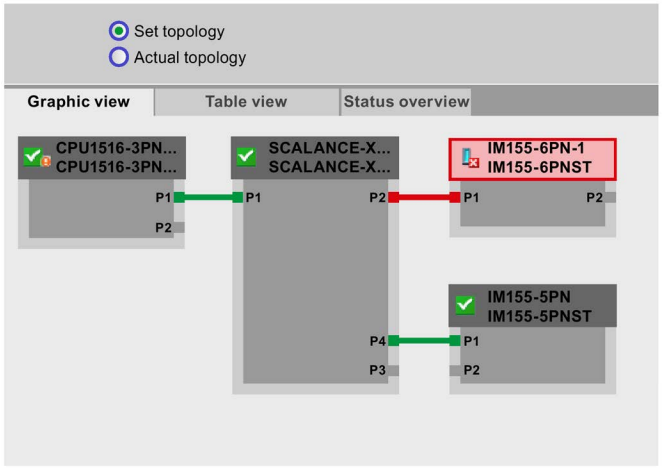

Figure 3-26 "Set topology" with failed device

"Actual topology" with failed device

In the "Actual topology" view, the device that has failed in the meantime is displayed separately in the bottom area of the view. The failed device is displayed with a red border around the device header and the icon.

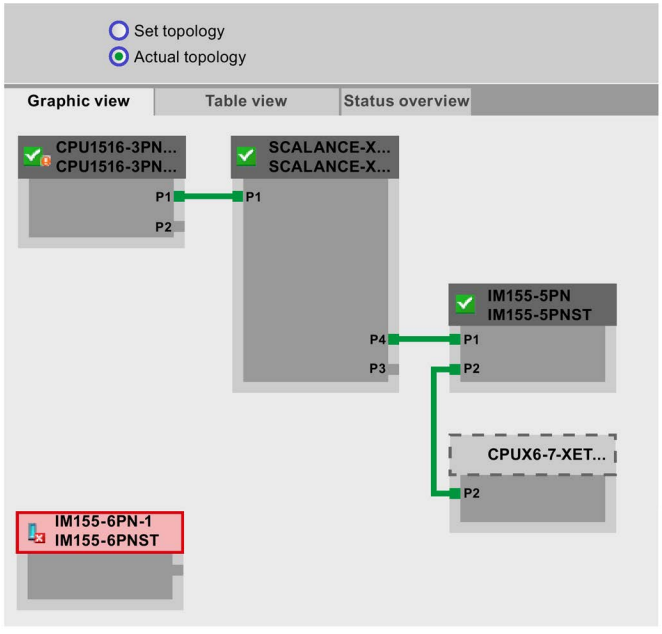

Figure 3-27 "Actual topology" with failed device

"Set topology" with interchanged ports

If a port was interchanged for a configured, directly adjacent PROFINET device, this device remains in the same place in the "Set topology" view. The interchanged connection is indicated by a red line.

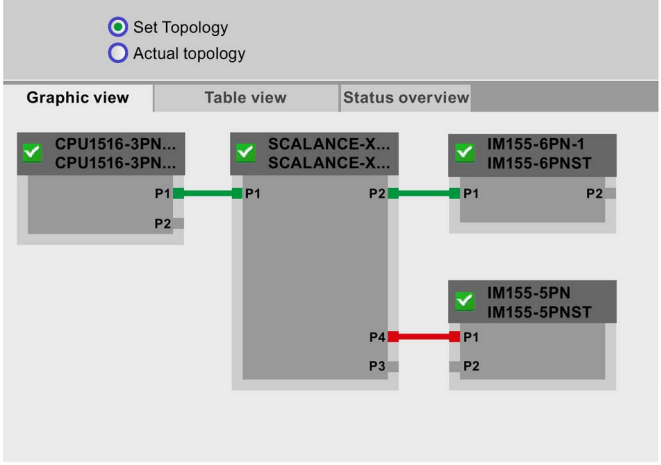

Figure 3-28 "Set topology" with interchanged ports

3.9 Tag status

Tag status

The browser outputs the tag status on the web page of the same name.

Note

Saving the tag status as a bookmark

When the page is exited, the entries made on it are not saved. If you want to monitor the same entered tag again later on, then create a bookmark in your Web browser for the "Tag status" page. Otherwise, you will have to enter the tag again when the page is re-displayed.

If you have defined your user page as home page of the Web server, you cannot access the tag status via the saved bookmarks. You can find more information in the section Defining the user page as home page (Page 76)

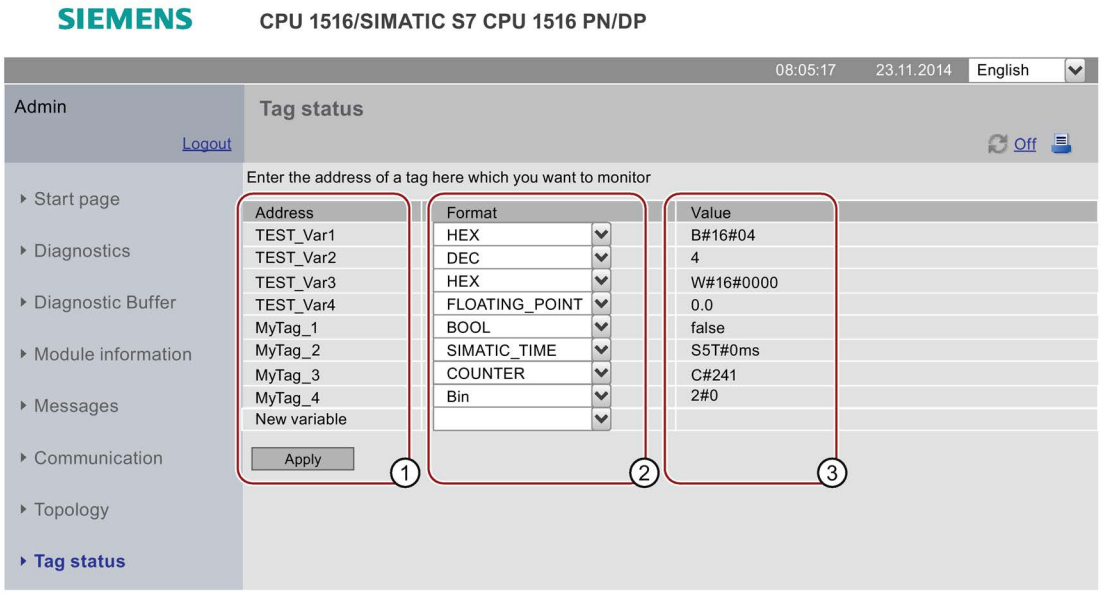

Figure 3-29 Tag status

① "Address"

In the "Address" text field, enter the symbolic address of the tags whose behavior you want to monitor. The input of an absolute address is not permitted. Invalid entries are displayed in red font.

② "Format"

Using the drop-down list box, select the desired display format of the respective tag. If the tag cannot be displayed in the desired format, it will be displayed in hexadecimal format.

③ "Value"

Under "Value", the value of the corresponding operand is displayed in the selected format.

Special considerations when changing languages

You can change the language, e.g., from German to English, in the upper right corner. Note that the German mnemonics differ from those of the other languages.

For monitoring available data types

In principle, data types of PLC tags that can be monitored in the TIA Portal can also be monitored via the Web server.

Note that structured data types such as ARRAY, STRUCT and DTL are not available as data types for PLC tags because of their data volume.

3.10 Watch tables

Watch tables

The browser displays the content of the configured, web-enabled watch tables on the web page of the same name.

Note

If you are monitoring many large watch tables on the Web server, the update time may be increased due to the large data quantities.

The number of watch tables you can monitor depends on the size of the SIMATIC Memory Card used.
If the available memory is exceeded by the configured alarms and tags, only incomplete watch tables will be displayed in the Web browser.

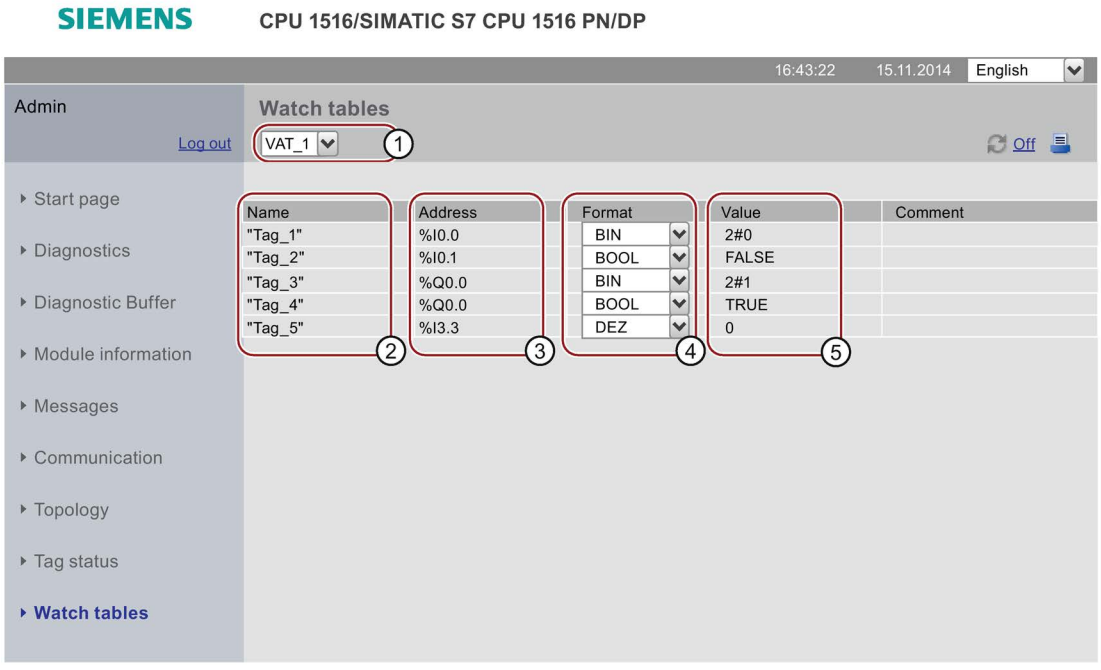

Figure 3-30 Watch tables

① Selection

Select one of the configured watch tables from the drop-down list.

② "Name"

The symbolic name of the tag is shown in this info box.

③ "Address"

The address of the tag is shown in this info box.

③ "Format"

Select the display format of the respective tag from the drop-down list.

⑤ "Value"

This column shows the values in the corresponding display format.

3.11 User pages

User pages

In the "User pages" area of the Web server you can upload HTML pages you have created yourself for reading out data of the target system.

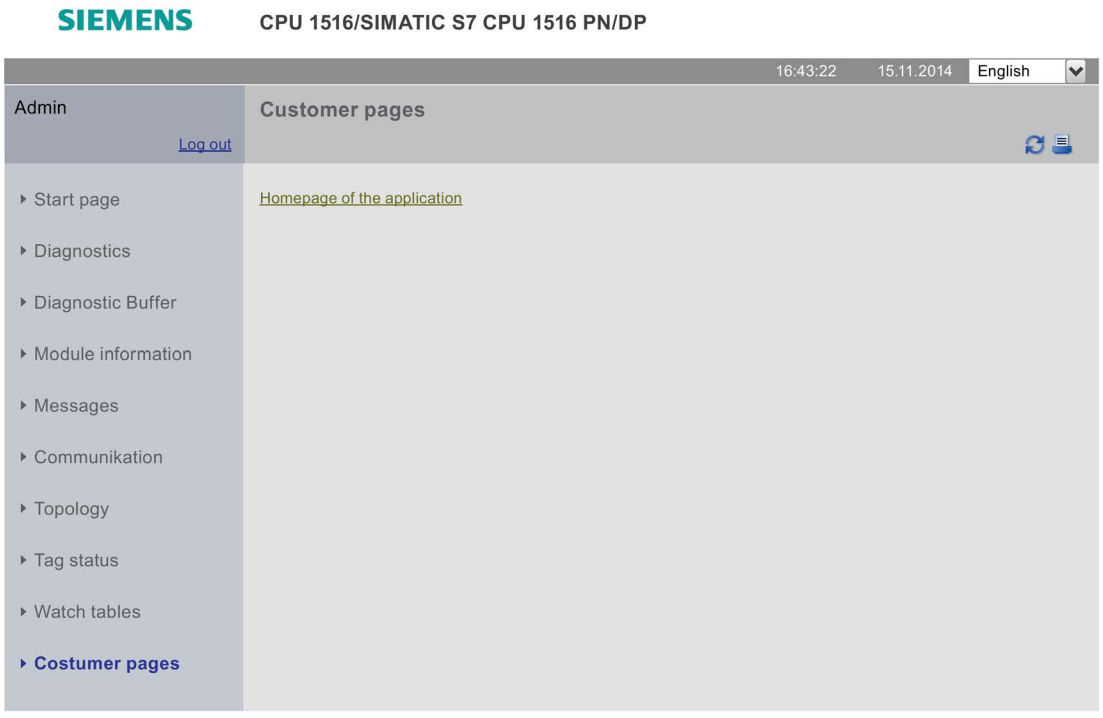

Figure 3-31 User pages

You create the pages with an HTML editor of your choice from which you generate data blocks (Web control DB and Fragment DBs) in STEP 7 and download them to the CPU. The "WWW" instruction synchronizes the user program with the Web server on the CPU and initializes the Web server. With the first call of the "WWW" instruction, the link to the user page is displayed on the web page of the CPU. A click on the link opens the user page in a new window.

Note

Write access to user pages allows the process parameters and, thus, the operation of the CPU to be influenced.
To prevent external manipulation of user pages, always assign a password for users with write access to user pages in the user administration. You will find information on user administration in section Configuring the Web server (Page 12), section "Amending user administration".

Requirements

- You have assigned symbolic names to the tags you want to use on your web page in STEP 7 .
- In the Inspector window under "Properties > General > Web server", you have at least:
  - Activated the Web server
  - Assigned read-only or read and write permissions to the users for user-defined pages (see section Properties of the Web server (Page 10))
- You have completed all necessary communication settings (IP address parameter, subnet mask, etc.).
- You have downloaded the configuration.
- You have created your user page in an HTML editor of your choice:
  - Automatic HTML pages, if you want to **disable** control of the page layout by means of the user program (requires at least one call of SFC 99).
    Changes in mode from RUN to STOP do not affect the call of the user pages.
  - Manual HTML pages, if you want to **enable** control of the page layout by means of the user program (cyclic call of SFC 99 required).

Creating user pages

You can use any HTML editor to create your own user page(s). Make sure that your HTML code complies with the standards of the W3C (World Wide Web Consortium), because STEP 7 does not check the HTML syntax in any way. In addition to the simple HTML code, you can also use JavaScript commands in your user pages.

Proceed as follows:

1. Create the HTML file for your user page with an HTML editor.
   To allow data from the CPU to be read out on your web page, integrate the AWP commands as HTML comments (see section AWP commands (Page 62)).
2. Store the HTML file and all associated source files (e.g., *.gif, *.jpg, *.js, etc.) in a directory on your PG/PC and note the storage path.
3. Call the "WWW" instruction in STEP 7 and program it (see section Programming the WWW instruction (Page 74)).
4. Configure the user page in STEP 7 (see section Configuring user pages (Page 73)). In this way, you compile the contents of your HTML files, among other things, into data blocks.
5. Download the configuration and the user program to the CPU.
6. Open your user page with your display device by means of a web browser in the Web server of the CPU.

Note

Comprehensive HTML pages, especially those with a lot of images, take up a lot of memory in the load memory. Make sure you select a SIMATIC memory card with sufficient memory to provide ample load memory.

Updating user pages

User pages are not updated automatically in the browser. You can program the HTML code so that the pages are updated automatically.

Pages which read out data from the controller, are always up-to-date due to regular updates.

Note

If the HTML page contains form fields for data input, automatic update can impair the correct data input by the user.

To update the entire page automatically, you can add the following instruction in the <head> area of your HTML page, whereby the number "10" stands for the update interval in seconds:

```
<meta http-equiv="refresh" content="10">
```

Reference

The description of a user page is available in the section Example of a user page (Page 78).

Additional help for visualization with user-defined web pages is available in the application examples on the Internet:

- S7-1200 and STEP 7 V11 (http://support.automation.siemens.com/WW/view/en/58862931)
- S7-300 / S7-400 and STEP 7 as of V5.5 (http://support.automation.siemens.com/WW/view/en/44212999)

You will find more information on JavaScript commands in the ECMAScript specification on the Internet (http://www.ecma-international.org/ecma-262/5.1/).

3.11.1 AWP commands

Overview

Automation Web Programming (AWP) commands are a special command syntax for data exchange between CPU and user page (HTML file).

AWP commands are entered as HTML comments and offer the following options for your user pages:

- Reading PLC tags
- Writing PLC tags
- Reading special tags
- Writing special tags
- Defining enum types
- Assigning enum types to tags
- Defining data block fragments
- Importing data block fragments

General syntax

All AWP commands, except for the command for reading a PLC tag, have this structure:
`<!-- AWP_< command name and parameter> -->`

Files including AWP commands:

- must be UTF-8 encoded.
  To define UTF-8 as character set of the page, add the following line to your HTML code:
  `<meta http-equiv="content-type" content="text/html; charset utf-8">`

  Note
  Saving the HTML page
  Make sure that you save the file in the editor in UTF 8 character encoding as well.

- may not include the following sequence:]]>
- may not include the following sequence outside "Reading tag areas" (:="<Varname>":): :=
- depending on the use, must identify special characters in tag names or data block names with character escape sequences or quotation marks
- are case-sensitive
- should be additionally enclosed by JavaScript comments ("/*...*/") in JavaScript files

Overview of AWP commands

Table 3- 5 AWP commands

Function	Representation
Reading PLC tags	`:=<Varname>:`
Writing PLC tags	`<!-- AWP_In_Variable Name='<Varname1>' -->`
Reading special tags	`<!-- AWP_Out_Variable Name='<Typ>:<Name>' -->`
Writing special tags	`<!-- AWP_In_Variable Name='<Typ>:<Name>' -->`
Defining enum types	`<!-- AWP_Enum_Def Name='<Name Enum-Typ>' Values='0: "<Text_1>",1:"<Text_2>",...,x:"<Text_y>"' -->`
Assigning enum types to tags	`<!-- AWP_Enum_Ref Name='<Varname>' Enum='<Name Enum-Typ>' -->`
Defining data block fragments	`<!-- AWP_Start_Fragment Name='<Name>'[Type=<Typ>] [ID=<Id>] -->`
Importing data block fragments	`<!-- AWP_Import_Fragment Name='<Name>' -->`

3.11.1.1 PLC tags

Introduction to PLC tags

User pages can read PLC tags from the CPU and write data to the CPU.

To do so, PLC tags must:

- be enclosed by double quotation marks ("...").
- also be enclosed by single quotation marks ('" ... "') or with quotation marks masked with a backslash ("\" ... "\").
- be specified by a PLC tag name.
- identify, if the PLC tag name includes the characters \ (backslash) or ', these characters with the escape sequence \\ or \' as normal characters of the PLC tag name.
- be enclosed with single quotation marks ('...'), if an absolute address (input, output, bit memory) is used in the AWP command.

Reading PLC tags

These out-tags (output direction as seen from the controller) are inserted at any place in the HTML text with the syntax described below.

Syntax

`:=<Varname>:`

<Varname> corresponds to the tag to be read from your STEP 7 project and can be a simple shared tag or a complete tag path to a structural element. Make sure that you use the name of the data block and not its number when you use data blocks.

Examples

```
:="Conveying speed":
:="My_datablock".bitmemory1:
:=MW100:
```

Reading tags of the String and Character type

Below, these types of quotation marks are used in the explanation: single quotes ('), double quotes (").

As of firmware V1.6, with the "Read PLC tags" function, the CPU outputs tags of the String or Character type enclosed in single quotes to the browser.
For example:

- "Varname".MyString = ABC string tag
- You read the tag in HTML using the function :="Varname".MyString:
- The Web server outputs the character string 'ABC' to the browser

Using String or Character tags in expressions

On your HTML page, you use an expression in which the character string for reading a tag is enclosed in quotes, for example in forms.

Possible HTML code used:

```
<input type="text" name="appfield" value="myvalue">
```

If you read the displayed value for the "value" attribute from a PLC tag in this expression, the HTML code appears as follows:

```
<input type="text" name="appfield" value=":="Varname".MyString:">
```

By reading the PLC tag, the Web server outputs the value 'ABC'. In HTML, the code is then represented as follows:

```
<input type="text" name="appfield" value=" 'ABC' ">
```

If you have used single quotes instead of double quotes in your HTML code to enclose the attributes, the Web server passes on the content of the tags enclosed in two single quotes to the browser. As a result of this, the browser does not output the content of the String or Character tag, since two consecutive single quotes each form a closed sequence. The values to be read are located between these sequences and are not output by the browser.

In this context, note in particular that the character string with double quotes is not identical to two single quotes even if they appear to be identical.

Note

The code is not adapted automatically during an update to firmware as of V1.6.
Adapt your HTML code if you have used single quotation marks to enclose attributes for the "Read PLC tags" function.

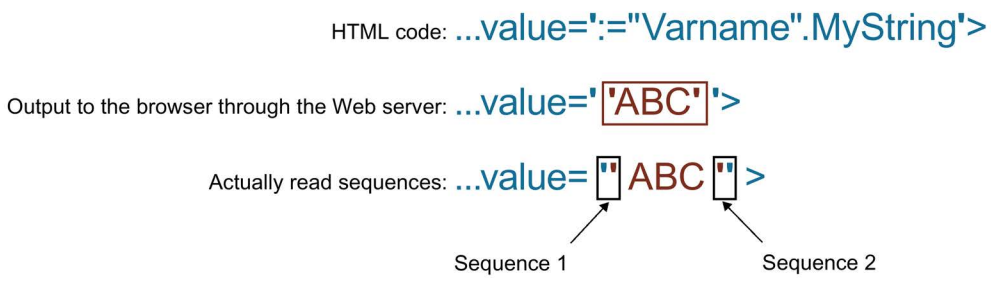

Figure 3-32 Example of HTML code with attribute in single quotation marks

Writing PLC tags

These in-tags (input direction as seen from the controller) are set on the browser page. This can take place in a form on your HTML page, for example, with text input or list selection boxes that correspond to the tags that can be written.

The tags are either set in the HTTP Header (per cookie or POST method) or in the URL (GET method) by the browser in the HTTP request and are then written by the Web server into the respective PLC tag.

Note

Write access during operation

For data to be written from a user page to the CPU, a user must have the required write permissions and be logged on as this user. This applies to all write accesses of web pages to the CPU.

Syntax

```
<!-- AWP_In_Variable Name='"<Varname1>"' Name='"<Varname2>"'
Name='"<Varname3>"' -->
```

If the name of the tag that you are using for the web application is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter.

```
<!-- AWP_In_Variable Name='<Varname_Webapp>' Use='<PLC_Varname>' -->
```

Examples with HTML input boxes

```
<!-- AWP_In_Variable Name='"Target_Level"' -->
<form method="post">
<p>Input Target Level: <input name='"Target_Level"'
type="text"><input type="submit" value="Write to PLC"> </p>
</form>

<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->
<form method="post">
<p>Braking: <input name='"Data_block_1".Braking' type="text"> <input
type="submit" value="Write to PLC"></p>
</form>
```

Examples with HTML drop-down list

```
<!-- AWP_In_Variable Name='"Data_block_1".ManualOverrideEnable' -->
<form method="post">
<select name='"Data_block_1".ManualOverrideEnable'>
<option value=1>Yes</option>
<option value=0>No</option>
</select><input type="submit" value="submit setting"> </form>
```

3.11.1.2 Special tags

Special tags

Special tags are mainly the HTTP tags specified in the definitions of the World Wide Web Consortium (W3C). Special tags are also used for cookies and server tags.

Reading special tags

The Web server can read PLC tags and transfer them to special tags in the HTTP response header. You can, for example, read out a path name from a PLC tag to redirect the URL to another storage location with the special tag "HEADER:Storage location".

Syntax

```
<!-- AWP_Out_Varible Name='<Type>:<Name>' Use='<Varname>' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- COOKIE_VALUE
- COOKIE_EXPIRES

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Status: HTTP status code (if no other value was set, status code 302 is returned).
  - Location: path for redirection to another page. Status code 302 must be set.
  - Retry-After: time for which the service is most likely not available. Status code 503 must be set.
- COOKIE_VALUE:name: value of the named cookie.
- COOKIE_EXPIRES:name: expiration time of the named cookie in seconds.

Examples

The HTTP HEADER tag is written to the PLC tag of the same name:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' -->
```

If the name of the special tag is not identical with the name of the PLC tag, you can assign it to a PLC tag with the "Use" parameter:

```
<!-- AWP_Out_Variable Name='"HEADER:Status"' Use='"Status"' -->
```

Writing special tags

The Web server gives you the option to write values of special tags written in the HTTP header in the CPU. You can, for example, save information on the cookie of a user page or on the user that accesses a page in STEP 7.

Syntax

```
<!-- AWP_In_Variable Name='<Type>:<Name>' Use='Varname' -->
```

<Type> corresponds to the type of special tag.
Options are:

- HEADER
- SERVER
- COOKIE_VALUE

<Name> corresponds to the name of the HEADER tag or the cookie:

- HEADER tags:
  - Accept-Language: accepted or preferred language
  - User-Agent: information on the browser
  - Authorization: credentials for a requested resource
- SERVER tags:
  - current_user_id: Indicates whether a user is logged on:
    current_user_id=0: No user is logged on / access by "Everybody" user.
    current_user_id=1: At least one user is logged on.
  - current_user_name: user name of the logged-on user
- COOKIE_VALUE:name: value of the named cookie.

Examples

The HTTP-SERVER tag is written to the PLC tag of the same name:

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"' -->
```

The HTTP-SERVER tag is written to the PLC tag "My_userID":

```
<!-- AWP_In_Variable Name='"SERVER:current_user_id"'
Use='"My_userID"' -->
```

3.11.1.3 Enum types

Enumeration types (enum types)

Enum types convert numerical values from the PLC program into texts or vice versa. The numerical values may also be assigned for use with several languages.

Define enum types

You can define enum types in your user pages and assign the values in an AWP command.

Syntax

```
<!-- AWP_Enum_Def_Name='<Name Enum-Typ>' Values='0:"<Text_1>",
1:"<Text_2>",...,x:"<Text_y>"' -->
```

Examples

To store German values as HTML file in the "de" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"Fault"' -
->
```

To store English values as HTML file in the "en" folder of the HTML directory:

```
<!-- AWP_Enum_Def Name="Enum1" Values='0:"on", 1:"off", 2:"error"' -
->
```

Assigning enum types to tags

The assignment of tags from the user program to the individual enum types takes place by means of a separate AWP command. The used tag can be used at a different location of the user pages in a read operation or in a write operation.

For a read operation, the Web server replaces the value read from the CPU with the enum text value defined correspondingly. For a write operation, the Web server replaces the defined enum text value with the corresponding integer value of the enumeration before the value is written to the CPU.

Syntax

```
<!-- AWP_Enum_Ref_Name='<Varname>' Enum="<Enum-Type>" -->
```

<Varname> is the symbolic tag name from the user program; <Enum-Type> the previously specified name of the enum type.

Example for a declaration

```
<!-- AWP_Enum_Ref_Name='"Alarm"' Enum="AlarmEnum" -->
```

Example for use when reading a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<p> The current value of "Alarm" is :="Alarm": </p>
```

If the value of "Alarm" in the CPU is 2, the HTML page shows 'The current value of "Alarm" is container is empty' because the definition of the enum type assigns the numerical value 2 to the character sequence "Container is empty".

Example for use when writing a tag

```
<!-- AWP_Enum_Def Name='AlarmEnum' Values='0:"No alarms",
1:"Container is full", 2:"Container is empty"' -->
<!-- AWP_In_Variable_Name='"Alarm"' -->
<!-- AWP_Enum_Ref Name='"Alarm"' Enum="AlarmEnum" -->
...
<form method="post">
<p><input type="hidden" name ='"Alarm"' value='Container is full'
/></p>
<p><input type="submit" value='Set container is full' /></p>
</form>
```

The value 1 is written to the PLC tag "Alarm" because the definition of the enum type assigns the numerical value 1 the text "Container is full".

Keep in mind that the name specified in "AWP_In_Variable" must be exactly the same in "AWP_Enum_Ref".

3.11.1.4 Fragments

Fragments

Fragments are "short paragraphs" of a website that the CPU processes separately.

Fragments are usually entire pages, but they can be individual elements, such as files (e.g. images) or documents.

Note

In each fragment in which enum texts are referenced by a PLC tag, this PLC tag must be assigned to the enum type name with the appropriate AWP command.

Defining fragments

A fragment extends to the beginning of the next fragment or to the end of the file.

Syntax

```
<!-- AWP_Start_Fragment_Name='<Name>' [Type="<Typ>"] [ID="<Id>"] -->
```

This command specifies the start of a fragment.

- <Name> Specifies the name of the fragment. The name must start with a letter [a-zA-Z] or an underscore (_). This first character can be followed by letters, underscores or numbers [0-9].
- <Type> Specifies the type of the fragment.
  - "manual": The user program is notified of the request for a fragment and can react accordingly. The function of the fragment must be controlled with STEP 7 and the tags of the control DB.
  - "automatic": The page is automatically processed (default)
- <Id> You can specify a numerical ID for the fragment. If no ID is assigned, the fragment is automatically assigned an ID. For manual pages (<Type>=manual), the fragment can be addressed with this ID in the user program of the CPU.

  Note

  ID assignment

  Set the ID as low as possible because the highest ID influences the size of the Web control DB.

- <Modus>
  - "visible": The contents of the fragment are displayed on the user page (default).
  - "hidden": The contents of the fragment are **not** displayed on the user page.

Importing fragments

You can specify a fragment in an HTML page and import this fragment into other websites.

Note

Ensure that no AWP command for importing fragments is positioned between an enum assignment and enum usage, because this import can result in the enum assignment being located in a different fragment than the enum usage.

Example

A company logo is to be displayed on all websites of a web application.

The HTML code for the fragment that displays the company logo exists only once. You can import the fragment as often and into as many HTML files as necessary.

Syntax

```
<!-- AWP_Import_Fragment_Name='<Name>' -->
```

<Name> corresponds to the name of the fragment to be imported.

Example

HTML code within a website that creates a fragment for displaying an image:

```
<!-- AWP_Start_Fragment Name='My_company_logo' -->
<p><img src="Company logo.jpg"></p>
```

HTML code that imports the created fragment into another website:

```
<!-- AWP_Import_Fragment Name='My_company_logo' -->
```

3.11.2 Configuring user pages

Configuring user pages

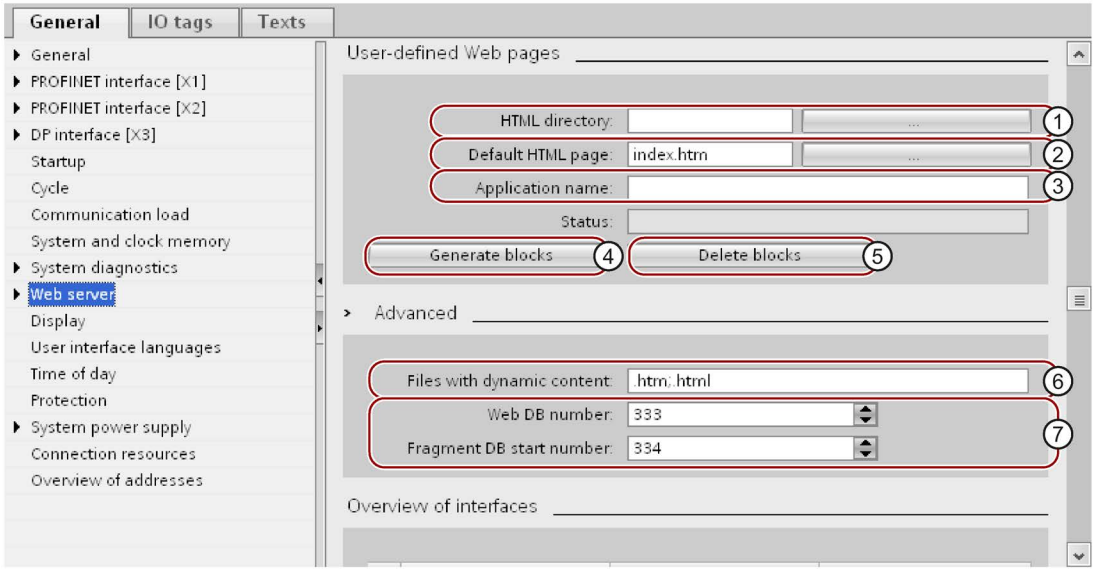

Figure 3-33 Configuring user pages in STEP 7

Proceed as follows to configure the user pages in STEP 7:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. In the area "User pages" under ① "HTML directory", select the folder on your display device in which you have saved your HTML page.
4. Enter the name of the HTML page under ② "Start HTML page" that is to open when you start the application.
5. You can also specify a name for your application under ③ "Application name". This name is used to further divide or group the webpages. If an application name already exists, the URL is displayed in the following format: http://a.b.c.d/awp/<application name>/<page name>.html
6. In the "Extended" area, enter the file extensions that have to be checked for AWP commands in input box ⑥ "Files with dynamic contents". By default, STEP 7 analyses files with the extensions ".js", ".htm" and ".html". Here you can enter other file extensions that you have used when creating your user page.
7. You can accept the number for the Web DB ⑦ and the fragment DB start number ⑦ or you can assign a new number of your choice that is not assigned.

8. Click the button ④ "Create blocks" to create data blocks from the source files. The created data blocks are stored in the STEP 7 project tree in the folder "System blocks > Web server". These data blocks consist of a control data block (Web control DB) that controls the display of the webpages and one or several data block fragments (fragment DBs) with the compiled webpages.
9. In the network view, select the CPU you want to download and select the command "Download to device" in the "Online" menu to download the blocks. The compilation of the blocks is implicitly triggered before the download. If errors are signaled during this process, they must be remedied before you can download the configuration.

Deleting data blocks

Click the "Delete block" button ⑤ to delete previously generated data blocks. STEP 7 deletes the Web Control DB and all fragment DBs from the project containing your user pages.

3.11.3 Programming the WWW instruction

The WWW instruction

The WWW instruction initializes the Web server of the CPU or synchronizes the user pages with the user program in the CPU. The Web control DB is the input parameter for the WWW instruction and specifies the content of the pages as they are displayed in the fragment DBs as well as the status and control information. STEP 7 creates the Web control DB when you click the button "Create blocks".

Programming the WWW instruction

The user program must execute the WWW instruction so that the user pages can be accessed in the Web server.

Table 3- 6 WWW instruction

LAD/FBD	SCL	Description
	`ret_val :=WWW(ctrl_db:=uint_in_);`	Access to user pages by means of the Web server

Parameters

The table below shows the parameters of the WWW instruction.

Table 3- 7 Parameters

Parameters	Declaration	Data type	Description
CTRL_DB	Input	DB_WWW	Data block that describes the user pages (Web control DB)
RET_VAL	Output	INT	Error information

RET_VAL parameter

Table 3- 8 RET_VAL

Error code (W#16#...)	Explanation
0000	No error has occurred. There are no pending website requests that must be released by the user program.
00xy	x: indicates if an error occurred during initialization of the Web control DB (CTRL_DB): x=0: no errors. x=1: errors occurred. The error is encoded in the "CTRL_DB.last_error" byte of the Web control DB. y: Number of the pending request. Several requests are possible (e.g., request "0" and "1" are pending: y="3"). y="1": Request "0" y="2": Request "1" y="4": Request "2" y="8": Request "3"
803A	The specified Web Control DB does not exist on the CPU.
8081	Incorrect version or incorrect format of the Web Control DB.
80C1	There are no resources available to initialize the Web application.

3.11.4 Defining the user page as home page

Defining the user page as home page

In addition to the default intro page, you can also define the home page of your user pages as the home page of the Web server.

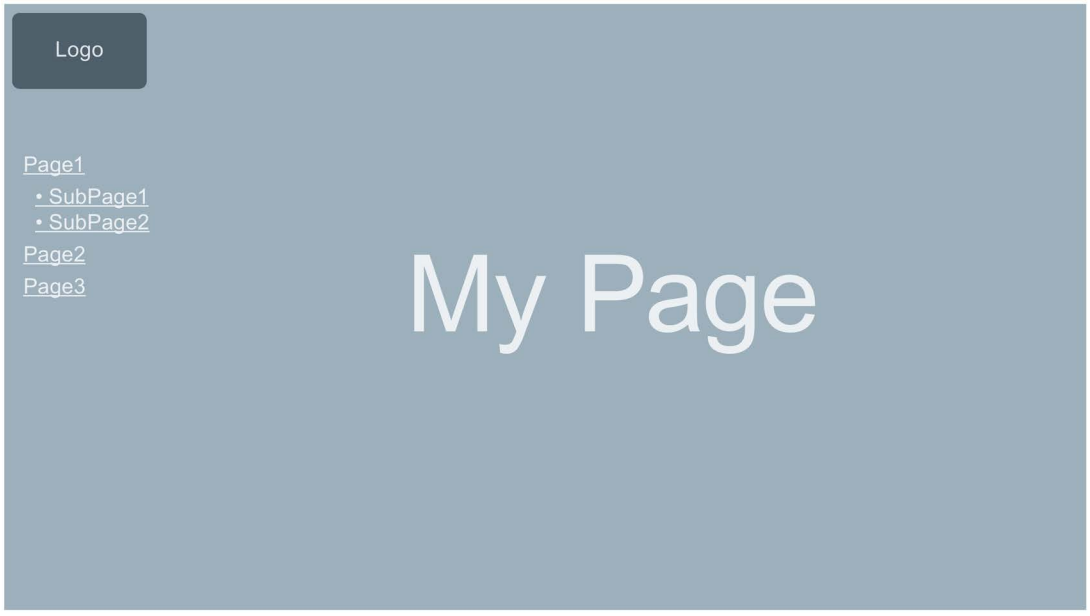

Figure 3-34 Example of user page as home page of the Web server

Requirements

1. You have configured a user in STEP 7, whom you have assigned at least the authorization "... open user-defined web pages".
2. The CPU is in RUN mode.

Procedure

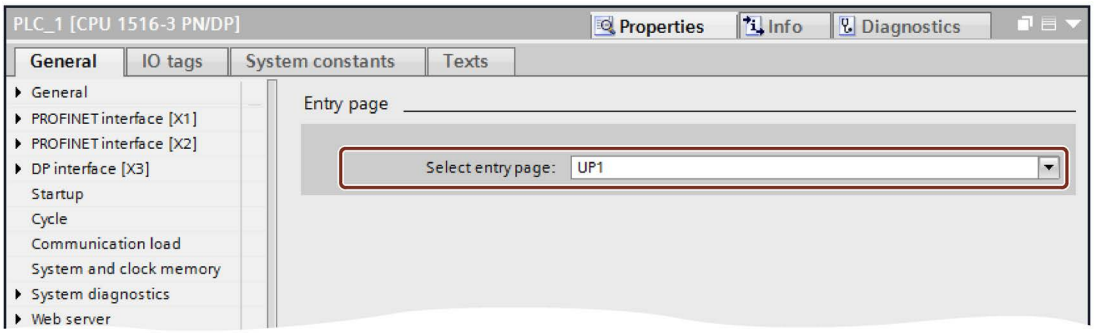

Figure 3-35 Setting user page in STEP 7 as home page

Proceed as follows to define the user pages in STEP 7 as home page of the Web server:

1. Select the CPU in the device configuration.
2. Open the settings in the Inspector window of the CPU under "Properties > General > Web server".
3. Select the entry "AWP1" in the area "Entry page" under "Select entry page".

If you now enter the IP address of the CPU in the browser, a connection is automatically established to your user pages.

If you want to again access the web pages of your CPU, link the web pages from your user pages, via the URL "http://a.b.c.d./Portal/Portal.mwsl?PriNav=Start" or "https://a.b.c.d/Portal/Portal.mwsl?PriNav=Start" for example. In this case, the information "a.b.c.d" represents, as an example, the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/Portal/Portal.mwsl?PriNav=Start">SIMATIC web pages</a>
```

Note

If you define your user page as home page of the Web server, all direct access to the web pages of the CPU is disabled. This applies also to the bookmarks you saved for the web pages of the CPU as well as the page for reading out the service data.

Reading out service data

If you define your user page as home page of the Web server, all direct access to the web pages for reading out the service data is also disabled.
If you want to continue to read out service data via the Web server if necessary, here is how you can link the service data page directly to your user page.
Just as for the web pages of the CPU, link the service data page e.g. via the URL "http://a.b.c.d/save_service_data" or "https://a.b.c.d/save_service_data", the "a.b.c.d" here is an example of the IP address of the configured CPU.

Example of link in HTML:

```
<a href="/save_service_data">Service data</a>
```

3.11.5 Example of a user page

3.11.5.1 Website for monitoring and controlling a wind turbine

Example of a user page

Here you see a user page for monitoring and controlling a wind turbine:

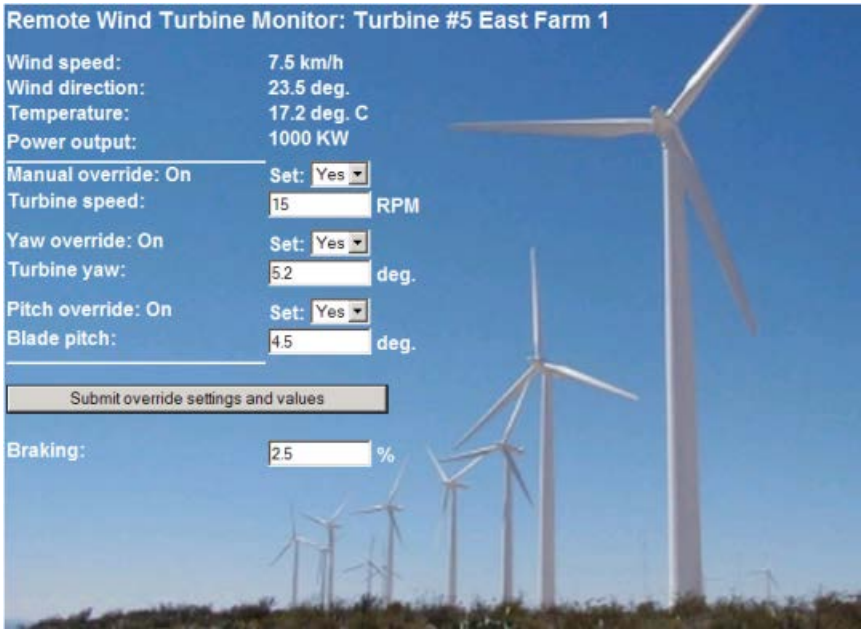

Figure 3-36 Overview of user page wind turbine

The user page was created in English in this example, but you can select any language you wish when you create your own user page.

In this application, each wind turbine of the wind farm has a data block in STEP 7 with specific data for the respective location and the turbine.

The user page gives you the option to access the turbine remotely with a display device. A user can open the standard websites for a CPU of a specific wind turbine and go to the "Remote Wind Turbine Monitor" user page to view the turbine data. A user with the corresponding access permissions can also set the turbine into the manually controlled mode and thus control the tags for speed, orientation and angle of attack of the turbine by means of the website. The user can also specify a brake value regardless of manual or automatic control of the turbine.

STEP 7 checks the Boolean values for override of the automatic control and, if set, uses the values for speed, orientation and angle of attack of the turbine as defined by the user.

Files used

Three files are used in the application example:

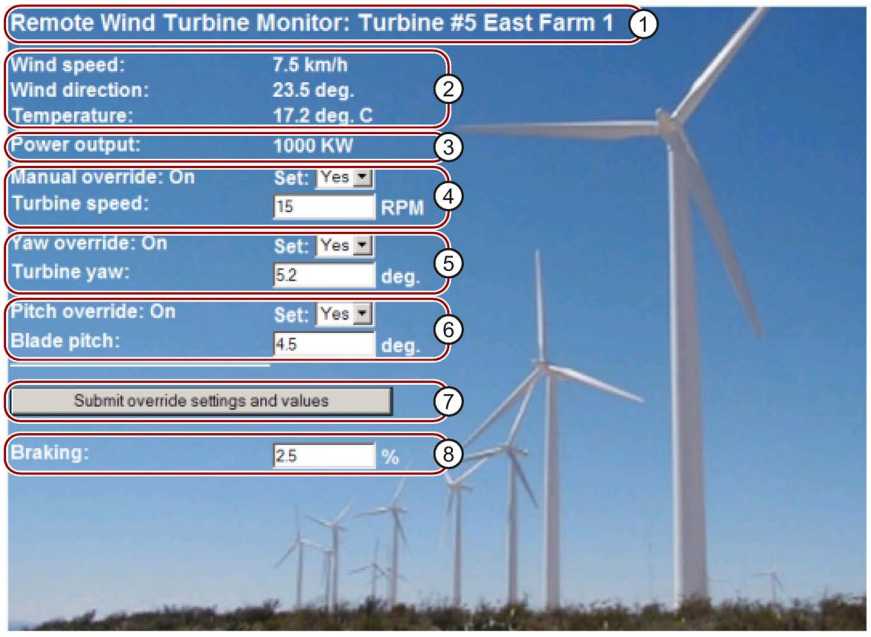
- Wind_turbine.html: The user page in the figure shown above. The control data is accessed by AWP commands.
- Wind_turbine.css: The Cascading Style Sheet which includes the formatting specifications of the user page. The use is optional but can simplify the design of the user page.
- Wind_turbine.jpg: The background image displayed on the user page. The use of images is optional, user pages with lots of images require a lot more memory in the load memory.

These files are not part of your installation but they are described as an example below.

Implementation

The user page uses AWP commands to read out values from the CPU as well as writing values to it. The user page also uses AWP commands for the definition of enum types, such as the assignment of tags to enum types for handling the ON/OFF settings.

The user page is structured as follows:



① Header of the website with number and location of the wind turbine.

② Atmospheric conditions at the turbine, wind speed, wind direction and current temperature are displayed.

③ Read-out power output.

④ Manual override: Activates manual override of the turbine. To make manual settings for speed, orientation and angle of attack, the STEP 7 user program requires that manual override has been activated.

⑤ Override of the orientation: Activates manual override of the turbine orientation.

⑥ Override of the angle of attack: Activates manual override of the angle of attack of the rotor blades.

⑦ By clicking this button, you transfer the override settings to the CPU.

⑧ Manual setting of a percentage value for braking. The setting "Manual override" is not required to enter a brake value.

Figure 3-37 Overview of user page wind turbine

The user page also uses an AWP command which writes the special tag into the tag table; it includes the user ID of the user who currently accesses the page.

3.11.5.2 Reading and displaying data from the CPU

Example HTML code for reading out and displaying data from the CPU

This part of the HTML code is used for displaying the power output on the user side.

The text "Power Output:" is displayed on the left-hand side; on the right-hand side, the value of the tags for the power output including the unit ("KW") is displayed.

The AWP command `:="Data_block_1".PowerOutput` executes the reading operation. The data block is referenced by its symbolic name here and not by its number ("Data_block_1" instead of "DB1").

The code used in the example is:

```
<tr style="height:2%;">
<td>
<p>Power output:</p>
</td>
<td>
<p style="margin-bottom:5px;"> :="Data_block_1".PowerOutput: KW</p>
</td>
</tr>
```

See also

PLC tags (Page 63)

3.11.5.3 Using enum types

Definition of enum types

The described user page uses enum types in three locations. "On" or "Off" is displayed for a Boolean value at these locations.

The enum type for "On" results in a value of 1; the enum type for "Off" results in a value of 0. The following excerpts from the HTML code of the user page show the declaration of an enum type with the name "OverrideStatus" and the values "0" and "1" for "Off" or "On" as well as the specification of an enum type reference of "OverrideStatus" for the tag "ManualOverrideEnable" in the data block "Data_block_1".

Note

Assignment of enum types

If the user page writes into a tag by using an enum type, there has to be a declaration "AWP_In_Variable" for each "AWP_Enum_Ref" declaration.

The code used in the example is:

```
<!-- AWP_In_Variable_Name='"Data_block_1".ManualOverrideEnable' -->
<!-- AWP_Enum_Def_Name="OverrideStatus" Values='0: "Off",1:"On"' -->
<!-- AWP_Enum_Ref_Name='"Data_block_1".ManualOverrideEnable'
Enum="OverrideStatus" -->
```

The following code describes a display box for displaying the current status of "ManualOverrideEnable". A normal read command for tags is used but because of the declared and referenced enum type, the website displays the values "On" and "Off" instead of "1" and "0".

```
<td style="width:24%; border-top-style: Solid; border-top-width:
2px; border-top-color: #ffffff;">
<p>Manual override: :="Data_block_1".ManualOverrideEnable:</p>
</td>
```

The following code describes a drop-down list for changing "ManualOverrideEnable" by the user. The drop-down list consists of the "Yes" and "No" options that are assigned to the "On" or "Off" values by means of the enum type reference. If you make no selection, the status remains the same.

```
<select name='"Data_block_1"ManualOverrideEnable'>
<option value=':"Data_block_1".ManualOverrideEnable:'> </option>
<option value="On">Yes</option>
<option selected value="Off">No</option>
</select>
```

The drop-down list is included in the form on the website. The form is uploaded, when the user clicks on the "Send" button. If the user has selected "Yes", the value "1" is written in the tag "ManualOverrideEnable" in the "Data_block_1" data block; if the user has selected "No", the value "0" is written.

3.11.5.4 Writing user inputs into the controller

Setting options

The user page "Remote Wind Turbine Monitor" includes different AWP commands for writing data into the controller. A user with the corresponding access permissions can control the wind turbine manually, activate the override for the turbine speed and the turbine orientation as well as the angle of attack of the rotor blades with the declaration of different "AWP_In_Variable" write commands. The user can also specify floating-point numbers for turbine speed, orientation angle of attack and percentage of braking. The user page uses an HTTP command in the format "POST" to write the tags into the controller.

The code used in the example for setting the brake value is:

```
<!-- AWP_In_Variable Name='"Data_block_1"' -->
...
<tr sytle="vertical-align: top; height: 2%;">
<td style="width: 22%;"><p>Braking:</p></td>
<td>
<form method="POST">
<p><input name='"Data_block_1".Braking' size="10" type ="text">
%</p>
</form>
</td>
</tr>
```

This excerpt from the HTML code first defines a "AWP_In_Variable" for the "Data_block_1" data block which enables the user page to write any number of tags into the data block. The text "Braking:" is displayed on the left-hand side; on the right-hand side is a box in which the user can make entries for the "Braking" tag in the data block.

The user page reads out the actual braking value from the controller and displays it in the text box. A user with the corresponding access permissions can then write a brake value that controls the braking process into the data block of the CPU.

Note

Declaration of data blocks

If you declare an entire data block by means of a "AWP_In_Variable", each tag in the data block can be written by means of the user page. If only certain tags in the data block are to be writable, you declare this specifically using `<!-- AWP_In_Variable Name='"Data_block_1".Braking' -->`, for example.

3.11.5.5 Writing special tags

Using special tags

The user page "Remote Wind Turbine Monitor" writes the special tag "Server:current_user_id" into a tag of the CPU. The tag value contains the value "1" if a user is logged on and "0" if a user is not logged on. In this example, a user is logged on, so the tag value is set to "1". The special tag is written into the CPU by the user page and does not need a user interface.

The code used in the example is:

```
<!-- AWP_in_variable Name="SERVER:current_user_id" Use="User_ID" -->
```

3.11.5.6 HTML code of the user page "Remote Wind Turbine Monitor"

The complete HTML code of the example user page "Remote Wind Turbine Monitor" as well as the used Cascading Style Sheet (CSS) is listed below.

Wind_turbine.html

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd"><!--
This test program simulates a website for monitoring and operating a
wind turbine.
Required PLC tags and data block tags in STEP 7:
PLC tag:
User_ID: Int
Data blocks:
Data_block_1
Tags in Data_Block_1:
TurbineNumber: Int
WindSpeed: Real
WindDirection: Real
Temperature: Real
PowerOutput: Real
ManualOverrideEnable: Bool
TurbineSpeed: Real
YawOverride: Bool
Yaw: Real
PitchOverride: Bool
Pitch: Real
Braking: Real
The user-defined website shows the current values for the PLC data
and offers a drop-down list to specify the three Boolean values with
the assigned enumeration type. The selected Boolean values as well
as the data text boxes for speed, orientation and angle of attack of
the turbine are uploaded with the "Send" button. The brake value can
be specified without the "Send" button.
```

```
No actual STEP 7 program is required for using this page. The STEP 7
program would theoretically only respond to the values for speed,
orientation and angle of attack of the turbine, if the assigned
Boolean values were specified. The only requirement for STEP 7 is
that the WWW instruction is called with the DB number of the
generated data blocks for this page.

```

3.12 File browser

Requirements

Execute permissions must be assigned for the user in the user administration.

File browser

The browser displays the content of the SIMATIC memory card on the "File browser" web page. This means, for example, that you can read and edit the log files generated by the CPU without having to use STEP 7.

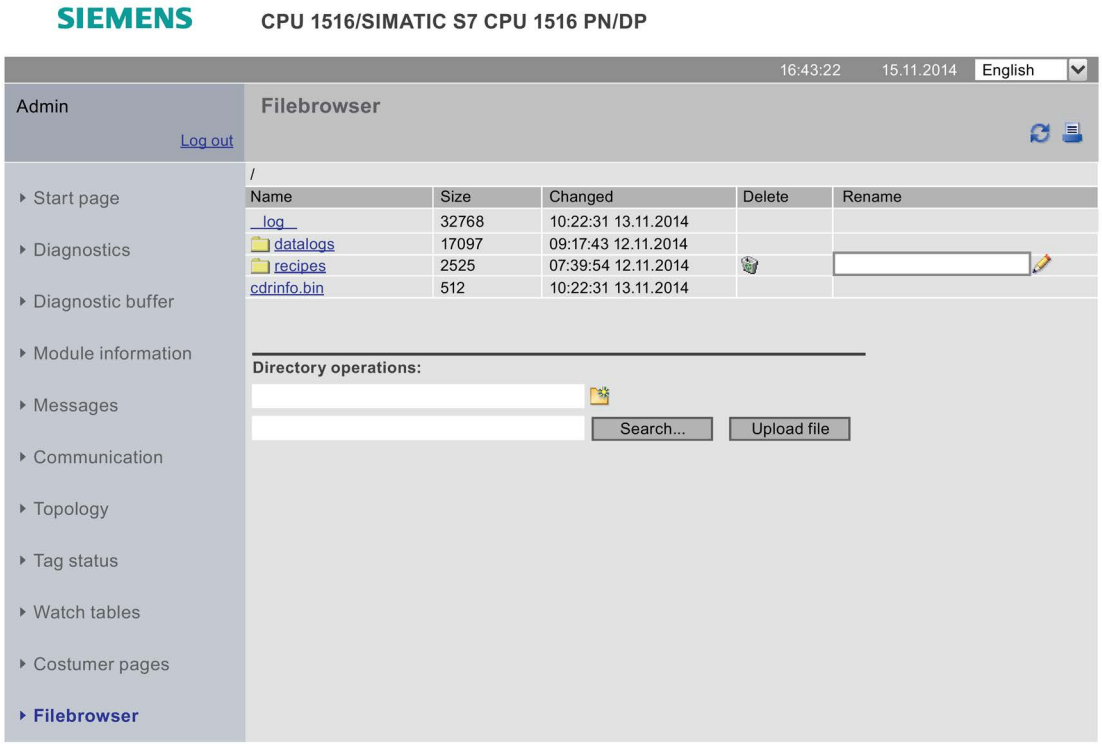

Figure 3-38 File browser view

The file browser lists all existing files and directories on the SIMATIC memory card. The files can be downloaded, deleted, renamed and uploaded; the directories can be created, deleted and renamed.

Note

The file browser only grants you read access to DataLogs.

Exception system files

The system files include the job file and all special directories including their contents to which the job file refers. System files are not displayed, and cannot be changed or deleted.

3.13 DataLogs

DataLogs

On the DataLogs web page, you can have all the DataLogs that you created displayed.

You can sort the DataLogs according to the individual parameters in ascending or descending order.
For this purpose, click on one of the parameters in the column header:

- Name
- Size
- Changed on

You can call and empty the relevant DataLog file by clicking the icon .

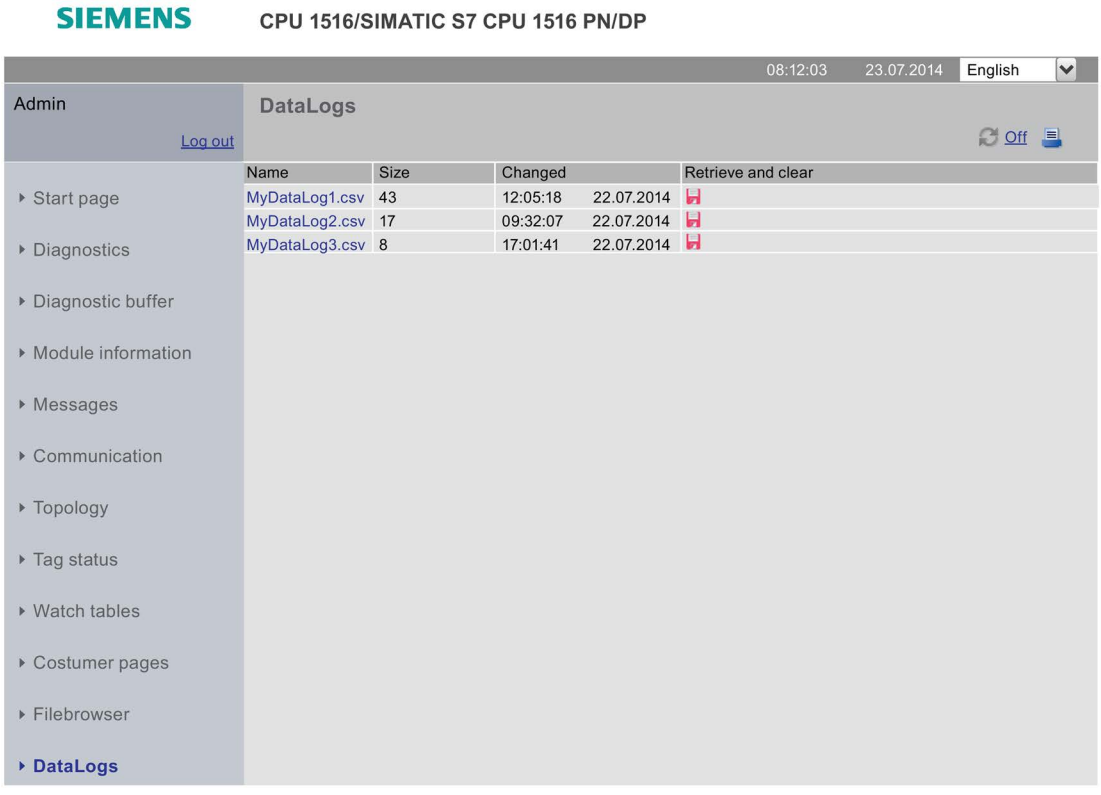

Figure 3-39 DataLogs

3.14 Reading out service data

The Web server gives you the option to save service data. In addition to the content of the diagnostic buffer, they include additional information on the internal status of the CPU. If you should encounter a problem with the CPU that cannot be resolved otherwise, you therefore have the option to submit the service data to the Service&Support team.

Procedure

1. Enter the following address in the address bar of your web browser:
   "http://<CPU IP address>/save_service_data", e.g.,
   "http://192.168.3.141/save_service_data"
2. Your screen displays the service data page with a button for saving the service data.

3. Save the service data locally on your display device by clicking "Save ServiceData".

Result

The data is saved into a .dmp file with the following naming convention: "<MLFB><serial number><time stamp>.dmp". The user can change the file name at a later time.

Note

If you have defined your user page as the start page, observe the note on reading out service data in section Defining the user page as home page (Page 76).

3.15 Basic websites

Web pages with reduced contents

Basic web pages are offered for display devices with smaller screens, for example HMI, on the Web server.
Basic web pages have reduced contents that are adapted to meet the requirements of smaller screens.
These sites do not support JavaScript for the sake of fast access. This means that not all standard web pages are available as basic web pages. The basic web page can also have fewer functions than the standard web page.

The switch to basic web pages takes place automatically for HMI devices.
You access basic web pages from other end devices by entering the IP address of the configured and the extension "/basic" in the address bar of the Web browser, for example http://192.168.3.141/basic or https://192.168.3.141/basic.

The following standard web pages are also available as basic web pages:

- Home page (in Basic: "Status")
- Diagnostics
- Diagnostics buffer
- Memory usage
- Module information
- Alarms
- Communication
- Tag status
- Watch tables
- User pages
- File browser (read access only)
- DataLogs
- Intro

The basic web pages are displayed as follows:

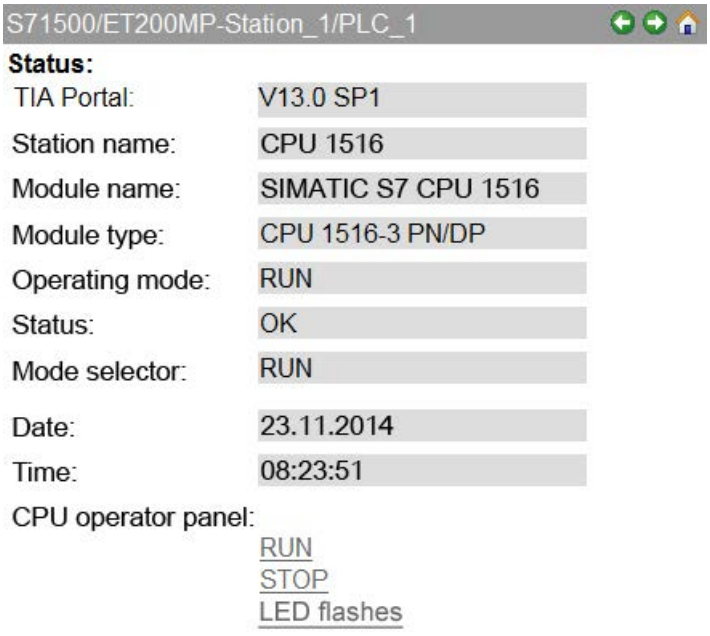

Figure 3-40 Example basic web pages, "Status" web page

Glossary

Automation system

An automation system is a programmable logic controller that consists of at least one CPU, various input and output modules, as well as operating and monitoring devices.

AWP

Automation Web Programming

AWP commands

Special command syntax for data exchange between CPU and HTML file.

Configuration

Systematic arrangement of individual modules (design).

CSS

A CSS (Cascading Style Sheet) specifies how an area or content marked up in HTML is displayed.

Device

Device that can send, receive or amplify data via the bus, e.g., IO controller.

Diagnostics

The detection, localization, classification, visualization and further evaluation of errors, malfunction and alarms.

Diagnostics provides monitoring functions that run automatically during plant operation. This increases the availability of plants by reducing commissioning times and downtimes.

Firewall

A firewall is used to restrict the network access based on sender or target address of the used services. The firewall decides based on specified rules which of the network packets it handles are forwarded and which are not. This way the firewall tries to prevent unauthorized network access.

It is not the function of a firewall to detect attacks. It only implements rules for network communication.

HTTP

Hypertext Transfer Protocol (HTTP). Protocol for data transmission across a network.

HTTPS

Hypertext Transfer Protocol Secure (HTTPS). Protocol for tap-proof transmission of sensitive data across a network.

Identification data

Identification data is stored on a module, and contains information which supports the user in

- Checking the system configuration
- Locating hardware changes in a system
- Correcting errors in a system

Modules can be clearly identified online using the identification data.

Master

The master in possession of the token is an active device. This master has the option to receive data from other devices and to send data to other devices.

PROFIBUS

PROcess **FI**eld **BUS**, process and field bus standard specified in standard IEC 61784-1:2002 Ed1 CP 3/1. It specifies functional, electrical, and mechanical properties for a bit-serial field bus system.

PROFIBUS is available with the protocols DP (= Distributed I/O), FMS (= Fieldbus Message Specification), PA (= Process Automation), or TF (= Technological Functions).

PROFINET

Within the framework of Totally Integrated Automation (TIA), PROFINET represents the consistent continuation of:

- PROFIBUS DP, the established field bus
- Industrial Ethernet, the communications bus for the cell level

Experience gained from both systems was and is being integrated into PROFINET.

PROFINET as an Ethernet-based automation standard from PROFIBUS International (previously PROFIBUS User Organization) defines a vendor-independent communication, automation, and engineering model.

PROFINET component

A PROFINET component includes the entire data of the hardware configuration, the parameters of the modules, and the corresponding user program. The PROFINET component is made up as follows:

- Technological Function

  The (optional) technological (software) function includes the interface to other PROFINET components in the form of interconnectable inputs and outputs.

- Device

  The device is the representation of the physical programmable controller or field device including the I/O, sensors and actuators, mechanical parts, and the device firmware.

PROFINET IO

As part of PROFINET, PROFINET IO is a communication concept that is used to implement modular, distributed applications.

PROFINET IO allows you to create automation solutions which are familiar to you from PROFIBUS.

PROFINET IO is implemented by the PROFINET standard for automation devices on the one hand, and on the other hand by the engineering tool STEP 7.

That is, you have the same application view in STEP 7, regardless of whether you configure PROFINET or PROFIBUS devices. Programming your user program is essentially the same for PROFINET IO and PROFIBUS DP if you use the extended blocks and system status lists for PROFINET IO.

PROFINET IO controller

Device used to address connected I/O devices. This means that the IO controller exchanges input and output signals with assigned field devices. The IO controller is often the controller on which the automation program runs.

PROFINET IO device

A distributed field device that is assigned to one of the IO controllers (e.g., remote IO, valve terminals, frequency converters, switches).

URL

Uniform Resource Locator (URL). Identifies and localizes a source, such as a web page, uniquely via the method of access used and the location of the source in computer networks.

UTF-8

Abbreviation for 8-bit UCS (Universal Character Set) transformation format. Most popular coding of Unicode characters.

Each Unicode character is assigned a specially coded byte string of variable length in this format. UTF-8 supports up to four bytes on which all Unicode characters can be mapped.

Web browser

Web browsers are visualization programs for web pages and can communicate with Web servers.

Typical web browsers are, for example:

- Microsoft Internet Explorer
- Mozilla Firefox

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides an overview of the diagnostics options for the automation systems S7-1500, ET 200MP, ET 200SP and ET 200AL.

The documentation covers the following:

- Illustration of the uniformity and consistency of system diagnostics
- Overview of the options for establishing system diagnostics information

Basic knowledge required

The following knowledge is required in order to understand the function manual:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge of working with STEP 7 and WinCC
- Knowledge about the use of Microsoft Windows operating systems

Scope of the documentation

This documentation is the basic documentation for all products of the S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The product documentation is based on this documentation.

Changes compared to previous version

Changes / enhancements described in this manual, compared to the previous version (version 02/2014):

- Extension of the scope of validity to the distributed I/O system ET 200AL
- The CPUs of the product series S7-1500 and ET 200SP are collectively referred to as "CPU"

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

This documentation contains pictures of the devices described. The figures may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on handling of the product and on the section of the documentation to which you should pay particular attention.

Additional support

- Information about Technical Support is available in the appendix Service & Support (Page 87).
- The technical documentation for the individual SIMATIC products and systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Documentation guide

1

Introduction

The documentation of the SIMATIC products has a modular structure and covers all aspects of your automation system.

The complete documentation for the S7-1500, ET 200SP, ET 200MP and ET 200AL systems consists of the respective system manuals, function manuals and product manuals.

The STEP 7 information system (online help) also supports you when configuring and programming your automation system.

Overview of the documentation on the topic "System diagnostics"

The following table lists additional documentation which supplements this description on the topic "System diagnostics".

Table 1- 1 Documentation on the topic "System diagnostics"

Topic	Documentation	Most important contents
STEP 7 (TIA Portal)	Online help for STEP 7 Professional V13	Configuring and programming with the engineering software
System description	S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792)	• Application planning • Installation • Wiring • Commissioning

SIMATIC manuals

All current manuals for the SIMATIC products are available for download free of charge on the Internet (http://www.siemens.com/automation/service&support).

Overview of system diagnostics

2

2.1 Properties of system diagnostics

Introduction

In the SIMATIC environment, diagnostics of devices and modules is collectively referred to as system diagnostics. The monitoring functions are automatically derived from the hardware configuration.

All SIMATIC products have integrated diagnostic functions that they can use to detect and remedy faults. The components automatically flag a potential fault in the operation and provide detailed information. Unscheduled standstill times can be minimized with plant-wide diagnostics.

The following states are monitored by the system in the running plant:

- Device failure
- Remove/insert fault
- Module fault
- I/O access error
- Channel fault
- Parameter assignment error
- Failure of the external auxiliary voltage

Properties ofSIMATIC system diagnostics

The SIMATIC system diagnostics has the following properties:

- Integrated as standard in the hardware
- System-wide across bus limits
- Automatic localization of the error source
- Automatic output of the cause of the error in plain text
- Plant-wide diagnostics of all components
- Archiving and logging of alarms
- Configurability of alarms

Consistent diagnostics from the field level all the way to the management level

The different diagnostics media give you a uniform view of maintenance-related information of all automation components in a plant:

- System status (module and network status, alarms for system errors) are available plant-wide in a uniform display.

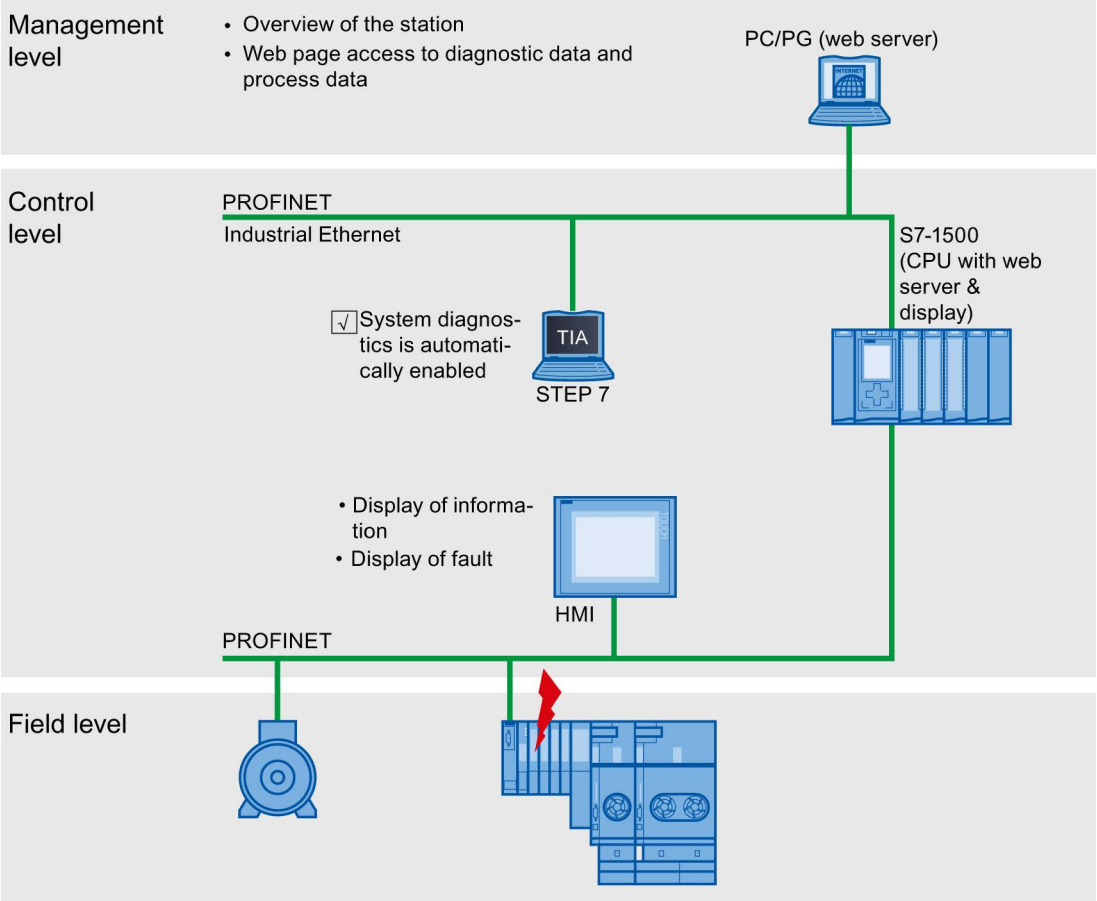

Figure 2-1 Overview of system diagnostics in a plant

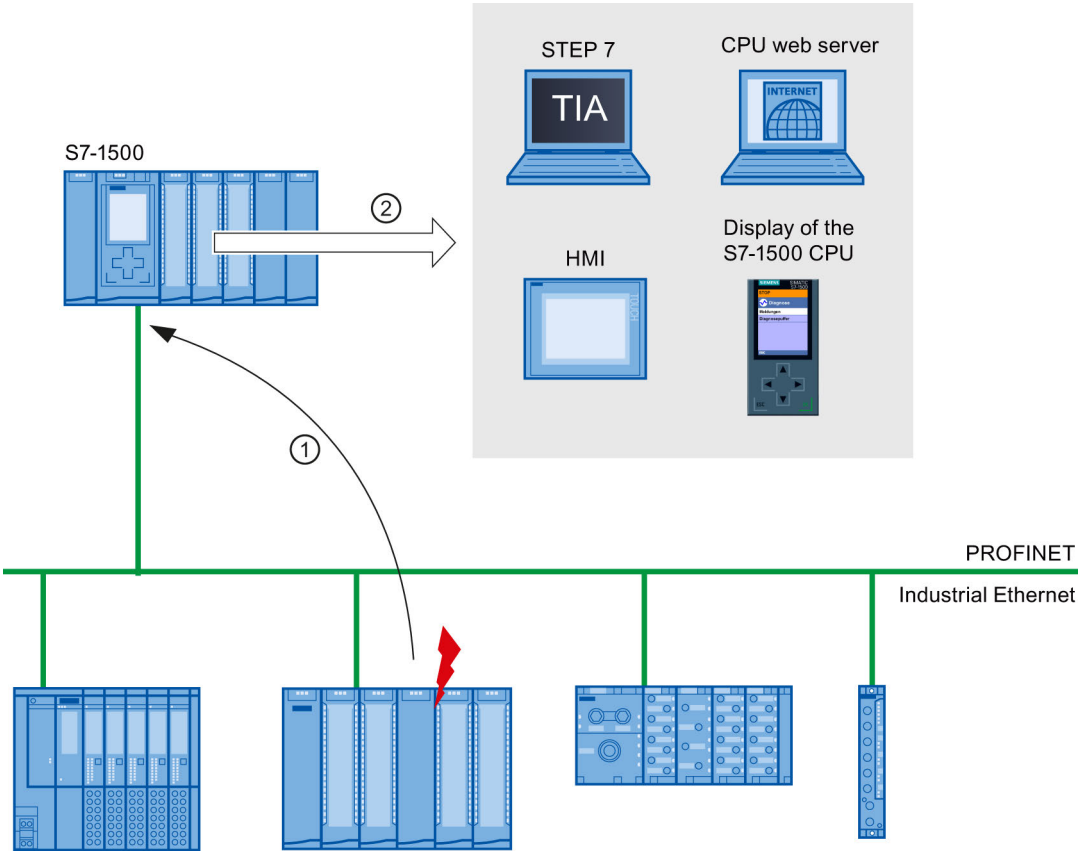
2.2 Benefits of innovative system diagnostics

System diagnostics is also possible in STOP.

The system diagnostics is integrated in the firmware of the CPU and works independent of the cyclic user program. This means it is also available in the STOP CPU operating mode. Faults are detected immediately and signaled to the higher-level HMI devices, the web server and the display of the S7-1500 CPU, even in STOP mode. This makes system diagnostics consistent with the actual plant state at all times.

Uniform display concept

All clients of a system are provided with diagnostics information by a uniform mechanism. The same system diagnostics information is used regardless of the display medium.



Step	Description
①	The device detects an error and sends diagnostics data to the assigned CPU.
②	The CPU informs the connected display media. The display of the system diagnostics is updated.

Figure 2-2 Sequence of the system diagnostics

Quick start

3

Introduction

The following chapters of this documentation describe the different options for establishing system diagnostics. All described options can be used independently of one another.

This chapter gives you an overview of the basic procedure to get initial diagnostics information fast.

Note

System diagnostics is generally available for the devices of the SIMATIC series.

3.1 Using the display of the CPU

The display of the S7-1500 CPU offers a fast and direct option to get diagnostics information. You can call up status information in different menus on the display.

Requirement

- A project has been created.
- The project has been downloaded to the CPU.

Determining diagnostics information using the display of the S7-1500 CPU

To determine diagnostics information using the display, follow these steps:

1. Select the "Diagnostics" menu on the display.

Figure 3-1 Display of the S7-1500 CPU

2. Select the "Alarms" entry from the "Diagnostics" menu.

Result

The "Alarms" entry displays the latest error information.

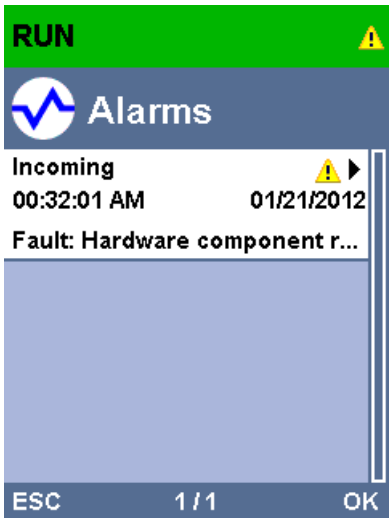


Figure 3-2 Display of the error message in the display of the S7-1500 CPU

Note

Automatic updating of diagnostics information

You set automatic updating of the diagnostics information under: "Display" > "DiagnosticRefresh".

Additional information

For additional information on configuring alarms, please refer to Configuring alarms for system diagnostics (Page 20).

3.2 Using STEP 7

The start using STEP 7 gives you fast access to detailed diagnostics information.

Requirements

- A project has been created.
- The project has been downloaded to the CPU.
- An error has occurred.
- The programming device must be able to establish a connection to the CPU via an interface.

Determining diagnostics information using STEP 7

To determine diagnostics information using STEP 7, follow these steps:

1. Open the respective project in STEP 7.
2. Open the portal view of STEP 7.
3. Select the "Online & Diagnostics" portal.
4. Select the "Online status" action.

   The "Select device" dialog opens. The dialog is an image of the configured devices in the project.

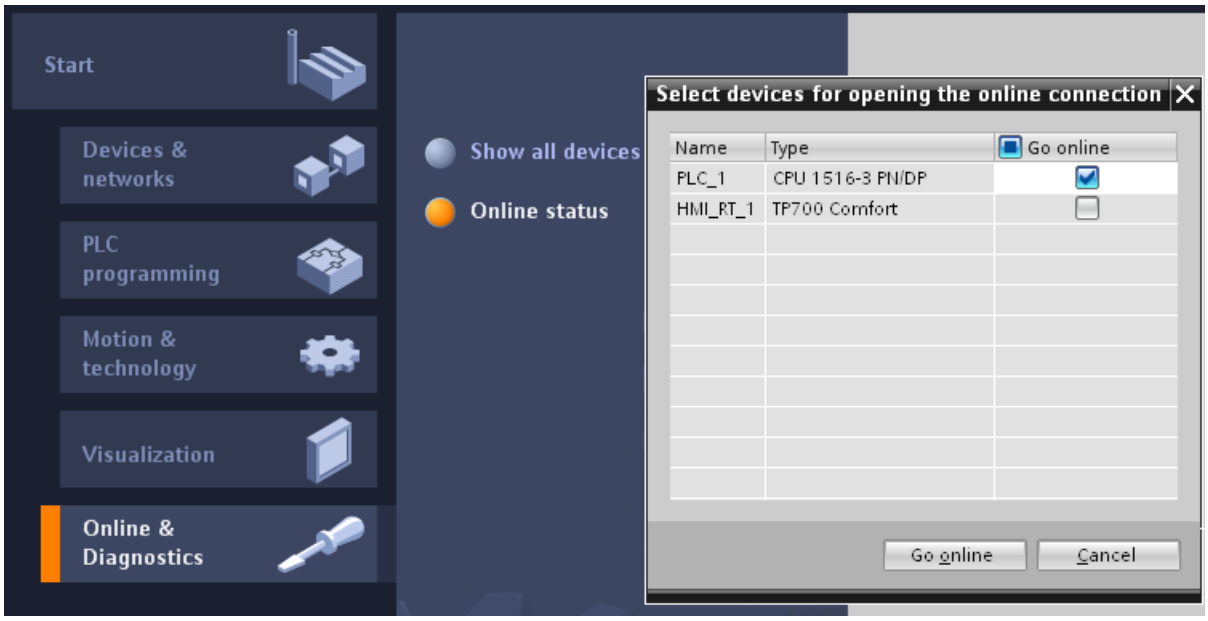

Figure 3-3 Device selection for online connection in the portal view

5. Activate the "Go online" option button for the device that you want to use to establish an online connection.
6. Click on the "Connect" button.

7. The "Go online" dialog opens.

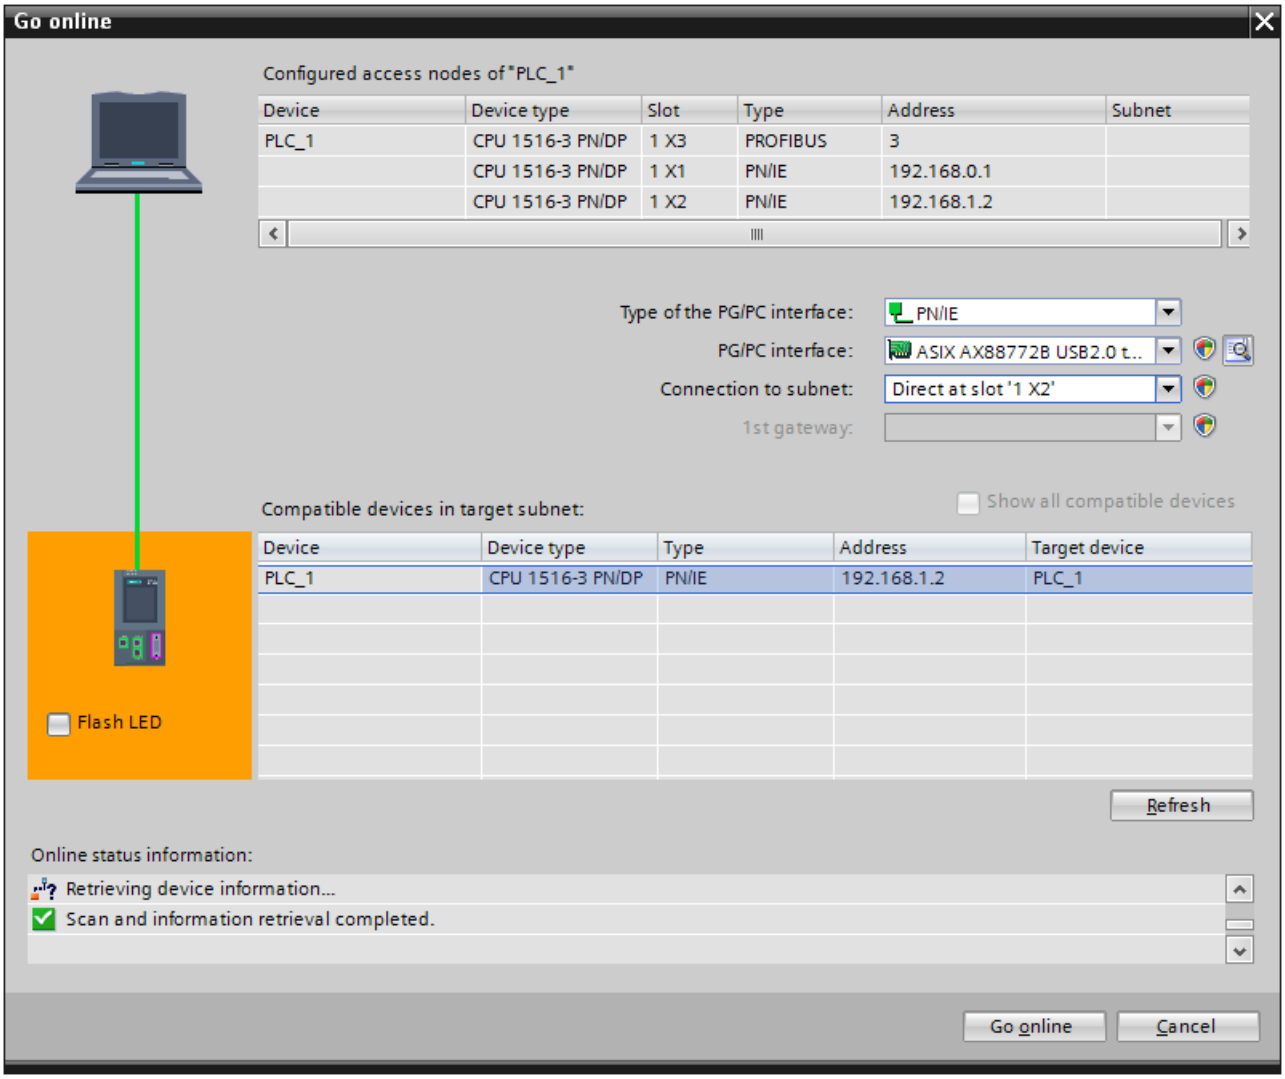

Figure 3-4 Establishing an online connection

8. Make the settings for the interface.

9. Click on the "Connect" button.

   The project view of STEP 7 opens. The network view is opened in the working area.

   The symbols in the project tree provide initial information about the faulty modules.

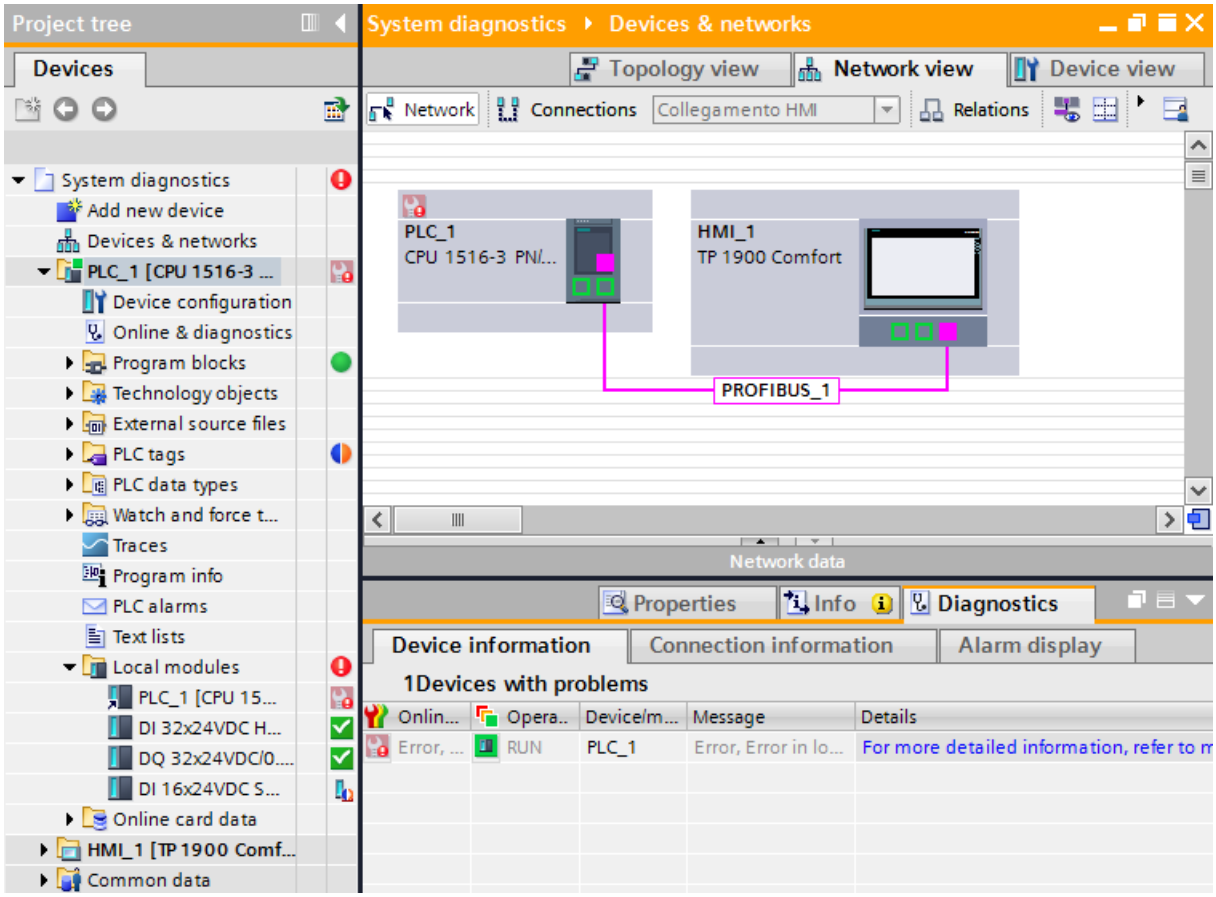

Figure 3-5 Display of the fault in network view

10. Double-click the device which displays an alarm message to access the faulty module directly. This is the CPU in the example.

    The device view of the CPU is opened in the working area. In this view you can see directly in which module the error has occurred.

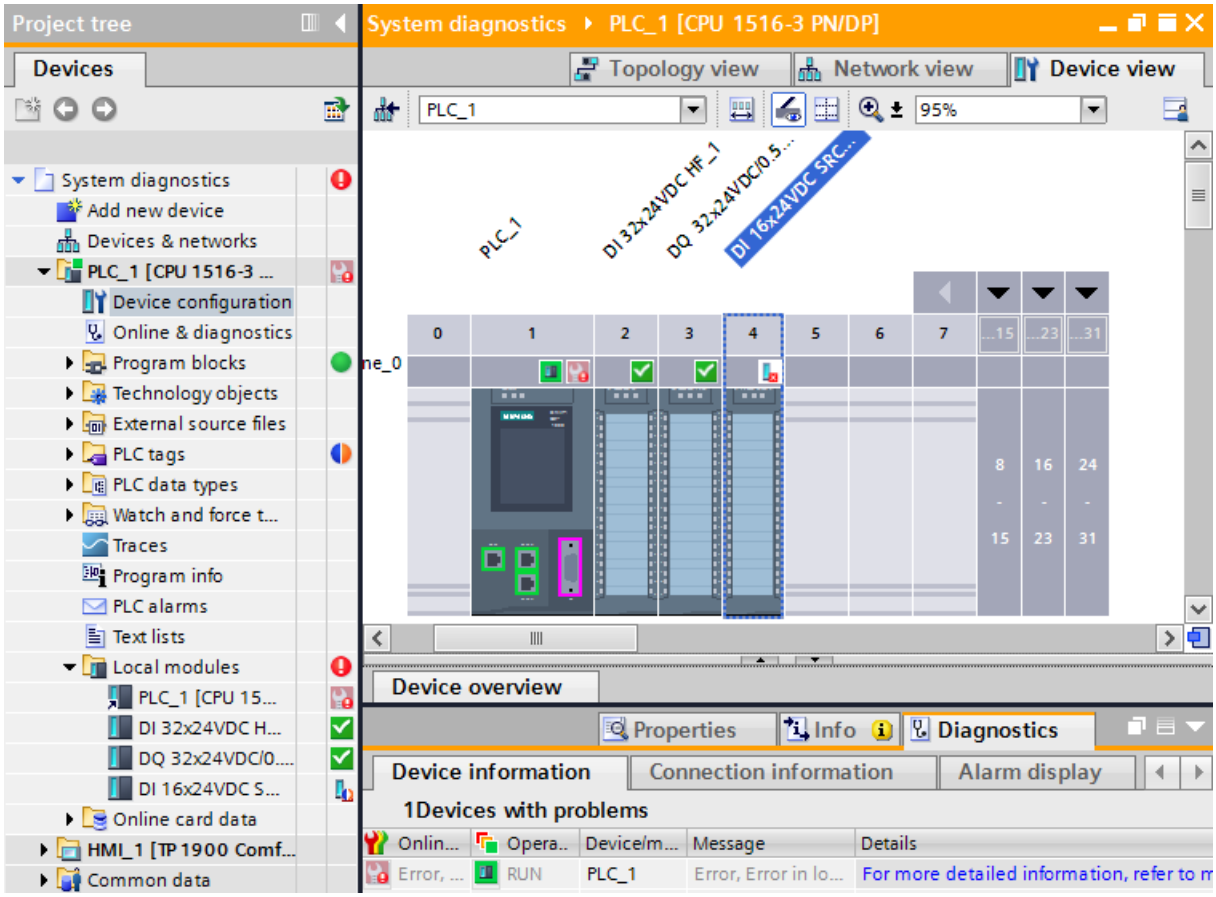

Figure 3-6 Display of the faulty module in the device view

11. Open the "Diagnostics" tab and the subordinate "Device information" tab in the Inspector window for a more detailed error description.

Result

The link in the "Details" table column takes you to the online and diagnostics view of the device and to the diagnostics buffer there, for example. It includes more information on all diagnostics events in the order in which they occurred.

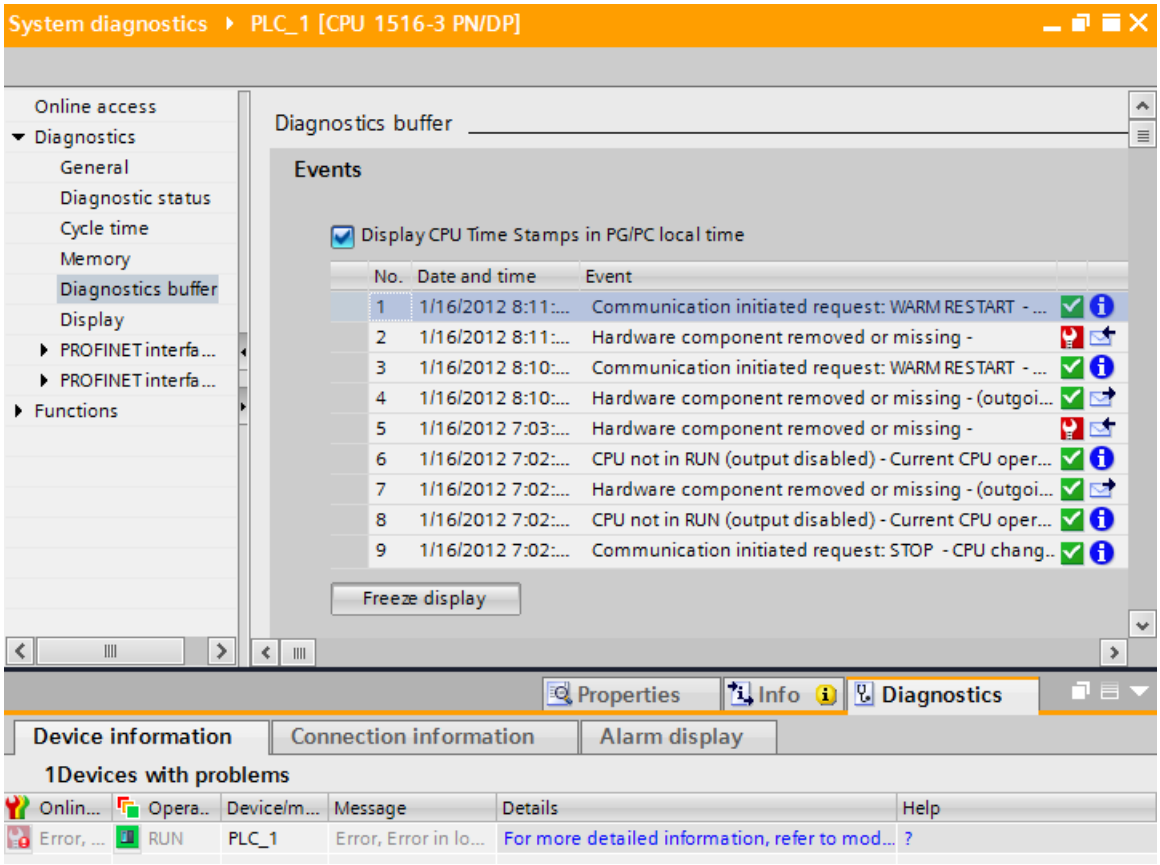

Figure 3-7 Diagnostics buffer with detailed error description

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 26) and in the online help for STEP 7.

Setting and determining system diagnostics

4

Introduction

System diagnostics is generally available for the devices of the SIMATIC series.

In the properties of each individual CPU, you can specify if you want to receive alarms for system diagnostics on your display device. Alarms are provided on the display of the S7-1500 CPU, the CPU web server and the HMI device. Alarms are enabled by default. If you do not want to receive alarms for system diagnostics on your display device, you can disable the sending of alarms.

4.1 Configuring alarms for system diagnostics

Predefined message texts are available for establishing the system diagnostics.

Requirement

- You have opened STEP 7.
- You have added a CPU to the project.

Procedure

To make alarm settings for system diagnostics of the CPU in STEP 7, follow these steps:

1. Open the project view.
2. Select the CPU.
3. Open the device view.
4. Open the "Properties" tab in the Inspector window.

5. Select the "System diagnostics" entry in the "General" area navigation.

   You now have access to the alarm settings. System diagnostics is enabled by default. System diagnostics cannot be disabled for the use of a CPU from the SIMATIC series.

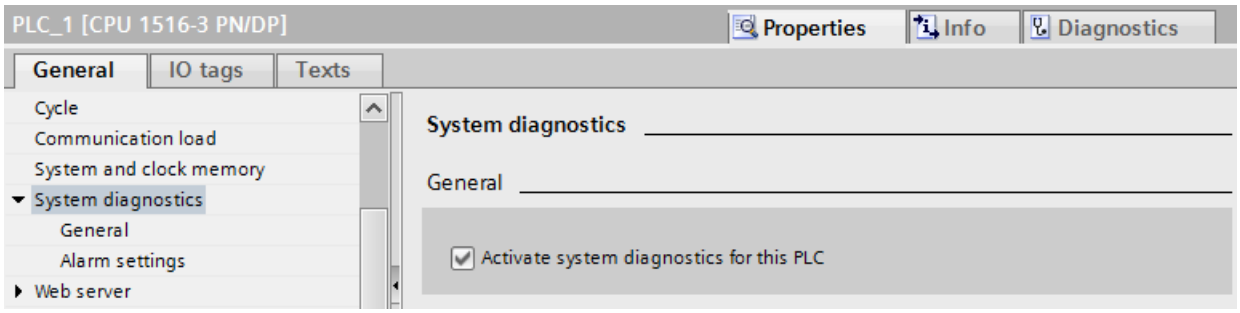

Figure 4-1 Properties of system diagnostics in STEP 7

6. In the settings, specify the alarm category that is to be displayed and if it needs to be acknowledged.

   The check boxes in the "Alarm" column are enabled by default. When you disable all check boxes, the status of the HMI system diagnostics view is still updated with the "Info Report" functionality.

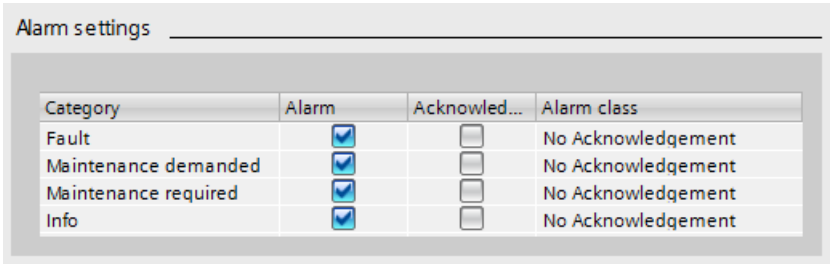

Figure 4-2 Alarm settings in STEP 7

7. Download the configuration to the CPU.

Result

You have configured the alarms for system diagnostics of the CPU in STEP 7.

The settings are saved with the project and become effective after the compiling and downloading of the hardware configuration to the involved components.

Maintenance events (maintenance demanded, maintenance required) are entered in the alarm buffer of the CPU just like any other event.

4.2 Options for displaying system diagnostics

Example

This section includes a diagnostics example to show how system diagnostics is established with the help of different display options. The example includes a S7-1500 CPU that is connected to an ET 200S distributed I/O system and an HMI Comfort Panel by means of PROFINET.

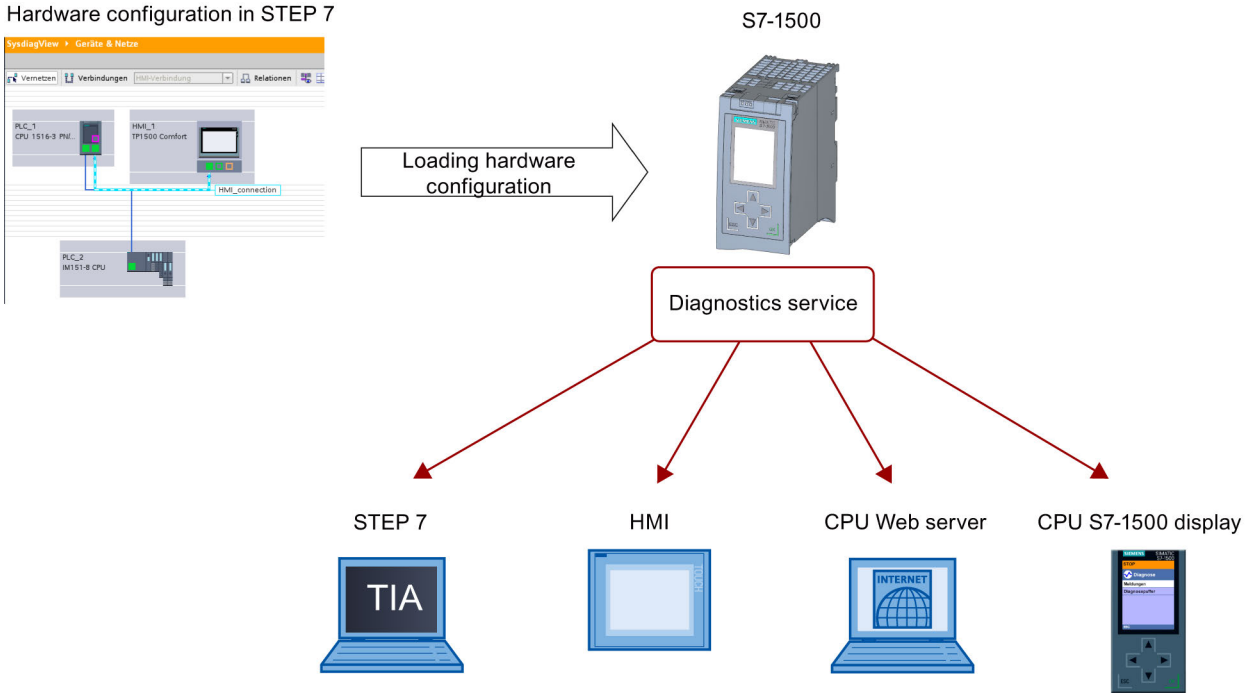

Figure 4-3 System diagnostics display options

The following sections include figures that illustrate how diagnostics information is displayed with the help of different display options.

- Using the LEDs on the hardware (Page 23)
- Local error analysis using the display of the CPU S7-1500 (Page 24)
- Using STEP 7 as of V12 (Page 26)
- Remote diagnostics using the web server (Page 44)
- Stationary system diagnostics using the HMI diagnostics view (Page 51)

4.2.1 Diagnostics information at the devices

4.2.1.1 LEDs

Overview

All hardware components, such as CPUs, interface modules and modules, provide information about their operating mode as well as internal and external errors through their LEDs. Diagnostics by means of LEDs is an initial tool for error localization.

The graphics below include examples for the arrangement of LEDs on some modules.

Table 4- 1 LED displays on the modules

	CPU 1516-3 PN/DP	IM 155-5 PN ST	DI 32x24VDC HF	PS 25W 24VDC
				①	RUN/STOP LED (two-colored LED: green/yellow)	RUN LED (two-colored LED: green/yellow)	RUN LED (single-colored LED: green)	RUN LED (single-colored LED: green)
②	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)	ERROR LED (single-colored LED: red)
③	MAINT LED (single-colored LED: yellow)	MAINT LED (single-colored LED: yellow)	without function	MAINT LED (single-colored LED: yellow)
④	X1 P1 (two-colored LED: green/yellow)	X1 P1 (single-colored LED: green)	LED CHx (two-colored LED: green/red)	
⑤	X1 P2 (two-colored LED: green/yellow)	X1 P2 (single-colored LED: green)		
⑥	X2 P1 (two-colored LED: green/yellow)			

Additional information

The meaning of the individual LED displays, their different combinations and the remedial measures resulting from them in case of errors are device-specific. The explanation can be found in the manuals of the modules.

4.2.1.2 Display of the CPU

Introduction

Each CPU in the S7-1500 automation system has a front cover with a display and operating keys. You can display status information in different menus on the display of the S7-1500 CPU. You use the operating keys to navigate through the menus.

Figure 4-4 Display - diagnostics screen

Display options

The display of the S7-1500 CPU displays the following diagnostics information:

- Information entered in the diagnostics buffer
- Alarms
- Information about network diagnostics
- Detailed device view with diagnostics symbols
- Error and alarm texts (system diagnostics alarms)
- Order number, CPU version and central I/O modules
- CPU operating mode
- Module status for central and distributed modules
- Information about the currently installed firmware

Additional information

For additional information on the topic "Functions and operation of the display of the S7-1500 CPU" see the documentation for the S7-1500 automation system (http://support.automation.siemens.com/WW/view/en/59191792).

4.2.2 Diagnostics information in STEP 7

4.2.2.1 Explanation of diagnostics symbols

Diagnostics symbols for modules and devices

When the online connection to a device in STEP 7 is established, the diagnostics status of the device and its lower-level components and, if applicable, the device operating mode are also determined. The following table shows the available symbols and their meaning.

Symbol	Meaning
	The connection with a CPU is being established.
	The CPU is not reachable at the set address.
	The configured CPU and the CPU actually present are of incompatible types. Example: An existing CPU 315-2 DP is incompatible with a configured CPU 1516-3 PN/DP.
	On establishment of the online connection to a protected CPU, the password dialog was terminated without specification of the correct password.
	No fault
	Maintenance required
	Maintenance demanded
	Error
	The module or device is deactivated.
	The module or the device cannot be reached from the CPU (valid for modules and devices below a CPU).
	Diagnostics data are not available because the current online configuration data differ from the offline configuration data.
	The configured module or device and the module or device actually present are incompatible (valid for modules or devices under a CPU).
	The configured module does not support display of the diagnostics status (valid for modules under a CPU).
	The connection is established, but the module status has not yet been determined or is unknown.
	Hardware error in lower-level component: A hardware error is present in at least one lower-level hardware component. (occurs as a separate symbol only in the project tree)

Symbols for the comparison status

The diagnostics symbols can be combined at the bottom right with additional smaller symbols that indicate the result of the online/offline comparison. The following table shows the available comparison symbols and their meaning.

Symbol	Meaning
	Hardware error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level hardware component.
	Software error in lower-level component: The online and offline versions differ (only in the project tree) in at least one lower-level software component.
	Online and offline versions of the object are different
	Object only exists online
	Object only exists offline
	Online and offline versions of the object are the same

Operating mode symbols for CPUs and CPs

The following table shows the available symbols and their respective operating states.

Symbol	Operating mode
	RUN
	STOP
	STARTUP
	HOLD
	DEFECTIVE
	Unknown operating mode
	The configured module does not support display of the operating mode.

Event table

The following information is displayed in the table for each diagnostics event:

- Sequential number of the entry

  The first entry contains the latest event.
- Date and time of the diagnostics event

  If no date and time are shown, the module has no integral clock.
- Short designation of the event and, if applicable, the reaction of the CPU
- Symbol for information on incoming/outgoing status

The following table shows the available symbols and their meaning.

Symbol	Meaning
	Incoming event
	Outgoing event
	Incoming event for which there is no independent outgoing event
	User-defined diagnostics event

Additional information

For additional information on the individual symbols, please refer to the online help for STEP 7.

4.2.2.2 Accessible devices (without project)

Accessible devices

Accessible devices are all devices that are connected to a PG/PC either directly by an interface or by means of a subnet and that are switched on. These devices can display diagnostic information even without an offline project.

Requirements

- STEP 7 is open.
- The project view is open.

Procedure

To display diagnostic information for specific devices even without an offline project, follow these steps:

1. Establish a connection to the respective CPU.
2. Select the command "Accessible devices" from the "Online" menu.

   The "Accessible devices" dialog opens.

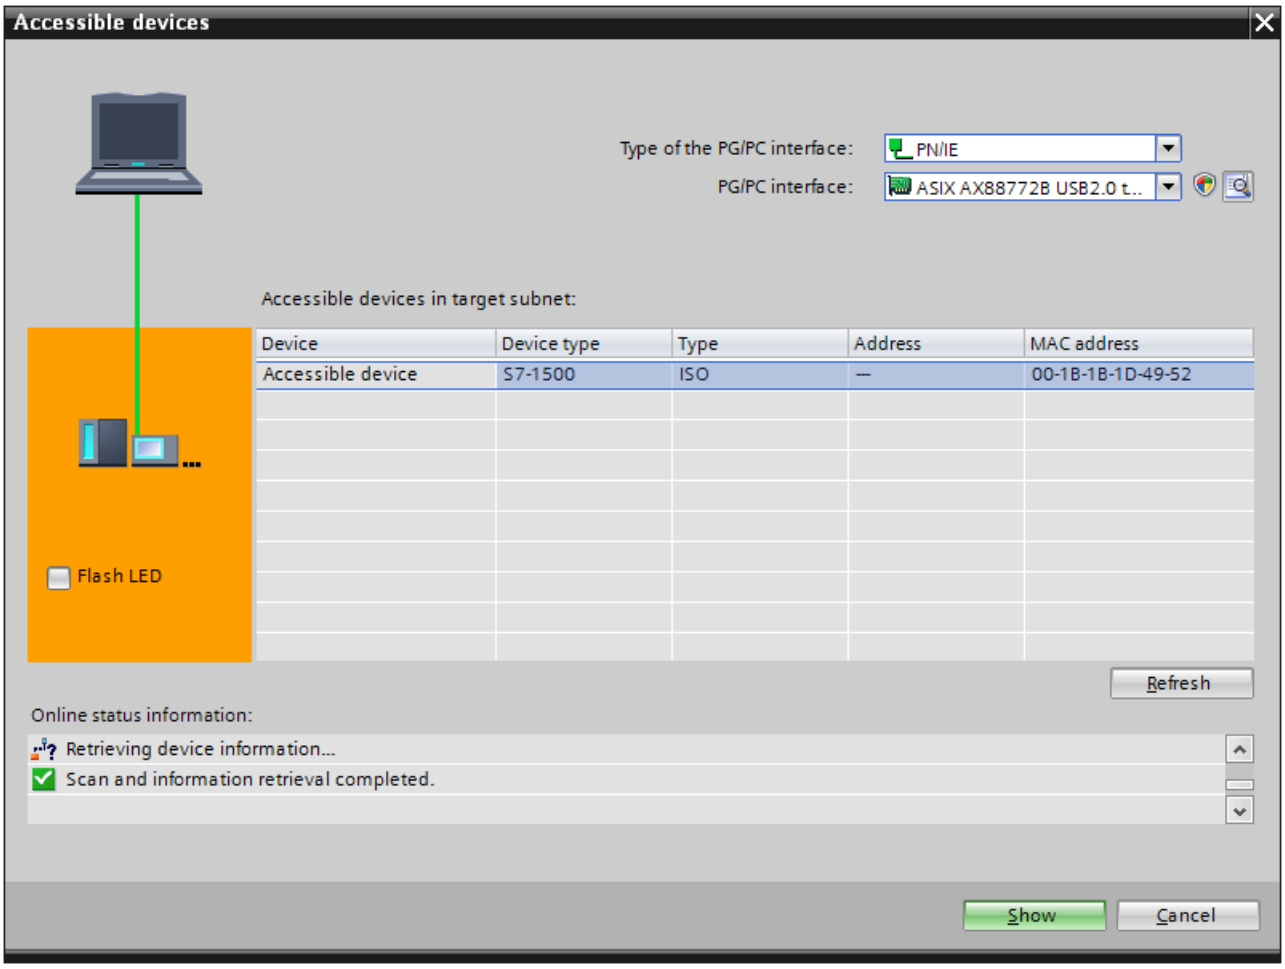

Figure 4-5 "Accessible devices" dialog

3. Make the settings for the interface.
4. Select the respective device under "Accessible devices in the target subnet".
5. Confirm the dialog with the "Display" button.

Result

The device is displayed in the project tree. You open the diagnostic information in the working area with a double-click on "Online & Diagnostics".

Information is available on the diagnostic status, cycle times, memory usage and the diagnostics buffer.

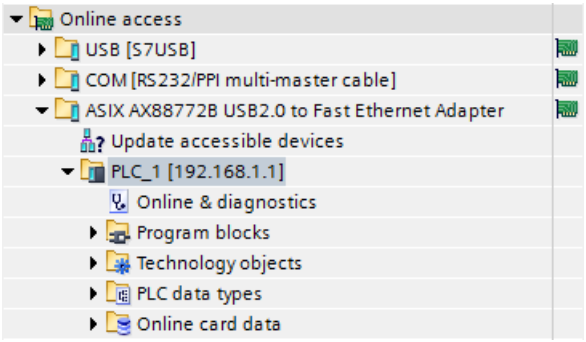

Figure 4-6 Device in the project tree

4.2.2.3 Devices & networks

Devices & networks - Go online

You can get an overview of the current state of your automation system in the device view or network view.

You implement the following tasks in the device view:

- Device configuration and parameter assignment
- Module configuration and parameter assignment

You implement the following tasks in the network view:

- Device configuration and parameter assignment
- Networking devices

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To get an overview of the current state of your automation system, follow these steps:

1. Open the "Network view" in the working area.
2. Select the CPU.
3. Click the "Go online" Go online button in the toolbar.

   The "Go online" dialog opens.

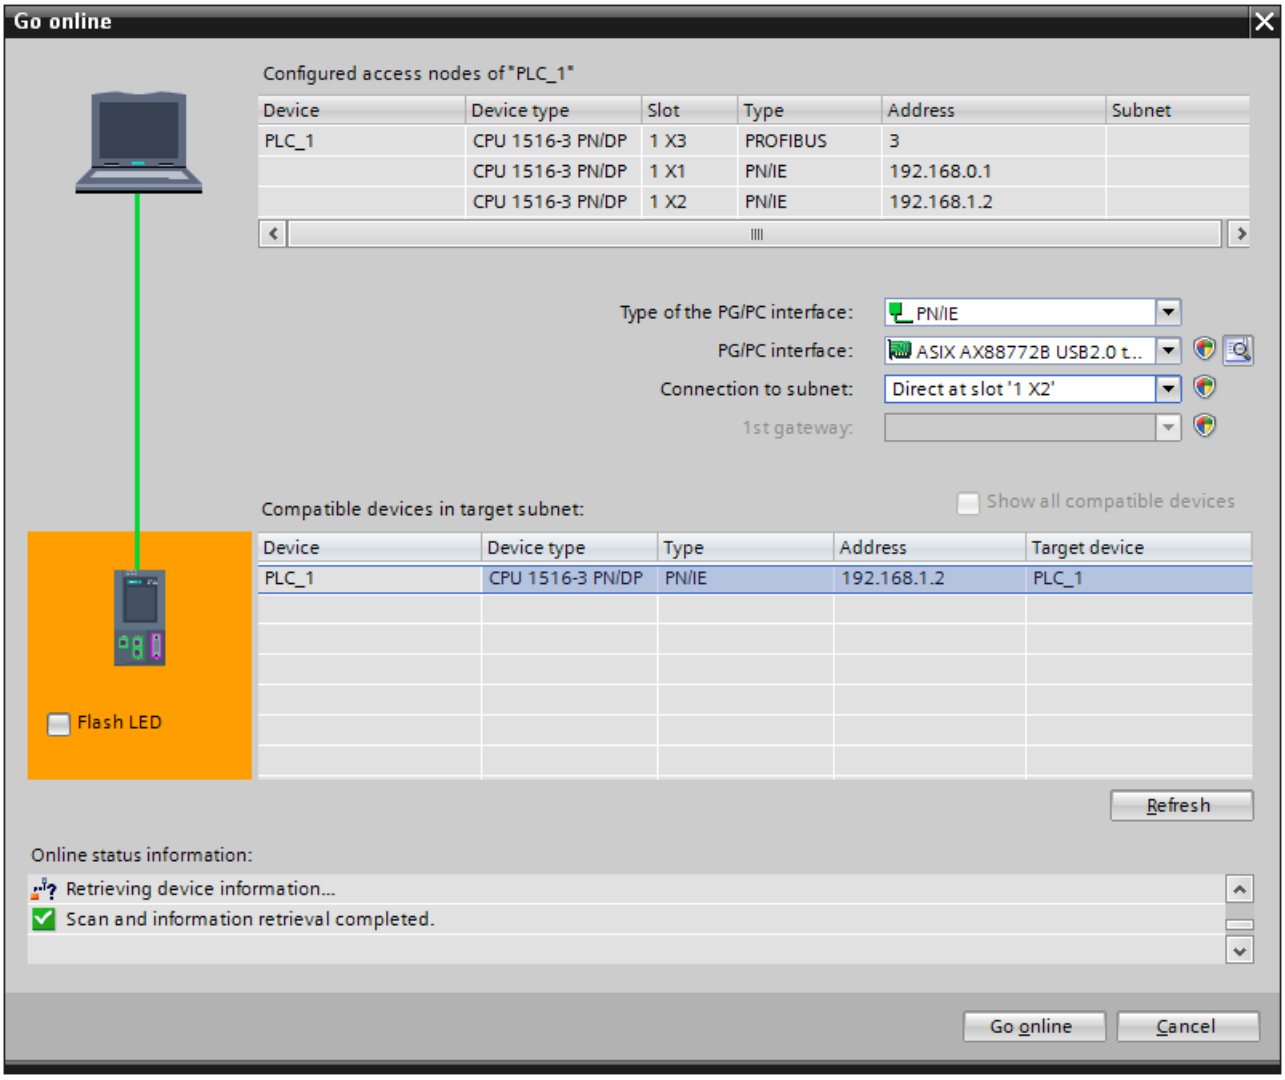

Figure 4-7 Go online

4. Make the settings for the interface.
5. Select the respective device under "Compatible devices in the target subnet".
6. Confirm the dialog with the "Connect" button.

   The online mode is started.

Result

The connected devices are now displayed with diagnostic information in the network view in the working area. Here you get an overview of the current state of your automation device.

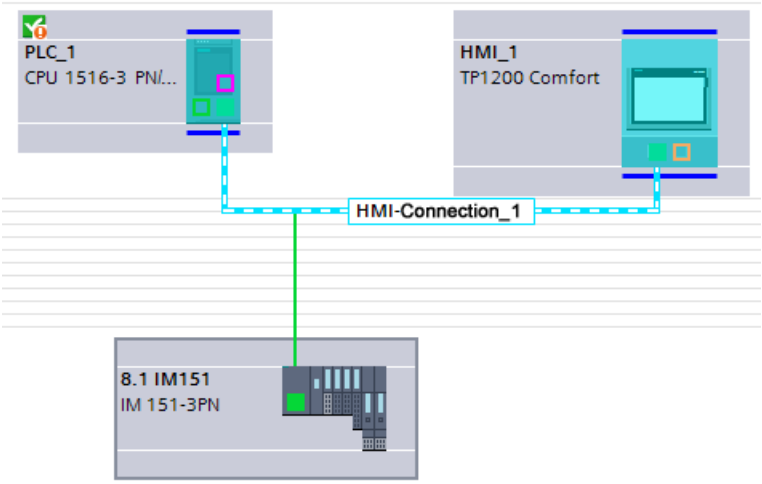

Figure 4-8 CPU with diagnostic information

You get to the "Device view" with a double-click on the device. The diagnostic information for the individual modules is displayed in this view.

Note

Symbols and their meaning

You will find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 26) and in the online help for STEP 7.

4.2.2.4 Online & diagnostics

Online mode

In online mode there is an online connection between your PG/PC and one or several devices. Depending on the properties of a device, you are offered specific diagnostics options in online mode and certain functions.

- Diagnostics
  - General module information
  - Diagnostics status
  - Cycle time
  - Memory
  - Diagnostics buffer
  - Display
  - Interface information (e.g. IP parameter, port information)
- Functions
  - Assigning an IP address
  - Setting time and date of the CPU
  - Firmware update (e.g. for PLC, display)
  - Assigning device name
  - Reset to factory settings
  - Format memory card
  - Save service data

To establish an online connection at least one PG/PC interface must be installed that is physically connected with a device, for example, with an Ethernet cable. The current online status of a device is indicated by a symbol to the right of the device in the project tree.

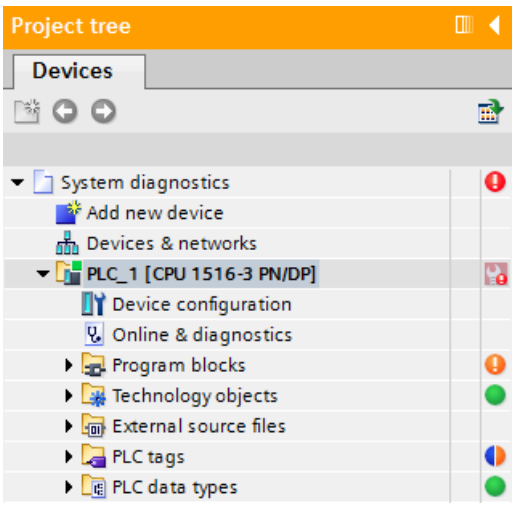

Figure 4-9 Partial view network view

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.

Procedure

To display an overview of the faulty devices, follow these steps:

1. Select the affected device folder in the project tree.
2. Select the shortcut menu command "Online & Diagnostics".

   The online and diagnostics view of the module to be diagnosed is started.

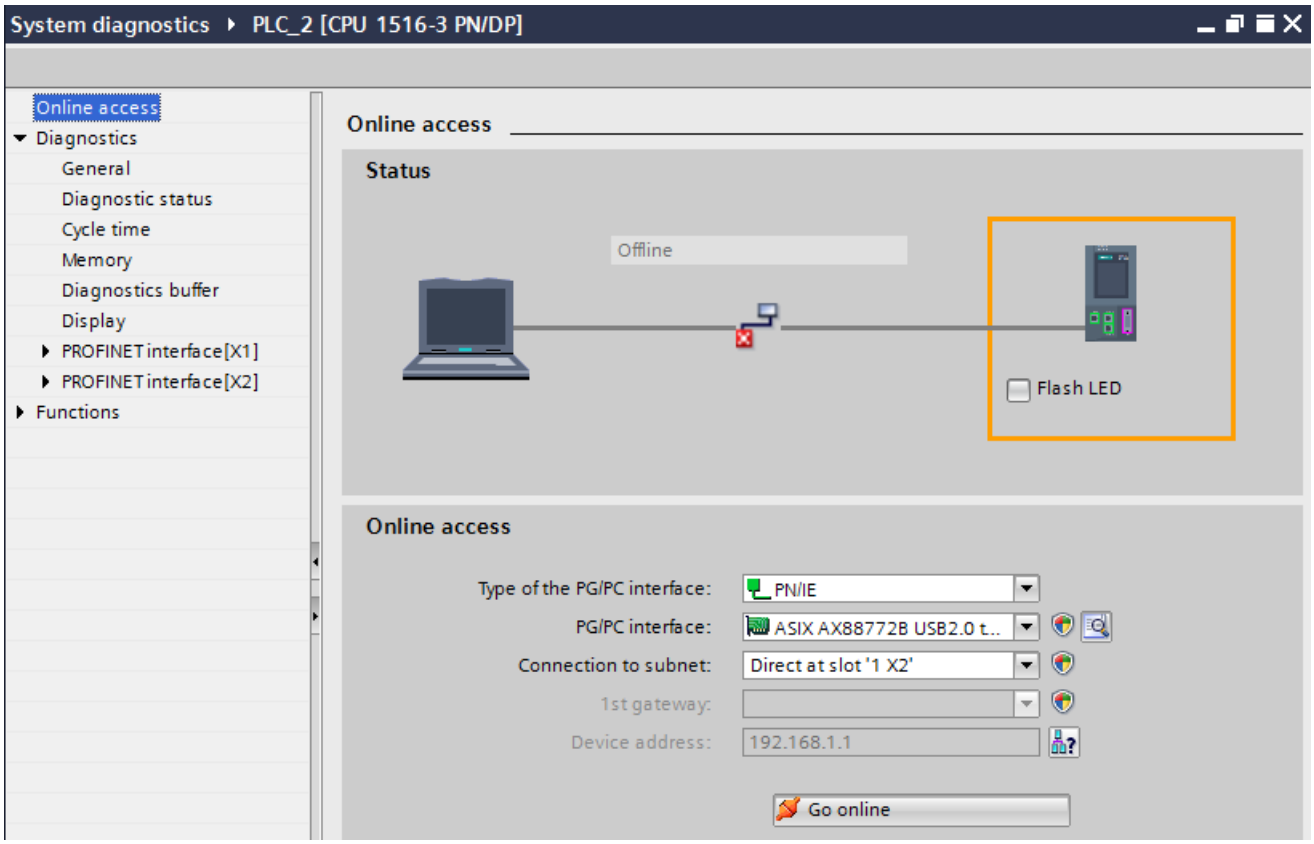

Figure 4-10 Setting online access

3. Make the settings for the interface.

   Here you can change an interface access that has already been set for an online connection that was successfully established previously.
4. Click on the "Go online" button.

   The online connection is established.

Result

You can find detailed diagnostics information on each device in the Inspector window, in the "Diagnostics" section of the area navigation on the "Properties" tab.

4.2.2.5 "Diagnostics" tab in the Inspector window

"Diagnostics" tab in the Inspector window

The "Diagnostics" tab of the Inspector window includes information on diagnostics events and configured alarm events.

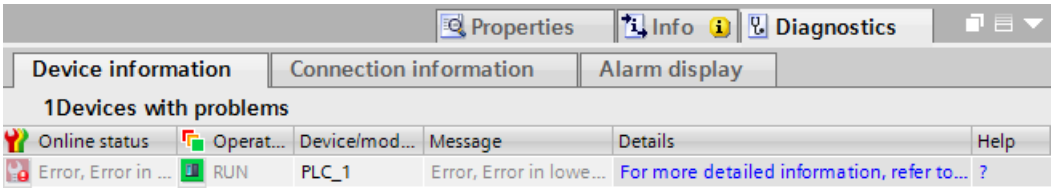

Figure 4-11 Diagnostics in the Inspector window, "Device information" tab

Note

Symbols and their meaning

You can find a legend with the meaning of each symbol in Explanation of diagnostics symbols (Page 26) and in the online help for STEP 7.

Subordinate "Device information" tab

This tab gives you an overview of faulty devices to which an online connection exists or has existed. The table provides the following diagnostics information on the faulty devices:

- Online status: includes the online status as diagnostics symbol and in words
- Operating mode: includes the operating mode as symbol and in words
- Device/module: Name of the affected device or the affected module
- Alarm: This explains the entry in the previous columns and displays an alarm, if necessary
- Details: The link opens the online and diagnostics view associated with the device or puts it in the foreground.
  If the device cannot be reached, the link opens the "Go online" dialog.
- Help: The link provides additional information on the fault.

Note

Communication and access errors

Errors that occur in the user program (e.g., communication errors, access errors) are not reported in the "Diagnostics" tab of the device information. You must read out the diagnostics buffer of the CPU in the online and diagnostics view to get this information. The link in the "Details" column opens the diagnostics buffer.

Subordinate "Connection information" tab

The "Connection information" tab displays detailed diagnostics information for connections.

There will only be information on the "Connection information" tab if there is an active online connection to at least one end point of the relevant connection.

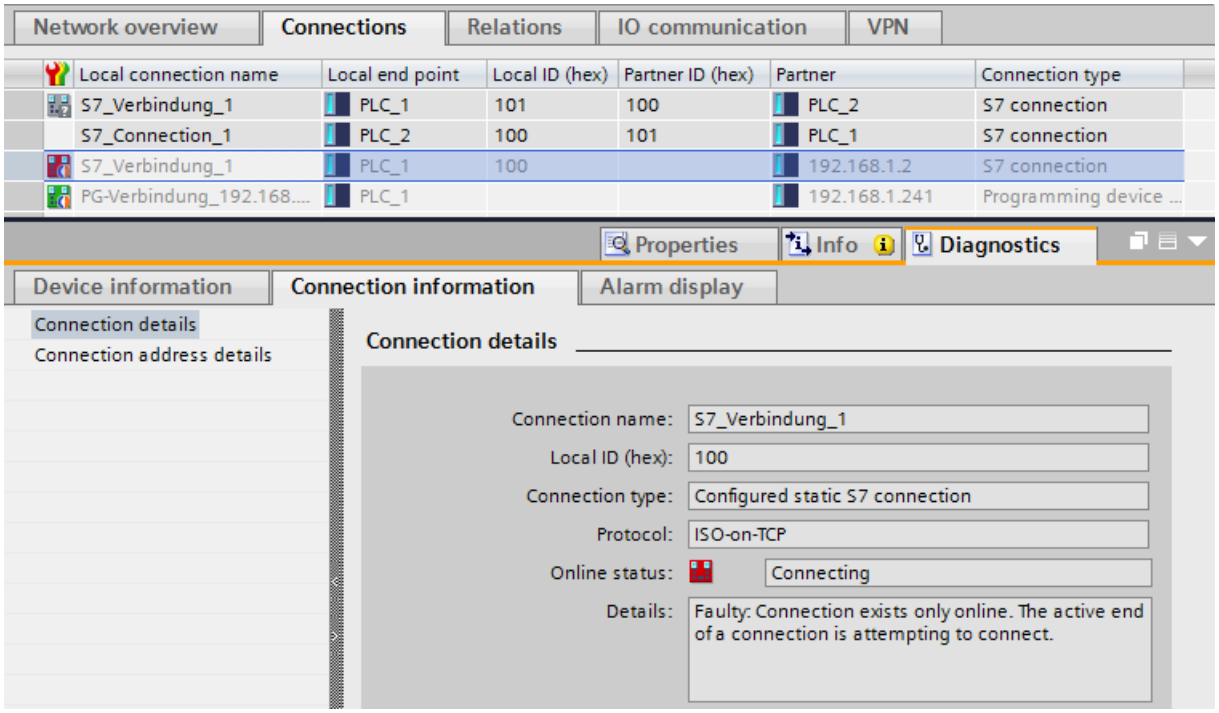

Figure 4-12 "Connection information" tab and open connection overview

If a module has been selected (network view), the tab contains the following group:

- Connection resources

If a connection has been selected (connection table), the tab contains the following groups:

- Connection details
- Address details of the connection

Subordinate "Alarm display" tab

System diagnostics alarms are output in the "Alarm display" tab.

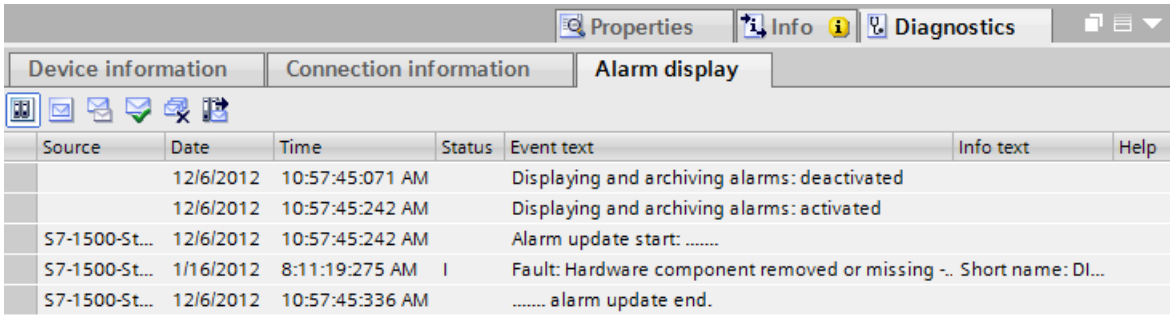

Figure 4-13 "Alarm display" tab

To receive alarms in STEP 7, follow these steps:

1. Open the project view.
2. Select the required CPU in the project tree.
3. To connect online with the respective CPU, select the shortcut menu command "Go online".
4. Select the required CPU once again in the project tree and select the shortcut menu command "Receive alarms".

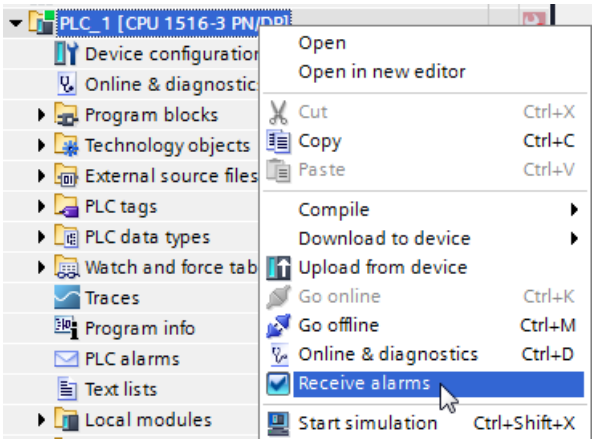

Figure 4-14 Receive alarms

5. Alarms are now displayed in the alarm display. "Archive view" is enabled by default.
6. To display the latest alarms, click the symbol "Active alarms" .

4.2.2.6 CPU diagnostics buffer

Definition

Each CPU and some other modules have their own diagnostics buffer, in which detailed information on all diagnostic events is entered in the order in which they occurred.

The CPU diagnostics buffer can be displayed on all display media (STEP 7, HMI, CPU web server and display of the CPU).

Diagnostic events

The entries available in the diagnostics buffer include:

- Internal and external errors on a module
- System errors in the CPU
- Operating mode transitions (e.g., from RUN to STOP)
- Errors in the user program
- Removal/insertion of modules

The contents of the diagnostics buffer is stored in the retentive memory in case of a memory reset of the CPU. Errors or events can be evaluated even after a longer period of time thanks to the diagnostics buffer to determine the cause of a STOP or to trace the occurrence of a single diagnostic event and to be able to assign it.

Procedure

To display the diagnostics buffer of a CPU, follow these steps:

1. Select the respective CPU.
2. Select the shortcut menu command "Online & Diagnostics".

   The "Online access" view is opened in the working area.

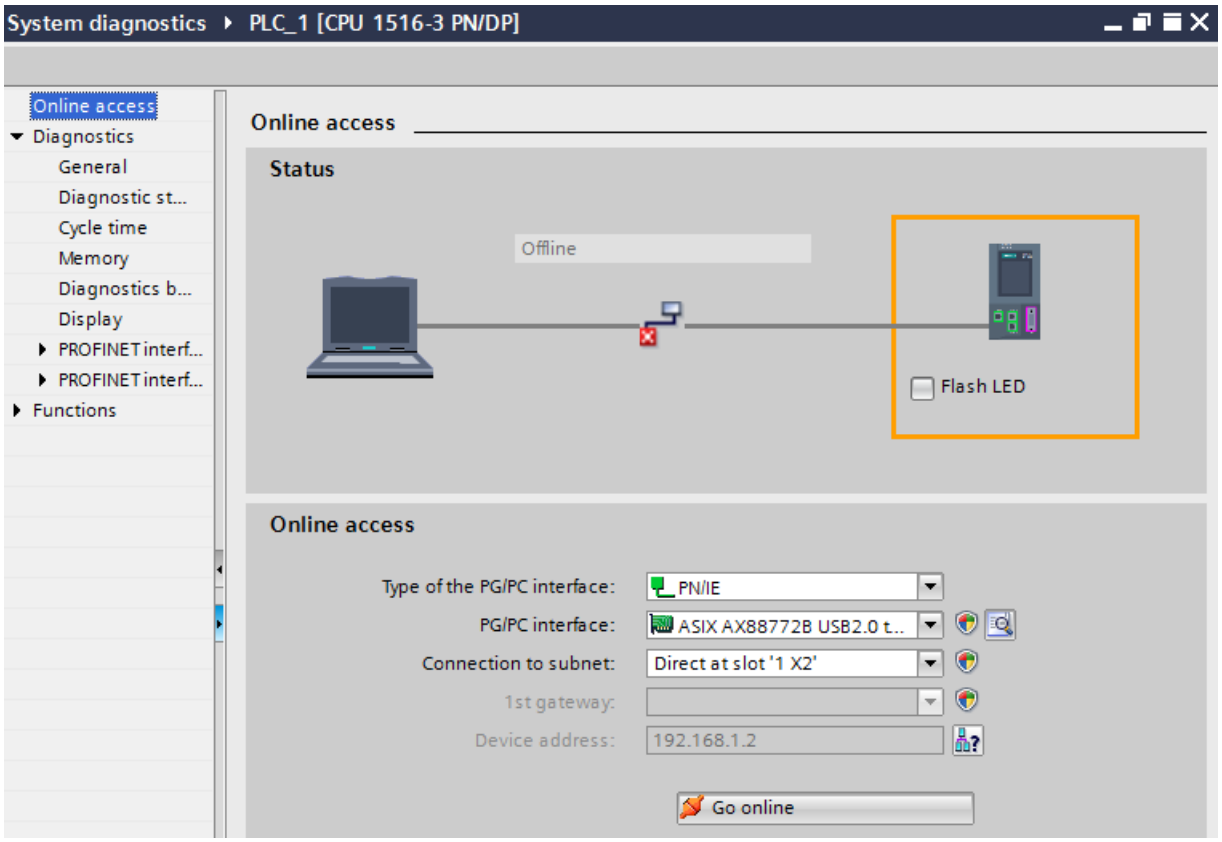

Figure 4-15 Setting up online access

3. Set the interface.

4. Click on the Go online button.
5. Select the area "Diagnostics buffer".

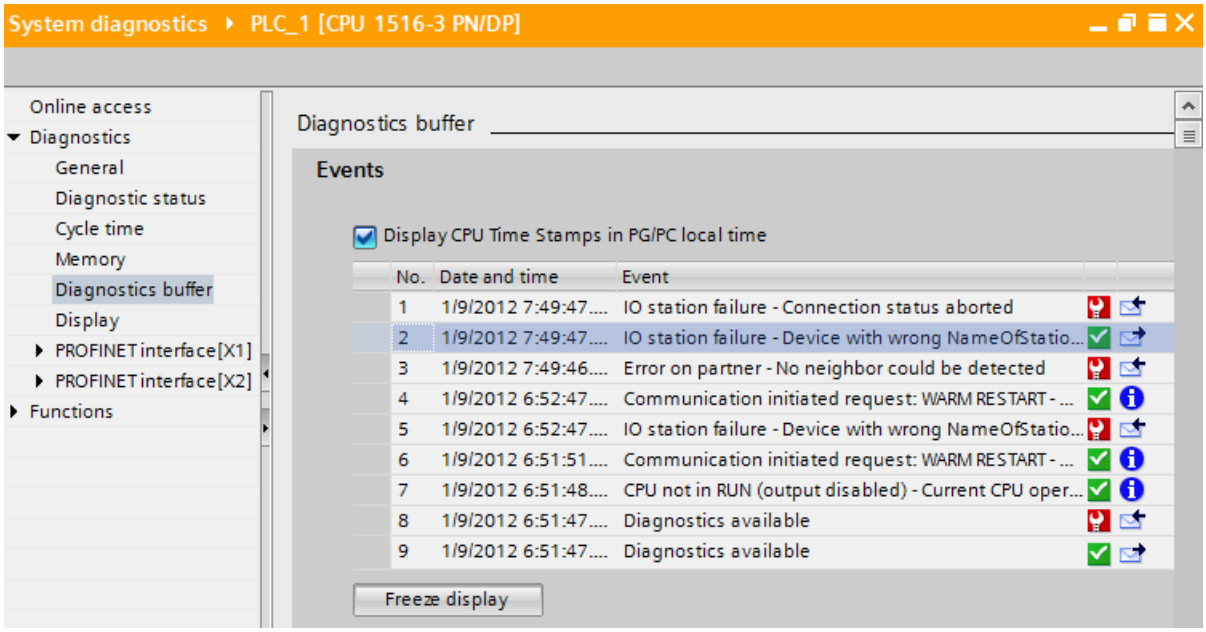

Figure 4-16 Diagnostics buffer in STEP 7

Note

Filter events

You can filter the entries in the diagnostics buffer in the settings of the "Diagnostics buffer" area to only display specific types of events. This means that specific events, such as "CPU and configuration-internal events" or "Connection diagnostics events", can be displayed separately.

4.2.2.7 "Online tools" task card

Online view in the "Online tools" task card

The following requirements must be met to display the online view of the "Online tools" task card:

- An online connection to the CPU is available.
- You have selected the CPU in the topology view, network view or device view.

The "Online tools" task card provides an overview of the CPU state, the cycle time and the memory usage.

- The "CPU Operator Panel" palette displays the current state of some LEDs and the mode switch of a CPU.
- The "Cycle time" palette displays the cycle time diagram and below it the measured cycle times as absolute values.
- The "Memory" palette contains the current memory usage of the associated CPU. The available memory is displayed in a bar diagram as well as a numerical value (percentage).

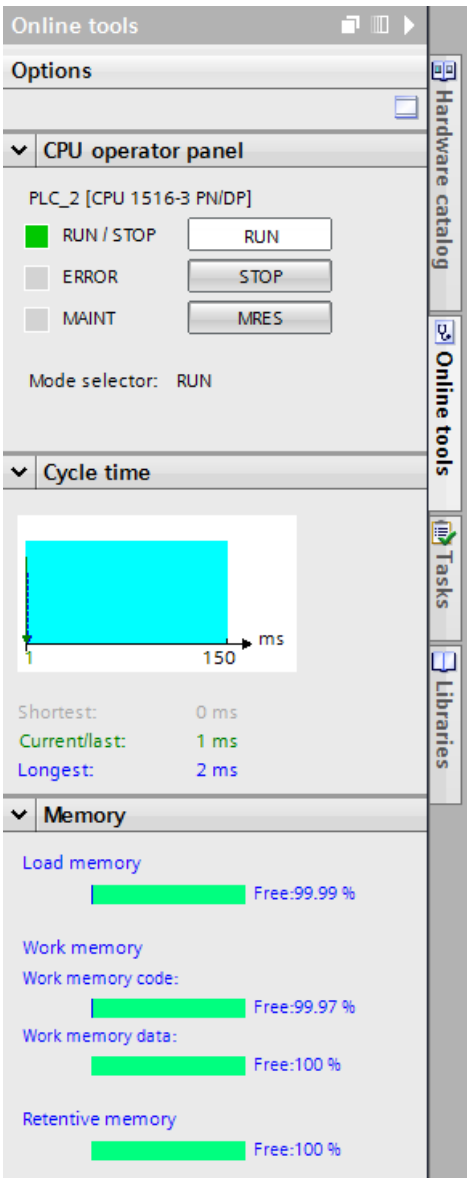

Figure 4-17 "Online tools" task card

4.2.2.8 Configuring the settings for I/O modules in STEP 7

You can also make settings for system diagnostics in STEP 7 for I/O modules. The parameters you have to configure depend on the I/O module.

The settings are optional.

Requirements

- STEP 7 is open.
- A project is open.
- The project view is open.
- A design with I/O modules has been configured.

Procedure

To make settings for system diagnostics of I/O modules in STEP 7, follow these steps:

1. Select the respective I/O module in the device view.
2. Open the "Properties" tab in the Inspector window.
3. Select the area "Inputs", for example.

   You have access to the settings for system diagnostics of the I/O module. If you select "Wire break", for example, a possible wire break for the channel is flagged during operation.

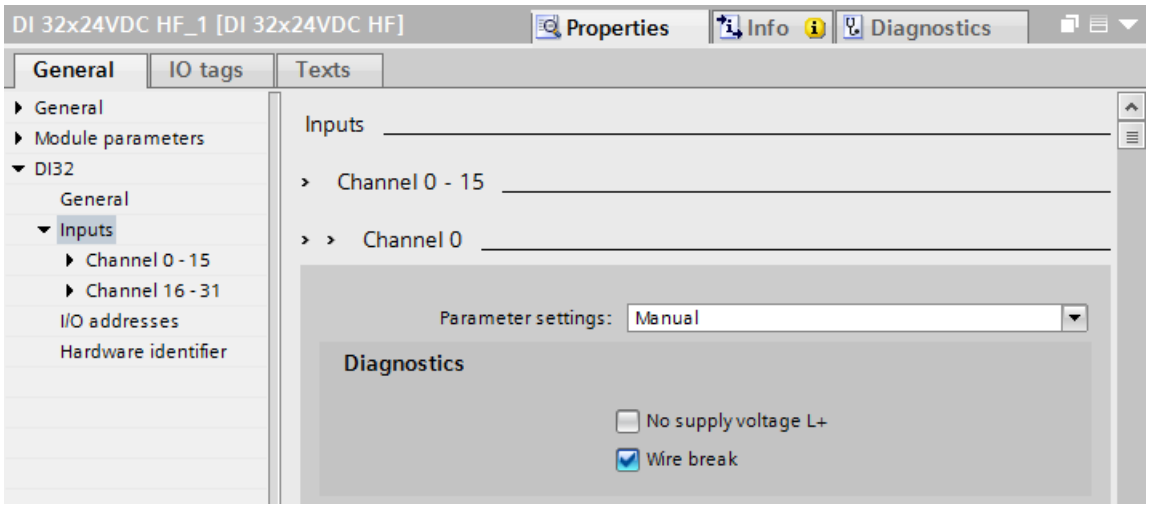

Figure 4-18 I/O setting with a digital input module

4. Save the hardware configuration.
5. Download the new hardware configuration to the CPU.

Additional information

The documentation for the respective module includes additional information on parameter assignment of I/O modules.

4.2.3 Diagnostics information using the web server

System diagnostics using the CPU web server

The CPUs of the SIMATIC series have an integrated web server and let you display the system diagnostics information by means of PROFINET. Any web client, such as PCs, multi panels or smartphones, has read-only access to module data, user program data and diagnostics data of a CPU by using an Internet browser. This means access to CPUs is possible without installed STEP 7.

The web server offers web pages with reduced complexity which have been optimized for devices with small screens and low computing power.

Using CPU 1516-3 PN/DP as an example, the following figure shows the start page of the Web server:

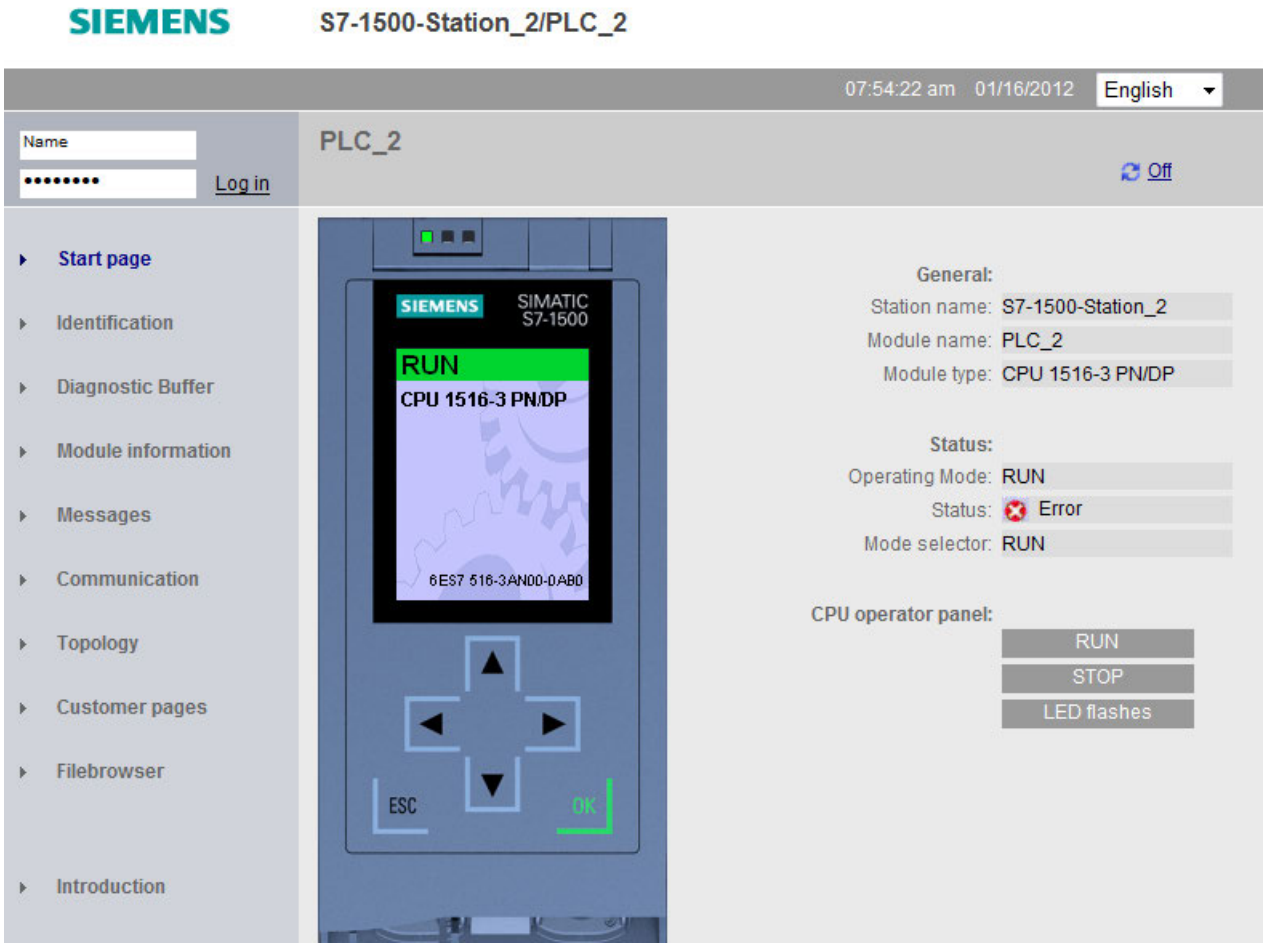

Figure 4-19 Web server, Start page

The following diagnostics options are available with the integrated web server:

- Start page with general CPU information
- Identification information
- Contents of the diagnostics buffer
- Module information
- Messages (without acknowledgment option)
- Information about communication
- Topology

Requirement

- You have opened STEP 7.
- You have added a CPU to the project.
- You have opened the project view.

Procedure

Follow these steps to access the web server:

1. Open the network view.
2. Select the CPU.
3. Open the "Properties" tab in the Inspector window.
4. Select the entry "Web server" in the "General" area navigation.

   The "Web server" area is displayed.

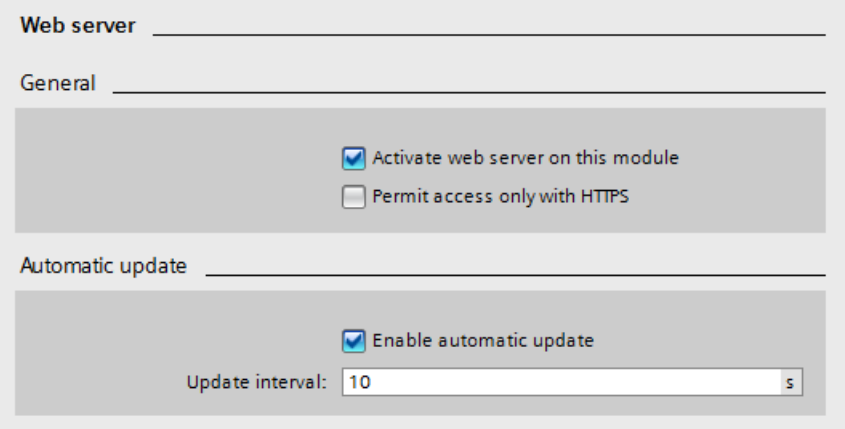

Figure 4-20 Activate the web server

5. Select the check box "Activate web server on this module".

6. Activate the web server also for each interface by which you want to access the web server. Select the respective interface. Open the "Properties" tab in the Inspector window and select the entry "Web server access" in the "General" area navigation. Select the check box "Activate web server for this interface".

   Automatic updating is activated in the basic setting of a configured CPU.

7. Connect the client to a PROFINET interface of the CPU or to a communication processor (e.g., CP 1543-1).
8. Open the web browser.
9. Enter the IP address of the CPU in the "Address" field of the web browser in the following format: http://a.b.c.d or https://a.b.c.d (input example: http://192.168.3.141).
   The welcome page of the Web server opens.
10. Click on the "Enter" link.

    You are on the start page of the Web server.

Note

Managing access rights

In STEP 7, you can create users, define access rights and assign passwords under "Web server > User management". Users only have access to the options that are permanently linked to the access rights.

For further information on managing access rights, please refer to "Configuring the Web server" in the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

Diagnostics option "Diagnostics buffer"

The browser displays the content of the diagnostics buffer on the "Diagnostics buffer" web page.

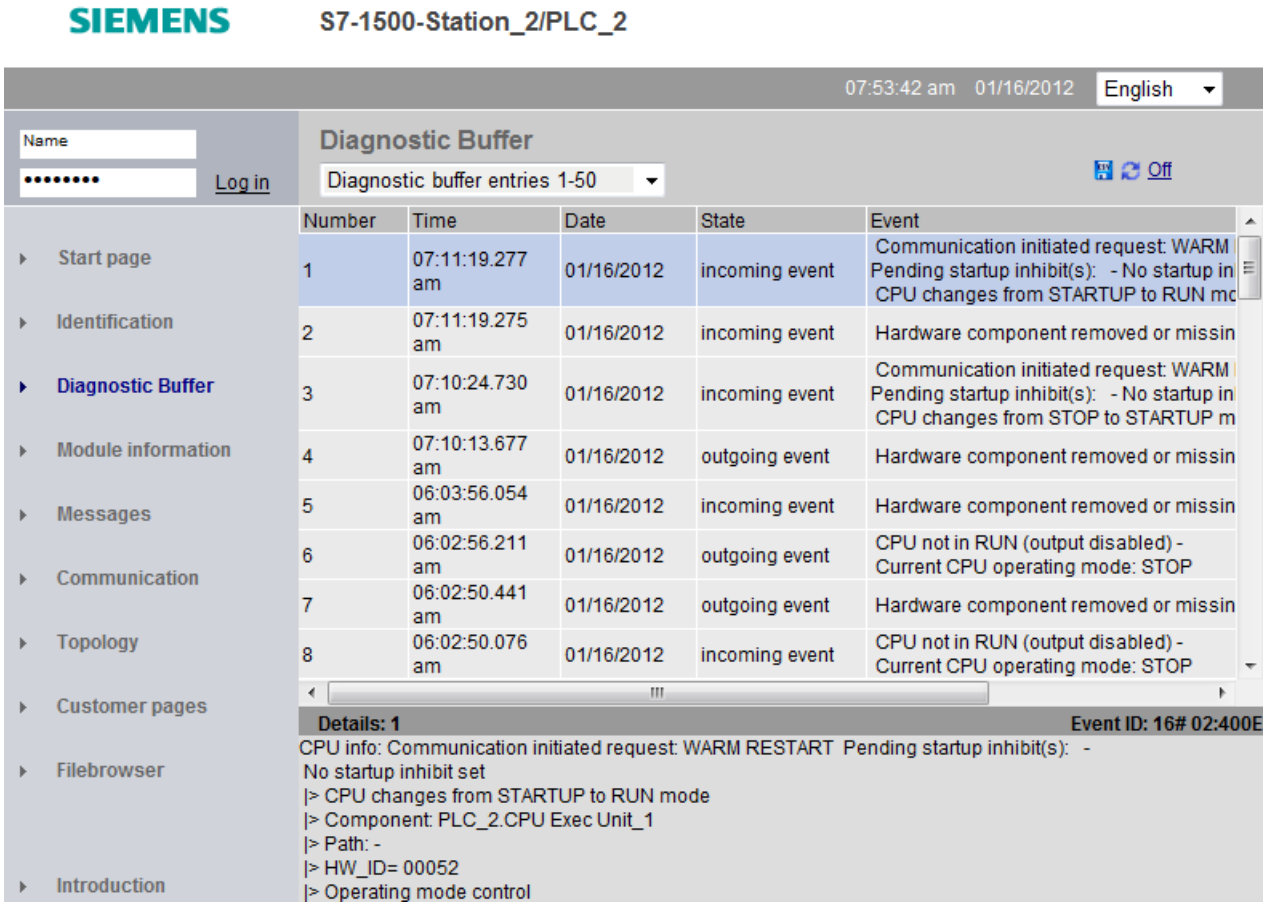

Figure 4-21 Web server, "Diagnostics buffer" view

Diagnostics option "Module information"

The status of a device is indicated by the web browser with symbols and comments on the "Module information" web page.

Modules are displayed on the "Module information" web page in the "Name" column with a link. You can get to the faulty module in hierarchical order.

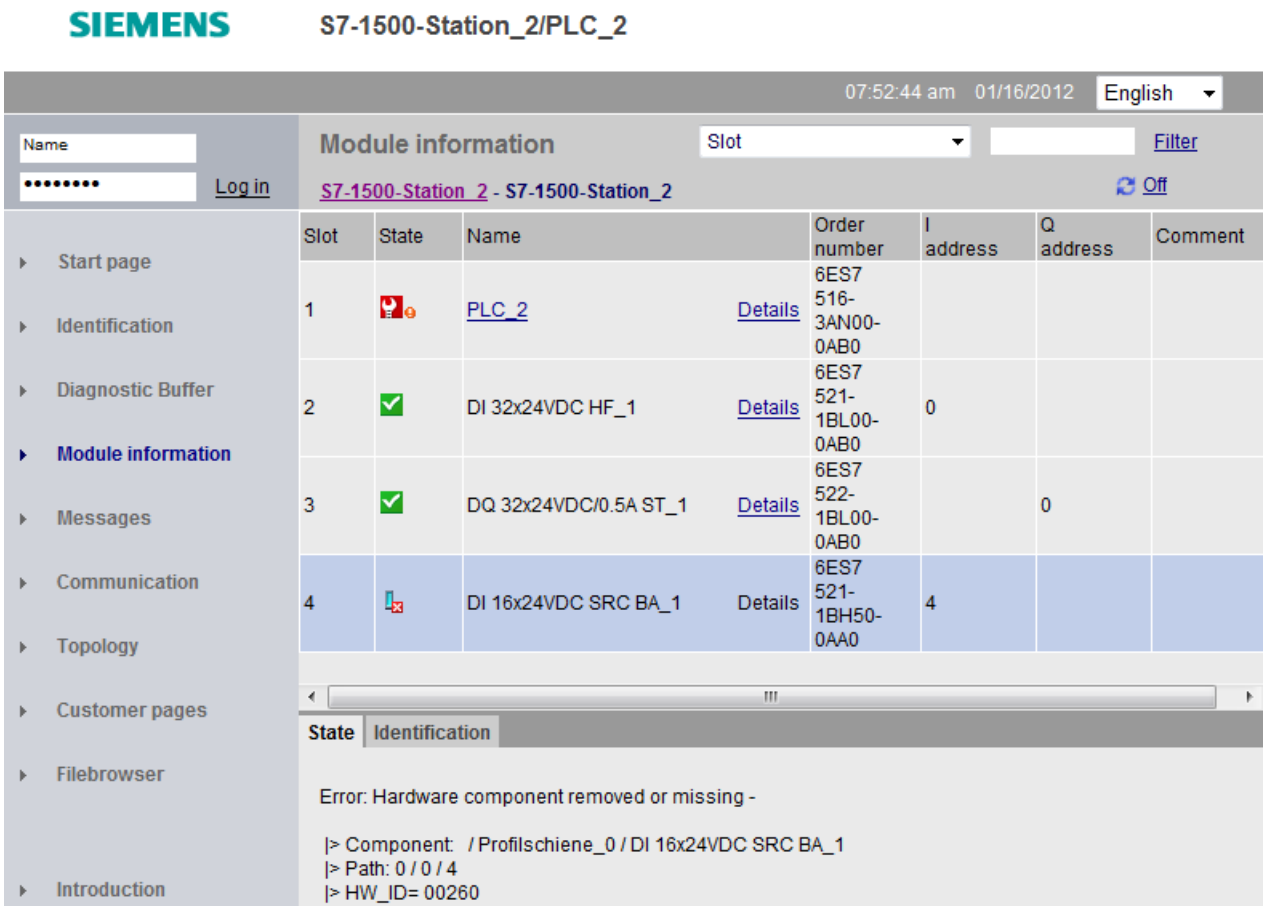

Figure 4-22 Web server, "Module information" web page

Diagnostics option "Messages"

The web browser displays the content of the message buffer on the "Messages" web page. The messages cannot be acknowledged on the web server.

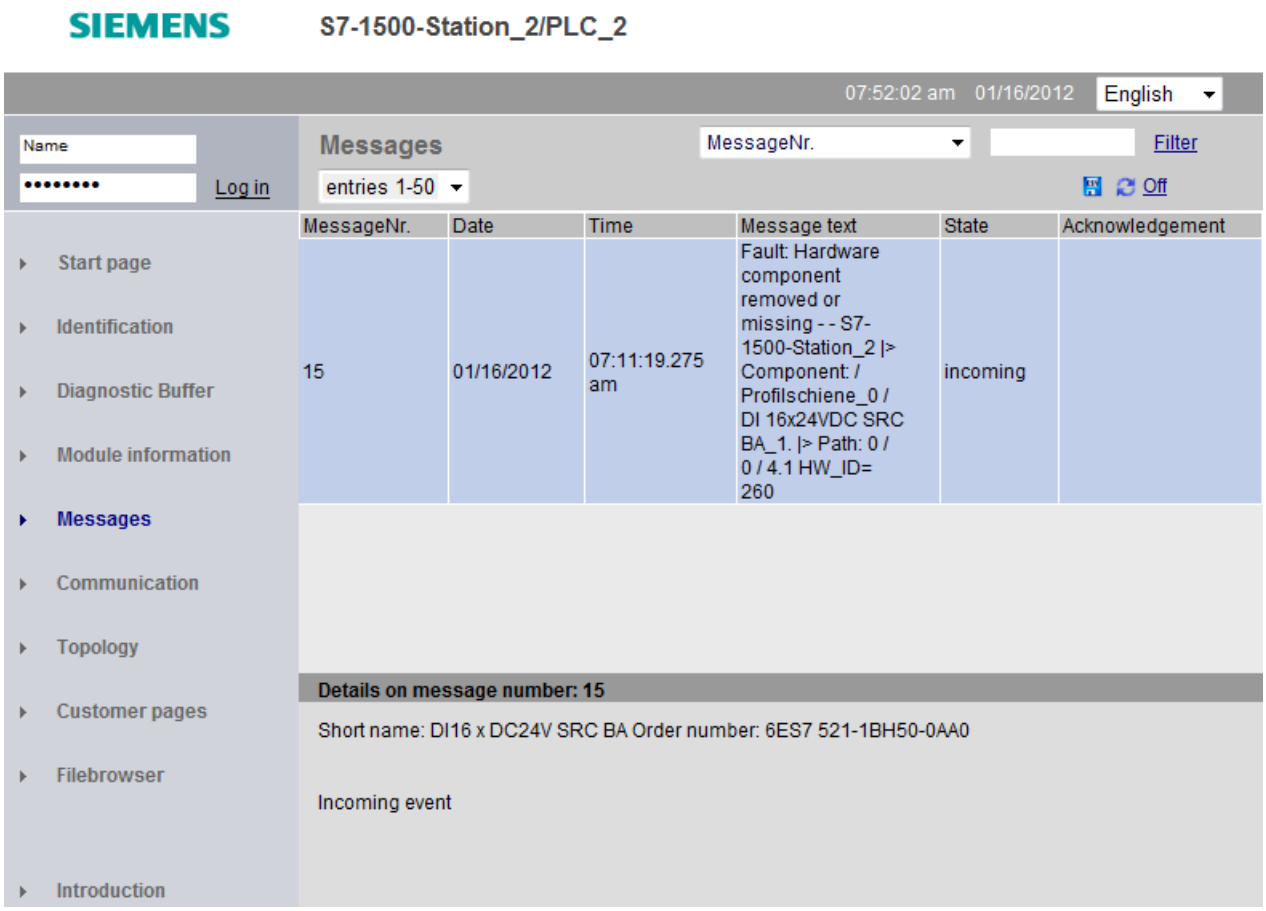

Figure 4-23 Web server, "Messages" web page

"Topology" diagnostics option

The "Topology" web page provides information on the topological configuration and status of the PROFINET devices in your PROFINET IO system.

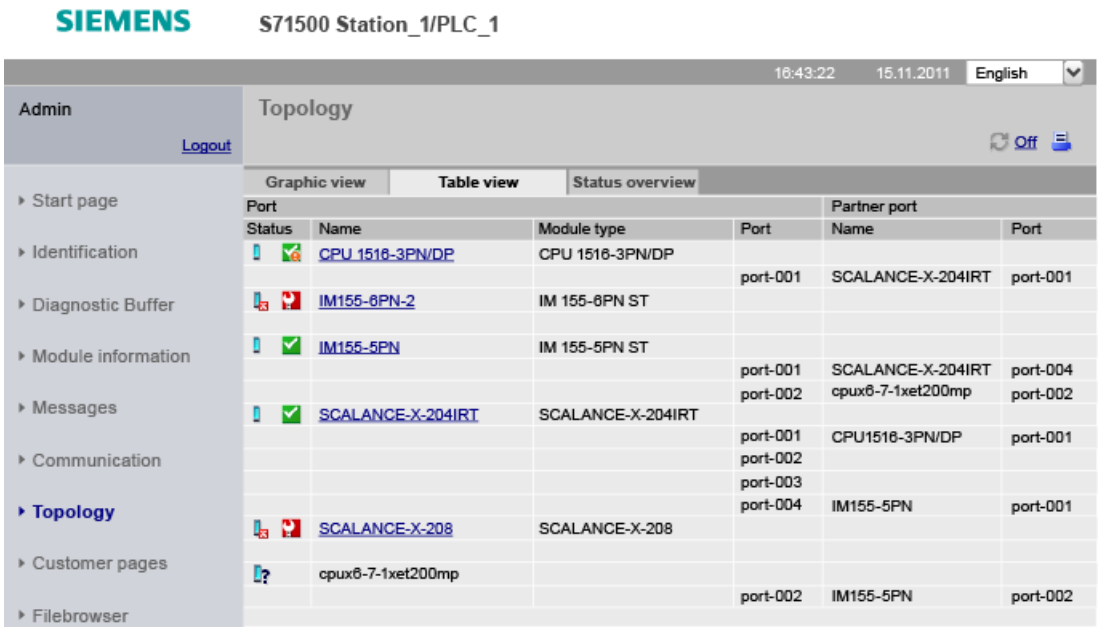

Figure 4-24 Web server, "Topology" web page

Additional information

Additional information on the topic is available in the Web server function manual (http://support.automation.siemens.com/WW/view/en/59193560).

4.2.4 Diagnostics information using the HMI diagnostics view

Objects for system diagnostics

The full functionality of the HIM diagnostics view is only available with Comfort Panels and WinCC RT Advanced . Basic Panels do not support the complete range of system diagnostics functions.

Two objects are available for system diagnostics on an HMI device.

System diagnostics view

The system diagnostics view reflects the current status of all accessible devices in your plant. You navigate directly to the cause of the error and the associated device. You have access to all diagnostics-capable devices that you have configured in the STEP 7 hardware and network editor.

System diagnostics window

The system diagnostics window is an operating element and display object.

The functions of the system diagnostics window are the same as for the system diagnostics view. Because the system diagnostics window is configured in the "Global screen", you can also specify, for example, if the object can be closed in WinCC Runtime.

Note

Compatibility with Basic Panels

Only the "System diagnostics view" object is available with Basic Panels.

Basic Panels do not support the "System diagnostics window" object or the graphic symbol "System diagnostics indicator".

4.2.4.1 Configuring system diagnostics

Introduction

You add a system diagnostics view to your project to get an overview of all devices available in your plant.

The system diagnostics window offers an overview of all devices available in your plant. The system diagnostics window behaves like the system diagnostics view but is only available in the global screen.

Requirements

- At least one CPU has been set up in the project.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- CPU and the HMI device are connected with each other by an HMI connection.
- You have created a screen (for the system diagnostics view).
- The global screen is open (for the system diagnostics window).
- The Inspector window is open.

Procedure

Proceed as follows to configure the system diagnostics:

1. Double-click the "System diagnostics view" object in the "Tools" task card. The object is added to the screen.

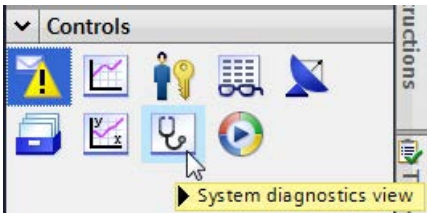

Figure 4-25 Adding a system diagnostics view

2. Select the "Properties" tab in the Inspector window.
3. Select the area "Columns".
4. Enable the columns that you require in the device view for WinCC Runtime, for example:
   - Status
   - Name
   - Operating mode
   - Slot
   - Address
5. Enable the columns that you require in the device view for WinCC Runtime, for example:
   - Status
   - Name
   - Operating mode
   - Plant designation
   - Address
6. You can change the column headers in the "Columns" area, if necessary.
7. Select the "Display" area.
8. Enable "Column settings > Columns moveable" to move the columns in WinCC Runtime.
9. To close the system diagnostics window in WinCC Runtime, select "Properties > Window > Closable" in the "Properties" tab of the Inspector window.

Result

The system diagnostics view has been added to the screen. The diagnostics status of the entire plant is displayed in the system diagnostics view in WinCC Runtime.

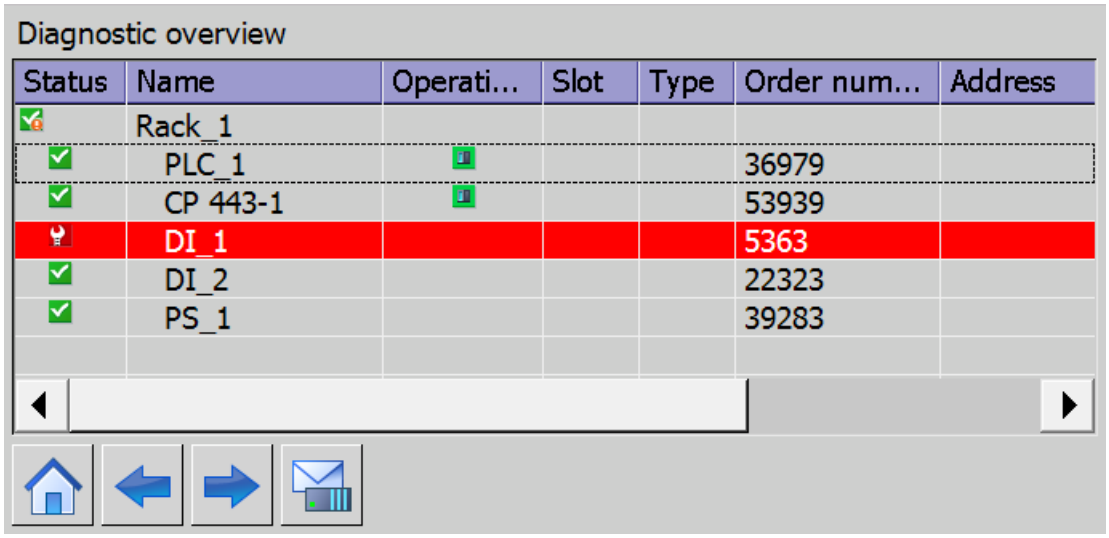

Figure 4-26 System diagnostics view in the screen

The system diagnostics window has been added to the global screen. If there is an error message in the plant, the system diagnostics window responds and displays the affected device.

4.2.4.2 Different views of the HMI diagnostics view

Introduction

There are three different views available in the system diagnostics view and the system diagnostics window.

- Device view
- Details view
- Matrix view (for master/IO systems only, PROFIBUS, PROFINET)

Device view

The device view shows all the available devices of a layer in a table. Double-clicking on a device opens either the lower-level devices or the detail view. Symbols in the first column provide information about the current state of the device.

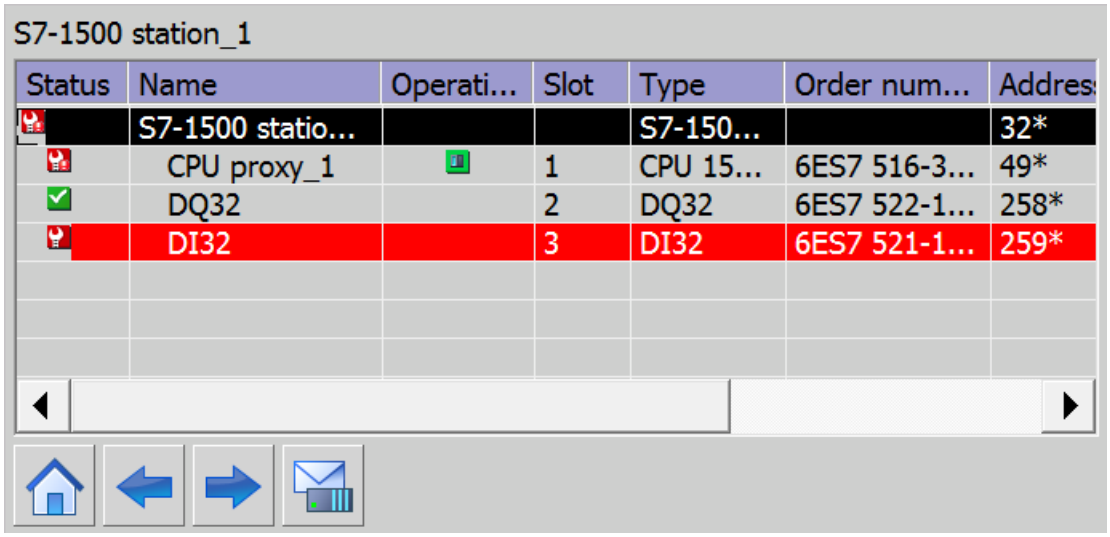

Figure 4-27 Device view

Details view

The detail view gives detailed information about the selected device and any pending errors. Check whether the data is correct in the detail view.

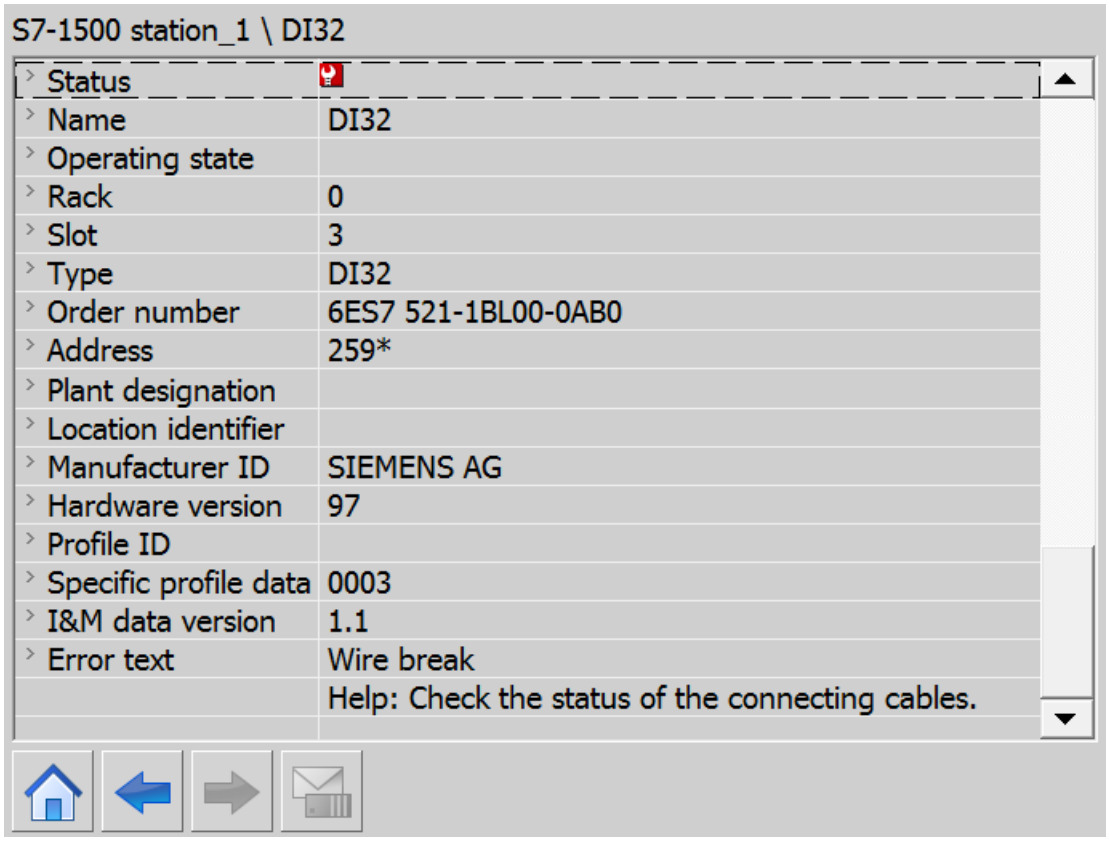

Figure 4-28 Details view

Matrix view

The matrix view is only available for distributed I/O systems. The matrix view shows the status of the devices of the PROFIBUS/PROFINET subnet.

- In PROFIBUS, the numbers assigned by PROFIBUS are used for identification (DP station number).
- In PROFINET, the IO devices are numbered consecutively from 1.

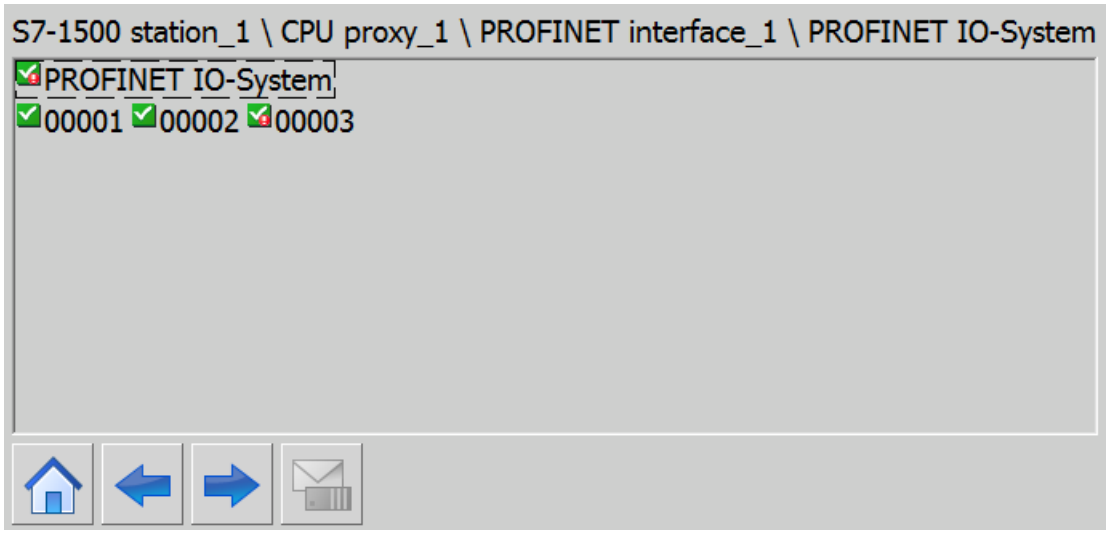

Figure 4-29 Matrix view

Navigation buttons

Button	Function
	Opens the lower-level devices or the detail view if there are no lower-level devices.
	Opens the higher-level device or the device view if there is no higher-level device.
	Opens the device view.

4.2.4.3 Inserting system diagnostics indicator

Introduction

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your plant.

The library object shows two different states:

- No error
- Error

Requirements

- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Libraries" task card is opened.
- The global library "Buttons and Switches > DiagnosticsButtons" is open.
- A screen is open.
- The system diagnostics window has been set up in the global screen.

Procedure

1. Select the "DiagnosticsIndicator" object in the library.
2. Drag-and-drop the library object to the position in the work area where you want to insert the object.

   The library object is added.

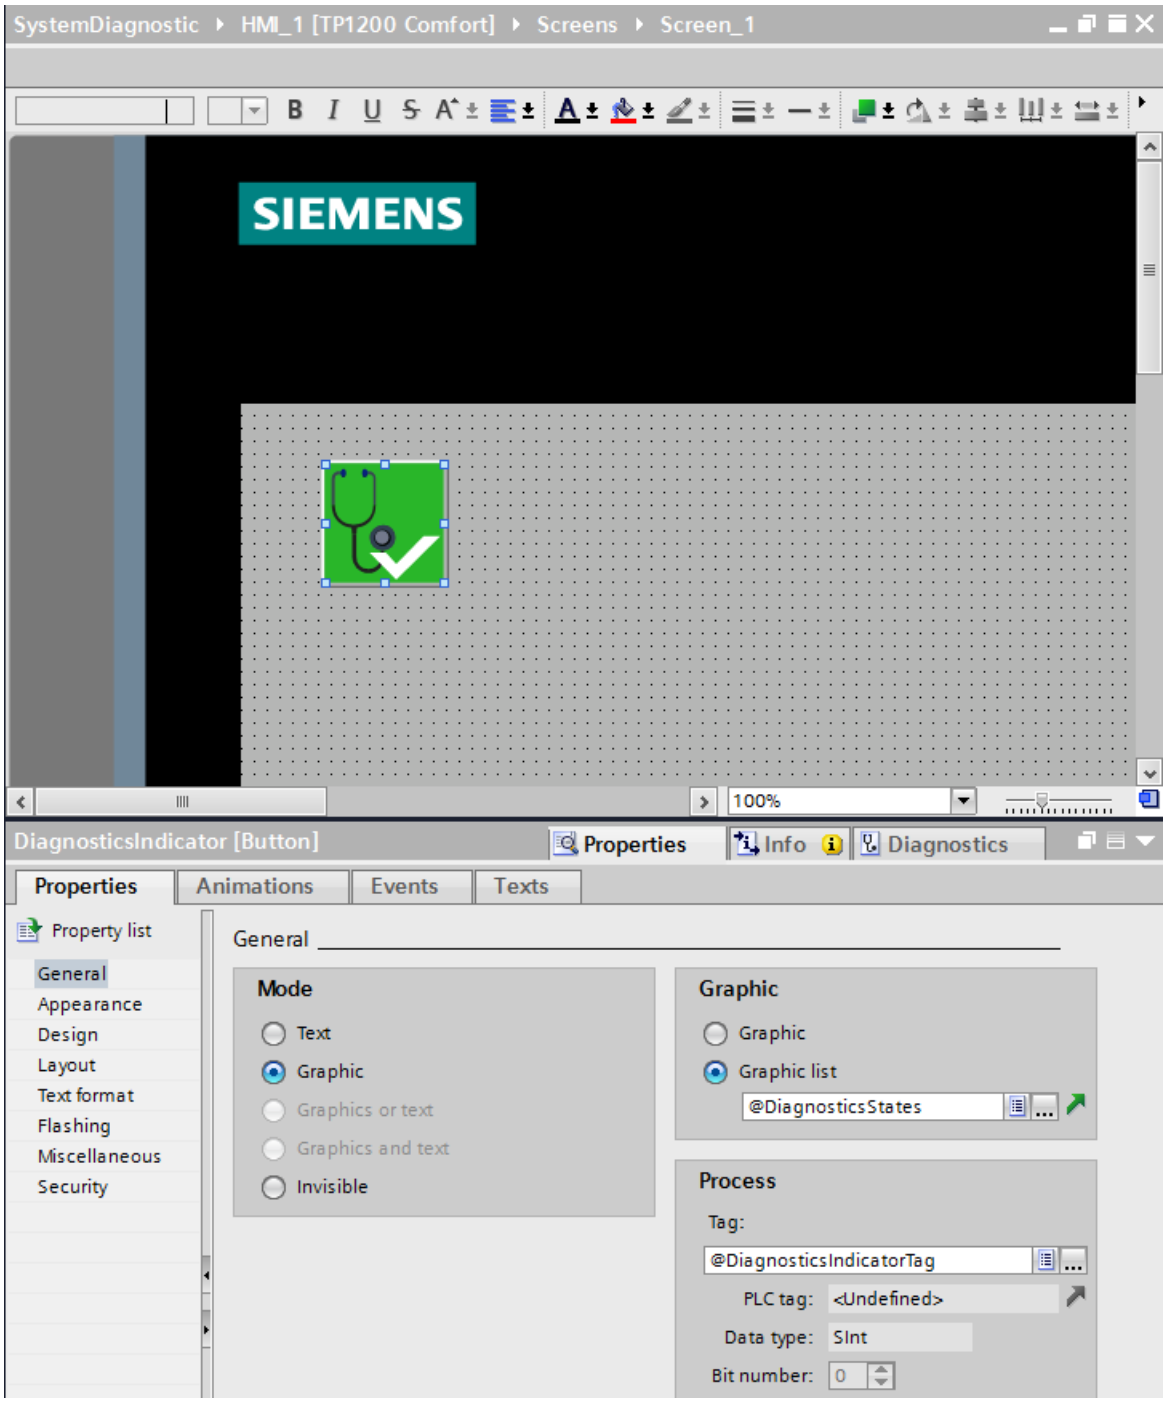

Figure 4-30 Inserting library object in the working area

3. Select the library object.
4. Open the "Events" tab in the Inspector window.

   The "ShowSystemDiagnosticsWindow" is preset for the event "Click".

Result

The system diagnostics indicator has been added to the project and connected with the system diagnostics window.

The system diagnostics indicator changes its appearance if an error message is output in WinCC Runtime. The system diagnostics window opens when you click on the system diagnostics indicator. The system diagnostics window shows the detail view of the affected device.

Configuring access protection for the system diagnostics window

Configure access protection for the system diagnostics indicator to prevent unauthorized access to the system diagnostics windows.

1. Select the "DiagnosticsIndicator" object in the screen.
2. Open the "Properties" tab in the Inspector window.
3. Select an authorization in the "Security in Runtime" area.

A logon dialog opens when you click on the system diagnostics indicator in WinCC Runtime. The system diagnostics window does not open unless you have the required authorization.

4.2.4.4 Configuring button as system diagnostics indicator

Introduction

Instead of using the object "DiagnosticsIndicator" from the library, you can, for example, configure a button in "Graphic" mode to indicate errors in your plant.

Requirements

- At least one CPU has been created.
- An HMI device (e.g., Comfort Panel) has been set up in the project.
- The "Tools" task card is open.
- A bit graphics list has been created with two different graphics for the states.
- A screen is open.
- You have created a system diagnostics view.

Procedure

Follow these steps to configure a button as system diagnostics indicator:

1. Double-click the "Button" object in the "Tools" task card. A button is added to the screen.
2. Enable the "Properties" tab in the Inspector window and the "Graphic" mode in the "General" area.
3. Select the bit graphics list as graphics list.
4. Select the "Properties" tab in the Inspector window and select the tag @DiagnosticsIndicatorTag under "Tag" in the "General" area.
5. To assign a function to the button, select the "Events" tab in the Inspector window.
6. Select the "Click" event.
7. Click on "Add function" in the table.
8. Select "EnableSystemDiagnosticsView".
9. Select the system diagnostics view.

Result

You have configured an interface that reacts to error events from the CPU. The button changes when an error event occurs in Runtime.

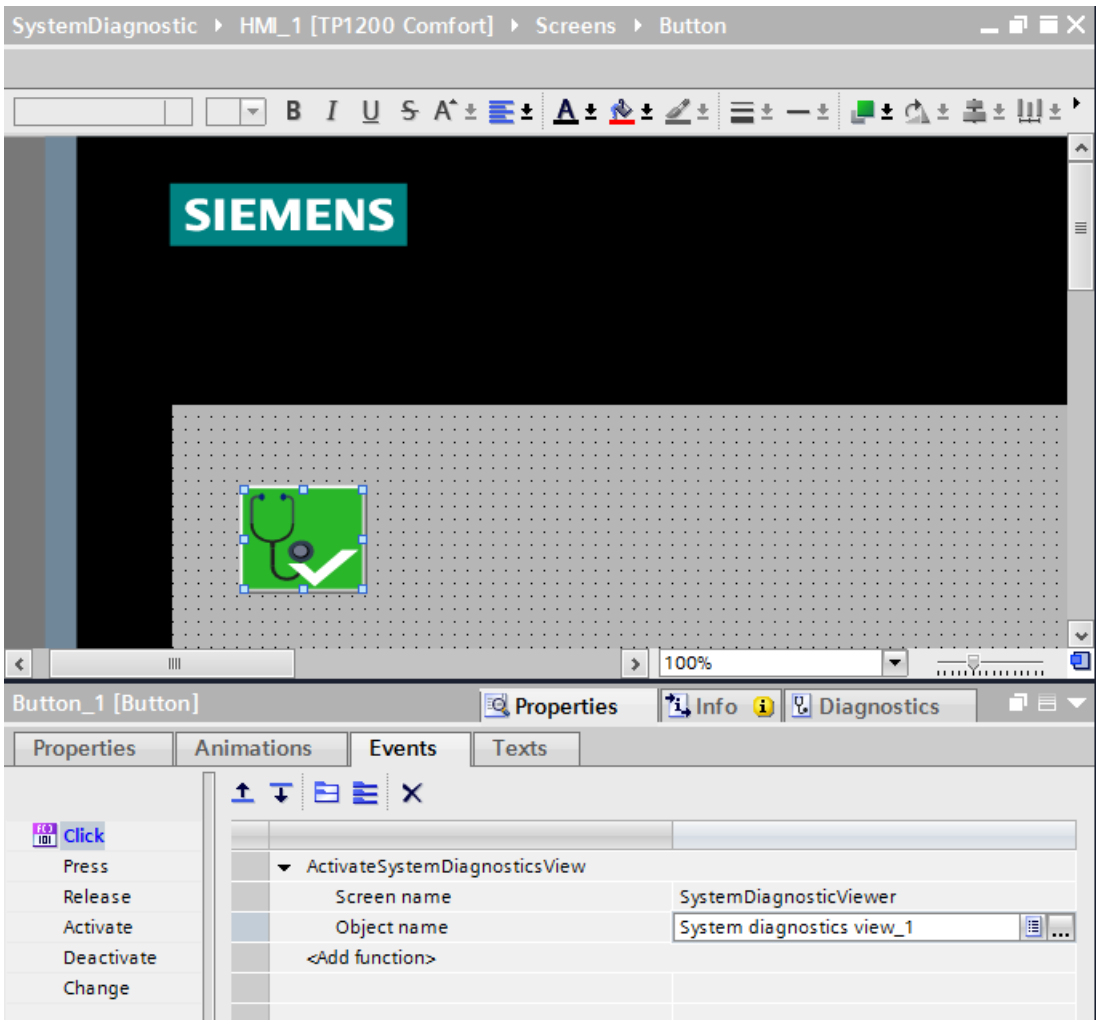

Figure 4-31 Configured button

The button has two states.

- Error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the detail view of the affected device.

- No error

  The system diagnostics view opens when you click on the button. The system diagnostics view shows the device view.

System diagnostics by means of the user program 5

5.1 Options of system diagnostics in the user program

Introduction

You can configure responses to diagnostics alarms in the user program. You can, for example, specify that your plant is stopped in case of specific diagnostics alarms.

Options of determining diagnostics in the user program

A vendor-independent structure of data records with diagnostics information applies. The following instructions are available for determining the system diagnostics of a device:

Instruction	Description
RDREC	• Includes error information on faulty modules • Works synchronously, which means processing takes place across several calls
RALRM	• Reads the start information of the OB when calling the diagnostics interrupt OB (OB 82) • Provides information on cause and location of error
DPNRM_DG	• Reads the current diagnostics data of a DP slave (DP standard diagnostics)
GEN_DIAG	• Generates diagnostics information • To generate diagnostics information, the module or submodule is identified with its logical address
Gen_UsrMsg	• Generates an alarm that is entered in the diagnostics buffer
GET_DIAG	• Provides diagnostics information • To provide diagnostics information, the module or submodule is selected
T_DIAG	• Provides diagnostics and status information on a connection • Works synchronously, which means processing takes place across several calls
RD_SINFO	• Reads the start information of the OB called last that has not been processed completely and the startup OB started last • Provides general error information
LED	• Reads the status of the module LED
Get_IM_Data	• Reads the Information&Maintenance data of the CPU • Works synchronously, which means processing takes place across several calls
Transfer_IM_Data	• Transmits the Information&Maintenance data of the CPU
DeviceStates	• Outputs the state of all devices of an IO system
ModuleStates	• Outputs the state of all modules of a device

Additional information

See the STEP 7 online help for additional information on the instructions for system diagnostics.

5.2 System diagnostics using process image inputs

Introduction

In addition to event-driven system diagnostics, the input and output modules of the SIMATIC series provide diagnostics information using the process image of the inputs.

The system diagnostics described in the preceding sections is made available asynchronously to the program processing. To ensure the correct processing of the input and output data in the case of faults while reading the input and output data, some modules offer the so-called value status (QI = Quality Information) for evaluation.

Requirement for evaluation of the value status

The diagnostics information about the process image of the inputs is transmitted synchronized with the user data. Select the "Value status" check box in the properties of the I/O module in STEP 7 if you want to evaluate the value status of the channel.

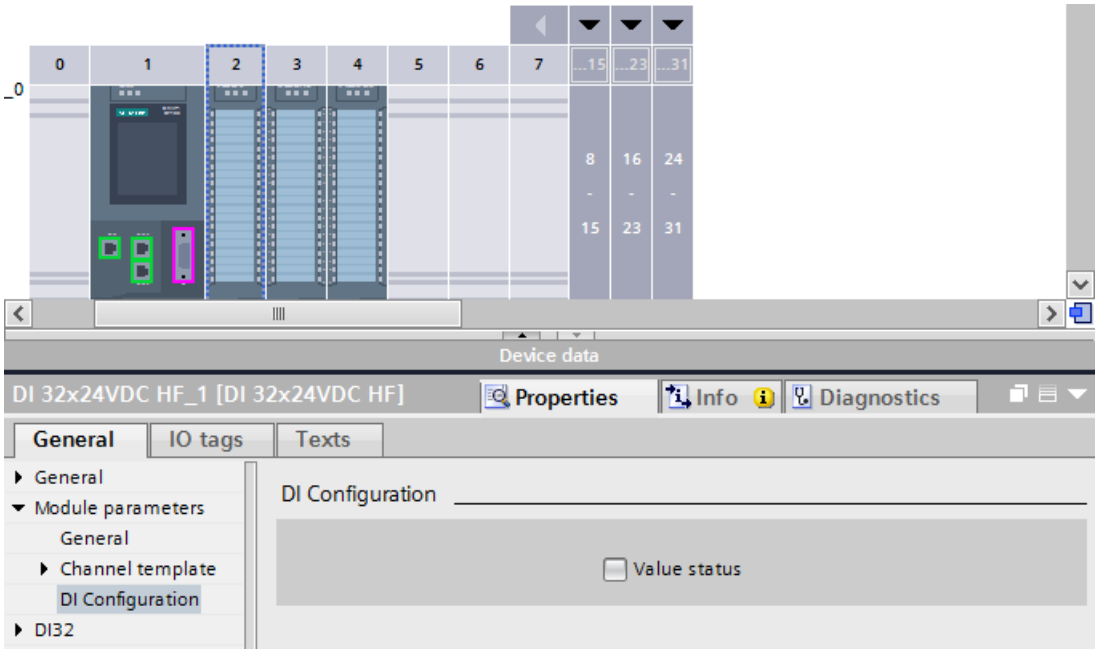

Figure 5-1 Enable value status

Evaluation of the value status

If you have enabled the value status for an I/O module, this module provides additional information on the value status in addition to the user data. This information is directly available in the process image of the inputs and can be called with simple binary operations.

Each channel is uniquely assigned one bit in the value status. The bit in the value status indicates the validity of the read-in value in the user data.

Table 5- 1 Example for evaluation of the user datum in case of a wire break for a digital input module

	Bit in user datum	Bit in value status	Value in user datum
Faulty channel	Logical 0	0	Invalid
Fault-free channel	Logical 0 (actual value)	1	Valid

Example - Evaluation of the value status for the input channel of an analog input module

The example below shows the basic evaluation of the value status for the input channel of an analog input module in the user program. The diameter of a cylinder is measured by means of a channel and its circumference is calculated.

- If the value status indicates the channel is error-free, the circumference is to be calculated.
- If the value status indicates the channel is defective, the value "0" is to be output as substitute value for the circumference.

The figure below shows the evaluation of the value status in the user program.

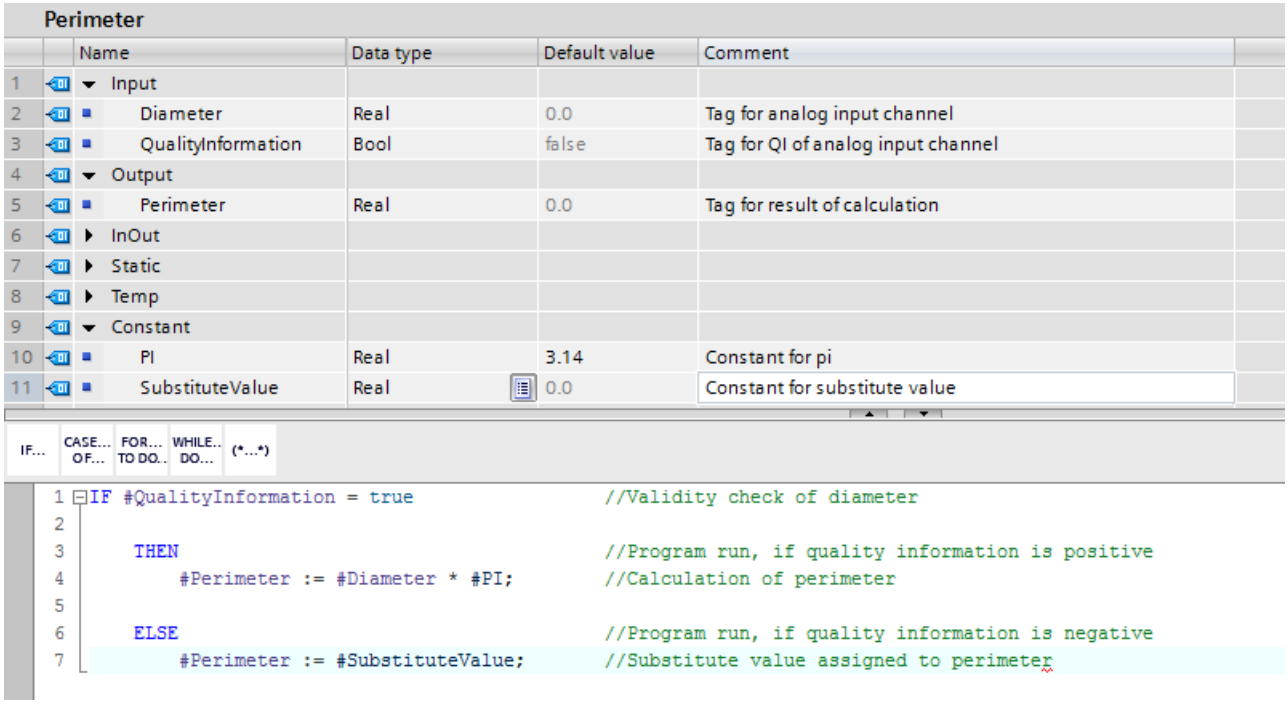

Figure 5-2 Example - Evaluation of the value status in the user program

Additional information

Depending on the I/O module, the value status reserves different addresses in the process image of the inputs. The specific manual for the used module includes specific information on allocation and assignment.

Alarms

6

Alarms allow you to display events from processing in the automation system and to quickly detect errors, to precisely localize them and to remove them. Downtimes are significantly reduced in a plant.

Before alarms can be output, they need to be configured.

You can create, edit and compile event-dependent alarms along with their alarm texts and alarm attributes and display them on display devices.

In STEP 7, you create program alarms in the user program with the "Program_Alarm" instruction. You edit the attributes and alarm texts in the alarm editor in STEP 7.

You can output the alarm status with the "Get_AlarmState" instruction.

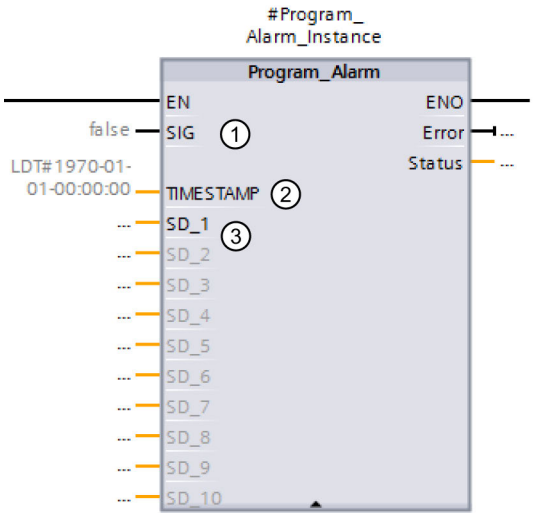
Advantages of program alarms

Compared to other alarm methods, such as HMI discrete alarms, program alarms offer the following advantages:

- Central engineering in STEP 7: You only configure a program alarm once for the CPU. The program alarm is automatically transferred from the CPU to all registered HMI devices.
- System-supported acknowledgment: The acknowledgment of a program alarm on an HMI device is automatically updated on other HMI devices by the CPU.
- Time stamping close to the event in the CPU
- Identical time stamps of the alarms on multiple HMI devices without time synchronization

6.1 Creating alarms with the "Program_Alarm" instruction

You create a program alarm in STEP 7 with the "Program_Alarm" instruction. The figure below shows the "Program_Alarm" instruction with the most important input variables.



① The "Program_Alarm" instruction monitors the signal at the SIG block input and generates a program alarm in case of a signal change at the SIG parameter. The instruction generates an incoming alarm when the signal changes from 0 to 1 and an outgoing program alarm if the signal changes from 1 to 0. The program alarm is triggered synchronously to program execution.

② The time stamp is automatically created when the alarm event occurs in the automation system and is passed along with the alarm.

③ You can append up to ten associated values to the program alarm at the parameters SD_i (1 ≤ i ≤10). The associated values are acquired at the time of the signal change at the SIG parameter and assigned to the program alarm.
Associated values are used to display dynamic contents in alarms.
Example: The temperature in the tank <associated value 1> is <associated value 2> °C.
You can find more information on associated values in the STEP 7 online help.

Figure 6-1 "Program_Alarm" instruction

Note

The "Program_Alarm" instruction can only be called in a function block.

You can find more information on creating program alarms in the STEP 7 online help under "Creating and editing alarms".

6.2 Editing alarms in the alarm editor

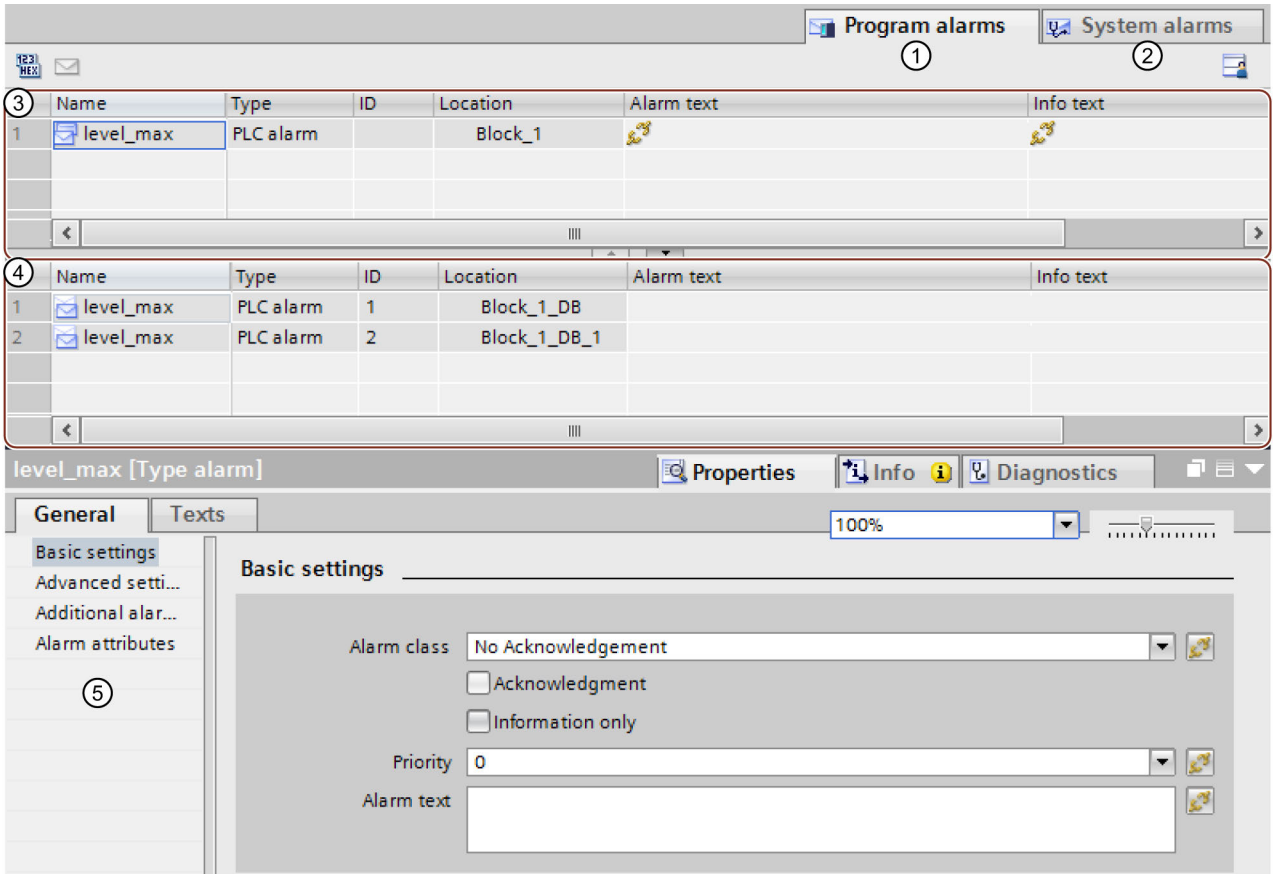
You can edit the created alarms in STEP 7 either in the program editor or in the alarm editor.

You can find more information on editing alarms in the program editor in the STEP 7 online help under "Creating and editing alarms".

Editing alarms in the alarm editor

You can edit alarm texts in the alarm editor and specify attributes such as alarm class or priority for the alarms.

The figure below shows the layout of the alarm editor.



① "Program alarms" tab: You can edit program alarms here.

② "System alarms" tab: System alarms can only be viewed but not edited. To edit these alarms, you must navigate to the device view ("Go to device" menu command), where you can modify the system diagnostics alarms in the Inspector window.

③ "Type alarms" area:

This is where the type alarms created in a function block with the "Program_Alarm" instruction are displayed. Type alarms serves as templates for instance alarms (④).
All the inputs you make for the type alarm are automatically included in the instance alarms derived from it.

You can find more information on type alarms in the STEP 7 online help under "Alarm types and alarms".

④ "Instance alarms" area:

When you assign an instance DB to the message block (for example, call in an OB, FB, FC), instance alarms are automatically generated based on the template of the type alarm and alarm numbers are assigned.
You can modify the instance alarms for specific instances.

You can find more information on instance alarms in the STEP 7 online help under "Alarm types and alarms".

⑤ Properties of the selected type and instance alarm in the Inspector window

Figure 6-2 Layout of the alarm editor

You can enter or modify the necessary parameters, texts and attributes in the table or in the Inspector window.

Additional information

You can find more information on texts and attributes in the STEP 7 online help under "Texts and attributes".

You can find more information on text lists in the STEP 7 online help under "Text lists for alarms".

6.3 Display of program alarms

Program alarms you create with the "Program_Alarm" instruction are automatically made available to the display devices.

You have the following options to display the alarms:

- Display of the CPU
- STEP 7
- HMI
- Web server of the CPU

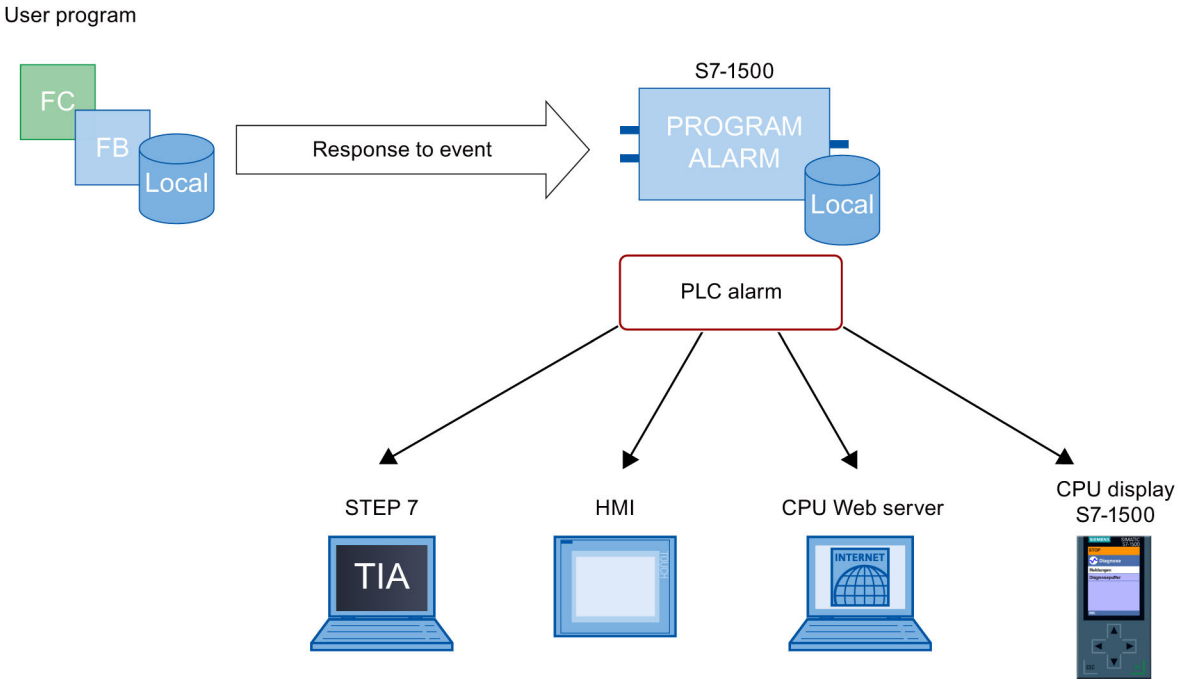


Figure 6-3 Alarms in the user program

6.4 Output of the alarm state with the "Get_AlarmState" instruction

Output of the alarm state with the "Get_AlarmState" instruction

The "Get_AlarmState" instruction outputs the alarm state of a program alarm. The output of the alarm state always refers to a program alarm that was created using the "Program_Alarm" instruction.

The program alarm is selected with the "Alarm" input parameter. Specify the instance DB of the "Program_Alarm" instruction at the "Alarm" parameter.

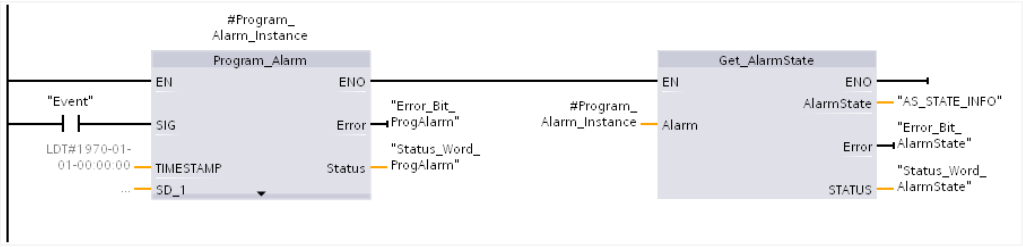

Figure 6-4 Call - Get_AlarmState

You can find additional information on evaluation of the "Get_AlarmState" instruction in the STEP 7 online help.

6.5 Example program for program alarms

6.5.1 Task

Introduction

This section describes the basic configuration of program alarms with the "Program_Alarm" instruction based on two examples. The two examples solve the same problem but use a different approach. Example 1 does not use associated values. In example 2, an associated value is assigned to the program alarm to reference a text list.

Example - Minimum/maximum fill level of a tank

A tank is filled with a liquid. The fill level is monitored by two sensors.

If the liquid in the tank drops below a minimum fill level, an alarm is output for low fill level.

If the liquid in the tank exceeds a maximum fill level, an alarm is output for high fill level.

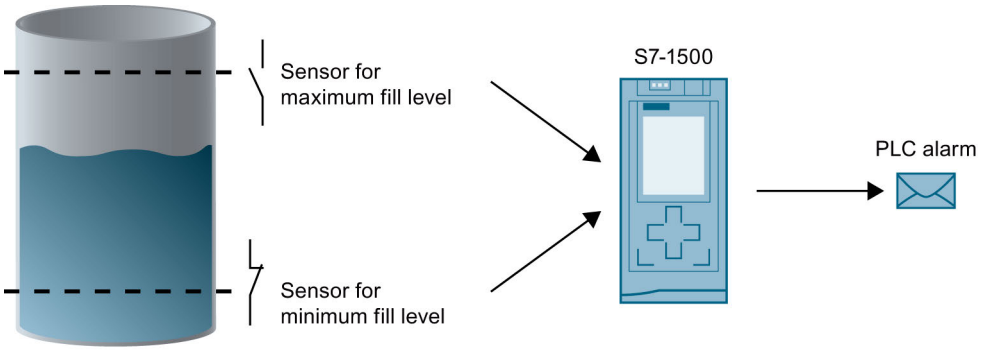

Figure 6-5 Example for fill level alarms

6.5.2 Example 1: Program alarm without associated values

Introduction

A program alarm is created for the minimum and the maximum fill level in this example.

How the example works

When the maximum fill level is exceeded in the tank, a program alarm with the alarm text for the excessive fill level is output.

When the minimum fill level is undershot in the tank, a program alarm with the alarm text indicating that the fill level is too low is output.

Steps

The following steps are necessary for this example:

- Define variables to pick up the signal
- Create function block
- Create program alarms
- Call function block
- Edit alarm text

Define variables to pick up the signal

The following table shows the variables that are used in this example. Define these variables in the standard variable table. The standard variable table is available in the project tree under "PLC variables".

Table 6- 1 Variables for fill level alarms

Name	Data type	Description
max	BOOL	Variable for maximum fill level If "max" = 1, the maximum fill level is exceeded.
min	BOOL	Variable for minimum fill level If "min" = 1, the minimum fill level is undershot.

The figure below shows the standard variable table with the defined variables "max" and "min".

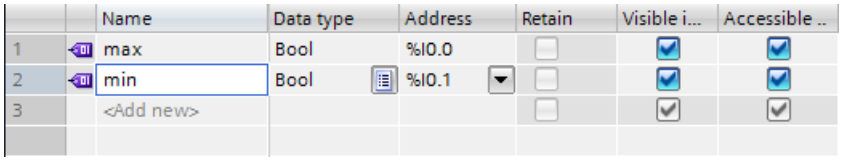

Figure 6-6 Define variables

Create function block

To create a function block, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Double-click "Add new block".
   The "Add new block" dialog opens.
3. Select the button "Function block".

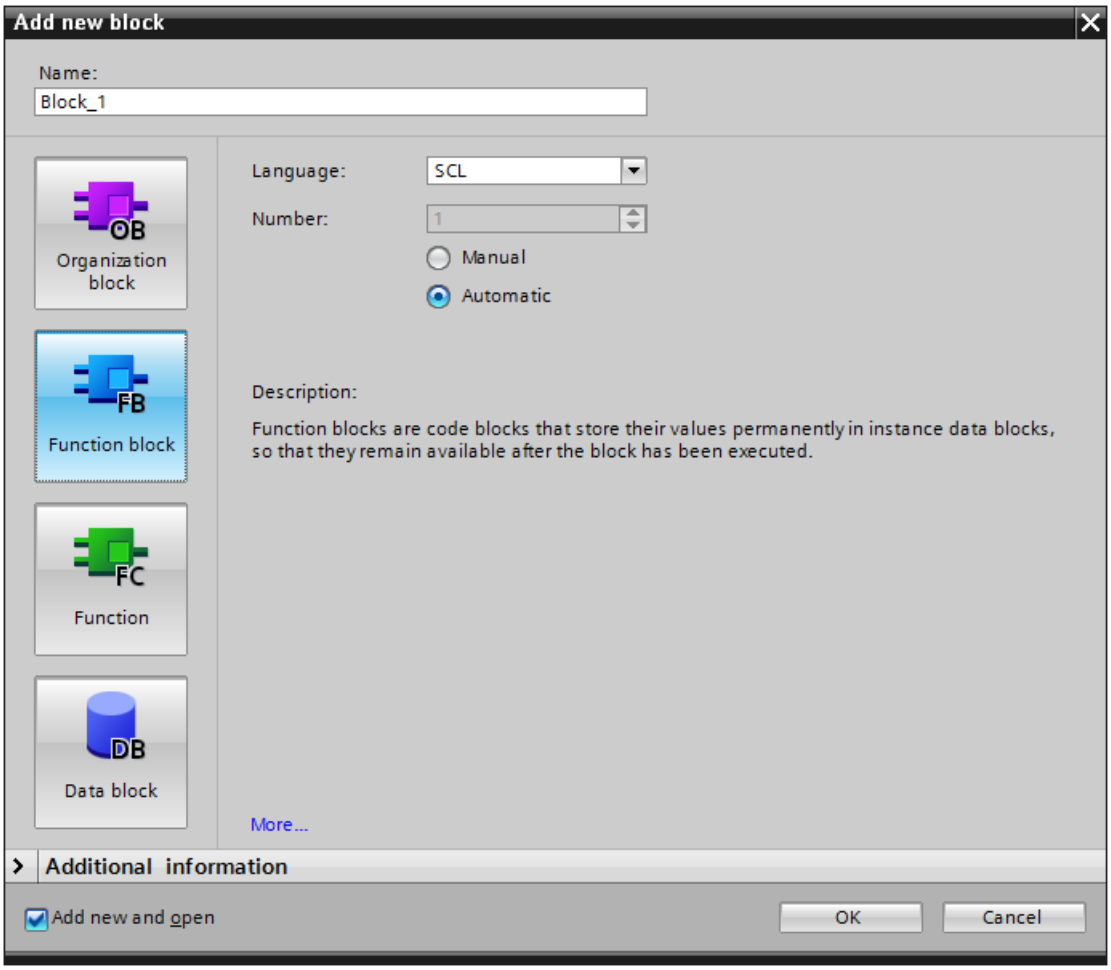

Figure 6-7 Create FB

4. Enter a name for the new block.
5. Select the language SCL.
6. Click on "OK" to confirm your input.

Result: You have created a function block.

Create program alarms

To create the program alarm for the example program, follow these steps:

1. Select the created function block (FB) in the "Program blocks" folder in the project tree and double-click the function block to open it.
2. Insert the call of the "Program_Alarm" instruction in the instruction part of the function block. The "Program_Alarm" instruction is available in the "Instructions" task card under "Extended instructions" > "Alarms".

   The "Call options" window opens.

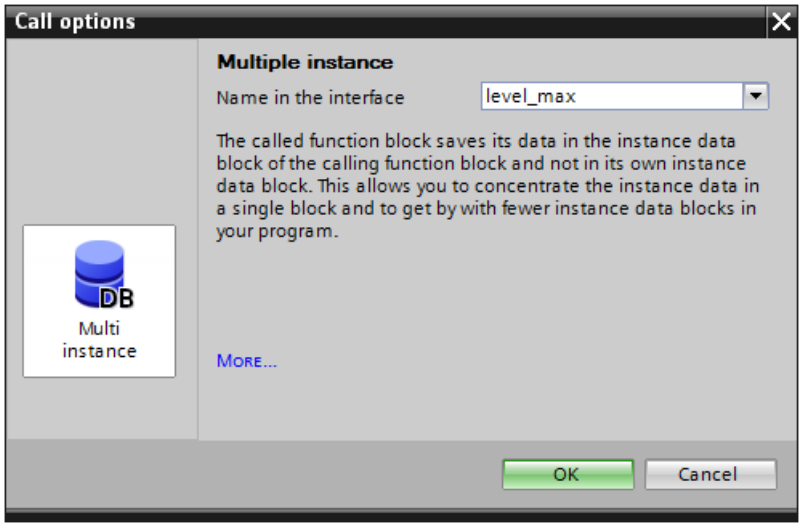

Figure 6-8 Calling PROGRAM_ALARM

3. Enter "level_max" as name and confirm the call options by clicking OK.

   Result: The input variables of the "Program_Alarm" instruction are displayed in the instruction part.
4. Supply the SIG input variable of the "Program_Alarm" instruction with the variables for the maximum fill level.

   ```
   #level_max(SIG:="max");
   ```

   SIG: If a signal change occurs at the SIG input variable, the "Program_Alarm" instruction generates a program alarm.
5. Insert another call of the "Program_Alarm" instruction.
   The "Call options" window opens.
6. Enter "level_min" as name and confirm the call options by clicking OK.
7. Result: The input variables of the "Program_Alarm" instruction are displayed in the instruction part.
8. Supply the SIG input variable of the "Program_Alarm" instruction with the variables for the minimum fill level.

   ```
   #level_min(SIG:="min");
   ```

Result: You have created two type alarms.

Call function block

To call the function block in the user program, follow these steps:

1. In the "Program blocks" folder, select the cycle OB (e.g., OB1) in which you want to call the function block and open the cycle OB with a double-click.
2. Select the function block you want to call in the "Program blocks" folder.
3. Drag the function block in the instruction part of the cycle OB.
   The "Call options" window opens.

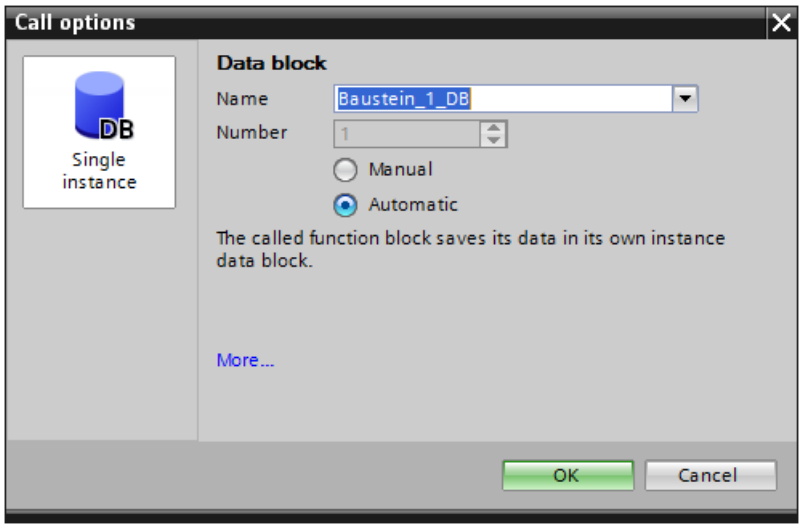

Figure 6-9 Call function block

4. Confirm the call options by clicking OK.

Result: You have called the alarm block in the user program and created an instance alarm.

Edit alarm text

To edit the alarm text, follow these steps:

1. Double-click on "PLC_Alarms" in the project tree.
   The alarm editor opens.
2. Select the type alarm for the maximum fill level.
3. Enter the alarm text for the maximum fill level in the "Alarm text" column.
4. Select the type alarm for the minimum fill level.
5. Enter the alarm text for the minimum fill level in the "Alarm text" column.

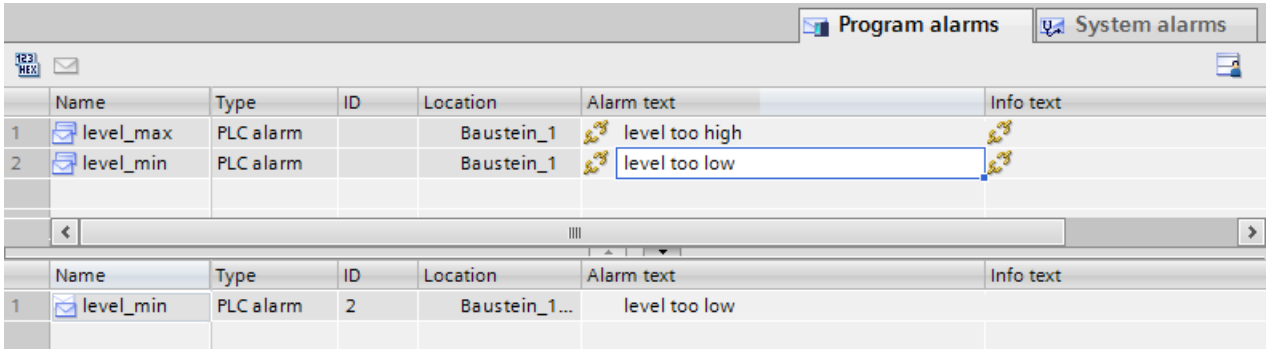

Figure 6-10 Edit alarm text

Result: You have created the alarm texts for both type alarms.

6.5.3 Example 2: Program alarm with associated value

Introduction

A shared program alarm is created for the maximum and the minimum fill level in this example. The program alarm is given an associated value. The program alarm uses the associated value to access a text list entry and outputs a separate alarm text for the minimum and the maximum fill level.

How the example works

The program alarm is output if either the minimum fill level is undershot or the maximum fill level is exceeded.

The associated value 1 of the "Program_Alarm" instruction is assigned the variable for the maximum fill level. The associated value references a text list with the entries "0" and "1".

The following scenarios are possible for output of the alarm text:

- Associated value is "0": The entry "0" of the text list with the alarm text for the undershot fill level is output.
- Associated value is "1": The entry "1" of the text list with the alarm text for the excessive fill level is output.

Steps

The following steps are necessary for this example:

- Define variables to pick up the signal
- Create function block
- Create program alarms
- Call function block
- Creating a text list
- Edit alarm text

Define variables to pick up the signal

The following table shows the variables that are used in this example. Define these variables in the standard variable table. The standard variable table is available in the project tree under "PLC variables".

Table 6- 2 Variables for fill level alarms

Name	Data type	Description
max	BOOL	Variable for maximum fill level If "max" = 1, the maximum fill level is exceeded.
min	BOOL	Variable for minimum fill level If "min" = 1, the minimum fill level is undershot.

The figure below shows the standard variable table with the defined variables "max" and "min".

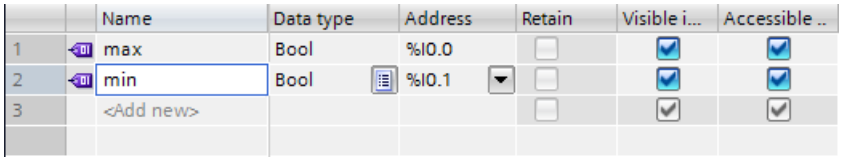

Figure 6-11 Define variables

Create function blocks

To create a function block, follow these steps:

1. Open the "Program blocks" folder in project tree.
2. Double-click "Add new block".
   The "Add new block" dialog opens.
3. Select the button "Function block".

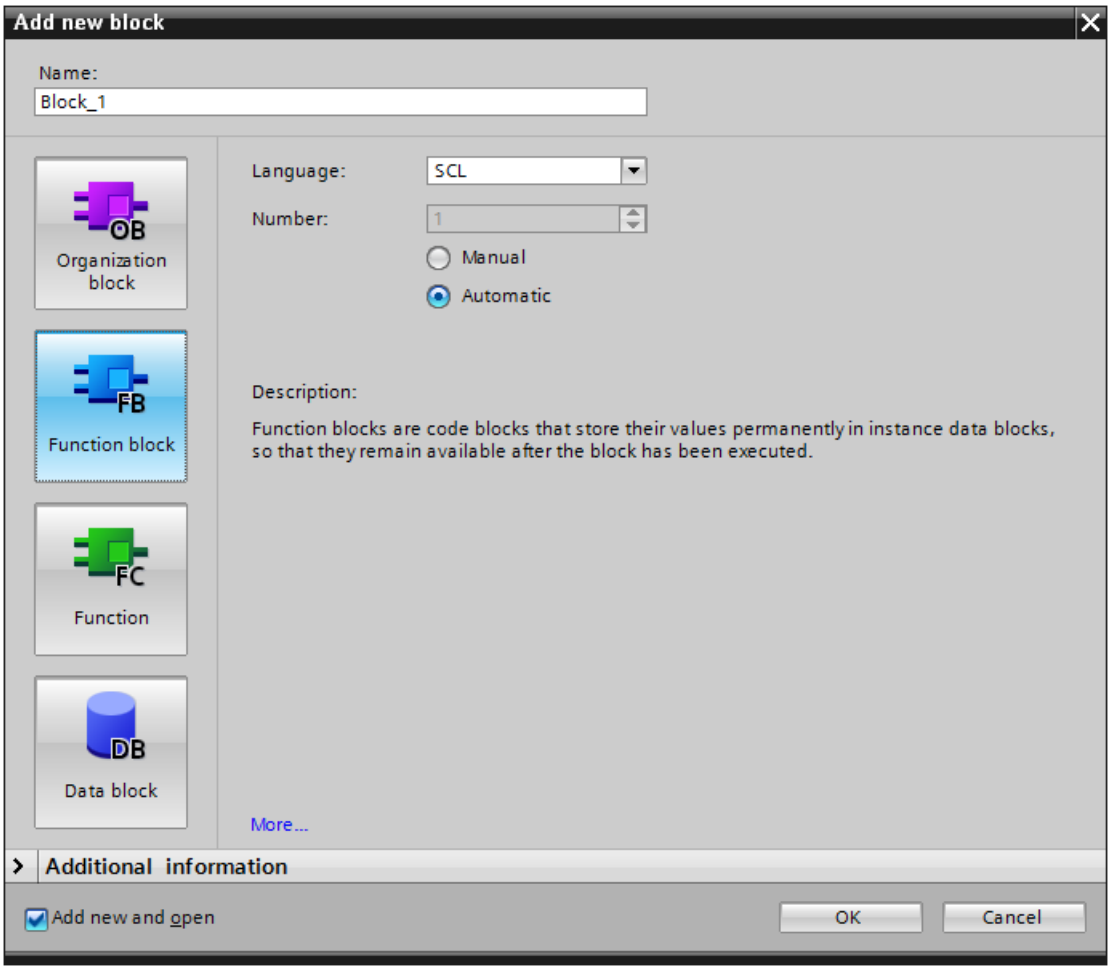

Figure 6-12 Create FB

4. Enter a name for the new block.
5. Select the language SCL.
6. Click on "OK" to confirm your input.

Result: You have created a function block.

Create program alarm

To create the program alarm for the example program, follow these steps:

1. Select the created function block (FB) in the "Program blocks" folder in the project tree.
2. Insert the call of the "Program_Alarm" instruction in the instruction part of the function block. The "Program_Alarm" instruction is available in the "Instructions" task card under "Extended instructions" > "Alarms".
   The "Call options" window opens.

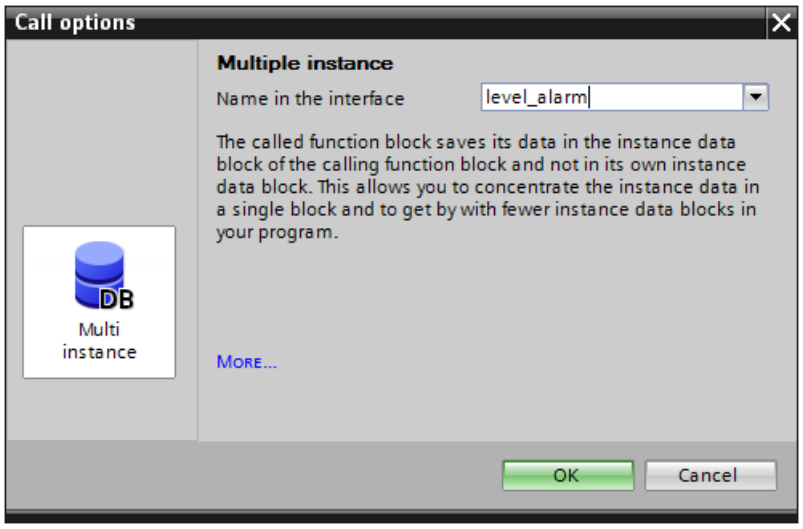

Figure 6-13 Calling PROGRAM_ALARM

3. Enter "level_alarm" as name and confirm the call options by clicking OK.
   Result: The input variables of the "Program_Alarm" instruction are displayed in the instruction part.
4. Supply the SIG input variable of the "Program_Alarm" instruction with the XOR logic operation of the variables for minimum and maximum fill level and the input variable SD_1 with the variable for the maximum fill level.

```
#level_alarm(SIG:="min"XOR"max",SD_1:="max");
```

   SIG: If a signal change occurs at the SIG input variable, the "Program_Alarm" instruction generates a program alarm.
   SD_1: The associated value is acquired at the time of the signal change at input variable and assigned to the program alarm.

Result: You have created a type alarm.

Call function block

To call the function block in the user program, follow these steps:

1. In the "Program blocks" folder, select the cycle OB (e.g., OB1) in which you want to call the function block and open the cycle OB with a double-click.
2. Select the function block you want to call in the "Program blocks" folder.
3. Drag the function block in the instruction part of the cycle OB.
   The "Call options" window opens.

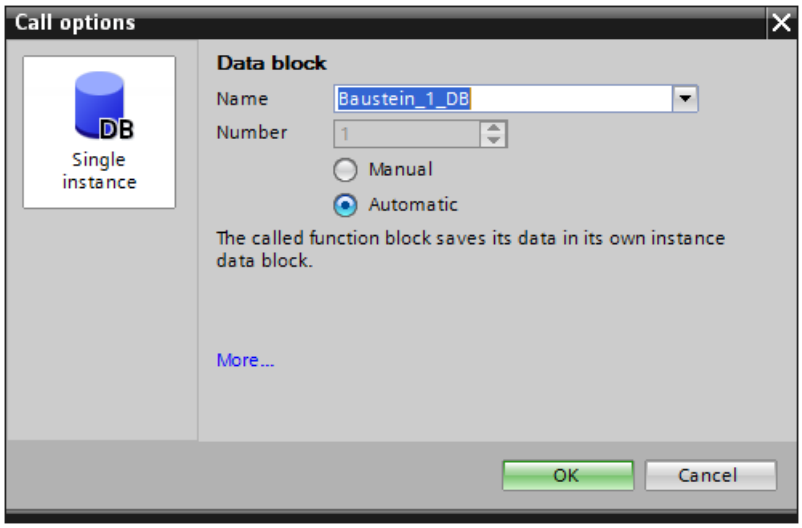

Figure 6-14 Call function block

4. Confirm the call options by clicking OK.
   Result: You have called the alarm block in the user program and created an instance alarm.

Creating a text list

To create the text list for the example program, follow these steps:

1. Double-click on the "Text lists" command in the program tree.
   The text list editor opens.
2. Double-click "<Add>" in the text lists area.
   A new text list is added.
3. Name the text list "level_textlist".
4. Double-click "<Add>" in the text lists area of level_textlist.
   A new text list entry is added in the level_textlist text list.
5. Enter the alarm text for the maximum fill level in the "Entry" column.
6. Add another entry in the text list.
7. Enter the alarm text for the minimum fill level in the "Entry" column.

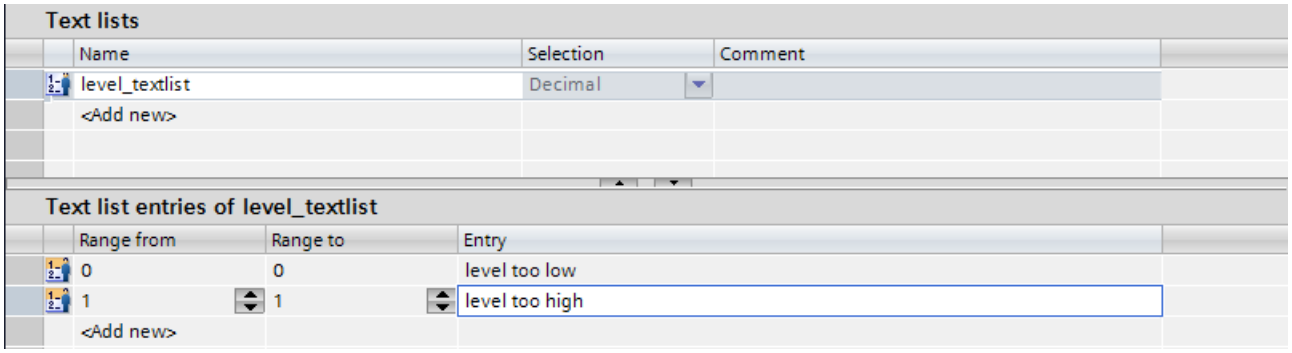

Figure 6-15 Creating a text list

Result: You have created the text list for the alarm text.

Edit alarm text

To edit the alarm text for the example program, follow these steps:

1. Double-click on "PLC_Alarms" in the project tree.
   The alarm editor opens.
2. Select the type alarm created for the example.
3. Click in the "Alarm text" column.
4. Open the shortcut menu and select the command "Insert dynamic parameter (text list)".

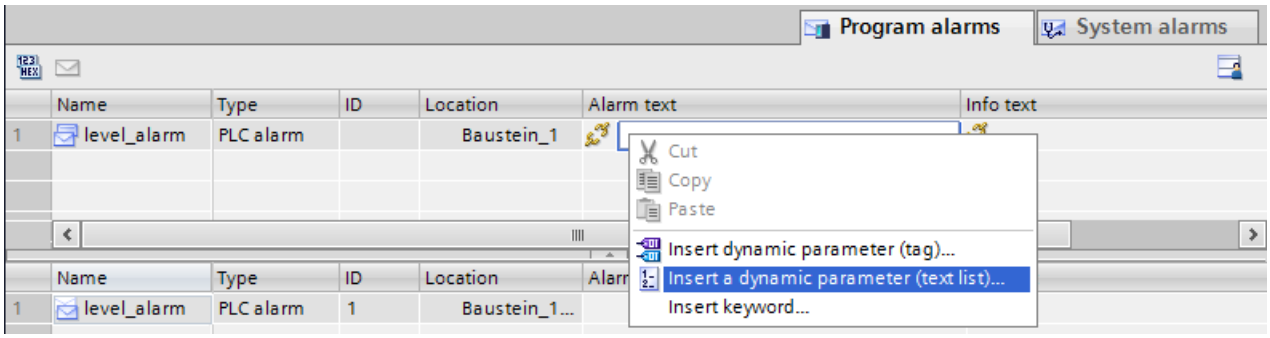

Figure 6-16 Edit alarm text

The window below opens.

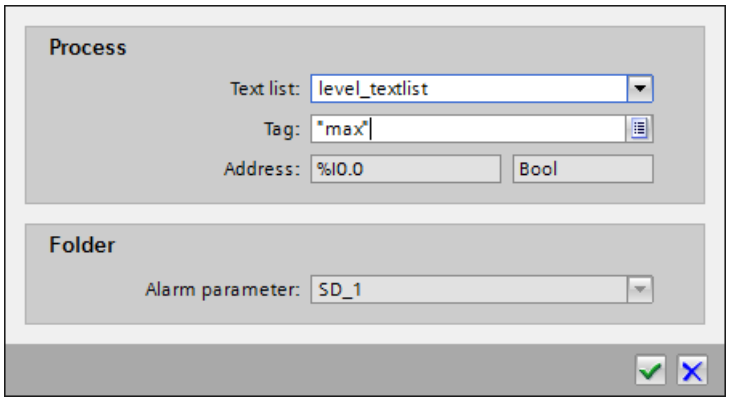

Figure 6-17 Insert dynamic parameter (text list)

5. Select the text list "level_textlist" and the variable "max". Confirm your selection by clicking "OK".

Result: You have created the alarm text for the type alarms.
If the variable "max" (associated value 1) is 0, the message text "level too low" is output.
If the variable "max" (associated value 1) is 1, the alarm text "level too high" is output.

6.5.4 Displaying the alarm

Displaying the alarm in the Web server

The figure below shows the display of the alarm in the Web server for both examples.

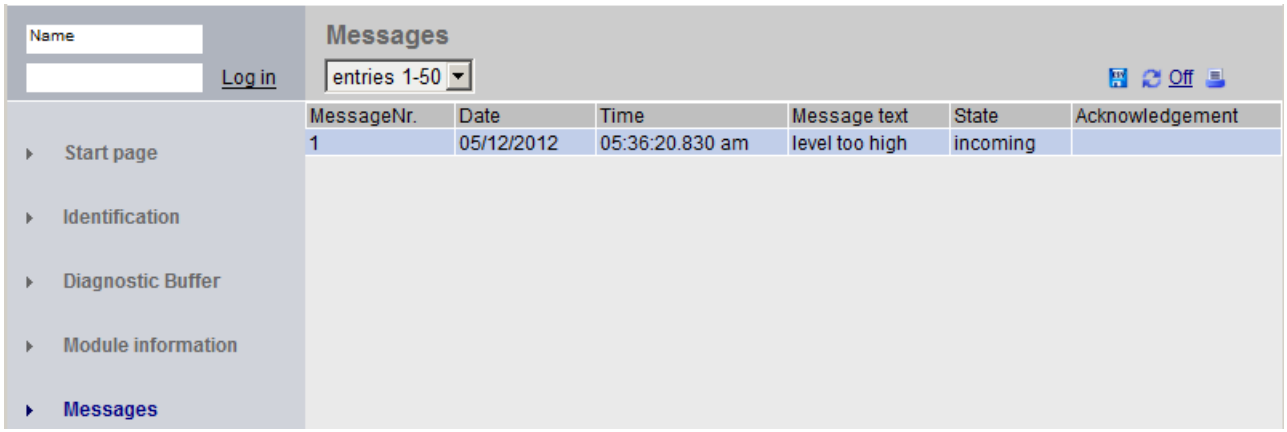

Figure 6-18 Displaying the alarm in the Web server

Displaying the alarm in STEP 7

Note

Displaying alarms in STEP 7

To display alarms in STEP 7, enable the option "Receive alarms" in the shortcut menu of the CPU.

The figure below shows the display of the alarm in STEP 7 for both examples.

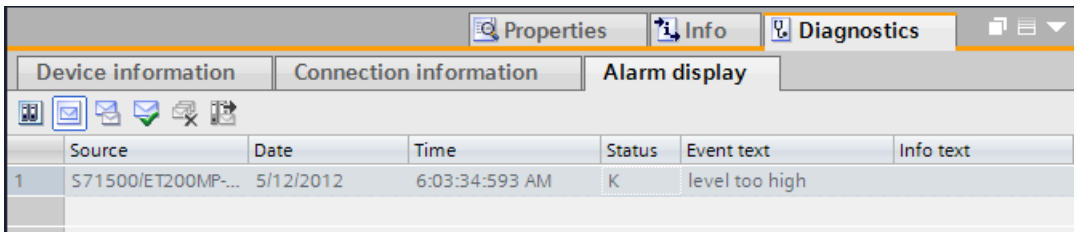

Figure 6-19 Display in STEP 7

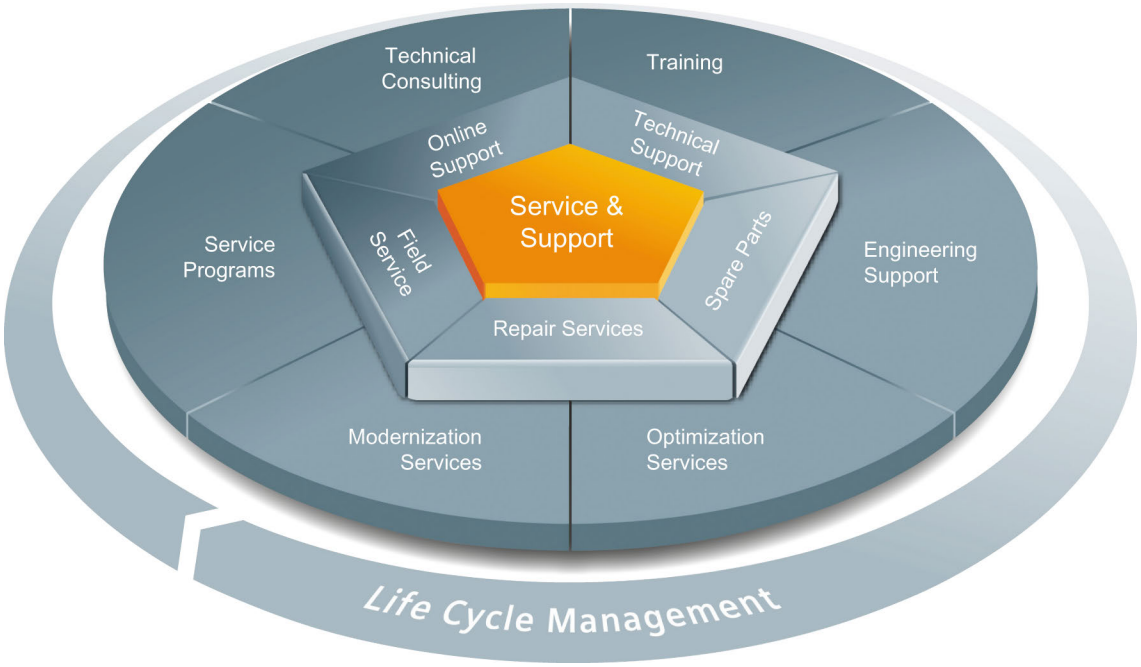
Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts and for the entire range of products supplied by Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Glossary

Alarm

An message sent to the operator due to events or states of the system.

Button (WinCC)

Object in WinCC that points out faults in the plant

Channel fault

Channel-related error of an individual channel - an I/O with inputs, for example, wire break or short circuit

Device

Modules with a network connection are referred to as device. Devices are installed on racks where they can be interconnected with other modules.

Diagnostics buffer

A buffered memory area in the CPU; it stores diagnostics events in the order of their occurrence

Firmware of the CPU

In SIMATIC, a distinction is made between the firmware of the CPU and user programs.

The firmware is a software embedded in electronic devices, which means it is permanently connected with the hardware functionally. It is usually saved in a flash memory, such as EPROM, EEPROM or ROM, and cannot be replaced by the user or only with special means or functions.

User program: see glossary entry "User program"

Global screen (WinCC)

A screen that is opened in the system diagnostics window is a global screen.

HMI device

Human Machine Interface, device for visualization and control of automation processes.

HMI diagnostics view (WinCC)

The HMI diagnostics view is an object in WinCC. The HMI diagnostics view can only be used with Comfort Panels and WinCC Advanced RT.

I/O module

Device of the distributed I/O that is used as interface between the controller and the process.

Industrial Ethernet

Guideline for setting up Ethernet in an industrial environment. The main difference to the standard Ethernet is the mechanical current carrying capacity and interference immunity of the individual components.

Memory reset

Procedure to set the memories of the CPU to a defined initial state.

PLC

Programmable **L**ogic **C**ontroller: Component of the CNC by which the machine manufacturer coordinates the interaction between the NC requirements (part program), the inputs of the machine operator and the current machine state.

PROFIBUS

Standard for fieldbus communication in automation technology.

PROFINET

Open component-based industrial communication system based on Ethernet for distributed automation systems. Communication technology promoted by the PROFIBUS Users Organization.

Subnet

Part of a network whose parameters must be synchronized with the devices (e.g., with PROFINET). It includes the bus components and all connected stations. Subnets can be linked by means of gateways, for example, to form a network.

System diagnostics

In the SIMATIC environment, diagnostics of devices and modules is collectively referred to as system diagnostics. System diagnostics is used, for example, to monitor the states of the following components in the system: Power supply, device, I/O.

System diagnostics indicator (WinCC)

The system diagnostics indicator is a predefined graphic symbol of the library which alerts you to errors in your plant and displays two states: No error, error

Topology

Structure of a network. Common structures include:

- Linear bus topology
- Ring topology
- Star topology
- Tree topology

User program

In SIMATIC, a distinction is made between user programs and the firmware of the CPU.

The user program contains all instructions, declarations and data by which a plant or process can be controlled. It is assigned to a programmable module (for example, CPU, FM) and can be structured in smaller units.

Firmware: see glossary entry "Firmware of the CPU"

Value status

The value status describes a specific signal state. The value status is constantly updated and cyclically transmitted by the field device as quality statement together with the measured value.

Web server

Software/ communication service for data exchange using Ethernet. The web server provides the documents by means of standardized transmission protocols (HTTP, HTTPS) to a web browser. Documents can be static or dynamic upon request by the web browser composed from different sources by the web server.

WinCC

Windows **C**ontrol **C**enter: a PC-based process visualization system

WinCC Runtime

Component of the basic software WinCC

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

The diagnostics options available with the trace and logic analyzer function are described in this documentation. Depending on the device used, the recording options can vary.

Required basic knowledge

In order to understand this documentation, the following knowledge is required:

- General knowledge in the field of automation
- Knowledge about the use of Windows-based computers
- S7-1200/1500 CPUs
  - Knowledge of working with the SIMATIC industrial automation system
  - Knowledge of working with TIA Portal >= V12.0
- SINAMICS G120
  - Knowledge of working with the drive

Validity of the documentation

This documentation applies to all products of the S7-1200, S7-1500 and SINAMICS G120 product family.

Conventions

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

Please also observe notes marked as follows:

Note

A note contains important information on the product described in the documentation, on the handling of the product and on the section of the documentation to which particular attention should be paid.

Further support

- The range of technical documentation for the individual SIMATIC products and systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the online ordering system is available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Description

1

1.1 Supported hardware

The following devices (Page 41) support the trace and logic analyzer function:

- SIMATIC S7-1200 CPUs (as of firmware version V4.0)
- SIMATIC S7-1500 CPUs
- SINAMICS G120

1.2 Recording of measured values with the trace function

Introduction

The trace and logic analyzer function can be called in the device folder in the project navigator under the name "Traces" (Page 11).

You record device tags and evaluate the recordings with the trace and logic analyzer function. Tags are, for example, drive parameters or system and user tags of a CPU. The maximum recording duration is limited by the memory size. How much memory is available for the recording depends on the hardware used.

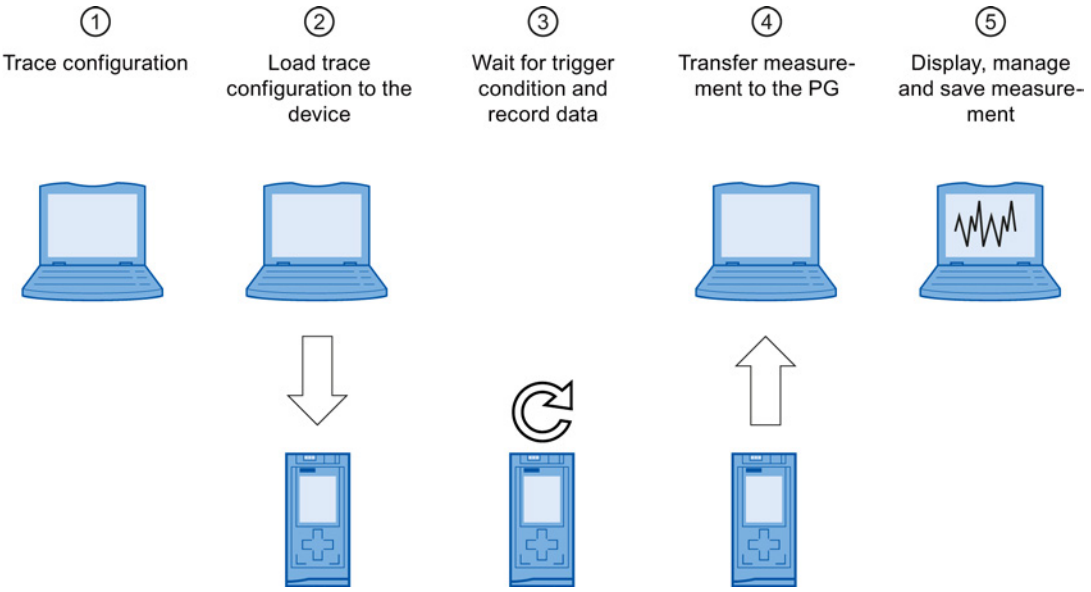
The recordings are saved on the device and, when required, can be read out with the engineering system (ES) and saved permanently. The trace and logic analyzer function is therefore suitable for monitoring highly dynamic processes. The recorded values are overwritten when "Installed traces" is activated again.

Active recordings from the axis control panel or from the PID are displayed at "Installed traces". These recordings can be added to the measurements in the curve diagram of the axis control panel or the PID via a shortcut menu command.

Depending on the device (Page 41) used, the recording options can vary.

A quick start (Page 27) for working with the trace and logic analyzer function can be found in the Operation section.

The following figure shows the method of operation of the "Traces":



① Trace configuration on the programming device (PG) in the TIA Portal

You can specify the signals to be recorded, the duration of the recording and the trigger condition in the trace configuration. The trace configuration depends on the device and is described at the respective device (Page 41).

② Transferring the trace configuration from the PG to the device

You can transfer the complete trace configuration (Page 34) to the device when an online connection is established.

③ Waiting for the recording

If the installed trace configuration is activated (Page 35), then the recording is performed independently of the PG. The recording is started as soon as the trigger condition is satisfied.

④ Transferring the measurement from the device to the PG

The saving of the measurement in the project (Page 36) stores the measurement in the opened project of the TIA Portal. The measurement can be saved at any time after completing the recording, irrespective of the time of the measurement.

⑤ Evaluating, managing and saving the measurement

Numerous options are available for the evaluation of the measurement in the curve diagram and in the signal table (Page 36). Various display types are possible, for example, a bit representation for binary signals.
Measurements can also be exported and imported as a file.
With the saving of the project (Page 36) in the TIA Portal, the measurements transferred to the project are also saved.

1.3 Trace configuration, recording and measurement

This section explains the meaning of the terms: trace configuration, recording and measurement.

Trace configuration

You can make the following settings in the trace configuration :

- Signals to be recorded
- Recording conditions
  - Sampling
  - Trigger

Recording

A recording is performed in the device. There is only one recording for each installed trace configuration. When a new recording is started, the old recording is overwritten.

An installed recording is not retentive (it is lost when the device is switched off/on) and can be saved permanently in the project as a measurement.

Installed traces

An installed trace consists of a trace configuration and optionally a recording. The maximum number of installed traces depends on the device.

The status of an installed trace can be viewed online.

Measurement

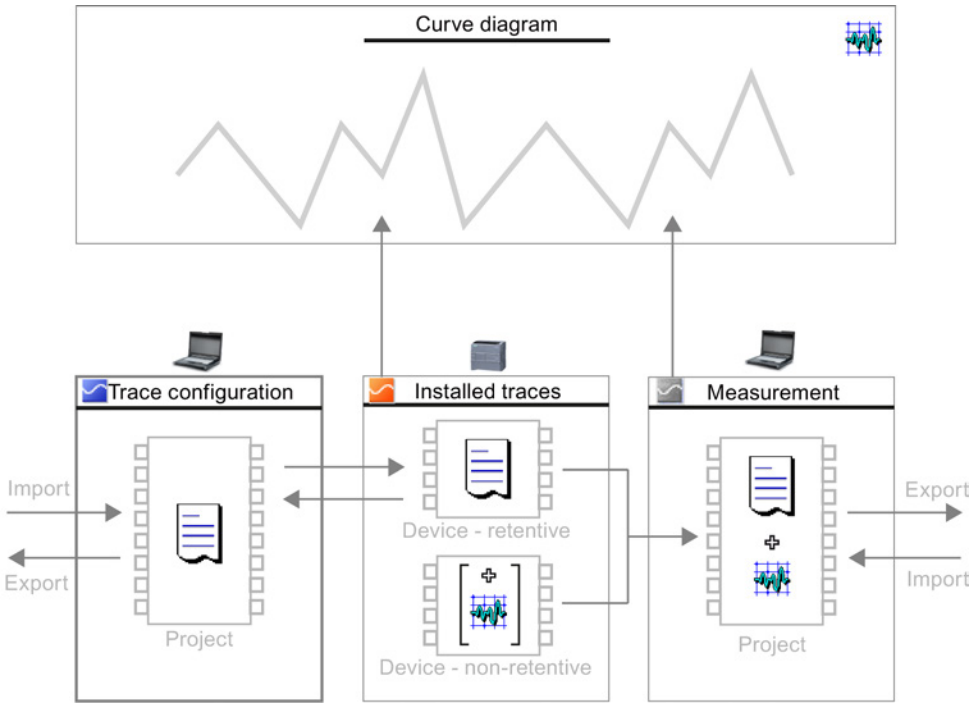
A measurement always consists of a trace configuration with an associated recording. If an installed trace contains a recording, it can be saved in the project as a measurement.

The recording of a measurement can be viewed offline.

1.4 Data storage

The trace handling and the curve diagram also enable the transfer of the trace configuration and the viewing of the recording.

The following figure is a schematic diagram of the data storage:



Note

Saving the trace configuration and measurement

You save the trace configuration and measurement with the project in the TIA Portal.

If you close the project without saving, the trace configurations and the measurements transferred to the project are discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

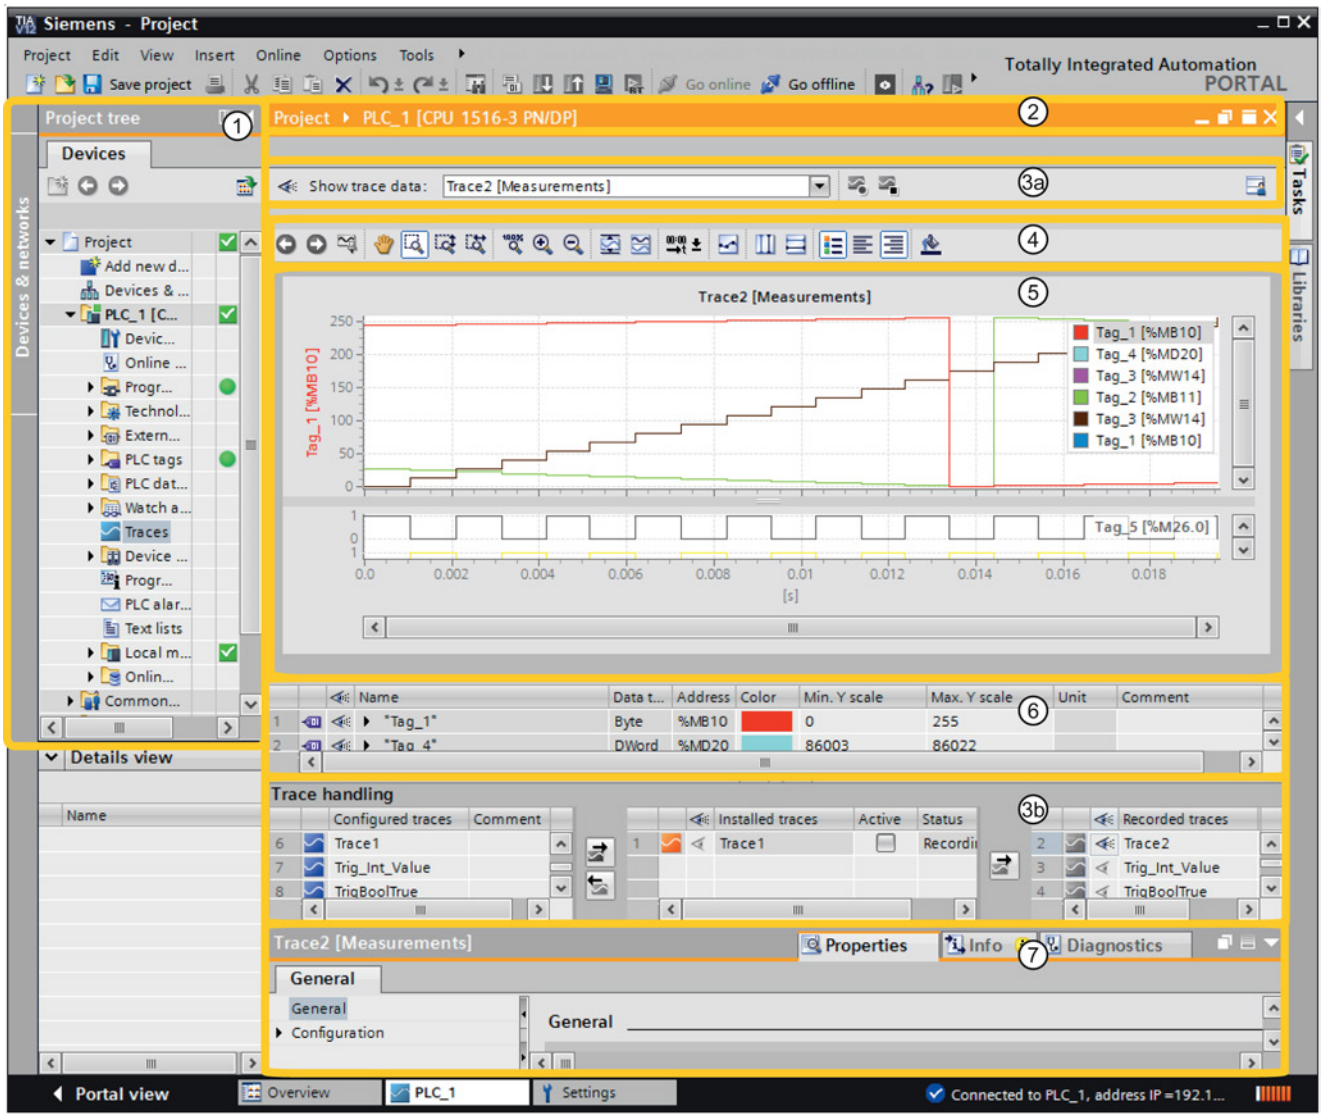
Software user interface

2

Display areas

The user interface of the trace and logic analyzer function consists of several areas.

The example in the figure below shows the division of the user interface in the TIA Portal:



1	Project navigator	
	Working area	
2		Title bar of the working area Shows the device to which the current display belongs.
3a		Toolbar of the trace handling (Page 18) Selection of recordings for display in the curve diagram and buttons for activation/deactivation of installed traces.
4		Toolbar of the curve diagram (Page 13) Tools for editing the measurement and for adapting the display in the curve diagram.
5		Curve diagram (Page 13) Display of the recorded values.
6		Signal table (Page 16) Signals of the shown measurement.
3b		Trace handling (Page 18) Creation of new trace configurations and the handling of the measurements.
	Device-specific area (see Devices (Page 41))	
7		Properties area in the Inspector window Configuration dialog boxes for the recording duration, trigger condition and signal selection.

2.1 Project navigator

If a device supports the trace and logic analyzer function, "Traces" is offered for selection in the project navigator below the device.

Double-clicking "Traces" opens the trace editor.

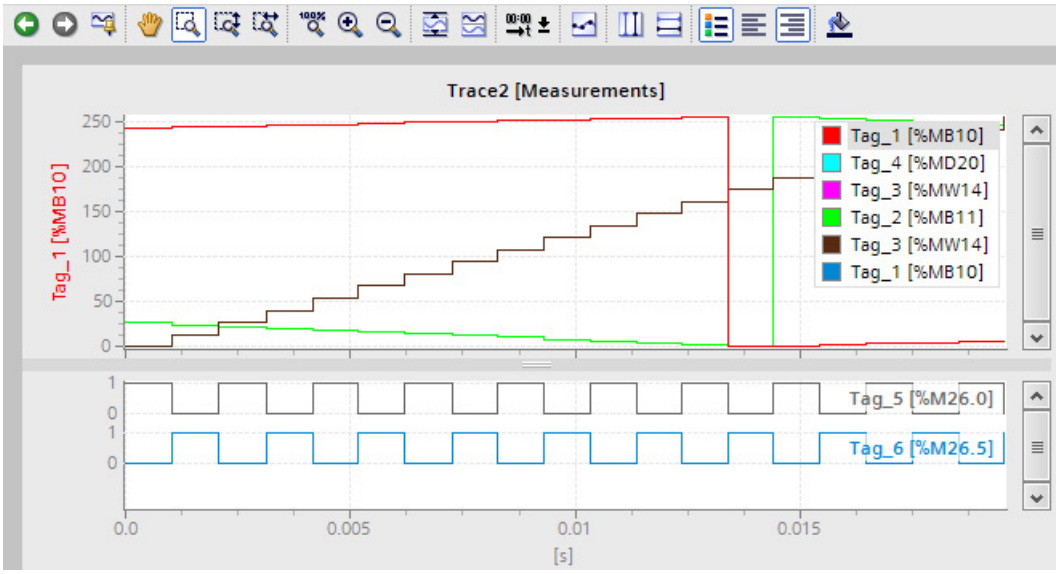
2.2 Working area

2.2.1 User interface - curve diagram

The curve diagram displays the selected signals of a recording. Bits are shown in the lower diagram as a bit track. You can adjust the display of the signals in the signal table (Page 16) and with the aid of the toolbar of the curve diagram.

Setting options and displays in the curve diagram

The following figure shows an example of the display in the TIA Portal:



The scale in the diagram applies to the selected (highlighted in gray) signal in the legend. The legend can be moved laterally with the mouse.

Shortcut menu commands

The following table shows the shortcut menu commands in the curve diagram:

Shortcut menu command	Description
"Save diagram as image"	Exports the current display as a bitmap.
"Copy image to clipboard"	Copies the current display to the clipboard.
"Center measurement cursors"	Positions the activated measurement cursors at a central point in the current display.
"Add to measurements" (only axis control panel and PID)	Adds the shown recording to the "Measurements" table.

Toolbar of the curve diagram

Tools are available for adapting the display via buttons.

The following table shows the functions of the buttons:

Icon	Function	Description
	Undo zoom	Undoes the zoom function executed last. If several zoom functions have been executed, they can be undone step-by-step.
	Redo zoom	Redoes the last undone zoom function. If several zoom functions have been undone, they can be redone step-by-step.
	Standard view	Uses the current view as standard for this recording. If the trace recording is shown again later, the standard view is restored.
	Move view	Moves the display with the mouse button pressed.
	Zoom selection	Selection of an arbitrary range with the mouse button pressed. The display is scaled to the range selection.
	Vertical zoom selection	Selection of a vertical range with the mouse button pressed. The display is scaled to the range selection.
	Horizontal zoom selection	Selection of a horizontal range with the mouse button pressed. The display is scaled to the range selection.
	Display all	Scales the display of the available data so that the entire time range and all values are displayed. **Note** The dynamic progress indicator of a running trace is stopped when a zoom function is activated. This button activates the progress indicator again.
	Zoom in	Enlargement of the display. The ranges of the time axis and value axis are reduced every time the button is clicked. The curves are displayed larger.
	Zoom out	Reduction of the display. The ranges of the time axis and value axis are increased every time the button is clicked. The curves are displayed smaller.
	Scale automatically	Scaling of the display so that all values are displayed for the currently displayed time range.
	Arrange in tracks	Arranges signals one beneath the other without overlaps.
	Unit changeover of the time axis	Changeover of the unit between time and cycles.
	Display samples	The samples are displayed as small circles on the curves.
	Display vertical measurement cursors	Display of the vertical measurement cursors. The vertical position of the two measurement cursors can be moved with the mouse. The associated measured values and the difference of the measurement cursors corresponding to the position are shown in the signal table.

Icon	Function	Description
	Display horizontal measurement cursors	Display of the horizontal measurement cursors. The horizontal position of the two measurement cursors can be moved with the mouse.
	Display chart legend	Display or hiding of the chart legend in the curve diagram.
	Align the chart legend to the left	Display of the chart legend on the left side of the curve diagram.
	Align the chart legend to the right	Display of the chart legend on the right side of the curve diagram.
	Change background color	Changeover between various background colors.

2.2.2 User interface - signal table

The signal table lists the signals of the selected measurement and provides setting options for some properties. If recording data of "Installed traces" is displayed and the settings are changed in the signal table, these settings are retained until there is a change to the offline mode. If the "Installed trace" is added to the measurements, the current settings of the signal table are saved in the measurement.

The signals can be sorted using drag-and-drop. The bits of a signal can be resorted within a signal.

Setting options and displays in the signal table

The following figure shows an example of the display in the TIA Portal:

			Name	Data type	Address	Color	Min. Y scale	Max. Y scale	Y(t1)	Y(t2)	DeltaY	Unit	Comment
1			"Tag_1"	Byte	%MB10		1	20	7	13	6		
2			"Tag_4"	DWord	%MD20		1	20	7	13	6		
3			"Tag_3"	Word	%MW...		3	60	21	39	18		

The following table shows the settings and displays of the recorded signals:

Column	Description
	Static display of the signal icon
	Selection for the display in the curve diagram The point indicates that at least one bit has been selected for display as bit track for the signal in the bit selection.
"Name"	Display of the signal name A click on the name of a displayed signal updates the scale in the curve diagram.
	Open bit selection Individual bits can also be selected for the following data types for display as a bit track in the lower curve diagram. • Byte, Word, DWord, LWord • SInt, USInt, Int, UInt, DInt, UDInt, LInt, ULInt Example of an opened bit selection for the DWORD data type:  Select or deselect the relevant bit for display by clicking the icon.
"Data type"	Display of the data type
"Address"	Display of the address (not for symbolic tags)
"Color"	Display and setting option for the color of the signal
"Min. Y-scale"	Display or input of the minimum value for the scaling of the signal
"Max. Y-scale"	Display or input of the maximum value for the scaling of the signal
"Signal group"	Display or input of the signal group name for one signal group The Y-scales are scaled identically for all signals of one signal group. Enter an identical signal group name for those signals that are to be scaled identically. Signals can be removed from the signal group by deleting the signal group name. The signal groups can be saved via the function "Use current view as standard" (button).
"Y(t1)"	Display of the value at the position of the first measurement cursor
"Y(t2)"	Display of the value at the position of the second measurement cursor
"ΔY"	Display of the value difference between the first and the second measurement cursor
"Unit"	Display of the unit (e.g. for technology objects)
"Comment"	Display and input option for a comment about the signal

Shortcut menu commands

The following table shows the shortcut menu commands of the signal table:

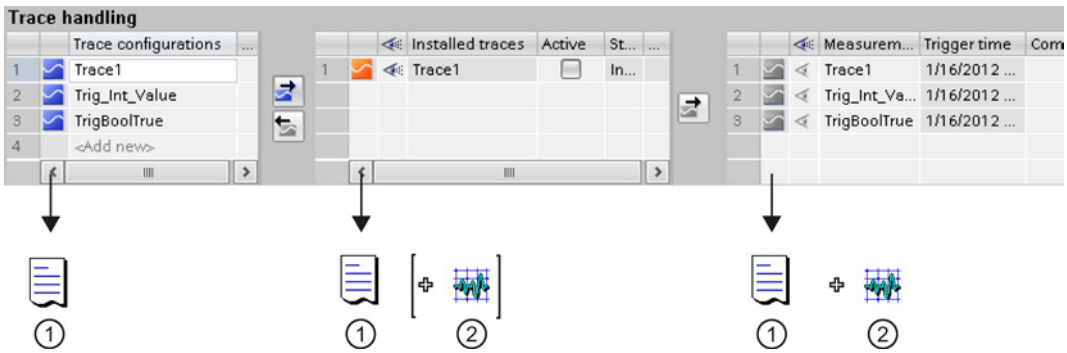
Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Show/hide signal"	Shows/hides the signal in the curve diagram.
"Bring to foreground"	Displays the selected signal in the foreground. The other signals are hidden.

2.2.3 User interface - trace management

The trace handling enables the configuration and handling of trace configurations.

Setting options and displays in the trace handling

The following figure shows an example of the display in the TIA Portal:



① Trace configuration
② Recording (recorded values)

Toolbar of the trace handling

A recording can be selected for display via a drop-down list and buttons, and activated or deactivated.

The example in the figure below shows the toolbar of the trace handling

The following table describes the functions of the buttons:

Icon	Description
	Static icon display of the drop-down list selection in the curve diagram
	Selection of an "Installed trace" or a "Measurement" for display in the curve diagram
	Activation of the recording The button is available for "Installed traces".
	Deactivation of the recording The button is available for "Installed traces".

"Trace configurations" table

The table contains all the trace configurations of the project that can be transferred to the device. Each trace configuration contains the tags to be recorded and the required recording settings. The data is displayed in offline and online mode.

The following table shows the settings and displays:

Column	Icon	Description
-		Display of the icon for the trace configuration Incorrect trace configurations are shown with a red border and cannot be transferred to the device. Check the configuration in the Inspector window. Double-clicking the icon brings the Inspector window with the properties to the foreground.
"Trace configuration"	-	Name of the trace configuration. The name can be changed after double-clicking the field.
"Comment"	-	Input field for a comment.

Shortcut menu commands

The following table shows the shortcut menu commands of the "Trace configurations" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.
"Transfer trace configuration to device"	Transfers the trace configuration selected in the "Trace configurations" table to the device. The button is active when all the required settings in the device-specific configuration have been configured correctly in the Inspector window and there is an online connection.
"Export trace configuration"	Exports a trace configuration as a file with the "*.ttcfgx" file extension. For compatibility reasons, the "*.ttcfg" file extension will be supported in V12, but does not contain any information about the device family.
"Import trace configuration"	Imports a trace configuration from a file.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

"Installed traces" table

The table contains the trace configurations already transferred to the device and their current status. The data is displayed in the online mode.

The following table shows the settings and displays:

Column	Icon	Description
-		Static display of the online icon Double-clicking the icon brings the Inspector window with the device-specific properties to the foreground.
		Selection for the display in the curve diagram A click on the icon shows/hides the recording in the curve diagram.
"Installed traces"	-	Name of the trace configuration.
"Active"		Activation of the recording and feedback of the status. The checkbox is reset at the end of the recording. If the recording of an installed trace is repeated, then the settings relevant for the display (curve diagram and signal table) are also retained for the new recording.
"Status"	-	Status display of the trace configuration The following states are possible: • "Installing" • "Waiting for trigger" • "Recording" • "Recording completed" • "Aborted" • "Fault"
"Comment"	-	Display of the trace configuration comment

Shortcut menu commands

The following table shows the shortcut menu commands of the "Installed traces" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Cannot be selected.
"Delete"	Deletes the selected lines from the table.
"Rename"	Cannot be selected.
"Add to trace configurations"	Transfers the installed trace configuration to the "Trace configurations" table.
"Add to measurements"	Adds the selected "Installed trace" to the "Measurements" table. **Note** The "Installed trace" data can be saved as a measurement after being displayed once in the curve diagram. The recording data is loaded from the device for the display.
"Activate"	Activates the recording and shows the status in the table
"Show/hide in curve diagram"	Shows/hides the recording in the curve diagram.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

"Measurements" table

The table contains the trace configurations with recordings. The data is displayed in offline and online mode.

Measurements can also be exported and imported, see Exporting and importing measurements (Page 37).

The following table shows the settings and displays:

Column	Icon	Description
-		Static display of the icon for a measurement Double-clicking the icon brings the Inspector window with the device-specific properties to the foreground.
		Selection for the display in the curve diagram A click on the icon shows/hides the recording in the curve diagram.
"Measurements"	-	Name of the measurement The name can be changed after double-clicking the field.
"Trigger time"	-	The meaning of the time stamp depends on the device Examples: • SIMATIC S7-1200/1500 CPUs The absolute time of the controller is entered at the start of the recording. • SINAMICS G120 The transfer time is entered with the transfer of the trace configuration to the device.
"Comment"	-	Input field for a comment.

Shortcut menu commands

The following table shows the shortcut menu commands of the "Measurements" table when a line is selected:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.
"Add to trace configurations"	Transfers the trace configuration of the measurement to the "Trace configurations" table.
"Show/hide in curve diagram"	Shows/hides the recording in the curve diagram.
"Export measurement"	Exports a measurement as a file with the "*.ttrecx" or "*.csv" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
"Import measurement"	Imports a measurement from a file with the "*.ttrecx" file extension. For compatibility reasons, the "*.ttrec" file extension will be supported in V12, but does not contain any information about the device family.
"Properties"	Brings the Inspector window with the device-specific properties to the foreground.

Buttons

The following table shows the functions available via buttons:

Icon	Description
	Button to transfer a selected trace configuration to the device The selected trace configuration in the "Trace configurations" table is transferred to the device. The button is active when all the required settings in the configuration have been correctly configured in the Inspector window and there is an online connection.
	Button to transfer a selected trace configuration from the device The trace configuration selected in the "Installed traces" table is transferred from the device to the "Trace configurations" table.
	Button to transfer a selected measurement from the device to the project The selection in the "Installed traces" table is added to the "Measurements" table. **Note for S7 CPUs** In order to be able to save the "Installed trace" data as a measurement, it must first have been displayed once in the curve diagram. The recording data is loaded from the device when displayed.

2.3 Device-specific area

The device-specific area enables the trace configuration.

The signals to be recorded and the trigger condition are specified here. These and other configuration options are described in the device-specific part (Page 41) for the individual devices.

Operation

3

3.1 Quick start

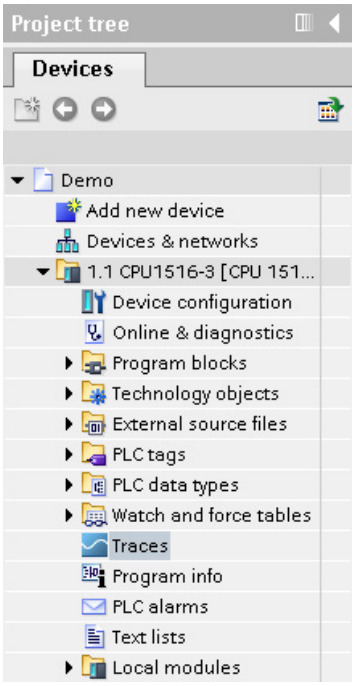
This description shows the steps for a recording of the S7-1500 CPU as an example. The displayed settings can differ depending on the device.

Requirement

A device is configured that supports the trace and logic analyzer function.

Calling the trace editor

The following figure shows the project navigator with "Traces" below the device:

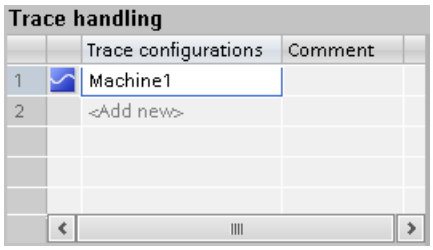


Procedure:

1. Open the trace editor by double-clicking the "Traces" entry.

Creating a trace configuration

The following figure shows the "Trace configurations" table:

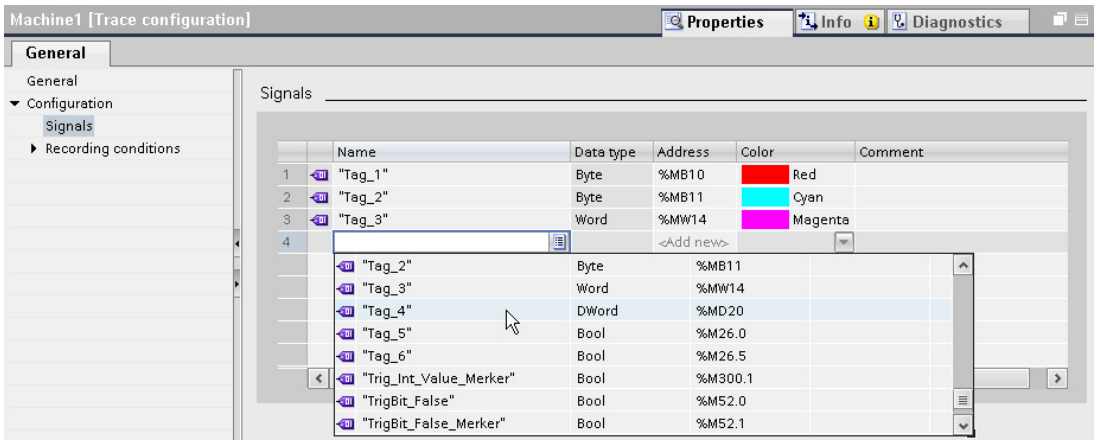


Procedure:

1. Enter the name of the trace configuration in the "Trace configurations" table.

Selecting signals

The following figure shows the configuration of the signals:



Procedure:

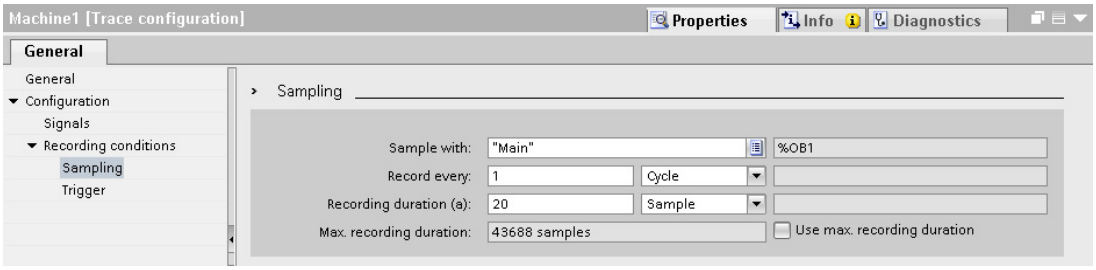
1. Select the signals to be recorded in the "Signals" area of the Inspector window.

Or:

1. Drag a signal to the table using drag-and-drop.

Configuring the recording cycle

The following figure shows the configuration of the sampling:

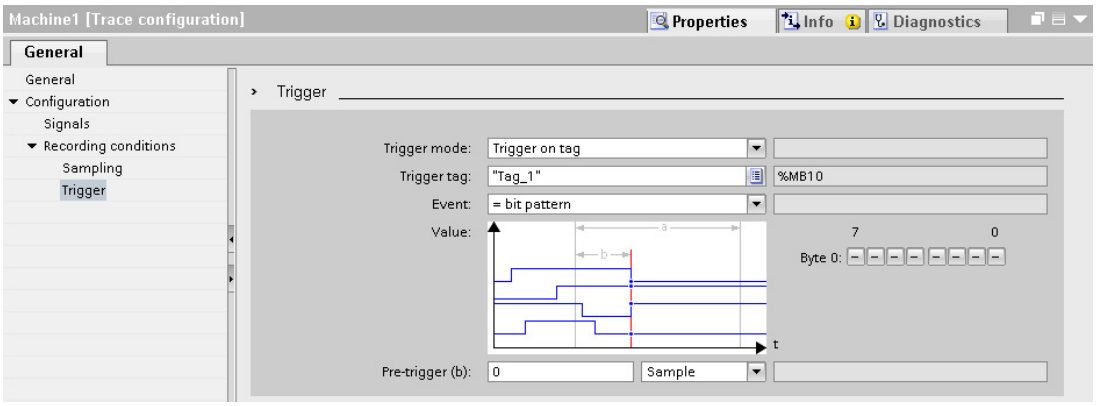


Procedure:

1. Configure the sampling.

Configuring the trigger

The following figure shows the configuration of the trigger:

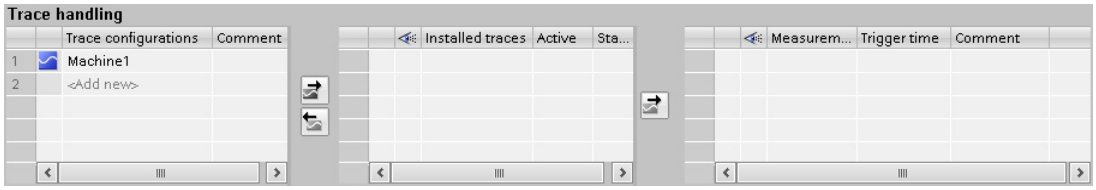


Procedure:

1. Configure the trigger mode and the condition for the selected trigger.

Transferring the trace configuration to the device

The following figure shows the trace handling in online mode:



Procedure:

1. Check whether the configuration is correct based on the icon in the "Trace configurations" table.

   The icon indicates a correct trace configuration.

   The icon indicates a faulty trace configuration.

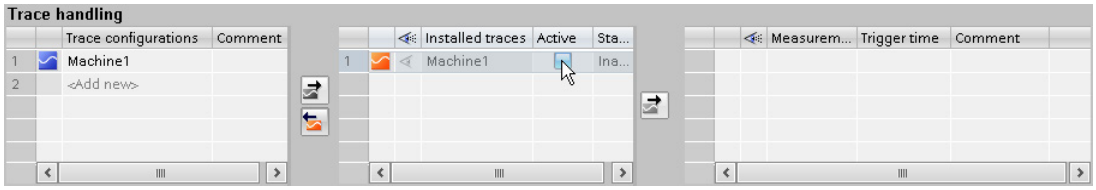
   Only correct trace configurations can be transferred to the device.

2. Establish an online connection to the device.

3. Select the trace configuration in the "Trace configurations" table and transfer it to the device with the button.

Activating a recording

The following figure shows the trace handling with an installed trace configuration:

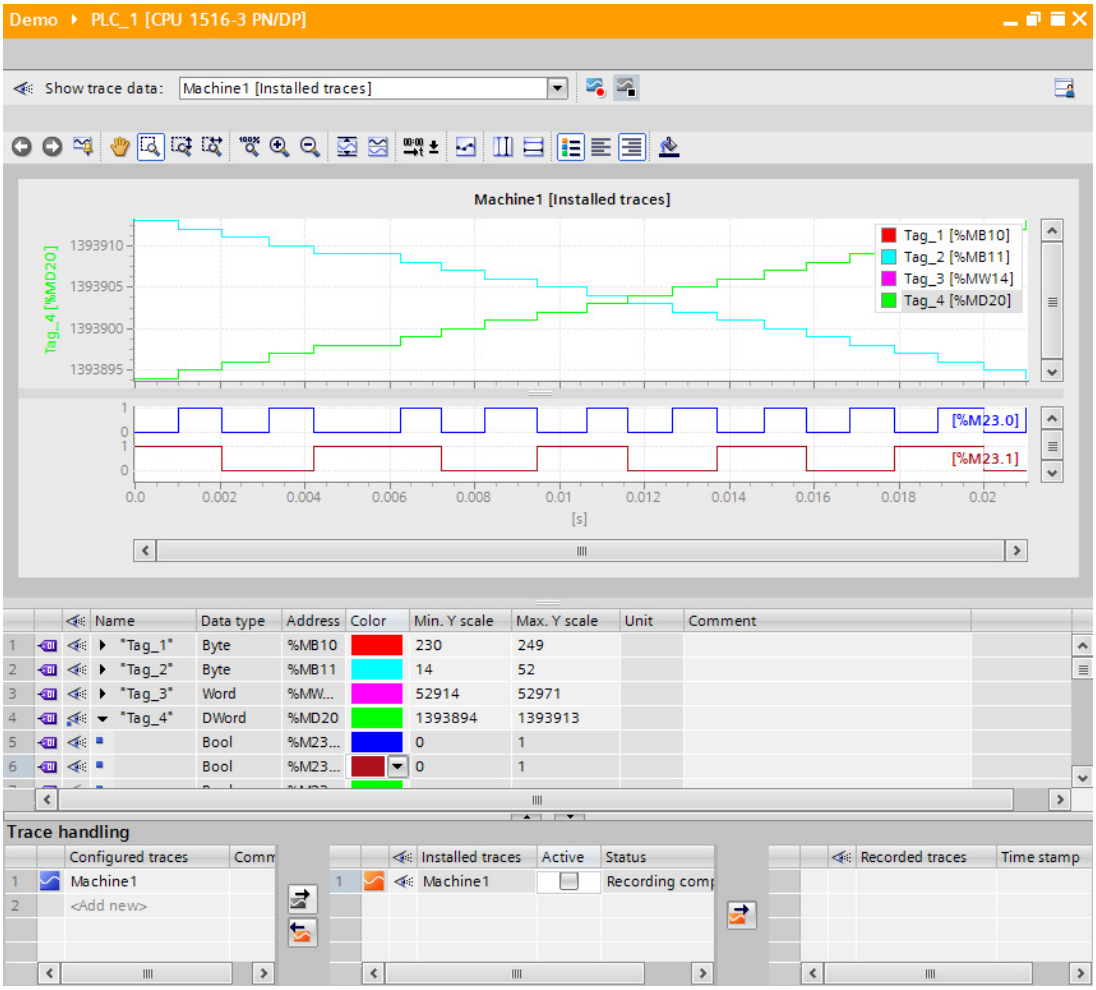


Procedure:

1. Click the checkbox in the "Active" column in the "Installed traces" table.

Displaying the recording

The following figure shows the curve diagram with the recording of the "Installed trace":



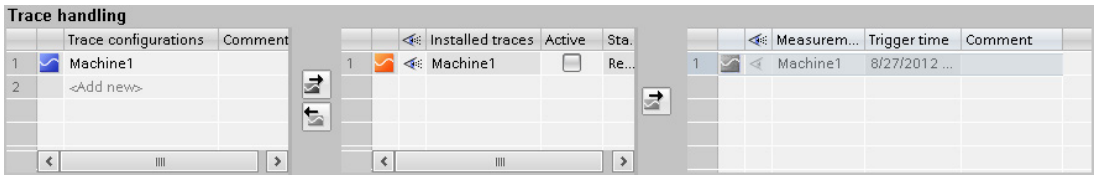
Procedure:

1. Wait until the "Recording" or "Recording completed" status is displayed in the "Installed traces" table.
2. Click the icon in the "Installed traces" table to display the recording in the curve diagram.
3. Click the icon of a signal in the signal table.

   The individual bits of the signal are offered for display as a bit track.
4. In the signal table, select or deselect the individual signals and bits for display with the icon.

Saving the measurement in the project

The following figure shows the measurement saved in the project:



Procedure:

1. Select the measurement in the "Installed traces" table and transfer it to the project with the button.

3.2 Using the trace function - overview

Requirement

A device is configured in the TIA Portal that supports the trace and logic analyzer function and to which an online connection has been established.

Procedure

The following table shows a procedural overview with typical steps when working with the trace and logic analyzer function.

Step	Description
1	Calling the trace editor (Page 33)
2	Configuring the trace (Page 33)
3	Transferring the trace configuration to the device (Page 34)
4	Activating/deactivating an installed trace (Page 35)
5	Monitoring the recording (Page 36)
6	Saving measurements in the project (Page 36)
7	Displaying the recording (Page 36)

3.3 Calling the trace editor

A trace editor can be opened for each device in the project navigator.

The following instructions describe how you call the trace editor in the work area of the TIA Portal.

Requirement

A device is configured that supports the trace and logic analyzer function.

Procedure

To call the trace editor, proceed as follows:

1. In the project navigator, double-click the device.

   The device folder opens.

2. Double-click "Traces".

3.4 Trace handling

3.4.1 Configuring the trace

Requirement

The trace editor is open.

Creating and deleting the trace configuration

To create a new trace configuration, proceed as follows:

1. Click the "<Add>" entry in the "Trace configurations" table in the Trace handling (Page 18).
2. Enter the name for the trace configuration.

   The new trace configuration is created.

To delete a trace configuration, proceed as follows:

1. Right-click a trace configuration in the "Trace configurations" table and select the shortcut menu command "Delete".

   The trace configuration is deleted.

Configuring the trace

In the configuration, you specify the recording and trigger conditions and select the signals to be recorded.

See Section "Configuration" below the respective device (Page 41).

Note

Saving the trace configuration

You save the trace configuration with the project in the TIA Portal.

If you close the project without saving, the configuration is discarded. The trace editor can be closed and reopened without loss of data until the project is closed.

3.4.2 Transferring the trace configuration to the device

Requirement

- A valid trace configuration is located in the "Trace configurations" table.
- The maximum number of "Installed traces" has not been reached yet.
- There is an online connection to the device.

Procedure

To transfer a trace configuration to the device, proceed as follows:

1. Select a trace configuration in the "Trace configurations" table.
2. Click the button to transfer the trace configuration to the device.

Result

The trace configuration is transferred to the device and displayed in the "Installed traces" table.

3.4.3 Activating/deactivating an installed trace

Requirement

A trace configuration is installed and there is an online connection to the device.

Activating an installed trace

To activate the recording for an installed trace, proceed as follows:

1. Activate the checkbox of the "Active" column in the "Installed traces" table.

   The installed trace is activated and starts the recording according to the configured trigger condition. The trigger condition is device-specific and described in Section "Configuration" below the respective device (Page 41).

Note

When a recording is restarted, the previously recorded values are lost.

To save the recorded values, save the measurement in the project (Page 36) before you activate the recording again.

Deactivating an installed trace

To deactivate an activated installed trace, proceed as follows:

1. Deactivate the checkbox of the "Active" column in the "Installed traces" table.

   The installed trace is deactivated.

3.4.4 Displaying the recording

Requirement

A trace configuration with recording is in the device and there is an online connection to the device or there is an entry in the "Measurements" table.

Procedure

To display the recording, proceed as follows:

1. Select an entry in the "Installed traces" table.
2. Click in the column for the selected entry.

Or:

1. Select an entry in the "Measurements" table.
2. Click in the column for the selected entry.

Result

The recording is displayed in the curve diagram and the signal table.

3.4.5 Saving measurements in the project

Requirement

A trace configuration with recording is installed and there is an online connection to the device.

The "Installed trace" data must have been displayed at least once in the curve diagram. The recording data is loaded from the device for the display.

Procedure

To save a recording in the project, proceed as follows:

1. Click an entry in the "Installed traces" table in the trace handling.
2. Click the button to transfer the selected entry.

   The selected entry in the "Installed traces" table is added to the "Measurements" table.
3. Save the project in the TIA Portal.

3.4.6 Exporting and importing measurements

Requirement

There is at least one measurement in the "Measurements" table.

Exporting measurements

To export a measurement, proceed as follows:

1. Right-click an entry in the "Measurements" table and select the shortcut menu command "Export measurement".
2. Select a folder, a file name and a data type to save the measurement.
3. Click the "Save" button.

Importing measurements

To import a measurement, proceed as follows:

1. Right-click in the "Measurements" table and select the shortcut menu command "Import measurement".
2. Select the file of the "*.ttrecx" file type with the measurement to be imported.
3. Click the "Open" button.

   The imported measurement is displayed with the file name in the "Measurements" table.

3.4.7 Transferring the trace configuration from the device to the project

Requirement

A trace configuration is installed and there is an online connection to the device.

Procedure

To transfer a trace configuration to the project, proceed as follows:

1. Select an entry in the "Installed traces" table.
2. Click the button to transfer the trace configuration from the device.

Result

The configuration of the "installed trace" is transferred to the "Trace configurations" table.

3.4.8 Deleting installed traces

Requirement

A trace is installed and there is an online connection to the device.

Deleting an installed trace

To delete an installed trace, proceed as follows:

1. Select one or more lines to be deleted in the "Installed traces" table.
2. Press <Del> to delete the "Installed traces".

3.5 Signal table

3.5.1 Use of the signal table

The signal table shows the signals of an installed trace or a measurement. You can show or hide individual signals for the display in the table and adapt the properties for the display. Individual bits can be selected for some data types and displayed as a bit track.

The following operating instructions describe the operation of the signal table.

Requirement

- An entry is selected in the column in the "Installed traces" or "Measurements" table.
- For the display of individual bits as a bit track:
  At least one recorded signal supports the display as a bit track.

Selecting individual signals in the signal table and changing the format

To adapt the display to suit your requirements, proceed as follows:

1. Click the icon of the respective signal in the column to select or deselect it for the display.
2. Click in the "Color" column for the respective signal to change the default color of the signal.
3. Click the "Bring to foreground" entry in the shortcut menu of a signal to display it in the foreground.

Selecting individual bits in the signal table for display as a bit track

To display individual bits as a bit track in the lower curve diagram, proceed as follows:

1. Click the icon of a signal in the signal table.
2. Click the icon in the opened bit selection of the signal to select or deselect individual bits for the display.

3.6 Curve diagram

3.6.1 Use of the curve diagram

The curve diagram shows the signals of a recording selected in the signal table. Select the recording in the "Installed traces" or "Measurements" table of the trace handling.

The display area can be zoomed as required. Measurement cursors can be used to select individual values for display in the signal table.

The following operating instructions describe the use of the measurement cursors.

Requirement

A recording has been selected for display.

Evaluation of a certain instant of a recording

To display the values for a specific sample, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required position in the recording.

   The values of the signals are displayed in the signal table. The time or sample for the measurement cursors is displayed in the lower area of the curve diagram.

Evaluation of the difference between two samples

To display the difference, proceed as follows:

1. Display the vertical measurement cursors via the button.
2. Move both measurement cursors with the mouse to the required samples in the recording.

   The values of the signals and the difference are displayed in the signal table. The time or sample for the measurement cursors is displayed in the lower area of the curve diagram.

Using horizontal measurement cursors

To check whether a certain value has been reached, proceed as follows:

1. Display the horizontal measurement cursors via the button.
2. Move a measurement cursor with the mouse to the required value of the recording.

   The values of the measurement cursor for the selected signal are displayed in the lower area of the curve diagram.

3.6.2 Printing a recording

The curve diagram supports the saving of the display as a bitmap and the copying of the display to the clipboard. Also use these functions (Page 13) for printing.

4 Devices

4.1 S7-1200/1500 CPUs

4.1.1 Recordable variables

Device-dependent recording of tags

The following list shows the operand areas from which tags can be recorded:

- Process image input
- Process image output
- Bit memory
- Data blocks

Data types

Elementary data types can be recorded. The availability of the individual data types depends on the device used:

The following table lists the elementary data types:

Data types	Note
Binary numbers	
BOOL	-
Bit strings	
BYTE	-
WORD	-
DWORD	-
LWORD	Symbolic name required
Integers	
SINT	-
USINT	-
INT	-
UINT	-
DINT	-
UDINT	-
LINT	Symbolic name required
ULINT	Symbolic name required
Floating-point numbers	
REAL	-
LREAL	Symbolic name required

4.1.2 Lifetime of the installed trace configuration and recorded values

Installed trace configurations are retained after POWER OFF. The recording is activated again after the restart of the CPU.

Recorded values are lost during the restart.

Note

Downloading a configuration to the device in the "STOP" operating state

Note that after downloading a configuration in the "STOP" operating state, you must check the installed traces and, if required, reactivate them or transfer them again.

Note

If signals or trigger tags that affect the address are changed, the trace configuration must also be transferred to the device again.

This is the case for example, when a data block is shortened or extended or the data type is changed.

4.1.3 Recording levels

The following list shows the execution levels that can be selected for the recording cycle:

- Program cycle - OB 1
- Time-of-day interrupt - OB 1x
- Time-delay interrupt - OB 2x
- Watchdog interrupt - OB 3x
- Synchronized processing cycles - OB 6x, not OB 60
- Servo task - OB 91 (S7-1500)
- IPO - OB 92 (S7-1500)

Note

The measured values are recorded at the end of the OB after the processing of the user program.

4.1.4 Quantity structure

The following table shows the maximum quantity structure that can be recorded with the trace and logic analyzer function:

Device	Maximum number of "Installed traces"	Maximum number of signals per trace configuration
S7-1200 (as of firmware version V4.0)	2	16
S7-1500	At least 4 (depending on the CPU type)	16

Example of S7-1516

- Maximum of 3854 samples for 16 long tags
- Maximum of 21844 samples for 16 binary tags
- Maximum of 58250 samples for 1 binary tag

Refer to respective manual for more detailed information.

4.1.5 CPU load through trace recording

A trace recording increases the runtime of the respective recording level that can result in an execution level overflow with high utilization of the CPU.

Remedy

- **Change the trace configuration**

  1) Configure fewer tags and signals.

  2) Then increase the number of tags and signals up to the maximum number of signals step-by-step without an execution level overflow.

- **Select a slower recording level**

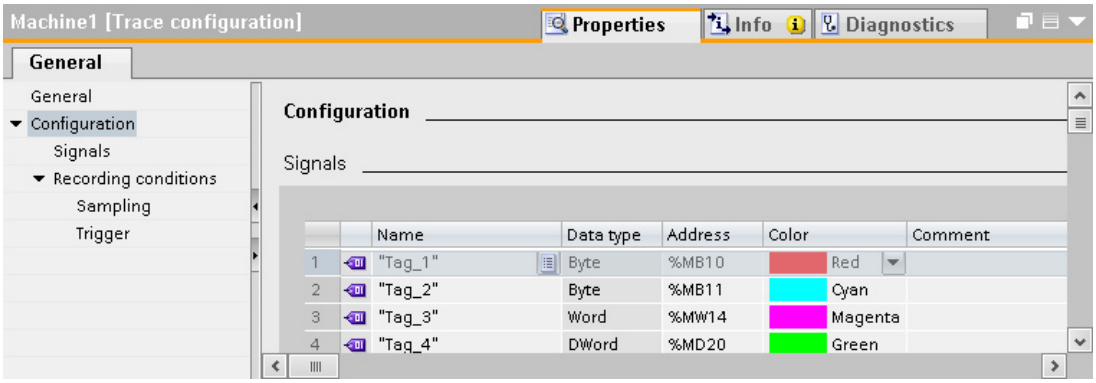
4.1.6 Software user interface of the device-specific area

4.1.6.1 Structure of the user interface

Display areas in the Properties window of the Inspector

The settings options differ depending on the configured device.

The following figure shows an example of the display in the TIA Portal:



The area navigation provides the following entries for selection:

- General
- Configuration
  - Signals (Page 46)
  - Recording conditions (Page 48)

Display of the properties of a trace configuration

The trace configuration is selected in the trace handling:

- Selection in the "Trace configurations" table

  The properties are displayed in the Inspector window and can be changed.
- Selection in the the "Installed traces" table or "Measurements" table

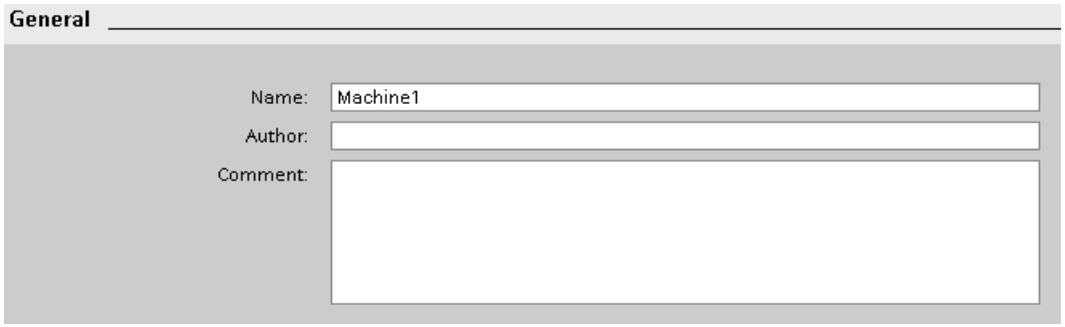
  The properties are displayed write-protected in the Inspector window.

4.1.6.2 User interface - General

The "General" area shows the name of the trace configuration and input fields for the author and a comment.

Input options and displays in General

The following figure shows an example of the display in the TIA Portal:



The following table shows the input fields and displays:

Column	Icon	Description
"Name"	-	Name of the trace configuration
"Author"	-	Author of the trace configuration
"Comment"	-	Input field for a comment

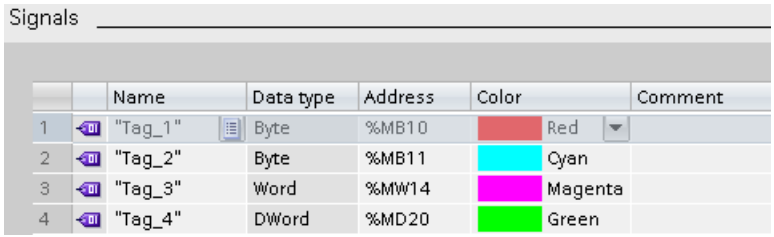
4.1.6.3 User interface - Signals

The "Signals" area shows a table in which the signals to be recorded are configured for the selected trace configuration.

Signals can also be inserted in the table using drag-and-drop.
The signals can be sorted using drag-and-drop.

Setting options and displays in "Signals"

The following figure shows an example of the display in the TIA Portal:



The following table shows the settings and displays:

Column	Icon	Description
		Display of the signal icon for a selected signal.
"Name"	-	Input field for the name or address of the signal. **Examples:** • M0.0 • DB1.DBW3 • "Data_block_1".pressure
-		Button to open the signal selection table. The button is displayed when the table line is selected. Clicking the icon opens a table which offers possible signals for selection. The selected signal is displayed in the input field.
"Data type"	-	Text field with display of the data type for the signal.
"Address"	-	Input field for the address of the signal. With purely symbolic signals the field remains empty.
"Color"	-	Text field for display and selection of the color. Click the selected field to display the signal color. Click the signal color to open the color selection dialog.
"Comment"		Input field for a comment on the signal.

Shortcut menu commands

The following table shows the shortcut menu commands of the table:

Shortcut menu command	Description
"Cut"	Cannot be selected.
"Copy"	Copies the contents of the selected lines to the clipboard.
"Paste"	Pastes the contents of the clipboard to the selected line. The existing contents are overwritten.
"Delete"	Deletes the selected lines from the table or deletes the name of the selected cell.
"Rename"	Switches the selected cell to the editing mode.

4.1.6.4 Recording conditions

Supported data types

The following table shows the supported data types for the trigger tag:

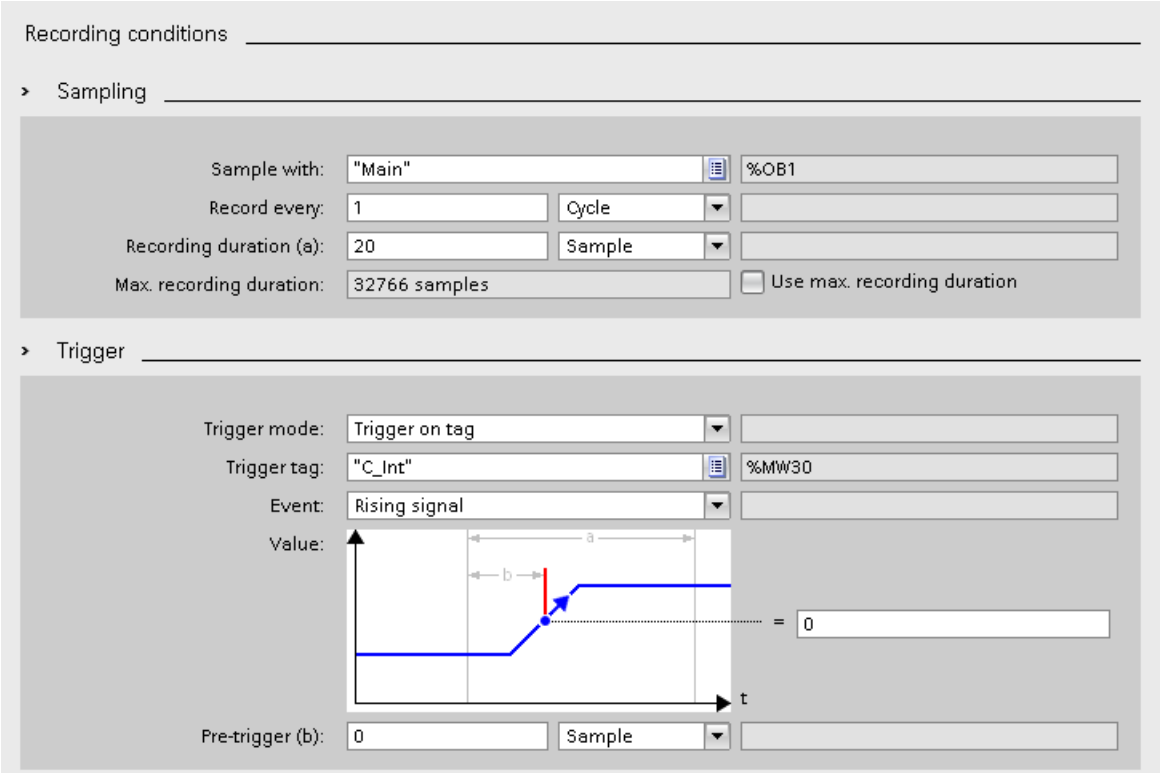
Memory requirement and format of the number	Data type
1 byte	BOOL
8-bit integers	SINT, USINT, BYTE
16-bit integers	INT, UINT, WORD
32-bit integers	DINT, UDINT, DWORD
64-bit integers	LINT, ULINT, LWORD (device-dependent)
32-bit floating-point numbers	REAL
64-bit floating-point numbers	LREAL

User interface - Recording conditions

The "Recording conditions" area shows the trigger condition for the selected trace configuration and in which cycle, how fast and how long the recording is made. The configuration is only possible if the trace configuration has been selected in the "Trace configurations" table of the trace handling.

Setting options and displays in "Recording conditions"

The following figure shows an example of the display in the TIA Portal:



Setting/display		Description
"Recording time"		
	Drop-down list	Selection of the recording time. See Recording levels (Page 43)
	Text field	Detailed information on the selected recording time.
"Record every"		
	Input field	Input of the reduction in relation to the cycles.
	Drop-down list	Selection of the reduction factor. The following settings are possible: • "Cycle"
	Text field	Display of the sampling time, taking into account the configured reduction.

Setting/display		Description
"Recording duration"		
	Input field	Input of the recording duration in relation to the samples. If the "Recording duration = max. recording duration" checkbox is activated, entries are overwritten by the value displayed in "Max. recording duration".
	Drop-down list	Select the time unit for the recording duration. The following settings are possible: • "Samples"
	Text field	Displays the calculated recording duration.
"Max. recording duration"		
	Text field	Displays the calculated maximum recording duration. The "Max. recording duration" depends on how many signals are recorded and the data type of these signals.
	"Use max. recording duration"	Set the recording duration to the maximum value. When the checkbox is activated, the recording duration is set to the maximum possible recording duration. The set reduction in the "Record every" input field is taken into account. The recording duration is also adapted when additional signals are added.
"Trigger mode"		Selection of the trigger mode.
	Drop-down list	The following settings are possible: • "Record immediately" The recording is made immediately after the device is activated. • "Trigger on tag" The recording is made as soon as the installed trace is activated and the configured trigger condition is fulfilled.
	Text field	Display of the trigger type.
"Trigger tag"		The "Trigger tag" specifies a signal that is used to trigger the recording.
	Input field	Enter a signal. **Examples:** • M0.0 • DB1.DBW3 • "DataBlock_1".Temperature
		Opens the signal selection table. Clicking the icon opens a table which offers possible signals for selection as trigger tag. The selected signal is displayed in the input field.
	Text field	Display of the trigger tag address.

Setting/display		Description
"Event"		The events that can be used on this trigger tag are offered for selection according to the data type of the trigger tag. The event can only be configured when a valid signal has been entered as trigger tag.
	Drop-down list	Event selection for which the trigger tag is checked. The entries in the drop-down list are described in Section Trigger event (Page 51).
	Text field	Display of the comparison type.
"Value"		Configuration of the selected event. The configuration options differ depending on the format of the trigger tag and the selected event. See Trigger event (Page 51).
"Pre-trigger"		"Pre-trigger" defines the time during which the signals are already recorded before the actual trigger condition is fulfilled. If the trigger event occurs immediately or shortly after the activation of the recording, this may result in a shorter recording duration. Example of "recording duration" = 20 samples and "pre-trigger" = 5 samples: • Trigger event occurs 50 samples after activation of the recording Actual recording duration = 20 samples • Trigger event occurs 2 samples after activation of the recording Actual recording duration = 17 samples
	Input field	Input of the duration in relation to the selection in the drop-down list.
	Drop-down list	Select the time unit The following settings are possible: • "Samples"
	Text field	Displays the calculated "pre-trigger" period

Trigger event

Depending on the selection in the drop-down list box, the further settings differ for the "event".

The individual events are described below.

"=TRUE"

Supported data types: Bit (Page 48)

The recording starts when the state of the trigger is TRUE.

"=FALSE"

Supported data types: Bit (Page 48)

The recording starts when the state of the trigger is FALSE.

"Rising edge"

Supported data types: Bit (Page 48)

The recording is started when the trigger state changes from FALSE to TRUE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Rising signal"

Supported data types: Integers and floating-point numbers (Page 48)

The recording is started when the rising value of the trigger reaches or exceeds the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling edge"

Supported data types: Bit (Page 48)

The recording is started when the trigger state changes from TRUE to FALSE.
After activation of the installed trace, at least two cycles are required to identify the edge.

"Falling signal"

Supported data types: Integers and floating-point numbers (Page 48)

The recording is started when the falling value of the trigger reaches or falls below the value configured for this event.
After activation of the installed trace, at least two cycles are required to identify the edge.

"In the range"

Supported data types: Integers and floating-point numbers (Page 48)

The recording starts as soon as the value of the trigger is in the value range configured for this event.

"Outside of the range"

Supported data types: Integers and floating-point numbers (Page 48)

The recording starts as soon as the value of the trigger is outside the value range configured for this event.

"= value"

Supported data types: Integers (Page 48)

The recording starts when the value of the trigger is equal to the value configured for this event.

"<> value"

Supported data types: Integers (Page 48)

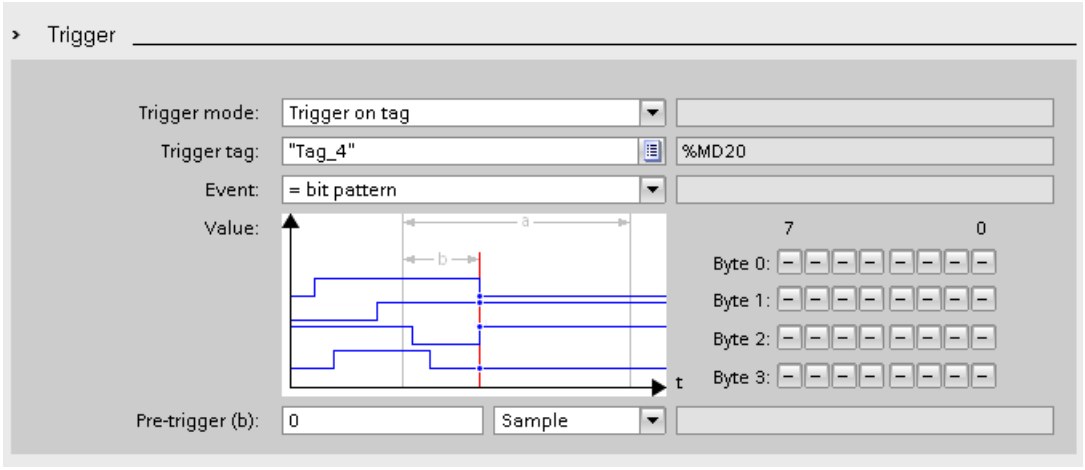
The recording starts when the value of the trigger is not equal to the value configured for this event.

"= bit pattern"

Supported data types: Integers (Page 48)

The recording starts when the value of the trigger matches the bit pattern configured for this event.

The following figure shows the setting options for a "bit pattern":



It is possible to switch between the icons by clicking the respective button.

The following table shows the icons:

Icon	Description
–	Bit is not evaluated
0	Bit is checked for FALSE
1	Bit is checked for TRUE

"<> bit pattern"

Supported data types: Integers (Page 48)

The recording starts when the value of the trigger does not match the bit pattern configured for this event.

See also

Configuring the trigger conditions (Page 57)

4.1.7 Configuration

4.1.7.1 Trace configuration - overview

The configuration of the recording conditions and the signals to be recorded is device-specific.

Requirement

A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.

Procedure

The following table shows the procedure for configuring.

Step	Description
1	Documentation of the configuration (optional) Enter a comment and an author for the configuration.
2	Selecting signals (Page 55) Select the signals to be recorded in the "Signals" area.
3	Configuring the recording cycle and duration Select a recording time, a cycle and the duration in the "Recording conditions" area.
4	Configuring the trigger conditions (Page 57) In the "Recording conditions" area, select whether the recording is to be performed immediately or depending on a trigger condition.

4.1.7.2 Selecting signals

Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Signals" area is open in the Inspector window.

Procedure

To configure the signals to be recorded, proceed as follows:

1. Click in the first empty line of the table.
2. Click in the first empty line of the "Name" column.
3. Select a signal. The following options are available:
   - In the "Name" column, click the button and select a tag.
   - Enter the symbolic tag name in the cell in the "Name" column.
   - Enter the address directly in the "Address" column.
   - Drag a signal to the table using drag-and-drop.
4. Click in the "Display color" column and select a color for the display of the signal.
5. Click in the "Comment" column and enter a comment for the signal.
6. Repeat the procedure from step 1 until all the signals to be recorded have been entered in the table.

4.1.7.3 Configuring the recording cycle and duration

Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Recording conditions" area is open in the Inspector window.

Procedure

To configure the cycle and the duration of a recording, proceed as follows:

1. Click the button for the recording time.
2. Select an OB for the recording time (Page 43).
3. Select a unit for the reduction factor in the drop-down list box for "Record every".
4. Enter the factor for the reduction in the input field for "Record every".
5. Select a unit in the drop-down list box for "Recording duration".
6. Specify the recording duration.
   The following options are available:
   - Enter a value for the duration in the input field for "Recording duration".
   - Activate the "Use max. recording duration" checkbox.

4.1.7.4 Configuring the trigger conditions

Requirement

- A trace configuration has been created and selected in the "Trace configurations" table of the trace handling.
- The "Recording conditions" area is open in the Inspector window.

"Record immediately" trigger condition

To start the recording immediately, proceed as follows:

1. Select the "Record immediately" entry in the drop-down list for "Trigger mode".

   The input fields for the trigger tag are hidden.

"Trigger on tag" trigger condition

To start the recording depending on a condition, proceed as follows:

1. Select the "Trigger on tag" entry in the drop-down list for "Trigger mode".
2. Select a trigger tag. The following options are available:
   - Click the button for the trigger tag and select a tag.
   - Enter the address or the symbolic name of the tag directly in the input field for the trigger tag.

   A drop-down list with events and input fields is displayed. The display depends on the data type of the tag.
3. Configure the event.
4. Select a unit for the pre-trigger in the drop-down list for "Pre-trigger".
5. In order to record a period before the trigger event, enter a value greater than 0 in the input field for the pre-trigger.

Note

The trigger condition is checked in every cycle irrespective of the setting in "Record every". To reliably identify the trigger, the trigger signal must be present for at least one full cycle.

Glossary

Curve diagram

Displays the selected signals of a recording.

Installed trace

Consists of a trace configuration and optionally a recording.

Measurement

Consists of a trace configuration with an associated recording.

Pre-trigger

Defines the time interval in which the signals are already recorded before the actual trigger condition is fulfilled.

Recording

Is performed in the device. There is only one recording for each installed trace configuration.

Recording condition

Sampling and trigger for a trace configuration.

Recording duration

Factor in number of samples. The factor of 100 means, for example, that 100 samples are recorded.

Reduction

Factor in number of cycles. A factor of 2 means, for example, that a recording is made every second cycle.

Sampling

Setting, in which cycle, how fast and how long the recording is to be made.

Signal table

Lists the signals of the selected measurement and provides setting options for some properties.

Trace configuration

Contains all the information required to record values in a device.

Trace handling

Enables the transfer of trace configurations and measurements to and from the device. Selection of an installed trace or a measurement displays recordings in the curve diagram.

Trigger

Specifies the trigger mode and the condition for the "Trigger on tag" mode.

Trigger mode

Specifies whether the recording should be started immediately or based on a trigger tag.

Trigger tag

Signal to trigger the recording.

Trigger time

The meaning of the measurement trigger time depends on the device.

For example, SIMATIC S7-1200/1500 CPUs: Specifies the absolute time of the control system at the start of recording.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides you with an overview of the communication options, the CPUs, communication modules and processors of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. This function manual describes the connection-oriented, asynchronous communication.

The documentation covers the following:

- Overview of the communication services
- Properties of the communication services
- Overview of the user activities for setting up the communication services

Basic knowledge required

The following knowledge is required in order to understand the Function manual:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of the documentation

This documentation is the basic documentation for all products of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The product documentation is based on this documentation.

Changes compared to previous version

The following changes / additions are described in this manual, compared to the previous version (version 06/2014):

- Addition to the communication protocols and port numbers used for SIMATIC S7-1500 software controller
- Addition to the maximum connection resources used for HMI devices
- Addition to the data record routing functionality

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)".

This documentation contains pictures of the devices described. The figures may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on handling of the product and on the section of the documentation to which you should pay particular attention.

Additional support

Information about Technical Support is available in the appendix Service & Support (Page 84).

The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).

The online catalog and the ordering system are available on the Internet (http://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

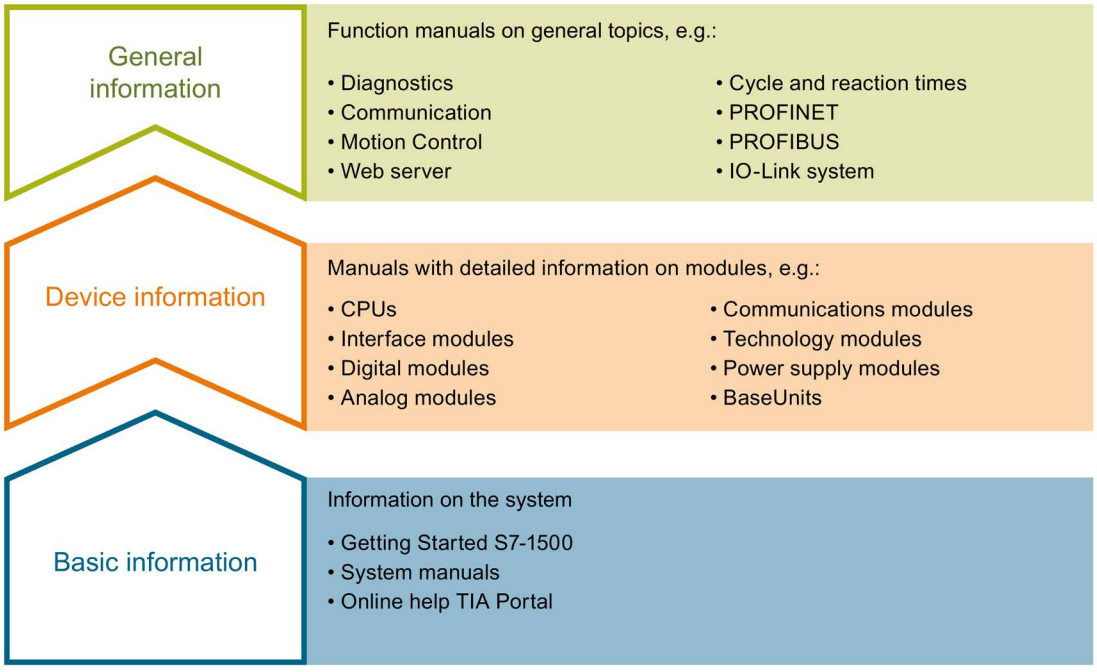
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP, ET 200SP and ET 200AL distributed I/O systems is divided into three areas. This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/86140384)
- ET 200SP (http://support.automation.siemens.com/WW/view/en/84133942)
- ET 200AL (http://support.automation.siemens.com/WW/view/en/95242965)

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

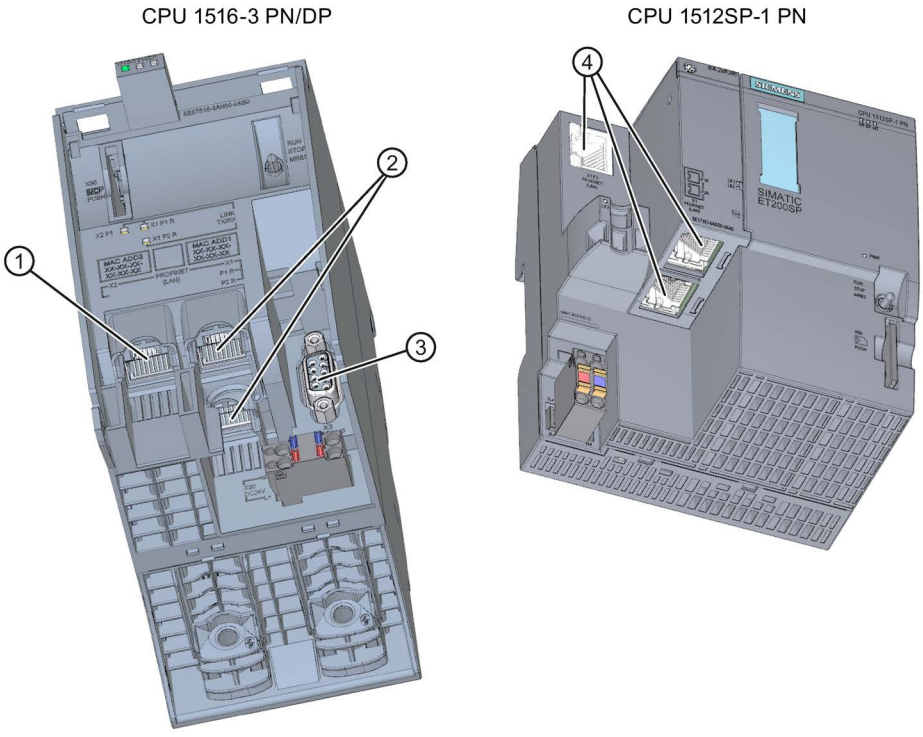
Product overview

2

CPUs, communications modules and processors, and PC systems of the S7-1500, ET 200MP, ET 200SP and ET 200AL systems provide you with interfaces for communication via PROFINET, PROFIBUS and point-to-point connections.

CPUs, communications modules and communications processors

PROFINET and PROFIBUS DP interfaces are integrated in the S7-1500 CPUs. The CPU 1516-3 PN/DP for example has two PROFINET interfaces and one PROFIBUS DP interface. Other PROFINET and PROFIBUS DP interfaces are available by using communications modules (CM) and communications processors (CP).

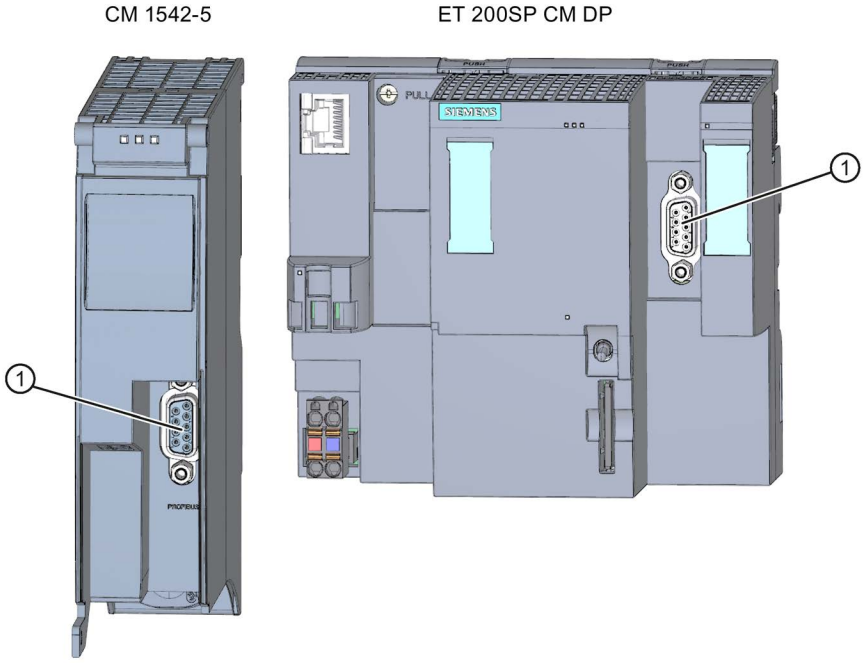


① PROFINET interface (X1) with 1 port
② PROFINET interface (X2) with 2-port switch
③ PROFIBUS DP interface (X3)
④ PROFINET interface (X1) with 3-port switch

Figure 2-1 Interfaces of the CPU 1516-3 PN/DP and CPU 1512SP-1 PN

Interfaces of communications modules

Interfaces of communications modules (CM) behave in exactly the same way as integrated interfaces of S7-1500 CPUs of the same interface type (for example PROFIBUS DP). They serve to extend the system with the corresponding interfaces (for example, they add a PROFIBUS interface to the communication module CM 1542 5 of the S7-1500 automation system).

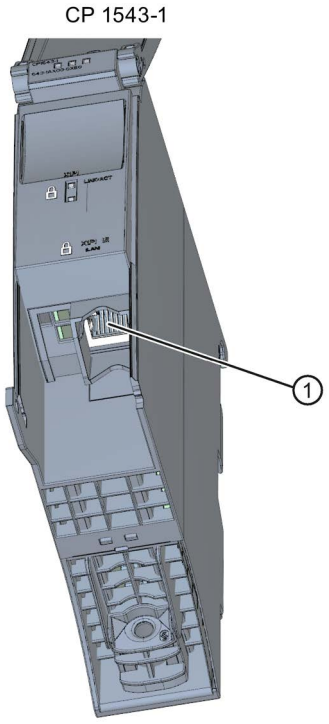


① PROFIBUS DP interface

Figure 2-2 PROFIBUS DP interface of the CM 1542-5 and CM DP

Interfaces of communications processors

Interfaces of communications processors (CP) provide different functionalities compared with the integrated interfaces of the CPUs. CPs allow special applications, for example the CP 1543-1 provides Industrial Ethernet security functions for protecting Industrial Ethernet networks via its Industrial Ethernet interface.



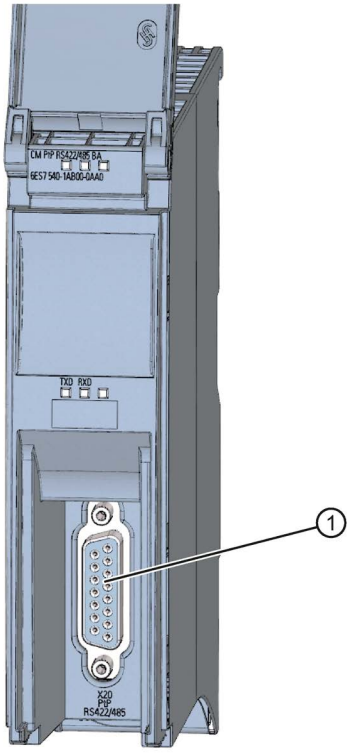
① Industrial Ethernet interface

Figure 2-3 Industrial Ethernet interface of the CP 1543-1

Interfaces of communications modules for point-to-point connections

The communication modules for point-to-point connections provide communication via their RS 232-, RS 422- and RS 485 interfaces, for example, Freeport or Modbus communication.

CM PtP RS422/485 BA

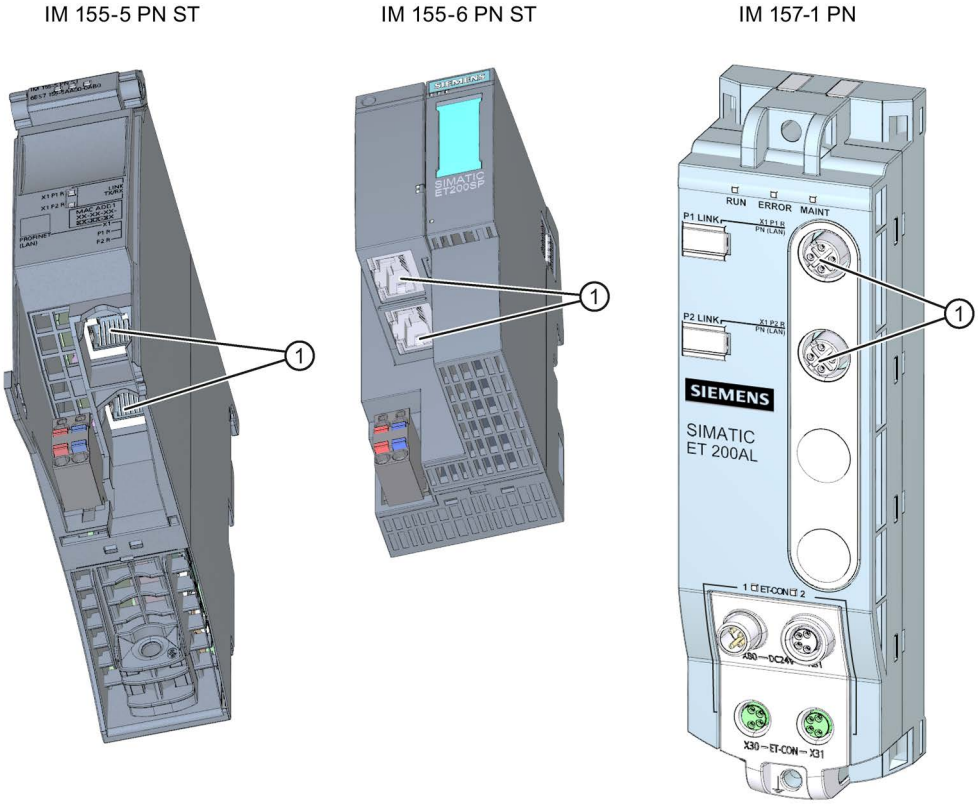


① Interface for point-to-point connections

Figure 2-4 Interface for point-to-point connection of the CM PtP RS422/485 BA

Interfaces of interface modules

PROFINET and PROFIBUS DP interfaces of the interface modules (IM) in ET 200MP, ET 200SP and ET 200AL are used to connect the distributed I/O ET 200MP, ET 200SP and ET 200AL to PROFINET or PROFIBUS of the higher-level IO controller or DP master.



① PROFINET interface with 2-port switch

Figure 2-5 PROFINET interfaces IM 155-5 PN ST (ET 200MP), IM 155-6 PN ST (ET 200SP), and IM 157-1 PN (ET 200AL)

Communications services

The communications services described below use the interfaces and communication mechanisms provided by the system via CPUs, communication modules and processors.

Communications services

3

3.1 Overview of communication options

Overview of communications options

The following communications options are available for your automation task.

Table 3- 1 Communications options

Communications options	Functionality	Via interface:		
		PN/IE*	DP	serial
PG communication	On commissioning, testing, diagnostics	X	X	-
HMI communication	On operator control and monitoring	X	X	-
Open communication using TCP/IP	Data exchange via PROFINET/Industrial Ethernet with TCP/IP Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Open communication using ISO-on-TCP	Data exchange via PROFINET/Industrial Ethernet with ISO-on-TCP Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Open communication with UDP	Data exchange via PROFINET/Industrial Ethernet with UDP Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-

Communications options	Functionality	Via interface:		
		PN/IE*	DP	serial
Open communication via ISO (only CPs with PROFINET/Industrial Ethernet interface)	Data exchange via PROFINET/Industrial Ethernet with the ISO protocol Instructions: • TSEND_C/TRCV_C • TSEND/TRCV • TCON • T_DISCON	X	-	-
Communication via Modbus TCP	Data exchange via PROFINET with Modbus TCP protocol Instructions: • MB_CLIENT • MB_SERVER	X	-	-
E-mail	Sending process alarms via e-mail Instruction: • TMAIL_C	X	-	-
FTP (only CPs with PROFINET/Industrial Ethernet interface)	File management and file access via FTP (File Transfer Protocol); CP can be FTP client and FTP server Instruction: • FTP_CMD	X	-	-
Fetch/Write (only CPs with PROFINET/Industrial Ethernet interface)	Server services via TCP/IP, ISO-on-TCP and ISO Via special instructions for Fetch/Write	X	-	-
S7 communication	Data exchange client/server or client/client Instructions: • PUT/GET • BSEND/BRCV • USEND/URCV	X	X	-
Serial point-to-point connection	Data exchange via point-to-point with Freeport, 3964(R), USS or Modbus protocol Via special instructions for PtP, USS or Modbus/RTU	-	-	X
Web server	Data exchange via HTTP(S), for example for diagnostics	X	-	-
SNMP (Simple Network Management Protocol)	Diagnostics for "network health" of IP networks, possibly parameterization of the IP network components via standard SNMP protocol	X	-	-
Time-of-day synchronization	Via PN/IE interface: CPU is NTP client (Network Time Protocol)	X	-	-
	Via DP interface: CPU/CM/CP is time-of-day master or time slave	-	X	-

* IE - Industrial Ethernet

Additional information

- You will find information about the Fetch/Write services in the STEP 7 online help.
- You can find additional information on the PtP link in the function manual CM PtP - Configurations for Point-to-Point Connections (http://support.automation.siemens.com/WW/view/en/59057093).
- You will find the description of the web server functionality in the function manual Web server (http://support.automation.siemens.com/WW/view/en/59193560).
- You will find information about the standard protocol SNMP on the Service & Support pages on the Internet (http://support.automation.siemens.com/WW/view/en/15166742).
- You can find information on time synchronization in the system manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792).

3.2 Overview of connection resources

Connection resources

Some communications services require connections. Connections allocate resources on the CPUs, CPs and CMs involved (for example memory areas in the CPU operating system). In most cases one resource per CPU/CP/CM is allocated for a connection. In HMI communication, up to 3 connection resources are required per HMI connection.

The connection resources available depend on the CPU being used, the CPs and CMs and must not exceed a defined high limit for the automation system.

Available connection resources in a station

The maximum number of resources of a station is determined by the CPU.

Each CPU has reserved connection resources for PG, HMI and web server communication. There are also resources available that can be used for SNMP, e-mail connections, HMI, S7 communication as well as for open communication.

When are connection resources allocated?

The time for allocation of connection resources depends on how the connection is set up, automatic, programmed or configured (see section Setting up a connection (Page 18)).

Additional information

You will find more detailed information on the allocation of connection resources and the display of connection resources in STEP 7 in the section Connection resources (Page 71).

3.3 Setting up a connection

Automatic connection

STEP 7 sets up a connection automatically (for example PG or HMI connection) if you have connected the PG/PC interface to an interface of the CPU physically and have made the interface assignment in STEP 7 in the "Go online" dialog.

Setting up a programmed connection

You set up the programmed connection in the program editor of STEP 7 in the context of a CPU by assigning instructions for communication, for example TSEND_C.

When specifying the connection parameters (in the Inspector window, in the properties of the instruction), you are supported by the easy-to-use user interface.

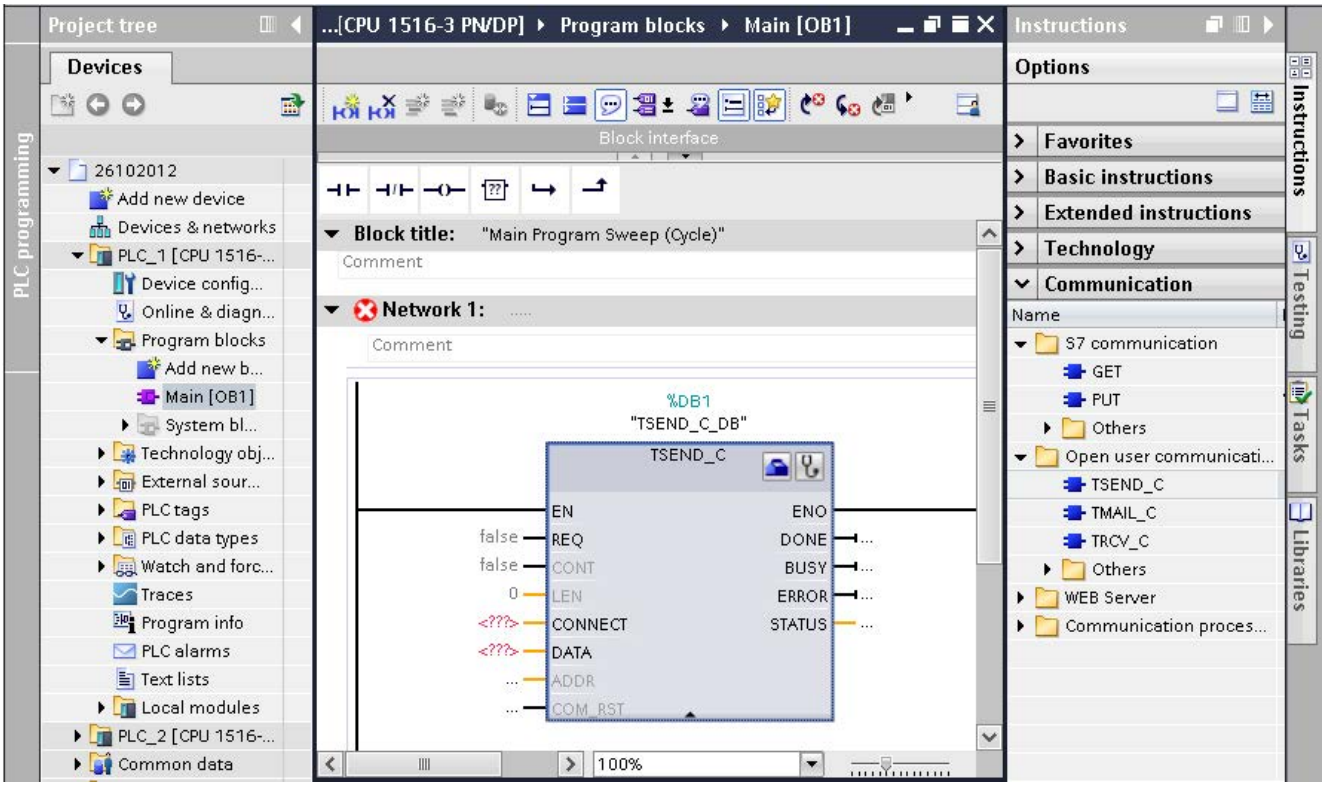


Figure 3-1 Programmed setup

Setting up a configured connection

You set up the configured connection in the network view of the Devices & networks editor of STEP 7 in the context of a CPU or a software controller.

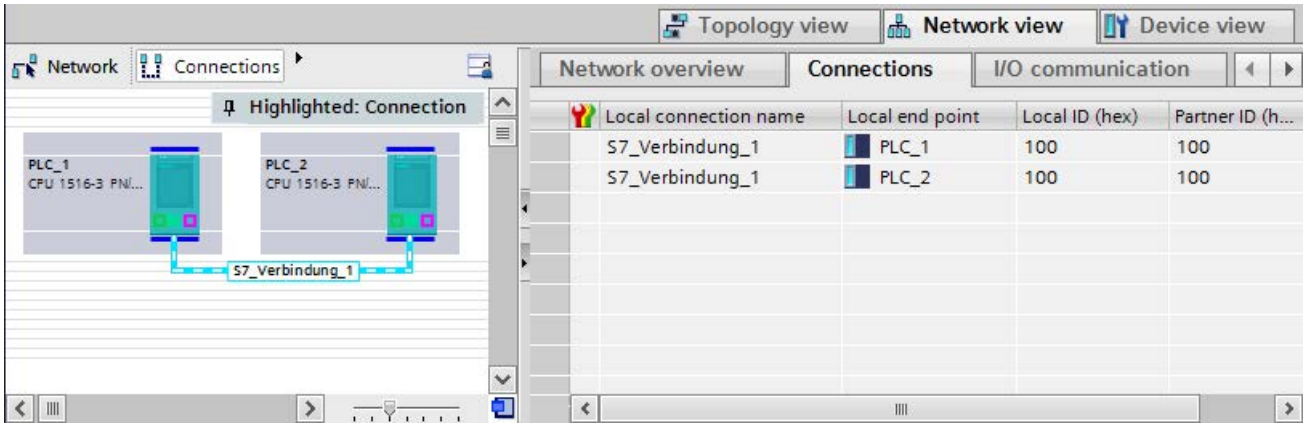

Figure 3-2 Configured setup

Summary

You can often choose between a configured or a programmed connection. Programmed connection setup allows connection resources to be released following data transfer. Programmed connections are not guaranteed as routed connections, i.e. they are not established when insufficient resources are available. With configured connection setup, the resource remains allocated after download of the configuration until the configuration changes again. Connection establishment via configured connections therefore cannot fail due to lack of resources. The "Connection resources" table in the Inspector window of the CPU displays an overview of connection resources already used and those still available.

Table 3- 2 Setting up the connection

Connection	Automatically	Programmed setup	Configured setup
Programming device connection	X	-	-
HMI connection	X	-	X
Open communication via TCP/IP connection	-	X	X
Open communication via ISO-on-TCP connection	-	X	X
Open communication via UDP connection	-	X	X
Open communication via ISO connection	-	X	X
Communication via Modbus TCP connection	-	X	-
E-mail connection	-	X	-
FTP connection	-	X	-
S7 connection	-	-	X

Additional information

You will find further information on the allocation of connection resources and the display of connection resources in STEP 7 in the section Connection resources (Page 71).

3.4 Data consistency

Definition of data consistency

A data block which cannot be modified by concurrent processes is called consistent data area. This means that a data block which belongs together and which is larger than the consistent data area can consist in part of new and of old data at the same time.

Example

An inconsistency can occur when an instruction for communication is interrupted, for example by a hardware interrupt OB with higher priority. If the user program in this OB now changes the data that has already been partly processed by the instruction, the transferred data originates:

- Partly from the time prior to hardware interrupt processing
- Partly from the time after the hardware interrupt processing.

This means that the date is inconsistent (processed at different points in time).

Effect

No inconsistency occurs if the system-specific maximum size of the consistent data is kept to. The S7-1500 CPUs allow a maximum of 462 bytes (see below).

If more data than the system-specific maximum size needs to be transferred consistently, you yourself must ensure that the data remains consistent in the application. This can, for example extend the interrupt reaction time of the CPU.

Data consistency with S7-1500

Use of instructions for access to common data:

If the user program contains instructions for communication that access common data, for example TSEND/TRCV, you can coordinate access to this data area yourself, for example using the "DONE" parameter. The data consistency of the data areas that are transferred locally with an instruction for communication can therefore be ensured in the user program.

Use of PUT/GET instructions or Write/Read via HMI communication:

In S7 communication with the PUT/GET instructions or Write/Read via HMI communication, you need to take into account the size of the consistent data areas during programming or configuration because there is no instruction in the user program of the target device (server) that can coordinate the data transfer in the user program.

System-specific maximum data consistency for S7-1500:

With an S7-1500, communication data is transferred in blocks of up to 462 bytes consistently into or out of the user memory during the program cycle. Data consistency is not ensured for larger data areas. Where defined data consistency is required, the length of communication data in the user program of the CPU must not exceed 462 bytes. You can then access these data areas consistently, for example from an HMI device using Read/Write tags.

Maximum data consistency for point-to-point CM:

With communication via a CM for a point-to-point connection, the data consistency is ensured by the Send/Receive instructions in the user program. The maximum data consistency is 4 KB, depending on the module type.

Additional information

- You will find the maximum amount of consistent data in the CPU, CM or CP manuals in the Technical specifications.
- You will find further information on data consistency in the description of the instructions in the STEP 7 online help.

3.5 Communications protocols and used port numbers

This section provides an overview of the protocols and port numbers used. For each protocol the address parameters, the respective communications layer as well as the communications role and the communications direction are specified.

This information makes it possible to match the security measures for protection of the automation system to the used protocols (for example firewall). Because security measures are limited to Ethernet or PROFINET networks, the tables do not include PROFIBUS protocols.

The tables below show the different layers and protocols that are being used.

The following table shows the protocols supported by the S7-1500 and ET 200SP CPUs. The S7-1500 software controllers also support the protocols listed in the following table for the Ethernet interfaces that are assigned to the software controller.

Table 3- 3 Layers and protocols

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET protocols				
DCP Discovery and configuration protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	Accessible devices PROFINET Discovery and configuration	DCP is used by PROFINET to discover PROFINET devices and provide basic settings.
LLDP Link Layer Discovery protocol	Not relevant	(2) Ethertype 0x88CC (LLDP)	PROFINET Link Layer Discovery protocol	LLDP is used by PROFINET to discover and manage neighbor relationships between PROFINET devices. LLDP uses the special multicast MAC address: 01-80-C2-00-00-0E
MRP Media Redundancy Protocol	Not relevant	(2) Ethertype 0x88E3 (IEC 62493-2-2010)	PROFINET medium redundancy	MRP provides control of redundant transmission paths by means of a ring topology. MRP uses multicast MAC addresses according to the standard
PTCP Precision Transparent Clock Protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	PROFINET send clock and time synchronization, based on IEEE 1588	PTC provides a time delay measurement between RJ45 ports and thus send clock synchronization and time synchronization. PTCP uses multicast MAC addresses according to the standard
PROFINET IO data	Not relevant	(2) Ethertype 0x8892 (PROFINET)	PROFINET Cyclic IO data transfer	The PROFINET IO frames are used to transmit IO data cyclically between PROFINET IO controller and IO devices via Ethernet.
PROFINET Context Manager	34964	(4) UDP	PROFINET connection less RPC	The PROFINET Context Manager provides an endpoint mapper in order to establish an application relation (PROFINET AR).

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
Connection-oriented communications protocols				
SMTP Simple mail transfer protocol	25	(4) TCP	Simple mail transfer protocol	SMTP is used for sending e-mail and SMS (depending on provider).
HTTP Hypertext transfer protocol	80	(4) TCP	Hypertext transfer protocol	HTTP is used for communication with the CPU-internal web server.
ISO on TCP (according to RFC 1006)	102	(4) TCP	ISO-on-TCP protocol	ISO on TCP (according to RFC 1006) is used for message-oriented data exchange to remote CPU or software controller. S7 communication with ES, HMI, OPC server, etc.
NTP Network time protocol	123	(4) UDP	Network time protocol	NTP is used for synchronization of the CPU system time with the time of an NTP server.
SNMP Simple network management protocol	161 162 (trap)	(4) UDP	Simple network management protocol	SNMP is used for reading and setting of network management data (SNMP managed Objects) by the SNMP Manager.
HTTPS Secure Hypertext transfer protocol	443	(4) TCP	Secure Hypertext transfer protocol	HTTPS is used for communication with the CPU-internal web server via Secure Socket Layer (SSL).
Modbus TCP Modbus Transmission Control Protocol	502	(4) TCP	Modbus/TCP protocol	Modbus/TCP is used by MB_CLIENT/MB_SERVER instructions in the user program.
OUC[1] Open User Communication	1 ... 1999 can be used to limited extent[2] 2000 ... 5000 Recommended 5001 ... 49151 can be used to limited extent[2]	(4) TCP (4) UDP	Open User Communication (TCP/UDP)	OUC instructions provide connection establishment, connection termination and data transfer based on the socket layer.

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
Reserved	49152 ... 65535	(4) TCP (4) UDP	-	Dynamic port area used for active connection end point if the application does not determine the local port number.

1 Note: The open communication provides direct access to the UDP/TCP for the user. The user is responsible for observing the port restrictions/definitions of the IANA (Internet Assigned Numbers Authority).

2 Do not use ports for OUC, which are already used by other protocols.

The following table shows the protocols that are supported by the S7-1500 software controller via the Ethernet interfaces assigned to Windows.

Table 3- 4 Layers and protocols

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET protocols				
DCP Discovery and configuration protocol	Not relevant	(2) Ethertype 0x8892 (PROFINET)	Accessible devices PROFINET Discovery and configuration	DCP is used by PROFINET to discover PROFINET devices and provide basic settings.
Connection-oriented communications protocols				
SMTP Simple mail transfer protocol	25	(4) TCP	Simple mail transfer protocol	SMTP is used for sending e-mail and SMS (depending on provider).
HTTP Hypertext transfer protocol	Adjustable [1]	(4) TCP	Hypertext transfer protocol	HTTP is used for communication with CPU-internal web server. You can change the port number to avoid conflict with other web servers on Windows. If you want to use web server access, you must activate the port in the Windows Firewall.
ISO on TCP (according to RFC 1006)	102	(4) TCP	ISO-on-TCP protocol	ISO on TCP (according to RFC 1006) for S7 communication with PG/PC or HMI.
OUC[2] Open User Communica-tion	1 ... 1999 can be used to limited extent[3, 4]	(4) TCP (4) UDP	Open User Communica-tion (TCP/UDP)	OUC instructions provide connection establishment, connection termination and data transfer based on the socket layer. If you want to use OUC, you must activate the ports in the Windows Firewall.
	2000 ... 5000 recom-mended[4]			
	5001 ... 49151 can be used to limited extent[3, 4]			

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
Reserved	49152 ... 65535	(4) TCP (4) UDP	-	Dynamic port range that is used for the active connection end point, if the application does not determine the local port number. If you wish to use this communication, you must activate the ports in the Windows Firewall.

1 Default setting for Windows assigned interfaces: 81

2 Note: The open user communication provides direct access to the UDP/TCP for the user. The user is responsible for observing the port restrictions/definitions of the IANA (Internet Assigned Numbers Authority).

3 Do not use ports for OUC, which are already used by other protocols.

4 Do not use ports for OUC, which are already used by other Windows applications.

The following table shows the protocols that are supported in addition to those listed in the tables for the S7-1500 communications modules (e.g. CP 1543-1).

Table 3- 5 Layers and protocols

Protocol	Port number	(2) Link layer (4) Transport layer	Function	Description
PROFINET/Industrial Ethernet protocols				
Connection-oriented communications protocols				
FTP File transfer protocol	20 (data) 21 (control)	(4) TCP	File transfer protocol	FTP is used for the transmission of files (only in connection with CP).
secureFTP File transfer protocol	20 (data) 21 (control)	(4) TCP	File transfer protocol	SecureFTP is used for the transmission of files by means of a TSL connection (only in connection with CP).
DHCP Dynamic Host Configuration Protocol	68	(4) UDP	Dynamic Host Configuration Protocol	DHCP is used to retrieve the IP Address Suite from a DHCP server when starting up the IE interface.
Secure NTPv3 Network time protocol	123	(4) UDP	Network time protocol	NTP is used to synchronize the CM/CP internal system clock with an NTP server.
SNMP Simple network management protocol	161 162 (trap)	(4) UDP	Simple network management protocol	SNMPv3 permits the CM/CP to read Network Management Data (MIBs) from SNMPv3 agent with authentication.

PG communication

4

Properties

Using PG communication, the CPU or another module capable of communication exchanges data with an engineering station (for example PG, PC). The data exchange is possible via PROFIBUS and PROFINET subnets. The gateway between S7 subnets is also supported.

PG communication provides functions needed to load programs and configuration data, run tests, and evaluate diagnostic information. These functions are integrated in the operating system of the module capable of communication.

A PG/PC can be connected to a CPU online. The PG/PC can operate a maximum of 4 online connections at one time (for example to 4 CPUs).

Requirements

- The PG/PC is physically connected to the communication-capable module.
- If the communication-capable module is to be reached via S7 routing, the hardware configuration has to be loaded in the participating stations (S7 router and end point).

Procedure for connecting online

You must establish an online connection to the CPU for the programming device communication:

1. Select the CPU in the project tree in STEP 7.
2. Select the "Online > Go online" menu command.

3. In the "Go online" dialog, make the following settings for your online connection:
   - Select interface type (e.g. PN/IE) in the "Type of PG/PC interface" drop-down list.
   - In the "PG/PC interface" drop-down list, select the PG/PC interface (e.g. Ind. Ethernet card) you want to use to establish the online connection.
   - Select the interface or the S7 subnet with which the PG/PC is physically connected from the "Connection to interface/subnet" drop-down list.
   - If the communication-capable module can be reached via an S7 router (gateway), select the S7 router that connects the subnets in question from the "1st Gateway" drop-down .

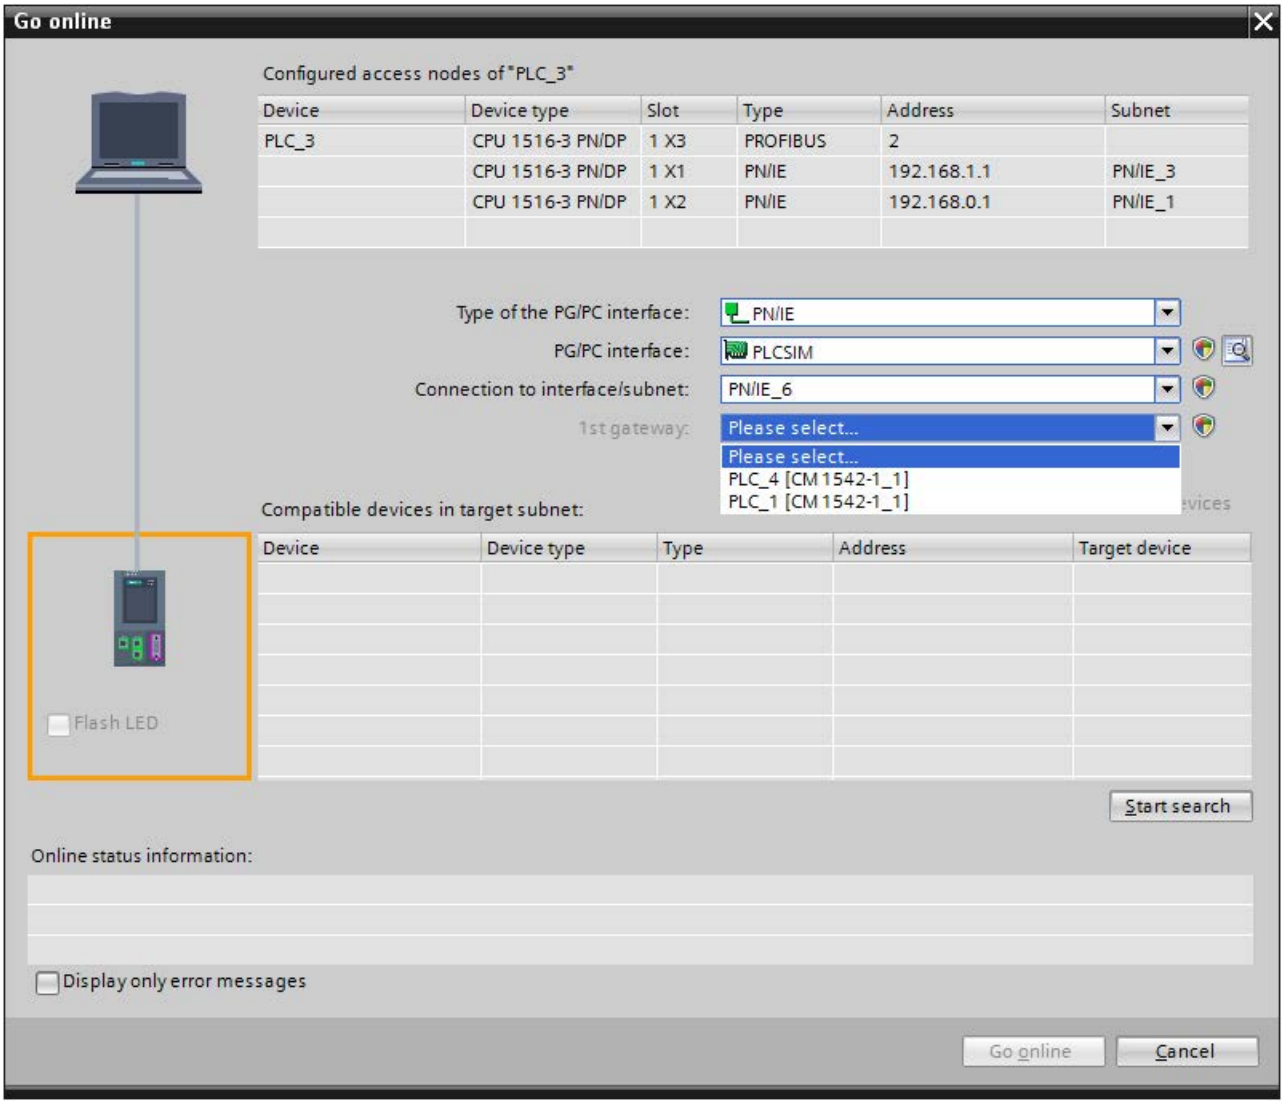

Figure 4-1 Setting up PG communication

4. In the "Compatible devices in target subnet" table, select the relevant CPU and confirm with "Go online".

Additional information

You can find more information on "Go online" in the STEP 7 online help.

HMI communication

5

Properties

Using HMI communication, one or more HMI devices (for example HMI Basic/Comfort/Mobile Panel) exchanges data with a CPU for operator control and monitoring with via the PROFINET or PROFIBUS DP interface. The data exchange is via HMI connections.

If you want to set up several HMI connections to a CPU, use for example:

- The PROFINET and PROFIBUS DP interfaces of the CPU
- CPs and CMs with the relevant interfaces

Procedure for setting up HMI communication

1. Configure the HMI device in an existing configuration with a CPU in the network view of the Devices & networks editor of STEP 7.
2. Select the "Connections" button and then "HMI connection" from the drop-down list.
3. Drag-and-drop a line between the end points of the connection (HMI device and CPU). The end points are highlighted in color. If the required S7 subnet does not yet exist, it is created automatically.

4. In the "Connections" tab, select the row of the HMI connection.

   In the "General" area of the "Properties" tab, you see the properties of the HMI connection, some of which you can change.

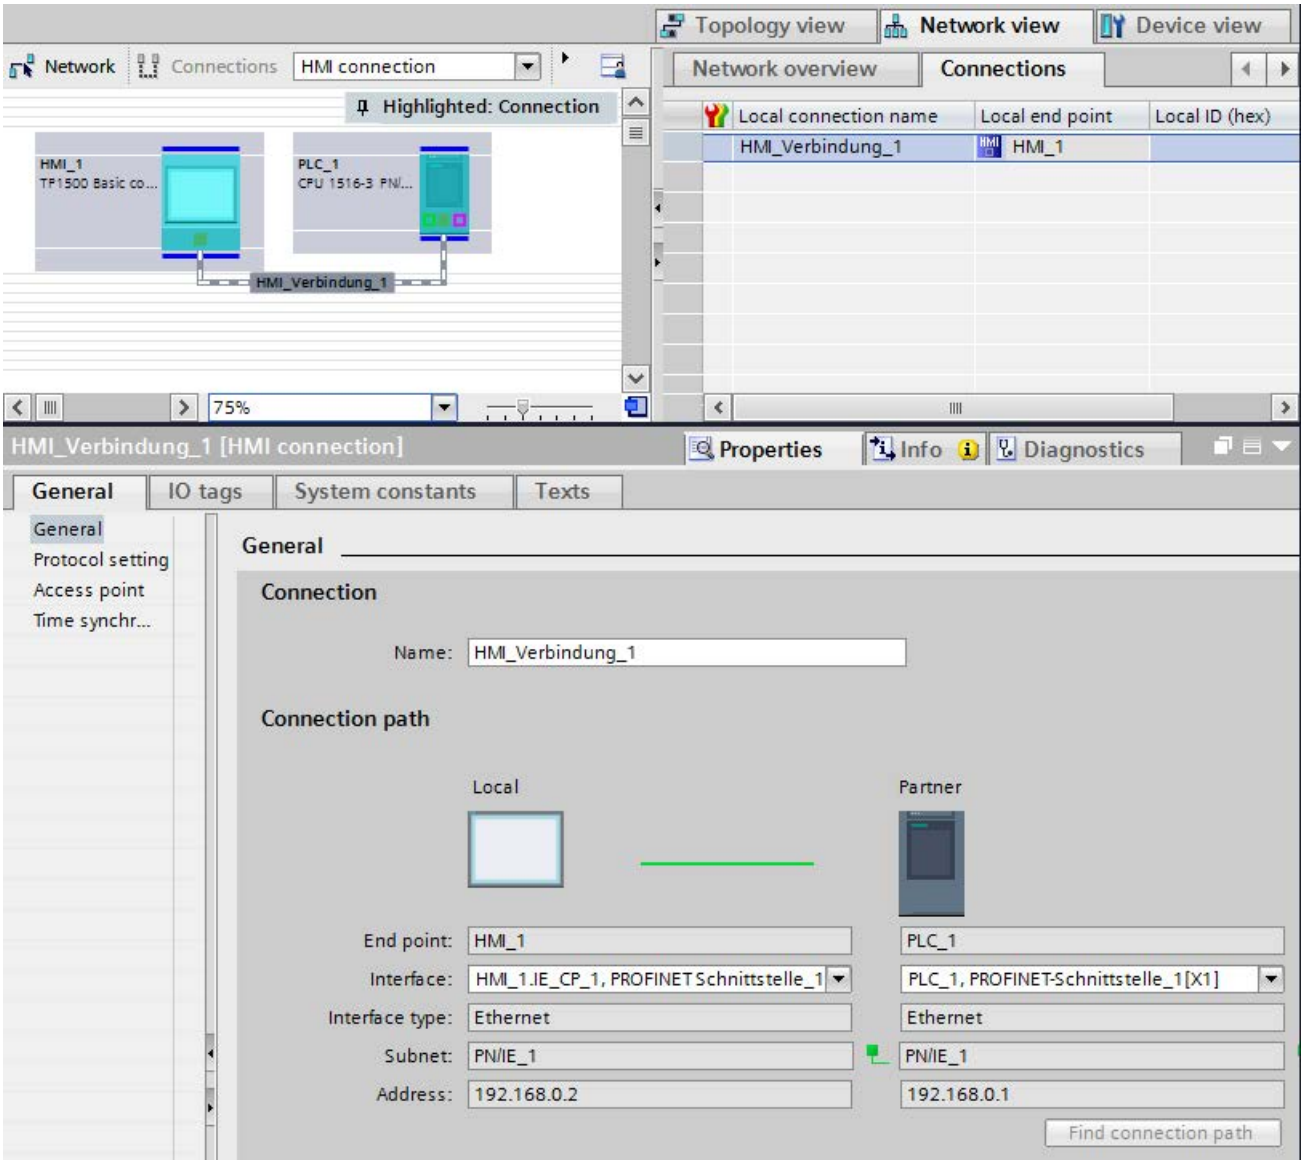

Figure 5-1 Setting up HMI communication

5. Download the hardware configuration to the CPU.
6. Download the hardware configuration to the HMI device.

Additional information

You can find information on S7 routing for HMI connections in the section S7 Routing (Page 64).

You can find more information on setting up HMI connections in the STEP 7 online help.

Open communication

6

6.1 Overview of open communication

Features of open communication

Using open communication, the CPU exchanges data with another module capable of communication. The main features of open communication are as follows:

- Open standard (communication partners can be two SIMATIC CPUs or a SIMATIC CPU and a suitable third-party device).
- Communication via various protocols (in STEP 7 known as "Connection types")
- High degree of flexibility in terms of the data structures transferred; this allows open data exchange with any communications devices as long as these support the connection types available.
- Open communication is possible in various automation systems, see technical specifications of the respective manuals.
  Examples:
  - Integrated PROFINET / Ind. Ethernet interfaces of CPUs (S7-1500, ET 200SP CPU, S7-1500 software controller)
  - PROFINET / Ind. Ethernet interfaces of communications modules (e.g. CP 1543-1, CM 1542-1)

6.2 Protocols for open communication

Protocols for open communication

The following protocols are available for open communication:

Table 6- 1 Transport protocols for open communication

Transport protocol	Via interface
TCP according to RFC 793	PROFINET/Industrial Ethernet
ISO-on-TCP according to RFC 1006 (Class 4)	PROFINET/Industrial Ethernet
ISO according to ISO/IEC 8073	Industrial Ethernet (only CP 1543-1)
UDP according to RFC 768	PROFINET/Industrial Ethernet

Table 6- 2 Application protocols for open communication

Application protocol	Used transport protocol
Modbus TCP	**TCP** according to RFC 793
E-mail	**TCP** according to RFC 793
FTP	**TCP** according to RFC 793

TCP, ISO-on-TCP, ISO, UDP

Prior to data transfer, these protocols (except UDP) establish a transport connection to the communications partner. Connection-oriented protocols are used when potential loss of data needs to be avoided.

The following is possible with UDP:

- Unicast to one device or broadcast to all devices on PROFINET via the PROFINET interface of the CPU or the Industrial Ethernet interface of the CP 1543-1
- Multicast to all recipients of a multicast group via the PROFINET/Industrial Ethernet interface of the CP 1543-1

Modbus TCP

The Modbus protocol is a communication protocol with linear topology based on a master/slave architecture. In the Modbus TCP (Transmission Control Protocol), the data is transmitted as TCP/IP packets.

Communication is controlled solely by suitable instructions in the user program.

E-mail and FTP

You can use email to send for example, data block contents (e.g. process data) as an attachment.

You can use the FTP connection (FTP = File Transfer Protocol) to transmit files to and from S7 devices.

The communication is controlled by instructions in the user program at the client end.

6.3 Instructions for open communication

Introduction

You set up open communication via the relevant connection (for example TCP connection) as follows:

- By programming in the user programs of the communications partners or
- By configuring the connection in STEP 7 in the hardware and network editor

Regardless of whether you set up the connection by programming or configuring, instructions are always required in the user programs of both communications partners for sending and receiving the data.

Setting up the connection via the user program

If the connection is set up by programming, the connection establishment and termination is implemented using instructions in the user program.

In certain areas of application it is an advantage not to set up the communications connections statically by configuring in the hardware configuration, but to have them set up by the user program. You can set up the connections via a specific application program-controlled and therefore when necessary. Programmed connection setup also allows connection resources to be released following data transfer.

A data structure is necessary for each communications connection that contains the parameters for establishing the connection (for example system data type "TCON_IP_v4" for TCP).

The system data types (SDT) are provided by the system and have a predefined structure that cannot be changed.

The various protocols have their own data structures (see table below). The parameters are stored in a data block ("connection description DB") for example of the system data type TCON_IP_v4.

There are two ways in which you can specify the DB with the data structure:

- Create the data block manually, assign parameters to it and write it directly to the instruction (necessary for e-mail and FTP)
- Recommendation: Have the data block created automatically in the properties in the program editor during configuration of the connection for the TSEND_C, TRCV_C and TCON instructions.

You can modify the connection parameters in the "connection description DB".

Protocols, system data types and employable instructions for programmed setup

Table 6- 3 Instructions for programmed setup of the connection

Protocol	System data type	Instructions for the user program
TCP	• TCON_IP_v4	Establish connection and send/receive data via: • TSEND_C/TRCV_C or • TCON, TSEND/TRCV (termination of the connection possible with TDISCON)
ISO-on-TCP	• TCON_IP_RFC	
ISO according to ISO/IEC 8073 (Class 4)	• TCON_ISOnative[1] • TCON_Configured	
UDP	• TCON_IP_v4 • TADDR_Param	Establish connection and send/receive data via: • TSEND_C/TRCV_C • TUSEND/TURCV (connection can be terminated via TDISCON)
Modbus TCP	• TCON_IP_v4	• MB_CLIENT • MB_SERVER
E-mail	• TMAIL_v4 • TMAIL_v6 • TMAIL_FQDN	• TMAIL_C
FTP	• FTP_CONNECT_IPV4[2] • FTP_CONNECT_IPV6[2] • FTP_CONNECT_NAME[2]	• FTP_CMD

[1] This protocol can only be used with the CP 1543-1

[2] User-defined data type

Setting up the connection with connection configuration

When setting up through the configuration of the connection, the address parameters of the connection are specified in the hardware and network editor of STEP 7.

To send and receive the data, use the same instructions as when the connections are set up by programming:

Table 6- 4 Instructions for sending/receiving with configured connections

Protocol	Send/receive with configured connections
Supported instructions:	
TCP	Send/receive data via: • TSEND_C/TRCV_C or • TSEND/TRCV
ISO-on-TCP	
ISO according to ISO/IEC 8073 (Class 4)	
UDP	Send/receive data via: • TSEND_C/TRCV_C • TUSEND/TURCV
Modbus TCP	Not supported
E-mail	Not supported
FTP	Not supported

Additional instructions for open communication

You can use the following instructions for connections set up in the user program as well for as configured connections:

- T_RESET: : Terminate and establish a connection
- T_DIAG: check connection

Additional information

The STEP 7 online help describes:

- The user and system data types
- The instructions for open communication
- The connection parameters

You will find information about the allocation and release of connection resources in the section Allocation of connection resources (Page 71).

6.4 Setting up open communication with TCP, ISO-on-TCP, UDP and ISO

Configuring a connection for the TSEND_C, TRCV_C or TCON instructions

Requirement: A TSEND_C, TRCV_C or TCON instruction is created in the programming editor.

1. Select a TCON, TSEND_C or TRCV_C block of Open User Communication in the program editor.
2. Open the "Properties > Configuration" tab in the inspector window.

3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.

   The connection parameters already known are displayed:

   – Name of the local end point
   – Interface of the local end point
   – IPv4 address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the local end point.

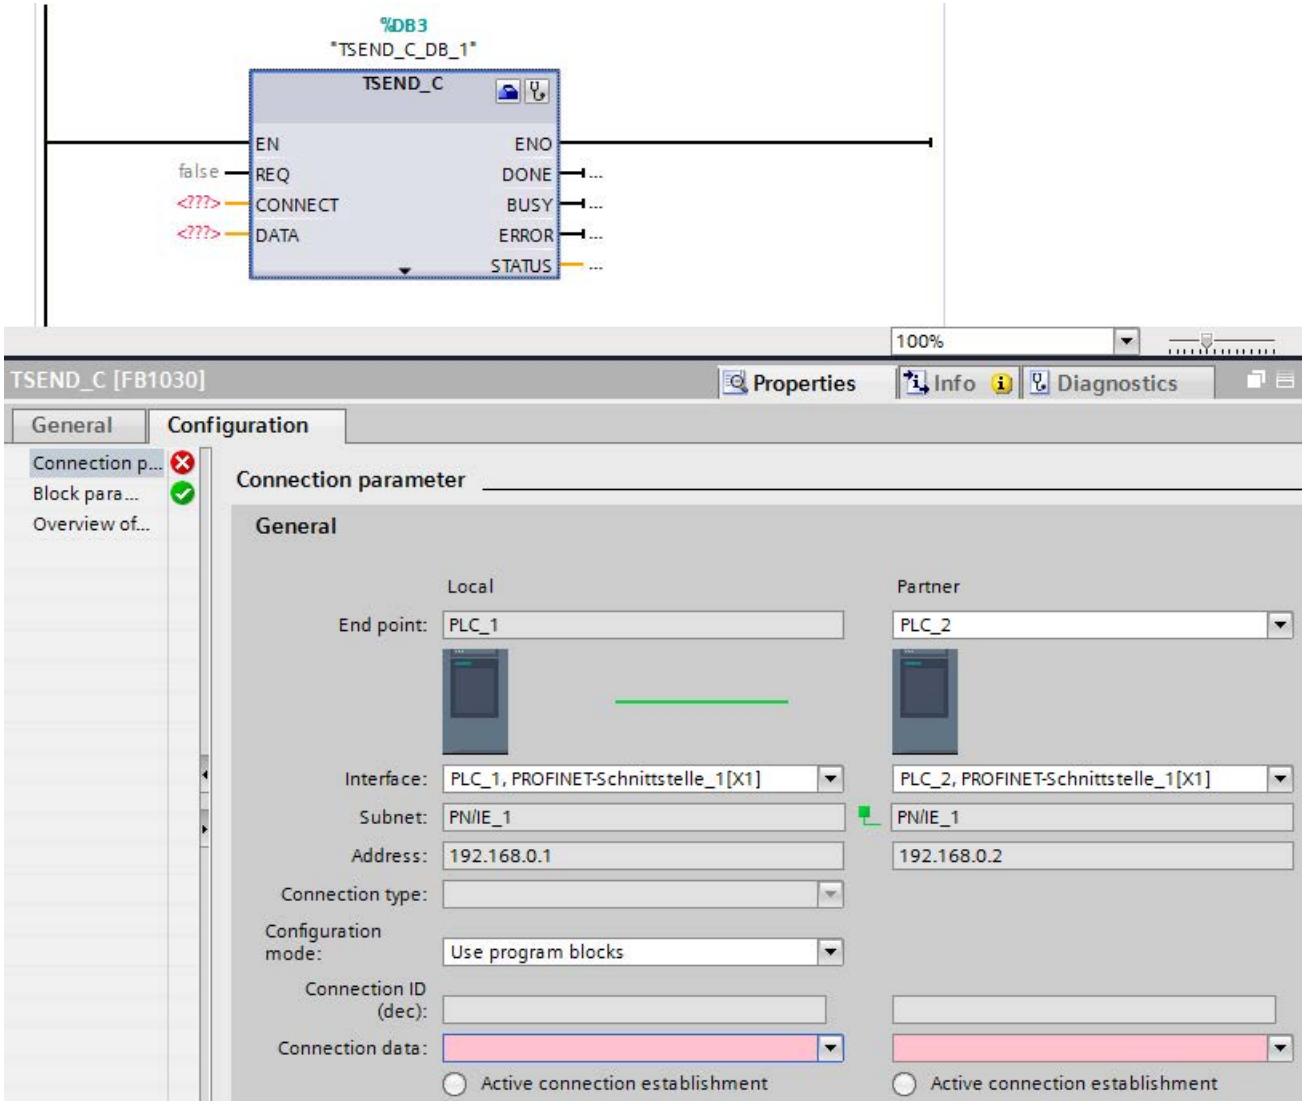

Figure 6-1 Connection parameters for TSEND_C

4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communication partner. Certain connection parameters are then entered automatically.

   The following parameters are set:

   – Name of the partner end point

   – Interface of the partner end point

   – IPv4 address (for Ethernet subnet) or PROFIBUS address (for PROFIBUS subnet) of the partner end point.

   If the connection partners are networked, the name of the subnet is displayed.

5. In the "Configuration type" drop-down list, select between using program blocks or configured connections.

6. Select an existing connection description DB in the "Connection data" drop-down list or for configured connections select an existing connection under "Connection name". You can also create a new connection description DB or a new configured connection. Later, you can still select other connection description DBs or configured connections or change the names of the connection description DBs in order to create new data blocks:

   – You can also see the selected data block at the interconnection of the CONNECT input parameter of the selected TCON, TSEND_C or TRCV_C instruction.

   – If you have already specified a connection description DB for the connection partner using the CONNECT parameter of the TCON, TSEND_C or TRCV_C instruction, you can either use this DB or create a new DB.

   – If you edit the name of the displayed data block in the drop-down list, a new data block with the changed name but with the same structure and content is generated and used for the connection.

   – Changed names of a data block must be unique in the context of the communication partner.

   – A connection description DB must have the structure TCON_Param, TCON_IP_v4 or TCON_IP_RFC, depending on CPU type and connection.

   – A data block cannot be selected for an unspecified partner.

   Additional values are determined and entered after the selection or creation of the connection description DB or configured connection.

   The following is valid for specified connection partners:

   – ISO-on-TCP connection type

   – Connection ID with default of 1

   – Active connection establishment by local partner

   – TSAP ID
   for S7-1200/1500: E0.01.49.53.4F.6F.6E.54.43.50.2D.31
   for S7-300/400: E0.02.49.53.4F.6F.6E.54.43.50.2D.31

The following is valid for unspecified connection partners:

- TCP connection type
- Partner port 2000

The following applies for a configured connection with a specified connection partner:

- TCP connection type
- Connection ID with default of 257
- Active connection establishment by local partner
- Partner port 2000

The following applies for a configured connection with an unspecified connection partner:

- TCP connection type
- Local port 2000

7. Enter a connection ID as needed for the connection partner. No connection ID can be assigned to an unspecified partner.

Note

You must enter a unique value for the connection ID at a known connection partner. The uniqueness of the connection ID is not be checked by the connection parameter settings and there is no default value entered for the connection ID when you create a new connection.

8. Select the desired connection type in the relevant drop-down list. Default values are set for the address details depending on the connection type. You can choose between the following:
   - TCP
   - ISO-on-TCP
   - UDP
   - ISO (only with Configuration mode "Use configured connection")

   You can edit the input boxes in the address details. Depending on the selected protocol, you can edit the ports (for TCP and UDP) or the TSAPs (for ISO-on-TCP and ISO).
9. Use the "Active connection establishment" check box to set the connection establishment characteristics for TCP, ISO and ISO-on-TCP. You can decide which communication partner establishes the connection actively.

Changed values are checked immediately for input errors by the connection configuration and entered in the data block for the connection description.

Note

Open User Communication between two communication partners can only work when the program section for the partner end point has been downloaded to the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Configuring connections, e.g. for TSEND/TRCV

If you want to use the instructions for TSEND/TRCV for open communication, for example, you first need to configure a connection (e.g. TCP connection).

To configure a TCP connection, follow these steps:

1. Configure the communications partners in the network view of the Devices & networks editor of STEP 7.
2. Click the "Connections" button and select the "TCP connection" connection type from the drop-down list.
3. Using drag-and-drop, connect the communication partner with each other (via an interface or local end point). If the required S7 subnet does not yet exist, it is created automatically.

   You can also set up a connection to unspecified partners.
4. Select the created connection in the network view.
5. Set the properties of the connection in the "Properties" tab in the "General" area, for example the name of the connection and the interfaces of the communications partner that will be used.

   For connections to an unspecified partner, set the address of the partner.
   You can find the local ID (reference of the connection in the user program) in the "Local ID" area.
6. In the Project tree, select the "Program blocks" folder for one of the CPUs and open OB1 in the folder by double-clicking on it. The program editor opens.
7. Select the required instruction from the "Instructions" task card, "Communication" area, "Open user communication", for example TSEND and drag it to a network of OB1.
8. At the ID parameter of the instruction, assign the local ID of the configured connection to be used for the transmission of data.
9. Interconnect the "DATA" parameter of the TSEND instruction with the user data, for example in a data block.
10. Download the hardware configuration and user program to the CPU.

Based on the procedure described above, set up the connection on the partner CPU with the instruction for receiving, TRCV, and download it to the CPU.

Point to note with ISO connections with CP 1543-1

If you use the "ISO connection" connection type, you will need to select the "Use ISO protocol" check box in the properties of the CP so that addressing using MAC addresses will work.

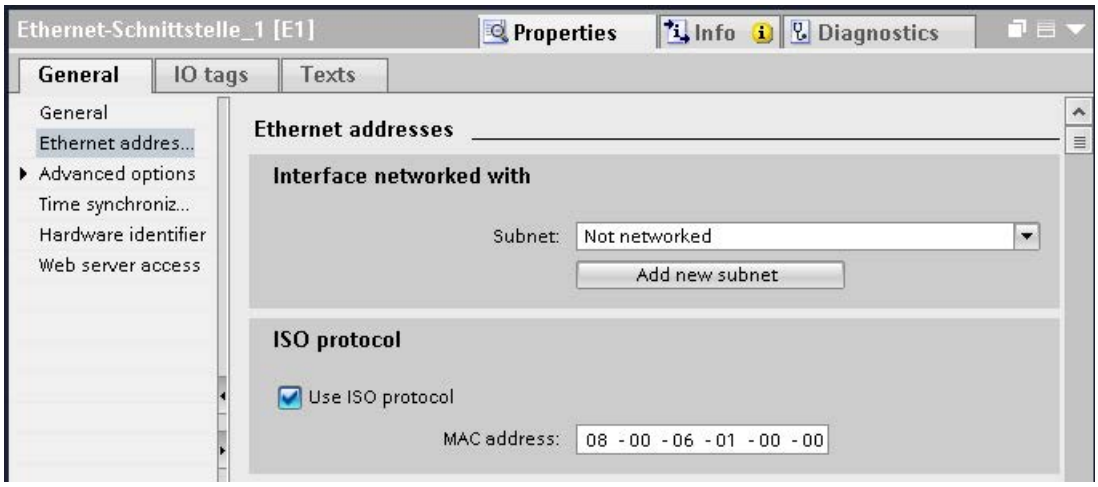

Figure 6-2 Select CP 1543-1 ISO protocol

Additional information

The STEP 7 online help describes:

- The instructions for open communication
- The connection parameters

6.5 Setting up communication with Modbus TCP

Setting up a connection for Modbus TCP via the user program

The parameter assignment takes place in the program editor at the instruction MB_CLIENT or MB_SERVER.

Procedure for setting up communication using Modbus TCP

The MB_CLIENT instruction communicates as a Modbus TCP client via the TCP connection. You establish a connection between the client and the server with the instruction, send Modbus requests to the server and receive the corresponding Modbus responses. You also control the setup of the TCP connection with this instruction.

The MB_SERVER instruction communicates as a Modbus TCP server via the TCP connection. The instruction processes connection requests of a Modbus client, receives and processes Modbus requests and sends responses. You also control the setup of the TCP connection.

Requirement: Client and server are connected via an S7 subnet (PROFINET) as far as IP is concerned.

1. Configure an S7-1500 automation system with CPU in the network view of the Devices & networks editor of STEP 7.
2. In the Project tree, select the "Program blocks" folder and open OB1 in the folder by double-clicking on it. The program editor opens.
3. Select the required instruction, for example MB_CLIENT, from the "Instructions" task card, "Communication" area, "Other", "MODBUS TCP" and drag it to a network of OB1.

4. Assign the parameters of the MB_CLIENT or MB_SERVER instruction. Observe the following rules:

   An IPv4 server address must be specified for each MB_CLIENT connection.

   Each MB_CLIENT or MB_SERVER connection must use a unique instance DB with the data structure TCON_IP_v4.

   Each connection requires a unique connection ID. The connection ID and instance DB belong together in pairs and must be unique for each connection.

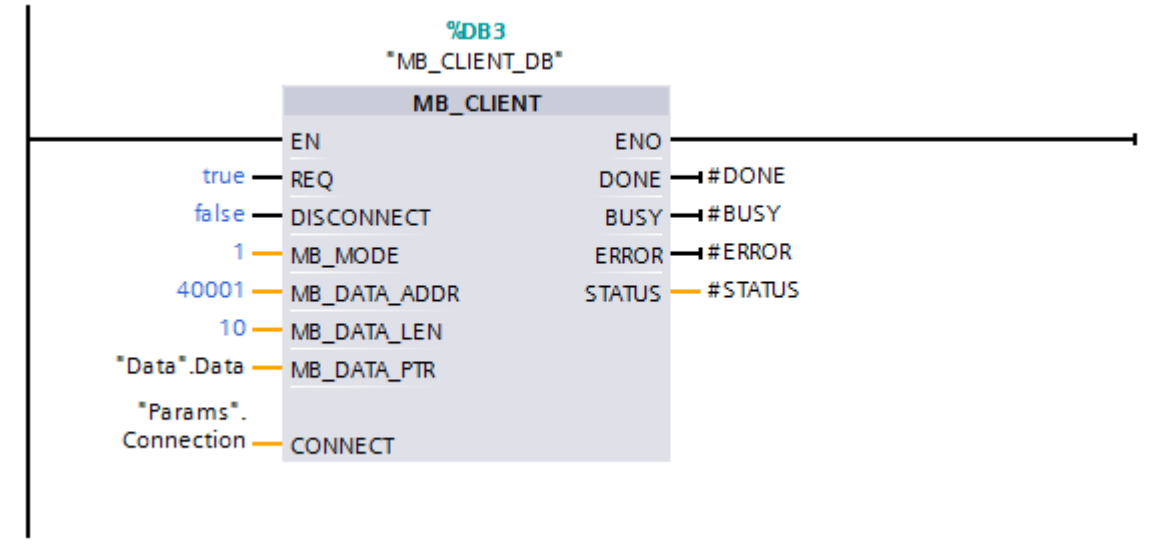

Figure 6-3 MB_CLIENT

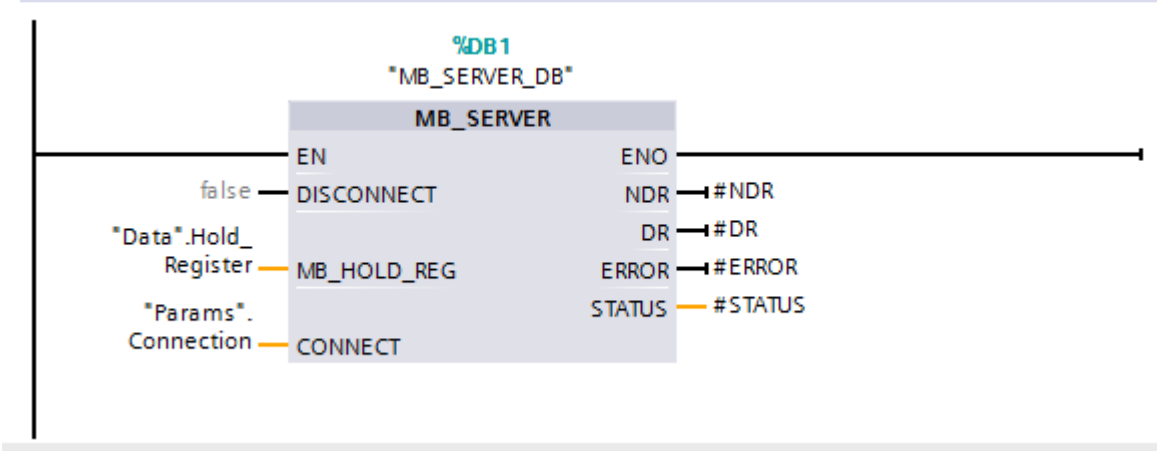

Figure 6-4 MB_SERVER

5. Download the hardware configuration and user program to the CPU.

Modbus TCP server as gateway to Modbus RTU

If you use a Modbus TCP server as a gateway to a Modbus RTU protocol, address the slave device in the serial network using the static parameter, MB_UNIT_ID. The MB_UNIT_ID parameter corresponds to the field of the slave address in the Modbus RTU protocol. The MB_UNIT_ID parameter in this case would forward the request to the correct Modbus RTU slave address.

You do not have to program the gateway function yourself.

You can find the MB_UNIT_ID parameter in the instance data block associated with MB_CLIENT instruction.

You can find more information on the MB_UNIT_ID parameter in the STEP 7 online help.

6.6 Setting up communication via e-mail

Setting up a connection for e-mail via the user program

For communication using e-mail, you need to create the data block of the relevant system data type yourself, assign parameters and call the instruction directly. This procedure is introduced below.

Procedure for setting up communication using e-mail

A CPU can send e-mails. To send e-mails from the user program of the CPU, use the TMAIL_C instruction.

Requirement: The SMTP server can be reached via the IPv4 network.

1. Configure an S7-1500 automation system with CPU in the network view of the Devices & networks editor of STEP 7.
2. Set the address parameters for the SMTP server in the TMAIL_C instruction. (Recommendation: Assign a name for the appendix.)
3. Create a global DB and within this DB a tag of the type TMAIL_v4, TMAIL_v6 (CP 1543-1 only) or TMAIL_FQDM (CP 1543-1 only).
4. Interconnect the variable to the MAIL_ADDR_PARAM parameter of the TMAIL_C instruction.
5. Download the hardware configuration and user program to the CPU.

Additional information

The STEP 7 online help describes:

- The system data types
- The instructions for open communication
- The connection parameters

6.7 Setting up communication via FTP

Setting up a connection for FTP via the user program

For communication via FTP, you need to create the data block of the relevant system data type yourself, assign parameters and call the instruction directly. This procedure is introduced below.

FTP client and server functionality

Files can be sent by a CPU to an FTP server and can be received from the FTP server. Communication with FTP is only possible for the S7-1500 using the CP 1543-1. The CP can be an FTP server, FTP client or both. FTP clients can also be third-party systems/PCs.

For the FTP server functionality, configure the CP accordingly in STEP 7.

You can use the FTP client functionality to implement, for example, the establishment and termination of an FTP connection, the transfer and deletion of files on the server. For the FTP client functionality, use the FTP_CMD instruction.

Procedure for setting up FTP server functionality

Requirement: The FTP server can be reached via the IPv4 network.

1. Configure an S7-1500 automation system with CPU and CP 1543-1 in the device view of the Devices & networks editor of STEP 7.

   At the same time, you need to select the check box "Permit access with PUT/GET communication from remote partner (PLC, HMI, OPC, ...)" in the HW configuration of the S7-1500 CPU under the "Protection" area navigation in the section "Connection mechanisms".

2. Make the following settings in the properties of the CP under "FTP configuration":
   - Select the "Use FTP server for S7 CPU data" check box.
   - Assign the CPU, a data block and a file name under which the DB for FTP will be stored.

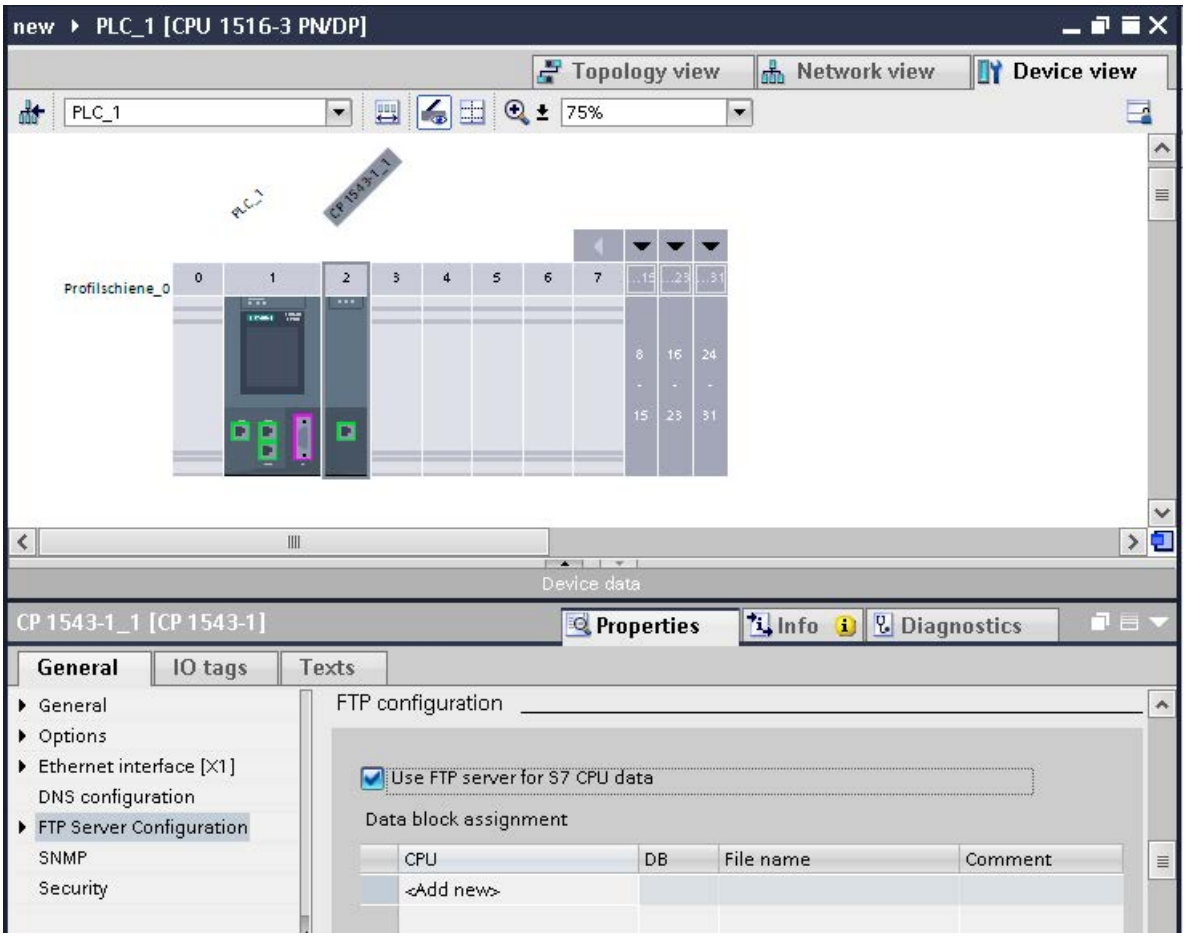

Figure 6-5 Setting up the FTP configuration

3. Download the hardware configuration to the CPU.

Procedure for setting up FTP client functionality

Requirement: The FTP server can be reached via the IPv4 network.

1. Configure an S7-1500 automation system with CPU and CP 1543-1 in the device view of the Devices & networks editor of STEP 7.

   At the same time, you need to select the check box "Permit access with PUT/GET communication from remote partner (PLC, HMI, OPC, ...)" in the HW configuration of the S7-1500 CPU under the "Protection" area navigation in the section "Connection mechanisms".

2. Call the FTP_CMD instruction in the user program of the CPU.
3. Set the connection parameters for the FTP server in the FTP_CMD instruction.
4. Create a global DB and within this DB a tag of the type FTP_CONNECT_IPV4, FTP_CONNECT_IPV6 or FTP_CONNECT_NAME.
5. Interconnect the tag within the data block with the FTP_CMD instruction.
6. For the connection to the FTP server, specify the following in the DB:
   - The user name, the password and the IP address for the FTP access in the relevant data type (FTP_CONNECT_IPV4, FTP_CONNECT_IPV6 or FTP_CONNECT_NAME)
7. Download the hardware configuration and user program to the CPU.

Additional information

The STEP 7 online help describes:

- The system data types
- The instructions for open communication
- The connection parameters

6.8 Establishment and termination of communications relations

Establishment and termination of communications

The table below shows the establishment and termination of communications as part of open communication.

Table 6- 5 Establishment and termination of communications

Setting up the connection	Establishing communication	Terminating communication
With the user program	After downloading the user program to the CPUs: The passive communications partner sets up the local connection access by calling TSEND_C/TRCV_C or TCON. Calling TSEND_C/TRCV_C or TCON on the active partner starts connection establishment. If the connection could be established, there is positive feedback to the instructions in the user program. After you have terminated a connection using the instruction T_RESET, the connection is reestablished. If the connection aborts, the active partner attempts to re-establish the connection. This applies only if the connection was successfully established beforehand with TCON.	• Using the TSEND_C/TRCV_C, TDISCON and T_RESET instructions • When the CPU changes from RUN to STOP mode • With POWER OFF/POWER ON on a CPU
By configuring a connection	After downloading the connection configuration and the user program to the CPUs.	By deleting the connection configuration in STEP 7 and downloading the changed configuration to the CPU.

S7 communication 7

Characteristics of S7 communication

S7 communication as homogeneous SIMATIC communication is characterized by vendor-specific communication between SIMATIC CPUs (not an open standard). S7 communication is used for migration and for connecting to existing systems (S7-300, S7-400).

For data transfer between two S7-1500 automation systems, we recommend that you use open communication (see section Open communication (Page 31)).

Properties of S7 communication

Using S7 communication, the CPU exchanges data with another CPU. Once the user has received the data at the receiver end, the reception data is automatically acknowledged to the sending CPU.

The data is exchanged via configured S7 connections. S7 connections can be configured at one end or at both ends.

S7 communication is possible via:

- Integrated PROFINET or PROFIBUS DP interface of a CPU
- Interface of a CP/CM

S7 connections configured at one end

For an S7 connection configured at one end, the configuration for this connection takes place in only one communication partner and is only downloaded to it.

A one-sided S7 connection can be configured to a CPU that is only a server of an S7 connection (e.g. CPU 315-2 DP). The CPU is configured and the address parameters and interfaces are thus known.

In addition, a one-sided S7 connection can be configured to a partner who is not in the project and whose address parameters and interface and therefore are not known. You need to enter the address; it is not checked by STEP 7. The partner is initially unspecified (no partner address is registered when you create the S7 connection). Once you enter the address, it is "unknown" (i.e. it is named, but the project is unknown).

This makes it possible to use S7 connections beyond the boundaries of a project. The communication partner is unknown to the local project (unspecified) and is configured in another STEP 7 or third-party project.

S7 connections configured at both ends

When an S7 connection is configured at both ends, the configuration and download of the configured S7 connection parameters takes place in both communication partners.

Instructions for S7 communication

For S7 communication with S7-1500, the following instructions can be used:

- PUT/GET

  You write data to a remote CPU with the PUT instruction. You can use the GET instruction to read data from a remote CPU. The PUT and GET instructions and are one-sided instructions, i.e. you need only an instruction in one communication partner. You can can easily set up the PUT and GET instructions via the connection configuration.

  Note

  Data blocks for PUT/GET instructions

  When using the PUT/GET instructions, you can only use data blocks with absolute addressing. Symbolic addressing of data blocks is not possible.

  You must also enable this service for protection in the CPU configuration in the "Protection" area.

- BSEND/BRCV

  The BSEND instruction sends data to a remote partner instruction of the type BRCV. The BRCV instruction receives data from a remote partner instruction of the type BSEND. You use the S7 communication via the BSEND/BRCV instruction pair for secure transmission of data.

- USEND/URCV

  The USEND instruction sends data to a remote partner instruction of the type URCV. The URCV instruction receives data from a remote partner instruction of the type USEND. You use the S7 communication via the BSEND/BRCV instruction pair for fast, non-secure transmission of data regardless of the timing of the processing by the communications partner; for example for operating and maintenance messages.

PROFIBUS DP interface in slave mode

You can find the "Test, commissioning, routing" check box in STEP 7 in the properties of the PROFIBUS DP interface of communications modules (e.g. CM 1542-5). Using this check box, you decide whether the PROFIBUS DP interface of the DP slave is an active or passive device on PROFIBUS.

- Check box selected: The slave is an active device on PROFIBUS. You can only set up S7 connections configured at both ends for this DP slave.
- Check box cleared: The DP slave is a passive device on PROFIBUS. You can only set up S7 connections configured at one end for this DP slave.

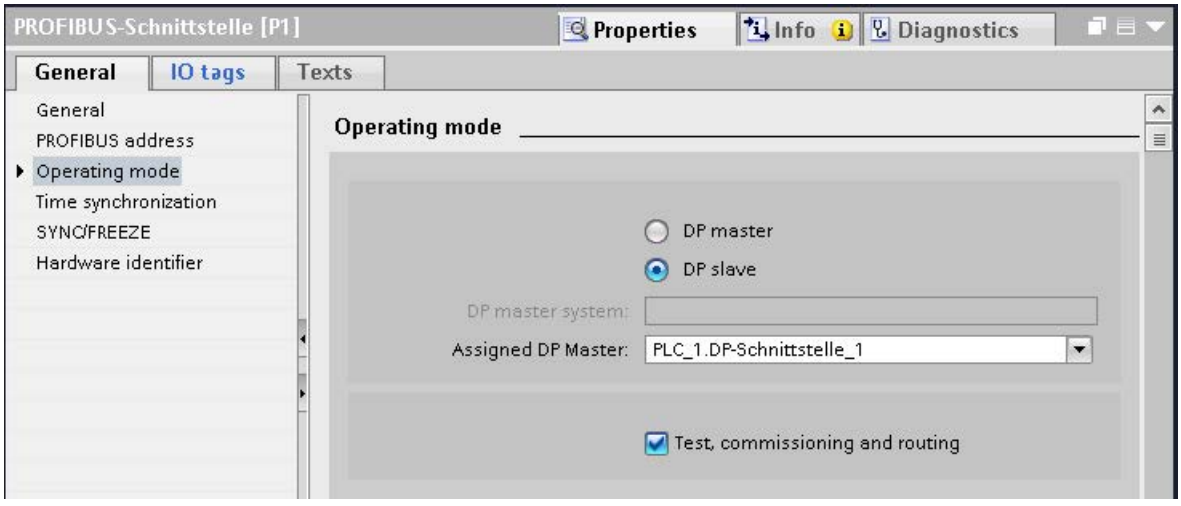

Figure 7-1 "Test, commissioning, routing" check box

Configuring S7 connections for PUT/GET instructions

You can create S7 connections and assign the parameters for these in the connection parameter assignment of the PUT/GET instructions. Changed values are checked immediately by the connection parameter assignment for input errors.

Requirement: A PUT or GET instruction is created in the programming editor.

To configure an S7 connection using PUT/GET instructions, follow these steps:

1. In the program editor, select the call of the PUT or GET instruction.
2. Open the "Properties > Configuration" tab in the inspector window.

3. Select the "Connection parameters" group. Until you select a connection partner, only the empty drop-down list for the partner end point is enabled. All other input options are disabled.

   The connection parameters already known are displayed:

   – Name of the local end point
   – Interface of the local end point
   – IPv4 address of the local end point

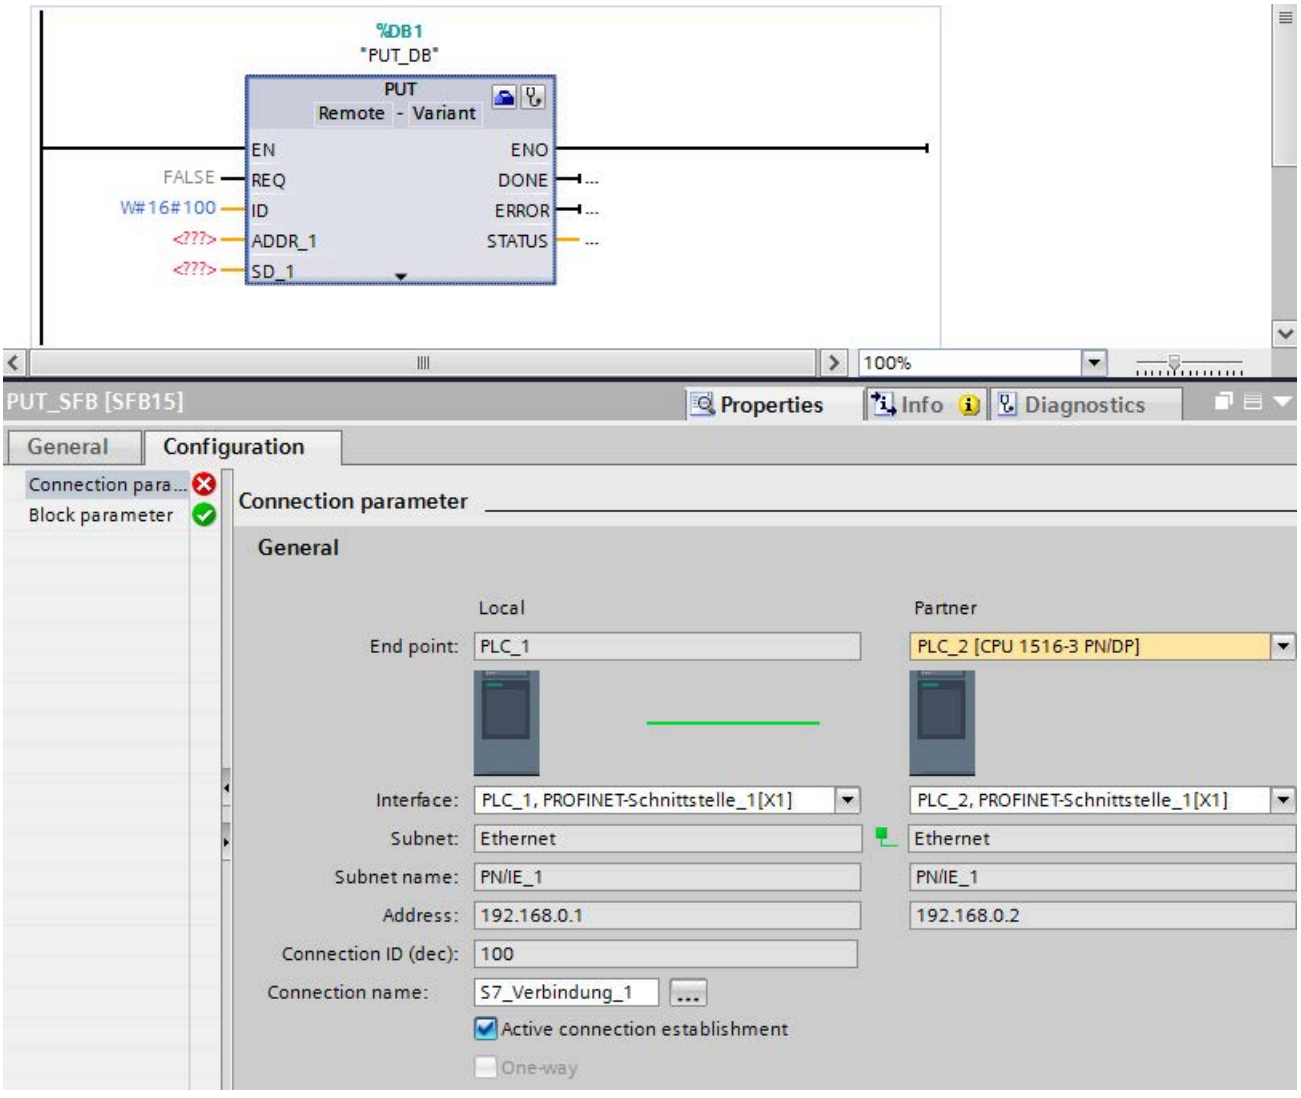

Figure 7-2 Connection configuration for PUT instruction

4. In the drop-down list box of the partner end point, select a connection partner. You can select an unspecified device or a CPU in the project as the communication partner.

   The following parameters are automatically entered as soon as you have selected the connection partner:

   – Name of the partner end point
   – Interface of the partner end point. If several interfaces are available, you can change the interface as required.
   – Interface type of the partner end point
   – Subnet name of both end points
   – IPv4 address of the partner end point
   – Name of the connection which is used for the communication.

5. If required, change the connection name in the "Connection name" input box. If you want to create a new connection or edit an existing connection, click on the "Create new connection" icon.

Note

The PUT and GET instructions between two communication partners can only run if both the hardware configuration and the program part for the partner end point have been loaded into the hardware. To achieve fully functional communication, make sure that you load not only the connection description of the local CPU on the device but also that of the partner CPU as well.

Configuring S7 connections for e.g. BSEND/BRCV

If you want to use the instructions for BSEND/BRCV for S7 communication, for example, you first need to configure an S7 connection.

To configure a S7 connection, follow these steps:

1. Configure the communications partners in the network view of the Devices & networks editor of STEP 7.
2. Select the "Connections" button and the "S7 connection" entry from the drop-down list.
3. Using drag-and-drop, connect the communication partner with each other (via an interface or local end point). If the required S7 subnet does not yet exist, it is created automatically.

   You can also set up a connection to unspecified partners.

4. In the "Connections" tab, select the row of the S7 connection.
5. Set the properties of the S7 connection in the "Properties" tab in the "General" area, for example the name of the connection and the interfaces of the communications partner that will be used.

   For S7 connections to an unspecified partner, set the address of the partner.
   You can find the local ID (reference of the S7 connection in the user program) in the "Local ID" area.

6. In the Project tree, select the "Program blocks" folder for one of the CPUs and open OB1 in the folder by double-clicking on it. The program editor opens.
7. In the program editor, call the relevant instructions for S7 communication in the user program of the communication partner (configured at one end) or in the user programs of the communication partners (configured at both ends). Select the BSEND and BRCV instructions from the "Communication" area of the "Instructions" task card, for example, and drag them to a network of OB1.
8. At the ID parameter of the instruction, assign the local ID of the configured connection to be used for the transmission of data.
9. Assign the parameters for the instructions indicating which data will be written to where and which data will be read from where.
10. Download the hardware configuration and user program to the CPU(s).

S7 communication via CP 1543-1

If you set up S7 communication via the Industrial Ethernet interface of the CP 1543-1, you can select the transport protocol for data transfer in the properties of the S7 connection under "General":

- "TCP/IP" check box selected (default): ISO-on-TCP (RFC1006): for S7 communication between S7-1500 CPUs
- "TCP/IP" check box cleared: ISO protocol (IEC8073): Addressing using MAC addresses

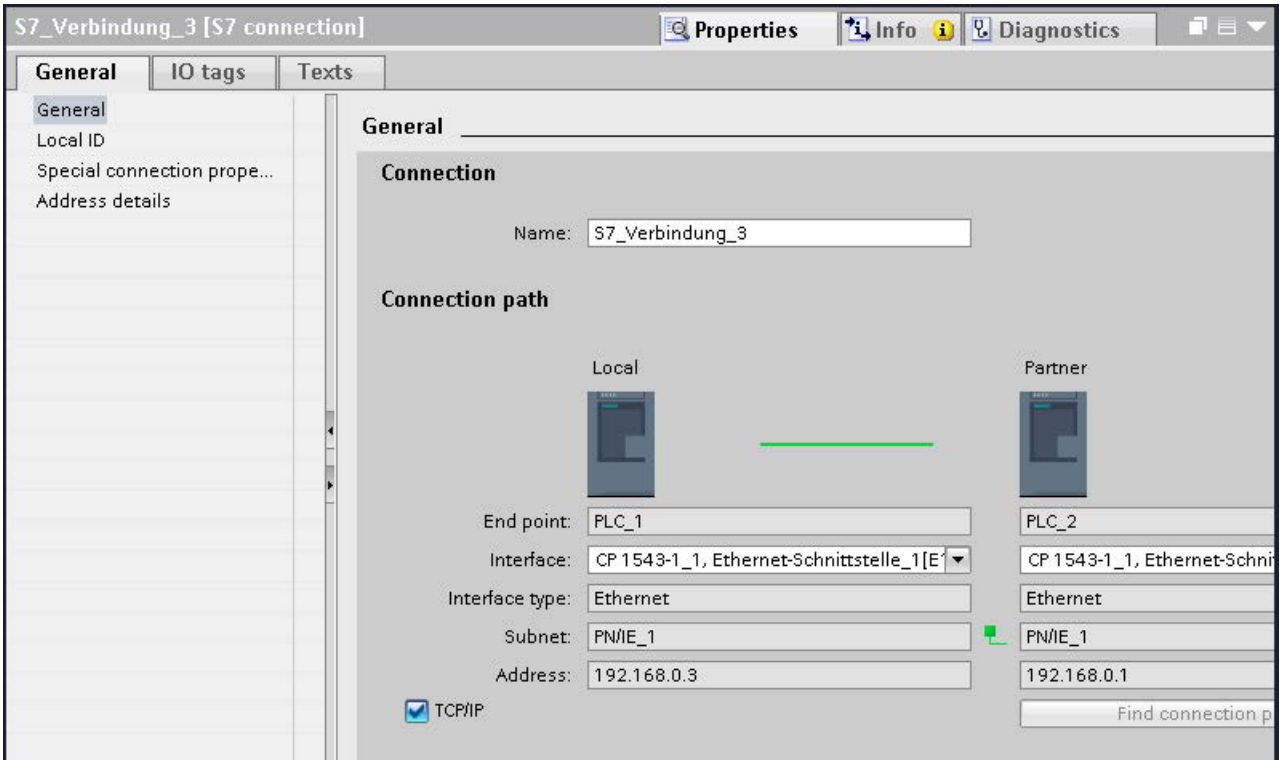

Figure 7-3 Selecting the CP 1543-1 transport protocol

Procedure for setting up an S7 connection via different S7 subnets

You have the option of using an S7 connection via multiple S7 subnets (PROFIBUS, PROFINET/Industrial Ethernet) (S7 routing).

1. Configure the communications partners in the network view of the Devices & networks editor of STEP 7.
2. Select the "Network" button.
3. Connect the relevant interfaces with the S7 subnets (PROFIBUS, PROFINET/Industrial Ethernet) using drag-and-drop.

4. Select the "Connections" button and the "S7 connection" entry from the drop-down list.
5. Using drag-and-drop in our example, connect PLC_1 in the left S7 subnet (PROFIBUS) to PLC_3 in the right S7 subnet (PROFINET).

   The S7 connection between CPU 1 and CPU 3 is configured.

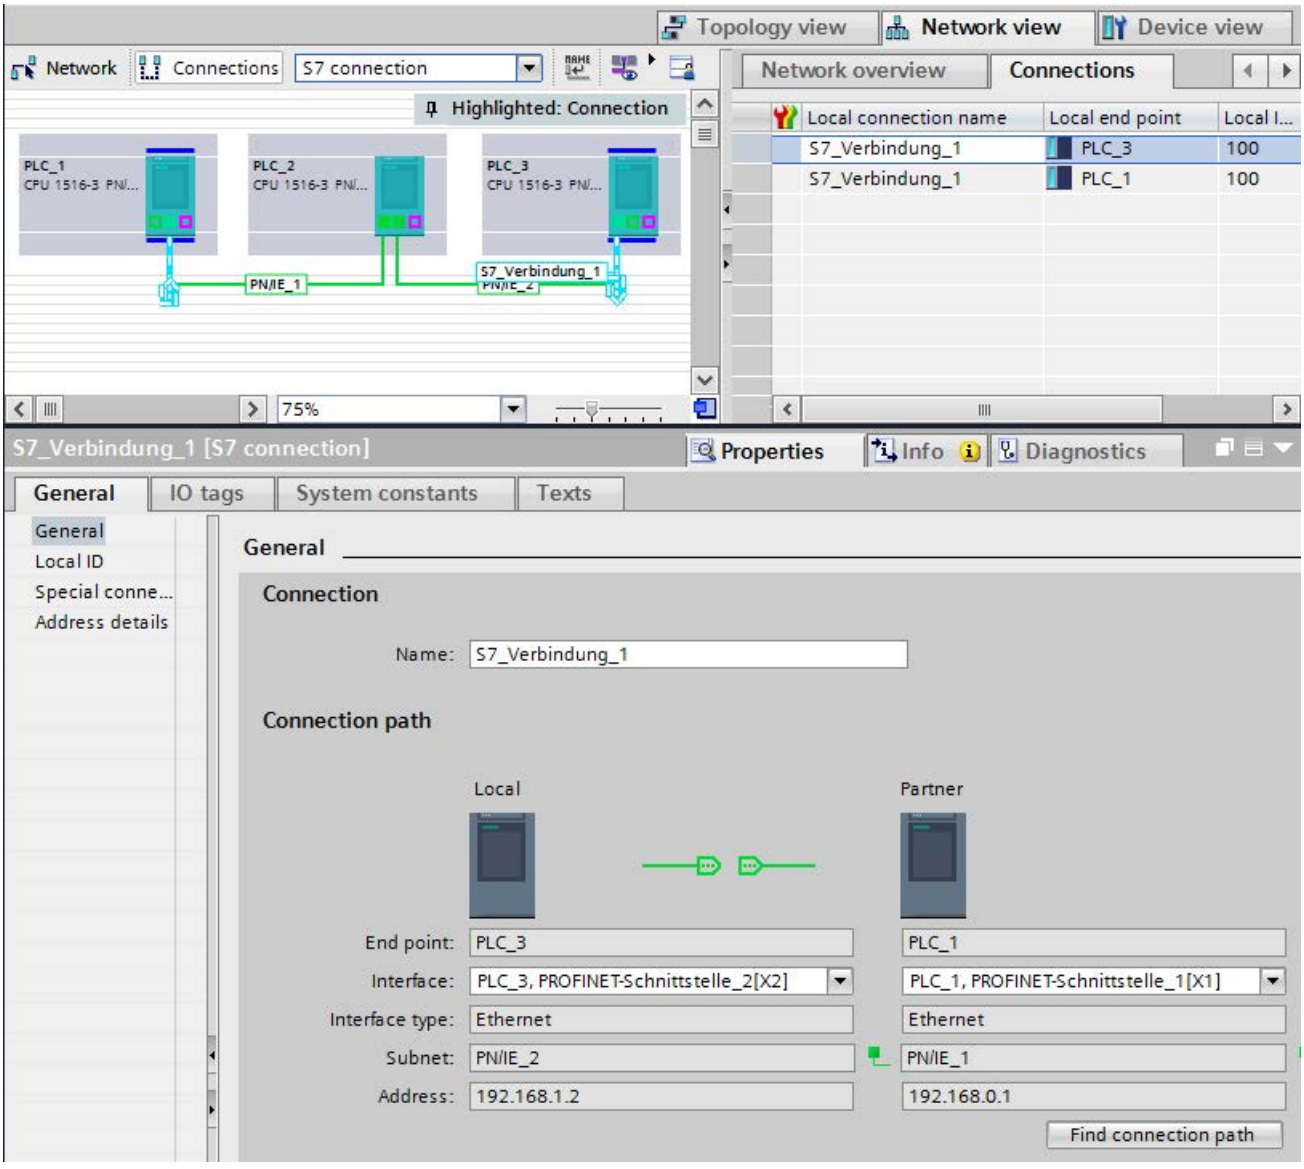

Figure 7-4 S7 connections via different subnets

CPU 1515SP PCas router for S7 connections

If you assign the "PROFINET onboard [X2]" interface to the CPU 1515SP PC of the SIMATIC PC station, the CPU 1515SP PC can be used as a router for S7 connections. With the setting "None, or a different Windows setting" on the CP interface "PROFINET onboard [X2]" , it is not possible to use the CPU 1515SP PC as a router for routed S7 connections.

An existing S7 connection routed by the CPU 1515SP PC becomes invalid if the assignment of the interface of the CPU 1515SP PC is changed from "SIMATIC PC station" to "None, or a different Windows setting". Since the PLC now no longer handles routing functions for this connection, when the CPU 1515SP PC is compiled, no message relating to the invalid connection is displayed. The invalid routed S7 connection is displayed only when the end points of the connection are compiled.

The interfaces required for routed S7 connections must remain explicitly assigned on the CPU 1515SP PC . You can edit the assignment of the interface of the CPU 1515SP PC in the properties under "PROFINET onboard [X2] > Interface assignment".

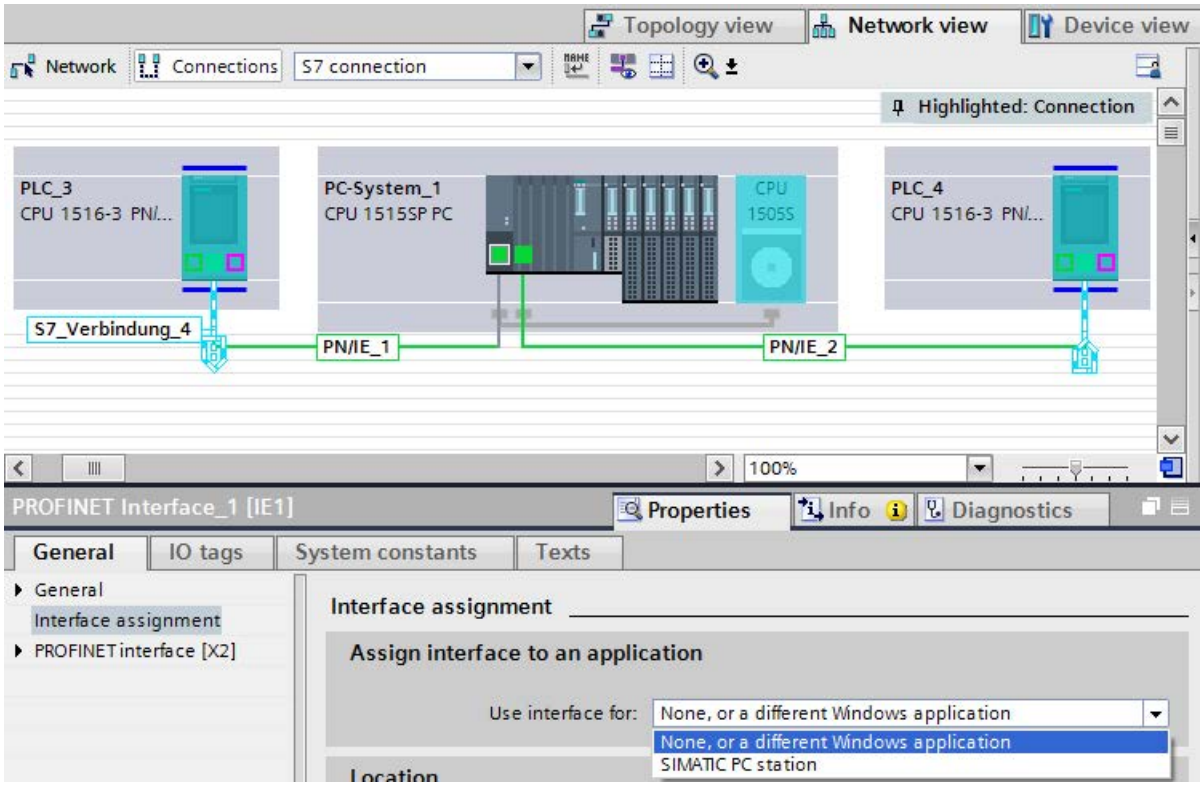

Figure 7-5 S7 routing PC station

Additional information

You can find detailed information on configuring S7 connections and how to use the instructions for S7 communication in the user program in the STEP 7 online help.

Point-to-point link

8

Functionality

A point-to-point connection for S7-1500, ET 200MP and ET 200SP is established via communications modules (CMs) with serial interfaces (RS232, RS422 or RS485):

- S7-1500/ET 200MP:
  - CM PtP RS232 BA
  - CM PtP RS422/485 BA
  - CM PtP RS232 HF
  - CM PtP RS422/485 HF
- ET 200SP:
  - CM PtP

The bidirectional data exchange via a point-to-point connection works between communications modules or third-party systems or devices capable of communication. At least 2 communication partners are required for communication ("point-to-point"). With RS422 and RS485, more than two communications partners are possible.

Protocols for communication via a point-to-point connection

- Freeport protocol (also called ASCII protocol)
- Procedure 3964 R)
- Modbus protocol in RTU format (RTU: Remote Terminal Unit)
- USS protocol (universal serial interface protocol)

The protocols use different layers according to the ISO/OSI reference model:

- Freeport: Uses layer 1 (physical layer)
- 3964 (R), USS and Modbus: Use layer 1 and 2 (physical layer and data link layer; therefore greater transmission reliability than with Freeport). USS and Modbus use additionally layer 4.

Properties of the Freeport protocol

- The recipient recognizes the end of the data transfer by means of a selectable end criterion (e.g. character delay time elapsed, receipt of end character, receipt of a fixed amount of data).
- The sender cannot recognize whether the sent data arrived free of errors at the recipient.

Properties of procedure 3964 (R)

- When the data is sent, control characters are added (start, end and block check characters). Make sure that these control characters are not included as data in the frame.
- Connection establishment and termination makes use of control characters.
- If transfer errors occur, data transfer is automatically repeated.

Data exchange using Freeport or 3964 (R) communication

The data to be sent is stored in the user program of the corresponding CPU in data blocks (send buffer). A receive buffer is available on the communications module for the received data. Check the properties of the receive buffer and adapt them if necessary. You must create a data block for receiving in the CPU.

In the user program of the CPU, the "Send_P2P" and "Receive_P2P" instructions handle the data transfer between the CPU and CM.

Procedure for setting up Freeport or 3964 (R) communication

1. Configure an S7-1500 configuration with CPU and CM in the device view of the hardware and network editor of STEP 7.
2. Assign the parameters for the interface of the CP (protocol, port parameters) in the "General" area in the "Properties" tab.

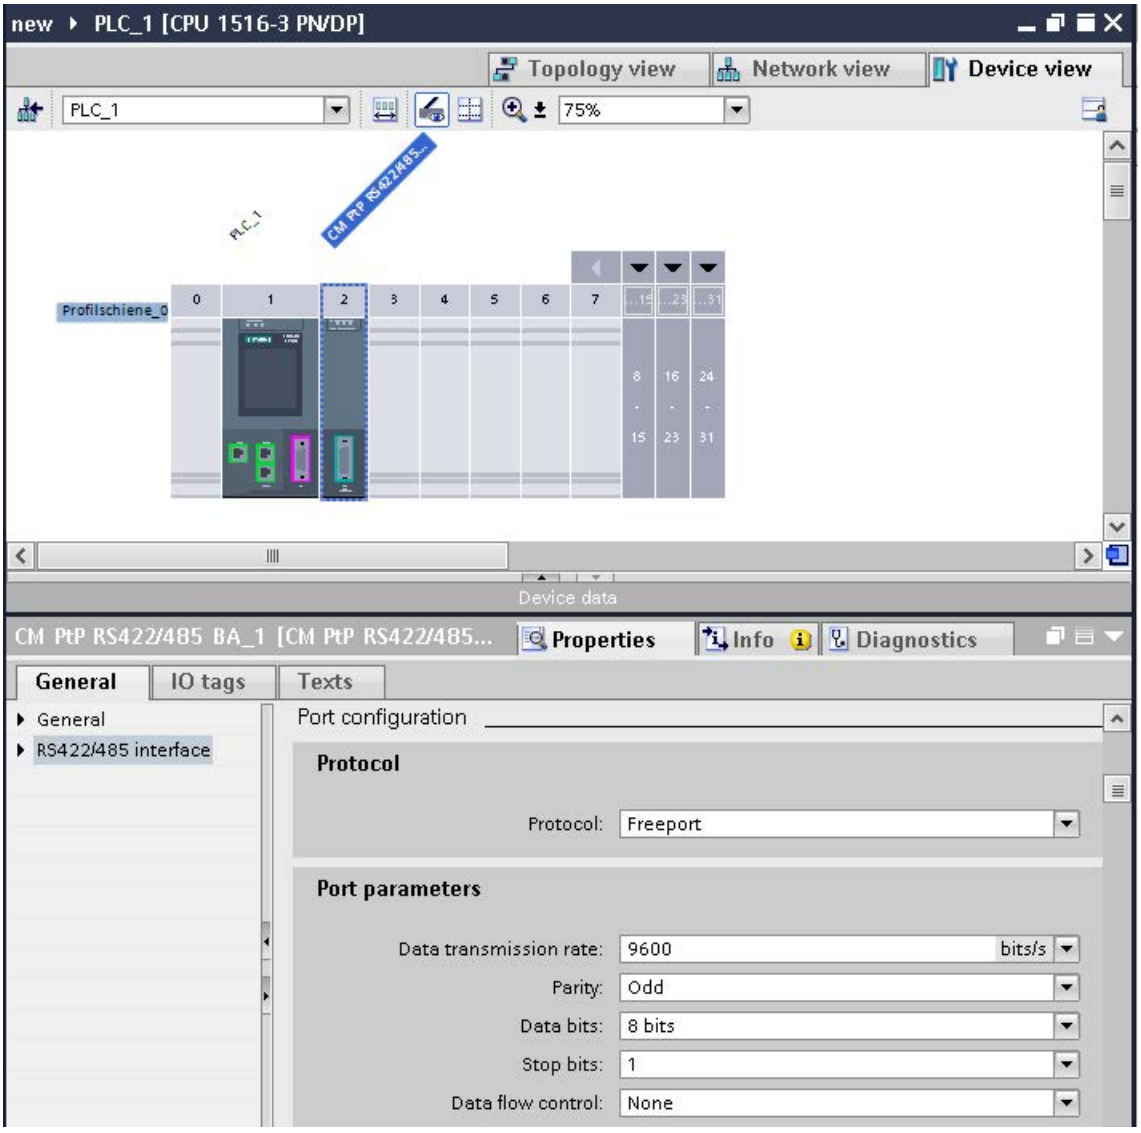

Figure 8-1 Setting up PtP communication

3. In the Project tree, select the "Program blocks" folder and open OB1 in the folder by double-clicking on it. The program editor opens.
4. Select the "Send_P2P" and "Receive_P2P" instructions from the "Communication" area of the "Instructions" task card and drag them to a network of OB1.
5. Assign the parameters for the instructions according to your configuration.
6. Download the hardware configuration and user program to the CPU.

Otherwise: Dynamic configuration via the user program

In certain types of application it is an advantage to set up communication dynamically; in other words, program-controlled by a specific application.

Typical applications for this, could be, for example manufacturers of serial machines. To make the user interfaces as convenient as possible for their customers, these manufacturers adapt the communications services to the particular operator entries.

Instructions for Freeport communication

There are 3 instructions available for the dynamic configuration in the user program for Freeport communication. The following applies to all 3 instructions: the previously valid configuration data is overwritten but not stored permanently in the target system.

- The "Port_Config" instruction is used for the program-controlled configuration of the relevant port of the communications module.
- The "Send_Config" instruction is used for the dynamic configuration, for example of time intervals and breaks in transmission (serial transmission parameters) for the relevant port.
- The "Receive_Config" instruction is used for dynamic configuration, for example of conditions for the start and end of a message to be transferred (serial receive parameters) for the relevant port.

Instructions for 3964 (R) communication

There are 2 instructions available for dynamic configuration in the user program for 3964 (R) communication. The following applies to the instructions: the previously valid configuration data is overwritten but not stored permanently in the target system.

- The "Port_Config" instruction is used for the program-controlled configuration of the relevant port of the communications module.
- The "P3964_Config" instruction is used for the dynamic configuration of protocol parameters.

Properties of the USS protocol

- Simple, serial data transfer protocol with cyclic message frame traffic in half duplex mode that is tailored to the requirements of drive technology.
- Data transfer works according to the master-slave principle.
  - The master has access to the functions of the drive and can, among other things, control the drive, read status values and read and write the drive parameters.

Data exchange using USS communication

The communications module is the master. The master continuously sends frames (job frames) to the up to 16 drives and expects a response frame from each addressed drive.

A drive sends a response frame under the following conditions:

- When a frame is received without errors
- When the drive is addressed in this frame

A drive must not send if these conditions are not met or the drive was addressed in the broadcast.

The connection to the relevant drive exists for the master once it receives a response frame from the drive after a specified processing time (response delay time).

Procedure for setting up USS communication

1. Configure an S7-1500 configuration with CPU and CM in the device view of the hardware and network editor of STEP 7.
2. In the Project tree, select the "Program blocks" folder and open OB1 in the folder by double-clicking on it. The program editor opens.
3. Select the instructions for USS communication according to your task in the "Communication" area, "Communications processor" folder of the "Instructions" task card and drag them to a network of OB1:
   - The "USS_Port_Scan" instruction allows you to communicate via the USS network.
   - The "USS_Drive_Control" instruction prepares send data for the drive and evaluates the response data of the drive.
   - The "USS_Read_Param" instruction is used to read out parameters from the drive.
   - The "USS_Write_Param" instruction is used to change parameters on the drive.
4. Assign the parameters for the instructions according to your configuration.
5. Download the hardware configuration and user program to the CPU.

Properties of the Modbus protocol (RTU)

- Communication takes the form of serial, asynchronous transfer with a transmission speed of up to 115.2 kbps, half duplex.
- Data transfer works according to the master-slave principle.
- The Modbus master can send jobs for reading and writing operands to the Modbus slave:
  - Reading inputs, timers, counters, outputs, memory bits, data blocks
  - Writing outputs, memory bits, data blocks
- Broadcast to all slaves is possible.

Data exchange using Modbus communication (RTU)

The communications module can be a Modbus master or Modbus slave. A Modbus master can communicate with one or more Modbus slaves (the number depends on the physical interface). Only the Modbus slave explicitly addressed by the Modbus master is permitted to return data to the Modbus master. The slave detects the end of the data transfer and acknowledges it. If an error occurs, it provides an error code to the master.

Procedure for setting up Modbus communication (RTU)

1. Configure an S7-1500 configuration with CPU and CM in the device view of the hardware and network editor of STEP 7.
2. In the Project tree, select the "Program blocks" folder and open OB1 in the folder by double-clicking on it. The program editor opens.
3. Select the instructions for Modbus communication according to your task in the "Communication" area, "Communications processor" folder of the "Instructions" task card and drag them to a network of OB1:
   - The "Modbus_Comm_Load" instruction configures the port of the CM for Modbus communication.
   - The "Modbus_Master" instruction is used for Modbus master functionality.
   - The "Modbus_Slave" instruction is used for Modbus slave functionality.
4. Assign the parameters for the instructions according to your configuration.
5. Download the hardware configuration and user program to the CPU.

Additional information

- You can find more detailed information on communication via point-to-point connections and basics of serial data transmission in the function manual CM PtP communication module - Configurations for point-to-point connections (http://support.automation.siemens.com/WW/view/en/59057093).
- You can find a description of how to use the instructions for point-to-point connections in the user program in the STEP 7 online help.
- You can find information about the communications modules with a serial interface in the manual of the particular communications module.

Routing

9

9.1 S7 routing

Definition of S7 routing

S7 routing is the transfer of data beyond S7 subnet boundaries. You can send information from a transmitter to a receiver across several s7 subnets. The gateway from one S7 subnet to one or more other subnets is provided by the S7 router The S7 router is a device which has interfaces to the respective S7 subnets. S7 routing is possible via various S7 subnets (PROFINET/Industrial Ethernet and/or PROFIBUS).

Requirements for S7 routing

- All devices that can be reached in a network have been configured in a project in STEP 7 and downloaded.
- All devices involved in the S7 routing must receive routing information about the S7 subnets that can be reached through specific S7 routers. The devices obtain the routing information by downloading the hardware configuration to the CPUs, since the CPUs play the role of an S7 router.

  In a topology with several consecutive S7 subnets, the following order must be kept to when downloading: First download the hardware configuration to the CPU(s) directly connected to the same S7 subnet as the PG/PC, then download one by one the CPUs of the S7 subnets beyond this starting with the nearest S7 subnet through to the S7 subnet furthest away.
- The PG/PC you want to use to establish a connection via a S7 router must be assigned to the S7 subnet it is physically connected to. You can assign the PG/PC to a PG/PC in STEP 7 under Online & Diagnostics > Online accesses > Connection to interface/subnet.
- For S7 subnets of the type PROFIBUS: Either the CPU must be configured as DP master or, if it is configured as a DP slave, the "Test, commissioning, routing" check box must be selected in the properties of the DP interface of the DP slave.
- S7 routing for HMI connections is possible as of STEP 7 V13 SP1.

S7 routing for online connections

With the PG/PC, you can reach devices beyond S7 subnets, for example to do the following:

- Download user programs
- Download a hardware configuration
- Execute test and diagnostics functions

In the following figure, CPU 1 is the S7 router between S7 subnet 1 and S7 subnet 2.

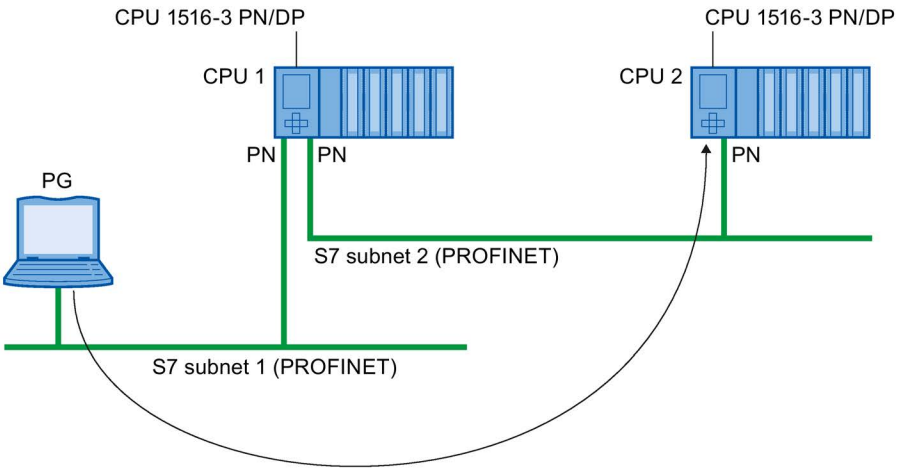

Figure 9-1 S7 routing: PROFINET - PROFINET

The following figure shows the access from a PG via PROFINET to PROFIBUS. CPU 1 is the S7 router between S7 subnet 1 and S7 subnet 2; CPU 2 is the S7 router between S7 subnet 2 and S7 subnet 3.

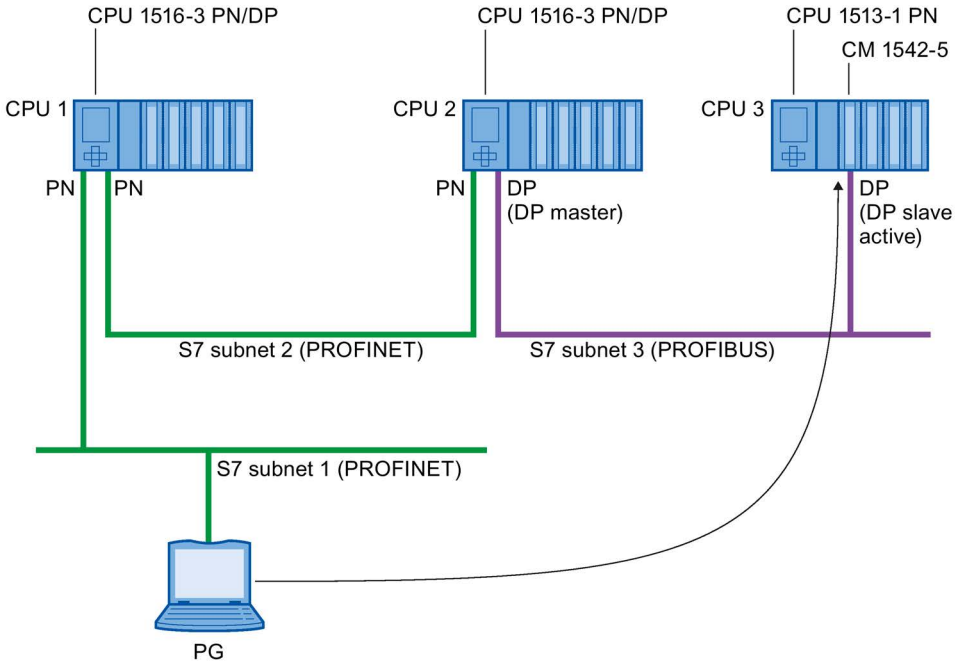

Figure 9-2 S7 routing: PROFINET - PROFIBUS

S7 routing for HMI connections

You have the option of setting up an S7 connection from an HMI to a CPU via different subnets (PROFIBUS and PROFINET or Industrial Ethernet). In the following figure, CPU 1 is the S7 router between S7 subnet 1 and S7 subnet 2.

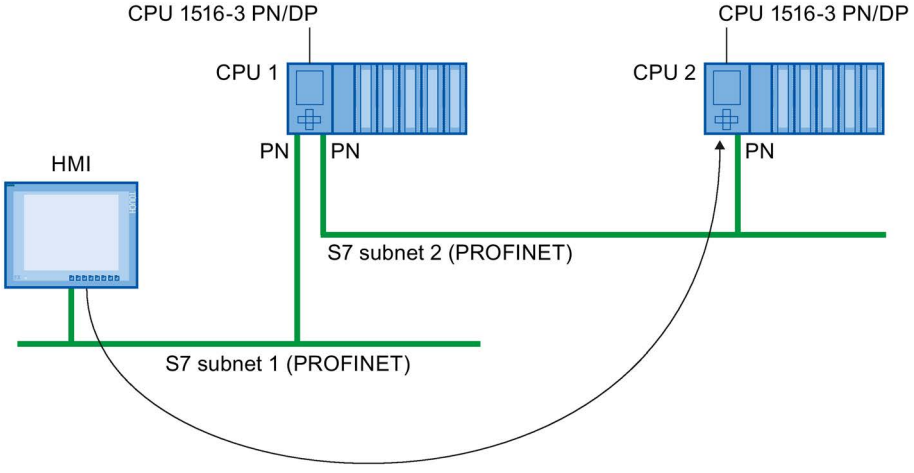

Figure 9-3 S7 routing via HMI connections

S7 routing for CPU-CPU communication

You have the option of setting up an S7 connection from a CPU to another CPU via different subnets (PROFIBUS and PROFINET or Industrial Ethernet). The procedure is described based on an example in the section S7 communication (Page 49).

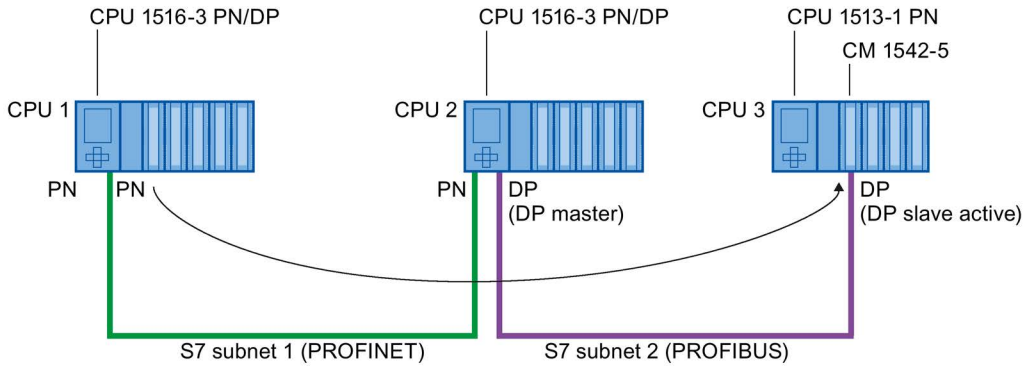

Figure 9-4 S7 routing via CPU-CPU communication

Using S7 routing

For the CPU, select the PG/PC interface and the S7 subnet in the "Go online" dialog of STEP 7. S7 routing is performed automatically.

Number of connections for S7 routing

The number of connections available for S7 routing in the S7 routers (CPUs, CMs or CPs) can be found in the technical specifications in the manuals of the relevant CPU/CM/CP.

S7 routing: Example of an application

The figure below shows the example of an application for remote maintenance of a system using a PG. The connection is made here beyond two S7 subnets via a modem connection.

You configure a remote connection via TeleService in STEP 7 using "Online access" or "Go online".

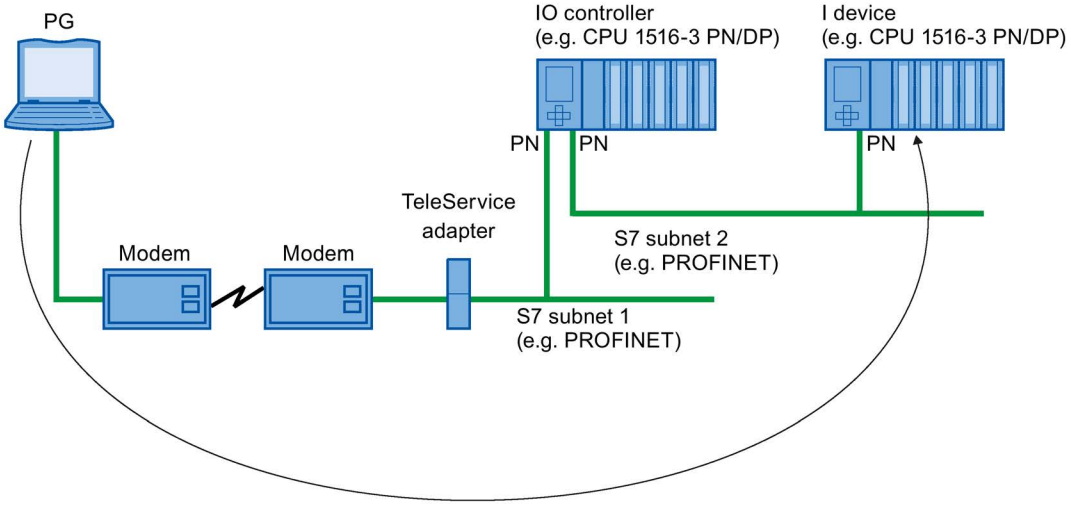

Figure 9-5 Remote maintenance of a plant using TeleService

Additional information

- The allocation of connection resources with S7 routing is described in the section Allocation of connection resources (Page 71).
- You can find more information on setting up TeleService in the STEP 7 online help.
- You can find more information on S7 routing and TeleService adapters when you search the Internet using the following links:
  - Device manual Industrial Software Engineering Tools TS Adapter IE Basic (http://support.automation.siemens.com/WW/view/en/51311100)
  - Downloads for the TS Adapter (http://support.automation.siemens.com/WW/view/en/10805406/133100)

HMI communication (Page 29)

9.2 Data record routing

Definition of data record routing

Data can be sent over PROFINET from an engineering station to field devices via multiple networks. Since the engineering station addresses the field devices using standardized records and these records are routed via S7 devices, the term "data record routing" is used to refer to this type of routing.

The data sent using data record routing include the parameter assignments for the participating field devices (slaves) and device-specific information (e.g. setpoint values, limit values).

Data record routing is used, for example, when field devices of different manufacturers are used. The field devices are addressed using standardized data records (PROFINET) for configuration and diagnostics.

Data record routing with STEP 7

You can perform data routing with STEP 7 by calling a device tool (for example, PCT) via the TCI interface (Tool Calling Interface) and passing call parameters. The device tool uses the communication paths that STEP 7 also uses for communication with the field device.

No configuration is required for this type of routing except the installation of the TCI tools on the STEP 7 computer.

Example: Data record routing with the Port Configuration Tool (PCT)

You can use the Port Configuration Tool (PCT) to configure the IO link master of the ET200 and assign parameters to connected IO link devices. The subnets are connected via data record routers. Data record routers are, for example, CPUs, CPs, IMs, IO link masters.

You can learn about the constellations of data record routers supported by the PCT here (http://support.automation.siemens.com/WW/view/en/87611392).

The figure below shows an example configuration with the data record routing with PCT.

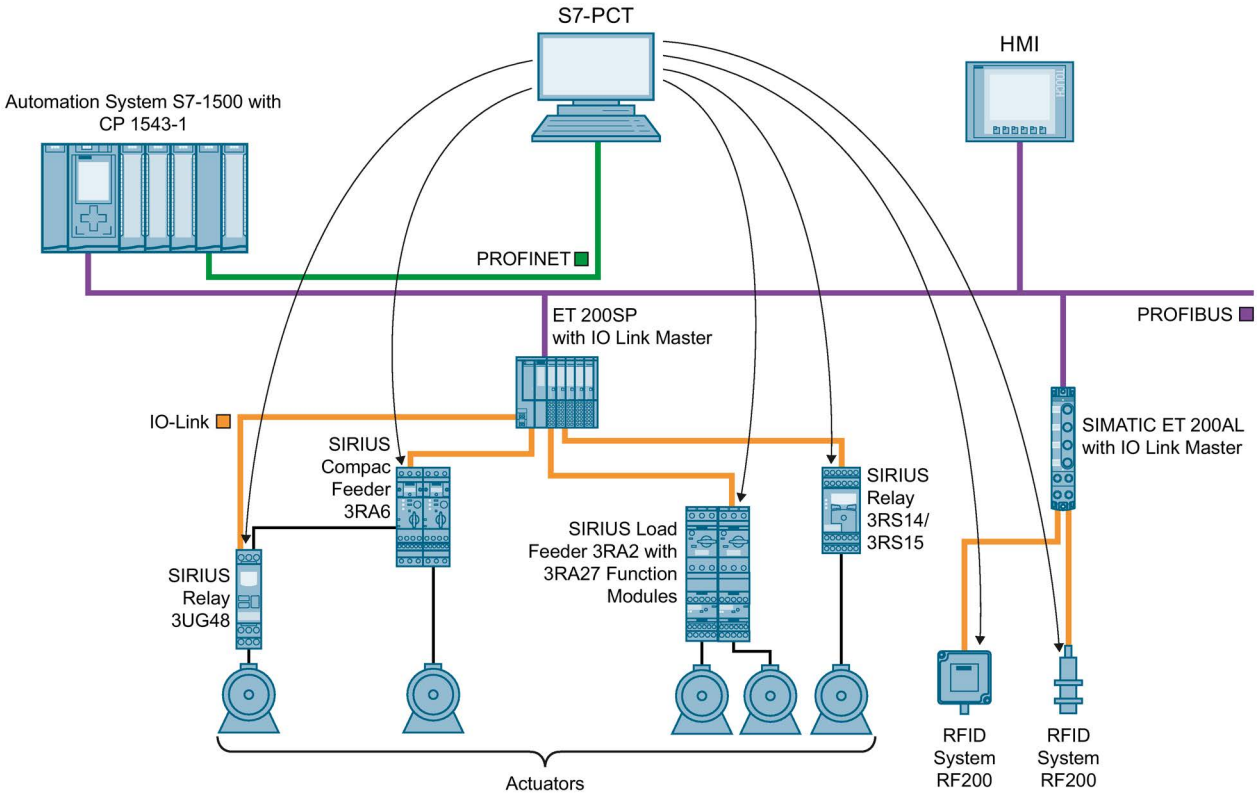

Figure 9-6 Example configuration for data record routing with PCT

Additional information

- Whether or not the CPU, CP or CM you are using supports data record routing can be found in the relevant manuals.
- The allocation of connection resources with data record routing is described in the section Allocation of connection resources (Page 71).
- You can find additional information on configuration with STEP 7 in the STEP 7 online help.

Connection resources

10

10.1 Allocation of connection resources

Allocation of connection resources with automatic connection

As soon as you have connected the PG or HMI device to a CPU physically and have gone online in STEP 7, connection resources are allocated.

Allocation of connection resources with programmed connection setup

With programmed connections, a connection resource is allocated when the instruction for establishing the connection (TSEND_C/TRCV_C or T_CON) is called.

With suitable parameter assignment of the CONT parameter of the TSEND_C/TRCV_C instructions or by calling the TDISCON instruction, the connection can be terminated following data transfer and the connection resource is available again. If the connection is terminated, the connection resources on the CPU/CP/CM are available again. If the connection remains, the execution time of the instructions during the next data transfer is shorter because the connection does not need to be established again. If the CPU goes to STOP, these connection resources are available again.

Allocation of connection resources with configured connection setup

With configured connections, the connection resource is allocated as soon as the hardware configuration is downloaded to the CPU.

After using a configured connection for transfer of data, the connection is not terminated. The connection resource is permanently allocated. To release the connection resource again, you need to delete the configured connection in STEP 7 and download the modified configuration to the CPU.

Monitoring the maximum possible number of connection resources

With **automatic** connections, the CPU monitors the use of connection resources in the automation system. Once the reserved connection resources have been exhausted, additional resources can be used (as long as connection resources are available for the automation system).

If the establishment and termination of the connections is **programmed** in the user program, you yourself will need to make sure that the limits of the connection resources are kept to on the automation system. If you use more connection resources that those provided by the automation system. the CPU acknowledges the instruction to establish connection with an error.

If you have **configured** connections in STEP 7, STEP 7 monitors use of the connection resources to ensure that the maximum possible number on an automation system is not exceeded. STEP 7 signals a violation of this with a suitable warning.

Configured connections: Display of the connection resources in STEP 7 (offline view)

You can display the reserved and available connection resources of an automation system in the hardware configuration. You can find the connection resources in the Inspector window in the properties of the CPU.

Connection resources

	Station resources			Module resour...	Module reso...	Module reso...
	Reserved		Dynamic ⚠	PLC_2 [CPU 15..	CP 1543-1_1..	CM 1542-5_1..
Maximum number of resources:		10	246	128	118	48
	Maximum	Configured	Configured	Configured	Configured	Configured
PG communication:	4	-	-	-	-	-
HMI communication:	4	4	6	6	4	0
S7 communication:	0	-	23	2	0	21
Open user communication:	0	-	118	39	52	27
Web communication:	2	-	-	-	-	-
Other communication:	-	-	-	-	-	-
Total resources used:		4	147	47	56	48
Available resources:		6	99	81	62	0

Figure 10-1 Reserved and available connection resources (offline view)

Module-specific connection resources (offline view)

The columns of the module-specific connection resources contain the following for the CPU, CPs and CMs of an automation system:

- How many connection resources are available as maximum for CPU/CP/CM
- How many of these were configured for which communications connections
- How many connection resources were configured in total and therefore used up
- How many connection resources are still available

The display is per module and not per interface.

In the example, the CPU provides a maximum of 128 connection resources. 6 HMI, 2 S7 and 39 open communication connections were configured for the CPU via the interfaces occupying a total of 47 resources on the CPU. 81 resources of the CPU remain available. For the CP 1543-1, 56 of the 118 available resources are allocated, 62 resources remain available. All 48 available resources are used for the CM 1542-5.

Station-specific connection resources (offline view)

The maximum number of available connection resources on the automation system (in the station) depends on the CPU being used. If the CPU-dependent limit is reached, it does not matter whether the CPU, CPs and CMs have further module-specific connection resources. For this station, the connection resources are used up.

In the example there are 246 + 10 reserved connection resources available for the automation system.

The 10 connection resources are reserved:

- 4 for PG communication required by STEP 7, for example, for test and diagnostics functions or downloading to the CPU
- 4 for HMI communication which are allocated by the first HMI connections configured in STEP 7
- 2 for communication with the web server that are allocated after connecting a Web browser if the web server of the CPU is activated

A maximum of 246 connection resources are dynamic; in other words, available for various communications services on the automation system. In this example, 147 of these connection resources are already configured for various communications services and modules. This leaves 99 connection resources available for the automation system.

The warning triangle in the column of the dynamic station resources is therefore displayed because the sum of the maximum available connection resources of CPU, CP and CM (= 294 connection resources) exceeds the station limit of 256.

Note

Available connection resources exceeded

STEP 7 signals the exceeding of the station-specific connection resources with a warning. In this case, either use a CPU with a higher maximum number of available station-specific connection resources or reduce the number of communications connections.

Display of the connection resources in STEP 7 (online view)

If you have selected a CPU in the network view of the Devices & networks editor of STEP 7 that is connected online, you can display the current status of the allocated and available resources for this automation system in the "Connection information" tab in the "Diagnostics" area of the Inspector window.

	Station resources					Module resour		Module resourc		Module resourc

Figure 10-2 Connection resources - online

The online view of the "Connection resources" table also contains the reserved and configured connection resources of the offline view columns with the connection resources currently allocated on the CPU. In the online view, **all** allocated connection resources on the automation system are displayed regardless of whether they were set up automatically, programmed or configured. In the "Other communication" row, allocated connection resources for communication with third-party devices and communication via data record routing are displayed. The table is updated automatically.

Note

If a routed S7 connection goes through a CPU, the required connection resources of the CPU do not appear in the table of connection resources!

Connection resources for HMI communication

You can find information about the availability and allocation of connection resources for HMI connections in the offline view in the context of the HMI device (in the Inspector window in the properties in the "Connection resources" area).

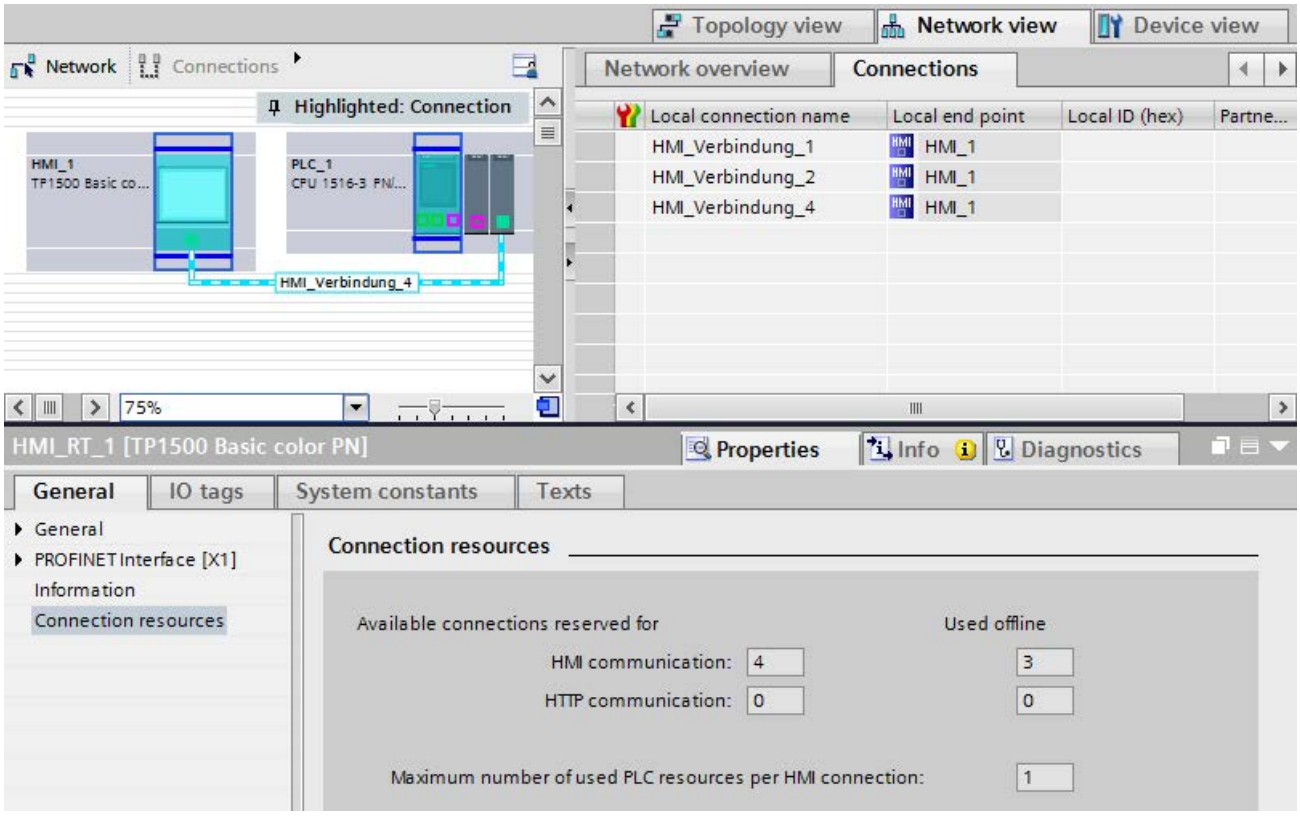

Figure 10-3 Connection resources - HMI communication

The following is displayed under "Offline used":

- The number of the connection resources used for HMI communication

  If the maximum number of available connection resources for an HMI device is exceeded, a corresponding message is output by STEP 7.

- The maximum number of connection resources allocated by the configured HMI connections

  With HMI communication, the allocation of connection resources in the CPU depends on the HMI device.

The following table shows the relationship between the HMI device used and the maximum allocated connection resources per HMI connection.

HMI device	Max. required connection resources of the CPU per HMI connection
Basic Panel	1
Comfort Panel	2[1]
RT Advanced	2[1]
RT Professional	3

[1] If you do not use system diagnostics and a message configuration, the CPU requires only one connection resource per HMI connection.

Connection resources for S7 routing

To transfer data beyond S7 subnets ("S7 routing"), an S7 connection is established between two CPUs. The S7 subnets are connected via gateways known as S7 routers. CPUs, CMs and CPs in S7-1500 are S7 routers.

The following applies for a routed S7 connection:

- A connection resource is allocated in each end point and displayed in the table of connection resources.
- In the S7 router, two connection resources are allocated, but they are not shown in the table of connection resources.

Connection resources for data record routing

Data record routing also enables transfer of data beyond S7 subnets from an engineering station connected to PROFINET to various field devices via PROFIBUS.

Two connection resources are allocated in each data record router for data record routing.

Note

Connection resources with data record routing

Two connection resources are allocated for data record routing in the data record router. Neither the data record connection nor the allocated connection resources are displayed in the table of connection resources.

Additional information

- S7 routing is described in the section S7 routing (Page 64).
- You can find the number of connection resources that an HMI device requires on the CPU in the documentation of the HMI device.

Connection diagnostics

11

Connections table in the online view

After selecting a CPU in the Devices & networks editor of STEP 7, you will see the status of your connections displayed in the online view of the connections table.

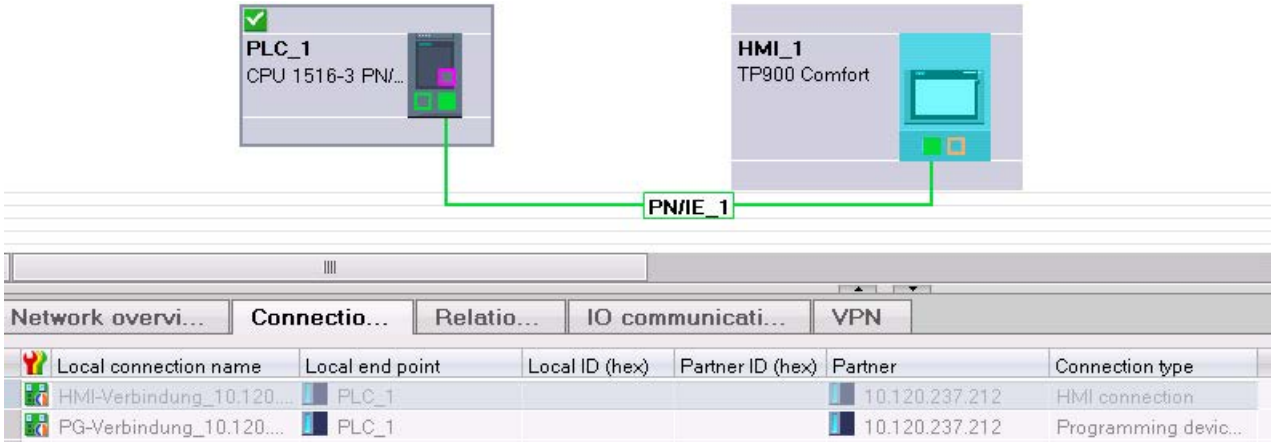

Figure 11-1 Online view of the connections table

After selecting the connection in the connections table, you obtain detailed diagnostic information in the "Connection information" tab.

"Connection information" tab: Connection details

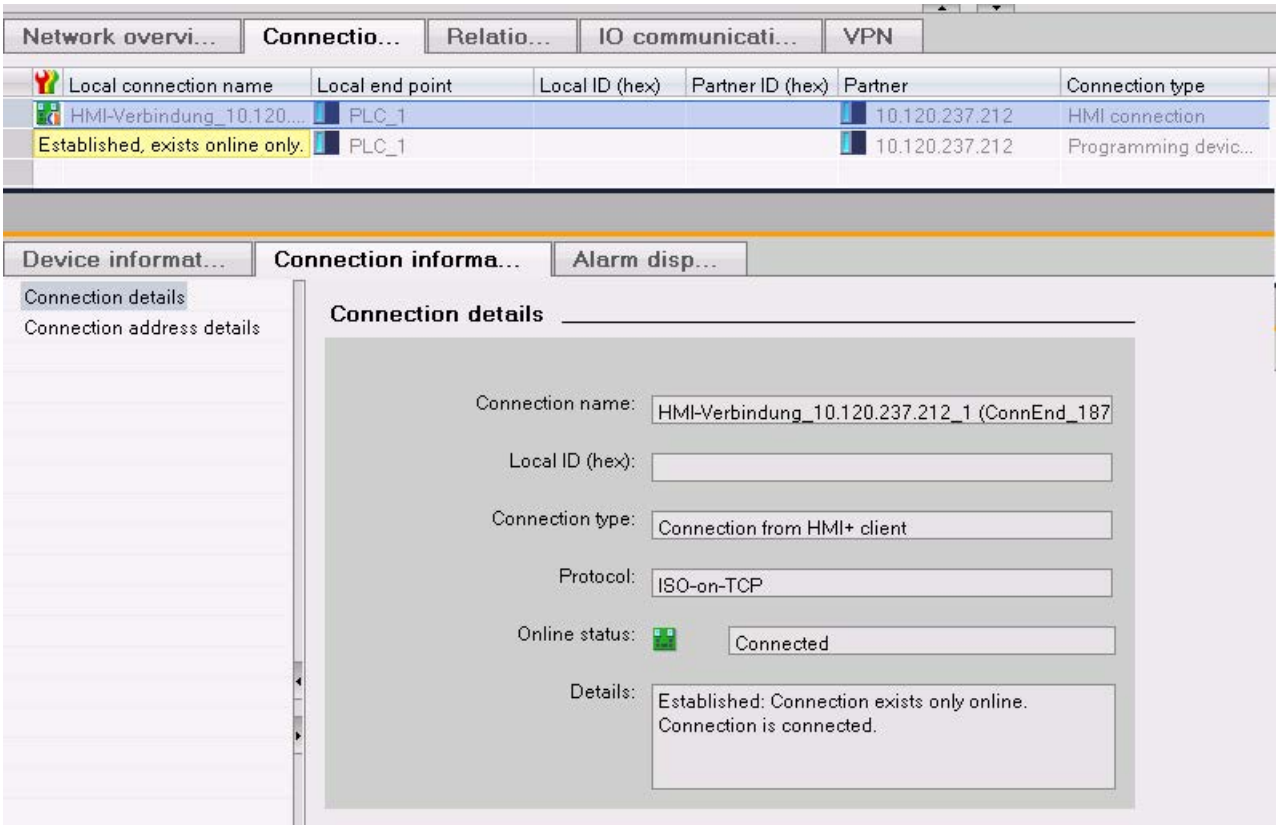

Figure 11-2 Diagnostics of connections - connection details

"Connection information" tab: Address details

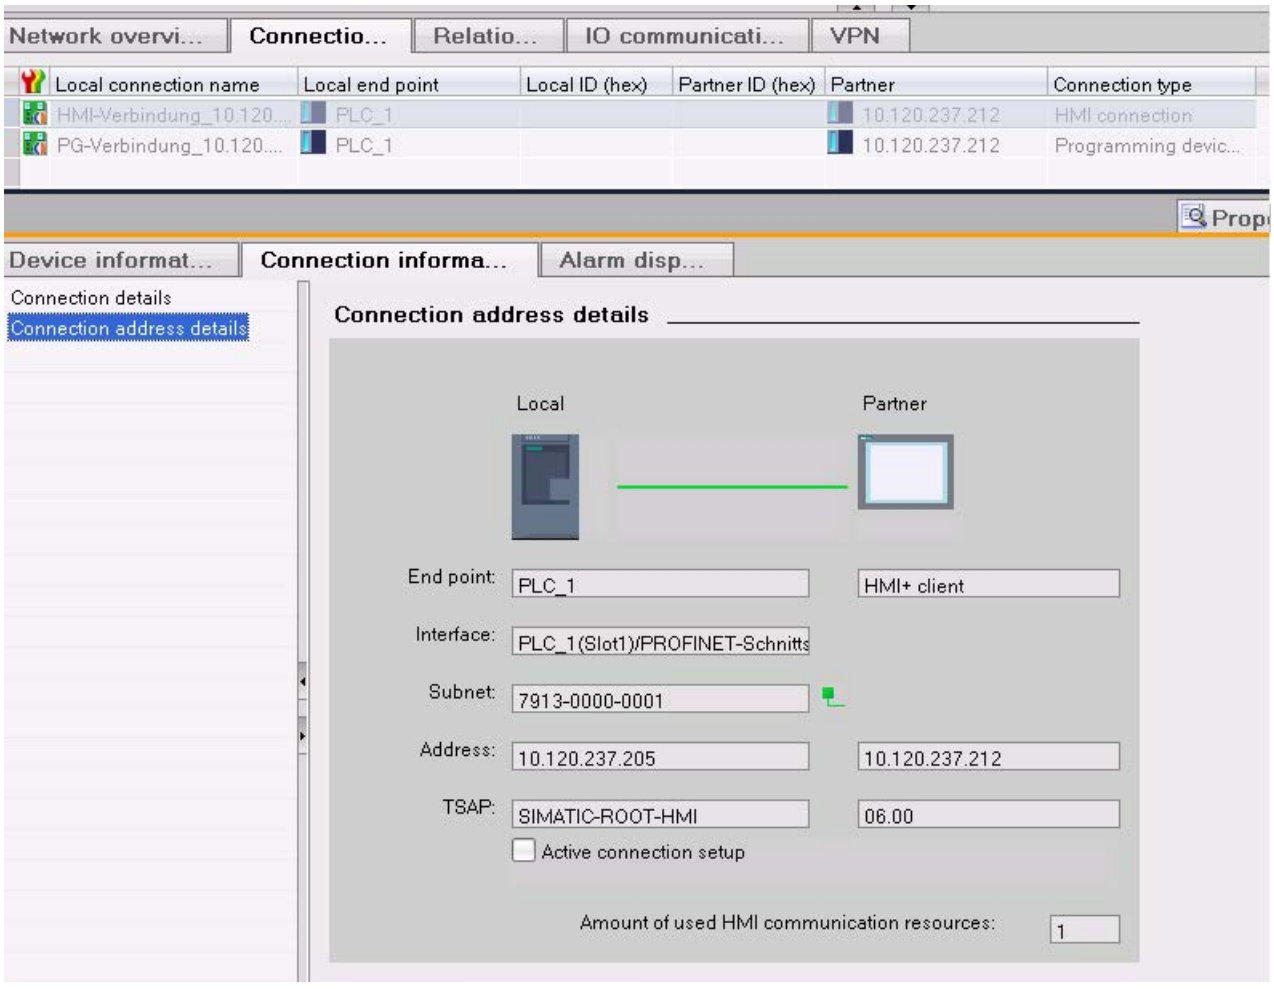

Figure 11-3 Diagnostics of connections - address details

Diagnostics via web server

You can evaluate diagnostic information from the CPU using a web browser via the integrated web server of a CPU.

On the "Communication" Web page, you will find the following information about communication via PROFINET in various tabs:

- Information on the PROFINET interfaces of the CPU (for example addresses, subnets, physical properties).
- Information on the quality of the data transfer (for example number of data packets sent/received error-free).
- Information about the allocation/availability of connection resources.
- The "Connections" page is similar to the online view in STEP 7 and also provides an overview of all connections with detail view.

Diagnostics with the user program

When you program the T_DIAG instruction, you can evaluate diagnostic information about the configured and programmed connections of the CPU using the user program.

Additional information

You will find the description of the web server functionality in the function manual Web server (http://support.automation.siemens.com/WW/view/en/59193560).

Industrial Ethernet Security 12

All-round protection - the task of Industrial Ethernet Security

With Industrial Ethernet Security, individual devices, automation cells or network segments of an Ethernet network can be protected. Data transfer can also be protected by a combination of different security measures:

- Data espionage
- Data manipulation
- Unauthorized access

Security measures

- Firewall
  - IP firewall with stateful packet inspection (layer 3 and 4)
  - Firewall also for Ethernet "non-IP" frames according to IEEE 802.3 (layer 2)
  - Bandwidth limitation
  - Global firewall rules

  All network nodes located in the internal network segment of a CP 1543-1 are protected by its firewall.
- Logging

  To allow monitoring, events can be stored in log files that can be read out using the configuration tool or can be sent automatically to a Syslog server.
- HTTPS

  For encrypted transfer of Web pages, for example during process monitoring.
- FTPS (explicit mode)

  For encrypted transfer of files.
- Secure NTP

  For secure time-of-day synchronization and transmission.
- SNMPv3

  For secure transmission of network analysis information safe from eavesdropping.
- Protection for devices and network segments

  The firewall protective function can be applied to the operation of single devices, several devices, or entire network segments.

12.1 Firewall

Tasks of the firewall

The purpose of the firewall functionality is to protect networks and stations from outside influences and disturbances. This means that only certain previously specified communications relations are permitted.

To filter the data traffic, IPv4 addresses, IPv4 subnets, port numbers or MAC addresses among other things can be used.

The firewall functionality can be configured for the following protocol levels:

- IP firewall with stateful packet inspection (layer 3 and 4)
- Firewall also for Ethernet "non-IP" frames according to IEEE 802.3 (layer 2)

Firewall rules

Firewall rules describe which packets are permitted or forbidden in which direction.

12.2 Logging

Functionality

For test and monitoring purposes, the security module has diagnostics and logging functions.

- Diagnostics functions

  These include various system and status functions that you can use in online mode.

- Logging functions

  This involves the recording of system and security events. Depending on the event type, the recording is made in volatile or non-volatile local buffer areas of the CP 1543-1. As an alternative, it is also possible to record on a network server.

  The parameter assignment and evaluation of these functions is only possible with a network connection.

Recording events with logging functions

You specify which events should be recorded with the log settings. Here you can configure the following recording variants:

- Local logging

  With this variant, you record the events in local buffers of the CP 1543-1. In the online dialog of the Security Configuration Tool, you can then access these recordings, visualize them and archive them on the service station.

- Network Syslog

  With the network Syslog, you use a Syslog server in the network. This records the events according to the configuration in the log settings.

12.3 NTP client

Functionality

To check the time validity of a certificate and the time stamp of log entries, the date and time are maintained on the CP 1543-1 as on the CPU. This time can be synchronized with NTP. The CP 1543-1 forwards the synchronized time to the CPU via the backplane bus of the automation system. This way the CPU also receives a synchronized time for the time events in program execution.

The automatic setting and periodic synchronization of the time takes place either via a secure or non-secure NTP server. You can assign a maximum of 4 NTP servers to the CP 1543-1. A mixed configuration of non-secure and secure NTP servers is not possible.

12.4 SNMP

Functionality

The CP 1543-1 supports the transfer of management information using the Simple Network Management Protocol (SNMP) just like on the CPU. To achieve this, an "SNMP agent" is installed on the CP that receives and responds to the SNMP queries. Information about the properties of devices capable of SNMP is contained in so-called MIB files (Management Information Base) for which the user needs to have the appropriate rights.

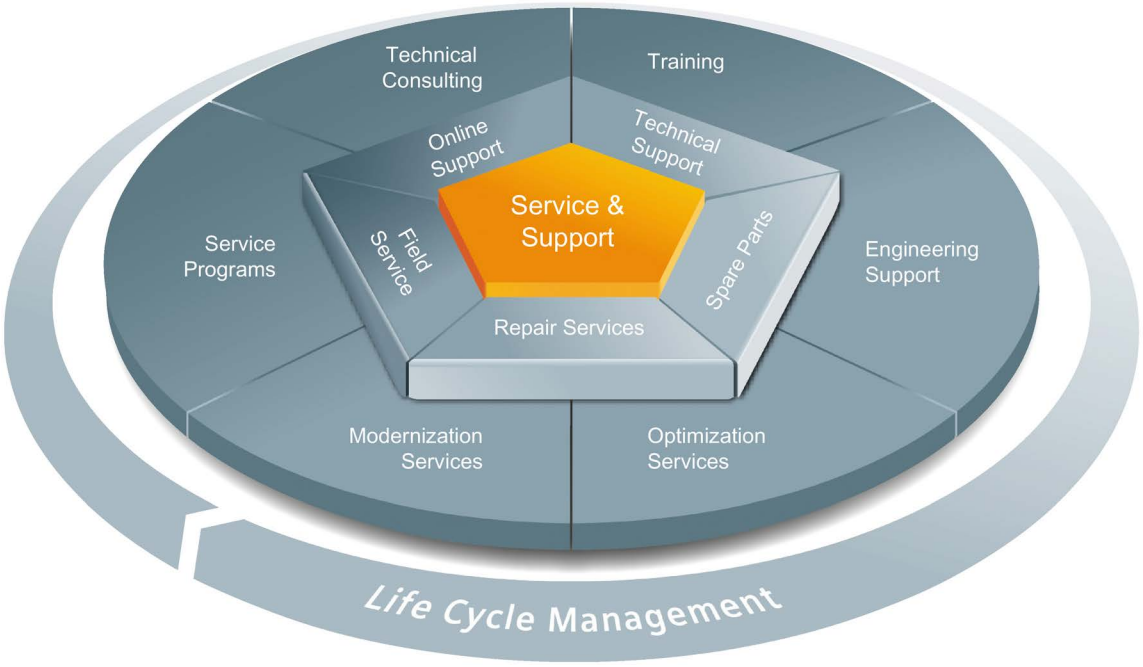
With SNMPv1, the "community string" is also sent. The "community string" is like a password that is sent along with the SNMP query. The requested information is sent when the "community string" is correct. The request is discarded when the string is incorrect.

With SNMPv3, data can be transferred encrypted. To do this, select either an authentication method or an authentication and encryption method.

Possible selection:

- Authentication algorithm: none, MD5, SHA-1
- Encryption algorithm: none, AES-128, DES

Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You will find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Glossary

Automation system

Programmable logic controller for the open-loop and closed-loop control of process chains of the process engineering industry and manufacturing technology. The automation system consists of different components and integrated system functions according to the automation task.

Bus

Transmission medium that connects several devices together. Data transmission can be performed electrically or via optical fibers, either in series or in parallel.

Client

Device in a network that requests a service from another device in the network (server).

CM

→ *Communications module*

Communications module

Module for communications tasks used in an automation system as an interface expansion of the CPU (for example PROFIBUS) and providing additional communications options (PtP).

Communications processor

Module for expanded communications tasks covering special applications, for example in the area of security.

Consistent data

Data that belongs together in terms of content and must not be separated when transferred.

CP

→ *Communications processor*

CPU

Central **P**rocessing **U**nit - Central module of the S7 automation system with a control and arithmetic unit, memory, operating system and interface for programming device.

Device

Generic term for:

- Automation systems (PLC, PC, for example)
- Distributed I/O systems
- Field devices (for example, PLC, PC, hydraulic devices, pneumatic devices) and
- Active network components (for example, switches, routers)
- Gateways to PROFIBUS, AS interface or other fieldbus systems

DP master

Within PROFIBUS DP, a master in the distributed I/O that behaves according to the EN 50170 standard, Part 3.

→ *See also DP slave*

DP slave

Slave in the distributed I/O that is operated on PROFIBUS with the PROFIBUS DP protocol and behaves according to the EN 50170 standard, Part 3.

→ *See also DP master*

Duplex

Data transmission system; a distinction is made between full and half duplex.

Half duplex: One channel is available for alternate data exchange (sending or receiving alternately but not at the same time).

Full duplex: Two channels are available for simultaneous data exchange in both directions (simultaneous sending and receiving in both directions).

Ethernet

International standard technology for local area networks (LAN) based on frames. It defines types of cables and signaling for the physical layer and packet formats and protocols for media access control.

Ethernet network adapter

Electronic circuitry for connecting a computer to an Ethernet network. It allows the exchange of data / communication within the network.

FETCH/WRITE

Server services using TCP/IP, ISO-on-TCP and ISO for access to system memory areas of S7 CPUs. Access (client function) is possible from a SIMATIC S5 or a third-party device/PC. FETCH: Read data directly; WRITE: Write data directly.

Field device

→ *Device*

Freeport

Freely programmable ASCII protocol; here for data transfer via a point-to-point connection.

FTP

File **T**ransfer **P**rotocol; a network protocol for transferring files via IP networks. FTP is used to download files from the server to the client or to upload files from the client to the server. FTP directories can also be created and read out and directories and files can be renamed or deleted.

HMI

Human **M**achine **I**nterface, device for visualization and control of automation processes.

IE

→ *Industrial Ethernet*

IM

→ *Interface module*

Industrial Ethernet

Guideline for setting up an Ethernet network in an industrial environment. The essential difference compared with standard Ethernet is the mechanical ruggedness and immunity to noise of the individual components.

Instruction

The smallest self-contained unit of a user program characterized by its structure, function or purpose as a separate part of the user program. An instruction represents an operation procedure for the processor.

Interface module

Module in the distributed I/O system. The interface module connects the distributed I/O system via a fieldbus to the CPU (IO controller/DP master) and prepares the data for the I/O modules.

IO controller, PROFINET IO controller

Central device in a PROFINET system, usually a classic programmable logic controller or PC. The IO controller sets up connections to the IO devices, exchanges data with them, thus controls and monitors the system.

IO device, PROFINET IO device

Device in the distributed I/O of a PROFINET system that is monitored and controlled by an IO controller (for example distributed inputs/outputs, valve islands, frequency converters, switches).

IP address

Binary number that is used as a unique address in computer networks in conjunction with the Internet Protocol (IP). It makes these devices uniquely addressable and individually accessible. An IPv4 address can be evaluated using a binary subnet mask that results in a network part or a host part as a structure. The textual representation of an IPv4 address is made up, for example, of 4 decimal numbers with a range of values from 0 to 255. The decimal numbers are separated by dots.

IPv4 subnet mask

Binary mask, with which an IPv4 address (as a binary number) is divided into a "network part" and a "host part"

ISO protocol

Communications protocol for message or packet-oriented transfer of data in an Ethernet network. This protocol is hardware-oriented, very fast and allows dynamic data lengths. The ISO protocol is suitable for medium to large volumes of data.

ISO-on-TCP protocol

Communications protocol capable of S7 routing for packet-oriented transfer of data in an Ethernet network; provides network addressing. The ISO-on-TCP protocol is suitable for medium and large volumes of data and allows dynamic data lengths.

Linear bus topology

Network topology characterized by the arrangement of the devices in a line (bus).

MAC address

Worldwide unique device identification for all Ethernet devices. The MAC address is assigned by the manufacturer and has a 3-byte vendor ID and 3-byte device ID as a consecutive number.

Master

Higher-level, active participant in the communication/on a PROFIBUS subnet. The master has rights to access the bus (token), requests data and sends it.

→ *See also DP master*

Modbus RTU

Remote **T**erminal **U**nit; Open communications protocol for serial interfaces based on a master/slave architecture.

Modbus TCP

Transmission **C**ontrol **P**rotocol; Open communications protocol for Ethernet based on a master/slave architecture. The data are transmitted as TCP/IP packets.

Network

A network consists of one or more interconnected subnets with any number of devices. Several networks can exist alongside each other.

NTP

The **N**etwork **T**ime **P**rotocol (NTP) is a standard for synchronizing clocks in automation systems via Industrial Ethernet. NTP uses the connectionless UDP transport protocol for the Internet.

Operating system

Software that allows the use and operation of a computer. The operating system manages resources such as memory, input and output devices and controls the execution of programs.

PG

→ *Programming device*

PNO

→ *PROFIBUS user organization*

Point-to-point connection

Bidirectional data exchange via communications modules with a serial interface between two communications partners (and two only).

Port

Physical connector to connect devices to PROFINET. PROFINET interfaces have one or more ports.

Process image

Address area of a programmable logic controller (PLC), in which the signal states of the inputs and the logical states of the outputs from the connected modules are stored digitally.

PROFIBUS

Process **Fi**eld **Bus** - European Fieldbus standard.

PROFIBUS address

Unique identifier of a device connected to PROFIBUS. The PROFIBUS address is sent in the frame to address a device.

PROFIBUS device

Device with at least one PROFIBUS interface either electrical (for example RS-485) or optical (for example Polymer Optical Fiber).

PROFIBUS user organization

Technical committee dedicated to the definition and development of the PROFIBUS and PROFINET standard.

PROFIBUS DP

A PROFIBUS with DP protocol that complies with EN 50170. DP stands for distributed I/O = fast, real-time capable, cyclic data exchange. From the perspective of the user program, the distributed I/O is addressed in exactly the same way as the centralized IO.

PROFINET

Open component-based industrial communications system based on Ethernet for distributed automation systems. Communications technology promoted by the PROFIBUS user organization.

PROFINET device

Device that always has a PROFINET interface (electrical, optical, wireless).

PROFINET interface

Interface of a module capable of communication (for example CPU, CP) with one or more ports. A MAC address is assigned to the interface in the factory. Along with the IP address and the device name (from the individual configuration), this interface address ensures that the PROFINET device is identified uniquely in the network. The interface can be electrical, optical or wireless.

PROFINET IO

IO stands for input/output; distributed I/O (fast, cyclic data exchange with real-time capability). From the perspective of the user program, the distributed I/O is addressed in exactly the same way as the centralized IO.

PROFINET IO as the Ethernet-based automation standard of PROFIBUS & PROFINET International defines a cross-vendor communication, automation, and engineering model.

With PROFINET IO, a switching technology is used that allows all devices to access the network at any time. In this way, the network can be used much more efficiently through the simultaneous data transfer of several devices. Simultaneous sending and receiving is enabled via the full-duplex operation of Switched Ethernet.

PROFINET IO is based on switched Ethernet with full-duplex operation and a bandwidth of 100 Mbps.

Programming device

Programming devices are essentially compact and portable PCs which are suitable for industrial applications. They are identified by a special hardware and software configuration for programmable logic controllers.

Protocol

Agreement on the rules by which the communication between two or more communication partners transpires.

PtP

Point-**t**o-**P**oint, interface and/or transmission protocol for bidirectional data exchange between two (and only two) communications partners.

Ring topology

All devices of a network are connected together in a ring.

Router

Network node with a unique identifier (name and address) that connects subnets together and allows transportation of data to uniquely identified communications nodes in the network.

RS232, RS422 and RS485

Standard for serial interfaces.

RTU

Modbus RTU (RTU: **R**emote **T**erminal **U**nit, transfers the data in binary form; allows a good data throughput. The data must be converted to a readable format before it can be evaluated.

S7 routing

Communication between S7 automation systems, S7 applications or PC stations in different S7 subnets via one or more network nodes functioning as S7 routers.

SDA service

Send Data with Acknowledge. SDA is an elementary service with which an initiator (for example DP master) can send a message to other devices and then receives acknowledgment of receipt immediately afterwards.

SDN service

Send Data with No Acknowledge. This service is used primarily to send data to multiple stations and the service therefore remains unacknowledged. Suitable for synchronization tasks and status messages.

Security

Generic term for all the measures taken to protect against

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability due to the destruction of data

Server

A device or more generally an object that can provide certain services; the service is performed at the request of a client.

Slave

Distributed device in a fieldbus system that can only exchange data with a master after the master has requested this.

→ *See also DP slave*

SNMP

Simple **N**etwork **M**anagement **P**rotocol, uses the wireless UDP transport protocol. SNMP works in much the same way as the client/server model. The SNMP manager monitors the network nodes. The SNMP agents collect the various network-specific information in the individual network nodes and makes this information available in a structured form in the MIB (**M**anagement **I**nformation **B**ase). This information allows a network management system to run detailed network diagnostics.

Subnet

Part of a network whose parameters must be matched up on the devices (for example in PROFINET). A subnet includes the bus components and all connected stations. Subnets can be linked together, for example using gateways or routers to form one network.

Switch

Network components used to connect several terminal devices or network segments in a local network (LAN).

TCP/IP

Transmission **C**ontrol **P**rotocol / **I**nternet **P**rotocol, connection-oriented network protocol, generally recognized standard for data exchange in heterogeneous networks.

Time-of-day synchronization

Capability of transferring a standard system time from a single source to all devices in the system so that their clocks can be set according to the standard time.

Tree topology

Network topology characterized by a branched structure: Two or more bus nodes are connected to each bus node.

Twisted-pair

Fast Ethernet via twisted-pair cables is based on the IEEE 802.3u standard (100 Base-TX). The transmission medium is a shielded 2x2 twisted-pair cable with an impedance of 100 Ohms (22 AWG). The transmission characteristics of this cable must meet the requirements of category 5.

The maximum length of the connection between the terminal and the network component must not exceed 100 m. The connectors are designed according to the 100Base-TX standard with the RJ-45 connector system.

UDP

User **D**atagram **P**rotocol; communications protocol for fast and uncomplicated data transfer, without acknowledgment. There are no error checking mechanisms as found in TCP/IP.

User program

In SIMATIC, a distinction is made between the CPU operating system and user programs. The user program contains all instructions, declarations and data by which a system or process can be controlled. The user program is assigned to a programmable module (for example, CPU, FM) and can be structured in smaller units.

USS

Universal Serial Interface protocol (**U**niverselles **S**erielles **S**chnittstellen-Protokoll); defines an access method according to the master-slave principle for communication via a serial bus.

Web server

Software/communications service for data exchange via the Internet. The web server transfers the documents using standardized transmission protocols (HTTP, HTTPS) to a Web browser. Documents can be static or put together dynamically from different sources by the web server on request from the Web browser.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides an overview of the PROFINET communication system with SIMATIC STEP 7 V13.

STEP 7 V13 is integrated into the powerful graphical Totally Integrated Automation Portal (TIA Portal), the new integration platform for all automation software tools.

This function manual supports you in planning a PROFINET system. The manual is structured into the following subject areas:

- PROFINET basics
- PROFINET diagnostics
- PROFINET functions

Basic knowledge required

The following knowledge is required in order to understand the manual:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Knowledge about how to use STEP 7 (TIA Portal)

Scope

This documentation is the basic documentation for all SIMATIC products from the PROFINET environment. The product documentation is based on this documentation.

The examples are based on the functionality of the S7-1500 automation system.

Changes compared to previous version

Changes / amendments described in this manual, compared to the previous version (version 06/2014):

- Addition of the function "Configuration control of PROFINET IO systems" to the description "Standard machine projects".
- Amendment of description "Connect DP slave via the IE/PB Link to a PROFINET IO system".
- New description of the function "Configuring PROFIenergy with I-devices".
- New sample program for I-device configuring and programming.

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

This documentation contains pictures of the devices described. The figures may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product, on handling of the product and on the section of the documentation to which you should pay particular attention.

Additional support

You will find information about available technical support in the appendix Service & Support (Page 226).

The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).

The online catalog and the ordering system are available on the Internet (http://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Preface **3**

1 Documentation guide **8**

2 Description **11**

2.1 Introduction to PROFINET 11
2.1.1 PROFINET terms 13
2.1.2 Basic terminology of communication 16
2.1.3 PROFINET interface 19
2.1.4 Implementation of the PROFINET device model in SIMATIC 23
2.2 Setting up PROFINET 25
2.2.1 Active Network Components 26
2.2.2 Cabling technology 28
2.2.3 Wireless design 30
2.2.3.1 Basics 30
2.2.3.2 Tips on assembly 32
2.2.4 Network security 34
2.2.4.1 Basics 34
2.2.4.2 Network components and software 36
2.2.4.3 Application example 37

3 Parameter assignment/addressing **39**

3.1 Assigning an IO device to an IO controller 41
3.2 Device name and IP address 43
3.2.1 Device name 44
3.2.2 IP address 45
3.2.3 Assigning a device name and IP address 48
3.2.4 Permitting changes to the device name and IP address directly on the device 53
3.3 Configuring topology 55
3.3.1 Topology view in STEP 7 59
3.3.2 Interconnecting ports in the topology view 61

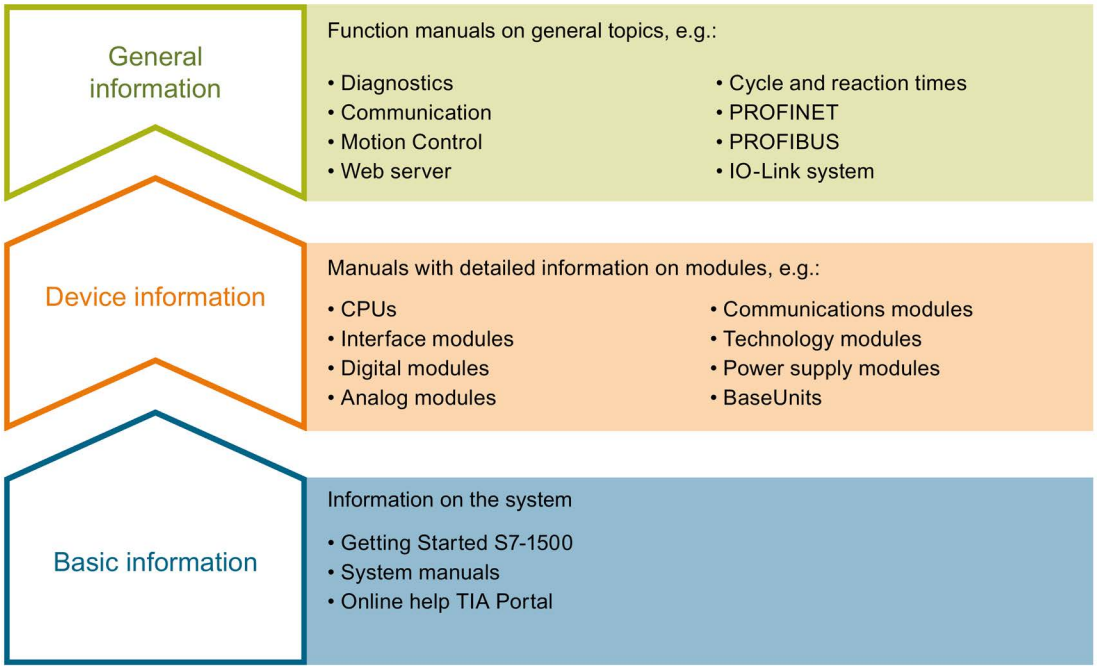
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP, ET 200SP and ET 200AL distributed I/O systems is divided into three areas. This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/86140384)
- ET 200SP (http://support.automation.siemens.com/WW/view/en/84133942)
- ET 200AL (http://support.automation.siemens.com/WW/view/en/95242965)

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Description 2

2.1 Introduction to PROFINET

What is PROFINET IO?

Within the framework of Totally Integrated Automation (TIA), PROFINET IO is the logical further development of:

- PROFIBUS DP, the established fieldbus and
- Industrial Ethernet

PROFINET IO is based on 20 years of experience with the successful PROFIBUS DP and combines the normal user operations with the simultaneous use of innovative concepts of Ethernet technology. This ensures the integration of PROFIBUS DP into the PROFINET world.

PROFINET IO as the Ethernet-based automation standard of PROFIBUS/PROFINET International defines a cross-vendor communication, automation, and engineering model.

Objectives of PROFINET

The objectives of PROFINET:

- Industrial networking, based on Industrial Ethernet (open Ethernet standard)
- Compatibility of Industrial Ethernet and standard Ethernet components
- High robustness due to Industrial Ethernet devices. Industrial Ethernet devices are suited to the industrial environment (temperature, noise immunity, etc.).
- Use of IT standards such as TCP/IP, http.
- Real-time capability
- Seamless integration of other fieldbus systems

Implementation of PROFINET in SIMATIC

PROFINET is implemented in SIMATIC as follows:

- We have implemented communication between field devices in SIMATIC with **PROFINET IO**.
- Installation technology and network components are available as SIMATIC NET products.
- Ethernet standard protocol and procedures (e.g., SNMP = Simple Network Management Protocol for network parameter assignment and diagnostics) are used for remote maintenance and network diagnostics.

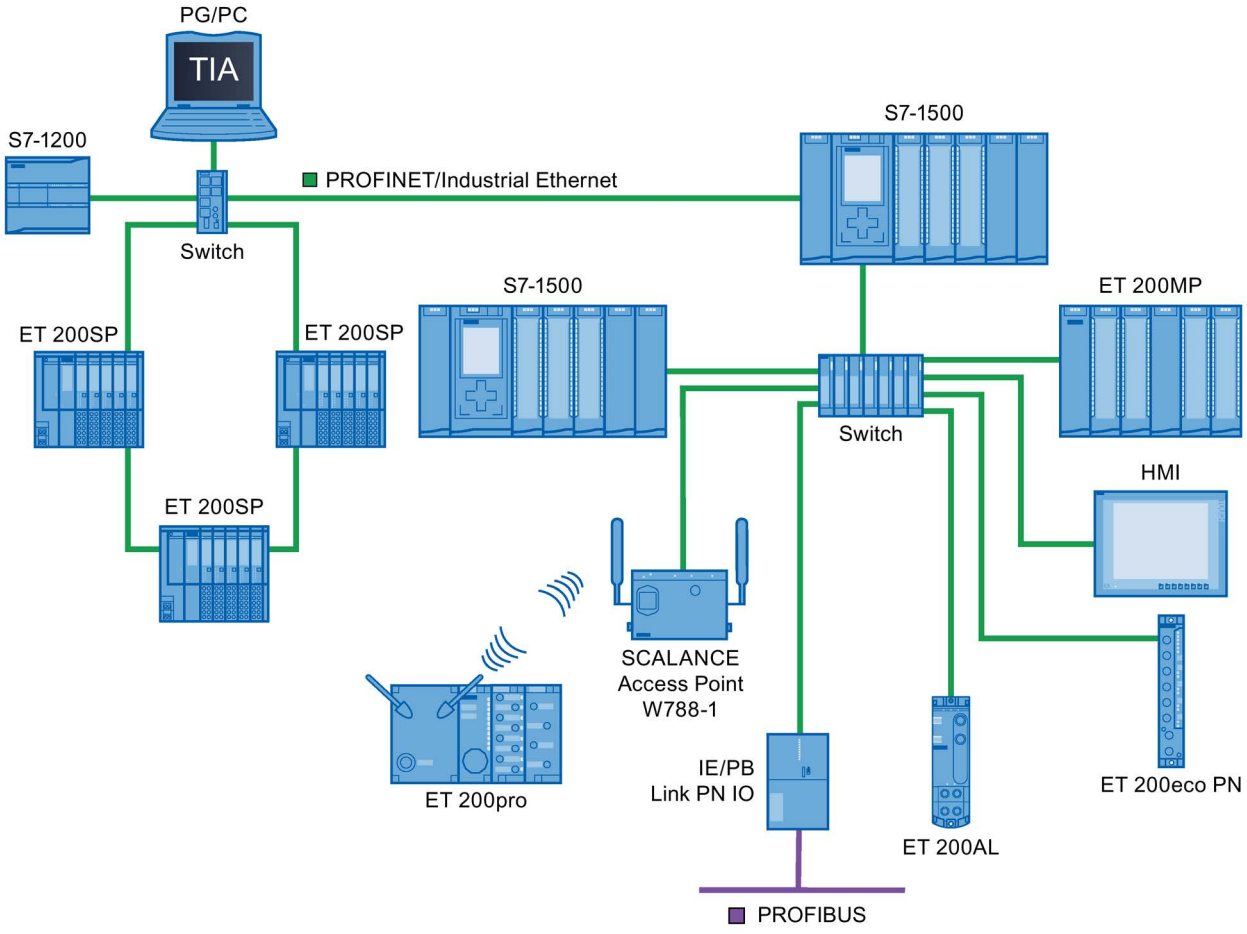


Figure 2-1 PROFINET overview configuration

STEP 7

The STEP 7 engineering tool supports you in setting up and configuring an automation solution. STEP 7 provides a uniform application view over all bus systems.

Documentation from PROFIBUS & PROFINET International on the Internet

You will find numerous documents on the topic of PROFINET at the Internet address (http://www.profibus.com) of the "PROFIBUS & PROFINET International" PROFIBUS user organization, which is also responsible for PROFINET.

Additional information can be found on the Internet (http://www.siemens.com/profinet).

2.1.1 PROFINET terms

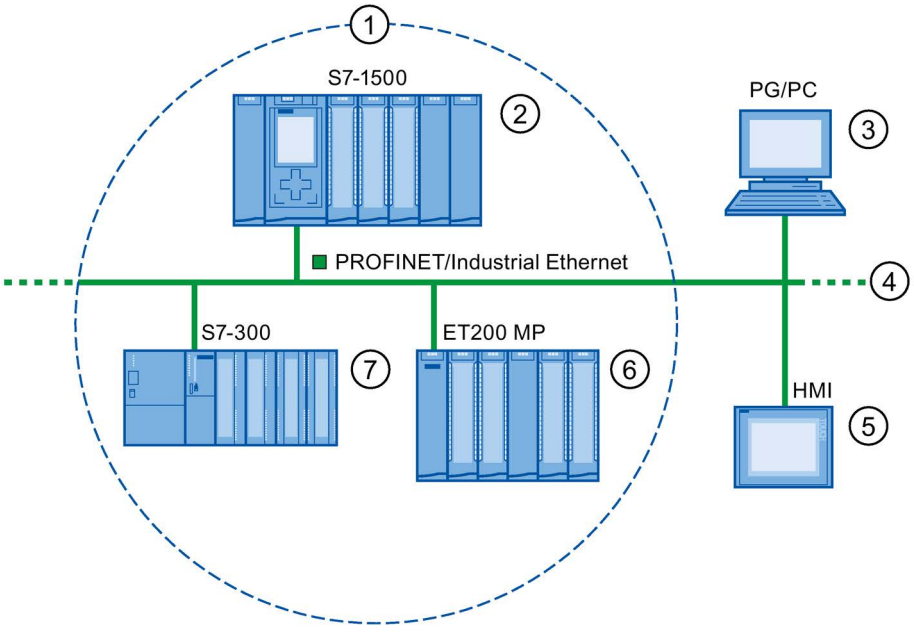
Definition: Devices in the PROFINET environment

In the PROFINET environment, "device" is the generic term for:

- Automation systems (PLC, PC, for example)
- Distributed I/O systems
- Field devices (for example, hydraulic devices, pneumatic devices)
- Active network components (for example, switches, routers)
- Gateways to PROFIBUS, AS interface or other fieldbus systems

PROFINET IO devices

The following graphic shows the general names used for the most important devices in PROFINET. In the table below the graphic you can find the names of the individual components in the PROFINET IO context.

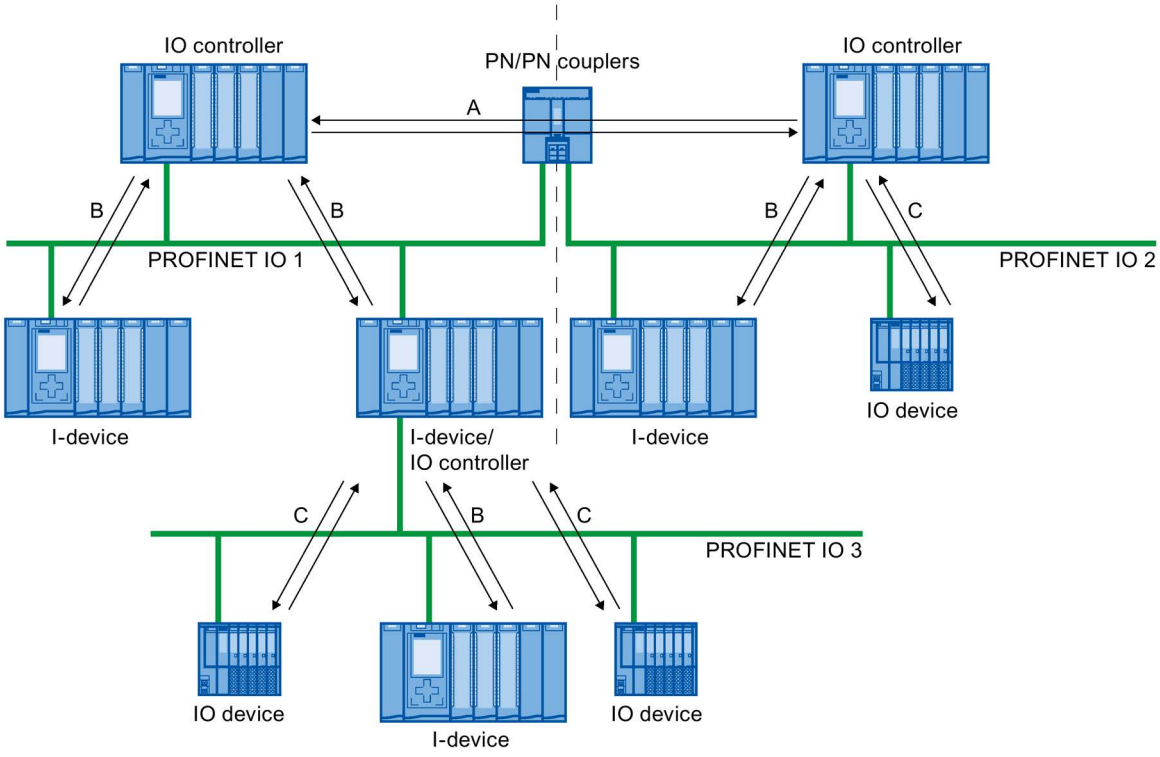


Number	PROFINET	Explanation
①	PROFINET IO System	
②	IO controller	Device used to address the connected IO devices. This means that: The IO controller exchanges input and output signals with field devices.
③	Programming device / PC (PROFINET IO supervisor)	PG/PC/HMI device used for commissioning and for diagnostics
④	PROFINET/Industrial Ethernet	Network infrastructure
⑤	HMI (Human Machine Interface)	Device for operating and monitoring functions.
⑥	IO device	A distributed field device that is assigned to one of the IO controllers (e.g., Distributed IO, valve terminals, frequency converters, switches with integrated PROFINET IO functionality)
⑦	I-device	Intelligent IO device

Figure 2-2 PROFINET devices

IO communication via PROFINET IO

The inputs and outputs of distributed I/O devices are read and written by means of PROFINET IO using what is referred to as IO communication. The following figure provides an overview of IO communication by means of PROFINET IO.



A IO controller - IO controller communication via PN/PN coupler

B IO controller - I-device communication

C IO controller - IO-device communication

Figure 2-3 IO communication via PROFINET IO

IO communication via PROFINET IO

Table 2- 1 IO communication via PROFINET IO

Communication between ...	Explanation
IO controllers and IO devices	The IO controller sends data cyclically to the IO devices of its PROFINET IO system and receives data from these devices.
IO controller and I-device	A fixed quantity of data is transferred cyclically between the user programs in CPUs of IO controllers and I-devices. The IO controller does not access the I/O module of the I-device, but instead accesses configured address ranges, i.e. transfer ranges, which may be located inside our outside the process image of the CPU of the I-device. If parts of the process image are used as transfer ranges, it is not permitted to use these for real I/O modules. Data transfer takes place using load- and transfer operations via the process image or via direct access.
IO controller and IO controller	A fixed quantity of data is cyclically transferred between the user programs in CPUs of IO controllers. A PN/PN coupler is required as additional hardware. The IO controllers mutually access configured address ranges, i.e. transfer ranges, which may be located inside or outside the process image of the CPU. If parts of the process image are used as transfer ranges, it is not permitted to use these for real I/O modules. Data transfer takes place using load- and transfer operations via the process image or via direct access.

Functions (Page 89)

Communication (http://support.automation.siemens.com/WW/view/en/59192925)

2.1.2 Basic terminology of communication

PROFINET communication

PROFINET communication takes place via Industrial Ethernet. The following transmission types are supported:

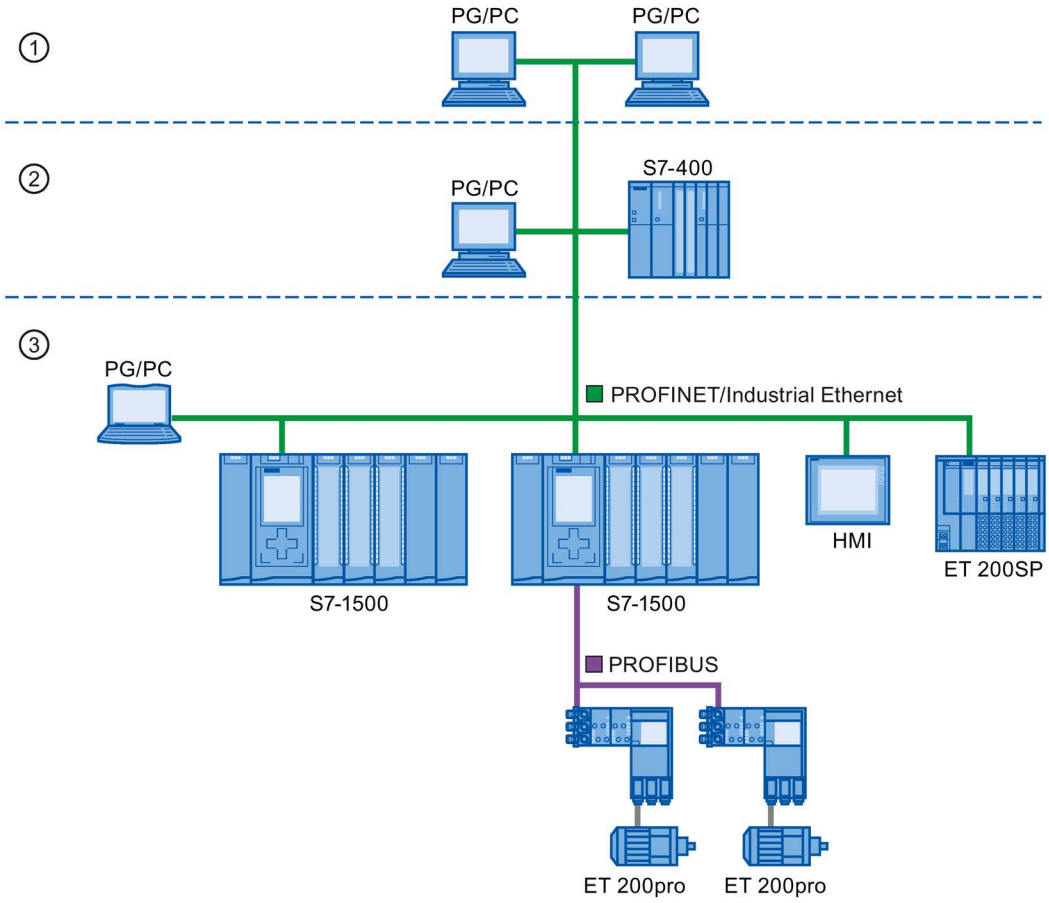
- Acyclic transmission of engineering and diagnostics data and interrupts
- Cyclic transmission of user data

The PROFINET-IO communication takes place in real-time.

For additional information on the real-time communication, refer to chapter Real-time communication (Page 153).

Transparent data access

Access to process data from different levels of the factory is supported by PROFINET communication. By using Industrial Ethernet, standard mechanisms of communication and information technology such as OPC/XML can now be used along with standard protocols such as UDP/TCP/IP and HTTP in automation engineering. This allows transparent access from company management level directly to the data from the automation systems at the control level and production level.



① Management level
② Control level
③ Production level

Figure 2-4 Access to process data

Update time

The update time is a time interval. IO controller and IO device/I-device exchange IO data cyclically in the IO system within this time interval. The update time can be configured separately for each IO device and determines the interval at which output data is sent from the IO controller to the IO device (output module/submodule) as well as input data from the IO device to the IO controller (input module/submodule).

STEP 7 calculates the update time automatically in the default setting for each IO device of the PROFINET IO system, taking into account the volume of data to be exchanged as well as the set send clock.

For additional information on the update time, refer to section Real-time communication (Page 153).

Watchdog time

The watchdog time is the time interval that an IO controller or IO device permits, without receiving IO data. If the IO device is not supplied by the IO controller with data within the watchdog time, the device detects the missing frames and outputs substitute values. This is reported in the IO controller as a station failure.

In STEP 7, the watchdog time is made up from an integral multiple of the update time and can be set by the user.

Send clock

The period of time between two consecutive communication cycles. The send clock is the shortest possible interval in data exchange.

Relationship between the update time and send clock

The calculated update times are reduction ratios (1, 2, 4, 8, ..., 512) of the send clock. The minimum possible update time thus depends on the minimum send clock of the IO controller that can be set and the efficiency of the IO controller and IO device. Depending on the send clock, it can be that only some of the reduction ratios are available (STEP 7 guarantees this through a pre-selection).

The following tables illustrate the dependency of the update time that can be set on the send clock, using an example of the CPU 1516-3 PN/DP. The update times satisfy the requirements of the PROFINET standard IEC 61158.

Table 2- 2 With real-time communication the following applies:

Send clock	Update time	Reduction ratios
250 µs	250 µs to 128 ms	1,2, ..., 512
500 µs	500 µs to 256 ms	1,2, ..., 512
1 ms	1 ms to 512 ms	1,2, ..., 512
2 ms	2 ms to 512 ms	1,2, ..., 256
4 ms	4 ms to 512 ms	1,2, ..., 128

Additional information

For information on real-time communication, refer to the section Real-Time Communication (RT) (Page 154).

2.1.3 PROFINET interface

Overview

PROFINET devices of the SIMATIC product family have one or more PROFINET interfaces (Ethernet controller/interface). The PROFINET interfaces have one or more ports (physical connection options).

In the case of PROFINET interfaces with multiple ports, the devices have an integrated switch.

PROFINET devices with two ports on one interface allow you to configure the system in line or ring topology. PROFINET devices with three and more ports on one interface are also ideal for setting up tree topologies.

Properties and rules for naming the PROFINET interface and its representation in STEP 7 are explained in the following.

Properties

Every PROFINET device on the network is uniquely identified via its PROFINET interface. For this purpose, each PROFINET interface has:

- A MAC address (factory default)
- An IP address
- A PROFINET device name

Identification and numbering of the interfaces and ports

Interfaces and ports for all modules and devices in the PROFINET system are identified with the following characters:

Table 2- 3 Identification for interfaces and ports of PROFINET devices

Element	Symbol	Interface number
Interface	X	In ascending order starting from number 1
Port	P	In ascending order starting from number 1 (for each interface)
Ring port	R	

Examples of identification

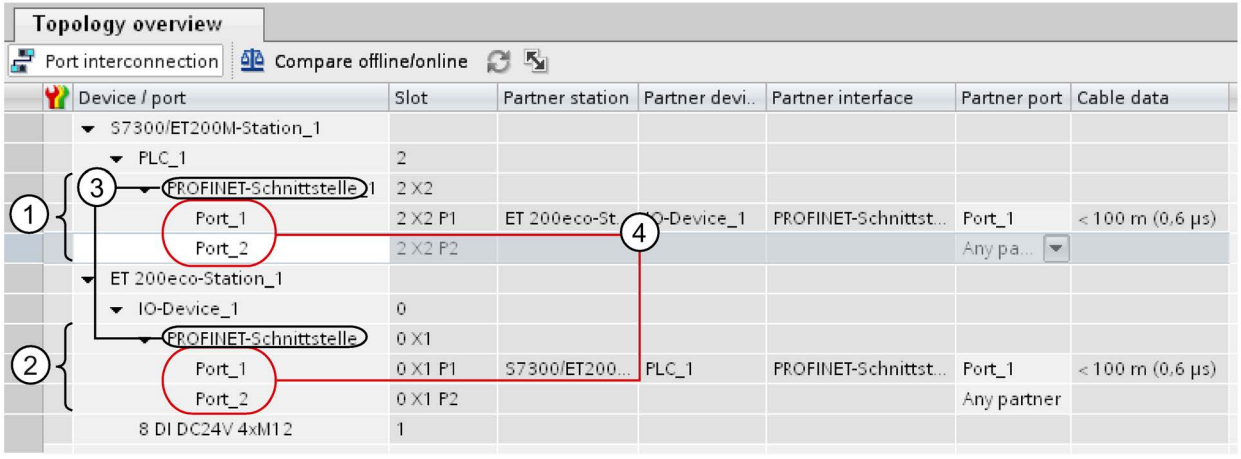
Three examples illustrate the rules for identifying PROFINET interfaces:

Table 2- 4 Examples for identifying PROFINET interfaces

Sample labeling	Interface number	Port number
X2 P1	2	1
X1 P2	1	2
X1 P1 R	1	1 (ring port)

Representation of PROFINET Interfaces in the Topology Overview in STEP 7

You can find the PROFINET interface in the topology overview in STEP 7. The PROFINET interface for an IO controller and an IO device is represented as follows in STEP 7:



Number	Description
①	PROFINET interface of an IO controller in STEP 7
②	PROFINET interface of an IO device in STEP 7
③	These lines represent the PROFINET interface.
④	These lines represent the "ports" of a PROFINET interface.

Figure 2-5 Representation of the PROFINET interfaces in STEP 7

Schematic Representation of a PROFINET Interface with Integrated Switch

The following schematic diagram shows the PROFINET interface with integrated switch and its ports for all PROFINET devices.

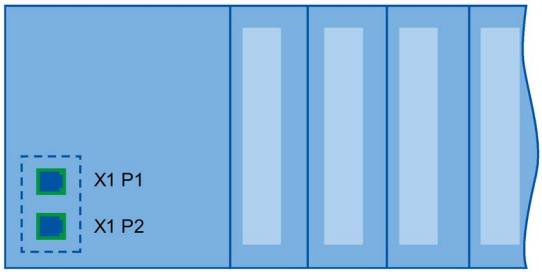


Figure 2-6 PROFINET interface with integrated switch

Functional differences of the PROFINET interfaces

PROFINET interfaces can provide different functions. PROFINET interface functions include identification, configuration, diagnostics and communication services (e.g., open communication). PROFINET interfaces that provide PROFINET IO functions and network security functions are also available.

The following table illustrates the differences using the example of the CPU 1516-3 PN/DP, which features two PROFINET interfaces with different functionality.

Table 2- 5 Differences of the PROFINET interfaces of the CPU 1516-3 PN/DP

PROFINET interface (X1)	PROFINET interface (X2)
2 ports with PROFINET IO functionality:	**1 port with PROFINETfunctionality:**
• Identification, configuration and diagnostics	
• PG communication	
• HMI communication	
• S7 communication	
• Time-of-day synchronization	
• Web server	
• Open communication	
• IO controller	-
• I-device	-
• RT/IRT	-
• Isochronous mode	-
• Media redundancy	-
• Prioritized startup	-

Additional Information on the Functionality of PROFINET interfaces

You can find information on the number and functionality of the interfaces of a PROFINET device in the documentation for the specific PROFINET device.

PROFINET communication services are described in the Communication function manual.

In the Network security section you can find components that are used to protect networks against hazards.

The Functions section describes the PROFINET IO functions.

2.1.4 Implementation of the PROFINET device model in SIMATIC

Slots and modules

A PROFINET device can have a modular and compact structure. A modular PROFINET device consists of slots into which the modules are inserted. The modules have channels which are used to read and output process signals. A compact device has the same design and can include modules, however, it cannot be physically expanded, which means that no modules can be inserted.

This is illustrated by the following graphic.

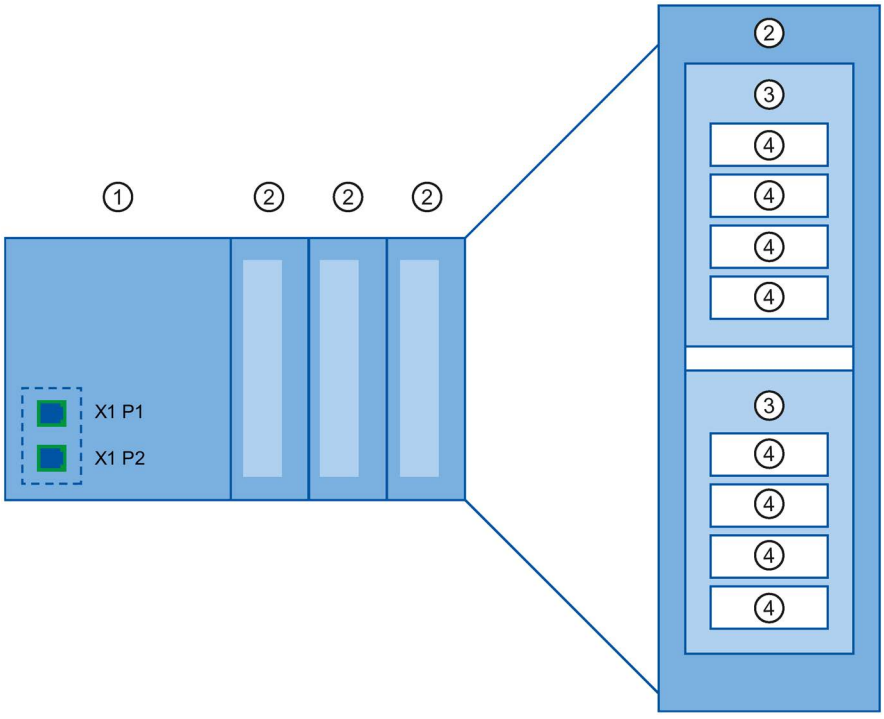

Figure 2-7 Configuration of a PROFINET device

Number	Description
①	Slot with bus interface
②	Slot with module
③	Subslot with submodule
④	Channel

A module can contain multiple submodules.

Representation of PROFINET Device Model in the Device View of STEP 7

The following figure shows the representation of the PROFINET device model in the device view of STEP 7, based on the example of a distributed I/O system ET 200MP:

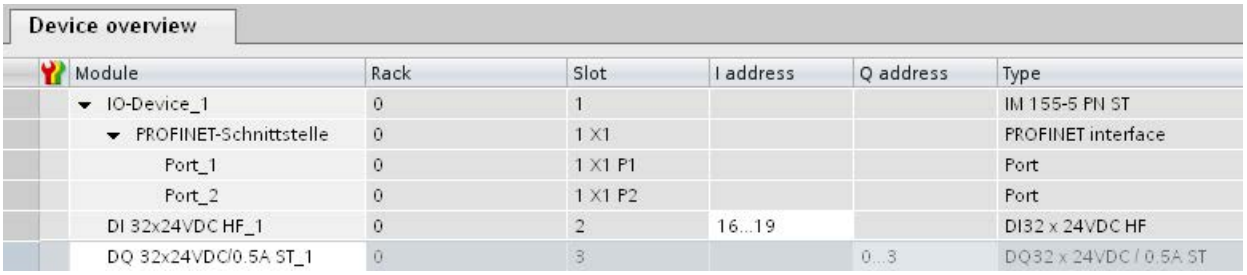

Figure 2-8 PROFINET device model in the device view of STEP 7

2.2 Setting up PROFINET

Contents of this chapter

The following chapter provides background information on building your communication network.

- Overview of the most important passive network components: These are network components that forward a signal without the possibility of actively influencing it, for example, cables, connectors, etc.
- Overview of the most important active network components: These are network components that actively affect a signal, for example switches, routers, etc.
- Overview of the most common network structures (topologies).

Physical connections of industrial networks

PROFINET devices can be networked in industrial systems in two different physical ways:

- Connected line
  - By means of electrical pulses via copper cables
  - By means of optical pulses via fiber-optic cables
- Wireless via wireless network using electromagnetic waves

PROFINET devices and cabling technology in SIMATIC are suited for industrial use, as they are based on Fast Ethernet and Industrial Ethernet.

- **Fast Ethernet**

  You can use Fast Ethernet to transfer data at a speed of 100 Mbps. This transmission technology uses the 100 Base-T standard for this.

- **Industrial Ethernet**

  Structure of Ethernet in industrial environment.

  The biggest difference from standard Ethernet is the mechanical current carrying capacity and noise immunity of the individual components.

2.2.1 Active Network Components

Introduction

The following active network components are available for PROFINET:

- Switch
- Router

Switched Ethernet

PROFINET IO is based on switched Ethernet with full-duplex operation and a transmission bandwidth of 100 Mbps. As a result, the network can be used very efficiently through the simultaneous data transfer of several devices. The PROFINET IO frames are processed with high priority.

Switches

Switches are network components used to connect several terminal devices or network segments in a local network (LAN).

For the communication of a device with several other devices on PROFINET, the device is connected to the port of a switch. Other communication devices (including switches) can then be connected to the other ports of the switch. The connection between a communication device and the switch is a point-to-point connection.

A switch has the task of receiving and distributing frames. The switch "learns" the Ethernet address(es) of a connected PROFINET device or additional switches and only forwards those frames that are intended for the connected PROFINET device or the connected switch.

Switch variants

Switches are available in two models:

- Integrated into a PROFINET device

  For PROFINET devices with multiple ports (two or more), we are dealing with devices with an integrated switch (for example, CPU 1516-3 PN/DP).

- As autonomous device (for example, switches of the SCALANCE product family)

Selection Guide for Switches

To use PROFINET with the RT class "RT", you can use any switch of "PROFINET Conformance Class A" or higher. All switches of the SCALANCE product family meet these requirements.

If you want to use PROFINET functions that provide an additional value, such as topology recognition, diagnostics, device exchange without exchangeable medium/programming device, you have to use a switch of the "PROFINET Conformance Class B" or higher.

To use PROFINET with the RT class "IRT", you must use a switch of "PROFINET Conformance Class C". With switches of the SCALANCE product family, watch out for the catalog feature "IRT PROFINET IO switch".

To select appropriate switches, we recommend the SIMATIC NET Selection Tool on the Internet (http://support.automation.siemens.com/WW/view/en/39134641).

Switches of the SCALANCE product family

Use the switches of the SCALANCE product family if you want to use the full scope of PROFINET. They are optimized for use in PROFINET IO.

In the SCALANCE X device family, you will find switches with electrical and optical ports and with a combination of both variants. SCALANCE X202-2IRT, for example, has two electrical ports and two optical ports and supports IRT communication.

With STEP 7, you can configure and perform diagnostics on and address switches from the SCALANCE X device family as PROFINET IO devices.

Router

A router connects separated network segments with each other (e.g. management level and control level). The volume of data volume must be coordinated with the services of the respective network segment. A router also separates two networks and acts as a mediator between both networks. It thus reduces the network load. Routing functionality is provided in the SCALANCE X device family, with SCALANCE X300 or higher.

Communication devices on different sides of a router can only communicate with one another if you have explicitly enabled communication between them via the router.

If you want to access manufacturing data directly from SAP, for example, use a router to connect your Industrial Ethernet in the factory with the Ethernet in your office.

Note

If devices need to communicate beyond the limits of a network, you must configure the router so that it allows this communication to take place.

Information on routing with STEP 7 is available in the function manual Communication (http://support.automation.siemens.com/WW/view/en/59192925).

2.2.2 Cabling technology

Cables for PROFINET

Electrical and optical cables are available for PROFINET. The type of cable depends on the data transfer requirements and on the ambient conditions.

Simple method for the prefabrication of twisted pair cables

When you set up your PROFINET system, you can cut the twisted-pair cable to the required length on site, strip it with the *stripping tool* (for Industrial Ethernet), and fit the *Industrial Ethernet Fast Connect RJ45 plugs* using the cut-and-clamp method. For more information on installation, refer to the installation instructions in the "SIMATIC NET Industrial Ethernet Network Manual" (http://support.automation.siemens.com/WW/view/en/8763736).

Note

A maximum of six plug-in connections are allowed between two switches per Ethernet path.

Simple method for the prefabrication of fiber-optic cables

The FastConnect FO cabling system is available for the easy, fast and error-free prefabrication of fiber-optic cables. The glass-fiber optic cable consists of:

- FC FO Termination Kit for SC and BFOC plug (cleave tool, Kevlar scissors, buffer grip, fiber remains container)
- FC BFOC Plug
- FC SC Duplex plug
- FO FC Standard cable
- FO FC Trailing cable

Simple method for the prefabrication of POF and PCF cables

The following special tools provide an easy and safe way to prefabricate POF / PCF cables and fit the SC RJ POF plugs:

- POF cable

  Prefabrication case IE Termination Kit SC RJ POF plug
- PCF cable

  Prefabrication case IE Termination Kit SC RJ PCF plug

Overview of transmission media with PROFINET

The following table summarizes the technical specifications of a PROFINET interface with integrated switch or an external switch, and possible transmission media.

Table 2- 6 Transmission media with PROFINET

Physical properties	Connection methods	Cable type / transmission medium standard	Transmission rate / mode	Max. segment length (between two devices)	Advantages
Electrical	RJ45 connector ISO 60603-7	100Base-TX 2x2 twisted, symmetrical and shielded copper cable, CAT 5 transmission requirement IEEE 802.3	100 Mbps, full duplex	100 m	Simple and cheap cable connection
Optical	SCRJ 45 ISO/IEC 61754-24	100Base-FX POF fiber-optic cable (Polymer Optical Fiber, POF) 980/1000 µm (core diameter / external diameter) ISO/IEC 60793-2	100 Mbps, full duplex	50 m	Use when there are large differences in potential Insensitive towards electromagnetic radiation Low line attenuation Considerably longer segments possible[1]
		Plastic-cladded glass fiber (Polymer Cladded Fiber, PCF) 200/230 µm (core diameter / external diameter) ISO/IEC 60793-2	100 Mbps, full duplex	100 m	
	BFOC (Bayonet Fiber Optic Connector) and SC (Subscriber Connector) ISO/IEC 60874	Monomode glass fiber optic cable 10/125 µm (core diameter / external diameter) ISO/IEC 60793-2	100 Mbps, full duplex	26 km	
		Multimode glass fiber optic cable 50/125 µm and 62.5/125 µm (core diameter / external diameter) ISO/IEC 9314-4	100 Mbps, full duplex	3000 m	
Electromagnetic waves	-	IEEE 802.11 x	Depends on the extension used (a, g, h, etc.)	100 m	Greater mobility Cost-effective networking to remote, difficult to access devices

[1] Applies for fiber-optic cables only

Assembly Instructions for SIMATIC NET Industrial Ethernet (http://support.automation.siemens.com/WW/view/en/27069465)

PROFINET Installation Guideline (http://www.profibus.com/nc/download/installation-guide/downloads/profinet-installation-guide/display/)

2.2.3 Wireless design

2.2.3.1 Basics

What is Industrial Wireless LAN?

In addition to data communication in accordance with the IEEE 802.11 standard, the SIMATIC NET Industrial Wireless LAN provides a number of enhancements which offer significant benefits for industrial customers. IWLAN is particularly suitable for demanding industrial applications that require reliable wireless communication. This is supported by the following properties:

- Automatic roaming when the connection to Industrial Ethernet is interrupted (Forced Roaming)
- Cost savings generated by using a single wireless network for reliable operation of a process with both process-critical data (alarm message, for example) and non-critical communication (service and diagnostics, for example)
- Cost-effective connection to devices in remote environments that are difficult to access
- Predictable data traffic (deterministic) and defined response times
- Cyclical monitoring of the wireless link (link check)

Objectives and advantages of Industrial Wireless LAN

Wireless data transmission achieves the following objectives:

- Seamless integration of PROFINET devices into the existing bus system via the wireless interface
- Mobile use of PROFINET devices for different production-linked tasks
- Flexible configuration of the system components for fast development in accordance with customer requirements
- Maintenance costs are minimized by savings in cables

Application examples

- Communication with mobile subscribers (mobile controllers and devices, for example), conveyor lines, production belts, translation stages , and rotating machines
- Wireless coupling of communication segments for fast commissioning or cost-effective networking where routing of wires is extremely expensive (e.g. public streets, railroad lines)
- Stacker trucks, automated guided vehicle systems and suspended monorail systems

The following graphic illustrates the many possible applications and configurations for SIMATIC device family wireless networks.

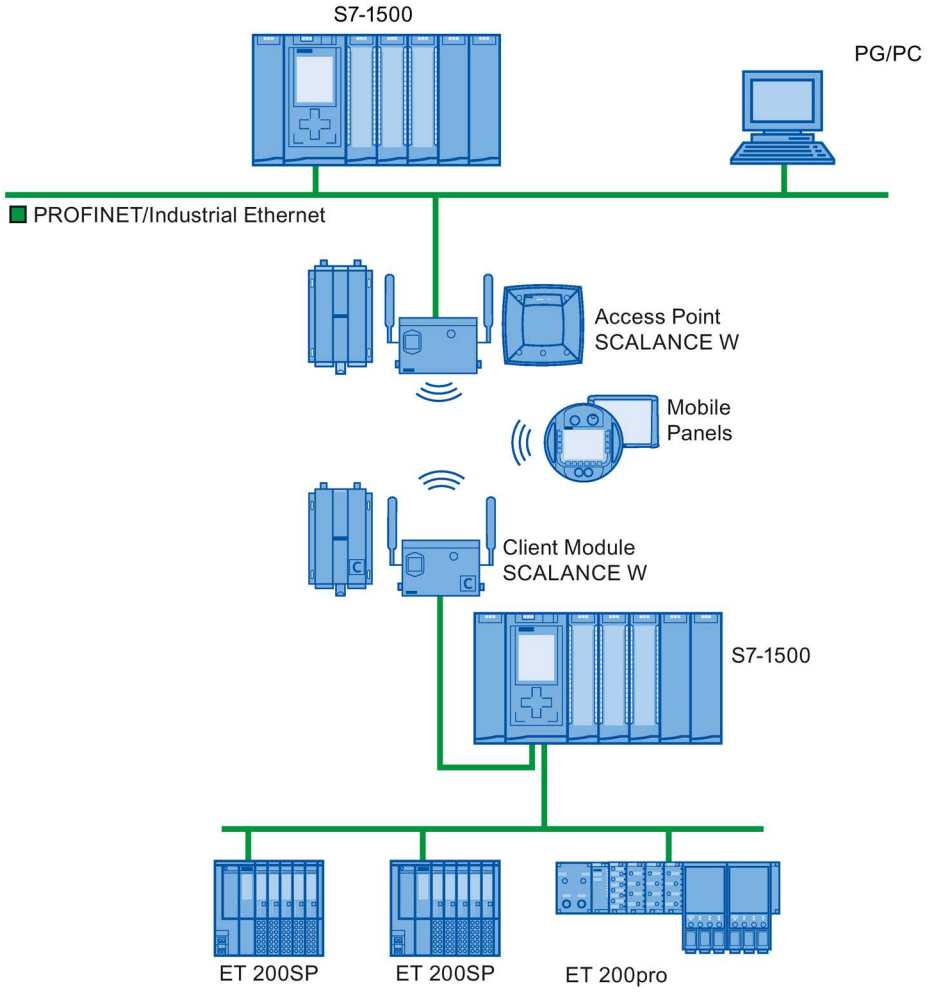

Figure 2-9 Application example for the use of Industrial Wireless LAN

Data transmission rate

In Industrial Wireless LAN, gross data transmission rates of 11 Mbps or 54 Mbps without full duplex are permitted.

Range

With SCALANCE W (access points), wireless networks can be set up indoors and outdoors. Multiple access points can be installed to create large wireless networks in which mobile subscribers are transferred seamlessly from one access point to another (roaming).

As an alternative to a wireless network, point-to-point connections of Industrial Ethernet segments can also be set up over large distances (several hundred meters). In this case, the range and characteristics of the RF field are determined by the antennas used.

Note

Range

The range can be considerably less, depending on spatial factors, the wireless standard used, the data rate, and the antennas on the send and receive sides.

2.2.3.2 Tips on assembly

Wireless networks, SCALANCE device family

With PROFINET, you can also set up wireless networks with Industrial Wireless Local Area Network (IWLAN) technology. We recommend implementing the SCALANCE W device line for this.

Update time in STEP 7

If you set up PROFINET with Industrial Wireless LAN, you may have to increase the update time for the wireless devices. The IWLAN interface provides lower performance than the wired data network: Several communication stations have to share the limited transmission bandwidth. For wired solutions, 100 Mbps is available for each communication device.

The Update time parameter can be found in the "Realtime settings" section in the Inspector window of IO devices in STEP 7.

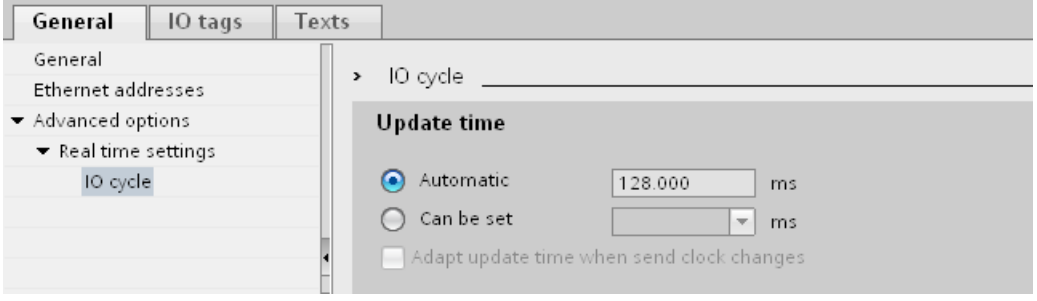

Figure 2-10 Update time in STEP 7

Additional information

More information about SCALANCE W Industrial Wireless LAN components can be found in the manual SIMATIC NET SCALANCE W-700 (http://support.automation.siemens.com/WW/view/en/42784493).

More information about wired data transmission can be found in the manual SIMATIC NET Twisted Pair and Fiber Optic Networks (http://support.automation.siemens.com/WW/view/en/8763736).

More information about wireless data transmission can be found in the manual Basics for configuring an industrial wireless LAN (http://support.automation.siemens.com/WW/view/en/9975764).

You should also read the PROFINET installation guideline of the PROFIBUS User Organization on the Internet (http://www.profibus.com/nc/download/installation-guide/downloads/profinet-installation-guide/display/). Various documents that assist with the setting up of your PROFINET automation solution are available here:

- PROFINET planning guideline
- PROFINET installation guideline
- PROFINET commissioning guideline
- Additional documents for setup of PROFINET

2.2.4 Network security

2.2.4.1 Basics

Introduction

The topic of data security and access protection (Security) has become increasingly important in the industrial environment. The increased networking of entire industrial systems, vertical integration and networking of levels within a company and new techniques such as remote maintenance all result in higher requirements for protecting the industrial plant.

Data security solutions for office environments cannot simply be transferred one-to-one to industrial applications to protect against manipulation in sensitive systems and production networks.

Requirements

Additional security requirements arise from the specific communication requirements in the industrial environment (real-time communication, for example):

- Protection against interaction between automated cells
- Protection of network segments
- Protection against faulty and unauthorized access
- Scalability of network security
- Must not influence the network structure

Definition of security

Generic term for all the measures taken to protect against:

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability due to destruction of data, for example, through faulty configuration and denial-of-service attacks

Threats

Threats can arise from external and internal manipulation. The loss of data security is not always caused by intentional actions.

Internal threats can arise due to:

- Technical errors
- Operator errors
- Defective programs

Added to these internal threats there are also external ones. The external threats are not really any different to the known threats in the office environment:

- Software viruses and worms
- Trojans
- Man-in-the-middle attacks
- Password Phishing
- Denial of Service

Protective measures

The most important precautions to prevent manipulation and loss of data security in the industrial environment are:

- Filtering and control of data traffic by means of firewall
- A virtual private network (VPN) is used to exchange private data on a public network (Internet, for example).

  The most common VPN technology is IPsec. IPsec (Internet Protocol Security) is a collection of security protocols that are used as the basis for the IP protocol at the mediation level and allow a secured communication via potentially unsecure IP networks.
- Segmenting in protected automation cells

  This concept has the aim of protecting the lower-level network devices by means of security modules. A group of protected devices forms a protected automation cell.
- Authentication (identification) of the devices

  The security modules identify each other over a safe (encrypted) channel using authentication procedures. It is therefore impossible for unauthorized parties to access a protected segment.
- Encrypting the data traffic

  The confidentiality of data is ensured by encrypting the data traffic. Each security module is given a VPN certificate which includes the encryption key.

2.2.4.2 Network components and software

Protection against unauthorized access

The following solutions may be used to connect industrial networks to the intranet and Internet to protect against internal and external threats:

- Communication processors, such as the SIMATIC CP 1543-1
- SCALANCE X-300 and SCALANCE S - the data security components of the SIMATIC NET product family
- SOFTNET security client for use on PCs

Features

Both of these products have a wide variety of features, such as:

- Easy integration of existing networks without configuration, with integrated firewall.
- Segmenting in protected automation cells
- Authentication (identification) of the devices
- Encrypting the data traffic

2.2.4.3 Application example

Data security at the office and production levels

The following graphic contains an application example with protected areas at different levels of the company created using SCALANCE S and the security client. The protected areas are highlighted in light gray.

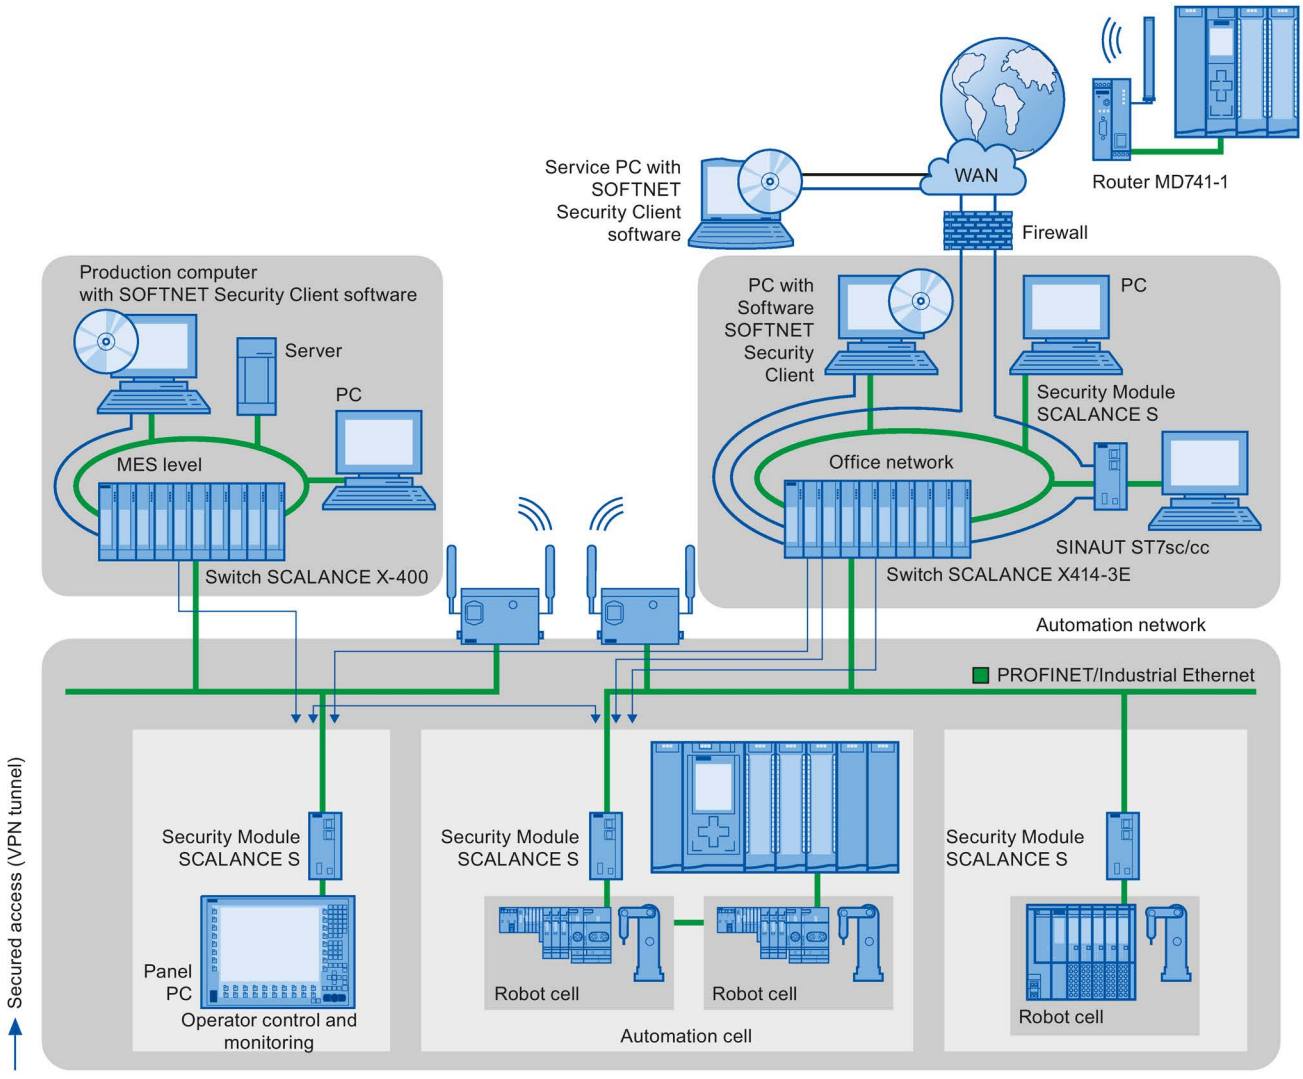

Figure 2-11 Network configuration with the SCALANCE S security module and the SOFTNET security client

Additional information

Additional information on the configuration of a security standard in PROFINET, is available:

- In the PROFINET security guideline. These guidelines can be found on the homepage of the PROFIBUS user organization on the Internet (http://www.profinet.com).
- In the Industrial Ethernet Security (http://support.automation.siemens.com/WW/view/en/56577508) manual
- In the SCALANCE S and SOFTNET Security Client (http://support.automation.siemens.com/WW/view/en/21718449) manual

You can find general information on industrial security concepts, functions and news on the Industrial Security website (http://www.siemens.com/industrialsecurity).

Parameter assignment/addressing 3

To set up an automation system, you will need to configure, assign parameters and interlink the individual hardware components. In STEP 7, the work needed for this is undertaken in the device, topology and network view.

Configuring

"Configuring" is understood to mean arranging, setting and networking devices and modules within the device, topology or network view.

An I/O address is automatically assigned to each module. The I/O addresses can be subsequently modified.

The CPU compares the configuration preset in STEP 7 with the actual current configuration of the system. In this way, potential errors can be detected and reported straight away.

The exact procedure for configuring devices is described in detail in the STEP 7 online help.

Assigning parameters

"Assigning parameters" is understood to mean setting the properties of the components used. The settings for the hardware components and for data communication are configured at the same time.

In STEP 7, you can "assign parameters" for the following settings PROFINET:

- Device names and IP address parameters
- Port interconnection and topology
- Module properties / parameters

The parameters are loaded into the CPU and transferred to the corresponding modules when the CPU starts up. Modules are easy to replace from spare parts, as the parameters assigned for the SIMATIC CPUs are automatically loaded into the new module at each startup.

Adjusting the hardware to the project requirements

You need to configure hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your structure, link these with existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset such that in many cases they do not have to be assigned parameters again.

Parameter assignment is however needed in the following cases:

- You want to change the default parameter settings of a module.
- You want to use special functions.
- You want to configure communication connections.

3.1 Assigning an IO device to an IO controller

PROFINET IO System

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices. After these devices have been placed in the network or topology view, STEP 7 assigns default values for them. Initially, you only have to worry about the assignment of IO devices to an IO controller.

Requirement

- You are in the network view of STEP 7.
- A CPU has been placed (e.g., CPU 1516-3 PN/DP).
- An IO device has been placed (e.g., IM 155-6 PN ST).

Procedure

To assign IO devices to an IO controller, proceed as follows:

1. Place the pointer of the mouse over the interface of the IO device.
2. Press and hold down the left mouse button.
3. Move the pointer.

   The pointer now uses the networking symbol to indicate "Networking" mode. At the same time, you see the lock symbol on the pointer. The lock symbol disappears only when the pointer is over a valid target position.
4. Now move the pointer onto the interface of the IO controller. You can keep the left mouse button pressed or release it when performing this action.
5. Now release the left mouse button or press it again (depending on your previous action).

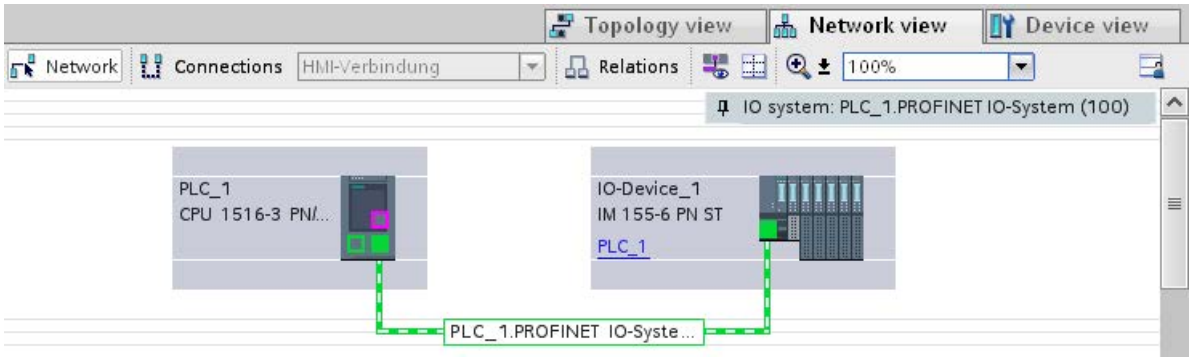

Figure 3-1 Assigning an IO device to an IO controller in the network view of STEP 7

Result

You have assigned an IO device to an IO controller.

Checking the assignment

You can find an overview of the communication relationships in the "IO communication" tab in the tabular area of the network view. This table is context-sensitive for selection in the graphic area:

- Selection of the interface shows the I/O communication of the respective interface.
- Selection of the CPU shows all I/O communication of the CPU (including PROFIBUS).
- Selection of the station (as in the above figure) interface shows the I/O communication of the complete station.

3.2 Device name and IP address

Introduction

In order that the PROFINET device can be addressed as node on PROFINET, the following are required:

- A unique PROFINET device name
- A unique IP address in the relevant IP subnet

STEP 7 assigns a device name during the arrangement of a PROFINET device in the hardware and network editor. The IP addresses are typically assigned automatically by STEP 7 and assigned to the devices based on the device name.

You can change the name and IP address manually.

In STEP 7

You can find the device name and the IP address under "Ethernet addresses" in the properties of the PROFINET interface in the Inspector window.

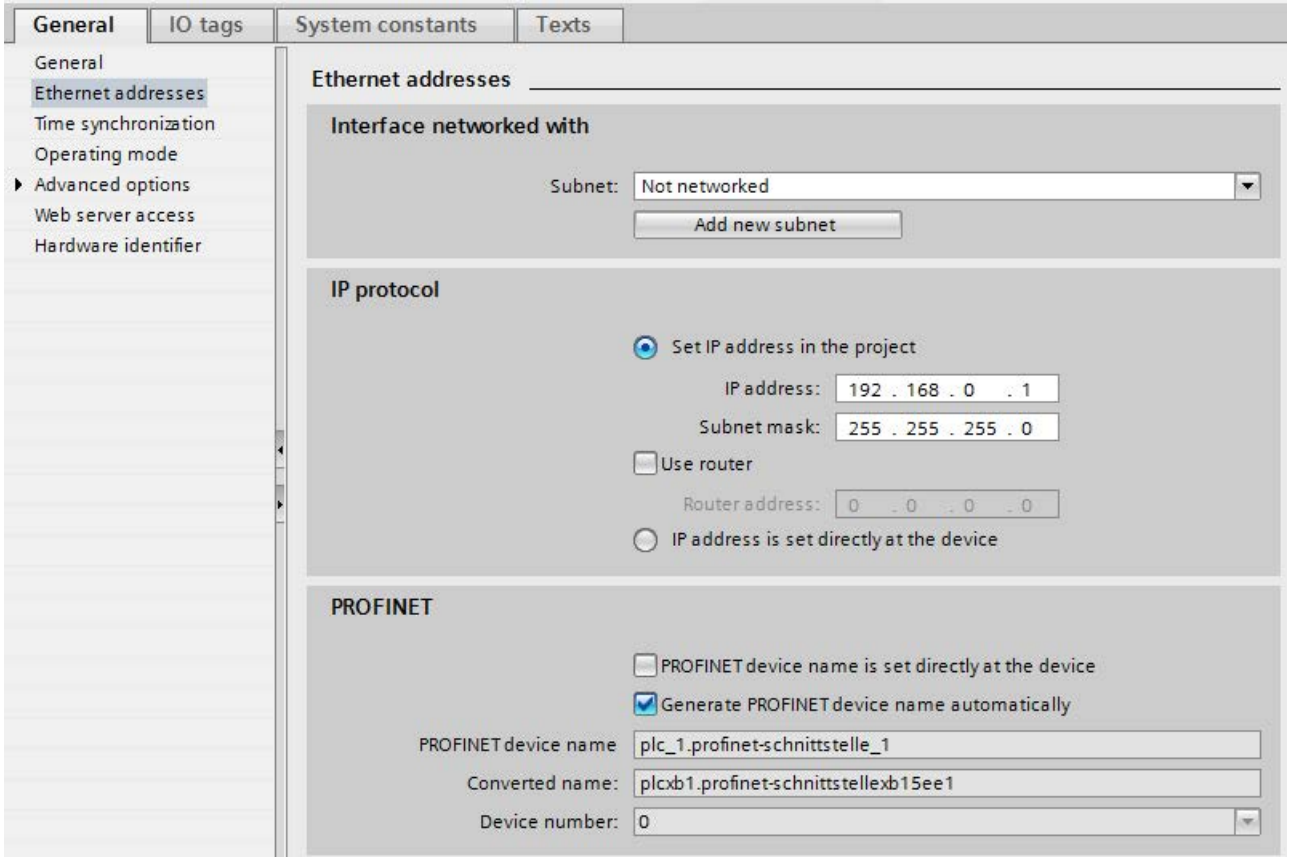

Figure 3-2 Device name and IP address in STEP 7

The function, the assignment and the changing of the device name and the IP address are described in the following sections.

3.2.1 Device name

Device names

Before an IO device can be addressed by an IO controller, it must have a device name. In PROFINET, this method was selected because it is simpler to work with names than with complex IP addresses.

The assignment of a device name for a specific IO device can be compared to setting the PROFIBUS address of a DP slave.

In delivery state, an IO device does not have a device name. A device name must first be assigned with the programming device or PC before an IO device can be addressed by an IO controller, for example, for transferring configuration data during startup or for user data exchange in cyclic operation.

IO devices that have a slot for removable storage media provide the option of writing the device name directly to the removable storage medium in the programming device.

When a device is replaced by a device without removable medium, the IO controller assigns the device name based on topological configuration (see section Configuring topology (Page 55)).

Structured device names

The device name is automatically assigned by default for PROFINET devices S7-1200, S7-1500, ET 200MP, ET 200SP and ET 200AL when these are configured in STEP 7. The device names are formed from the name of the CPU or the name of the interface module. For devices with several PROFINET interfaces, the name of the interface is enhanced, for example, "plc_1.profinet-interface_2" or "io-device_1".

You can structure the device names using DNS conventions.

These conventions are defined by "Internationalizing Domain Names in Applications (IDNA). According to this, device names are written in lower case.

The "Domain Name System" (DNS) is a distributed database (http://iana.org), which manages the name space on the Internet. To structure the names, you use the dot ("."). The hierarchy is shown in ascending order from left to right.

...<Subdomain name>.<Domain name>.<Top-level domain name>

If the name is not DNS-compliant, the name will be converted by STEP 7, for example, to "plcxb1.profinet-schnittstellexb2022c" or "io-devicexb15b32".

Device number

In addition to the device name, STEP 7 also assigns a device number beginning with "1" when an IO device is allocated.

The device number is located in the Inspector window in the properties of the PROFINET interface, under "Ethernet addresses" in the area PROFINET.

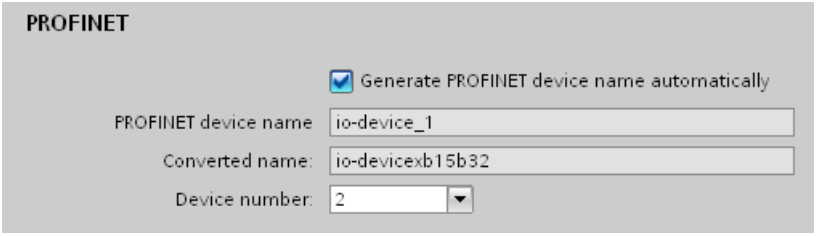

Figure 3-3 Device number

This device number can be used to identify an IO device in the user program (for example, with the instruction "LOG2GEO").

3.2.2 IP address

IP address

To allow a PROFINET device to be addressed as a device on Industrial Ethernet, this device also requires an IP address that is unique on that network. The IP addresses are typically assigned automatically by STEP 7 and assigned to the devices based on the device name. If it is a standalone network, you can apply the IP address and subnet mask suggested by STEP 7. If the network is part of an existing Ethernet company network, obtain the information from your network administrator.

Configuration of the IP address

In accordance with Internet Protocol version 4 (IPv4), the IP address is made up of four decimal numbers, each with a range of values from 0 through 255. The decimal numbers are separated from one another by a period (for example, 192.162.0.0).

The IP address consists of the following:

- Address of the network
- Address of the device (PROFINET interface of the IO controller/IO device)

Generating IP addresses

The IP addresses of the IO devices are generated by STEP 7 and first assigned to the IO devices when the CPU starts up. In addition, for some IO devices (e.g., SCALANCE X, S7-300 CPs), it is possible not to obtain the IP address during startup of the IO controller, but rather to set it beforehand on the device (see Permitting changes to the device name and IP address directly on the device (Page 53)).

The IP addresses of the IO devices always have the same subnet mask as the IO controller and are assigned from the IP address of the IO controller in ascending order. The IP address can be changed manually, if necessary.

For devices with several PROFINET interfaces (e.g., CPU 1516-3 PN/DP), the IP addresses must be located in different subnets.

Subnet mask

The bits set in the subnet mask decide the part of the IP address that contains the address of the network.

In general, the following applies:

- The network address is obtained from the AND operation of the IP address and subnet mask.
- The device address is obtained from the AND NOT operation of the IP address and subnet mask.

Example of the subnet mask

Subnet mask: 255.255.0.0 (decimal) = 11111111.11111111.00000000.00000000 (binary)

IP address: 192.168.0.2 (decimal) = 11000000.10101000.00000000.00000010 (binary)

Meaning: The first 2 bytes of the IP address determine the network - i.e., 192.168. The last two bytes address the device, i.e. 0.2.

Default router

The default router is used when data has to be forwarded via TCP/IP or UDP to a partner located outside the local network.

In STEP 7, the default router is named Router. You can activate the use of a router in the Inspector window of a CPU with the "Use router" check box in the"IP protocol" section. STEP 7 assigns the local IP address to the default router by default.

The router address that is set on the PROFINET interface of the IO controller is automatically transferred for the configured IO devices.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask with respect to the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc.). However, this is not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other, less significant bits of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of devices they contain is halved. Externally, the network continues to function as an individual network.

Example:

You have a subnet of address class B (for example, IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All devices with addresses from 129.80.001.000 to 129.80.127.254 are located in a subnet, all devices with addresses from 129.80.128.000 to 129.80.255.254 in a different subnet.

3.2.3 Assigning a device name and IP address

Assigning an IP address and subnet mask for an IO controller for the first time

You have the following options:

- **Using a programming device or PC:**

  Connect your programming device/PC to the same network as the relevant PROFINET device. The interface of the programming device/PC must be set to TCP/IP mode. During the download, first of all display all available devices via the "Accessible devices" download dialog box. Select the target device via its MAC address and then assign its IP address before you download the hardware configuration including the configured IP address (IP address is saved retentively).

- **Using the display of a S7-1500 CPU:**

  The S7-1500 CPUs have a front cover with a display and operating keys. You can use this display to assign or change the IP address. To set the IP address, navigate on the display via the menu items "Settings" > "Addresses" > "X1 (IE/PN)" > "Parameters".

- **Using a memory card:**

  If your PROFINET device is equipped for a memory card (Micro Memory Card/SIMATIC memory card), plug this into your programming device/PC and save the hardware configuration together with the configured IP address on this memory card. Then plug the memory card into the PROFINET device. Once inserted, the PROFINET device automatically applies the IP address.

  If you have saved a configuration to the memory card with the "IP address is set directly at the device" option, you must assign the IP address using a different method after inserting the memory card. (See chapter Permitting changes to the device name and IP address directly on the device (Page 53))

Assigning device names and IP address for "Device replacement without exchangeable medium/programming device"

For devices without exchangeable medium (e.g., ET 200MP, ET 200SP) and devices that support "Device replacement without exchangeable medium/PG" (e.g., ET 200S), the IO controller can identify the device without name from the neighbor relationships specified by the set topology and from actual neighbor relationships determined by the real PROFINET devices. The IO controller then assigns the PROFINET device the configured name and incorporates the PROFINET device in the user data traffic. (See also Device replacement without exchangeable medium (Page 176)).

IP address assignment when replacing IO devices with exchangeable medium PG

The following is contained on the memory card of the programmable logic controller:

- On the IO controller: Device name and IP address
- On the IO device: Device name

When you remove the memory card from a PROFINET device and insert it in another PROFINET device with exchangeable medium (e.g., ET 200S), device-specific information and the device name are loaded to the device.

If an IO device has to be replaced in its entirety due to a device or module defect, the IO controller automatically assigns parameters and configures the replaced device or module. The cyclic exchange of user data is then restarted. In addition to this, before the power ON of the IO device, the memory card with the valid name must be removed from the faulty IO device and added to the replaced device.

In the event of an error in the PROFINET device, the memory card allows you to replace a module without a programming device/PC. You can also transfer the device data directly from the programming device/PC to the memory card.

Procedure: Changing the device name using properties of the PROFINET interface

You can change the PROFINET name via the properties of the PROFINET interface. This is useful when the PROFINET device has not received its previous name from the automatic generation, for example, in the case of a migration.

1. In the network or device view of the STEP 7 hardware and network editor, select the PROFINET interface of a PROFINET device.
2. In the Inspector window, go to "Ethernet addresses" in the PROFINET area.
3. Clear the "Generate PROFINET device name automatically" check box.
4. Enter the new PROFINET device name in the relevant field.

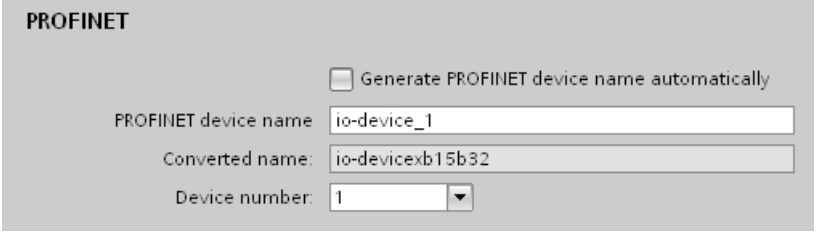

Figure 3-4 Changing the device name of a PROFINET device in the properties

Alternative procedure: Changing the device name of a PROFINET device in the network view

Requirement: The "Generate PROFINET device name automatically" check box is selected.

1. In STEP 7, select the "Network overview" tab in the tabular area of the network view.
2. In the "Device" column, overwrite the name in the row of the relevant PROFINET device.

The name is also changed accordingly in the graphic area of the network view.

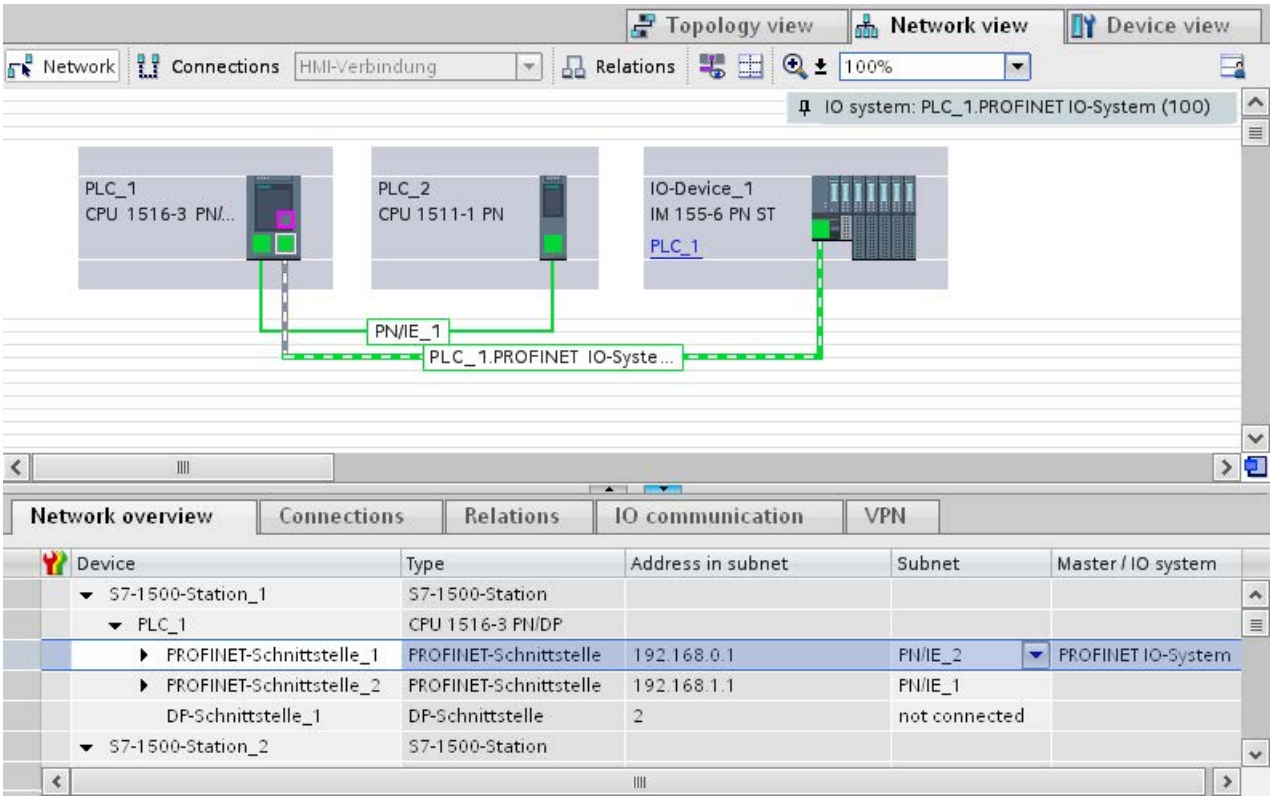

Figure 3-5 Changing the device name of a PROFINET device in STEP 7

Procedure: Changing the IP address

To change the IP address, follow these steps:

1. In the network or device view of the STEP 7 hardware and network editor, select the PROFINET interface of a PROFINET device.
2. In the Inspector window, go to "Ethernet addresses" in the "IP protocol" area.
3. Check that the option "Set IP address in the project" is selected.
4. Enter the new IP address in the relevant field.

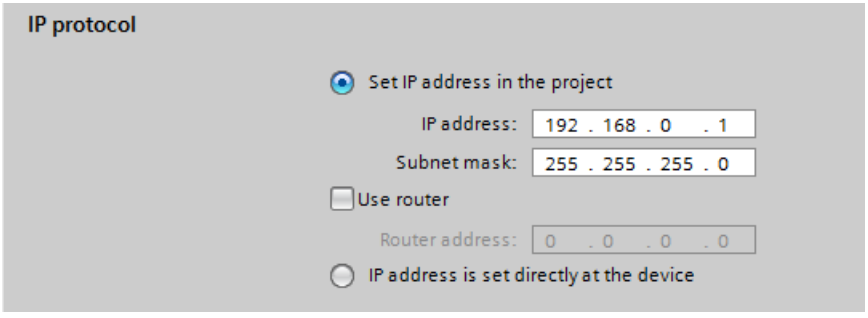

Figure 3-6 Changing the IP address of a PROFINET device in STEP 7

Downloading configured device name to IO device

To place the configured device names in the IO device, follow these steps:

1. Connect your programming device/PC to the same network as the relevant IO device. The interface of the programming device/PC must be set to TCP/IP mode.
2. In STEP 7, select the relevant IO device in the "Accessible devices" dialog based on the MAC address.
3. Click "Assign name" to download the configured device name to the IO device.

   The IO controller recognizes the IO device automatically by its device name and automatically assigns the configured IP address to it.

Identification of the PROFINET device

To clearly identify a device from several identical devices in a control cabinet, for example, you can flash the link LED of the PROFINET device.

To do this, select the menu command **Online > Accessible devices...** in STEP 7. In the "Accessible devices" dialog, set the PG/PC interface by means of which you are connected to the devices. STEP 7 will now automatically search for the accessible devices and display them in the "Accessible devices in target subnet" table. Select the desired PROFINET device and click on the "Flash LED" button. The PROFINET device is identified based on its MAC address.

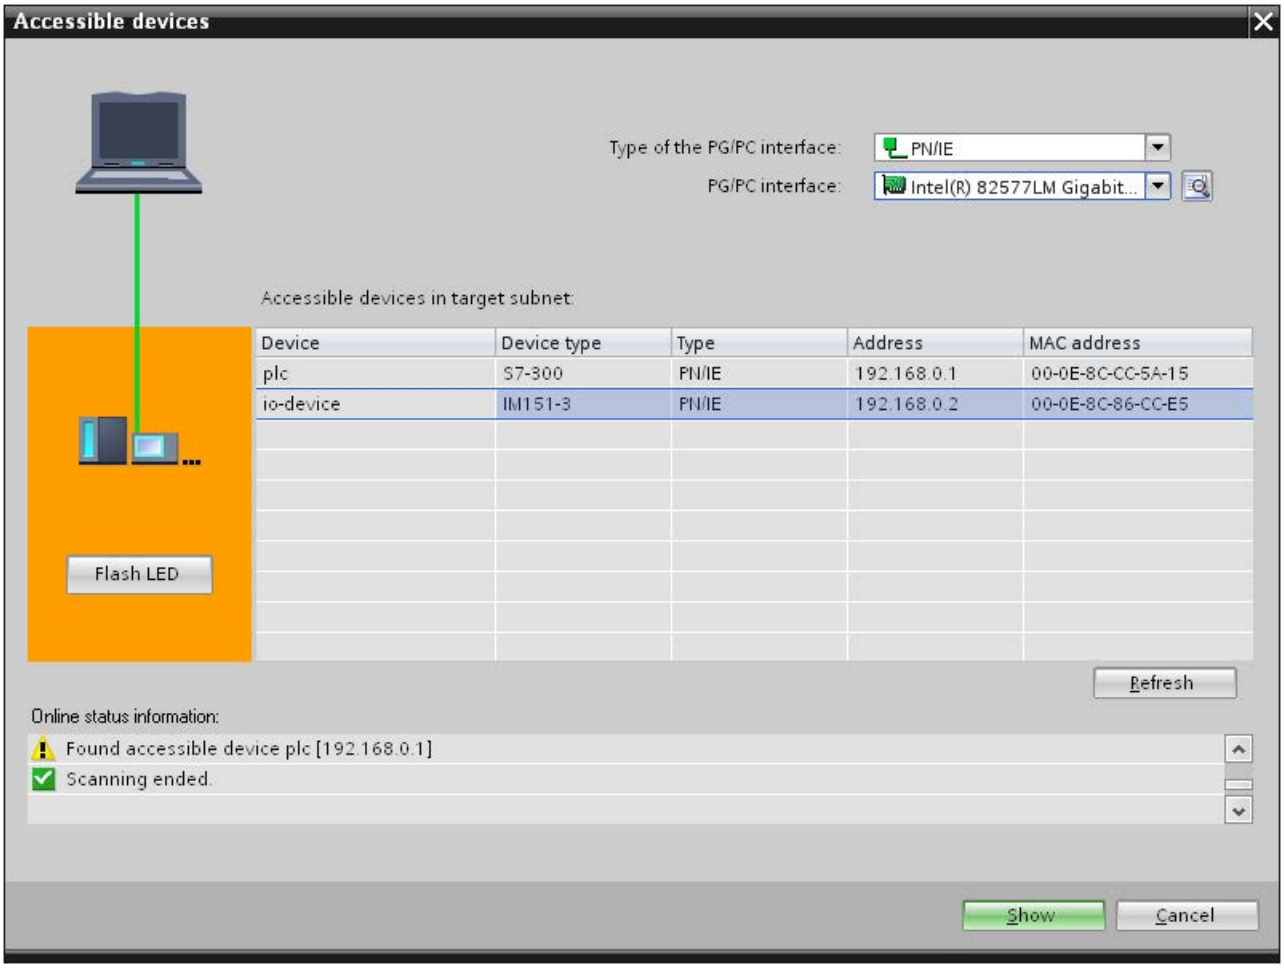

Figure 3-7 "Accessible devices" dialog

Using an different way to assign IP addresses for IO devices

Various IO devices, for example, SCALANCE X,S7-300 CPs, support the option of not having the IP addresses assigned by the IO controller during startup. In this case, the IP address is assigned in a different way. For additional information, refer to the manual of the respective PROFINET device of the SIMATIC device family.

Additional information

You can find a detailed description of the operation and functions of the display of the S7-1500 CPUs in the system manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792).

3.2.4 Permitting changes to the device name and IP address directly on the device

Introduction

Machines are frequently commissioned on site or integrated into the existing infrastructure without STEP 7. You can find typical applications in all areas of the series machine building. Alternative means for assigning the IP address are available for this.

Procedure

1. In the network or device view of the STEP 7 Hardware and Network editor, select the PROFINET interface of an IO controller.
2. Navigate in the Inspector window to "Ethernet addresses".
3. Select the "IP address is set directly at the device" option in the "IP protocol" area.
4. In the "PROFINET" area, select the " PROFINET device name is set directly at the device" check box.

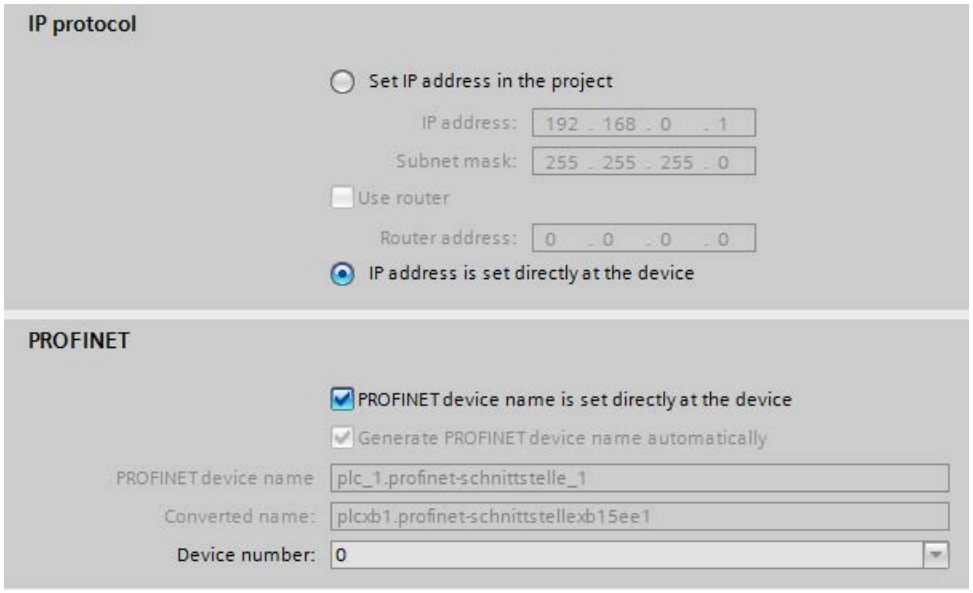

Figure 3-8 Setting the device name and IP address on the device

Note

Gateway

When you operate a PROFINET device with the option "Allow adaption of the device name/IP address directly on device", you cannot use this PROFINET device as gateway for S7 routing.

Options for assigning IP addresses and device names

Apart from the known address and device name assignment in the "Ethernet addresses" section of the Inspector window, there are other ways in which the IP address and name can be assigned:

- Assigning by means of the user program with the instruction "T_CONFIG"
- Assignment when downloading the configuration to the target system via the "Extended download to device" dialog box.
- Assignment via the Primary Setup Tool (PST)
- Assignment via the PRONETA ("PROFINET network analysis") commissioning and diagnostics tool

Additional information

For information on the "T_CONFIG" instruction and on downloading to the target system, refer to the STEP 7 online help.

A free Download (http://support.automation.siemens.com/WW/view/en/14929629) of the Primary Setup Tool (PST) can be found on the Internet. On this Internet page, you will also find a list of devices for which the PST is approved.

3.3 Configuring topology

Introduction

If an IO device is assigned to an IO controller, this does not yet specify how the ports are connected to each other.

A port interconnection is not required to use RT, but it provides the following advantages:

- A set topology is assigned with the port interconnection. Based on an online-offline comparison, it is possible to conduct a set-actual comparison with all devices that support this function.
- The "Device replacement without exchangeable medium" function can be used.

A port interconnection is an essential requirement for using IRT.

An overview of various options for setting up a PROFINET network is given below.

Line

All the communication devices are connected in a linear bus topology.

In PROFINET, the linear bus topology is implemented with switches that are already integrated into the PROFINET devices. Therefore, the linear bus topology at PROFINET is merely a special form of tree / star topology.

If a link element (switch, for example) fails, communication across the failed link element is no longer possible. The network is then divided into 2 subsegments.

Linear bus topology structures require the least cabling.

Star

If you connect communication devices to a switch with more than two PROFINET ports, you automatically create a star network topology.

If an individual PROFINET device fails, this does not automatically lead to failure of the entire network, in contrast to other structures. It is only if a switch fails that part of the communication network will fail as well

Tree

If you interconnect several star structures, you obtain a tree network topology.

Ring

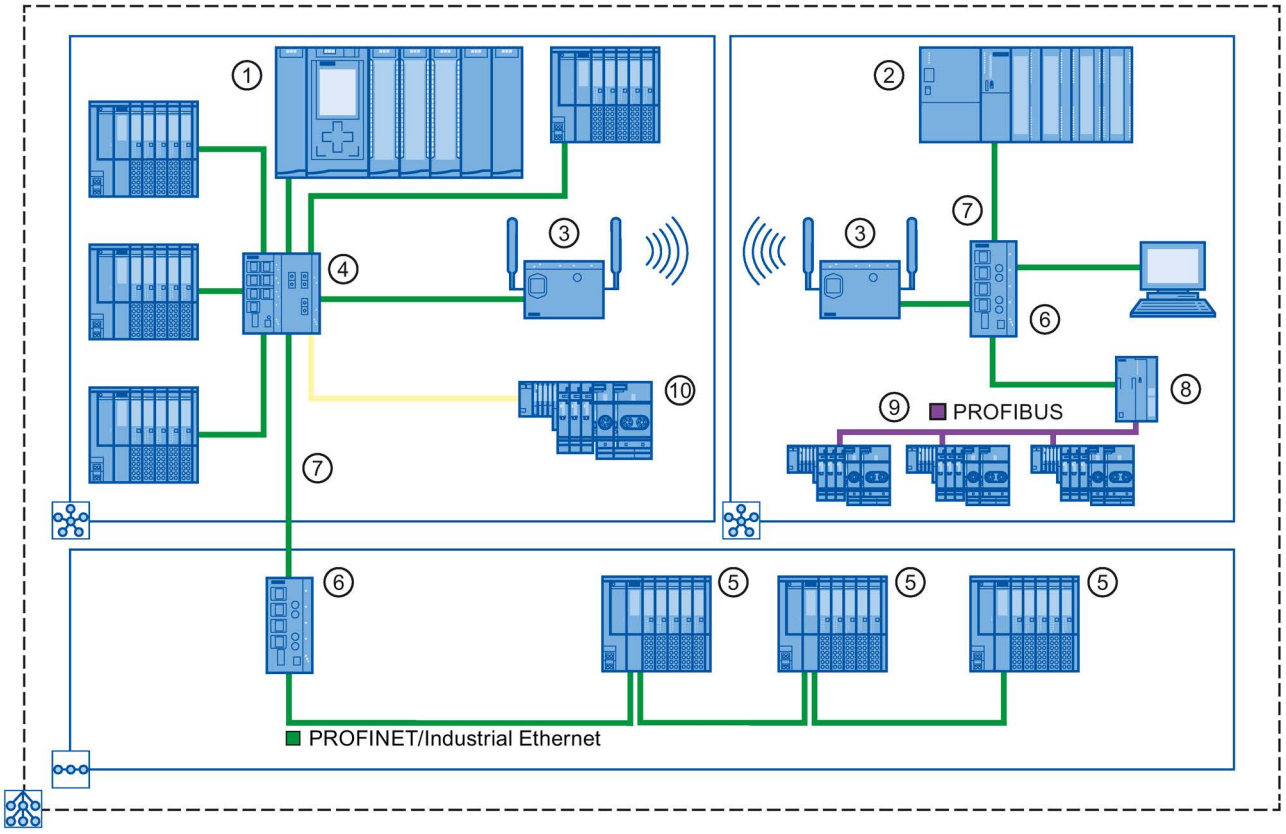
In order to increase the availability of a network, use ring structures. In principle, a linear bus topology is connected to a ring through a so-called redundancy manager.

The task of the redundancy manager is managed by an external switch SCALANCE X, a CPU that supports the Media Redundancy Protocol MRP (e.g., CPU 1516-3 PN/DP) or a CP (e.g., CP 343-1 Lean).

If there is a break in the network, the redundancy manager ensures that the data is redirected over an alternative network connection in the ring.

Example for topology

The following example shows a combination of different topologies.



Number	Meaning
①	S7-1500 as IO controller
②	S7-300 as IO controller
③	Industrial WLAN with SCALANCE W
④	SCALANCE X 307-3 with seven electrical and three optical ports
⑤	ET 200SP with integrated 2-port switch
⑥	SCALANCE X 204 with four electrical ports
⑦	PROFINET/Industrial Ethernet
⑧	IE/PB-Link PN IO
⑨	PROFIBUS DP
⑩	ET 200S with two optical ports
	Star topology
	Linear bus topology
	The combination of topology forms results in a tree topology.

Figure 3-9 Combined topology

Additional information

Observe the PROFINET Installation Guideline (http://www.profibus.com/nc/download/installation-guide/downloads/profinet-installation-guide/display/) of the PROFIBUS User Organization when planning your PROFINET topology.

For more detailed information, see the SIMATIC NET Twisted Pair and Fiber Optic Networks (http://support.automation.siemens.com/WW/view/en/8763736) manual.

You can find basic information in the Communication with SIMATIC (http://support.automation.siemens.com/WW/view/en/1254686) manual.

3.3.1 Topology view in STEP 7

Introduction

The topology view is one of three working areas of the hardware and network editor. You undertake the following tasks here:

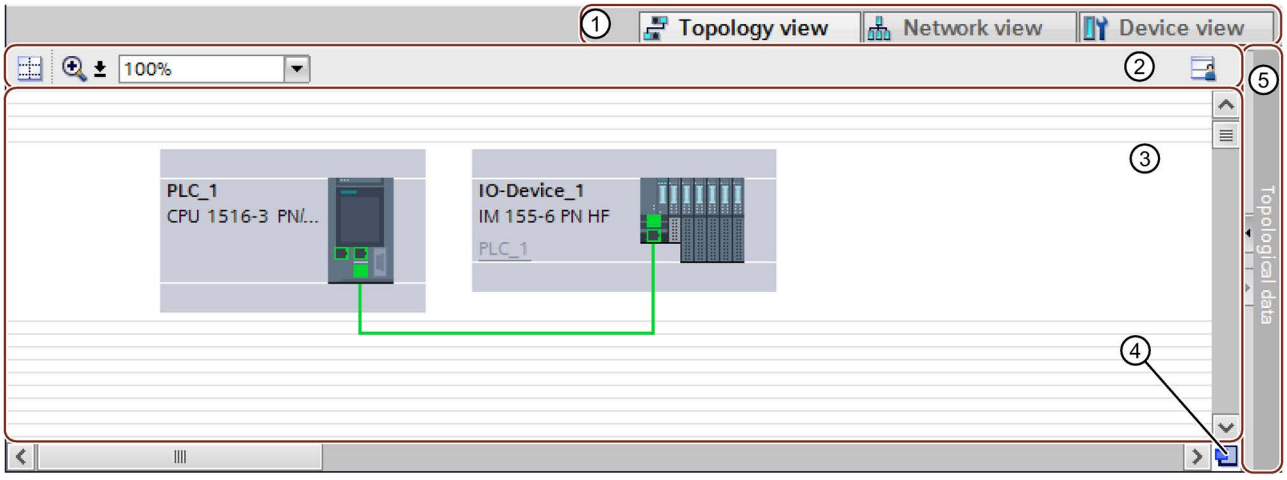
- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identify and minimize differences between the set and actual topology (online)

The topology view in STEP 7 consists of a graphic area and a table area.

Graphic area

The graphic area of the topology view displays PROFINET devices with their appropriate ports and port connections. Here you can add more PROFINET devices.

The following figure shows the graphic area of the topology view.



① Selector: Device view/Network view/Topology view
② Toolbar
③ Graphic area of the topology view
④ Overview navigation
⑤ Selector for the table area of the topology view

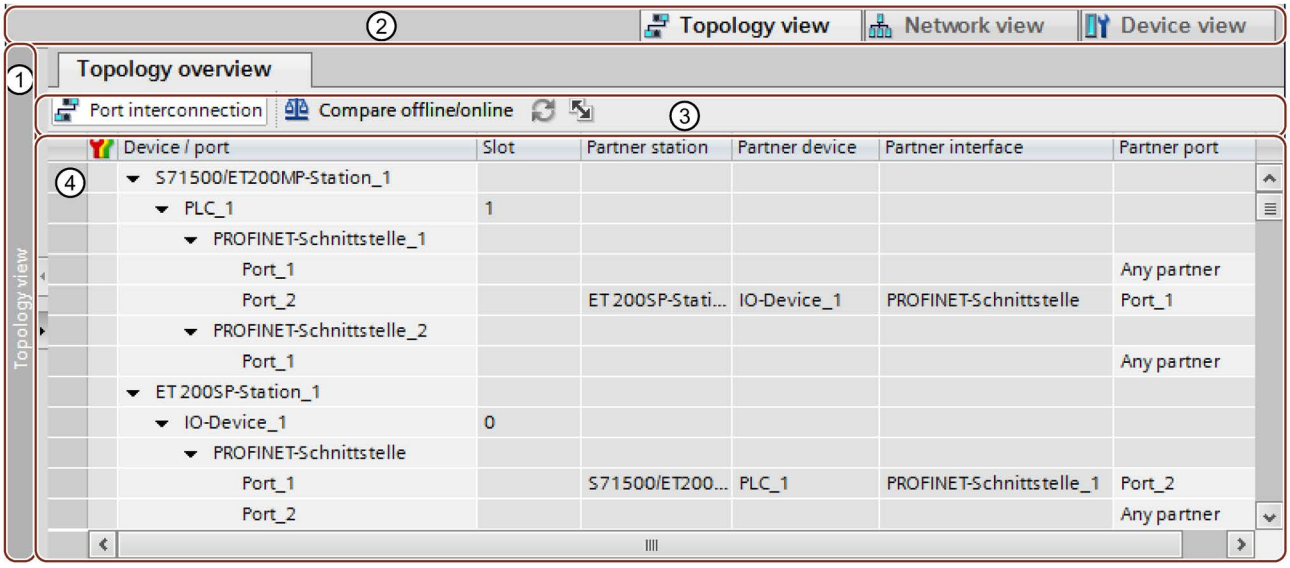
Figure 3-10 Graphic area of the topology view

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

This displays the Ethernet or PROFINET devices with their appropriate ports and port connections in a table. This table corresponds to the network overview table in the network view.



① Selector for the graphic area of the topology view
② Selector: Device view/Network view/Topology view
③ Toolbar
④ Table area of the topology view

Figure 3-11 Table area of the topology view

3.3.2 Interconnecting ports in the topology view

Requirement

You are in the graphic view of the topology view.

Procedure

To interconnect ports in the topology view, follow these steps:

1. Place the pointer of the mouse on the port you want to interconnect.
2. Press and hold down the left mouse button.
3. Move the pointer.

   The pointer now uses the networking symbol to indicate "Interconnecting" mode. At the same time, you see the lock symbol on the pointer. The lock symbol disappears only when the pointer is over a valid target position.
4. Now drag the pointer to the target port. You can keep the left mouse button pressed or release it when performing this action.
5. Now release the left mouse button or press it again (depending on your previous action).

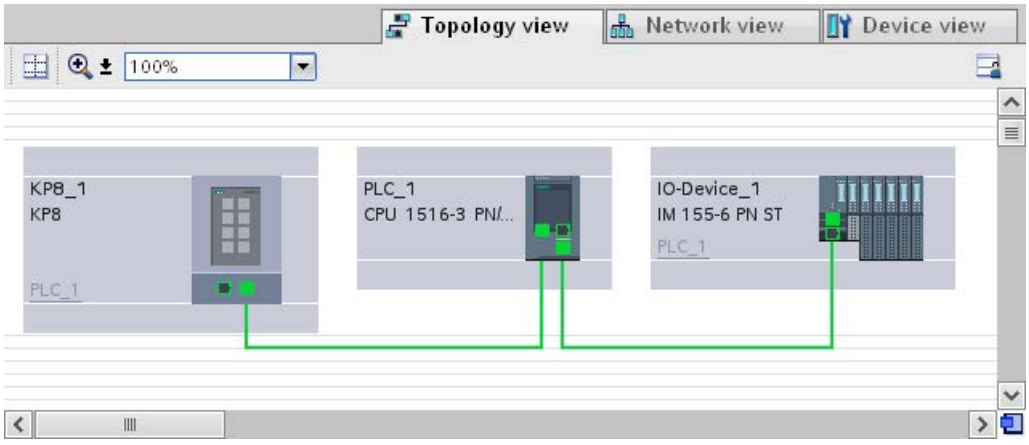


Figure 3-12 Interconnecting ports in the topology view

Result

You have created a port interconnection.

3.3.3 Interconnecting ports - Inspector window

Interconnecting ports in the Inspector window

To interconnect ports, follow these steps:

1. In the device or network view, select the PROFINET device or PROFINET interface.
2. In the Inspector window, navigate to the port property "Port interconnection".

   When the PROFINET interface is selected, you can find this setting in the Inspector window as follows: "Properties > General > Advanced Options > Port [...] > Port Interconnection."
3. In the "Local port" section, you can find the settings at the local port. In the case of fiber-optic cable you can, for example, set the cable names here.

   In the "Partner port" area, select the drop-down list for "Partner port" in order to display the available partner ports and make a selection.

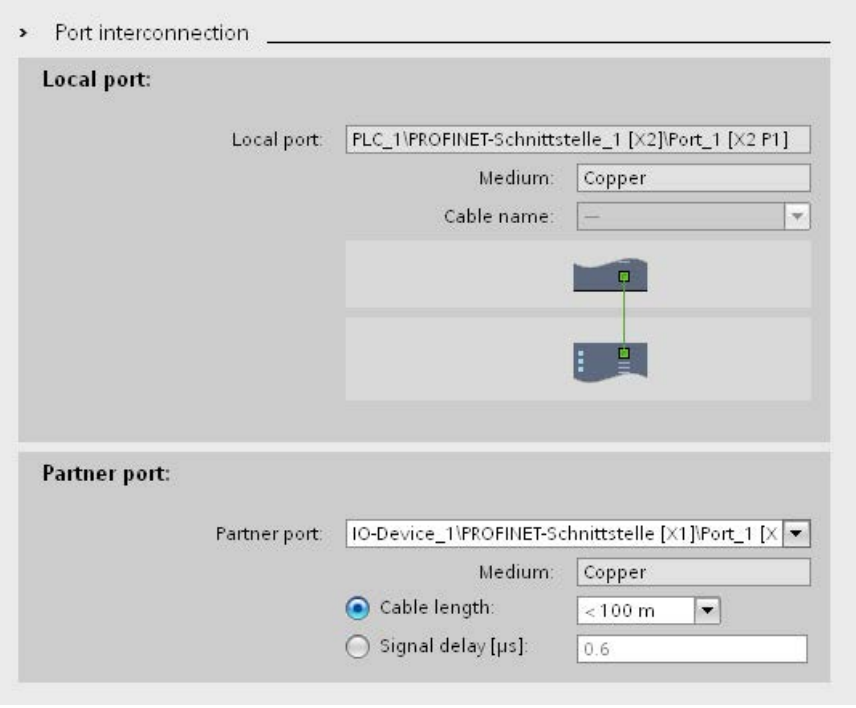

Figure 3-13 Interconnecting ports in the Inspector window in STEP 7

If the PROFINET interface was disconnected, it is automatically connected by this action. In the properties of the subnet you can set whether this subnet should or should not be used for the networking.

3.3.4 Automatic assignment of devices by offline/online comparison

Overview

During the offline/online comparison, the configured topology is compared with the actually existing topology. Devices identified online are automatically assigned to configured devices as far as this is possible.

The assignment of the devices is a requirement to apply the port interconnection in the project. (Apply the devices identified online in the project (Page 64))

Requirements

A device identified in the offline/online comparison is automatically assigned to a configured device if the following properties of the two devices match up:

- Device name
- Order number
- Number of ports

Procedure

To perform an online/offline comparison, follow these steps:

1. Click the "Compare offline/online" button in the tabular area of the topology view.
2. You restart the offline/online comparison by clicking the "Update" button.

Note

The offline/online comparison takes a few seconds. During this time, no user input is possible.

The status bar shows the progress of the offline/online comparison.

No automatic assignment

In the following situations, no automatic assignment is possible:

- No device can be identified online to match a configured device. This means that the corresponding columns in the "Online topology" area of the topology overview table are empty.

  In this case, you should add the already configured device to your system or delete the configured device from the configuration.

- A device identified online cannot be assigned to any configured device. In this case the corresponding columns in the "Offline topology" area of the topology overview table are empty.

  In this case, you can apply the device identified online in the project.

3.3.5 Apply the devices identified online in the project

Requirements

You have run an offline/online comparison in the topology view. The result of this is that at least one device identified online was assigned to a configured device and that there are differences relating to the interconnection.

Procedure

To manually apply one or more port interconnections identified online in the project, follow these steps:

1. Select the value "Apply" in the "Action" column for a port of a configured device to which a device identified online was assigned.
2. Repeat the step if necessary for other ports of the same configured device.
3. Repeat the steps up to now if necessary for other configured devices to which devices identified online were assigned and for which there are differences relating to the interconnection.
4. Click the "Synchronize" button.

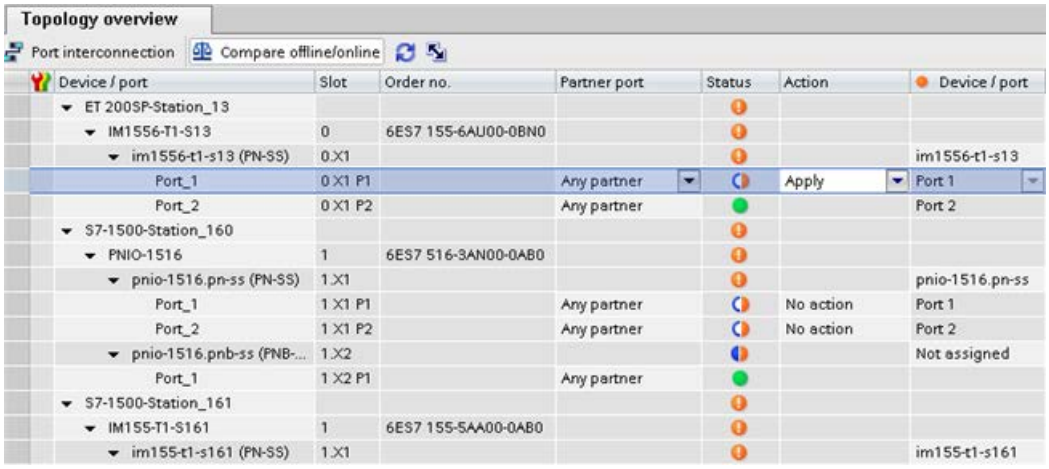

Figure 3-14 Apply the devices identified online in the project

Result

The port interconnections identified online and the cable information for the corresponding devices are applied in the project. Successful application is indicated by the diagnostics icon "Identical topology information" for each port.

Note

If other port interconnections are recognized for a device identified online and these differ from those in the project, applying these in the project means that the port interconnections that were previously in the project are replaced by those identified online.

If no interconnections are detected for a device identified online, applying in the project means that all the port interconnections of this device are deleted in the project.

Diagnostics

4

4.1 Diagnostics mechanisms of PROFINET IO

Totally Integrated Diagnostics Concept

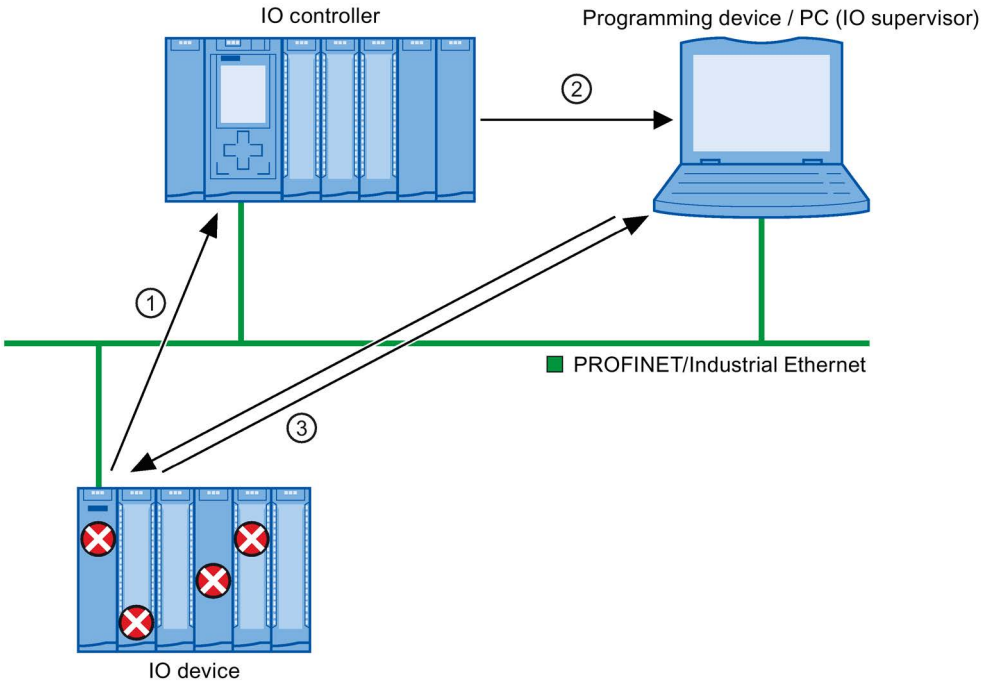
All SIMATIC products have integrated diagnostics functions that they can use to detect and remedy faults. The components automatically flag a potential fault in the operation and provide detailed information.

Each individual error or several errors occurring concurrently are transferred from the IO device to the IO controller. If you require the full status of the IO device including any pending errors, you can also read the status directly from the IO device.

The following sections provide basic information on using diagnostics via PROFINET IO. You can find a detailed description of the system diagnostics for S7-1500, ET 200MP, ET 200SP and ET 200AL in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

Accessing the status of an IO device with a PG/PC or an HMI device

If you are connected to the Industrial Ethernet via a PG/PC with STEP 7 or an HMI device, you can also call up diagnostics information online. This is illustrated by the following graphic.



Number	Description
①	The IO device detects an error and sends diagnostics data to the IO controller.
②	The IO controller notifies the programming/HMI device. The display of the system diagnostics is updated.
③	In STEP 7, you can read the station status for "Accessible devices" directly from the IO device regardless of the IO controller. This is only possible if the programming device/HMI is connected to the Industrial Ethernet. This means that you can access diagnostics information during the commissioning phase or for servicing even if the IO controller is not operational.

Figure 4-1 PROFINET IO diagnostics with PG/PC or HMI device

4.1.1 Diagnostics levels in PROFINET IO

Concept

The IO device sends all error messages that occur to the IO controller. The scope and volume of diagnostics information varies according to the level of diagnostics data evaluation and the PROFINET devices you are using.

Diagnostics levels

You can evaluate diagnostics data at different levels. The number and type of channels is selected, for example, at the diagnostics level 4.

The following figure shows the diagnostics levels with PROFINET IO.

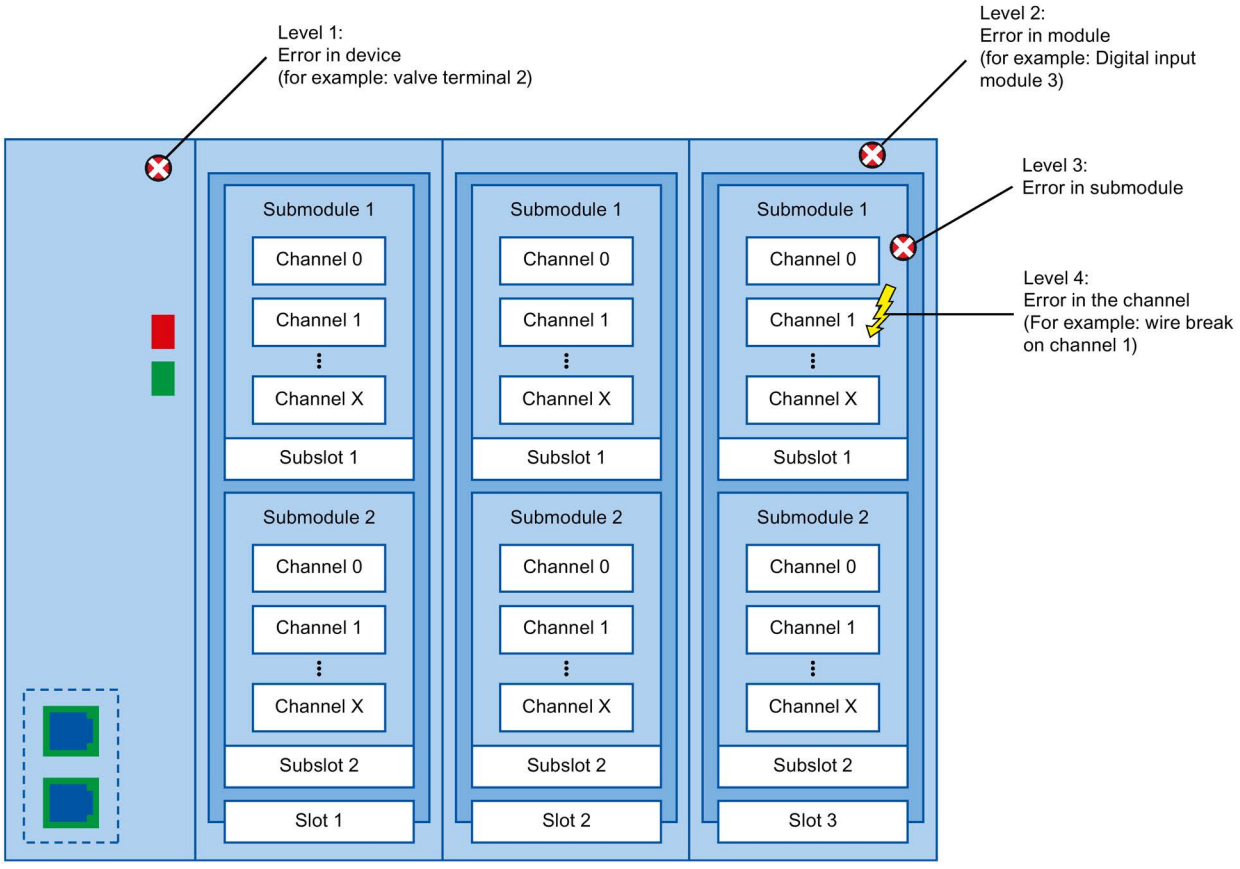


Figure 4-2 Diagnostics levels with PROFINET IO

Representation of diagnostics levels in the device view in STEP 7

The following figure shows the representation of the PROFINET device model in the device view of STEP 7, based on the example of a distributed I/O system ET 200MP:

Number	Description	
①	Level 1:	Error(s) in the device
②	Level 2:	Error(s) in the module

Figure 4-3 Diagnostics levels in the device view of STEP 7

4.1.2 I&M data (identification and maintenance)

Definition and properties

Identification and maintenance data (I&M) is information saved to module memory in order to provide support when:

- Checking the plant configuration
- Locating hardware changes in a plant

Identification data (I data) is module information (some of which may be printed on the module housing) such as the order and serial number. I data is read-only vendor-specific module data.

Maintenance data (M data) is plant-specific information such as the location identifier and installation date. M data is created during configuration.

The modules can be uniquely identified in online mode by means of the I&M data.

Further information

To find out whether and to what extent a PROFINET device supports I&M data, refer to the documentation of the relevant device.

4.2 Diagnostics using status LEDs

LEDs for diagnostics on PROFINET

Each port of a PROFINET interface of a SIMATIC device has one LED.

The following table shows a summary of the meaning of these LEDs in the S7-1500, ET 200MP, ET 200SP and ET 200AL systems.

Table 4- 1 S7-1500, ET 200MP, ET 200SP, ET 200AL: LEDs for diagnostics on PROFINET

Meaning	LED image	S7-1500	ET 200MP	ET 200SP	ET 200AL
		LINK/TX/RX LED		LK LED	P1 Link LED P2 Link LED
There is no connection between the PROFINET interface of your PROFINET device and a communication partner (for example, IO controller).	LED off	X	X	X	X
There is a connection between the PROFINET interface of your PROFINET device and a communication partner (for example, IO controller).	LED green	X	X	X	X
The "Node flash test" is performed.	LED flashes green	X	X	X	X
There is active data traffic (sending/receiving) via the Ethernet connection.	LED yellow	X	X	-	-

Additional information

You can find a detailed description of all LEDs of the module with cause of the error and remedies in the relevant documentation for the module.

4.3 Diagnostics via the display of the S7-1500 CPUs

Display of the S7-1500 CPUs

Each CPU in the S7-1500 automation system has a front cover with a display. Control and status information is shown in various menus on the display. You use the operating keys to navigate through the menus.

Diagnostics via the display

The following indicators can be evaluated for diagnostics purposes on the display:

- Error and alarm texts (system diagnostics, alarm messages)
- Module status for central and distributed modules

In the following example of a display of the CPU 1516-3 PN/DP, you can see a warning on the diagnostics icon and an exclamation mark on the icon for module.

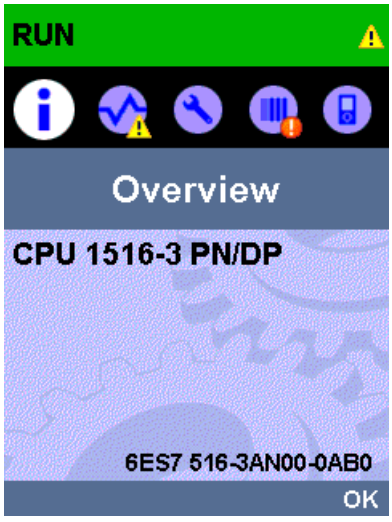

Figure 4-4 Display of overview

Module status

To show the module status, navigate on the display through the menu items "Module" > "PROFINET I/O (X1)" > "Station" > "Slot" > "Status" > "Module status".

The module status indicates that a fault has occurred in the module. The "lower-level status" is the status of the module in the diagnostics level below this. In the example, the status is "good", i.e., the fault is not in the lower diagnostics level submodule or channel, but instead in the module.

Figure 4-5 Display of module status

Error and alarm texts

You can show diagnostics buffer entries and alarm messages for the relevant automation system on the display.

To show the diagnostics buffer entries of the CPU, navigate on the display via the menu items "Diagnostics" > "Diagnostics buffer".

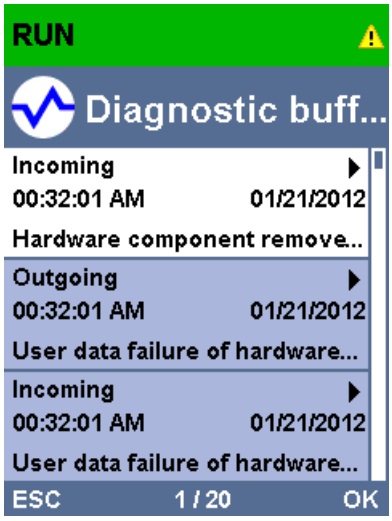

Figure 4-6 Display of diagnostics buffer

To show the alarm messages of the automation system, navigate through the menu items "Diagnostics" > "Alarms" > "Alarm text" on the display.

Note

Updating the alarm display

The display shows the currently read status of the CPU in static form, the display is not automatically updated. The alarm display is updated after it has been exited and opened again.

You set the automatic updating of the diagnostics information under: "Display" > "DiagnosticRefresh".

Figure 4-7 Display of alarms

Figure 4-8 Display of alarm message

Additional information

You can find the description of the operation and functions of the display in the system manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792).

4.4 Diagnostics via Web server

The CPUs belonging to the S7 family have their own integrated Web server with a wide range of functions.

For diagnostics, the Web server supports you with the following displays:

- Contents of the diagnostic buffer
- Module status
- Actual topology of the PROFINET system
- Set topology of the PROFINET system (from the configuration)

Set topology and actual topology - graphic view

Requirements for displaying the set and actual topology:

- You have configured the PROFINET ports in the topology editor of the hardware and network editor of STEP 7.
- You have loaded the entire project with STEP 7 in the CPU.

The following shows an example of the graphic view.

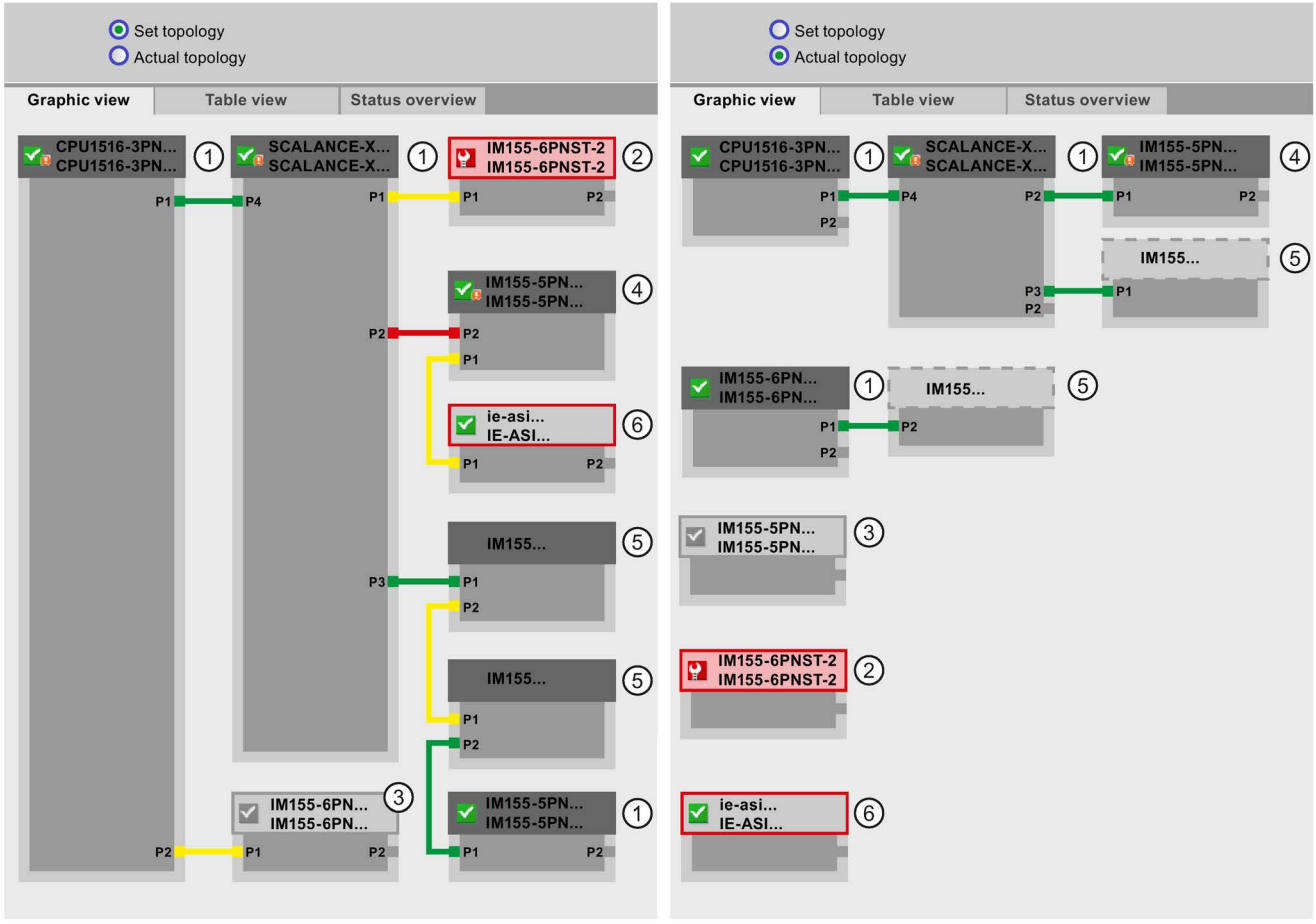

Figure 4-9 Topology - graphic view via the Web server

Meaning of the colored connections in the set/actual topology:

Table 4- 2 Meaning of the colored connections in the set/actual topology:

Connection	Meaning	
	Set topology	Actual topology
green	The current actual connection matches the configured set connection.	detected connections
red	The current actual connection does not match the configured set connection (e.g., port interchanged).	-
yellow	The connection cannot be diagnosed. Causes: • The communication to an IO device has been disrupted (e.g., cable removed) • Connection to a passive component • Connection to PROFINET devices of another IO controller or PROFINET system	-

① Configured and accessible PROFINET devices

Configured and accessible PROFINET devices are displayed dark-gray. Connections show the ports through which the PROFINET devices of a station are connected.

① Configured but not accessible PROFINET devices

The configured but not accessible PROFINET devices are displayed in pink with red border (e.g., device has failed, cable disconnected).

③ Disabled devices

All disabled, configured PROFINET devices are displayed light-gray.

④ Interchanged ports

Interchanged ports are marked red in the set topology view. The currently connected ports are displayed in the actual topology, the configured set connection in the set topology.

⑤ PROFINET devices of another PROFINET IO system

- In the set topology:

  A PROFINET device of another PROFINET IO system is displayed with a green connection (or red connected if the ports have been interchanged), when it is directly adjoining a configured and accessible PROFINET device ① and it is also accessible. When the PROFINET device of another PROFINET IO system is not accessible, a yellow connection line is displayed.

  The connection between two PROFINET devices that both belong to a different PROFINET IO system, cannot be determined and is always displayed in yellow.

- In the actual topology:

  A PROFINET device of another PROFINET IO system is only displayed if the PROFINET device is in direct proximity to a configured PROFINET device. The PROFINET device is displayed light-gray and with dashed line.

For PROFINET devices of a different PROFINET IO system, **no** status display is shown on the device head.

⑥ Representation of faulty neighbor relations

The devices whose neighbor relations cannot be read out completely or correctly are displayed light-gray with red border.

Additional information

The tabular view of the actual topology and the status overview of the PROFINET devices in the project are possible.

You can find these views, additional topology examples, and detailed information on the operation and the functions of the Web server in the Web server (http://support.automation.siemens.com/WW/view/en/59193560) manual.

4.5 Diagnostics in STEP 7

For PROFINET, you have the following options to evaluate diagnostics in STEP 7:

- Online & diagnostics - Devices & networks
- Online & diagnostics - diagnostics of PROFINET ports

Online & diagnostics network view

In the hardware and network editor (launched from the "Project tree" by double-clicking "Devices & networks"), you can get an overview of the current state of your system by clicking on the "Go online" button. It also shows the configuration information (for example, non-configured modules). This option is also available in the topology view in similar form.

Schematic drawing of the network view (online):

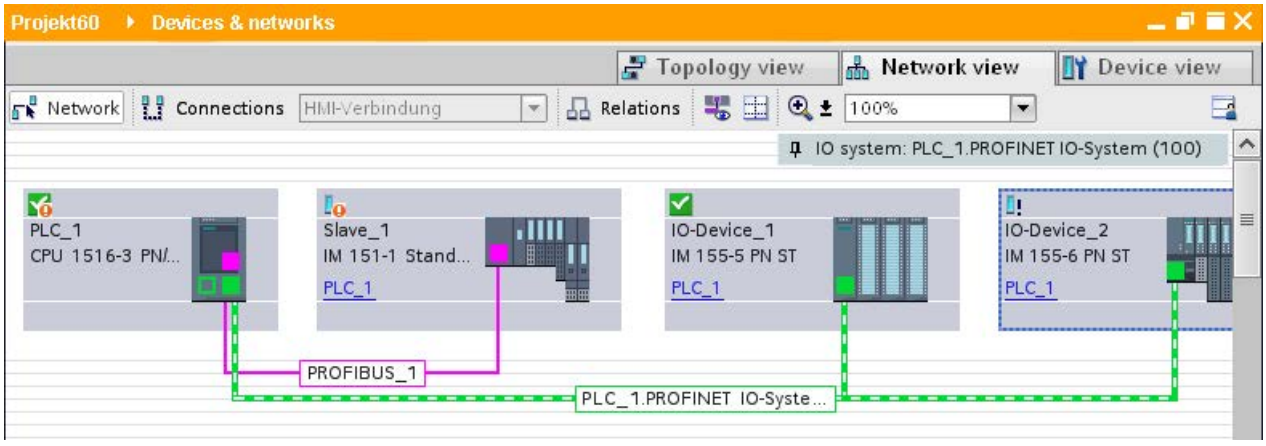

Figure 4-10 Online & diagnostics network view

Online & diagnostics device view

In STEP 7, you can display an overview of the modules in which faults have occurred. To do this, select the menu command "Online > Online & diagnostics". Once you are connected, you can see the status of the accessible devices in the project tree.

Double-click the device which displays an alarm message to access the faulty module directly. The device view is opened in the work area. In the device view of the device that reports the fault you can see directly in which module the fault occurs.

Open the "Diagnostics" tab and the subordinate "Device information" tab in the Inspector window for a more detailed error description.

Schematic drawing of the device view (online):

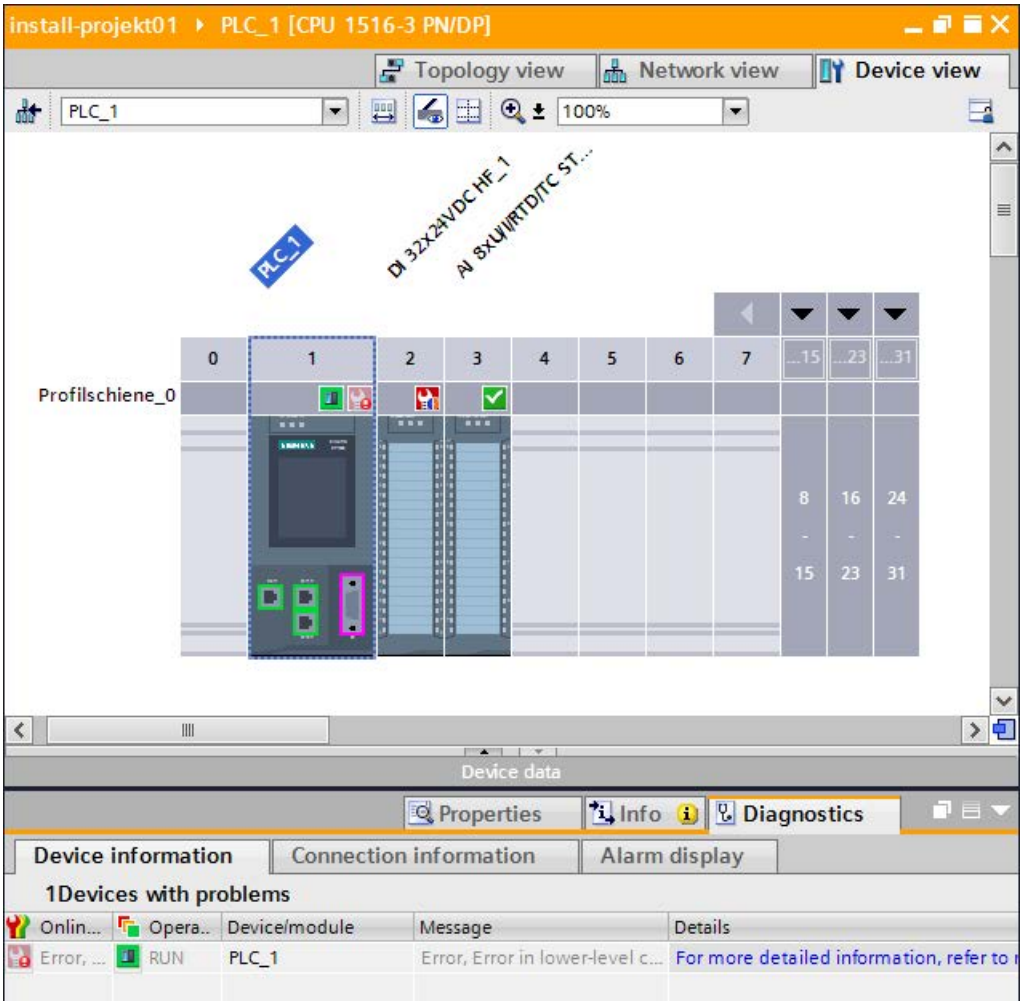

Figure 4-11 Online & diagnostics device view

Diagnostics of PROFINET ports

If you select "PROFINET interface > Ports" in the Diagnostics area in the online & diagnostics device view of a PROFINET device, the ports of the PROFINET interface are listed in a table.

The table provides you with the following information about the ports of the PROFINET interface.

- Name
- Status
- Settings
- Operating mode

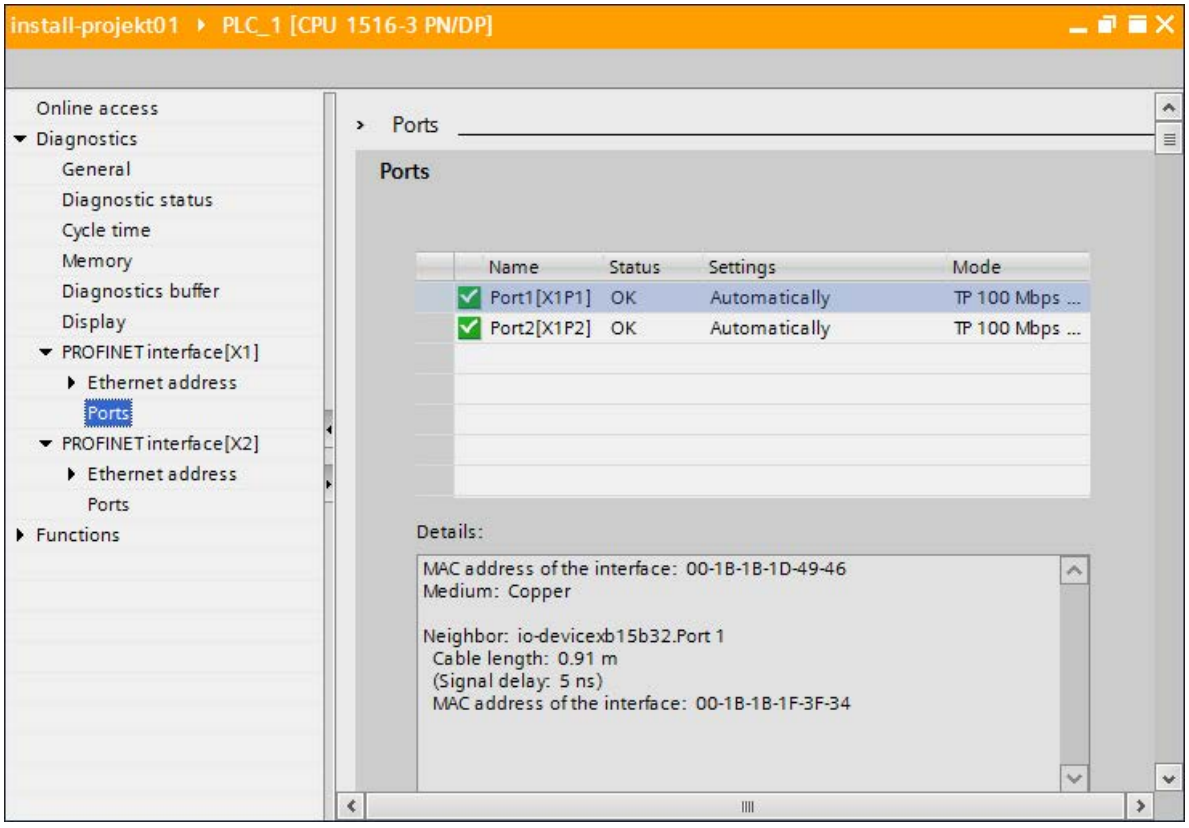

Figure 4-12 Diagnostics of PROFINET ports in STEP 7

Additional information

You can find information on the system diagnostics for S7-1500, ET 200MP, ET 200SP and ET 200AL in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual and online help for STEP 7.

4.6 Extended maintenance concept

Extended maintenance concept

The PROFINET interfaces with integrated switch of the SIMATIC devices support the four-level diagnostics concept in accordance with PROFINET specification Version V2.3 or higher with the following status:

Table 4- 3 Classification of the diagnostic status

Diagnostic status	Symbol		Severity of the error
Good	Green checkmark		Maintenance required	Green wrench		
Maintenance demanded	Yellow wrench		
Bad	Red wrench		

The aim of the diagnostics concept is the early detection and elimination of potential faults - before they cause a production outage.

Other status information is defined in addition to the Good (no fault) and Bad (fault) status information for a PROFINET device.

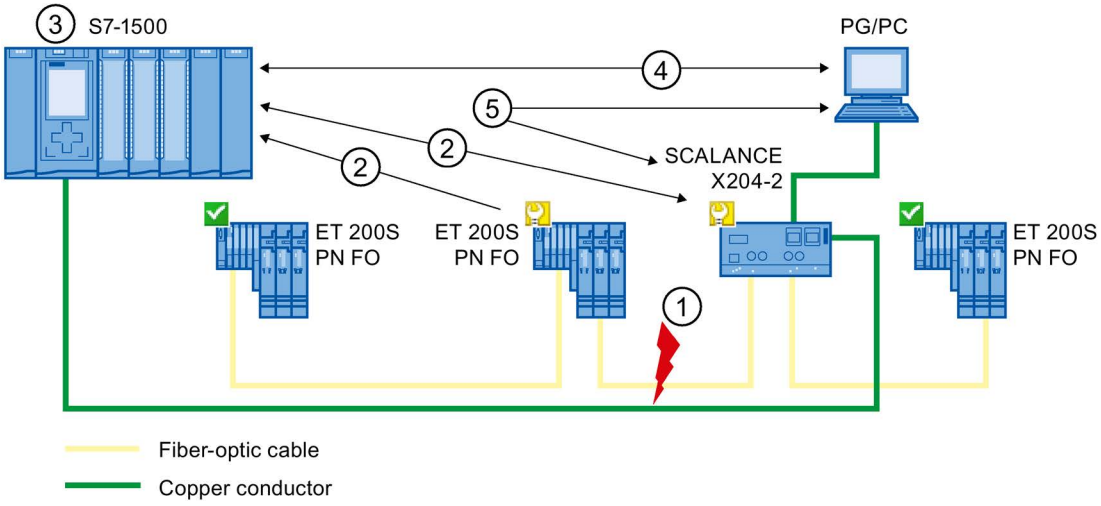
The maintenance information is generated with the following system alarms:

- Maintenance required (symbolized by a green wrench) and
- Maintenance demanded (symbolized by a yellow wrench)

The times at which the two system alarms are generated can be customized for most wear parameters.

Example: Maintenance demanded for a PROFINET cable

The following graphic illustrates how diagnostics information is exchanged when the transmission quality on the optical cable decreases due to ageing, for example. In this example, the scenario is considered after a maintenance required has already been diagnosed.



Number	Description
①	The system reserve of the fiber-optic cable drops below 0 dB.
②	Both the ET 200S PN FO and the switch send the maintenance demanded alarm to the IO controller.
③	Based on the interrupts, the IO controller detects the maintenance demanded from the switch and from the IO device. The module information data is updated in the IO controller and the corresponding error OBs are called. Note: To be able to start the error OBs in the IO controller, the "Call the user program if communication errors occur" property must be selected in STEP 7 for the relevant IO controller.
④	In STEP 7 (on the programming device/PC), the maintenance demanded message is indicated on the IO device and at the switch by a yellow wrench symbol.
⑤	STEP 7 can also read out detailed information directly from the switch.

Figure 4-13 Maintenance demanded for a PROFINET cable

4.7 Diagnostics of the network topology

Availability

As an open standard, you can use any SNMP based systems or software solutions for diagnostics in PROFINET.

Network diagnostics

The network management protocol SNMP (Simple Network Management Protocol) uses the wireless UDP transport protocol. It consists of two network components, similar to the client/server model. The SNMP manager monitors the network nodes and the SNMP clients collect the various network-specific information in the individual network nodes and store it in a structured form in the **MIB** (Management Information Base). This information allows a network management system to run detailed network diagnostics.

MIB

The MIB (Management Information Base) is the database of a device. SNMP clients access this database in the device. The S7 device family supports the following standard MIBs:

- MIB II, standardized in the RFC 1213
- LLDP-MIB, standardized in the international standard IEC 802.1AB
- LLDP-PNIO-MIB, standardized in the international standard IEC 61158-6-10

Detecting the network topology

LLDP (Link Layer Discovery Protocol) is a protocol that is used to detect the closest neighbor. LLDP enables a device to send information about itself and to receive information from its neighbor devices. This information is then saved in the LLDP MIB, for example, and can be queried using SNMP. This information allows a network management system to determine the network topology.

Use of SNMP (Simple Network Management Protocol)

SNMP can be used as follows:

- By users to integrate network diagnostics into a central HMI/SCADA system using the SIMATIC NET OPC server
- By the IT administration of machine and plant operators to monitor their Industrial Ethernet network using standard network management systems.
- By the IT administration, to monitor the automation network, alongside the office network, using standard network management systems.

Use of SNMP in the SIMATIC NET environment

SNMP-compliant devices from the SIMATIC NET family can be monitored and operated via a conventional standard Internet browser. The management system known as web-based management offers a wide range of device-specific information (network statistics, status of redundant supply, for example).

4.8 Diagnostics in the user program

4.8.1 Diagnostics and configuration data records

Diagnostics mechanism

The IO device outputs a diagnostics interrupt to the IO controller when it detects faults such as wire break on an IO module. This interrupt calls a corresponding organization block in the user program (diagnostics interrupt OB82), in order to generate a defined (programmed) response to the fault and passes a diagnostics data record.

Diagnostics data records in PROFINET IO

There are two different types of diagnostics data record:

1. Channel diagnostics data records

   Channel diagnostics data records are generated if a channel is in an error state and / or has triggered an interrupt.

   A diagnostics data record of length 0 is returned if there is no fault.

2. Vendor-specific diagnostics data records

   The structure and size of vendor-specific diagnostics data records depend on the vendor's settings.

   For information about vendor-specific diagnostics data records, refer to the appropriate device manual.

Addressing levels of diagnostics data records

Diagnostics and configuration data is evaluated at the following addressing levels:

- Device level
- AR (Application Relation)
- API (Application Process Identifier)
- Slot
- Subslot

A group of diagnostics and configuration data records are available for each address level (exception: device level always 0xF80c). In HEX representation, the individual groups of data records are distinguished by the first letter of the data record number.

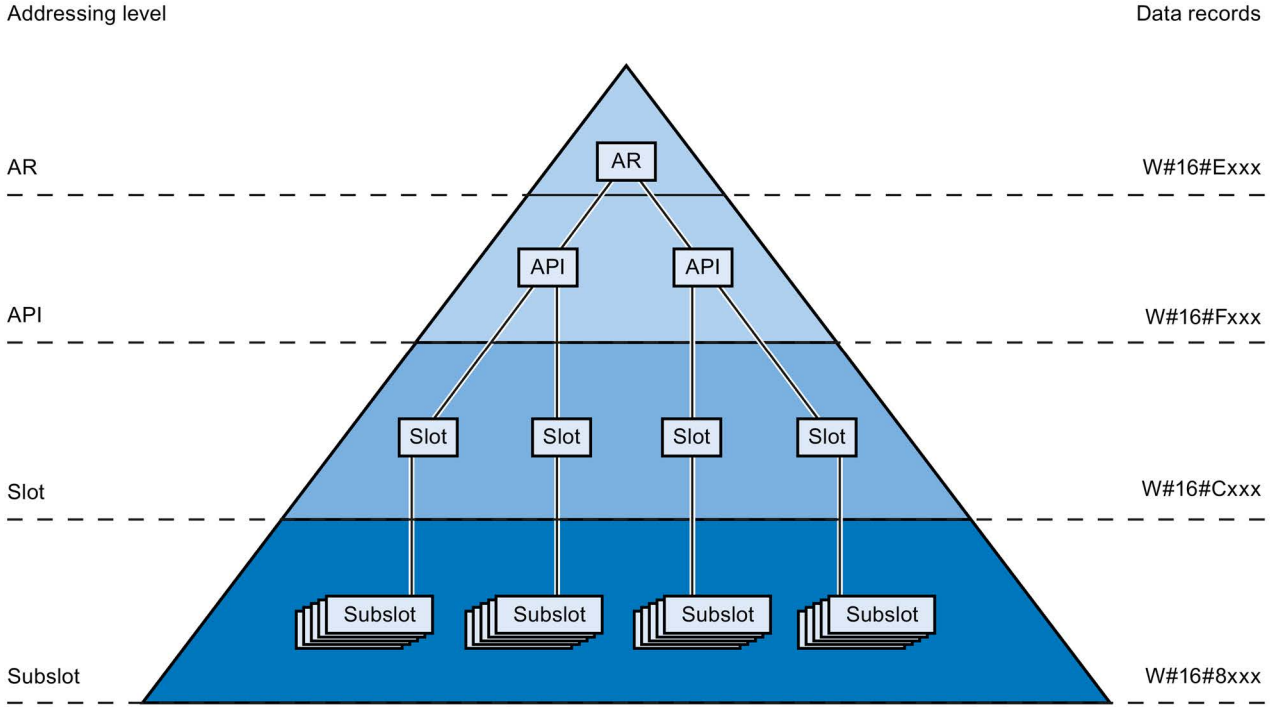


Figure 4-14 Addressing levels of diagnostics data records

The information for each IO device (addressing level AR), module (addressing level slot) or submodule (addressing level subslot) is always transferred in separate diagnostics or configuration data records. The data record returns diagnostics data or configuration data for one or more subslots, slots and APIs, depending on the addressing level.

Note

The diagnostics information is only generated for configured modules / submodules / channels.

4.8.2 Evaluate diagnostics in the user program

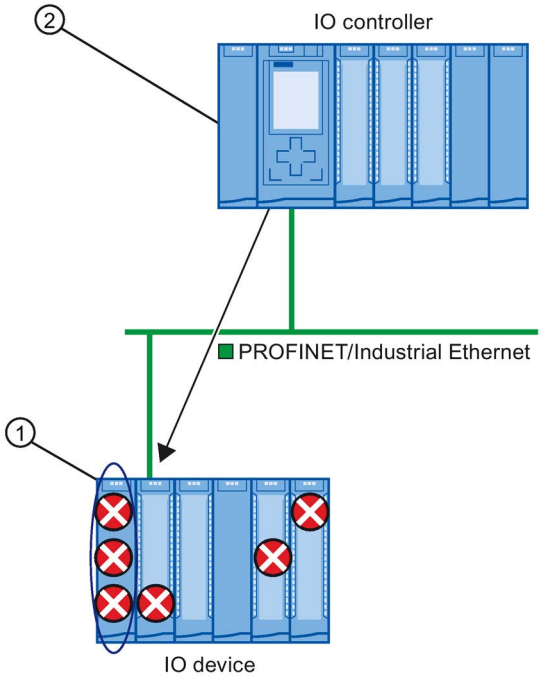
Diagnostics in the user program

For PROFINET IO, a cross-vendor structure of data records with diagnostics information applies. Diagnostics information is created only for channels on which a fault has occurred. With PROFINET, there are two basic ways to obtain diagnostics information.

1. Evaluating the diagnostics status

Read out the diagnostics of your PROFINET IO system using the instructions "DeviceStates" and "ModuleStates", to localize those stations / modules or station / modules with maintenance demanded or maintenance required that have faults within a PROFINET IO system.

The instruction RDREC (read data record) is then used to read various diagnostics data records directly from the module concerned and thus obtain detailed information about the error.

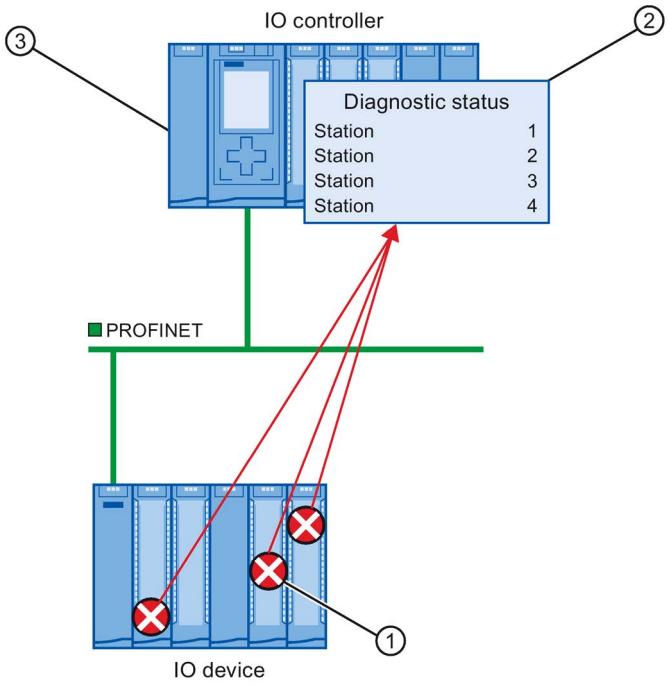


Number	Description
①	All individual errors are collected in a single data record on the interface module.
②	In your user program, the instruction "RDREC" reads the entire station status asynchronously directly from the IO device.

Figure 4-15 Example: Evaluating diagnostics data records with the instruction "RDREC"

2. Evaluation of interrupts

When the error OB (OB 82) is called, the OB's start information provides you with information on the cause and location of the error. Detailed information on the error event can be obtained in the error OB using the instruction "RALRM" (read additional interrupt information).



Number	Description
①	Every error is sent to the IO controller individually as channel diagnostics information in the form of an interrupt.
②	In the IO controller, the module status data is updated automatically and the error OB (OB 82) is started.
③	In your user program in the error OB (OB 82), the instruction "RALRM" reads the error synchronously from the IO controller without addressing the IO device.

Figure 4-16 Diagnostics with OB 82 and the instruction "RALRM"

Instructions and OBs

You will find information on the instructions and OBs in the STEP 7 online help.

Functions

5

Introduction

The following section describes the PROFINET IO functions for field of application, properties and configuration in STEP 7.

Refer to the documentation for the respective device to see to what extent the PROFINET devices support the described functions.

You can find a tabular overview of the PROFINET devices and the functions these support on the Internet (http://support.automation.siemens.com/WW/view/en/44383954).

5.1 Connecting other bus systems

5.1.1 Connecting other bus systems

Fieldbus integration

PROFINET allows you to use a proxy-capable PROFINET device to integrate existing fieldbus systems (for example, PROFIBUS, AS interface). The devices of these fieldbus systems are mapped on proxy PROFINET devices. In this way, you can set up any hybrid systems consisting of fieldbus and Ethernet-based subsystems. This allows a continuous exchange of information.

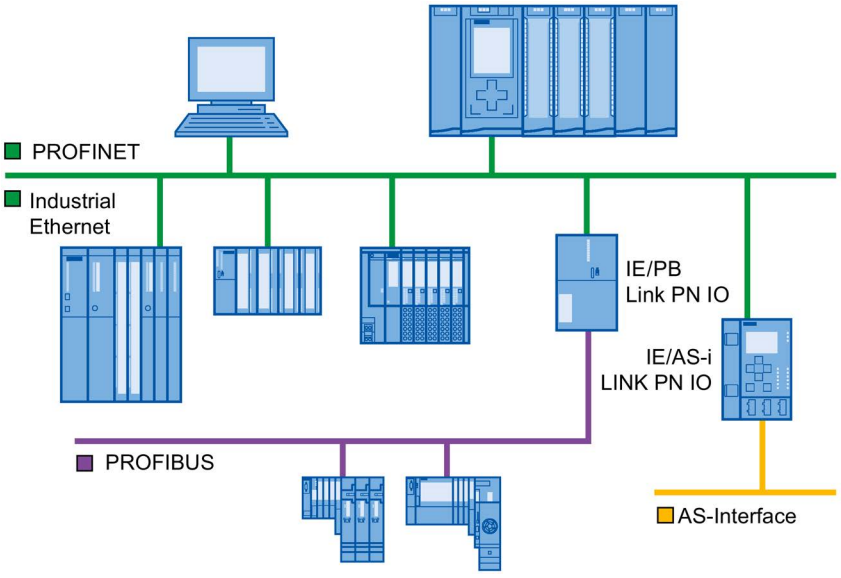


Figure 5-1 Gateways on PROFINET IO

5.1.2 Linking PROFINET and PROFIBUS

Linking PROFINET and PROFIBUS

With a proxy-capable PROFINET device which is equipped with a PROFINET interface in addition to a PROFIBUS interface (for example, IE/PB Link PN IO), you can integrate existing PROFIBUS configurations into the PROFINET configuration.

The following figures shows how a PROFIBUS system is connected via IE/PB Link to a CPU S7-1500 (as of firmware version 1.7).

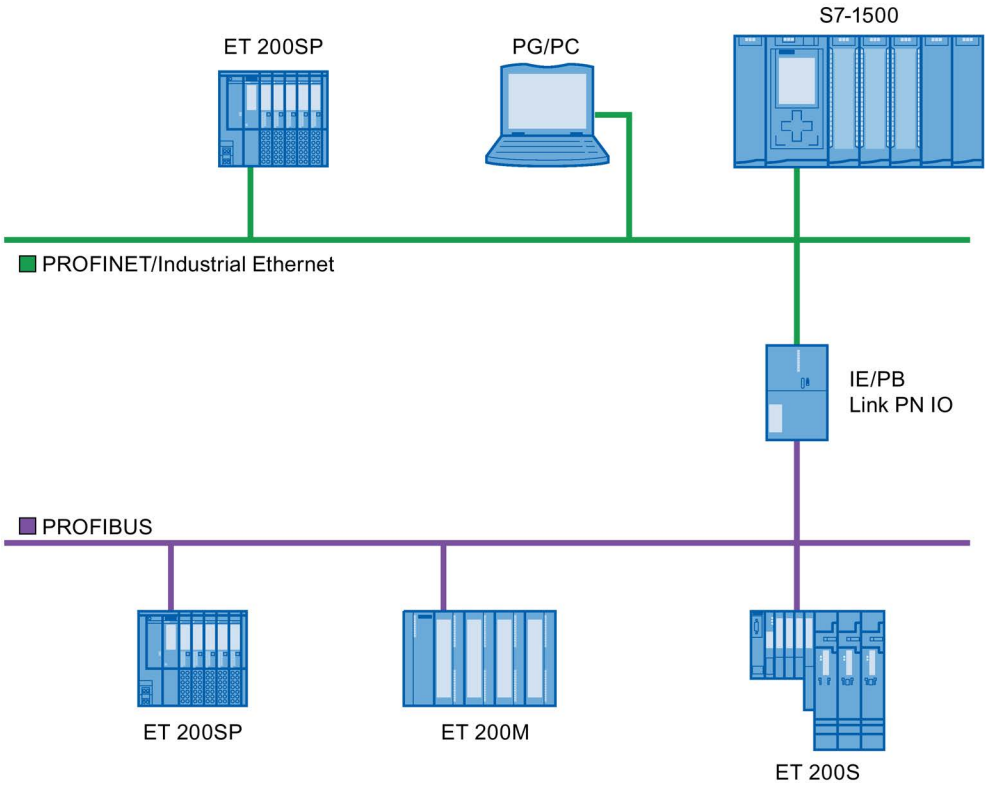

Figure 5-2 Gateway from PROFINET and PROFIBUS via IE/PB link

PROFINET device with proxy functionality

The PROFINET device with proxy functionality is the substitute for a PROFIBUS device on Ethernet. The proxy functionality allows a PROFIBUS device to communicate not only with its master but also with all devices on PROFINET.

With PROFINET you can connect an existing PROFIBUS system to an IO controller, for example with the help of an IE/PB Link PN IO.

From the IO controller perspective, the PROFIBUS DP slaves are connected to the same network as the IE/PB Link PN IO. These slaves have the same device name and IP address as the IE/PB Link PN IO, but different device numbers. Furthermore, each also has a specific PROFIBUS address.

In this way, you can link both DPV0 and DPV1 slaves to PROFINET.

For information on how to connect a DP slave to a PROFINET IO system, refer to section Connect the DP slave via the IE/PB Link to a PROFINET IO system (Page 93).

Diagnostic options with a CPU S7-1500 as IO controller

The CPU S7-1500 (as of firmware version 1.7) as IO controller detects disrupted DP slaves behind the IP/PB link.

5.1.3 Connect the DP slave via the IE/PB Link to a PROFINET IO system

Requirement

- STEP 7 as of V12
- S7-1500 CPU as of firmware version 1.7
- ET 200SP CPU as of firmware version 1.7
- S7-1500 software controller
- S7-300/400 CPU

Procedure for connecting a DP slave via an IE/PB Link

To connect a DP slave to a PROFINET IO system via an IE/PB Link in STEP 7, follow these steps:

1. Drag a PROFINET CPU, e.g. 1513-1 PN, from the hardware catalog to the network view of STEP 7.
2. Drag an IE/PB Link PN IO from the hardware catalog to the network view of STEP 7. You will find the IE/PB Link PN IO under Network components > Gateways > IE/PB Link PN IO.
3. Assign the IE/PB Link PN IO to the CPU.
4. Drag a PROFIBUS interface module e.g. IM155-6 DP HF, from the hardware catalog to the network view.
5. Assign the interface module to the IE/PB Link.

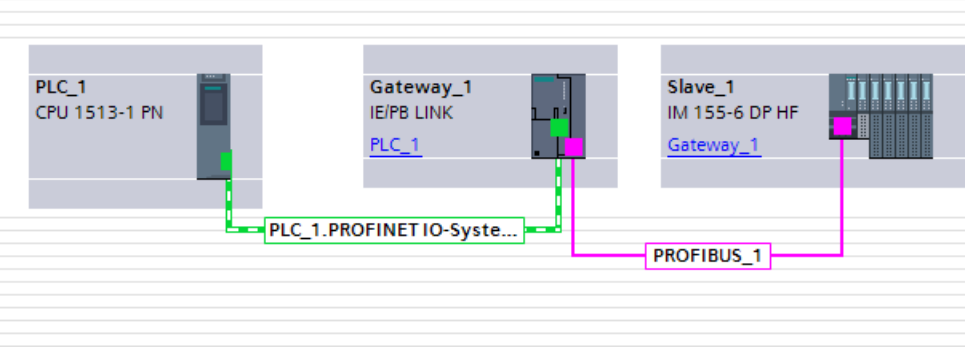

Figure 5-3 Configuring an IE/PB link

6. Select the IE/PB Link PN IO in the network view of STEP 7.

7. In the Inspector window, go to the "Gateway" area and select the "Network gateway as PROFINET IO proxy" option.

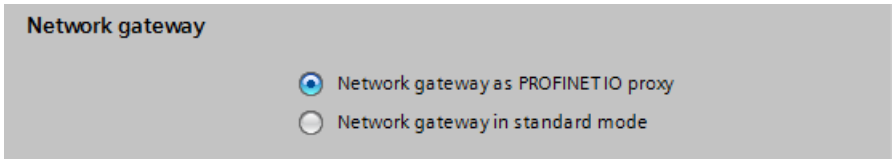

Figure 5-4 Setting a gateway

8. In the PROFINET device number area, you can assign a PROFINET device number for the DP slave.
   If you have selected the "Device number = PB address" check box (default), STEP 7 automatically assigns the device number according to the PROFIBUS address of the slave. In addition, you no longer need to update the device number if the PROFIBUS address changes.

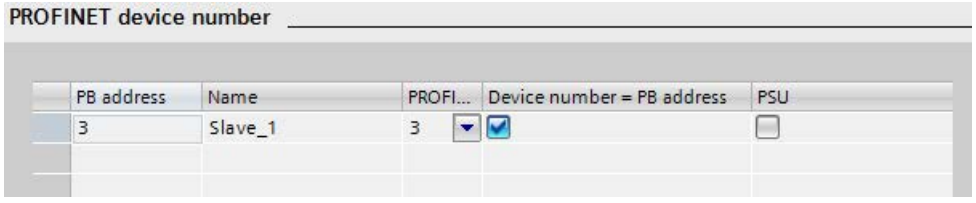

Figure 5-5 Assigning PN device numbers for IE/PB link

Result

You have connected the DP slave to the PROFINET IO system.

Reference

Additional information on the IE/PB link is available in the manual Gateway IE/PB Link PN IO (http://support.automation.siemens.com/WW/view/en/19299692).

5.2 Intelligent IO devices (I-devices)

5.2.1 I-device functionality

I-device functionality

The "I-device" (intelligent IO device) functionality of a CPU facilitates data exchange with an IO controller and operation of the CPU as intelligent preprocessing unit of sub processes, for example. The I-device is linked as an IO device to a "higher-level" IO controller.

The preprocessing is handled by the user program in the I-device. The process values acquired in the centralized or distributed (PROFINET IO or PROFIBUS DP) I/O are preprocessed by the user program and made available to the IO controller.

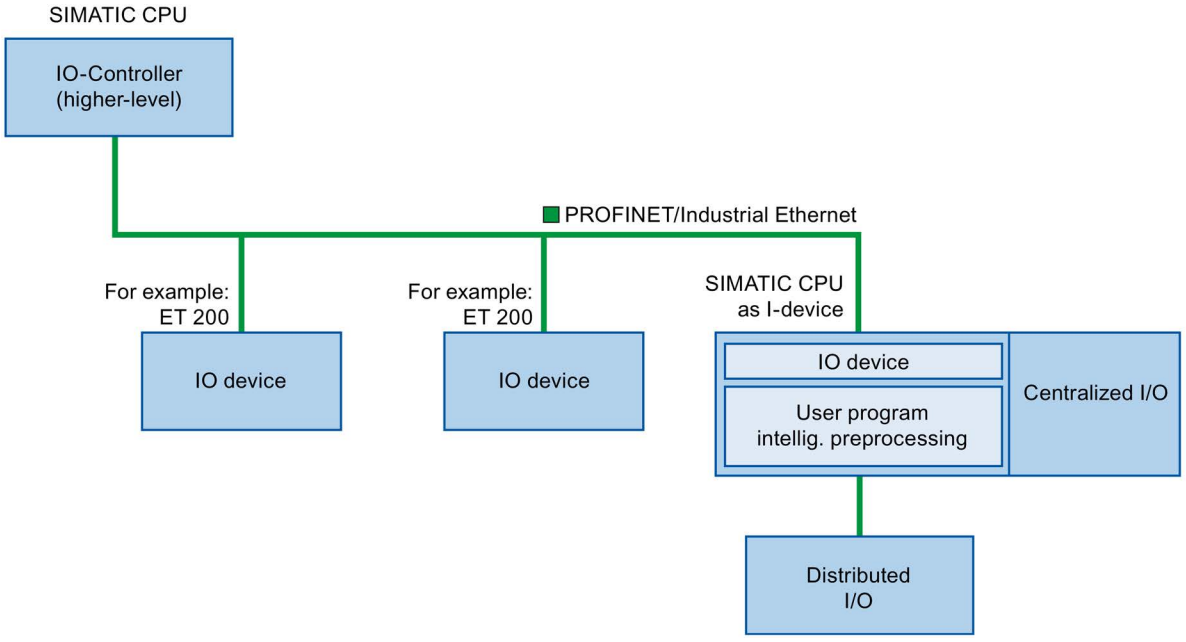

Figure 5-6 I-device

"I-device" naming conventions

In the remainder of this description, a CPU or a CP with I-device functionality is simply called an "I-device".

5.2.2 Properties and Advantages of the I-Device

Fields of application

Fields of application of the I-device:

- Distributed processing

  A complex automation task can be divided into smaller units/subprocesses. This results in manageable processes which lead to simplified subtasks.

- Separating subprocesses

  Complicated, widely distributed and extensive processes can be subdivided into several subprocesses with manageable interfaces by using I-devices. These subprocesses can be stored in individual STEP 7 projects if necessary, which can later be merged to form one master project.

- Know-how protection

  Components can only be delivered with a GSD file for the I-device interface description instead of with a STEP 7 project. The know-how of the user program may no longer be published.

Properties

Properties of the I-device:

- Unlinking STEP 7 projects

  Creators and users of an I-device can have completely separated STEP 7 automation projects. The GSD file forms the interface between the STEP 7 projects. This allows a link to standard IO controllers via a standardized interface.

- Real-time communication

  The I-device is provided with a deterministic PROFINET IO system via a PROFINET IO interface and therefore supports RT (real-time communication) and IRT (isochronous real time).

Advantages

The I-device has the following advantages:

- Simple linking of IO controllers
- Real-time communication between IO controllers
- Relieving the IO controller by distributing the computing capacity to I-devices.
- Lower communication load by processing process data locally.
- Manageable, due to processing of subtasks in separate STEP 7 projects

5.2.3 Characteristics of an I-Device

Principle

An I-device is included in an IO system like a standard IO device.

I-device without lower-level PROFINET IO system

The I-device does not have its own distributed I/O. The configuration and parameter assignment of the I-devices in the role of an IO device is the same as for a distributed I/O system (for example ET 200).

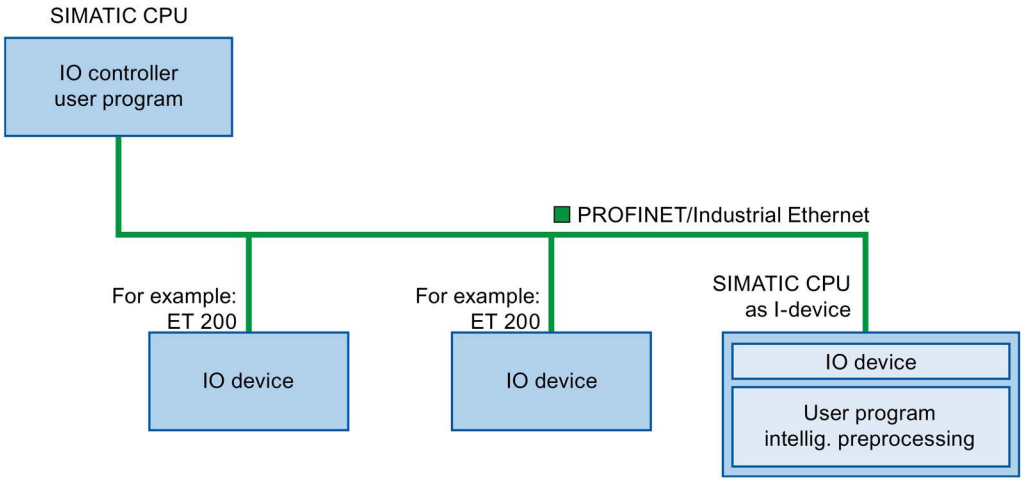

Figure 5-7 I-device without lower-level PROFINET IO system

I-device with lower-level PROFINET IO system

Depending on the configuration, an I-device can also be an IO controller on a PROFINET interface in addition to having the role of an IO device.

This means that the I-device can be part of a higher-level IO system via its PROFINET interface and as an IO controller can support its own lower-level IO system.

The lower-level IO system can, in turn, contain I-devices (see figure below). This makes hierarchically structured IO systems possible.

In addition to its role as IO controller, an I-device can also be used via a PROFIBUS interface as DP master for a lower-level PROFIBUS system.

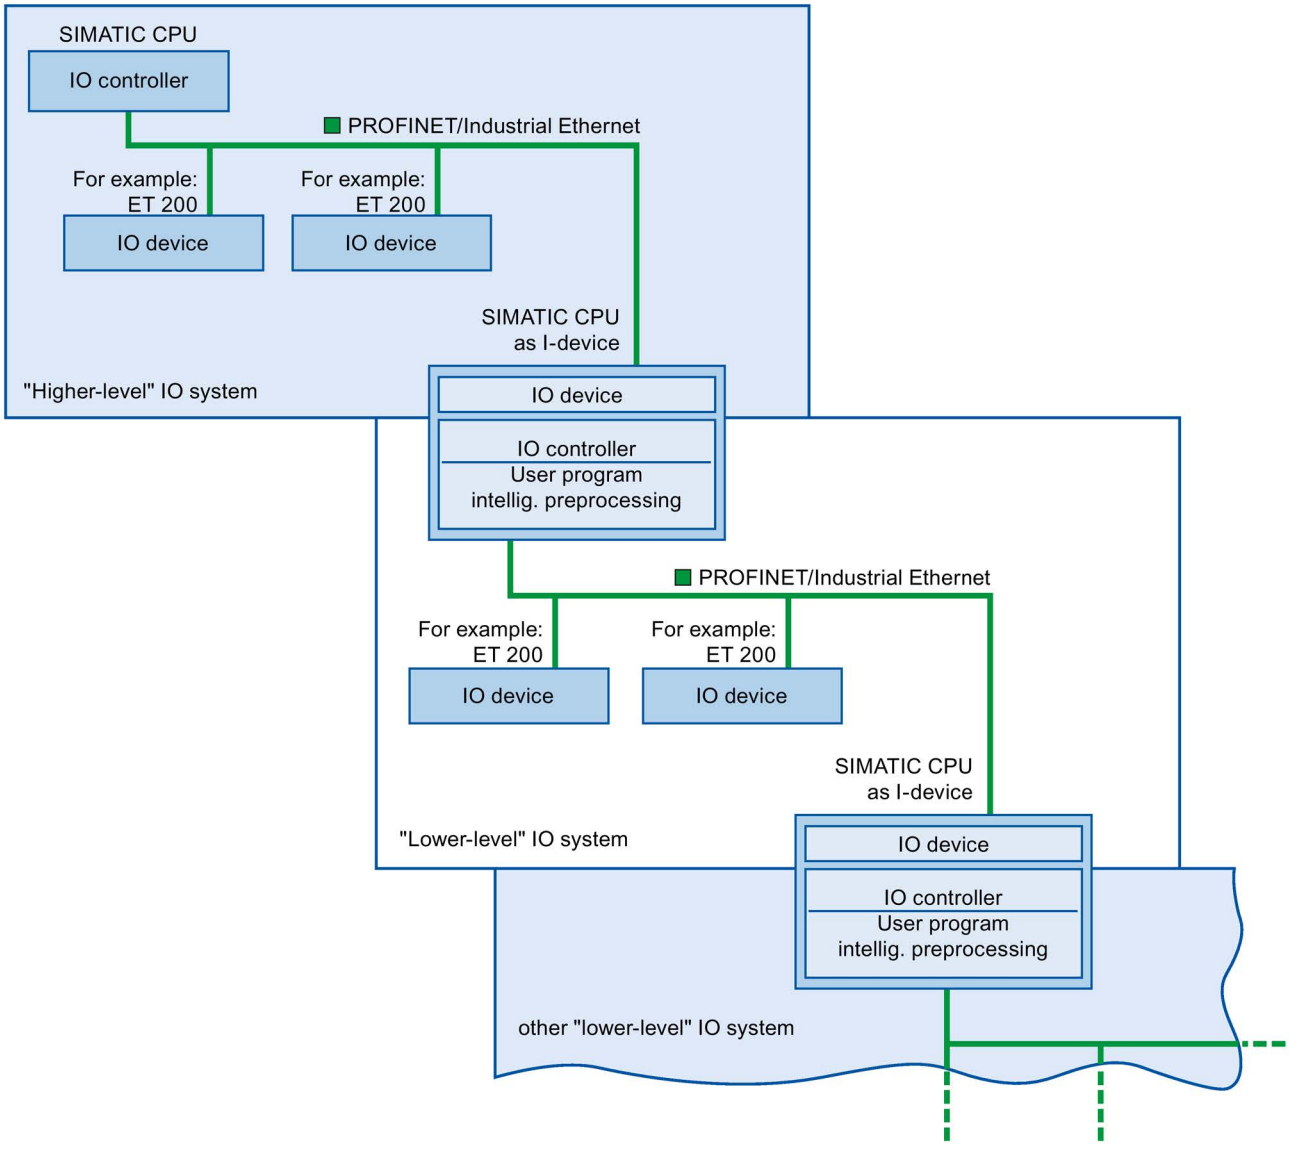

Figure 5-8 I-device with lower-level IO system

I-device as a shared device

An I-device can also be used simultaneously by multiple IO controllers as a shared device.

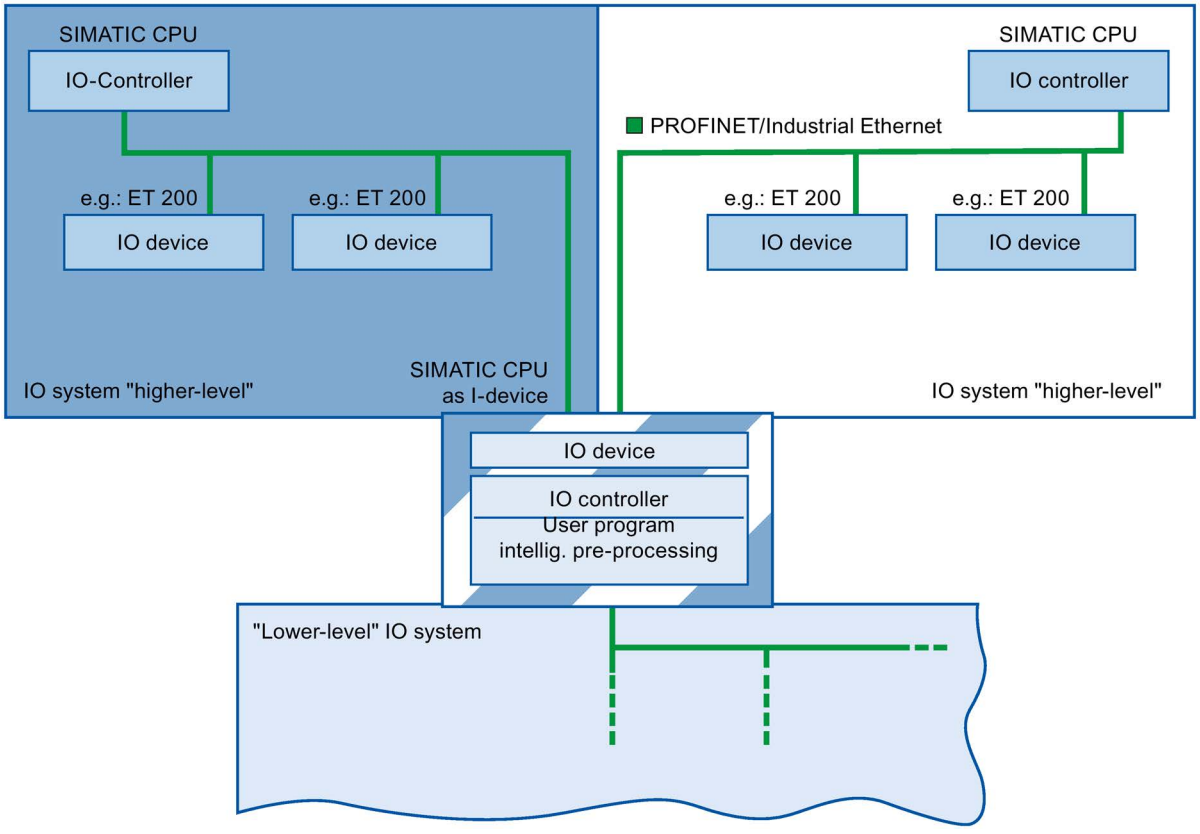

Figure 5-9 I-device as a shared device

Example - the I-device as IO device and IO controller

The I-device as IO device and IO controller is explained based on the example of a print process. The I-device controls a unit (a subprocess). One unit is used, for example, to insert additional sheets such as flyers or brochures in a package of printed material.

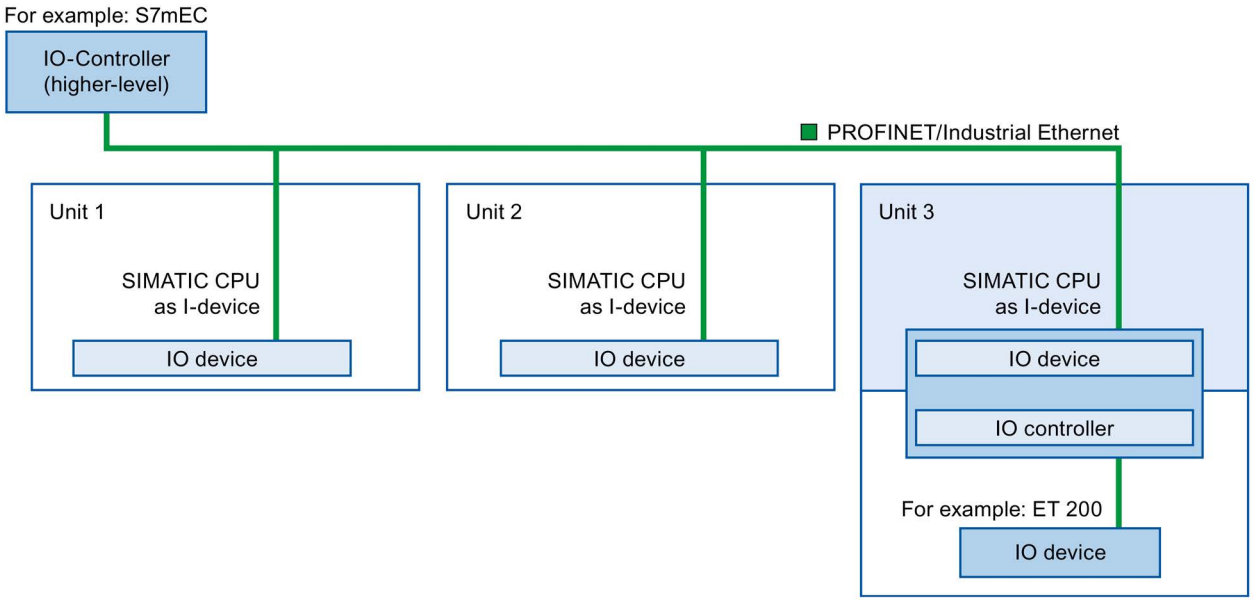

Figure 5-10 Example - the I-device as IO device and IO controller

Unit 1 and unit 2 each consist of an I-device with centralized I/O. The I-device along with the distributed I/O system (for example ET 200) forms unit 3.

The user program on the I-device is responsible for preprocessing the process data. For this task, the user program of the I-device requires default settings (for example control data) from the higher-level IO controller. The I-device provides the higher-level IO controller with the results (for example status of its subtask).

5.2.4 Data Exchange between higher- and lower-level IO system

Introduction

The next chapter shows the data exchange between the higher- and lower-level IO system.

Transfer areas

Transfer areas are an interface to the user program of the I-device CPU. Inputs are processed in the user program and outputs are the result of the processing in the user program.

The data for communication between IO controller and I-device is made available in the transfer areas. A transfer area contains an information unit that is exchanged consistently between IO controller and I-device. You can find more information on configuration and use of transfer areas in the section Configuring the I-device (Page 103).

The next figure shows the data exchange between the higher- and lower-level IO system. The individual communication relations are explained below based on the numbers.

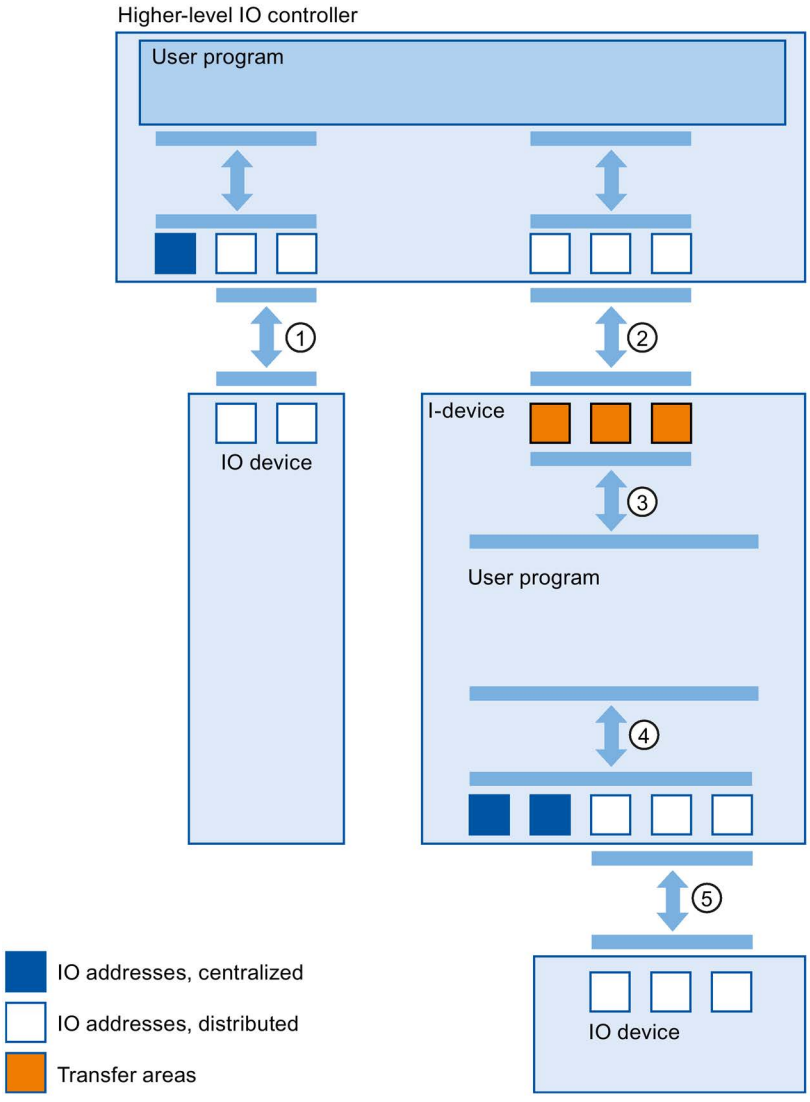

Figure 5-11 Data exchange between higher- and lower-level IO system

① Data exchange between higher-level IO controller and normal IO-device

In this way, the IO controller and IO devices exchange data through PROFINET.

② Data exchange between higher-level IO controller and I-device

In this way, the IO controller and the I-device exchange data through PROFINET.

The data exchange between a higher-level IO controller and an I-device is based on the conventional IO controller / IO device relationship.

For the higher-level IO controller, the transfer areas of the I-devices represent submodules of a preconfigured station.

The output data of the IO controller is the input data of the I-device. Analogously, the input data of the IO controller is the output data of the I-device.

③ Transfer relationship between the user program and the transfer area

In this way, the user program and the transfer area exchange input and output data.

④ Data exchange between the user program and the I/O of the I-device

In this way, the user program and the centralized / distributed I/O exchange input and output data.

⑤ Data exchange between the I-device and a lower-level IO device

In this way, the I-device and its IO devices exchange data. The data transfer is via PROFINET.

5.2.5 Configuring the I-device

Introduction

There are basically two possibilities for configuration:

- Configuration of an I-device within a project
- Configuration of an I-device that is used in another project or in another engineering system.

STEP 7 allows you to configure an I-device for another project or for another engineering system by exporting a configured I-device to a GSD file. You import the GSD file in other projects or engineering systems as with other GSD files. The transfer areas for the data exchange, among other data, are stored in this GSD file.

Configuration of an I-device within a project

1. Drag-and-drop a PROFINET CPU from the hardware catalog into the network view.
2. Drag-and-drop a PROFINET CPU, which can also be configured as an IO device, from the hardware catalog into the network view. This device is configured as I-device (e.g., CPU 1516-3 PN/DP).
3. Select the PROFINET interface for the I-device.
4. In the Inspector window in the area navigation choose "Operating mode" and select the check box "IO device".
5. Now you have the option of choosing the IO controller in the "Assigned IO controller" drop-down list.

   Once you have chosen the IO controller, the networking and the IO system between both devices are displayed in the network view.

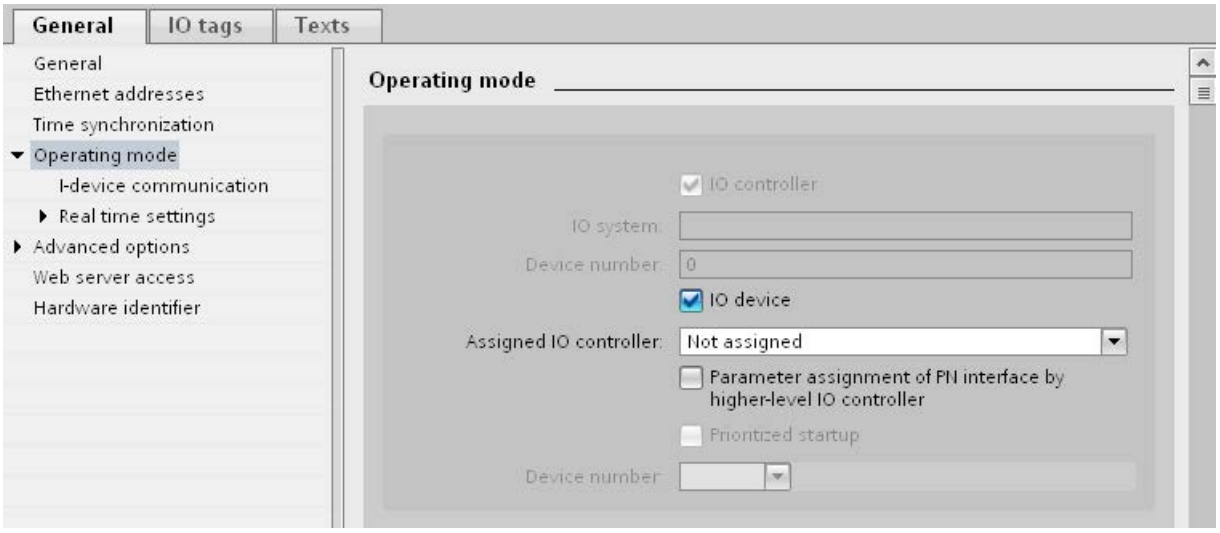

Figure 5-12 Configuring the I-device

6. With the "Parameter assignment of PN interface by higher-level IO controller" check box, you specify whether the interface parameters will be assigned by the I-device itself or by a higher-level IO controller.

   If you operate the I-device with a lower-level IO system, then the parameters of the I-device PROFINET interface (for example, port parameter) cannot be assigned with the higher-level IO controller.

7. Configure the transfer areas. The transfer areas are found in the area navigation section "I-device communication".
   - Click in the first field of the "Transfer area" column. STEP 7 assigns a default name which you can change.
   - Select the type of communication relation: you can currently only select CD or F-CD for "Controller-device communication relation".
   - Addresses are automatically preset; you can correct addresses if necessary, and determine the length of the transfer area which is to be consistently transferred.

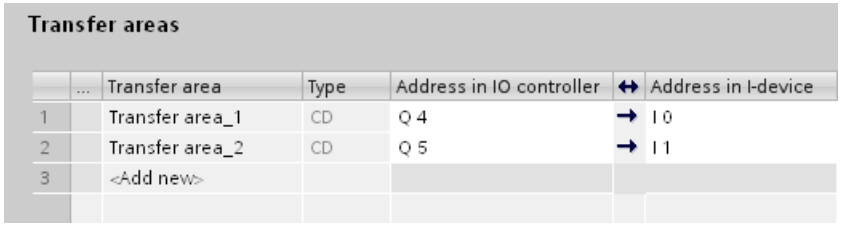

Figure 5-13 Configuring the transfer areas

8. A separate entry is created in the area navigation for each transfer area. If you select one of these entries, you can adjust the details of the transfer area, or correct them and comment on them.

Configuring an I-device with a GSD file

If you use an I-device in another project, or if the I-device is used in another engineering system, then configure the higher-level IO controller and the I-device as described above.

However, click on the "Export" button after configuring the transfer areas so a new GSD file is created from the I-device. This GSD file represents the configured I-device in other projects.

The "Export" button is found in the "I-device communication" section of the Inspector window.

The hardware configuration is compiled and the export dialog opened.

Assign a name for the I-device proxy as well as a description in the fields provided. Click the "Export" button to complete your process.

Finally, import the GSD file, for example, in another project.

5.2.6 Program examples

Introduction

This simple program example shows how you use the transfer areas of an I-device.

Requirement

You have configured an I-device.

Task

The result of an "AND logic operation" of two inputs (preprocessing) in the I-device is to be provided to the higher-level IO controller. This result is to be assigned to a local output in the IO master (further processing).
Use a transfer area with the following addresses for this purpose:

- Address in the I-device: Q568
- Address in the IO controller: I68

Required steps

The following steps to solve the task:

1. Configuring the transfer area
2. Programming I-device
3. Programming IO controller

Configuring the transfer area

Configure a transfer area with the following properties in the I-device:

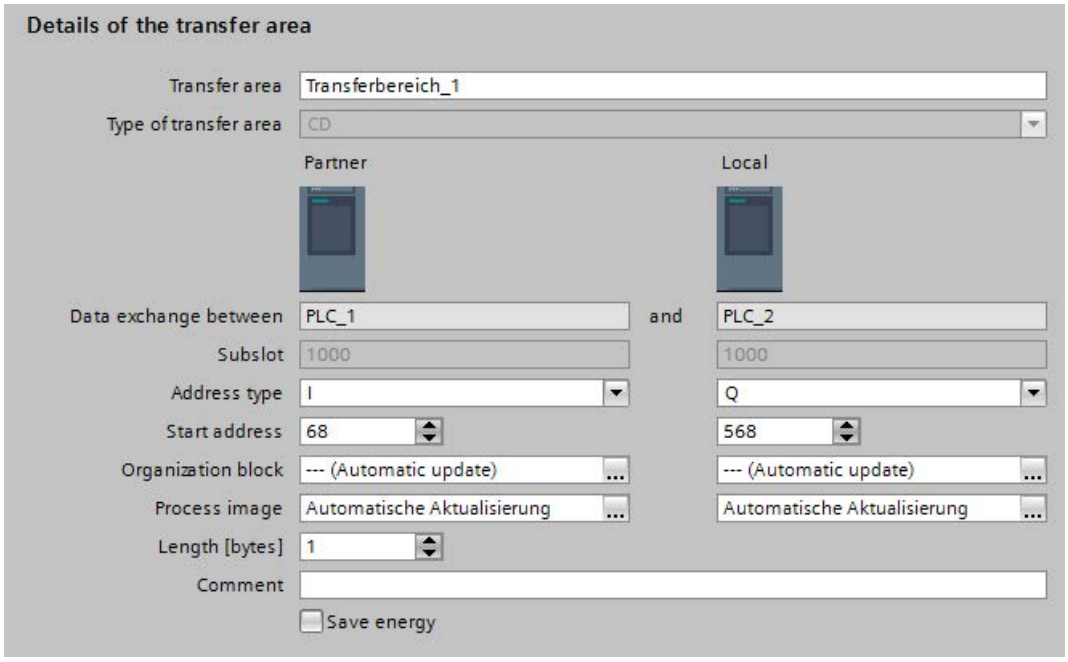

Figure 5-14 I-device transfer area, sample program

Programming I-device

To program the sample program for the I-device, follow these steps:

1. Using the SCL programming language, create a new function with the name "preprocessing" in the project tree in "Program blocks" > "Add new block". Open the function.
2. In the interface of the function "preprocessing", create the following tags:

Name	Data type	Input / output type
input 1	bool	Input
input 2	bool	Input
result	bool	Output

3. In the instruction window of the function "preprocessing", write the following program code:
   #result:=#input 1&#input 2;
4. Call the function "preprocessing" in a program cycle OB, for example, in OB1.
5. Wire the function "preprocessing" in the program cycle OB as follows:

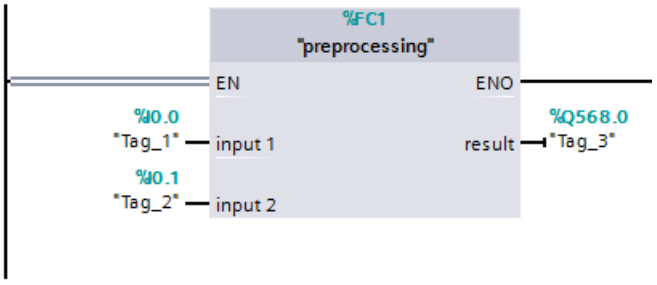

Figure 5-15 I-device sample program

Programming IO controller

To program the sample program for the IO controller, follow these steps:

1. Using the SCL programming language, create a new function with the name "further processing" in the project tree in "Program blocks" > "Add new block". Open the function.
2. In the interface of the function "further processing", create the following tags:

Name	Data type	Input / output type
result	bool	Input
output	bool	Output

3. In the instruction window of the function "further processing", write the following program code:
   #output:=#result;
4. Call the function "further processing" in a program cycle OB, for example, in OB1.
5. Wire the function "further processing" in the program cycle OB as follows:

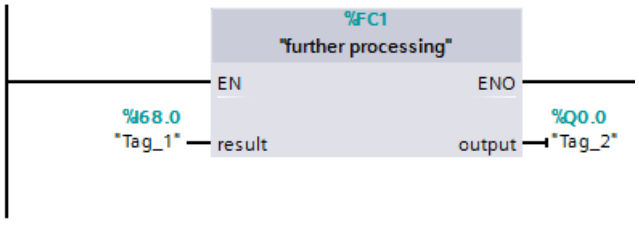

Figure 5-16 IO controller sample program

Result

You mastered the task successfully.

5.2.7 Diagnostics and interrupt characteristics

Diagnostics and interrupt characteristics

S7 CPUs have numerous diagnostics and interrupt functions that can, for example, report errors or failures of lower-level IO systems. These diagnostics messages reduce down times and simplify localization and elimination of problems.

Diagnostics options in the higher-level IO controller and in the I-device

The following diagnostics functions are available to the higher-level IO controller and the I-device CPU:

- OB 83 (pull/plug)
- OB 86 (rack failure)
- OB 122 (I/O access error)

Note

The diagnostics messages of the I/O can be processed in the user program of the I-device CPU and passed on from there to the higher-level IO controller via transfer areas.

Operating state changes and station failure / station return

In the following table, you can see which consequences an operating state change or the failure of an IO controller / I-device of the SIMATIC family has on the respective other(s):

Table 5- 1 Operating state changes and station failure / station return

Initial status	Event	I-device response	Higher-level IO controller
I-device CPU is in RUN, higher-level IO controller is in RUN	The I-device CPU changes to STOP	-	During the updating of the process image with the instructions "UPDAT_PI" and "UPDAT_PO" an error report is returned at the parameter RET_VAL. With direct IO access to all transfer areas to the I-device: depending on the type of error handling, e.g., call of OB 122 (IO access error).
I-device CPU is in STOP higher-level IO controller is in RUN	The I-device CPU is starting up	Call of OB 100 (startup). Call of OB 83 (pull/plug) for input transfer areas to the higher-level IO controller. Until call of OB 83 in the case of direct access to the input transfer areas to the higher-level IO controller: depending on the type of error handling, e.g., call of OB 122 (IO access error).	Call of OB 83 (pull/plug) for all transfer areas to the I-device. Until call of OB 83 in the case of direct access to the transfer areas to the I-device: depending on the type of error handling, e.g., call of OB 122 (IO access error).

Initial status	Event	I-device response	Higher-level IO controller
I-device CPU is in RUN, higher-level IO controller is in RUN	The higher-level IO controller changes to STOP	During the updating of the process image with the instructions "UPDAT_PI" and "UPDAT_PO" an error report is returned at the parameter RET_VAL. With direct IO access to the input transfer areas to the higher-level IO controller: depending on the type of error handling, e.g., call of OB 122 (IO access error). Note: Output transfer areas can still be accessed.	-
Higher-level IO controller is in STOP, I-device CPU in RUN	The higher-level IO controller starts up	Call of OB 83 (pull/plug) for input transfer areas to the higher-level IO controller. Until call of OB 83 in the case of direct access to the input transfer areas to the higher-level IO controller: depending on the type of error handling, e.g., call of OB 122 (IO access error).	Call of OB 100 (startup).
I-device CPU is in RUN, higher-level IO controller is in RUN	Station failure I-device, for example, through bus interruption	If the I-device continues to run without a bus connection: Call of OB 86 (rack failure). During the updating of the process image with the instructions "UPDAT_PI" and "UPDAT_PO" an error report is returned at the parameter RET_VAL. With direct IO access to all transfer areas to the higher-level IO controller: depending on the type of error handling, e.g., call of OB 122 (IO access error).	Call of OB 86 (rack failure). During the updating of the process image with the instructions "UPDAT_PI" and "UPDAT_PO" an error report is returned at the parameter RET_VAL. With direct IO access to all transfer areas to the I-device: depending on the type of error handling, e.g., call of OB 122 (IO access error).
I-device CPU is in RUN, higher-level IO controller is in RUN, communication connection between IO controller and I-device is interrupted (bus interruption).	The bus connection between the IO controller and I-device has been reestablished and the I-device is again included in the user data traffic.	Call of OB 86 (rack failure). Call of OB 83 (pull/plug) for input transfer areas to the higher-level IO controller. Until call of OB 83 in the case of direct access to the input transfer areas to the higher-level IO controller: depending on the type of error handling, e.g., call of OB 122 (IO access error).	Call of OB 86 (rack failure). Until reporting of station re-integration by OB 86 with direct IO access to all transfer areas to the I-device: depending on the type of error handling, e.g., call of OB 122 (IO access error)

Note

Special characteristic during startup of the higher-level IO controller

In contrast to the station return message from IO devices in the IO controller, which are covered completely by the call of the OB 86, the station return message of a higher-level IO controller in the I-device is separated into 2 parts:

1. Call of the OB 86: The initial values for the outputs of the I-device are set. However, the input values are not yet valid. These values will first be valid with the opening of OB 86 in the higher-level IO controller.
2. Call of OB 83 for each input transfer area; with this call, the validity of an input transfer area is displayed. The starting up of the I device is first complete when the OB 83 has been called for the input transfer areas. This step can be delayed or not occur at all in the following situations:
   - Higher-level IO controller is in STOP: OB 83 is first called at the STOP-RUN transition of the higher-level IO controller.
   - The IRT communication has been disrupted (sync-master failure, topology error, ...). OB 83 is opened only after the IRT communication has taken place.

Reference

For more information on error handling in the case of direct I/O access, refer to "Error handling" in the STEP 7 online help.

5.2.8 Rules for the Topology of a PROFINET IO System with I-Device

Introduction

The following recommendations for the structure and configuration of an IO system when using I-devices will help you to keep the bandwidths required for keeping communication small.

The following communication paths should not overlap:

- Communication paths between the IO controller and the IO device of its IO system.
- Communication paths of the I-device CPU and the IO devices of your IO system.

I-device with one port

Connect an I-device with only one port to a PROFINET switch that is uncoupled from the higher-level IO system. Connect the lower-level IO system to another port of the switch as shown in the following figure.

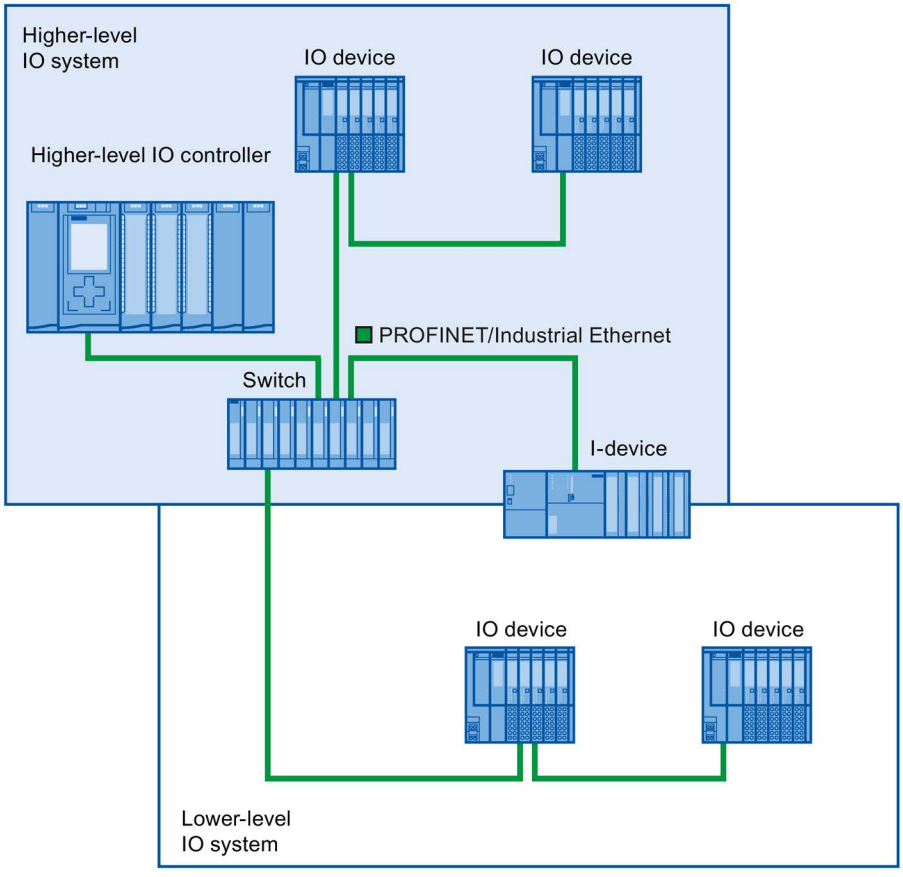

Figure 5-17 I-device with one port

I-device with two ports

With an I-device with two ports, connect one port, uncoupled from the higher-level IO system, to the port of the PROFINET switch. Use the second port for the lower-level IO system as shown in the following figure.

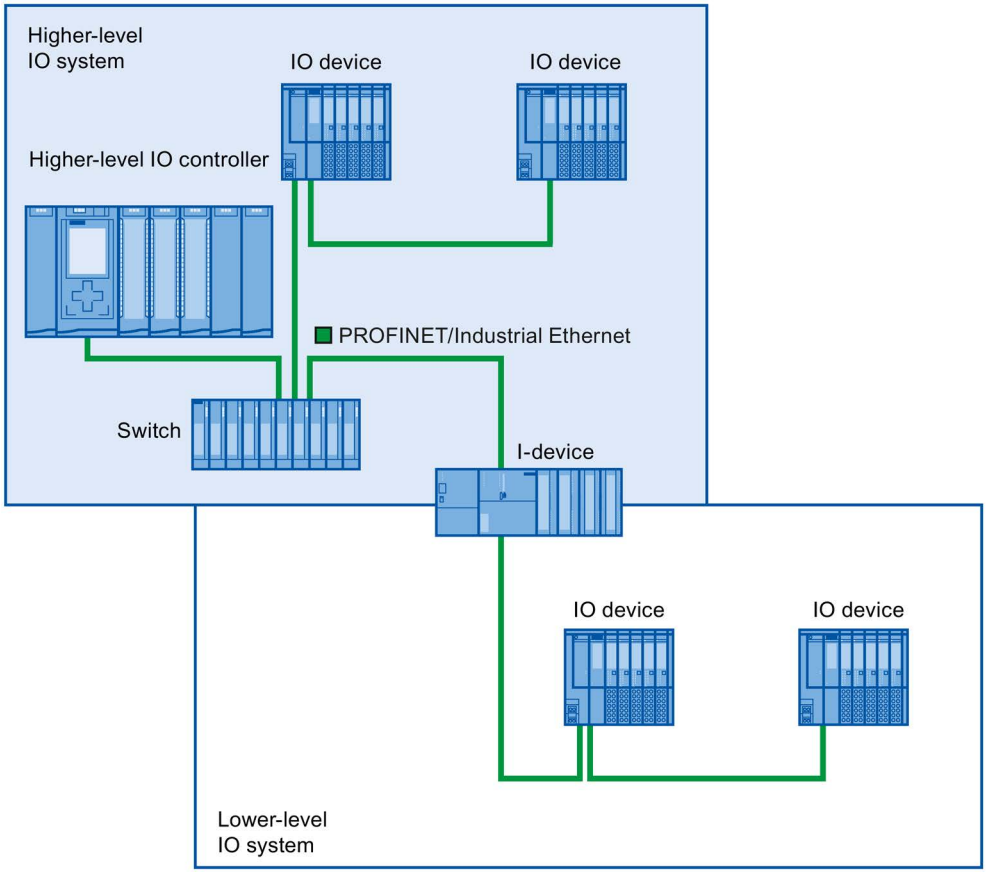

Figure 5-18 I-device with two ports

I-device with three or more ports

If you have an I-device with three or more ports, connect the I-device to one or both ports to the higher-level IO system in a linear bus topology. Connect the third port to the lower-level IO system uncoupled from the linear bus topology as shown in the following figure.

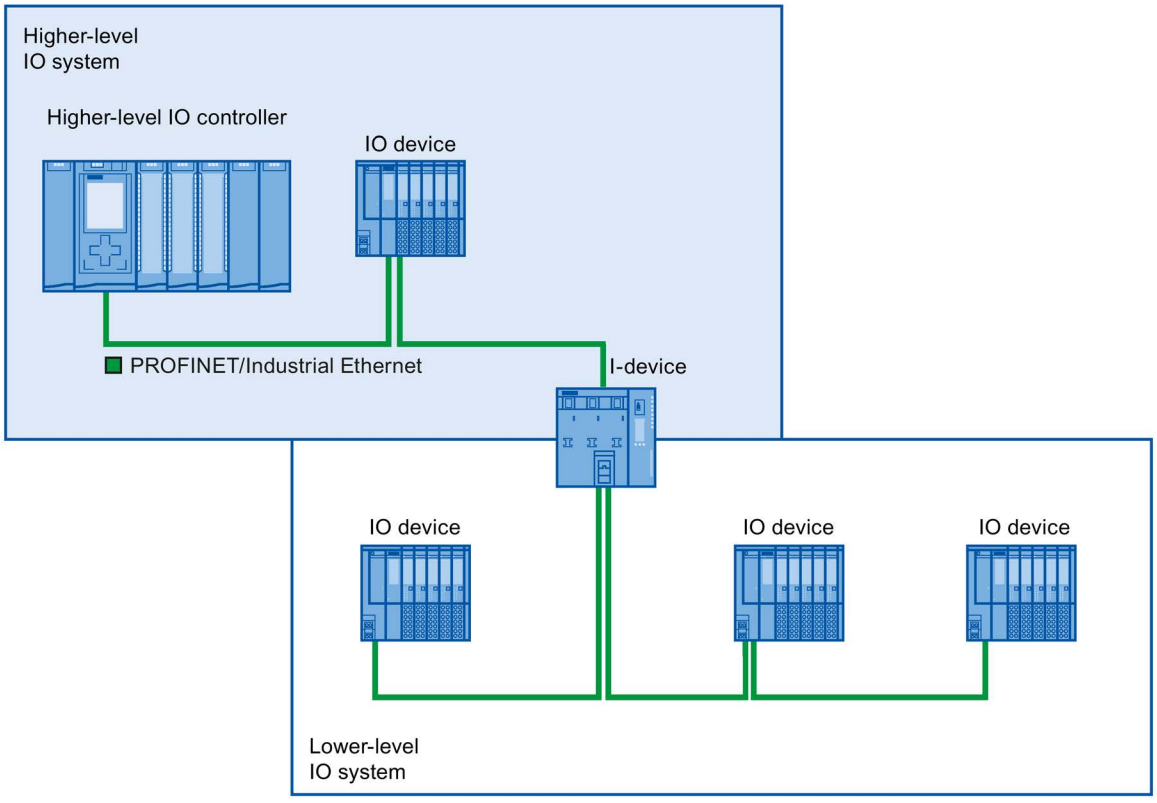

Figure 5-19 I-device with three or more ports

5.2.9 Boundary conditions when using I-devices

Note the following boundary conditions when using I-devices:

Bandwidth

The number of addresses of the configured transfer areas affects the usable bandwidth of the I-device:

- Bandwidth of the transfer areas + bandwidth of the lower-level IO system = total bandwidth used on the I-device

If the address space of the transfer areas is too large, this indicates a larger bandwidth requirement and can thus lead to longer update times.

Tip: Keep the address space of the transfer area as small as possible.

Rules for RT and IRT communication.

IO systems with I-devices are also suitable for setting up real-time applications with RT and IRT communication. The following rules must be followed for this:

- Both the higher-level and the lower-level IO system support RT communication. You can use RT communication for both IO systems at the same time.
- IRT communication can be combined with RT communication. IRT communication, however, cannot be used in both IO systems at the same time. IRT is possible where the parameters of the IO interface are set.

5.2.10 Configuring PROFIenergy with I-devices

The requirement for program-controlled pauses for saving energy with PROFINET devices is that the PROFINET devices support the PROFIenergy protocol.

Only if a PROFINET device (I/O device) supports the PROFIenergy protocol does an I/O controller actually send PE commands to this I/O device, for example to start or stop pauses.

If an I/O device supports the PROFIenergy protocol, this property is saved in its PROFINET GSD file and is available for configuration in an engineering system.

For S7-1500 CPUs as intelligent I/O devices (I-devices), you have the option with STEP 7 V13 service pack 1 or later to set PROFIenergy support for each transfer area.

If you have enabled the option "Use PROFIenergy to save energy" for a transfer area and import the generated PROFINET GSD file into another project, you can handle an I-device as a PE entity there.

Requirement

- STEP 7 as of V13 service pack 1
- S7-15XX-CPU as of firmware version 1.7 configured as I-device with transfer areas
- The user program on the I-slave handles PROFIenergy commands

  Background: You need to program PROFIenergy functions with I-devices in the user program using the "PE_I_DEV" instruction and corresponding auxiliary blocks; this is different compared with IO devices for which this functionality is made available by the firmware. This means that you can only enable PROFIenergy support for transfer areas if the user program on the I-slave is suitably designed.

Enabling PROFIenergy for transfer areas of I-devices

Proceed as follows to assign parameters for the support of PROFIenergy:

1. Select the PROFINET interface (X1) of the CPU.
2. Select the required transfer area in the area navigation, for example:

   Operating mode > I-device communication > Transfer_area_1.
3. Select the "Use PROFIenergy for energy savings" check box.

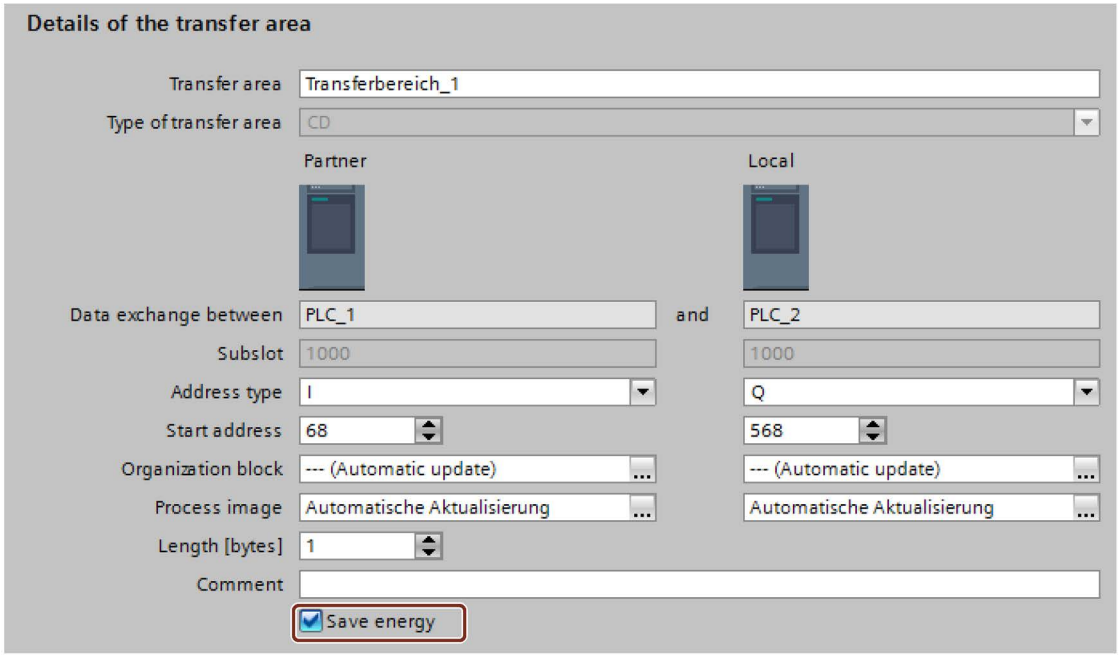

Figure 5-20 Configuring PROFIenergy with I-devices

Once the I-device is fully configured, generate the GSD file for the I-device and import this file in the project for the I/O controller. The GSD file generated is compatible with GSD version 2.31 and contains an entry that specifies that the I-device supports the PROFIenergy profile.

To address the I-device, for example for the PE command "PE_START_END", use the hardware identifier of the "PROFIenergy supporting" transfer area in the I-device.

To address the IO controller for the PE command "PE_I_DEV", use the hardware identifier of the transfer area that is supplied with the data for PROFIenergy on the IO controller.

5.3 Shared device

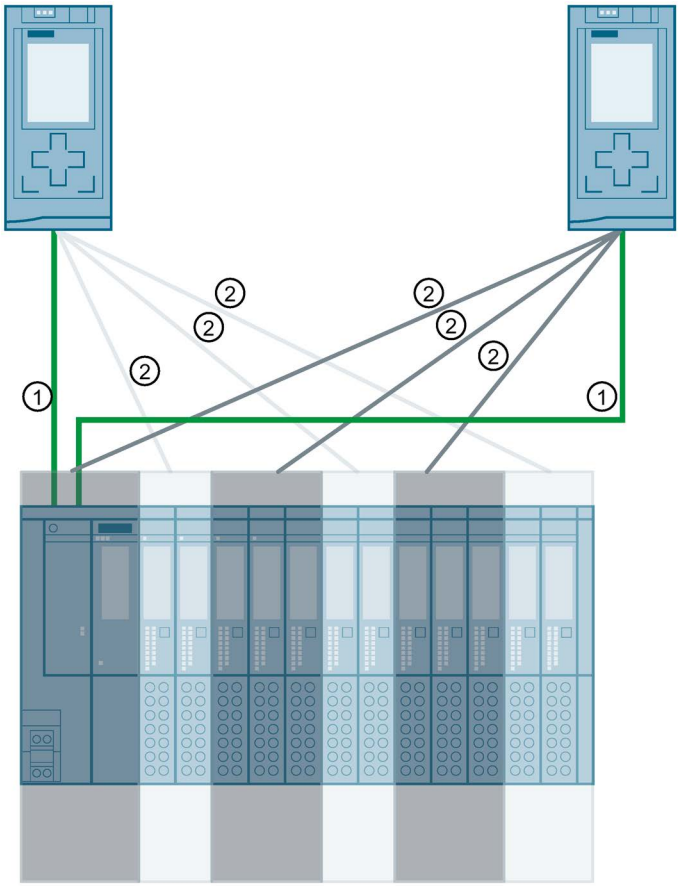
5.3.1 Useful information on shared devices

shared device functionality

Numerous IO controllers are often used in larger or widely distributed systems.

Without the "Shared Device" function, each I/O module of an IO device is assigned to the same IO controller. If sensors that are physically close to each other must provide data to different IO controllers, several IO devices are required.

The "Shared Device" function allows the modules or submodules of an IO device to be divided up among different IO controllers. Thus allowing flexible automation concepts. You have, for example, the possibility of combining I/O modules lying near other into an IO device.



① PROFINET
② Logical assignment

Principle

Access to the submodules of the shared device is then divided up among the individual IO controllers. Each submodule of the shared device is assigned exclusively to one IO controller.

Requirement (GSD configuration)

- STEP 7 V12 Service Pack 1 or higher
- CPU as of FW 1.1 as IO controller
- IO device supports the shared device function, e.g. interface module IM 155-5 PN ST
- GSD file for configuring the IO device is installed

Explanatory notes:

- An S7-1500-CPU configured as an I-device supports the Shared Device functionality as of firmware version V1.5. The I-device must be integrated by GSD import into the IO system of the IO controller.
- An S7-300-CPU or S7-400-CPU configured as an I-device supports the Shared Device functionality. You must export the PROFINET GSD file for the I-device from STEP 7 (as of V5.5) and then import it into STEP 7 (TIA Portal).
- An ET 200SP-CPU configured as an I-device supports the Shared Device functionality as of firmware version V1.6. The I-device must be integrated by GSD import into the IO system of the IO controller.

Configuring the access

The IO device must be present in several projects so that the modules or submodules of an IO device can be assigned to different IO controllers. A separate project is required for each IO controller.

You use the "Shared device" parameter of the interface module to determine the modules or submodules to which the IO controller has access:

- If the local IO controller has access to the configured module, select the name of the IO controller from the list.
- If the IO controller from a different project and not the local IO controller is to have access to the configured module, select the entry "---".

The configuration is consistent regarding access if each module or submodule in exactly one project is assigned to an IO controller.

Module or submodule is assigned to another IO controller

The paragraph below describes the consequences of the "---" setting of the "Shared device" parameter from the point of view of the local IO controller.

In this case, the local IO controller does not have access to the module configured in this way. Specifically, this means:

- No data exchange with the module or submodule
- No reception of alarms or diagnostics, which means no display of the diagnostics status in the online view
- No parameter assignment of the module or submodule

Setting of the real-time properties

STEP 7 calculates the communication load and thus the resulting update times. You must enter the number of project-external IO controllers in the project in which the PROFINET interface of the shared device is assigned to the IO controller so that a calculation is possible with shared device configurations.

The maximum possible number of IO controllers for the shared device depends on the device. This number is stored in the GSD file of the shared device.

You can set a very short send clock with a CPU as IO controller. The send clock can be shorter than the shortest send clock supported by the shared device. In this case, the shared device is operated by the IO controller with a send clock that it supports (send clock adaptation).

Example:

A CPU supports send clocks starting from 0.25 ms. A configured IO device also supports send clocks starting at 0.25 ms; another IO device supports send clocks starting at 1 ms. In this case, you have the option of setting the short send clock of 0.25 ms for the CPU. The CPU operates the "slow" IO device with the send clock of 1 ms, for example.

Rules for the configuration

- IO controllers that use the shared device are created in different projects. In each project, care must be taken that the shared device is configured identically in each station. Only one IO controller may ever have full access to a submodule. Inconsistencies in the configuration result in a failure of the shared device.
- I/O addresses of a module or submodule can only be edited if a module or submodule is assigned to the IO controller in the same project.
- The shared device must have the same IP parameters and the same device name in each project.
- The send clock must be identical for all IO controllers that have access to the shared device.
- The S7 subnet ID of the subnet to which the shared device is connected must be identical in all projects.
- The following functions are only available if the PROFINET interface of the shared device is assigned to the local IO controller:
  - IRT operation
  - Prioritized startup
  - Parameter assignment of the port properties

Boundary conditions

The following boundary conditions result because a shared device configuration is distributed across several projects:

- The addresses of modules or submodules that are not assigned to this IO controller are missing in the address overview of each IO controller that has access to a shared device.
- The modules or submodules that are not assigned are not taken into consideration in the configuration limit calculation for the shared device during the consistency check. For this reason, you must verify for yourself that the maximum number of submodules or the maximum amount of cyclic IO data for the shared device will not be exceeded.
  For information on the maximum quantities, refer to the documentation for the devices you are using.
- Configuration errors such as the assignment of a module or submodule to several IO controllers are not detected in STEP 7.
- CPUs that are loaded with a shared device configuration do not have any information on whether the IO device is a shared device. Modules or submodules that are assigned to other IO controllers and therefore other CPUs are missing in the loaded configuration. These modules or submodules are therefore displayed neither in the CPU web server nor in the CPU display.

5.3.2 Configuring a shared device (GSD configuration)

Below, you will find a description of how to configure a distributed I/O system as a shared device with STEP 7 V12, Service Pack 1 or higher.

A "distributed" configuration with different engineering tools for different IO controller families is always possible. However, the description of the procedure is exclusively based on STEP 7 as of V12, Service Pack 1. The description is limited to two IO controllers of the S7-1500 series that share one shared device.

Two projects are created (Shared-Device-1 and Shared-Device-2), each with one IO controller (PLC1 and PLC2). You must create the shared device in both projects, even though it is physically one and the same IO device.

Requirement

- STEP 7 V12 Service Pack 1 or higher
- IO device supports shared device functionality, e.g., interface module IM 155-5 PN ST V2.0.
- GSD file for configuring the IO device as a shared device is installed.

Procedure - Creating project 1

To create the first project with a shared device, follow these steps:

1. Start STEP 7.
2. Create a new project with the name "Shared-Device-1".
3. Insert, for example, a CPU 1513-1 PN from the hardware catalog in the network view. Name it "PLC1".
4. Insert an IO device with the "Shared Device" function from the hardware catalog (hardware catalog: Other field devices > PROFINET IO > I/O).
5. Assign the IO controller "PLC1" to the IO device.
6. Double-click the IO device and insert all required modules and submodules from the hardware catalog in the device overview table.
7. Assign the module parameters.
8. Save the project.

Procedure - Creating project 2

To create the second project with a shared device, follow these steps:

1. Start STEP 7 once again.

   A new instance of STEP 7 opens.

2. In the new instance, create a new project with the name "Shared-Device-2".
3. Insert, for example, a CPU 1513-1 PN in the network view. Name it "PLC2".
4. Copy the IO device from the project "Shared-Device-1" and insert it in the network view of project "Shared-Device-2".
5. Assign the IO controller "PLC2" to the IO device.
6. Save the project.

Both projects now have an identically structured IO device that must be configured in the next step for the different types of IO controller access.

Procedure - Configuring access to the shared device

The modules and submodules you insert in the shared device are automatically assigned to the local CPU. To change the assignment, follow these steps:

1. Select the interface module in the network view or device view of project "Shared-Device-1".
2. Select the "Shared Device" area in the Inspector window.

   A table shows which CPU has access to the respective module or submodule for all configured modules. The default setting is that the local CPU has access to all modules and submodules.

3. Keep the "PLC1" setting for all modules and submodules that are to remain in the address range of the local CPU.

   Select the setting "---" for all modules and submodules that are to be located in the address range of the CPU from the "Shared-Device-2" project (PLC2). This means that an IO controller outside the project is to have access to the module or submodule.

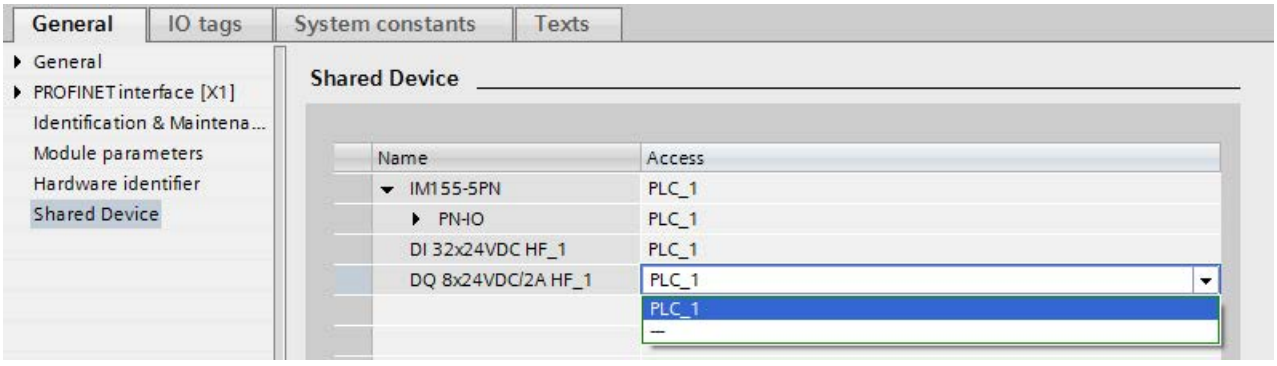


Figure 5-21 Configuring shared device

4. Select the interface module in the network view or device view of project "Shared-Device-2".
5. Select the "Shared Device" area in the Inspector window.

   A table shows which CPU has access to the respective module or submodule for all configured modules.
6. Select the setting "---" for all modules and submodules that are to be located in the address range of the CPU from the "Shared-Device-1" project (PLC1).
7. Finally, check whether the settings for access are "complementary" for each module or submodule in both projects. This means that if the local CPU has access in one project, the option "---" must be set in the other project and vice versa.

   Special consideration: The option "---" for the PROFINET interface and therefore for the ports makes the associated parameters read-only and not changeable. Parameters of the PROFINET interface and port parameters can only be edited in the project in which the PROFINET interface is assigned to the local CPU. The ports can be interconnected in both projects regardless of this.
8. Check whether the same IP address parameters and device name are set for the shared device in all projects.

   Check whether the same S7 subnet ID is set in all projects for the subnet to which the shared device is connected (subnet properties, "General" area in the Inspector window).

Note

If you make changes to the shared device: Make the same changes in each project on the shared device. Make sure that only one IO controller has access to a module or submodule.

Procedure - Adjusting the real-time settings

To ensure that all IO controllers and shared devices are operated with the appropriate send clock and that the update times are calculated correctly based on the communication load, you must adjust and check the following settings:

1. Select the project whose IO controllers have access to the PROFINET interface and the ports of the shared device.
2. Select the interface module of the shared device in the network view.
3. In the Inspector window, navigate to the "PROFINET interface > Advanced options > Real time settings > IO cycle" area.
4. In the "Shared Device" area, set the number of project-external IO controllers. The maximum number depends on the IO device (specification in GSD file).
5. You must set the same send clock for each IO controller that has access to modules and submodules of the shared device:
   - If you configure the IO controller with STEP 7 (TIA Portal):

     Open the corresponding project.

     Select the PROFINET interface of the IO controller.

     Select the "Advanced options > Real time settings > IO communication" area in the Inspector window and set the shared send clock.
   - If you configure the IO controller with a different engineering tool:

     Select the PROFINET interface of the shared device in STEP 7 (TIA Portal) and read out the send clock on the shared device ("Advanced options > Real time settings" area)

     Enter the read send clock in the engineering tool.
   - Special consideration: If you configure **all** IO controllers that have access to the shared device in STEP 7 (TIA Portal or V5.5), you can set shorter send clocks on the IO controller than supported by the shared device (send clock adaptation).

Compiling and loading

You must compile the configurations for the different IO controllers and load them to the CPUs one after the other.

Due to the distributed configuration with separate projects, STEP 7 does not output consistency errors in the case of incorrect access parameter assignment. Example for incorrect access parameter assignment:

- Several IO controllers have access to the same module
- IP address parameters or send clocks are not identical

These errors do not show up until operation and are output as configuration errors, for example.

Note

After a configuration has been loaded in the IO controller, non-assigned modules or submodules retain their current parameterization state to ensure the independence from the parameterizations of other IO controllers.

5.3.3 Configuring an I-device as a shared device

Below, you will find a description of how you configure an S7-1500 as an I-device with STEP 7 Version V13 or higher and then use it in two projects as a shared device.

A "distributed" configuration with different engineering tools for different IO controller families is generally also possible here. The procedure described below is based on STEP 7 V13 and is limited to a configuration with two IO controllers of the S7-1500 family that share the transfer areas of an I-device as a shared device. The I-device itself is also an S7-1500 CPU.

Three projects are created with one IO controller each (PLC-I-Device, PLC_1, and PLC_2).

PLC-I-Device is used to configure the I-device. The PROFINET GSD variant of PLC-I-Device is used in the PLC_1 and PLC_2 projects in order to assign the transfer areas in the respective higher-level IO controller.

Shared I-device concept

For the introduction of the shared I-device concept, two roles are distinguished:

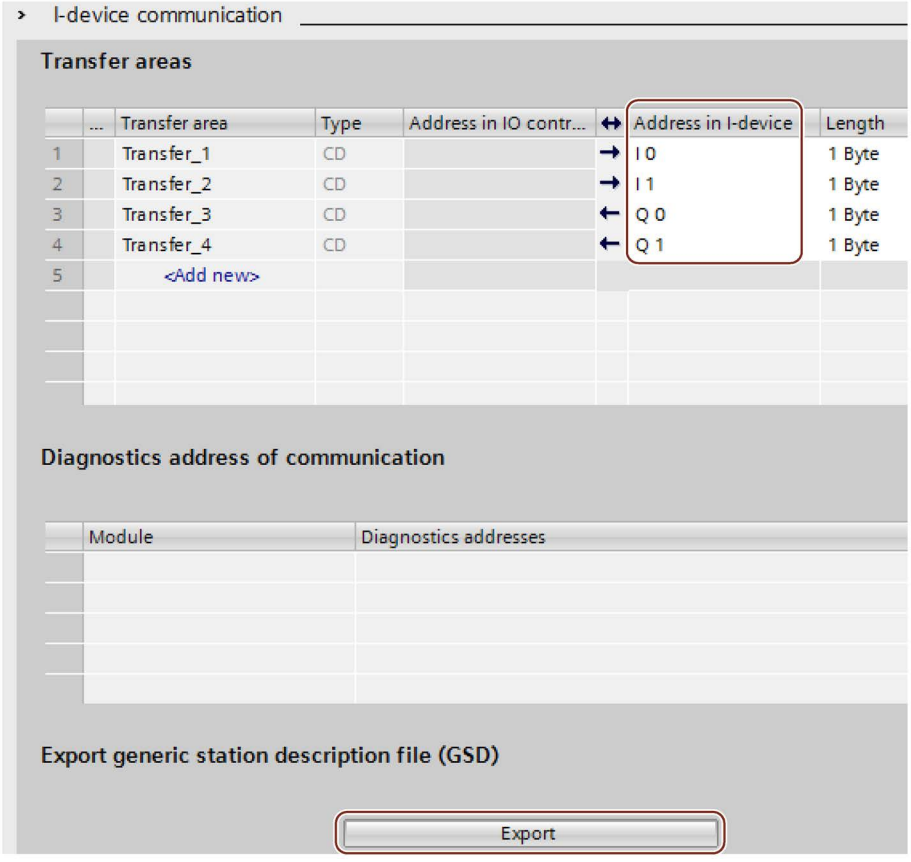
- The role of manufacturer (e.g., machine manufacturer): The manufacturer configures and programs an I-device that performs a particular automation task. Transfer areas are defined as the I/O interface to the operator of the machine. These transfer areas can be assigned to different IO controllers. For the connection to higher-level IO controllers, the manufacturer provides a PROFINET GSD file and discloses the transfer areas via which the I-device can be accessed.
- The role of the operator: The operator uses the I-device as a PROFINET GSD variant during configuration of the PROFINET IO system and, in this process, specifies the I/O addresses under which the IO controllers access the transfer areas.

Manufacturer view

You assign the following parameters for an S7-1500 CPU as an I-device: centralized and distributed I/O, the desired transfer areas, and the number of IO controllers having access to this I-device (always greater than 1 for a shared device!).

Special consideration: The I-device is configured without a higher-level IO controller. As a result, only the local I/O addresses of the transfer area are available (= "Address in the I-device") in order to create the user program for editing the addresses from the transfer area. The I-device that has been completely configured except for the connection to the higher-level IO controller is loaded to the S7-1500 CPU.

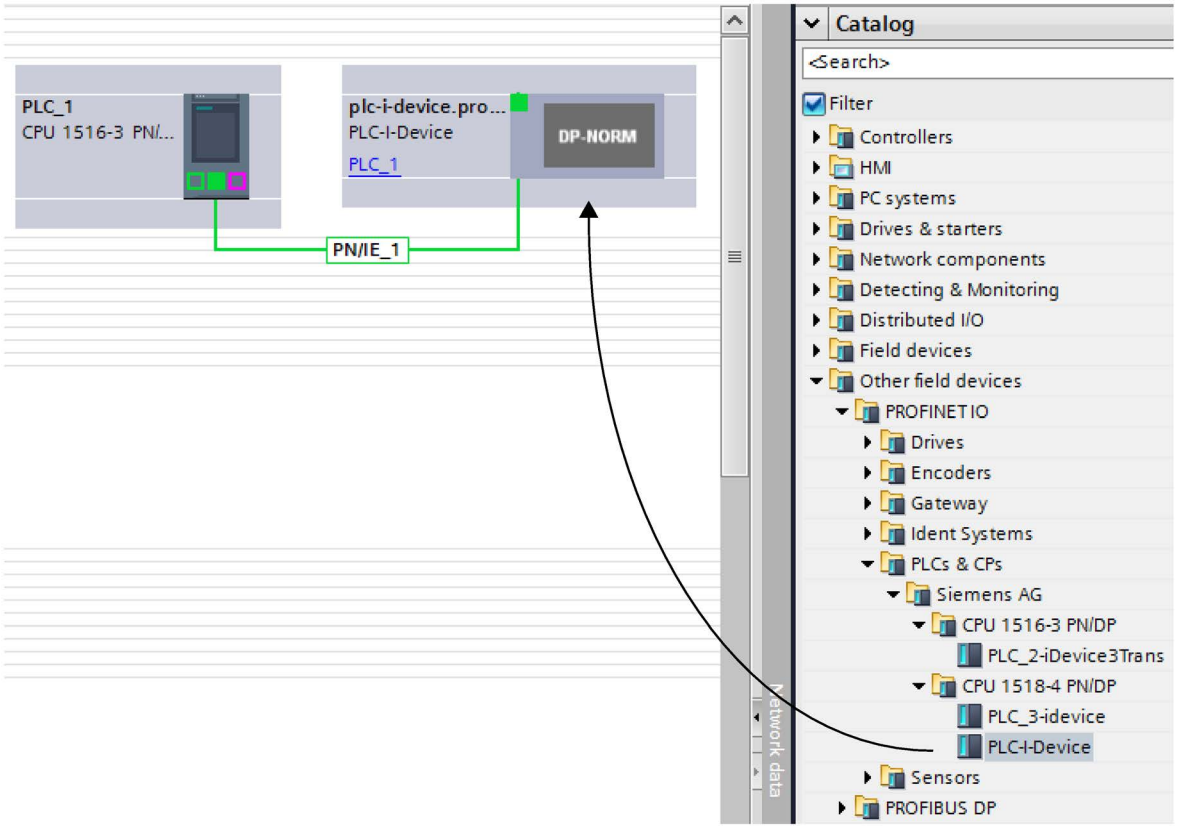
You export a PROFINET GSD file from the I-device configuration.



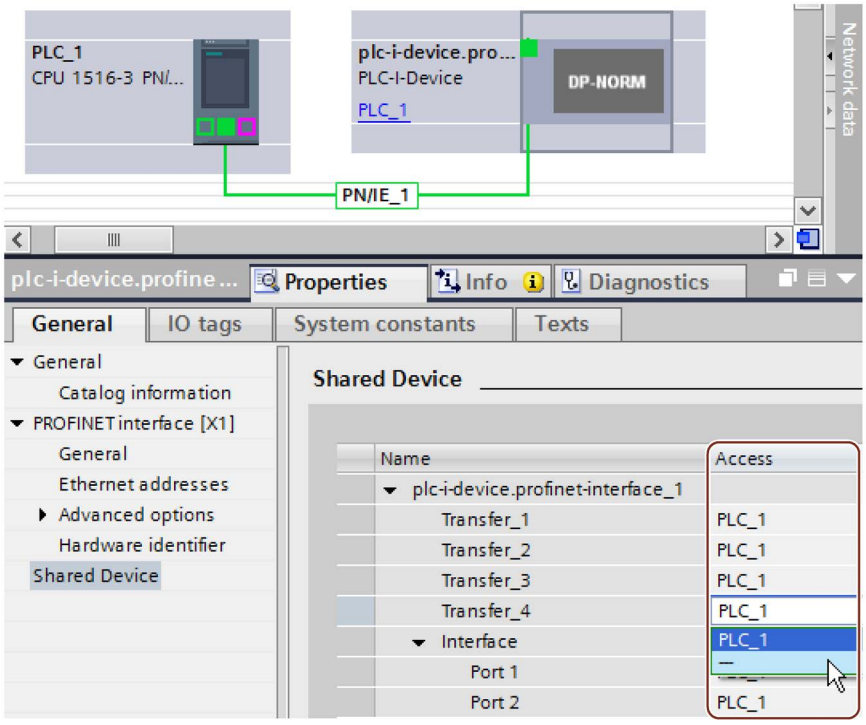
Operator view

You must install the PROFINET GSD file created from the I-device configuration in all engineering systems that are involved in configuring a PROFINET IO system with this shared I-device. If all uses of this I-device will be configured with STEP 7 V13, it is sufficient to install the GSD file in STEP 7.

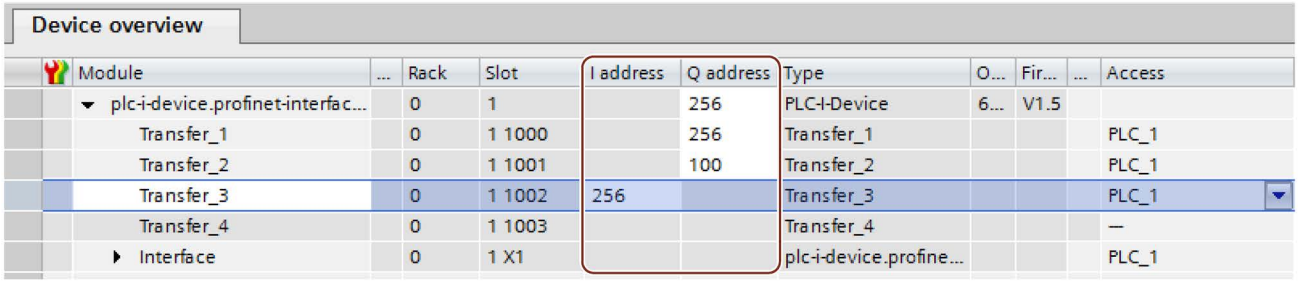
You configure the I-device as a GSD variant on the PROFINET IO system in the projects involved. In STEP 7 V13, this I-device can be found under "Other field devices > PROFINET IO > PLCs & CPs" following installation.



In each of the projects involved, you define which transfer areas are assigned exclusively to the higher-level IO controller (default setting: all). You set the other transfer areas to "---" (not assigned). As a result of this setting, the local IO controller has no access to this transfer area and it can therefore be assigned to another IO controller in another project.



You adapt the addresses from the view of the IO controller in the device overview. To open the device overview, double-click the I-device.



Requirement

- STEP 7 as of V13

Procedure - Creating the PLC-I-device project

To create the project with a shared I-device, follow these steps:

1. Start STEP 7.
2. Create a new project with the name "PLC-I-device".
3. Insert, for example, a CPU 1518-4 PN/DP from the hardware catalog in the network view. Assign the name "PLC-I-device".
4. Double-click the IO device and configure all required modules and submodules.

5. Assign the module parameters.

   In particular, the following settings for the CPU are necessary in the area of the PROFINET interface [X1]:

   – Enable the "IO device" option in the "Operating mode" area.

   – Configure the transfer areas in the "Operating mode" > "I-device configuration" area. The "Address in IO controller" column remains empty because no IO controller is assigned.

     Note: To change an input area to an output area, and vice versa, you must navigate to the area of the corresponding transfer area.

   – Select the number of IO controllers (at least two) that will access the shared I-device during operation ("Operating mode" > "Real time settings" area, "Shared Device" area).

6. Save the project.
7. Click the "Export" button ("Mode" > "I-device configuration" area, "Export general station description file (GSD)" section).

   If you do not change the name in the Export dialog, the GSD file has a name in the form "GSDML-V2.31-#Siemens-PreConf_PLC-I-Device-20130925-123456", for example.

Procedure - Creating the PLC_1 project

To create the first project with a shared I-device, follow these steps:

1. Start STEP 7.
2. Install the PROFINET GSD file from the export of the I-device CPU (PLC-I-Device).
3. Create a new project with the name "PLC_1".
4. Insert, for example, a CPU 1516-3 PN/DP in the network view. The name of the CPU should be "PLC_1".
5. Insert the I-device from the hardware catalog (Hardware catalog: Other field devices > PROFINET IO > PLCs & CPs).
6. Assign the IO controller "PLC_1" to the I-device.
7. Select the "Shared Device" area in the properties of the I-device.

   In the table, all transfer areas and the PROFINET interface are assigned to the local IO controller (PLC_1).
8. Define the transfer areas to which the PLC_1 CPU should **not** have access. Select the "---" entry for these areas. These transfer areas are provided for PLC_2.
9. Save the project.

Procedure - Creating the PLC_2 project

To create the second project with a shared device, follow these steps:

1. Start STEP 7 once again.

   A new instance of STEP 7 opens.

2. In the new instance, create a new project with the name "PLC_2".
3. Insert, for example, a CPU 1516-3 PN/DP in the network view. Assign the name "PLC_2".
4. Insert the I-device from the hardware catalog (Hardware catalog: Other field devices > PROFINET IO > PLCs & CPs).
5. Assign the IO controller "PLC_2" to the I-device.
6. Adapt the access to the transfer areas as in the PLC_1 project. Ensure that no duplicate assignments result.
7. Adapt the parameters of the subnet and PROFINET interface. Because the shared I-device involves the same device in different projects, these data must match.
8. Save the project.

Both projects now have an identically configured shared I-device. The IO controller access and the parameters of the PROFINET interface should still be checked in the different projects during the next step.

Summary - Assigning parameters for access to the shared device

The transfer areas are automatically assigned to the local IO controller. To change the assignment, follow these steps:

1. Click the "PLC_I-Device" device in the network view of the "PLC_1" project, and select the "Shared Device" area.
2. A table shows which CPU has access to each of the configured transfer areas. The default setting is that the local CPU has access to all modules and submodules.
3. Keep the setting "PLC_1" for all transfer areas that are to remain in the address range of the local CPU

   Select the setting "---" for all transfer areas that are to be located in the address range of the "PLC_2" CPU from the "PLC_2" project. This means that an IO controller outside the project is to have access to the transfer area.
4. Follow the same procedure for the remaining projects.
5. Finally, check whether the settings for access are "complementary" for each module or submodule in both projects. This means that if the local CPU has access in one project, the option "---" must be set in the other project and vice versa.

   Special consideration: The option "---" for the PROFINET interface and therefore for the ports makes the associated parameters read-only and not changeable. Parameters of the PROFINET interface and port parameters can only be edited in the project in which the PROFINET interface is assigned to the local CPU. The ports can be interconnected in both projects regardless of this.
6. Check whether the same IP address parameters and device name are set for the shared device in all projects.

   Check whether the same S7 subnet ID is set in all projects for the subnet to which the shared device is connected (subnet properties, "General" area in the Inspector window).

Note

If you make changes to the I-device (e.g., change the number or length of the transfer areas):

Export the I-device as a GSD file again. Re-install the GSD file in each project that uses the I-device as a shared device. Make sure that only one IO controller has access to a transfer area.

Procedure - Adjusting the real-time settings

To ensure that all IO controllers and shared devices are operated with the appropriate send clock and that the update times are calculated correctly based on the communication load, you must adjust and check the following settings:

1. You must set the same send clock for each IO controller that has access to modules and submodules of the shared device:
   - If you configure the IO controller with STEP 7 (TIA Portal):

     Open the corresponding project.

     Select the PROFINET interface of the IO controller.

     Select the "Advanced options > Real time settings > IO communication" area in the Inspector window and set the shared send clock.
   - If you configure the IO controller with a different engineering tool:

     Select the PROFINET interface of the shared device in STEP 7 (TIA Portal) and read out the send clock on the shared device ("Advanced options > Real time settings" area)

     Enter the read send clock in the engineering tool.
   - Special consideration: If you configure **all** IO controllers that have access to the shared I-device in STEP 7 (TIA Portal or V5.5), you can set shorter send clocks on the IO controller than supported by the shared device (send clock adaptation).

Compiling and loading

You must compile the configurations for the different IO controllers and load them to the CPUs one after the other.

Due to the distributed configuration with separate projects, STEP 7 does not output consistency errors in the case of incorrect access parameter assignment. Example for incorrect access parameter assignment:

- Several IO controllers have access to the same module
- IP address parameters or send clocks are not identical

These errors do not show up until operation and are output as configuration errors, for example.

Note

After a configuration has been loaded in the IO controller, non-assigned modules or submodules retain their current parameterization state to ensure the independence from the parameterizations of other IO controllers.

5.3.4 Module-internal shared input/shared output (MSI/MSO)

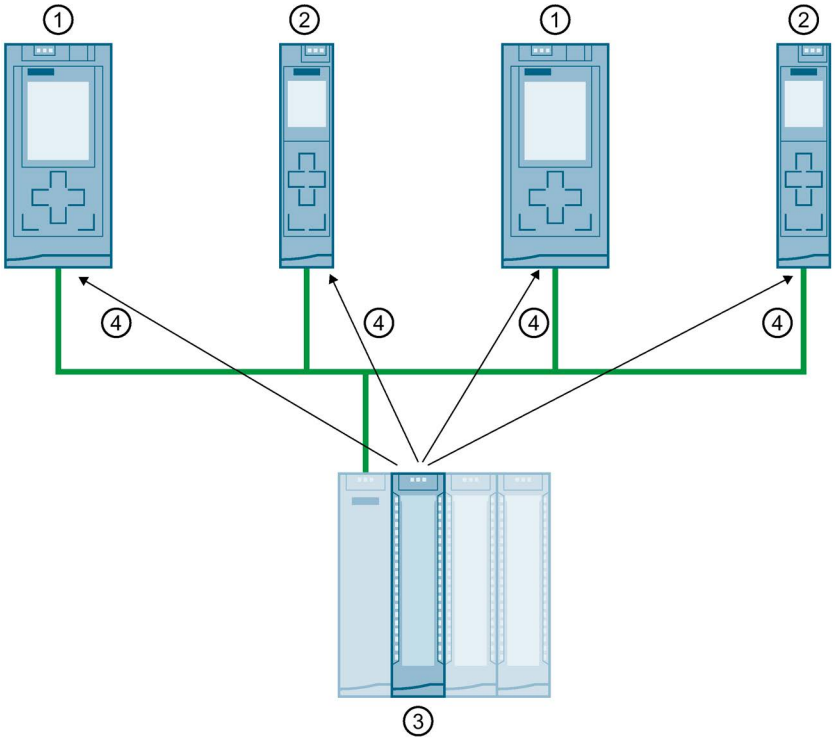
Introduction

This chapter describes the module-internal shared input/shared output (MSI/MSO) functionality for I/O modules that are operated on PROFINET.

Module-internal shared input/shared output functionality

The module-internal shared input (MSI) function allows an input module to make its input data available to up to four IO controllers. Each controller has read access to the same channels.

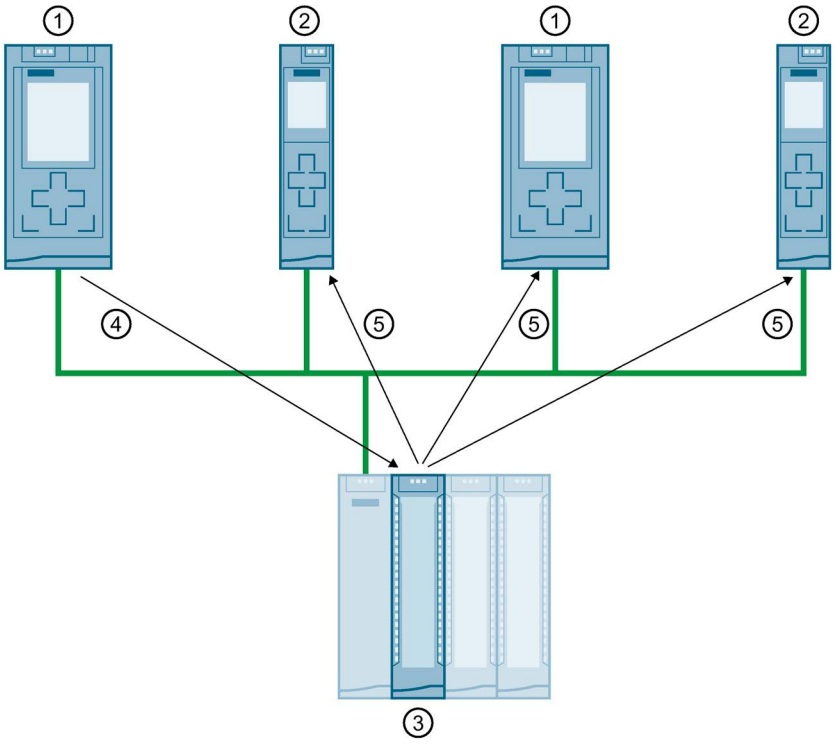
The following figure shows the MSI functionality.



① CPU 1516-3 PN/DP as IO controller
② CPU 1511-1 PN as IO controller
③ Input module with MSI
④ Read access to the input channels of the input module
⑤ Write access to the channels of the I/O module (only with MSO)

The module-internal shared output (MSO) function allows an output module to make its output data available to up to four IO controllers. An IO controller has write access to the channels of the output module. Up to three IO controllers can additionally have read-access to the channels.

The following figure shows the MSO functionality.



① CPU 1516-3 PN/DP as IO controller
② CPU 1511-1 PN as IO controller
③ Output module with MSO
④ Write access to the output channels of the output module
⑤ Read access to the output channels of the output module

Figure 5-22 MSO functionality

Advantages of MSI/MSO

Module-internal shared input/shared output (MSI/MSO) offers the following advantages:

- Real-time acquisition in multiple CPUs
- Lower costs due to saving on additional IO devices and modules
- Lower space requirements due to saving on additional IO devices and modules
- Reduced communication load because no CPU-CPU communication is needed
- No additional programming effort is needed for CPU-CPU communication

Requirements for the use of MSI/MSO

Observe the following requirements:

- MSI/MSO can only be used with PROFINET IO
- Configuration software: STEP 7 (TIA Portal) as of V12 SP1 with GSD file; the modules are integrated in the hardware catalog as of V13.
- The IM 155-5 PN ST interface module and the modules support MSI/MSO as of firmware version V2.0.0.

Boundary conditions for the use of MSI/MSO

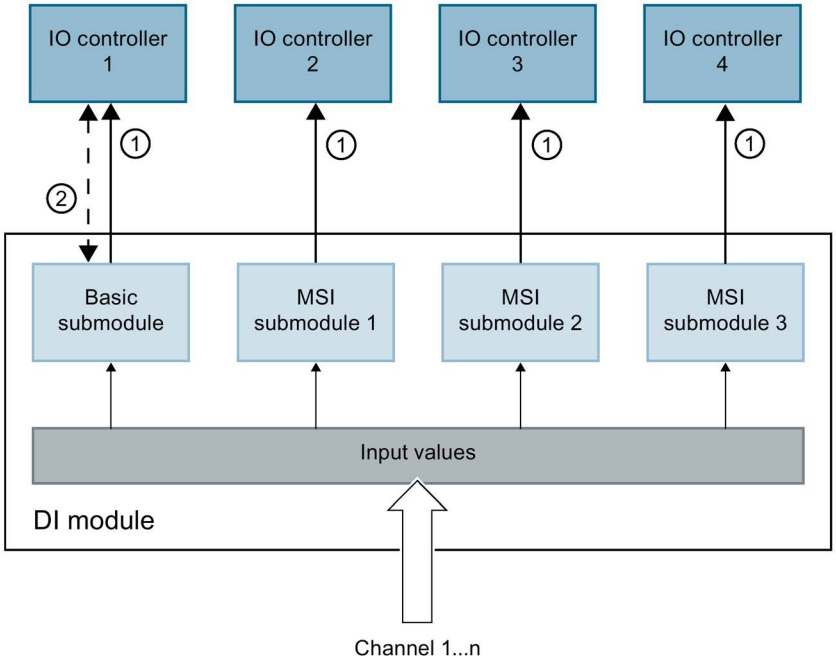
Note the following boundary conditions:

- The use of MSI/MSO is not possible in the case of module grouping.
- Modules with MSI/MSO cannot be operated in isochronous mode.
- The maximum number of IO controllers is dependent on the interface module. To find out how many IO controllers the interface module supports, refer to the manual for the respective interface module.

MSI submodules

The input values of all channels are copied to a basic submodule and up to three other MSI submodules during MSI configuration of an input module. The channels of the module are then available with identical input values in the basic submodule and the MSI submodules. The MSI submodules can be assigned to up to three IO controllers when the module is used in a shared device. Each IO controller has read access to the same channels.

The following figure shows a digital input module with the basic submodule and three MSI submodules. Each submodule is assigned to an IO controller. Diagnostics and parameter assignment of the digital input module can be performed from the IO controller 1 via the basic submodule.



① Read access
② Parameter assignment and system diagnostics

Value status (Quality Information, QI)

The meaning of the value status depends on the submodule to which it pertains.

For the basic submodule (= submodule 1), the value status "0" indicates that the value is incorrect.

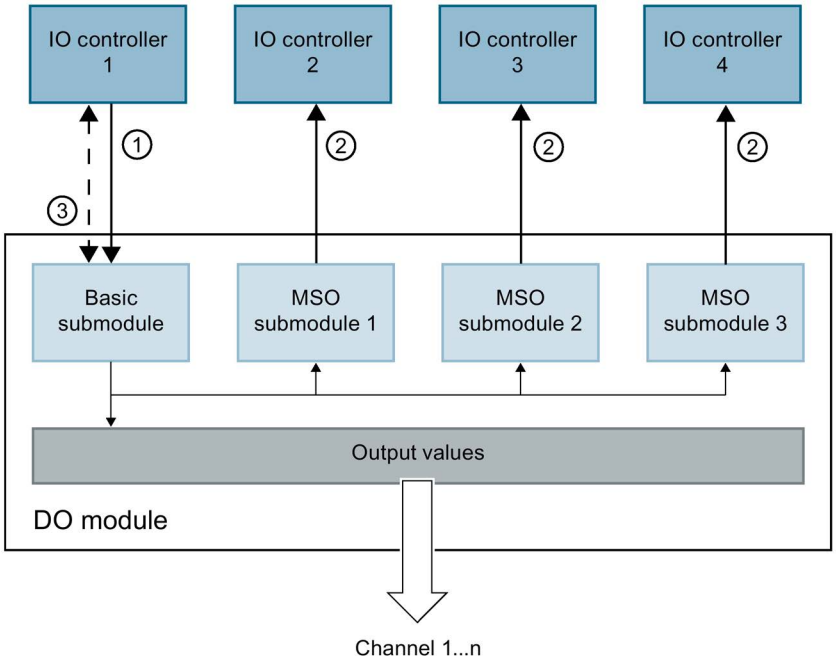
For an MSI submodule (submodules 2 to 4), the value status "0" indicates that the value is incorrect or the basic submodule parameters have not yet been assigned (not ready for operation).

MSO submodules

During MSO configuration of an output module, the output values of all channels of the module are copied from a basic submodule to up to three other MSO submodules. The channels of the module are then available with identical values in the basic submodule and the MSO submodules. The MSO submodules can be assigned to up to three IO controllers when the module is used in a shared device.

- The IO controller to which the basic submodule is assigned has write access to the outputs of the module. The basic submodule therefore occupies output addresses in the process image of the IO controller.
- The IO controllers to which the MSO submodules are assigned have read access to the outputs of the module. MSO submodules therefore occupy input addresses in the process image of the IO controller.

The following figure shows a digital output module with the basic submodule and three MSO submodules. Each submodule is assigned to an IO controller. Diagnostics and parameter assignment of the digital output module can be performed from IO controller 1 via the basic submodule.



① Write access
② Read access
③ Parameter assignment and system diagnostics

Value status (Quality Information, QI)

The meaning of the value status depends on the submodule to which it pertains.

For the basic submodule (= submodule 1), the value status "0" indicates that the value is incorrect.

For an MSO submodule (submodules 2 to 4), the value status "0" indicates that the value is incorrect or one of the following errors has occurred:

- The basic submodule parameters have not yet been assigned (not ready for operation).
- The connection between the IO controller and the basic submodule has been interrupted.
- The IO controller of the basic submodule is in STOP or POWER OFF state.

Configuring I/O modules with MSI/MSO submodules

Requirement

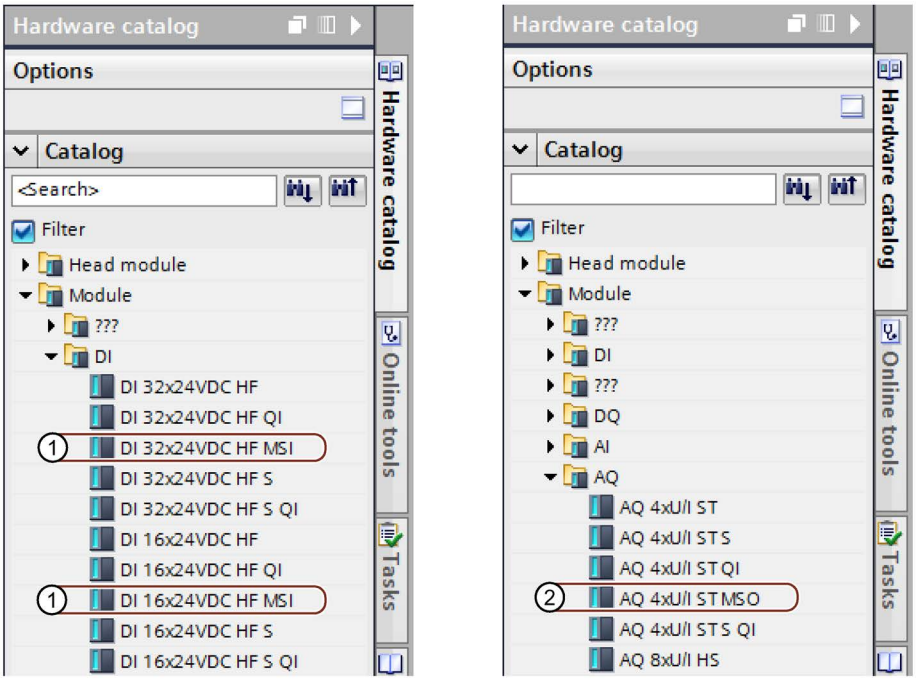
- STEP 7 (TIA Portal) configuration software as of V12 Service Pack 1
- GSD file for I/O modules with MSI/MSO
- IO device supports MSI/MSO (e.g., IM 155-5 PN ST as of firmware version V2.0.0)

Procedure

1. In the network view of STEP 7, insert an interface module IM 155-5 PN ST V2.0 (hardware catalog: Other field devices > PROFINET IO > I/O > Siemens AG > ET 200MP)
2. Double-click the IO device.

   You are now in the device view.
3. Insert the modules with MSI/MSO from the hardware catalog into the device overview table.

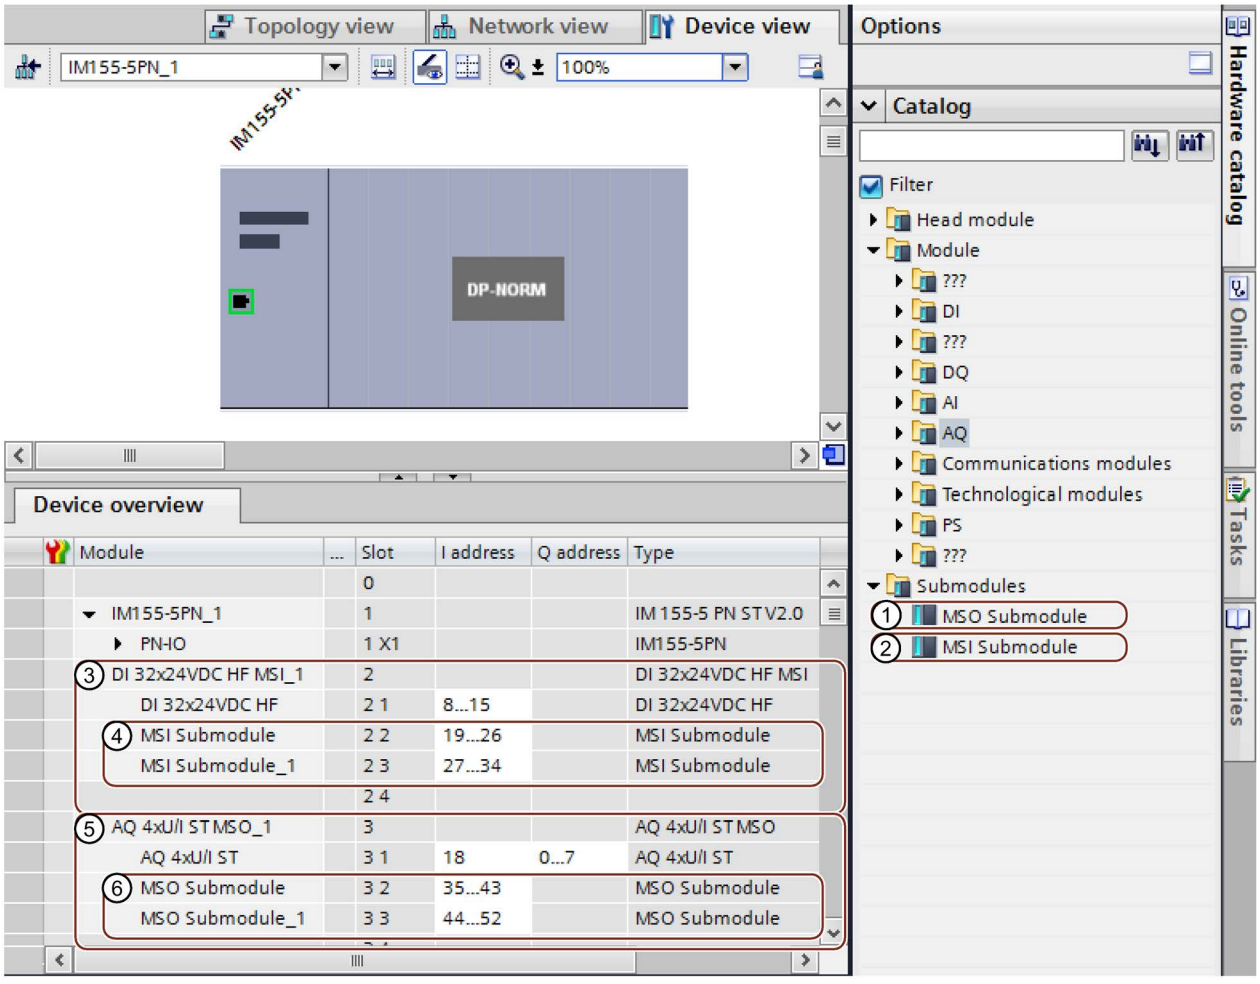
   The modules are created with the basic submodule in the device overview.



① Module with MSI in the hardware catalog
② Module with MSO in the hardware catalog

Figure 5-23 Configuring I/O modules with MSI/MSO

4. Add the modules in the device overview table for MSI/MSO submodules. You can find the MSI/MSO submodules in the hardware catalog.



① MSO submodule in the hardware catalog
② MSI submodule in the hardware catalog
③ Configured module (MSI) with basic submodule in the device overview
④ Configured MSI submodules in the device overview
⑤ Configured module (MSO) with basic submodule in the device overview
⑥ Configured MSO submodules in the device overview

Figure 5-24 Configuring MSI/MSO submodules

Assigning MSI/MSO submodules to an IO controller

You can assign the submodules in a shared device to an IO controller.

For more information, refer to Configuring a shared device (GSD configuration) (Page 123).

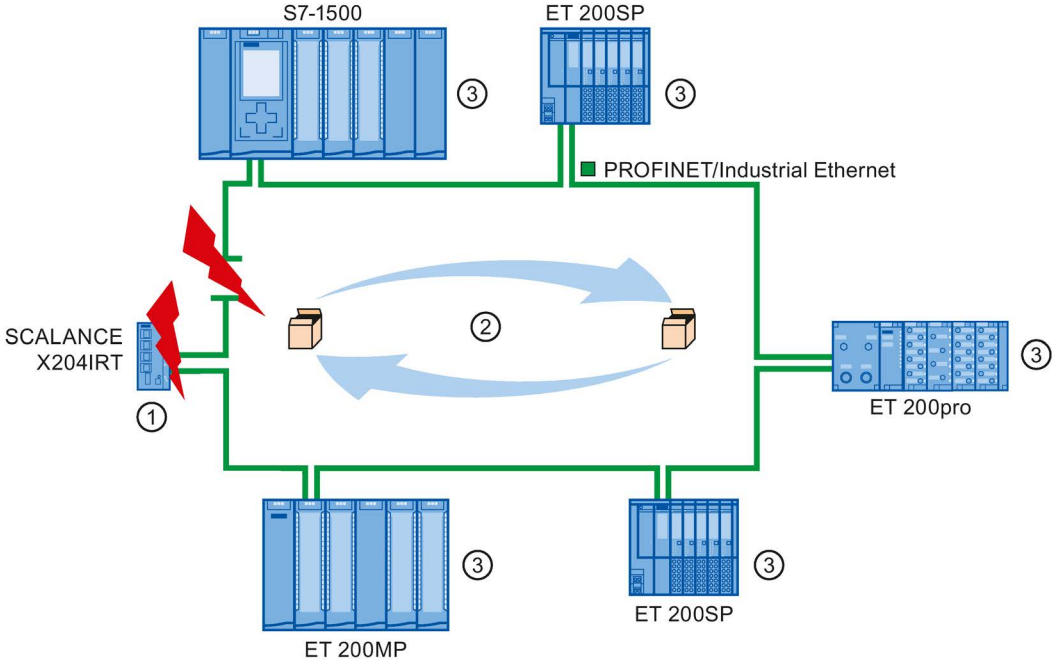
5.4 Media redundancy (ring topologies)

In order to increase the network availability of an Industrial Ethernet network with optical or electrical linear bus topologies, you can convert a linear bus topology to a ring topology by joining the ends together.

Media redundancy in ring topologies

Devices in a ring topology can be IO devices, IO controllers, external switches and/or the integrated switches of communication modules.

To set up a ring topology with media redundancy, you need to bring together the two free ends of a linear bus topology in one device. Closing the linear bus topology to form a ring is achieved with two ports (ring ports) of a device in the ring. One device of the resulting ring then takes over the role of the redundancy manager. All other devices in the ring are redundancy clients.



① Redundancy manager
② Test frames
③ Redundancy clients

Figure 5-25 Media redundancy in ring topology

The ring ports of a device are the ports that establish the connection to the two neighboring devices in the ring topology. The ring ports are selected and set in the configuration of the relevant device (is also preset, if applicable).

How media redundancy works in a ring topology

The data paths between the individual devices are automatically reconfigured if the ring is interrupted at any point. The devices are available again after reconfiguration.

In the redundancy manager, one of the two ring ports is blocked in uninterrupted network operation for normal communication so that no data frames are circulated. In terms of data transmission, the ring topology is a linear bus topology. The redundancy manager monitors the ring for interruptions. It does this by sending test frames both from ring port 1 and ring port 2. The test frames run round the ring in both directions until they arrive at the other ring port of the redundancy manager.

An interruption of the ring can be caused by loss of the connection between two devices or by failure of a device in the ring.

If the test frames of the redundancy manager no longer arrive at the other ring port during an interruption of the ring, the redundancy manager connects its two ring ports. This substitute path once again restores a functioning connection between all remaining devices in the form of a linear bus topology.

The time between the ring interruption and restoration of a functional linear topology is known as the reconfiguration time.

As soon as the interruption is eliminated, the original transmission paths are established again, the two ring ports of the redundancy manager are disconnected and the redundancy clients informed of the change. The redundancy clients then use the original paths again to the other devices.

Media redundancy method

The standard method of media redundancy in SIMATIC is MRP (Media Redundancy Protocol) with a typical reconfiguration time of 200 ms. Up to 50 devices can participate per ring.

5.4.1 Media Redundancy Protocol (MRP)

Media Redundancy Protocol (MRP)

The "MRP" process works in conformity with Media Redundancy Protocol (MRP), which is specified in IEC 61158 Type 10 "PROFINET".

Requirements

The following requirements must be met for error-free operation with the media redundancy protocol MRP:

- The ring in which you want to use MRP may only consist of devices that support this function.
- "MRP" must be activated for all devices in the ring.
- All devices must be interconnected via their ring ports.
- At least one redundancy manager (role "Manager (Auto)") must be available.
- The ring must contain not more than 50 devices. Otherwise, reconfiguration times of greater than or equal to 200 ms may occur.
- All partner ports within the rings must have the identical settings.

Topology

The following schematic shows a possible topology for devices in a ring with MRP. The devices inside the shaded oval are in the redundancy domain.

Example of a ring topology with the MRP media redundancy protocol:

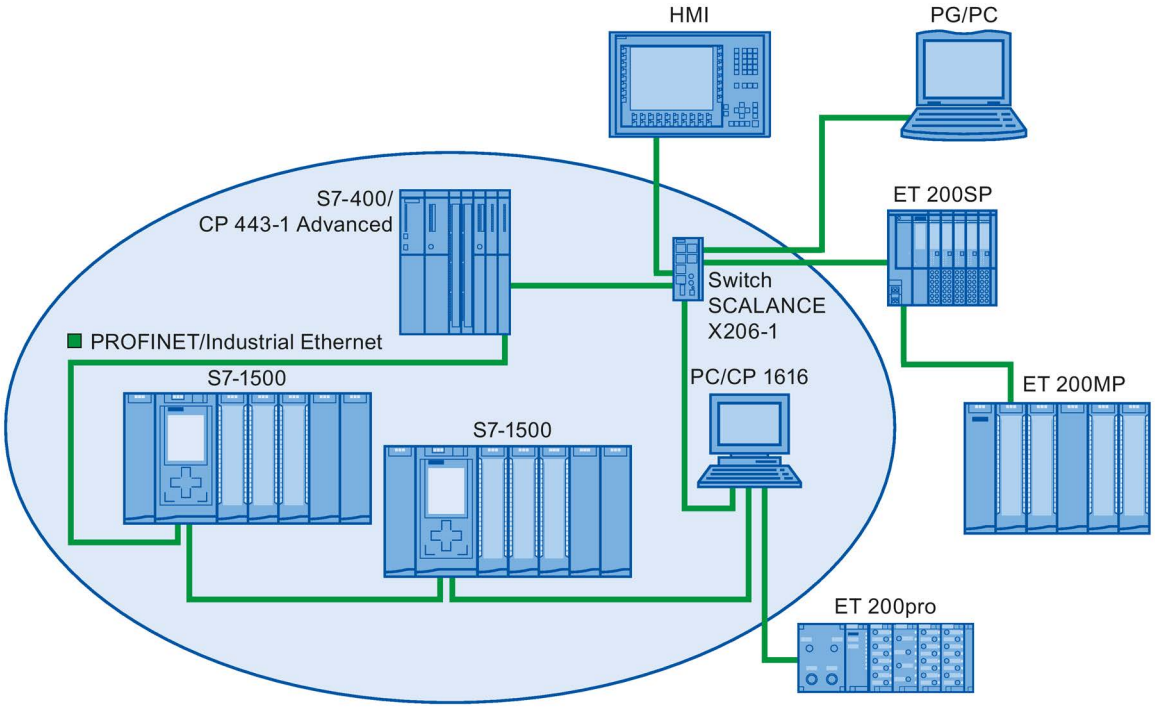


Figure 5-26 Example of a ring topology with the MRP media redundancy protocol:

The following rules apply to a ring topology with media redundancy using MRP:

- All devices in the ring belong to the same redundancy domain.
- One device in the ring has the role of a redundancy manager.
- All other devices in the ring are redundancy clients.

Non MRP-compliant devices can, for example, be connected to the ring via a SCALANCE X switch or via a PC with a CP 1616.

Boundary conditions

MRP and RT

RT operation is possible with the use of MRP.

Note

The RT communication is disrupted (station failure) if the reconfiguration time of the ring is greater than the selected response monitoring time of the IO device. This is why you should select a response monitoring time of the IO devices that is sufficiently large.

MRP and IRT

IRT mode is not possible together with MRP.

MRP and TCP/IP (TSEND, HTTP, ...)

The TCP/IP communication with MRP is possible, because lost data packages are resent, if applicable.

MRP and prioritized startup

If you configure MRP in a ring, you cannot use the "prioritized startup" function in PROFINET applications on the devices involved.

If you want to use the "prioritized startup" function, then you must disable MRP in the configuration (the device may also not be part of the ring).

MRP on PROFINET devices with more than two ports

If you operate a PROFINET device with more than two ports in a ring, you should set a sync boundary on the ports that are not in the ring. By setting the sync boundary, you define a boundary for a sync domain. No forwarding of sync frames transmitted to synchronize devices within a sync domain.

5.4.2 Configuring media redundancy

Requirements for media redundancy with MRP

- The involved components must support the media redundancy protocol (MRP).
- No IRT communication is configured.

Procedure

To configure media redundancy, proceed as follows:

1. Establish a ring by means of appropriate port interconnections (e.g., in the topology view).
2. Select a PROFINET device for which you want to configure media redundancy.
3. In the Inspector window, navigate to "PROFINET" interface [X1]">"Advanced options">"Media redundancy".

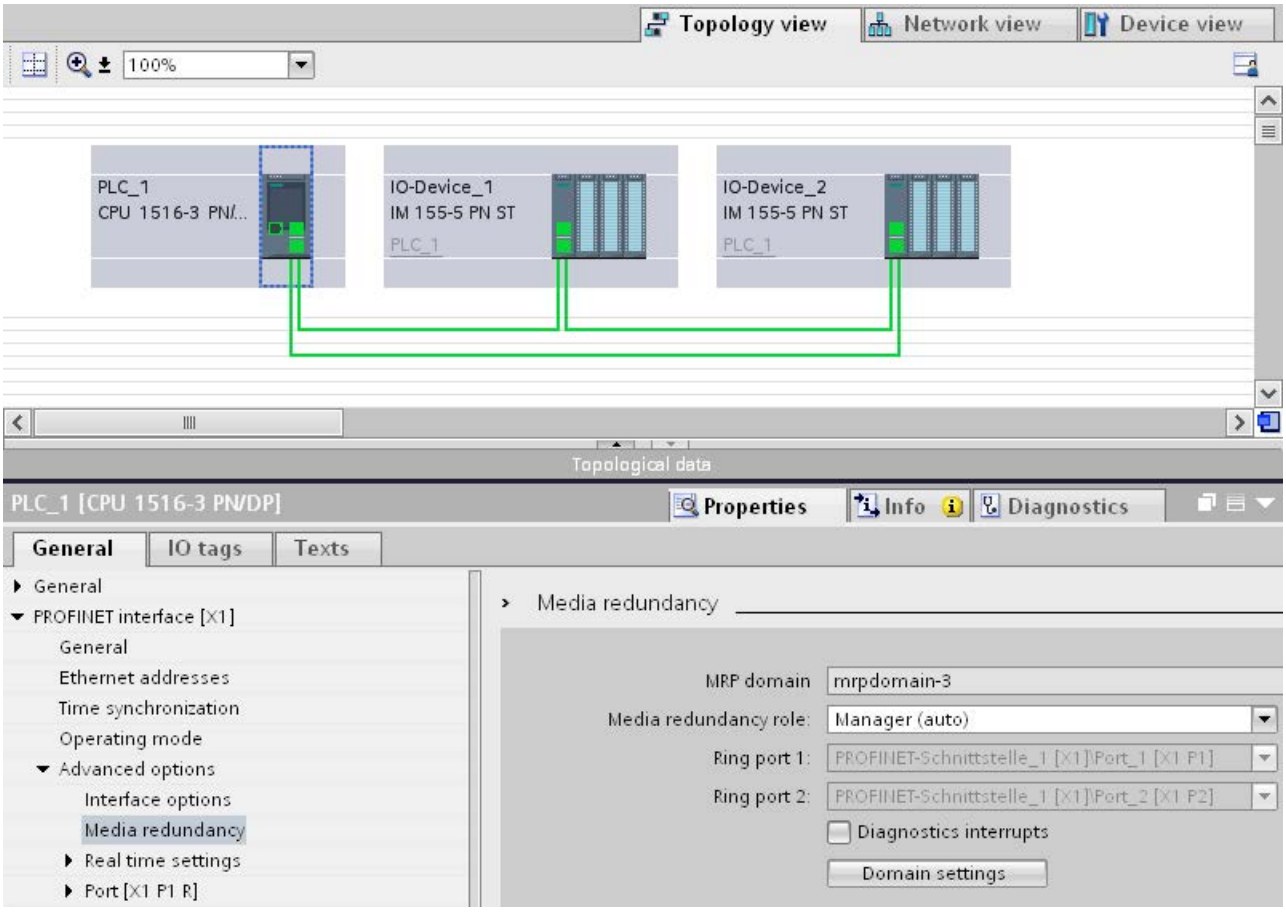

Figure 5-27 Configuring media redundancy

4. Under "Media redundancy role", assign the "Manager (Auto)", "Client", or "Not device in the ring" role to the device.
5. Repeat steps 2 to 4 for all PROFINET devices in the ring.

Or

1. Highlight the PROFINET IO system in the network view.
2. Click on the PROFINET IO system.
3. Navigate to the device of the required MRP domain in the inspector window.

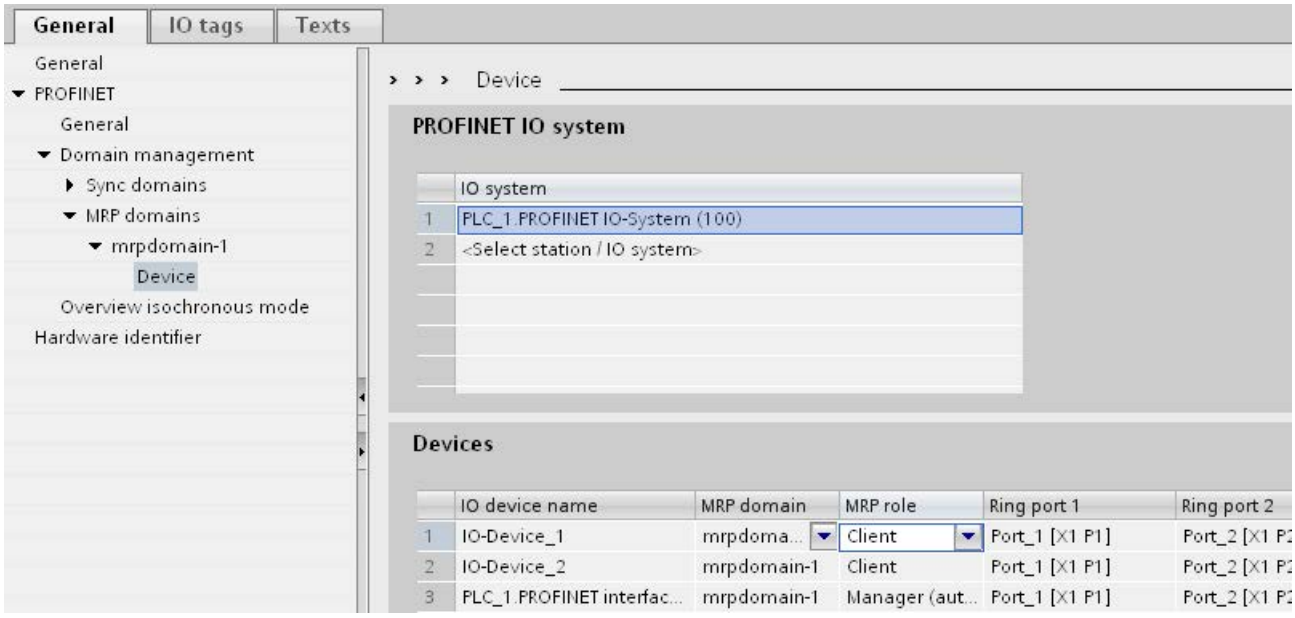

Figure 5-28 MRP domain

4. For the PROFINET devices, set the "Manager (Auto)", "Client", or "Not device in the ring" role.

"Media redundancy" setting options

Media redundancy role

Depending on the device used, the roles "Manager", "Manager (Auto)", "Client" and "Not device in the ring" are available.

Rules:

- A ring must have precisely one device with the role "Manager". No additional devices with the role "Manager" or "Manager (Auto)" are permissible. All other devices may only have the role "Client" or "Not device in the ring".
- If a ring has no device with the "Manager" role, the ring must at least have a device with the role "Manager (Auto)". A ring may have any number of devices with the roles "Client" and "Not device in the ring".

Ring port 1 / Ring port 2

Select one at a time those ports you want to configure as ring port 1 or ring port 2. The drop-down list box shows the selection of possible ports for each device type. If the ports are set at the factory, then the fields are unavailable.

Diagnostic interrupts

If diagnostic interrupts to the MRP state are to be output in the local CPU, select the "Diagnostic interrupts" check box. The following diagnostic interrupts can be configured:

- Wiring or port error

  Diagnostic interrupts will be generated for the following errors in the ring ports:

  – A neighbor of the ring port does not support MRP.

  – A ring port is connected to a non-ring port

  – A ring port is connected to the ring port of another MRP domain.

- Interruption / return (redundancy manager only)

  If the ring is interrupted and the original configuration is returned, diagnostic interrupts will be generated. If both of these interrupts occur within 0.2 seconds, this indicates an interruption of the ring.

You can respond to these events in the user program by programming the appropriate response in the diagnostic error interrupt OB (OB 82).

Note

Third-party devices as redundancy manager

To assure error-free operation when a third party device is used as redundancy manager in a ring, you must assign the fixed role of "Client" to all other devices in the ring before you close the ring. Otherwise circulating data frames and network failure could occur.

5.5 Real-time communication

5.5.1 Introduction

Properties

PROFINET IO is a scalable real-time communication system based on the Layer 2 protocol for Fast Ethernet. With the RT transmission method, two real-time-support performance levels are available for time-critical process data and IRT for high-accuracy and also isochronous processes .

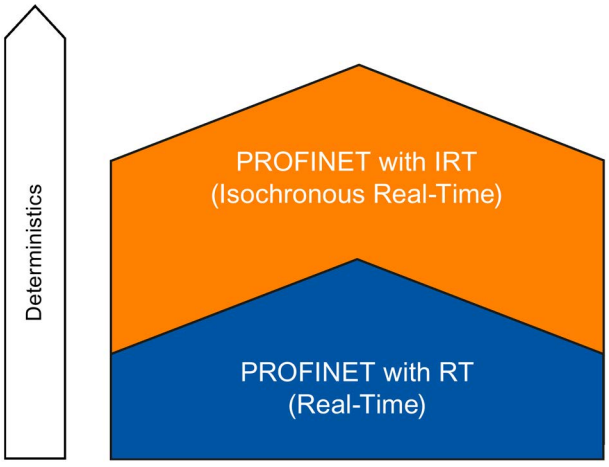

Figure 5-29 Real-time communication performance

Real-time communication and IT communication

Industrial communication, especially in the factory automation and process automation, requires a punctual and deterministic data transmission. This is why, for the cyclic exchange of time-critical IO user data, PROFINET IO does not use TCP/IP, it uses real-time communication (RT) or isochronous real-time communication (IRT) for the synchronized data exchange in reserved time intervals.

Fields of application of PROFINET with RT

PROFINET with RT is suited for:

- Time-critical applications in factory automation
- The implementation of large quantity structures in line process plants

Fields of application of PROFINET with IRT

PROFINET with IRT is particularly suitable for:

- Considerable deterministics with large quantity structures concerning the I/O user data communication (productive data)
- Considerable performance also with many devices concerning the I/O user data communication (productive data)
- Parallel transfer of productive and TCP/IP data via a cable, even with considerable data traffic whilst ensuring the forwarding of productive data by reserving the transmission bandwidth.

International standard IEC 61158

The communication procedures RT and IRT are standardized in the international standard IEC 61158.

5.5.2 RT

PROFINET IO with real-time communication (RT) is the ideal solution for integrating IO systems. This is a solution that also uses standard Ethernet in the devices and commercially available industrial switches as infrastructure components. A special hardware support is not required.

If you want to use PROFINET functions that provide an additional value, such as topology detection, diagnostics, device exchange without exchangeable medium/PG, you have to use switches that support the PROFINET standard according to the IEC 61158 standard. In the integrated switches of PROFINET devices and PROFINET switches (e.g., the SCALANCE product family), PROFINET functions in accordance with the PROFINET standard are implemented and can be used without restriction for integration in the PROFINET IO system (see also section Active network components (Page 26).

Real-time communication (RT)

PROFINET IO frames have priority over standard frames in accordance with IEEE802.1Q. This ensures the required determinism in the automation technology. The data is transferred via prioritized Ethernet frames. With RT, you can achieve update times ≥ 250 µs with RT.

Switching mechanisms

Switches in SIMATIC meet the real-time requirements with two mechanisms on PROFINET: "Store and forward" and "Cut through".

Store and forward

In the Store and forward method, the switch stores the frames completely and places them in a queue. If the switch supports the international standard IEEE 802.1Q, then the data is sorted according to its priority in the queue. The frames are then forwarded selectively to the specific port that can access the addressed node (Store and forward).

Cut through

In the Cut through process the entire data package is not stored temporarily in a buffer, it is passed directly onto the target port as soon as the target address and the target port have been determined.

The times required by the data package to pass through the switch are then minimal and independent of the frame length. The data are only stored temporarily in accordance with the Store and forward process as per priority when the section between the target segment and the port of the next switch is occupied.

5.5.3 IRT

Isochronous real-time communication (IRT)

IRT is a synchronized communication protocol for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth is available in the send cycle for IRT data. The reserved bandwidth ensures that the IRT data can be transferred at reserved synchronized intervals, without being influenced also by higher other network loads (such as TCP/IP communication, or additional real-time communication).

Advantages

PROFINET with IRT is synchronized communication in reserved time intervals. With IRT you have the option to be able to control time-critical applications such as motion control via PROFINET. With IRT you use further advantages:

- High-precision deterministics allow highest control quality and thus, for example, exact positioning of axes
- Simple and flexible integration of PROFINET devices for real-time applications in existing company networks
- Shortest response times and highest deterministics by means of bandwidth reservation and thus also for applications that have to satisfy highest performance requirements (e.g., printing control/position control for presses, print-mark recognition with packaging machines)
- Secured standard communication parallel to real-time communication via the same transmission medium
- You can continue to use standard components for your PROFINET IO system outside of the sync domain

Properties of isochronous real-time

Topology configuration is a prerequisite for IRT.

In addition to the reserved bandwidth, the telegrams from defined transmission paths are exchanged for the further optimization of data transfers. For this, the topological information from the configuration is used for planning the communication. Thus, transmission and reception points of every individual data telegram at every communication node are guaranteed. This allows you to achieve optimal usage of the bandwidth and reach the best possible performance in the PROFINET IO system.

Use of IRT allows you to achieve update times with highest deterministics ≥ 250 µs and a jitter accuracy of the send clock < 1 µs. Isochronous applications are possible with IRT (see section Isochronous mode (Page 164)).

Note

IWLAN and IRT

PROFINET devices that are connected to PROFINET IO via access points, do not support IRT.

Synchronization

The prerequisite for the IRTcommunication is a synchronization cycle for all PROFINET devices in a sync domain for distributing a mutual time basis. A synchronism of the transmission cycle of the PROFINET devices within a sync domain is achieved with this basic synchronization.

A sync master specifies the clock to which sync slaves are synchronized. An IO controller or an IO device can have the role of sync master. If the sync master fails, all IO devices with IRT will fail.

Sync master and sync slaves are always devices in a sync domain. Bandwidth is reserved within the sync domain for IRT communication. Real-time and non-real-time communication (TCP/IP communication) is possible outside of the reserved bandwidth.

Default sync domain

If you have created a PROFINET subnet, a special sync domain is automatically created, the default sync domain. All PROFINET devices configured for the PROFINET subnet automatically belong to this sync domain.

For additional information on creating sync domains, refer to the STEP 7 online help.

Time ranges of the communication cycle

The communication cycle is divided into three time ranges, which are shown in the following chart:

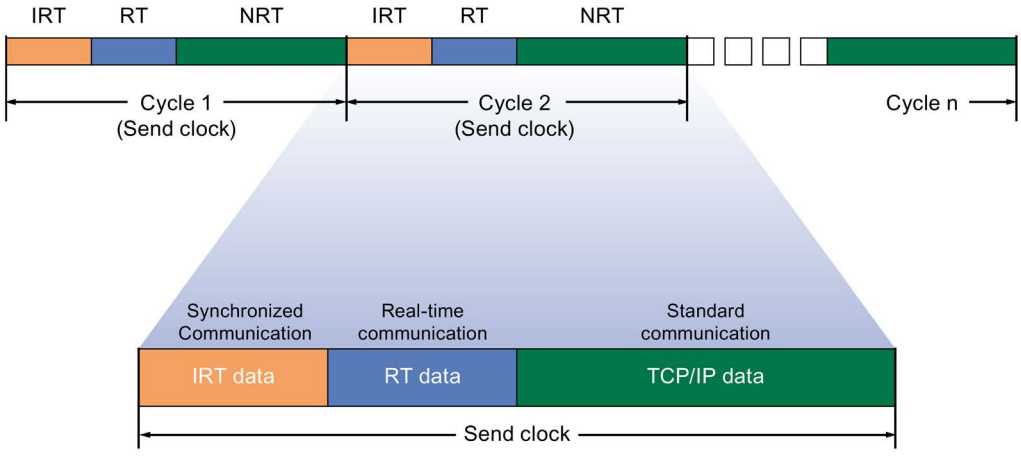

Figure 5-30 Reserving bandwidth

- IRT data (synchronized communication)

  This time range can be reserved in specific steps, depending on the send clock. Only IRT data is transmitted during this time range.

- RT data (real-time communication)

  The cyclic RT data is transmitted in this time range. RT data has a higher priority than "normal" TCP/IP data. TCP/IP data or Ethernet frames can have a priority between 1 and 7. RT data has a priority of 6.

- TCP/IP data (standard communication)

  Standard communication (e.g., TCP/IP) is transmitted in the remaining interval of the communication cycle.

5.5.4 Comparison of RT and IRT

The most important differences between RT and IRT

Table 5- 2 Comparison between RT and IRT

Property	RT	IRT
Transmission method	Prioritizing the RT frames through Ethernet priority (VLAN tag)	Path-based switching on the basis of a communication path plan; no transmission of TCP/IP frames in the time range with IRT communication.
Determinism	Variance of the duration of transmission by the shared use of the transmission bandwidth with other protocols (e.g., TCP/IP)	Exact, planned transmission, transmission and reception times are guaranteed for all topologies.
Hardware support through special Ethernet controllers is required	Not required	Required
Isochronous application	-	Yes (only for the integrated PROFINET IO interface of the CPU)
Starting time of the isochronous application	-	The point in time for the reception of the data is planned exactly. Application can be started synchronized to the cycle.

5.5.5 Configuring PROFINET IO with IRT

Introduction

If you want to configure a PROFINET IO system with IRT, you have to configure the PROFINET IO devices. These PROFINET devices must support IRT. Set which device acts as the sync master and synchronizes the other devices. This is done by configuring a sync domain with a sync master and at least one sync slave.

Requirement

- There is an IO system with an IO controller and at least one IO device.
- You have configured the topology for the IO system.
- The devices support IRT.

Procedure

Proceed as follows to enable an existing IO system for the use of IRT:

1. Select the PROFINET interface of the IO controller.
2. In the Inspector window, navigate to "Advanced options > Real time settings > Synchronization".

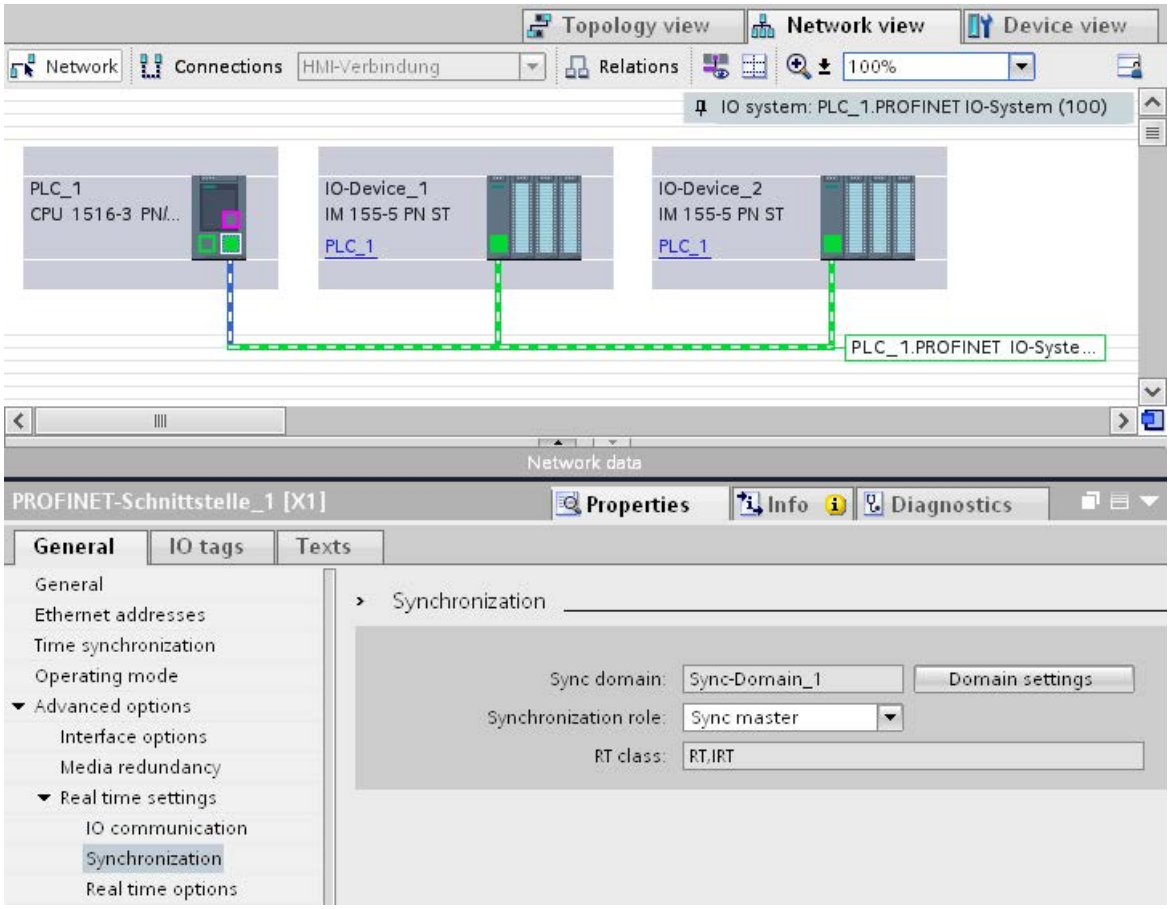

Figure 5-31 IRT configuring sync master

3. Assign the IO controller the role of sync master under "Synchronization role".
4. Select the PROFINET interfaces of an associated IO device.
5. In the Inspector window, navigate to "Advanced options > Real time settings > Synchronization".

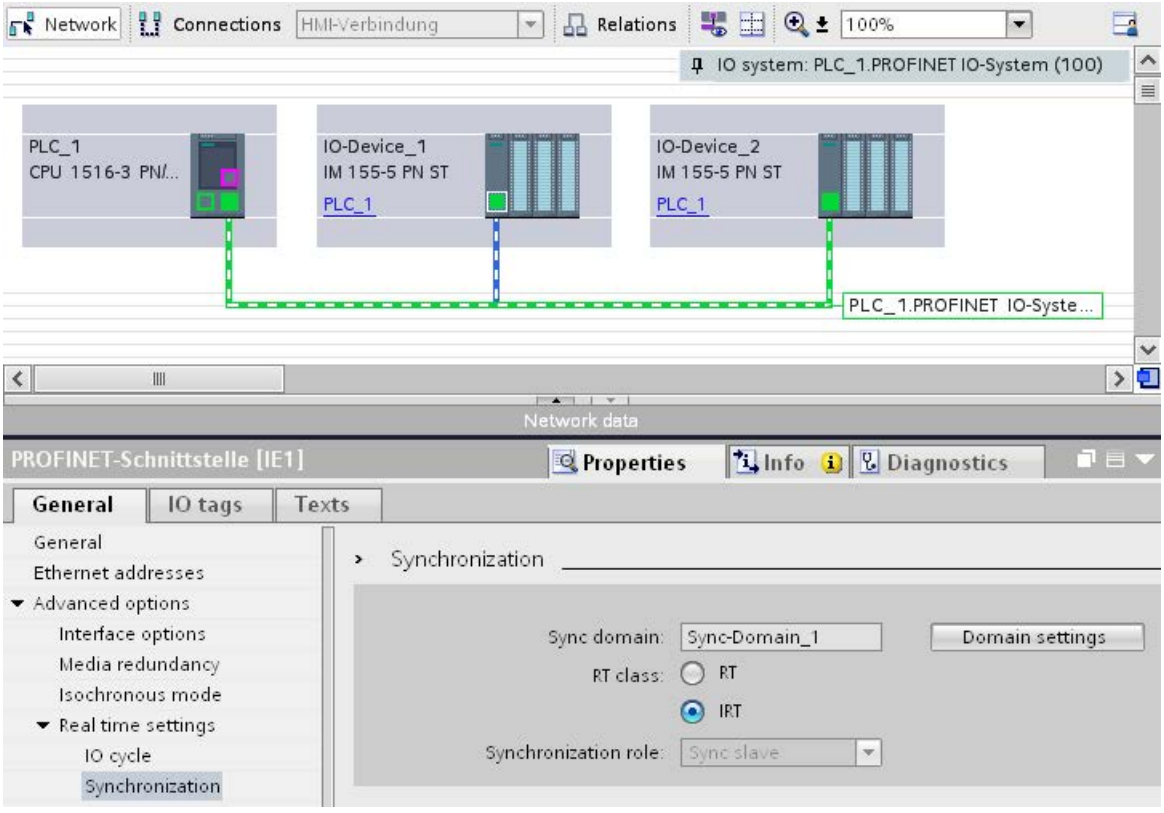

Figure 5-32 IRT configuring sync slave

6. Activate the RT class "IRT". The IO device will then automatically be assigned the synchronization role "sync slave".
7. You can check and correct your settings at any time using the "Domain settings" button.

Or

1. Highlight the PROFINET IO system in the network view.
2. Click on the PROFINET IO system.
3. Navigate to the device of the required sync domain in the Inspector window.

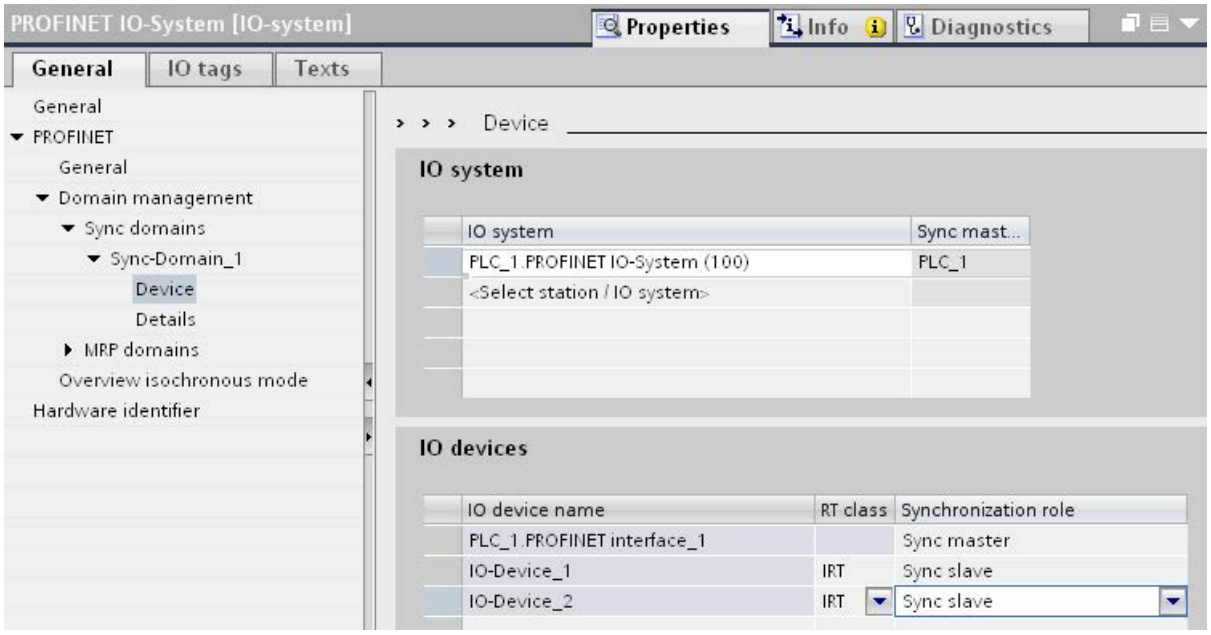

Figure 5-33 IRT configuring sync domain

4. Enter all necessary settings in the tables:
   - Select an IO system.
   - Set the synchronization role "sync master" for the IO controller.
   - Set the RT class for the IO devices to "IRT". The IO devices will then automatically be assigned the synchronization role "sync slave".

You can now load the configuration to the relevant devices with PROFINET IRT.

5.5.6 Setup recommendations for optimizing PROFINET

Optimizing PROFINET with RT

PROFINET provides you with high-performance communication on all levels.

The following figure shows an example of an optimized PROFINET topology.

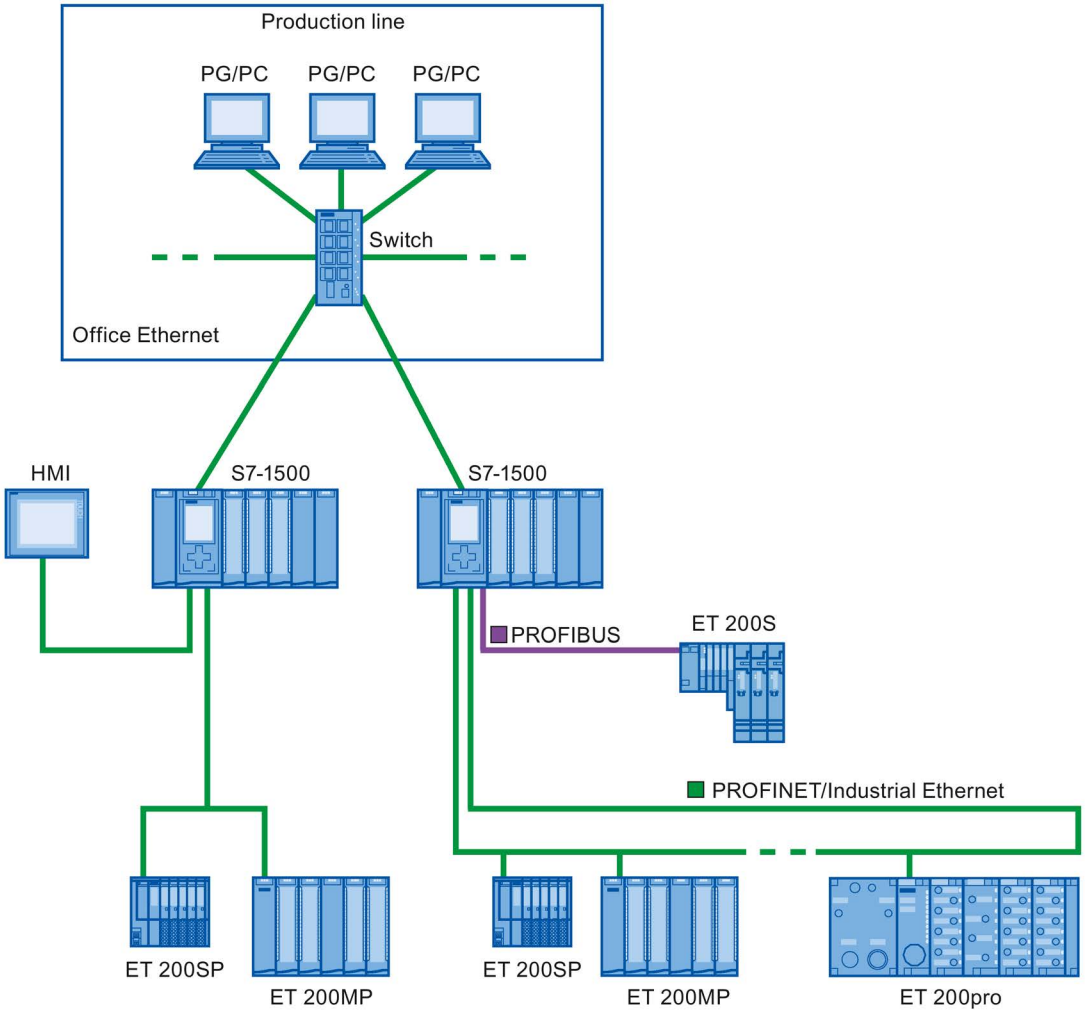

Figure 5-34 Optimized PROFINET topology

When setting up your PN network topology, take care that the various automation applications are distributed among separate network branches so that a sufficient bandwidth reserve will be available for future expansions.

- If you integrate standard Ethernet devices into the network topology or use standard Ethernet communication, take into account the network load caused by standard Ethernet and adapt the network topology as appropriate (max. bandwidth 100 Mbps).

- For communication with higher-level networks with a high data volume, use the most direct paths possible to the higher-level network infrastructure.

Also observe the Installation Guideline (http://www.profibus.com/nc/download/installation-guide/downloads/profinet-installation-guide/display/) of the PROFIBUS User Organization.

Setting up PROFINET with IRT

Keep in mind the following rules for setting up and operating a PROFINET IO system in IRT mode. These rules will ensure best possible operation of your PROFINET IO system.

- When using IRT, you must configure the topology. This will enable exact calculation of the update time, bandwidth, and other parameters.
- If you would like to use multiple sync domains, configure a sync boundary for the port which is currently connected to the PROFINET device of another sync domain.
- In a sync domain, you can only configure one sync master at a time.
- A PROFINET IO system may only be part of a single sync domain.
- If you configure PROFINET devices in a sync domain and want to synchronize with IRT, the PROFINET devices concerned must support IRT communication.
- Wherever possible, use the same PROFINET device as the PROFINET IO controller and sync master.
- If only some of the PROFINET devices in a PROFINET IO system are synchronized, please keep in mind the following: Assign PROFINET devices that are not participating in the IRT communication to the RT class "RT" and the synchronization role "unsynchronized" in the sync domain.

Installation guidelines of the PROFIBUS user organization

The installation guidelines can be found on the Internet (http://www.profibus.com/nc/download/installation-guide/downloads/profinet-installation-guide/display/).

5.6 Isochronous mode

5.6.1 What is isochronous mode?

Objectives of isochronous operation

Assuming public transport were to operate at maximum speed while reducing stop times at the passenger terminals to absolute minimum, the last thing many potential passengers would notice of the departing contraption are its red tail lights. The overall travel time is, however, decided by the train, bus or underground-railway clock, because well adjusted timing is essential to a good service. This also applies to distributed automation engineering. Not only fast cycles but also the adaptation and synchronization of the individual cycles result in optimum throughput.

Just-In-Time

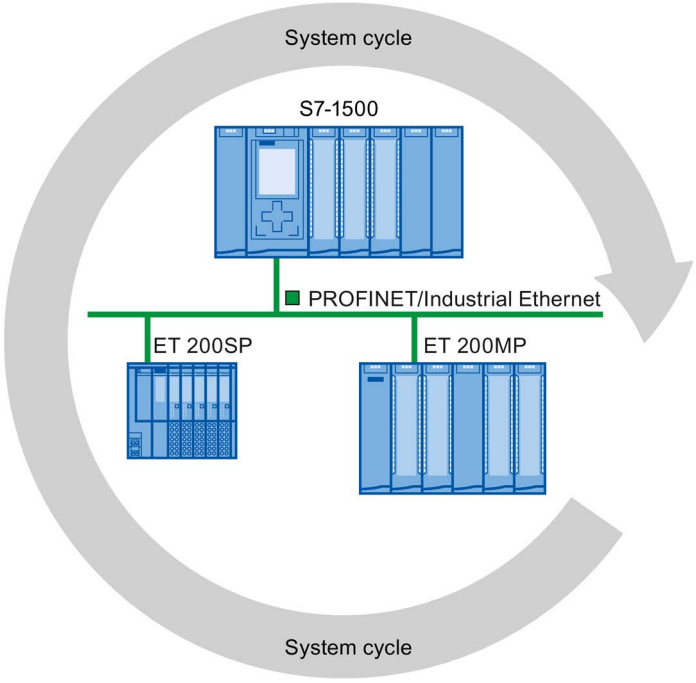

Figure 5-35 System cycle

The high speed and reliable reaction time of a system operating in isochronous mode is based on the fact that all data are provided just-in-time. The constant bus cycle time PROFINET IO cycle beats the time here.

Advantages of isochronous mode

The use of isochronous mode allows high-precision control.

- Optimized control
- Determinism
- Consistent (simultaneous) reading in of input data
- Consistent (simultaneous) output of output data

5.6.2 Use of isochronous mode

With the "Isochronous mode" system property, measured values and process data can be acquired in a fixed system clock. The signal processing up to the switching-through to the "output terminal" occurs within the same system clock. Isochronous mode thus contributes to high-quality control and hence to greater manufacturing precision. With isochronous mode, the possible fluctuations of process response times are drastically reduced. The time-assured processing can be utilized to improve machine cycle times.

In principle, isochronous mode is worthwhile whenever measured values must be acquired synchronously, movements must be coordinated, and process responses must be defined and simultaneously executed, as in the following example. There are thus numerous areas in which isochronous mode can be used.

5.6.3 Isochronous applications

Example: Isochronous measurement at several measuring points

Quality assurance requires precise measurement of dimensions within a camshaft production process.

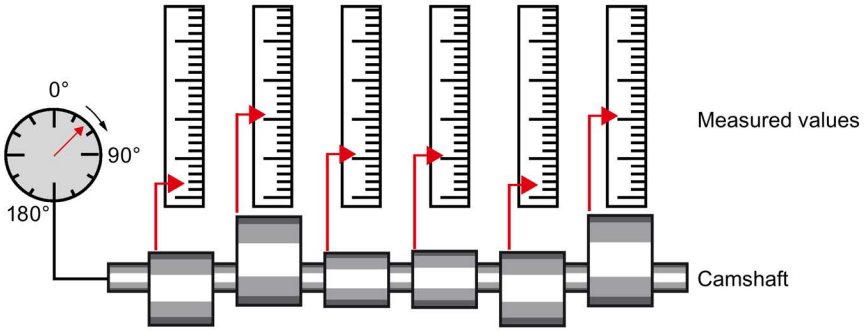

Figure 5-36 Measuring of camshafts

Isochronous workflow

When the isochronous mode property of the system is used, the measured value acquisition is clocked and occurs simultaneously at the various measuring points. The time required for measurement is reduced. Resultant workflow:

- Continuous machining of the camshaft
- Synchronous measurement of the camshaft positions and gradients within a continuous rotation.
- Machining of the next camshaft

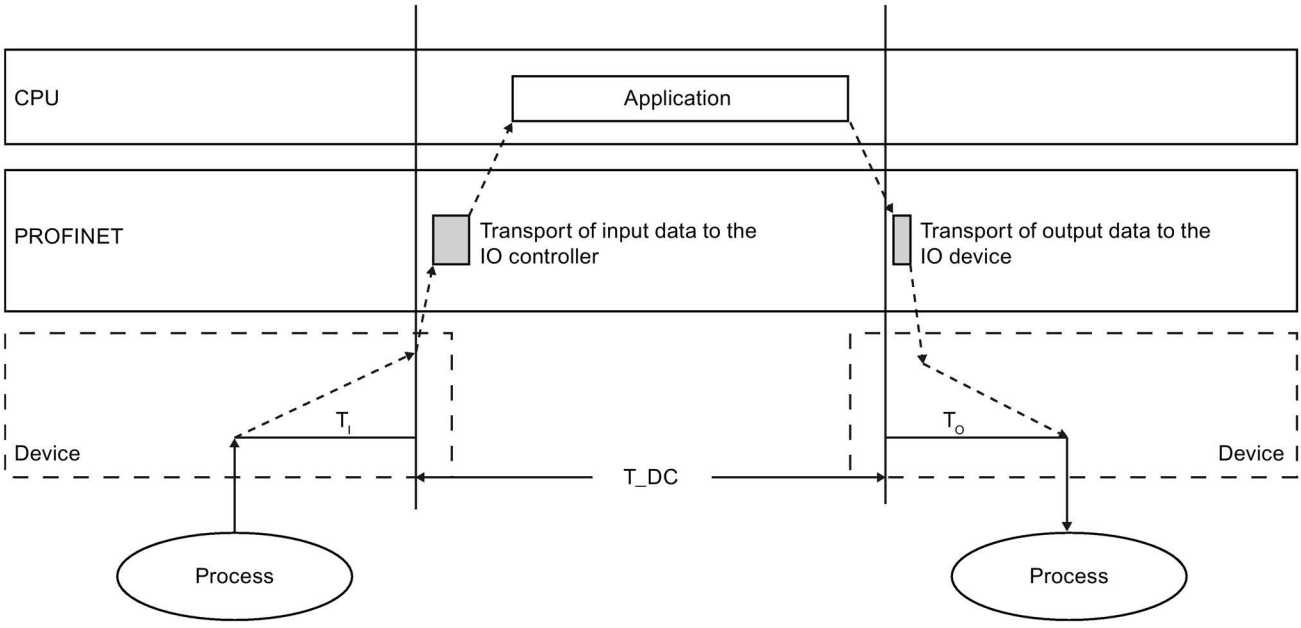
All camshaft positions and the corresponding measured values (red) are measured synchronously within a single rotation of the camshaft. This increases machine output and maintains or enhances precision of the measurement.

5.6.4 Time sequence of synchronization

From reading-in of input data to outputting of output data

The basic time sequence of all components involved in synchronization is explained in the following:

- Reading-in of input data in isochronous mode
- Transport of input data to the IO controller (CPU) via the PROFINET subnet
- Further processing in the isochronous application of the CPU
- Transport of output data to the outputting IO device via the PROFINET subnet
- Outputting of output data in isochronous mode



T_DC Data cycle (Time_DataCycle)

T_I Time for reading in the input data

T_O Time for outputting the output data

Figure 5-37 Time sequence of synchronization

The start of the I/O read cycle is advanced by the amount of a bias time T_I in order to make all input data available for transfer on the PROFINET IO line at the start of the next PROFINET IO cycle. T_I is the "flashlight" for the inputs; at this instant all synchronized inputs are read in. T_I is necessary in order to compensate for analog-to-digital conversion, backplane bus times, and the like. The bias time T_I can be configured by STEP 7 or by the user. We recommend automatically assigning the bias time T_I of STEP 7.

The PROFINET IO line transports the input data to the IO controller. The application can be started synchronized to the cycle, i.e., the isochronous mode interrupt OB is called after a parameterizable delay time. The user program in the isochronous mode interrupt OB decides the process reaction and provides the output data in time for the start of the next data cycle. The length of the data cycle is always configured by the user.

T_O is the compensation arising from the backplane bus and the digital-to-analog conversion within the IO device. T_O is the "flashlight" for the outputs; at this instant the synchronized outputs are output. The time T_O can be configured by STEP 7or by the user. We recommend automatically assigning the bias time T_o of STEP 7.

Isochronous mode and non isochronous mode distributed I/O

It is possible to combine isochronous mode distributed I/O with non isochronous mode distributed I/O on one IO controller.

5.6.5 Basics of Programming

Programming in the isochronous mode interrupt OBs

The isochronous elements of the program are always programmed in the isochronous mode interrupt OBs OB 61 to OB 64. As the isochronous mode interrupts are processed at higher priority, only the time-sensitive elements of the program should be processed in OB 6x. The isochronous mode interrupt is called with a configured delay time.

Accessing isochronous I/O by calling system functions

The isochronous I/O are updated exclusively by calling the "SYNC_PI" and "SYNC_PO" instructions and therefore in the corresponding process image partition. Direct access to the I/O areas returns current values of the process that do not, however, necessarily relate to other values.

The "SYNC_PI" and "SYNC_PO" instructions can update the process image partition only within the permitted execution window. The execution window for the possible call of the "SYNC_PI" and "SYNC_PO" instructions stretches from the end of the cyclical data exchange on the PROFINET IO until the point in time before the end of T_DC at which the outputs can still be copied on time. The data exchange must be started within this time window. If the "SYNC_PI" and "SYNC_PO" instructions are not processed within the execution window, the system functions will indicate this with a corresponding error message. An image in which the execution window and the corresponding times are displayed can be found in the next chapter.

Note

To prevent inconsistent data from being returned for OB6x, you should avoid using the "DPRD_DAT" and "DPWR_DAT" instructions (direct data access) in the isochronous mode OB.

Note

In order to ensure trouble-free isochronous operation, you should not call any data record services for IO devices in isochronous mode and there should not be any interrupts configured if possible.

Program processing models

Depending on the order of the "SYNC_PI" and "SYNC_PO instructions in OB6x and the application cycle factor used, the program processing can be divided into two basic models:

- **IPO** model (read **I**nputs - **P**rocessing - write **O**utputs), CACF = 1
- **IPO** model (read **I**nputs - **P**rocessing - write **O**utputs), CACF > 1

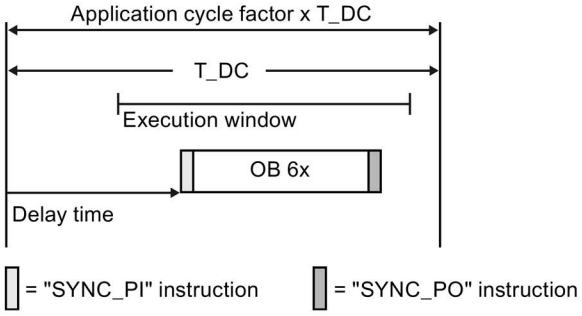
5.6.6 Program processing according to the IPO model with application cycle = 1

Characteristics of the IPO-model with application cycle factor = 1

The IPO model with application cycle factor = 1 is characterized by the fact the processing of the I/O data is complete within one system clock cycle T_DC. The shortest response times are achieved with this model.

IPO model with application cycle factor = 1

With the IPO model with application cycle factor = 1, there is a constant processing time from the "input terminal" to the "output terminal" of T_I + T_DC + T_O. T_I + 2×T_DC + T_O can be guaranteed for the process response time.



The figure shows the IPO model with the application cycle factor = 1 from acquisition through processing on the CPU to output of the process values. STEP 7 calculates the delay time or you can enter it yourself (see chapter Setting the application cycle and delay time (Page 174)). In this time, the read input data is on its way on PROFINET IO.

The start is the transfer with the instruction "SYNC_PI" and the end is reached with the instruction "SYNC_PO". The delay time is set as a default to the start of the execution window.

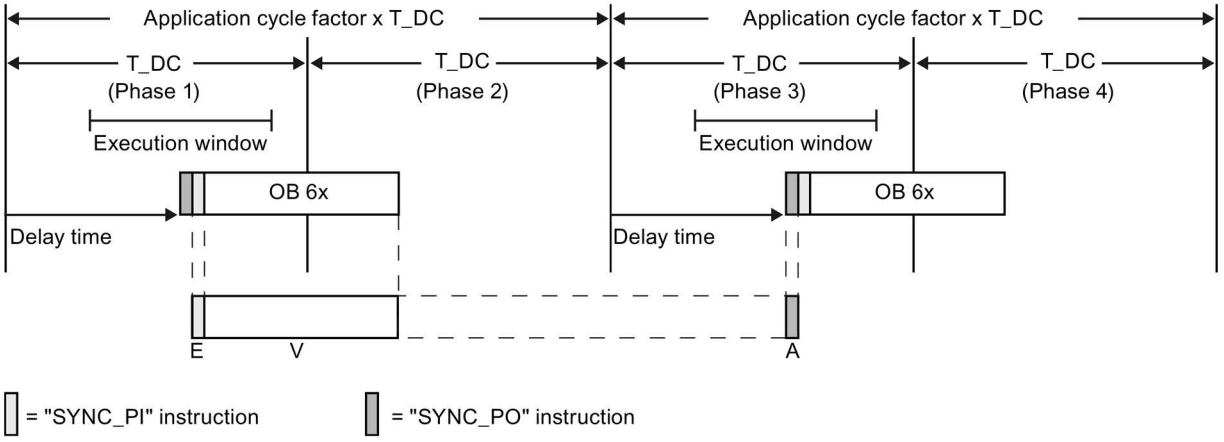
The "SYNC_PI" and "SYNC_PO" instructions may only be processed within the execution window. The processing of the data must be completed within the data cycle T_DC. When the application cycle factor is set to a value >1, the "SYNC_PI" and "SYNC_PO" instructions must be completed within the first data cycle T_DC; only the processing of the data may still occur in the following data cycles.

5.6.7 Program execution according to the IPO model with application cycle > 1

Characteristics of the IPO-model with application cycle factor > 1

The IPO model with application cycle factor > 1 is an IPO model over multiple data cycles T_DC. In this case, it is an IPO model with an output delayed by one application cycle (OB6x). The input and processing take place in the same application clock cycle. Output is performed at the start of the next application clock cycle, directly before the next input.

The "SYNC_PI" and "SYNC_PO" instructions may only be processed within the execution window of the first data cycle T_DC of the application clock cycle. (With application cycle factor > 1, is available only there). The other user program processing in OB 6x then occurs in the next data cycle or over the following data cycles T_DC.



The figure shows the signals of the IPO model with application cycle factor = 2 over time from the acquisition through the processing on the IO controller to the output of the process values. STEP 7 calculates the delay time T_M. In this time, the read input data is on its way on PROFINET IO.

The IPO model with application cycle factor > 1 is particularly ideal for large IO infrastructures with a comprehensive user program in the OB6x. With this model, longer calculation times are possible when processing the input data and obtaining the corresponding output data.

With the IPO model with application cycle factor > 1, there is a constant processing time from the "input terminal" to the "output terminal" of T_I + (application cycle factor + 1) x T_DC + T_O. T_I + (2 x application cycle factor + 1) x T_DC + T_O can be guaranteed for the process response time.

5.6.8 Configuring isochronous mode

Introduction

The configuring of isochronous mode for a module is described as IO device in the following based on the ET 200MP distributed I/O system. The procedure described also applies to other distributed I/O systems (e.g., ET 200S or ET 200SP).

The IO controller is an S7-1500 CPU.

Requirements

- The STEP 7 network view is open.
- A S7-1500 CPU has been placed (e.g., CPU 1516-3 PN/DP).
- An interface module IM 155-5 PN HF (ET 200MP) has been placed and networked with the CPU.
- All requirements for an IRT configuration are met, namely:
  - The ports of the CPU and the interface module are interconnected.
  - The RT class of the interface module is set to "IRT" (area "Advanced options > Real time settings > Synchronization").
  - You have assigned the "sync master" and "sync slave" roles.

Procedure

To create an isochronous connection between the I/O and user program, follow these steps:

1. Select the "IM 155-5 PN HF" in the network view of STEP 7 and switch to the device view.
2. Insert an IO module that can be operated in isochronous mode (module with the extension "HF").
3. Go to the "I/O addresses" area in the Inspector window of the selected I/O module.

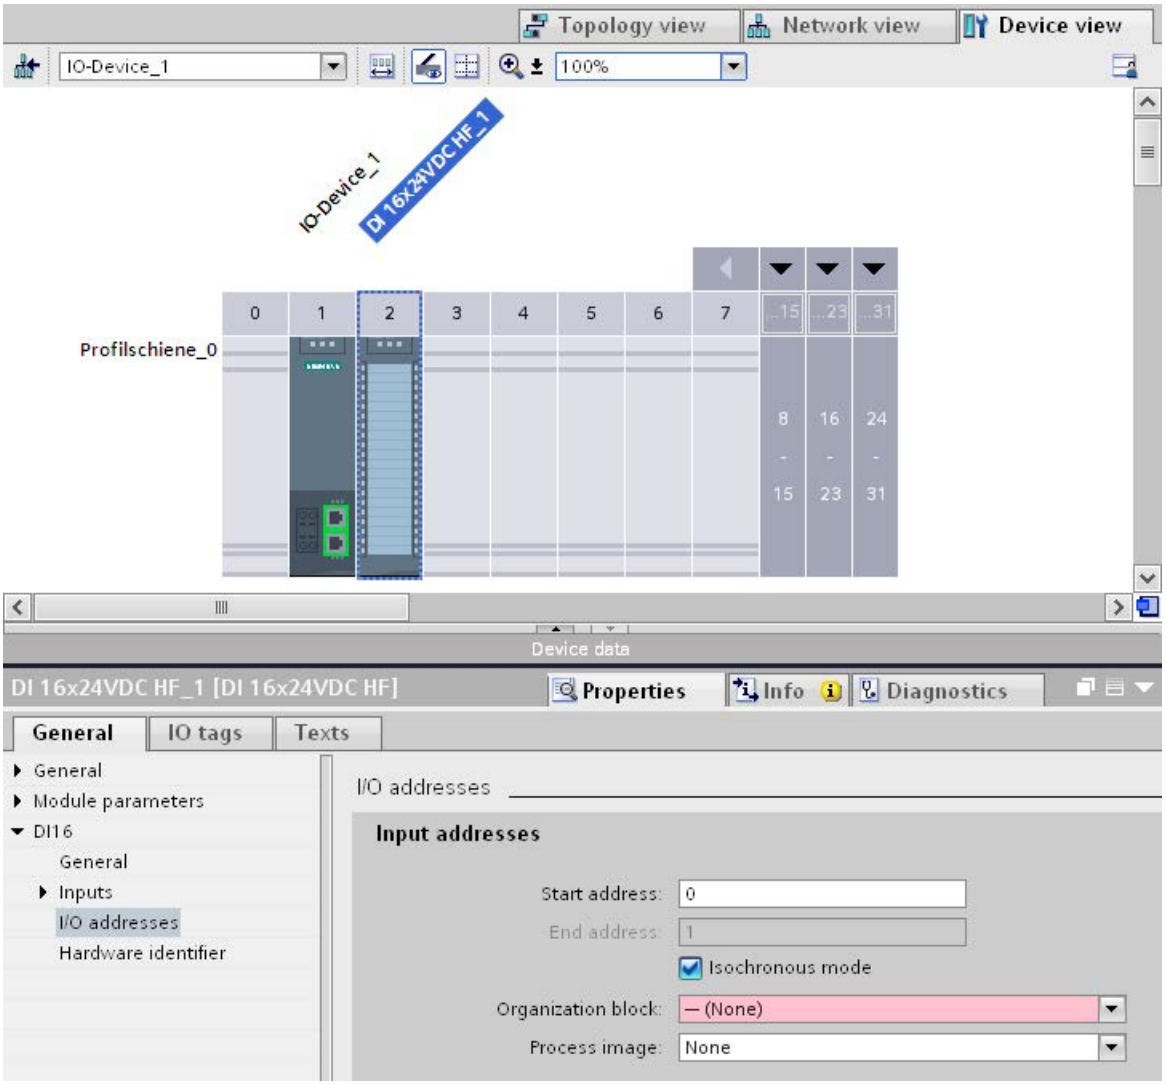


Figure 5-38 Configuring isochronous mode in STEP 7

4. Make the following settings in the I/O addresses area:
   - Select the "Isochronous mode" option.
   - Select a process image partition, e.g., process image partition 1.
   - Click on the "Assigned organization block" in the drop-down list and click the "Add object" button, or select an already existing OB.

Figure 5-39 Creating the organization block for programming isochronous mode

A dialog box for selecting organization blocks opens.

   - Select the "Synchronous Cycle" OB and confirm the selection with "OK".

     In the case of automatic number assignment, OB 61 will be generated and opened. The "Isochronous mode" area is selected in the Inspector window, and you can continue directly with the setting of the application cycle and delay time and start the programming of the OB in the instruction section.

5. Add other IO devices as required in the network view and adapt the configuration and the isochronous mode settings.
6. To retrieve information about calculated bandwidths or to adapt the send clock, select the subnet and navigate to the corresponding area of the domain management in the Inspector window.

Programming isochronous mode

The user program must be set up accordingly in order to operate your plant in isochronous mode. To do this, you must create an isochronous mode interrupt OB (OB 6x) in an I/O module (see above). You access the isochronous I/O via a process image partition, i.e., the addresses of isochronous modules must be in a process image partition. You have to program accesses to the isochronous IO with the instructions SYNC_PI and SYNC_PO in the isochronous mode interrupt OB.

You call the SYNC_PI instruction at the start of the isochronous mode interrupt OB provided you have selected the automatic setting for the delay time. You call the instruction SYNC_PO at the end of the OB 6x.

5.6.9 Setting the application cycle and delay time

Requirement

- You have created an isochronous mode configuration in STEP 7.
- You have created an isochronous mode interrupt OB.
- The isochronous mode interrupt OB is open.

Setting the application cycle and delay time

To set the application cycle for your isochronous mode application, follow these steps:

1. Open the "Properties" dialog associated with the relevant isochronous mode interrupt OB.
2. In the area navigation, click the "Isochronous mode" group .
3. Set the application cycle in "Application cycle (ms)". Open the drop-down list box and select the application cycle. The drop-down list box offers multiples of the PROFINET send cycle clock as possible values for the application cycle. The PROFINET send cycle clock is set to 2 ms in the following figure.

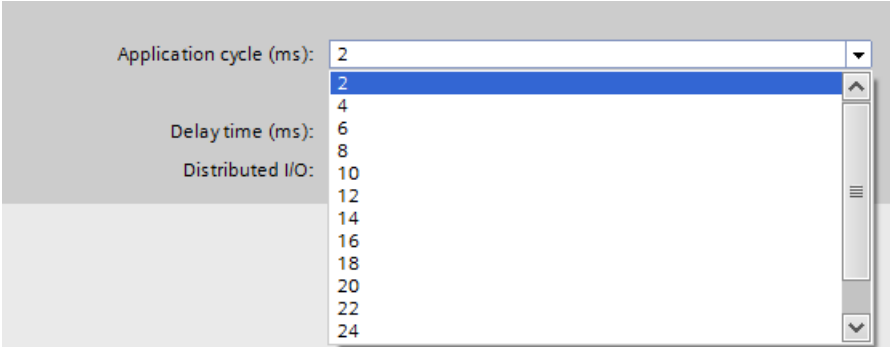

Figure 5-40 Setting the application cycle

Setting the delay time

STEP 7 sets the delay time automatically to the start of the execution window by default. As a result, the isochronous mode update of the process image partition automatically falls within the execution window of the application cycle.

You can also set the delay time manually. A shorter delay time enables you to increase the processing time for your user program in the isochronous mode interrupt OB. If a manual setting is made, note that you must call the "SYNC_PI" and "SYNC_PO" instructions in the execution window of the application cycle.

To set the delay time for your isochronous mode application, follow these steps:

1. Open the "Properties" dialog associated with the relevant isochronous mode interrupt OB.
2. In the area navigation, click the "Isochronous mode" group .
3. Clear the "Automatic setting" check box.
4. Enter your desired delay time in "Delay time (ms)".

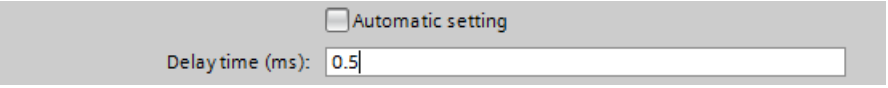

Figure 5-41 Setting the delay time

5.7 Device replacement without exchangeable medium

Definition

IO devices which have no slot for exchangeable medium (e.g. ET 200SP, ET 200MP) or IO devices which support the PROFINET functionality "Device replacement without exchangeable medium/PG" can be replaced without having an exchangeable medium with saved device names inserted and without having to assign the device name with the PG. The new IO device is given a device name by the IO controller and not by the exchangeable medium or the PG.

To assign the device name, the IO controller uses the configured topology and the neighborhood relations established from the IO devices.

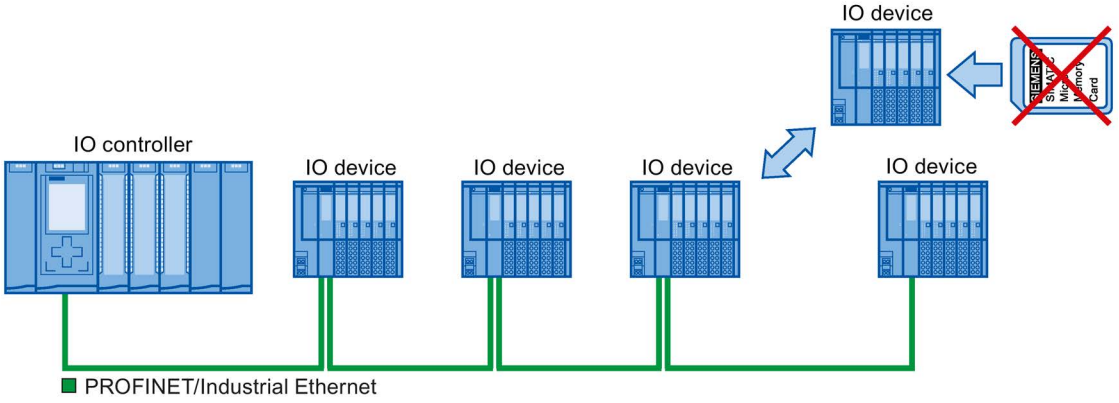

Figure 5-42 Device replacement without exchangeable medium

Note

When you exchange a device, make sure that the PROFINET cable is again inserted into the correct port, as it is configured in STEP 7.

Otherwise, the system will not run.

Advantages

With the Device replacement without exchangeable medium/PG PROFINET functionality, you can profit from the following advantages:

- After the replacement of the IO device, it automatically obtains its device name from the IO controller. You no longer have to assign device names with the PG or exchangeable medium.
- You can save on the storage medium for the IO device that replaces the removed one.
- Simple device name allocation with series machines that have the same configuration and set topology. It is no longer necessary to assign device names via exchangeable medium/PG.

5.7.1 Device replacement without exchangeable medium/PG function

Neighborhood

Neighborhood is the physical relationship between two ports of adjacent PROFINET devices. A PROFINET device is connected in this case through one of its ports over a physical Ethernet line to a specific port of the second PROFINET device in close proximity (neighbors).

Both terminal devices, for example, IO controllers and IO devices with a port, and network components, for example, switches, IO controllers and IO devices with multiple ports, are considered PROFINET devices.

Failure and replacement of an IO device

The following example describes device replacement without exchangeable medium in the case of failure of an IO device.

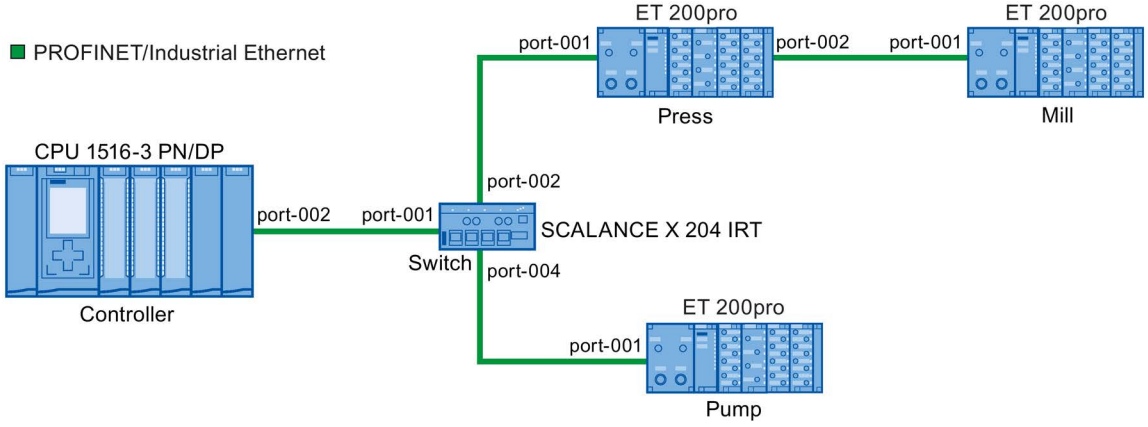

Figure 5-43 Example configuration of device replacement without exchangeable medium

For the device replacement, the following information is available to the IO controller:

PROFINET device	Device alias
Controller	"port-001.Switch"
Switch	"port-002.Controller", "port-001.Press", "port-001.Pump"
Press	"port-002.Switch", "port-001.Mill"
Mill	"port-002.Press"
Pump	"port-004.Switch"

The IO device with the device name "Mill" fails in this example:

Requirement

The PROFINET device replacing the removed one has no device name.

Principles of name assignment

The failure of the "Mill" IO device is considered here.

1. The IO controller queries the device name of the replaced IO device.
2. The IO controller detects that the IO device with the device alias "port-002.Press" does not have a device name.
3. The IO controller assigns the device name "Mill" to the replaced IO device via the device alias "port-002.Press" of the failed IO devices.

Note

If you insert a device with the Device replacement without exchangeable medium/PG PROFINET functionality at a different location than the configuration, a different device name is then assigned to the device.

Reset a wrongly inserted device to delivery state before you use it again.

5.7.2 Replacing an IO device without exchangeable medium

Introduction

Replacement of IO devices is sometimes frequently required in automation systems. The IO devices are generally assigned a device name by either inserting an exchangeable medium or via the programming device. The CPU identifies the IO device by using these device names.

Under certain circumstances, replacing an IO device can be done without inserting an exchangeable medium or without the PG.

Requirements

- The topology of the PROFINET IO system with the respective IO devices must be configured.

  By configuring the topology, the neighbor relationships of all the PROFINET devices located in the PROFINET IO system are announced to the PROFINET IO system or the IO controller. From the neighbor relationships specified by the set topology and the actual neighbor relationships established by the real PROFINET devices, the IO controller can identify the replaced IO device without a name and assign to it the configured name and the IP address and then again list it in the user data traffic.

- The affected IO devices in the automation system must support device replacement without exchangeable medium.

  If the individual IO devices in the automation system do not support device replacement without exchangeable medium, a corresponding alarm is output for the IO device.

Note

Use only new IO devices as replacements or restore configured IO devices to their delivery state.

Activating/deactivating device replacement without exchangeable medium

The "Device replacement without exchangeable medium" function is activated in the IO controller by default.

To deactivate device replacement without exchangeable medium, follow these steps:

1. In the device or network view of the STEP 7, select the PROFINET interface in the corresponding IO controller.
2. In the interface properties under "Advanced options > Interface options", clear the "Support device replacement without exchangeable medium" check box.

To reactivate device replacement without exchangeable medium, you must select the "Support device replacement without exchangeable medium" check box again.

5.7.3 Permit overwriting of PROFINET device name

With an S7-1500 CPU as of firmware version V1.5 or with an ET 200SP CPU as of firmware version V1.6, you can overwrite PROFINET device names of IO devices during startup of the CPU. This option reduces the effort during automatic commissioning, for example, when replacing a device.

Effect of "Permit overwriting of PROFINET device name" option

The IO controller (CPU) can overwrite the PROFINET device names of IO devices in the IO system when the "Permit overwriting of PROFINET device name" option is enabled.

Multiple use IO systems can only be operated when this option is enabled. The IO controller checks prior to overwriting if the type of the IO device matches the configured type.

⚠ WARNING

Wrong PROFINET device name

When the "Permit overwriting of PROFINET device name" option is selected, incorrectly connected devices can receive an incorrect PROFINET device name from the configuration.

Depending on the connected I/O, there is risk of death, severe injuries or damage caused by malfunctions.

To rule out any danger, check whether the suitable replacement device has been connected in case of a device replacement and whether the port interconnection matches the configured preset topology.

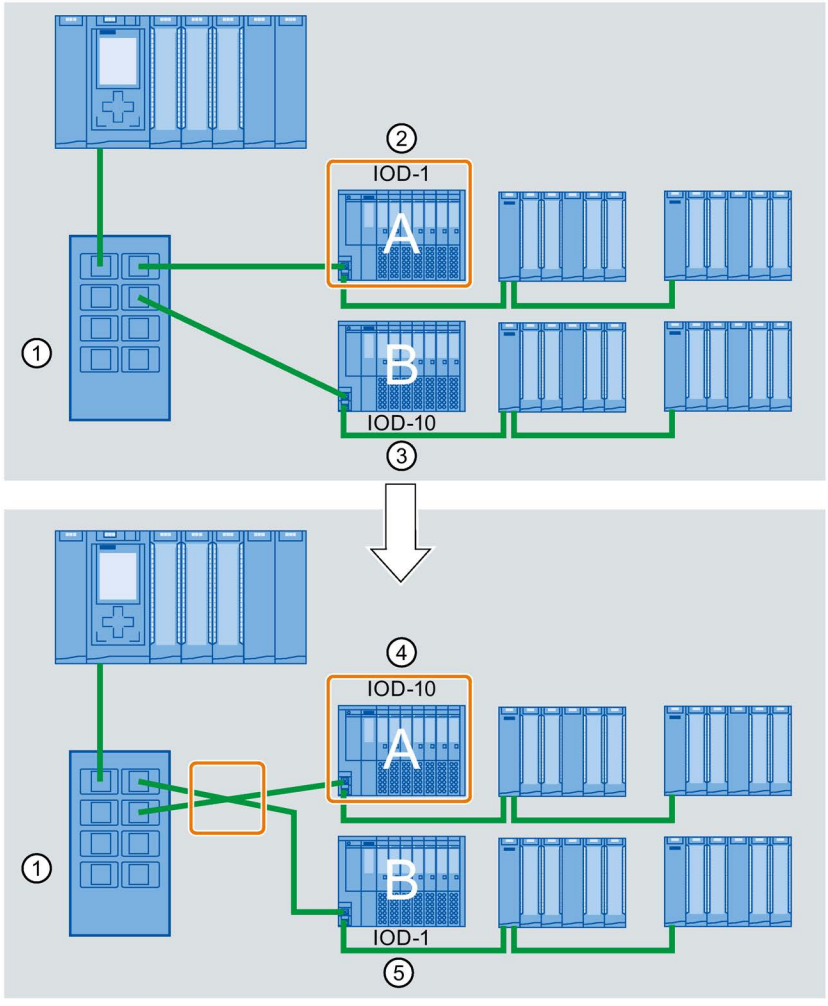
If the option is not selected, the IO controller cannot overwrite the device names of the IO devices. In this case, you must manually assign the PROFINET device name on the IO device if the PROFINET device name changes in the configuration or when a device is replaced, or delete the device names of the IO devices prior to an automatic commissioning.

Typical source of danger

When replacing an IO device ("standard case"), it is almost guaranteed that the replaced device will be connected according to the configured port interconnection.

The figure below shows a scenario whereby the connections of two identical PROFINET cables are swapped at two switch ports. Because the IO controller assigns the device names according to the preset topology, the incorrect connection of the devices has serious effects on the naming.

Due to the control of different actuators, the plant could become hazardous in this case.



① Switch with connected PROFINET cables
② Device A, device name "IOD-1": controls motor 1
③ Device B, device name "IOD-10": controls motor 10
④ Device A controls motor 10!
⑤ Device B controls motor 1!

Procedure

To change the "Permit overwriting of PROFINET device name" option, follow these steps:

1. Select the PROFINET interface of the CPU for which you want to change the option in the network view or in the device view.
2. Select the area "Advanced options", section "Interface options".
3. Change the option.

5.8 Standard machine projects

Introduction

Standard machine projects are STEP 7 projects that use a set of innovative functions allowing simple configuration and commissioning of flexible automation solutions for standard machines or for machines with a modular structure.

A hardware configuration consisting of an S7-1500 CPU as the IO controller and any connected IO devices represents a "PROFINET IO system master". This master is configured with a maximum configuration based on a template from which various options can be derived for different standard machines, for example with different configuration variants of the IO system.

Greater flexibility at all levels

Standard machine projects have the following central characteristics:

- Different variants of a standard machine can be loaded from precisely one project with an engineered maximum configuration (IO system options). The standard machine project covers all variants (options) of the IO system.
- An IO system option can be integrated in an existing network locally using simple tools.

Flexibility is provided in more ways than one:

- With suitable configuration, adaptation of the IP address parameters of the IO controller is possible locally using simple tools. This allows a standard machine to be integrated in different plants with little effort or to be included in a network several times.
  IO systems with this property are known as **multiple use IO systems**.
- With suitable configuration and programming, different setups of IO system options can be operated locally that differ in terms of the selection of IO devices used or in terms of the arrangement of the IO devices.
  Since the specific configuration of the IO system is controlled by the user program, this is known as **configuration control for IO systems**.
- Independently of the functions described above, with suitable configuration and programming, you can use different station options of central devices or distributed I/O devices in one project. The devices can be different in terms of the selection and arrangement of the modules.
  Since the concrete configuration of the station is controlled by the user program, this is also known as **configuration control**.

Additional information

For more information on multiple use IO systems, refer to section Multiple use IO systems (Page 184).

For more information on the configuration control for IO systems, refer to section Configuration control for IO systems (Page 193).

For more information on configuration control, refer to the system manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792).

5.8.1 Multiple use IO systems

5.8.1.1 What you should know about multiple use IO systems

Multiple use automation solutions

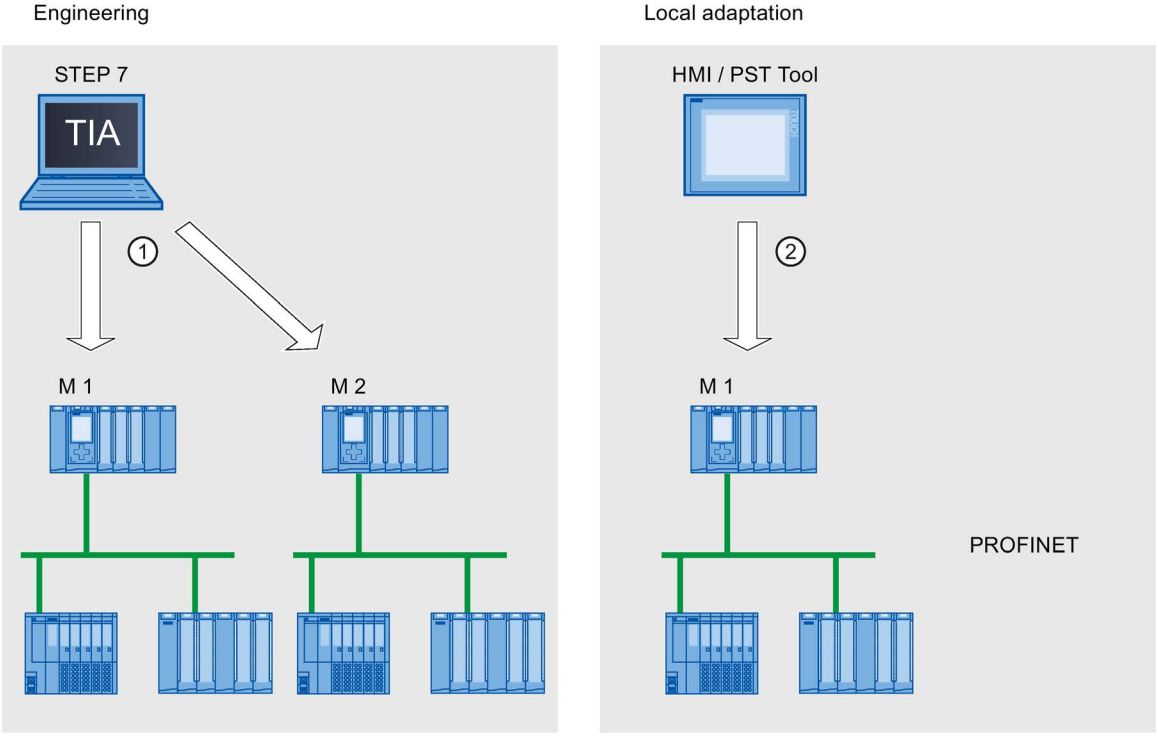
For a flexible reusable automation solution as is the case with series machines, the following use cases are typical:

- The machine (and therefore also the PROFINET IO system) is used more than once by the customers.
- The machine is used in different plants by various customers.

For this to be possible, the automation solution must meet the following requirements:

- A project (configuration and program) can be loaded on various machines of the same type without changes.
- Only a few easy adaptations need to be performed locally to integrate the machine into an existing network infrastructure.

The following figure shows how an automation solution with a multiple use IO system is loaded on different automation systems and then one automation system is adapted to the existing network infrastructure locally.



① Load configuration with multiple use IO system
② Set IP address and device name locally on the IO controller

Principle

The automation components for a machine include a PROFINET IO system, consisting of an IO controller (PROFINET interface of a CPU) and the IO devices assigned to it.

With the "Multiple use IO system" setting for the IO system, you turn a STEP 7 project into a "Standard machine project".

The "Multiple use IO system" setting triggers various settings and checks of the configuration by STEP 7. The settings ensure that the IO system is self-contained and there are no dependencies on components outside the IO system.

Requirement

- STEP 7 as of V13
- An CPU S7-1500 as of firmware version V1.5 as IO controller

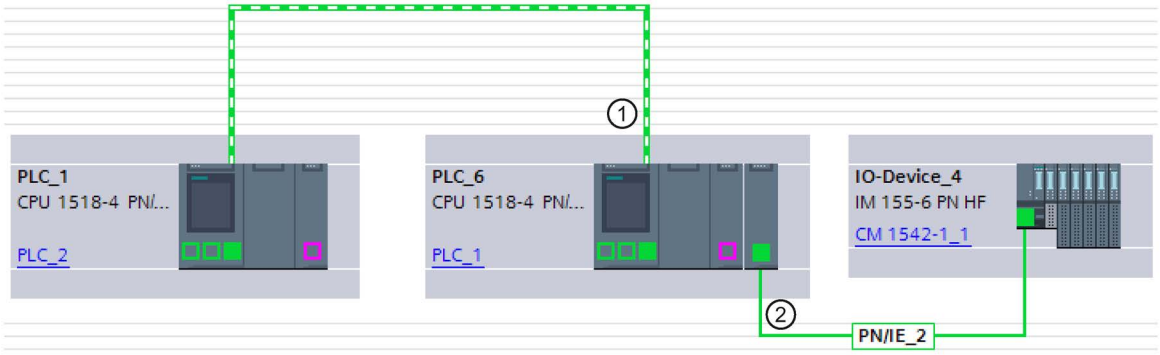
  or
- An ET 200SP CPU as of firmware version V1.6 as IO controller

Rules

The following rules apply to a multiple use IO system:

- No IO device can be configured as shared device.
- The ports of the devices must be interconnected.
  Devices for which no port interconnection is configured, for example, interface module IM 154-6 IWLAN (ET 200pro PN), cannot be operated with STEP 7 V13 as IO devices on a multiple use IO system.
- If an IO device in a multiple use IO system is an I-device (CPU as an "intelligent" IO device):
  - If the I-device has a lower-level IO system, this I-device cannot be connected to the same PROFINET interface as the higher-level IO controller.

    Note: If the I-device is configured using a PROFINET GSD, STEP 7 cannot check for compliance with this rule. In this case, you are responsible for ensuring compliance with the rule.



① I-device in multiple use IO system. The PROFINET interface is operated as IO device. No other IO system is connected here.

② A lower-level IO system on the I-device is connected to another PROFINET interface.

  - The PROFINET interface of the I-device must be set to “Parameter assignment of PN interface by higher-level controller”.
- If MRP (Media Redundancy Protocol) is configured:
  - All IO devices on multiple use IO systems must belong to the same MRP domain.
- If IRT (Isochronous Real Time) is configured:
  - All IO devices in multiple use IO systems must belong to the same sync domain.
  - The sync domain must not include any other IO devices.
- IE/PB Links cannot be operated as an IO device in a multiple use IO system with STEP 7 V13.

Configuration

You specify whether or not a configuration can be used multiple times in the properties of the IO system.

All other parameter settings for the configured devices are then set automatically by STEP 7 and checked during compilation.

Boundary conditions

To prevent a standard machine project from having dependencies on other devices outside of the machine, observe the following:

- A standard machine project consists of an IO controller and the corresponding IO devices. You should therefore configure only one CPU as IO controller and the corresponding IO devices in the standard machine project.
- Do not use connection configured at both ends for the communication. Instead, use only a connection configured at one end or unspecified connections if necessary.

  Background: To configure the communication in a STEP 7 project, it is always possible to set the IP address parameters in the project. For multiple use IO systems, however, this strategy is not possible since the IP address parameters of the IO controller and the assigned IO devices are assigned locally. At the time of the configuration, the IP address parameters are therefore unknown.

  If you nevertheless want to configure communication with devices on PROFINET, for example with a central coordinator, you can only use communications mechanisms that allow dynamic assignment of the IP address parameters in the user program.

  Example: Open User Communication

  If, for example, the device is configured as an active end point (initiator of the connection), the IP address parameters can be stored, for example, in a data block. You then supply the data block with the currently valid IP address parameters during commissioning. For this dynamic type of IP address parameter assignment, there is no system support; in other words, if you change the configuration of the system, the IP address parameters are not automatically adapted.

  You will find a description of handling instructions for Open User Communication under this keyword in the STEP 7 online help.

5.8.1.2 Configuring multiple use IO systems

Requirement

- An CPU S7-1500 as of firmware version V1.5 as IO controller

  or

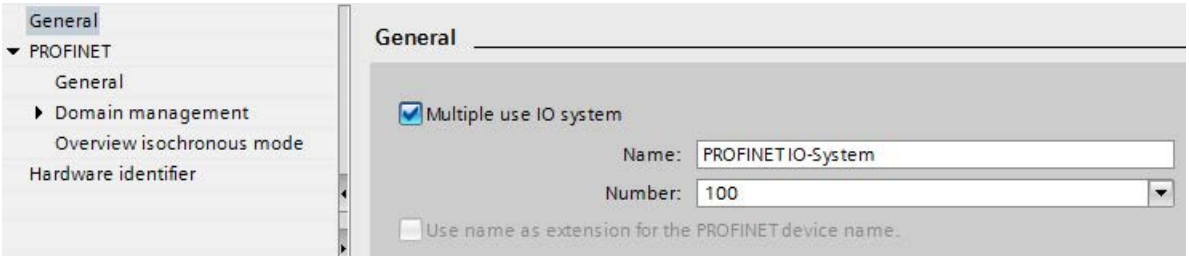
- An ET 200SP CPU as of firmware version V1.6 as IO controller

Procedure

The following describes the configuration of a series machine using an S7-1500 CPU as an example.

To create a standard machine project, follow these steps:

1. Create a project.
2. Configure an S7-1500 CPU firmware version V1.5 or higher as IO controller.
3. Configure the required IO devices and assign the IO devices to the IO controller.
4. Configure the port interconnection between the devices.
5. Select the IO system so that you can edit the properties in the inspector window.
6. Select the "Multiple use IO system" check box in the "General" area of the inspector window.



Result: The following settings are made by STEP 7:

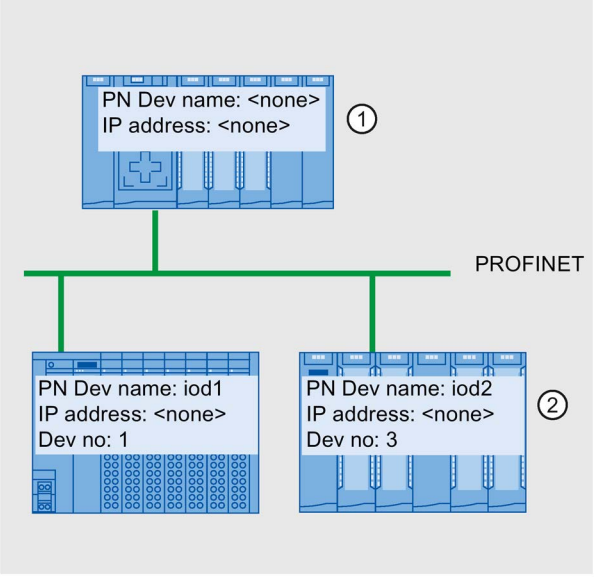
- The device name of the IO controller (CPU) in the standard machine project is set to "PROFINET device name is set directly at the device". The IO controller (CPU) has no PROFINET device name initially.
- The IP protocol of the IO controller (CPU) is set to "IP address is set directly at the device". The CPU has no IP address initially.
- The "Support device replacement without exchangeable medium" option is selected automatically. This option enables automatic commissioning. A commissioning engineer does not have to assign device names to the IO devices locally. The IO controller assigns the device name and IP address to the IO devices based on the preset topology and other settings during startup.
- The device name of the IO devices is set to "Generate PROFINET device name automatically" (from the configured name of the IO device).

- The IP protocol of the IO devices is set to "IP address is set by the IO controller during runtime". The IO devices have no IP address initially. If an IO device is not a typical distributed I/O system (e.g., ET 200 systems), but rather another device such as an HMI device, change the option to "IP address is set directly at the device"; see below.
- The device number for the IO devices is automatically assigned and is used locally for making the IP address unique.

The option "Permit overwriting of PROFINET device name" must be selected (CPU parameters, properties of the PROFINET interface, Ethernet addresses area) so that the IO controller can adapt the device name later at the operator.

This option is disabled by default.

The following figure shows the above-described settings for the IP address and PROFINET device name.



① After the configuration is loaded from the standard machine project, the IO controller has no device name and no IP address.

② Following loading, the IO devices have a device name and a device number but no IP address.

Figure 5-44 Settings for the IP address and the PROFINET device name

How an IO device obtains an IP address locally

Below, you will find an explanation of the "Adapt IP address" and "IP address is set directly at the device" options, which can generally be configured for a multiple use IO system.

If you have set the "Multiple use IO system" option for the IO system, STEP 7 automatically sets the "IP address" option for the IO devices.

In this case, the IO controller assigns the IO device an IP address that results from the locally assigned IP address of the IO controller (see next section). This option is appropriate if the IO device is a field device, e.g., ET 200MP, ET 200SP, ET 200AL, or another distributed I/O system.

If the IO device is not a "standard" field device, e.g., an HMI device for a Windows operating system, the "IP address" option described above does not work. In this case, choose the "IP address is set directly at the device" option. You must then assign the IP address to the device locally and take steps to ensure that this address is suitable for the IP addresses of the other IO devices and the IP address of the IO controller.

5.8.1.3 Adapt multiple use IO systems locally

A few steps are needed to adapt the machine that was loaded with the standard machine project.

Only the device name and IP address of the IO controller must be adapted locally. The device names and IP addresses of the IO devices result from these adaptations. In this example, the effects of local settings are described for two specific machine modules.

The local settings are possible, for example, with the CPU display and commissioning tools such as Primary Setup Tool (PST) or PRONETA. You do not need a programming device with STEP 7 to make these settings, even though it is possible to do so.

Requirement

- The machine was loaded with a standard machine project (see Configuring multiple use IO systems (Page 188)).
- The display is ready for operation and the desired tool for assigning the IP address and device name is available (e.g., PST Tool, STEP 7).
- The ports of the IO controller and IO devices are interconnected according to the configuration.

Procedure

Observe the boundary conditions and instructions for commissioning an S7-1500. For more information on commissioning an S7-1500 CPU, refer to the system manual S7-1500, ET 200MP (http://support.automation.siemens.com/WW/view/en/59191792).

To adapt a standard machine locally, follow these steps:

1. Integrate the machine into the network.
2. Connect the device for assigning the IP address and device name to the CPU, for example a PG/PC with the appropriate software.
3. Assign the desired device name and IP address to the IO controller.
4. Start up the CPU.

The IO controller then assigns the adapted PROFINET device name and a unique IP address to the IO devices.

The following rules apply to the assignment:

- The device names of the IO devices are formed by chaining together the following name components, separated by a period:

  <configured name of the IO device from the standard machine project>.<name of the associated IO controller set on the device>

- The IP addresses of the IO devices result from the locally configured IP address of the associated IO controller and the device number (sum).

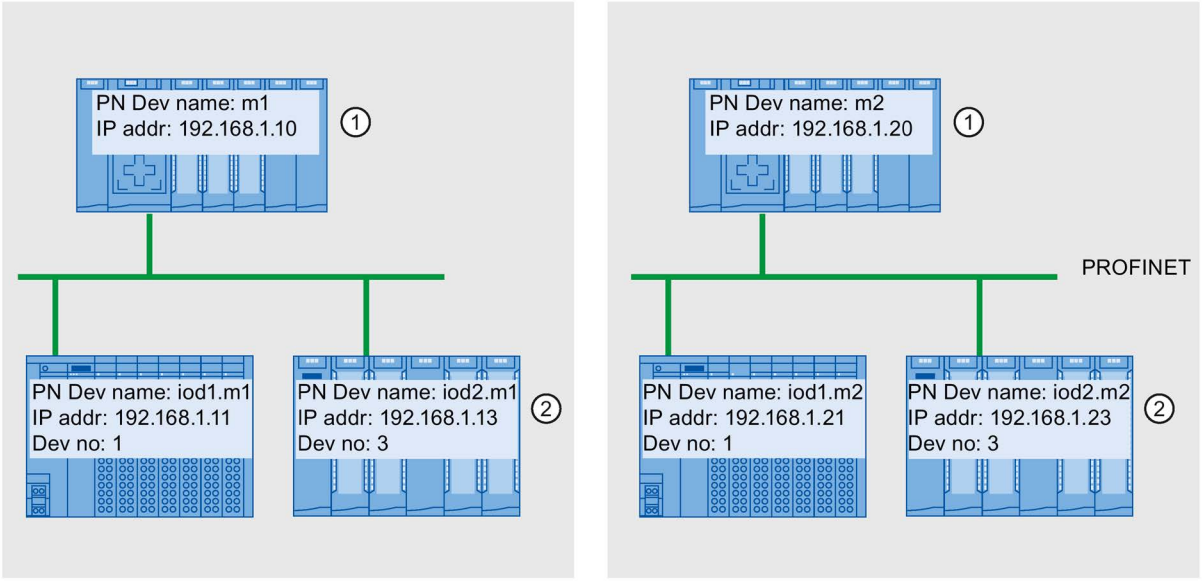
Note

Make sure that duplicate IP addresses cannot be created on the subnet during the assignment. The IO controller does not assign a new IP address in this case.

In the following figure, the device name "m1" and the IP address 192.168.1.10 have been assigned to the IO controller of the first machine.

The device name "m2" and the IP address 192.168.1.20 has been assigned for the second machine.

Refer to the figure for the resulting device names and IP addresses.



① Set device name and IP address on the IO controller

② After startup, the IO devices have an updated device name (<configured device name>.<device name of IO controller>) and an adapted IP address (= <IP address of IO controller> + <device number>)

5.8.2 Configuration control for IO systems

5.8.2.1 Information about configuration control of IO systems

Configuration control of IO systems makes it possible to generate several concrete versions of a standard machine from a standard machine project.

You are given the flexibility to vary the configuration of an IO system for a specific application as long as the real configuration can be derived from the set configuration. The configured configuration therefore represents the superset of all real configurations that can be derived from it.

The following figure shows an example of how two IO systems with a different number of IO devices arise from one standard machine project.

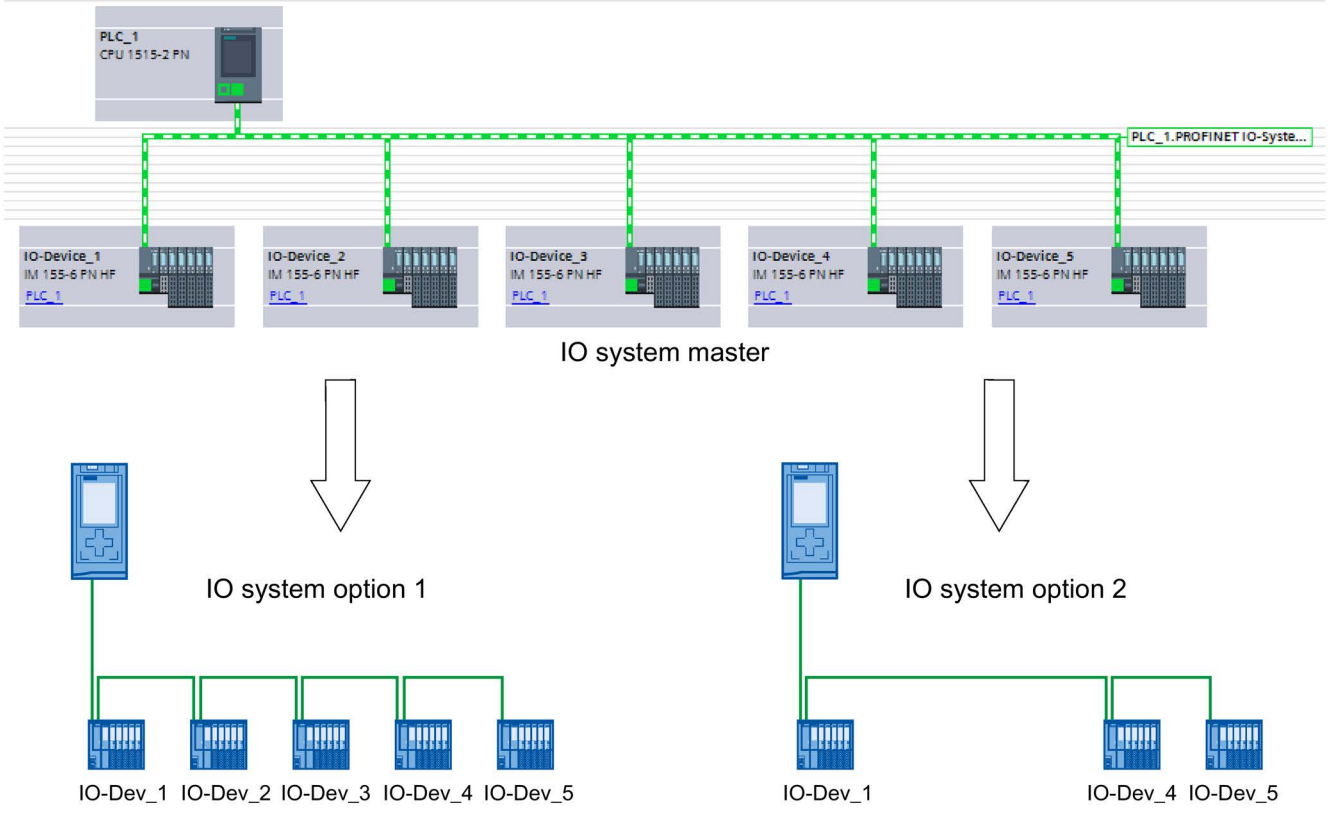

Figure 5-45 Example of configuration control for PROFINET IO systems

In the following sections, you find a description of how to configure and program a PROFINET IO system to commission, for example, a standard machine on-site without using configuration software.

Concept

The principle of configuration control is already known at the device level for the flexible use of submodules/modules ("option handling"). Different configurations can be derived from one engineering project both for central as well as for distributed I/O.

With S7-1500 CPUs as of firmware version V1.7, this principle can also be applied at the IO system level. You have the option of omitting, adding or changing the order of stations (IO devices) of a PROFINET IO system in a specific plant.

Configuration control for devices and configuration control for IO systems can be combined; the functions are independent of each other.

It is possible to operate variants deviating from a maximum configuration of an IO system. In a standard machine project, you can prepare a kit of IO devices which can be flexibly customized for various configurations using configuration control.

The following variations are available:

- Variation of the number of IO devices involved

  You include optional IO devices for the configuration control in the configuration by transferring a suitable data record with the required configuration in the user program.

- Variation of the order of IO devices involved

  You adapt the port interconnection of the IO devices to the topology being used by transferring a suitable data record with the required topology in the user program.

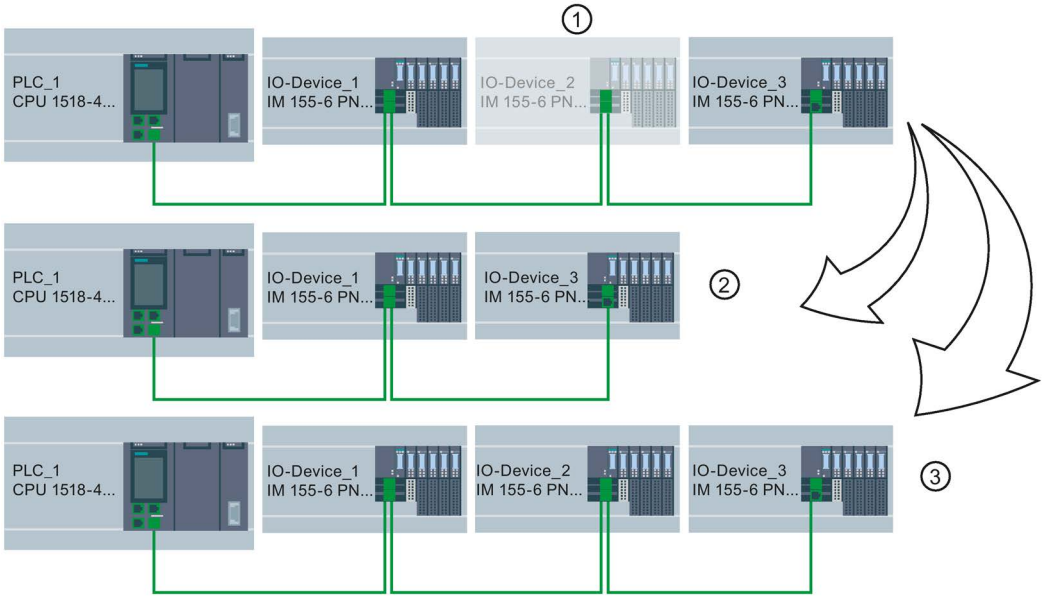
The following figure shows how you serve two different configurations with an IO device marked as optional in the network view of STEP 7.

- Configuration without the optional IO device:

  In this case, you use the instruction "ReconfigIOSystem" to transfer a data record to the PROFINET interface containing the information that no optional IO device is to be included in the configuration.

- Configuration with the optional IO device:

  In this case, you use the instruction "ReconfigIOSystem" to transfer a data record to the PROFINET interface adding the optional IO device to the configuration.



① Determined through parameter assignment: IO Device_2 is optional IO device
② Configuration without the optional IO device
③ Configuration with the optional IO device

Summary: The procedure in principle

The following phases are distinguished when it comes to the implementation of a standard machine concept:

1. Engineering phase: Creating a standard machine project and loading into specific machine or plant:
   - Completely configuring all IO devices (options) ever required in a specific machine or plant
   - Configuring as optional those IO devices that will be omitted in specific machines or plants
   - Configuring the interconnection of ports with respect to various arrangements of IO devices
   - Preparing user program (see Configuring flexible order of IO devices (Page 205)) with the possibility of selecting on-site the actually existing configuration via switch or HMI device
2. Commissioning phase: Preparing specific machine or plant for operation:
   - Integrating machine or plant in the on-site network (see Adapt multiple use IO systems locally (Page 190))
   - Selecting the currently existing configuration of the IO system via configured option

5.8.2.2 Configuring IO devices as optional

Requirement

- S7-1500 CPU firmware version V1.7 or higher as IO controller
- STEP 7 V13 SP1 or higher
- The rules (Page 210) for the establishment and operation of a standard machine project have been considered.

Procedure

To configure an IO device as optional IO device, proceed as follows:

1. Create a project.
2. Configure an S7-1500 CPU firmware version V1.7 or higher as IO controller.
3. Configure the required IO devices and assign the IO devices to the IO controller.
4. Configure the port interconnection between the devices.

Note

A port interconnection between the devices of the IO system is mandatory for IO systems to be customized with the user program. Otherwise, no order would be defined for the interconnected IO devices. The following settings are possible for the partner port:

- Specific partner port of an IO device (selection via the "Partner port" drop-down list in the port properties or interconnection with drag-and-drop in the topology view)
- "Setting partner port by user program" (selection via the "Partner port" drop-down list in the port properties).

5. Select the IO device you want to mark as optional.
6. Select the area "PROFINET interface [X1]" > Advanced options".
7. Enable the "Optional IO device" option.
8. Repeat steps 5 to 7 for all IO devices to be configured as optional.
9. Load the configuration onto the CPU.

Result: Once this configuration is loaded, the system behavior is as follows:

- The CPU is prepared for the configuration control of the IO system.
- All IO devices are disabled.
- Irrespective of whether you customize the configuration with the user program (adding optional IO devices) or make no changes to the loaded configuration: You must call the instruction "ReconfigIOSystem" in the user program and notify the current configuration to the system!

  The system will not be operational without calling the instruction "ReconfigIOSystem".

  For further information on the proceeding see Enabling optional IO devices in the program (Page 198).

Fast parameter assignment in the "IO communication" table

You can also specify whether or not an IO device is optional in the "IO communication" tab.

In an additional "Optional IO device" column, a selectable check box is available for each IO device that indicates whether or not an IO device is optional. Here, you can adjust the setting centrally.

5.8.2.3 Enabling optional IO devices in the program

Requirement

- CPU S7-1500 firmware version V1.7 or higher as IO controller.
- STEP 7 V13 SP1
- At least one IO device was configured as optional IO device.
- The rules (Page 210) for the establishment and operation of a standard machine project have been considered.

Procedure

Please note the information on and rules for commissioning an S7-1500 system in the documentation for SIMATIC S7-1500!

The following description of the proceeding only includes steps required to understand the program-controlled activation of an optional IO device.

To activate or deactivate IO devices, follow these steps:

1. Create a data record "CTRLREC" for the instruction "ReconfigIOSystem". You can find information on the structure of the data record in the STEP 7 online help.
2. Call the instruction "ReconfigIOSystem" and select MODE 1 to deactivate all IO devices.

   If you set the CPU to STOP or POWER OFF state in order to modify the plant in this status (for example to add an optional IO device), explicit deactivation using "ReconfigIOSystem" with mode 1 is not necessary. In this case, i.e. following a STOP-RUN transition and following a POWER-OFF > POWER-ON transition, all IO devices are deactivated automatically.
3. When you have brought the plant to a safe status that allows restructuring without any danger:

   Put the plant together according to your intended application. Add the required optional IO devices at the points at which you planned this in the configuration (observe the order!) or remove optional IO devices that you no longer require.
4. Network the IO devices.
5. Startup the S7-1500 system and call again the instruction "ReconfigIOSystem". Select MODE 2 to transfer the data record CTRLREC.
6. Following successful transfer of the data record, call again the instruction "ReconfigIOSystem". Select MODE 3 to activate all IO devices forming part of the current configuration.

   Result: The CPU **activates** the following IO devices:

   – All IO devices that you have not set as optional IO devices.

   – All optional IO devices listed in the control data record (CTRLREC).

   The following IO devices remain **disabled**:

   – Docking units (IO devices changing during operation).

   – Optional IO devices that are not listed in the control data record.

Note

Call the instruction "ReconfigIOSystem" for all values of the parameter MODE with the same control data record (CTRLREC)!

If you use different data records for the values of the MODE parameter, this results in an inconsistent customization of the configuration and thus to rather incomprehensible error messages.

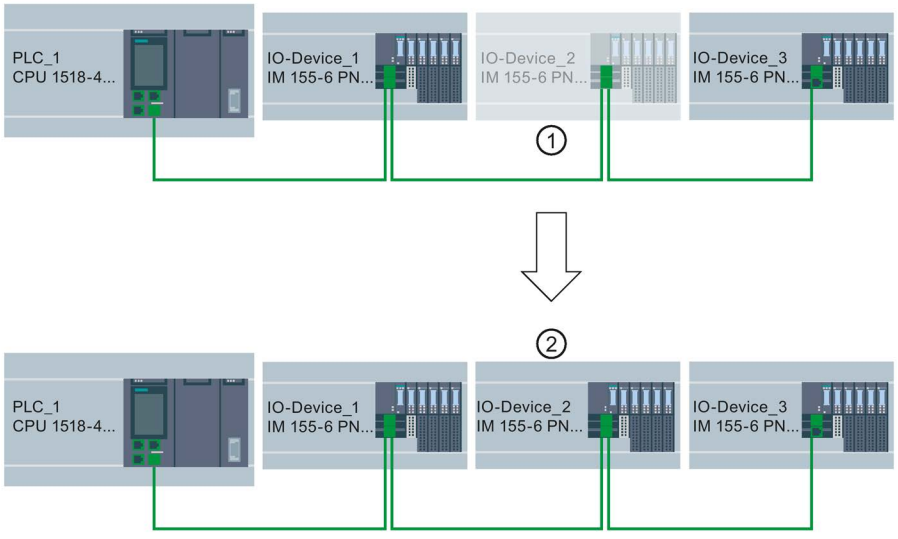
Example: Data record structure for the activation of an IO device

The IO device "IO-Device_2" is to be activated as the only IO device in the user program.

To do this, you only require the hardware identifier of "IO-Device_2".

Recommendation: Use the system constants of the hardware identifiers instead of the absolute values as shown in this example. With this procedure, the content of the DB is not influenced by changes to the hardware identifiers as the result of changes to the configuration.

The data record is to be stored in a data block and to be transmitted to the PROFINET interface of the IO controller in the user program using the instruction "ReconfigIOSystem".



① IO device_2 is configured as optional IO device.

② Once the data record is transmitted and the configuration is activated using the instruction "ReconfigIOSystem" IO device_2 is included in the configuration and participates in the data exchange with the IO controller.

Creating data block

In this example, the control data record is created in a data block. The data block is structured as follows:

Line 2: Array definition: Array of type Word with 4 elements. Array of Word is permitted as the data type.

Line 3: Version of the data record (currently: V1.0).

Line 4: Number of optional IO devices to be activated (here: 1).

Line 5: List of the hardware identifiers of the IO devices, inserted here as a system constant.

Line 6: Number of port interconnections that are set in the user program (here: 0).

Line 7: Additional data records (optional)

myCTRLREC

	Name	Data type	Start value	Comment
1	Static			
2	ArrMachineConfig0	Array[0..3] of Word		Array for one optional IO device
3	ArrMachineConfig0[0]	Word	16#0100	
4	ArrMachineConfig0[1]	Word	16#0001	
5	ArrMachineConfig0[2]	Word	"IO-Device_2~IODevice"	
6	ArrMachineConfig0[3]	Word	16#0000	
7	ArrMachineConfig1	Array[0..8] of Word		

Parameter MODE of instruction "ReconfigIOSystem"

You control how the "ReconfigIOSystem" instruction works with the MODE parameter.

The following values are possible for the MODE input parameter:

MODE	Description
1	All IO devices of the IO system can be disabled by calling the instruction with MODE 1. The "ReconfigIOSystem" instruction uses the "D_ACT_DP" instruction internally. "ReconfigIO-System" returns errors that are detected by D_ACT_DP in the following output parameters: • STATUS (error code) • ERR_INFO (hardware identifier of the IO device causing the error). In STATUS and ERR_INFO, the CPU enters the last determined error/HW identifier and in so doing overwrites an existing error code. For this reason, additional errors can be present besides the entered error.
2	For controlling the actual configuration of the IO system, the instruction transfers the data record to the PROFINET interface, which is addressed with LADDR block parameter (HW identifier of the PROFINET interface).
3	All non-optional IO devices in the IO system and optional IO devices that are listed in the control data record CTRLREC are enabled. The optional IO devices that are **not** listed in the CTRLREC data record remain disabled. If IO devices that are part of docking units (alternating IO devices in operation) are listed in the CTRLREC control data record, the PN IO system reacts as follows: • IO devices of the docking units remain disabled when ReconfigIOSystem is called with MODE 3. This reaction corresponds to the reaction of a configuration without configuration-controlled IO devices. IO devices of docking units are disabled by default and must be enabled in the user program. For more information on docking units, refer to the section Docking systems (Page 214).

Rules for the call sequence of "ReconfigIOSystem"

- Always supply the instruction "ReconfigIOSystem" with the same control data record (CTRLREC input parameter)!
- Call sequence following POWER OFF -> POWER ON transition:
  - ReconfigIOSystem call with MODE 1 (optional).
  - ReconfigIOSystem call with MODE 2 (mandatory, even without previous reconfiguration!).
  - ReconfigIOSystem call with MODE 3 (mandatory).
- Call sequence following STOP > RUN transition:
  - ReconfigIOSystem call with MODE 1 (optional).
  - ReconfigIOSystem call with MODE 2 (mandatory, even when configuration was modified in STOP state). Otherwise not required).
  - ReconfigIOSystem call with MODE 3 (mandatory).
- Call sequence for reconfiguration in RUN state:
  - ReconfigIOSystem call with MODE 1 (mandatory).
  - ReconfigIOSystem call with MODE 2 (mandatory).
  - ReconfigIOSystem call with MODE 3 (mandatory).

Explanations and recommendations concerning the rules

- If you do not list an IO device to be configured as optional IO device in the control data record or data block resp. this IO device does not form part of the configuration and does not take part in data exchange with the CPU.
- If you do not activate any optional IO device at all and work with the loaded configuration without reconfiguration, you still have to follow the proceeding described in the above section and transmit the control data record to the CPU.

  The control data record has the simple structure with the following tags:
  - Version (High Byte =1, Low Byte = 0)
  - Number of optional devices to be activated = 0
  - Number of port interconnections that are set in the user program = 0
- Following a STOP > RUN transition and following a POWER-OFF > POWER-ON transition, all IO devices are deactivated automatically. For this reason, no ReconfigIOSystem call with MODE 1 is required for configuration control to function properly.

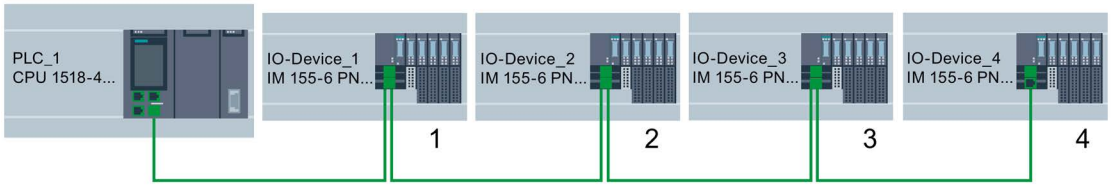
  If you use your project as a universally valid sample for programming the configuration control, we still recommend to perform the ReconfigIOSystem call with MODE 1 prior to any reconfiguration. This way, the sample can also be used for reconfigurations in RUN mode.

- Commissioning extensive I/O systems (more than 8 optional IO devices) while using IRT at the same time:

  To keep the startup times short when activating the optional IO devices (ReconfigIOSystem, mode 3), note the following tip: Check the device numbers of the IO devices. The device numbers should follow the topological interconnection starting at the IO controller in ascending order. The further an IO device is from the IO controller topologically, in other words the more IO devices there are between the IO controller and the IO device in question, the higher the device number should be.

  You set the device numbers in the "Ethernet addresses - PROFINET" area in the Inspector window with the PROFINET interface selected.

  Example of the assignment of device numbers with a linear topology:



- The CPU processes the instruction "ReconfigIOSystem" to transfer the control data record asynchronously.

  For this reason, you must call "ReconfigIOSystem" in a loop repeatedly when calling the instruction in the startup program until the output parameter "BUSY" or "DONE" indicate that the data record has been transferred.

  Tip: To program the loop, use the SCL programming language with the instruction REPEAT ... UNTIL.

```
REPEAT

    "ReconfigIOSystem"(REQ := "start_config_ctrl",

                MODE := 1,

                LADDR := 64,

                CTRLREC := "myCTRLREC".ArrMachineConfig0,

                DONE => "conf_DONE",

                BUSY => "conf_BUSY",

                ERROR => "conf_ERROR",

                STATUS => "conf_STATUS");

UNTIL NOT "conf_BUSY"

END_REPEAT;
```

Additional information

For information on the basic structure of the data record and on using the instruction "ReconfigIOSystem" see the STEP 7 online help.

Configuring IO devices as optional (Page 197)

5.8.2.4 Configuring flexible order of IO devices

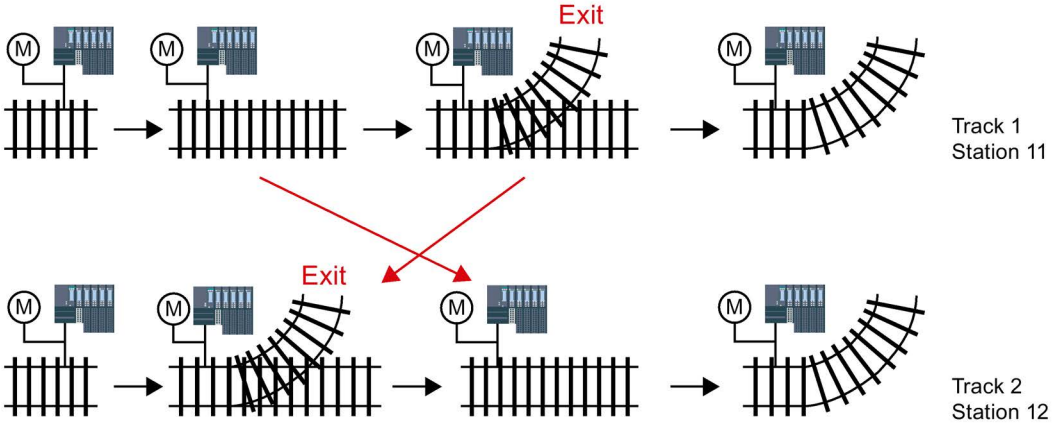
The following section shows how you can create the conditions required to change the order of IO devices in a PROFINET IO system.

This function is also supported with optional IO devices. For simplicity, a maximum configuration without optional IO devices is shown below.

Concept

A typical application for a standard machine project consists of composing an entire plant from a set of various plant units which only differ with respect to the different arrangement of the units, e.g. in the case of transport systems. Each plant unit consists of a functional unit of mechanics (rails or conveyor belts) and electrics (power supply, IO device with IO modules, sensors, actuators, motors, PROFINET port for data exchange with central control ...).

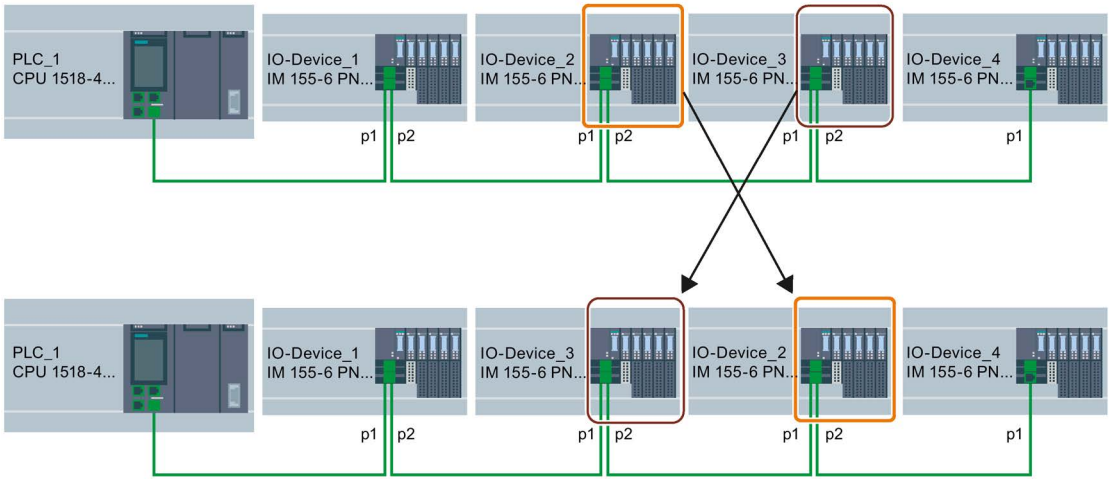
The following figure shows how, simply by exchanging two rail segments, a new transport system is created that is adapted with an upstream points to the local conditions.



From the automation viewpoint, no change in the project is required for the flexible adjustment of the PROFINET configuration.

The order of the IO devices is determined by the port interconnection. For each IO device, you define in the port properties the partner port and thus the neighboring device connected at the respective local port. If the partner port is to be defined by the user program, the option "Partner set by user program" is to be selected as partner port.

The figure below shows the initial configuration of the transport system shown above, which is to permit the order of the connected IO devices to be changed via the user program. In the example, the order of IO-Device_2 and IO-Device_3 is to be controlled via the user program.



To determine how the partner port settings are to be selected, you must note for each device and each port of a device which partner can be interconnected.

- If the partner is always the same in the different configurations provided, you select the partner port for this partner.
- If the partners vary in the different configurations, you select "Setting partner by user program".

For the example in the figure above, the following port settings result:

Device	Local port	Partner port setting	Explanation
PLC_1	p1	p1 (IO device_1)	Partner of PLC_1 at port 1 is IO device_1 (always)
IO device_1	p1	p1 (PLC_1)	Partner of IO device_1 at port 1 is PLC_1 (always)
IO device_1	p2	Partner is set by user program	Partner of IO device_1 at port 2 is either IO device_2 or IO device_3 => Setting partner by user program
IO device_2	p1	Partner is set by user program	Partner of IO device_2 at port 1 is either IO device_1 or IO device_3 => Setting partner by user program
IO device_2	p2	Partner is set by user program	Partner of IO device_2 at port 2 is either IO device_3 or IO device_4 => Setting partner by user program
IO device_3	p1	Partner is set by user program	Partner of IO device_3 at port 1 is either IO device_2 or IO device_1 => Setting partner by user program
IO device_3	p2	Partner is set by user program	Partner of IO device_3 at port 2 is either IO device_4 or IO device_2 => Setting partner by user program
IO device_4	p1	Partner is set by user program	Partner of IO device_4 at port 1 is either IO device_3 or IO device_2 => Setting partner by user program
IO device_4	p2	Any partner	No partner planned at port 2

Requirement

- S7-1500 CPU firmware version V1.7 or higher as IO controller.
- STEP 7 V13 SP1 or higher
- The rules (Page 210) for the establishment and operation of a standard machine project have been considered.

Procedure

To set the partner port for a program controlled interconnection, proceed as follows:

1. Select the PROFINET interface of the device (IO controller or IO device) whose port you want to set.
2. In the properties of the PROFINET interface, select the area "Port interconnection" (Extended options > Port [...] > Port interconnection).
3. From the drop-down list, select "Setting partner by user program" as partner port.
4. Repeat steps 1 to 3 for each port to be interconnected via the user program.

See also

Customizing arrangement of IO devices in the program (Page 207)

5.8.2.5 Customizing arrangement of IO devices in the program

Requirement

- CPU S7-1500 firmware version V1.7 or higher as IO controller.
- STEP 7 V13 SP1
- At least one partner port was configured as "Partner set by user program".
- The rules (Page 210) for the establishment and operation of a standard machine project have been considered.

Procedure

The proceedings corresponds to the proceeding for activating optional IO devices.

Only the structure of the data record must be extended for the program-controlled assignment of the ports. The extension is described in the following sections.

Example: Data record structure for the assignment of partner ports

For the data record structure, you need the HW identifications of the ports.

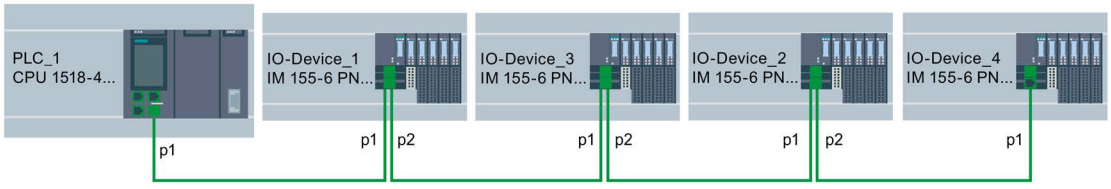
The data record is to be stored in a data block and to be transmitted to the PROFINET interface of the IO controller in the user program using the instruction "ReconfigIOSystem".

As the input parameter RECORD of the instruction "ReconfigIOSystem" is of the VARIANT data type, you first have to create a data type for the data block.

In the following sections, you find a description of the structure of the PLC data type as well as of the structure of the data block based on this type.

Selecting derived configuration

For the following selected configuration it is shown below what the data record must look like so that the IO devices are interconnected in the planned order by the user program.



This example is based on the flexible configuration from the previous section (Page 205) with the settings for the respective partner ports described there.

The partner ports in the specific derived configuration have been defined so that it is possible to name the HW identifications of the ports involved.

The following table only contains those devices whose ports can be defined by the user program. Only these devices are relevant for the data record structure.

Device	Local port	Partner port setting	Partner port of the selected configuration
IO device_1	p2 = Port 2 HW identifier: 251	Partner is set by user program	Port 1 of IO device_3 HW identifier: 261
IO device_2	p1 = Port 1 HW identifier: 281	Partner is set by user program	Port 2 of IO device_3 HW identifier: 291
IO device_2	p2 = Port 2 HW identifier: 311	Partner is set by user program	Port 1 of IO device_4 HW identifier: 321

Creating data block

For the derived configuration, the structure of the data block "DB-IO-SYSTEM-Port-Interconnections" is explained as an example.

This data block is used when calling the instruction "ReconfigIOSystem" at input parameter "CTRLREC".

Instead of the absolute values for the hardware identifiers of the ports, the system constants of the hardware identifiers are used here.

The data block is structured as follows:

Line 2: Declaration of an Array of Word (only this data type is possible).

Line 3: Version of the control data record: V1.0.

Line 4: Number of optional IO devices: 0.

Line 5: Number of specified port interconnections: 3.

Line 6: Port interconnection 1, local port.

Line 7: Port interconnection 1, partner port.

Line 8: Port interconnection 2, local port.

Line 9: Port interconnection 2, partner port

Line 10: Port interconnection 3, local port.

Line 11: Port interconnection 3, partner port.

IO-SYSTEM-Port-Interconnections

	Name	Datentyp	Startwert	Kommentar
1	Static			
2	ArrMachineConfig	Array[0..8] of Word		data record for port interconn settings
3	ArrMachineConfig[0]	Word	16#0100	
4	ArrMachineConfig[1]	Word	16#0000	
5	ArrMachineConfig[2]	Word	16#0003	
6	ArrMachineConfig[3]	Word	"IO_device_1~PROFINET_interface~Port_2"	
7	ArrMachineConfig[4]	Word	"IO_device_3~PROFINET_interface~Port_1"	
8	ArrMachineConfig[5]	Word	"IO_device_2~PROFINET_interface~Port_1"	
9	ArrMachineConfig[6]	Word	"IO_device_3~PROFINET_interface~Port_2"	
10	ArrMachineConfig[7]	Word	"IO_device_2~PROFINET_interface~Port_2"	
11	ArrMachineConfig[8]	Word	"IO_device_4~PROFINET_interface~Port_1"	

Interconnection not listed in data block

If the partner port was configured as "Setting partner by user program" in the port properties and this port is not listed in the data record or data block resp., then the CPU sets this port to the setting "any partner". If no data record is transmitted at all, the CPU sets this "any partner" setting for all program-controlled assignments.

Additional information

For information on the basic structure of the data record and on using the instruction "ReconfigIOSystem" see the STEP 7 online help.

5.8.2.6 System behavior and rules

Below, you find a description of how an IO system whose configuration is controlled by the user program behaves in operation.

In addition, rules and restrictions are listed here which must be considered when configuring the maximum structure of the configuration in a standard machine project.

System behavior

- System diagnostics:

  If an optional IO device is deactivated, the IO device is displayed as "deactivated" from the system diagnostics viewpoint (online view or Online & Diagnostics).

- Topology view:

  Offline view: As configured. No interconnection is shown for ports with partner ports configured as "Setting partner by user program".

  Online view: Ports and interconnections with deactivated IO devices are shown in a different shade of green as error-free ports and interconnections of activated IO devices.

- Representation in the Web server:

  The names of devices are shown as configured (Properties > General > Project information).

  The assigned PROFINET device name for the CPU is shown on the "Communication" website, at the "Parameter" tab.

  IP address parameters: Currently assigned IP address parameters are shown on the site "Module state".

  Topology: The current topology resulting from any customizations via user program is shown in the Web server. IO devices configured as optional are shown as "deactivated" IO devices in the Web server.

Rules

The rules for standard machine projects as described here (Page 184) apply.

For configuration-controlled IO systems, the following additional rules apply:

- When configuring MRP (Media Redundancy Protocol):

  The ports configured as ring ports must not be interlinked via user program.

  However, devices with ring ports (devices of an MRP domain) can be optional IO devices.

- When configuring docking stations (= IO devices changing during operation):

  Neither the docking station nor the first IO device of a docking unit may be optional IO devices.

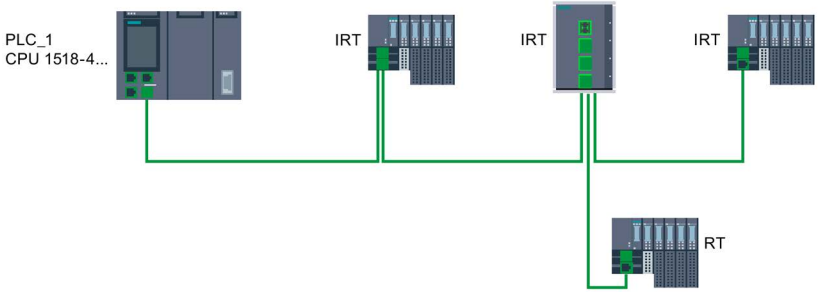
  The ports of the docking units must not be interlinked via user program.

- When configuring IRT:

  The order of synchronized IO devices ("IRT devices") must be defined by the configuration and must not be changed in the different variants of a standard machine. For this reason, the ports of the IRT devices must not be interlinked via user program.

  However, you have the possibility to configure IRT devices primarily as optional IO devices.

  You also have the option to interconnect, by user program, RT devices that are, for example, separated from this line by a switchport (see figure).



5.9 Saving energy with PROFIenergy

Saving energy with PROFIenergy

PROFIenergy is a PROFINET-based data interface for switching off consumers centrally and with full coordination during pause times regardless of the manufacturer or device type. Through this, the process should only be provided with the energy that is absolutely required. The majority of the energy is saved by the process; the PROFINET device itself only contributes a few watts of savings potential.

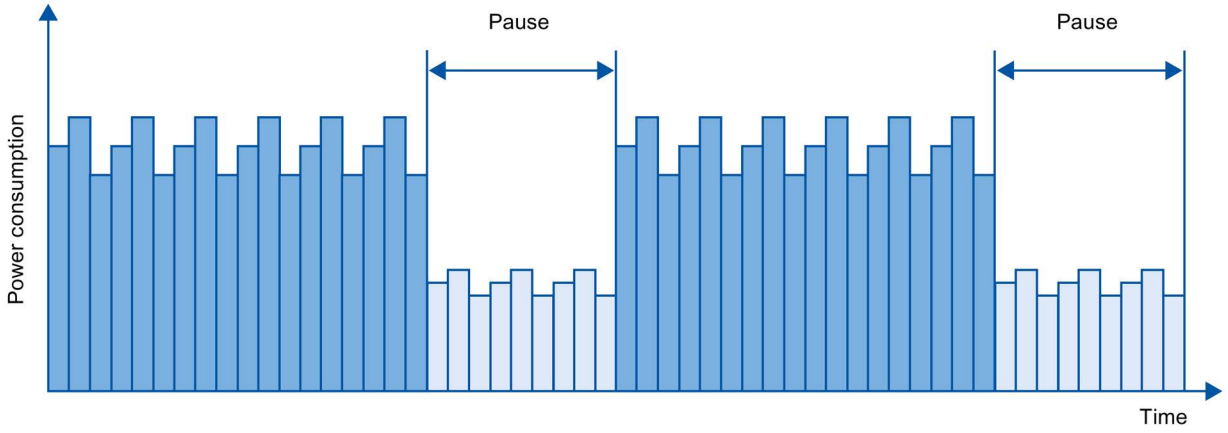


Figure 5-46 Energy savings during pauses with PROFIenergy

Basic information

Turning off the PROFINET devices or the power modules occurs through special commands in the user program of the PROFINET IO controller. No additional hardware is needed; the PROFIenergy commands are directly interpreted by the PROFINET devices.

Principle of operation

At the beginning and end of pauses, the system manager enables or disables the pause function of the system; then the IO controller sends the PROFIenergy command "Start_Pause"/"End_Pause" to the PROFINET devices. The device interprets the contents of the PROFIenergy command and switches off or back on.

Through other PROFIenergy functions, device information can be accessed during pauses. The user can use this information in order to optimally time the transfer of the "Start_Pause"/"End_Pause" command.

PROFIenergy instructions for IO controllers

Two instructions are needed for controlling and monitoring the PROFIenergy functions.

The instruction PE_START_END allows you to easily activate and deactivate the idle state of PROFINET devices. This occurs by means of an incoming edge or outgoing edge. The instruction PE_START_END provides a simple interface for implementing the PROFIenergy commands Start_Pause and End_Pause.

The instruction PE_CMD allows you to transmit all PROFIenergy commands, including Start_Pause and End_Pause. The other commands can be used, for example, to query the current status of the PROFINET device or the behavior during the pauses. The instruction PE_CMD is a convenient means for handling all PROFIenergy functions.

PROFIenergy instruction for I-devices

The instruction PE_I_DEV allows you to also implement PROFIenergy on I-devices. The instruction receives PROFIenergy commands on the I-device and forwards these to the user program for processing. After processing the command, the user program calls the PE_I_DEV instruction again in order to send the acknowledgment to the IO controller. For these replies, each command offers you a helper instruction that supplies the reply data to the instruction.

The instructions can be found in the "Instructions" task card of the STEP 7 program editor.

An application example can be found on the Internet (http://support.automation.siemens.com/WW/view/en/41986454) in the Service and Support portal.

Configuration and programming

The functions can be comfortably integrated into existing systems. No configuration is required for the use of PROFIenergy. However, amendments to the user program are required:

- Before the "Start_Pause" command, you must ensure that your system is brought into a condition that is suitable for a pause.
- A sequential control system for the beginning of the pause of the devices and for the punctual restarting of the device on break must be programmed (depending on the required startup times that the respective PROFINET device demands).
- The error messages of the PE_CMD instruction must be evaluated, and the required reaction must be programmed (for example, cancellation or continuation of further commands on lower-level PROFINET devices).

Note

In the case of the ET 200S distributed I/O system, you have to configure the application of PROFIenergy in STEP 7. You configure PROFIenergy by selecting the "Use energy saving for this potential group" check box in the PM-E DC24V/8A RO power module.

For I-devices, you have to configure the application of PROFIenergy in STEP 7. You will find more information in the section Configuring PROFIenergy with I-devices (Page 117).

5.10 Docking systems

Using alternating IO devices ("alternating partners") during operation in a docking station

The following figure shows an automation cell with a docking station and several docking units.

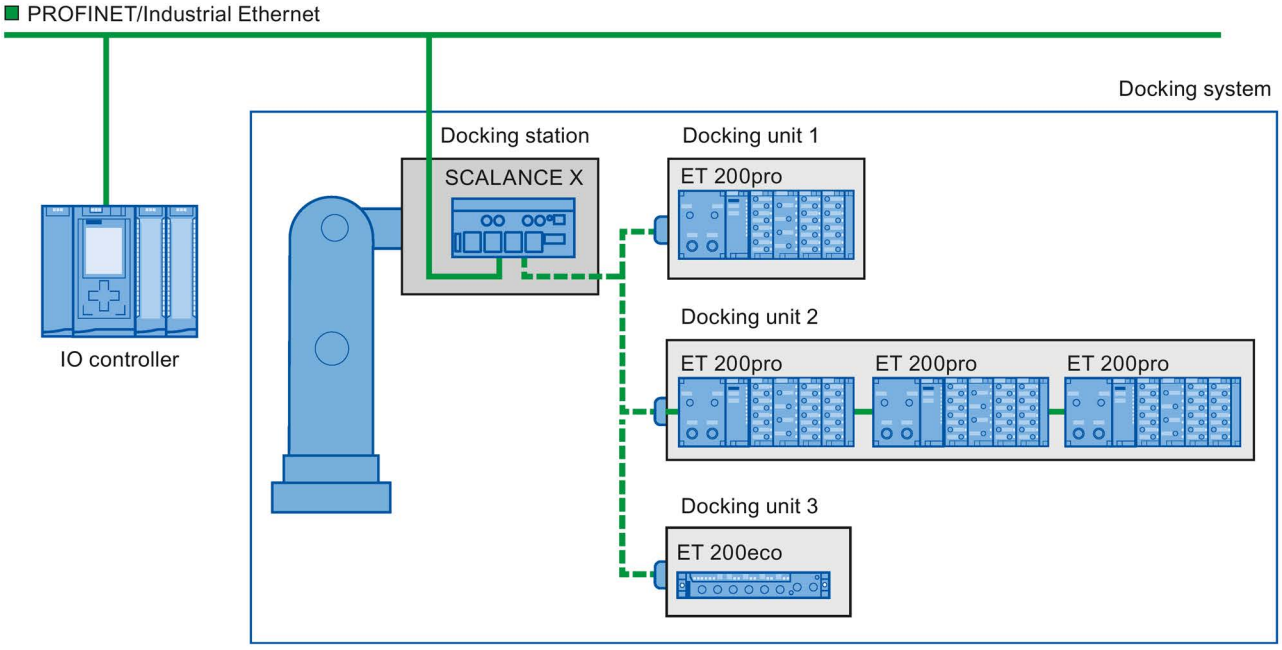

Figure 5-47 Alternating IO devices (partner ports) in a docking system

Area of application for alternating IO devices during operation

You can use the PROFINET function "Alternating IO devices during operation" ("alternating partners"), for the tool changeover for robots, for example. Typical tools include:

- Welding guns
- Positioning tools for manufacturing parts

Requirements for interconnecting alternating partner ports during operation

You can interconnect IO devices with alternating partner ports during operation in the following situations:

- The alternating IO device (docking unit) has no IRT communication configured.
- The PROFINET interface is connected to the Ethernet subnet.
- The PROFINET devices support topology configuration.
- The IO controller, the alternating IO devices (docking unit) and the switch (docking station) on which the alternating IO devices are to be operated support this feature.

Note

Unique IP address

Each docking unit of a docking system must be configured with a unique IP address in a shared project and operated on the same IO controller as all other docking units of the system.

Applicative conditions

The following points should be observed when implementing a docking system with alternating IO devices during operation:

- The IO devices of all docking units must be deactivated by default in the configuration.
- At any time, only one docking unit can be active, i.e., only the IO devices of one docking unit can be activated. All IO devices of other docking units must be deactivated or become deactivated before the IO devices of a docking unit can be activated. You activate an IO device with the "D_ACT_DP" instruction.
- A physical connection to this docking unit and its IO devices must be created in order to activate a docking unit. The IO devices are then switched on (power on). At the same time, all the IO devices of this docking unit must be activated in the user program with the "D_ACT_DP" instruction.

Note

Automatic deactivation in "Startup" mode of the CPU

If the CPU is in "Startup" mode, IO devices of a docking system that alternate during operation are deactivated automatically.

- After the feedback "IO device activated", you can access the IO device by means of direct I/O access.
- Call the "D_ACT_DP" instruction to activate and deactivate the IO device as close as possible to the start of the OB 1 cycle.

Note

Number of alternating IO devices during operation ("alternating partner port") - number of docking units

If you wish to achieve the shortest possible tool changeover times, you must observe the following points that are dependent on the CPU or the CP that is being used:

- Only those IO devices that have been configured with the PROFINET function "Prioritized startup" can start up in an optimized fashion. The number of IO devices with configuration for this PROFINET function is restricted.
- Only a limited number of IO devices can be activated at the same time. This number depends on the available "D_ACT_DP" resources. A docking unit should not contain more than the corresponding number of IO devices. If more IO devices are operated in a docking unit, the IO devices must be activated one after the other, which takes correspondingly longer.

Example: An S7-CPU 1516-3 PN/DP can operate a maximum of 32 IO devices with prioritized startup and can simultaneously activate 8 IO devices by means of "D_ACT_DP".

Therefore, for a scheduled optimum use, a docking unit should include no more than 8 IO devices and no more than 32 IO devices should be used in all the alternating docking units.

5.10.1 Configuring docking systems

Configuring docking systems

The possible connections to the individual IO devices must be configured in STEP 7.

Procedure in STEP 7

1. Configure your system as usual, but do not yet configure the topological interconnections of the individual PROFINET devices.
2. Navigate to the "Topology view" tab.
3. Select the port which you want to operate with alternating partners during operation.
4. Navigate to the "Properties" tab of the inspector window and select "Port interconnection" in the area navigation.
5. Under "Partner port", select the "Alternative partners" option.
6. Select the desired partner ports: To do this, click "<Add alternative partners... and choose a partner port. Repeat this process until all required partner ports are connected.

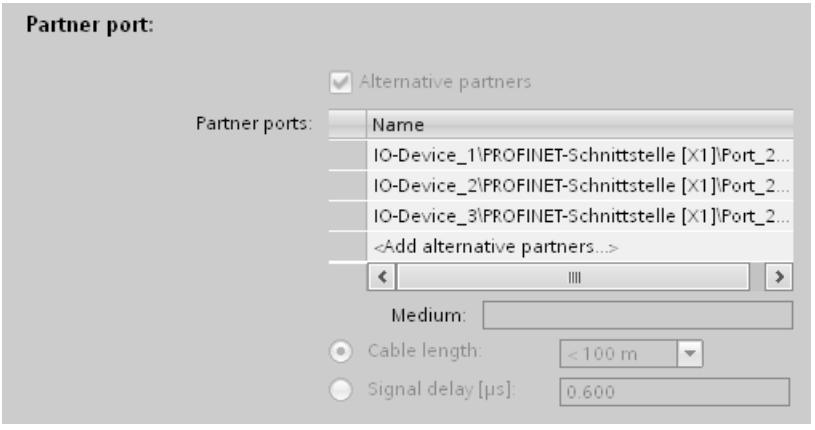

Figure 5-48 Configuring docking systems in STEP 7

Tip: You can also use drag-and-drop operation to connect alternative partner ports in the topology view.

Result

You have interconnected the respective port with one or more alternating IO devices. The connections with the individual alternating partner ports during operation are shown in the topology view by a green, dashed line.

Multiple IO devices as a docking unit ("Alternating partner port")

A docking unit may also consist of several IO devices connected in series. If you use IO devices connected in series as a docking unit, ensure that the topology of the IO devices is configured. A docking unit consisting of two IO devices connected in series (Tool_3_1 and Tool_3_2) is shown at the bottom right in the figure below.

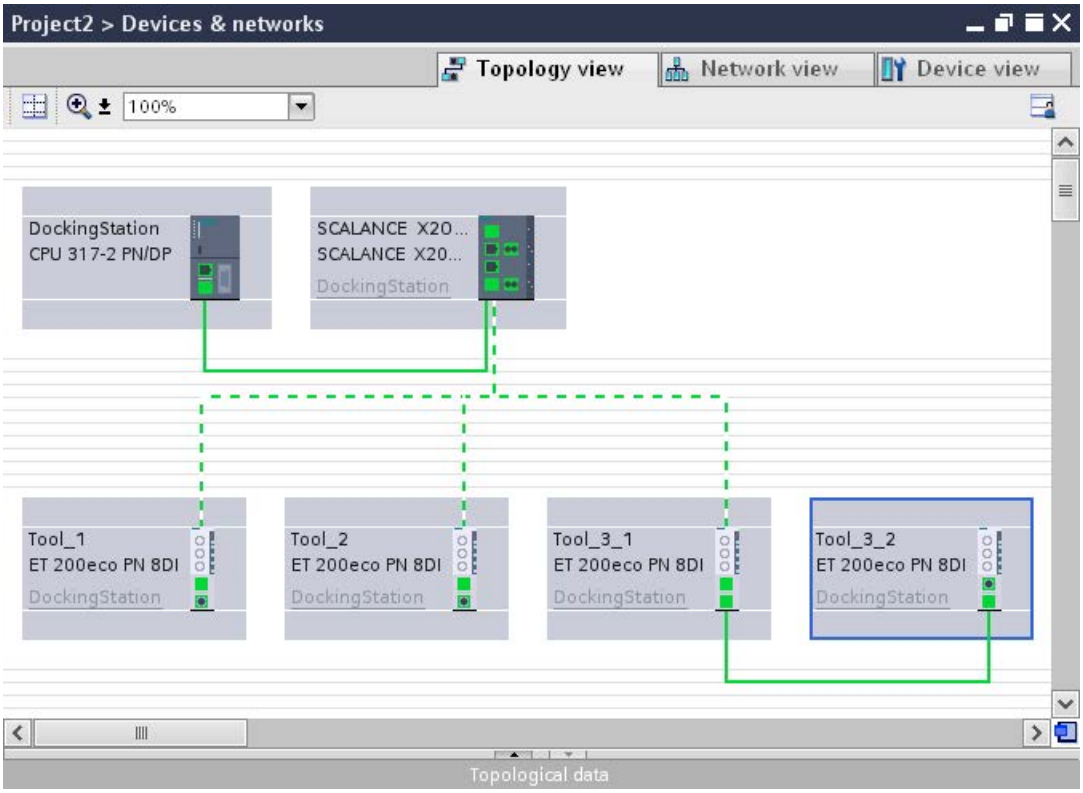

Figure 5-49 Docking system in the topology view of STEP 7

Restriction in the interconnection

The interconnection with a partner port is not possible in the following cases:

- The partner port does not have a suitable type of cable. In this case, a media convertor from the catalog must be inserted.
- The partner port is blocked (deactivated).
- The two ports that are to be interconnected belong to the same interface (it is only possible to interconnect the ports from different interfaces in a station).
- The two ports that are to be interconnected belong to different Ethernet subnets.

Deleting interconnections

Select the port of the alternating partner and remove the interconnection with the "Remove" button.

5.11 Accelerating startup

5.11.1 Options for accelerating the startup of IO devices

The time needed for the startup of IO devices depends on various factors and can be reduced in different ways. You can achieve a significant reduction in the startup time using the "Prioritized startup" function.

Dependencies

The length of the startup time for an IO device (distributed I/O) with the "Prioritized startup" PROFINET function depends on the following factors:

- IO devices (distributed I/O)
- IO structure of the IO device (distributed I/O)
- Modules of the IO device (distributed I/O)
- IO controller
- Switch
- Port setting
- Cabling
- Configured RT class of the IO device

Note

Startup time and RT class of the IO device

An IO device with IRT communication requires longer than an IO device with RT communication for the accelerated startup.

The longer startup for IRT is due to the necessity of synchronizing the IO device before the communication can be set up.

Note

IWLAN and prioritized startup

PROFINET devices which are connected via access points to PROFINET IO do not support the "Prioritized startup" PROFINET function.

Further acceleration

To achieve the shortest possible startup time, you need to implement the following measures:

- Correct port settings on the IO device
- Optimizing the cabling of the ports
- Measures in the user program (for docking systems only)

These steps will accelerate the startup of IO devices even without the "Prioritized startup" PROFINET function. However, you can only achieve the fastest startup times of about 500 ms by combining all the measures with "Prioritized startup".

Note

Startup time up to 8 s

In the following situation, despite prioritized startup, a startup time of up to 8 s may occur:

On a docking point, multiple physical IO devices dock as an IO device with identical device names and identical IP configurations (for example, docking point for automatic transport system).

5.11.2 Prioritized startup

Definition

Prioritized startup refers to the PROFINET function for accelerating the startup of IO devices in a PROFINET IO system with RT communication. It shortens the time that the respective configured IO devices require in order to reach the cyclic user data exchange in the following cases:

- After the power supply has returned
- After a station has returned
- After activation of IO devices

⚠ WARNING

Data exchange despite multiple use IP addresses/device names in PROFINET IO system

To achieve higher ramp-up times, the IO controller checks the uniqueness of device name of IP address parallel to the device ramp-up. In the case of incorrect or double assignment of device name or IP address, a short-time data exchange is possible until the IO controller reacts to the error. In this time the IO controller can exchange IO data with the false device.

During commissioning, ensure that no IP addresses / device names are assigned multiple times in the PROFINET IO system.

Advantages

The PROFINET functionality "prioritized startup" enables PROFINET IO applications in which machine parts or tools and their IO devices have been permanently replaced. Waiting times of several seconds between the scheduled processes of the restart are reduced to a minimum by this optimization. This accelerates the production process with alternating IO devices (PROFINET functionality "docking systems"), e.g. in tool changer applications, and enables a greater throughput in production.

The PROFINET functionality "prioritized startup" also offers a considerable increase in performance for applications where a quick startup time of the IO devices after "power on" or after station failure / station return is required, or when activating IO devices.

Area of application

You can use prioritized startup, for example, for changing tools for robots in the automotive industry. Typical tools are, for example:

- Welding guns
- Positioning tools for the manufacture of car body parts

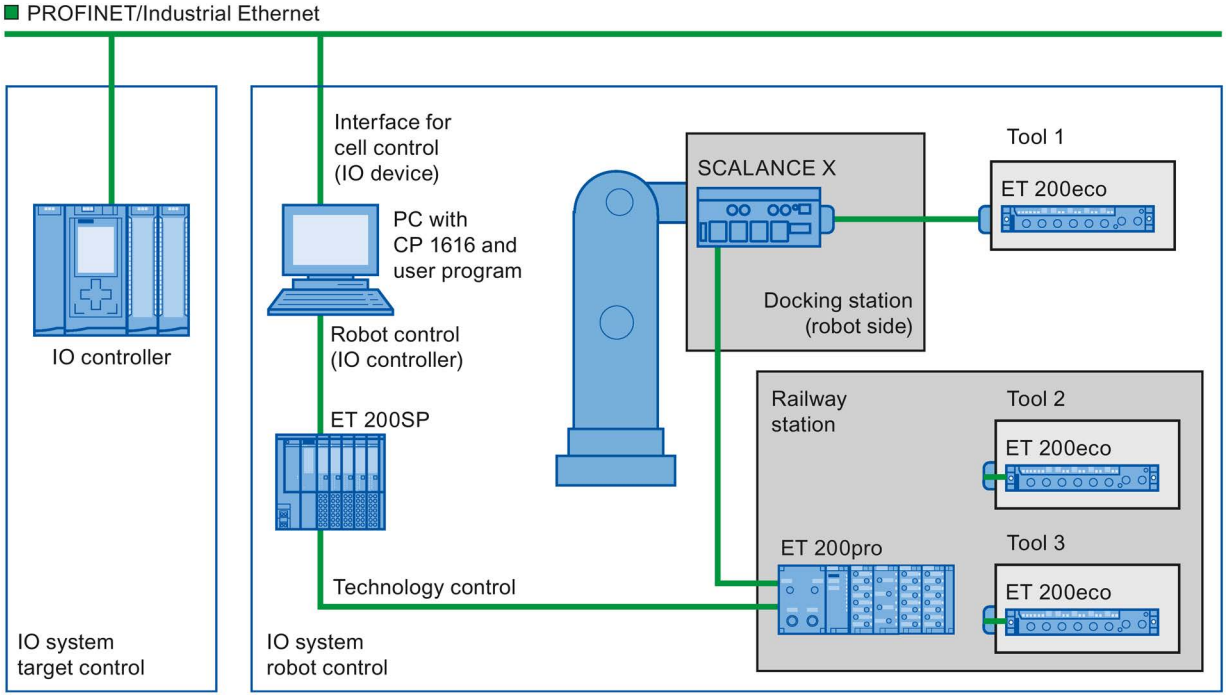

Figure 5-50 Example configuration of a tool changer: Tools 1-3 configured with "Prioritized startup".

5.11.3 Configuring prioritized startup

Requirements

You can enable the "Prioritized startup" PROFINET function for the IO devices (distributed I/O) only in the following cases:

- The IO controller used can prioritize selected IO devices during startup.
- The IO device used supports prioritization.

Procedure

1. Select the IO device in the network view or device view for which you wish to accelerate startup.
2. Open the IO device properties in the Inspector window.
3. Select "PROFINET interface > Advanced options > Interface options".
4. Select the "Prioritized startup" check box.

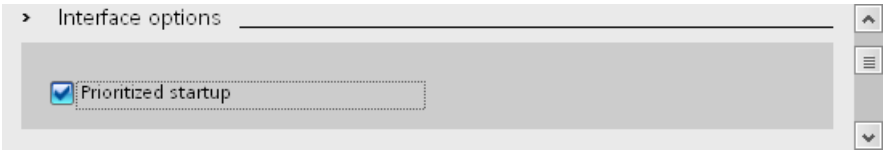

Figure 5-51 Configuring prioritized startup in STEP 7

5. Download the configuration to the IO controller.

Note

Prioritized startup after a startup for the first time

A prioritized startup of the IO device is always available to you after the first configuration of this IO device in the very first startup of the PROFINET IO system. Even in the case of spare parts or a reset to factory settings, the first startup is a standard startup for the respective configured IO devices.

Note

Number of IO devices (distributed I/O) with prioritized startup

You can only start up a maximum number of IO devices with the "Prioritized startup" PROFINET functionality within one PROFINET IO system. This maximum number depends on the IO controller used.

5.11.4 Optimizing port settings for accelerated startup

Optimizing port settings on the IO device and IO controller

The transfer medium and the duplex option are checked during startup of the IO device for control unit cabling.

These checks require time, but with specific presets of these options you can save the time the check requires. Make certain that the settings made correspond to the actual conditions (using the correct cables).

Optimizing port settings for accelerated startup

To optimize port settings for accelerated startup, follow these steps:

1. Select the ports of the IO controller or the partner port of the corresponding IO device.
2. Navigate to "Port options > Connection" in the Inspector window. Select the setting "TP 100 Mbps full duplex" under "Transmission rate/duplex"
3. Clear the "Enable autonegotiation" check box.

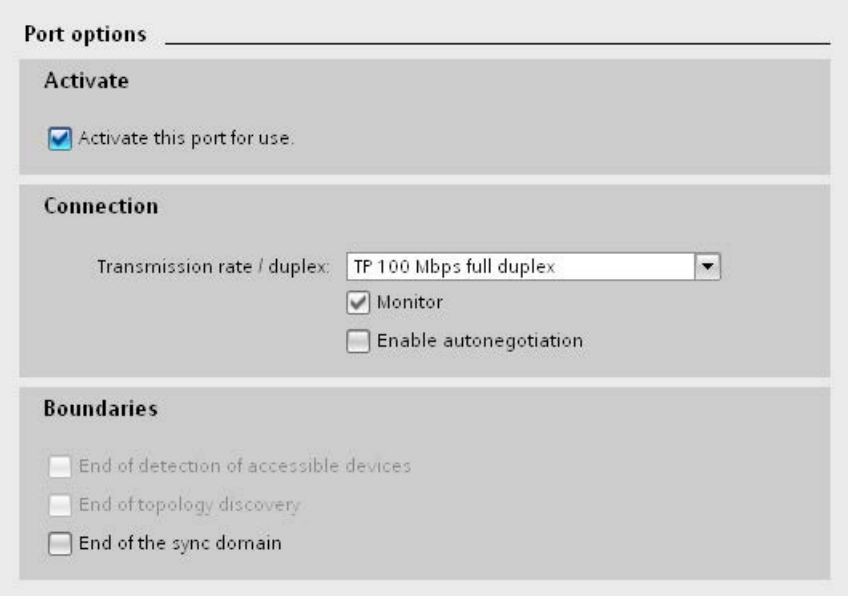

Figure 5-52 Optimizing port settings for accelerated startup in STEP 7

These settings are automatically applied during topology configuration for the partner port.

5.11.5 Optimizing the cabling for accelerated startup

Requirements

You have made the following settings for the port in question to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation deactivated

The time for negotiating the transmission rate during startup is saved.

If you have disabled autonegotiation, you must observe the cabling rules.

Properties of ports

PROFINET devices have the following two types of ports:

Type of port	PROFINET devices
Switch port with crossed pin assignment	For IO devices: Port 2 For S7-CPUs with two ports: Ports 1 and 2
Terminal device port with normal pin assignment	For IO devices: Port 1 For S7-CPUs with one port: Port 1

Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is inverted internally.

Validity of the cabling rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting in STEP 7.

Rules for cabling

You can connect several IO devices in series using patch cables. To do this, connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic provides an example with two IO devices.

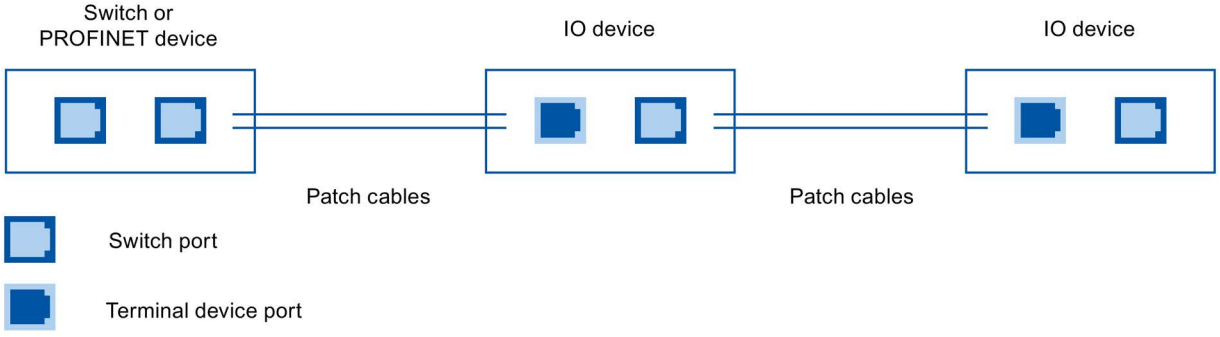

Figure 5-53 Optimized cabling for accelerated startup

5.11.6 Optimizing the user program for accelerated startup

Introduction

You can make certain changes in the user program to accelerate the startup for IO devices of docking systems that alternate during operation.

Making the required changes to the user program

To accelerate the startup by making changes to the user program, follow these steps:

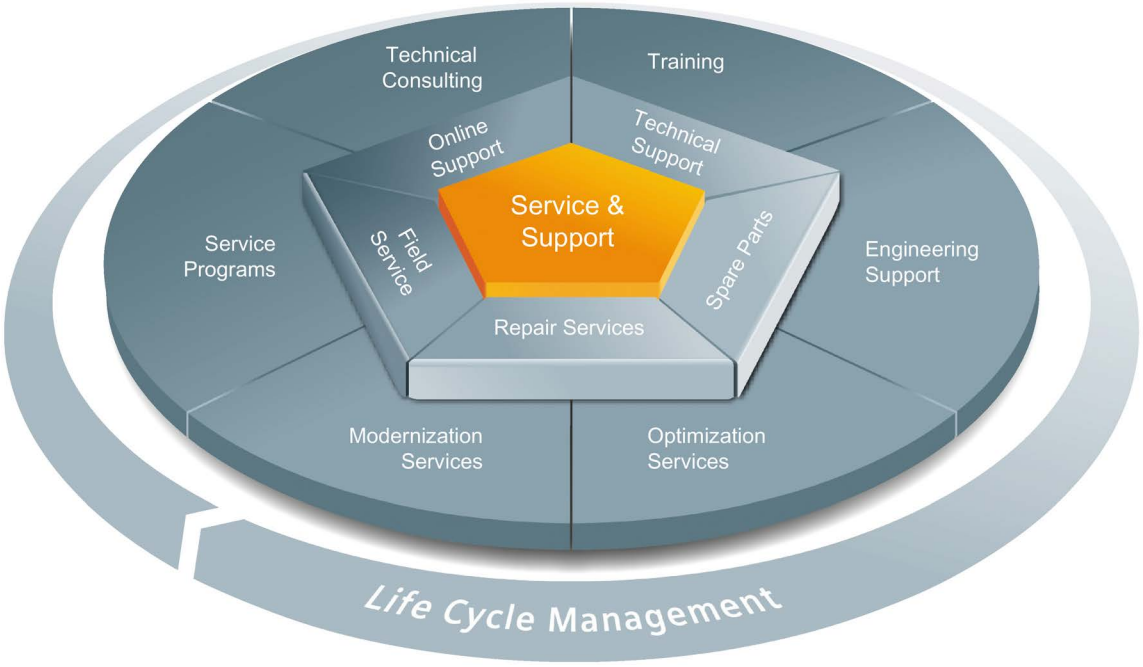
1. Call the "D_ACT_DP" instruction to activate and deactivate the IO device at the start of the OB 1 cycle.

   If the IO device is replaced, the device that is no longer required must be deactivated and the new device must be activated.

2. If you control the "Power ON" command of the IO devices via the application, then start the activation of the IO devices via the corresponding call of the "D_ACT_DP" instruction as near to the same time as possible. The IO device has to be physically connected for this.

3. You access the IO device using direct access commands after the "D_ACT_DP" instruction has provided the feedback "IO device activated".

Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You will find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Glossary

API

API (**A**pplication **P**rocess **I**dentifier) is a parameter, the value of which specifies the IO data processing process (application).

The PROFINET standard IEC 61158 assigns profiles to specific APIs (PROFIdrive, PROFIsave), which are defined by the PROFINET user organization.

The standard API is 0.

Application

An application is a program that runs directly on the MS-DOS/Windows operating system. An application on the PG is STEP 7, for example.

AR

AR (**A**pplication **R**elation) is an addressing level for diagnostics data records.

Automation system

Programmable logic controller for the open-loop and closed-loop control of process chains of the process engineering industry and manufacturing technology. The automation system consists of different components and integrated system functions according to the automation task.

Backplane bus

The backplane bus is a serial data bus for module intercommunication and the distribution of the necessary power to the modules. Bus connectors interconnect the modules.

Bus

A bus is a transfer medium that interconnects several devices. Data transmission can be performed electrically or via optical fibers, either in series or in parallel.

Communications Cycle and Reservation of Transmission Bandwidth

PROFINET IO is a scalable real-time communication system based on the Layer 2 protocol for Fast Ethernet. With the RT transmission method, two real-time-support performance levels are available for time-critical process data and IRT for high-accuracy and also isochronous processes .

Communications processor

Communication processors are modules used for point-to-point and bus connections.

Configuring

Selecting and putting together individual components of an automation system or installing necessary software and adapting it for a specific application (for example, by configuring the modules).

Consistent data

Data which belongs together in terms of content and must not be separated is known as consistent data.

For example, the values of analog modules must always be handled as a whole, that is, the value of an analog module must not be corrupted as a result of reading out at two different points in time.

CP

→ *Communications processor*

CPU

Central **P**rocessing **U**nit - Central module of the S7 automation system with a control and arithmetic unit, memory, operating system and interface for programming device.

DCP

DCP (**D**iscovery and Basic **C**onfiguration **P**rotocol). Enables the assignment of device parameters (for example, the IP address) using manufacturer-specific configuration/programming tools.

Default router

The default router is used when data has to be forwarded via TCP/IP to a partner located outside the local network.

Determinism

Determinism means that a system responds in a predictable (deterministic) manner.

Device

In the PROFINET environment, "device" is the generic term for:

- Automation systems (for example, PLC, PC)
- Distributed I/O systems
- Field devices (for example, PLC, PC, hydraulic devices, pneumatic devices)
- Active network components (for example, switches, routers)
- Gateways to PROFIBUS, AS interface or other fieldbus systems

Device name (PROFINET device name)

In the PROFINET IO environment, the device name is a unique identifier for the PROFINET IO interface of a device.

Diagnostics

→ *System diagnostics*

Diagnostics buffer

The diagnostics buffer represents a backup memory in the CPU, used to store diagnostics events in their order of occurrence.

Diagnostics error interrupt

Modules capable of diagnostics operations report detected system errors to the CPU by means of diagnostics interrupts.

→ *See also CPU*

DP master

A master which behaves in accordance with EN 50170, Part 3, is known as a DP master.

→ *See also Master*

DP slave

A slave operated on PROFIBUS with PROFIBUS DP protocol and in accordance with EN 50170, Part 3 is referred to as DP slave.

→ *See also Slave*

DPV1

The designation DPV1 refers to the functional extension of acyclic services (to include new interrupts, for example) provided by the DP protocol. The DPV1 functionality is integrated in IEC 61158/EN 50170, Volume 2, PROFIBUS.

Duplex

Half duplex: One channel is available for alternating exchange of information.

Full duplex: Two channels are available for simultaneous exchange of information in both directions.

Ethernet

Ethernet is an international standard technology for local area networks (LAN) based on frames. It defines types of cables and signaling for the physical layer and packet formats and protocols for media access control.

GSD file

As a Generic Station Description, this file contains all properties of a PROFINET device that are necessary for its configuration in XML format.

I-device

The "I-device" (intelligent IO device) functionality of a CPU facilitates data exchange with an IO controller, for example, as intelligent preprocessing unit of sub-processes. In its role as an IO device, the I-device is accordingly integrated into a "higher-level" IO controller.

Industrial Ethernet

Industrial Ethernet is a guideline for installing an Ethernet in an industrial environment. The biggest difference from standard Ethernet is the mechanical current carrying capacity and noise immunity of the individual components.

Interrupt

An interrupt is an event that causes the operating system of an S7-CPU to automatically call an assigned organization block (interrupt OB) in which the user can program the desired reaction.

Interrupt, diagnostics

→ *Diagnostics error interrupt*

IP address

To allow a PROFINET device to be addressed as a device on Industrial Ethernet, this device also requires an IP address that is unique on that network. The IP address is made up of 4 decimal numbers with a range of values from 0 through 255. The decimal numbers are separated by dots.

The IP address is made up of the following components:

- Address of the network
- Address of the device (generally called the host or network node).

IRT

IRT is a synchronized communication protocol for cyclic exchange of IRT data between PROFINET devices. A reserved bandwidth is available in the send cycle for IRT data. The reserved bandwidth ensures that the IRT data can be transferred at reserved synchronized intervals, without being influenced also by higher other network loads (such as TCP/IP communication, or additional real-time communication).

LAN

Local **A**rea **N**etwork - a local network to which multiple computers within a company are connected. The LAN therefore has a limited geographical span and is only available to the company or institution.

Line depth

Designates the number of external switches or integrated switches interconnected in series.

MAC address

Worldwide unique device identification for all Ethernet devices. It is assigned by the manufacturer and has a 3-byte vendor ID and 3-byte device ID as a consecutive number.

Every PROFINET device is assigned a worldwide unique device identifier at the factory. This 6-byte long device identifier is the MAC address.

Maintenance Required / Maintenance Demanded

A "Maintenance required" system message can be defined for different wear parameters and an inspection of a component can be recommended, for example, when a certain number of operating hours has elapsed.

The "Maintenance demanded" alarm is sent when the part involved needs to be replaced within a foreseeable period.

(Example printer: The maintenance demanded alarm is sent when the ink/printer cartridges have to be replaced immediately.)

Master

Higher-level, active participant in the communication/on a PROFIBUS subnet. It has rights to access the bus (token), sends data and requests it.

Media redundancy

The so-called **M**edia **R**edundancy **P**rotocol (MRP) enables the configuration of redundant networks. Redundant transmission links (ring topology) ensure that an alternating communication path is made available if a transmission link fails. The PROFINET devices that are a part of this redundant network form an MRP domain.

Micro Memory Card (MMC)

Micro Memory Cards are memory media for CPUs and CPs. Their only difference to the SIMATIC memory card is the smaller size. S7-1500 and ET 200SP-CPUs use SIMATIC memory cards.

MPI

The multipoint interface (**M**ulti **P**oint **I**nterface,MPI) represents the programming device interface of SIMATIC S7. It enables multiple devices (programming devices, text-based displays, OPs) to be operated simultaneously by one or more CPUs. Each device is identified by its unique (MPI) address.

Network

A network consists of one or more interconnected subnets with any number of devices. Several networks can exist alongside each other.

OB

→ *Organization block*

OPC

OPC (OLE for Process Control) refers to a standard interface for communication in automation technology.

Operating mode

Operating modes known to SIMATIC S7 automation systems: STOP, STARTUP, RUN

Organization block

Organization blocks (OBs) form the interface between the CPU operating system and the user program. The order in which the user program is executed is defined in the organization blocks.

Parameter

1. Tag of a STEP 7 code block:
2. Tag used to set one or several characteristics of a module

In delivery state, every module has practical basic settings, which can be modified by configuration in STEP 7.

There are static and dynamic parameters

PG

→ *Programming device*

PLC

→ *Programmable logic controller*

Prioritized startup

Prioritized startup denotes the PROFINET functionality for accelerating the startup of IO devices operated on a PROFINET IO system with RT and IRT communication. It reduces the time that the correspondingly configured IO devices require in order to return to cyclic user data exchange in the following cases:

- After the power supply has returned
- After a station has returned
- After activation of IO devices

Process image

The process image is part of CPU system memory. At the start of cyclic program execution, the signal states of the input modules are transferred to the process image of the inputs. At the end of cyclic program execution, the process image of the outputs is transferred to the output modules as signal state.

→ *See also System memory*

PROFIBUS

Process **Fi**eld **Bus** - European Fieldbus standard.

PROFIBUS device

A PROFIBUS device has at least one PROFIBUS interface with an electrical (RS485) or optical (polymer optical fiber, POF) interface.

PROFIBUS DP

A PROFIBUS with DP protocol that complies with EN 50170. DP stands for distributed I/O (fast, real-time capable, cyclic data exchange). From the perspective of the user program, the distributed I/Os are addressed in exactly the same way as the centralized I/Os.

PROFIBUS Users Organization

Technical committee dedicated to the definition and development of the PROFIBUS and PROFINETstandard. Additional information can be found on the Internet.

PROFIenergy

Function for energy saving in the process, for example, during pause times by briefly switching off the entire system via standardized PROFIenergy commands.

PROFINET

Open component-based industrial communication system based on Ethernet for distributed automation systems. Communication technology promoted by the PROFIBUS Users Organization.

PROFINET device

A PROFINET device always has a PROFINET interface (electrical, optical, wireless). A lot of devices also have a PROFIBUS DP interface to connect PROFIBUS devices.

PROFINET IO

Communication concept for the realization of modular, distributed applications within the scope of PROFINET.

PROFINET IO is based on switched Ethernet with full-duplex operation and a bandwidth of 100 Mbps.

PROFINET IO Controller

Device used to address the connected IO devices. This means that the IO controller exchanges input and output signals with assigned field devices. The IO controller is often the controller on which the automation program runs.

PROFINET IO Device

A distributed field device that is assigned to one of the IO controllers (e.g. remote IO, valve terminals, frequency converters, switches)

PROFINET IO System

PROFINET IO controller with assigned PROFINET IO devices.

Programmable logic controller

Programmable logic controllers (PLCs) are electronic controllers whose function is stored as a program in the control unit. The structure and wiring of the device does not therefore depend on the controller's function. A programmable logic controller is structured like a computer. It consists of a CPU with memory, input/output modules and an internal bus system. The IOs and the programming language are oriented to the requirements of the control technology.

Programming device

Programming devices are essentially compact and portable PCs which are suitable for industrial applications. They are identified by a special hardware and software configuration for programmable logic controllers.

Proxy

The PROFINET device with proxy functionality is the substitute for a PROFIBUS device on Ethernet. The proxy functionality allows a PROFIBUS device to communicate not only with its master but also with all devices on PROFINET.

With PROFINET, existing PROFIBUS systems can be integrated into the PROFINET communication with the aid of an IE/PB link, for example. The IE/PB Link PN IO then handles communication via PROFINET on behalf of the PROFIBUS components.

In this way, you can link both DPV0 and DPV1 slaves to PROFINET.

Real-time

Real-time means that a system processes external events within a defined time.

Real-time communication

Group error for RT and IRT.

PROFINET uses its own real-time channel (RT) rather than TCP/IP for communication of time-critical IO user data.

Router

A router interconnects two subnets. A router works in a similar way to a switch. With a router, however, you can also specify which communication devices may communicate via the router and which may not. The communication devices on various sides of a router can only communicate with one another if you have explicitly enabled communication between these devices via the router. Real-time data cannot be exchanged beyond subnet boundaries.

RT

PROFINET IO with real-time communication (RT) is the optimal transmission method for time-critical applications in factory automation. PROFINET IO frames have priority over standard frames in accordance with IEEE802.1Q. This ensures the required determinism in the automation technology.

Security

Generic term for all the measures taken to protect against

- Loss of confidentiality due to unauthorized access to data
- Loss of integrity due to manipulation of data
- Loss of availability due to the destruction of data

Send clock

Period between two consecutive intervals for IRT or RT communication. The send clock is the shortest possible transmit interval for exchanging data.

For IRT, any multiples of 125 µs can be set as "uneven" send clocks in addition to the "even" send clocks (250 µs, 500 µs, 1 ms, 2 ms, 4 ms) in the range from 250 µs to 4 ms: 375 µs, 625 µs to 3.875 ms.

With "uneven" send clocks, the following is valid for all PROFINET IO devices:

- Update time = send clock
- It is not possible to extend IRT using RT devices

SIMATIC

The term denotes Siemens AG products and systems for industrial automation.

SIMATIC NET

Siemens Industrial Communication division for Networks and Network Components.

SIMATIC PC Station

A "PC station" is a PC with communication modules and software components within a SIMATIC automation solution.

SIMATIC Memory Card (SMC)

→ *Micro Memory Card (MMC)*

Slave

A slave can only exchange data after being requested to do so by the master.

→ See also DP slave

SNMP

The network management protocol SNMP (**S**imple **N**etwork **M**anagement **P**rotocol) uses the wireless UDP transport protocol. It consists of two network components, similar to the client/server model. The SNMP manager monitors the network nodes and the SNMP agents collect the various network-specific information in the individual network nodes and stores it in a structured form in the MIB (**M**anagement **I**nformation **B**ase). This information allows a network management system to run detailed network diagnostics.

STEP 7

STEP 7 is an engineering system and contains programming software for the creation of user programs for SIMATIC S7 controllers.

Subnet

All the devices interconnected by switches are nodes of the same network or subnet. All the devices in a subnet can communicate directly with each other.

All devices in the same subnet have the same subnet mask.

A subnet is physically restricted by a router.

Subnet mask

The bits set in the subnet mask decide the part of the IP address that contains the address of the network.

In general, the following applies:

- The network address is obtained from the AND operation of the IP address and subnet mask.
- The device address is obtained from the AND NOT operation of the IP address and subnet mask.

Switch

Network components used to connect several terminal devices or network segments in a local network (LAN).

Sync domain

All PROFINET devices to be synchronized with IRT via PROFINET IO must belong to a sync domain.

The sync domain consists of exactly one sync master and at least one sync slave. An IO controller or switch generally handles the role of the sync master.

Non-synchronized PROFINET devices are not part of a sync domain.

System diagnostics

System diagnostics refers to the detection, evaluation, and signaling of errors that occur within the automation system, for example, programming errors or module failures. System errors can be indicated by LEDs or in STEP 7.

TCP/IP

The Ethernet itself is only a transport system for data - similar to a highway, which is a transport system for people and goods. The actual data transport is performed by so-called protocols - similar to cars and trucks, which transport people and goods on the highway.

The two basic protocols TCP (**T**ransmission **C**ontrol **P**rotocol) and IP (**I**nternet **P**rotocol) - TCP/IP for short - perform the following tasks:

1. The data is broken down into packets at the sender.
2. The packets are transported over the Ethernet to the correct recipient.
3. At the recipient, the packets are reassembled in the correct order.
4. Corrupt packets continue to be sent until they are received correctly.

Most higher-level protocols use TCP/IP to perform their duties. **H**yper **T**ext **T**ransfer **P**rotocol (HTTP), for example transfers documents written in **H**yper **T**ext **M**arkup **L**anguage (HTML) in the **W**orld **W**ide **W**eb (WWW). This technique is what enables you to view web pages in your Internet browser in the first place.

Topology

Structure of a network. Common structures include:

- Linear bus topology
- Ring topology
- Star topology
- Tree topology

Topology configuration

All the interconnected ports of the PROFINET devices in the STEP 7 project and their relationships to each other.

Twisted-pair

Fast Ethernet via twisted-pair cables is based on the IEEE 802.3u standard (100 Base-TX). The transmission medium is a shielded 2x2 twisted-pair cable with an impedance of 100 Ω (AWG 22). The transmission characteristics of this cable must meet the requirements of category 5.

The maximum length of the connection between the terminal and the network component must not exceed 100 m. The connectors are designed according to the 100Base-TX standard with the RJ45 connector system.

Update time

An IO device / IO controller in the PROFINET IO system is supplied cyclically with new data from the IO controller / IO device within this time interval. The update time can be configured separately for each IO device and determines the interval at which data is sent from the IO controller to the IO device (outputs) as well as from the IO device to the IO controller (inputs).

User program

In SIMATIC, we distinguish between the CPU operating system and user programs. The user program contains all instructions, declarations and data by which a plant or process can be controlled. The user program is assigned to a programmable module (for example, CPU, CM) and can be structured in smaller units.

WAN

A network that extends beyond LAN boundaries and enables, for example, intercontinental network communication. Legal rights do not belong to the user but to the provider of the communication network.

XML

XML (E**x**tensible **M**arkup **L**anguage) is a flexible, easy to understand and easy to learn data description language. Information is exchanged using readable XML documents. These include continuous text supplemented by structure information.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the manual

This function manual provides an overview of the PROFIBUS communication system with SIMATIC STEP 7 V13.

STEP 7 V13 is integrated into the powerful graphic Totally Integrated Automation Portal (TIA Portal), the new integration platform for all automation software tools.

This function manual supports you in planning a PROFIBUS system. The manual is structured into the following subject areas:

- PROFIBUS basics
- PROFIBUS diagnostics
- PROFIBUS functions

Basic knowledge required

The following knowledge is required in order to understand the manual:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7

Scope

This function manual is the basic documentation for all SIMATIC products from the PROFIBUS environment. The product documentation is based on this documentation.

The examples are based on the functionality of the S7-1500 automation system.

Changes compared to previous version

As compared to the previous version (version 07/2014), this manual contains the following amendments/changes:

- Extension of the documentation to STEP 7 (TIA Portal) V13 SP1
- Addition of the function Intelligent DP slaves (I-slaves)
- New guide

Conventions

STEP 7: We refer to "STEP 7" in this documentation as a synonym for the configuration and programming software "STEP 7 as of V12 (TIA Portal)" and subsequent versions.

This documentation contains figures of the devices described. The figures may differ slightly from the device supplied.

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Additional support

You will find information about available technical support in the appendix Service & Support (Page 91).

The technical documentation for the individual SIMATIC products and systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).

The online catalog and the ordering system are available on the Internet (http://mall.industry.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Preface **3**

1 Documentation guide **7**

2 Description **10**

2.1 Introduction to PROFIBUS 10
2.1.1 Applications of PROFIBUS DP 11
2.1.2 PROFIBUS terminology 12
2.1.3 PROFIBUS DP interface 16

2.2 Structure of PROFIBUS networks 17
2.2.1 Passive network components for RS 485 networks 19
2.2.1.1 RS 485 cables 19
2.2.1.2 PROFIBUS FastConnect system 20
2.2.1.3 PROFIBUS bus connector 22
2.2.1.4 M12 bus connector 24
2.2.1.5 Bus terminals for RS 485 networks 24
2.2.1.6 M12 bus terminating resistor 24
2.2.2 Passive components for optical networks 25
2.2.2.1 Fiber-optic cables 25
2.2.2.2 Plastic and PCF fiber-optic cables 26
2.2.2.3 Glass fiber-optic cables 27
2.2.3 Active network components 29
2.2.3.1 Network components in electrical networks 29
2.2.3.2 Network components in optical networks 33
2.2.4 Examples for topology 35
2.2.4.1 Topology with RS485 repeater 35
2.2.4.2 Topology with diagnostic repeater 37
2.2.4.3 OLM topology 40
2.2.4.4 WLAN topology 40
2.2.4.5 Connecting PROFIBUS to PROFINET 41

3 Parameter assignment/addressing **42**

3.1 Assigning the DP slave to a DP master 43

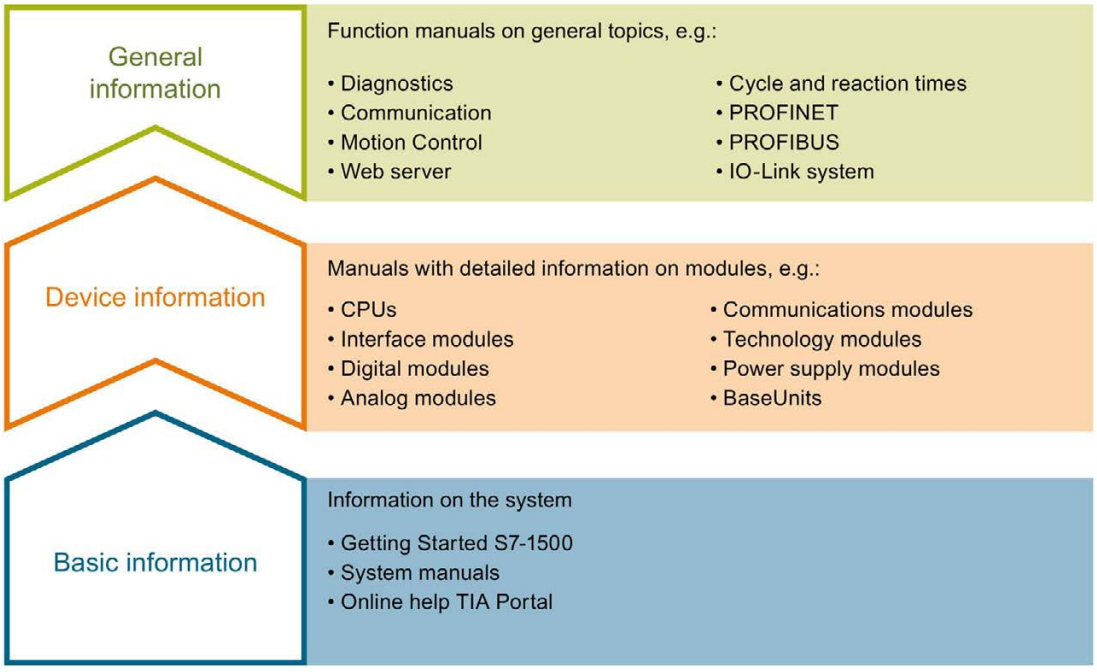
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP, ET 200SP and ET 200AL distributed I/O systems is divided into three areas. This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/86140384)
- ET 200SP (http://support.automation.siemens.com/WW/view/en/84133942)
- ET 200AL (http://support.automation.siemens.com/WW/view/en/95242965)

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

Description 2

2.1 Introduction to PROFIBUS

What is PROFIBUS?

PROFIBUS is a bus system that networks automation systems and field devices that are compatible with PROFIBUS. As communication medium for the field level, PROFIBUS is an important part of Totally Integrated Automation (TIA).

The different communication networks can be used independent of one another or they can be combined with each other.

PROFIBUS protocols

PROFIBUS DP (distributed I/O) is a communication network for the field level according to IEC 61158-2 / EN 61158-2 with the hybrid access protocols token bus and master-slave. The networking takes place by means of two-wire lines or fiber-optic cables. Data transmission rates of 9.6 kbps to 12 Mbps are possible.

PROFIBUS PA is the PROFIBUS for process automation (PA). It connects the PROFIBUS DP communication protocol with the MBP (Manchester Bus Powered) transmission technology to IEC 61158-2.

PROFIBUS PA networks can be designed based on shielded, twisted two-wire lines intrinsically safe and are therefore suitable for hazardous areas (Ex zones 0 and 1). The data transmission rate is 31.25 kbps.

2.1.1 Applications of PROFIBUS DP

Introduction

The efficiency of control systems is not determined by automation devices alone, but depends to a large extent on the overall configuration of an automation solution. This includes a powerful communication system in addition to plant visualization and operator control and monitoring.

The STEP 7 engineering tool supports you during the engineering and configuration of an automation solution.

Applications of PROFIBUS DP

The PROFIBUS network offers wireless connection of several controllers, components and subnets as electrical network, optical network or by using links. Sensors and actuators are controlled centrally by means of PROFIBUS DP.

The following figure shows connection options to PROFIBUS DP:

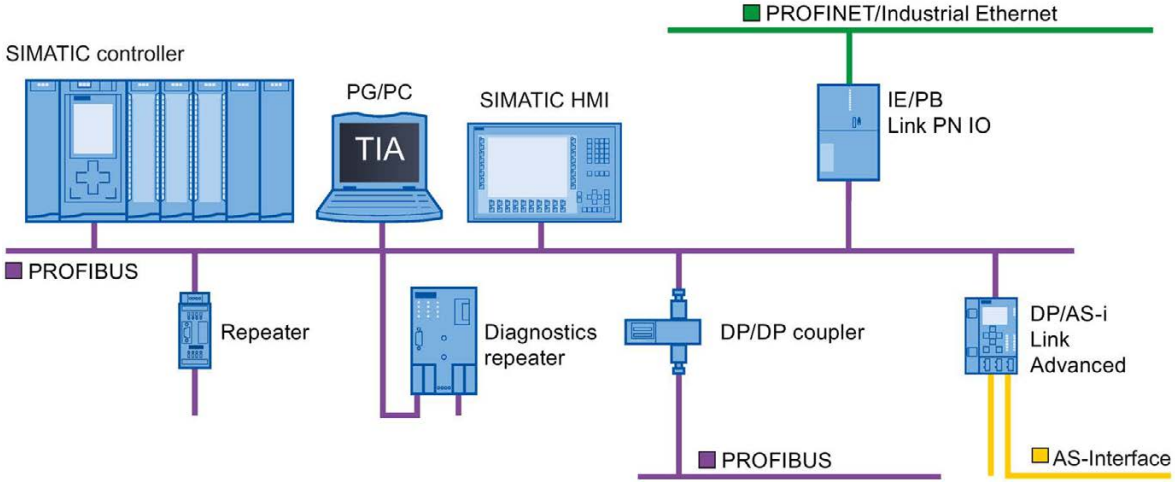


Figure 2-1 Connection options to PROFIBUS DP

Objectives of PROFIBUS DP

Distributed automation systems are increasingly used in production and process automation. This means a complex control task is divided up into smaller, more transparent subtasks with distributed control systems. This creates a high demand for communication between the distributed systems.

Distributed systems offer the following benefits:

- Independent and simultaneous commissioning of individual devices is possible
- Small, manageable programs
- Parallel processing due to distributed automation systems
- Reduced response times
- Higher-level structures can take on additional diagnostics and logging functions.
- Increased plant availability because the rest of the overall system can continue to work when a subordinate station fails.

2.1.2 PROFIBUS terminology

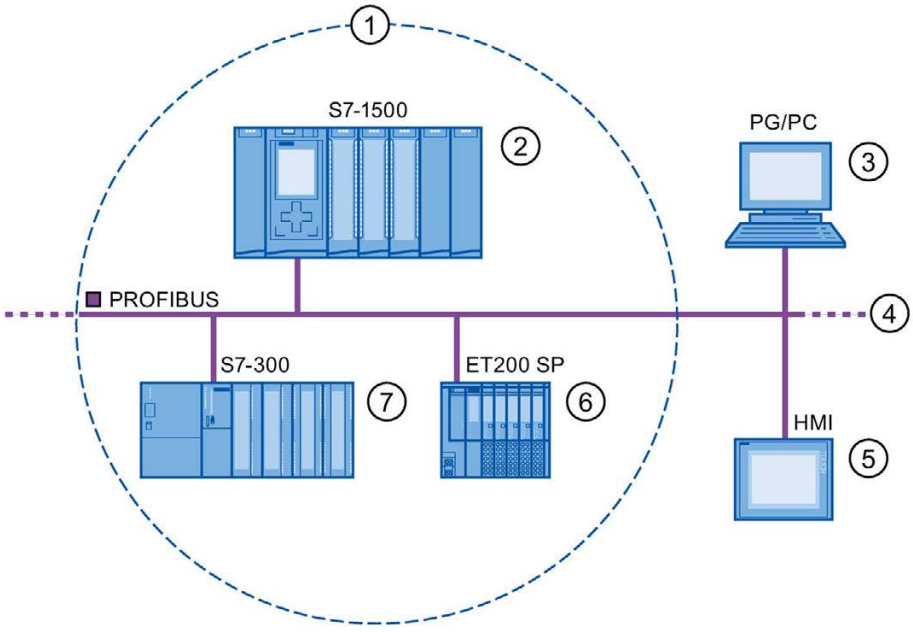
Definition: Devices in the PROFIBUS environment

In the PROFIBUS environment, "device" is the generic term for:

- Automation systems (for example, PLC, PC)
- Distributed I/O systems
- Field devices (for example, hydraulic devices, pneumatic devices)
- Active network components (e.g., diagnostic repeater, optical link module)
- Gateways to AS interface or other fieldbus systems

Devices with PROFIBUS DP

The figure below shows the most important components with PROFIBUS DP. The table below lists the designations of the individual components.



Number	PROFIBUS	Note
①	DP master system	
②	DP master	Device used to address the connected DP slaves. The DP master exchanges input and output signals with field devices. The DP master is often the controller on which the automation program runs.
③	PG/PC	PG/PC/HMI device for commissioning and diagnostics DP master of class 2
④	PROFIBUS	Network infrastructure
⑤	HMI	Device for operating and monitoring functions
⑥	DP slave	Distributed field device assigned to the DP master, e.g., valve terminals, frequency converters.
⑦	I-slave	Intelligent DP slave

Figure 2-2 Devices with PROFIBUS

Overview of I/O communication

I/O communication is the reading or writing of inputs/outputs of the distributed I/O. The figure below gives you an overview of I/O communication using PROFIBUS DP:

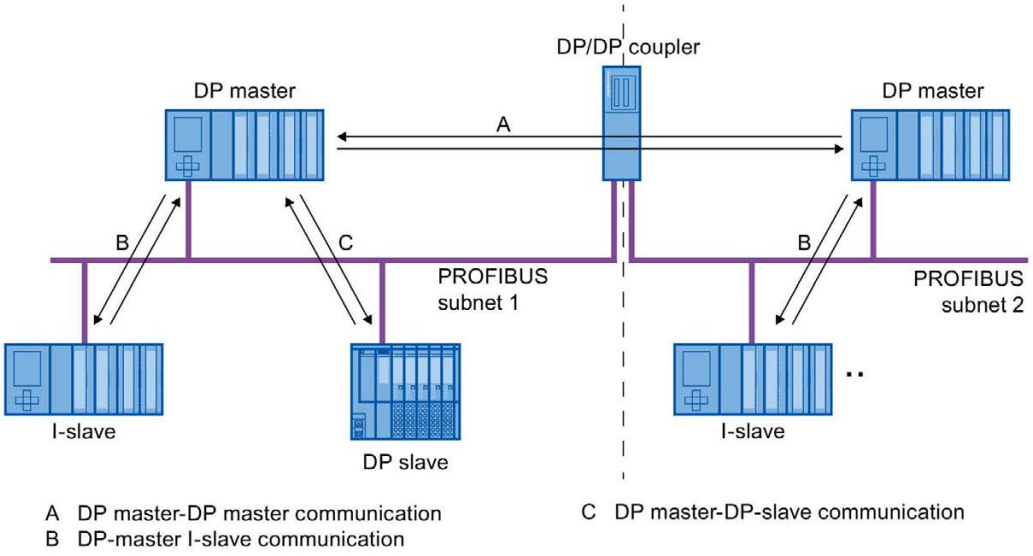


Figure 2-3 I/O communication using PROFIBUS DP

I/O communication is also available with the communication module (CM) or the interface module (IM) with integrated DP interface. These DP interfaces behave like integrated DP interfaces of the CPU.

I/O communication using PROFIBUS DP

Table 2- 1 I/O communication using PROFIBUS DP

Communication between …	Explanation
DP master and DP slave	The data exchange between a DP master and DP slaves with I/O modules takes place as follows: The DP master queries the DP slaves of its master system one after the other, receives input values from the DP slaves, and transmits output data to the DP slaves (master-slave principle).
DP master and I-slave	A fixed amount of data is transmitted cyclically between the user programs in CPUs of DP masters and I-slaves. The DP master does not access the I/O modules of the I-slave, but instead accesses configured address areas, called transfer areas, that can be inside or outside the process image of the I-slave CPU. If parts of the process image are used as transfer areas, these may not be used for actual I/O modules. Data transmission takes place with load and transfer operations using the process image or by direct access.
DP master and DP master	A fixed amount of data is transmitted cyclically between the user programs in CPUs of DP masters. A DP/DP coupler is required as additional hardware. The DP masters mutually access configured address areas, called transfer areas, inside or outside the process image of the CPUs. If parts of the process image are used as transfer areas, these may not be used for actual I/O modules. Data transmission takes place with load and transfer operations using the process image or by direct access.

Additional information

You can find additional information on the hardware configuration in the STEP 7 online help.

2.1.3 PROFIBUS DP interface

Properties

A PROFIBUS device has at least one PROFIBUS interface with an electrical (RS 485) interface or optical (Polymer Optical Fiber, POF) interface.

Table 2- 2 Properties of the PROFIBUS DP interface

Standard	PROFIBUS: IEC 61158/61784
Physical bus/media	PROFIBUS cables (twisted two-wire lines RS 485 or fiber-optic cables)
Transmission rate	9.6 kbps to 12 Mbps

Representation of the PROFIBUS DP interface in STEP 7

In the device view of STEP 7, the PROFIBUS DP interfaces for a DP master and a DP slave are highlighted by a purple rectangle:

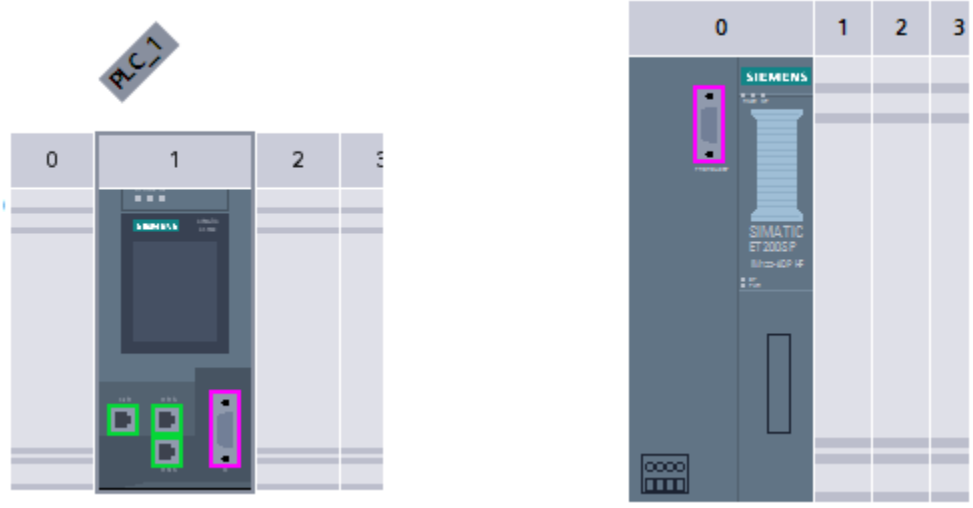

Figure 2-4 PROFIBUS DP interfaces

2.2 Structure of PROFIBUS networks

Contents of this chapter

The following chapter provides background information on building your communication network.

- Overview of the most important passive network components: These are network components that forward a signal without the possibility of actively influencing it, for example, cables, connectors.
- Overview of the most important active network components: These are network components that actively affect a signal, for example, repeaters, diagnostic repeaters.
- Overview of the most common network structures (topologies)

Physical connections of industrial networks

PROFIBUS devices can be networked in industrial plants in two different physical ways:

- By means of electrical signals via copper cables
- By means of optical signals via fiber-optic cables

Selection criteria for networking

The table below includes selection criteria for electrical and optical networking of PROFIBUS devices:

Table 2- 3 Selection criteria for electrical and optical networking

Criteria		Electrical PROFIBUS	Optical network with OLM	Optical network with OBT
Transmission medium	Shielded two-wire line	●	–	–
	POF	–	●	●
	PCF	–	●	●
	Glass	–	●	–
Distances	Max. network span	PROFIBUS DP: 9.6 km PROFIBUS PA: 1.9 km	90 km	9.6 km
	Between two devices	up to 1 km 1)	up to 15 km 2)	up to 300 m 2)
Topology	Bus	●	–	–
	Linear	–	●	●
	Tree	●	●	●
	Ring	–	●	●
Transmission protocols		DP, PA	DP, PA	DP
Connection of devices by means of	OLM	–	●	–
	Integrated interfaces	●	–	●
	Bus terminal	●	–	●
	Bus connector	●	–	–
Electrical network segments can be connected		●	●	–

● Suitable

– Not relevant for this application

1) Depending on data rate and type of service used

2) Depending on cable type used

Installation guideline for PROFIBUS networks

A PROFIBUS segment must be terminated at the start and end; passively with a connector or actively with a bus terminating resistor.

The same principles apply to the installation of a PROFIBUS network as described in the SIMATIC NET PROFIBUS networks (http://support.automation.siemens.com/WW/view/en/35222591) manual.

2.2.1 Passive network components for RS 485 networks

2.2.1.1 RS 485 cables

Introduction

The following applies to all RS 485 cables for PROFIBUS from Siemens:

- Their double shielding makes them especially suited for laying in industrial environments with electromagnetic interference.
- A continuous grounding concept can be implemented by means of the outer shield of the bus cable and the ground terminals of the bus terminals.
- The imprinted meter marking makes it easier to determine the length (accuracy ±5%).

RS 485 cables for PROFIBUS

SIMATIC NET PROFIBUS cables are available in different versions which allow optimum adaptation to different areas of application:

- FC Standard Cable GP (bus cable for fixed laying inside buildings)
- FC Standard Cable IS GP (bus cable for hazardous area)
- FC-FRNC Cable GP (bus cable with halogen-free protective jacket for use inside buildings)
- FC Food Cable (bus cable with PE jacket for use in the food and beverage industry)
- FC Robust Cable (bus cable with PUR jacket for environments subject to chemical and mechanical stress)
- FC Ground Cable (ground cable with PE jacket)
- PROFIBUS FC Trailing Cable (trailing cable for tow chains)
- PROFIBUS Festoon Cable (bus cable for festoon mounting)
- PROFIBUS Torsion Cable (torsion-free bus cable for networking movable plant parts, for example, robots)
- PROFIBUS FC Flexible Cable (bus cable for machine parts that are moved infrequently or cabinet doors)
- SIENOPYR-FR ship cable (for permanent laying on ships and off-shore units in all rooms and on open deck)
- PROFIBUS Hybrid Standard Cable (hybrid cable with 2 power wires (1.5 mm^2) for data and power supply of the ET 200pro)
- PROFIBUS Hybrid Robust Cable (trailable hybrid cable with 2 power wires (1.5 mm^2) for data and power supply of the ET 200pro)

Maximum cable lengths

When using copper cables, the maximum size of a PROFIBUS segment depends on the transmission rate.

If these lengths are not sufficient for your application, you can expand the network by using repeaters. You can achieve a maximum size by cascading up to nine repeaters.

Table 2- 4 Maximum cable lengths

Transmission rate	Maximum cable length of a bus segment	Maximum distance between two stations
9.6 to 187.5 kbps	1000 m	10000 m
500 kbps	400 m	4000 m
1.5 Mbps	200 m	2000 m
3 to 12 Mbps	100 m	1000 m

2.2.1.2 PROFIBUS FastConnect system

PROFIBUS FastConnect (FC)

PROFIBUS FastConnect is a system for fast and easy fabrication of PROFIBUS copper cables.

The system consists of three components:

- FastConnect bus cables for quick mounting
- FastConnect stripping tool
- FastConnect bus connector for PROFIBUS with insulation displacement method

FastConnect bus cables and stripping tool

The special design of the FastConnect bus cables allows for the use of the FastConnect stripping tool to accurately strip away the protective jacket and the braided shield in one step. The connection of the prepared cables takes place in the FastConnect bus connectors using the insulation displacement method.

All PROFIBUS FastConnect bus cables can also be connected to the conventional bus connectors with screw-type terminals.

Area of application

You need FastConnect bus connectors for PROFIBUS for the following applications:

- Connect devices with an electrical 9-pin D-Sub interface to IEC 61158-2 directly with SIMATIC NET PROFIBUS cables.
- Connect electrical segments or individual devices to the Optical Link Module (OLM) and Optical Bus Terminal (OBT).
- Connect devices or programming devices to the repeater.

Versions

The FastConnect bus connector in degree of protection IP20 is available in the following versions:

- with integrated terminating resistor and isolating function
- with or without PG socket
- with a cable outlet of 35°, 90° or 180°
- with device category 3G suitable for zone 2 hazardous area

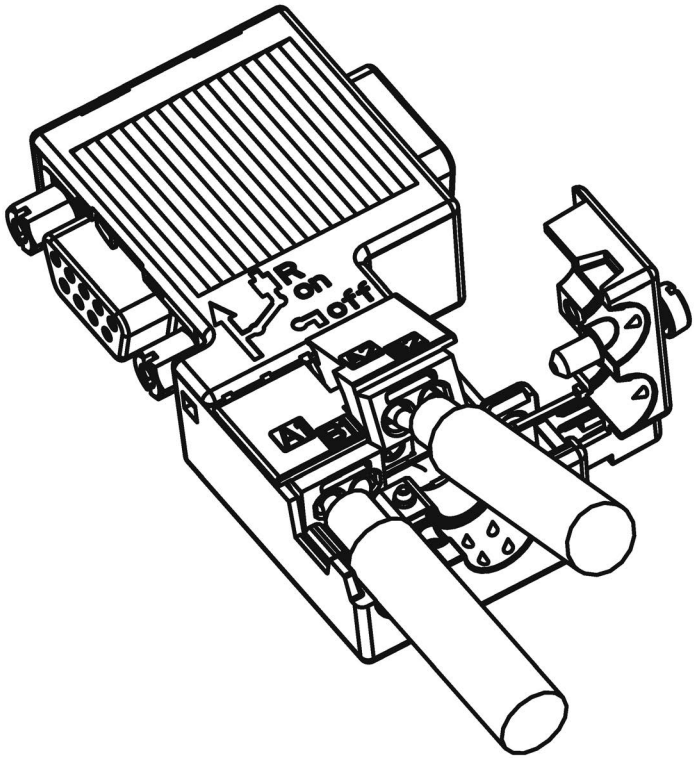

Figure 2-5 Example for PROFIBUS FastConnect bus connector with PG socket, cable outlet 90°

Additional information

For additional information on the available components visit the Siemens Mall (http://mall.industry.siemens.com).

2.2.1.3 PROFIBUS bus connector

Area of application

You need PROFIBUS bus connectors for the following applications:

- Connect devices with a 9-pin D-Sub interface to IEC 61158-2 directly with the SIMATIC NET PROFIBUS cables.
- Connect electrical segments or individual devices to the Optical Link Module (OLM) and Optical Bus Terminal (OBT).
- Connect devices or programming devices to the repeater.

Versions

The PROFIBUS bus connector in degree of protection IP20 is available in the following versions:

- with integrated terminating resistor and isolating function
- with or without PG socket
- with a cable outlet of 35°, 90° or 180°
- with device category 3G suitable for zone 2 hazardous area

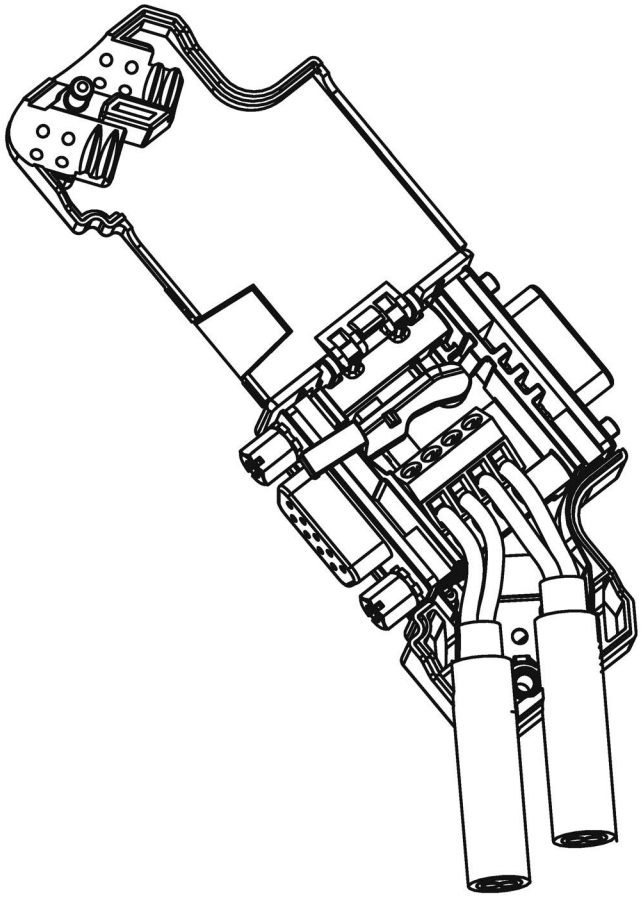

Figure 2-6 Example for PROFIBUS bus connector with PG socket, cable outlet 35°

Additional information

For additional information on the available components visit the Siemens Mall (http://mall.industry.siemens.com).

2.2.1.4 M12 bus connector

Area of application

Devices with an electrical M12 interface can use the M12 bus connector for SIMATIC NET PROFIBUS for direct connection with the SIMATIC NET PROFIBUS cables.

The M12 bus connector in degree of protection IP65 is available in the following versions:

- with screw-type terminals
- with insulation displacement termination
- with a cable outlet of 180°

2.2.1.5 Bus terminals for RS 485 networks

Bus terminal RS 485 and bus terminal M12

A bus terminal is used for the connection of an individual PROFIBUS station with RS485 interface to the PROFIBUS bus cable.

Bus terminals in degree of protection IP20 are available in the following versions:

- Bus terminal RS 485 with or without PG interface, transmission rate 9.6 kbps to 1.5 Mbps, integrated terminating resistor combination (connectible), with 1.5 m and 3 m connecting cable
- Bus terminal M12, transmission rate 9.6 kbps to 12 Mbps, integrated terminating resistor combination with isolating function, with 1.5 m connecting cable

2.2.1.6 M12 bus terminating resistor

Terminating segment with terminating resistor

If there is a station with M12 connection system at the beginning or end of a PROFIBUS segment, you need an M12 bus terminating resistor.

The M12 PROFIBUS connection of a device consists of an M12 socket for the infeed and an M12 male connector to loop-through the bus signal.

This means you need one bus terminating resistor with male contacts (6GK1905-0EC00) and with female contacts (6GK1905-0ED00) for each M12 bus cable.

2.2.2 Passive components for optical networks

2.2.2.1 Fiber-optic cables

Types of fiber-optic cables

Data transmission with fiber-optic cables takes place through modulation of electromagnetic waves in the range of visible and invisible light. These cables are made of high-quality plastic fibers and glass fibers:

- Plastic and PCF fiber-optic cables (Page 26)
- Glass fiber-optic cables (Page 27)

The different types of fiber-optic cables provide solutions matched to the operating and environmental conditions for the connection of components with each other.

Benefits

Fiber-optic cables offer the following benefits when compared with electrical cables:

- Galvanic isolation of the devices and segments
- No potential equalization currents
- No impact on transmission path through external electromagnetic interference
- No lightning protection elements required
- No noise radiation along the transmission route
- Low weight
- Depending on the type of fiber you can implement cable lengths up to few kilometers at even higher transmission rates.
- No dependency of the maximum permitted distances on the transmission rate

Additional information

Additional information of the properties and technical specifications of the passive components and connectors for fiber-optic cables is available in the PROFIBUS network manual (http://support.automation.siemens.com/WW/view/en/35222591).

2.2.2.2 Plastic and PCF fiber-optic cables

Plastic and PCF fiber-optic cables

Plastic (POF) and PCF fiber-optic cables are used for the connection of Optical Link modules with connections for plastic fiber-optic cables (OLM/P), Optical Bus Terminal (OBT) and devices with integrated optical interfaces. Under certain conditions, they are an inexpensive alternative to conventional glass fiber-optic cables.

Plastic Fiber Optic duplex core

The plastic fiber-optic duplex core is a flat dual core with PVC inner jacket without protective jacket. The cable can be easily assembled on-site.

The cable is intended for indoor applications with low mechanical loads or inside cabinets. For OLM connections and with integrated optical interfaces you cover a length of up to 50 m between two devices with this cable.

Plastic Fiber Optic standard cable

The plastic fiber optic standard cable consists of two plastic fibers with robust polyamide inner jacket surrounded by Kevlar tensile elements and a purple PVC protective jacket. The cable can be easily assembled on-site.

The robust round cable is suited for indoor applications. The maximum distance that can be covered is 80 m for OLM/P connections and 50 m with integrated optical interfaces and OBT.

PCF Standard Cable

The pre-assembled PCF Standard Cable consists of two PCF fibers surrounded by Kevlar tensile elements and a purple PVC protective jacket. It is always supplied with a pulling aid installed on one end to pull in the cable channels.

The robust round cable is suited for indoor applications with cable lengths up to 400 m (OLM) or 300 m (integrated optical interfaces, OBT) between two devices.

PCF Standard Cable GP

The PCF Standard Cable GP consists of two PCF fibers surrounded by Aramid tensile elements and a green PVC protective jacket. The cable is pre-assembled and can be ordered by the meter. It is supplied with a pulling aid installed on one end to pull in the cable channels.

The robust round cable is suited for indoor and outdoor applications with cable lengths up to 400 m (OLM) or 300 m (integrated optical interfaces, OBT) between two devices.

PCF Trailing Cable

The PCF Trailing Cable consists of two PCF fibers surrounded by Aramid tensile elements and a green PUR protective jacket. The cable is pre-assembled and can be ordered by the meter. It is supplied with a pulling aid installed on one end to pull in the cable channels.

The robust round cable is suited for moving indoor and outdoor applications with cable lengths up to 400 m (OLM) or 300 m (integrated optical interfaces, OBT) between two devices.

PCF Trailing Cable GP

The PCF Trailing Cable GP consists of two PCF fibers surrounded by Aramid tensile elements and a green PVC protective jacket. The cable is pre-assembled and can be ordered by the meter. It is supplied with a pulling aid installed on one end to pull in the cable channels.

The robust round cable is suited for moving indoor and outdoor applications with cable lengths up to 400 m (OLM) or 300 m (integrated optical interfaces, OBT) between two devices.

2.2.2.3 Glass fiber-optic cables

Glass fiber-optic cables

Glass fiber-optic cables are suitable for connection of optical interfaces that work in the wavelength range around 850 nm and around 1300 nm. They include two graded-index multimode fibers of the type 62.5/125 µm.

The glass fiber-optic cables are available in different versions which makes for an optimum adaptation to different areas of application:

- Fiber Optic standard cable
- INDOOR Fiber Optic indoor cable
- Flexible Fiber Optic trailing cable

Fiber Optic standard cable

The standard cable is the universal cable for indoor and outdoor use.

INDOOR Fiber Optic indoor cable

The indoor cable is intended for weather-proof indoor use. It is halogen-free, non-crush and flame-retardant.

Flexible Fiber Optic trailing cable

The trailing cable was designed for the special application of forced movement, for example, for constantly moved machine parts such as trailing chains. It is mechanically designed for 100,000 bending cycles by ±90° (with the specified minimum radius). Integrated dummy elements ensure a round cross-section of the cable. The trailing cable can be used indoors and outdoors.

Maximum distances between two optical link modules

The following distances may not be exceeded between two OLMs regardless of the optical power budget:

- OLM/P11, OLM/P12: 400 m
- OLM/G11, OLM/G12, OLM/G12-EEC: 3 km
- OLM/G11-1300, OLM/G12-1300: 15 km

Additional information

All operating instructions (http://support.automation.siemens.com/WW/view/en/10805951/133300) of the SIMATIC NET bus components include information on distances that can be covered with the SIMATIC NET glass fiber-optic cables. You can configure your optical network without any calculations using simple limits.

2.2.3 Active network components

2.2.3.1 Network components in electrical networks

Active network components

The following active network components are available for PROFIBUS in electrical networks:

- Repeater RS485
- Diagnostics repeater
- PROFIBUS Terminator
- DP/DP coupler
- IE/PB Link PN IO
- IWLAN/PB Link PN IO
- Active components for the connection of CAN
- Active components for the gateway between PROFIBUS and AS-Interface
  - DP/AS-i LINK Advanced
  - DP/AS-Interface Link 20E
  - DP/AS-i F-Link

RS485 repeater

The RS485 IP20 repeater connects two PROFIBUS bus segments in RS485 technology with up to 32 devices. It provides transmission rates from 9.6 kbps to 12 Mbps.

The RS485 repeater refreshes a signal regarding amplitude, signal width and edge steepness between two segments. It is used when more than 32 stations are connected to the bus or the maximum cable length of a segment is exceeded.

Bus segments can be operated ungrounded (galvanic isolation of segments) with an RS485 repeater.

Diagnostics repeater

The diagnostic repeater connects three PROFIBUS segments in RS485 technology, two of which are diagnostics-capable segments with 31 devices each. It is designed as DP slave to send diagnostics alarms to the DP master.

The diagnostic function provides the location and the cause of cable faults, such as wire break or missing terminating resistors. The fault location is indicated relative to the existing devices.

The diagnostics repeater refreshes a signal regarding amplitude, signal width and edge steepness between the segments. The cascading depth between any two PROFIBUS devices is limited to nine diagnostics repeaters.

PROFIBUS Terminator

The PROFIBUS Terminator forms an active bus termination. Bus devices can be switched off, removed or replaced without affecting data transmission. This is particularly true for bus devices on both ends of the bus cable at which terminating resistors must be connected or supplied. The PROFIBUS Terminator can be mounted on a standard mounting rail.

IE/PB Link PN for the connection of a PROFIBUS segment to an Industrial Ethernet network

The IE/PB Link PN IO as independent component provides the seamless transition between Industrial Ethernet and PROFIBUS. Through the use of IE/PB Link PN IO as substitute on the Ethernet, the existing PROFIBUS devices can continue to be used and can be integrated into a PROFINET application.

A PROFINET IO controller is required for this configuration. The IE/PB Link PN acts as master on the PROFIBUS end.

IWLAN/PB Link PN IO as gateway between LAN and PROFIBUS

PROFIBUS devices can be coupled to PROFINET IO by means of IWLAN/PB Link PN IO. This means you can integrate existing PROFIBUS configurations into PROFINET.

The IWLAN/PB Link PN IO supports the use of IWLAN and WLAN antennas for wireless data transmission, for example, in suspended monorail systems or conveyor systems. Because of the PROFINET support, the numerous PROFIBUS system services, for example, diagnostics by bus, can continue to be used.

A PROFINET IO controller is required for this configuration. The IWLAN/PB Link PN IO acts as master on the PROFIBUS end.

CANopen module for connection to CAN

You can use the CANopen module to easily connect CANopen applications to PROFIBUS.

Typical areas of application:

- Control of hydraulic valves/hydraulic axes in vehicles
- Control of motors in packaging machines and on conveyor belts
- Use in wind turbines for detection of angular encoders
- Detection of HMI devices on machines, e.g., joysticks
- Detection of measured data from displacement transducers, inclination sensors or angle encoders on tower cranes or gantry cranes

DP/DP coupler for connection of two PROFIBUS networks

The PROFIBUS DP/DP coupler is used to connect two PROFIBUS DP networks. Data (0 to 244 bytes) is transmitted from the DP master of the first network to the DP master of another network and vice versa.

The DP/DP coupler comes equipped with two independent DP interfaces that establish the connection to the two DP networks. There is one slave at each DP network. The data exchange between the two DP networks takes place by internal copying in the coupler.

DP/PA bus link for connection of PROFIBUS PA

The DP/PA bus link is the connection between PROFIBUS DP and PROFIBUS PA. This means it connects the process control systems with the field devices of the process automation.

The following components are available for a DP/PA bus link:

- DP/PA coupler Ex [ia]
- DP/PA coupler FDC 157-0
- Interface module IM 153-2 for establishing a DP/PA link.
- Active field distributor AFDiS for hazardous areas

Active components for the gateway between PROFIBUS and AS-Interface

- **DP/AS-i LINK Advanced**:

  The **DP/AS-i LINK Advanced** is PROFIBUS DPV1 slave (according to IEC 61158-2/EN 61158-2) and AS-Interface master (according to AS-Interface specification V3.0 according to EN 50295) and provides transparent data access to AS-Interface from PROFIBUS DP.

  PROFIBUS DP masters can cyclically exchange I/O data with the AS-Interface; DP masters with acyclic services can also make AS-Interface master calls. The **DP/AS-i LINK Advanced** is particularly suited for distributed configurations and for the connection of a subordinate AS-Interface network.

  The DP/AS-i LINK Advanced in the version as AS-Interface single master is completely sufficient for applications with typical configuration limits.

  For applications with high configuration limits, the DP/AS-i LINK Advanced is used as AS-Interface double master. In this case, the duplicate configuration limits can be used on two independently running AS-Interface strands.

- **DP/AS-Interface Link 20E:**

  The DP/AS-Interface Link 20E is PROFIBUS DP slave (in accordance with EN 61158) and AS-Interface master (in accordance with AS-Interface specification V3.0 according to EN 50295) and supports operation of the AS-Interface on PROFIBUS DP.

  Single PROFIBUS masters can cyclically exchange I/O data with the AS-Interface; masters with acyclic services can exchange I/O data and make master calls.

- **DP/AS-i F-Link:**

  The DP/AS-i F-Link is PROFIBUS DP-V1 slave (according to EN 61158) and AS-i master (according to AS-Interface specification V3.0 to EN 50295) and provides transparent data access to AS-Interface from PROFIBUS DP. The DP/AS-i F-Link is also the only AS-i master that can forward safety-oriented input data of ASIsafe slaves to a fail-safe CPU with PROFIBUS DP master by means of the PROFIsafe protocol. Additional safety cabling or monitoring is not required (in particular, no AS-Interface safety monitor). Depending on the slave type, you can transmit binary values or analog values. All slaves according to AS-Interface specification V2.0, V2.1 or V3.0 can be operated as AS-i slaves.

  As fully-featured AS-i master according to specification V3.0, you can use higher configuration limits on the AS-i network (496 inputs and outputs each, up to 62 digital or analog slaves).

Additional information

Information on the components is available in the Siemens Mall (http://mall.industry.siemens.com).

Topology with RS485 repeater (Page 35)

OLM topology (Page 40)

WLAN topology (Page 40)

Connecting PROFIBUS to PROFINET (Page 41)

2.2.3.2 Network components in optical networks

Active network components

The following active network components are available for PROFIBUS in optical networks:

- Optical Link Module OLM
- Optical Bus Terminal OBT

Optical Link Module OLM

You can use the PROFIBUS Optical Link Modul OLM to install PROFIBUS networks in line, star structure and redundant ring structure.

The transmission rate of a fiber-optic cable line does not depend on the distance and can be 9.6 kbps to 12 Mbps.

Applications for OLM include, for example, plant buses on PROFIBUS base, networking across buildings using glass fiber-optic cables, mixed networks with electrical and optical segments, large networks (road tunnels, traffic guidance systems) and networks with high demands on availability (redundant ring networks).

Optical Link modules can be combined by means of an RS485 interface and individual devices or entire electrical segments can be integrated into the optical PROFIBUS network.

The following distances may not be exceeded between two OLMs regardless of the optical power budget:

- OLM/P11, OLM/P12: 400 m
- OLM/G11, OLM/G12, OLM/G12-EEC: 3 km
- OLM/G11-1300, OLM/G12-1300: 15 km

Optical Bus Terminal OBT (optical bus terminal)

The Optical Bus Terminal connects an individual PROFIBUS device without integrated optical interface or a PROFIBUS RS 485 segment with up to 31 devices to an optical PROFIBUS.

An individual PROFIBUS DP device is connected with its RS 485 interface by means of a PROFIBUS cable with integrated terminating resistor, for example, connecting cable 830-1T, to the RS 485 interface of the OBT. The OBT is integrated into the optical line by means of two optical interfaces.

The following optical transmission media can be connected to the OBT:

- Plastic fiber-optic cable up to 50 m single distance length. They can be assembled on-site with two 2x2 Simplex connectors.
- PCF fiber-optic cable up to 300 m single distance length. The cables are delivered pre-assembled.

Additional information

Information on the components is available in the Siemens Mall (http://mall.industry.siemens.com).

Additional information is available in these manuals:

- PROFIBUS network manual (http://support.automation.siemens.com/WW/view/en/35222591)
- SIMATIC NET PROFIBUS, Optical Link Module (http://support.automation.siemens.com/WW/view/de/56606534/0/en)
- SIMATC NET Twisted-Pair and Fiber-Optic Networks (http://support.automation.siemens.com/WW/view/en/8763736)

2.2.4 Examples for topology

2.2.4.1 Topology with RS485 repeater

Configuration options with the RS485 repeater

You can operate the RS485 repeater in the following configurations:

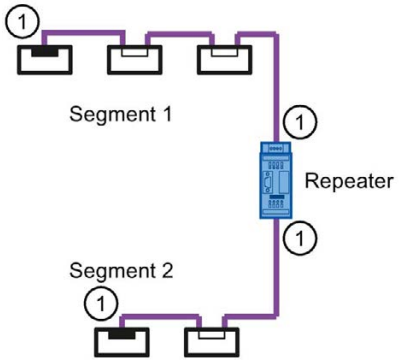

Figure 2-7 Segment 1 and segment 2 connected to RS485 repeater

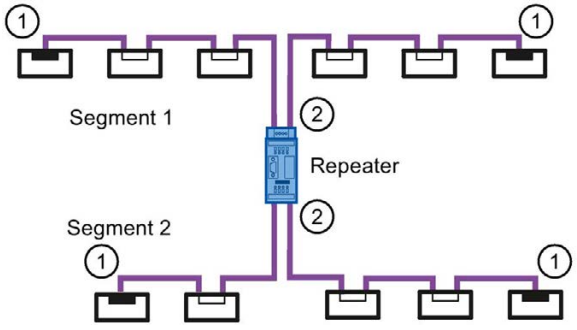

Figure 2-8 Segment 1 and segment 2 looped-through to RS485 repeater

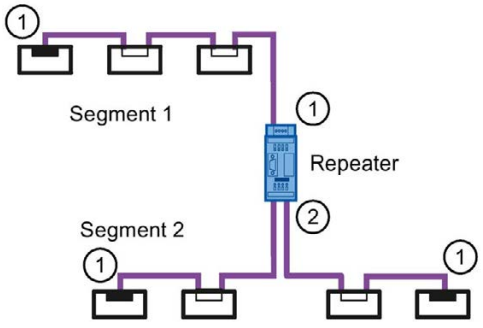

Figure 2-9 Segment 1 connected to RS485 repeater and segment 2 looped-through to RS485 repeater

① Connect terminating resistor

② Do not connect terminating resistor

Configuration example

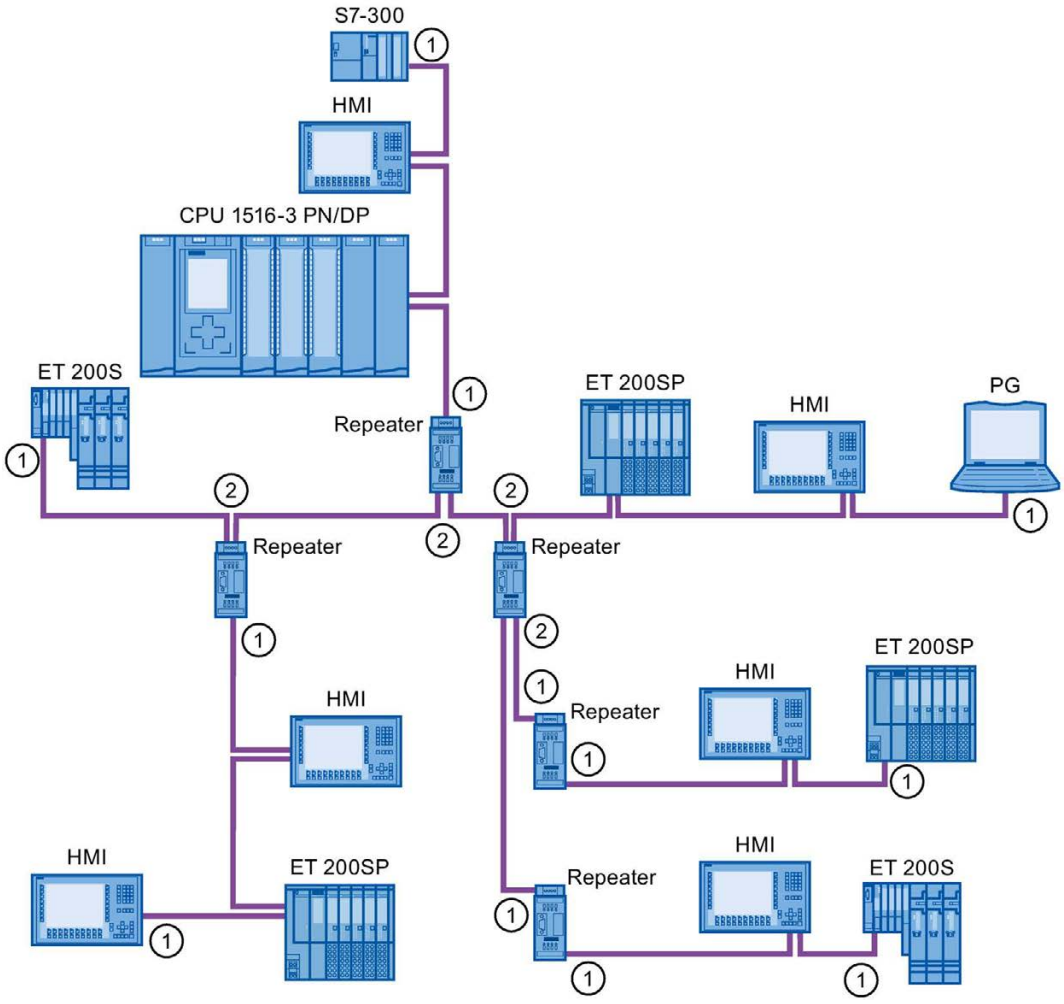

Figure 2-10 Configuration example with five RS485 repeaters

① Connect terminating resistor

② Do not connect terminating resistor

Maximum configuration

If you install a PROFIBUS network with RS485 repeaters, you may not connect more than nine RS485 repeaters in series.

2.2.4.2 Topology with diagnostic repeater

Diagnostic repeater with three segments

You may not exceed the maximum permitted cable length of 100 m per segment that can be monitored for the diagnostic repeater. The segments connected to DP2 and DP3 are diagnostics-capable. The cable length that can be monitored is limited for some cable types.

Maximum cascade depth

You can connect up to nine diagnostic repeaters in series between any two PROFIBUS stations.

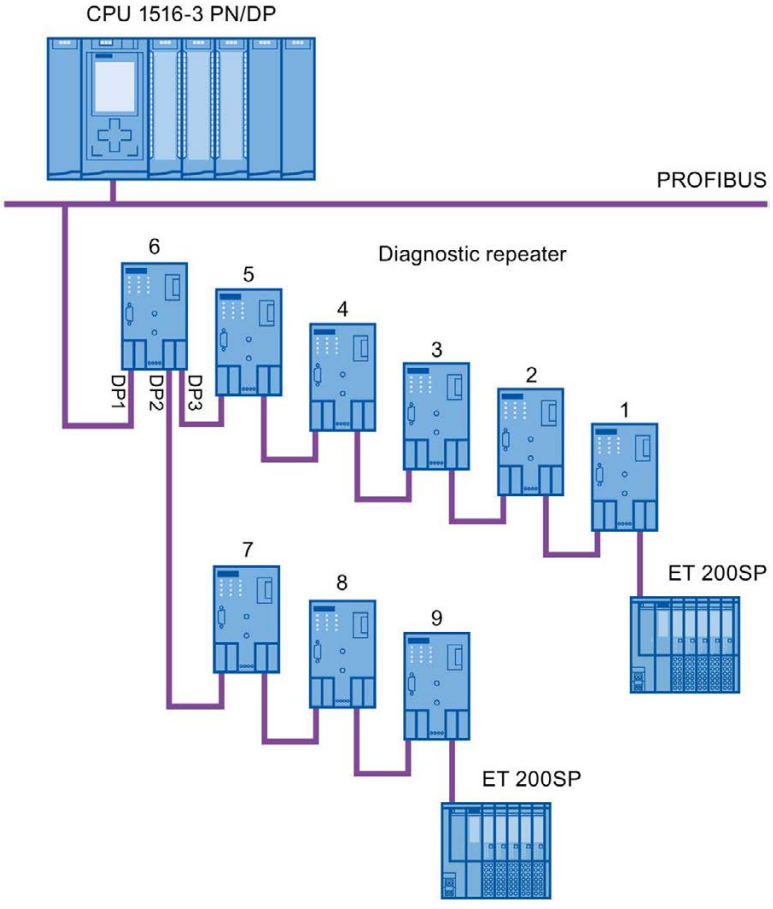

Figure 2-11 Schematic layout of a PROFIBUS network with maximum possible cascade depth at diagnostic repeaters

Example: Maximum cascade depth exceeded

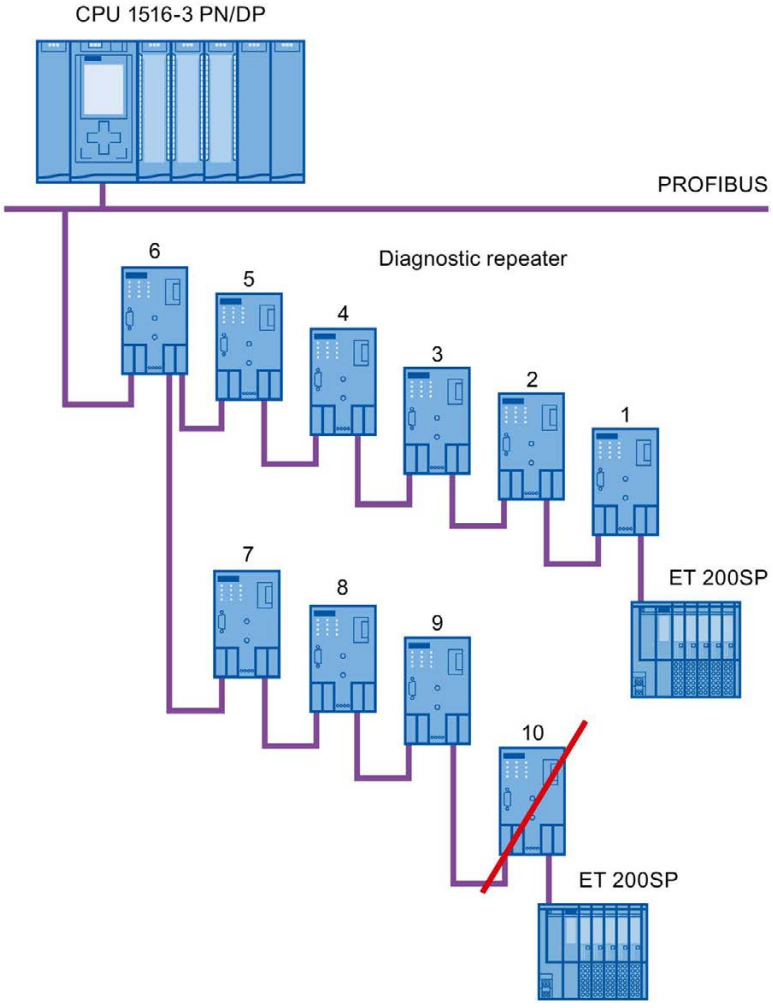

Figure 2-12 Maximum cascade depth exceeded

Layout with several segments

You can increase the number of used diagnostic repeaters by using several segments. The example shows a layout in which the maximum cascade depth is exceeded at two segments.

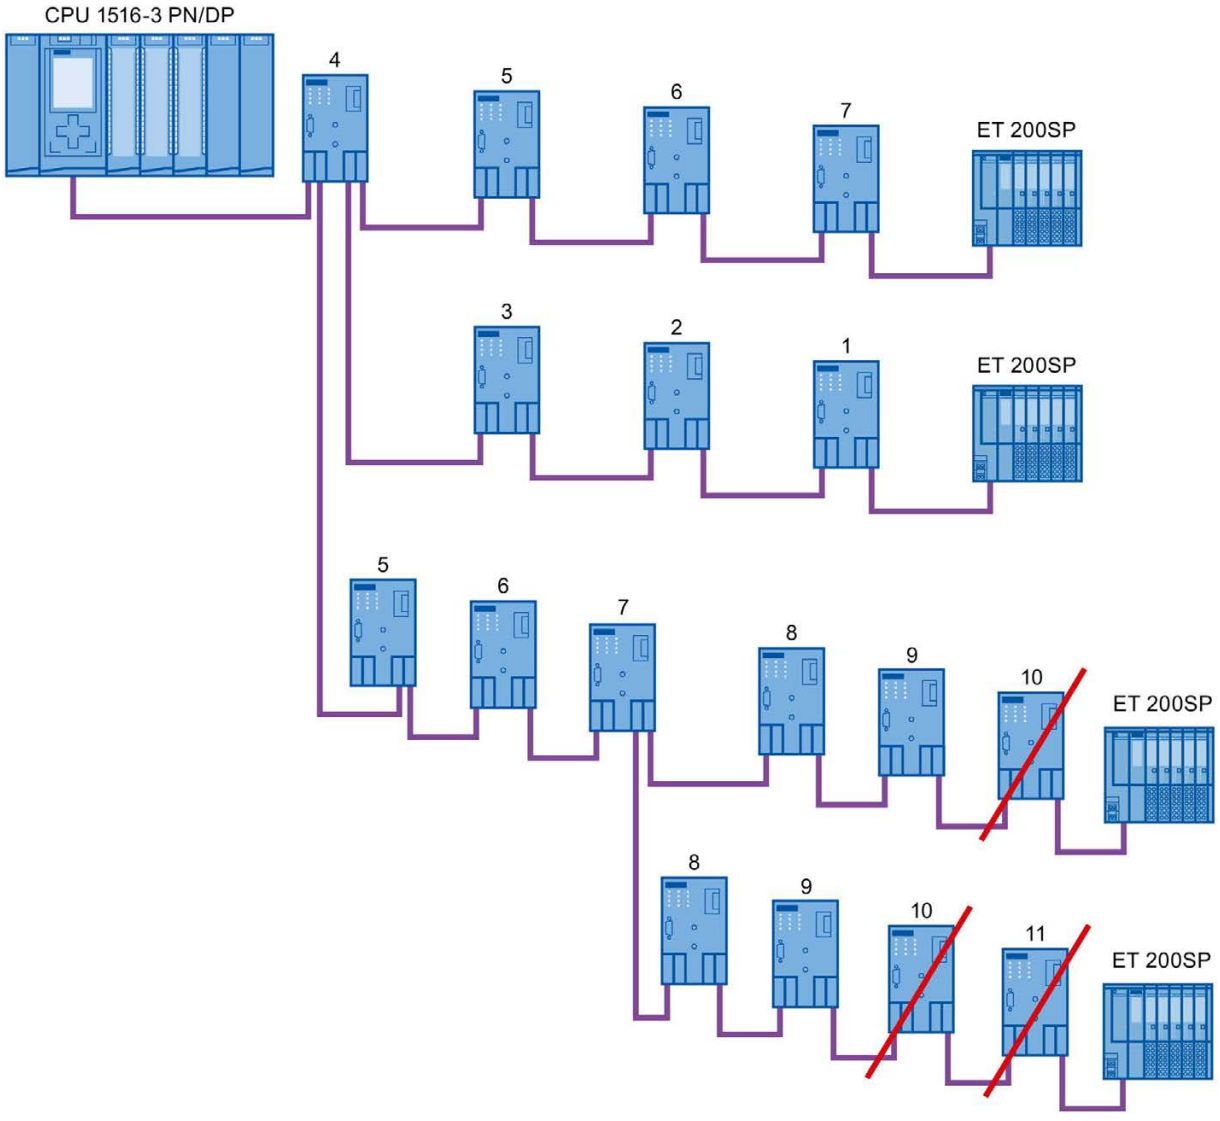

Figure 2-13 Layout with several segments, maximum cascade depth exceeded

Additional information

Additional information is available in the Diagnostic Repeater (http://support.automation.siemens.com/WW/view/en/7915183) manual.

2.2.4.3 OLM topology

Combination of electrical and optical networks with OLM

Additional distances can be covered by means of the Optical Link Module.

Because bus cables across several buildings are particularly vulnerable to damage caused by overvoltage (effect of lightning), the devices in the connected bus segment must be protected against overvoltage.

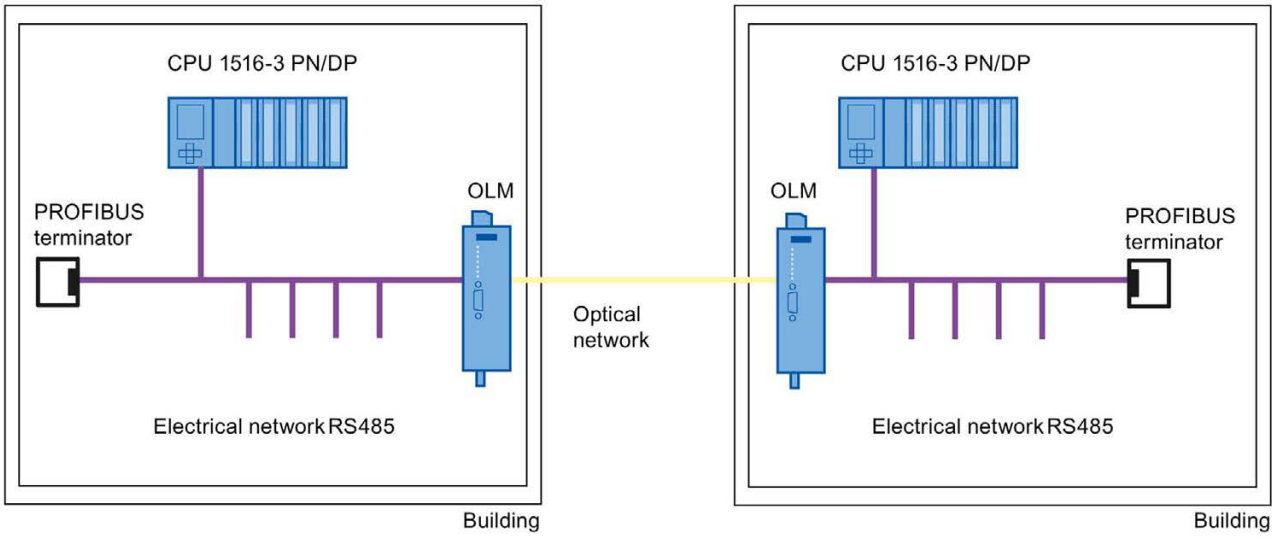

Figure 2-14 Combination of electrical and optical networks

2.2.4.4 WLAN topology

IWLAN/PB Link PN IO as gateway between Industrial Wireless LAN and PROFIBUS

The IWLAN/PB Link PN IO supports the use of IWLAN and WLAN antennas for wireless data transmission. This means the numerous PROFIBUS system services, for example, diagnostic by bus, can be used throughout.

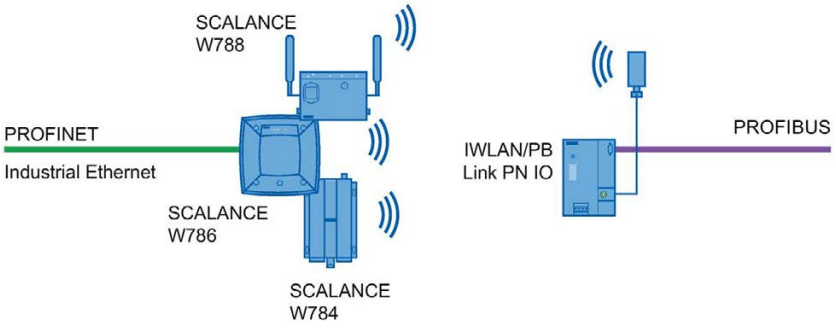

Figure 2-15 PROFIBUS and WLAN

2.2.4.5 Connecting PROFIBUS to PROFINET

PROFIBUS can be integrated in PROFINET. In this way, you can set up any hybrid systems consisting of fieldbus and Ethernet-based subsystems. This provides a continuous data exchange.

Coupling of PROFIBUS and PROFINET

With a proxy-capable PROFINET device that is equipped with a PROFIBUS interface in addition to a PROFINET interface, you can integrate existing PROFIBUS configurations into the PROFINET configuration.

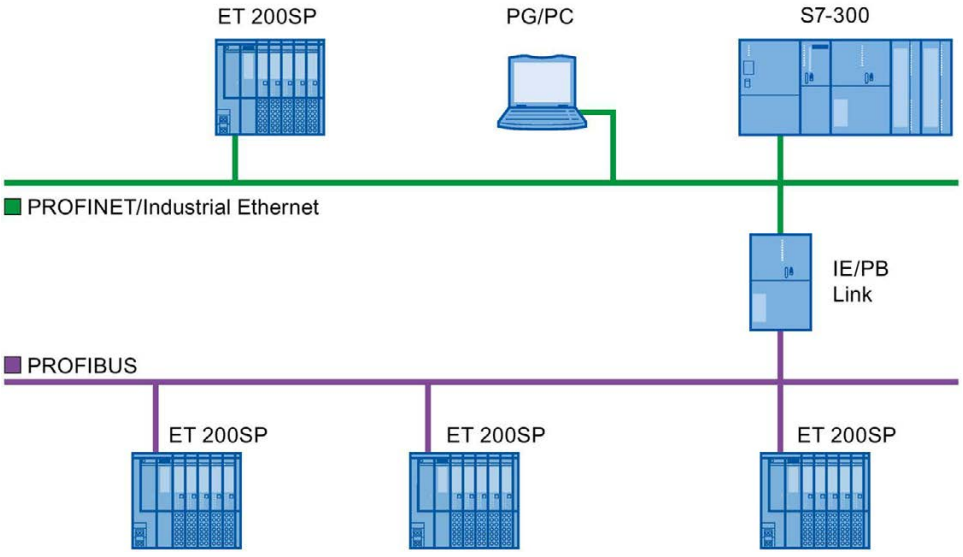

Figure 2-16 Connection of PROFIBUS and PROFINET with IE/PB link

PROFINET device with proxy functionality

The PROFINET device with proxy functionality is the substitute for a PROFIBUS device on Ethernet. The proxy functionality allows a PROFIBUS device to communicate not only with its master but also with all devices on PROFINET.

With PROFINET, existing PROFIBUS systems can be integrated into the PROFINET communication with the aid of an IE/PB link. The IE/PB link PN IO then handles communication via PROFINET on behalf of the PROFIBUS components.

Parameter assignment/addressing 3

To set up an automation system, you will need to configure, assign parameters and link the individual hardware components. The work needed for this is undertaken in the STEP 7 device, topology and network view.

Configuration

"Configuring" is understood to mean arranging, setting and networking devices and modules within the device or network view.

A PROFIBUS address is automatically assigned to each module. The addresses can be subsequently modified.

The CPU compares the preset configuration created in STEP 7 with the actual configuration of the plant. Errors can be detected and signaled immediately this way.

The exact procedure for configuring devices is described in detail in the STEP 7 online help.

Parameter assignment

"Parameter assignment" is understood to mean setting the properties of the components used. The settings for the hardware components and for data exchange are assigned, for example, activating diagnostics, input delay with DI.

The parameters are downloaded into the CPU and transferred to the corresponding modules when the CPU starts up. Modules can be replaced with ease because with SIMATIC CPUs the set parameters are automatically downloaded into the new module during each startup.

Adjusting the hardware to the project requirements

You need to adapt the hardware if you want to set up, expand or change an automation project. To do this, add hardware components to your layout, link them with existing components, and adapt the hardware properties to the tasks.

The properties of the automation systems and modules are preset so that in many cases you do not have to assign parameters again.

But parameter assignment is required in the following cases:

- You want to change the preset parameters of a module.
- You want to use special functions.
- You want to configure communication connections.

Basic procedure for creating a PROFIBUS DP system

- Configuration
  - Creating PROFIBUS devices and modules in STEP 7
  - Assigning the DP slave to a DP master (Page 43)
- Optional: Parameter assignment
  - Assigning the PROFIBUS address (Page 45)
  - Making network settings (Page 46)
  - Considering cable configuration (Page 49)
  - Considering additional network devices (Page 51)
  - Bus parameters – creating a user-defined profile (Page 52)
  - Configuring constant bus cycle time (Page 55)

3.1 Assigning the DP slave to a DP master

PROFIBUS DP system

A PROFIBUS DP system consists of a PROFIBUS DP master and its assigned PROFIBUS DP slaves. Once the devices have been placed in the network view or device view, STEP 7 assigns default parameter values to them. Initially, you only have to assign the DP slaves to one DP master.

Requirement

- The network view of STEP 7 is open.
- A CPU has been placed (e.g., CPU 1516-3 PN/DP).
- A DP slave has been placed (e.g., IM151-1 HF).

Procedure

To assign DP slaves to a DP master, follow these steps:

1. On the DP slave, use the left mouse button to click on the "Not assigned" link. The "Select DP master" menu opens.
2. Select the DP master in the menu to which you want to assign the DP slave.

   Result: A subnet with a DP system is created on the CPU. The CPU is now the PROFIBUS DP master. The DP slave is assigned to the DP master.
3. Repeat steps 1 and 2 for all other DP slaves that you want to assign to the DP master.

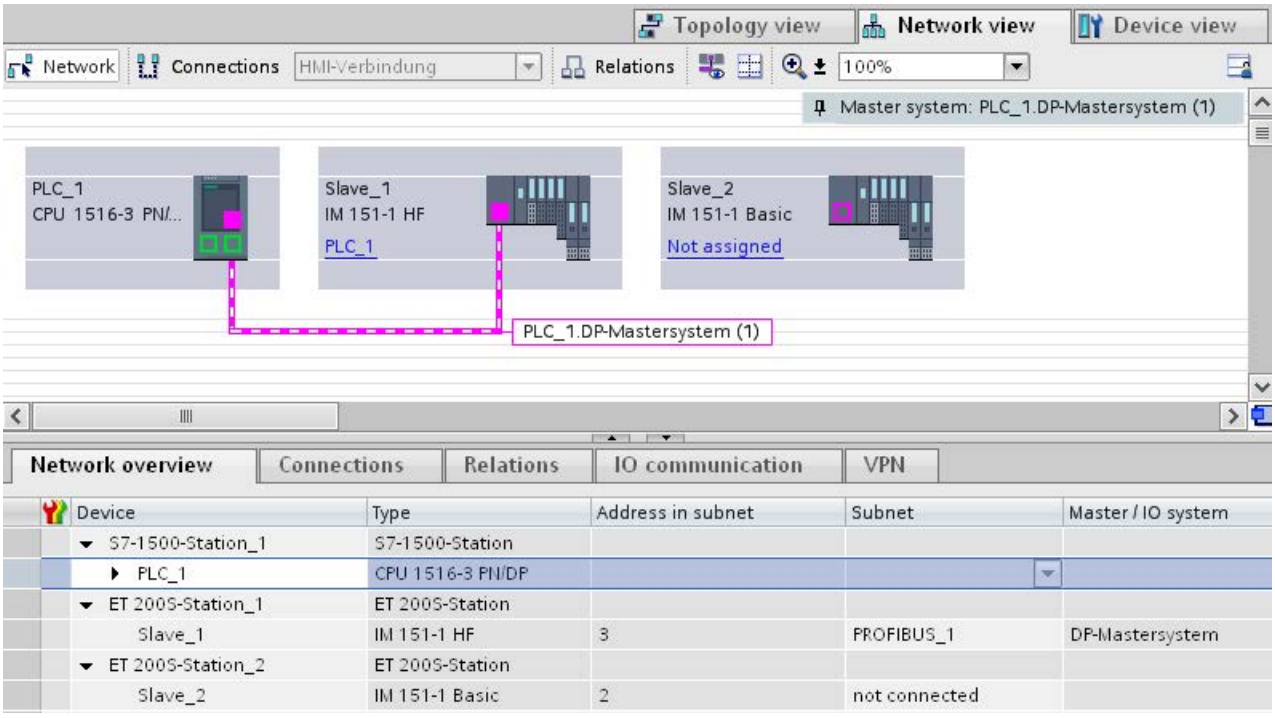

Figure 3-1 Assigning the DP slave to a DP master

Network overview

You can check the communication relationships of the activated interface in the network overview. The network overview is context-sensitive for selection in the network view:

- The selection of the CPU shows the DP communication of the CPU.
- The selection of the station shows the communication of the entire station.
- The selection of the interface shows the DP communication of the interface.

3.2 PROFIBUS address

Devices can be connected to the PROFIBUS subnet that communicate by means of configured connections or that are part of a PROFIBUS DP master system.

If the DP slave has already been assigned to a DP master, the PROFIBUS subnet to which the device is connected is automatically displayed under "Interface linked with".

In the Inspector window under "PROFIBUS", select the subnet to which the interface is linked or add a new subnet.

All devices of a subnet must have different PROFIBUS addresses.

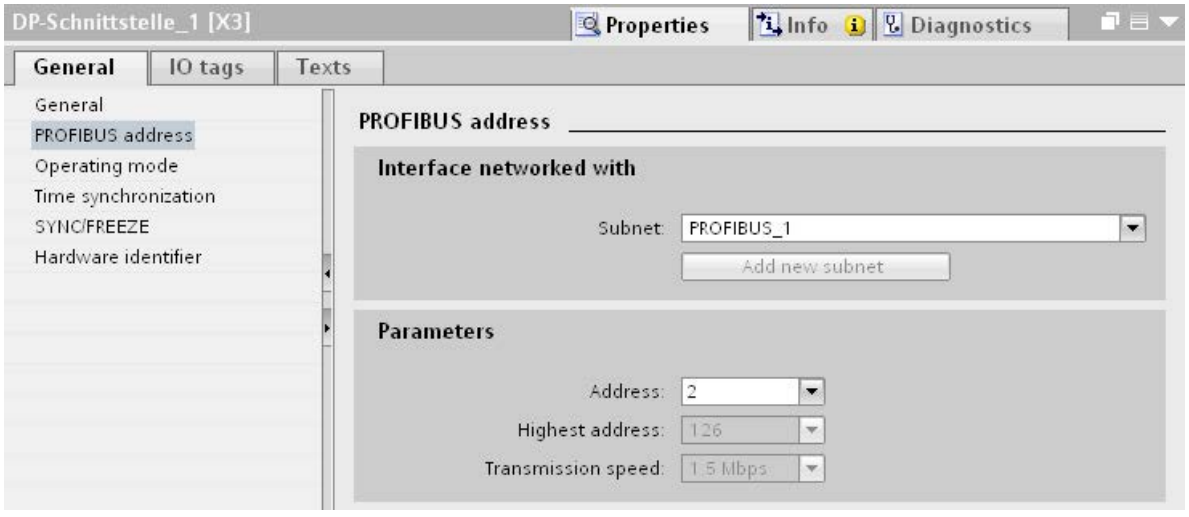

Figure 3-2 PROFIBUS address

Rules for address assignment

STEP 7 automatically assigns device addresses.

You can change the addresses if you observe the following points:

- Assign a unique PROFIBUS address to each device in the PROFIBUS network, each DP master and each DP slave in the PROFIBUS network.
- Depending on the DP slave, not all permitted PROFIBUS addresses are supported. For devices with BCD switches, it is often the case that only the PROFIBUS addresses 1 to 99 are supported.

Changing the PROFIBUS address

You change the PROFIBUS address under "Parameter".

3.3 Network settings

Highest PROFIBUS address (HSA)

Outputs the highest PROFIBUS address of an active device. PROFIBUS addresses greater than HSA are permitted for passive devices, but only up to 126.

Profile

Depending on the connected device types and the protocols used, different profiles are available on the PROFIBUS. The profiles differ with respect to their setting options and calculation of the bus parameters.

The PROFIBUS subnet will only work properly if the bus parameters of all devices have the same values.

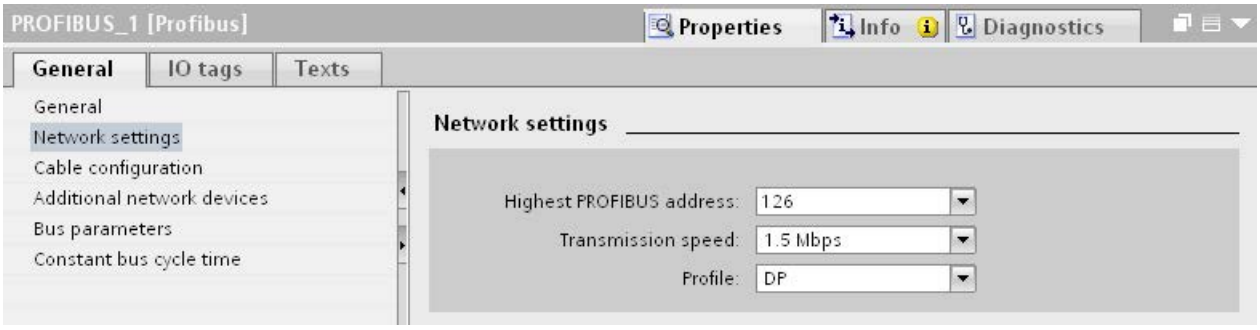

Figure 3-3 Network settings

Profiles and transmission rates

Table 3- 1 Profiles and transmission rates

Profiles	Supported transmission rates
DP	9.6 kbps to 12 Mbps
Standard	9.6 kbps to 12 Mbps
Universal (DP/FMS) (FMS is not supported)	9.6 kbps to 1.5 Mbps
User-defined	9.6 kbps to 12 Mbps

DP (recommended profile)

Select the "DP" profile if only devices meeting the requirements of the standard EN 61158-6-3 are connected to the PROFIBUS subnet. The setting of the bus parameters has been optimized for these devices. These include devices with DP master and DP slave interfaces of SIMATIC S7 as well as distributed I/O devices from third parties.

Note

Profile for constant bus cycle time and isochronous mode

DP is the recommended profile for the configuration of constant bus cycle time and isochronous mode.

Standard

Compared with the "DP" profile, the "Standard" profile gives you the option to take into consideration devices of another project or devices that have not been configured here for calculation of the bus parameters. The bus parameters are then calculated with a simple algorithm that was not optimized.

Universal (DP/FMS) (FMS is not supported)

Select the "Universal (DP/FMS)" profile if individual devices in the PROFIBUS subnet use the FMS service (e.g., CP 343-5, PROFIBUS FMS devices).

As with the "Standard" profile, here, too, you have the option to take additional devices into consideration for calculation of the bus parameters.

User-defined

The PROFIBUS subnet will only work properly if the parameters for the profile have been synchronized. Select the "User-defined" profile if none of the other profiles "match" for operation of a PROFIBUS device and if you have to adapt the bus parameters for your special layout.

You cannot configure all theoretically possible combinations with the user-defined profile either. The PROFIBUS standard prescribes some parameter limits depending on other parameters. It is, for example, not permitted that a responder responds (Min Tsdr) before the initiator is able to receive the frame (Trdy). These standard specifications are also checked in the "User-defined" profile.

Note

User-defined settings

Use user-defined settings only if you are familiar with the PROFIBUS parameters. It is usually better to work with the "DP" profile.

Contact Customer Support (Page 91) if you have any questions.

The bus parameters that were last valid on the PROFIBUS subnet are automatically set as user-defined. If the "DP" bus profile was valid for the subnet, for example, the bus parameters for "DP" are set in the "User-defined" bus profile. You can modify the parameters based on these settings.

The monitoring times are not automatically recalculated in the "User-defined settings" setting so that the uniformity of the set values is not changed without your knowledge, for example, to configure other configuration tools.

You can calculate the monitoring times Ttr and watchdog based on the parameters you have set. To do so, click on the "Recalculate" button.

See also

Additional network stations (Page 51)

3.4 Cable configuration

Considering cable configuration

Information on the cable configuration can be taken into consideration for calculation of the bus parameters. To do so, select the check box "Take into account the following cable configuration" in the properties of the PROFIBUS subnet.

The other information depends on the type of cable used.

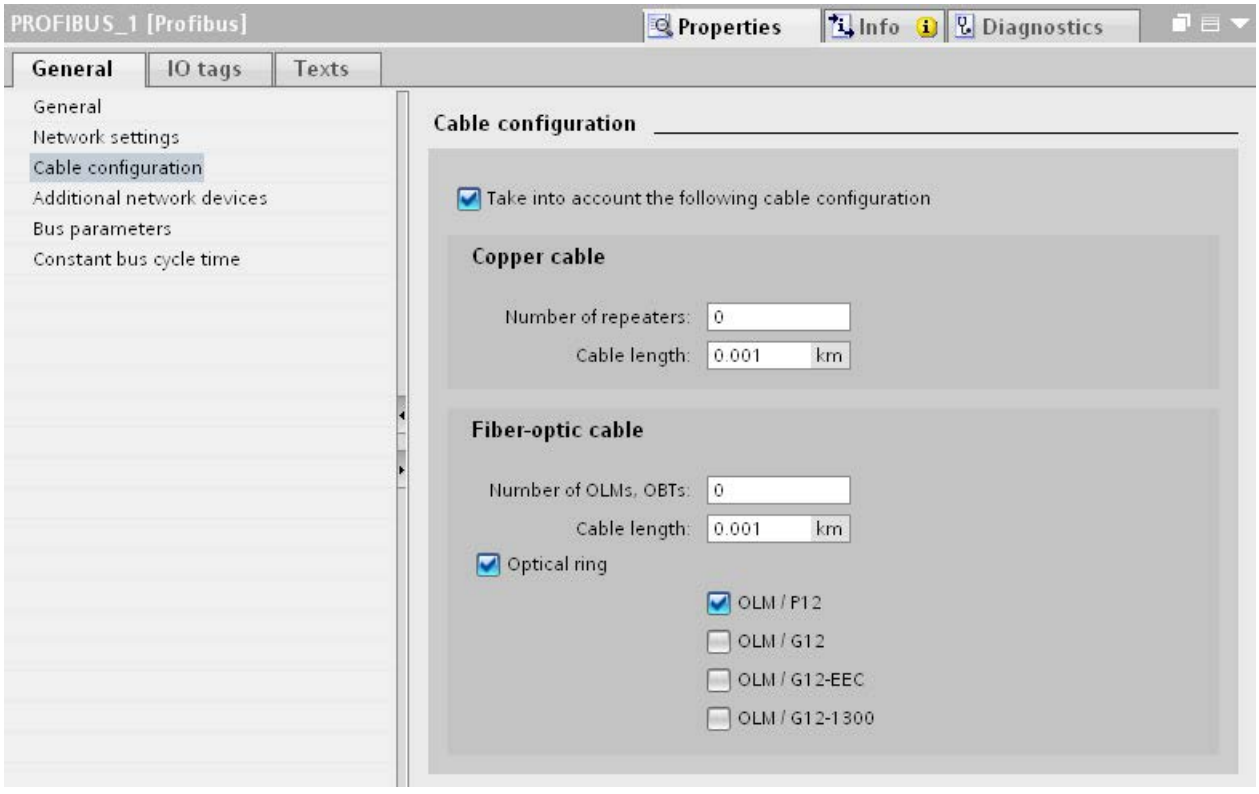

Figure 3-4 Cable configuration

Cable configuration: Fiber-optic cables/optical ring

The calculation depends on the used OLM types. Select the corresponding check box. Multiple selections are possible.

Adapting bus parameters in the optical ring

With the layout as ring, there is a kind of redundancy because you have the option to address all devices using the ring structure even if the connection between two devices is interrupted.

The following configuration conditions must be met in the optical ring:

- A free address below HSA (Highest Station Address)
- Increase of the retry value to at least 3

  (Network settings: user-defined profile)
- Checking and adapting of the slot time

  (Network settings: user-defined profile; bus parameters: Tslot parameter:

  You need short slot time values for OLM / P12, medium slot time values for OLM / G12 and OLM / G12-EEC and high slot time values for OLM / G12-1300. This results in a high performance for small networks and a medium to low performance with medium to large networks.

Additional information

Additional information on adaptation of the retry value and the slot time is available in the PROFIBUS Network Manual (http://support.automation.siemens.com/WW/view/en/35222591).

3.5 Additional network stations

Communication load - considering additional network stations

The bus parameters depend on the communication volume of the active network stations. There are differences between cyclical communication (DP) and connection-oriented, acyclical communication (S7 communication, Send/Receive (FDL)). Contrary to DP, the number and size of the communication jobs (communication load) depends on the user program. This means the communication load cannot always be determined automatically.

If you select the check box "Consider the following network stations", you can consider network stations in the calculation of the bus times that were not configured in the project.

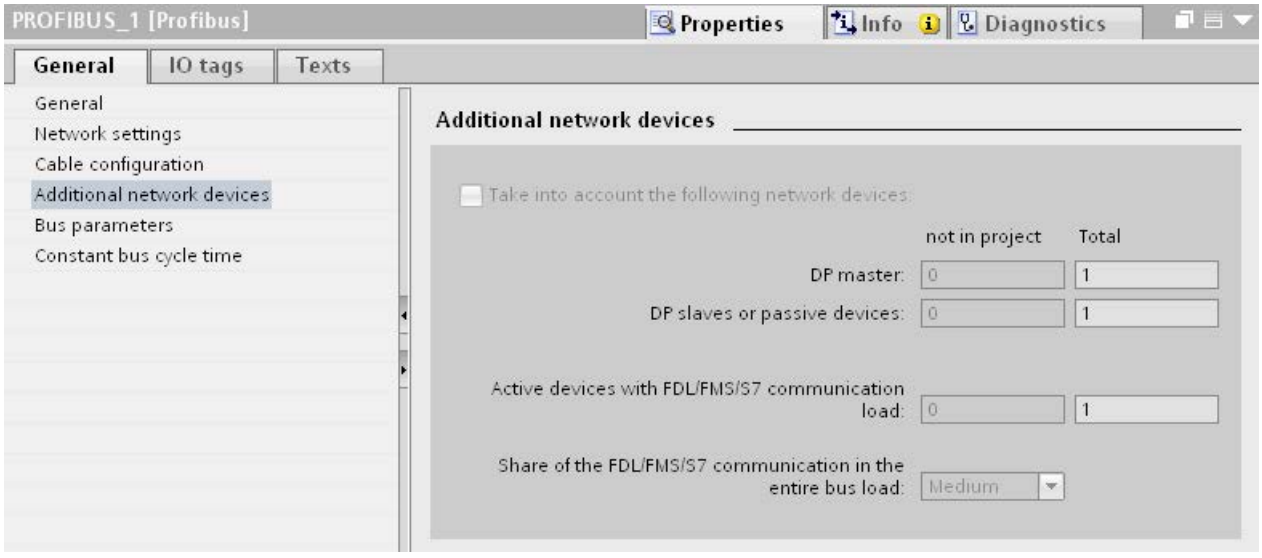

Figure 3-5 Additional network stations

Calculating the bus times

You can specify a network configuration in the parameter group "Additional network stations" for calculation of the bus times that deviates from the configured network configuration.

The network configuration is available for the following profiles:

- Standard
- Universal (DP/FMS)
- User-defined

Quantification of the communication load

The following settings are possible to take the communication load into consideration:

- Number of network stations that are not configured
- Information on the communication load from the user programs for FDL or S7 communication. You can choose from the following levels:
  - Low: Typical for DP, no larger data communication except DP.
  - Medium: Typical for mixed operation of DP and other communication services (e.g., S7 communication), if DP has high time requirements and with medium, acyclical communication volume.
  - High: For mixed operation of DP and other communication services (e.g., S7 communication), if DP has low time requirements and with high, acyclical communication volume.

3.6 Bus parameters

Introduction

Bus parameters control the transmission behavior on the bus. Each device on the bus must correspond with the bus parameters of other devices.

Note

The PROFIBUS subnet will only work properly if the parameters for the bus profile have been synchronized. Change the preset values only if you are familiar with the parameter assignment of the bus profile for PROFIBUS.

Cyclical distribution of the bus parameters

If the check box "Activate cyclical distribution of bus parameters" is selected under "Bus parameters" with the selected PROFIBUS subnet in the Inspector window, the bus parameters are sent cyclically during operation by the modules that support this function. This way you can, for example, connect a programming device to the PROFIBUS during operation.

Disable this function in the following cases:

- In constant bus cycle time mode to minimize the bus cycle.
- If third-party devices are connected in the PROFIBUS subnet whose protocol uses the DSAP 63 (Destination Service Access Point) for multicast.

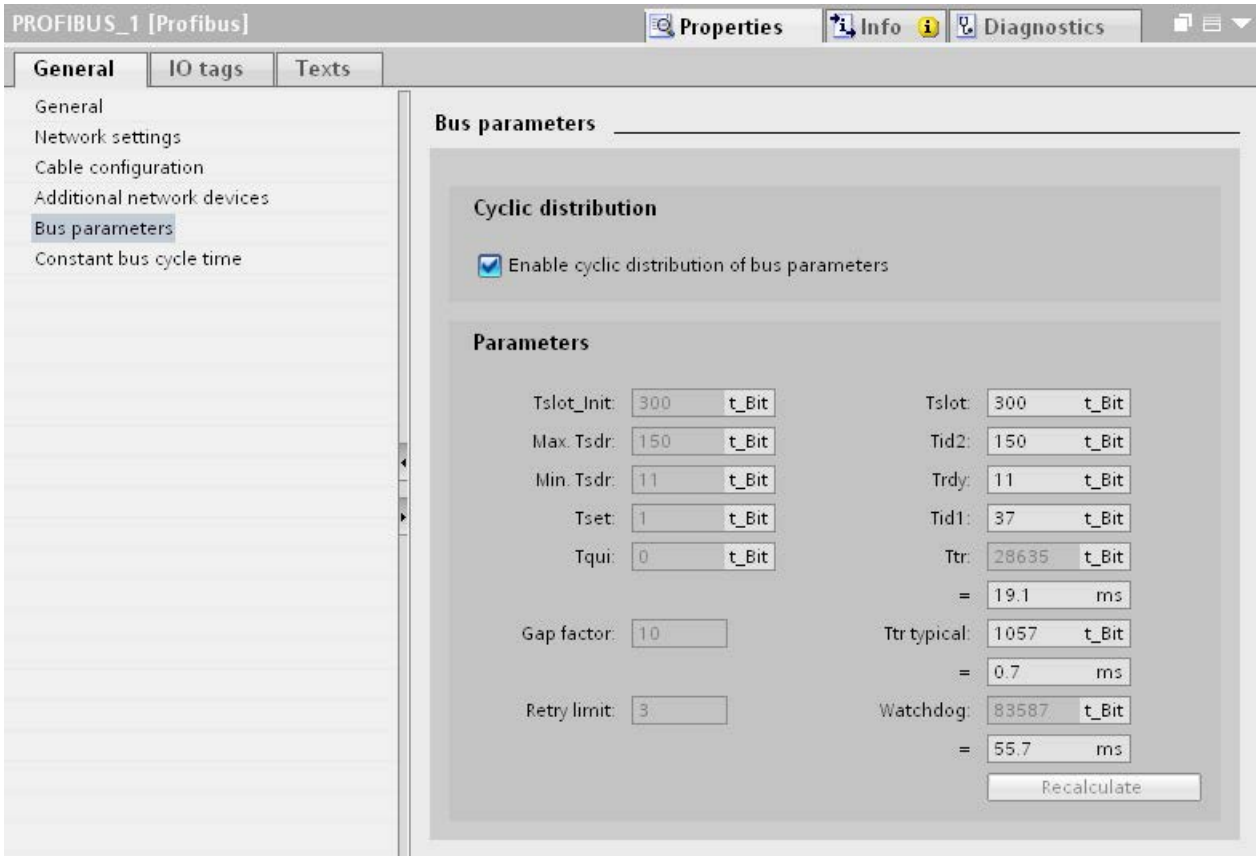

Figure 3-6 Bus parameters

Bus parameters for the bus profile of PROFIBUS subnets

Note

Display of offline values

The offline values of the bus parameters are always displayed even if they are connected online with the target system.

Table 3- 2 Bus parameters - value ranges

Bus parameters	Adjustable [1]	Limit values
Tslot_Init	Yes	Max. Tsdr + 15 <= Tslot_Init <= 16.383 t_Bit
Max. Tsdr	Yes	35 + 2*Tset + Tqui <= Max. Tsdr <= 1,023 t_Bit
Min. Tsdr	Yes	11 t_Bit <= Min. Tsdr <= MIN(255 t_Bit, ... Max. Tsdr - 1, 34 + 2*Tset + Tqui)
Tset	Yes	1 t_bit <= Tset <= 494 t_bit
Tqui	Yes	0 t_bit <= Tqui <= MIN(31 t_bit, Min. Tsdr - 1)
GAP factor	Yes	1 <= GAP factor <= 100
Retry limit	Yes	1 <= Retry limit <= 15
Tslot (slot time)	No	-
Tid2	No	Tid2 = Max. Tsdr
Trdy	No	Trdy = Min. Tsdr
Tid1	No	Tid1 = 35 + 2*Tset + Tqui
Ttr (Target Rotation Time)	Yes	256 t_Bit <= Ttr <= 16,777,960 t_bit
Ttr typical	No	This time is for information only and is not transmitted to the devices.
Watchdog		10 ms <= Watchdog <= 650 s

[1] depending on bus profile

User-defined bus profile

Use the following settings to create a user-defined bus profile:

- minimum Target Rotation Time (Ttr) = 5000x HSA (highest PROFIBUS address of an active device)
- minimum watchdog (Watchdog) = 6250x HSA

Recalculate

Use the button "Recalculate" to recalculate the parameters.

3.7 Constant bus cycle time

Constant bus cycle time

The DP master addresses its assigned DP slaves cyclically. S7 communication may cause the intervals to vary. You can enable a "bus cycle with constant bus cycle time" to achieve identical intervals. This ensures data transmission at the same (constant bus cycle time) intervals.

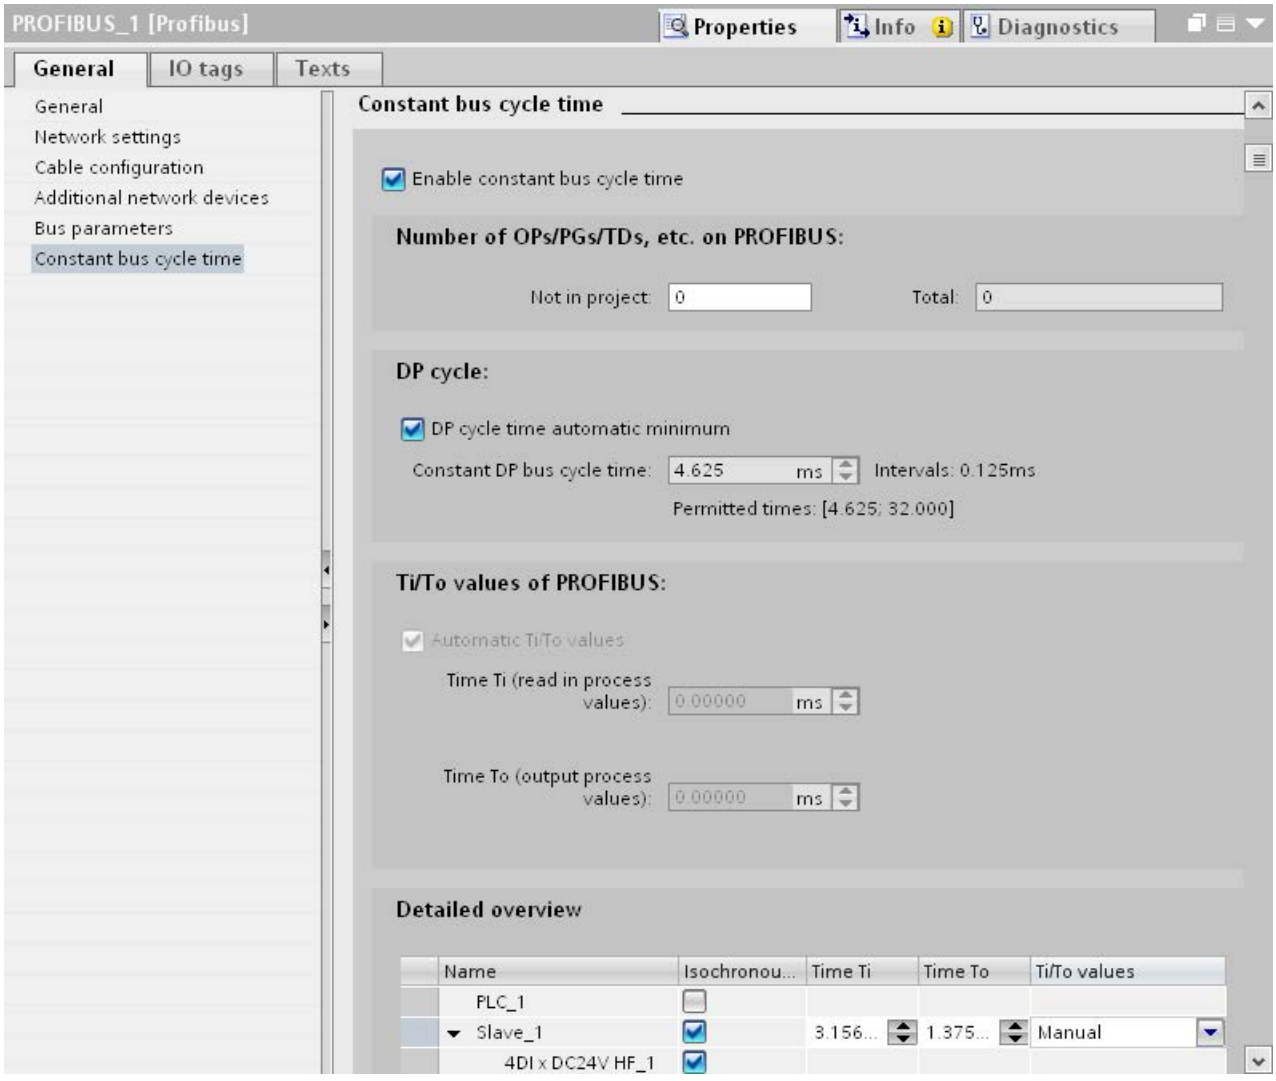

Figure 3-7 Enabling a bus cycle with constant bus cycle time

Number of OPs/PGs/TDs at the PROFIBUS

Here you enter the number of devices that are not configured.

Increasing DP cycle time manually

The following situation can occur especially with very short DP cycle times:
The runtime of the user program is greater than the shortest cycle (see Technical specifications of the CPU, section "Isochronous mode"). You have to manually increase the automatically calculated DP cycle time in this case.

Configuring isochronous mode (Page 67)

Diagnostics 4

4.1 Overview

Diagnostics options

In case of an error you can determine the current status of your automation system and react specifically by using the event-related diagnostics and the evaluation of interrupts.

You can use the following options for diagnostics of the PROFIBUS components:

- Determine the status of the system using the Lifelist in STEP 7.
- Evaluate the module status, error and message texts by using the display of the S7-1500 CPU.
- Run cable diagnostics during operation by means of the diagnostics repeater.
- Evaluate the diagnostics and interrupt behavior in isochronous mode. (Page 70)
- Determine status information for fault localization and fault rectification by using the DP/PA coupler FDC 157-0 configured as PROFIBUS diagnostics slave.

Additional information

Additional information on diagnostics is available in these manuals:

- In the Diagnostics repeater for PROFIBUS-DP (http://support.automation.siemens.com/WW/view/en/7915183) manual for diagnostics with STEP 7, diagnostics in the user program, monitoring function isochronous PROFIBUS, topology display in STEP 7.
- In the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual for diagnostics options that are available for the SIMATIC systems S7-1500, ET 200MP, ET 200SP and ET 200AL.
- In the PROFIBUS Network Manual (http://support.automation.siemens.com/WW/view/en/35222591) system manual for diagnostics of fiber-optic cables.
- In the DP/PA Coupler, Active Field Distributors, DP/PA Link and Y Link (http://support.automation.siemens.com/WW/view/en/1142696) operating instructions.
- In the Web Server (http://support.automation.siemens.com/WW/view/en/59193560) function manual for diagnostics options (based on the functionality of the CPU).

4.2 Diagnostics using the display of the S7-1500

Displays

Each CPU in the S7-1500 automation system has a front cover with a display and operating buttons. Control and status information is displayed in different menus on the display. You use the operating buttons to navigate through the menus.

The following states can be evaluated on the display:

- Module status for central and distributed modules
- Error and alarm texts (system diagnostics, user-defined alarms)

Module status

From the station overview you go to the module status for a distributed module via the module overview.

Figure 4-1 Example: Station overview, module overview, module status

Error and alarm texts

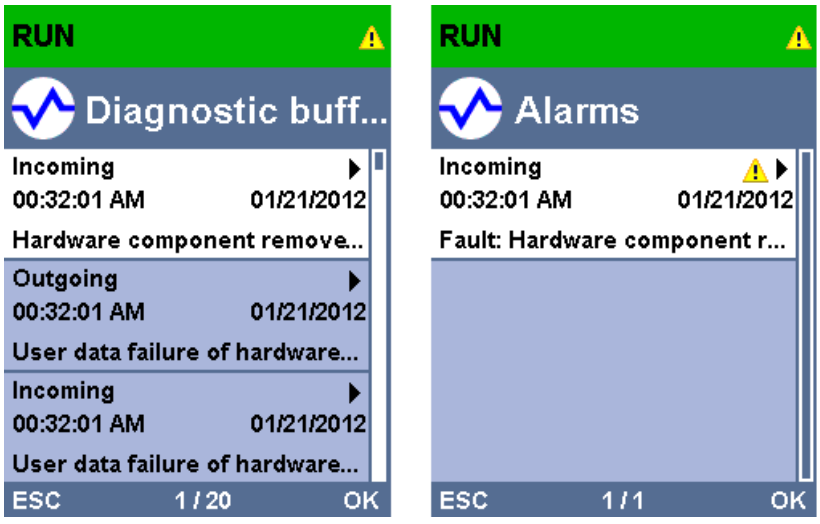

Figure 4-2 Example: Diagnostic buffer, alarms

Additional information

Additional information on the topic "Functions and operation of the display" is available in the documentation for the S7-1500 automation system on the Internet (http://support.automation.siemens.com/WW/view/en/59191792).

4.3 Diagnostics with the diagnostic repeater

Introduction

The diagnostic repeater is a repeater that can monitor two segments of a RS485-PROFIBUS subnet (copper cable) during operation and signal cable faults to the DP master by sending a diagnostic frame. Fault location and the cause of the fault can be displayed in plain text by means of STEP 7 as well as operator control and monitoring devices (SIMATIC HMI).

With its cable diagnostics during operation, the diagnostic repeater allows you to detect and localize cable faults early on. This means plant faults are detected early and plant downtimes can be prevented.

Diagnostic functions

- The diagnostic function provides the location and the cause of cable faults, such as wire break or missing terminating resistors. The fault location is specified relative to the devices present, for example "Break on signal line A and/or B".
- Reading out the saved diagnostic and statistical information.
- Monitoring of the isochronous PROFIBUS, e.g., violation of cycle time.
- Providing identification data.

Additional information

Additional information on diagnostics with STEP 7 and for reading out the diagnostics with the user program is available in the Diagnostic repeater for PROFIBUS DP (http://support.automation.siemens.com/WW/view/en/7915183) manual.

4.4 I&M data (Identification and Maintenance)

Definition and properties

Identification and maintenance data (I&M) is information saved in a module to provide support when:

- Checking the plant configuration
- Locating hardware changes in a plant

Identification data (I data) is module information (some of which may be printed on the module housing) such as the order and serial number. I data is read-only, vendor-specific module information.

Maintenance data (M data) is system-specific information such as the installation location and date. M data is generated in the course of configuration and is written to the module memory.

The modules can be uniquely identified in online mode by means of the I&M data.

Additional information

Information if and to what extent a DP device supports I&M data is available in the respective device manual of the device.

Functions

5

5.1 Isochronous mode

5.1.1 What is isochronous mode?

Why isochronous mode?

Assuming public transport were to operate at maximum speed while reducing stop times at the passenger terminals to absolute minimum, the last thing many potential passengers would notice of the departing contraption are its red tail lights. The overall travel time is, however, decided by the train, bus or underground clock, because well adjusted timing is essential to a good service. This also applies to distributed automation engineering. Not only fast cycles but also the adaptation and synchronization of the individual cycles result in optimum throughput.

Just-In-Time

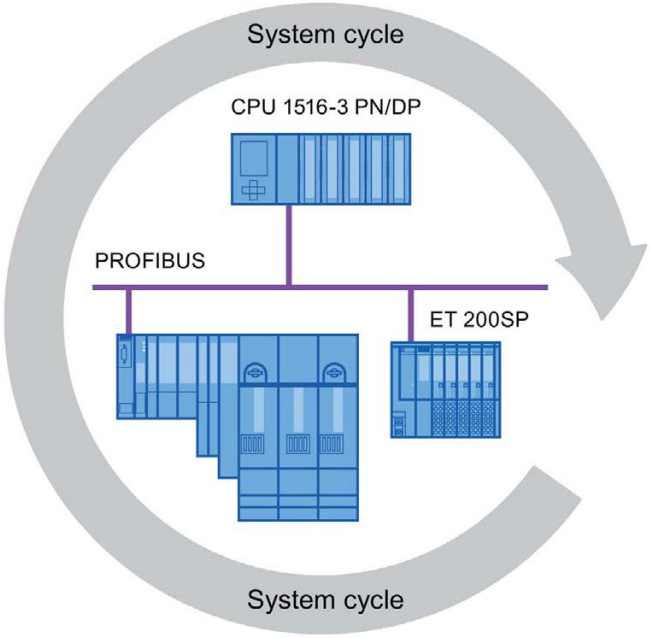

Figure 5-1 System cycle

The high speed and reliable reaction time of a system operating in isochronous mode is based on the fact that all data is provided just-in-time. The constant bus cycle time PROFIBUS DP cycle beats the time here.

Advantages of isochronous mode

The use of isochronous mode provides:

- Optimized controls
- Determinism
- Consistent (simultaneous) reading of input data
- Consistent (simultaneous) output of output data

5.1.2 Use of isochronous mode

The system property "isochronous mode" enables recording of measured values and process data in a defined system cycle. Signal processing takes place in the same system cycle all the way to switching to the "output terminal". This means isochronous mode improves the control quality and provides greater manufacturing precision. Isochronous mode drastically reduces the possible fluctuations of process response times. The time-assured processing can be used for a higher machine cycle.

Isochronous mode is basically always the choice when acquisition of measured values needs to be synchronized, movements need to be coordinated and process reactions need to be defined and take place simultaneously. This means the areas of applications for isochronous mode are manifold.

5.1.3 Isochronous applications

Example: Isochronous measurement at several measuring points

QC requires precise measurement of dimensions within a camshaft production process.

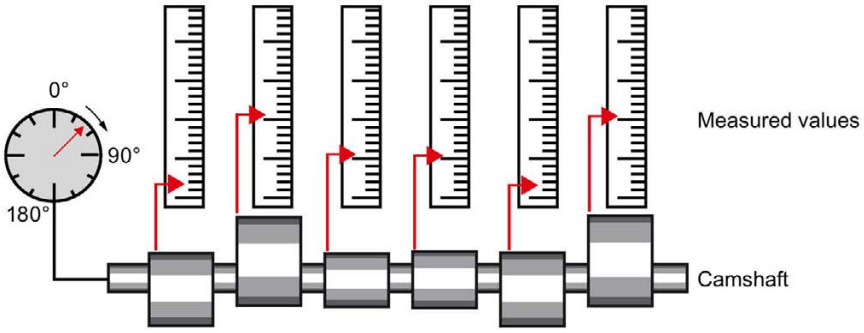

Figure 5-2 Measuring of camshafts

Isochronous workflow

By using the system property "isochronous mode" and the associated simultaneous measured value acquisition, measurement can be performed continuously and the time required for measurement is reduced. Resultant workflow:

- Continuous turning of the camshaft.
- During the continuous turning, measure the positions and cam excursion synchronously.
- Process the next camshaft.

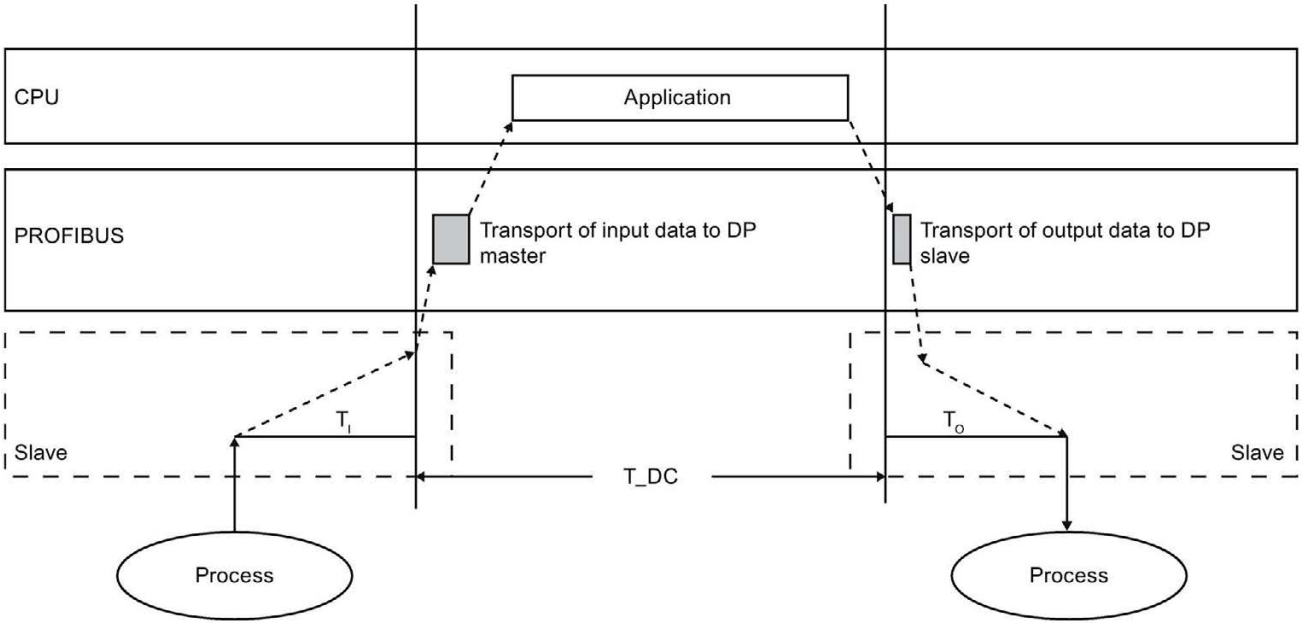
All camshaft positions and the corresponding measured values (red) are measured synchronously within a single rotation of the camshaft. This increases machine output and maintains or enhances precision of the measurement.

5.1.4 Sequence of synchronization

From reading of input data to output of output data

The sequence of all components involved in the synchronization is explained in the paragraphs below:

- Isochronous reading of input data
- Transport of input data by means of the PROFIBUS subnet to the DP master (CPU)
- Further processing in the isochronous application of the CPU
- Transport of output data by means of the PROFIBUS subnet to the output DP slave
- Isochronous output of output data



T_DC Date cycle

T_I Time for reading the input data

T_O Time for output of output data

Figure 5-3 Time sequence of synchronization

To ensure that all input data is ready for transportation via the PROFIBUS DP line when the next PROFIBUS DP cycle begins, the I/O read cycle has a lead time T_I so that it starts earlier. The T_I is the "flash gun" for all inputs. This T_I is necessary to compensate for analog to digital conversion, backplane bus times, etc. The lead time T_I can be configured by STEP 7 or by the user. We recommend that you have T_I assigned automatically by STEP 7 .

The PROFIBUS DP line transports the input data to the DP master. The synchronous cycle interrupt OB SynchronousCycle is called. The user program in the synchronous cycle interrupt OB decides the process reaction and provides the output data in time for the start of the next data cycle. The length of the data cycle is always configured by the user.

T_o is the compensation from the backplane bus and the digital to analog conversion within the slave. The T_o is the "flash gun" for all outputs. The time T_o can be configured by STEP 7 or by the user. We recommend that you have T_o assigned automatically by STEP 7.

Without isochronous mode, application, data transmission and field devices have their own, unsynchronized processing cycles; these result in a higher total cycle time with high jitter. With isochronous mode, application, data transmission and field device are synchronized resulting in a minimum total cycle with minimum jitter.

Isochronous mode and non isochronous mode distributed I/O

It is possible to combine isochronous mode distributed I/O with non isochronous mode distributed I/O on one DP master.

5.1.5 Requirements for configuration

Note the following requirements for configuration of isochronous mode:

- Isochronous mode cannot be used in optical PROFIBUS networks.
- Constant bus cycle time and isochronous mode are only possible with the bus profiles "DP" and "User-defined".
- Isochronous mode is only possible with the DP interfaces integrated in the CPU. Isochronous mode with CPs for PROFIBUS is not possible.
- Only the constant bus cycle time master is permitted as active station on the isochronous PROFIBUS DP. OPs and PGs (for example, PCs with PG functionality) influence the time behavior of the isochronous DP cycle and are therefore not permitted.
- Isochronous mode is not permitted across lines.
- Isochronous I/O can only be processed in process image partitions. Isochronous consistent data transmission is not possible without the use of process image partitions. The adherence to quantity structures is monitored because the number of slaves and bytes on the DP master system is limited for each process image partition.
- The addresses of isochronous modules must be located in a process image partition.
- Full isochronous mode from "terminal" to "terminal" is only possible if all components involved in the chain support the system property "isochronous mode".

  Make sure you look for the entry "Isochronous mode" or "Isochronous processing" in the information box of the module when you select it in the catalog.
- When you configure isochronous mode, you may not assign a SYNC/FREEZE group to the slave.

5.1.6 Configuring isochronous mode

Introduction

A SIMATIC automation solution can be connected to the isochronous PROFIBUS with the isochronous mode function. Isochronous mode guarantees the synchronous reading of input data, the processing and output of output data at the same (isochronous) intervals.

Basic procedure for configuration of isochronous mode

1. Setting the properties for isochronous mode on the DP slave:
   - Isochronous DP cycle
   - Isochronous mode of the modules
2. Setting the properties for isochronous mode on the modules:
   - Synchronous cycle interrupt (SynchronousCycle)
   - Process image partition
   - Input delay
3. Create user program with access to isochronous I/O

Requirement

- The network view in STEP 7 is open.
- A CPU has been placed (e.g., CPU 1516-3 PN/DP).
- An interface module has been placed and networked with the CPU (e.g., IM 151-1 HF).
- I/O modules have been placed (e.g., 2DI x DC24V HF and 2DO x DC24V/0,5A HF).

Configuring isochronous mode on the DP slave

1. Select the DP slave in the network view and navigate to the "isochronous mode" area in the Inspector window.
2. Enable the option for synchronization to the DP cycle for the DP slave.

   Default: The DP slaves get the Ti/To values from the subnet which means the values are automatically the same for all DP slaves of the DP master system.
3. Enable the "Isochronous mode" option the the "Detail view" for all I/O modules you want to operate in isochronous mode.
4. Repeat steps 1 and 3 for all DP slaves that you want to operate in isochronous mode.

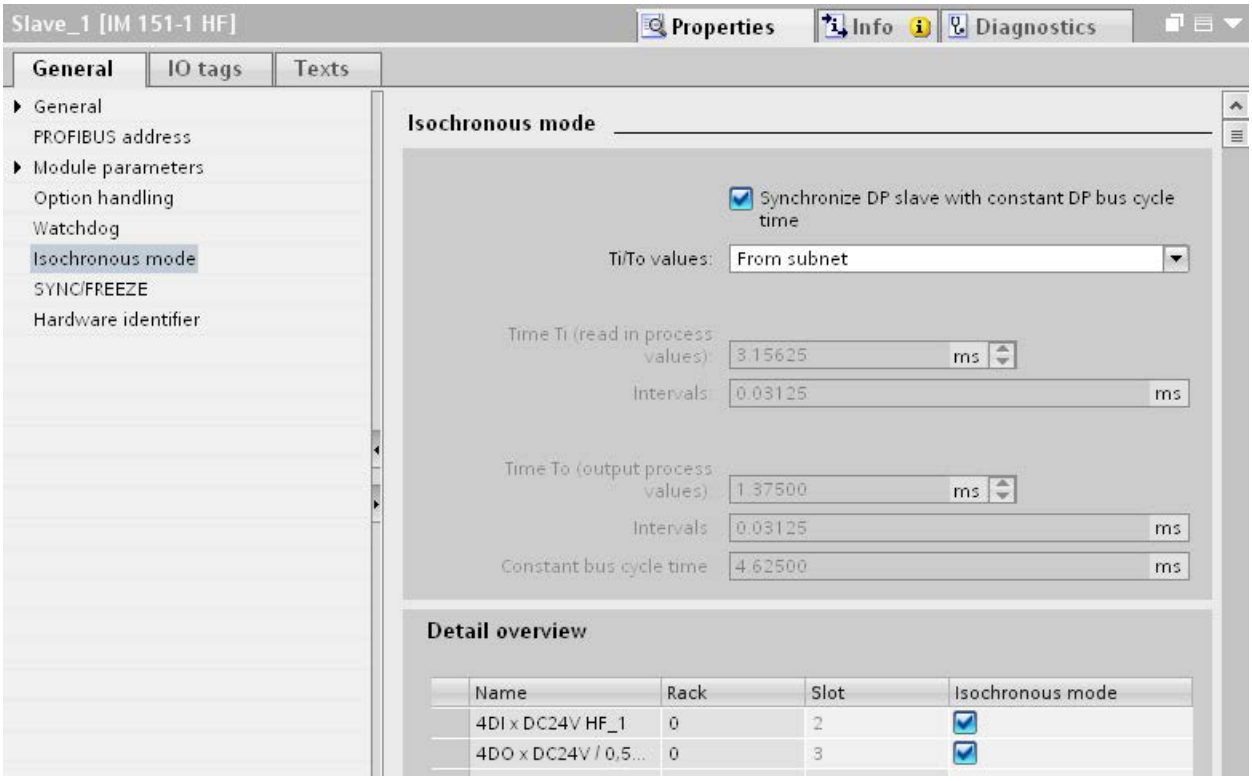


Figure 5-4 Configuring isochronous mode on the DP slave

Configuring synchronous cycle interrupt on the I/O module

1. Select an I/O module in the device view and navigate to the "I/O addresses" area in the Inspector window.
   – The option for isochronous mode is selected.
2. Select the synchronous cycle interrupt in the drop-down list.

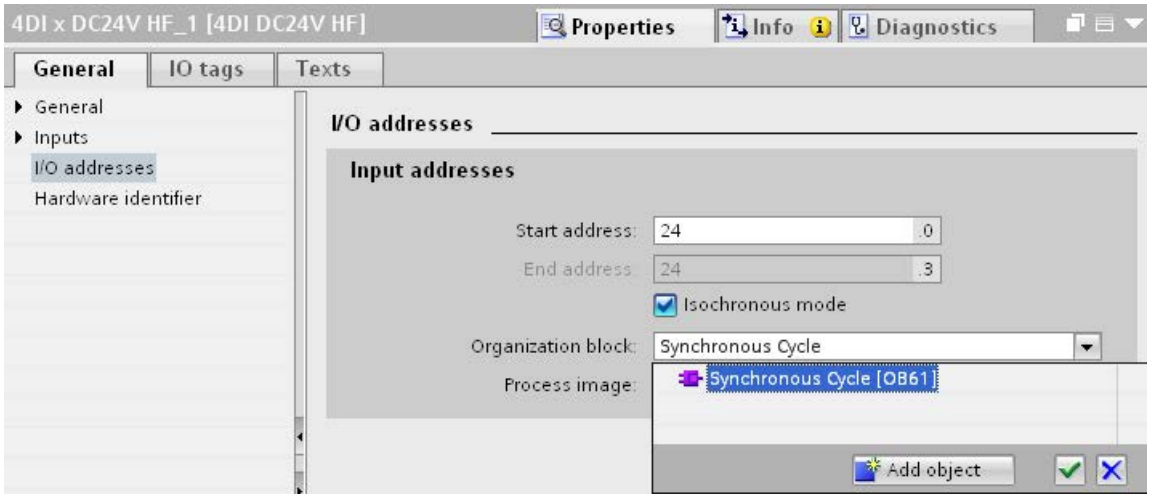

Figure 5-5 I/O addresses - creating the synchronous cycle interrupt OB

3. Assign the process image partition configured in the CPU.

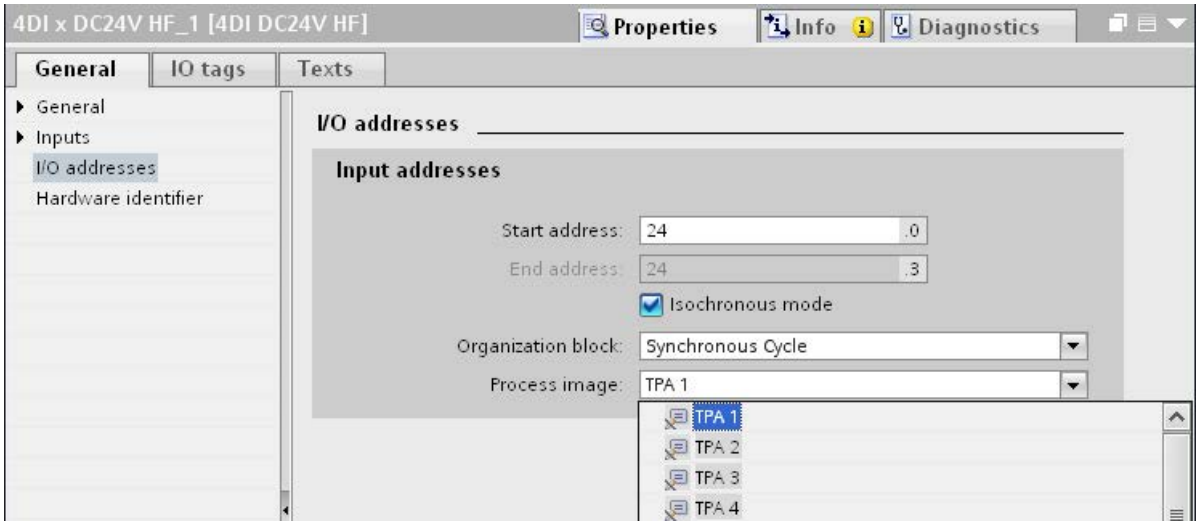

Figure 5-6 I/O addresses - assigning process image partitions

4. Repeat steps 1 and 3 for all I/O modules that you want to operate in isochronous mode.

Programming isochronous mode

To operate your plant in isochronous mode, the user program must be structured accordingly. This means you have to add a synchronous cycle interrupt in the STEP 7 project tree.

You access the isochronous I/O by means of a process image partition, which means the addresses of the isochronous modules must be located in a process image partition. You program access to isochronous I/O with the "SYNC_PI" instructions (updating the process image partitions of the inputs) and "SYNC_PO" (updating the process image partition of the outputs) in the synchronous cycle interrupt OB.

You call the "SYNC_PI" instruction at the start of the synchronous cycle interrupt OB, provided you have selected the automatic setting for the delay time. You call the "SYNC_PO" instruction at the end of the synchronous cycle interrupt OB.

5.1.7 Diagnostics and interrupt functions

The diagnostic and interrupt functions of STEP 7 are available for isochronous mode. These reduce downtimes and simplify localization and elimination of faults.

Events, causes of errors and remedies

Below, you will find the events for diagnostic and interrupt functions and remedies for the problem.

Table 5- 1 Events, causes of errors and remedies

Event	Cause of the error	Remedy
• Synchronous cycle interrupt OB is started with the input parameter EventCount > 0 (number of lost OB calls since last OB call) If configured: • Call of the time error OB • Diagnostic buffer entry "Buffer overflow for OB6x events"	The synchronous cycle interrupt OB takes too long.	• Shorten the synchronous cycle interrupt OB. • Increase the DP cycle. • Reduce the delay time setting (setting with isochronous mode at synchronous cycle interrupt OB).
Error (negative RetVals) when updating the isochronous process image partition with SYNC_PI / SYNC_PO: • Consistency warning • Update time is after / before the permitted access window.	SYNC_PI / SYNC_PO are not called in the permitted access window in the synchronous cycle interrupt OB, which means they are called or processed during the I/O data transfer on PROFIBUS.	• Increase the delay time. • Increase the DP cycle. • Adapt the program.
Error when updating the isochronous process image partition with SYNC_PI / SYNC_PO: • Access error	DP slave / module does not respond / is not available.	

5.1.8 Parameter settings for isochronous mode

Parameter changes as task of the field service technician

The task of a field service technician is to maintain the production process.

In this context the technician has to detect, localize and eliminate errors and performance losses of isochronous mode.

All parameters which influence isochronous mode can be checked and configured using the "Isochronous mode" dialog box.

Parameters should only be changed by experienced users or service technicians.

5.1.8.1 Viewing isochronous mode parameters

"Isochronous mode" dialog box

1. Select "Properties > Isochronous mode" in the Inspector window.

   The "isochronous mode" dialog box opens with an overview of parameters which influence isochronous mode.
   Information on the individual parameters is available under "Detail overview".

2. Compare the values shown with the values in the documentation, or with the value specified by a technician.

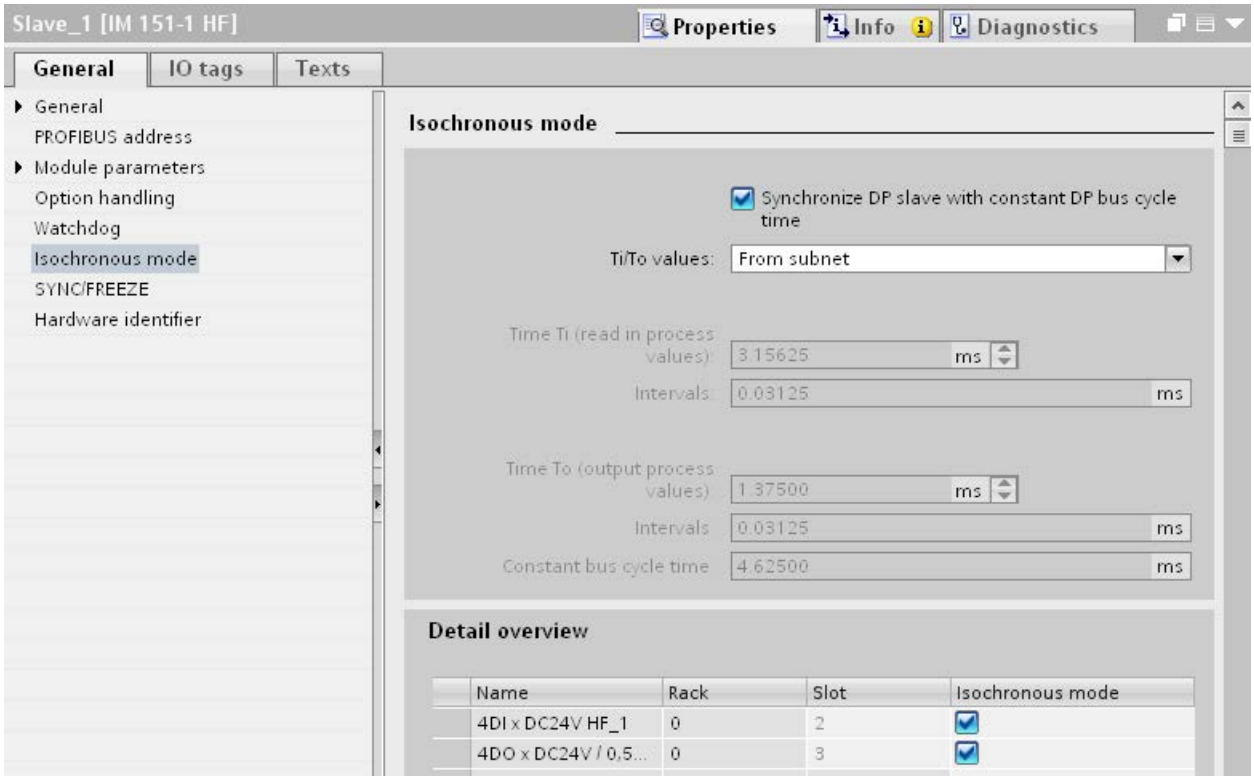

Figure 5-7 Viewing parameters for isochronous mode

5.1.8.2 Change parameters

Changing parameters for the DP master system

You can change the parameters for isochronous mode in the "Constant bus cycle time" dialog box.

1. Select the DP master system in the network view.
2. Select the section "Constant bus cycle time" in the Inspector window.
3. Change the parameters according to the received instructions.

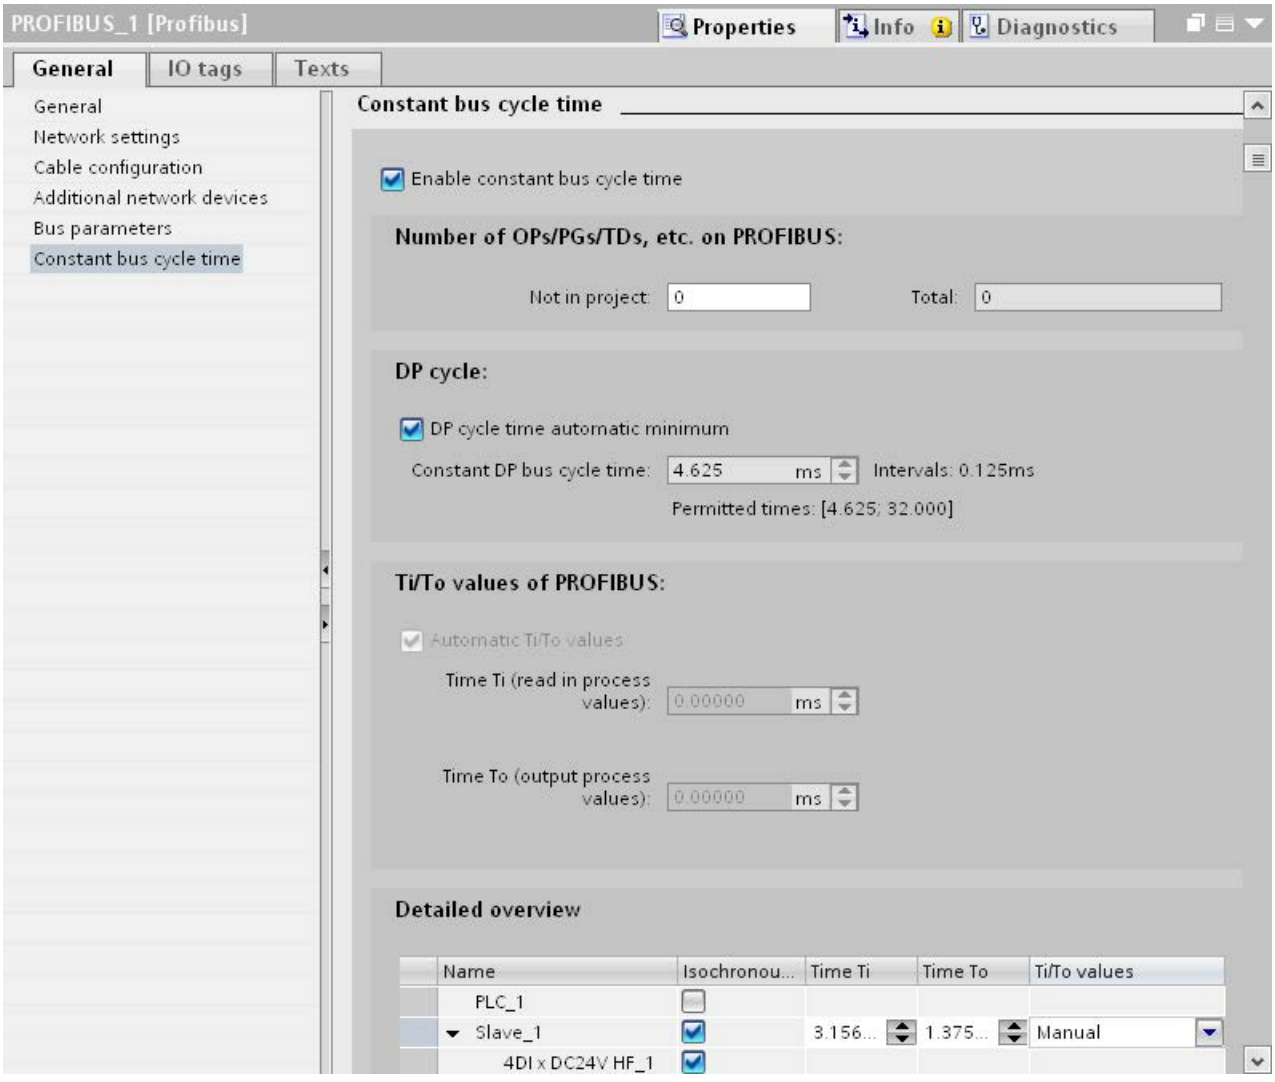

Figure 5-8 Changing parameters for the DP master system

Adapting the input delay

1. Select the input module in the device view.
2. Select the section "Inputs" in the Inspector window.
3. Adapt the input delay.

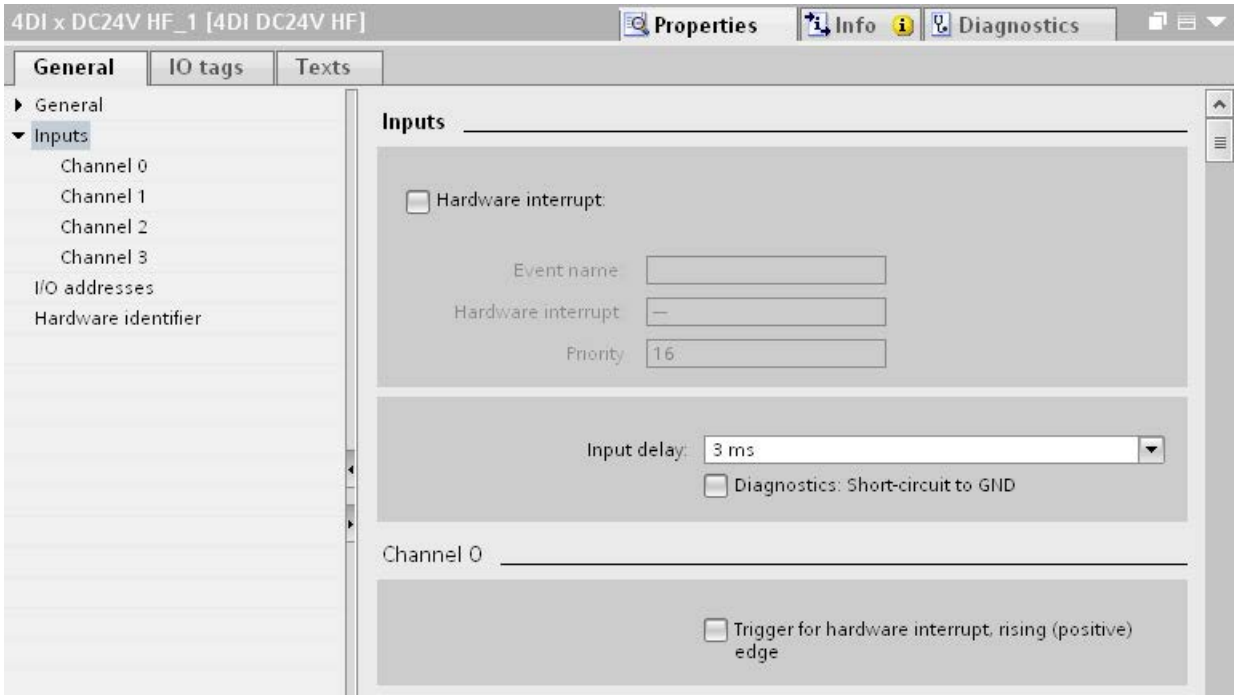

Figure 5-9 Adapting the input delay

Compile, load and save the changed configuration

1. Put the plant out of operation.
2. Select the CPU in the project navigator.
3. Select "Compile > Hardware" in the shortcut menu.
4. Select "Download to device" in the shortcut menu.
5. Save the project.

5.2 Acyclical data exchange

Additional functionality with DPV1 devices (DP master/DP slaves)

DP masters and DP slaves that support DPV1 have the following additional functions compared to the devices that support only DPV0:

- The acyclic data exchange between master and slave is supported.
- Interrupts can be set by a DPV1 slave which ensure handling of the interrupt-triggering event in the master CPU.

Acyclic data exchange

Read/write data record, for example, to change the parameters of a slave during operation. The data records of a module and the structure of these data records is available in the documentation for the respective module.

The table below contains the instructions with their functions for access to DPV1 slaves. Detailed information is available in the STEP 7 online help.

Table 5- 2 Instructions for access to DPV1 slaves

Instructions	Function (DPV1)
RDREC	Read data record
WRREC	Write data record
RALRM	Receive interrupt from a DP slave. (The instruction must be called in the OB that triggers the interrupt.)

5.3 SYNC/FREEZE groups

Assigning the SYNC/FREEZE group to the DP slave

A DP master with the corresponding functionality can send the control commands SYNC and/or FREEZE for synchronization of the DP slaves simultaneously to a group of DP slaves. You must assign SYNC/FREEZE groups to the DP slaves for this purpose.

Requirement: A DP master system has been created in the project.

Procedure

To assign a DP slave to a SYNC/FREEZE group, follow these steps:

1. Select the DP interface of the DP slave you want to assign to a group in the device view or network view.
2. Select the check boxes for the required SYNC/FREEZE groups under the group "SYNC/FREEZE" in the Inspector window.

   You can assign each DP slave to only one SYNC/FREEZE group.

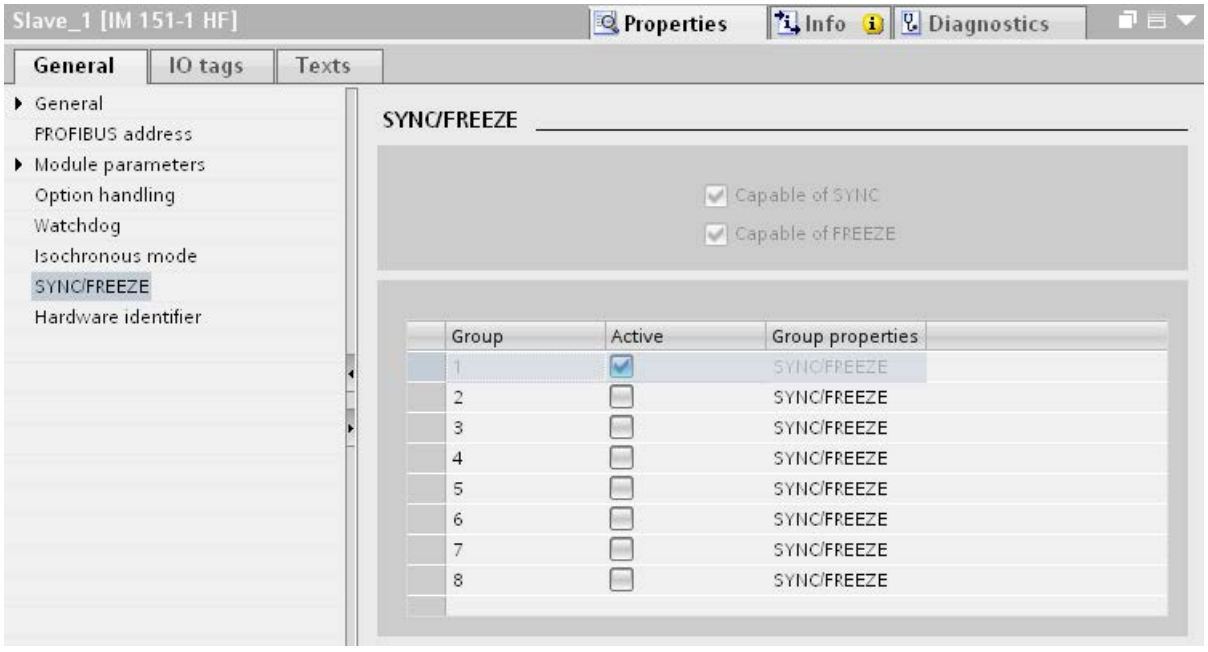

Figure 5-10 Assigning the DP slave to a SYNC/FREEZE group

Important information on the control commands SYNC and FREEZE

You can use the control commands SYNC and FREEZE in the DP master to synchronize the DP slaves event-controlled. The DP master sends the control commands simultaneously to a group of DP slaves in its master system. It does not take into consideration DP slaves that have failed or are currently sending diagnostic information.

Requirement for synchronization using control commands is that you have assigned the DP slaves to SYNC/FREEZE groups.

For a S7 CPU use the instruction DPSYC_FR (SFC 11) to synchronize the DP slaves.

When you select the DP master, you see a list of the eight SYNC/FREEZE groups under "Properties > DP interface > SYNC/FREEZE" in the Inspector window.

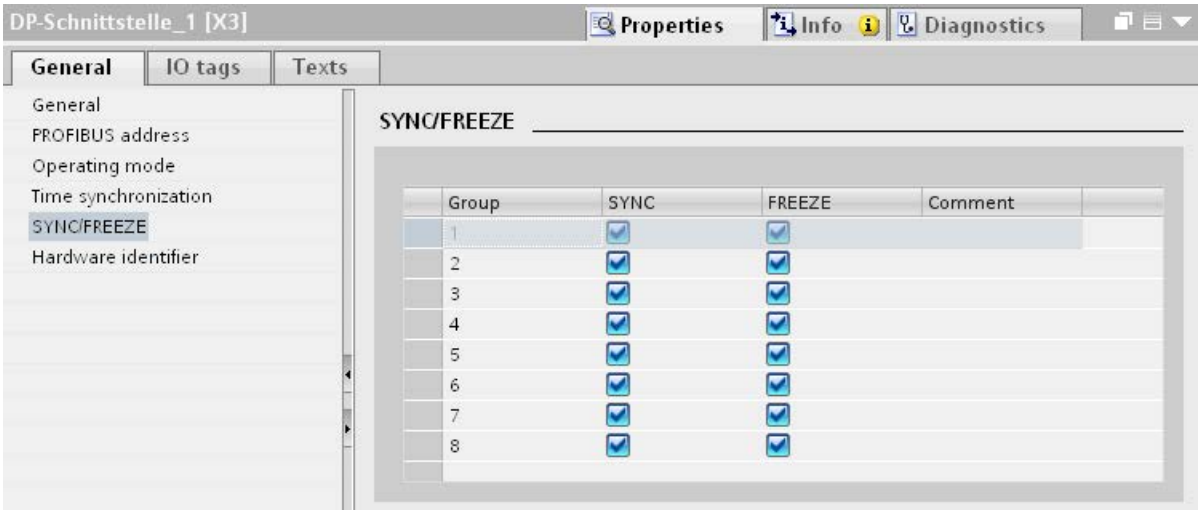

Figure 5-11 SYNC/FREEZE groups on DP master

SYNC control command

The DP master uses the SYNC control command to cause a group of DP slaves to freeze the states of their outputs to the current value.

The DP slaves save the output data of the DP master for the following frames. But the states of the DP slave outputs remain unchanged.

Only after each new SYNC control command does the DP slave set its outputs to the values that it has saved as the output data of the DP master.

The outputs are not updated cyclically again until the DP master has sent a UNSYNC control command.

FREEZE control command

After receiving the FREEZE control command from the DP master, the DP slaves of a group freeze the current status of their inputs. The DP slaves send these frozen input data to the DP master with the following cyclical frames.

The DP slaves freeze the current state of their inputs again after each new FREEZE control command.

The state of the DP slave inputs is only send to the DP master cyclically again when the DP master sends the UNFREEZE control command.

5.4 Interrupts

Interrupts and interrupt OBs for DPV1

Interrupts can be set by a DPV1 slave which ensure handling of the interrupt-triggering event in the master CPU. The interrupt data is evaluated in the CPU and the diagnostics buffer and the module state are updated even in the "STOP" operating mode. The OB is not processed in STOP.

The following DPV1 interrupts are supported:

- Status interrupt
- Update interrupt
- Vendor-specific interrupt

Detailed information is available in the descriptions on the OBs. You can use the corresponding OBs that are provided by the operating system of the S7 CPUs for diagnostic interrupts, hardware interrupts, and pull/plug interrupts.

OB 55 interrupt - Status interrupt

The status interrupt can be triggered when the operating mode of a device or module changes, for example, from RUN to STOP.

OB 56 interrupt - Update interrupt

An update interrupt can be triggered if the parameters of a slot were changed. This may be caused by local access or partner access to the parameters.

OB 57 interrupt - Vendor-specific interrupt

The event that triggers the vendor-specific interrupt can be specified by the manufacturer of a DPV1 slave.

Additional information

A detailed description of the events at which interrupts are triggered is available in the documentation of the respective manufacturer of the DPV1 slave.

5.5 Intelligent DP slaves (I-slaves)

5.5.1 I-slave functionality

I-slave functionality

The "I-slave" (intelligent DP slave) functionality of a CPU supports the exchange of data with a DP master and thus allows the CPU to be used, for example, as intelligent preprocessing unit of subprocesses. The I-slave is connected in its role as DP slave to a "higher-level" DP master.

The preprocessing is handled by the user program in the I-slave. The process values acquired by the I/O modules are preprocessed by the user program and made available to the DP master.

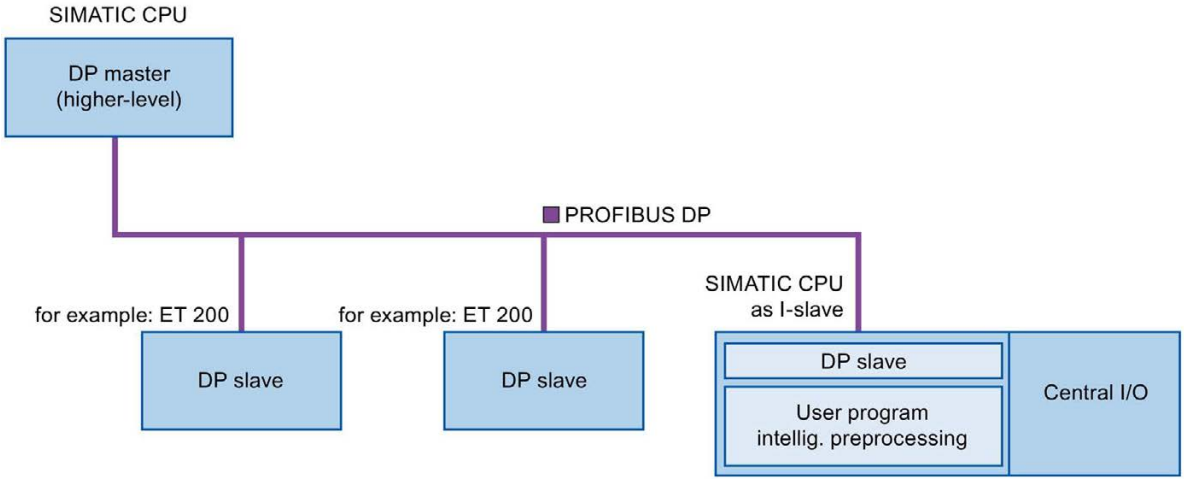

Figure 5-12 I-slave functionality

"I-slave" naming convention

In the remainder of this description, a CPU or a CP with I-slave functionality is simply called an "I-slave".

Advantages of configurations with I-slaves

The I-slave offers the following advantages:

- Simple coupling of CPUs with PROFIBUS interface
- Real-time communication between CPUs and PROFIBUS interface
- Distributed processing

  A complex automation task can be divided into smaller units/subprocesses. This results in manageable processes which lead to simplified subtasks.
- Relieving the DP master by distributing the computing capacity to I-devices
- Lower communication load by processing process data locally
- Separating subprocesses

  Complicated, widely distributed and extensive processes can be subdivided into several subprocesses with manageable interfaces by using I-slaves. These subprocesses can be stored in individual STEP 7 projects if necessary, which can later be merged to form one master project.
- Separating STEP 7 projects

  Creators and users of an I-device can have completely separated STEP 7 projects. The GSD file together with the configuration of the transfer areas of the I-slave form the interface between the STEP 7 projects. This allows coupling to standard DP masters via a standardized interface.
- Know-how protection

  Plant units can now only be delivered with a GSD file and the configuration of the transfer areas instead of with a STEP 7 project for the I-slave interface description. This means that you no longer have to disclose the user program know-how.

Difference: DP slave - I-slave

In the case of a DP slave, the DP master accesses the distributed inputs/outputs directly.

In the case of an I-slave, the DP master accesses a transfer area in the I/O address space of the preprocessing CPU instead of accessing the connected inputs/outputs of the I-slave. The user program running on the preprocessing CPU is responsible for ensuring data exchange between the operand area and inputs/outputs.

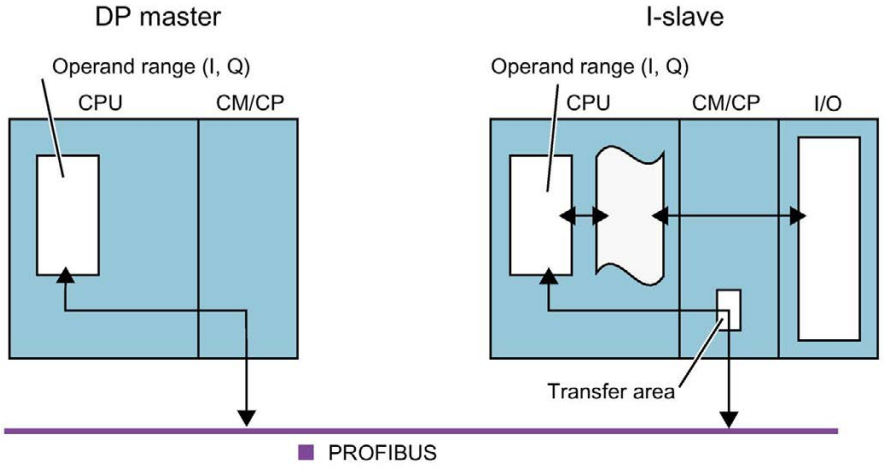

Figure 5-13 Data access to an I-slave

Note

DP master or DP slave

Note: The communication modules of the S7-1500 CPUs/ET 200SP CPUs, for example the CP 1542-5, support the operation as DP master or DP slave only as alternative.

Note

The I/O areas configured for data exchange between the DP master and DP slaves must not be used by I/O modules.

5.5.2 Data exchange with higher-level DP master

Introduction

The following section describes the data exchange between the I-slave and the higher-level DP master.

Transfer areas

Transfer areas are an interface to the user program of the I-slave CPU. Inputs are processed in the user program and outputs are the result of the processing in the user program.

The data for communication between DP master and I-slave is made available in the transfer areas. A transfer area contains an information unit that is exchanged consistently, in terms of bytes, words or overall, between DP master and I-slave. You can find more information on configuration and use of transfer areas in the section Configuring transfer areas (Page 84).

The following figure shows the data exchange between the I-slave and the higher-level DP master. The individual communication relations are explained below based on the numbers.

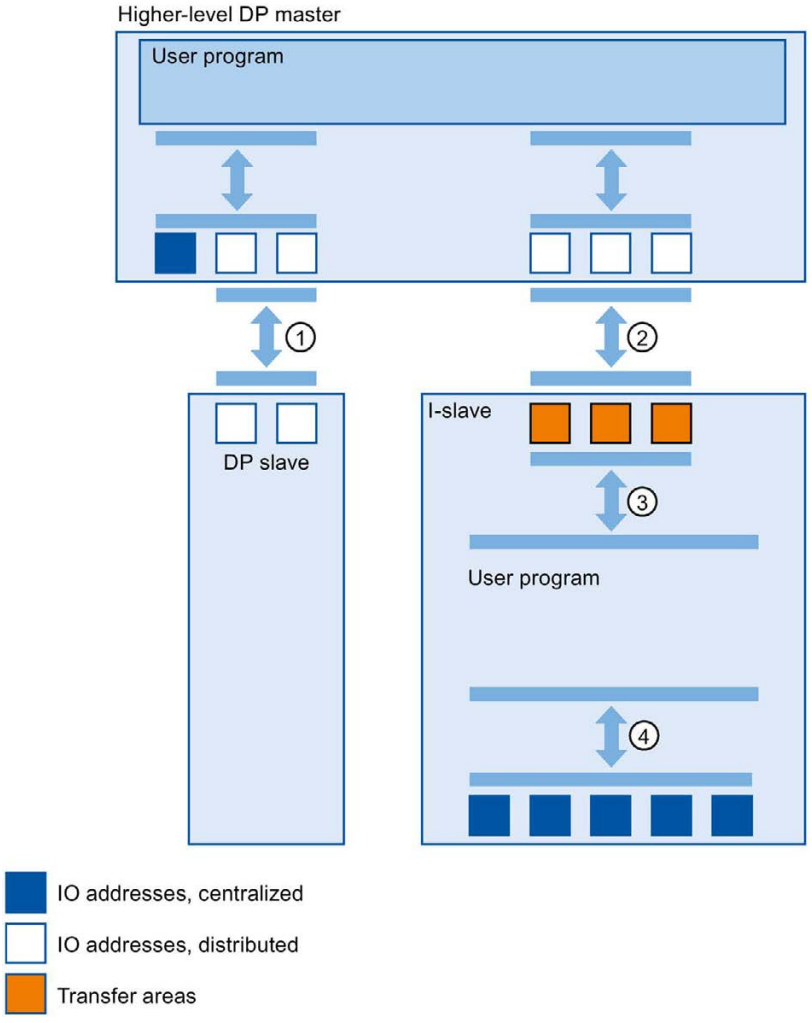

Figure 5-14 Data exchange with the DP master

① Data exchange between higher-level DP master and normal DP slave

In this way, the DP master and the DP slave exchange data through PROFIBUS.

② Data exchange between higher-level DP master and I-slave

In this way, the DP master and the slave exchange data through PROFIBUS.

The data exchange between a higher-level DP master and an I-slave is based on the conventional DP master/DP slave relationship.

For the higher-level DP master, the transfer areas of the I-slave represent submodules of a DP slave.

The output data of the DP master is the input data of the I-slave. Analogously, the input data of the DP master is the output data of the I-slave.

③ Transfer relationship between the user program and the transfer area

In this way, the user program and the transfer area exchange input and output data.

④ Data exchange between the user program and the I/O of the I-slave

In this way, the user program and the centralized I/O of the I-slave exchange input and output data.

5.5.3 Configuring an I-slave

Requirements for configuring an I-slave

The I-slave consists of:

- A CPU from S7-1500 and a communications module CM 1542-5/CP 1542-5 (STEP 7 as of V12)
- A CPU from ET 200SP and a communications module CM DP (STEP 7 as of V13 SP1)

Procedure for configuring an I-slave

This section shows how to configure an I-slave in STEP 7 based on the example of a CPU 1512SP-1 PN. The procedure for the CPUs from S7-1500 with CM 1542-5/CP 1542-5 and for the CPU 1510SP-1 PN with CM DP is the same.

To configure an I-slave, follow these steps:

1. Drag a CPU 1512SP-1 PN from the hardware catalog to the network view.
2. Open the device view of the CPU.
3. Double-click on the CM DP communications module in the hardware catalog. STEP 7 creates the CM DP in the device view.
4. Select the PROFIBUS interface of the CM DP communications module.
5. In the Inspector window in the area navigation, select the "Operating mode" entry and enable the "DP slave" check box.
6. Now you can select the DP master in the "Assigned DP Master" drop-down list.

   Once you have selected the DP master, the networking and the DP master system between both devices are displayed in the network view.

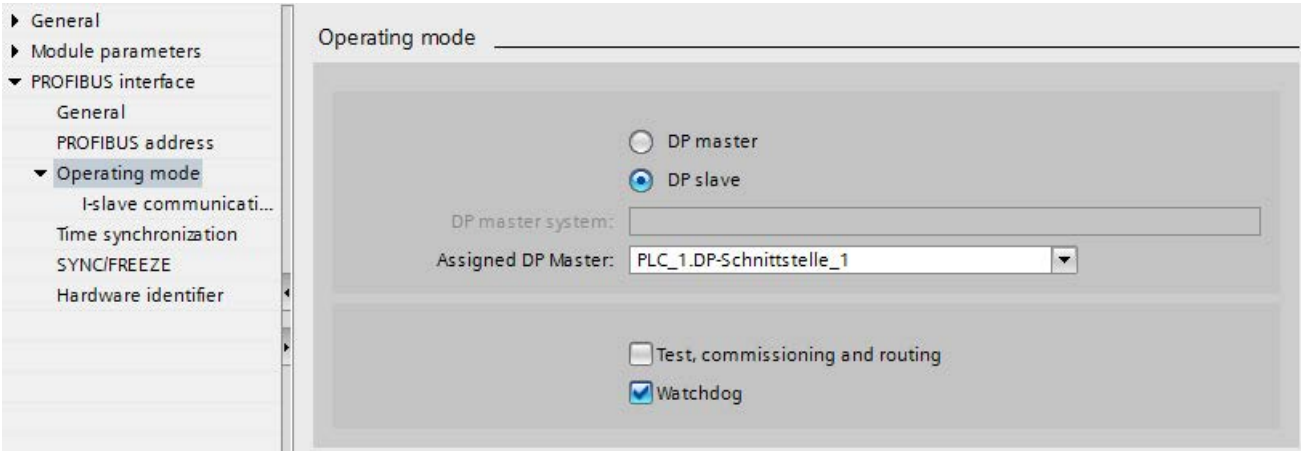

Figure 5-15 Configuring an I-slave

Note

Operation using a GSD file

If you operate an I-slave using a GSD file, you should not select the "Test, commissioning and routing" check box.

Create a DP subnet on the PROFIBUS interface of the I-slave.

Result

You have configured an I-slave.

5.5.4 Configuring transfer areas

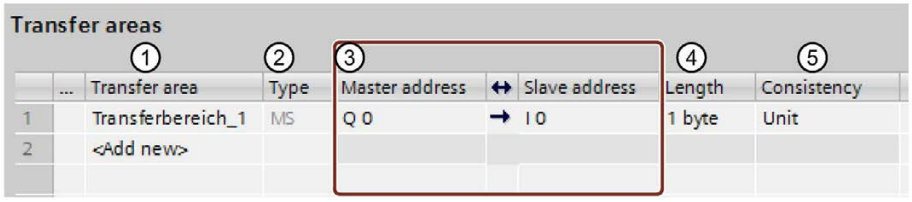
Requirements for configuring transfer areas

- You have configured an I-slave in STEP 7.
- You are in the device view of the I-device and have selected the PROFIBUS interface of the communications module.

Procedure for configuring transfer areas

To configure transfer areas for an I-slave in STEP 7, follow these steps:

1. In the area navigation, go to the section "Operating mode" > "I-slave communication" > "Transfer areas".
2. Create transfer areas. Set the properties of the created transfer areas.



① Click in the first cell of the "Transfer area" column. STEP 7 assigns a default name that you can change.

② Select the type of communication relation: Currently, you can only select MS for "master-slave communication relation".

③ STEP 7 assigns the addresses for the transfer area automatically. Correct the addresses if necessary.

④ Set the length of the transfer area. Specify the length of the transfer area in the cell in the following format: [1...64] Byte/Word.
Examples: "32 Byte", "64 Word"

⑤ Specify whether the transfer area is exchanged in units of bytes or words or consistently over the entire length between the DP master and I-slave.

Figure 5-16 Configuring transfer areas

A separate entry is created in the area navigation for each transfer area. If you select one of these entries, you can adjust the details of the transfer area, or correct them and comment on them.

5.5.5 Sample program

Introduction

This simple sample program shows how you use the transfer areas of an I-slave.

Requirement

You have configured an I-slave.

Task

The result of an "AND logic operation" of two inputs (preprocessing) in the I-slave is to be provided to the higher-level DP master. This result is to be assigned to a local output in the DP master (further processing).
Use a transfer area with the following addresses for this purpose:

- Address in the I-slave: Q568
- Address in the DP master: I68

Required steps

The following steps are necessary to solve the task:

1. Configuring the transfer area
2. Programming the I-slave
3. Programming the DP master

Configuring the transfer area

Configure a transfer area with the following properties in the I-slave:

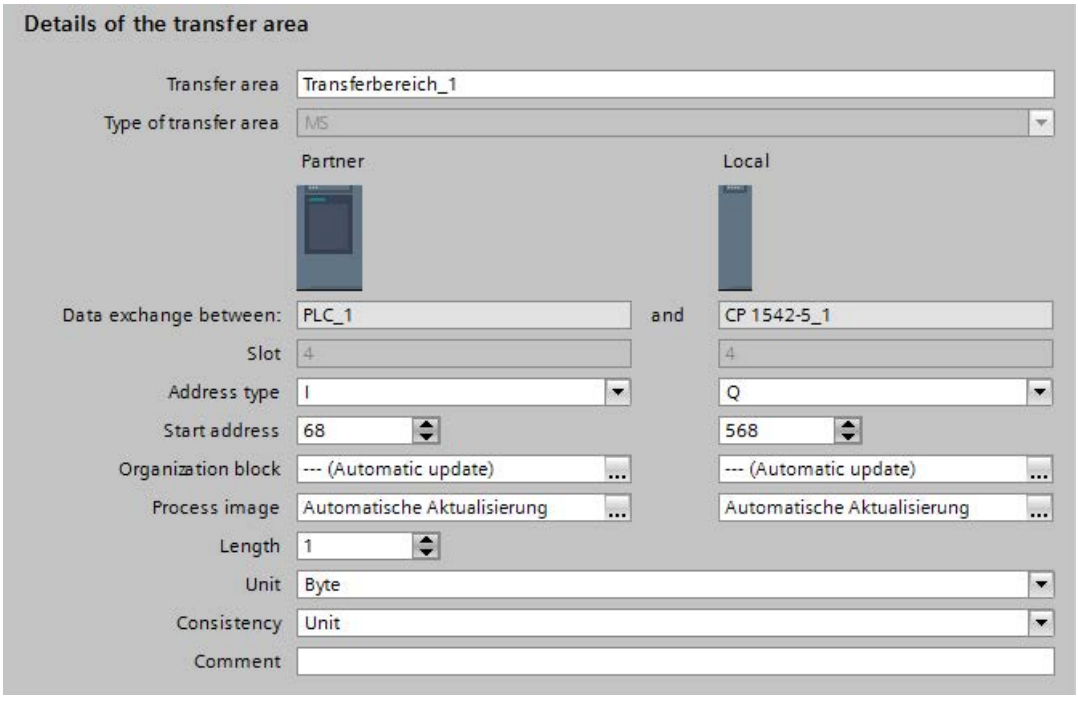


Figure 5-17 Transfer area, I-slave sample program

Programming the I-slave

To program the sample program for the I-slave, follow these steps:

1. Using the SCL programming language, create a new function with the name "preprocessing" in the project tree under "Program blocks" > "Add new block". Open the function.
2. In the interface of the function "preprocessing", create the following tags:

Name	Data type	Input/output type
input 1	bool	Input
input 2	bool	Input
result	bool	Output

3. In the instruction window of the function "preprocessing", write the following program code:
   #result:=#input 1&#input 2;
4. Call the function "preprocessing" in a cycle OB, for example, in OB1.
5. Wire the function "preprocessing" in the cycle OB as follows:

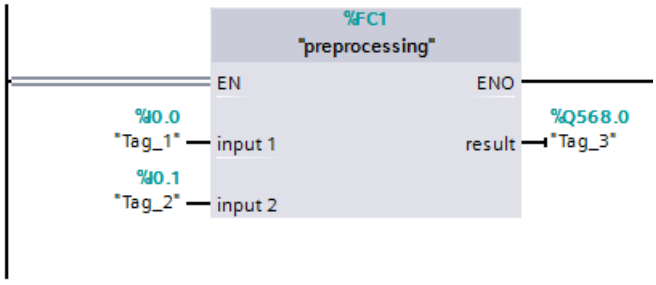

Figure 5-18 I-slave sample program

Programming the DP master

To program the sample program for the DP master, follow these steps:

1. Using the SCL programming language, create a new function with the name "further processing" in the project tree under "Program blocks" > "Add new block". Open the function.
2. In the interface of the function "further processing", create the following tags:

Name	Data type	Input/output type
result	bool	Input
output	bool	Output

3. In the instruction window of the function "further processing", write the following program code:
   #output:=#result;
4. Call the function "further processing" in a cycle OB, for example, in OB1.
5. Wire the function "further processing" in the cycle OB as follows:

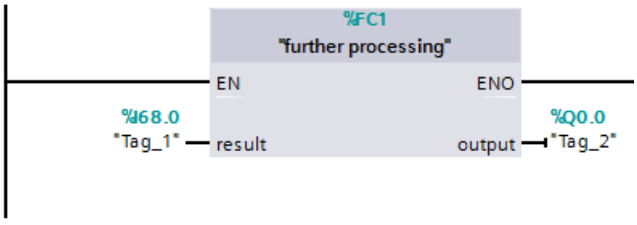

Figure 5-19 DP master sample program

Result

You mastered the task successfully.

5.5.6 Diagnostics and interrupt behavior

Diagnostics and interrupt behavior

S7 CPUs have numerous diagnostics and interrupt functions that can, for example, report errors/faults or failures of underlying DP systems. These diagnostics alarms reduce downtimes and simplify localization and elimination of problems.

Diagnostics options in the higher-level DP master and in the I-slave

The following diagnostics mechanisms are available to the higher-level DP master and the I-slave:

- OB 82 (diagnostic interrupt)

  When the I-slave changes mode, the DP master calls OB 82 (diagnostic interrupt).

  When the DP master changes mode, the I-slave calls OB 82 (diagnostic interrupt).

- OB 86 (rack failure)

  If the bus connection to the I-slave is interrupted, the DP master calls OB 86 (rack failure).

  If the bus connection to the DP master is interrupted, the I-slave calls OB 86 (rack failure).

- OB 122 (I/O access error)

  If you have not set the attribute "Handle errors within block" for OB 122, the following applies:

  – If the bus connection to the I-slave is interrupted, the DP master calls OB 122 (I/O access error) if there is direct access to the relevant transfer areas.

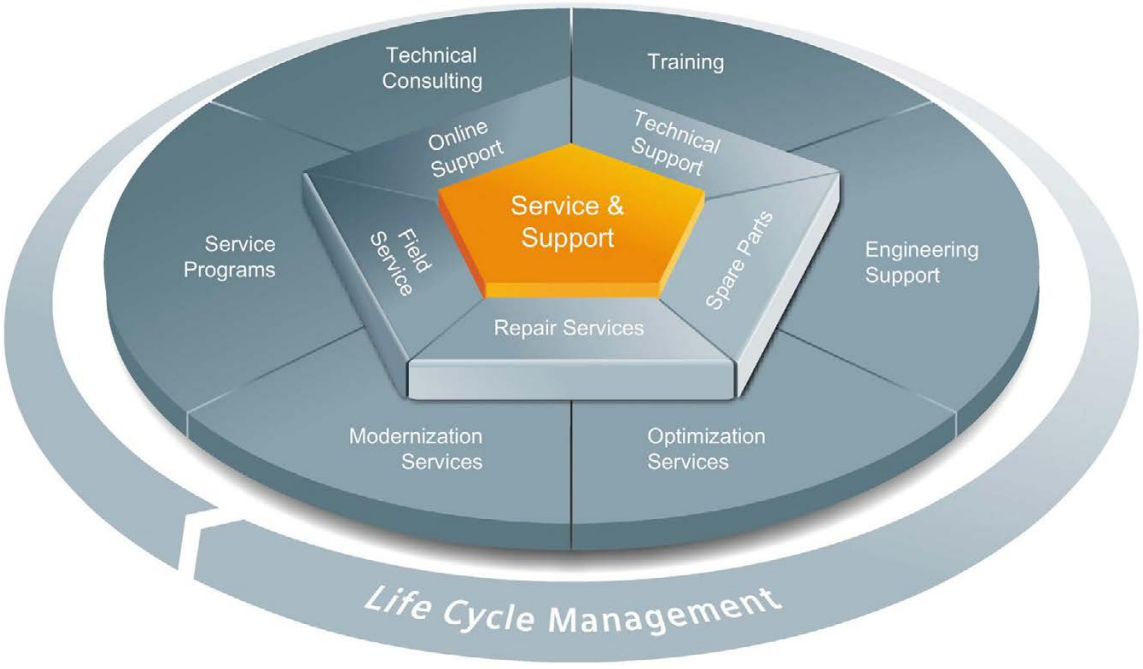
  – If the bus connection to the DP master is interrupted, the I-slave calls OB 122 (I/O access error) if there is direct access to the relevant transfer areas.

Reaction of the transfer areas to mode changes

Table 5- 3 Reaction of the transfer areas to mode changes

DP master	I-slave	Reaction of DP master input transfer areas	Reaction of I-slave input transfer areas
RUN→STOP	RUN	No updating of the process image	The input transfer areas retain their current values. (no access error)
STOP→RUN	RUN	The input transfer areas are updated by the cyclic user program via the process image.	The input transfer areas are updated via the process image.
RUN	RUN→STOP	The I-slave sets the input transfer areas on the DP master to "0".	No updating of the process image
RUN	STOP→RUN	The I-slave sets the input transfer areas on the DP master to "0". After the startup program of the I-slave, the input transfer areas of the DP master are updated via the process image.	Prior to processing of the startup program, the input transfer areas are updated via the process image.

Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Complete service from one source: fewer interfaces and more know-how

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Glossary

Automation system

Programmable logic controller for the open-loop and closed-loop control of process chains of the process engineering industry and manufacturing technology. The automation system consists of different components and integrated system functions according to the automation task.

Bus

A common transfer route to which all nodes are connected; it has two defined ends.

In the case of PROFIBUS, the bus is a two-wire line or a fiber-optic cable.

Bus connector

Physical connection between the node and bus cable.

Bus system

All stations physically connected to a bus cable form a bus system.

Device

In the PROFIBUS environment, "device" is the generic term for:

- Automation systems (for example, PLC, PC)
- Distributed I/O systems
- Field devices (for example, hydraulic devices, pneumatic devices)
- Active network components
- Gateways to AS interface or other fieldbus systems

Device that can send, receive or amplify data via the bus, for example, a DP slave by means of PROFIBUS DP.

Device

In the PROFIBUS environment, "device" is the generic term for:

- Automation systems (for example, PLC, PC)
- Distributed I/O systems
- Field devices (for example, hydraulic devices, pneumatic devices)
- Active network components
- Gateways to AS interface or other fieldbus systems

Device that can send, receive or amplify data via the bus, for example, a DP slave by means of PROFIBUS DP.

Diagnostics

Monitoring functions for the recognition, localization, classification, display and further evaluation of errors, faults and alarms. They run automatically during plant operation. This increases the availability of systems/plants by reducing commissioning times and downtimes.

DP master

CPU or device that conducts the communication with the DP slaves according to a defined algorithm. To do this, the DP master uses the functions for communication with the DP slaves which are defined by PROFIBUS DP. It acts according to standard EN 50170, Part 3.

→ *Master*

DP slave

Slave in the distributed I/O that is operated on the PROFIBUS with PROFIBUS DP protocol and acts according to standard EN 50170, Part 3. The DP slave is addressed by the DP master and provides it with specified functions (I/O data, diagnostics, etc.).

→ *Slave*

DPV1

The designation DPV1 refers to the functional extension of acyclic services (to include new interrupts, for example) provided by the DP protocol. The DPV1 functionality is integrated in IEC 61158/EN 50170, Volume 2, PROFIBUS.

FDL

Fieldbus Data Link (bus access protocol). Step 2 with PROFIBUS.

HMI device

Human Machine Interface, device for visualization and control of automation processes.

HSA

Highest Station Address. A bus parameter for PROFIBUS. Outputs the highest PROFIBUS address of an active device. PROFIBUS addresses greater than HSA are permitted for passive devices, up to 126.

Industrial Ethernet

Guideline for setting up Ethernet in an industrial environment. The main difference to the standard Ethernet is the mechanical current carrying capacity and interference immunity of the individual components.

I-slave

The "I-slave" functionality of a CPU supports the exchange of data with a DP master and can thus be used, for example, as intelligent preprocessing unit of partial processes. The I-slave is connected in its role as DP slave to a "higher-level" DP master.

Master

A master device that is in possession of the token can send data to other devices and request data from them (= active device).

PCF

Polymer Cladded Fiber (plastic-covered glass fiber)

POF

Polymer Optical Fiber (plastic fiber-optic cable made of light-conducting plastics)

Process image

Address area in the system memory of the DP master. At the start of the cyclic program the signal states of the input modules are transmitted to the process image of the inputs. And the end of cyclic program execution, the process image of the outputs is transmitted to the DP slave as signal state.

PROFIBUS

PROcess FIeld BUS, in IEC 61158-2 as "Type 3" standardized, bit-serial fieldbus system. The standard specifies functional, electrical and mechanical properties.

PROFIBUS is a bus system that networks automation systems and field devices compatible with PROFIBUS at the cell and field level. PROFIBUS is available with the protocols DP (= distributed I/O), FMS (= fieldbus message specification) or PA (process automation).

PROFIBUS address

Unique identification of a device connected to PROFIBUS. The PROFIBUS address is transmitted in the frame for addressing a device. A PC or programming device has the PROFIBUS address "0". DP masters and DP slaves have a PROFIBUS address in the range from 1 to 125.

PROFIBUS device

A PROFIBUS device has at least one PROFIBUS interface with an electrical (RS 485) or optical (Polymer Optical Fiber, POF) interface.

PROFIBUS DP

A PROFIBUS with DP protocol that complies with EN 50170. DP stands for distributed I/O (fast, real-time capable, cyclic data exchange). From the perspective of the user program, the distributed I/Os are addressed in exactly the same way as the centralized I/Os.

PROFINET

Open component-based industrial communication system based on Ethernet for distributed automation systems. Communication technology promoted by the PROFIBUS Users Organization.

RS 485

Asynchronous data transmission process for PROFIBUS DP to ANSI TIA/EIA-RS485-A.

RS 485 repeater

Equipment for amplifying bus signals and for coupling segments over long distances.

Segment

The bus line between two terminating resistors forms a bus segment.

A bus segment can contain up to 32 bus nodes. Segments can be coupled, for example, by means of RS 485 repeaters or diagnostics repeaters.

Slave

Distributed device in a fieldbus system that may exchange data with a master after being requested to do so by the master. Slaves are all DP slaves, for example, such asET 200SP, ET 200MP, ET 200AL.

Standard mounting rail

Standardized metal profile to EN 50022.

The standard mounting rail is used for quick snap-on installation of network components, such as OLM, repeaters, etc.

Subnet

Part of a network whose parameters must be synchronized with the devices (e.g., with PROFIBUS). A subnet includes the bus components and all connected stations.

SynchronousCycle

Name for synchronous cycle interrupt OB in STEP 7.

Target-Rotation-Time (Ttr)

Bus parameter for PROFIBUS. The token is the send permission for a device on PROFIBUS. A device compares a token rotation time it has measured with the Target-Rotation-Time and controls the sending of frames with high priority or low priority based on this comparison.

Terminating resistor

Component that terminates the ends of a data transmission line to prevent reflections in the transmission medium.

Terminator

Terminating resistor of bus segments with transmission rates of 9.6 kbps to 12 Mbps. The power supply is separate from the bus nodes.

TIA Portal

Totally Integrated Automation Portal

Topology

Structure of a network. Common structures are line topology, ring topology, star topology and tree topology.

Transmission rate

Specifies the number of bits transmitted per second.

Watchdog

Mechanism for monitoring the readiness for operation.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation provides important information on configuring and commissioning the point-to-point communication modules for the S7-1500 (ET 200MP) and ET 200SP.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7 V12

Validity of the documentation

This documentation is valid for all point-to-point communication modules of the S7-1500 (ET 200MP) and the ET 200SP.

Conventions

The term "CPU" is used in this manual both for the CPUs of the S7-1500 as well as for interface modules of distributed I/O systems, such as the IM 155-5.

Please also observe notes labeled as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

Recycling and disposal

The products can be recycled due to their low pollutant content. For environmentally compliant recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste.

Additional assistance

- Information about the technical support (http://www.siemens.com/automation/support-request) available can be found in the appendix to this documentation.
- The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com/).

Note on IT security

Siemens offers IT security mechanisms for its automation and drive product portfolio in order to support the safe operation of the plant/machine. We recommend that you inform yourself regularly on the IT security developments regarding your products. You can find information on this on the Internet (http://support.automation.siemens.com).

You can register for a product-specific newsletter here.

For the safe operation of a plant/machine, however, it is also necessary to integrate the automation components into an overall IT security concept for the entire plant/machine, which corresponds to the state-of-the-art IT technology. You can find information on this on the Internet (http://www.siemens.com/industrialsecurity).

Products used from other manufacturers should also be taken into account here.

Guide to documentation

1

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-1500, ET 200MP and ET 200SP systems consists of the respective system manual, function manuals and product manuals.

Furthermore, the STEP 7 V12 information system (online help) offers you assistance in configuring and programming your automation system.

Overview of documentation on the topic of point-to-point communication

The table below includes additional documentation which amends this description.

SIMATIC Manuals

The latest manuals of SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) and can be downloaded free of charge.

Introduction 2

2.1 Overview of the communication modules

Automation systems encompass a wide range of components. These also include communication modules. A simple possibility of data exchange is provided by serial communication via point-to-point connections.

Customizing to a wide range of communication partners is possible by setting the communication parameters at a lower layer of the OSI layer model (see chapter Transmission security (Page 16)).

Communication through point-to-point connection with S7-1500, ET 200MP and ET 200SP takes place exclusively by means of communication modules (CM) with serial interfaces.

SIMATIC S7 offers a number of modules that provide the physical interface and fundamental protocol mechanisms for this purpose.

- RS232: An interface that can coordinate the communication between the partners through additional accompanying signals.
- RS422/RS485: An interface that allows longer lines through the use of differential voltages as transmission technology and also enables structures with more than 2 devices through a bus structure (RS485).

Instructions that carry out the coordination between the CPU and CM (Communication Module) are available to transfer data from the CPU to the respective modules. They inform the user program about a successful transfer or the receipt of new data (in systems without a SIMATIC CPU users have to program the function of these instructions themselves).

The function and use of the PtP communication modules is described in this function manual.

Overview of components and order numbers

Tabular overview of communication modules and their application suitability

Communication module	S7-1500	ET 200MP	ET 200SP	Order number
CM PtP RS232 BA [1)]	X	X	-	6ES7540-1AD00-0AA0
CM PtP RS422/485 BA	X	X	-	6ES7540-1AB00-0AA0
CM PtP RS232 HF [2)]	X	X	-	6ES7541-1AD00-0AB0
CM PtP RS422/485 HF	X	X	-	6ES7541-1AB00-0AB0
CM PtP (ET 200SP)	-	-	X	6ES7137-6AA00-0BA0

1) BA = Basic

2) HF = High Feature

Overview of components and interfaces

Tabular overview of communication modules and their functions.

Communication module	Interface	Protocols					Connection technology	
		Freeport	3964(R)	Modbus Master	Modbus Slave	USS-Master	D-Sub 9-pin	D-Sub 15-pin
CM PtP RS232 BA	RS232	X	X	-	-	X	X	-
CM PtP RS422/485 BA	RS422	X	X	-	-	X	-	X
	RS485	X	-	-	-	X	-	X
CM PtP RS232 HF	RS232	X	X	X	X	X	X	-
CM PtP RS422/485 HF	RS422	X	X	X	X	X	-	X
	RS485	X	-	X	X	X	-	X
CM PtP (ET 200SP)	RS232	X	X	X	X	X	ET 200SP BaseUnit [1]	
	RS422 [2]	X	X	X	X	X		
	RS485	X	-	X	X	X		

1) BaseUnit with terminals instead of D-Sub; assignment depending on physical transmission properties

2) The CM PtP communication module can also be used for multipoint connection in RS422 mode

Overview of components and data transmission rates

The communication modules can send and receive data with different data transmission rates. The table below shows the assignment to the individual communication modules.

Communication module	Data transmission rate in bps										
	300	600	1200	2400	4800	9600	19200	38400	57600	76800	115200
CM PtP RS232 BA	X	X	X	X	X	X	X	-	-	-	-
CM PtP RS422/485 BA	X	X	X	X	X	X	X	-	-	-	-
CM PtP RS232 HF	X	X	X	X	X	X	X	X	X	X	X
CM PtP RS422/485 HF	X	X	X	X	X	X	X	X	X	X	X
CM PtP (ET 200SP)	X	X	X	X	X	X	X	X	X	X	X

Overview of components and receive buffer size

Each communication module has a buffer to temporarily store received frames. The table below shows the assignment of the maximum size of an individual frame as well as the size of the memory for the individual communication modules.

Module	Receive buffer size KB	Max. frame length KB	Bufferable frames
CM PtP RS232 BA	2	1	255
CM PtP RS422/485 BA	2	1	255
CM PtP RS232 HF	8	4	255
CM PtP RS422/485 HF	8	4	255
CM PtP (ET 200SP)	4	2	255

Accompanying signals and data flow control

- Software data flow control with XON/XOFF

  The Freeport protocol supports data flow control with XON/XOFF via the RS232 and RS422 interfaces.

- Hardware data flow control with RTS/CTS

  The Freeport protocol supports data flow control with RTS/CTS via the RS232 interface.

- Automatic operation of accompanying signals

  The RS232 accompanying signals can be controlled with the Freeport, Modbus master and Modbus slave protocols by means of the RS232 interface. (Only available if hardware data flow control is not activated.)

Protocols of the communication modules

You may set up a communication connection with different protocols, depending on the communication modules used:

- Freeport: Transmission of ASCII character strings without specified protocol format
- 3964(R): Communication between programmable logic controllers (master/master communication)
- USS: Communication between a programmable logic controller and a drive (master/slave communication) Communication is tailored to the drive technology requirements. The communication module can only be master.
- Modbus RTU: Communication between programmable logic controllers (master/slave communication) The communication module can be the master as well as the slave.

2.2 Overview of the processing steps

Point-to-point connection

The system provides various networking options for the exchange of data between two or more communication partners. The simplest form of data interchange is via a point-to-point connection between two communication partners.

The communication module (CM) forms the interface between a programmable logic controller and a communication partner. Data is sent in serial mode via point-to-point connection with the communication module.

Configuring / parameter assignment

Configuring the communication module includes the arrangement of the communication module in the device configuration of STEP 7 V12 as well as the settings of the specific protocol parameters in the properties dialog of the communication module (static configuration).

Programming

Programming includes the program-specific connection of the communication module to the corresponding CPU by means of the user program. You program the communication module with STEP 7 V12.

Communication between CPU, communication module and a communication partner takes place through instructions. A number of instructions are available for the S7-1500 automation system that you can use to initiate and control communication in the user program as well as influence the configuration for runtime (dynamic configuration).

For more information, please refer to Overview of instructions (Page 13) and the STEP 7 V12 online help.

2.3 Overview of instructions

Note

CPU quantity structures

The point-to-point instructions communicate with the communication modules by reading or writing data records.
When using the instructions, you should therefore check the quantity structure of the CPU for reading and writing data records.
If multiple instructions need to read or write data records simultaneously on a CPU, there may need to be a gap between the calls of each instruction by the user program.

Overview of the instructions

The communication protocols are implemented on the communication module. The protocol is used to adapt the interface of the communication module to the interface of the communication partner.

Communication between the CPU, the communication module and a communication partner takes place by means of special instructions and protocols that support the corresponding communication modules.

The instructions form the software interface between the CPU and the communication module. They must be called cyclically from the user program. Data transmission takes place across several cycles.

The instructions are part of STEP 7 V12. The instructions are available in the "Instructions" task card under Communication > Communication processor.

The corresponding instruction descriptions are available in the information system. They apply to all listed communication modules if they support the required function.

Table 2- 1 Instructions for PtP

Instruction	Meaning
Port_Config	The instruction Port_Config allows you to dynamically assign basic interface parameters.
Send_Config	The instruction Send_Config (send configuration) allows you to dynamically assign serial send parameters of a port.
Receive_Config	The instruction Receive_Config (receive configuration) allows you to dynamically assign serial receive parameters of a port.
P3964_Config	The instruction P3964_Config (protocol configuration) allows you to dynamically configure the parameters of the 3964(R) procedure.
Send_P2P	The instruction Send_P2P allows you to send data to a communication partner.
Receive_P2P	The instruction Recveive_P2P allows you to receive data from a communication partner.
Receive_Reset	The instruction Receive_Reset allows you to clear the receive buffer of the communication module.
Signal_Get	The instruction Signal_Get allows you to read the RS232 accompanying signals.
Signal_Set	The instruction Signal_Set allows you to set the RS232 accompanying signals.

Instruction	Meaning
Get_Features	The instruction Get_Features allows you to read the extended functions supported by the communication module.
Set_Features	The instruction Set_Features allows you to activate the extended functions supported by the communication module.

Table 2- 2 Instructions for USS

Instruction	Meaning
USS_Port_Scan	The instruction USS_Port_Scan allows you to communicate by means of the USS network.
USS_Drive_Control	The instruction USS_Drive_Control allows you to swap data with the drive.
USS_Read_Param	The instruction USS_Read_Param allows you to read parameters from the drive.
USS_Write_Param	The instruction USS_Write_Param allows you to change parameters in the drive.

Table 2- 3 Instructions for Modbus

Instruction	Meaning
Modbus_Comm_Load	The instruction Modbus_Comm_Load allows you to configure the port of the communication module for Modbus RTU. .
Modbus_Master	The instruction Modbus_Master allows you to communicate as Modbus master by means of the PtP port.
Modbus_Slave	The instruction Modbus_Slave allows you to communicate as Modbus slave by means of the PtP port.

Basics of serial communication 3

3.1 Serial data transmission

During serial data transmission, the individual bits of a character of information to be transmitted are sent successively in a defined sequence.

Bidirectional data traffic - operating mode

In the context of bidirectional data traffic, we distinguish between two operating modes for the communication module:

- Half-duplex operation

  The data is exchanged between the communication partners in both directions alternately. In half-duplex operation one communication partner is sending and the other communication partner is receiving at the same time. In the process one line is alternately used for sending or receiving.

- Full-duplex operation

  The data is exchanged between one or more communication partners in both directions simultaneously, which means you can send and receive data at the same time. This process requires one line for sending and one line for receiving.

Asynchronous data transmission

Serial data transmission is performed asynchronously with communication modules. The so-called time base synchronism (a fixed timing code used in the transmission of a fixed character string) is only upheld during transmission of a character. Each character to be sent is preceded by a synchronization impulse, also called start bit. The length of the start-bit transmission determines the clock pulse. The end of character transmission is formed by one or two stop bits.

Declarations

In addition to start and stop bits, additional declarations must be made between the sending and receiving partners before serial transmission can take place. These include:

- Data transmission rate
- Frame start and end criteria (e.g., character delay time)
- Parity
- Number of data bits (7 or 8 bits/characters)
- Number of stop bits (1 or 2)

3.2 Transmission security

Transmission security plays an important role in the transmission of data and in the selection of the transmission procedure. Generally speaking, the more layers of the reference model are applied, the higher the transmission security.

Classification of existing protocols

The figure below illustrates how the protocols of the communication module fit into the reference model.

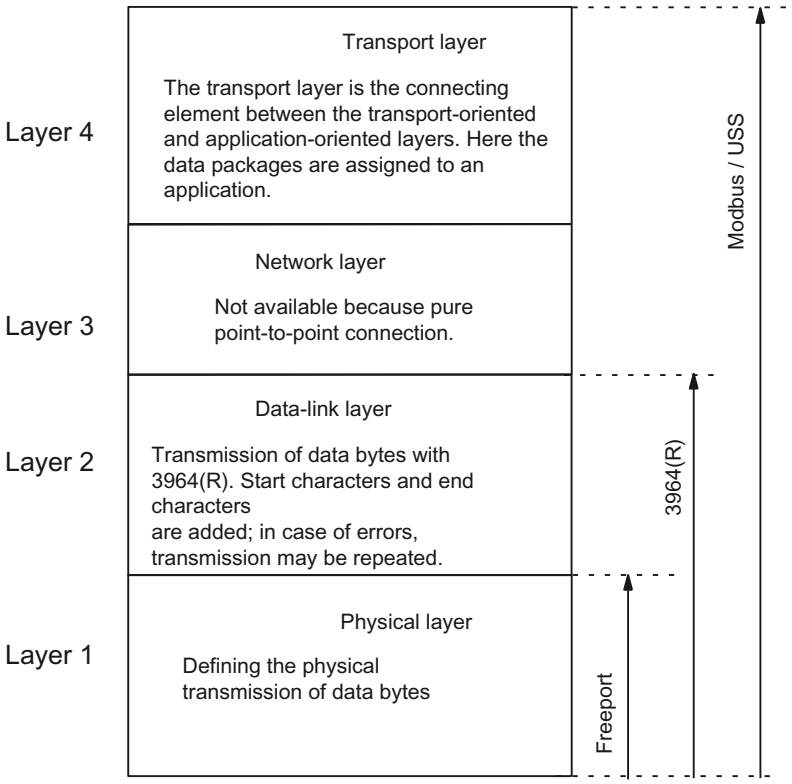

Figure 3-1 Classification of the existing protocols of the communication module in the reference model

Transmission security with Freeport

Transmission security when using Freeport:

- When data is sent with Freeport, there are no data security measures other than the use of a parity bit. This means data transmission with Freeport is very efficient, but data security is not guaranteed. A certain degree of data security can be achieved through parameter assignment of the frame start and frame end conditions.
- Using the parity bit ensures that the inversion of a bit in a character to be sent can be recognized. If two or more bits of a character are inverted, however, there is no guarantee that these errors are still detected.
- To increase transmission security, you can, for example, implement a checksum, a frame length specification, or configurable end conditions. These measures must be implemented by the user.
- A further increase in data security can be achieved by means of acknowledgment frames in response to send or receive frames. This is the case with high-grade protocols for data communication (ISO 7-layer reference model).

Transmission security with 3964(R)

The parity bit is used to increase data security; depending on the configuration, it completes the number of data bits to be transmitted to form an even or odd number.

Using the parity bit ensures that the inversion of a bit in a character to be sent can be recognized. If two or more bits of a character are inverted, however, these errors can no longer be reliably detected.

If parity is set to "none", no parity bit is transmitted. This setup reduces transmission security.

Two different procedures for data transmission can be used, either with or without a block check character:

- Data transmission without block check character: **3964**

  Transmission security is achieved by means of a specified frame structure, frame breakdown, and frame repetitions.

- Data transmission with block check character: **3964R**

  The high degree of transmission security is achieved by means of a specified frame structure and breakdown, frame repetitions, as well as inclusion of a block check character (BCC).

In this manual, the term 3964(R) is used when descriptions and notes refer to both data transmission modes.

Transmission integrity for Modbus and USS

The parity bit is used to increase transmission security; depending on the configuration, it completes the number of data bits to be transmitted to form an even or odd number.

Using the parity bit ensures that the inversion of a bit in a character to be sent can be recognized. If two or more bits of a character are inverted, however, this error can no longer be clearly detected.

If parity is set to "none", no parity bit is transmitted. This setup reduces transmission security.

The CRC (cyclic redundancy check) is additionally used with Modbus. With this method additional redundancy in the form of a so-called CRC value is added for each data block of the user data before data transmission. This is a check value calculated by using a specific procedure that can be used to detect any errors that may occur during transmission.

A BCC (block check character) is additionally used with USS. The block check character is formed during the receipt and is compared with the received BCC after the entire frame has been read in. If these two characters do not match, the frame is not evaluated. (If a character is incorrectly transmitted, an error is reliably detected. If an even number of characters are incorrectly transmitted, an error can no longer be reliably detected.)

3.3 RS232 mode

The following communication modules support RS232 mode:

- CM PtP RS232 BA
- CM PtP RS232 HF
- CM PtP (ET 200SP)

In RS232 mode, data is sent via two lines. A separate line is available for the send direction and the receive direction. Simultaneous sending and receiving is possible (full duplex).

RS232 signals

In addition to the TXD (interface transmits; Transmitted Data), RXD (interface receives; Received Data) and GND (Ground; isolated) signals, the communication module provides the following RS232 signals when using RS232 hardware:

DCD	(input)	Data Carrier detect; Carrier signal when connecting a modem. The communication partner signals that it recognizes incoming data.
DTR	(output)	Data terminal ready; DTR set to "ON": Communication module switched on, ready for operation DTR set to "OFF": Communication module not switched on, not ready for operation
DSR	(input)	Data set ready; DSR set to "ON": Communication partner signals readiness for operation DSR set to "OFF": Communication partner not switched on, not ready for operation
RTS	(output)	Request to send; RTS set to "ON": Communication module ready to send; signals to the communication partner that there is data ready to send RTS set to "OFF": Communication module not ready to send
CTS	(input)	Clear to send; Communication partner can receive data from the communication module (response to RTS = ON of the communication module) CTS set to "ON": Signals readiness to receive to the communication partner CTS set to "OFF": Signals "Not ready to receive" to the communication partner
RI	(input)	Ring Indicator; Incoming call when connecting a modem

After power on of the communication module, the output signals are in the OFF state (inactive).

You configure the operation of the DTR/DSR and RTS/CTS control signals in the user interface of the communication module.

The RS232 signals cannot be influenced in case of:

- configured data flow control "Hardware RTS always switched"

  (corresponds to automatic operation of the accompanying signals)
- configured data flow control "Hardware RTS always ON"

  (corresponds to hardware flow control with RTS/CTS)
- configured data flow control "Hardware RTS always ON, ignore DTR/DSR"

For more information on this topic, refer to chapter Handshake procedure (Page 23).

3.4 RS422 mode

The following communication modules support RS422 mode:

- CM PtP RS422/485 BA
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

In RS422 mode, data is transmitted via two line pairs (four-wire operation). A separate line pair is available for the send direction and the receive direction. Simultaneous sending and receiving is possible (full duplex).

All communication partners must be capable of simultaneous operation of a sender and receiver unit.

The data can be exchanged simultaneously between one or several communication partners. In RS422 multipoint mode, only one slave may send data at any given time.

Interface operating modes

The following table is a summary of the interface operating modes for the various communication modules and protocols.

The communication module can be used in the following topologies in RS422 mode:

- Link between two devices: Point-to-point connection
- Link between several devices: Multipoint connection
  (only available with CM PtP (ET 200SP))

Operating mode	Description
Full duplex (RS422) four-wire operation (point-to-point connection)	Both devices have the same priority in this operating mode.
Full duplex (RS422) four-wire operation (multipoint master)	The communication module can be used as multipoint master.
Full duplex (RS422) four-wire operation (multipoint slave)	The communication module can be used as multipoint slave.

The following applies for a multipoint master/slave topology in RS422 mode:

- The master's sender is interconnected with the receivers of all slaves.
- The slaves' senders are interconnected with the master's receiver.
- Only the receiver of the master and the receiver of one slave have a default setting. All other slaves operate without default settings.

3.5 RS485 mode

The following communication modules support RS485 mode:

- CM PtP RS422/485 BA
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

In RS485 mode, data is transmitted via one line pair (two-wire operation). The line pair is available alternately for the send and receive directions. It is possible to either send or receive (half duplex). On completion of a send operation, operation is immediately switched to receive mode (ready to receive). Send mode is reset again as soon as a new send job is received.

RS485 mode

The following table is a summary of the interface operating modes for the various communication modules and protocols.

Operating mode	Description
Half duplex (RS485) two-wire operation	Operating mode for point-to-point connection or multipoint connection (multipoint) in two-wire operation. The communication module can be the master as well as the slave.

If you operate the Freeport in RS485 mode (half duplex, two-wire operation), you must make provisions in the user program to ensure that only one device sends data at any given time. If more than one device sends data at the same time, the frames are corrupted.

Modbus automatically ensures that only one device is sending.

Changeover times for RS485 communication module in half duplex mode

A maximum time of 0.1 ms is set for the changeover between sending and receiving.

3.6 Handshake procedure

Introduction

Handshaking controls the data flow between two communication partners. The use of the handshaking method prevents data loss during transmission if the devices are operating at different speeds.

We can basically distinguish between the following methods:

Table 3- 1 Overview of methods and interfaces

Method	RS232	RS422	RS485
Software data flow control XON/XOFF	X	X	-
Hardware data flow control (RTS/CTS)	X	-	-
Automatic operation of accompanying signals	X	-	-

Software data flow control

Software data flow control is implemented as follows on the communication module:

- XON/XOFF
  - As soon as the communication module has been set to the "XON/XOFF" operating mode by means of parameter assignment, it sends the XON character, thereby allowing the communication partner to send data.
  - On reaching the configured maximum number of frames, or 16 characters ahead of receive buffer overflow, the communication module sends the XOFF character, thereby requesting that the communication partners stop sending. If the communication partner nonetheless continues to send data, an error message is generated if the receive buffer overflows. Data received in the last frame is discarded.
  - As soon as a frame has been fetched by the CPU and the receive buffer is ready to receive data again, the communication module sends the XON character.
  - If the communication module receives the XOFF character during sending, it cancels the current send operation until it receives a XON again from its communication partner. If no XON is received within a specific configurable time, send operation is canceled and a corresponding error message is output.

Note

You can configure the characters for XON and XOFF (any ASCII character).

During parameter assignment of the XON/XOFF software data flow control, user data may not contain any of the configured XON or XOFF characters.

Hardware data flow control

Note

The DTR/DSR signals do not have to be wired for "Hardware RTS always ON, ignore DTR/DSR" parameter assignment.

If "Hardware RTS always ON" is configured, it is imperative that you fully wire the interface signals used. Make sure that the local RTS (out) is connected with the CTS (in) of the communication partner and the local CTS is connected with the RTS of the communication partner. Accordingly, the local DTR must be connected with the DSR of the communication partner and the local DSR with the DTR of the communication partner.

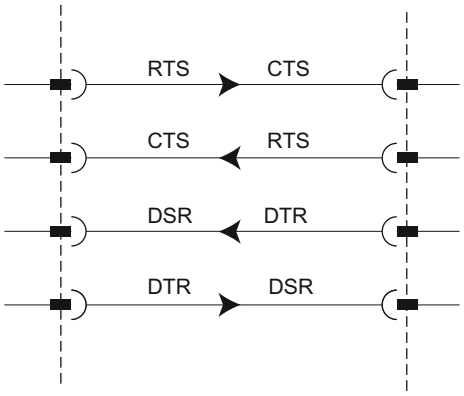

Figure 3-2 Wiring of the interface signals

- **Hardware RTS always ON, ignore DTR/DSR**
  - As soon as the communication module has been set to an operating mode with "Hardware RTS always ON" through parameter assignment, it outputs the RTS = ON signal to the communication partner to indicate its ready state.
  - RTS is set to OFF as soon as the configured maximum number of frames or 16 characters before buffer overflow is reached.
    If the communication partner nonetheless continues to send data, an error message is generated on overflow of the receive buffer. Data received in the last frame is discarded.
  - RTS is reset to ON as soon as the frame has been fetched by the CPU and the receive buffer is ready to receive data again.
  - If CTS switches to OFF during the send operation, the communication module interrupts the send operation until CTS is reset to ON. If CTS is not reset to ON within a specific configurable time, the send operation is canceled and a corresponding error message is output.
- **Hardware RTS always ON**

  The "Hardware RTS always ON" mode corresponds to the "Hardware RTS always ON, ignore DTR/DSR" mode. However, you also need to wire DTR and DSR.
  - As soon as the communication module has been set set to an operating mode with "Hardware RTS always ON" through parameter assignment, it sets DTR = ON and RTS = ON to signal its general ready state to the communication partner.
  - RTS is set to OFF as soon as the configured maximum number of frames or 16 characters before buffer overflow is reached.
    If the communication partner nonetheless continues to send data, an error message is generated on overflow of the receive buffer. Data received in the last frame is discarded.
  - RTS is reset to ON as soon as the frame has been fetched by the CPU and the receive buffer is ready to receive data again.
  - If CTS switches to OFF during the send operation, the communication module interrupts the send operation until CTS is reset to ON. If CTS is not reset to ON within a specific configurable time, the send operation is canceled and a corresponding error message is output.
  - A switch from DSR = ON to DSR = OFF cancels an active send job and triggers an error message.

Automatic operation of accompanying signals

- **Hardware RTS always switched**

  "Hardware RTS always switched" is implemented as follows on the communication module:

  – As soon as the communication module is set to the operating mode with "Hardware RTS always switched" through parameter assignment, it sets the line RTS to OFF and DTR to ON (communication module ready for operation).

    It is not possible to send frames until the DSR line is set to ON. No data is sent via the RS232C interface as long as DSR is set to OFF. A send job is canceled and a corresponding error message is generated.

  – When a send job is pending, RTS is set to ON and the configured RTS ON delay starts. On expiration of the data output time, the system checks whether the communication partner has set CTS to ON. If so, the data is sent via the RS232 interface.

  – If the CTS line is not set to ON within the RTS ON delay, or if CTS changes to OFF during transmission, the send job is aborted and an error message is generated.

  – Once the data has been sent and the configured clear RTS OFF delay has elapsed, the RTS line is set to OFF. The system does not wait for CTS to change to OFF.

  – It is always possible to receive data via the RS232 interface. There will be no reaction if there is a danger of the receive buffer of the communication module overflowing.

  – A switch from DSR = ON to DSR = OFF cancels an active send job and triggers an error message.

  Note

  Set the "RTS ON delay" in such a way that the communication partner is able to enter the ready to receive state before the time elapses.

  Set the "RTS OFF delay" in such a way that the communication partner is able to receive the last characters of the frame completely before RTS is set to OFF and the send request is canceled.

  Note

  When automatic operation of the RS232 signals is configured, RTS and DTR cannot be controlled by means of the corresponding instruction!

Time diagram

The figure below shows the chronological sequence of a send job with configured data flow control "Hardware RTS always switched":

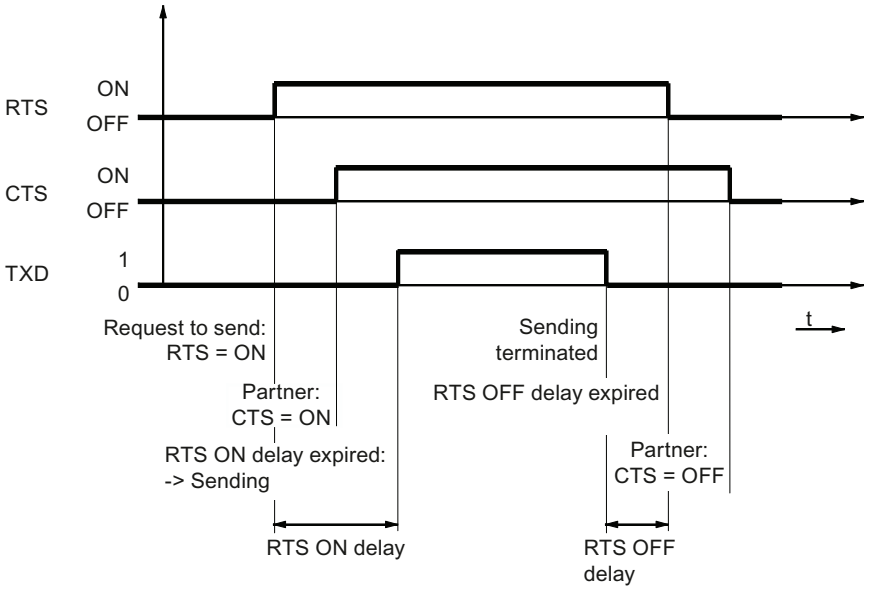

Figure 3-3 Time diagram for Hardware RTS always switched

Additional information

Note

Operation of DTR/DSR or RTS/CTS is accepted by the communication module with the following settings:

- Hardware RTS always ON, ignore DTR/DSR
- Hardware RTS always ON
- Hardware RTS always switched

Configuring / parameter assignment 4

4.1 Configuring / parameter assignment of a communication module

The following sections contain explanations on the following protocols and their parameters:

- Communication using Freeport (Page 30)
- Communication using 3964(R) (Page 38)
- Communication using USS (Page 42)
- Communication through Modbus RTU (Page 46)

This information is required to carry out the parameter assignment and subsequently programming of the communication in accordance with the used protocol.

Configuration and parameter assignment are carried out in the device view of STEP 7 and in the properties dialog of the communication module. Some configurations can also be changed during runtime by means of the corresponding "Config" instructions (Port_Config, Send_Config, Receive_Config, P3964_Config).

Procedure for setting up point-to-point communication

The procedure does not depend on the communication module used.

1. Configure an S7-1500 design with CPU and communication module in the device view of the STEP 7 V12 hardware editor.
2. You assign the parameters of the communication module interface (protocol, protocol parameters, addresses) in the "General" area of the "Properties" tab.

Additional information

Information about programming the communication is available in the section Programming - communication using instructions (Page 53).

4.2 Communication using Freeport

4.2.1 Data transmission with Freeport

Introduction

Freeport is a freely programmable frame-based protocol that is also known as ASCII protocol.

The Freeport protocol controls data transmission by means of a point-to-point connection between the communication module and a communication partner. The Freeport protocol contains the physical layer (Layer 1).

The Freeport protocol supports sending and receiving of messages with any structure (all characters from 00H through FFH (for character frames with 8 data bits) or from 00H through 7FH (for character frames with 7 data bits)).

The frame start and end criteria must be configured both for the send and the receive direction. The start and end criteria can be configured differently.

Instructions are available for communication with a communication partner (see Programming - communication using instructions (Page 53)).

4.2.2 Sending data with Freeport

Specifying settings for sending

To send a message, the partner must be informed of the start and end of the message. These settings can be set fixed in the hardware configuration or be adjusted during runtime by using the instruction Send_CFG. You can select one of the following options or also combine them:

- Send break before frame start

  You can specify that an additional Break is sent at the beginning of each message transmission on expiration of the RTS ON delay time.
  The duration of the "Break" is specified in bit times.

  Compliance with the send break can be deactivated if other mechanisms are used for synchronization.

- Send idle line

  You can specify that an additional "Idle Line" signal is output at the start of each message transmission.
  The duration of the "Idle Line" is specified in bit times.

  Compliance with the send break can be deactivated if other mechanisms are used for synchronization.

- RTS ON delay

  You can configure the time that has to expire after the RTS (Request to send) before the actual data transmission starts (RS232 only).

- RTS OFF delay

  You can configure the time that has to expire after transmission has been completed before the RTS signal is deactivated (RS232 only).

- Send up to and including the end delimiter

  You can configure the number of end delimiters (1 or 2) and their value.

  All data up to the end delimiter(s) is sent, independent of the selected frame length. The end delimiter must be included in the data to be sent. Data is sent only up to and including the delimiter, even if the specified data length is longer.

- Number of appended characters

  Input of the number of appended characters. Sending takes place up to the configured length. The end delimiter(s) is/are appended automatically. Depending on the number of end delimiters, one to five characters more than the number specified at the instruction are sent to the partner.

Note

If you combine "Send break before frame start", "Send idle line" and "RTS ON delay", these are processed in the order "RTS ON delay", "Send break before frame start" and "Send idle line".

4.2.3 Receiving data with Freeport

Specifying the message start

For data transmission with Freeport, you can choose between several different start criteria. The start criterion defines when a frame starts. Once a criterion that indicates the start of the message is met, the data stream is scanned for message end criteria. Here you select the settings that correspond to the properties of the sending communication partner.

Two different methods are available for detecting the message start:

- **Start on any character**

  Any character can be used to define the start of the message (default).

  This means that the first character sent at the start of communication, or after the frame end has been detected, will be identified as the first character of a message.

- **Start on special condition**

  The start of the message is detected based on the following specified conditions.

  – **After detection of a line break**

    The frame start is not accepted unless a break has been received beforehand, in other words, it is compulsory for the partner to send a break before sending a frame.

  – **After detection of an idle line**

    The frame start is not accepted until the configured idle line duration has expired. This procedure requires a minimum interval between two frames.

  – **After receipt of a start character**

    The frame start is detected when the configured start character is identified.

  – **After detection of one or several start sequences**

    The frame start is detected when the configured string with a length of up to five characters is identified. You can configure up to 4 start sequences. The start sequences that are up to 5 characters long can also contain "don't care characters".

Example:

Table 4- 1 Configured start conditions

Start condition	1st character	2nd character	3rd character	4th character	5th character
1	0x68	xx	xx	0x68	xx
2	0x10	0xaa	xx	xx	xx
3	0xdc	0xaa	xx	xx	xx
4	0xe5	xx	xx	xx	xx
:					

The following message has been received: 68 10 aa 68 bb 10 aa 16

The evaluation of the start criteria begins with the receipt of the first character 0x68.
The 2nd and 3rd characters are free.
When the 4th character (second 0x68) is received, the first start condition is met and further evaluation of the message begins.

Specifying the message end

You can choose from several different end criteria for data transmission using the Freeport protocol. The end criterion defines the point at which a frame has been received completely.

Configurable end criteria are:

- **Recognize message end by message timeout**
- **Recognize message end by response timeout**
- **After character delay time elapses (default)**
- **After receipt of a fixed frame length**
- **After receipt of a maximum number of characters**
- **Read message length from message**
- **After receipt of an end sequence**

Message timeout

When data is received, the end of frame is detected on expiration of the configured time for transferring a frame. Time measurement starts after the start criterion has been met.

Response timeout

The response time is used to monitor the response behavior of the communication partner. If a valid frame start is not recognized after the completion of a send job, the send job is acknowledged with a corresponding message.

The actual end criterion has to be configured additionally.

Expiration of character delay time

When data is received, the frame end is detected when the configured maximum time between successive characters is exceeded (character delay time). The value is specified in bit times.

In this case, the character delay time must be set in such a way as to ensure that it expires between two consecutive frames. However, it should be of sufficient length to exclude incorrect identification of the end of the frame whenever the communication partner performs a transmission pause within a frame.

Fixed frame length

When data is received, the end of the frame is identified after the configured frame length has been reached.

An error message is output and the frame is discarded if the character delay time expires (if activated) before the fixed frame length has been reached.

Please note the following if the frame length of the received characters does not match the fixed configured frame length:

- All characters received after the fixed configured frame length has been reached will be discarded until a new start criterion is detected.
- An error message is output and the frame is discarded if another (activated) end criterion is met before the fixed frame length has been reached.

Maximum number of characters

When receiving data, the end of the frame is recognized after the declared number of characters have arrived.

This setting can be combined with the "Character delay time" settings. The frame received is also assessed as free of error if another end condition occurs, regardless of whether the maximum number of characters has been reached.

Please note the following if the frame length of the received characters does not match the configured maximum frame length:

- All characters received after the configured maximum number of characters has been reached will be discarded until a new start criterion (e.g. "Idle Line") is detected.
- If a different (activated) end criterion is met before the configured maximum number of characters has been reached, this "frame part" is assessed as a valid frame and the partner waits for a new start criterion. All characters received prior to fulfillment of a new start criterion are discarded.

Note

If no further end criterion is activated, the fixed frame length and maximum number of characters will respond in the same way.

Message length in the message

When data is received, the frame end is detected when the frame length sent with the received frame has been reached.

The following parameters define the characters to be used for evaluation of the message length:

- **Offset of length field in message**

  In the message, the value defines the position of the character that is to be used to determine the message length.

  You can set values from 0 to 4095 characters, depending on the buffer size.

- **Size of length field**

  This value specifies the number of characters as of the first evaluation position to be used to determine the message length.

  You can set values of 1, 2 and 4 characters.

- **Number of characters not counted in length specification**

  Number of characters appended to the frame without counting towards the frame length. This value defines the number of bytes at the end of the frame which should not be included in the evaluation of the message length.

  You can set values from 0 to 255 characters.

Example:

Parameter assignments for "Message length in the message"

Offset of length field in message:	3rd byte ("2" has to be configured as offset)
Size of length field:	1 byte
Number of characters not counted in length specification:	3 bytes

Message					**Number of characters not counted in length specification**		
Start character	**Address**	**Length field**			**Checksum**	**End delimiter**	
Byte 1	Byte 2	Byte 3	Byte ...	Byte X	Byte X+1	Byte X+2	Byte X+3

End sequence

When data is received, the end of the frame is identified when the configured end sequence (max. 5 characters) is received. The end sequence which is up to 5 characters long can also contain "don't care characters". The received data is applied by the CPU, including the end sequence.

If you are working with the end sequence, transmission is not code-transparent and you must exclude the presence of end code in the user data.

4.2.4 Code transparency

Code transparency

Code-transparent means that any character combinations can occur in the user data without the end criterion being recognized.

The code transparency of the procedure depends on the selection of the configured end criterion and flow control:

- With specified end sequence or using XON/XOFF flow control
  - Not code-transparent
- End criterion character delay time, fixed frame length, maximum frame length, message timeout, or response timeout and message length in the message
  - Code-transparent

4.2.5 Receive buffer

Receive buffer of the module

The communication modules have a receive buffer that stores the received frames temporarily until they are transmitted to the CPU. The receive buffer is implemented as a ring buffer, which means the frames are transmitted to the CPU in the order in which they were received until the receive buffer is full. If additional frames are received once the buffer is full, the oldest frame is overwritten. If "Prevent overwriting" was configured, a corresponding message is generated when the receive buffer is full. All further frames are rejected until the receive buffer is ready to receive new ones.

During the parameter assignment, you can specify whether the receive buffer should be deleted during startup. You can also specify the range of values (1 to 255) for the number of buffered receive frames.

The receive buffer of the module may have a size of up to 8 KB, depending on the communication module used (see chapter Introduction (Page 9)). The frame has a maximum length of 4 KB. This means that each communication module is capable of buffering at least two frames.

If you always want to transfer the last frame received to the CPU, you must set the value "1" for the number of buffered frames and deactivate overwrite protection.

Note

If continuous reading of the received data in the user program is interrupted for a certain time, you may find when the receive data is requested again, that the communication module first sends older frames before the CPU receives the most recent one. At the time of interruption, the old frame had already been transmitted from the receive buffer of the communication module and prepared for transmission to the CPU.

4.3 Communication using 3964(R)

4.3.1 Data transmission with 3964(R) procedure

Introduction

The 3964(R) procedure controls point-to-point data exchange between the communication module and a communication partner. and contains both the physical layer (layer 1) and the link layer (layer 2).

Instructions are available for communication with a communication partner (see Programming - communication using instructions (Page 53)).

4.3.2 Control characters

Introduction

During data transmission, the 3964(R) procedure adds control characters to the information data (link layer). The communication partner can use these control characters to check whether it has received all data completely and without errors.

Control characters of the 3964(R) procedure

The 3964(R) procedure evaluates the following control characters:

STX	Start of Text	Beginning of the character string to be transmitted	02H
DLE	Data Link Escape	Data transmission changeover	10H
ETX	End of Text	End of the character string to be transmitted	03H
NAK	Negative Acknowledge	Negative acknowledgment	15H
BCC	Block Check Character (only with 3964R)	Block check character	

BCC is formed and monitored automatically in the communication module. The block check character is not transmitted as frame content to the CPU.

Note

If the DLE character is transmitted as an information character within a frame, it is sent twice (DLE duplication) to distinguish it from the DLE control character during connection establishment and termination. The receiver reverses the DLE duplication.

Priority

With the 3964(R) procedure, one communication partner must be assigned a higher and the other a lower priority. If both partners start to establish a connection at the same time, the partner having lower priority will cancel its send job.

4.3.3 Block check character

Block check character

With the 3964R transfer protocol, data security is enhanced by sending an additional block check character (BCC = Block Check Character).

The block check character is the even longitudinal parity (EXOR logic operation of all data bytes) of a sent or received block. Its calculation begins with the first byte of user data (first byte of the frame) after the connection establishment, and ends after the DLE ETX character at connection termination.

Note

With DLE duplication, the DLE character is included twice in the BCC calculation.

4.3.4 Sending data with 3964(R)

Connection establishment for sending

The 3964(R) procedure sends the STX control character to set up the connection. If the communication partner responds with the DLE character before the acknowledgment delay time expires, the procedure switches to send mode.

If the communication partner answers with NAK or any other character (except for DLE or STX), or the acknowledgment delay time expires without a response, the procedure tries to set up the connection again. After the configured number of unsuccessful setup attempts, the procedure cancels the connection setup and sends the NAK character to the communication partner. The communication module outputs a corresponding error message.

Sending data

If the connection is successfully established, the user data contained in the output buffer of the communication module is sent to the communication partner with the selected transmission parameters (a DLE recognized in the user data is doubled during the send job). The communication partner monitors the time intervals between the incoming characters. The interval between two characters must not exceed the character delay time. Monitoring of the character delay time starts immediately after the connection has been established.

If the communication partner sends the NAK character during an active send operation, the procedure cancels the block and repeats it as described above, beginning with connection establishment. If a different character is sent, the procedure first waits for the character delay time to expire and then sends the NAK character to set the communication partner to idle state. Then, the procedure restarts sending with the connection setup STX.

Connection termination during sending

Once the contents of the buffer have been sent, the procedure appends the DLE and ETX characters and (only with 3964R) the block checksum BCC as the end identifier, and then waits for an acknowledgment character. If the communication partner sends the DLE characters within the acknowledgment delay time, the data block has been received without errors. If the communication partner responds with NAK, any other character (except DLE), or with a corrupted character, or if the acknowledgment delay time expires without a response, the procedure restarts sending with the connection setup STX.

After the configured number of attempts to send, the procedure stops the process and sends an NAK to the communication partner. The communication module outputs a corresponding error message.

4.3.5 Receiving data with 3964(R)

Connection setup for receiving

In idle state, when there is no send job to be processed, the procedure waits for the communication partner to set up the connection.

A wait time is started (wait time = acknowledgment delay time - 10 ms, however, maximum of 400 ms) if no free receive buffer is available during the connection setup with STX. An error message is generated if no free receive buffer is available on expiration of this time. The procedure sends the NAK character and returns to the idle state. Otherwise, the procedure sends a DLE and receives the data as described above.

The acknowledgment delay time should be set to the same value at both communication partners.

If the procedure receives any character (except for STX or NAK) while in idle state, it waits for the character delay time (CDT) to expire and then sends the NAK character. The communication module outputs a corresponding error message.

Receiving data

After a successful connection establishment, the incoming receive characters are saved to the receive buffer. If two consecutive DLE characters are received, only one of these is saved to the receive buffer.

After connection has been established and after each receive character, the procedure waits for the next character during the character delay time. If this period expires before another character is received, an NAK is sent to the communication partner. The communication module outputs a corresponding error message. A retry is then expected.

If transmission errors occur during receiving (frame errors, parity errors, etc.), the procedure continues to receive data until the connection is terminated and then sends an NAK to the communication partner. A retry is then expected. If the block still cannot be received without errors after the specified number of transfer attempts, or if the communication partner does not start the retry within a block wait time of 4 seconds, the procedure cancels the receive operation. The communication module reports the first corrupted transfer and the final cancelation.

Connection setup for receiving

If the 3964 procedure detects a DLE ETX string, it terminates the receive operation and confirms a successfully received block by sending a DLE to the communication partner. In the case of a receive error, an NAK is sent to the communication partner. A retry is then expected.

The 3964R procedure terminates the receive operation after having detected the DLE ETX BCC string. It compares the received block check character BCC with the internally calculated longitudinal parity. If the BCC is correct and no other receive errors have occurred, the 3964R procedure sends a DLE and returns to the idle state. The communication module informs the control system that new receive data is available.

If the BCC is faulty or a different receive error occurs, an NAK is sent to the communication partner. A retry is then expected.

4.4 Communication using USS

4.4.1 Overview of USS communication

Position in the system environment

The following USS description refers to the use of the corresponding communication modules.

- CM PtP RS232 BA
- CM PtP RS422/485 BA
- CM PtP RS232 HF
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

Introduction

The USS® protocol (Universal Serial Interface Protocol) is a basic serial data transmission protocol designed to meet the requirements of drive technology.

The USS protocol defines an access method based on the master-slave principle for communication via a serial bus. One master and up to 16 drives (slaves) can be connected to the bus. The individual drives are selected by the master using an address character in the frame. A drive can never send anything without first being initiated by the master. Therefore, direct data transmission between individual drives is not possible. Communication functions in half-duplex mode. The master function cannot be transferred.

Drive technology requires specific response times for the control tasks and therefore strict cyclical frame traffic:

The master continuously sends frames (job frames) to the drives and expects a response frame from each addressed drive.

A drive must send a response frame if

- it has a received a frame without errors and
- it was addressed in this frame.

A drive may not send if these conditions are not met or the drive was addressed in the broadcast.

The connection with the respective drives exists for the master once it receives a response frame from the drive after a specified processing time (response delay time).

frame structure

Each frame begins with a start character (STX), followed by the length specification (LGE) and the address byte (ADR). The data field comes after that. The frame ends with the block check character (BCC). The frame length includes the user data (quantity n), the address byte (ADR) and the data verification character (BCC).

STX	LGE	ADR	1	2	...	N	BCC

For single-word (16-bit) data, the high byte is sent first followed by the low byte. Correspondingly, with double-word data the high word is sent first, followed by the low word. The length of a frame is specified in bytes.

Data encryption

The data is encrypted as follows:

- STX: 1 byte, start of text, 02H
- LGE: 1 byte, contains the frame length as a binary number
- ADR: 1 byte, contains the slave address and frame type in binary code
- Data fields: One byte each, content depending on job
- BCC: 1 byte, block check character

Data transmission procedure

The master ensures cyclic data transmission in frames. The master addresses all slave devices one after another with a job frame. The nodes addressed respond with a response frame. In accordance with the master-slave procedure, the slave must send the response frame to the master after it has received the job frame. Only then can the master address the next slave.

Data field in the frame

The data field is divided into two areas: the parameter area (PKW) and the process data area (PZD).

STX	LGE	ADR	Parameter (PKW)	Process data (PZD)	BCC

- **Parameter area** (PKW)

  The PKW area handles parameter transmission between two communication partners (e.g., controller and drive). This involves, for example, reading and writing parameter values and reading parameter descriptions and the associated text. The PKW interface generally contains jobs for operation and display, maintenance and diagnostics.

- **Process data area** (PZD)

  The PZD area consists of signals that are required for automation:

  – Control words and setpoints from the master to the slave

  – Status words and actual values from the slave to the master

  The contents of the parameter area and process data area are defined by the slave drives.

  For additional information on this, refer to the drive documentation.

4.4.2 Overview of functions

Transmission sequence

The instructions process the data transmission cyclically with up to 16 drive slaves. Only one job is active for each drive at any one time.

Performance features:

- Creation of data storage areas for communication, depending on the bus configuration
- Execution and monitoring of PKW jobs
- Monitoring of the complete system and troubleshooting
- Communication with the CPU
- Access to the drive functions
- Reading the drive parameters
- Writing the drive parameters

4.5 Communication through Modbus RTU

4.5.1 Overview of modbus communication

Modbus RTU communication

Modbus RTU (Remote Terminal Unit) is a standard protocol for communication in the network and uses the electrical RS232 or RS422/485 connection for serial data transmission between Modbus devices in the network.

Modbus RTU uses a master/slave network in which the entire communication is triggered by only one master device while the slaves can only respond to the request of the master. The master sends a request to a slave address and only this slave address responds to the command (exception: broadcast frames to slave address 0 which are not acknowledged by the slaves).

The procedure used is a code-transparent, asynchronous half-duplex procedure. Data transmission is carried out without handshake.

Position in the system environment

The following Modbus description refers to the use of the corresponding communication modules.

- CM PtP RS232 HF
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

Function of the coupling

With the corresponding communication modules and the related instructions, you can establish a communication connection between a remote Modbus control system and a SIMATIC S7.

The GOULD-MODBUS protocol in RTU format is used for transmission.

Function codes 01, 02, 03, 04, 05, 06, 08, 15 and 16 are used for communication between a communication module operated as a Modbus slave and a master system (see Function Codes (Page 50)).

If a SIMATIC S7 communication module is operated as a Modbus master, function codes 11 and 12 are also available.

SIMATIC S7 as a Modbus slave

The master has the initiative for transmission, the communication module works as a slave.

frame traffic from slave to slave is not possible.

The instruction Modbus_Slave makes the data available on a SIMATIC data area in accordance with the mapping specification or stores them.

SIMATIC S7 as a Modbus master

As master, the communication module initiates transmission and, after outputting a request frame, it waits for the configured response monitoring time for a response frame from the slave. If the slave does not respond, the master repeats the request in accordance with the configuration before it outputs an error message.

frame structure

The data exchange "Master-Slave" and/or "Slave-Master" begins with the **slave address**, followed by the **function code**. Then the data are transferred. The structure of the data field depends on the function code used. The CRC check is transmitted at the end of the frame.

ADDRESS	FUNCTION	DATA	CRC-CHECK
Byte/Word	Byte	n byte	2 byte

ADDRESS	Modbus slave address • Standard address: 1 to 247 (bytes) • Extended station address: 1 to 65535 (word)
FUNCTION	Modbus Function Codes (Page 50)
DATA	frame data: Management and net data depending on the function code
CRC-CHECK	frame checksum

Slave address

The slave address can be range from 1 to 247 (byte) or 1 to 65535 (word). The address is used to address a defined slave on the bus.

Broadcast Message

The master uses slave address 0 to address all slaves on the bus.

Broadcast messages are only permitted in conjunction with writing Function codes 05, 06, 15 and 16.

A broadcast message is not followed by a response frame from the slave.

Data Field DATA

The data field DATA is used to transfer the function code-specific data such as:

- Bytecount, Coil_Startaddress, Register_Startaddress; Number_of_Coils, Number_of_Registers, ...

  For details, see "Function Codes (Page 50)".

CRC-Check

The end of the frame is identified by means of the CRC 16 checksum consisting of 2 bytes. It is calculated by the following polynominal: $x^{16} + x^{15} + x^2 + 1$.

The low byte is transmitted first, followed by the high byte.

End of frame

The end of frame is recognized when no transmission takes place during the time period required for the transmission of three and a half characters (3.5 times character delay time) (see Modbus Protocol Reference Guide).

This end of frame TIME_OUT therefore depends on the data transmission rate and is indicated in bit times (35 bit times are fix coded internally; further bit times can be configured in addition at the instruction).

The Modbus frame received from the connection partner is evaluated and formally checked after the end of frame TIME_OUT is received.

Exception responses

On recognition of an error in the request frame from the master, for example, register address illegal, the slave sets the highest value bit in the function code of the response frame.

This step is followed by transmission of a byte exception code that describes the cause of the error.

A detailed description of the meaning of the above-mentioned parameters is available in the "GOULD MODICON Modbus Protocol" (not part of this documentation).

Exception code frame

The exception code frame from the slave has the following structure:

- for example, slave address 5, function code 5, exception code 2

Response frame from the slave EXCEPTION_CODE_xx:

05H	Slave address
85H	Function code
02H	Exception code (1...7)
xxH	CRC checksum "Low"
xxH	CRC checksum "High"

On receipt of an exception code frame by the driver, the current job is completed with error.

The following error codes are defined in accordance with the Modbus specification:

Error code	Meaning in accordance with Modbus specification	Cause - Short Description *
1	Illegal function	Illegal function code
2	Illegal data address	Slave has illegal data address
3	Illegal data value	Slave has illegal data value
4	Failure in Associated Device	Slave has internal error
5	Acknowledge	Function is carried out
6	Busy, Rejected message	Slave is not ready to receive
7	Negative acknowledgement	The function cannot be carried out.
* Check slave for further details.		

RS232 mode

The following communication modules support RS232 mode:

- CM PtP RS232 HF
- CM PtP (ET 200SP)

For more information on RS232 mode, see the chapter RS232 mode (Page 19).

For information on hardware data flow control and on automatic operation of the accompanying signals, refer to the Handshake procedure (Page 23) chapter.

RS422/485 mode

The following communication modules support RS422/485 mode:

- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

For more information on RS422/485 mode, see the chapters RS422 mode (Page 21) and RS485 mode (Page 22).

4.5.2 Function Codes

Used function codes

The function code defines the meaning of the frame. It also defines the structure of a frame.

The following function codes are supported by the communication module:

Function code	Function in accordance with MODBUS specification	Range
01	Read Coil Status	1 to 2000 bit/request
02	Read Input Status	1 to 2000 bit/request
03	Read Holding Registers	1 to 124/125 bit/request (124 at extended station address)
04	Read Input Registers	1 to 124/125 bit/request (124 at extended station address)
05	Force Single Coil	1 bit/request
06	Preset Single Register	1 word/request
08 *	Loop Back Test	Read slave status or reset event counter in the slave
11 *	Fetch Communications Event Counter (only master)	-
15	Force Multiple Coils	1 to 1968 bits/request
16	Preset Multiple Registers	1 to 123 bit/request

* Diagnostic information for slave communication

Modbus function code 00 sends a broadcast message to all slaves (without slave response).

Assignment of the Modbus addresses to the SIMATIC addresses

The table below shows the assignment of the Modbus addresses to the SIMATIC addresses.

Modbus				S7-1500	
FC [1]	Function	Declaration	Address area	Declaration	CPU address
01	Read bits	Output	1 - 9999	Process image of outputs	Q0.0 to Q1248.6
02	Read bits	Input	10001 - 19999	Process image of inputs	I0.0 - 1248.6
03 [2]	Read words	Holding Register	40001 - 49999 or 400001 - 465535	DW0 - DW19998 or DW0 - DW131068	The M address area depends on the CPU
04	Read words	Input	30001 - 39999	Process image of inputs	IW0 to IW19996
05 [2]	Write bits	Output	1 - 9999	Process image of outputs	Q0.0 to Q1248.7
06	Write words	Holding Register	40001 - 49999 or 400001 - 465535	DW0 - DW19998 or DW0 - DW131068	The M address area depends on the CPU
15	Write bits	Output	1 - 9999	Process image of outputs	Q0.0 to Q1248.6
16 [2]	Write words	Holding Register	40001 - 49999 or 400001 - 465535	DW0 - DW19998 or DW0 - DW131068	The M address area depends on the CPU

1) FC = function code

2) The value of the HR_Start_Offset determines whether data areas or bit memory address areas can be addressed with the FCs 03, 05 and 16 in the SIMATIC CPU.

Programming - communication using instructions 5

5.1 Overview of point-to-point programming

Data exchange using Freeport or 3964(R) communication

You must make the send data available in data blocks or in the bit memory address area in the user program of the corresponding CPU. A receive buffer is available in the communication module for the receive data. A corresponding data block is set up in the data block.

In the user program of the CPU, the instructions Send_P2P and Receive_P2P carry out the data transfer between the CPU and the communication module. The receive buffer can be deleted with the instruction Receive_Reset.

Dynamic configuration by means of the user program

As an alternative to or in addition to the parameter assignment of the communication module interface described in chapter Configuring / parameter assignment of a communication module (Page 29), it may be advisable in certain application areas to set up the communication dynamically, i.e., program-controlled by a specific application.

All configurations carried out in the properties dialog of the communication module can also be changed during runtime by means of the corresponding "Config" instructions (Port_Config, Send_Config, Receive_Config, P3964_Config).

Program calls for point-to-point communication - sequence

The figure below shows the function of the point-to-point instructions for communication between the user program and communication partner.

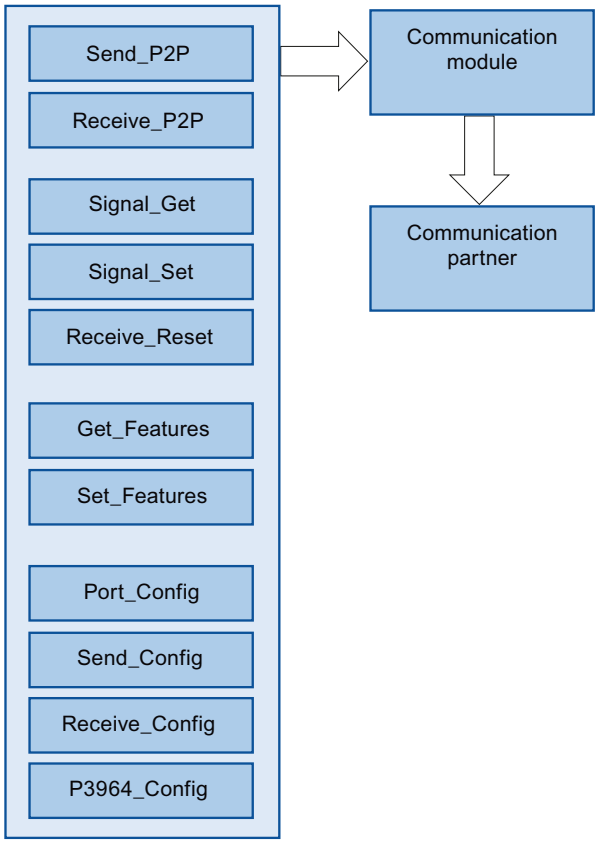

Figure 5-1 Program sequence

PtP instructions

- Instructions for dynamic parameter assignment
  - Port_Config

    You can use the Port_Config instruction (port configuration) to configure basic interface parameters, such as the data transmission rate, parity and data flow control dynamically through your user program.
  - Send_Config

    With the instruction Send_Config (send configuration) you can configure serial send parameters, such as RTS ON-/RTS OFF delay, dynamically for a point-to-point communication interface.
  - Receive_Config

    The instruction Receive_Config (receive parameter assignment) allows you to dynamically assign serial receive parameters to a communication module.

    This instruction configures the conditions that specify the start and the end of a received message.
  - P3964_Config

    The instruction P3964_Config (configure protocol) can be used to dynamically configure protocol parameters of the procedure 3964(R), such as character delay time, priority and block check using your program.
- Instructions for data exchange (communication)
  - Send_P2P

    The instruction Send_P2P (send point-to-point data) can be used to send data to the communication partner.

    Call up the instruction Send_P2P to send data using the Freeport protocol. You have to call the instruction cyclically until you receive a corresponding acknowledgement at the output parameters of the instruction.

    Note: During parameter assignment of the XON/XOFF data flow control, user data may not contain any of the configured XON or XOFF characters. Default settings are DC1 = 11H for XON and DC3 = 13H for XOFF.
  - Receive_P2P

    The instruction Receive_P2P (receive point-to-point data) can be used to pick up the messages received in the communication module from a communication partner.

    Call the instruction Receive_P2P cyclically to receive data using the Freeport protocol. The instruction indicates at the NDR parameter if new received data is available.

    To signal the start and end of a message transmission, you need to define criteria in the Freeport protocol which identify the start and end of the message.
  - Receive_Reset

    The instruction Receive_Reset (delete receive buffer) allows you to clear the receive buffer of the communication module.

- Instructions for operation of the RS232 signals
  - Signal_Get

    With the Signal_Get instruction (get RS232 signals) you can read the current states of the RS232 signals.
  - Signal_Set

    With the instruction Signal_Set (get RS232 signals), you can set the states of the RS232 signals DTR and RTS.
- Instructions for advanced functions
  - Get_Features

    You can use the instruction Get_Features (get extended functions) to get information on the Modbus support and on generating diagnostic alarms.
  - Set_Features

    If supported by the module, you can use the instruction Set_Features (set extended functions) to activate the generation of diagnostic alarms.

Procedure for setting up Freeport or 3964(R) communication

Requirement: The configuration and parameter assignment of a CPU and a communication module in the device view and in the properties dialog of the communication module are complete.

1. In the project navigation for the CPU select the folder "Program blocks" and open the Main (OB1) in the folder by double-clicking it. The program editor opens.
2. From the "Instructions" task card, "Communication" area select the instructions Send_P2P and Receive_P2P and drag-and-drop them into a network of the Main (OB1).
3. Configure the instructions in accordance with your specifications.
4. Download the hardware configuration and the user program to the CPU.

Additional information

You can find a list of available instructions in chapter Overview of instructions (Page 13).

Information about the instructions is available in the info system of STEP 7 V12.

5.2 Overview of USS programming

Program calls for USS communication - sequence

The figure below shows the function of the USS instructions for communication between user program and USS drive. (The instructions Send_P2P, Receive_P2P and the Config instruction are required downstream).

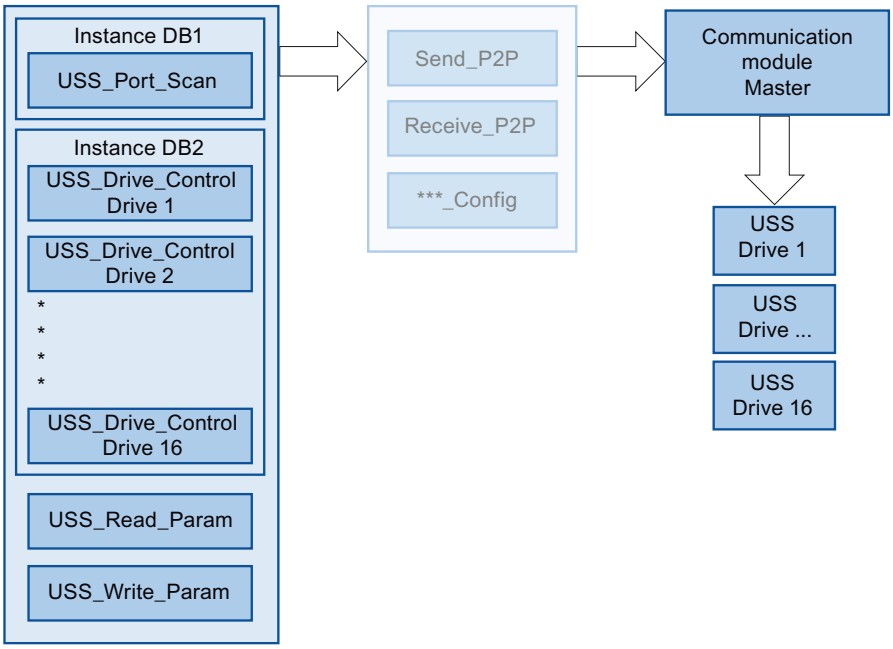

Figure 5-2 Program sequence

USS instructions

- USS_Port_Scan:

  The instruction USS_Port_Scan allows you to communicate via a communication module with up to 16 drives using a USS network (must be called cyclically).

  The instruction USS_Port_Scan controls the communication between CPU and the drives by means of the PtP communication port. A communication with the drive is processed every time you call this function. The instruction USS_Port_Scan is required once:

  Since most drives features a configurable internal function that monitors the integrity of the communication based on a timeout, the instruction USS_Port_Scan should be called from a time-controlled OB.

- USS_Drive_Control:

  The instruction USS_Drive_Control allows you to prepare the send data for a drive and to display the receive data.

  The inputs and outputs of the instruction correspond to the states and operating functions of the drive. The instruction USS_Drive_Control must be called once for each drive. Only one common instance DB is required for all calls of the instruction USS_Drive_Control for a USS network. Interconnect all calls of the instructions USS_Drive_Control for a USS network with the same instance DB.

  The instruction USS_Drive_Control should be called from the cyclic Main (OB1) of the main program.

- USS_Read_Param:

  The instruction USS_Read_Param allows you to read parameters from the drive.

  You use the USS_Read_Param instruction to read the operating parameters of the drive that control the internal drive functions.

  The instruction USS_Read_Param should be called from the cyclic Main (OB1) of the main program.

- USS_Write_Param:

  The instruction USS_Write_Param allows you to change parameters in the drive.

  The instruction USS_Write_Param should be called from the cyclic Main (OB1) of the main program.

Procedure for setting up USS communication

Requirement: The configuration and parameter assignment of a CPU and a communication module in the device view and in the properties dialog of the communication module are complete.

1. In the project tree for the CPU, select the "Program blocks" folder and open the desired time-controlled OB by double-clicking it. The program editor opens.
2. From the "Instructions" task card, "Communication" area select the instruction USS_Port_Scan and drag-and-drop it into a network of a time-controlled OB.

   The instruction USS_Port_Scan allows you to communicate by means of the USS network.
3. In the project navigation for the CPU select the folder "Program blocks" and open the Main (OB1) in the folder by double-clicking it. The program editor opens.
4. From the "Instructions" task card, "Communication" area select the instructions for USS communication in accordance with your task and drag-and-drop them into a network of the Main (OB1):
   - The instruction USS_Drive_Control is used for data exchange with the drive.
   - The instruction USS_Read_Param is used for reading parameters from the drive.
   - The instruction USS_Write_Param is used for changing parameters in the drive.
5. Configure the instructions in accordance with your specifications.
6. Download the hardware configuration and the user program to the CPU.

Additional information

You can find a list of available instructions in chapter Overview of instructions (Page 13).

Information about the instructions is available in the info system of STEP 7 V12.

5.3 Overview of Modbus programming

Program calls for Modbus communication - sequence

The figure below shows the function of the Modbus instructions for communication between user program and Modbus device. (The instructions Send_P2P, Receive_P2P and the Config instruction are required downstream).

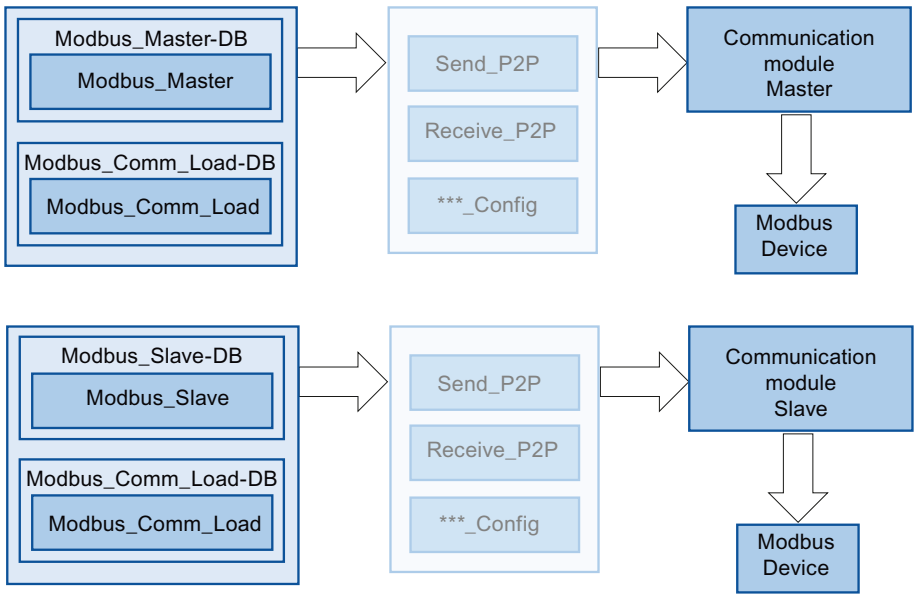

Figure 5-3 Program sequence

Modbus instructions

- Modbus_Comm_Load:

  The instruction Modbus_Comm_Load allows you to configure the port of the communication module for Modbus RTU.

  You have to run Modbus_Comm_Load to set up PtP port parameters, such as data transmission rate, parity and flow control. Once you have configured the interface for the Modbus RTU protocol, it can only be used by the instruction Modbus_Master or the instruction Modbus_Slave .

- Modbus_Master:

  The instruction Modbus_Master allows you to communicate as Modbus master by means of the PtP port.

  The CPU can be used as Modbus RTU master device with the Modbus_Master instruction for communication with one or several Modbus slave devices.

- Modbus_Slave:

  The instruction Modbus_Slave allows you to communicate as Modbus slave by means of the PtP port.

  The CPU can be used as Modbus RTU slave device with the Modbus_Slave instruction for communication with one Modbus master device.

Note

Alternative use of Modbus_Slave and Modbus_Master

A communication module can be operated either as master or as slave.

Procedure for setting up Modbus communication

Requirement: The configuration and parameter assignment of a CPU and a communication module in the device view and in the properties dialog of the communication module are complete.

1. In the project navigation for the CPU select the folder "Program blocks" and open the Main (OB1) in the folder by double-clicking it. The program editor opens.
2. From the "Instructions" task card, "Communication" area select the instructions for Modbus communication in accordance with your task and drag-and-drop them into a network of the Main (OB1):
   - The instruction Modbus_Comm_Load configures the port of the communication module for Modbus communication.

     The Modbus_Comm_Load must be called in Main (OB1) until DONE (or ERROR) is reported.
   - The instruction Modbus_Master is used for the Modbus master functionality.
   - The instruction Modbus_Slave is used for the Modbus slave functionality.
3. Configure the instructions in accordance with your specifications.
4. Download the hardware configuration and the user program to the CPU.

Additional information

You can find a list of available instructions in chapter Overview of instructions (Page 13).

Information about the instructions is available in the info system of STEP 7 V12.

Startup and Diagnostics

6

6.1 Startup characteristics

Operating mode transitions

After the communication module starts up, all data between the CPU and the communication module is exchanged by means of instructions.

CPU STOP	During a running data transmission communication module - CPU, both a send and a receive job is aborted.
CPU RUN	Send and receive operation is ensured in the RUN state of the CPU. With a corresponding configuration in the properties dialog of the communication module, you can automatically clear the receive buffer on the communication module during CPU startup.

From the view of the communication module, there are no further operating states/operating state transitions.

6.2 Diagnostic functions

Introduction

The diagnostic functions of the communication module allow errors that have occurred to be located quickly. The following diagnostic options are available to you:

Diagnostics by means of the display elements of the communication module	The indicators provide information on the operating mode or the possible error states of the communication module. The indicators provide an initial overview of any internal or external errors and interface-specific errors. For more information refer to the device manual of the corresponding communication module.
Diagnostics via the STATUS output of the instructions	Instructions have a STATUS output for error diagnostics; it provides information about communication errors between the communication module and the CPU. You can evaluate the STATUS parameter in the user program (it is active for exactly one cycle).
Diagnostic error interrupt	The communication module can trigger a diagnostic error interrupt on the CPU assigned to it. The communication module makes diagnostic information available. The analysis of this information is made via the user program or by reading the CPU diagnostics buffer.

6.3 Error messages

Overview of error messages - PtP

The error messages are output at the STATUS output of an instruction and can be evaluated there or processed in the user program.

Error code	Description	Remedy
0x0000	No error	-
RECEIVE status and error codes		
0x0094	frame end identified based on the "Receipt of fixed/maximum frame length"	-
0x0095	frame end identified based on "Message timeout"	-
0x0096	frame end identified based on expiration of the "Character delay time"	-
0x0097	The frame was aborted because the maximum response time was reached.	-
0x0098	frame end identified based on the fulfillment of the "Read message length from message" conditions	-
0x0099	frame end identified based on the receipt of the "End sequence"	-
SEND status and error codes		
0x7000	Block idle	-
0x7001	Initial call for a new frame: Data transmission initiated	-
0x7002	Interim call: Data transmission running	-
0x8085	Invalid length	Select a suitable frame length. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)
0x8088	The specified length exceeds the range set in the receive buffer. Note: If the data type STRING has been specified at the BUFFER parameter, this error code will also appear if the current string is shorter than the length specified at the LENGTH parameter.	Change the range in the receive buffer or select a frame length which corresponds to the range set in the receive buffer. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)
RECEIVE status and error codes		
0x8088	The number of characters received exceeds the number specified at the BUFFER parameter.	Select a suitable frame length. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)

Error code	Description	Remedy
Error message codes of the special functions		
0x818F	Incorrect parameter number setting (with USS only)	Select a suitable parameter number (PARAM). The following numbers are valid: 0-2047
0x8190	Incorrect setting of the CRC calculation	Select a suitable value for the CRC calculation. The following are valid: deactivated or activated. Check whether the module addressed supports CRC calculation.
0x8191	Incorrect setting of the diagnostic error interrupt	Select a suitable value for "Diagnostic error interrupt". The following are valid: Diagnostic error interrupt deactivated or diagnostic error interrupt activated. Check whether the module addressed supports the generation of diagnostic interrupts.
Error message codes of the "Port configuration"		
0x81A0	The module does not support this protocol.	Select a valid protocol for the module (PROTOCOL).
0x81A1	The module does not support this data transmission rate.	Select a valid data transmission rate for the module (BAUD).
0x81A2	The module does not support this parity setting.	Select a suitable value for "Parity" (PARITY). The following are valid: • None (1) • Even (2) • Odd (3) • Mark (4) • Space (5) • Any (6)
0x81A3	The module does not support this number of data bits.	Select a suitable value for "Number of data bits" (DATABITS). The following are valid: • 7 (2) • 8 (1)
0x81A4	The module does not support this number of stop bits.	Select a suitable value for "Number of stop bits" (STOPBITS). The following are valid: • 1 (1) • 2 (2)
0x81A5	The module does not support this type of data flow control.	Select a valid data flow control for the module (FLOWCTRL).
0x81A7	Invalid valid for XON or XOFF	Select suitable values for XON (XONCHAR) and XOFF(XOFFCHAR). Valid range of values: 0...255

Error code	Description	Remedy
0x81AA	Invalid operating mode	Valid operating modes are: • Full duplex (RS232) (0) • Full duplex (RS422) four-wire mode (point-to-point) (1) / (CM PtP (ET 200SP)) • Full duplex (RS422) four-wire mode (multipoint master) (2)/ (CM PtP (ET 200SP)) • Full duplex (RS422) four-wire mode (multipoint slave) (3) • Half duplex (RS485) two-wire mode (4)
0x81AB	Invalid receive line initial state	Valid initial states are: • "No" default setting (0) • Signal R(A)=5 V, signal R(B)=0 V (break detection) (1): Can only be selected with: "Full duplex (RS422) four-wire mode (point-to-point connection)" and "Full duplex (RS422) four-wire mode (multipoint slave)". • Signal R(A)=0 V, signal R(B)=5 V (2): This default setting corresponds to the idle state (no active send operation).
0x81AC	Invalid value for "Break detection"	Select a suitable value for "Break detection". The following are valid: • Break detection deactivated (0) • Break detection activated (1).
0x81AF	The module does not support this protocol.	Select a valid protocol for the module.
Error codes of the "Send configuration"		
0x81B5	More than two end delimiters or end sequence > 5 characters	Select suitable values for "End delimiter" and "End sequence". The following are valid: • deactivated (0), • 1 (1) or 2 (2) end delimiters or • deactivated (0), • 1 (1) up to 5 (5) characters for the end sequence.
0x81B6	Send configuration rejected because the 3964(R) protocol was selected	Make sure that no send configuration is transmitted if the 3964(R) protocol is set.

Error code	Description	Remedy
Error codes of the "Receive configuration"		
0x81C0	Invalid start condition	Select a suitable start condition. The following are valid: • Send break before frame start • Send Idle Line.
0x81C1	Invalid end condition or no end condition selected	Select a suitable end condition (see Receiving data with Freeport (Page 32)).
0x81C3	Invalid value for "Maximum message length"	Select a suitable value for "Maximum message length" (MAXLEN). Valid range of values (depending on the module): 1-1024/2048/4096 (Byte)
0x81C4	Invalid value for "Offset of the length specification in the message"	Select a suitable value for "Offset of the length specification in the message". Valid range of values (depending on the module): 1-1024/2048/4096 (Byte)
0x81C5	Invalid value for "Size of length field"	Select a suitable value for "Size of length field" (LENGTHSIZE). Valid range of values in bytes: • 1 (1) • 2 (2) • 4 (4)
0x81C6	Invalid value for "Number of characters not counted in length specification"	Select a suitable value for "Number of characters not counted in length specification" (LENGTHM). Valid range of values: 0 to 255 (bytes)
0x81C7	The total of "Offset in the message + size of length field + number of characters not counted" is greater than the maximum frame length	Select a suitable value for "Offset in message", "Size of length field" and "Number of characters not counted". Valid range of values: • Offset in the message (depending on the module): 0-1024/2048/4096 (Byte) • Size of length field: 1, 2, or 4 (bytes) • Number of characters not counted: 0 to 255 (bytes)
0x81C8	Invalid value for "Response timeout"	Select a suitable value for "Response timeout". Valid range of values: 1-65535 (ms)
0x81C9	Invalid value for "Character delay time"	Select a suitable value for "Character delay time". Valid range of values: 1-65535 (bit times)
0x81CB	frame end sequence is activated, but no character is activated for the check	Activate one or several characters for the check.
0x81CC	frame start sequence is activated, but no character is activated for the check	Activate one or several characters for the check.

Error code	Description	Remedy
0x81CD	Invalid value for "Prevent overwriting"	Select a suitable value for "Prevent overwriting". The following are valid: • Prevent overwriting is deactivated (0) or • Prevent overwriting is activated (1)
0x81CE	Invalid value for "Clear receive buffer on startup"	Select a suitable value for "Clear receive buffer on startup". The following are valid: • Clear receive buffer at startup is deactivated (0) • Clear receive buffer at startup is activated (1)
SEND status and error codes		
0x81D0	Receiving send request during runtime of a send command	Make sure that you do not receive an additional send request during runtime of a send command.
0x81D1	The waiting time for XON or CTS = ON has expired.	The communication partner has a fault, is too slow or is offline. Check the communication partner or change the parameters, if necessary.
0x81D2	"Hardware RTS always ON": Send command aborted due to change from DSR = ON to OFF	Check the communication partner. Make sure that DSR is ON for the entire duration of transmission.
0x81D3	Send buffer overflow / send frame too long	Select a shorter frame length. The following are valid (depending on the module): 1-1024/2048/4096 (bytes)
0x81D5	Transmission aborted due to parameter changes, detected wire break, or because CPU in STOP	Check the parameter assignment, for wire break, and the CPU status.
0x81D6	Transmission canceled because end identifier was not received	Check the parameter assignment of the end characters and the frame of the communication partner.
0x81D7	Communication error between the user program and module	Check the communication (e.g., matching the sequence number).
0x81D8	Transmission attempt rejected because module is not configured	Configure the module.
Error codes of the receive configuration		
0x81E0	Frame aborted: Send buffer overflow / send frame too long	Increase the call rate for the receive function in the user program or configure communication with data flow control.
0x81E1	Frame aborted: Parity error	Check the connection line of the communication partners, or verify that both devices are configured for the same data transmission rate, parity and stop bit number.
0x81E2	Frame aborted: Character frame error	Check the settings for start bit, data bits, parity bit, data transmission rate, and stop bit(s).
0x81E3	Frame aborted: Character overflow error	Firmware error: Please contact Customer Support.
0x81E4	Frame aborted: The total length of "Offset in the message + size of the length field + number of characters not counted" is greater than the receive buffer	Select a suitable value for offset in message, size of the length field, and number of characters not counted.
0x81E5	Frame aborted: Break	Receive line to partner is interrupted. Reconnect or switch on partner.

Error code	Description	Remedy
0x81E6	Maximum number of "Buffered received frames" exceeded	In the user program call the instruction more often or configure a communication with data flow control or increase the number of buffered frames.
0x81E8	Frame aborted: The character delay time has expired before the message end criterion was detected	Partner device faulty or too slow. Check this, if required, using an interface tester that is interconnected in the transmission line.
0x81E9	Modbus CRC error (only communication modules which support Modbus)	Checksum error of the Modbus frame. Check the communication partner.
0x81EA	Modbus frame too short (only communication modules which support Modbus)	Minimum length of Modbus frame not met. Check the communication partner.
0x81EB	Frame aborted: Maximum frame length reached	Select a shorter frame length at the communication partner. The following are valid (depending on the module): 1-1024/2048/4096 (Byte) Check the parameters for end of frame detection.
Error codes V24 accompanying signals		
0x81F0	The module does not support V24 accompanying signals	You have tried to set accompanying signals for a module that does not support V24 accompanying signals. Make sure that this is an RS232 module or that RS232 mode (ET 200SP) is set.
0x81F1	No operation of the V24 accompanying signals	The V24 accompanying signals cannot be operated manually if hardware data flow control is active.
Error codes of the receive configuration		
0x8201 [1)]	BUFFER is a pointer to an invalid data type	Enter a pointer to one of the following data types: DB, BOOL, BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, DATE, TIME_OF_DAY, TIME, S5TIME, DATE_AND_TIME, STRING
0x8225	BUFFER points to an optimized memory area greater than 1 kB or BUFFER points to an optimized memory area and the receive length is greater than the area addressed by BUFFER.	Enter a pointer to an area with a maximum length of: • Optimized memory area: 1 kByte • Non-optimized area: 4 kByte Note: If the pointer points to an optimized memory area, do not send more than 1 kByte.
0x8229 [1)]	BUFFER is a pointer to BOOL with a number of bits not equal to n * 8	If you are using a pointer to BOOL, the number of bits must be a multiple of 8.
Error codes, general		
0x8280	Negative acknowledgment when reading module	Check the input at the PORT parameter You will find more detailed information on error causes in the RDREC.STATUS static parameters and in the description of the SFB RDREC.
0x8281	Negative acknowledgment when writing module	Check the input at the PORT parameter You will find more detailed information on error causes in the WRREC.STATUS static parameters and in the description of the SFB WRREC.
0x8282	Module not available	Check the input at the parameter PORT and ensure that the module can be reached.

Error code	Description	Remedy
Error codes of the receive configuration		
0x82C1	Invalid value for "Buffered received frames".	Select a suitable value for "Buffered received frames". Valid range of values: 1-255
0x82C2	Receive configuration rejected because the 3964(R) protocol was selected	Make sure that no receive configuration is sent if the 3964(R) protocol is set.
0x8301 1)	BUFFER is a pointer to an invalid data type	Select a valid data type. The following are valid: DB, BOOL, BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, DATE, TIME_OF_DAY, TIME, S5TIME, DATE_AND_TIME, STRING
0x8322	Range length error when reading a parameter	Check the input at the BUFFER parameter
0x8324	Range error when reading a parameter	Check the input at the BUFFER parameter
0x8328	Setting error when reading a parameter	Check the input at the BUFFER parameter
Error codes of the send configuration		
0x8328 1)	BUFFER is a pointer to BOOL with a number of bits not equal to n * 8	If you are using a pointer to BOOL, the number of bits must be a multiple of 8.
Error codes of the receive configuration		
0x8332	Invalid data block at the Receive_Conditions parameter	Check the input at the Receive_Conditions parameter
0x833A	The designation of the data block at the BUFFER parameter refers to a data block which is not loaded.	Check the input at the BUFFER parameter
0x8351	Invalid data type	Check the input at the BUFFER parameter
0x8352 1)	Receive_Conditions does not point to a data block	Check the pointer to Receive_Conditions
0x8353 1)	Receive_Conditions does not point to a structure of the type Receive_Conditions	Check the pointer to Receive_Conditions
Error codes 3964(R) protocol		
0x8380	Parameter assignment error: Invalid value for "Character delay time".	Select a suitable value for "Character delay time" (CharacterDelayTime). Valid range of values: 1-65535 (ms)
0x8381	Parameter assignment error: Invalid value for "Response timeout".	Select a suitable value for "Response timeout" (AcknDelayTime). Valid range of values: 1-65535 (ms)
0x8382	Parameter assignment error: Invalid value for "Priority".	Select a suitable value for "Priority" (Priority). The following are valid: • High (1) • Low (0)
0x8383	Parameter assignment error: Invalid value for "Block check"	Select a suitable value for "Block check" (BCC). The following are valid: • With block check (1) • Without block check (0)
0x8384	Parameter assignment error: Invalid value for "Connection attempts".	Select a suitable value for "Connection attempts" (BuildupAttempts). Valid range of values: 1-255

Error code	Description	Remedy
0x8385	Parameter assignment error: Invalid value for "Transmission attempts".	Select a suitable value for "Transmission attempts" (RepetitionAttempts). Valid range of values: 1-255
0x8386	Runtime error: Number of connection attempts exceeded	Check the interface cable and the transmission parameters. Also check whether the receive function is configured correctly at the partner device.
0x8387	Runtime error: Number of transmission attempts exceeded	Check the interface cable, the transmission parameters and the configuration of the communication partner.
0x8388	Runtime error: Error at the "Block check character" The internally calculated value of the block check character does not correspond to the block check character received by the partner at the connection end.	Check whether the connection is seriously disrupted; in this case you may also occasionally see error codes. Check for proper function at the partner device, possibly by using an interface test device that is switched into the transmission line.
0x8389	Runtime error: Invalid character received while waiting for free receive buffer	The send request of the communication partner (STX, 02H) is only answered with DLE when the receive buffer is empty. No additional character may be received before this (except STX again). Check for proper function at the partner device, possibly by using an interface test device that is switched into the transmission line.
0x838A	Runtime error: Logical error during receiving. Another character (other than DLE, ETX) was received after receipt of DLE.	Check whether the partner DLE in the frame header and in the data string is always in duplicate or the connection is released with DLE ETX. Check for proper function at the partner device, possibly by using an interface test device that is switched into the transmission line.
0x838B	Runtime error: Character delay time exceeded	Partner device too slow or faulty. Verify by using an interface test device that is switched into the transmission line, if necessary.
0x838C	Runtime error: Wait time for free receive buffer has started	In the user program call the instruction more often or configure a communication with data flow control.
0x838D	Runtime error: frame repetition does not start within 4 s after NAK	Check the communication partner. A received frame that is possibly corrupted must be repeated by the partner within 4 seconds.
0x838E	Runtime error: In idle mode, one or several characters (other than NAK or STX) were received.	Check for proper function of the partner device, possibly using an interface test device that is switched into the transmission line.
0x838F	Runtime error: Initialization conflict - Both partners have set high priority	Set the "Low" priority at one of the partners
0x8391	Parameter assignment error: 3964 configuration data rejected because Freeport is set	If the Freeport protocol is set, make sure that no 3964 parameter assignment data is sent.

[1] Only with instructions for S7-300/400 CPUs

Overview of error messages - Modbus

Error code	Description	Remedy
0x0000	No error	-
Configuration error of the interface - Modbus_Comm_Load		
0x8181	The module does not support this data transmission rate.	Select a valid data transmission rate for the module at the BAUD parameter.
0x8182	The module does not support this parity setting.	Select a suitable value for "Parity" at the PARITY parameter. The following are valid: • None (1) • Even (2) • Odd (3) • Mark (4) • Space (5) • Any (6)
0x8183	The module does not support this type of data flow control.	Select a valid data flow control for the module at the FLOW_CTRL parameter.
0x8184	Invalid value for "Response timeout".	Select a valid value for "Response timeout" at the RESP_TO parameter. Valid range of values: 1-65535 (ms)
0x8280	Negative acknowledgment when reading module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_Config.RDREC.STATUS, Receive_Config.RDREC.STATUS or RDREC.STATUS, and in the description of the SFB RDREC.
0x8281	Negative acknowledgment when writing module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_Config.WRREC.STATUS, Receive_Config.WRREC.STATUSor WRREC.STATUS , and in the description of the SFB WRREC.
0x8282	Module not available	Check the input at the parameter PORT and ensure that the module can be reached.

Error code	Description	Remedy
Configuration error - Modbus_Slave		
0x8186	Invalid slave address	Select a suitable slave address at the MB_ADDR parameter. The following are valid: 1-247 at standard address range; 1-65535 at extended address area (0 is reserved for broadcast)
0x8187	Invalid value at the MB_HOLD_REG parameter	Select a suitable value for the holding register at the MB_HOLD_REG parameter.
0x8188	Invalid operating mode or broadcast (MB_ADDR = 0) and parameter MODE ≠ 1	Select the value 1 for MODE in broadcast operating mode or select a different operating mode.
0x818C	The pointer to an MB_HOLD_REG area must be a data block or a flag area.	Select a valid value for the pointer to the MB_HOLD_REG area.
0x8280	Negative acknowledgment when reading module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_P2P.RDREC.STATUS or Receive_P2P.RDREC.STATUS, and in the description of the SFB RDREC.
0x8281	Negative acknowledgment when writing module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_P2P.WRREC.STATUS or Receive_P2P.WRREC.STATUS, and in the description of the SFB WRREC.
0x8452 [1)]	MB_HOLD_REG is not a pointer to a DB or a flag area	Check the pointer MB_HOLD_REG
0x8453 [1)]	MB_HOLD_REG is not a pointer of type BOOL or WORD	Check the pointer MB_HOLD_REG
0x8454 [1)]	The area addressed by MB_HOLD_REG is longer than the DB, or the area addressed is too small for the number of data bytes to be read or written.	Check the pointer MB_HOLD_REG
0x8455 [1)]	MB_HOLD_REG points to a write-protected DB	Check the pointer MB_HOLD_REG
0x8456 [1)]	Error during instruction execution. The cause of the error is shown in the static parameter STATUS.	Determine the value of the SFCSTATUS parameter. Check what this means in the description for SFC51, STATUS parameter.

Error code	Description	Remedy
Configuration error - Modbus_Master		
0x8180	Invalid value for MB_DB parameter	The value configured for MB_DB (instance data DB) at the Modbus_Comm_Load instruction is not valid. Check the interconnection of the Modbus_Comm_Load instruction and its error messages.
0x8186	Invalid station address	Select a suitable station address at the MB_ADDR parameter. The following are valid: 1-247 at standard address range; 1-65535 at extended address area (0 is reserved for broadcast)
0x8188	Invalid operating mode or broadcast (MB_ADDR = 0) and parameter MODE ≠ 1	Select the value 1 for MODE in broadcast operating mode or select a different operating mode.
0x8189	Invalid data address	Select a suitable value for the data address at the DATA_ADDR parameter. See description Modbus_Master in the Info system
0x818A	Invalid length	Select a suitable data length at the DATA_LEN parameter. See description Modbus_Master in the Info system
0x818B	Invalid valid for DATA_PTR	Select a suitable value for the data pointer at the DATA_PTR parameter (flag or DB address). See description Modbus_Master in the Info system
0x818C	Interconnection error of the DATA_PTR parameter	Check the interconnection of the instruction.
0x818D	The area addressed by DATA_PTR is longer than the DB, or the area addressed is too small for the number of data bytes to be read or written.	Check the pointer DATA_PTR
0x8280	Negative acknowledgment when reading module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_P2P.RDREC.STATUS or Receive_P2P.RDREC.STATUS, and in the description of the SFB RDREC.
0x8281	Negative acknowledgment when writing module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Send_P2P.WRREC.STATUS, Receive_P2P.WRREC.STATUS or Receive_Reset, and in the description of the SFB WRREC.

Error code	Description	Remedy
Communication errors - Modbus_Master and Modbus_Slave		
0x80 D1	The waiting time for XON or CTS = ON has expired.	The communication partner has a fault, is too slow or is offline. Check the communication partner or change the parameters, if necessary.
0x80D2	"Hardware RTS always ON": Send command aborted due to change from DSR = ON to OFF	Check the communication partner. Make sure that DSR is ON for the entire duration of transmission.
0x80E0	Frame aborted: Send buffer overflow / send frame too long	In the user program call the instruction more often or configure a communication with data flow control.
0x80E1	Frame aborted: Parity error	Check the connection line of the communication partners, or verify that both devices are configured for the same data transmission rate, parity and stop bit number.
0x80E2	Frame aborted: Character frame error	Check the settings for start bit, data bits, parity bit, data transmission rate, and stop bit(s).
0x80E3	Frame aborted: Character overflow error	Check the number of data in the frame of the communication partner.
0x80E4	Frame aborted: Maximum frame length reached	Select a shorter frame length at the communication partner. The following are valid (depending on the module): 1-1024/2048/4096 (bytes)
Communication error - Modbus_Master		
0x80C8	The slave does not respond within the set time	Check the data transmission rate, parity and wiring of the slave.
0x8200	The interface is busy with an ongoing request.	Repeat the command later. Make sure that there are no commands still running before you start a new one.
Protocol error - Modbus_Slave (only communication modules that support Modbus)		
0x8380	CRC error	Checksum error of the Modbus frame. Check the communication partner.
0x8381	The function code is not supported or is not supported for broadcast.	Check the communication partner and make sure that a valid function code is sent.
0x8382	Invalid length information in the request frame	Select a suitable data length at the DATA_LEN parameter.
0x8383	Invalid data address in the request frame	Select a suitable value for the data address at the DATA_ADDR parameter.
0x8384	Invalid data value error in the request frame	Check the data value in the request frame of the Modbus master
0x8385	The diagnostic value is not supported by the Modbus slave (function code 08)	The Modbus slave only supports the diagnostic values 0x0000 and 0x000A.

Error code	Description	Remedy
Protocol error - Modbus_Master (only communication modules that support Modbus)		
0x8380	CRC error	Checksum error of the Modbus frame. Check the communication partner.
0x8381	Response frame from Modbus Slave with the following error message: The function code is not supported.	Check the communication partner and make sure that a valid function code is sent.
0x8382	Response frame from Modbus Slave with the following error message: Invalid length	Select a suitable data length.
0x8383	Response frame from Modbus Slave with the following error message: Invalid data address in the request frame	Select a suitable value for the data address at the DATA_ADDR parameter.
0x8384	Response frame from Modbus Slave with the following error message: Data value error	Check the request frame to the Modbus slave.
0x8385	Response frame from Modbus Slave with the following error message: The diagnostic value is not supported by the Modbus slave	Modbus slaves only support the diagnostic values 0x0000 and 0x000A.
0x8386	The returned function code does not match the requested function code.	Check the response frame and the addressing of the slave.
0x8387	A slave that was not requested answers	Check the response frame of the slave. Check the address settings of the slave.
0x8388	Error in the response of the slave to a write request.	Check the response frame of the slave.
0x8828 [1)]	DATA_PTR points to a bit address which is not equal to n * 8	Check the pointer DATA_PTR
0x8852 [1)]	DATA_PTR is not a pointer to a DB or a flag area	Check the pointer DATA_PTR
0x8853 [1)]	DATA_PTR is not a pointer of type BOOL or WORD	Check the pointer DATA_PTR
0x8855 [1)]	DATA_PTR points to a write-protected DB	Check the pointer DATA_PTR
0x8856 [1)]	Error during call of SFC51	Call the Modbus_Master instruction again
Error - Modbus_Slave (only communication modules that support Modbus)		
0x8428 [1)]	MB_HOLD_REG points to a bit address which is not equal to n * 8	Check the pointer MB_HOLD_REG
0x8452 [1)]	MB_HOLD_REG is not a pointer to a DB or a flag area	Check the pointer MB_HOLD_REG
0x8453 [1)]	MB_HOLD_REG is not a pointer of type BOOL or WORD	Check the pointer MB_HOLD_REG
0x8454 [1)]	The area addressed by MB_HOLD_REG is longer than the DB, or the area addressed is too small for the number of data bytes to be read or written.	Check the pointer MB_HOLD_REG
0x8455 [1)]	MB_HOLD_REG points to a write-protected DB	Check the pointer MB_HOLD_REG
0x8456 [1)]	Error during call of SFC51	Call the Modbus_Slave instruction again

[1)] Only with instructions for S7-300/400CPUs

Overview of error messages - USS

Error code	Description	Remedy
0x0000	No error	-
0x8180	Length error in response of drive	Check the response frame of the drive.
0x8181	Data type error	Select a suitable data type. The following are valid: • Real • Word • Double word
0x8182	Data type error: "Double word" or "Real" may not be returned for the "Word" request.	Check the response frame of the drive.
0x8183	Data type error: "Word" may not be returned for the "Double word" or "Real" request.	Check the response frame of the drive.
0x8184	Checksum error in response of drive	Check the drive and the communication connection.
0x8185	Addressing error	Valid drive address range: 1 to 16
0x8186	Setpoint error	Valid setpoint range: -200 % to +200 %
0x8187	Incorrect drive number returned	Check the response frame of the drive.
0x8188	Invalid PZD length	Permitted PZD lengths: 2, 4, 6 words
0x8189	The module does not support this data transmission rate.	Select a valid data transmission rate for the module.
0x818A	A different request for this drive is currently active.	Repeat the parameter read or write command later.
0x818B	The drive does not respond.	Check the drive.
0x818C	The drive responds with an error message to a parameter request.	Check the response frame of the drive. Check the parameter request.
0x818D	The drive responds with an access error message to a parameter request.	Check the response frame of the drive. Check the parameter request.
0x818E	The drive was not initialized.	Check the user program and make sure that the USS_Drive_Control instruction is called for this drive.

Error code	Description	Remedy
0x8280	Negative acknowledgment when reading module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Port_Config.RDREC.STATUS, Send_Config.RDREC.STATUS , Receive_Config.RDREC.STATUS , Send_P2P.RDREC.STATUS or Receive_P2P.RDREC.STATUS, and in the description of the SFB RDREC.
0x8281	Negative acknowledgment when writing module	Check the input at the PORT. parameter You will find more detailed information on error causes in the static parameters Port_Config.WRREC.STATUS, Send_Config.WRREC.STATUS , Receive_Config.WRREC.STATUS , Send_P2P.RDREC.STATUS or Receive_P2P.RDREC.STATUS, and in the description of the SFB WRREC.

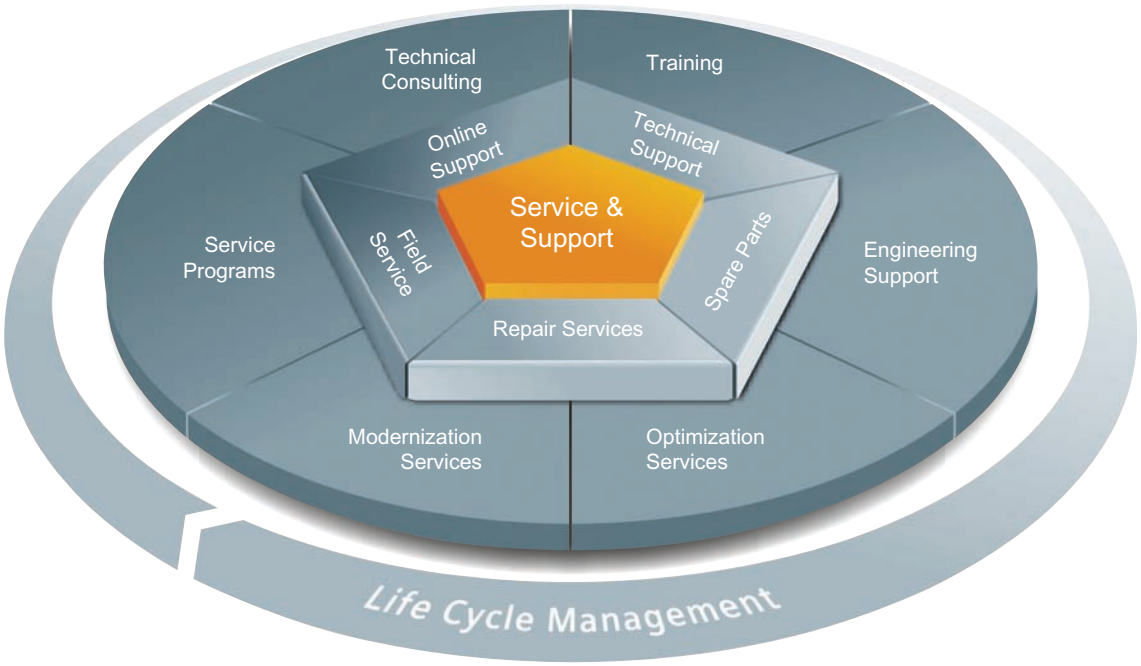
A.1 Service & Support



Unmatched complete service for the entire life cycle

For machine manufacturers, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address on the Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses at the following address on the Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are select service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a service program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Benefits at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products from Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet (http://www.siemens.com/automation/partner).

Glossary

Automation system

An automation system is a programmable logic controller consisting of at least one CPU, various input and output modules, and operating and monitoring devices.

Communication module

Communication modules are used for point-to-point connections and bus links.

Configuring

Configuring refers to the configuration of separate modules of an automation system in the configuration table.

CPU

Central Processing Unit = Central module of the automation system that consists of the control and computing units, memory, system program, and interfaces to the I/O modules.

CTS

Clear to send. The communication partner is ready to receive data.

Cycle time

The cycle time is the time that the CPU requires to process the user program once.

Cyclic program processing

In cyclic program processing the user program runs in program loop, or cycle, that is constantly repeated.

Default setting

The default setting is a reasonable basic setting that can be used whenever no other value is specified.

Diagnostic events

Diagnostics events are, for example, module errors or system errors in the CPU that may be caused by a program error.

Diagnostic functions

The diagnostic functions cover the entire system diagnostics and include the recognition, interpretation and reporting of errors within the automation system.

Diagnostics buffer

Memory area in which detailed information on all diagnostics events is entered based on the order of their occurrence.

Hardware

Hardware is the entire physical and technical equipment of a automation system.

Module parameters

Module parameters are values with which the behavior of the module can be set.

Online/Offline

When you are online there is a data connection between the automation system and programming device, when you are offline there is no data connection between them.

Parameter assignment

Parameter assignment refers to the setting of a module's behavior.

Parameters

Parameters are values that can be allocated. There are two different types of parameters: block parameters and module parameters.

Point-to-point communication

In point-to-point communication the communication processor forms the interface between a programmable logic controller and a communication partner.

Procedure

Procedure refers to the process of a data transmission according to a specific protocol.

Protocol

All communication partners involved in data transmission must follow fixed rules for handling and implementing the data traffic. Such rules are called protocols.

Receive line initial state

The initial state of the receive line for RS422 and RS485 mode:

- enables break detection (wire break)
- ensures a defined level on the receive line while it is not sending.

RTS

Request to send. The communication module is ready to send.

Software

Software refers to the entirety of all programs that are used on a computing system. The operating system and user programs belong to this.

User program

The user program contains all instructions and declarations for processing the signals used for controlling a system or a process. In SIMATIC S7 the user program is structured and divided into small units, the blocks.

USS

The USS® protocol (universal serial interface protocol) defines an access method based on the master-slave principle for communication by means of a serial bus. The point-to-point connection is included as a subset in this protocol.

XON/XOFF

Software data flow control with XON/XOFF. You can configure the characters for XON and XOFF (any ASCII character). The user data may not contain these characters.

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation addresses users who want to use the point-to-point communication modules independently of the SIMATIC S7. It offers you important information with regard to the configuration and commissioning of the point-to-point communication modules for S7-1500 (ET 200MP) and ET 200SP.

Requirements

To use PtP communication modules in a system independently of the SIMATIC S7, the CPU must support communication by means of data records and come equipped with a PROFINET IO controller. For more information on this topic, refer to the *Distributed I/O System ET 200SP* and *Distributed I/O System ET 200MP* system manuals.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7

GSDML file

Engineering must be provided with information regarding functionality and parameters of the communication modules for the higher-level application.

The properties of the PtP communication modules are defined in a GSDML (Generic Station Description Markup Language) file, an XML-based language that is defined based on the GSDML scheme (ISO 15745: GSD for PROFIBUS and GSDML for PROFINET IEC 61804: EDDL IEC 62453: FDT/DTM).

The Engineering System must provide a suitable interpreter that makes the GSDML data available to the system.

The name of a GSDML file for the communication modules can have the following syntax, for example: GSDML-V2.3-Siemens-ET200SP-20110824.xml

The GSDML file contains:

- Device and identification data
- Parameter assignment data
- Diagnostics data

In order to enable parameter assignment of the communication modules, the GSDML file must be installed/imported in the Engineering System.

Validity of the documentation

This documentation is valid for the following point-to-point communication modules

- CM PtP RS232 BA (6ES7540-1AD00-0AA0) communication module
- CM PtP RS422/485 BA (6ES7540-1AB00-0AA0) communication module
- CM PtP RS232 HF (6ES7541-1AD00-0AB0) communication module
- CM PtP RS422/485 HF (6ES7541-1AB00-0AB0) communication module
- CM PtP (6ES7137-6AA00-0BA0) communication module

Conventions

Please also observe notes labeled as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

Recycling and disposal

The products can be recycled due to their low pollutant content. For environmentally compliant recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste.

Additional assistance

- Information about the Technical support (http://www.siemens.com/automation/support-request) available can be found in the appendix to this documentation.
- The portfolio of technical documentation for SIMATIC products and systems is available on the SIMATIC Portal (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available in the Catalog (http://mall.automation.siemens.com).

Note on IT security

Siemens offers IT security mechanisms for its automation and drive product portfolio in order to support the safe operation of the plant/machine. We recommend that you inform yourself regularly on the IT security developments regarding your products. You can find information on this on the Internet (http://support.automation.siemens.com).

You can register for a product-specific newsletter here.

For the safe operation of a plant/machine, however, it is also necessary to integrate the automation components into an overall IT security concept for the entire plant/machine, which corresponds to the state-of-the-art IT technology. You can find information on this on the Internet (http://www.siemens.com/industrialsecurity).

Products used from other manufacturers should also be taken into account here.

Introduction

This modular documentation of the SIMATIC products covers diverse topics concerning your automation system.

The complete documentation for the S7-300/400, ET 200MP/SP systems consists of the relevant operating instructions, manuals and product information.

Overview of documentation on the topic of point-to-point communication

The table below includes additional documentation which amends this description.

Subject	Documentation	Important contents
System	System manual ET 200MP distributed I/O system (http://support.automation.siemens.com/WW/view/en/59193214) System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installing • Connecting • Addressing • Commissioning • Maintenance

CM PtP RS422/485 HF	8	4	255
CM PtP (ET 200SP)	4	2	255

Secondary signals and data flow control

- Software data flow control with XON/XOFF

  The Freeport protocol supports data flow control with XON/XOFF via the RS232 and RS422 interfaces.

- Hardware data flow control with RTS/CTS

  The Freeport protocol supports data flow control with RTS/CTS via the RS232 interface.

- Automatic operation of secondary signals

  The Freeport protocol supports operation of the RS232 secondary signals by means of the RS232 interface. (Only available if hardware data flow control is not activated.)

Application options for the communication modules

You may set up a communication connection with different partners, depending on the communication modules used:

- Freeport: Transmission of ASCII character strings without specified protocol format
- 3964(R): Communication between programmable logic controllers (master/master communication)

Basic information

3

3.1 Serial transmission of a character

Introduction

Different networking options are available for the exchange of data between two or more communication partners. The PtP connection between two communication partners is the simplest means of information exchange.

Point-to-point connection

In point-to-point connection, the communication processor forms the interface between a programmable logic controller and a communication partner. Data is sent in serial mode via PtP connection with the communication module.

Serial data transmission

During serial data transmission, the individual bits of a character of information to be transferred are sent successively in a defined sequence.

Bidirectional data traffic - operating mode

In the context of bidirectional data traffic, we distinguish between two operating modes for the communication module:

- Half duplex mode

  The data is transferred between one or several communication partners in both directions alternately. Half duplex mode means that data is either sent or received at a given point in time.

- Full duplex mode

  The data is exchanged simultaneously between one or several communication partners, i.e. it is possible to send and receive data simultaneously at a given point in time.

Asynchronous data transmission

Serial data transmission occurs asynchronously at the communication module. The so-called time base synchronism (fixed time base for transmission of a fixed character string) is only upheld during transmission of a character. Each character to be sent is preceded by a synchronization pulse, which is also known as start bit. The length of the start bit transmission determines the clock cycle. The end of character transmission is formed by one or two stop bits.

Handshakes

In addition to the start and stop bits, both communication partners need further handshake procedures for serial data transmission. These include:

- Data transmission rate
- Character and acknowledgment delay time
- Parity
- Number of data bits (7 or 8 bits/characters)
- Number of stop bits (1 or 2)

3.2 Transmission security

Transmission security plays an important role in the transmission of data and in the selection of the transmission procedure. Generally speaking, the more layers of the reference model are applied, the higher the transmission security.

Classification of existing protocols

The figure below illustrates how the protocols of the communication module fit into the reference model.

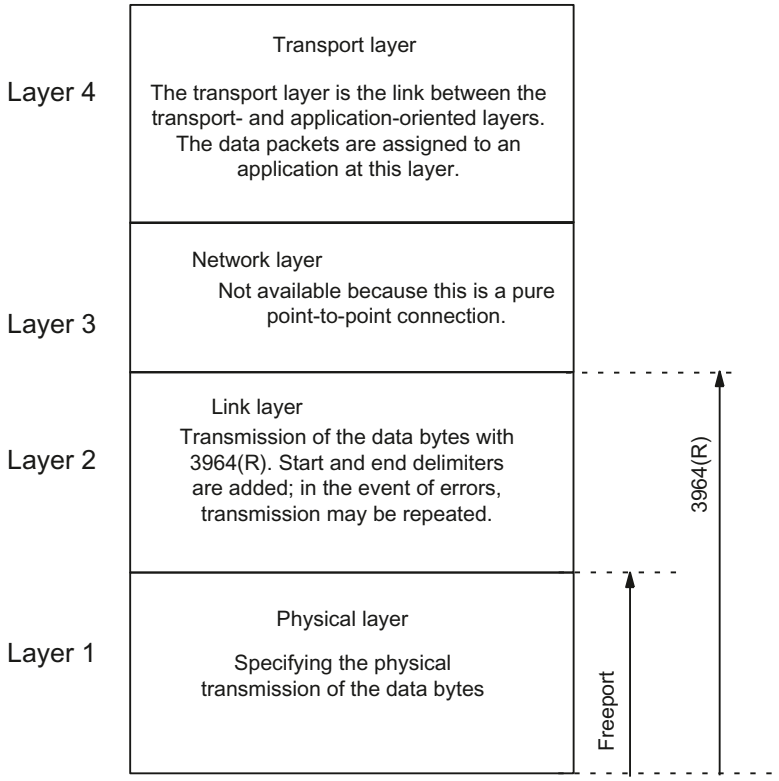

Figure 3-1 Classification of the existing protocols of the communication module in the reference model

Transmission security with Freeport

Data security when using Freeport:

- Despite the efficiency of data transmission with the Freeport protocol, it is not possible to ensure secure data transmission with Freeport because no data security measures other than the use of a parity bit (can also be disabled, depending on the character frame setting) are applied. A certain degree of data security can be achieved through parameter assignment of the frame start and frame end conditions.
- The parity bit ensures that the inversion of a bit in a character to be sent can be recognized. If two or more bits of a character are inverted, this error can no longer be detected.
- To increase transmission security, you can, for example, implement a checksum, a frame length specification, or configurable end conditions. These measures must be implemented by the user.
- A further increase in data security can be achieved by means of acknowledgment message frames in response to send or receive message frames. This is the case with high-grade protocols for data communication (ISO 7-layer reference model).

Transmission security with 3964(R)

Two different procedures for data transmission can be used, either with or without a block check character:

- Data transmission without block check character: 3964

  Transmission security is achieved by means of a specified frame structure, frame breakdown, and frame repetitions.

- Data transmission with block check character: 3964R

  The high degree of transmission security is achieved by means of a specified frame structure and breakdown, frame repetitions, as well as inclusion of a block check character (BCC). The hamming distance in 3964R mode is 3.

The hamming distance represents a measure for data transmission security.

In this manual, the term 3964(R) is used when descriptions and notes refer to both data transmission modes.

Basic communication mechanisms

4

Reading/writing data records

Note

Reading/writing data records

For information about the functions for reading/writing data records, refer to the documentation of your controller.

The "Write data record" function can be used to configure the devices by means of configuration data records. The "Write data record" function also transmits the send data to the devices. Accordingly, "Read data record" can be used to read diagnostics data and receive data from the devices.

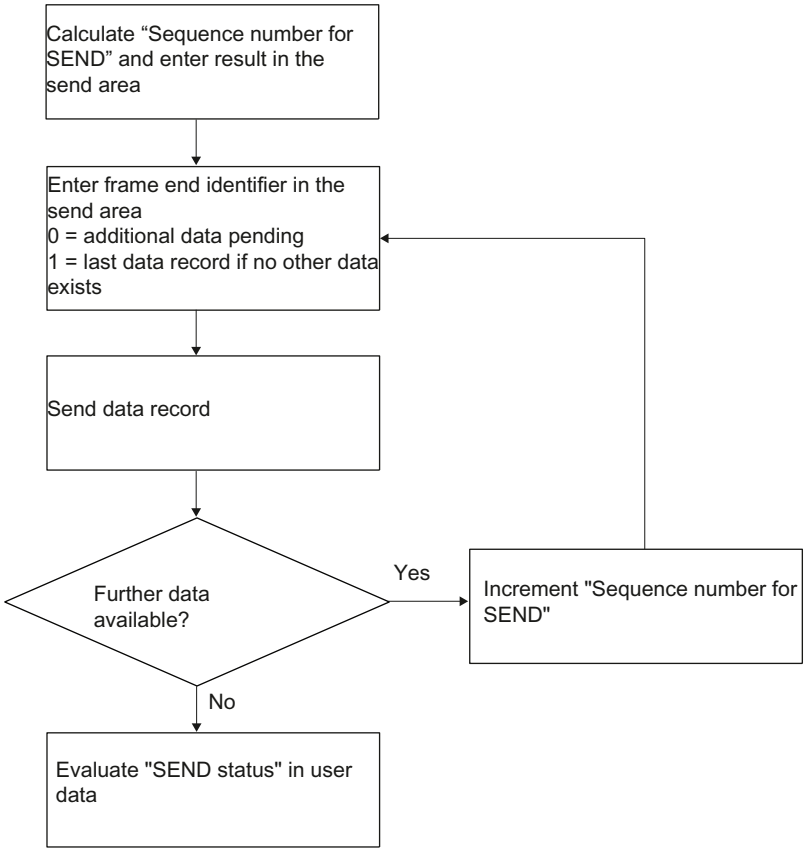
- For operation, you need to configure the communication modules for the relevant application.
  The following configuration data records can be used for this purpose:
  - Freeport communication (Page 41)
  - 3964 communication (Page 49)
- Use the following data records to send and receive data:
  - Sending data (Page 55)
  - Receiving data (Page 59)
- The cyclic user data shows you whether the module has sent or received new data.
  - Querying send acknowledgment - input user data (Page 57)
  - Query: New receive frame - input user data (Page 61)
- In RS232 mode, you can derive the current state of the secondary signals from the cyclic user data of the module, or control the RS232 secondary signals by means of the user program (provided hardware data flow control is not activated).
  - RS232 signals (Page 65)
- Data records can also be used to send additional control and verification commands.
  - Activate special function (Page 51)

Additional information

Chapter Data records and user data interface (Page 20) provides an overview of all configuration data records.

Send - flow chart

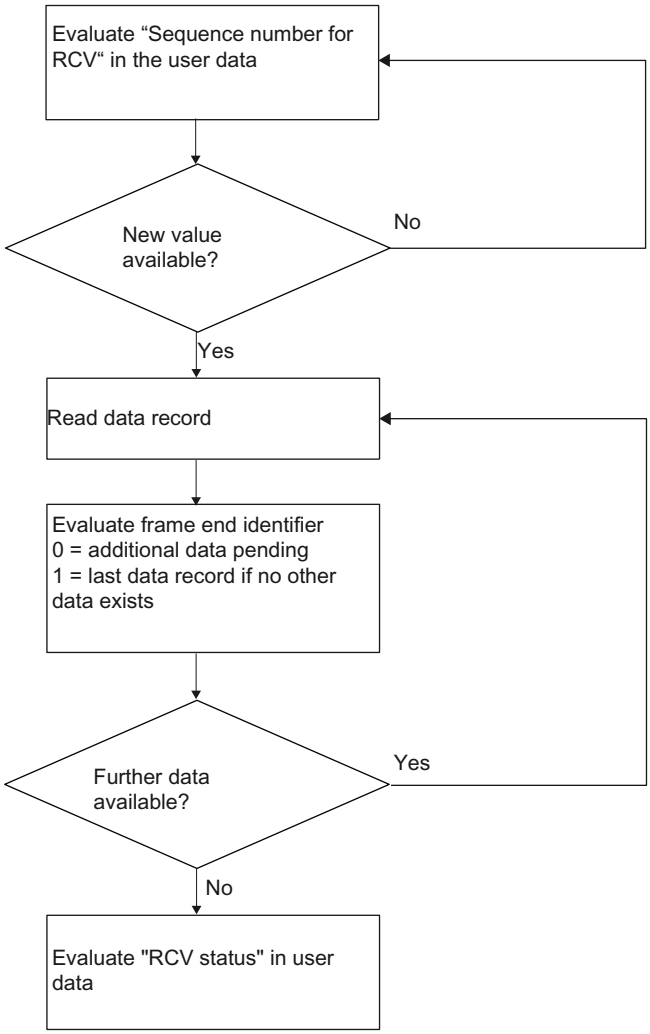
Users can transmit data based on the sequence outlined below (refer to Sending data (Page 55) for details). Management data and send data is transmitted to the communication module by means of a special data record. The communication module provides the acknowledgment in the input user data.



Receive - flow chart

The communication module signals the availability of new received data in the input user data (refer to Receiving data (Page 59) for details). The communication module provides management and receive data in a special data record.

Users can receive data based on the sequence outlined below.



4.1 Data records and user data interface

Overview of data records

Configuration data records are available for the following tasks:

- Freeport communication
  Configuration of the communication module for data transmission using the open Freeport frame
  - Activate special function (Page 51)
  - Send configuration record - data record 59 (Page 44)
  - Receive configuration record - data record 60 (Page 46)
- 3964 communication
  Configuration of the communication module for data transmission with 3964(R) protocol
  - Port configuration record - data record 57 (Page 41)
  - 3964 protocol configuration - data record 61 (Page 49)
- Special functions - Activation
  Activating or verifying the active state of diagnostic interrupts.
  - Activate special function (Page 51)

The following data records are available for operating the communication modules:

- Query error status
  Acknowledgment of the communication module in response to the writing of a configuration data record
  - Read error status - data record 55 (Page 53)
- Send data
  Transmitting send data to the communication module and querying transmission acknowledgment in the user data
  - Send data - data record 48 (Page 55)
  - Querying send acknowledgment - input user data (Page 57)
- Receive data
  Display of a receive frame in the user data
  - Data received - data record 49/50 (Page 59)
  - Query: New receive frame - input user data (Page 61)
- Clear receive buffer
  Clearing the receive buffer of the communication module
  - Clear receive buffer - data record 54 (Page 63)
- RS232 secondary signals
  Manipulation of the RS232 secondary signals of the communication module and reading the RS232 secondary signals in the user data
  - Set RS232 secondary signals - data record 53 (Page 65)
  - Read RS232 secondary signals - input user data (Page 66)

Data transmission with Freeport

5

Introduction

Freeport is a freely programmable, frame-based protocol.

The Freeport driver controls data transmission via point-to-point connection between the communication module and a communication partner. The Freeport driver contains the physical layer (layer 1).

The Freeport driver supports sending and receiving of messages with any structure - all characters from 00 to FFH (for character frames with 8 data bits), or from 00 to 7FH (for character frames with 7 data bits).

The frame start and end criteria must be configured both for the send and the receive direction. The structure of the send frames may differ from that of the receive frames.

5.1 Sending data with Freeport

Sending data

Note

During parameter assignment of the XON/XOFF data flow control, user data may not contain any of the configured XON or XOFF characters. Default settings are DC1 = 11H for XON and DC3 = 13H for XOFF.

Specifying settings for sending

To send a message, the partner must be informed of the start and end of the message (see Send configuration record - data record 59 (Page 44)). You can select one of the following options:

- Send the Break signal at the start of the message

  You can specify that an additional Break is sent at the beginning of each message transmission on expiration of the RTS ON delay time.
  The duration of the "Break" is specified in bit times (refer to Send configuration record - data record 59 (Page 44) bytes 12 and 13).

  Compliance with the send break can be deactivated if other mechanisms are used for synchronization.

- Send Idle Line

  You can specify that an additional "Idle Line" signal is output at the start of each message transmission.
  The duration of the "Idle Line" is specified in bit times (see Send configuration record - data record 59 (Page 44) bytes 14 and 15).

  Compliance with the send break can be deactivated if other mechanisms are used for synchronization.

- RTS ON delay

  You can configure the time that has to expire after the RTS (Request to send) before the actual data transmission starts (see Send configuration record - data record 59 (Page 44) bytes 8 and 9).

- RTS OFF delay

  You can configure the time that has to expire after transmission has been completed before the RTS signal is deactivated (see Send configuration record - data record 59 (Page 44) bytes 10 and 11).

- Sending including the end delimiter

  You can configure the number of end delimiters (1 or 2) and their value.

  All data up to the end delimiter(s) is sent, independent of the selected frame length. The end delimiter must be included in the data to be sent. Data is sent only up to and including the end delimiter, even if the data length specified is longer (refer to Send configuration record - data record 59 (Page 44) bytes 18 and 21).

- Number of appended characters

  Input of the number of appended characters. All data transferred to the communication module will be sent. The end delimiter(s) is/are appended automatically. 1 to 5 characters more than the specified number are sent to the partner, depending on the number of end delimiters (see Send configuration record - data record 59 (Page 44) bytes 22 and 28).

Note

If you do not configure either the "End delimiter" (0) or the "Number of appended characters" (0), all data transferred to the communication module is sent to the partner in a transparent operation.

5.2 Receiving data with Freeport

Introduction

You need to specify message start and end criteria in the Freeport driver to enable detection of a message in the incoming data flow.

Note

The start and end criteria described below can be combined as required. Such combinations may lead to unwanted results if the start and end criteria influence or even exclude each other.

Specifying the message start

For data transmission with Freeport, you can choose between several different start criteria. The start criterion defines when a frame starts. Once a criterion that indicates the start of the message is met, the data stream is scanned for message end criteria. (See Receive configuration record - data record 60 (Page 46) byte 9)

Two different methods are available for detecting the message start:

- **Start on any character**
- **Start on special condition**

Start on any character

- **Start on any character**

  Any character can be used to define the start of the message (default).

  This means that the first character sent at the start of communication, or after the frame end has been detected, will be identified as the first character of a message. (See Receive configuration record - data record 60 (Page 46) byte 12)

Start on special condition

The start of the message is detected based on the following specified conditions:

- **After detection of a line break**

  The frame start is not accepted unless a break has been received beforehand, in other words, it is compulsory for the partner to send a break before sending a frame.

- **After detection of an idle line**

  The frame start is not accepted until the configured idle line duration has expired. This procedure requires a minimum interval between two frames. (See Receive configuration record - data record 60 (Page 46) bytes 10 and 11)

- **After receipt of a start character**

  The frame start is detected when the configured start character is identified. (See Receive configuration record - data record 60 (Page 46) byte 12)

- **After detection of one or several start sequences**

  The frame start is detected when the configured string with a length of up to five characters is identified. You can configure up to 4 start sequences. (See Receive configuration record - data record 60 (Page 46) bytes 13 to 37)

Specifying the message end

You can choose from several different end criteria for data transmission using the Freeport driver. The end criterion defines the point at which a message frame has been received completely. (See Receive configuration record - data record 60 (Page 46) byte 39)

Configurable end criteria are:

- **Recognize message end by message timeout**
- **Recognize message end by response timeout**
- **After character delay time elapses (default)**
- **After receipt of a fixed frame length**
- **After receipt of a maximum number of characters**
- **Read message length from message**
- **After receipt of an end sequence**

Message timeout

When data is received, the end of frame is detected on expiration of the configured time for transferring a frame. Time measurement starts after the start criterion has been met. (See Receive configuration record - data record 60 (Page 46) bytes 52 and 53)

An error message is output and the frame is discarded if a message end condition is met before the fixed frame length has been reached.

Response timeout

When data is received, the end of frame is detected on expiration of the configured time between the end of the send operation and the receipt of a frame start. (See Receive configuration record - data record 60 (Page 46) bytes 50 and 51)

An error message is output and the frame is discarded if a message end condition is met before the fixed frame length has been reached.

Expiration of character delay time

When data is received, the frame end is detected when the configured maximum time (bit times) between successive characters is exceeded (character delay time). (See Receive configuration record - data record 60 (Page 46) bytes 54 and 55)

In this case, the character delay time must be set in such a way as to ensure that it expires between two consecutive frames. However, it should be of sufficient length to exclude incorrect identification of the end of the frame whenever the communication partner performs a transmission pause within a frame.

Fixed frame length

When data is received, the end of the frame is identified after the configured frame length has been reached. (See Receive configuration record - data record 60 (Page 46) bytes 40 and 41)

An error message is output and the frame is discarded if the character delay time expires (if activated) before the fixed frame length has been reached.

Please note the following if the frame length of the received characters does not match the fixed configured frame length:

- All characters received after the fixed configured frame length has been reached will be discarded until a new start criterion (e.g. "any character") is detected.
- Receiving is terminated if the character delay time (if activated) expires before the fixed configured frame length has been reached. An error message is generated and the message frame fragment is discarded.
- If a different (activated) end criterion is met before the fixed configured frame length has been reached, this "frame part" is assessed as a valid frame and the partner waits for a new start criterion. All characters received prior to fulfillment of a new start criterion are discarded.

Maximum number of characters

When receiving data, the end of the message frame is recognized after the declared number of characters have arrived. (See Receive configuration record - data record 60 (Page 46) bytes 42 and 43)

This setting can be combined with the "Character delay time" settings. The frame received is also assessed as free of error if another end condition occurs, regardless of whether the maximum number of characters has been reached.

Please note the following if the frame length of the received characters does not match the configured maximum frame length:

- All characters received after the configured maximum number of characters has been reached will be discarded until a new start criterion (e.g. "Idle Line") is detected.
- If a different (activated) end criterion is met before the configured maximum number of characters has been reached, this "frame part" is assessed as a valid frame and the partner waits for a new start criterion. All characters received prior to fulfillment of a new start criterion are discarded.

Note

If no further end criterion is activated, the fixed frame length and maximum number of characters will respond in the same way.

Message length in the message

The length of the receive frame is also sent. When data is received, the frame end is identified after the frame length also sent has been reached. If "After character delay time elapses" is activated as an additional end criterion, receiving will be terminated prematurely. An error message is generated and the message frame fragment is discarded.

The following parameters define the characters to be used for evaluation of the message length:

- **Offset of the length field in the message**

  In the message, the value defines the position of the character that is to be used to determine the message length.

  You can set values from 1 to 4096 characters, depending on the buffer size.

  (See Receive configuration record - data record 60 (Page 46) bytes 44 to 45)

- **Size of the length field**

  This value specifies the number of characters as of the first evaluation position to be used to determine the message length.

  You can set values of 0, 1, 2 and 4 characters.

  (See Receive configuration record - data record 60 (Page 46) bytes 46 to 47)

- **Number of characters not counted in length specification**

  Number of characters appended to the frame without counting towards the frame length. This value defines the number of bytes at the end of the frame which should not be included in the evaluation of the message length.

  You can set values from 0 to 255 characters.

  (See Receive configuration record - data record 60 (Page 46) bytes 48 to 49)

End sequence

When data is received, the end of the frame is identified when the configured end sequence (max. 5 characters) is received. The received data is applied by the CPU, including the end sequence. (See Receive configuration record - data record 60 (Page 46) bytes 56 to 61)

If you are working with the end sequence, transmission is not code-transparent and you must exclude the presence of end code in the user data.

5.3 Code transparency

Code transparency

Code-transparent means that any character combinations can occur in the user data without the end criterion being recognized.

The code transparency of the protocol depends on the selection of the parameterized end criterion and flow control:

- With up to five end delimiters or using XON/XOFF flow control
  - Not code-transparent
- End criterion character delay time, fixed frame length, maximum frame length, message timeout, or response timeout and message length in the message
  - Code-transparent

5.4 Receive buffer

Receive buffer of the module

The receive buffer of the module may have a size of up to 8 KB, depending on the communication module used (see chapter Overview (Page 11)). The maximum frame length always equals half the length of the receive buffer. This means that each communication module is capable of buffering at least two frames.

During parameter assignment, you can specify whether to clear the receive buffer at startup and whether to prevent overwriting of data in the receive buffer. You can also specify the range of values (1 to 255) for the number of buffered receive frames. (See Receive configuration record - data record 60 (Page 46) bytes 62 to 64)

The receive buffer on the communication module is organized as FIFO:

- If several frames are entered in the receive buffer of the communication module, the communication module always sends the oldest frame to the CPU.
- If you always want to transfer the last frame received to the CPU, you must set the value "1" for the number of buffered frames and deactivate overwrite protection.

Note

If continuous reading of the receive data in the user program is interrupted for a certain time and the receive data is then requested again, the communication module will possibly transmit an older frame before the CPU receives the most recent one. At the time of interruption, the old frame had already been transferred from the receive buffer of the communication module and prepared for transmission to the CPU.

5.5 RS232 mode

The following communication modules support RS232 mode:

- CM PtP RS232 BA
- CM PtP RS232 HF
- CM PtP (ET 200SP)

In RS232 mode, data is sent via two lines. A separate line is available for the send direction and the receive direction. Simultaneous sending and receiving is possible (full duplex).

RS232 secondary signals

In addition to the TXD, RXD and GND signals, the communication module provides the following RS232 secondary signals when RS232 hardware is used:

DCD	(input)	Data Carrier detect; Data carrier signal detected
DTR	(output)	Data terminal ready; Module ready for operation
DSR	(input)	Data set ready; Communication partner ready for operation
RTS	(output)	Request to send; Module is ready to send
CTS	(input)	Clear to send; Communication partner can receive data from the module (response to RTS = ON of the communication module)
RI	(input)	Ring Indicator; Ring indicator

After power on of the communication module, the output signals are in the OFF state (inactive).

You can parameterize the operation of the DTR/DSR and RTS/CTS control signals in the configuration data record of the module (Port configuration record - data record 57 (Page 41)).

The RS232 secondary signals cannot be manipulated by data record communication (Set RS232 secondary signals - data record 53 (Page 65)) in case of:

- parameterized data flow control "Hardware RTS always ON"

  (corresponds to automatic operation of the secondary signals)
- parameterized data flow control "Hardware RTS always ON"

  (corresponds to hardware flow control with RTS/CTS)
- parameterized data flow control "Hardware RTS always ON, ignore DTR/DSR "

An error message is generated if an attempt is made to manipulate RS232 secondary signals by means of data record communication.

For more information, refer to chapter Handshaking (Page 33).

5.6 RS422 mode

The following communication modules support RS422 mode:

- CM PtP RS422/485 BA
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

In RS422 mode, data is transmitted via two line pairs (four-wire mode). A separate line pair is available for the send direction and the receive direction. Simultaneous sending and receiving is possible (full duplex).

All communication partners must be capable of simultaneous operation of a sender and receiver unit.

The data can be exchanged simultaneously between one or several communication partners. In RS422 multipoint mode, only one multipoint slave may send data at any given time.

Interface operating modes

The following table is a summary of the interface operating modes for the various communication modules and protocols.

The communication module can be used in the following topologies in RS422 mode:

- Link between two nodes: Point-to-point connection
- Link between several nodes: Multipoint coupling
  (only available with CM PtP (ET 200SP))

Operating mode	Description
Full duplex (RS 422) four-wire mode (point-to-point connection)	Both devices have the same priority in this operating mode.
Full duplex (RS422) four-wire mode (multipoint master)	The communication module can be used as multipoint master.
Full duplex (RS 422) four-wire mode (multipoint slave)	The communication module can be used as multipoint slave.

The following applies for a multipoint master/slave topology in RS422 mode:

- The master's sender is interconnected with the receivers of all slaves.
- The slaves' senders are interconnected with the master's receiver.
- The receiver of the master and the receiver of one slave are assigned default settings (refer to chapter Port configuration record - data record 57 (Page 41) byte 25). All other slaves operate without default settings.

5.7 RS485 mode

The following communication modules support RS485 mode:

- CM PtP RS422/485 BA
- CM PtP RS422/485 HF
- CM PtP (ET 200SP)

In RS485 mode, data is transferred via one line pair (two-wire mode). The line pair is available alternately for the send and receive directions. It is possible to either send or receive (half duplex). On completion of a send operation, operation is immediately switched to receive mode (ready to receive). Send mode is reset again as soon as a new send job is received.

RS485 mode

The following table is a summary of the interface operating modes for the various communication modules and protocols.

Operating mode	Description
Half duplex (RS485) two-wire mode	Operating mode for point-to-point connection or multipoint connection (multipoint) in two-wire mode. The communication module can be the master as well as the slave.

When you operate the Freeport driver in RS485 mode (half duplex, two-wire mode), you must make provisions in the user program to ensure that only one device sends data at any given time. If more than one device sends data at the same time, the frame is corrupted.

Changeover times for RS485 communication module in half duplex mode

A maximum time of 0.1 ms is set for the changeover between sending and receiving.

5.8 Handshaking

Introduction

Handshaking controls the data flow between two communication partners. The use of the handshaking method prevents data loss during transmission if the devices are operating at different speeds.

We can basically distinguish between the following methods:

Table 5- 1 Overview of methods and interfaces

Method	RS232	RS422	RS485
Software data flow control XON/XOFF	X	X	
Hardware data flow control (RTS/CTS)	X		
Automatic operation of secondary signals	X		

Software data flow control

Software data flow control is implemented as follows on the communication module:

- XON/XOFF
  - As soon as the communication module has been set to the "XON/XOFF" operating mode by means of parameter assignment, it sends the XON character, thereby allowing the communication partner to send data.
  - On reaching the configured maximum number of frames, or 16 characters ahead of receive buffer overflow, the communication module sends the XOFF character, thereby requesting that the communication partner stop sending. If the communication partner nonetheless continues to send data, an error message is generated if the receive buffer overflows. Data received in the last frame is discarded.
  - As soon as a frame has been fetched by the CPU and the receive buffer is ready to receive data again, the communication module sends the XON character.
  - If the communication module receives the XOFF character during sending, it cancels the current send operation until it receives a XON again from its communication partner. If no XON is received within a specific configurable time, send operation is canceled and a corresponding error message is output.

Note

You can configure the characters for XON and XOFF (any ASCII character).

During parameter assignment of the XON/XOFF software data flow control, user data may not contain any of the configured XON or XOFF characters.

Hardware data flow control

Note

The DTR/DSR signals do not have to be wired for "Hardware RTS always ON, ignore DTR/DSR" parameter assignment.

If "Hardware RTS always ON" is configured, it is imperative that you fully wire the interface signals used. Make sure that the local RTS (out) is connected with the CTS (in) of the communication partner and the local CTS is connected with the RTS of the communication partner. Accordingly, the local DTR must be connected with the DSR of the communication partner and the local DSR with the DTR of the communication partner.

- **Hardware RTS always ON, ignore DTR/DSR**
  - As soon as the communication module has been set to an operating mode with "Hardware RTS always ON" through parameter assignment, it outputs the RTS = ON signal to the communication partner to indicate its ready state.
  - RTS is set to OFF as soon as the configured maximum number of frames or 16 characters before buffer overflow is reached.
    If the communication partner nonetheless continues to send data, an error message is generated on overflow of the receive buffer. Data received in the last frame is discarded.
  - RTS is reset to ON as soon as the frame has been fetched by the CPU and the receive buffer is ready to receive data again.
  - If CTS switches to OFF during the send operation, the communication module interrupts the send operation until CTS is reset to ON. If CTS is not reset to ON within a specific configurable time, the send operation is canceled and a corresponding error message is output.
- **Hardware RTS always ON**

  The "Hardware RTS always ON" mode corresponds to the "Hardware RTS always ON, ignore DTR/DSR" mode. However, you also need to wire DTR and DSR.
  - As soon as the communication module has been set set to an operating mode with "Hardware RTS always ON" through parameter assignment, it sets DTR = ON and RTS = ON to signal its general ready state to the communication partner.
  - RTS is set to OFF as soon as the configured maximum number of frames or 16 characters before buffer overflow is reached.
    If the communication partner nonetheless continues to send data, an error message is generated on overflow of the receive buffer. Data received in the last frame is discarded.
  - RTS is reset to ON as soon as the frame has been fetched by the CPU and the receive buffer is ready to receive data again.
  - If CTS switches to OFF during the send operation, the communication module interrupts the send operation until CTS is reset to ON. If CTS is not reset to ON within a specific configurable time, the send operation is canceled and a corresponding error message is output.
  - A switch from DSR = ON to DSR = OFF cancels an active send job and triggers an error message.

Automatic operation of secondary signals

- **Hardware RTS always switched**

  "Hardware RTS always switched" is implemented as follows on the communication module:

  – As soon as the communication module is set to the operating mode with "Hardware RTS always switched" through parameter assignment, it sets the line RTS to OFF and DTR to ON (communication module ready for operation).

    It is not possible to send frames until the DSR line is set to ON. No data is sent via the RS232C interface as long as DSR is set to OFF. A send job is canceled and a corresponding error message is generated.

  – If a send job is pending, RTS is set to ON and the configured data output wait time starts. On expiration of the data output time, the system checks whether the communication partner has set CTS to ON. If so, the data is sent via the RS232 interface.

  – If the CTS line is not set to ON within the data output time, or changes to OFF during the send operation, the send job is aborted and an error message generated.

  – Once the data has been sent and the configured clear RTS time has elapsed, the RTS line is set to OFF. The system does not wait for CTS to change to OFF.

  – It is always possible to receive data via the RS232 interface. There will be no reaction if there is a danger of the receive buffer of the communication module overflowing.

  – A switch from DSR = ON to DSR = OFF cancels an active send job and triggers an error message.

  Note

  Set the "data output wait time" in such a way that the communication partner is able to enter the ready to receive state before the time elapses.

  Set the "Clear RTS time" in such a way that the communication partner is able to receive the last characters of the frame completely before RTS is set to OFF and the send request is canceled.

Additional information

For information on the settings, refer to chapter Port configuration record - data record 57 (Page 49).

Note

Operation of DTR/DSR or RTS/CTS is accepted by the communication module with the following settings. Operation by means of Set RS232 secondary signals - data record 53 (Page 65) is impossible (any attempt made will trigger an error message):

- Hardware RTS always ON, ignore DTR/DSR
- Hardware RTS always ON
- Hardware RTS always switched

Data transmission with 3964(R) 6

6.1 Data transmission with 3964(R) protocol

Introduction

The 3964(R) protocol controls PtP data exchange between the communication module and a communication partner. The 3964(R) protocol contains both the physical layer (layer 1) and the link layer (layer 2).

6.2 Control characters

Introduction

During data transmission, the 3964(R) protocol adds control characters to the information data (link layer). The communication partner can use these control characters to check whether it has received all data completely and without errors.

Control characters of the 3964(R) protocol

The 3964(R) protocol evaluates the following control characters:

- **STX** Start of Text; start of the string to be sent
- **DLE** Data Link Escape
- **ETX** End of Text; end of the string to be sent
- **BCC** Block Check Character (only with 3964R)
- **NAK** Negative Acknowledge; negative response

Note

If the DLE character is transferred as an information character, it is sent twice during connection setup and shutdown (DLE duplication) in order to distinguish it from the DLE control character. The receiver reverses the DLE duplication.

Priority

For operation with 3964(R) protocol, one communication partner must be assigned a higher priority and one communication partner a lower priority. If both partners simultaneously start the connection setup, the partner having lower priority will postpone its send job.

6.3 Block checksum

Block checksum

With the 3964R transfer protocol, data security is enhanced by sending an additional block check character (BCC = Block Check Character).

The block checksum represents the even longitudinal parity (EXOR logic operation of all data bytes) of a sent or received block. Its calculation begins with the first byte of user data (first byte of the frame) after the connection establishment, and ends after the DLE ETX character at connection termination.

Note

With DLE duplication, the DLE character is included twice in the BCC calculation.

6.4 Sending data with 3964(R)

Connection setup for sending

The 3964(R) protocol sends the STX control character to set up the connection. The transition to send mode is initiated when the communication partner responds with the DLE character before the ACK delay time has expired.

The protocol retries to connect if the communication partner responds with NAK or any other character (except DLE or STX), or if inactivity triggers an acknowledgment timeout. After the parameterized number of unsuccessful retries to connect, the connection setup is canceled and the NAK character is transmitted to the communication partner. The communication module outputs a corresponding error message.

Sending data

On successful connection setup, the user data from the output buffer of the communication module and the selected transmission parameters are sent to the communication partner. The partner monitors the time intervals between incoming characters. The interval between two characters must not exceed the character delay time. Monitoring of the character delay time starts immediately after the connection was set up.

If the communication partner transmits an NAK while a transmission is busy, the block transmission is aborted and repeated as shown above starting with the connection setup. If any other character is received, a wait time for expiration of the character delay time is triggered and an NAK is then transmitted to set the communication partner to idle state. Transmission is then restarted with STX connection setup.

Connection shutdown during transmission

After the buffer content has been transmitted, the routine inserts the DLE, ETX characters, appends the BCC block checksum (only for 3964R) and waits for an ACK character. If the communication partner sends the DLE characters within the acknowledgment delay time, the data block has been received without errors. If the communication partner responds with NAK, or any other character (except DLE), or with a corrupt character, or if the acknowledgment delay time expires without response, the routine restarts transmission with STX connection setup.

After the parameterized number of retries to connect, the routine is aborted and NAK is transmitted to the communication partner. The communication module outputs a corresponding error message.

6.5 Receiving data with 3964(R)

Connection setup for receiving

While in idle state and not processing a send job, the module waits for the communication partner to set up the connection.

A wait time is started (wait time = acknowledgment delay time - 10 ms, however, maximum of 400 ms) if no free receive buffer is available during the connection setup with STX. An error message is generated if no free receive buffer is available on expiration of this time. An NAK is transmitted and initiates the transition to idle state. Otherwise, the DLE character is transmitted and the data is received as described above.

The acknowledgment delay time should be set to the same value at both communication partners.

If any character (except for STX or NAK) is received in idle state, the routine waits for expiration of the character delay time (CDT) and then transmits the NAK character. The communication module outputs a corresponding error message.

Receiving data

After successful connection setup, the incoming receive characters are saved to the receive buffer. If two consecutive DLE characters are received, only one of these is saved to the receive buffer.

After connection setup and after each receive character, the routine waits for the next character within the character delay time. If this period expires before another character is received, an NAK is sent to the communication partner. The communication module outputs a corresponding error message. A retry is then expected.

If transfer errors occur during receiving (lost character, frame error, parity error, etc.), the procedure continues to receive data until the connection is terminated and then sends an NAK to the communication partner. A retry is then expected. Receiving is aborted if the block cannot be received without errors after the specified number of transmission retries, or if the communication partner fails to retry transmission within a block delay time of 4 seconds. The communication module reports the first corrupted transfer and the final cancelation.

Connection setup for receiving

Once the DLE ETX string is detected, receiving is terminated and DLE is transmitted to the communication partner for a block that was received without error. In the case of a receive error, an NAK is sent to the communication partner. A retry is then expected.

Receiving is stopped once the DLE ETX BCC string is detected. The BCC is compared with the internally generated longitudinal parity. DLE is transmitted (return to idle state) if the BCC is correct and no other receive error is pending. If the BCC is faulty or a different receive error occurs, an NAK is sent to the communication partner. A retry is then expected.

Configuration data records

7

7.1 Freeport communication

The following three configuration data records must be sent to the communication module for Freeport communication.

7.1.1 Port configuration record - data record 57

Note

Parameter assignment error

If the communication module detects a parameter assignment error when writing the "Port Configuration Record - data record 57", the data record is rejected with error status 0x80E1.

The corresponding cause of error can be read by means of data record "Read Error Status - data record 55" (error codes of the port configuration).

7.2 3964 communication

The following two configuration data records must be transferred to the communication module for 3964 communication:

7.2.1 Port configuration record - data record 57

Note

The "Port configuration record" is described in chapter Port configuration record - data record 57 (Page 41).

7.2.2 3964 protocol configuration - data record 61

Note

Parameter assignment error

If the communication module detects a parameter assignment error when writing the "3964 Protocol Configuration - data record 61", the data record is rejected with error status 0x80E1.

The corresponding cause of error can be read by means of data record "Read Error Status - data record 55" (error codes of the 3964 protocol).

7.3 Activate special function

The following data record can be used to activate diagnostic interrupts (write) and check whether diagnostic interrupts are activated (read).

Note

Parameter assignment error

If the communication module detects a parameter assignment error when writing the "Activate special function - data record 58", the data record is rejected with error status 0x80E1.

The corresponding cause of error can be read by means of data record "Read Error Status - data record 55" (error codes of the special functions).

17								
18	Error codes of the 3964 protocol *							
19								

* A list of all error codes is available in chapter Error messages (Page 67).

Sending data

9

9.1 Send data - data record 48

The following data record is used to write send data to the communication module:

SEND_PTP record (write record 0030H)								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	Sequence number for SEND (0 to 255)							
1	Frame end identifier (0 or 1)							
2	Data to transmit byte 0							
:	:							
:	:							

Sequence number for SEND

The "Sequence number for SEND" parameter identifies a new send frame, or a new data record of a frame. The "SEND acknowledgment from module" (refer to chapter "Querying send acknowledgment - input user data (Page 57)") must be read as first "Sequence number for SEND" and incremented by the count of one. For the first data record, the "Sequence number for SEND" therefore starts with 1 after a STOP/RUN transition of the CPU and is then incremented by one for each data record with new content.

The value "0" may not be used as "Sequence number for SEND". as it serves to detect the start of the module. The value is reset to 1 again after 255 has been reached.

Frame end identifier

The "Frame end identifier" parameter serves to identify the last data record belonging to a frame.

- The value 0 means that at least one more data record follows for the current frame.
- The value 1 means that this data record is the last one for the current frame.

Data to transmit byte 0

The data must be stored in the data record as of "Data to transmit byte 0". The size and therefore the number of data records for transmitting a frame is defined by the transmission medium, for example, 240 bytes with PROFIBUS.

If the length of the data to transmit is not a multiple of the data record length, the length of the last data record corresponds to the length of the remaining data to transmit.

Send acknowledgment from module

The module writes the "Sequence number" received in the data record as send acknowledgment to the user data. See "SEND acknowledgment from module", chapter "Querying send acknowledgment - input user data (Page 57)".

For the last data record belonging to a frame,the acknowledgment is not written until the module has sent the frame.

This means that the "SEND acknowledgment from module" must be evaluated along with the "SEND status" after the last data record was written.

Startup characteristics

At startup, the module writes a zero value to "SEND acknowledgment from module" (see chapter "Querying send acknowledgment - input user data (Page 57)"

A busy job must be aborted if "SEND acknowledgment from module" equals zero.

9.2 Querying send acknowledgment - input user data

The communication module enters the send acknowledgment in the user data that has the following structure:

Input process image structure ***Italic* = not supported**								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	SGN_STAT 0 - no status 1 - Status valid	Reserved = 0	Ring_Status	DCD_Status	CTS_Status	RTS_Status	DSR_Status	DTR_Status
1	SEND acknowledgment from module							
2	SEND status *							
3								
4	Sequence number for RCV							
5	*Reserved: 00H*							
6	*Reserved: 00H*							
7	*Reserved: 00H*							

* A list of all status and error codes is available in chapter Error messages (Page 67)

You can read status information as well as error numbers (value unequal to 0) from "SEND Status".

If "SEND acknowledgment from module" equals the number transferred in the last data record ("Sequence number for SEND") and the "SEND Status" equals 0, the frame or data record was transmitted without errors.

It is necessary to wait for this communication module feedback, which means "SEND Status" is equal to an error code, or "SEND acknowledgment from module" equals "Sequence number for SEND" and "SEND Status" equals zero, before a new frame is transmitted.

Reaction of the module to an unexpected sequence number for SEND

The module rejects a data record with an unexpected sequence number for SEND when writing the data record and returns error message 0x80B8. The code 0x81D7 is then stored in "SEND status or error code" in the user data. In this case, active communication must be canceled and transmission must be repeated with the first data record. Set the sequence number for SEND as described in chapter Send data - data record 48 (Page 55).

9.3 Example

A frame with a length of 500 bytes is to be transmitted. The data record has a length of 240 bytes.

- First data record, length of 240 bytes:

  "Sequence number for SEND" = 1

  "Frame end identifier" = 0

  238 bytes user data

- Second data record, length of 240 bytes:

  "Sequence number for SEND" = 2

  "Frame end identifier" = 0

  238 bytes user data

- Third data record, length of 26 bytes

  "Sequence number for SEND" = 3

  "Frame end identifier" = 1

  24 bytes user data

- Wait for feedback from the communication module; see Querying send acknowledgment - input user data (Page 57).

Afterwards, a frame with a length of 100 bytes is to be transmitted.

- First = last data record, length of 102 bytes:

  "Sequence number for SEND" = 4

  "Frame end identifier" = 1

  100 bytes user data

- Wait for feedback from the communication module; see Querying send acknowledgment - input user data (Page 57).

Receiving data

10

10.1 Data received - data record 49/50

A new value at "Sequence number for RCV" (Query: New receive frame - input user data (Page 61)) indicates a new frame is ready for reading in the communication module.

The following data records are used to read receive data from the communication module:

RCV_PTP record (read record 0031H/0032H)								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	Sequence number for this data record (1 to 255)							
1	Frame end identifier (0 or 1)							
2	RCV status *							
3								
4	Receive data byte 0							
:	:							
:	:							

* A list of all status and error codes is available in chapter Error messages (Page 67)

Change of the data record number when receiving data

After startup of the communication module, reading of the frame content must start at data record number 16#0031, while the data record numbers change between 16#0032 and 16#0031 in all subsequent read operations.

Sequence number of this data record

For the first data record of a frame, the "Sequence number of this data record" is equal to the "Sequence number for RCV" in the user data that indicated the new frame. This value is incremented by the count of one for each data record read subsequently. An overflow to 2 is triggered at 255. The values 0 and 1 have a special significance (see below).

Frame end identifier

The "Frame end identifier" is equal to 1 for the last data record that has to be read for this frame, while it is 0 for all other data records.

The size of the last data record that belongs to a frame is determined by the frame length and limited accordingly by the communication module.

RCV status

"RCV Status" displays the result of the last data reception.

0x009x: Frame received without error

0x8xxx: Frame received with error

See chapter Error messages (Page 67).

Resetting communication after power on of the communication module

- "Sequence number for RCV" is equal to 0

  A "Sequence number for RCV" with value 0 in the input user data indicates that the communication module has performed a restart after power on and that no frame has been received yet.

- "Sequence number for RCV" is equal to 1

  A "Sequence number for RCV" with value 1 in the input user data indicates that this is the first frame after power on of the communication module.

A busy job must be aborted in both cases.

In the second case, reading of the frame content must start at data record number 16#0031.

10.2 Query: New receive frame - input user data

Sequence number for RCV

A new received frame is indicated by a "Sequence number for RCV" in byte 4 of the user data that has the following structure.

Input process image structure ***Italic* = not supported**								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	SGN_STAT 0 - no status 1 - Status valid	Reserved = 0	Ring_Status	DCD_Status	CTS_Status	RTS_Status	DSR_Status	DTR_Status
1	Sequence number from module							
2	SEND status *							
3								
4	Sequence number for RCV							
5	*Reserved: 00H*							
6	*Reserved: 00H*							
7	*Reserved: 00H*							

* A list of all status and error codes is available in chapter Error messages (Page 67)

10.3 Example

A frame with a length of 500 bytes was received. The data record has a length of 240 bytes

- In the user data, the frame is indicated by "Sequence number for RCV" = 1.
- Read data record 16#0031 that contains:

  "Sequence number of this record" = 1

  "Frame end identifier" = 0

  "RCV status or error code return value" = 0x009x [1)]

  It contains 236 bytes of user data.
- Read the second data record 16#0032 that contains:

  "Sequence number of this data record" = 2

  "Frame end identifier" = 0

  "RCV status or error code" = 0x009x [1)]

  It contains 236 bytes of user data.
- Read the third data record 16#0031 that contains:

  "Sequence number of this data record" = 3

  "Frame end identifier" = 1

  "RCV status or error code" = 0x009x [1)]

  It contains 28 bytes of user data. The communication module has limited the data record length to 32 bytes.

  This completes reading of the first frame from the CM.

A frame with a length of 100 bytes was received subsequently.

The sequence number for RCV changes from 1 to 4 in the user data.

- Read the data record 16#0032 that contains:

  "Sequence number of this data record" = 4

  "Frame end identifier" = 1

  "RCV status or error code" = 0x009x [1)]

  The data record contains 100 bytes of user data and the communication module has limited the data record length to 104 bytes.

1) 0x009x Frame received without error
   0x8xxx Frame received with error
   (see error codes in chapter Query: New receive frame - input user data (Page 61))

Clear receive buffer

11

11.1 Clear receive buffer - data record 54

The receive buffer of the communication module is cleared by writing the following data record with "RST_RCV_BUF" = TRUE.

PtP RCV_RST(write record 0036H) *Italic* = not supported								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	Block type: 0036H - RCV_RST							
1								
2	Block length: 0008H							
3								
4	Block version high byte: 01H							
5	Block version low byte: 00H							
6	Reserved: 0000H							
7								
8	0	0	0	0	0	0	0	RST_RCV_BUF
9	*Reserved: 00H*							
10	*Reserved: 00H*							
11	*Reserved: 00H*							

Note: RST_RCV_BUF = 0; no changes are made to the receive buffer.
RST_RCV_BUF = 1; the receive buffer is cleared.

The communication module does not acknowledge the reset of its receive buffer.

RS232 signals

12

12.1 Set RS232 secondary signals - data record 53

The RS232 secondary signals of the communication module are manipulated by writing to the following data record, provided the communication module supports this action in the current mode.

Note

Parameter assignment error

If the communication module detects a parameter assignment error when writing the "Set RS232 secondary signals - data record 53", the data record is rejected with error status 0x80E1.

The corresponding cause of error can be read by means of data record "Read Error Status - data record 55" (error codes of the RS232 secondary signals).

PtP SGN_SET(write record 0035H) *Italic* = not supported								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	Block type: 0035H - SGN_SET							
1								
2	Block length: 0008H							
3								
4	Block version high byte: 01H							
5	Block version low byte: 00H							
6	Reserved: 0000H							
7								
8	0	0	0	0	0	0	Set_DTR_State	Set_RTS_State
9	0	0	0	0	0	0	DTR_State	RTS_State
10	*Reserved: 00H*							
11	*Reserved: 00H*							

Note: Set_xxx_State = 0, the status of the specified control bit is not changed. Set_xxx_State = 1, the status of the specified control bit must be set to the value that was specified by xxx_State.

For information on reading the acknowledgment to the writing of this data record, refer to chapter "Error status (Page 53) ".

12.2 Read RS232 secondary signals - input user data

The RS232 secondary signals of the communication module can be read from the user data.

Input process image structure *Italic* = not supported								
Bit->	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Byte								
0	SGN_STAT 0 - no status 1 - Status valid	Reserved = 0	Ring_Status	DCD_Status	CTS_Status	RTS_Status	DSR_Status	DTR_Status
1	Sequence number for SEND (acknowledgment from module)							
2	SEND status or error code *							
3								
4	Sequence number for RCV							
5	*Reserved: 00H*							
6	*Reserved: 00H*							
7	*Reserved: 00H*							

* A list of all error codes is available in chapter Error messages (Page 67)

SGN_STAT = 0 indicates that no RS232 secondary signals are available in the current operating mode of the communication module.

Error messages

13

Overview of error messages

Error code	Description	Remedy
0x0000	No error	-
RECEIVE status and error codes		
0x0094	Frame end identified based on the "Receipt of fixed/maximum frame length"	-
0x0095	Frame end identified based on "Message timeout"	-
0x0096	Frame end identified based on expiration of the "Character delay time"	-
0x0097	No response frame was received within the parameterized maximum response time.	-
0x0098	Frame end identified based on the fulfillment of the "Read message length from message" conditions	-
0x0099	Frame end identified based on the receipt of the "End sequence"	-
SEND status and error codes		
0x7000	Block idle	-
0x7001	Initial call for a new frame: Data record transmission initiated	-
0x7002	Interim call: Data record transmission in process	-
0x8085	Invalid length specification	Select a suitable frame length. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)
0x8088	The specified length exceeds the range set in the receive buffer	Change the range in the receive buffer or select a frame length which corresponds to the range set in the receive buffer. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)
Error codes of the special functions		
0x8190	Incorrect setting of the CRC calculation	Select a suitable value for CRC calculation. The following are valid: deactivated or activated. Check whether the module addressed supports CRC calculation.
0x8191	Incorrect setting of the diagnostic interrupt	Select a suitable value for "Diagnostic interrupt". The following are valid: Diagnostic interrupt deactivated (0) or diagnostic interrupt activated (1). Check whether the module addressed supports the generation of diagnostic interrupts.

Error code	Description	Remedy
Error codes of the "Port configuration"		
0x81A0	The module does not support this protocol.	Select a valid protocol for the module.
0x81A1	The module does not support this data transmission rate.	Select a valid data transmission rate for the module.
0x81A2	The module does not support this parity setting.	Select a suitable value for "Parity". The following are valid: • None (1) • Even (2) • Odd (3) • Mark (4) • Space (5) • Any (6)
0x81A3	The module does not support this number of data bits.	Select a suitable value for "Number of data bits". The following are valid: • 7 (2) • 8 (1)
0x81A4	The module does not support this number of stop bits.	Select a suitable value for "Number of stop bits". The following are valid: • 1 (1) • 2 (2)
0x81A5	The module does not support this type of data flow control.	Select a valid data flow control for the module.
0x81A7	Invalid value for XON or XOFF	Select suitable values for XON and XOFF. Valid range of values: 0 - FF.
0x81A8	Error in frame header	Check the data/values in the frame header.
0x81AA	Invalid operating mode	Valid operating modes are: • Full duplex (RS232) (0) • Full duplex (RS422) four-wire mode (point-to-point) (1) • Full duplex (RS422) four-wire mode (multipoint master) (2) / (CM PtP (ET 200SP)) • Full duplex (RS422) four-wire mode (multipoint slave) (3) / (CM PtP (ET 200SP)) • Half duplex (RS485) two-wire mode (4)

Error code	Description	Remedy
0x81AB	Invalid default setting of the receive line	Valid default settings are: • "No" default setting (0) • Signal R(A)=5 V, signal R(B)=0 V (break detection) (1): Can only be selected with: "Full duplex (RS422) four-wire mode (point-to-point connection)" and "Full duplex (RS422) four-wire mode (multipoint slave)". • Signal R(A)=0 V, signal R(B)=5 V (2): This default corresponds to the idle state (no active send operation). No break detection is possible with this default setting.
0x81AC	Invalid value for "Break detection"	Select a suitable value for "Break detection". The following are valid: • "0" (break detection deactivated) • "1" (break detection activated)
0x81AF	The module does not support this protocol.	Select a valid protocol for the module.
Error codes of the "Send configuration"		
0x81B5	More than two end delimiters or end sequence > 5 characters	Select suitable values for "End delimiter" and "End sequence". The following are valid: • deactivated (0), • 1 (1) or 2 (2) end delimiters or • deactivated (0), • 1 (1) up to 5 (5) characters for the end sequence.
0x81B6	Send configuration rejected because the 3964(R) protocol was selected	Verify that no send configuration is transmitted if the 3964R) protocol is set.
Error codes of the "Receive configuration"		
0x81C0	Invalid start condition	Select a suitable start condition. The following are valid: • Send break before frame start • Send Idle Line.
0x81C1	Invalid end condition or no end condition selected	Select a suitable end condition.
0x81C3	Invalid value for "Maximum message length"	Select a suitable value for "Maximum message length". Valid range of values (module-dependent): 1-1024/2048/4096 (Byte)
0x81C4	Invalid value for "Offset of the length specification in the message"	Select a suitable value for "Offset of the length specification in the message". Valid range of values (module-dependent): 1-1024/2048/4096 (Byte)

Error code	Description	Remedy
0x81C5	Invalid value for "Size of length field"	Select a suitable value for "Size of length field". Valid range of values in bytes: • 1 (1) • 2 (2) • 4 (4)
0x81C6	Invalid value for "Number of characters not counted in length specification"	Select a suitable value for "Number of characters not counted in length specification". Valid range of values: 0 to 255 (bytes)
0x81C7	The total of "Offset in the message + size of the length field + number of character not counted" is greater than the maximum frame length	Select a suitable value for "Offset in message", "Size of the length field" and "Number of characters not counted". Valid range of values: • Offset in the message (module-dependent): 0-1022/2046/4094 (Byte) • Size of the length field: 1, 2, or 4 (bytes) • Number of characters not counted: 0-255 (bytes)
0x81C8	Invalid value for "Response timeout"	Select a suitable value for "Response timeout". Valid range of values: 1-65535 (ms)
0x81C9	Invalid value for "Character delay time"	Select a suitable value for "Character delay time". Valid range of values: 1-65535 (bit times)
0x81CB	Frame end sequence is activated, but no character is activated for the check	Activate one or several characters for the check.
0x81CC	Frame start sequence is activated, but no character is activated for the check	Activate one or several characters for the check.
0x81CD	Invalid value for "Prevent overwriting"	Select a suitable value for "Prevent overwriting". The following are valid: • Prevent overwriting is deactivated (0) or • Prevent overwriting is activated (1)
0x81CE	Invalid value for "Clear receive buffer at startup"	Select a suitable value for "Clear receive buffer at startup". The following are valid: • Clear receive buffer at startup is deactivated (0) • Clear receive buffer at startup is activated (1)

Error code	Description	Remedy
SEND status and error codes		
0x81D0	Receiving send requests during runtime of a send job	Make sure that you do not receive send requests during runtime of a send job.
0x81D1	The waiting time for XON or CTS = ON has expired.	The communication partner has a fault, is too slow or is offline. Check the communication partner or, if necessary, change the parameter assignment.
0x81D2	"Hardware RTS always ON": Send command aborted due to change from DSR = ON to OFF	Check the communication partner. Make sure that DSR is ONfor the entire duration of transmission.
0x81D3	Send buffer overflow / send frame too long	Select a shorter frame length. The following are valid (depending on the module): 1-1024/2048/4096 (Byte)
0x81D5	Transmission aborted due to parameter changes, detected wire break, or because CPU in STOP	Check the parameter assignment, for wire break, and the CPU status.
0x81D6	Transmission canceled because end identifier was not received	Check the parameter assignment of the end delimiters and the frame of the communication partner.
0x81D7	Communication error between the user program and module	Check communication (e.g. consistency of the sequence number).
0x81D8	Transmission attempt rejected because module is not configured	Configure the module.
Error codes of the receive configuration		
0x81E0	Frame canceled: Send buffer overflow / send frame too long	Increase the call rate for the receive function in the user program, or parameterize communication with data flow control.
0x81E1	Frame canceled: Parity error	Check the connection line of the communication partners, or verify that both devices are configured for the same data transmission rate, parity and stop bit number.
0x81E2	Frame canceled: Character frame error	Check the settings for the start bit, data bits, parity bit, data transmission rate, and stop bit(s).
0x81E3	Frame canceled: Character overflow error	Firmware error: Contact Customer Support.
0x81E4	Frame canceled: The total length of "Offset in the message + size of the length field + number of character not counted" is greater than the receive buffer	Select a suitable value for Offset in message, Size of the length field, and Number of characters not counted.
0x81E5	Frame canceled: Break	Receive line to partner is interrupted. Reconnect or switch on partner.
0x81E6	Maximum number of "Buffered receive frames" exceeded	In the user program, increase the call rate of the instruction, or parameterize communication with data flow control, or increase the number of buffered frames.
0x81E8	Frame canceled: The character delay time has expired before the message and criterion was detected	Partner device faulty or too slow. Check this, if required, using an interface tester that is interconnected in the transmission line.

Error code	Description	Remedy
0x81EB	Frame canceled: Maximum frame length reached	Select a shorter frame length at the communication partner. The following are valid (depending on the module): 1-1024/2048/4096 (Byte) Check the parameters of the frame end detection.
Error codes of RS232 secondary signals		
0x81F0	The module does not support RS232 secondary signals	You have made an attempt to set up secondary signals on a module that does not support RS232 secondary signals. Verify that this is an RS232 module or that RS232 mode (ET 200SP) is set.
0x81F1	No operation of RS232 secondary signals	RS232 secondary signals cannot be manipulated manually as long as hardware data flow is active.
Error codes of the receive configuration		
0x82C1	Invalid value for "Buffered receive frames".	Select a suitable value for "Buffered receive frames". Valid range of values: 1-255
0x82C2	Receive configuration rejected because the 3964(R) protocol was selected	Verify that no receive configuration is transmitted if the 3964(R) protocol is set.
3964(R) protocol error codes		
0x8380	Parameter assignment error: Invalid value for "Character delay time".	Select a suitable value for "Character delay time". Valid range of values: 1-65535 (ms)
0x8381	Parameter assignment error: Invalid value for "Response timeout".	Select a suitable value for "Response timeout". Valid range of values: 1-65535 (ms)
0x8382	Parameter assignment error: Invalid value for "Priority".	Select a suitable value for "Priority". The following are valid: • High (1) • Low (0)
0x8383	Parameter assignment error: Invalid value for "Block check"	Select a suitable value for "Block check". The following are valid: • with block check (1) • without block check (0)
0x8384	Parameter assignment error: Invalid value for "Connection attempts".	Select a suitable value for "Connection attempts". Valid range of values: 1-255
0x8385	Parameter assignment error: Invalid value for "Transmission attempts".	Select a suitable value for "Transmission attempts". Valid range of values: 1-255
0x8386	Runtime error: Number of connection attempts exceeded	Check the interface cable and the transmission parameters. Also check whether the receive function is configured correctly at the partner device.
0x8387	Runtime error: Number of transmission attempts exceeded	Check the interface cable, the transmission parameters and the configuration of the communication partner.

Error code	Description	Remedy
0x8388	Runtime error: Error at the "Block check character" The internally calculated value of the block check character does not correspond to the block check character received by the partner at the connection end.	Check whether the connection is seriously disrupted; in this case you may also occasionally see error codes. Check for proper function at the partner device, possibly by using an interface test device that is switched into the transmission line.
0x8389	Runtime error: Invalid character received while waiting for free receive buffer	The send request of the communication partner (STX, 02H) is not answered with DLE until the receive buffer has been cleared. No additional character may be received before it has been cleared (except STX again). Check for proper function at the partner device, possibly by using an interface test device that is switched into the transmission line.
0x838A	Runtime error: Logical error during receiving. Another character (other than DLE, ETX) was received after receipt of DLE.	Check whether the partner DLE in the frame header and in the data string is always in duplicate or the connection is released with DLE ETX. Check for proper function of the partner device, possibly using an interface test device that is switched into the transmission line.
0x838B	Runtime error: Character delay time exceeded	Partner device too slow or faulty. Check for proper function of the partner device, possibly using an interface test device that is switched into the transmission line.
0x838C	Runtime error: Wait time for free receive buffer has started	Increase the call rate of the instruction in the user program, or parameterize communication with data flow control.
0x838D	Runtime error: Frame repetition does not start within 4 s after NAK	Check the communication partner. A received frame that is possibly corrupted must be repeated by the partner within 4 seconds.
0x838E	Runtime error: One or several characters (except NAK and STX) were received in idle mode.	Verify the proper function of the partner device, for example, by means an interface tester that is interconnected in the transmission line.
0x838F	Runtime error: Initialization conflict - Both partners have set high priority	Set the "Low" priority at one of the partners
0x8390	Parameter assignment error: Error in frame header	Check the data/values in the frame header.
0x8391	Parameter assignment error: 3964 Parameter data record rejected because Freeport is set	Verify that no 3964 parameter data is transmitted if the Freeport protocol is set.

Glossary

Address

The address indicates the physical storage space and enables direct access to the operand that is stored under this address.

Automation system

An automation system is a programmable logic controller consisting of at least one CPU, various I/O modules, and operator control and monitoring devices.

Communication module

Communication modules are used for point-to-point connections and bus links.

Configuration

The term configuration refers to the summary of individual modules of an automation system in the configuration table.

CPU

Central Processing Unit = Central module of the automation system that consists of the control and computing units, memory, system program, and interfaces to the I/O modules.

CPU operating system

The CPU operating system organizes all the functions and sequences of the CPU that are not linked to a special control task.

Cycle time

The cycle time denotes the time a CPU requires to execute one user program cycle.

Cyclic program processing

In cyclic program processing, the term cycle denotes execution of the user program in a continuous repetitive program loop.

Default setting

The default is a useful basic setting that is used whenever no other value is specified.

Diagnostic functions

The diagnostic functions cover the entire system diagnostics and the detection, evaluation and reporting of errors in the automation system.

Diagnostics buffer

Memory area in which detailed information on all diagnostics events is entered based on the order of their occurrence.

Diagnostics events

Diagnostics events are, for example, module errors or system errors in the CPU that may be caused by a program error.

Hardware

The term hardware denotes the entire physical and technical equipment of an automation system.

Interrupt

The term interrupt designates the interruption of program execution in the processor of an automation system which is triggered by an external alarm.

Module parameters

Module parameters are values that are used to determine the behavior of the module. We distinguish between static and dynamic module parameters.

Online/Offline

In online mode, there is a data connection between the automation system and programming device, while there is no data connection in offline mode.

Parameter assignment

The term parameter assignment denotes actions that define the response of a module or block.

Parameters

Parameters represent values that can be used to define the behavior of a module or software. We distinguish between module parameters and block parameters.

Point-to-point connection

In a point-to-point connection the communication module interfaces a programmable logic controller and a communication partner.

Protocol

The communication partners participating in data transmission must conform to fixed rules for the handling and execution of data traffic. These rules are called protocols.

Rack

The rack is a mounting rail with slots that can be used to mount modules.

Software

The term software refers to all programs that are used on a computing system. These include the operating system and user programs.

User program

The user program contains all instructions and declarations for processing the signals used for controlling a system or a process. In SIMATIC S7, the user program is structured and divided into small units, namely the blocks.

Work memory

Work memory is CPU RAM (Random Access Memory) that is accessed by the processor when processing the user program.
