Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual provides a general overview of the IO-Link communication system.

It shows the interaction of the various components of an IO-Link system and will help you improve your general understanding of IO-Link.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Proficiency with STEP 7

Scope of the documentation

This documentation is the basic documentation for IO-Link systems at Siemens. The product documentation is based on this documentation.

Additional support

- Information about the technical support available can be found in the appendix to this documentation (Page 29).
- The range of technical documentation for the individual SIMATIC products and automation systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Documentation

Various IO-Link products are available from Siemens. Each of these products has a separate documentation. The IO-Link products are embedded in systems, such as ET 200SP. The documentation for the system consists of the respective system manual, function manuals and manuals. In addition, the STEP 7 online help and the Port Configuration Tool - S7-PCT online help assist you in configuring and programming your automation system with IO-Link.

IO-Link components from Siemens

Siemens offers a wide range of products and support for IO-Link:

- Master
- Device, I/O modules
- Device, industrial switchgear
- Device, RFID systems (RFID = radio-frequency identification)
- Port Configuration Tool - S7-PCT (http://support.automation.siemens.com/WW/view/en/37936752)
- "IOL_CALL" function blocks for SIMATIC S7-300 and S7-400 (http://support.automation.siemens.com/WW/view/en/38487085)
- IO-Link application example (http://support.automation.siemens.com/WW/view/en/38006560)

Additional information on the products can be found on the Internet (http://www.siemens.com/io-link).

Additional documentation for IO-Link

All current documentation for IO-Link products is available for download free of charge on the Internet (http://support.automation.siemens.com/WW/view/en/29036712/133300).

System overview

2

Introduction

A continuous communication down to the lowest field level ensures enhanced use of the functions and performance capability of sensors and actuators. Enhanced use of sensors and actuators allows you to operate your machines and plants more productively.

No data other than the actual process value can be exchanged via the standard interfaces (digital, analog) used at the sensor/actuator level. Sensors and actuators with integrated intelligence are now used for increasingly complex functions and require a communication interface tailored to these requirements.

Definition

IO-Link is an innovative, point-to-point communication interface for the sensor/actuator area that is specified in IEC 61131-9.

IO-Link consists of the following system components:

- IO-Link master
- IO-Link device
- Unshielded 3-wire standard cable
- Engineering tool for configuring and assigning parameters of IO-Link

2.1 Advantages of IO-Link

The IO-Link system offers decisive advantages for connecting complex (intelligent) sensors and actuators.

- Open standard in accordance with IEC 61131-9
  - Devices can be integrated in the same way in all standard fieldbus systems and automation systems.
- Tool supported parameter setting and central data management
  - Fast configuration and commissioning
  - Simple creation of current plant documentation even for sensors/actuators
- Single, uniform wiring and far fewer different interfaces at the sensors/actors
  - Reduction in the variety of types and inventory
  - Fast commissioning
  - Reduction in space requirement
  - Any combination of IO-Link devices and sensors/actuators without IO-Link at IO-Link master
- Continuous communication between sensors/actuators and the CPU
  - Access to all process data, diagnostic data and device information
  - Access to device-specific data, such as energy data
  - Remote diagnostics can be performed
- Continuous diagnostic information down to sensor/actuator level
  - Reduction in troubleshooting effort
  - Minimizing risk of failure
  - Preventive maintenance and optimization of service and maintenance planning
- Dynamic change of sensor/actuators parameters by the controller or the operator at the HMI
  - Reduction in downtimes during product change
  - Increase in product diversity of machine
- Automatic reassignment of parameters when devices are replaced during operation
  - Minimization of downtimes
  - Device replacement by untrained personnel without additional aids
  - Avoidance of incorrect settings

2.2 Overview of IO-Link system

Components

An IO-Link system consists of the following components:

- IO-Link master
- IO-Link device, for example:
  - Sensors/actuators
  - RFID readers
  - I/O modules
  - Valves
- Unshielded 3-wire standard cables
- Engineering tool for configuring and assigning parameters of IO-Link

Example plant with IO-Link

The figure below shows an example of plant architecture with IO-Link.

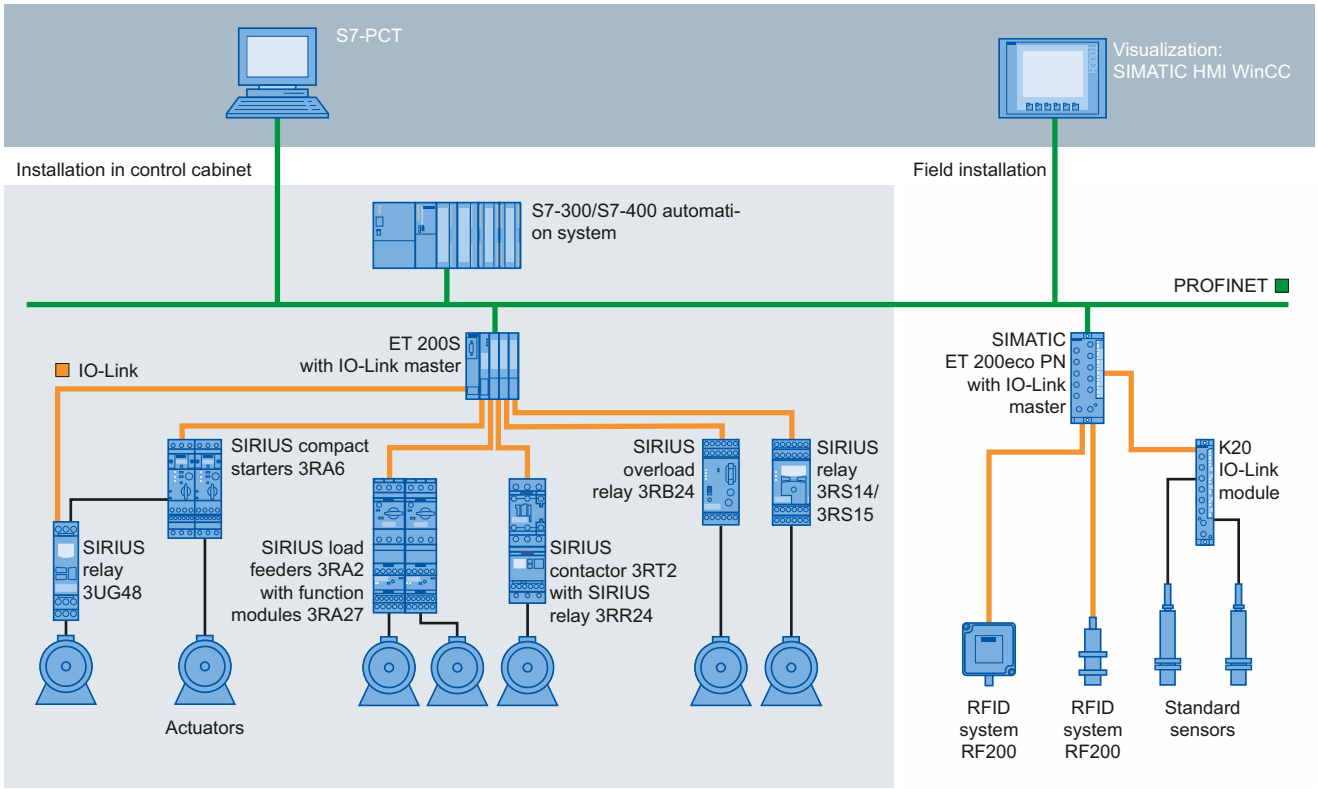

Figure 2-1 Plant architecture with IO-Link

The IO-Link master establishes the connection between the IO-Link devices and the automation system. If the IO-Link master is a component of the I/O system, it is installed either in the control cabinet or directly in the field as remote I/O in degree of protection IP65/67. The IO-Link master communicates by means of various fieldbuses or product-specific backplane buses. An IO-Link master can have multiple IO-Link ports (channels). An IO-Link device can be connected (point-to-point communication) to each port.

Engineering

The IO-Link system is engineered parallel to the overall automation system and can be embedded in it and intermeshed with it.

2.3 IO-Link interface

Introduction

The IO-Link is a serial, bidirectional point-to-point connection for signal transmission and power distribution under any network, fieldbus or backplane bus.

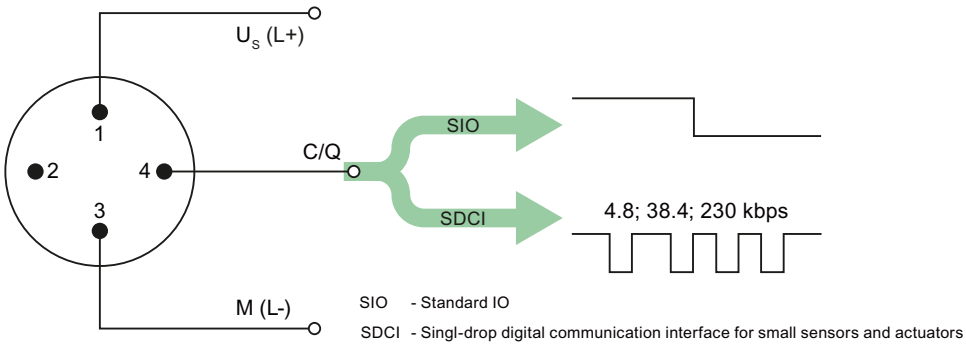
Connection system in IP65/67

M12 connectors and other connectors are defined for the connection system in IP65/67; sensors have a 4-pin connector, actuators a 5-pin connector. IO-Link masters are always equipped with a 5-pin M12 socket.

The pin assignment according to IEC 60974-5-2 is specified as follows:

- Pin 1: 24 V
- Pin 3: 0 V
- Pin 4: Switching and communication cable (C/Q)

In addition to providing IO-Link communication, these three pins supply a maximum of 200 mA to the device.



Pin	Signal	Definition	Standard
1	U_S (L+)	24 V	IEC 61131-2
2	-	not defined	-
3	M (L-)	0 V	IEC 61131-2
4	Q	Switching signal DI, DQ (SIO)	IEC 61131-2
4	C	"coded switching signal" (IO-Link)	IEC 61131-9

Figure 2-2 Pin assignment IO-Link device

Port types in IP65/67

Two types of ports are distinguished in the specifications for IO-Link masters:

- Port Class A (Type A)
  With this type, the functions of pins 2 and 5 are not assigned. The manufacturer defines this function. Generally, an additional digital channel is assigned to pin 2.

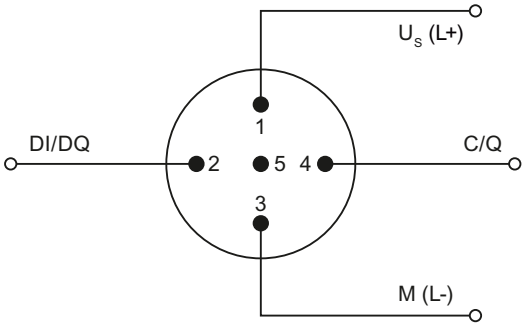


Figure 2-3 Pin assignment Port Class A

- Port Class B (Type B)
  This type offers an additional supply voltage and is suitable for the connection of devices that have an increased power requirement. In this case an additional (galvanically isolated) supply voltage is made available by pins 2 and 5. A 5-wire standard cable is required to use this additional supply voltage.

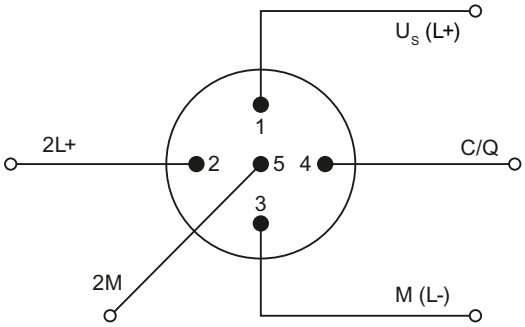

Figure 2-4 Pin assignment Port Class B

Connecting cables

The devices are connected to the master by means of an unshielded 3-wire standard cable that is up to 20 m long. Standard cables can be used to wire the sensors. No shielding or compliance with specific regulations is necessary for the installation of the cables.

2.4 IO-Link protocol

Operating modes

The IO-Link port of the master can be operated in the following modes:

- IO-Link:
  In "IO-Link" operating mode, the port is in IO-Link communication.
- DI:
  In "DI" operating mode the port behaves like a digital input.
- DQ:
  In "DQ" operating mode the port behaves like a digital output.
- Deactivated:
  The "Deactivated" operating mode is used for unused ports.

Transmission rate

In the IO-Link specification V1.1, three data transmission rates (baud rates) are specified for the IO-Link operating mode:

- COM 1 = 4.8 kBaud
- COM 2 = 38.4 kBaud
- COM 3 = 230.4 kBaud (optional according to Specification V1.0)

The IO-Link device only supports one of the defined data transmission rates. The IO-Link master to Specification V1.1 supports all data transmission rates and adjusts automatically to the data transmission rated supported by the device.

Response time of the IO-Link system

The response time of the IO-Link system provides information about the frequency and speed of the data transmission between device and master. The response time depends on various factors.

A value for the minimum cycle time of the device is stored in the device description file IODD of the device (Page 18). This value indicates in which time intervals the master may address the device. The value has a big influence on the response time. The master also has an internal processing time that is factored into the calculation of the response time.

Devices with different minimum cycle time can be configured on a master. The response time for these devices differs accordingly. In other words, the response time for various devices connected to a master can vary greatly.

When you configure the master you can specify a fixed cycle time in addition to the device-specific minimum cycle time stored in the IODD. The master then addresses the device according to this specification.

The typical response time for a device thus results from the effective cycle time of the device and the typical internal processing time of the master.

Transmission performance

IO-Link is a very robust communication system. This communication system operates with a 24V level. If transmissions fail, the frame is repeated two more times. The IO-Link master only detects a break in communication after the failure of the second repeat attempt and reports this to the higher-level CPU.

Data types

Four data types are available:

- Process data → Cyclic data
- Value status → Cyclic data
- Device data → Acyclic data
- Events → Acyclic data

Process data

The process data of the devices is transferred cyclically in a data frame with the process data size being determined by the device. Process data from 0 to 32 bytes is possible per device (input and output, respectively). No fixed consistency width is set for the transmission; as a result the consistency width depends on the master.

Value status

Each port has a value status (PortQualifier). The value status indicates whether the process data is valid or invalid. The value status is transferred cyclically together with the process data. By default, the value status is deactivated.

Device data

Device data can be parameters, identification data or diagnostic information. The data is exchanged cyclically and at the request of the IO-Link master. Device data can be written to the device and also read from the device.

Events

When an event occurs, the device signals to the master that an event is present. The master then reads the event. Events can be error messages (for example, short-circuit) and warning/maintenance data (for example, dirt, overheating).

Error messages are transferred from the device to the CPU or the HMI by the IO-Link master.

The IO-Link master can also transfer events and states. Such events are, for example, wire break, break in communication or overload.

Device parameters or events are transmitted independently of the cyclic transmission of process data. The transmissions do not influence or impair each other.

Startup of the IO system

If the port of the master is set to IO-Link mode, the IO-Link master attempts to communicate with the connected IO-Link device. For this purpose the IO-Link master sends a defined signal and waits for the reply of the IO-Link device.

The IO-Link master first attempts a communication with the highest defined data transmission rate. If this transmission attempt fails the IO-Link master attempts a communication with the lowest data transmission rate. The device always supports only one defined data transmission rate.

If the master receives a reply, communication starts. First they exchange communication parameters. If necessary the parameters stored in the system are transferred to the device.

Then the cyclic data exchange of process data and value status starts.

2.5 Device profiles

Introduction

Device profiles are defined for IO-Link to standardize access of the CPU user program to the devices.

Data structure, data contents and basic functionality are defined in the device profiles. A standard user view and an identical program access is thus achieved for a number of different devices that have the same device profile.

IO-Link profiles

The device profile "Smart Sensor Profile" is currently defined for IO-Link. This profile is especially suited for measurement sensors. In other words, measured values are transmitted in addition to switching points.

In addition, the switchgear (for example, contactors) support the LVSG (Low Voltage Switchgear) profile defined in IEC 61915-2.

2.6 IODD and Port Configuration Tool - S7-PCT

Device description IODD

An electronic device description, the IODD file (IO Device Description) is available for each device. The IODD provides a wealth of information for system integration:

- Communication properties
- Device parameters with value range and default value
- Identification, process and diagnostic data
- Device data
- Text description
- Image of the device
- Manufacturer logo

The structure of the IODD is identical for all devices from all manufacturers. The structure of the IODD is always represented in the identical manner by the IO-Link Configuration Tool of the master manufacturer (for Siemens, S7-PCT). This ensures that the handling is the same for all IO-Link devices regardless of the manufacturer.

Two different IODD versions are available for devices that support both V1.0 and V1.1 functionality.

IO-Link configuration tool

Configuration tools are required to configure the entire IO-Link system. The IO-Link configuration tools of the master manufacturers are able to read IODDs.

The main tasks of the IO-Link configuration tool include:

- Assigning the devices to the ports of the master
- Address assignment of ports within the address area of the master
- Assigning parameters for the IO-Link device

Diagnostics can also be carried out on the connected devices.

This means the IO-Link configuration tool supports the transparent representation of the IO-Link system down to field level.

Siemens provides S7-PCT for engineering of the IO-Link system.

S7-PCT with IODD of a device

The following figure shows a section from S7-PCT with IODD of a device and the device information contained therein.

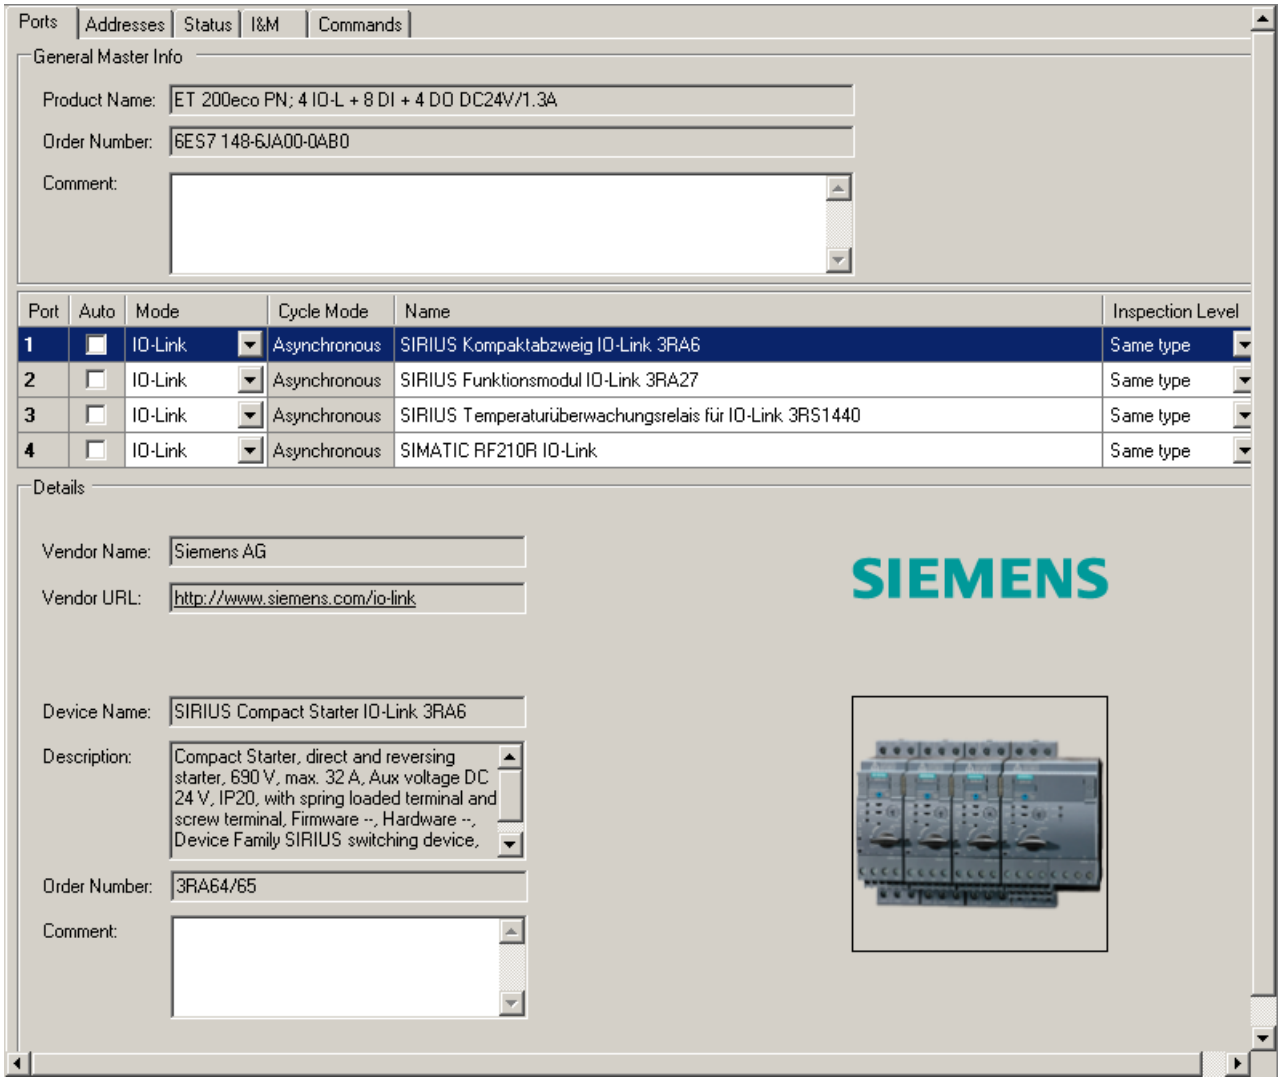

Figure 2-5 S7-PCT with IODD of a device and the device information contained therein

2.7 Differences between IO-Link specifications V1.0 and V1.1

Specification

The technical definition of the IO-Link system is described in a specification of the IO-Link consortium. The first step was the creation of specification version 1.0. The further development and added functions of the IO-Link system led to version 1.1.

The main enhancements of version 1.1 are:

- Parameter assignment server function (data storage)
- Data transmission rate 230.4 kBaud is mandatory for IO-Link master

Combination of IO-Link devices

Note the following when combining IO-Link devices:

- Only IO-Link devices that comply with V1.0 can be operated on the IO-Link master to V1.0.
- IO-Link devices that comply with V1.0 and V1.1 can be operated on the IO-Link master to V1.1.
- The parameter assignment function and the 230.4 kBaud data transmission rate of the IO-Link master to V1.1 can only be used if these functions are also supported by the IO-Link device.

Integration into the automation system 3

3.1 Configuration of the IO-Link system

Introduction

An IO-Link system is configured in several steps. In the first step the IO-Link master is integrated into the automation system and configured. In the second step the parameters are assigned for the IO-Link devices.

Integration in STEP 7

If you are using a SIMATIC S7 CPU, use V5.x or STEP 7 TIA Portal to configure the STEP 7 engineering tool. In the configuration, the IO-Link system is represented by the IO-Link master and integrated using the corresponding device description (for example, GSD). The IO-Link master can also be a fieldbus device (for example, ET 200eco PN IO-Link master) or part of a modular IO system that is connected with the fieldbus (for example, ET 200SP IO-Link master). In both cases, the number of ports, the address range and the module properties are described. However, no additional information is available for the IO-Link system, for example, for the IO-Link devices to be connected.

Example configuration in STEP 7 TIA-Portal

The following figure shows a PROFINET configuration in which the PROFINET devices ET 200SP and ET 200ecoPN are integrated with IO-Link masters.

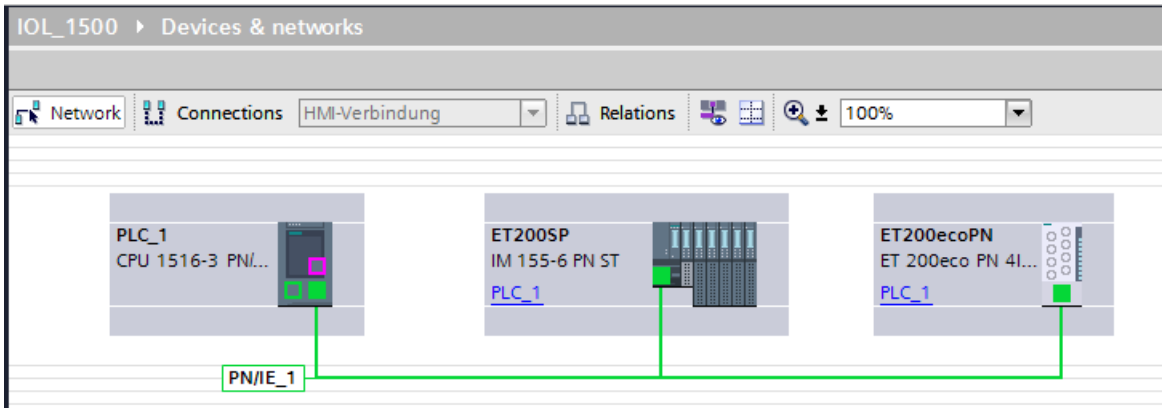

Figure 3-1 Configuring a PROFINET network with lower-level IO-Link masters

The address areas for the exchange of the cyclic data (process values) are specified by the IO-Link in the device view of the PROFINET device.

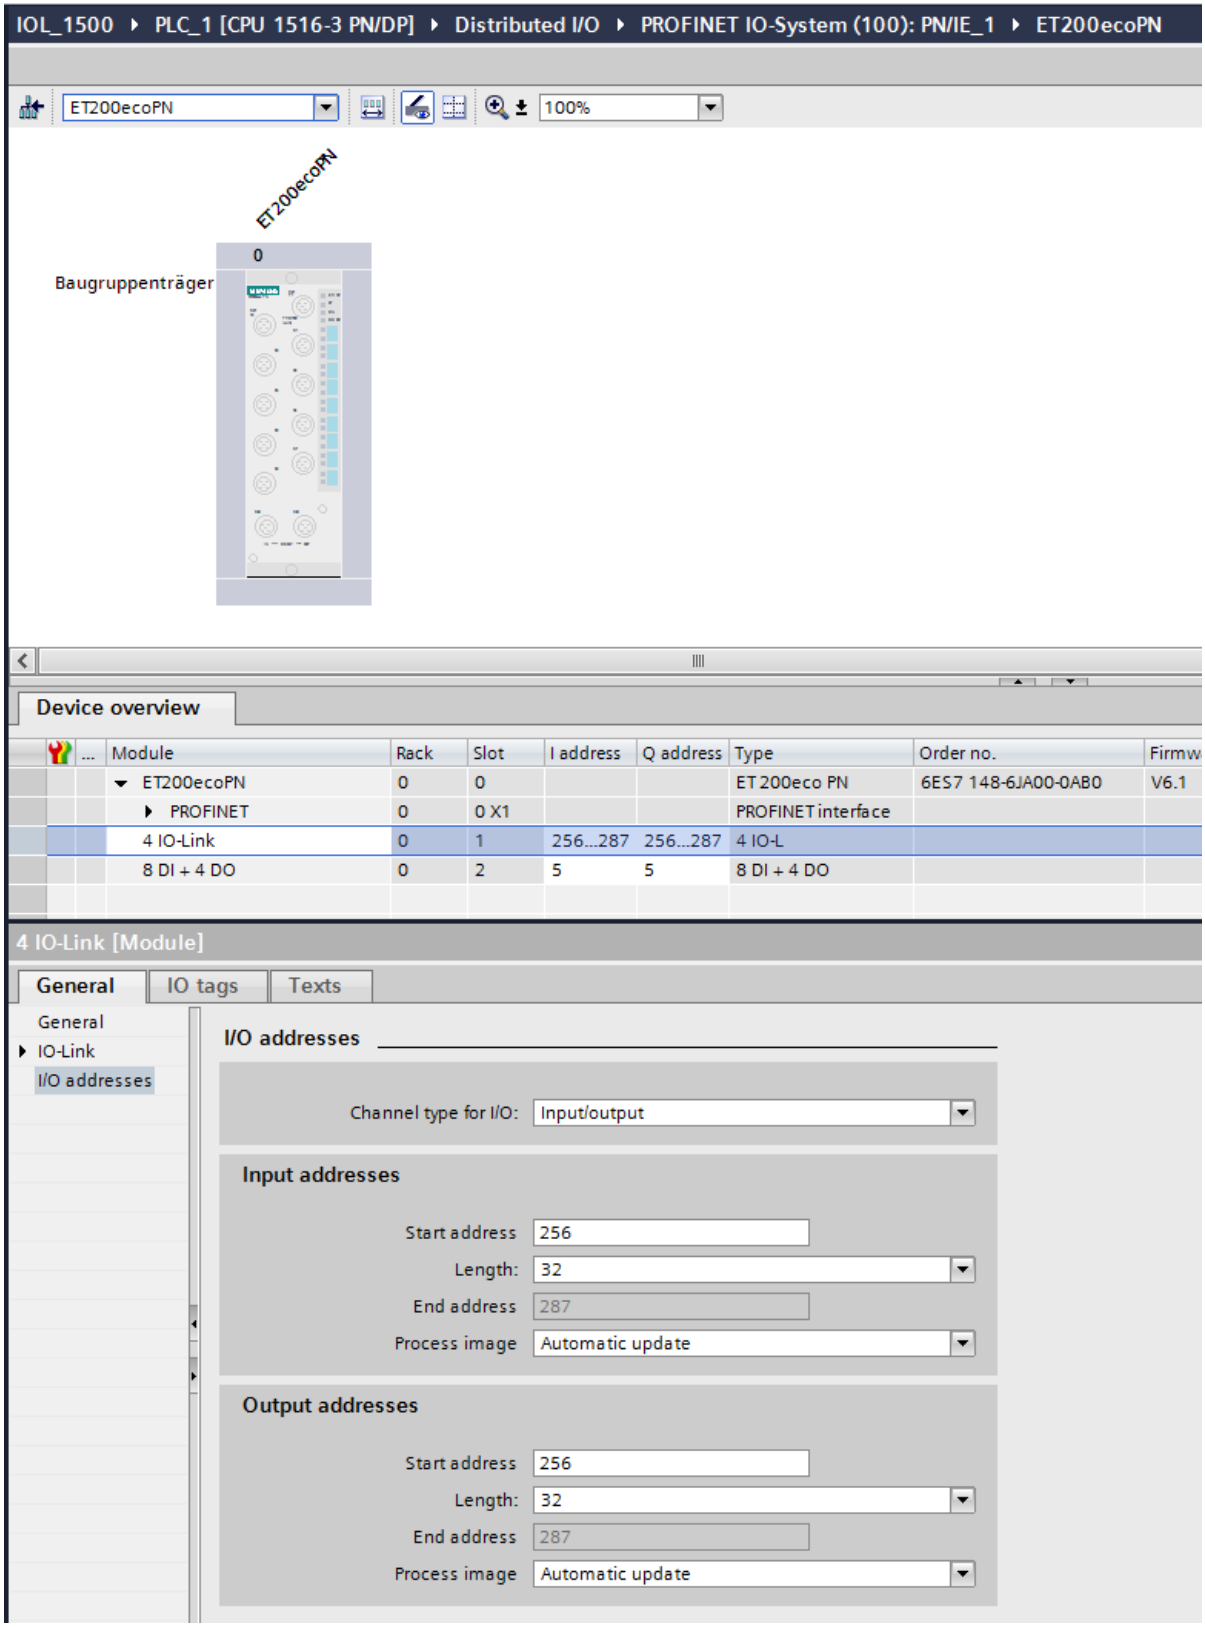

Figure 3-2 Device view with setting of the IO-Link address range

Port Configuration Tool - S7-PCT

S7-PCT is required to represent the system architecture fully and transparently down the IO-Link device and to configure and parameterize the IO-Link system in detail.

Start S7-PCT from the hardware configuration of STEP 7. S7-PCT displays all Siemens IO-Link masters configured in the automation system. After you select an IO-Link master you can assign its IO-Link ports to the respective IO-Link devices. To do this, select the corresponding devices (or their IODDs) from the device catalog and drag these to the IO-Link master port.

Example configuration in S7-PCT

The following figure shows the configuration of an IO-Link master in S7-PCT.

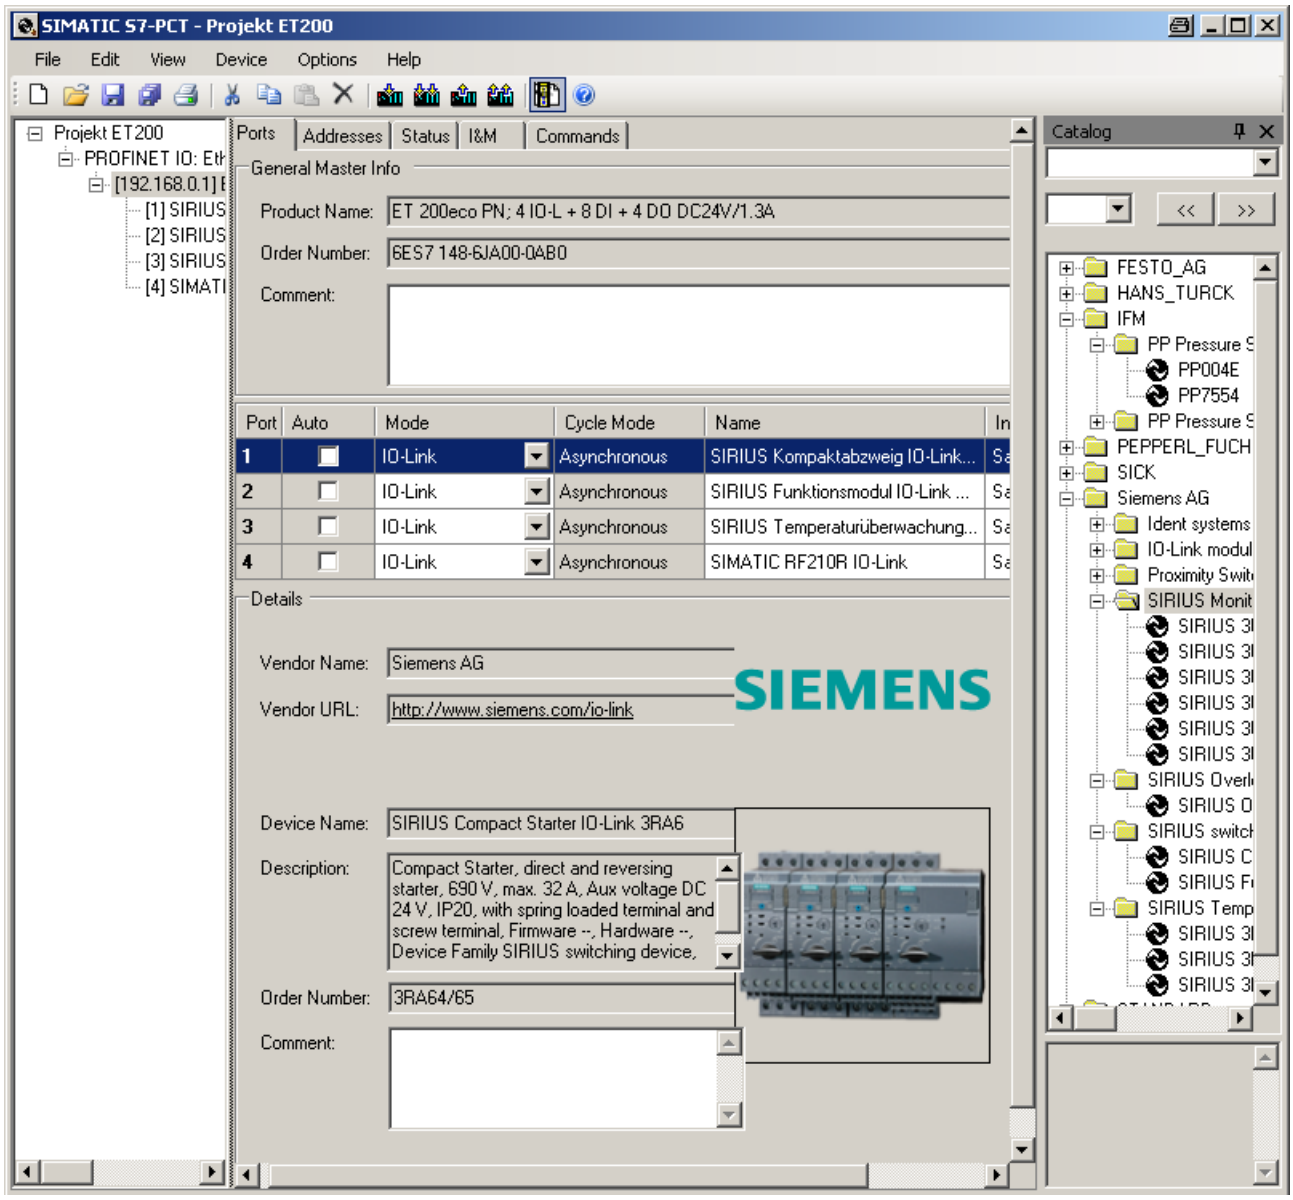

Figure 3-3 Configuring an IO-Link master in S7-PCT

This S7-PCT view shows you a wide variety of information:

- Higher-level fieldbus and overview or structure of the lower-level IO-Link masters (left tree)
- Detailed information on the selected IO-Link master
- Current configuration of the IO-Link ports of the selected IO-Link master
- Detailed information on the selected IO-Link device
- Device catalog with the IODDs of the IO-Link device from various manufacturers (right tree)

Address range of the ports

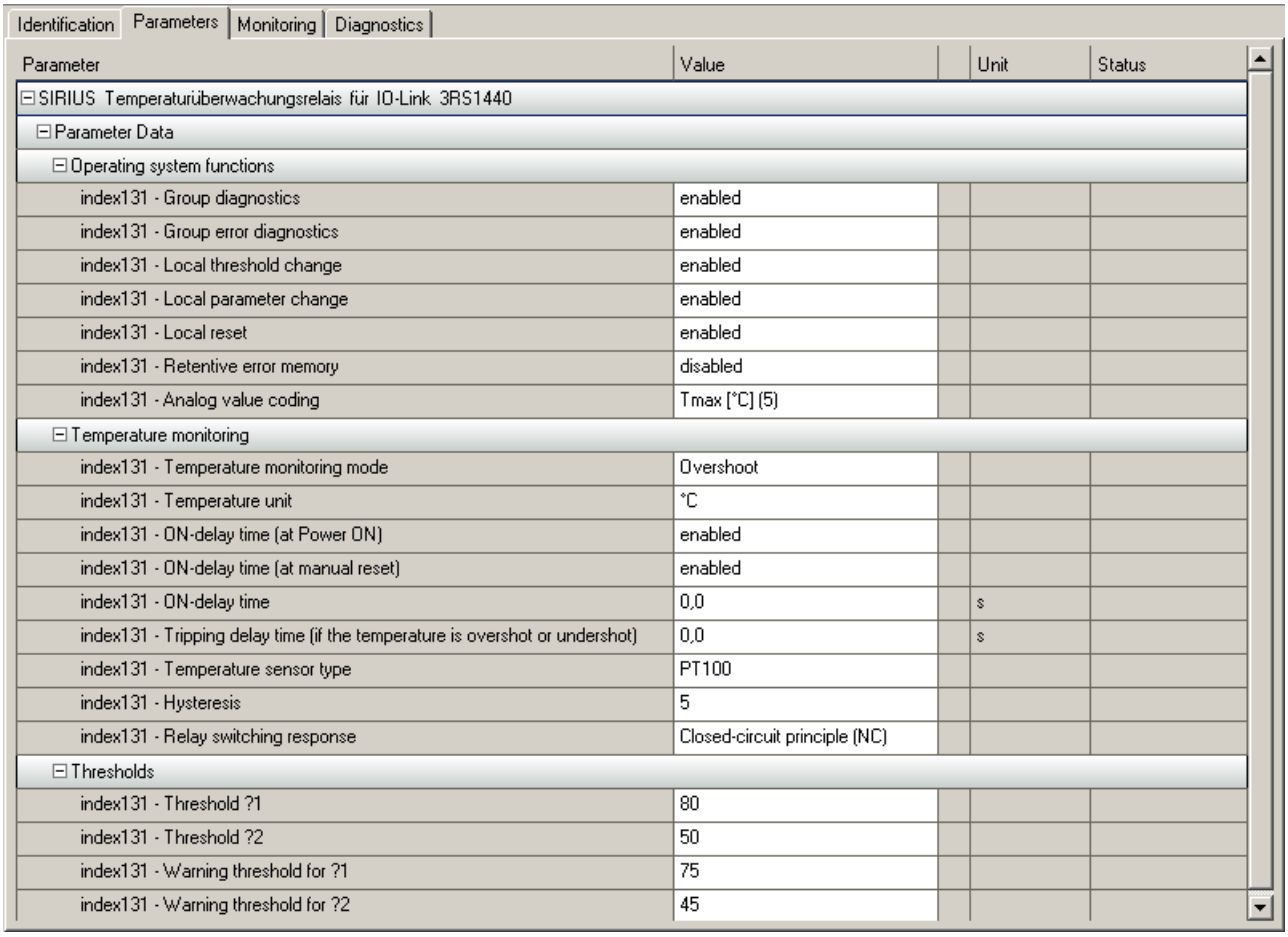
In addition to the assignment of the IO-Link devices to the IO-Link master ports, the default address ranges of the ports can be changed. The IO-Link master transfers the process values that it receives from the IO-Link device in these address ranges and makes the process values available to the higher-level automation system.

To set this address range, select the "Addresses" tab (see previous figure).

Setting device parameters

Specific parameter settings are required to adjust the device to the respective application task. The possible parameters and set values are contained in the IODD of each device. You set the device parameters directly in S7-PCT.

To do this, select the "Parameters" tab in the project tree (left tree) after you have selected the appropriate device.



Parameter	Value	Unit	Status
SIRIUS Temperaturüberwachungsrelais für IO-Link 3RS1440			
Parameter Data			
Operating system functions			
index131 - Group diagnostics	enabled		
index131 - Group error diagnostics	enabled		
index131 - Local threshold change	enabled		
index131 - Local parameter change	enabled

Thresholds			
index131 - Threshold ?1	80		
index131 - Threshold ?2	50		
index131 - Warning threshold for ?1	75		
index131 - Warning threshold for ?2	45		

Figure 3-4 Setting the parameter values of the IO-Link device

Starting from the displayed defaults, you can edit and save the values in the defined value range.

The configuration of the IO-Link system and the parameters of the devices are available to the IO-Link system and the entire automation project. You have the option of saving and printing the configuration and the parameters.

3.2 Data access of the automation system and the HMI device

Cyclic data exchange

To exchange cyclic process data between an IO-Link device and a CPU, the IO-Link data is assigned by the IO-Link master to the previously set address ranges. The user program of the CPU accesses and processes the process values by using these addresses. The cyclic data from the CPU to the IO-Link device (for example, IO-Link actuator) takes place in reverse order.

Acyclic data exchange

Acyclic data, such as device parameters or events, is exchanged by means of a fixed index and subindex area. The CPU accesses the data using system mechanisms (for example, for online functions such as reading the status). You can use the index and subindex area to access specific device information (for example, to re-assign parameters of the device or master during operation).

Programming the user program

The programming of the CPU user program is another task in addition to the configuration and parameterization of the IO-Link system and its integration into the overall automation system.

To support the programming of acyclic access, Siemens offers the "IOL_CALL" function block/instruction for the automation systems SIMATIC S7-300 and S7-400 for IO-Link.

This instruction is used to write (parameter) data to an IO-Link device or to read it from an IO-Link device. The data is uniquely addressed with index and subindex on the IO-Link device. For information on the structure of data objects, refer to the respective documentation of the IO-Link device.

Application example

An IO-Link application example is available on the Internet (http://support.automation.siemens.com/WW/view/en/38006560).

This application example implements the reading and writing of process data and parameterization data from IO-Link masters and switchgear and the visualization on the HMI. In the process, the CPU and HMI configuration is performed so that it can be easily integrated into your own projects.

3.3 Replacing devices during operation

Introduction

Replacing a device during operation is a scenario that occurs again and again and has to be completed without longer plant downtimes. Replace a device quickly and avoid incorrect settings. Devices can also be replaced by operators without special knowledge and aids.

Parameter assignment server function

The device parameters set during engineering with S7-PCT and IODD are transferred to the device. The device stores these parameters in a non-volatile manner. These parameters can be used at any time with S7-PCT or modified from the CPU/HMI and stored in the device.

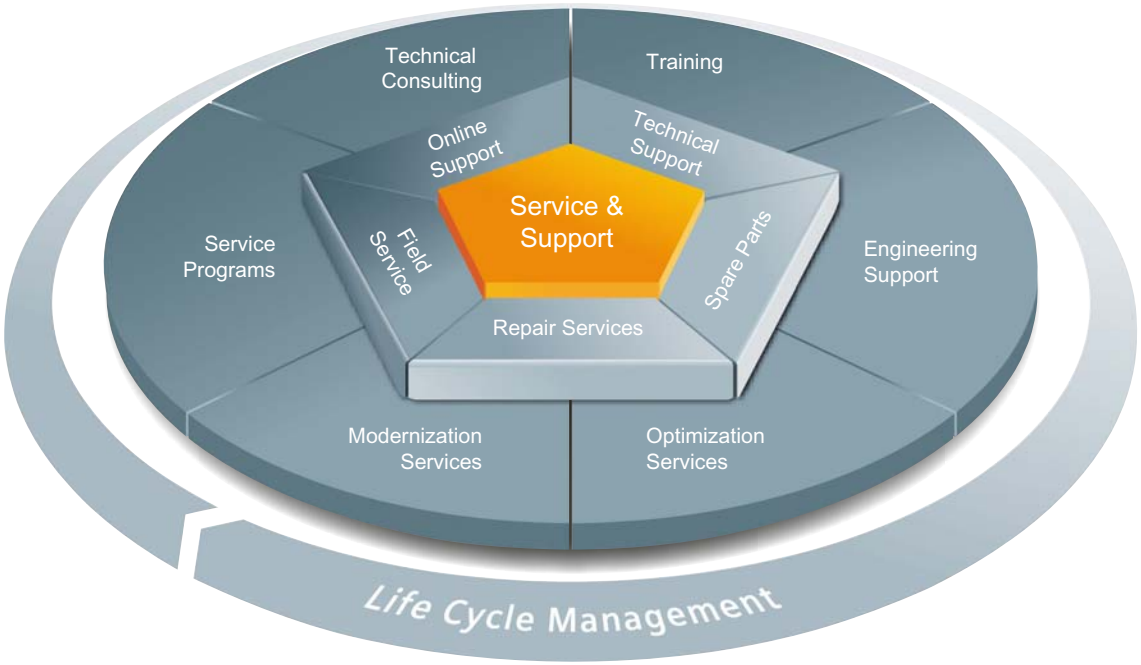
The following different scenarios apply to the backup of device parameter data in the master:

1. You have set the device parameters with S7-PCT and downloaded them to the device; in this case the backup is triggered by S7-PCT (default in the "Data Storage" tab).
2. You have modified the device parameters online in the S7-PCT; in this case you have to explicitly trigger the backup afterward. To do this, trigger the backup in S7-PCT in the "Data Storage" tab.
3. You have modified the device parameters by means of a parameter transfer from the CPU/HMI; in this case you have to trigger the backup using a system command after the parameters have been transferred. To do this, transfer a system command to index 2 and subindex 0 of the device with the coding 0x05. If the device parameters were stored in the master, the master automatically makes these parameters available to the new device when the device is replaced.

Device replacement is thus supported, because the new device is automatically parameterized by the IO-Link master. Requirement for the use of the parameter assignment server function is the implementation of the IO-Link specification V1.1 in the master and in the devices.

Master and devices to IO-Link specification V1.0 do not feature this function. In these cases we recommend to store the device parameters in the higher-level automation system. Use the "IOL_CALL" function block/instruction to store the parameters and to reassign the parameters of a replaced device.

Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet (http://www.siemens.com/automation/partner).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation covers general topics applicable to all products.

In addition to introductory information about analog value processing, this manual covers the following topics:

- Wiring transducers to analog inputs
- Wiring actuators/loads to analog outputs
- Compensating for reference junction temperatures
- Calibrating analog modules
- Diagnostics options of an analog module
- High-speed analog modules

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of analog value processing (analog technology)
- Knowledge of the industrial automation system SIMATIC
- Knowledge about how to use STEP 7 (TIA Portal)

Scope of the documentation

This manual is considered the basic documentation for all analog input and analog output modules of the S7-1500, ET 200MP, ET 200SP, ET 200AL, ET 200pro and ET 200eco PN product series.

Changes compared to previous version

Changes / enhancements described in this manual, compared to the previous version (version 12/2013):

- Extension of the scope of validity to the distributed I/O system ET 200AL

Conventions

STEP 7: In this documentation, "STEP 7" is used as a synonym for "STEP 7 as of V12 (TIA Portal)" and subsequent versions of the configuration and programming software.
This documentation includes images of the products it describes. The products supplied may differ slightly from these images.

Please observe notes labeled as follows:

Note

Notes contain important information on a point in the documentation of particular importance.

Additional support

Additional information on SIMATIC products is available on the Internet. The associated documentation is also available on the Internet.

- The portfolio of technical documentation for SIMATIC products and systems can be accessed on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Documentation guide

1

Introduction

The documentation of the SIMATIC products has a modular structure and covers diverse topics concerning your automation system.

The complete documentation for the S7-1500, ET 200MP, ET 200SP, ET 200AL, ET 200pro and ET 200eco PN systems consists of the respective system manuals, function manuals and product manuals.

Overview of additional documents related to analog value processing

The following table lists further references that supplement this description of analog value processing.

Table 1- 1 References for analog value processing

What you should know about analog technology 2

2.1 Overview

Introduction

This chapter is intended to familiarize you with the essential parameters of analog input modules and analog output modules based on the fundamentals of analog technology. The descriptions and examples provided on the following pages serve as a reference to the manuals for the respective analog module and are intended to facilitate the handling of these manuals.

Analog and binary signals

Binary signals can assume only 2 signal states: signal state 1 (voltage present) and signal state 0 (no voltage present). In control engineering, it is frequently necessary to read, process and output analog signals in addition to binary signals. In contrast to binary signals, analog signals take on any number of values within a specific range. Possible analog variables include:

- Temperature
- Pressure
- Speed
- Fill level
- pH value

Transducers

Controllers are only capable of processing analog values in the form of bit patterns. For this purpose, transducers which can be connected to the analog module measure physical variables such as pressure or temperature. The analog input module reads this analog value in the form of current, voltage or resistance. To enable the CPU to process the current or voltage measured, an integrated analog-to-digital converter in the analog input module converts the value into a 16-bit integer value. Depending on the type of measurement, you can use the following transducers:

- Voltage transducers
- Current transducers
  - 2-wire transducers
  - 4-wire transducers
- Resistance transducers
  - 4-wire connection
  - 3-wire connection
  - 2-wire connection
- Thermocouples

Additional information on wiring various types of transducers to analog inputs can be found in Wiring transducers (Page 65).

Example

Speed is acquired using a transducer which converts the speed range of 0 to 1500 rpm to a voltage range of 1 to 5 V. At a measured speed of 865 rpm, the transducer outputs a value of 3.3 V.

The resulting voltage value is calculated as follows:

$$U = \frac{5\ V - 1\ V}{1500\ \frac{U}{min}} * 865\ \frac{U}{min} + 1\ V = 3.3\ V$$

The graph below illustrates voltage acquisition:

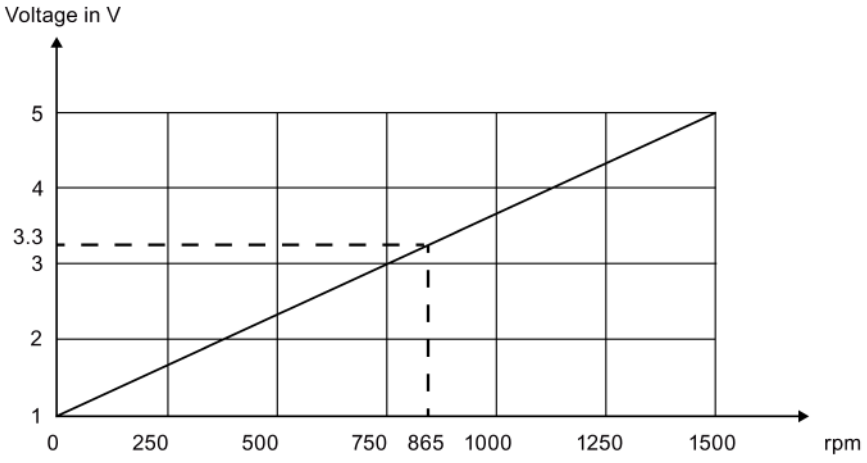

Figure 2-1 Speed measurement

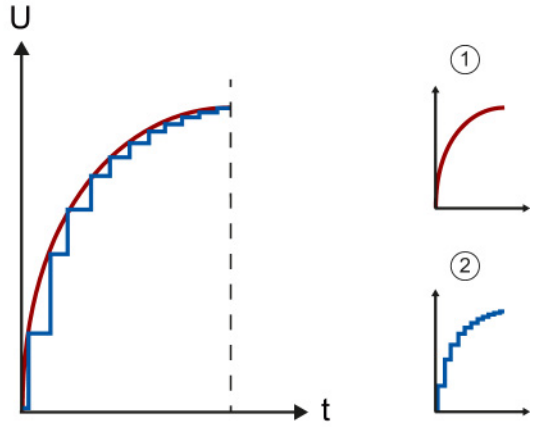
Analog-to-digital conversion

A CPU processes information exclusively in digital format. The analog value is therefore converted into a bit pattern. Conversion is done using an integrated ADC (analog-to-digital converter) in the analog input module. For the CPU, this conversion always returns a 16-bit word for SIMATIC products. The ADC used digitalizes the analog signal and approximates its value with a stepped curve. Resolution and conversion speed are the most important ADC parameters.



① Analog value
② Digital value

Figure 2-2 Approximation of an analog graph with low- and high-resolution stepped curves

Digital-to-analog conversion

Once the CPU has processed the digital signal, an integrated DAC (digital-to-analog converter) in the analog output module converts the output signal to an analog current or voltage value. The resulting value of the output signal corresponds to the output value used to control the analog actuators. Such actuators include, for example, small servo drives or proportional valves. You will find more information on wiring actuators in Wiring loads/actuators (Page 103).

Important parameters of analog modules

Alongside the type and range of measurement, the precision, resolution and conversion time are the main points to consider when selecting an analog module. For some applications such as systems which cover a large area, common mode or channel isolation are also important. The parameters listed here are examined in more detail in the following pages.

Processing analog signals

The following figure demonstrates analog signal processing in a PLC.

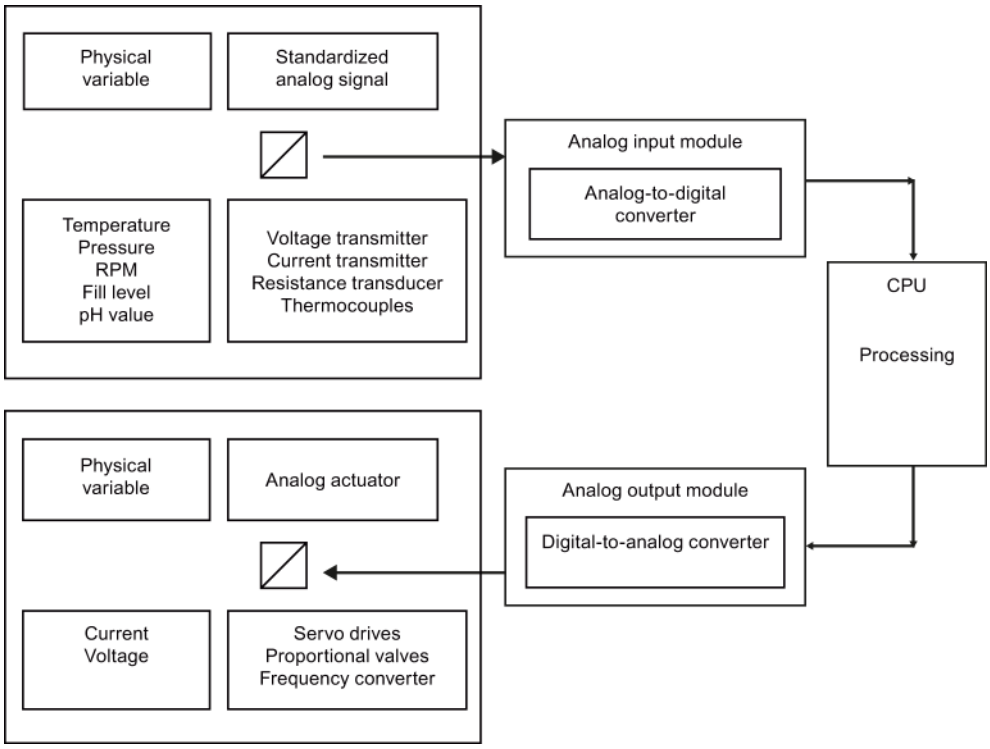


Figure 2-3 Analog value processing

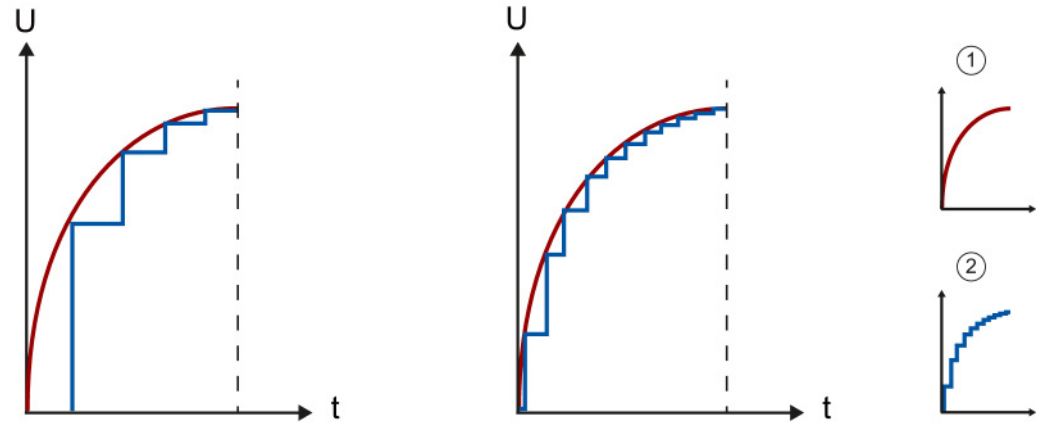
2.2 Precision/resolution

The resolution of an analog module depends on the converter and its external circuitry. An approximation of the analog signal to be acquired/output is returned by a stepped curve. The resolution determines the number of increments of the analog value along this stepped curve. A higher module resolution reduces the length of increments and adds precision to the digitization of the analog signal.

Approximation of an analog value

The figures below show the approximation of an analog value by means of a stepped curve. A low resolution only returns a rough approximation of the actual curve (left figure), while the approximation is more precise at higher resolutions (right figure).



① Analog value
② Digital value

Figure 2-4 Approximation of an analog curve with a stepped curve

Visualization of the measuring range at a resolution of 13 bits and 16 bits

The unipolar measured value from a module having a resolution of 13 bits (= 12 bits + S) is segmented into a total of 2^{12} = 4096 increments. The smallest increment in a measuring range of 0 to10 V is 10 V/4096, equal to 2.4 mV.

A module with16-bit (= 15 bits + S) resolution thus provides an increment of 0.3 mV. If the resolution increases by one bit, the number of increments doubles and the width of an increment halves.

If the resolution increases from 13 bits to 16 bits, the number of increments increases eightfold from 4096 to 32768. With a resolution of 13 bits, the smallest value that can be displayed is therefore 2.4 mV. By contrast, this value is approximately 0.3 mV at a resolution of 16 bits.

Measuring ranges

For the display of the measuring range, SIMATIC S7 distinguishes between the rated range, the overrange and underrange, and the overflow or underflow. This distinction allows you to recognize whether the measured value is actually in the measuring range determined in the technical specifications. The overflow and underflow ranges are reserved for error detection.

At a resolution of 16 bits the theoretically possible 32768 increments are distributed across a voltage range of 11.852 V, which means that only 27648 increments are actually available for the resolution of a measuring range of 10 V. The minimum value which can be represented is therefore 0.3617 mV (see table).

Table 2- 1 Example of resolution for the 0 to 10 V measuring range of a SIMATIC S7 module

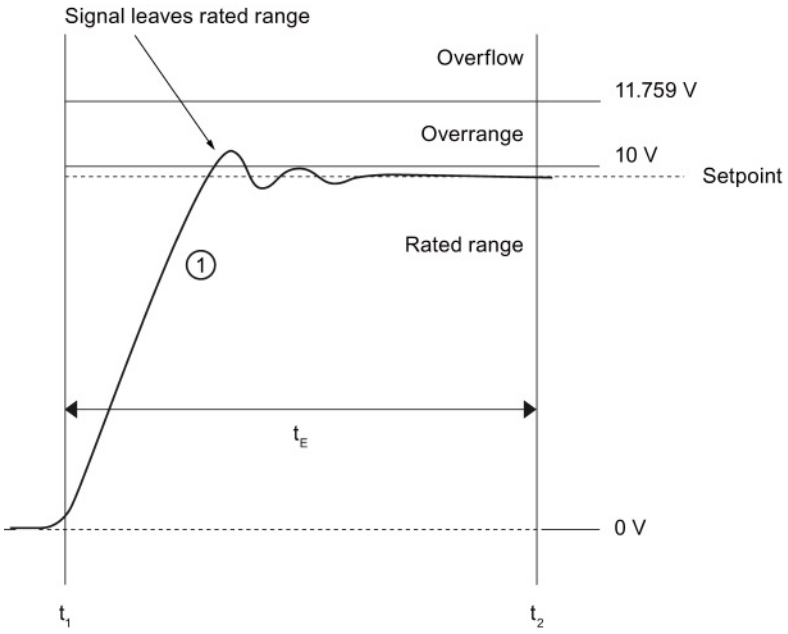
Value (increments)	Voltage measuring range	
Decimal	0 to 10 V	Range
32767	11.852 V	Overflow
32512		
32511	11.759 V	Overrange
27649		
27648	10.0 V	Rated range
20736	7.5 V	
1	361.7 µV	
0	0 V	
not relevant for this example		Underrange
as negative values are not possible		Underflow

The digitized visualization of the input ranges, separated into bipolar and unipolar input ranges, is shown in the section Visualization of the input ranges (Page 62). The digitized visualization of the output ranges, separated into bipolar and unipolar output ranges, is shown in the section Visualization of the output ranges (Page 63). You will find a summary of all measuring ranges which you can use with your analog module in the corresponding device manual.

Over and underrange

It may happen for control processes with high signal jumps that the settling curve of the signal briefly leaves the rated range until it reaches the setpoint. The over and underrange ensures that no error is reported while the signal is not in the rated range. If the signal exceeds the over or underrange, however, and reaches the overflow or underflow range, the error state "Overflow" or "Underflow" is diagnosed. This means the over or underrange correspond to a tolerance range between the rated range and the overflow or underflow. Additional information on the settling time is available in the section Settling and response times of analog output modules (Page 52).

The figure below shows the rated range, the overrange and overflow of a unipolar measuring range. The signal leaves the rated range briefly during the settling phase.



① Analog output signal

t_E Settling time of the signal to the setpoint

t_1 Module ends conversion at the terminal of the analog output channel and outputs the signal

t_2 Signal has settled and the specified analog output value has been reached

Analog module precision

The precision of an analog module is specified as a percentage value or absolute value, for example, in K or °C. This characterizes the total error of measured value acquisition. The basic error limit at 25 °C, as well as the operational limit, are specified in accordance with international standard IEC 61131, which also forms the basis for European Standard EN 61131. For more information on the operational/basic error limits, refer to the Operational and basic error limits (Page 23) section.

Relation between resolution and precision

A certain resolution must be given to reach a specific precision (operational error).

Example

Measuring error as a result of digitization at a resolution of 8 bits and 14 bits

An analog module has a measuring range of 0 V to 10 V. A resolution of 8 bits represents a total of 256 values. This is equivalent to a minimum possible voltage step of 39 mV or 0.4% of the measuring range end value. A resolution of 14 bits represents a total of 16384 values. This is equivalent to a minimum possible voltage step of 0.61 mV or 0.006% of the measuring range end value.

The percentages derived in this way also represent the theoretical best-case values for the operational limit. With a resolution of 8 bits and a measuring range of 0 to 10 V, it is therefore impossible to achieve a precision of more than 0.4 %. In practical life, this value would be clearly worse, depending on the implemented circuitry.

Calculating the maximum measuring error

The maximum measuring error of a 0 to 10 V analog module with an operational limit of ±0.5 % across the entire temperature range is calculated as follows:

10 V x 0.5/100 = 50 mV

This means the maximum measuring error is approximately ±50 mV. This also means that each analog voltage input is subject to a distortion of ±50 mV across the entire input range. A voltage of 3.5 V that is to be measured can therefore be visualized by any value between 3.45 V and 3.55 V.

For more information on the operational/basic error limits, refer to the Operational and basic error limits (Page 23) section.

2.3 Scaling analog values

Scaling

It is often necessary to calculate the actual process value rather than increments (e.g., 10 V = 27648 increments) for further processing of digitalized analog values. The conversion of a value range (e.g., -27648 to +27648 increments) to the original physical quantity (e.g., 0 to 500 liters) is referred to as scaling.

Scaling blocks

STEP 7 offers the suitable program block for scaling of analog values. The SCALE block is included in the STEP 7 scope of delivery and permits input of a high and low limit (e.g., 0 to 500 liters).

Example

In the example below the fill level of a tank with a capacity of 500 liters is to be measured. The transducer used measures a voltage of -10 V with an empty tank and a voltage of +10 V with a full tank. The analog module converts the voltage range from -10 V to +10 V into the value range -27648 to +27648 and converts this range into the original quantity of 0 to 500 liters with the SCALE program block.

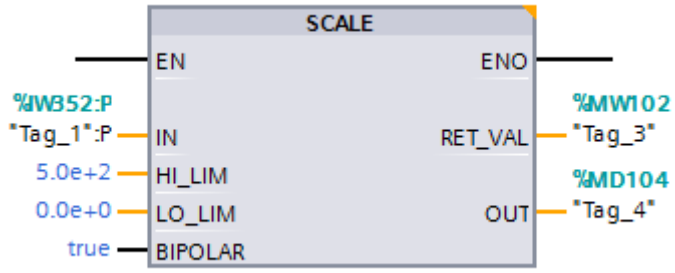


Figure 2-5 Scaling in the SCALE program block

The analog value at input **IN** is read directly by the module or is transferred by a data interface in INT format. The input **LO_LIM** is used to determine the low limit (0 liters) and **HI_LIM** to determine the high limit (500 liters) of the physical quantity. The output **OUT** outputs the scaled value (physical quantity) as floating-point number (LO_LIM <= OUT <= HI_LIM). You can assign parameters via the input **BIPOLAR** to specify if only positive or only negative values are to be converted. If the parameter receives an operand with the state '0', there is a unipolar scaling. An operand with the state '1' results in a bipolar scaling. The output **RET_VAL** outputs an error code in case of an error (e.g., overflow) and the value '0' in case of an error-free execution.

Additional information on the SCALE block can be found in the STEP 7 online help.

Unipolar and bipolar measuring ranges

The measurement of the fill level in our example took place within a bipolar measuring range. In addition to the positive voltage the transducer also provides negative voltage. Because the tank volume is mapped to the range from -27648 to +27648 increments, the measurement of the fill level takes place with twice the resolution (Δ) as in the unipolar measuring range.

Note

Transducers

The prerequisite for a measurement within a bipolar measuring range is that the used transducer supports bipolar measuring ranges.

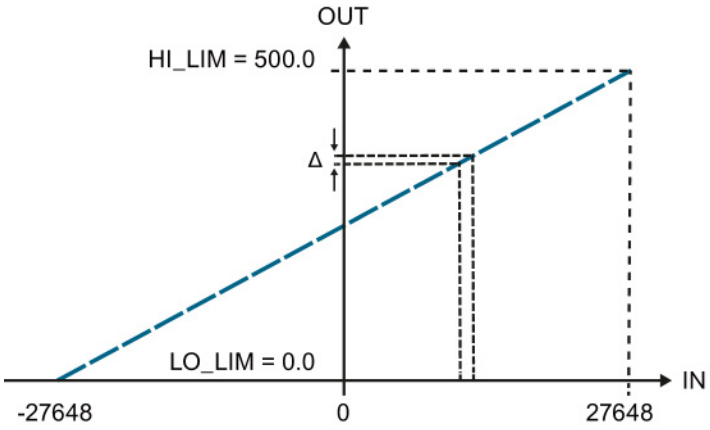

Figure 2-6 Bipolar measuring range

The measurement of the fill level in the bipolar measuring range takes place with twice the resolution (Δ) as in the unipolar measuring range.

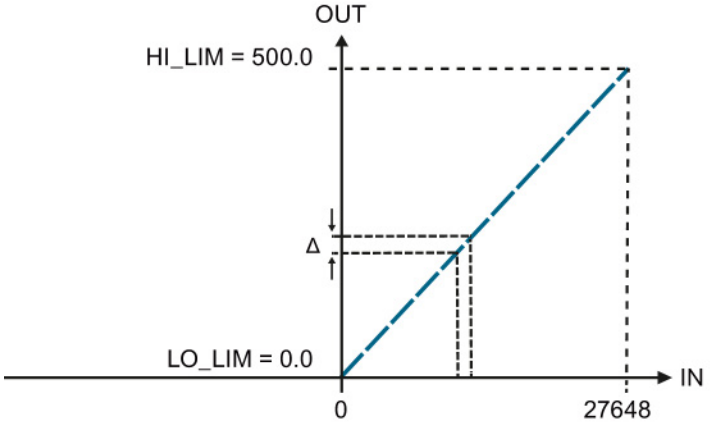

Figure 2-7 Unipolar measuring range

2.4 Unscaling analog values

Unscaling

The output of scaled analog values often requires conversion of the analog value calculated by the user program into the value range of the analog output module. This conversion is referred to as unscaling.

Unscaling blocks

STEP 7 offers the suitable program block for unscaling of analog values. The UNSCALE block is included in the STEP 7 scope of delivery and permits the input of a high and low limit that defines the range of the program value.

Example

An analog value from 0.0 to 100.0% calculated by the user program is to be converted with the UNSCALE block to the value range -27648 to +27648. When the unscaled value is output to an analog output module, this module addresses an analog actuator (e.g., modulating valve). The actuator is to be addressed at a program value of 0% with the minimum value (-10 V or -20 mA) and at 100% with the maximum value (+10 V or +20 mA).

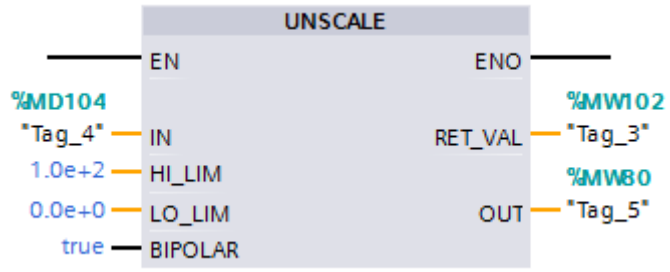

Figure 2-8 Unscaling in the UNSCALE program block

The value calculated by the program must be transferred in the REAL format (**IN**). You use the input **LO_LIM** to determine the low limit (0.0%), and **HI_LIM** to determine the high limit (100.0%) within which the program value moves. The unscaled value is output in INT format at the **OUT** output. You can assign parameters via the input **BIPOLAR** to specify if only positive or only negative values are to be converted. If the parameter receives an operand with the state '0', there is a unipolar scaling. An operand with the state '1' results in a bipolar scaling. The output **RET_VAL** outputs an error code in case of an error and the value '0' in case of an error-free execution.

Additional information on the UNSCALE block can be found in the STEP 7 online help.

Unipolar and bipolar measuring ranges

The figure below shows the scaling for an actuator that is to be addressed at a program value of 0% with the minimum value 0 (0 V or 0 mA) and at 100% (+27648) with the maximum value (10 V or 20 mA).

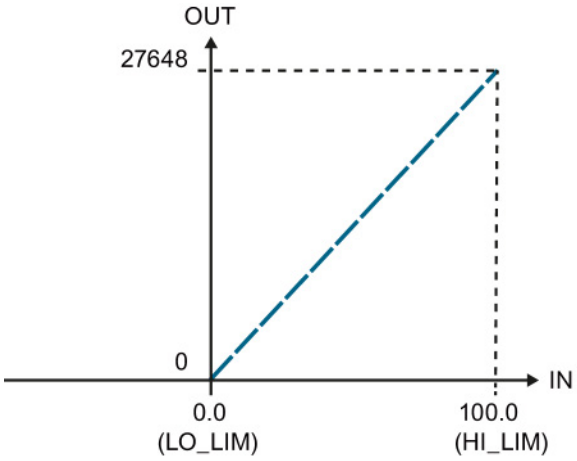

Figure 2-9 Unipolar measuring range

The figure below shows the scaling for an actuator that is to be addressed at a program value of 0% (-27648) with the minimum value 0 (-10 V or -20 mA) and at 100% (+27648) with the maximum value (+10 V or +20 mA).

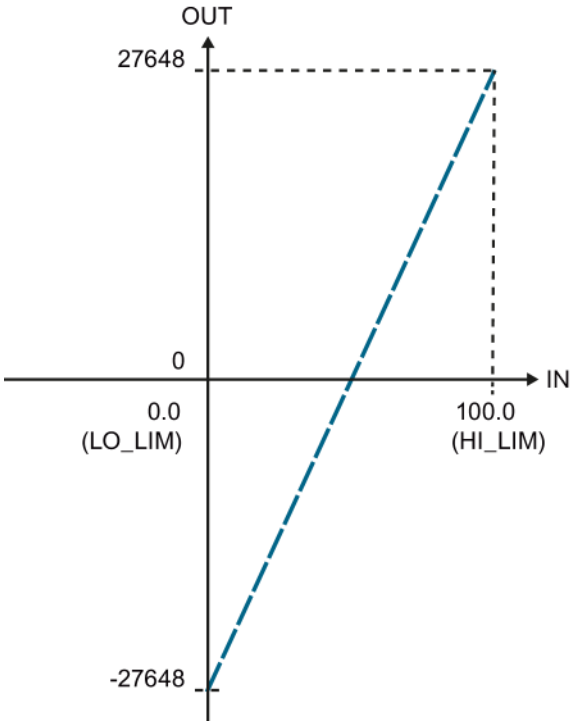

Figure 2-10 Bipolar measuring range

2.5 Linearity errors

Definition

Linearity denotes the deviation of the actual A/D or D/A conversion from the ideal lines within a specified measuring range. The linearity error therefore represents the deviation of the real transmission function from the ideal straight line. The error is given in the technical data as a percentage of the rated range of the analog module.

The figure below shows the linearity error of an ADC, magnified for better visibility.

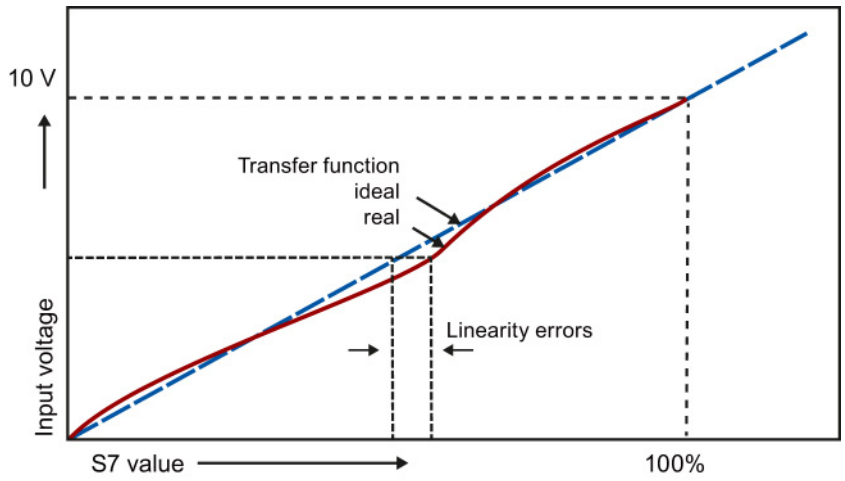

Figure 2-11 Linearity errors

Example

An error of ±1 mV is returned at an input range of ±10 V and a linearity error of ±0.01%. The error is calculated as follows: 10 V · 0.01 % = 1 mV

The linearity error information given in the technical specifications is taken into account in the operational limit. You will find a detailed description of the operational limit in Operational and basic error limits (Page 23).

2.6 Repeat accuracy

Definition

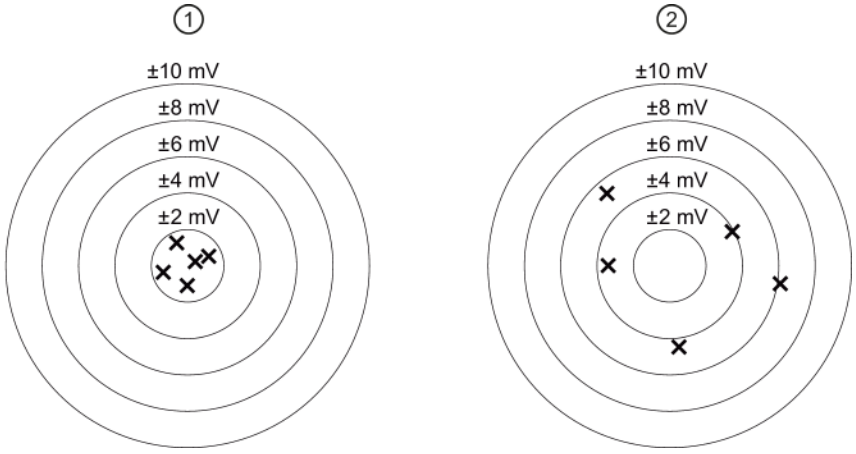
The repeat accuracy is the maximum deviation in measured/output value for the same input signal or output value after another value has been created or output. Other parameters, e.g. the Temperature parameter, remain unchanged. The repeat accuracy refers to the rated range of the module and applies in a steady temperature state.

Measured value variance

The repeat accuracy provides information on the variance of individual measurements. The smaller the variance, the greater the repeat accuracy. The repeat accuracy is therefore one of the most important properties of measuring devices. In the technical data, the repeat accuracy is given as a percentage of the input or output range at 25°C in the steady state.

Example

The specified repeat accuracy for an analog input module as a percentage of the measuring range end value is ±0.02 %. This corresponds to a repeat accuracy of 2 mV for any value within the measuring range of ±10 V. If you change the measured value from 10 V to -10 V, for example, and then measure with 10 V again, the measured value deviation may not exceed ±2 mV.



① Good repeat accuracy
② Poor repeat accuracy

Figure 2-12 Repeat accuracy of measured values output

2.7 Operational and basic error limits

Introduction

The following section shows you how to determine the operational or basic error limits and thus the measurement error or output error with the help of the technical specification. The worst-case configuration ensures that the module will not exceed the specified value within the valid operational range.

The precision of analog input or output modules is only part of the precision of the entire measurement section. A measurement section usually consists of transducer, transmitter, transmission line as well as input / output module.

Operational limit

The operational limit is the entire measurement or output error rate of the analog module in the rated range in temperature-settled state within the approved temperature range.

Basic error limit

The basic error limit is the entire measurement or output error rate in the rated range at an ambient temperature of 25 °C and temperature-settled state.

The basic error limit of the module is more or less a theoretical value, because a constant ambient temperature of 25 °C is rarely maintained in plants. For this reason, the operational limit always takes priority in terms of the practical selection and assessment of a module.

Note

The operational limit and basic error limit percentages listed in the technical specifications always relate to the **maximum possible** I/O value (the measuring range end value) in the rated range of the module.

The following image shows an example of operational and basic error limits in comparison with the ideal curve.

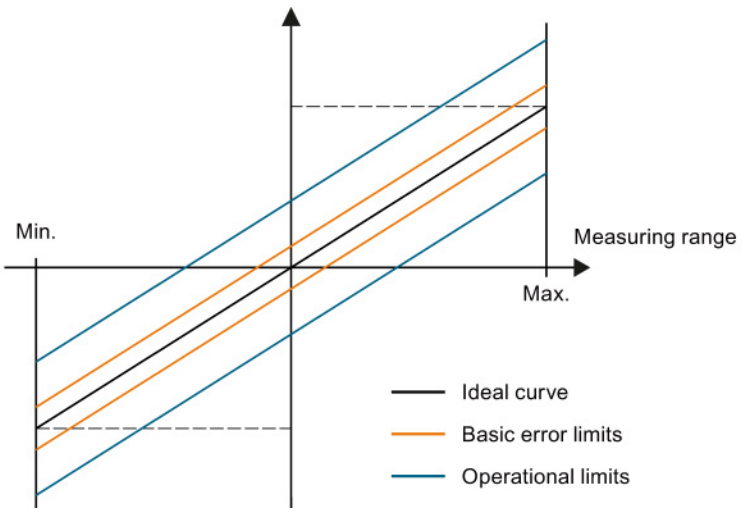


Figure 2-13 Operational and basic error limits

Example of output error calculation

An analog output module is used for voltage output in a range of 0 to 10 V. The module is operating at an ambient temperature of 30 °C, which means that the operational limit applies. Technical specifications of the module:

- Operational limit for the voltage output: ±0.1 %

The result is an output error of approximately ±10 mV (±0.1 % of 10 V) across the rated range of the module.

For example, the output value may range from 2.49 V to 2.51 V at an actual voltage of 2.50 V.

Note

Bipolar measuring ranges

The calculation also applies to bipolar measuring ranges.

An error of ±10 mV is also returned at an input range of ±10 V and a linearity error of ±0.1%.

2.8 Temperature error

Introduction

Analog modules are exposed to operational conditions that have an impact on their precision and on the measurement results they return. Temperature errors develop, for example, if the operating temperature of the module deviates from the ambient temperature of 25 °C. These temperature errors within the approved temperature range are taken into account in the operational limit.

Definition

The temperature error identifies the maximum drift of measuring/output values caused by fluctuation of the ambient temperature at the analog module. The maximum drift can occur at any ambient temperature. The temperature error is specified depending on the module used in percent per degree Celsius and/or percent per Kelvin, e.g. ±0.005%/K, and relates to the measuring range end value of the analog module.

Operational limits of compensation

The temperature error of the reference junction temperature compensation function only occurs with thermocouple measurements. The temperature error of compensation is added to the actual temperature error if "Internal reference junction" operating mode is selected. The temperature error of compensation is defined in the technical specifications as a percentage of the physical rated range of the analog module or as an absolute value in °C.

Note

Calculating the error in thermocouple measurements

Add the error of a thermocouple measurement to the error of the compensation measurement to determine the total error of a thermocouple measurement. These errors are defined in the respective manual.

Example

In this example, the total error of the temperature measurement is determined with the help of a type K thermocouple. The type K thermocouple takes measurements at a temperature range from -270 °C to +1372 °C.

The technical specifications state an operational limit of >-200 °C ±2.4 K for the type K thermocouple. The temperature error of compensation amounts to ±6 °C. The total temperature error is measured as follows at a temperature of >-200 °C:

Operational error (±2.4 K) + temperature error of compensation (±6 °C) = ±8.4 °C.

2.9 Interference frequency suppression

Definition

The interference frequency suppression function is applied to analog input modules to suppress the noise caused by the frequency of the AC voltage supply used.

The frequency of the AC voltage supply is likely to have a negative effect particularly on the values returned by measurements in the low voltage range and on thermocouples.

Parameter assignment

The line frequency at which the system is operated can be set by means of module parameters, for example, in STEP 7.

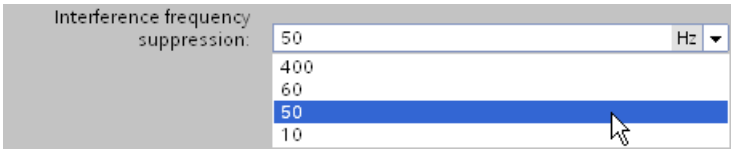

Figure 2-14 Interference frequency suppression

The conversion time changes depending on the set interference frequency suppression. The data sheets of the respective module define this dependency.

Please note the following when selecting interference frequency suppression:

The higher the frequency setting, the shorter the conversion time.

Note

Line frequency

Always select the interference frequency based on the line frequency used. Mismatch errors must be expected if a frequency that deviates from this line frequency is set, for example, to reduce the conversion time. In this case, the specified technical data and, in particular, precision are possibly outside the specified range.

Smoothing

By smoothing analog values, you achieve an additional improvement for the suppression of interference frequencies. For more information on the smoothing of analog values, refer to the section Smoothing (Page 54).

Line frequencies used

The line frequency is the frequency used in an electricity network for AC supply. It is measured in hertz and indicates the number of oscillations per second in a periodic signal. A line frequency of 50 Hz, for example, means 50 oscillations per second.

Europe, Australia and most countries in Asia and Africa use a line frequency of 50 Hz. North and Central America and most countries in South America have electricity networks with a line frequency of 60 Hz.

Frequencies of 400 Hz are most commonly used in on-board networks for airplanes, in the aerospace sector and for military applications. One reason for this is that engines with a line frequency of 400 Hz can usually be made smaller and lighter. As, however, it is not economic to transport such high frequencies over large distances, 400 Hz applications are usually subject to significant spatial limits.

A frequency of 16 2/3 Hz is used for the traction power supply in Germany, Austria and Switzerland. Some modules of the SIMATIC S7 product range also support the interference frequency suppression of this line frequency. The configurable interference frequency suppression in these cases is 16.6 Hz.

2.10 Common mode interference (UCM)

Definition

Common mode interference denotes interference voltages and currents in the lines connecting electrical devices and system components. They affect both the positive and negative line with the same phase angle and amplitude. The interference signal needs an additional current path to affect the utility signal. This current path is usually provided by common reference potential, e.g. earth or ground connection, of the utility signal and interference source.

Common mode interference in analog modules

Common mode interference occurs in analog input and output modules if their reference potential is different from the reference potential of the connected sensor or actuator.

Common mode interference is most likely to occur when analog modules are operated with grounded sensors. The size of the overall system means that voltage differences may develop between machine components with grounded sensors and the analog module reference. These voltage differences affect both the positive and negative signal path equally, which is why they are termed common mode interference.

In operation with non-grounded sensors, the occurrence of common mode interference is not as obvious as in grounded operation. Nevertheless, capacitive or inductive coupling can also create voltage differences in such cases which have the effect of common mode interference. Depending on the conditions in grounded and non-grounded operation, common mode voltage can occur as direct or as alternating voltage.

Example

The following figure of an analog module with two inputs (Ch_1/Ch_2) shows the coupled interference voltages at the inputs (U_{CM1}/U_{CM2}) as well as an interference voltage coupled between these inputs (U_{CM3}). Common mode rejection indicates the extent to which these interference signals can be suppressed. It is calculated using the following equation:
$CMR\ [dB] = 20 \cdot \log (U_{CM} / U_a)$

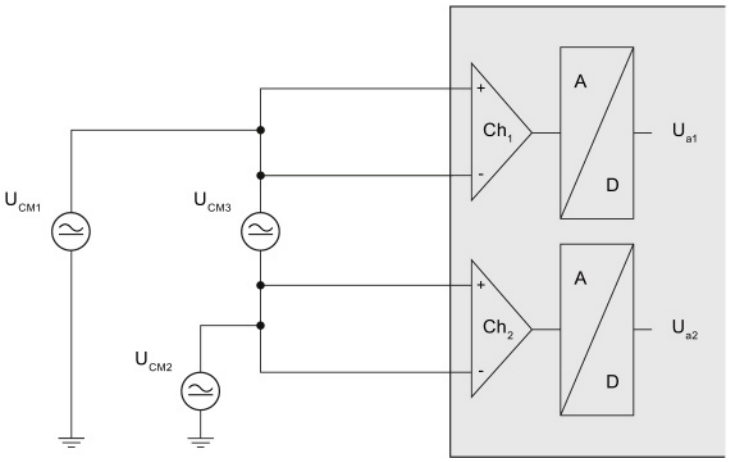

Figure 2-15 Common mode voltage coupled between two inputs

If there is common-mode voltage (U_{CM}), the equation is solved for U_a to calculate the measuring error (U_a):

$$U_a = U_{CM} * 10^{-\frac{CMR}{20}}$$

Note

The common mode rejection (CMR) is detailed in "Common mode interference" in the technical data of the device manual for your analog module.

2.11 Series mode interference (USM)

Definition

Series mode interference is interference voltages and currents affecting the connection lines in opposite directions. They have opposite polarity in the positive and negative directions. Series mode interference currents cause a voltage drop at the input impedance that has the effect of an interference voltage.

Causes

Series mode interference is caused by capacitive or inductive coupling. Inductive coupling generates a magnetic flow that is radiated between adjacent current-carrying conductors. This induces an interference voltage in the conductor. Galvanic coupling is given where different circuits influence each other due to common conductor sections, e.g. common ground connection.

The diagram below shows series mode interference as a voltage source (U_{SM}) connected in series to the actual measuring signal (U_M). The index "SM" stands for "Series Mode". Series Mode rejection indicates the extent to which these interference signals are suppressed. It is calculated using the following equation: SMR [dB] = 20 · log (U_{SM} / U_a)

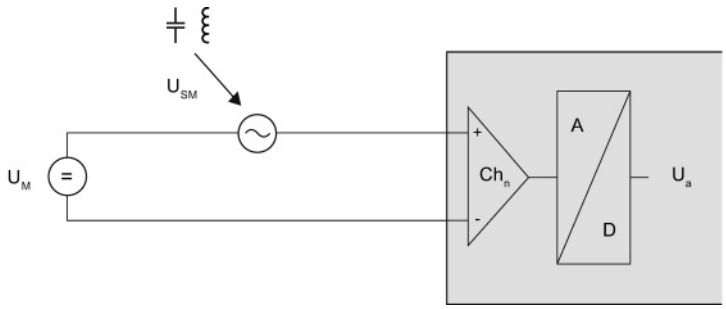

Figure 2-16 Capacitive or inductive interference coupling to the signal cable

The voltage (U_a) measurement error is calculated by solving the equation for U_a.

$$U_a = U_{SM} * 10^{-\frac{SMR}{20}}$$

The following equation shows the calculation of current (I_a) measuring errors using a current input.

$$I_a = \frac{U_{SM}}{R_{ein}} * 10^{-\frac{SMR}{20}}$$

Note

The series mode rejection (SMR) is detailed in "Series mode interference" in the technical data of the device manual for your analog module. The level of input resistance (R_{ein}) is also specified in the technical data.

2.12 Interference voltage suppression

Definition

Interference voltage suppression gives the factor by which the interference signal is suppressed in measurement value acquisition. Higher values reduce the effect of interference on the measurement signal. The technical data differentiates between "Common mode interference" and "Series mode interference". Interference voltage suppression is specified in decibels.

Example

The diagram below shows the measuring error for interference voltages in volts and interference voltage suppression of 0 to 120 dB.

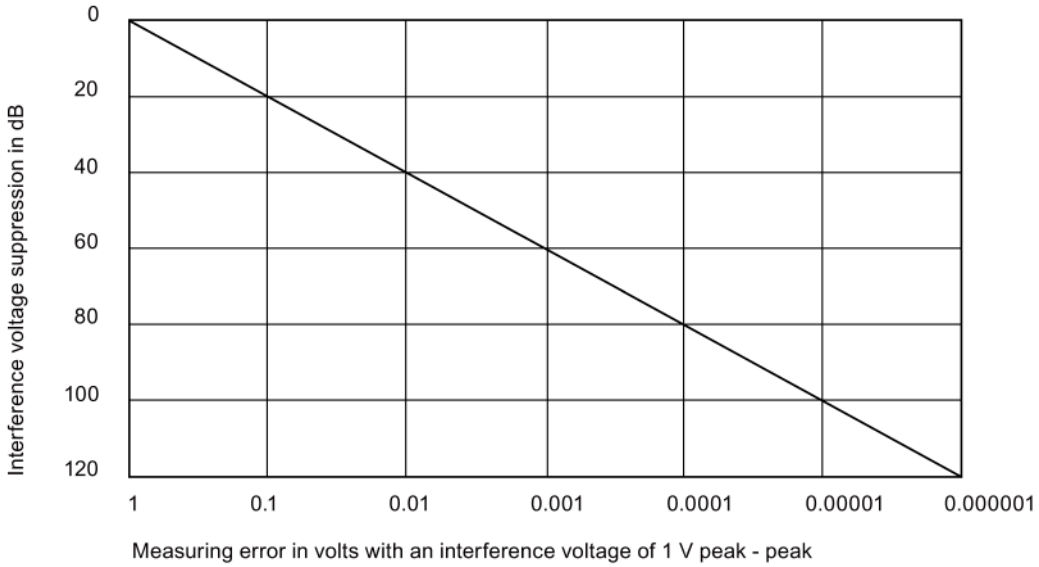

Figure 2-17 Interference voltage suppression

With an interference voltage suppression of 40 dB and an interference voltage of 1 V, the measured value is only distorted by 0.01 V.

Note

Interference-free design

Disturbance variables can be substantially reduced by means of appropriate grounding and shielding to increase interference immunity of the configuration. You will find a detailed description of how to avoid interference in the Configuring interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) function manual.

Common mode rejection

The table below sets out the possible common mode rejection specifications in the technical data of an analog input module:

Interference voltage suppression for f = n x (f1 ± 1 %), (f1 = interference frequency), n = 1, 2, ...	
Common mode interference	> 100 dB
Common mode voltage, max.	10 V

If the interference frequency is configured as 50 Hz, the specified interference voltage suppression for common mode interference will only apply for the frequencies 50 Hz ±1 %, 100 Hz ±1 %, 150 Hz ±1 %, etc. Immunity is lower for all other frequencies. Interferences caused by the line voltage distort the measured utility signal in the ratio of 100,000 : 1. An interference voltage amplitude of 1 V, for example, will affect the utility signal by 10 µV.

The Common Mode voltage (U_{CM}) defines the maximum permitted deviation of the potential between two channels and between one channel and analog ground. The interference voltage suppression defined in the technical specifications must not be exceeded. If the maximum common mode voltage specified, for example, 10 V, is exceeded, the analog signal is processed incorrectly. Depending on the module used, this error may be diagnosed and an error message output. The maximum common mode voltage may be exceeded as a result of varying input or overly long lines.

Series mode rejection

The table below sets out the possible series mode rejection specifications in the technical data of an analog module:

Interference voltage suppression for f = n x (f1 ± 1 %), (f1 = interference frequency), n = 1, 2, ...	
Series mode interference	> 60 dB

If the interference frequency is configured as 50 Hz, the specified interference voltage suppression for series mode interference will only apply for the frequencies 50 Hz ±1 %, 100 Hz ±1 %, 150 Hz ±1 %, etc. Immunity is lower for all other frequencies. Overall, interference caused by the line voltage distorts the utility signal measured by 1000 : 1. For example, an interference voltage amplitude of 1 V will affect the utility signal by 1 mV.

2.13 Crosstalk between channels

Origin of the term

The term crosstalk/XT was originally used in the field of telecommunication to denote unwanted coupling of voice signals between two cable conductors of different subscribers.

Definition

Crosstalk between signal channels denotes the interactive influence between two independent channels as a result of leakage currents and capacitive or inductive coupling. Crosstalk between the channels changes the signal by the value of the amplitude of the crosstalk signal.

Causes

Technically, it is not feasible to totally isolate the module channels from environmental conditions. This means that it is always possible for leakage currents or disturbance coupling having an interactive effect.

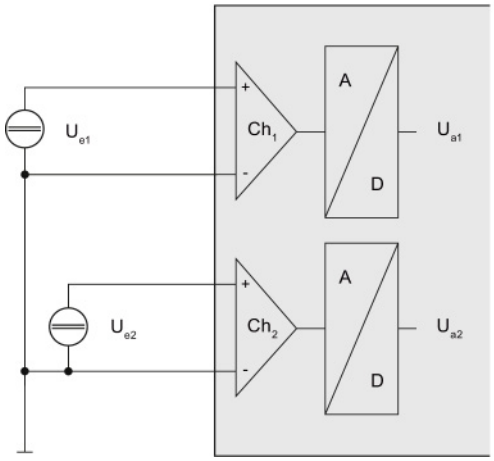

Figure 2-18 Crosstalk between two channels

The diagram shows the effects of crosstalk for the user with two channels (Ch_1/Ch_2) of an analog module. The crosstalk value is the factor by which the utility signal at a second channel U_{a2} is affected by the signal at the first channel U_{e1}. The measuring error (U_{a1}) can be calculated using the following equation:

$$U_{a1} = U_{e2} * 10^{\frac{XT\ [dB]}{20}}$$

Example of crosstalk attenuation

The "crosstalk between inputs" value in the technical specifications is defined as a value of >-100 dB at a measuring range of -10 V to +10 V on channel 1 of an eight-channel analog input module. The voltage at the input has an amplitude of 10 V. What is the error caused by crosstalk at channel 0 (measuring range ±10 V) and channel 2 (measuring range ±80 mV)?

100 dB are equal to a factor of 100,000. The measured values at channels 0 and 2 to 7 are therefore affected by 10 V / 100,000 = 100 µV. This distortion is added to or subtracted from the pending measuring signal and its effect depends on the selected measuring range.

- Channel 0: 100 µV / 10 V = 0.001 %
- Channel 2: 100 µV / 80 mV = 0.125 %

A voltage of 10 V set at channel 1 distorts the measured value at channel 0 by 0.001% and the measured value at channel 2 by 0.125%. The measuring error resulting from crosstalk in this example is therefore 0.001 % or 0.125 %. The basic error limit already includes the error generated as a result of crosstalk between the channels.

Calculating measuring error

You calculate the measurement error at channel 1 in this example based on a change in the measurement voltage of 10 V at channel 2. The crosstalk (XT [dB]) value is defined in the technical specifications in the manual of the analog module that you are using.

$$\text{Measured value error channel 1 [in V]} = \text{measured value change at channel 2 [in V]} * 10^{\frac{\text{XT [dB]}}{20}}$$

$$\text{Measured value error channel 1 [in V]} = 10\ \text{V} * 10^{\frac{-80\ \text{dB}}{20}} = 0.001\ \text{V}$$

A change in the measurement voltage of 10 V at channel 2 causes a measurement deviation of 0.001 V at channel 1.

2.14 Diagnostics

Diagnostics for analog modules

SIMATIC analog modules can diagnose errors. A number of different types of diagnostics are available for analog modules in STEP 7. Please note that the parameter assignment options vary depending on the analog module and product family used. More detailed information on the types of diagnostics can be found in the device manual for your analog input or analog output module.

Proceed as follows to select the diagnostics types of the analog module used:

1. Open STEP 7.
2. Select the analog module in the Device view.
3. Select the "Properties" tab.
4. Select the inputs or the required channel of the analog module in the Inspector window.

Table 2- 2 Overview of diagnosable errors

Type of diagnostics	Analog input module	Analog output module
Wire break	✓	✓
No supply voltage L+	✓	✓
Overflow	✓	✓
Underflow	✓	✓
Common mode error	✓	-
Short-circuit	✓	✓
Overload	-	✓
Reference junction	✓	-

Diagnostics of the analog module are carried out while the system is in operation, on the basis of the current output variables such as current or voltage. If the output current or output voltage is no longer sufficient, the module will not be able to run reliable diagnostics. The limits within which diagnostics are possible are specified in the technical data for each module.

The module reports the diagnosed state to the CPU using a diagnostics error interrupt. If several diagnostics are pending at the same time, the diagnostics with the highest priority is reported to the CPU first. Diagnostics are output on LED displays on the affected module, on the CPU display, on the Web server or on an HMI device.

The configurable diagnostics types depend on the respective selected measuring type or output type. The following tables shows the relationship between the diagnostics types, measuring types or output types of an analog input module or analog output module.

Diagnostics Analog input modules

Table 2- 3 **Diagnostics types of an analog input module to be configured depending on the measurement type "Voltage"**

Note

Measuring ranges

Note that the diagnostics types that can be parameterized depend on the selected measurement/output type as well as on the respective measuring range.

Note

Minimum output values

Certain errors such as wire break and short circuit cannot be diagnosed below a given current or voltage value. Diagnostics are only possible again once the output returns to above this minimum value.

No supply voltage L+

You can diagnose a missing or low supply voltage L+ at the analog module by activating the "No supply voltage L+" checkbox. If the supply voltage is missing or too low, the status and error display on the analog module will provide the relevant information. The entry in the diagnostics buffer also makes this information available to the CPU.

If there is no supply voltage, no other types of diagnostics available are possible either.

Wire break

The term wire break denotes a failure state that is triggered by the interruption of a usually closed electrical circuit.

Wire break in analog input modules

The "Wire break" diagnostics function facilitates the detection of errors during system operation. In STEP 7 you define the module properties by setting various parameters. Depending on the module used, you may, for example, be able to set a current limit parameter at which a wire break is to be reported.

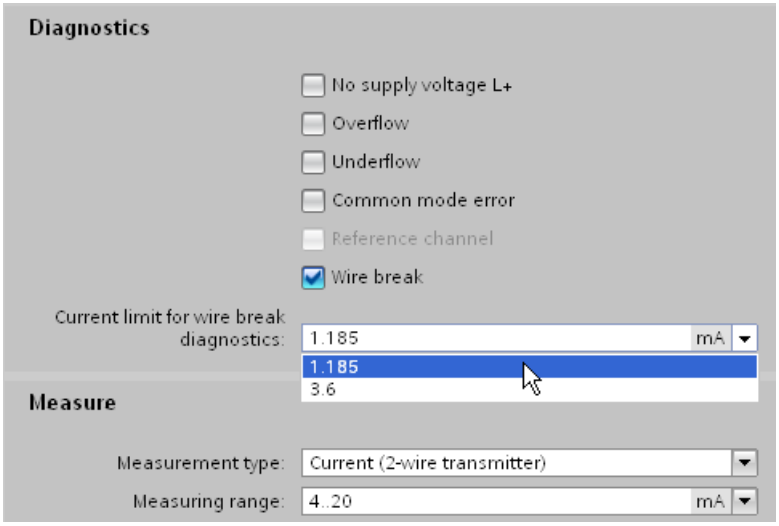

Figure 2-19 Configuring the wire break current limit for an analog input module in STEP 7

Usually, the live zero technique is deployed to detect wire breaks. The start of the measuring range for the standard live zero signal of 4 to 20 mA is assigned the 4 mA signal value. A wire break between the input and sensor can therefore be detected based on the missing current flow. Instead of a current signal, you may also use a voltage signal from 1 to 5 V to detect a wire break. The "Wire break" diagnostics function can therefore only be configured for a range of 4 to 20 mA or 1 to 5 V.

For "Resistor", "Thermal resistor" and "Thermocouple" measurements, a current is impressed into the line. If a wire break occurs, the flow of current is interrupted and the analog module therefore detects the wire break.

Wire break in analog output modules

The analog signal output is used for wire break detection. Reliable wire break diagnostics is not possible if the voltage is too low. In this case, the diagnostics function is deactivated without triggering a change of the diagnostics status.

The current limit up to which the module will diagnose wire break can be found in the technical data for the module.

Overflow/underflow

The resolution of the measuring range of an analog input module distinguishes between the rated range, the overrange or underrange, and the overflow or underflow. The following table assign the number of increments into which the measured signal is divided to the various voltage measuring ranges.

Table 2- 15 Voltage measuring range ±10 V of an analog input module

Value (increments)	Voltage measuring range	Range
Decimal	±10 V	
32767	> 11.759 V	Overflow
32511	11.759 V	Overrange
27649		
27648	10.0 V	Rated range
0	0 V	
-27648	-10 V	
-27649		Underrange
-32512	-11.759 V	
-32768	< -11.759 V	Underflow

As of a decimal value of 32512, the value acquired is beyond the overrange and is no longer valid. If this is the case, the error status "Overflow" is diagnosed. The overrange is a tolerance range before overflow is reached.

As of a decimal value of -32513, the value acquired is below the configured measuring range and is no longer valid. If this is the case, the error status "Underflow" is diagnosed. The underrange is the equivalent of the overrange, but for negative values.

An "Overflow" or "Underflow" diagnostics may be caused, for example, by a wire break, an incorrect measuring range or incorrect wiring.

Note

Accuracy

The accuracy specified in the technical data of the relevant module is only guaranteed within the rated range.

Common mode error

Activating the "Common mode" checkbox diagnoses a violation of the maximum potential difference U_{CM}. A violation of the permitted potential difference U_{CM} has occurred, for example, between the reference point of the measuring inputs and the analog ground M_{ANA} .

Possible causes:

- Wiring error
- Environments with EMC disturbance
- Incorrectly grounded transducers
- Long line lengths
- Sensor not connected
- 2-wire transducer connected to M_{ANA}

Note

With 4-wire transducers, a current meter connected in series will result in too great a drop in voltage.

Potential differences U_{CM} beyond the valid limits may lead to measurement errors and malfunctions. If you want to ensure that the maximum value is not exceeded, interconnect the measuring inputs and analog ground M_{ANA} with an equipotential bonding cable. More detailed information can be found in Wiring transducers.

Short-circuit

Activating the "Short circuit" checkbox activates short-circuit diagnostics for an analog channel. The diagnostics function is triggered by channel overload.

Possible causes:

- Wiring error (e.g. short circuit between conductors at the connections or in the cable)
- Use of faulty or incorrect actuators (e.g. internal short circuit or low input resistance as a result of actuator failure)

The analog signal output is used for short circuit detection. If the voltage is too low, reliable short-circuit diagnostics are not possible. In this case, the diagnostics function is deactivated without triggering a change of the diagnostics status. The voltage limit up to which the module will diagnose a short circuit can be found in the technical data for the module.

SIMATIC modules have a special protective circuit to prevent short circuit. The short circuit current is limited internally in the module. The level of short circuit current is specified in the technical data of your analog module.

Note

Overload

Please note that overload exposes the modules are exposed to a greater thermal load. This can affect the output channels. You should therefore avoid continuously running analog output modules in overload.

Reference junction

This type of diagnostics can only be selected for analog input modules for "Thermocouple" measuring. Selecting the "Reference junction" check box diagnoses an error on the reference channel for compensating the reference junction temperature.

The temperature at the reference junction of a thermocouple is measured at the reference channel of the module using an external thermal resistor (RTD). If an error occurs, for example as a result of a wire break, the temperature measured at the reference junction of the thermocouple will no longer be compensated. The reference temperature may then be outside the valid range.

Additional information on connecting thermocouples and thermal resistors and on how they operate can be found in Thermocouples and Wiring transducers.

Overload

Activating the "Overload" checkbox activates the diagnostics of the thermal monitoring of the output level. The "Overload" diagnostics is triggered when the maximum temperature is exceeded at the output and is detected channel by channel.

The maximum temperature may be exceeded for the following reasons:

- Ambient temperature is too high
- Output is being operated outside the specification

Note

Overload

Please note that overload exposes the modules to a high thermal load. This can affect the output channels. You should therefore avoid continuously running analog output modules in overload.

2.15 Value status

Value status

In case of a faulty analog value, the analog module outputs the error values 0x7FFF (error value for overflow and all other error states) or 0x8000 (error value for underflow) for the affected channel. The user program is now able to detect and evaluate a channel error. The user also has the option to evaluate the system diagnostics event-driven by means of diagnostics alarms.

In addition to the error values 0x7FFF or 0x8000 and the configured diagnostic types, analog input and output modules provide diagnostics information by means of the Process image input (PII). It is referred to as Value status and transferred synchronously with the user data. The value status (Quality Information = QI) provides a statement regarding the validity of the input signal. A distinction is made between the quality level "Good" (signal valid = 1) and "Bad" (signal invalid = 0).

Note

For analog input modules, the use of the value status is an alternative to the evaluation of the channels by the error values 0x7FFF or 0x8000. Compared to the error values, the binary evaluation of the value status (0 or 1) in the user program is simpler and more clearly arranged.

For analog output modules, the value status informs you as to whether the written value can be output by the respective channel. Using the value status you can respond to this information without having to evaluate the diagnostics of the module in the first place.

Example

Enabling the value status of an analog input module

To enable the value status of an analog input module, follow these steps:

- Select the required analog module in STEP 7.
- Select "AI configuration" in the "Properties" tab of the analog module.
- Click the "Value status" button.

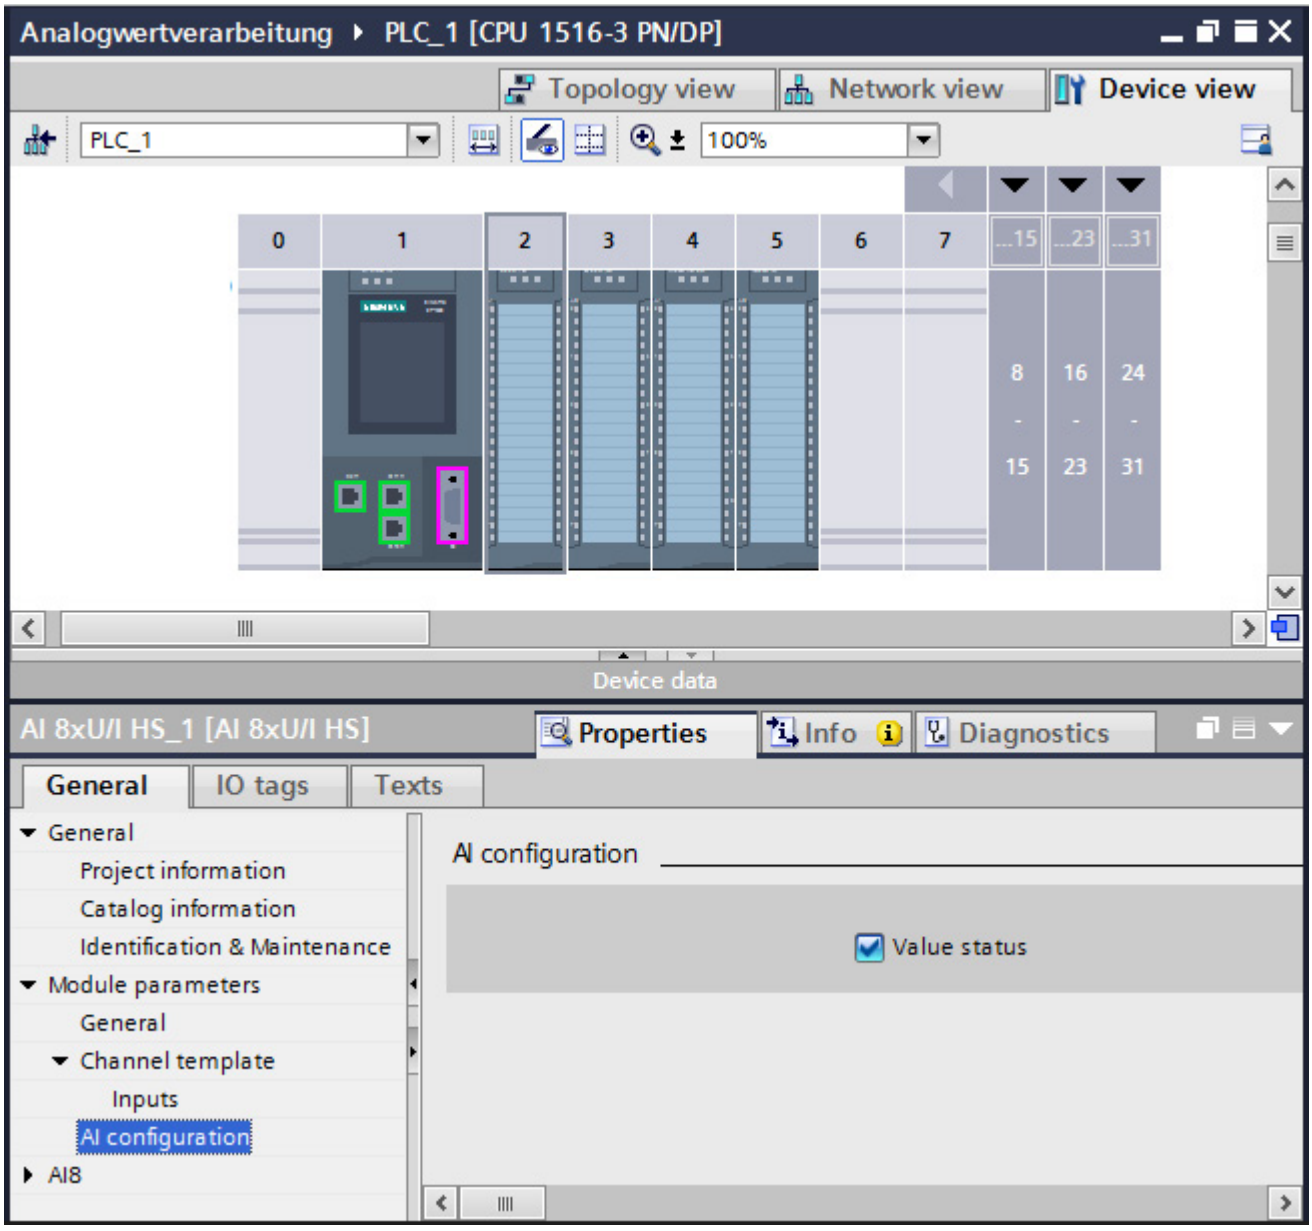

Figure 2-20 Enabling the value status in STEP 7

An additional byte is occupied in the input address space of the respective module when you enable the value status. Each bit in this byte is assigned to a channel and provides information on, for example, whether the output value specified by the user program is actually queued at the module terminal (0= value is invalid; 1= value is valid).

Error occurrence

If a wire break occurs at an analog input module, for example, the current signal state is entered in the process image and the value status of the signal is set to "invalid". To trigger an indicator light in case of an error, for example, evaluate the value status in the user program.

Diagnostics alarms and value status

If you configure analog modules in a third-party product with the help of a GSD file and the diagnostics alarms are not evaluated event-driven, it is best to use the value status.

Note

The Value status represents a group diagnostics which only gives the user a Good or Bad information. The Value status is not suitable for a more specific identification of the cause of the error (e.g., wire break, short circuit in the encoder cable or load voltage failure).

2.16 Conversion time of an analog module

Basic conversion time and conversion time of an analog input channel

The basic conversion time is the minimum time required by one single channel to convert analog values. The actual conversion time comprises both the basic conversion time and, depending on the analog input module used:

- Processing time for measuring resistance
- Processing time for wire break monitoring
- Processing time for overflow/underflow monitoring
- Processing time for checking common mode errors

Example

This example shows channel 6 of an analog input module for resistance measurement in the range of 6000 Ω, a configured integration time of 20 ms, and activated wire break monitoring.

The conversion time of the channel is derived from the total of the following measurement variables:

Measurement variable	Time in ms
Basic conversion time	27
Processing time for RTD/resistance (6000 Ω)	4
Processing time for wire break monitoring in the RTD/resistance and thermocouple areas	9
Conversion time of the channel	**40**

Conversion time of the analog output channels

The conversion time of an output channel starts with the transfer of the digital value from the internal memory of the module and ends with the digital-to-analog conversion.

The conversion time does not include the settling time for the analog signal at the module terminal. Detailed information on the settling time can be found in Settling and response times of analog output modules (Page 52).

Note

Relationship between diagnostics and conversion time

While some diagnostics run parallel to the conversion and do not extend the conversion time, other diagnostics types can lead to an extension of the conversion time, as demonstrated in the example above.

Conversion time for high-speed analog modules

High-Speed analog modules (HS modules) are designed for faster processing of signals. HS modules offer fewer diagnostics and measurement types than standard modules (ST modules). You can find more information on HS modules in the section High-Speed analog modules (Page 113).

2.17 Cycle time of an analog module

Definition

The cycle time of an analog module represents the time that the module needs to process all channels used. The cycle time depends on the form of measured value acquisition used, e.g. multiplex or parallel measured value acquisition.

Sequential measured value processing

This procedure processes the analog channels in the module one after another (sequentially). For analog inputs, the values are connected to a converter, for example using a multiplexer, and sequentially converted.

The cycle time of the analog module is derived from the total conversion time of all activated analog channels of the module. STEP 7 provides the option of deactivating unused analog channels. to reduce the cycle time.

The figure below gives an overview of the factors that determine the cycle time of an n-channel analog module.

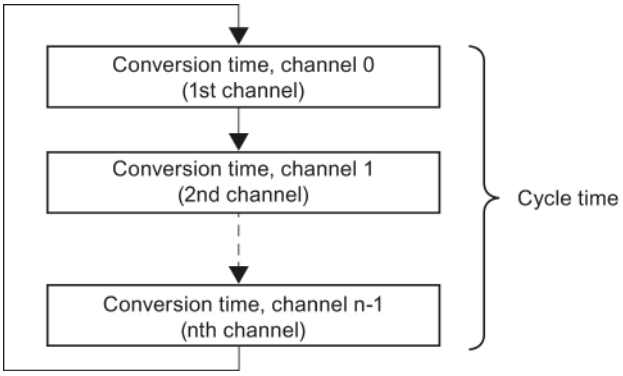

Figure 2-21 Cycle time of an analog module with multiplex conversion

Parallel measured value acquisition

This procedure processes the analog channels of a module at the same time (in parallel) rather than one after another. In parallel measured value processing, the cycle time of the module is usually constant and does not depend on the number of channels used. The goal of parallel measured value acquisition as it is applied by high-speed analog modules, for example, is a shorter cycle time. You can find more information on HS modules in the section High-Speed analog modules (Page 113).

2.18 Settling and response times of analog output modules

Settling and response times provide information on the delay of the output of a specified analog output variable and its availability to the process.

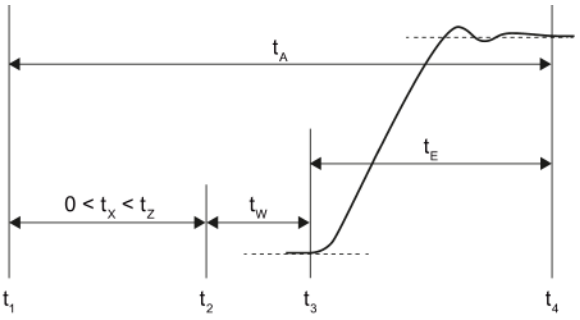
Response time

The response time for a new output value is defined as the time between the input of a digital output value to the internal memory of the module and the value to be output at the analog output being reached (with a residual error of 1 %).

The response time (t_A) is the sum of application time (t_X), conversion time (t_W) and settling time (t_E):

$t_A = t_X + t_W + t_E$

Settling and response times of analog output modules



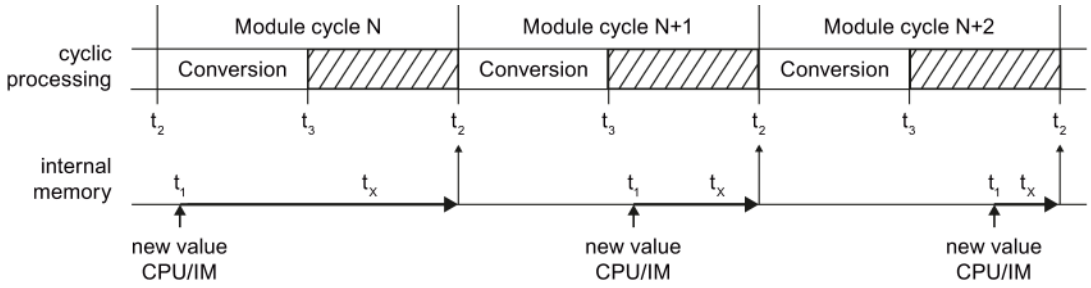
t_A Response time
t_X Application time
t_Z Module cycle time
t_W Conversion time
t_E Settling time
t_1 New digital output value is available in the internal memory of the module
t_2 Module activates the digital output value and starts conversion
t_3 Module ends conversion at the terminal of the analog output channel and outputs the analog signal
t_4 Signal has settled and the specified analog output value has been reached (residual error 1 %)

Figure 2-22 Settling and response time of an output channel

Application time

The CPU/IM (interface module) writes new output values to the internal memory of the analog output module. The time required for this is not determined by the CPU/IM. These output values are converted asynchronously to their entry in buffer memory. The worst-case application time (t_X) may be equal to the cycle time (t_Z). This situation develops if the CPU writes a new value to the internal memory of the module immediately after the transfer of the value for conversion. This new value will not be processed until the next conversion.

The figure below shows acyclic access of the analog output module to output values from the internal memory in non-isochronous mode. You can find more information on isochronous mode in the paragraph on isochronous mode of the section High-Speed analog modules (Page 113).



t_X Application time

t_1 New digital output value is available in the internal memory of the module

t_2 Module activates the digital output value and starts conversion

t_3 Module ends conversion at the terminal of the analog output channel and outputs the analog signal

Figure 2-23 Application of the output values

Conversion time

The conversion time of an output channel starts with the transfer of the digital value from the internal memory of the module (t_2) and ends with the digital-to-analog conversion (t_3).

Settling time

The settling time starts when the analog signal is output to the module (t_3) terminals and ends when the output value (t_4) is reached. The output value is reached as soon as the output signal has settled at its final value, taking into account a residual error of 1%.

The settling time depends on the type of output for the module, and on the connected load. The load for the analog output consists of connecting line and connected actuator. When the output is "Current", the settling time increases with high ohmic resistance. Inductive loads cause subsequent fluctuation in the output value. When the output is "Voltage", the capacitive load causes subsequent fluctuation.

2.19 Smoothing

Using the smoothing functions

Most analog input modules allow you to configure smoothing for the measuring signal in STEP 7. Smoothing analog values reduces the effect of interference signals. Smoothing is useful with slow changes in measured values, for example in temperature measurements.

Smoothing principle

The measured values are smoothed by means of filtering. The module forms mean values from a specified number of converted (digitalized) analog values. Smoothing should not be confused with the integration of measured values over a defined period of time. It is therefore not possible to smooth measured signals to filter out a specific interference frequency. However, this smoothing returns more "stable" data values because it suppresses peaks which overlay the measured signal.

4 (none, weak, medium, strong) or more levels of smoothing can be configured by the user depending on the module used. The level determines the number of analog values from which the mean value is generated. The greater the smoothing factor, the better the filtering.

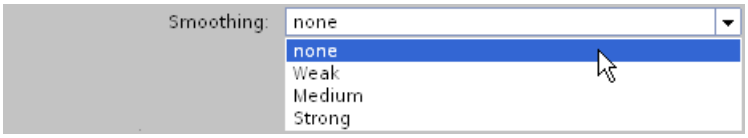


Figure 2-24 Selecting the smoothing level in STEP 7

Smoothing method

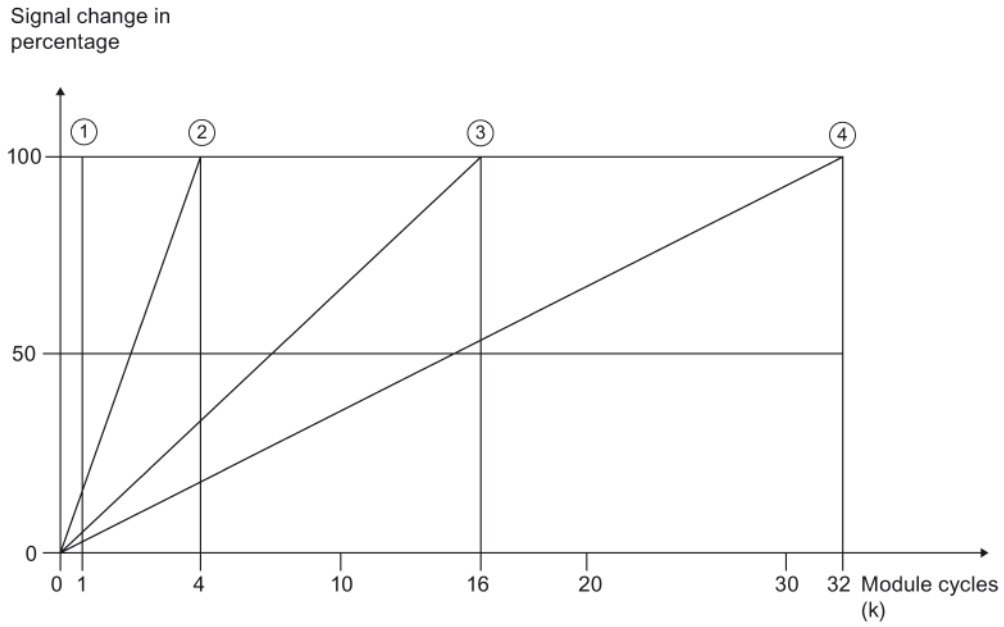
A smoothing algorithm is applied to a configurable number of measured values (e.g. 4, 8, 32) in line with the moving average. Each new measured value is factored in, and the oldest measured value then ignored. This mechanism suppresses interference peaks which overlay the measured signal. Utility signal jumps only become evident in the data after some time (see examples below).

The modules of the various product ranges use different smoothing algorithms. Smoothing is either linear or exponential. The differences are apparent particularly with strong smoothing and lead to a faster or slower rate of rise depending on the product used.

For information on whether or not a specific module supports customization of the smoothing function, please refer to the manual of the analog input module.

Example 1: Linear smoothing

The diagram below shows the number of module cycles (k) it takes for each smoothing level setting for the smoothed analog value to reach approximately 100 % after a step response. This specification is valid for all signal changes at the analog input.

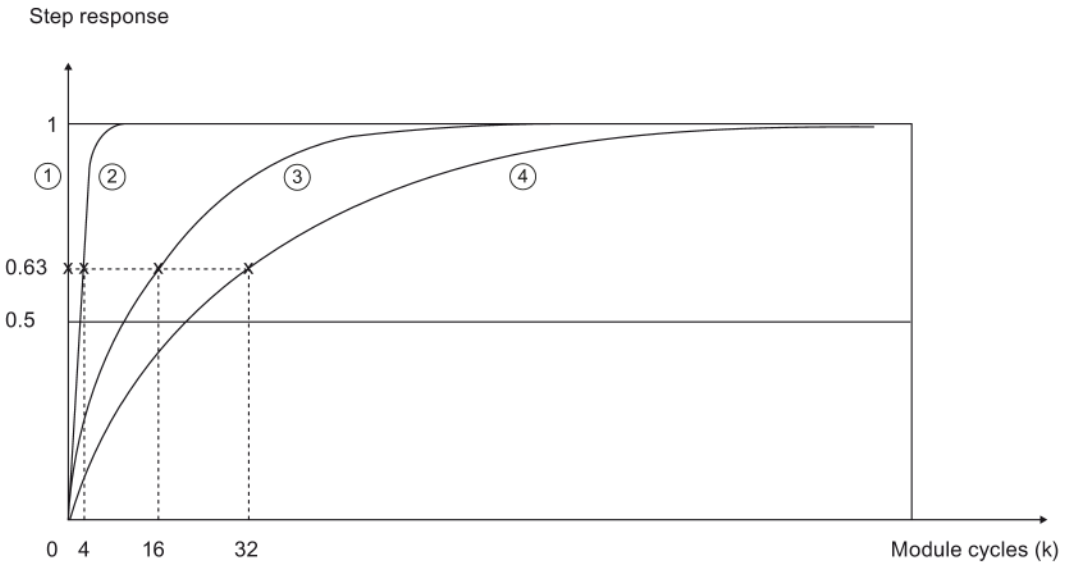


① No smoothing (k = 1)
② Weak smoothing (k = 4)
③ Medium smoothing (k = 16)
④ Strong smoothing (k = 32)

Figure 2-25 Linear smoothing with four smoothing levels

Example 2: Exponential smoothing

The diagram below shows the step response of the smoothing factor for different numbers of module cycles.



① No smoothing (k = 1)
② Weak smoothing (k = 4)
③ Medium smoothing (k = 16)
④ Strong smoothing (k = 32)

Figure 2-26 Exponential smoothing with four smoothing levels

2.20 Burden with 2-wire transducers

2-wire transducers

2-wire transducers are current transducers which convert the process variable into a current signal of between 4 and 20 mA. Two connection lines supply the transducer with an output current of at least 4 mA. Additional information on connecting 2-wire transducers to analog input modules can be found in the section Wiring current transducers (Page 72).

Burden

The burden indicates how great the external resistance in a current loop may be. If the external resistance is greater than the specified burden, the 2-wire transducer supply voltage is too low. The burden consists of the resistance of the transducer and all other resistances connected to the current loop.

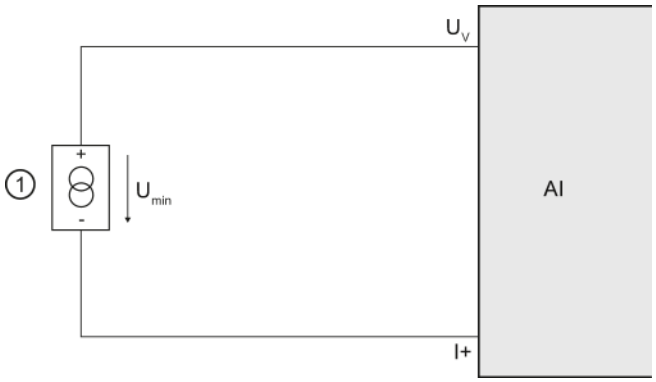
The maximum admissible burden of the transducer, e.g. 820 Ω, is specified in the technical data of the analog module.

Example 1: Connecting a transducer to the electrical circuit

In accordance with the technical data of the 2-wire transducer used, it requires a supply voltage (U_{min}) of at least 8.5 V. Using Ohm's Law, you can calculate the resistance of the transducer used (R_{2DMU}) for a current of 20 mA.

$$R_{2DMU} = \frac{U_{min}}{I} = \frac{8.5\ V}{0.020\ A} = 425\ \Omega$$

With a supply voltage of at least 8.5 V, the transducer has a resistance of 425 Ω. The resistance is less than 820 Ω. You can therefore connect the transducer to the analog input module (AI) without exceeding the maximum burden.



① 2-wire transducers
U_V Terminal for feed voltage at the channel
I+ Terminal for current input
U_{min} Voltage drop at 2-wire transducer

Figure 2-27 Connecting a transducer to the electrical circuit

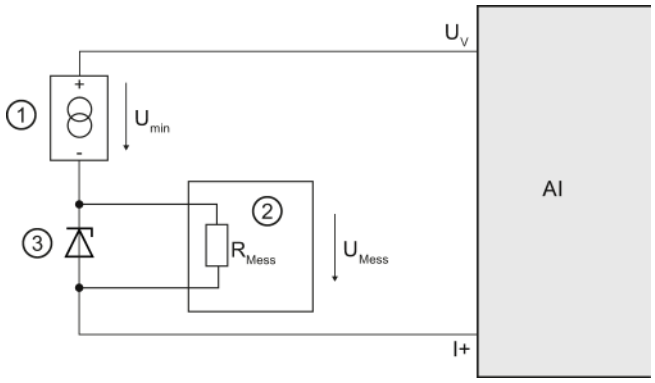
Example 2: Connecting a transducer and other devices

If multiple measuring devices are connected in series, the sum of all connected resistances may not exceed the value of the maximum burden.

If you have connected a 2-wire transducer to a supply voltage of 8.5 V, you will need to allow for the resistance of the measuring device connected ②.

Maximum transducer burden:	820 Ω
Transducer resistance upon a voltage drop of 8.5 V:	425 Ω
Maximum resistance of additional devices connected:	395 Ω

The resistance of the measuring instrument may therefore not exceed 395 Ω.



① 2-wire transducers
② Digital multimeter
③ Zener diode
U_V Terminal for feed voltage at the channel
I+ Terminal for current input
U_{min} Voltage drop at 2-wire transducer
R_{Mess} Resistance at measuring instrument
U_{Mess} Voltage drop at the measuring instrument

Figure 2-28 Connecting a transducer and other devices to the circuit

Calculating admissible voltage drop

The maximum additional resistance in the current loop may not exceed 395 Ω at a maximum current of 20 mA. You can calculate the voltage drop at the connected measuring instrument (U_{Mess}) as follows using Ohm's Law:

$U_{Mess} = R_{Mess} * I = 395\ \Omega * 0.020\ A = 7.9\ V$

The voltage drop at the measuring instrument should therefore not exceed 7.9 V.

Representation of analog values

3

3.1 Overview

Conversion of analog values

The CPU only processes analog values in digitalized format.

Analog input modules convert the analog signal into a digital value for further processing by the CPU.

Analog output modules convert the digital output value from the CPU into an analog signal.

Analog value representation at 16-bit resolution

The digitized analog value is the same for all I/O values at the same rated range. The analog values are represented as fixed point numbers in twos complement. This leads to the following conditions:

Table 3- 1 Representation of analog values

Resolution	Analog value															
Bit number	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Significance of the bits	S	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^{9}	2^{8}	2^{7}	2^{6}	2^{5}	2^{4}	2^{3}	2^{2}	2^{1}	2^{0}

Sign

The sign (S) of the analog value is always set in bit 15:

- "0" → +
- "1" → -

Resolution less than 16 bits

The analog value is left-aligned in the memory of analog modules with a resolution of less than 16 bits. The unused least significant digits are padded with "0" values.

This reduces the number of measured values that can be represented. Modules occupy a range of values of between+32767 and -32768 regardless of the resolution. The scaling between two successive values depends on the resolution of the module.

Example

The following example shows how the least significant digits are padded with "0" values:

- The module with 16-bit resolution is capable of incrementing the values in steps of one unit ($2^0 = 1$).
- The module with 13-bit resolution is capable of incrementing the values in steps of 8 units ($2^3 = 8$).

Table 3- 2 Example: Bit pattern of a 16-bit and 13-bit analog value

Resolution	Analog value															
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
16-bit	S	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
13-bit	S	2^{14}	2^{13}	2^{12}	2^{11}	2^{10}	2^9	2^8	2^7	2^6	2^5	2^4	2^3	0	0	0

S = sign

Note

For information on the resolution supported by each analog module, please refer to the technical data for the relevant module.

3.2 Representation of input ranges

The tables below set out the digitalized representation of the input ranges by bipolar and unipolar input ranges. The resolution is 16 bits.

Please see the device manuals for each analog input module for assignment of the values to the specific measured values in each measuring range.

Table 3- 3 Bipolar input ranges

** When values < 0 are specified, the output value is limited to 0% (0.0 V / 0.0 mA).

Connecting transducers

4

4.1 Overview

Introduction

This chapter describes the basic procedure for wiring transducers to analog inputs. Information on specific wiring options is available in the manual of each module.

For more information, e.g. on cable routing and shielding or potential equalization, etc., refer to the function manual for Configuring interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566).

Transducers that can be wired to analog inputs

You can wire the following transducers to the analog input modules, depending on the type of measurement:

- Voltage transducers
- Current transducers
  - 2-wire transducers
  - 4-wire transducers
- Resistance transducers
  - 4-wire connection
  - 3-wire connection
  - 2-wire connection
- Thermocouples

Isolated transducers and non-isolated transducers

Transducers are available in various models:

- Isolated transducers are **not connected** locally to the ground potential. Floating operation is possible.
- Non-isolated transducers are **connected** locally to the ground potential.

  Non-isolated transducer connections are connected to the conductive enclosure.

  Note: All non-isolated transducers must have a galvanic connection to each other and be locally connected to the ground potential.

Abbreviations used in the figures

Key to the abbreviations in the figures below:

AI	Analog input module
M	Ground connection
L+	Supply voltage connection
M_n+/M_n-	Measuring input, channel n
I_{Cn}+/I_{Cn}-	Current output to thermal resistor (RTD) channel n
U_n+/U_n-	Voltage input channel n
I_n+/I_n-	Current input channel n
COMP+/COMP-	Compensation input
I_{Comp}+/I_{Comp}-	Current output for compensation
U_V	Feed voltage at channel (the connection can be used for 2-wire transducer (2DMU) or with ET 200eco PN and ET 200pro for 2/4-wire transducer).
U_{CM}	Potential difference between the reference points of the measuring inputs / the analog ground M_{ANA}
U_{ISO}	Potential difference between the reference points of the measuring inputs and the central ground
M_{ANA}	Reference point of the analog ground

Lines for analog signals

Always use shielded twisted-pair cables to wire the analog signals. This improves immunity.

4.2 Wiring analog inputs with MANA connection

The reference potentials of the measuring inputs and the central ground are electrically isolated in analog input modules with M_{ANA} connection.

Limited potential difference U_{ISO} (insulation voltage)

Always verify that the admissible potential difference U_{ISO} between the reference point of the analog ground M_{ANA} and the central ground is not exceeded.

Potential difference U_{ISO} may be caused by: Maximum line lengths exceeded.

If you want to ensure that the permitted value U_{ISO} is not exceeded, install an equipotential bonding cable between the terminal M_{ANA} and the central grounding point.

Limited potential difference U_{CM} (common mode)

Always verify that the admissible potential difference U_{CM} between the reference point of the measuring inputs and the analog groundM_{ANA} is not exceeded.

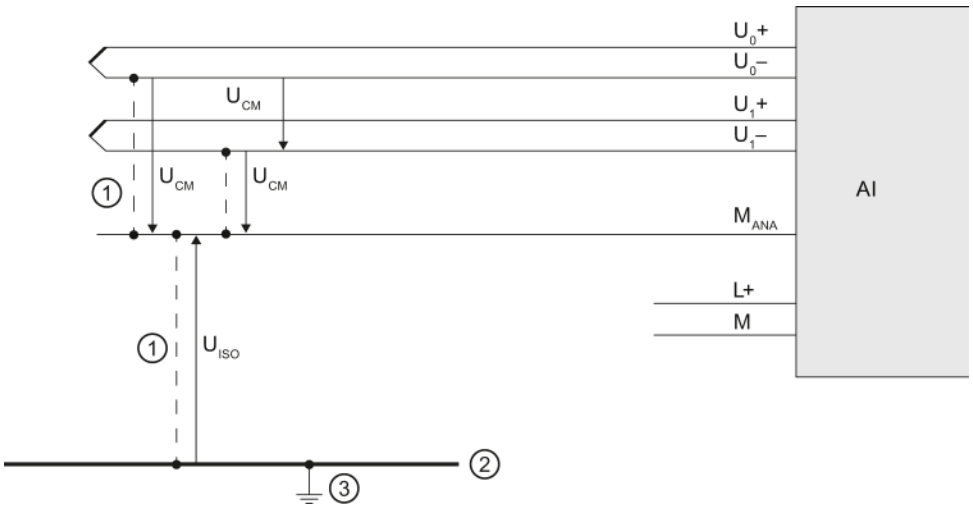
Potential differences U_{CM} may be caused by:

- Environments with EMC disturbance
- Use of grounded transducers
- Use of long cable lengths

Measuring errors / malfunctions can occur if the admissible potential difference U_{CM} is exceeded.

Some modules can detect an invalid potential difference U_{CM} and report this error with an entry in the diagnostics buffer of the CPU.

If you want to ensure that the maximum value U_{CM} is not exceeded, interconnect the reference points of the measuring inputs and the analog ground M_{ANA} with an equipotential bonding cable.



① Equipotential bonding cable
② Grounding bus cable
③ Central ground

Figure 4-1 Example: Reference potential for analog input modules with M_{ANA} connection

4.3 Wiring analog inputs without MANA connection

The reference potentials of the measuring inputs and the central ground are electrically isolated from each other in analog input modules without an M_{ANA} connection.

Limited potential difference U_{ISO} (insulation voltage)

Always verify that the maximum potential difference U_{ISO} between the reference points of the measuring inputs and central ground is not exceeded.

Potential difference U_{ISO} may be caused by: Maximum line lengths exceeded.

If you want to ensure that the permitted value U_{ISO} is not exceeded, install an equipotential bonding cable between the reference points of the measuring inputs and the central grounding point.

Limited potential difference U_{CM} (common mode)

Always ensure that the permitted potential difference U_{CM} between the reference points of the measuring inputs is not exceeded.

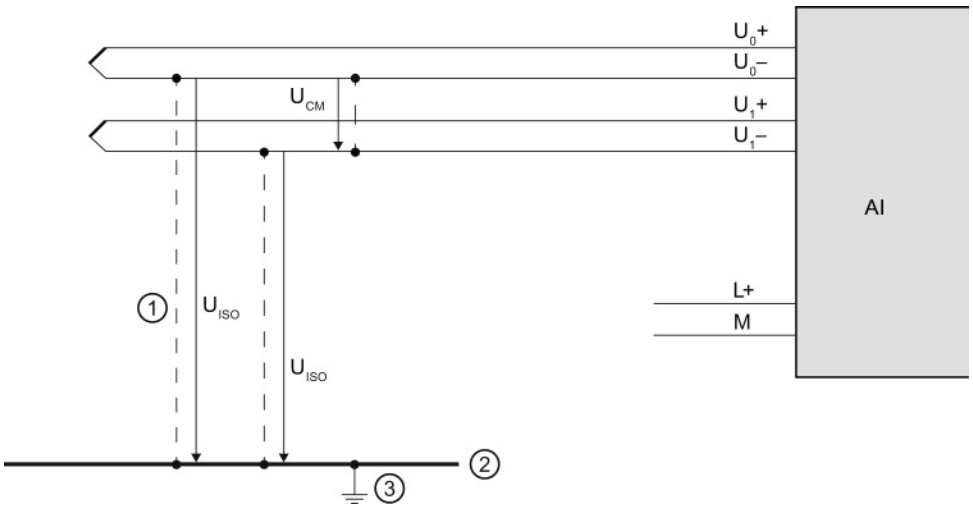
Potential differences U_{CM} may be caused by:

- Environments with EMC disturbance
- Use of grounded transducers
- Use of long cable lengths

Measuring errors / malfunctions can occur if the admissible potential difference U_{CM} is exceeded.

Some modules can detect an invalid potential difference U_{CM} and report this error with an entry in the diagnostics buffer of the CPU.

If you want to ensure that the permitted value U_{CM} is not exceeded, install equipotential bonding cables between the reference points of the measuring inputs or, with the ET 200eco PN and ET 200pro, between the reference points of the measuring inputs and ground.

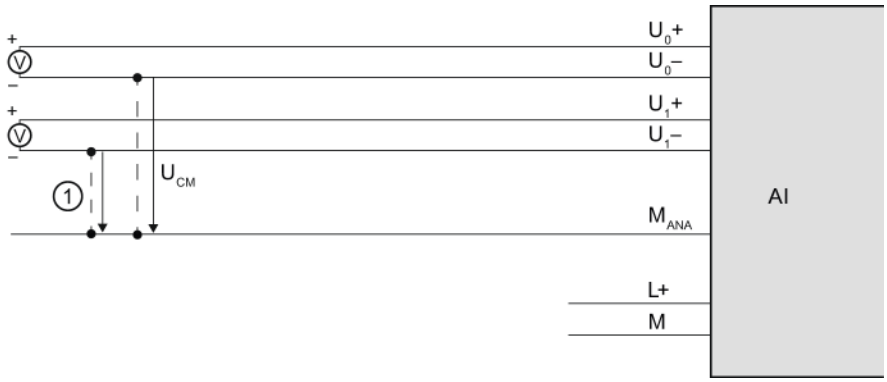


① Equipotential bonding cable (not for 2-wire and resistance transducers)
② Grounding bus cable
③ Central ground

Figure 4-2 Example: Reference potential for analog input modules without M_{ANA} connection

4.4 Wiring voltage transducers

The figure below shows how to connect voltage transducers. If you want to ensure that the permitted value U_{CM} is not exceeded, install equipotential bonding cables to connect the reference points of the measuring inputs to the analog ground M_{ANA}, or with ET 200eco PN and ET 200pro the reference points of the measuring inputs to the ground.



① Equipotential bonding cable (only relevant to modules with M_{ANA} connection)

Figure 4-3 Example: Wiring voltage transducers to an analog input module

4.5 Wiring current transducers

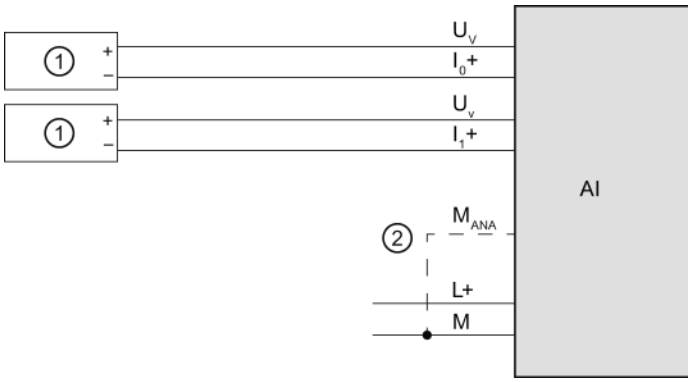
Current transducers are available as 2-wire transducers and 4-wire transducers. Below are a number of ways to supply current transducers with voltage.

Wiring 2-wire transducers with power supply from the module

The 2-wire transducer converts the process variable into a current. The 2-wire transducer is wired to the short circuit-proof supply voltage at the terminals of the analog input module. The transducer is therefore frequently also called a "passive transducer". Its simple wiring means that the 2-wire transducer is frequently used in industrial environments. If you use this type of connection, you will need to set the "Current (**2-wire transducer**)" measurement type in STEP 7.

Note

2-wire transducers must be electrically isolated.



① 2-wire transducers (2WT)

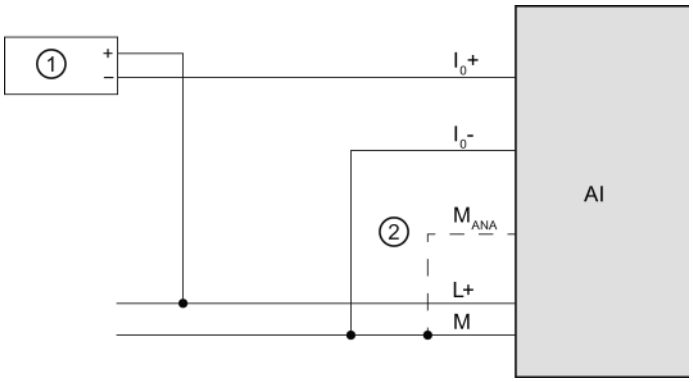
② Equipotential bonding cable (only relevant to modules with M_{ANA} connection)

Figure 4-4 Example: Wiring 2-wire transducers to an analog input module

Wiring 2-wire transducers to an analog input for 4-wire transducers

The figure below shows an alternative to the above connection: supplying the 2-wire transducer from supply line L+ of the module. If you use this type of connection, you will need to set the "Current (**4-wire transducer**)" measurement type in STEP 7.

In this type of connection, galvanic isolation between the supply voltage L+ and the analog circuit will be removed.



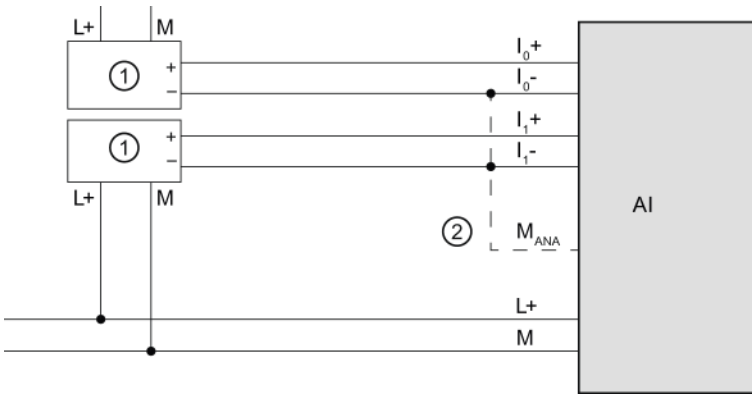
① 2-wire transducers (2WT)

② Equipotential bonding cable (only relevant to modules with M_{ANA} connection)

Figure 4-5 Example: Wiring 2-wire transducers to an analog input for 4-wire transducers

Wiring and connecting 4-wire transducers

4-wire transducers provide terminals for connecting a separate supply voltage. They are powered with an external supply and are frequently called "active transducers". If you use this type of connection, you will need to set the "Current (**4-wire transducer**)" measurement type in STEP 7.



① 4-wire transducers (4WT)

② Equipotential bonding cable (only relevant to modules with M_{ANA} connection)

Figure 4-6 Example: Wiring 4-wire transducers to an analog input module

4.6 Wiring thermal resistors and resistors

The module provides a constant current at terminals I_C+ and I_C- for resistance measurements. The constant current is fed to the resistance to be measured where it is measured as voltage drop. It is important to wire the connected constant current cables directly to the thermal resistor/resistor.

Measurements with 4-wire or 3-wire connection compensate for line resistance and therefore achieve greater accuracy compared to measurements with 2-wire connection.

Measurements with two-wire connection always acquire line resistance in addition to the actual resistance; you must therefore allow for a significant loss of precision in the measuring results.

The figures below give some connection examples.

4-wire connection of a thermal resistor

The voltage at the thermal resistor is acquired using high-impedance measurement via the M_0+ and M_0- terminals. Make sure the wiring is correctly poled (I_{C0}+ and M_0+, and I_{C0}- and M_0- at the thermal resistor).

Always wire the **I_{C0}+ and M_0+** lines, and the **I_{C0}- and M_0-** lines directly to the thermal resistor.

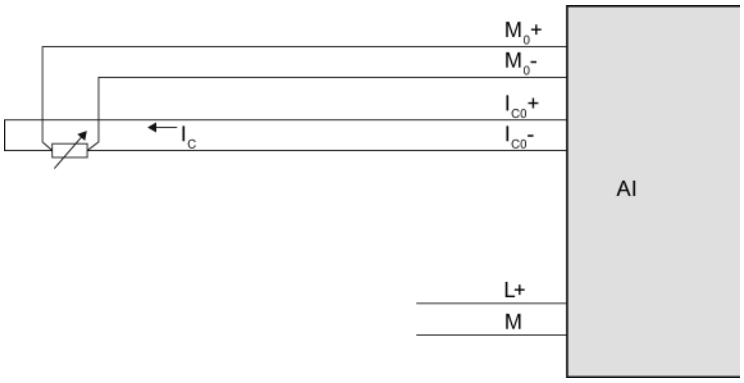


Figure 4-7 Example: 4-wire connection of thermal resistor to an analog input module

3-wire connection of a thermal resistor

Depending on the module, for a 3-wire connection to modules with 4 terminals (per channel), you may need to insert a bridge between **M_0- and I_{C0}-** (see figure below) or between **M_0+ and I_{C0}+**. Always wire the I_{C0}+ and M_0+ lines directly to the thermal resistor. Use cable with wires with identical cross-section.

For ET 200AL, ET 200eco PN and ET 200pro, no bridge is required as all necessary connections are implemented internally.

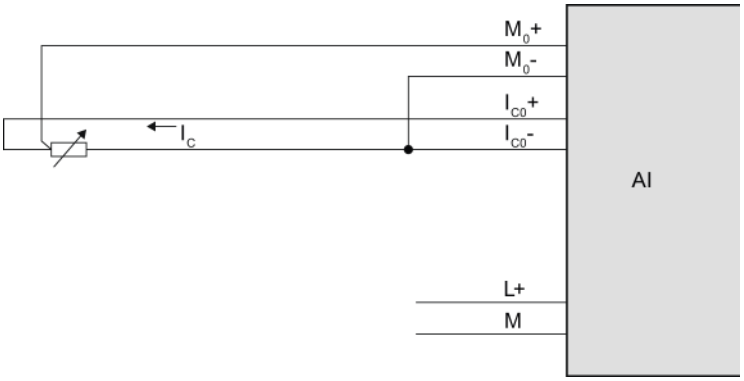

Figure 4-8 Example: 3-wire connection of thermal resistor to an analog input module

2-wire connection of a thermal resistor

When installing a 2-wire device on modules with 4 terminals (per channel), you will need to insert bridges at the module between **M_0+ and I_{C0}+** and between **M_0- and I_{C0}-** as shown in the figure below. The line resistance is measured, but not compensated. As a result of physical limitations, this measurement type is less accurate than measurement with 3-wire or 4-wire connections. The wiring for this type of measurement is, however, simple as the bridges required can be wired in the plug, saving line.

For ET 200AL, ET 200eco PN and ET 200pro, no bridge is required as all necessary connections are implemented internally.

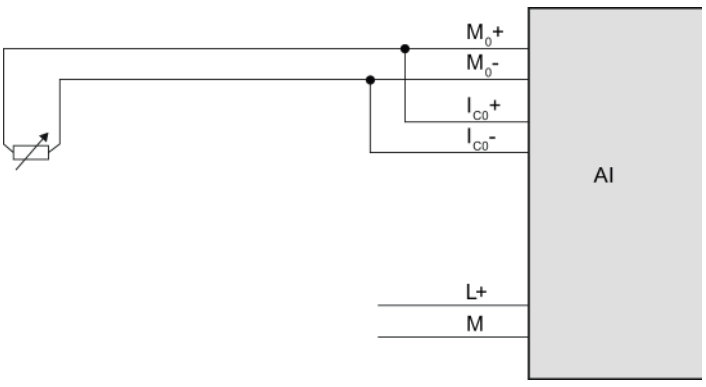

Figure 4-9 Example: 2-wire connection of thermal resistor to an analog input module

4.7 Wiring thermocouples

Introduction

Thermocouples are generally supplied ready-to-use. Protective casing prevents the thermocouples from being destroyed by mechanical force, for example.

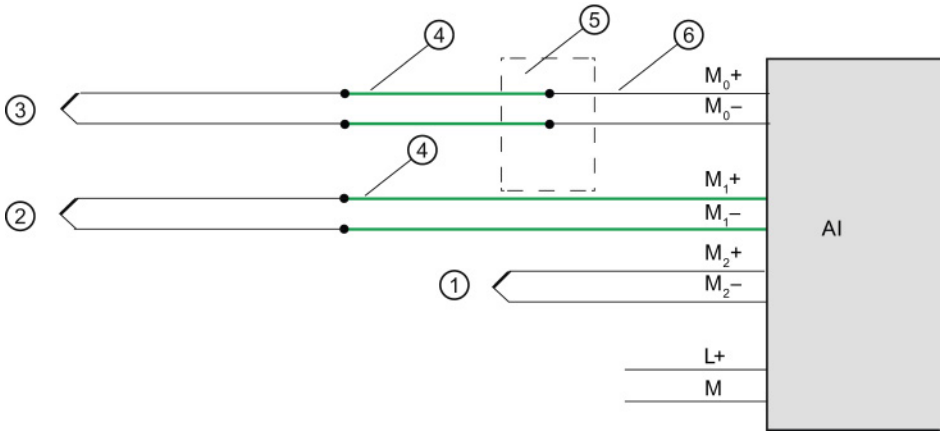
Compensating lines

The compensating lines belonging to the respective thermocouples are identified by a special color code, because only the compensating line that is made of the material matching the thermocouple may be used. The standardized compensating lines are specified in DIN EN 60584. Observe the maximum temperatures in the manufacturer's specifications.

Thermocouple connection options

There are various different ways to wire thermocouples to an analog input module:

- Directly ①.
- Using compensating lines ②.
- With a compensating line to the reference junction, connected with a supply line, e.g. copper ③.



① Thermocouple without compensating line
② Thermocouple with compensating line
③ Thermocouple with compensating line and supply line
④ Compensating line (same material as thermocouple)
⑤ External reference junction
⑥ Copper supply cable, for example

Figure 4-10 Example: Wiring thermocouples to an analog input module

Further information

Further information, such as the selection of thermocouples and how they operate, can be found in the section Thermocouples (Page 77).

Thermocouples

5

5.1 Selecting thermocouples

Introduction

Thermocouples are electrical devices for precise temperature measurement. They consist of two different metals connected at one point. Temperature affecting this point generates a voltage difference from which the temperature can be calculated.

Thermocouples can measure a wide range of temperatures and come in extremely robust models. They are therefore frequently used in industrial applications. Below are some of the criteria to consider when selecting the right thermocouple:

- Temperature range
- Atmospheric conditions
- Price

Grounded thermocouples

In grounded thermocouples, a conductive thermocouple wire is attached to the inside of the sensor housing. This results in good heat transfer from the sensor housing to the thermocouple measuring tip.

Non-grounded thermocouples

In non-grounded thermocouples, the thermocouple is not connected to the sensor housing. The response time following temperature changes is longer than with grounded thermocouples. The measuring point is galvanically isolated.

Type and temperature range

The different thermocouple types are derived from different material compositions.

Note

Due to physical conditions, thermocouples are extremely inaccurate outside the specified temperature range. Only use thermocouple in the temperature range specified by the manufacturer.

The following table lists the types and material compositions, as well as the temperature measuring range of different thermocouples:

Type	Material composition	Temperature range
B	PtRh-PtRh	250 to 1820 °C
C	W-Re	0 to 2315 °C
E	NiCr-CuNi	-270 to 1000 °C
J	Fe-CuNi	-210 to 1200 °C
K	NiCr-Ni	-270 to 1372 °C
L	Fe-CuNi	-200 to 900 °C
N	NiCrSi-NiSi	-270 to 1300 °C
R	PtRh-Pt (Pt 13%)	- 50 to 1769 °C
S	PtRh-Pt (Pt 10%)	-50 to 1769 °C
T	Cu-CuNi	-270 to 400 °C
U	Cu-CuNi	-200 to 600 °C
TXK/XKL	NiCr-CuCr	-200 to 800 °C

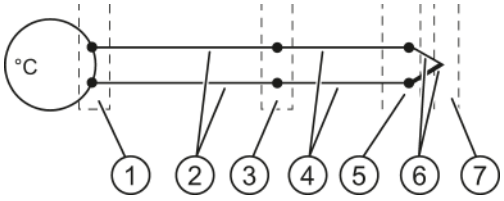
5.2 Structure and operating principle of thermocouples

Thermocouple structure

A thermocouple consists of a pair of thermal sensors and the respective installation and wiring elements. Two wires made of different metals/alloys are welded together at their ends (hot end). The welding point forms the so-called measuring point, while the free ends of the thermocouple form the reference junction.

The free ends are interconnected with the evaluation device (e.g. analog input module) via insulated wires or cables.

The different thermocouple types, e.g. K/J/N, are derived from different material composition; the same measuring principle is applied to all thermocouples, independent on their type.



① Thermal voltage acquisition point
② Copper supply cable, for example
③ Reference junction
④ Compensating line (same material as thermocouple)
⑤ Connection point
⑥ Thermocouple with positive and negative thermal elements
⑦ Measurement point

Figure 5-1 Thermocouple

Operating principle of thermocouples

Temperature differences between the measuring point and the free ends of the pair of thermal sensors (connection point) generate a thermal voltage at the reference junction. The value of the thermal voltage is determined by the temperature difference between the measuring point and the free ends, as well as by the material composition of the pair of thermal sensors.

Thermocouples always acquire a differential temperature, which means that the temperature at their free ends (reference junction) must be known to determine the temperature at the measuring point.

The thermocouple can be extended with compensating lines from the connection point. This allows the reference junction to be located at a specific point, for example, where the temperature can be kept constant or the temperature sensor is easy to install. The compensating lines and thermocouple wires are made of the same material. Copper cables are used to connect the reference junction to the module.

Note

Always observe the polarity, as incorrect wiring will result in unacceptable measuring errors.

5.3 Compensation for the reference junction temperature

5.3.1 Overview

Introduction

You have several options for measuring the reference junction temperature in order to obtain a correct temperature value as a function of the temperature difference between the reference junction and the measuring point.

You have various compensation options to suit requirements at the location of the reference junction.

The compensation options supported by the analog module used are specified in the manual of the respective module.

Options of compensating for the reference junction temperature

Table 5- 1 Compensation options: Explanation and use case

Compensation options	Explanation	Use case / special feature
Internal reference junction	**Function principle** With this type of compensation, the temperature of the reference junction is measured using an integrated sensor in the analog module. **Procedure** Connect the thermocouple to the I/O module directly, or with compensating lines; see chapter Compensation with internal reference junction (Page 84).	• For the connection, use compensating lines that match the thermocouple material. • If the reference junction temperature and the module temperature are identical in your system, you may also use lines made from a different material. • Advantages: – Inexpensive – No external reference junction required – No additional wiring required

Compensation options	Explanation	Use case / special feature
Reference channel of the module	**Properties** With this type of compensation, the reference junction temperature is determined using an external thermal resistor (RTD). **Procedure** Connect the thermocouple to the supply lines directly at the reference junction, or indirectly using compensating lines. Wire the supply lines to the corresponding terminals of the module. Wire the thermal resistor (RTD) to the reference channel of the module. The thermal resistor (RTD) must be positioned in the area of the reference junction; see chapter Compensation with reference channel of the module (Page 86).	• They acquire the temperature directly at the reference junction. • The measured temperatures of all channels that you have configured for this compensation type will be corrected automatically by the temperature value of the reference junction. • Advantages: – More precise compared to compensation with internal reference junction; however, you need to install and wire an additional thermal resistor.
Reference channel of group 0	**Properties** With the "TC" (thermocouple...) setting, the channel acts as receiver for the reference junction temperature of group 0. The associated transmitter of group 0 is set up to for the RTD channel. **Procedure** Connect the thermocouple to the supply lines directly at the reference junction, or indirectly using compensating lines. Wire the supply lines to the corresponding terminals of the module. Wire the thermal resistor (RTD) to the configured reference channel for group 0 of the module. The thermal resistor (RTD) must be positioned in the area of the reference junction; see chapter Compensation, reference channel of Group 0 (Page 88).	• They acquire the temperature directly at the reference junction. • The measured temperatures of all channels that you have configured for this compensation type will be corrected automatically by the temperature value of the reference junction (transmitter).
Fixed reference temperature	**Properties** With this type of compensation, the reference junction temperature is stored in the module as fixed value. **Procedure** Connect the thermocouple to the supply lines directly at the reference junction, or indirectly using compensating lines. Wire the supply lines to the corresponding terminals of the module. Depending on the module, you can enter a fixed reference junction temperature in the configuration data (e.g. 20 °C), or use the fixed reference junction temperature of the module (0 °C); see chapter Compensation with fixed reference temperature (Page 91).	• You keep the reference junction temperature constant and know the temperature value. • To ensure high precision, you must ensure that the temperature remains constant (this can be complicated, depending on the application).

Compensation options	Explanation	Use case / special feature
Dynamic reference temperature	**Properties** With this type of compensation, the reference junction temperature is determined using a module. Transfer this temperature value to other modules in the user program by means of a data record. **Procedure** Wire the thermal resistor (RTD) for the reference junction to any channel. The reference junction temperature is transferred with a function block by means of data records from the CPU or IM to the module, see section Compensation by means of dynamic reference temperature (Page 94).	• You are using multiple modules at the reference junction and can therefore compensate for all channels using a common temperature value. • You only need a thermal resistor (RTD) or a thermocouple to measure the temperature value.
No/external compensation	**Properties** With this type of compensation, the reference junction temperature is measured outside the analog input module. You can, for example, connect a compensating box to the thermocouple for this purpose. **Procedure** Connect the compensating box with the connection module of the analog input module with copper cables, see section "None" or external compensation (Page 98).	• The temperature of the reference junction for this type of compensation is specified as 0 °C. This can be achieved by using a compensating box. A separate compensating box is required for each thermocouple. • Thermocouples of type B do not require a compensating box.
RTD (0)	**Properties** This compensation is based on a measurement of the resistance value of a Pt1000 at the clamping unit of a compensation connector or of an external resistance value Pt1000. **Procedure** Additional information about the connection options with and without compensation connector is available in the section Type of compensation RTD (0) (Page 100).	• The reference junction temperature is determined with resistance value of the Pt1000. • All channels of the analog input module that you select for this type of compensation receive the same reference junction temperature.

5.3.2 Compensation with internal reference junction

Function principle

The reference junction for compensation via internal reference junction is at the terminals of the analog input module. Wire the thermocouples or compensating lines directly to the module inputs. The internal temperature sensor acquires the module temperature and returns a compensating voltage.

Note that compensation via internal reference junction will not always reach the precision of external compensation!

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. In the device view, select the required analog module and the corresponding channel.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the "Inputs/Measuring" area.
5. Select the "Thermocouple" value as "Measurement type".
6. As "Reference junction", select the value "Internal reference junction".

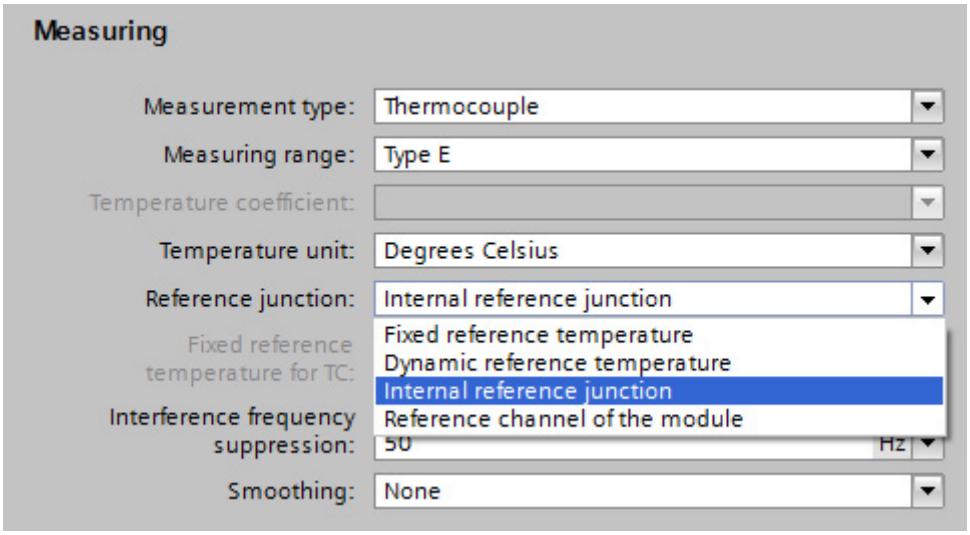


Figure 5-2 Internal reference junction

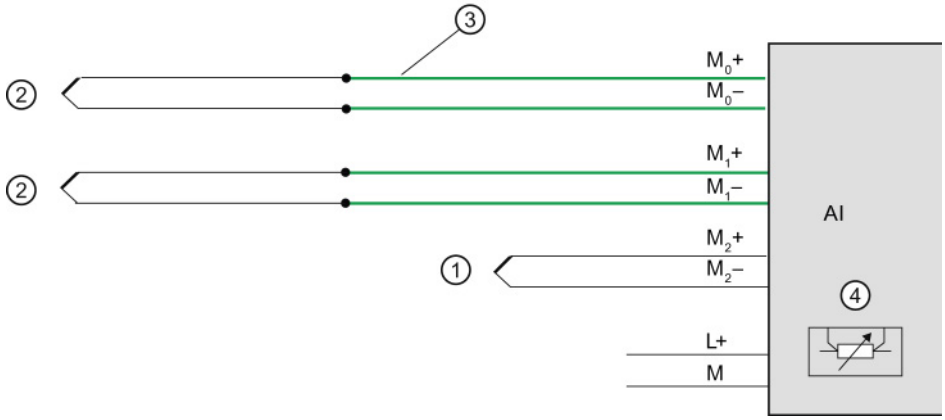
Wiring thermocouples

Wire the thermocouples directly or indirectly via compensating lines to the module inputs.



① Thermocouple without compensating line
② Thermocouple with compensating line
③ Compensating line (same material as thermocouple)
④ Internal reference junction

Figure 5-3 Example: Wiring thermocouples for compensation via internal reference junction

5.3.3 Compensation with reference channel of the module

Function principle

With this type of compensation, the reference junction temperature is determined using an external thermal resistor (RTD). Certain modules provide an internal reference channel.

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. In the device view, select the required analog module and the corresponding channel.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the "Inputs/Measuring" area.
5. Select the "Thermocouple" value as "Measurement type".
6. As "Reference junction", select the value "Reference channel of the module"".

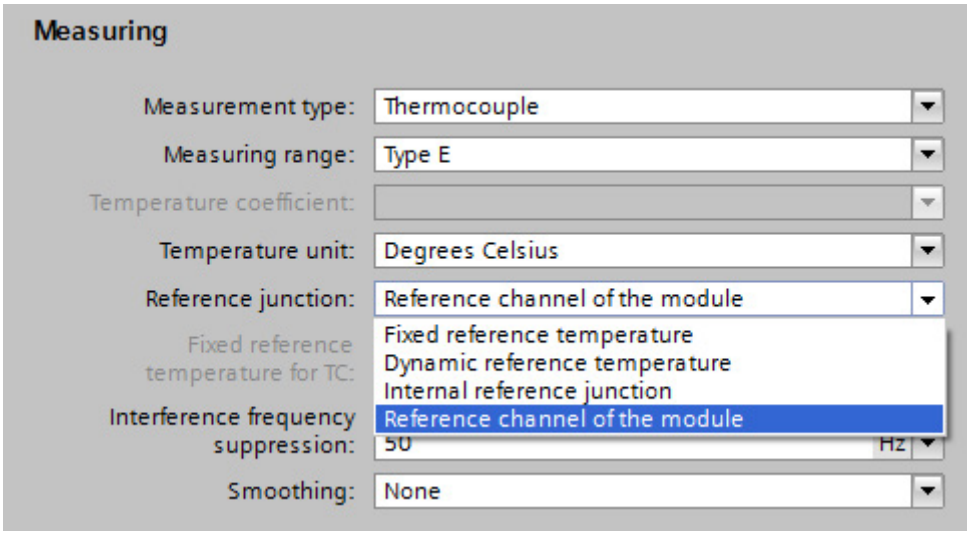


Figure 5-4 Reference channel of the module

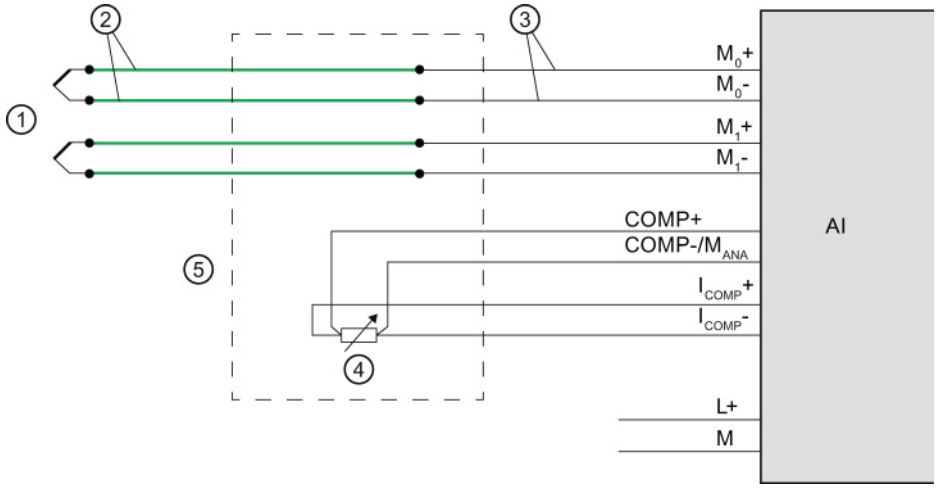
Wiring thermocouples and thermal resistors

Connect the thermocouple to the supply lines directly at the reference junction, or indirectly using compensating lines. Wire the supply lines to the corresponding terminals of the module.

You may use cables made of any material to wire the thermal resistor to the module terminals.



① Thermocouple
② Compensating line (same material as thermocouple)
③ Copper supply cable, for example
④ Thermal resistor (RTD)
⑤ Reference junction

Figure 5-5 Example: Wiring thermocouples/thermal resistors for compensation by means of reference channel of the module

5.3.4 Compensation, reference channel of Group 0

Function principle

For this compensation, a module channel with a connected thermal resistor (RTD) acts as "Reference temperature transmitter". Other channels (reference temperature receivers) with connected thermocouples can be compensated using this reference temperature. The measured temperatures of all channels (receivers) that you have configured for this compensation type will be compensated automatically by the temperature value of the reference junction (transmitter).

The reference junction temperature is determined by means of an external thermal resistor (RTD).

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. In the device view, select the required analog module and the corresponding channel.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the area "Inputs/measurement".
5. For the channel of the relevant module, specify as transmitter:

   As "Measurement type" select, for example, "Thermal resistor (4-wire connection)".

   As "Reference junction", select the value "Reference channel of group 0".

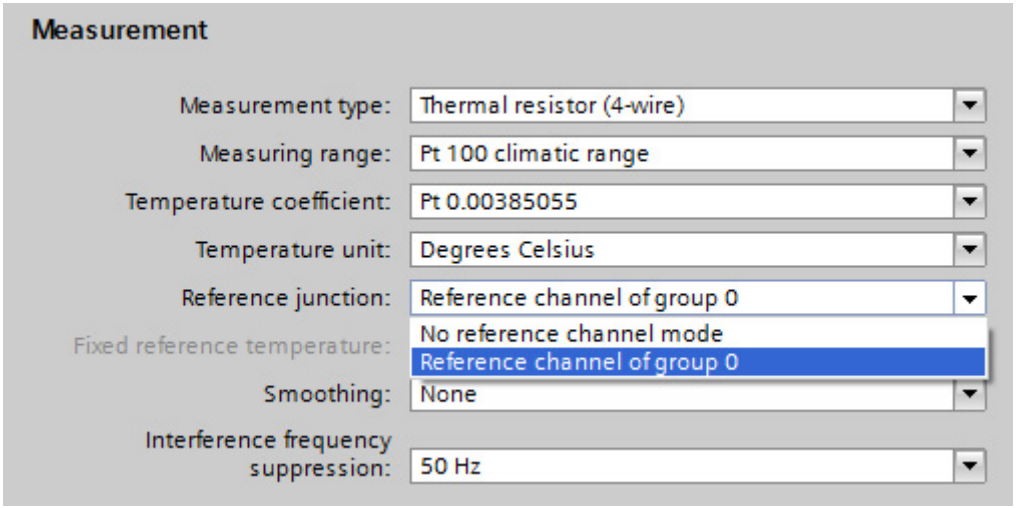


Figure 5-6 Transmitter: Reference channel of group 0

6. For the channels you specify as receivers:

   Select the "Thermocouple" value as "Measurement type".

   As "Reference junction", select the value "Reference channel of group 0".

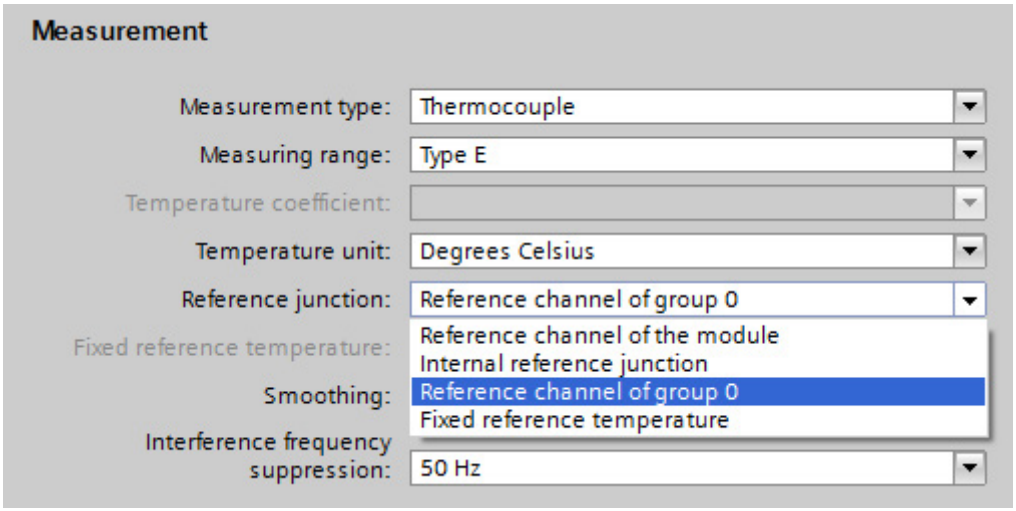

Figure 5-7 Receivers: Reference channel of group 0

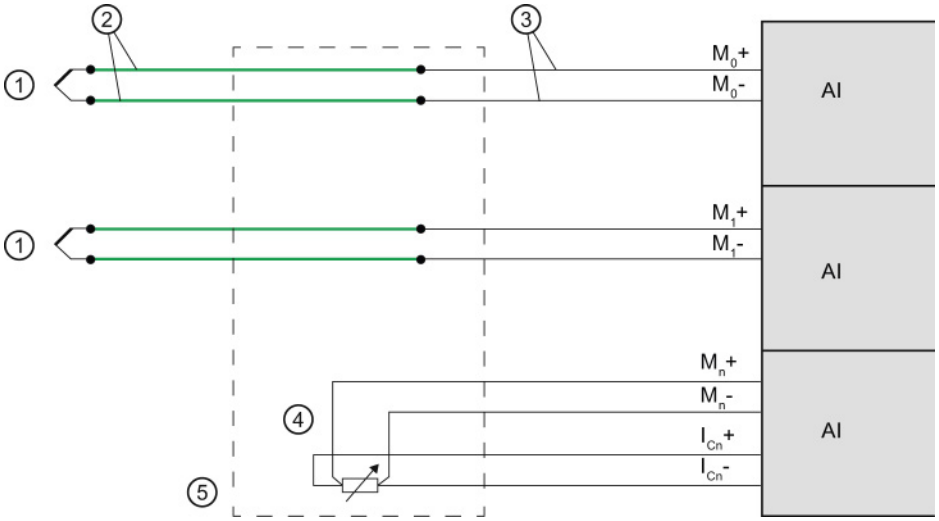
Connecting thermocouples and thermal resistors

The example below shows:

- An analog module with thermal resistor as reference temperature transmitter and
- Two analog modules with thermocouple as reference temperature receivers.

Connect the thermocouples to the supply lines at the reference junction, either directly or with compensating lines. Wire the supply lines to the corresponding terminals of the module.

You may use cables made of any material to wire the thermal resistor to the module terminals.



① Thermocouple
② Compensating line (same material as thermocouple)
③ Copper supply cable, for example
④ Thermal resistor (RTD)
⑤ Reference junction

Figure 5-8 Example: Connecting thermocouples/thermal resistors for group 0 compensation

5.3.5 Compensation with fixed reference temperature

Function principle

With this type of compensation, the reference junction temperature is stored in the module as fixed value.

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. Select the required analog module in the Device view.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the "Inputs/Measuring" area.
5. Select the "Thermocouple" value as "Measurement type".
6. As "Reference junction", select the value "Fixed reference temperature".
7. Specify the temperature of the reference junction in the "Fixed reference temperature" area, for example, 20 °C.

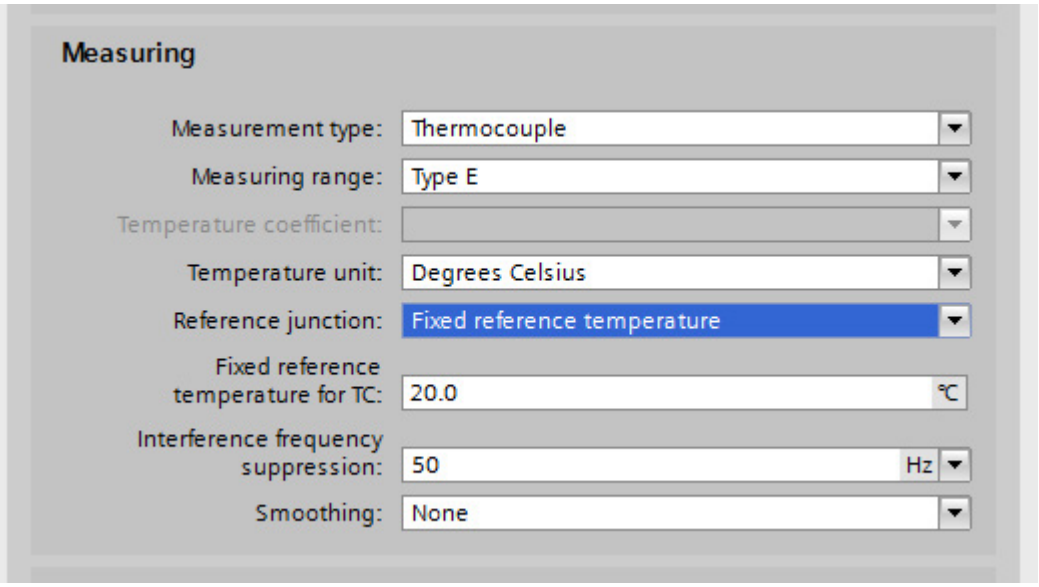


Figure 5-9 Fixed reference temperature

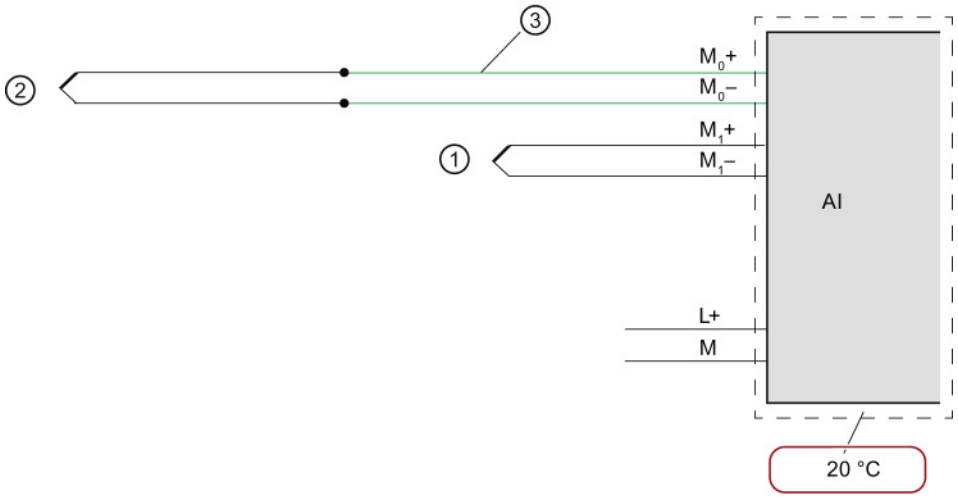
Temperature condition with "Fixed reference temperature" setting

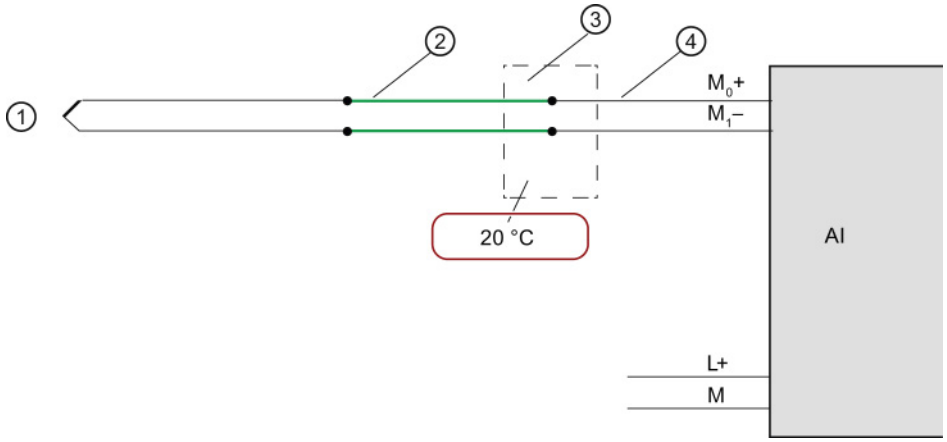
The figure below shows the connection options for thermocouples provided the temperature of the module is kept at a fixed reference temperature (20 °C), for example by installing it in an air-conditioned switch cabinet. The reference junction is in the module.



① Thermocouple without compensating line
② Thermocouple via compensating line
③ Compensating line (same material as thermocouple)

Figure 5-10 Example 1: Connecting a thermocouple to an analog module for compensation with "fixed reference temperature"

The figure below shows the connection options for thermocouples provided the temperature of the reference junction (outside the module) is kept at a fixed reference temperature (20 °C).



① Thermocouple with compensating line and supply line
② Compensating line (same material as thermocouple)
③ Reference junction
④ Copper supply cable, for example

Figure 5-11 Example 2: Connecting a thermocouple to an analog module for compensation with "fixed reference temperature"

5.3.6 Compensation by means of dynamic reference temperature

Function principle

This compensation type allows you to handle the reference junction temperature for temperature compensation in the user program. You can derive the temperature value from any other module of the station. The reference junction temperature is transferred via data records using the instruction **WRREC** (SFB 53).

The structure of the data records is detailed in the device manual for each module.

Requirement

STEP 7 project with the following contents:

- User program with WRREC (SFB 53) instruction for transferring the data records with reference temperature
- Analog module for acquisition of the process temperature using thermocouple (TC)
- Analog module for measuring the process temperature using thermal resistor (RTD)

Analog module for acquisition of the process temperature using thermocouple (TC)

Configuration steps:

1. Open the project in STEP 7.
2. In the device view, select the required analog module and the corresponding channel.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the "Inputs/Measuring" area.
5. Select the "Thermocouple" value as "Measurement type".
6. As "Reference junction", select the value "Dynamic reference temperature".

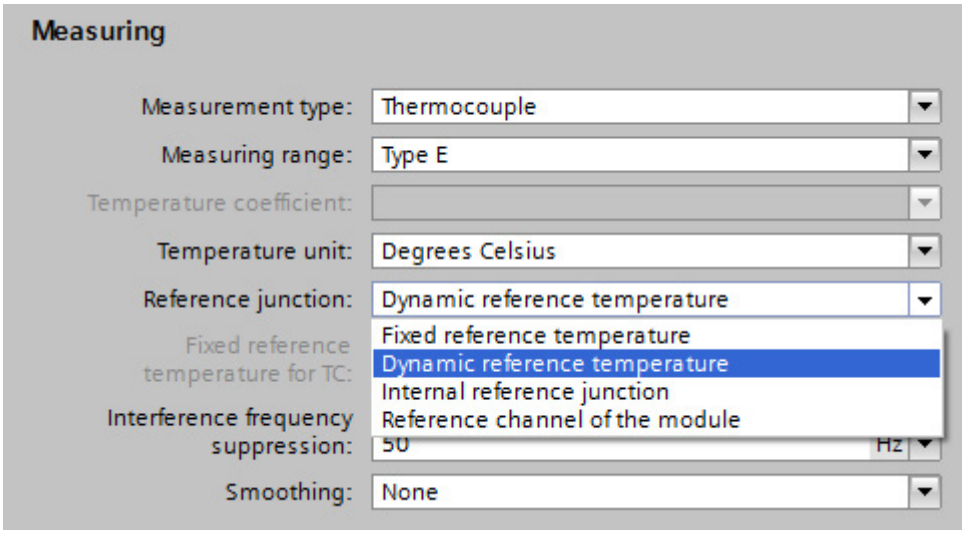


Figure 5-12 Dynamic reference temperature

Analog module for measuring the process temperature using thermal resistor (RTD)

Configuration steps:

1. Open the project in STEP 7.
2. In the device view, select the required analog module and the corresponding channel.
3. Select the "General" tab in the Inspector window of the selected module.
4. Select the "Inputs/Measuring" area.
5. Select the "Thermal resistor (4-wire connection)" value as "Measurement type".

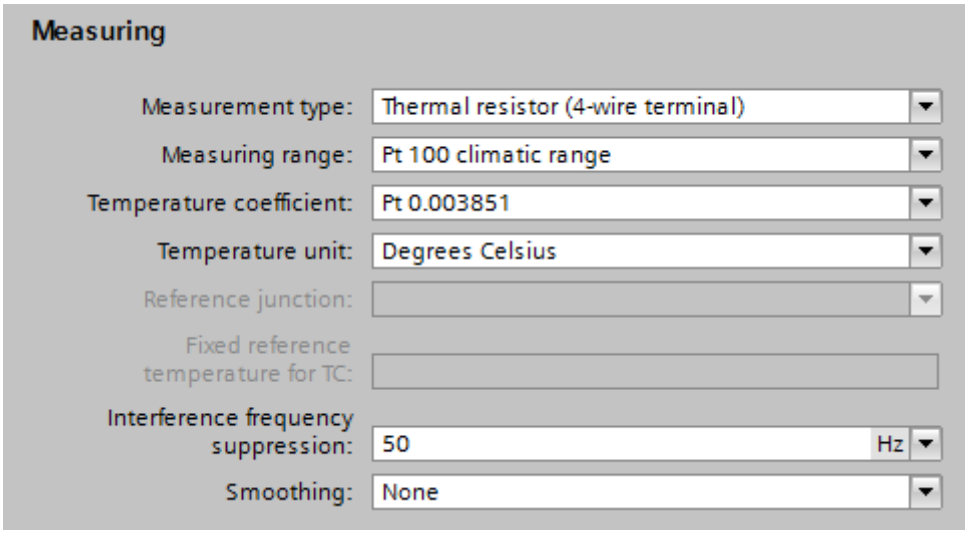

Figure 5-13 Settings for thermal resistor (RTD) type of measurement

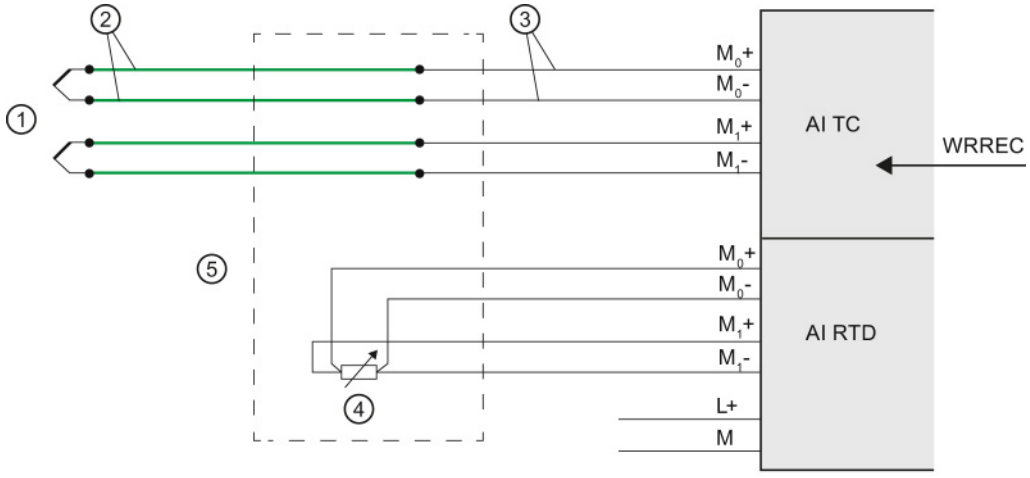
Connecting thermocouples and thermal resistors

Connect the thermocouples, for example, to the module inputs using supply lines for temperature compensation with dynamic reference temperature. In this case, the temperature is acquired at the reference junction by means of a thermal resistor (RTD). This reference junction temperature determined in this way is transferred to the analog module with thermocouple via data records with the WRREC instruction.



① Thermocouple
② Compensating line (same material as thermocouple)
③ Copper supply cable, for example
④ Thermal resistor (RTD)
⑤ Reference junction

Figure 5-14 Example: Connecting thermocouples/thermal resistors for compensation by means of dynamic reference temperature

5.3.7 "None" or external compensation

Function principle

The reference junction temperature of the thermocouples is measured outside the analog input module, e.g., by means of a compensating box on the thermocouple. The temperature of the reference junction for this type of compensation is specified as 0° C.

The compensating box includes a bridge circuit that is calibrated for a specific reference junction temperature (compensation temperature). The connectors for the ends of the compensating line of the thermocouple form the reference junction. If the actual comparison temperature deviates from the compensation temperature, the temperature-dependent bridge resistor changes. A positive or negative compensation voltage is generated and added to the thermal voltage.

Note

Thermocouples of type B do not require a compensating box.

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. Select the required analog module in the Device view.
3. Select the "Inputs" tab in the Inspector window of the selected module and the respective channel.
4. Select the "Thermocouple" value as "Measurement type" in the "Measuring" area.
5. As "Reference junction", select the value "None" or "External compensation" depending on the used module.

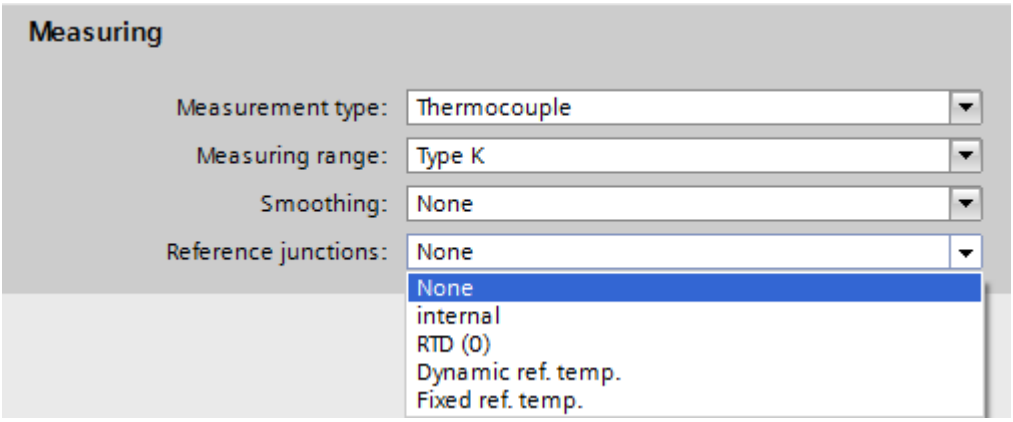


Figure 5-15 No reference junction

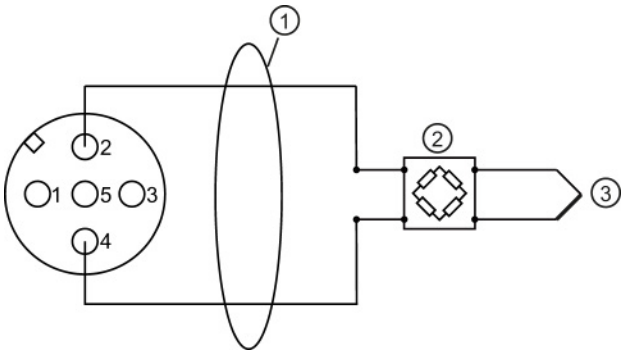
Connection of the compensating box

The compensating box is looped into the supply lines of an individual thermocouple. The compensating box must be supplied isolated. The power supply unit must have a sufficient noise filter, e.g., by means of a grounded shielding winding.

Each channel can use its own thermocouple type supported by the analog module regardless of the other channels. A separate compensating box is required for each channel.

Connection example "None" or external compensation

Connect the compensating box with the connection module of the analog input module using copper cables.



① Copper cables
② Compensating box (per channel), for example; thermocouple type B does not require a compensating box
③ Thermocouple

Figure 5-16 Connection example "No" compensation as reference junction

5.3.8 Compensation type RTD (0)

Function principle

The reference junction temperature is determined by means of the resistance value of a Pt 1000 at the clamping unit of the M12 compensation connector. The resistance measurement is only permitted at the X1 circular socket (channel 0). All of the module's channels with this type of compensation receive the same reference junction temperature.

Procedure

Configuration steps:

1. Open the project in STEP 7.
2. Select the required analog module in the Device view.
3. Select the "Inputs" tab in the Inspector window of the selected module.
4. Select the "Thermocouple" value as "Measurement type" in the "Measuring" area.
5. As "Reference junction", select the value "RTD (0)".

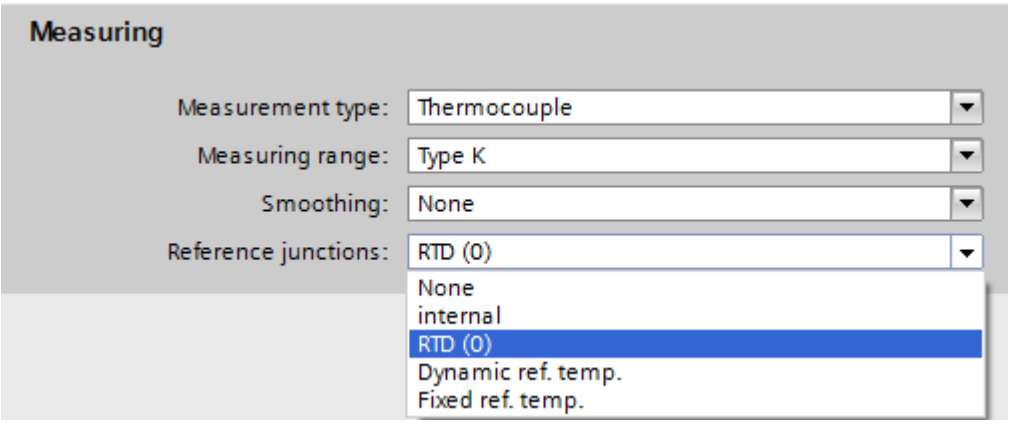


Figure 5-17 Compensation type RTD (0)

Connection example

Connection with M12 compensation connector

Connect the thermocouple to the M12 compensation connector directly or with compensating lines. Install the M12 compensation connector to the X1 circular socket (channel 0) of the CM IO 4 x M12 at the 4 AI TC High Feature.

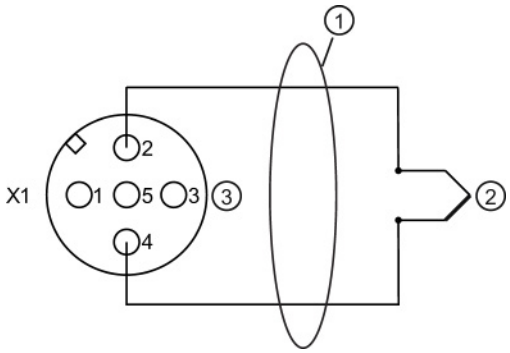
Connection without M12 compensation connector

To measure the referent junction temperature, connect an external Pt1000 (with α = 003851) to terminals 1 and 3 using copper cables. The thermal resistor Pt1000 must be positioned in the area of the reference junction. Connect the thermocouples to terminals 2 and 4 from the reference junction with copper cables.

Connecting additional thermocouples

You can connect additional thermocouples to the circular sockets X2 to X4 on the CM IO 4 x M12 of the 4 AI TC High Feature. The temperature of reference junction collected by measuring the resistance value at the X1 circular socket applies to all channels of the module that you have selected for this type of compensation.

The figure below shows a connection example "RTD (0)" as reference junction with M12 compensation connector and integrated thermal resistor Pt1000:



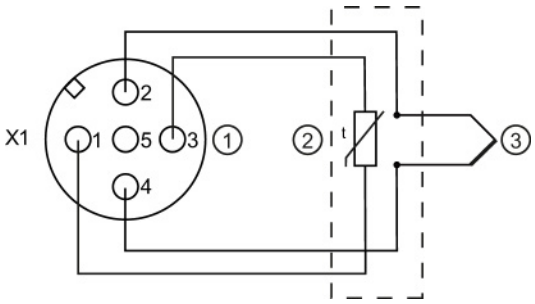
① Direct connection of the thermocouple or with compensating lines

② Thermocouple

③ M12 compensation connector (terminals 1 and 3 with internal Pt1000) only at X1 circular socket. The comparison value of the M12 compensation connector at circular socket X1 also applies to thermocouples at X2, X3 and X4.

Figure 5-18 Connection example "RTD (0)" as reference junction in the M12 compensation connector

The figure below shows a connection example "RTD (0)" as reference junction with external thermal resistor Pt1000:



① M12 connector only at X1 circular socket

② External Pt1000 (α = 0.003851) in the area of the reference junction with copper cables at terminals 1 and 3. The comparison value of the external Pt1000 at circular socket X1 also applies to thermocouples at X2, X3 and X4.

③ Thermocouple

Figure 5-19 Connection example "RTD (0)" as reference junction with external Pt1000

Wiring loads/actuators

6

6.1 Overview

Introduction

This chapter describes the basic procedure for wiring loads/actuators to analog outputs. Information on specific wiring options is available in the manual of each module.

For detailed information on cable routing and shielding, potential equalization, etc. please refer to the function manual Configuring interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566).

Abbreviations used in the figures

Key to the abbreviations in the figures below:

AQ	Analog output module
M	Ground connection
L+	Supply voltage connection
S_n+/S_n-	Sense line channel n
QV_n+/QV_n-	Voltage output channel n
QI_n+/QI_n-	Current output channel n
M_{ANA}	Reference point of the analog ground
U_{ISO}	Insulation voltage

Lines for analog signals

Always use shielded twisted-pair cables to wire the analog signals. This improves immunity.

6.2 Wiring loads/actuators

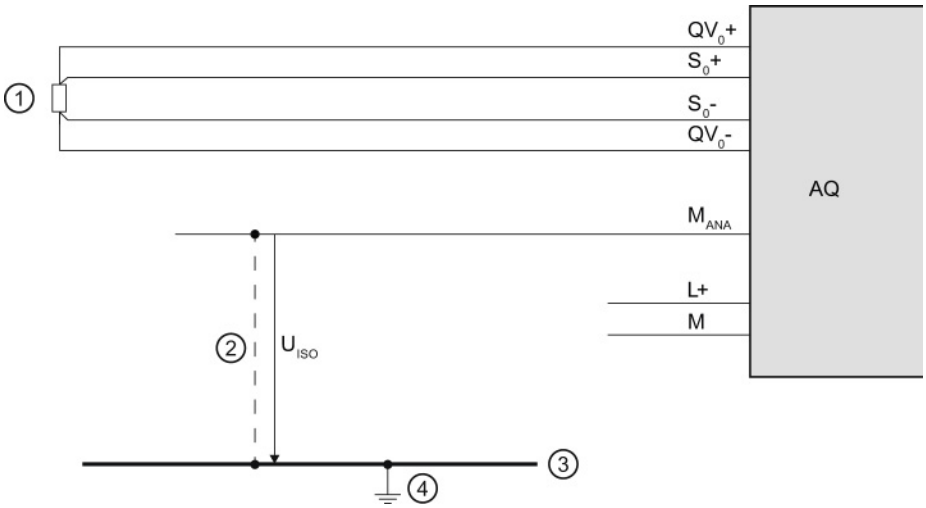
Reference potential for analog output modules with M_{ANA} connection

Analog output modules have no galvanic connection between the reference point of the analog ground M_{ANA} and the central ground.

Always verify that the admissible potential difference U_{ISO} between the reference point of the analog ground M_{ANA} and the central ground is not exceeded.

Potential difference U_{ISO} may be caused by: Maximum line lengths exceeded.

If you want to ensure the maximum value U_{ISO} is not exceeded, wire terminal M_{ANA} and the central ground with an equipotential bonding cable.



① Load on the voltage output
② Equipotential bonding cable
③ Grounding bus cable
④ Central ground

Figure 6-1 Example: Reference potential for an analog output module with M_{ANA} connection

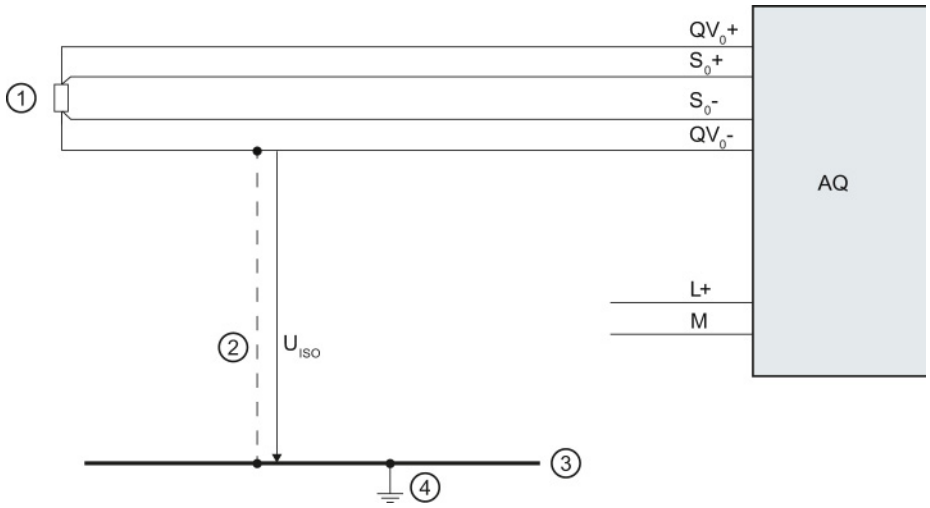
Reference potential for analog output modules without M_{ANA} connection

Analog output modules have no galvanic connection between the reference potential of the analog output circuits and central ground.

Always verify that the maximum potential difference U_{ISO} between the reference points of the analog output circuits and the central ground is not exceeded.

Potential difference U_{ISO} may be caused by: Maximum line lengths exceeded.

If you want to ensure the maximum value U_{ISO} is not exceeded, interconnect each analog output circuit with the central ground using an equipotential bonding cable.



① Load on the voltage output
② Equipotential bonding cable
③ Grounding bus cable
④ Central ground

Supported functions 7

7.1 Calibrating analog modules

7.1.1 Overview

Calibration

A calibration checks the process values measured by the analog input module and the process values output by the analog output module, determines the deviation from the actual values and compensates for any measurement and output errors.

Calibrating analog modules

The SIMATIC analog modules were calibrated before being shipped and have excellent long-term stability; calibration is therefore not required during runtime.

But certain regulations and directives, for example from the Food and Drug Administration (FDA), require regular calibration for all components in a measuring circuit. These components include analog input and output modules.

A calibration makes sense especially for plants in which sensors detect and process relatively small voltages or currents. The calibration compensates for influences on the measuring result by cables and/or temperature.

The calibration collects the new values and saves them retentively on the module. But the calibration values determined prior to delivery at the plant are not lost. You can return to these original calibration values at any time.

Note

The calibration saves the calibration values of each channel for the specific measuring range retentively on the module, which means the values apply to the same measuring range in which the user calibration took place.

If you reconfigure a channel with effective user calibration values to another type of measuring mode, the calibration values saved at the plant for this channel and for this measuring range will become effective.

But the user calibration values are not deleted. They are not overwritten until there is a new user calibration of the channel. If you set the original measuring range for this channel once again without new user calibration, the previously determined user calibration values will become effective.

The respective manual will include information whether or not your analog module supports the "Calibration" functionality.

Scope of functions

The "Calibration" group offers the following functions:

- Specifying the current calibration of all channels
- Calibrating a channel
- Canceling a running calibration
- Resetting the calibration of a channel to the factory settings

7.1.2 Calibrating analog modules

Manual calibration

The following requirements must be met to start manual calibration:

- An online connection exists between STEP 7, the respective CPU and the analog module to be calibrated.
- You have opened the "Online & Diagnostics" view for the selected analog module from the shortcut menu of the project and you are now in the "Functions > Calibration" area.
- The configuration reflects the actual structure of the station.
- No calibration process is busy on the module (if you want to launch calibration).
- A 24 V load voltage must be present at each module for the calibration.
- The last step was successfully completed (if you want to continue or conclude calibration).

Procedure

The basic mask for calibration opens once you start the "Calibration" function. The module reads the following general information data and calibration values after each new selection of a channel:

- **Calibration:** Indicates whether or not the currently effective calibration values are factory calibration values or user calibration values.
- **Measurement type:** Information about the selected measurement type
- **Measuring range:** Currently configured measuring range of the selected channel
- **Gain:** Currently effective gain correction of the analog-digital converter
- **Offset:** Currently effective offset correction of the analog-digital converter

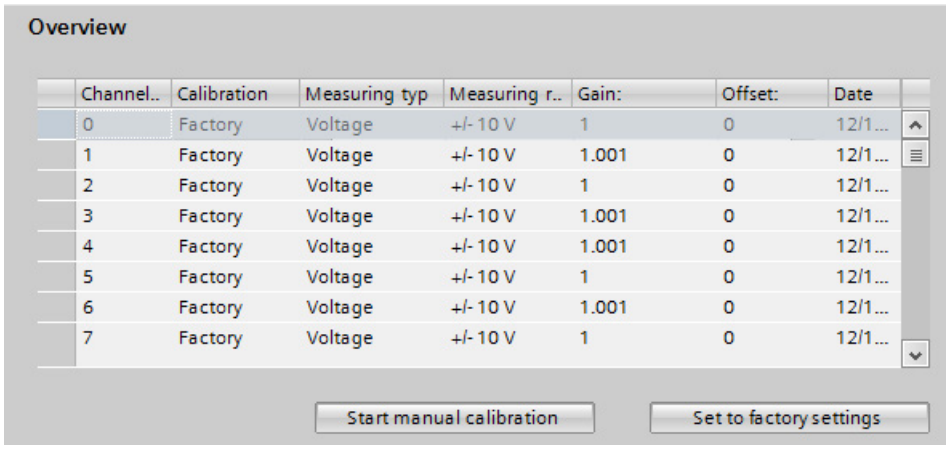

Figure 7-1 Calibration table

To start the calibration, follow these steps:

1. Select the line associated with the channel to be calibrated in the overview table.
2. Click the "Start manual calibration" button.
3. Now go through the steps in the "Manual calibration" section.
4. Follow the instructions in the "Command" field.
5. Click ""Next".

The required calibration values of the selected channel according to the measuring range configured for this channel are specified once again during the user calibration.

Note

The calibration can take place in RUN mode as well as STOP mode of the CPU. If the CPU is in RUN, the calibration value that was last collected prior to the start of the calibration is supplied for the duration of the calibration.

The module channel to be calibrated cannot process any new process values during the user calibration. All analog input values of the module are set to 0x7FFF ("Invalid analog value") until the end of the calibration. When the value status is enabled, the value status of the signal is set to "invalid" for the duration of the calibration.

You must provide a voltage and/or temperature during a user calibration. To do so, use the corresponding external wiring and an external voltage/temperature transducer. The field "Command" includes numbers of pins to which you can connect the calibration stimulus. The first pin number identifies the positive connector, the second pin number the negative connector. The accuracy of the calibration depends on the accuracy of the provided voltage/temperature.

Note

To ensure that the module retains the specified measuring accuracy after the user calibration, the provided voltage/temperature must be twice as accurate as specified for the module. Inaccurate voltages or temperature result in a faulty calibration.

The figure below shows an example of channel calibration with "Voltage" measurement, measuring range "+/- 10 V".

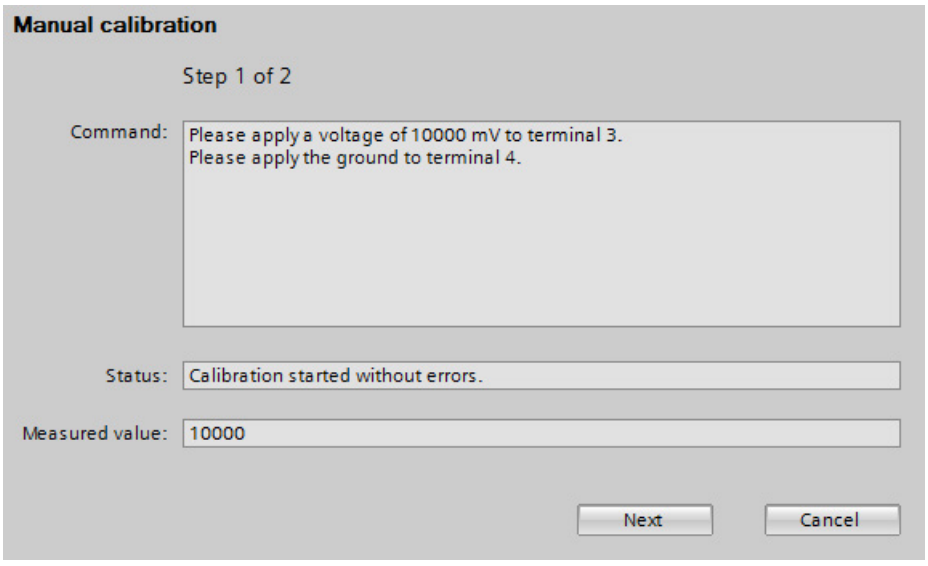

Figure 7-2 Manual calibration

- **Command:** The field "Command" indicates which actions the user has to execute during the current calibration step. Here you execute the specified actions and confirm them with the "Next" button. The module now executes all actions required for the current calibration step. If the calibration step was error-free, the next calibration step takes place.
  The instructions in the "Command" field are to be performed additively. For example, after you have applied the voltage/ground to the terminals 3/4, these connections must remain in place during the execution of the next calibration step.
- **Status:** Depending on the set type of measurement, several calibration steps are required for calibration of a channel. The field "Status" indicates whether or not the last calibration step included errors. If an error occurs during processing of a calibration step, the error is displayed here and calibration of the channel is aborted. All calibration values recorded up to this point are deleted. The calibration values that were in effect prior to the start of the user calibration are effective once again.

Note

Calibrators

If the "Wire break" diagnostics is activated for analog input modules, a test current is applied to the line for the measuring types "Resistance", "Thermistor" and "Thermocouple". This applied test current can result in inaccurate measured values in some calibrators. The wire break monitoring is therefore automatically disabled in some analog modules during the calibration.

To avoid the risk of inaccurate measured values, we recommend you disable the "Wire break" diagnostics during the calibration of analog input modules.

Result

Calibration sets new settings for the channel.

Error occurrence

If an error occurs during the calibration, the module cancels the calibration. All calibration values recorded up to this point are lost. The channel to be calibrated will then have the same settings as before the start of calibration.

7.1.3 Canceling a calibration

Requirement

- You have opened the "Online & Diagnostics" view for the selected analog module from the shortcut menu of the project and you are now in the "Functions > Calibration" area.
- The associated CPU is online.
- A calibration is currently running on the analog module.

Procedure

Click the "Cancel" button to cancel an ongoing calibration.

Result

The active calibration is canceled. The channel to be calibrated will then have the same settings as before the start of calibration.

7.1.4 Resetting analog modules to factory settings

Requirement

- You have opened the "Online & Diagnostics" view for the selected analog module from the shortcut menu of the project and you are now in the "Functions > Calibration" area.
- The associated CPU is online.

Procedure

Proceed as follows to reset the channel of an analog module to factory settings:

1. In the overview table, select the line of the channel to be calibrated.
2. Click the "Set to factory settings" button.

Result

The factory settings of the channel are restored.

Note

When you reset the current channel to the factory settings, the original calibration values that were saved in the delivery state of the module become effective once again. Any existing user calibration values of this channel are lost. You cannot restore these user calibration values.

High-speed analog modules

8

8.1 Basics

High-Speed analog modules (HS) are available for users with high demands regarding performance and speed. The main characteristics of these HS analog modules compared to Standard analog modules (ST) is their shorter cycle times. To achieve this goal, the input and output modules are equipped with components with extremely short throughput and conversion times. In addition, the entire architecture of the modules is designed for faster signal processing.

HS analog modules convert the output of measured values and output values at the same time. Each channel within the module has its own A/D or D/A converter. This means the cycle time is basically the conversion time and independent of the number of activated channels. This is true for analog input modules as well as analog output modules. This means HS modules can be used in fast isochronous mode.

Apart from isochronous mode, the HS analog modules also provide benefits in non-isochronous (free-running) mode. Due to the fast processing of the process signals, HS analog modules are able to detect changes in the process values more quickly and to respond to these events with the appropriate program blocks (for example, hardware interrupt or cyclic interrupt organization blocks). Additional information on the various organizational blocks can be found in the STEP 7 online help.

Isochronous mode

Isochronous mode refers to synchronous coupling:

- Of signal acquisition and output via the distributed I/O
- Of signal transmission via PROFIBUS or PROFINET
- Of program processing with the constant bus cycle time of PROFIBUS or PROFINET.

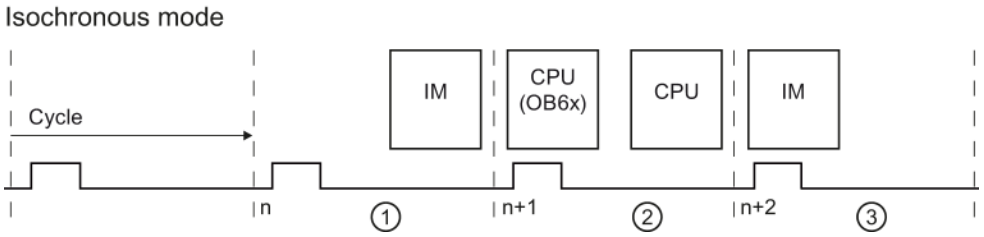
The result is a system that acquires its input signals in constant time intervals, processes them and outputs the output signals. Isochronous mode guarantees reproducible and defined process reaction times as well as equidistant and synchronous signal processing with distributed I/O.

The bus system and the I/O modules work synchronously with configured isochronous mode. The transmitted input and output data are linked to an "isochronous task" in the CPU. As a result, the data of a cycle are always consistent. All data of a process image belong together logically and in time. Jitter in the user program caused by the acquisition of outdated values is therefore almost impossible.

Even fast processes can be perfectly controlled by the exact timing reproducibility of all processes. Isochronous mode thus contributes to high control quality and hence to greater manufacturing precision. While possible fluctuations of the process reaction times are drastically reduced. The time-assured processing can be utilized to improve machine cycle times. Shorter cycle times increase the processing speed and help to lower production costs.

Send clocks

When you configure isochronous mode, the input and output data is synchronized within a send clock (cycle). The data of the input modules is acquired in cycle n and simultaneously transferred to the IM. The data is available in cycle n+1 in the CPU and can be processed. The CPU copies the data to the IM in the next cycle n+2. The output modules then output the data simultaneously in the same send clock. The acquisition – processing – output therefore takes place in three cycles. You can find more information on the configuration of isochronous mode in the STEP 7 online help.



① Measured values of the input modules are acquired and copied to the IM

② Measured values are processed and output values determined

③ Output values are copied to the IM and output by output modules

Figure 8-1 3-cycle model

Oversampling

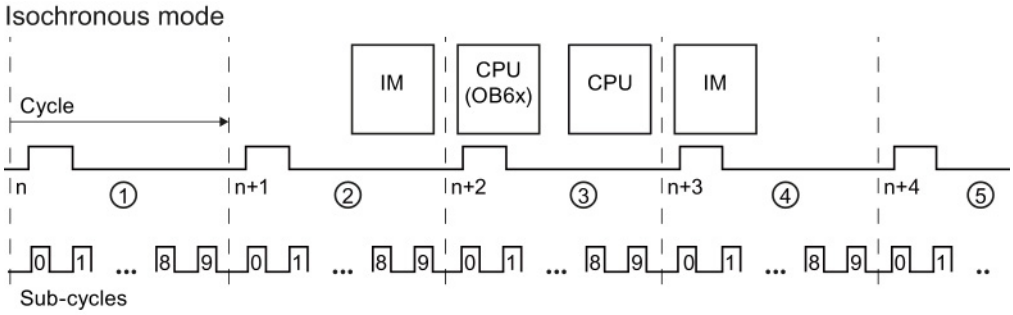
The use of the oversampling function in analog input or analog output modules requires an isochronous configuration.

With analog input modules, the set send clock is divided into time-equidistant sub-cycles. The send clocks can be subdivided into 2 to 16 sub-cycles. Each sub-cycle reads in a measured value. The read-in measured values of a data cycle are copied to the IM in the next send clock and are then available to the processing CPU one send clock later.

With analog output modules, the set send clock is also divided into time-equidistant sub-cycles. The send clocks can be subdivided into 2 to 16 sub-cycles. Each sub-cycle returns an output value. The output values are copied to the IM by the CPU within the same send clock and are written to the process one send clock later.

The read-in and output values are transmitted in the user data of the analog module. This way, the address space of the module is extended from 2 bytes of user data per channel to 16 x 2 bytes of user data per channel. If you subdivide the send clock into less than 16 sub-cycles, the unused addresses are assigned the error value 0x7FFF during input. For output, the values of the unused addresses are ignored.

Because the sub-cycles have to be within a send clock, oversampling needs an additional send clock to copy the data to the IM, unlike the 3-cycle model of isochronous mode. The result is a 5-cycle model.



① Send clock is divided into sub-cycles which record the measured value
② Measured values are copied to the IM
③ Measured values are processed and output values determined
④ Output values are copied by the CPU to the IM
⑤ Output values are written to the process

Figure 8-2 5-cycle model

Due to the configured modules, the send clock of an IO device has a minimum possible update time, which means the time interval within which an IO device/IO controller of the PROFINET IO system is supplied with new data. Modules with oversampling functionality, however, offer the option of further reducing the update time for their channels without having to shorten the send clock for the entire S7 station at the same time. The subdivision of the send clock into time-equidistant sub-cycles therefore enables an even faster signal processing speed.

Example

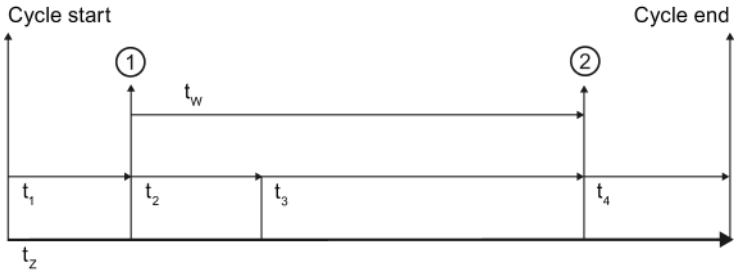
In practice, the use of oversampling makes sense when the isochronous system works with only one specific specific send clock (for example, 1 ms) due to the modules used and when faster sampling of the process values is required. By using oversampling and a subdivision of the send clock into 4 sub-cycles, for example, you can sample the process values in intervals of 250 µs.

Configuring oversampling

Enable the option "Isochronous mode" in the IO device used and set the corresponding parameters ("Send clock", etc.). You define the number of sub-cycles in the relevant distributed analog module with the "Sampling rate" parameter for analog input modules and the "Output rate" parameter for analog output modules. If, for example, you configure a "Sampling rate" of 4 "Values/cycle" for a "Send clock" of 1 ms, the send clock is subdivided into 4 sub-cycles and the process values are sampled in intervals of 250 µs.

Cycle time of an analog input module

If you have configured the system property "Isochronous mode" for HS modules, all analog input modules are synchronized to a shared time within the send clock (cycle) ①. The cycle time is made up of the following time intervals: $t_Z = t_1 + t_2 + t_3 + t_4$



① Synchronization time for all analog input modules in isochronous mode and simultaneously time of the converted input signal at the terminal in this cycle

② Digitalized input signal is transferred to the backplane bus

t_Z Cycle time

t_1 Time between cycle start and synchronization

t_2 Hardware-related runtime up to the analog-digital converter

t_3 Processing time of digitalized input data in the module

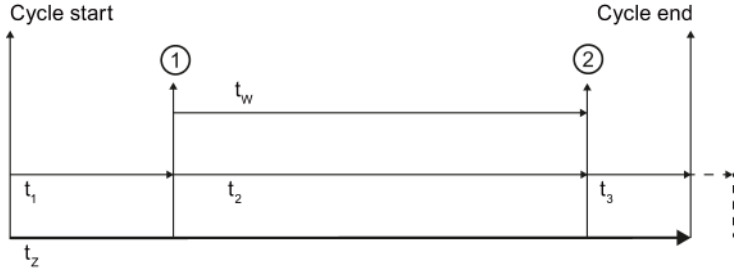
t_4 Transfer time of the backplane bus

t_W Conversion time of the module

Figure 8-3 Cycle time of the analog input module

Cycle time of an analog output module

The synchronization time for analog output modules refers to the output of the digital-analog converter ②. Because the impedance of the connected actuator including connection cable is unknown in output modules but has a significant impact on the signal run time, the settling time cannot be added as a fixed value. The respective manuals of the output modules specify the typical load settling times as reference point. But in practice, a measurement with an oscilloscope is required for a precise measurement of the settling time. The settling time may exceed the actual end of the cycle due to very short cycle times and very high capacitive loads. The cycle time is made up of the following time intervals: $t_Z = t_1 + t_2 + t_3$



① Output data is available in digital form in the module

② Synchronization time for all analog output modules in isochronous mode and simultaneously output time of data in the digital-analog converter

t_Z Cycle time

t_1 Transfer time of the backplane bus

t_2 Processing time of data in the module until output at digital-analog converter

t_3 Settling time of hardware until setpoint of output value

t_W Conversion time of the module

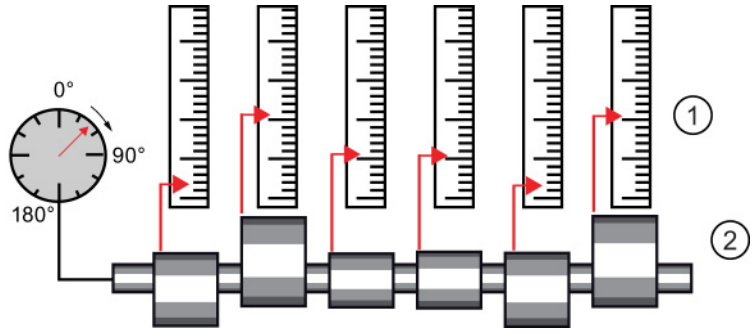
Figure 8-4 Cycle time of the analog output module

Typical applications

In principle, isochronous mode is worthwhile whenever measured values must be acquired synchronously, movements must be coordinated, and process reactions must be defined and executed at the same time. There are thus numerous areas in which isochronous mode can be used.

Typical applications include, for example, the acquisition of binary signals for quality assurance at specific times and positions. But hydraulic applications with position and pressure control can benefit as well from the equidistant and isochronous data transmission.

The following example shows the use of isochronous mode within the production process of camshafts. Precise measurements must be made at several measuring points for quality assurance.



① Measured values
② Camshaft

Figure 8-5 Measuring of camshafts

By using the system property "isochronous mode" and the associated simultaneous measured value acquisition, measurement can be performed continuously. The time required for measurement is reduced. Resultant workflow:

- Continuous machining of the camshaft
- During the continuous turning, measure the positions and cam excursion synchronously
- Process the next cam shaft

All camshaft positions and the corresponding measured values are measured synchronously within a single rotation of the camshaft. This increases machine output and maintains or enhances precision of the measurement.

8.2 ST modules vs HS modules

This section gives you an overview of other important distinctions between standard and high-speed analog modules. The specified numerical values are examples of selected modules. Keep in mind that the information can vary from module to module. The exact information of specific used analog module is available in the corresponding manual.

Conversion method

Instantaneous value conversion

Instantaneous value conversion if often used to convert analog signal into digital information in HS modules. In this type of conversion a very short sample is taken from the measured signal and converted into digital data. This digital information therefore represents an instantaneous value of the measured signal. Instantaneous value conversion is used to acquire fast changes of process values, such as in the area of motion control. The quickly changing physical quantities in this case must be acquired and processed quickly in cooperation with suitable transducers. Input areas are primarily voltage, current and resistance, the latter especially for position potentiometers.

Because the measured signal is converted within a short time, there is a risk of incorrect measurements in case of faulty signals. The analog inputs working with the instantaneous value conversion method cannot detect if the sampled signal value is the target signal or an overlaying disturbing pulse. They always convert the "instantaneously" detected value. This means the pending measurement task should be carefully examined with regard to time constraints.

Integrating conversion

ST modules usually work according to the integrating conversion principle. The integrating conversion involves the sampling of a measured signal across a specified time period (integration time). Although this method is slower than instantaneous value conversion, it returns a conversion with higher immunity to interference. When you select the time interval for the conversion so that it corresponds to one or several periods of the surrounding network frequency, the omnipresent interference that is possibly also overlaying the signal is basically suppressed. SIMATIC modules give you the option to set the network frequency at which the plant is operated by means of parameter assignment. The resolution and conversion times may change depending on the interference frequency suppression that is set. The technical specifications of the respective module define these dependencies.

Analog inputs with integrating methods can be used universally. Even though the cabling must also be carefully designed with these analog inputs, the requirements are much less than those for analog inputs with instantaneous value conversion due to their slower signal acquisition that is basically immune to interference.

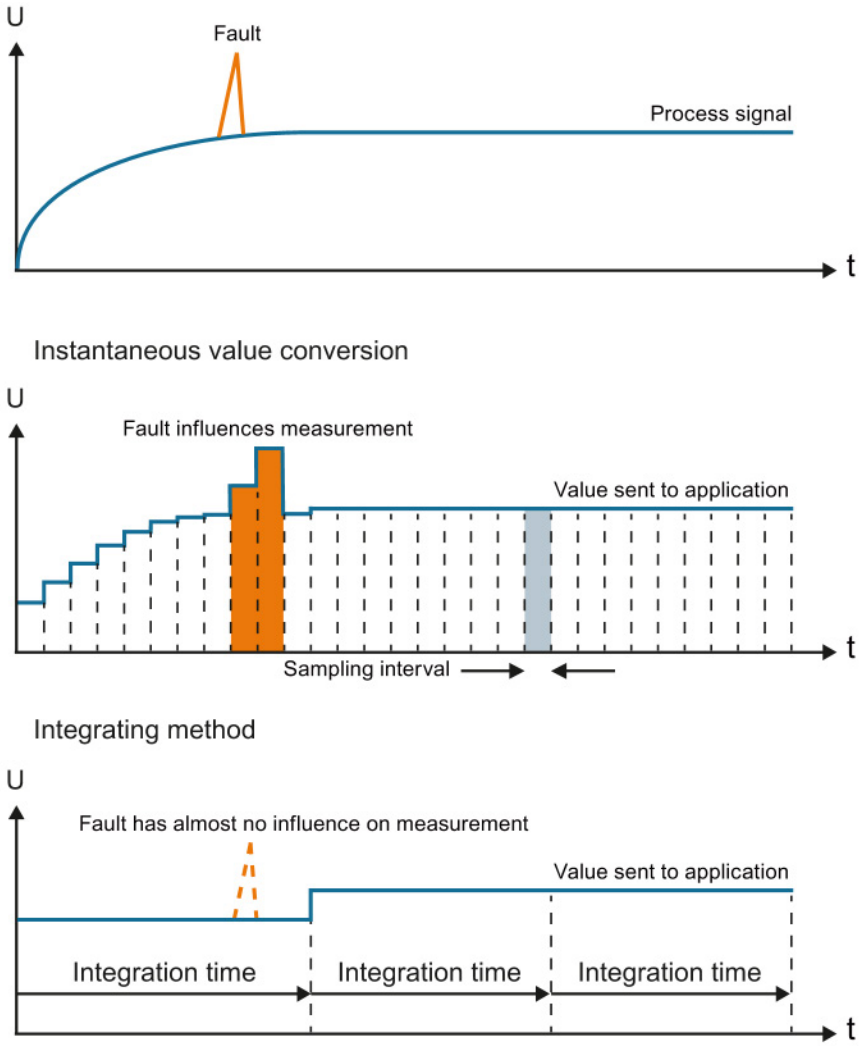


Figure 8-6 While an interference directly influences the value that is supplied to the application with instantaneous value encryption, its influence is negligible for the integrating method.

Electromagnetic compatibility

The entire architecture of HS modules is designed for fast processing of the signals. An interference-free design is therefore critical when using HS modules.

The following rules apply to the wiring of HS modules with sensors and actuators:

- Keep the cables as short as possible
- Use shielded and twisted pair cables
- Low-impedance connection of the cable shield at the respective shield supports
- Short cable loop between shield support and terminal connection

Note

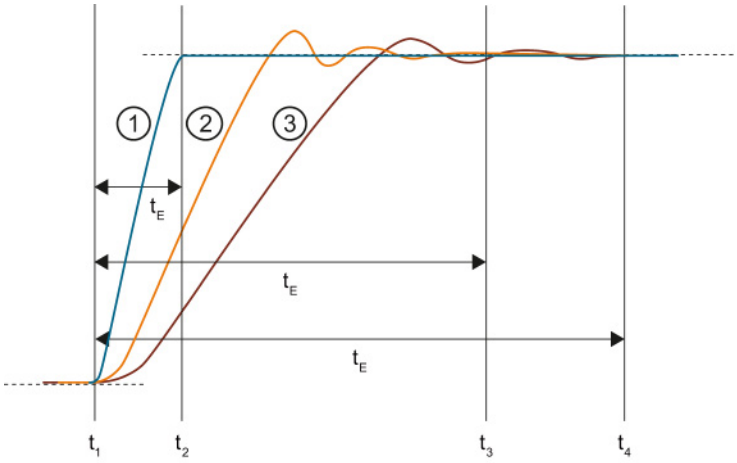
Interference-free design

Make sure that you pay close attention to the notes listed in the function manual Configuring interference-free controllers (http://support.automation.siemens.com/WW/view/en/59193566) when using HS modules.

Effect of load on the settling time

The settling times to the setpoint achieved with analog output modules depend on the applied load, among other things. To take advantage of the faster conversion times, only small loads (e.g., max. 47 nF) are permitted in HS modules as specified in the technical specifications.

The type of load has an effect on the form of settling to the setpoint when using output modules. Capacitive loads reduce the rise time due to the charging process and can cause the output signal to overshoot. Inductive loads result in a delayed current increase due to remagnetization and therefore also a shorter rise time. The figure below shows the output signal with no/small ①, medium ② and high ③ capacitive load.



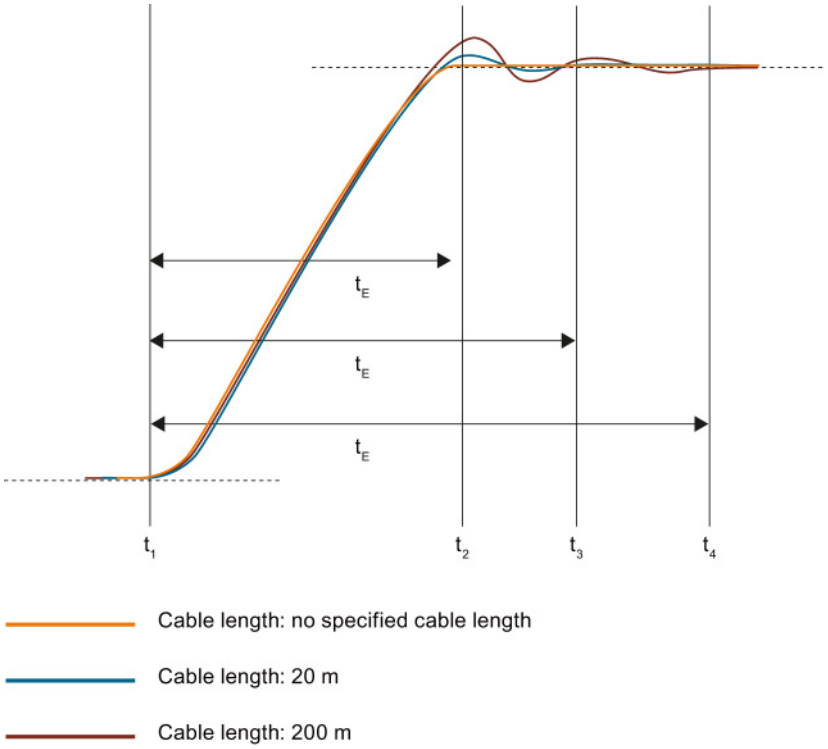
① Reference curve of a signal with no/small load capacity
② Signal with a load capacity of 47 nF
③ Signal with a load capacity of 100 nF
t_E Settling time
t_1 Module ends conversion at the terminal of the analog output channel and outputs the analog signal
t_2 Signal ① has settled and the specified analog output value has been reached (residual error 1 %)
t_3 Signal ② has settled and the specified analog output value has been reached (residual error 1 %)
t_4 Signal ③ has settled and the specified analog output value has been reached (residual error 1 %)

Figure 8-7 Effect of different loads on the settling time

Effect of the cable length on the settling time

Long cables between signal source and module are a target for interferences. You should therefore keep the cables as short as possible especially for HS modules. Cables have a capacitive and inductive component and therefore have an effect on the settling behavior of the signal.

The example below shows the jump of the output voltage of an HS output module with small, medium and long cable length. The overshoot of the input signal increases with the length of the cable and therefore the time until it reaches the setpoint.



t_E Settling time

t_1 Module ends conversion at the terminal of the analog output channel and outputs the analog signal

t_2 The signal running through a cable with short length has settled and the specified analog output value has been reached (residual error 1 %)

t_3 The signal running through a 20 m cable has settled and the specified analog output value has been reached (residual error 1 %)

t_4 The signal running through a 200 m cable has settled and the specified analog output value has been reached (residual error 1 %)

Figure 8-8 Effect of different cable lengths on the settling time

Effect of the value jump on the settling time

The figure below shows the effect of the height of the value jump between different output values on the settling time for analog output modules. The dotted line indicates the time when the signal has reached the setpoint. The higher the value jump, the later the signal reaches the setpoint.

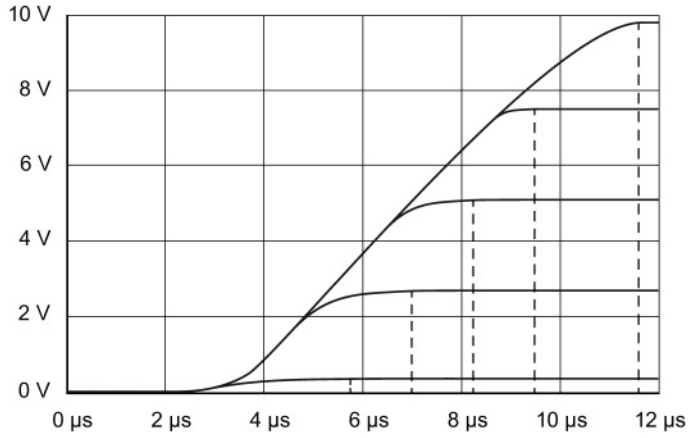


Figure 8-9 Settling time of five different analog signals with different value jumps

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This function manual will support you when you use "Time-based IO" technology with the S7-1500, ET 200MP, and ET 200SP systems.

The documentation deals with the following topics:

- Using "Time-based IO" technology
- Functions of the "Time-based IO" technology
- Hardware and software requirements for "Time-based IO"
- Configuring the "Time-based IO" function with STEP 7 (TIA Portal)
- Diagnostics of the "Time-based IO" function

Basic knowledge required

The following knowledge is required in order to understand the Function manual:

- General knowledge of automation engineering
- Knowledge of the industrial automation system SIMATIC
- Proficiency with STEP 7 (TIA Portal)

Scope of the documentation

The following documentation is valid for all components of the S7-1500, ET 200MP and ET 200SP systems that support the "Time-based IO" technology.

Conventions

The following terms are used as synonyms in this documentation:

- **TIA Portal:** This term is used as synonym for the "STEP 7" configuration and programming software (TIA Portal)".
- **TIO module**: This term is used as synonym for I/O modules of the type:
  - IO-Link Master CM 4xIO-Link
  - ET 200MP TM Timer DIDQ 16x24V
  - ET 200SP TM Timer DIDQ 10x24V
- **TIO_Time**: This term is used as synonym for the shared time basis (relative time) of the TIO modules.
- **Jitter**: This is a general term that includes various time influences affecting accuracy. This means that:
  - for input data: Deviation of the measured time from the actual event.
  - for output data: Deviation of the actual switching time from the specified time.

This documentation contains pictures of the devices described. The pictures may differ slightly from the devices supplied.

You should also pay particular attention to notes such as the one shown below:

Note

The notes contain important information on the product, handling the product or on part of the documentation to which particular attention should be paid.

Additional support

You will find information about the technical support available in the appendix.

The range of technical documentation for the individual SIMATIC products and systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).

The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Introduction

The documentation of the SIMATIC products has a modular structure and covers a range of topics concerning your automation system.

The complete documentation for the S7-1500, ET 200MP, and ET 200SP systems consists of the respective system manuals, function manuals, and manuals for the specific device.

In addition, the TIA Portal (online help) information system supports you in configuring and programming your automation system.

Documentation for Time-based IO

The following table lists further documentation that you will need when using Time-based IO.

Table 1- 1 Documentation for Time-based IO

Topic	Documentation	Most important contents
System description	System manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792)	• Application planning • Installation • Wiring • Commissioning • Maintenance
	System Manual ET 200MP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/59193214)	
	System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)	
PROFINET with TIA Portal	PROFINET with STEP 7 function manual (http://support.automation.siemens.com/WW/view/en/49948856)	• PROFINET basics • PROFINET functions • PROFINET IO Engineering • Diagnostics with PROFINET IO • Isochronous mode
CPU	Manuals (http://support.automation.siemens.com/WW/view/en/67295862/133300)	• Block diagram • Wiring • Interrupts, diagnostics, error, and system messages • Technical specifications • Dimension drawings

SIMATIC manuals

All current manuals for SIMATIC products are available for download free of charge from the Internet (http://www.siemens.com/automation/service&support).

Software download for IO-Link

The Port Configuration Tool (SIMATIC S7-PCT) is available on the Internet (http://support.automation.siemens.com/WW/view/en/32469496).

You will find software downloads for the IO-Link Device with time stamp function on the Internet:

- SICK (http://www.sick.com/group/EN/home/products/technologies/smart_sensor_solutions/Pages/product_track_and_trace.aspx)
- halstrup-walcher (http://www.halstrup-walcher.de/en/downloads/index.php)

Time-based IO basics

2

2.1 Using Time-based IO

Many processes in a plant require a relatively precise reproducibility as far as time is concerned. The reproducibility can be optimized to a limited extent by shorter CPU cycle times. The use of high-precision input/output with Time-based IO provides a more accurate reproducibility than the one that can be achieved by optimizing the CPU cycle time. An additional advantage of Time-based IO is the independence from the minimum time scale of the application cycle.

Below is a selection of typical areas of application that can benefit from this technology.

Defined response times

An output signal that responds with a precise delay time that is independent of the application cycle can be output by adding a specified time to the time stamp of an edge at the digital input.

Length measurement

The length of a product passing by can be determined by the difference between two input time stamps and an associated travel speed.

Cam controller

The ongoing movement can be extrapolated from a synchronous position information (for example, from a counter module or an axis). Based on this result, the time of a switching position (cam position) is calculated and transferred to the TIO module (output). This way the switch event takes place at the required position.

Dosing

By specifying a switch-on and a switch-off edge to a time-controlled digital output, a valve can be opened for a specific time and the amount of liquid can be dosed accordingly.

2.2 Time behavior of Time-based IO

2.2.1 Time behavior of standard technology

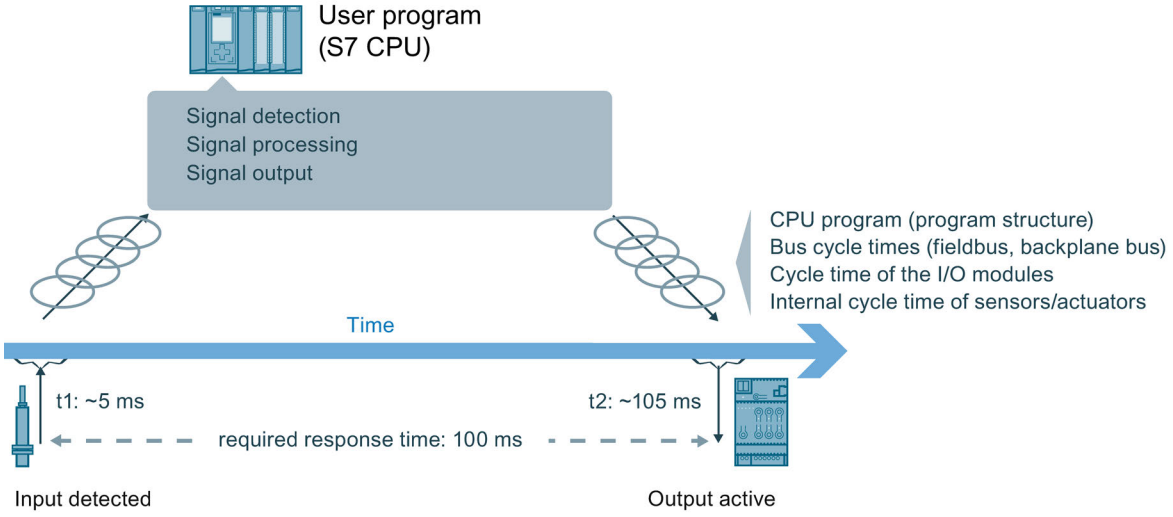
The time behavior of the inputs/outputs depends on the following factors for standard technology:

- CPU program (program structure)
- Bus cycle times (fieldbus, backplane bus)
- Cycle time of the I/O modules
- Internal cycle time of sensors/actuators

A deterministic statement as to

- when an input event (e.g., sensor signal) has taken place
- when the output event has an effect on the input event (e.g., output switches)

will become inaccurate due to the time factors listed above.

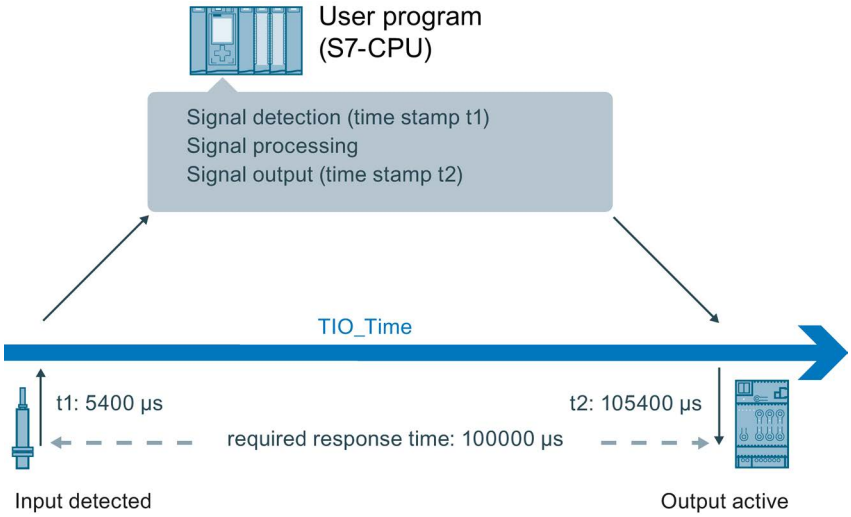


2.2.2 Time-based IO properties

Time-controlled I/O functionality

Time-based IO stands for time-based processing of I/O signals. All input signals are referred to one time (TIO_Time). The input signals receive the time stamp t1. After signal processing, the output event can also be linked with the TIO_Time and output at the required time. Output takes place at time t2.

Here an example for Time-based IO:



Independence and focus of Time-based IO

The shared time basis (TIO_Time) of all components involved is the basis for Time-based IO. By using TIO_Time, the accuracy of the output with Time-based IO does not depend on:

- CPU program (program structure)
- Bus cycle times (fieldbus, backplane bus)
- Cycle time of the I/O modules
- Internal cycle time of the IO-Link sensors/actuators

The focus of Time-based IO is not on the I/O response time but on the predictability (determinism) of I/O signals. With Time-based IO, it is possible to respond to an input signal with an output signal within a defined time. Keep in mind the system-dependent minimum response time when using Time-based IO.

Time-based IO stands for:

- I/O functionalities executed with high precision
- I/O processes with time stamp

Accuracy

Accuracy is crucial for the performance capability of Time-based IO.

Accuracy is a property of

- TIO module
- IO-Link sensor/ actuator

and indicates the deviation with which the required response is achieved. For Time-based IO, the accuracy and reproducibility of the response is in the millisecond range.

Response time

In addition to a very high accuracy, a minimum response time to an input event can result depending on the configuration.

The response time is the time between the input event and the required output event.

For the minimum response time:

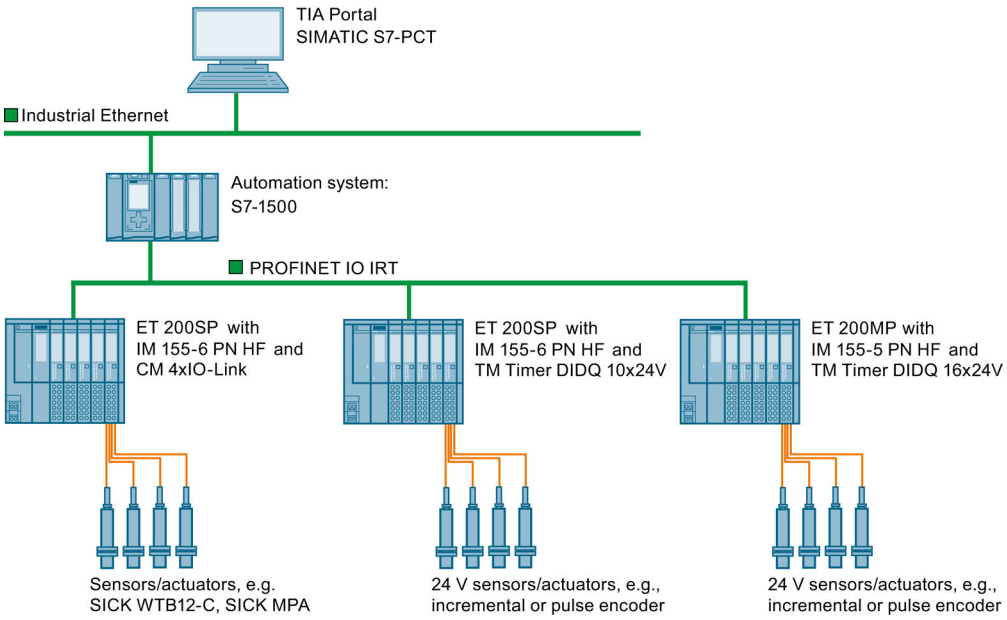
at least 3 * application cycle (T_{APP})

2.3 System environment

Introduction

Possible system configurations with PROFINET for the use of Time-based IO are shown below.

Use with TIA Portal



2.4 Hardware requirements

Introduction

The properties of the hardware components required for Time-based IO are listed below. You will also find specific modules as an example.

Requirements

Component	Properties	Examples
CPU	• Isochronous mode/ PROFINET IO IRT: provides defines response time and high-precision plant behavior.	• CPU 1511-1 PN
ET 200 interface module	• Supports isochronous mode	• ET 200SP with IM 155-6 PN HF (as of firmware V2.1) • ET 200MP with IM 155-5 PN HF
I/O module	• TIO module	• ET 200SP: CM 4xIO-Link (as of firmware V2.0) TM Timer DIDQ 10x24V • ET 200MP: TM Timer DIDQ 16x24V
IO-Link Device for CM 4xIO-Link	• supports IO-Link time stamp function	• SICK WTB12-C • halstrup-walcher PSE, PSS, PSW

2.5 Configuration software requirements

Introduction

Below please find a list of the software versions which support the "Time-based IO" function.

Requirements

Configuration software	Requirements	Supported hardware components	Additional information
STEP 7 (TIA Portal) as of V13	• PROFINET IO IRT • For CM 4xIO-Link: IO-Link technology	• S7-1500 automation system • ET 200SP and ET 200MP distributed I/O systems • CM 4xIO-Link • TM Timer DIDQ 16x24V (as of V13 Update 3) • TM Timer DIDQ 10x24V (as of V13 Update 3)	TIA Portal online help
S7-PCT as of V3.2	—	• CM 4xIO-Link	S7-PCT online help

TIO instructions

The TIO instructions are specific function blocks for use of Time-based IO. The following TIO instructions (Page 29) are available:

- TIO_SYNC
- TIO_IOLink_IN
- TIO_IOLink_OUT
- TIO_DI
- TIO_DQ

As of V13 Update 3, the TIO instructions are available as integrated instructions in TIA Portal.

2.6 Technical implementation

Introduction

The information below will help you better understand the core aspects of Time-based IO and find out which SIMATIC functions are used to implement the described aspects.

Synchronization of involved modules in PROFINET (shared time basis)

The Time-based IO technology uses isochronous mode for all involved PROFINET stations. Isochronous communication is made possible with PROFINET IRT (Isochronous Real-Time) and isochronous mode of the PROFINET stations.

Additional information on isochronous mode is available in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) and Isochronous Mode (http://support.automation.siemens.com/WW/view/en/15218045) manuals.

Several TIO modules can be synchronized to a shared time basis by using the isochronous PROFINET. The basis of the shared time basis for the TIO modules is the relative time TIO_Time.

TIO_Time

The TIO_Time is the central time basis to which all time stamps refer.

TIO_Time has the following properties:

- Shared time basis for all TIO modules which are synchronized with the TIO instruction TIO_SYNC.
- The time starts counting again with each CPU startup.
- TIO_Time has the data type LTime (e.g., LT#14s830ms652us315ns).
- All valid time stamps refer to TIO_Time:
  - Input time stamps of the TIO modules are converted to TIO_Time in TIO instructions TIO_IOLink_IN and TIO_DI.
  - Output time stamps are converted to output time stamps of the TIO modules in TIO instructions TIO_IOLink_OUT and TIO_DQ.

TIO instructions in the "Synchronous Cycle" OB

The TIO instructions must be called in a "Synchronous Cycle" OB.

You can find additional information in the chapter Programming (Page 29).

Modes for updating the process image

In isochronous mode, you can influence the order of the update of the process image partition of the input and output data. In doing so, you can select the following program execution models:

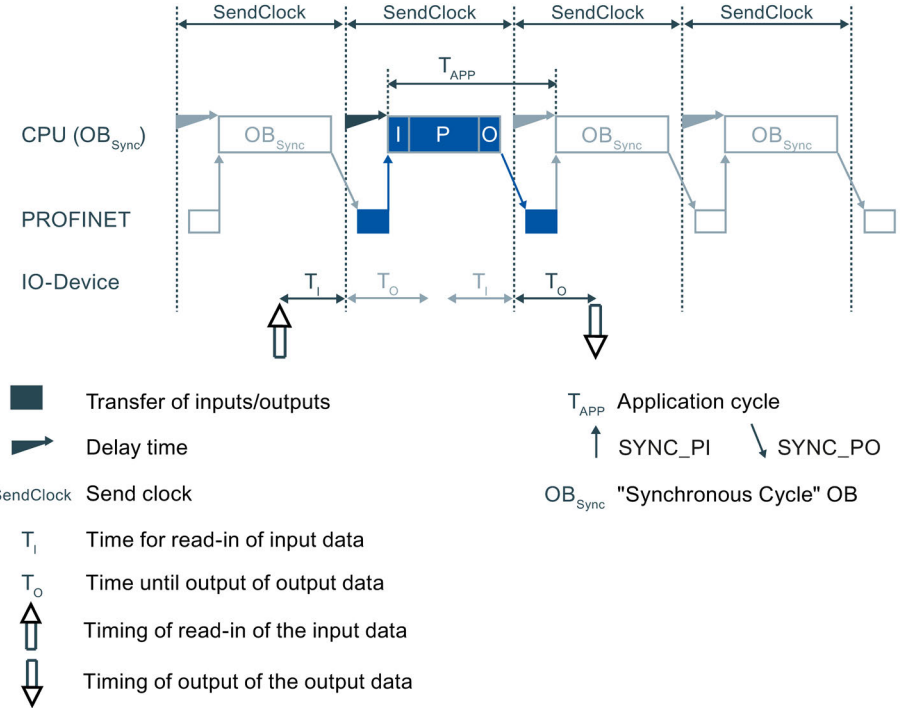
- IPO model (application cycle factor = 1)
- OIP model (application cycle factor >= 1)

The abbreviations I, P, O stand for the following processes: I = Input, P= Processing, O = Output.

Additional information on the application cycle factor is available in the PROFINET with STEP 7 (http://support.automation.siemens.com/WW/view/en/49948856) Manual.

IPO model (application cycle factor = 1)

The user program is started after the delay time. Start by updating the corresponding process image partition of the inputs in the user program by calling the SYNC_PI system instruction. Processing is started next (for example, calculation of the time stamps). The corresponding process image partition of the outputs is updated at the end of the user program in the CPU by SYNC_PO.



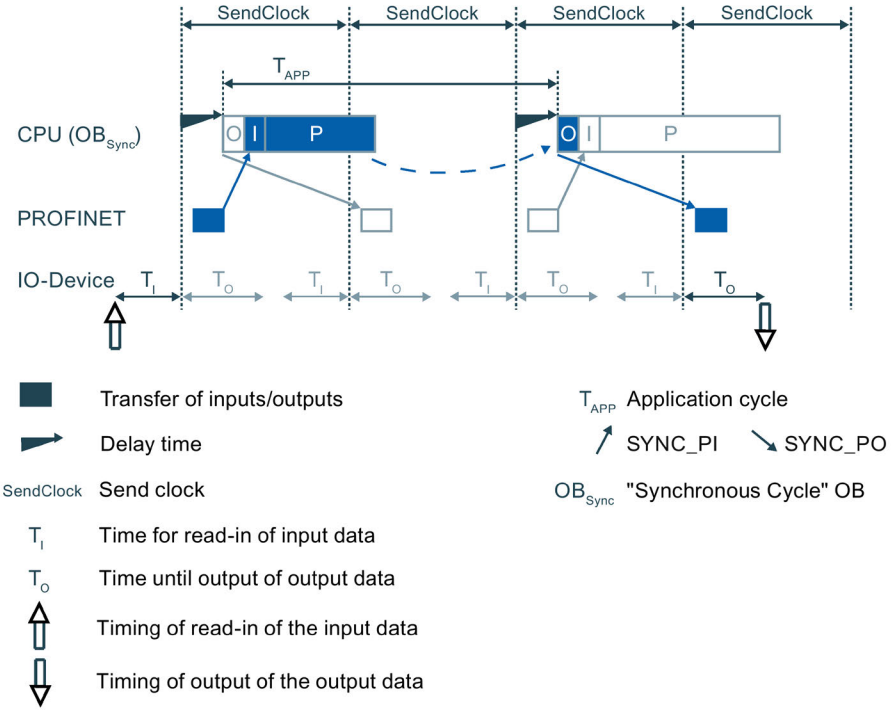
Properties of the IPO model:

- Supports shorter response times
- The application cycle may not be greater than the send clock.

  This gives the application less time than with the OIP model.

OIP model (application cycle factor >= 1)

The user program is started after the delay time. In PIP_Mode 0, the TIO_SYNC instruction updates the process image. In the other modes, you start by updating the corresponding process image partition of the outputs in the user program by calling the SYNC_PO system instruction. As a result, the output data that was calculated in the previous network cycle will become active during the next network cycle (T_O). Next the corresponding process image partition of the inputs is updated in the CPU by SYNC_PI. Processing starts after the data is transmitted (for example, calculation of the time stamps).



Properties of the OIP model:

- The response time is longer than with the IPO model.
- It is one application cycle longer than permitted by the send clock.

  This gives the application more time than with the IPO model.

Influence of accuracy

To estimate the accuracy you need the accuracy of

- TIO module
- Sensor/ actuator

Consult the data sheets of the respective module regarding the accuracy value.

You have to add the individual jitters of the TIO modules and the sensors/actuators. You can neglect any other influencing factors.

Configuring and parameter assignment 3

3.1 Requirements

Introduction

You need additional software components to use Time-based IO. You must also have created the standard configuration for your project.

Below you will learn more about the standard configuration for Time-based IO.

Requirements

In the TIA Portal:

- The project has been created.
- The CPU has been created and the parameters are assigned.
- ET 200 distributed I/O and modules have been created and the parameters are assigned.
- The connection has been created and the parameters are assigned via PROFINET.
- A "Synchronous Cycle" OB has been created.

In addition for IO-Link:

- S7-PCT is installed on the programming device/PC.
- IODD for IO-Link device (with time stamp function) are installed.

* Does not describe the exact location but the topic in the configuration software.

Setting for Time-based IO

If you have no special response time requirements, the following setting is suitable as a starting point:

- Send clock: 2 ms
- Application cycle: 4 ms
- Assignment to the process image partition: PIP1
- PIP_Mode: 0 (OIP model)

See also

Programming of Time-based IO (Page 30)

3.3 Configure IO-Link and activate Time-based IO

Introduction

For Time-based IO, the ports of the IO-Link Master must be set to the required operating mode and suitable sensors/actuators must be connected to the ports.

Requirements

- S7-PCT is installed on the programming device/PC.
- IODD for IO-Link Device (with time stamp function) are installed.

  You can find additional information on installation in the online help for S7-PCT.
- The project is open in network view in the TIA Portal.
- The hardware catalog is open.

Procedure

1. Right-click the IO-Link Master in the TIA Portal and select "Start Device Tool".

   The Port Configuration Tool (S7-PCT) opens.

2. Select the connected IO-Link Device (sensors/actuators with time stamp function) from the device catalog for the ports of the IO-Link Master in S7-PCT.

   Use drag-and-drop to insert the IO-Link Device to the matching Port of the IO-Link Master.

3. Adapt the settings of the ports to match their respective task in the application.

   Possible port settings:

   – IO-Link Time based IN: The input signals of the sensor are given a time stamp.

   – IO-Link Time based OUT: The signal is output at the specified time.

4. Save the settings.
5. Download the Port configuration to the IO-Link Master.
6. Close S7-PCT.

Result

The IO-Link Master is configured with the connected sensor and actuator information.

Programming

4

4.1 Overview of instructions

Introduction

Time-based IO is used with special instructions (TIO instructions). The TIO_SYNC TIO instruction is responsible for synchronizing all involved TIO modules and creates a unique time basis (TIO_Time) to which all actions are referenced.

Depending on the type of TIO module, additional instructions undertake the reading in of process input signals with associated time stamps and/or the time-controlled output of process output signals.

Note

The TIO instructions use the time stamp functions of the TIO modules. For the other functions of the respective TIO module, no use of instructions is necessary.

TIO instructions

Instruction	Can be used with TIO module	Short description
TIO_SYNC (Page 34)	• CM 4xIO-Link • TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Synchronizes the TIO modules and provides the time basis for Time-based IO
TIO_IOLink_IN (Page 38)	• CM 4xIO-Link	Reads the input signals with time stamp from the IO-Link Device (sensor)
TIO_DI (Page 42)	• TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Detects the edges at the digital input (Timer DI) and supplies the associated time stamp
TIO_IOLink_OUT (Page 47)	• CM 4xIO-Link	Outputs time-controlled output signals at the IO-Link Device
TIO_DQ (Page 52)	• TM Timer DIDQ 16x24V • TM Timer DIDQ 10x24V	Outputs time-controlled edges at the digital output (Timer DQ)

4.2 Programming of Time-based IO

Introduction

For use of Time-based IO, the TIO instructions must be called in a "Synchronous Cycle" OB. The application can also run in another OB. In this way, you can shorten the runtime of the "Synchronous Cycle" OB.

You need the following TIO instructions according to the required task:

TIO module	TIO instructions	
CM 4xIO-Link	• Per sensor, one TIO_IOLink_IN for read-in • Per actuator, one TIO_IOLink_OUT for output	One TIO_SYNC (for up to eight TIO modules)
TM Timer DIDQ	• Per digital input, one TIO_DI for read-in • Per digital output, one TIO_DQ for output	

This section below describes the programming of the CPU for Time-based IO.

Requirements

Hardware configuration in the TIA Portal:

- The TIO modules are assigned to an isochronous network.
- The TIO modules are assigned to a shared process image partition.
- The process image partition is assigned to a "Synchronous Cycle" OB.

Additional information on configuration of Time-based IO is available in the section Settings for Time-based IO (Page 26).

Procedure

1. Create a TIO_SYNC TIO instruction in the "Synchronous Cycle" OB.
2. Connect all TIO modules to be synchronized at the TIO_SYNC TIO instruction using parameters HWID_1 to HWID_8.

   The HWID is located in HWCN under the module properties.
3. Configure the send clock at the TIO_SYNC TIO instruction.

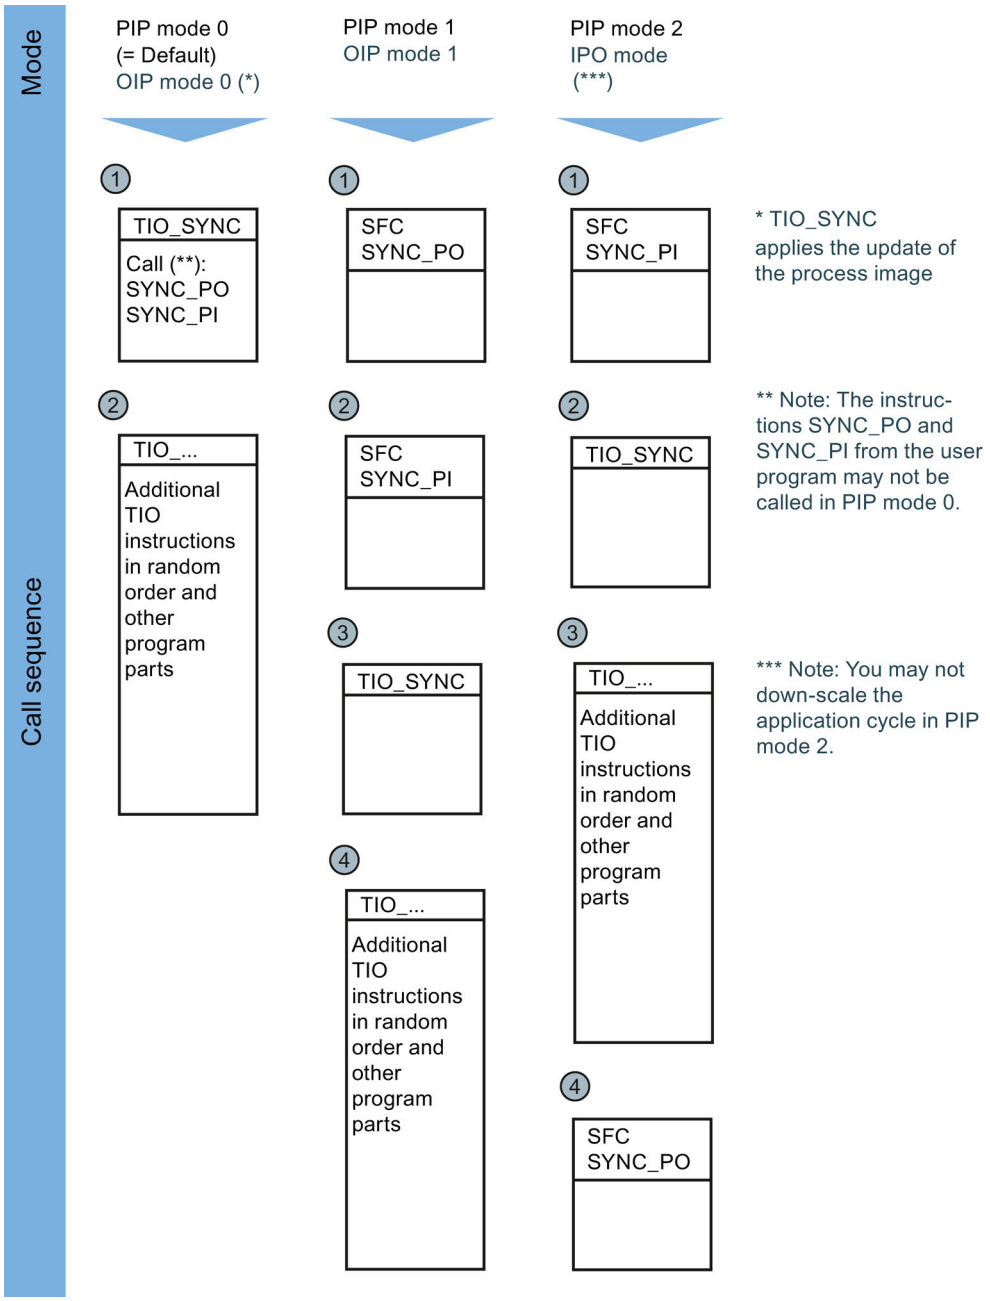
   The send clock is listed in the properties of the ET 200 station.

4. Set the data update mode at the TIO_SYNC instruction at the PIP_Mode input parameter.

   The description of the modes is available in the chapter Technical implementation (Page 20).

   The parameter assignment of the TIO_SYNC TIO instruction is complete.

5. For the following instructions, note the call sequence depending on the selected value for PIP_Mode:



6. Add the TIO instructions for data read-in/output required for your application in the "Synchronous Cycle" OB.

7. Connect the TIO_SYNC_Data input to the output of the same name at TIO_SYNC at each TIO instruction for read-in and output.
8. Assign the input parameters TO (see properties of the ET 200 station), HWID (see module properties in HWCN), and Port/Channel" for the TIO instructions for data read-in/output.

   Programming for the Time-based IO functionality is complete.
9. Connect the Time-based IO functionality with your application.
10. Compile and download the entire project to the CPU.

Result

You have completed programming the use of Time-based IO.

4.3 Time-based IO

4.3.1 TIO_SYNC: Synchronizing TIO modules

Description

You can use Time-based IO with the TIO_SYNC instruction. TIO_SYNC synchronizes TIO modules to a shared time basis TIO_Time.

You can synchronize up to 8 TIO modules with TIO_SYNC. All TIO modules must be assigned to the same process image partition (PIP). If you select "0" for the input parameter PIP_Mode, you assign the number of the process image partition at the PIP_PART input parameter.

Startup characteristics

At the startup of the CPU, the TIO_SYNC instruction receives and checks the input parameters once and initializes the TIO_Time. If startup takes place without errors, the instruction changes to normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction ensures synchronization of all TIO modules configured at the HWID input.

The calculated TIO_Time for the instructions of the TIO modules is provided at the TIO_SYNC_Data output.

Reaction to error

The Error output indicates whether the instruction parameters are assigned correctly and whether an error has occurred. If the instruction was not processed successfully, the reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_SYNC instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
HWID_1 ... HWID_8*	Input	HW_IO	-1	Hardware identifier for TIO module from HWCN
SendClock*	Input	LTime	LT#0ns	Send clock of the sync domain. Apply the send clock from the PROFINET configuration.
PIP_Mode*	Input	USInt	0	Mode for the data update**: • 0: OIP model with internal update of the process image by SYNC_PO and SYNC_PI. • 1: OIP model without internal update of the process image • 2: IPO model without internal update of the process image
PIP_PART*	Input	USInt	1	Only relevant if PIP_Mode = 0 Number of the process image partition which is to be updated isochronously.
TIO_SYNC_ Data	Output	"TIO_SYNC_ Data"		Calculated system time for the TIO instructions of the TIO modules and internal data used for synchronization. See UDT "TIO_SYNC_Data" (Page 57).
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

** The IPO model (PIP_Mode = 2) provides the shortest response times, but it also places the highest demands on system performance. Processing of all TIO instructions and other program sections must be completed within one send clock.

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
1001xxxx	An error has occurred with system function RD_SINFO. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10020000	The read cycle time of the isochronous OB is LT#0ms or has as negative value and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the value of the cycle time. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10030000	The TIO_SYNC instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB. Possible cause: The TIO_SYNC instruction was called in an "MC-Servo" or "MC-Interpolator" OB.	Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10040000	The assigned value at the PIP_Mode input parameter is outside the valid range of 0 to 2.	Correct the value at the PIP_Mode input parameter.
10050000	The assigned send clock is outside the permitted range of 0 < SendClock <= 4 ms and is therefore invalid.	Correct the value of the send clock.
0006xxxx	An error has occurred during execution of the SYNC_PI system function. The low word xxxx displays the error information of the RET_VAL return value from SYNC_PI.	Read the description of the SYNC_PI in the TIA Portal information system.
0007xxxx	An error has occurred during execution of the SYNC_PO system function. The low word xxxx displays the error information of the RET_VAL return value from SYNC_PO.	Read the description of the SYNC_PO in the TIA Portal information system.

Error code (DW#16#...)	Meaning	Remedy
10080000	Isochronous mode missing. Time-based IO cannot be used. Possible cause: Internal error during address calculation	Check the values of input parameters HWID_1 to HWID_8. Specify the hardware identifier of the TIO module from its module properties in HWCN.
10090000	TIO module HWID_1: Error during reading of HWID_1.	Check the value of the respective input parameter. Specify the hardware identifier of the TIO module in each case from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
100A0000	TIO module HWID_2: Error during reading of HWID_2.	
100B0000	TIO module HWID_3: Error during reading of HWID_3.	
100C0000	TIO module HWID_4: Error during reading of HWID_4.	
100D0000	TIO module HWID_5: Error during reading of HWID_5.	
100E0000	TIO module HWID_6: Error during reading of HWID_6.	
100F0000	TIO module HWID_7: Error during reading of HWID_7.	
10100000	TIO module HWID_8: Error during reading of HWID_8.	
10110000	The configured process image partition at input parameter PIP_PART is not within the valid range of 1 to 31.	Correct the value at the PIP_PART input parameter.
x0FF0000	General internal error.	—

4.3.2 TIO_IOLink_IN: Read process input signals with time stamps

Description

You can use the Time-based IO with the TIO_IOLink_IN instruction. TIO_IOLink_IN detects an event at the IO-Link Device and returns the process value including the associated time stamp.

The IO-Link Device must be equipped with the time stamp function and the Port must be in "IO-Link, Time based IN" mode.

Startup characteristics

During startup of the CPU, the instruction TIO_IOLink_IN applies the input parameters once and checks the following:

- Checking HWID
- Checking whether the Port number is in the range (1 to 4)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for a positive value
- Checking the setting to type IO-Link
- Checking Port mode regarding configuration for IO-Link Time based IN
- Checking whether the OB is a "Synchronous Cycle" OB
- Checking PortQualifier

If startup takes place without errors, the instruction changes to normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction detects the process data (SA_Data) of an IO-Link Device and the associated time stamp (time = TIO_Time) of the last valid change. Each valid change of the SA_Data with a correctly functioning port is accompanied by a valid time stamp.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_IOLink_IN instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN
Port*	Input	USInt	0	Port number (1 to 4) of the connected IO-Link Device
TIO_SYNC_ Data*	Input	"TIO_SYNC_ Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
SA_Bit0	Output	Bool	False	Display of a process data change (bit 0 of SA_Data). SA_Bit0 is event-oriented. As long as no valid time stamp has been acquired (EventCount = 0), the process data are invalid.
SA_Bit1	Output	Bool	False	Display of a process data change (bit 1 of SA_Data). SA_Bit1 is event-oriented. As long as no valid time stamp has been acquired (EventCount = 0), the process data are invalid.
SA_Data	Output	DWord	16#0	Process data SA_Data (Sensor Application Data)
TimeStamp	Output	LTime	LT#0ns	Time stamp: Time when a change of the process signal SA-Data took place at the IO-Link Device.
EventCount	Output	UInt	0	Counter: Is incremented with each new, valid time stamp. The counter is reset with each CPU startup.
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The system function is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number at the Port input parameter is outside the valid range of 1 to 4.	Correct the value at the Port input parameter.
10020000	The TIO_IOLink_IN instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
10060000	Unable to find IO-Link Device. Possible cause: The module configured using the hardware identifier is not an IO-Link Master for Time-based IO.	• Make sure that the configured module is an IO-Link Master for Time-based IO. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of $0 < T_{APP} <= 16$ ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_IOLink_IN is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of $0 < T_o <= 4$ ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	The converted time stamp is invalid.	Check the connected sensor and the interaction between IO-Link Master and sensor (e.g., configuration).
000D0000	The value status PortQualifier of the IO-Link indicates that the process data is invalid.	Check the connected sensor and its configuration.
100E0000	The configured port mode of the IO-Link is incorrect.	Check the configuration of the connected sensor with S7-PCT.
x0FF0000	General internal error.	—

4.3.3 TIO_DI: Reading in edges at digital input and associated time stamps

Description

You can use the Time-based IO with the TIO_DI instruction. TIO_DI continuously detects the edges at a digital input of a TM Timer DIDQ and returns the associated time stamps.

Startup characteristics

During startup of the CPU, the instruction TIO_DI applies the input parameters once and checks the following:

- Checking HWID
- Checking to see if the number of the digital input (Channel) is in the permitted range (depending on addressed module and channel configuration)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for validity (0 ms to 4 ms)
- Checking whether the OB is a "Synchronous Cycle" OB

If startup takes place without errors, the instruction changes to normal operation. The input parameter EdgeSel can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction detects the edges at a digital input and the associated time stamps (time = TIO_Time) of the last valid, defined edge pair. Use the input parameter EdgeSel to determine the edges for which time stamps are detected.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_DI instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN
Channel*	Input	UInt	0	Number (0 ... m) of the digital input of the connected TM Timer DIDQ
TIO_SYNC_Data*	Input	"TIO_SYNC_Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
EdgeSel	Input	UInt	3	Specify the edges for which time stamps are detected: 0_D: Reserved 1_D: Only at positive edges 2_D: Only at negative edges 3_D: Positive and negative edges (order depending on occurrence) 4_D: First positive, then negative edge 5_D: First negative, then positive edge 6 bis 255_D: Reserved
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
DI	Output	Bool	False	Status of digital input. If an inversion of the digital input is configured, this parameter is inverted as well.
TimeStampRE	Output	LTime	LT#0ns	Time stamp: Time at which a positive edge was detected. Exception: EdgeSel = 2_D: Time at which a negative edge was detected.
TimeStampFE	Output	LTime	LT#0ns	Time stamp: Time at which a negative edge was detected. Exception: EdgeSel = 1_D: Time at which a positive edge was detected.
EventCountRE	Output	UInt	0	Counter: Is incremented with each new, valid time stamp at a positive edge. The counter is reset with each CPU startup.
EventCountFE	Output	UInt	0	Counter: Is incremented with each new, valid time stamp at a negative edge. The counter is reset with each CPU startup.
LEC	Output	UInt	0	Counter: Number of edges for which no time stamp could be saved. The module can count a maximum of seven edges per application cycle. The counter is reset with each new application cycle.

Parameter	Declaration	Data type S7-1500	Default	Description
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The system function is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number of the digital input at the Channel input parameter is outside the permitted range (depending on addressed module and channel configuration).	Correct the value at the Channel input parameter.
10020000	The TIO_DI instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
10060000	Unable to find TM Timer DIDQ. Possible cause: The module configured using the hardware identifier is not a TM Timer DIDQ.	• Make sure that the configured module is a TM Timer DIDQ. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of $0 < T_{APP} <= 16$ ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_DI is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of $0 < T_o <= 4$ ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.

Error code (DW#16#...)	Meaning	Remedy
000C0000	The converted time stamp is invalid. Possible cause: Communication error	Check the PROFINET communication with the TIO module.
000D0000	The Quality Information of the digital input indicates that an error has occurred at the digital input.	Check the wiring of the digital input.
000E0000	The assigned number at the Channel input parameter is not a digital input configured as Timer DI.	• Check the channel configuration (only for TM Timer DIDQ 16x24V). • Check the operating mode of the digital input.
000F0000	The assigned value at the EdgeSel input parameter is outside the valid range of 1 to 5.	Correct the value at the EdgeSel input parameter.
10100000	The send clock is outside the permitted range of 0 < SendClock <= 4 ms and is therefore invalid. The error code can also indicate that • The data in TIO_SYNC_Data is invalid or does not exist. • The TIO_DI instruction is not called in an isochronous OB.	Correct the send clock.
x0FF0000	General internal error.	—

4.3.4 TIO_IOLink_OUT: Output time-controlled process output signals

Description

You can use Time-based IO with the TIO_IOLink_OUT instruction. TIO_IOLink_OUT lets you activate the output data of an IO-Link Device at a specified time.

The IO-Link Device must be equipped with the time stamp function and the Port must be in "IO-Link, Time based OUT" mode.

Startup characteristics

During startup of the CPU, the instruction TIO_IOLink_OUT applies the input parameters once and checks the following:

- Checking HWID
- Checking whether the Port number is in the range (1 to 4)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for a positive value
- Checking the setting to type IO-Link
- Checking Port mode regarding configuration for IO-Link Time based OUT
- Checking whether the OB is a "Synchronous Cycle" OB
- Checking PortQualifier

If startup takes place without errors, the instruction changes to normal operation. The input parameters REQ , Out_Mode, TimeStamp and AA_Data can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

In normal operation, the instruction sends the process data (AA_Data) to an IO-Link Device. The output data AA_Data are activated at the time defined at the input parameter TimeStamp.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

You start an output job with a positive edge at the "REQ" parameter. You can only start a new job when there is no error pending and no job is active. When starting the output job, the AA_Data (bit 0, 1) are activated on the IO-Link Device at a time defined by TimeStamp. The job is done when the last application cycle is executed before the output time is reached (Done). Status and Error are constantly being updated during the job runtime.

Note

Once the job has been started with a positive edge, you can adapt the output time with the input of a new TimeStamp without having to restart the job.

Constraint:

If the adapted time stamp is less than 16 ms before the output time (TimeStamp - TIO_Time < 16), the last valid time stamp is used.

If you specify the value 0 as TimeStamp, the output is written directly with the data specified at the input AA_Data. This gives you the option to implement a direct control from the TIO module without time stamp in manual mode. You can use the direct control to interrupt an ongoing job.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_IOLink_OUT instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
REQ	Input	Bool	False	Starts the job at a positive edge.
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN.
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
Port*	Input	USInt	0	Port number (1 to 4) of the specified IO-Link Device
TIO_SYNC_Data*	Input	"TIO_SYNC_Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
TimeStamp	Input	LTime	LT#0ns	Time stamp: Time when the process data (AAE1, AAE2) are to be output.
AA_Data	Input	Word	16#0	Process output data: Date to be output (Word). Includes AAE1 and AAE2 on bit 0, 1.
Busy	Output	Bool	False	Busy = True: The job is not complete yet.
Done	Output	Bool	False	Done = True is displayed for one cycle: The job is signaled as "done, no errors".
Error	Output	Bool	False	If True, this output indicates that an error has occurred. In this case, BUSY and DONE are set to False. For detailed information see Status parameter. Error is reset as soon as the error is remedied.
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number at the Port input parameter is outside the valid range of 1 to 4.	Correct the value at the Port input parameter.
10020000	The TIO_IOLink_OUT instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
10060000	Unable to find IO-Link Device. Possible cause: The module configured using the hardware identifier is not an IO-Link Master for Time-based IO.	• Make sure that the configured module is an IO-Link Master for Time-based IO. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
00080000	TIO module is not synchronized using the TIO_SYNC instruction.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is outside the permitted range of 0 < T_{APP} <= 16 ms and is therefore invalid. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_IOLink_OUT is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	The time stamp at the TimeStamp input parameter is invalid.	Check the TimeStamp input parameter.
000D0000	The value status PortQualifier of the IO-Link indicates that the process data is invalid.	Check the connected sensor and its configuration.
100E0000	The configured port mode of the IO-Link is incorrect.	Check the configuration of the connected sensor with S7-PCT.
100F0000	The read cycle time of the "Synchronous Cycle" OB is too long. T_{APP} > 16 ms.	Configure a smaller multiple of the send clock as the cycle time.
x0FF0000	General internal error.	—

4.3.5 TIO_DQ: Output edges time-controlled at the digital output

Description

You can use Time-based IO with the TIO_DQ instruction. TIO_DQ switches the digital output of a TM Timer DIDQ at a specified time.

Startup characteristics

During startup of the CPU, the instruction TIO_DQ applies the input parameters once and checks the following:

- Checking HWID
- Checking to see if the number of the digital input (Channel) is in the permitted range (depending on addressed module and channel configuration)
- Checking TIO_SYNC_Data.Error: Is an error present at TIO_SYNC?
- Checking T_o for validity (0 ms to 4 ms)
- Checking whether the OB is a "Synchronous Cycle" OB

If startup takes place without errors, the instruction changes to normal operation. The input parameters REQ , Out_Mode, TimeStampRE and TimeStampFE can be changed during normal operation. In the event of an error, the instruction does not change to normal operation and generates an error message.

Operating principle

The instruction outputs edges time-controlled at a digital output during normal operation.

- At the time defined at the TimeStampRE input parameter, a positive edge is output at the digital output.
- At the time defined at the TimeStampFE input parameter, a negative edge is output at the digital output.

Use the input parameter Out_Mode to determine if only one edge or both edges are output.

You connect the input TIO_SYNC_Data with the output of the same name of the TIO_SYNC instruction. This ensures a shared time basis.

You start an output job with a positive edge at the "REQ" parameter. You can only start a new job when there is no error pending and no job is active. When the output job is started, the digital output is switched at the times defined with TimeStampRE and TimeStampFE.

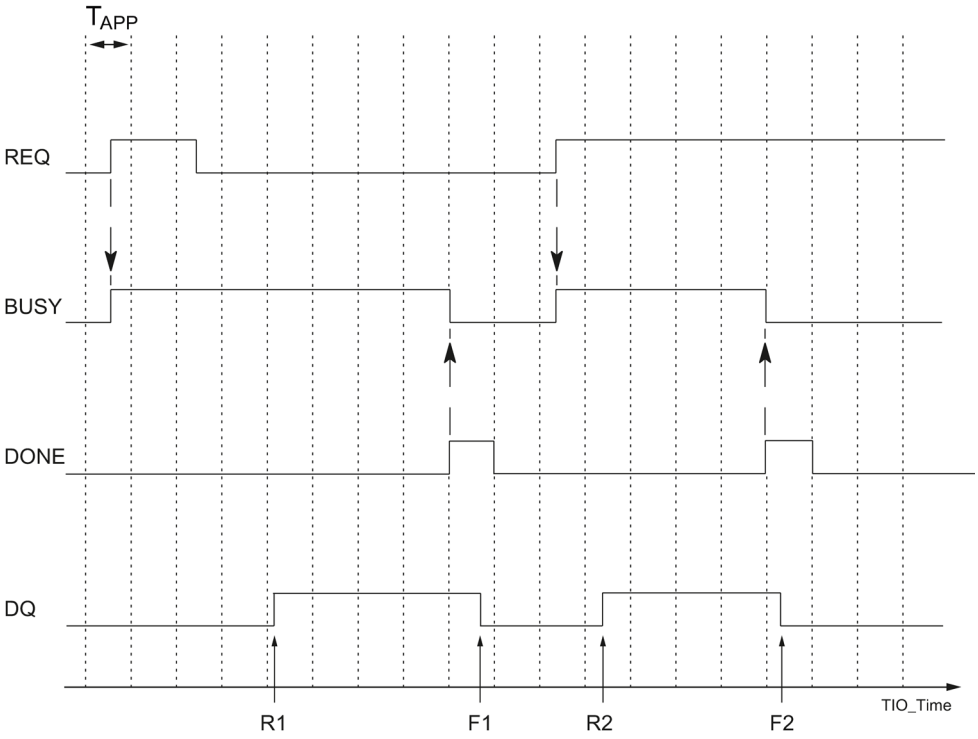
- If the digital output is already set at time TimeStampRE, the output job is not transferred to the module for the positive edge.
- If the digital output is not set at time TimeStampFE, the output job is not transferred to the module for the negative edge.

This means the digital output is not switched in both cases.

The job is done when the last application cycle is executed before the second output time is reached (DONE). Status and Error are constantly being updated during the job runtime.

The figure below shows an example for the reaction of the bits DONE and BUSY at the start of an output job under the following conditions:

- Out_Mode = 2
- The two time stamps are not adapted between the start of the job and the output.



T_{APP}	Application cycle
R1, R2	Specified times of a positive DQ edge
F1, F2	Specified times of a negative DQ edge

Note

Once the job has been started with a positive edge, you can adapt the output times with the input of TimeStampRE and TimeStampFE without having to restart the job.

Constraint:

If an adapted time stamp is less than two application cycles away from the output time (TimeStampRE - TIO_Time < 2*T_{APP} or TimeStampFE - TIO_Time < 2*T_{APP}), the last valid time stamp is used.

If you specify the value "0" as TimeStampRE or TimeStampFE, you can output the respective edge directly at the digital output with the input parameter Out_Mode = 3. This gives you the option to implement a direct control from the TIO module without time stamp in manual mode. You can use the direct control to interrupt an ongoing job.

Changes to the input parameters are not applied until the TIO_DQ instruction detects a startup of the CPU.

Reaction to error

The Error output indicates if the instruction was processed correctly. The reasons for the errors are displayed at the Status output.

Parameter

The table below shows the parameters of the TIO_DQ instruction.

Parameter	Declaration	Data type S7-1500	Default	Description
REQ	Input	Bool	False	Starts the job at a positive edge.
HWID*	Input	HW_IO	0	Hardware identifier for TIO module from HWCN.
Channel*	Input	UInt	0	Number (0 ... m) of the digital output of the connected TM Timer DIDQ
TIO_SYNC_Data*	Input	"TIO_SYNC_Data"		System time provided for the TIO instructions of the TIO modules by the TIO_SYNC instruction. See UDT "TIO_SYNC_Data" (Page 57). Connect this input parameter with the "TIO_SYNC_Data" output parameter of the TIO_SYNC instruction.
Out_Mode	Input	UInt	2	Specify the output mode for the edges at the digital output: 0_D: Output only positive edge (TimeStampRE). 1_D: Output only negative edge (TimeStampFE). 2_D: Both edges are output (TimeStampRE and TimeStampFE). 3_D: Each edge is output directly when TimeStampRE = 0 or TimeStampFE = 0. If both time stamps have the value "0" or if no time stamp has the value "0", no edge is output. 4 bis 255_D: Reserved
TO*	Input	LTime	LT#0ns	T_o: Time for output of isochronous output data. Apply T_o from the ET 200 station (properties of the PROFINET interface).
TimeStampRE	Input	LTime	LT#0ns	Time stamp: Time when a positive edge is to be output.
TimeStampFE	Input	LTime	LT#0ns	Time stamp: Time when a negative edge is to be output.
StatusDQ	Output	Bool	False	Actual status of the digital output. If an inversion of the digital output is configured, StatusDQ is inverted as well.
BUSY	Output	Bool	False	BUSY = True: The job is not complete yet.
DONE	Output	Bool	False	DONE = True is displayed for one cycle: The job is signaled as "done, no errors".
Status	Output	DWord	16#0	Status of the instruction: see description of Status parameter
Error	Output	Bool	False	If True, this output indicates that an error has occurred. In this case, BUSY and DONE are set to False. For detailed information see Status parameter. Error is reset as soon as the error is remedied.

* Checked once at startup of the CPU

Status parameter

Error codes or status information is output as double word at the Status output.

The double word is divided as follows:

Segment of the error code	Meaning
z0yywwww	Error of a system function: • during startup (z = 0) • during normal operation (z = 1) System functions with subordinate use are coded in yy: See table with error codes. wwww specifies the RET_VAL of the system function. The error information is available in the help for the system function.
z0yy0000	An error that does not originate in a system function. This error receives a consecutive error number yy. The error can occur: • during startup (z = 0) • during normal operation (z = 1)

Table with error codes

Error code (DW#16#...)	Meaning	Remedy
00000000	No error.	—
10010000	The assigned number of the digital output at the Channel input parameter is outside the permitted range (depending on addressed module and channel configuration).	Correct the value at the Channel input parameter.
10020000	The TIO_DQ instruction is not called in an isochronous OB. The instruction can only be used without errors in an isochronous OB.	Make sure that TIO_DQ is called in a "Synchronous Cycle" OB.
10030000	An error occurred when reading the HWID input parameter.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0040000	The data in TIO_SYNC_Data is invalid/incorrect.	Check the TIO_SYNC instruction and the interconnection of its TIO_SYNC_Data output.
1005xxxx	An error has occurred during execution of the RD_SINFO system function. The low word xxxx displays the error information of the RET_VAL return value from RD_SINFO.	• Read the description of the RD_SINFO in the TIA Portal information system. • Make sure that TIO_SYNC is called in a "Synchronous Cycle" OB.
10060000	Unable to find TM Timer DIDQ. Possible cause: The module configured using the hardware identifier is not a TM Timer DIDQ.	• Make sure that the configured module is a TM Timer DIDQ. • Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN.

Error code (DW#16#...)	Meaning	Remedy
10070000	An internal error occurred during the address calculation.	Check the value at the HWID input parameter. Specify the hardware identifier of the TIO module from its module properties in HWCN. An internal system constant of data type Hw_SubModule is available for the symbolic addressing.
x0080000	TIO module is not synchronized using the TIO_SYNC instruction. The error code can also indicate that: • A job was already present before the first run of the instruction. • The assigned number at the Channel input parameter is not a digital output.	Check the instruction TIO_SYNC.
10090000	The read cycle time of the isochronous OB is LT#0ms or has as negative value and is therefore invalid. Correct the value. The instruction can only be used without errors in an isochronous OB.	• Correct the cycle time. • Make sure that TIO_DQ is called in a "Synchronous Cycle" OB.
100A0000	The assigned time at the TO input parameter is outside the permitted range of 0 < T_o <= 4 ms.	Correct the value at the TO input parameter.
100Bxxxx	An error has occurred during execution of the RD_ADDR system function. The low word xxxx displays the error information of the RET_VAL return value from RD_ADDR.	Read the description of the RD_ADDR in the TIA Portal information system.
000C0000	One or both time stamps at the TimeStampRE and TimeStampFE input parameters are invalid. The error is only signaled for the duration of one application cycle.	Check the TimeStampRE and TimeStampFE input parameters.
000D0000	The Quality Information of the digital output indicates that an error has occurred at the digital output.	• Check the parameter assignment of the digital output. • Check the wiring of the digital output for short-circuit, overload, and overtemperature.
000E0000	The assigned number at the Channel input parameter is not a digital output.	• Check the channel configuration (only for TM Timer DIDQ 16x24V). • Check the operating mode of the digital output.
100F0000	The read cycle time of the "Synchronous Cycle" OB is too long. T_{APP} > 16 ms.	Configure a smaller multiple of the send clock as the cycle time.
10100000	The send clock is outside the permitted range of 0 < SEND_CLOCK <= 4 ms and is therefore invalid. The error code can also indicate that • The data in TIO_SYNC_Data is invalid or does not exist. • The TIO_DQ instruction is not called in an isochronous OB.	Correct the send clock.

Error code (DW#16#...)	Meaning	Remedy
00110000	The assigned value at the Out_Mode input parameter is outside the valid range of 0 to 3.	Correct the value at the Out_Mode input parameter.
x0FF0000	General internal error.	—

4.3.6 UDT "TIO_SYNC_Data"

Description

The data type UDT "TIO_SYNC_Data" contains the central structure and data for synchronization of the modules and passing of the TIO_Time.

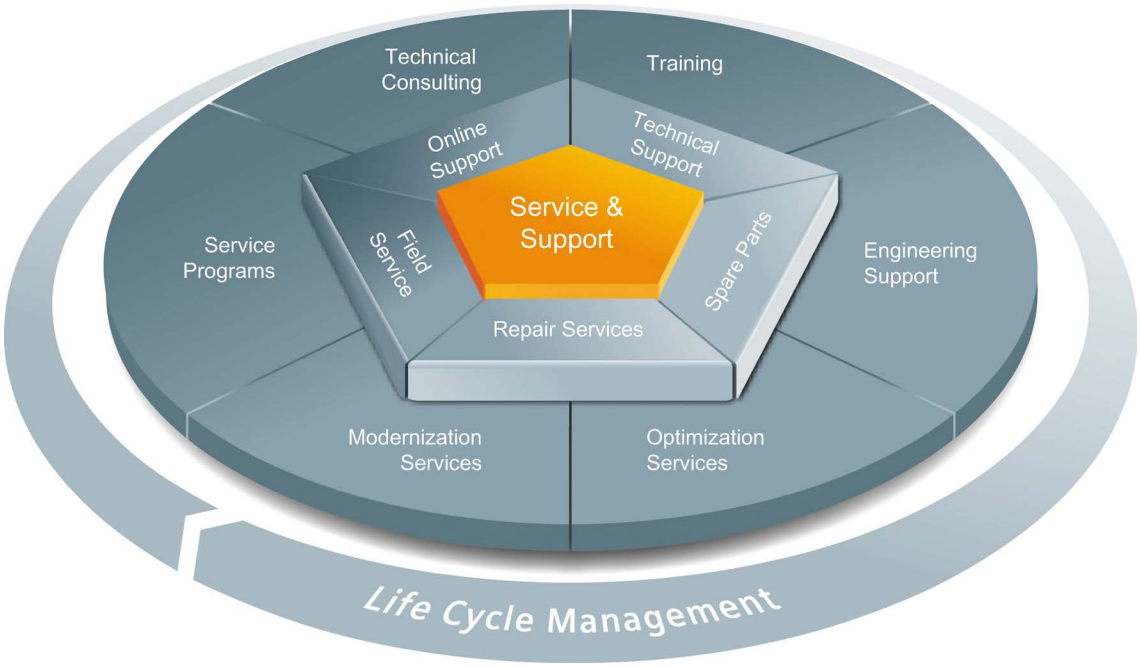
Parameter

Parameter	Data type S7-1500	Description
TIO_TIME_BASE	LTime	Internal use
TIO_TIME	LTime	Shared time basis (relative time) of the TIO modules.
PIP_MODE	USInt	Mode for data update (is forwarded by the PIP_Mode input parameter of the TIO_SYNC instruction)
APP_CYC	LTime	Application cycle of the "Synchronous Cycle" OB
SEND_CLOCK	LTime	Send clock of sync domain (is forwarded by the SendClock input parameter of the TIO_SYNC instruction)
TBase	LTime	Internal use
ERROR	Bool	Internal use

Service & Support

5

5.1 Service & Support



The unmatched complete service for the entire life cycle

For machine constructors, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support on the Internet at the following address: Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support on the Internet at the following address: Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses we offer on the Internet at the following address: Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are selected service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a Service Program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Advantages at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products supplied by Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database at: Internet (http://www.siemens.com/automation/partner).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation will support you in installing and commissioning programmable controllers.

Correct configuration is essential for fault-free operation of programmable controllers.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge of VDE (German Association for Electrical, Electronic and Information Technologies) and EC regulations
- Knowledge of the rules for installing controllers and switchgear

Conventions

You should also pay particular attention to notes such as the one shown below:

Note

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

Scope of the documentation

This documentation is valid for all products of the product series SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL.

The product series SIMATIC S7-1500, ET 200MP and ET 200SP are approved for IP20 degree of protection, i.e. the modules of these product series must be installed in a control cabinet.

The SIMATIC ET 200AL product series is approved for IP65/IP67 degree of protection, i.e. the modules need **not** be installed in a control cabinet.

Changes compared to previous version

Changes / enhancements described in this manual, compared to the previous version (version 01/2013):

- Extension of the scope of validity to the distributed I/O system ET 200AL
- Supplement to the section Connection of the cable shielding for ET 200AL
- Components for lightning protection potential equalization amended

Additional support

Additional information on SIMATIC products is available on the Internet. The associated documentation is also available on the Internet.

- The range of technical documentation for the individual SIMATIC products and automation systems can be found on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Documentation guide

1

Introduction

The documentation of the SIMATIC products has a modular structure and covers diverse topics concerning your automation system.

The complete documentation for the S7-1500, ET 200SP, ET 200MP and ET 200AL systems consists of the respective system manuals, function manuals and product manuals.

The STEP 7 information system (online help) also supports you when configuring and programming your automation system.

Overview of documentation on the subject of designing interference-free controllers

The following table lists additional documentation which supplements this description of designing interference-free controllers.

Table 1- 1 Documentation on the subject of designing interference-free controllers

Topic	Documentation	Most important contents
System description	System manual S7-1500 Automation System (http://support.automation.siemens.com/WW/view/en/59191792)	• Application planning • Installation • Wiring • Commissioning
	System manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293)	
	System Manual ET 200MP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/59193214)	
	System manual Distributed I/O System ET 200AL (http://support.automation.siemens.com/WW/view/en/89254965)	

SIMATIC manuals

All current manuals for SIMATIC products are available for download free of charge from the Internet (http://www.siemens.com/automation/service&support).

Basic information on electromagnetic compatibility 2

2.1 Overview of possible interference

Introduction

SIMATIC products and their components have been developed for use in industrial environment and meet the legal EMC requirements (EMC - Electromagnetic Compatibility). However, you still need to conduct an EMC assessment before installing your controller in order to identify possible sources of interference and to include these in your considerations.

Electromagnetic compatibility

Electromagnetic compatibility describes the ability of an electrical device to function properly in its particular electromagnetic environment. Neither the environment itself nor the electrical device are influenced in an unacceptable manner.

Possible interference

Electromagnetic interference can influence an automation system in various ways. The most significant interferences and their causes are as follows:

- Electromagnetic fields having a direct influence on the system
- Interference coupling caused by bus signals (for example, PROFINET)
- Interference influencing the system via the process wiring
- Interference which reaches the system via the power supply and/or protective ground

The figure below shows the likely paths of electromagnetic interference.

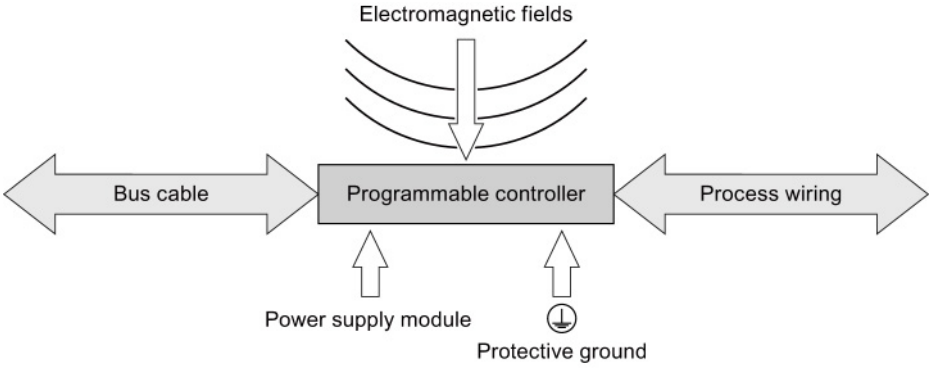

Figure 2-1 Electromagnetic interference

2.2 Coupling mechanisms

Depending on the emitting medium and the distance between the source of interference and the device, interference can reach the automation system via four different coupling mechanisms.

The following table shows possible causes and typical sources of interference for the various coupling mechanisms:

Table 2- 1 Coupling mechanisms

Coupling mechanism	Cause	Typical sources of interference
Galvanic coupling	Two electric circuits share the same cable	• Clocked devices (influence on the network due to converters and third-party power supply units) • Starting motors • Potential differences on component enclosures with shared power supply
Capacitive coupling	Potential difference between conductors	• Interference coupling due to parallel routing of signal cables • Static discharge of the operator
Inductive coupling	Mutual influencing of current-carrying conductor loops. The magnetic fields caused by the current flow induce interference voltages.	• Transformers, motors, electrical welding equipment • Power supply cables routed in parallel • Cables whose currents are switched • High-frequency signal cables • Unwired coils
Radiation coupling	Effect of an electromagnetic wave on a cable configuration. This wave induces currents and voltages.	• Neighboring transmitters (for example, walkie-talkies) • Spark gaps (spark plugs, collectors of electrical motors, welding devices)

Interference-free cable routing

3

This chapter describes the EMC-compatible classification of cables and cable routing for bus, data, signal and supply lines.

3.1 Classifying cables into cable categories

Classify the cables into cable categories according to their sensitivity to interference coupling and interference emission. The further away from one another cables of different cable categories are installed, the lower the mutual influence by capacitive and inductive coupling.

The following table shows the cable categories into which you can classify your cables accordingly.

Table 3- 1 Cable categories

Category A	• Signal lines to I/O modules • Bus and data lines (for example, PROFIBUS, PROFINET) • Lines to HMI devices • Supply lines for extra-low voltages (< 24V DC or < 60V AC)
Category B	• Supply lines with safe electrical isolation (SELV) • Supply voltages < 400 V
Category C	• Supply voltages > 400 V

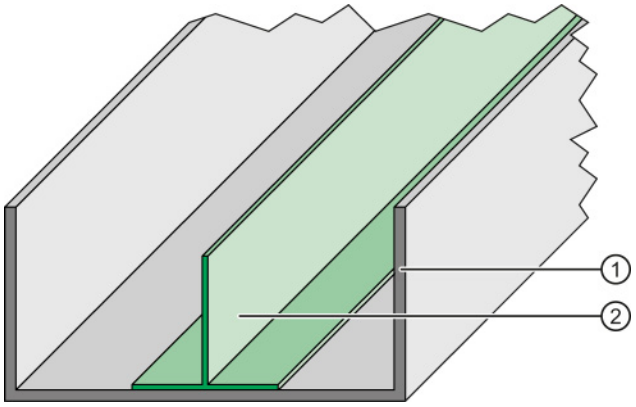
The following table shows the minimum clearance you must maintain when installing cables.

Table 3- 2 Combination of cable categories

	Category A	Category B	Category C
Category A	• In common bundles or cable channels	• In separate bundles or cable channels (no minimum clearance necessary)	• Inside cabinets in separate bundles or cable channels • Outside cabinets, but inside buildings, on separate cable racks with at least 10 cm clearance
Category B	• In separate bundles or cable channels (no minimum clearance necessary)	• In common bundles or cable channels	
Category C	• Inside cabinets in separate bundles or cable channels • Outside cabinets, but inside buildings, on separate cable racks with at least 10 cm clearance		• In common bundles or cable channels

If you install different cable categories in the same cable channel, use metallic cable channels with metallic partition.

The following figure show a schematic view of a cable channel with partition.



① Metallic cable channel
② Metallic partition

Figure 3-1 Cable channel with partition

3.2 Cable routing inside cabinets in buildings

Rule

Observe the following rules for proper cable routing inside of control cabinets:

- If a crossing of cables is unavoidable, then cross the cables at an angle of 90°, if possible, in order to keep interference from electrical fields as low as possible.
- Do not route cables coming into the cabinet from outside parallel to the shield supports.

3.3 Cable routing outside cabinets and inside buildings

Rule

Observe the following rules for proper cable routing outside control cabinets and inside buildings:

- Read the information in section Assigning cables to cable categories (Page 9).
- If you route the cables in metallic cable channels, you can rearrange the cable channels next to each other.
- Connect metallically conductive cable racks to the potential equalization of the building.
- If a crossing of cables is unavoidable, then cross the cables at an angle of 90°, if possible, in order to keep interference from electrical fields as low as possible.

3.4 Cable routing outside buildings

If possible, lay the cables outside buildings on metallic cable holders. Connect the cable holder joints galvanically to each other and ground the cable holders.

Rule

Observe the following rules when laying cables outside of buildings:

- Use metallic auxiliary terminal boxes to connect cables coming from outside at the junction to cables inside the building. Ground these boxes.
- If a crossing of cables is unavoidable, then cross the cables at an angle of 90°, if possible, in order to keep interference from electrical fields as low as possible.
- Integrate bus cables installed outside of buildings into your lightning and overvoltage concept.

Lightning protection

When you lay cables for SIMATIC devices outside of buildings, you have to take internal and external lightning protection measures.

Reference

For additional information about lightning protection, refer to chapter Lightning protection and overvoltage protection (Page 26).

3.5 Underground cable routing

Rule

Observe the following rules for underground cable routing:

- Lay the cable at least 60 cm below the ground surface.
- Install equipotential bonding approximately 20 cm above the cable. You can use a zinc-plated ground strip, for example. The ground strips also serve as protection against lightning strikes.
- Protect the cable against mechanical damage by, for example, using a plastic pipe and/or a cable warning tape in the ground, approximately 40 cm above the cable.
- Separate the various cable categories in the ground using cable channels, for example.

The following figure shows the arrangement of cable warning tape, equipotential bonding and a cable.

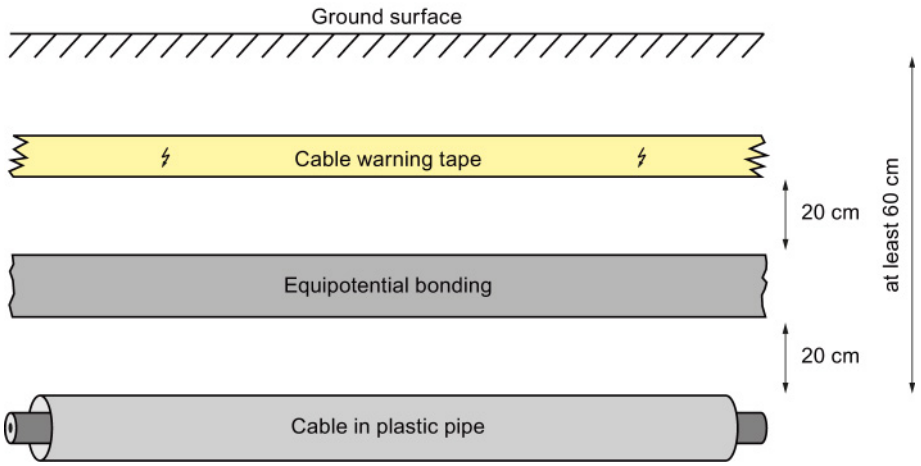


Figure 3-2 Arrangement underground

Lightning protection

When you lay cables for SIMATIC devices outside of buildings, you have to take internal and external lightning protection measures.

Reference

For additional information about lightning protection, refer to chapter Lightning protection and overvoltage protection (Page 26).

3.6 Bending radii and tensile strength of cables

Tensile strain

A high strain on the cables due to tensile forces leads to conductor material flow. The tensile forces thus cause a change in the structure of the material and lower the conductor cross-section. This decrease of the conductor cross-section leads, in turn, to a heating of the conductor and premature wear of the conductor insulation.

Use the supplied cable ties to relieve the terminal points on the plugs for the I/O modules of the product series SIMATIC S7-1500 and SIMATIC ET 200MP.

Bending radius

If you select too small bending radii when laying cables, this will cause the materials to stretch and compress and changes the mechanical structure of the cables. The electrical properties are impaired as a result.

Pay particular attention to the bending radii of fiber-optic cables. If the bending radii are too small, the optical properties of the fiber-optic cable are adversely affected. Reliable transmission is no longer guaranteed.

Cable shielding

4

Shielding is a measure to attenuate (dampen) magnetic, electrical or electromagnetic interference fields.

Interference currents on cable shields are diverted from the shield connection to ground. To avoid interference as a result of these currents, it is imperative to provide a low-impedance connection to the protective conductor.

Rules

Ideally, you should use cables equipped with a protective braided shield. The shield's contacting must be more than 80% at the contact point. Avoid tensile and compression strain on cables with a foil shield. This type of strain can damage the foil shield very slightly at the fastening point. The result is a reduced shielding effect.

Shield connection with grounding at both ends

Always connect the cable shields to the ground at both ends. Low and high frequency interference can be reduced only by connecting both ends of the shield to the ground.

Note

Laying an additional equipotential bonding cable

Whenever potential differences develop between the grounding points, an equalizing current flows on a shielding that is connected at both ends. In this case, lay an additional equipotential bonding cable. You can find more information on this topic in the chapter Equipotential bonding (Page 23).

Shield connection with capacitive grounding at one end

If you do not have the option of installing equipotential bonding (in plants covering a large area, for example), connect capacitive grounding to one end of your shield. In this case, only high-frequency interference will be reduced.

The following figure shows the capacitive grounding of a cable shield. The values indicated in the figure are indicative and will differ from system to system. The capacity diverts the high-frequency interference. This capacity provides high-impedance protection for the power frequency (50 or 60 Hz), thus preventing equalizing currents via the shield. A parallel switched high-impedance resistance prevents the capacity from loading a direct current.

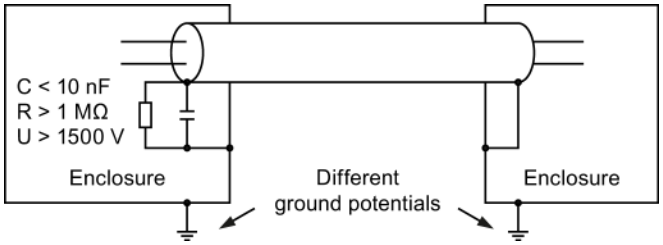

Figure 4-1 Capacitive grounding of the shield

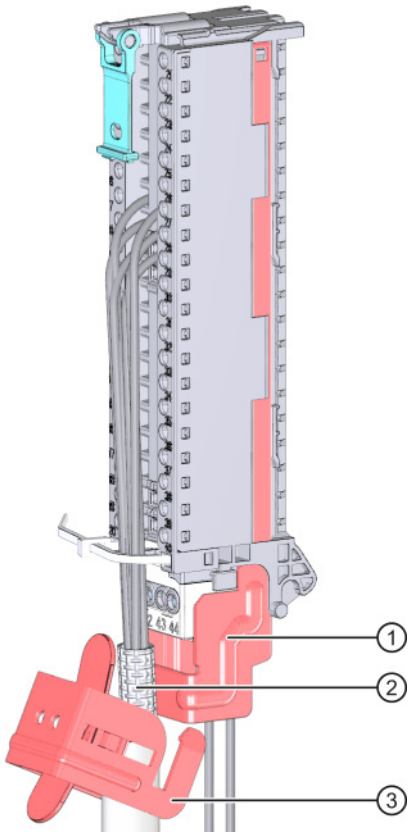
4.1 Connecting the cable shielding for S7-1500 and ET 200MP

A special shield design has been developed for the automation system S7-1500 and the distributed I/O system ET 200MP for the shield connection of the signal lines. The connection element for the cable shield consists of a shield clamp and a shield terminal.

If the front connector is located in the module, the interference currents which occur are diverted by the connection element to the ground via the module and mounting rail.

The shield clamp is a pluggable mount for the analog and technology modules. The shield clamp allows the low-impedance application of cable shields with minimum installation times.

The following figure shows a front connector with mounted shield clamp and associated shield terminal.



① Shield clamp
② Stripped cable shield
③ Shield terminal

Figure 4-2 Shield clamp and shield terminal on front connector

The shield clamp is inserted from below onto the front connector until the shield clamp latches audibly. The shield terminal is fastened to the shield clamp.

Additional information

For additional information on installing the shield clamp and shield terminal, refer to the "Connecting front connectors" chapter in the S7-1500 automation system (http://support.automation.siemens.com/WW/view/en/59191792) or ET 200MP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/59193214) system manuals.

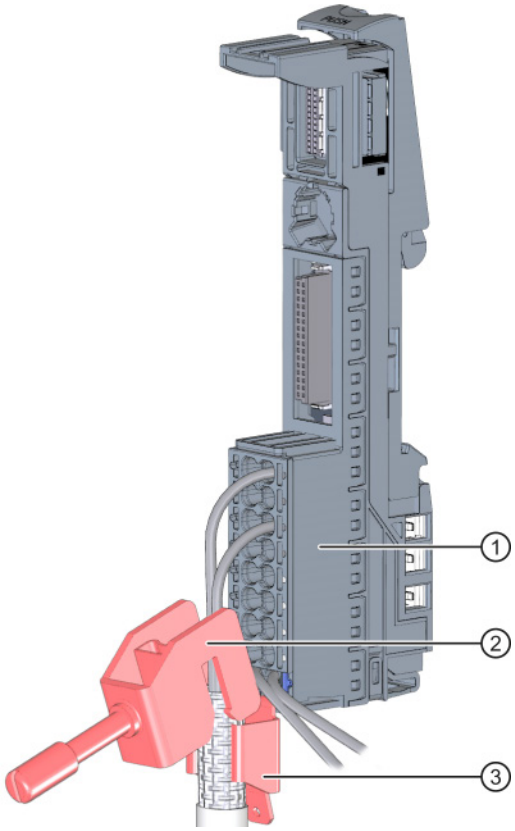
4.2 Connecting the cable shielding for ET 200SP

A special shield design has been developed for the shield connection of the signal lines of the ET 200SP distributed I/O system. The connection element for the cable shield consists of a shield terminal.

If the front connector is located in the module, the interference currents that occur are diverted by the connection element via BaseUnit and mounting rail to the ground.

The shield terminal is plugged into a mount of the BaseUnit. The shield terminal allows the low-impedance application of cable shields with minimum installation times. There is no need for the otherwise standard connection of the cable shield at the cabinet entry.

The following figure shows a BaseUnit with shield terminal and shield support.



① BaseUnit of ET 200SP
② Shield terminal
③ Shield support with flat plug for terminal sockets

Figure 4-3 BaseUnit with shield terminal

Additional information

For more information on mounting the shield terminal, refer to the "Connecting cable shields" chapter of the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293).

4.3 Connecting the cable shielding for ET 200AL

Each module of the ET 200AL distributed I/O system features a functional ground connection.

Use only shielded cables for connection of analog signals, PROFINET and PROFIBUS signals and for the ET-Connection. If you have screwed the plug in correctly, the interference currents that occur are diverted to the metal parts and functional ground.

If you attach an ET 200AL module to a **conductive**, grounded base, the lower mounting bolt establishes a conductive connection to the earth potential.

If you attach an ET 200AL module to a **non-conductive** base, connect the lower mounting bolt to the ground wire at the same time.

The following figure shows how to connect the functional ground via a ground wire, using the IM 157-1 PN interface module as an example.

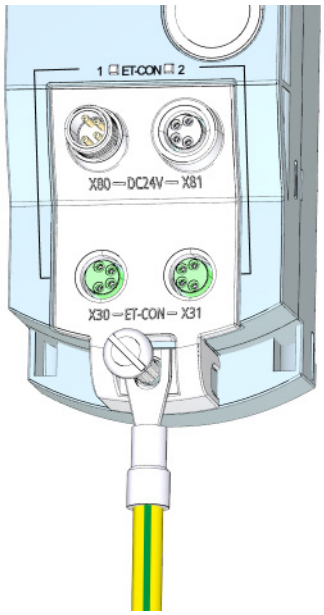


Figure 4-4 Connect functional ground via a ground wire

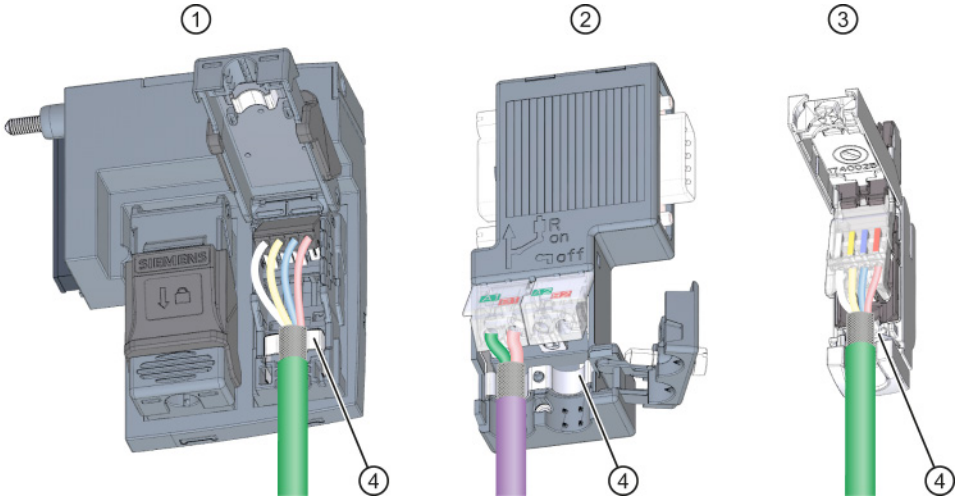
Additional information

You can find more information on installing ET 200AL modules in the Installing Modules section of the system manual Distributed I/O System ET 200AL (http://support.automation.siemens.com/WW/view/en/89254965).

4.4 Connecting the cable shield for bus cables

In the S7-1500, ET 200MP and ET 200SP systems, the cable shields of PROFIBUS and PROFINET cables are connected to the existing bus connection elements. Cable shield and shield support are thus galvanically connected to each other. If the connector is plugged into the module, the coupled interferences are diverted via the module carrier to the ground. There is no need for the otherwise standard connection of the shield at the cabinet entry.

The following figure shows examples of the shield connection for various bus connection elements.



① BusAdapter BA 2xRJ45 for ET 200SP
② PROFIBUSconnector, 9-pin D-Sub
③ PROFINETconnector RJ45
④ Shield support of respective connector

Figure 4-5 Shield connection for bus connection elements

Reference

For more information on installing the connectors, refer to the "Connecting PROFINET IO BusAdapter BA 2xRJ45 to the interface module" chapter of the system manual ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293) and to the supplied product information.

4.5 Connecting the cable shield for other components

The following procedures for connecting the shield to devices that do not have any special shield terminals have proven themselves in practice.

Rule

Note the following points when handling the shield:

- Always use metal clamps to mount the protective braided shields of the cables. The clamps must cover a large area of the shield and provide appropriate contact force.
- Attach the shield to a shielding bus directly after the point where the cable enters the cabinet. If you route the shield further to the module, do not connect the shield again in front of the module, as this would create ground loops.

The following figure shows standard types of shield fastening.

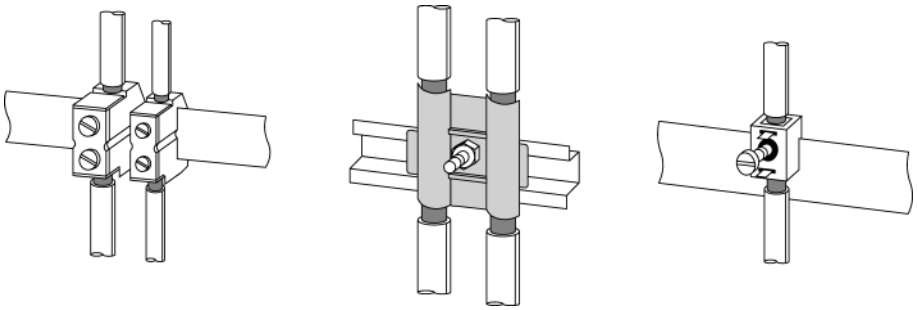


Figure 4-6 Cable shielding

Equipotential bonding

5

Definition according to DIN VDE 0100

Equipotential bonding is an electrical connection which brings the bodies of electrical equipment and external conductive parts to the same, or nearly the same, potential.

Equipotential bonding is divided into:

- Main equipotential bonding
- Additional local equipotential bonding

Both versions of equipotential bonding are of great importance not only for protection against electric shock, but also for EMC.

Main equipotential bonding

Main equipotential bonding is required by DIN VDE 0100 Part 410 as a protective measure and is mandatory, regardless of other measures for protection against direct and indirect contact.

Additional local equipotential bonding

Additional local equipotential bonding is required if:

- Unfavorable grounding conditions exist between plant parts due to different conductivity of the soil (for example, sandy or stony ground)
- Cables bridge a large distance
- Electrical energy is fed in from various power supplies (for example, in the case of multiple substations)
- Considerable electrical power is used (for example, welding robots, large drives)

Measures

In such cases, an additional equipotential bonding cable between the individual potentials can solve the problem. The equipotential bonding cable must also be able to divert large currents and carry lightning stroke current. The following equipotential bonding systems have proven themselves in practice:

- 16 mm^2 for copper equipotential bonding cables up to 200 m long
- 25 mm^2 for copper equipotential bonding cables over 200 m long

To prevent ground loops, equipotential bonding cables are installed in parallel and, whenever possible, near to the signal/bus cable. This allows the area between the two cables to be kept as small as possible.

The following figure shows a schematic view of the installation of an equipotential bonding cable.

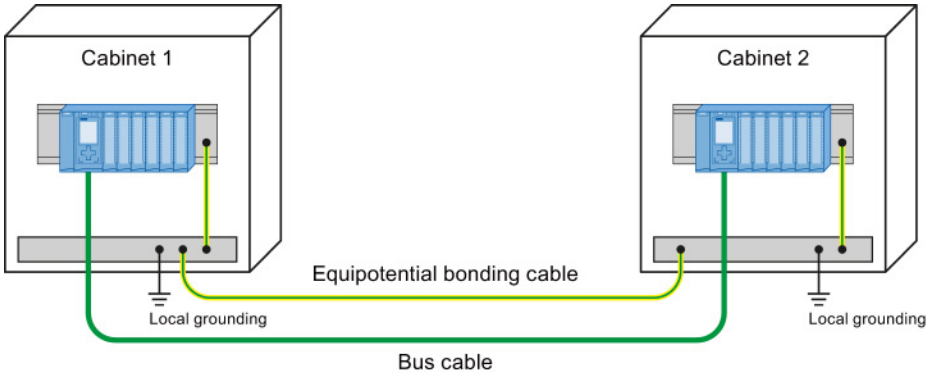

Figure 5-1 Installation of equipotential bonding cables

Rule

Note the following issues regarding equipotential bonding:

- The lower the impedance of an equipotential bonding cable, the more effective is equipotential bonding. The impedance of the additionally installed equipotential bonding cable should not exceed 10% of the shield impedance.
- Connect the equipotential bonding cables to a large area of the grounding system.
- Protect the connection points against corrosion.
- Avoid ground loops.
- Install the equipotential bonding cables in such a way as to minimize the areas enclosed between the equipotential bonding cables and signal lines.

Special measures for interference-free operation

6

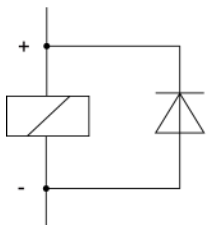
Connecting inductances to quenching elements

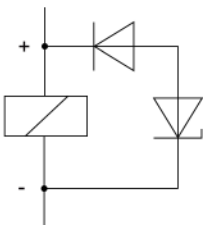
Ideally, the inductances (for example, contactor or relay coils) controlled by SIMATIC do not require any wiring to external quenching elements. The required quenching elements are already integrated into the modules.

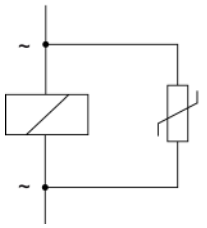
If the SIMATIC output circuit can also be switched off by built-in contacts (such as relay contacts for EMERGENCY OFF), the module's integrated quenching elements are no longer effective. In this case, the inductances must be wired to quenching elements.

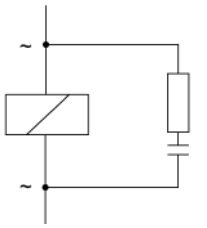
Wire inductances to freewheeling diodes, varistors or RC elements, for example.

Table 6- 1 Wiring inductances

Wiring DC-operated inductances		Wiring AC-operated inductances	
with diode	with Z diode	with varistor	with RC element
			








Programming devices

Provide a socket in each cabinet for the supply of the programming devices. The sockets are supplied from the distribution board to which the protective conductor for the cabinet is also connected.

Observe the following points during the installation of the socket in the control cabinet:

- Include the grounding of the socket in your consideration of the equipotential bonding.
- The common star point of the two ground potentials (cabinet and socket) must be close to the two end points.
- An equipotential bonding cable is not permitted as communication cable between programming device and controller.

Lightning protection and overvoltage protection 7

7.1 What is lightning and overvoltage protection?

Introduction

The term "Lightning and overvoltage protection" covers both the concept and system for the protection of structural systems (such as buildings or electrical equipment). This concept also includes the protection of people and animals.

Overvoltages are most frequently caused by lightning strikes.

Lightning protection system

The lightning protection system is the complete system used to reduce physical damage to a structural system as a result of direct lightning strikes and overvoltages. The lightning protection system is divided into external and internal lightning protection.

External lightning protection

External lightning protection is part of the lightning protection system and comprises an interception device, an arrester and a grounding system. In the event of a lightning strike, the external lightning protection serves to divert the lightning current safely to the ground. This measure most frequently prevents fire damage.

Internal lightning protection

Internal lightning protection is part of the lightning protection system and comprises lightning protection equipotential bonding and/or electrical isolation with respect to the external lightning protection. In the event of a lightning strike, the internal lightning protection reduces the damage caused by overvoltages resulting from the lightning.

Even at larger distances of up to 1.5 km, lightning strikes can sometimes still cause damage. You obtain effective lightning protection by expanding the external lightning protection into an overall protection system. This system includes equipotential bonding and surge protection devices.

7.2 Lightning protection zone concept

Introduction

Each building requires a coordinated protection zone concept. The grading of the protection is of key importance for this. Sufficient protection can only be guaranteed if this grading requirement is satisfied.

The lightning protection zone concept described in the standards IEC 62305-4 and DIN EN 62305-4 is used for this purpose. The lightning protection zone concept groups devices and areas that have the same risk potential and can be wired to arresters of the same type.

Use overvoltage protection devices at the transitions of the lightning protection zones based on the requirements. Install the overvoltage protection devices at an appropriate location such as the main or sub-distribution board.

Principle of the lightning protection zone concept

The principle behind the lightning protection zone concept is the division of the areas to be protected from overvoltages, for example buildings, into lightning protection zones based on EMC considerations.

Schematic diagram of the lightning protection zone concept

The following is a schematic diagram of the lightning protection zone concept in a physical structure.

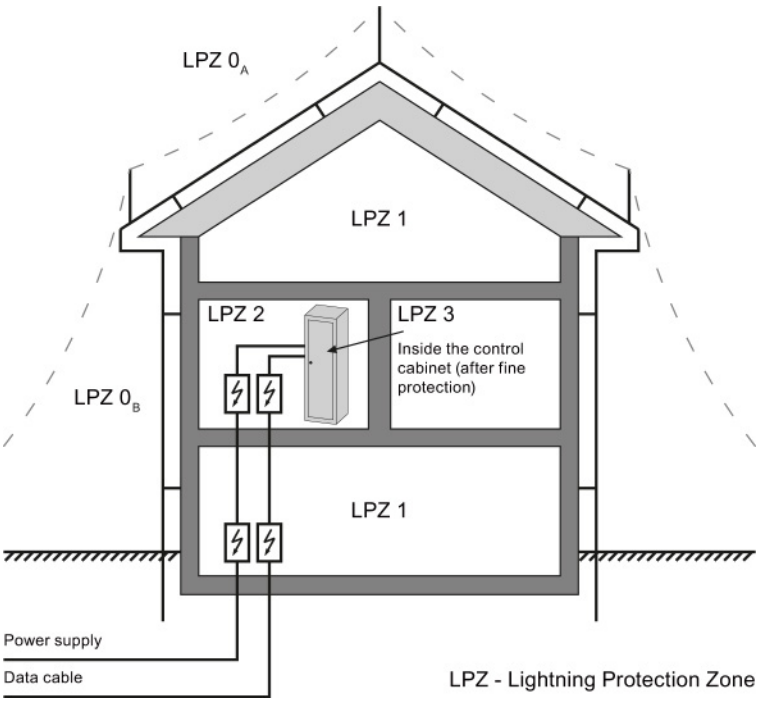


Figure 7-1 Division of a structural system into lightning protection zones

Division of lightning protection zones

The various lightning protection zones (LPZ - Lightning Protection Zone) are limited spatially as follows and not necessarily by physical boundaries, such as walls or floors.

The following table explains the division into various lightning protection zones.

Table 7- 1 External and internal lightning protection zones

Lightning protection zones	
External lightning protection zones:	
LPZ 0_A	• Risk from direct lightning strikes • Risk from the full electromagnetic field of the lightning
LPZ 0_B	• Protected against direct lightning strike • Risk from the full electromagnetic field of the lightning
Internal lightning protection zones:	
LPZ 1	• Protected against direct lightning strike • Attenuated electromagnetic field of the lightning
LPZ 2	• Protected against direct lightning strike • Reduced leakage currents and electromagnetic fields compared to LPZ 1 • Protected terminal devices
LPZ 3	• Protected against direct lightning strike • Protected area inside the terminal device • Local equipotential bonding

Effects of the lightning strike

Direct lightning strikes occur in the lightning protection zone LPZ 0_A. Effects of the lightning strike are high-energy lightning currents and strong electromagnetic fields. These effects are reduced from one lightning protection zone to the next through suitable lightning current or overvoltage arrester/shielding measures.

Frequent damage caused by lightning strikes includes:

- Injury to people and animals, which may in worst cases lead to death
- Damage to buildings
- Fire caused by strong heat development of a lightning strike

Overvoltages

Electromagnetic fields of the lightning channel can be reduced with appropriate shielding measures. Overvoltages due to inductions can be reduced to a safe level starting in lightning protection zone LPZ 0_B with overvoltage arresters.

7.3 Rules and components for the transitions between lightning protection zones

Introduction

This chapter provides you with information on the rules for transitions between lightning protection zones. Measures must be taken to reduce the surge current load and the magnetic fields at the transitions between the lightning protection zones.

Each zone-penetrating metallic/electrical system is incorporated into the equipotential bonding at the zone transition.

The metallic systems include channels, structural parts, and pipes (for water, gas, and heat, for example).

Electrical systems include power and IT cables and wires (for example, power cables and bus cables).

Transitions between lightning protection zones

Overvoltage protection must be provided at the transitions between lightning protection zones (LPZ - Lightning Protection Zone) in accordance with DIN EN 62305. The protection levels are defined at the transitions and implemented by means of overvoltage protection devices (SPD - Surge Protective Device).

- SPD Type 1 - Coarse protection for the transition from LPZ 0 to LPZ 1
- SPD Type 2 - Medium protection for the transition from LPZ 1 to LPZ 2
- SPD Type 3 - Fine protection for the transition from LPZ 2 to LPZ 3

The following figure illustrates the lightning protection zones and the type classes from the supply line to the consumer.

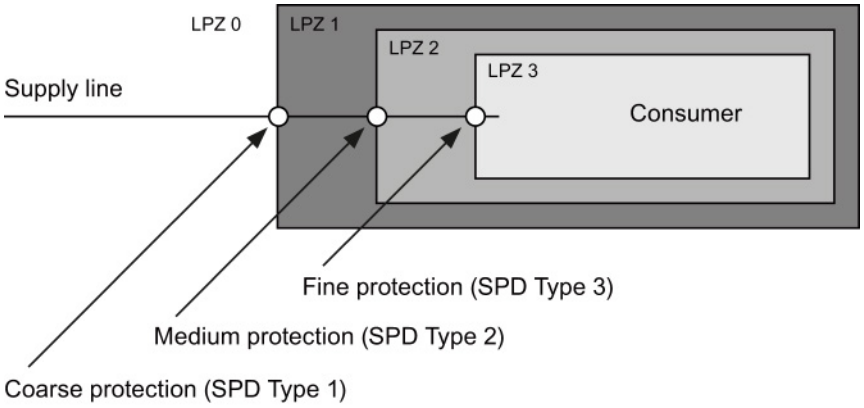

Figure 7-2 Lightning protection zone transitions

Rule for transition from lightning protection zone 0_A to 1

Lightning protection equipotential bonding is required at the transition from lightning protection zone 0_A to 1. The following applies to the transition at the interface of lightning protection zone 0_A to 1:

- Use of lightning arresters prevents introduction of partial lightning currents into structural systems
- Creation of local equipotential bonding at the transition of lightning protection zones, with incorporation of metallic supply systems (for example, pipes, air ducts, cable channels or cable ducts)

Components for lightning protection equipotential bonding from lightning protection zone 0_A to 1

The following table shows components for lightning protection equipotential bonding from lightning protection zone 0_A to 1.

Table 7- 2 Components for transition from lightning protection zone 0_A to 1

Rule for the transition from lightning protection zone 0_B to 1, 1 to 2, or 2 to 3

The transition from lightning protection zone 0_B to 1, 1 to 2, or 2 to 3 prevents strong electromagnetic coupling and serves as overvoltage protection. The following applies to the transition at the interface from lightning protection zone 0_B to 1, 1 to 2, or 2 to 3:

- Use of power cables with surge current-carrying cable shields or twisted-pair IT cables
- Laying cables and lines
  - In continuous, surge current-carrying metal pipes that are grounded at both ends
  - In reinforced concrete channels capable of carrying surge current with grounding at both ends
  - On closed metal cable racks that are grounded at the beginning and end
- Use of fiber-optic cables without a metal shield if such a transmission is intended
- Creation of local equipotential bonding at the transition of lightning protection zones, with incorporation of metallic supply systems (for example, pipes, air ducts, cable channels or cable ducts)

Additional measures

If the actions listed above cannot be implemented, protection by means of overvoltage arresters must be provided. The following sections contain tables with overvoltage arresters that are very suitable for protecting the plant.

Components for lightning protection equipotential bonding from lightning protection zone 0_B to 1 and 1 to 2

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation provides important information that you need to configure and commission the integrated Motion Control functionality of the S7-1500 Automation systems.

Required basic knowledge

In order to understand this documentation, the following knowledge is required:

- General knowledge in the field of automation
- General knowledge in the field of drive engineering and motion control

Validity of the documentation

This documentation is valid for the S7-1500 product range.

Conventions

- For the path settings in the project navigation it is presumed that the "Technology objects" object is opened in the CPU subtree. The "Technology object" placeholder represents the name of the technology object.

  Example: "Technology object > Configuration > Basic parameters".
- The <TO> placeholder represents the name set in tags for the respective technology object.

  Example: <TO>.Actor.Type
- This documentation contains pictures of the devices described. The pictures may differ in minor details from the devices supplied.

You should also observe the notes that are marked as follows:

Note

A note contains important information about the product described in the documentation, about the handling of the product, and about sections in this documentation demanding your particular attention.

Further support

- The range of technical documentation for the individual SIMATIC products and systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the online ordering system is available on the Internet (http://mall.automation.siemens.com).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Preface **3**

1 Guide to documentation S7-1500 / ET 200MP **13**

2 Introduction **15**

2.1 Integrated Motion Control Functionality of the CPU S7-1500 15

2.2 Principle of operation of S7-1500 Motion Control 16

3 Basics **20**

3.1 Functions 20

3.2 Scale 21

3.3 Speed-controlled axis technology object 21

3.4 Positioning axis technology object 22

3.5 Synchronous axis technology object 23

3.6 External encoder technology object 25

3.7 Axis types 26

3.8 Modulo setting 26

3.9 Units of measure 27

3.10 Drive and encoder connection 28
3.10.1 Brief description 28
3.10.2 Frames 29
3.10.3 Setting reference values 31
3.10.4 Tags 32

3.11 Safety functions in the drive 33
3.11.1 Brief description 33
3.11.2 Safe Torque Off (STO) 33
3.11.3 Safe Stop 1 (SS1) 34
3.11.4 Safe Stop 2 (SS2) 34

3.12 Actual values 35
3.12.1 Brief description 35
3.12.2 Incremental actual value 35
3.12.3 Absolute actual value 35
3.12.4 Tags 36

3.13 Mechanics 37
3.13.1 Brief description 37
3.13.2 Tags 38

3.14 Homing 39
3.14.1 Brief description 39
3.14.2 Terms 40
3.14.3 Homing mode 41

3.14.4 Active homing with zero mark and proximity switch ... 43
3.14.5 Active homing with zero mark ... 46
3.14.6 Active homing with digital input ... 48
3.14.7 Passive homing with zero mark and proximity switch ... 50
3.14.8 Passive homing with zero mark ... 52
3.14.9 Passive homing with digital input ... 54
3.14.10 Direction reversal at the hardware limit switch (reversing cam) ... 55
3.14.11 Direct homing ... 56
3.14.12 Absolute value adjustment ... 56
3.14.13 Resetting the "Homed" status ... 57
3.14.14 Tags ... 58

3.15 Control ... 59
3.15.1 Brief description ... 59
3.15.2 Control structure ... 60
3.15.3 Tags ... 61

3.16 Position-related monitoring ... 61
3.16.1 Brief description ... 61
3.16.2 Positioning monitoring ... 62
3.16.3 Following error monitoring ... 63
3.16.4 Tags ... 64

3.17 Traversing range limitation ... 65
3.17.1 Brief description ... 65
3.17.2 Hardware limit switches ... 65
3.17.3 Software limit switch ... 67
3.17.4 Tags ... 68

3.18 Motion control and limits for dynamics ... 69
3.18.1 Brief description ... 69
3.18.2 Velocity profile ... 70
3.18.3 Emergency stop deceleration ... 71
3.18.4 Tags ... 72

3.19 Synchronous operation ... 73
3.19.1 Brief description ... 73
3.19.2 Relative gearing ... 74
3.19.3 Master value coupling ... 76
3.19.4 Tags ... 77

3.20 Operational sequence ... 78
3.20.1 Organization Blocks for Motion Control ... 78
3.20.2 Process image partition "OB Servo PIP" ... 80
3.20.3 Operational Sequence and Timeouts ... 80
3.20.4 Operating modes ... 83

4 Guidelines ... 85

4.1 Guidelines on use of motion control ... 85

5 Using versions ... 86

5.1 Overview of versions ... 86

5.2 Changing a technology version ... 89

6 Configuring 91

6.1 Adding and configuring drives in the device configuration 91
6.1.1 Add and configure PROFINET IO drives 91
6.1.2 Add and configure PROFIBUS DP drives 94
6.1.3 Adding and configuring drives with analog connections 96

6.2 Add technology object 99

6.3 Working with the configuration editor 100

6.4 Compare values 101

6.5 Configuring the Speed-Control Axis technology object 102
6.5.1 Configuration - Basic Parameters 102
6.5.2 Hardware interface 102
6.5.2.1 Configuration - Drive 102
6.5.2.2 Configuration - Data exchange 104
6.5.3 Extended Parameters 105
6.5.3.1 Configuration - Mechanics 105
6.5.3.2 Configuration - Dynamic limits 105
6.5.3.3 Configuration - Dynamic Defaults 107
6.5.3.4 Configuration - Emergency stop 109

6.6 Configuring the positioning axis/synchronous axis technology object 110
6.6.1 Configuration - Basic Parameters 110
6.6.2 Hardware interface 111
6.6.2.1 Configuration - Drive 111
6.6.2.2 Configuration - Encoder 113
6.6.2.3 Configuration - Data exchange 114
6.6.3 Configuration - master value interconnections (synchronous axis only) 124
6.6.4 Extended Parameters 125
6.6.4.1 Configuration - Mechanics 125
6.6.4.2 Configuration - Position monitoring 129
6.6.4.3 Configuration - Dynamic limits 130
6.6.4.4 Configuration - Dynamic Defaults 132
6.6.4.5 Configuration - Emergency stop 134
6.6.4.6 Homing 135
6.6.4.7 Position monitoring 144
6.6.4.8 Configuration - Control loop 146

6.7 Configuring the External Encoder technology object 147
6.7.1 Configuration - Basic Parameters 147
6.7.2 Hardware interface 148
6.7.2.1 Configuration - Encoder 148
6.7.2.2 Configuration - Data exchange 149
6.7.3 Extended Parameters 153
6.7.3.1 Configuration - Mechanics 153
6.7.3.2 Homing 155

6.8 Parameter view 159
6.8.1 Introduction to the parameter view 159
6.8.2 Structure of the parameter view 161
6.8.2.1 Toolbar 161
6.8.2.2 Navigation 161
6.8.2.3 Parameter table 162

6.8.3 Opening the parameter view ... 163
6.8.4 Working with the parameter view ... 164
6.8.4.1 Overview ... 164
6.8.4.2 Filtering the parameter table ... 164
6.8.4.3 Sorting the parameter table ... 165
6.8.4.4 Transferring parameter data to other editors ... 165
6.8.4.5 Indicating errors ... 166
6.8.4.6 Editing start values in the project ... 166
6.8.4.7 Monitoring values online in the parameter view ... 168
6.8.4.8 Modifying values ... 169
6.8.4.9 Comparing values ... 170

7 Programming ... 172

7.1 Introduction ... 172

7.2 Technology data block ... 172
7.2.1 Introduction ... 172
7.2.2 Evaluating the technology data block ... 173
7.2.3 Evaluate StatusWord, ErrorWord and WarningWord ... 175
7.2.4 Change restart-relevant data ... 177

7.3 Motion Control instructions ... 178
7.3.1 Motion Control instruction parameters ... 178
7.3.2 Add Motion Control instructions ... 181

7.4 Starting Motion Control jobs ... 183

7.5 Tracking active jobs ... 184
7.5.1 Introduction ... 184
7.5.2 Motion Control instructions with "Done" parameter ... 185
7.5.3 Motion Control instructions without "Done" parameter ... 189
7.5.4 Motion Control instruction "MC_MoveJog" ... 193

7.6 Ending Motion Control jobs ... 196

7.7 Restart of technology objects ... 197

8 Downloading to CPU ... 198

9 Commissioning ... 199

9.1 Introduction ... 199

9.2 Commissioning guidelines ... 199

9.3 Axis control panel ... 202
9.3.1 Function and structure of the axis control panel ... 202
9.3.2 Using the axis control panel ... 206

9.4 Optimization ... 207
9.4.1 Function and structure of the optimization ... 207
9.4.2 Optimize position controller ... 210

9.5 Simulation mode ... 213

10 Diagnostics 214

10.1 Introduction 214
10.2 Diagnostic concept 214
10.3 Technology alarms 215
10.4 Errors in Motion Control instructions 219
10.5 Speed-controlled axis technology object 220
10.5.1 Status and error bits 220
10.5.2 Motion status 223
10.5.3 PROFIdrive frame 224
10.6 Positioning axis/synchronous axis technology object 225
10.6.1 Status and error bits 225
10.6.2 Motion status 229
10.6.3 PROFIdrive frame 230
10.7 External encoder technology object 231
10.7.1 Status and error bits 231
10.7.2 Motion status 232
10.7.3 PROFIdrive frame 233

11 Instructions 234

11.1 S7-1500 Motion Control V2 234
11.1.1 MC_Power 234
11.1.1.1 MC_Power: Enable, disable technology objects V2 234
11.1.1.2 MC_Power: Function chart V2 238
11.1.2 MC_Home 239
11.1.2.1 MC_Home: Home technology objects, set home position V2 239
11.1.3 MC_MoveJog 244
11.1.3.1 MC_MoveJog: Move axes in jog mode V2 244
11.1.3.2 MC_MoveJog: Function chart V2 248
11.1.4 MC_MoveVelocity 249
11.1.4.1 MC_MoveVelocity: Move axes at predefined velocity V2 249
11.1.4.2 MC_MoveVelocity: Function chart V2 254
11.1.5 MC_MoveRelative 255
11.1.5.1 MC_MoveRelative: Relative positioning of axes V2 255
11.1.5.2 MC_MoveRelative: Function chart V2 259
11.1.6 MC_MoveAbsolute 260
11.1.6.1 MC_MoveAbsolute: Absolute positioning of axes V2 260
11.1.6.2 MC_MoveAbsolute: Function chart V2 264
11.1.7 MC_MoveSuperimposed 265
11.1.7.1 MC_MoveSuperimposed: Superimposed positioning of axes V2 265
11.1.7.2 MC_MoveSuperimposed: Function chart V2 269
11.1.8 MC_GearIn 270
11.1.8.1 MC_GearIn: Start gearing V2 270
11.1.8.2 MC_GearIn: Function chart V2 274
11.1.9 MC_Halt 275
11.1.9.1 MC_Halt: Stop axes V2 275
11.1.9.2 MC_Halt: Function chart V2 278

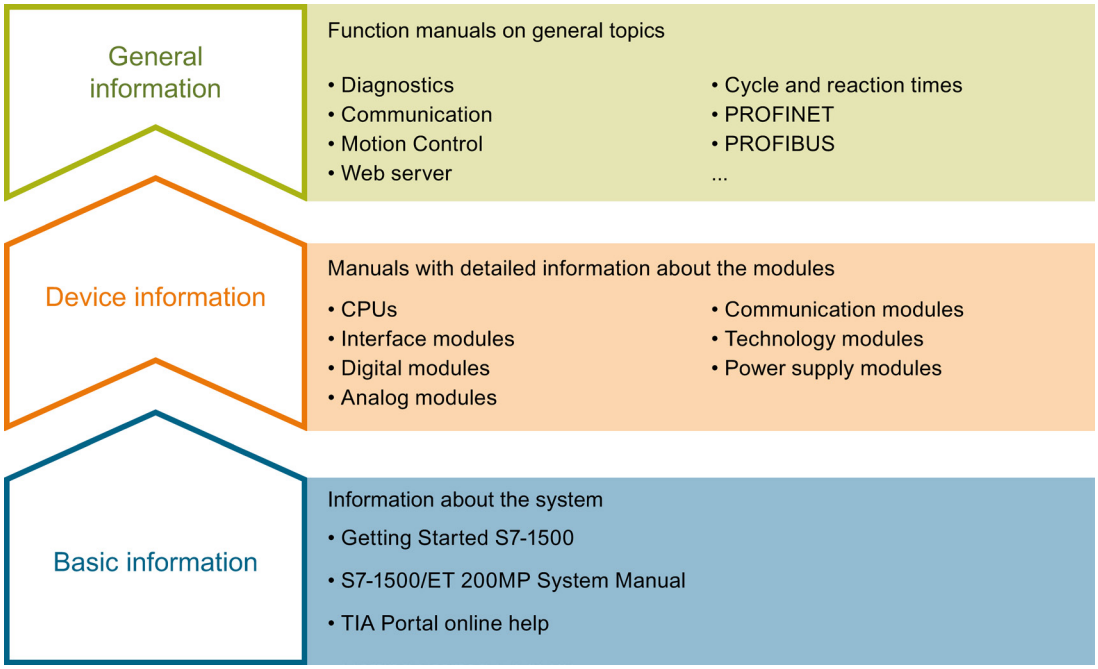
Guide to documentation S7-1500 / ET 200MP

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.



Basic information

System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500 and ET 200MP systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics, technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC S7-1500 and ET 200MP systems, e.g. diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/tech-doc-controllers/Pages/Default.aspx).

Changes and supplements to the manuals are documented in a Product Information.

Manual Collection S7-1500 / ET 200MP

The Manual Collection contains the complete documentation on the SIMATIC S7-1500 automation system and the ET 200MP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/86140384).

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.automation.siemens.com/WW/view/en/38715968).

Applications & Tools

Applications & Tools supports you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find Applications & Tools on the Internet (http://support.automation.siemens.com/WW/view/en/20208582).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.automation.siemens.com/WW/view/en/42455541).

Introduction

2

2.1 Integrated Motion Control Functionality of the CPU S7-1500

S7-1500 Motion Control supports controlled positioning and moving of axes and is an integral part of every CPU S7-1500 as well as every CPU S7-1500SP. The Motion Control functionality supports the technology objects rotation axis, positioning axis, synchronous axis and external encoders.

Drives with PROFIdrive capability and drives with analog setpoint interface are controlled by means of standardized Motion Control instructions according to PLCopen.

The axis control panel and comprehensive online and diagnostic functions support easy commissioning and optimization of drives.

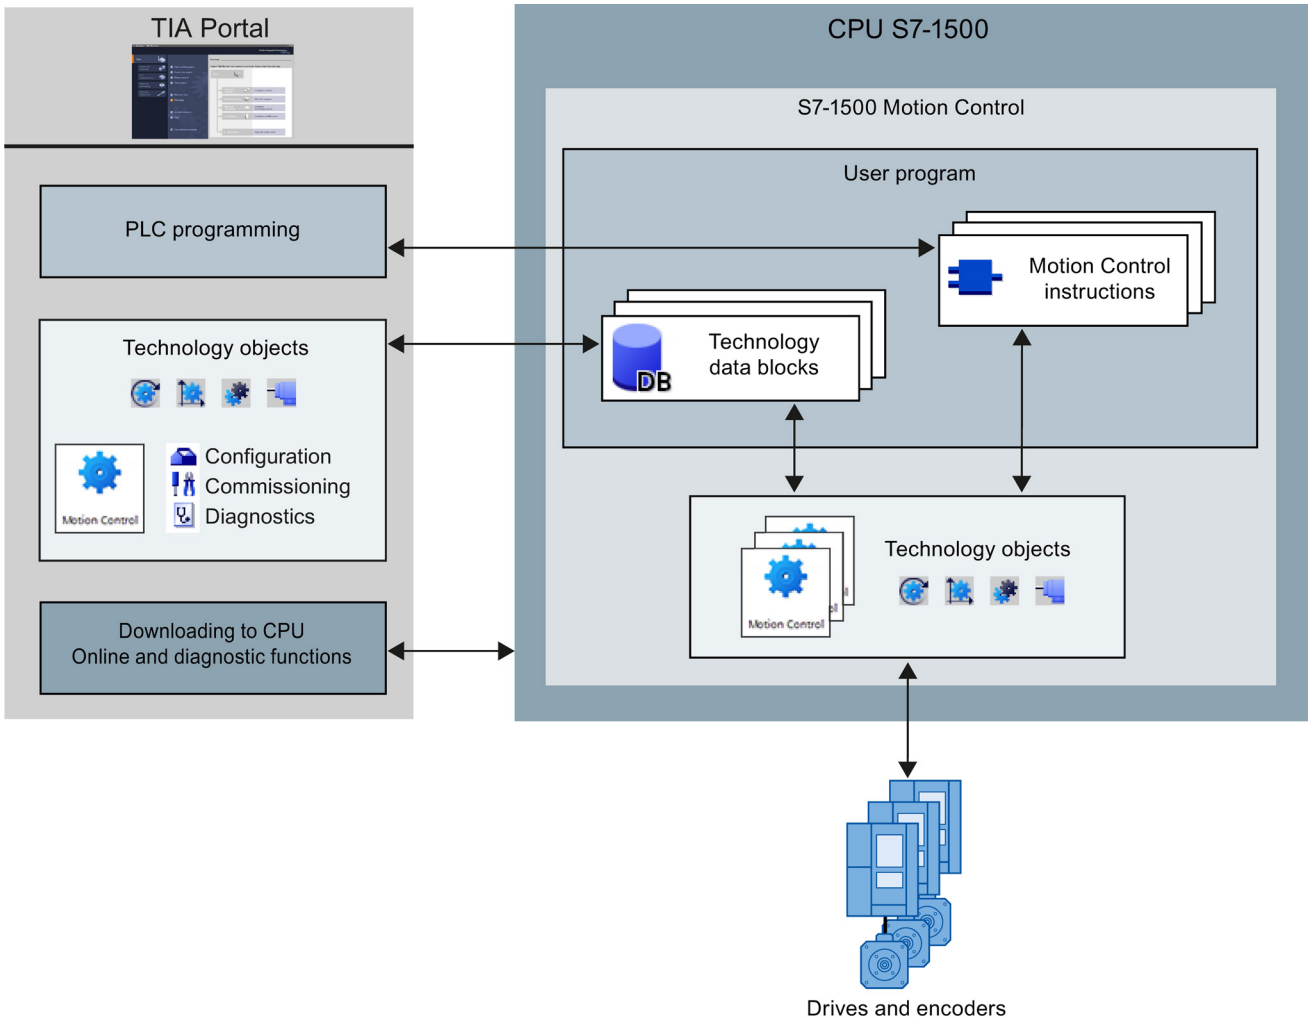
S7-1500 Motion Control is constantly integrated into the CPU S7-1500 system diagnostics.

2.2 Principle of operation of S7-1500 Motion Control

Overview

You create a project, configure technology objects, and load the configuration into the CPU using the TIA Portal. The Motion Control functionality is processed in the CPU.
You control the technology objects with the Motion Control instructions in your user program. The TIA Portal provides additional functions for commissioning, optimization (Page 199) and diagnostics (Page 214).

The following figure shows schematically the user interfaces and the integration of Motion Control into the CPU S7-1500. The concepts are then briefly explained:



TIA Portal

The TIA Portal supports you in the planning and commissioning of Motion Control functionality:

- Integrating and configuring hardware
- Creating and configuring technology objects
- Creating the user program
- Downloading to CPU
- Commissioning of axes
- Optimization of drives
- Diagnostics

You use the TIA Portal to configure the hardware, the technology objects as well as your user program. You download the program you created to the CPU. You test your user program and diagnose the hardware with the online and diagnostic functions of the TIA Portal.

Technology objects

Technology objects represent real objects (e.g., a drive) in the controller. You can call the functions of the technology objects by means of Motion Control instructions in your user program. The technology objects provide open- and closed-loop control of the movement of the real objects, and report status information (e.g. the current position).

The configuration of the technology objects represents the properties of the real object. The configuration data are stored in a technology data block.

The following technology objects are available for Motion Control:

- **Speed axis technology object**

  The speed axis technology object ("TO_SpeedAxis") permits the specification of the speed for a drive. You program the movement of the axis with Motion Control instructions.

- **Positioning axis technology object**

  The positioning axis technology object ("TO_PositioningAxis") permits the position-controlled positioning of a drive. You assign positioning jobs to the axis with Motion Control instructions in your user program.

- **Synchronous axis technology object**

  The synchronous axis technology object ("TO_SynchronousAxis") includes all functions of the positioning axis technology object. You can also interconnect the axis with a master value so that the axis follows the position change of a leading axis in synchronous operation.

- **External encoder technology object**

  The external encoder technology object ("TO_ExternalEncoder") detects a position, and makes it available to the controller. The detected position can be evaluated in the user program.

Technology data block

The properties of real objects are configured by means of the technology objects and saved in a technology data block. The technology data block contains all configuration data, setpoint and actual values, and status information of the technology object. The TIA Portal automatically creates the technology data block when the technology object is created. You access the data of the technology data block with your user program.

Motion Control instructions

With the Motion Control instructions you perform the desired functionality in the technology objects. The Motion Control instructions are available in the TIA Portal under "Instructions > Technology > Motion Control > S7-1500 Motion Control".

The Motion Control instructions conform to PLCopen (version 2.0).

User program

The Motion Control instructions and the technology data block represent the programming interfaces for the technology objects. Use the Motion Control instructions to start Motion Control jobs at technology objects in your user program. You track the status of running jobs with the output parameters of the Motion Control instructions. You access status information of the technology object with the technology data block and change specific configuration parameters during runtime.

Drives and encoders

Drives permit the movement of the axis. They are integrated into the hardware configuration.

When you perform a Motion Control job in your user program, the technology object takes over the control of the drive and the reading in of values from position encoders.

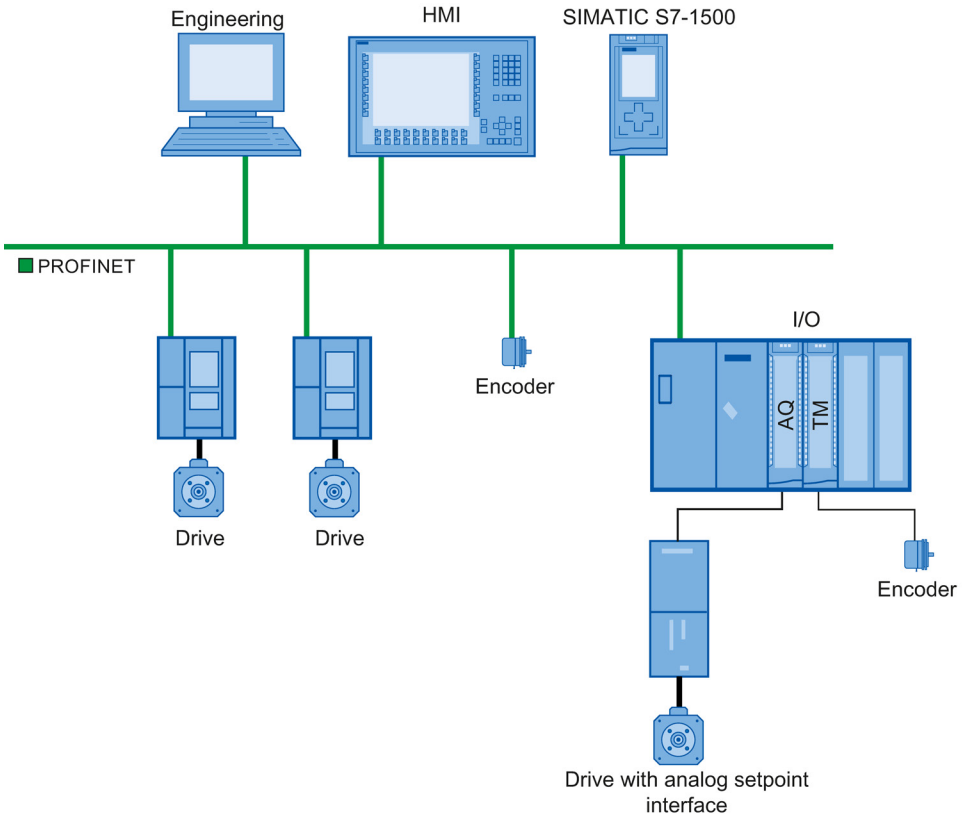
Drives and encoders with PROFIdrive capability are connected by means of PROFIdrive frames. The following connections are possible:

- PROFINET IO
- PROFIBUS DP
- Technology module (TM)

Drives with analog setpoint interfaces are connected using an analog output (AQ) and an optional enable signal. Analog inputs and outputs are made available by means of corresponding IO modules.

A drive is also called an actuator, and an encoder is also called a sensor.

The figure below shows an example configuration in which all components are connected to the CPU by means of PROFINET IO:



Basics

3

3.1 Functions

You can perform the Motion Control function by means of Motion Control instructions in your user program or the TIA Portal (under Commissioning).

The following table shows the functions that are supported by technology objects:

Function	Speed axis	Positioning axis	Synchronous axis	External encoder
Motion Control instructions (user program)				
"MC_Power (Page 234)" Enable, disable technology objects	X	X	X	X
"MC_Home (Page 239)" Homing technology objects, setting home position	-	X	X	X
"MC_MoveJog (Page 244)" Moving axes in jog mode	X	X	X	-
"MC_MoveVelocity (Page 249)" Moving axes with the specified speed	X	X	X	-
"MC_MoveRelative (Page 255)" Position axis relatively	-	X	X	-
"MC_MoveAbsolute (Page 260)" Position axis absolutely	-	X	X	-
"MC_MoveSuperimposed (Page 265)" Superimposed positioning of axes	-	X	X	-
"MC_GearIn (Page 270)" Start gearing	-	-	X	-
"MC_Halt (Page 275)" Stop axis	X	X	X	-
"MC_Reset (Page 279)" Acknowledging alarms, restarting technology objects	X	X	X	X
TIA Portal				
"Axis control panel (Page 202)" Moving and homing axes using the TIA Portal	X	X	X	-
"Optimization (Page 207)" Optimization of position control ("Kv" factor)	-	X	X	-

3.2 Scale

For information on the number of technology objects that may be used, refer to the technical specifications of the utilized CPU.

A synchronous axis requires twice as many resources as a speed-controlled axis or positioning axis. You can configure two fewer speed or positioning axes for every synchronous axis you use.

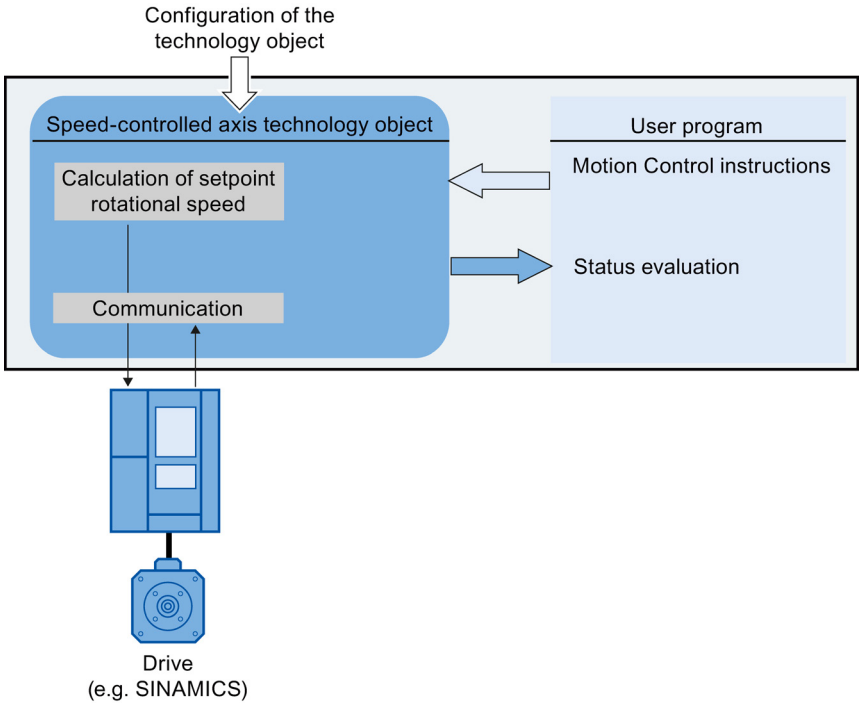
3.3 Speed-controlled axis technology object

The speed axis technology object calculates speed setpoints, taking account of the specified dynamics, and outputs them to the drive. All movements of the speed axis occur under speed control. The system takes account of an existing load gear.

A drive is assigned to each speed axis by means of a PROFIdrive frame, or by means of an analog setpoint interface.

The speed is specified in revolutions per unit of time.

The following figure shows the basic principle of operation of the speed axis technology object:



3.4 Positioning axis technology object

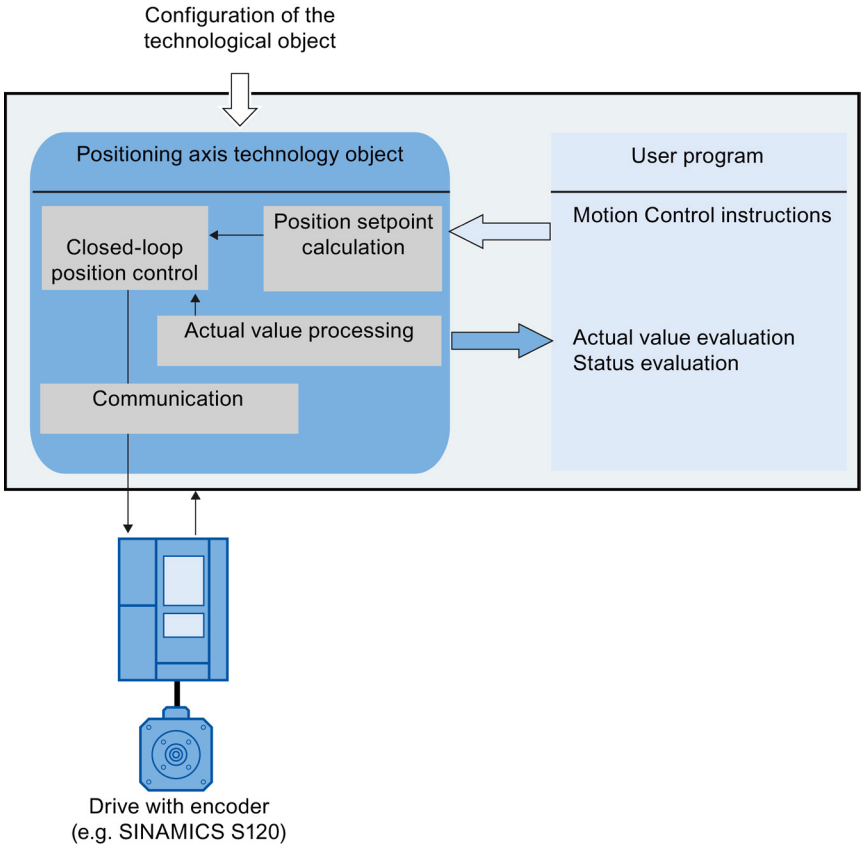
The positioning axis technology object calculates position setpoints, taking account of the specified dynamics, and outputs corresponding speed control setpoints to the drive. All movements of the positioning axis occur under position control. For absolute positioning, the physical position must be known to the positioning axis technology object.

Each positioning axis is assigned a drive by means of a PROFIdrive frame or by means of an analog setpoint interface, and an encoder by means of a PROFIdrive frame.

The relationship between the encoder values and a defined position is created by assigning parameters to the mechanical properties and the encoder settings, as well as to a homing process. The technology object can also perform movements without a position relationship, and relative position movements, even without being in a homed status.

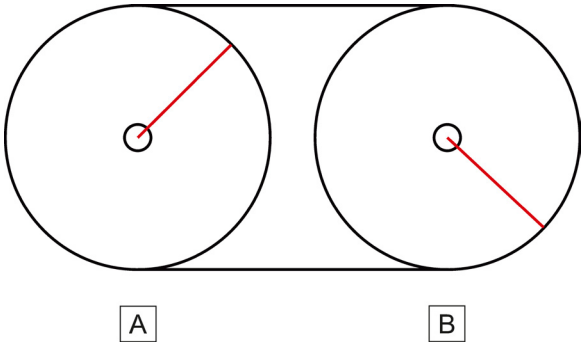
Depending on the execution of the mechanics, a positioning axis is implemented as linear axis or rotary axis (Page 26).

The figure below shows the basic principle of operation of the positioning axis technology object:



3.5 Synchronous axis technology object

The synchronous axis technology object follows the position change of a leading axis in relative synchronous operation. A relative gearing exists, for example, when two mechanically coupled rollers are driven by the same motor:



A Leading axis (driven axis)

B Following axis

Relative position relationship

The change of the leading axis position setpoint is multiplied by a specified gear ratio and passed on to the following axis as setpoint. The synchronous axis technology object outputs this setpoint as speed setpoint to the drive limited to the maximum speed of the drive (<TO>.Actor.DriveParameter.MaxSpeed).

The synchronous axis technology object includes all functions of the positioning axis technology object. All movements of the synchronous axis occur under position control.

If the synchronous axis is operated without synchronous operation, the dynamic limits configured at the technology object apply.

If the synchronous axis is operated as following axis in synchronous operation, the following dynamic limits apply depending on the status of the synchronous operation.

- **Synchronization**

  During synchronization, dynamic limits configured at the technology object apply to the lead axis and the following axis respectively.

- **Travel synchronous** ("MC_GearIn.InGear" = TRUE)

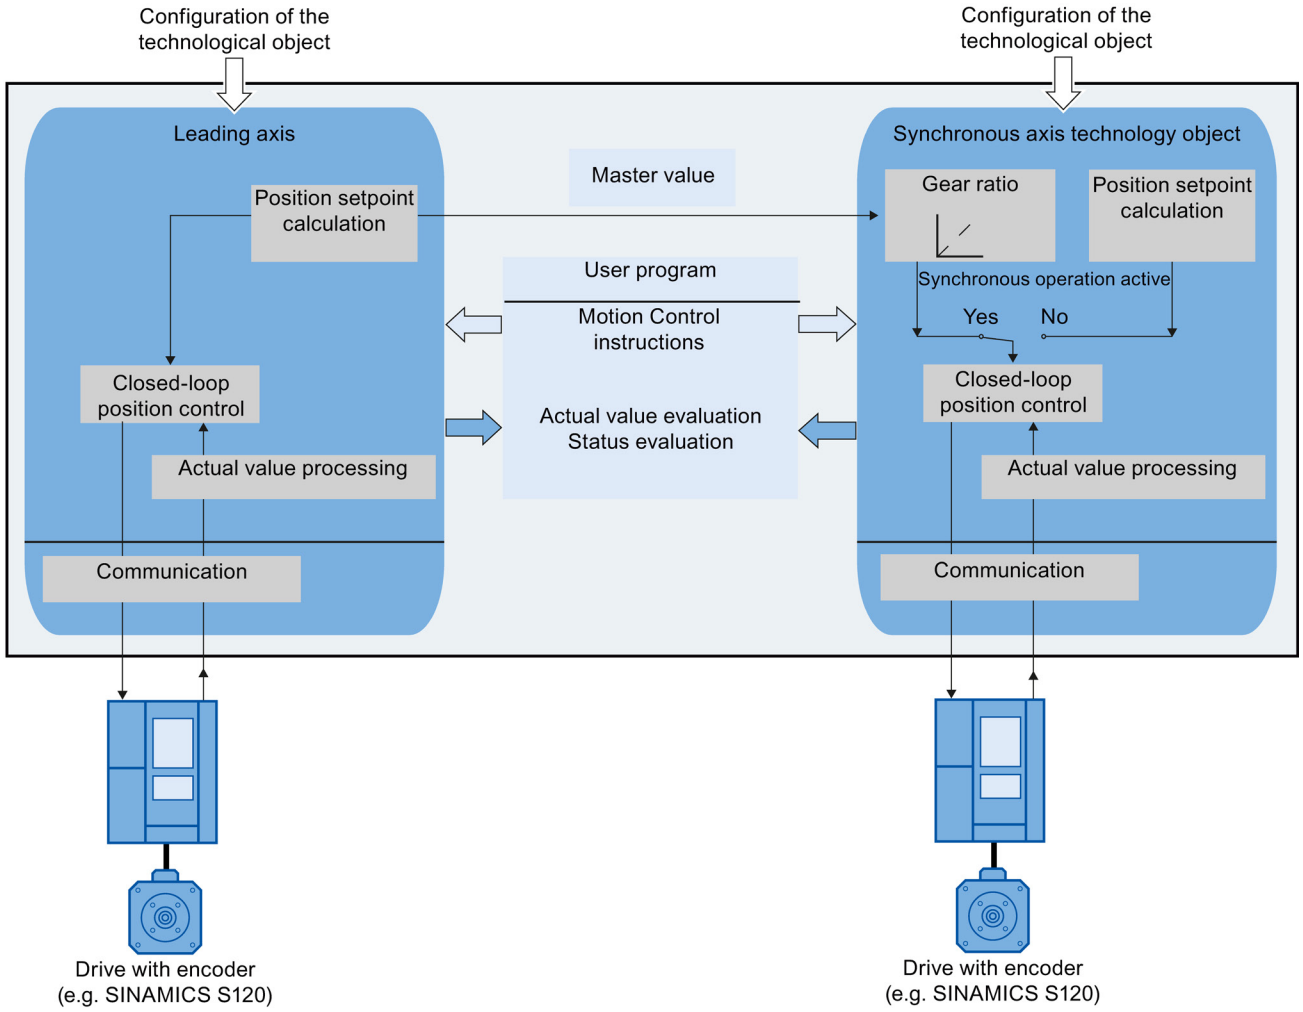
  If the synchronous axis is operated as following axis, the dynamic limits of the leading axis are multiplied by the gear ratio apply. The configured dynamic limits of the following axis are ignored. The dynamic of the following axis is limited to the maximum speed of the drive.

The following hardware components are assigned to each synchronous axis:

- A drive by means of a PROFIdrive frame or by means of an analog setpoint interface
- An encoder by means of a PROFIdrive frame

Depending on the execution of the mechanics, a synchronous axis is implemented as linear axis or rotary axis (Page 26).

The figure below shows the basic principle of operation of the synchronous axis technology object:

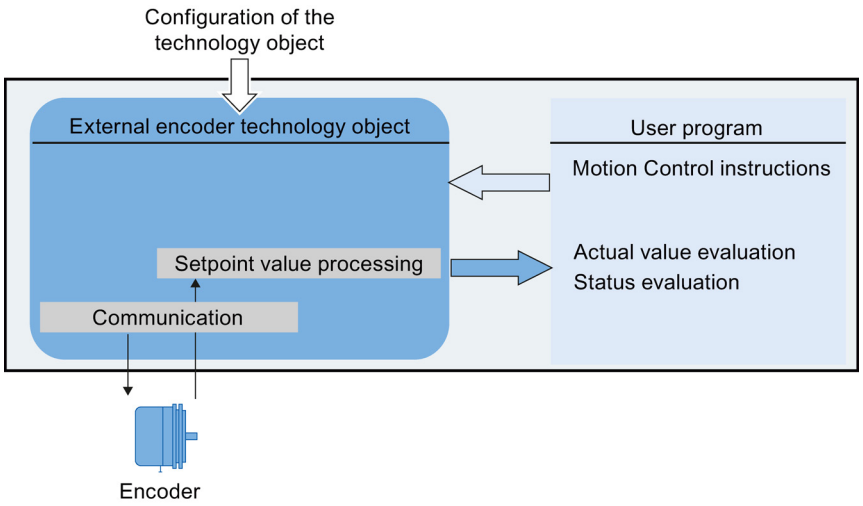


3.6 External encoder technology object

The external encoder technology object detects a position, and makes it available to the controller.

The relationship between the encoder values and a defined position is created by assigning parameters to the mechanical properties and the encoder settings, as well as to a homing process.

The following figure shows the basic principle of operation of the external encoder technology object:



Specification of the position occurs according to the selected system of units:

- **Linear system of units**

  The position is specified as a linear measure, e.g. millimeters (mm).

- **Rotary system of units**

  The position is specified as an angular measure, e.g. degrees (°).

Note

The positioning axis/synchronous axis technology objects and external encoder are independent of each other, and cannot be coupled to each other. The actual position of an external encoder cannot be used for position control of a positioning axis or synchronous axis.

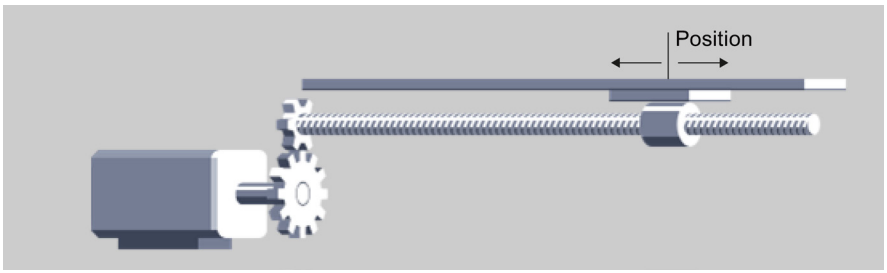
3.7 Axis types

Axes can be configured with different axis types:

- Positioning and synchronous axes can be configured as rotary or linear axis.
- Speed axes are always rotary axes.

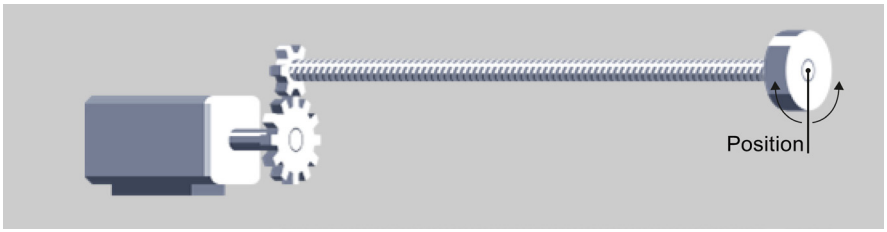
Depending on the execution of the mechanics, an axis is implemented as a linear axis or rotary axis:

- **Linear axis**



For linear axes, the position of the axis is specified as a linear measure, e.g. millimeters (mm).

- **Rotary axis**



For rotary axes, the position of the axis is specified as an angular measure, e.g. degrees (°).

3.8 Modulo setting

The positioning axis, synchronous axis and external encoder technology objects can be enabled with the "Modulo" setting.

If an axis is moved in only one direction, the position value continually increases. To limit the position value to a recurring reference system, you can enable the "Modulo" setting.

When "modulo" is enabled, the position value of the technology object is represented by means of a recurring modulo range. The modulo range is defined by the start value and the length.

For example, to limit the position value of a rotary axis to a full rotation, the modulo range can be defined with start value = 0° and length = 360°. With an encoder resolution of 0.1°/encoder step, the position value is represented in the modulo range 0° to 359.9°.

3.9 Units of measure

The table below shows the supported units of measure for position and velocity:

Position	Velocity
nm, µm, mm, m, km	mm/s, mm/min, mm/h, m/s, m/min, m/h, km/min, km/h
in, ft, mi	in/s, in/min, ft/s, ft/min, mi/h
°, rad	°/s, °/min, rad/s, rad/min

The acceleration is configured accordingly as unit of measure of the position/s².

The jerk is configured accordingly as unit of measure of the position/s³.

The speed is configured as revolutions per unit of time: 1/s, 1/min, 1/h

Note

When setting or changing the units of measurement, note the effect on the depiction and the user program:

- Depiction in the technology data block
- Supply to the parameters in the user program
- Input and display of the position and speed in the TIA Portal
- Setpoint settings by leading axes in synchronous operation

All information and displays are output in the selected unit of measure.

3.10 Drive and encoder connection

3.10.1 Brief description

A speed axis is assigned a drive.
A positioning axis/synchronous axis is assigned a drive and an encoder.
An external encoder is assigned an encoder.

The setpoint value at the drive is specified either with PROFIdrive message frames, or with an analog output.

The following connection options are available for an encoder:

- Encoder to drive
- Encoder on technology module
- PROFIdrive encoder directly to PROFIBUS DP / PROFINET IO

The encoder value is transmitted exclusively via PROFIdrive message frames.

PROFIdrive

PROFIdrive is the standardized standard profile for drive technology in the connection of drives and encoders via PROFIBUS DP and PROFINET IO.

Drives that support the PROFIdrive profile are connected according to the PROFIdrive standard.

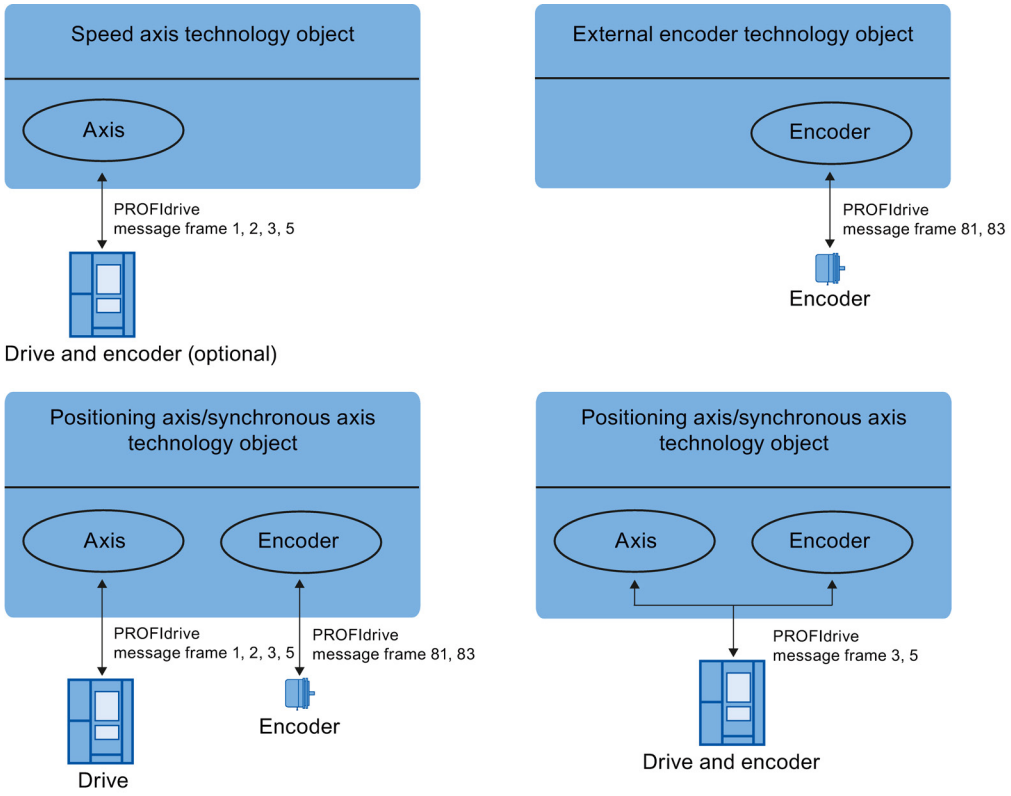
Communication between controller and drive/encoder is by means of various PROFIdrive message frames. Each of the message frames has a standardized structure. Depending on the application, you can select the applicable message frame. Control words and status words as well as setpoints and actual values are transmitted in the PROFIdrive message frames.

The PROFIdrive profile likewise supports the "Dynamic Servo Control" (DSC) control concept. DSC uses rapid position control in the drive. This can be used to solve highly dynamic positioning jobs.

3.10.2 Frames

The transmission of the encoder value occurs either in a frame together with the setpoint (frame 3 or frame 5), or in a separate encoder frame (frame 81 or frame 83).

The following figure represents the relationship between the technology objects and the drives / encoders:



Explanation of the figure:

- The setpoint of a speed axis is transmitted to a drive via PROFIdrive frame 1, 2, 3 or 5.
- The encoder value of an external encoder is transmitted via PROFIdrive frame 81 or 83.
- The setpoint of a positioning axis/synchronous axis is transmitted to a drive via PROFIdrive frame 1, 2, 3 or 5
- Encoder value of the positioning axis/synchronous axis

  The encoder value can be transmitted in the following PROFIdrive frames:

  – Transmission in the same PROFIdrive frame, in which the setpoint is also transmitted. For example, with PROFIdrive frame 3 or 5
  – Transmission in PROFIdrive frame 81 or 83.

Frame types

The following table shows the supported PROFIdrive frame types for the assignment of drives and encoders:

Frame	Brief description
Standard frames	
1	• 16 bit speed setpoint (NSET) • 16 bit actual speed value (NACT),
2	• 32 bit speed setpoint (NSET) • 32 bit actual speed (NACT) • Signs of life
3	• 32 bit speed setpoint (NSET) • 32 bit actual speed (NACT) • Encoder actual value • Signs of life
5	• 32 bit speed setpoint (NSET) • 32 bit actual speed (NACT) • Dynamic Servo Control (DSC) • Encoder actual value • Signs of life
Standard frames encoder	
81	• Encoder actual value • Signs of life
83	• 32 bit actual speed (NACT) • Encoder actual value • Signs of life

When connecting by means of a PROFIdrive frame, the drives and encoders are handled and switched on in accordance with the PROFIdrive profile.

3.10.3 Setting reference values

The reference values for the drive connection and encoder connection must be set identically in the controller, and in the drive or encoder.

The setpoint speed setpoint NSET and the actual speed value NACT are transmitted in the PROFIdrive frame as a percentage value relative to the reference speed. The reference value for the speed must be set identically in the controller and in the drive.

The resolution of the actual value in the PROFIdrive frame must likewise be set identically in the controller and in the drive or encoder.

Frame settings

The controller settings are made in the TIA Portal under "Technology object > Configuration > Hardware interface > Data transmission".

The settings for drive and encoder are set in the configuration for the respective hardware.

The following table contrasts the controller settings and corresponding PROFIdrive parameters (<TO> stands for the applicable technology object):

Setting in the TIA Portal	Controller tag in the technology data block	PROFIdrive parameter
Frame	<TO>.Actor.Interface.Telegram	P922
Reference speed in [rpm]	<TO>.Actor.DriveParameter.ReferenceSpeed	(SINAMICS drives: P2000)
Maximum speed of the motor in [rpm]	<TO>.Actor.DriveParameter.MaxSpeed	(SINAMICS drives: P1082)
Encoder message frame	<TO>.Sensor[n].Interface.Telegram	P922
Encoder system (linear or rotary encoder)	<TO>.Sensor[n].System	P979[1] Bit0
Encoder type 0: incremental 1: absolute 2: cyclic absolute	<TO>.Sensor[n].Type	P979[5]
Resolution (linear encoder) The grid spacing is specified on the nameplate of the sensor as a separation distance of the marks on the linear measuring system.	<TO>.Sensor[n].Parameter.Resolution	P979[2]
Increments per revolution (rotary encoder)	<TO>.Sensor[n].Parameter.StepsPerRevolution	P979[2]
Number of bits for fine resolution XIST1 (cyclic actual encoder value, linear or rotary encoder)	<TO>.Sensor[n].Parameter.FineResolutionXist1	P979[3]
Number of bits for fine resolution XIST2 (absolute encoder value, linear or rotary encoder)	<TO>.Sensor[n].Parameter.FineResolutionXist2	P979[4]
Differentiable encoder revolutions (rotary absolute value encoder)	<TO>.Sensor[n].Parameter.DeterminableRevolutions	P979[5]

3.10.4 Tags

The following technology object tags are relevant for the connection of drives and encoders:

Drive frame	
<TO>.Actor.Interface.Telegram	Frame number
<TO>.Actor.DriveParameter.Reference Speed	Reference velocity / reference speed for the velocity / speed (NSET), which is transmitted as a percentage value
<TO>.Actor.DriveParameter.MaxSpeed	Maximum value for the setpoint speed of the drive (NSET) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)
Encoder frame	
<TO>.Sensor[n].Interface.Telegram	Frame number
<TO>.Sensor[n].System	Encoder system linear or rotary
<TO>.Sensor[n].Type	Encoder type, incremental, absolute or cyclically absolute
<TO>.Sensor[n].Parameter.StepsPer Revolution	Increments per revolution for rotary encoder
<TO>.Sensor[n].Parameter.Determinable Revolutions	Number of differentiable encoder revolutions for a multi-turn absolute value encoder
<TO>.Sensor[n].Parameter.Resolution	Resolution for linear encoder The grid spacing corresponds to the interval between two marks.
Fine resolution	
<TO>.Sensor[n].Parameter.FineResolution Xist1	Number of bits for fine resolution XIST1 (cyclic actual encoder value)
<TO>.Sensor[n].Parameter.FineResolution Xist2	Number of bits for fine resolution XIST2 (absolute value of the encoder)

3.11 Safety functions in the drive

3.11.1 Brief description

The safety functions are internal drive functions and are described in detail in the relevant drive documentation.

The following section describes the reactions to the supported safety functions at the controller end .

The safety features are only supported for the drive connection via PROFIdrive.

The following safety features are supported by S7-1500 Motion Control:

- Safe Torque Off (STO)
- Safe Stop 1 (SS1)
- Safe Stop 2 (SS2)

The active safety functions can also be evaluated via Safety Info Channel (SIC). Since the SIC is not a component of S7-1500 Motion Control, you must evaluate it separately in the user program.

3.11.2 Safe Torque Off (STO)

The Safe Torque Off (STO) safety function is the most common and basic internal safety function in the drive. STO ensures that no torque generating energy acts on a drive. This prevents an unintended startup of the controller. The pulses of the drive are eliminated. The drive is reliably torque-free. This state is monitored internally in the drive.

You can use STO when the drive comes to a standstill in a sufficiently short time due to the load torque or friction. Other areas of use are where "coasting" of the drive has no relevance for safety.

Behavior with S7-1500 Motion Control

When STO is triggered in the drive, technology alarm 421 is output, and the technology object is disabled (alarm reaction: Remove enable).

When the STO signal is no longer present in the drive, you can enable the technology object again after acknowledgment of the alarm.

3.11.3 Safe Stop 1 (SS1)

The Safe Stop 1 (SS1) safety function brings a drive to standstill quickly and safely via a drive-internal rapid stop ramp. Safe Torque Off (STO) is activated after standstill. STO ensures that no torque generating energy acts on a drive. This prevents an unintended startup of the controller.

You can use the SS1 safety function when a fast stop of the drive with a subsequent transition to STO is required. SS1 is used, for example, to quickly stop high inertia or brake drives quickly and safely at high speeds

Behavior with S7-1500 Motion Control

When SS1 is triggered, the drive decelerates at a drive-internal rapid stop ramp and automatically triggers the Safe Torque Off (STO) safety function.

When SS1 is triggered in the drive, the technology alarm 550 (alarm reaction: Follow-up setpoint) is output and the actual values supplied by the drive are automatically tracked as setpoints. The actual values are not monitored at the controller end. When standstill is achieved, technology alarm 421 is output, and the technology object is disabled (alarm reaction: Remove enable).

When the SS1 signal is no longer present in the drive, you can enable the technology object again after the acknowledgment of the alarm.

3.11.4 Safe Stop 2 (SS2)

The Safe Stop 2 (SS2) safety function brings a drive to standstill quickly and safely via a drive-internal rapid stop ramp. When standstill is achieved, the standstill position is monitored at the drive end. The drive can deliver full torque to maintain the standstill.

SS2, for example, is used for machine tools.

Behavior with S7-1500 Motion Control

When SS2 is triggered, the drive decelerates at a drive-internal rapid stop ramp. The drive control monitors the standstill.

When SS2 is triggered in the drive, the technology alarm 550 (alarm reaction: Follow-up setpoint) is output and the actual values supplied by the drive are automatically tracked as setpoints. The actual values are not monitored at the controller end.

When the SS2 signal is no longer present in the drive, the drive goes automatically into "read for operation" mode. The operational readiness of the drive is indicated in the technology object tags <TO>.StatusDrive.InOperation with TRUE. The technology object is automatically enabled again after acknowledging the alarm.

3.12 Actual values

3.12.1 Brief description

For position-controlled motion and positioning, the controller must know the actual position value.

The actual position value is provided by a PROFIdrive frame. The actual value is updated after a one-off transition of the operating mode from STOP to RUN.

The actual values are represented incrementally or absolutely in the PROFIdrive frame, and standardized in the controller to the technological unit. Homing is used to convert the actual value to the physical position of the axis, or of the external encoder.

The controller supports the following types of actual values:

- Incremental actual value
- Absolute actual value with the setting absolute (measuring range > traversing range of the axis)
- Absolute actual value with the setting absolute (measuring range < traversing range of the axis)

3.12.2 Incremental actual value

The actual value in the PROFIdrive frame is based on an incremental value.

After POWER ON, position zero is displayed. The actual value is updated after a one-time transition of the operating mode from STOP to RUN in the STOP and RUN operating modes. The relationship between the technology object and the mechanical position must be recreated by means of homing (Page 39).

3.12.3 Absolute actual value

The actual value in the PROFIdrive frame is based on an absolute value.

After POWER ON, position zero is displayed. The actual value is updated after a one-off transition of the operating mode from STOP to RUN. The supplied absolute value is assigned to the associated mechanical axis position by means of absolute value adjustment (Page 56). The absolute value adjustment must be performed once. The absolute value offset is retentively saved beyond the switching on/off of the controller.

Differentiation of absolute values:

- The measuring range of the encoder is larger than the traversing range of the axis:

  Absolute value with absolute setting
- The measuring range of the encoder is smaller than the traversing range of the axis:

  Absolute value with cyclically absolute setting

Absolute actual value with the setting absolute (measuring range > traversing range)

The axis position results directly from the actual encoder value. The traversing range must be within an encoder measuring range. This means that the zero point of the encoder must not be located in the traversing range.

When the controller is switched on, the axis position is determined from the absolute encoder value.

Absolute actual value with the setting absolute (measuring range < traversing range)

The encoder supplies an absolute value within its measuring range. The controller includes the traversed measuring ranges and thus determines the correct axis position beyond the measuring range.

When the controller is switched off, the traversed measuring ranges are saved in the retentive memory area of the controller.
At the next power-on, the stored overflows are taken into account in the calculation of the actual position value.

NOTICE
Movements of the axis while the controller is switched off can skew the actual value
If the axis or the encoder is moved by more than half of the encoder measuring range while the controller is switched off, then the actual value in the controller is no longer in accord with the mechanical axis position.

3.12.4 Tags

The tags named in the Homing (Page 58) section are relevant for adapting actual values.

3.13 Mechanics

3.13.1 Brief description

For the display and processing of the technology object's position, the decisive factor is whether the position is represented as a unit of length (linear axis) or as a rotary unit (rotary axis).

Examples of units of length: mm, m, km

Examples of rotary units: °, rad

For the determination of the physical position from an actual encoder value, the system must know the various properties and configurations of the mechanics.

Positioning axis/synchronous axis

The following configuration options for mechanics are supported:

- Load gear
- Leadscrew pitch (linear axes only)
- Type of encoder mounting:
  - On the motor side (before the load gear)
  - On the load side (after the load gear and as applicable the leadscrew)
  - External (e.g. odometer)
- Inversion of the setpoint
- Inversion of the setpoint

External encoder

The following configuration options for mechanics are supported:

- Measuring gearbox (for rotary encoders)
- Leadscrew (only with linear system of units and rotatory encoders)
- Inversion of the setpoint

Speed axis

The following configuration options for mechanics are supported:

- Load gear
- Inversion of the setpoint

3.13.2 Tags

The following technology object tags are relevant for the setting of the mechanics:

Type of motion	
<TO>.Properties.MotionType	Indication of linear or rotary motion 0: Linear motion 1: Rotary motion
Load gear	
<TO>.LoadGear.Numerator	Load gear counter
<TO>.LoadGear.Denominator	Load gear denominator
Leadscrew pitch	
<TO>.Mechanics.LeadScrew	Leadscrew pitch
Type of encoder mounting	
<TO>.Sensor[n].MountingMode	Type of encoder mounting
<TO>.Sensor[n].Parameter.DistancePerRevolution	Load distance per encoder revolution with an externally mounted encoder
Inversion	
<TO>.Actor.InverseDirection	Setpoint inversion
<TO>.Sensor[n].InverseDirection	Actual value inversion
Modulo	
<TO>.Modulo.Enable	Enable modulo
<TO>.Modulo.Length	Modulo length
<TO>.Modulo.StartValue	Modulo start value

3.14 Homing

3.14.1 Brief description

With homing, you create the relationship between the position in the technology object and the mechanical position. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

With incremental actual values this process is called homing; with absolute actual values it is called absolute value adjustment.

Homing is a requirement for the indication of the correct position in the technology object, and for absolute positioning.

Homing is enabled with the Motion Control instruction "MC_Home", and is enabled for a single homing process each time.

Homing status

The technology object tag <TO>.StatusWord.X5 (HomingDone) indicates whether the technology object has been homed to an axis or external encoder.

Type of homing

Homing can occur by means of an independent movement for homing (active homing), by means of a homing mark during an application-initiated movement (passive homing), or by means of direct position assignment.

A distinction is made between the following types of homing:

- Active homing

  Active homing initiates a homing movement and performs the necessary approach to the homing mark. When the homing mark is detected, the actual position is set to the configured value. It is possible to specify an offset from the home position.

  When active homing starts, current traversing movements are aborted. The offset is automatically traversed after the approach to home position.

- Passive homing

  The homing job does not perform its own homing motion. When the homing mark is detected during an application-initiated motion, the actual position is set to the configured value.

  Passive homing is also called homing on the fly.

- Direct homing

  The homing job directly sets the actual position to the configured value, or offsets it by this amount.

- Absolute value adjustment

  Absolute value adjustment adjusts the position of the technology object to the existing absolute actual value.

Homing mode

Depending on the type of homing mark and of the homing mark search, a distinction is made among the following homing modes (Page 41):

- **Homing with zero mark via PROFIdrive frame and proximity switch**
- **Homing with zero mark via PROFIdrive frame**
- **Homing with digital input**

3.14.2 Terms

Homing mark

A homing mark is an input signal, on whose occurrence a known mechanical position can be assigned to the actual values.

A homing mark can be:

- **A zero mark**

  The zero mark of an incremental encoder or an external zero mark is used as a homing mark.

  The zero mark is detected at the drive module or encoder module, and transmitted in the PROFIdrive frame. Perform the setting and evaluation as an encoder zero mark or external zero mark at the drive module and sensor module.

- **An edge at the digital input**

  The falling or rising edge at a digital input is used as a homing mark.

Proximity switch

If there are several zero marks in the traversing range, the proximity switch permits the selection of a specific zero mark before or after the proximity switch.

Homing mark position

This is the position assigned to the homing mark.

The homing mark position corresponds to the home position minus the home position offset.

Home position

At the end of the active homing motion, the axis arrives at the home position.

Home position offset

The difference between the homing mark position and the home position is the home position offset.

An offset between homing mark position and home position only has an effect during active homing. The offset is traversed after the synchronization of the axis via the Motion Control instruction "MC_Home". For axes with the modulo setting, the home position offset is always traversed using the direction setting for the shortest path.

Direction reversal at the hardware limit switch (reversing cam)

Hardware limit switches can be used as reversing cams in active homing. If the homing mark is not detected or was approached from the wrong side, then the motion continues after the reversing cam in the opposite direction.

3.14.3 Homing mode

Various homing modes are available for the positioning axis/synchronous axis and external encoder technology objects with incremental encoders. The homing mode is set in the configuration.

Homing with zero mark via PROFIdrive frame and proximity switch

The system checks for when the proximity switch is reached. After the proximity switch is reached and is left again in the assigned homing direction, zero mark detection is enabled via the PROFIdrive message frame.

When the zero mark is reached in the pre-selected direction, then the actual position of the technology object is set to the homing mark position.

Homing with zero mark via PROFIdrive frame

The system enables zero mark detection, as soon as the actual value of the technology object moves in the assigned homing direction.

When the zero mark is reached in the specified homing direction, the actual position of the technology object is set to the homing mark position.

Homing with digital input

The system checks the state of the digital input, as soon as the actual value of the axis or encoder moves in the assigned homing direction.

When the homing mark is reached (setting of the digital input) in the specified homing direction, the actual position of the technology object is set to the homing mark position.

Note

The digital inputs must be placed into the process image partition "PIP OB Servo".

The filter time of the digital inputs must be set smaller than the duration of the input signal at the reference point switch.

Homing SINAMICS drives with external zero marks (Page 396)

3.14.4 Active homing with zero mark and proximity switch

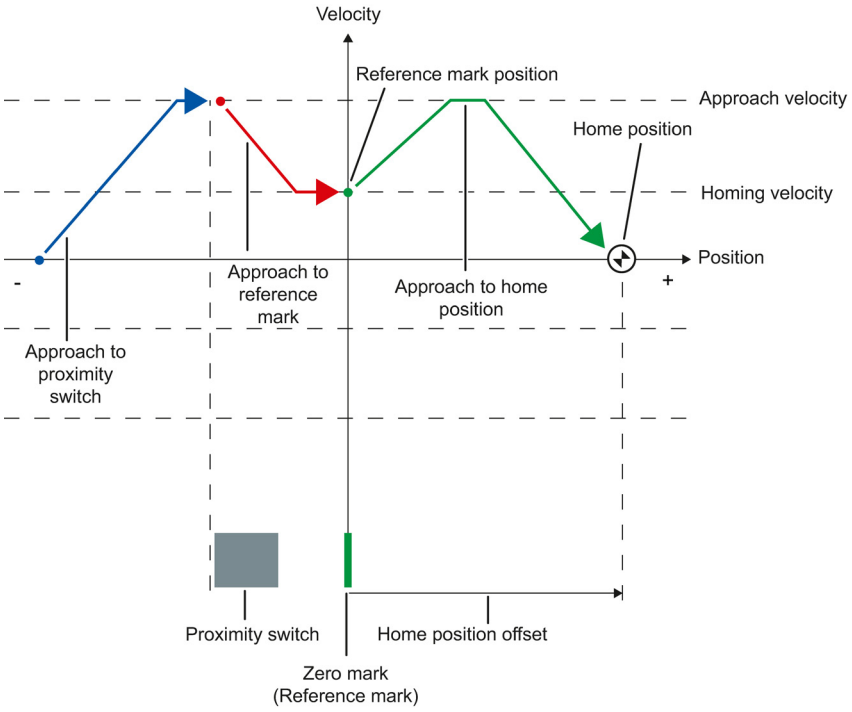
The following examples show homing motions in the positive and negative directions.

Example of homing in the positive direction

The approach to the homing mark and the home position occurs in the positive direction.

The following figure shows the homing motion with the following settings:

- Active homing with zero mark and proximity switch
- Approach in the positive direction
- Homing in the positive direction
- Positive home position offset

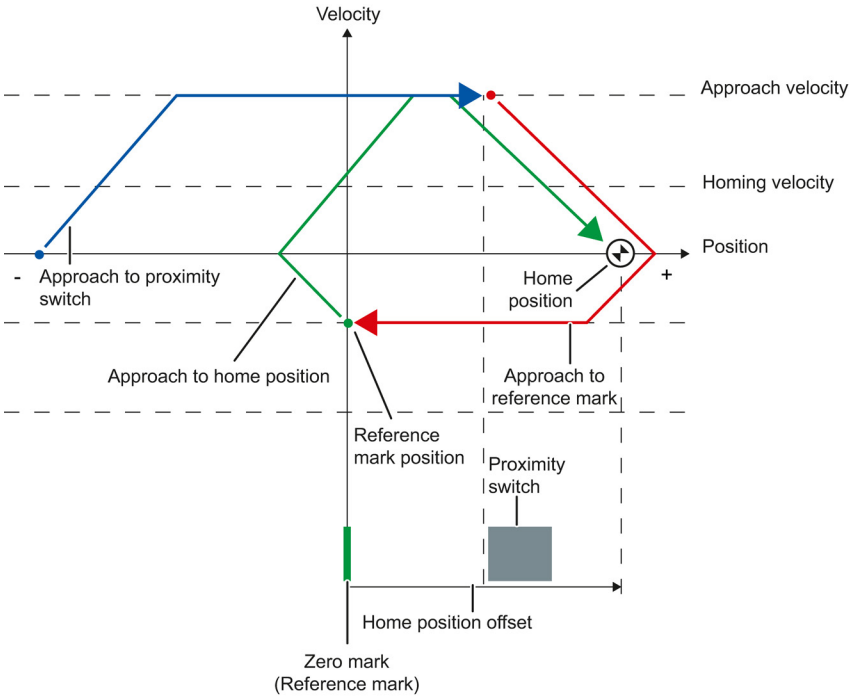


Example of homing in the negative direction

The move to the homing mark occurs in the negative direction by means of a direction reversal during the homing process. The move to the home position causes another direction reversal and occurs in the positive direction.

The following figure shows the homing motion with the following settings:

- Active homing with zero mark and proximity switch
- Approach in the positive direction
- Homing in the negative direction
- Positive home position offset



Motion sequence

The motion occurs in the following sequence:

1. **Start of active homing via the Motion Control instruction "MC_Home"**
2. **Approach to the proximity switch**
3. **Detection of the proximity switch in the homing direction, while moving at homing velocity**
4. **Departure from the proximity switch, and approach to the homing mark**

   With the departure from the proximity switch, the detection of the homing mark is enabled.

5. **Detection of the homing mark**

   When the homing mark is detected, the position of the technology object is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 3

     Position = value in parameter "Position" minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   – Parameter "Mode" to "MC_Home" = 5

     Position = value in the tag <TO>.Homing.HomePosition minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   Note

   Parameter "MC_Home.Mode"

   The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

6. **Approach to the home position**

   – Parameter "Mode" to "MC_Home" = 3

     The axis moves to the position that is specified in the "Position" parameter.

   – Parameter "Mode" to "MC_Home" = 5

     The axis moves to the position that is specified in the <TO>.Homing.HomePosition tag.

   Note

   If the velocity on the span from the detection of the proximity switch to the zero mark cannot be reduced to the homing velocity, then homing occurs at the velocity that exists when the zero mark is traversed.

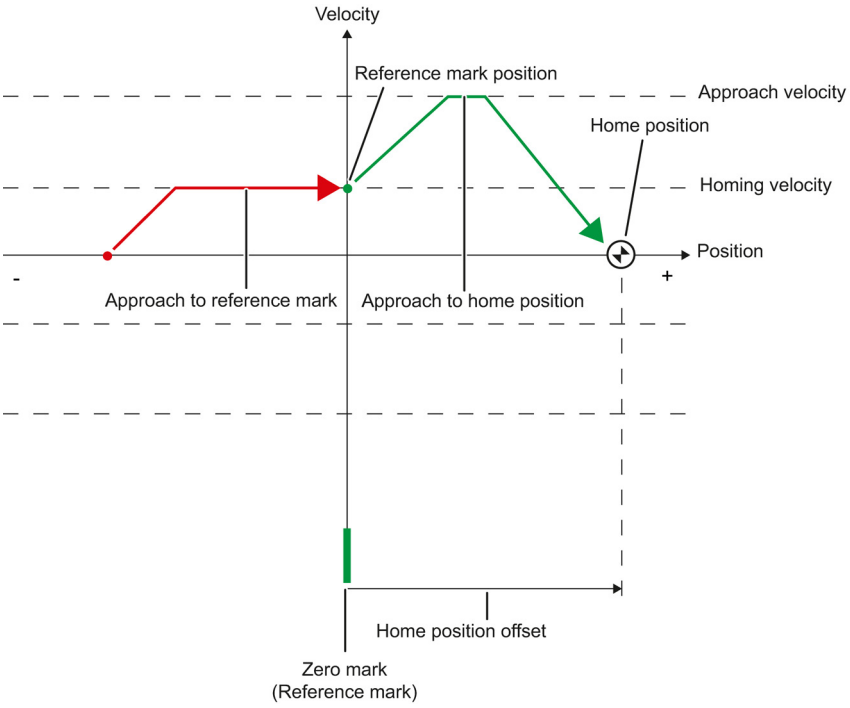
See also

Homing SINAMICS drives with external zero marks (Page 396)

3.14.5 Active homing with zero mark

The following figure shows an example of the homing motion with the following settings:

- Active homing with zero mark
- Homing in the positive direction
- Positive home position offset



Motion sequence

The motion occurs in the following sequence:

1. **Start of active homing via the Motion Control instruction "MC_Home"**
2. **Move to the homing mark in the homing direction with the homing velocity**
3. **Detection of the homing mark**

   When the homing mark is detected, the position of the axis or encoder is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 3

     Position = value in parameter "Position" minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   – Parameter "Mode" to "MC_Home" = 5

     Position = value in the tag <TO>.Homing.HomePosition minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   Note

   Parameter "MC_Home.Mode"

   The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

4. **Approach to the home position**

   – Parameter "Mode" to "MC_Home" = 3

     The axis moves to the position that is specified in the "Position" parameter.

   – Parameter "Mode" to "MC_Home" = 5

     The axis moves to the position that is specified in the <TO>.Homing.HomePosition tag.

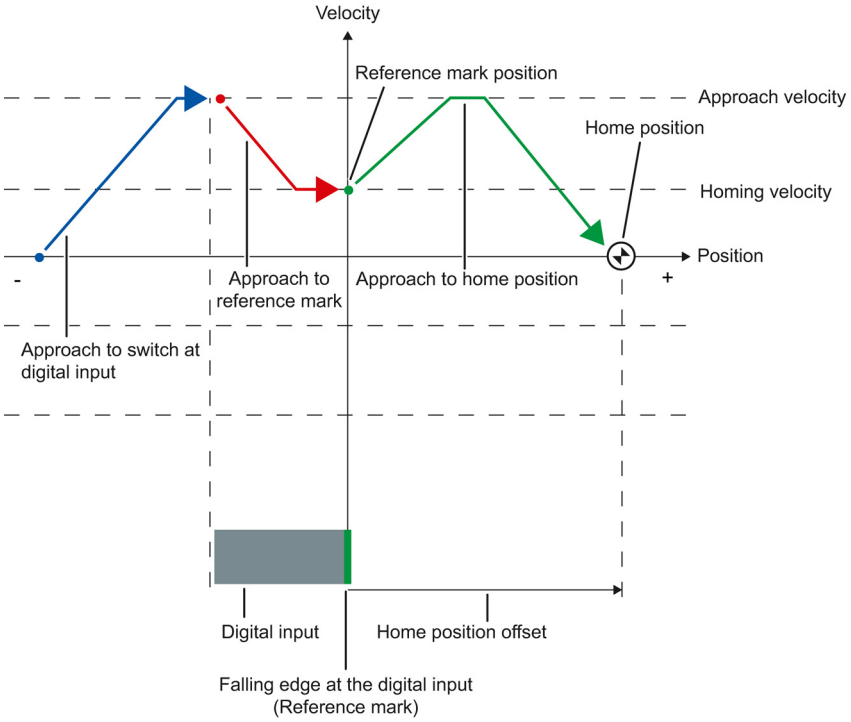
Homing SINAMICS drives with external zero marks (Page 396)

3.14.6 Active homing with digital input

The following figure shows an example of the homing motion with the following settings:

- Active homing with digital input
- Approach in the positive direction
- Homing mark on the positive side of the digital input
- Positive home position offset



Motion sequence

The motion occurs in the following sequence:

1. **Start of active homing via the Motion Control instruction "MC_Home"**
2. **Detection of the rising edge at the digital input, while moving at homing velocity**
3. **Approach to the homing mark**
4. **Detection of the homing mark**

   In the example, the falling edge of the switch at the digital input represents the homing mark.

   When the homing mark is detected, the position of the axis or encoder is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 3

     Position = value in parameter "Position" minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   – Parameter "Mode" to "MC_Home" = 5

     Position = value in the tag <TO>.Homing.HomePosition minus <TO>.Sensor[n].ActiveHoming.HomePositionOffset

   Note

   Parameter "MC_Home.Mode"

   The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

5. **Approach to the home position**

   – Parameter "Mode" to "MC_Home" = 3

     The axis moves to the position that is specified in the "Position" parameter.

   – Parameter "Mode" to "MC_Home" = 5

     The axis moves to the position that is specified in the <TO>.Homing.HomePosition tag.

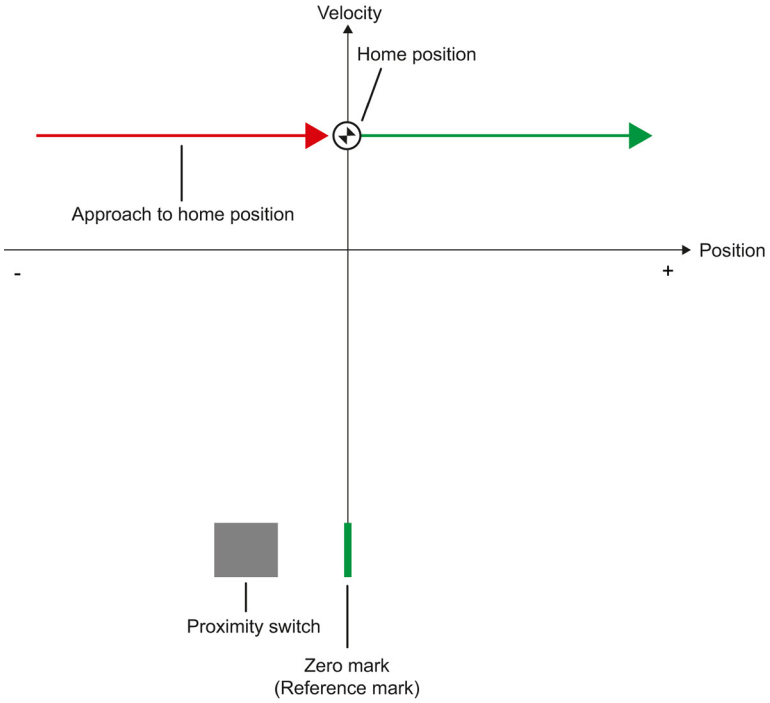
   Note

   If the velocity on the span from the detection of the rising edge to the falling edge cannot be reduced to the homing velocity, then homing occurs at the velocity that exists when the homing mark is traversed.

3.14.7 Passive homing with zero mark and proximity switch

The following figure shows an example of the homing motion with the following settings:

- Passive homing with zero mark and proximity switch
- Homing in the positive direction



Motion sequence

The motion occurs in the following sequence:

1. **Enablement of passive homing via the Motion Control instruction "MC_Home".**
2. **Motion due to a Motion Control job from the application**

   The detection of the proximity switch and of the homing mark is enabled when the actual position value of the axis or encoder moves in the assigned homing direction.
3. **Detection of the proximity switch**
4. **Departure from the proximity switch**

   The departure from the proximity switch enables the detection of the homing mark.
5. **Detection of the homing mark**

   When the homing mark is detected, the position of the axis or encoder is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 2, 8

     Position = value in parameter "Position"

   – Parameter "Mode" to "MC_Home" = 10

     Position = value in tag <TO>.Homing.HomePosition

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

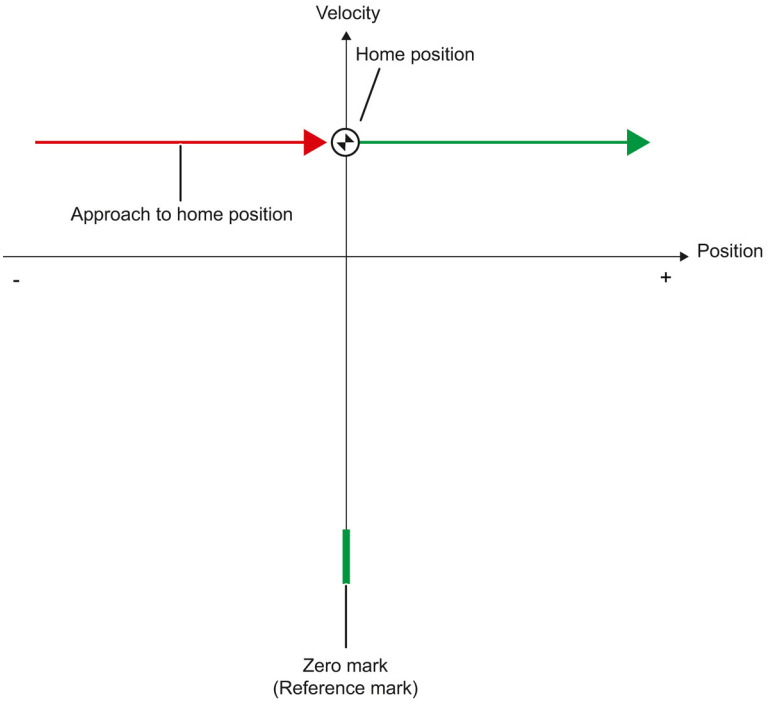
Note

If the direction of motion changes after departure from the proximity switch and before detection of the homing mark, then the proximity switch must be detected again. The Motion Control instruction "MC_Home" remains enabled.

3.14.8 Passive homing with zero mark

The following figure shows an example of the homing motion with the following settings:

- Passive homing with zero mark
- Homing in the positive direction



Motion sequence

The motion occurs in the following sequence:

1. **Enablement of passive homing via the Motion Control instruction "MC_Home".**
2. **Motion due to a Motion Control job from the application**

   The detection of the homing mark is enabled when the actual position value of the axis or encoder moves in the assigned homing direction.

3. **Detection of the homing mark**

   When the homing mark is detected, the position of the axis or encoder is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 2, 8

     Position = value in parameter "Position"

   – Parameter "Mode" to "MC_Home" = 10

     Position = value in tag <TO>.Homing.HomePosition

Note

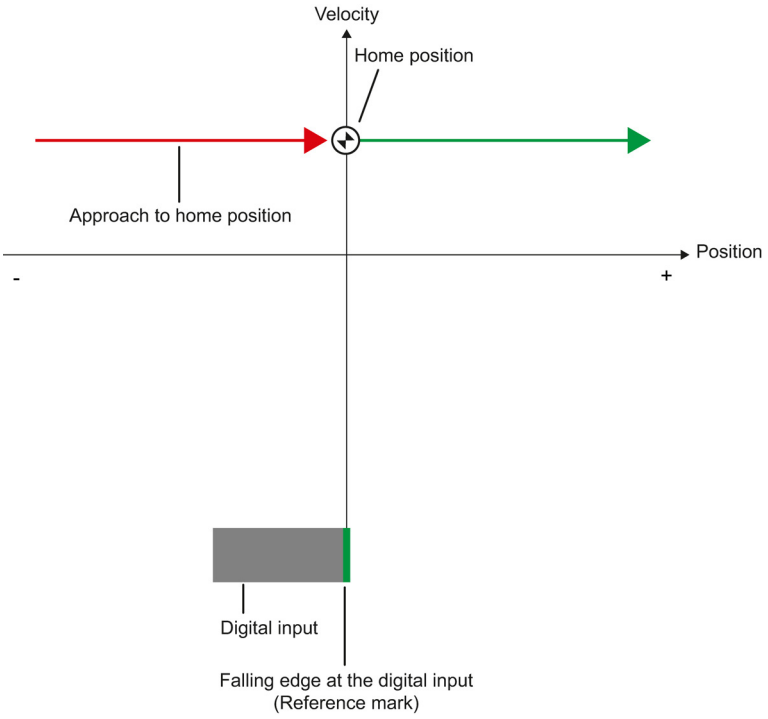
Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

3.14.9 Passive homing with digital input

The following figure shows an example of the homing motion with the following settings:

- Passive homing with digital input
- Homing in the positive direction
- Homing mark on the positive side of the digital input



Motion sequence

The motion occurs in the following sequence:

1. **Enablement of passive homing via the Motion Control instruction "MC_Home".**
2. **Motion due to a Motion Control job from the application**

   The detection of the homing mark at the digital input is enabled when the actual position value of the axis or encoder moves in the assigned homing direction.
3. **Detection of the homing mark**

   In the example, the falling edge of the switch at the digital input represents the homing mark.

   When the homing mark is detected, the position of the axis or encoder is set depending on the configured mode:

   – Parameter "Mode" to "MC_Home" = 2, 8

     Position = value in parameter "Position"

   – Parameter "Mode" to "MC_Home" = 10

     Position = value in tag <TO>.Homing.HomePosition

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

3.14.10 Direction reversal at the hardware limit switch (reversing cam)

During active homing, the hardware limit switch can optionally be used as a reversing cam. If the homing mark is not detected or the motion was not in the homing direction, then the motion continues after the reversing cam in the opposite direction with the approach velocity.

When the hardware limit switch is reached, the dynamic defaults become effective. Deceleration with the emergency stop deceleration does not occur.

NOTICE

Avoid moving to a mechanical endstop

Ensure by one of the following measures, that in a direction reversal the machine does not move to a mechanical endstop.

- Keep the approach velocity low.
- Increase the configured acceleration / deceleration.
- Increase the offset between the hardware limit switch and the mechanical endstop.

3.14.11 Direct homing

Depending on the configured mode, the position of the positioning axis/synchronous axis or external encoder technology objects can be absolutely or relatively set with "MC_Home".

Set position absolutely

Proceed as follows to set the position absolutely:

1. In the Motion Control instruction "MC_Home", enter the absolute position in the "Position" parameter.
2. Call the Motion Control instruction "MC_Home" with parameter "Mode" = 0.

The position is set to the value specified in the "Position" parameter.

Set position relatively

Proceed as follows to set the position relatively:

1. In the Motion Control instruction "MC_Home", enter the relative position in the "Position" parameter.
2. Call the Motion Control instruction "MC_Home" with parameter "Mode" = 1.

The position is set to the current position plus the value specified in the "Position" parameter.

3.14.12 Absolute value adjustment

In absolute value adjustment, Motion Control determines an absolute value offset, that is retentively stored on the CPU.

Depending on the configured mode, the position of the axis or the encoder is absolutely or relatively set in the "MC_Home" Motion Control instruction.

- Parameter "Mode" = 7 (absolute specification of position)

  Position = value in parameter "Position"

- Parameter "Mode" = 6 (relative specification of position)

  Position = current position + value in parameter "Position"

3.14.13 Resetting the "Homed" status

Incremental encoder

In the following cases, the "Homed" status is reset, and the technology object must be rehomed.

- Errors in the sensor system / encoder failure
- Initiation of active homing with the Motion Control instruction "MC_Home" with "Mode" = 3, 5 (after successful completion of the homing process, the status "Homed" is set again.)

  Note

  Parameter "MC_Home.Mode"

  The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

- Initiation of passive homing with the Motion Control instruction "MC_Home" with "Mode" = 2, 8, 10 (after successful completion of the homing process, the status "Homed" is set again.)
- Replacement of the CPU
- Replacement of the SIMATIC Memory Card
- POWER OFF
- Memory reset
- Modification of the encoder configuration
- Restart of the technology object
- Restoration of the CPU factory settings
- Transfer of a different project into the controller

Absolute value encoder

In the following cases, the "Homed" status is reset, and the technology object must be rehomed.

- Errors in the sensor system / encoder failure
- Replacement of the CPU
- Modification of the encoder configuration
- Restoration of the CPU factory settings
- Transfer of a different project into the controller

Resetting the memory of the CPU or upgrading a project does not require another absolute value adjustment.

3.14.14 Tags

The following technology object tags are relevant for homing:

Status indicators	
<TO>StatusWord.X11 (HomingCommand)	Homing command active
<TO>StatusWord.X5 (HomingDone)	Technology object is homed
<TO>ErrorWord.X10 (HomingFault)	Error occurred during homing
Approach to the proximity switch	
<TO>.Homing.ApproachDirection	Start direction or approach direction for the approach to the proximity switch
<TO>.Homing.ApproachVelocity	Velocity for the approach to the proximity switch
Approach to the homing mark	
<TO>.Sensor[n].ActiveHoming.Direction	Homing direction
<TO>.Homing.ReferencingVelocity	Velocity for the approach to the homing mark
Approach to home position	
<TO>.Homing.ApproachVelocity	Velocity for the approach to the home position
Positions	
<TO>.Homing.AutoReversal	Reversal at the hardware limit switches
<TO>.Homing.HomePosition	Home position
<TO>.StatusSensor[n].AbsEncoderOffset	Calculated offset after the absolute value adjustment
Parameters for active homing	
<TO>.Sensor[n].ActiveHoming.Mode	Homing mode
<TO>.Sensor[n].ActiveHoming.SideInput	Side of the digital input
<TO>.Sensor[n].ActiveHoming.Direction	Homing direction or approach direction
<TO>.Sensor[n].ActiveHoming.DigitalInput Address	Byte number of the I/O address of the digital input
<TO>.Sensor[n].ActiveHoming.DigitalInputBit Number	Bit number of the I/O address of the digital input
<TO>.Sensor[n].ActiveHoming.HomePosition Offset	Offset of the homing mark from the home position
Parameters for passive homing	
<TO>.Sensor[n].PassiveHoming.Mode	Homing mode
<TO>.Sensor[n].PassiveHoming.SideInput	Side of the digital input
<TO>.Sensor[n].PassiveHoming.Direction	Homing direction or approach direction
<TO>.Sensor[n].PassiveHoming.DigitalInput Address	Byte number of the I/O address of the digital input
<TO>.Sensor[n].PassiveHoming.DigitalInputBit Number	Bit number of the I/O address of the digital input

Note

Evaluation of the bits in StatusWord, ErrorWord and WarningWord

Read the information provided in section Evaluate StatusWord, ErrorWord and WarningWord (Page 175).

3.15 Control

3.15.1 Brief description

The position controller of the positioning axis/synchronous axis is a closed-loop P controller with pre-control of velocity.

If the drive supports Dynamic Servo Control (DSC), then a closed-loop position controller in the drive can optionally be used.

Dynamic Servo Control (DSC)

In drives that support Dynamic Servo Control (DSC), you can optionally use the closed-loop position controller in the drive. The position controller in the drive is usually implemented with a rapid speed-control cycle. This improves the control performance for digitally coupled drives. The communication times between controller and drive are automatically taken into account.

For DSC, the drive's encoder must be used and standard message frame 5 must be set on the drive.

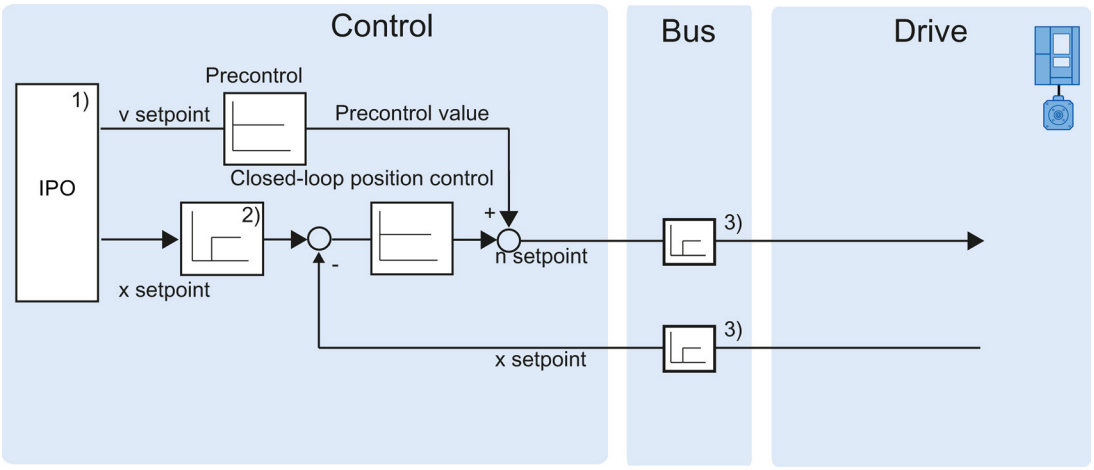
Frames (Page 29)

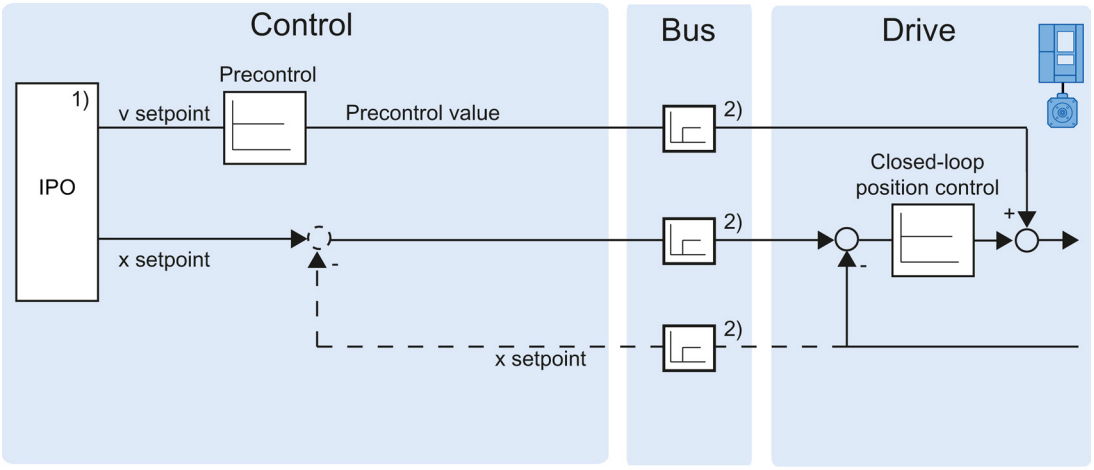
3.15.2 Control structure

The following figure shows the effective control structure without DSC:



1) Interpolator with motion control
2) Internal accounting of the signal delay times
3) Communication control drive

The following figure shows the effective control structure with DSC:



1) Interpolator with motion control
2) Communication control drive

3.15.3 Tags

The following technology object tags are relevant for control:

Parameter	
<TO>.PositionControl.Kv	Proportional gain in the position control
<TO>.PositionControl.Kpc	Velocity pre-control in the position control (in %)
<TO>.PositionControl.EnableDSC	Enabling DSC

3.16 Position-related monitoring

3.16.1 Brief description

The following functions are available in the positioning axis/synchronous axis technology object for monitoring positioning and motion:

- Positioning monitoring (Page 62)

  The actual position value must reach a positioning window within a specified time, and remain in this positioning window for a minimum dwell time.

- Following error monitoring (Page 63)

  The following error is monitored based on a velocity-dependent following error limit. The permissible maximum following error depends on the setpoint velocity.

If monitored conditions are violated, then technology alarms are output. The technology object responds in accordance with the alarm response.

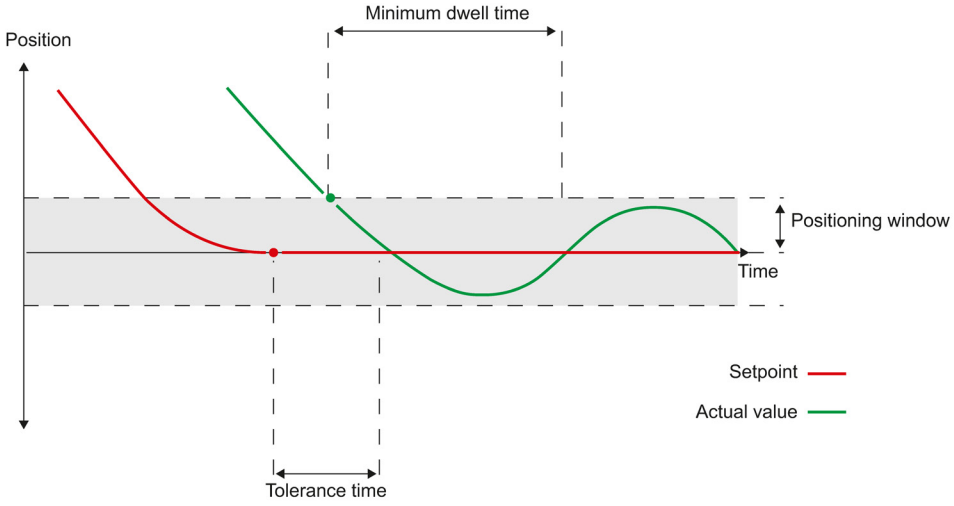
3.16.2 Positioning monitoring

Positioning monitoring monitors the behavior of the actual position at the end of the setpoint calculation.

As soon as the setpoint velocity reaches the value zero, the actual position value must be located within a tolerance time in the positioning window. The setpoint must not exit the positioning window during the minimum dwell time.

If the actual position value at the end of a positioning motion is reached within the tolerance time and remains in the positioning window for the minimum dwell time, then <TO>.StatusWord.X6 (Done) is set in the technology data block. This completes a Motion Control job.

The following figure shows the chronological sequence and the positioning window:



Positioning monitoring does not make any distinction between how the setpoint interpolation was completed. The end of setpoint interpolation can for example be reached as follows:

- by the setpoint reaching the target position
- by position controlled stopping during the motion, via the Motion Control instruction "MC_Halt"

Violation of positioning monitoring

In the following cases, technology alarm 541 is output by the positioning monitoring, and the technology object is disabled (alarm reaction: remove enable).

- The actual value does not reach the positioning window during the tolerance time.
- The actual value exits the positioning window during the minimum dwell time.

3.16.3 Following error monitoring

The following error in the positioning axis/synchronous axis technology object is monitored based on a velocity-dependent following error limit. The permissible following error depends on the setpoint velocity.

A constant permissible following error can be specified for velocities less than an adjustable velocity low limit.

Above this lower velocity limit, the permissible following error increases in proportion to the setpoint velocity. The maximum permissible following error may be reached at the maximum velocity.

Calculation of the following error

The following error is the difference between the position setpoint and the actual position value. The transmission times of the setpoint to the drive, and of the actual position value to the controller, are taken into account in the calculation of the following error, i.e., subtracted out.

Warning limit

A warning limit can be specified for the following error. The warning limit is input as a percentage value and operates relative to the current permissible following error. If the warning limit of the following error is reached, then technology alarm 522 is output. This is a warning and contains no alarm response.

Exceedance of the permissible following error

If the permissible following error is exceeded, then technology alarm 521 is output, and the technology object is disabled (alarm response: remove enable).

3.16.4 Tags

The following technology object tags are relevant for positioning monitoring:

Status indicators	
<TO>.StatusWord.X7 (Standstill)	Is set to the value TRUE , when the actual velocity value goes below the velocity threshold, and does not exit it within the minimum dwell time. The standstill signal is only present at the positioning axis/synchronous axis.
<TO>.StatusWord.X6 (Done)	**Positioning axis/synchronous axis** Is set to the value TRUE, when the actual velocity value reaches the positioning window within the tolerance time, and remains for the minimum dwell time in the window. **Speed axis** Is set to TRUE, when the motion is completed and thus the speed setpoint is equal to zero.
<TO>.ErrorWord.X12 (PositioningFault)	A positioning error has occurred.
Positions and times	
<TO>.PositioningMonitoring.ToleranceTime	Maximum permissible time until positioning window is reached The time is started with the end of the setpoint interpolation.
<TO>.PositioningMonitoring.MinDwellTime	Minimum dwell time in the positioning window
<TO>.PositioningMonitoring.Window	Positioning window
Standstill signal	
<TO>.StandstillSignal.VelocityThreshold	Velocity threshold for the standstill signal
<TO>.StandstillSignal.MinDwellTime	Minimum dwell time below the velocity threshold

The following technology object tags are relevant for following error monitoring:

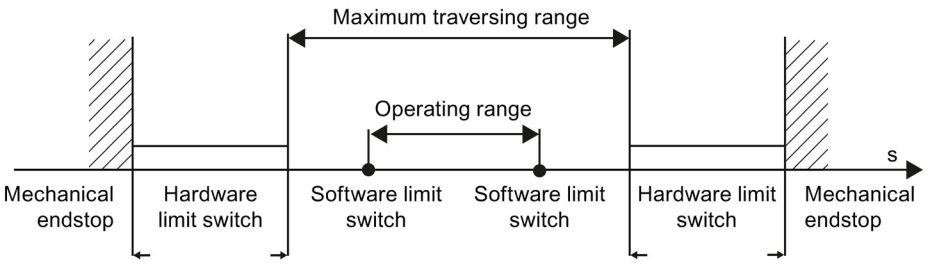
Status indicators	
<TO>.StatusPositioning.FollowingError	Current following error
<TO>.ErrorWord.X11 (FollowingErrorFault)	Status indication, that the following error is too large
<TO>.WarningWord.X11 (FollowingErrorWarning)	Status indication, that the following error warning limit has been reached
Control bits	
<TO>.FollowingError.EnableMonitoring	Enabling / disabling following error monitoring
Limit values	
<TO>.FollowingError.MinVelocity	Lower setpoint velocity for the characteristic curve of the maximum following error
<TO>.FollowingError.MinValue	Permissible following error below the <TO>.FollowingError.MinVelocity
<TO>.FollowingError.MaxValue	Maximum permissible following error at maximum axis velocity
<TO>.FollowingError.WarningLevel	Warning limit as a percentage value relative to the maximum permissible following error (velocity-dependent in accordance with the characteristic curve)

3.17 Traversing range limitation

3.17.1 Brief description

Hardware and software limit switches limit the permissible traversing range and operating range of the positioning axis/synchronous axis. Before use, they must be enabled in the configuration or in the user program.

The following figure shows the relationship between operating range, maximum traversing range and the limit switches:



3.17.2 Hardware limit switches

Hardware limit switches are limit position switches that limit the maximum permissible traversing range of the axis.

Select the positions of the hardware limit switches so that there is adequate braking distance for the axis when needed. The axis should come to a standstill before a mechanical endstop.

Approaching the hardware limit switches

In the monitoring of range limitation, no distinction is made, whether the switches are approached or overshot.

If a hardware limit switch is approached, technology alarm 531 is output, and the technology object is disabled (alarm response: remove enable).

Exception

If the hardware limit switches are used as reversing cams or reference cams, then the monitoring of the hardware limit switches has no effect.

Retracting

The position of the axis when the hardware limit switch is detected is stored internally on the CPU. The status of the approached hardware limit switch is reset only after the hardware limit switch is left and the axis is once again in the maximum traversing range.

To be able to traverse the axis again after reaching the hardware limit switch and to reset the status of the hardware limit switch, follow the steps below:

1. To allow movement away from the limit switch, acknowledge the technology alarm.
2. Traverse the axis away from the hardware limit switch until it leaves it.
   The axis must then be within the maximum traversing range.
   If you traverse the axis in the direction of the limit switch before the axis has left it, the monitoring will be triggered again.

The following diagram shows the response of the status word when reaching the hardware limit switch and when releasing the axis again:

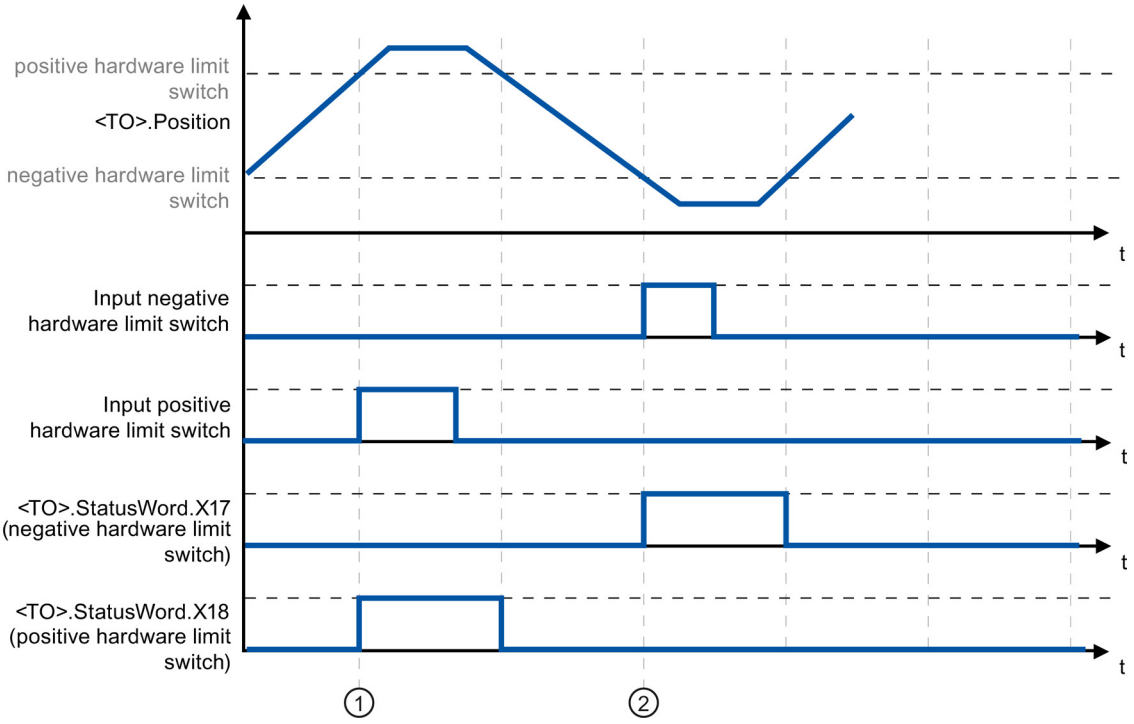


Figure 3-1 Status message HW-ES

At the time ① the position of the axis when the positive hardware limit switch is detected is stored internally on the CPU. To reset the status of the hardware limit switch, the axis must be pulled back from this position.

At the time ② the position of the axis when the negative hardware limit switch is detected is stored internally on the CPU. To reset the status of the hardware limit switch, the axis must pass this position.

3.17.3 Software limit switch

The operating range of the axis is limited with software limit switches. Relative to the traversing range, always position the software limit switches within the hardware limit switches. Since the positions of the software limit switches can be flexibly configured, the operating range of the axis can be individually adapted in accordance with the current velocity profile.

Software limit switches are only effective when there is a valid actual value after homing the technology object. The monitoring of the software limit switches is relative to the setpoint.

Modulo enabled

With modulo enabled, the modulo position is monitored.

The software limit switches are enabled or disabled using the tags in the technology data block. If the positions of both software limit switches are outside the modulo range, then the monitoring has no effect. It is not checked, whether the positions of the software limit switches are within the modulo range.

Approaching the software limit switches

At the beginning of a positioning motion, it is not checked, whether the software limit switches will be approached by approaching the specified target position.

If the software limit switches are approached, then technology alarm 533 is output, and the axis is stopped with the maximum dynamic values (alarm response: Stop with maximum dynamic values). The technology object remains enabled.

Overshooting the software limit switches

If a software limit switch is overshot, technology alarm 534 is output, and the technology object is disabled (alarm response: remove enable).

Retracting

Proceed as follows to retract the axis after violation of the software limit switch:

1. Acknowledge the technology alarm.
2. Move the axis in the free travel direction, until the software limit switch is exited.

   If you move opposite to the free travel direction before exiting the software limit switch, then the monitor with be triggered again.

3.17.4 Tags

The following technology object tags are relevant for software limit switches:

Status indicators	
<TO>.StatusWord.X15 (SWLimitMinActive)	Negative software limit switch is enabled
<TO>.StatusWord.X16 (SWLimitMaxActive)	Positive software limit switch is enabled
<TO>.ErrorWord.X8 (SWLimit)	An alarm is pending, that a software limit switch was violated
Control bits	
<TO>.PositonLimits_SW.Active	Enables / disables the monitoring of the software limit switches
Position values	
<TO>.PositonLimits_SW.MinPosition	Position of the negative software limit switch
<TO>.PositonLimits_SW.MaxPosition	Position of the positive software limit switch

The following technology object tags are relevant for hardware limit switches:

Status indicators	
<TO>.StatusWord.X17 (HWLimitMinActive)	Negative hardware limit switch is enabled
<TO>.StatusWord.X18 (HWLimitMaxActive)	Positive hardware limit switch is enabled
<TO>.ErrorWord.X9 (HWLimit)	An alarm is queued; a hardware limit switch was violated
Control bits	
<TO>.PositonLimits_HW.Active	Enables / disables the monitoring of the hardware limit switches
Parameter	
<TO>.PositonLimits_HW.MinSwitchLevel	Level selection for enablement of the lower hardware limit switch: FALSE: At low level, the signal is enabled TRUE: At high level, the signal is enabled
<TO>.PositonLimits_HW.MinSwitchAddress	Byte number of the I/O address of the hardware limit switch for the lower or minimum position
<TO>.PositonLimits_HW.MinSwitchBitNumber	Bit number of the I/O address of the hardware limit switch for the lower or minimum position
<TO>.PositonLimits_HW.MaxSwitchLevel	Level selection for enablement of the upper hardware limit switch: FALSE: At low level, the signal is enabled TRUE: At high level, the signal is enabled
<TO>.PositonLimits_HW.MaxSwitchAddress	Byte number of the I/O address of the hardware limit switch for the upper or maximum position
<TO>.PositonLimits_HW.MaxSwitchBitNumber	Bit number of the I/O address of the hardware limit switch for the upper or maximum position

3.18 Motion control and limits for dynamics

3.18.1 Brief description

Motion control of the axis occurs by means of velocity profiles (Page 70). The velocity profiles are calculated in accordance with the specifications for dynamics. A velocity profile defines the behavior of the axis during approach, braking and changes in velocity. During positioning a velocity profile is calculated, that moves the axis to the target point.

Maximum values for velocity, acceleration and jerk result from the properties of the drive and the mechanics. These maximum values can be configured in the limits for dynamics. The limits for dynamics are in effect as limits for every motion generated by means of the technology object.

The configurable emergency stop deceleration (Page 71) is triggered by the Motion Control instruction MC_Power or by a technology alarm.

The jerk limit reduces the mechanical load during an acceleration ramp or deceleration ramp. A "smoothed" velocity profile results.

3.18.2 Velocity profile

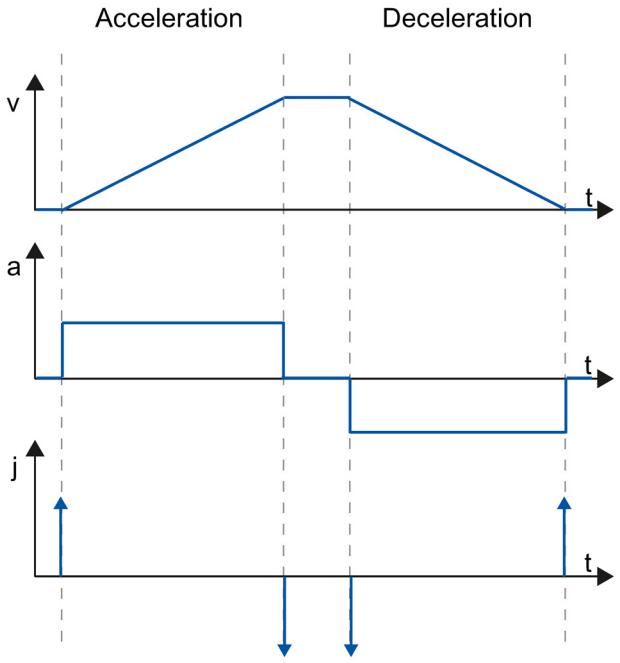
A velocity profile without jerk limit and a velocity profile with jerk limit are both supported for Motion Control of the axis.

The dynamic values for the motion are specified in the Motion Control job. Alternatively the dynamic default values can be used. The defaults and the limits for velocity, acceleration, deceleration and jerk are set in the configuration.

To influence velocity, a velocity override can override the current traversing velocity.

Velocity profile without jerk limit

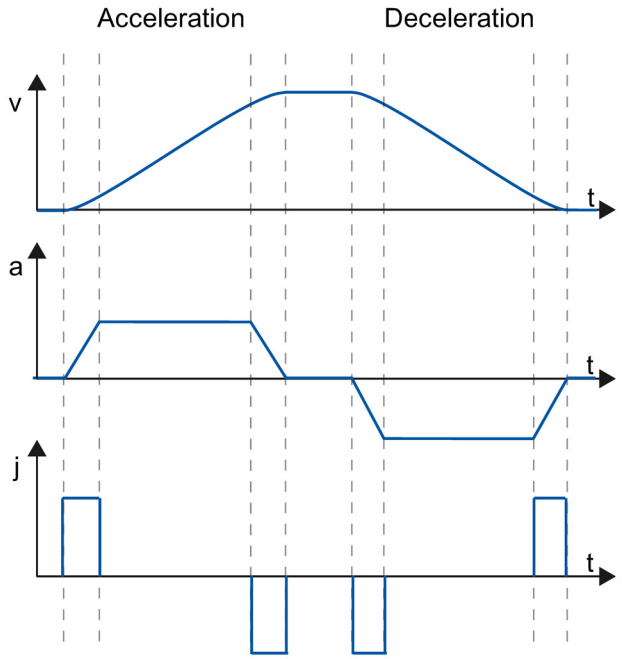
The following figure shows velocity, acceleration and jerk:



v - velocity
a - acceleration
j - jerk
t - time

Velocity profile with jerk limit

The following figure shows velocity, acceleration and jerk:



v - velocity
a - acceleration
j - jerk
t - time

A velocity profile with jerk limit is employed for a continuous acceleration and deceleration sequence. The jerk can be specified.

3.18.3 Emergency stop deceleration

When stopping with the emergency stop ramp, the axis is braked to a standstill without a jerk limit, using the configured emergency stop deceleration.

In the following cases the configured emergency stop deceleration is in effect:

- For an emergency stop ramp that has been enabled via the Motion Control instruction "MC_Power" with parameter "StopMode" = 0.
- For a technology alarm with the local alarm response "Stop with emergency stop ramp".

This emergency stop deceleration can be set greater than the maximum deceleration. If the emergency stop deceleration is set lower than this, it may occur that the axis does not stop until after the limit switch in the case of "Stop at software limit switch" and the occurrence of a technology alarm with the local alarm response "Stop with emergency stop ramp".

3.18.4 Tags

The following technology object tags are relevant for motion control:

Status	
<TO>.StatusWord	Status indicators for an active motion
<TO>.Position	Setpoint position
<TO>.Velocity	Setpoint velocity / setpoint speed
<TO>.ActualPosition	Actual position
<TO>.ActualVelocity	Actual velocity
<TO>.ActualSpeed	Actual speed of the motor (with analog setpoint = 0.0)
<TO>.Acceleration	Setpoint acceleration
<TO>.ActualAcceleration	Actual acceleration
Override	
<TO>.Override.Velocity	Velocity override
Dynamic limit values	
<TO>.DynamicLimits.MaxVelocity	Dynamic limit for maximum velocity
<TO>.DynamicLimits.MaxAcceleration	Dynamic limit for maximum acceleration
<TO>.DynamicLimits.MaxDeceleration	Dynamic limit for maximum deceleration
<TO>.DynamicLimits.MaxJerk	Dynamic limit for maximum jerk
Defaults for the dynamics	
<TO>.DynamicDefaults.Velocity	Default velocity
<TO>.DynamicDefaults.Acceleration	Default acceleration
<TO>.DynamicDefaults. Deceleration	Default deceleration
<TO>.DynamicDefaults.Jerk	Default jerk
<TO>.DynamicDefaults. EmergencyDeceleration	Emergency stop deceleration

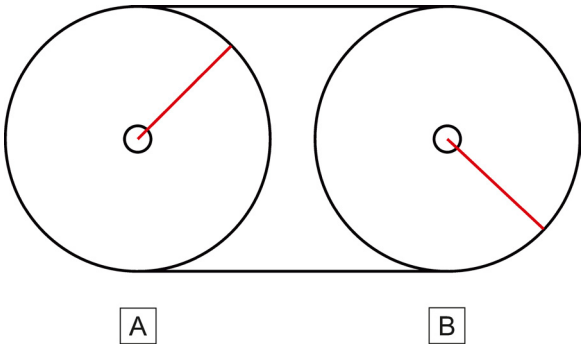
3.19 Synchronous operation

3.19.1 Brief description

The functionality of relative gearing is provided by the synchronous axis technology object.

The change of the leading axis position setpoint is multiplied by a specified gear ratio and passed on to the following axis as change in the position setpoint.

The relative gearing couples a following axis to a leading axis as if the axes were connected via a mechanical transmission.



A Leading axis (driven axis)

B Following axis

Relative position relationship

The following axis is synchronized to the leading axis by means of the Motion Control instruction "MC_GearIn", which represents the mechanical transmission in this case. An active synchronous operation is overridden by motion jobs on the following axis.

3.19.2 Relative gearing

The gear ratio is specified as the relationship between two integers at the Motion Control instruction "MC_GearIn". The result is a linear transmission function. With relative gearing, there is a relative correlation between the leading axis and the following axis. The change of the leading axis position setpoint results from the change in the position setpoint of the leading axis multiplied by the gear ratio.

Synchronization

Synchronization is begins by starting an "MC_GearIn" job. When a synchronous axis synchronizes to a master value, it is displayed in the tag of the <TO>.StatusWord.X21 (Synchronizing) technology object. Active motion jobs are overridden. The dynamic values (acceleration, delay, jerk) of the following axis for the synchronization are specified at "MC_GearIn".

The following axis is synchronized and moves synchronously to the leading axis when the following axis reaches the velocity and acceleration of the leading axis, taking the gear ratio into consideration.

Duration and length of synchronization depend on the dynamic of the leading axis and the dynamic defaults at "MC_GearIn". A position offset can result between leading axis and following axis. This position offset is not compensated.

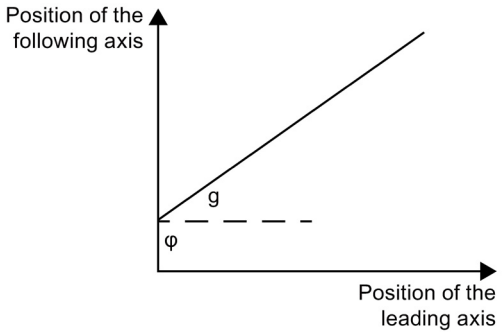
Synchronous motion

When a synchronous axis is synchronized to a master value, the "synchronous" status is displayed by the parameter "MC_GearIn.InGear" = TRUE as well as in the tag of the <TO>.StatusWord.X22 (Synchronous) technology object. The following axis follows the dynamics of the leading axis according to the gear ratio.

The dynamic limits configured on the following axis are no longer in effect in the "synchronous" state. The speed setpoint output to the drive is limited to the configured maximum speed of the drive (<TO>.Actor.DriveParameter.MaxSpeed).

If the following axis cannot follow the master value, a following error occurs which is monitored by the following error monitoring.

The response characteristic of gearing is expressed as a linear correlation between the master value and the slave value.



g Gear ratio (transformation ratio)

φ Position offset between master value and slave value in synchronous operation
The position offset is derived from the synchronization and is constant thereafter.

The slave value is calculated according to the following formula:

Slave value = g × master value + φ

Overriding synchronous operation

An active synchronous operation is overridden by motion jobs on the following axis.

Direction

The numerator of the gear ratio is specified as positive or negative. This results in the following response:

- Positive gear ratio:
  The leading and following axes move in the same direction.
- Negative gear ratio:
  The following axis rotates in the opposite direction of the leading axis.

Homing with active synchronous operation

A position offset at the following axis is not compensated with relative gearing. This means a new offset results when homing the following axis during an active synchronous operation. A job for active homing at a following axis overrides synchronous operation.

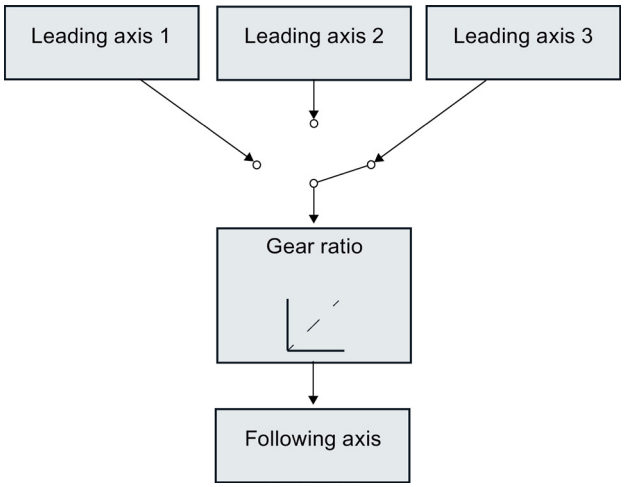
NOTICE
Drive damage The position of the leading axis can change suddenly during homing of the leading axis. This master value jump has the effect of a setpoint jump at the following axis. The setpoint jump is traversed at the following axis taking the gear ratio into consideration. Jerky compensation motions at the following axis and drive damage could result. If homing of the leading axis is required during active synchronous operation, keep the master value jump and its effects on the following axis to a minimum.

3.19.3 Master value coupling

The master value for synchronous operation is provided by a leading axis. The master values are always the position setpoints of the leading axis (setpoint coupling). A following axis can be coupled with different master values. Only one master value is actively evaluated at any one time. The master value can be specified by positioning axes or synchronous axes.

The master value is specified in the user program with the call of the Motion Control instruction "MC_GearIn". The master value is switched when you call the "MC_GearIn" again specifying a different leading axis.

The figure below shows an example of a synchronous axis with several master values:



The following rules apply to the master value coupling:

- Positioning axes and synchronous axes can specify master values. A leading axis can output the master value to several following axes.
- The synchronous axis can be interconnected with different master values. All interconnections required during operation must be set up during configuration of the synchronous axis technology object.
- Only one master value is actively evaluated at any one time.
- Recursive interconnections are not possible. A leading axis cannot be interconnected as following axis to its own master value.

  The following example shows a recursive interconnection that is not permitted:

  The following interconnections are configured in the TIA Portal:

Interconnection		Axis 1		Axis 2
A	Axis 1 is a possible leading axis for axis 2	Leading axis	→	Following axis
B	Axis 2 is possible leading axis for axis 1	Following axis	←	Leading axis

  Use the Motion Control instruction "MC_GearIn" to enable interconnection A or interconnection B. Interconnections A and B cannot be enabled at the same time because it would be a recursive interconnection.

Note

The master values and slave values are coupled without conversion into the relevant configured user unit. If the leading axis is a linear axis (millimeters) and the following axis is a rotary axis (degrees), for example, the unit is not converted during synchronous operation. If the leading axis moves by 10 mm, the following axis moves by 10° with a gear ratio of 1:1.

3.19.4 Tags

The following technology object tags are relevant for synchronous operation:

Status indicators	
<TO>.StatusSynchronizedMotion.ActualMaster	When a "MC_GearIn" job is started, the number of the technology data block of the currently used leading axis is displayed. "ActiveMaster" = 0 with disabled synchronous operation
<TO>.StatusWord.X21 (Synchronizing)	When the synchronous axis synchronizes to a master value, the value is set to TRUE.
<TO>.StatusWord.X22 (Synchronous)	When the synchronous axis is synchronized and moves synchronously to the leading axis, the value is set to TRUE .
<TO>.ErrorWord.X14 (SynchronousError)	Error during synchronous operation The leading axis specified at the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis.

3.20 Operational sequence

3.20.1 Organization Blocks for Motion Control

Description

When you create a technology object, organization blocks are automatically created for processing the technology objects. The Motion Control functionality of the technology objects creates its own execution level, and is called according to the Motion Control application cycle.

The following blocks are created:

- MC-Servo [OB91]

  Calculation of the Position Controller

- MC-Interpolator [OB92]

  Evaluation of the motion control instructions, generation of setpoints and monitoring functionality

The organization blocks are protected (know-how protection). The program code cannot be viewed or changed.

The frequency relationship of the two organization blocks to one another is always 1:1. MC-Servo [OB91] is always executed before MC-Interpolator [OB92].

You can set the application cycle and the priority of the organization blocks according to your requirements for control quality and system load.

Application cycle

You can set the application cycle in which the MC-Servo [OB91] is called in the properties of the organization block in "General > Cycle Time":

- **Synchronous to the bus**

  MC-Servo [OB91] is called synchronously with or at a reduced ratio to a bus system. You set the send clock in the properties of the selected bus system. In the "Distributed I/O" drop-down list, you can select the following bus systems:

  – Isochronous PROFIBUS DP

  – Isochronous PROFINET IO

  You cannot call the MC-Servo [OB91] synchronously with a bus system that is connected to the CPU via a communications processor/communications module (CP/CM).

- **Cyclic**

  The MC-Servo [OB91] is called cyclically with the specified application cycle.

The selected application cycle must be long enough to be able to process the technology objects in one cycle. If the processing time of the technology objects is longer than the application cycle, overflows (Page 80) will occur.

You can check the runtime of MC-Servo [OB91] and MC-Interpolator [OB92] with the expanded instruction "RT_INFO".

Clock reduction (CPU V1.5 and higher)

You can reduce the application cycle of the MC-Servo [OB91] relative to the send clock of an isochronous PROFINET IO system. You can set an integer multiple of the send clock as the factor. Values up to 14 times the send clock (maximum 32 ms) are possible for the application cycle.

If you call a isochronous interrupt OB and the MC-Servo [OB91] synchronously with the same PROFINET IO system, set the same application cycle for both organization blocks.

Priority

You can configure the priority of the organization blocks as needed in their properties under "General > Properties > Priority":

- **MC Servo [OB91]**

  Priority 17 to 31 (default value 25)

- **MC Interpolator [OB92]**

  Priority 16 to 30 (default value 24)

The priority of MC Servo [OB91] must be at least one higher than the priority of the MC Interpolator [OB92].

3.20.2 Process image partition "OB Servo PIP"

The process image partition "OB Servo PIP" is made available in isochronous mode for Motion Control. All drives and encoders used by Motion Control are assigned to this process image partition.

Additionally, you should assign all I/O modules used by Motion Control to this process image partition (e.g. hardware limit switches). The assignment results in chronologically synchronous processing with the technology object.

The input process image partition is also updated in STOP mode.

Process image partition in the user program

As of CPU version V1.5, you can access the process image partition "TPA OB Servo" in your user program. This makes it possible to evaluate the process image partition using the trace and logic analyzer function.

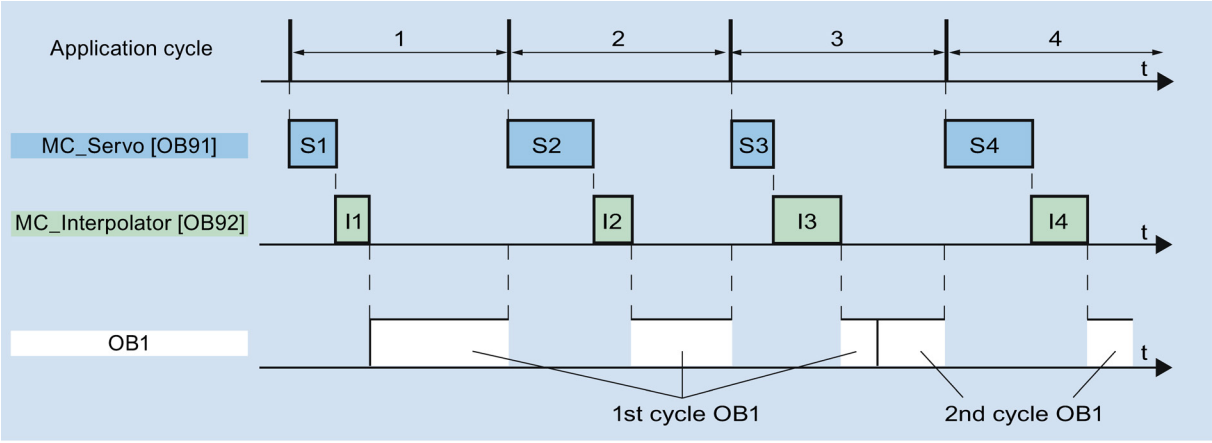
3.20.3 Operational Sequence and Timeouts

When processing the motion control functionality, the organization blocks MC-Servo [OB91] and MC-Interpolator [OB92] are called and processed in each application cycle. The remaining cycle time is available for the processing of your user program.

For error-free program execution, keep to the following rules:

- In each application cycle, MC-Servo [OB91] must be started and executed completely.
- In every application cycle, the relevant MC-Interpolator [OB92] must at least be started.

The following figure shows an example of the error-free operational sequence for the processing of organization block OB1:

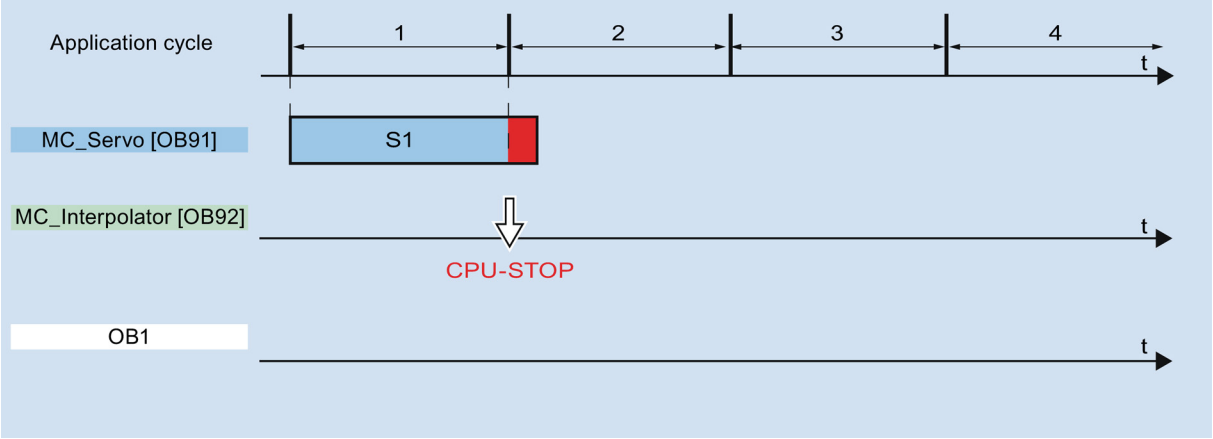


Overflows

If the set application cycle is not adhered to, for example because the application cycle is too short, overflows can occur.

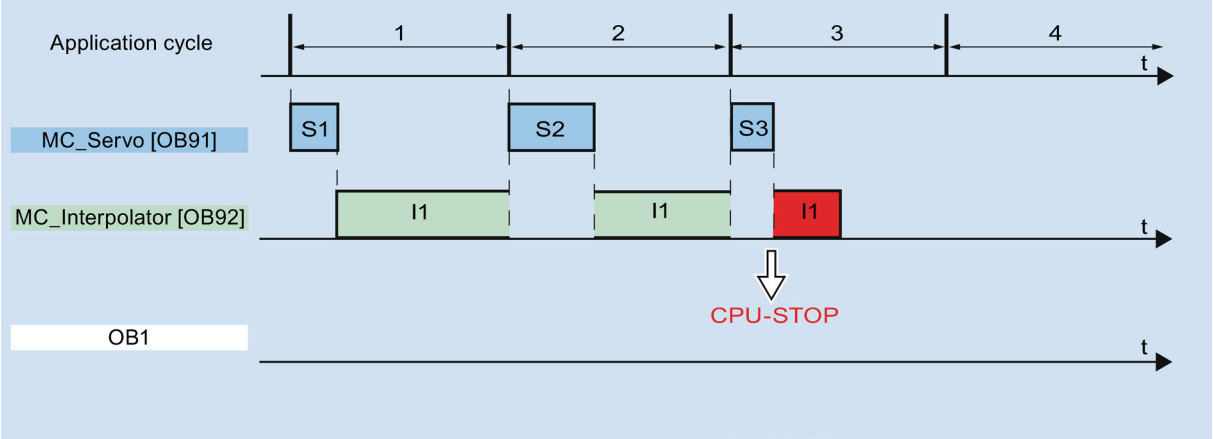
The CPU will not tolerate overflow of MC-Servo [OB91]. An overflow will cause the CPU to change to STOP mode.

The following figure shows the operational sequence if there is an overflow of MC-Servo [OB91]:



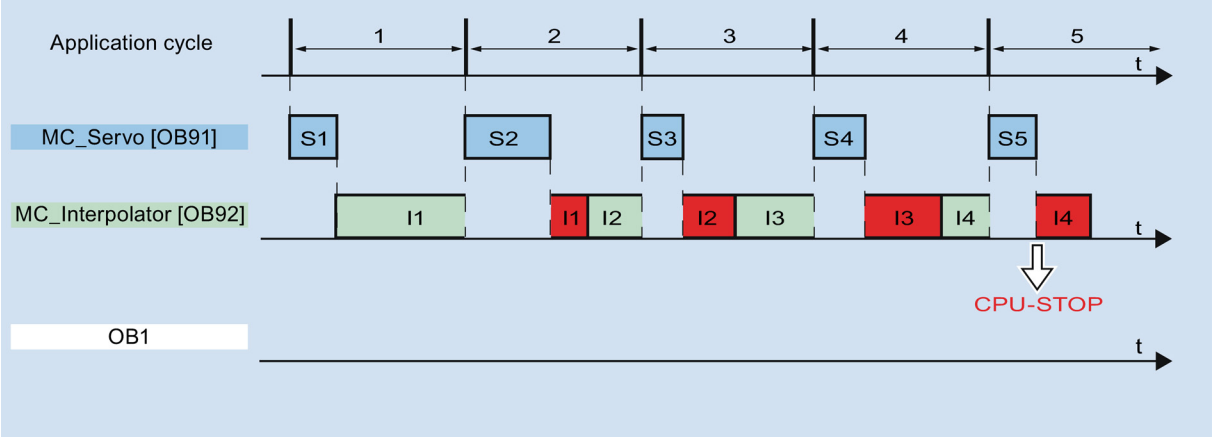
The execution of an MC-Interpolator [OB92] may only be interrupted by an MC-Servo [OB91] call. If more interruptions occur, the CPU switches to STOP mode.

The following figure shows the sequence when an MC-Interpolator [OB92] is interrupted over two time slices:



The CPU tolerates a maximum of three consecutive overflows of MC-Interpolator [OB92]. If more overflows occur, the CPU switches to STOP mode.

The following figure shows the sequence if there are four consecutive individual overflows of MC-Interpolator [OB92]:

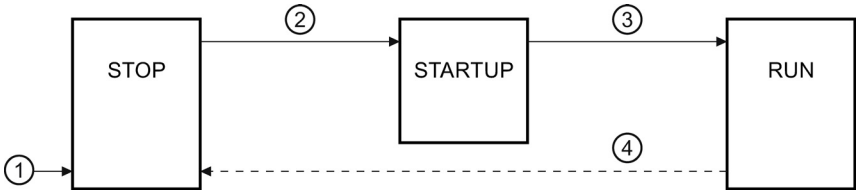


3.20.4 Operating modes

This section examines the behavior of Motion Control in each operating mode, and in the transitions between operating modes. A general description of the operating modes can be found in system manual S7-1500.

Operating modes and transitions

The CPU has three operating modes: STOP, STARTUP and RUN. The following figure shows the operating modes and the operating mode transitions:



STOP mode

In STOP mode the user program is not processed and al process outputs are disabled. Thus no Motion Control jobs are executed.

The technology data blocks are updated.

STARTUP mode

Before the CPU starts processing of the cyclical user program, the startup OBs are processed one time.

In STARTUP mode, the process outputs are disabled. Motion Control jobs are rejected.

The technology data blocks are updated.

RUN mode

The user program is processed in RUN mode.

In RUN mode, the programmed Motion Control jobs are cyclically called and processed.

The technology data blocks are updated.

Operating mode transitions

The following table shows the behavior of Motion Control in the transitions between the operating modes:

No.	Operating mode transition	Behavior
①	POWER ON → STOP	The CPU performs a restart of the technology objects. The technology objects are reinitialized with the values from the load memory.
②	STOP → STARTUP	Not relevant to Motion Control.
③	STARTUP → RUN	The process outputs are enabled.
④	RUN → STOP	When the CPU changes to RUN mode after STOP mode, all technology objects are disabled in accordance with the alarm response "remove enablement". Running Motion Control jobs are terminated.

Guidelines

4

4.1 Guidelines on use of motion control

The guidelines described here present the basic procedure for using Motion Control with the CPU S7-1500. These guidelines serve as recommendations.

Requirements

- A project with a CPU S7-1500 has been created.

Procedure

Proceed as follows to use Motion Control with the CPU S7-1500:

1. Add technology object (Page 99)
2. Working with the configuration editor (Page 100)
3. Programming (Page 172)
4. Downloading to CPU (Page 198)
5. Functional test in the Commissioning window (Page 199)
6. Diagnostics (Page 214)

Using versions

5

5.1 Overview of versions

The technology version for S7-1500 Motion Control includes the version of the technology objects and the version of the Motion Control instructions. Only one technology version can be operated on a CPU. This means that operation of two different technology versions side-by-side is not possible on one CPU.

When changing to a CPU V1.6, you must change the technology version to V2.0. Card replacement from a CPU < V1.6 to a CPU V1.6 is not permitted. In the TIA Portal, you can only work on projects with technology version V2.0 with a CPU V1.6.

There are two ways of changing the technology version:

- Changing the version of the Motion Control instructions

  You change the version of the Motion Control instructions in the "Instructions" task card in the folder "Technology > Motion Control > S7-1500 Motion Control".

  If the Motion Control instruction version used does not correspond to the compatibility list, the relevant Motion Control instructions are highlighted in red in the program editor.

- Adding a technology object with an alternative version

  If a technology object with an alternative version is added in the "Add new object" dialog, the technology version is changed to the alternative version.

The technology objects and Motion Control instructions are only converted to the selected version of the technology during compilation.

The version of a technology object or a Motion Control instruction can be checked in the object properties in the "General > Information" tab in the "Version" box.

Compatibility list

The table below shows the compatibility of the technology version with the CPU version:

CPU	Technology	Technology object	Motion Control Instruction
V1.0, V1.1, V1.5[1]	V1.0	Speed axis V1.0 Positioning axis V1.0 External encoder V1.0	MC_Power V1.0 MC_Home V1.0 MC_MoveJog V1.0 MC_MoveVelocity V1.0 MC_MoveRelative V1.0 MC_MoveAbsolute V1.0 MC_Halt V1.0 MC_Reset V1.0
V1.6	V2.0 Innovations: • Synchronous axis • Relative gearing • MC_GearIn • MC_MoveSuperimposed • Standardization of the "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control • Simulation mode • Support of the safety functions of the drive	Speed axis V2.0 Positioning axis V2.0 External encoder V2.0 Synchronous axis V2.0	MC_Power V2.0 MC_Home V2.0 MC_MoveJog V2.0 MC_MoveVelocity V2.0 MC_MoveRelative V2.0 MC_MoveAbsolute V2.0 MC_Halt V2.0 MC_Reset V2.0 MC_GearIn V2.0 MC_MoveSuperimposed V2.0

1) Card replacement from a CPU < V1.6 to a CPU V1.6 is not supported.

Parameter "Mode" of the Motion Control instruction "MC_Home"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter.

The table below shows a comparison of the "MC_Home.Mode" parameter for technology V1.0 and V2.0:

MC_Home.HomingMode V1.0	Parameter value	MC_Home.Mode V2.0
Direct homing (absolute)	0	Direct homing (absolute)
Direct homing (relative)	1	Direct homing (relative)
Passive homing	2	Passive homing (without reset)
Passive homing (with configured home position)	3	Active homing
Active homing	4	Reserved
Active homing (with configured home position)	5	Active homing (with configured home position)
Absolute encoder adjustment (relative)	6	Absolute encoder adjustment (relative)
Absolute encoder adjustment (absolute)	7	Absolute encoder adjustment (absolute)
Passive homing (without reset)	8	Passive homing
Canceling passive homing	9	Canceling passive homing
-	10	Passive homing (with configured home position)

You can find additional information about the "MC_Home.Mode" parameter in the description of the Motion Control instruction "MC_Home" (Page 239).

5.2 Changing a technology version

Before you can access all the benefits of a new technology version, you need to change the technology version for existing projects.

Changing technology version to V2.0

To change the technology version to V2.0, follow these steps:

1. Replace the CPU V1.0...V1.5 in the project with a CPU V1.6.
2. Open the programming editor (e.g., by opening the OB1).

   The technology objects and Motion Control instructions are highlighted in red after the CPU is replaced.
3. In the "Instructions" task card, open the technology version V2.0 in the "Technology > Motion Control > S7-1500 Motion Control" folder.
4. Save and compile the project.

   The version of the technology objects and Motion Control instructions is changed to V2.0 during compilation of the project.

   Pay attention to any error information that is displayed during compilation. Deal with the causes of the errors indicated.
5. Check the configuration of the technology objects.

Resetting the parameter "Mode" of the Motion Control instruction "MC_Home"

When the technology version is changed from V1.0 to V2.0, the "MC_Home.HomingMode" (V1.0) parameter is renamed to "MC_Home.Mode" (V2.0). The assignment of the parameter values is changed as well.

To reset the "MC_Home.Mode" (V2.0) parameter, follow these steps:

1. To change the technology version, follow the instructions given above.

   When compiling the project, the "MC_Home.HomingMode" (V1.0) parameter is renamed to "MC_Home.Mode" (V2.0):

   – The assignment of the parameter values is changed. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

     You can find additional information about the "MC_Home.Mode" parameter in the description of the Motion Control instruction "MC_Home" (Page 239).

   – The value configured at the "MC_Home.HomingMode" parameter (V1.0) is lost. As a note on renaming, the following text is entered at the "MC_Home.Mode" (V2.0) parameter as parameter value:

     "Die Schnittstelle hat sich geändert. Weitere Informationen finden Sie in der Beschreibung der Motion Control-Anweisung MC_Home."

   – There is a message in the "Info > Compile" tab in the Inspector window stating that the operand has the wrong data type.

2. Change the value of the "MC_Home.Mode" parameter (V2.0) in your user program according to the new assignment.
3. Save and compile the project.

Configuring

6

6.1 Adding and configuring drives in the device configuration

6.1.1 Add and configure PROFINET IO drives

Adding and configuring a PROFINET IO drive is described below using a **SINAMICS S120 drive**. Adding and configuring other PROFINET IO drives may differ from the description in certain respects.

Requirements

- The SIMATIC S7-1500 device is created in the project.
- The desired drive can be selected in the hardware catalog.

If the drive is not available in the Hardware Catalog, then it must be installed in the "Extras" menu as a device description file (GSD).

Adding a drive and frame in the device configuration

1. Open the device configuration and change to the network view.
2. In the hardware catalog, open the folder "Additional Field Devices > PROFINET IO > Drives > Siemens AG > SINAMICS".
3. Select the desired drive with the desired version, then drag it to the network view.
4. Assign the drive to the PROFINET interface of the PLC.
5. Open the drive in the device view.
6. Drag a Drive Object (DO) and a standard frame from the hardware catalog to the slot of the device overview of the drive.

Depending on the version of the SINAMICS S120 drive, select "DO with standard telegram X", or "DO Servo" and a "Standard telegram X" for the frame.

For more information on suitable frames, refer to the section Frames (Page 29).

Repeat step 6, if you want to add another drive and another standard frame.

Enable isochronous operation of the drive in the device configuration

PROFINET drives can always be operated in isochronous mode or non-isochronous mode. Isochronous mode, however, increases the quality of the position control of the drive.

Proceed as follows if you want to control the drive in isochronous mode:

1. Open the device view in the drive.
2. In the properties dialog, select the tab "PROFINET Interface [X1] > Advanced options > Isochronous mode".
3. Select the "Isochronous mode" check box in this tab.

The entry for the frame also has to be selected for isochronous mode in the detailed view.

Interconnecting the port of the PLC with the port of the drive

1. Open the topology view in the device configuration.
2. Interconnect the port of the PLC with the port of the drive.

Configuring the PLC as the sync master and setting isochronous mode

1. Select the device view of the PLC.
2. In the properties dialog, select the tab "PROFINET Interface [X1] > Advanced options > Realtime settings > Synchronization".
3. Select "Sync master" from the "Synchronization role" drop-down list.
4. Click the "Domain settings" button.
5. Open the "Domain Management > Sync Domains" tab and set the desired "Send clock" (isochronous clock).

Select drive in the configuration of the technology object

1. Add a new axis technology object, or open the configuration of an existing axis.
2. Open the configuration "Hardware interface > Drive".
3. Select "PROFIdrive" from the "Drive type" drop-down list.
4. Select the Drive Object of the PROFINET drive from the "Drive" list.

For information on how to add a technology object, refer to the section Add technology object (Page 99).

Result

The technology object is connected to the drive and the "MC Servo" organization block can be checked / configured.

The frame of the configured drive is assigned to the "PIP OB Servo" process image.

Checking/configuring the properties of the MC Servo

1. Open the "Program blocks" folder in the project navigator.
2. Select the "MC Servo" organization block.
3. Select the "Properties" command in the shortcut menu.
4. Select the "Cycle time" entry in the area navigation.
5. The option "Synchronous to the bus" must be selected in the dialog box.
6. A "PROFINET IO_System" must be selected in the "Distributed I/O" drop-down list.
7. The application cycle of "MC-Servo" must correspond to the send clock of the bus or be reduced by an integral factor relative to the send clock of the bus.

Result

The PROFINET IO drive is now configured so that it can be controlled in the PROFINET IO network in isochronous mode.

The properties of the SINAMICS drive must be configured according to the configuration of the axis with a separate STARTER program.

Checking isochronous mode on the drive

If the configuration sequence described above is not adhered to during configuration of the axis, and drive-specific error occurs when the project is compiled, the setting for isochronous mode on the drive must be checked.

1. Open the device view in the drive.
2. Select standard message item in the device overview.
3. Select the properties dialog "General > I/O Addresses".
4. The following settings apply for the input and output addresses:
   - "Isochronous mode" is enabled.
   - "MC Servo" must be select the "Organization block".
   - "PIP OB Servo" must be select the "Process image".

Frames (Page 29)

Add technology object (Page 99)

6.1.2 Add and configure PROFIBUS DP drives

Adding and configuring a PROFIBUS IO drive is described below using a **SINAMICS S120**. Adding and configuring other PROFIBUS drives may differ from the description in certain respects.

Requirements

- The SIMATIC S7-1500 device is created in the project.
- You have a basic knowledge of how to configure PROFIBUS DP networks.
- The desired drive can be selected in the hardware catalog.

If the drive is not available in the Hardware Catalog, then it must be installed in the "Extras" menu as a device description file (GSD).

Adding a drive and frame in the device configuration

1. Open the device configuration and change to the network view.
2. In the hardware catalog, open the folder "Additional Field Devices > PROFIBUS DP > Drives > Siemens AG > SINAMICS".
3. Select the folder of the desired drive with the desired version, then drag the drive object to the network view.
4. Assign the drive to the PROFIBUS interface of the PLC.
5. Open the drive in the device view.
6. Drag a standard frame from the hardware catalog to the slot of the device overview of the drive.

For more information on suitable frames, refer to the section Frames (Page 29).

Use the "Axis disconnector" in the hardware catalog if you want to add another drive and another standard frame in the device overview.

Enable isochronous operation of the drive in the device configuration

PROFIBUS drives can always be operated in cyclic mode or isochronous mode. Isochronous mode, however, increases the quality of the position control of the drive.

Proceed as follows if you want to control the drive in isochronous mode:

1. Open the device view in the drive.
2. In the properties dialog, select the tab "General > Isochronous Mode".
3. Select the "Synchronize DP slave to constant DP bus cycle time" check box .

Setting isochronous mode

1. Select the network view.
2. Select the DP master system.
3. In the properties dialog, select the tab "General > Constant bus cycle time".
4. Select the desired "Constant DP bus cycle times".

Select drive in the configuration of the technology object

1. Add a new axis technology object, or open the configuration of an existing axis.
2. Open the configuration "Hardware interface > Drive".
3. Select "PROFIdrive" from the "Drive type" drop-down list.
4. Select the standard frame of the PROFIBUS drive from the "Drive" list.

For information on how to add a technology object, refer to the section Add technology object (Page 99).

Result

The technology object is connected to the drive and the "MC Servo" organization block can be checked/configured.

The frame of the configured drive is assigned to the "PIP OB Servo" process image.

Checking/configuring the properties of the MC Servo

1. Open the "Program blocks" folder in the project navigator.
2. Select the "MC Servo" organization block.
3. Select the "Properties" command in the shortcut menu.
4. Select the "Cycle time" entry in the area navigation.
5. The option "Synchronous to the bus" must be selected in the dialog box.
6. A "PROFINET IO system" must be selected in the "Distributed I/O" drop-down list.
7. The application cycle of "MC-Servo" must correspond to the send clock of the bus or be reduced by an integral factor relative to the send clock of the bus.

You can select a drive connected to the CPU via a communications processor/communications module (CP/CM) in the configuration of the technology object. You cannot select the DP master system of the CP/CM as the source clock for MC-Servo [OB91].

Result

The PROFIBUS DP drive is now configured so that it can be controlled in the PROFIBUS network in isochronous mode.

The properties of the SINAMICS drive must be configured according to the configuration of the axis with a separate STARTER program.

Checking isochronous mode on the drive

If the configuration sequence described above is not adhered to during configuration of the axis, and drive-specific error occurs when the project is compiled, isochronous mode can be checked on the drive.

1. Open the device view in the drive.
2. Select standard message item in the device overview.
3. Select the properties dialog "General > I/O Addresses".
4. The following settings apply for the input and output addresses:
   - "MC Servo" must be select the "Organization block".
   - "PIP OB Servo" must be select the "Process image".

Add technology object (Page 99)

Frames (Page 29)

6.1.3 Adding and configuring drives with analog connections

A description is provided below of how to add and configure a drive with an analog drive connection and an encoder. An incremental encoder and a technology module in the rack of the PLC is used as an example of the connection.

Requirements

The SIMATIC S7-1500 device is created in the project.

Adding and configuring an analog output module in the device configuration

1. Open the device configuration of the PLC.
2. Select an analog output module from the hardware catalog and drag the module to the rack of the PLC.
3. Select the analog output module in the device view.
4. Open the "General" tab in the properties dialog and select there "Name of the Analog Output Module > I/O Addresses".
5. Enter the desired start address.
6. In the properties dialog, select the tab "General > IO Tags".
7. Enter the tag name for the desired analog output.

Adding and configuring a technology module

1. Switch to the device view of the PLC.
2. In the hardware catalog, open the folder "TM > Count > TM Count 2X24V".
3. Drag the counter module to a free slot in the rack.
4. Select the technology module in the device view.
5. In the properties dialog, open the "General" tab and select there "Count 2x24V > Basic Parameters > Channel X > Operating Mode" of the channel to be used.
6. Select "Position detection for motion control" option for "Selection of the operating mode for the channel".
7. Under "Module parameters", adapt the parameters of the incremental encoder (steps per revolution = increments per revolution).
8. Under "Reaction to CPU STOP", select the item "Continue working".

Selecting the drive and encoder in the configuration of the technology object

1. Add a new positioning axis/synchronous axis technology object, or open the configuration of an existing positioning axis/synchronous axis.
2. Open the configuration "Hardware interface > Drive".
3. Select "Analog drive connection" from the "Drive type" drop-down list.
4. Select the previously defined tag name of the analog output from the "Output" list.
5. Open the configuration "Hardware interface > Encoder".
6. Under "Select encoder coupling" select "Encoder on technology module (TM)".
7. Select the channel of the incremental encoder from the "Technology module" list under "local modules".

For information on how to add a technology object, refer to the section Add technology object (Page 99)

Result

The analog drive connection and the encoder connection are configured.

The analog addresses and the addresses of the TM module are assigned to the process image "PIP OB Servo".

Checking the encoder connection / drive connection

The encoder data are applied to the position control cycle clock. If in doubt, check the following settings:

1. Switch to the device view of the PLC.
2. Select the module technology.
3. Open the properties dialog "Basic Parameters > I/O Addresses".
4. The following settings apply for the input and output addresses:
   - "MC Servo" must be select the "Organization block".
   - "PIP OB Servo" must be select the "Process image".
5. Select the analog module.
6. Open the properties dialog "Name of the Analog Module > I/O Addresses".
7. The settings from Step 4 apply for the input and output addresses

See also

Add technology object (Page 99)

6.2 Add technology object

To add a technology object in the project navigator, proceed as follows:

Requirement

A project with a CPU S7-1500 has been created.

Procedure

1. Open the CPU's folder in the project navigator.
2. Open the "Technology Objects" folder.
3. Double-click "Add new object".

   The "Add new object" dialog box opens.
4. Select the "Motion Control" technology.
5. Open the folder "Motion Control" > "SIMATIC S7-1500".
6. If you want to add an axis from an older version, then click on the Version entry and select an alternative version of the technology.
7. Select the "TO_SpeedAxis" object for a speed axis, "TO_PositioningAxis" for a positioning axis, "TO_SynchronousAxis" for a synchronous axis or "TO_ExternalEncoder" for an external encoder.
8. In the "Name" field, adapt the name of the axis to your requirements.
9. Select the "Manual" option if you want to change the suggested data block number.
10. Click on "Further Information" if you want to add your own information to the technology object.
11. Click on the "Cancel" button if you want to discard the entries.

    Activate the "Add new and open" check box if you want to open the configuration after adding the technology object.

    Click on the "OK" button if you want to add the technology object.

Result

The new technology object was created and saved in the project navigator in the folder "Technology objects".

If the organization blocks "MC Servo" and "MC Interpolator" had not yet been added, they have now been added.

6.3 Working with the configuration editor

You configure the properties of a technology object in the configuration window. To open the configuration window of the technology object in the project view, follow these steps:

1. Open the device "Technology objects" group in the project navigator.
2. Select the technology object and double-click on "Configuration".

The configuration is divided into categories which depend on the object type, for example: Basic parameters, hardware interface, extended parameters.

Configuration editor icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values you can use the technology object without additional changes.
	The configuration contains values set by the user and is complete. All input fields of the configuration contain valid values and at least one preset value has changed.
	The configuration is incomplete or incorrect At least one input field or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the field shows you the roll-out error message that indicates the cause of error.

6.4 Compare values

If there is an online connection to the CPU, the "Compare values" function appears in the configuration of the technology object.

The "Compare values" function provides the following options:

- Comparison of configured start values of the project with the start values in the CPU and the actual values
- Direct editing of actual values and the start values of the project
- Immediate detection and display of input errors with suggested corrections
- Backup of actual values in the project
- Transfer of start values of the project to the CPU as actual values

Symbols and operator controls

If there is an online connection to the CPU, the actual values are displayed at the parameters.

In addition to the actual values of the parameters, the following symbols appear:

Symbol	Description
	Start value in CPU matches the configured Start value in the project
	Start value in CPU does not match the configured Start value in the project
	The comparison of the Start value in CPU with the configured Start value in the project cannot be performed
	Use the button to show the start value of the CPU and the start value of the project for each parameter.

The actual value and the start value of the CPU can be changed directly, and then downloaded to the CPU. The change of actual value is transferred directly to the CPU for directly modifiable parameters.

6.5 Configuring the Speed-Control Axis technology object

6.5.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Axis name

Define the name of the speed axis in this field. The technology object is listed in the project navigation under this name. The tags of the speed axis can be used in the user program under this name.

Speed unit

Select the measuring system for speed from the drop-down list box.

6.5.2 Hardware interface

6.5.2.1 Configuration - Drive

In the "Drive" configuration window, configure which drive type and which drive you want to use.

Drive type

In the drop-down list, select whether you want to deploy a PROFIdrive drive or a drive with an analog drive connection.

PROFIdrive drives are connected to the controller by means of a digital communication system (PROFINET or PROFIBUS). The communication occurs via PROFIdrive frames.

Drives with an analog drive connection receive the setpoint speed via an analog output signal (e.g. from -10 V to +10 V) from the PLC.

Drive (drive type: PROFIdrive)

In the "Drive" field, select an already configured PROFIdrive drive / slot. If a PROFIdrive drive was selected, then it can be configured using the "Device configuration" button.

Switch to the device configuration, and add a PROFIdrive drive in the network view, in the event that no PROFIdrive drive can be selected.

Analog output (drive type: Analog drive connection)

In the "Output" field, select the PLC tag of the analog output over which the drive is to be controlled. If an output was selected, then it can be configured using the "Device configuration" button.

In order to be able to select an output, an analog output module must have been added in the device configuration, and the PLC tag name for the analog output must be defined.

Activate enable output (drive type: Analog drive connection)

In the "Enable output" field, select the PLC tag of the digital output to enable the drive. With the enable output, the speed controller in the drive is enabled, or disabled.

In order to be able to select an enable output, a digital output module must have been added in the device configuration, and the PLC tag name for the digital output must be defined.

Note

If you do not use an enable output, the drive cannot be immediately disabled on the part of the system due to error reactions or monitoring functions. A controlled stop of the drive is not guaranteed.

Enable ready input (drive type: Analog drive connection)

In the "Ready input" field, select the PLC tag of the digital input with which the drive is to report its operational readiness to the technology object. The power unit is switched on and the analog setpoint speed input is enabled.

In order to be able to select a ready input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Note

The enable output and the ready input can be separately enabled.

The following conditions apply to the enabled ready input:

- The axis is not enabled (MC_Power Status=TRUE), until a signal is pending at the ready input.
- If the signal at the ready input goes away for an enabled axis, then the axis is disabled with an error.
- If the axis is disabled with the instruction MC_Power (Enable= FALSE), then the axis is disabled even with a pending signal at the ready input.

See also

Configuration - Data exchange (Page 104)

6.5.2.2 Configuration - Data exchange

Data exchange with the drive

In this area, you can configure the data transmission to the drive.

Message frame type (drive type PROFIdrive)

In the drop-down list, select the frame for the drive. The specification must match the setting in the device configuration.

Reference speed (drive type PROFIdrive)

In this field, configure the reference speed of the drive in accordance with the manufacturer's specifications. The specification of the drive's speed occurs as a percentage of the reference speed in the range from -200% to 200%.

Reference speed (drive type analog drive connection)

The reference speed of the drive is the speed, with which the drive spins when there is an output of 100% at the analog output. The reference speed must be configured in the drive, and transferred into the configuration of the technology object.

The analog value that is output at 100% depends on the type of the analog output. As an example, with an analog output with +/- 10 V, the value 10 V is output at 100%.

Analog outputs can be overloaded by about 17%. This means that an analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.

Maximum speed

In this field, specify the maximum speed of the drive.

Invert drive direction

Select the check box if the rotation direction of the drive should be inverted.

6.5.3 Extended Parameters

6.5.3.1 Configuration - Mechanics

Configure the connection of the load to the drive in the "Mechanics" configuration window.

Number of motor revolutions / number of load revolutions

The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

6.5.3.2 Configuration - Dynamic limits

In the "Dynamic limits" configuration window, configure the maximum values for speed, acceleration, deceleration and jerk of the axis.

Maximum speed

In this field, define the maximum permitted speed of the axis.

Maximum acceleration / maximum deceleration - ramp-up time / ramp-down time

Set the desired acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The relationship between ramp-up time and acceleration, and ramp-down time and deceleration can be seen in the following equations:

$$\text{Ramp-up time} = \frac{\text{Maximum velocity}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Maximum speed}}{\text{Deceleration}}$$

Note

A change in the maximum speed influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration ramp and the deceleration ramp in the "Maximum jerk" box. The value 0 means that the jerk is not limited.
- Set the required smoothing time for the acceleration ramp in the "Smoothing time" box.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration ramp and the deceleration ramp are the same.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Rounding off time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Rounding off time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Traversing jobs initiated in the user program are executed with the selected jerk.

6.5.3.3 Configuration - Dynamic Defaults

In the "Dynamic defaults" configuration window, configure the default values for speed, acceleration, deceleration and jerk of the axis.

The default values have an effect, when values < 0 are specified in Motion Control instructions for the "Velocity", "Acceleration", "Deceleration" or "Jerk" parameters. The default values can be applied separately for each of the parameters just listed.

Speed

In this field, define the default value for the speed of the axis.

Acceleration / deceleration - ramp-up time / ramp-down time

Set the desired default value for acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The relationship between ramp-up time and acceleration, and ramp-down time and deceleration can be seen in the following equations:

$$\text{Ramp-up time} = \frac{\text{Speed}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Speed}}{\text{Deceleration}}$$

Note

A change in the velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration ramp and the deceleration ramp in the "Jerk" box. The value 0 means that the jerk is disabled.
- Set the required smoothing time for the acceleration ramp in the "Smoothing time" box.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration ramp and the deceleration ramp are the same.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Rounding off time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Rounding off time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Traversing jobs initiated in the user program are executed with the selected jerk.

6.5.3.4 Configuration - Emergency stop

In the "Emergency stop" configuration window, you can configure the emergency stop deceleration of the axis. In the event of an error, and when disabling the axis, the axis is brought to a standstill with this deceleration using the Motion Control instruction "MC_Power" (input parameter StopMode = 0).

Emergency stop deceleration / Emergency stop ramp-down time

Configure the deceleration value for emergency stop in the "Emergency stop deceleration" field or the "Emergency stop ramp-down time" field.

The relationship between emergency stop ramp-down time and emergency stop deceleration can be seen in the following equation:

$$\textit{Emergency stop ramp-down time} = \frac{\textit{Maximum speed}}{\textit{Emergency stop deceleration}}$$

The configuration of the emergency stop deceleration is related to the configured maximum speed of the axis. If the maximum speed of the axis changes, then the value of the emergency stop deceleration also changes (the emergency stop ramp-down time remains unchanged).

6.6 Configuring the positioning axis/synchronous axis technology object

6.6.1 Configuration - Basic Parameters

Axis name

Define the name of the positioning axis/synchronous axis in this field. The technology object is listed in the project navigation under this name. The variables of the technology object can be used in the user program under this name.

Axis type

In this selection, configure whether the axis should perform linear or rotary motions.

Units of measure

In the drop-down list, select the desired measurement system for the position and velocity of the axis.

Modulo

Select the check box "Enable modulo", if you want to employ a recurring unit of measure for the axis (e.g. 0-360° for an axis of the "rotary" axis type).

- **Modulo start value**

  In this field, define the position at which the modulo range should begin (e.g. 0° for an axis of the "rotary" axis type).

- **Modulo length**

  In this field, define the length of the modulo range (e.g. 360° for an axis of the "rotary" axis type).

6.6.2 Hardware interface

6.6.2.1 Configuration - Drive

In the "Drive" configuration window, configure which drive type and which drive you want to use.

Drive type

In the drop-down list, select whether you want to deploy a PROFIdrive drive or a drive with an analog drive connection.

PROFIdrive drives are connected to the controller by means of a digital communication system (PROFINET or PROFIBUS). The communication occurs via PROFIdrive frames.

Drives with an analog drive connection receive the setpoint speed via an analog output signal (e.g. from -10 V to +10 V) from the PLC.

Drive (drive type: PROFIdrive)

In the "Drive" field, select an already configured PROFIdrive drive / slot. If a PROFIdrive drive was selected, then it can be configured using the "Device configuration" button.

Switch to the device configuration, and add a PROFIdrive drive in the network view, in the event that no PROFIdrive drive can be selected.

Analog output (drive type: Analog drive connection)

In the "Output" field, select the PLC tag of the analog output over which the drive is to be controlled. If an output was selected, then it can be configured using the "Device configuration" button.

In order to be able to select an output, an analog output module must have been added in the device configuration, and the PLC tag name for the analog output must be defined.

Activate enable output (drive type: Analog drive connection)

In the "Enable output" field, select the PLC tag of the digital output to enable the drive. With the enable output, the speed controller in the drive is enabled, or disabled.

In order to be able to select an enable output, a digital output module must have been added in the device configuration, and the PLC tag name for the digital output must be defined.

Note

If you do not use an enable output, the drive cannot be immediately disabled on the part of the system due to error reactions or monitoring functions. A controlled stop of the drive is not guaranteed.

Enable ready input (drive type: Analog drive connection)

In the "Ready input" field, select the PLC tag of the digital input with which the drive is to report its operational readiness to the technology object. The power unit is switched on and the analog setpoint speed input is enabled.

In order to be able to select a ready input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Note

The enable output and the ready input can be separately enabled.

The following conditions apply to the enabled ready input:

- The axis is not enabled (MC_Power Status=TRUE), until a signal is pending at the ready input.
- If the signal at the ready input goes away for an enabled axis, then the axis is disabled with an error.
- If the axis is disabled with the instruction MC_Power (Enable= FALSE), then the axis is disabled even with a pending signal at the ready input.

6.6.2.2 Configuration - Encoder

For position control, positioning axes/synchronous axes require an actual position value in the form of an encoder position. The encoder position is transmitted to the controller by means of a PROFIdrive frame. In the "Encoder" configuration window, configure the encoder coupling with which the encoder is to be connected.

Select encoder coupling:

In this area, select how the encoder will be connected in keeping with the graphic representation.

- **Connection to drive (not with analog drive connection)**

  Select this option, if the encoder is connected to the drive. The configuration of the encoder occurs via the configuration of the PROFIdrive drive. The drive evaluates the encoder signals and sends them to the controller in a PROFIdrive frame.

- **Encoder on technology module (TM)**

  Select this option, if the encoder is connected to a technology module (TM).

  – **Technology module:**

    In the "Technology module" field, select a technology module that has already been configured, and the channel to be used. Only technology modules set to the "Position detection for motion control" mode are displayed for selection.

    If no technology module is available for selection, change to the device configuration and add a technology module. If you have selected a technology module, you can change to the configuration of the technology module using the "Device configuration" button.

    You can operate the technology module centrally on an S7-1500 PLC, or distributed on a distributed I/O. You can identify the technology modules suitable for position detection for Motion Control in the documentation for the technology module and the catalog data.

- **PROFIdrive encoder on PROFINET/PROFIBUS (PROFIdrive)**

  Select this option, if you are deploying a PROFIdrive compatible encoder.

  – **PROFIdrive encoder:**

    In the "PROFIdrive encoder" field, select a configured encoder on PROFINET/PROFIBUS. If an encoder was selected, then it can be configured using the "Device configuration" button.

    Switch to the device configuration in the network view, and add an encoder, in the event that no encoder can be selected.

6.6.2.3 Configuration - Data exchange

Configuration - Data exchange

In the "Data exchange" configuration window, you can configure the data exchange of the drive and the encoder. The configuration varies according to the drive type and encoder coupling:

- Analog driver connection - Encoder to technology module (TM) (Page 114)
- Analog driver connection - PROFIdrive encoder on PROFINET/PROFIBUS (Page 116)
- PROFIdrive Drive - Encoder to Drive (Page 118)
- PROFIdrive drive - Encoder on the technology module (TM) (Page 120)
- PROFIdrive drive - PROFIdrive encoder on PROFINET/PROFIBUS (Page 122)

Analog driver connection - Encoder to technology module (TM)

Data exchange with the drive

In this area, you can configure the data exchange with the drive.

- **Drive message frame:**

  Since the analog drive is controlled via an analog signal, the selection of the frame type is omitted.

- **Reference speed:**

  The reference speed of the drive is the speed, with which the drive spins when there is an output of 100% at the analog output. The reference speed must be configured in the drive, and transferred into the configuration of the technology object.

  The analog value that is output at 100% depends on the type of the analog output. As an example, with an analog output with +/- 10 V, the value 10 V is output at 100%.

  Analog outputs can be overloaded by about 17%. This means that an analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.

- **Maximum speed**

  In this field, specify the maximum speed of the drive.

- **Invert drive direction**

  Select the check box if the rotation direction of the drive should be inverted.

Data exchange with encoder

In this area, you can configure how the encoder data are to be evaluated. The specifications must match those in the device configuration.

- **Encoder message frame:**

  The encoder data can be transferred only with encoder message frame 83.

- **Encoder type:**

  Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

Analog driver connection - PROFIdrive encoder on PROFINET/PROFIBUS

Data exchange with the drive

In this area, you can configure the data exchange with the drive.

- **Drive message frame:**

  Since the analog drive is controlled via an analog signal, the selection of the frame type is omitted.

- **Reference speed:**

  The reference speed of the drive is the speed, with which the drive spins when there is an output of 100% at the analog output. The reference speed must be configured in the drive, and transferred into the configuration of the technology object.

  The analog value that is output at 100% depends on the type of the analog output. As an example, with an analog output with +/- 10 V, the value 10 V is output at 100%.

  Analog outputs can be overloaded by about 17%. This means that an analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.

- **Maximum speed**

  In this field, specify the maximum speed of the drive.

- **Invert drive direction**

  Select the check box if the rotation direction of the drive should be inverted.

Data exchange with encoder

In this area, you can configure the encoder frame and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

- **Encoder message frame:**

  In the drop-down list, select the frame of the encoder. The specification must match the setting in the device configuration.

- **Encoder type:**

  Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (Gn_XIST2)	In this field, configure the number of bits for fine resolution within the absolute actual value (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (Gn_XIST2)	In this field, configure the number of bits for fine resolution within the absolute actual value (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

PROFIdrive Drive - Encoder to Drive

Data exchange with the drive

In this area, you can configure the data exchange with the drive.

- **Drive message frame:**

  In the drop-down list, select the frame for the drive. The specification must match the setting in the device configuration.

- **Reference speed:**

  In this field, configure the reference speed of the drive in accordance with the manufacturer's specifications. The specification of the drive's speed occurs as a percentage of the reference speed in the range from -200% to 200%.

- **Maximum speed**

  In this field, specify the maximum speed of the drive.

- **Invert drive direction**

  Select the check box if the rotation direction of the drive should be inverted.

Data exchange with encoder

In this area, you can configure how the encoder data are to be evaluated. The specifications must match those in the device configuration.

- **Encoder message frame:**

  The encoder data is transmitted with the drive frame. Therefore, no frame selection is available.

- **Encoder type:**

  Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

PROFIdrive drive - Encoder on the technology module (TM)

Data exchange with the drive

In this area, you can configure the data exchange with the drive.

- **Drive message frame:**

  In the drop-down list, select the frame for the drive. The specification must match the setting in the device configuration.

- **Reference speed:**

  In this field, configure the reference speed of the drive in accordance with the manufacturer's specifications. The specification of the drive's speed occurs as a percentage of the reference speed in the range from -200% to 200%.

- **Maximum speed**

  In this field, specify the maximum speed of the drive.

- **Invert drive direction**

  Select the check box if the rotation direction of the drive should be inverted.

Data exchange with encoder

In this area, you can configure how the encoder data are to be evaluated. The specifications must match those in the device configuration.

- **Encoder message frame:**

  The encoder data can be transferred only with encoder message frame 83.

- **Encoder type:**

  Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

PROFIdrive drive - PROFIdrive encoder on PROFINET/PROFIBUS

Data exchange with the drive

In this area, you can configure the data exchange with the drive.

- **Drive message frame:**

  In the drop-down list, select the frame for the drive. The specification must match the setting in the device configuration.

- **Reference speed:**

  In this field, configure the reference speed of the drive in accordance with the manufacturer's specifications. The specification of the drive's speed occurs as a percentage of the reference speed in the range from -200% to 200%.

- **Maximum speed**

  In this field, specify the maximum speed of the drive.

- **Invert drive direction**

  Select the check box if the rotation direction of the drive should be inverted.

Data exchange with encoder

In this area, you can configure the encoder frame and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

- **Encoder message frame:**

  In the drop-down list, select the frame of the encoder. The specification must match the setting in the device configuration.

- **Encoder type:**

  Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

6.6.3 Configuration - master value interconnections (synchronous axis only)

You can interconnect a synchronous axis with multiple leading axes. You can only actively interconnect one leading axis as a master value during runtime of your user program.

All interconnection required during operation must be set up during configuration of the technology object.

Possible master values

Add all axes that you require for operation as a master value for the synchronous axis in the "Possible master values" list. You can add positioning axes or synchronous axes as leading axes.

You can interconnect the axes added in the list as master value with the synchronous axis with the Motion Control instruction "MC_GearIn".

All configured master value interconnections for the technology object are displayed in the cross-reference list of the technology object.

6.6.4 Extended Parameters

6.6.4.1 Configuration - Mechanics

Configuration - Mechanics

In the "Mechanics" configuration window, you can configure the mounting type of the encoder, and the adaptation of the encoder value to the mechanical conditions.

Type of encoder mounting

In the drop-down list, select how the encoder is mounted on the mechanism. The configuration varies depending on the axis type and the type of encoder mounting.

Axis type: Linear

- Linear - On the motor shaft (Page 125)
- Linear - On the motor side (Page 126)
- Linear - External Measuring System (Page 126)

Axis type: Rotary

- Rotary - On the motor shaft (Page 127)
- Rotary - On the load side (Page 127)
- Rotary - External Measuring System (Page 128)

Linear - On the motor shaft

The encoder is firmly mechanically connected with the motor shaft. Motor and encoder form a unit.

Load gear

- **Consider load gear and leadscrew pitch for encoder evaluation**

  Activate the check box, if you want to perform the configuration based on the gear ratio and the leadscrew pitch.

  Deactivate the check box, if you want to perform the configuration based on the motor revolution and the resulting distance.

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

Position parameter

- **Leadscrew pitch (select "Consider load gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the distance by which the load is moved when the leadscrew makes one revolution.

- **Leadscrew pitch (select "Consider load gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the load distance for one motor revolution.

Linear - On the motor side

The encoder is mechanically connected with the load side of the gear.

Load gear

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Position parameter

- **Leadscrew pitch**

  In this field, configure the distance by which the load is moved when the leadscrew makes one revolution.

Linear - External Measuring System

An external measuring system provides the position values of the linear load motion.

Load gear

- **Consider load gear and leadscrew pitch for encoder evaluation**

  Activate the check box, if you want to perform the configuration based on the gear ratio and the leadscrew pitch.

  Deactivate the check box, if you want to perform the configuration based on the motor revolution and the resulting distance.

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Position parameter

- **Leadscrew pitch (select "Consider load gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the distance by which the load is moved when the leadscrew makes one revolution.

- **Leadscrew pitch (select "Consider load gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the distance by which the load is moved when the motor makes one revolution.

- **Distance per encoder revolution**

  In this field, configure the distance recorded by the external measuring system per encoder revolution.

Rotary - On the motor shaft

The encoder is firmly mechanically connected with the motor shaft. Motor and encoder form a unit.

Load gear

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Rotary - On the load side

The encoder is mechanically connected with the load side of the gear.

Load gear

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Rotary - External Measuring System

An external measuring system provides the position values of the rotary load motion.

Load gear

- **Number of motor revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Position parameter

- **Distance per encoder revolution**
- In this field, configure the distance recorded by the external measuring system per encoder revolution.

6.6.4.2 Configuration - Position monitoring

Configure the hardware and software limit switches of the axis in the "Position monitoring" configuration window.

Enable HW limit switches

The check box activates the function of the negative and positive hardware limit switches. The negative hardware limit switch is located on the side in the negative direction of travel, and the positive hardware limit switch on the side in the positive direction of travel.

With enabled hardware limit switches, the drive is disabled when the hardware limit switch is approached or overshot. The drive brakes with the braking ramp configured in the drive.

Exception: If a hardware limit switch is overshot during an active home position approach with activated direction reversal at the hardware limit switch, then the axis stops with the configured maximum deceleration, and continues the home position approach in the opposite direction.

Note

Only use hardware limit switches that remain permanently switched after the approach. This switch state may only be canceled after the return into the permitted traversing range.

The digital inputs of the hardware limit switch are evaluated by default in cyclical data exchange. In the settings for the input module under "I/O addresses", select the entry "MC-Servo" for "Organization block" and the entry "PIP OB servo" for "Process image" if the hardware limit switches are to be evaluated in the position control cycle of the drive.

Negative / positive HW limit switch input

In these fields, select the PLC tags of the digital input for the negative and positive HW limit switches.

In order to be able to select an input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

CAUTION

During installation of hardware limit switches, attention must be paid to the filter times of the digital inputs

Based on the time for a servo clock cycle and the filter time of the digital inputs, the resulting delay times must be taken into account.

The filter time is configurable in individual digital input modules in the device configuration.

The digital inputs are set to a filter time of 6.4 ms by default. If these are used as hardware limit switches, undesired decelerations may occur. If this occurs, reduce the filter time for the relevant digital inputs.

The filter time can be set under "Input filter" in the device configuration of the digital inputs.

Negative / positive HW limit switch level selection

Select the triggering signal level ("Lower level" / "Upper level") of the hardware limit switch. At "Lower level", the input signal is FALSE after the axis has reached or passed the hardware limit switch. At "Upper level", the input signal is TRUE after the axis has reached or passed the hardware limit switch.

Enable software limit switch

This check box activates the upper and lower software limit switches. An active motion is stopped after the axis has reached a position of the software limit switch. The technological object reports a fault. After acknowledging the error, the axis can again be moved in the direction of its working range.

Note

Enabled software limit switches only affect a homed axis.

Position of negative / positive SW limit switch

Configure the operating range of the axis using the positions of the negative and positive software limit switches.

6.6.4.3 Configuration - Dynamic limits

In the "Dynamic limits" configuration window, configure the maximum values for velocity, acceleration, deceleration and jerk of the axis.

Maximum velocity

In this field, define the maximum permitted velocity of the axis.

Maximum acceleration / maximum deceleration - ramp-up time / ramp-down time

Set the desired acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The relationship between ramp-up time and acceleration, and ramp-down time and deceleration can be seen in the following equations:

$$\text{Ramp-up time} = \frac{\text{Maximum velocity}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Maximum velocity}}{\text{Deceleration}}$$

Note

A change in the maximum velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

The "maximum deceleration" for active homing with change of direction at the hardware limit switch must be set sufficiently large, to brake the axis before reaching the mechanical endstop.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration ramp and the deceleration ramp in the "Jerk" box. The value 0 means that the jerk is not limited.
- Set the required smoothing time for the acceleration ramp in the "Smoothing time" box.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration ramp and the deceleration ramp are the same.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Rounding off time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Rounding off time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Traversing jobs initiated in the user program are executed with the selected jerk.

6.6.4.4 Configuration - Dynamic Defaults

In the "Dynamic defaults" configuration window, configure the default values for velocity, acceleration, deceleration and jerk of the axis.

The default values have an effect, when values < 0 are specified in Motion Control instructions for the "Velocity", "Acceleration", "Deceleration" or "Jerk" parameters. The default values can be applied separately for each of the parameters just listed.

The default values for acceleration and deceleration additionally have an effect on the traversing motions of active homing.

Velocity

In this field, define the default value for the velocity of the axis.

Acceleration / deceleration - ramp-up time / ramp-down time

Set the desired default value for acceleration in the "Ramp-up time" or "Acceleration" fields. The desired deceleration can be set in the "Ramp-down time" or "Deceleration" fields.

The relationship between ramp-up time and acceleration, and ramp-down time and deceleration can be seen in the following equations:

$$\text{Ramp-up time} = \frac{\text{Velocity}}{\text{Acceleration}}$$

$$\text{Ramp-down time} = \frac{\text{Velocity}}{\text{Deceleration}}$$

Note

A change in the velocity influences the acceleration and deceleration values of the axis. The ramp-up and ramp-down times are retained.

Smoothing time / jerk

You can enter the jerk limit parameters in the "Smoothing time" box, or alternatively in the "Jerk" box:

- Set the desired jerk for the acceleration ramp and the deceleration ramp in the "Jerk" box. The value 0 means that the jerk is disabled.
- Set the required smoothing time for the acceleration ramp in the "Smoothing time" box.

Note

The configured smoothing time displayed in the configuration, applies only to the acceleration ramp.

If the values of the acceleration and deceleration differ, the smoothing time of the deceleration ramp is calculated and used according to the jerk of the acceleration ramp.

The smoothing time of the deceleration is adapted as follows:

- **Acceleration > Deceleration**

  A shorter smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration < Deceleration**

  A longer smoothing time is used for the deceleration ramp compared with the acceleration ramp.
- **Acceleration = Deceleration**

  The smoothing times of the acceleration ramp and the deceleration ramp are the same.

If an error occurs, the axis decelerates with the configured emergency stop deceleration. A configured jerk limit is not taken into account for this.

The following equations show the relationship between the smoothing times and the jerk:

$$\text{Rounding off time (acceleration ramp)} = \frac{\text{Acceleration}}{\text{Jerk}}$$

$$\text{Rounding off time (deceleration ramp)} = \frac{\text{Deceleration}}{\text{Jerk}}$$

Traversing jobs initiated in the user program are executed with the selected jerk.

6.6.4.5 Configuration - Emergency stop

In the "Emergency stop" configuration window, you can configure the emergency stop deceleration of the axis. In the event of an error, and when disabling the axis, the axis is brought to a standstill with this deceleration using the Motion Control instruction "MC_Power" (input parameter StopMode = 0).

Emergency stop deceleration / Emergency stop ramp-down time

Configure the deceleration value for emergency stop in the "Emergency stop deceleration" field or the "Emergency stop ramp-down time" field.

The relationship between emergency stop ramp-down time and emergency stop deceleration can be seen in the following equation:

$$\textit{Emergency stop ramp-down time} = \frac{\textit{Maximum velocity}}{\textit{Emergency stop deceleration}}$$

The configuration of the emergency stop deceleration is related to the configured maximum velocity of the axis. If the maximum velocity of the axis changes, then the value of the emergency stop deceleration also changes (the emergency stop ramp-down time remains unchanged).

6.6.4.6 Homing

Homing means matching the position value of a technology object to the real, physical location of the drive. Absolute positions on the axis can only be approached with a homed axis.

In S7-1500 Motion Control, axis homing is implemented with the Motion Control instruction, "MC_Home". A distinction is made between the following operation modes of the Motion Control instruction:

Operation modes of the Motion Control instruction "MC_Home"

- **Active homing**

  In active homing mode, the Motion Control instruction "MC_Home" performs the configured home position approach. Active traversing motions are aborted. When the homing mark is detected, the position of the axis is set according to the configuration.

- **Passive homing**

  During passive homing, the motion control instruction "MC_Home" does not carry out any homing motion. The traversing motion required for this step must be implemented by the user via other motion control instructions. Active traversing motions are not aborted upon start of passive homing. When the homing mark is detected, the axis is set according to the configuration.

- **Direct homing absolute**

  The axis position is set regardless of the homing switch. Active traversing motions are not aborted. The value of input parameter "Position" of motion control instruction "MC_Home" is set immediately as the home position of the axis.

- **Direct homing relative**

  The axis position is set regardless of the homing switch. Active traversing motions are not aborted. The following statement applies to the axis position after homing:

  New axis position = current axis position + value of parameter "Position" of instruction "MC_Home".

Active homing

Configuration - Active homing

Configure the parameters for active homing in the "Active Homing" configuration window. "Active Homing" is performed using the Motion Control instruction "MC_Home" Mode = 3 and 5.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

Selecting the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive frame and proximity switch (Page 137)
- Zero mark via PROFIdrive frame (Page 138)
- Homing mark via digital input (Page 138)

Zero mark via PROFIdrive frame and proximity switch

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and the direction is then reversed. The proximity switch is then sought in the reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Approach direction

Select the approach direction for seeking the proximity switch.

"Positive" is the approach direction in the direction of positive position values; "negative" in the direction of negative position values.

Homing direction

Select the direction in which the zero mark should be approached for homing.

Approach velocity

In this field, specify the velocity at which the proximity switch is sought during the home position approach. A possibly configured home position offset is traversed with the same velocity.

Homing velocity

In this field, specify the velocity at which the axis approaches the zero mark for homing. For zero mark detection, the proximity switch must be exited.

Home position offset

In the case of a differing zero mark position and home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

Zero mark via PROFIdrive frame

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and the direction is then reversed. The zero mark is then sought in the reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Homing direction

Select the direction in which the next zero mark should be approached for homing.

"Positive" is the homing direction in the direction of positive position values; "negative" in the direction of negative position values.

Approach velocity

In the "Zero mark via PROFIdrive frame" homing mode, the approach velocity for traversing the home position offset is used.

Homing velocity

In this field, specify the velocity at which the axis approaches the zero mark for homing.

Home position offset

In the case of a differing zero mark position and home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

Homing mark via digital input

If a digital input is used as a homing mark, the accuracy of the homing process is not as high as with hardware-supported homing using zero marks.

You can improve the accuracy by using a low homing velocity and a timer-supported input module.

Pay attention to the setting of short filter times at the digital input as well.

Digital input, homing mark

In this field, select the PLC tag of the digital input, which should act as a homing mark (reference cam).

In order to be able to select an input, a digital input module must have been added in the device configuration, and the PLC tag name for the digital input must be defined.

Enable direction reversal at the hardware limit switch

Select this check box to use the hardware limit switch as a reversing cam for the home position approach. After the axis has reached the hardware limit switch during active homing, it is ramped down at the configured maximum deceleration rate and then reversed. The home position switch is then sensed in reverse direction. If this function is not enabled and the axis reaches the hardware limit switch during active homing, then the drive is disabled and braked with the ramp configured in the drive.

Approach direction

Select the approach direction for seeking the homing mark.

"Positive" is the approach direction in the direction of positive position values; "negative" in the direction of negative position values.

Homing direction

Select the direction in which the homing mark should be approached for homing.

Homing mark

Select the switch position of the "digital input" that is to be used as homing mark.

When a "digital input" is overshot, two switch edges which are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated based on the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Approach velocity

In this field, specify the velocity at which the "digital input" should be sought during the home position approach. A possibly configured home position offset is traversed with the same velocity.

Homing velocity

In this field, specify the velocity at which the axis approaches the home position for homing.

Home position offset

In the case of a differing switch position and home position, enter the corresponding home position offset in this field. The axis approaches the home position at approach velocity.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect, when the Motion Control instruction "MC_Home" is executed with Mode = 5.

Passive homing

Configuration - Passive homing

Configure the parameters for passive homing in the "Passive Homing" (homing on the fly) configuration window. The homing function "Passive homing" is performed using the Motion Control instruction "MC_Home" Mode = 2, 8 and 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

Selecting the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive frame and proximity switch (Page 141)
- Zero mark via PROFIdrive frame (Page 142)
- Homing mark via digital input (Page 143)

Zero mark via PROFIdrive frame and proximity switch

Homing direction

Select the direction in which the zero mark should be approached for homing. The next zero mark after exiting the proximity switch is used.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

Zero mark via PROFIdrive frame

Homing direction

Select the direction in which the next zero mark should be approached for homing. The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

Homing mark via digital input

Digital input

In this dialog field, select a digital input which should act as a homing mark (reference cam).

Homing direction

Select the direction in which the homing mark should be approached for homing.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Homing mark

Select which switch position of the "digital input" is to be used as homing mark.

When a "digital input" is overshot, two switch edges which are spatially separated from one another are generated. The selection of the positive or negative side ensures that the homing mark is always evaluated based on the same mechanical position.

The positive side is the switch position with a greater position value; the negative side is the switch position with the lesser position value.

The selection of the side is independent of the approach direction, and independent of whether it causes a rising or falling edge.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

6.6.4.7 Position monitoring

Configuration - Positioning monitoring

In the "Positioning Monitoring" configuration window, configure the criteria for monitoring the target position.

Positioning window:

In this field, configure the size of the positioning window. If the axis is located within this window, then the position is considered to be "reached".

Positioning tolerance time:

In this field, configure the tolerance time, in which the position value must reach the positioning window.

Minimum dwell time in the positioning window:

In this field, configure the minimum dwell time. The current position value must be located in the positioning window for at least the "minimum dwell time".

If one of the criteria is violated, then the axis is stopped and a positioning alarm is displayed.

Configuration - Following error

In the "Following Error" configuration window, configure the permissible deviation of the actual position of the axis from the setpoint position. The following error can be dynamically adapted to the current velocity of the axis.

Enable following error monitoring

Activate this check box, if you want to enable following error monitoring. When following error monitoring is enabled, the axis will be stopped in the error range (orange); in the warning range an alarm will be displayed.

When following error monitoring is disabled, the configured limits have no effect.

Maximum following error:

In this field, configure the following error that is permissible at maximum velocity.

Warning level:

In this field, configure a percentage of the current following error limit, above which a following error warning should be output.

Example: The current maximum following error is 100 mm; the warning level is configured at 90%. If the current following error exceeds a value of 90 mm, then a following error warning will be output.

Following error:

In this field, configure the permissible following error for low velocities (without dynamic adaptation).

Beginning of dynamic adaptation:

In this field, configure the velocity above which the following error should be dynamically adapted. Above this velocity the following error will be adapted up to the maximum following error at the maximum velocity.

Configuration - Standstill signal

In the "Standstill Signal" configuration window, configure the criteria for standstill detection.

Standstill window:

In this field, configure the size of the standstill window. For standstill to be indicated, the velocity of the axis must be within this window.

Minimum dwell time in the standstill window:

In this field, configure the minimum dwell time in the standstill window. The velocity of the axis must also be in the standstill window for the specified duration.

If both criteria are met, then the standstill of the axis is indicated.

6.6.4.8 Configuration - Control loop

In the "Control loop" configuration window, configure the gain Kv of the position control loop.

The Kv factor affects the following parameters:

- Positioning accuracy and stop control
- Uniformity of motion
- Positioning time

The better the mechanical conditions of the axis are (high stiffness), the higher the Kv factor can be configured. This reduces the following error, and a higher dynamic response is achieved.

For basic information, refer to the section Control (Page 59).

Precontrol

In this box, configure the percentage velocity precontrol of the position control loop.

Gain

In the input field, enter the gain Kv of the control loop.

Dynamic Servo Control (DSC):

For position-controlled axes (positioning axes/synchronous axes), the position control can occur either in the CPU or in the drive, provided the drive supports the Dynamic Servo Control (DSC) control process. Select your preferred control process:

- **Position control in drive (DSC enabled)**
- **Position control in the PLC**

Note

Dynamic Servo Control (DSC) is only possible with standard frame 5.

6.7 Configuring the External Encoder technology object

6.7.1 Configuration - Basic Parameters

Configure the basic properties of the technology object in the "Basic Parameters" configuration window.

Name of the external encoder

Define the name of the external encoder in this field. The technology object is listed in the project navigation under this name. The tags of the external encoder can be used in the user program under this name.

Type of the external encoder

In this selection, configure whether the external encoder records linear or rotary motions.

Units of measure

In the drop-down list, select the desired measurement system for the position and velocity of the external encoder.

Modulo

Select the check box "Activate modulo", if you want to employ a recurring unit of measure for the external encoder (e.g. 0-360° for an external encoder of the "rotary" type).

- **Modulo start value**

  In this field, define the position at which the modulo range should begin (e.g. 0° for an external encoder of the "rotary" type).

- **Modulo length**

  In this field, define the length of the modulo range (e.g. 360° for an external encoder of the "rotary" type).

6.7.2 Hardware interface

6.7.2.1 Configuration - Encoder

The external encoder records the position of an externally controlled drive. The encoder required for this purpose communicates the encoder position to the controller by means of a PROFIdrive frame. In the "Encoder" configuration window, configure the encoder coupling with which the encoder is to be connected.

Select encoder coupling:

In this area, select how the encoder will be connected in keeping with the graphic representation.

- **Connection via technology module (TM)**

  Select this option, if the encoder is connected to a technology module (TM).

  – **Technology module:**

    In the "Technology module" field, select a technology module that has already been configured, and the channel to be used. Only technology modules set to the "Position detection for motion control" mode are displayed for selection.

    If no technology module is available for selection, change to the device configuration and add a technology module. If you have selected a technology module, you can change to the configuration of the technology module using the "Device configuration" button.

    You can operate the technology module centrally on an S7-1500 PLC, or distributed on a distributed I/O. You can identify the technology modules suitable for position detection for Motion Control in the documentation for the technology module and the catalog data.

- **Connection via PROFINET/PROFIBUS (PROFIdrive)**

  Select this option, if you are deploying a PROFIdrive compatible encoder.

  – **Encoder:**

    In the "Encoder" field, select a configured encoder on PROFINET/PROFIBUS. If an encoder was selected, then it can be configured using the "Device configuration" button.

    Switch to the device configuration in the network view, and add an encoder, in the event that no encoder can be selected.

6.7.2.2 Configuration - Data exchange

Configuration - Data exchange

In the "Data transmission" configuration window, configure the data transmission to the encoder. The configuration varies according to the encoder coupling:

- Encoder to technology module (Page 149)
- Encoder to PROFINET/PROFIBUS (Page 151)

Encoder to technology module

Data exchange with encoder

In this area, you can configure the encoder frame and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder message frame

In the drop-down list for the technology module, select the message frame that you have configured in the technology module.

Encoder type

In this area, you can configure how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (Gn_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (Gn_XIST1).
Bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2)	In this field, configure the number of reserved bits for the multiplication factor of the absolute value of the fine resolution (Gn_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

Encoder to PROFINET/PROFIBUS

Data exchange with encoder

In this area, you can configure the encoder frame and the criteria for how the encoder data are to be evaluated. The specifications must match those in the device configuration.

Encoder message frame

In the drop-down list, select the frame of the encoder. The specification must match the setting in the device configuration.

Encoder type

Depending on the selected encoder type, configure the following parameters:

Encoder type	Rotary incremental
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Bits for fine resolution in the incremental actual value (GN_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (GN_XIST1).

Encoder type	Rotary absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (GN_XIST1)	In this field, configure the number of reserved bits for fine resolution within the incremental actual value (GN_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (GN_XIST2).

Encoder type	Rotary cyclic absolute
Steps per revolution:	In this field, configure the number of steps that the encoder resolves per revolution.
Number of revolutions:	In this field, configure the number of revolutions that the absolute value encoder can detect.
Bits for fine resolution in the incremental actual value (GN_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (GN_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (GN_XIST2).

Encoder type	Linear incremental
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (GN_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (GN_XIST1).

Encoder type	Linear absolute
Distance between two increments:	In this field, you can configure the distance between two steps of the encoder.
Bits for fine resolution in the incremental actual value (GN_XIST1)	In this field, configure the number of bits for fine resolution within the incremental actual value (GN_XIST1).
Bits for fine resolution in the absolute actual value (GN_XIST2)	In this field, configure the number of reserved bits for fine resolution within the absolute actual value (GN_XIST2).

Invert encoder direction

Select this check box if you would like to invert the actual value of the encoder.

6.7.3 Extended Parameters

6.7.3.1 Configuration - Mechanics

Configuration - Mechanics

Configure the encoder parameters for the position of the externally controlled drive in the "Mechanics" configuration window.

The configuration varies according to the type of encoder:

- Linear (Page 153)
- Rotary (Page 154)

Linear

Measuring gearbox

- **Consider measuring gearbox and leadscrew pitch for encoder evaluation**

  Activate the check box, if you want to perform the configuration based on the gear ratio and the leadscrew pitch.

  Deactivate the check box, if you want to perform the configuration based on the encoder revolution and the resulting distance.

- **Number of encoder revolutions / number of load revolutions**

  The gear ratio of the load gear is specified as the ratio between motor revolutions and load revolutions. Specify here an integral number of motor revolutions and the resulting number of load revolutions.

Position parameter

- **Leadscrew pitch (select "Consider measuring gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the distance by which the load is moved when the leadscrew makes one revolution.

- **Load movement per motor revolution (select "Consider measuring gear and leadscrew pitch for encoder evaluation")**

  In this field, configure the load distance for one motor revolution.

See also

Configuration - Mechanics (Page 153)

Rotary (Page 154)

Rotary

Measuring gearbox

- **Number of encoder revolutions / number of load revolutions**

  The gear ratio of the measuring gearbox is specified as the ratio between encoder revolutions and load revolutions. Specify here an integral number of load revolutions and the resulting number of encoder revolutions.

  Select the same values for the number of motor revolutions and load revolutions, if no load gear is present.

Position parameter

- **Distance per encoder revolution**

  In this field, configure the value indicated by the external measuring system per encoder revolution.

Configuration - Mechanics (Page 153)

Linear (Page 153)

6.7.3.2 Homing

Configuration - Homing

Configure the parameters for homing the external encoder in the "Homing" configuration window. Homing is performed using the Motion Control instruction "MC_Home" Mode = 2, 8 and 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

Selecting the homing mode

Select from among the following homing modes:

- Zero mark via PROFIdrive frame and proximity switch (Page 156)
- Zero mark via PROFIdrive frame (Page 157)
- Homing mark via digital input (Page 158)

Zero mark via PROFIdrive frame and proximity switch

Homing direction

Select the direction in which the zero mark should be approached for homing. The next zero mark after exiting the proximity switch is used.

The following options are available:

- **Positive**

  Axis moves in the direction of higher position values.

- **Negative**

  Axis moves in the direction of lower position values.

- **Current**

  The currently effective approach direction is used for homing.

Home position

In this field, configure the absolute coordinate of the home position. The home position configured here is in effect when the Motion Control instruction "MC_Home" is executed with Mode = 10.

Note

Parameter "MC_Home.Mode"

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

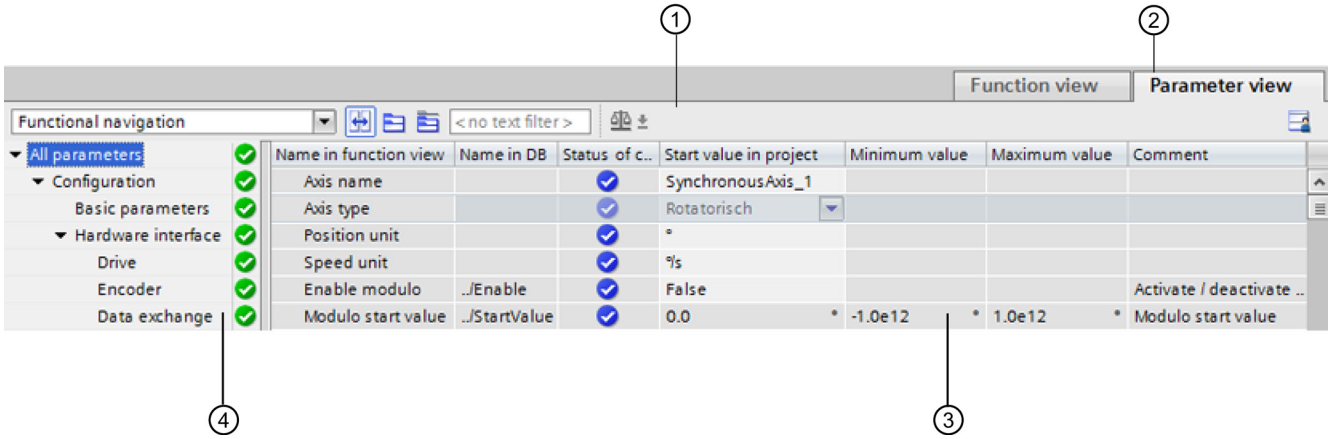
6.8 Parameter view

6.8.1 Introduction to the parameter view

The Parameter view provides you with a general overview of all relevant parameters of a technology object. You obtain an overview of the parameter settings and can easily change them in offline and online mode.



① Toolbar (Page 161)
② "Parameter view" tab
③ Parameter table (Page 162)
④ Navigation (Page 161)

Function scope

The following functions are available for analyzing the parameters of the technology objects and for enabling targeted monitoring and modification.

Display functions:

- Display of parameter values in offline and online mode
- Display of status information of the parameters
- Display of value deviations and option for direct correction
- Display of configuration errors
- Display of value changes as a result of parameter dependencies
- Display of all memory values of a parameter: Start value PLC, Start value project, Monitor value
- Display of the parameter comparison of the memory values of a parameter

Operator control functions:

- Navigation for quickly changing between the parameters and parameter structures.
- Text filter for faster searches for particular parameters.
- Sorting function for customizing the order of parameters and parameter groups to requirements.
- Memory function for backing up structural settings of the Parameter view.
- Monitoring and modifying of parameter values online.
- Function for saving a snapshot of parameter values of the CPU in order to capture momentary situations and to respond to them.
- Function for applying a snapshot of parameter values as start values.
- Download of modified start values to the CPU.
- Comparison functions for comparing parameter values with one another.

6.8.2 Structure of the parameter view

6.8.2.1 Toolbar

The following functions can be selected in the toolbar of the parameter view.

Symbol	Function	Explanation
	Select navigation structure	Toggle between function-based navigation and the view for the data structure of the technology data block.
	Couple the function view and parameter view for the objects selected in the navigation	Enables the targeted toggling between the parameter view for function-based view.
	Collapse/expand all nodes and objects	Collapses or expands all nodes and objects of the navigation or the data structure in the currently active view.
	Collapse/expand the nodes below the marked nodes	Collapses or expands all marked nodes and objects of the navigation or the data structure in the currently active view.
	Text filter...	After entry of a character string: Display of all parameters containing the specified string in one of the currently visible columns.
	Selection of compare values	Selection of parameter values that are to be compared with one another in online mode (Start value project, Start value PLC) Only in online mode.
	Save window settings	Saves your display settings for the Parameter view (e.g., selected navigation structure, activated table columns, etc.)

6.8.2.2 Navigation

Within the "Parameter view" tab, the following alternative navigation structures can be selected.

Navigation		Explanation
Functional navigation		In the functional navigation, the structure of the parameters is based on the structure in the configuration dialog ("Functional view" tab), commissioning dialog, and diagnostics dialog.
Data structure		In the data navigation navigation, the structure of the parameters is based on the structure in the technology data block.

You can use the "Select navigation structure" drop-down list to toggle the navigation structure.

6.8.2.3 Parameter table

The table below shows the meaning of the individual columns of the parameter table. You can show or hide the columns as required.

- Column "Offline" = X: Column is visible in offline mode.
- Column "Online" = X: Column is visible in online mode (online connection to the CPU).

Column	Explanation	Offline	Online
Name in functional view	Name of the parameter in the functional view. The display field is empty for parameters that are not configured via the technology object.	X	X
Name in DB	Name of the parameter in the technology data block. If the parameter is part of a structure or UDT, the prefix ". ./" is added. The display field is empty for parameters that are not contained in the technology data block.	X	X
Full name in DB	Complete path of the parameter in the instance DB. The display field is empty for parameters that are not contained in the technology data block.	X	X
Status of configuration	Display of the completeness of the configuration using status symbols.	X	
Compare result	Result of the "Compare values" function. This column is displayed when there is an online connection.		X
Start value project	Configured start value in the project. Error indication if entered values have a syntax or process-related error.	X	X
Default value	Value that is pre-assigned to the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Start value PLC	Start value in the CPU. This column is displayed when there is an online connection.		X
Monitor value	Current value in the CPU. This column is displayed when there is an online connection.		X
Modify value	Value that is to be used to change the monitor valuet. This column is displayed when there is an online connection.		X
Minimum value	Minimum process-related value of the parameter. If the minimum value is dependent on other parameters, it is defined: • Offline: By the Start value project. • Online: By the Monitor values.	X	X
Maximum value	Maximum process-related value of the parameter. If the maximum value is dependent on other parameters, it is defined: • Offline: By the Start value project. • Online: By the Monitor values.	X	X
Setpoint	Designates the parameter as a setpoint. These parameters can be initialized online.	X	X

Column	Explanation	Offline	Online
Data type	Data type of the parameter. The display field is empty for parameters that are not contained in the technology data block.	X	X
Retain	Designates the value as a retentive value. The values of retentive parameters are retained even after the voltage supply is switched off.	X	X
Accessible from HMI	Indicates whether the HMI can access this parameter during runtime.	X	X
Visible in HMI	Indicates whether the parameter is visible in the selection list of the HMI by default.	X	X
Comment	Brief description of the parameter.	X	X

6.8.3 Opening the parameter view

Requirement

The technology object was added in the project navigator.

Procedure

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click the "Configuration" object.
4. Select the "Parameter view" tab in the top right corner.

Result

The Parameter view opens. Each displayed parameter is represented by one row in the parameter table.

The displayable parameter properties (table columns) vary depending on whether you are working with the Parameter view in offline or online mode.

In addition, you can selectively display and hide individual table columns.

6.8.4 Working with the parameter view

6.8.4.1 Overview

The following table provides an overview of the functions of the Parameter view in online and offline mode described in the following.

- Column "Offline" = X: This function is possible in offline mode.
- Column "Online" = X: This function is possible in online mode.

Function/action	Offline	Online
Filtering the parameter table (Page 164)	X	X
Sorting the parameter table (Page 165)	X	X
Transferring parameter data to other editors (Page 165)	X	X
Indicating errors (Page 166)	X	X
Editing start values in the project (Page 166)	X	X
Monitoring values online in the parameter view (Page 168)		X
Modifying values (Page 169)		X
Comparing values (Page 170)		X

6.8.4.2 Filtering the parameter table

You can filter the parameters in the parameter table in the following ways:

- With the text filter
- With the subgroups of the navigation

Both filter methods can be used simultaneously.

With the text filter

Texts that are visible in the parameter table can be filtered. This means only texts in displayed parameter rows and columns can be filtered.

1. Enter the desired character string for filtering in the “Text filter...” input box.

   The parameter table displays only the parameters containing the character string.

The text filtering is reset.

- When another parameter group is selected in the navigation.
- When navigation is changed from data navigation to functional navigation, or vice versa.

With the subgroups of the navigation

1. Click the desired parameter group in the navigation, e.g., "Static".

   The parameter table only shows the static parameters. You can select further subgroups for some groups of the navigation.

2. Click “All parameters” in the navigation if all parameters are to be shown again.

6.8.4.3 Sorting the parameter table

The values of the parameters are arranged in rows. The parameter table can be sorted by any displayed column.

- In columns containing numerical values, sorting is based on the magnitude of the numerical value.
- In text columns, sorting is alphabetical.

Sorting by column

1. Position the cursor in the header cell of the desired column.

   The background of this cell turns blue.
2. Click the column header.

Result

The entire parameter table is sorted by the selected column. A triangle with tip facing up appears in the column header.

Clicking the column header again changes the sorting as follows:

- Symbol "▲": Parameter table is sorted in ascending order.
- Symbol "▼": Parameter table is sorted in descending order.
- No symbol: The sorting is removed again. The parameter table assumes the default display.

The "../" prefix in the "Name in DB" column is ignored when sorting.

6.8.4.4 Transferring parameter data to other editors

You can paste parameters of the parameter view in the following editors:

- Program editor
- Watch table
- Signal table for Trace

The following options are available for pasting:

- Drag-and-drop
- <Ctrl+C>/<Ctrl+V>
- Copy/Paste via shortcut menu

6.8.4.5 Indicating errors

Error indication

Parameter assignment errors that result in compilation errors (e.g., limit violation) are indicated in the Parameter view.

Every time a value is entered in the Parameter view, a check is made for process-related and syntax errors and displayed with the following indicators:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns
- Table field with red background

  If you click the bad field, a roll-out error message appears with information of the permissible value range or the required syntax (format)

Compilation error

From the error message of the compiler, you can directly open the Parameter view (functional navigation) containing the parameter causing the error in situations where the parameter is not displayed in the configuration dialog.

6.8.4.6 Editing start values in the project

With the Parameter view, you can edit the start values in the project in offline mode and online mode.

- You make value changes in the “Start value project” column of the parameter table.
- In the “Status of configuration” column of the parameter table, the progress of the configuration is indicated by the familiar status symbols from the configuration dialog of the technology object.

Boundary conditions

- If other parameters depend on the parameter whose start value was changed, the start value of the dependent parameters are also adapted.
- If a parameter of a technology object is not editable, it is also not editable in the parameter view. The ability to edit a parameter can also depend on the values of other parameters.

Defining new start values

To define start values for parameters in the Parameter view, follow these steps:

1. Open the Parameter view of the technology object.
2. Enter the desired start values in the "Start value project" column. The value must match the data type of the parameter and must not exceed the value range of the parameter. The limits of the value range can be seen in the “Maximum value” and “Minimum value” columns.

The "Status of configuration" column indicates the progress of the configuration with colored symbols.

Following adaptation of the start values and downloading of the technology object to the CPU, the parameters take the defined value at startup if they are not declared as retentive (“Retain” column).

Error indication

When a start value is input, a check is made for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red error symbol in the "Status of configuration" (offline mode) or "Compare result" (online mode, depending on the selected comparison type) columns

and/or

- Red background in the “Start value project” field
  If you click on the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Correcting bad start values

1. Correct bad start values using information from the roll-out error message.

   Red error symbol, red field background, and roll-out error message are no longer displayed.

The project cannot be successfully compiled unless the start values are error-free.

6.8.4.7 Monitoring values online in the parameter view

You can monitor the values currently taken by the parameters of the technology object in the CPU (monitor values) directly in the Parameter view.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

As soon as the Parameter view is online, the following columns are additionally displayed:

- Compare result
- Start value PLC
- Monitor value
- Modify value
- Selection for transmission

The "Monitor value" column shows the current parameter values on the CPU.

Display

All columns that are only available online have an orange background:

- Values in light-orange cells can be changed.
- Values in cells with a dark orange background cannot be changed.

See also

Parameter table (Page 162)

6.8.4.8 Modifying values

With the Parameter view, you can modify values of the technology object in the CPU.

You can assign values to the parameter once (Modify value) and modify them immediately. The modify request is executed as quickly as possible without reference to any particular point in the user program.

⚠ DANGER

Danger when modifying:

Changing the parameter values while the plant is operating may result in severe damage to property and personal injury in the event of malfunctions or program errors.

Make sure that dangerous states cannot occur before you use the "Modify" function.

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.
- The parameter can be modified (associated field in the "Modify value" column has a light-orange background).

Procedure

To modify parameters immediately, follow these steps:

- Enter the desired modify values in the “Modify values” column of the parameter table.

The selected parameters are modified once and immediately with the specified values and can be monitored in the "Modify values" column. The check boxes for modifying in the "Selection for transmission" column are automatically cleared after the modify request is complete.

Error indication

When a start value is input, a check is made immediately for process-related and syntax errors and the result is indicated.

Bad start values are indicated by:

- Red background in the “Modify value” field

and

- If you click the bad field, a roll-out error message appears with information of the permissible value range or the necessary syntax (format)

Bad modify values

- Modify values with process-related errors can be transmitted.
- Modify values with syntax errors **cannot** be transmitted.

6.8.4.9 Comparing values

You can use comparison functions to compare the following memory values of a parameter:

- Start value project
- Start value PLC

Requirements

- There is an online connection.
- The technology object is downloaded to the CPU.
- The Parameter view of the technology object is open.

Procedure

To compare the start values on the various target systems, follow these steps:

1. Click the "Selection of compare values" icon .

   A selection list containing the comparison options opens:

   – Start value project - Start value PLC (default setting)

2. Select the desired comparison option.

   The selected comparison option is executed as follows:

   – A scales symbol appears in the header cells of the two columns selected for comparison.

   – Symbols are used in the "Compare result" column to indicate the result of the comparison of the selected columns.

Symbol in "Compare result" column

Symbol	Meaning
	The compare values are equal and error-free.
	The compare values are not equal and error-free.
	At least one of the two compare values has a process-related or syntax error.
	The comparison cannot be performed. At least one of the two compare values is not available (e.g., snapshot).

Symbol in the navigation

The symbols are shown in the same way in the navigation if the comparison result applies to at least one of the parameters below the displayed navigation structure.

Programming 7

7.1 Introduction

The "Programming" section contains general information on supplying and evaluating the Motion Control instructions and on technology data blocks.

An overview of the Motion Control instructions can be found in the Functions (Page 20) section.

You can transmit jobs to the technology object by means of Motion Control instructions in the user program. You define the job using the input parameters of the Motion Control instructions. The current job status is indicated in the output parameters.

The technology data block is available to you as an additional interface to the technology object. Via your user program, you can access the technology data block's data.

7.2 Technology data block

7.2.1 Introduction

The properties of real objects are configured by means of the technology objects and saved in a technology data block. The technology data block contains all configuration data, setpoint and actual values, and status information of the technology object. The TIA Portal automatically creates the technology data block when the technology object is created. You access the data of the technology data block with your user program.

A listing and description of the tags can be found in the Appendix (Page 332).

7.2.2 Evaluating the technology data block

Description

Access to data in the technology data block occurs in accordance with the access to standard data blocks.

Reading values from the technology data block

In your user program you can read actual values (e.g. current position) and status information, or detect error messages in the technology object. When you program a query in your user program (e.g. current velocity), the value is directly read from the technology object.

Reading values from the technology data block takes longer than for other data blocks. If you use these tags several times in a single cycle of your user program, it is recommended to copy the tag values to local tags, and use the local tags in your program.

Writing values to the technology data block

The configuration of the technology object in the TIA Portal is used to write the corresponding data to the technology data block. After they have been loaded into the CPU, these data are stored in the CPU on the SIMATIC Memory Card (load memory).

- **Required changes in the technology data block**

  In the following cases, it may be necessary for the user program to write values to the technology data block:

  – Adaptation of the configuration of the technology object (e.g. dynamic limits, software limit switches)

  – Use of overrides

  – Adaptation of position control (e.g. "Kv" parameter)

- **Effectiveness of changes in the technology data block**

  Changes to values in the technology data block by the user program can take effect at various points in time. The relevant property of the individual tags can be found in their descriptions in the Appendix (Page 332).

  – **Effective immediately:**

    LREAL data type

    (e.g. <TO>.Override.Velocity)

    Value changes take effect immediately when writing these tags. The technology object performs a range check on the written value, and immediately starts using the new value. If range limits are violated when writing, the technology object automatically corrects the values. If the value is below the range, then the value is set to the lower limit of the range; if the range is exceeded, then the value is set to the upper limit of the range. You write changes using direct assignments. The changes are retained until the next POWER OFF of the CPU or restart of the technology object.

DINT/BOOL data types

(e.g. <TO>.Senso[n].ActiveHoming.Direction)

Changes are only permitted in the defined value range. Value changes outside the value range are not applied. If you enter invalid values, the programming error OB (OB 121) is started. You write changes using direct assignments. The changes are retained until the next POWER OFF of the CPU or restart of the technology object.

– **Effective after restart:**

(e.g. <TO>.Homing.AutoReversal)

Since restart-relevant tags have dependencies on other tags, value changes cannot be applied at any arbitrary time. The changes are only used after reinitialization (restart) of the technology object. During a restart the technology object is reinitialized with the data in load memory. You therefore write changes to the starting value in load memory, using the extended instruction "WRIT_DBL" (write to data block in load memory).

You trigger the restart in your user program using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE. Additional information on a restart can be found in the Restarting Technology Objects (Page 197) section.

Note

Save changes with "WRIT_DBL"

Changes to immediately effective tags are lost on POWER OFF of the CPU, or restart of the technology object.

If changes in the technology data block should also be retained after POWER OFF of the CPU, or restart of the technology object, you must write the changes to the starting value in load memory using the extended instruction "WRIT_DBL".

Note

Using the "READ_DBL" and "WRIT_DBL" data block functions

The "READ_DBL" and "WRIT_DBL" data block functions can only be used on a single tag in conjunction with the tags of the technology object. The "READ_DBL" and "WRIT_DBL" data block functions cannot be applied to data structures of the technology object.

Evaluation of data in the isochronous interrupt OB

If you want to write the technology data block's data isochronously from a Motion Control application cycle, there is the option of evaluating these data in the isochronous interrupt OB. The MC-Servo [OB91] is called synchronously with a bus system.

Assign the same bus cycle (Page 78) to the isochronous interrupt OB as to the MC_Servo [OB91]. By this means, the isochronous interrupt OB is called in each Motion Control application cycle.

In the isochronous interrupt OB, read the necessary data into global tags. Use these global tags for further programming.

7.2.3 Evaluate StatusWord, ErrorWord and WarningWord

To be able to use individual status and error information from the "StatusWord", "ErrorWord" and "WarningWord" data double words, the evaluation can be performed as described below. For consistent evaluation, you should avoid using bit addressing to access these data double words in the technology data block. Access to an individual bit in the technology data block only lasts as long as the access to the entire data word.

When required, copy the required data double word into a tag of a data structure and query the individual bits of the tag.

A description of the data double words and the allocation of the individual bits can be found in the Appendix:

- StatusWord (Page 351)
- ErrorWord (Page 353)
- WarningWord (Page 356)

Requirements

The technology object has been created.

Procedure

To evaluate the individual bits in the data word "StatusWord", proceed as follows:

1. Crate a global data structure. Name the data structure, e.g. as "Status".
2. Create a double word (DWORD) in the data structure "Status". Name the data structure, e.g. as "Temp".
3. Create 32 Boolean tags in the "Status" data structure. You can obtain a clearer overview by naming Booleanhe Boolean tags as defined for the bits in the technology DB (e.g. name the fifth Boolean tag "HomingDone").
4. Copy the tag <TO>.StatusWord as needed from the technology data block to the double word "Temp" in your data structure.
5. Copy the bits of dword "Temp" to the corresponding Boolean tags by means of bit access.
6. Use the Boolean tags to query the status bits.

Evaluate the "ErrorWord" and "WarningWord" data words as specified in steps 1 to 6.

Example

The following example shows how you can read and save the fifth bit "HomingDone" of the data word "StatusWord":

SCL

```
Status.Temp := <TO>.StatusWord;                          Copy status
                                                         word
Status.HomingDone := Status.Temp.X5;                     Copy individual
                                                         bits per bit
                                                         access
```

STL

```
L <TO>.StatusWord                                        Copy status
                                                         word
T Status.Temp
U Status.Temp.X5                                         Copy individual
                                                         bits per bit
                                                         access
= Status.HomingDone
```

7.2.4 Change restart-relevant data

In order to change restart-relevant data in the technology data block, write to the starting values of the tags in load memory using the extended instruction "WRIT_DBL". In order for the changes to be applied, a restart of the technology object must be performed.

Whether changes to the value of a tag are relevant for the restart can be found in the description of the tags in the Appendix (Page 332).

Requirement

The technology object has been created.

Procedure

To change restart-relevant data, proceed as follows:

1. Create a data block and fill it with the restart-relevant values, that you want to change in the technology data block. In doing so, the data types must match the tags to be changed.
2. Write the values from your data block to the starting values of the tags of the technology data block in load memory, using the extended instruction "WRIT_DBL".

   If restart-relevant data were changed, this will be indicated in the <TO>.StatusWord.X3 (OnlineStartValuesChanged) tag of the technology object.
3. Perform a restart of the technology object using the Motion Control instruction "MC_Reset" with parameter "Restart" = TRUE.

After the restart of the technology object, the new value is transferred into the technology data block in work memory, and is effective.

7.3 Motion Control instructions

7.3.1 Motion Control instruction parameters

Description

When creating your user program, take account of the following explanations of the Motion Control instruction parameters.

Reference to the technology object

The specification of the technology object to the Motion Control instruction occurs as follows:

- **"Axis" parameter**

  In the "Axis" input parameter of a Motion Control instruction, a reference to the technology object is specified, which the corresponding job should use.

Job start and receipt of the input parameters of a Motion Control instruction

When jobs are started, and when changed parameter values are received, a distinction is made between the following Motion Control instructions:

- **Motion Control instructions with "Execute" parameter**

  With a rising edge at the "Execute" parameter, the job is started and the values pending in the input parameters are applied.

  Subsequently changed parameter values are not applied until the next job start.

  Resetting the "Execute" parameter does not end the job, but does have an effect on the indication duration of the job status. As long as "Execute" is set to TRUE, the output parameters will be updated. If "Execute" is reset before the completion of a job, the parameters "Done", "Error" and "CommandAborted" are correspondingly set for only one call cycle.

- **Motion Control instructions with "Enable" parameter**

  The job is started by setting the "Enable" parameter.

  As long as "Enable" = TRUE. the job remains enabled and changed parameter values are immediately applied.

  The job is ended by resetting the "Enable" parameter.

  The input parameters "JogForward" and "JogBackward" of the "MC_MoveJog" Motion Control instruction correspond in their behavior to the "Enable" parameter.

Job status

The following output parameters indicate the status of the job processing:

- **Motion Control instructions with "Done" parameter**

  The normal completion of a job is indicated with parameter "Done" = TRUE.

- **Motion Control instructions without "Done" parameter**

  The achievement of the job target is indicated by means of other parameters (e.g. "Status", "InVelocity"). For more information, refer to the section "Tracking running jobs (Page 184).

- **"Busy" parameter**

  As long as a job is being processed, the parameter "Busy" shows the value TRUE. If a job was ended or aborted, "Busy" shows the value FALSE.

- **"CommandAborted" parameter**

  If a job was aborted by another job, CommandAborted shows the value "TRUE".

- **"Error" parameter**

  If an error occurs in the Motion Control instruction, the "Error" parameter shows the value TRUE. The ErrorID parameter shows the cause of the error.

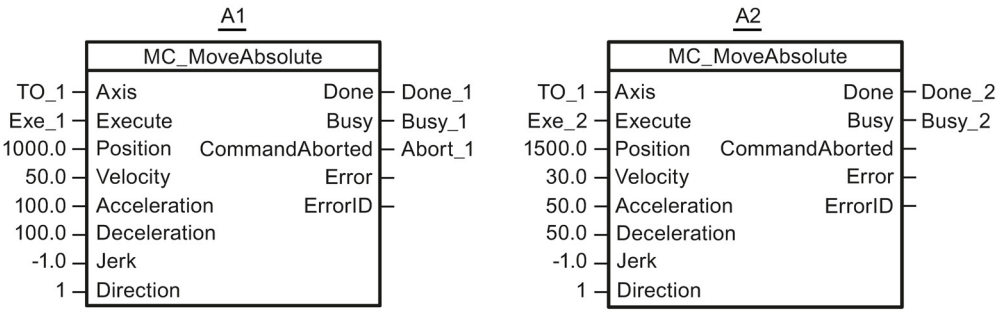
As long as the "Execute" or "Enable" parameter is set to TRUE, the output parameters will be updated. Otherwise the parameters "Done", "Error" and CommandAborted" are correspondingly only set for one cycle.

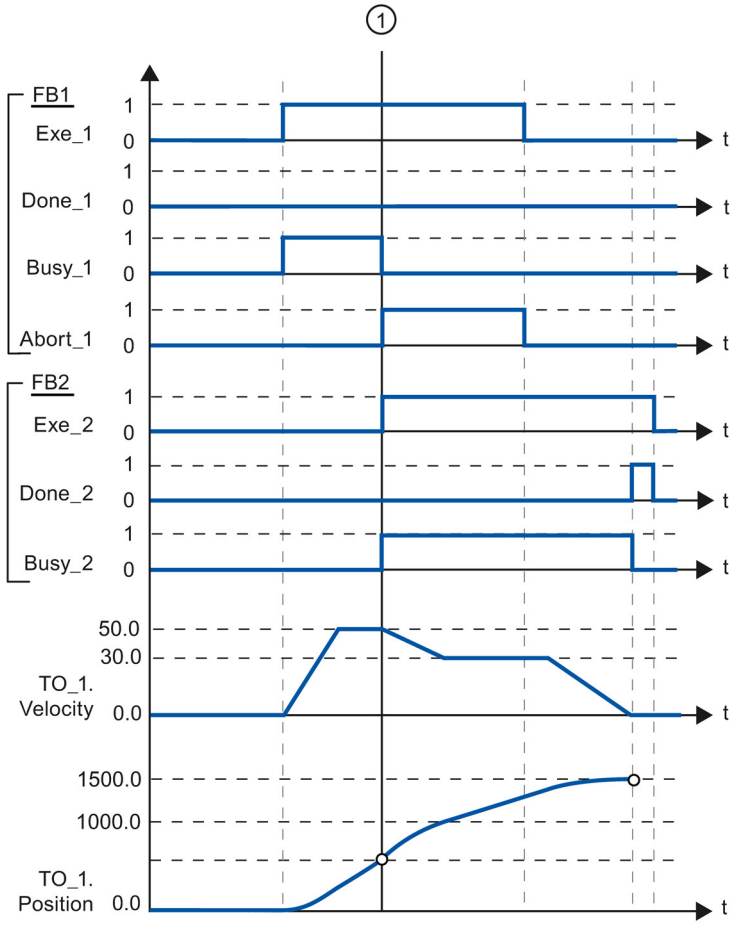
Termination of active jobs

A running Motion Control job is terminated by the initiation of a new Motion Control job. In the process, the current dynamic setpoints (acceleration, deceleration, jerk, velocity) are set to the values of the overriding job.

Example of parameter behavior

The behavior of the parameters of Motion Control instructions is shown by way of the example of two "MC_MoveAbsolute" jobs.





Using "Exe_1", an "MC_MoveAbsolute" job (A1) with target position 1000.0 is initiated. "Busy_1" is set to TRUE. The axis is accelerated to the specified velocity and moved to the target position (see TO_1.Velocity and TO_1.Position). Before the target position is reached, the job is overridden at time ① by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1", and "Busy_1" is set to FALSE. The axis is braked to the velocity specified in A2, and moved to the new target position 1500.0. When the axis reaches the target position, this is signaled via "Done_2".

7.3.2 Add Motion Control instructions

You add Motion Control instructions to a program block in the same way as other instructions. You control all available functions of the technology object using the Motion Control instructions.

Requirements

The technology object was created.

Procedure

To add Motion Control instructions in your user program, proceed as follows:

1. Double click your program block in the Project Navigator (the program block must be called in the cyclical program).

   The program block is opened in the programming editor, and the available instructions are displayed.

2. In the "Instructions" task card, open the "Technology > Motion Control > S7-1500 Motion Control" folder.

3. Drag and drop the Motion Control instruction, e.g. "MC_Power", into the desired segment of the program block.

   The "Call options" dialog opens.

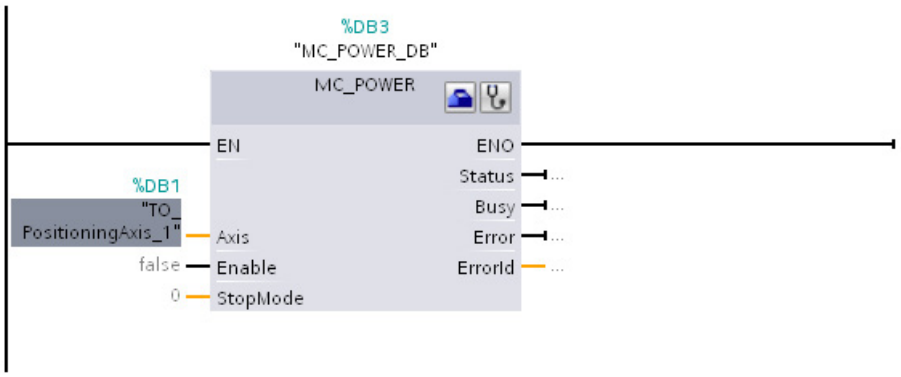
4. In the dialog, specify a name and a number for the instance data block of the Motion Control instruction.

5. Click "OK".

   The Motion Control instruction "MC_Power" is added to the segment.

   The instance data block is automatically created under "Program Blocks > System Blocks > Program Resources".

6. Input parameters without a default value (e.g. "Axis"), must be supplied. Mark the technology object in the Project Navigator, and drag and drop it to <...> in the "Axis" parameter.



After specifying the technology object in the "Axis" parameter, the following buttons are available to you:

To open the configuration of the technology object, click on the toolbox icon.

To open the diagnostics of the technology object, click on the stethoscope icon.

7. Add additional Motion Control instructions in accordance with steps 3 through 6.

See also

Tracking active jobs (Page 184)

Tags of the positioning axis/synchronous axis technology object (Page 332)

7.4 Starting Motion Control jobs

Description

Motion Control jobs are started by setting the "Execute" or "Enable" parameter of the Motion Control instruction. The call of the Motion Control instructions for a technology object should occur in an execution level.

When executing Motion Control jobs, you should also take note of the status of the technology object.

Starting Motion Control jobs should be performed in the following steps:

1. Query the status of the technology object.
2. Initiate new job for the technology object.
3. Check job status.

These steps are explained using the example of a job for absolute positioning.

1. Query the status of the technology object

Make sure that the technology object is in the appropriate status to perform the desired job:

- **Has the technology object been released?**

  To execute motion jobs, the technology object must be enabled.

  Enabling is performed using the Motion Control instruction "MC_Power".

  The "MC_Power.Status" parameter must show the value TRUE.

- **Is a technology alarm pending?**

  To perform motion jobs, no technology alarms may be pending. After resolving the error, acknowledge any possibly pending alarms using the Motion Control instruction "MC_Reset".

  A list of the technology alarms and alarm reactions can be found in the appendix, Technology Alarms (Page 368).

- **Has the technology object been homed?**

  In order to perform a job for absolute positioning, the positioning axis/synchronous axis technology object must be homed. The referencing occurs via the Motion Control instruction "MC_Home". The "<TO>.StatusWord.X5 (HomingDone) " tag of the technology object must show the value TRUE .

2. Initiate new job for the technology object

Initiate a new job.

In the "Position" parameter of the "MC_MoveAbsolute" instruction, specify the position to which the axis should be moved. Start the job with a positive edge at the "Execute" parameter.

3. Check job status

Parameter "Done" of the Motion Control instruction indicates successful completion of a job (target reached, in this case).

If an error is detected, the "Error" parameter of the Motion Control instruction is set to TRUE, and the job is rejected.

You can program an error handling routine for the Motion Control job. For this purpose, evaluate the error indicated in the "Error" parameter. The cause of the error is indicated in the ErrorID parameter. After resolving the cause of the error, restart the job.

Output of the "Error" = TRUE and "ErrorID" = 16#8001 status information during job processing indicates that a technology alarm was triggered.

A list of the ErrorIDs can be found in the appendix, Error Detection (Page 386).

Additional information

An option for the evaluation of the individual status bits, error bits, and warning bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

7.5 Tracking active jobs

7.5.1 Introduction

The current status of the job processing is made available via the output parameters of the Motion Control instruction. These parameters are updated with each call of the Motion Control instruction.

When tracking jobs, a distinction is made between three groups:

- Motion Control instructions with "Done" parameter (Page 185)
- Motion Control instructions without "Done" parameter (Page 189)
- Motion Control instruction "MC_MoveJog" (Page 193)

7.5.2 Motion Control instructions with "Done" parameter

Description

Jobs for Motion Control instructions with the "Done" parameter are started with a positive edge at the "Execute" parameter. If the job was completed without errors and without interruption by another job (e.g. "MC_ MoveAbsolute": target position reached), then the "Done" parameter shows the value TRUE.

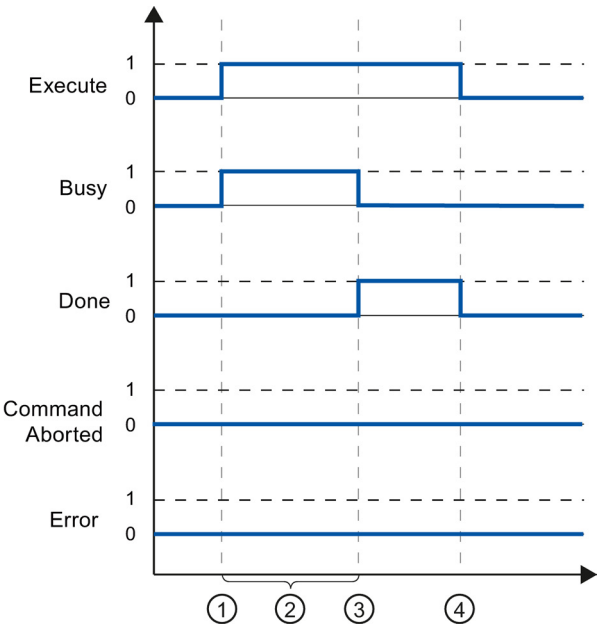
The following Motion Control instructions have a "Done" parameter:

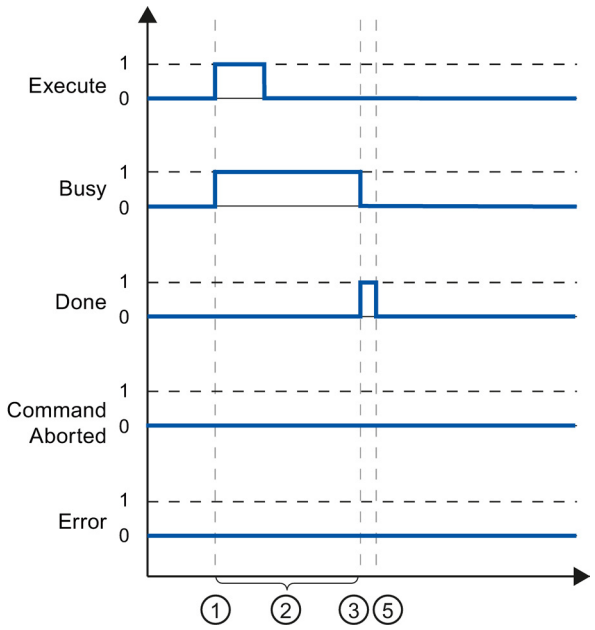
- MC_Home
- MC_MoveRelative
- MC_MoveAbsolute
- MC_MoveSuperimposed
- MC_Halt
- MC_Reset

The behavior of the parameters is presented by way of example for various situations:

Complete execution of job

If the Motion Control job has been fully processed to the point of completion, then this is indicated in the "Done" parameter with the value TRUE. The signal status of the "Execute" parameter influences the indication duration in the "Done" parameter:

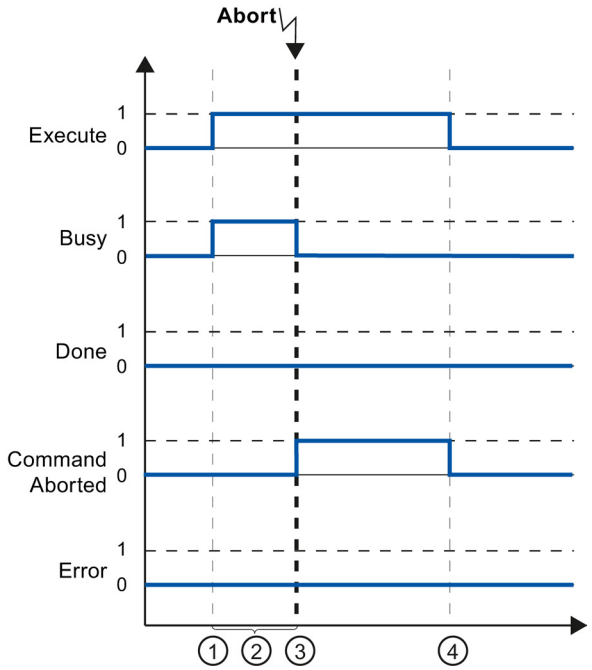
You set "Execute" **after completion** of the job to FALSE.	You set "Execute" **during processing** of the job to FALSE.
	


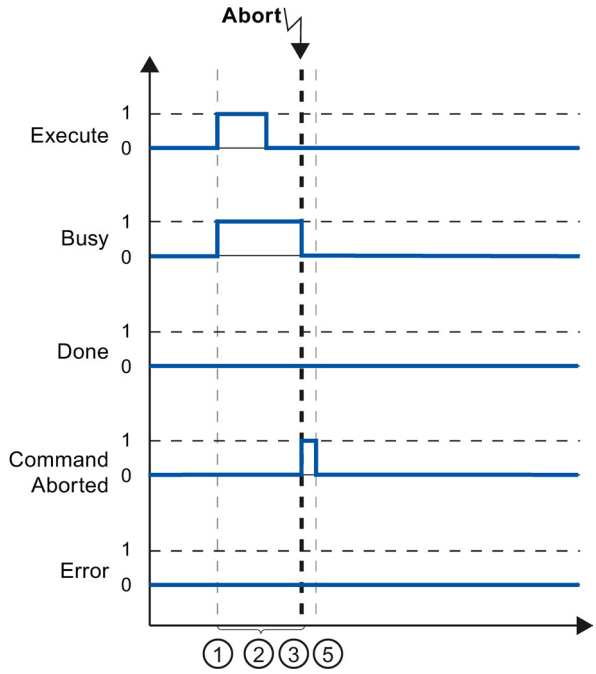


①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value while the job is still busy, or retain the TRUE value until the job has been completed.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	When the job is complete (for example, for Motion Control instruction "MC_MoveAbsolute": target position reached) the "Busy" parameter changes to FALSE, and the "Done" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Done" parameter also retains the value TRUE.
⑤	If the "Execute" parameter has been set to FALSE before the job is complete, then the "Done" parameter only shows the value TRUE for one execution cycle.

Job termination

If the Motion Control job is aborted during processing by another job, then this is indicated in the "CommandAborted" parameter with the value TRUE. The signal status of the "Execute" parameter influences the indication duration in the "CommandAborted" parameter:

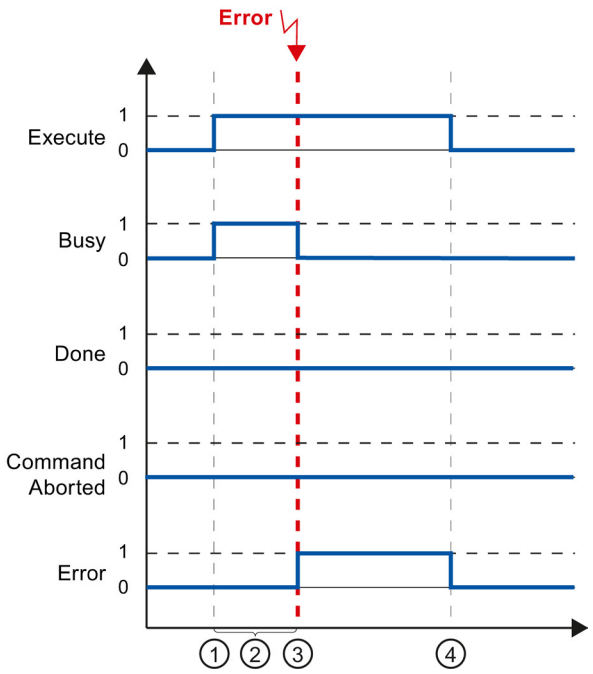
You set "Execute" **after** the job is aborted to FALSE.	You set "Execute" **before** the job is aborted to FALSE.
	


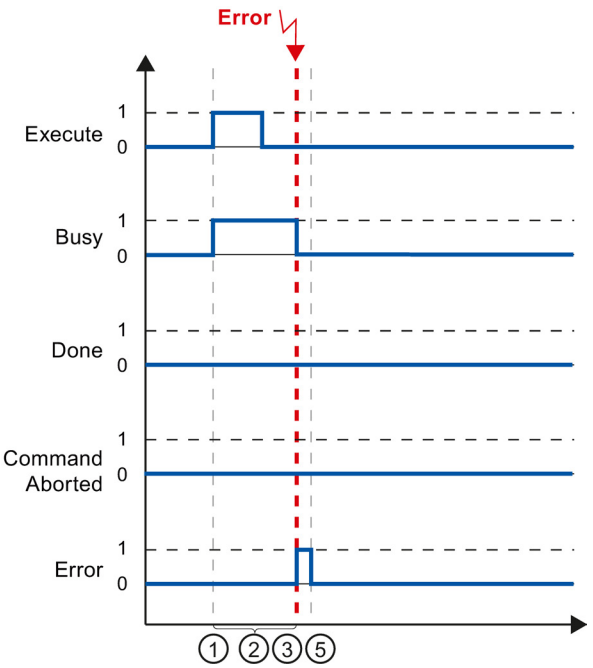


①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value while the job is still busy, or retain the TRUE value until the job has been completed.
②	While the job is active, the parameter "Busy" shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter has been set to FALSE before the job is aborted, then the "CommandAborted" parameter only shows the value TRUE for one execution cycle.

Error during job execution

If an error occurs during execution of the Motion Control job, then this is indicated in the "Error" parameter with the value TRUE. The signal status of the "Execute" parameter influences the indication duration in the "Error" parameter:

You set "Execute" **after** the occurrence of the error to FALSE.	You set "Execute" **before** the occurrence of the error to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value while the job is still busy, or retain the TRUE value until the job has been completed.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE, and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after the occurrence of the error, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter has been set to FALSE before the occurrence of the error, then the "Error" parameter only shows the value TRUE for one execution cycle.

7.5.3 Motion Control instructions without "Done" parameter

Description

Motion Control instructions without the "Done" parameter use a special parameter to achieve the job target (e.g. "InVelocity", "InGear"). The target state or the movement is paused until the job is canceled or an error occurs.

The following Motion Control instructions have a special parameter to display the job status:

- MC_Power (parameter "Status")
- MC_MoveVelocity (parameter "InVeloctity")
- MC_GearIn (parameter "InGear")
- MC_MoveJog (parameter "InVelocity")

  The special behavior of "MC_MoveJog" is described in the section Motion Control Instruction MC_MoveJog (Page 193).

The behavior of the parameter is shown for various situations using the Motion Control instruction "MC_MoveVelocity" as an example:

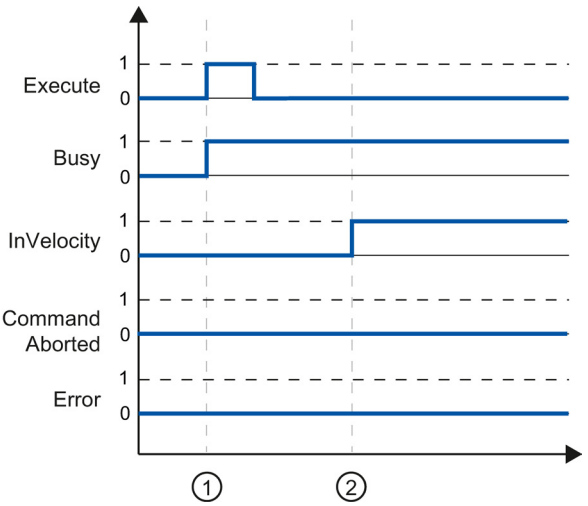
Example "MC_MoveVelocity"

An "MC_MoveVelocity" job is started with a positive edge at the "Execute" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

The motion of the axis can, for example, be stopped with an "MC_Halt" job.

The assigned velocity is reached and maintained

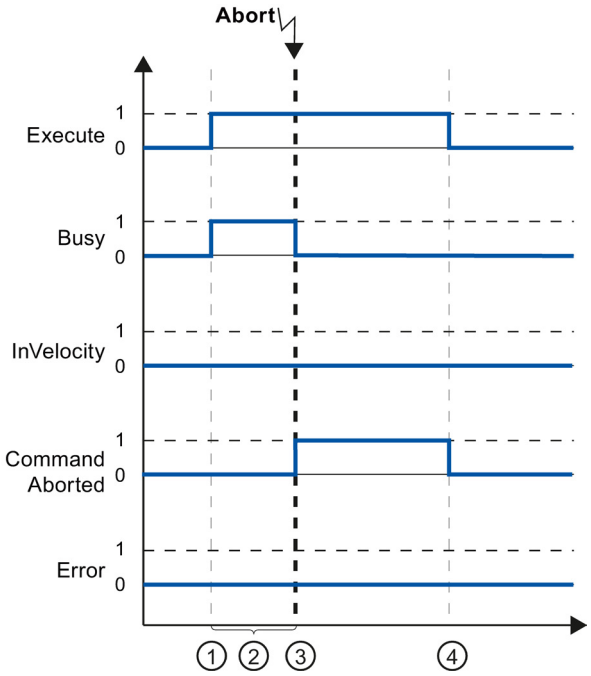
The achievement of the assigned velocity is indicated in the "InVelocity" parameter with the value TRUE. The "Execute" has no effect on the indication duration in the "InVelocity" parameter.

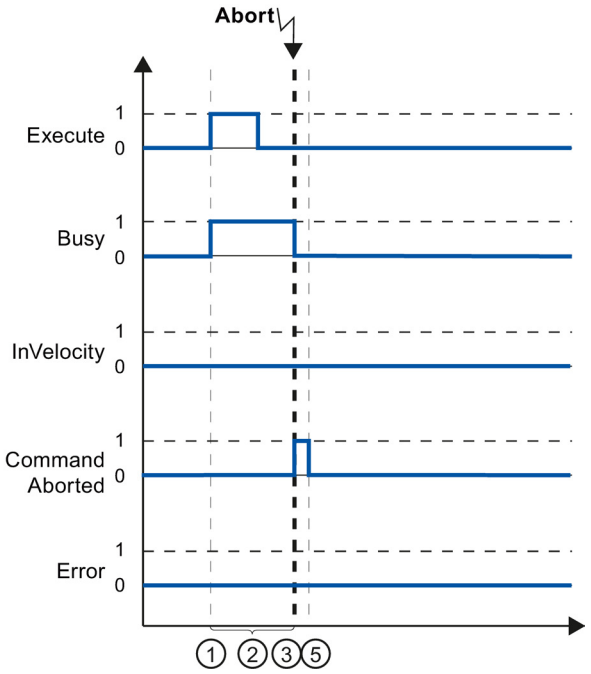


①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value before or after the parameterized velocity has been reached. While the job is active, the parameter "Busy" shows the value TRUE.
②	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE. The "Busy" and "InVelocity" parameters retain the TRUE value until a different Motion Control job overrides the "MC_MoveVelocity" job.

The job is aborted prior to reaching the assigned velocity

If the Motion Control job is aborted by another job before reaching the assigned velocity, then this is indicated in the "CommandAborted" parameter with the value TRUE. The signal status of the "Execute" parameter influences the indication duration in the "CommandAborted" parameter.

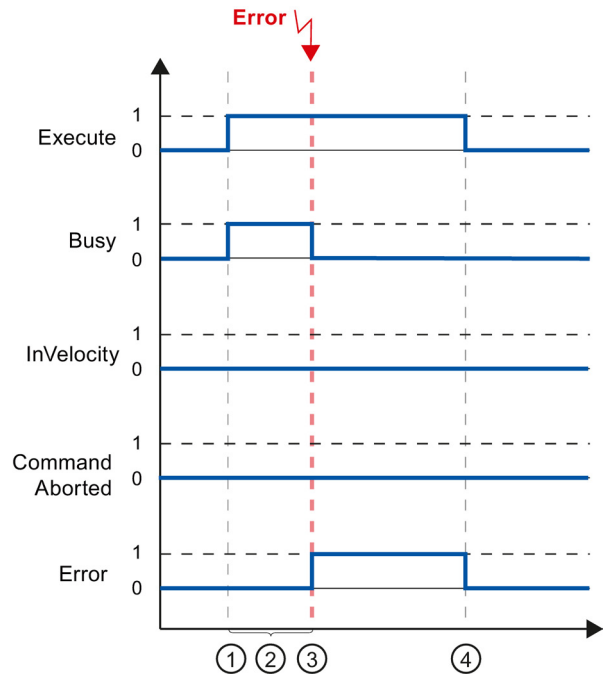
You set "Execute" **after** the job is aborted to FALSE.	You set "Execute" **before** the job is aborted to FALSE.
	


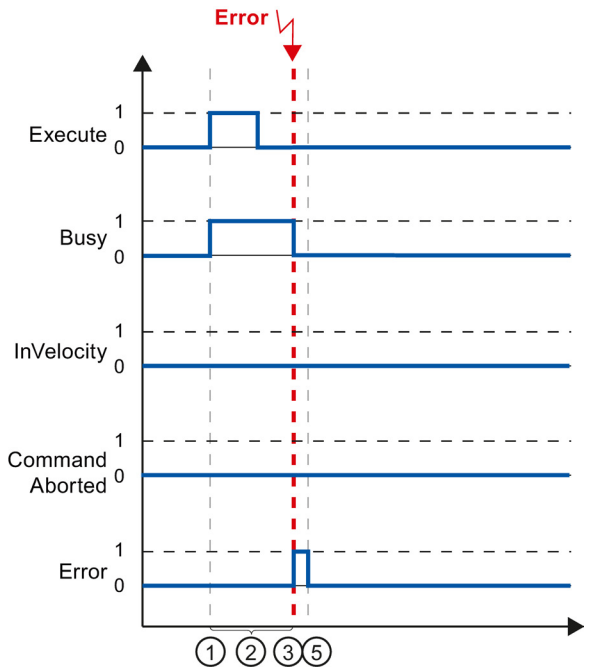


①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value while the job is still busy, or retain the TRUE value until the job is aborted.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "CommandAborted" parameter also retains the value TRUE.
⑤	If the "Execute" parameter has been set to FALSE before the job is aborted, then the "CommandAborted" parameter only shows the value TRUE for one execution cycle.

An error has occurred prior to reaching the assigned velocity

If an error occurs during execution of the Motion Control job before the assigned velocity has been reached, this is indicated in the "Error" parameter with the value TRUE. The signal status of the "Execute" parameter influences the indication duration in the "Error" parameter.

You set "Execute" **after** the occurrence of the error to FALSE.	You set "Execute" **before** the occurrence of the error to FALSE.
	




①	The job is started with a positive edge at the "Execute" parameter. Depending on the program, "Execute" can be reset to the FALSE value while the job is still busy, or retain the TRUE value until the error has occurred.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to FALSE, and the "Error" parameter to TRUE.
④	As long as the "Execute" parameter retains the value TRUE after completion of the job, the "Error" parameter also retains the value TRUE.
⑤	If the "Execute" parameter has been set to FALSE before the job is aborted, then the "Error" parameter only shows the value TRUE for one execution cycle.

7.5.4 Motion Control instruction "MC_MoveJog"

Description

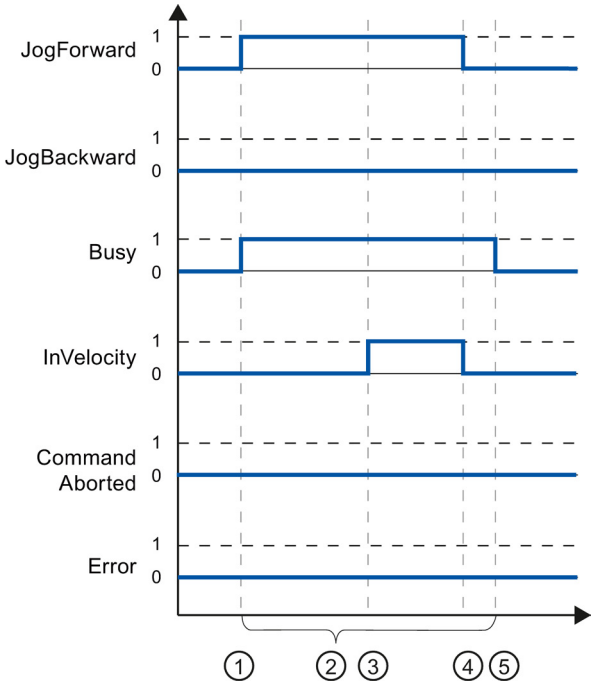
An "MC_MoveJog" job is started by setting the "JogForward" or "JogBackward" parameter. The job objective is fulfilled when the assigned velocity is reached and the axis travels at constant velocity. When the assigned velocity is reached and maintained, this is indicated in the "InVelocity" parameter with the value TRUE.

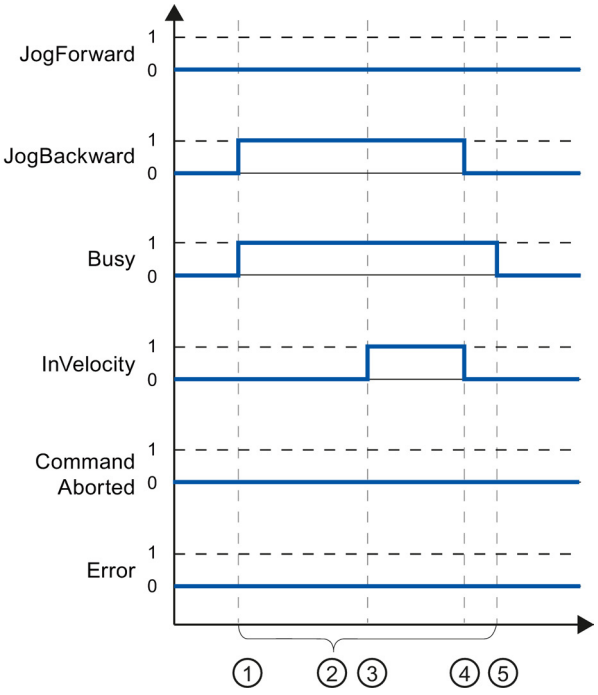
The job is complete when the "JogForward" or "JogBackward" parameter has been set to the value FALSE and the axis has come to a standstill.

The behavior of the parameters is presented below for various example situations:

The assigned velocity is reached and maintained

If the Motion Control job has been performed up to the point of reaching the assigned velocity, then this is indicated in the "InVelocity" parameter with the value TRUE.

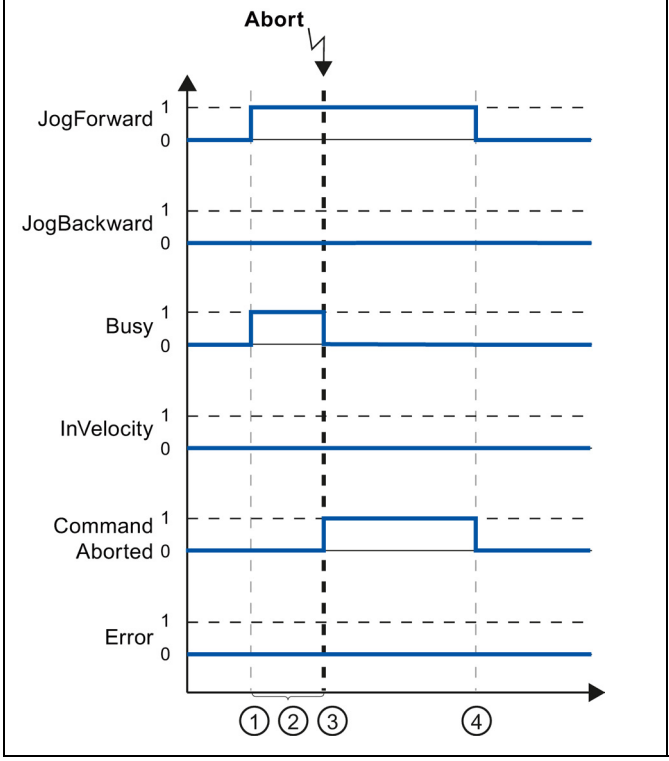
Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


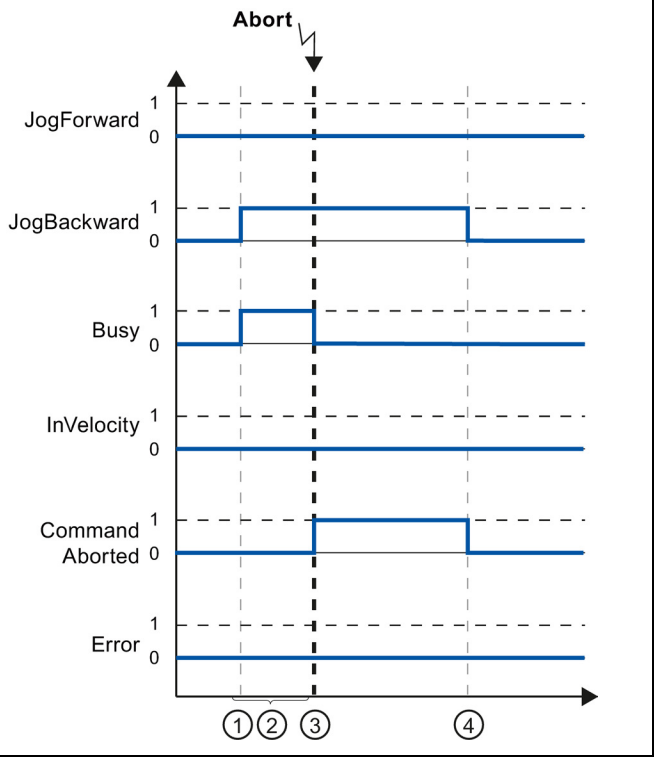


①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	When the assigned velocity is reached, the "InVelocity" parameter changes to TRUE.
④	When the "JogForward" or "JogBackward" parameter is reset, the motion of the axis ends. The axis decelerates. The "InVelocity" parameter changes to FALSE.
⑤	If the axis has come to a standstill, then the Motion Control job is complete and the "Busy" parameter changes to FALSE.

The job is aborted during execution

If the Motion Control job is aborted during processing by another job, then this is indicated in the "CommandAborted" parameter with the value TRUE. The behavior of the "CommandAborted" parameter is independent of reaching the assigned velocity.

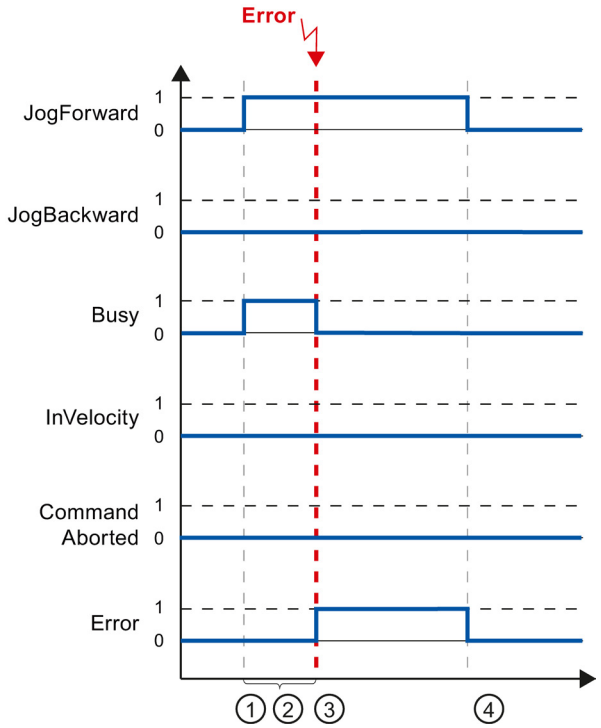
Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	


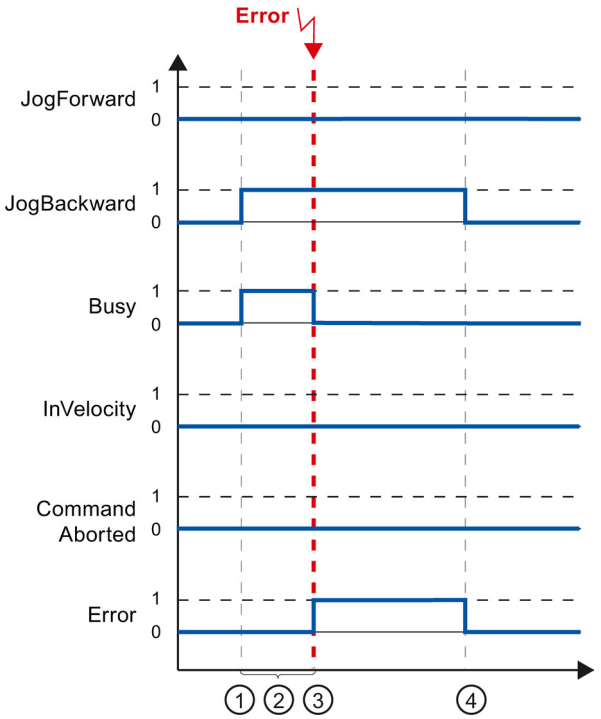


①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is processing, the "Busy" parameter shows the value TRUE.
③	During job execution, the job is aborted by another Motion Control job. When the job is aborted, the "Busy" parameter changes to "FALSE" and "CommandAborted" changes to TRUE.
④	When the "JogForward" or "JogBackward" parameter is reset, the "CommandAborted" parameter likewise changes to FALSE.

An error occurs during the execution of the job

If an error occurs during execution of the Motion Control job, this is indicated in the "Error" parameter with the value TRUE. The behavior of the "Error" parameter is independent of reaching the assigned velocity.

Jog mode is controlled by the "JogForward" parameter.	Jog mode is controlled by the "JogBackward" parameter.
	




①	The job is started by setting the "JogForward" or "JogBackward" parameter.
②	While the job is active, the "Busy" parameter shows the value TRUE.
③	An error occurs during the execution of the job. When the error occurs, the "Busy" parameter changes to "FALSE", and "Error" changes to TRUE.
④	When the "JogForward" or "JogBackward" is reset to the value FALSE, the "Error" parameter likewise changes to FALSE.

7.6 Ending Motion Control jobs

When ending a job, a distinction is made between error-free completion of the job, and the termination of a motion.

Completion of the job

The completion of a Motion Control job is indicated as described in the Tracking running jobs (Page 184) section.

Termination of a motion

If a motion must be aborted, you can perform the following measures:

- "Execute MC_Halt (Page 275)"

  To abort a motion and stop the axis, you can use the "MC_Halt" instruction.

- "Disable MC_Power (Page 234)"

  In an emergency, you can stop the axis using an emergency stop ramp. For this purpose, set the "Enable" parameter of the "MC_Power" instruction to FALSE. The axis is decelerated according to the selected "StopMode" and all jobs at the technology object are aborted.

7.7 Restart of technology objects

Description

After the CPU is switched on, or after technology objects are downloaded into the CPU, the system automatically initializes the technology objects with the start values from the technology data blocks. If restart-relevant changes are detected during a reload into the CPU, a restart of the technology object is automatically performed.

If restart-relevant data have been changed in RUN mode by the user program, then the technology object must be reinitialized by the user in order for the changes to be used.

If changes in the technology data block should also be retained after the restart of the technology object, then you must write the changes to the start value in load memory using the extended instruction "WRIT_DBL".

Restart necessary

A necessary TO restart is indicated at "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Online start value changed", as well as in the tag of technology object <TO>.StatusWord.X3 (OnlineStartValuesChanged).

Restarting a technology object

A restart of the technology object is triggered by the user by means of the "MC_Reset" Motion Control instruction, with parameter "Restart" = TRUE.

During a restart, all configuration data of the technology object are loaded from load memory into work memory. In the process, the actual values in the technology data block are overwritten.

Note the following during a restart of the technology object:

- A restart resets the "Referenced" status of a technology object with incremental actual values (<TO>.StatusWord.X5 (HomingDone).
- While a restart is being performed, the technology object cannot perform any jobs. An active restart will be indicated under "Technology object > Diagnostics > Status and error bits > Axis status or Encoder status > Restart active", and in the <TO>.StatusWord.X2 (RestartActive) tag of the technology object.
- Motion Control jobs are rejected during a restart with the "Error" = TRUE and "ErrorID" = 16#800D parameters (job not executable, because a restart is active).
- While a restart is being executed, you cannot access the technology data block.

See also

Change restart-relevant data (Page 177)

Downloading to CPU

8

Description

When downloading to the CPU S7-1500, it is always verified that the project files are consistent online and offline after the download.

The data of the technology objects are saved in technology data blocks. The conditions for downloading blocks thus apply when loading new or modified technology objects.

Load in RUN mode

When loading in the CPU's RUN mode, it is checked whether a load without restart of the technology objects is possible.

If restart-relevant configuration values were changed, then a restart of the technology object is automatically performed after the load into the CPU.

Loading a technology object is only possible if the technology object is disabled.

You **cannot** download the following changes to the CPU in RUN mode:

- Changes to the MC-Servo clock speeds
- Changes to the hardware interface of the technology object in "Technology object > Configuration > Hardware interface"

Commissioning 9

9.1 Introduction

The following guidelines describe the steps that you should note when commissioning the Motion Control-specific components of your equipment.

The commissioning of other components of your automation system depends on the particular equipment configuration. Commissioning (not Motion Control) is described in the Automation System S7-1500 (http://support.automation.siemens.com/WW/view/en/59191792) system manual.

9.2 Commissioning guidelines

These guidelines serve as recommendations for commissioning equipment with Motion Control. The procedure is described using the example of a positioning axis technology object.

Requirement

- The configuration of the following components is complete:
  - CPU
  - BUS communication
  - Drives
  - Technology objects
- The user program has been created.
- The wiring of the CPU and of the associated I/O is complete.
- The commissioning and optimization of the drive is complete.

Procedure

Proceed as follows to commission the Motion Control-specific components of your equipment:

Step	Action to be performed	Supported by TIA Portal
Turn on CPU	Turn on the power supply and the CPU.	-
"Disable" position controller	Set the gain (Kv factor) of the position control loop to zero. (This setting avoids unwanted drive movements that may be caused by incorrect parameterization of the position control loop.)	"Technology object > Configuration > Extended parameters > Control loop"
Load project into the CPU	Bring the CPU to the STOP mode. Download your project to the CPU (load hardware and software).	• "Toolbar > Stop CPU" • "Toolbar > Download to device"
Create online connection to the CPU	Select the "Receive messages" check box under "Online & Diagnostics > Online Access". Configure the interface of the TIA Portal, and create an online connection with the CPU.	• Device configuration • "Online & Diagnostics > Online Access"
Disable Motion Control specific user program	In order to avoid conflicts with the axis control panel, lock the enabling of technology objects in your user program (MC_Power.Enable = FALSE).	• PLC programming • Motion Control instructions
Evaluating pending messages	Evaluate the message display in the inspector window. Resolve the causes of pending technology alarms. Acknowledge the technology alarms (Page 215).	"Inspector window > Diagnostics > Message display"
Check hardware limit switches	Click the hardware limit switches. Check for correct message display (technology alarm 531). Acknowledge the technology alarm.	"Inspector window > Diagnostics > Message display"
Check the connection and configuration of the drive (setpoint)	Bring the CPU into the RUN mode. Open the Axis control panel (Page 202) and take over control. Perform the following steps: • Enable the technology object. ⇒ The drive must turn itself on, and where applicable release the brake. The position is held. • Move the axis in jog mode at low velocity in the positive direction. ⇒ The drive must move. The actual position value must increase (positive direction). • Disable the technology object. ⇒ The drive must turn itself off, and where applicable apply the brake.	"Technology object > Commissioning > Axis control panel"
Check the connection and configuration of the encoder (actual value)	Check the scaling of the actual values (rotation direction, distance evaluation, and resolution of the encoder) ⇒ The change in the actual mechanical position must match the change in the actual values.	• "Technology object > Diagnostics > PROFIdrive frame" • "Technology object > Commissioning > Axis control panel"

Step	Action to be performed	Supported by TIA Portal
Checking the reference speed	Traverse the axis in jog mode at low velocity in the positive direction. ⇒ The displayed current velocity must match the velocity setpoint. If the displayed current velocity deviates significantly from the velocity setpoint, adjust the reference speed.	• "Technology object > Hardware interface > Data exchange" • "Technology object > Commissioning > Axis control panel"
Optimize position controller	Use the Optimization (Page 207) commissioning function to optimize the gain (Kv) of the position control loop. For this purpose, adapt following error limits as needed.	"Technology object > Commissioning > Optimization"
Transfer the gain Kv to the project.	Enter the gain Kv that you determined by means of the optimization function in your configuration data. Load your project into the CPU.	"Technology object > Configuration > Extended parameters > Control loop"
Enable Motion Control specific user program	Unlock the enabling technology objects lock in your user program (MC_Power.Enable = TRUE).	• PLC programming • Motion Control instructions
Check the functioning of the user program	Check the programmed functions of your user program.	• Watch and force tables • Online and diagnostic functions
End of commissioning for a positioning axis technology object	To commission additional technology objects, perform the corresponding steps again.	See above.

9.3 Axis control panel

9.3.1 Function and structure of the axis control panel

Description

You traverse individual axes with the axis control panel.

A user program is necessary for the operation of the axis control panel. With the axis control panel, you take over master control for a technology object and control the movements of the axis.

⚠ WARNING

Uncontrolled axis motions

During operation with the axis control panel, the axis can execute uncontrolled motions (e.g. due to erroneous configuration of the drive, or of the technology object). Furthermore, any synchronized following axis is moved as well when moving a leading axis with the axis control panel.

Therefore, perform the following protective measures before operation with the axis control panel:

- Ensure that the EMERGENCY OFF switch is within the reach of the operator.
- Enable the hardware limit switches.
- Enable the software limit switches.
- Ensure that following error monitoring is enabled.
- Make sure that no following axis is coupled to the axis to be moved.

The axis control panel of the speed axis, positioning axis and synchronous axis can be found in the Project Navigator under "Technology object > Commissioning".

The axis control panel is divided into the following areas:

- Master control
- Axis
- Operating mode
- Modify
- Axis status
- Current values

The following table lists the elements of the axis control panel:

Area	Element	Description
Master control		In the "Master control" area, you take over master control of the technology object, or return it to your user program.
	"Activate" button	With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. • To take over master control, the technology object must be disabled in the user program. • Any synchronized following axis is moved as well when moving a leading axis with the axis control panel. • If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program. • When you click the "Fetch" button, a warning message is displayed. In the warning, you can adapt the sign-of-life monitoring (100 to 60000 ms). If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the alarm "Error during commissioning. Sign-of-life failure between controller and TIA Portal" is displayed. To eliminate this error, adapt the sign-of-life monitoring in the warning. • Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with the error ("ErrorID" = 16#8012: axis control panel enabled). • When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not become effective until master control has been returned. For this reason, make any necessary changes before master control is taken over. • If master control has been taken over for the technology object, the axis control panel is blocked for access by another installation of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object
Operating mode		Select the required mode in the "Operating mode" drop-down list.

Area	Element	Description
Modify		The "Control" area displays the parameters for traversing with the axis control panel according to the selected operating mode.
	Position	Position to which the axis is homed. (Homing and set home position modes only)
	Distance	Distance the axis is traversed. (Relative positioning mode only)
	Target position	Position to which the axis is traversed. (Absolute positioning mode only)
	Velocity/ Velocity setpoint	Velocity or speed at which the axis is traversed. Default: 10% of the default value (Velocity specification/Default speed, Jog and Positioning modes only)
	Acceleration	Acceleration with which the axis is traversed. Default: 10% of the default value
	Deceleration	Deceleration with which the axis is traversed. Default: 10% of the default value
	Jerk	Jerk with which the axis is traversed. Default: 100% of default value
	"Start" button	With the "Start" button, you start a job according to the selected operating mode.
	"Forward" button	With the "Forward" button, you start a motion in the positive direction according to the selected operating mode.
	"Backward" button	With the "Backward" button, you start a motion in the negative direction according to the selected operating mode.
	"Stop" button	With the "Stop" button, you cancel a job or stop the axis.
Axis status		The "Axis status" area displays the status of the axis and the status of the drive.
	Drive ready	The drive is ready to execute setpoints.
	Error	An error has occurred at the technology object.
	Enabled	The technology object is enabled. The axis can be controlled with Motion Control instructions.
	Homed	The technology object is homed.
	More	With the "More" link, you display the "Technology object > Diagnostics > Status and error bits" dialog.
	Active errors	The error that occurred most recently is displayed in the "Active errors" text box.
	"Confirm" button	With the "Confirm" button, you acknowledge pending errors.
Current values		The "Current values" area shows the actual values of the axis.
	Position	Actual position of the axis
	Velocity	Actual velocity of the axis

Note

No transfer of the parameters

The configured parameter values are discarded when master control is returned. Transfer the values as needed into your configuration.

If you change configuration values with the axis control panel during operation, they have no effect on the operation of the axis control panel.

Operating mode

The following table shows the operating modes of the axis control panel:

Operating mode	Description
Homing	This function corresponds to active homing. The parameters for homing (Page 39) must be configured. Homing is not possible with an absolute encoder. The technology object is not referenced when this mode is used with an absolute encoder.
Set home position	This function corresponds to direct homing (absolute). With the "Start" button, you set the actual position to the value specified in "Position" and the "Homed" status is set.
Jog	Motion commands occur by means of jogging. With the "Forward" or "Backward" button you start motion in the positive or negative direction. The motion runs for as long as you hold down the left mouse button.
Velocity specification/speed setpoint	The axis is moved at the specified velocity or speed until you stop the movement. The motion commands are performed according to the setpoints assigned under "Controller".
Positioning relative	The positioning is executed as a controlled, relative traversing motion according to the defaults assigned under "Controller".
Positioning absolute	The positioning is executed as a controlled, absolute traversing motion according to the defaults assigned under "Controller". If you have enabled the "Modulo" setting of the technology object, the buttons "Forward" and "Backward" are shown in the "Controller" area. The axis is positioned within the modulo range. Position settings outside the modular range are recalculated to the modulo range. If you have not enabled the "Modulo" setting of the technology object, only the "Start" button is shown in the "Controller" area. You can directly approach the entered position.

9.3.2 Using the axis control panel

Requirement

- The CPU must be in RUN mode.
- The project has been created and downloaded to the CPU.
- The technology object is disabled by your user program (MC_Power.Enable = FALSE).
- The axis control panel for the technology object is not used by another installation of the TIA Portal (Team Engineering as of CPU V1.5).

Procedure

Proceed as follows to enable control the axis using the axis control panel:

1. Click "Activate" in the "Master control" area to assume master control over the technology object and to set up an online connection to the CPU.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and confirm with "OK".
3. In the "Axis" area, click the "Enable" button to enable the technology object.
4. In the drop-down list in the "Operation mode" area, select the desired function of the axis control panel.
5. In the "Control" area, specify the parameter values for your job.
6. Click the "Start", "Forward" or "Backward" button to start the job.
7. Click the "Stop" button to stop the job.
8. Repeat steps 3 through 6 for additional jobs.
9. In the "Axis" area, click the "Disable" button to disable the technology object.
10. In the "Master control" area, click the "Deactivate" button to return master control to your user program.

9.4 Optimization

9.4.1 Function and structure of the optimization

Description

The "Optimization" function supports you in determining the optimal gain (Kv factor) for the position control of the axis. The axis velocity profile is recorded by means of Trace function to this effect for the duration of a configurable positioning movement. Then you can evaluate the recording, and adapt the gain accordingly.

The "Optimization" function for the positioning axis and synchronous axis technology objects can be found in the Project Navigator under "Technology object > Commissioning".

The "Optimization" dialog is divided into the following areas:

- Master control
- Axis
- Optimize gain setting
- Trace

The following table lists the elements of optimization:

Area	Element	Description
Master control		In the "Master control" area, you take over master control of the technology object, or return it to your user program.
	"Activate" button	With the "Activate" button, you set up an online connection to the CPU and take over master control for the selected technology object. • To take over master control, the technology object must be disabled in the user program. • Any synchronized following axis is moved as well when moving a leading axis with the axis control panel. • If the online connection to the CPU is lost during operation with the axis control panel, then after the sign of life monitoring has elapsed, the axis will be stopped with maximum deceleration. In this case, an error message is displayed ("ErrorID" = 16#8013) and the master control is passed back to the user program. • When you click the "Fetch" button, a warning message is displayed. You can adapt the sign-of-life monitoring here (100 to 60000 ms). If the master control of the axis control panel is lost repeatedly without a direct error message, the online connection to the CPU may be impaired because the communication load is too high. In this case, the alarm "Error during commissioning. Sign-of-life failure between controller and TIA Portal" is displayed. To eliminate this error, adapt the sign-of-life monitoring in the warning. • Until master control is returned, the user program has no influence on the functions of the technology object. Motion Control jobs from the user program to the technology object are rejected with the error ("ErrorID" = 16#8012: axis control panel enabled). • When master control is taken over, the configuration of the technology object is adopted. Changes to the configuration of the technology object do not become effective until master control has been returned. For this reason, make any necessary changes before master control is taken over. • If master control has been taken over for the technology object, the axis control panel is blocked for access by another installation of the TIA Portal (Team Engineering as of CPU V1.5).
	"Deactivate" button	With the "Deactivate" button, you return master control to your user program.
Axis		In the "Axis" area, enable or disable the technology object.
	"Enable" button	With the "Enable" button, you enable the selected technology object
	"Disable" button	With the "Disable" button, you disable the selected technology object

Area	Element	Description
Optimize gain setting		In the "Optimize gain setting" area, you make the settings for optimization of the gain.
	Gain	Current velocity gain (Kv) With the symbol beside the box, you open a list of values. The list of values contains the following gain values: • Online actual value • Online start value • Start value project In the input field for the actual value, enter the new value for the gain. The new value is applied by clicking the "Forward" or "Backward" button.
	Distance	Travel distance for a test step
	Measurement duration	Time for a test step
	"Adapt dynamic values" check-box	With the "Adapt dynamic values" check box, you enable adaptation of the acceleration and the maximum velocity.
	Acceleration	Presetting of the acceleration for a test step
	Maximum velocity	Presetting of the maximum velocity for a test step
	"Forward" button	With the "Forward" button, you start a test step for optimization in the positive direction.
	"Backward" button	With the "Backward" button, you start a test step for optimization in the negative direction.
Trace		The Trace function is displayed In the lower area of the "Optimization" dialog. With each test step a trace recording of the required parameters is automatically started and displayed after completion of the test step. After returning master control, the trace recording is deleted. You will find a full description of the trace function in the section on using the trace and logic analyzer function.

Note

No transfer of the parameters

The configured parameter values are discarded after master control is returned.

Transfer the values as needed into your configuration. You can apply the gain value in your configuration using the "Project start value" value.

See also

Control (Page 59)

9.4.2 Optimize position controller

Requirement

- The CPU must be in RUN mode.
- The project has been created and downloaded to the CPU.
- The technology object is disabled by your user program (MC_Power.Enable = FALSE).
- The axis control panel for the technology object is not used by another installation of the TIA Portal (Team Engineering as of CPU V1.5).

Optimizing position control gain (Kv)

Proceed as follows to optimize the gain (Kv):

1. In the "Master control" area, click the "Activate" button to activate master control for the technology object, and to establish an online connection to the CPU.

   A warning message is displayed.
2. If necessary, adapt the sign-of-life monitoring and confirm with "OK".
3. In the "Axis" area, click the "Enable" button to enable the technology object.
4. As appropriate, configure values for the distance, duration, and dynamics of a test step.
5. Enter a start value for the gain. Start with a low value.
6. Click the "Forward" or "Start" button to start a test step for the optimization.
   For the specified duration, a setpoint is output according to the specified distance. The axis moves by the specified distance. A trace recording of the motion (setpoint and actual values) is created automatically.

   You will find a full description of the trace function in the section on using the trace and logic analyzer function.

   Note

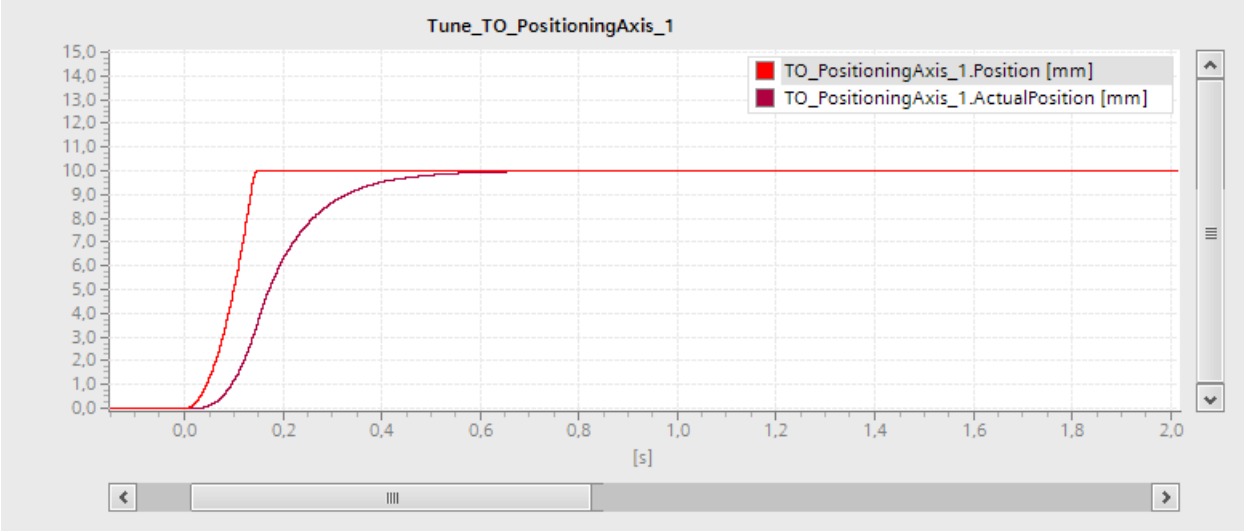
   Adapt following error limits

   If error messages from following error monitoring are repeatedly displayed during optimization, temporarily adapt the following error limits.
7. Evaluate the curve of the trace recording. Adapt the gain incrementally. Click the "Forward" or "Backward" button after each value you enter. This applies the value and start a new movement and trace recording each time.

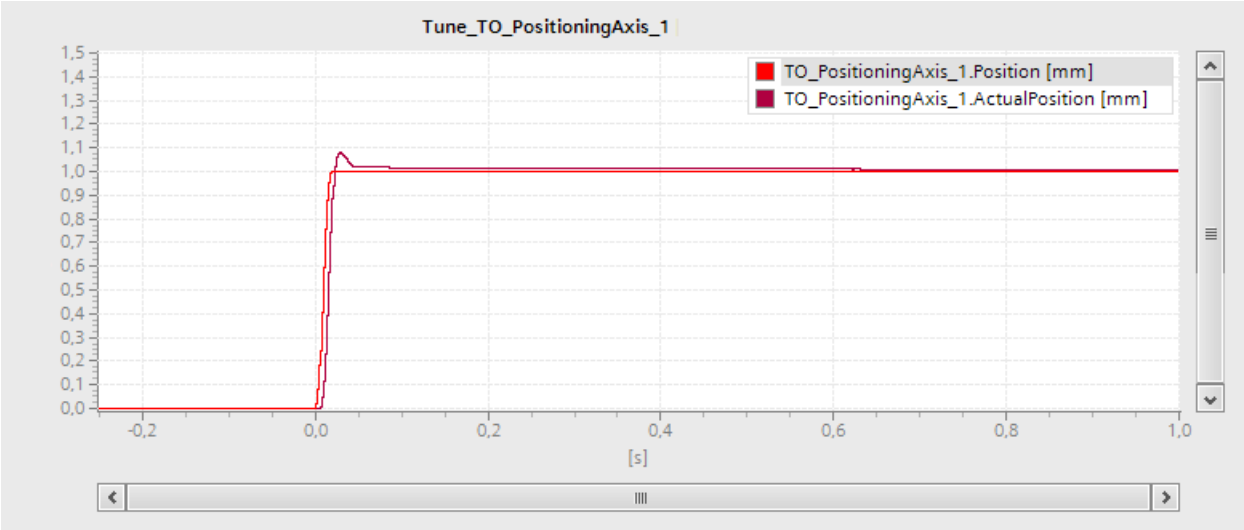
When adjusting the gain, pay attention to the following properties of the curve:

- The curve shows a brief compensation time.
- The curve does not show any motion reversal of the actual position.
- When approaching the position setpoint, no overshoot occurs.
- The curve shows a stable overall behavior (oscillation-free curve).

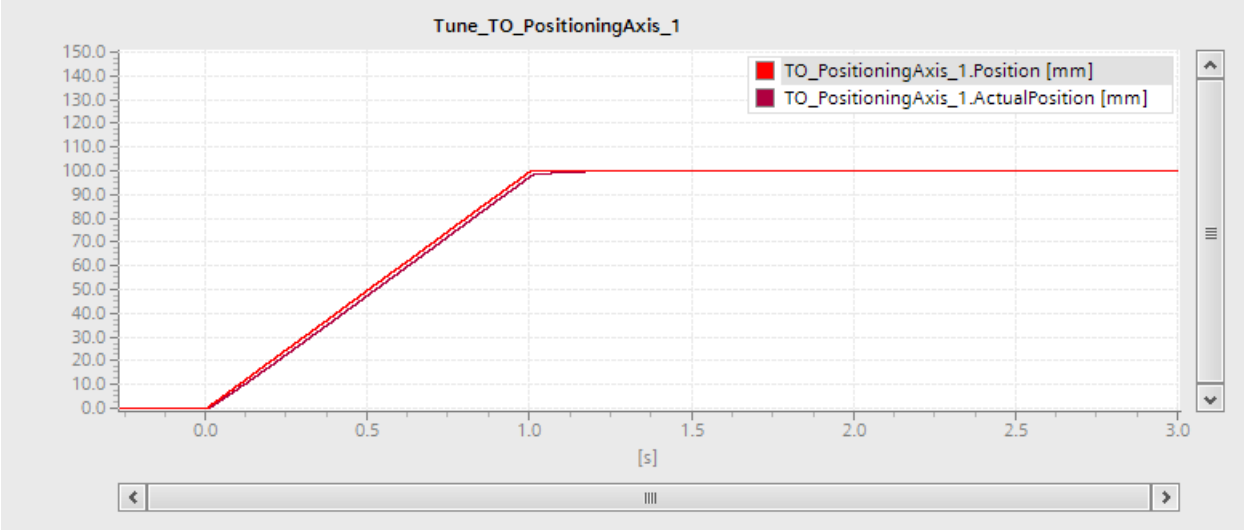
The following trace recording shows a curve with a long settling time:



The following trace recording shows a curve with overshoot when approaching the setpoint:



The following trace recording shows a curve in which the gain is optimal and the overall response is steady:



Transferring the position control gain (Kv) to the project

Proceed as follows to transfer the determined gain (Kv) into your project:

1. Click on the icon next to the "Gain" box.

   A list of values is displayed.
2. Enter the measured gain value in the "Project start value" box of the value list.
3. In the "Axis" area, click the "Disable" button to disable the technology object.
4. In the "Master control" area, click the "Deactivate" button to return master control to your user program.
5. Load your project into the CPU.

9.5 Simulation mode

S7-1500 Motion Control offers the option to traverse axes without real hardware in simulation mode. This allows speed, positioning and synchronous axes to be simulated in the CPU without a drive.

Simulation mode is only possible for the drive connection via PROFIdrive.

To traverse axes in simulation mode, follow these steps:

1. Configure the hardware, the technology objects and your user program.
2. For the each axis to be simulated, set the technology object tag <TO>.Simulation.Mode to the value 1.
3. If the hardware configured under point 1 is not connected to the CPU, change the "Configuration time for central and distributed I/O" parameter to a low value (e.g. 2000 ms). You can find the parameter in the CPU properties in the "Startup" area navigation.
4. Save the project and compile the hardware and software.
5. Download the program to the CPU.

Note

Adapting monitoring

If error messages from the monitoring functions are repeatedly displayed during simulation, temporarily adapt the monitoring limits.

Diagnostics 10

10.1 Introduction

The Diagnostics chapter is limited to describing the diagnostic concept for Motion Control, and describing the Diagnostics view of the individual technology objects in the TIA Portal.

For more information about system diagnostics with the S7-1500 CPU, refer to the "Diagnostics" (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

10.2 Diagnostic concept

The diagnostic concept encompasses alarms and associated messages, as well as error messages in the Motion Control instructions. The TIA Portal also supports you with consistency checks during configuration of the technology objects, and during the creation of your user program.

All alarms in runtime (from the CPU, technology, hardware etc.) are displayed in the Inspector window of the TIA Portal. Diagnostic information that relates to technology objects (technology alarms, status information) are additionally displayed in the Diagnostics window of the respective technology object.

During Motion Control, if an error occurs at a technology object (e.g. approaching a hardware limit switch), then a technology alarm (Page 215) is triggered, and a corresponding message is displayed in the TIA Portal as well as on HMI devices.

In your user program, technology alarms are generally signaled via error bits in the technology data block. The program always displays the technology alarm that has top priority. In order to simplify error evaluation, the "Error" and "ErrorID" parameters of the Motion Control instructions also indicate that a technology alarm is pending.

Program errors (Page 219) can occur during parameter assignment or during the processing sequence of the Motion Control instructions (e.g. invalid parameter specification when calling the instruction, initiation of a job without enablement via MC_Power). Errors in Motion Control instructions are indicated when the instructions are called, by means of the "Error" and "ErrorID" parameters.

10.3 Technology alarms

Description

If an error occurs at a technology object (e.g. approaching a hardware limit switch), then a technology alarm is triggered and indicated. The impact of a technology alarm on the technology object is specified by the alarm reaction.

Alarm classes

Technology alarms are divided into three classes:

- **Warning (can be acknowledged)**

  The processing of Motion Control jobs continues. The current motion of the axis can be influenced, e.g. by limitation of the current dynamic values to the configured limit values.

- **Alarm (must be acknowledged)**

  Motion jobs are aborted in accordance with the alarm reaction. In order to continue job processing after resolving the cause of error, you must acknowledge the alarms.

- **Fatal error**

  Motion jobs are aborted in accordance with the alarm reaction.

  To be able to use the technology object again after eliminating the problem, you will need to restart the technology object (Page 197).

Display of technology alarms

A technology alarm is displayed in the following locations:

- **TIA Portal**
  - **"Technology object > Diagnostics > Status and error bits"**

    Display of pending technology alarms for each technology object.
  - **"Technology object > Commissioning > Axis control panel"**

    Display of the last pending technology alarm for each technology object.
  - **"Inspector window > Diagnostics > Message display"**

    Select the "Receive messages" check box under "Online & Diagnostics > Online Access" in order to display technology alarms via the message display.

    With an online connection to the CPU, the pending technology alarms for all technology objects are displayed. Additionally, the archive view is available to you.

    The message display can also be enabled at a connected HMI, and displayed.
  - **"CPU > Online & diagnostics"**

    Display of the technology alarms that have been recorded in the diagnostics buffer.
- **User program**
  - **Tags <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction**

    Indication of the number and the reaction for the last technology alarm that occurred.
  - **Tag <TO>.StatusWord**

    A pending technology alarm is indicated with bit 1 ("Error").
  - **Tag <TO>.ErrorWord**

    Indication of alarms and fatal errors.
  - **Tag <TO>.WarningWord**

    Indication of warnings.
  - **Parameter "Error" and "ErrorID"**

    In a Motion Control instruction, the parameters "Error" = TRUE and "ErrorID" = 16#8001 indicate that a technology alarm is pending.
- **Display of the CPU**

  In order to show technology alarms on the CPU display, make the following setting when loading to the CPU:
  In the "Load preview" dialog, select the action "Consistent download" for the "Text libraries" entry.

Alarm reaction

A technology alarm always contains an alarm reaction, which describes the impact on the technology object. The alarm reaction is specified by the system.

The following list shows possible alarm reactions:

- **No reaction (warnings only)**

  <TO>.ErrorDetail.Reaction = 0

  The processing of Motion Control jobs continues. The current motion of the axis can be influenced, e.g. by limitation of the current dynamic values to the configured limit values.

- **Stop with current dynamic values**

  <TO>.ErrorDetail.Reaction = 1

  Active motion commands are aborted. The axis is braked with the dynamic values that are pending in the Motion Control instruction, and brought to a standstill.

- **Stop with maximum dynamic values**

  <TO>.ErrorDetail.Reaction = 2

  Active motion commands are aborted. The axis is braked with the dynamic values configured under "Technology object > Extended parameters > Dynamic limits", and brought to a standstill. The configured maximum jerk is taken into account at the same time.

- **Stop with emergency stop ramp**

  <TO>.ErrorDetail.Reaction = 3

  Active motion commands are aborted. The axis is braked with the emergency stop deceleration configured under "Technology object > Extended parameters > Emergency stop ramp", without any jerk limit, and brought to a standstill.

- **Remove enable**

  <TO>.ErrorDetail.Reaction = 4

  The setpoint zero is output, and the enablement is removed. The axis is braked depending on the configuration in the drive, and is brought to a standstill.

- **Follow-up setpoints**

  <TO>.ErrorDetail.Reaction = 5

  Active motion commands are aborted. The actual values supplied by the drive are automatically tracked as setpoints. The actual values are not monitored at the controller end.

Acknowledging technology alarms

You can acknowledge technology alarms as follows:

- **TIA Portal**
  - **"Technology object > Diagnostics > Status and error bits"**

    Click "Confirm" to acknowledge all alarms and warnings pending for the selected technology object.

    (Not possible for external encoder technology object)
  - **"Technology object > Commissioning > Axis control panel"**

    Click "Confirm" to acknowledge all alarms and warnings pending for the selected technology object.

    (Not possible for external encoder technology object)
  - **"Inspector window > Diagnostics > Message display"**

    You can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **HMI**

  At an HMI with enabled message display, you can acknowledge the alarms and warnings for all technology objects either individually, or all at once.
- **User program**

  Acknowledge pending alarms at a technology object using the Motion Control instruction "MC_Reset".

Additional information

A list of the technology alarms and alarm reactions can be found in the appendix, Technology Alarms (Page 368).

10.4 Errors in Motion Control instructions

Description

Errors in Motion Control instructions (e.g. invalid parameter value setting) are indicated at the "Error" and "ErrorID" output parameters.

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated at the Motion Control instruction:

- Invalid status of the technology object, which prevents the execution of the job.
- Invalid parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm response for an error at the technology object.

Error indication

If an error occurs in a Motion Control instruction, the "Error" parameter shows the value TRUE. The cause of the error can be found in the value of the ErrorID" parameter.

Jobs at the technology object are rejected when "Error" = TRUE. Running jobs are not influenced by rejected jobs.

If "Error" = TRUE and "ErrorID" = 16#8001 are indicated during the job processing, then a technology alarm has occurred. In this case, evaluate the indication of the technology alarm.

If "Error" = TRUE is displayed during the execution of a "MC_MoveJog" job, the axis is braked and brought to a standstill. In this case, the deceleration configured with the "MC_MoveJog" instruction takes effect.

Acknowledge errors

Acknowledging errors in Motion Control instructions is not required.

Restart a job after resolving the error.

Additional information

A list of the ErrorIDs can be found in the appendix, Error Detection (Page 386).

10.5 Speed-controlled axis technology object

10.5.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Enabled	The technology object is enabled. The axis can be controlled with Motion Control instructions. (<TO>.StatusWord.X0 (Enable))
Error	An error has occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel enabled	The axis control panel is enabled. The axis control panel has master control over the technology object. The axis cannot be controlled from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	The drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Online start value changed	Data relevant for the restart has been changed. The changes will not be applied until the technology object is restarted. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no active job)	No motion job is active at the technology object. (<TO>.StatusWord.X6 (Done))
Jog	The axis is being moved by a jog mode job from the Motion Control instruction "MC_MoveJog", or from the axis control panel. (<TO>.StatusWord.X9 (JogCommand))
Speed preset	The axis is traversed by means of a job with speed preset in Motion Control instruction "MC_MoveVelocity", or using the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Constant speed	The axis is traversing at a constant speed or is at a standstill. (<TO>.StatusWord.X12 (ConstantVelocity))
Accelerating	The axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration adapted	One or several configuration parameters are adjusted internally at a certain time. (<TO>.WarningWord.X1 (ConfigurationFault))
Job rejected	Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values were limited to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))

Error

The following table shows the possible errors:

Error	Description
System	An internal system error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigurationFault))
User program	Error in the user program in a Motion Control instruction, or in its utilization. (<TO>.ErrorWord.X2 (UserFault))
Drive	Error in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Data exchange	Error in communication with a connected device. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions have not been fulfilled (e.g. technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values were limited to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))

Confirm

Click "Confirm" to acknowledge alarms and warnings pending.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

10.5.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Speed setpoint	Speed setpoint of the axis (<TO>.Velocity)
Speed override	Speed setpoint correction as percentage The speed setpoint specified in motion control instructions or set by the axis control panel are superimposed with an override signal and corrected as a percentage. Valid speed correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Speed	Configured maximum speed (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)

10.5.3 PROFIdrive frame

Description

The "Technology object > Diagnostics > PROFIdrive frame" diagnostics function is used in the TIA Portal to monitor the PROFIdrive frame that the drive returns to the controller. The Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive frame that the drive returns to the controller:

- Status words "SW1" and "SW2"
- The setpoint speed that was output to the drive (NSET)
- The actual speed that was signaled from the drive (NACT)

10.6 Positioning axis/synchronous axis technology object

10.6.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Axis status

The following table shows the possible axis status values:

Status	Description
Enabled	The technology object is enabled. The axis can be controlled with Motion Control instructions. (<TO>.StatusWord.X0 (Enable))
Homed	The technology object is homed. The relationship between the position at the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error has occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Axis control panel enabled	The axis control panel is enabled. The axis control panel has master control over the technology object. The axis cannot be controlled from the user program. (<TO>.StatusWord.X4 (ControlPanelActive))
Drive ready	The drive is ready to execute setpoints. (<TO>.StatusDrive.InOperation)
Encoder values valid	The encoder values are valid. (<TO>.StatusSensor[n].State)
Online start value changed	Data relevant for the restart has been changed. The changes will not be applied until after reinitialization (restart) of the technology object. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Status limit switch

The following table shows the possibilities for enabling the software and hardware limit switches:

Limit switch	Description
Negative software limit switch approached	The negative software limit switch was approached. (<TO>.StatusWord.X15 (SWLimitMinActive))
Positive software limit switch approached	The positive software limit switch was approached. (<TO>.StatusWord.X16 (SWLimitMaxActive))
Negative hardware limit switch approached	The negative hardware limit switch was approached. (<TO>.StatusWord.X17 (HWLimitMinActive))
Positive hardware limit switch approached	The positive hardware limit switch was approached or passed. (<TO>.StatusWord.X18 (HWLimitMaxActive))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no active job)	No motion job is active at the technology object. (<TO>.StatusWord.X6 (Done))
Homing job	The technology object is executing a homing job from the Motion Control instruction "MC_Home", or from the axis control panel. (<TO>.StatusWord.X11 (HomingCommand))
Jog	The axis is being moved by a jog mode job from the Motion Control instruction "MC_MoveJog", or from the axis control panel. (<TO>.StatusWord.X9 (JogCommand))
Velocity setpoint	A job traverses the axis at the speed setpoint specified in Motion Control instruction "MC_MoveVelocity" or at the axis control panel. (<TO>.StatusWord.X10 (VelocityCommand))
Positioning job	The axis is being moved by a positioning job from the Motion Control instructions "MC_MoveAbsolute", "MC_MoveRelative", or from the axis control panel. (<TO>.StatusWord.X8 (PositioningCommand))
Constant velocity	The axis is traversing at a constant velocity or is at a standstill. (<TO>.StatusWord.X12 (ConstantVelocity))
Standstill	The axis is at a standstill. (<TO>.StatusWord.X7 (StandStill))
Accelerating	The axis is being accelerated. (<TO>.StatusWord.X13 (Accelerating))
Decelerating	The axis is being decelerated. (<TO>.StatusWord.X14 (Decelerating))

Status	Description
Synchronization	Synchronous axis only The axis is synchronized to the master value of a leading axis. (<TO>.StatusWord.X21 (Synchronizing))
Gearing	Synchronous axis only The axis is synchronized and moves synchronously to the leading axis. (<TO>.StatusWord.X22 (Synchronous))

Warnings

The following table shows the possible warnings:

Warning	Description
Configuration adapted	One or several configuration parameters are adjusted internally at a certain time. (<TO>.WarningWord.X1 (ConfigurationFault))
Job rejected	Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met. (<TO>.WarningWord.X3 (CommandNotAccepted))
Dynamic limitation	Dynamic values were limited to the dynamic limits. (<TO>.WarningWord.X6 (DynamicError))

Error

The following table shows the possible errors:

Error	Description
System	An internal system error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigurationFault))
User program	Error in the user program in a Motion Control instruction, or in its utilization. (<TO>.ErrorWord.X2 (UserFault))
Drive	Error in the drive. (<TO>.ErrorWord.X4 (DriveFault))
Encoder	Error in the encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Error in communication with a connected device. (<TO>.ErrorWord.X7 (CommunicationFault))
I/O	Error accessing a logical address. (<TO>.ErrorWord.X13 (PeripheralError))
Job rejected	Command cannot be executed. A Motion Control instruction cannot be executed because the necessary conditions have not been fulfilled (e.g. technology object not homed). (<TO>.ErrorWord.X3 (CommandNotAccepted))
Homing	Error during a homing process. (<TO>.ErrorWord.X10 HomingFault))
Positioning	The axis was not correctly positioned at the end of a positioning motion. (<TO>.ErrorWord.X12 (PositioningFault))
Dynamic limitation	Dynamic values were limited to the dynamic limits. (<TO>.ErrorWord.X6 (DynamicError))
Following error	The maximum permitted following error was exceeded. (<TO>.ErrorWord.X11 (FollowingErrorFault))
SW limit switch	A software limit switch has been reached. (<TO>.ErrorWord.X8 (SwLimit))
Hardware limit switch	A hardware limit switch has been reached or overshot. (<TO>.ErrorWord.X9 (HWLimit))
Synchronize/desynchronize	Synchronous axis only Error during synchronous operation. The leading axis specified at the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis. (<TO>.ErrorWord.X14 (SynchronousError))

Confirm

Click "Confirm" to acknowledge alarms and warnings pending.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

10.6.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the motion status of the axis. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Target position	Current target position of an active positioning job The target position value is only valid while a positioning job is busy. (<TO>.StatusPositioning.TargetPosition)
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)
Velocity override	Percentage correction of the velocity override The velocity setpoint specified in motion control instructions or set by the axis control panel are superimposed with an override signal and corrected as a percentage. Valid velocity correction values range from 0.0 % to 200.0 %. (<TO>.Override.Velocity)

"Dynamic limits" area

This area displays the limit values for the dynamic parameters.

The following table shows the meaning of the status data:

Status	Description
Velocity	Configured maximum velocity (<TO>.DynamicLimits.MaxVelocity)
Acceleration	Configured maximum acceleration (<TO>.DynamicLimits.MaxAcceleration)
Deceleration	Configured maximum deceleration (<TO>.DynamicLimits.MaxDeceleration)

10.6.3 PROFIdrive frame

Description

The "Technology object > Diagnostics > PROFIdrive frame" diagnostics function is used in the TIA Portal to monitor the PROFIdrive frame returned by the drive and encoder. The display of the Diagnostics function is available in online operation.

"Drive" area

This area displays the following parameters contained in the PROFIdrive frame that the drive returns to the controller:

- Status words "SW1" and "SW2"
- The setpoint speed that was output to the drive (NSET)
- The actual speed that was signaled from the drive (NACT)

"Encoder" area

This area displays the following parameters contained in the PROFIdrive frame that the encoder returns to the controller:

- Status word "G1_ZSW"
- The actual position value "G1_XIST1" (cyclic actual encoder value)
- The actual position value "G1_XIST2" (absolute value of the encoder)

10.7 External encoder technology object

10.7.1 Status and error bits

Description

You use the "Technology object > Diagnostics > Status and error bits" diagnostic function in the TIA Portal to monitor the status and error messages for the technology object. The Diagnostics function is available in online operation.

The meaning of the status and error messages is described in the following tables. The associated technology object tag is given in parentheses.

Encoder status

The following table shows the possible external encoder status values:

Status	Description
Enabled	The technology object is enabled. (<TO>.StatusWord.X0 (Enable))
Homed	The technology object is homed. The relationship between the position at the technology object and the mechanical position was successfully created. (<TO>.StatusWord.X5 (HomingDone))
Error	An error has occurred at the technology object. Detailed information about the error is available in the "Error" area, and in the <TO>.ErrorDetail.Number and <TO>.ErrorDetail.Reaction tags of the technology object. (<TO>.StatusWord.X1 (Error))
Restart active	The technology object is being reinitialized. (<TO>.StatusWord.X2 (RestartActive))
Encoder values valid	The encoder values are valid. (<TO>.StatusSensor[n].State)
Online start value changed	Data relevant for the restart has been changed. The changes will not be applied until the technology object is restarted. (<TO>.StatusWord.X3 (OnlineStartValuesChanged))

Motion status

The following table shows the possible axis motion status values:

Status	Description
Done (no active job)	No active Motion Control job at the TO. (Enable by "MC_Power" job excepted) (<TO>.StatusWord.X6 (Done))
Homing job	The technology object is executing a homing job from the Motion Control instruction "MC_Home". (<TO>.StatusWord.X11 (HomingCommand))

Error

The following table shows the possible errors:

Error	Description
System	An internal system error has occurred. (<TO>.ErrorWord.X0 (SystemFault))
Configuration	Configuration error One or more configuration parameters are inconsistent or invalid. The technology object was incorrectly configured, or editable configuration data were incorrectly modified during runtime of the user program. (<TO>.ErrorWord.X1 (ConfigurationFault))
User program	Error in the user program in a Motion Control instruction, or in its utilization. (<TO>.ErrorWord.X2 UserFault))
Encoder	Error in the encoder system. (<TO>.ErrorWord.X5 (SensorFault))
Data exchange	Missing or faulty communication. (<TO>.ErrorWord.X7 (CommunicationFault))

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

10.7.2 Motion status

Description

You use the "Technology object > Diagnostics > Motion status" diagnostic function in the TIA Portal to monitor the encoder values. The Diagnostics function is available in online operation.

"Current values" area

The following table shows the meaning of the status data:

Status	Description
Actual position	Actual position of the axis If the technology object is not homed, then the value is displayed relative to the position that existed when the technology object was enabled. (<TO>.ActualPosition)
Actual velocity	Actual velocity of the axis (<TO>.ActualVelocity)

10.7.3 PROFIdrive frame

Description

The "Technology object > Diagnostics > PROFIdrive interface" diagnostic function is used in the TIA Portal to monitor the PROFIdrive frame of the encoder. The display of the diagnostics function is available in the online mode TO.

"Encoder" area

This area displays the following parameters contained in the PROFIdrive frame that the encoder returns to the controller:

- Status word "G1_ZSW"
- The actual position value "G1_XIST1" (cyclic actual encoder value)
- The actual position value "G1_XIST2" (absolute value of the encoder)

Instructions 11

11.1 S7-1500 Motion Control V2

11.1.1 MC_Power

11.1.1.1 MC_Power: Enable, disable technology objects V2

Description

The Motion Control instruction "MC_Power" is used to enable and disable technology objects.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis
- External encoder

Requirements

- The technology object has been configured correctly.

Override response

- A MC_Power job cannot be aborted by any other Motion Control job.
- A MC_Power job with the parameter Enable = TRUE enables a technology object, but does not thereby abort any other Motion Control instructions.
- Disabling the technology object (parameter "Enable" = FALSE) aborts all Motion Control jobs at the corresponding technology object in accordance with the selected "StopMode". This process cannot be aborted by the user.

Parameters

The following table shows the parameters of the "MC_POWER" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The technology object is enabled.
				FALSE	The technology object is disabled. All current jobs at the technology object are aborted in accordance with the configured "StopMode".
StopMode	INPUT	INT	0	Not applicable to the external encoder technology object. If you disable a technology object with a falling edge at the Enable parameter, then the axis decelerates in accordance with the selected "StopMode".	
				0	Emergency stop When the technology object is disabled, the axis brakes to a standstill without any jerk limitation, using the emergency stop deceleration configured in Technology object > Configuration > Extended parameters > Emergency stop ramp. Enabling is then removed. (<TO>.DynamicDefaults.EmergencyDeceleration)
				1	Immediate stop When a technology object is disabled, the setpoint zero is output, and the enabling is removed. The axis is braked depending on the configuration in the drive, and is brought to a standstill.
				2	Stop with maximum dynamic values When the technology object is disabled, the axis brakes to a standstill using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits". The configured maximum jerk is taken into account at the same time. Enabling is then removed. (<TO>.DynamicLimits.MaxDeceleration; <TO>.DynamicLimits.MaxJerk)
Status	OUTPUT	BOOL	FALSE	Technology object enable status	
				FALSE	Disabled - A positioning axis or speed axis does not accept any Motion Control jobs. - Speed control and position control are not active. - The actual values of the technology object are not checked for validity.
				TRUE	Enabled - An enabled positioning axis or speed axis accepts Motion Control jobs. - Speed control and positioning control are active. - The actual values of the technology object are valid.

Parameter	Declaration	Data type	Default value	Description	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction MC_Power. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Enabling technology objects

To enable a technology object, set the Enable parameter to TRUE.

If the Status parameter shows the value TRUE , then the technology object is enabled.

If an axis is in motion when the technology object is enabled (actual velocity is present), then the axis brakes to the setpoint zero, using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits" (<TO>.DynamicLimits.MaxDeceleration). This braking ramp can be overridden by Motion Control jobs.

Note

Automatic enabling after acknowledgement of a technology alarm

If the technology object is disabled due to a technology alarm, then it will automatically be enabled again after the cause has been eliminated and the alarm has been acknowledged. This requires the Enable parameter to have retained the value TRUE during this process.

Disabling technology objects

To disable a technology object, set the Enable parameter to FALSE.

If an axis is in motion, then it will be braked to a standstill according to the selected "StopMode".

If the "Busy" and "Status" parameters show the value FALSE , then the disabling of the technology object has been completed.

Drive connection by means of PROFIdrive

When coupling a drive with PROFIdrive, the setpoint, enabling, and drive status are transmitted via the PROFIdrive frame.

- **Enable technology object and drive**

  The parameter ""Enable" = TRUE" is used to enable the technology object. The drive is enabled according to the PROFIdrive standard.

  If the tag <TO>.StatusDrive.InOperation shows the value TRUE , then the drive is ready to execute setpoints. The "Status" parameter is set to the value TRUE .

- **Disable technology object and drive**

  With the parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". The drive is disabled according to the PROFIdrive standard.

Analog drive connection

The setpoint is output via an analog output. Optionally, you can configure an enabling signal via digital output (<TO>.Actor.Interface.EnableDriveOutput), and a readiness signal via digital input (<TO>.Actor.Interface.DriveReadyInput).

- **Enable technology object and drive**

  With the parameter "Enable" = TRUE, the enabling output ("Enable drive output") is set.

  If the drive reports back the readiness signal via the ready input ("Drive ready input"), then the "Status" parameter and the technology object's <TO>.StatusDrive.InOperation tag are set to TRUE, and the setpoint is switched at the analog output.

- **Disable technology object and drive**

  With the parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". When the setpoint zero is reached, the enabling output is set to FALSE.

Additional information

Additional information on enabling and disabling technology objects and drives can be found in the appendix, MC_Power Function Charts (Page 388).

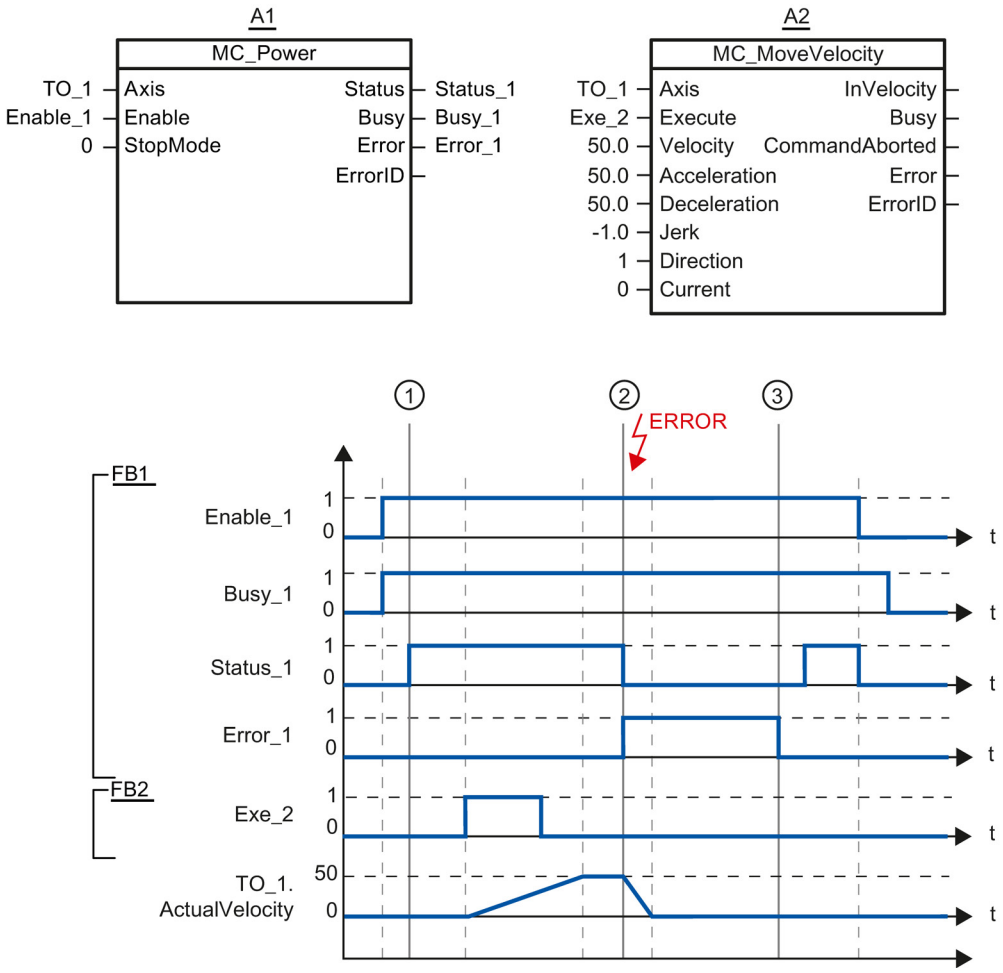
Error ID (Page 386)

11.1.1.2 MC_Power: Function chart V2

Function chart: Enabling a technology object, and example for alarm response



A technology object is enabled with "Enable_1= TRUE". Successful enabling can be read from "Status_1" at time ①. The axis will then move with an "MC_MoveVelocity" job (A2). The velocity profile of the axis can be read from "Velocity Axis_1".

At time ② an error occurs in the technology object, which results in the disabling of the technology object (alarm response: remove enable). The axis is braked depending on the configuration in the drive, and is brought to a standstill. When the technology object is disabled, Status_1 is reset. Since the axis was not disabled using "Enable_1" = FALSE, the selected "StopMode" does not apply. The cause of the error is corrected and the alarm is acknowledged at time ③.

Since "Enable_1" is still set, the technology object is enabled again. Successful enabling can be read from "Status_1". Next the technology object is disabled with "Enable_1" = FALSE.

11.1.2 MC_Home

11.1.2.1 MC_Home: Home technology objects, set home position V2

Description

With the Motion Control instruction "MC_Home", you create the relationship between the position in the technology object and the mechanical position. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

The homing process occurs according to the mode selected with the "Mode" parameter, and the configuration under "Technology object > Configuration > Extended parameters > Homing".

The "MC_Home.Mode" parameter for S7-1200 Motion Control and S7-1500 Motion Control has been standardized within the framework of technology version V2.0. This results in a new assignment of the parameter values for the "MC_Home.Mode" parameter. A comparison of the "MC_Home.Mode" parameter for technology versions V1.0 and V2.0 is available in the section Version overview (Page 86).

The preset values under "Technology object > Configuration > Extended parameters > Dynamic default values" are used for the dynamic values Acceleration, Deceleration and Jerk.

Applies to

- Synchronous axis
- Positioning axis
- External encoder

The following table shows which modes are possible with each of the technology objects:

Operating mode	Positioning axis/ synchronous axis with incremental encoder	Positioning axis/ synchronous axis with absolute encoder	External incremental encoder	External absolute encoder
Active homing ("Mode" = 3, 5)	X	-	-	-
Passive homing ("Mode" = 2, 8, 10)	X	-	X	-
Set actual position ("Mode" = 0)	X	X	X	X
Relative shift of the actual position ("Mode" = 1)	X	X	X	X
Homing absolute encoder ("Mode" = 6, 7)	-	X	-	X

Requirement

- The technology object has been configured correctly.
- "Mode" = 2, 3, 5, 8, 10
  The technology object must be enabled.
- "Mode" = 0, 1, 6, 7, 8
  The encoder values must be valid. (<TO>.StatusSensor[n].State = 2)

Override response

- An MC_Home job for passive homing is aborted by:
  - Disabling the technology object by means of "MC_Power.Enable" = FALSE
  - "MC_Home" job with parameter "Mode" = 3, 5, 9
- An "MC_Home" job for passive homing does not abort any other Motion Control jobs.
- An "MC_Home" job for active homing is aborted by:
  - Disabling the technology object with "MC_Power.Enable" = FALSE
  - "MC_Home" job "Mode" = 3, 5
  - "MC_Halt" job
  - "MC_MoveAbsolute" job
  - "MC_MoveRelative" job
  - "MC_MoveVelocity" job
  - "MC_MoveJog" job
  - "MC_GearIn" job
- An "MC_Home" job for active homing aborts the following running Motion Control jobs.
  - "MC_Home" job with parameter "Mode" = 3, 5, 8, 10
  - "MC_Halt" job
  - "MC_MoveAbsolute" job
  - "MC_MoveRelative" job
  - "MC_MoveVelocity" job
  - "MC_MoveJog" job
  - "MC_GearIn" job
  - "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_Home" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Position	INPUT	LREAL	0.0	The specified value is used according to the selected "Mode".	
Mode	INPUT	INT	0	Operating mode	
				0	Direct homing (absolute) The current position of the technology object is set to the value of parameter "Position".
				1	Direct homing (relative) The current position of the technology object is shifted by the value of parameter "Position".
				2	Passive homing (without reset) Functions like "Mode" 8, with the difference that the "homed" status is **not** reset when the function is enabled.
				3	Active homing The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After the completion of the movement, the axis is positioned at the value of the "Position" parameter.
				4	Reserved
				5	Active homing ("Position" parameter has no effect) The TO positioning axis/synchronous axis performs a homing movement according to the configuration. After completion of the movement, the axis is positioned at the home position configured under "Technology object > Configuration > Extended parameters > Homing > Active homing". (<TO>.Homing.HomePosition)
				6	Absolute encoder adjustment (relative) The current position is shifted by the value of the parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n]. AbsEncoderOffset)

Parameter	Declaration	Data type	Default value	Description	
				7	Absolute encoder adjustment (absolute) The current position is set to the value of the parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				8	Passive homing When the homing mark is detected, the actual value is set to the value of the "Position" parameter.
				9	Canceling passive homing A running job for passive homing is aborted.
				10	Passive homing ("Position" parameter has no effect) When the homing mark is detected, the actual value is set to the home position configured under "Technology object > Configuration > Extended parameters > Homing > Passive homing". (<TO>.Homing.HomePosition)
Done	OUTPUT	BOOL	FALSE	TRUE	Job is completed
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Resetting the "Homed" status

The "Homed" status of a technology object is reset under the following conditions (<TO>.StatusWord.X5 (HomingDone)):

- **Technology objects with incremental actual values:**
  - Starting an "MC_Home" job with "Mode" = 3, 5, 8, 10

    (After successful completion of the homing operation, the "Homed" status is reset.)
  - Error in the encoder system, or encoder failure
  - Restart of the technology object
  - After POWER OFF -> POWER ON of the CPU
  - Memory reset
  - Modification of the encoder configuration
- **Technology objects with absolute actual values:**
  - Restoration of the CPU factory settings
  - Modification of the encoder configuration
  - Replacement of the CPU

Homing a technology object with "Mode" = 1..8, 10

To home a technology object, follow these steps:

1. Check the requirements indicated above.
2. Specify the desired homing function in the "Mode" parameter.
3. Initialize the necessary parameters with values, and start the homing operation with a positive edge at the "Execute" parameter.

If the "Done" parameter shows the value TRUE, then the "MC_Home" job has been completed according to the selected "Mode". The "Homed" status of the technology object is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Homed" (<TO>.StatusWord.X5 (HomingDone)).

Termination of a passive homing process with "Mode" = 9

With "Mode" = 9, the technology object is not homed. If a running "MC_Home" job for passive homing ("Mode" = 2, 8, 10) is overridden by another "MC_Home" job with "Mode" = 9, then the running job is terminated with the parameter "CommandAborted" = TRUE. The overriding job with "Mode" = 9 signals successful execution with the parameter "Done" = TRUE.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Error ID (Page 386)

11.1.3 MC_MoveJog

11.1.3.1 MC_MoveJog: Move axes in jog mode V2

Description

With the Motion Control instruction "MC_MoveJog", you can move an axis in jog mode.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified at the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveJog" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_MoveJog" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_MoveJog" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
JogForward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".	
JogBackward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".	
Velocity	INPUT	LREAL	100.0	Setpoint speed / setpoint speed for the motion process Value > 0.0: The specified value is used. Value < 0.0: The specified value is used. ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The setpoint velocity / setpoint speed was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Behavior with setpoint velocity / setpoint speed zero (Velocity" = 0.0)

An "MC_MoveJog" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the setpoint velocity / setpoint speed zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

Moving an axis in jog mode

Proceed as follows to move an axis in jog mode:

1. Check the requirements indicated above.
2. Move the axis in the positive direction with "JogForward", or in the negative direction with "JogBackward".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

Note

Behavior when changing the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), then the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity is reached ("Velocity" × "Override" %), then "InVelocity" is set again.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

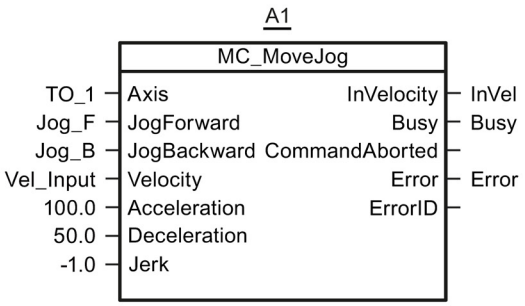
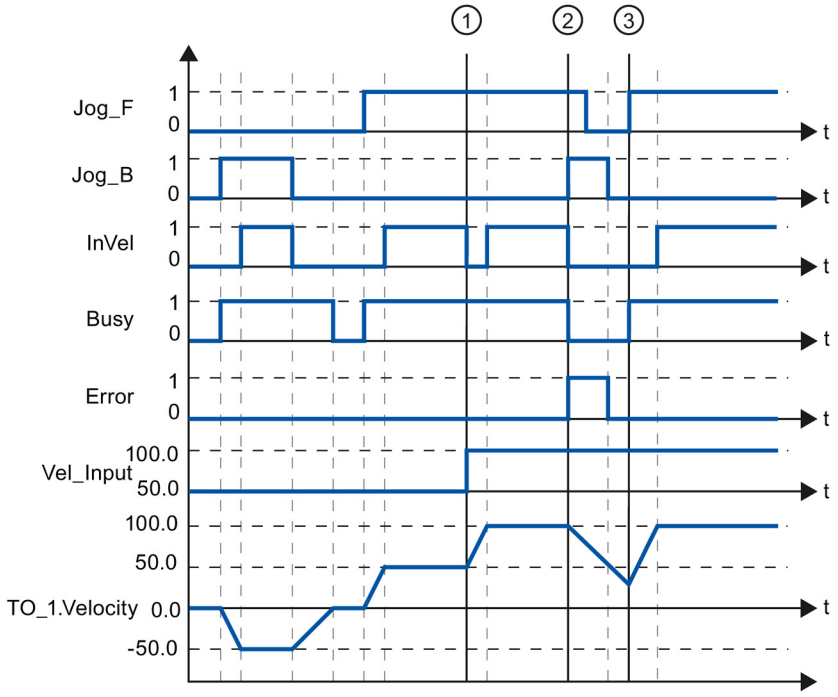
Error ID (Page 386)

11.1.3.2 MC_MoveJog: Function chart V2

Function chart: Moving an axis in jog mode





The axis is moved in the negative direction in jog mode via "Jog_B". When the setpoint velocity -50.0 is reached, this is signaled via "InVel" = TRUE. After "Jog_B" is reset, the axis is braked and brought to a standstill. Then the axis is moved in the positive direction via "Jog_F". When the setpoint velocity 50.0 is reached, this is signaled via "InVel" = TRUE.

At time ①, if "Jog_F" is set, the setpoint velocity is changed to 100.0 by means of "Vel_Input". Alternatively, you can also change the setpoint velocity via the velocity override. "InVel" is reset. The axis is being accelerated. When the new setpoint velocity 100.0 is reached, this is signaled via "InVel" = TRUE.

If "Jog_F" is set, "Jog_B" is likewise set at time ②. If both "Jog_F" and "Jog_B" are set, then the axis is braked with the last applicable deceleration. An error is indicated via "Error", and the "ErrorID" of the error 16#8007 (incorrect direction specification) is output.

This error is resolved by resetting the two inputs "Jog_F" and "Jog_B".

During the braking ramp, "Jog_F" is set at time ③. The axis is accelerated to the last configured velocity. When the setpoint velocity 100.0 is reached, this is signaled via "InVel" = TRUE.

11.1.4 MC_MoveVelocity

11.1.4.1 MC_MoveVelocity: Move axes at predefined velocity V2

Description

With the Motion Control instruction "MC_MoveVelocity", you can move an axis with a constant velocity.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis/synchronous axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified at the "Velocity" parameter.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveVelocity" is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_MoveVelocity" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_MoveVelocity" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Velocity	INPUT	LREAL	100.0	Setpoint speed / setpoint speed for the motion process ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Direction	INPUT	INT	0	Direction of rotation of the axis	
				0	The sign of the velocity specified at the "Velocity" parameter defines the direction of rotation.
				1	Positive direction of rotation Value of "Velocity" is used.
				2	Negative direction of rotation Value of "Velocity" is used.

Parameter	Declaration	Data type	Default value	Description	
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	Disabled The values of parameters "Velocity" and "Direction" are taken into account.
				TRUE	Enabled The values at the parameters "Velocity" and "Direction" are **not** taken into account. The current velocity and direction at function start are retained. When the axis resumes motion at the velocity that was current at function start, the "InVelocity" parameter returns the value TRUE.
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The setpoint velocity / setpoint speed was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Behavior with setpoint velocity / setpoint speed zero (Velocity" = 0.0)

An "MC_MoveVelocity" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the setpoint velocity / setpoint speed zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

The parameters "InVelocity" and "Busy" show the value TRUE, until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Moving an axis with constant velocity / speed

Proceed as follows to move an axis with constant velocity / speed:

1. Check the requirements indicated above.
2. At the parameter "Velocity", specify the velocity / speed, with which the axis should be moved.
3. Start the "MC_MoveVelocity" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

If the "InVelocity" parameter shows the value TRUE, then the setpoint velocity / setpoint speed was reached. The axis continues moving at this constant velocity. The parameters "InVelocity" and "Busy" show the value TRUE, until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Note

Behavior when changing the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), then the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity / speed is reached ("Velocity" × "Override" %), then "InVelocity" is reset.

Additional information

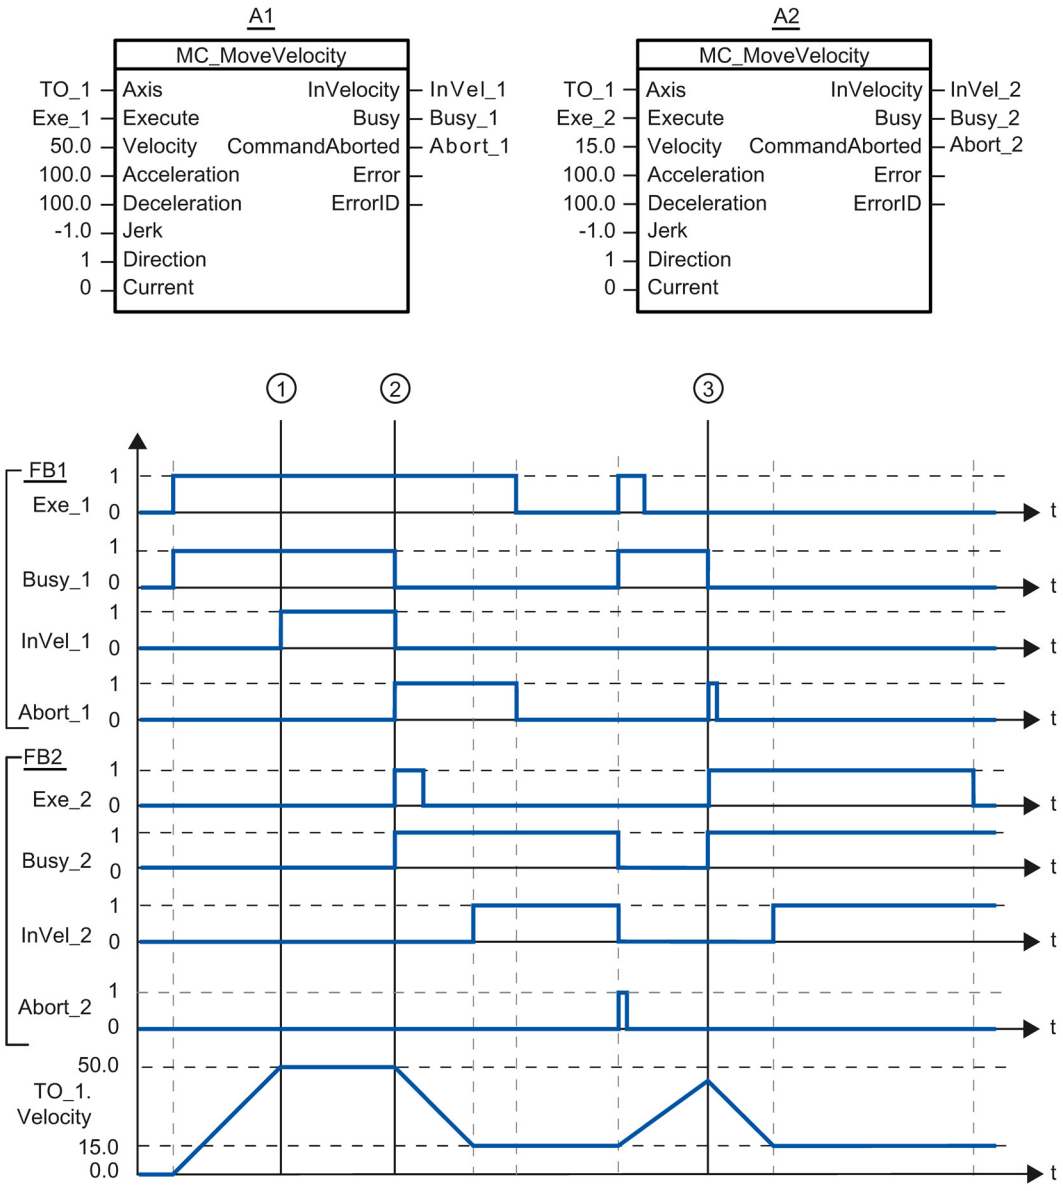
An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

See also

Error ID (Page 386)

11.1.4.2 MC_MoveVelocity: Function chart V2

Function chart: Moving an axis with specification of velocity, and the response to an overriding job



A "MC_MoveVelocity" job (A1) initiated via "Exe_1" accelerates the axis and signals at time ① via "InVel_1" that the setpoint velocity 50.0 has been reached.

At time ②, the task is overridden via another "MC_MoveVelocity" job (A2). The abort is signaled via "Abort_1". When the new setpoint velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

The running "MC_MoveVelocity" job (A2) is overridden by another "MC_MoveVelocity" job (A1). The abort is signaled via "Abort_2". The axis is accelerated to the new setpoint velocity 50.0. Before the setpoint velocity is reached, the current "MC_MoveVelocity" job A1) is overridden at time ③ by another "MC_MoveVelocity" job A2). The abort is signaled via "Abort_1". When the new setpoint velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

11.1.5 MC_MoveRelative

11.1.5.1 MC_MoveRelative: Relative positioning of axes V2

Description

With the Motion Control instruction "MC_MoveRelative", you can move an axis relative to the position that exists at the beginning of job processing.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveRelative" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_MoveRelative" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_MoveRelative" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Positioning Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Distance	INPUT	LREAL	0.0	Distance for the positioning process (negative or positive)	
Velocity	INPUT	LREAL	-1.0	Setpoint velocity for the positioning Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Advanced parameters > Default dynamics" is used. (<TO>.DynamicDefaults.Velocity)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.

Parameter	Declaration	Data type	Default value	Description	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Moving an axis relative to the starting position

Proceed as follows to move an axis relative to the starting position:

1. Check the requirements indicated above.
2. Specify distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveRelative" job with a positive edge at the parameter "Execute".

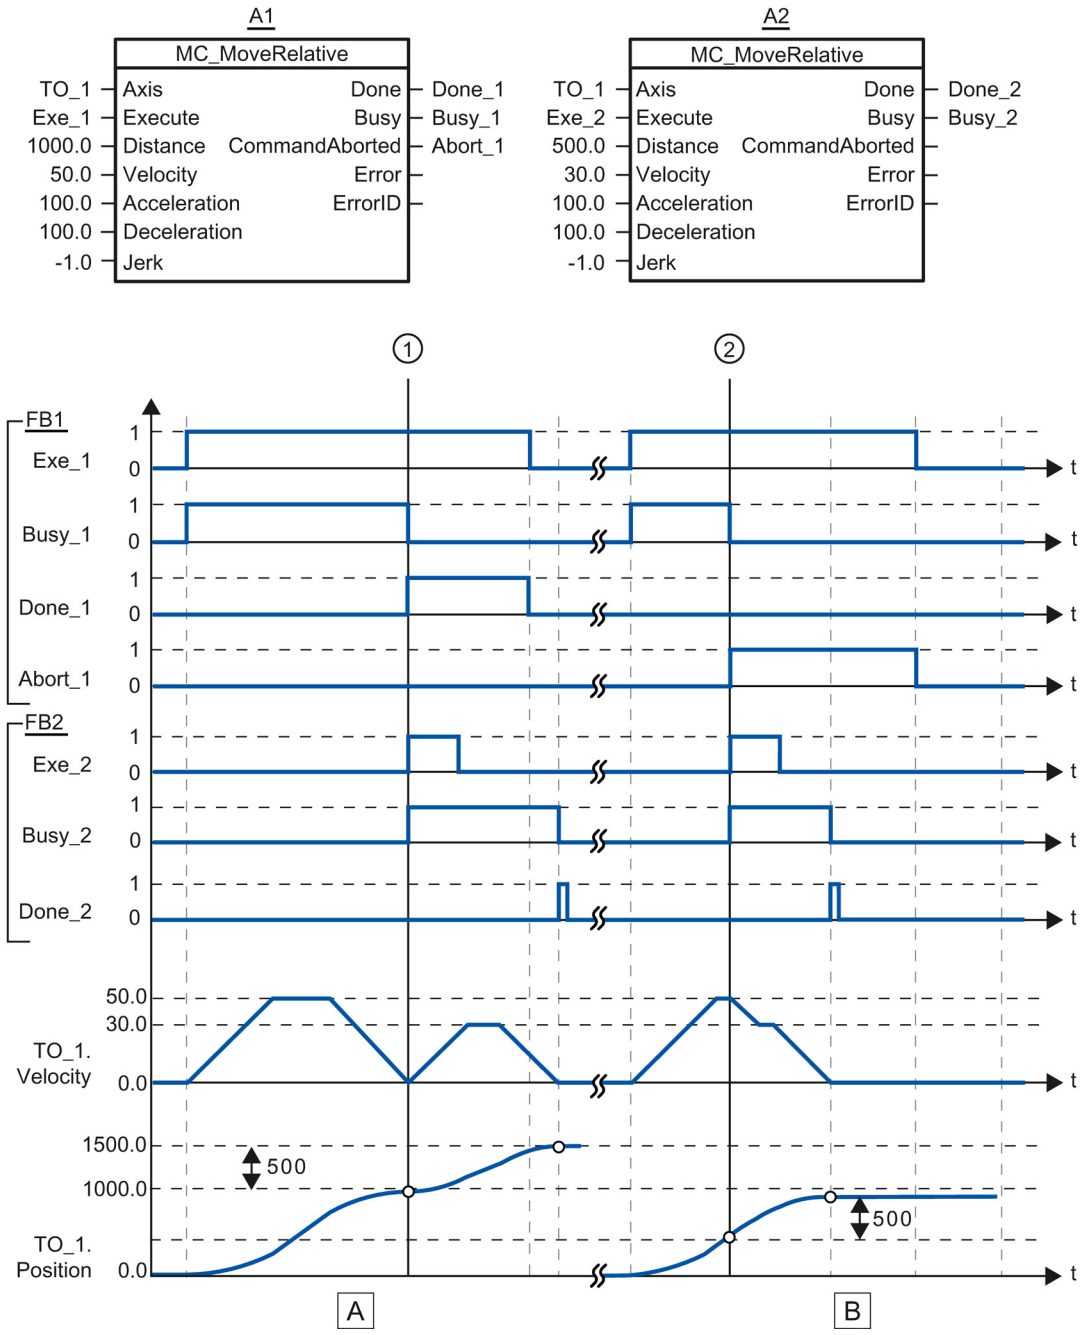
The current motion state is indicated in "Busy", "Done" and "Error".

See also

Error ID (Page 386)

11.1.5.2 MC_MoveRelative: Function chart V2

Function chart: Relative positioning of an axis, and the response to an overriding job



Section A	The axis is moved by an "MC_MoveRelative" job (A1) by the distance ("Distance") 1000.0 (the starting position here is 0.0). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveRelative" job (A2) with distance 500.0 is started. When the axis reaches the new target position, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	A running "MC_MoveRelative" job (A1) is overridden by another "MC_MoveRelative" job (A2). The abort is signaled at time ② via "Abort_1". The axis is then moved at the new velocity by the distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

11.1.6 MC_MoveAbsolute

11.1.6.1 MC_MoveAbsolute: Absolute positioning of axes V2

Description

With the Motion Control instruction "MC_MoveAbsolute", you can move an axis to an absolute position.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object is enabled.
- The technology object is homed.

Override response

The "MC_MoveAbsolute" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_MoveAbsolute" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_MoveAbsolute" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description
Axis	InOut	TO_Positioning Axis	-	Technology object
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge
Position	INPUT	REAL	0.0	Absolute target position
Velocity	INPUT	LREAL	-1.0	Setpoint velocity for the positioning Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Advanced parameters > Default dynamics" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Direction	INPUT	INT	3	Direction of rotation of the axis Is only evaluated with "modulo" enabled. "Technology object > Configuration > Basic parameters > Enable modulo 1: Positive direction of rotation 2: Negative direction of rotation 3: Shortest path
Done	OUTPUT	BOOL	FALSE	TRUE: Target position reached.

Parameter	Declaration	Data type	Default value	Description	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Moving an axis to an absolute position

Proceed as follows to move an axis to an absolute position:

1. Check the requirements indicated above.
2. Specify the desired target position at the "Position" parameter.
3. Start the "MC_MoveAbsolute" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

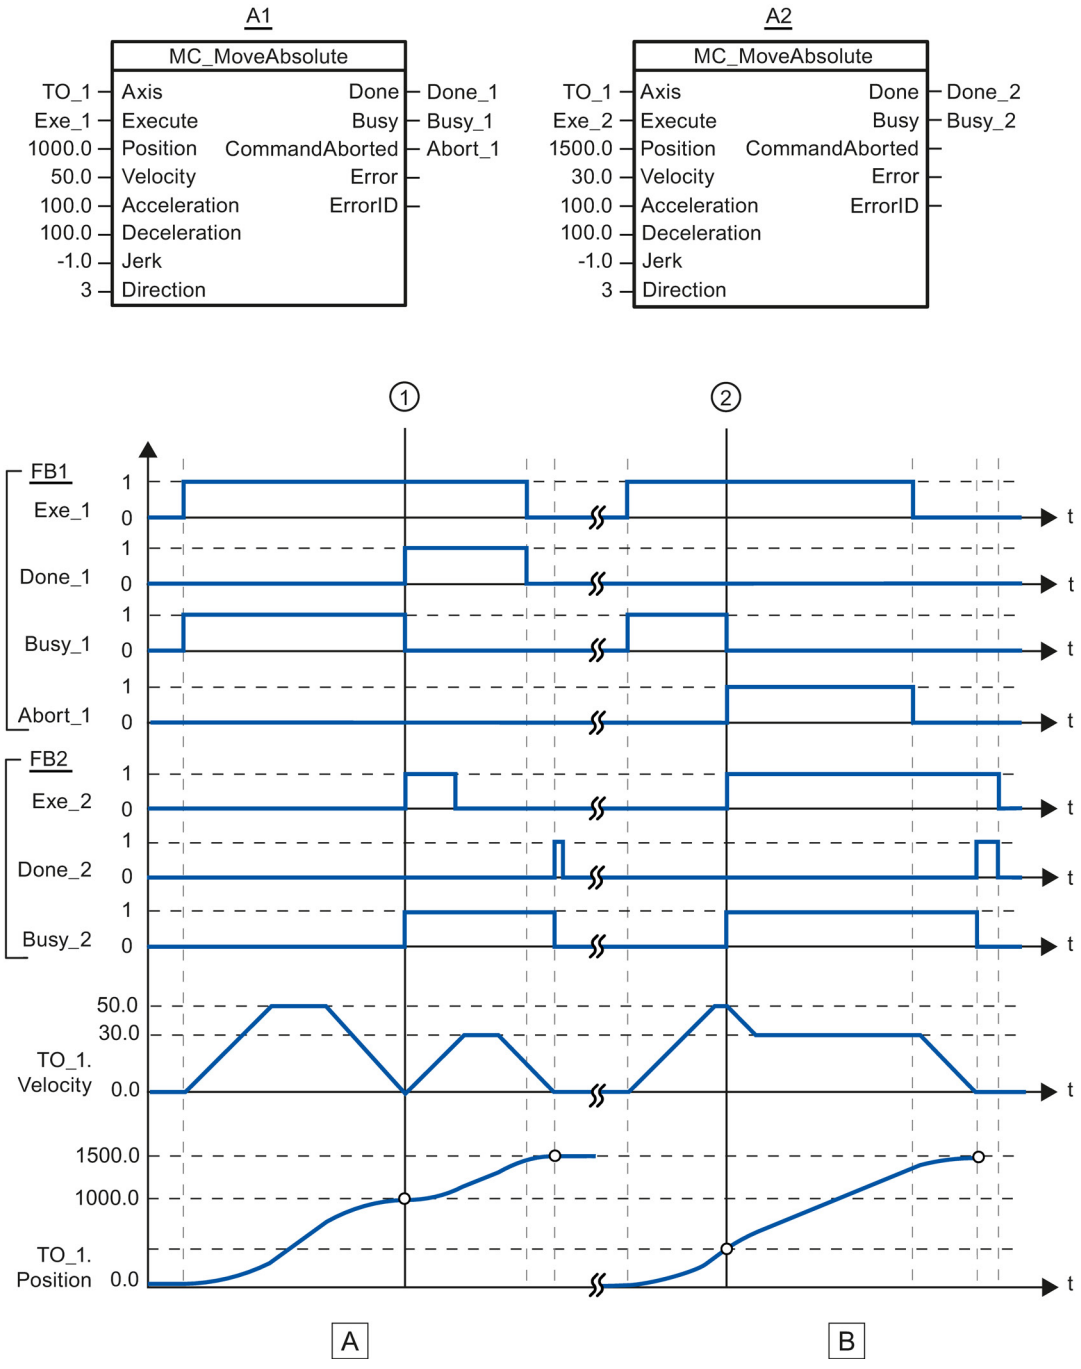
Error ID (Page 386)

11.1.6.2 MC_MoveAbsolute: Function chart V2

Function chart: Absolute positioning of an axis, and the response to an overriding job



Section A	An axis is moved to absolute position 1000.0 with an "MC_MoveAbsolute" job (A1). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveAbsolute" job (A2) with target position 1500.0 is started. When the axis reaches the target position 1500.0, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	A running "MC_MoveAbsolute" job (A1) is overridden at time ② by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1". The axis is braked to the changed velocity and moved to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

11.1.7 MC_MoveSuperimposed

11.1.7.1 MC_MoveSuperimposed: Superimposed positioning of axes V2

Description

With the Motion Control instruction "MC_MoveSuperimposed", you can start a relative positioning motion which is superimposed on a running basic motion.

Dynamic behavior during movement is defined with the parameters "VelocityDiff", "Jerk", "Acceleration" and "Deceleration". The dynamic values are added to the values of the basic motion. The duration of the basic motion is not extended by a superimposed motion.

The dynamic of the total axis motion is the sum of the dynamic values of the basic motion and the superimposed motion.

The behavior of the total motion depends on the type of basic motion:

- The basic motion is a single-axis motion:
  - The maximum dynamic of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The entire motion is limited to the configured dynamic limits.
- The basic motion is a synchronous motion:
  - The maximum dynamic of the superimposed motion is the difference between the current dynamic values of the basic motion and the dynamic limits.
  - The synchronous motion of the following axis is not limited to the dynamic limits of the following axis.
  - A "MC_MoveSuperimposed" job on a lead axis in synchronous operation affects the lead axis and the following axis.
  - A "MC_MoveSuperimposed" job on a following axis in synchronous operation only affects the following axis.

It is always the dynamic of the total motion that is displayed in the technology data block and in the TIA Portal.

Applies to

- Synchronous axis
- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveSuperimposed" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Starting a "MC_MoveSuperimposed" job aborts an active "MC_MoveSuperimposed" job.

Parameters

The following table shows the parameters of the "MC_MoveSuperimposed" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_PositioningAxis	-	Axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Distance	INPUT	LREAL	0.0	Additional travel distance for the superimposing positioning operation (negative or positive)	
VelocityDiff	INPUT	LREAL	-1.0	Maximum velocity deviation compared to the running motion Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Advanced parameters > Default dynamics" is used. (<TO>.DynamicDefaults.Velocity)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Superimposed positioning complete
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.

Parameter	Declaration	Data type	Default value	Description	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 386) for parameter "Error"	

Starting superimposed positioning motion

To start a superimposed positioning motion with the "MC_MoveSuperimposed" Motion Control instruction, follow these steps:

1. Check the requirements indicated above.
2. Specify the additional distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveSuperimposed" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

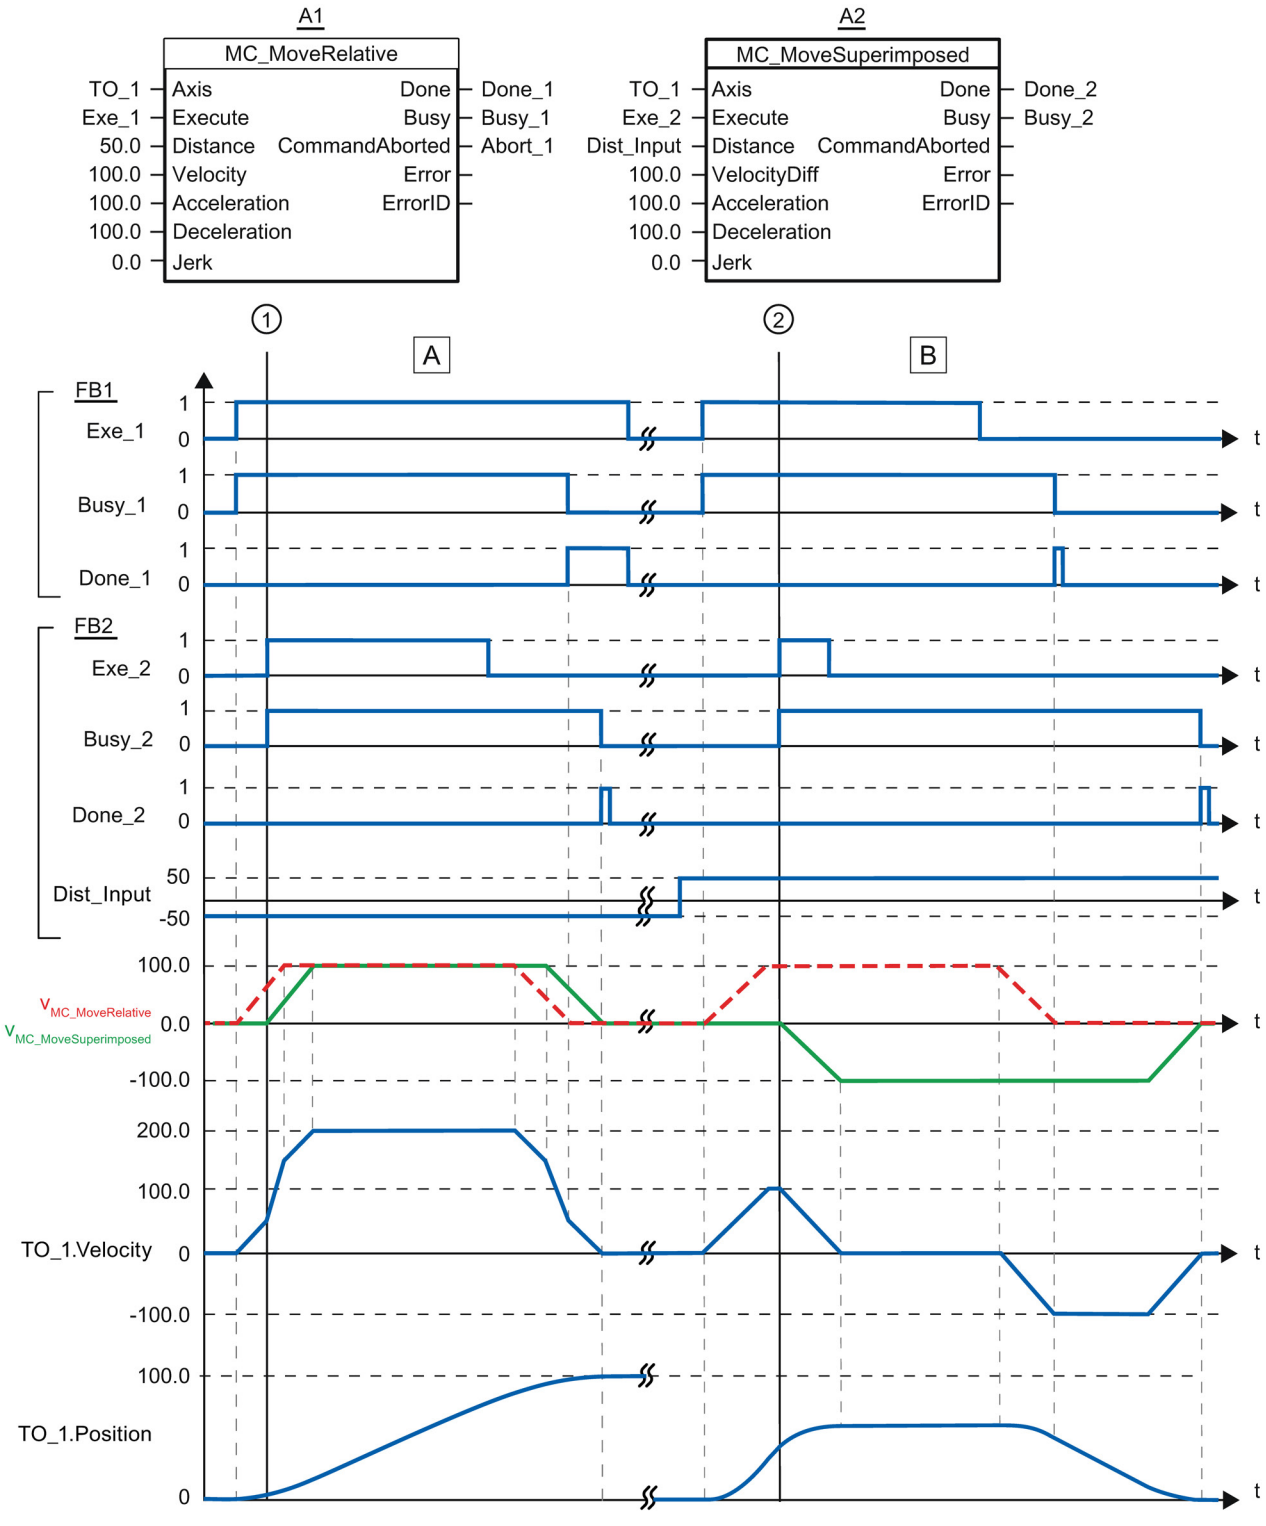
Error ID (Page 386)

11.1.7.2 MC_MoveSuperimposed: Function chart V2

Function chart: Superimposed positioning of axes



Section A	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At the point in time ①, using "Exe_2", a MC_MoveSuperimposed job with a distance of 50.0 is initiated. The axis is traversed with the added dynamic values of both jobs with the distance 50 + 50 = 100.0. When the axis reaches the target position, "Done_2" is signaled.
Section B	Using "Exe_1", an "MC_MoveRelative" job with a distance of 50.0 is initiated. At the point in time ②, using "Exe_2", a MC_MoveSuperimposed job with a distance of-50.0 is initiated. The axis is traversed with the added dynamic values of both jobs with the distance 50.0 - 50.0 = 0.0. When the axis reaches the target position, "Done_2" is signaled.

11.1.8 MC_GearIn

11.1.8.1 MC_GearIn: Start gearing V2

Description

With the Motion Control instruction "MC_GearIn", you can start a relative gearing between a leading axis and a following axis.

Dynamic behavior of the following axis during synchronization is defined with the parameters"Jerk", "Acceleration", and "Deceleration" .

You specify the gear ratio as the relationship between two integers (numerator/denominator) with the parameters "RatioNumerator" and "RatioDenominator". You can change the gear ratio during operation by placing a new "MC_GearIn" job. Transition processes are executed with the specified dynamic values.

The numerator of the gear ratio is specified as positive or negative. This results in the following response:

- Positive gear ratio:
  The leading and following axes move in the same direction.
- Negative gear ratio:
  The following axis rotates in the opposite direction of the leading axis.

You can start synchronous operation when the leading axis is at a standstill or when it is in motion.

A position offset can occur between leading axis and following axis during synchronization. This position offset depends on the start time of the "MC_GearIn" and the duration of the synchronization process. The position offset is not compensated.

Applies to

- Synchronous axis

Requirements

- The technology object has been configured correctly.
- The leading axis is a positioning axis or synchronous axis.
- The following axis is a synchronous axis.
- The leading axis is specified as possible leading axis in the configuration of the following axis in "Technology object > Configuration > Master value interconnections".
- The following axis is enabled.

Override response

The "MC_GearIn" job is aborted by:

- Disabling the following axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_GearIn" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Disabling the leading axis with "MC_Power.Enable" = FALSE does not abort synchronous operation. The following axis follows the leading axis even during the braking ramp and after the leading axis is enabled again.

Parameter

The following table shows the parameters of the "MC_GearIn" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Master	InOut	TO_PositioningAxis	-	Leading axis technology object	
Slave	InOut	TO_SynchronousAxis	-	Following axis technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
RatioNumerator	INPUT	DINT	1	Gear ratio numerator Permitted integer values: -2147483648 to 2147483648 (value 0 not permitted)	
RatioDenominator	INPUT	DINT	1	Gear ratio denominator Permitted integer values: 1 to 2147483648	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
InGear	OUTPUT	BOOL	FALSE	TRUE	Synchronous operation reached The following axis is synchronized and moves synchronously to the leading axis.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.

Parameter	Declaration	Data type	Default value	Description	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	0	Error ID (Page 386) for parameter "Error"	

Starting synchronous operation

To start synchronous operation with the "MC_GearIn" Motion Control instruction, follow these steps:

1. Check the requirements indicated above.
2. Specify the leading axis, the following axis and the gear ratio at the corresponding parameters.
3. Start the "MC_GearIn" job with a positive edge at the parameter "Execute".

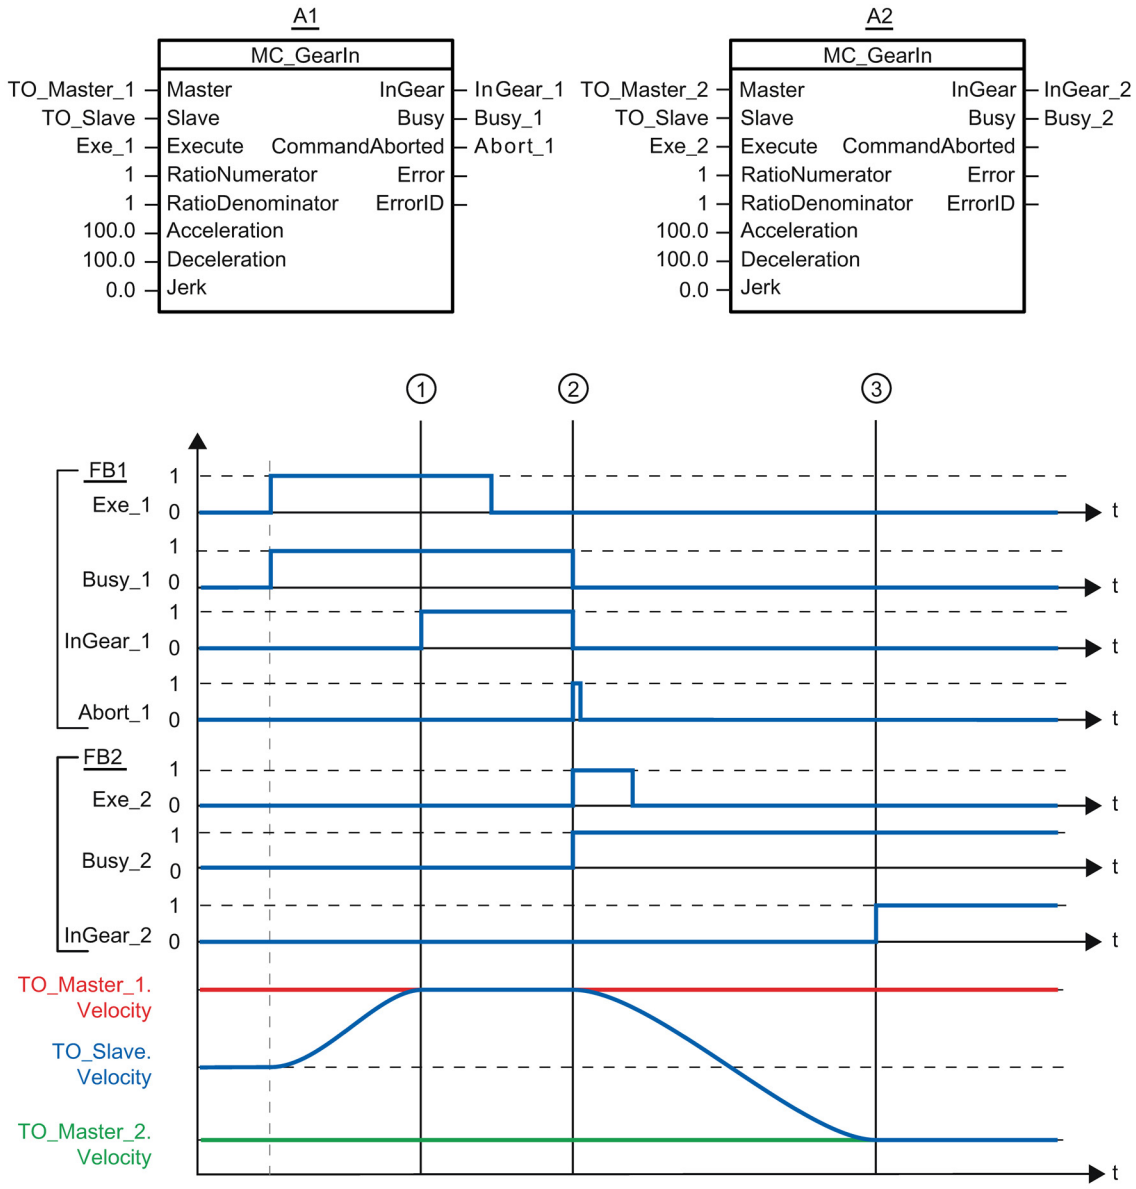
The following axis is synchronized to the master value of the leading axis. If the "InGear" parameter shows the value TRUE, the following axis is synchronized and moves synchronously to the leading axis. The parameters "InGear" and "Busy" show the value TRUE until the "MC_GearIn" job is overridden by another Motion Control job.

See also

Error ID (Page 386)

11.1.8.2 MC_GearIn: Function chart V2

Function chart: Synchronizing and switching the master value



Using "Exe_1", an "MC_GearIn" job (A1) is initiated. The following axis (TO_Slave) is synchronized to the leading axis (TO_Master_1). "InGear_1" signals at time ① that the following axis is synchronized and moves synchronously to the leading axis.

At time ②, synchronous operation is overridden by another "MC_GearIn" job (A2). The abort is signaled via "Abort_1". The following axis is synchronized to the new leading axis (TO_Master_2). "InGear_2" signals at time ③ that the following axis is synchronized and moves synchronously to the leading axis.

11.1.9 MC_Halt

11.1.9.1 MC_Halt: Stop axes V2

Description

With the Motion Control instruction "MC_Halt", you can brake an axis to a standstill.

Dynamic behavior during the braking process is defined with the parameters "Jerk" and "Deceleration".

Applies to

- Synchronous axis
- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_Halt" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job

Starting a "MC_Halt" job aborts the following active Motion Control jobs:

- "MC_Home" job "Mode" = 3, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job
- "MC_GearIn" job
- "MC_MoveSuperimposed" job

Parameters

The following table shows the parameters of the "MC_Halt" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Braking an axis with "MC_Halt"

Proceed as follows to decelerate an axis to a standstill:

1. Check the requirements indicated above.
2. Supply the parameters "Deceleration" and "Jerk" with the desired values.
3. Start the "MC_Halt" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error". The standstill of the axis is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Standstill" (<TO>.StatusWord.X7 (Standstill)).

Additional information

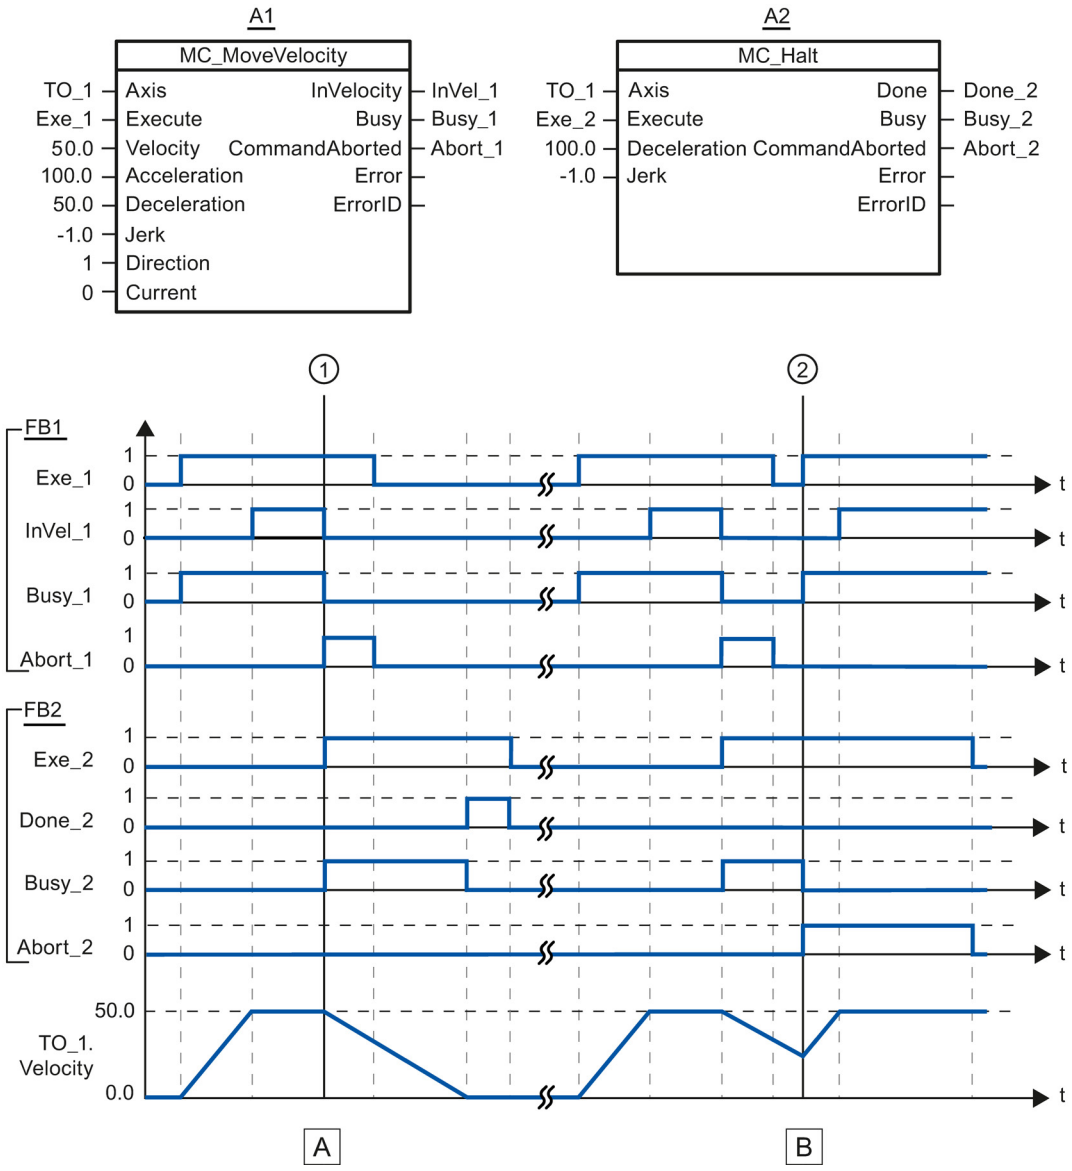
An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

See also

Error ID (Page 386)

11.1.9.2 MC_Halt: Function chart V2

Function chart: Stopping an axis, and the response to an overriding job



Section A	An axis is moved with an "MC_MoveVelocity" job (A1). When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". At time ①, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job termination is signaled via "Abort_1". The axis is braked to a standstill. Successful completion of the "MC_Halt" job is signaled via "Done_2".
Section B	The axis is moved with an "MC_MoveVelocity" job (A1). When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". Next the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job termination is signaled via "Abort_1". During the braking process the "MC_Halt" job is overridden at time ② by an "MC_MoveVelocity" job (A1). The job termination is signaled via "Abort_2". When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". The axis is then moved with constant velocity.

11.1.10 MC_Reset

11.1.10.1 MC_Reset: Acknowledge alarms, restart technology objects V2

Description

All technology alarms that can be acknowledged in the user program are acknowledged with the Motion Control instruction "MC_Reset". Acknowledgment also resets the "Error" and "Warning" bits in the technology data block.

Technology objects are reinitialized (restarted) using the Motion Control instruction "MC_Reset" with "Restart" = TRUE. Upon restart of the technology object, the new configuration data are applied in the technology data block.

Applies to

- Synchronous axis
- Positioning axis
- Speed axis
- External encoder

Requirements

- The cause of the error for a pending technology alarm has been resolved.
- For a restart, the technology object must be disabled.
  ("MC_Power.Status" = FALSE and "MC_Power.Busy" = FALSE)

Override response

- Parameter "Restart" = FALSE:

  Processing of the instruction "MC_Reset" can be aborted by other Motion Control jobs. The MC_Reset job does not abort any running Motion Control jobs.

- Parameter "Restart" = TRUE:

  The processing of the instruction "MC_Reset" with parameter "Restart" = TRUE cannot be aborted by any other Motion Control job.

Parameters

The following table shows the parameters of the "MC_Reset" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Restart	INPUT	BOOL	FALSE	TRUE	"Restart" Reinitialization of the technology object and acknowledgment of pending technology alarms. The technology object is reinitialized with the configured start values.
				FALSE	Acknowledgement of queued technology alarms.
Done	OUTPUT	BOOL	FALSE	TRUE	Error has been acknowledged. Restart has been executed.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
Command Aborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Acknowledging technology alarms

To acknowledge technology alarms, follow these steps:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = FALSE.
3. Start the acknowledgement of the error with a positive edge at parameter "Execute".

If the Done parameter shows the value TRUE, then the error was acknowledged.

Note

Acknowledging with "Restart" = FALSE

If only the technology alarms are to be acknowledged, set "Restart" = FALSE. The technology object cannot be used during a restart.

Restarting a technology object

Proceed as follows to restart a technology object:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = TRUE.
3. Perform the restart with a positive edge at the input parameter "Execute".

If the "Done" parameter shows the value TRUE, then the restart of the technology object has been completed.

Additional information on a restart can be found in the Restarting Technology Objects (Page 197) section.

Error ID (Page 386)

11.2 S7-1500 Motion Control V1

11.2.1 MC_Power

11.2.1.1 MC_Power: Enable, disable technology objects V1

Description

The Motion Control instruction "MC_Power" is used to enable and disable technology objects.

Applies to

- Positioning axis
- Speed axis
- External encoder

Requirements

- The technology object has been configured correctly.

Override response

- A MC_Power job cannot be aborted by any other Motion Control job.
- A MC_Power job with the parameter Enable = TRUE enables a technology object, but does not thereby abort any other Motion Control instructions.
- Disabling the technology object (parameter "Enable" = FALSE) aborts all Motion Control jobs at the corresponding technology object in accordance with the selected "StopMode". This process cannot be aborted by the user.

Parameters

The following table shows the parameters of the "MC_POWER" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Enable	INPUT	BOOL	FALSE	TRUE	The technology object is enabled.
				FALSE	The technology object is disabled. All current jobs at the technology object are aborted in accordance with the configured "StopMode".
StopMode	INPUT	INT	0	Not applicable to the external encoder technology object. If you disable a technology object with a falling edge at the Enable parameter, then the axis decelerates in accordance with the selected "StopMode".	
				0	Emergency stop When the technology object is disabled, the axis brakes to a standstill without any jerk limitation, using the emergency stop deceleration configured in Technology object > Configuration > Extended parameters > Emergency stop ramp. Enabling is then removed. (<TO>.DynamicDefaults.EmergencyDeceleration)
				1	Immediate stop When a technology object is disabled, the setpoint zero is output, and the enabling is removed. The axis is braked depending on the configuration in the drive, and is brought to a standstill.
				2	Stop with maximum dynamic values When the technology object is disabled, the axis brakes to a standstill using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits". The configured maximum jerk is taken into account at the same time. Enabling is then removed. (<TO>.DynamicLimits.MaxDeceleration; <TO>.DynamicLimits.MaxJerk)
Status	OUTPUT	BOOL	FALSE	Technology object enable status	
				FALSE	Disabled - A positioning axis or speed axis does not accept any Motion Control jobs. - Speed control and position control are not active. - The actual values of the technology object are not checked for validity.
				TRUE	Enabled - An enabled positioning axis or speed axis accepts Motion Control jobs. - Speed control and positioning control are active. - The actual values of the technology object are valid.

Parameter	Declaration	Data type	Default value	Description	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred in Motion Control instruction MC_Power. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Enabling technology objects

To enable a technology object, set the Enable parameter to TRUE.

If the Status parameter shows the value TRUE , then the technology object is enabled.

If an axis is in motion when the technology object is enabled (actual velocity is present), then the axis brakes to the setpoint zero, using the maximum deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic limits" (<TO>.DynamicLimits.MaxDeceleration). This braking ramp can be overridden by Motion Control jobs.

Note

Automatic enabling after acknowledgement of a technology alarm

If the technology object is disabled due to a technology alarm, then it will automatically be enabled again after the cause has been eliminated and the alarm has been acknowledged. This requires the Enable parameter to have retained the value TRUE during this process.

Disabling technology objects

To disable a technology object, set the Enable parameter to FALSE.

If an axis is in motion, then it will be braked to a standstill according to the selected "StopMode".

If the "Busy" and "Status" parameters show the value FALSE , then the disabling of the technology object has been completed.

Drive connection by means of PROFIdrive

When coupling a drive with PROFIdrive, the setpoint, enabling, and drive status are transmitted via the PROFIdrive frame.

- **Enable technology object and drive**

  The parameter ""Enable" = TRUE" is used to enable the technology object. The drive is enabled according to the PROFIdrive standard.

  If the tag <TO>.StatusDrive.InOperation shows the value TRUE , then the drive is ready to execute setpoints. The "Status" parameter is set to the value TRUE .

- **Disable technology object and drive**

  With the parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". The drive is disabled according to the PROFIdrive standard.

Analog drive connection

The setpoint is output via an analog output. Optionally, you can configure an enabling signal via digital output (<TO>.Actor.Interface.EnableDriveOutput), and a readiness signal via digital input (<TO>.Actor.Interface.DriveReadyInput).

- **Enable technology object and drive**

  With the parameter "Enable" = TRUE, the enabling output ("Enable drive output") is set.

  If the drive reports back the readiness signal via the ready input ("Drive ready input"), then the "Status" parameter and the technology object's <TO>.StatusDrive.InOperation tag are set to TRUE, and the setpoint is switched at the analog output.

- **Disable technology object and drive**

  With the parameter "Enable" = FALSE, the "Status" parameter is set to the value FALSE, and the axis is braked according to the selected "StopMode". When the setpoint zero is reached, the enabling output is set to FALSE.

Additional information

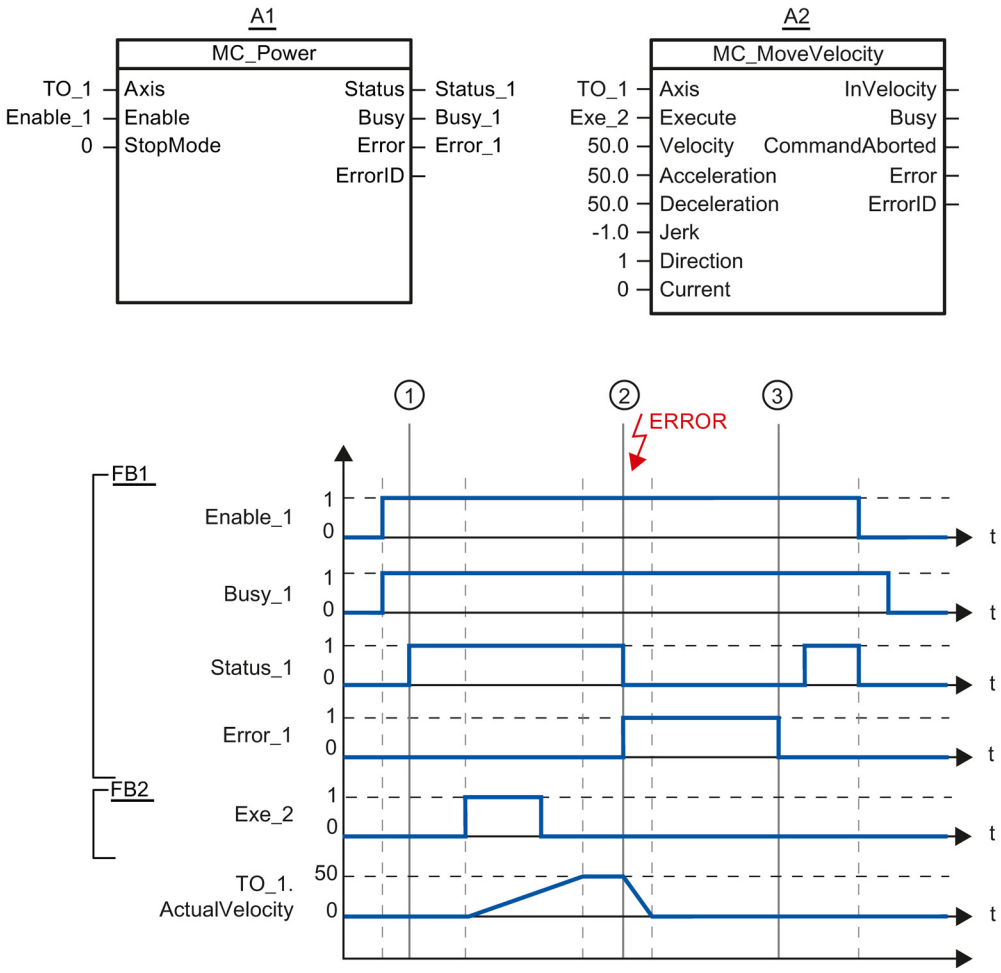
Additional information on enabling and disabling technology objects and drives can be found in the appendix, MC_Power Function Charts (Page 388).

See also

Error ID (Page 386)

11.2.1.2 MC_Power: Function chart V1

Function chart: Enabling a technology object, and example for alarm response



A technology object is enabled with "Enable_1= TRUE". Successful enabling can be read from "Status_1" at time ①. The axis will then move with an "MC_MoveVelocity" job (A2). The velocity profile of the axis can be read from "Velocity Axis_1".

At time ② an error occurs in the technology object, which results in the disabling of the technology object (alarm response: Remove enable). The axis is braked depending on the configuration in the drive, and is brought to a standstill. When the technology object is disabled, Status_1 is reset. Since the axis was not disabled using "Enable_1" = FALSE, the selected "StopMode" does not apply. The cause of the error is corrected and the alarm is acknowledged at time ③.

Since "Enable_1" is still set, the technology object is enabled again. Successful enabling can be read from "Status_1". Next the technology object is disabled with "Enable_1" = FALSE.

11.2.2 MC_Home

11.2.2.1 MC_Home: Home technology objects, set home position V1

Description

With the Motion Control instruction "MC_Home", you create the relationship between the position in the technology object and the mechanical position. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

The homing process occurs according to the mode selected with the "HomingMode" parameter, and the configuration under "Technology object > Configuration > Extended parameters > Homing".

The preset values under "Technology object > Configuration > Extended parameters > Dynamic default values" are used for the dynamic values Acceleration, Deceleration and Jerk.

Applies to

- Positioning axis
- External encoder

The following table shows which modes are possible with each of the technology objects:

Operating mode	Positioning axis with incremental encoder	Positioning axis with absolute encoder	External incremental encoder	External absolute encoder
Active homing (HomingMode = 4, 5)	X	-	-	-
Passive homing (HomingMode = 2, 3, 8)	X	-	X	-
Setting a positioning value ("HomingMode" = 0)	X	X	X	X
Relative shift of the actual value ("HomingMode" = 1)	X	X	X	X
Homing absolute encoder ("HomingMode" = 6, 7)	-	X	-	X

Requirement

- The technology object has been configured correctly.
- "HomingMode" = 2, 3, 4, 5, 8
  The technology object must be enabled.
- "HomingMode" = 0, 1, 2, 6, 7
  The encoder values must be valid. (<TO>.StatusSensor[n].State = 2)

Override response

- An MC_Home job for passive homing is aborted by:
  - Disabling the technology object by means of "MC_Power.Enable" = FALSE
  - "MC_Home" job with parameter "HomingMode" = 4, 5, 9
- An "MC_Home" job for passive homing does not abort any other Motion Control jobs.
- An "MC_Home" job for active homing is aborted by:
  - Disabling the technology object with "MC_Power.Enable" = FALSE
  - "MC_Home" job "HomingMode" = 4, 5
  - "MC_Halt" job
  - "MC_MoveAbsolute" job
  - "MC_MoveRelative" job
  - "MC_MoveVelocity" job
  - "MC_MoveJog" job
- An "MC_Home" job for active homing aborts the following running Motion Control jobs.
  - "MC_Home" job with parameter "HomingMode" = 2, 3, 4, 5
  - "MC_Halt" job
  - "MC_MoveAbsolute" job
  - "MC_MoveRelative" job
  - "MC_MoveVelocity" job
  - "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_Home" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Position	INPUT	LREAL	0.0	The specified value is used according to the selected "HomingMode".	
HomingMode	INPUT	INT	4	Operating mode	
				0	Direct homing (absolute) The current position of the technology object is set to the value of parameter "Position".
				1	Direct homing (relative) The current position of the technology object is shifted by the value of parameter "Position".
				2	Passive homing When the homing mark is detected, the actual value is set to the value of the "Position" parameter.
				3	Passive homing ("Position" parameter has no effect) When the homing mark is detected, the actual value is set to the home position configured under "Technology object > Configuration > Extended parameters > Homing > Passive homing". (<TO>.Homing.HomePosition)
				4	Active homing The TO positioning axis performs a homing movement according to the configuration. After the completion of the movement, the axis is positioned at the value of the "Position" parameter.
				5	Active homing ("Position" parameter has no effect) The TO positioning axis performs a homing movement according to the configuration. After completion of the movement, the axis is positioned at the home position configured under "Technology object > Configuration > Extended parameters > Homing > Active homing". (<TO>.Homing.HomePosition)

Parameter	Declaration	Data type	Default value	Description	
				6	Absolute encoder adjustment (relative) The current position is shifted by the value of the parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				7	Absolute encoder adjustment (absolute) The current position is set to the value of the parameter "Position". The calculated absolute value offset is stored retentively in the CPU. (<TO>.StatusSensor[n].AbsEncoderOffset)
				8	Passive homing (without reset) Functions like "HomingMode" 2, with the difference that the "homed" status is **not** reset when the function is enabled.
				9	Canceling passive homing A running job for passive homing is aborted.
Done	OUTPUT	BOOL	FALSE	TRUE	Job is completed
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Resetting the "Homed" status

The "Homed" status of a technology object is reset under the following conditions (<TO>.StatusWord.X5 (HomingDone)):

- **Technology objects with incremental actual values:**
  - Starting an "MC_Home" job with "HomingMode" = 2, 3, 4, 5

    (After successful completion of the homing operation, the "Homed" status is reset.)
  - Error in the encoder system, or encoder failure
  - Restart of the technology object
  - After POWER OFF -> POWER ON of the CPU
  - Memory reset
  - Modification of the encoder configuration
- **Technology objects with absolute actual values:**
  - Restoration of the CPU factory settings
  - Modification of the encoder configuration
  - Replacement of the CPU

Homing a technology object with "HomingMode" = 1..8

To home a technology object, follow these steps:

1. Check the requirements indicated above.
2. Specify the desired homing function in the "HomingMode" parameter.
3. Initialize the necessary parameters with values, and start the homing operation with a positive edge at the "Execute" parameter.

If the "Done" parameter shows the value TRUE, then the "MC_Home" job has been completed according to the selected "HomingMode". The "Homed" status of the technology object is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Homed" (<TO>.StatusWord.X5 (HomingDone)).

Termination of a passive homing process with "HomingMode" = 9

With "HomingMode" = 9, the technology object is not homed. If a running "MC_Home" job for passive homing ("HomingMode" = 2, 3, 8) is overridden by another "MC_Home" job with "HomingMode" = 9, then the running job is terminated with the parameter "CommandAborted" = TRUE. The overriding job with "HomingMode" = 9 signals successful execution with the parameter "Done" = TRUE.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Error ID (Page 386)

11.2.3 MC_MoveJog

11.2.3.1 MC_MoveJog: Move axes in jog mode V1

Description

With the Motion Control instruction "MC_MoveJog", you can move an axis in jog mode.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified at the "Velocity" parameter.

Applies to

- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveJog" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Starting a "MC_MoveJog" job aborts the following active Motion Control jobs:

- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_MoveJog" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
JogForward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the positive direction at the velocity specified in parameter "Velocity".	
JogBackward	INPUT	BOOL	FALSE	As long as the parameter is TRUE, the axis moves in the negative direction at the velocity specified in parameter "Velocity".	
Velocity	INPUT	LREAL	100.0	Setpoint speed / setpoint speed for the motion process Value > 0.0: The specified value is used. Value < 0.0: The specified value is used. ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The setpoint velocity / setpoint speed was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Behavior with setpoint velocity / setpoint speed zero (Velocity" = 0.0)

An "MC_MoveJog" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the setpoint velocity / setpoint speed zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

Moving an axis in jog mode

Proceed as follows to move an axis in jog mode:

1. Check the requirements indicated above.
2. Move the axis in the positive direction with "JogForward", or in the negative direction with "JogBackward".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

Note

Behavior when changing the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), then the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity is reached ("Velocity" × "Override" %), then "InVelocity" is set again.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

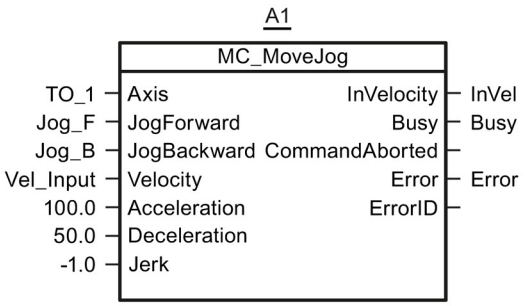
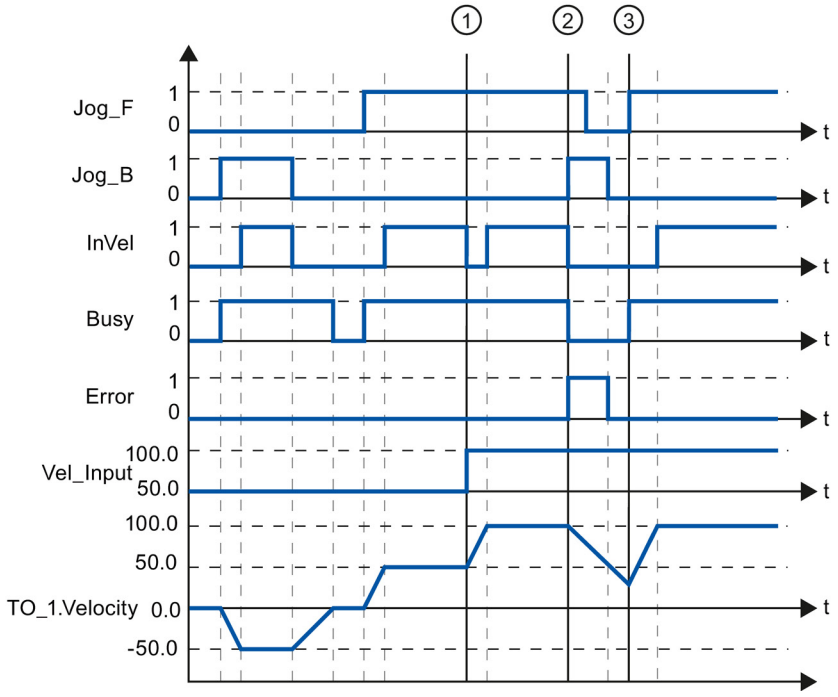
Error ID (Page 386)

11.2.3.2 MC_MoveJog: Function chart V1

Function chart: Moving an axis in jog mode





The axis is moved in the negative direction in jog mode via "Jog_B". When the setpoint velocity -50.0 is reached, this is signaled via "InVel" = TRUE. After "Jog_B" is reset, the axis is braked and brought to a standstill. Then the axis is moved in the positive direction via "Jog_F". When the setpoint velocity 50.0 is reached, this is signaled via "InVel" = TRUE.

At time ①, if "Jog_F" is set, the setpoint velocity is changed to 100.0 by means of "Vel_Input". Alternatively, you can also change the setpoint velocity via the velocity override. "InVel" is reset. The axis is being accelerated. When the new setpoint velocity 100.0 is reached, this is signaled via "InVel" = TRUE.

If "Jog_F" is set, "Jog_B" is likewise set at time ②. If both "Jog_F" and "Jog_B" are set, then the axis is braked with the last applicable deceleration. An error is indicated via "Error", and the "ErrorID" of the error 16#8007 (incorrect direction specification) is output.

This error is resolved by resetting the two inputs "Jog_F" and "Jog_B".

During the braking ramp, "Jog_F" is set at time ③. The axis is accelerated to the last configured velocity. When the setpoint velocity 100.0 is reached, this is signaled via "InVel" = TRUE.

11.2.4 MC_MoveVelocity

11.2.4.1 MC_MoveVelocity: Move axes at predefined specified velocity V1

Description

With the Motion Control instruction "MC_MoveVelocity", you can move an axis with a constant velocity.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

- Positioning axis:

  A velocity is specified in the "Velocity" parameter.
- Speed axis:

  A speed is specified at the "Velocity" parameter.

Applies to

- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveVelocity" is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Starting a "MC_MoveVelocity" job aborts the following active Motion Control jobs:

- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_MoveVelocity" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Velocity	INPUT	LREAL	100.0	Setpoint speed / setpoint speed for the motion process ("Velocity" = 0.0 is permitted)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used. Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Direction	INPUT	INT	0	Direction of rotation of the axis	
				0	The sign of the velocity specified at the "Velocity" parameter defines the direction of rotation.
				1	Positive direction of rotation Value of "Velocity" is used.
				2	Negative direction of rotation Value of "Velocity" is used.

Parameter	Declaration	Data type	Default value	Description	
Current	INPUT	BOOL	FALSE	Maintain current velocity	
				FALSE	Disabled The values of parameters "Velocity" and "Direction" are taken into account.
				TRUE	Enabled The values at the parameters "Velocity" and "Direction" are **not** taken into account. The current velocity and direction at function start are retained. When the axis resumes motion at the velocity that was current at function start, the "InVelocity" parameter returns the value TRUE.
InVelocity	OUTPUT	BOOL	FALSE	TRUE	The setpoint velocity / setpoint speed was reached and will be maintained.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Behavior with setpoint velocity / setpoint speed zero (Velocity" = 0.0)

An "MC_MoveVelocity" job with "Velocity" = 0.0 stops the axis with the configured deceleration. When the setpoint velocity / setpoint speed zero is reached, the parameter "InVelocity" will indicate the value TRUE.

Under "Technology object > Diagnostics > Status and error bits > Motion status", "constant velocity" and "standstill" will be displayed (<TO>.StatusWord.X12 (ConstantVelocity); <TO>.StatusWord.X7 (Standstill)).

The parameters "InVelocity" and "Busy" show the value TRUE, until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Moving an axis with constant velocity / speed

Proceed as follows to move an axis with constant velocity / speed:

1. Check the requirements indicated above.
2. At the parameter "Velocity", specify the velocity / speed, with which the axis should be moved.
3. Start the "MC_MoveVelocity" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "InVelocity" and "Error".

If the "InVelocity" parameter shows the value TRUE, then the setpoint velocity / setpoint speed was reached. The axis continues moving at this constant velocity. The parameters "InVelocity" and "Busy" show the value TRUE, until the "MC_MoveVelocity" job is overridden by another Motion Control job.

Note

Behavior when changing the override

If the velocity / speed is influenced during constant motion by a change in the override (<TO>.Override.Velocity), then the "InVelocity" parameter is reset during the acceleration or deceleration. When the newly calculated velocity / speed is reached ("Velocity" × "Override" %), then "InVelocity" is reset.

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

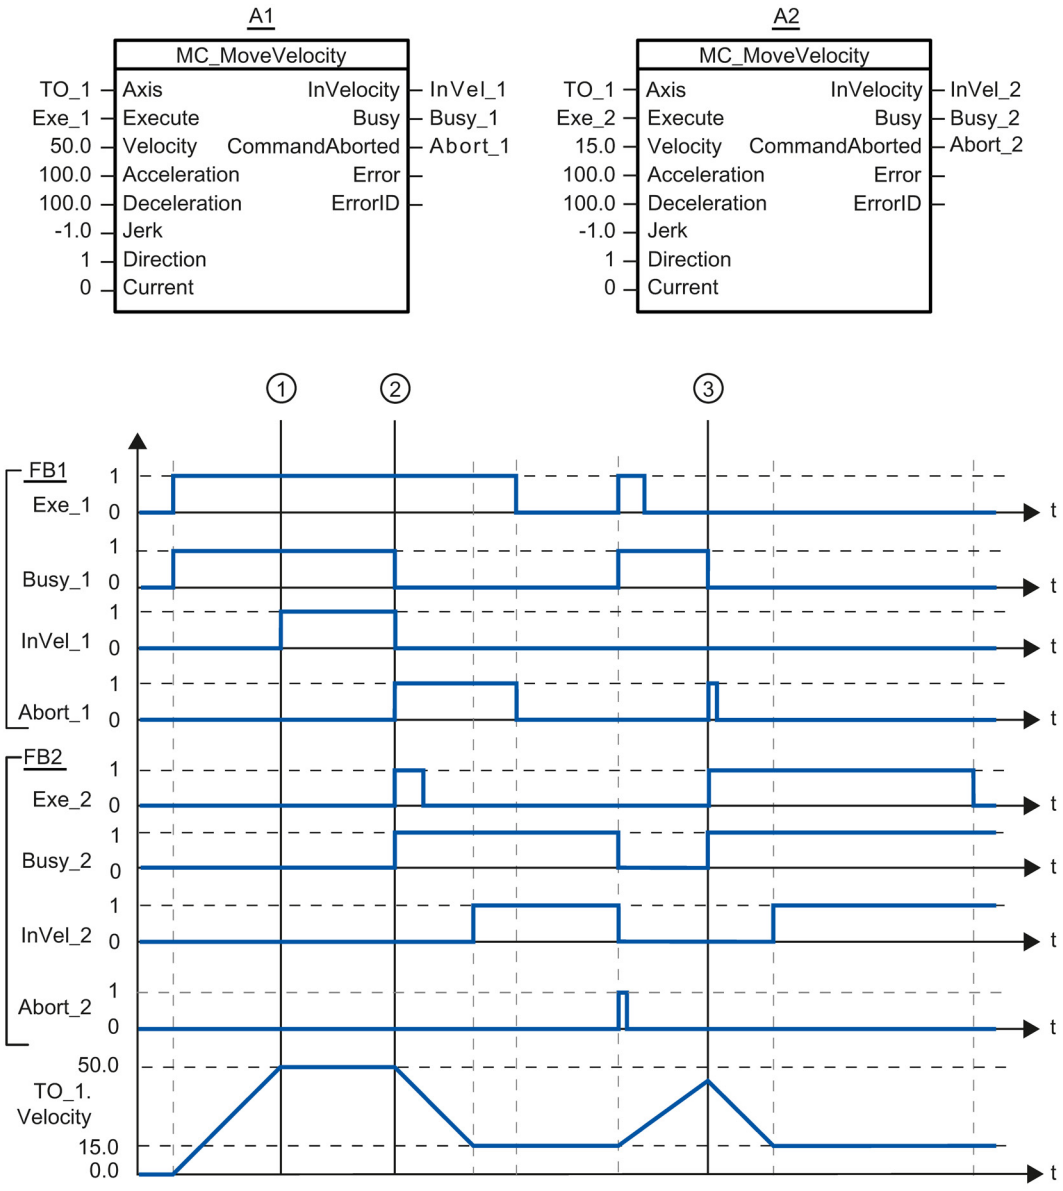
Error ID (Page 386)

11.2.4.2 MC_MoveVelocity: Function chart V1

Function chart: Moving an axis with specification of velocity, and the response to an overriding job



A "MC_MoveVelocity" job (A1) initiated via "Exe_1" accelerates the axis and signals at time ① via "InVel_1" that the setpoint velocity 50.0 has been reached.

At time ②, the task is overridden via another "MC_MoveVelocity" job (A2). The abort is signaled via "Abort_1". When the new setpoint velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

The running "MC_MoveVelocity" job (A2) is overridden by another "MC_MoveVelocity" job (A1). The abort is signaled via "Abort_2". The axis is accelerated to the new setpoint velocity 50.0. Before the setpoint velocity is reached, the current "MC_MoveVelocity" job A1) is overridden at time ③ by another "MC_MoveVelocity" job A2). The abort is signaled via "Abort_1". When the new setpoint velocity 15.0 is reached, this is signaled via "InVel_2". The axis then continues moving at the constant velocity 15.0.

11.2.5 MC_MoveRelative

11.2.5.1 MC_MoveRelative: Relative positioning of axes V1

Description

With the Motion Control instruction "MC_MoveRelative", you can move an axis relative to the position that exists at the beginning of job processing.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_MoveRelative" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Starting a "MC_MoveRelative" job aborts the following active Motion Control jobs:

- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_MoveRelative" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Positioning Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Distance	INPUT	LREAL	0.0	Distance for the positioning process (negative or positive)	
Velocity	INPUT	LREAL	-1.0	Setpoint velocity for the positioning Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Advanced parameters > Default dynamics" is used. (<TO>.DynamicDefaults.Velocity)	
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Target position reached
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.

Parameter	Declaration	Data type	Default value	Description	
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Moving an axis relative to the starting position

Proceed as follows to move an axis relative to the starting position:

1. Check the requirements indicated above.
2. Specify distance to be moved in the "Distance" parameter.
3. Start the "MC_MoveRelative" job with a positive edge at the parameter "Execute".

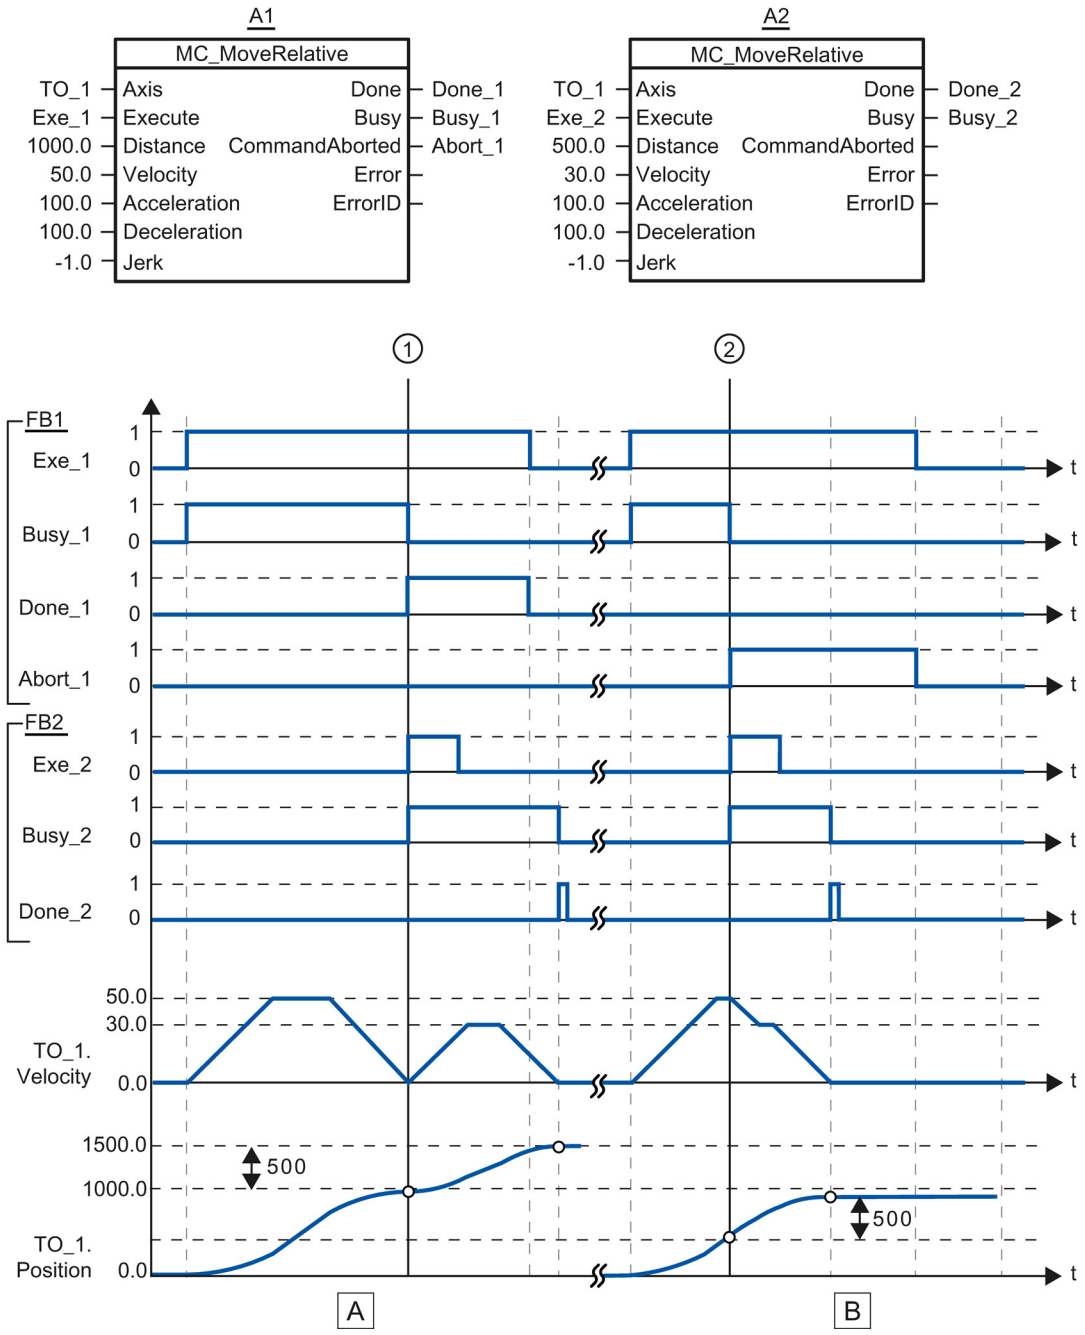
The current motion state is indicated in "Busy", "Done" and "Error".

See also

Error ID (Page 386)

11.2.5.2 MC_MoveRelative: Function chart V1

Function chart: Relative positioning of an axis, and the response to an overriding job



Section A	The axis is moved by an "MC_MoveRelative" job (A1) by the distance ("Distance") 1000.0 (the starting position here is 0.0). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveRelative" job (A2) with distance 500.0 is started. When the axis reaches the new target position, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	A running "MC_MoveRelative" job (A1) is overridden by another "MC_MoveRelative" job (A2). The abort is signaled at time ② via "Abort_1". The axis is then moved at the new velocity by the distance ("Distance") 500.0. When the new target position is reached, this is signaled via "Done_2".

11.2.6 MC_MoveAbsolute

11.2.6.1 MC_MoveAbsolute: Absolute positioning of axes V1

Description

With the Motion Control instruction "MC_MoveAbsolute", you can move an axis to an absolute position.

Dynamic behavior during movement is defined with the parameters "Velocity", "Jerk", "Acceleration" and "Deceleration".

Applies to

- Positioning axis

Requirements

- The technology object has been configured correctly.
- The technology object is enabled.
- The technology object is homed.

Override response

The "MC_MoveAbsolute" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Starting a "MC_MoveAbsolute" job aborts the following active Motion Control jobs:

- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_MoveAbsolute" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description
Axis	InOut	TO_Positioning Axis	-	Technology object
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge
Position	INPUT	REAL	0.0	Absolute target position
Velocity	INPUT	LREAL	-1.0	Setpoint velocity for the positioning Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The velocity configured in "Technology object > Configuration > Advanced parameters > Default dynamics" is used. (<TO>.DynamicDefaults.Velocity)
Acceleration	INPUT	LREAL	-1.0	Acceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The acceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Acceleration)
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)
Direction	INPUT	INT	3	Direction of rotation of the axis Is only evaluated with "modulo" enabled. "Technology object > Configuration > Basic parameters > Enable modulo 1: Positive direction of rotation 2: Negative direction of rotation 3: Shortest path
Done	OUTPUT	BOOL	FALSE	TRUE: Target position reached.

Parameter	Declaration	Data type	Default value	Description	
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Moving an axis to an absolute position

Proceed as follows to move an axis to an absolute position:

1. Check the requirements indicated above.
2. Specify the desired target position at the "Position" parameter.
3. Start the "MC_MoveAbsolute" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error".

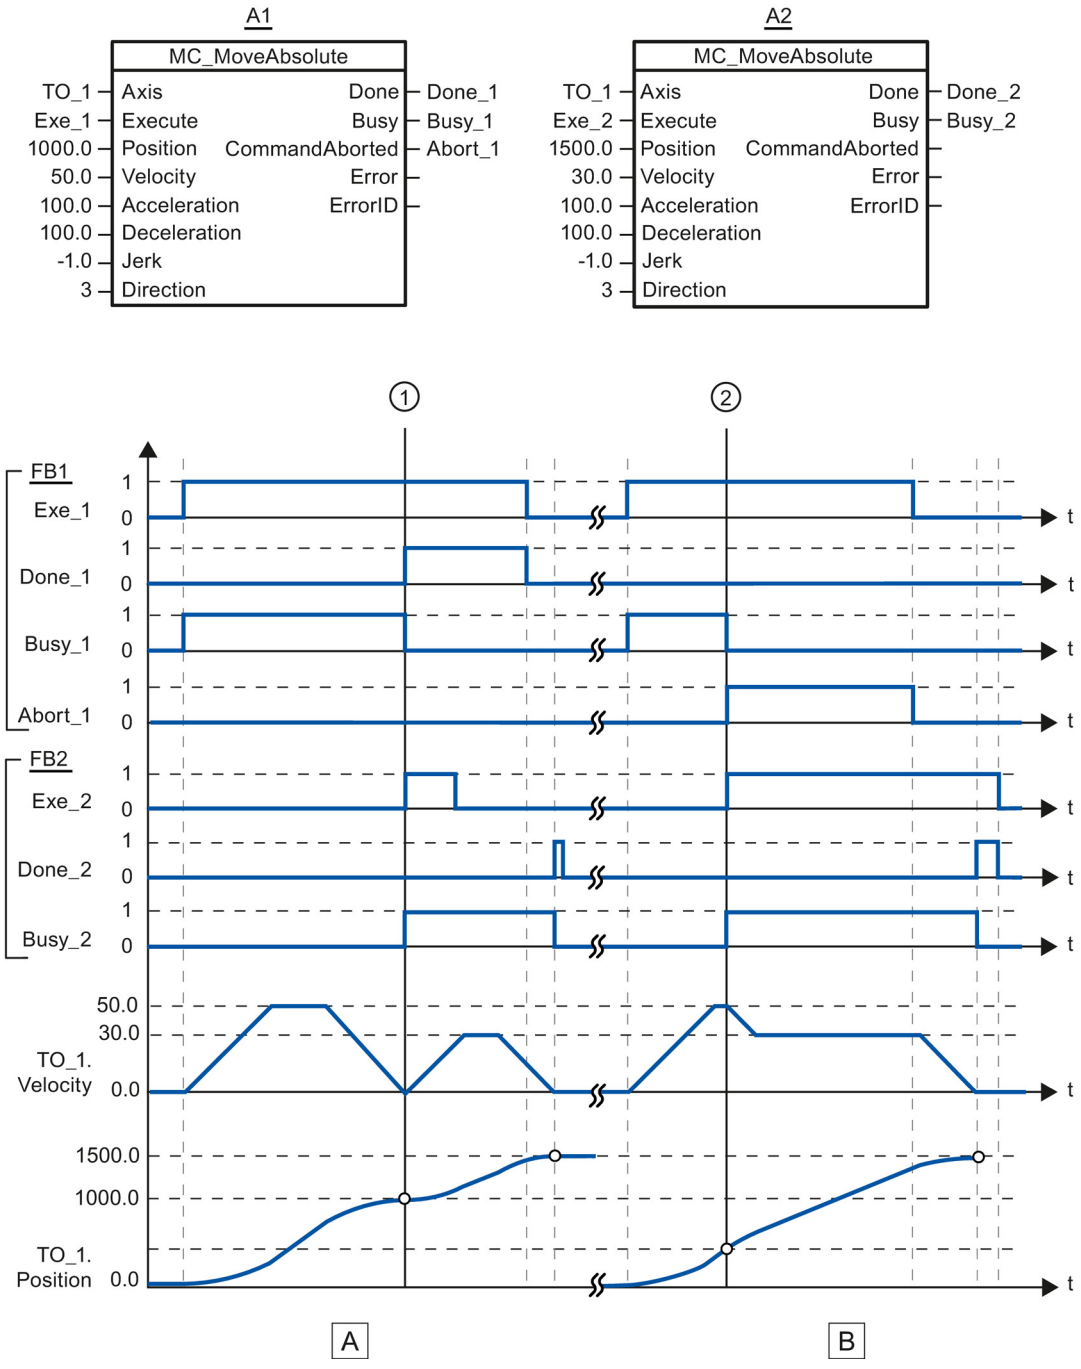
Error ID (Page 386)

11.2.6.2 MC_MoveAbsolute: Function chart V1

Function chart: Absolute positioning of an axis, and the response to an overriding job



Section A	An axis is moved to absolute position 1000.0 with an "MC_MoveAbsolute" job (A1). When the axis reaches the target position, this is signaled at time ① via "Done_1". At this time ①, another "MC_MoveAbsolute" job (A2) with target position 1500.0 is started. When the axis reaches the target position 1500.0, this is signaled via "Done_2". Since "Exe_2" was previously reset, "Done_2" is applied only to one cycle.
Section B	A running "MC_MoveAbsolute" job (A1) is overridden at time ② by another "MC_MoveAbsolute" job (A2). The abort is signaled via "Abort_1". The axis is braked to the changed velocity and moved to the new target position 1500.0. When the new target position is reached, this is signaled via "Done_2".

11.2.7 MC_Halt

11.2.7.1 MC_Halt: Stop axes V1

Description

With the Motion Control instruction "MC_Halt", you can brake an axis to a standstill.

Dynamic behavior during the braking process is defined with the parameters "Jerk" and "Deceleration".

Applies to

- Positioning axis
- Speed axis

Requirement

- The technology object has been configured correctly.
- The technology object is enabled.

Override response

The "MC_Halt" job is aborted by:

- Disabling the axis with "MC_Power.Enable" = FALSE
- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Starting a "MC_Halt" job aborts the following active Motion Control jobs:

- "MC_Home" job "HomingMode" = 4, 5
- "MC_Halt" job
- "MC_MoveAbsolute" job
- "MC_MoveRelative" job
- "MC_MoveVelocity" job
- "MC_MoveJog" job

Parameters

The following table shows the parameters of the "MC_Halt" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_SpeedAxis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Deceleration	INPUT	LREAL	-1.0	Deceleration Value > 0.0: The specified value is used. Value = 0.0: not permitted Value < 0.0: The deceleration configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Deceleration)	
Jerk	INPUT	LREAL	-1.0	Jerk Value > 0.0: Constant-acceleration velocity profile; the specified jerk is used Value = 0.0: Trapezoid velocity profile Value < 0.0: The jerk configured in "Technology object > Configuration > Extended parameters > Dynamic defaults" is used. (<TO>.DynamicDefaults.Jerk)	
Done	OUTPUT	BOOL	FALSE	TRUE	Zero velocity reached
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Braking an axis with "MC_Halt"

Proceed as follows to decelerate an axis to a standstill:

1. Check the requirements indicated above.
2. Supply the parameters "Deceleration" and "Jerk" with the desired values.
3. Start the "MC_Halt" job with a positive edge at the parameter "Execute".

The current motion state is indicated in "Busy", "Done" and "Error". The standstill of the axis is indicated under "Technology object > Diagnostics > Status and error bits > Motion status > Standstill" (<TO>.StatusWord.X7 (Standstill)).

Additional information

An option for the evaluation of the individual status bits can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

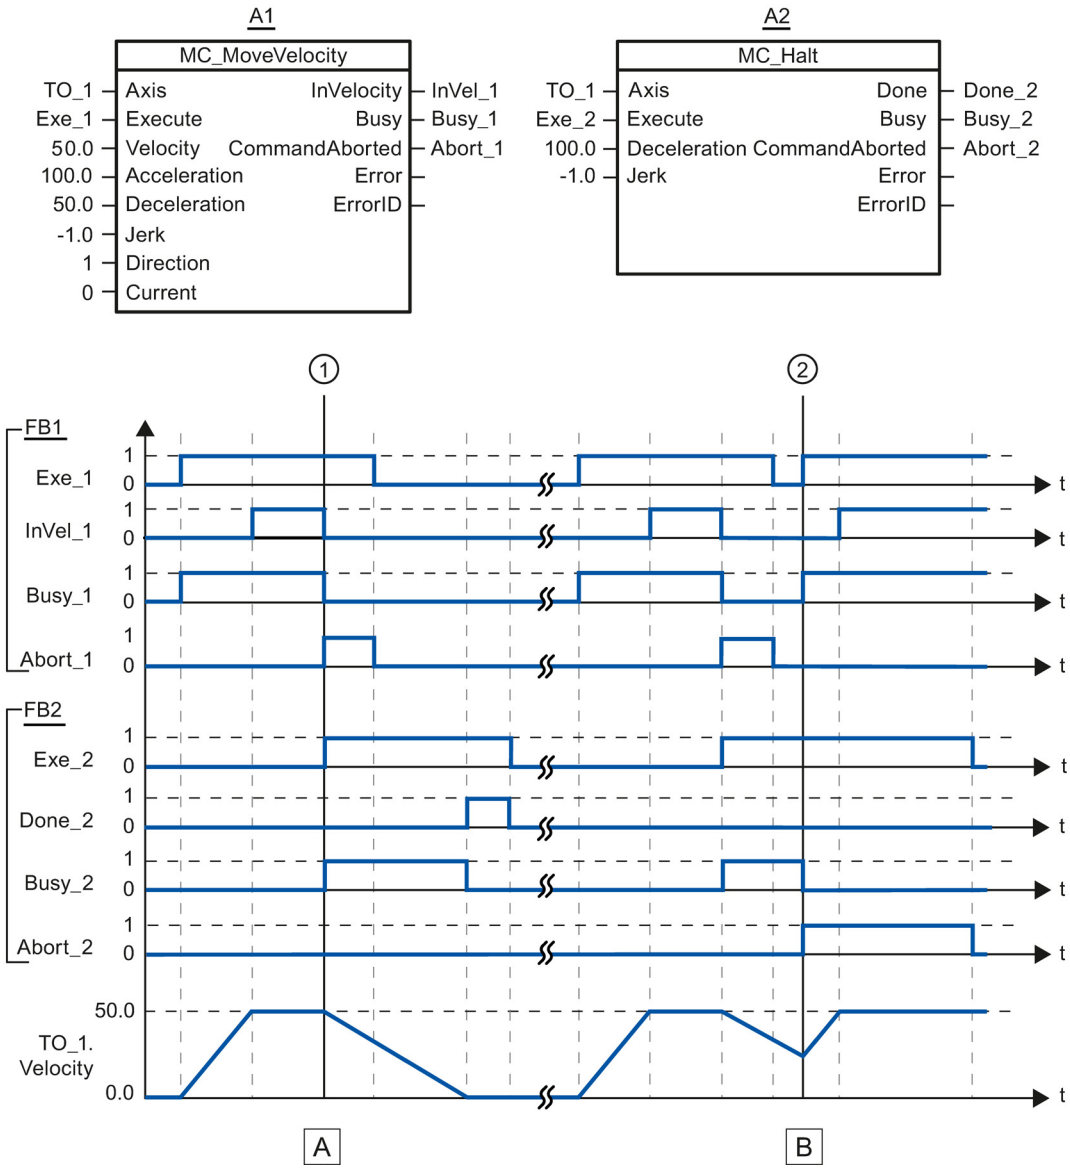
11.2.7.2 MC_Halt: Function chart V1

Function chart: Stopping an axis, and the response to an overriding job



Section A	An axis is moved with an "MC_MoveVelocity" job (A1). When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". At time ①, the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job termination is signaled via "Abort_1". The axis is braked to a standstill. Successful completion of the "MC_Halt" job is signaled via "Done_2".
Section B	The axis is moved with an "MC_MoveVelocity" job (A1). When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". Next the "MC_MoveVelocity" job is overridden by an "MC_Halt" job (A2). The job termination is signaled via "Abort_1". During the braking process the "MC_Halt" job is overridden at time ② by an "MC_MoveVelocity" job (A1). The job termination is signaled via "Abort_2". When the setpoint velocity 50.0 is reached, this is signaled via "InVel_1". The axis is then moved with constant velocity.

11.2.8 MC_Reset

11.2.8.1 MC_Reset: Acknowledge alarms, restart technology objects V1

Description

All technology alarms that can be acknowledged in the user program are acknowledged with the Motion Control instruction "MC_Reset". Acknowledgment also resets the "Error" and "Warning" bits in the technology data block.

Technology objects are reinitialized (restarted) using the Motion Control instruction "MC_Reset" with "Restart" = TRUE. Upon restart of the technology object, the new configuration data are applied in the technology data block.

Applies to

- Positioning axis
- Speed axis
- External encoder

Requirements

- The cause of the error for a pending technology alarm has been resolved.
- For a restart, the technology object must be disabled.
  ("MC_Power.Status" = FALSE and "MC_Power.Busy" = FALSE)

Override response

- Parameter "Restart" = FALSE:

  Processing of the instruction "MC_Reset" can be aborted by other Motion Control jobs. The MC_Reset job does not abort any running Motion Control jobs.

- Parameter "Restart" = TRUE:

  The processing of the instruction "MC_Reset" with parameter "Restart" = TRUE cannot be aborted by any other Motion Control job.

Parameters

The following table shows the parameters of the "MC_Reset" Motion Control instruction:

Parameter	Declaration	Data type	Default value	Description	
Axis	InOut	TO_Axis	-	Technology object	
Execute	INPUT	BOOL	FALSE	Start of the job with a positive edge	
Restart	INPUT	BOOL	FALSE	TRUE	"Restart" Reinitialization of the technology object and acknowledgment of pending technology alarms. The technology object is reinitialized with the configured start values.
				FALSE	Acknowledgement of queued technology alarms.
Done	OUTPUT	BOOL	FALSE	TRUE	Error has been acknowledged. Restart has been executed.
Busy	OUTPUT	BOOL	FALSE	TRUE	The job is being executed.
CommandAborted	OUTPUT	BOOL	FALSE	TRUE	During execution the job was aborted by another job.
Error	OUTPUT	BOOL	FALSE	TRUE	An error occurred during execution of the job. The job is rejected. The cause of the error can be found in the "ErrorID" parameter.
ErrorID	OUTPUT	WORD	16#0000	Error ID (Page 386) for parameter "Error"	

Acknowledging technology alarms

To acknowledge technology alarms, follow these steps:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = FALSE.
3. Start the acknowledgement of the error with a positive edge at parameter "Execute".

If the Done parameter shows the value TRUE, then the error was acknowledged.

Note

Acknowledging with "Restart" = FALSE

If only the technology alarms are to be acknowledged, set "Restart" = FALSE. The technology object cannot be used during a restart.

Restarting a technology object

Proceed as follows to restart a technology object:

1. Check the requirements indicated above.
2. Set the parameter "Restart" = TRUE.
3. Perform the restart with a positive edge at the input parameter "Execute".

If the "Done" parameter shows the value TRUE, then the restart of the technology object has been completed.

Additional information on a restart can be found in the Restarting Technology Objects (Page 197) section.

Appendix A

A.1 Tags of the technology object SpeedAxis

A.1.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Immediate: Changes to the value are made with a direct assignment and are immediately effective.
	RES	Restart: Changes to the start value in load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed.
Description	Description of the tag	

L - Linear specification R - Rotary specification

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.1.2 Actual values and setpoints (speed axis)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 321)

Tag	Data type	Values	W	Description
Velocity	LREAL	-	RON	Setpoint velocity / setpoint speed
ActualSpeed	LREAL	-	RON	Actual speed of the motor (with analog setpoint = 0.0)
Acceleration	LREAL	-	RON	Setpoint acceleration

A.1.3 Variable simulation (speed axis)

The tag structure <TO>.Simulation.<tag name> contains the configuration for the simulation signal. In simulation mode, you can simulate axes without a real drive in the CPU.

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
Simualtion.		STRUCT			
	Mode	DINT	-	RES	Simulation mode 0: no simulation, normal operation 1: Simulation mode

A.1.4 Actor tags (speed axis)

The tag structure <TO>.Actor.<tag name> contains the controller-side configuration for the drive.

Tags

Legend (Page 321)

Tag			Data type	Values	W	Description
Actor.			STRUCT			
	Type		DINT	-	RON	Drive connection 1: PROFIdrive frame 0: Analog output
	InverseDirection		BOOL	-	RES	Inversion of the setpoint FALSE: no TRUE: yes
	Interface.		STRUCT			
		AddressIn	UDINT	0 to 65535	RON	Input address for the PROFIdrive frame
		AdressOut	UDINT	0 to 65535	RON	Output address for the PROFIdrive frame or the analog setpoint
		Telegram	UDINT	-	RON	PROFIdrive frame of the drive 1: NSET (16 bit), NACT (16 bit) 2: NSET (32 bit), NACT (32 bit), signs of life 3: NSET (32 bit), NACT (32 bit), actual encoder value, signs of life 5: NSETP (32-bit), NACT (32-bit), actual encoder value, sign-of-life, DSC (NSET - setpoint speed, NACT - actual speed value)

Tag			Data type	Values	W	Description
		EnableDriveOutput	BOOL	-	RON	"Enable output" for analog drives FALSE: disabled TRUE: enabled
		EnableDrive OutputAddress	UDINT	0 to 65535	RON	Byte number for the "enable output"
		EnableDrive OutputBitNumber	UDINT	0 to 7	RON	Bit number for the "enabling output"
		DriveReadyInput	BOOL	-	RON	"Ready input" for analog drives The analog drive signals its readiness to receive setpoint speeds. FALSE: disabled TRUE: enabled
		DriveReady InputAddress	UDINT	0 to 65535	RON	Byte number for the "ready input"
		DriveReady InputBitNumber	UDINT	0 to 7	RON	Bit number for the "ready input"
	DriveParameter.					
		ReferenceSpeed	LREAL	0.0 to 1.0E12	RES	Reference value (100%) for the setpoint speed of the drive (N-set) The setpoint speed is transmitted in the PROFIdrive frame as a standardized value from -200% to 200% of the "ReferenceSpeed". For setpoint specification via an analog output, the analog output can be operated in the range from -117% to 117%, insofar as the drive permits this.
		MaxSpeed	LREAL	0.0 to 1.0E12	RES	Maximum value for the setpoint speed of the drive (N-set) (PROFIdrive: MaxSpeed ≤ 2 × ReferenceSpeed Analog setpoint: MaxSpeed ≤ 1.17 × ReferenceSpeed)

A.1.5 LoadGear tags (speed axis)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 321)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.1.6 DynamicLimits tags (speed axis)

The tag structure <TO>.DynamicLimits.<tag name> contains the configuration of the dynamic limits. During Motion Control, no dynamic values greater than the dynamic limits are permitted. If you have specified greater values in a Motion Control instruction, then motion is performed using the dynamic limits, and a warning is indicated (alarm 501 to 503 - Dynamic values were limited).

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
DynamicLimits.		STRUCT			
	MaxVelocity	LREAL	0.0 to 1.0E12	RES	Maximum permissible velocity of the axis
	MaxAcceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible acceleration of the axis
	MaxDeceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible deceleration of the axis
	MaxJerk	LREAL	0.0 to 1.0E12	DIR	Maximum permissible jerk on the axis

A.1.7 DynamicDefaults tags (speed axis)

The tag structure <TO>.DynamicDefaults.<tag name> contains the configuration of the dynamic defaults. These settings will be used, if you specify a dynamic value less than 0.0 in a Motion Control instruction (exceptions: MC_MoveJog.Velocity, MC_MoveVelocity.Velocity). Changes to the dynamic defaults will be applied with the next rising edge at the "Execute" parameter of a Motion Control instruction.

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
DynamicDefaults.		STRUCT			
	Velocity	LREAL	0.0 to 1.0E12	DIR	Default velocity
	Acceleration	LREAL	0.0 to 1.0E12	DIR	Default acceleration
	Deceleration	LREAL	0.0 to 1.0E12	DIR	Default deceleration
	Jerk	LREAL	0.0 to 1.0E12	DIR	Default jerk
	EmergencyDeceleration	LREAL	0.0 to 1.0E12	DIR	Emergency stop deceleration

A.1.8 Override tags (speed axis)

The tag structure <TO>.Override.<tag name> contains the configuration for the override parameters. The override parameters are used to apply a correction percentage to default values. An override change takes effect immediately, and is performed with the dynamic settings in effect in the Motion Control instruction.

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

A.1.9 StatusDrive tags (speed axis)

The tag structure <TO>.StatusDrive.<tag name> indicates the status of the drive.

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
StatusDrive.		STRUCT			
	InOperation	BOOL	-	RON	Operational status of the drive FALSE: Drive not ready. Setpoints will not be executed. TRUE: Drive ready. Setpoints can be executed.
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and drive FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No error at the drive TRUE: Error at the drive

A.1.10 StatusWord tag (speed axis)

The <TO>.StatusWord tag contains the status information of the technology object.

Notes on the evaluation of the individual bits (e.g. bit 0, "Enable") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 321)

Tag	Data type	Values	W	Description
Status tus-Word	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tag unchanged 1: Change to "Restart" tag. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"ControlPanelActive" Axis control panel 0: disabled 1: enabled
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"Done" 0: Motion job in process, or axis control panel enabled 1: No motion job in process and axis control panel disabled
Bit 7	-	-	-	Reserved
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	"JogCommand" 0: No "MC_MoveJog" frame active 1: "MC_MoveJog" job active
Bit 10	-	-	-	"VelocityCommand" 0: No "MC_MoveVelocity" job active 1: "MC_MoveVelocity" job active
Bit 11	-	-	-	Reserved

Tag	Data type	Values	W	Description
Bit 12	-	-	-	"ConstantVelocity" 0: The axis accelerates or decelerates. 1: Velocity setpoint reached. The axis is traversing at this constant velocity or is at a standstill.
Bit 13	-	-	-	"Accelerating" 0: No acceleration process active 1: Acceleration process active
Bit 14	-	-	-	"Decelerating" 0: No deceleration process active 1: Deceleration process active
Bit 15... Bit 31	-	-	-	Reserved

A.1.11 ErrorWord tag (speed axis)

The <TO>.ErrorWord tag indicates errors at the technology object (technology alarms).

Notes on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the section Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 321)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" System error
Bit 1	-	-	-	"ConfigurationFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in the user program in a motion control instruction, or in its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met.
Bit 4	-	-	-	"DriveFault" Error in the drive
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.1.12 ErrorDetail tags (speed axis)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction to the technology alarm that is currently pending at the technology object.

A list of the technology alarms and alarm reactions can be found in the appendix, Technology Alarms (Page 368).

Tags

Legend (Page 321)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0 to 5	RON	Effective alarm reaction 0: No reaction 1: Stop with current dynamic values 2 Stop with maximum dynamic values 3: Stop with emergency stop ramp 4: Remove enable 5: Follow-up setpoints For the external encoder technology object, only alarm reactions 0 and 4 are possible.

A.1.13 WarningWord tag (speed axis)

The <TO>.WarningWord tag indicates pending warnings at the technology object.

Notes on the evaluation of the individual bits (e.g. bit 11, "FollowingErrorWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 321)

Tag	Data type	Values	W	Description
Warning-Word	DWORD	-	RON	
Bit 0	-	-	-	Reserved
Bit 1	-	-	-	"ConfigurationFault" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	Reserved
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	Reserved
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7... Bit 31	-	-	-	Reserved

A.1.14 ControlPanel tags (speed axis)

The tag structure <TO>.ControlPanel.<tag name> contains no application-relevant data. This tag structure is internally used.

Evaluating the technology data block (Page 173)

A.2.10 DynamicLimits tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicLimits.<tag name> contains the configuration of the dynamic limits. During Motion Control, no dynamic values greater than the dynamic limits are permitted. If you have specified greater values in a Motion Control instruction, then motion is performed using the dynamic limits, and a warning is indicated (alarm 501 to 503 - Dynamic values were limited).

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
DynamicLimits.		STRUCT			
	MaxVelocity	LREAL	0.0 to 1.0E12	RES	Maximum permissible velocity of the axis
	MaxAcceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible acceleration of the axis
	MaxDeceleration	LREAL	0.0 to 1.0E12	DIR	Maximum permissible deceleration of the axis
	MaxJerk	LREAL	0.0 to 1.0E12	DIR	Maximum permissible jerk on the axis

See also

Evaluating the technology data block (Page 173)

A.2.11 DynamicDefaults tags (positioning axis/synchronous axis)

The tag structure <TO>.DynamicDefaults.<tag name> contains the configuration of the dynamic defaults. These settings will be used, if you specify a dynamic value less than 0.0 in a Motion Control instruction (exceptions: MC_MoveJog.Velocity, MC_MoveVelocity.Velocity). Changes to the dynamic defaults will be applied with the next rising edge at the "Execute" parameter of a Motion Control instruction.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
DynamicDefaults.		STRUCT			
	Velocity	LREAL	0.0 to 1.0E12	DIR	Default velocity
	Acceleration	LREAL	0.0 to 1.0E12	DIR	Default acceleration
	Deceleration	LREAL	0.0 to 1.0E12	DIR	Default deceleration
	Jerk	LREAL	0.0 to 1.0E12	DIR	Default jerk
	EmergencyDeceleration	LREAL	0.0 to 1.0E12	DIR	Emergency stop deceleration

Evaluating the technology data block (Page 173)

A.2.13 PositionLimits_HW tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionLimits_HW.<tag name> contains the configuration for position monitoring with hardware limit switches. Hardware limit switches are used to limit the traversing range of a positioning axis.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
PositionLimits_HW.		STRUCT			
	Active	BOOL	-	RES	FALSE: Monitoring disabled TRUE: Monitoring enabled With "Active", both (negative and positive) hardware limit switches are enabled or disabled.
	MinSwitchLevel	BOOL	-	RES	Level selection for enabling of the negative hardware limit switch: FALSE: Lower level (low-enabled) TRUE: Upper level (high-enabled)
	MinSwitchAddress	UDINT	0 to 65535	RON	Byte number for the negative hardware limit switch
	MinSwitchBitNumber	UDINT	0 to 7	RON	Bit number for the negative hardware limit switch
	MaxSwitchLevel	BOOL	-	RES	Level selection for enabling of the positive hardware limit switch: FALSE: Lower level (low-enabled) TRUE: Upper level (high-enabled)
	MaxSwitchAddress	UDINT	0 to 65535	RON	Byte number for the positive hardware limit switch
	MaxSwitchBitNumber	UDINT	0 to 7	RON	Bit number for the positive hardware limit switch

Evaluating the technology data block (Page 173)

A.2.14 Homing tags (positioning axis/synchronous axis)

The tag structure <TO>.Homing.<tag name> contains the configuration for homing the TO.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
Homing.		STRUCT			
	AutoReversal	BOOL	-	RES	Reversal at the hardware limit switches FALSE: no TRUE: yes
	ApproachDirection	BOOL	-	DIR	Direction of approach to the homing position switch FALSE: Negative side TRUE: Positive direction
	ApproachVelocity	LREAL	L: 0.0 to 10000.0 mm/s R: 0.0 to 360000.0°/s	DIR	Approach velocity Velocity during active homing, with which the axis moves toward the proximity switch and toward home position.
	ReferencingVelocity	LREAL	L: 0.0 to 1000.0 mm/s R: 0.0 to 36000.0°/s	DIR	Homing velocity Velocity during active homing, with which the axis is moved toward home position.
	HomePosition	LREAL	-1.0E12 to 1.0E12	DIR	Home position

See also

Evaluating the technology data block (Page 173)

A.2.15 Override tags (positioning axis/synchronous axis)

The tag structure <TO>.Override.<tag name> contains the configuration for the override parameters. The override parameters are used to apply a correction percentage to default values. An override change takes effect immediately, and is performed with the dynamic settings in effect in the Motion Control instruction.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
Override.		STRUCT			
	Velocity	LREAL	0.0 to 200.0%	DIR	Velocity or speed override Percentage correction of the velocity/speed

See also

Evaluating the technology data block (Page 173)

A.2.16 PositionControl tags (positioning axis/synchronous axis)

The tag structure <TO>.PositionControl.<tag name> contains the settings for position control.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
PositionControl.		STRUCT			
	Kv	LREAL	0.0 to 2147480.0	DIR	Proportional gain in the position control ("Kv" > 0.0)
	Kpc	LREAL	0.0 to 150.0%	DIR	Velocity pre-control in the position control Recommended setting: • Isochronous drive connection via PROFIdrive: 100.0% • Non-isochronous drive connection via PROFIdrive: 0.0 to 100.0% • Analog drive connection: 0.0 to 100.0%
	EnableDSC	BOOL	-	RES	Dynamic Servo Control (DSC) FALSE: DSC disabled TRUE: DSC enabled DSC is only possible if frame 5 is used.

See also

Evaluating the technology data block (Page 173)

A.2.17 FollowingError tags (positioning axis/synchronous axis)

The tag structure <TO>.FollowingError.<tag name> contains the configuration for following error monitoring.

If the permissible following error is exceeded, then technology alarm 521 is output, and the technology object is disabled (alarm reaction: remove enable).

When the warning level is reached, a warning is output (technology alarm 522).

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
FollowingError.		STRUCT			
	EnableMonitoring	BOOL	-	RES	FALSE: Following error monitoring disabled TRUE: Following error monitoring enabled
	MinValue	LREAL	L: 0.0 to 1.0E12 R: 0.001 to 1.0E12	DIR	Permissible following error at velocities below the value of "MinVelocity".
	MaxValue	LREAL	L: 0.0 to 1.0E12 R: 0.002 to 1.0E12	DIR	Maximum permissible following error, which may be reached at the maximum velocity.
	MinVelocity	LREAL	0.0 to 1.0E12	DIR	"MinValue" is permissible below this velocity, and is held constant.
	WarningLevel	LREAL	0.0 to 100.0	DIR	Warning level: Percentage value relative to the valid maximum following error.

See also

Evaluating the technology data block (Page 173)

A.2.18 PositionMonitoring tags (positioning axis/synchronous axis)

The tag structure <TO>.PositioningMonitoring.<tag name> contains the configuration for position monitoring at the end of a positioning motion.

If the actual position value at the end of a positioning motion is reached within the tolerance time and remains in the positioning window for the minimum dwell time, then <TO>.StatusWord.X5 (Done) is set in the technology data block. This completes a Motion Control job.

If the tolerance time is exceeded, then technology alarm 541 "Positioning monitoring" with supplemental value 1: "Target area not reached within the positioning tolerance time" will be indicated.

If the minimum dwell time is not met, then technology alarm 541 "Positioning monitoring" with supplemental value 2: "Target area exited within the minimum dwell time" will be indicated.

Tags

Legend (Page 332)

Tag		Data type	Values	W	Description
PositioningMonitoring.		STRUCT			
	ToleranceTime	LREAL	0.0 to 1.0E12	DIR	Tolerance time Maximum permitted duration from reaching velocity setpoint zero, until entrance into the positioning window.
	MinDwellTime	LREAL	0.0 to 1.0E12	DIR	Minimum dwell time in the positioning window:
	Window	LREAL	0.0 to 1.0E12	DIR	Positioning window

Evaluating the technology data block (Page 173)

A.2.23 StatusSynchronizedMotion tags (synchronous axis)

The tag structure <TO>.StatusSynchronizedMotion.<tag name> indicates the status of the synchronous operation.

Tags

Legend (Page 332)

Tag		Data type	Value range	W	Description
StatusSynchronizedMotion.		STRUCT			
	ActualMaster	DB_ANY	-	RON	When a "MC_GearIn" job is started, the number of the technology data block of the currently used leading axis is displayed. "ActualMaster" = 0 with disabled synchronous operation

See also

Synchronous operation (Page 73)

A.2.24 StatusWord tag (positioning axis/synchronous axis)

The <TO>.StatusWord tag contains the status information of the technology object.

Notes on the evaluation of the individual bits (e.g. bit 5, "HomingDone") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 332)

Tag	Data type	Values	W	Description
Status-Word	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tag unchanged 1: Change to "Restart" tag. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	"ControlPanelActive" Axis control panel 0: disabled 1: enabled
Bit 5	-	-	-	"HomingDone" Homing status 0: Technology object not homed 1: Technology object homed
Bit 6	-	-	-	"Done" 0: Motion job in process, or axis control panel enabled 1: No motion job in process and axis control panel disabled
Bit 7	-	-	-	"Standstill" Standstill signal 0: Axis in motion 1: Axis at a standstill
Bit 8	-	-	-	"PositioningCommand" 0: No positioning job active 1: Positioning job active ("MC_MoveReleative", "MC_MoveAbsolute")
Bit 9	-	-	-	"JogCommand" 0: No "MC_MoveJog" frame active 1: "MC_MoveJog" job active

Tag	Data type	Values	W	Description
Bit 10	-	-	-	"VelocityCommand" 0: No "MC_MoveVelocity" job active 1: "MC_MoveVelocity" job active
Bit 11	-	-	-	"HomingCommand" 0: No "MC_Home" job in process 1: "MC_Home" job in process
Bit 12	-	-	-	"ConstantVelocity" 0: The axis accelerates or decelerates. 1: Velocity setpoint reached. The axis is traversing at this constant velocity or is at a standstill.
Bit 13	-	-	-	"Accelerating" 0: No acceleration process active 1: Acceleration process active
Bit 14	-	-	-	"Decelerating" 0: No deceleration process active 1: Deceleration process active
Bit 15	-	-	-	"SWLimitMinActive" 0: Negative software limit switch not reached 1: Negative software limit switch reached or exceeded
Bit 16	-	-	-	"SWLimitMaxActive" 0: Positive software limit switch not reached 1: Positive software limit switch reached or exceeded
Bit 17	-	-	-	"HWLimitMinActive" 0: Negative hardware limit switch not reached 1: Negative Hardware limit switch reached or exceeded
Bit 18	-	-	-	"HWLimitMaxActive" 0: Positive hardware limit switch not reached 1: Positive hardware limit switch reached or exceeded
Bit 19	-	-	-	Reserved
Bit 20	-	-	-	Reserved
Bit 21	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronizing" 0: The axis does not synchronize to a master value. 1: The axis synchronizes to a master value.
Bit 22	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "Synchronous" 0: The axis does not move synchronously to a master value. 1: The axis moves synchronously to a master value.

Tag	Data type	Values	W	Description
Bit 23	-	-	-	"SuperimposedMotionCommand" 0: No superimposed motion active 1: Superimposed motion active
Bit 24... Bit 31	-	-	-	Reserved

A.2.25 ErrorWord tag (positioning axis/synchronous axis)

The <TO>.ErrorWord tag indicates errors at the technology object (technology alarms).

Notes on the evaluation of the individual bits (e.g. bit 3, CommandNotAccepted) can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 332)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" System error
Bit 1	-	-	-	"ConfigurationFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in the user program in a motion control instruction, or in its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met.
Bit 4	-	-	-	"DriveFault" Error in the drive
Bit 5	-	-	-	"SensorFault" Error in the encoder system
Bit 6	-	-	-	"DynamicError" Specified dynamic values are limited to permissible values.
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.

Tag	Data type	Values	W	Description
Bit 8	-	-	-	"SWLimit" Software limit switch reached or overshot.
Bit 9	-	-	-	"HWLimit" Hardware limit switch reached or overshot.
Bit 10	-	-	-	"HomingFault" Error during homing process The homing cannot be completed.
Bit 11	-	-	-	"FollowingErrorFault" Following error limits exceeded
Bit 12	-	-	-	"PositioningFault" Positioning error
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14	-	-	-	Positioning axis technology object: Reserved Synchronous axis technology object: "SynchronousError" Error during synchronous operation The leading axis specified at the Motion Control instruction "MC_GearIn" was not configured as a possible leading axis.
Bit 15... Bit 31	-	-	-	Reserved

A.3 Tags of the technology object external encoder

A.3.1 Legend

Tag	Name of the tag	
Data type	Data type of the tag	
Values	Value range of the tag - minimum value to maximum value If no specific value is shown, the value range limits of the relevant data type apply or the information under "Description".	
W	Effectiveness of changes in the technology data block	
	DIR	Immediate: Changes to the value are made with a direct assignment and are immediately effective.
	RES	Restart: Changes to the start value in load memory are made using the extended instruction "WRIT_DBL" (write to DB in load memory). Changes will not take effect until after restart of the technology object.
	RON	Read only: The tag cannot and must not be changed.
Description	Description of the tag	

L - Linear specification R - Rotary specification

Access to the tags is with "<TO>.<tag name>". The placeholder <TO> represents the name of the technology object.

A.3.2 Actual values and setpoints (external encoder)

The following tags indicate the setpoint and actual values of the technology object.

Tags

Legend (Page 358)

Tag	Data type	Values	W	Description
ActualPosition	LREAL	-	RON	Actual position
ActualVelocity	LREAL	-	RON	Actual velocity
ActualAcceleration	LREAL	-	RON	Actual acceleration

A.3.3 Sensor tags (external encoder)

The tag structure <TO>.Sensor.<tag name> contains the CPU-side configuration for the encoder, and the configuration for active and passive homing.

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
Sensor.		STRUCT			
	Type	DINT	-	RES	Encoder type 0: Incremental 1: Absolute 2: Cyclically absolute
	InverseDirection	BOOL	-	RES	Inversion of the actual value FALSE: no TRUE: yes
	System	DINT	-	RES	Encoder system 0: Linear encoder 1: Rotary encoder
	MountingMode	DINT	-	RES	Mounting type of the encoder 0: Incremental 1: Absolute 2: External

Tag			Data type	Values	W	Description
	Interface.					
		AddressIn	UDINT	0 to 65535	RON	Input address for the PROFIdrive frame
		AddressOut	UDINT	0 to 65535	RON	Output address for the PROFIdrive frame
		Telegram	UDINT	-	RON	PROFIdrive frame of the encoder 3: Actual values via drive frame (NSET (32 bit), NACT (32 bit), actual encoder value, signs of life) 5: Actual values from drive frame (NSETP (32-bit), NACT (32-bit), actual encoder value, sign-of-life, DSC) 81: Actual values via your own encoder telegram (actual encoder value, signs of life) 83: Actual values via your own encoder telegram (NACT (32 bit), actual encoder value, signs of life) For the technology object of external encoders, only frames 81 and 83 are valid. (NSET - setpoint speed, NACT - actual speed value)
	Parameter.					
		Resolution	LREAL	1.0E-12 to 1.0E12	RES	Resolution of a linear encoder (offset between two encoder pulses)
		StepsPer Revolution	UDINT	1 to 8388608	RES	Increments per rotary encoder revolution
		FineResolution Xist1	UDINT	0 to 31	RES	Number of bits for fine resolution Gn_XIST1 (cyclic actual encoder value)
		FineResolution Xist2	UDINT	0 to 31	RES	Number of bits for fine resolution Gn_XIST2 (absolute value of the encoder)
		Determinable Revolutions	UDINT	0 to 8388608	RES	Number of differentiable encoder revolutions for a multi-turn absolute value encoder (For a single-turn absolute value encoder = 1; for an incremental encoder = 0)
		DistancePer Revolution	LREAL	0.0 to 1.0E12	RES	Load distance per revolution of an externally mounted encoder
	PassiveHoming.		STRUCT			
		Mode	DINT	-	RES	Homing mode 0: Homing mark only 1: Homing mark and proximity switch 2: Digital input
		SideInput	BOOL	-	DIR	Side of the digital input for passive homing: FALSE: Negative side TRUE: Positive side
		Direction	DINT	-	DIR	Homing direction / homing mark approach direction 0: Current homing direction 1: Positive homing direction 2: Negative homing direction
		Digital InputAddress	UDINT	0 to 65535	RON	Byte number of the digital input
		DigitalInput BitNumber	UDINT	0 to 7	RON	Bit number of the digital input

A.3.4 Mechanics tags (external encoder)

The tag structure <TO>.Mechanics.<tag name> contains the configuration of the mechanics.

Tags

Legend (Page 358)

Tag		Data type	Value range	W	Description
Mechanics.					
	LeadScrew	LREAL	0.0 to 1.0E12	RES	Leadscrew pitch

A.3.5 LoadGear tags (external encoder)

The tag structure <TO>.LoadGear.<tag name> contains the configuration for the load gear.

Tags

Legend (Page 358)

Tag		Data type	Value range	W	Description
LoadGear.		STRUCT			
	Numerator	UDINT	1 to 4294967295	RES	Load gear counter
	Denominator	UDINT	1 to 4294967295	RES	Load gear denominator

A.3.6 Properties tags (external encoder)

The tag structure <TO>.Properties.<tag name> contains the configuration for the axis or type of motion.

Tags

Legend (Page 358)

Tag		Data type	Value range	W	Description
Properties.					
	MotionType	DINT	-	RON	Indication of axis or motion type: 0: Linear axis or motion 1: Rotary axis or motion

A.3.7 Modulo tags (external encoder)

The tag structure <TO>.Modulo.<tag name> contains the modulo configuration.

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
Modulo.		STRUCT			
	Enable	BOOL	-	RES	FALSE: Modulo conversion disabled TRUE: Modulo conversion enabled When modulo conversion is enabled, a check is made for modulo length > 0.0
	Length	LREAL	0.001 to 1.0E12	RES	Modulo length
	StartValue	LREAL	-1.0E12 to 1.0E12	RES	Modulo start value

A.3.8 Homing tags (external encoder)

The tag structure <TO>.Homing.<tag name> contains the configuration for homing the TO.

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
Homing.		STRUCT			
	HomePosition	LREAL	-1.0E12 to 1.0E12	DIR	Home position

A.3.9 StatusSensor tags (external encoder)

The tag structure <TO>.StatusSensor.<tag name> indicates the status of the measuring system.

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
StatusSensor.		STRUCT			
	State	DINT	-	RON	Status of the actual encoder value: 0: "NOT_VALID (not valid) 1: "Waiting_FOR_VALID (waiting for valid status) 2: "VALID (valid)
	CommunicationOK	BOOL	-	RON	Cyclic BUS communication between controller and encoder FALSE: Not established TRUE: Established
	Error	BOOL	-	RON	FALSE: No error in the measuring system TRUE: Error in the measuring system.
	AbsEncoderOffset	LREAL	-	RON	Home point offset to the value of an absolute value encoder. The value will be retentively stored in the CPU.

A.3.10 StatusWord tag (external encoder)

The <TO>.StatusWord tag contains the status information of the technology object.

Notes on the evaluation of the individual bits (e.g. bit 5, "HomingDone") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 358)

Tag	Data type	Values	W	Description
Status-Word	DWORD	-	RON	Status data of the technology object
Bit 0	-	-	-	"Enable" Enable status 0: Technology object disabled 1: Technology object enabled
Bit 1	-	-	-	"Error" 0: No error present 1: Error present
Bit 2	-	-	-	"RestartActive" 0: No "Restart" active 1: "Restart" active. The technology object is being reinitialized.
Bit 3	-	-	-	"OnlineStartValuesChanged" 0: "Restart" tag unchanged 1: Change to "Restart" tag. For the changes to be applied, the technology object must be reinitialized.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"HomingDone" Homing status 0: Technology object not homed 1: Technology object homed
Bit 6	-	-	-	"Done" 0: Motion job in process, or axis control panel enabled 1: No motion job in process and axis control panel disabled
Bit 7	-	-	-	Reserved
Bit 8	-		-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	Reserved
Bit 11	-	-	-	"HomingCommand" 0: No "MC_Home" job in process 1: "MC_Home" job in process
Bit 12... Bit 31	-	-	-	Reserved

A.3.11 ErrorWord tag (external encoder)

The <TO>.ErrorWord tag indicates errors at the technology object (technology alarms).

Notes on the evaluation of the individual bits (e.g. bit 3 "CommandNotAccepted") can be found in the section Evaluating StatusWord, ErrorWord and WarningWord (Page 175).

Tag

Legend (Page 358)

Tag	Data type	Values	W	Description
ErrorWord	DWORD	-	RON	
Bit 0	-	-	-	"SystemFault" System error
Bit 1	-	-	-	"ConfigurationFault" Configuration error One or more configuration parameters are inconsistent or invalid.
Bit 2	-	-	-	"UserFault" Error in the user program in a motion control instruction, or in its use
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met.
Bit 4	-	-	-	Reserved
Bit 5	-	-	-	"SensorFault" Error in the encoder system.
Bit 6	-	-	-	Reserved
Bit 7	-	-	-	"CommunicationFault" Communication error Missing or faulty communication.
Bit 8	-	-	-	Reserved
Bit 9	-	-	-	Reserved
Bit 10	-	-	-	"HomingFault" Error during homing process The homing cannot be completed.
Bit 11	-	-	-	Reserved
Bit 12	-	-	-	Reserved
Bit 13	-	-	-	"PeripheralError" Error accessing a logical address
Bit 14... Bit 31	-	-	-	Reserved

A.3.12 ErrorDetail tags (external encoder)

The tag structure <TO>.ErrorDetail.<tag name> contains the alarm number and the effective local alarm reaction to the technology alarm that is currently pending at the technology object.

A list of the technology alarms and alarm reactions can be found in the appendix, Technology Alarms (Page 368).

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
ErrorDetail.		STRUCT			
	Number	UDINT	-	RON	Alarm number
	Reaction	DINT	0 to 5	RON	Effective alarm reaction 0: No reaction 1: Stop with current dynamic values 2 Stop with maximum dynamic values 3: Stop with emergency stop ramp 4: Remove enable 5: Follow-up setpoints For the external encoder technology object, only alarm reactions 0 and 4 are possible.

A.3.13 WarningWord tag (external encoder)

The <TO>.WarningWord tag indicates pending warnings at the technology object.

Notes on the evaluation of the individual bits (e.g. bit 11, "FollowingErrorWarning") can be found in the Evaluating StatusWord, ErrorWord and WarningWord (Page 175) section.

Tag

Legend (Page 358)

Tag	Data type	Values	W	Description
Warning-Word	DWORD	-	RON	
Bit 0	-	-	-	Reserved
Bit 1	-	-	-	"ConfigurationFault" Configuration error One or several configuration parameters are adjusted internally.
Bit 2	-	-	-	Reserved
Bit 3	-	-	-	"CommandNotAccepted" Command cannot be executed. A Motion Control command cannot be executed, because necessary preconditions are not met.
Bit 4... Bit 31	-	-	-	Reserved

A.3.14 InternalToTrace tags (external encoder)

The tag structure <TO>.InternalToTrace.<tag name> contains no application-relevant data. This tag structure is internally used.

Tags

Legend (Page 358)

Tag		Data type	Values	W	Description
InternalToTrace.		ARRAY [1..4] OF STRUCT			
	Id	DINT	-	DIR	-
	Value	LREAL	-	RON	-

A.4 Technology alarms

A.4.1 Overview

The following table shows an overview of the technology alarms and the corresponding alarm reactions. When a technology alarm occurs, evaluate the entire indicated alarm text, in order to find the precise cause.

Legend

No.	Number of the technology alarm (corresponds to <TO>.ErrorDetail.Number)
Response	Effective alarm reaction (corresponds to <TO>.ErrorDetail.Reaction)
Error bit	Bit that is set in <TO>.ErrorWord when the technology alarm occurs
Warning bit	Bit that is set in <TO>.WarningWord when the technology alarm occurs
Restart	To acknowledge the technology alarm, the technology object must be reinitialized (restart).
Alarm text	Indicated alarm test (limited)

List of the technology alarms

No.	Response	Error bit	Warning bit	Restart	Alarm text
101	Remove enable	X1 (Configuration-Fault)	-	X	Error in the configuration.
104	Stop with maximum dynamic values	X1 (Configuration-Fault)	-	-	Error in the specification of software limit switches.
105	Remove enable	X1 (Configuration-Fault)	-	X	Configuration mode (drive/actuator).
106	Remove enable	X1 (Configuration-Fault)	-	X	Configuration error in the drive actuator driver.
107	Remove enable	X1 (Configuration-Fault)	-	X	Configuration error encoder.
108	Remove enable	X1 (Configuration-Fault)	-	X	Configuration error encoder driver.
109	Remove enable	X1 (Configuration-Fault)	-	-	Configuration error.
110	No reaction	-	X1 (Configuration-Fault)	-	Configuration is being internally adapted.
201	Remove enable	X0 (SystemFault)	-	-	Internal error.
202	No reaction	X0 (SystemFault)	-	-	Internal configuration error.
203	Remove enable	X0 (SystemFault)	-	-	Internal error. Please contact customer service.

No.	Response	Error bit	Warning bit	Restart	Alarm text
204	Remove enable	X0 (SystemFault)	-	-	Commissioning error.
304	Stop with emergency stop ramp	X2 (UserFault)	-	-	Limit value for velocity is zero.
305	Stop with emergency stop ramp	X2 (UserFault)	-	-	Limit value for acceleration/deceleration is zero.
306	Stop with emergency stop ramp	X2 (UserFault)	-	-	Limit value for jerk is zero.
307	Stop with maximum dynamic values	X2 (UserFault)	-	-	The numeric value range of the position was reached.
308	Remove enable	X2 (UserFault)	-	-	The numeric value range of the position was exceeded.
321	Stop with emergency stop ramp	X3 (Command-NotAccepted)	-	-	Axis is not homed.
322	No reaction	-	X3 (Command-NotAccepted)	-	Restart not performed.
323	No reaction	-	X3 (Command-NotAccepted)	-	MC_Home was not executed because this would result in the numerical value range being exceeded.
341	Remove enable	X10 (HomingFault)	-	-	Error in homing data.
342	Stop with emergency stop ramp	X10 (HomingFault)	-	-	Reference cam / encoder zero mark was not found.
401	Remove enable	X13 (Peripheral Error)	-	-	Error accessing logical address.
411	Remove enable	X5 (SensorFault)	-	-	Encoder at the logical address disrupted.
412	Remove enable	X5 (SensorFault)	-	-	Violation of the range limit for the incremental actual value.
421	Remove enable	X4 (DriveFault)	-	-	Drive/actuator at the logical address disrupted.
431	Remove enable	X7 (Communication-Fault)	-	-	Communication with device disrupted.
501	No reaction	-	X6 (DynamicError)	-	Programmed velocity limited.
502	No reaction	-	X6 (DynamicError)	-	Programmed acceleration/deceleration limited.
503	No reaction	-	X6 (DynamicError)	-	Programmed jerk limited.
504	No reaction	-	X6 (DynamicError)	-	Speed setpoint monitoring active.
521	Remove enable	X11 (Following ErrorFault)	-	-	Window of the following error monitoring exceeded.
522	No reaction		X11 (Following-ErrorWarning)		Warning level of the following error monitoring exceeded

No.	Response	Error bit	Warning bit	Restart	Alarm text
531	Remove enable	X9 (HWLimit)	-	-	• Positive HW limit switch reached. • Negative HW limit switch reached. • Incorrect traverse direction with active hardware limit switch
531	Remove enable	X9 (HWLimit)	-	X	• Hardware limit switch polarity is reversed, axis cannot be freed • Both hardware limit switches are active, axis cannot be freed
533	Stop with maximum dynamic values	X8 (SWLimit)	-	-	Software limit switch reached.
534	Remove enable	X8 (SWLimit)	-	-	Software limit switch passed.
541	Remove enable	X12 (Postioning-Fault)	-	-	Positioning monitoring error.
550	Follow-up setpoints	X4 (DriveFault)	-	-	The drive performs a autonomous movement.
601	Stop with maximum dynamic values	X14 (Synchronous Error)	-	-	The lead axis specified at the MC_GearIn.Master parameter is not configured or not available.

Technology alarms (Page 215)

A.4.2 Technology alarms 101-110

Technology alarm 101

Alarm reaction: Remove enable

Restart: required

Alarm text	Solution
Error in the configuration	
Faulty load gear factors.	Adjust the specified value.
Illegal value for the configuration data Actor.DriveParameter.MaxSpeed.	Adjust the specified value.
Illegal value for the configuration data DynamicLimits.MaxVelocity.	Adjust the specified value.
Illegal value for the configuration data maximum acceleration in DynamicLimits.MaxAcceleration.	Adjust the specified value.
The set leadscrew pitch is invalid. Illegal value in Mechanics.Leadscrew	Adjust the specified value.
Illegal combination of data for homing with incremental encoder.	Adjust the specified value.
The set mounting position of the encoder is invalid. Illegal value in Sensor.MountingMode.	Adjust the specified value.
The configuration of the measuring wheel circumference of the encoder is invalid. Illegal value in Sensor.Parameter.DistancePerRevolution.	Adjust the specified value.
The configuration for the resolution of the linear encoder is faulty. Illegal value in Sensor.Parameter.Resolution.	Adjust the specified value.
The set resolution of the encoder is invalid. Illegal value in Sensor.Parameter.StepsPerRevolution.	Adjust the specified value.
The set fine resolution for Gn_XIST1 is invalid. Illegal value in Sensor.Parameter.FineResolutionXist1.	Adjust the specified value.
The set fine resolution for Gn_XIST1 in Sensor.Parameter.FineResolutionXist1 is not consistent with the setting in PROFIdrive parameter P979.	Adjust the specified value.
Illegal value for the configuration data Actor.Interface.Telegram.	Adjust the specified value.
The set encoder type is invalid. Illegal value in Sensor.Type.	Adjust the specified value.
The set encoder system is invalid. Invalid value in Sensor.System.	Adjust the specified value.
The set home position offset is invalid. Illegal value in Sensor.ActiveHoming.HomePositionOffset.	Adjust the specified value.
Parameter of position monitoring faulty. Illegal value in PositioningMonitoring.Window.	Adjust the specified value.
Parameter of position monitoring faulty. Illegal value in PositioningMonitoring.Window.	Adjust the specified value.
The set home position offset is invalid. Illegal value in Sensor.ActiveHoming.Mode.	Adjust the specified value.
The set home position offset is invalid. Illegal value in Sensor.PassiveHoming.Mode.	Adjust the specified value.
The configuration of the PROFIdrive interface of the actual value is faulty. Illegal value in Sensor.Interface.Telegram.	Adjust the specified value.
Faulty controller factors.	Adjust the specified value.
Limit for standstill signal is faulty. Illegal value in StandStillSignal.VelocityThreshold.	Adjust the specified value.
Parameter of position monitoring faulty. Invalid value in PositioningMonitoring.ToleranceTime.	Adjust the specified value.
Illegal value in Actor.Type.	Adjust the specified value.
Inconsistent PROFIBUS parameterization; the sum of Ti and To is greater than one DP cycle clock.	Adjust the specified value.

Alarm text		Solution
	Parameter of standstill monitoring faulty. Invalid value in StandStillSignal.MinDwellTime.	Adjust the specified value.
	Parameter of the following error monitoring faulty. Illegal value in FollowingError.MaxValue.	Adjust the specified value.
	Drive or message frame type not suitable for DSC.	Adjust the specified value.
	Illegal value for the configuration data maximum jerk in DynamicLimits.MaxJerk.	Adjust the specified value.
	Illegal value for the configuration data maximum deceleration in DynamicLimits.MaxAcceleration.	Adjust the specified value.
	Illegal value in Modulo.Length.	Adjust the specified value.
	Illegal value in Modulo.StartValue.	Adjust the specified value.
	Illegal value in Actor.DriveParameter.ReferenceSpeed.	Adjust the specified value.
	The set fine resolution for Gn_XIST2 is invalid. Illegal value in Sensor.Parameter.FineResolutionXist2.	Adjust the specified value.
	The number of determinable encoder revolutions is invalid. Invalid value in Sensor.Parameter.DeterminableRevolutions.	Adjust the specified value.
	The specified approach direction of the homing mark for passive homing is invalid. Invalid value in Sensor.PassiveHoming.Direction.	Adjust the specified value.
	Illegal value in DynamicDefaults.Velocity.	Adjust the specified value.
	Invalid value in DynamicDefaults.Acceleration.	Adjust the specified value.
	Illegal value DynamicDefaults.Deceleration.	Adjust the specified value.
	Illegal value in DynamicDefaults.Jerk.	Adjust the specified value.
	Illegal value in DynamicDefaults.EmergencyDeceleration.	Adjust the specified value.
	Illegal value in PositionLimits_SW.MinPosition.	Adjust the specified value.
	Illegal value in PositionLimits_SW.MaxPosition.	Adjust the specified value.
	The specified approach direction of the homing mark for active homing is invalid. Invalid value in Sensor.PassiveHoming.Direction.	Adjust the specified value.
	Illegal value in Homing.ApproachVelocity.	Adjust the specified value.
	Illegal value in Homing.ReferencingVelocity.	Adjust the specified value.
	Illegal value in Homing.HomePosition.	Adjust the specified value.
	Parameter of the following error monitoring faulty. Illegal value in FollowingError.MaxValue.	Adjust the specified value.
	Parameter of the following error monitoring faulty. Illegal value in FollowingError.MinVelocity.	Adjust the specified value.
	Parameter of the following error monitoring faulty. Illegal value in FollowingError.WarningLevel.	Adjust the specified value.
	Controller parameter is incorrect. Illegal value of the pre-control factor PositionControl.Kpc	Adjust the specified value.
	TimeOut parameter outside the permissible limits.	Adjust the specified value.
	Simulation.Mode parameter outside the permissible limits.	Adjust the specified value.

Technology alarm 104

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Error in the specification of software limit switches.	
Negative switch greater than positive switch when axis is not modulo axis.	Change the position of the software limit switches.

Technology alarm 105

Alarm reaction: Remove enable

Restart: required

Alarm text	Solution
Configuration mode (drive/actuator).	
Configuration error.	Connect a suitable device. Check the device (I/Os). Compare the configuration in HW Config and the technology object.
The driver needs a smaller servo cycle clock.	Connect a suitable device. Check the device (I/Os). Compare the configuration in HW Config and the technology object.
Error in internal communication.	Check the project for consistency and reload it into the controller.

Technology alarm 106

Alarm reaction: Remove enable

Restart: required

Alarm text	Solution
Configuration error in the drive actuator driver.	
System has no communication with drive.	Internal system error. Check the project for consistency and reload it into the controller.
Actuator driver not initialized during ramp-up.	To release a technology object, the actuator drivers must be finished initializing. Initiate the job again later.

Technology alarm 107

Alarm reaction: Remove enable

Restart: required

Alarm text	Solution
Configuration error encoder.	
Configuration error.	Connect a suitable device. Check the device (I/Os). Compare the configuration in HW Config and the technology object.
The driver needs a smaller servo cycle clock.	
Error in internal communication.	Check the project for consistency and reload it into the controller.

Technology alarm 108

Alarm reaction: Remove enable

Restart: required

Alarm text	Solution
Configuration error encoder driver.	
System has no communication with encoder.	Internal system error. Check the project for consistency and reload it into the controller.
Encoder driver not initialized during ramp-up.	An attempt is being made to release an axis or encoder, although the driver is not finished initializing.

Technology alarm 109

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Configuration error.	Connect a suitable device. Check the device (I/Os). Compare the configuration in HW Config and the technology object.
Negative hardware limit switch.	
Positive hardware limit switch.	
Reference cam active homing.	
Reference cam passive homing.	
Enable drive bit analog drive interface	
Drive ready bit of the analog drive interface	

Technology alarm 110

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Configuration is being internally adapted.	
Illegal value for Actor.MaxSpeed (Actor.MaxSpeed greater than 2*Actor.Reference Speed; Actor.MaxSpeed is set to 2*Actor.Reference Speed.	Correct the reference value in the drive as well as in the configuration of the technology object on Actor.MaxSpeed/2. For the analog drive connection, correct the reference value in the drive as well as in the configuration of the technology object on Actor.MaxSpeed/1.17.
The delay time to reach the tolerance window of positioning monitoring (PositionMonitoring.ToleranceTime) is limited.	Change the configuration datum.
The emergency deceleration (DynamicDefaults.EmergencyDeceleration) is too low and is set to the minimum value possible.	

A.4.3 Technology alarms 201-204

Technology alarm 201

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Internal error.	Contact the hotline.

Technology alarm 202

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Internal configuration error.	Contact the hotline.

Technology alarm 203

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Internal error. Please contact customer service.	Contact the hotline.

Technology alarm 204

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Commissioning error	
Sign-of-life failure between controller and TIA Portal.	Check the connection properties.

A.4.4 Technology alarms 304-342

Technology alarm 304

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Limit value for velocity is zero.	Enter a non-zero value for the maximum speed (DynamicLimits.MaxVelocity) in the dynamic limits.

Technology alarm 305

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Limit value for acceleration/deceleration is zero.	
Acceleration	Enter a non-zero value for the maximum acceleration (DynamicLimits.MaxAcceleration) in the dynamic limits.
Deceleration	Enter a non-zero value for the maximum deceleration (DynamicLimits.MaxDeceleration) in the dynamic limits.

Technology alarm 306

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Limit value for jerk is zero.	Enter a non-zero value for the maximum jerk (DynamicLimits.MaxJerk) in the dynamic limits.

Technology alarm 307

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
The numeric value range of the position was reached.	
Negative	Enable the "Modulo" setting for the technology object.
Positive	Enable the "Modulo" setting for the technology object.

Technology alarm 308

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
The numeric value range of the position was exceeded.	
Negative	Enable the "Modulo" setting for the technology object.
Positive	

Technology alarm 321

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Axis is not homed.	To perform absolute positioning, you need to home the technology object.

Technology alarm 322

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Restart not performed.	
The technology object is not ready for restart.	Download the project again.
Condition for restart of the technology object is not satisfied (e.g. technology object must be disabled).	Disable the technology object.

Technology alarm 323

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
MC_Home was not executed because this would result in the numerical value range being exceeded.	Enable the "Modulo" setting for the technology object. Enter a valid position value for the use of MC_Home instruction.

Technology alarm 341

Alarm reaction: Remove enable

Restart: Not required

Alarm text		Solution
Error in homing data.		
	The approach velocity is zero. Homing.ApproachVelocity.	Check the configuration for homing (Homing.Approach Velocity)
	The homing velocity is zero. Homing.ReferencingVelocity.	Check the configuration for homing (Homing.ReferencingVelocity)

Technology alarm 342

Alarm reaction: Stop with emergency stop ramp

Restart: Not required

Alarm text	Solution
Reference cam / encoder zero mark was not found.	Connect a suitable device. Check the device (I/Os). Compare the configuration in HW Config and the technology object.

A.4.5 Technology alarms 401-431

Technology alarm 401

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Error accessing logical address.	
The requested logical address is invalid.	Connect a suitable device. Check the device (I/Os). Check the topological configuration in HW Config. Compare the configuration in HW Config and the technology object.
The requested logical output address is invalid.	
The requested logical output address is invalid.	

Technology alarm 411

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Encoder at the logical address disrupted.	
Alarm message from encoder.	Check the device in regard to function, connections and I/Os.
General hardware error of the encoder.	
Encoder dirty.	
Error reading the absolute value of the encoder.	Compare the encoder type in the drive or encoder parameter P979 with the configuration data of the technology object.
Zero mark monitoring of the encoder.	Encoder reports error for the zero mark monitoring (error code 0x0002 in Gx_XIST2, see PROFIDrive profile). Check the system for electromagnetic compatibility (EMC).
Encoder has gone in parking state.	Locate the cause of the error in the connected drive or encoder. Check whether the alarm was possibly triggered by a startup action on the drive or encoder.

Technology alarm 412

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Violation of the range limit for the incremental actual value.	
Range violation in positive direction.	Home the axis/encoder to a valid actual value range.
Range violation in negative direction.	
The change of the actual position in a position control clock cycle is greater than the modulo length.	Adjust the modulo length of the employed encoder.

Technology alarm 421

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Drive/actuator at the logical address disrupted.	Check the device in regard to function, connections and I/Os.
Alarm message from drive.	
PROFIdrive: Drive signal "Control requested" failed.	
PROFIdrive: Drive has shut down.	

Technology alarm 431

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Communication with device disrupted.	
PROFIdrive: Drive at bus failed (station failure).	Check the device in regard to function, connections and I/Os.
PROFIdrive: Signs of life of drive faulty.	Check the device in regard to function, connections and I/Os. Compare the clock parameters of HW Config (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be configured in the same clock cycle time. (Incorrect parameterization is indicated by reason 0x0080)
PROFIdrive: Encoder at bus failed (station failure).	Check the device in regard to function, connections and I/Os.
PROFIdrive: Signs of life of encoder faulty.	Check the device in regard to function, connections and I/Os. Compare the clock parameters of HW Config (PROFIBUS line, slave OM for drive or encoder) and the execution system. Tmapc and servo must be configured in the same clock cycle time.

A.4.6 Technology alarms 501-550

Technology alarm 501

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Programmed velocity limited.	Check the value for the speed of the Motion Control instruction. Check the configuration of the dynamic limits.

Technology alarm 502

Alarm reaction: No reaction

Restart: Not required

Alarm text		Solution
Programmed acceleration/deceleration limited.		
	Acceleration	Check the value for the acceleration of the Motion Control instruction. Check the configuration of the dynamic limits.
	Deceleration	Check the value for the deceleration of the Motion Control instruction. Check the configuration of the dynamic limits.

Technology alarm 503

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Programmed jerk limited.	Check the value for the jerk of the Motion Control instruction. Check the configuration of the dynamic limits.

Technology alarm 504

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Speed setpoint monitoring active.	Check the mechanical configuration. Check the encoder connection. Check the configuration of the speed setpoint interface. Check the configuration of the control loop. Check the value for the maximum speed DynamicLimits.MaxVelocity. Enter a value ≤ Actor.MaxSpeed for the "Velocity" parameter at the Motion Control instruction.

Technology alarm 521

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Window of the following error monitoring exceeded.	Check the configuration of the control loop. Check the direction of the encoder. Check configuration of the following error monitoring.

Technology alarm 522

Alarm reaction: No reaction

Restart: Not required

Alarm text	Solution
Warning level of the following error monitoring exceeded	Check the configuration of the control loop. Check the direction of the encoder. Check configuration of the following error monitoring.

Technology alarm 531

Alarm reaction: Remove enable

Restart: See "Restart" column

Alarm text	Solution	Restart
Positive HW limit switch reached.	Acknowledge the alarm. Movements in the negative direction are allowed after acknowledgment.	-
Negative HW limit switch reached.	Acknowledge the alarm. Movements in the positive direction are allowed after acknowledgment.	-
Incorrect traverse direction with active hardware limit switch	The programmed motion direction is disabled due to the active hardware limit switch. Retract the axis in the opposite direction.	-
Hardware limit switch polarity is reversed, axis cannot be freed	Check the mechanical configuration of the hardware limit switch.	X
Both hardware limit switches are active, axis cannot be freed	Check the mechanical configuration of the hardware limit switch.	X

Technology alarm 533

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
Software limit switch reached.	
Negative	.The software limit switch has been approached from an ongoing movement. Acknowledge the alarm. Move the axis in the positive direction away from the software limit switch.
Positive	The software limit switch has been approached from an ongoing movement. Acknowledge the alarm. Move the axis in the negative direction away from the software limit switch.

Technology alarm 534

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Software limit switch passed.	
Negative	The software limit switch was exceeded. Acknowledge the alarm. Movements in the positive direction are allowed after acknowledgment.
Positive	The software limit switch was exceeded. Acknowledge the alarm. Movements in the negative direction are allowed after acknowledgment.

Technology alarm 541

Alarm reaction: Remove enable

Restart: Not required

Alarm text	Solution
Positioning monitoring error.	
Target range not reached.	The target range was not reached within the positioning tolerance time. Check the configuration of the positioning monitoring. Check configuration of the control loop..
Exit target range again.	The target area was exited within the minimum dwell time. Check the configuration of the positioning monitoring. Check configuration of the control loop.

Technology alarm 550

Alarm reaction: Follow-up setpoints

Restart: Not required

Alarm text	Solution
The drive performs a autonomous movement.	When the SS2 signal is no longer present in the drive, the drive goes automatically into standby mode (<TO>.StatusDrive.InOperation = TRUE). Acknowledge the alarm. The technology object is automatically released after acknowledgment.

A.4.7 Technology alarm 601

Technology alarm 601

Alarm reaction: Stop with maximum dynamic values

Restart: Not required

Alarm text	Solution
The lead axis specified at the MC_GearIn.Master parameter is not configured or not available.	Specify all master value interconnections for the configuration required in operation for the synchronous axis technology object. If a restart is performed for a lead axis in synchronous operation, the alarm is displayed and the following axis is stopped with the maximum dynamic values. Acknowledge the alarm after restarting the lead axis and restart the synchronization.

A.5 Error ID

Errors in Motion Control instructions are reported by means of "Error" and "ErrorID" parameters.

Under the following conditions, "Error" = TRUE and "ErrorID" = 16#8xxx are indicated at the Motion Control instruction:

- Invalid status of the technology object, which prevents the execution of the job.
- Invalid parameter assignment of the Motion Control instruction, which prevents the execution of the job.
- As a result of the alarm reaction for an error at the technology object.

ErrorIDs and remedies

The following table lists all "ErrorIDs" that can be indicated in Motion Control instructions. Along with the cause of the error, the table lists corresponding troubleshooting routines:

ErrorID	Description	Solution
16#0000	No error	-
16#8001	A technology alarm (TO error) occurred while processing the Motion Control instruction.	In the technology data block, an error message is output at the "ErrorDetail.Number" tag. A list of the technology alarms and alarm reactions can be found in the appendix, Technology Alarms (Page 368).
16#8002	Invalid value in the "Axis" parameter.	Check the value in the "Axis" parameter
16#8003	Invalid velocity	Set a valid velocity value at parameter "Velocity".
16#8004	Invalid acceleration	Set a valid acceleration value at parameter "Acceleration".
16#8005	Invalid deceleration	Set a valid deceleration value at parameter "Deceleration".
16#8006	Invalid jerk	Set a valid jerk value at parameter "Jerk".
16#8007	Invalid direction	Set a valid directional value at parameter "Direction".
	When the axis is at a standstill, "Direction" = 4 (current direction) is not permitted.	
	Invalid input Both the "JogForward" and "JogBackward" parameters set to TRUE at the same time. The axis decelerates with the most recently valid deceleration.	Reset both the "JogForward" parameter and the "JogBackward" parameter.
16#8008	Invalid distance specification	Set a valid distance value at parameter "Distance".
16#8009	Invalid position specification	Set a valid position value at parameter "Position".
16#800A	Invalid operating mode	Set a valid operating mode at parameter "Mode".
16#800B	Invalid stop mode	Set a valid stop mode at parameter "StopMode".
16#800C	Only one instance of the "MC_Power" instruction is allowed per technology object.	A technology object was specified in several instances of the "MC_Power" instruction, in the "Axis" parameter. Ensure that the technology object is only specified in one "MC_Power" instruction.

ErrorID	Description	Solution
16#800D	Job not permitted in current mode. "Restart" is being executed.	Wait until the "Restart" of the technology object is complete.
16#800E	If the axis is activated, a "Restart" is not possible.	Before a "Restart", deactivate the technology object with "MC_Power.Enable"FALSE.
16#800F	The technology object is disabled. The job cannot be executed.	Enable the technology object with "MC_Power.Enable" = TRUE. Restart the job.
16#8010	Invalid homing mode for incremental encoder.	Absolute value adjustment is not possible with an incremental encoder ("Mode" = 6, 7). Start a homing process for an incremental encoder using parameter "Mode" = 0, 1, 2, 3, 5, 8, 10.
16#8011	Invalid homing mode for absolute encoder.	Passive and active homing ("Mode" = 2, 3, 5, 8, 10) are not possible for an absolute value encoder. Start a homing process for an absolute encoder using parameter "Mode" = 0, 1, 6, 7.
16#8012	Job cannot be executed - axis control panel is activated.	Return master control to the user program. Restart the job.
16#8013	The online connection between the CPU and the TIA Portal is down.	Check the online connection to the CPU.
16#8014	No internal job memory available.	The maximum number of motion control jobs has been reached. Reduce the number of jobs to be executed (parameter "Execute" = FALSE).
16#8015	Error acknowledgement with MC_Reset" not possible. Error in the configuration of the technology object.	Check the configuration of the technology object.
16#8016	The actual values are not valid.	The actual values must be valid in order to execute a MC_Home job. Check the status of the actual values. The "<TO>.StatusSensor[n].State" tag of the technology object must show the value 2 (valid).
16#8017	Invalid value for gear ratio numerator.	Set a valid value at parameter "RatioNumerator" for the gear ratio numerator. Permitted integer values: -2147483648 to 2147483648 (value 0 not permitted)
16#8018	Invalid value for gear ratio denominator.	Set a valid value at parameter "RatioDenominator" for the gear ratio denominator. Permitted integer values: 1 to 2147483648
16#8019	Job cannot be executed. The specified following axis is the original master value for the synchronous operation chain.	Recursive interconnections are not possible. A leading axis cannot be interconnected as following axis to its own master value. Set a valid following axis at parameter "Slave".
16#8FFF	Unspecified error	Please contact the Siemens agent at your local agency or branch. You will find information on whom to contact at: Contact information for Industry Automation and Drive Technologies (http://www.siemens.com/automation/partner)

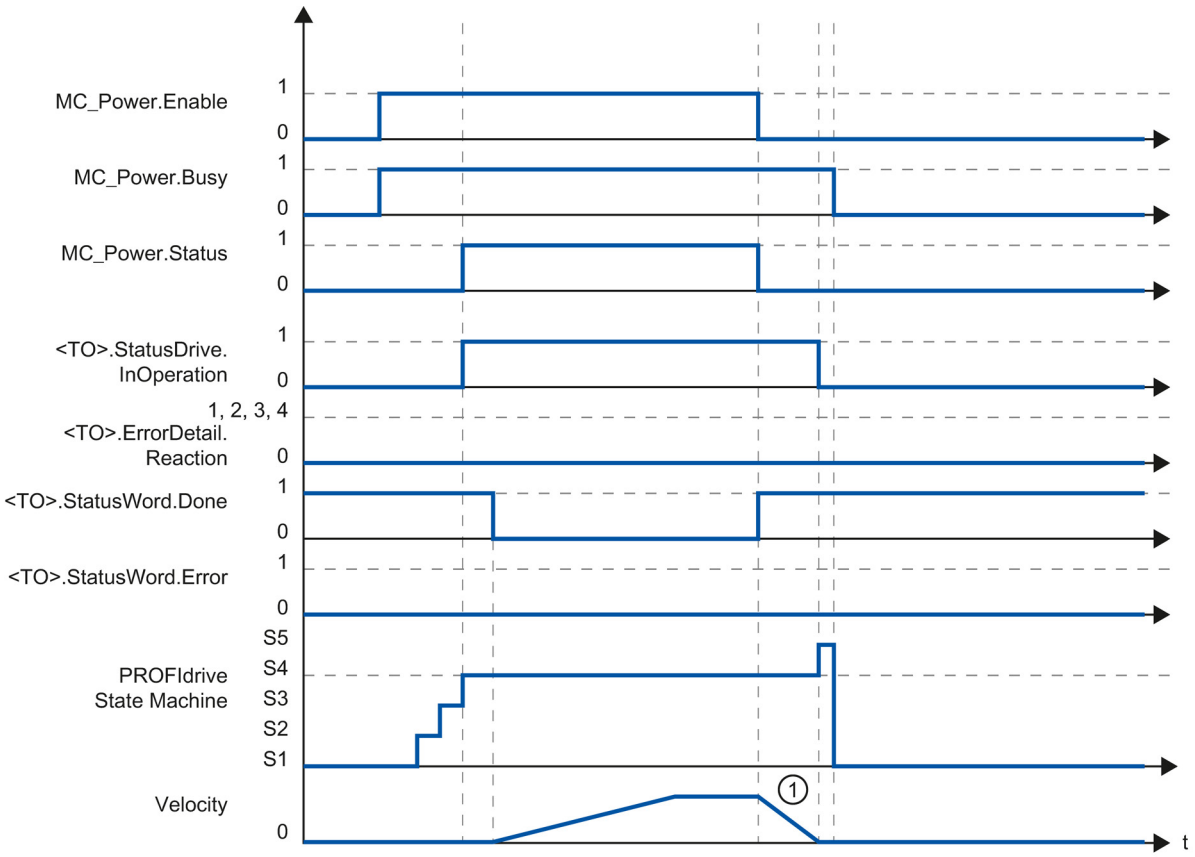
A.6 MC_Power function chart

A.6.1 Drive connection via PROFIdrive

A.6.1.1 StopMode 0

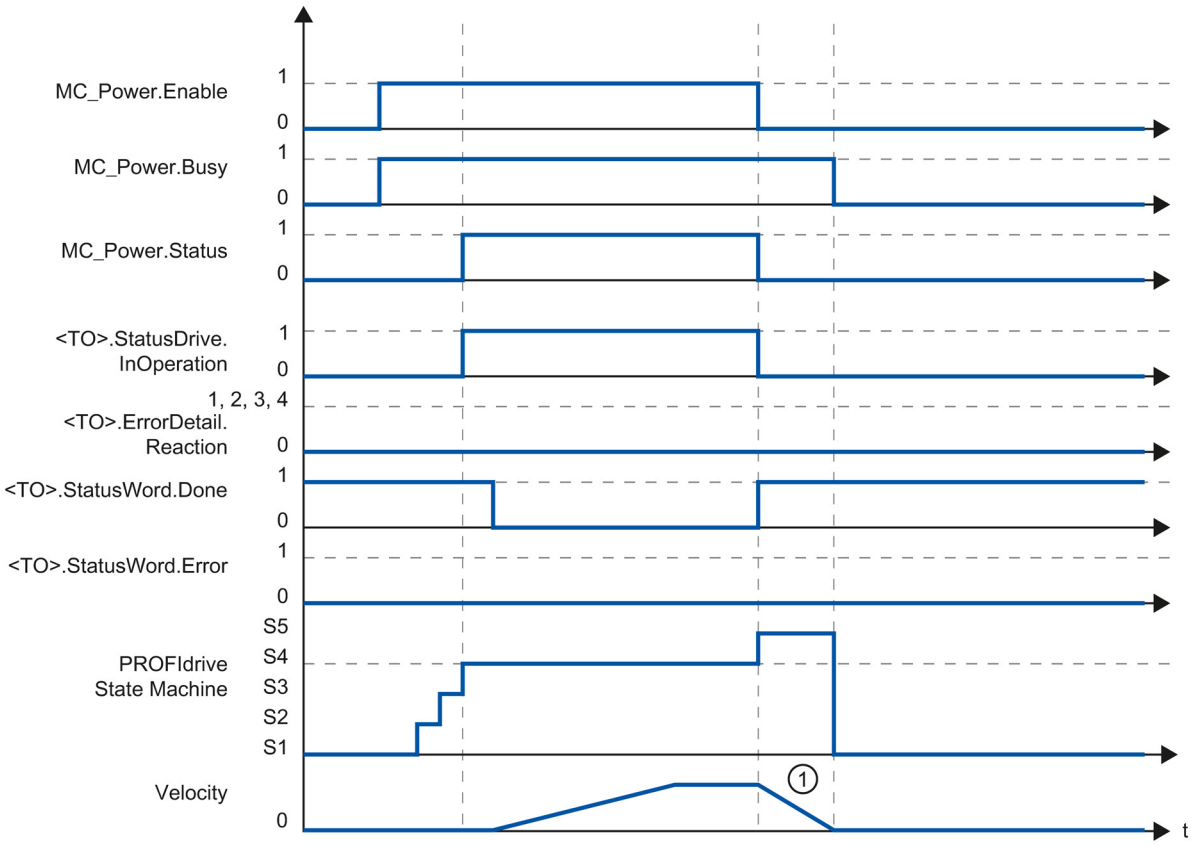
Function chart: Enabling a technology object and disabling with "StopMode" = 0



① The axis decelerates with the configured emergency stop deceleration.

A.6.1.2 StopMode 1

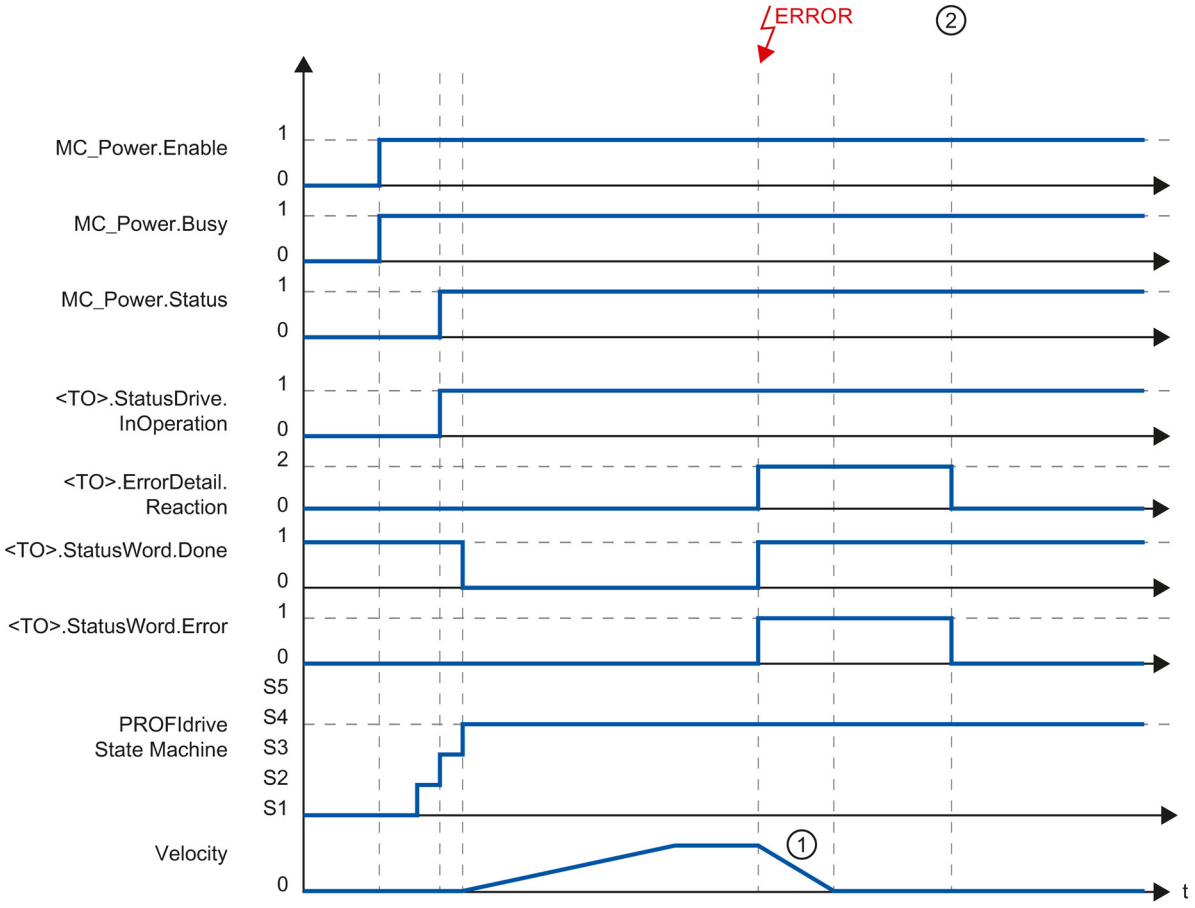
Function chart: Enabling a technology object and disabling with "StopMode" = 1



① The deceleration ramp depends on the configuration in the drive.

A.6.1.3 Alarm response "Stop with maximum dynamic values"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm response "Stop with maximum dynamic values"

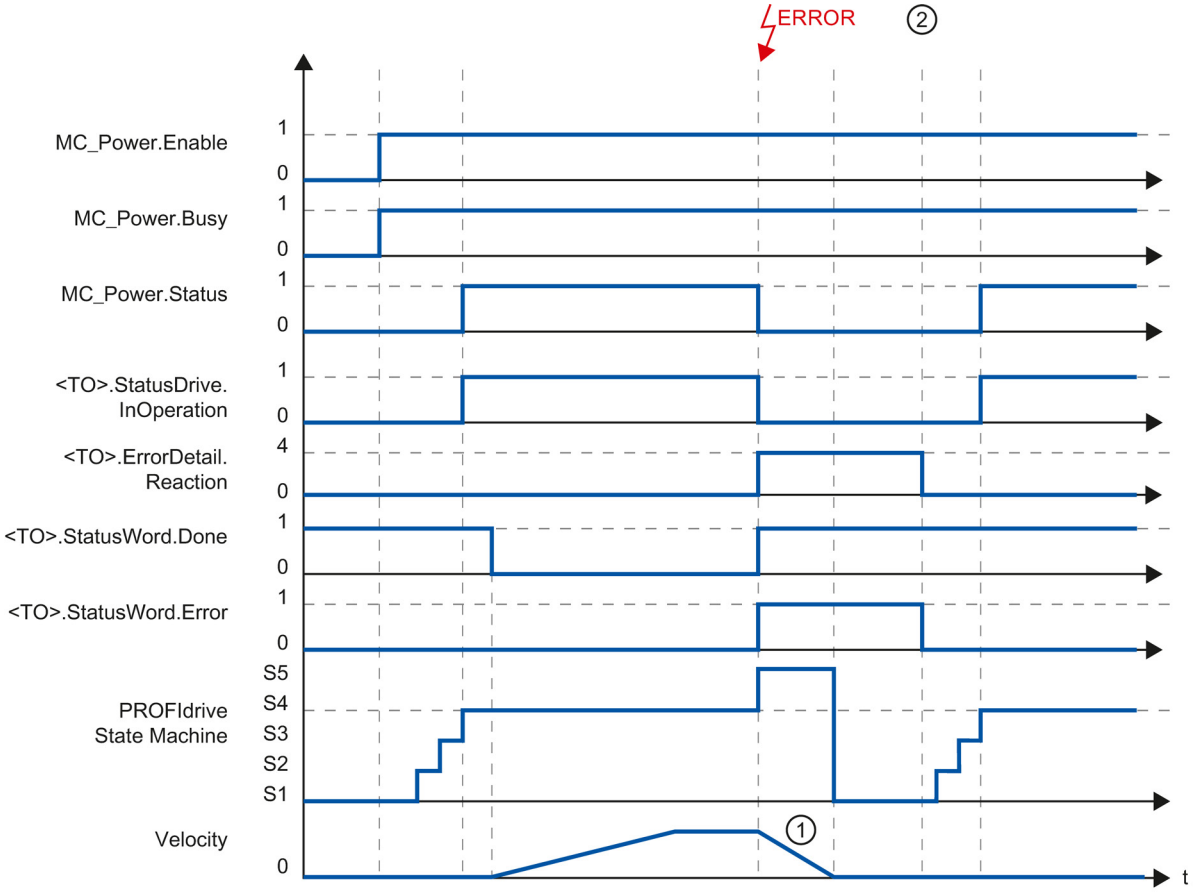


① The axis decelerates with the configured maximum deceleration.

② The technology alarm is acknowledged.

A.6.1.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm response "Remove enable"

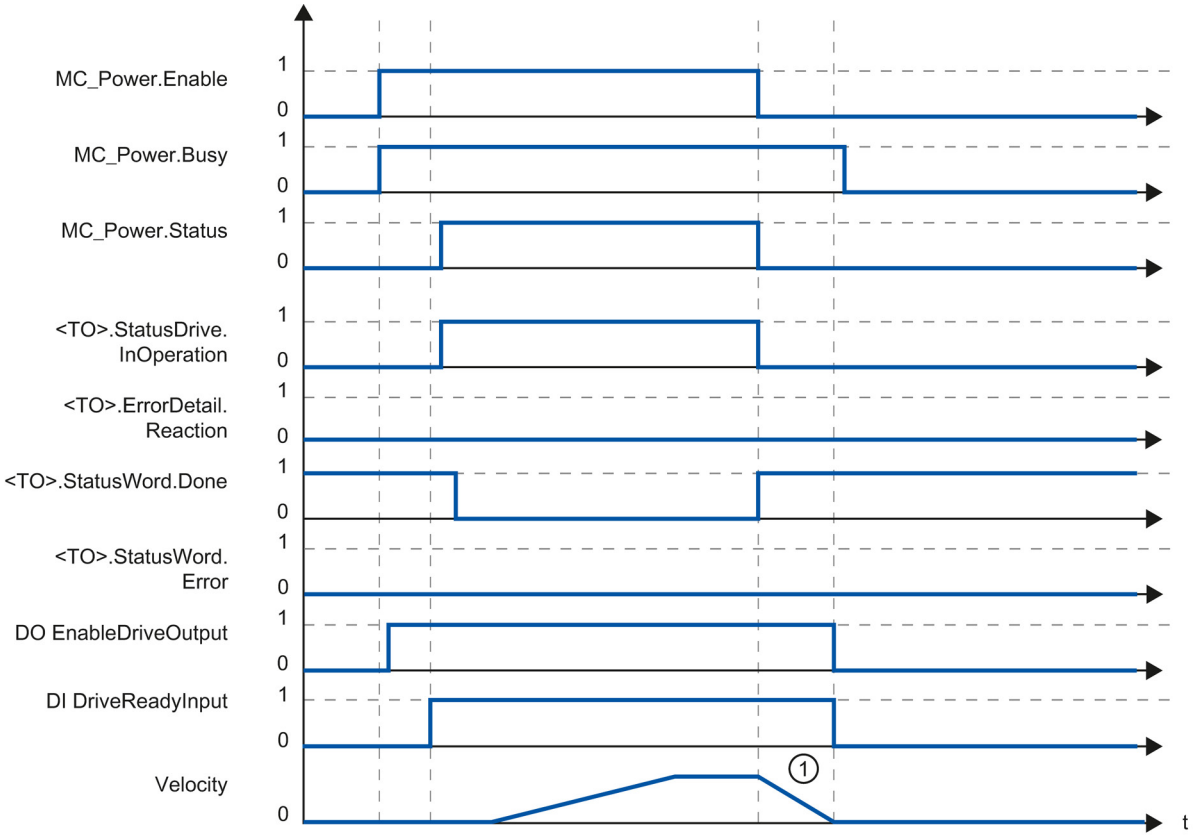


① The deceleration ramp depends on the configuration in the drive.
② The technology alarm is acknowledged at time ②.

A.6.2 Analog drive connection

A.6.2.1 StopMode 0

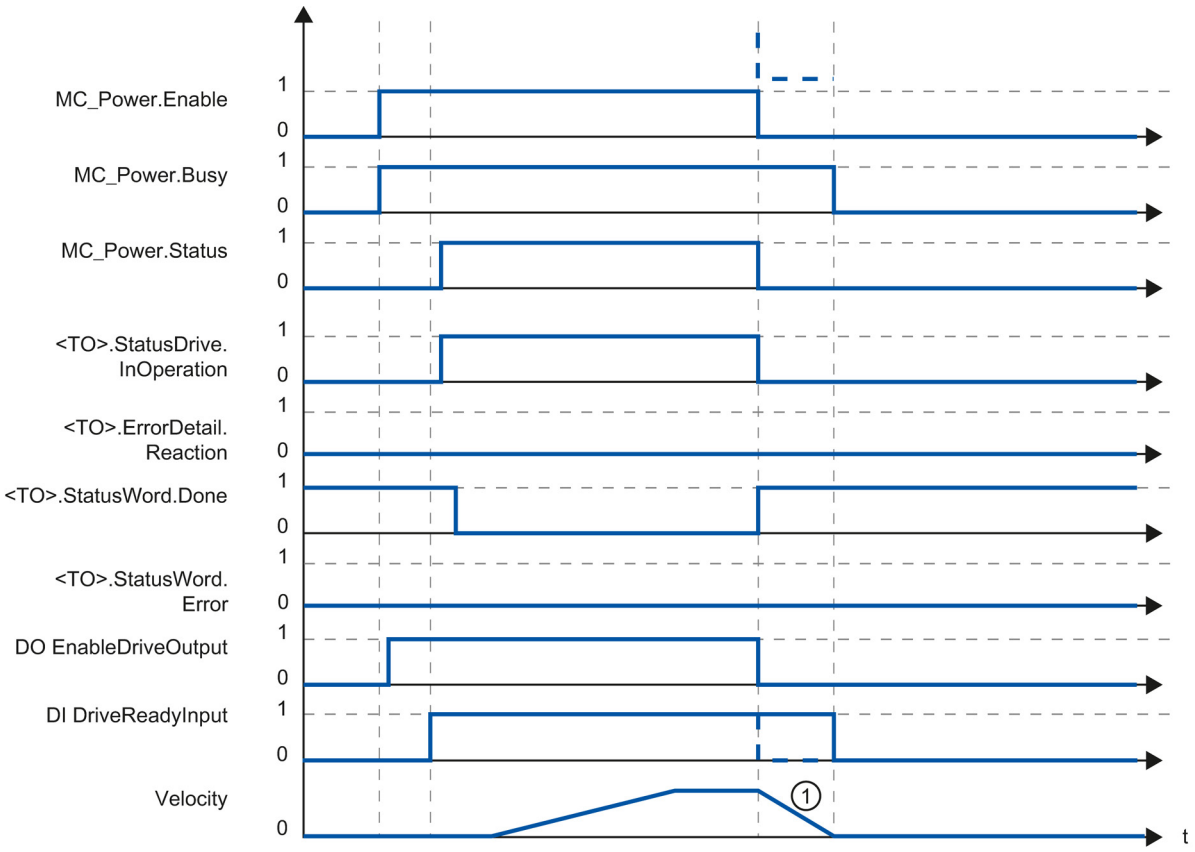
Function chart: Enabling a technology object and disabling with "StopMode" = 0



① The axis decelerates with the configured emergency stop deceleration.

A.6.2.2 StopMode 1

Function chart: Enabling a technology object and disabling with "StopMode" = 1

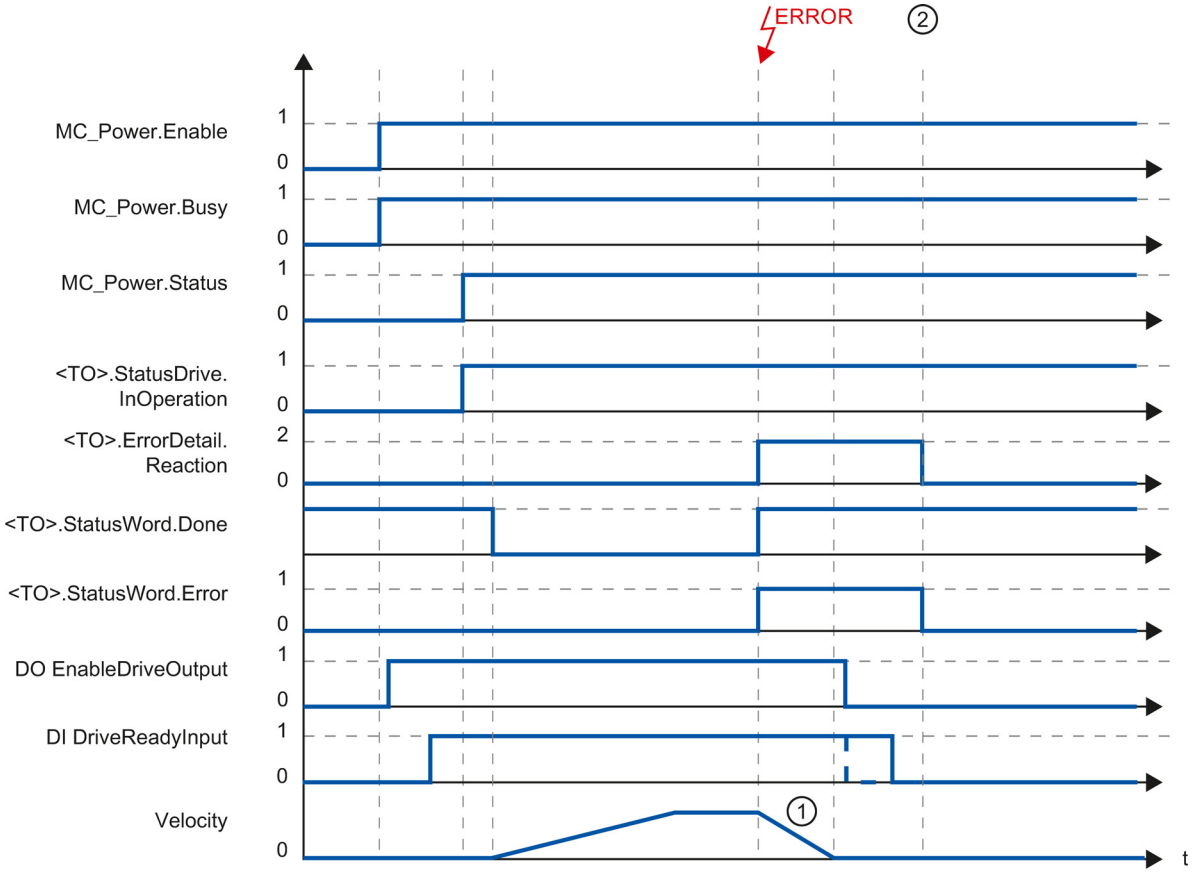


① The deceleration ramp depends on the configuration in the drive.

The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

A.6.2.3 Alarm response "Stop with maximum dynamic values"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm response "Stop with maximum dynamic values"



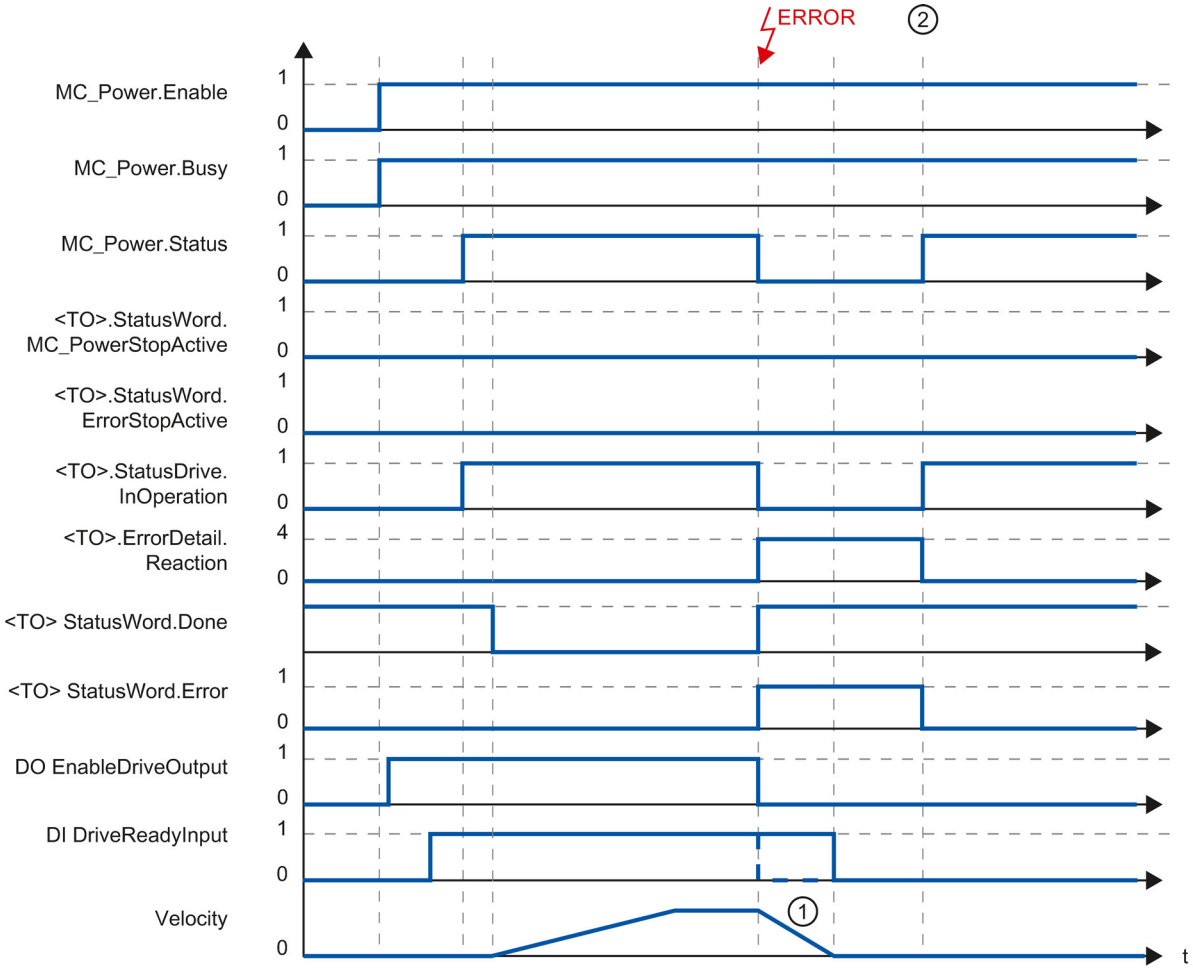
① The axis decelerates with the configured maximum deceleration.

② The technology alarm is acknowledged at time ②.

The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

A.6.2.4 Alarm response "Remove enable"

Function chart: Enabling a technology object and occurrence of a technology alarm with alarm reaction "Remove enable"



① The deceleration ramp depends on the configuration in the drive.

② The technology alarm is acknowledged at time ②.

The behavior of the ready signal of the drive "DI DriveReadyInput" is manufacturer-specific.

A.7 SINAMICS drives

A.7.1 Homing SINAMICS drives with external zero marks

For SINAMICS drives with external zero marks, synchronization during homing must always occur on the left side of the external zero mark's signal. That is to say, with a positive direction of travel synchronization is done on a positive edge, and with a negative direction of travel synchronization is done on a negative edge.

By inverting the signal, synchronization can also be done on the right sight of the signal of the external zero mark. The inversion can be configured in the drive using SINAMICS parameter P490.

Homing to an encoder zero mark or an external zero mark is configured in SINAMICS parameter P495.

Glossary

Absolute value encoder

Position encoder which outputs the position in the form of a digital numerical value. This numerical value is unique within the entire resolution range of the absolute value encoder.

Axis control panel

The axis control panel allows you to move the axis in manual mode, optimize the axis settings, and test the operation of the axis in your system.

Axis type

The axis type differs depending on the unit of measurement according to which the axis is positioned.

Depending on the execution of the mechanics, an axis is implemented as a linear axis or rotary axis:

- For linear axes, the position of the axis is specified as a linear measure, e.g. millimeters (mm).
- For rotary axes, the position of the axis is specified as an angular measure, e.g. degrees (°).

Communication processor (CP)

Module for expanded communications tasks covering special applications, for example in the area of security.

Communications module (CM)

Module for communications tasks which is used as an interface expansion of the CPU (for example PROFIBUS) or provides additional communications options (e.g. PtP) in an automation system.

Drive

The combination of motor (electric or hydraulic), actuator (converter, valve), control system, measuring system and supply (infeed, accumulator).

Dynamic Servo Control (DSC)

In drives that support DSC, you can optionally use the position controller in the drive. The position controller in the drive is usually implemented with a rapid speed-control cycle. This improves the control performance for digitally coupled drives.

Following error

The following error is the difference between the position setpoint and the actual position value. The transmission times of the setpoint to the drive, and of the actual position value to the controller, are taken into account in the calculation of the following error.

GSD file

As a Generic Station Description, this file contains all properties of a PROFINET or PROFIBUS device that are necessary for its configuration.

Hardware limit switch

Mechanical limit position switch that limits the maximum permissible traversing range of the axis.

Homing

With homing, you create the relationship between the position in the technology object and the mechanical position of the axis. The position value in the technology object is assigned to a homing mark at the same time. This homing mark represents a known mechanical position.

Incremental encoder

Position encoder which outputs the position change incrementally in the form of a digital numerical value.

Kv factor

Velocity gain

Gain factor in position control loop

Master value

Input variable for synchronous operation

Motion Control instruction

Use the Motion Control instructions to start Motion Control jobs at technology objects in your user program and thus execute the desired functionality at the technology objects. You track the status of running jobs with the output parameters of the Motion Control instructions.

Override

Percentage correction of the velocity/speed

PROFIdrive

PROFIdrive is a profile specified by the PNO (PROFIBUS user organization) for PROFIBUS DP and PROFINET IO for speed- and position-controlled drives.

PROFIdrive frame

Frame for communication according to PROFIdrive.

Proximity switch

Position switch which is activated with the moving part without mechanical contact.

Restart

The technology object is reinitialized with the current configuration parameters.

Software limit switch

A programmable position which limits the traversing range of an axis.

Synchronous operation

Defined movement of a following axis to a leading axis.

Technology data block

The technology data block represents the technology object and contains all configuration data, setpoint and actual values, and status information of the technology object.

Technology interrupt

If an error occurs at a technology object (e.g. approaching a hardware limit switch), then a technology interrupt is triggered and indicated.

The impact of a technology interrupt on the technology object is specified by the interrupt reaction (e.g. remove enable). The interrupt reaction is specified by the system.

Technology module (TM)

Module for technological tasks, e.g. counting, measuring and positioning.

Zero mark

Position reference for the movement of rotary and linear incremental encoders. The zero mark of an incremental encoder is used as a homing mark, for example.

Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

Purpose of the documentation

This documentation supports you in configuring and programming technology modules for counting and measurement tasks of the S7-1500, ET 200MP and ET 200SP, as well as in position feedback and position detection.

Basic knowledge required

The following knowledge is required in order to understand the documentation:

- General knowledge of automation technology
- Knowledge of the industrial automation system SIMATIC
- Knowledge about the use of Windows-based computers
- Proficiency with STEP 7

Validity of the documentation

This documentation applies to the use of the following modules:

- S7-1500 modules
  - TM Count 2x24V
  - TM PosInput 2
  - DI 32×24VDC HF (as of firmware version V2.1.0)
- ET 200SP modules:
  - TM Count 1x24V
  - TM PosInput 1
  - DI 8×24VDC HS

Technology modules are suitable for complex counting and measuring tasks and for position detection. Digital input modules are suitable for simple counting tasks.

Conventions

Please observe notes marked as follows:

Note

The notes contain important information on the product described in the documentation, on the handling of the product or on part of the documentation to which particular attention should be paid.

Additional assistance

- You can find information about the technical support offerings in the appendix Service & Support (Page 165).
- The range of technical documentation for the individual SIMATIC products and automation systems is available on the Internet (http://www.siemens.com/simatic-tech-doku-portal).
- The online catalog and the ordering system are available on the Internet (http://mall.automation.siemens.com).

Table of contents

Preface **3**

1 Documentation guide **9**

2 The basics of counting, measurement and position detection **13**

2.1 Overview of modules and properties 13

2.2 The basics of counting, measurement and position detection (technology modules) 16
2.2.1 Overview of applications 16
2.2.2 Recording of count signals 18
2.2.2.1 Counting with incremental or pulse encoder 18
2.2.2.2 Position input with SSI absolute encoder 20
2.2.3 Behavior at the counting limits 21
2.2.4 Gate control with incremental or pulse encoder 22
2.2.4.1 Software gate 22
2.2.4.2 Hardware gate 23
2.2.4.3 Internal gate 24
2.2.4.4 Counter behavior at gate start 25
2.2.5 Capture 26
2.2.5.1 Capture with incremental or pulse encoder 26
2.2.5.2 Capture with SSI absolute encoder 29
2.2.6 Synchronization 31
2.2.6.1 Synchronization by digital input 34
2.2.6.2 Synchronization at signal N 36
2.2.7 Comparison values 39
2.2.7.1 Comparison values and outputs 39
2.2.7.2 Switch at comparison values in Counting mode 40
2.2.7.3 Switch at comparison values in Measuring mode 48
2.2.8 Measured value determination 50
2.2.8.1 Overview of measuring functions 50
2.2.8.2 Measured value determination with incremental or pulse encoder 51
2.2.8.3 Measured value determination with SSI absolute encoder 55
2.2.9 Hysteresis 58
2.2.9.1 Hysteresis with incremental or pulse encoder 58
2.2.9.2 Hysteresis with SSI absolute encoder 60
2.2.10 Interrupts 62
2.2.11 Position detection for Motion Control 62
2.2.12 Encoder signals 63
2.2.12.1 24 V and TTL count signals 63
2.2.12.2 RS422 count signals 65
2.2.12.3 SSI signals 67
2.2.13 Signal evaluation of incremental signals 68
2.2.13.1 Overview 68
2.2.13.2 Single evaluation 68
2.2.13.3 Double evaluation 69
2.2.13.4 Quadruple evaluation 69
2.2.14 Isochronous mode 70

2.3 Basics of counting (digital input modules) ... 71
2.3.1 Overview of applications ... 71
2.3.2 Counting with pulse encoders ... 72
2.3.3 Behavior at the counting limits ... 73
2.3.4 Gate control ... 75
2.3.4.1 Software gate ... 75
2.3.4.2 Hardware gate ... 75
2.3.4.3 Internal gate ... 76
2.3.5 Comparison values ... 77
2.3.6 Interrupts ... 79
2.3.7 24 V count signals ... 80

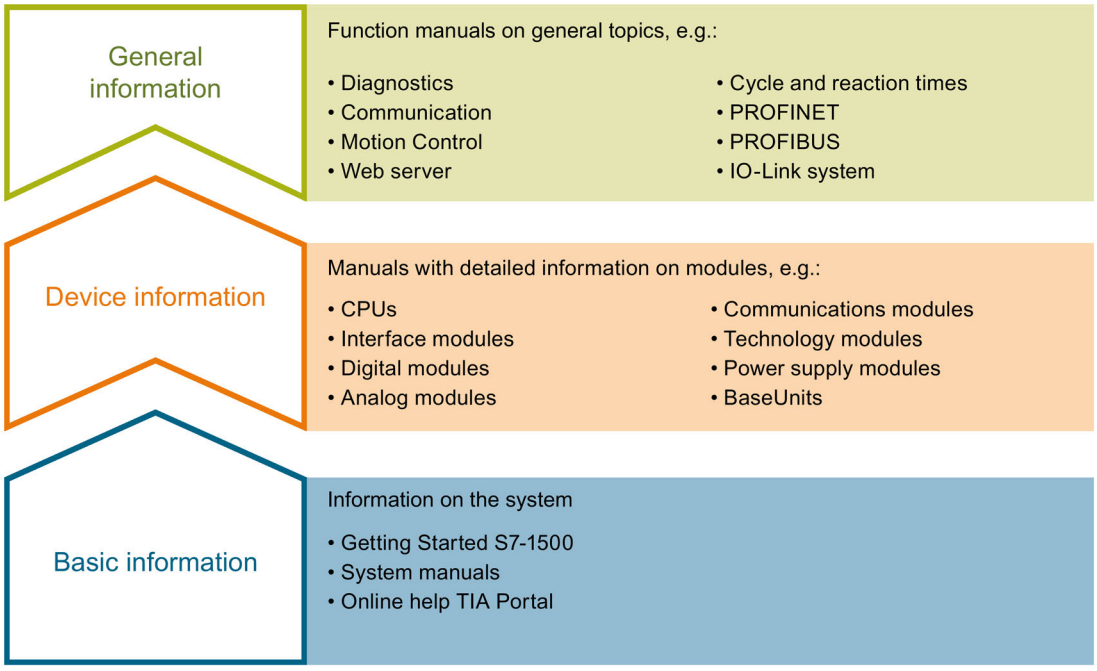
Documentation guide

1

The documentation for the SIMATIC S7-1500 automation system and the SIMATIC ET 200MP, ET 200SP and ET 200AL distributed I/O systems is divided into three areas.
This division allows you easier access to the specific information you require.



Basic information

System manuals and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC S7-1500, ET 200MP, ET 200SP and ET 200AL systems. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, terminal diagrams, characteristics and technical specifications.

General information

The function manuals contain detailed descriptions on general topics such as diagnostics, communication, Motion Control, Web server.

You can download the documentation free of charge from the Internet (http://w3.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/Pages/Default.aspx).

Changes and additions to the manuals are documented in product information sheets.

Manual Collections

The Manual Collections contain the complete documentation of the systems put together in one file.

You will find the Manual Collections on the Internet:

- S7-1500/ET 200MP (http://support.automation.siemens.com/WW/view/en/86140384)
- ET 200SP (http://support.automation.siemens.com/WW/view/en/84133942)
- ET 200AL (http://support.automation.siemens.com/WW/view/en/95242965)

My Documentation Manager

The My Documentation Manager is used to combine entire manuals or only parts of these to your own manual.
You can export the manual as PDF file or in a format that can be edited later.

You can find the My Documentation Manager on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

Application examples

The application examples support you with various tools and examples in solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

CAx Download Manager

The CAx Download Manager is used to access the current product data for your CAx or CAe systems.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find the CAx Download Manager on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.

The basics of counting, measurement and position detection

2

2.1 Overview of modules and properties

Technology modules

The tables below summarize the performance features of the modules for counting, measurement and position detection sorted according to the following systems:

- S7-1500
- ET 200SP

Table 2- 1 S7-1500 modules for counting, measurement and position detection

Property	S7-1500		
	Technology module		Digital input module
	TM Count 2x24V	TM PosInput 2	DI 32x24VDC HF
Number of counters	2	2	2
Maximum signal frequency	200 kHz	1 MHz	1 kHz
Maximum count frequency for incremental encoders with quadruple evaluation (Page 68)	800 kHz	4 MHz	—

2.2 The basics of counting, measurement and position detection (technology modules)

2.2.1 Overview of applications

Introduction

The technology module is configured and assigned parameters using the configuration software.

The technology module functions are controlled and monitored via the user program.

System environment

The technology modules can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central and distributed operation in an S7-1500 system with a corresponding ET 200 system	• S7-1500 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): • Device configuration with hardware configuration (HWCN) • Parameter settings with High_Speed_Counter technology object	Counting and measuring functions: High_Speed_Counter instruction for the technology object Position input with SSI absolute encoder: Direct access to technology module control and feedback interface in the I/O data
		STEP 7 (TIA Portal): Device configuration with hardware configuration (HWCN) in operating mode "Position Detection for Motion Control"	Control by means of technology object
Distributed operation in an S7-300/400 system	• S7-300/400 automation system • ET 200 distributed I/O system • Technology module	STEP 7 (TIA Portal): Device configuration and parameter settings with hardware configuration (HWCN) STEP 7: Device configuration and parameter settings with HSP	Direct access to technology module control and feedback interface in the I/O data
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Technology module	Third-party configuration software: Device configuration and parameter settings with GSD file	Direct access to technology module control and feedback interface in the I/O data

Parameter assignment options

In an S7-1500 system, you have two options for parameter assignment and control of technology module functions:

- Configuration using the High_Speed_Counter technology object and control with the corresponding High_Speed_Counter instruction.
  The technology module control and feedback interface is accessed with the technology object.
- Parameter settings with HWCN
  The control and feedback interface of the technology module is accessed using direct access to the I/O data.

Configuration via technology object

For central and distributed use in an S7-1500 system, we recommend simple configuration with graphic support using a High_Speed_Counter technology object. A detailed description of this configuration can be found in section High_Speed_Counter technology object (Page 81) and below.

You can define "Operation with technology object" for the technology module in the device configuration: see section Operating mode (Page 121).

You can assign the technology module and counting channel in the basic parameters of the technology object: see section Basic parameters (Page 86).

Parameter setting via HWCN

Additional support for parameter settings via HWCN is available in the context-sensitive help for the parameters in STEP 7 (TIA Portal). A description of the control and feedback interface is available in the following sections:

Assignment of the control interface (Page 151)

Assignment of the feedback interface (Page 154)

2.2.2 Recording of count signals

2.2.2.1 Counting with incremental or pulse encoder

Counting refers to the recording and adding up of events. The counters of the technology modules capture and evaluate pulse and incremental signals. The count direction can be specified using encoder or pulse signals or through the user program.

You can control counting processes using the digital inputs of the technology module. You can switch the digital outputs exactly at defined counter values, regardless of the user program.

You can configure the response of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program.

The highest counter limit that can be set is 2147483647 (2^{31}–1). The lowest counter limit that can be set is –2147483648 (–2^{31}).

You can configure the response of the counter at the counter limits:

- Continue or stop counting upon violation of a counter limit (automatic gate stop)
- Set counter value to start value or to opposite counter limit upon violation of a counter limit

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime by the user program.

The technology module can, as configured, set the current counter value to the start value upon synchronization, upon Capture function activation, upon violation of a counter limit or when the gate is opened.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are captured.

The hardware gate is controlled externally via a digital input of the technology module. The software gate is controlled via the user program. The hardware gate can be enabled through parameter assignment. The software gate (bit in the control interface of the cyclic I/O data) cannot be disabled.

Capture

You can configure an external reference signal edge that triggers the saving of the current counter value or position value as a Capture value. The following external signals can trigger the Capture function:

- Rising or falling edge of a digital input
- Both edges of a digital input
- Rising edge of signal N at the encoder input (for incremental and pulse encoders)

For incremental and pulse encoders, you can configure whether counting continues from the current counter value or from the start value after the Capture function.

Synchronization

You can configure an external reference signal edge to load the counter with the specified start value. The following external signals can load the counter with the start value:

- Rising or falling edge of a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input depending on the level of the assigned digital input

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the counter value fluctuate around this position. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output will be switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

2.2.2.2 Position input with SSI absolute encoder

Description

You can use the TM PosInput technology modules with an SSI absolute encoder for position detection. The technology module reads the position value via a synchronous serial interface from the SSI absolute encoder and makes it available to the controller.

You can switch the digital outputs of the technology module exactly at defined position values, regardless of the user program. Position input with an SSI absolute encoder does not involve gate control. Due to system constraints, synchronization is not possible with an SSI absolute encoder.

To do this, select the signal type "Absolute encoder (SSI)" in the parameter setting (HWCN) of the technology module in STEP 7 (TIA Portal).

Gray-dual conversion

Gray-code and dual-code SSI absolute encoders are supported.

Capture

You can configure one or both edges of a digital input that triggers a saving of the current position value as Capture value.

Hysteresis

You can specify hysteresis for the comparison values, within which a digital output is prevented from switching again. An encoder can come to a standstill at a specific position, and slight movements may make the position value fluctuate around this position. If a comparison value or a limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. The hysteresis prevents these unwanted switching operations.

Range for position value

You can specify a frame length of 10 bits to 40 bits for the SSI absolute encoder. The configurable bit numbers of the LSB and the MSB of the position value in the frame define the value range. The technology module can read a position value with a maximum length of31 bits and communicate it to the controller. The position value is treated as unsigned positive value and can assume values between 0" and "$2^{(MSB-LSB+1)-1}$".

Complete SSI frame

Instead of having a measured variable returned, you can choose to have the least significant 32 bits of the current unprocessed SSI frame returned. This provides you with encoder-specific additional bits, such as error bits, in addition to the position value. If the SSI frame is shorter than 32 bits, the complete SSI frame is returned right-aligned and the top unused bits are returned with "0" in the feedback interface.

2.2.3 Behavior at the counting limits

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another upward count pulse is received. The low counting limit is violated when the current counter value is equal to the low counting limit and another downward count pulse is received.

The appropriate status bit is set in the feedback interface in the event of limit violation:

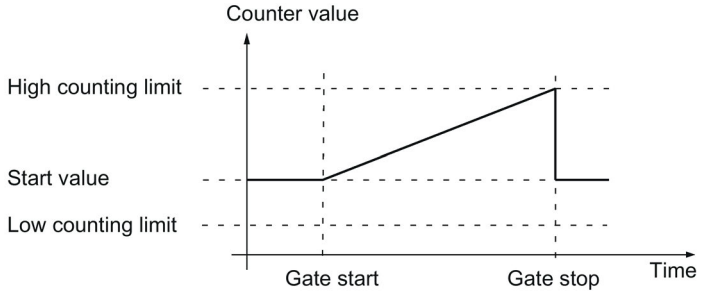
Counting limit violated	Status bit
High counting limit	EVENT_OFLW is set
Low counting limit	EVENT_UFLW is set

You can reset the status bits with RES_EVENT .

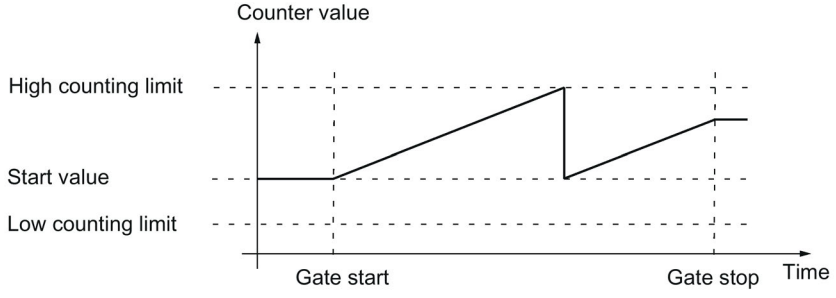
You can configure whether or not and from which counter value counting is to continue following counting limit violation.

Examples

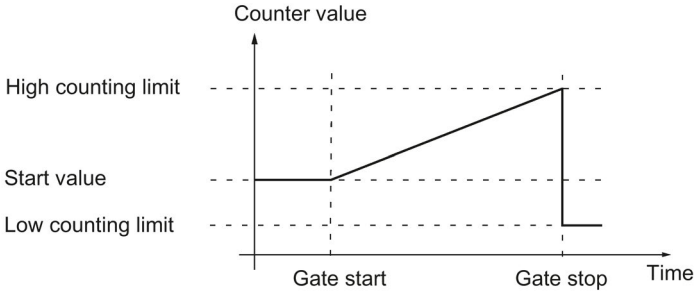
The figure below shows an example for terminating the counting process (automatic gate stop) after an overflow and setting the counter to the start value:



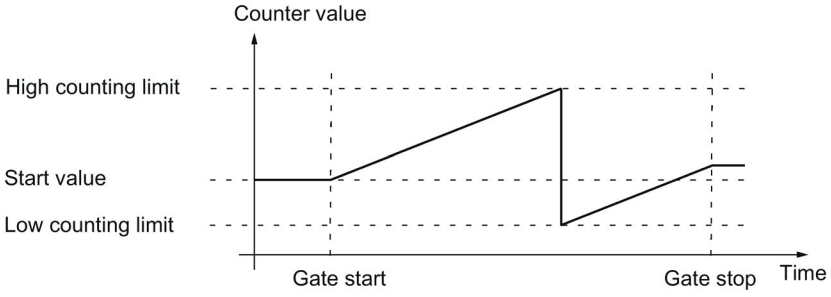
The figure below shows an example for continuing the counting process after an overflow and setting the counter to the start value:



The figure below shows an example for terminating counting after setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.2.4 Gate control with incremental or pulse encoder

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The technology modules have two gates for each channel. These define the resulting internal gate:

- Software gate
- Hardware gate

2.2.4.1 Software gate

The software gate of the channel is opened and closed with the control bit (Page 151) SW_GATE. The status of the software gate is indicated by the feedback bit (Page 154) STS_SW_GATE .

2.2.4.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate by means of signals at the configured digital inputs of the channel.

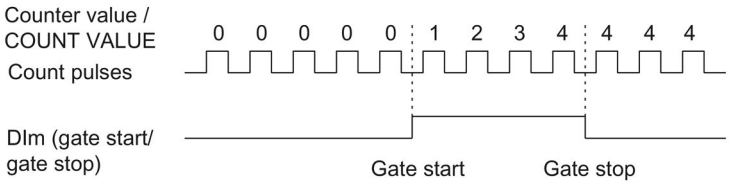
Note

The configured input filters delay the control signal of the digital input.

The status of a DIm digital input is indicated by the respective feedback bit (Page 154) STS_DIm .

Level-triggered opening and closing of the hardware gate with a digital input

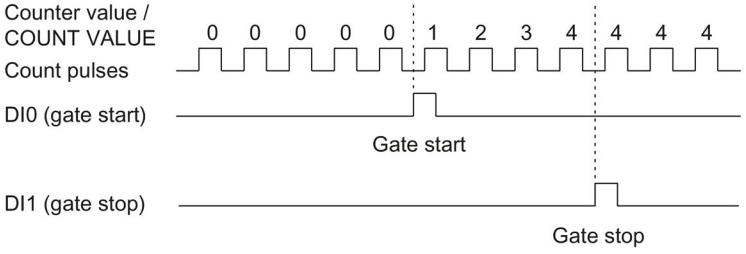
The figure below shows an example of level-triggered opening and closing with a digital input. The digital input is configured to be active with high level:



As long as the digital input is active, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input becomes inactive. The counter value stays constant and ignores any further count pulses.

Edge-triggered opening and closing of the hardware gate with two digital inputs

The figure below shows an example of opening and closing with two digital inputs. The two digital inputs are configured so that the rising edge of the hardware gate opens:



The hardware gate is opened with the configured edge at the digital input that is configured for opening. The hardware gate is closed with the configured edge at the digital input that is configured for closing.

2.2.4.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the feedback bit (Page 154) STS_GATE.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

When you configure the counter behavior, you can specify whether the counting process is to start from the start value or from the current counter value when the internal gate is opened.

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.2.4.4 Counter behavior at gate start

You have the following configuration options for counter behavior upon gate start:

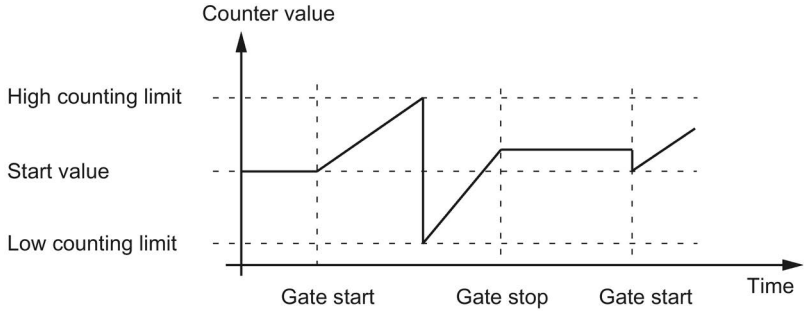
- Setting counter to start value
- Continuing with the current counter value

Setting counter to start value

Counter behavior is as follows for this configuration:

Each counting process starts with the start value when the internal gate is opened.

The figure below shows an example for continuing the counting process after counter is set to the start value:

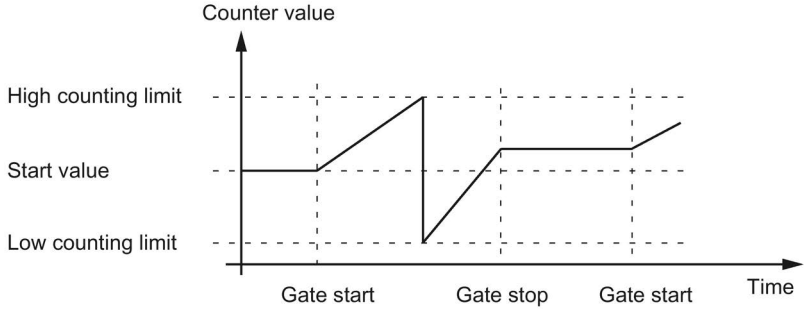


Continuing with the current counter value

Counter behavior is as follows for this configuration:

Each counting process starts from the current counter value after the internal gate is reopened.

The figure below shows an example for continuing the counting process with the current counter value:



2.2.5 Capture

2.2.5.1 Capture with incremental or pulse encoder

Description

The "Capture" function is used to save the current counter value with an external reference signal. You can configure the Capture function for the following reference signals:

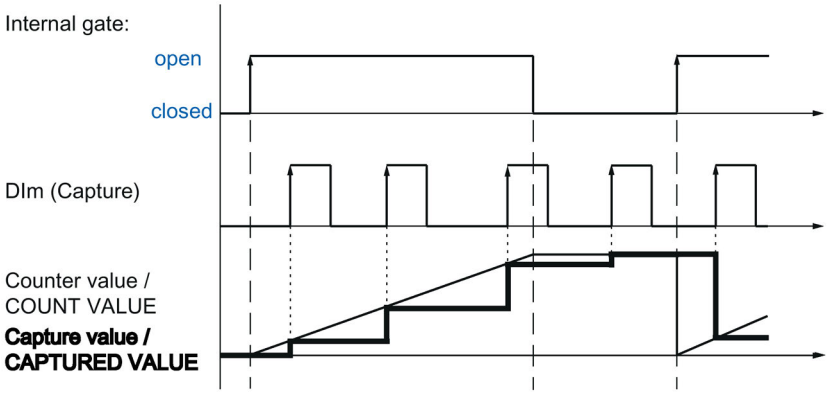
- Rising or falling edge at a digital input
- Rising and falling edge at a digital input
- Rising edge of signal N at the encoder input

Function principle

The Capture value is always the exact counter value at the time of the edge in question (delayed by the configured input filter time). The Capture function is effective regardless of the status of the internal gate. The unchanged counter value is saved when the gate is closed.

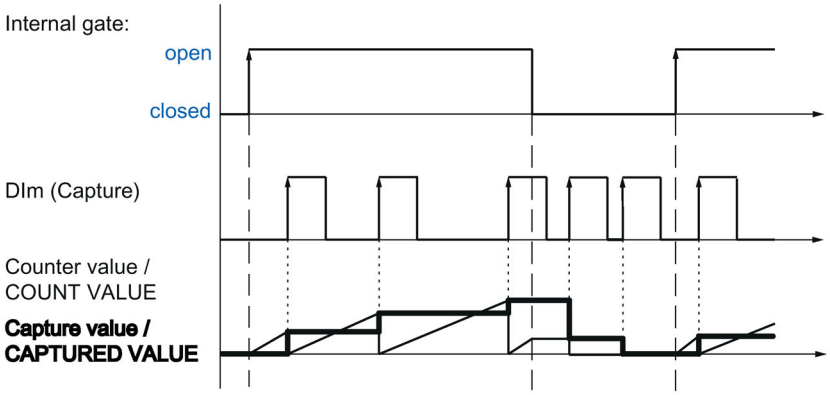
The figure below shows an example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Continue counting after Capture event



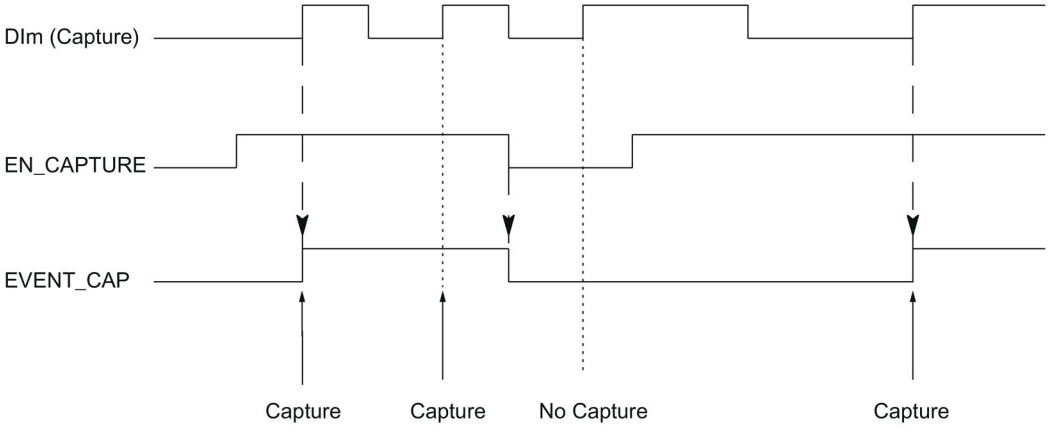
The figure below shows another example of the Capture function with the following configuration:

- Start value = 0
- Capture event upon rising edge at configured digital input
- Set counter to start value at gate start
- Reset counter value to start value after Capture event and continue counting.



The control bit (Page 151) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 154) EVENT_CAP indicates that a counter value has been saved as a Capture in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 154) STS_DIm.

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

The Capture function has no effect on the feedback bit STS_CNT and the LEDs UP and DN.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. Individual hardware interrupts may be lost if the hardware interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.5.2 Capture with SSI absolute encoder

Description

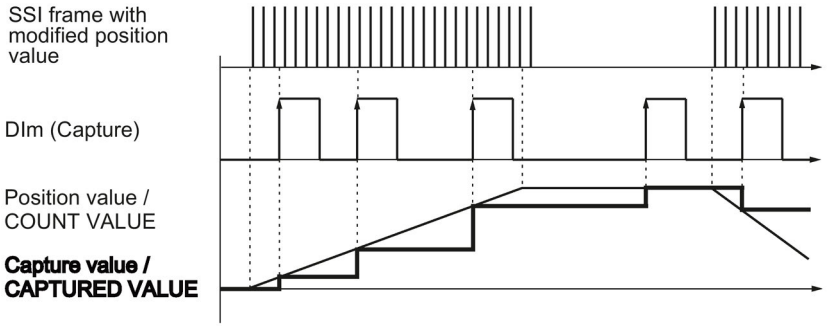
The "Capture" function is used to save the current position value using an external reference signal. You can configure the Capture function for the following reference signals:

- Rising or falling edge at a digital input
- Rising and falling edge at a digital input

Function principle

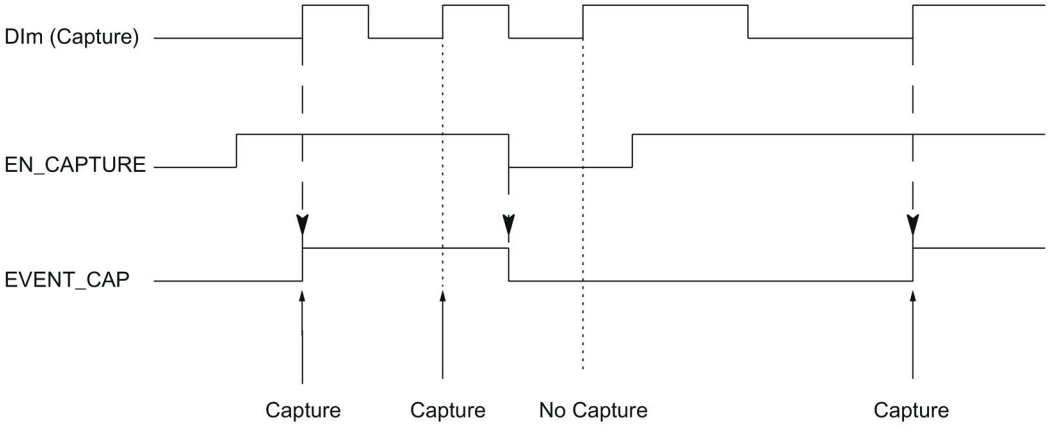
At the time of each edge, the position value of the last valid SSI frame is stored in the Capture value.

The figure below shows an example of the Capture event by a rising edge at the configured digital input:



The control bit (Page 151) EN_CAPTURE is used to enable the Capture function. The feedback bit (Page 154) EVENT_CAP indicates that a position value has been saved as Capture value in the feedback interface. If you reset EN_CAPTURE, EVENT_CAP is also reset. The status of a digital input is indicated by the respective feedback bit (Page 154) STS_DIm.

The figure below shows an example of the EN_CAPTURE and EVENT_CAP bits with use of the Capture function by the rising edge at a digital input:



Note

The configured input filters delay the control signal of the corresponding digital input.

Hardware interrupt

You can configure a hardware interrupt for the Capture function. Individual hardware interrupts may be lost if the hardware interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.6 Synchronization

Description

You use the "Synchronization" function to set the counter to the pre-defined start value with an external reference signal. You can configure synchronization for the following reference signals:

- Rising or falling edges at a digital input
- Rising edge of signal N at the encoder input
- Rising edge of signal N at the encoder input defined by the level of a digital input

Function principle

Synchronization always takes place exactly at the time of the reference signal. Synchronization is effective regardless of the status of the internal gate.

You use the control bit (Page 151) EN_SYNC_UP to enable synchronization for counting in an upwards direction. Use the control bit (Page 151) EN_SYNC_DN to enable synchronization for counting down. The feedback bit (Page 154) EVENT_SYNC indicates that synchronization has been performed. Resetting EN_SYNC_UP or EN_SYNC_DN also resets EVENT_SYNC.

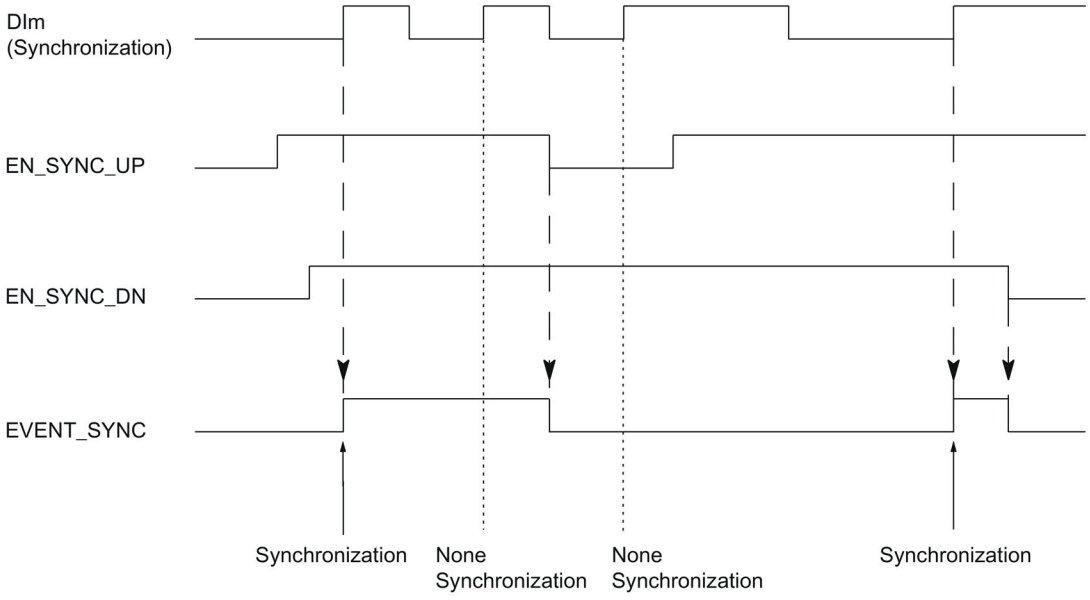
Note

The configured input filters delay the control signal of the corresponding digital input.

Synchronization has no effect on the feedback bit (Page 154) STS_CNT and the LEDs UP and DN.

Single synchronization

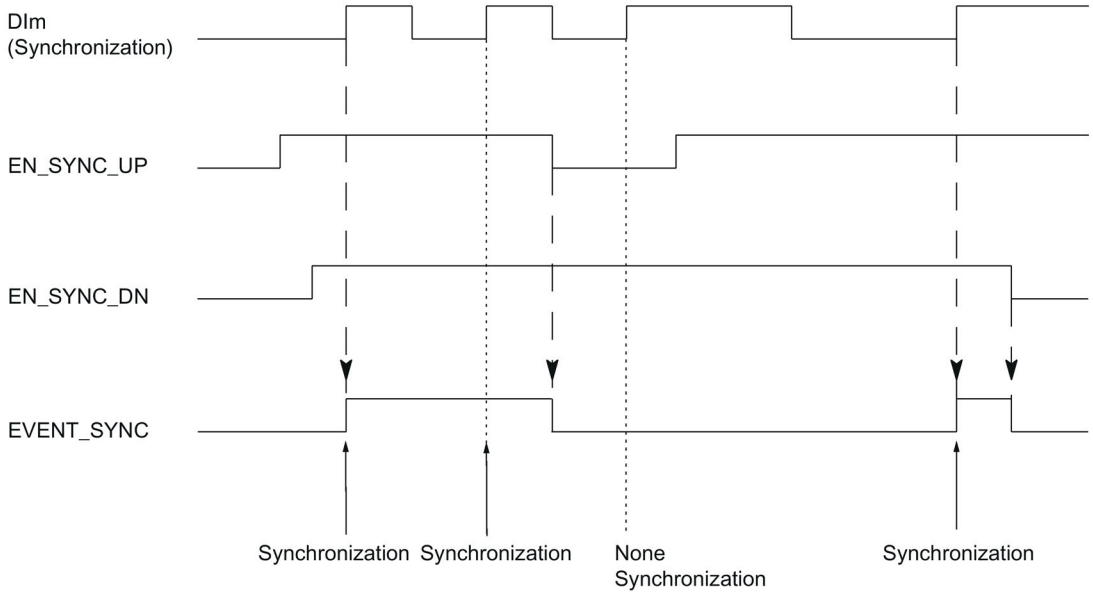
The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DNand EVENT_SYNC bits with single synchronization by an edge at a digital input for count pulses in an upwards direction:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. The counter can only be synchronized again once the control bit (Page 151) EN_SYNC_UP has been reset and set again.

Periodic synchronization

The figure below shows an example of the EN_SYNC_UP, EN_SYNC_DN and EVENT_SYNC bits with periodic synchronization by an edge at a digital input for count pulses in an upwards direction:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

Hardware interrupt

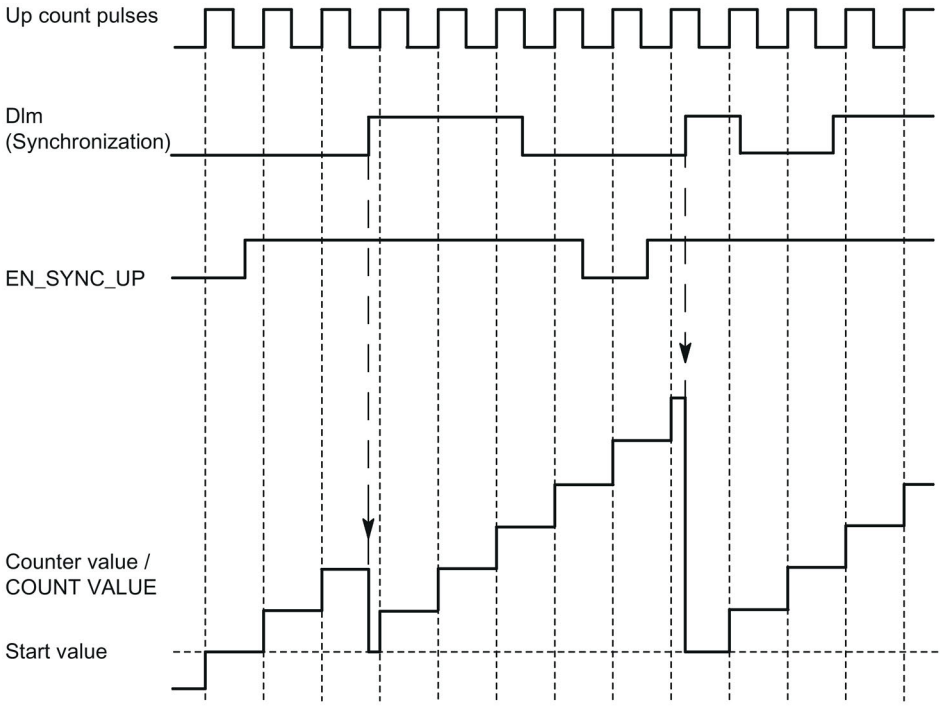
You can configure a hardware interrupt for the synchronization. The hardware interrupts will be lost if the interrupt rate is higher than the system acknowledgement rate. You can signal a lost hardware interrupt with a diagnostic interrupt.

2.2.6.1 Synchronization by digital input

You can trigger synchronization by edges at a digital input.

Single synchronization

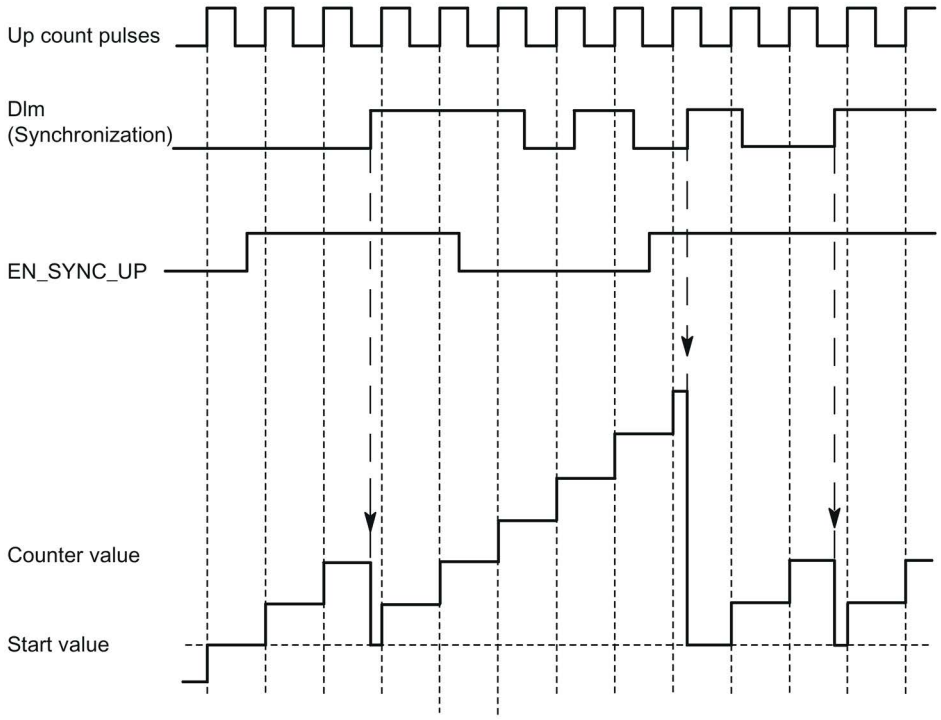
The figure below shows an example for single synchronization by an edge at a digital input:



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first rising edge at the configured digital input. Until the control bit (Page 151) EN_SYNC_UP has been reset and set again, any additional rising edge at the digital output is ignored. The counter can then be synchronized again.

Periodic synchronization

The figure below shows an example for periodic synchronization by an edge at a digital input:



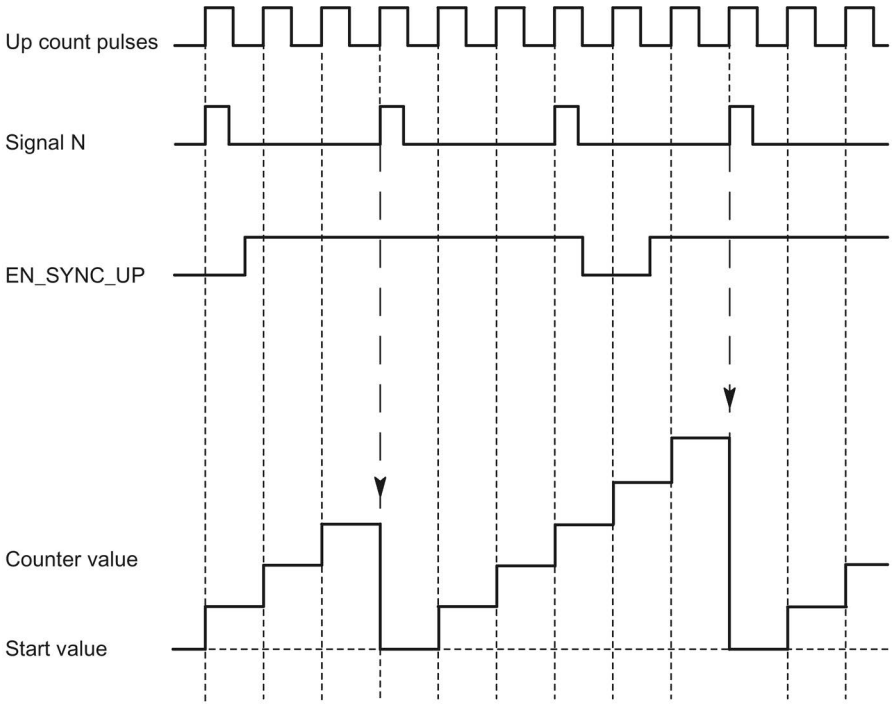
As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each rising edge at the configured digital input.

2.2.6.2 Synchronization at signal N

You can trigger synchronization at signal N at the encoder input either directly or depending on the status of a digital input.

Single synchronization

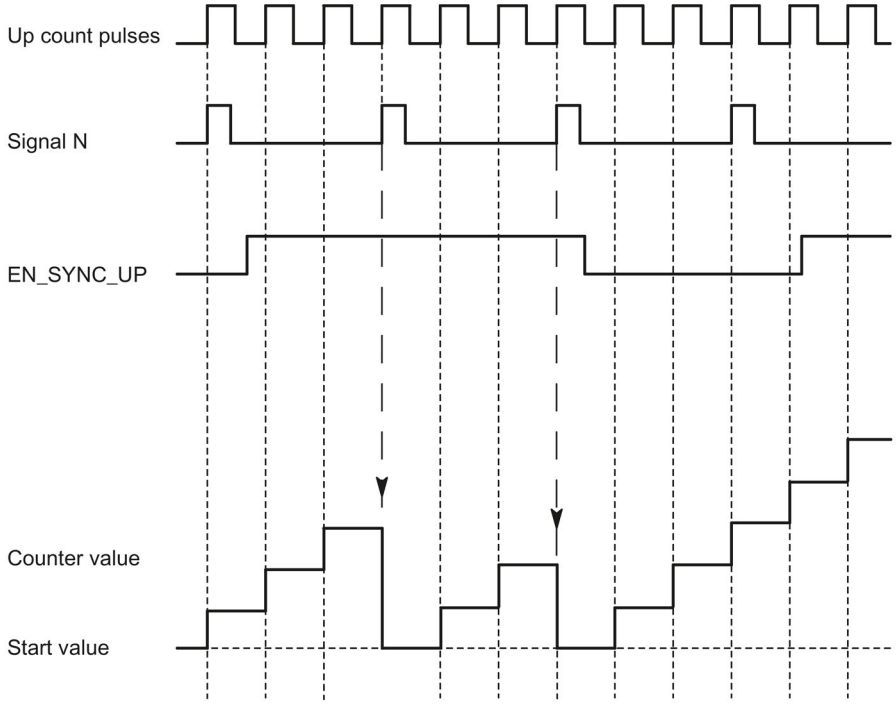
The figure below shows an example of single synchronization at signal N (not dependent on a digital input):



After synchronization is enabled for counting in an upwards direction, the counter is synchronized at the first signal N. After resetting and setting the control bit (Page 151) EN_SYNC_UP once again, the counter can be synchronized again.

Periodic synchronization

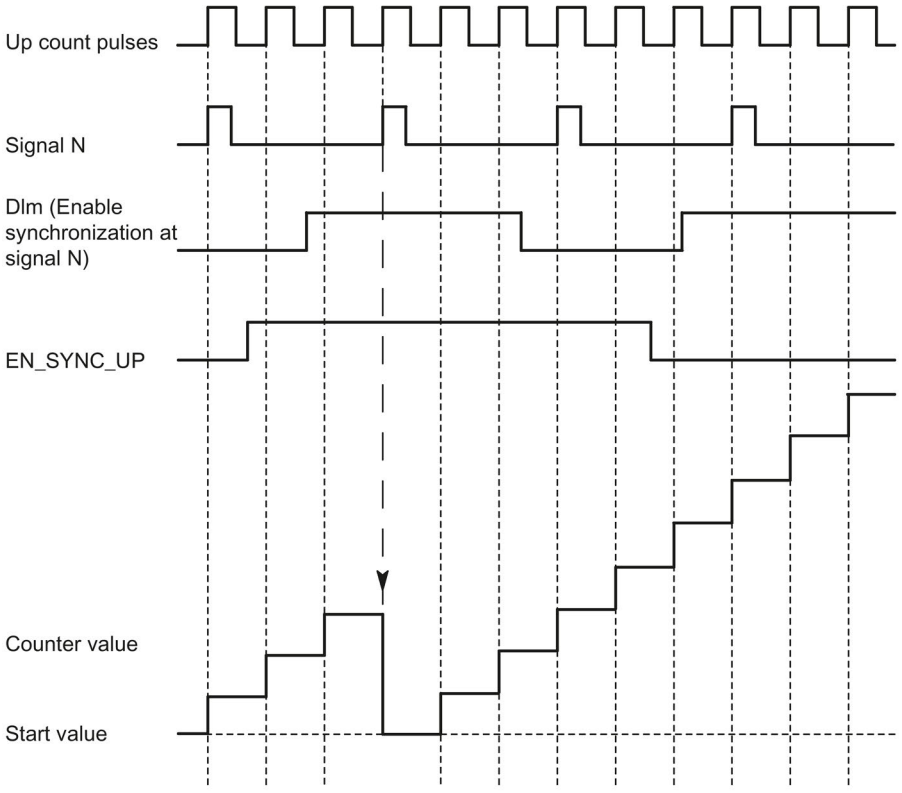
The figure below shows an example for periodic synchronization at signal N:



As long as synchronization for counting in an upwards direction is enabled, the counter is synchronized at each signal N.

Enable by a digital input

The figure below shows an example for periodic synchronization at signal N depending on the status of a digital input:



As long as synchronization for counting up is enabled and the corresponding digital input is active, the counter is synchronized at each signal N. If one of the conditions is not met, the counter is not synchronized at the signal N.

2.2.7 Comparison values

2.2.7.1 Comparison values and outputs

Description

You can specify two comparison values to control both digital outputs of the channel independently of the user program:

- Comparison value 0 for digital output DQ0
- Comparison value 1 for digital output DQ1

Depending on the operating mode and the encoder used, define two position, counter or measured values as comparison value. Comparison value 1 must be greater than comparison value 0. The comparison values are configurable and can be modified during runtime using the user program.

Switching digital outputs from the user program

The control bits (Page 151) TM_CTRL_DQ0 and TM_CTRL_DQ1 are used to control use of the digital outputs.

If TM_CTRL_DQm is set to 0, you can control the relevant digital output from the user program with the control bit SET_DQm regardless of the configured technological function. If TM_CTRL_DQm is set to 1, the technological function of the controller of the respective digital output is enabled.

The status of a digital output is indicated by the respective STS_DQm feedback bit.

2.2.7.2 Switch at comparison values in Counting mode

The comparison values are compared with the current counter or position value. If the counter or position value meets the configured comparison condition and the technological function of the corresponding digital output is enabled, the digital output is set. If you configure "Between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

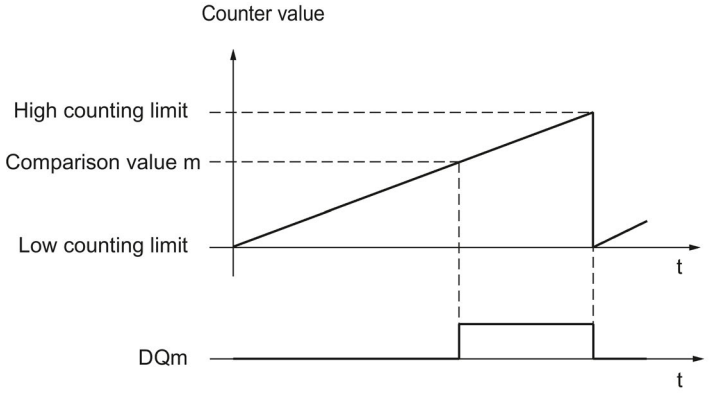
Switch at comparison values with incremental or pulse encoder

You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high counter limit

The digital output is set to 1 if:

Comparison value <= counter value <= high counter limit

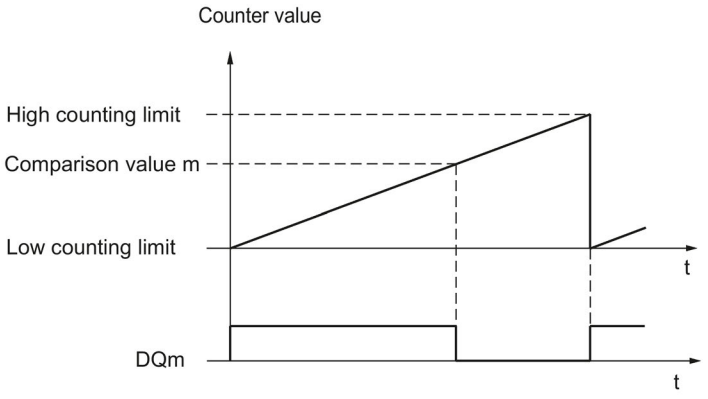


The comparison event is independent of the count direction.

Setting between comparison value and low counter limit

The digital output is set to 1 if:

Low counter limit <= counter value <= comparison value



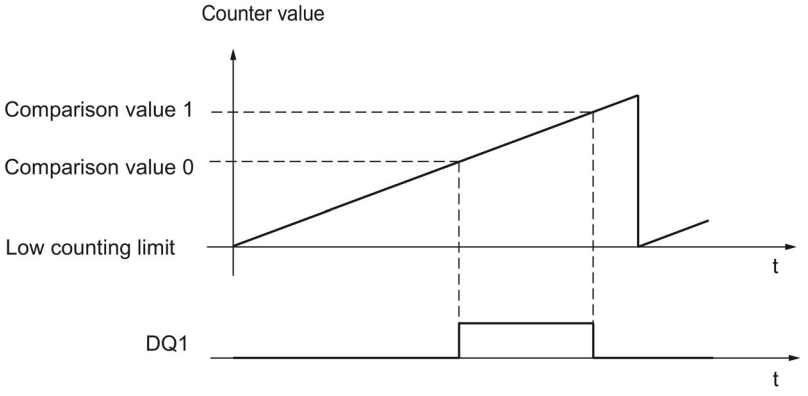
The comparison event is independent of the count direction.

Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= counter value <= comparison value 1



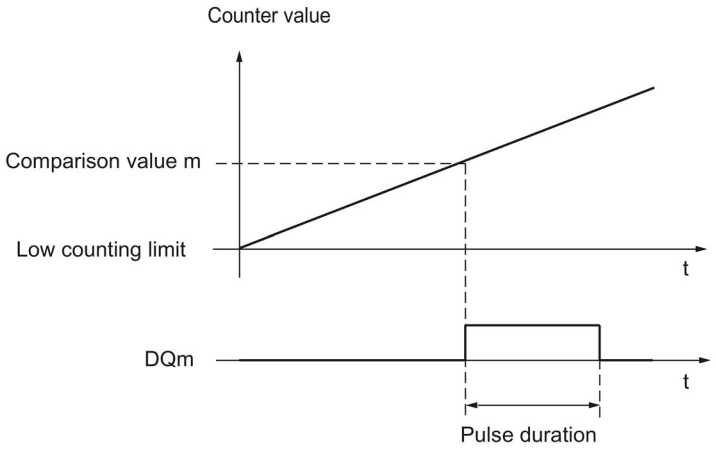
The comparison event is independent of the count direction.

Setting at comparison value for one pulse duration

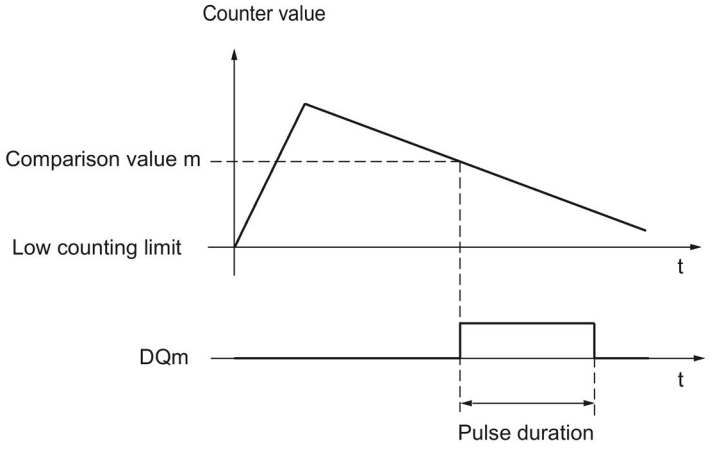
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Counter value = comparison value
- Current count direction = configured count direction for the comparison event

The figure below shows an example of the comparison event when counting in an upwards direction:

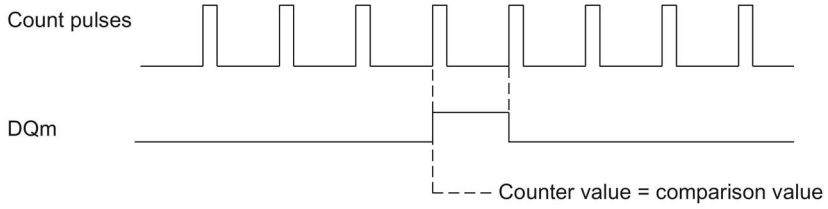


The figure below shows an example of the comparison event when counting in a downward direction:



To repeat the comparison event, the counter value must change and then correspond to the respective comparison value again.

If the pulse duration has been defined as "0" and the counter value is equal to the comparison value, the digital output is set to 1 until the next count pulse:



Note

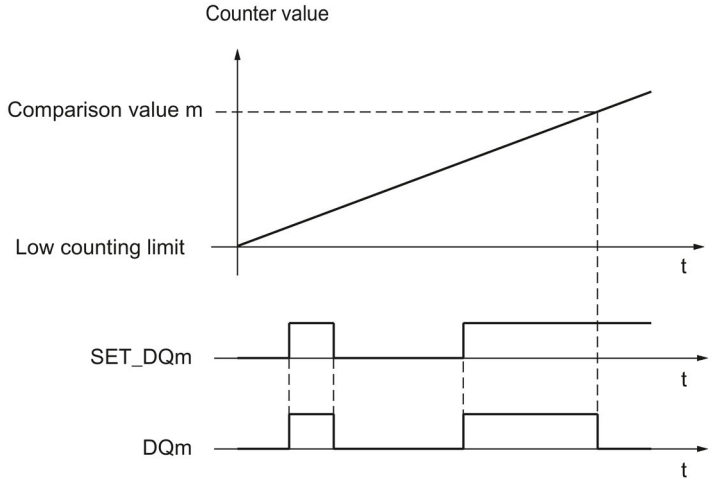
This comparison event switches the relevant digital output if a count pulse reaches the comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

Setting by the user program up to comparison value

You can set the respective digital output to 1 (edge) by setting the control bit (Page 151) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Match of the counter value and the comparison value in the configured direction of the comparison event
- Reset of the corresponding SET_DQm control bit.

The figure below shows an example of the comparison event when counting in an upwards direction:



You can disable the digital output before the counter value reaches the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached in the configured counting direction, the feedback bit EVENT_CMPm is set independently of the state of the control bit SET_DQm.

The comparison event switches a digital output when a count pulse reaches the respective comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

Switch at comparison values with SSI absolute encoder

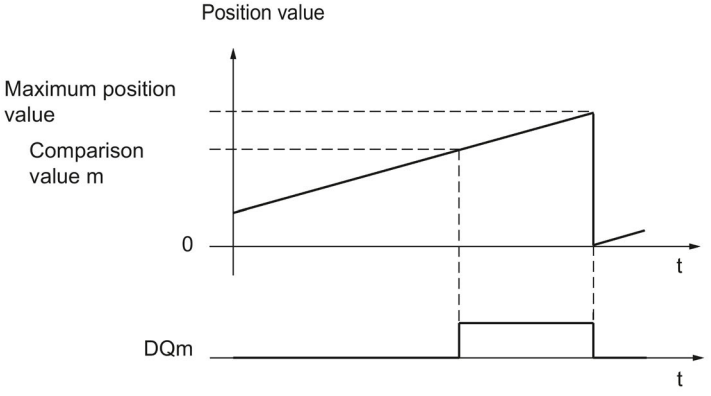
You can make switching for a digital output dependent on one of the following comparison events:

Setting between comparison value and high limit

The high limit corresponds to the maximum position value.

The digital output is set to 1 if:

Comparison value <= position value <= maximum position value



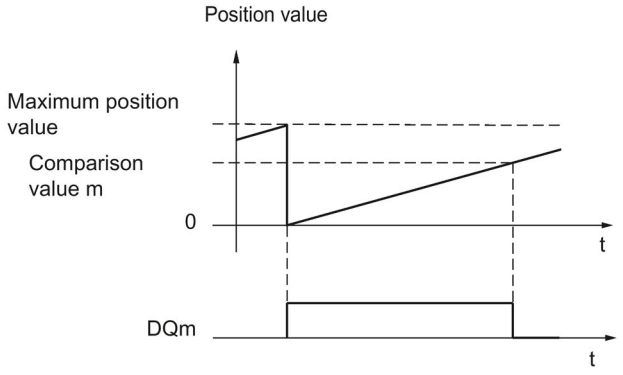
The comparison event is independent of the direction of the position value change. The maximum position value depends on the resolution of the SSI absolute encoder.

Setting between comparison value and low limit

The low limit corresponds to the position value "0".

The digital output is set to 1 if:

0 <= position value <= comparison value



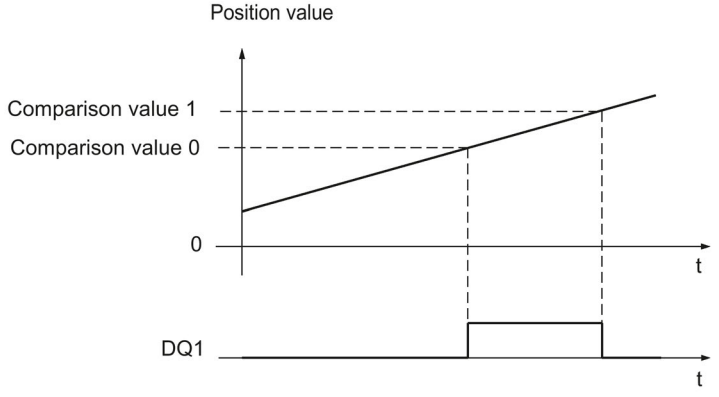
The comparison event is independent of the direction of the position value change.

Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= position value <= comparison value 1



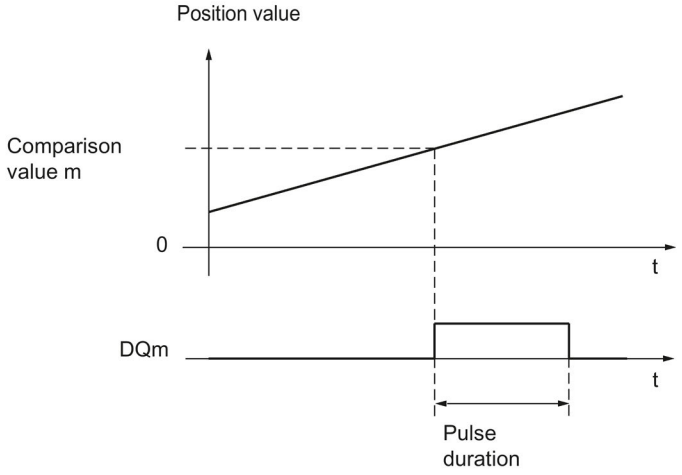
The comparison event is independent of the direction of the position value change.

Setting at comparison value for one pulse duration

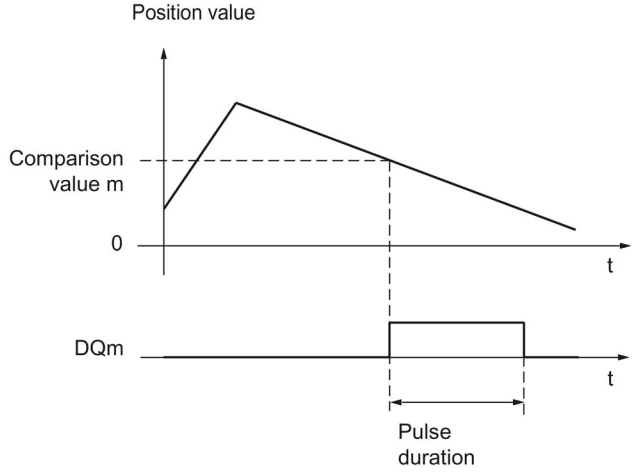
The respective digital output is set to 1 for a specified period of time when the following conditions are fulfilled:

- Matching of the position value and comparison value or crossing of the comparison value
- Current direction of the position value change = assigned direction for the comparison event

The figure below shows an example of the comparison event when counting up:



The figure below shows an example of the comparison event when counting down:



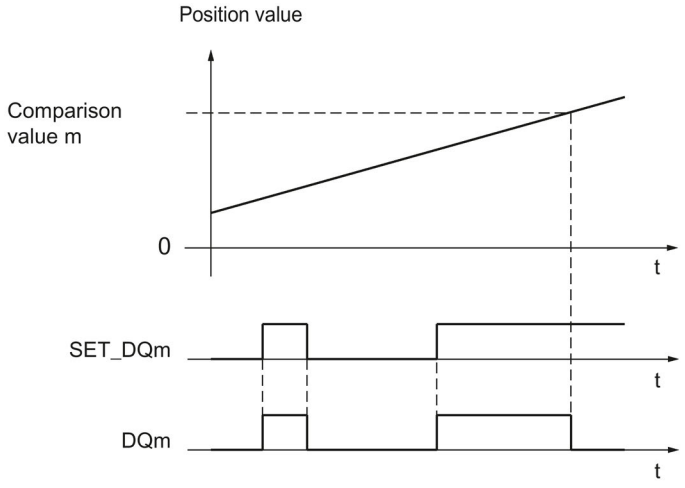
To repeat the comparison event, the position value must change and then correspond to or cross the respective comparison value again.

Setting by the user program up to comparison value

You can set each digital output to 1 (edge) by setting the control bit (Page 151) SET_DQm. The respective digital output is set to 0 by any of the following events:

- Matching of the position value and the comparison value or crossing of the comparison value in the configured direction of the comparison event
- Resetting of the SET_DQm control bit.

The figure below shows an example of the comparison event when counting up:



You can disable the digital output before the position value corresponds to or exceeds the comparison value by setting the control bit SET_DQm to 0.

Note

If the comparison value is reached or exceeded in the assigned direction, feedback bit EVENT_CMPm is set independently of the status of control bit SET_DQm.

2.2.7.3 Switch at comparison values in Measuring mode

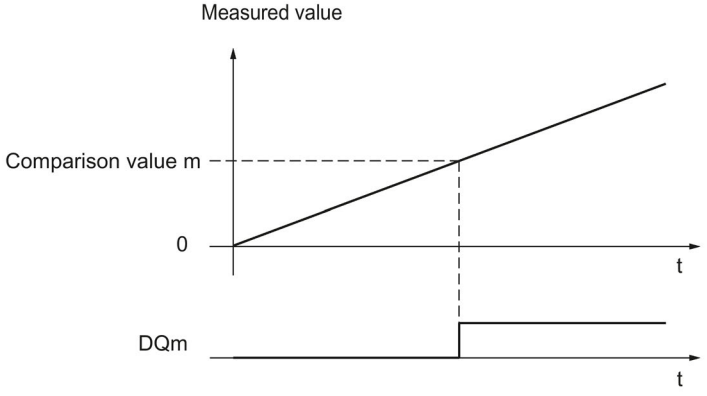
The comparison values are compared with the current measured value. If the measured value meets the configured comparison condition and the technological function of the corresponding digital output is enabled, the digital output is set. If you configure "Between comparison value 0 and 1" or "Not between comparison value 0 and 1" for digital output DQ1, both comparison values affect DQ1.

You can make switching for a digital output dependent on one of the following comparison events:

Setting above the comparison value

The digital output is set to 1 if:

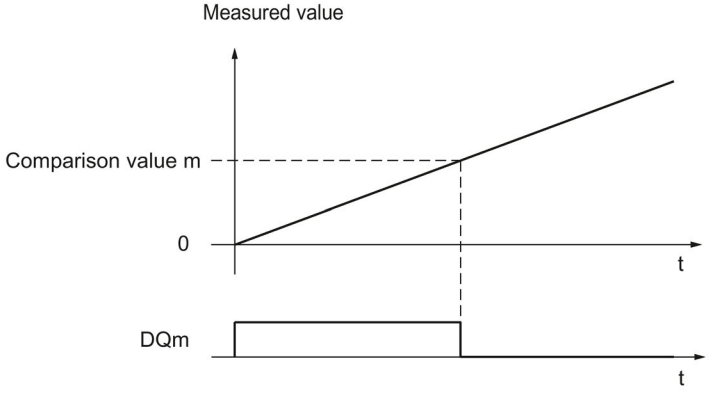
Measured value >= comparison value



Setting below the comparison value

The digital output is set to 1 if:

Measured value <= comparison value

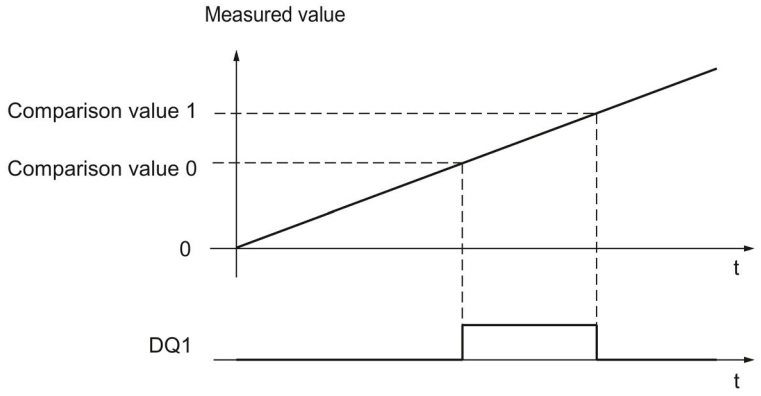


Setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 0 <= measured value <= comparison value 1

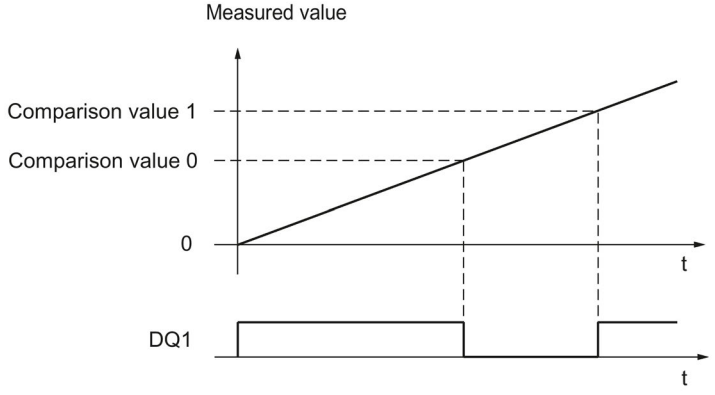


Not setting between comparison value 0 and comparison value 1

The comparison event can be configured for the digital output DQ1 if "Use by user program" has been configured for the digital output DQ0.

DQ1 is set to 1 if:

Comparison value 1 <= measured value <= comparison value 0



2.2.8 Measured value determination

2.2.8.1 Overview of measuring functions

The following measuring functions are available:

Measurement type (Page 53)	Description
Frequency measurement	The mean frequency is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in Hertz as floating point number.
Period measurement	The mean period duration is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and returned in seconds as floating point number.
Velocity measurement	The mean velocity is calculated at set measuring intervals on the basis of the time profile of the count pulses or position value changes and other parameters, and returned in the configured unit of measurement.

Measured values and counter values are available concurrently in the feedback interface.

Update time

You can configure the interval at which the technology module updates the measured values cyclically as the update time. Setting longer update time intervals allows uneven measured variables to be smoothed and increases measuring accuracy.

Gate control for incremental and pulse encoders

Opening and closing the internal gate defines the period of time during which the count pulses are captured. The update time is asynchronous to the opening of the gate, which means that the update time is not started when the gate is opened. After the internal gate is closed, the last measured value captured is still returned.

2.2.8.2 Measured value determination with incremental or pulse encoder

Measuring ranges

Measuring ranges

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0,04 Hz	800 kHz* / 4 MHz**
Period measurement	1,25 µs* / 0,25 µs**	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

* Applies to 24 V incremental encoders and "quadruple" signal evaluation.

** Applies to RS422 incremental encoders and "quadruple" signal evaluation.

All measured values are returned as signed values. The sign indicates whether the counter value increased or decreased during the relevant time period.

Measuring intervals

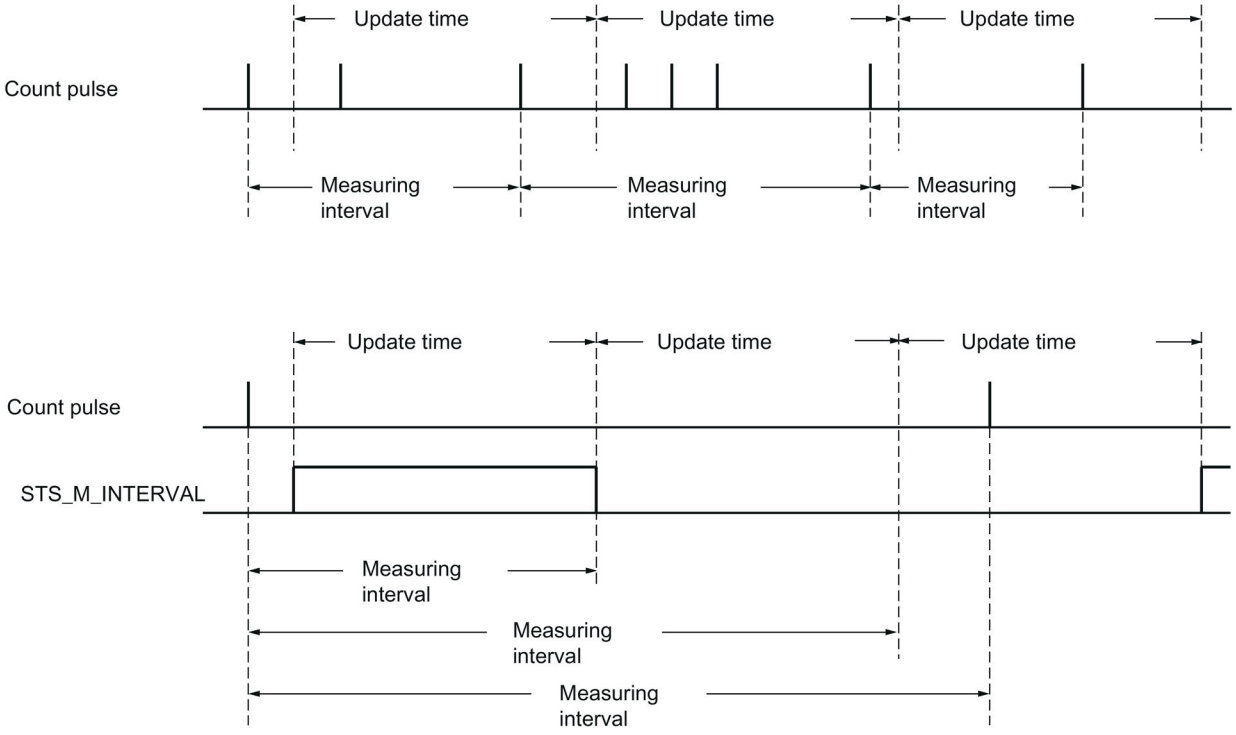
Measuring principle

The technology module assigns a time value to each count pulse. The measuring interval is defined as the time between each last count pulse before and during the previous update time. The measuring interval and the number of pulses in the measuring interval are evaluated to calculate measured variables.

If there is no count pulse within an update time, the measuring interval is dynamically adjusted. In this case, a pulse is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last pulse which occurred. The number of pulses is then 1.

The feedback bit STS_M_INTERVAL indicates whether a count pulse occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual count pulse.

The following figures show the principle of measurement and the dynamic adjustment of the measuring interval:



Measuring types

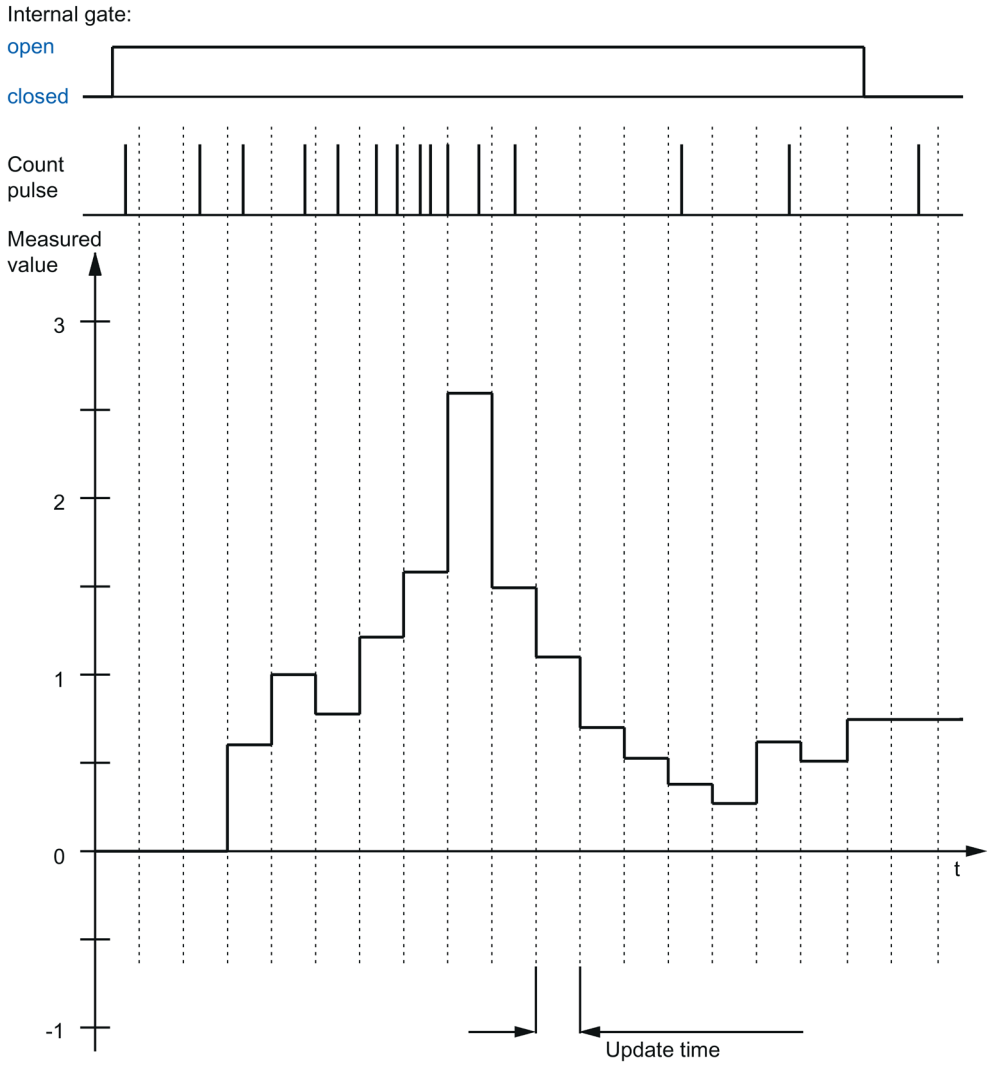
Frequency measurement

A value "0" is returned until the first measured value is available.

The measurement process begins with the first pulse detected once the internal gate has been opened. The first measured value can be calculated after the second pulse at the earliest.

The measured value is updated in the feedback interface (Page 154) upon completion of each update time. If the internal gate is closed, measuring stops and the measured value is no longer updated.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your encoder delivers 4000 increments per meter. The velocity is to be measured in meters per minute.

In this case, you need to configure 4000 Increments per unit and a time basis of one minute.

2.2.8.3 Measured value determination with SSI absolute encoder

Measuring ranges

Measuring range SSI absolute encoder

The measuring functions have the following measuring limits:

Measurement type	Low measuring range limit	High measuring range limit
Frequency measurement	0,04 Hz	4 MHz
Period measurement	0,25 µs	25 s
Velocity measurement	Depending on the configured number of "increments per unit" and the "time base for velocity measurement"	

All measured values are returned as signed values. The sign indicates whether the position value increased or decreased during the relevant time period.

Measuring intervals

Measuring principle

The technology module assigns a time value to each SSI frame. The measuring interval is defined as the time between the last SSI frame with a change of position value before and during the previous update time. The measuring interval and the total change in position value in the measuring interval are evaluated to calculate a measured variable. The total change in position value in a measuring interval corresponds to the number of encoder increments in the same measuring interval.

If there is no change in position value within an update time, the measuring interval is dynamically adjusted. In this case, a change in position value is assumed at the end of the update time and the measuring interval is calculated as the time between that point and the last SSI frame with a change in position value. The change in position value is then 1.

The feedback bit STS_M_INTERVAL indicates whether a change in position value occurred in the previous measuring interval. This allows for a differentiation between an assumed and an actual change in position value. If the technology module cannot calculate measured values because the measuring range limit has been violated, the feedback bit STS_M_INTERVAL is not set.

Measuring types

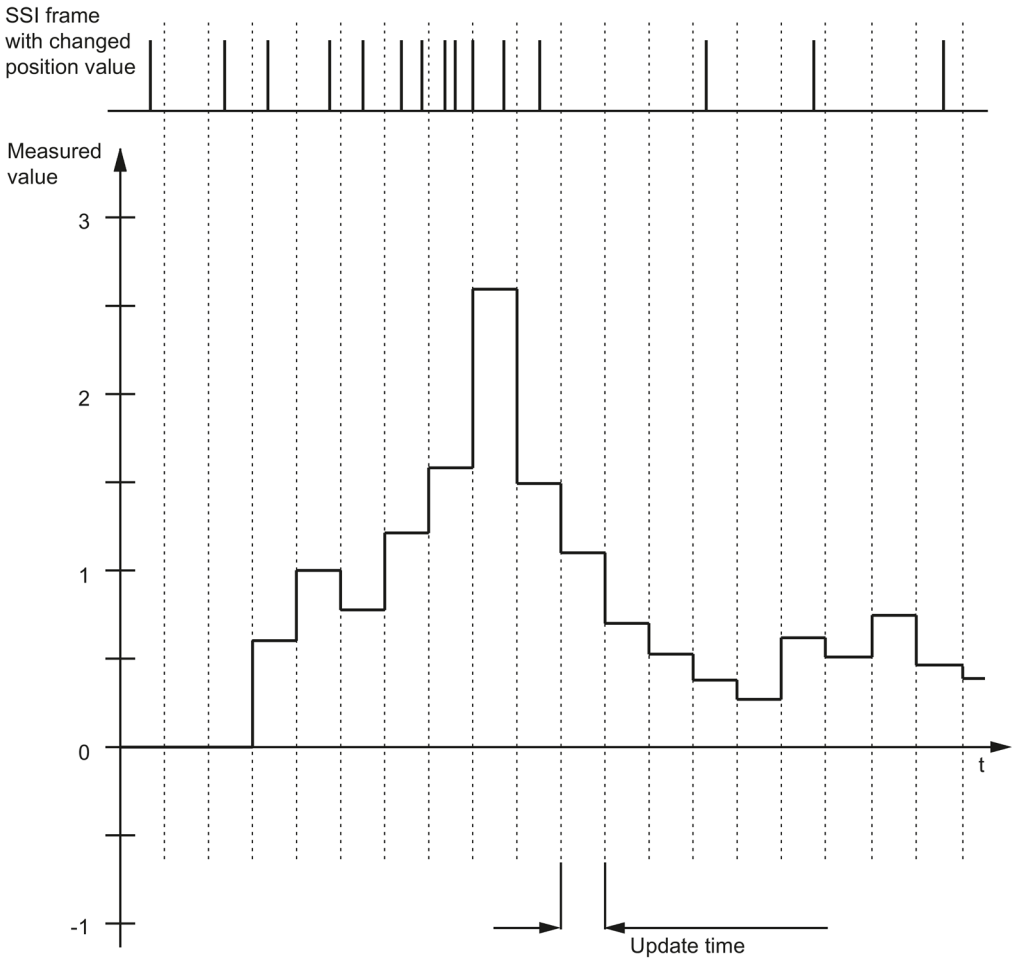
Frequency measurement

The value "0.0" is reported in the time up to the first available measured value.

The measuring process begins with the first detected change in position value. The first measured value can be calculated after the second detected change in position value at the earliest.

The measured value is updated in the feedback interface (Page 154) upon completion of each update time.

The figures below shows an example of frequency measurement with an update time of 1 s:



Period measurement

The reciprocal of the frequency is output as the measured value for period measurement.

A value "25 s" is returned until the first measured value is available.

Velocity measurement

The normalized frequency is output as the measured value in velocity measurement. You can configure the scaling using the time basis and the number of increments that your encoder delivers per unit.

Example:

Your SSI absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to configure 4096 Increments per unit and a time basis of one minute.

2.2.9 Hysteresis

2.2.9.1 Hysteresis with incremental or pulse encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the counter value has gone outside this range.

Slight movements by the encoder can result in the counter value fluctuating around a certain value. If a comparison value or a counting limit lies within this fluctuation range, the corresponding digital output is switched on and off with corresponding frequency if hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a compare event occurs.

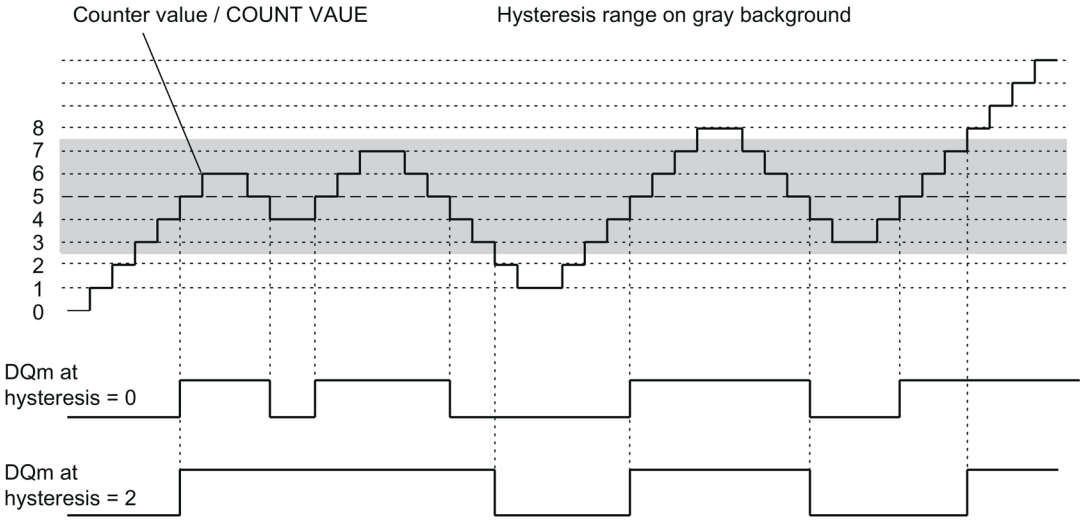
The Hysteresis becomes active when the respective comparison value is reached by a count pulse. If the counter value is set to the start value during an active Hysteresis, the Hysteresis becomes inactive.

Regardless of the hysteresis value, the hysteresis range ends at the low/high counting limits.

Function principle

The figure below shows an example for the hysteresis with the following configuration:

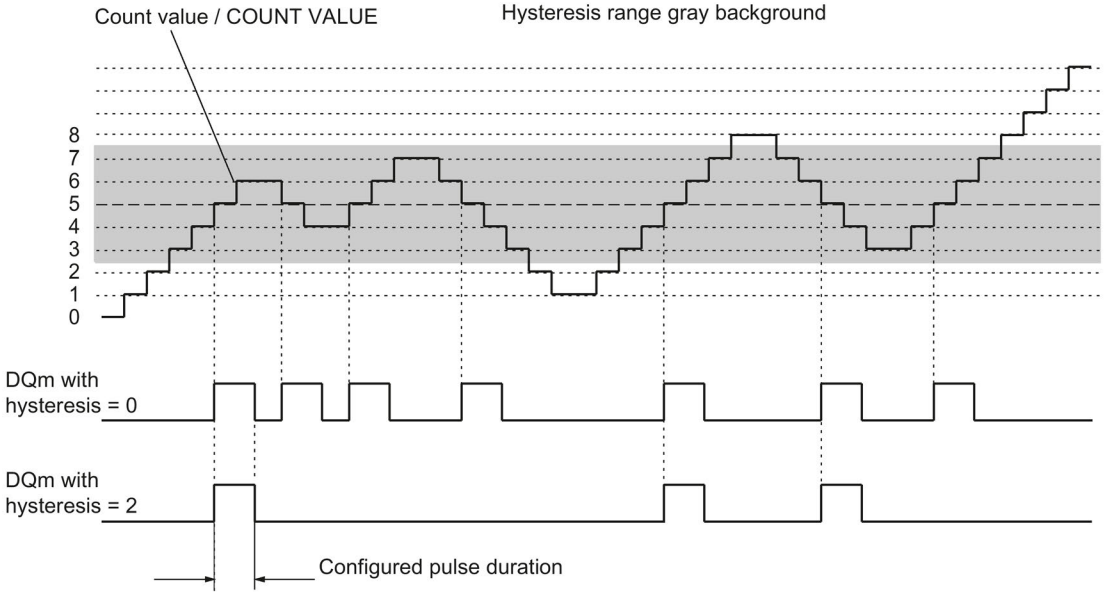
- Setting of a digital output between comparison value and high counting limit
- Comparison value = 5
- Hysteresis = 0 or 2



Hysteresis is enabled when the counter value 5 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the counter values 2 or 8 are reached.

The figure below shows an example for the hysteresis with the following configuration:

- Setting at comparison value for one pulse duration
- Comparison value = 5
- Comparison in both count directions
- Hysteresis = 0 or 2



2.2.9.2 Hysteresis with SSI absolute encoder

Description

Hysteresis allows you to specify a range around the comparison values within which the digital outputs are not to be switched again until the position value has gone outside this range.

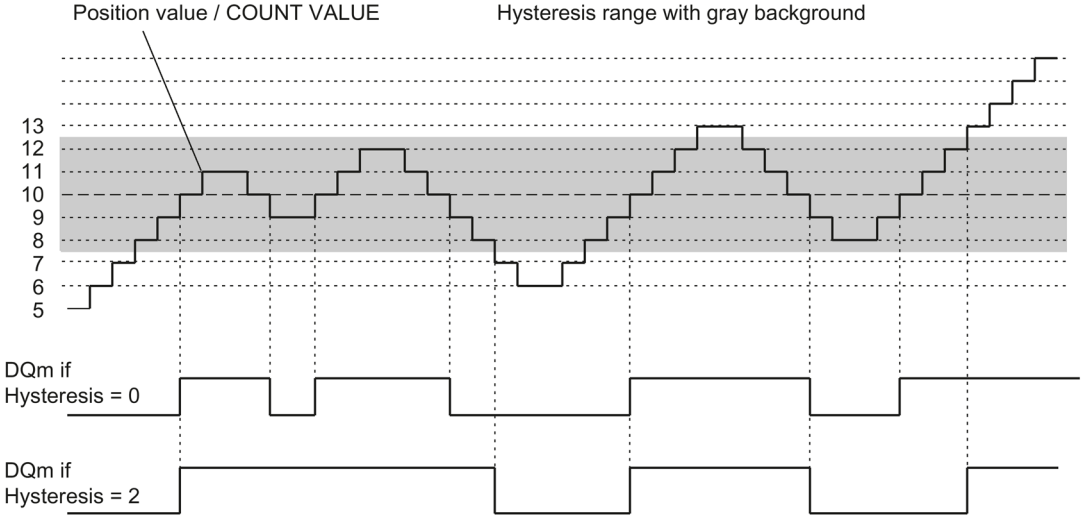
Slight movements by the encoder can result in the position value fluctuating around a certain value. If a comparison value, "0", or the respective maximum position value lies within this fluctuation range, the associated digital output is switched on and off with corresponding frequency if a hysteresis is not used. Hysteresis prevents this unwanted switching, and configured hardware interrupts when a compare event occurs.

Regardless of the hysteresis value, the hysteresis range ends at "0" and at the respective maximum position value.

Function principle

The figure below shows an example for the hysteresis with the following parameter assignment:

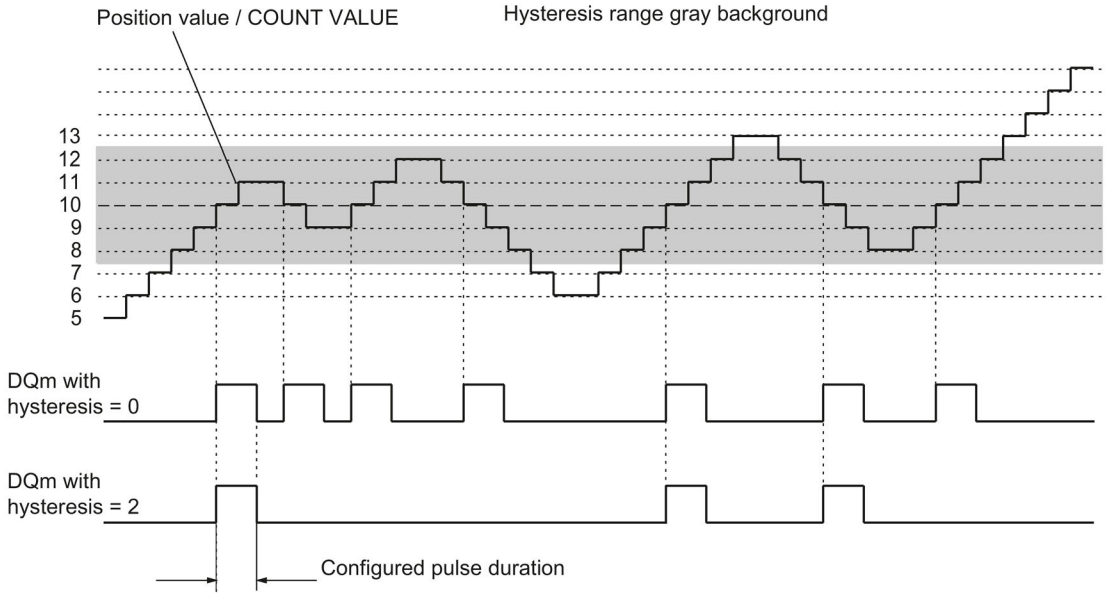
- Setting of a digital output between comparison value and high limit
- Comparison value = 10
- Hysteresis = 0 or 2



Hysteresis is enabled when the position value 10 is reached. When the hysteresis is active, the comparison result remains unchanged. Hysteresis is disabled when the position values 7 or 13 are reached.

The figure below shows an example for the hysteresis with the following parameter assignment:

- Setting at comparison value for one pulse duration
- Comparison value = 10
- Comparison in both directions of position value changes
- Hysteresis = 0 or 2



2.2.10 Interrupts

Hardware interrupt

The technology module can trigger a hardware interrupt in the CPU if, for example, a comparison event occurs; in the event of overflow or underflow; in the event of a zero crossing of the counter and/or of a change in count direction (direction reversal). You can specify which events are to trigger a hardware interrupt during operation.

Diagnostic interrupt

The technology module can trigger diagnostic interrupts in the event of errors. You enable the diagnostic interrupts for certain errors in the device configuration. Refer to the device manual for the technology module to learn about the events that can trigger a diagnostic interrupt during operation.

2.2.11 Position detection for Motion Control

Description

You can use the technology module with S7-1500 Motion Control for position detection.

In the Device configuration of the technology module in STEP 7 (TIA Portal), select "Position input for Motion Control" mode. This reduces the configuration options to the parameters that are essential. The mode automatically applies to all channels of the technology module.

When using an incremental or pulse encoder, the position input is based on the counting function of the technology module. With an SSI absolute encoder, the absolute value is transferred via a synchronous, serial interface and prepared according to the parameter assignment to be made available for S7-1500 Motion Control.

2.2.12 Encoder signals

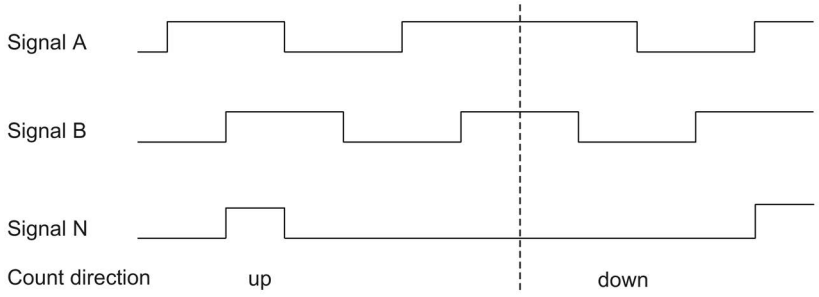
2.2.12.1 24 V and TTL count signals

24 V and TTL incremental encoder count signals

The 24 V incremental encoder returns the 24 V signals A, B, and N to the technology module. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

A 24 V incremental encoder uses the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value to the Capture value.

The figure below shows an example of the time profile of the signals of an 24 V incremental encoder:



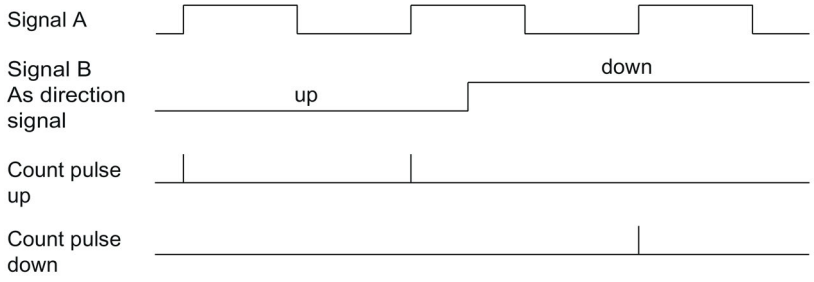
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

24 V and TTL pulse encoder count signals without/with direction signal

The encoder, for example an initiator (BERO) or a light barrier, returns only a count signal that is connected to terminal A of the counter.

In addition, you can connect a signal for direction detection to terminal B of the counter. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

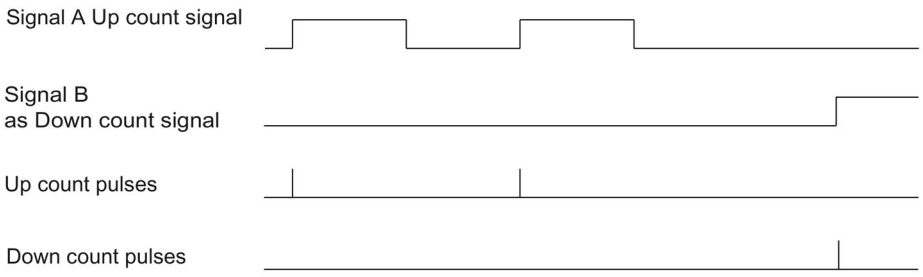
The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



24 V and TTL pulse encoder count signals with Up/Down count signal

The Up count signal is connected to terminal A. The Down count signal is connected to terminal B.

The figure below shows an example of the time profile of the signals of a pulse encoder with Up/Down count signal and the resulting count pulses:



Sourcing output/sinking output for 24 V count signals

You can connect the following encoders/sensors to the counter inputs:

- Sourcing output:
  The A, B, and N inputs are wired to 24VDC .
- Sinking output:
  The A, B, and N inputs are wired to ground M .
- Push-pull (sourcing and sinking output):
  The A, B, and N inputs are wired alternately to 24VDC and ground M .

Monitoring of encoder signals

The signals of push-pull 24 V sensors are monitored for wire breaks by the technology module. The technology module monitors TTL signals for offset voltages.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.12.2 RS422 count signals

RS422 incremental encoder count signals

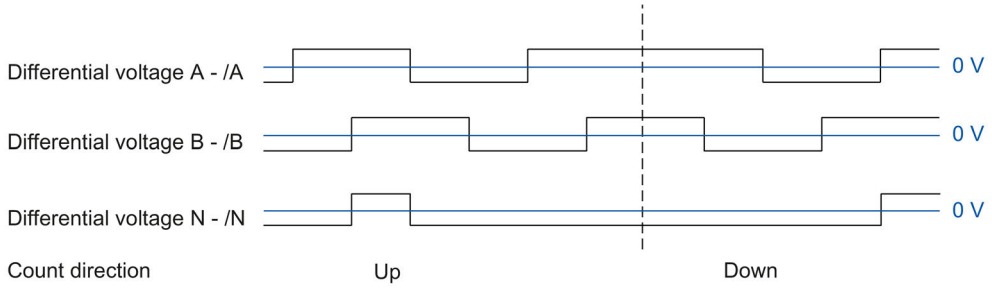
The RS422 incremental encoder sends the following differential signals to the technology module:

- A and /A
- B and /B
- N and /N

The signal information for RS422 signals is encoded in the differential voltage between A and /A, B and /B or N and /N. The A and B signals are phase-shifted by 90°. You can also connect incremental encoders without an N signal.

RS422 incremental encoders use the A and B signals for counting. If configured accordingly, the N signal is used for setting the counter to the start value or for saving the current counter value as the Capture value.

The figure below shows an example of the time profile of the signals of an RS422 incremental encoder:



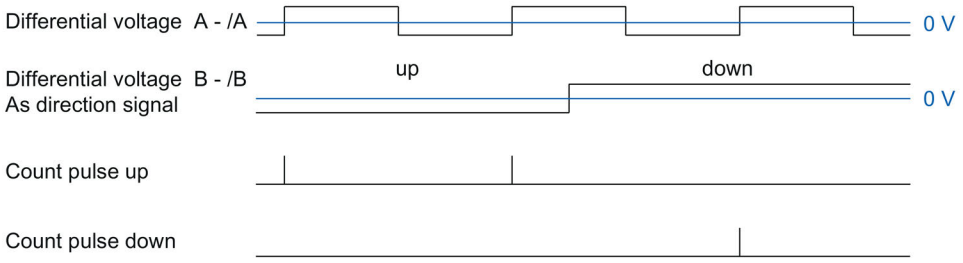
The technology module detects the count direction by evaluating the sequence of edges of the A and B signals. You can specify an inversion of the count direction.

Count signals of RS422 pulse encoders without/with direction signal

The encoder, for example a light barrier, only returns a count signal that is connected to terminal A.

You can also connect a signal for direction detection to terminal B. If your encoder does not return a corresponding signal, you can specify the count direction with the user program using the control interface.

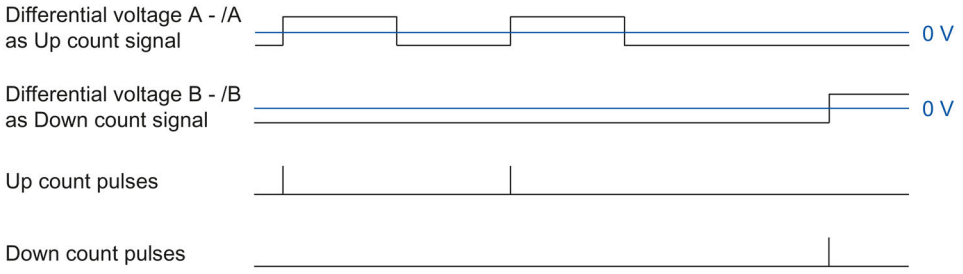
The figure below shows an example of the time profile of the signals of a RS422 pulse encoder with direction signal and the resulting count pulses:



Count signals of RS422 pulse encoders with Up/Down count signal

The Up count signal is connected to the A terminals. The Down count signal is connected to the B terminals.

The figure below shows an example of the time profile of the signals of an RS422 pulse encoder with Up/Down count signal and the resulting count pulses:



Monitoring of encoder signals

The technology module monitors RS422 signals for wire breaks, short-circuits, and offset voltages.

If you enable the diagnostic interrupt in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal errors.

2.2.12.3 SSI signals

Signals from SSI absolute encoders

The SSI absolute encoder and the technology module communicate via SSI data signals DAT and /DAT (D) and the SSI clock signals CLK and /CLK (C). SSI uses the RS422 signal standard. The signal information is coded in the respective differential voltage between C and /C as well as D and /D.

Monitoring of the encoder signals and the SSI frames

The technology module monitors the signals of an SSI absolute encoder for wire breaks, short-circuits, and offset voltages. The technology module also monitors SSI frames for errors.

If you enable the diagnostic interrupts in the device configuration, the technology module triggers a diagnostic interrupt in the event of encoder signal or SSI frame errors.

2.2.13 Signal evaluation of incremental signals

2.2.13.1 Overview

The technology module counter counts the edges of encoder signals A and B. For incremental encoders with phase-shifted signals A and B, you can select either single or multiple evaluation to improve the resolution.

You can configure the following signal evaluations:

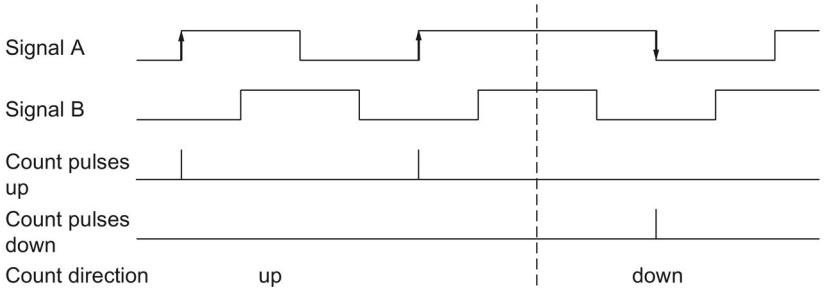
- Single evaluation (Page 68)
- Double evaluation (Page 69)
- Quadruple evaluation (Page 69)

2.2.13.2 Single evaluation

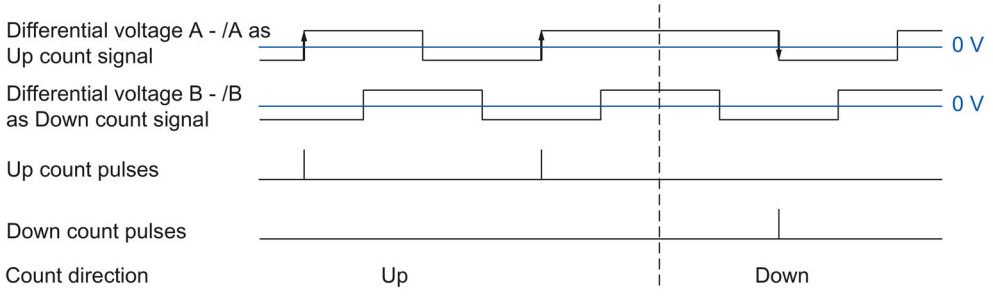
Single evaluation evaluates the rising and falling edge at signal A when signal B has a low level.

Count pulses in an upwards direction are generated with a rising edge at signal A during a low level at signal B. Count pulses in a downwards direction are generated with a falling edge at signal A during a low level of signal B.

The following figure shows an example for single evaluation of 24 V and TTL count signals:



The following figure shows an example for single evaluation of RS422 count signals:

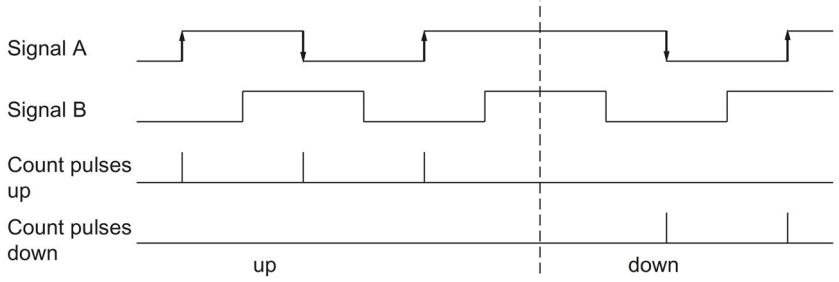


2.2.13.3 Double evaluation

With double evaluation, the rising and falling edges of signal A are evaluated.

The edge direction of signal A and the level at signal B determines whether count pulses are generated in an upward or downward direction.

The following figure shows an example for double evaluation of 24 V and TTL count signals:



The following figure shows an example for double evaluation of RS422 count signals:

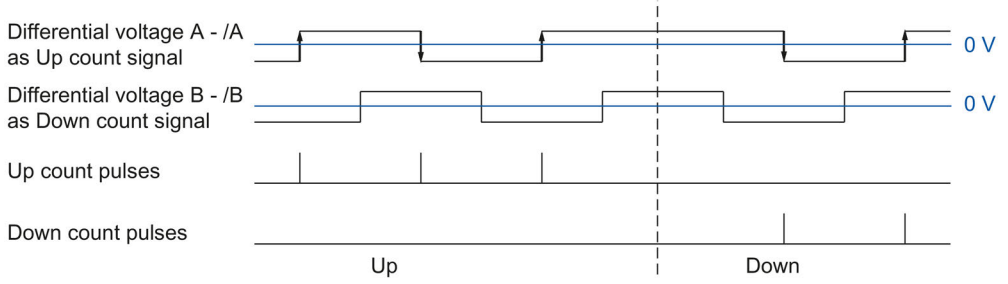


Figure 2-1 Double

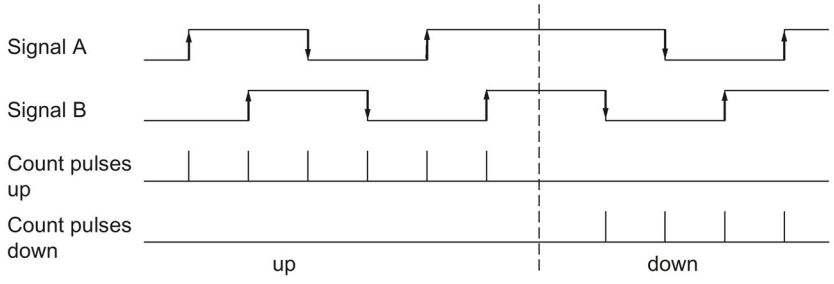
2.2.13.4 Quadruple evaluation

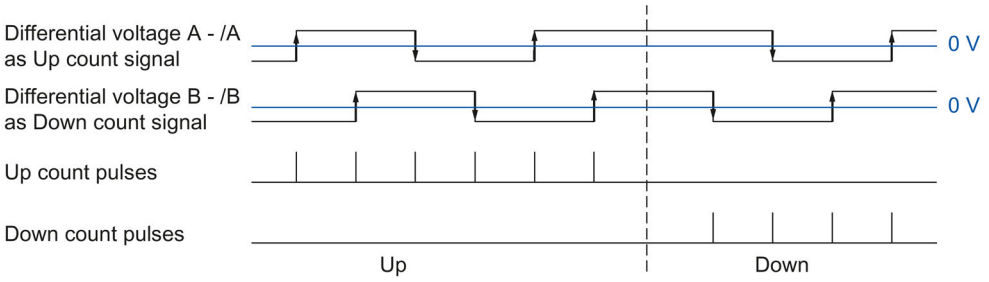
With quadruple evaluation, the rising and falling edges of signals A and B are evaluated.

The edge direction of one signal and the level of the other signal determines whether count pulses are generated in an upward or downward direction.

The figure below shows an example for quadruple evaluation of 24 V and TTL count signals:



The figure below shows an example for quadruple evaluation of RS422 count signals:



2.2.14 Isochronous mode

The technology module supports the "isochronous mode" system function in distributed mode. This system function enables position, counter and measured values to be recorded in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the technology module are synchronized. The output signals switch immediately if the relevant comparison condition is met. A change in the state of a digital input immediately affects the planned reaction of the technology module and changes the status bit of the digital input in the feedback interface.

Data processing

The data that was transmitted to the technology module in the current bus cycle via the control interface takes effect when it is processed in the internal technology module cycle. The position or counter value and, if required, the measured value and the status bits as well are captured at the time T_i and made available in the feedback interface for retrieval in the current bus cycle.

In isochronous mode, there is always data consistency across all bytes in the feedback interface.

2.3 Basics of counting (digital input modules)

2.3.1 Overview of applications

Introduction

The digital input module is configured and assigned parameters using the configuration software.

The module's functions are controlled and monitored via the user program.

System environment

The respective module can be used in the following system environments:

Applications	Components required	Configuration software	In the user program
Central and distributed mode in an S7-1500 system with a corresponding ET 200 system	• S7-1500 automation system • ET 200 distributed I/O system • Digital input module	STEP 7 (TIA Portal) and STEP 7: Device configuration and parameter settings with HSP	Direct access to technology module control and feedback interface in the I/O data
Distributed operation in an S7-300/400 system	• S7-300/400 automation system • ET 200 distributed I/O system • Digital input module		
Distributed operation in a third-party system	• Third-party automation system • ET 200 distributed I/O system • Digital input module	Third-party configuration software: Device configuration and parameter settings with GSD file	

Note

A description of the control and feedback interface is available in the device manual for the digital input module.

2.3.2 Counting with pulse encoders

Counting refers to the detection and summation of events. The modules' counters record and evaluate pulse signals. The counting direction can be specified using encoder or pulse signals or through the configuration.

You can use feedback bits to switch the digital outputs of digital output modules exactly at defined counter values, independent of the user program.

You can configure the characteristics of the counters using the functionalities described below.

Counter limits

The counter limits define the counter value range used. The counter limits are configurable and can be modified during runtime using the user program. See the module's device manual for the maximum and minimum configurable counter limits.

You can configure whether the counting processes are terminated or continue when a counter limit is violated (automatic gate stop).

Start value

You can configure a start value within the counter limits. The start value can be modified during runtime with the user program.

Gate control

Opening and closing the hardware gate and software gate defines the period of time during which the counting signals are recorded.

The hardware gate is controlled externally via a digital input of the technology module. The hardware gate can be enabled through parameter assignment. The software gate is controlled via the user program. A description of the control and feedback interface is available in the device manual for the digital input module.

2.3.3 Behavior at the counting limits

Violation of a counting limit

The counter high limit is violated when the current counter value is equal to the counter high limit and another upward count pulse is received. The counter low limit is violated when the current counter value is equal to the counter low limit and another downward count pulse is received.

With digital input modules for ET 200SP, the corresponding event bit is set in the feedback interface when the limit is violated. You can reset an event bit with the respective control bit:

Counting limit violated	Event bit	Reset bit
Counter high limit	EVENT_OFLW	RES_EVENT_OFLW
Counter low limit	EVENT_UFLW	RES_EVENT_UFLW

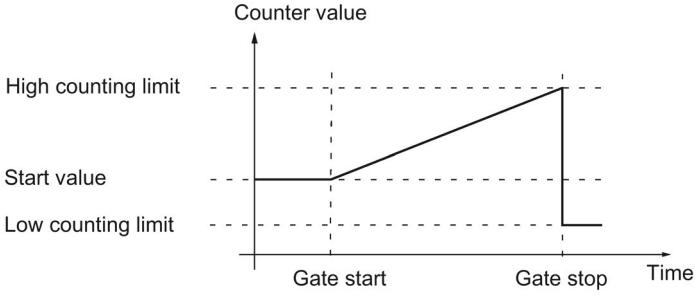
Note

A description of the control and feedback interface is available in the device manual for the digital input module.

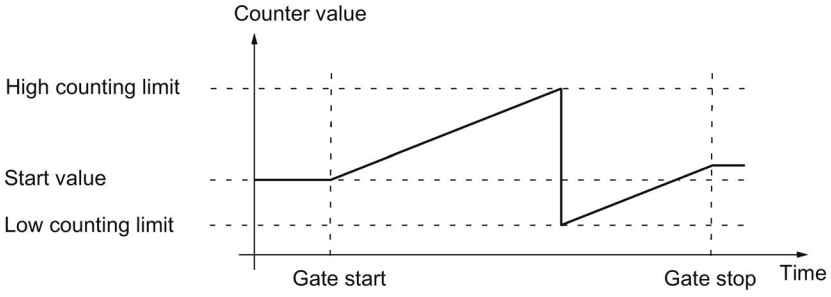
You can configure whether or not you want to continue counting to another counter limit after a counting limit violation.

Examples

The figure below shows an example for terminating counting after setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:



2.3.4 Gate control

Many applications require counting processes to be started or stopped in accordance with other events. In such cases, counting is started and stopped using the gate function.

The digital input modules have two gates for each counting channel. These define the resulting internal gate:

- Software gate
- Hardware gate

Note

The hardware gate is not configurable for all digital input modules.

2.3.4.1 Software gate

The software gate of the channel is opened and closed with the SW_GATEcontrol bit.

See the module's device manual for information on the design of the control and feedback interface.

2.3.4.2 Hardware gate

The hardware gate is optional. You open and close the hardware gate using signals at the corresponding digital input.

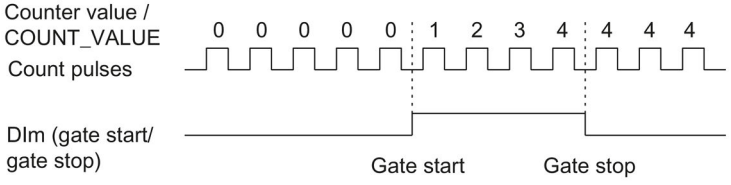
Note

A configurable input delay delays the control signal of the digital input.

The status of a DIm digital input is indicated by the respective STS_DIm feedback bit. A description of the control and feedback interface is available in the device manual for the digital input module.

Opening and closing the hardware gate

The figure below shows an example of opening and closing with a digital input:



As long as the digital input is set, the hardware gate is open and the count pulses are counted. The hardware gate is closed when the digital input is reset. The counter value stays constant and ignores any further count pulses.

2.3.4.3 Internal gate

Internal gate

The internal gate is open if the software gate is open and the hardware gate is open or has not been configured. The status of the internal gate is indicated by the STS_GATE feedback bit. See the module's device manual for information on the design of the control and feedback interface.

If the internal gate is open, counting is started. If the internal gate is closed, all other count pulses are ignored and counting is stopped.

If you want to control a counting process with the hardware gate only, the software gate must be open. If you do not configure a hardware gate, the hardware gate is considered to be always open. In this case, you open and close the internal gate with the software gate only.

Hardware gate	Software gate	Internal gate
Open/not configured	open	open
Open/not configured	closed	closed
closed	open	closed
closed	closed	closed

The internal gate can also be automatically closed upon violation of a counting limit. The software or hardware gate must then be closed and reopened to continue counting.

2.3.5 Comparison values

Depending on the module, you can define up to two comparison values that control a reset bit for the channel, independent of the user program.

When there are two comparison values, comparison value 1 must be greater than comparison value 0. The comparison values are configurable and can be changed at runtime by the user program.

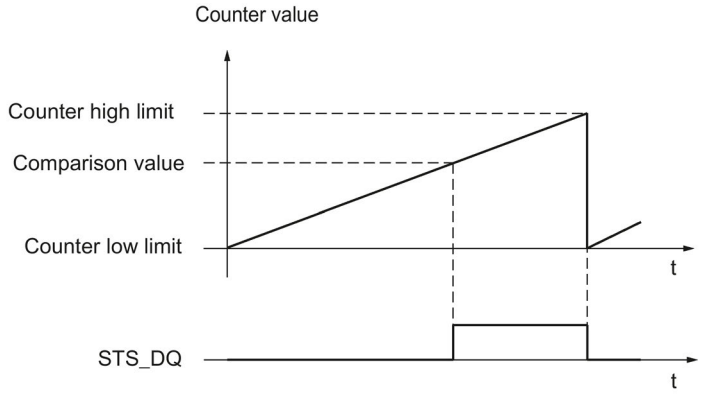
The comparison values are compared with the current counter value. If the counter value meets the configured comparison condition, the respective STS_DQ reset bit is set.

You can use the respective reset bit in order to switch a digital output module's digital output. You can make setting the respective STS_DQ reset bit dependent on one of the following comparison events. See the device manual for the technology module to find out which comparison events can be configured.

Setting between comparison value and high counter limit

The respective STS_DQ feedback bit is set to 1 when:

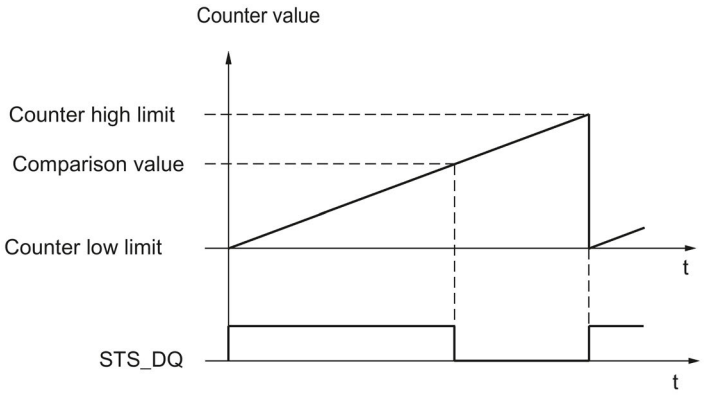
Comparison value <= counter value <= high counter limit



Setting between comparison value and low counter limit

The respective STS_DQ feedback bit is set to 1 when:

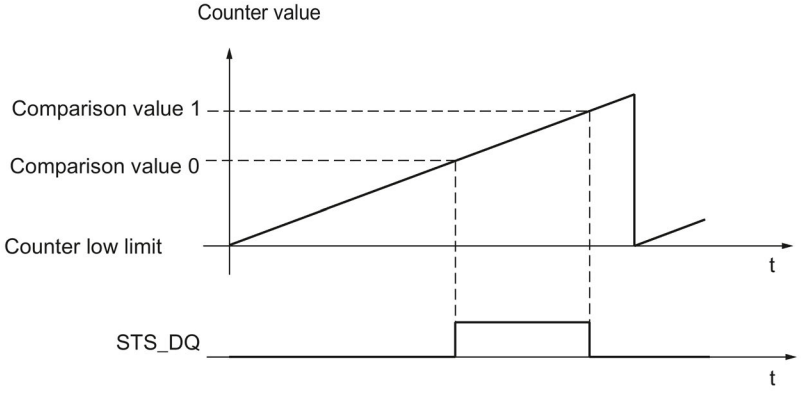
Low counter limit <= counter value <= comparison value



Setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

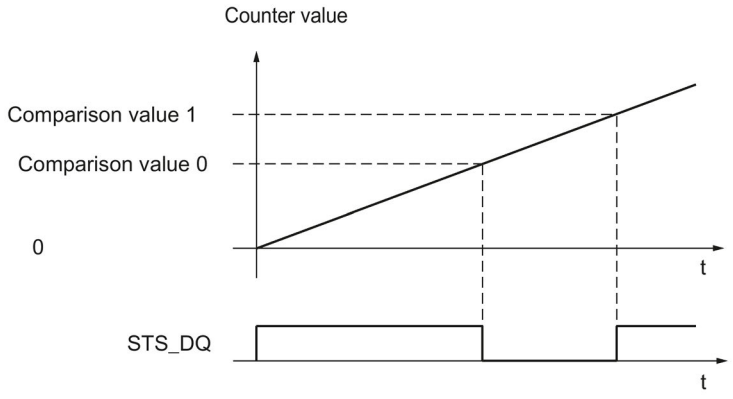
Comparison value 0 <= counter value <= comparison value 1



Not setting between comparison value 0 and comparison value 1

The respective STS_DQ feedback bit is set to 1 when:

Comparison value 0 <= counter value <= comparison value 1



2.3.6 Interrupts

Hardware interrupt

The module can trigger a hardware interrupt in the CPU during operation for certain events. The hardware interrupts can be enabled in the configuration. Refer to the device manual for the module to learn about the events that can trigger a hardware interrupt during operation.

Note

Hardware interrupts for counting are not configurable for all digital input modules.

Diagnostic interrupt

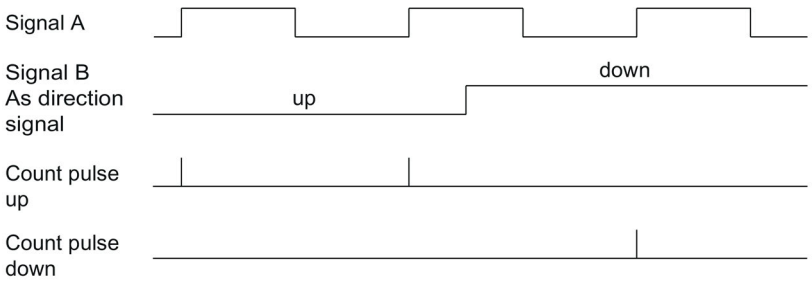
The module can trigger diagnostic interrupts in the event of errors. You enable the diagnostic interrupts for certain errors in the configuration. Refer to the device manual for the technology module to learn about the events that can trigger a diagnostic interrupt during operation.

2.3.7 24 V count signals

24 V pulse encoder count signals

The encoder, for example an initiator (BERO) or a light barrier, returns a count signal that is connected to the terminal (signal A) of the counter. You can also connect a signal for direction detection (signal B).

The figure below shows an example of the time profile of the signals of a 24 V pulse encoder with direction signal and the resulting count pulses:



Note

A signal for direction detection cannot be connected for all digital input modules.

Monitoring of encoder signals

If you enable the respective diagnostic interrupt in the device configuration, the module triggers a diagnostic interrupt in the event of an encoder signal error.

2.3.8 Isochronous mode

The digital input module supports the "isochronous mode" system function in distributed mode. This system function enables counter values to be acquired in a defined system cycle.

In isochronous mode, the cycle of the user program, the transmission of the input signals and processing in the module are synchronized. A change in the state of a digital input immediately causes a change to the status bit of the digital input in the feedback interface.

Data processing

The data that was transmitted to the module in the current bus cycle via the control interface takes effect when it is processed in the module's internal cycle. The the counter value and status bits are detected at time T_i and made available in the feedback interface for retrieval in the current bus cycle.

In isochronous mode, there is always data consistency across all bytes in the feedback interface.

Using the High_Speed_Counter technology object 3

3.1 High_Speed_Counter technology object

STEP 7 (TIA Portal) helps you with the configuration of the counting and measuring functions for the technology modules with the "Technology objects" function in the project navigator ("Project > S7-1500 PLC > Technology objects"):

- You configure the High_Speed_Counter technology object in STEP 7 (TIA Portal) with the settings for the counting and measuring functions.
- The corresponding High_Speed_Counter instruction is programmed in the user program. This instruction supplies the control and feedback interface of the technology module.

The High_Speed_Counter technology object corresponds to the instance DB of the High_Speed_Counter instruction. The configuration of the counting and measuring functions is saved in the technology object. The technology object is located in the folder "PLC > Technology objects". It is implemented by an instance DB of the instruction.

The High_Speed_Counter technology object can be used for technology modules of both the S7-1500 and ET 200SP systems.

Counting operating mode

Counting mode is automatically defined if the technology object High_Speed_Counter is being used. The measured values are available concurrently.

Measuring mode

No technology object is available for the Measuring mode. The parameters of the Measuring mode are assigned using the parameter setting (HWCN) (Page 127) of the technology module. The technology module is controlled by direct access to the control and feedback interface (Page 151).

Position input

- The parameter assignment of the SSI absolute encoder (Page 135) is performed using the parameter setting (HWCN) (Page 127) of the technology module. No technology object is available for position detection using an SSI absolute encoder.
- The parameter assignment of the encoder signals for position input for Motion Control (Page 122) is performed using the device configuration of the technology module. You can perform additional configuration for this application using an axis technology object of S7-1500 Motion Control.

3.2 Overview of the configuration steps

Introduction

The overview below shows the basic procedure for configuring the counting and measuring functions of the technology module with the High_Speed_Counter technology object.

Requirement

Before you can use the High_Speed_Counter technology object, a project must be created in STEP 7 (TIA Portal) with an S7-1500 CPU.

Procedure

Proceed in the recommended sequence outlined below:

Step	Description
1	Configuring the technology module and specifying use with technology object (Page 117)
2	Add technology object (Page 83)
3	Working with the configuration dialog (Page 85)
4	Call instruction in the user program (Page 103)
5	Load to CPU
6	Commissioning the technology object (Page 113)
7	Diagnostics of the technology object (Page 115)

3.3 Add technology object

Add technology object in the project navigator

When a technology object is added, an instance DB is created for the instruction of this technology object. The configuration of the technology object is stored in this instance DB.

Requirement

A project with an S7-1500 CPU has been created.

Procedure

To add a technology object, proceed as follows:

1. Open the CPU folder in the project tree.
2. Open the "Technology objects" folder.
3. Double-click on "Add new object".
   The "Add new object" dialog opens.
4. Select the "Counting and measurement" technology.
5. Select the "High_Speed_Counter" object.
6. Enter an individual name for the technology object in the "Name" text box.
7. Select the "Manual" option if you want to change the suggested data block number of the instance DB.
8. Click "Additional information" if you want to add your own information to the technology object.
9. Confirm with "OK".

Result

The new technology object has now been created and stored in the project tree in the "Technology objects" folder.

	Object	Description
①	Configuration (Page 85)	In the configuration dialog: • Assignment of technology module and channel • Technology object parameter settings for counting and measurement functions When you change the configuration of the technology object, you must download the technology object **and** the hardware configuration to the CPU.
②	Commissioning (Page 113)	Commissioning and function test of the technology object: Simulating parameters of the High_Speed_Counter instruction and monitoring the effects
③	Diagnostics (Page 115)	Monitoring the counting and measuring functions

3.4 Configuring the High_Speed_Counter

3.4.1 Working with the configuration dialog

You configure the properties of the technology object in the configuration window. Proceed as follows to open the configuration window of the technology object:

1. Open the "Technology objects" folder in the project tree.
2. Open the technology object in the project tree.
3. Double-click on the "Configuration" object.

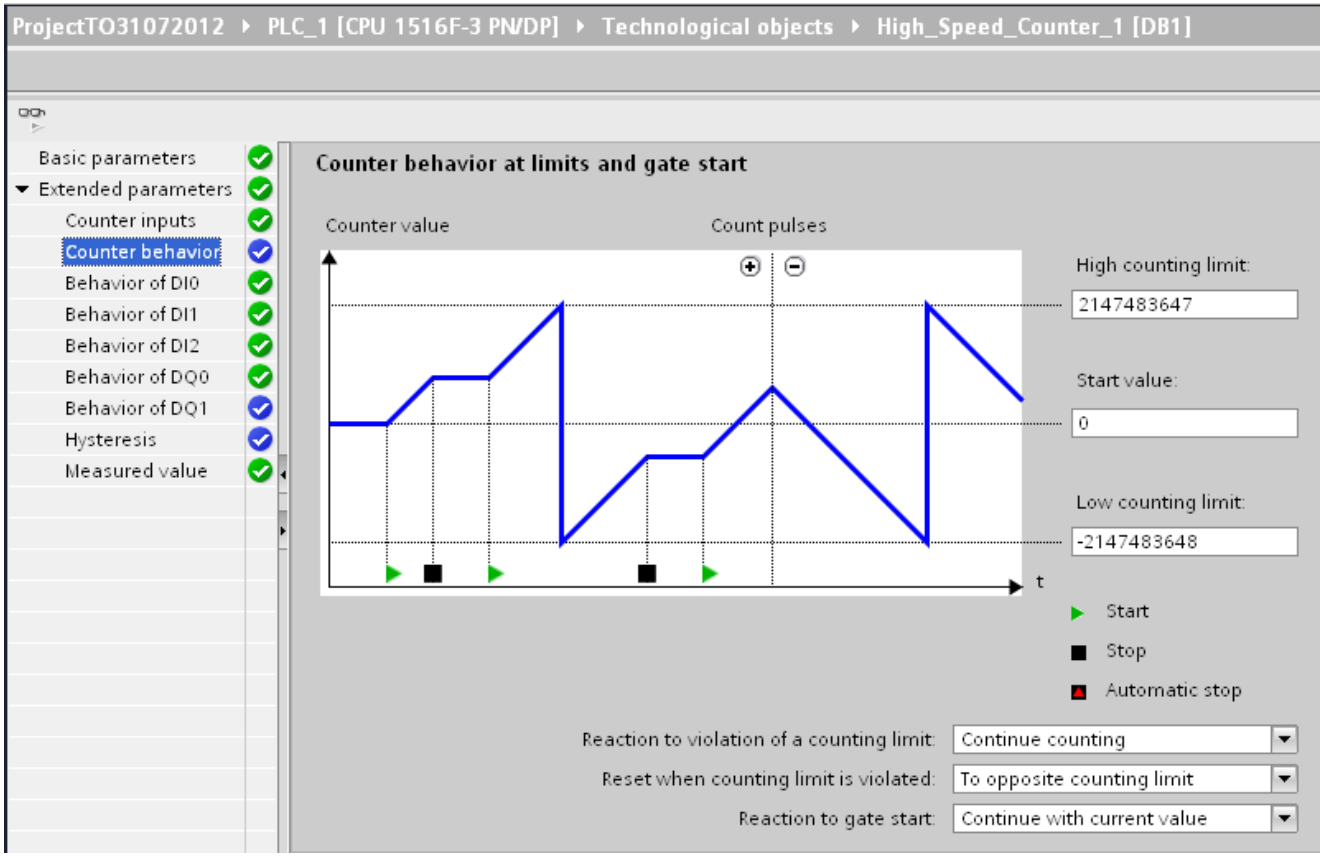
The configuration is divided into the following categories:

- **Basic parameters**

  The basic parameters include the selection of the technology module and the number of the counting channel for which the technology object is configured.

- **Extended parameters**

  The extended parameters include the parameters for adapting the counting and measuring functions and for setting the characteristics of the digital inputs and digital outputs.



Configuration window icons

Icons in the area navigation of the configuration show additional details about the status of the configuration:

	The configuration contains default values and is complete. The configuration contains only default values. With these default values, you can use the technology object without additional changes.
	The configuration contains values set by the user and is complete. All text boxes of the configuration contain valid values and at least one default value was changed.
	The configuration is incomplete or incorrect At least one text box or drop-down list contains an invalid value. The corresponding field or the drop-down list is displayed on a red background. Click the roll-out error message to indicate the cause of error.

3.4.2 Basic parameters

You can establish the connection between the High_Speed_Counter technology object and the technology module under "Basic parameters".

Module

You select the technology module in a subsequent dialog box. You can choose any of the technology modules (central or distributed) which are configured in the S7-1500 CPU for use with a technology object from "Counting and measuring".

After selecting the technology module, you can open the device configuration associated with the technology module by clicking the"Device configuration" button.

The technology module parameter settings required for the use of the technology object are made in the "Extended parameters" of the technology object.

Channel

For a technology module with several counting channels, you can also select the number of the counting channel for which the High_Speed_Counter technology object is to be valid.

Synchronization of the parameter values

If there is an inconsistency between the parameter values under "Parameters" (HWCN) and in the technology object after assigning the count channel to the technology object, a button appears: "Overwrite technology module parameters". When you click the button, the parameter values under "Parameters" (HWCN) are overwritten (after a prompt) with the parameter values of the technology object in STEP 7 (TIA Portal). The current parameter values (read only) of the technology object are displayed under "Parameters" (HWCN).

3.4.3 Counter inputs

3.4.3.1 Specifying input signals/encoder type

Signal type

You can choose from the following signal types (Page 63):

Symbol	Signal type	Meaning
	Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.
	Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.
	Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.
	Pulse (A)	A pulse encoder (signal A) without direction signal is connected. You can specify the counting direction by means of the control interface (Page 151).
	Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.

Invert direction

You can invert the count direction to adapt it to the process.

Inversion of direction can only be configured and become effective if signal type "Incremental encoder (A, B phase-shifted)" or "Incremental encoder (A, B, N)" is selected.

3.4.3.2 Additional parameters

Signal evaluation

By configuring signal evaluation (Page 68), you can specify which edges of the signals are counted.

You can select from the following options:

Icon	Signal evaluation	Meaning
	Single (Page 68) (default)	The edges of signal A are evaluated during a low level of signal B.
	Double (Page 69)	Each edge of signal A is evaluated.
	Quadruple (Page 69)	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counter inputs A, B and N.

The selected filter frequency is based on a pulse-break ratio of between 40:60 and 60:40. This produces a set minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Table 3- 1 Filter frequency and respective minimum pulse/break time

Filter frequency	Minimum pulse/break time
100 Hz	4,0 ms
200 Hz	2,0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8,0 µs
100 kHz	4,0 µs
200 kHz (default at TM Count)	2,0 µs
500 kHz*	0,8 µs
1 MHz* (default at TM PosInput)	0,4 µs

* only with TM PosInput

Sensor type

By configuring the sensor type, you specify how the counter inputs are wired for the TM Count.

You can select from the following options:

Sensor type	Meaning
Sourcing output (default)	The encoder/sensor switches the inputs A, B and N to 24VDC.
Sinking output	The encoder/sensor switches the inputs A, B and N to M.
Push-pull (sinking and sourcing output)	The encoder/sensor alternately switches the inputs A, B and N to M and 24VDC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull encoder, you can monitor the encoder signals for wire break.

Interface standard

You use this parameter to specify whether the encoder outputs symmetric (RS422) or asymmetric (TTL) signals for the TM PosInput.

You can select from the following options:

Interface standard	Meaning
RS422, symmetric	The encoder outputs symmetric signals according to the RS422 standard (Page 65).
TTL (5 V), asymmetric	The encoder outputs asymmetric 5 V signals according to the TTL standard (Page 63).

Note

The RS422 standard provides greater interference immunity than the TTL standard. If your incremental or pulse encoder supports the RS422 standard **and** the TTL standard, we recommend using the RS422 standard.

Reaction to signal N

You use this parameter to specify which reaction is triggered at signal N.

You can select from the following options:

Option	Meaning
No reaction to signal N (default)	The counter is not affected by signal N.
Synchronization at signal N (Page 36)	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.
Capture at signal N (Page 26)	The counter value is stored in the Capture value at signal N.

Note

You can only select the reaction at signal N if you have selected the signal type (Page 87) "Incremental encoder (A, B, N)".

Note

If "Synchronization at signal N" is selected, you can select the function "Enable synchronization at signal N" for a digital input (Page 94).

Frequency

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

3.4.4 Counter behavior

3.4.4.1 Counting limits and start value

High counting limit

You limit the counting range by setting the high counting limit. You can enter a value up to 2147483647 (2^{31}-1). You must enter a value that lies above the low counting limit.

The default setting is "2147483647".

Low counting limit

You limit the counting range by setting the low counting limit. You can enter a value up to -2147483648 (-2^{31}). You must enter a value below the high counting limit.

The default setting is "-2147483648".

Start value

By configuring the start value, you specify the value at which counting is to start and where it is to continue in the case of defined events. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Additional information

For more information, see Behavior at the counting limits (Page 21) and Counter behavior at gate start (Page 25).

3.4.4.2 Counter behavior at limits and gate start

Reaction to violation of a counting limit

You can configure the following characteristics for violation of a counting limit (Page 21):

Reaction	Meaning
Stop counting	If a counting limit is violated, counting is stopped and the internal gate is closed. To restart counting, you must also close and reopen the software/hardware gate.
Continue counting (default)	Counting continues either with the start value or at the opposite counting limit, depending on the additional parameter assignment.

Reset when counting limit is violated

You can reset the counter to the following values when a counting limit is violated:

Reset the value	Meaning
To start value	The counter value is set to the start value.
To opposite counting limit (default)	The counter value is set to the opposite counting limit.

Reaction to gate start

You can set the following Reaction to gate start (Page 25):

Reaction	Meaning
Set to start value	When the gate is opened, the counter value is set to the start value.
Continue with current value (default)	When the gate is opened, counting is continued with the last counter value.

3.4.5 Behavior of a DI

3.4.5.1 Function of a DI

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the hardware gate (Page 23).
Gate start (edge-triggered)	The configured edge at the respective digital input opens the hardware gate (Page 23).
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the hardware gate (Page 23).
Synchronization (Page 31)	The configured edge at the respective digital input sets the counter to the start value.
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N (Page 36).
Capture (Page 26)	The configured edge at the respective digital input saves the current counter value as a Capture value.
Digital input without function	No function is assigned to the respective digital input. The signal status of the digital input can be read by the CPU by means of the feedback interface (Page 154).

Note

With the exception of "Digital input without function", each function can only be used once, and if used for one digital input is not available to the others.

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You can only configure the input delay under "Behavior of DI0" for all digital inputs together.

3.4.5.2 Function options

Certain functions require additional parameters which allow you to specify characteristics in more detail. These can be configured for each of the relevant functions.

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level (default)	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be set for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered.

The following options may be available depending on the function selected:

- At rising edge (default)
- At falling edge
- At rising and falling edge

The parameter can be set for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization
- Capture

"At rising and falling edge" can only be configured for the function "Capture".

Behavior of counter value after Capture

You can configure the following characteristics for the counter after a capture event (Page 26):

	Meaning
Continue counting (default)	After saving the current count value as Capture value, counting is continued unchanged.
Set to start value and continue counting	After saving the current count value as Capture value, counting is continued with the start value.

See also

Function of a DI (Page 94)

3.4.6 Function of a DQ

Set output

By configuring a digital output, you can specify the condition (Page 40) upon which the digital output switches.

You can select from the following options:

Function of a digital output	Meaning
Between comparison value and high limit (default)	The respective digital output is active if the counter value is between the comparison value and the high counting limit.
Between comparison value and low counting limit	The respective digital output is set to active if the counter value is between the comparison value and the low counting limit.
Between comparison value 0 and 1	The digital output DQ1 is active if the counter value is between the comparison value 0 and the comparison value 1.
At comparison value for a pulse duration	The respective digital output is active once for the configured time and count direction when the count value reaches the comparison value.
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active until the counter value is equal to the comparison value.
Use by user program	The respective digital output (Page 39) can be switched by the CPU via the control interface (Page 151).

Note

You can select the function "Between comparison value 0 and 1" if the function "Use by user program" is selected for digital output DQ0.

Note

The "At comparison value for a pulse duration" and "After set command from CPU until comparison value" functions only switch the digital output in question if a count pulse reaches the comparison value. The digital output does not switch when the counter value is set, by synchronization for example.

Comparison value 0

By configuring the comparison value (Page 39), you can specify the counter value at which the digital output DQ0 is to switch as a result of the selected compare event.

You must enter a value which is greater than or equal to the low counting limit and smaller than comparison value 1.

The default setting is "0".

Comparison value 1

By configuring the comparison value (Page 39), you can specify the counter value at which the digital output DQ1 is to switch as a result of the selected compare event.

You must enter a value which is greater than comparison value 0 and smaller than or equal to the high counting limit.

The default setting is "10".

Count direction

You use this parameter to specify the count direction for which the selected function is valid.

You can select from the following options:

Count direction	Meaning
In both directions (default)	The comparison and switching of the respective digital output take place regardless of the count direction.
Up	The comparison and switching of the respective digital output only takes place when the counter counts up.
Down	The comparison and switching of the respective digital output only takes place when the counter counts down.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

If you enter "0" and the counter value corresponds to the comparison value, the digital output remains active until the next count pulse.

You can enter a value between 0.0 and 6553.5.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

3.4.7 Hysteresis

Set hysteresis range

By configuring hysteresis (Page 58), you can define a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again until the counter value is outside the range.

Regardless of the hysteresis value, the hysteresis range ends at the low/high counting limits. If you enter "0", the hysteresis is turned off. You can enter a value between 0 and 255. The default setting is "0".

Hysteresis can only be configured in Counting mode.

3.4.8 Specifying the measured value

Measured variable

This parameter is used to specify the measured variable (Page 53) to be provided by the technology module.

You can select from the following options:

Measured variable	Meaning
Frequency (default)	The measured variable is a frequency. The unit is Hz.
Period	The measured variable is a period. The unit is s.
Velocity	The measured variable is a velocity. You configure the time basis for the velocity measurement and the Increments per unit separately.

Update time

By configuring the update time (Page 51) in milliseconds, you can specify the time interval between two measured value updates.

The update time and the signal type (Page 87) effect the accuracy of the measurement. In the case of update times of at least 100 ms, the effect of the signal type is negligible.

In the case of update times of less than 100 ms, you achieve maximum measurement accuracy using the following signal types:

- Incremental encoder (A, B phase-shifted) with Signal evaluation "Single"
- Incremental encoder (A, B, N) with Signal evaluation "Single"
- Pulse (A) and direction (B)
- Pulse (A)

In the case of other signal types, measurement accuracy depends on the encoder and cable used.

If you enter "0", the measured value is updated in each cycle. Up to three decimal places can be entered. You can enter a value between 0.000 and 25000.000. The default setting is "10.000".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s/1 min
- The default setting is "60 s/1 min".

Increments per unit

This parameter defines the number of count pulses per relevant unit.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example:

Your encoder delivers 4000 increments per meter. The velocity is to be measured in meters per minute. "Double" is configured as signal evaluation.

In this case, you need to assign the following parameters:

- Increments per unit: 8000
- Time base for velocity measurement: 60 s/1 min

3.5 Programming the High_Speed_Counter

3.5.1 High_Speed_Counter instruction

High_Speed_Counter

The High_Speed_Counter instruction is part of the High_Speed_Counter technology object. It supplies the control and feedback interface of the technology module.

The High_Speed_Counter instruction therefore forms the software interface between the CPU and the technology module. It is called cyclically from the user program to synchronize the input and output data.

The High_Speed_Counter instruction can be used for the technology modules of both S7-1500 and ET 200SP.

Additional information

Description High_Speed_Counter (Page 104)

High_Speed_Counter input parameters (Page 107)

High_Speed_Counter output parameters (Page 108)

ErrorID parameter (Page 110)

High_Speed_Counter static variables (Page 111)

3.5.2 Call instruction in the user program

The High_Speed_Counter instruction can be called once for each counter in the cycle or, alternatively, in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Procedure

Proceed as follows to call the instruction in the user program:

1. Open the CPU folder in the project tree.
2. Open the "Program blocks" folder.
3. Double-click the OB for cyclic program execution.
   The block is opened in the work area.
4. In the "Instructions" window, open the "Technology" group and the "Counting and measurement" folder.
   The instructions are located in the folder.
5. Select an instruction and drag it to your OB.
   The "Call options" dialog opens.
6. Select a technology object from the "Name" list or enter the name for a new technology object.

Result

If the technology object does not exist yet, it is added. The instruction is added in the OB. The technology object is assigned to this call of the instruction.

3.5.3 Description High_Speed_Counter

Description

The High_Speed_Counter instruction is used to control the technology module counting and measuring functions via the user program.

Call

The instruction High_Speed_Counter must be called once per counter, either cyclically or in a time-controlled program. The call is not permitted in an event-controlled interrupt program.

Functional description

Counter value: The counter value is available at the output parameter CountValue. The counter value is updated at every call of the High_Speed_Counter instruction.

Measured value: The measured value is available at the output parameter MeasuredValue. The measured value is updated at every call of the High_Speed_Counter instruction.

The measured value and the counter value are available concurrently in the feedback interface.

Capture: The output parameter CaptureStatus = TRUE indicates a valid Capture value at the output parameter CapturedValue.

- A Capture value is captured under the following conditions:
  - A digital input has the parameter assignment "Capture"
  - CaptureEnable = TRUE
  - Edge at digital input with the Capture function
- The output parameter CaptureStatus is reset by a falling edge at input parameter CaptureEnable.

Synchronization: The output parameter SyncStatus = TRUE indicates that a synchronization has occurred.

- The counter value is synchronized under the following conditions:
  - A digital input has the parameter assignment "Synchronization" **or** the incremental encoder has the parameter assignment "Synchronization at signal N"
  - SyncEnable = TRUE
  - SyncUpDirection (or SyncDownDirection) = TRUE
  - Edge at digital input with the synchronization function **or** rising edge of the signal N at the encoder input
- The output parameter SyncStatus is reset by a falling edge at
  - the input parameter SyncEnable or
  - the static tag SyncDownDirection or
  - the static tag SyncUpDirection

Parameter changes via the user program

Proceed as follows to modify parameters using the user program:

1. Check the relevant Set tag to establish whether the technology object is ready for the parameter change (Set tag = FALSE) or whether a change command is still running (Set tag = TRUE).
2. If the technology object is ready for the parameter change, modify the relevant static tag.
3. Set the relevant Set tag for execution of the change command.
4. Use the output parameter Error to check whether an error has occurred.
   If no errors have occurred and the Set tag has been automatically reset by the technology object, the parameter change was successful.

Low or high counter limit: The two limits are changed as follows via the user program:

1. Checking the static tag SetUpperLimit (or SetLowerLimit) = FALSE
2. Changing the static tag NewUpperLimit (or NewLowerLimit)
3. SetUpperLimit (or SetLowerLimit) = TRUE
4. Checking the new counter limit in the static tags CurUpperLimit or CurLowerLimit

Note

If the new high counting limit is less than the current count value, the count value is set to the low counting limit or the start value, depending on the configuration. If the new low counting limit is greater than the current count value, the count value is set to the high counting limit or the start value, depending on the configuration.

Comparison values: The two comparison values are changed as follows via the user program:

1. Checking the static tag SetReferenceValue0 (or ReferenceValue1) = FALSE
2. Changing the static tag NewReferenceValue0 (or NewReferenceValue1)
3. SetReferenceValue0 (or SetReferenceValue1) = TRUE
4. Checking the new comparison value in the static tag CurReferenceValue0 (or CurReferenceValue1)

Counter value: You can set the current counter value to a new counter value from the user program. The current counter value is changed as follows:

1. Checking the input parameter SetCountValue = FALSE
2. Changing the static tag NewCountValue
3. SetCountValue = TRUE
4. Checking the new counter value in the output parameter CountValue

Start value: The start value is changed as follows using the user program:

1. Checking the static tag SetStartValue = FALSE
2. Changing the static tag NewStartValue
3. SetStartValue = TRUE
4. Checking the new start value in the static tag CurStartValue

Acknowledgment of events

Acknowledgment of signaled events can be performed via the rising edge of the input parameter EventAck . EventAck must stay set until the technology object has reset the status bits of the following events of the counting channel:

- CompResult0
- CompResult1
- ZeroStatus
- PosOverflow
- NegOverflow

Status of the digital inputs

You can obtain the status of the digital inputs with the static tags StatusDI0, StatusDI1 or StatusDI2.

Use digital outputs by user program

You can set the digital outputs with the High_Speed_Counter instruction,

- if the setting "Use by user program" is configured for "Set output".
- if the setting "After set command from CPU until comparison value" is configured for "Set output" .
- if you set the corresponding static tag ManualCtrlDQm (temporary overwrite).

The static tags SetDQ0 and SetDQ1 are only effective in these cases. In the first and third case, DQm follows the value of SetDQm. In the second case, DQm is set with an edge (rising or falling) by SetDQm. DQm is reset when the counter value equals the comparison value.

Reaction to error

If an error has occurred during the call of the instruction or in the technology module, the output parameter Error is set. More detailed error information can be read at the output parameter ErrorID.

Eliminate the cause of the error and acknowledge the error message by setting the input parameter ErrorAck. When no more errors are pending, the technology object resets the output parameter Error. No new error is signaled until you acknowledge the previous error.

Changing the count direction

The count direction can only be changed by the user program if "Pulse (A)" is configured as the signal type. In all other cases, the count direction is determined by the input signals of the technology module. The count direction is controlled by the static tag NewDirection:

- +1: Upward count direction
- -1: Downward count direction

To execute the change command, you need to set the tag SetNewDirection = TRUE.

3.5.4 High_Speed_Counter input parameters

Parameter	Declaration	Data type	Default	Description
SwGate	INPUT	BOOL	FALSE	Control software gate: • Rising edge: Software gate opens • Falling edge: Software gate closes Together with the hardware gate, the SwGate enables the internal gate.
SetCountValue	INOUT	BOOL	FALSE	A rising edge starts the transmission of the new counter value in the static tag NewCountValue to the technology module. The counter value is effective as soon as transmission is complete.
CaptureEnable	INPUT	BOOL	FALSE	Enabling the Capture function A Capture event occurs after enabling at the next configured edge at the relevant digital input. A falling edge at CaptureEnable resets the output parameter CaptureStatus. A falling edge at CaptureEnable resets the enable even if no Capture event has occurred.
SyncEnable	INPUT	BOOL	FALSE	Enable synchronization The direction enabled for synchronization is indicated in the static tags SyncUpDirection and SyncDownDirection. A falling edge at SyncEnable resets the output parameter SyncStatus.
ErrorAck	INPUT	BOOL	FALSE	A rising edge acknowledges the error status reported.
EventAck	INPUT	BOOL	FALSE	A rising edge resets the following output parameters: • CompResult0 • CompResult1 • ZeroStatus • PosOverflow • NegOverflow

3.5.5 High_Speed_Counter output parameters

Parameter	Declaration	Data type	Default	Description
StatusHW	OUTPUT	BOOL	FALSE	Status bit technology module: The module is configured and ready for operation. The module data is valid.
StatusGate	OUTPUT	BOOL	FALSE	Status bit: Internal gate is released if parameter is set
StatusUp	OUTPUT	BOOL	FALSE	Status bit: The last count pulse has incremented counter and took place no more than 0.5 s ago
StatusDown	OUTPUT	BOOL	FALSE	Status bit: The last count pulse has decremented the counter and took place no more than 0.5 s ago
CompResult0	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ0 has occurred The rising edge of the input parameter EventAck is used to reset CompResult0.
CompResult1	OUTPUT	BOOL	FALSE	Status bit: Compare event for DQ1 has occurred The rising edge of the input parameter EventAck is used to reset CompResult1.
SyncStatus	OUTPUT	BOOL	FALSE	Status bit: Synchronization has occurred If the input parameter SyncEnable is set, the configured edge sets the status bit SyncStatus at the respective digital input. SyncStatus is reset with falling edge at • SyncEnable (input parameter) or • SyncUpDirection (static tag) or • SyncDownDirection (static tag)
CaptureStatus	OUTPUT	BOOL	FALSE	Status bit: Capture event has occurred If the input parameter CaptureEnable is set, the configured edge sets the status bit CaptureStatus. at the respective digital input. Falling edge of input parameter CaptureEnable resets Captur-eStatus .
ZeroStatus	OUTPUT	BOOL	FALSE	Status bit: CountValue has reached "0" value The rising edge of the input parameter EventAck is used to reset ZeroStatus.
PosOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated high counting limit The rising edge of the input parameter EventAck is used to reset PosOverflow.
NegOverflow	OUTPUT	BOOL	FALSE	Status bit: CountValue has violated low counting limit The rising edge of the input parameter EventAck is used to reset NegOverflow.
Error	OUTPUT	BOOL	FALSE	An error has occurred. Refer to the output parameter ErrorID for the cause of the error.
ErrorID	OUTPUT	WORD	0	The ErrorID (Page 110) parameter displays the number of the error message. ErrorID = 0000_H: No error pending.
CountValue	OUTPUT	DINT	0	Current counter value

Parameter	Declaration	Data type	Default	Description
CapturedValue	OUTPUT	DINT	0	Last captured Capture value; CaptureStatus = TRUE, if new Capture event has occurred
MeasuredValue	OUTPUT	REAL	0.0	Current measured value for frequency, period or velocity (depending on configuration)

3.5.6 ErrorID parameter

Error code (W#16#...)	Description
0000	No error
Error messages from technology module	
80A1	POWER_ERROR from feedback interface: Incorrect supply voltage L+
80A2	ENC_ERROR from feedback interface: Incorrect encoder signal
80A3	LD_ERROR from feedback interface: Error when loading via control interface
Error messages of the instruction High_Speed_Counter	
80B1	Invalid count direction
80B4	New low counting limit does not meet the following conditions: • Low counting limit < high counting limit • Low counting limit <= comparison value/counter value/start value
80B5	New high counting limit does not meet the following conditions: • Low counting limit < high counting limit • High counting limit >= comparison value/counter value/start value
80B6	New start value does not meet the following condition: • Low counting limit <= start value <= high counting limit
80B7	New counter value does not meet the following condition: • Low counting limit <= counter value <= high counting limit
80B8	New comparison value 0 does not meet the following conditions: • Low counting limit <= comparison value 0 <= high counting limit • Comparison value 0 < comparison value 1
80B9	New comparison value 1 does not meet the following conditions: • Low counting limit <= comparison value 1 <= high counting limit • Comparison value 0 < comparison value 1
80C0	Instruction High_Speed_Counter was called multiple times with the same instance (DB)
80C1	Communication with technology module failed (read data records): Error information of internal instruction RDREC saved in static tag AdditionalErrorID
80C2	Communication with technology module failed (write data records): Error information of internal instruction WRREC saved in static tag AdditionalErrorID
80C3	Access to input data (feedback interface) failed: Error information of internal instruction GETIO_PART saved in static tag AdditionalErrorID
80C4	Access to output data (control interface) failed: Error information of internal instruction SETIO_PART saved in static tag AdditionalErrorID
80C5	Reading of the current start information of the OB failed: Error information of internal instruction RD_SINFO saved in static tag AdditionalErrorID
80C6	Failed to get I/O addresses of the technology module: Error information of internal instruction RD_ADDR saved in static tag AdditionalErrorID

3.5.7 High_Speed_Counter static variables

Tag	Data type	Default	Access	Description
NewCountValue	DINT	L#0	Writing	New counter value
NewReferenceValue0	DINT	L#0	Writing	New comparison value 0
NewReferenceValue1	DINT	L#10	Writing	New comparison value 1
NewUpperLimit	DINT	L#2147483647	Writing	New high counting limit
NewLowerLimit	DINT	L#-2147483648	Writing	New low counting limit
NewStartValue	DINT	L#0	Writing	New start value
CurReferenceValue0	DINT	L#0	Read	Current comparison value 0
CurReferenceValue1	DINT	L#10	Read	Current comparison value 1
CurUpperLimit	DINT	L#2147483647	Read	Current high counting limit
CurLowerLimit	DINT	L#-2147483648	Read	Current low counting limit
CurStartValue	DINT	L#0	Read	Current start value
NewDirection	INT	0	Writing	New count direction: +1: Upward count direction -1: Downward count direction
AdditionalErrorID	WORD	W#16#0000	Read	Error information of an internal instruction, e.g.,RDREC
UserCmdFlags	STRUCT	-		
SetNewDirection	BOOL	FALSE	Writing	Setting a new count direction
SetUpperLimit	BOOL	FALSE	Writing	Set high counting limit
SetLowerLimit	BOOL	FALSE	Writing	Set low counting limit
SetReferenceValue0	BOOL	FALSE	Writing	Set comparison value 0
SetReferenceValue1	BOOL	FALSE	Writing	Set comparison value 1
SetStartValue	BOOL	FALSE	Writing	Set start value
SyncDownDirection	BOOL	TRUE	Writing	Enable synchronization in downward count direction
SyncUpDirection	BOOL	TRUE	Writing	Enable synchronization in upward count direction
SetDQ0	BOOL	FALSE	Writing	Set digital output DQ0
SetDQ1	BOOL	FALSE	Writing	Set digital output DQ1
ManualCtrlDQ0	BOOL	FALSE	Writing	Enable setting of digital output DQ0: TRUE: • SetDQ0 sets DQ0 • Control bit TM_CTRL_DQ0 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ0 = TRUE

Tag		Data type	Default	Access	Description
	ManualCtrlDQ1	BOOL	FALSE	Writing	Enable setting of digital output DQ1: TRUE: • SetDQ1 sets DQ1 • Control bit TM_CTRL_DQ1 = FALSE FALSE: • Setting not enabled • Control bit TM_CTRL_DQ1 = TRUE
UserStatusFlags		STRUCT	-		
	StatusDI0	BOOL	FALSE	Read	Current status of digital input DI0
	StatusDI1	BOOL	FALSE	Read	Current status of digital input DI1
	StatusDI2	BOOL	FALSE	Read	Current status of digital input DI2
	StatusDQ0	BOOL	FALSE	Read	Current status of digital output DQ0
	StatusDQ1	BOOL	FALSE	Read	Current status of digital output DQ1

3.6 Commissioning the High_Speed_Counter

3.6.1 Commissioning the technology object

The commissioning editor helps you with commissioning and the function test for the technology object. You can change specific parameters of the High_Speed_Counter instruction in CPU/IM online mode and monitor their effects.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The corresponding High_Speed_Counter instruction is called cyclically from the user program.
- The parameters of the technology object are not overwritten by the user program.

Procedure

To open the commissioning editor of a technology object, follow these steps:

1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Commissioning" object.
   The functions for commissioning the High_Speed_Counter technology object are displayed.
4. Click the button "Launch display".
   The parameters (online values) of the High_Speed_Counter technology object are loaded and displayed.

Online mode

In online mode, you can modify the following parameters to test the technology object function:

- New counter value (NewCountValue)
- New high counting limit (NewUpperLimit)
- New low counting limit (NewLowerLimit)
- New comparison value 0 (NewReferenceValue0)
- New comparison value 1 (NewReferenceValue1)
- New start value (NewStartValue)
- Start and stop counter (SwGate)
- Enable Capture (CaptureEnable)

- Enable synchronization (SyncEnable)
- Acknowledgment of signaled error states (ErrorAck)
- Resetting the status flag (EventAck)

Modified values become effective as new parameters of the technology object when the text box is closed, when you press ENTER or by additionally setting the relevant set variable.

3.7 High_Speed_Counter diagnostics

3.7.1 Monitoring counter values, measured values, DIs and DQs

You use the diagnostic functions to monitor the counting and measuring functions.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the display editor for the diagnostic functions, follow these steps:

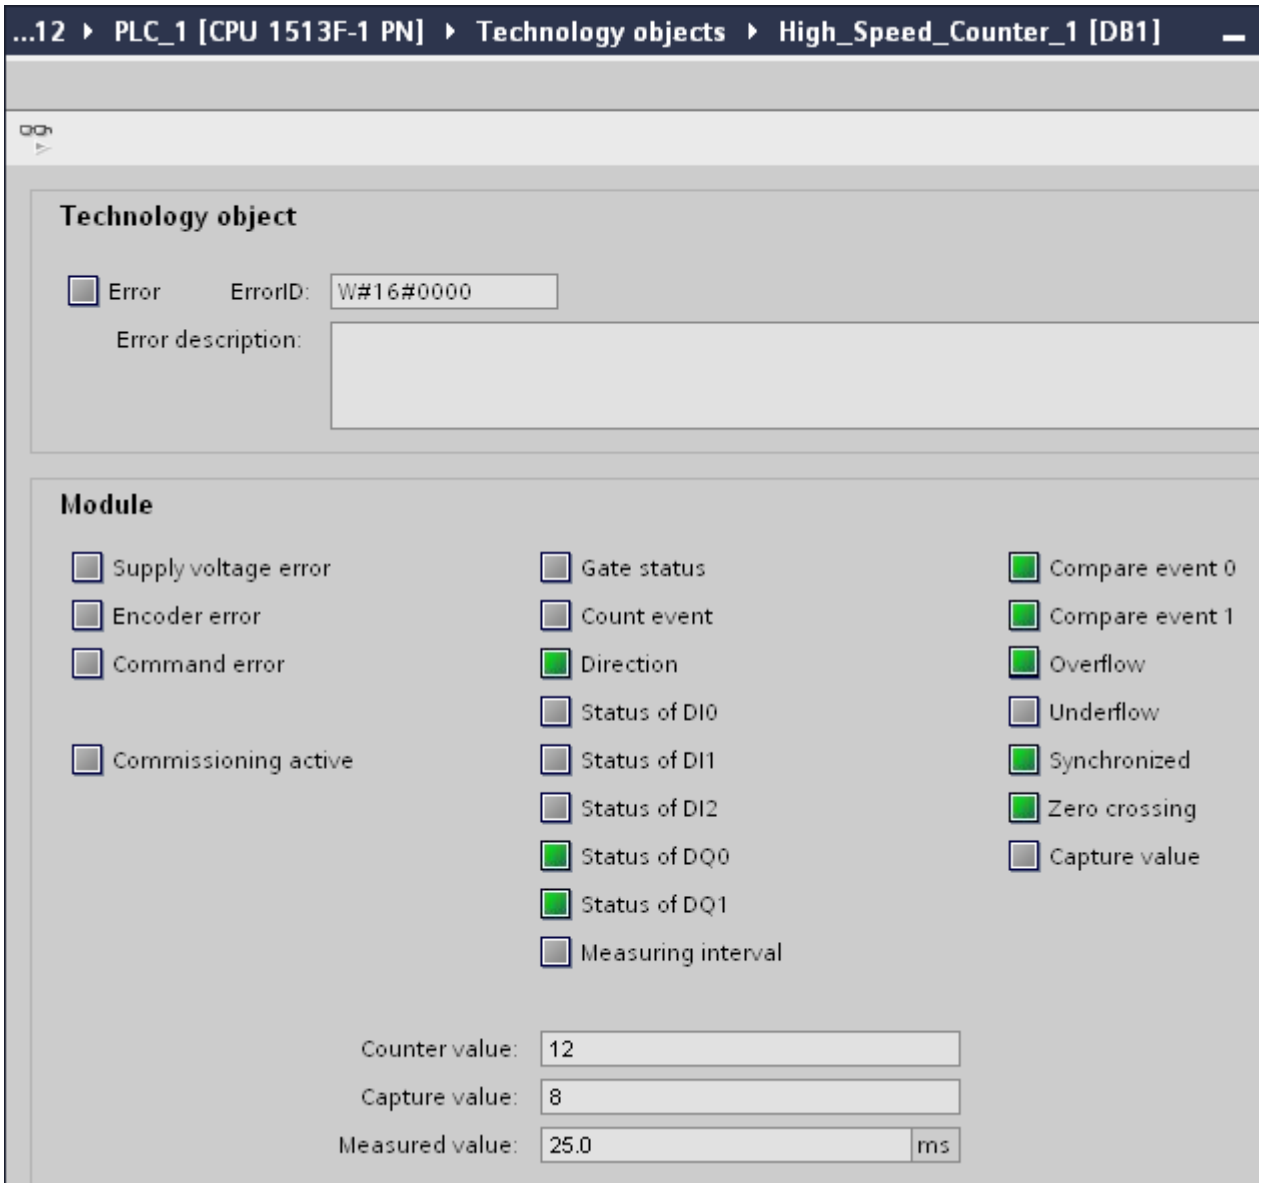
1. Open the "Technology objects" folder in the project tree.
2. Open the High_Speed_Counter technology object in the project tree.
3. Double-click on the "Diagnostics" object.

Display

The following values are read out from the technology object and displayed:

- Event display/diagnostics information
- Signal states of the digital inputs and digital outputs
- Counter value
- Capture value
- Measured value

Additional information on status displays is available in the context-sensitive help for each event in STEP 7 (TIA Portal). When the CPU is in STOP, the status display is not updated.



Using the module

4

4.1 Using the technology module

4.1.1 Configuring a module

4.1.1.1 Adding a technology module to hardware configuration

Procedure

A technology module can only be configured if you have set up a project in which the configuration can be saved.

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the technology module from the module catalog:
   "TM > Counting or Position feedback> Technology module > Order number".
4. Drag the technology module to the required slot in the module rack.

Result

The new technology module is now displayed with the following objects under "Local modules" or "Distributed I/O" in the project tree. Double-click to open the required editor.

	Object	Description
①	Device configuration (Page 119)	In the Inspector window (per channel): • Setting the reaction to CPU STOP • Enable diagnostic interrupt • Setting the operating mode (Page 121) • Enable hardware interrupts (Page 124) • Setting the module addresses
②	Online & Diagnostics (Page 147)	• Hardware diagnostics • Obtain information on technology module • Run firmware update
③	Parameter (Page 126)	Display and, if applicable, parameter settings for the counting and measuring functions in HWCN, if parameter assignment and control are not implemented using the High_Speed_Counter technology object.
④	Commissioning (Page 148)	Commissioning and function test of the technology module: Simulate counter values and DIs in CPU or IM online mode and monitor their effects.

4.1.1.2 Basic parameters

Reaction to CPU STOP

Reaction to CPU STOP

You set the response of the technology module for each channel to CPU STOP in the basic parameters of the device configuration.

Table 4- 1 Reaction of the technology module to CPU STOP depending on parameter assignment (by channel)

Basic parameters	Reaction to CPU STOP
Continue operation	The technology module remains fully functional. Incoming count pulses are processed or the actual position is read. The digital outputs continue to switch according to the parameter assignment.
Output substitute value	The technology module outputs the configured substitute values at the digital outputs until the next CPU STOP-RUN transition. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.
Keep last value	The technology module outputs the values at the digital outputs that were valid when the transition to STOP took place until the next CPU STOP-RUN transition. If a digital output with the function "In case of comparison value for a pulse duration" is set at CPU stop, the digital output is reset after expiry of pulse duration. The technology module is returned to its startup state after a STOP-RUN transition: The counter value is set to the Start value (with incremental encoders or pulse encoders) and the digital outputs switch according to the parameter assignment.

Substitute value for DQ0

This parameter lets you specify which value the technology module is to output to the digital output DQ0 in the event of a CPU STOP under "Output substitute value".

Note

In "Operation with technology object" mode you define this parameter using the technology object.

Substitute value for DQ1

This parameter lets you specify which value the technology module is to output to the digital output DQ1 in the event of a CPU STOP under "Output substitute value".

Note

In "Operation with technology object" mode you define this parameter using the technology object.

Diagnostic interrupts

The technology module can trigger additional diagnostic interrupts when you enable the diagnostic interrupts in the basic parameters. These diagnostic interrupts are processed in an interrupt OB.

Enabling diagnostic interrupts for wire break

You use this parameter to specify whether a diagnostic interrupt is to be triggered in the event of wire breaks of the utilized signals for the following encoders:

- Push-pull 24 V encoder (Page 63)
- RS422 encoder (Page 65) (also monitored for short-circuits and offset voltages)
- SSI absolute encoder (Page 67) (also monitored for short-circuits and faulty voltages)

Note

If you use an encoder with a different sensor type or interface standard, wire break cannot be detected.

Enabling additional diagnostic interrupts

You use this parameter to specify whether diagnostic interrupts are to be triggered for additional errors.

See the device manual for the technology module to find out which errors during operation can trigger a diagnostic interrupt.

Operating mode

Selecting the mode for the channel

This setting defines how the channel counting and measuring functions are to be configured and controlled.

Operating mode	Description
Operating with technology object	The channel is configured using the High_Speed_Counter technology object. Access to the control and feedback interface of the technology module is provided by the corresponding High_Speed_Counter instruction in the user program. Technology module/channel assignment to a technology object is defined at the start of technology object configuration: see Basic parameters technology object (Page 86) Counting mode is automatically defined if the technology object High_Speed_Counter is being used.
Position input for Motion Control	The technology module is used for position input for a higher-level Motion Control controller. All channels of the technology module for Motion Control are then available. Parameter assignment is implemented via the Device configuration of the technology module. Parameter assignment of the encoder signals is implemented by means of the Module parameters (Page 122).
Manual operation	The channel is configured using the parameter setting (HWCN) (Page 127) of the technology module. You have direct access to the control and feedback interface of the technology module from the user program.

Selects the channel operating mode

You can use this parameter in "Manual operation" to specify the function for which the channel of the technology module is used. This defines the settings options under "Parameters" (HWCN).

Operating mode	Description
Counting (Page 18) / Position input (Page 20)	The main function of the technology module is counting or position input. The comparison functions and hardware interrupts work with the counter value or position value. The measured value is available concurrently.
Measuring (Page 50)	The main function of the technology module is measuring. The comparison functions (Page 134) and hardware interrupts for compare events work with the measured value. The counter value is available concurrently.

Module parameters (position input for Motion Control)

In the operating mode "Position input for Motion Control" mode, the parameters for the encoder signals of the channel are assigned under "Module parameters". The parameters depend on the encoder used.

Module parameters for incremental encoders and pulse encoders

If you use an incremental or pulse encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Signal evaluation
- Filter frequency
- Sensor type (for TM Count)
- Interface standard (for TM PosInput)
- Signal selection for reference mark 0
- Increments per unit and
- Reference speed

You can find a description of the first six parameters in section Counter inputs (Page 87).

Module parameters for SSI absolute encoders

If you use an TM PosInput with an SSI absolute encoder, you need to configure the following parameters for the encoder signals of the channel.

- Signal type
- Invert direction
- Frame length
- Type of code
- Transmission rate
- Monoflop time
- Parity
- LSB bit number of position setpoint
- MSB bit number of position setpoint
- Increments per unit and
- Reference speed

You can find additional information on the first new parameters in section Configure position detection with SSI absolute encoder (Page 135).

Signal selection for reference mark 0

When S7-1500 Motion Control is used, this parameter specifies the external reference signal upon which a new reference mark is saved for the encoder position.

You can select from the following options:

Option	Meaning
DI0	The current counter value is saved as the new encoder position reference mark upon a rising edge at digital input DI0.
Signal N of incremental encoder	The current counter value is saved as the new encoder position reference mark upon a rising edge of the signal N of incremental encoder.

Increments per unit

When using an incremental encoder or pulse encoder, you specify the number of counter pulses per encoder revolution with this parameter. When you use an SSI absolute encoder, you use this parameter to specify the number of increments the encoder delivers per revolution.

The number of count pulses depends on the configured signal evaluation. You can enter a value between 1 and 65535.

Example of an incremental or pulse encoder:

Your incremental or pulse encoder delivers 2048 increments per revolution. Depending on the signal evaluation , you need to assign the following in this case:

Signal evaluation	Increments per unit
Single	2048
Double	4096
Quadruple	8192

Reference speed

When an S7-1500 Motion Control is used, the encoder transmits the process value of the speed as a percentage of the reference speed. This parameter defines the speed in rpm which is to be correspond to the value 100 % . The reference speed must be identical to the setting in the controller.

You can enter a value between 6.00 and 210000.00. The default setting is "3000.00".

Further configuring

You can perform additional configuration using the "TO_ExternalEncoder" technology object of S7-1500 Motion Control. See the S7-1500 Motion Control (http://support.automation.siemens.com/WW/view/en/59381279) function manual for further details on configuring and commissioning position input.

Hardware interrupts

You can set for each channel the events which are to trigger a hardware interrupt during operation when assigning the basic parameters of the technology module.

In an S7-1500 system, you enter a matching event name for each enabled hardware interrupt and assign a corresponding hardware interrupt OB to each hardware interrupt. If a hardware interrupt is triggered, the corresponding OB is started to evaluate the hardware interrupt data.

A hardware interrupt is triggered if the condition for changing the respective status bit or event bit in the feedback interface is fulfilled.

Lost hardware interrupt

If an event occurs which is supposed to trigger a hardware interrupt but the previous, identical event has not yet been processed, no further hardware interrupt is triggered. The hardware interrupt is lost. This may lead to the "Hardware interrupt lost" diagnostic interrupt, depending on the parameter assignment.

Hardware interrupts that can be activated

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in position input for Motion Control mode	Description	EventType number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
New Capture value available	Yes	Yes	No	No	No	Hardware interrupt when current counter value or position value is saved as Capture value	8
Synchronization of the counter by an external signal	Yes	No	Yes	No	No	Hardware interrupt upon synchronization of the counter by signal N or DI edge	9
Gate start	Yes	No	Yes	No	No	Hardware interrupt when internal gate opens	1
Gate stop	Yes	No	Yes	No	No	Hardware interrupt when internal gate closes	2
Overflow (high counter limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value violates high counting limit	3
Underflow (low counter limit violated)	Based on counter value	No	Based on counter value	No	No	Hardware interrupt when counter value violates low counting limit	4

Hardware interrupt	Available in counting mode using		Available in measuring mode using		Available in position input for Motion Control mode	Description	EventType number
	Incremental or pulse encoder	SSI absolute encoder	Incremental or pulse encoder	SSI absolute encoder			
Direction reversal*	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt when counter value or position value changes direction	10
Zero pass	Based on counter value	Based on position value	Based on counter value	Based on position value	No	Hardware interrupt with zero pass of counter value or position value	7
Comparison event for DQ0 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ0 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	5
Comparison event for DQ1 occurred	Based on counter value	Based on position value	Based on measured value	Based on measured value	No	Hardware interrupt when a comparison event for DQ1 occurs as a result of the selected comparison condition. No hardware interrupt when the change of the counter value for an incremental or pulse encoder was not caused by a count pulse	6

* The feedback bit STS_DIR has the default value "0". A hardware interrupt is not triggered when the first change to the counter value or position value immediately after the technology module is switched on is in the down direction.

Default setting

No hardware interrupts are enabled in the default setting.

4.1.2 Parameter assignment of module

4.1.2.1 Parameter assignment options

Counting mode — Parameter assignment options

You have two options for technology module counting function parameter assignment and control:

- Configuration of a High_Speed_Counter technology object and control with a corresponding High_Speed_Counter instruction

  Note

  Configuration via technology object

  We recommend the simple configuration with graphic support using the High_Speed_Counter technology object. A detailed description of this configuration can be found in section High_Speed_Counter technology object (Page 81) and below.

  You start technology object parameter assignment (Page 86) by assigning the technology object the configured technology module and counting channel.

- Parameter settings via HWCN (Page 127) and control via the control and feedback interface of the technology module

  Note

  Parameter setting via HWCN

  Additional support for parameter settings via HWCN is available in the context-sensitive help for the parameters in STEP 7 (TIA Portal). A description of the control and feedback interface is available in the following sections:

  Assignment of the control interface (Page 151)

  Assignment of the feedback interface (Page 154)

Measuring mode

No technology object is available for the measuring mode. The parameters (Page 128) of the Measuring mode are assigned using the parameter setting (HWCN) (Page 127) of the technology module.

The technology module is controlled by direct access to the control and feedback interface.

Position input with SSI absolute encoder

No technology object is available for position input with SSI absolute encoder.

- In "Manual operation", the parameter assignment (Page 135) of the SSI absolute encoder, the digital inputs and digital outputs is implemented by means of the Parameter setting (HWCN) (Page 127) of the technology module.
- In operating mode "Position input for Motion Control", the parameter assignment of the SSI absolute encoder is implemented by means of the module parameters (Page 122) during the device configuration of the technology module.

Feedback from the technology module is returned by means of the feedback interface.

4.1.2.2 Opening the parameter settings (HWCN)

Opening via the project tree

Proceed as follows:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Open the technology module in the project tree.
3. Double-click on the "Parameters" object.

Opening from the device view

Proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click on the technology module and select "Parameters".

4.1.2.3 Measuring mode

Overview

In Measuring mode, the following applies:

- Counter inputs
  - Specifying input signals/encoder type (Page 128)
  - Additional parameters (Page 129)
- Specifying the measured value (Page 100)
- Behavior of a DI
  - Function of a DI (Page 132)
  - Function options (Page 133)
- Behavior of a DQ
  - Function of a DQ (Page 134)
- Counter behavior (Page 92)

Counter inputs: Specifying input signals/encoder type (Measuring mode)

Signal type

You can choose from the following signal types:

Signal type	Meaning
Incremental encoder (A, B phase-shifted)	An incremental encoder with phase-shifted A and B signals is connected.
Incremental encoder (A, B, N)	An incremental encoder with phase-shifted signals A and B and a zero signal N is connected.
Pulse (A) and direction (B)	A pulse encoder (signal A) with direction signal (signal B) is connected.
Pulse (A)	A pulse encoder (signal A) without direction signal is connected. You can specify the counting direction by means of the control interface (Page 151).
Count up (A), count down (B)	Signals for counting up (signal A) and down (signal B) are connected.
Absolute encoder (SSI)	An SSI absolute encoder is connected (only applicable if TM PosInput is being used): see Configure position detection with SSI absolute encoder (Page 135)

Invert direction

You can invert the count direction or position values to adapt them to the process.

Inversion can be configured and become effective for the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)
- Absolute encoder (SSI)

Counter inputs: Additional parameters (Measuring mode)

Signal evaluation

By configuring signal evaluation (Page 68), you can specify which edges of the signals are counted.

You can select from the following options:

Signal evaluation	Meaning
Single (default)	The edges of signal A are evaluated during a low level of signal B.
Double	Each edge of signal A is evaluated.
Quadruple	Each edge of signals A and B is evaluated.

The parameter can be assigned with the following signal types:

- Incremental encoder (A, B phase-shifted)
- Incremental encoder (A, B, N)

Filter frequency

By configuring the filter frequency, you suppress interferences at the counter inputs A, B and N.

The selected filter frequency is based on a pulse-break ratio of between 40:60 and 60:40. This produces a set minimum pulse/break time. Signal changes with a duration shorter than the minimum pulse/break time are suppressed.

You can select from the following filter frequencies:

Table 4- 2 Filter frequency and respective minimum pulse/break time

Filter frequency	Minimum pulse/break time
100 Hz	4.0 ms
200 Hz	2.0 ms
500 Hz	800 µs
1 kHz	400 µs
2 kHz	200 µs
5 kHz	80 µs

Filter frequency	Minimum pulse/break time
10 kHz	40 µs
20 kHz	20 µs
50 kHz	8.0 µs
100 kHz	4.0 µs
200 kHz (default at TM Count)	2.0 µs
500 kHz*	0.8 µs
1 MHz* (default for TM PosInput)	0.4 µs

* only with TM PosInput

Sensor type

By configuring the sensor type, you specify how the counter inputs are switched for the TM Count.

You can select from the following options:

Sensor type	Meaning
Sourcing output (default)	The encoder/sensor activates the inputs A, B and N after 24VDC.
Sinking output	The encoder/sensor activates the inputs A, B and N after M.
Push-pull (sinking and sourcing output)	The encoder/sensor alternately activates the inputs A, B and N after M and 24VDC.

"Push-pull" is usually selected when incremental encoders are used. If using 2-wire sensors, such as light barriers or proximity switches, you need to select the corresponding wiring "sourcing output" or "sinking output".

The data sheet of the encoder includes information on whether your incremental encoder is a push-pull encoder.

Note

If you use a push-pull incremental encoder, you can monitor the encoder signals for wire break.

Reaction to signal N

You use this parameter to specify which reaction is triggered at signal N.

You can select from the following options:

Option	Meaning
No reaction to signal N (default)	The counter is not affected by signal N.
Synchronization at signal N (Page 36)	The counter is set to the start value at signal N. If you select the function "Enable synchronization at signal N" for a digital input, the synchronization depends on the level at the digital input.

Note

You can only select the reaction at signal N if you have selected the signal type (Page 128) "Incremental encoder (A, B, N)".

Note

If "Synchronization at signal N" is selected, you can select the function "Enable synchronization at signal N" for a digital input (Page 132).

Frequency

This parameter is used to define the frequency of the following events:

- Synchronization at signal N
- Synchronization as function of a digital input

You can select from the following options:

Option	Meaning
Once (default)	The counter is only set at the first signal N or the first configured edge of the digital input.
Periodic	The counter is set at each signal N or each configured edge of the digital input.

Behavior of a DI: Function of a DI (Measuring mode)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning
Gate start/stop (level-triggered)	The level at the respective digital input opens and closes the hardware gate (Page 23).
Gate start (edge-triggered)	The configured edge at the respective digital input opens the hardware gate (Page 23).
Gate stop (edge-triggered)	The configured edge at the respective digital input closes the hardware gate (Page 23).
Synchronization (Page 31)	The configured edge at the respective digital input sets the counter to the start value.
Enable synchronization at signal N	The active level at the respective digital input enables synchronization of the counter at signal N (Page 36).
Digital input without function	No function is assigned to the respective digital input. The signal status of the digital input can be read by the CPU by means of the feedback interface (Page 154).

Note

With the exception of "Digital input without function", each function can only be used once, and if used for one digital input is not available to the others.

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You can only configure the input delay under "Behavior of DI0" for all digital inputs together.

Behavior of a DI: Function options (Measuring mode)

Certain functions require additional parameters which allow you to specify characteristics in more detail. These can be configured for each of the relevant functions.

Select level

You use this parameter to specify the level at which the digital input is active.

You can select from the following options:

Level	Meaning
Active with high level (default)	The respective digital input is active when it is set.
Active with low level	The respective digital input is active when it is not set.

The parameter can be set for the following functions of a digital input:

- Gate start/stop (level-triggered)
- Enable synchronization at signal N

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered.

You can select from the following options:

- At rising edge (default)
- At falling edge

The parameter can be set for the following functions of a digital input:

- Gate start (edge-triggered)
- Gate stop (edge-triggered)
- Synchronization

Function of a DQ (Measuring operating mode)

Set output

By configuring a digital output, you can specify the condition (Page 48) upon which the digital input switches.

You can select from the following options:

Function of a digital output	Meaning
Measured value >= comparison value (default)	The respective digital output is active if the measured value is greater than or equal to the comparison value.
Measured value <= comparison value	The respective digital output is active if the measured value is smaller than or equal to the comparison value.
Between comparison value 0 and 1	The digital output DQ1 is active if the measured value is between the comparison value 0 and the comparison value 1.
Not between comparison value 0 and 1	The digital output DQ1 is active if the measured value is less than comparison value 0 or greater than comparison value 1.
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 151).

Note

You can select the function "Between comparison value 0 and 1" and "Not between comparison value 0 and 1" if the function "Use by user program" is selected for digital output DQ0.

Comparison value 0

By configuring the comparison value (Page 55), you can specify the measured value at which the digital output DQ0 switches as a result of the selected compare event.

You must enter a value that is smaller than comparison value 1. Up to six decimal places can be entered.

The default setting is "0.000000". The unit of the comparison value depends on the measured variable.

Comparison value 1

By configuring the comparison value (Page 55), you can specify the measured value at which the digital output DQ1 switches as a result of the selected compare event.

You must enter a value that is greater than comparison value 0. Up to six decimal places can be entered.

The default setting is "10.000000". The unit of the comparison value depends on the measured variable.

4.1.2.4 Configure position detection with SSI absolute encoder

Overview

When using an SSI absolute encoder, assign the parameters as follows:

- Counter inputs
  - Specifying input signals/encoder type (Page 136)
  - Additional parameters (Page 136)
- Behavior of a DI
  - Function of a DI in Counting mode (Page 138)
  - Function of a DI in Measuring mode (Page 139)
  - Function options (Page 140)
- Behavior of a DQ
  - Function of a DQ in Counting mode (Page 140)
  - Function of a DQ in Measuring mode (Page 142)
- Hysteresis (Page 142)
- Specifying the measured value (Page 142)

You can find two examples of the SSI frame format in the technology module at Examples of the frame format (Page 144).

Counter inputs: Specifying input signals/encoder type (SSI)

Signal type

If an SSI absolute encoder (Page 20) is connected, select the signal type "Absolute encoder (SSI)".

Invert direction

You can invert the values delivered by the SSI absolute encoder to adapt them to the process.

Counter inputs: Additional parameters (SSI)

Frame length

By configuring the frame length, you can define the number of bits for an SSI frame. You can find the frame length of your SSI absolute encoder in the data sheet of the encoder. A parity bit does not count in the frame length.

A frame length of between 10 bits and 40 bits is permitted. The default setting is "13 Bit".

Type of code

You use the parameter assignment of the code type to specify whether the encoder supplies Dual code or Gray code.

You can select from the following options:

Type of code	Meaning
Gray (default)	The gray-coded position value returned by the SSI absolute encoder is converted to dual code.
Dual	The value returned by the SSI absolute encoder is not converted.

Transmission rate

By configuring the transmission rate, you can specify the rate of data transmission between the SSI absolute encoder and the technology module. You can select from several options between 125 kHz and 2 MHz. The default setting is "125 kHz".

The maximum transmission rate depends on the cable length and the technical specifications of the SSI absolute encoder. For additional information, please refer to the encoder description.

Monoflop time

By configuring the monoflop time, you can specify the break time between two SSI frames.

The configured monoflop time must be greater than the monoflop time of the SSI absolute encoder used. You can find this value in the technical specifications of the SSI absolute encoder.

You can select from the following options:

- Automatic (default)
- 16 µs
- 32 µs
- 48 µs
- 64 µs

Note

If you use the system function "Isochronous mode", the "Automatic" option corresponds to a Monoflop time of 64 µs.

Parity

When you configure the parity, you specify if a parity bit is to be transferred to the SSI absolute encoder.

If, for example, a 25-bit encoder with parity is assigned, the technology module reads 26 bits. The bit following the LSB (least significant bit) in the SSI frame is evaluated as a parity bit. A parity error is reported in the feedback interface (Page 154) by means of the ENC_ERROR bit.

LSB bit number of position setpoint

This parameter is used to specify the bit number of the LSB (least significant bit) of the position value in the frame of the SSI absolute encoder. This restricts the resolution of the SSI absolute encoder. The value must be less than the bit number of the MSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 31.

The default setting is "0".

MSB bit number of position setpoint

This parameter is used to specify the bit number of the MSB (most significant bit) of the position value in the frame of the SSI absolute encoder. This restricts the resolution of the SSI absolute encoder. The value must be less than the frame length and higher than the bit number of the LSB of the position value. The difference between the bit numbers of the MSB and the LSB of the position value must be less than 31.

The default setting is "12".

Note

If you have selected the Code type "Gray", only the values in the range between LSB and MSB of the position value are converted to dual code.

Behavior of a DI: Function of a DI (SSI, Measuring mode)

Setting function of the DI

By configuring a digital input, you specify which functions the digital input triggers at switching.

You can select from the following options:

Function of a digital input	Meaning
Capture (Page 29)	The configured edge at the respective digital input saves the current position value as a Capture value. The function can only be used for a digital input.
Digital input without function	No function is assigned to the respective digital input. The signal status of the digital input can be read by the CPU by means of the feedback interface (Page 154).

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms

- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You can only configure the input delay under "Behavior of DI0" for all digital inputs together.

Behavior of a DI: Function of a DI (SSI, Measuring mode)

Setting function of the DI

"Digital input without function" is assigned to the respective digital input. The signal status of the digital input can be read by the CPU by means of the feedback interface (Page 154).

Input delay

By configuring the input delay, you suppress interferences at the digital inputs. Signals with a pulse duration below the configured input delay are suppressed.

You can select from the following input delays:

- None
- 0.05 ms
- 0.1 ms (default)
- 0.4 ms
- 0.8 ms
- 1.6 ms
- 3.2 ms
- 12.8 ms
- 20 ms

Note

If you select the "None" or "0.05 ms" option, you have to use shielded cables for connection of the digital inputs.

Note

You can only configure the input delay under "Behavior of DI0" for all digital inputs together.

Behavior of a DI: Function options (SSI)

Edge selection

You can use this parameter to specify the edge of the digital input at which the configured function is triggered for the "Capture" function.

You can select from the following options:

- At rising edge (default)
- At falling edge
- At rising and falling edge

Behavior of a DQ: Function of a DQ (SSI, Measuring mode)

Set output

By configuring a digital output, you can specify the condition (Page 44) upon which the digital output switches.

You can select from the following options:

Function of a digital output	Meaning
Between comparison value and high limit (default)	The respective digital output is active if the position value is between the comparison value and the high limit.
Between comparison value and low counter limit	The respective digital output is active if the position value is between "0" and the comparison value.
Between comparison value 0 and 1	The digital output DQ1 is active if the position value is between comparison value 0 and comparison value 1.
At comparison value for a pulse duration	The respective digital output is active once for the assigned time and direction of the position value change when the position value is equal to the comparison value or has fallen below or exceeded it.
After set command from CPU until comparison value	When a set command is sent from the CPU, the respective digital output is active for the assigned direction of the position value change until the position value is equal to the comparison value or has fallen below or exceeded it.
Use by user program	The respective digital output can be switched by the CPU via the control interface (Page 151).

Note

You can select the function "Between comparison value 0 and 1" if the function "Use by user program" is selected for digital output DQ0.

Comparison value 0

By configuring the comparison value, you specify the position value at which the digital output DQ0 is to switch as a result of the selected comparison event.

You must enter a value that is less than comparison value 1.

The default setting is "0".

Comparison value 1

By configuring the comparison value, you specify the position value at which the digital output DQ1 is to switch as a result of the selected comparison event.

You must enter a value that is greater than comparison value 0.

The default setting is "10".

Count direction

You use this parameter to specify the direction of position value change for which the selected function is valid.

You can select from the following options:

Direction of position value change	Meaning
In both directions (default)	The comparison and switching of the respective digital output is carried out regardless of whether the position value becomes larger or smaller.
Up	The comparison and switching of the respective digital output only takes place when the position value becomes larger.
Down	The comparison and switching of the respective digital output only takes place when the position value becomes smaller.

The parameter can be configured for the following functions:

- At comparison value for a pulse duration
- After set command from CPU until comparison value

Pulse duration

By configuring the pulse duration for the function "At comparison value for a pulse duration", you specify the number of milliseconds for which the respective digital output is active.

You can enter a value between 0.5 and 6553.5 s.

The default setting is "500.0", which is equivalent to a pulse duration of 0.5 s.

Behavior of a DQ: Function of a DQ (SSI, Measuring mode)

In measuring mode, you specify the parameters described in the section Function of a DQ (Measuring operating mode) (Page 134) for the digital outputs of the channel.

Hysteresis (SSI)

Set hysteresis range

By configuring the hysteresis (Page 60), you can define a range around the comparison values. Within the hysteresis range, the digital outputs cannot switch again until the position value has left this range once.

If you enter "0", the hysteresis is turned off. You can enter a value between 0 and 255. The default setting is "0".

Hysteresis can only be configured in Counting mode.

Specifying measured value (SSI)

Measured variable

This parameter is used to specify the measured variable (Page 56) to be provided by the technology module.

You can select from the following options:

Measured variable	Meaning
Frequency (default)	The measured variable is a frequency. The unit is Hz. The incremental changes of the position value are measured.
Period	The measured variable is a period of time corresponding to the reciprocal value of the frequency. The unit is s.
Velocity	The measured variable is a velocity. You configure the time basis for the velocity measurement and the Increments per unit separately.
Complete SSI frame	The first 32 bits of the SSI frame are returned instead of a measured variable. Extra bits that do not belong to the actual position information are supplied in this case. A configured inversion of the direction is ignored.

Update time

By configuring the update time (Page 55) in milliseconds, you can specify the time interval between two measured value updates.

The update time influences the accuracy of the measurement.

If you enter "0", the measured value is updated in each cycle. Up to three decimal places can be entered. You can enter a value between 0.000 and 25000.000. The default setting is "10.000".

Time base for velocity measurement

This parameter defines the time base on which the velocity is to be returned.

You can select from the following options:

- 1 ms
- 10 ms
- 100 ms
- 1 s
- 60 s/1 min

The default setting is "60 s/1 min".

Increments per unit

This parameter defines the number of increments the SSI absolute encoder delivers per revolution.

You can enter a value between 1 and 65535.

Example:

Your absolute encoder operates with a resolution of 12 bits per revolution and performs 4096 increments per revolution. The velocity should be measured in revolutions per minute.

In this case, you need to assign the following parameters:

- Increments per unit: 4096
- Time base for velocity measurement: 60 s/1 min

Examples of the frame format

Example 1

In this example the SSI absolute encoder has the following specification:

- The SSI frame has a length of 25 bits.
- The MSB of the position value is bit 24.
- The LSB of the position value is bit 0.
- The position value is Gray coded.
- A parity bit is not available.

The frame has the following format:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
Bit:	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	MG	SG	SG
	MSB																								LSB

Position value

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Complete SSI frame

If you want to obtain the unedited SSI frame instead of a measured variable, it is returned right-justified in the feedback interface:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG

MG Multiturn bit as Gray code

SG Singleturn bit as Gray code

Feedback value position value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	0	0	0	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD	SD

MD Multiturn bit as binary code

SD Singleturn bit as binary code

Example 2

In this example the SSI absolute encoder has the following specification:

- The SSI frame has a length of34 bits.
- The MSB of the position value is bit 33.
- The LSB of the position value is bit 6.
- The position value is Gray coded.
- The SSI frame has two special bits.
- A parity bit is available. A parity bit does not count in the frame length.

The frame has the following format:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35
Bit:	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	*	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	MG	SG	SG	SG	SG	SG	S1	S2	P	0	0	0	0
	MSB																											LSB							

Position value

MG Multiturn bit as Gray code
SG Singleturn bit as Gray code
S1 Status bit 1
S2 Status bit 2
P Parity bit

Complete SSI frame

If you want to obtain the unedited SSI frame instead of a measured variable, the technology module reads the least significant 32 bit as maximum from the encoder. The technology module returns the bit following the LSB as parity bit. In this example the technology module therefore reads in the least significant 31 bit of the SSI frame.

The returned complete SSI frame has the following format:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MG	MG	MG	MG	MG	MG	MG	MG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	SG	MG	SG	SG	P	S1	S2	0	0	0	0

MG Multiturn bit as Gray code
SG Singleturn bit as Gray code

Position value

The position value supplied in Gray code is converted into binary code by the technology module and returned right-justified in the feedback interface:

Cycle:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	0	0	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	MD	SD	SD	SD	SD	SD	SD	SD	MD	SD	SD	SD	SD	SD	SD	SD	SD	SD

SD Singleturn bit as binary code

4.1.3 Online & diagnostics module

4.1.3.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the technology module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure

To open the display editor for the diagnostic functions, follow these steps:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Open the technology module in the project tree.
3. Double-click on the "Online & diagnostics" object.
4. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the technology module device manual.

Note

Position input for Motion Control

In the operating mode "Position input for Motion Control", channel diagnostics is not available for the technology module.

4.1.4 Commissioning the module

The commissioning editor assists you in the commissioning and the function test of the technology module.

You can simulate the count signals and the control of digital input states without process wiring. This allows you to monitor and test the characteristics of the user program technology module during counting.

Note

The digital output functions and hardware interrupts which have been configured are triggered in line with the simulated counter value.

Note

The commissioning editor is not used in the operating mode "Position input for Motion Control".

See also

Assignment of the feedback interface (Page 154)

4.1.4.1 Monitoring counter values, measured values, DIs and DQs

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.

Procedure

To open the commissioning editor of a technology module, follow these steps:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Open the technology module in the project tree.
3. Double-click on the "Commissioning" object.

The commissioning editor automatically switches to online mode. The CPU operator panel is displayed on the right in the "Test" task card to control the CPU mode.

Monitor values

The following values are read from the technology module cyclically and displayed under "Monitor values":

- Counter value
- Measured value
- Capture value
- Error code

The following values are read from the technology module once and displayed under "Monitor values":

- Comparison value 0
- Comparison value 1
- High counting limit
- Low counting limit
- Start value

You can toggle between the decimal and hexadecimal format of the displayed values in the "Display format" column. The display format "Floating point number" is also available for the measured value.

Monitor status flags

The status information from the technology module is read and displayed online. When the CPU is in STOP, the status display is not updated.

Monitor DIs & DQs

The technology module digital input and digital output signal states are displayed under "Monitor/control DI & DQ". The function currently configured is displayed in the "Comment" column. You can manually change the values with the control panel above the table and thus simulate the counting and measuring functions: see Manually controlling counter values, DIs and DQs (Page 150)

4.1.4.2 Manually controlling counter values, DIs and DQs

With manual control, you can modify the technology module digital input states online and specify a counter value without process wiring. You can use a simulation function and specify a simulation velocity to monitor the effects on the measuring and counting functions. The digital outputs are switched in accordance with the simulated counter value, and the corresponding hardware interrupts are triggered.

Requirements

- There is an online connection between STEP 7 (TIA Portal) and the CPU.
- The CPU is in RUN.
- The commissioning window "Monitor/control DI & DQ" for the technology module is open. The current values of the technology module are displayed.

Manual control

⚠WARNING

Warning of personal injury and material damage

Incorrect manual control can cause serious injury and damage plants and equipment:

- Check all entries before you switch to manual control and before you apply changed values during manual control.
- Manual control may only be carried out by trained personnel.

Basic procedure - manually controlling counter values, DIs and DQs

1. Activate manual control in the operator panel using the "Activate" button.
2. Enter new values in the empty "Control value" column.
   The check box to the right is automatically selected. The yellow warning triangle indicates that this value has not been transmitted to the technology module yet.
3. Enter a value for the "Velocity for simulation". For a TM Count the limits of the value range are ±800000.00. For a TM PosInput, the limits of the value range are ±4000000.00. The value determines the speed of the simulated count signals.
4. Apply the modified values with the selected check box by clicking the Change" button. The yellow warning triangle goes out. The changed values are updated in the technology module.
5. Control the simulation of the counting or measuring function with the "Start" and "Stop" buttons.
6. You can monitor the displays under "Monitor values", "Monitor status flags" and "Monitor/control DIs & DQs" and check how your user program responds.
7. If necessary, you can adapt the values in the column "Control value" by repeating steps 2 to 4.

4.1.5 Control and feedback interface

Information on using the control and feedback interface can be found under Overview of application options (Page 16).

4.1.5.1 Assignment of the control interface

The user program uses the control interface to influence the behavior of the technology module.

Control interface per channel

The following table shows control interface assignment:

Offset to the start address	Parameter	Meaning				
Bytes 0 to 3	Slot 0	Load value (significance of the value is specified in LD_SLOT_0)				
Bytes 4 to 7	Slot 1	Load value (significance of the value is specified in LD_SLOT_1)				
Byte 8	LD_SLOT_0*	Specifies the significance of the value in Slot 0				
		Bit 3	**Bit 2**	**Bit 1**	**Bit 0**	
		0	0	0	0	No action, idle
		0	0	0	1	Load count value (with incremental or pulse encoder)
		0	0	1	0	Reserve
		0	0	1	1	Load start value (with incremental or pulse encoder)
		0	1	0	0	Load comparison value 0
		0	1	0	1	Load comparison value 1
		0	1	1	0	Load low counter limit (with incremental or pulse encoder)
		0	1	1	1	Load high counter limit (with incremental or pulse encoder)
		1	0	0	0	Reserve
		to				
		1	1	1	1	

Offset to the start address	Parameter	Meaning				
Byte 8	LD_SLOT_1*	Specifies the significance of the value in Slot 1				
		Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	
		0	0	0	0	No action, idle
		0	0	0	1	Load count value (with incremental or pulse encoder)
		0	0	1	0	Reserve
		0	0	1	1	Load start value (with incremental or pulse encoder)
		0	1	0	0	Load comparison value 0
		0	1	0	1	Load comparison value 1
		0	1	1	0	Load low counting limit (with incremental or pulse encoder)
		0	1	1	1	Load high counting limit (with incremental or pulse encoder)
		1	0	0	0	Reserve
		to				
		1	1	1	1	
Byte 9	EN_CAPTURE	Bit 7: Capture function enable				
	EN_SYNC_DN	Bit 6: Enable downward synchronization (with incremental or pulse encoder)				
	EN_SYNC_UP	Bit 5: Enable upward synchronization (with incremental or pulse encoder)				
	SET_DQ1	Bit 4: Set DQ1				
	SET_DQ0	Bit 3: Set DQ0				
	TM_CTRL_DQ1	Bit 2: enable technological function DQ1				
	TM_CTRL_DQ0	Bit 1: Enable technological function DQ0				
	SW_GATE	Bit 0: Software gate (with incremental or pulse encoder)				
Byte 10	SET_DIR	Bit 7: Count direction (for encoders without direction signal)				
	–	Bits 2 to 6: Reserve; bits must be set to 0				
	RES_EVENT	Bit 1: Reset of saved events				
	RES_ERROR	Bit 0: Reset of saved error states				
Byte 11	–	Bits 0 to 7: Reserve; bits must be set to 0				

* If values are loaded simultaneously via LD_SLOT_0 and LD_SLOT_1, the first value is taken internally from Slot 0 and then the value from Slot 1 is taken. This may lead to unexpected intermediate states.

Notes on the control bits

Control bit	Notes
EN_CAPTURE	Use this bit to enable the Capture function. Resetting this bit resets a set EVENT_CAP in the feedback interface.
EN_SYNC_DN	Use this bit to enable the synchronization of the counter when counting in downward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
EN_SYNC_UP	Use this bit to enable the synchronization of the counter when counting in upward direction with an incremental encoder or pulse encoder. Resetting this bit resets a set EVENT_SYNC in the feedback interface.
RES_EVENT	Use this bit to trigger the reset of the saved events in the EVENT_ZERO, EVENT_OFLW, EVENT_UFLW, EVENT_CMP0, EVENT_CMP1 feedback bits.
RES_ERROR	Use this bit to trigger the reset of the saved error states LD_ERROR and ENC_ERROR .
SET_DIR	Use this bit to specify the count direction for signal type "Pulse (A)". 0 means: Up 1 means: Down
SET_DQ0	Use this bit to set digital output DQ0 when TM_CTRL_DQ0 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ0 is effective regardless of TM_CTRL_DQ0 as long as the counter value is not equal to the comparison value.
SET_DQ1	Use this bit to set digital output DQ1 when TM_CTRL_DQ1 is set to 0. In the case of the function "After set command from CPU until comparison value",SET_DQ1 is effective regardless of TM_CTRL_DQ1 as long as the counter value is not equal to the comparison value.
SW_GATE	Use this bit to open and close the software gate when using an incremental encoder or pulse encoder. Together, the software gate and the hardware gate form the internal gate. The technology module only counts when the internal gate is open. 0 means: Software gate closed 1 means: Software gate open
TM_CTRL_DQ0	Use this bit to enable the technological function of digital output DQ0. 0 means: SET_DQ0 defines the state of DQ0 1 means: assigned function defines the state of DQ0
TM_CTRL_DQ1	Use this bit to enable the technological function of digital output DQ1. 0 means: SET_DQ1 defines the state of DQ1 1 means: assigned function defines the state of DQ1

4.1.5.2 Assignment of the feedback interface

The user program receives current values and status information from the technology module via the feedback interface.

Feedback interface per channel

The following table shows the assignment of the feedback interface:

Offset to the start address	Parameter	Meaning
Bytes 0 to 3	COUNT VALUE	Current counter value or position value
Bytes 4 to 7	CAPTURED VALUE	The last acquired Capture value
Bytes 8 to 11	MEASURED VALUE	Current measured value or complete SSI frame
Byte 12	–	Bits 3 to 7: Reserve; set to 0
	LD_ERROR	Bit 2: Error when loading via control interface
	ENC_ERROR	Bit 1: Faulty encoder signal or SSI frame
	POWER_ERROR	Bit 0: S7-1500 module: Incorrect supply voltage L+ / ET 200SP module: Supply voltage too low L+
Byte 13	–	Bits 6 to 7: Reserve; set to 0
	STS_SW_GATE	Bit 5: Software gate status (with incremental or pulse encoder)
	STS_READY	Bit 4: Technology module started up and configured
	LD_STS_SLOT_1	Bit 3: Load request for Slot 1 detected and executed (toggling)
	LD_STS_SLOT_0	Bit 2: Load request for Slot 0 detected and executed (toggling)
	RES_EVENT_ACK	Bit 1: Reset of event bits active
	–	Bit 0: Reserve; set to 0
Byte 14	STS_DI2 (TM Count)	Bit 7: TM Count: Status DI2 / TM PosInput: Reserve; set to 0
	STS_DI1	Bit 6: Status DI1
	STS_DI0	Bit 5: Status DI0
	STS_DQ1	Bit 4: Status DQ1
	STS_DQ0	Bit 3: Status DQ0
	STS_GATE	Bit 2: Internal gate status (with incremental or pulse encoder)
	STS_CNT	Bit 1: Count pulse or position value change detected within the last ca. 0.5 s
	STS_DIR	Bit 0: Direction of last counter value or position value change
Byte 15	STS_M_INTERVAL	Bit 7: Count pulse or position value change detected in previous measurement interval
	EVENT_CAP	Bit 6: Capture event has occurred
	EVENT_SYNC	Bit 5: Synchronization has occurred (with incremental or pulse encoder)
	EVENT_CMP1	Bit 4: Comparison event for DQ1 has occurred
	EVENT_CMP0	Bit 3: Comparison event for DQ0 has occurred
	EVENT_OFLW	Bit 2: An overflow has occurred
	EVENT_UFLW	Bit 1: An underflow has occurred
	EVENT_ZERO	Bit 0: A zero pass has occurred

Notes on the feedback bits

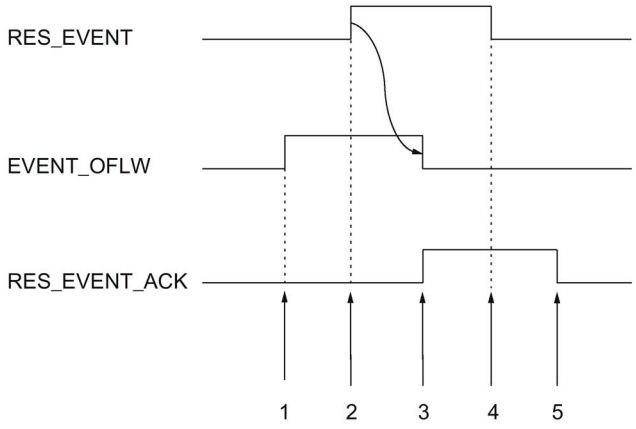
Feedback bit	Notes
ENC_ERROR	This bit indicates that one of the following errors has occurred at the encoder signals (retentive) for the respective technology module: TM Count: • Wire break of digital input A, B, or N (with push-pull encoder) • Invalid transition of A/B signals (with incremental encoder) TM PosInput: • Invalid transition of A/B signals (with incremental encoder) • RS422/TTL error • SSI encoder error or SSI frame error (with SSI absolute encoder) If you have enabled the diagnostic interrupts, the respective diagnostic interrupt is triggered in the event of encoder signal errors. For information on the meaning of the diagnostic interrupts, refer to the manual for the respective technology module. The bit is reset once you have acknowledged the error with RES_ERROR.
EVENT_CAP	This bit indicates that a Capture event has occurred and a counter value has been saved in CAPTURED VALUE. You reset the status by resetting EN_CAPTURE.
EVENT_CMP0	This bit indicates the saved status that a comparison event has occurred for the digital output DQ0. You reset the status by acknowledgment with RES_EVENT. The EVENT_CMP0 bit is not set when you set the counter value to the start value.
EVENT_CMP1	This bit indicates the saved status that a comparison event has occurred for the digital output DQ1. You reset the status by acknowledgment with RES_EVENT. The EVENT_CMP1 bit is not set when you set the counter value to the start value.
EVENT_OFLW	This bit indicates the saved state which shows that there was a counter value overflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_SYNC	This bit indicates the saved status for which the counter was loaded with the start value by an external reference signal (synchronization) when using an incremental or pulse encoder. You reset the state by resetting EN_SYNC_UP or EN_SYNC_DN.
EVENT_UFLW	This bit indicates the saved state which shows that there was a counter value underflow. You reset the status by acknowledgment with RES_EVENT.
EVENT_ZERO	This bit indicates the saved status with which the counter value or position value experienced a zero crossing. You reset the status by acknowledgment with RES_EVENT.
LD_ERROR	This bit indicates that an error occurred (latching) during loading via the control interface. The loaded values were not applied. When using an incremental or pulse encoder, one of the following conditions is not fulfilled: • Low counting limit <= counter value <= high counting limit • Low counting limit <= start value <= high counting limit • Low counting limit <= comparison value 0/1 <= high counting limit • Comparison value 0 < comparison value 1 When using an SSI absolute encoder, one of the following conditions is not fulfilled: • 0 <= position value <= maximum position value • 0 <= comparison value 0/1 <= maximum position value • Comparison value 0 < comparison value 1 The bit is reset once you have acknowledged the error with RES_ERROR.

Feedback bit	Notes
LD_STS_SLOT_0	This bit indicates by a status change (toggling) that the load request for Slot 0 (LD_SLOT_0) has been detected and executed.
LD_STS_SLOT_1	This bit indicates by a status change (toggling) that the load request for Slot 1 (LD_SLOT_1) has been detected and executed.
POWER_ERROR	For an S7-1500 technology module, this bit indicates that the supply voltage L+ is not available or too low or that the front plug is not plugged in. For an ET 200SP technology module, this bit indicates that the supply voltage L+ is too low. If the supply voltage L+ is available at a sufficient level once again, POWER_ERROR is automatically set to 0.
RES_EVENT_ACK	This bit indicates that the reset of event bit EVENT_SYNC, EVENT_CMP0, EVENT_CMP1, EVENT_OFLW, EVENT_UFLW, EVENT_ZERO is active.
STS_CNT	This bit indicates that at least one count pulse or a position value change has occurred in the last ca. 0.5 s.
STS_DI0	This bit indicates the status of digital input DI0.
STS_DI1	This bit indicates the status of digital input DI1.
STS_DI2	This bit indicates the status of digital input DI2 of the TM Count.
STS_DIR	This bit indicates the count direction of the last count pulse or the direction of the last position value change. 0 means: Down 1 means: Up
STS_DQ0	This bit indicates the status of digital output DQ0.
STS_DQ1	This bit indicates the status of digital output DQ1.
STS_GATE	This bit indicates the status of the internal gate when using an incremental or pulse encoder. 0 means: Gate closed 1 means: Gate open
STS_M_INTERVAL	This bit indicates that at least one count pulse or a position value change was detected in the previous measurement interval.
STS_READY	This bit indicates that the technology module supplies valid user data. The technology module has been started up and configured.
STS_SW_GATE	This bit indicates the status of the software gate. 0 means: Gate closed 1 means: Gate open

Complete acknowledgment principle

Saving bits are acknowledged according to the complete acknowledgment principle.

The figure below shows an example of the sequence of the complete acknowledgment principle in the event of an overflow:



① The EVENT_OFLW feedback bit is set as a saving event upon overflow.
② You set the RES_EVENT control bit to trigger EVENT_OFLW reset.
③ The RES_EVENT_ACK feedback bit is set when reset of EVENT_OFLW is detected.
④ You then rest the control bit RES_EVENT .
⑤ The RES_EVENT_ACK feedback bit is reset.

4.2 Using the digital input module

4.2.1 Configuring and assigning parameters to the module

4.2.1.1 Adding a module to the hardware configuration

Requirements

- The project has been created.
- The CPU has been created.
- The ET 200 distributed I/O has been created.

Procedure

1. Open the device configuration of the CPU or IM.
2. Select a module rack.
3. Select the digital input module from the module catalog:
   "DI > Digital input module > Article number"
4. Drag the module to the required slot in the module rack.

Result

The new module is displayed under "Local modules" or "Distributed I/O" in the project tree.

4.2.1.2 Open Hardware configuration (HWCN)

Opening via the project tree

Proceed as follows:

1. Open the "Local modules" or "Distributed I/O" folder in the project tree.
2. Double-click the module in the project tree.

Opening from the device view

Proceed as follows:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Click on the module.

4.2.1.3 Counting operating mode

In counting operating mode, you can set the following parameters for each channel.

Note

Some of the parameters and options are not available for all digital input modules. See the module's device manual for the associated parameters and options.

Channel enabled

You use this parameter to specify whether the respective channel is enabled or disabled.

Each channel is enabled by default.

Input delay

By configuring the input delay, you suppress signal errors at the digital inputs. Changes to the signal are only detected if they are constantly pending longer than the set input delay time.

Isochronous configuration is only possible if there is an input delay of 0.05 ms configured for at least one channel. In isochronous mode, the feedback interface is updated at the time T_i (time for reading the input data).

You can select from the following options:

- 0.05 ms
- 0.1 ms
- 0.4 ms
- 0.8 ms

- 1.6 ms
- 3.2 ms (default)
- 12.8 ms
- 20 ms

Note

If you select the "0.05 ms" option for the input delay, you have to use shielded cables for connection of the digital inputs.

Reaction to violation of a counting limit

The following behavior can be configured for Violation of the counter high limit in the upward direction or the counter low limit in the downward direction (Page 73):

Reaction	Meaning
Stop counting (default)	After a counting limit is violated, the internal gate is closed (automatic gate stop). As a result, the counting process is stopped and the module ignores any further counting signals. The counter value is set to the opposite counting limit. To restart counting, you must close and reopen the software/hardware gate.
Continue counting	After a counting limit is violated, the counter value is set to the opposite counting limit and counting continues.

Edge selection

This parameter is used to specify which edge the respective counter counts:

Edge selection	Meaning
At rising edge (default)	The respective counter counts all rising edges at the digital input.
At falling edge	The respective counter counts all falling edges at the digital input.
At rising and falling edge	The respective counter counts all edges at the digital input.

Count direction

Use this parameter to specify the counting direction of the respective counter.

You can select from the following options:

- Up
- Down

Note

This parameter has no effect if the "Reverse direction" option is selected in "Set function of DI".

Set output

Use this parameter to specify the Function (Page 77) that controls the STS_DQ feedback bit. You can use the STS_DQ reset bit in order to control a digital output module's digital output.

You can select from the following options:

Option	Meaning
Off (DQ = 0)	Regardless of the counter value, STS_DQ is permanently not set.
Off (DQ = 1)	Regardless of the counter value, STS_DQ is permanently set.
Between comparison value 0 and 1	STS_DQ is set if the counter value between comparison values 0 and 1.
Not between comparison values 0 and 1	STS_DQ is set if the counter value is outside the range between comparison values 0 and 1.
Between comparison value and counter high limit	STS_DQ is set if the counter value is between the comparison value and the counter high limit.
Between comparison value and counter low limit	STS_DQ is set if the counter value is between the comparison value and the counter low limit.

Setting function of the DI

Use this parameter to specify which function the respective digital input DI_{n+4} triggers.

You can select from the following options:

Option	Meaning
Digital input without function	No function is assigned to the respective digital input DI_{n+4}. The signal status of DI_{n+4} can be read by the CPU using the feedback interface.
Gate start/stop	Setting the respective digital input DI_{n+4} opens the hardware gate (Page 75) for DI_n. Resetting the respective digital input DI_{n+4} closes the hardware gate for DI_n.
Reverse direction	The respective DI_{n+4} digital input reverses the counting direction at DI_n, in order to adjust it to the process. If DI_{n+4} is not set, DI_n counts up. If DI_{n+4} is set, DI_n counts down.

Note

If "Reverse direction" is selected and the counting direction in the process changes, the counting edge is automatically adjusted (opposite edges).

Counter high limit

You limit the counting range by setting the counter high limit. The maximum value for the counter high limit depends on the module:

Counter high limit	DI 8x24VDC HS	DI 32x24VDC HF
Maximum value	2147483647 (2^{31}–1)	4294967295 (2^{32}–1)
Default	2147483647	4294967295

You must enter a value that lies above the counter low limit.

Counter low limit

You limit the counting range by setting the counter low limit. The minimum value for the counter low limit depends on the module:

Counter low limit	DI 8x24VDC HS	DI 32x24VDC HF
Minimum value	–2147483648 (–2^{31})	0 (not configurable)
Default	–2147483648	0

You must enter a value below the counter high limit.

Start value

By configuring the start value, you specify the value at which counting is to start. You must enter a value between the counting limits or equal to the counting limits.

The default setting is "0".

Comparison value 0

By configuring a comparison value (Page 77), you specify the counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than or equal to the counter low limit and less than comparison value 1.

The default setting is "0".

Comparison value 1

By configuring the second comparison value (Page 77), you specify the additional counter value that controls the STS_DQ reset bit based on the comparison function that was selected under "Set output".

You must enter a value which is greater than comparison value 0 and less than or equal to the counter high limit.

The default setting is "10".

Hardware interrupt: Comparison event for DQ occurred

This parameter specifies whether a hardware interrupt is generated when a comparison event occurs based on the comparison function that was selected under "Set output".

The hardware interrupt is not enabled in the default setting.

4.2.2 Online & diagnostics module

4.2.2.1 Displaying and evaluating diagnostics

The online and diagnostics view enables hardware diagnostics. You can also

- Obtain information on the module (e.g., Firmware version and serial number)
- Execute a firmware update if required

Procedure

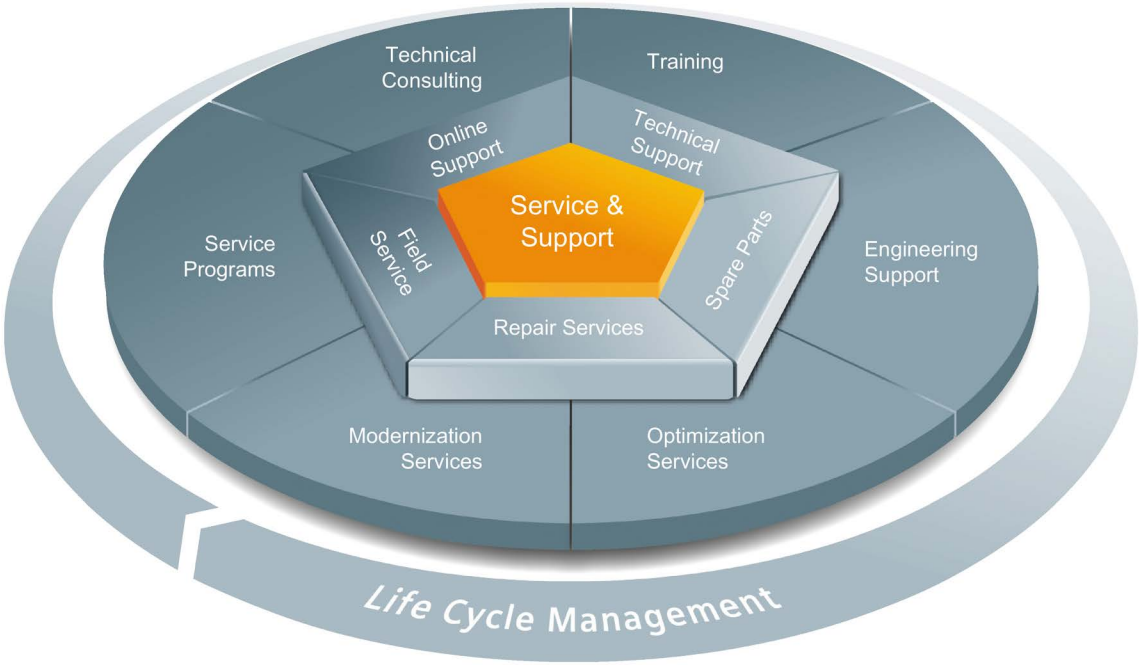
To open the display editor for the diagnostic functions, follow these steps:

1. Open the device configuration of the CPU or IM.
2. Select the device view.
3. Right-click on the module and select "Online & Diagnostics".
4. Select the required display in the diagnostics navigation.

Additional information

Additional information on the diagnostic alarms and possible remedies can be found in the module's device manual.

Service & Support



Unmatched complete service for the entire life cycle

For machine manufacturers, solution providers and plant operators: The service offering from Siemens Industry Automation and Drive Technologies includes comprehensive services for a wide range of different users in all sectors of the manufacturing and process industry.

To accompany our products and systems, we offer integrated and structured services that provide valuable support in every phase of the life cycle of your machine or plant – from planning and implementation through commissioning as far as maintenance and modernization.

Our Service & Support accompanies you worldwide in all matters concerning automation and drive technology from Siemens. We provide direct on-site support in more than 100 countries through all phases of the life cycle of your machines and plants.

You have an experienced team of specialists at your side to provide active support and bundled know-how. Regular training courses and intensive contact among our employees – even across continents – ensure reliable service in the most diverse areas.

Online Support

The comprehensive online information platform supports you in all aspects of our Service & Support at any time and from any location in the world.

You can find Online Support at the following address on the Internet (http://www.siemens.com/automation/service&support).

Technical Consulting

Support in planning and designing your project: From detailed actual-state analysis, definition of the goal and consultation on product and system questions right through to the creation of the automation solution.

Technical Support

Expert advice on technical questions with a wide range of demand-optimized services for all our products and systems.

You can find Technical Support at the following address on the Internet (http://www.siemens.com/automation/support-request).

Training

Extend your competitive edge – through practical know-how directly from the manufacturer.

You can find the training courses at the following address on the Internet (http://www.siemens.com/sitrain).

Engineering Support

Support during project engineering and development with services fine-tuned to your requirements, from configuration through to implementation of an automation project.

Field Service

Our Field Service offers you services for commissioning and maintenance – to ensure that your machines and plants are always available.

Spare parts

In every sector worldwide, plants and systems are required to operate with constantly increasing reliability. We will provide you with the support you need to prevent a standstill from occurring in the first place: with a worldwide network and optimum logistics chains.

Repairs

Downtimes cause problems in the plant as well as unnecessary costs. We can help you to reduce both to a minimum – with our worldwide repair facilities.

Optimization

During the service life of machines and plants, there is often a great potential for increasing productivity or reducing costs.

To help you achieve this potential, we are offering a complete range of optimization services.

Modernization

You can also rely on our support when it comes to modernization – with comprehensive services from the planning phase all the way to commissioning.

Service programs

Our service programs are select service packages for an automation and drives system or product group. The individual services are coordinated with each other to ensure smooth coverage of the entire life cycle and support optimum use of your products and systems.

The services of a service program can be flexibly adapted at any time and used separately.

Examples of service programs:

- Service contracts
- Plant IT Security Services
- Life Cycle Services for Drive Engineering
- SIMATIC PCS 7 Life Cycle Services
- SINUMERIK Manufacturing Excellence
- SIMATIC Remote Support Services

Benefits at a glance:

- Reduced downtimes for increased productivity
- Optimized maintenance costs due to a tailored scope of services
- Costs that can be calculated and therefore planned
- Service reliability due to guaranteed response times and spare part delivery times
- Customer service personnel will be supported and relieved of additional tasks
- Comprehensive service from a single source, fewer interfaces and greater expertise

Contact

At your service locally, around the globe: your partner for consultation, sales, training, service, support, spare parts... for the entire range of products from Industry Automation and Drive Technologies.

You can find your personal contact in our contacts database on the Internet (http://www.siemens.com/automation/partner).

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Important notes

Purpose of this documentation

The information in this documentation enables you to configure and program SIMATIC Safety fail-safe systems. In addition, you will obtain information on acceptance of a SIMATIC Safety F-system.

Basic knowledge requirements

General basic knowledge of automation engineering is needed to understand this documentation. Basic knowledge of the following is also necessary:

- Fail-safe automation systems
- S7-300/400/1200/1500/WinAC RTX F automation systems
- Distributed I/O systems on PROFIBUS DP/PROFINET IO
- Totally Integrated Automation Portal, including:
  - Hardware configuration with the *hardware and network editor*
  - Programming in the LAD and FBD programming languages using the *program editor*.
  - Communication between CPUs

Scope of this documentation

This documentation is valid for the optional packages *STEP 7 Safety Advanced V13 SP1* and *STEP 7 Safety Basic V13 SP1.*

The optional packages *STEP 7 Safety Advanced V13 SP1* and *STEP 7 Safety Basic V13 SP1* are used for configuration and programming of the fail-safe SIMATIC Safety system.

In this context, integration of the fail-safe I/O listed below in SIMATIC Safety is also addressed:

- ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200eco fail-safe I/O modules
- ET 200pro fail-safe modules
- ET 200iSP fail-safe modules
- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- Fail-safe GSD based DP slaves
- Fail-safe GSD based I/O devices

Approvals

The SIMATIC Safety F-system is certified for use in safety mode up to:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance Level (PL) e and category 4 in accordance with ISO 13849-1:2006 or EN ISO 13849-1:2008

Incorporation in the information landscape

Depending on your application, you will need the following supplementary documentation when working with *STEP 7 Safety*.

This documentation includes references to the supplementary documentation where appropriate.

Documentation	Brief description of relevant content
For the SIMATIC Safety system	Depending on which F-CPU you are using, you will need the following documentation: • The S7-1500 automation system (http://support.automation.siemens.com/WW/view/en/59191792) system manual describes the installation and wiring of S7-1500 systems. • The Device manuals (http://support.automation.siemens.com/WW/view/en/67295862/133300) describe S7-1500 F-CPUs. • The "S7-300, CPU 31xC and CPU 31x: Installation" (http://support.automation.siemens.com/WW/view/en/13008499) operating instructions describe the installation and wiring of S7-300 systems. • The "CPU 31xC and CPU 31x, Technical Data" (http://support.automation.siemens.com/WW/view/en/12996906) device manual describes the CPUs 315-2 DP and PN/DP, the CPU 317-2 DP and PN/DP, and the CPU 319-3 PN/DP. • The "S7-400 Automation System, Installation (http://support.automation.siemens.com/WW/view/en/1117849) installation manual describes the installation and wiring of S7-400 systems. • The "S7-400 Automation System, CPU Data" (http://support.automation.siemens.com/WW/view/en/23904550) reference manual describes the CPUs 414-3 PN/DP, the CPU 416-2, and the CPU 416-3 PN/DP. • The "ET 200S Interface Module IM 151-7 CPU" (http://support.automation.siemens.com/WW/view/en/12714722) manual describes the IM 151-7 CPU. • The "ET 200S, Interface Module IM 151-8 PN/DP CPU" (http://support.automation.siemens.com/WW/view/en/47409312) manual describes the IM 151-8 PN/DP CPU. • The "ET 200S, Interface Module IM 154-8 CPU" (http://support.automation.siemens.com/WW/view/de/24363739/0/en) manual describes the IM 154-8 CPU. • The Manual "Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176)" describes the WinAC RTX 2010 and the WinAC RTX F 2010. • Each F-CPU that can be used has its own product information. The product information only describes the deviations from the respective standard CPUs.

Documentation	Brief description of relevant content
System manual "S7-1200 Functional Safety manual" (http://support.automation.siemens.com/WW/view/en/34612486/133300)	Describes the F-CPUs S7-1200 and the fail-safe modules S7-1200 (including installation, wiring, and technical specifications)
"S7-1500/ET200MP system manual (http://support.automation.siemens.com/WW/view/en/59191792)" system manual and the product manuals (http://support.automation.siemens.com/WW/view/en/57251728/133300) for the corresponding ET 200MP fail-safe modules	Describes the hardware of the ET 200MP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)" system manual and the product manuals (http://support.automation.siemens.com/WW/view/en/55679227/133300) for the corresponding ET 200SP fail-safe modules	Describes the hardware of the ET 200SP fail-safe modules (including installation, wiring, and technical specifications)
"ET 200eco Distributed I/O Station Fail-safe I/O Block (http://support.automation.siemens.com/WW/view/en/19033850)" manual	Describes the hardware of the ET 200eco fail-safe I/O module (including installation, wiring, and technical specifications)
"Distributed I/O System ET 200S, Fail-Safe Modules (http://support.automation.siemens.com/WW/view/en/27235629)" operating instructions	Describes the hardware of the ET 200S fail-safe modules (including installation, wiring, and technical specifications)
"S7-300 Automation System, ET 200M Distributed I/O System, Fail-safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151)" manual	Describes the hardware of the S7-300 fail-safe signal modules (including installation, wiring, and technical specifications)
"Distributed I/O system ET 200pro, fail-safe I/O modules (http://support.automation.siemens.com/WW/view/en/22098524)" operating instructions	Describes the hardware of the ET 200pro fail-safe modules (including installation, wiring, and technical specifications)
"ET 200iSP distributed I/O device - Fail-safe modules (http://support.automation.siemens.com/WW/view/en/47357221)" operating instructions	Describes the hardware of the ET 200iSP fail-safe modules (including installation, wiring, and technical specifications)
Online help for *STEP 7*	• Describes the operation of the standard tools in *STEP 7* • Contains information regarding configuration and parameter assignment of hardware • Contains a description of the FBD and LAD programming languages

The complete *SIMATIC S7* documentation is available on DVD. You can find more information on the Internet (http://www.automation.siemens.com/mcms/industrial-automation-systems-simatic/en/manual-overview/manual-collection/Pages/Default.aspx).

Guide

This documentation describes how to work with the optional packages *STEP 7 Safety.* It includes instructions and reference sections (description of the instructions for the safety program).

The following topics are addressed:

- Configuration of SIMATIC Safety
- Access protection for SIMATIC Safety
- Programming of the safety program (safety-related user program)
- Safety-related communication
- Instructions for the safety program
- Support for the system acceptance
- Operation and maintenance of SIMATIC Safety
- Monitoring and response times

Conventions

In this documentation, the terms "safety engineering" and "fail-safe engineering" are used synonymously. The same applies to the terms "fail-safe" and "F-".

When *"STEP 7 Safety Advanced V13 SP1" or "STEP 7 Safety Basic V13 SP1"* appears in italics, it refers to the optional package for the "SIMATIC Safety" F-system.

"STEP 7 Safety V13 SP1" stands for the optional package *"STEP 7 Safety Advanced V13 SP1"* and the optional package *"STEP 7 Safety Basic V13 SP1"*.

"(S7-300)" indicates that the section **only** applies to S7-300 F-CPUs as well as WinAC RTX F. S7-300 F-CPUs also includes the F-CPUs ET 200S and ET 200pro (IM F-CPUs).

"(S7-400)" indicates that the section **only** applies to S7-400 F-CPUs.

"(S7-1200)" indicates that the section **only** applies to S7-1200 F-CPUs.

"(S7-1500)" indicates that the section **only** applies to S7-1500 F-CPUs. S7-1500 F-CPUs also includes ET 200SP F-CPUs.

The scopes can be combined.

The term "safety program" refers to the fail-safe portion of the user program and is used instead of "fail-safe user program," "F-program," etc. For purposes of contrast, the non-safety-related part of the user program is referred to as the "standard user program".

All fail-safe modules and instructions are highlighted in yellow to distinguish them from the modules and instructions of the standard user programs on the software interface (e.g., in the project tree). Similarly, the fail-safe parameters of F-CPUs and F-I/O are highlighted in yellow in the hardware configuration.

Each warning is marked with a unique number at the end of the text. This enables you to easily reference other documents to obtain an overview of the safety requirements for the system.

Additional support

If you have further questions about the use of products presented in this manual, contact your local Siemens representative.

You can find information on whom to contact on the Web (http://www.siemens.com/automation/partner).

A guide to the technical documentation for the various SIMATIC products and systems is available on the Web (http://www.siemens.com/simatic-tech-doku-portal).

You can find the online catalog and online ordering system on the Web (www.siemens.com/industrymall).

Training center

We offer courses to help you get started with the S7 automation system. Contact your regional training center or the central training center in Nuremberg (90327), Federal Republic of Germany.

You can find more information on the Internet (http://www.sitrain.com).

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to system commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You can find more detailed information on the Internet (www.siemens.com/safety-services).

Contact us at safety-services.industry@siemens.com if you have any questions.

Technical Support

To contact Technical Support for all Industry Automation products, use the Support Request Web form (http://www.siemens.com/automation/support-request).

You can find additional information about our Technical Support on the Web (http://www.siemens.com/automation/service).

Industry Online Support

In addition to our documentation, we also offer a comprehensive technical knowledge base on the Internet (http://www.siemens.com/automation/service&support).

There, you can find the following information:

- Newsletters providing the latest information on your products
- A search engine in Industry Online Support for locating the documents you need
- A forum where users and experts from all over the world exchange ideas
- Your local contact
- Information about on-site services, repairs, and about spare parts Lots more can be found on our "Services" page.

Important note for maintaining the operational safety of your system

Note

The operators of systems with safety-related characteristics must adhere to operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens publishes a special newsletter to keep system operators informed about product developments and properties which may form important issues in terms of operational safety. You should subscribe to the corresponding newsletter in order to obtain the latest information and to allow you to modify your system accordingly. Please go to the Internet (https://www.automation.siemens.com/WW/newsletter/guiThemes2Select.aspx?HTTPS=REDIR&subjectID=2) and register for the following newsletters:

- SIMATIC S7-300/S7-300F
- SIMATIC S7-400/S7-400H/S7-400F/FH
- SIMATIC S7-1500/SIMATIC S7-1500F
- SIMATIC S7-1200/SIMATIC S7-1200F
- Distributed I/O
- SIMATIC Industrial Software

To receive these newsletters, select the check box "Update".

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Table of contents

Important notes 3

1 Product Overview 21

1.1 Overview 21
1.2 Hardware and Software Components 23
1.3 Installing/uninstalling the STEP 7 Safety Basic V13 SP1 optional package 27
1.4 Installing/uninstalling the STEP 7 Safety Advanced V13 SP1 optional package 28
1.5 Installing the STEP 7 Safety PowerPack 29
1.6 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced 30
1.7 Migrating an S7-300/400 F-CPU 33
1.8 Upgrading projects from STEP 7 Safety Advanced V11 34
1.9 Upgrading projects from STEP 7 Safety Advanced V12 35
1.10 Working with projects from STEP 7 Safety Advanced V12 35
1.11 Upgrading projects from STEP 7 Safety Advanced V13 35
1.12 Working with projects from STEP 7 Safety Advanced V13 36
1.13 First steps 36

2 Configuring 37

2.1 Overview of Configuration 37
2.2 Particularities for configuring the F-System 41
2.3 Configuring an F-CPU 42
2.4 Configuring F-I/O 47
2.5 Configurations supported by the SIMATIC Safety F-system 50
2.6 PROFIsafe addresses for F-I/O of PROFIsafe address type 1 52
2.7 PROFIsafe addresses for F-I/O of PROFIsafe address type 2 54
2.8 Recommendation for PROFIsafe address assignment 56
2.9 Assigning F-destination addresses to fail-safe modules with SIMATIC Safety 57
2.9.1 Identifying F-modules 58
2.9.2 Assigning a fail-safe destination address 60
2.9.3 Changing the F-destination address and the F-source address 60
2.10 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices 61

3 Safety Administration Editor 64
3.1 Opening the Safety Administration Editor 66
3.2 "General" area 67
3.3 "F-blocks" area 69
3.4 "F-compliant PLC data types" area (S7-1200, S7-1500) 70
3.5 "Settings" area 71
4 Access protection 76
4.1 Overview of Access Protection 77
4.2 Setting up, changing and revoking access permission for the safety program 79
4.3 Setting up access permission for the F-CPU 82
5 Programming 84
5.1 Overview of Programming 84
5.1.1 Program structure of the safety program (S7-300, S7-400) 85
5.1.2 Program structure of the safety program (S7-1200, S7-1500) 87
5.1.3 Fail-Safe Blocks 89
5.1.4 Restrictions in the programming languages FBD/LAD 90
5.1.5 F-compliant PLC data types (S7-1200, S7-1500) 97
5.1.5.1 Example of the use of F-compliant PLC data types for access to F-I/O (S7-1200, S7-1500) 98
5.2 Defining F-Runtime Groups 102
5.2.1 Rules for F-Runtime Groups of the Safety Program 102
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400) 104
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500) 107
5.2.4 Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400) 110
5.2.5 F-shared DB (S7-300, S7-400) 114
5.2.6 F-runtime group information DB (S7-1200, S7-1500) 115
5.2.7 Deleting an F-runtime group 116
5.2.8 Changing the F-runtime group (S7-300, S7-400) 116
5.2.9 Changing the F-runtime group (S7-1200, S7-1500) 117
5.3 Creating F-blocks in FBD / LAD 118
5.3.1 Creating F-blocks 118
5.3.2 Using libraries 120
5.4 Programming startup protection 121
6 F-I/O access 122
6.1 F-I/O access 122
6.2 Value status (S7-1200, S7-1500) 124
6.3 Process Data or Fail-Safe Values 128
6.4 F-I/O DB 129
6.4.1 Tags of the F-I/O DB 130
6.4.1.1 PASS_ON 131
6.4.1.2 ACK_NEC 132
6.4.1.3 ACK_REI 132

6.4.1.4 IPAR_EN 133
6.4.1.5 PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status 135
6.4.1.6 ACK_REQ 136
6.4.1.7 IPAR_OK 136
6.4.1.8 DIAG 137
6.4.2 Accessing tags of the F-I/O DB 138

6.5 Passivation and reintegration of F-I/O 139
6.5.1 After startup of F-system 140
6.5.2 After communication errors 142
6.5.3 After F-I/O or channel faults 144
6.5.4 Group passivation 149

7 Implementation of user acknowledgment 151

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller 151

7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (S7-300, S7-400, S7-1500) 156

8 Data exchange between standard user program and safety program 159

8.1 Data Transfer from the Safety Program to the Standard User Program 160

8.2 Data Transfer from Standard User Program to Safety Program 161

9 Safety-related communication (S7-300, S7-400, S7-1500) 163

9.1 Configuring and programming communication (S7-300, S7-400) 163
9.1.1 Overview of communication 163
9.1.2 Safety-related IO controller-IO controller communication 166
9.1.2.1 Configure safety-related IO controller-IO controller communication 166
9.1.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP 170
9.1.2.3 Program safety-related IO controller-IO controller communication 171
9.1.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer 174
9.1.3 Safety-related master-master communication 175
9.1.3.1 Configure safety-related master-master communication 175
9.1.3.2 Safety-related master-master communication via SENDDP and RCVDP 180
9.1.3.3 Program safety-related master-master communication 181
9.1.3.4 Safety-related master-master communication:Limits for data transfer 184
9.1.4 Safety-related communication between IO controller and I-device 185
9.1.4.1 Configuring safety-related communication between IO controller and I-device 185
9.1.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP 188
9.1.4.3 Programming safety-related IO controller I-device communication 189
9.1.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer 191
9.1.5 Safety-related master-I-slave communication 192
9.1.5.1 Configuring safety-related master-I-slave communication 192
9.1.5.2 Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP 195
9.1.5.3 Program the safety-related master-I-slave or I-slave-I-slave communication 196
9.1.5.4 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication 199
9.1.6 Safety-related I-slave-I-slave communication 200
9.1.6.1 Configure safety-related I-slave-I-slave communication 200
9.1.6.2 Safety-related I-slave-I-slave communication via SENDDP and RCVDP 204
9.1.6.3 Programming safety-related I-slave-I-slave communication 204

9.2.6 Safety-related IO controller-I-slave communication ... 261
9.2.6.1 Safety-related IO controller-I-slave communication ... 261
9.2.7 Safety-related communication with S7 F-systems ... 262
9.2.7.1 Introduction ... 262
9.2.7.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication) ... 262
9.2.7.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication) ... 263

9.3 Configuring and programming communication between S7-300/400 and S7-1500 F-CPUs 264
9.3.1 Overview of communication 264
10 Compiling and commissioning a safety program 265
10.1 Compiling the safety program 265
10.2 Downloading the Safety Program 268
10.3 Safety program work memory requirements (S7-300, S7-400) 273
10.4 Function test of safety program and protection through program identification 274
10.4.1 Transferring the safety program to an S7-300/400 F-CPU with memory card inserted (flash card or SIMATIC Micro memory card) 274
10.4.2 Transferring the safety program to an S7-400 F-CPU without flash card inserted 276
10.4.3 Transferring the safety program to an S7-300/400 F-CPU with memory card 277
10.4.4 Transferring the safety program to a WinAC RTX F 278
10.4.5 Transferring the safety program to an S7-1200/1500 F-CPU 280
10.4.6 Restoring a backup of the safety program to an S7-300/1500 F-CPU 281
10.4.7 Transferring the safety program to an S7-1200 F-CPU with inserted program card 282
10.4.8 Transferring the safety program from the internal load memory to an empty SIMATIC Memory Card of an S7-1200 F-CPU 284
10.4.9 Transferring the safety program to an S7-1200 F-CPU using a transfer card 285
10.4.10 Updating the safety program on an S7-1200 F-CPU using a transfer card 286
10.5 Comparing Safety Programs 286
10.6 Printing project data 290
10.7 Testing the safety program 292
10.7.1 Overview of Testing the Safety Program 292
10.7.2 Disabling safety mode 293
10.7.3 Testing the safety program 295
10.7.4 Testing the safety program with S7-PLCSIM (S7-300, S7-400, S7-1500) 299
10.7.5 Changing the safety program in RUN mode (S7-300, S7-400) 302
10.7.6 Deleting the safety program 305
10.8 F-change history 307
11 System Acceptance 308
11.1 Overview of System Acceptance 308
11.2 Correctness of the safety program including hardware configuration (including testing) 309
11.3 Completeness of the safety summary 310
11.4 Compliance of the system library elements used in the safety program with the TÜV certificate 311
11.5 Completeness and correctness of the hardware configuration 312
11.6 Correctness of the communication configuration 316
11.7 Consistency of the online safety program 317
11.8 Other characteristics 318
11.9 Acceptance of Changes 319

12 Operation and Maintenance 322

Product Overview

1

1.1 Overview

SIMATIC Safety fail-safe system

The SIMATIC Safety fail-safe system is available to implement safety concepts in the area of machine and personnel protection (for example, for emergency STOP devices for machining and processing equipment) and in the process industry (for example, for implementation of protection functions for safety devices of instrumentation and controls and of burners).

⚠ WARNING

The SIMATIC Safety F-system is used to control processes and to force the system into a safe state after shutdown.

SIMATIC Safety can only be used for controlling processes in which an immediate shutdown does not pose a danger to persons or the environment. *(S062)*

Achievable safety requirements

SIMATIC Safety F-systems can satisfy the following safety requirements:

- Safety integrity level SIL3 in accordance with IEC 61508:2010
- Performance level (PL) e and category 4 in accordance with ISO 13849-1:2006 or EN ISO 13849-1:2008

Principles of safety functions in SIMATIC Safety

Functional safety is implemented principally through safety functions in the software. Safety functions are executed by the SIMATIC Safety system in order to bring the system to a safe state or maintain it in a safe state in case of a dangerous event. Safety functions are contained mainly in the following components:

- In the safety-related user program (safety program) in the F-CPU
- In the fail-safe inputs and outputs (F-I/O)

The F-I/O ensure the safe processing of field information (sensors: e.g., emergency OFF pushbutton, light barriers, actuators for motor control, for example). They have all of the required hardware and software components for safe processing, in accordance with the required Safety Integrity Level. The user only has to program the user safety function. The safety function for the process can be provided through a user safety function or a fault reaction function. In the event of an error, if the F-system can no longer execute its actual user safety function, it executes the fault reaction function; for example, the associated outputs are shut down, and the F-CPU switches to STOP mode, if necessary.

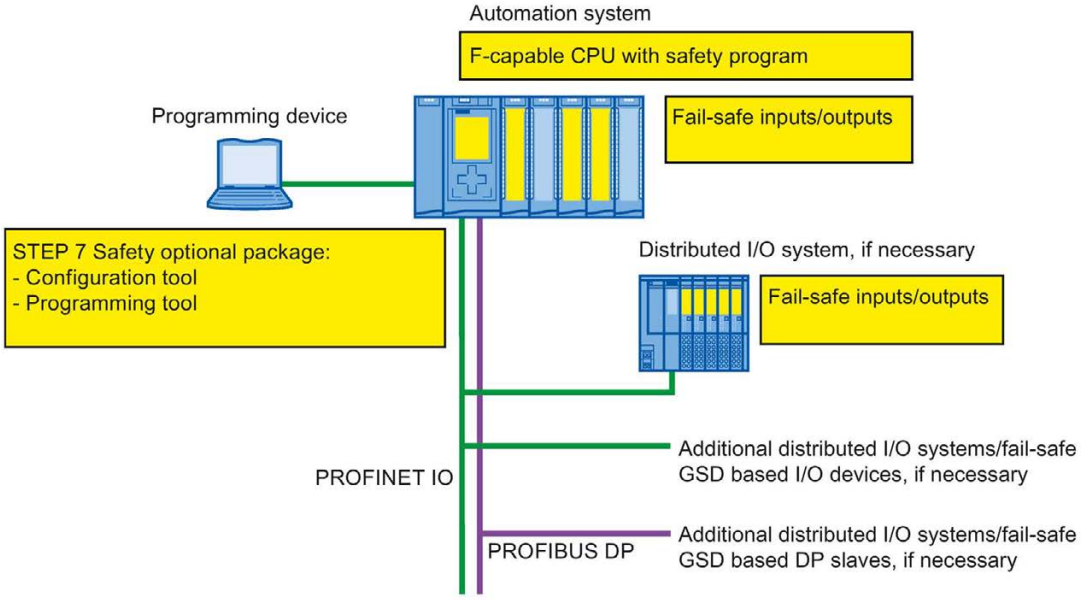
Example of user safety function and fault reaction function

In the event of overpressure, the F-system will open a valve (user safety function). In the event of a dangerous malfunction of the F-CPU, all outputs are shut down (fault reaction function). This means that the valve opens in the event of overpressure and the other actuators also switch to safe mode. For a non-faulty F-system, only the valve would be opened.

1.2 Hardware and Software Components

Hardware and software components of SIMATIC Safety

The following figure provides an overview of the hardware and software components required to configure and operate a SIMATIC Safety F-system.



Hardware components for PROFIBUS DP

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFIBUS DP:

- F-CPUs with DP interface, such as CPU 1516F-3 PN/DP
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe I/O modules ET 200eco (S7-300, S7-400)
  - Fail-safe GSD based DP slaves (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFIBUS DP for connection to distributed F-I/O:

- CP 443-5 Basic
- CP 443-5 Extended
- CM 1542-5
- CP 1542-5

Hardware components for PROFINET IO

You can use the following fail-safe components in SIMATIC Safety F-systems on PROFINET IO:

- F-CPUs with PN interface, such as CPU 1516F-3 PN/DP
- Fail-safe inputs and outputs (F-I/O), such as:
  - S7-300 fail-safe signal modules in ET 200M
  - ET 200MP fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe GSD based I/O devices (light grid, laser scanner, etc.)

You have the option to expand the configuration with standard I/O.

The following CPs/CMs can be used in a SIMATIC Safety F-system on PROFINET IO for connection to distributed F-I/O:

- CP 443-1
- CP 443-1 Advanced-IT
- CM 1542-1

Hardware components for central configuration

You can use the following fail-safe components in SIMATIC Safety F-systems centrally on an F-CPU:

- S7-300 fail-safe signal modules
- S7-1200 fail-safe modules
- ET 200MP fail-safe modules
- ET 200SP fail-safe modules
- ET 200S fail-safe modules
- ET 200pro fail-safe modules

You have the option to expand the configuration with standard I/O.

Required software components

You require the following software components:

- *SIMATIC STEP 7 Basic V13 SP1* with the *STEP 7 Safety Basic V13 SP1* optional package

  or

- *SIMATIC STEP 7 Professional V13 SP1* with the *STEP 7 Safety Basic V13 SP1* optional package

  or

- *SIMATIC STEP 7 Professional V13 SP1* with the *STEP 7 Safety Advanced V13 SP1* optional package

STEP 7 Safety optional packages

This documentation describes the optional packages *STEP 7 Safety Advanced V13 SP1* and *STEP 7 Safety Basic V13 SP1*. The *STEP 7 Safety* optional packages are the configuration and programming software for the SIMATIC Safety F-system. With *STEP 7 Safety*, you receive the following:

- Support for configuring the F-I/O in the *hardware and network editor* of the TIA Portal
- Support for creating the safety program using LAD and FBD and integrating error detection functions into the safety program
- Instructions for programming your safety program in LAD and FBD, which you are familiar with from the standard user programs
- Instructions for programming your safety program in LAD and FBD with special safety functions

Moreover, *STEP 7 Safety* offers functions for comparing safety programs and for assisting you with the system acceptance.

⚠ WARNING

The F-CPU and F-I/O must be configured in the *hardware and network editor* of the TIA Portal as described in this documentation. F-blocks must be created with the *program editor* of the TIA Portal as described in this documentation. For system acceptance, you have to use the safety summary created according to this documentation. Any other procedures are not permitted. *(S056)*

Additional optional packages

In addition to the *STEP 7 Safety* optional packages, you can use additional optional packages with F-I/O and F-CPUs within the SIMATIC Safety F-system. For example, SINUMERIK.

The installation, parameter assignment and programming as well as what is important to note during system acceptance, is described in the documentation for the specific optional packages.

Please also read the notes in Configurations supported by the SIMATIC Safety F-system (Page 50).

Safety program

You can create a safety program using the *program editor*. You can program fail-safe FBs and FCs in the FBD or LAD programming languages using the instructions from the optional package and create fail-safe DBs.

Safety checks are automatically performed and additional fail-safe blocks for error detection and error reaction are inserted when the safety program is compiled. This ensures that failures and errors are detected and appropriate reactions are triggered to maintain the F-system in the safe state or bring it to a safe state.

In addition to the safety program, a standard user program can be run on the F-CPU. A standard program can coexist with a safety program in an F-CPU because the safety-related data of the safety program are protected from being affected unintentionally by data of the standard user program.

Data can be exchanged between the safety program and the standard user program in the F-CPU by means of bit memory or data of a standard DB or by accessing the process image of the inputs and outputs.

See also

Data Transfer from the Safety Program to the Standard User Program (Page 160)

1.3 Installing/uninstalling the STEP 7 Safety Basic V13 SP1 optional package

Software requirements for *STEP 7 Safety Basic V13* SP1

At a minimum, one of the following software packages must be installed on the programming device or PC:

- *SIMATIC STEP 7 Basic V13 SP1*
- *SIMATIC STEP 7 Professional V13 SP1*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Basic V13 SP1*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Basic V13 SP1"* or *"SIMATIC STEP 7 Professional V13 SP1*" software package has been installed, and make sure that *SIMATIC STEP 7 Basic V13 SP1 or SIMATIC STEP 7 Professional V13 SP1* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Basic V13 SP1* is completely integrated into the information system of *SIMATIC STEP 7 Basic V13 SP1 or SIMATIC STEP 7 Professional V13 SP1*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Basic V13 SP1*

To uninstall *STEP 7 Safety Basic V13 SP1*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Basic V13 SP1* optional package, you can no longer edit projects with F-CPUs whose F-capability is enabled.

You may open and continue working with projects with F-CPUs whose F-capability was previously disabled (see also Configuring the F-CPU (Page 42)).

1.4 Installing/uninstalling the STEP 7 Safety Advanced V13 SP1 optional package

Software requirements for *STEP 7 Safety Advanced V13 SP1*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Professional V13 SP1*

Reviewing the Readme file

The readme file contains important up-to-date information about the software (for example, Windows versions supported). You can display the readme file in the setup program or open it later in the *SIMATIC STEP 7* information system.

Installing *STEP 7 Safety Advanced V13 SP1*

1. Start the programming device or PC on which the *"SIMATIC STEP 7 Professional V13 SP1"* software package has been installed, and make sure that *SIMATIC STEP 7 Professional V13 SP1* is closed.
2. Insert the optional package product DVD.
3. Initiate the *SETUP.EXE* program on the DVD.
4. Follow the instructions of the Setup program, bearing in mind the information in the readme file.

Displaying integrated Help

The help on *STEP 7 Safety Advanced V13 SP1* is completely integrated into the information system of *SIMATIC STEP 7 Professional V13 SP1*. You have the following two options to open the integrated help:

- In the "Help" menu, select the "Show help" command or press <F1> to show the appropriate help for the context.
- Click on the link within a tool tip cascade to go directly to a place with more information within the help.

Uninstalling *STEP 7 Safety Advanced V13 SP1*

To uninstall *STEP 7 Safety Advanced V13 SP1*, proceed as described in the *STEP 7 Help* under "Uninstall".

Post-uninstall procedures

After uninstalling the *STEP 7 Safety Advanced V13 SP1* optional package, you can no longer edit projects with F-CPUs whose F-capability is enabled.

You may open and continue working with projects with F-CPUs whose F-capability was previously disabled (see also Configuring the F-CPU (Page 42)).

1.5 Installing the STEP 7 Safety PowerPack

Software requirements for *STEP 7 Safety PowerPack*

At a minimum, the following software package must be installed on the programming device or PC:

- *SIMATIC STEP 7 Safety Basic V13 SP1*
- *SIMATIC STEP 7 Professional V13 SP1*

Installing *STEP 7 Safety PowerPack*

1. Start the *Automation License Manager* on the programming device/PC on which the *"SIMATIC STEP 7 Professional V13 SP1"* software package is installed.
2. Install the license included in the *STEP 7 Safety PowerPack* as described in the *Automation License Manager help*.

Uninstalling *STEP 7 Safety PowerPack*

To uninstall the license included in the *STEP 7 Safety PowerPack*, proceed as described in the *STEP 7 Safety PowerPack Help*.

1.6 Migrating projects from S7 Distributed Safety V5.4 SP5 to STEP 7 Safety Advanced

Introduction

In *STEP 7 Safety Advanced*, you can continue to use projects with safety programs that you created with *S7 Distributed Safety V5.4 SP5*. **To that end, the projects must have been compiled in *S7 Distributed Safety V5.4 SP5* and then migrated.**

Requirement

STEP 7 Safety Advanced, *S7 Distributed Safety V5.4 SP5*, and the *F-Configuration Pack* used to create the project must all be installed on the computer you are using for migration. The *F-Configuration Pack V5.4 SP5* to *V5.5 SP11* is supported.

Prior to migration

Delete all F-blocks not required by the safety program in your *S7 Distributed Safety V5.4 SP5* project prior to migration.

Procedure as in *STEP 7 Professional*

Proceed just as you would for standard projects to migrate projects from *S7 Distributed Safety V5.4 SP5* to *STEP 7 Safety Advanced*. Once the migration is complete, you should verify using the collective F-signature whether the project was migrated unchanged.

Note

If you use the safety program to migrate F-blocks with know-how protection, remove the know-how protection prior to migration.

You can assign the F-blocks know-how protection again once the migration is completed.

This migration approach is described in the "Migration" section of the *STEP 7 Professional* Help. Special considerations about *STEP 7 Safety Advanced* are described below.

Older hardware versions

Older versions of F-hardware may not be supported by *STEP 7 Safety Advanced*.

If you have used and configured versions of F-CPUs and F-I/O in S7 Distributed Safety projects that are not approved for *STEP 7 Safety Advanced*, you will need to upgrade this hardware to the new version in *S7 Distributed Safety V5.4 SP5* and the corresponding *F-Configuration Pack*. Once the upgrade is completed, migration to *STEP 7 Safety Advanced* is feasible. A list of approved hardware is available on the Internet. (http://support.automation.siemens.com/WW/view/en/49368678/133100)

Particularities for safety-related CPU-CPU communication via S7 connections

You can find information about the special considerations for migrated projects with safety-related CPU-CPU communication via S7 connections in Safety-related communication via S7 connections (Page 212). Please also note Communication with S7 Distributed Safety via S7 connections (Page 222).

Particularities for ESTOP1 or FDBACK instructions

Information on the special considerations when using the ESTOP1 and FDBACK instructions can be found in the "Instruction versions" section in ESTOP1: Emergency STOP up to stop category 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 348) and FDBACK: Feedback monitoring (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 393).

Post-migration procedures

Once migration is complete, you have a complete project with a safety program which has retained the program structure of *S7 Distributed Safety* and the collective F-signature. F-blocks from the S7 Distributed Safety F-library (V1) are converted into instructions that are provided by *STEP 7 Safety Advanced*.

If you receive an error message after migration and subsequent compilation of the hardware that the F-source address does not match the basis for the PROFIsafe addresses of the F-CPU, change the basis for the PROFIsafe addresses of the F-CPU at the corresponding interface. The F-source addresses of all F-I/O connected to the CPU will be reassigned.

The migrated project therefore does not need to be re-accepted; it can be loaded as is to the F-CPU as long as it has not been modified or compiled since migration.

Note

Safety summary

You cannot create a safety summary in *STEP 7 Safety Advanced* for a migrated project. The printout of the project created with *S7 Distributed Safety V5.4 SP5* and the corresponding acceptance documents are still valid, because the collective F-signature has been retained.

After migration of an SM 326; DI 24 x DC 24V (6ES7 326-1BK01-0AB0 and 6ES7 326-1BK02-0AB0), the following error message may be output during compilation of the hardware configuration: "F_IParam_ID_1: Value outside the permitted range".

Solution: Delete the module and reinsert it.

Using the latest versions used in the safety program

If you want to expand the migrated safety program, we recommend that you update the system library elements used in safety program, specified in the *Safety Administration Editor* in the "Settings" area, to the latest available version before compiling with *STEP 7 Safety Advanced* for the first time.

Using the latest version of instructions

If you want to expand the migrated safety program, we recommend that you update to the latest version of the instructions used before compiling with *STEP 7 Safety Advanced* for the first time. Read the information on instruction versions for each instruction.

Compiling the migrated safety programs

As a result of compilation of the migrated project with *STEP 7 Safety Advanced*, the existing program structure (with F-CALL) is transformed into the new program structure of *STEP 7 Safety Advanced* (with main safety block). This changes the collective F-signature and a new acceptance for the safety program may have to be executed.

Note

Note that compiling the migrated safety program extends the runtime of the F-runtime group(s) and increases the memory requirements of the safety program (see also Excel file for calculating response time (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

1.7 Migrating an S7-300/400 F-CPU

To migrate an F-CPU S7-300/400 onto an F-CPU S7-1500, proceed as with the migration of a standard CPU S7-300/400 onto a CPU S7-1500.

Points to note after migration:

- Non-automatable actions
  - Creating an F-runtime group and assigning it to the main safety block.
  - The hardware configuration of the initial F-CPU is not automatically transferred to an S7-1500 F-CPU. Implement the hardware configuration of the new CPU manually after migration.
- Instructions not supported:
  - OV
  - MUTING
  - TWO_HAND
  - WR_FDB
  - RD_FDB
  - OPN
  - SENDS7
  - RCVS7
- Data types not supported
  - DWORD
- Changes to safety program programming
  - F_GLOBDB.VKE0/1 replaced by FALSE/TRUE (Page 90).
  - Readable values from the F_GLOBDB replaced by the F-runtime group information DB. Additional information is available under F-shared DB (S7-300, S7-400) (Page 114) and F-runtime group information DB (S7-1200, S7-1500) (Page 115).
  - Replacement of the QBAD_I_xx or QBAD_O_xx tag by the value status. Additional information is available under Value status (S7-1200, S7-1500) (Page 124) and F-I/O DB (Page 129).
- F-runtime group communication is not supported.
- New naming convention when naming the F-I/O DBs
- Modified behavior of QBAD and PASS_OUT (Page 135) tags for F-I/O with "RIOforFA-Safety" profile

Compile the safety program and eliminate any compilation errors displayed.

Note

A new acceptance must be carried out following F-CPU migration.

See also

Programming (Page 84)

1.8 Upgrading projects from STEP 7 Safety Advanced V11

The safety program signature does not change after upgrading. Acceptance of changes is therefore not required.

Perform the upgrade following the usual procedure for *STEP 7 Professional*. Once upgraded, a project can no longer be opened with *STEP 7 Safety Advanced V11*. We recommend that you back up the project before upgrading.

Note

Adjustments are required before you can continue working in the upgraded safety program in *STEP 7 Safety Advanced V13 SP1*:

There was a product warning for *STEP 7 Safety Advanced V11* regarding setting the parameters "Discrepancy behavior" and "Reintegration after discrepancy error" for the fail-safe digital input and output modules 4F-DI/3F-DO DC24V/2A (6ES7138-4FC01-0AB0, 6ES7138-4FC00-0AB0). These parameters could be displayed incorrectly in certain combinations.

Based on the handling instructions in this product warning, you used a conversion table to set the affected parameters so that they were displayed incorrectly in the safety summary and hardware configuration in order for them to have the correct effect in the F-module. You also corrected the safety summary by hand to document the actual behavior of F-modules.

To reverse these changes, follow these steps:

1. Compile the upgraded project with *STEP 7 Safety Advanced V13 SP1*. An error message is displayed for each F-module in *STEP 7 Safety Advanced V11* the parameters of which you have corrected: "The CRC (F_Par_CRC) of the module (xxx) does not match the calculated value (yyy)."
2. Adapt the parameter assignment of each F-module for which this error message is displayed to match your handwritten corrections in the safety summary.
3. Do this for each F-CPU and then compile the safety program.
4. If the collective F-signature following compiling corresponds to the collective F-signature on the safety summary, you have made all the necessary corrections.

Use of CPs

F-I/Os operated downstream from a CP 443-5 Basic, CP443-5 Extended, CP443-1 or CP 443-1 Advanced-IT have not been assigned a unique F-destination address.

As soon as you compile the hardware in a project with such F-I/Os in *STEP 7 Safety V13 SP1*, you are notified for the affected F-I/Os. You have to assign new, unique F-destination addresses for the reported F-I/Os. Additional information is available under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 52), PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 54) and Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 61).

This changes the collective F-signature of the safety program. However, you can verify that only the changed F-destination addresses have caused this change:

- The F-parameter signature (without address) for each changed F-I/O remains the same.
- Only the affected F-I/O DBs are listed in the comparison editor of the safety program with the filter set to "Compare only F-blocks relevant for certification".

1.9 Upgrading projects from STEP 7 Safety Advanced V12

The safety program signature does not change after upgrading. Acceptance of changes is therefore not required.

Perform the upgrade following the usual procedure for *STEP 7 Professional*. Once upgraded, a project can no longer be opened with *STEP 7 Safety Advanced V12*. We recommend that you back up the project before upgrading.

1.10 Working with projects from STEP 7 Safety Advanced V12

You can open, edit and save projects from *STEP 7 Safety Advanced V12*.

If you want to use an S7-1200 F-CPU or a newer S7-1500 F-CPU, you have to upgrade the project.
Please note that projects can no longer be edited with *STEP 7 Safety Advanced V12* following the upgrade.

1.11 Upgrading projects from STEP 7 Safety Advanced V13

The safety program signature does not change after upgrading. Acceptance of changes is therefore not required.

Perform the upgrade following the usual procedure for *STEP 7 Professional*. Once upgraded, a project can no longer be opened with *STEP 7 Safety Advanced V13*. We recommend that you back up the project before upgrading.

1.12 Working with projects from STEP 7 Safety Advanced V13

You can open, edit and save projects from *STEP 7 Safety Advanced V13*.

If you want to use an S7-1200 F-CPU or a newer S7-1500 F-CPUs, you have to upgrade the project.
Please note that projects can no longer be edited with *STEP 7 Safety Advanced V13* following the upgrade.

1.13 First steps

Getting Started in SIMATIC Safety

Three Getting Started documents are available to help you begin using SIMATIC Safety.

The Getting Started documentation is an instruction manual that provides a step-by-step description of how to create a project with SIMATIC Safety. It gives you the opportunity to quickly become familiar with the scope of features of SIMATIC Safety.

Contents

The Getting Started documentation describes the creation of a single, continuous project that is extended with each section. Based on the configuration, you program a fail-safe shutdown, make changes to the programming, and accept the system.

In addition to the step-by-step instructions, the Getting Started documentation also gives you background information for every new topic, which explains the functions used in more detail and how they interrelate.

Target audience

The Getting Started documentation is intended for beginners but is also suitable for users who are switching from *S7 Distributed Safety*.

Download

Three Getting Started documents are available as PDF files for free download in the Industry Online Support:

- STEP 7 Safety Advanced with F-CPUs S7-300/400 (http://support.automation.siemens.com/WW/view/en/49972838)
- STEP 7 Safety Basic with S7-1200 F-CPUs (http://support.automation.siemens.com/WW/view/en/34612486/133300) (part of the manual "S7-1200 Functional Safety manual")
- STEP 7 Safety Advanced with F-CPUs S7-1500 (http://support.automation.siemens.com/WW/view/en/101177693)

Configuring

2

2.1 Overview of Configuration

Introduction

You configure a SIMATIC Safety F-system basically in the same way as a standard S7-300, S7-400, S7-1200, S7-1500 or ET200MP, ET 200SP, ET 200S, ET 200iSP, ET 200eco or ET 200pro automation system in *STEP 7.*

This section presents only the essential differences compared to standard configuration you encounter when configuring a SIMATIC Safety F-system.

This documentation distinguishes between two groups of F-I/O:

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

Which F-components can you configure with the *STEP 7 Safety Basic V13 SP1* optional package?

The following hardware components are configured for a SIMATIC Safety F-system with the *STEP 7 Safety Basic V13 SP1* optional package:

- S7-1200 F-CPUs
- F-I/Os of PROFIsafe address type 2
  - S7-1200 fail-safe modules (central configuration)

Which F-components can you configure with the *STEP 7 Safety Advanced V13 SP1* optional package?

The following hardware components are configured for a SIMATIC Safety F-system with the *STEP 7 Safety Advanced V13 SP1* optional package:

- F-CPUs S7-300, S7-400, S7-1200, S7-1500 and WinAC RTX F
- F-I/Os of PROFIsafe address type 1:
  - S7-300 fail-safe signal modules
  - ET 200S fail-safe modules
  - ET 200pro fail-safe modules
  - ET 200iSP fail-safe modules
  - Fail-safe I/O modules ET 200eco (S7-300, S7-400)
  - Fail-safe GSD based DP slaves *
  - Fail-safe GSD based I/O devices *
- F-I/Os of PROFIsafe address type 2
  - S7-1200 fail-safe modules
  - ET 200SP fail-safe modules
  - ET 200MP fail-safe modules
  - Fail-safe GSD based DP slaves *
  - Fail-safe GSD based I/O devices *

* Consult the respective documentation to determine the PROFIsafe address type of a GSD based DP slave/GSD based I/O device. If in doubt, assume that the PROFIsafe address is type 1.

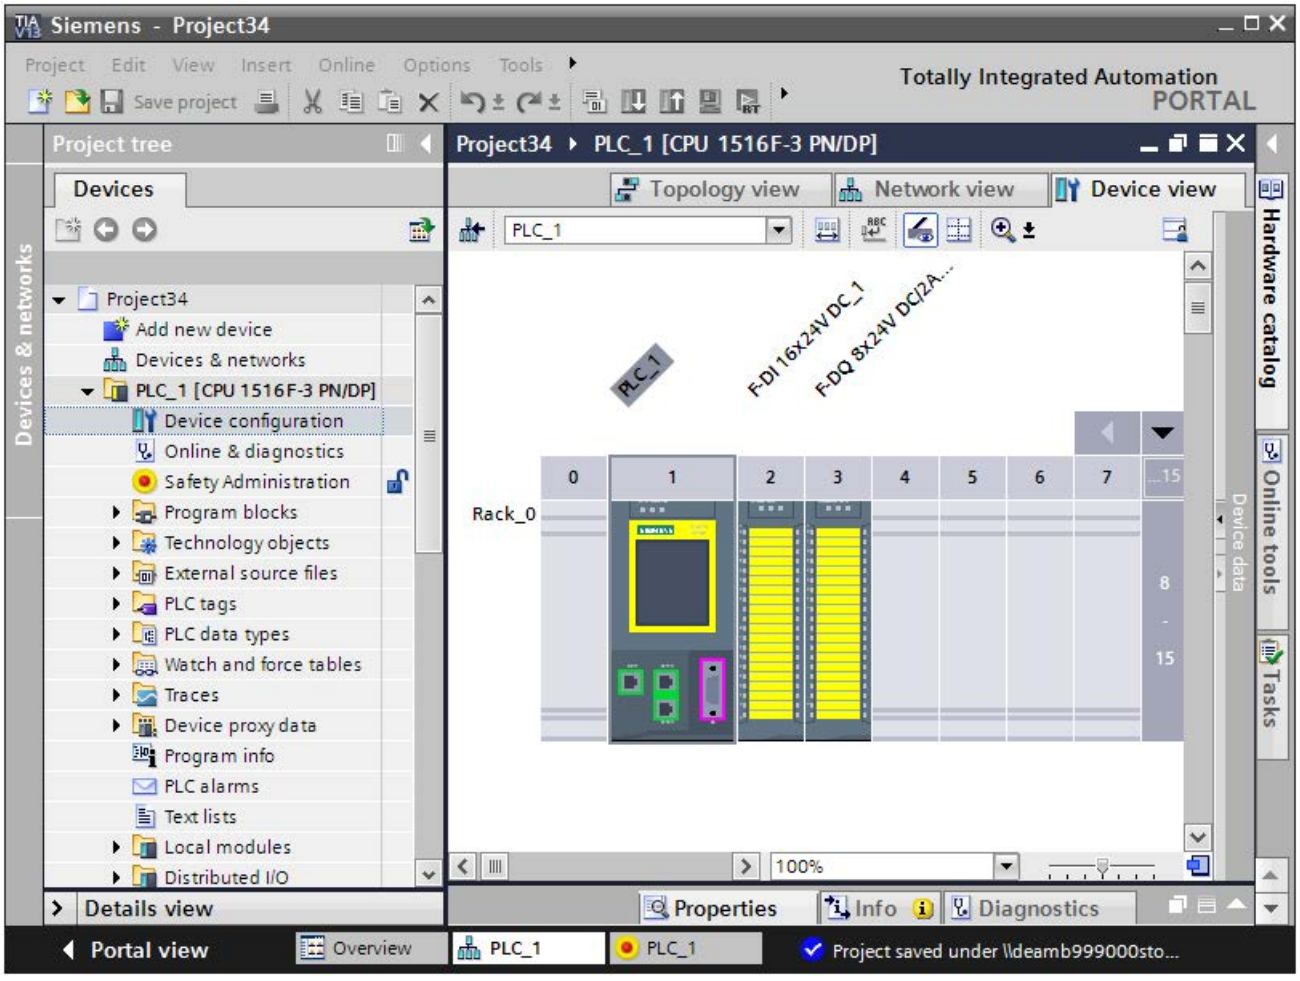
Note

"Shared Device" functionality is not permitted for F-I/O.

Safety-related I-slave-slave communication is not permitted for the fail-safe modules ET 200SP and ET 200MP.

Example: Configured F-system in *STEP 7 Professional*

The following figure presents a configured F-system. You choose the fail-safe components in the "Hardware catalog" task card as you would do with standard components and place them in the work area of the network or device view. F-components are shown in yellow.



Additional information

For detailed information on F-I/O, refer to the *manuals for the relevant F-I/O*.

Which safety-related communication options can you configure?

You need to use the *hardware and network editor* to configure the following safety-related communication options (see Configuring and programming communication (S7-300, S7-400) (Page 163) or Configuring and programming communication (S7-1500) (Page 226):

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related I-slave-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication
- Safety-related communication via S7 connections
- Safety-related communication via S7 connections for S7 Distributed Safety or S7 F Systems

2.2 Particularities for configuring the F-System

Configuring is the same as for standard components

You configure a SIMATIC Safety F-system in the same way as a standard S7 system. This means that you configure and assign parameters for the hardware in the *hardware and network editor* in a centralized system (F-CPU and F-IO if required e.g. CPU 1516F-3 PN/DP and F-module ET 200MP) and/or as distributed system (F-CPU, F-SMs in ET 200M, F-module ET 200MP, F-module ET 200SP, ET 200S, ET 200pro, ET 200iSP, ET 200eco, fail-safe GSD based DP slaves and fail-safe GSD based I/O devices).

Special F-parameters

For the F-functionality there are special F-parameters that you can review and set in the "Properties" of the fail-safe components (F-CPU and F-I/O). F-parameters are marked in yellow.

F-parameters are explained in "Configuring an F-CPU (Page 42)" and "Configuring F-I/O (Page 47)".

Compiling the hardware configuration

You must compile the hardware configuration of the SIMATIC Safety F-system (shortcut menu "Compile > Hardware configuration"). A configured F-CPU with enabled F-capability is the only prerequisite for programming the safety program.

Note

Inconsistencies are possible when configuring the hardware and can also be saved. A full consistency check of the hardware configuration and possible connection data is performed only during compilation. Therefore, perform "Edit > Compile" regularly.

Changing safety-related parameters

Note

If you change a safety-related parameter (marked in yellow) for an F-I/O or an F-CPU, you must then compile the modified hardware configuration and the Compiling the safety program (Page 265) (shortcut menu "Compile > Hardware and software (only changes)") and download. This also applies for changes to the F-I/O which are not used in the safety program. F-I/O in standard operation is not affected by this.

2.3 Configuring an F-CPU

Introduction

You configure the F-CPU basically in the same way as a standard automation system.

F-CPUs are always configurable in *STEP 7*, regardless of whether or not the *STEP 7 Safety* optional package is installed. Without an installed optional package, however, the F-CPU can only be used as a standard CPU.

If the *STEP 7 Safety* optional package is installed, you can enable or disable the F-capability for the F-CPU.

If you want to use the F-I/O in safety mode or in safety-related communication, the F-capability of the F-CPU must be enabled.

F-capability is enabled by default after the *STEP 7 Safety* optional package is installed.

Enabling/disabling F-capability

If you want to modify the F-capability setting, proceed as follows:

1. Select the F-CPU in the device or network view, and select the "Properties" tab in the inspector window.
2. Select "Fail-safe" in the area navigation.
3. Use the appropriate button to enable/disable the F-capability.
4. If you want to disable F-capability, confirm the "Disable F-activation" dialog with "Yes".

Disabling F-capability for an existing safety program

If you want to disable the F-capability for an F-CPU because you intend to use the F-CPU as a standard CPU although a safety program is installed, you must note the following:

- You need the password for the safety program, if assigned.
- The Safety Administration Editor (Page 64) is deleted from the project tree.
- The F-OB is deleted. (S7-1200, S7-1500)
- All F-blocks in the "Program blocks" folder are marked as no longer supported in the project tree . They can no longer be opened or compiled.

  All F-blocks within the "System blocks" folder are deleted.

  A warning is issued during the next compilation.
- From now on you cannot use F-I/O in safety mode with this F-CPU.

Configuring the F-parameters of the F-CPU

In the "Properties" tab of the F-CPU, you can change or apply the default settings for the following parameters:

- The basis for PROFIsafe addresses

  Note

  A change in the basis for the PROFIsafe addresses results in modifications to the safety program when it is recompiled if it contains F-I/O of PROFIsafe address type 2. A new acceptance may therefore be required.

- The default F-monitoring time for central or distributed F-I/O at the F-CPU

  Note

  A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

"Basis for PROFIsafe addresses" parameter for F-I/O with PROFIsafe address type 1

Setting this parameter defines a start value for the automatic assignment of F-destination addresses of all F-I/O of PROFIsafe address type 1 assigned to the F-CPU. The parameter has no effect on the F-source address of F-I/O of PROFIsafe address type 1.

The F-destination addresses for F-I/O of PROFIsafe address type 1 must be unique network-wide and CPU-wide.

By selecting different start values for different F-CPUs, you can define different ranges for the automatic assignment of the F-destination address. This is useful when you are operating multiple F-CPUs in one network. Subsequent address changes are possible.

You can specify the "Basis for PROFIsafe addresses" parameter in increments of 100. During automatic assignment of the F-destination addresses, the next free F-destination address is selected. The maximum possible F-destination address for ET 200S, ET 200eco, ET 200pro, ET 200iSP F-modules and S7-300 F-SMs is 1022.

Example: You set "200" as the basis. The F-destination address is then automatically assigned in ascending order from the F-destination address 200.

For F-I/O in which the "Basis for PROFIsafe addresses" is outside the F-destination address value range, a start value of 1 is used for the automatic assignment of the F-destination address.

Note

The "Basis for PROFIsafe addresses" parameter has no influence on the following F-I/O:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

"Basis for PROFIsafe addresses" parameter for F-I/O with PROFIsafe address type 2

The basis for PROFIsafe addresses is applied as an F-source address for F-I/O of PROFIsafe address type 2. The F-source address ("Basis for PROFIsafe addresses" parameter) must be unique network-wide. Subsequent address changes are possible.

Note

A change to the "Basis for PROFIsafe addresses" parameter results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required because the F-source addresses of all F-I/O are changed centrally by this step.

You can specify the "Basis for PROFIsafe addresses" parameter in increments of 100.

The F-destination address of F-I/O of PROFIsafe address type 2 is assigned automatically for each F-CPU in descending order starting with 65534.

"Default F-monitoring time" parameter

Configure the "Default F-monitoring time" for monitoring the communication between the F-CPU and F-I/O.

You can adjust the F-monitoring time via the following parameters:

- "Default F-monitoring time for central F-I/O"
- "Default F-monitoring time for F-I/O of this interface"

The **default F-monitoring time for the central F-I/O** acts on the F-I/O that is arranged centrally, i.e. near the F-CPU. You set this parameter in the properties of the F-CPU (select F-CPU, then select "Properties > Fail-safe > F-parameters").

The **default F-monitoring time for the F-I/O of this interface** acts on the F-I/O that is assigned to this interface of the F-CPU (PROFIBUS or PROFINET). You change this parameter in the properties of the relevant interface (selection of the interface in the "Device view" tab, then "F-parameters").

The various settings available allow you to flexibly adapt the F-monitoring time to the conditions of your F-system, for example to take account of different bus cycles.

You can also change the F-monitoring time individually for each F-I/O in the F-I/O properties (see Configuring F-I/O (Page 47) or Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 61)).

Note

A change of the F-monitoring time for central or distributed F-I/O at the F-CPU results in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal state is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 661).

Automatic generation of the safety program

The safety program of an F-CPU consists of one or two F-runtime groups that contain the F-blocks (see also Defining F-Runtime Groups (Page 102)). When the F-CPU (with activated F-capability) is inserted into the work area of the device view or network view, a safety program with an F-runtime group is generated automatically.

You can define in *STEP 7 Safety* that no F-runtime group is generated while inserting the F-CPU (with activated F-capability).

Proceed as follows:

1. Select the "Options > Settings" menu command.
2. Select the "STEP 7 Safety" area.
3. If it is not already disabled , disable automatic generation of an F-runtime group by deselecting the "Generate default fail-safe program" option.

This change has no influence on any existing safety programs; it only defines whether an F-runtime group is automatically generated for each one of the subsequently inserted F-CPUs.

Configuring the protection level of the F-CPU

WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would allow changes to the safety program. To rule out this possibility, you must configure the **protection level "Write protection for fail-safe blocks"** and configure a password for the F-CPU. If only **one person** is authorized to change the standard user program **and** the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs). (See also Access protection (Page 76)) *(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. You therefore need to configure at least the protection level "Full access (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)". *(S041)*

You configure the protection level following the same procedure as for standard CPUs.

For information on the password for the F-CPU, refer to Access protection (Page 76). Pay special attention to the warnings in Setting up access permission for the F-CPU (Page 82).

2.4 Configuring F-I/O

Introduction

You configure the ET 200 MP, ET 200SP, ET 200S, ET 200eco (S7-300, S7-400), ET 200pro and ET 200iSP F-modules, the S7-300 F-SMs and the S7-1200 F-modules as usual in *STEP 7*.

After you have inserted the F-I/O in the work area of the *device or network view*, you access the configuration dialogs by selecting the relevant F-I/O and the "Properties" tab.

Note

Changes to the parameter assignment result in modifications to the safety program when it is recompiled. A new acceptance may therefore be required.

The use of ET 200SP F-modules is possible with IM155-6PN ST as of firmware V1.1, IM155-6PN HF and IM155-6DP HF.

The distributed use of ET 200MP F-modules is possible with IM 155-5 PN ST as of firmware V3.0, IM 155-5 PN HF as of firmware V2.0 and IM 155-5 DP ST as of firmware V3.0.

The central use of ET 200MP F-modules is possible with S7-1500 F-CPUs as of firmware V1.7.

(S7-1500) When using ET 200MP F-modules you must set the version of the F-I/O access to V1.3 in the SAE under "Settings".

Channel-granular passivation after channel faults

You can configure how the F-I/O will respond to channel faults, such as a short-circuit, overload, discrepancy error, or wire break, provided the F-I/O supports this parameter (e.g. for ET 200S or ET 200pro F-modules). You configure this response in the properties for the relevant F-I/O ("Behavior after channel fault" parameter). This parameter is used to specify whether the entire F-I/O or just the faulty channel(s) are passivated in the event of channel faults.

Note

(S7-300, S7-400) Note that channel-granular passivation increases the runtime of the F-runtime group(s) compared to passivation of the entire F-I/O (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

"Channel failure acknowledge" parameter

For ET 200MP F-modules and S7-1200 F-modules, the "Channel failure acknowledge" parameter replaces the ACK_NEC tag of the F-I/O DB.

If an F-I/O fault is detected by the F-I/O, passivation of all channels of the relevant F-I/O occurs. If channel faults are detected, the relevant channels are passivated if "Passivate channel" is configured. If "Passivate the entire module" is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, reintegration of the relevant F-I/O occurs in line with the "Channel failure acknowledge" parameter.

- Automatically
- Manually

⚠ WARNING

The parameter assignment "Channel failure acknowledge = Automatic" is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S045)*

Note

The default assignment for the "Channel failure acknowledge" parameter when the F-module is created is "Manually".

Organization block/Process image (S7-1200, S7-1500)

If you use F-I/O in standard mode (only for S7-1500 CPUs), you can select the organization block/process image as you do for standard I/O.

If you use F-I/O in safety mode, no selection is possible. The process image is updated at the beginning or end of the F-OB (see section Program structure of the safety program (S7-1200, S7-1500) (Page 87)).

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB (Page 129) are assigned automatically when the F-I/O is configured. You can change the number in the properties of the F-I/O. Alternatively, you can change the name in the project tree via the shortcut menu for the F-I/O DB.

You can find information on the assignment of number ranges in *Safety Administration Editor*, "Settings" area (Page 71).

Customizing the F-monitoring time for F-I/O

You can customize the F-monitoring time in the properties of the F-I/O under "F-parameters". This may be necessary to prevent a timeout being triggered when no error occurs and the F-I/O requires a longer F-monitoring time or assignment with a default F-monitoring time is not possible. For this purpose, activate the corresponding check box and assign an F-monitoring time.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal state is pending for at least as long as the assigned monitoring time. *(S018)*

You can find additional information in Monitoring and response times (Page 661).

Group diagnostics for fail-safe S7-300 signal modules

By disabling a channel of the fail-safe signal module in the module properties, you also disable the group diagnostics for this channel.

Exception for S7-300/400 F-CPUs:

For the following S7-300 fail-safe signal modules

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13Bit (article number 6ES7336-1HE00-0AB0)

the "Group diagnostics" parameter enables and disables the monitoring of channel-specific diagnostic messages of F-SMs (such as wire break and short-circuit) to the F-CPU. You should disable group diagnostics for **unused** input or output channels.

⚠ WARNING

(S7-300, S7-400) For the following S7-300 fail-safe signal modules (F-SMs) with activated safety mode, "Group diagnostics" must be enabled for all connected channels:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

Check to verify that you have only disabled group diagnostics for these F-SMs for input and output channels that are actually unused. *(S003)*

Diagnostic interrupts can be enabled optionally.

Additional information

For detailed description of the **parameters**, refer to the help on the properties of the respective F-I/O and in the respective *manual for the F-I/O*.

2.5 Configurations supported by the SIMATIC Safety F-system

Supported configurations

F-I/Os (see Overview of Configuration (Page 37)) are supported in the following configurations:

The F-I/O is not addressed by means of I-slave-slave communication and can be located in one of the following configurations:

- Centrally in the F-CPU (including expansion rack)
- At the PROFIBUS DP (integrated DP interface of the F-CPU or via PROFIBUS CP/ PROFIBUS CM)
- At the PROFINET IO (integrated PN interface of the F-CPU or via PROFINET CP/ PROFINET CM)
- Downstream of an IE/PB-Link at the PROFIBUS DP (integrated PN interface of the F-CPU or via PROFINET CP/PROFINET CM)

The F-I/O is addressed by means of I-slave-slave communication and can be located in one of the following configurations:

- At the PROFIBUS DP (integrated DP interface of the (F)-CPU* or via PROFIBUS CP/ PROFIBUS CM)
- Downstream of an IE/PB-Link at the PROFIBUS DP (integrated PN interface of the (F)-CPU* or via PROFINET CP/PROFINET CM)

* The IO controller of the IE/PB-Link or the DP master can be a standard CPU or an F-CPU.

For F-I/O not listed in Overview of Configuration (Page 37), please check the relevant documentation to see whether or not it is supported by the SIMATIC Safety F-system. If in doubt, treat these F-I/Os as part of a configuration that is not supported.

Checks performed by the SIMATIC Safety F-system

For supported configuration, the F-system checks:

- Correctness of the PROFIsafe operating mode parameter (F_Par_Version)
- CPU-wide unique assignment of the F-destination address
  You yourself must ensure the network-wide uniqueness of the PROFIsafe address.
- Correct assignment of the F-source address according to the "Basis for PROFIsafe addresses" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.

WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O appears in the safety summary and that an F-I/O DB has been created for it. Otherwise you cannot use the F-I/O in this configuration. (Contact Industry Online Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Use the safety summary to check that the F-source address corresponds to the "Basis for PROFIsafe addresses" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1, or if you cannot set the F-source address in accordance with the "Basis for PROFIsafe addresses" parameter of the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported. (see Completeness and correctness of the hardware configuration (Page 312)) *(S050)*

* "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/ IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

2.6 PROFIsafe addresses for F-I/O of PROFIsafe address type 1

F-destination address

The uniqueness of the PROFIsafe address is ensured solely with the F-destination address. The F-source address has no effect on whether or not the PROFIsafe address is unique.

Therefore, the F-destination address must be unique network-wide and CPU-wide (see the following rules for address assignment).

To prevent incorrect parameter assignment, an F-destination address which is unique CPU-wide is automatically assigned during placement of the F-I/O in the work area of the device or network view as long as you only configure supported configurations (Page 50).

To ensure a network-wide unique F-destination address assignment when multiple DP master systems and PROFINET IO systems are operated on one network, you must set the "Basis for PROFIsafe addresses" parameter (in the properties of the F-CPU) in SIMATIC Safety F-systems appropriately, before placing the F-I/O (see section "Recommendations for address assignment").

When you change the F-destination address of an F-I/O, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations. You yourself must ensure the network-wide uniqueness of the F-destination address.

For ET 200S, ET 200eco (S7-300, S7-400), ET 200pro, and ET 200iSP F-modules and S7-300 F-SMs:
You must set the F-destination address at the F-I/O with the DIP switch before you install the F-I/O. You can assign up to 1022 different F-destination addresses.

Note

(S7-300, S7-400) For the following fail-safe S7-300 signal modules, the F-destination address is the start address of the F-SM divided by 8:

- SM 326; DI 8 x NAMUR (as of article number 6ES7326-1RF00-0AB0)
- SM 326; DO 10 x DC 24V/2A (article number 6ES7326-2BF01-0AB0)
- SM 336; AI 6 x 13 Bit (article number 6ES7336-1HE00-0AB0)

The next free start address and F-destination address is assigned for these F-SMs beginning with F-destination address 1.

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-source and F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

⚠ WARNING

F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).

The following rules ensure the uniqueness of the F-destination addresses.

The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 56).

See also

Completeness of the safety summary (Page 310)

2.7 PROFIsafe addresses for F-I/O of PROFIsafe address type 2

F-source address and F-destination address

The uniqueness of the PROFIsafe address is ensured by the combination of F-source address and F-destination address.

The PROFIsafe address must be unique network-wide and CPU-wide. This is the case if the following two conditions are met:

- The F-source address ("Basis for PROFIsafe addresses" parameter) of the F-CPU is unique network-wide.
- The F-destination address of the F-module is unique CPU-wide.

You define the F-source address using the "Basis for PROFIsafe addresses" parameter in the F-CPU. Provided you only configure supported configurations (Page 50), this parameter is automatically applied as the F-source address and a CPU-wide unique F-destination address is assigned (usually in descending order starting with 65534).

Please note that the F-source address must be unique network-wide, especially when the "Basis for PROFIsafe addresses" parameter is changed. When you change the F-destination address, the CPU-wide uniqueness of the F-destination address is checked automatically for supported configurations.

You must assign the F-source address and F-destination address to the F-I/O before you commission the F-I/O. You can find additional information in Assigning F-destination addresses to fail-safe modules with SIMATIC Safety (Page 57).

You can show the columns "F-source address" and "F-destination address" in the device view of the device overview. The addresses displayed in these columns are for information purposes only. You have to check the F-source and F-destination addresses in the safety summary when you accept the system.

Rules for address assignment

⚠ WARNING

F-I/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Basis for PROFIsafe addresses of the assigned F-CPU" parameter) and F-destination address.

The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

To ensure that addresses are unique across F-CPUs for supported configurations (Page 50), you need to ensure that the "Basis for PROFIsafe addresses" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Basis for PROFIsafe addresses" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

Please also note Recommendation for PROFIsafe address assignment (Page 56).

See also

Completeness of the safety summary (Page 310)

2.8 Recommendation for PROFIsafe address assignment

Before inserting the F-I/O, specify an address range for each F-CPU for the F-destination addresses of the F-I/O of PROFIsafe address type 1 that does not overlap with the address range of any other F-CPU network-wide or CPU-wide (system-wide). You specify the beginning of this range for F-I/O of PROFIsafe address type 1 with the "Basis for PROFIsafe addresses" parameter.

The F-destination addresses of F-I/O of PROFIsafe address type 2 must not overlap with any address range of the F-I/O of PROFIsafe address type 1. The ranges of the F-destination addresses of the F-I/O of PROFIsafe address type 2 may overlap if the F-source addresses are different. This is the case for supported configurations (Page 50) if the "Basis for PROFIsafe addresses" parameter has been set differently for each F-CPU.

Assign relatively low F-destination addresses for F-I/O of PROFIsafe address type 1 and relatively high F-destination addresses for F-I/O of PROFIsafe address type 2.

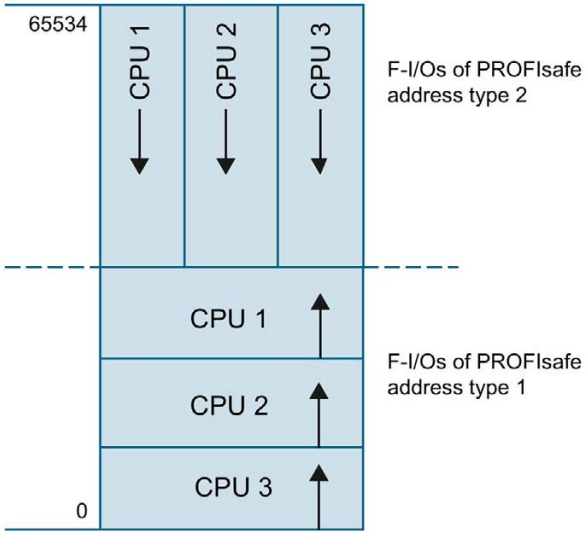


Figure 2-1 Address assignment for F-I/O of PROFIsafe address types 1 and 2

The safety summary (Page 310) lists the following information for each F-CPU:

- "Basis for PROFIsafe addresses" parameter (F-source address for F-I/O of PROFIsafe address type 2)
- Range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 1
- Range of the F-destination addresses of the assigned F-I/O of PROFIsafe address type 2

Any F-I/O configured using I-slave-slave communication is listed in the safety summary as part of the F-destination address range of the I-slave.

2.9 Assigning F-destination addresses to fail-safe modules with SIMATIC Safety

Introduction

Fail-safe ET 200SP modules, fail-safe ET 200MP modules and fail-safe S7-1200 modules do not have a DIP switch that allows you to assign the unique F-destination address for each module. Instead, you assign the PROFIsafe address (Page 50) directly from *STEP 7 Safety* for fail-safe ET 200SP modules and fail-safe ET 200MP modules. The PROFIsafe addresses for S7-1200 F-modules are automatically assigned during download of the hardware configuration.

You can manually change the F-destination addresses set by the F system in the hardware configuration.

You configure the F-destination address in the hardware configuration for each F-module. The F-source address for supported configurations (Page 50) corresponds to the "Basis for PROFIsafe addresses" parameter of the corresponding F-CPU.

In the following cases it is necessary to reassign the addresses of the fail-safe ET 200SP and fail-safe ET 200MP modules:

- Later placement of a fail-safe module during initial commissioning
- Intentional modification of the F-destination address
- Modification of the "Basis for PROFIsafe addresses" parameter of the associated F-CPU (changes the F-source address).
- Replacement of the coding element
- Commissioning of a mass-produced machine

In the following cases it is not necessary to reassign the addresses of the fail-safe ET 200SP and fail-safe ET 200MP modules:

- Power On/Off
- Replacement of an F-module (repair) without PG/PC
- Replacement of the BaseUnit
- Changes in the design in case a new BaseUnit is inserted in front of a fail-safe module
- Repair/replacement of the interface module

Basic procedure

Note

Assigning the PROFIsafe address for S7-1200 fail-safe modules

The procedure described below for identifying and assigning the PROFIsafe addresses is not required for S7-1200 fail-safe modules.

Note that an S7-1200 F-CPU must not include an additional unconfigured F-module.

1. Configure the F-destination address (Page 54) and F-source address in the hardware configuration in *STEP 7 Safety*.
2. Identify the ET 200SP or ET 200MP F-modules to which you want to assign the configured F-destination addresses (together with the F-source address).
3. Assign the F-destination address (together with the F-source address) to the F-modules.

2.9.1 Identifying F-modules

Requirement

The following requirements must be met:

- The F-CPU and fail-safe modules are configured.
- The configuration has been downloaded.
- The F-CPU and fail-safe modules can be reached online.

⚠ WARNING

Clicking "Identification" confirms the fail-safe correctness of the PROFIsafe addresses for the fail-safe modules.

Therefore, proceed carefully when confirming the fail-safe modules by LED flashing or the serial number of the F-CPU with fail-safe modules or the interface module with fail-safe modules. *(S046)*

Procedure

Proceed as follows to identify the F-modules:

1. Establish an online connection to the F-CPU with which the fail-safe modules are operated.
2. In the network view, select the F-CPU with fail-safe modules or the interface module with the fail-safe modules to which you want to assign the F-destination address (together with the F-source address).
3. Select "Assign F-destination address" from the shortcut menu.
4. Under "Assign F-destination address by", select the method to be used for identifying the F-modules.
   - "Identify by LED flashing"

     This is the default setting. The DIAG and STATUS LED of the F-modules to be identified flash upon identification.
   - "By serial number"

     If you cannot see the fail-safe modules directly, you can identify the fail-safe modules by the serial number of the F-CPU or interface module.

     Note

     The displayed serial number may be amended with a year number compared to the serial number printed on the interface module. The serial numbers are nevertheless identical.
5. In the "Assign" column, select all the fail-safe modules to which you want to assign the F-destination address (together with the F-source address).

   If you select the F-CPU or the interface module in the "Assign" column, all F-modules of the station are selected.
6. Click the "Identification" button. Check whether the DIAG and status LED for the F-modules whose F-destination address you want to assign are flashing green. If you identify using the serial number, compare the displayed serial number to the serial number of the F-CPU with the fail-safe modules or the interface module with fail-safe modules.
7. If you have configured more ET 200MP fail-safe modules than exist online, a dialog is displayed. Enter the number of ET 200MP fail-safe modules actually existing in this dialog and confirm the dialog.

   If you have configured fewer ET 200MP fail-safe modules than exist online, the online-offline difference is shown and the assignment of the F-destination addresses is not possible.

2.9.2 Assigning a fail-safe destination address

Requirement

The F-modules have been successfully identified.

Procedure

To assign an F-destination address, proceed as follows:

1. Use the "Assign F-destination address" button to assign the F-destination address (together with the F-source address) to the fail-safe modules. You may have to enter the password of the F-CPU.

   To assign the F-destination address (together with the F-source address), the "Confirm assignment" dialog must be confirmed within 60 seconds.

2.9.3 Changing the F-destination address and the F-source address

Changing the F-destination address or F-source address

1. Change the F-destination address or F-source address in the hardware configuration.
2. Compile the hardware configuration.
3. Download the hardware configuration to the F-CPU.
4. Select "Assign F-destination address" from the shortcut menu.
5. Proceed as described under Identifying F-modules (Page 58) and Assigning a fail-safe destination address (Page 60).

2.10 Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices

Requirement

In order to use fail-safe GSD based DP slaves for SIMATIC Safety, these GSD based slaves must be operated on PROFIBUS DP and support the PROFIsafe bus profile. In order to use an F-CPU S7-1500, the GSD based DP slaves have to support the PROFIsafe bus profile in V2 mode.

Fail-safe GSD based DP slaves used in hybrid configurations on PROFIBUS DP and PROFINET IO downstream from a IE/PB link must support the PROFIsafe bus profile in V2 mode.

In order to use fail-safe GSD based I/O devices for SIMATIC Safety, the GSD based devices must be operated on PROFINET IO and support the PROFIsafe bus profile in V2 mode.

Configuration with GSD files

As is the case in a standard system, the basis for configuring fail-safe GSD based DP slaves/GSD based I/O devices is the device specification in the GSD file (generic station description file).

A GSD file contains all of the properties of a GSD based DP slave or GSD based I/O device. For fail-safe GSD based DP slaves/GSD based I/O devices, certain parts are protected by a CRC.

The GSD files are supplied by the device manufacturers.

Protection of the data structure of the device in GSD files

The only GSD files supported are those that satisfy the requirements for protection defined as of *PROFIsafe Specification* V2.0 using a CRC stored in this file ("desired value" for F_IO_StructureDescCRC).

The data structure described in the GSD file is checked when the F-I/O is added to the hardware configuration and when the hardware configuration is compiled. If an error is detected, you should clarify whether the GSD file provided by the device manufacturer contains the desired value for F_IO_StructureDescCRC.

Assigning the PROFIsafe address

⚠ WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 52) or PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 54).

Set the PROFIsafe source address for fail-safe GSD based DP slaves / GSD based I/O devices according to the manufacturer's specifications. If the F-source address needs to correspond to the "Basis for PROFIsafe addresses" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Basis for PROFIsafe addresses" parameter matches the value of the F-source address of the fail-safe GSD based DP slave / fail-safe GSD based I/O device. *(S053)*

Configuration procedure with GSD files

You import the GSD files to your project (see *Help on STEP 7 "GSD files"*).

1. Select the fail-safe GSD based DP slave / GSD based I/O device in the "Hardware catalog" task card and connect it to the relevant subnet in the network view.
2. Select the fail-safe GSD based DP slave/GSD based I/O device and insert the necessary F-modules, if this does not occur automatically.
3. Select the relevant F-module and open the "Properties" tab in the inspector window.

For fail-safe GSD based DP slaves/GSD based I/O devices (contrary to other F-I/O), the "Manual assignment of the F-monitoring time" parameter is enabled. The result is that the value specified for the F-monitoring time is used as default value when the slaves/devices are plugged. You can change both values (time and type of assignment) later manually.

F-parameter "F_CRC_Seed" and "F_Passivation" for fail-safe GSD based I/O devices

The F-parameters "F_CRC_Seed" and "F_Passivation" influence the behavior of a fail-safe GSD based I/O device. The combination of the F-parameters cannot be set but is specified by selecting a corresponding F-module. Up to three F-module variants can be used, depending on the S7-300/400 or S7-1500 F-CPU used.

F-module variant	F_CRC_Seed	F_Passivation	Behavior of the fail-safe GSD based I/O device	Can be used with F-CPU
1	Parameter does not exist	Parameter does not exist	The GSD based I/O device works with the Basic Protocol (BP) from PROFIsafe. The RIOforFA-Safety profile is not supported.	S7-300/400/1500*
2	CRC-Seed24/32	Device/module	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The RIOforFA-Safety profile is not supported.	S7-1500
3	CRC-Seed24/32	Channel	The GSD based I/O device works with the Expanded Protocol (XP) from PROFIsafe. The RIOforFA-Safety profile is supported.	S7-1500

* Only use the F-module variant 1 with S7-1500 F-CPUs if neither F-module variant 2 nor 3 exists.

Additional information

You can find the description of the parameters in the Help on fail-safe GSD based DP slaves and GSD based I/O devices.

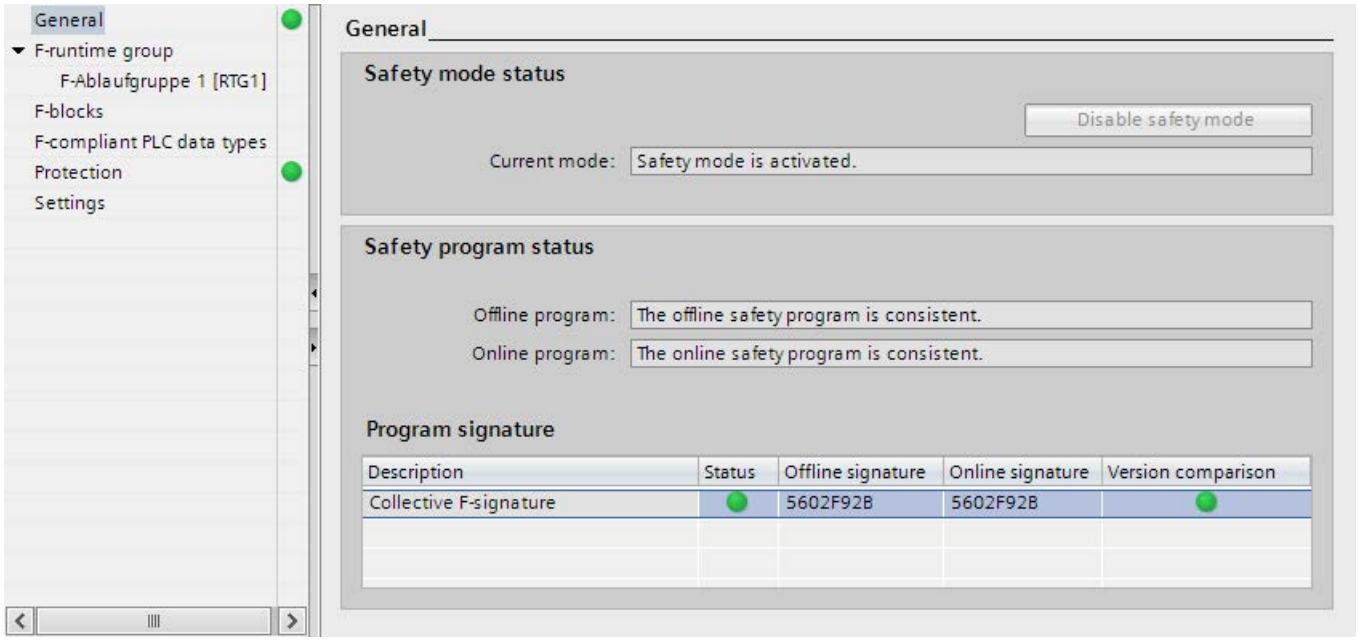
Safety Administration Editor

3

Overview

The *Safety Administration Editor* supports you in the following tasks:

- Displaying of status of the safety program
- Displaying of collective F-signature
- Displaying of status of safety mode
- Creating and organizing of F-runtime groups
- Displaying information on the F-blocks
- Displaying information about F-compliant PLC data types
- Specifying/changing access protection
- Specifying/changing general settings for the safety program
- Set/modify advanced settings for the safety program, e.g. Enable F-change history



The *Safety Administration Editor* is divided into the following areas:

- General

  Under "General", the status of safety mode, the safety program, and the collective F-signature are displayed to you. Additional information on the "General" area can be obtained in ""General" area (Page 67)".

- F-runtime groups

  A safety program consists of one or two F-runtime groups. Under "F-runtime groups", you determine the blocks and properties of an F-runtime group.

  General information on F-runtime groups can be found in "Program structure of the safety program (S7-1200, S7-1500) (Page 87)" and "Program structure of the safety program (S7-300, S7-400) (Page 85)".

  Information on the creation of F-runtime groups can be obtained under "Defining F-Runtime Groups (Page 102)".

- F-blocks

  Under "F-blocks", you can find information on the F-blocks used in your safety program and their properties . Additional information on the "F-blocks" area can be obtained in " "F-blocks" area (Page 69)".

- F-compliant PLC data types

  Under "F-compliant PLC data types", you obtain information on the created F-compliant PLC data types. There you also obtain information whether or not an F-compliant PLC data type is used in the safety program. Additional information on "F-compliant PLC data types" can be found in ""F-compliant PLC data types" area (S7-1200, S7-1500) (Page 70)".

- Access protection

  Under "Access protection", you can set up, change, or revoke the password for the safety program. Access protection is mandatory for productive operation. Additional information on access protection can be found in "Setting up, changing and revoking access permission for the safety program (Page 79)"

- Settings

  Under "Settings", you set the parameters for the safety program. Information on the settings for your safety program can be found in ""Settings" area (Page 71)".

3.1 Opening the Safety Administration Editor

Requirement

The *Safety Administration Editor* is visible as an element in the project tree, if you have configured a CPU as an F-CPU in the project, which means the "F-capability activated" option must be selected (in the properties of the F-CPU).

Procedure

To open the *Safety Administration Editor*, follow these steps:

1. Open the folder for your F-CPU in the project tree.
2. Double-click on "Safety administration" or right-click and select the corresponding shortcut menu for the *Safety Administration Editor*.

Result

The *Safety Administration Editor* for your F-CPU opens in the work area.

3.2 "General" area

"Safety mode status"

The "Safety mode status" shows the current status of safety mode. The prerequisite is an existing online connection to the selected F-CPU.

The following statuses are possible:

- "Safety mode is activated"

  Safety mode for the selected F-CPU is activated.
- "The safety mode is not activated"

  The safety mode for the selected F-CPU is not activated.
- "F-CPU is in STOP"

  The selected F-CPU is in STOP mode.
- "F-CPU is in RUN but no safety program exists"
- "No active F-CPU available"
- "Unknown"

  The safety mode status for the selected F-CPU could not be determined.
- "F-runtime group was not called"
- "The safety program is not called"
- "Safety program status changing"
- "(No online connection)"

  An online connection to the selected F-CPU does not exist.

"Disable safety mode"

For existing online connection and active safety mode operation, you have the option of using the "Disable safety mode" button to disable safety mode for the selected F-CPU. Safety mode can be deactivated only for the entire safety program and not for individual F-runtime groups.

Requirement: "Safety mode can be disabled" is selected in the "Settings" area.

Proceed as follows:

1. Click the "Disable safety mode" button.
2. Enter the password for the safety program in the dialog window and confirm with "OK".
3. A corresponding dialog will display the collective F-signature.
4. Using the displayed collective F-signature, verify that you have selected the desired F-CPU.
5. If you have selected the correct F-CPU, confirm the dialog with "Yes".

Result: Safety mode for the selected F-CPU is deactivated.

"Safety program status"

"Safety program status" displays the current status of your online and offline program.

The following statuses are possible:

- Consistent (with information if no password has been assigned.)
- Inconsistent
- Modified

If no connection to the online program could been established, the message "(no online connection) " will be shown.

"Program signature"

For a non-existing online connection

"Program signature" displays the collective F-signature offline and the "Time stamp" displays the time of the last compilation process.

For an existing online connection

For an existing online connection, the "Program signature" shows the following:

- The status of safety program
- The online and offline collective F-signatures
- Information on whether the block versions and the versions from "System library elements used in safety program " match online and offline.

The meaning of the symbols in the "Status" column are described in the following table.

Status	Meaning
	The online and offline collective F-signatures match, and a password was assigned for the online and offline safety programs.
	The online and offline collective F-signatures do *not* match or no password was assigned for a safety program.
—	The safety program status could not be determined.

See also

Disabling safety mode (Page 293)

3.3 "F-blocks" area

Overview

The "F-Blocks" area helps you in the following tasks:

- Displaying the F-blocks used in your safety programs.
- Displaying the F-blocks used in the F-runtime groups.
- Displaying additional information about the F-blocks.

A description of the F-blocks is available in "Creating F-blocks in FBD / LAD (Page 118)".

Displayed information

The following information is displayed for F-blocks in offline mode:

- Has the F-block been compiled and used?
- Function of F-block in the safety program
- Offline signature
- Time stamp of the last change

The following information is displayed for F-blocks in online mode:

- Status (whether block has the same time stamp online and offline)
- Function of F-block in the safety program
- Offline signature
- Online signature

The F-blocks are hierarchically displayed as in the "Program blocks" folder.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 286)".

Note

During the offline-online comparison, the comparison statuses may occasionally differ between the *comparison editor* and status display in the *Safety Administration Editor*. The decisive status is the result of the comparison in the *comparison editor*, since this is the only comparison that takes into account the contents of the F-blocks.

Filter function

Using the filter function, you can select whether you want to view all F-blocks of a certain F-runtime group or the entire safety program.

- Select "All F-blocks " from the drop-down list to view all F-blocks.
- Select an F-runtime group from the drop-down list to see all F-blocks of this F-runtime group.

3.4 "F-compliant PLC data types" area (S7-1200, S7-1500)

Overview

Under "F-compliant PLC Data Types" you obtain information on the F-compliant PLC data types you have defined.

You can delete F-compliant PLC data types from the shortcut menu.

A description of F-compliant PLC data types is available in "F-compliant PLC data types (S7-1200, S7-1500) (Page 97)".

Displayed information

The following information is displayed for F-compliant PLC data types in offline mode:

- Is the F-compliant PLC data type used in the safety program?
- Time stamp of the last change.

The following information is displayed for F-compliant PLC data types in online mode:

- Status (whether the F-compliant PLC data types have the same time stamp online and offline)

The F-compliant PLC data types are displayed hierarchically as in the folder "PLC Data Types".

Double-click the F-compliant PLC data type to open it for editing.

The description of the symbols in the "Status" column can be found in "Comparing Safety Programs (Page 286)".

Note

During offline-online comparison, the comparison statuses between the *comparison editor* and status display in the *Safety Administration Editor* can be different under certain circumstances. The comparison result in the *comparison editor* is decisive, since this is the only comparison that takes into account the contents of the F-compliant PLC data types.

3.5 "Settings" area

"Number ranges of the F-system blocks"

The number ranges assigned here are used by the F-System for new, automatically generated F-blocks.

At this point, you can select whether the number ranges are managed by the F-system or if a fixed range specified by you is used.

- "System managed"

  The number ranges are managed automatically by the F-system, depending on the F-CPU used. The F-system selects an available number range. The start and end ranges of the number ranges are displayed.

- "Fixed range"

  You can select the start and end ranges of the number ranges from the available range. The available range depends on the F-CPU used.

  An invalid number range selection is indicated by an error message.

  The only check performed during configuration is whether the configured low limit is less than or equal to the high limit and within the available range of the F-CPU. The check as to whether the configured range is sufficient is first made during compiling. You need to ensure a sufficiently large range. Where the available range is insufficient, a compiling error occurs. Not all blocks are generated and the safety program is not executable.

Changes will become valid only during the next compilation. The automatically created F-blocks may be moved into the new area during compilation. The F-I/O DBs are an exception. They always retain their original number that you may change in the properties of the F-I/O.

"System library elements used in safety program"

Usually, you do not need to make any settings for these parameters.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

- Instructions (without their own version)

  Specifies the functionality of instructions (without their own version).

  A number of versions are available:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	These versions have identical functions.
1.2	x	—	x	
1.3	x	x	x	

- F-system blocks

  Specifies the version of the F-system blocks to be used.

  A number of versions are available:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	These versions have identical functions.
1.2	x	—	x	
1.3	x	x	x	This version has identical functions to version 1.2. In addition, the current and the longest runtime of the F-runtime group are available in the F-runtime group information DB for S7-1200/1500 F-CPUs.

- F-I/O access

  Specifies the version of the access procedure for the F-I/O.

  A number of versions are available:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	These versions have identical functions For S7-1200/1500 F-CPUs, you evaluate the value status using the process image of the inputs. For S7-300/400 F-CPUs, you evaluate the QBAD_I_xx and QBAD_O_xx tags in the F-I/O DB.
1.2	x	—	x	
1.3	x	x	x	This version also supports the PROFIsafe Expanded Protocol (XP) and the RIOforFA profile for S7-1200/1500 F-CPUs.

"Local data used in safety program" (S7-300, S7-400)

You use this parameter to specify the amount of temporary local data (in bytes) that is available for the call hierarchy below the main safety block.

The setting applies to each F-runtime group of a safety program. Additional information on F-runtime groups can be found in Program structure of the safety program (S7-1200, S7-1500) (Page 87) and "Program structure of the safety program (S7-300, S7-400) (Page 85)".

The **minimum possible amount** is determined by the local data requirement of the F-blocks generated automatically when the safety program is compiled.

For this reason, you must provide at least 440 bytes. However, the local data requirement for the automatically added F-blocks may be higher depending on the local data requirement of the F-blocks you created with FBD or LAD.

Therefore, provide as much local data as possible. If there is not enough local data available for the automatically added F-blocks (440 bytes or more), the safety program will be compiled nevertheless.

Data in automatically added F-DBs are then used instead of local data. However, this increases the runtime of the F-runtime group(s). You will receive a notice when the automatically added F-blocks require more local data than configured.

⚠ WARNING

The calculated maximum runtime of the F-runtime group using the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is no longer correct in this case because the calculation assumes sufficient availability of F-local data.

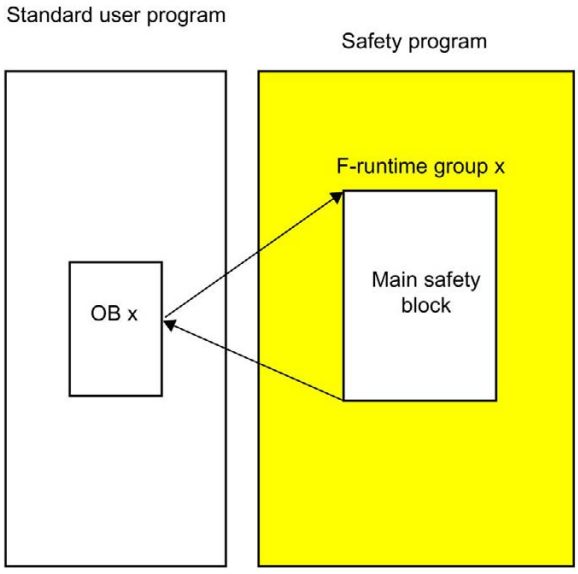
In this case, use the value you configured for the maximum cycle time of the F-runtime group (F-monitoring time) as the maximum runtime of the F-runtime group when calculating the maximum response times in the event of an error and for any runtimes of the standard system using the above-mentioned Excel file. *(S004)*

The maximum possible amount depends on:

- Local data requirement of the main safety block and the higher-level standard user program. For this reason, you should call the main safety blocks directly in OBs (cyclic interrupt OBs, whenever possible), and additional local data should not be declared in these cyclic interrupt OBs.
- Maximum volume of local data of the utilized F-CPU (see Technical Specifications in the product information for the utilized F-CPU). For S7-400 F-CPUs, you can configure the local data for each priority class. Therefore, assign the largest possible local data volume for the priority classes in which the safety program (the main safety blocks) will be called (e.g., OB 35).

Maximum possible amount of local data as a function of local data requirement of main safety block and higher-level standard user program (S7-300, S7-400):

Case 1: Main safety block called directly from OBs

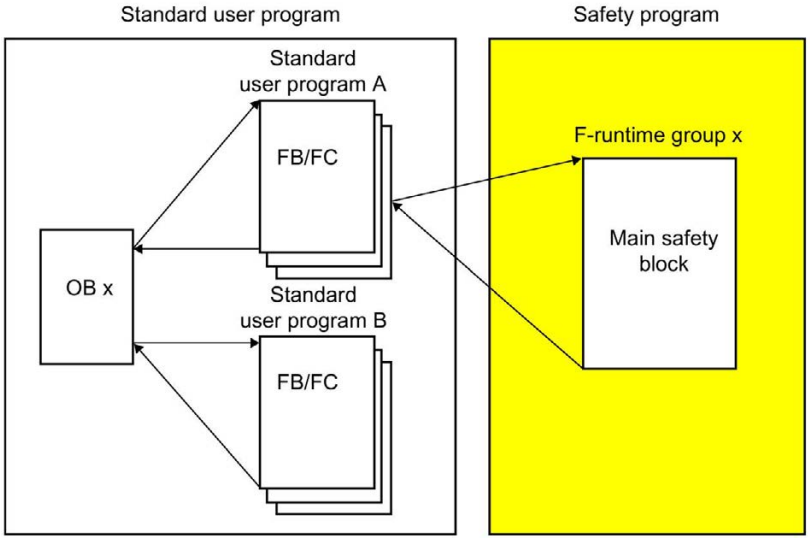


Set the "Local data used in safety program" parameter to the maximum amount of local data of the utilized F-CPU minus the local data requirement of the main safety block (if the main safety block has 2 F-runtime groups, use the largest local data requirement) and minus the local data requirement of the calling OBx (if there are 2 F-runtime groups, use the OB with the largest local data requirement).

Note: If you have not declared any temporary local data in the main safety blocks and calling OBx, the local data requirement of the main safety blocks is 6 bytes and the local data requirement of the calling OBx is 26 bytes. You can derive the local data requirement of the main safety blocks and calling OBx from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

Case 2: Main safety block not called directly from OBs



Set the "Local data settings" parameter to the value calculated for Case 1, minus the local data requirement of standard user program A (if standard user program A has 2 F-runtime groups, use the largest local data requirement).

Note: You can derive the local data requirement of the standard user program A from the program structure.

Select the utilized F-CPU in the project tree and then "Tools > Call structure". The table gives the local data requirement in the path or for the individual blocks (see also the help on *STEP 7*).

"Advanced settings"

If you deselect the "Safety mode can be disabled" option, you can prevent the disabling of safety mode for a safety program.

When you change the setting for this option, you need to recompile the safety program and download it to the F-CPU for the change to become effective. This changes the collective F-signature of your safety program.

We recommend that you disable this option before you start production and before acceptance of the safety program to prevent an unintentional disabling of the safety mode.

Use the option "Deactivate the online-offline comparison status to accelerate the online connection.

If you select this option, the results of the online-offline comparison are no longer displayed in the project tree next to "Safety Administration". The online-offline comparison in the SAE under "Safety program status" is not affected by this option.

Enable the logging of changes to the safety program by using the "Enable F-change history" option. For more information, refer to the section "F-change history (Page 307)".

Access protection

4

Access protection is necessary for productive operation

Access protection to the SIMATIC Safety F-system is mandatory for productive operation.

For test purposes, commissioning, etc. no access protection is necessary at first. This means that you can execute all offline and online actions without access protection, i.e., without password prompt.

⚠ WARNING

Access to the SIMATIC Safety F-system without access protection is intended for test purposes, commissioning, etc., when the system is not in productive operation mode. You must guarantee the safety of the system through other organizational measures, for example, restricted access to certain areas.

Before you transition into productive operation mode, you must have set up and activated access protection. *(S005)*

Note

(S7-300/400) If you also want to download an F-CPU with *STEP 7 Distributed Safety*, you must specify the password for the F-CPU because assignment of a password is mandatory for the F-CPU in *STEP 7 Distributed Safety* .

4.1 Overview of Access Protection

Introduction

You can protect access to the SIMATIC Safety F-system by two password prompts: one for the safety program and another for the F-CPU.

Password for the safety program

The password for the safety program is available in two forms:

- The offline password is part of the safety program in the offline project on the programming device or PC.
- The online password is part of the safety program in the F-CPU.

Password for the F-CPU

The access protection is set at the F-CPU level. This password is also used to identify the F-CPU and must therefore be unique network-wide.

Overview of password assignment and prompt

The following table provides an overview of the access permissions for the F-CPU and the safety program.

The sections below show you how to assign the passwords and how to set up, change, and cancel access permissions for the F-CPU and the safety program.

	Password for F-CPU	Password for safety program
Assignment	In the *hardware and network editor*, during configuration of the F-CPU, inspector window, in "Settings" tab under "Protection", corresponding safety level, e.g., "Write protection for fail-safe blocks" (S7-300, S7-400). Select at least the access level "Full access (no protection)" for S7-1200/1500 F-CPUs and assign a password for "Full access incl. fail-safe (no protection)". If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".	In the *Safety Administration Editor* under "Access Protection"
Prompt	If you do not have access permission for the safety program (Page 79): e.g. • When the safety program is downloaded in its entirety • (S7-300, 400) When the hardware configuration is downloaded • When F-destination addresses are assigned • When F-blocks that are used in the safety program are downloaded and deleted • When disabling safety mode • When restoring a backup of the F-CPU. Exception with S7-1200/1500 F-CPUs: If neither the safety program nor the F-CPU password is changed by the restore process, you are not prompted for the F-CPU password.	If you have assigned a password and this has not yet been entered since the project was opened, or you do not have access permission for the safety program (Page 79): **Offline password** e.g.: • When the password is changed • When modifying the safety program • When changing and deleting F-runtime groups • When changing safety-related parameters of F-I/O **Online password** e.g., when disabling safety mode (the password must always be entered, even if access permission for the safety program is still valid)

Safety program recompilation is required after changes to standard DBs to which the safety program has read or write access (Page 159). These standard DBs are not governed by the safety program access protection.

Please note that you also require the online password to download the safety-relevant changes to the hardware configuration. This is also true for changes to F-I/O not used in the safety program.
You have to also recompile and download the safety program for the download to be consistent.

4.2 Setting up, changing and revoking access permission for the safety program

Procedure for assigning the password for the safety program

Use the following procedure to assign the password for the safety program:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open. Select "Protection" in the area navigation.
3. Under "Offline safety program protection", click "Setup" and enter the password for the safety program in the following dialog in the "New password" and "Confirm password" fields.
4. Confirm the assigned password with "OK".

Note

You cannot define the online password separately; the offline password assigned during the next download is applied. After a change to the offline password, the online and offline passwords may differ until the next time the offline safety program is downloaded to the F-CPU.

Note

Use different passwords for the F-CPU and the safety program to optimize access protection.

⚠ WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the password protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

Changing the password for the safety program

You may change the safety program password as long as you have the necessary access permissions. It takes place likewise in the "Protection" area (via "Change" button) and is carried out as usual under Windows through entry of the old and double entry of the new password.

Revoking the password for the safety program

You can revoke the password for a safety program, i.e., the safety program is then no longer protected by a password.

Proceed as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Protection" in the area navigation.
4. Click the "Change" button.
5. Under "Old password", enter the password for the safety program.
6. Click "Revoke" and then on "OK".

Logging in to the safety program

Log in to the safety program as follows:

1. Open the folder for your F-CPU in the project tree.
2. Select "Safety Administration" and select "Go to protection" in the shortcut menu.

   Alternatively, double-click on "Safety Administration". The *Safety Administration Editor* of the F-CPU will open.
3. Select "Protection" in the area navigation.
4. Enter the password for the safety program in the "Password" input field.
5. Select the "Login" button.

Validity of access permission for a safety program

If access permission for a safety program was granted through the entry of the password, this remains until the project is closed. If *STEP 7* is closed, any project that is still open is automatically closed and any access permission granted is reset.

Canceling access permission for the safety program

The access permission for the safety program can be canceled as follows:

- By clicking the "Log off" button in the "Access protection" area in the "*Safety Administration Editor*".
- In the shortcut menu for the *Safety Administration Editor* shortcut menu (access by right-clicking).
- By using the lock symbol in the line of the *Safety Administration Editor*.

The user will then be prompted to enter the password for the safety program again the next time an action requiring a password is performed. To "cancel" access permission when using the Modify function, the connection to the F-CPU must first be terminated (e.g. with the "Online > Go offline" menu command or the corresponding icon in the toolbar).

Access permission for the safety program is reset automatically, if the project or *STEP 7* has been closed.

Displaying the validity of access permission

The validity of the access permission is displayed in the project tree as follows:

- The access permission is valid, if the lock symbol in the line of the *Safety Administration Editor* is shown unlocked.
- The access permission is not available, if the lock symbol shows a closed lock.
- If no lock symbol is shown, no password was assigned.

4.3 Setting up access permission for the F-CPU

Obtaining access permission for the F-CPU

You obtain access permission for the F-CPU - depending on the configured protection level - by entering the password for the F-CPU prior to performing an action requiring a password.

Procedure for assigning a password for the F-CPU

You assign the password for the F-CPU when configuring the F-CPU.

You arrive there directly, if you click the link "Go to the "Protection" area of the F-CPU" in the "Access protection" area in the *Safety Administration Editor*.

Assign a password for "Write protection for fail-safe blocks" for F-CPUs S7-300/400.

Assign at least the level "Full access (no protection)" for S7-1200/1500 F-CPUs and assign a password under "Full access incl. fail-safe (no protection)". Proceed as described in the *STEP 7* help under "Configuring access levels".

(S7-1200, S7-1500) If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)".

⚠ WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Industrial Ethernet) by **a programming device or PC**, you must take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPU having the respective Ethernet address "PW_8".

Note the following:

- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

Changing the password for the F-CPU

For the new password to become valid after a password change for the F-CPU, you must download the changed configuration into the F-CPU. If necessary, you must enter the "old" password for the F-CPU for this load operation. The F-CPU must be in STOP mode.

Validity/cancelation of the access permission for the F-CPU

Access permission for the F-CPU remains valid until the project is closed in *STEP 7* or access permission is canceled using the "Online > Delete access rights" menu command.

⚠ WARNING

If access protection is not used to limit access to the programming device or PC to only those persons who are authorized to modify the safety program, the following organizational measures must be taken to ensure the effectiveness of the password protection for the F-CPU at the programming device or PC:

- Only authorized personnel may have access to the password.
- Authorized personnel must explicitly cancel the access permission for the F-CPU before leaving the programming device or PC by closing *STEP 7* or via the "Online > Delete access rights" menu. If this is not strictly implemented, a screen saver equipped with a password accessible only to authorized personnel must also be used. *(S006)*

Programming

5

5.1 Overview of Programming

Introduction

A safety program consists of F-blocks that you create using the FBD or LAD programming language and F-blocks that are automatically added. Fault detection and reaction measures are automatically added to the safety program you create, and additional safety-related tests are performed. Moreover, you have the option to incorporate special ready-made safety functions in the form of instructions into your safety program.

An overview of the following is given below:

- The structure of the safety program
- The fail-safe blocks
- Differences in the programming of the safety program with FBD/LAD compared to programming of standard user programs

5.1.1 Program structure of the safety program (S7-300, S7-400)

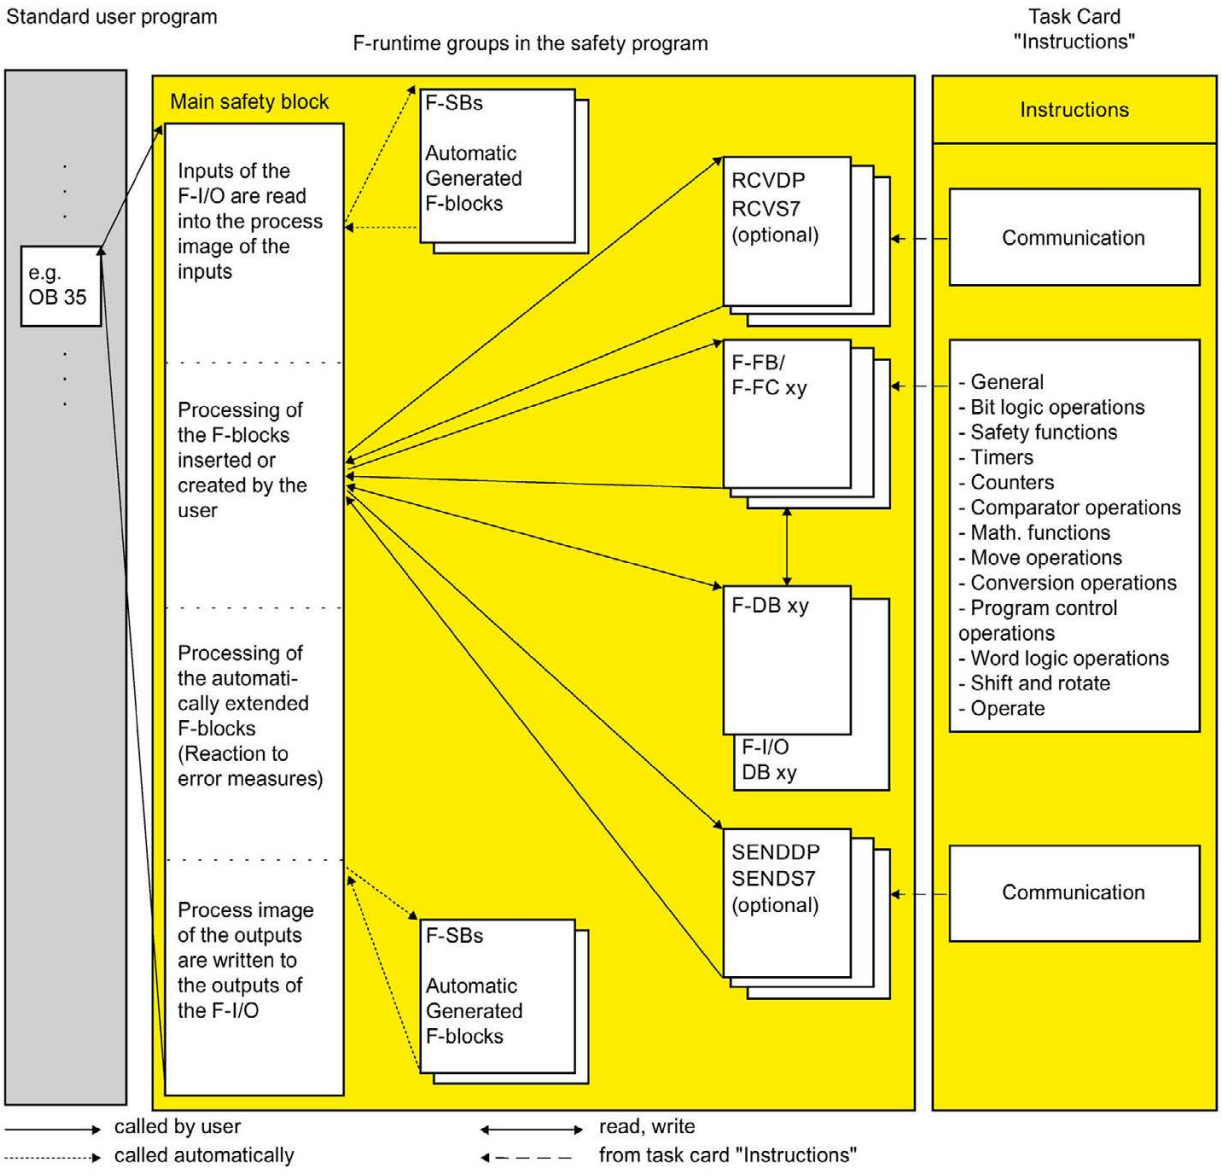
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks, automatically generated F-blocks, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-300/400 F-CPU.

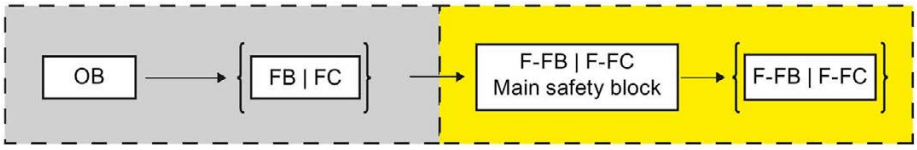


Main safety block

The main safety block is the first F-block of the safety program that you program yourself. During compiling, it is supplemented by additional invisible calls of F-system blocks.

You must assign the main safety block to an F-runtime group (Page 102).

The main safety block in an S7-300/400 F-CPU is called from any block in the standard user program. We recommend a call from an OB 3x.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- a main safety block (an F-FB/F-FC that you assign to the OB)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

5.1.2 Program structure of the safety program (S7-1200, S7-1500)

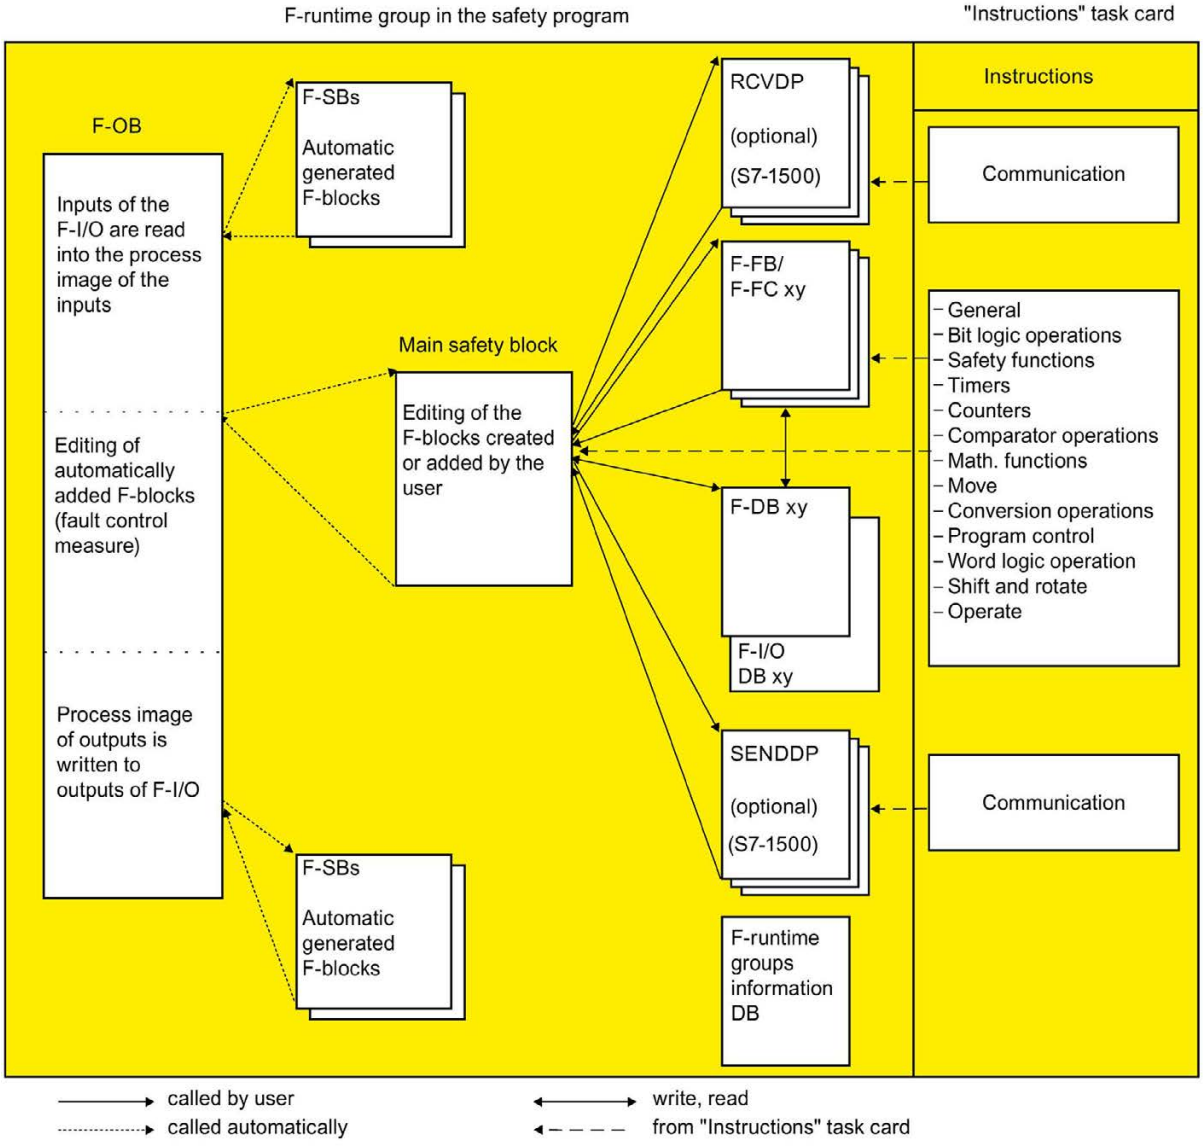
Representation of program structure

For structuring purposes, a safety program consists of one or two F-runtime groups.

Each F-runtime group contains:

- F-blocks that you create using FBD or LAD or that are inserted from the project library or global libraries
- F-blocks that are added automatically (F-system blocks F-SBs, automatically generated F-blocks, F-runtime DB, and F-I/O DBs)

Below is a schematic diagram of a safety program or an F-runtime group for an S7-1200/1500 F-CPU.

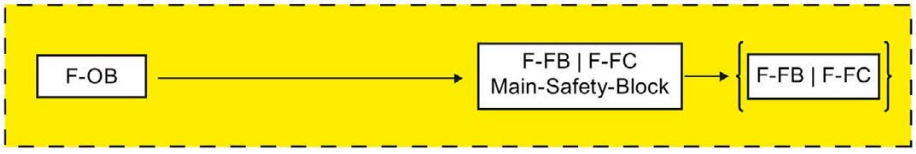


Main safety block

The main safety block is the first F-block of the safety program that you program yourself.

You must assign the main safety block to an F-runtime group (Page 102).

The main safety block in an S7-1200/1500 F-CPU is called by the F-OB assigned to the F-runtime group.



F-runtime groups

To improve handling, a safety program consists of one or two "F-runtime groups". An F-runtime group is a logical construct of several related F-blocks that is formed internally by the F-system.

An F-runtime group consists of the following:

- An F-OB which calls the main safety block
- A main safety block (an F-FB/F-FC that you assign to the F-OB)
- Any additional F-FBs or F-FCs that you program using FBD or LAD and call from the main safety block
- One or more F-DBs, as needed
- F-I/O DBs
- F-runtime group information DB
- F-blocks from the project library or global libraries
- F-system blocks F-SBs
- Automatically generated F-blocks

Structuring the safety program in two F-runtime groups

You can divide your safety program into two F-runtime groups. By having parts of the safety program (one F-runtime group) run in a faster priority class, you achieve faster safety circuits with shorter response times.

See also

F-runtime group information DB (S7-1200, S7-1500) (Page 115)

5.1.3 Fail-Safe Blocks

F-blocks of an F-runtime group

The following table shows the F-blocks that you use in an F-runtime group:

F-block	Function	S7-300/400 F-CPUs	S7-1200/ 1500 F-CPUs
Main safety block	The first step in programming of the safety program is the main safety block. The main safety block in S7-300/400 F-CPUs is an F-FC or F-FB (with instance DB), which is called by a standard block (recommendation: OB 35) from the standard user program. The main safety block in S7-1200/1500 F-CPUs is an F-FC or F-FB (with instance DB), which is called by the F-OB.	X	X
F-FB/F-FC	Both in the main safety block as well as additional F-FBs and F-FCs, you can perform the following: • Program the safety program with the instructions available for F-blocks in FBD or LAD • Call other created F-FBs/F-FCs for structuring the safety program • Insert F-blocks from the project library or global libraries	X	X
F-DB	Optional fail-safe data blocks that can be read- and write-accessed within the entire safety program.	X	X
F-I/O DB	An F-I/O DB is automatically generated for each F-I/O when it is configured. You can or you must access the tags of the F-I/O DB in conjunction with F-I/O accesses.	X	X
F-shared DB	The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system.	X	—
F-runtime group information DB	An F-runtime group information DB is created when you create an F-runtime group. The F-runtime group information DB provides information on the F-runtime group and on the safety program as a whole.	—	X

Note

Main safety blocks, F-FBs/F-FCs and F-DBs of the safety program of an S7-1200/1500 F-CPU cannot be know-how-protected. If they are, the safety program cannot be compiled.

Note

You may not add, edit or delete blocks in the "System blocks" folder. Failure to do so can lead to compilation errors or cause an F-CPU stop.

Note

You are not permitted to insert F-system blocks from the "System blocks" folder in a main safety block/F-FB/F-FC.

Instructions for the safety program

In the "Instructions" task card, you can find instructions for the F-CPU used and which you can to use program the safety program.

You can find instructions that you know from the standard user program, such as bit logic operations, mathematical functions, functions for program control, and word logic operations.

Moreover, there are instructions with safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP, safety door monitoring, and feedback loop monitoring.

Additional information

For a detailed description of the instructions for the safety program, refer to Overview of instructions (Page 328).

5.1.4 Restrictions in the programming languages FBD/LAD

LAD and FBD programming languages

The user program in the F-CPU typically consists of a standard user program and a safety program.

The standard user program is created using standard programming languages such as SCL, STL, LAD, or FBD.

For the safety program, LAD or FBD may be used with certain restrictions in the instructions and the applicable data types and operand areas. Please also note the restrictions for the individual instructions in FBD (Page 494) and LAD (Page 329).

Supported instructions

The instructions available depend on the F-CPU used. You can find the supported instructions in the description of the instructions (starting from Overview of instructions (Page 328)).

Note

Preconnection of enable input EN or evaluation of enable output ENO is not possible.

Supported data types and parameter types

Only the following data types are supported:

- BOOL
- INT
- WORD
- DINT
- DWORD (S7-300, S7-400)
- TIME
- F-compliant PLC data type (S7-1200, S7-1500)

Note

If the result of an instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostics event is entered in the diagnostics buffer of the F-CPU.
You can find additional information on the cause in the online help for diagnostic messages.
You must therefore ensure that the permitted range for the data type is observed when creating the program or select a matching data type.

Note

DINT data type for S7-1200 F-CPUs

Note that the runtimes of the instructions "Comparator operations" and "Math functions" with data type DINT are very time consuming on S7-1200 F-CPUs.

Non-permitted data and parameter types

The following types are **not** permitted:

- All types not listed in the section "Supported data types and parameters types" (e.g. BYTE, REAL)
- Complex data types (e.g., STRING, ARRAY, STRUCT, PLC data type (S7300/400))
- Parameter types (e.g., BLOCK_FB, BLOCK_DB, ANY)

Supported operand areas

The system memory of an F-CPU is divided into the same operand areas as the system memory of a standard CPU. You can access the operand areas listed in the table below from within the safety program.

Table 5- 1 Supported operand areas

Operand area	Access via units of the following size:	S7 Notation	Description
Process image of the inputs			
• Of F-I/O	Input (bit) Input word Input double-word	I IW ID	Only read-only access to input channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. The process image of the inputs of F-I/O is updated before the start of the main safety block.
• Of standard I/O	Input (bit) Input word Input double-word	I IW ID	Input channels of standard I/O can only be accessed read-only. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In addition, a process-specific validity check is required. See the *STEP 7 help* for the update times of the process image of the inputs of standard I/O.
Process image of the outputs			
• Of F-I/O	Output (bit) Output word Output double-word	Q QW QD	Only write-only access to output channels of F-I/O is possible. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the F-I/O are calculated and stored in the process image of the outputs. The process image of the outputs for F-I/O is updated after the end of the main safety block.
• Of standard I/O	Output (bit) Output word Output double-word	Q QW QD	Output channels of standard I/O are write-only channels. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. In the safety program, the values for the outputs of the standard I/O are also calculated and stored in the process image of the outputs, if needed. See the *STEP 7 help* for the update times of the process image of the outputs of standard I/O.

Operand area	Access via units of the following size:	S7 Notation	Description
Bit memory	Bit memory (bit) Memory word Memory double word	M MW MD	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. A particular element of the bit memory can be either read- or write-accessed in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Note that it is only permitted to use bit memory for connecting the standard user program and the safety program; it must not be used as a buffer for F-data.
Data blocks			
• F-DB	Data bit Data word Data double word	DBX DBW DBD	Data blocks store information for the program. They can either be defined as global data blocks such that all F-FBs, F-FCs, or main safety blocks can access them or assigned to a particular F-FB or main safety block (instance DB). A tag of a shared DB can only be accessed from one F-runtime group, and an instance DB only from the F-runtime group in which the corresponding F-FB/instruction is called.
• DB	Data bit Data word Data double word	DBX DBW DBD	This area is used for data exchange with the standard user program. In addition, read access requires a process-specific validity check. For a tag of a DB, either read access or write access is possible in the safety program. Transfer to IN_OUT parameters of an F-FB or F-FC is therefore not valid either. Please note that the tags of a DB can only be used for transferring data between the standard user program and the safety program; DBs must not be used as a buffer for F-data.
Temporary local data	Local data bit Local data word Local data double word	L LW LD	This memory area holds the temporary tags of a block (or F-block) while the (F-) block is being executed. The local data stack also provides memory for transferring block parameters and for saving intermediate results.

File type conversion

Just as with the standard user program, there are two possibilities for file type conversion in the safety program.

- Implicit conversion

  The implicit conversion is executed as in the standard user program with the following restrictions: The bit length of the source data type has to match the bit length of the destination data type.

- Explicit conversion

  You use the explicit conversion instruction in FBD (Page 617) and LAD (Page 448), before the actual instruction is executed.

Slice access

Slice access is not possible in the safety program.

Non-permitted operand areas

Access via units other than those listed in the table above is **not** permitted. The same applies to access to operand areas not listed, in particular:

- Data blocks that were automatically added

  Exception: Certain tags in the F-I/O DB (Page 129) and in the F-shared DB (S7-300, S7-400) (Page 114) or F-runtime group information DB (S7-1200, S7-1500) (Page 115)

- I/O area: Inputs
- I/O area: Outputs

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-300, S7-400)

If you require Boolean constants "0" or "FALSE" and "1" or "TRUE" in your safety program to assign parameters during block calls, you can access the tags "VKE0" and "VKE1" in the F-shared DB using fully qualified DB access ("F_GLOBDB".VKE0 or "F_GLOBDB".VKE1).

Boolean constants "0" or "FALSE" and "1" or "TRUE" (S7-1200, S7-1500)

The Boolean constants "0" or "FALSE" and "1" or "TRUE" are available for S7-1200/1500 F-CPUs to assign parameters during block calls.

If you require the Boolean constant 1 for bit logic operations, you can interconnect the corresponding input of the bit logic operation with the "Assignment" instruction. Do not interconnect the box input of the "Assignment" instruction in FBD.

If you require the Boolean constant 0 for bit logic operations, you can interconnect the corresponding input of the bit logic operation with the "Assignment" instruction. Negate the output of the "Assignment" instruction. Do not interconnect the box input of the "Assignment" instruction in FBD.

Operand area of temporary local data: Particularities

Note

Note when using the operand area of temporary local data that the first access of a local data element in a main safety block/F-FB/F-FC must always be a write access. This initializes the local data element.

Make sure that the initialization of the local data element is **not** skipped over by JMP, JMPN. or RET instructions (branching).

The "local data bit" should be initialized with the Assign ("=") (FBD) or ("--( )") (LAD) instruction. Assign the local data bit a signal state of "0" or "1" as a Boolean constant.

Local data bits cannot be initialized with the Flip Flop (SR, RS), Set Output (S) or Reset Output (R) instructions.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

"Fully qualified DB access"

Access to tags of a data block in an F-FB/F-FC is "fully qualified DB access". This also applies to initial access to tags of a data block after a jump label.

For S7-300/400 F-CPUs, only initial access needs to be "fully qualified DB access". Alternatively, you can use the instruction "OPN".

Example of "fully qualified DB access":

Assign a name for the F-DB, e.g. "F_Data_1". Use the names assigned in the declaration of the F-DB instead of the absolute addresses.

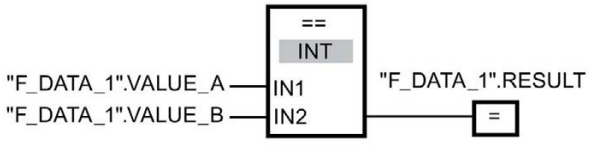


Figure 5-1 Example with fully-qualified access and symbolic names

Example of "non-fully qualified DB access" (S7-300, S7-400):

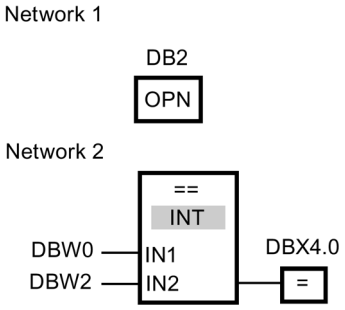

Figure 5-2 Example without fully-qualified access and symbolic names

Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

5.1.5 F-compliant PLC data types (S7-1200, S7-1500)

Introduction

You declare and use F-compliant PLC data types as you would standard PLC data types. You can use F-compliant PLC data types in the safety program as well as in the standard user program.

Differences to standard PLC data types are described in this chapter.

Information on the use and declaration of standard PLC data types is available in the *STEP 7 online help* under "Using PLC data types (UDT)" and "Programming PLC data types".

Declaring F-compliant PLC data types

You declare F-compliant PLC data types as you would PLC data types.

In F-compliant PLC data types, you can use all data types (Page 90) that you can also use in safety programs.

Nesting of F-compliant PLC data types within F-compliant PLC data types is not supported.

Proceed as follows for declaration:

1. Click on "Add new PLC data type" in the "PLC Data Types" folder in the project tree.
2. To create an F-compliant PLC data type, enable the option "Create F-compliant PLC data type" in the "Add new PLC data type" dialog.
3. Proceed as described in the *STEP 7 online help* under "Programming structure of PLC data types".

You specify default values for F-compliant PLC data types during the declaration.

When you access the F-I/O using an F-compliant PLC data type, the structure of the F-compliant PLC data type tag must match the channel structure of the F-I/O.

An F-compliant PLC data type for an F-I/O with 8 digital inputs, for example, may consist of up to 8 tags of the BOOL data type. For F-I/O with value status, there are up to 8 more tags of the BOOL data type for the value status. For an F-I/O with 6 analog inputs, it can consist of up to 6 tags of the INT data type. For F-I/O with value status, there are up to 6 more tags of the BOOL data type for the value status. Access to F-I/O is only permitted for existing and enabled channels. Please note the restrictions detailed in F-I/O access (Page 122).

Using F-compliant PLC data types

You use F-compliant PLC data types as you would standard PLC data types.

Changes to F-compliant PLC data types

You need the password for the safety program to change F-compliant PLC data types. Regardless if you are using the F-compliant PLC data type in an F-block, in a standard block or not at all.

See also

"F-compliant PLC data types" area (S7-1200, S7-1500) (Page 70)

5.1.5.1 Example of the use of F-compliant PLC data types for access to F-I/O (S7-1200, S7-1500)

Introduction

This example uses the F-module 4 F-DI/3 F-DO DC24V/2A with 1oo2 evaluation to demonstrate how you use F-compliant PLC data types for access to F-I/O.

Channel structure of the 4 F-DI/3 F-DO DC24V/2A F-module

The table below sets out the channel structure and address assignment of the 4 F-DI/3 F-DO DC24V/2A F-module with 1oo2 evaluation. You may only access existing and enabled channels (addresses I11.0 to I11.3 and I12.0 to I12.3). These channels provide the result of 1oo2 evaluation generated internally in the F-module.

Table 5- 2 Channel structure and addresses of the channel values of inputs with 1oo2 evaluation

Channel	Address
DI channel 0 channel value	I11.0
DI channel 1 channel value	I11.1
DI channel 2 channel value	I11.2
DI channel 3 channel value	I11.3
—	I11.4
—	I11.5
—	I11.6
—	I11.7

Table 5- 3 Channel structure and addresses of the value status of inputs with 1oo2 evaluation

Channel	Address
DI channel 0 value status	I12.0
DI channel 1 value status	I12.1
DI channel 2 value status	I12.2
DI channel 3 value status	I12.3
—	I12.4
—	I12.5
—	I12.6
—	I12.7

Table 5- 4 Channel structure and addresses of the value status of outputs

Channel	Address
DO channel 0 value status	I13.0
DO channel 1 value status	I13.1
DO channel 2 value status	I13.2
DO channel 3 value status	I13.3

Table 5- 5 Channel structure and addresses of the channel values of outputs

Channel	Address
DO channel 0 channel value	Q11.0
DO channel 1 channel value	Q11.1
DO channel 2 channel value	Q11.2
DO channel 3 channel value	Q11.3

Creating F-compliant PLC data types

Create two F-compliant PLC data types, for example, for access to all channels.

The figure below shows an F-compliant PLC data type for access to the channel values and value status of the inputs with 1oo2 evaluation:

4 F-DI/3 F-DO DC24V/2A_DI

	Name	Data type	Comment
1	CH_DI_0	Bool	Channel 0 (DI)
2	CH_DI_1	Bool	Channel 1 (DI)
3	CH_DI_2	Bool	Channel 2 (DI)
4	CH_DI_3	Bool	Channel 3 (DI)

Figure 5-3 F-compliant "4 F-DI/3 F-DO DC24V/2A_DI" PLC data type

The figure below shows the F-compliant PLC data type for access to the channel values and value status of the outputs:

4 F-DI/3 F-DO DC24V/2A_DO

	Name	Data type	Comment
1	CH_DO_0	Bool	Channel 0 (DQ)
2	CH_DO_1	Bool	Channel 1 (DQ)
3	CH_DO_2	Bool	Channel 2 (DQ)

Figure 5-4 F-compliant "4 F-DI/3 F-DO DC24V/2A_DO" PLC data type

Using F-compliant PLC data types

As demonstrated in the figure below, you can use the two F-compliant PLC data types that you have created in an F-FC (e.g. "Motor"):

Motor

	Name	Data type	Default value	Comment
1	Input			
2	Motor SS DI	"4 F-DI/3 F-DO DC24V/2A_DI"		Motor interface channel values DI
3	CH_DI_0	Bool		Channel 0 (DI)
4	CH_DI_1	Bool		Channel 1 (DI)
5	CH_DI_2	Bool		Channel 2 (DI)
6	CH_DI_3	Bool		Channel 3 (DI)
7	Motor SS DI VS	"4 F-DI/3 F-DO DC24V/2A_DI"		Motor interface value status DI
8	CH_DI_0	Bool		Channel 0 (DI)
9	CH_DI_1	Bool		Channel 1 (DI)
10	CH_DI_2	Bool		Channel 2 (DI)
11	CH_DI_3	Bool		Channel 3 (DI)
12	Motor SS DO VS	"4 F-DI/3 F-DO DC24V/2A_DO"		Motor interface value status DQ
13	CH_DO_0	Bool		Channel 0 (DQ)
14	CH_DO_1	Bool		Channel 1 (DQ)
15	CH_DO_2	Bool		Channel 2 (DQ)
16	Output			
17	Motor SS DO	"4 F-DI/3 F-DO DC24V/2A_DO"		Motor interface channel values DQ
18	CH_DO_0	Bool		Channel 0 (DQ)
19	CH_DO_1	Bool		Channel 1 (DQ)
20	CH_DO_2	Bool		Channel 2 (DQ)
21	InOut			

Access to the channels with PLC tags

Create PLC tags for access to the channels (incl. value status):

Tag table_1

	Name	Data type	Address	Comment
1	TagDI_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DI"	%I11.0	Motor 1 DI
2	TagDI_VS_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DI"	%I12.0	Motor 1 DI VS
3	TagDO_VS_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DO"	%I13.0	Motor 1 DQ VS
4	TagDO_4 F-DI/3 F-DO(1)	"4 F-DI/3 F-DO DC24V/2A_DO"	%Q11.0	Motor 1 DQ

Accessing the F-FC

Transfer the PLC tags you have created when you call the F-FC (e.g. "Motor"):

Value status (S7-1200, S7-1500) (Page 124)

5.2 Defining F-Runtime Groups

5.2.1 Rules for F-Runtime Groups of the Safety Program

Rules

Note the following:

- The channels (channel values and value status) of an F-I/O can only be accessed from a single F-runtime group.
- Tags of the F-I/O DB of an F-I/O can only be accessed from one F-runtime group and only from that F-runtime group from which the channels or value status of this F-I/O are also accessed (if access is made).
- F-FBs can be used in more than one F-runtime group but they must be called with different instance DBs.
- Instance DBs can only be accessed from the F-runtime group in which the associated F-FB is called.
- Individual tags of F-DBs (except the F-shared DB) can only be used in one F-runtime group (however, an F-DB can be used in more than one F-runtime group).
- (S7-300, S7-400) A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", but only read-accessed by the "receiver" F-runtime group.
- (S7-300, S7-400) Individual tags of the F-runtime group DB can only be used in that F-runtime group.
- (S7-300, S7-400) An F-communication DB can only be accessed from one F-runtime group.
- (S7-1200, S7-1500) You must not call the main safety block yourself. It is automatically called by the assigned F-OB.
- (S7-1200, S7-1500). The F-OB should be created with the highest priority of all OBs.
- (S7-300, S7-400) The main safety block may only be called once from a standard block. Multiple calls can cause the F-CPU to go to STOP mode.
- (S7-300, S7-400) For optimal use of temporary local data, you must call the F-runtime group (the main safety block) directly in an OB (cyclic interrupt OB, if possible); you should not declare any additional temporary local data in this cyclic interrupt OB.
- (S7-300, S7-400) Within a cyclic interrupt OB, the F-runtime group should be executed **before** the standard user program; i.e. it should be called at the very beginning of the OB, so that the F-runtime group is always called at fixed time intervals, regardless of how long it takes to process the standard user program.

  For this reason, the cyclic interrupt OB should also not be interrupted by higher priority interrupts.

- The process image inputs and outputs of standard I/O, bit memory, and tags of DBs in the standard user program may be accessed either as read-only or read/write from more than one F-runtime group. (See also Data exchange between standard user program and safety program (Page 159))
- F-FCs can generally be called in more than one F-runtime group.

Note

You can improve performance by writing sections of the program that are not required for the safety function in the standard user program.

When determining which elements to include in the standard user program and which to include in the safety program, you should keep in mind that the standard user program can be modified and downloaded to the F-CPU more easily. In general, changes in the standard user program do not require an acceptance.

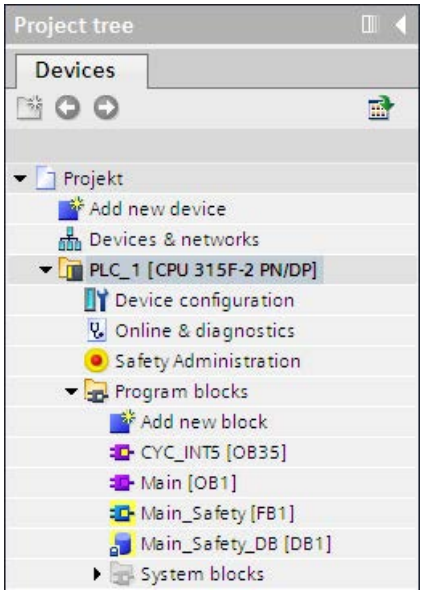
5.2.2 Procedure for defining an F-runtime group (S7-300, S7-400)

Requirements

In your project, you have selected an S7-300 or S7-400 F-CPU from the "Hardware catalog" task card and inserted it into the *hardware and network editor*. In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default. You see the (F-)blocks of the F-runtime group (CYC_INT5 [OB 35], Main_Safety [FB 1], and Main_Safety_DB [DB1] in the project tree when you open the "Program blocks" folder.

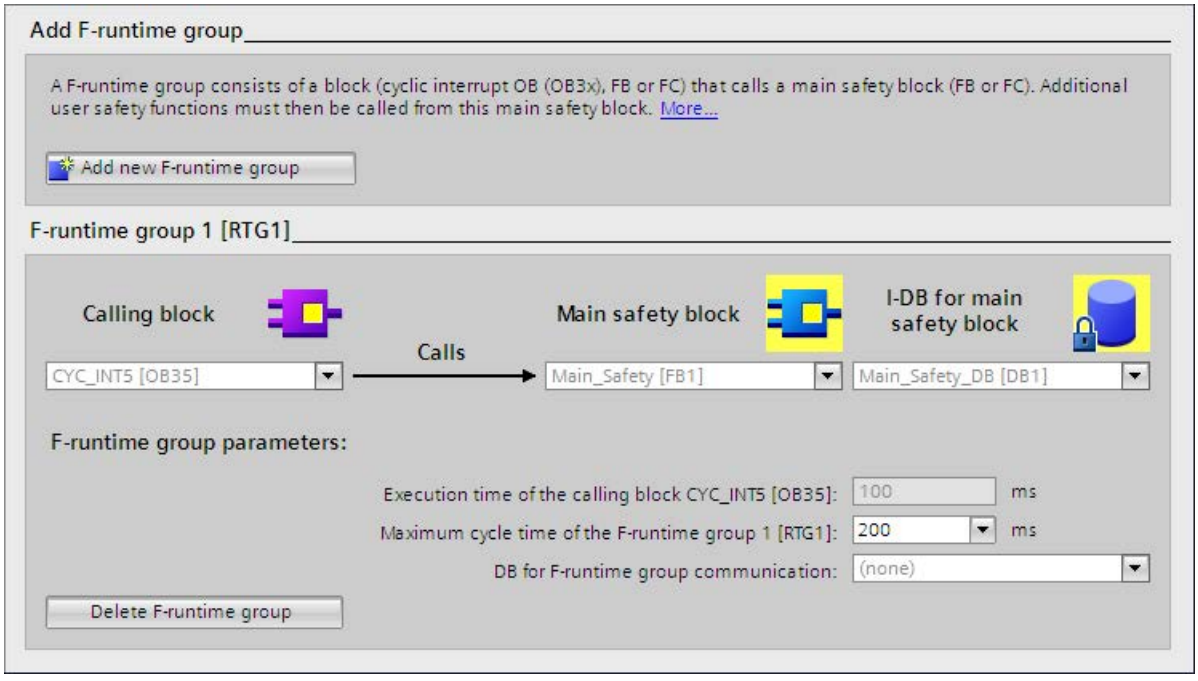


Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Specify the block in which the main safety block is to be called.

   Cyclic interrupt OB 35 is suggested here by default. The advantage of using cyclic interrupt OBs is that they interrupt the cyclic program execution in OB 1 of the standard user program at fixed time intervals; that is, the safety program is called and executed at fixed time intervals in a cyclic interrupt OB.

   In this input field, you can select only those blocks that were created in the LAD, FBD, or STL programming language. If you select a block here, the call is inserted automatically into the selected block and, if necessary, removed from a previously selected block.

   If you want to call the main safety block in a block that was created in another programming language, you must program this call itself. The input field is then not editable (grayed out), and you can change the call only in the calling block and not the Safety Administration Editor.

4. Assign the desired main safety block to the F-runtime group. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety [FB1] and Main_Safety_DB [DB1]) are suggested by default.

5. The F-CPU monitors the F-cycle time in the F-runtime group. For "Maximum cycle time of F-runtime group", enter the maximum permitted time between two calls of this F-runtime group.

   WARNING

   The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 409) from the "Instructions" task card and not using counters (OB calls). *(S007)*

6. If one F-runtime group is to provide tags for evaluation to another F-runtime group of the safety program, assign a DB for F-runtime group communication. Select an F-DB for "DB for F-runtime group communication". (See also Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400) (Page 110))
7. **Create an additional F-runtime group** by clicking the "Add new F-runtime group" button.
8. Assign an F-FB or F-FC as the main safety block to a calling block. This F-FB or F-FC is automatically generated in the project tree, if not already present.
9. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
10. Follow steps 3 and 4 above to complete generation of the second F-runtime group.

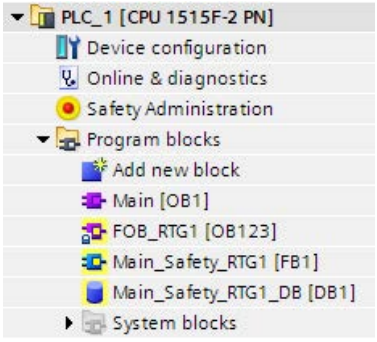
5.2.3 Procedure for defining an F-runtime group (S7-1200, S7-1500)

Requirements

In your project, you have selected an S7-1200/1500 F-CPU from the "Hardware catalog" task card and inserted it into the *hardware and network editor*. In the "Properties" tab of the F-CPU, the "F-capability activated" check box is selected (default setting).

F-runtime group created by default

STEP 7 Safety inserts F-blocks for an F-runtime group in the project tree by default. The (F-)blocks of the F-runtime group (FOB_RTG1 [OB123], Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1]) are shown in the project tree when you open the "Program blocks" folder.

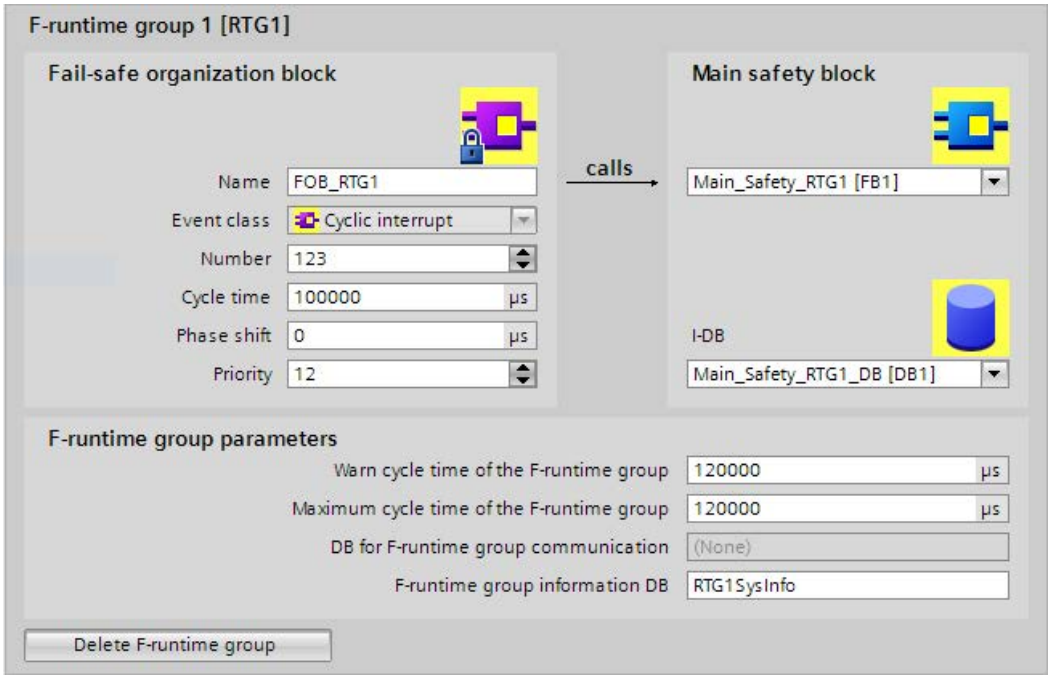


Procedure for defining an F-runtime group

Proceed as follows to define an F-runtime group:

1. Open the *Safety Administration Editor* by double-clicking in the project tree.
2. Select "F-runtime group" in the area navigation.

   Result: The work area for defining an F-runtime group with the (default) settings for F-runtime group 1 opens.



3. Assign a name for the F-OB under "F-OB". The F-OB calls the main safety block.

   By default, the F-OB is created with the event class "cyclic interrupt OB". The advantage of the event class "cyclic interrupt OB" is that the F-OB calls the main safety block, and therefore the safety program, at set intervals.

4. Assign the F-OB a number.

5. Assign parameters for the cycle time, phase shifting and priority of the F-OB.

   Select a cycle time which is less than the "Maximum cycle time of F-runtime group" and less than the "Cycle time warning limit of F-runtime group".

   Select a phase shift which is less than the cycle time.

   Note

   You can also specify the event class "cyclic" for the F-OB. Keep in mind that the F-OB has the lowest priority in this case and that the runtime as well as the reaction time of the safety program are also influenced by the standard user program.

   Note

   We recommend creating the F-OB with the highest priority of all OBs. This will ensure:
   - Defined response times
   - Guaranteed data consistency during data communication between the standard and safety program. See also Data exchange between standard user program and safety program (Page 159).

6. Assign the calling main safety block to the F-OB. If the main safety block is an FB, you must also assign an instance DB.

   Main_Safety_RTG1 [FB1] and Main_Safety_RTG1_DB [DB1] are suggested by default.

7. The F-CPU monitors the F-cycle time in the F-runtime group. Two parameters are available:
   - If "Cycle time warning limit of F-runtime group" is exceeded, an entry is written to the diagnostics buffer of the F-CPU. This parameter can, for example, be used to determine whether the cycle time exceeds a required value without the F-CPU switching to STOP mode.
   - If "Maximum cycle time of F-runtime group" is exceeded, the F-CPU switches to STOP mode. For "Maximum cycle time of F-runtime group", select the maximum permitted time between two calls of this F-runtime group (maximum of 20000000 µs).

     ⚠ WARNING

     The F-runtime group call interval is monitored for the maximum value; i.e. monitoring is performed to determine whether the call is executed often enough, but not whether it is executed too often. Fail-safe timers must therefore be implemented using the TP, TON, or TOF instructions (Page 409) from the "Instructions" task card and not using counters (OB calls). *(S007)*

   "Cycle time warning limit of F-runtime group" must be configured as less than or equal to the "Maximum cycle time of F-runtime group".

8. Assign a symbolic name for the F-runtime group DB (Page 115) under "F-runtime group DB".
9. **Create an additional F-runtime group** by clicking the "Add new F-runtime group" button.

10. If the main safety block is an F-FB, assign an instance DB to the main safety block. The instance DB is generated automatically in the project tree.
11. Follow steps 3 to 6 above to complete generation of the second F-runtime group.

5.2.4 Safety-related communication between the F-runtime groups of a safety program (S7-300, S7-400)

Safety-related communication between F-runtime groups

Safety-related communication can take place between the two F-runtime groups of a safety program. This means fail-safe tags can be provided by one F-runtime group in an F-DB and read in another F-runtime group.

Note

A DB for F-runtime group communication can be read and write accessed by the F-runtime group to which it was assigned as "DB for runtime group communication", while it can only be read-accessed by the "receiver" F-runtime group.

Tip: You can improve performance by structuring your safety program in such a way that as few tags as possible are exchanged between the F-runtime groups.

Procedure for defining a DB for F-runtime group communication

You define the DB for F-runtime group communication in the work area "F-runtime groups". Proceed as follows:

1. Click "F-runtime groups" in "*Safety Administration Editor*".
2. Select an existing F-DB in the "DB for F-runtime group communication" field or assign a new one.
3. Assign a symbolic name for the F-DB.

Up-to-dateness of tags read from another F-runtime group

Note

Tags read are up-to-date as at the time of the last completed processing cycle of the F-runtime group providing the tags prior to start-up of the F-runtime group reading the tags.

If the tags supplied undergo multiple changes during runtime of the F-runtime group supplying the tags, the F-runtime group reading the tags only receives the last change (see figure below).

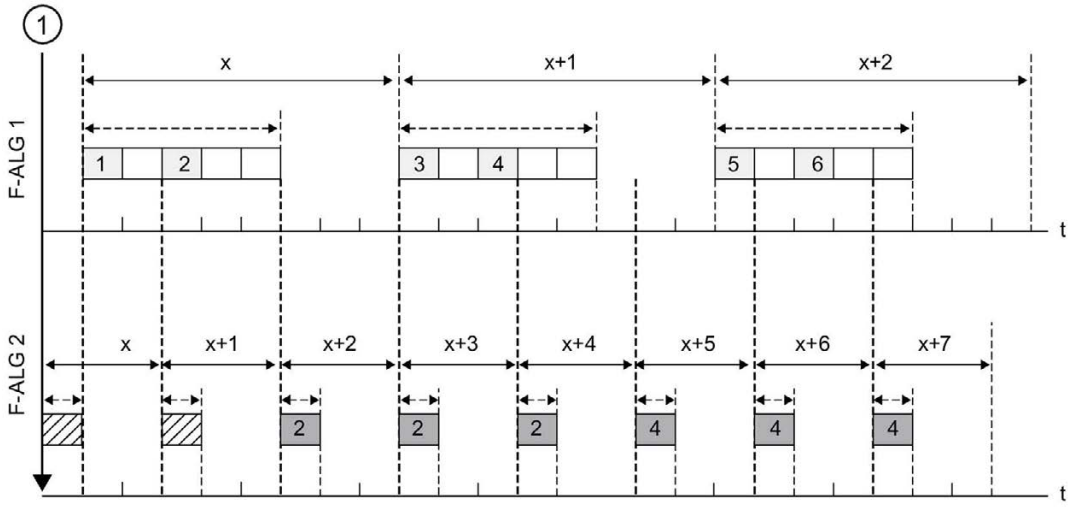
Assignment of fail-safe values

After F-system start-up, fail-safe values are supplied to the F-runtime group which has read access to tags in the DB for F-runtime group communication of another F-runtime group (for example, F-runtime group 2). These are the values you specified as initial values in the DB for F-runtime group communication of F-runtime group 1.

F-runtime group 2 reads the fail-safe values the first time it is called. The second time the F-runtime group 2 is called, it reads the latest tags if F-runtime group 1 has been processed completely between the two calls of F-runtime group 2. If F-runtime group 1 has not been processed completely, F-runtime group 2 continues to read the fail-safe values until F-runtime group 1 is completely processed.

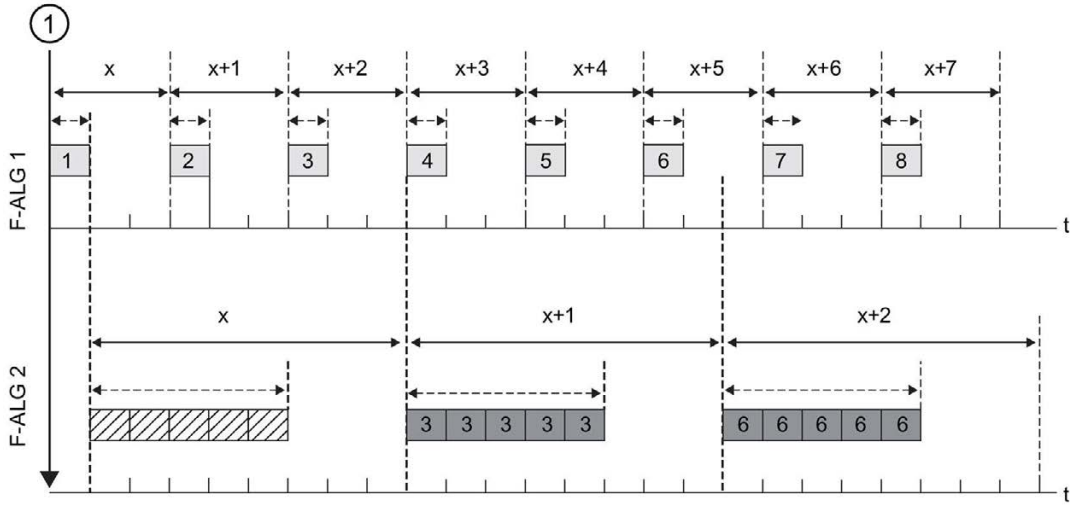
The behavior is illustrated in the two figures below.

Reading tags from F-runtime group 1, which has a longer OB cycle and lower priority than F-runtime group 2



①	Startup of F-system
⟷	Cycle time of the (F-)OB in which the F-runtime group is called.
⟷ (dashed)	Runtime of the F-runtime group
1	... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1
2	...Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1
▨	Initial value in the DB for F-runtime group communication

Reading tags from F-runtime group 1, which has a shorter OB cycle and higher priority than F-runtime group 2



① Startup of F-system

Cycle time of the (F-)OB in which the F-runtime group is called.

Runtime of the F-runtime group

1 ... Tag of F-runtime group 1, written to DB for F-runtime group communication of F-runtime group 1

2 ... Tag of F-runtime group 2, read in DB for F-runtime group communication of F-runtime group 1

Initial value in the DB for F-runtime group communication

F-runtime group supplying tags is not processed

Note

If the F-runtime group whose DB for F-runtime group communication is to supply the tags is not processed (the main safety block of the F-runtime group is not called), the F-CPU goes to STOP mode. One of the following diagnostic events is then entered in the diagnostic buffer of the F-CPU:

- Error in safety program: cycle time exceeded
- Number of the relevant main safety block (of F-runtime group that is not processed)
- Current cycle time in ms: "0"

5.2.5 F-shared DB (S7-300, S7-400)

Function

The F-shared DB is a fail-safe data block that contains all of the shared data of the safety program and additional information needed by the F-system. The F-shared DB is automatically inserted when the hardware configuration is compiled.

Using its name F_GLOBDB, you can evaluate certain data elements of the safety program in the standard user program.

Reading an F-shared DB in the standard user program

You can read out the following information in the F-shared DB in the standard user program or on an operator control and monitoring system:

- Operating mode: safety mode or disabled safety mode ("MODE" tag)
- Error information "Error occurred when executing safety program" ("ERROR" tag)
- Collective F-signature ("F_PROG_SIG" tag)
- Compilation date of the safety program ("F_PROG_DAT" tag, DATE_AND_TIME data type)

You use fully qualified access to access these tags (e.g. ""F_GLOBDB".MODE").

5.2.6 F-runtime group information DB (S7-1200, S7-1500)

Introduction

The F-runtime group information DB provides key information on the corresponding F-runtime group and on the safety program as a whole.

The F-runtime group information DB is generated automatically when an F-runtime group is created. A symbol, for example, "RTG1SysInfo", is assigned for the F-runtime group information DB. You have the option of changing the symbol in SAE.

Information in the F-runtime group information DB

The F-runtime group information DB provides the following information:

Symbolic name		Data type	For processing in the safety program	For processing in the standard user program	Description
MODE		BOOL	x	x	1 = Disabled safety mode
F_SYSINFO					
	MODE	BOOL	—	x	1 = Disabled safety mode
	TCYC_CURR	DINT	—	x	Current cycle time of the F-runtime group, in ms
	TCYC_LONG	DINT	—	x	Longest cycle time of the F-runtime group, in ms
	TRTG_CURR	DINT	—	x	Current runtime of the F-runtime group, in ms
	TRTG_LONG	DINT	—	x	Longest runtime of the F-runtime group, in ms
	T1RTG_CURR	DINT	—	x	Not supported by *STEP 7 Safety V13 SP1*.
	T1RTG_LONG	DINT	—	x	Not supported by *STEP 7 Safety V13 SP1*.
	F_PROG_SIG	DWORD	—	x	Collective F-signature of the safety program
	F_PROG_DAT	DTL	—	x	Compilation date of the safety program
	F_RTG_SIG	DWORD	—	x	Collective F-signature of the F-runtime group
	F_RTG_DAT	DTL	—	x	Compilation date of the F-runtime group
	VERS_S7SAF	DWORD	—	x	Version identifier for *STEP 7 Safety*

You access the content of the F-runtime group information DB with fully qualified addressing. Either collectively with the F_SYSINFO PLC data type, for example, "RTG1SysInfo.F_SYSINFO", provided by the F-system or individual information, for example, "RTG1SysInfo.F_SYSINFO.MODE".

5.2.7 Deleting an F-runtime group

Deleting an F-runtime group

To delete an F-runtime group, proceed as follows:

1. In the area navigation of the *Safety Administration Editor*, click on the F-runtime group to be deleted.
2. Select the "Delete F-runtime group" button in the work area.
3. Confirm the dialog with "Yes".
4. Compile the safety program (Page 265) (menu command "Edit > Compile") to put your changes into effect.

The assignment of the F-blocks to an F-runtime group (to the calling block of the main safety block) is deleted. However, the F-blocks continue to exist.

Note

If you want to delete your safety program, delete all F-blocks outside the System blocks folder in the project tree.

F-blocks that do not allow deletion are deleted by recompiling the safety program or deactivating F-capability for the F-CPU (see Configuring an F-CPU (Page 42)).

5.2.8 Changing the F-runtime group (S7-300, S7-400)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Specify another block as the calling block of the main safety block.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time of the F-runtime group
- Specify another DB as a data block for F-runtime group communication.

5.2.9 Changing the F-runtime group (S7-1200, S7-1500)

Changing an F-runtime group

You can make the following changes for each F-runtime group in your safety program in the corresponding "F-runtime group" work area:

- Change the name, number, cycle time, phase shift and priority of the F-OB.
- Specify another F-FB or F-FC as main safety block.
- Enter a different or new I-DB for the main safety block.
- Change the value for the maximum cycle time and the cycle time warning limit of the F-runtime group.
- Assign another symbolic name for the F-runtime group information DB.

Copying F-OB

The F-OB in the "Program blocks" folder reacts like a standard OB.

You should not copy an F-OB to another F-CPU. Copying an F-OB to another F-CPU terminates the F-OB connection to the main safety block. The F-OB is stored in the destination F-CPU as a block. It is not connected to an F-runtime group. You can UNDO these actions.

5.3 Creating F-blocks in FBD / LAD

5.3.1 Creating F-blocks

Introduction

In order to create F-FBs, F-FCs, and F-DBs for the safety program, you should follow the same basic procedure as for standard blocks. In the following, only the deviations from the procedure for standard blocks are presented.

Creating F-FBs, F-FCs, and F-DBs

You create F-blocks in the same way as for standard blocks. Proceed as follows:

1. Double-click on "Add new block" under "Program blocks" in the project tree.
2. In the dialog that appears, specify the type, name, and language and select the "Create F-block" check box. (If you do not select the check box, a standard block is created.)
3. After the dialog is confirmed, the F-block is opened in the *Program editor*.

Note the following

Note the following important instructions:

Note

The main safety block must not contain any parameters, as they cannot be provided with actual values when the block is called.

Note

Editing the start values in instance DBs of F-FBs is not permitted online or offline and can cause the F-CPU to switch to STOP mode.

Note

It is not permitted to access static local data in single instances or multi-instances of other F-FBs.

Note

Outputs of F-FCs must always be initialized.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

If you wish to assign an operand from the data area (data block) to a formal parameter of an F-FC as an actual parameter, you must use fully qualified DB access. (S7-300, S7-400)

Note

Note that access to the inputs in an F-FB/F-FC is read-only, while access to the outputs is write-only.

Use an in/out if you wish to have both read and write access.

Note

For greater clarity, assign unique symbolic names to the F-blocks you have created. These symbolic names appear in the project tree and in the block interface. Symbolic names are assigned in the same way as for standard blocks.

Copying/pasting F-blocks

You can copy F-FBs, F-FCs, and F-DBs in exactly the same was as blocks of the standard user program.

(S7-1200, S7-1500) Information on copying an F-OB is provided in Changing the F-runtime group (S7-1200, S7-1500) (Page 117).

Exception:

You must not copy blocks from the folder "Program blocks > System blocks".

Nesting depth for F-FBs and F-FCs

We recommend that you do not exceed a nesting depth of 8 levels.

If you exceed this, a warning is reported during compilation for S7-1200/1500 F-CPUs.

5.3.2 Using libraries

Introduction

As with standard blocks, you have the option of storing F-blocks which you wish to reuse as master copy or types in global libraries or in the project library.

Additional information can be found in the *STEP 7* help in "Using libraries".

Reusing F-blocks which have already been tested and accepted

Please note the following when reusing F-blocks which have already been tested and if applicable also accepted:

- Document the signature and, if applicable, also the initial value signature of the F-block for S7-300/400 F-CPUs after you have finished compiling, testing, and accepting the F-block, if necessary.
- Document the version set for "Instructions (without their own version)" in the Safety Administration Editor under "Settings"/"System library elements used in safety program".

  For documentation purposes, you can create a safety summary of the safety program you used to create the F-block.
- When using the F-block again, make sure that the signature and, if applicable, the initial value signature of the F-block for S7-300/400 F-CPUs are unchanged.

For F-blocks with instructions for which a version is indicated in the "Version" column of the "Instructions" task card, you must also note the following:

- Document the versions of these instructions that were set at the time the F-block was compiled and on the basis of which the F-block was tested and, if applicable, approved.

  You can use the safety summary for documentation purposes.
- When using the F-block again make sure that the documented versions are set for these instructions in the "Instructions" task card.
- If versions other than the documented versions are set for these instructions, you must check yourself whether the F-block still works with these versions as intended.

  To do so, identify any differences between the versions based on the online help on the instructions.

  If there are differences you have to retest the F-block and have it accepted if necessary. Additional information on instruction versions can be found in the help on *STEP 7* in "Basics for instruction versions".

To help you manage F-blocks that you wish to reuse and that have already been tested and if applicable accepted, we recommend that you save these blocks as types in a global library.

5.4 Programming startup protection

Introduction

⚠ WARNING

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The F-system automatically reintegrates the F-I/O.

An operating error or an internal error can also trigger a startup of the safety program with the values from the load memory. If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S008)*

Example of restart/startup prevention

In order to implement a restart/startup prevention, it must be possible to detect a startup. To detect a startup, you declare a tag of data type BOOL with initial value "TRUE" in an F-DB.

Block the output of process data when this tag has the value "1," for example, by passivating F-I/O using the PASS_ON tag in the F-I/O DB.

To manually enable the output of process data, you reset this tag by means of a user acknowledgment.

F-I/O DB (Page 129)

F-I/O access

6

6.1 F-I/O access

Overview

The following describes how you can access the F-I/O and the special characteristics you must consider when programming this access.

Access via the process image

As with standard I/O, you access F-I/O (e.g., ET 200MP fail-safe modules) via the **process image** (PII and PIQ).

Access here is only permitted via the corresponding channel for the specified data type.

Example: To access input channels of data type BOOL in the process input image of F-I/O, you must use the "input (bit)" (I x.y) unit. Access to the 16 consecutive input channels of the data type BOOL via the unit "input word" (IW x) is not possible.

Direct I/O access is not permitted. Inputs or outputs of the F-I/O to which you have access must be enabled in the hardware configuration. You must not access the channel value/value status of an F-I/O from various F-runtime groups. The first programmed access defines the assignment for the F-runtime group.

The process image of the inputs is updated at the start of the F-runtime group. The process image of the outputs is updated at the end of the F-runtime group (see Program structure of the safety program (S7-300, S7-400) (Page 85) or Program structure of the safety program (S7-1200, S7-1500) (Page 87)). For additional information on updating the process image, refer to the note in Data Transfer from the Safety Program to the Standard User Program (Page 160).

The actual communication between the F-CPU (process image) and the F-I/O for the purpose of updating the process image takes place in the background using a special safety protocol in accordance with PROFIsafe.

⚠ WARNING

If you use an additional component between the F-CPU (S7-300/400) and the F-I/O that copies the safety frame in accordance with PROFIsafe between the F-CPU (S7-300/400) and F-I/O per user program, you must test all safety functions affected by the copy function whenever you change the user-programmed copy function. *(S049)*

Note

Due to the special safety protocol, the F-I/O occupies a larger area of the process image than is required for the existing and enabled channels on the F-I/O (channel values and value status). To find the area of the process image where the channels are stored, refer to the relevant *manuals for the F-I/O*. When the process image is accessed in the safety program, only the channels that are actually present may be accessed.

Note that for certain F-I/O (such as ET 200SP fail-safe modules or ET 200MP fail-safe modules), a "1oo2 evaluation of the sensors can be specified. To find out which of the channels combined by the "1oo2 evaluation of the sensors" you can access in the safety program, refer to the relevant manuals for the F-I/O.

Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 210)

Value status (S7-1200, S7-1500) (Page 124)

6.2 Value status (S7-1200, S7-1500)

Properties

The value status is additional binary information for the channel value of an F-I/O. The value status is entered in the process image input (PII).

The value status is supported by ET 200MP, ET 200SP, ET 200S, ET 200iSP, ET 200pro, S7-1200 fail-safe modules or S7-300 F-SMs and fail-safe GSD based I/O devices which support the "RIOforFA-Safety" profile.

We recommend you assign the name for the channel value amended with "_VS" as a symbolic name for the value status, for example, "TagIn_1_VS".

The value status provides information on the validity of the corresponding channel value:

- 1: A valid process value is output for the channel.
- 0: A fail-safe value is output for the channel.

The channel value and value status of an F-I/O can only be accessed from the same F-runtime group.

Location of value status bits in the PII for F-I/O with digital inputs

The value status bits come straight after the channel values in the PII.

Table 6- 1 Example: Address assignment in PII for F-I/O with 16 digital input channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
x + 1	DI_{15}	DI_{14}	DI_{13}	DI_{12}	DI_{11}	DI_{10}	DI_9	DI_8
x + 2	Value status DI_7	Value status DI_6	Value status DI_5	Value status DI_4	Value status DI_3	Value status DI_2	Value status DI_1	Value status DI_0
x + 3	Value status DI_{15}	Value status DI_{14}	Value status DI_{13}	Value status DI_{12}	Value status DI_{11}	Value status DI_{10}	Value status DI_9	Value status DI_8

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs

The value status bits in the PII are mapped with the same structure as the channel values in the PIQ.

Table 6- 2 Example: Address assignment in PIQ for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

Table 6- 3 Example: Address assignment in PII for F-I/O with 4 digital output channels

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with digital outputs and digital inputs

The value status bits come directly after the channel values in the PII in the following order:

- Value status bits for the digital inputs
- Value status bits for the digital outputs

Table 6- 4 Example: Address assignment in PIQ for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

Table 6- 5 Example: Address assignment in PII for F-I/O with 2 digital input channels and 1 digital output channel

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status DI_1	Value status DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

The location of the channel values in the PII and PIQ can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog inputs

The value status bits come directly after the channel values in the PII.

Table 6- 6 Example: Address assignment in PII for F-I/O with 6 analog input channels (data type INT)

Byte in the F-CPU	Assigned bytes/bits in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AI_0							
...	...							
x + 10	Channel value AI_5							
x + 12	—	—	Value status AI_5	Value status AI_4	Value status AI_3	Value status AI_2	Value status AI_1	Value status AI_0

x = Module start address

The location of the channel values in the PII can be found in the device manual for the F-I/O.

Location of value status bits in the PII for F-I/O with analog outputs

The value status bits are mapped in the PII.

Table 6- 7 Example: Address assignment in PIQ for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bytes in the F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	Channel value AO_0							
...	...							
x + 10	Channel value AO_5							

x = Module start address

Table 6- 8 Example: Address assignment in PII for F-I/O with 6 analog output channels (data type INT)

Byte in the F-CPU	Assigned bits in F-CPU per F-I/O:							
	7	6	5	4	3	2	1	0
x + 0	—	—	Value status AO_5	Value status AO_4	Value status AO_3	Value status AO_2	Value status AO_1	Value status AO_0

x = Module start address

The location of the channel values in the PIQ can be found in the device manual for the F-I/O.

6.3 Process Data or Fail-Safe Values

When are fail-safe values used?

The safety function requires that fail-safe values (0) be used instead of process data for passivation of the entire F-I/O or individual channels of an F-I/O in the following cases. This applies both to digital channels (data type BOOL) as well as for analog channels (data type INT or DINT):

- When the F-system starts up
- When errors occur during safety-related communication (communication errors) between the F-CPU and F-I/O using the safety protocol in accordance with PROFIsafe
- When F-I/O faults and channel faults occur (such as wire break, short circuit, and discrepancy errors)
- As long as you enable passivation of the F-I/O with PASS_ON = 1 in the F-I/O DB (see below)

Fail-safe value output for F-I/O/channels of an F-I/O

When **passivation** occurs for an **F-I/O with inputs**, the F-system provides the safety program with fail-safe values (0) in the PII instead of the process data pending at the fail-safe inputs of the F-I/O.

The overflow or underflow of a channel of the **SM 336; AI 6 x 13Bit** or **SM 336; F-AI 6 x 0/4 ... 20 mA HART** is recognized by the F-system as an F-I/O/channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If you want to process fail-safe values other than "0" in the safety program for an F-I/O with inputs **for analog channels of data type INT or DINT**, you can assign individual fail-safe values for QBAD = 1 and value status = 0 or QBAD_I_xx/QBAD_O_xx = 1 (instructions JMP/JMPN, LABEL and MOVE).

⚠ WARNING

For an F-I/O with digital input channels (data type BOOL), the value provided in the PII must always be processed in the safety program, regardless of the value status or QBAD/QBAD_I_xx. *(S009)*

When passivation occurs in an F-I/O with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values in the PIQ provided by the safety program. The F-system overwrites the associated PIQ with fail-safe values (0).

Reintegration of F-I/O/channels of an F-I/O

The switchover from fail-safe values (0) to process data (**reintegration of an F-I/O**) takes place **automatically** or following **user acknowledgment** in the F-I/O DB. The reintegration method depends on the following:

- The reason for passivation of the F-I/O or channels of the F-I/O
- The parameter assignment to be implemented by you in the F-I/O DB (Page 129) or the parameter assignment for the ET 200MP F-modules (S7-1500)/S7-1200 F-modules and possibly GSD based I/O devices according to RIOforFA-Safety profile

Note

Note that for channel faults in the F-I/O, channel-granular passivation takes place if configured accordingly in the *hardware and network editor*. For the concerned channels, fail-safe values (0) are output.

Reintegration after channel faults reintegrates all channels whose faults were eliminated; faulty channels remain passivated.

See also

Configuring F-I/O (Page 47)

6.4 F-I/O DB

Introduction

An F-I/O DB is automatically generated for each F-I/O (in safety mode) when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that you can evaluate or can/must write to in the safety program. It is not permitted to change the initial values of the tags directly in the F-I/O DB. When an F-I/O is deleted, the associated F-I/O DB is also deleted.

Access to an F-I/O DB

You access tags of the F-I/O DB for the following reasons:

- For reintegration of F-I/O after communication errors, F-I/O faults, or channel faults
- If you want to passivate the F-I/O depending on particular states of your safety program (for example, group passivation)
- For changing parameters for fail-safe GSD based DP slaves/GSD based I/O devices
- If you want to evaluate whether fail-safe values or process data are output

6.4.1 Tags of the F-I/O DB

The following table shows the tags of an F-I/O DB:

	Tag	Data type	Function	Initial value
Tags that you can or must write	PASS_ON	BOOL	1=enable passivation	0
	ACK_NEC	BOOL	1=acknowledgment for reintegration required in the event of F-I/O or channel faults	1
	ACK_REI	BOOL	1=acknowledgment for reintegration	0
	IPAR_EN	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
Tags that you can evaluate	PASS_OUT	BOOL	Passivation output	1
	QBAD	BOOL	1=Fail-safe values are output	1
	ACK_REQ	BOOL	1=Acknowledgment request for reintegration	0
	IPAR_OK	BOOL	Tag for parameter reassignment of fail-safe GSD based DP slaves/GSD based I/O devices or, in the case of SM 336; F-AI 6 x 0/4 ... 20 mA HART, for enabling HART communication	0
	DIAG	BYTE	Service information	
	QBAD_I_xx	BOOL	1=fail-safe values are output to input channel xx (S7-300/400)	1
	QBAD_O_xx	BOOL	1=fail-safe values are output to output channel xx (S7-300/400)	1

Differences in evaluation in S7-1200/1500 F-CPUs and S7-300/400

The following table describes the differences in the evaluation of tags of the F-I/O DB and the value status depending on the F-I/O and F-CPU used.

Tag in the F-I/O DB or value status	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPU	F-I/O with S7-300/400 F-CPU
ACK_NEC	—[2]	x	x
QBAD	x[3]	x	x
PASS_OUT	x[3]	x	x
QBAD_I_xx[1]	—	—	x
QBAD_O_xx[1]	—	—	x
Wertstatus[1]	x	x	—

1 QBAD_I_xx and QBAD_O_xx indicate the validity of the channel value on a channel-granular basis and are therefore equivalent to the value status in S7-1200. Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves or fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

2 Via F-I/O configuration; for ET 200MP/S7-1200 fail-safe modules using the "Channel failure acknowledge" parameter

3 For details about the characteristics, see "PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status" below

6.4.1.1 PASS_ON

The PASS_ON tag allows you to enable passivation of an F-I/O, for example, depending on particular states in your safety program.

Using the PASS_ON tag in the F-I/O DB, you can passivate F-I/O; channel-granular passivation is not possible.

As long as PASS_ON = 1, **passivation** of the associated F-I/O occurs.

6.4.1.2 ACK_NEC

If an F-I/O fault is detected by the F-I/O, **passivation** of the relevant F-I/O occurs. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. Once the F-I/O fault or channel fault has been eliminated, **reintegration** of the relevant F-I/O occurs, depending on ACK_NEC:

- With ACK_NEC = 0, you can assign an **automatic reintegration**.
- With ACK_NEC = 1, you can assign a **reintegration** by **user acknowledgment**.

WARNING

Assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

Note

The initial value for ACK_NEC is 1 after creation of the F-I/O DB. If you do not require automatic reintegration, you do not have to write ACK_NEC.

6.4.1.3 ACK_REI

When the F-system detects a communication error or an F-I/O fault for an F-I/O, the relevant F-I/O is passivated. If channel faults are detected and channel granular passivation is configured, the relevant channels are passivated. If passivation of the entire F-I/O is configured, all channels of the relevant F-I/O are passivated. **Reintegration** of the F-I/O/channels of the F-I/O after elimination of faults requires a **user acknowledgment** with a positive edge at the ACK_REI tag of the F-I/O DB:

- After every communication error
- After F-I/O or channel faults only with parameter assignment "Channel failure acknowledge =

  Manually" or ACK_NEC = 1

Reintegration after channel faults reintegrates all channels whose faults were eliminated.

Acknowledgment is not possible until tag ACK_REQ = 1.

In your safety program, you must provide a user acknowledgment by means of the ACK_REI tag for each F-I/O.

WARNING

For the user acknowledgment, you must interconnect the ACK_REI tag of the F-I/O DB with a signal generated by an operator input. An interconnection with an automatically generated signal is not permitted. *(S011)*

Note

Alternatively, you can use the "ACK_GL" instruction to carry out reintegration of the F-I/O following communication errors or F-I/O/channel faults (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 407)).

6.4.1.4 IPAR_EN

The IPAR_EN tag corresponds to the iPar_EN_C tag in the PROFIsafe bus profile as of PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out when this tag must be set or reset when parameters of fail-safe GSD based DP slaves/GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

Note that IPAR_EN = 1 does not trigger passivation of the relevant F-I/O.

If passivation is to occur when IPAR_EN = 1, you must also set tag PASS_ON = 1.

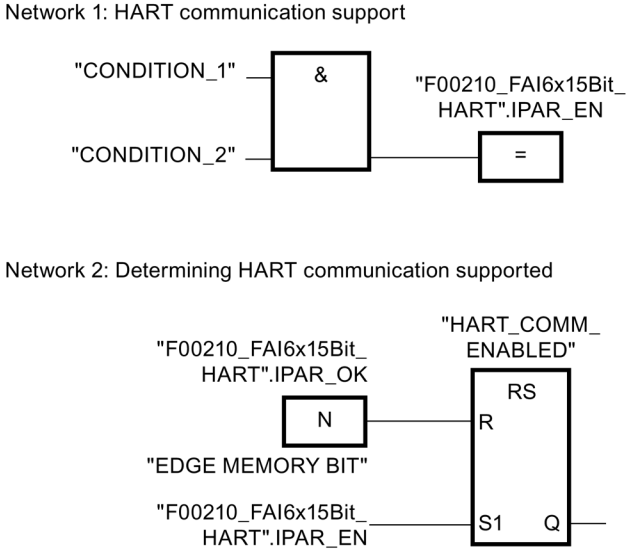
HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART

If you set the IPAR_EN tag to "1" while parameter "HART_Tor" = "switchable" is assigned, the HART communication for the SM 336; F-AI 6 x 0/4 ... 20 mA HART is enabled. Setting this tag to "0" disables the HART communication. The F-SM acknowledges the enabled or disabled HART communication with tag IPAR_OK = 1 or 0.

Enable HART communication only when your system is in a status, in which any reassignment of parameters for an associated HART device can be done without any risk.

If you want to evaluate the "HART communication enabled" status in your safety program, e.g., for the purpose of programming interlocks, you must build up the information as shown in the following example. This is necessary to ensure that the information is properly available even if communication errors occur while the HART communication is enabled with IPAR_EN = 1. Only change the status of the IPAR_EN tag during this evaluation if there is no passivation due to a communication error or F-I/O or channel fault.

Example of enabling HART communication



Additional information on HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART can be found in the Automation System S7-300, ET 200M Distributed I/O System manual, Fail-Safe Signal Modules (http://support.automation.siemens.com/WW/view/en/19026151) manual and in the online help on the module.

6.4.1.5 PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status

The following table set outs differences in the reaction of the channel values and PASS_OUT, QBAD, QBAD_I_xx/QBAD_O_xx tags and of the value status depending on the F-I/O and F-CPU used.

Fail-safe value output after...	**F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU**	**F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPUs**	**F-I/O with S7-300/400 F-CPU**
Startup of F-system Communication errors F-I/O faults Channel faults in configuration of passivation for complete F-I/O	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
Channel faults during configuration of channel-granular passivation	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
As long as passivation of the F-I/O is activated in the F-I/O DB with PASS_ON = 1	QBAD = 1, PASS_OUT **unchanged** For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD = 1, PASS_OUT **unchanged** For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

6.4.1.6 ACK_REQ

When the F-system detects a communication error or an F-I/O fault or channel fault for an F-I/O, the relevant F-I/O or individual channels of the F-I/O are passivated. ACK_REQ = 1 signals that **user acknowledgment** is required for reintegration of the relevant F-I/O or channels of the F-I/O.

The F-system sets ACK_REQ = 1 as soon as the fault has been eliminated and user acknowledgment is possible. For channel-granular passivation, the F-system sets ACK_REQ = 1 as soon as the channel fault is corrected. User acknowledgment is possible for this fault. Once acknowledgment has occurred, the F-system resets ACK_REQ to 0.

Note

For F-I/O with outputs, acknowledgment after F-I/O or channel faults may only be possible some minutes after the fault has been eliminated, until the necessary test signal is applied (see *F-I/O manuals*).

6.4.1.7 IPAR_OK

The IPAR_OK tag corresponds to the iPar_OK_S tag in the PROFIsafe bus profile, PROFIsafe Specification V1.20 and higher.

Fail-safe GSD based DP slaves/GSD based I/O devices

To find out how to evaluate this tag when parameters of fail-safe GSD based DP slaves or GSD based I/O devices are reassigned, consult the PROFIsafe Specification V1.20 or higher or the documentation for the fail-safe GSD based DP slave/GSD based I/O device.

For HART communication with SM 336; F-AI 6 x 0/4 ... 20 mA HART see Chapter IPAR_EN (Page 133).

6.4.1.8 DIAG

The DIAG tag provides non-fail-safe information (1 byte) about errors or faults that have occurred for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you perform an acknowledgment with the ACK_REI tag or until automatic reintegration takes place.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Timeout detected by F-I/O	The PROFIBUS/PROFINET connection between F-CPU and F-I/O is faulty. The value of the F-monitoring time for the F-I/O is set too low. The F-I/O are receiving invalid parameter assignment data or	• Check the PROFIBUS/PROFINET connection and ensure that there are no external sources of interference. • Check the parameter assignment of the F-I/O. If necessary, set a higher value for the monitoring time. Recompile the hardware configuration, and download it to the F-CPU. Recompile the safety program. • Check the diagnostics buffer of the F-I/O. • Turn the power of the F-I/O off and back on.
		Internal F-I/O fault or	Replace F-I/O
		Internal F-CPU fault	Replace F-CPU
Bit 1	F-I/O fault or channel fault detected by F-I/O[1]	See *F-I/O manuals*	See *F-I/O manuals*
Bit 2	CRC error or sequence number error detected by F-I/O	See description for bit 0	See description for bit 0
Bit 3	Reserved	—	—
Bit 4	Timeout detected by F-system	See description for bit 0	See description for bit 0
Bit 5	Sequence number error detected by F-system[2]	See description for bit 0	See description for bit 0

Bit 7	Addressing error[3]	—	Contact Service & Support

[1] Not for F-I/O that support the "RIOforFA-Safety" profile.

[2] For S7-300/400 F-CPUs only

[3] For S7-1200/1500 F-CPUs only

6.4.2 Accessing tags of the F-I/O DB

Name of the F-I/O DB

An F-I/O DB is automatically generated for each F-I/O when the F-I/O is configured in the *hardware and network editor* and a name is generated at the same time.

The name is formed by combining the fixed prefix "F", the start address of the F-I/O, and the names entered in the properties for the F-I/O in the *hardware and network editor* (example: F00005_4_8_F_DI_DC24V_1).

Changing the name and number of the F-I/O DB

The name and number of the F-I/O DB are assigned automatically when the F-I/O are configured. You can change the number in the "Properties" tab of the associated F-I/O. You can also change the name and number in the project tree.

Rule for accessing tags of the F-I/O DB

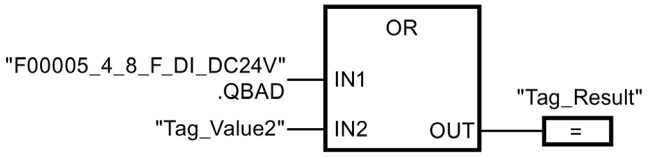
Tags of the F-I/O DB of an F-I/O can only be accessed from the F-runtime group from which the channels of this F-I/O are accessed (if access is made).

"Fully qualified DB access"

You can access the tags of the F-I/O DB with "fully qualified DB access" (that is, by specifying the name of the F-I/O DB and by specifying the name of the tag).

Example of evaluating the QBAD tag

Network 4: fully qualified access to the QBAD tag



6.5 Passivation and reintegration of F-I/O

Overview

In the following you can find information on passivation and reintegration of F-I/O.

Signal sequence charts

The signal sequences presented below represent typical signal sequences for the indicated behavior.

Actual signal sequences and, in particular, the relative position of the status change of individual signals can deviate from the given signal sequences within the scope of known "fuzzy" cyclic program execution factors, depending on the following:

- The F-I/O used
- The F-CPU used
- The cycle time of the (F-)OB in which the associated F-runtime group is called
- The target rotation time of the PROFIBUS DP or the update time of the PROFINET IO

Note

The signal sequences shown refer to the status of signals in the user's safety program.

Contrary to what is shown in the signal charts, the status changes shown between process data and fail-safe values that are transmitted to the fail-safe outputs ("To outputs" signal sequence) can occur before the status change of the associated QBAD signal or value status.

6.5.1 After startup of F-system

Behavior after a startup

Fail-safe value output after startup of the F-system	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
Passivation of the entire F-I/O occurs during startup.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the F-I/O, i.e. the provision of process values in the PII or the transfer of process values provided in the PIQ to the fail-safe outputs, takes place **automatically**, regardless of the setting at the tag ACK_NEC or the configuration "Channel failure acknowledge", no sooner than the second cycle of the F-runtime group after startup of the F-system.

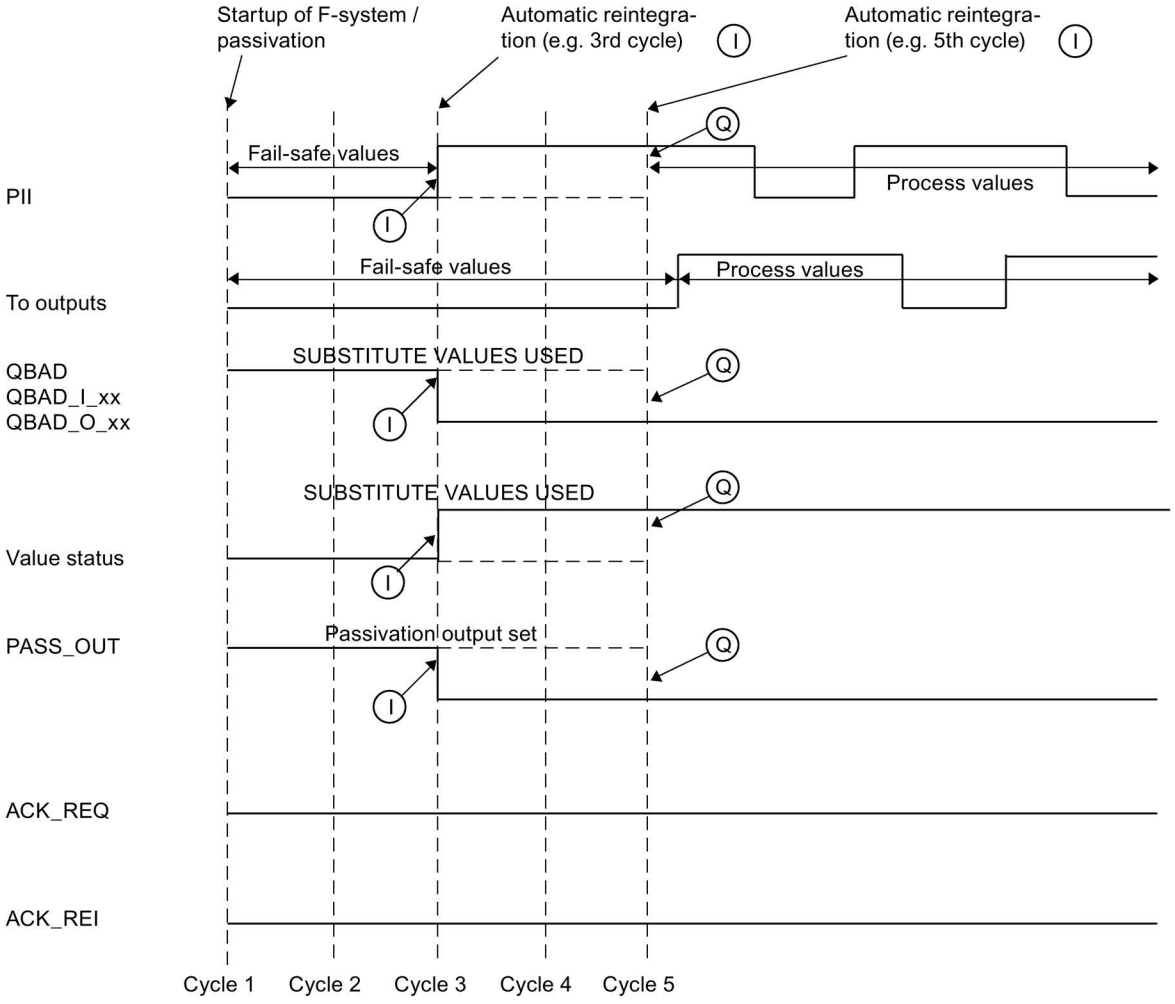
You can find additional information on pending F-communication, F-I/O or channel errors during startup of the F-system in the sections After communication errors (Page 142) and After F-I/O or channel faults (Page 144).

For fail-safe GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based I/O device .

Depending on the F-I/O you are using and the cycle time of the F-runtime group and PROFIBUS DP/PROFINET IO, several cycles of the F-runtime group can elapse before reintegration occurs.

If communication between the F-CPU and F-I/O takes longer to establish than the F-monitoring time set in the properties for the F-I/O, automatic reintegration does not take place.

Signal sequence for passivation and reintegration of F-I/O after F-system startup



(I) For F-I/O with inputs

(Q) For F-I/O with outputs and F-I/O with inputs and outputs

WARNING

When an F-CPU is switched from STOP to RUN mode, the standard user program starts up in the usual way. When the safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The F-system automatically reintegrates the F-I/O, as described above.

An operating error or an internal error can also trigger a startup of the safety program with the values from the load memory. If your process does not allow such a startup, you must program a restart/startup protection in the safety program: The output of process data must be blocked until manually enabled. This enable must not occur until it is safe to output process data and faults have been corrected. *(S008)*

6.5.2 After communication errors

Behavior after communication errors

Fail-safe value output after communication errors	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If a communication error between the F-CPU and the F-I/O is detected, passivation of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

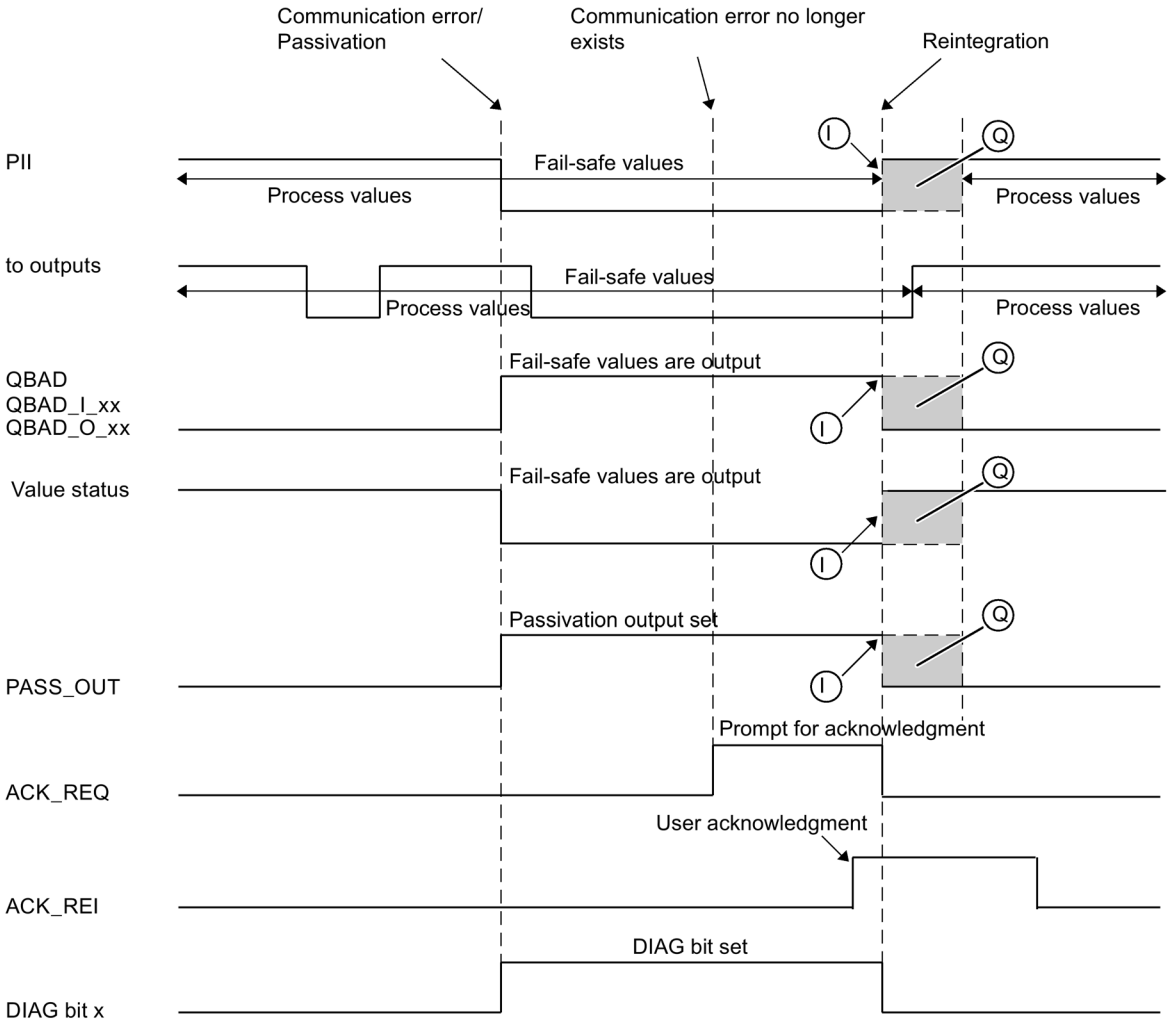
* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the relevant F-I/O, that is, provision of process data in the PII or transfer of process data provided in the PIQ to the fail-safe outputs, takes place only when the following occurs:

- All communication errors have been eliminated and the F-system has set tag ACK_REQ = 1
- A **user acknowledgment** with a positive edge has occurred:
  - At the ACK_REI tag of the F-I/O DB (Page 132) or
  - At the ACK_REI_GLOB input of the "ACK_GL" instruction (ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 407))

Signal sequence for passivation and reintegration of F-I/O after communication errors



Ⓘ for F-I/O with inputs

Ⓠ For F-I/O with outputs and F-I/O with inputs and outputs
(signal trend depends on the F-I/O used and on the S7-1200/1500 or S7-300/400 F-CPU used)

Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 151)

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (S7-300, S7-400, S7-1500) (Page 156)

6.5.3 After F-I/O or channel faults

Behavior after F-I/O faults

Fail-safe value output after F-I/O faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
If an F-I/O fault is detected by the F-system, passivation of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Behavior after channel fault

Fail-safe value output after channel faults	F-I/O with "RIOforFA-Safety" profile with S7-1200/1500 F-CPU	F-I/O without profile "RIOforFA-Safety" with S7-1500 F-CPU	Every F-I/O with S7-300/400 F-CPU
When passivation for **complete** F-I/O is configured: If a channel fault is detected by the F-system, passivation of the entire F-I/O occurs.	QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) Value status = 0*		QBAD and PASS_OUT = 1 For **all** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*
With configuration of **channel-granular** passivation: If a channel fault is detected by the F-system, passivation of the affected channels occurs.	QBAD and PASS_OUT **unchanged** For the **affected** channels: Channel value = fail-safe value (0) Value status = 0	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) Value status = 0*	QBAD and PASS_OUT = 1 For the **affected** channels: Channel value = fail-safe value (0) QBAD_I_xx and QBAD_O_xx = 1*

* Value status or QBAD_I_xx and QBAD_O_xx are not available for fail-safe GSD based DP slaves and fail-safe GSD based I/O devices without the "RIOforFA-Safety" profile.

Reintegration of F-I/O

Reintegration of the relevant F-I/O or the relevant channels of the F-I/O, that is, provision of process data in the PII or transfer of process data provided in the PIQ to the fail-safe outputs, takes place only when the following occurs:

- All F-I/O or channel faults have been eliminated.

If you have configured channel-granular passivation for the F-I/O, the relevant channels are reintegrated once the fault is corrected; any faulty channels remain passivated.

Reintegration is performed depending on your setting for the ACK_NEC tag or the "Channel failure acknowledge" parameter (configuration of the ET 200MP F-module and S7-1200 F-module)

- With ACK_NEC = 0 or the configuration "Channel failure acknowledge = automatic", **automatic reintegration** is performed as soon as the F-system detects that the fault has been corrected. For F-I/O with inputs, reintegration takes place right away. For F-I/O with outputs or F-I/O with inputs and outputs, depending on the F-I/O you are using, reintegration can take several minutes, first after the necessary test signals have been applied, which are used by the F-I/O to determine that the fault has been eliminated.
- With ACK_NEC = 1 or the configuration "Channel failure acknowledge = manual", reintegration is performed only as a result of user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB or at the ACK_REI_GLOB input of the "ACK_GL" instruction. Acknowledgment can be made as soon as the F-system detects that the fault has been eliminated and tag ACK_REQ = 1 has been set.

  For fail-safe GSD based I/O devices with "RIOforFA-Safety" profile, consult the respective documentation for the fail-safe GSD based I/O device .

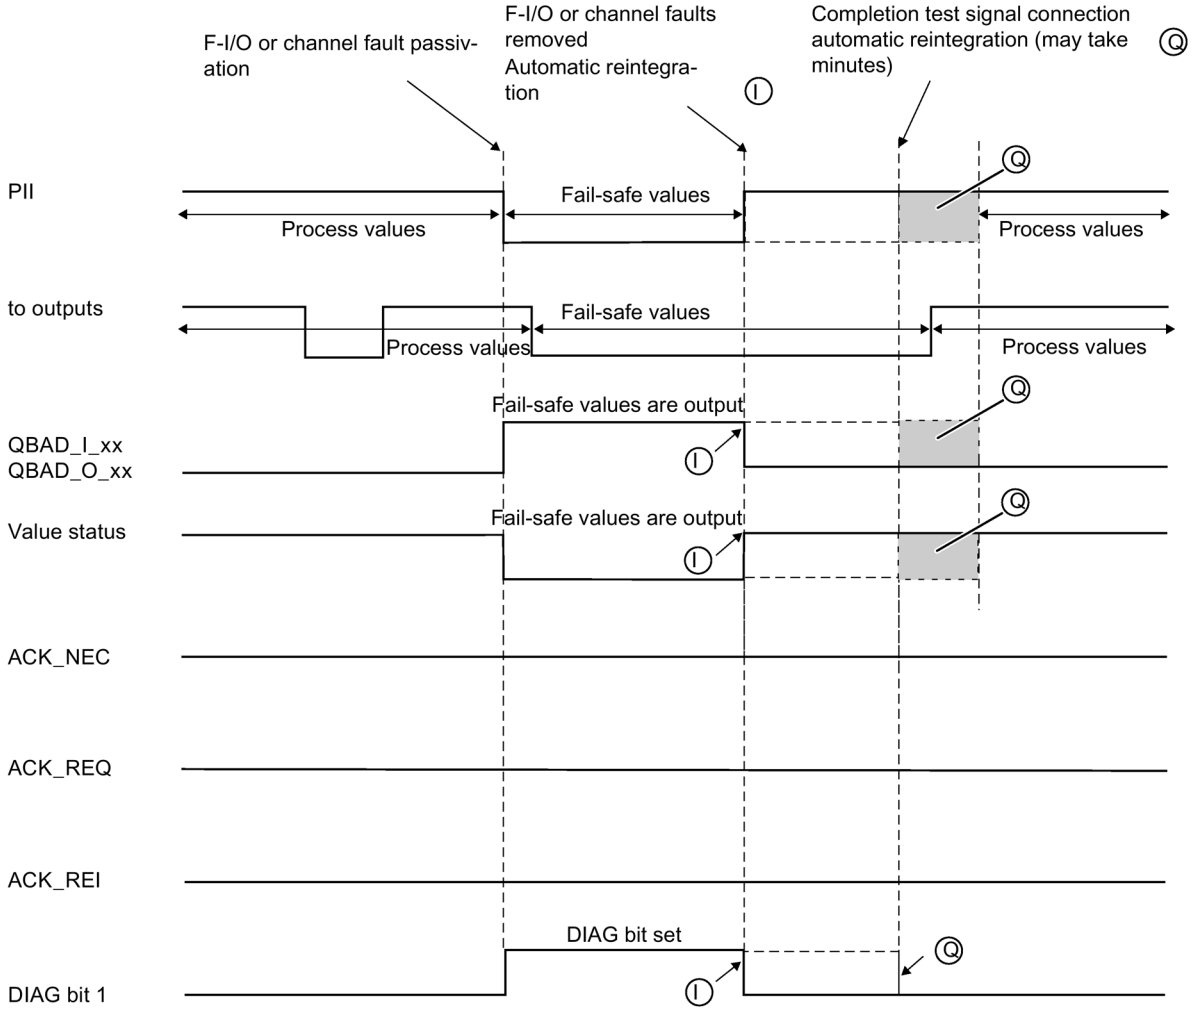
⚠ WARNING

Following a power failure of the F-I/O lasting less than the assigned F-monitoring time for the F-I/O, automatic reintegration can occur regardless of your setting for the ACK_NEC tag, as described for the case when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic".

If automatic reintegration is not permitted for the relevant process in this case, you must program startup protection by evaluating tags QBAD or QBAD_I_xx and QBAD_O_xx or value status or PASS_OUT.

In the event of a power failure of the F-I/O lasting longer than the specified F-monitoring time for the F-I/O, the F-system detects a communication error. *(S012)*

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults and channel faults when ACK_NEC = 0 or configuration "Channel failure acknowledge = automatic" (for passivation of entire F-I/O after channel faults)



Ⓘ for F-I/O with inputs

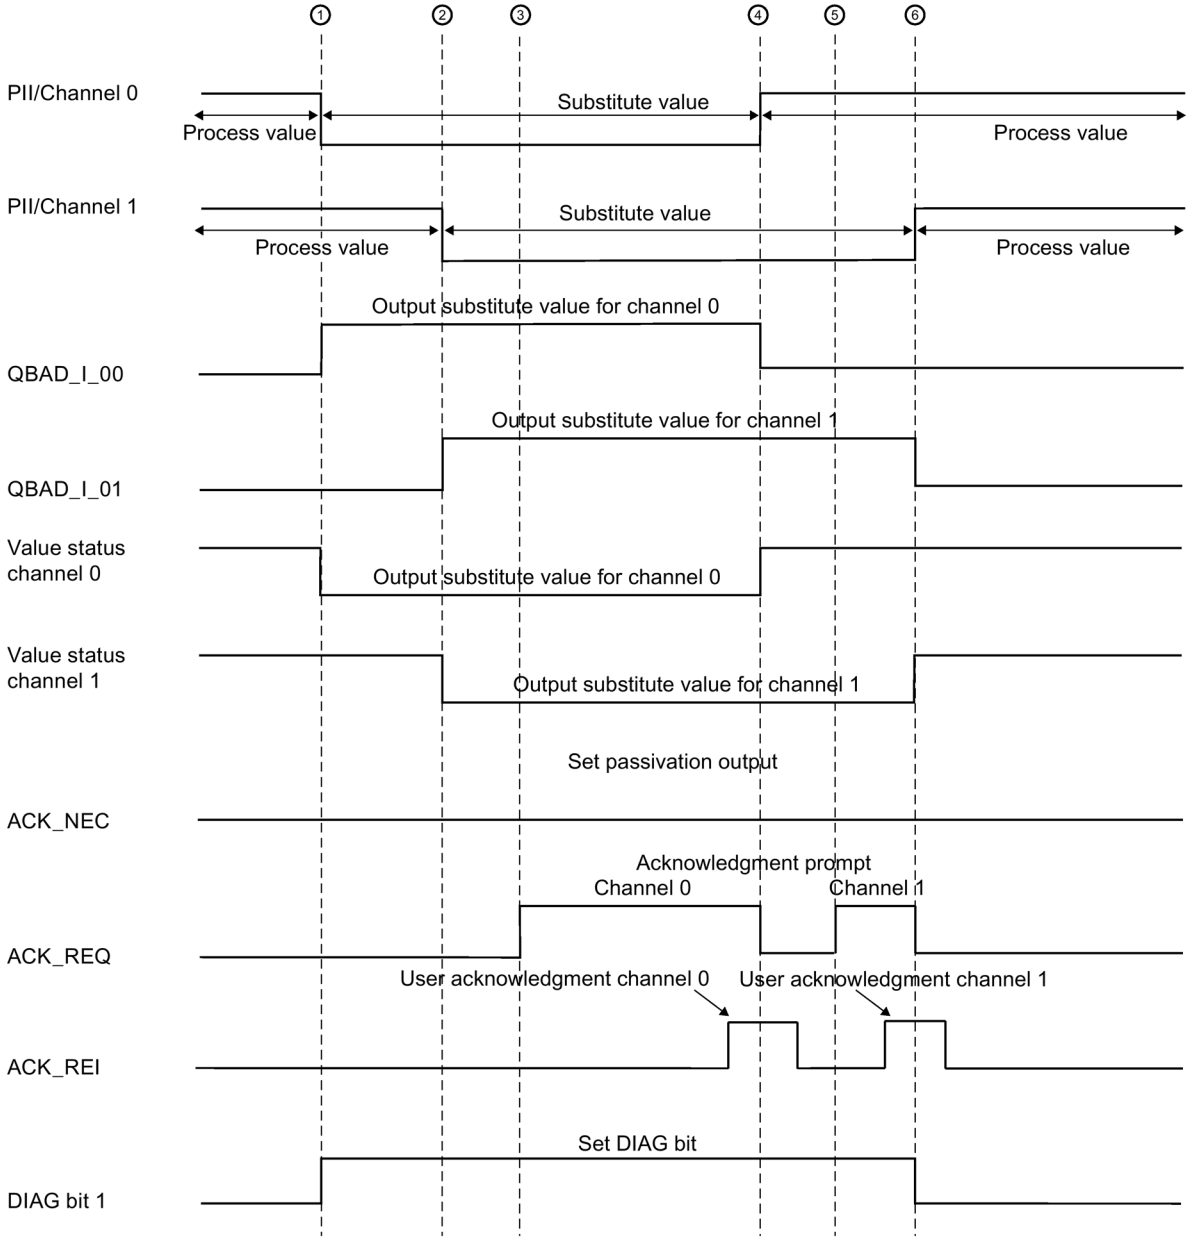
Ⓠ For F-I/O with outputs and F-I/O with inputs and outputs
(signal trend depends on the F-I/O used and on the S7-1200/1500 or S7-300/400 F-CPU used)

Signal sequence for passivation and reintegration of F-I/O after F-I/O faults and channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for passivation of entire F-I/O after channel faults)

For the signal sequence for passivation and reintegration of F-I/O after F-I/O or channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (initial value), see Passivation and reintegration of F-I/O (Page 139).

Signal sequence for passivation and reintegration of F-I/O after channel faults when ACK_NEC = 1 or configuration "Channel failure acknowledge = manual" (for channel-granular passivation)

Example for an F-I/O with inputs:



① Channel fault for channel 0/passivation of channel 0
② Channel fault for channel 1/passivation of channel 1
③ Channel fault eliminated for channel 0
④ Reintegration of channel 0
⑤ Channel fault eliminated for channel 1
⑥ Reintegration of channel 1

6.5.4 Group passivation

Programming a group passivation

If you want to enable passivation of additional F-I/O when an F-I/O or a channel of an F-I/O is passivated by the F-system, you can use the PASS_OUT/PASS_ON tags to perform **group passivation** of the associated F-I/O.

Group passivation by means of PASS_OUT/PASS_ON can, for example, be used to force simultaneous reintegration of all F-I/O after startup of the F-system.

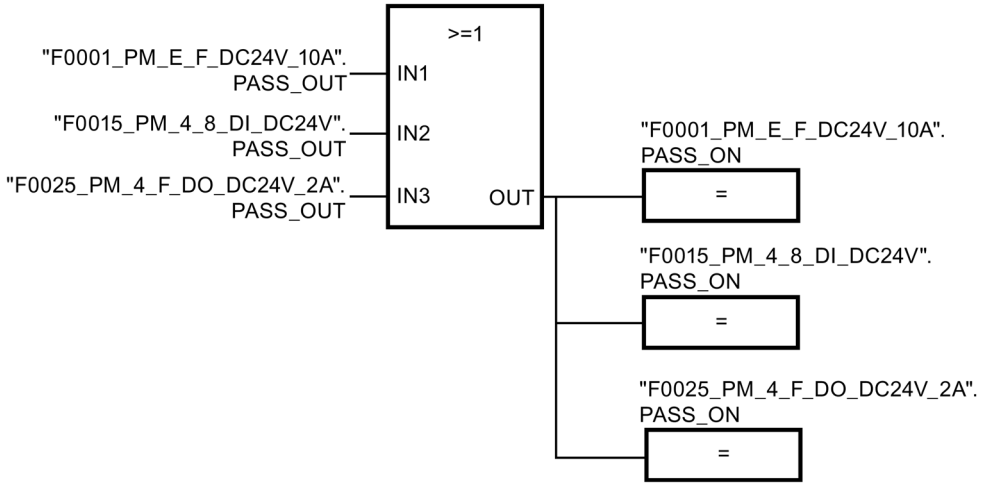
For group passivation, you must OR all PASS_OUT tags of the F-I/O in the group and assign the result to all PASS_ON tags of the F-I/O in the group.

During use of fail-safe values (0) due to group passivation by means of PASS_ON = 1, the QBAD tag of the F-I/O of this group = 1.

Note

Note the different behavior of PASS_OUT for F-I/O with/without RIOforFA-Safety profile (see table in chapter PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 135)).

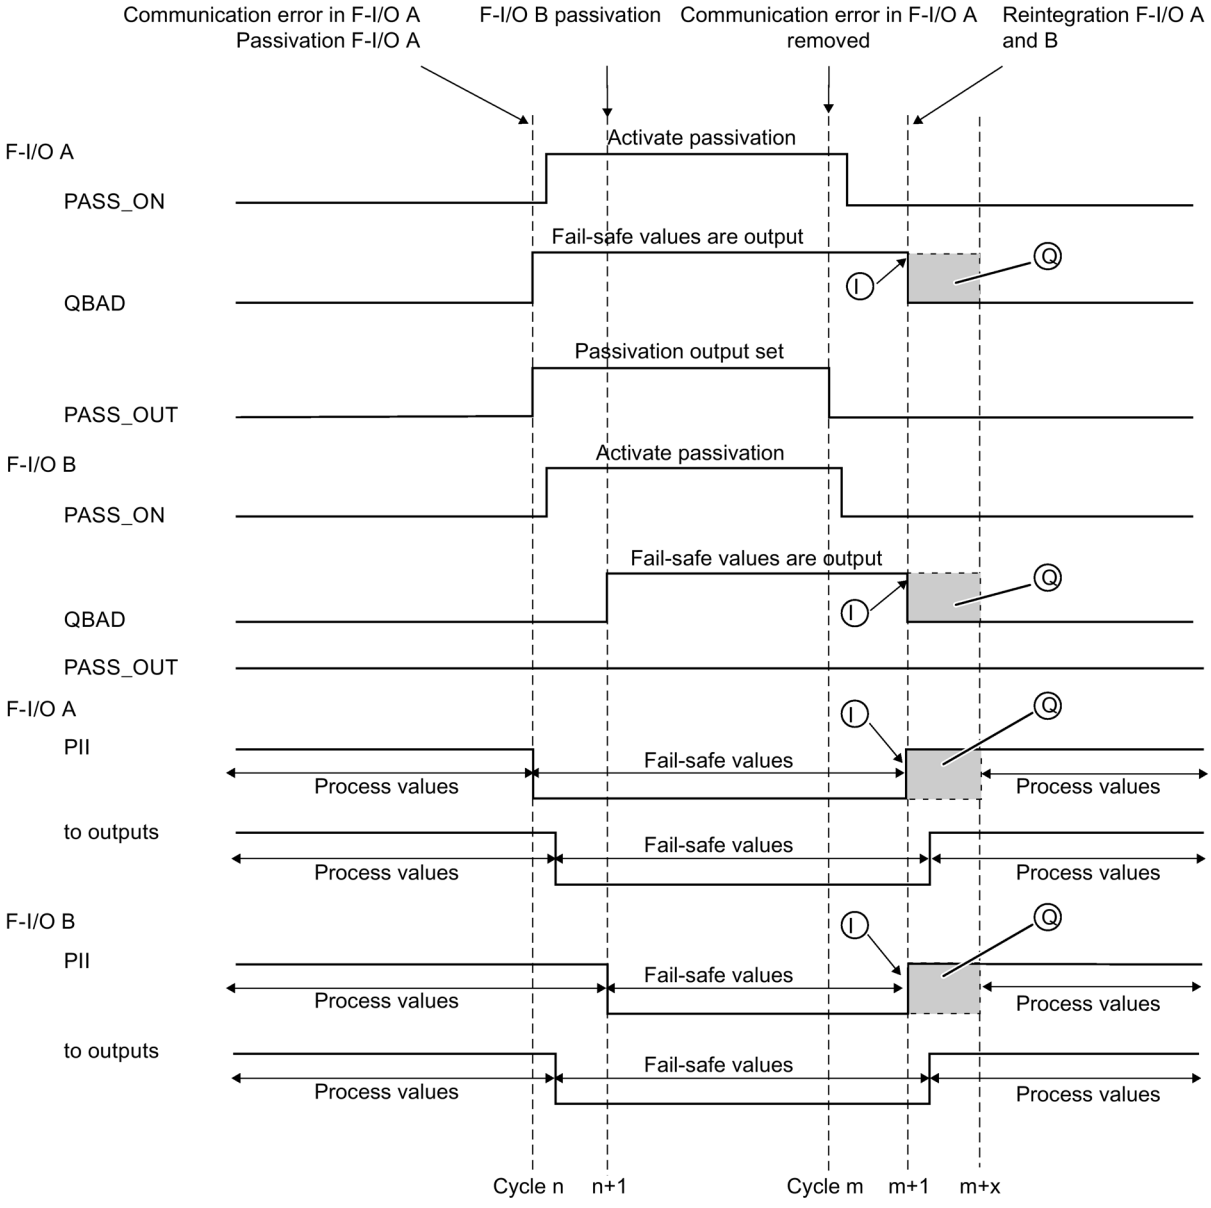
Example of group passivation



Reintegration of F-I/O

Reintegration of F-I/O passivated by group passivation occurs **automatically**, if a reintegration **automatic** or **through user acknowledgment**) occurs for the F-I/O that triggered the group passivation (PASS_OUT = 0).

Signal sequence for group passivation following communication error



(I) for F-I/O with inputs

(Q) For F-I/O with outputs and F-I/O with inputs and outputs
(signal trend depends on the F-I/O used and on the S7-1200/1500 or S7-300/400 F-CPU used)

Implementation of user acknowledgment 7

7.1 Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller

Options for user acknowledgment

You have the following options for implementing a user acknowledgment:

- An acknowledgment key that you connect to an F-I/O with inputs
- An HMI system

User acknowledgment by means of acknowledgment key

Note

When you implement user acknowledgment by means of acknowledgment key, and a communication error, an F-I/O fault, or a channel fault occurs in the F-I/O to which the acknowledgment key is connected, then it will not be possible to acknowledge the reintegration of this F-I/O.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected.

User acknowledgment by means of an HMI system

For implementation of a user acknowledgment by means of an HMI system, the ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 471) instruction is required.

Procedure for programming user acknowledgment by means of an HMI system (S7-300, S7-400)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and an "acknowledgment value" of "9" (2nd step in acknowledgment).

   or

   Assign function key 1 to transfer an "acknowledgment value" of "6" (1st step in acknowledgment) once, and function key 2 to transfer an "acknowledgment value" of "9" (2nd step in acknowledgment) once. You need to assign the in/out IN (in the data area of the ACK_OP instruction) to the field or the function keys.
3. Optional: on your HMI system, evaluate output Q in the instance DB of F_ACK_OP to indicate the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

If you want to perform a user acknowledgment exclusively from a programming device or PC using the watch table (monitor/modify tag) without having to disable safety mode, then you must transfer an operand (memory word or DBW of a DB of the standard user program) at in/out IN when calling ACK_OP. You can then transfer "acknowledgment values" "6" and "9" on the programming device or PC by modifying the memory word or DBW of a DB once. The memory word or DBW of a DB must not be written by the program.

Note

If you connect the in/out IN to a memory word or DBW of a DB, you have use a separate memory word or DBW of a DB of the standard user program for each instance of the ACK_OP instruction at the in/out IN.

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name.*(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Procedure for programming user acknowledgment by means of an HMI system (S7-1200, S7-1500)

1. Select the "ACK_OP" instruction in the "Instructions" task card and place it in your safety program. The acknowledgment signal for evaluating user acknowledgments is provided at output OUT of ACK_OP.
2. Assign the ACK_ID input an identifier between 9 and 30000 for the acknowledgment.
3. Assign the in/out IN a memory word or DBW of a DB of the standard user program.

   Note

   You need to provide the in/out IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

4. On your HMI system, set up a field for manual entry of an "acknowledgment value" of "6" (1st step in acknowledgment) and the "Identifier" configured at the ACK_ID input (2nd step in acknowledgment).

   or

   Allocate a function key 1 for a one-time transfer of the "acknowledgment value" of "6" (1st step in acknowledgment) and a function key 2 for a one-time transfer of the "Identifier" set at the ACK_ID input (2nd step in acknowledgment).
   You need to assign memory word or the DBW of the DB of the standard user program assigned to the in/out IN to the field or the function keys.
5. Optional: In your HMI system, evaluate output Q in the instance DB of F_ACK_OP to see the time frame within which the 2nd step in acknowledgment must occur or to indicate that the 1st step in acknowledgment has already occurred.

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction.
  Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Example of procedure for programming a user acknowledgment for reintegrating an F-I/O

1. Optional: set the ACK_NEC tag in the respective F-I/O DB (Page 132) to "0" if automatic reintegration (without user acknowledgment) is to take place after an F-I/O fault or a channel fault.

   ⚠ WARNING

   Assignment of the ACK_NEC = 0 tag is only allowed if automatic reintegration is permitted for the relevant process from a safety standpoint. *(S010)*

2. Optional: Evaluate the QBAD or QBAD_I_xx/QBAD_O_xx (S7-300/400) tags or value status (S7-1200, S7-1500) or DIAG in the respective F-I/O DB to trigger an indicator light in the event of an error, and/or generate error messages on the HMI system in your standard user program by evaluating the above tags or the value status. These messages can be evaluated before performing the acknowledgment operation. Alternatively, you can evaluate the diagnostic buffer of the F-CPU.
3. Optional: Evaluate the ACK_REQ tag in the respective F-I/O DB, for example, in the standard user program or on the HMI system, to query or to indicate whether user acknowledgment is required.
4. Assign the input of the acknowledgment key or the OUT output of the ACK_OP instruction to the ACK_REI tag in the respective F-I/O DB or the ACK_REI_GLOB input of the ACK_GL instruction (see above).

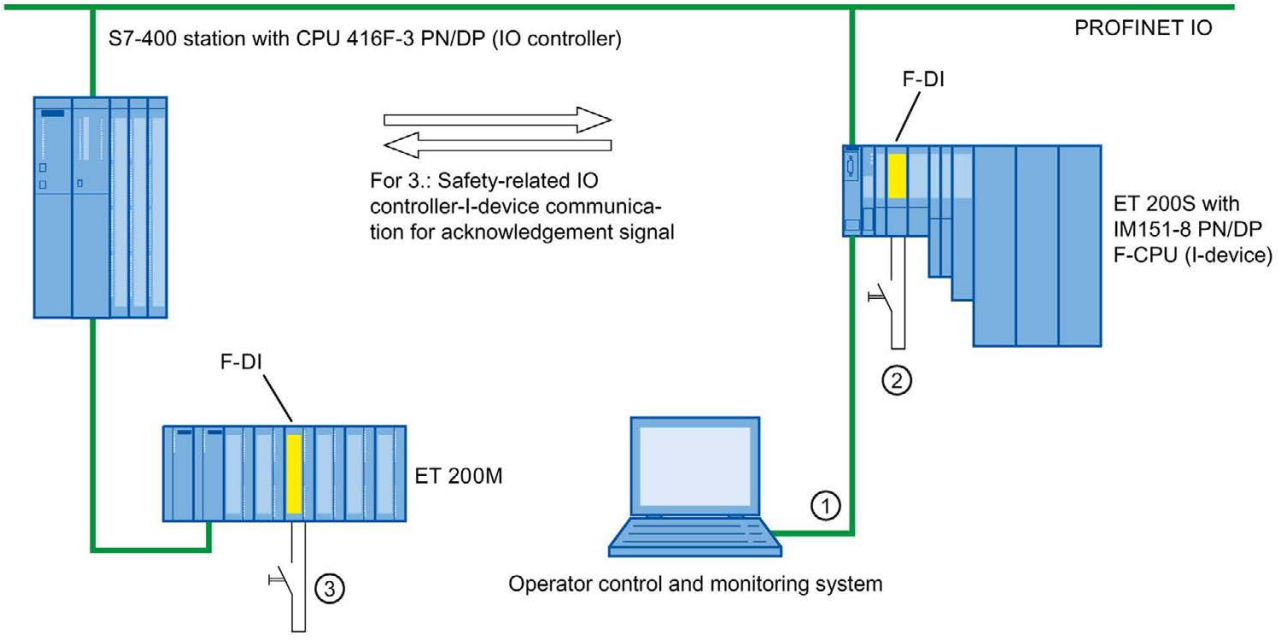
7.2 Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (S7-300, S7-400, S7-1500)

Options for user acknowledgment

You can implement a user acknowledgment by means of:

- An HMI system that you can use to access the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the I-slave/I-Device
- An acknowledgment key that you connect to an F-I/O with inputs that is assigned to the F-CPU of the DP master/IO controller

These three options are illustrated in the figure below.



1. User acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device

The ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 471) instruction is required to implement user acknowledgment with an HMI system that you can use to access the F-CPU of the I-slave/I-device.

Programming procedure

Follow the procedure described in "Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 151)" under "Programming procedure ...".

From your HMI system, you can then directly access the instance DB of ACK_OP in the I-slave/I-Device.

2. User acknowledgment by means of an acknowledgment key at an F-I/O with inputs that is assigned to the F-CPU of the I-slave/I-Device

Note

In the event of a communication error, F-I/O fault, or channel fault in the F-I/O to which the acknowledgment key is connected, an acknowledgment for reintegration of this F-I/O is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of an F-I/O to which an acknowledgment key is connected (see 1).

3. User acknowledgment by means of acknowledgment key at an F-I/O with inputs that is assigned to the F-CPU of the DP master/IO controller

If you want to use the acknowledgment key that is assigned to the F-CPU at the DP master/IO controller to perform user acknowledgment in the safety program of the F-CPU of an I-slave/I-device as well, you must transmit the acknowledgment signal from the safety program in the F-CPU of the DP master/IO controller to the safety program in the F-CPU of the I-slave/I-device using safety-related master-I-slave/IO controller-I-device communication.

Programming procedure

1. Place the SENDDP (Page 480) instruction in the safety program in the F-CPU of the DP master/IO controller.
2. Place the RCVDP (Page 480) instruction in the safety program in the F-CPU of the I-slave/I-Device.
3. Supply an input SD_BO_xx of SENDDP with the input of the acknowledgment key.

4. The acknowledgment signal for evaluating user acknowledgments is now available at the corresponding RD_BO_xx output of RCVDP.

   The acknowledgment signal can now be read in the program sections in which further processing is to take place with fully qualified access directly in the associated instance DB (for example, "RCVDP_DB".RD_BO_02).

5. Supply the corresponding input SUBBO_xx of RCVDP with FALSE (fail-safe value 0) to ensure that user acknowledgment is not accidentally triggered before communication is established for the first time after startup of the sending and receiving F-systems, or in the event of a safety-related communication error.

Note

If a communication error, an F-I/O error, or a channel fault occurs at the F-I/O to which the acknowledgment key is connected, then an acknowledgment for reintegration of this F-I/O will no longer be possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the DP master/IO controller.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the DP master/IO controller, in order to acknowledge reintegration of the F-I/O to which an acknowledgment key is connected.

If a safety-related master-I-slave/IO controller-I-Device communication error occurs, the acknowledgment signal cannot be transmitted, and an acknowledgment for reintegration of safety-related communication is no longer possible.

This "blocking" can only be removed by a STOP-to-RUN transition of the F-CPU of the I-slave/I-Device.

Consequently, it is recommended that you also provide for an acknowledgment by means of an HMI system that you can use to access the F-CPU of the I-slave/I-Device, in order to acknowledge reintegration of the safety-related communication for transmission of the acknowledgment signal (see 1).

Data exchange between standard user program and safety program

8

You have the option of transferring data between the safety program and the standard user program. Tags can be transferred using DBs, F-DBs and bit memory:

	From the standard user program		From the safety program	
	Read access	Write access	Read access	Write access
Tag from DB	Permitted	Permitted	A tag from the DB can be read-accessed *or* write-accessed	
Tag from F-DB	Permitted	**Not permitted**	Permitted	Permitted
Bit memory	Permitted	Permitted	Bit memory can be read-accessed *or* write-accessed	

You can also access the process image of the standard I/O and F-I/O:

		From the standard user program		From the safety program	
		Read access	Write access	Read access	Write access
Process image of standard I/O	PII	Permitted	Permitted	Permitted	**Not permitted**
	PIQ	Permitted	Permitted	**Not permitted**	Permitted
Process image of F-I/O	PII	Permitted	**Not permitted**	Permitted	**Not permitted**
	PIQ	Permitted	**Not permitted**	**Not permitted**	Permitted

Decoupling of the safety program from the standard program in case of data transfer

For data exchange between standard user program and safety program, we recommend that you define special data blocks (transfer blocks) in which the data to be exchanged is stored. This action allows you to decouple the blocks of the standard and the safety program. The changes in the standard program do not affect the safety program (and vice versa) provided these data blocks are not modified.

8.1 Data Transfer from the Safety Program to the Standard User Program

Data transfer from the safety program to the standard user program

The standard user program can read all data of the safety program, for example using symbolic (fully qualified) accesses to the following:

- The instance DBs of the F-FBs ("Name of instance DB".Signal_x)
- F-DBs (for example "Name of F_DB".Signal_1)
- The process image of the inputs and process image of the outputs of F-I/O (for example "Emergency_Stop_Button_1" (I 5.0))

Note

For S7-300 and S7-400 F-CPUs

The process image of the inputs of F-I/O is updated not only at the start of the main safety block, but also by the standard operating system.

To find the standard operating system update times, refer to the *Help on STEP 7* under "Process image of the inputs and output". For F-CPUs that support process image partitions, also bear in mind the update times when process image partitions are used. For this reason, when the process image of the inputs of F-I/O is accessed in the standard user program, it is possible to obtain different values than in the safety program. The differing values can occur due to:

- Different update times
- Use of fail-safe values in the safety program

To obtain the same values in the standard user program as in the safety program, you must not access the process image of the inputs in the standard program until after execution of an F-runtime group. In this case, you can also evaluate the QBAD or QBAD_I_xx tag in the associated F-I/O DB in the standard user program, in order to find out whether the process image of the inputs is receiving fail-safe values (0) or process data. When using process image partitions, also make sure that the process image is not updated by the standard operating system or by the UPDAT_PI instruction between execution of an F-runtime group and evaluation of the process image of the inputs in the standard user program.

Note

For S7-1200/1500 F-CPUs

The process image of the inputs of F-I/O is updated prior to processing the main safety block.

You can also write safety program data directly to the standard user program (see also the table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 90)):

Data block/bit memory

In order to write safety program data directly to the standard user program (e.g., DIAG output of the SENDDP instruction), you can write to data blocks of the standard user program from the safety program. However, a written tag must not be read in the safety program itself.

You can also write to bit memory in the safety program. However, written bit memory must not be read in the safety program itself.

Process image of the outputs

You can write to the process image of the outputs (PIQ) of standard I/O in the safety program, for example for display purposes. The PIQ must not be read in the safety program.

8.2 Data Transfer from Standard User Program to Safety Program

Data transfer from standard user program to safety program

As a basic principle, only fail-safe data or fail-safe signals from F-I/O and other safety programs (in other F-CPUs) can be processed in the safety program, as standard tags are unsafe.

If you have to process tags from the standard user program in the safety program, however, you can evaluate either bit memory from the standard user program, tags from a standard DB, or the process image input (PII) of standard I/O in the safety program (see table of supported operand areas in: Restrictions in the programming languages FBD/LAD (Page 90)).

⚠ WARNING

Because these tags are not generated safely, you must carry out additional process-specific validity checks in the safety program to ensure that no dangerous states can arise. If bit memory, a tag of a standard DB, or an input of standard I/O is used in both F-runtime groups, you must perform the validity check separately in each F-runtime group. *(S015)*

To facilitate checks, all PLC tags from the standard user program that are evaluated in the safety program are included in the safety summary (Page 290).

Bit memory

In order to process tags of the standard user program in the safety program, you can also read bit memory in the safety program. However, read bit memory must not be written in the safety program itself.

Data block

In order to process tags of the standard user program in the safety program, you can read tags from data blocks of the standard user program in the safety program. However, a read tag must not be written in the safety program itself.

Process image of the inputs

You can read the process image of the inputs (PII) of standard I/O in the safety program. The PII must not be written in the safety program.

Examples: Programming validity checks

- Use Comparison (Page 597) instructions to check whether tags from the standard user program exceed or fall below permitted high and low limits. You can then influence your safety function with the result of the comparison.
- Use the S: Set output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 505), R: Reset output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 504) or SR: Set/reset flip-flop (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 507) instructions, for example, with tags from the standard user program to allow a motor to be switched off, but not switched on.
- For switch-on sequences, use the AND logic operation instruction, for example, to logically combine tags from the standard user program with switch-on conditions that you derive from fail-safe tags.

If you want to process tags from the standard user program in the safety program, please bear in mind that there is not a sufficiently simple method of checking validity for all tags.

Reading tags from the standard user program that can change during the runtime of an F-runtime group

If you want to read tags from the standard user program (bit memory, tags of a standard DB, or PII of standard I/O) in the safety program, and these tags can be changed - either by the standard user program or an operator control and monitoring system - during runtime of the F-runtime group in which they are read (for example because your standard user program is being processed by a higher-priority cyclic interrupt), you must use bit memory or tags of a standard DB for this purpose. You must write the bit memory or tags of a standard DB with the tags from the standard user program immediately before calling the F-runtime group. You are then permitted to access only this bit memory or these tags of a standard DB in the safety program.

Also note that **clock memory** that you defined when configuring your F-CPU in the "Properties" tab can change during runtime of the F-runtime group, since clock memory runs asynchronously to the F-CPU cycle.

Note

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Safety-related communication (S7-300, S7-400, S7-1500)

9

9.1 Configuring and programming communication (S7-300, S7-400)

9.1.1 Overview of communication

Introduction

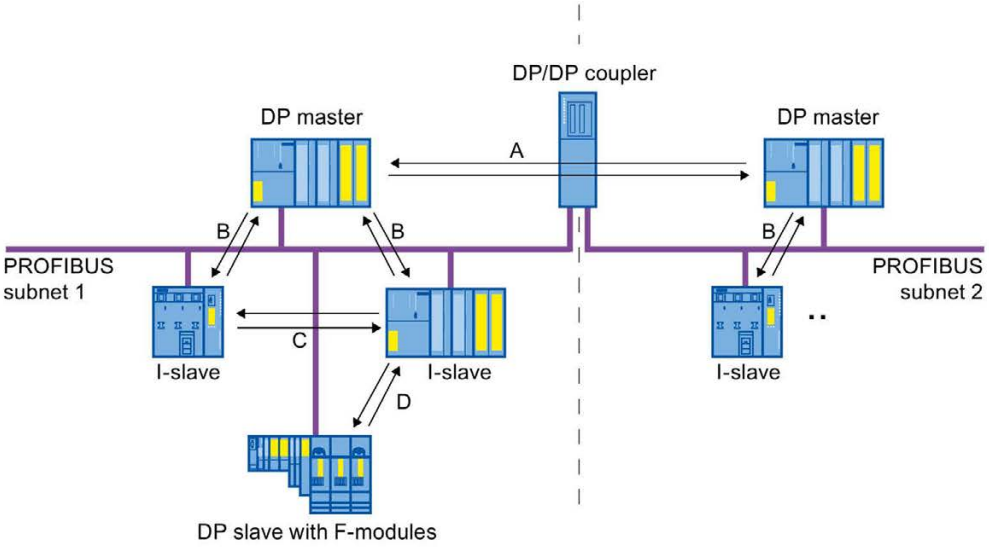
This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	On subnet	Additional hardware required
I-slave-slave communication	PROFIBUS DP	—
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
I-slave-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
Safety-related communication via S7 connections	Industrial Ethernet	—
IO controller-IO controller communication for S7 Distributed Safety	PROFINET IO	PN/PN coupler
Master-master communication for S7 Distributed Safety	PROFIBUS DP	DP/DP coupler
Safety-related communication to S7 Distributed Safety or S7 F Systems via S7 connections	Industrial Ethernet	—

Overview of safety-related communication via PROFIBUS DP

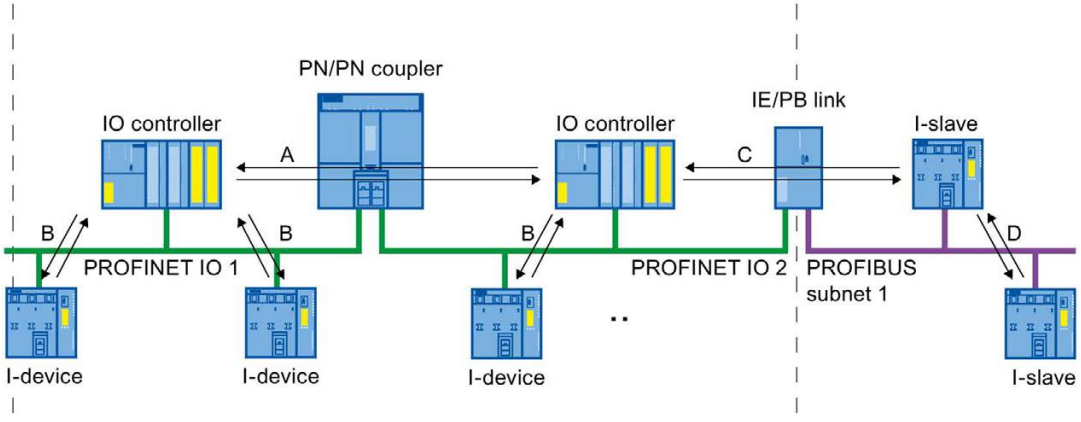
The figure below presents an overview of the 4 options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-300/400 F-CPUs.



A Safety-related master-master communication
B Safety-related master-I-slave communication
C Safety-related I-slave-I-slave communication
D Safety-related I-slave-slave communication

Overview of safety-related communication via PROFINET IO

The figure below presents an overview of the 4 options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-300/400 F-CPUs. If an IE/PB link is used, safety-related communication is possible between assigned I-slaves.



A safety-related IO controller-IO controller communication
B safety-related IO controller-I-device communication
C safety-related IO controller-I-slave communication
D safety-related I-slave-I-slave communication integrating an IO controller

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of fail-safe data of the data type INT or BOOL is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. Each transfer area consists of one input and one output address area.

Safety-related I-slave-slave communication via PROFIBUS DP

Safety-related I-slave-slave communication is possible with F-I/O in a DP slave that supports safety-related I-slave-slave communication, for example, with all ET 200S F-modules and with all S7-300 fail-safe signal modules with IM 153-2.

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O of a DP slave takes place using direct data exchange, as in the standard program. The process image is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave.

Safety-related CPU-CPU communication via Industrial Ethernet

Safety-related CPU-CPU communication via Industrial Ethernet is possible using S7 connections, both from and to the following:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 Advanced-IT

In safety-related communication via S7 connections, a specified amount of fail-safe data of data type BOOL, INT, WORD, DINT, DWORD, or TIME is transferred fail-safe between the safety programs of the F-CPUs linked by the S7 connection.

The data transfer makes use of the SENDS7 instruction for sending and the RCVS7 instruction for receiving. Data are exchanged using one F-DB ("F-communication DB") each at the sender and receiver ends.

Safety-related CPU-CPU communication to *S7 Distributed Safety* or *F-systems*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety* or *S7 F-systems*.

9.1.2 Safety-related IO controller-IO controller communication

9.1.2.1 Configure safety-related IO controller-IO controller communication

Introduction

Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

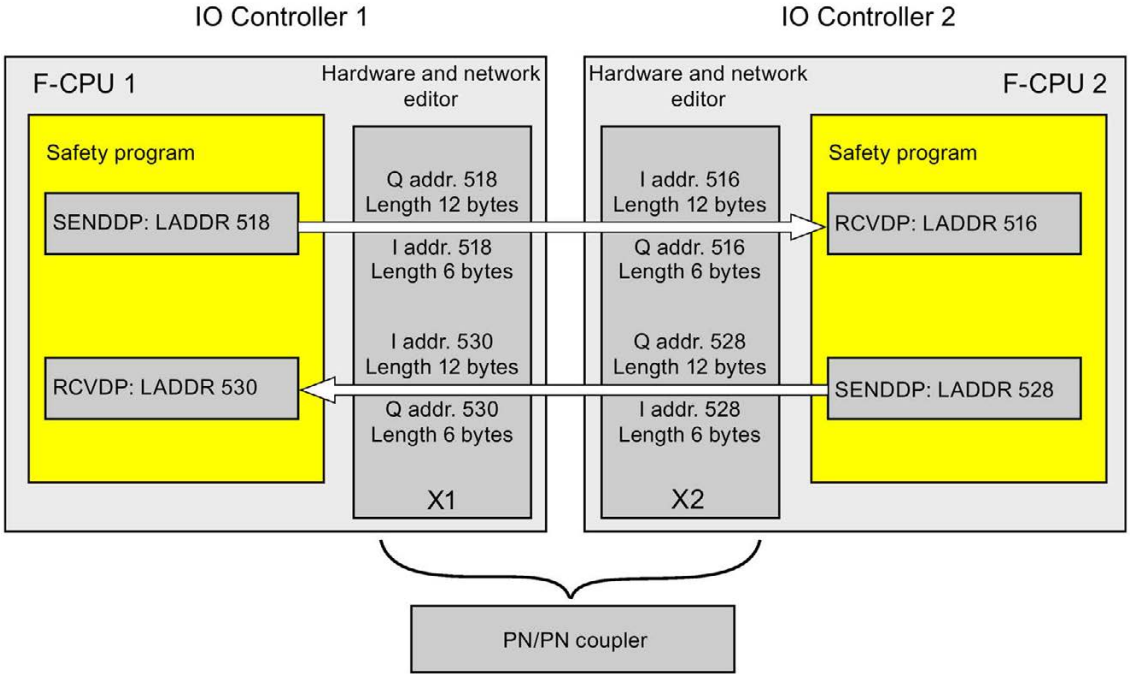
In the case of a CPU 416F-2 DP without an integrated PROFINET interface, you use a 443-1 Advanced-IT.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the PN/PN coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for output data and the transfer area for input data for the **data to be sent** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

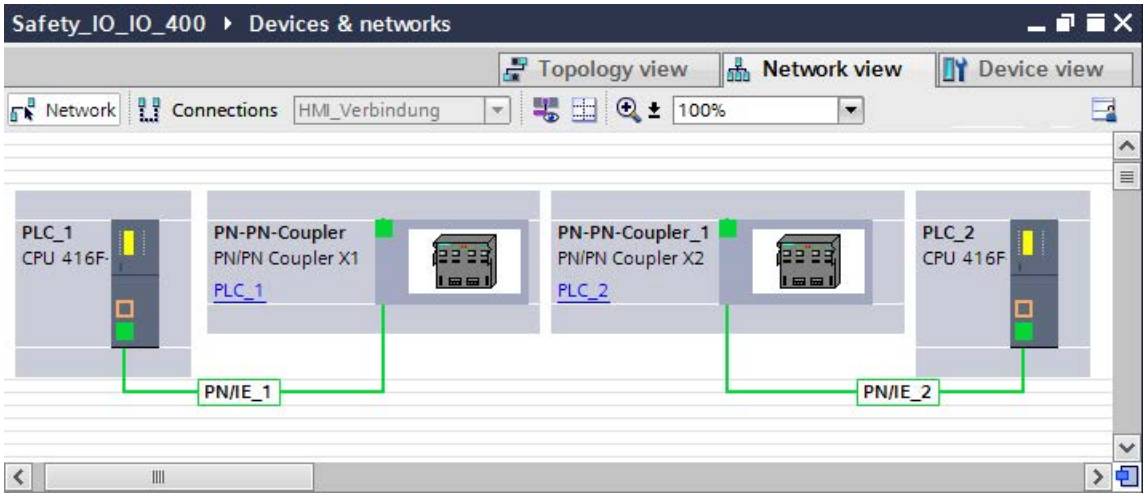
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Insert a PN/PN coupler X1 and a PN/PN coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



5. Switch to the device view of PN/PN coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

6. In the properties of the modules, assign the addresses outside the process image as follows:

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:

   – Input addresses: Start address 518

   – Output addresses: Start address 518

   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:

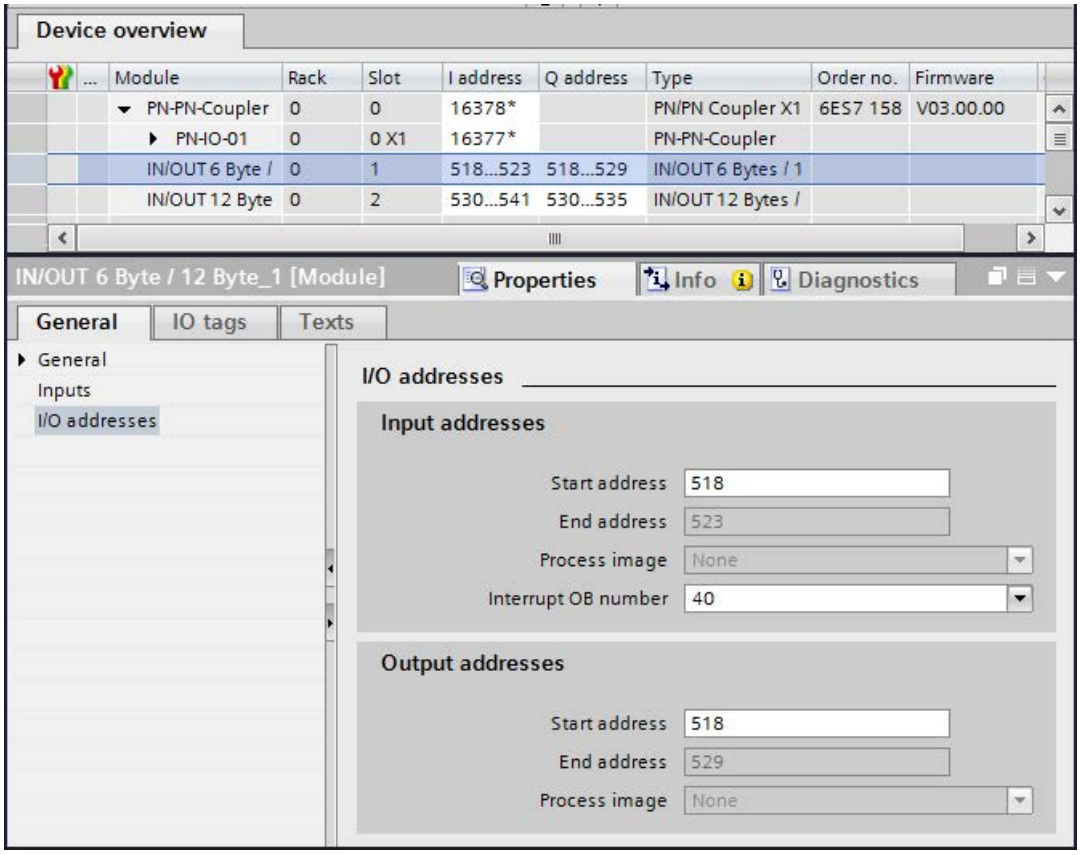
   – Input addresses: Start address 530

   – Output addresses: Start address 530

Note

Make sure that you assign identical start addresses for the address areas of the output and input data.

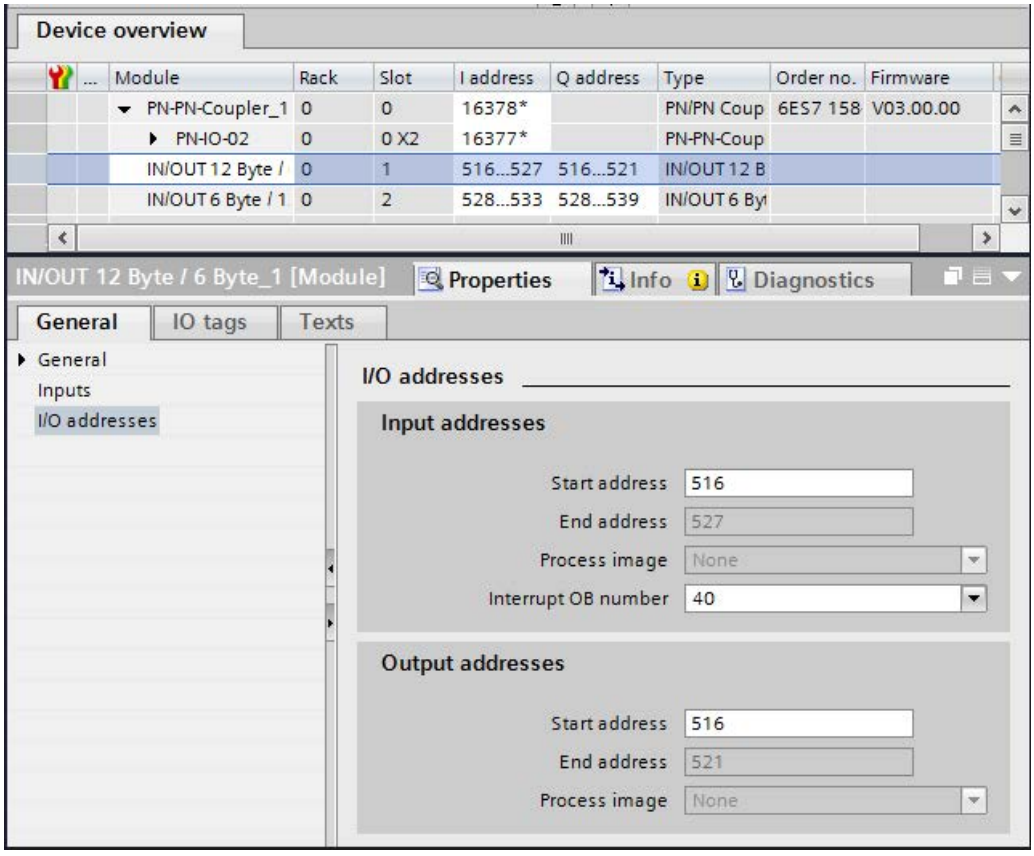
Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



7. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   - One "IN/OUT 12 bytes / 6 bytes" module and
   - One "IN/OUT 6 bytes / 12 bytes" module
8. In the properties of the modules, assign the addresses outside the process image as follows:

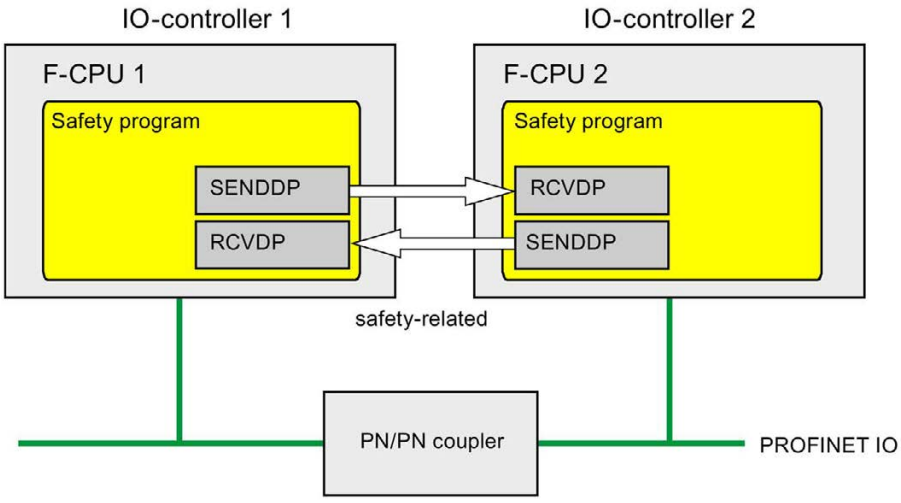
   For the "IN/OUT 12 bytes / 6 bytes" module for receiving data for example:
   - Input addresses: Start address 516
   - Output addresses: Start address 516

   For the "IN/OUT 6 bytes / 12 bytes" module for sending data for example:
   - Input addresses: Start address 528
   - Output addresses: Start address 528



9.1.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.1.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

Programming procedure

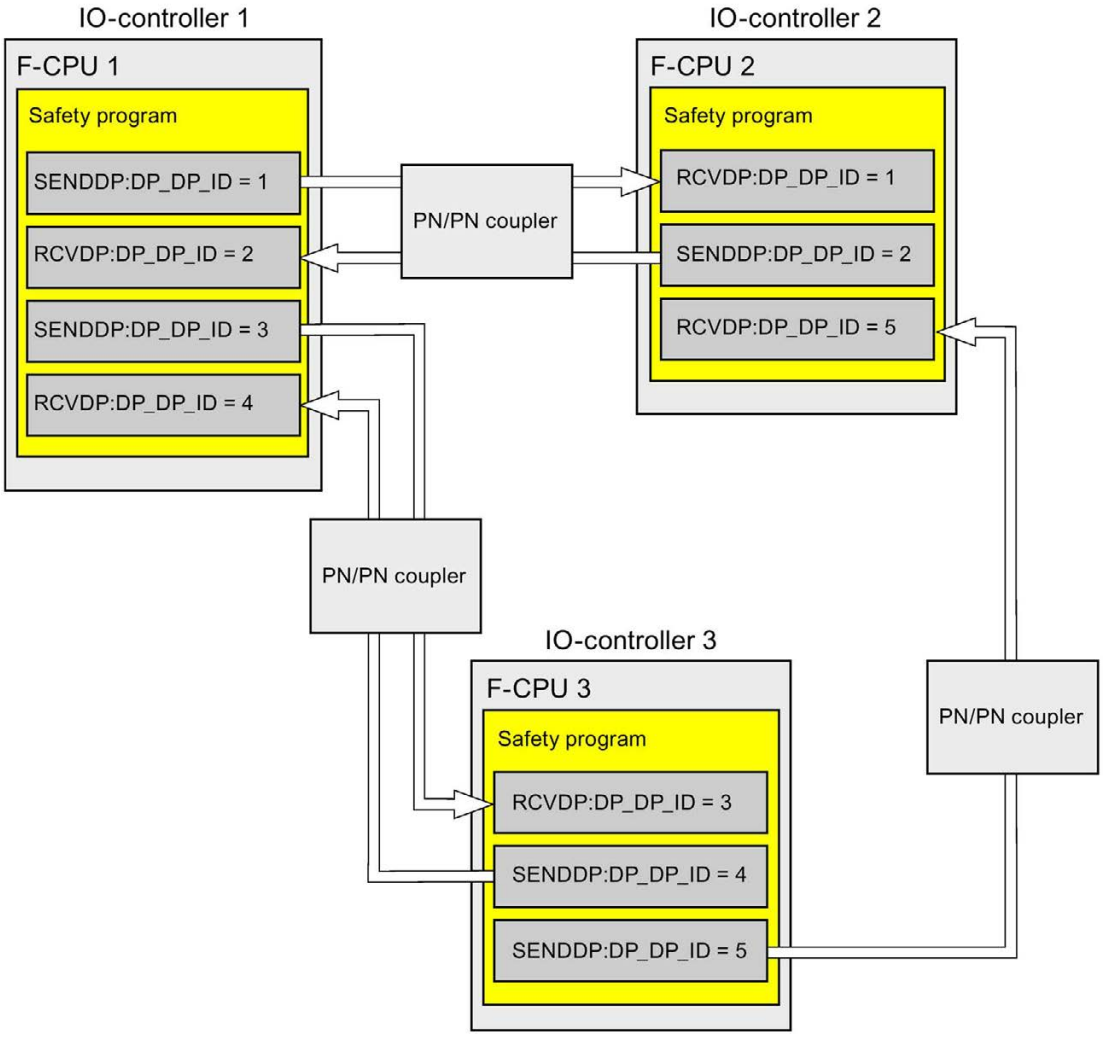
You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 646) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 646) for receiving at the start of the main safety block.
3. Assign the start addresses of the output and input data transfer areas of the PN/PN coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for five safety-related IO controller-IO-controller communication relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*
8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 293).

9.1.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.1.3 Safety-related master-master communication

9.1.3.1 Configure safety-related master-master communication

Introduction

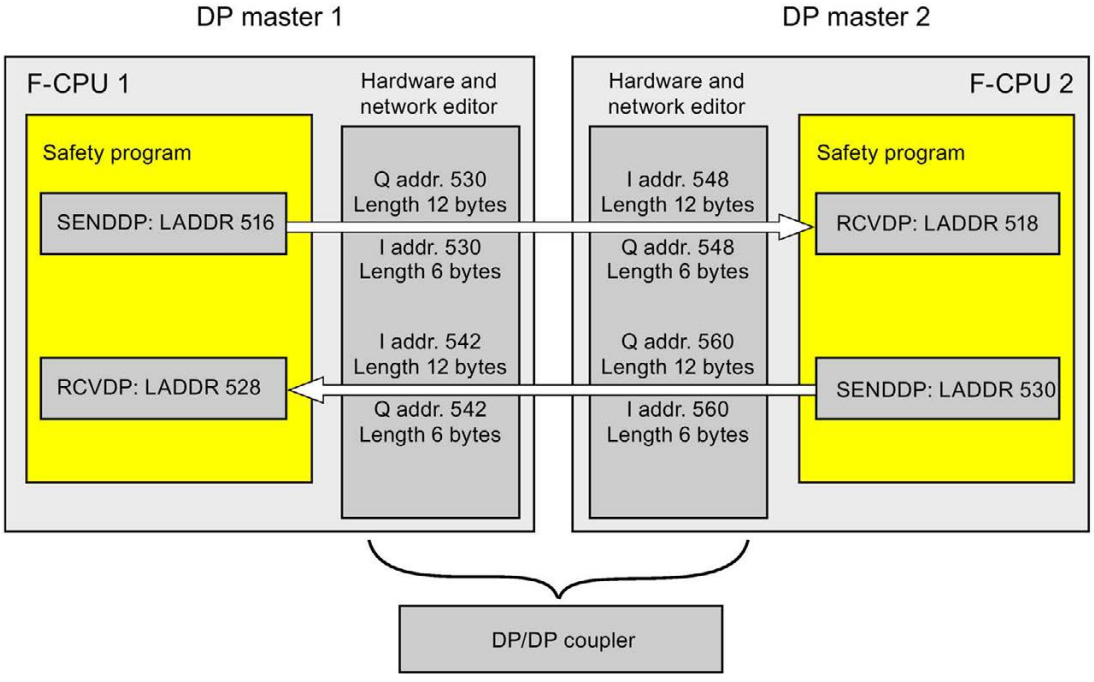
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication). One transfer area for output data and one transfer area for input data must be configured in the DP/DP coupler for each of the two communication connections.



Rules for defining transfer areas

The transfer area for input data and the transfer area for output data for the **data to be sent** must begin with the same start address. A total of 6 bytes (consistent) is required for the transfer area for input data; 12 bytes (consistent) are required for the transfer area for output data.

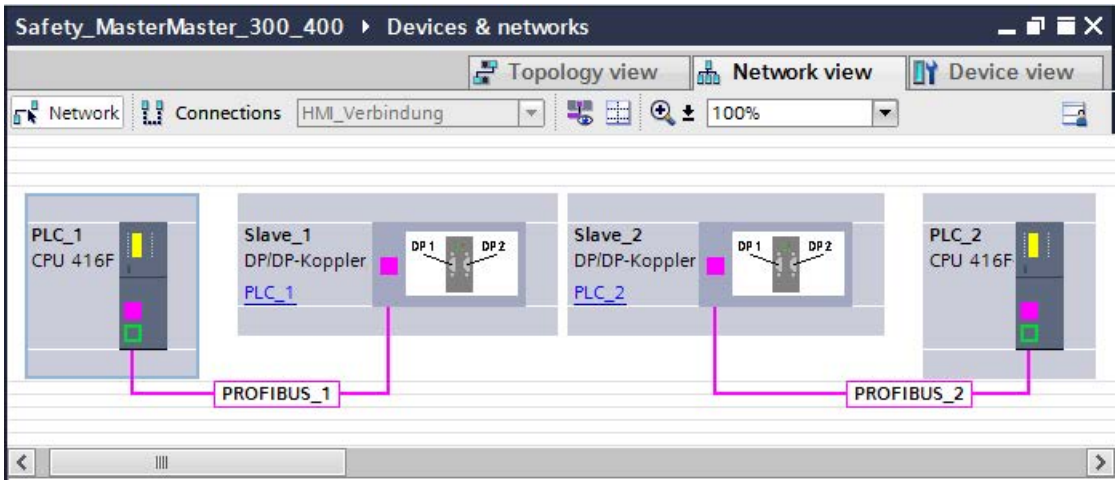
The transfer area for input data and the transfer area for output data for the **data to be received** must begin with the same start address. A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.



6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler of PLC 1, either using the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).

7. Switch to the device view of the DP/DP coupler for PLC1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "6 bytes I/12 bytes Q consistent" module, and
   - One "12 bytes I/6 bytes Q consistent" module

8. In the properties of the modules, assign the addresses outside the process image as follows:

   For "6 bytes I/12 bytes Q consistent" module for sending data for example:

   – Input addresses: Start address 530

   – Output addresses: Start address 530

   For "12 bytes I/6 bytes Q consistent" module for receiving data for example:

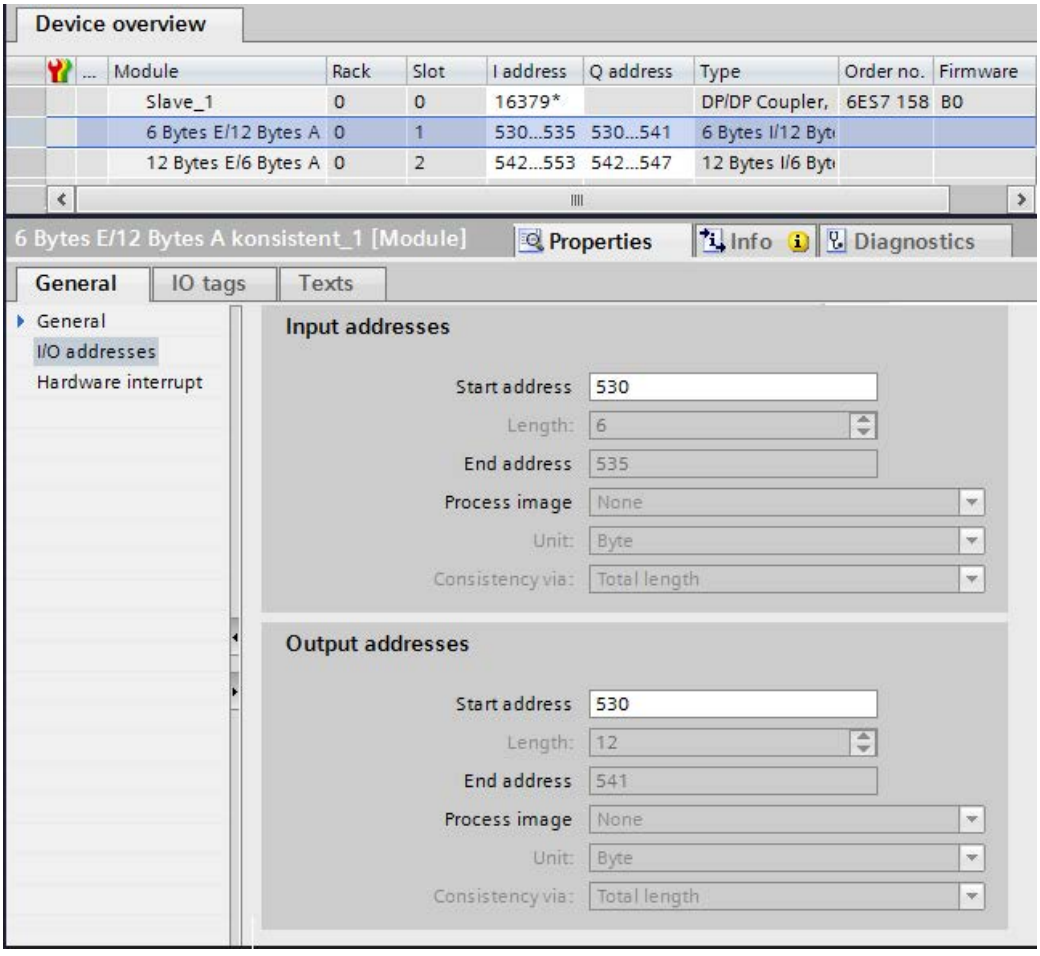
   – Input addresses: Start address 542

   – Output addresses: Start address 542

   Note

   Make sure that you assign identical start addresses for the address areas of the output and input data.

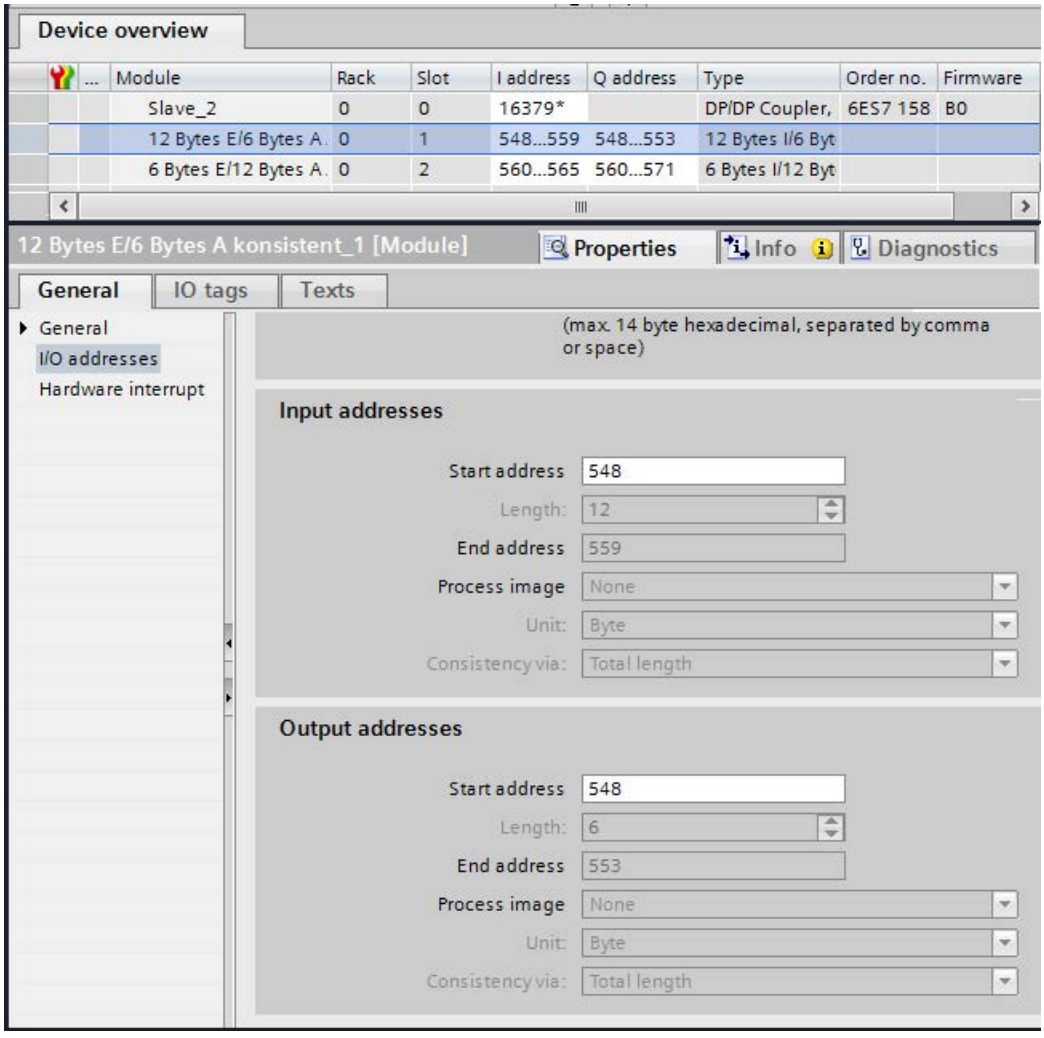
   Tip: Make a note of the start addresses of the transfer areas. You need these to program the SENDDP and RCVDP blocks (LADDR input).



9. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module
10. In the properties of the modules, assign the addresses outside the process image as follows:

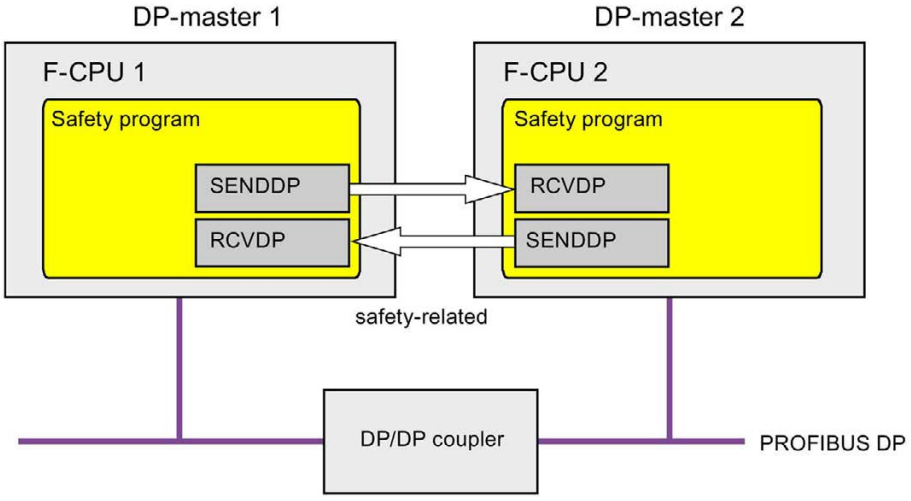
    For "12 bytes I/6 bytes Q consistent" module for receiving data for example:
    - Input addresses: Start address 548
    - Output addresses: Start address 548

    For "6 bytes I/12 bytes Q consistent" module for sending data for example:
    - Input addresses: Start address 560
    - Output addresses: Start address 560



9.1.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP masters uses the SENDDP and RCVDP instructions for sending and receiving respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.1.3.3 Program safety-related master-master communication

Requirement for programming

The transfer areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

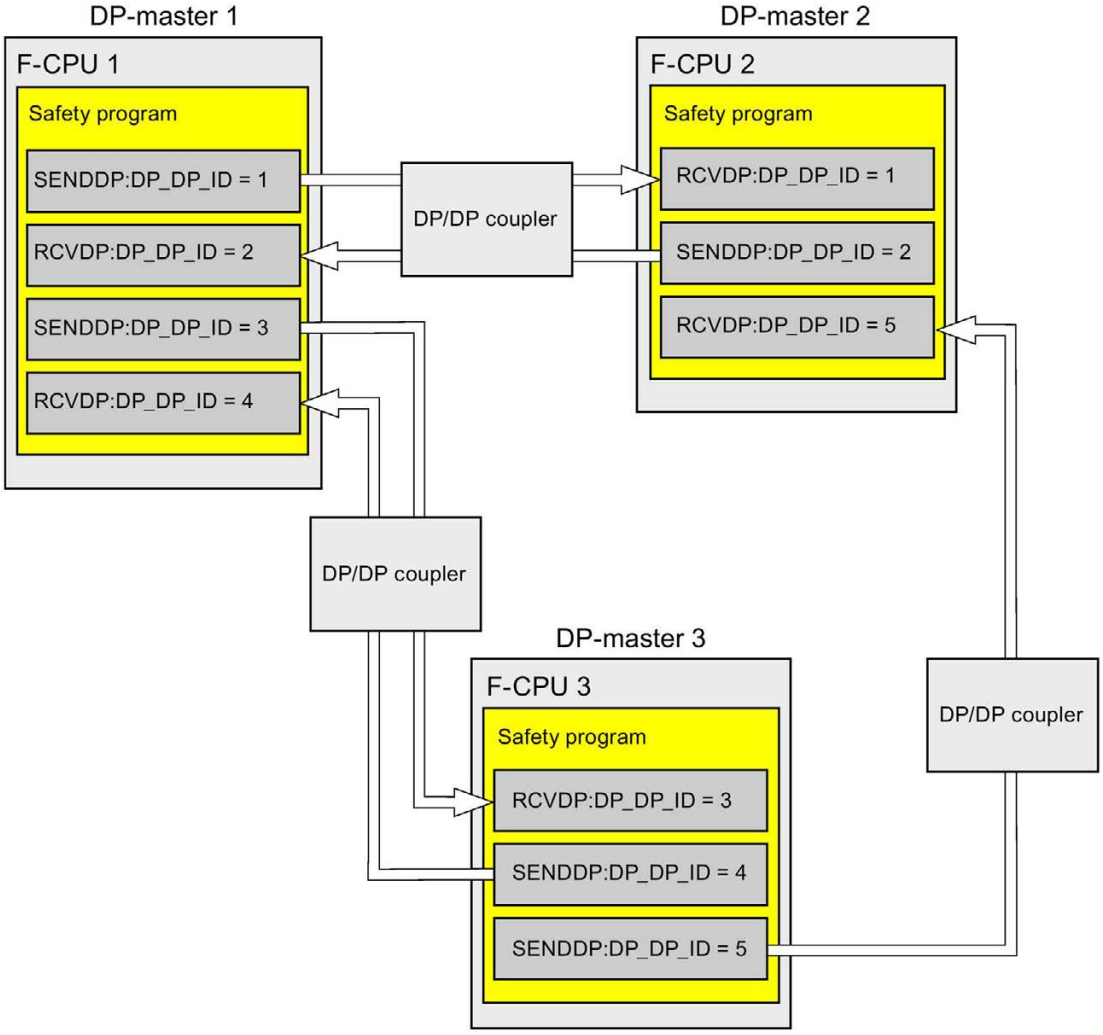
You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 646) for sending at the end of the main safety block.
2. In the safety program from which data are to be received, call the RCVDP instruction (Page 646) for receiving at the start of the main safety block.
3. Assign the start addresses of the transfer areas for output and input data of the DP/DP coupler configured in the *hardware and network editor* to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for five safety-related master-master communications relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs of SENDDP with the send signals. To cut down on intermediate signals when transferring parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. Supply the SUBBO_xx and SUBI_xx inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT, you can enter constant fail-safe values directly as constants in the SUBI_xx input (initial value = "0"). If you want to specify a constant fail-safe value for data of data type BOOL, enter the "F_GLOBDB".VKE1 tag (fully qualified) in the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBI_xx or SUBBO_xx input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*
8. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

   ⚠ WARNING

   It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

   Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
10. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
11. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx inputs.
12. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
13. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 293).

9.1.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.1.4 Safety-related communication between IO controller and I-device

9.1.4.1 Configuring safety-related communication between IO controller and I-device

Introduction

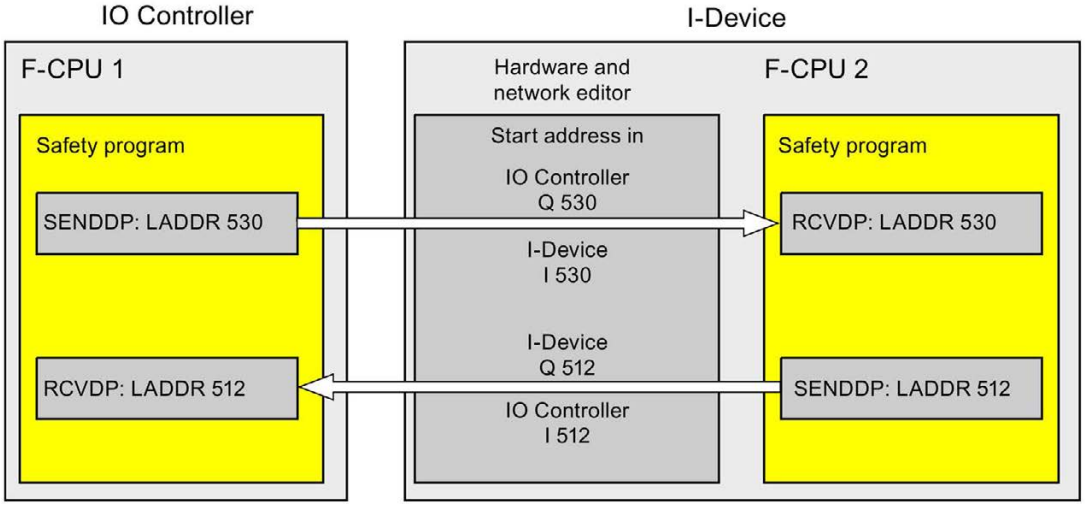
Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (**F**-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

The F-CPU to be used as an I-device must support the "IO-device" operating mode.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify the communication relationship, for example "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO-controller F-CPU 1 and I-device F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR parameter of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

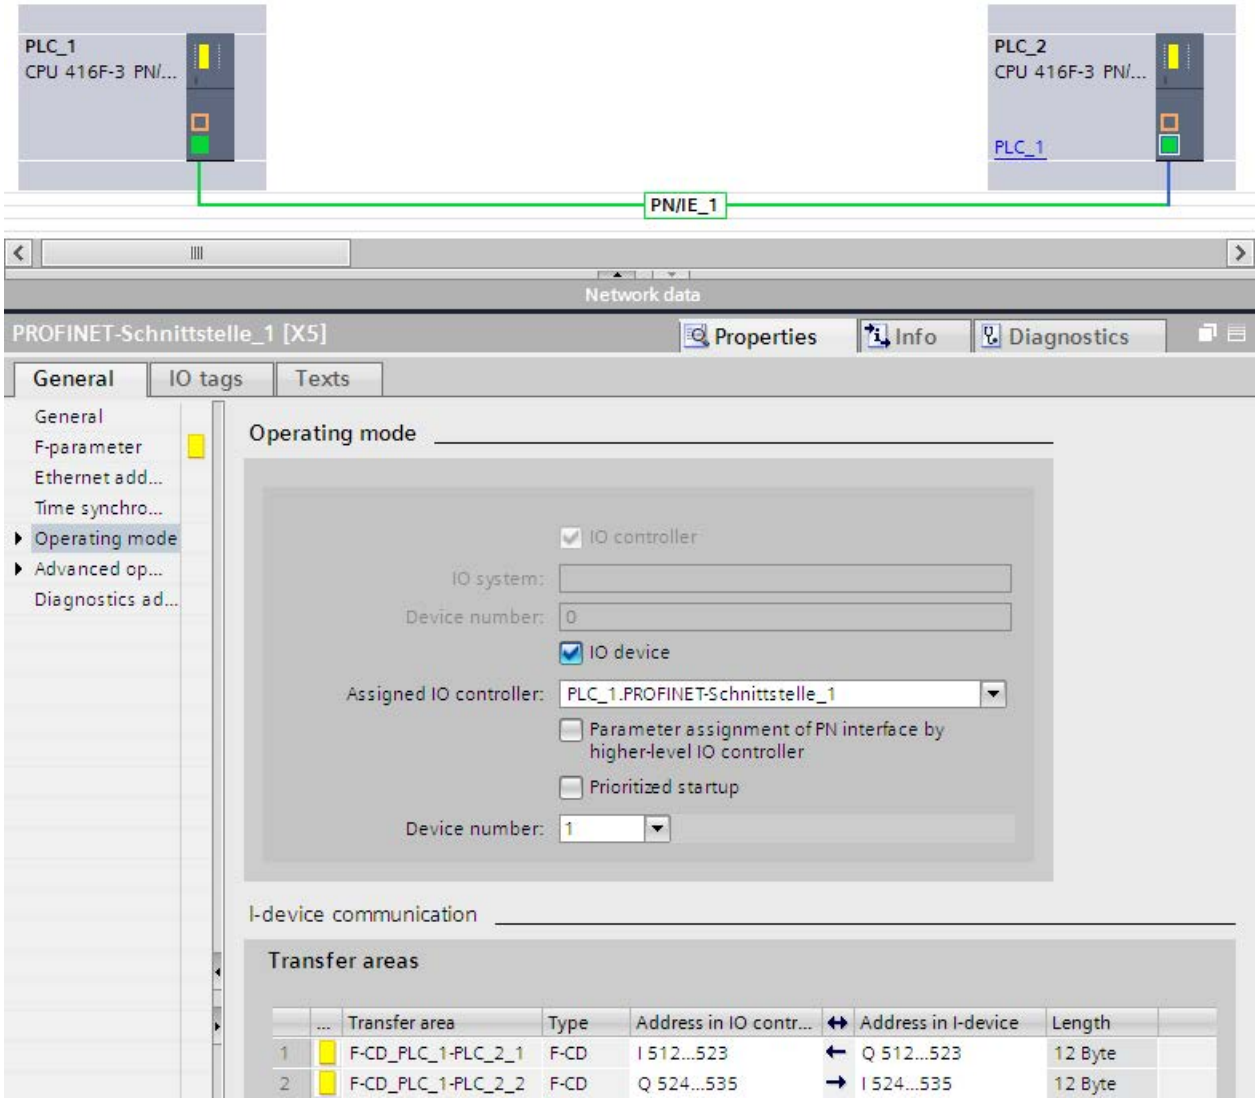
The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Activate the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", you create an F-CD connection (type "F-CD") for sending to the IO controller (←). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned outside of the process image are displayed.

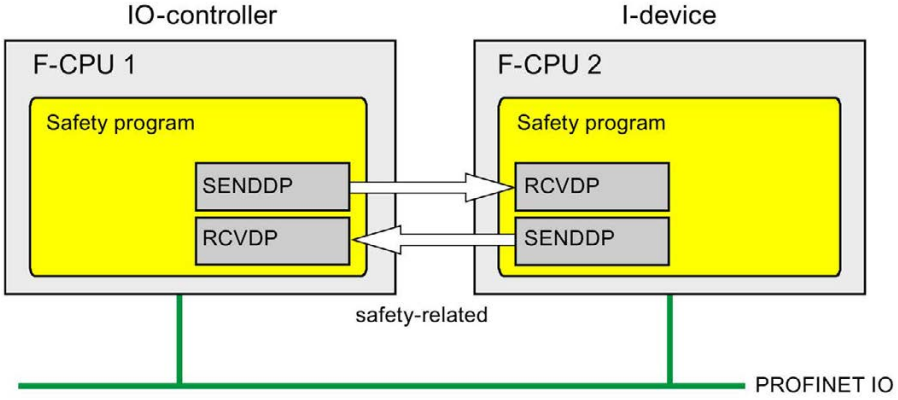
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").

4. Create an additional F-CD connection for receiving from the IO controller.
5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from IO controller (→).



9.1.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.1.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

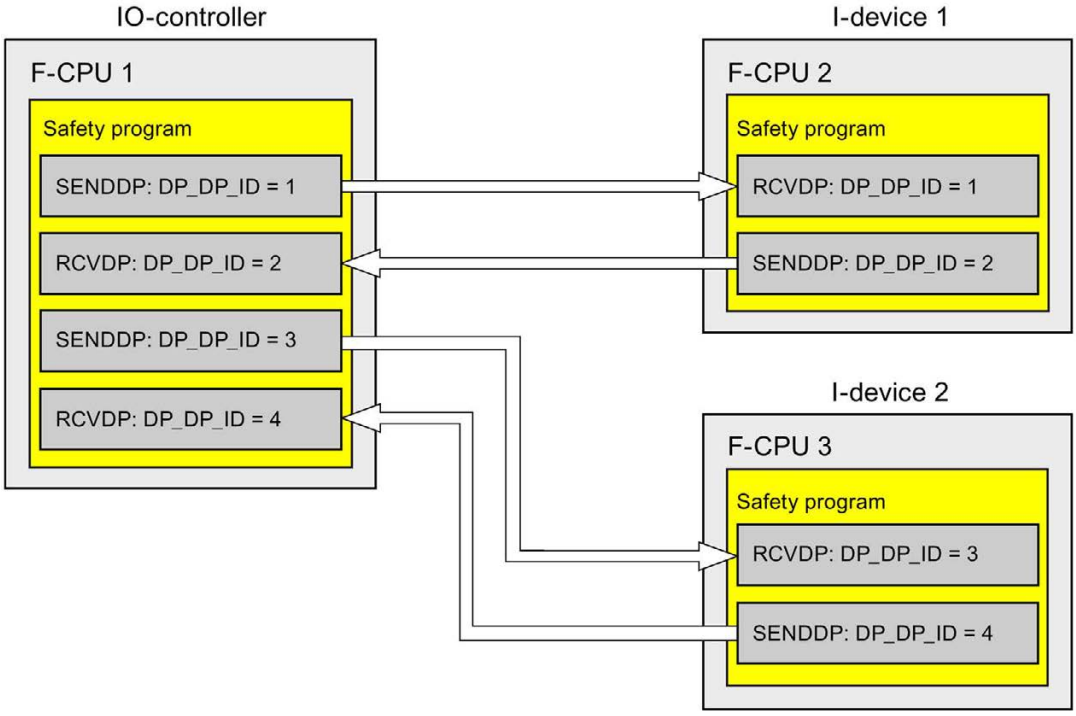
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 171)).

The assignment of the start addresses of the transfer areas to the LADDR parameter of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the IO controller	→	Address in the IO controller
RCVDP in the IO controller	←	Address in the IO controller
SENDDP in the I-device	←	Address in the IO device
RCVDP in the I-device	→	Address in the IO device

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for four safety-related IO controller-I-device communication relationships.



⚠ WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal state is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9.1.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller . In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.1.5 Safety-related master-I-slave communication

9.1.5.1 Configuring safety-related master-I-slave communication

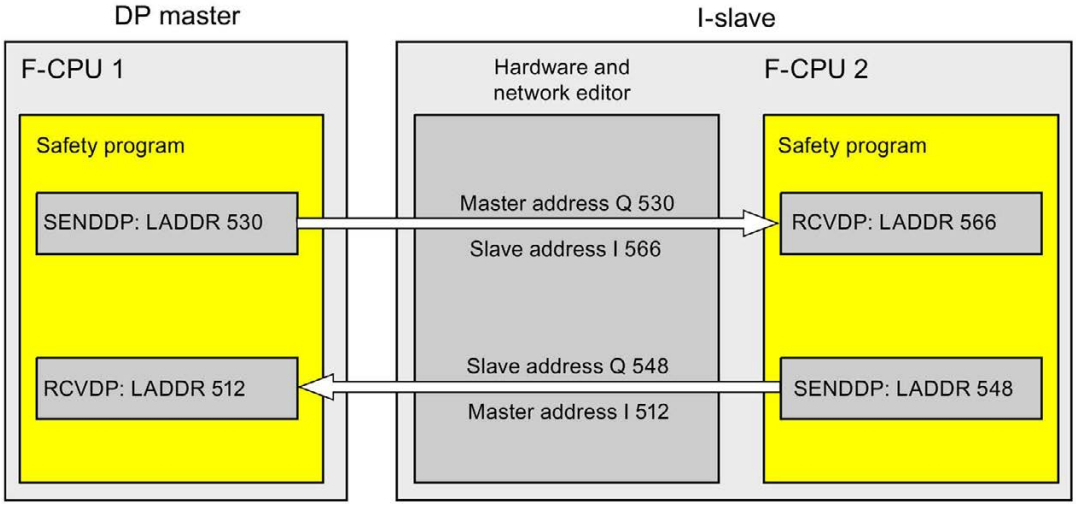
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship, for example "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

You assign the start addresses of the transfer areas to the LADDR parameter of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

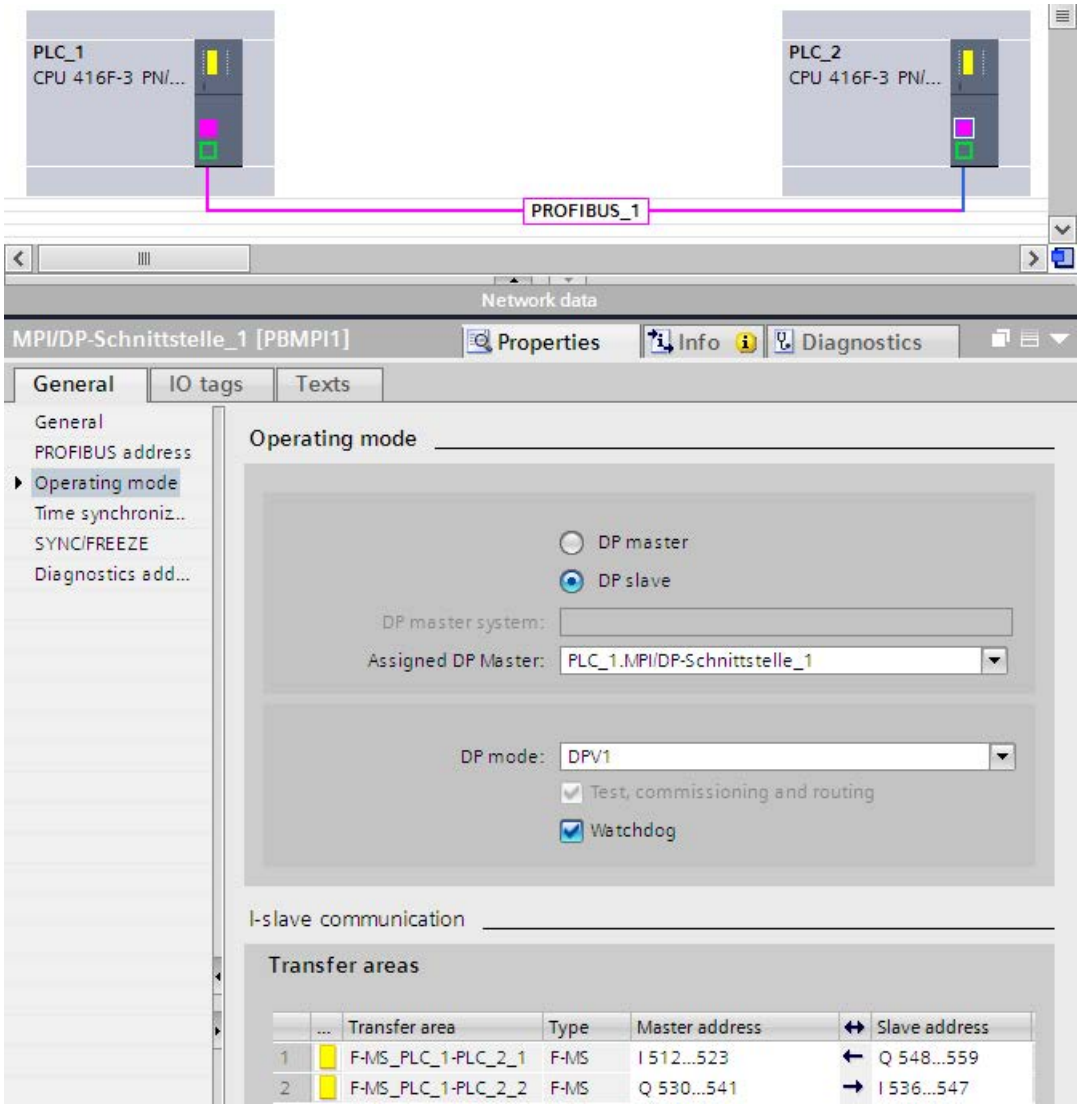
The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Activate the "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this DP interface to a DP interface of F-CPU 1.
3. Select the PROFIBUS interface of F-CPU 2. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the transfer areas in the I-slave and DP master assigned outside of the process image are displayed.

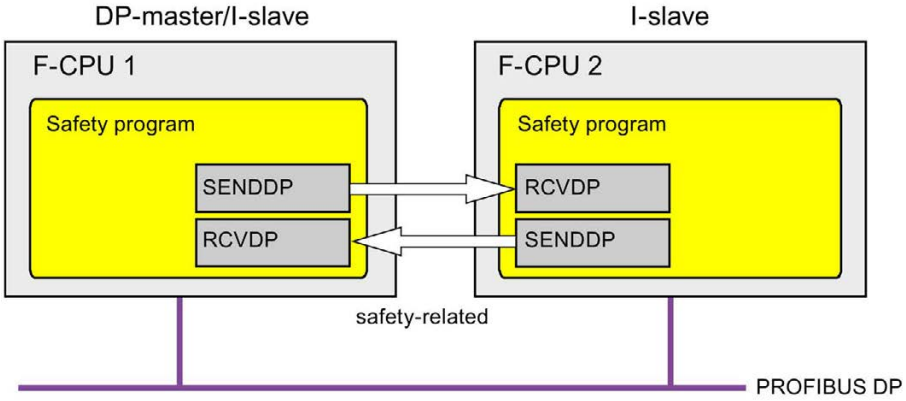
   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").

4. Create an additional F-MS connection for receiving from the DP master.
5. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.1.5.2 Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave or between the F-CPUs of several I-slaves makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type INT or BOOL.

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.1.5.3 Program the safety-related master-I-slave or I-slave-I-slave communication

Requirements

The transfer areas must be configured.

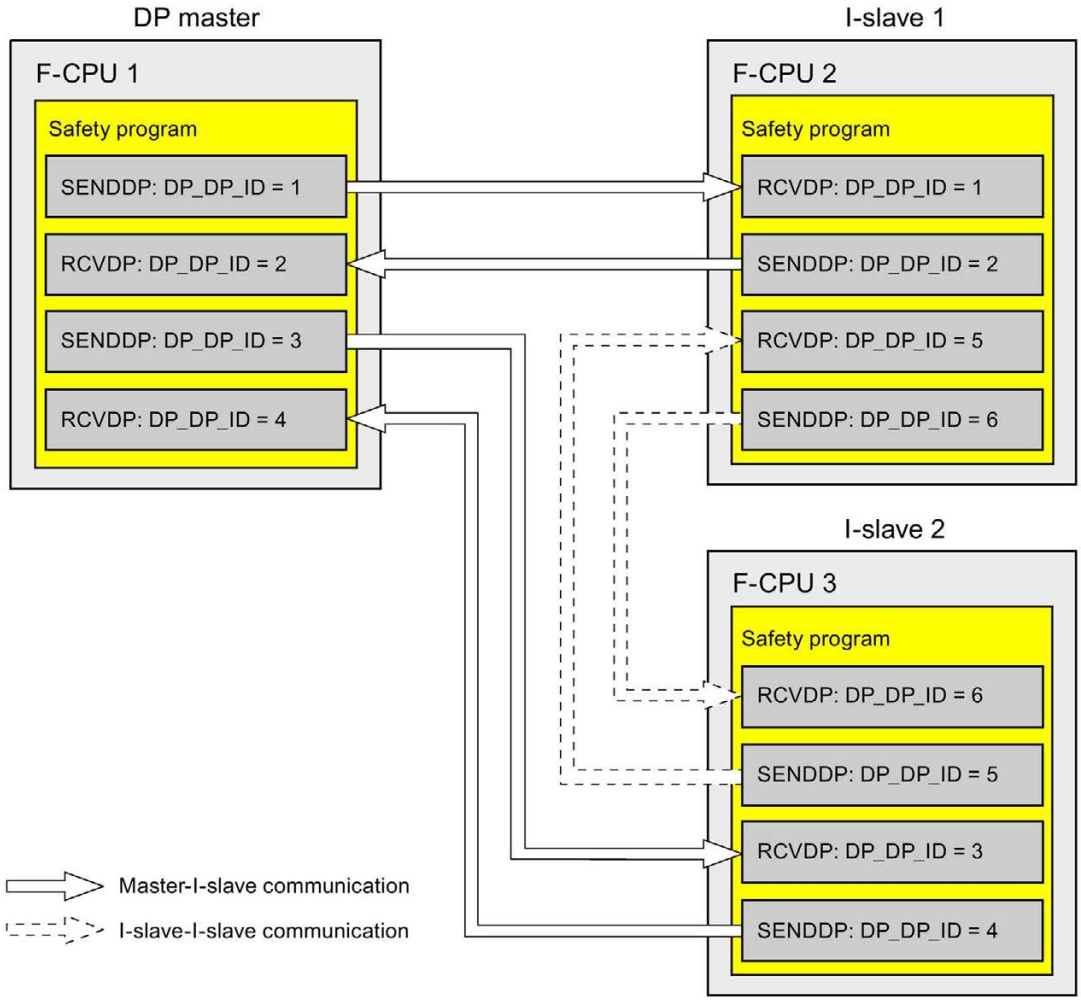
Programming procedure

The procedure for programming safety-related master-I-slave communication or I-slave-I-slave communication is the same as that for programming safety-related master-master communication (see Program safety-related master-master communication (Page 181)).

The assignment of the start addresses of the transfer areas to the LADDR parameter of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the DP master	→	Master address
RCVDP in the DP master	←	Master address
SENDDP in the I-slave	←	Slave address
RCVDP in the I-slave	→	Slave address

The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave and two I-slave-I-slave communications relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9.1.5.4 Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data					
		DP master		I-slave 1		I-slave 2	
		Output data	Input data	Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes	—	—
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes	—	—
I-slave-I-slave	**Sending:** I-slave 1 to I-slave 2	—	18 bytes	12 bytes	6 bytes	6 bytes	12 bytes
	Receiving: I-slave 1 from I-slave 2	—	18 bytes	6 bytes	12 bytes	12 bytes	6 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS, F-DX, F-DX-Mod., MS, DX and DX-Mod). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.6 Safety-related I-slave-I-slave communication

9.1.6.1 Configure safety-related I-slave-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPUs of I-slaves takes place using direct data exchange (**F-**DX) – same as in standard programs.

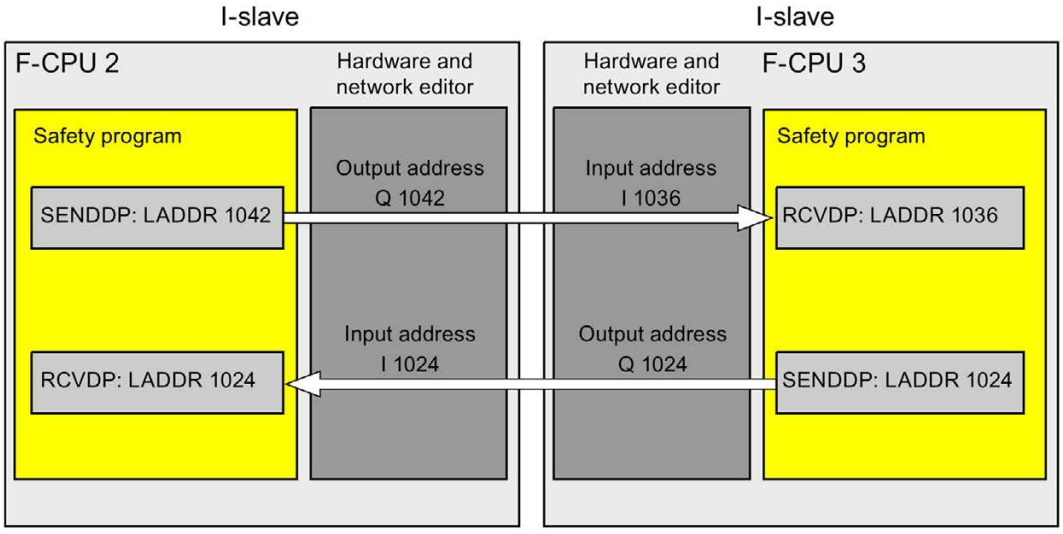
You do not need any additional hardware for I-slave-I-slave communication.

I-slave-I-slave communication is also possible:

- If the assigned DP master is a standard CPU that supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

Configuring transfer areas

For every safety-related communication connection between two I-slaves, you must configure transfer areas in the *hardware and network editor*. In the figure below, both of the I-slaves are to be able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship, for example "F-DX_PLC_2-PLC_1_1" for the first F-DX connection between F-CPU 1 and CPU 2.

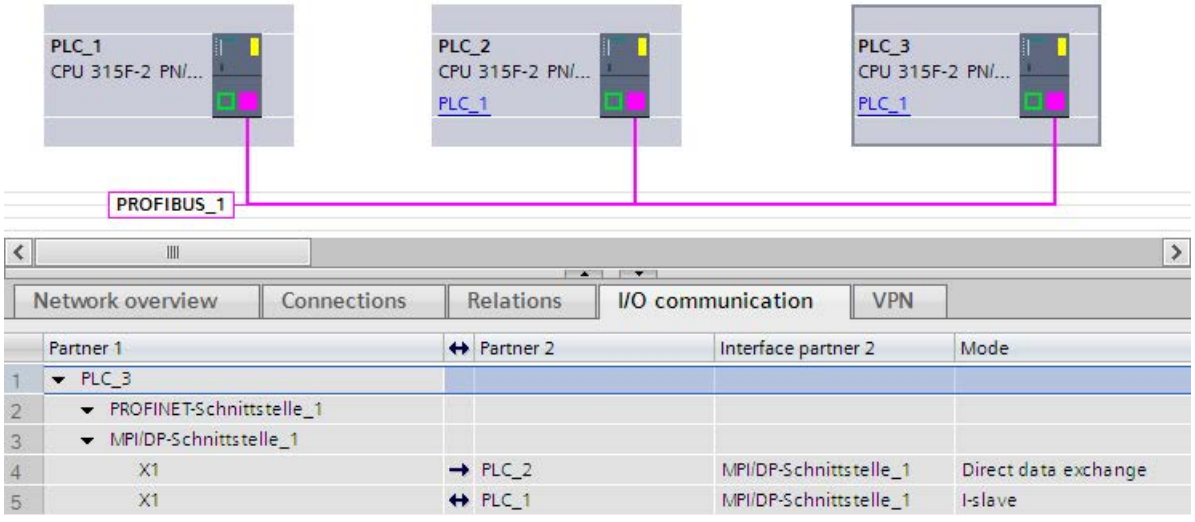
You assign the start addresses of the transfer areas to the LADDR parameter of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

The procedure for configuring safety-related I-slave-I-slave communication is identical to that in the standard system. Proceed as follows:

1. Insert three F-CPUS from the "Hardware catalog" task card in the project.
2. Activate "DP slaves" mode (I-slave) for F-CPU 2 and F-CPU 3 in the properties of their DP interfaces and assign these DP interfaces to a DP interface of F-CPU 1.
3. Select the DP interface of F-CPU 3 in the network view.
4. Select the "I/O communication" tab.
5. Use a drag-and-drop operation in the network view to move F-CPU 2 to the "Partner 2" column on the "I/O-communication" tab.

   This creates a line with "Direct data exchange" mode for sending to the I-slave (F-CPU 2) (→).

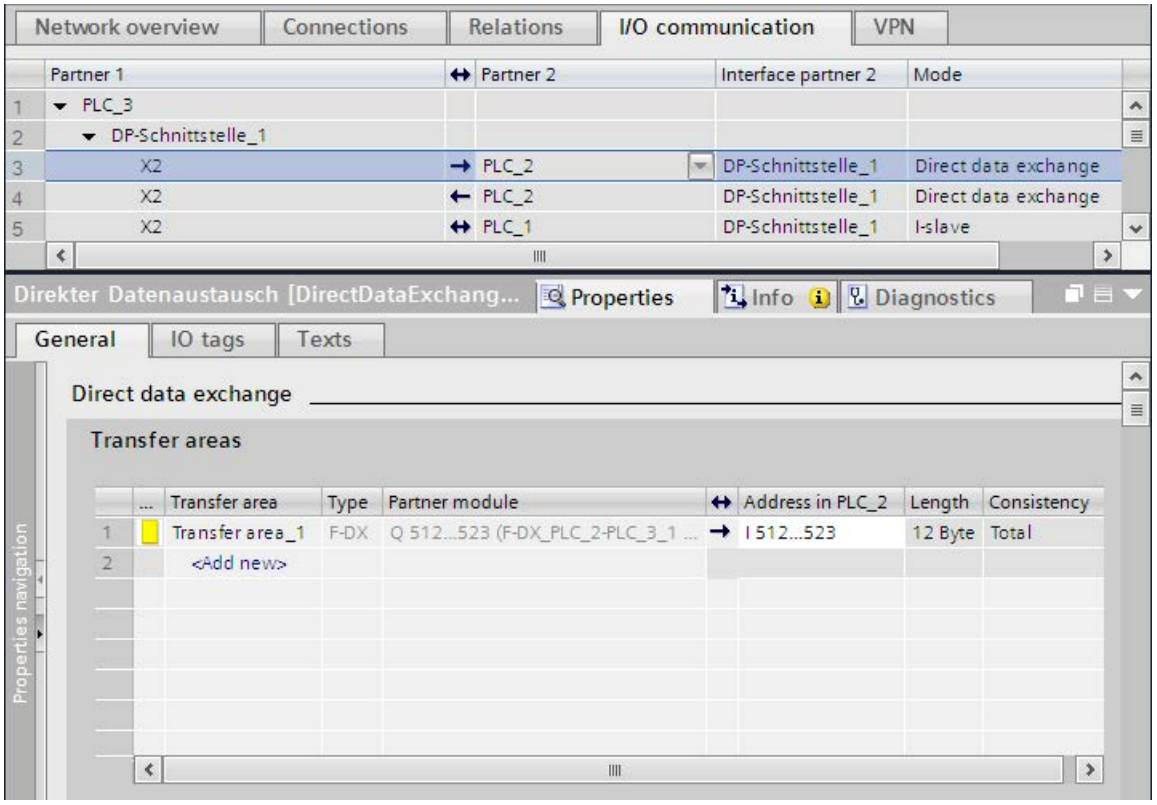


6. In "Transfer areas" ("Direct data exchange" table), create an F-DX connection (type "F-DX") for sending to the I-slave (F-CPU 2) (→). The F-DX connection is shown in yellow in the table and the transfer areas in the I-slaves assigned outside of the process image (PLC_2 and PLC_3) are displayed.

   In addition, a line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 2) (→) is created automatically in the "I/O communication" tab, and an acknowledgment connection (←, transfer area x_Ack) is created automatically in the associated "Direct data exchange" table.

   One transfer area (type F-MS) for the master CPU (disabled in display) is created for in the "I-slave communication table" of each I-slave.

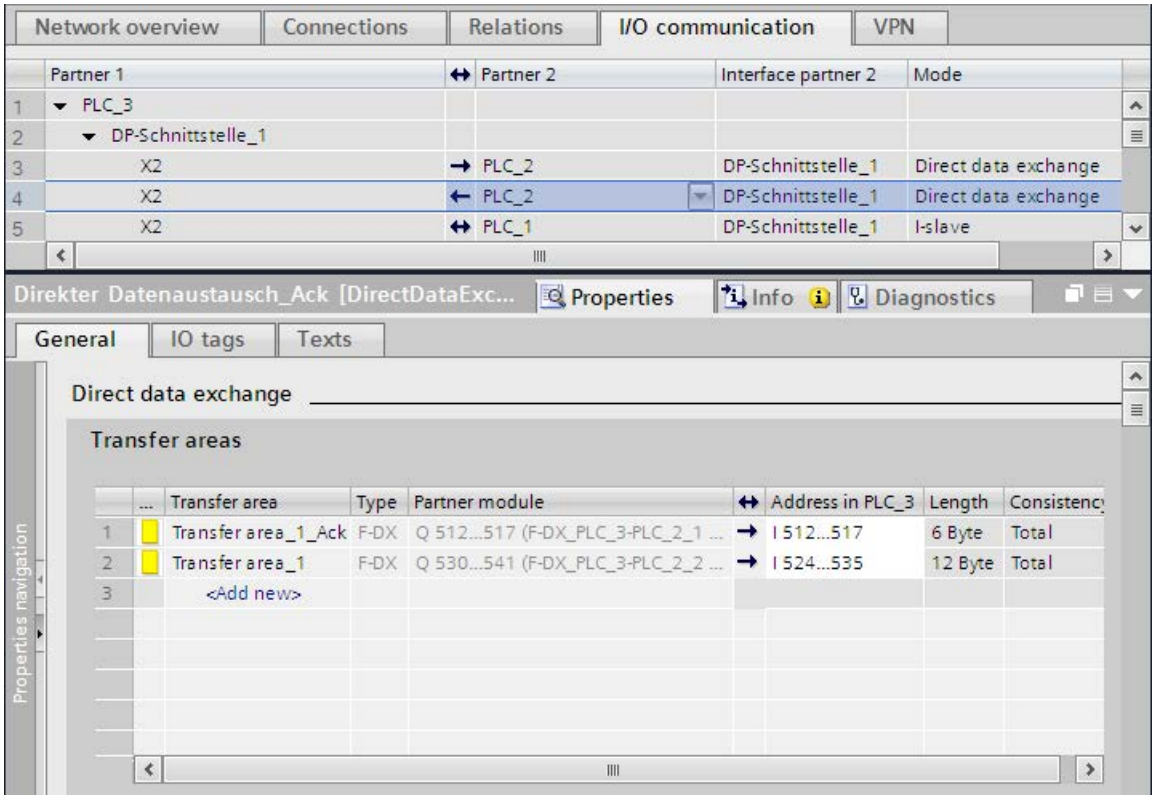
   This completes the configuration for sending to F-CPU 2.



7. In the "I/O communication" tab, select the automatically created line with "Direct data exchange" mode for receiving from the I-slave (F-CPU 3) (←).
8. In "Transfer areas" ("Direct data exchange" table), create another F-DX connection for receiving from the I-slave (F-CPU 3).

   In this case, as well, an acknowledgment connection (←, transfer area x_Ack) is created automatically in the "Data exchange table" and two transfer areas (type F-MS) for the master CPU (disabled in display) are created in the "I-slave communication" table of both I-slaves.

   This completes the configuration for receiving from F-CPU 2.



Changing disabled local address areas of the transfer areas

In order to change the disabled local address area of "Transfer area x", you must change the address area of the corresponding acknowledgment connection "Transfer area x_Ack".

1. In "I/O communication", select the line with the arrow pointing in the same direction as the arrow of "Transfer area x" in the "Direct data exchange" table.
2. Then select the line with "Transfer area x_Ack" in the "Direct data exchange" table.
3. Change the address area there.

9.1.6.2 Safety-related I-slave-I-slave communication via SENDDP and RCVDP

Reference

The description of the communication via SENDDP and RCVDP for safety-related I-slave-I-slave communication can be found in Safety-related master-I-slave or I-slave-I-slave communication via SENDDP and RCVDP (Page 195).

9.1.6.3 Programming safety-related I-slave-I-slave communication

Reference

The description of the programming of safety-related I-slave-I-slave communication can be found in Program the safety-related master-I-slave or I-slave-I-slave communication (Page 196).

The assignment of the start addresses of the transfer areas to the LADDR parameter of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	Start address LADDR	
	From row	From column
SENDDP in the 1st I-slave	→	Address in the <1st I-slave> (in example column "Address in PLC_2")
RCVDP in the 1st I-slave	←	Address in the <1st I-slave> (in example column "Address in PLC_2")
SENDDP in the 2nd I-slave	←	Address in the <2nd I-slave> (in example column "Address in PLC_3")
RCVDP in the 2nd I-slave	→	Address in the <2nd I-slave> (in example column "Address in PLC_3")

9.1.6.4 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

The description of the limits for the data transfer of safety-related I-slave-I-slave communication can be found in Limits for data transfer of safety-related master-I-slave or I-slave-I-slave communication (Page 199).

9.1.7 Safety-Related I-Slave-Slave Communication

9.1.7.1 Configuring Safety-Related I-Slave-Slave Communication

Introduction

Safety-related communication between the safety program of the F-CPU of an I-slave and F-I/O in a DP slave takes place using direct data exchange (**F-**DX-Mod), same as in standard programs.

You do not need any additional hardware for I-slave-slave communication.

I-slave-slave communication is also possible:

- when the assigned DP master is a standard CPU, if the standard CPU supports direct data exchange
- when instead of a DP master, an IO controller is networked with the I-slaves via an IE/PB link

An F-I/O DB is automatically generated for each F-I/O when it is configured in the *hardware and network editor*; this is required for the F-I/O access via safety-related I-slave-slave communication. The F-I/O DB is initially created in the safety program of the DP master, provided it is an F-CPU with F-activation. Only with the setup of the F-DX-Mod connection is the F-I/O DB created in the safety program of the I-slave.

The process image of the inputs is used to access the channels of the F-I/O in the safety program of the F-CPU of the I-slave (see description in Safety-Related I-Slave-Slave Communication - F-I/O Access (Page 210)).

Restrictions

Note

Safety-related I-slave-slave communication is possible for F-I/O in a DP slave that supports safety-related I-slave-slave communication, e.g. for all ET 200S F-modules with IM 151-x HIGH FEATURE and all S7-300 fail-safe signal modules with IM 153-2, as of item no. 6ES7153-2BA01-0XB0, firmware > V4.0.0.

Safety-related I-slave-slave communication is not supported for ET 200SP F-modules and ET 200MP F-modules.

Note

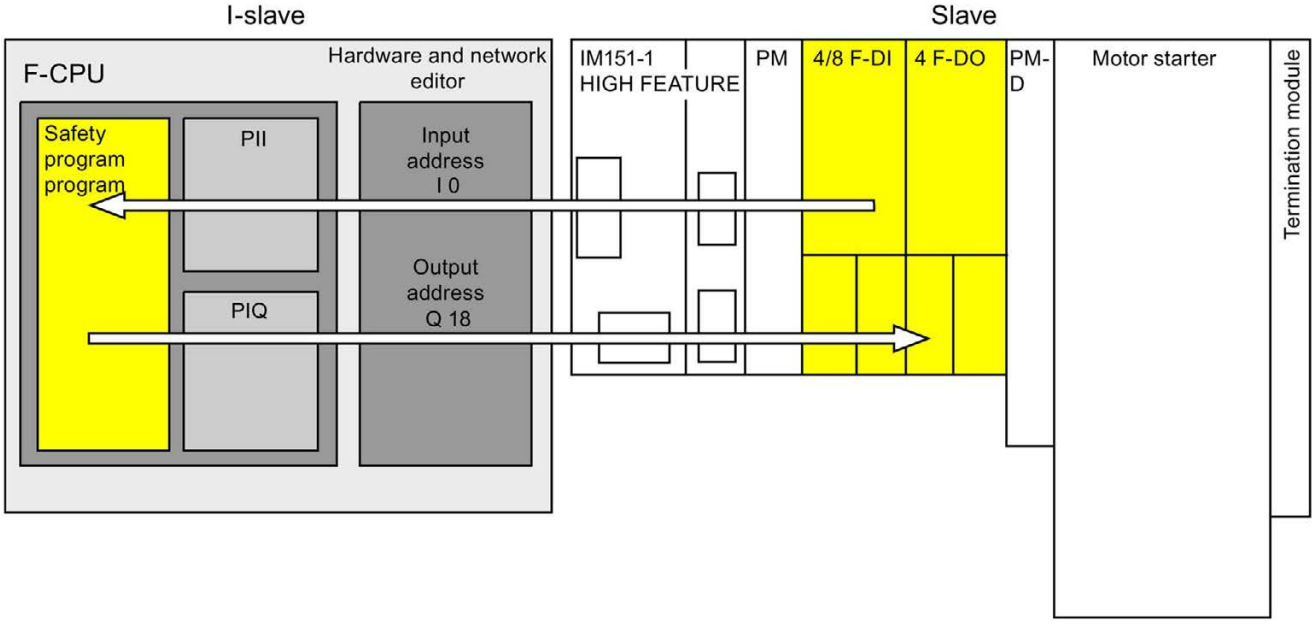
With safety-related I-slave-slave communication, make sure that the CPU of the DP master is powered up before the F-CPU of the I-slave.

Otherwise, depending on the F-monitoring time specified for the F-I/O, the F-system can detect an error in safety-related communication (communication error) between the F-CPU and the F-I/O assigned to the I-slave. This means that the F-I/O are not reintegrated automatically after F-system startup. They are instead only reintegrated after a user acknowledgment with a positive edge in the ACK_REI tag of the F-I/O DB (see also After communication errors (Page 142) and After startup of F-system (Page 140)).

Configuring transfer areas

For every safety-related communication connection between an I-slave and slave, you must configure transfer areas in the *hardware and network editor*.

The transfer area is assigned a label when it is created to identify it as the communication relationship, for example "F-DX-Mod_PLC_2-PLC_1_1" for the first F-DX-Mod connection between F-CPU 1 and F-CPU 2.

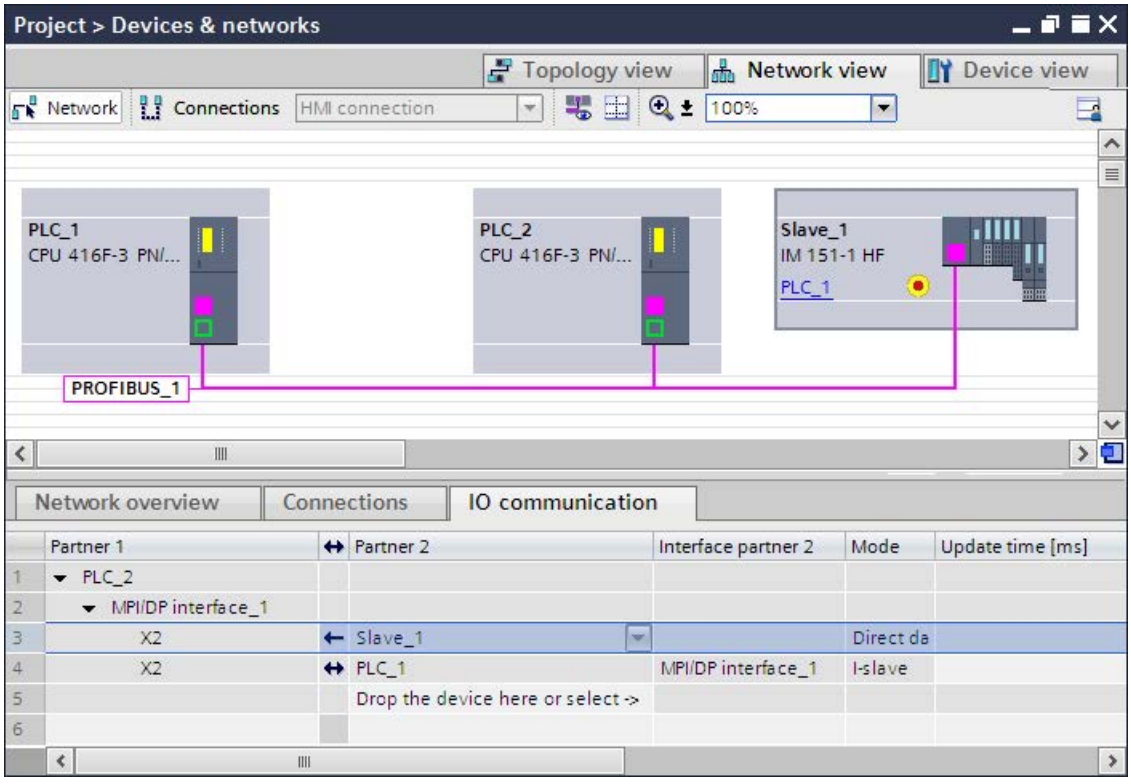


Configuration procedure using the example of an ET 200S with F-modules in the slave

The procedure for configuring safety-related I-slave-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Insert a suitable DP slave, e.g. IM 151-1 HF, article no. 6ES7151-1BA0... from the "Hardware catalog" task card into the network view of the *hardware and network editor*.
3. Assign a 4/8 F-DI module and a 4 F-DO-module in the device view of the ET 200S.
4. Activate "DP slave" mode (I-slave) for F-CPU 2 in the properties of its DP interface and assign this to F-CPU 1.
5. Assign the DP interface of the IM 151-1 HF to the DP master (F-CPU 1).
6. Select the DP interface of F-CPU 2 (I-slave) in the network view.
7. Select the "I/O communication" tab.
8. Use a drag-and-drop operation in the network view to move the ET 200S to the "Partner 2" column in the "I/O-communication" tab.

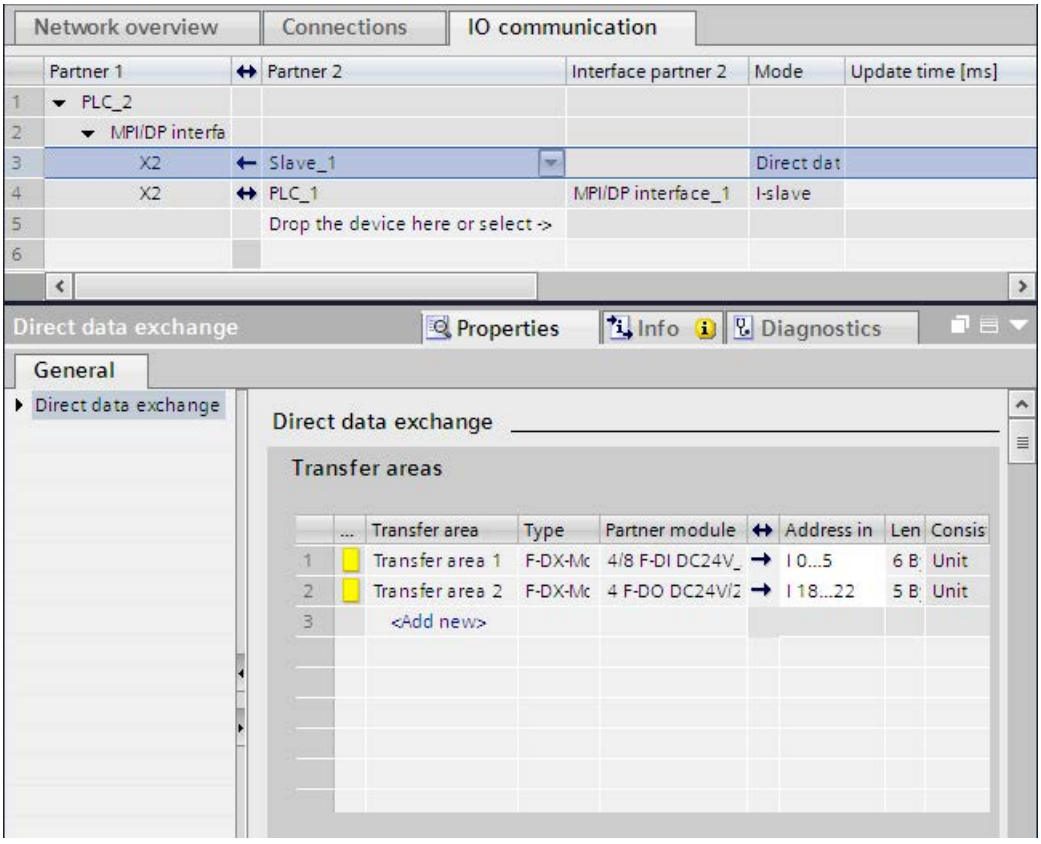


9. In "Transfer areas", create an F-DX-Mod connection (type "F-DX-Mod"). The F-DX-Mod connection is marked in yellow in the table. The addresses for the "partner module" 4/8 F-DI in the I-Slave (PLC_2) are displayed. You can change the addresses directly in the table, if required.

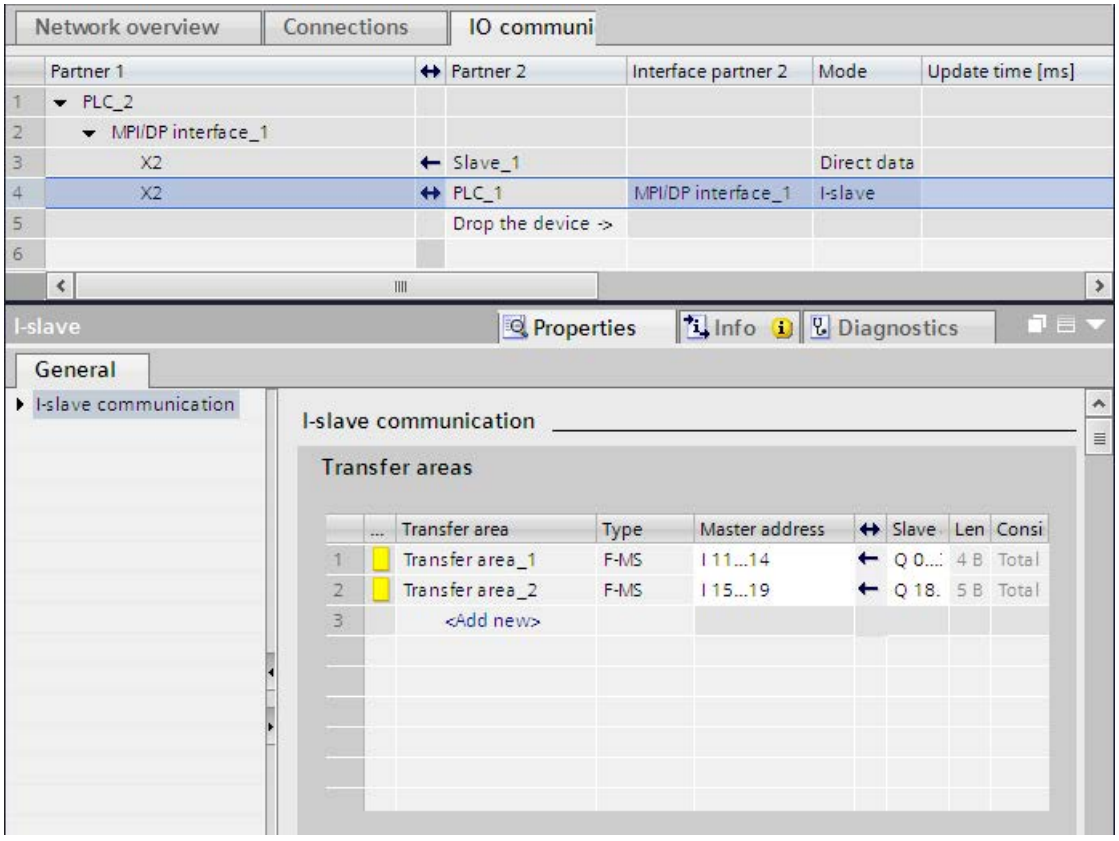
   This completes the configuration for the 4/8 F-DI module.

10. In "Transfer areas", create another F-DX-Mod connection.
11. Change the partner module to the 4 F-DO module, either directly in the "Transfer areas" table or in the details of transfer area 2, if the 4 F-DO module was not already selected.

    This completes the configuration for the 4 F-DO module.



In the "I-slave communication table" of the I-slave, a transfer area (type F-MS) for the master CPU (disabled in display) is created for each F-DX-Mod connection.



Change in configuration of I-slave-slave communication

⚠ WARNING

If you have reconfigured I-slave-slave communication for an F-I/O or have deleted an existing I-slave-slave communication, you must compile the hardware configuration of the DP master as well as the hardware configuration of the I-slave and download them to the DP master and I-slave, respectively.

The collective F-signature in the F-CPU of the I-slave and the collective F-signature in the F-CPU of the DP master (if a safety program exists there, too) are set to "0". You must then recompile the safety program(s). *(S019)*

9.1.7.2 Safety-Related I-Slave-Slave Communication - F-I/O Access

Access via the process image

In safety-related I-slave-slave communication, you use the process image (PII or PIQ) to access the F-I/O in the safety program of the F-CPU of the I-slave. This is the same as F-I/O access to F-I/O that are directly assigned to an I-slave or DP master. In the I-slave you access the F-I/O with the addresses that were assigned for the F-DX-Mod connection in "Transfer areas" ("Direct data exchange" table).

In this case, ignore the displayed operand area. Access F-I/O with inputs using the PII and F-I/O with outputs using PIQ.

Information on I/O access can be found in F-I/O access (Page 122).

9.1.7.3 Limits for data transfer of safety-related I-slave-I-slave communication

Limits for data transfer

Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

An example of the amount of output data and input data that are assigned for safety-related communication is shown in the table below for an ET 200S 4/8 F-DI and an ET 200S 4 F-DO:

Safety-related communication	Communication connection	Assigned input and output data*	
		Between I-slave and DP master	
		Output Data in the I-slave	Input data in the I-slave
I-slave-slave	I-slave-slave communication with 4/8 F-DI	4 bytes	6 bytes
	I-slave-slave communication with 4 F-DO	5 bytes	5 bytes

* Example for 4/8 F-DI and 4 F-DO of ET 200S

Consider all additional configured safety-related and standard communication connections (F-MS, F-DX, F-DX-Mod., MS, DX und DX-Mod. connections) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master. If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.1.8 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 661)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 192) also applies.

9.1.9 Safety-related communication via S7 connections

9.1.9.1 Configuring safety-related communication via S7 connections

Introduction

Safety-related communication between the safety programs of F-CPUs via S7 connections takes place by means of established S7 connections that you create in the network view of the *hardware and network editor* - same as in standard programs.

Restrictions

Note

In SIMATIC Safety, S7 connections are generally permitted only via Industrial Ethernet.

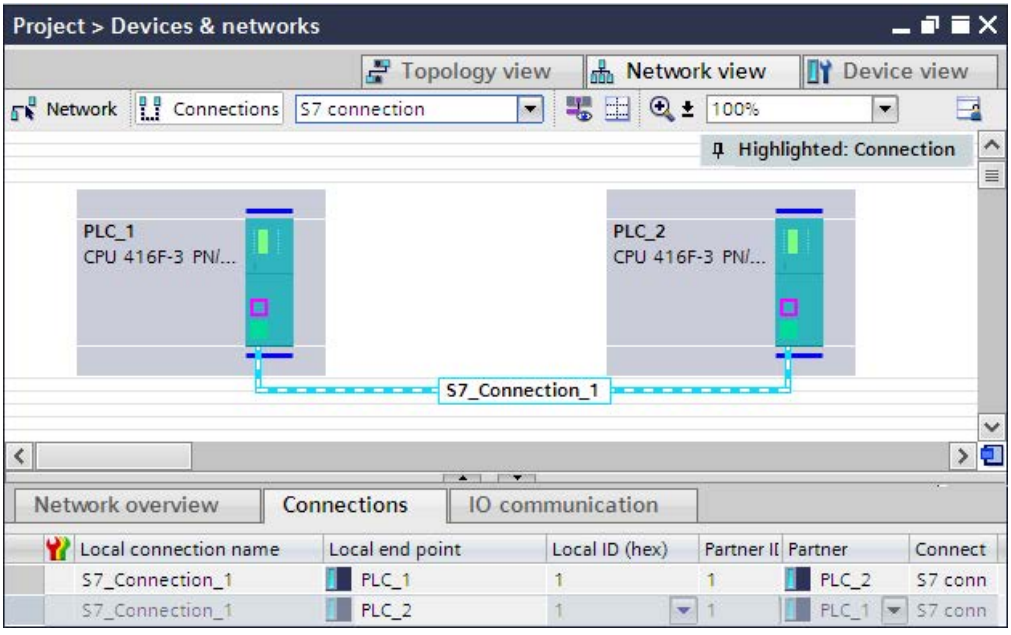
Safety-related communication via S7 connections is possible from and to the following CPUs:

- S7-300 F-CPUs via the integrated PROFINET interface
- S7-400 F-CPUs via the integrated PROFINET interface or a CP 443-1 Advanced-IT

Creating S7 connections

For each connection between two F-CPUs, you must create an S7 connection in the network view of the *hardware and network editor*.

For every end-point of a connection, a local and a partner ID is automatically assigned from the perspective of the end-point (the F-CPU). If necessary, you can change both IDs in the "Connections" tab. You assign the local ID to the "ID" parameter of the SENDS7 and RCVS7 instructions in the safety programs.

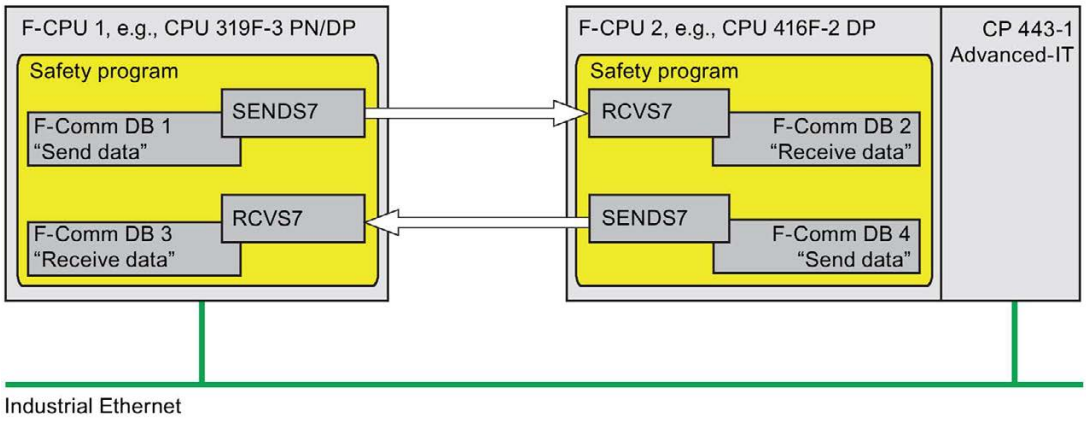


Procedure for configuring S7 connections

You configure the S7 connections for safety-related CPU-to-CPU communication in the same way as in *STEP 7 Professional* (see *Help on STEP 7 Professional* "S7 connections").

9.1.9.2 Communication via SENDS7, RCVS7, and F-Communication DB

Communication via the SENDS7 and RCVS7 instructions



You use the **SENDS7 and RCVS7** instructions for fail-safe sending and receiving of data via S7 connections.

These instructions can be used to transmit a specified amount of fail-safe data of data types BOOL, INT, WORD, DINT, DWORD, and TIME in a fail-safe manner. The fail-safe data are stored in F-DBs (F-communication DBs) that you have created.

You can find these instructions in the "Instructions" task card under "Communication". The RCVS7 instruction **must** be called at the start of the main safety block. The SENDS7 instruction **must** be called at the end of the main safety block.

Note that the send signals are sent only after calling the SENDS7 instruction at the end of the relevant F-runtime group execution.

A detailed description of the SENDS7 and RCVS7 instructions is found in SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 654).

F-communication DB

For each connection, send data are stored in an F-DB (F-communication DBx) and receive data are stored in an F-DB (F-communication DBy).

You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

9.1.9.3 Programming safety-related communication via S7 connections

Introduction

The programming of safety-related CPU-CPU communication via S7 connections is described below. You must set up the following in the safety programs of the relevant F-CPUs:

- Create F-DBs (F-Communication-DBs) in which send/receive data for communication are stored.
- Call and assign parameters for instructions for communication from the "Instructions" Task Card in the safety program.

Requirement for programming

The S7 connections between the relevant F-CPUs must be configured in the network view in the "Connections" tab of the *hardware and network editor*.

Creating and Editing an F-Communication DB

F-communication DBs are F-DBs that you create and edit in the same way as other F-DBs in the project tree. You can assign the F-communication DB numbers in the SENDS7 and RCVS7 instructions.

Note

The length and structure of the F-communication DB at the receiver end must match the length and structure of the associated F-communication DB at the sender end.

If the F-communication DBs do not match, the F-CPU can go to STOP mode. A diagnostic event is entered in the diagnostic buffer of the F-CPU.

For this reason, we recommend that you use the following procedure:

1. Create an F-communication DB in the project tree in or below the "Program blocks" folder of the F-CPU at the sender end.
2. Specify the appropriate structure of the F-communication DB, taking into account the data to be transferred.
3. Copy this F-communication DB to the project tree in or below the "Program blocks" folder of the F-CPU at the receiver end, and change the name, if necessary.

Other requirements for F-communication DBs

F-communication DBs must also conform to the following properties:

- They are not permitted to be instance DBs.
- Their length is not permitted to exceed 100 bytes.
- In F-communication DBs, only the following data types may be declared: BOOL, INT, WORD, DINT, DWORD, and TIME.
- The data types must be arranged block-wise and in the following order: BOOL, data types with bit length of 16 bits (INT, WORD), and data types with bit length of 32 bits (DINT, DWORD, and TIME). Within the data blocks with lengths of 16 bits and 32 bits, the data types can be arranged in any order.
- No more than 128 data elements of data type BOOL are permitted to be declared.
- The amount of data of data type BOOL must always be an integer multiple of 16 (word limit). Reserve data must be added, if necessary.

If these criteria are not fulfilled, *STEP 7 Safety Advanced* outputs an error message during compilation.

Assignment of fail-safe values

Fail-safe values are made available at the receiver end:

- While the connection between the communication partners is being established the first time after startup of the F-systems
- Whenever a communication error occurs

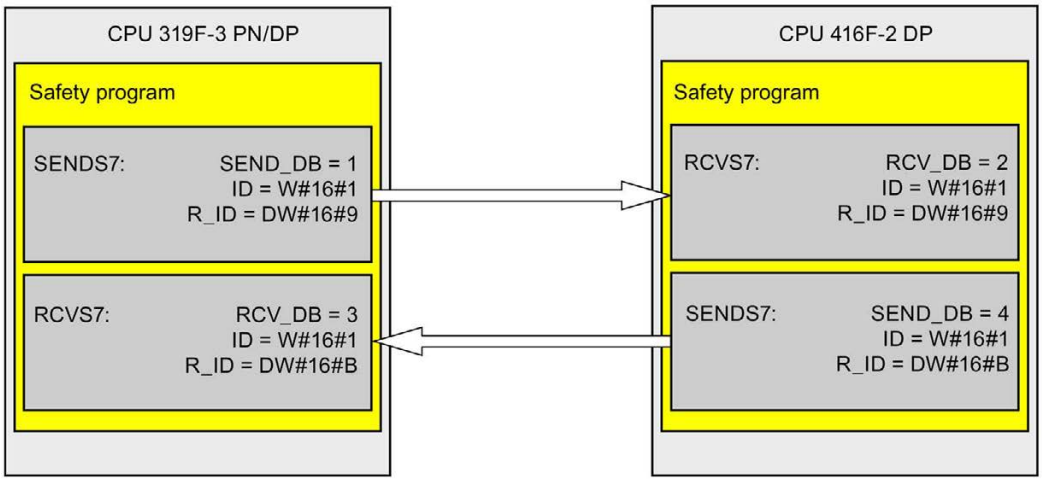
The values you specified as initial values in the F-communication DB at the receiver end are made available as initial values.

Programming procedure

You program safety-related communication via S7 connections as follows:

1. Supply the tags in the F-communication DB at the sender end with send signals using fully qualified access (e.g., "Name of F-communication DB"."tag name").
2. Read the tags in the F-communication DB at the receiver end (receive signals) that you want to process further in other sections of the program using fully qualified access (e.g., "Name of F-communication DB"."tag name").
3. In the safety program from which data are to be sent, call the SENDS7 instruction for sending at the end of the main safety block.
4. In the safety program from which data are to be received, call the RCVS7 instruction for receiving at the start of the main safety block.
5. Assign F-communication DB numbers to the SEND_DB input of SENDS7 and the RCV_DB input of RCVS7.
6. Assign the local ID of the S7 connection (data type:WORD) from the perspective of the F-CPU that was configured in the "Connections" tab of the network view to the ID input of SENDS7 .

7. Assign the local ID of the S7 connection (data type: WORD) that was configured in the "Connections" tab of the network view to the ID input of RCVS7 .
8. Assign an odd number (data type: DWORD) to the R_ID inputs of SENDS7 and RCVS7 . This serves to specify that a SENDS7 instruction belongs to an RCVS7 instruction. The associated instructions receive the same value for R_ID.



WARNING

The value for each address relationship (R_ID input; data type: DWORD) is user-defined; however, it must be an odd number and unique network-wide* for all safety-related communication connections. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program! *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

9. Assign the TIMEOUT inputs of the SENDS7 and RCVS7 instructions with the required monitoring time.

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

10. To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND (initial value = "TRUE") with 0. In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction and the receiver RCVS7 provides fail-safe values for this period (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.
11. Optional: evaluate the ACK_REQ output of RCVS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
12. Supply the ACK_REI input of RCVS7 with the signal for the acknowledgment for reintegration.
13. Optional: evaluate the SUBS_ON output of RCVS7 or SENDS7 in order to query whether the RCVS7 instruction is outputting the fail-safe values you specified as initial values in the F-communication DB.
14. Optional: evaluate the ERROR output of RCVS7 or SENDS7, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
15. Optional: evaluate the SENDMODE output of RCVS7 in order to query whether the F-CPU with the associated SENDS7 instruction is in disabled safety mode (Page 293).

Particularities for migrated projects

If you have migrated a project from *S7 Distributed Safety V5.4* to *STEP 7 Safety Advanced* in which safety-related communication via S7 connections is programmed, you must note the following:

- Do not delete migrated instance DBs for the SENDS7 and RCVS7 instructions in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks".

Otherwise, communication errors may occur in the relevant communication connections.

A migrated instance DB for the SENDS7 and RCVS7 instructions has been deleted if, after compiling the safety program, the "User-defined ID" in the newly generated is not identical to "FRCVS7CL" or "FSNDS7CL".

You can find the "User-defined ID" of a block in its properties in the "Information" area.

9.1.9.4 Safety-related communication via S7 connections - Limits of data transfer

Note

If the amount of data to be transmitted exceeds the permitted length for the F-communication DB (100 bytes), you can create another F-communication DB that you transfer to additional SENDS7/RCVS7 instructions with modified R_ID.

Note that USEND and URCV instructions are called internally at each SENDS7 or RCVS7 call and use connection resources in the F-CPU. This affects the maximum number of communication connections available (*see manuals for F-CPUs*).

Additional information on the data transfer limits for S7 connections of individual F-CPUs is available on the Internet (http://support.automation.siemens.com/WW/view/en/38549114).

9.1.10 Safety-related communication with S7 F-systems

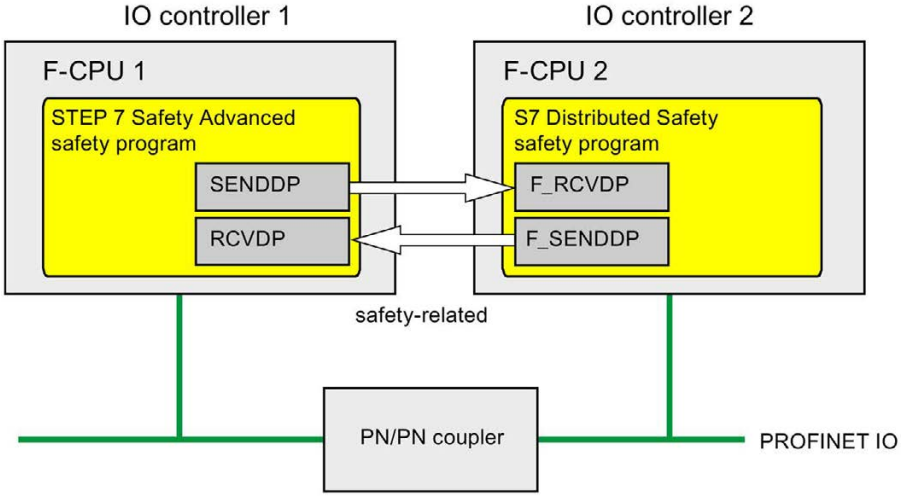
9.1.10.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs as IO controller-IO controller communication, master-master communication or communication via established S7 connections.

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 F/FH Systems F-systems is possible via established S7 connections.

9.1.10.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

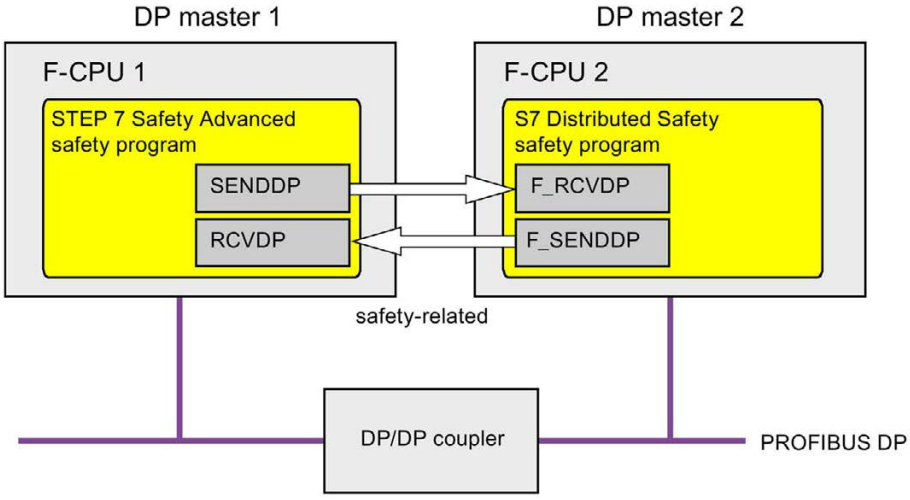
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related IO controller-IO controller communication (Page 166).

9.1.10.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety Advanced* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

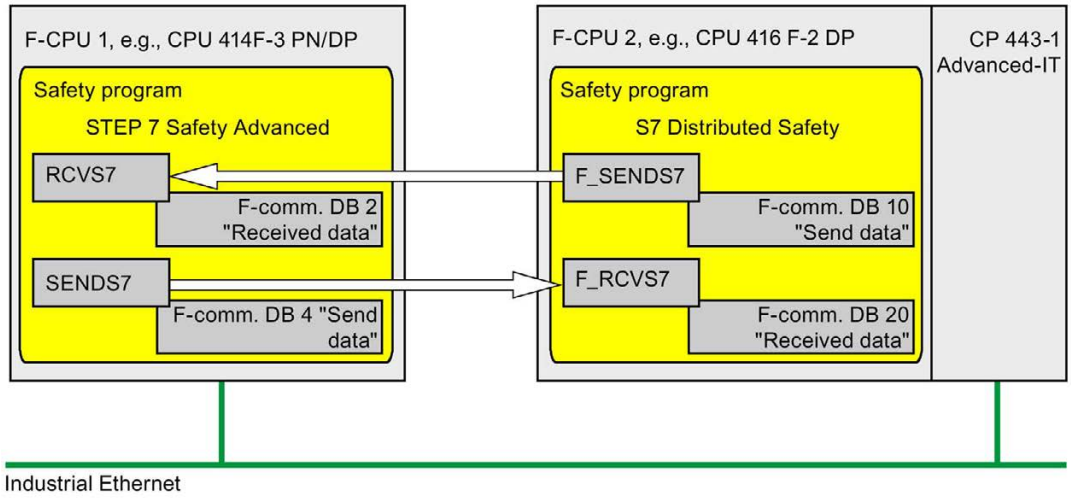
At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related master-master communication (Page 175).

9.1.10.4 Communication with S7 Distributed Safety via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SENDS7/F_RCVS7 F-application blocks at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

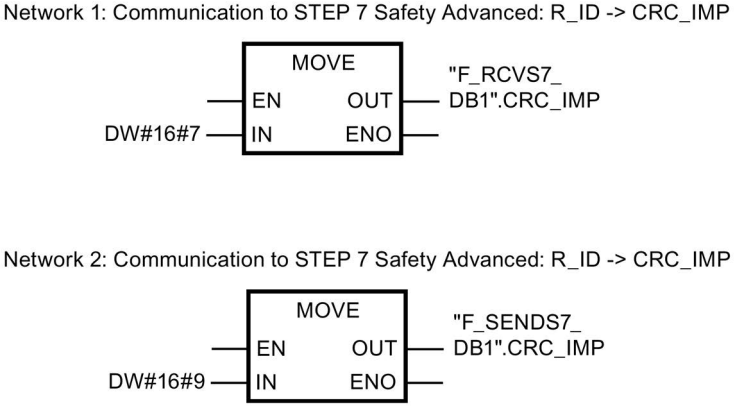
At the *S7 Distributed Safety* end, proceed as described in section "Safety-related communication via S7 communications" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Because safety-related communication via S7 connections is not possible with unspecified partners in S7 Distributed Safety, you must first create a "virtual" SIMATIC station in *S7 Distributed Safety* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Professional*.

In addition, for all communication connections to this F-CPU, you must transfer the address relationship that you assigned in the R_ID input of the associated calls of the F_SENDS7 and F_RCVS7 F-application blocks additionally to the CRC_IMP tag in the instance DB of F_SENDS7 and F_RCVS7, respectively, in the standard user program immediately before calling the F-CALL.

Program example:



Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in Safety-related communication via S7 connections (Page 212).

For the F-CPU in *S7 Distributed Safety*, you must create and specify an unspecified S7 connection (links to standard online help: Creating an unspecified connection and Specifying and unspecified connection).

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 Distributed Safety*.

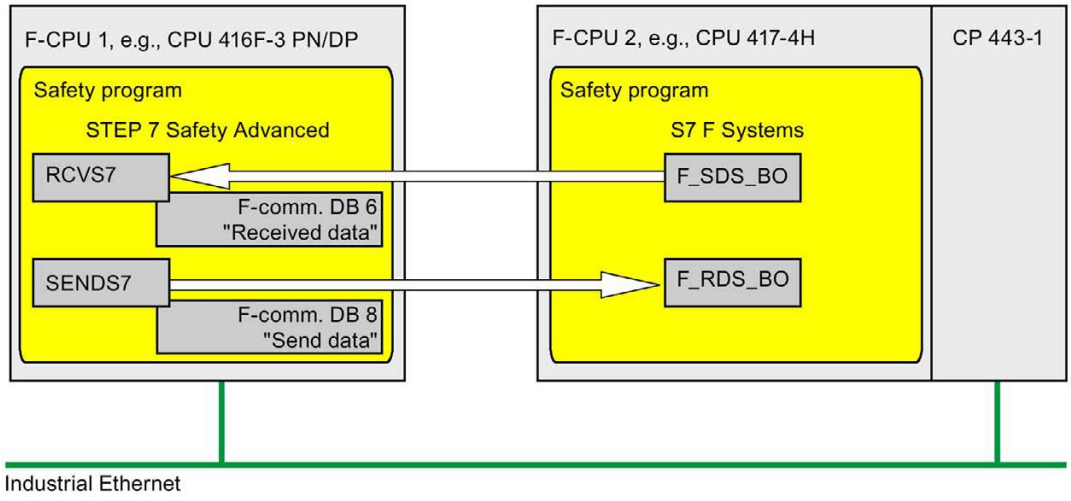
If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

If the instance DBs of the SENDS7 and RCVS7, instructions that you want to use for communication with *S7 Distributed Safety* were migrated from *S7 Distributed Safety*, you must delete them in the project tree in the "STEP 7 Safety" folder, under "Program blocks > System blocks" (contrary to the information in Programming safety-related communication via S7 connections (Page 215), section "Particularities for migrated projects").

9.1.10.5 Communication with S7 F/FH Systems via S7 connections

Communication functions between SENDS7/RCVS7 instructions at the *STEP 7 Safety Advanced* end and F_SDS_BO/F_RDS_BO F-blocks at the *S7 F Systems* end.

A maximum of 32 data elements of data type BOOL can be exchanged.



Procedure at the *S7 F Systems* end

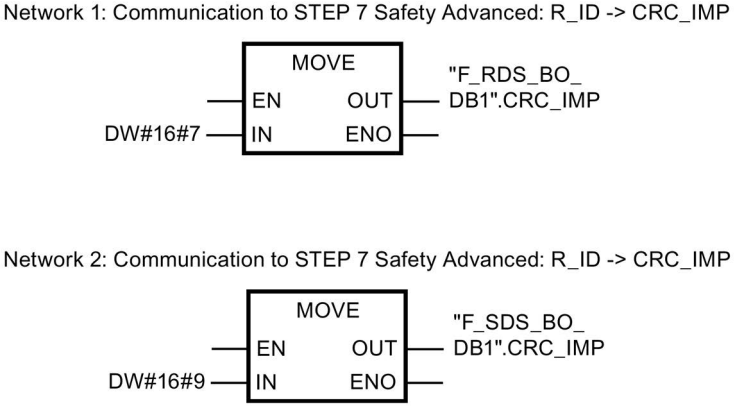
At the *S7 F-systems* end, proceed as described in section "Safety-related communication between F-CPUs" in the S7 F/FH Systems - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/16537972) manual.

Because safety-related communication via S7 connections is not possible with unspecified partners in *S7 F/FH Systems*, you must first create a "virtual" SIMATIC station in *S7 F/FH Systems* in which you configure an F-CPU as a proxy for the F-CPU in *STEP 7 Safety Advanced* with its IP address.

You then insert an S7 connection to this F-CPU in the connection table. Both the local connection and partner connection resources (hex) are thereby fixed. You must then set these in the associated, unspecified S7 connection that you created in *STEP 7 Safety Advanced*.

In addition, you must insert a function in your S7 program (in the area reserved in CFC for other applications), in which, for all communication connections for this F-CPU, you transfer the address relationship that you assigned in the R_ID input of the associated calls of the F_SDS_BO and F_RDS_BO F-blocks additionally to the CRC_IMP tag in the instance DB of the F_SDS_BO and F_RDS_BO, respectively. You obtain the number of the instance DB from the object properties of the block in CFC. Assign descriptive symbolic names for these instance DBs. If you perform a compress operation in CFC, you must check whether the numbers of these instance DBs have changed.

Program example:



You must then import the function in CFC as block type and insert your standard user program in a chart. In the run sequence, make sure that the associated standard runtime group is processed before the F-runtime group.

Procedure at the *STEP 7 Safety Advanced* end

At the *STEP 7 Safety Advanced* end, proceed as described in "Safety-related communication via S7 connections" (Page 212).

Particularity: In *STEP 7 Safety Advanced*, you must create the F-communication DB with exactly 32 data elements of data type BOOL.

For the F-CPU in *S7 F/FH Systems*, you must create and specify an unspecified S7 connection (see online help for *STEP 7* under "Creating an unspecified connection" and "Specifying an unspecified connection").

For these you must set the local and partner connection resources (hex) that are fixed as a result of the associated S7 connection that you have created in *S7 F Systems*.

If the local connection resource (hex) is already occupied by an existing connection, you must change the connection resource (hex) for it.

9.2 Configuring and programming communication (S7-1500)

9.2.1 Overview of communication

Introduction

This section gives an overview of the safety-related communication options in SIMATIC Safety F-systems.

Options for safety-related communication

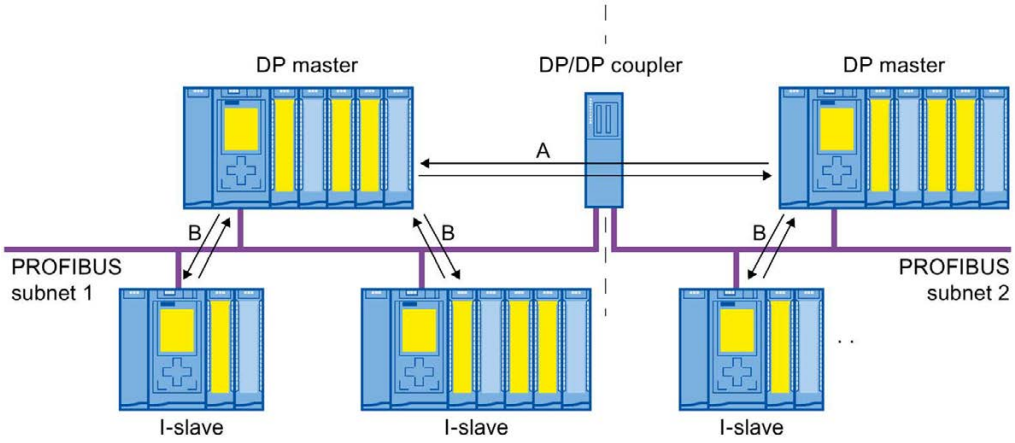
Safety-related communication	On subnet	Additional hardware required
Safety-related CPU-CPU communication:		
IO controller-IO controller communication	PROFINET IO	PN/PN coupler
Master-master communication	PROFIBUS DP	DP/DP coupler
IO controller-I-device communication	PROFINET IO	—
Master-I-slave communication	PROFIBUS DP	—
IO controller-I-slave communication	PROFINET IO and PROFIBUS DP	IE/PB link
IO controller-IO controller communication for *S7 Distributed Safety*	PROFINET IO	PN/PN coupler
Master-master communication for *S7 Distributed Safety*	PROFIBUS DP	DP/DP coupler

Note

"Shared Device" functionality is not supported for fail-safe I/O.

Overview of safety-related communication via PROFIBUS DP

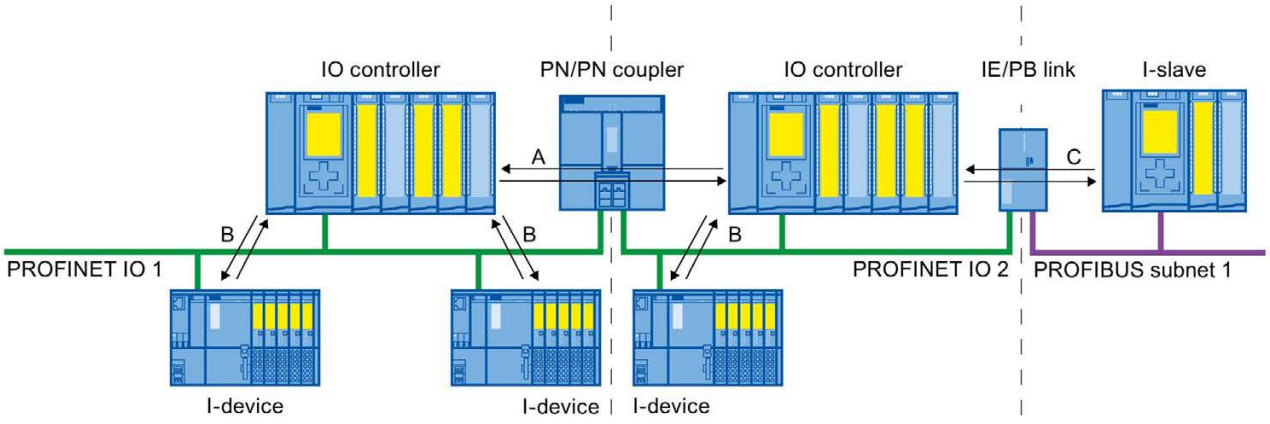
The figure below provides an overview of the options for safety-related communication via PROFIBUS DP in SIMATIC Safety F-systems with S7-1500 F-CPUs.



A safety-related master-master communication
B safety-related master-I-slave communication

Overview of safety-related communication via PROFINET IO

The figure below provides an overview of the options for safety-related communication via PROFINET IO in SIMATIC Safety F-systems with S7-1500 F-CPUs.



A safety-related IO controller-IO controller communication
B safety-related IO controller-I-device communication
C safety-related IO controller-I-slave communication

Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO

In safety-related CPU-CPU communication, a fixed amount of data of the data type BOOL or INT (DINT as alternative) is transmitted fail-safe between the safety programs in F-CPUs of DP masters/I-slaves or IO controllers/I-devices.

The data are transferred using the SENDDP instruction for sending and the RCVDP instruction for receiving. The data are stored in configured transfer areas of the devices. The hardware identifier (HW identifier) defines the transfer areas configured.

Safety-related CPU-CPU communication for *S7 Distributed Safety*

Safety-related communication is possible from F-CPUs in *SIMATIC Safety* to F-CPUs in *S7 Distributed Safety*.

9.2.2 Safety-related IO controller-IO controller communication

9.2.2.1 Configure safety-related IO controller-IO controller communication

Introduction

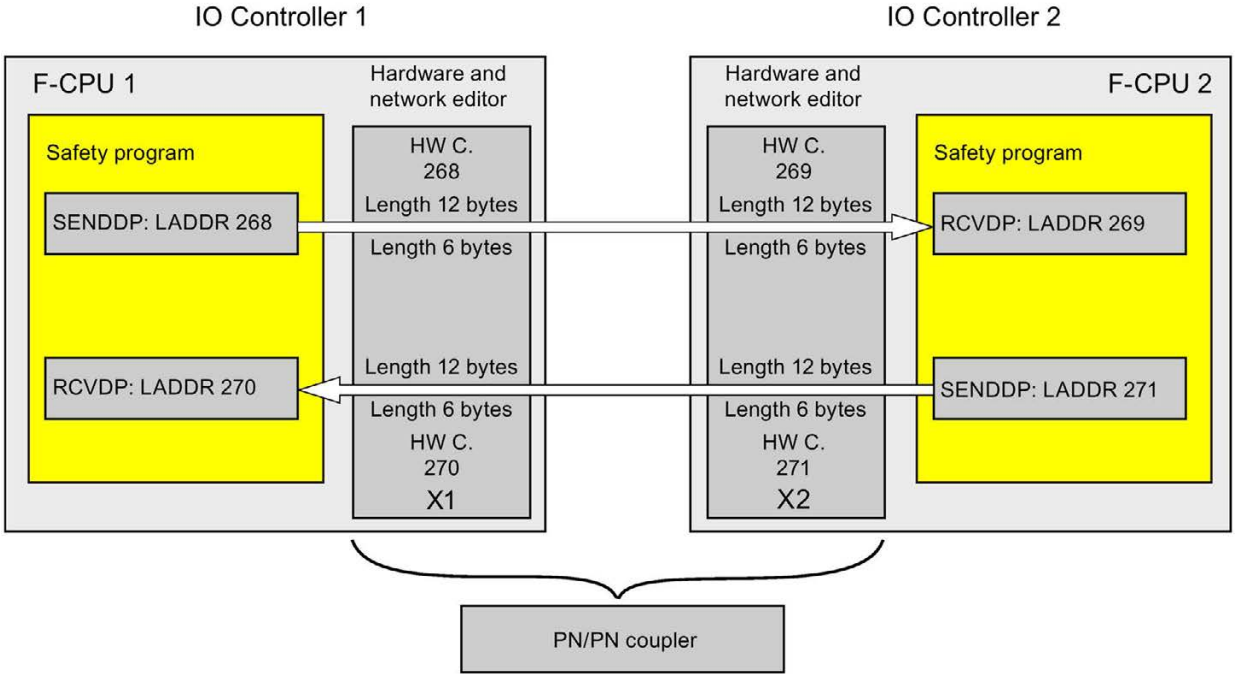
Safety-related communication between safety programs of the F-CPUs of IO controllers takes place over a PN/PN coupler that you set up between the F-CPUs.

Note

Deactivate the "Data validity display DIA" parameter in the properties for the PN/PN coupler in the *hardware and network editor*. This is the default setting. Otherwise, safety-related IO controller-IO controller communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the PN/PN coupler. The figure below shows how both of the F-CPUs are able to send **and** receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

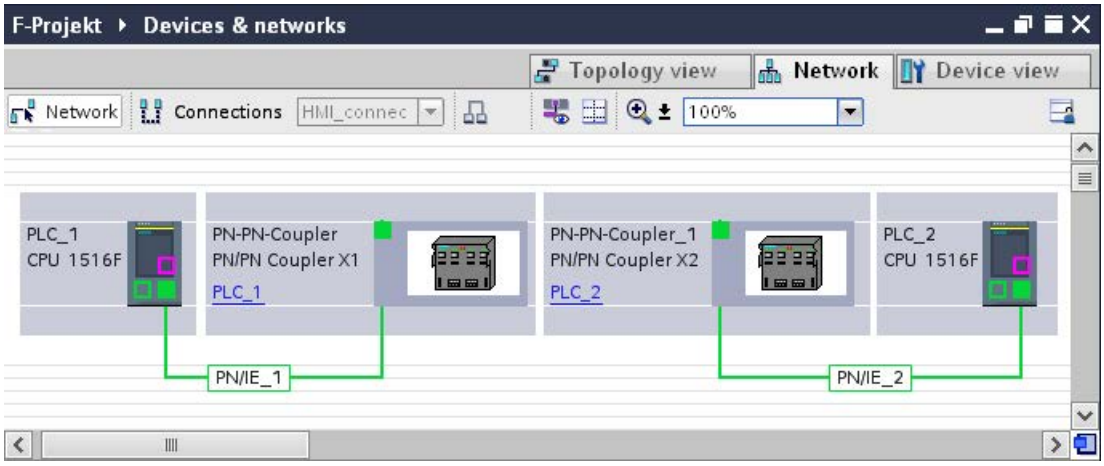
A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related IO controller-IO controller communication is identical to that in the standard system.

Proceed as follows:

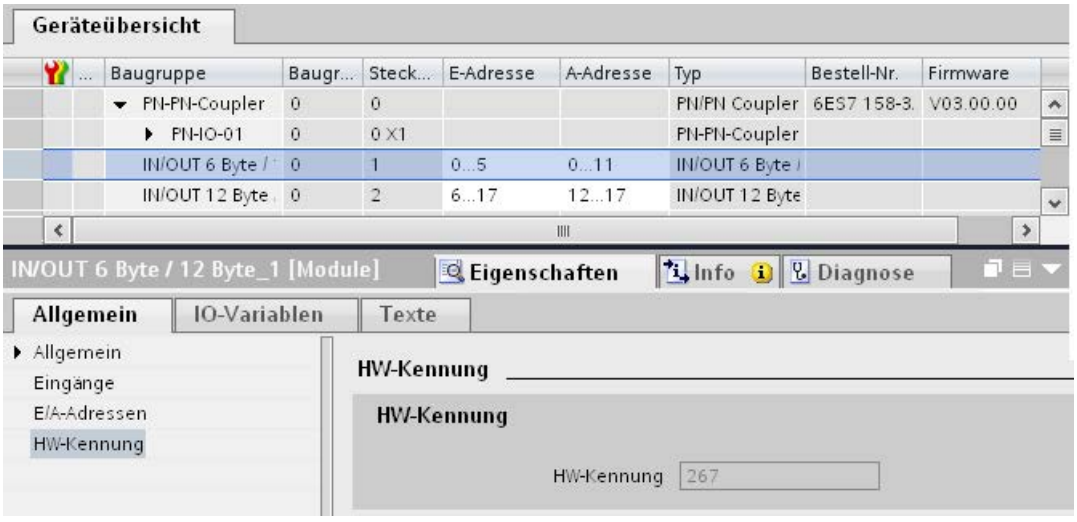
1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Insert a PN/PN coupler X1 and a PN/PN coupler X2 from "Other field devices\PROFINET IO\Gateway\Siemens AG\PN/PN Coupler" in the "Hardware catalog" task card.
4. Connect the PN interface of the F-CPU 1 with the PN interface of the PN/PN Coupler X1 and the PN interface of the F-CPU 2 with the PN interface of PN/PN Coupler X2.



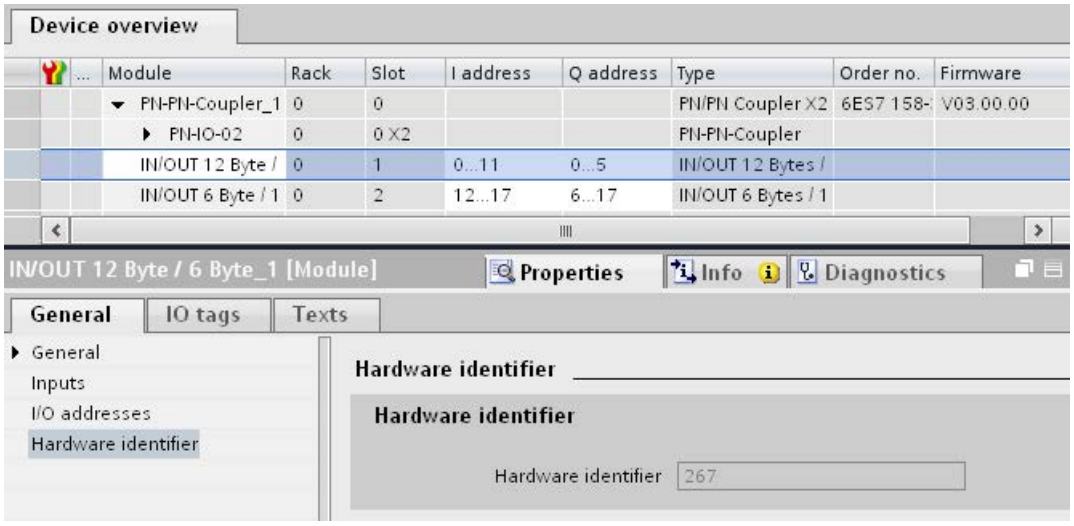
5. Switch to the device view of PN/PN coupler X1 for bidirectional communication connections i.e. where each F-CPU is both to send and to receive data. Select the following modules from "IN/OUT" in the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab:
   - One "IN/OUT 6 bytes / 12 bytes" module and
   - One "IN/OUT 12 bytes / 6 bytes" module

Note

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

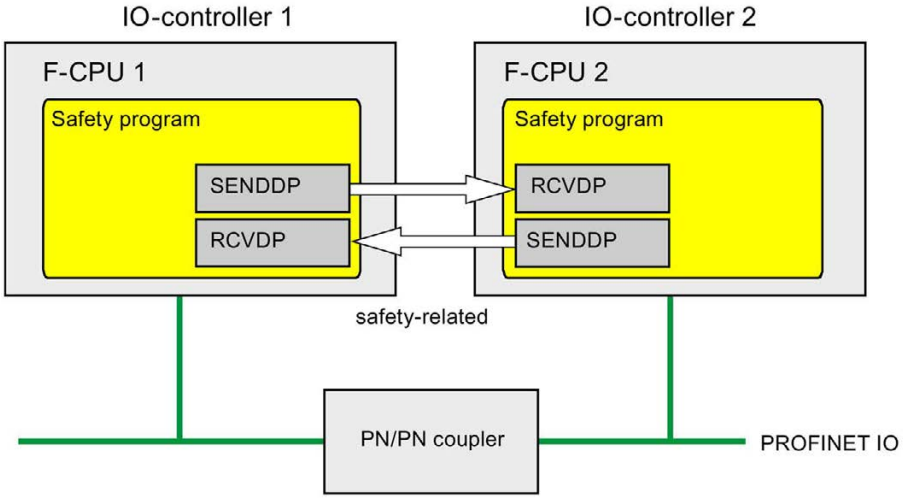


6. Select the following modules from "IN/OUT" in the device view of PN/PN coupler X2 and insert them in the "Device overview" tab:
   - One "IN/OUT 12 bytes / 6 bytes" module and
   - One "IN/OUT 6 bytes / 12 bytes" module



9.2.2.2 Safety-related IO controller-IO controller communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controllers uses the SENDDP and RCVDP instructions for sending and receiving respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.2.2.3 Program safety-related IO controller-IO controller communication

Requirement for programming

The transfer areas for input and output data for the PN/PN coupler must be configured.

Programming procedure

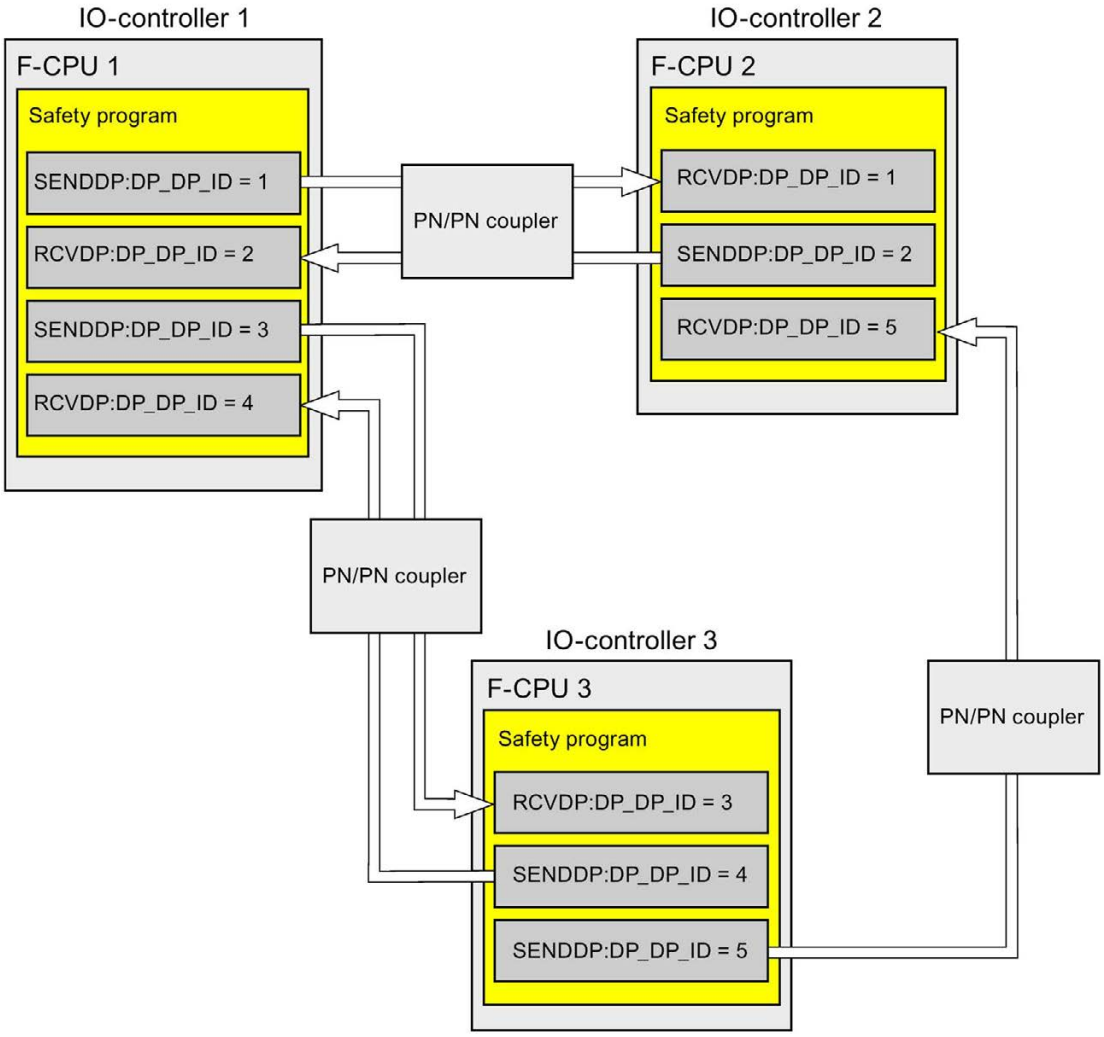
You program safety-related IO controller-IO controller communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 646) for sending at the end of the main safety block.
2. In the safety program in which data are to be received, call the RCVDP instruction (Page 646) for receiving at the start of the main safety block.
3. Assign the respective LADDR inputs HW identifiers (system constants in the default tag table) for the transfer areas for output and input data of the PN/PN coupler that are configured in the hardware and network editor.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for five safety-related IO controller-IO-controller communication relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.
13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 293).

9.2.2.4 Safety-related IO controller-IO controller communication - Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the PN/PN coupler. Whether or not this is possible with one single PN/PN coupler depends on the capacity restrictions of the PN/PN coupler.

9.2.3 Safety-related master-master communication

9.2.3.1 Configure safety-related master-master communication

Introduction

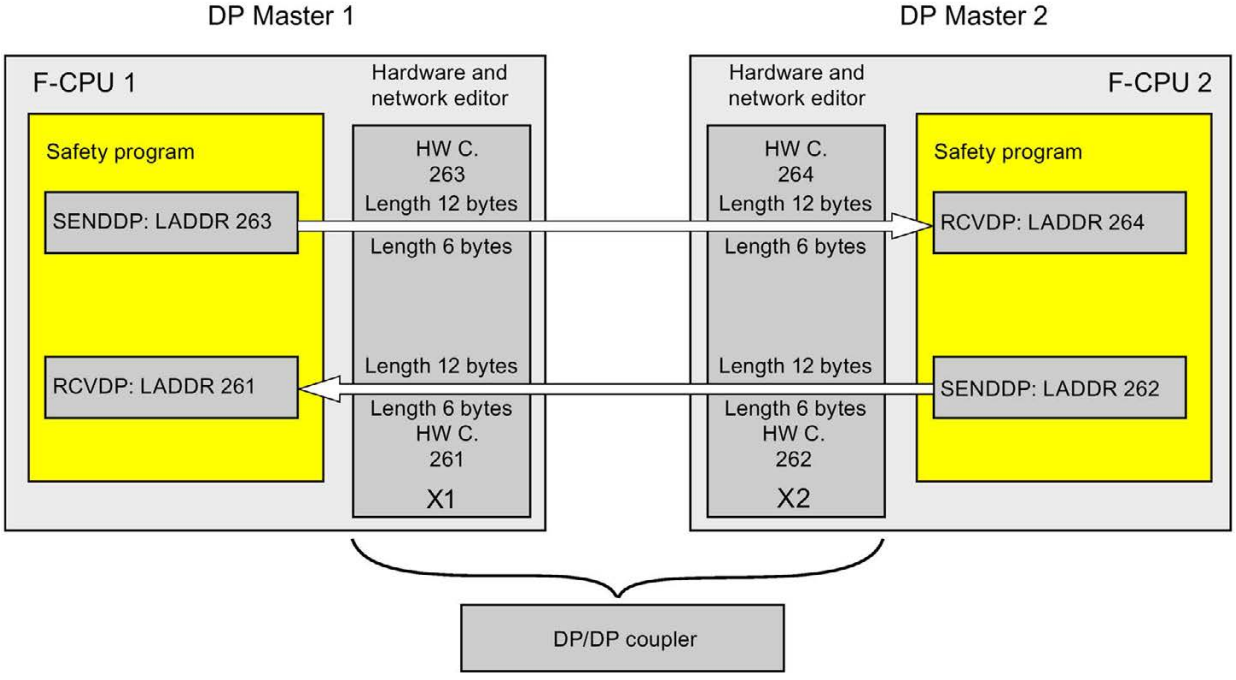
Safety-related communication between safety programs of the F-CPUs of DP masters takes place via a DP/DP coupler.

Note

Switch the data validity indicator "DIA" on the DIP switch of the DP/DP coupler to "OFF". Otherwise, safety-related CPU-CPU communication is not possible.

Configuring transfer areas

You must configure one transfer area for output data and one transfer area for input data in the *hardware and network editor* for each safety-related communication connection between two F-CPUs in the DP/DP coupler. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



Rules for defining transfer areas

Data to be sent:

A total of 12 bytes (consistent) is required for the transfer area for output data; 6 bytes (consistent) are required for the transfer area for input data.

Data to be received:

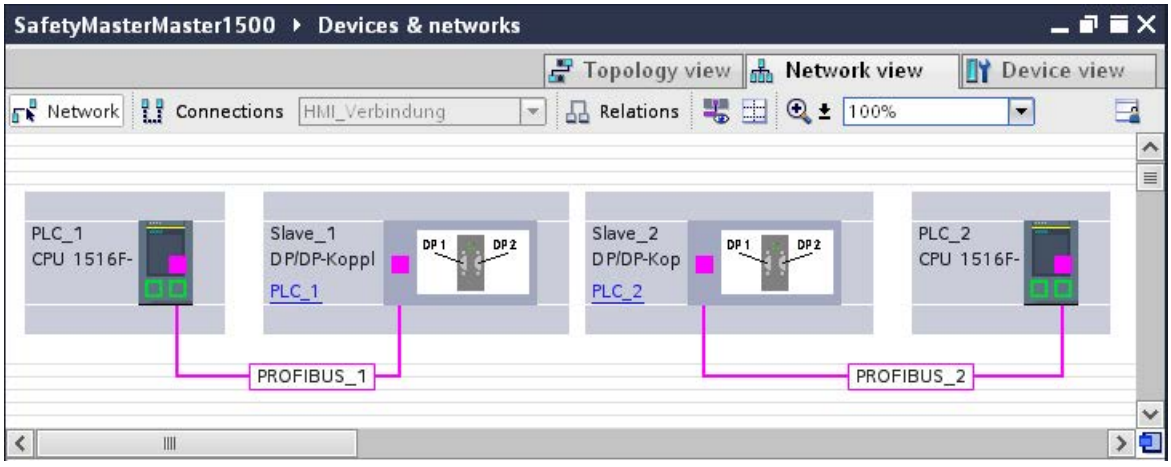
A total of 12 bytes (consistent) is required for the transfer area for input data; 6 bytes (consistent) are required for the transfer area for output data.

Procedure for configuration

The procedure for configuring safety-related master-master communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Switch to the network view of the *hardware and network editor*.
3. Select a DP/DP coupler from "Other field devices\PROFIBUS DP\Gateways\Siemens AG\DP/DP Coupler" in the "Hardware catalog" task card and insert it into the network view of the hardware and network editor.
4. Insert a second DP/DP coupler.
5. Connect a DP interface of F-CPU 1 to the DP interface of a DP/DP coupler and a DP interface of F-CPU 2 to the DP interface of the other DP/DP coupler.

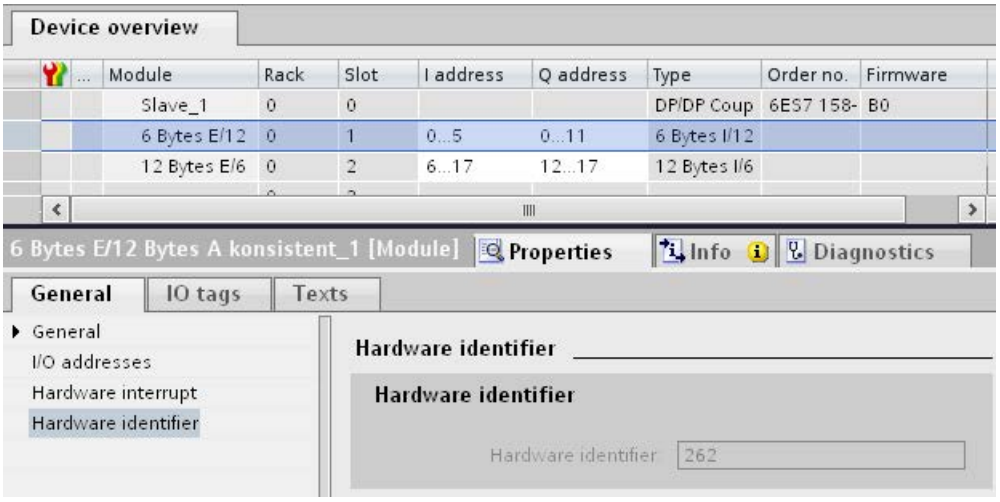


6. A free PROFIBUS address is assigned automatically in the properties of the DP/DP-coupler in the device view. You must set this address on the DP/DP coupler, either via the DIP switch on the device or in the configuration of the DP/DP coupler (see DP/DP Coupler (http://support.automation.siemens.com/WW/view/en/1179382) manual).

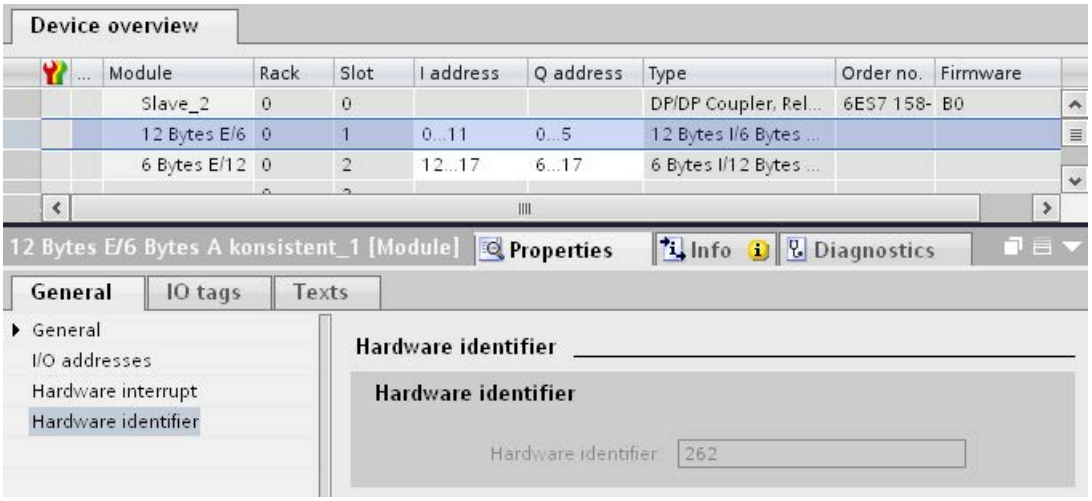
7. Switch to the device view of the DP/DP coupler PLC1 for bidirectional communication connections i.e. where each F-CPU should both send and receive data. Select the following modules from the "Hardware catalog" task card (with filter activated), and insert them in the "Device overview" tab of the DP/DP coupler:
   - One "6 bytes I/12 bytes Q consistent" module, and
   - One "12 bytes I/6 bytes Q consistent" module

Note

The transfer areas are assigned on the basis of the hardware identifier which is automatically assigned to the modules and devices. You need the HW identifier to program the SENDDP and RCVDP blocks (LADDR input). A system constant is created in the corresponding F-CPU for each hardware identifier of the transfer area. You can assign these system constants symbolically to the SENDDP and RCVDP blocks.

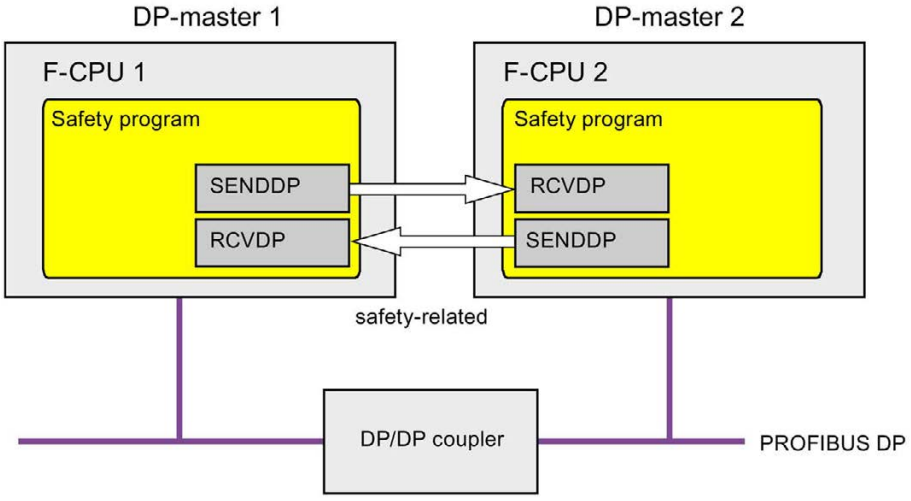


8. Select the following modules from the "Hardware catalog" task card (with filter activated) in the device view of DP/DP coupler PLC2, and insert them in the "Device overview" tab:
   - One "12 bytes I/6 bytes Q consistent" module, and
   - One "6 bytes I/12 bytes Q consistent" module



9.2.3.2 Safety-related master-master communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP masters uses the SENDDP and RCVDP instructions for sending and receiving respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.2.3.3 Program safety-related master-master communication

Requirement for programming

The address areas for input and output data for the DP/DP coupler must be configured.

Programming procedure

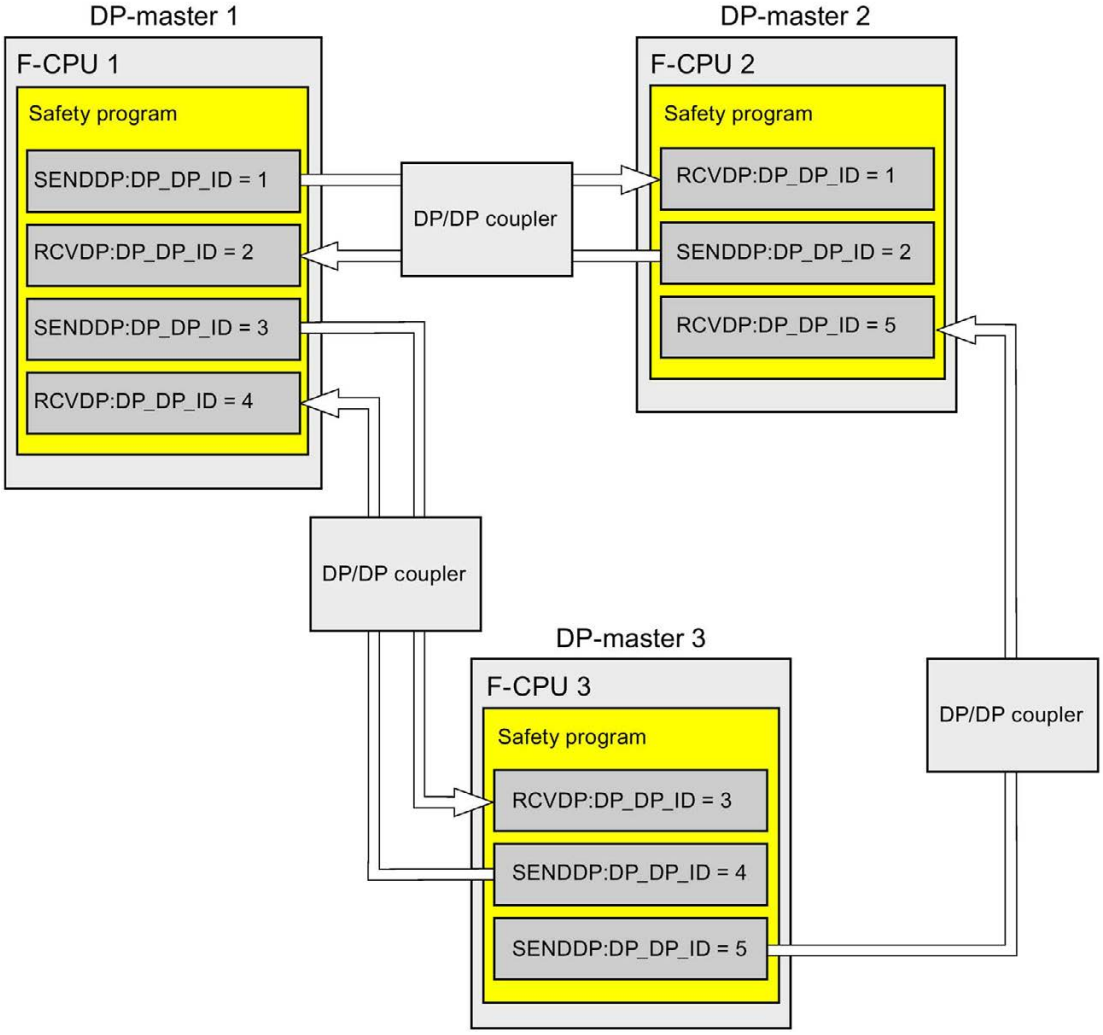
You program safety-related master-master communication as follows:

1. In the safety program from which data are to be sent, call the SENDDP instruction (Page 646) for sending at the end of the main safety block.
2. In the safety program from which data are to be received, call the RCVDP instruction (Page 646) for receiving at the start of the main safety block.
3. Assign the HW identifiers for the output and input data of the DP/DP coupler configured in the *hardware and network editor* (constant in the tag table) to the respective LADDR inputs.

   You must carry out this assignment for every communication connection for each of the F-CPUs involved.

4. Assign the value for the respective address relationship to the DP_DP_ID inputs. This establishes the communication relationship between the SENDDP instruction in one F-CPU and the RCVDP instruction in the other F-CPU: The associated instructions receive the same value for DP_DP_ID.

   The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for five safety-related master-master communications relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

5. Supply the SD_BO_xx and SD_I_xx inputs (SD_DI_00 as alternative) of SENDDP with the send signals. To cut down on intermediate signals when transferring parameters, you can write the value directly to the instance DB of SENDDP using fully qualified access (for example, "Name SENDDP_1".SD_BO_02) before calling SENDDP.
6. Supply the RD_BO_xx and RD_I_xx outputs (RD_DI_00 as alternative) of RCVDP with the signals that you want to process further in other program sections or use fully qualified access to read the received signals directly in the associated instance DB in the program sections to be processed further (e.g., "Name RCVDP_1".RD_BO_02).
7. If you want to send the data at the SD_DI_00 input instead of the data at the SD_I_00 and SD_I_01 inputs, supply the DINTMODE input (initial value = "FALSE") of SENDDP with TRUE.
8. Supply the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs of RCVDP with the fail-safe values that are to be output by RCVDP in place of the process data until communication is established for the first time after startup of the sending and receiving F-systems or in the event of an error in safety-related communication.
   - Specification of constant fail-safe values:

     For data of data type INT/DINT, you can enter constant fail-safe values directly as constants in the SUBI_xx or alternatively SUBDI_00 input (initial value = "0"). If you want to specify a constant fail-safe value "TRUE" for data of the data type BOOL, set TRUE for the SUBBO_xx input (initial value = "FALSE").
   - Specification of dynamic fail-safe values:

     If you want to specify dynamic fail-safe values, define a tag that you change dynamically through your safety program in an F-DB and specify this tag (fully qualified) in the SUBBO_xx or SUBI_xx or alternatively SUBDI_00 input.

     ⚠ WARNING

     Note that your safety program for dynamically changing the tag for a dynamic fail-safe value can only be processed after the call of the RCVDP, because prior to the RCVDP call, there must not be any network and no more than one other RCVDP instruction in the main safety block. You must therefore assign appropriate start values for these tags to be output by RCVDP in the first cycle after a startup of the F-system. *(S017)*

9. Configure the TIMEOUT inputs of the RCVDP and SENDDP instructions with the required monitoring time.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

10. Optional: Evaluate the ACK_REQ output of the RCVDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether user acknowledgment is required.
11. Supply the ACK_REI input of the RCVDP instruction with the acknowledgment signal for reintegration.
12. Optional: Evaluate the SUBS_ON output of the RCVDP or SENDDP instruction in order to query whether the RCVDP instruction is outputting the fail-safe values assigned in the SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs.
13. Optional: Evaluate the ERROR output of the RCVDP or SENDDP instruction, for example, in the standard user program or on the HMI system in order to query or to indicate whether a communication error has occurred.
14. Optional: Evaluate the SENDMODE output of the RCVDP instruction in order to query whether the F-CPU with the associated SENDDP instruction is in disabled safety mode (Page 293).

9.2.3.4 Safety-related master-master communication:Limits for data transfer

Note

If the data quantities to be transmitted exceed the capacity of the SENDDP / RCVDP correlated instructions, a second (or third) SENDDP / RCVDP call can be used. This requires configuration of an additional connection via the DP/DP coupler. Whether or not this is possible with one single DP/DP coupler depends on the capacity restrictions of the DP/DP coupler.

9.2.4 Safety-related IO controller-I-device communication

9.2.4.1 Configuring safety-related communication between IO controller and I-device

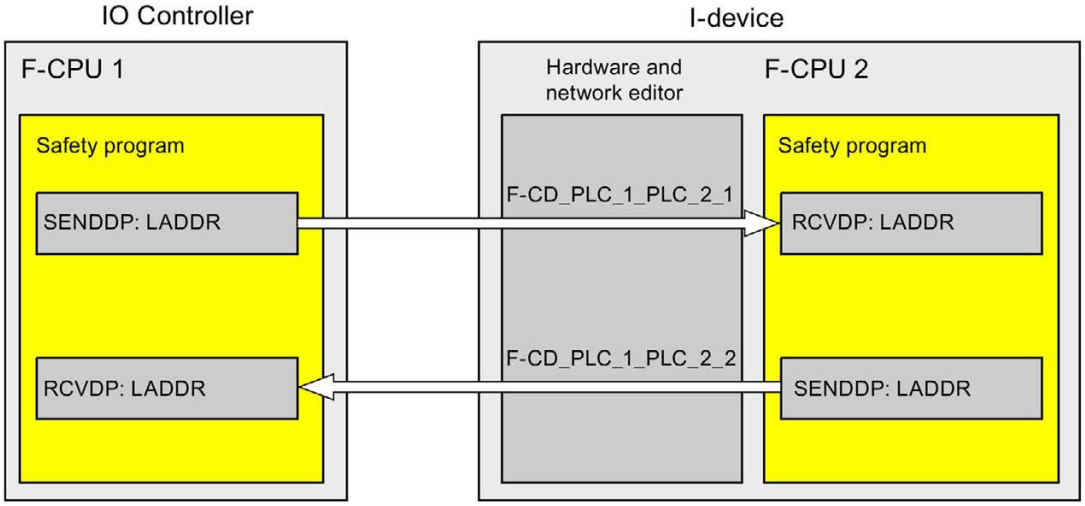
Introduction

Safety-related communication between the safety program of the F-CPU of an IO controller and the safety program(s) of the F-CPU(s) of one or more I-devices takes place via IO controller-I-device connections (F-CD) in PROFINET IO, in the same way as in standard systems.

You do not need any additional hardware for IO controller-I-device communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify the communication relationship, for example "F-CD_PLC_2 PLC_1_1" for the first F-CD connection between IO-controller F-CPU 1 and I-device F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the IO controller and in the F-CPU of the I-device. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR parameter of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

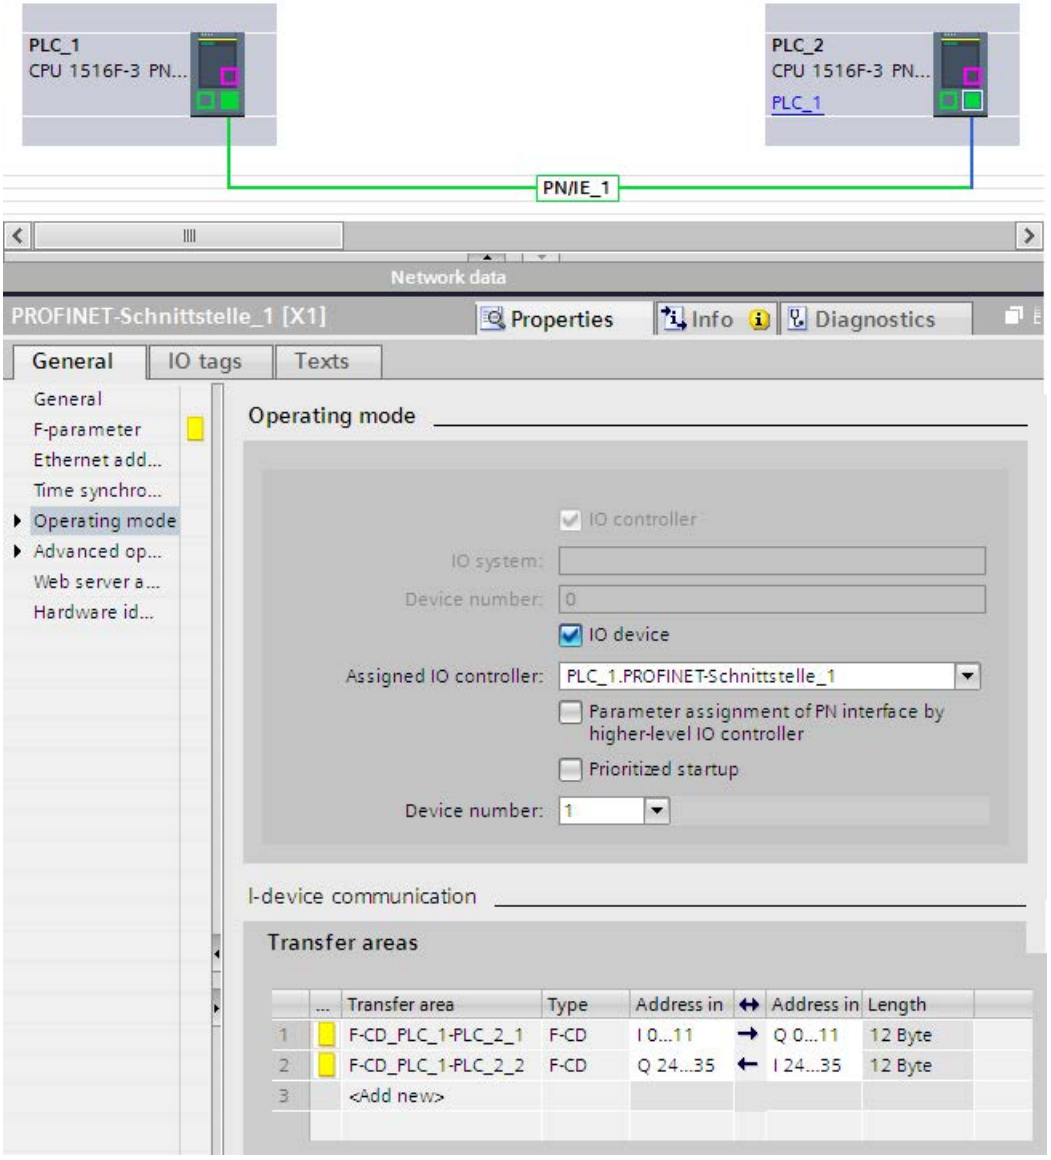
The procedure for configuring safety-related IO controller-I-device communication is identical to that in the standard system.

Proceed as follows:

1. Insert two F-CPUS from the "Hardware catalog" task card into the project.
2. Enable the "IO Device" mode for F-CPU 2 in the properties of its PN interface and assign this PN interface to a PN interface of F-CPU 1.
3. Select the PROFINET interface of F-CPU 2. Under "Transfer areas", create an F-CD connection (type "F-CD") for receiving from the IO controller (→). The F-CD connection is shown in yellow in the table and the address areas in the I-device and IO controller assigned are displayed.

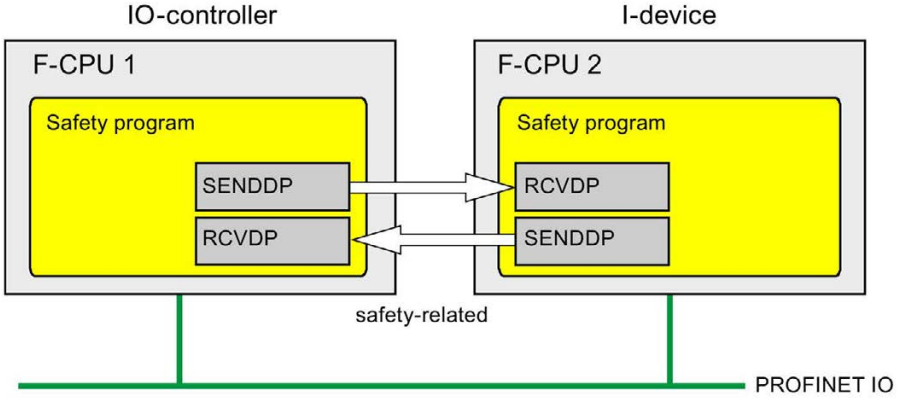
   In addition, an acknowledgment connection is created automatically for each F-CD connection. (see "Transfer area details").

4. Create an additional F-CD connection for sending to the IO controller.
5. In the transfer area you just created, click on the arrow to change the transfer direction to sending to the IO controller (←).



9.2.4.2 Safety-related IO controller-I-device communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the IO controller and an I-device makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 646).

9.2.4.3 Programming safety-related IO controller I-device communication

Requirement for programming

The transfer areas must be configured.

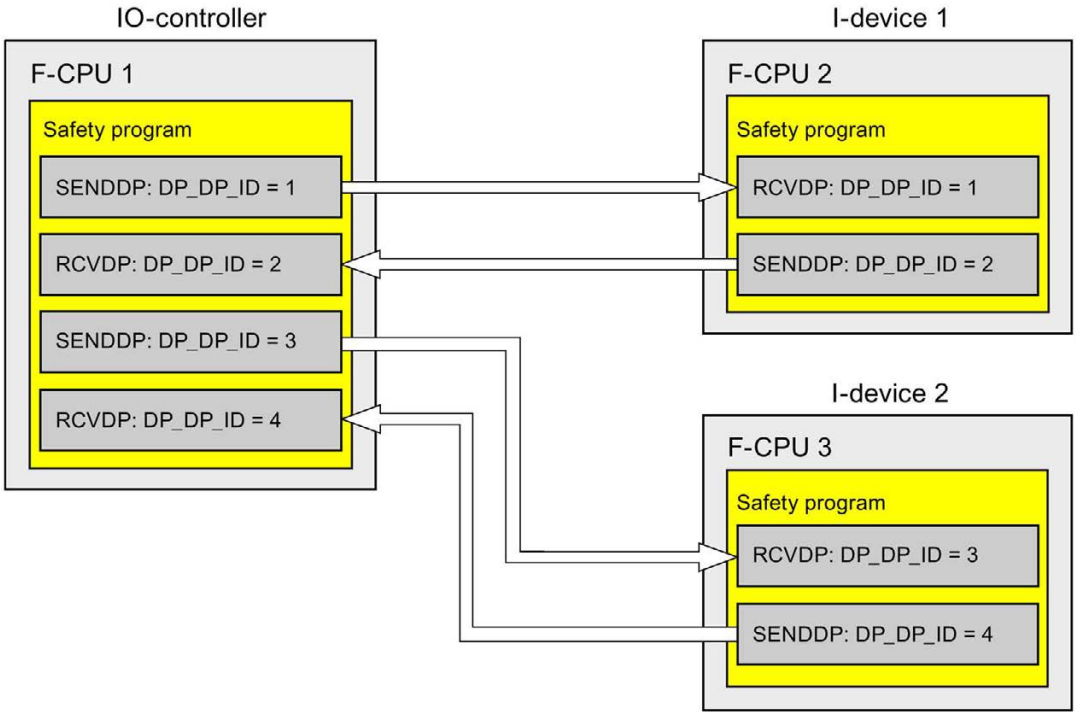
Programming procedure

The procedure for programming safety-related IO controller-I-device communication is the same as that for programming safety-related IO controller-IO controller communication (see Program safety-related IO controller-IO controller communication (Page 234)).

The assignment of the HW identifiers (system constants in the standard tag table) of the transfer areas to the LADDR parameter of the SENDDP/RCVDP instructions can be obtained from the following table:

Instruction	HW identifier
SENDDP in the IO controller	Hardware identifier of the transfer area in the IO controller
RCVDP in the IO controller	Hardware identifier of the transfer area in the IO controller
SENDDP in the I-device	Hardware identifier of the transfer area in the I-device
RCVDP in the I-device	Hardware identifier of the transfer area in the I-device

The figure below contains an example of how to specify the address relationships for the inputs of the SENDDP and RCVDP instructions for four safety-related IO controller-I-device communication relationships.



WARNING

The value for each address relationship (DP_DP_ID inputs; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal state is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9.2.4.4 Safety-related IO-Controller-IO-Device communication - Limits for data transfer

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Remember the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and a IO controller.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		In the IO controller		In the I-device	
		Output data	Input data	Output data	Input data
IO controller-I-Device	**Sending:** I-Device 1 to IO controller	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-Device 1 from IO controller	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-CD and CD) for the maximum limit of 1440 bytes of input data or 1440 bytes of output data for transfer between an I-device and an IO controller . In addition, data are assigned for internal purposes such that the maximum limit may be reached sooner.

When the limit is exceeded, a corresponding error message is displayed.

9.2.5 Safety-related master-I-slave communication

9.2.5.1 Configuring safety-related master-I-slave communication

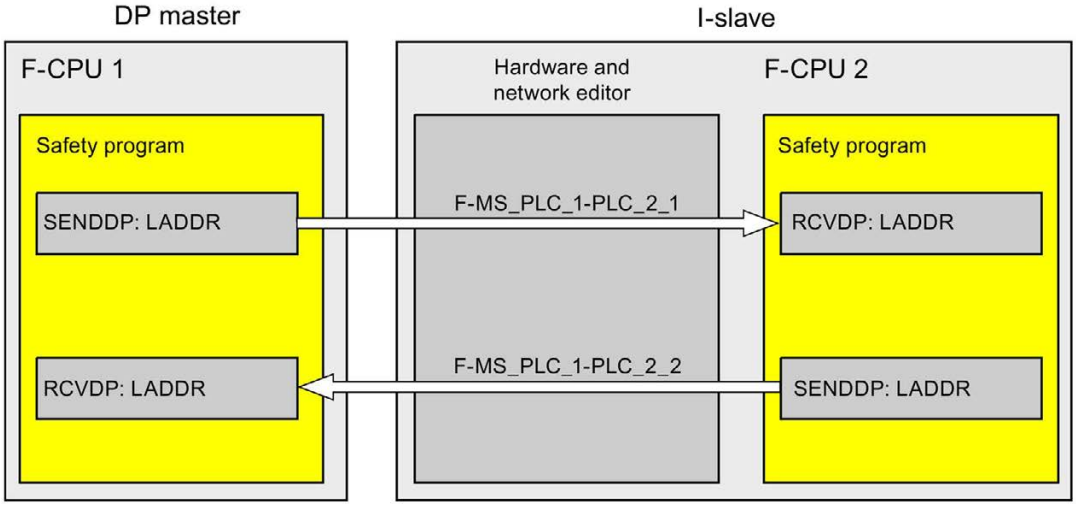
Introduction

Safety-related communication between the safety program of the F-CPU of a DP master and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

You do not need a DP/DP coupler for master-I-slave communication.

Configuring transfer areas

For every safety-related communication connection between two F-CPUs, you must configure transfer areas in the *hardware and network editor*. The figure below shows how both of the F-CPUs are able to send and receive data (bidirectional communication).



The transfer area is assigned a label when it is created to identify it as the communication relationship, for example "F-MS_PLC_2-PLC_1_1" for the first F-MS connection between DP master F-CPU 1 and I-slave F-CPU 2.

When you create a transfer area, a system constant with the name of the transfer area is created in the F-CPU of the DP master and in the F-CPU of the I-slave. The system constant contains the hardware identifier of the transfer area for the corresponding F-CPU.

You assign the hardware identifier (system constant from the default tag table) of the transfer areas symbolically to the LADDR parameter of the SENDDP and RCVDP instructions in the safety programs.

Procedure for configuration

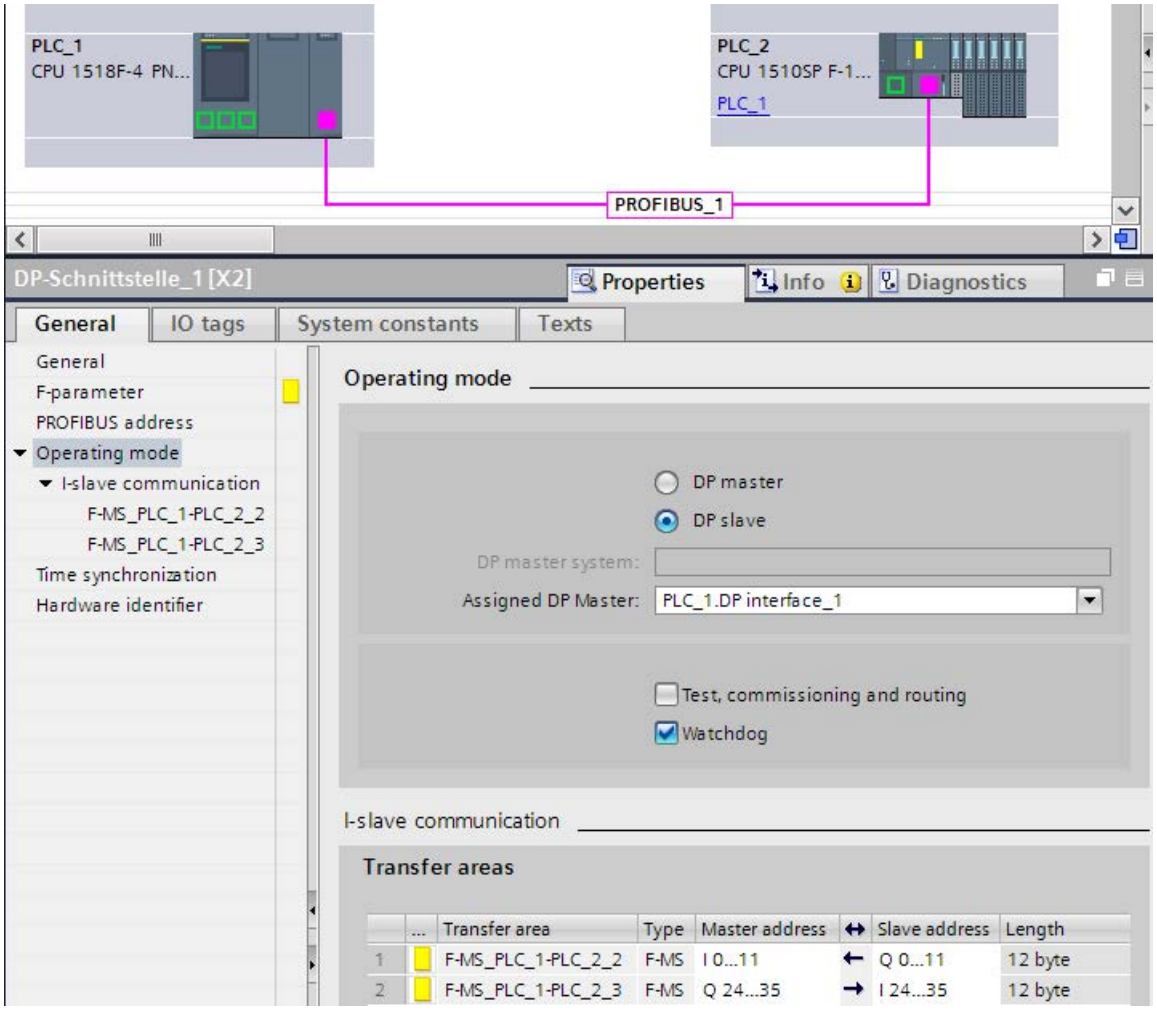
The procedure for configuring safety-related master-I-slave communication is identical to that in the standard system.

Proceed as follows:

1. Insert one F-CPU from the "Hardware catalog" task card as DP master in the project. If the F-CPU does not have an integrated PROFIBUS DP interface, insert e.g. an PROFIBUS-CM.
2. Insert a 1510SP F-1 PN CPU or 1512SP F-1 PN CPU as I-slave.
3. From the device view of the I-slave, insert a CM DP module.
4. Under properties, enable the "DP slave" mode (I-slave) for the CM DP module and assign this DP interface to a DP interface of F-CPU 1.
5. Select the PROFIBUS interface of F-CPU 2. Under "Transfer areas", you create an F-MS connection (type "F-MS") for sending to the DP master (←). The F-MS connection is shown in yellow in the table and the assigned transfer areas in the I-slave and DP master are displayed.

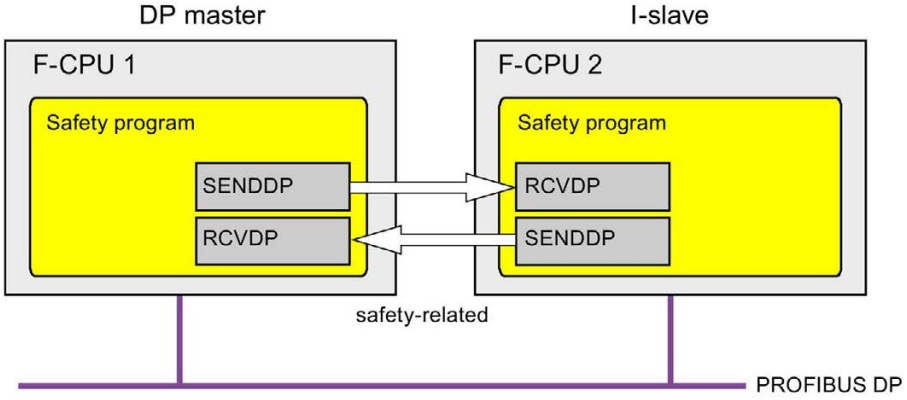
   In addition, an acknowledgment connection is created automatically for each F-MS connection. (see "Transfer area details").

6. Create an additional F-MS connection for receiving from the DP master.
7. In the transfer area you just created, click the arrow in order to change the transfer direction to receiving from DP master (→).



9.2.5.2 Safety-related master-I-slave communication via SENDDP and RCVDP

Communication via SENDDP and RCVDP instructions



Safety-related communication between the F-CPUs of the DP master and an I-slave makes use of the SENDDP and RCVDP instructions for sending and receiving, respectively. These can be used to perform a fail-safe transfer of a *fixed* amount of fail-safe data of the data type BOOL or INT (DINT as alternative).

You can find these instructions in the "Instructions" task card under "Communication". The RCVDP instruction **must** be called at the start of the main safety block. The SENDDP instruction **must** be called at the end of the main safety block.

Note that the send signals are not sent until after the SENDDP instruction call at the end of execution of the relevant F-runtime group.

A detailed description of the SENDDP and RCVDP instructions can be found in SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500) (Page 480).

9.2.5.3 Programming safety-related master-I-slave communication

Requirements

The transfer areas must be configured.

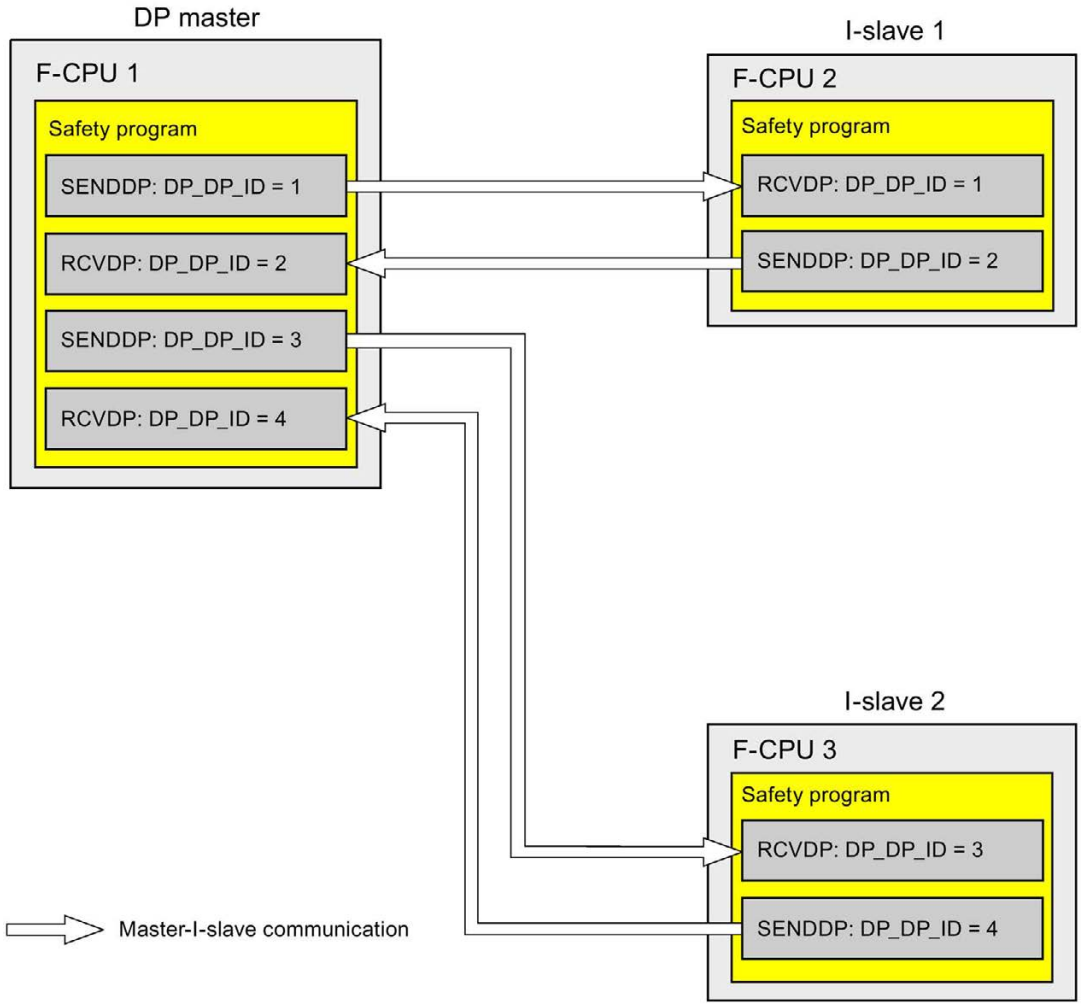
Programming procedure

The procedure for programming safety-related master-I-slave communication is the same as that for programming safety-related master-master communication (see Safety-related master-master communication (Page 238)).

The assignment of the HW identifiers of the transfer areas to the LADDR parameter of the SENDDP/RCVDP instructions can be obtained from the following table.

Instruction	HW identifier
SENDDP in the DP master	Hardware identifier of the respective transfer area in the DP master
RCVDP in the DP master	Hardware identifier of the respective transfer area in the DP master
SENDDP in the I-slave	Hardware identifier of the transfer area in the I-slave
RCVDP in the I-slave	Hardware identifier of the transfer area in the I-slave

The figure below contains an example of how to specify the address relationships at the inputs of SENDDP and RCVDP instructions for four safety-related master-I-slave communication relationships.



WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned monitoring time. *(S018)*

Information on calculating the monitoring times can be found in Monitoring and response times (Page 661).

9.2.5.4 Limits for data transfer of safety-related master-I-slave communication

Limits for data transfer

If the amount of data to be transferred is greater than the capacity of related SENDDP/RCVDP instructions, you can use additional SENDDP/RCVDP instructions. Configure additional transfer areas for this purpose. Note the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-slave and a DP master.

The following table shows the amount of output and input data assigned in safety-related communication connections:

Safety-related communication	Communication connection	Assigned input and output data			
		DP master		I-slave	
		Output data	Input data	Output data	Input data
Master-I-slave	**Sending:** I-slave 1 to DP master	6 bytes	12 bytes	12 bytes	6 bytes
	Receiving: I-slave 1 from DP master	12 bytes	6 bytes	6 bytes	12 bytes

Consider all additional configured safety-related and standard communication connections (transfer areas of type F-MS-, F-DX-, F-DX-Mod., MS-, DX- and DX-Mod) for the maximum limit of 244 bytes of input data or 244 bytes of output data for transfer between an I-device and a DP master F-MS and MS). If the maximum limit of 244 bytes of input data or 244 bytes of output data is exceeded, you will receive a corresponding error message.

9.2.6 Safety-related IO controller-I-slave communication

9.2.6.1 Safety-related IO controller-I-slave communication

Introduction

Safety-related communication between the safety program of the F-CPU of an IO-controller and the safety program(s) of the F-CPU(s) of one or more I-slaves takes place over master-I-slave connections (**F-**MS), as in standard systems.

IE/PB link

For the safety-related IO-controller-I-slave communication, the IE/PB link is mandatory. Each of the two F-CPUs is linked to the IE/PB link by means of its PROFIBUS DP or PROFINET-interface.

Note

If you are using an IE/PB link, you must take this into account when configuring the F-specific monitoring times and when calculating the maximum response time of your F-system (see also Monitoring and response times (Page 661)).

Note that the Excel file for calculating response times (http://support.automation.siemens.com/WW/view/en/49368678/133100) for S7-300/400 F-CPUs does not support all conceivable configurations.

Reference

The information on safety-related master-I-slave communication in Safety-related master-I-slave communication (Page 254) also applies.

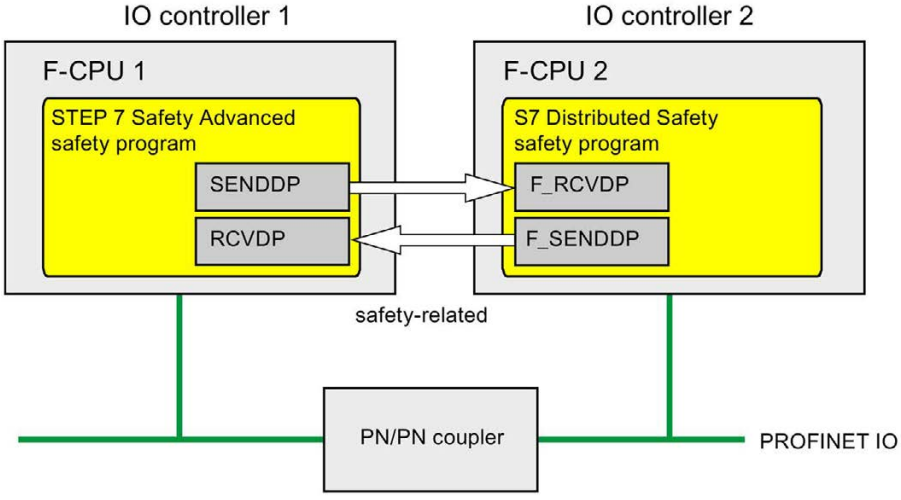
9.2.7 Safety-related communication with S7 F-systems

9.2.7.1 Introduction

Safety-related communication from F-CPUs in SIMATIC Safety to F-CPUs in S7 Distributed Safety F-systems is possible, via a PN/PN coupler or DP/DP coupler that you use between the two F-CPUs, as IO controller-IO controller communication or master-master communication.

9.2.7.2 Communication with S7 Distributed Safety via PN/PN coupler (IO controller-IO controller communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

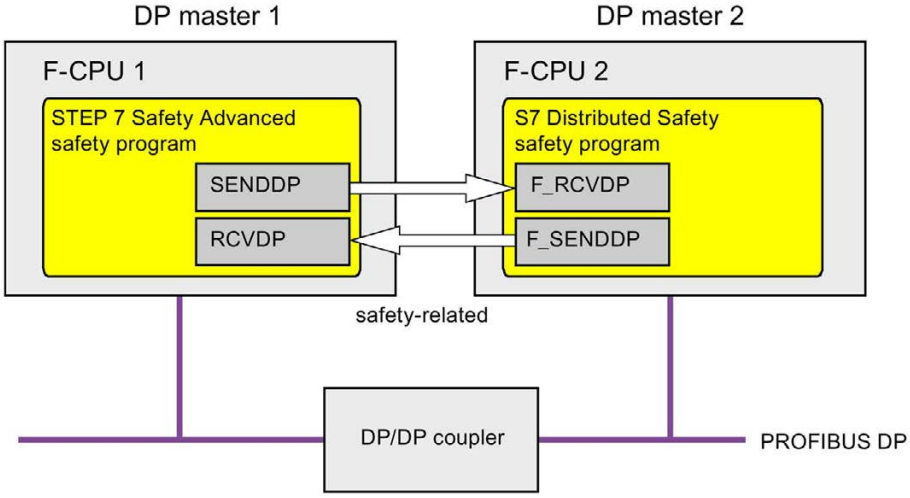
At the *S7 Distributed Safety* end, proceed as described in "Safety-related IO controller-IO controller communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related IO controller-IO controller communication (Page 229).

9.2.7.3 Communication with S7 Distributed Safety via DP/DP coupler (master-master communication)

Communication functions between SENDDP/RCVDP instructions at the *STEP 7 Safety* end and F-application blocks F_SENDDP/F_RCVDP at the *S7 Distributed Safety* end:



Procedure at the *S7 Distributed Safety* end

At the *S7 Distributed Safety* end, proceed as described in "Safety-related master-master communication" in the S7 Distributed Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/22099875) manual.

Procedure at the *STEP 7 Safety* end

At the *STEP 7 Safety* end, proceed as described in Safety-related master-master communication (Page 238).

9.3 Configuring and programming communication between S7-300/400 and S7-1500 F-CPUs

9.3.1 Overview of communication

Introduction

This section provides an overview of the options for safety-related communication between S7-300/400 and S7-1500 F-CPUs in SIMATIC Safety F-systems.

Options for safety-related communication

Safety-related communication	Particularities	On subnet	Additional hardware required
Safety-related CPU-CPU communication:			
Master-master communication	—	PROFIBUS DP	DP/DP coupler
Master-I-slave communication	—	PROFIBUS DP	—
IO controller-IO controller communication	—	PROFINET IO	PN/PN coupler
IO controller-I-device communication	—	PROFINET IO	—

Basic procedure for configuring and programming

Configure and program safety-related communication between S7-300/400 F-CPUs and S7-1500 F-CPUs as described in Configuring and programming communication (S7-300, S7-400) (Page 163) and Configuring and programming communication (S7-1500) (Page 226) for your application.

To program an S7-300/400 F-CPU, use the start addresses of the transfer areas. To program an S7-1500 F-CPU, use the HW identifiers of the transfer areas.

Compiling and commissioning a safety program 10

10.1 Compiling the safety program

Introduction

To compile a safety program, follow the same basic procedure as for compiling a standard user program. You can start at various points to accomplish this in *STEP 7*. The basics for compiling user programs can be found in the *Help on STEP 7*.

Note

Please note that following a safety-related change to the hardware configuration that not only this, but also the safety program has to be recompiled and downloaded. This also applies for changes to the F-I/O which are not used in the safety program.

We will show you the options for compiling the safety program below.

Basics for compiling

1. Selection	2. Via menu command/symbol…	3. The following are compiled...	4. Result: Safety program is...
Select folder of the F-CPU in the project tree or **Select F-CPU in network view** or **Select F-CPU in the device view** or **Select F-CPU in the topology view**	"Compile" shortcut menu:		
	• "Hardware and software (only changes)"	Hardware configuration, standard and safety programs	Consistent
	• "Hardware (only changes)"	Hardware configuration	—
	• "Software (only changes)"	Changes in the standard and safety programs	Consistent
	• "Software (rebuild all blocks)"	Entire standard program and safety program	Consistent
	• "Software (reset memory reserve)" (S7-1200, S7-1500)	Entire standard program and safety program	Consistent
Select Safety Administration Editor	Menu "Edit > Compile" or "Compile" button	Entire standard program and safety program	Consistent

1. Selection	2. Via menu command/symbol…	3. The following are compiled...	4. Result: Safety program is...
Select "Program blocks" folder in the project tree	Menu "Edit > Compile" or "Compile" button	Changes in the standard and safety programs	Consistent
	"Compile" shortcut menu:		
	• "Software"	Changes in the standard and safety programs	Consistent
	• "Software (rebuild all blocks)"	Entire standard program and safety program	Consistent
Select user-created folder in the project tree	Menu "Edit > Compile" or "Compile" button	All standard and F-blocks contained in the folder	Inconsistent
User-created folder containing all F-blocks	Menu "Edit > Compile" or "Compile" button	All standard blocks contained in the folder and complete safety program	Consistent
(F-)blocks in "Program blocks" folder in the project tree	Menu "Edit > Compile" or "Compile" button	Selected standard and F-blocks	Inconsistent
Different (F-)blocks in "Program blocks" folder in the project tree			
Individual (F-)blocks in "Program blocks" folder in the project tree			
Downloading a safety program to an F-CPU or memory card	Automatic compiling	Changes in the standard and safety programs	Consistent

A consistency check is always performed, regardless of the selection. This consistency check extends across all selected blocks. If the consistency check does not detect any errors, the status of the compiled safety program is as specified in column 4 "Result: Safety program is..." of the table.

Note

The following applies for S7-300/400 F-CPUs:

If you want to compile an F-FB with know-how protection, open it before compiling.

Result "Safety program is consistent"

After successful compilation of the safety program, a consistent safety program is always available in the "Program blocks" folder.

There may still be some F-blocks that are not called in an F-runtime group. These F-blocks are displayed in the "F-blocks" area of the *Safety Administration Editor*, marked with "No" in the "Used and compiled" column.

Result "Safety program is inconsistent"

When the safety program is compiled with the result "Safety program is not consistent", only the selected F-blocks were compiled. Additionally required F-blocks and F-system blocks were not generated. The safety program in the "Program blocks" folder is not consistent and is, thus, not executable.

Use this procedure to test if modified F-blocks can be compiled.

Reporting compiling errors

You can recognize whether or not the compilation was successful based on the message in the inspector window under "Info > Compile", error messages and warnings are output.

For information on the procedure you must follow to eliminate compiling errors, see "Eliminating compiling errors" in the *Help on STEP 7*.

Safety Administration Editor (Page 64)

10.2 Downloading the Safety Program

Introduction

Once you have successfully compiled your safety program, you can download it to the F-CPU. To download a safety program, you follow essentially the same approach as for downloading a standard user program, via different starting points in *STEP 7*.

- In the "Load preview" dialog, enter data (e.g. password for the F-CPU) and set the requirements for downloading (e.g. that the F-CPU is switched to STOP mode before downloading).
- The "Load results" dialog shows the results after downloading.

We will show you the options for downloading the safety program later. For basic information on downloading, refer to the *Help on STEP 7*.

Downloading a safety program to an F-CPU, if multiple F-CPUs are accessible

⚠ WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Industrial Ethernet) by **a programming device or PC**, you must take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPU having the respective Ethernet address "PW_8".

Note the following:

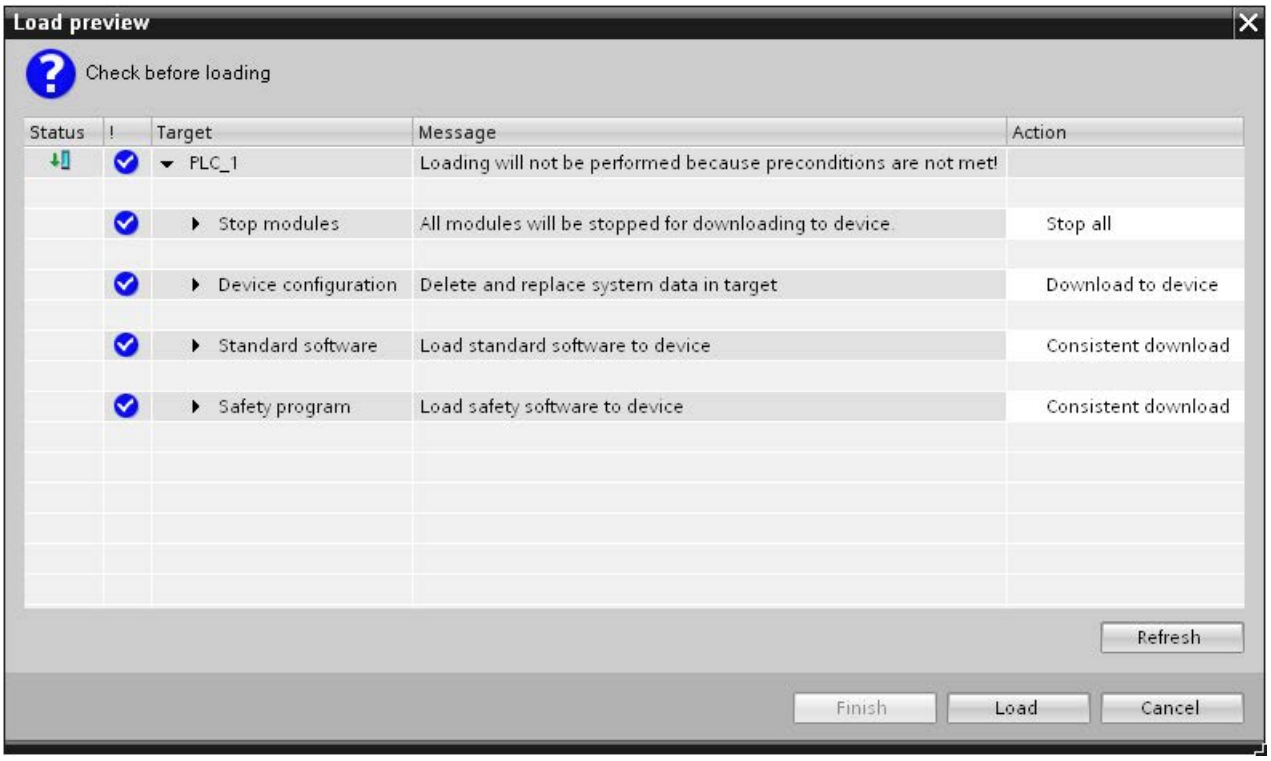
- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

Password prompt before downloading to an F-CPU

If you have assigned a protection level for the F-CPU (Page 82) (in the properties of the F-CPU in the "Protection" tab), the corresponding password is prompted in "Load preview" dialog. Without entry of password, only actions that are allowed without password are possible. As soon as the conditions for downloading are met, the "Load" button becomes active.

"Load preview" dialog

For an F-CPU, the "Load preview" dialog also contains the section "Safety program".



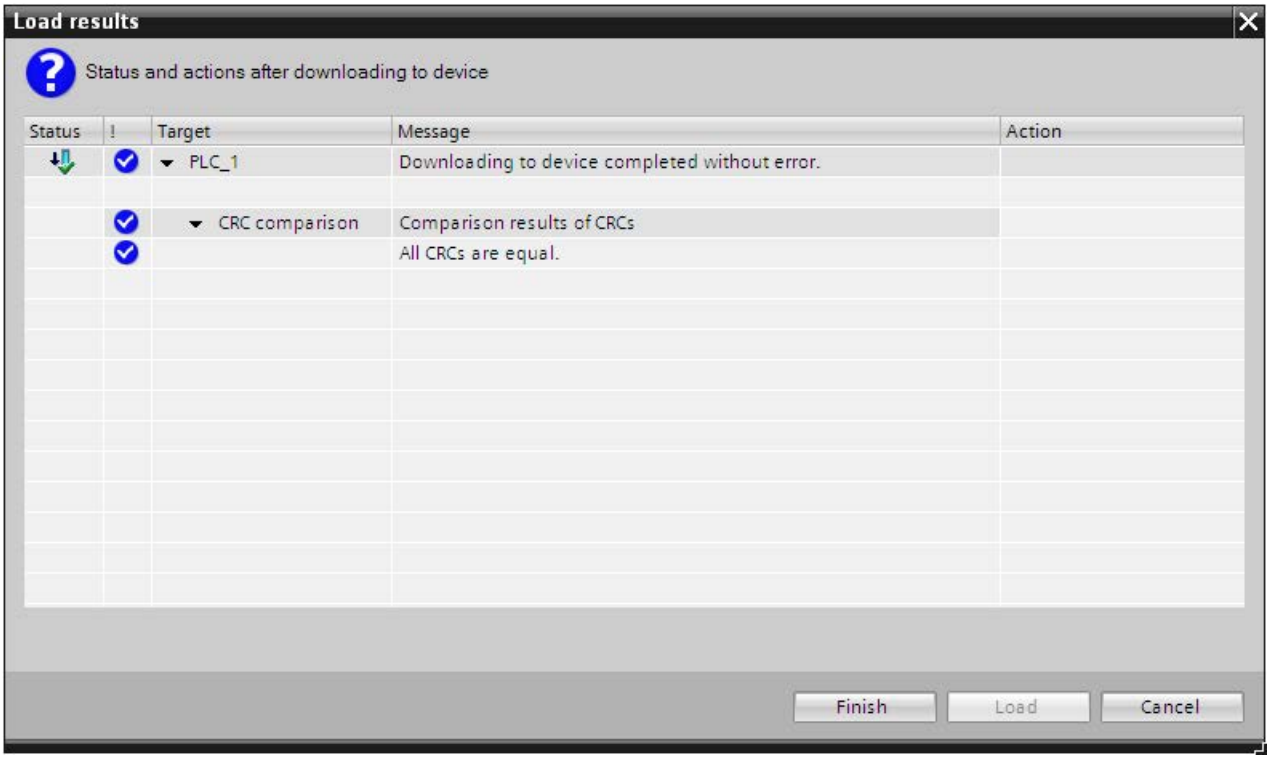
Make the following selection:

- In order to download a consistent safety program, select the "Consistent download" action under target "Safety program".
- You have the option of selectively downloading individual F-blocks to an S7-300/400 F-CPU. To download individual F-blocks selectively, select the "Download selection" action under the target "Safety program", and then select the required F-blocks. If necessary, you will be prompted to disable safety mode under "Disable safety mode". This setting is only suitable for the online test of individual F-blocks.
- (S7-300, S7-400) In order to download the safety program only, select the "Consistent download" action under target "Safety program" and the "Download selection" action under target"Standard software", and then select only the standard blocks that call the main safety block.
- Users who do not know the password for the F-CPU cannot download F-blocks. They have to select "No action" for the safety program.

For S7-1200/1500 F-CPUs, only the "Consistent download" value is possible as an action in the "Load preview" dialog. It is not possible to select separate loading of standard program or safety program. The complete user program is automatically consistently downloaded as soon as changes have been made in both the standard program and in the safety program. Please also note Data exchange between standard user program and safety program (Page 159).

"Load results" Dialog

After downloading into the F-CPU, the dialog "Load results" is opened. This dialog shows you the status and the necessary actions after downloading.



Verify that the "All CRCs are identical" message appears in this dialog. On the basis of the CRCs, the system checks after the download operation to determine whether all F-blocks were correctly transferred to the F-CPU.

Rules for downloading the safety program to an F-CPU

Note

You can perform the downloading of a consistent safety program only in STOP mode.

(S7-300, S7-400) If you are downloading F-blocks only, the blocks in which the main safety blocks are called (e.g., cyclic interrupt OB 35) are not downloaded. To do so, select the "Selection" option under "Standard software" in the preview dialog, and select the necessary blocks.

Note

If *STEP 7 Safety* detects an inconsistent safety program during startup of the F-CPU, startup of the F-CPU is prevented if the F-CPU supports this detection. (See product information for the respective S7-300/400 F-CPU. This is always supported with S7-1200/1500 F-CPUs). A corresponding diagnostic event is entered in the diagnostic buffer of the F-CPU:

If the F-CPU does not support this detection function, the F-CPU can go to STOP mode if an inconsistent safety program is executed in activated safety mode.

The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

When downloading the safety program, ensure that the "Consistent download" action is set for the "Safety program" selection in the "Load preview" dialog.

Verify that the "All CRCs are identical" message appears in the "Load results" dialog for S7-300/400 F-CPUs. The system uses CRCs after the download operation to check whether all F-blocks have been correctly transferred to the F-CPU. If not, repeat the download operation.

Inconsistent downloading is only possible in disabled safety mode.

Downloading individual F-blocks (S7-300, S7-400)

You can download F-blocks and standard blocks simultaneously to the F-CPU via the project tree. However, as soon as F-blocks are to be downloaded, a check is carried out to determine whether or not the F-CPU is in STOP mode or disabled safety mode. If not, you have the option of switching to disabled safety mode or placing the F-CPU in STOP mode. We recommend that you download individual F-blocks in disabled safety mode because downloading to an F-CPU in STOP results in the F-CPU no longer being able to startup following the download.

If you want to download individual F-blocks to the F-CPU, for example, to test changes, make sure that you have not selected the folder "Program blocks" or the F-CPU in the project tree but only one of the blocks you want to download.

Only then will you be prompted in the "Load preview" dialog to disable safety mode once you have changed the option from "Consistent download" to "Download selection".

If you fail to observe this prompt, the blocks are downloaded without deactivation of the safety mode which will STOP the F-CPU.

You can also deactivate the safety mode explicitly in the *Safety Administration Editor* before you start the download.

Be aware that the consistency of the safety program in the F-CPU cannot be guaranteed when individual F-blocks are downloaded. For a consistent safety program, always download the entire safety program to the F-CPU.

Rules for downloading individual F-blocks (S7-300, S7-400)

The following rules apply to downloading of individual F-blocks:

- Downloading is only possible in disabled safety mode or when the F-CPU is in STOP mode.
- F-blocks can only be downloaded to an F-CPU to which a safety program has already been downloaded.
- Only an offline safety program is permitted to be used as a source program.

Consequently, you have to download the entire safety program when initially downloading the safety program and after changing the password for the safety program.

Note

Downloading of individual F-blocks is only suitable for testing F-blocks. Prior to the transition to productive mode, you must download the safety program consistently to the F-CPU.

Transferring a safety program with programming device/PC or memory card to an F-CPU

For information on transferring the safety program to the F-CPU with a programming device/PC or a memory card, refer to Function test of safety program and protection through program identification (Page 274).

Uploading the safety program to a programming device or PC (S7-300, S7-400)

Note

In principle, it is possible to upload a safety program from the F-CPU to a programming device or PC. Note, however, that any symbols used in the safety program are deleted and cannot be recreated, since no symbol information is saved in the F-CPU. Symbols are available only if you are using an offline project.

A safety program uploaded from the F-CPU to a programming device/PC must not be downloaded again to the F-CPU.

Uploading the safety program to a programming device or PC (S7-1200, S7-1500)

The "Load from device" function has not been released for S7-1200/1500 F-CPUs. This also applies to F-I/O in standard mode.

Uploading to a PG/PC (S7-300, S7-400)

You upload a safety program from an F-CPU to a programming device/PC using menu command "Online> Upload device to PG/PC" or the "Load from device" button in the toolbar.

You can only upload the hardware configuration if F-capability is not enabled for the F-CPU. You can only upload F-I/O if these are operated in standard mode.

Download in *S7-PLCSIM* (S7-300, S7-400, S7-1500)

You can load the safety program with *S7-PLCSIM* (hardware simulation) like in a real F-CPU. For this purpose, use the menu command "Online > Simulation > Start" to start *S7-PLCSIM*, same as in the standard system.

Note that the cycle time on a simulated CPU can differ from the real cycle time.

10.3 Safety program work memory requirements (S7-300, S7-400)

Estimation

You can estimate the work memory requirement for the safety program as follows:

Work memory required for the safety program

32 KB for F-system blocks

+ 4.4 KB for safety-related communication between F-runtime groups
+ 4.5 x work memory requirement for all F-FB/F-FCs/main safety blocks
+ 4.5 x work memory requirement of all utilized instructions, which are shown in the "Instructions" task card with the block icon.
  (except SENDDP, RCVDP, SENDS7, and RCVS7)
+ Work memory requirement of the utilized SENDDP and RCVDP instructions
  (4.3 KB each)
+ Work memory requirement of the utilized SENDS7 and RCVS7 instructions
  (8.5 KB each)

Work memory required for data

5 x work memory requirement for all F-DBs (including F-communication DB, but excluding DB for F-runtime group communication) and I-DBs for main safety block/F-FB

+ 24 x work memory requirement for all DBs for F-runtime group communication
+ 2.3 x work memory requirement for all I-DBs of instructions (except SENDDP, RCVDP, SENDS7 and RCVS7)
+ Work memory requirement of all I-DBs of instructions SENDDP (0.2 KB), RCVDP (0.3 KB), SENDS7 (0.6 KB), and RCVS7 (1.0 KB)
+ 0.7 KB per F-FC
+ 0.7 KB per F-I/O (for F-I/O DBs, etc.)
+ 4.5 KB

Block size of automatically generated F-blocks

Do not utilize the entire maximum size of an F-block, because the automatically generated F-blocks are larger and as a result, the maximum possible size may be exceeded in the F-CPU. If the block size is exceeded, this triggers a corresponding error message with information on which F-blocks are too large. These must be divided up, if necessary.

10.4 Function test of safety program and protection through program identification

10.4.1 Transferring the safety program to an S7-300/400 F-CPU with memory card inserted (flash card or SIMATIC Micro memory card)

F-CPUs with memory card inserted (flash card or SIMATIC Micro memory card)

The following warnings apply when the safety program is transferred from a programming device or PC to:

- F-CPUs with flash card inserted (e.g. CPU 416F-2)
- F-CPUs with SIMATIC Micro memory card

  (e.g. CPU 317F-2 DP, CPU 315F-2 PN/DP or IM 151-7 F-CPU)

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when transferring the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Load the safety program on the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline).
- Perform a memory reset of the F-CPU using the mode selector or via the programming device/PC. Once the work memory has been deleted, the safety program is again transferred from the load memory (memory card, SIMATIC Micro memory card for F-CPUs 3xxF, ET 200S and ET 200pro IM-CPUs or flash card for F-CPUs 4xxF). *(S022)*

WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Industrial Ethernet) by **a programming device or PC**, you must take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPU having the respective Ethernet address "PW_8".

Note the following:

- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

Rules for plugging removable media into the F-CPU

WARNING

You must limit access to the F-CPU to persons who are authorized to plug in removable media by using access protection.

You must ensure that the correct safety program is on the connected removable medium, either with online program identification or other appropriate measures (for example, unique ID of the removable medium). *(S025)*

10.4.2 Transferring the safety program to an S7-400 F-CPU without flash card inserted

The following warnings apply when the safety program is transferred from a programming device or PC to:

- F-CPUs without an inserted flash card (e.g. CPU 416F-2)

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when transferring the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Perform a memory reset of the F-CPU using the **mode selector** or via the **programming device/PC**.
- Download the configuration and the safety program to the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S023)*

⚠ WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Industrial Ethernet) by **a programming device or PC**, you must take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPU having the respective Ethernet address "PW_8".

Note the following:

- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

10.4.3 Transferring the safety program to an S7-300/400 F-CPU with memory card

Use of SIMATIC Micro memory card or flash card

The following warning applies when you use:

- Flash card (e.g. for CPU 416F-2)
- SIMATIC Micro memory card (e.g. for CPU 317F-2 DP, CPU 315F-2 PN/DP or IM 151-7 F-CPU)

⚠ WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when transferring the safety program to the F-CPU with a memory card (SIMATIC Micro memory card or flash card) to ensure that the F-CPU does not contain an "old" safety program:

- Switch off the power to the F-CPU. For F-CPUs with battery backup (e.g. CPU 416F-2), remove any battery. (To make sure that the F-CPU is de-energized, wait for the buffer time of the power supply you are using or, if this is not known, remove the F-CPU.)
- Remove the memory card (SIMATIC Micro memory card or flash card) with the old safety program from the F-CPU.
- Plug the memory card (SIMATIC Micro memory card or flash card) with the new safety program into the F-CPU.
- Switch on the F-CPU again. For F-CPUs with battery backup (e.g. CPU 416F-2), reinsert the battery, if one was removed.

You need to ensure that the memory card inserted (SIMATIC Micro memory card or flash card) contains the correct safety program. You can do so using program identification or other measures, such as a unique identifier on the memory card (SIMATIC Micro memory card or flash card).

When loading a safety program on a memory card (**SIMATIC Micro memory card** or flash card), you must adhere to the following procedure:

- Load the safety program on the memory card (SIMATIC Micro memory card or flash card).
- Perform a program identification (in other words, check whether the collective F-signatures offline and on the memory card, SIMATIC Micro memory card or flash card match).
- Label the memory card (SIMATIC Micro memory card or flash card) appropriately.

The procedure outlined must be ensured through organizational measures. *(S026)*

Rules for plugging removable media into the F-CPU

⚠ WARNING

You must limit access to the F-CPU to persons who are authorized to plug in removable media by using access protection.

You must ensure that the correct safety program is on the connected removable medium, either with online program identification or other appropriate measures (for example, unique ID of the removable medium). *(S025)*

10.4.4 Transferring the safety program to a WinAC RTX F

⚠ WARNING

In order to guarantee that there is no "old" safety program in the F-controller, you must adhere to the following procedure when transferring the safety program to the F controller with a programming device/PC:

1. Perform a memory reset of WinAC RTX F (see Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176) manual).
2. Download the configuration to the WinAC RTX F (see Windows Automation Center RTX WinAC RTX (F) 2010 (http://support.automation.siemens.com/WW/view/en/43715176) manual).
3. Download the safety program (Page 268) to the WinAC RTX F.

   If the function test of the safety program does not take place in the destination F-controller, you must also follow points 4 and 5:
4. Perform a program identification (i.e. check whether the collective F-signatures match online and offline).
5. Perform the F-system startup.

Between the online program identification and the startup of the F-system, the WinAC RTX F must not be closed (for example, as a result of NETWORK OFF/NETWORK ON or booting). *(S024)*

WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Ind. Ethernet) by **a programming device or PC**, you must also take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPUs having the respective Ethernet address "PW_8".

Note the following:

- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

Rules for plugging removable media (for example SIMATIC Micro memory cards, flash cards and hard disks) into the F-CPU

WARNING

You must limit access to the F-CPU to persons who are authorized to plug in removable media by using access protection.

You must ensure that the correct safety program is on the connected removable medium, either with online program identification or other appropriate measures (for example, unique ID of the removable medium). *(S025)*

10.4.5 Transferring the safety program to an S7-1200/1500 F-CPU

WARNING

If the function test of the safety program is not carried out in the destination F-CPU, you must adhere to the following procedure when transferring the safety program to the F-CPU with a **programming device/PC** to ensure that the F-CPU does not contain an "old" safety program:

- Load the safety program on the F-CPU.
- Perform a program identification (i.e. check whether the collective F-signatures match online and offline). *(S042)*

WARNING

If **multiple F-CPUs** can be accessed over a network (e.g. Industrial Ethernet) by **a programming device or PC**, you must take the following additional measures to ensure that the safety program is downloaded to the correct F-CPU:

Use passwords specific to each F-CPU, such as a unique password for the F-CPU having the respective Ethernet address "PW_8".

Note the following:

- A point-to-point connection must be used when assigning a password to an F-CPU for the first time (as when assigning an MPI address to an F-CPU for the first time).
- Before downloading a safety program to an F-CPU, you must first revoke an existing access permission for any other F-CPU.
- After activation of the access protection and before the transition to productive mode, you must download the safety program again to the F-CPU. *(S021)*

Rules for plugging removable media into the F-CPU

WARNING

You must limit access to the F-CPU to persons who are authorized to plug in removable media by using access protection.

You must ensure that the correct safety program is on the connected removable medium, either with online program identification or other appropriate measures (for example, unique ID of the removable medium). *(S025)*

Using a SIMATIC memory card

⚠ WARNING

If the function test of the safety program is not performed in the destination F-CPU, you need to ensure that the SIMATIC memory card inserted has the correct safety program. You can do so through a program identification or other measures, such as a unique identifier on the SIMATIC memory card.

When downloading a safety program to a SIMATIC memory card, you must adhere to the following procedure:

- Load the safety program on the SIMATIC memory card.
- Perform a program identification (i.e. check to determine whether the collective F-signatures offline and on the SIMATIC memory card match).
- Label the SIMATIC memory card accordingly.

The procedure outlined must be ensured through organizational measures. *(S043)*

10.4.6 Restoring a backup of the safety program to an S7-300/1500 F-CPU

You have the option of backing up an F-CPU in the same way as a standard CPU. You can find information on backing up a CPU in the *online help on STEP 7* under "Creating a backup of an S7 CPU".

Note the following warning when using an F-CPU:

⚠ WARNING

After restoring a safety program for an F-CPU, you must connect with the F-CPU using *STEP 7* and read out the collective F-signature from the F-CPU load memory using the SAE and compare it with your expected result. You can also check the result using the F-CPU display. *(S055)*

10.4.7 Transferring the safety program to an S7-1200 F-CPU with inserted program card

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory of the F-CPU when you insert a program card into an S7-1200 F-CPU:

1. If the internal load memory of the F-CPU has already been deleted (for example, when the F-CPU has already been operated with a program card as external load memory), **the STOP/RUN LED (orange) and the maintenance LED must flash during startup for 3 seconds on an F-CPU without SIMATIC Memory Card**. You can skip steps 3 in this case.
2. Insert the program card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program card is being evaluated or that the internal load memory must be deleted.
3. Use one of the following methods to delete the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program.
4. Use one of the following methods to evaluate the program card:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S061)*

⚠ WARNING

If you use a programming device/PC to transfer F-blocks to an S7-1200 F-CPU with inserted program card (external load memory), you must ensure that the transfer takes place to the external load memory. This can be accomplished, for example, by the following measures:

- Check to see if the program card is inserted correctly.
- Insert a program card whose memory size is different than the size of the internal load memory. Check in the project tree under "Online & Diagnostics > Diagnostics > Memory" if the memory size displayed for the load memory matches the memory size of the program card. *(S058)*

Note

For an S7-1200 F-CPU without inserted SIMATIC Memory Card and deleted internal load memory, the status LEDs have the status described in the table below.

Description	STOP/RUN Orange/Green	ERROR Red	MAINT Orange
Internal load memory deleted and SIMATIC Memory Card not inserted.	Flashing (orange) (for 3 seconds during startup)	Off	Flashing (for 3 seconds during startup)

10.4.8 Transferring the safety program from the internal load memory to an empty SIMATIC Memory Card of an S7-1200 F-CPU

⚠ WARNING

To ensure that the safety program is transferred from the internal load memory of the F-CPU to the SIMATIC Memory Card when plugging an empty SIMATIC Memory Card into an S7-1200 F-CPU and that the internal load memory of the F-CPU is deleted afterward, you must observe the following procedure:

1. Make sure that you are using an empty SIMATIC Memory Card, for example, by checking in the Windows Explorer that the "SIMATIC.S7S" folder and the "S7_JOB.S7S" file are deleted.
2. Insert the empty SIMATIC Memory Card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the program can be copied from the internal load memory to the SIMATIC Memory Card and that the internal load memory is deleted afterward.
3. Use one of these methods to trigger copying from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart and copying of the program from the internal load memory to the SIMATIC Memory Card and subsequent deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store the safety program. The SIMATIC Memory Card is now a program card.
4. Use one of the following methods to evaluate the program card:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU restarts and evaluates the program card.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S057)*

10.4.9 Transferring the safety program to an S7-1200 F-CPU using a transfer card

⚠ WARNING

You must observe the following procedure to ensure that there is no "old" safety program in the internal load memory when you transfer a safety program to an S7-1200 F-CPU using a transfer card:

1. If the internal load memory of the F-CPU has already been deleted, **the STOP/RUN LED (orange) and the maintenance LED must flash for 3 seconds during startup on an F-CPU without SIMATIC Memory Card**. You can skip step 3 in this case.
2. Insert the transfer card into the F-CPU.

   If the F-CPU is in RUN, it will change to STOP. The maintenance LED on the F-CPU is flashing to indicate that the transfer card is being evaluated or that the internal load memory must be deleted.
3. Use one of the following methods to delete the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart and deletion of the internal load memory, **the STOP/RUN LED (orange) and the maintenance LED must be flashing**. The internal load memory of the F-CPU has been deleted in this case and does no longer store an "old" safety program.
4. Use one of the following methods to evaluate the transfer card (transfer from the transfer card to the internal load memory):
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   After restart and evaluation of the SIMATIC Memory Card, the F-CPU copies the safety program to the internal load memory of the F-CPU. Once the copy process is complete, the maintenance LED on the F-CPU is flashing to indicate that you can remove the transfer card.
5. Remove the transfer card from the F-CPU.
6. Use one of the following methods to evaluate the safety program transferred to the internal load memory:
   - Turn the F-CPU off and back on.
   - Switch the F-CPU from STOP to RUN.
   - Execute the "Memory reset" (MRES) function.

   The F-CPU then enters the startup mode (RUN or STOP) that has been set up for the F-CPU. *(S059)*

10.4.10 Updating the safety program on an S7-1200 F-CPU using a transfer card

⚠ WARNING

If you run an update of the safety program on an S7-1200 F-CPU with the help of a transfer card, you must ensure that the transfer to the internal load memory took place correctly by means of a subsequent program identification. *(S060)*

10.5 Comparing Safety Programs

Compare safety programs as in standard

You can use the *comparison editor* in *STEP 7* for offline-online or offline-offline comparison of safety programs. The procedure is the same as for standard user programs. The contents of F-blocks are also compared for the comparison of safety programs. As a result, an offline-offline comparison can also be used for an acceptance of changes (Page 319).

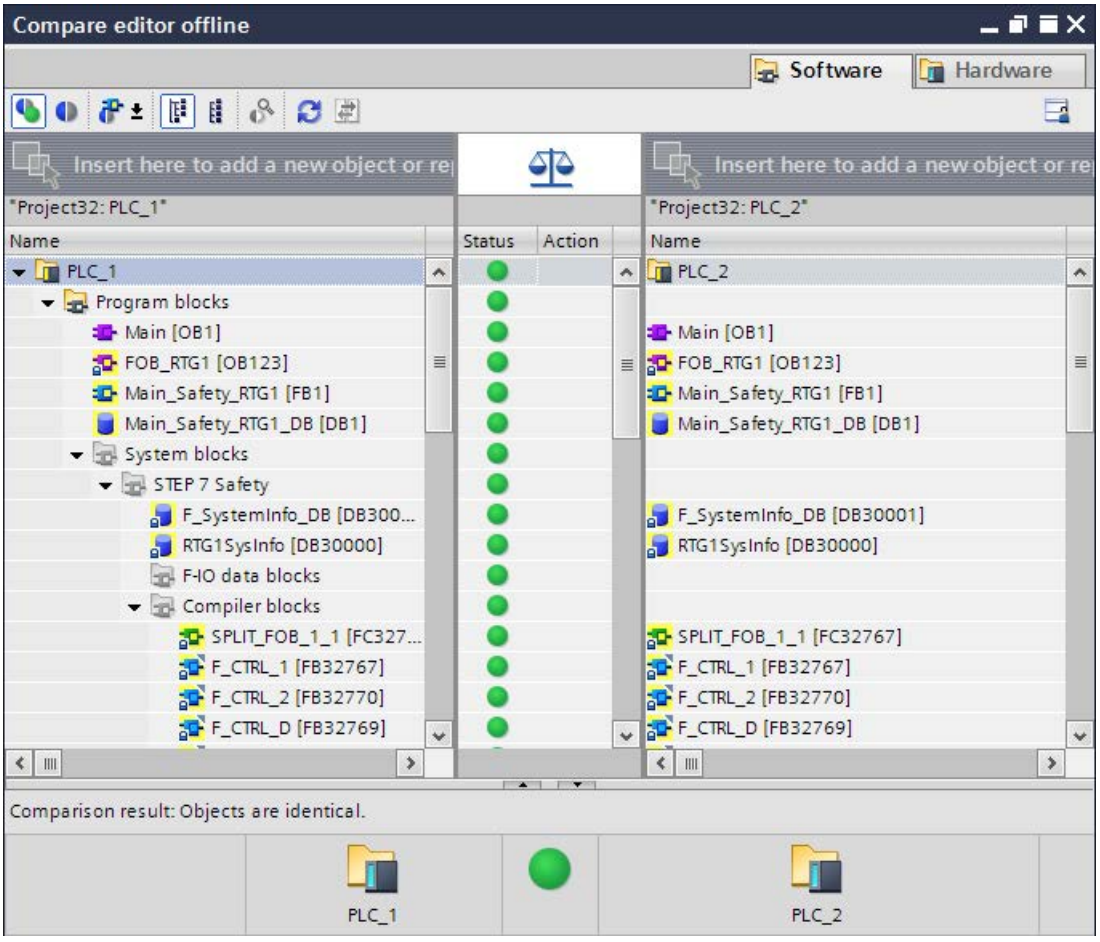
Note

During the offline-online comparison, the comparison statuses may occasionally differ between the *comparison editor* and status display in the project tree or *Safety Administration Editor*. The decisive status is the result of the comparison in the *comparison editor*, since this is the only comparison that takes into account the contents of the F-blocks.

Comparison result for safety programs

The representation of the comparison result corresponds to the representation of *STEP 7*.

If you click the "Program blocks" folder on the left of the comparison editor, you can see the collective F-signature of the safety program displayed under "Comparison result". You also receive information about whether the safety program is consistent.



If you click on an F-block, you can see the respective signatures and interface signatures in addition to the standard information.

Note

If you interrupt the connection to the F-CPU during the online/offline comparison, the comparison result will be incorrect.

The meaning of the symbols in the "Status" column is explained below:

Table 10- 1 Offline-online comparison: Status of the comparison and causes

Symbol	Meaning for safety program	Possible causes
	The offline and online versions of the object are identical.	—
	The offline and online versions of the object are different.	The relevant differences are displayed in the row above the detailed comparison.
	Object exists only offline	The block only exists offline.
	Object exists only offline	The block exists only offline.

Table 10- 2 Offline-offline comparison: Status of the comparison and causes

Symbol	Meaning for safety program	Possible causes
	Both offline versions of the object are identical.	—
	Both offline versions of the object are different	The relevant differences are displayed in the row above the detailed comparison.
	Object available only in safety program 1	—
	Object available only in safety program 2	—

Comparison filter options

You can use filters in the *comparison editor* to limit the comparison result to the following block groups:

- Compare only F-blocks
- Compare only F-blocks relevant for certification
- Compare only standard blocks

You also have the *STEP 7* filter options "Show only objects with differences" and "Show identical and different objects".

For comparison of safety programs, F-blocks in the "System blocks" folder are also relevant.

Classification of displayed changes

Regardless of whether you carried out an offline/online or offline/offline-comparison, the following changes could account for the indicated changes to the automatically generated F-blocks:

- Change in the maximum cycle time of F-runtime group and warn cycle time of F-runtime group
- Change in F-parameters of the F-CPU
- Modified version of F-system blocks (S7-1200/1500: Displayed as change of the "F_SystemInfo_DB" block).
- (S7-300/400) Change in the F-runtime group communication, for example, change in the number of a DB for F-runtime group communication
- Change in main safety block, F-FB, F-FC, F-DB
- Change of the hardware configuration for the F-I/O addressed in the safety program

It is possible that a block is displayed as changed, but no changes are displayed in the detailed comparison of the block content. This is not a display problem but means that changes in the hardware configuration or the tag table, for example, have an effect on this block. Test this block in case of doubt.

Printing result of comparison

The comparison result can be printed via "Project > Print" in the menu bar or the print button in the toolbar. Select "Print objects/area" "All" and "Properties" "All".

10.6 Printing project data

Printing

You can print all important project data of the hardware configuration of the F-I/O and safety program. You obtain a "safety summary" that, alongside the documentation, serves as a basis for testing the correctness of the individual components of the system. Correctness is a prerequisite for system acceptance.

The collective F-signature specifications in the footer of the printout ensure that the printout is explicitly associated with a safety program.

Procedure for creating a safety summary

To create a safety summary, follow these steps:

1. In the project tree, select the *Safety Administration Editor* of the F-CPU whose safety summary you want to create.
2. Select "Print" in the shortcut menu or "Project > Print" in the menu bar or the print button in the toolbar.

   In the displayed dialog, you can make layout settings for the printout and specify the scope of the printout (all/subset), among other things.
3. Select the "All" option, if the F-blocks and F-compliant PLC data types are to be shown in the printout. This is necessary, for example, to document the program code for the acceptance(see Acceptance of system (Page 308)). Select the "Compact" option to exclude the source code from the printout.
4. Click the "Print" button.

As a result, you receive the safety summary for the F-CPU.

Safety summary

The safety summary provides documentation of the safety program and provides support for the acceptance of the system.

Contents of the summary in overview

The topics that are considered in the summary are summarized in the following:

- General information on program identification, software versions, access protection, settings (from the "Settings" work area of the *Safety Administration Editor*)
- System library elements used in safety program (from the "Instructions" task card and F-system blocks) along with their versions
- Information about the F-runtime groups (F-monitoring time, cycle time warning limit, max. cycle time, F-blocks and their names)
- Listing of the F-blocks within the "Program blocks" folder (name, function, associated F-runtime group, signature)
- (S7-1200, S7-1500) Listing of F-compliant PLC data types
- Data from the standard user program that are evaluated in the safety program
- Parameters of safety-related CPU-CPU communication
- (S7-300, S7-400) Absolute addresses and names of the F-shared DB tags that can be accessed from the standard user program
- Information on hardware (used F-I/O, CPU version, addresses)
- Information on the printout (print date, number of pages)

Footer of the printouts

On the basis of the footer of the printout, you can find out:

- whether you printed out the "correct" project (specification of the project name and file path)
- whether the printout is consistent and belongs to the same safety program and the same version (the same collective F-signature in the footer of every page means that the printout belongs to the safety program with this collective F-signature).

The footer is added to the source code of the F-blocks only if the "All" option was selected for the safety summary.

If F-blocks are printed by other means, the footer is omitted, and you can no longer easily identify whether the block printout belongs to the current safety program version.

Printing a migrated project

You can only print a safety summary for a project migrated from *S7 Distributed Safety* V5.4 SP5 if the project was compiled with *STEP 7 Safety Advanced* and the new program structure for safety programs (main safety block) has therefore been applied. Otherwise, the printout is not possible and you will receive a corresponding error message.

We recommend that you print out your project in *S7 Distributed Safety V5.4 SP5* before the migration.

10.7 Testing the safety program

10.7.1 Overview of Testing the Safety Program

Complete function test or test of changes

After creating a safety program, you must carry out a complete function test in accordance with your automation task.

For changes made to a safety program that has already undergone a complete function test, only the changes need be tested.

Monitoring

In general, all read-only test functions (such as tag monitoring) are also available for safety programs and in safety mode.

Modifying

Modifying safety program data and write accesses to the safety program are possible only in a limited way and in disabled safety mode.

Simulation with *S7-PLCSIM* (S7-300, S7-400, S7-1500)

You can test the safety program using *S7-PLCSIM*. You use *S7-PLCSIM* in the same way as for standard user programs.

You start the simulation with *S7-PLCSIM* using menu item "Online > Simulation > Start".

10.7.2 Disabling safety mode

Introduction

The safety program generally runs in the F-CPU in safety mode. This means that all fault control measures are activated. The safety program cannot be modified during operation (in RUN mode) in safety mode. You must disable safety mode of the safety program to, for example, modify tags in the safety program in RUN mode. Safety mode remains deactivated until the F-CPU is next switched from STOP to RUN mode.

Rules for disabling safety mode

⚠ WARNING

Because changes to the safety program can be made in RUN mode when safety mode is deactivated, you must take the following into account:

- Disabling safety mode is intended for test purposes, commissioning, etc. Whenever safety mode is deactivated, the safety of the system must be ensured by other organizational measures, such as monitored operation, manual safety shutdown, and access restrictions to certain areas.
- Disabling of safety mode must be displayed.

  Use the MODE tag in the F-shared DB ("F_GLOBDB".MODE) for S7-300/400 F-CPUs or in the F-runtime group information DB (e.g RTG1SysInfo.F_SYSINFO.MODE) for S7-1200/1500 F-CPUs, which you can evaluate to read the operating mode (1 = Disabled safety mode). This means not only is the disabled safety mode displayed on the programming device or PC in the dialog box for disabling safety mode, but it can also be indicated by means of an indicator light controlled by the standard user program or a message to an HMI system generated by evaluating the above-mentioned "Disabled safety mode" variable in the F-shared DB.
- It must be possible to verify that safety mode has been disabled. A log is required, if possible by recording messages to the HMI system, but if necessary, through organizational measures. In addition, it is recommended that disabling of safety mode be indicated on the HMI system.
- Safety mode is disabled F-CPU-wide. In spite of this, you must take the following into account for safety-related CPU-CPU communication: If the F-CPU with the SENDDP or SENDS7 instruction is in disabled safety mode, you can no longer assume that the data sent by this F-CPU are generated safely. You must then implement organizational measures such as operation monitoring and manual safety shutdown to ensure safety in those portions of the system that are affected by the sent data. Alternatively, you must output fail-safe values instead of the received data in the F-CPU with the instruction RCVDP or RCVS7 (Page 646) or SENDMODE by evaluating SENDMODE. *(S027)*

Procedure for disabling safety mode

To disable safety mode, follow these steps:

1. Open the *Safety Administration Editor* of the corresponding F-CPU.
2. Open the work area "General (Page 67)" in the area navigation.
3. Check to see whether the safety mode status is displayed as activated.

   If so, continue with the next step; if not, stop the process, because safety mode is already disabled or cannot be disabled.
4. Click the "Disable safety mode" button.
5. Enter the password for the online safety program.

   If you enter the correct password, another prompt will appear, which also contains the collective F-signature in the F-CPU. Check to see whether this is the collective F-signature you expected. If there is a match, acknowledge the dialog.

   Safety mode is then disabled.

   If the password is not valid, safety mode is not deactivated and remains active.

   (S7-300, S7-400) When individual F-blocks are downloaded, the condition "Disable safety mode" is listed automatically in the "Load preview" dialog. For this reason, it is not necessary to explicitly disable safety mode before every F-block download.

Note

If the collective F-signature or the passwords do not agree for the safety program online and offline, this means:

- The offline safety program was modified after the last downloading, or
- An incorrect F-CPU was addressed. Check the latter based on the online collective F-signature.

Enabling safety mode

Note

To enable safety mode, the F-CPU must be switched from STOP to RUN mode.

Switching the F-CPU from STOP to RUN mode always enables safety mode, even if the safety program has been modified or is not consistent. The MODE tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB is set to "0" for S7-1200/1500 F-CPUs.

If you have changed your safety program, but have not recompiled and downloaded it, the F-CPU can revert to STOP mode.

Evaluating safety mode/disabled safety mode

If you wish to evaluate safety mode/disabled safety mode in the safety program, you can evaluate the "MODE" tag in the F-shared DB for S7-300/400 F-CPUs or F-runtime group information DB for S7-1200/1500 F-CPUs (1 = Disabled safety mode). You use fully qualified access to access this tag (e.g. "F_GLOBDB".MODE or RTG1SysInfo.MODE).

You can use this evaluation, for example, to passivate F-I/O when the safety program is in disabled safety mode. To do so, assign the "MODE" tag in the F-shared DB or F-runtime group information DB to all "PASS_ON" tags in the F-I/O DBs of the F-I/O that you wish to passivate.

⚠ WARNING

When the safety program is in disabled safety mode, the "MODE" tag in the F-shared DB or F-runtime group information DB is also evaluated in disabled safety mode.

Even if the F-I/O are passivated in disabled safety mode as a result of evaluation of the "MODE" tag, system safety must be ensured in disabled safety mode through other organizational measures, such as operation monitoring and manual safety shutdown. *(S028)*

F-runtime group information DB (S7-1200, S7-1500) (Page 115)

10.7.3 Testing the safety program

Introduction

In disabled safety mode, certain fault control measures of the safety program are deactivated to enable online changes to be made to the safety program in RUN mode. In this way, safety program data can be changed using standard tools from *STEP 7* (watch table, monitoring in the *program editor*).

Changing the safety program data by modifying tags

In addition to data in the standard user program, which can always be modified, you can modify the following data of a safety program in disabled safety mode:

- Process image of the F-I/O (channel values and value status (S7-1200, S7-1500))
- F-DBs (except DB for F-runtime group communication), instance DBs of F-FBs
- F-I/O DBs (for permitted signals, see F-I/O DB (Page 129))

Note

F-I/O can only be modified in RUN mode of the F-CPU. You must allocate a separate row in the watch table for each channel value and value status (S7-1200, S7-1500) to be modified; this means, for example, that digital channels of data type BOOL cannot be modified on a byte-by-byte or word-by-word basis.

You can modify a maximum of 5 inputs/outputs from a watch table for S7-300/400 F-CPUs. You can use more than one watch table.

You cannot modify a configured F-I/O from which neither a channel value or a value status (S7-1200, S7-1500), nor any tag from the associated F-I/O DB has been used. In your safety program, you should therefore always use at least one tag from the associated F-I/O DB or at least one channel value or value status (S7-1200, S7-1500) of the F-I/O to be modified.

As a trigger point, you must set "Begin scan cycle" or "End scan cycle", either "permanently" or "once". However, note that regardless of the trigger point setting, requests to modify inputs (PII) of F-I/O always become effective before the main safety block is executed and requests to modify outputs (PIQ) always become effective after execution of the main safety block.

For inputs (PII), modify requests take priority over fail-safe value output, while for outputs (PIQ), fail-safe value output takes priority over modify requests. For outputs (channels) that are not activated in the properties for the F-I/O, modify requests affect the PIQ only, and not the F-I/O.

Note

The following applies for S7-1200/1500 F-CPUs:

To avoid invalid combinations of channel value and status value:

- The value status is set by the F-system automatically to 1 when setting a channel value to a value <> fail-safe value 0
- The fail-safe value 0 is automatically output when setting the value status to 0 for the associated channel value

⚠ WARNING

Constant modify requests for F-I/O can continue to remain active in the following cases:

- The connection between the programming device or PC and F-CPU is interrupted (e.g. because the bus cable is unplugged)
- if the watch table no longer responds

To delete constant modify requests in such cases, you must

- Switch the relevant F-CPU from STOP to RUN when the connection to the programming device or PC is interrupted

  or
- Perform a memory reset on the relevant F-CPU. *(S029)*

Wiring test using tag table

You can carry out a wiring test for an input by changing an input signal and verifying whether or not the new value arrives in the PII.

You can carry out a wiring test for an output by changing the output with the Modify function and verifying whether the required actuator responds.

For the wiring test (both for an input and output), note that a safety program must be running on the F-CPU in which at least one channel of the F-I/O to be modified or one tag from the associated F-I/O DB has been used.

For F-I/O that can also be operated as standard I/O (e.g., S7-300 fail-safe signal modules), you can also carry out the wiring test for outputs using the Modify function in STOP mode by operating the F-I/O as standard I/O rather than in safety mode. When doing so, you must comply with the other rules for testing.

Note

A modify function controlled by the F-system is only possible if the *STEP 7 Safety* optional package is installed. Modification of tags by means of an HMI system as well as modification without an installed *STEP 7 Safety* optional package can cause the F-CPU to go into STOP.

The test functions are selected using the standard tools from *STEP 7* (*program editor*, watch table). An attempt to modify a safety program in safety mode is rejected with a corresponding error message, or a dialog box for disabling safety mode is provided. In certain circumstances, a modify request can cause the F-CPU to go to STOP mode.

Opening and changing F-blocks

Opening of an F-block online in the F-CPU is only possible with write protection in the *program editor*; that is, you cannot change an F-block directly in the F-CPU, even if safety mode is deactivated. After a successful password prompt, the F-block switches automatically to offline mode while opening (block icon is labeled accordingly in the project tree) and can be changed by you.

You must then compile the F-block and download it to the F-CPU. To do so, follow the procedure as outlined in "Downloading the Safety Program (Page 268)".

Downloading F-blocks for testing purposes (S7-300, S7-400)

To execute a download of F-blocks for testing purposes, only the F-blocks to be tested may be selected and "Stop module" has to be set to "No action" in the "Load preview" dialog.

Modifying values in F-DBs

Values in F-DBs can only be modified online in the F-CPU. If the value is also to be changed offline, you must do this by editing the start value offline and compiling the safety program.

Additional rules for testing

- Forcing is not possible for F-I/O.
- Setting breakpoints in the standard user program will cause the following errors in the safety program:
  - Expiration of F-cycle time monitoring
  - Error during communication with the F-I/O
  - Error during safety-related CPU-CPU communication
  - Internal CPU faults

  If you nevertheless want to use breakpoints for testing, you must first disable safety mode (Page 293). This will result in the following errors:
  - Error during communication with the F-I/O
  - Error during safety-related CPU-CPU communication
- Changes in the configuration of F-I/O or safety-related CPU-CPU communication can only be tested after the hardware configuration has been saved and downloaded, and after the safety program has been compiled and downloaded to the F-CPU.

Procedure for monitoring and modifying the safety program

Monitor or modify the required F-data and/or F-I/O from an open watch table or from the *program editor* (program status) (for the procedure, see *Help on STEP 7*, "Testing user program").

1. For modifying, deactivate the safety mode (Page 293) in the automatically shown dialog.
2. Terminate existing modify requests after testing is complete before activating safety mode.

If the safety program does not behave as you wish during testing, you have the option of modifying the safety program in RUN mode (Page 302) and immediately continuing testing until the safety program behaves according to your requirements.

10.7.4 Testing the safety program with S7-PLCSIM (S7-300, S7-400, S7-1500)

You can test your safety program analog to your standard program on a simulated CPU with *S7-PLCSIM* and without the need for hardware.

You use *S7-PLCSIM* for SIMATIC Safety F-systems as you would for S7 standard systems. Note the following special features:

Safety mode/disabled safety mode

We recommend that you test your safety program in safety mode to detect whether the F-CPU goes into STOP as early as in the test phase of your safety program in *S7-PLCSIM* as a result of, for example that the results of instructions were outside the permitted range for the data type.

The following simulations can be run in *S7-PLCSIM*, just as on an actual F-CPU, in disabled safety mode only.

- Modifying tags in F-DBs and F-I/O DBs.
- (S7-1500) Modifying inputs (value status) for F-output I/O (see below)

The CPU can go to STOP mode in *S7-PLCSIM* if this is disregarded. The cause of the diagnostic event is entered in the diagnostic buffer of the CPU.

(S7-1500) To prevent unintentional modification of tags in F-DBs and F-I/O DBs in safety mode, we recommend that you do not select the "Activate/deactivate modification of non-inputs" button in *S7-PLCSIM*.

Monitoring the F-cycle time

The F-system monitors the F-cycle time of the F-runtime group in safety mode. Due to different cycle times of the CPU in *S7-PLCSIM* and the real F-CPU, monitoring of the F-cycle time can be triggered on the CPU in *S7-PLCSIM* and the CPU goes into STOP mode. A corresponding diagnostic event is entered in the diagnostic buffer of the CPU.

In this case you must increase the "Maximum cycle time of the F-runtime group" for all affected F-runtime groups in the SAE (for example, to the maximum time that can be set) during simulation in *S7-PLCSIM*.

Input simulation of F-I/O

Modification of inputs (channel values) in *S7-PLCSIM:*

You modify inputs (channel values) of F-I/O as you would inputs (channel values) of standard I/O in *S7-PLCSIM*.

Modification of inputs (value status) in *S7-PLCSIM:*

(S7-1500) By modifying inputs (value status) of F-I/O you can simulate the incoming and outgoing F-I/O/channel faults. Keep in mind the following notes/restrictions:

- To realistically simulate the behavior of the F-I/O, you must note the connection between channel value and value status on the real F-I/O. The combination value status = 0 and channel value <> fail-safe value (0) is invalid and can result in the simulation deviating from the behavior of the real F-CPU.
- During the transition from "STOP" to "RUN" of the CPU in *S7-PLCSIM*, all F-I/O inputs (value status) are initialized with 1. This means you can start with the modification of inputs (channel values) without simulation of the inputs (value status).
- The modification of inputs (value status) in *S7-PLCSIM* does not have an effect on the tags QBAD and PASS_OUT in the F-I/O DB. Note that with real F-I/O QBAD and PASS_OUT can be 1 as soon as the value status is 0 for at least once channel of the F-I/O. (see tags of the F-I/O DB: PASS_OUT/QBAD/QBAD_I_xx/QBAD_O_xx and value status (Page 135)).
- For F-I/O configured with "Behavior after channel fault" = "Passivation of the complete F-I/O", use the tag PASS_ON in the F-I/O DB for simulation of the passivation of the complete F-I/O for F-I/O / channel faults. If you only passivate individual inputs (channel value including value status) for the simulation, the behavior of the simulation will deviate from the real F-CPU.
- You can also use the PASS_ON tag in the F-I/O DB for F-I/O without value status to simulate the passivation of the entire F-I/O in case of F-I/O or channel faults.
- You must modify the inputs (channel values) to $7FFF_H$ (for overflow) or 8000_H (for underflow) to simulate an F-I/O/channel fault of the SM 336; AI 6 x 13Bit or the SM 336; F-AI 6 x 0/4...20 mA HART with configuration "Behavior after channel fault" = "Passivate channel".
- Inputs (value status) for F-output I/O may only be modified in disabled safety mode. The CPU can go to STOP mode in *S7-PLCSIM* if this is disregarded. The cause of the diagnostic event is entered in the diagnostic buffer of the CPU.
- For F-I/O which does not support the RIOforFA-Safety profile, you must run a user acknowledgment with a positive edge at the ACK_REI tag of the F-I/O DB as with a real F-I/O for reintegration after the value status has changed from 0 to 1 or when the channel value has changed from $7FFF_H$/8000_H to unequal $7FFF_H$/8000_H (see above) when ACK_NEC = 1 of the F-I/O DB. Reintegration takes place automatically in all other cases possibly deviating from the real F-I/O.

Update times

Keep in mind that the status of the inputs (channel values or value status (S7-1500)) which you are monitoring in the SIM table in *S7-PLCSIM* is only identical to the status being processed in the F-program if there is not passivation of the associated F-I/O.

With passivation of the F-I/O, the F-program operates with fail-safe values (channel value and value status (S7-1500) =0).

Instructions for communication between F-CPUs

You cannot simulate communication between F-CPUs with the SENDDP and RCVDP instructions in *S7-PLCSIM*. You can, however, use the SENDDP and RCVDP instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVDP instruction outputs the fail-safe values pending at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00. The SENDDP and RCVDP instructions signal this with 1 at output SUBS_ON.

(S7300/400) You cannot simulate communication between F-CPUs with the SENDS7 and RCVS7 instructions in *S7-PLCSIM*. You can, however, use the SENDS7 and RCVS7 instructions together with *S7-PLCSIM*.

During simulation in *S7-PLCSIM*, the RCVS7 instruction outputs the initial values specified in the communication DB as fail-safe values. The SENDS7 and RCVS7 instructions signal this with 1 at output SUBS_ON.

Inconsistent safety program (S7-1500)

If the CPU goes into STOP in *S7-PLCSIM* with the diagnostic entry "Safety program: inconsistent", the CPU is not initialized correctly in *S7-PLCSIM* yet. Perform a memory reset of the CPU in *S7-PLCSIM* and download the program once again to the CPU in *S7-PLCSIM*.

10.7.5 Changing the safety program in RUN mode (S7-300, S7-400)

Introduction

Changes to the safety program during operation (in RUN mode) can only be made in disabled safety mode (Page 293). You make changes to F-blocks offline in the *program editor* in the same way as for a standard program. F-blocks cannot be changed online.

Note

If you do **not** want to make changes to the safety program during operation, see Creating F-blocks in FBD/LAD (Page 118).

Procedure for changing the safety program in RUN mode

To change the safety program, follow these steps:

1. Change the main safety block or F-FB and its associated instance DB, F-FC, or F-DB in the *Program editor*.
2. Download the changed F-block(s) to the F-CPU (for procedure, see Downloading the Safety Program (Page 268)). The entire program is then automatically compiled.
3. If safety mode is active, the "Load preview" dialog will prompt you to deactivate it and to enter the password for the safety program.

Note

The following applies for S7-300/400 F-CPUs:

When downloading in disabled safety mode, you can only download the fail-safe blocks created by you (main safety blocks, F-FB, F-FC, or F-DB), F-application blocks, or standard blocks and their associated instance DBs. If you download automatically added F-blocks (F-SBs or automatically generated F-blocks and associated instance DBs, F-shared DB), the F-CPU can go to STOP mode or safety mode can be activated.

Therefore, always select individual blocks only when downloading in disabled safety mode.

Sequence for downloading changes

Changes in the safety program in RUN mode when safety mode is deactivated can cause e.g., the status of an actuator to change as a result of program changes.

After changes, start by downloading the safety program and then the function of the standard user program monitored by the safety program.

Restrictions on safety-related CPU-CPU communication

During operation (in RUN mode), you cannot establish new safety-related CPU-CPU communication by means of new SENDDP/RCVDP or SENDS7/RCVS7 instructions.

To establish new safety-related CPU-CPU communication you must always download the relevant safety program consistently to the F-CPU while in STOP mode after inserting a new SENDDP, SENDS7, RCVDP, or RCVS7 instruction.

Restrictions for F-runtime group communication (S7-300, S7-400)

You cannot make any changes to the safety-related communication between F-runtime groups in RUN mode. This means that you cannot assign, delete, or change any DBs for F-runtime group communication of an F-runtime group.

Following changes in the F-runtime group communication, you must always download the safety program consistently to the F-CPU while in STOP mode.

Restrictions for F-I/O access (S7-300, S7-400)

If during operation (in RUN mode), you insert an F-I/O access to an F-I/O of which no single channel value or tag from the associated F-I/O DB has yet been used in the safety program, the F-I/O access only becomes effective when the safety program is downloaded consistently to the F-CPU.

Changes in the standard user program (S7-300, S7-400)

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

⚠ WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would allow changes to the safety program. To rule out this possibility, you must configure **protection level "Write protection for fail-safe blocks"** and configure a password for the F-CPU. If only **one person** is authorized to change the standard user program **and** the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs). (See also Access protection (Page 76)) *(S001)*

Changes in the standard user program (S7-1200, S7-1500)

You can download changes in the standard user program when the F-CPU is in RUN mode, regardless of whether safety mode is enabled or disabled.

⚠ WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. You therefore need to configure at least the protection level "Full access (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)". *(S041)*

Procedure for applying changes to the safety program (S7-300, S7-400)

If you download individual F-blocks to the F-CPU during operation (in RUN mode), the F-system blocks (F-SBs) and the automatically generated F-blocks are neither updated nor downloaded, resulting in an inconsistent safety program in the F-CPU. Use the following procedure to apply changes to the safety program:

1. Download the safety program consistently to the F-CPU, and activate safety mode by switching the F-CPU from STOP to RUN mode (for procedure, see Downloading the Safety Program (Page 268)).
2. Follow the steps described in Acceptance of Changes (Page 319).

10.7.6 Deleting the safety program

Deleting individual F-blocks

To delete an F-block, follow the same procedure as in *STEP 7*.

Deleting an F-runtime group

See Deleting an F-runtime group (Page 116)

(S7-300, S7-400) Remove all calls that you have used to call the safety program (Main_Safety).

Deleting the entire safety program for F-CPUs *with* plugged memory card (SIMATIC Micro memory card)

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Compile the hardware configuration.

   The offline project no longer contains a safety program.
4. Format the SIMATIC memory card online in the F-CPU as usual in the standard program.
5. Select the menu command "Project> SIMATIC Card Reader> Show SIMATIC Card Reader" in the menu bar.
6. Open the "SIMATIC Card Reader" folder. You can now access the memory Card and can delete the safety program.

   You can then download the offline standard user program to the F-CPU.

Deleting the entire safety program for F-CPUs *with* plugged memory card (SIMATIC Micro memory card or flash card)

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Clear the cyclic interrupt OB 3x for each F-runtime group.
4. Compile the hardware configuration.

   The offline project no longer contains a safety program.
5. To delete a safety program on a Memory Card (SIMATIC Micro Memory Card or Flash Card), insert the Memory Card (SIMATIC Micro Memory Card or Flash Card) in the programming device or PC or in a SIMATIC USB prommer.
6. Select the menu command "Project> SIMATIC Card Reader> Show SIMATIC Card Reader" in the menu bar.
7. Open the "SIMATIC Card Reader" folder. You can now access the memory Card and can delete the safety program.

   You can then download the offline standard user program to the F-CPU.

Deleting the entire safety program for F-CPUs *without* plugged flash card

To delete an entire safety program, proceed as follows:

1. Delete all F-blocks (shown with yellow symbol) in the project tree.
2. Select the F-CPU in the *hardware and network editor* and clear the "F-capability activated" option in the properties of the F-CPU.
3. Compile the hardware configuration.

   The offline project no longer contains a safety program.

By performing a memory reset on the F-CPU (in the "Online tools" task card of the F-CPU), you can delete the safety program.

10.8 F-change history

Enable the logging of changes to the safety program by using the option "Enable F-change history" in the *Safety Administration Editor*. The F-change history behaves like the standard change history.

An F-change history is created for each F-CPU in the project navigation under "Common data/logs".

The following is logged in the F-change history:

- collective F-signature
- User name
- Compile time stamp
- Download of the safety program with time stamp
- Compiled F-blocks with signature and time stamp

The F-change history can contain a maximum of 5000 entries per F-CPU. When the 5000 entries are exceeded, a new F-change history is created using the name pattern "F-change history <CPU name> YYYY-MM-DD hh:mm:ss".

NOTICE
The connection between the F-CPU and the associated F-change history is made through the name of the F-change history. Therefore, do not rename the F-CPU and the F-change history. If you rename the F-CPU or the F-change history, a new F-change history with the changed name is started.

System Acceptance 11

11.1 Overview of System Acceptance

Introduction

When a system undergoes an acceptance, all standards relevant to the specific application must be met. This also applies to systems that are not "subject to acceptance". For the acceptance, you must consider the requirements in the Certification Report (http://support.automation.siemens.com/WW/view/en/49368678/134200).

As a general rule, the acceptance of an F-System is performed by an independent expert.

Observe all warnings in this manual.

WARNING

The F-CPU and F-I/O must be configured in the hardware and network editor of the TIA Portal as described in this documentation. F-blocks must be created with the program editor of the TIA Portal as described in this documentation. For system acceptance, you have to use the safety summary created according to this documentation. Any other procedures are not permitted. *(S056)*

Proof of correctness of components

In order for a system acceptance to be granted, you must recognize and document the correctness of the individual components. For documentation of the component properties, you must create a safety summary. First compile the safety program with "Compile > Software (rebuild all blocks)"

The following characteristics must be covered:

- Correctness of the safety program including hardware configuration (including testing) (Page 309)
- Completeness of the safety summary (Page 310)
- Compliance of the system library elements used in the safety program with the TÜV certificate (Page 311)
- Completeness and correctness of the hardware configuration (Page 312)
- Correctness of the communication configuration (Page 316)
- Consistency of the online safety program (Page 317)
- Other characteristics (Page 318) such as software version, use of data from the standard user program

After the acceptance, you should archive all relevant documents and also the project data so as to make the accepted project available as a reference for a subsequent acceptance.

Safety summary

The safety summary (Page 290) is the project documentation required for acceptance of the system.

11.2 Correctness of the safety program including hardware configuration (including testing)

Verification/function test

Already during the creation, you will test (Page 292) your safety program and the associated hardware configuration. You must carry out tests with regard to the specification of your safety functions and document them before you seek acceptance for the system.

To allow you to perform a code review of your safety program and document the accepted program code, the source code of all F-blocks is printed as a part of the safety summary (Page 290), provided you have selected the "All" property for the printout.

The correct function of the safety program must be guaranteed by complete function tests before it may be used productively. You should archive the test reports along with the safety summary and the acceptance documents.

Times, for example monitoring times (Page 661) and delay times, are extremely hard to verify with functional tests (Page 274). You should check these times selectively to determine whether they are dimensioned correctly, for example, on the basis of the safety summary.

Some of these times are itemized specially in the safety summary, for example, the F-monitoring time (for communication between F-CPU and F-I/O) and the monitoring time of the safety-related CPU-CPU communication (parameter TIMEOUT). For the approximate determination of these monitoring times, the Excel file for response time calculation is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100).

Consistency of the safety program

Check in the "General information" section of the safety summary to determine whether the safety program was recognized as "consistent".

This is the case for S7-300/400 F-CPUs if the following signatures are also identical:

- Collective F-signature ("General information" section, "Collective F-signature")
- "Signature of F-blocks with F-attribute" ("General information" section, "Current compilation")

Consistency of the safety program is required for the acceptance. If the signatures are not identical, you should recompile the safety program and regenerate the safety summary.

Password protection

Verify that a password was assigned for both the safety program and the F-CPU, if other organizational measures for access protection of the safety program were not taken.

For information about this, refer to section "General information" under "Access protection".

Additional notes

If necessary, review the "Notes" in section "General information", which provides additional notes on the safety program that must be observed or errors that must be eliminated.

11.3 Completeness of the safety summary

Introduction

If your safety program status including hardware configuration is ready for acceptance, you must carry out and document additional checks on the basis of the safety summary. The safety summary must be complete and belong to the safety program undergoing acceptance.

Procedure for creation of safety summary

To generate the safety summary, follow the procedure described in Printing project data (Page 290).

In so doing, use the "All" property in order to include the source code of your F-blocks in the printout.

Checking the safety summary for completeness

If you want to use an existing summary, whose completeness is not exactly known, you must check to determine whether the same collective F-signature is contained in the footer on all pages of the printout. This allows you to prove that all printed sheets belong to the same project.

In section "Supplementary information", you can find the number of pages in the safety summary, among other things. With this, you can prove that all pages of the safety summary are printed.

If you created the safety summary with the "All" option, the source code of all F-blocks will also be printed. The printout of this source code also contains the footer to enable you to easily assign the source code to a particular safety summary.

Association with the safety program

In the "General information" section of the safety summary, check whether the collective F-signature corresponds to the collective F-signature of the safety program to be accepted in the work area of the Safety Administration Editor under "*General*". If they are not the same, then the summary and safety program do not match.

11.4 Compliance of the system library elements used in the safety program with the TÜV certificate

Introduction

The *STEP 7 Safety* optional package contains LAD/FBD instructions and F-system blocks that have been created and tested by SIEMENS and certified by TÜV for use in programming your safety program.

To allow you to check whether the instructions and F-system blocks used correspond to the TÜV certificate and with the versions you have created, these instructions are listed in the safety summary under "System library elements used in the safety program" along with their versions, signatures and initial value signatures (S7-300, S7-400) or versions (S7-1200, S7-1500).

Procedure

To check, download the current Annex 1 of the report for the TÜV certificate "SIMATIC Safety" from the Internet (http://support.automation.siemens.com/WW/view/en/49368678/134200).

⚠ WARNING

- The versions of the system library elements listed in the safety summary must match the versions in Annex 1.
- The versions of the system library elements listed in the safety summary must match the safety requirements of your application.

  Keep in mind possible differences in functionality of different versions, see chapters "Settings" area (Page 71) and Instructions - LAD (Page 329) or Instructions - FBD (Page 494).
- (S7-300, S7-400) The signatures and initial value signatures of the system library elements listed in the safety summary must match the signatures and initial value signatures in Annex 1. *(S054)*

In case of discrepancies, recheck whether you have the correct versions.

11.5 Completeness and correctness of the hardware configuration

Introduction

The hardware configuration is an essential component of the project to be accepted. With the configuration of the hardware, you have set properties that can influence the safety of signals. You must document these settings in detail with the safety summary to prove that you fulfill the safety requirements for your application.

The section "Hardware configuration of F-I/O" is available in the safety summary for this. This section consists of several tables:

- A table with information about the F-CPU and the ranges of the F-destination addresses used and the "Basis for PROFIsafe addresses" parameter of the F-CPU.
- An overview table with the F-I/O used.
- A table for each F-I/O with detailed specifications, for example, the configured parameter values.

Note

Note that you will find F-I/O that you address via safety-related I-slave-slave communication in the safety summary of the I-slave and not in the safety summary of the assigned DP master.

Procedure for checking that the hardware configuration is complete

Check whether the safety summary contains the complete configured F-I/O.

Procedure for checking the correctness of the hardware configuration

To check the hardware configuration for correctness, proceed as follows:

1. Check in the "F-hardware configuration" section to verify the uniqueness of the PROFIsafe addresses.

   Check in the section "F-hardware configuration", if the "Basis for PROFIsafe addresses" parameter of the individual F-CPUs differs.

   Please see PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 52) and PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 54).

   Please note the following for F-I/Os of PROFIsafe address type 1:

   ⚠ WARNING

   F-I/Os of PROFIsafe address type 1 are uniquely addressed by their F-destination address (e.g. with the switch setting on the address switch).

   The following rules ensure the uniqueness of the F-destination addresses.

   The F-destination address (and therefore also the switch setting on the address switch) of the F-I/O must be unique network-wide* and CPU-wide** (system-wide) **for the entire** F-I/O. The F-I/O of PROFIsafe address type 2 must also be considered. *(S051)*

   * A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

   ** "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

   Please note the following for F-I/Os of PROFIsafe address type 2:

   ⚠ WARNING

   F-I/O of PROFIsafe address type 2 is uniquely addressed using a combination of F-source address ("Basis for PROFIsafe addresses of the assigned F-CPU" parameter) and F-destination address.

   The combination of F-source address and F-destination address for each F-I/O must be unique network-wide* and CPU-wide** (system-wide). In addition, the F-destination address may not be occupied by F-I/O of PROFIsafe address type 1.

   To ensure that addresses are unique across F-CPUs for supported configurations (Page 50), you need to ensure that the "Basis for PROFIsafe addresses" parameter of all F-CPUs is unique network-wide*. This is achieved through different settings for the "Basis for PROFIsafe addresses" parameter of the F-CPUs. *(S052)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

** "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

WARNING

Check the documentation for your fail-safe GSD based DP slaves / GSD based I/O devices to find out the valid PROFIsafe address type. If you do not find the necessary information, assume PROFIsafe address type 1. Proceed as described under PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 52) or Configurations supported by the SIMATIC Safety F-system (Page 50).

Set the PROFIsafe source address for fail-safe GSD based DP slaves / fail-safe GSD based I/O devices according to the manufacturer's specifications. If the PROFIsafe source address needs to correspond to the "Basis for PROFIsafe addresses" parameter of the F-CPU (PROFIsafe address type 2), you will find the latter in the "Properties" tab of the F-CPU. In this case, also check in the safety summary that the value of the F-CPU for the "Basis of PROFIsafe addresses" parameter matches the value of the PROFIsafe source address of the fail-safe GSD based DP slave/fail-safe GSD based I/O device. *(S053)*

2. Check the safety-related parameters (including F-monitoring time or F_WD_Time) of all configured F-I/O.

   You can find these parameters in the "Hardware configuration of F-I/O" section in the detailed tables for the F-I/O.

   The table consists of two parts:

   – Left part is for parameters that relate to the F-I/O themselves and their access function in the safety program ("Module data")
   – Right part is for the parameters of the individual channels ("Channel parameters")

   These parameters must be set as prescribed by the safety requirements of your application.

   When using fail-safe GSD based DP slaves/GSD based I/O devices, note the relevant documents for the possible additional safety-related (technical) parameters.

Note

F-I/O that are to be assigned the same safety-related parameters (except for PROFIsafe addresses) can be copied during configuration. Except for the PROFIsafe addresses, you no longer have to check the safety-related parameters individually. It is sufficient to compare the "Signature of F-parameters (without addresses)" in the "Hardware configuration of the F-I/O" section in the overview table. This also applies to fail-safe GSD based DP slaves/GSD based I/O devices without i-parameters. For GSD based DP slaves / GSD based I/O devices with i-parameters, it may be that "F-parameter signature (w/o addresses)" does not match, even though all safety-related parameters, except for the PROFIsafe addresses, do match. In this case, you need to compare all safety-related parameters.

3. Check whether the MLFBs of the F-I/O in the safety summary correspond to the MLFBs of the actual F-I/O in the system. If the MLFBs do not correspond, the F-I/O in the system must be spare-part compatible with the F-I/O listed in the safety summary.
4. For non-supported configuration, please see Configurations supported by the SIMATIC Safety F-system (Page 50).

WARNING

Please note the following with configurations that are not included in supported configurations:

- Make sure that the F-I/O appears in the safety summary and that an F-I/O DB has been created for it. Otherwise you cannot use the F-I/O in this configuration. (Contact Customer Support.)
- For F-I/Os in the PROFINET IO environment**, you must check the PROFIsafe operating mode parameter (F_Par_Version) against the safety summary to make sure that it is correct. V2 mode must be set in the PROFINET IO environment. F-I/O which only support V1 mode may not be used in the PROFINET IO environment.
- You must ensure that PROFIsafe address assignment is unique CPU-wide* and network-wide***:
  - Use the safety summary to check that the F-source address corresponds to the "Basis for PROFIsafe addresses" parameter of the F-CPU for F-I/O of PROFIsafe address type 2.
  - For F-I/O of PROFIsafe address type 1 or if you cannot set the F-source address in accordance with the F-CPU, you will have to ensure the uniqueness of the PROFIsafe address solely by assigning a unique F-destination address.

  You must check the uniqueness of the F-destination address individually for each F-I/O based on the safety summary in a configuration that is not supported. *(S050)*

* "CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

** The F-I/O is located in the "PROFINET IO environment" if at least part of safety-related communication with the F-CPU takes place via PROFINET IO. If the F-I/O is connected via I-slave-slave communication, also keep in mind the communication line to the DP master/IO controller.

*** A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

11.6 Correctness of the communication configuration

Introduction

Safety-related communication is based on the mechanisms of the standard communication of *STEP 7*. To detect errors in standard communication, there must be additional protection for safety-related communication connections between F-CPUs. For the acceptance, you must document the restrictions (uniqueness) resulting from the protection.

For this purpose, the "Parameters for safety-related CPU-CPU-communication" section is available in the safety summary. In this section, there are up to two tables (for communication via PROFIBUS DP or PROFINET IO and for communication via S7 connections).

Procedure for testing for correctness of the communication configuration

To check the communication configuration for correctness, proceed as follows:

- In the "Safety-related CPU-CPU communication via PROFIBUS DP or PROFINET IO" table, check to determine whether you have assigned a unique DP_DP_ID parameter throughout the network for all safety-related communication connections (e.g., master-master, master-I-slave and IO controller-IO controller communication).

  This means that sender and receiver of the relevant communication connection must have the same values for DP_DP_ID. All other communication connections in the entire network must not have these values.

- In the "Safety-related CPU-CPU communication via S7 connections" table, check to determine whether you have assigned a unique R_ID parameter throughout the network for all safety-related communication via S7 connections.

11.7 Consistency of the online safety program

Once you have checked all properties of the offline safety program you must ensure that the safety program is identical on the F-CPU on which it is supposed to be run.

The signatures must match the checked signature from the safety summary online and offline. To do so, open the *Safety Administration Editor* and go to online view.

In the "General" area, check the information for

- Program signature online
- Program signature offline
- Information on whether safety programs are consistent online and offline.
- Version check view

Use the output information to check which situation you are dealing with and, if necessary, execute the recommended measure:

collective F-signatures online/offline	Consistency online to offline	Statement	Measure
	(n/a)	The safety programs are different.	Acceptance of the online safety program required
		The safety programs are identical but different versions of F-blocks are used.	The safety program must be downloaded to the F-CPU for the latest versions to become effective.
		The safety programs are identical.	None

Keep in mind that only a change comparison will provide reliable information as to whether the safety programs are identical. The display of signatures is used for quick identification of changes.

11.8 Other characteristics

Introduction

In addition, you must check a few more characteristics that are also relevant for the acceptance of the project.

Validity check for data transfer from the standard program to the safety program

Check to determine whether a validity check was programmed for all data transferred from the standard user program to the safety program. For this purpose, the "Data from the standard user program" section lists all signals that you are using in the safety program.

Checking the program version

Check whether the version of *STEP 7 Safety* used to create the summary (in the footer of the printout) is as least as high as the version used to compile the safety program. The latter version can be found in the "General information" section of the safety summary under "Used Versions". Both versions must be listed in Annex 1 of the TÜV certificate.

Ability to disable safety mode

Make sure that safety mode cannot be disabled. For information about this, refer to section "General information" under "Safety program settings". This setting ensures that the safety mode of the safety program cannot be disabled inadvertently.

Access protection

Check in the "General information" section under "Protection" to determine whether the setting for access protection is permitted. Note the following warning.

Otherwise, the project must not be accepted, because the safety program in the F-CPU is not protected against unauthorized accesses.

⚠ WARNING

(S7-300, S7-400) In safety mode, access with the CPU password must not be authorized during changes to the standard user program as this would allow changes to the safety program. To rule out this possibility, you must configure **protection level "Write protection for fail-safe blocks"** and configure a password for the F-CPU. If only **one person** is authorized to change the standard user program **and** the safety program, the protection level "Write protection" or "Read/write protection" should be configured so that other persons have only limited access or no access at all to the entire user program (standard and safety programs). (See also Access protection (Page 76).) *(S001)*

WARNING

(S7-1200, S7-1500) In safety mode, the safety program must be password-protected. You therefore need to configure at least the protection level "Full access (no protection)". This protection level only allows full access to the standard user program, not to F-blocks.

If you select a higher protection level, for example to protect the standard user program, you must assign an additional password for "Full access (no protection)". *(S041)*

See also

Data Transfer from Standard User Program to Safety Program (Page 161)

11.9 Acceptance of Changes

Introduction

In general, you can adopt the same approach for the acceptance of changes as the initial acceptance (see Overview of System Acceptance (Page 308)).

To avoid the acceptance of the entire system in case of negligible changes, *STEP 7 Safety* helps you to identify those parts of your safety program that have changed.

For an acceptance of changes, it is sufficient to check the following:

- Checking the changed or newly added F-blocks.
- Checking the changed or newly added instructions and F-system blocks.
- Checking the safety-related parameters of the changed or newly added F-I/O.

You then perform a function test of the changed or newly added F-blocks/F-I/O.

Note

Acceptance of changes is not possible after CPU migration.

Detection of changes in the safety program

To detect changes in the safety program, proceed as follows:

1. Perform an offline-offline comparison between the changed safety program and the accepted safety program (see Comparing Safety Programs (Page 286)). Use filter setting "Compare only F-blocks relevant for certification". This limits the output of the comparison to exactly those F-blocks that must be considered for the acceptance of changes.

   The status of the comparison enables you to identify which F-blocks were changed.

Detection of safety-related changes in the configuration of the F-I/O

There are two possible ways of detecting safety-related changes in the configured F-I/O:

- Comparison in the comparison editor
- Comparison based on two safety summaries

Comparison in the comparison editor

If you have saved the accepted project, you can also perform an offline-offline comparison of the changed project and the accepted project to detect changes in the configuration of the F-I/O (see Comparing Safety Programs (Page 286)).

1. Navigate in the comparison result to the "System blocks > STEP 7 Safety > F-I/O DBs" folder. All data blocks listed in this folder are F-I/O-DBs and are each assigned to an F-I/O.
2. The names of the F-I/O DBs (Page 138) are automatically assigned. They specify to which F-I/O they refer. If you have changed the names of the F-I/O DBs, you can find their numbers in the module data of the safety summary.

   If the F-I/O-DBs in the comparison result are identical, this means that the safety-related configuration (standard parameters may have changed) of the assigned F-I/O was not changed (assuming that your current safety program is consistent and compiled). In this way, you can quickly identify which F-I/O have changed.
3. If you have found changed F-I/O, you can check the changed parameters in the safety summary as described above. In so doing, always check the DB number to ensure that the DB name did not lead you to the wrong F-I/O.

Comparison based on two safety summaries

In the overview table of the utilized F-I/O in the "Hardware configuration of F-I/O" section of the safety summary, compare the parameter CRCs of all GSD based F-I/O/DP slaves/GSD based I/O devices with those in the safety summary of the accepted project.

If the "Parameter signature (without addresses)" is different for an F-I/O, this indicates the existence of a safety-related change in the configuration of this F-I/O, e.g. including PROFIsafe addresses.

If this information is identical, only the PROFIsafe addresses were changed. In this case, you do not have to check the other safety-related parameters of the F-I/O individually.

Make sure that the uniqueness of the PROFIsafe addresses of all configured F-I/O will continue to be ensured. This means:

- The F-destination addresses with F-I/O of PROFIsafe address type 1.
- The F-destination addresses and the F-source address with F-I/O of PROFIsafe address type 2.

See also
PROFIsafe addresses for F-I/O of PROFIsafe address type 1 (Page 52)

PROFIsafe addresses for F-I/O of PROFIsafe address type 2 (Page 54)

Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 61)

Detecting changes of the start addresses of F-I/O

You can detect changes in the start addresses of F-I/O in the output of the program comparison, as well. Note that the names of the F-I/O DBs contain the address in this case, provided you have not changed the names manually. In order to detect changes, it is necessary to distinguish between the following two cases:

- You have not changed the name of the F-I/O DB; the name represents the same F-I/O in both program versions.

  If you change the start address of an F-I/O, this also changes the name of the F-I/O DB. If you then compare the program with its previous version, the newly named F-I/O does not exist in the old program version and the formerly named F-I/O does not exist in the new program version. The comparison log contains two lines in which the names are different. Both I-DBs represent the module whose start address has changed. Carry out a comparison for this module using the module signatures and check the fail-safe parameters, if applicable.

- You have changed the name of the F-I/O DB.

  In this case, the F-I/O DB appears in the comparison output as a changed F-I/O, just the same as if other module parameters have changed.

Operation and Maintenance 12

12.1 Notes on Safety Mode of the Safety Program

Introduction

Pay attention to the following important notes on safety mode of the safety program.

Use of simulation devices/simulation programs

⚠ WARNING

Use of simulation devices/simulation programs

If you operate simulation devices or simulation programs that generate safety message frames, e.g., based on PROFIsafe, and make them available to the SIMATIC Safety F-system via the bus system (such as PROFIBUS DP or PROFINET IO), you must ensure the safety of the F-system using organizational measures, such as operational monitoring and manual safety shutdown.

If you use the S7-PLCSIM (Page 292) to simulate safety programs, these measures are not necessary because S7-PLCSIM cannot establish an online connection to a real component.

Note, for example, that a protocol analyzer is not permitted to perform any function that reproduces recorded message frame sequences with correct time behavior. *(S030)*

STOP via programming device or PC, mode selector, or communication function

⚠ WARNING

STOP via programming device/PC, mode selector, or communication function

Switching from STOP to RUN mode using a programming device/PC interface, mode selector, or communication function is not locked. For example, only one keystroke is necessary to switch from STOP to RUN mode on a programming device or PC interface. For this reason, a STOP that you have set by means of a programming device or PC, mode selector, or communication function must not be regarded as a safety condition.

You must therefore program startup protection (see Programming startup protection (Page 121)). *(S031)*

Switch F-CPU to STOP mode with the "STP" Instruction

WARNING

Switching F-CPU to STOP mode with the "STP" Instruction

A STOP state initiated by the "STP" instruction can be canceled very easily (and unintentionally) from the programming device or PC. For this reason, a STOP initiated by the STP instruction is not a safety-related STOP.

You must therefore program startup protection (see Programming startup protection (Page 121)). *(S032)*

CRC error in safety-related communication

Note

CRC error in safety-related communication

If you observe that an F-CPU requests manual acknowledgement of a CRC error more than once within the space of 100 hours, and this occurs repeatedly, check whether the PROFINET or PROFIBUS installation guidelines have been followed.

There is a CRC error if:

- The ACK_REQ tag of the F-I/O DB is set and the DIAG tag of the F-I/O DB (bit 2 or bit 6) indicates CRC errors
  or
- A CRC error is entered in the diagnostic buffer of the F-CPU

In this case, the failure probability values (PFD/PFH) for safety-related communication no longer apply.

Information on installation guidelines for PROFINET and PROFIBUS can be found in:

- PROFIBUS Installation Guidelines (www.profibus.com/PBInstallationGuide)
- PROFIBUS Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profibus-interconnection-technology/display/)
- PROFINET Installation Guide (www.profibus.com/PNInstallationGuide)
- PROFINET Cabling and Interconnection Technology (http://www.profibus.com/nc/downloads/downloads/profinet-cabling-and-interconnection-technology/display/)
- PROFIsafe Environment Requirements (www.profibus.com/PROFIsafeRequirements)

If your review indicates that the configuration guidelines for PROFIBUS and PROFINET have been met, contact Technical Support.

12.2 Replacing Software and Hardware Components

Replacement of software components

When replacing software components on your programming device or PC (e.g. with a new version of *STEP 7)*, you must adhere to the information regarding upward and downward compatibility in the documentation and readme files for these products.

Replacement of hardware components

Hardware components for SIMATIC Safety (F-CPU, F-I/O, batteries, etc.) are replaced in the same way as in standard automation systems.

Removing and inserting F-I/O during operation

It is possible to remove and insert F-I/O during operation, as with standard F-I/O. However, be aware that replacing an F-I/O module during operation can cause a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 132) or, alternatively, by using the "ACK_GL (Page 407)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

CPU firmware update

Check of the CPU operating system for F-approval: When using a new CPU operating system (firmware update), you must check to see if the CPU operating system you are using is approved for use in an F-system.

The minimum CPU operating system versions with guaranteed F-capability are specified in the appendix of the Certificate. This information and any notes on the new CPU operating system must be taken into account.

Firmware update for interface module

When using a new operating system for an interface module, e.g. IM 151-1 HIGH FEATURE ET 200S (firmware update), you must observe the following:

If you have selected the "Activate firmware after update" option for the firmware update (see *Help on STEP 7*, "Online & Diagnostics"), the IM will be automatically reset following a successful download operation and will then run on the new operating system. Note that the firmware update for interface modules during operation generates a communication error in the F-CPU.

You must acknowledge the communication error in your safety program in the ACK_REI tag of the F-I/O DB (Page 132) or, alternatively, by using the "ACK_GL (Page 407)" instruction. Without an acknowledgment, the F-I/O will remain passivated.

Preventive maintenance (proof test)

The probability values for the certified F-system components guarantee a proof-test interval of 20 years for ordinary configurations.

Proof test for complex electronic components generally means replacement with new, unused components.

PFD and PFH values for S7-300/400 F-CPUs and F-I/O

You will find a list of the failure probability values (PFD and PFH values) for components that can be used in SIMATIC Safety on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133300).

PFD and PFH values for S7-1200/1500 F-CPUs

Below are the probability of failure values (PFD_{avg}, PFH values) for S7-1200 F-CPUs with a service life of 20 years and an MTTR of 100 hours:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< < 2E-05	< 1E-09

PFD, PFH values for safety-related communication

Below you will find the failure probability values (PFD_{avg}, PFH values) for safety-related communication:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFD_{avg} = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h^{-1}]**
< 1E-05*	< 1E-09*

*** Note on S7-300/400 F-CPUs:**

The PFH value is valid under the assumption that a maximum of 100 F-I/Os are involved in a safety function. If you use more than 100 F-I/Os, you have to also add 4E-12 per F-I/O for the safety function.
The PFD_{avg} value is valid for a service life of 20 years and under the assumption, that a maximum of 25 F-I/Os are involved in a safety function. If more than 25 F-I/OS are used, you need to add 3.5E-7 per F-I/O for this safety function.

12.3 Guide to diagnostics (S7-300, S7-400)

Introduction

Here you find a compilation of diagnostic capabilities that can be evaluated for your system when an error occurs. Most of the diagnostic capabilities are the same as those in standard automation systems. The sequence of steps represents a recommendation.

Steps for evaluating diagnostic capabilities

The following table shows the steps you take to evaluate diagnostic capabilities.

Step	Procedure	Reference
1	**Evaluate LEDs on the hardware (F-CPU, F-I/O):** • BUSF LED on the F-CPU: Flashes when a communication error occurs on PROFIBUS DP/PROFINET IO; On if a programming error occurs when OB85 and OB121 are programmed (e.g. instance DB is not loaded) • STOP LED on the F-CPU: illuminates when the F-CPU is in STOP mode • Fault LEDs on the F-I/O: e.g. SF-LED (group error LED) on if any fault occurs in the individual F-I/O	*Manuals for F-CPU and F-I/O*
2	**Evaluate diagnostic buffer of the modules:** You read the diagnostic buffer of a module (F-CPU, F-I/O, CP) in its online and diagnostic view in the "Diagnostic buffer" group under the "Online & Diagnostics folder.	*Help on STEP 7 and manuals for the F-CPU and F-I/O*
3	**Evaluate stacks of the F-CPU:** when the F-CPU is in STOP mode, read the following successively: • Block stack: Check whether STOP mode of the F-CPU was triggered by an F-block of the safety program • Interruption stack • Local data stack	*Help on STEP 7*
4	**Evaluate diagnostic tag of the F-I/O DB using testing and commissioning functions, by means of an operator control and monitoring system, or in the standard user program:** Evaluate the DIAG tag in the F-I/O DB	F-I/O access (Page 122)

Step	Procedure	Reference
5	**Evaluate diagnostic outputs of the instance DBs of instructions using testing and commissioning functions, using an operator control and monitoring system, or in the standard user program:** • For MUTING, EV1oo2DI, TWO_H_EN, MUT_P, ESTOP1, FDBBACK, SFDOOR, evaluate in the assigned instance: – Output DIAG • Evaluate the following for SENDDP or RCVDP in the assigned instance DB: – Output RET_DPRD/RET_DPWR – Output DIAG • Evaluate the following for SENDS7 or RCVS7 in the assigned instance DB: – Output STAT_RCV – Output STAT_SND – Output DIAG	Instructions (Page 494)

Tip on RET_DPRD/RET_DPWR

The diagnostic information of the RET_DPRD/RET_DPWR parameters correspond to the diagnostic information of the RETVAL parameter of the "DPRD_DAT" and "DPWR_DAT" instructions. You can find the description in the help on *STEP 7* for the "DPRD_DAT" and "DPWR_DAT" instructions.

Tip: STAT_RCV and STAT_SND

The diagnostic information of the parameter STAT_RCV corresponds to the diagnostic information of the parameter STATUS of the instruction "URCV". The diagnostic information of the parameter STAT_SND corresponds to the diagnostic information of the parameter STATUS of the instruction "USEND". You can find the description in the help on *STEP 7* for the instruction "UCRV" or "USEND" .

12.4 Guide to diagnostics (S7-1500)

Detailed information on diagnostics for an S7-1500 F-CPU can be found in the Diagnostics (http://support.automation.siemens.com/WW/view/en/59192926) function manual.

12.5 Guide to diagnostics (S7-1200)

Detailed information on diagnostics for an S7-1200 F-CPU can be found in the S7-1200 User Manual Fail-Safety (http://support.automation.siemens.com/WW/view/en/34612486/133300).

STEP 7 Safety V13 SP 1 instructions 13

13.1 Overview of instructions

Overview of instructions for the safety program

When programming an F-block, you can find all instructions available for programming an F-block in LAD or FBD with the configured F-CPU in the "Instructions" task card.

In addition to the instructions that are familiar to you from programming a standard block, there are also special safety functions, e.g., for two-hand monitoring, discrepancy analysis, muting, emergency STOP, safety door monitoring, and feedback monitoring.

All instructions for LAD and FBD are explained in the following.

Note the following

Note

Preconnection of enable input EN or evaluation of enable output ENO is not possible.

13.2 Instructions - LAD

13.2.1 General

13.2.1.1 New network (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an LAD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.2.1.2 Empty box (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Requirement

A network is available.

Procedure

To insert an LAD instruction into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the required instruction from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.2.1.3 Open branch (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Use branches to program parallel connections with the Ladder Logic (LAD) programming language. Branches are inserted into the main current path. You can insert several contacts into the branch, thereby creating a parallel connection from series connections. You can program complex ladder diagrams in this way.

Requirement

- A network is available.
- The network contains elements.

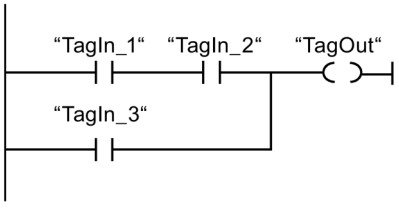
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Open branch".
3. Use a drag-and-drop operation to move the element to the desired place in the network.
4. If you want to connect the new branch directly to the power rail, drag the element to the power rail.

Example

The following figure provides an example of how to use branches:



13.2.1.4 Close branch (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Branches must be closed again at suitable places. When a branch is closed, any necessary empty elements are added. If necessary, branches will be arranged so that they do not cross each other.

Requirement

A branch is available.

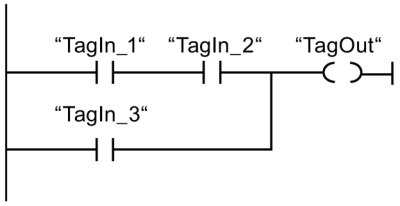
Procedure

To close an open branch, follow these steps:

1. Select the open branch.
2. Press and hold down the left mouse button.
3. A dashed line will appear as soon as the cursor is moved.
4. Drag the dashed line to a suitable place on the network. Permissible connections are indicated by green lines.
5. Release the left mouse button.

Example

The figure below provides an example of how to use branches:



13.2.2 Bit logic operations

13.2.2.1 ---| |---: Normally open contact (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

The activation of the normally open contact depends on the signal state of the associated operand. If the operand has signal state "1," the normally open contact is closed. Power flows from the left power rail through the normally open contact into the right power rail and the signal state at the output of the instruction is set to "1".

If the operand has signal state "0," the normally open contact is not activated. The power flow to the right power rail is interrupted and the signal state at the output of the instruction is reset to "0".

Two or more normally open contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally open contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

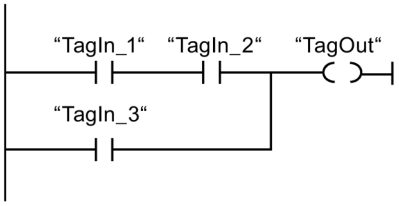
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "1".

13.2.2.2 ---| / |---: Normally closed contact (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

The activation of the normally closed contact depends on the signal state of the associated operand. If the operand has signal state "1", the normally closed contact is opened and the signal state at the output of the instruction is reset to "0".

If the operand has signal state "0", the normally closed contact is not activated and the signal state at the output of the instruction is set to "1".

Two or more normally closed contacts are linked bit-by-bit by AND when connected in series. With a series connection, power flows when all contacts are closed.

The normally closed contacts are linked by OR when connected in parallel. With a parallel connection, power flows when one of the contacts is closed.

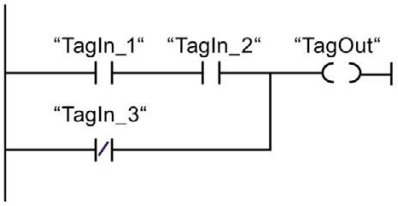
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	Operand whose signal state is queried.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

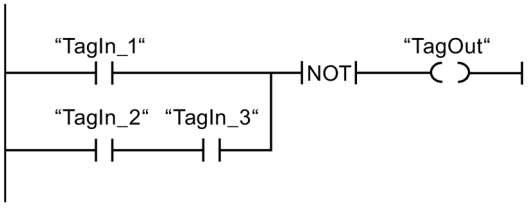
13.2.2.3 --|NOT|--: Invert RLO (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Invert RLO" instruction to invert the signal state of the result of logic operation (RLO). When the signal state is "1" at the input of the instruction, the output of the instruction has the signal state "0". When the signal state is "0" at the input of the instruction, the output has the signal state "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operands "TagIn_2" and "TagIn_3" have signal state "1".

13.2.2.4 ---( )---: Assignment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. When the result of logic operation (RLO) at the input of the coil is "1," the specified operand is set to signal state "1". When the signal state is "0" at the input of the coil, the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the input of the coil is sent immediately to the output.

The "Assignment" instruction can be placed at any position in the network.

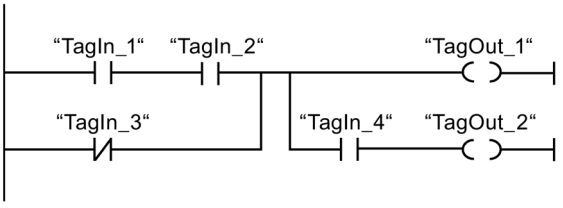
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut_1" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at operand "TagIn_3" is "0".

Operand "TagOut_2" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" as well as operand "TagIn_4" have signal state "1".
- The signal state of operand "TagIn_3" is "0" and the signal state of operand "TagIn_4" is "1".

13.2.2.5 ---(R)---: Reset output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If power flows to the coil (RLO is "1"), the specified operand is set to "0". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

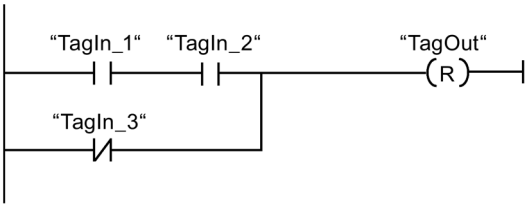
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.6 ---(S)---: Set output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If power flows to the coil (RLO is "1"), the specified operand is set to "1". If the result of logic operation at the input of the coil is "0" (no signal flow to the coil), the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the input of the coil is sent directly to the output of the coil.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

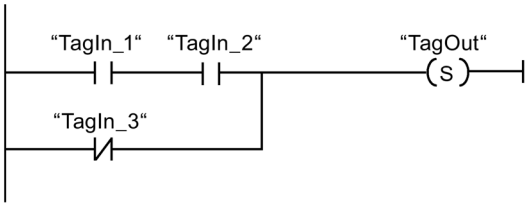
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set when RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.2.2.7 SR: Set/reset flip-flop (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

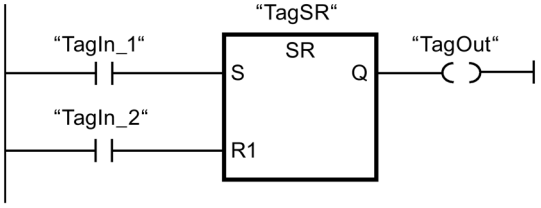
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable setting
R1	Input	BOOL	Enable resetting
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.8 RS: Reset/set flip-flop (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

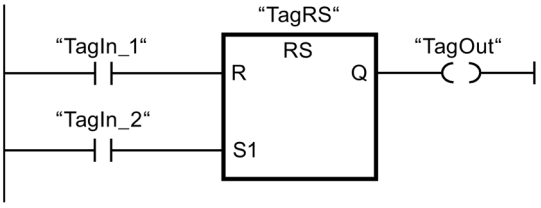
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable resetting
S1	Input	BOOL	Enable setting
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.2.2.9 --|P|--: Scan operand for positive signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

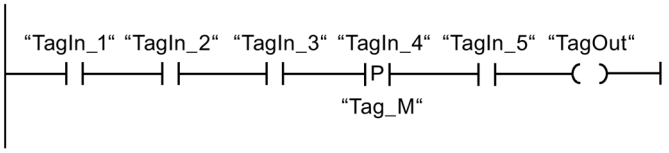
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1", "TagIn_2", and "TagIn_3" have signal state "1".
- There is a rising edge at input "TagIn_4". The signal state of the previous query is saved at edge memory bit "Tag_M".
- The signal state of operand "TagIn_5" is "1".

13.2.2.10 --|N|--: Scan operand for negative signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

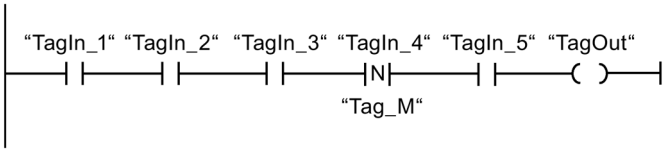
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Operand "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1", "TagIn_2", and "TagIn_3" have signal state "1".
- There is a falling edge at operand "TagIn_4". The signal state of the previous query is saved at edge memory bit "Tag_M".
- The signal state of operand "TagIn_5" is "1".

13.2.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation (RLO) with the signal state of the previous query, which is saved in the edge bit memory (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

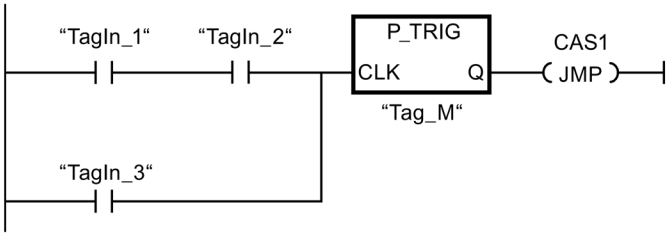
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit "Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.2.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

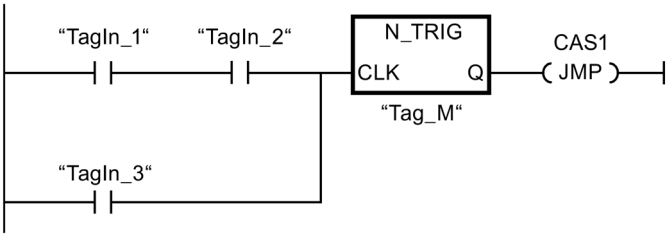
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory "Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.2.3 Safety functions

13.2.3.1 ESTOP1: Emergency STOP up to stop category 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements an emergency STOP shutdown with acknowledgment for Stop Categories 0 and 1.

Enable signal Q is reset to 0, as soon as input E_STOP takes a signal state of 0 (Stop category 0). Enable signal Q_DELAY is reset to 0 after the time delay set at input TIME_DEL (Stop Category 1).

Enable signal Q is reset to 1 not before input E_STOP takes a signal state of 1 and an acknowledgment occurs. The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets output ACK_REQ to 1, as soon as input E_STOP = 1.

Following an acknowledgment, the instruction resets ACK_REQ to 0.

Every call of the "Emergency STOP up to Stop Category 1" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ESTOP1_DB_1) or a multi-instance (e.g., ESTOP1_Instance_1) for the "Emergency STOP up to Stop Category 1" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note: Only one emergency STOP signal (E_STOP) can be evaluated for the instruction. Discrepancy monitoring of the two NC contacts (when two channels are involved) in accordance with Categories 3 and 4 as defined in ISO 13849-1:2006 / EN ISO 13849-1:2008 is performed with suitable configuration (type of sensor interconnection: 2-channel equivalent) directly through the F-I/O with inputs. In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
E_STOP	Input	BOOL	Emergency STOP
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	1=Acknowledgment
TIME_DEL	Input	TIME	Time delay
Q	Output	BOOL	1=Enable
Q_DELAY	Output	BOOL	Enable is OFF delayed
ACK_REQ	Output	BOOL	1=Acknowledgment necessary
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	-—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	x	
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After an F-system startup, when ACK_NEC = 1, you must acknowledge the instruction using a rising edge at input ACK.

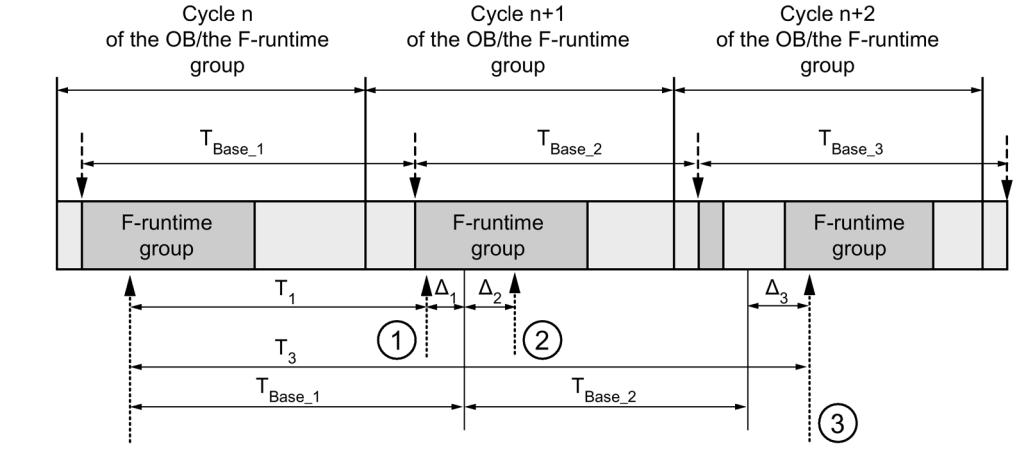
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 1 to 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect TIM_DEL setting	Time delay setting < 0	Set time delay > 0
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Acknowledgment not possible because emergency STOP is still active	Emergency STOP switch is locked	Release interlocking of emergency STOP switch
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of emergency STOP switch	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Emergency STOP switch is defective	Check emergency STOP switch
		Wiring fault	Check wiring of emergency STOP switch
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowl-edgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

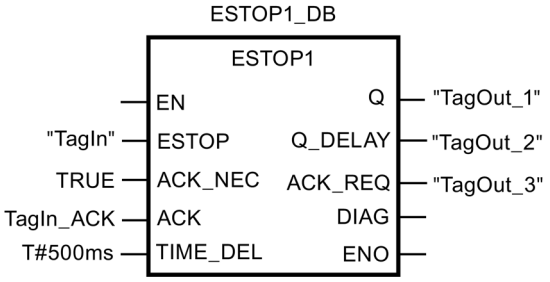
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

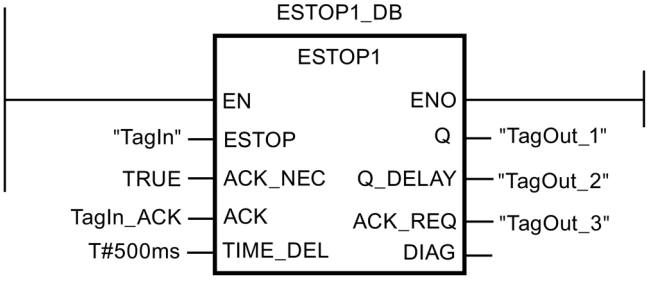
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.2.3.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction implements two-hand monitoring.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Two-hand monitoring with enable". The application "Two-hand monitoring with enable" replaces the instruction "Two-hand monitoring" with compatible functions.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN2 = 0). Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time. Enable signal Q can never be set to 1 if the discrepancy time is set to values less than 0 or greater than 500 ms.

Every call of the "Two-hand monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_HAND_DB_1) or a multi-instance (e.g., TWO_HAND_Instance_1) for the "Two-hand monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (type of sensor interconnection: 2-channel non equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration. If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 is set in the relevant F-I/O DB. (See also F-I/O access (Page 122))

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

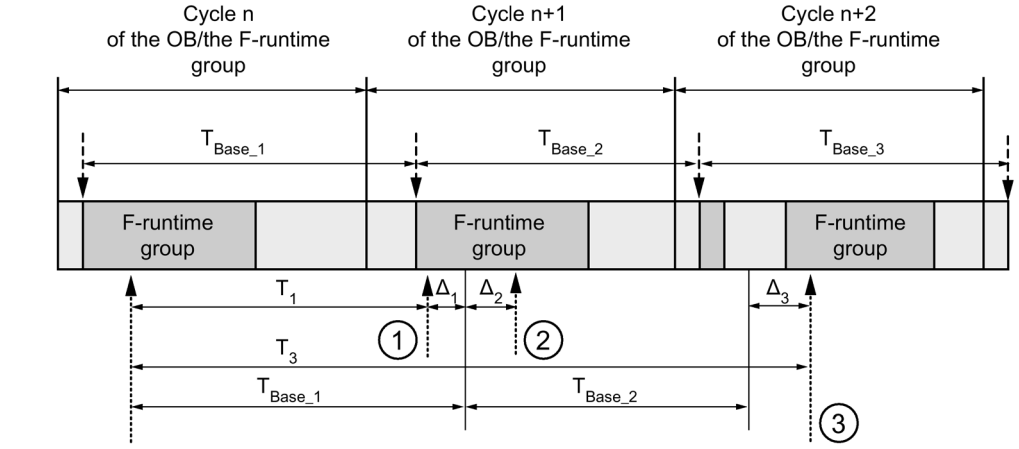
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

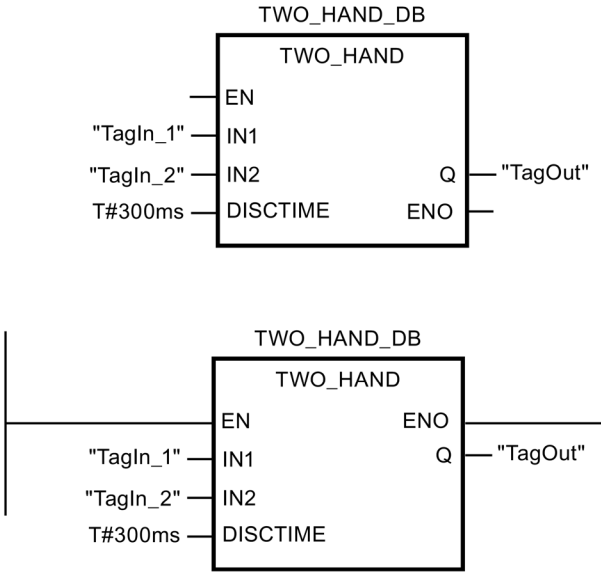
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.2.3.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements two-hand monitoring with enable.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1 when existing ENABLE = 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN 2 = 0) or ENABLE = 0. Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time when existing ENABLE = 1.

Every call of the "Two-hand monitoring with enable" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_H_EN_DB_1) or a multi-instance (e.g., TWO_H_EN_Instance_1) for the "Two-hand monitoring with enable" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (type of sensor interconnection: 2-channel non equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

If a discrepancy is detected, a fail-safe value of 0 is entered in the process image input (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
ENABLE	Input	BOOL	Enable input
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

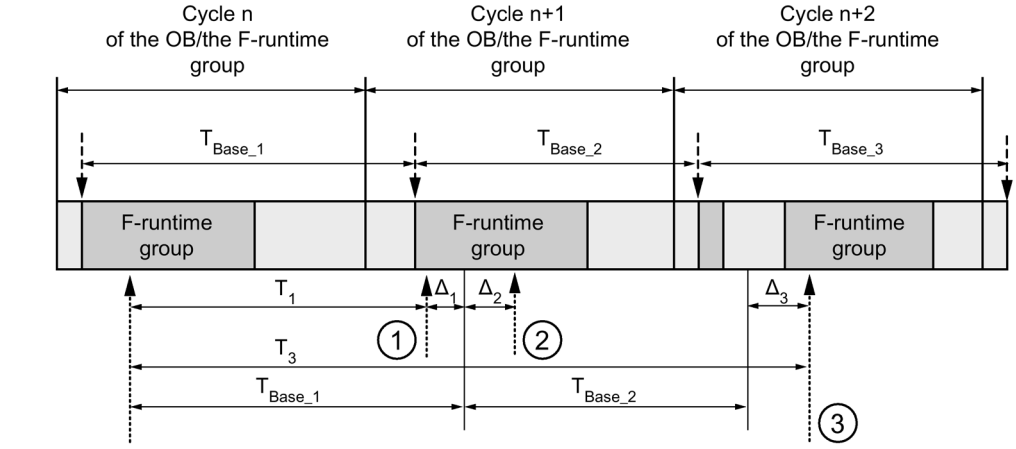
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 5 are saved until the cause of the error has been eliminated.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect discrepancy time DISCTIME setting	Discrepancy time setting is <0 or > 500 ms	Set discrepancy time in range of 0 to 500 ms
Bit 1	Discrepancy time elapsed	Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Pushbuttons were not activated within the discrepancy time	Release pushbuttons and activate them within the discrepancy time
		Wiring fault	Check wiring of pushbuttons
		Pushbuttons defective	Check pushbuttons
		Pushbuttons are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Incorrect activation sequence	One pushbutton was not released	Release pushbuttons and activate them within the discrepancy time
		Pushbuttons defective	Check pushbuttons
Bit 5	ENABLE does not exist	ENABLE = 0	Set ENABLE = 1, release pushbutton and activate it within the discrepancy time
Bit 6	Reserved	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

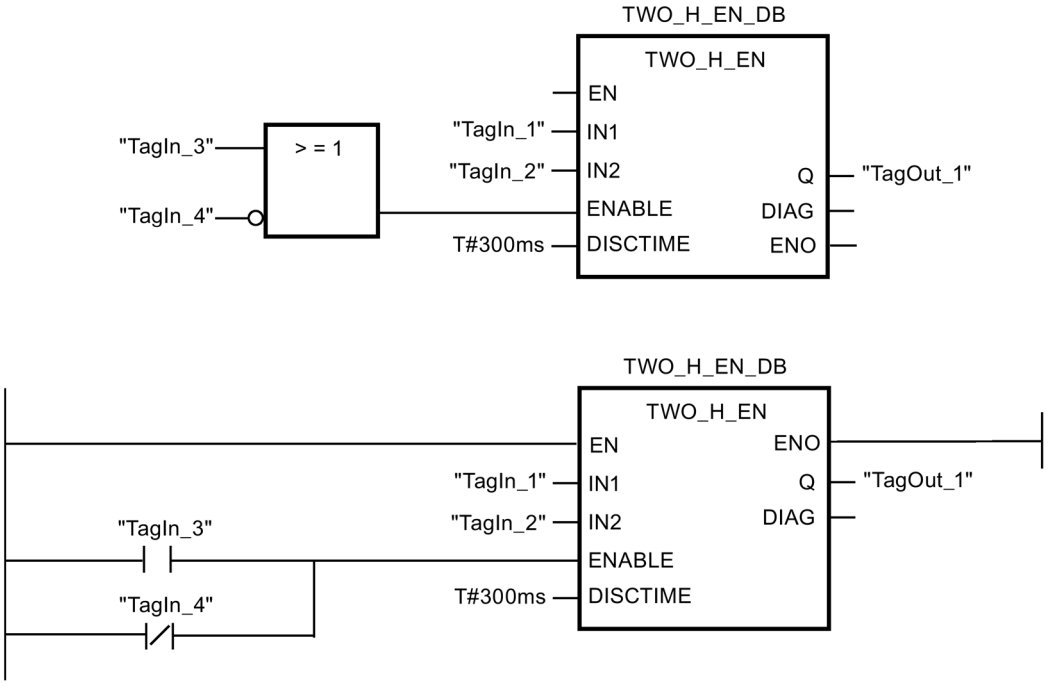
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.2.3.4 MUTING: Muting (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction performs parallel muting with two or four muting sensors.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Parallel muting (Page 373)". The instruction "Parallel muting" replaces the instruction "Muting" with compatible functions.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUTING_DB_1) or a multi-instance (e.g., MUTING_Instance_1) for the "Muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

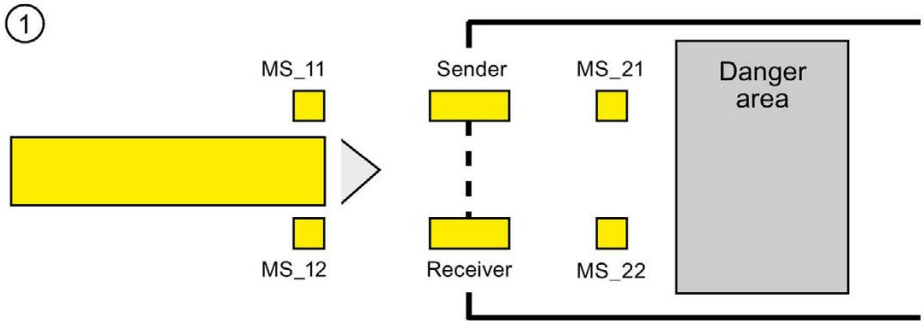
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 1 of sensor pair 1
MS_12	Input	BOOL	Muting sensor 2 of sensor pair 1
MS_21	Input	BOOL	Muting sensor 1 of sensor pair 2
MS_22	Input	BOOL	Muting sensor 2 of sensor pair 2
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal of the muting lamp channel
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
ACK	Input	BOOL	Acknowledgment of restart inhibit
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	BYTE	Service information

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

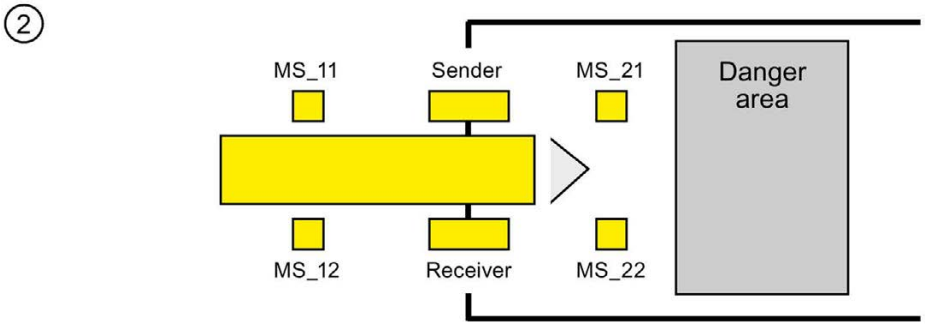


- If both muting sensors MS_11 and MS_12 are activated by the product within DISCTIM1 (apply signal state = 1), the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

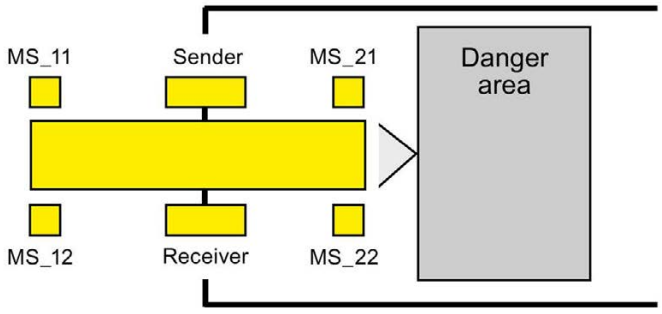
The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



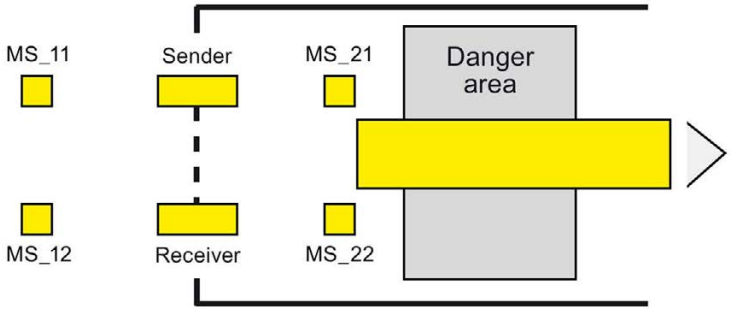
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop).

③



- The two muting sensors MS_21 and MS_22 must be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

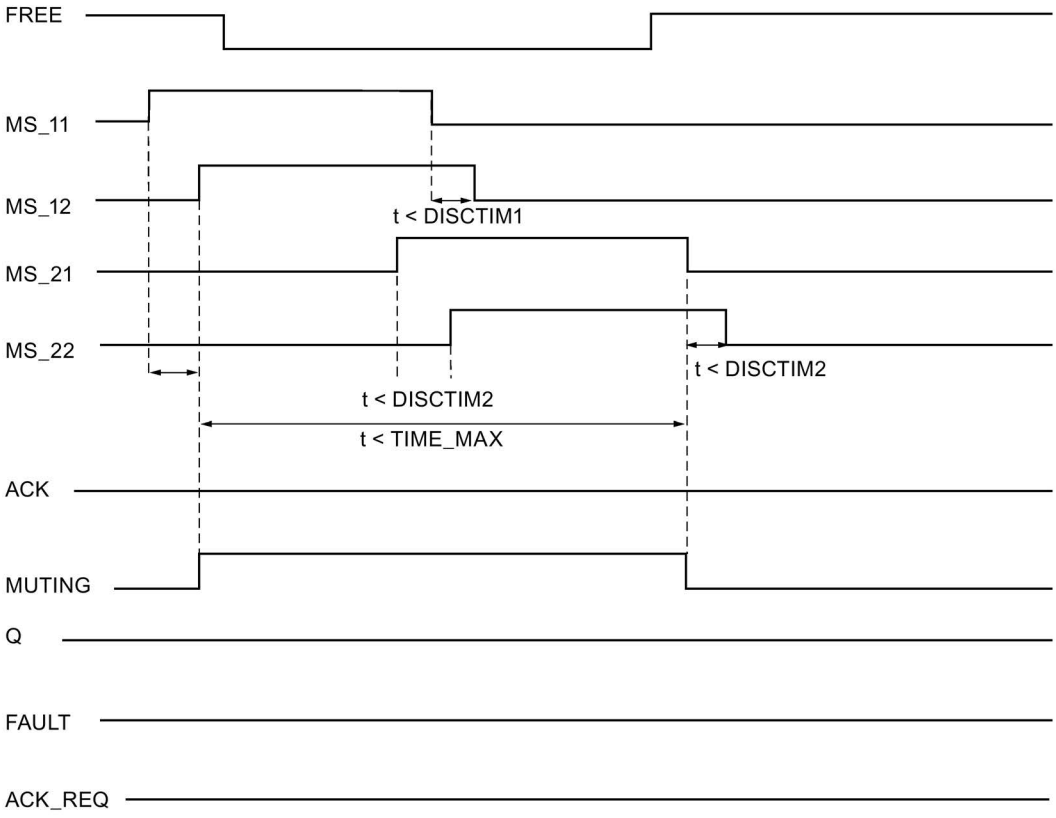


- Only if one of the two muting sensors MS_21 and MS_22 is switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

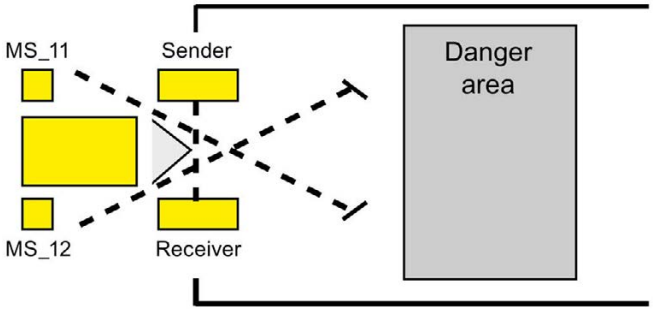


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (if MUTING is not active), when errors occur, and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- The muting lamp monitoring function responds at input QBAD_MUT
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

⚠ WARNING

When a valid combination of muting sensors is immediately detected at startup of the F-system (for example, because the muting sensors are interconnected to inputs of a standard I/O that immediately provide process values during the F-system startup), the MUTING function is immediately started and the MUTING output and enable signal Q are set to 1. The FAULT output (group error) is not set to 1 (no restart inhibit!). *(S035)*

Acknowledgment of restart inhibit

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- Errors, if present, are eliminated (see output DIAG)

  and

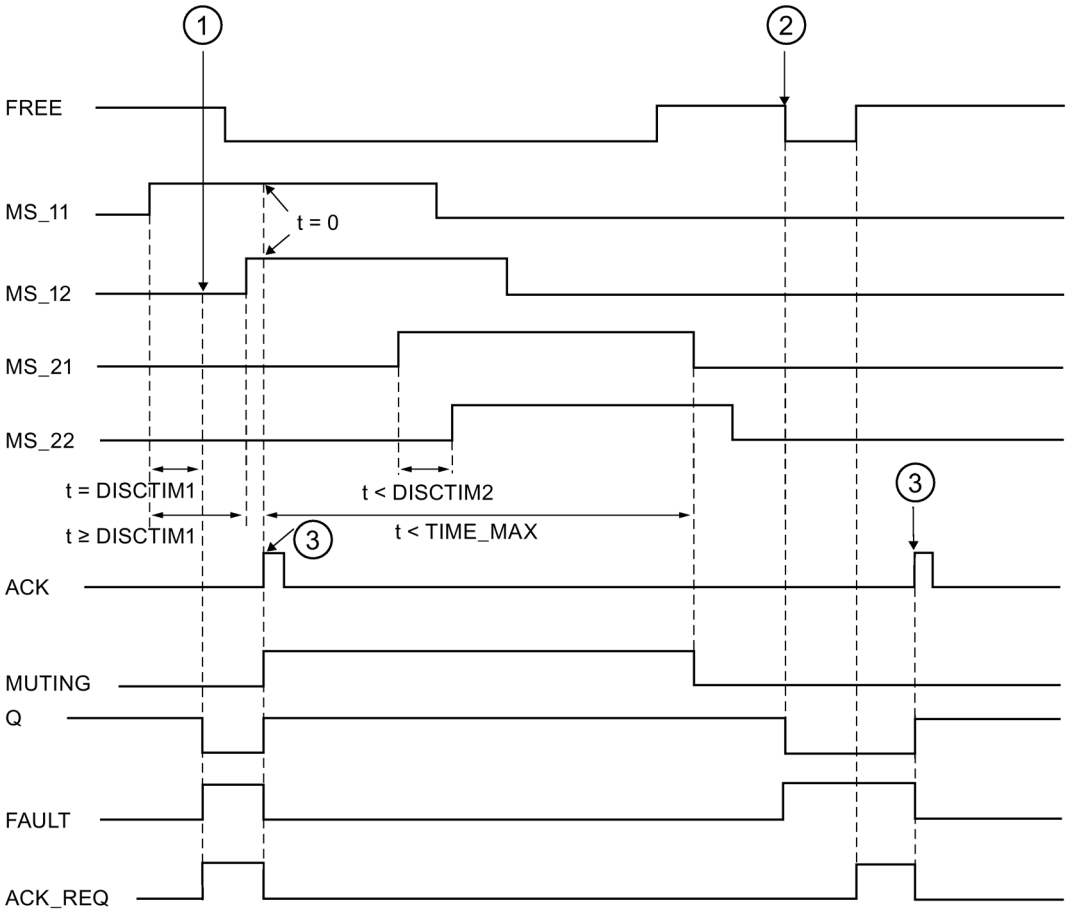
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 151)).

The FAULT output is set to 0. Output ACK_REQ = 1 signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK-REQ = 1 as soon as the light curtain is no longer interrupted or errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

Note

Following discrepancy errors and once the maximum muting time has been exceeded, ACK_REQ is immediately set to 1. As soon as a user acknowledgment has taken place at input ACK, discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (if MUTING is not active)



① Sensor pair 1 (MS_11 and MS_12) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though the MUTING function is not active.

③ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

you must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

When STOP = 1, the discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the error is not detected and the MUTING function can be started unintentionally. *(S036)*

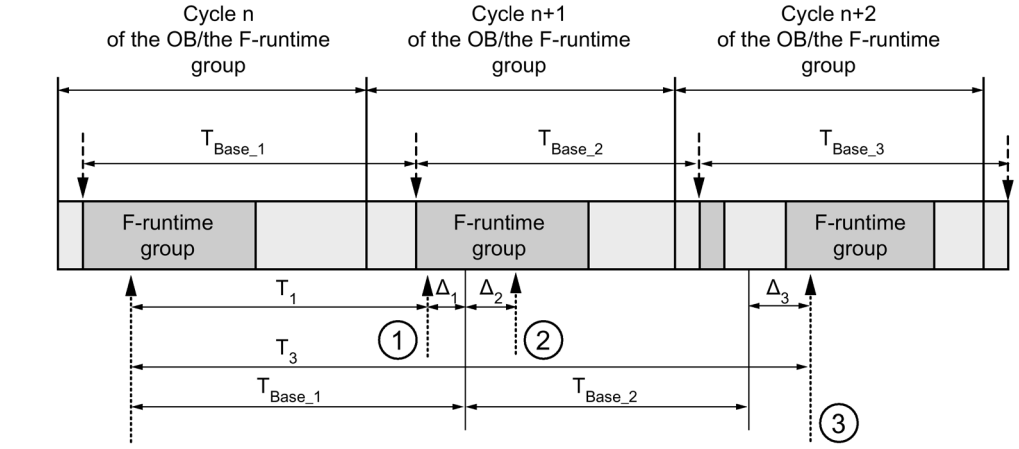
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 5	Reserved	—	—
Bit 6	Reserved	—	—
Bit 7	Reserved	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

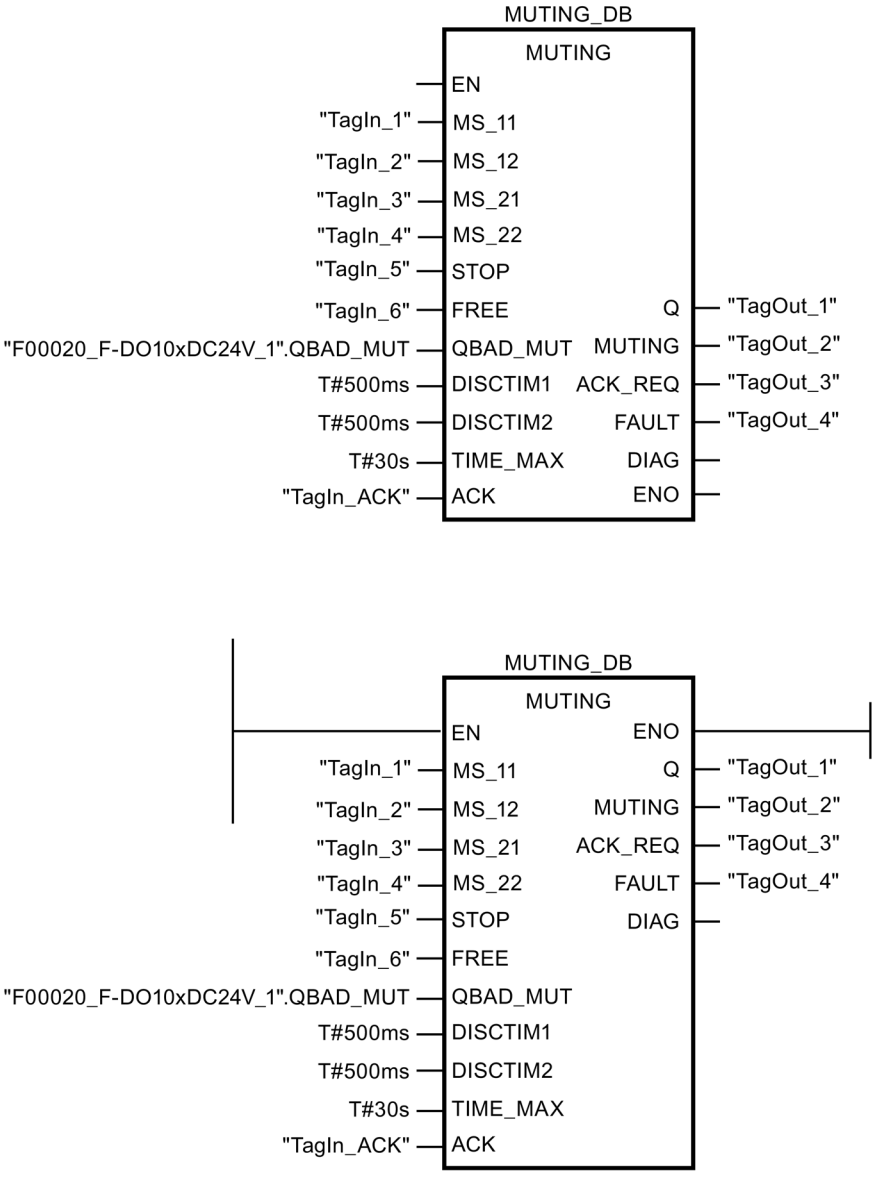
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.2.3.5 MUT_P: Parallel muting (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction performs parallel muting with two or four muting sensors.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Parallel muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUT_P_DB_1) or a multi-instance (e.g., MUT_P_Instance_1) for the "Parallel muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 11
MS_12	Input	BOOL	Muting sensor 12
MS_21	Input	BOOL	Muting sensor 21
MS_22	Input	BOOL	Muting sensor 22
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
ENABLE	Input	BOOL	1=Enable MUTING
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the muting lamp channel
ACK	Input	BOOL	Acknowledgment of restart inhibit
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	WORD	Service information

Instruction versions

A number of versions are available for this instruction:

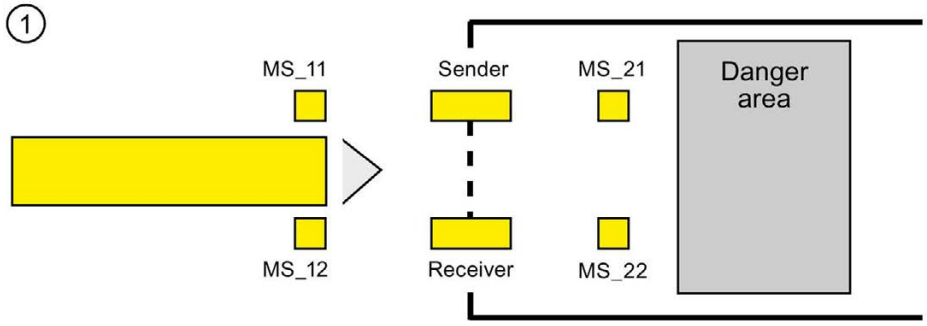
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x*	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x*	—	—	These versions have identical functions to version V1.0. The output DIAG can now be correctly interconnected with the operand of data type WORD.
1.2	x*	—	x	
1.3	x*	x	x	

* S7-300/400: When a restart inhibit (output FAULT = 1) and ENABLE = 1 is present, output ACK_REQ is set to 1 even if not at least one muting sensor is activated. Use the DIAG bits 5 and 6 for additional information.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

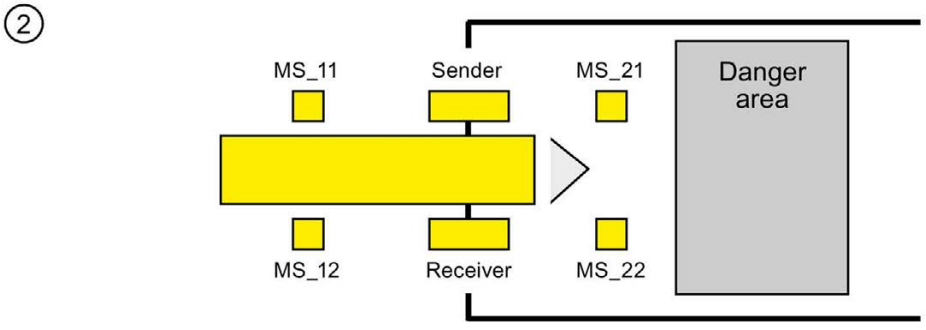


- If muting sensors MS_11 and MS_12 are both activated by the product within DISCTIM1 (apply signal state = 1) and MUTING is enabled by setting the ENABLE input to 1, the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

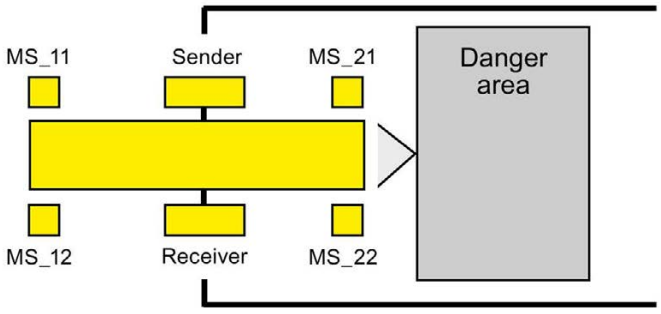
The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / with inverted value statues of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



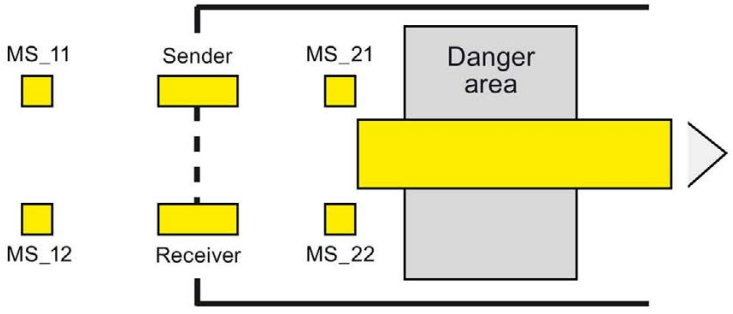
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop). Each of the two muting sensors MS_11 and MS_12 may be switched to inactive (t < DISCTIM1) for a short time (apply signal state 0).

③



- Muting sensors MS_21 and MS_22 must both be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

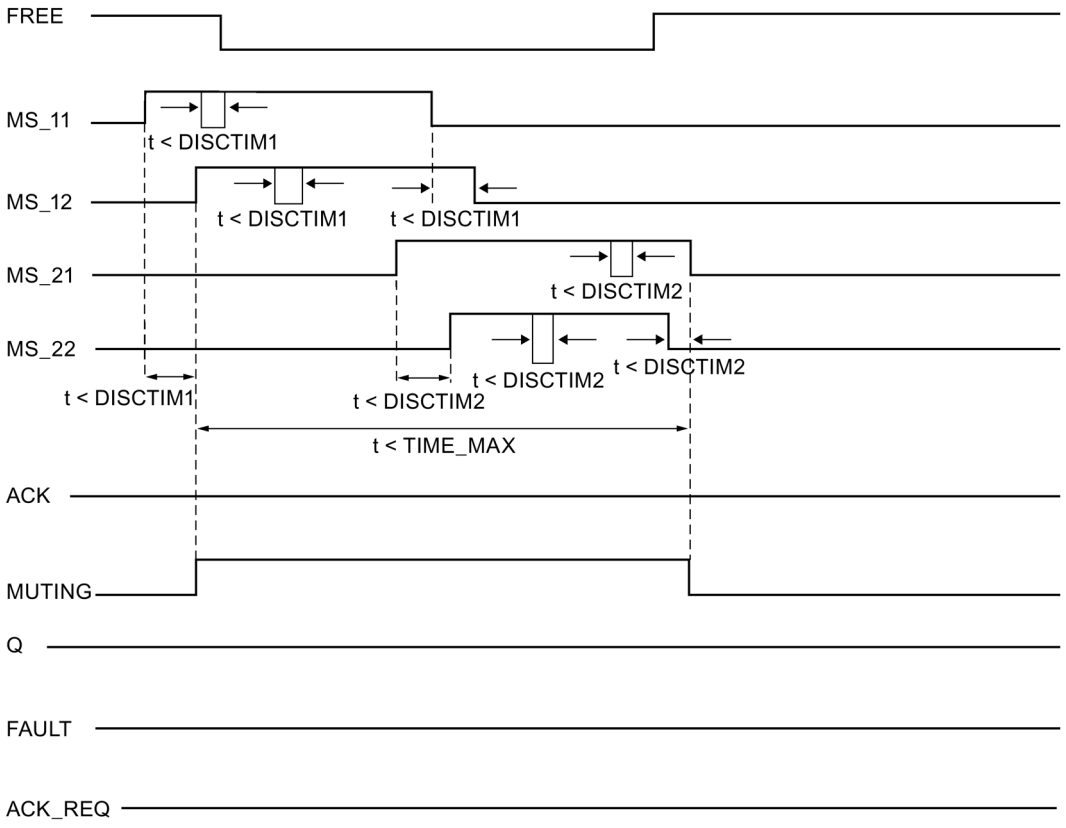


Only if muting sensors MS_21 and MS_22 are both switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

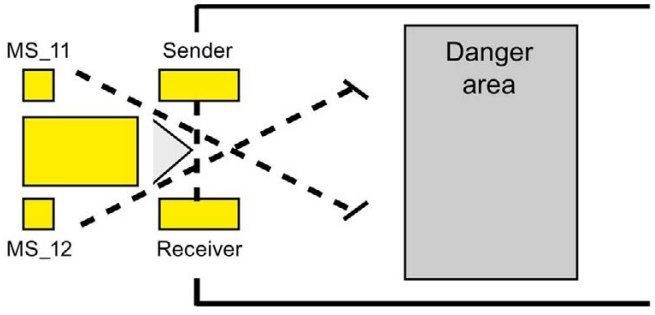


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (MUTING is not active), as well as when errors occur and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- Light curtain is (being) interrupted and the muting lamp monitoring at input QBAD_MUT is set to 1
- Light curtain is (being) interrupted and the MUTING function is not enabled by setting input ENABLE to 1
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min
- The F-system starts up (regardless of whether or not the light curtain is interrupted, because the F-I/O is passivated after F-system startup and, thus, the FREE input is initially supplied with 0)

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

User acknowledgment of restart inhibit (no muting sensor is activated or ENABLE = 0)

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- Errors, if present, are eliminated (see output DIAG)

  and

- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 151)).

The FAULT output is set to 0. Output ACK_REQ = 1 (and DIAG bit 6) signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

User Acknowledgment of restart inhibit (at least one muting sensor is activated and ENABLE = 1)

Enable signal Q becomes 1 again, when:

- Errors, if present, are eliminated (see output DIAG)
- FREE occurs until a valid combination of muting sensors is detected

The FAULT output is set to 0. The MUTING function is restarted, if necessary, and the MUTING output becomes 1 if a valid combination of muting sensors is detected. When ENABLE = 1, output ACK_REQ = 1 (and DIAG bit 5) signals that FREE is necessary for error elimination and for removal of the restart inhibit.*After successful FREE, ACK_REQ is reset to 0 by the instruction.

Note

Once the maximum muting time is exceeded, TIME_MAX is reset as soon as the MUTING function is restarted.

FREE function

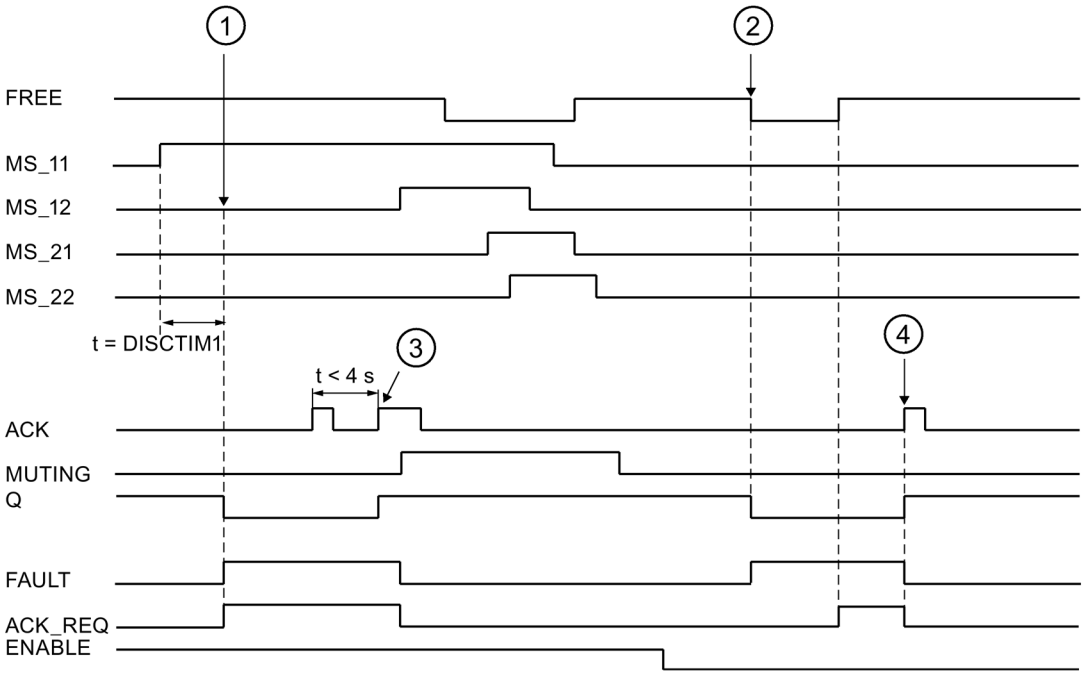
If an error cannot be corrected immediately, the FREE function can be used to free the muting range. Enable signal Q and output MUTING =1 temporarily. The FREE function can be used if:

- ENABLE = 1
- At least one muting sensor is activated
- A user acknowledgment with rising edge at input ACK occurs twice within 4 s, and the second user acknowledgment at input ACK remains at a signal state of 1 (acknowledgment button remains activated)

⚠ WARNING

When using the FREE function, the action must be observed. A dangerous situation must be able to be interrupted at any time by releasing the acknowledgment button. The acknowledgment button must be mounted in such a way the entire danger area can be observed. *(S037)*

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (MUTING is not active)



① Sensor pair 1 (MS_11 and MS_22) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though there is no enable (ENABLE=0)

③ FREE function

④ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

When STOP = 1 or ENABLE = 0, discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the fault is not detected and the MUTING function can be started unintentionally (when ENABLE =1). *(S038)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 6 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies

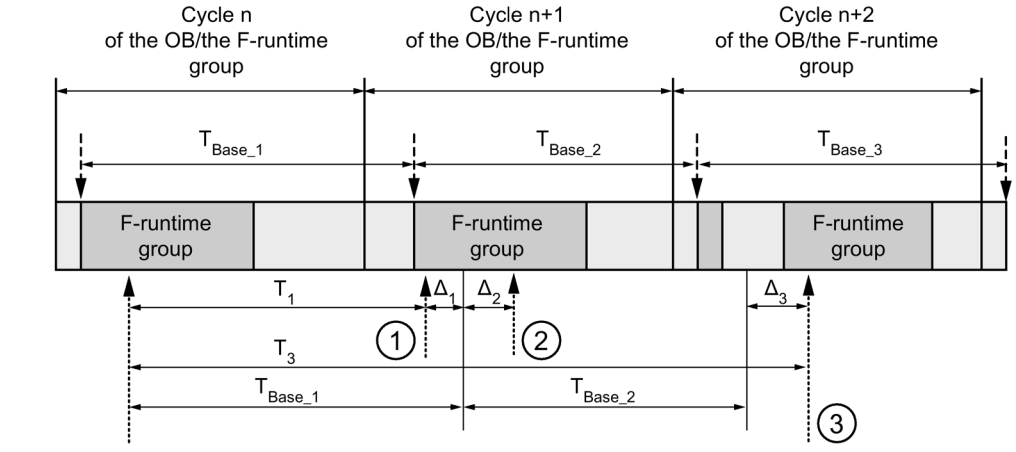
Timing imprecision resulting from the update time of the time base used in the instruction:



⋯⋯► = Time base update

⋯⋯► = Call time of an instruction with time processing

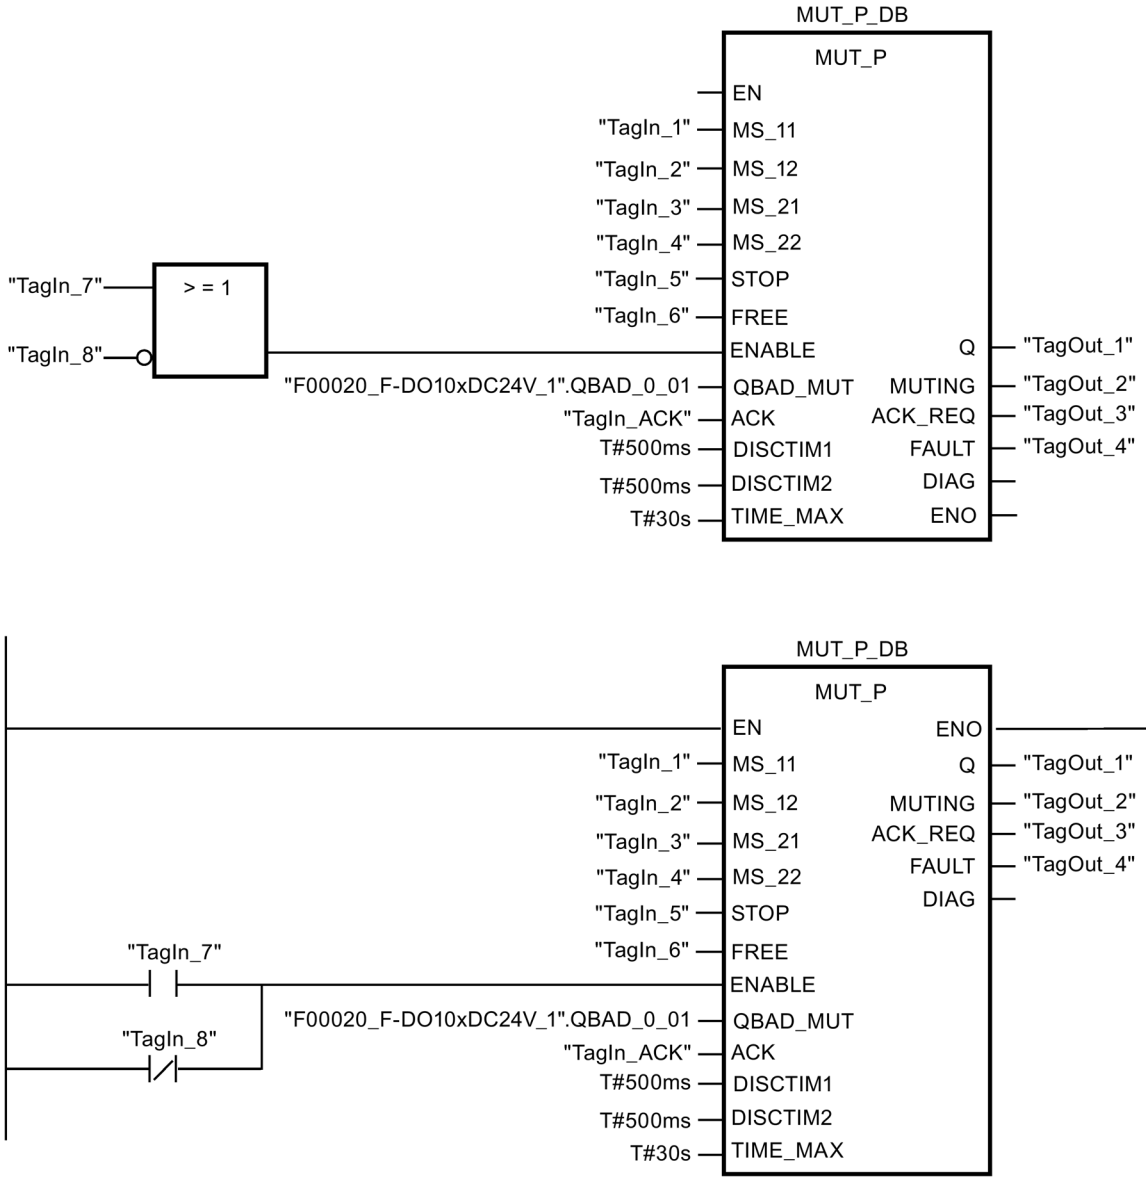
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.2.3.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements a 1oo2 evaluation of two single-channel sensors combined with a discrepancy analysis.

Output Q is set to 1, if the signal states of inputs IN1 and IN2 both equal 1 and no discrepancy error DISC_FLT is stored. if the signal state of one or both inputs is 0, output Q is set to 0.

As soon as the signal states of inputs IN1 and IN2 are different, the discrepancy time DISCTIME is started. If the signal states of the two inputs are still different once the discrepancy time expires, a discrepancy error is detected and DISC_FLT is set to 1 (restart inhibit).

If the discrepancy between inputs IN1 and IN2 is no longer detected, the discrepancy error is acknowledged according to the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK to acknowledge the discrepancy error.

The output ACK_REQ = 1 signals that a user acknowledgment at input ACK is necessary to acknowledge the discrepancy error (cancel the restart inhibit). The instruction sets ACK_REQ = 1 as soon as discrepancy is no longer detected. After acknowledgment or if, prior to acknowledgment, there is once again a discrepancy between inputs IN1 and IN2, the instruction resets ACK_REQ to 0.

Output Q can never be set to 1 if the discrepancy time setting is < 0 or > 60 s. In this case, output DISC_FLT is also set to 1 (restart inhibit). The call interval of the safety program (e.g., OB35) must be less than the discrepancy time setting.

Every call of the "1oo2 evaluation with discrepancy analysis" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., EV1oo2DI_DB_1) or a multi-instance (e.g., EV1oo2DI_Instance_1) for the "1oo2 evaluation with discrepancy analysis" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Sensor 1
IN2	Input	BOOL	Sensor 2
DISCTIME	Input	TIME	Discrepancy time (0 to 60 s)
ACK_NEC	Input	BOOL	1 = acknowledgment necessary for discrepancy error
ACK	Input	BOOL	Acknowledgment of discrepancy error
Q	Output	BOOL	Output
ACK_REQ	Output	BOOL	1 = acknowledgment required
DISC_FLT	Output	BOOL	1 = discrepancy error
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

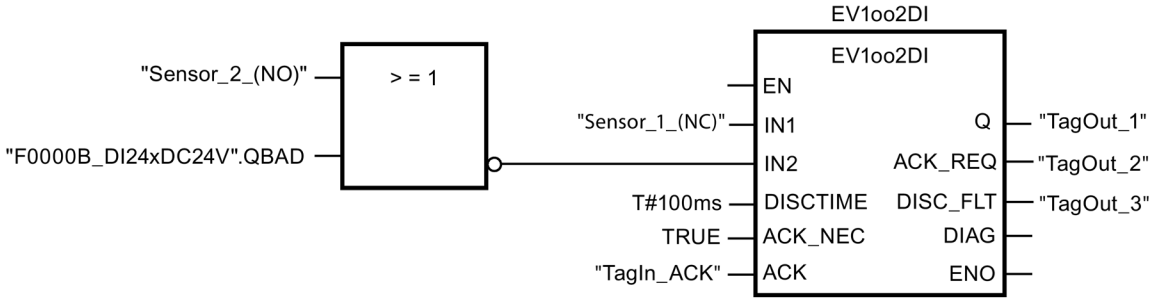
Activating inputs IN1 and IN2

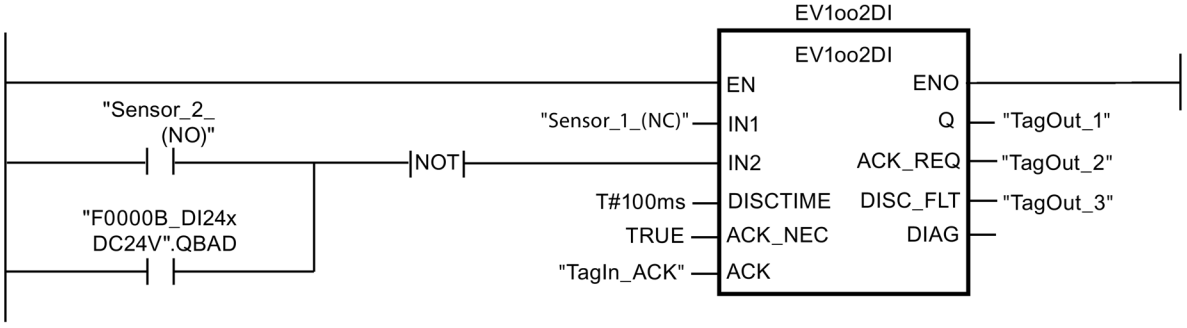
Inputs IN1 and IN2 must both be activated in such a way that their safe state is 0.

Example with QBAD or QBAD_I_xx signal

For non-equivalent signals you need to OR the input (IN1 and IN2) with which you assign the encoder signal to the safe state 1, with the QBAD signal of the associated F-I/O or the QBAD_I_xx signal of the associated channel (with S7-300/400 F-CPUs) and negate the result. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Network1: EV1oo2DI with non-equivalent signals

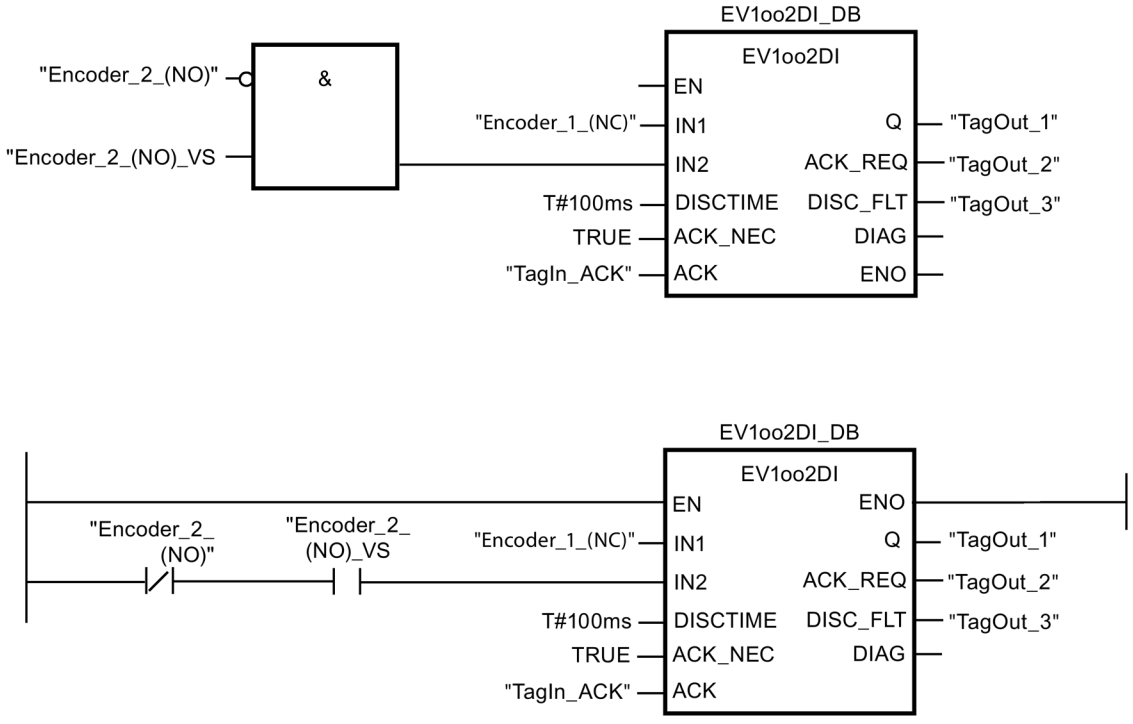




Example with value status

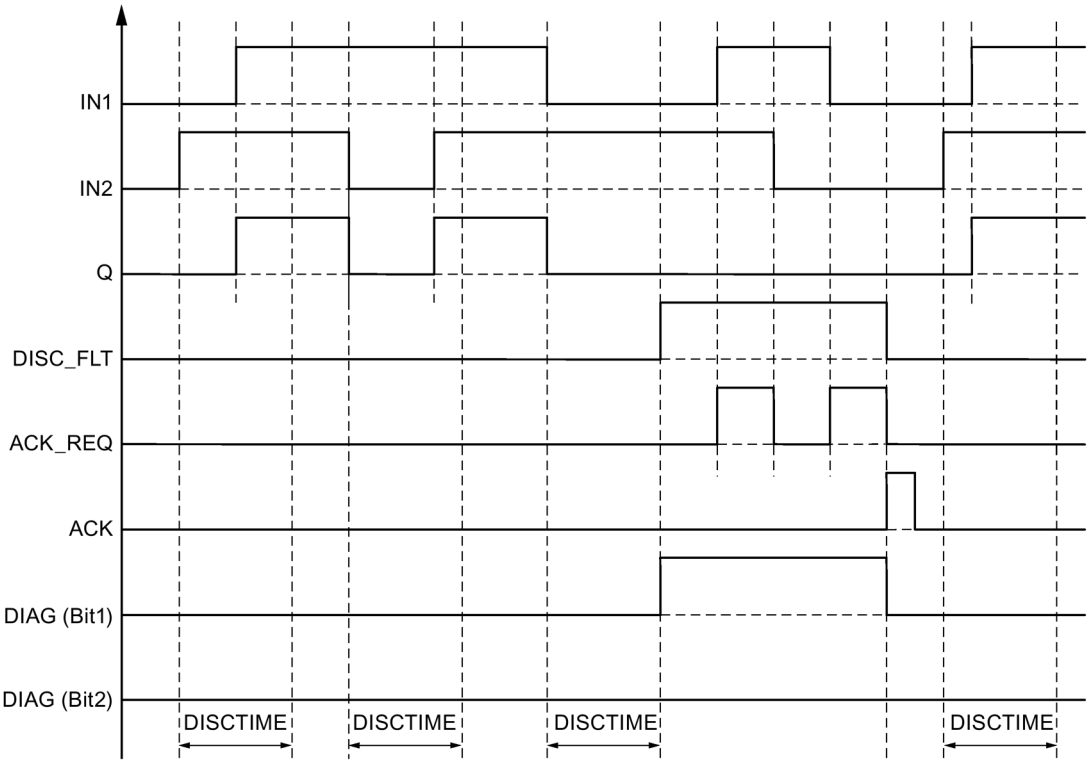
For nonequivalent signals, you have to negate the input (IN1 or IN2) with which you have assigned the encoder signal to a safe state of 1 and AND it with the value status of the associated channel. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Network1: EV1oo2DI with non-equivalent signals



Timing diagrams EV1oo2DI

If ACK_NEC = 1:



Startup characteristics

Note

If the sensors at inputs IN1 and IN2 are assigned to different F-I/O, it is possible that the fail-safe values are output for different lengths of time following startup of the F-system due to different startup characteristics of the F-I/O. If the signal states of inputs IN1 and IN2 remain different after the discrepancy time DISCTIME has expired, a discrepancy error is detected after the F-system starts up.

If ACK_NEC = 1 you must acknowledge the discrepancy error with a rising edge at input ACK.

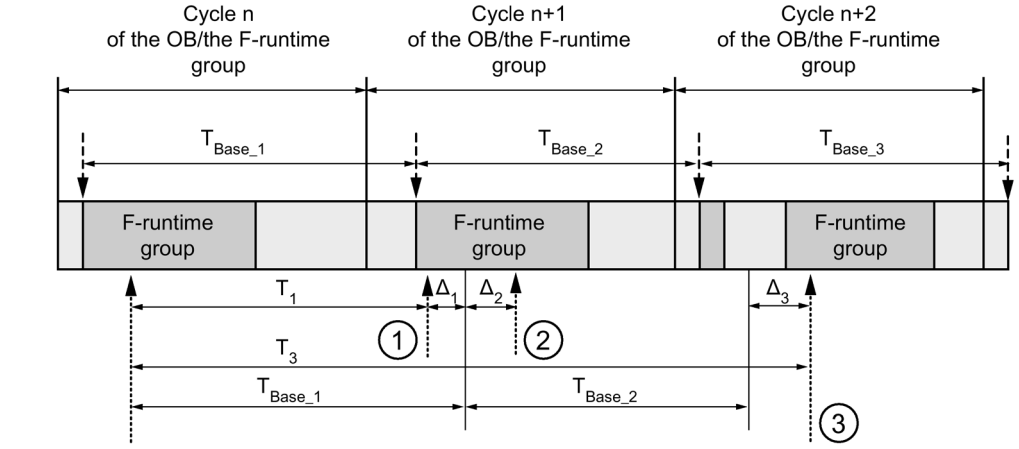
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time setting (= status of DISC_FLT)	Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 60 s	Set discrepancy time in range between 0 s and 60 s
Bit 1	For discrepancy errors: last signal state change was at input IN1	—	—
Bit 2	For discrepancy errors: last signal state change was at input IN2	—	—
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For discrepancy errors: input ACK has a permanent signal state of 1	Acknowledgment button defective	Replace acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

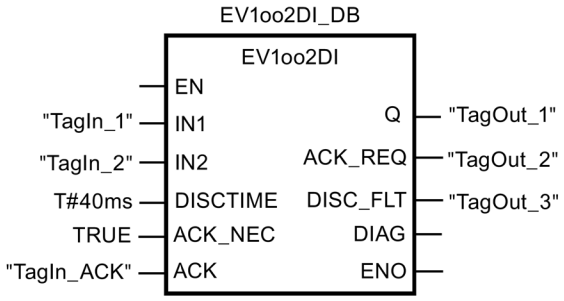
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

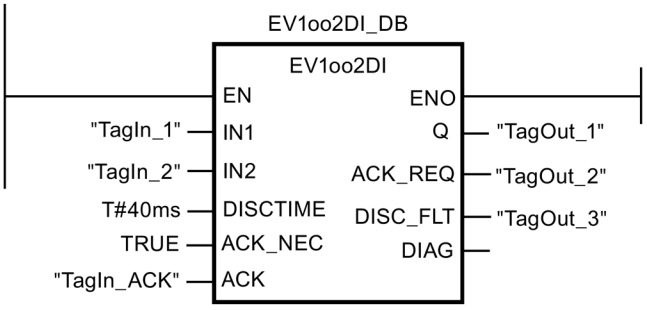
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.2.3.7 FDBACK: Feedback monitoring (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements feedback monitoring.

The signal state of output Q is checked to see whether it corresponds to the inverse signal state of the feedback input FEEDBACK.

Output Q is set to 1 as soon as input ON = 1. Requirement for this is that the feedback input FEEDBACK = 1 and no feedback error is saved.

Output Q is reset to 0, as soon as input ON = 0 or if a feedback error is detected.

A feedback error ERROR = 1 is detected if the inverse signal state of the feedback input FEEDBACK (to input Q) does not follow the signal state of output Q within the maximum tolerable feedback time. The feedback error is saved.

If a discrepancy is detected between the feedback input FEEDBACK and the output Q after a feedback error, the feedback error is acknowledged in accordance with the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must acknowledge the feedback error with a rising edge at input ACK.

The ACK_REQ = 1 output then signals that a user acknowledgment is necessary at input ACK to acknowledge the feedback error. Following an acknowledgment, the instruction resets ACK_REQ to 0.

To avoid a feedback errors from being detected and acknowledgment from being required when the F-I/O controlled by the Q output are passivated, you need to supply input QBAD_FIO with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / inverted value status of the associated channel.

Every call of the "Feedback monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., FDBACK_DB_1) or a multi-instance (e.g., FDBACK_Instance_1) for the "Feedback monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision *(S034)*.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ON	Input	BOOL	1= Enable output
FEEDBACK	Input	BOOL	Feedback input
QBAD_FIO	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the Q output
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
FDB_TIME	Input	TIME	Feedback time
Q	Output	BOOL	Output
ERROR	Output	BOOL	Feedback error
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Service information

Instruction versions

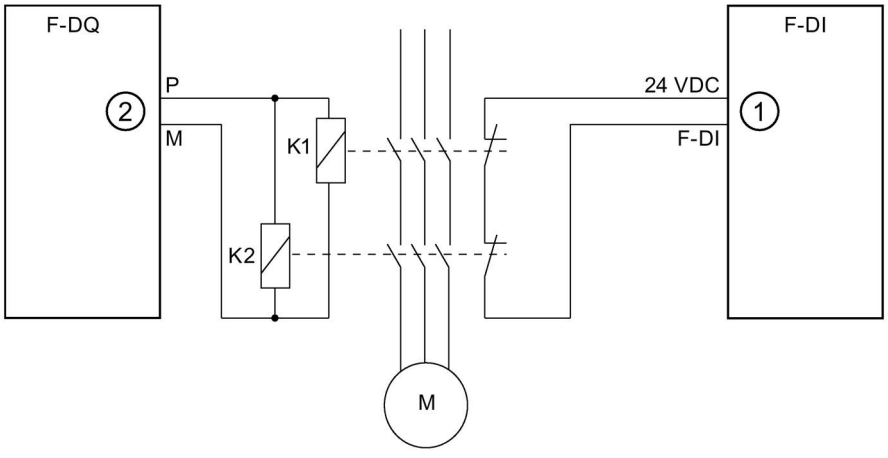
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	x	
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Interconnection example



① Sent to the FEEDBACK input of the instruction
② from output Q of the instruction

Startup characteristics

After an F-system startup, the instruction does not have be acknowledged when no errors are present.

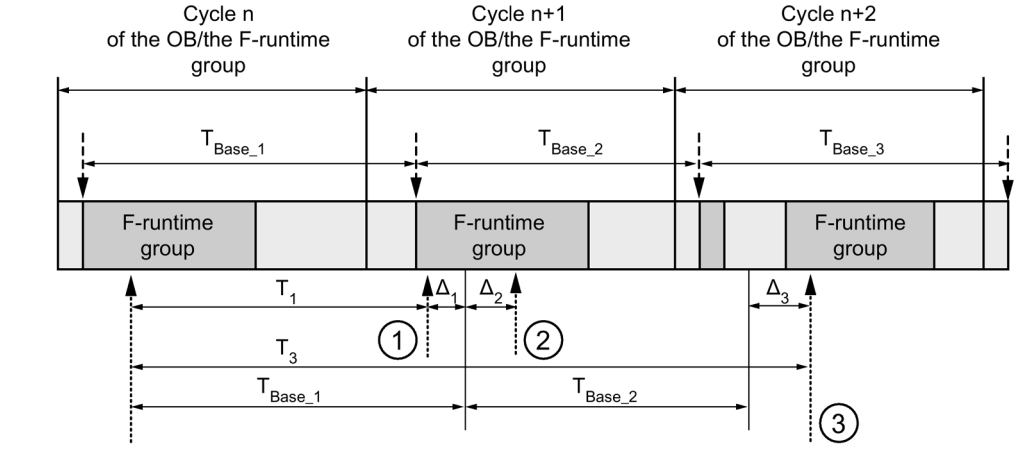
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0, 2, and 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Feedback error or incorrect feedback time setting (= state of ERROR)	Feedback time setting < 0	Set feedback time > 0
		Feedback time setting is too low	If necessary, set a higher feedback time
		Wiring fault	Check wiring of actuator and feedback contact
		Actuator or feedback contact is defective	Check actuator and feedback contact
		I/O fault or channel fault of feedback input	Check I/O
Bit 1	Passivation of F-I/O/channel controlled by output Q (= state of QBAD_FIO)	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 2	After feedback error: feedback input has permanent signal state of 0	F-I/O fault or channel fault of feedback input	Check I/O
		Feedback contact is defective	Check feedback contact
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of feedback input	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For feedback error: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

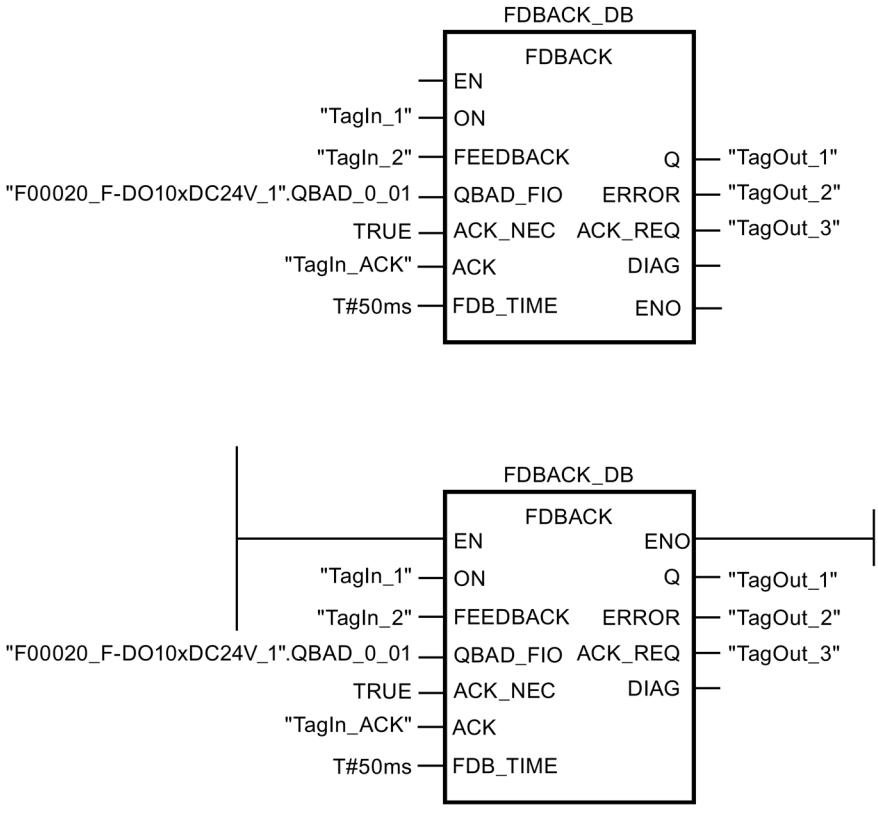
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

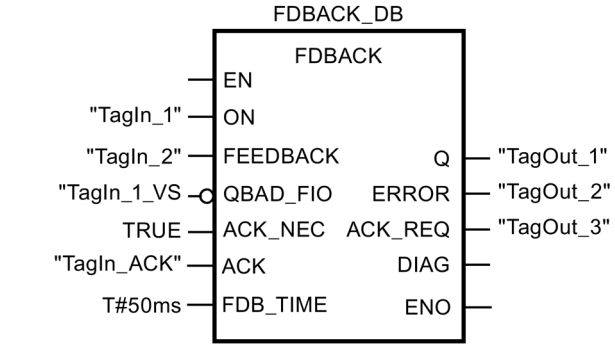
③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

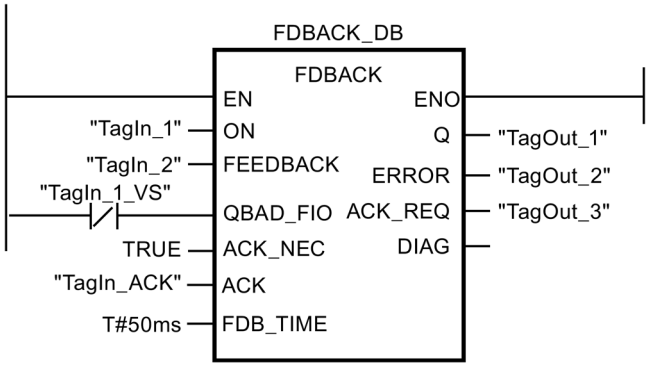
Example

The following example shows how the instruction for S7-300/400 F-CPUs works:



The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.2.3.8 SFDOOR: Safety door monitoring (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements safety door monitoring.

Enable signal Q is reset to 0 as soon as one of the inputs IN1 or IN2 take a signal state of 0 (safety door is opened). The enable signal can be reset to 1, only if:

- Inputs IN1 and IN2 both take a signal state of 0 prior to opening the door (safety door has been completely opened)
- Inputs IN1 and IN2 then both take a signal state of 1 (safety door is closed)
- An acknowledgment occurs

The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ = 1 is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets ACK_REQ = 1 as soon as the door is closed. Following an acknowledgment, the instruction resets ACK_REQ to 0.

In order for the instruction to recognize whether inputs IN1 and IN2 are 0 merely due to passivation of the associated F-I/O, you need to supply inputs QBAD_IN1 or QBAD_IN2 with the QBAD signal of the associated F-I/O or QBAD_I_xx signal / inverted value status of the associated channel. Among other things, this will prevent you from having to open the safety door completely prior to an acknowledgment in the event the F-I/O are passivated.

Every call of the "Safety door monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SFDOOR_DB_1) or a multi-instance (e.g., SFDOOR_Instance_1) for the "Safety door monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Input 1
IN2	Input	BOOL	Input 2
QBAD_IN1	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN1
QBAD_IN2	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN2
OPEN_NEC	Input	BOOL	1= Open necessary at startup
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
Q	Output	BOOL	1= Enable, safety door closed
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

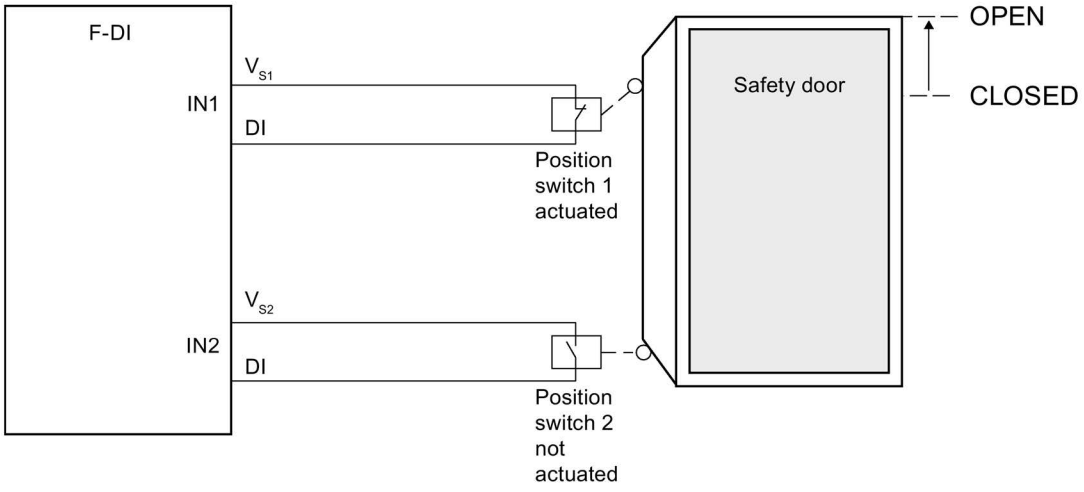
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

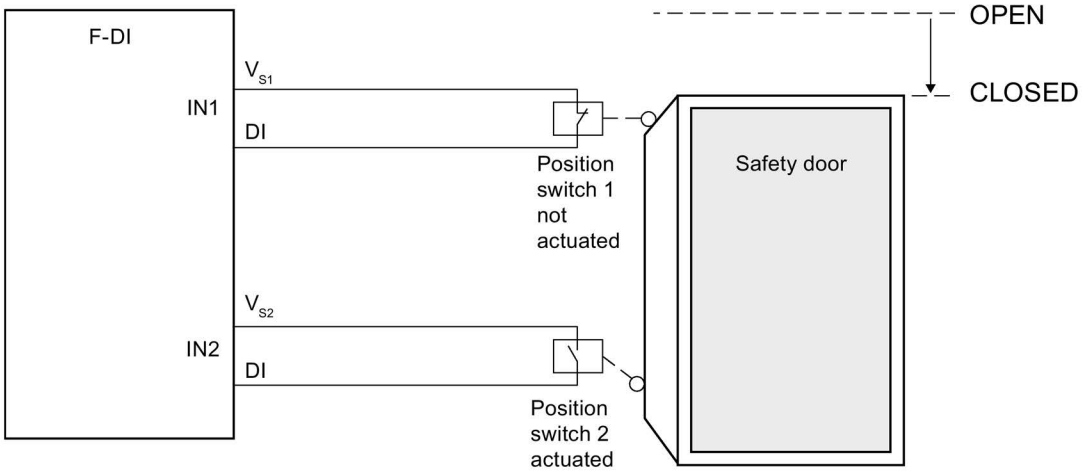
Interconnection example

You must interconnect the NC contact of position switch 1 of the safety door at input IN1 and the NO contact of position switch 2 at input IN2. Position switch 1 must be mounted in such a way that it is positively operated when the safety door is open. Position switch 2 must be mounted in such a way that it is operated when the safety door is closed.

Safety door open:



Safety door closed:



Startup characteristics

After an F-system startup, enable signal Q is reset to 0. The acknowledgment for the enable takes place according to the parameter assignment at inputs OPEN_NEC and ACK_NEC:

- When OPEN_NEC = 0, an automatic acknowledgment occurs **independently** of ACK_NEC, as soon as the two inputs IN1 and IN2 take signal state 1 for the first time following reintegration of the associated F-I/O (safety door is closed).
- When OPEN_NEC = 1 **or** if at least one of the IN1 and IN2 inputs still has a signal state of 0 after reintegration of the associated F-I/O, an automatic acknowledgment occurs **according** to ACK_NEC or you have to use a rising edge at input ACK for the enable. Prior to acknowledgment, inputs IN1 and IN2 both have to take a signal state of 0 (safety door has been completely opened) followed by a signal state of 1 (safety door is closed).

⚠ WARNING

The OPEN_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S039)*

Output DIAG

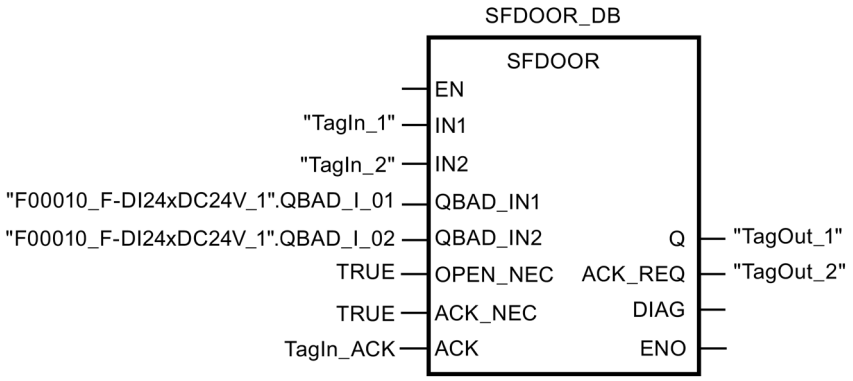
The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.

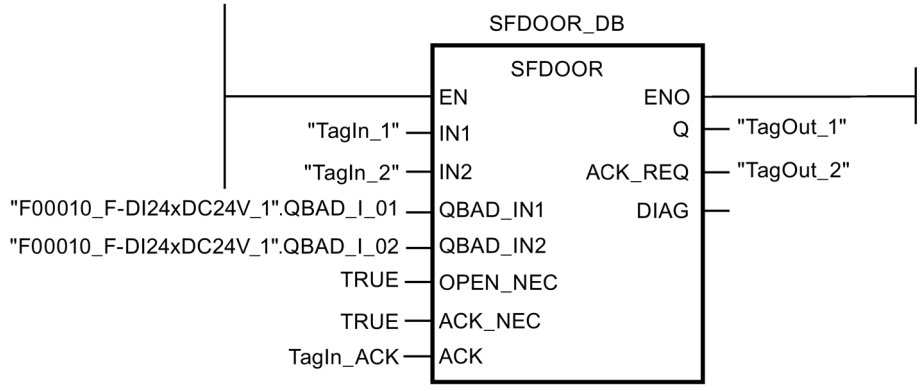
Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Signal state 0 is missing at both IN1 and IN2 inputs	Safety door was not completely opened when OPEN_NEC = 1 after F-system startup	Open safety door completely
		Open safety door was not completely opened	Open safety door completely
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 2	Signal state 1 is missing at both IN1 and IN2 inputs	Safety door was not closed	Close safety door
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 3	QBAD_IN1 and/or QBAD_IN2 = 1	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O or channel of IN1 and/or IN2	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 4	Reserved	—	—
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

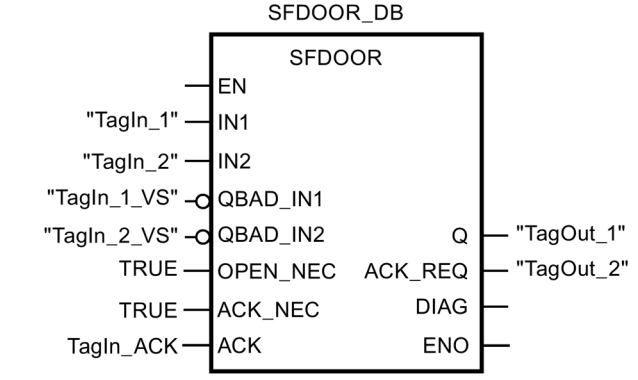
Example

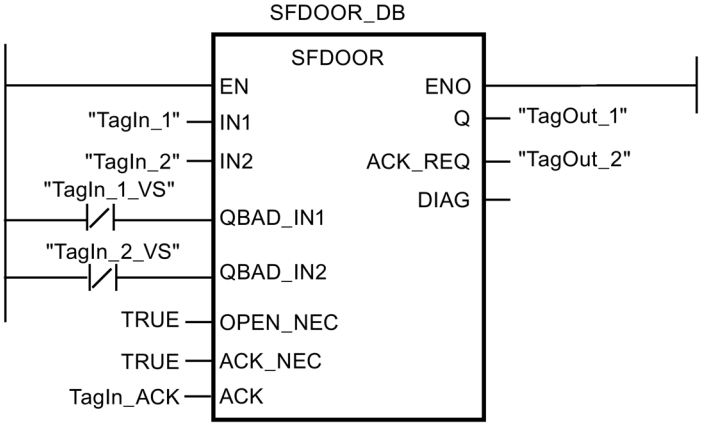
The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.2.3.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction creates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F-I/O of an F-runtime group after communication errors, F-I/O errors, or channel faults.

A user acknowledgment (Page 151) with a positive edge at input ACK_GLOB is required for reintegration. The acknowledgment occurs analogously to the user acknowledgment via the ACK_REI tag of the F-I/O DB (Page 132), but it acts simultaneously on all F-I/O of the F-runtime group in which the instruction is called.

If you use the instruction ACK_GL, you do not have to provide a user acknowledgment for each F-I/O of the F-runtime group via the ACK_REI tag of the F-I/O DB.

Every call of the "Global acknowledgment of all F-I/O of a runtime group" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_GL_DB_1) or a multi-instance (e.g., ACK_GL_Instance_1) for the "Global acknowledgment of all F-I/O of a runtime group" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

An acknowledgment via the ACK_GL instruction is only possible if the tag ACK_REI of the F-I/O DB = 0. Accordingly, an acknowledgment via the tag ACK_REI of the F-I/O DB is only possible if the input ACK_GLOB of the instruction = 0.

The instruction is only allowed to be called once per F-runtime group.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_GLOB	Input	BOOL	1=acknowledgment for reintegration

Instruction versions

A number of versions are available for this instruction:

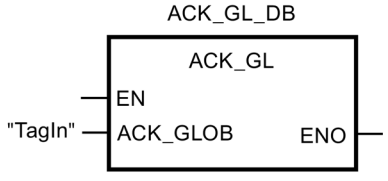
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

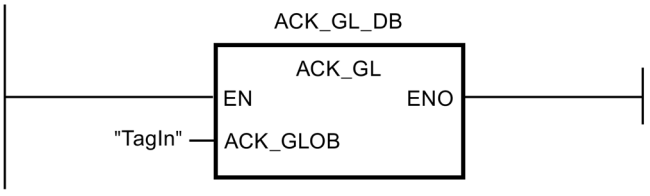
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





13.2.4 Timer operations

13.2.4.1 TP: Generate pulse (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate pulse" instruction to set output Q for an assigned period. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The assigned period PT starts running when the instruction starts. Output Q is set for period PT, regardless of the subsequent sequence of the input signal. Also the detection of a new positive signal edge does not influence the signal state at output Q as long as period PT runs.

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached. If period PT is reached and the signal state at input IN is "0", output ET is reset.

Every call of the "Generate pulse" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate pulse" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction").
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate pulse" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TP instruction in the following points:

- When a call is made with PT = 0 ms, the TP instance is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only outputs Q and ET are reset. To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of pulse; must be positive.
Q	Output	BOOL	Pulse output
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

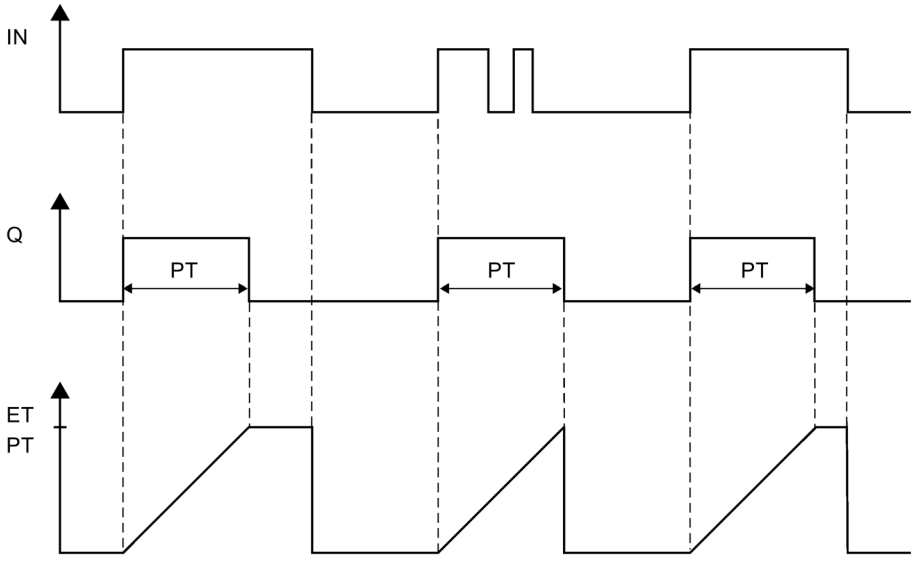
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

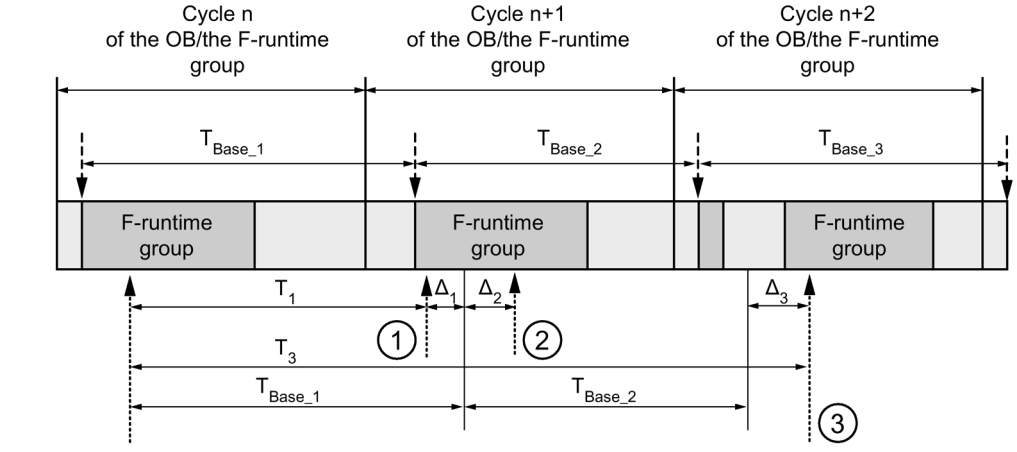
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction:



Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

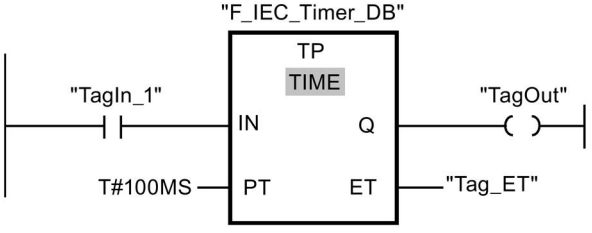
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate pulse" instruction is started and the period assigned at input PT (100 ms) runs, regardless of the further course of operand "TagIn_1".

Operand "TagOut" at output Q has signal state "1" as long as the period is running. Operand "Tag_ET" contains the current time value.

13.2.4.2 TON: Generate on-delay (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate on-delay" instruction to delay the setting of output Q by the assigned period PT. The "Generate on-delay" instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The assigned period PT starts running when the instruction starts. When period PT has expired, output Q is set to signal state "1". Output Q remains set as long as the start input is set to "1". When the signal state at the start input changes from "1" to "0", output Q is reset. The time function is restarted when a new positive signal edge is detected at the start input.

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached. Output ET is reset, as soon as the signal state at input IN changes to "0".

Every call of the "Generate on-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate on-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate on-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TON instruction in the following points:

- When a call is made with PT = 0 ms, the instance of the TON is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only output ET is reset. To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of on-delay; must be positive.
Q	Output	BOOL	Output that is set after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

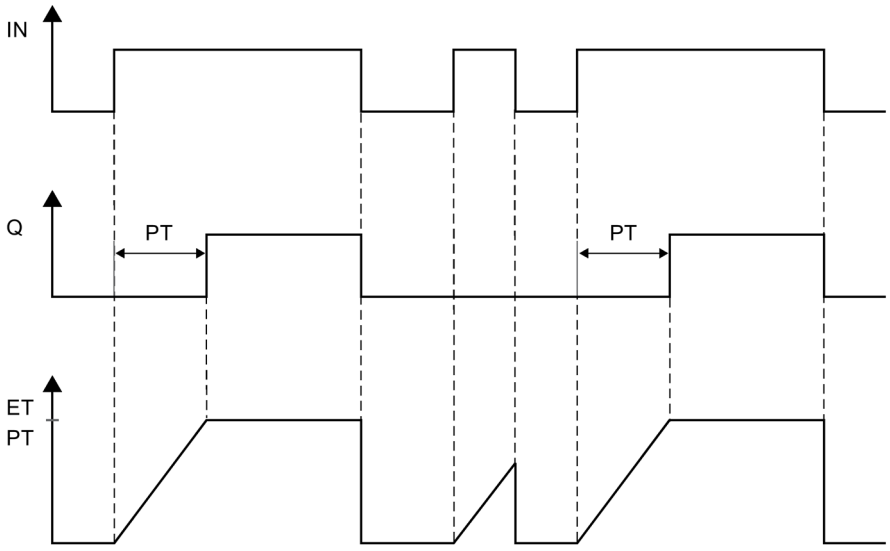
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

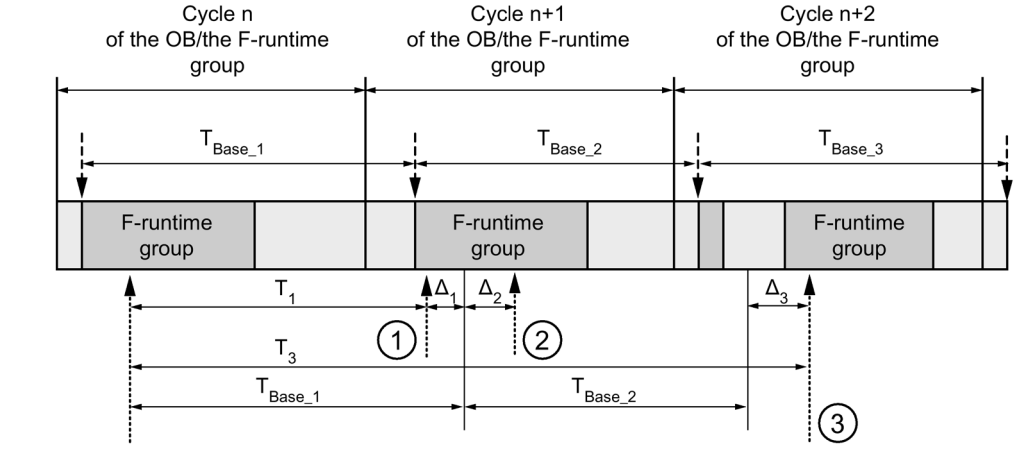
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction:



Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

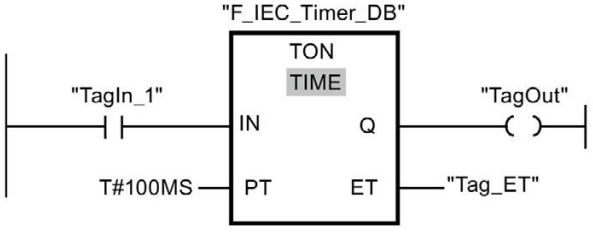
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



When the signal state of operand "TagIn_1" changes from "0" to "1", the

"Generate on-delay" instruction is started and the period assigned at input PT (1 s) runs.

Operand "TagOut" at output Q feeds signal state "1" when the period has elapsed and remains set as long as operand "TagIn_1" still feeds signal state "1". Operand "Tag_ET" contains the current time value.

13.2.4.3 TOF: Generate off-delay (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate off-delay" instruction to delay resetting output Q by the assigned period PT. Output Q is set if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The assigned period PT starts when the signal state at input IN changes back to "0". Output Q remains set as long as period PT runs. After period PT expires, output Q is reset. If the signal state at input IN changes to "1" before period PT has expired, then the time is reset. The signal state at output Q remains at "1".

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached.

Every call of the "Generate off-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is in inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate off-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate off-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TOF instruction in the following points:

- When a call is made with PT = 0 ms, the instance of the TOF is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only outputs Q and ET are reset. To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of off delay; must be positive.
Q	Output	BOOL	Output that is reset after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

A number of versions are available for this instruction:

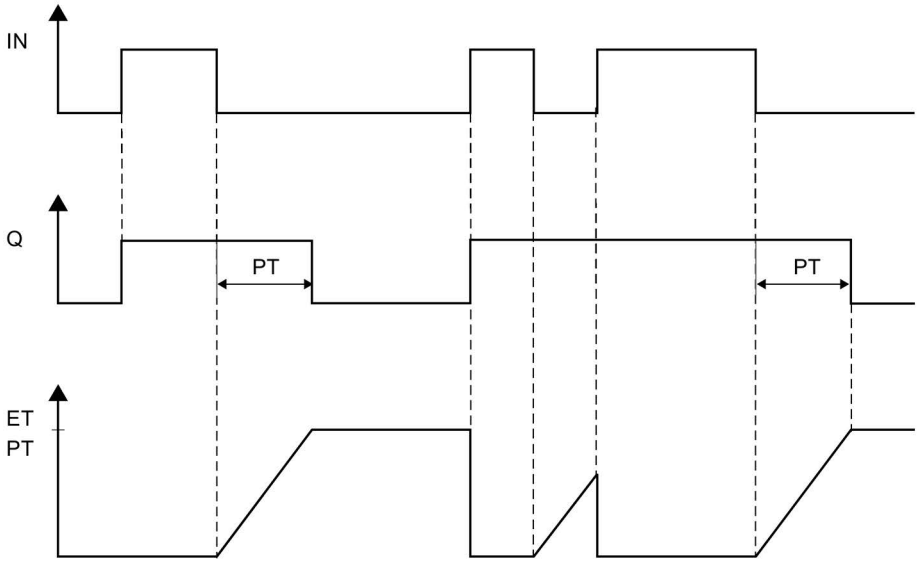
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

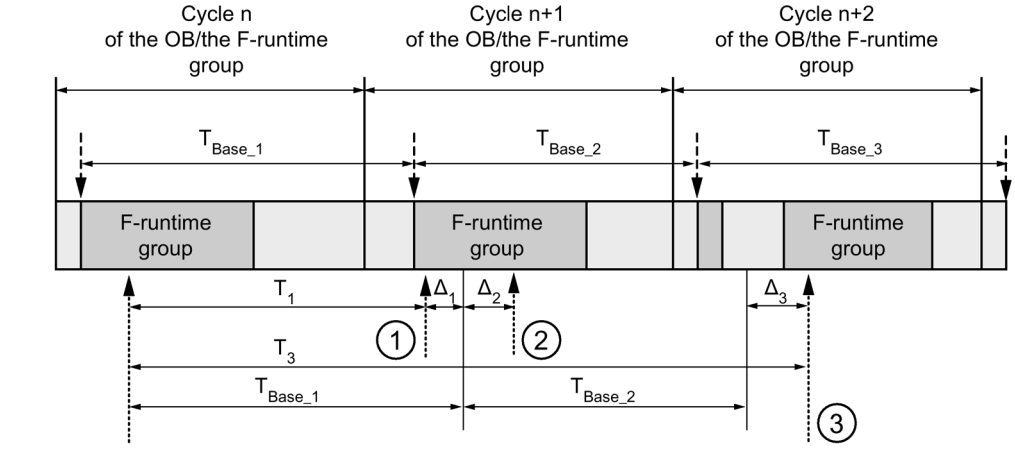
For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram

The following figure shows the pulse diagram of the instruction:



Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

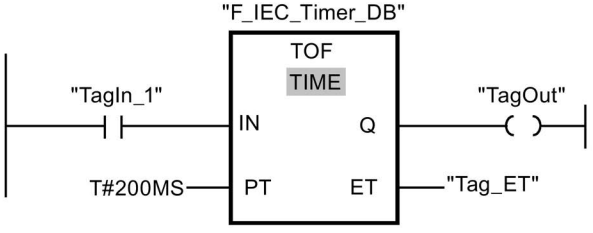
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time T_{Base_1} + T_{Base_2} instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the signal state of operand"TagOut" at output Q is set to "1".

If the signal state of operand "TagIn_1" changes back to "0", the period assigned at input PT (200 ms) runs.

The "TagOut" operand at output Q is set back to "0" when the period expires. Operand "Tag_ET" contains the current time value.

13.2.5 Counter operations

13.2.5.1 CTU: Count up (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at input CU changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is increased by one. The count value is increased on each detection of a positive signal edge until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the signal state at input CU no longer affects the instruction.

The counter status can be queried at output Q. The signal state at output Q is determined by parameter PV. When the current count value is greater than or equal to the value of parameter PV, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is reset to zero when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at input CU has no effect on the instruction.

Every call of the "Count up" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Counter input
R	Input	BOOL	Reset input
PV	Input	INT	Value for which output Q is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

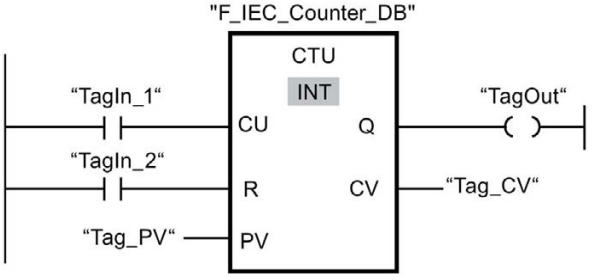
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count up" instruction is executed and the current count value of the "Tag_CV" operand is increased by one. The count value is increased on every additional positive signal edge until the high limit of the specified data type (32767) is reached.

The value at parameter PV is taken as the limit for the determination of output "TagOut". Output "TagOut" delivers the signal state "1" as long as the current count value is greater than or equal to the value of operand "Tag_PV". In all other cases, output TagOut has signal state "0".

13.2.5.2 CTD: Count down (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at input CD changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is decreased by one. The count value is decreased on each detection of a positive signal edge until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at input CD no longer affects the instruction.

The counter status can be queried at output Q. When the current count value is less than or equal to zero, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is set to the value of parameter "PV" when the signal state at input LD changes to "1". As long as signal state "1" exists at input LD, the signal state at input CD has no effect on the instruction.

Every call of the "Count down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count down" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Counter input
LD	Input	BOOL	Load input
PV	Input	INT	Value at the output CV when LD = 1 is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

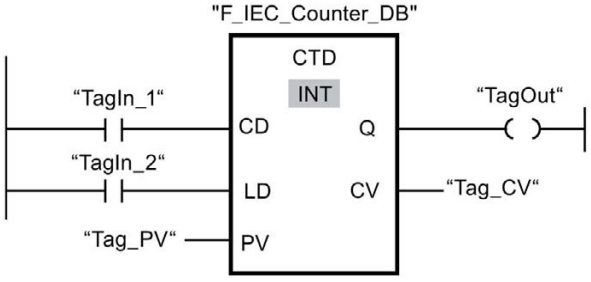
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



If the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count down" instruction is executed and the current count value at output "Tag_CV" is decreased by one. The count value is decreased on each additional positive signal edge until the low limit of the specified data type (-32768) is reached.

Output "TagOut" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut has signal state "0".

13.2.5.3 CTUD: Count up and down (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count up and down" instruction to increment and decrement the count value at output CV. If the signal state at input CU changes from "0" to "1" (positive signal edge), the current count value at output CV is increased by one. If the signal state at input CD changes from "0" to "1" (positive signal edge), the count value at output CV is decreased by one. If a positive signal edge is present at inputs CU and CD in one program cycle, the current count value at output CV remains unchanged.

The count value can be increased until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is no longer decreased.

When the signal state at input LD changes to "1", the count value at output CV is set to the value of parameter PV. As long as signal state "1" exists at input LD, the signal state at inputs CU and CD has no effect on the instruction.

The count value is set to zero, when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at inputs CU, CD, and LD has no effect on the "Count up and down" instruction.

The status of the up counter can be queried at output QU. When the current count value is greater than or equal to the value of parameter PV, output QU delivers signal state "1". In all other cases, the signal state at output QU is "0".

The status of the down counter can be queried at output QD. When the current count value is lesser than or equal to zero, output QD delivers signal state "1". In all other cases, the signal state at output QD is "0".

Every call of the "Count up and down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up and down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up and down" instruction on a cold restart of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input
PV	Input	INT	Value set at the output QU/ at which the output CV is set at LD = 1.
QU	Output	BOOL	Status of up counter
QD	Output	BOOL	Status of down counter
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

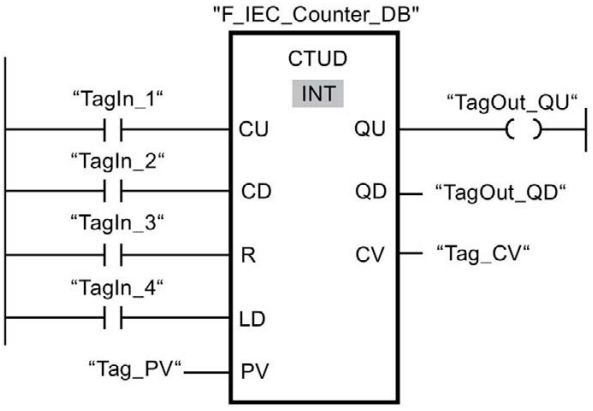
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state at input "TagIn_1" or at input "TagIn_2" changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When a positive signal edge is present at input "TagIn_1", the current count value of the "Tag_CV" operand is increased by one. When a positive signal edge is present at input "TagIn_2", the current count value at output "Tag_CV" is decreased by one. The count value is increased on each positive signal edge at input CU until it reaches the high limit of 32767. The count value is decreased on each positive signal edge at input CD until it reaches the low limit of -32768.

Output "TagOut_QU" delivers the signal state "1" as long as the current count value is greater than or equal to the value at input "Tag_PV". In all other cases, output TagOut_QU has signal state "0".

Output "TagOut_QD" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut_QD has signal state "0".

13.2.6 Comparator operations

13.2.6.1 CMP ==: Equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Equal" instruction to determine if the first comparison value (<Operand1>) is equal to the second comparison value (<Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0". The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

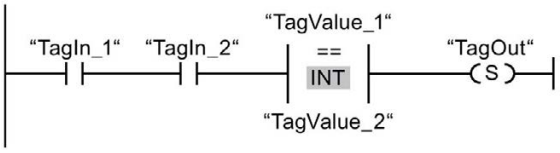
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME, WORD, DWORD	First value to compare
<Operand2>	Input	INT, DINT, TIME, WORD, DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue_1" = "TagValue_2").

13.2.6.2 CMP <>: Unequal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Not equal" instruction to determine if the first comparison value (<Operand1>) is not equal to the second comparison value (<Operand2>).

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0". The RLO is linked to the RLO of the instruction of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

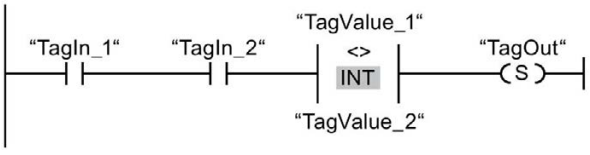
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME, WORD, DWORD	First value to compare
<Operand2>	Input	INT, DINT, TIME, WORD, DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Inputs "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue_1" <> "TagValue_2").

13.2.6.3 CMP >=: Greater or equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Greater or equal" instruction to determine if the first comparison value (<Operand1>) is greater than or equal to the second comparison value (<Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

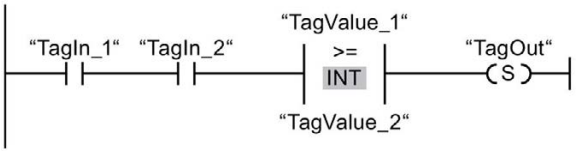
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME	First value to compare
<Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue_1" >= "TagValue_2").

13.2.6.4 CMP <=: Less or equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Less or equal" instruction to determine if the first comparison value (<Operand1>) is less than or equal to the second comparison value (<Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

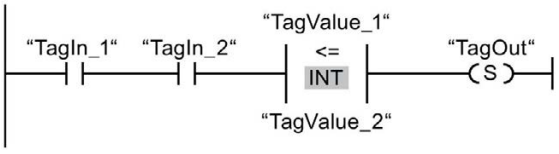
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME	First value to compare
<Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue_1" <= "TagValue_2").

13.2.6.5 CMP >: Greater than (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Greater than" instruction to determine if the first comparison value (<Operand1>) is greater than the second comparison value (<Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

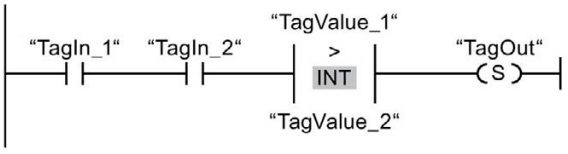
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME	First value to compare
<Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue1" > "TagValue2").

13.2.6.6 CMP <: Less than (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Less than" instruction to determine if the first comparison value (<Operand1>) is less than the second comparison value (<Operand2>). Both comparison values must be of the same data type.

If the condition of the comparison is satisfied, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not satisfied, the instruction returns RLO "0".

The RLO of the instruction is linked to the RLO of the entire current path as follows:

- By AND, when the comparison instruction is connected in series.
- By OR, when the comparison instruction is connected in parallel.

Enter the first comparison value (<Operand1>) in the operand placeholder above the instruction. Enter the second comparison value (<Operand2>) in the operand placeholder below the instruction.

Parameters

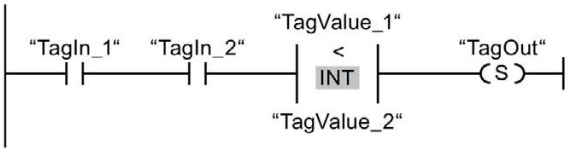
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	INT, DINT, TIME	First value to compare
<Operand2>	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The condition of the comparison instruction is fulfilled ("TagValue_1" < "TagValue_2").

13.2.7 Math functions

13.2.7.1 ADD: Add (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at the OUT output (OUT = IN1 + IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

Table 13- 1

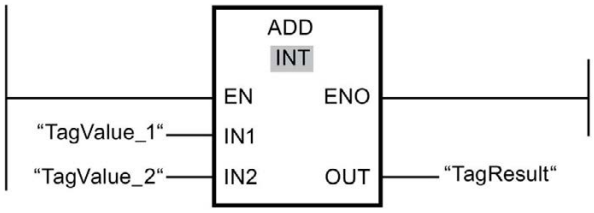
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	First addend
IN2	Input	INT, DINT	Second addend
OUT	Output	INT, DINT	Total

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

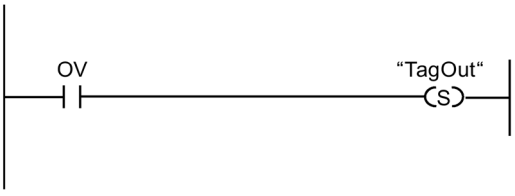
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "TagValue_1" operand is added to value of the TagValue_2 operand. The result of the addition is stored in the "TagResult" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.7.2 SUB: Subtract (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at the OUT output (OUT = IN1 – IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

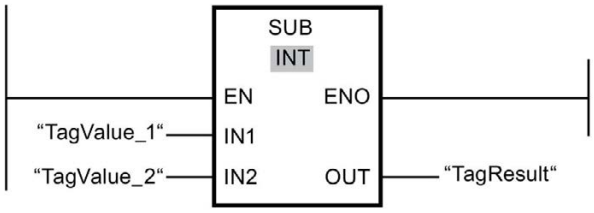
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Minuend
IN2	Input	INT, DINT	Subtrahend
OUT	Output	INT, DINT	Difference

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

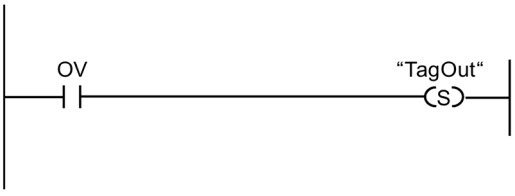
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Subtract" instruction is always executed (regardless of the signal state at enable input EN).

The value of operand "TagValue_2" is subtracted from the value of operand "TagValue_1". The result of the addition is stored in operand "TagResult".

(S7-300, S7-400) If an overflow occurs during execution of the "Subtract" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.7.3 MUL: Multiply (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Multiply" instruction to multiply the value at input IN1 by the value at input IN2 and query the product at output OUT (OUT = IN1 × IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

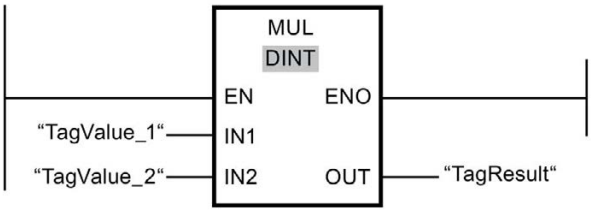
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Multiplier
IN2	Input	INT, DINT	Multiplicand
OUT	Output	INT, DINT	Product

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

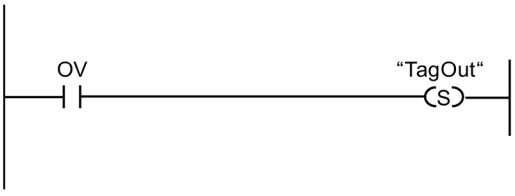
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Multiply" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "TagValue_1" operand is multiplied by the value of the "TagValue_2" operand. The result of the multiplication is stored in the "TagResult" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Multiply" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

13.2.7.4 DIV: Divide (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at the OUT output (OUT = IN1 / IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts in this case like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Note

S7-300/400:

If the divisor (input IN2) of a DIV instruction = 0, the quotient of the division (result of division at output OUT) = 0. The result reacts like the corresponding instruction in a standard block. The F-CPU does *not* go to STOP mode.

S7-1200/1500:

If the divisor (input IN2) of a DIV instruction = 0, the F-CPU goes to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages. We recommend that you rule out a divisor (input IN2) = 0 when creating the program.

Parameters

The following table shows the parameters of the instruction:

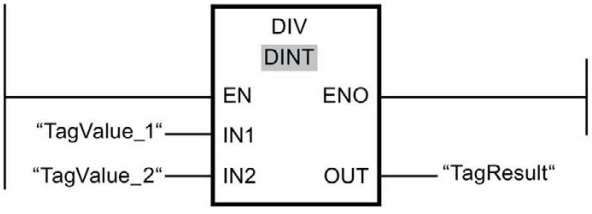
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Dividend
IN2	Input	INT, DINT	Divisor
OUT	Output	INT, DINT	Quotient

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

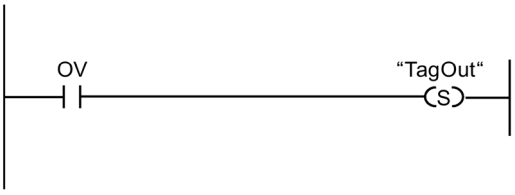
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Divide" instruction is always executed (regardless of the signal state at enable input EN).

The value of operand "TagValue_1" is divided by the value of operand "TagValue_2". The result of the division is stored in operand "TagResult".

(S7-300, S7-400) If an overflow occurs during execution of the "Divide" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.7.5 NEG: Create twos complement (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN input and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

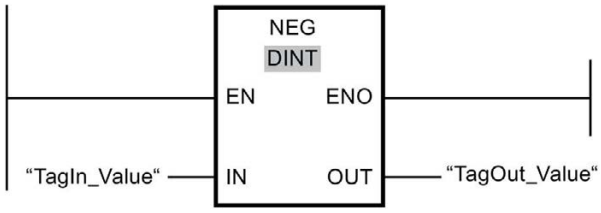
Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Twos complement of the input value

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

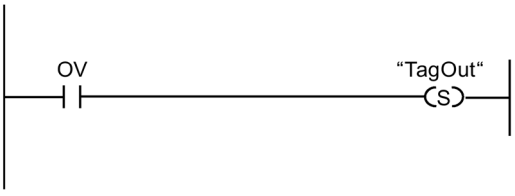
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Create twos complement" instruction is always executed (regardless of the signal state at enable input EN).

The sign of the "TagIn_Value" operand is changed and the result is stored in the "TagOut_Value" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Create twos complement" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.8 Move operations

13.2.8.1 MOVE: Move value (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Move value" instruction to transfer the content of the operand at input IN to the operand at output OUT1.

Only identical operand widths can be specified for input IN and output OUT1.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

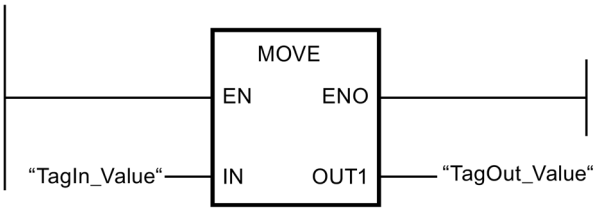
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT, WORD, DWORD, TIME	Source value
OUT1	Output	INT, DINT, WORD, DWORD, TIME	Destination address

Example

The following example shows how the instruction works:



The instruction is always executed regardless of the signal state at enable input "EN". The instruction copies the content of operand "TagIn_Value" to operand "TagOut_Value".

13.2.8.2 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction writes the value specified in input IN to the tag addressed by INI_ADDR and OFFSET in an F-DB.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostic event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB to which the value at input IN is to be written is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

As shown in the following example, the INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Value to be written to the F-DB
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset

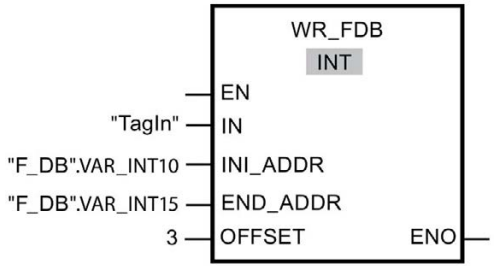
You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFS

Name	Data type	Initial value	Comment
Static			
VAR_BOOL10	Bool	false	
VAR_BOOL11	Bool	false	
VAR_BOOL12	Bool	false	
VAR_BOOL13	Bool	false	
VAR_TIME10	Time	T#0MS	
VAR_TIME11	Time	T#0MS	
VAR_INT10	Int	0	<- INI_ADDR = "F-DB".VAR_INT10 Example 1
VAR_INT11	Int	0	
VAR_INT12	Int	0	
VAR_INT13	Int	0	<- OFFSET = 3
VAR_INT14	Int	0	
VAR_INT15	Int	0	<- END_ADDR = "F-DB".VAR_INT15
VAR_BOOL20	Bool	false	
VAR_BOOL21	Bool	false	
VAR_BOOL22	Bool	false	
VAR_BOOL23	Bool	false	
VAR_INT20	Int	0	<- INI_ADDR = "F-DB".VAR_INT20 Example 2
VAR_INT21	Int	0	
VAR_INT22	Int	0	
VAR_INT23	Int	0	<- END_ADDR = "F-DB".VAR_INT23
VAR_INT30	Int	0	<- INI_ADDR = "F-DB".VAR_INT30 Example 3
VAR_INT31	Int	0	<- OFFSET = 1
VAR_INT32	Int	0	
VAR_INT33	Int	0	
VAR_INT34	Int	0	<- END_ADDR = "F-DB".VAR_INT34
VAR_TIME20	TIME	T#0MS	
VAR_DINT10	DInt	0	<- INI_ADDR = "F-DB".VAR_DINT10 Example 4
VAR_DINT11	DInt	0	
VAR_DINT12	DInt	0	<- OFFSET = 2
VAR_DINT13	DInt	0	<- END_ADDR = "F-DB".VAR_DINT13

Example

The following example shows how the instruction works:



13.2.8.3 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction reads the tag addressed via INI_ADDR and OFFSET in an F-DB and provides it at output OUT.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostic event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB from which the tag is to be read is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

The INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted. Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFSET are contained in WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 445).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

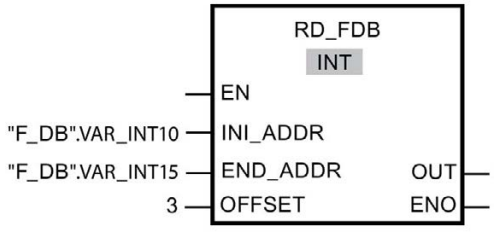
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset
OUT	Output	INT, DINT	Value to be read from the F-DB

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



13.2.9 Conversion operations

13.2.9.1 CONVERT: Convert value (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

The "Convert value" instruction reads the content of parameter IN and converts it according to the data types selected in the instruction box. The converted value is output at output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

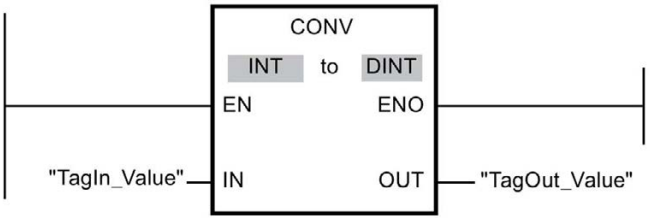
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Value to be converted.
OUT	Output	DINT	Result of the conversion

Example

The following example shows how the instruction works:



The instruction is always executed regardless of the signal state at enable input EN. The content of the operand "TagIn_Value" is read and converted to an integer (32 bit). The result is stored in operand "TagOut_Value".

13.2.9.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction converts the 16 values of data type BOOL at inputs IN0 to IN15 to a value of data type WORD, which is made available at output OUT. The conversion takes place as follows: The i-th bit of the WORD value is set to 0 (or 1), if the value at input INi = 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN0	Input	BOOL	Bit 0 of WORD value
IN1	Input	BOOL	Bit 1 of WORD value
...			...
IN15	Input	BOOL	Bit 15 of WORD value
OUT	Output	WORD	WORD value consisting of IN0 to IN15

Instruction versions

A number of versions are available for this instruction:

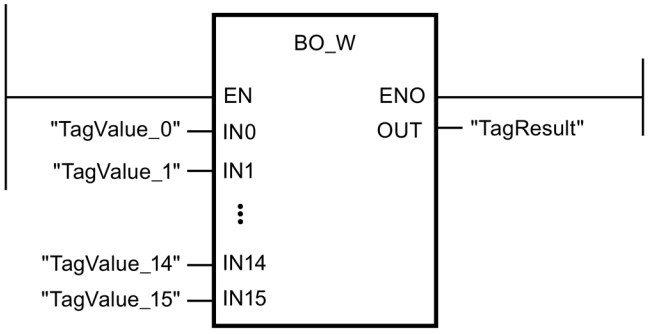
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN0	TagValue_0	FALSE
IN1	TagValue_1	FALSE
...		...
IN13	TagValue_13	FALSE
IN14	TagValue_14	TRUE
IN15	TagValue_15	TRUE
OUT	TagResult	W#16#C000

The values of operands "TagValue_0" to " TagValue_15" are combined to form data type WORD and assigned to operand "TagResult".

13.2.9.3 W_BO: Convert 16 data elements of data type WORD to a data element of data type BOOL (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction converts the value of data type WORD at input IN to 16 values of data type BOOL, which are provided at outputs OUT0 to OUT15. The conversion takes place as follows: Output OUTi is set to 0 (or 1), if the i-th bit of the WORD value is 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	WORD value
OUT0	Output	BOOL	Bit 0 of WORD value
OUT1	Output	BOOL	Bit 1 of WORD value
...			...
OUT15	Output	BOOL	Bit 15 of WORD value

Instruction versions

A number of versions are available for this instruction:

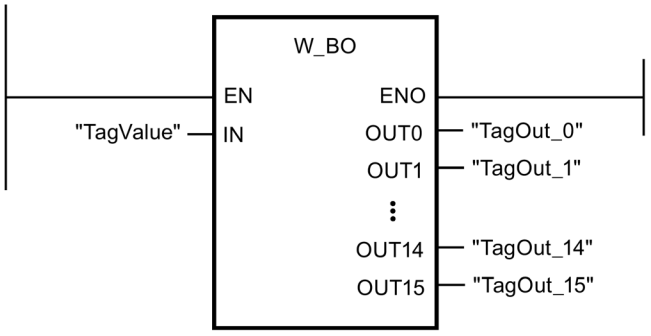
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagValue	W#16#C000
OUT0	TagOUT_0	FALSE
OUT1	TagOUT_1	FALSE
...		...
OUT13	TagOUT_13	FALSE
OUT14	TagOUT_14	TRUE
OUT15	TagOUT_15	TRUE

The value of operand "TagValue" of data type WORD is converted to the 16 values "TagOUT_0" to "TagOUT_15" of data type BOOL.

13.2.9.4 SCALE: Scale values (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale values" instruction must be assigned a data area in which the instruction data are stored. In addition, when the instruction is inserted in the program, the "Call options" dialog is automatically opened, where you can create a data block (single instance) (e.g., SCALE_DB_1) or a multi-instance (e.g., SCALE_Instance_1) for the "Scale values" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	INT	High limit value of value range of OUT
LO_LIM	Input	INT	Low limit value of value range of OUT
OUT	Output	INT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	This version has identical functions to version V1.0.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

Note

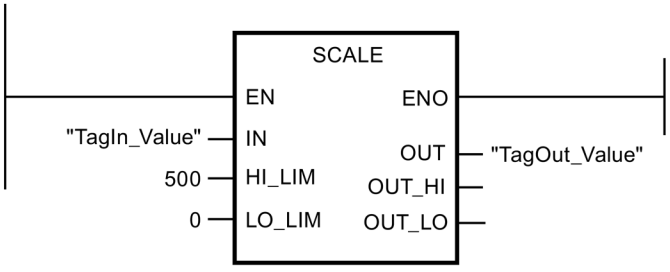
If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If other fail-safe values should be output in this case, you need to evaluate the QBAD signal of the associated F-I/O or QBAD_I_xx signal / value status of the corresponding channel.

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:



When operand "TagIn_Value" = 20000, the result is "TagOut_Value" 361.

13.2.10 Program control operations

13.2.10.1 ---(JMP): Jump if RLO = 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (Page 459) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1" or the input is not connected, the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "0", the program continues executing in the next network.

Note

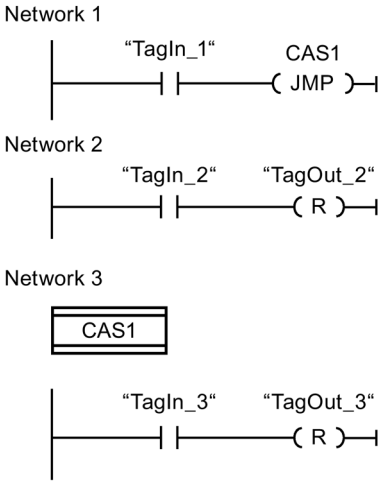
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.2.10.2 ---(JMPN): Jump if RLO = 0 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Jump if RLO = 0" instruction to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (Page 459) (LABEL). The description of the jump label is specified in the placeholder above the instruction.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "1", the program continues executing in the next network.

Note

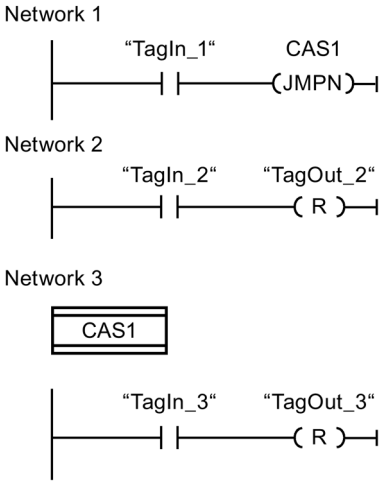
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "0", the "Jump if RLO = 0" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.2.10.3 LABEL: Jump label (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

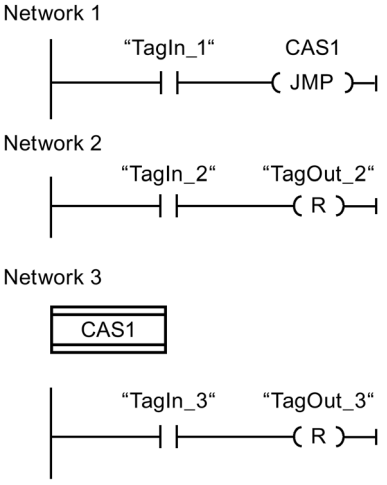
You can use a jump label to specify a destination network, in which the program execution should resume after a jump.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. To each jump label can be jumped from several locations.

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

---(JMP): Jump if RLO = 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 455)

---(JMPN): Jump if RLO = 0 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 457)

--(RET): Return (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 460)

13.2.10.4 --(RET): Return (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Return" instruction to stop the processing of a block.

If the result of logic operation (RLO) at the input of the "Return" instruction is "1", program execution is terminated in the currently called block and continued in the calling block (for example, in the main safety block) after the call function. If the RLO at the input of the "Return" instruction is "0", the instruction is not executed. Program execution continues in the next network of the called block.

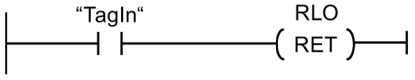
Influencing the status of the call function (ENO) is irrelevant, because the enable output "ENO" cannot be connected.

Note

You cannot program a RET instruction before a main safety block call.

Example

The following example shows how the instruction works:



When the "TagIn" operand delivers signal state "1", the "Return" instruction is executed. Program execution is terminated in the called block and continues in the calling block.

---(JMPN): Jump if RLO = 0 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 457)

LABEL: Jump label (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 459)

13.2.10.5 ---(OPN): Open global data block (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

You can use the "Open global data block" instruction to open a data block. The number of the data block is transferred to the DB register. Subsequent DB commands access the relevant blocks depending on the register contents.

Note

Note when using the "Open global data block" instruction that the content of the DB register can be changed following calls of F-FB/F-FC and "fully qualified DB accesses," such that there is no guarantee that the last data block you opened with "Open global data block" is still open.

You should therefore use the following method for addressing data to avoid errors when accessing data of the DB register:

- Use symbolic addressing.
- Use only fully qualified DB accesses.

If you still want to use the "Open global data block" operation, you must ensure that the DB register is restored by repeating the "Open global data block" instruction following calls of F-FB/F-FC and "fully qualified DB accesses." Otherwise, a malfunction could result.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Data block>	Input	BLOCK_DB	Data block that is opened

"Fully qualified DB access"

The initial access to data of a data block in an F-FB/F-FC must always be a "fully qualified DB access," or it must be preceded by the "Open global data block" instruction. This also applies to the initial access to data of a data block after a jump label.

An example of "fully qualified DB access" and "non-fully qualified DB access" is provided in Restrictions in the programming languages FBD/LAD (Page 90).

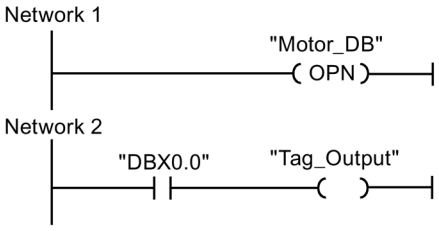
Access to instance DBs

You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

Example

The following example shows how the instruction works:



The "Motor_DB" data block is called in network 1. The number of the data block is transferred to the DB register. The "DBX0.0" operand is queried in network 2. The signal state of the "DBX0.0" operand is assigned to the "Tag_Output" operand.

13.2.11 Word logic operations

13.2.11.1 AND: AND logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "AND logic operation" instruction to combine the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

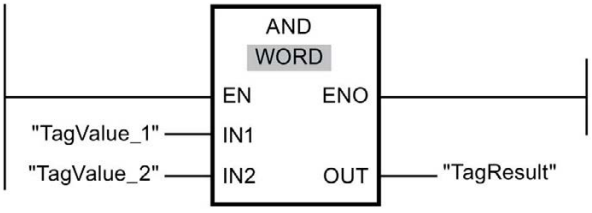
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"TagValue_1" = 01010101 01010101
IN2	"TagValue_2" = 00000000 00001111
OUT	"TagResult" = 00000000 00000101

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "TagValue_1" operand and the value of the "TagValue_2" operand are ANDed. The result is mapped bit-by-bit and output in the "TagResult" operand.

13.2.11.2 OR: OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "OR logic operation" instruction to connect the value at input IN1 input to the value at input IN2 bit-by-bit by OR logic and query the result at output OR.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ORed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The result bit has signal state "1" when at least one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

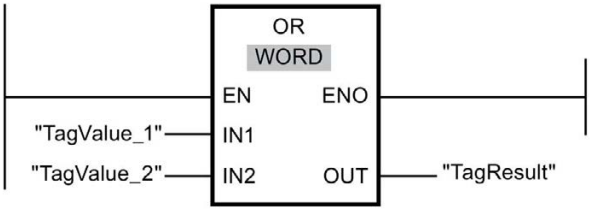
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"TagValue_1" = 01010101 01010101
IN2	"TagValue_2" = 00000000 00001111
OUT	"TagResult" = 01010101 01011111

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "TagValue_1" operand and the value of the "TagValue_2" operand are ORed. The result is mapped bit-by-bit and output in the "TagResult" operand.

13.2.11.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at input IN1 and the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 input and bit 0 of the value at input IN2 are logically combined by EXCLUSIVE OR. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The result bit has signal state "1" when one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

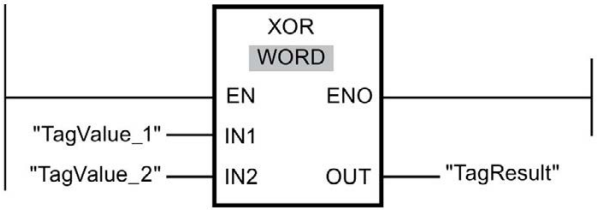
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"TagValue_1" = 01010101 01010101
IN2	"TagValue_2" = 00000000 00001111
OUT	"TagResult" = 01010101 01011010

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "TagValue_1" operand and the value of the "TagValue_2" operand are logically combined by EXCLUSIVE OR. The result is mapped bit-by-bit and output in the "TagResult" operand.

13.2.12 Shift and rotate

13.2.12.1 SHR: Shift right (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

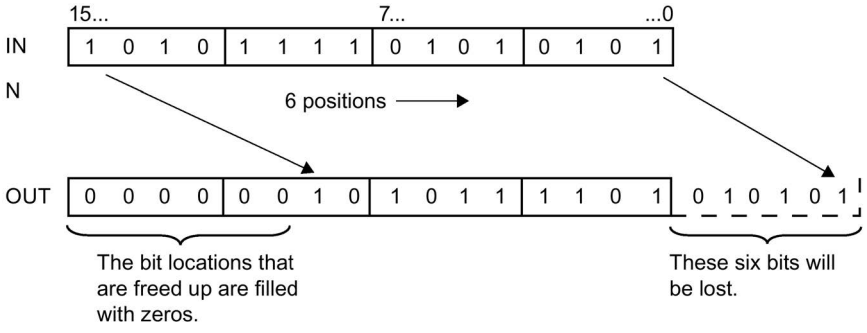
Use the "Shift right" instruction to shift the content of the operand at input IN bit-by-bit to the right and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The bit locations that are freed up in the left area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the right:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

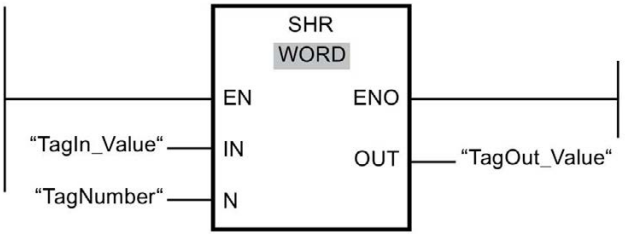
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	TagNumber	3
OUT	TagOut_Value	0000 0111 1111 0101

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved three bit positions to the right. The result is output at output "TagOut_Value".

13.2.12.2 SHL: Shift left (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

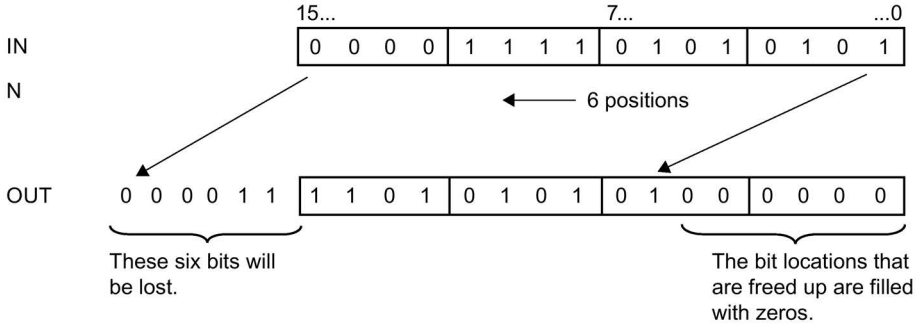
Use the "Shift left" instruction to shift the content of the operand at input IN bit-by-bit to the left and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions that are freed up in the right area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the left:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

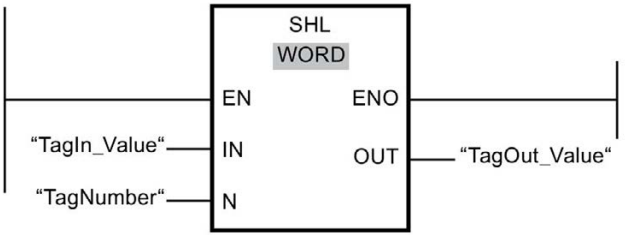
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	TagNumber	4
OUT	TagOut_Value	1111 1010 1111 0000

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved four bit positions to the left. The result is output at output "TagOut_Value".

13.2.13 Operating

13.2.13.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description (S7-300, S7-400)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to a value of 9 within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value of 9 after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value 9 within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value 9, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name.*(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note

You can read out output Q by means of HMI systems or, if applicable, you can evaluate it in your standard user program.

You can provide the in/out IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Description (S7-1200, S7-1500)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to the value at the ACK_ID input within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value at the ACK_ID input after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value at the ACK_ID input within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value at the ACK_ID input, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

⚠ WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:
  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note

You can read out output Q by means of HMI systems or, if applicable, you can evaluate it in your standard user program.

You need to provide the in/out IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Parameters (S7-300, S7-400)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Parameters (S7-1200, S7-1500)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_ID	Input	INT	Identifier of the acknowledgment (9 to 30000)
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Instruction versions

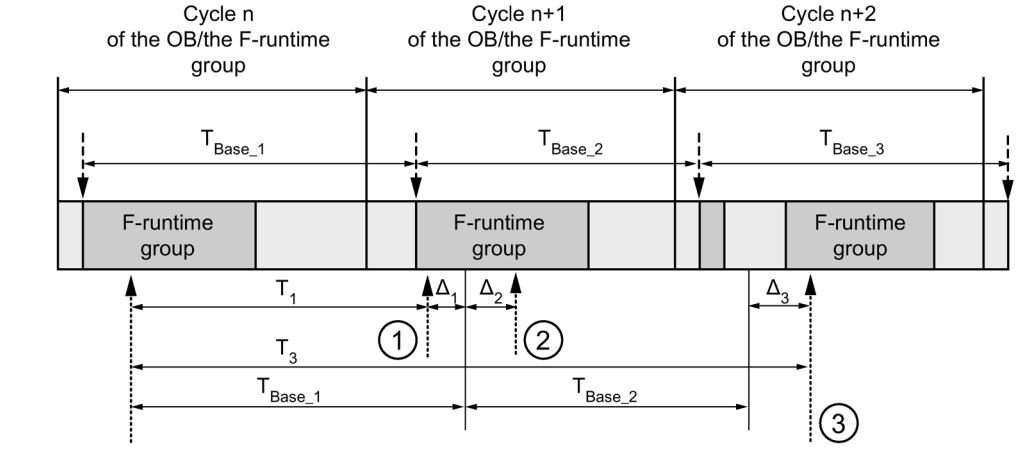
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions are identical in function to version V1.0 for S7-300/400 F-CPUs. The input ACK_ID must also be taken into consideration for S7-1200/1500 F-CPUs.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing imprecision resulting from the update time of the time base used in the instruction:



① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

An example how the instruction is used is available under Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 151).

See also

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (S7-300, S7-400, S7-1500) (Page 156)

13.2.14 Additional instructions

13.2.14.1 ---| |--- OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed. The "Get status bit OV" instruction functions like a normally open contact. If the query is fulfilled, the instruction has signal state "1". If the condition is not fulfilled the instruction has signal state "0".

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

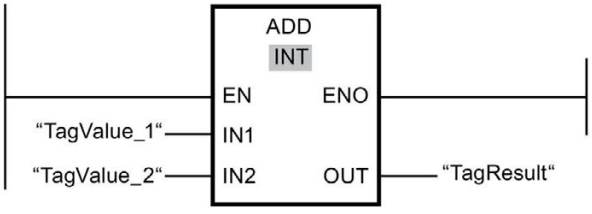
Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

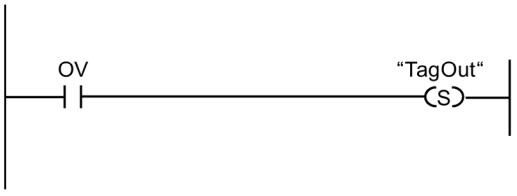
Example

The following example shows how the instruction works:

Network 1:



Network 2:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "TagValue_1" operand is added to value of the TagValue_2 operand. The result of the addition is stored in the "TagResult" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.14.2 ---| / |--- OV: Get negated status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

You can use the "Get negated status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed. The "Get negated status bit OV" instruction functions like a normally closed contact. If the query is satisfied, the instruction has signal state "0". If the query not satisfied, the instruction has signal state "1".

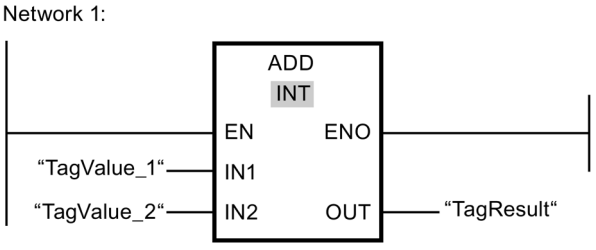
The "Get negated status bit OV" evaluation must be inserted in the network following the instruction that influences the OV. This network must not contain any jump labels.

Note

The execution time of the OV-affecting instruction is extended when the "Get negated status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

Example

The following example shows how the instruction works:



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "TagValue_1" operand is added to value of the TagValue_2 operand. The result of the addition is stored in the "TagResult" operand.

If an overflow does *not* occur during execution of the "Add" instruction, the status bit OV is reset to "0". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.2.15 Communication

13.2.15.1 PROFIBUS/PROFINET

SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500)

Introduction

You use the SENDDP and RCVDP instructions for fail-safe sending and receiving of data using:

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication

Description

The SENDDP instruction sends 16 data elements of data type BOOL and 2 data elements of data type INT or one data element of the data type DINT (S7-1500) in a fail-safe manner to another F-CPU via PROFIBUS DP/PROFINET IO. The data can be received there by the related RCVDP instruction.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., RCVDP_DB_1) for these instructions. Once it is created, the new data block can be found in the "STEP 7 Safety" folder in the project tree under "Program blocks > System blocks". For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

With the SENDDP instruction, the data to be sent (for example, outputs of other F-blocks/instructions) are available at input SD_BO_xx or SD_I_xx or SD_DI_00 as alternative.

With the RCVDP instruction, the data received are available at outputs RD_BO_xx and RD_I_xx or RD_DI_00 as alternative for additional processing by other F-blocks/instructions.

(S7-1500) At the DINTMODE input of the SENDDP instruction you specify if the data at the inputs SD_I_00 and SD_I_01 or the data at the input SD_DI_00 is sent.

The operating mode of the F-CPU with the SENDDP instruction is provided at output SENDMODE. If the F-CPU with the SENDDP instruction is in disabled safety mode, output SENDMODE = 1.

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define the communication relationship between a SENDDP instruction in one F-CPU and a RCVDP instruction in the other F-CPU by specifying an address relationship at the DP_DP_ID inputs of the SENDDP and RCVDP instructions. Associated SENDDP and RCVDP instructions are assigned the same value for DP_DP_ID.

⚠ WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Note

Within a safety program, you must assign a different start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) for every call of the SENDDP and RCVDP instructions at input LADDR.

A separate instance DB must be used for each call of the SENDDP and RCVDP instructions. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVDP instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVDP instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVDP or RCVS7 instruction called in an upstream network.

The RD_D_00 output must not be evaluated for DINTMODE = 0; the RD_I_xx outputs of the RCVDP instruction must not be evaluated for DINTMODE = 1.

(S7-1500) The outputs of the SENDDP and RCVDP instructions must not be supplied with tags from the standard user program. Exception: RET_DPRD, RET_DPWR and DIAG outputs.

You cannot use an actual parameter for an output of an RCVDP instruction, if it is already being used for an input of the same or another RCVDP or RCVS7 instruction.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You are not permitted to insert any SENDDP instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

You cannot insert a RET instruction prior to a SENDDP instruction.

SENDDP parameter

The following table shows the parameters of the SENDDP instruction:

Parameter	Declaration	Data type	Description
SD_BO_00	Input	BOOL	Send data BOOL 00
...			...
SD_BO_15	Input	BOOL	Send data BOOL 15
SD_I_00	Input	INT	Send data INT 00
SD_I_01	Input	INT	Send data INT 01
SD_DI_00	Input	DINT	(S7-1500) (hidden) Send data DINT 00
DINTMODE	Input	DINT	(S7-1500) (hidden) 0=SD_I_00 u. SD_I_01 are sent 1=SD_DI_00 is sent
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
LADDR	Input	INT	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=RCVDP outputs fail-safe values
RET_DPRD	Output	WORD	Error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))

Parameter	Declaration	Data type	Description
RET_DPWR	Output	WORD	Error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Service information

RCVDP parameter:

The following table shows the parameters of the RCVDP instruction:

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	1=Acknowledgment for reintegration of send data following communication error
SUBBO_00	Input	BOOL	Fail-safe value for receive data BOOL 00
...			...
SUBBO_15	Input	BOOL	Fail-safe value for receive data BOOL 15
SUBI_00	Input	INT	Fail-safe value for receive data INT 00
SUBI_01	Input	INT	Fail-safe value for receive data INT 01
SUBDI_00	Input	DINT	(S7-1500) (hidden) Fail-safe value for receive data DINT 00
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
LADDR	Input	INT	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with SENDDP instruction in disabled safety mode
RD_BO_00	Output	BOOL	Receive data BOOL 00
...			...
RD_BO_15	Output	BOOL	Receive data BOOL 15
RD_I_00	Output	INT	Receive data INT 00
RD_I_01	Output	INT	Receive data INT 01

Parameter	Declaration	Data type	Description
RD_DI_00	Output	DINT	(S7-1500) (hidden) Receive data DINT 00
RET_DPRD	Output	WORD	Error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))
RET_DPWR	Output	WORD	Error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	This version has identical functions to version V1.0.
1.3	x	—	x	S7-300/400: This version has identical functions to version V1.0. S7-1500: Instead of 2 data of data type INT, one data of data type DINT can be sent/received as alternative. Otherwise identical function as version V1.0.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

The RCVDP instruction must be inserted at the start of the main safety block and the SENDDP instruction at the end.

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDDP and RCVDP instructions). During this time, the receiver (RCVDP instruction) outputs the fail-safe values present at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00.

The SENDDP and RCVDP instructions signal this at output SUBS_ON with 1. Output SENDMODE has a default of 0 and is not updated, as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVDP instruction) then outputs the fail-safe values assigned at its SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs. Output SENDMODE is not updated while output SUBS_ON = 1.

The send data of the SENDDP instruction present at inputs SD_BO_xx and SD_I_xx, SD_DI_00 as alternative, are only output again when communication errors are no longer detected (ACK_REQ = 1) and you acknowledge (Page 151) the RCVDP instruction with a positive edge at input ACK_REI.

⚠ WARNING

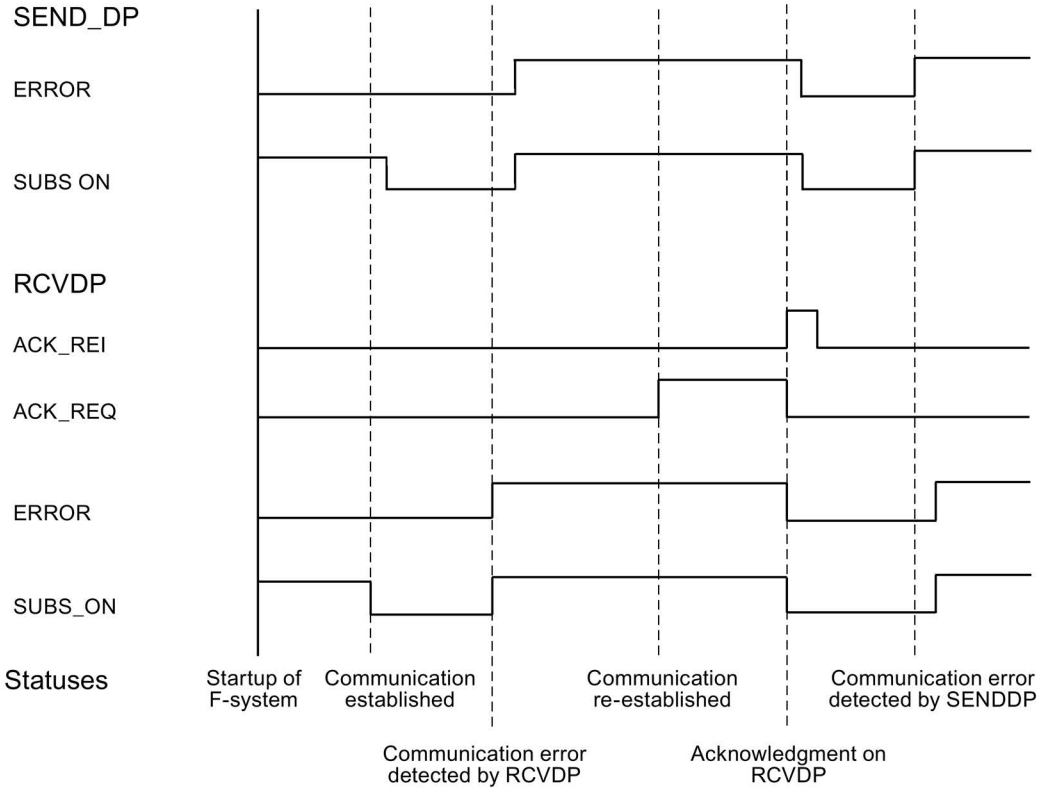
For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) for a communication error will not be set unless communication between the connection partners (SENDDP and RCVDP instructions) has been previously established. If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDDP and the RCVDP instructions, and the bus connection. You also obtain information on possible error causes by evaluating outputs RET_DPRD and RETDP_WR.

In general, always evaluate RET_DPRD and RETDP_WR, since it is possible that only one of the two outputs will contain error information.

Timing diagrams SENDDP/RCVDP



Output DIAG

In addition, non-fail-safe information about the type of communication errors that occurred is provided at output DIAG of the SENDDP and RCVDP instructions for service purposes.

You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge the errors at input ACK_REI of the RCVDP instruction.

Structure of DIAG of the SENDDP/RCVDP instruction

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout of SENDDP/RCVDP detected	Interference in bus connection to partner F-CPU.	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low.	Check assigned monitoring time TIMEOUT for SENDDP and RCVDP of both F-CPUs. If possible, set a higher value. Recompile safety program
		DP/DP coupler or PN/PN coupler configuration is invalid.	Check DP/DP coupler or PN/PN coupler configuration.
		Internal fault of DP/DP coupler or PN/PN coupler	Replace DP/DP coupler or PN/PN coupler
		CP in STOP mode, or internal fault in CP	Switch CP to RUN mode, check diagnostic buffer of CP, and replace CP, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	Switch F-CPUs to RUN mode, check diagnostic buffer of F-CPUs, and replace F-CPUs, if necessary
Bit 5	Sequence number error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 6	CRC-error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 7	Reserved	—	—

SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Introduction

You use the SENDS7 and RCVS7 instructions for fail-safe sending and receiving of data using S7 connections.

Note

In *STEP 7 Safety Advanced*, S7 connections are generally permitted over Industrial Ethernet only.

Safety-related communication via S7 connections is possible from and to F-CPUs with PROFINET interface or S7-400 F-CPUs with PROFINET-capable CPs. See also Safety-related communication via S7 connections (Page 212).

Description

The SENDS7 instruction sends the send data contained in an F-communication DB to the F-communication DB of the associated RCVS7 instruction of another F-CPU in a fail-safe manner using an S7 connection.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SENDS7_DB_1) or a multi-instance (e.g., SENDS7_Instance_1) for this instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Information on the F-communication DB is contained in "Programming safety-related communication via S7 connections (Page 215)".

An F-communication DB is an F-DB for safety-related CPU-CPU communication with special properties. You must specify the numbers of the F-communication DBs at inputs SEND_DB and RCV_DB of instructions SENDS7 and RCVS7.

The operating mode of the F-CPU with the SENDS7 instruction is provided at output SENDMODE of the RCVS7 instruction. If the F-CPU with the SENDS7 instruction is in disabled safety mode, then output SENDMODE = 1.

To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND with "0" (default = "1"). In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction, and the receiver provides fail-safe values for this period of time (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.

You must specify the local ID - from the perspective of the F-CPU - of the S7 connection (from the connection table in the network view) at input ID of the SENDS7 instruction (see also Configuring (Page 37)).

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define a communication relationship between an SENDS7 instruction in one F-CPU and a communication relationship between an RCVS7 instruction and the other F-CPU by assigning an odd number at input R_ID (of the SENDS7 and RCVS7 instructions). Associated SENDS7 and RCVS7 instructions receive the same value for R_ID.

⚠ WARNING

The value for each address relationship (R_ID input; data type: DWORD) is user-defined; however, it must be an odd number and unique network-wide* for all safety-related communication connections. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program! *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

A separate instance DB must be used for each call of the SENDS7 and RCVS7 instructions within a safety program. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVS7 instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVS7 instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVS7 or RCVDP instruction called in an upstream network.

You cannot use an actual parameter for an output of an RCVS7 instruction, if it is already being used for an input of the same or another RCVS7 or RCVDP instruction. The F-CPU can go to STOP if this is not observed. A diagnostic event is entered in the diagnostic buffer of the F-CPU.

Note

You must not program any SENDS7 instruction between a JMP or JMPN instruction and the associated destination network of the JMP or JMPN instruction.

You cannot program a RET instruction prior to a SENDS7 instruction.

SENDS7 parameter

The following table shows the parameters of the SENDS7 instruction:

Parameter	Declaration	Data type	Description
SEND_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
EN_SEND	Input	BOOL	1= Send enable
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Receiving block outputs fail-safe values
STAT_RCV	Output	WORD	Status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Service information

RCVS7 parameter

The following table shows the parameters of the RCVS7 instruction.

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	Acknowledgment for reintegration of send data after communication error
RCV_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with the SENDS7 instruction in disabled safety mode
STAT_RCV	Output	WORD	Status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1500	Function
1.0	x	—	
1.1	x	—	This version has identical functions to version V1.0. It also supports later versions of internally called instructions. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.1 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.2	x	—	This version has identical functions to version V1.0/1.1. It also supports later versions of internally called instructions.

When a new F-CPU is created with *STEP 7 Safety Advanced*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDS7 and RCVS7 instructions). The receiver (RCVS7 instruction) provides fail-safe values for this time period (initial values in its F-communication DB).

The SENDS7 and RCVS7 instructions signal this at output SUBS_ON with 1. Output SENDMODE (RCVS7 instruction) has a default of 0 and is not updated, as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVS7 instruction) then provides fail-safe values (initial values in its F-communication DB). Output SENDMODE is not updated while output SUBS_ON = 1.

The send data present in the F-communication DB (SENDS7 instruction) are not output before the communication error is no longer detected ((ACK_REQ = 1)) and you acknowledge (Page 151) with a positive edge at input ACK_REI of the RCVS7 instruction.

⚠ WARNING

For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

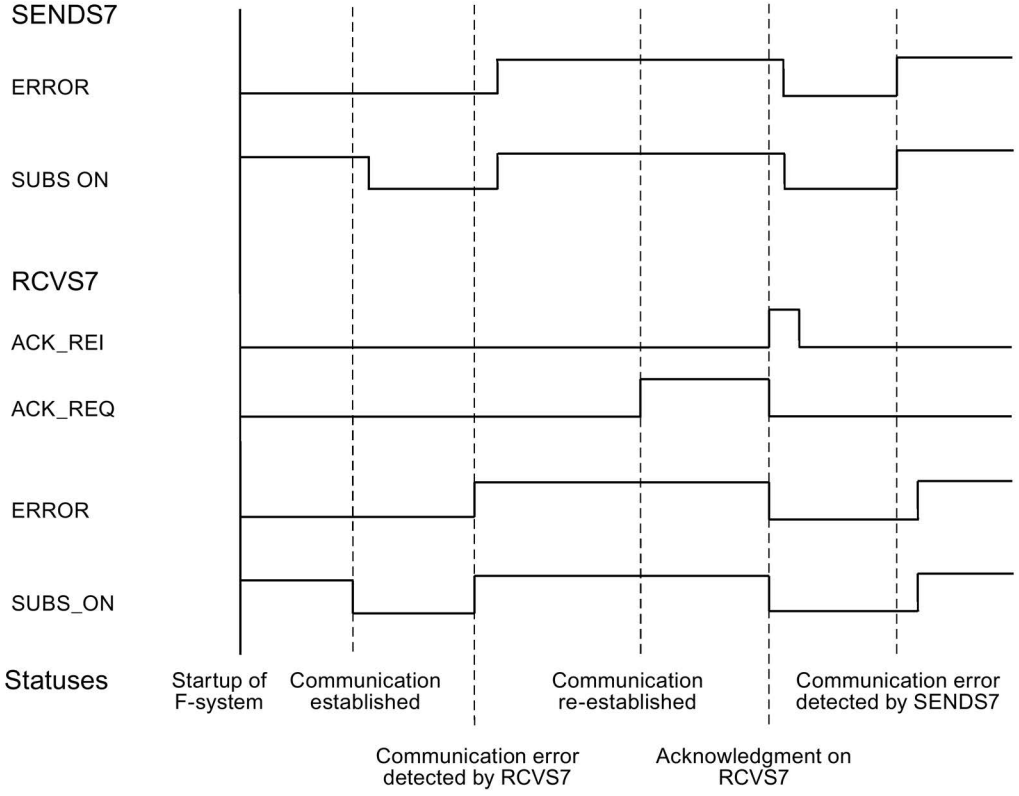
An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) will be set for the first time on a communication error if communication has already been established between the connection partners (SENDS7 and RCVS7 instructions). If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions, and the bus connection. You can also receive information on possible error causes by evaluating the STAT_RCV and STAT_SND outputs.

In general, always evaluate STAT_RCV and STAT_SND, since it is possible that only one of the two outputs will contain error information.

If one of the DIAG bits is set at output DIAG, also check whether the length and structure of the associated F-communication DB on both the sending and receiving ends match.

Timing diagrams SENDS7 and RCVS7



Output DIAG

Non-fail-safe information on the type of communication errors that have occurred is made available at output DIAG for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge them at input ACK_REI of the associated RCVS7 instruction.

Structure of DIAG

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout detected by SENDS7 and RCVS7	Fault in bus connection to partner F-CPU	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low	Check assigned monitoring time TIMEOUT for SENDS7 and RCVS7 of both F-CPUs. If possible, set a higher value. Recompile safety program
		CPs in STOP mode, or internal fault in CPs	• Switch CPs to RUN mode • Check diagnostic buffer of CPs • Replace CPs, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	• Switch F-CPUs to RUN mode • Check diagnostic buffer of F-CPUs • Replace F-CPUs, if necessary
		Communication was shut down with EN_SEND = 0.	Enable communication again at the associated SENDS7 with EN_SEND = 1
		S7 connection has changed, the IP address of the CP has changed, for example	Recompile the safety programs and download them to the F-CPUs
Bit 5	Sequence number error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 6	CRC-error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 7	RCVS7: Communication cannot be established	Configuration of the safety-related CPU-CPU communication is incorrect, parameter assignment of the SENDS7 and RCVS7 instructions is incorrect See also description for Bit 4	Check configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions is incorrect See also description for Bit 4

13.3 Instructions - FBD

13.3.1 General

13.3.1.1 New network (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Requirement

An F-block is open.

Procedure

To insert a new network, follow these steps:

1. Select the network after which you want to insert a new network.
2. Select the "Insert network" command in the shortcut menu.

Note

If you insert an element into the last empty network of the F-block in an FBD program, a new empty network is automatically inserted below it.

Result

A new empty network is inserted into the F-block.

13.3.1.2 Empty box (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Requirement

A network is available.

Procedure

To insert FBD elements into a network using an empty box, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Empty box".
3. Use a drag-and-drop operation to move the "Empty box" element to the desired place in the network.
4. Hover the cursor over the yellow triangle in the top right corner of the empty box.

   A drop-down list is displayed.
5. Select the desired FBD element from the drop-down list.

If the instruction acts as a function block (FB) within the system, the "Call options" dialog opens. In this dialog, you can create an instance data block for the function block, either as a single instance or, if necessary, multi-instance, in which data of the inserted instruction are stored. Once it is created, the new instance data block can be found in the "Program resources" folder in the project tree under "Program blocks > System blocks". If you have selected "multi-instance", you can find it in the block interface in the "Static" section.

Result

The empty box is changed to the appropriate instruction. Placeholders are inserted for the parameters.

13.3.1.3 Open branch (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You use branches to program parallel connections with the Function Block Diagram (FBD) programming language. For this purpose, you use branches that you insert between the boxes. You can insert additional boxes in the branch, thereby programming complex function block diagrams.

Requirement

A network is available.

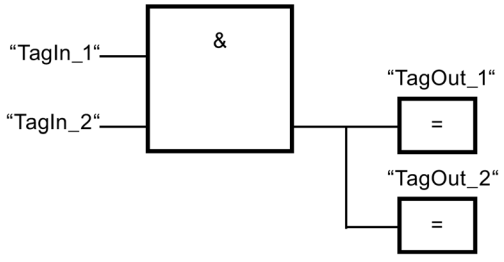
Procedure

To insert a new branch in a network, follow these steps:

1. Open the "Instructions" task card.
2. Navigate to "Basic instructions > General > Branch".
3. Use a drag-and-drop operation to move the element to the desired place in the network.

Example

The following figure provides an example of how to use branches:



13.3.1.4 Insert binary input (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Use the "Insert binary input" instruction to expand the box of one of the following instructions by a binary input:

- "AND logic operation"
- "OR logic operation"
- "EXCLUSIVE OR logic operation"

You can query the signal state of several operands by expanding the instruction box.

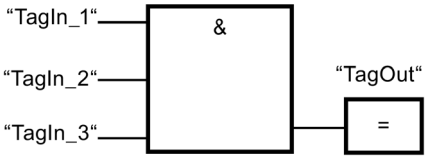
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



The box of instruction "AND logic operation" has been expanded by an additional binary input at which the signal state of operand "TagIn_3" is queried. Output "TagOut" is set when the signal state of operands "TagIn_1", "TagIn_2", and "TagIn_3" is "1".

See also

AND logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 499)

OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 500)

X: EXCLUSIVE OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 501)

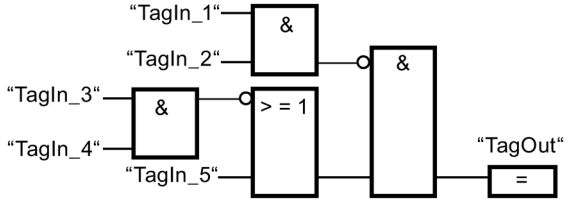
13.3.1.5 Invert RLO (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Invert RLO" instruction to invert the result of logic operation (RLO).

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Input "TagIn_1" or "TagIn_2" has signal state "0".
- Input "TagIn_3" or "TagIn_4" has the signal state "0" or input "TagIn_5" has the signal state "1".

13.3.2 Bit logic operations

13.3.2.1 AND logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "AND logic operation" instruction to query the signal states of two or more specified operands and evaluate them according to the AND truth table.

If the signal state of all the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of one of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "AND logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "AND logic operation" instruction that is not the first instruction in the logic string logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the AND truth table.

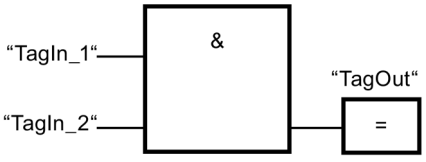
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of operands "TagIn_1" and "TagIn_2" is "1".

AND truth table

The following table shows the results when linking two operands by an AND logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	1	1
0	1	0
1	0	0
0	0	0

See also

Insert binary input (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 497)

13.3.2.2 OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "OR logic operation" instruction to get the signal states of two or more specified operands and evaluate them according to the OR truth table.

If the signal state of at least one of the operands is "1", then the conditions are fulfilled and the instruction returns the result "1". If the signal state of all of the operands is "0", then the conditions are not fulfilled and the instruction generates the result "0".

If the "OR logic operation" instruction is the first instruction in a logic string, it saves the result of its signal state query in the RLO bit.

Each "OR logic operation" instruction that is not the first instruction in the logic string, logically combines the result of its signal state query with the value saved in the RLO bit. This logical combination is performed according to the OR truth table.

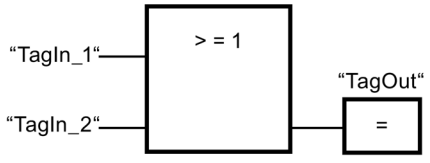
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of operand "TagIn_1" or "TagIn_2" is "1".

OR truth table

The following table shows the results when linking two operands by an OR logic operation:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	1
0	0	0

See also

Insert binary input (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 497)

13.3.2.3 X: EXCLUSIVE OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to get the result of a signal state query according to the the EXCLUSIVE OR truth table.

With an "EXCLUSIVE OR logic operation" instruction, the signal state is "1" when the signal state of one of the two specified operands is "1". When more than two operands are queried, the overall result of logic operation is "1" if an odd-numbered quantity of queried operands returns the result "1".

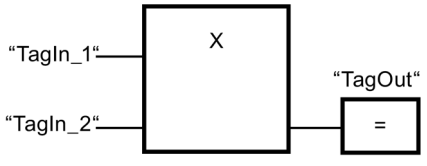
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Input	BOOL	The operand indicates the bit whose signal state will be queried.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the signal state of one of the two operands "TagIn_1" and "TagIn_2" is "1". When both operands have signal state "1" or "0" then output "TagOut" is reset.

EXCLUSIVE OR truth table

The following table shows the results when two operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Result of logic operation
1	0	1
0	1	1
1	1	0
0	0	0

The following table shows the results when three operands are linked by an EXCLUSIVE OR:

Signal state of the first operand	Signal state of the second operand	Signal state of the third operand	Result of logic operation
1	0	0	1
0	1	1	0
0	1	0	1
1	0	1	0
0	0	1	1
1	1	0	0
1	1	1	1
0	0	0	0

See also

Insert binary input (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 497)

13.3.2.4 =: Assignment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Assignment" instruction to set the bit of a specified operand. If the result of logic operation (RLO) at the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to signal state "1". If the signal state at the box input is "0", the bit of the specified operand is reset to "0".

The instruction does not influence the RLO. The RLO at the box input is assigned directly to the operand located above the Assign box.

The "Assignment" instruction can be placed at any position in the logic operation sequence.

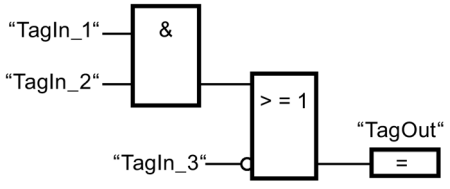
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand to which the RLO is assigned.

Example

The following example shows how the instruction works:



Operand "TagOut" at the output of the "Assignment" instruction is set when one of the following conditions is fulfilled:

- Inputs "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state at input "TagIn_3" is "0".

13.3.2.5 R: Reset output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Reset output" instruction to reset the signal state of a specified operand to "0".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is reset to "0". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

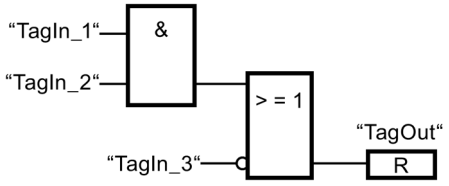
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is reset with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is reset when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.3.2.6 S: Set output (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Set output" instruction to set the signal state of a specified operand to "1".

If the box input has signal state "1" or the box input for S7-1200/1500 F-CPUs is not connected, the specified operand is set to "1". If there is a result of logic operation of "0" at the box input, the signal state of the specified operand remains unchanged.

The instruction does not influence the RLO. The RLO at the box input is transferred directly to the box output.

Note

The instruction is not executed if it is applied to an output of an F-I/O that is passivated (e.g., during startup of the F-system). Therefore, it is preferable to access outputs of the F-I/O using only the "Assignment" instruction.

An F-I/O output is passivated if QBAD or QBAD_O_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

If the operand area "local data (temp)" is used for the operands of the instruction, the local data bit used must be initialized beforehand.

Note

You cannot use the "process image of the inputs", "process image of the outputs" from standard I/O and "standard DB" and "bit memory" operand areas for the operands of the instruction.

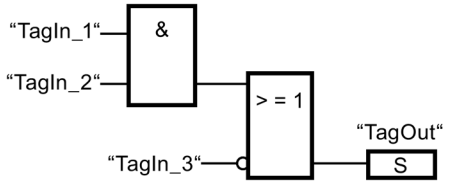
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand>	Output	BOOL	Operand that is set with RLO = "1".

Example

The following example shows how the instruction works:



Operand "TagOut" is set when one of the following conditions is fulfilled:

- Operands "TagIn_1" and "TagIn_2" have signal state "1".
- The signal state of operand "TagIn_3" is "0".

13.3.2.7 SR: Set/reset flip-flop (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Set/reset flip-flop" instruction to set or reset the bit of the specified operand based on the signal state of inputs S and R1. If the signal state at input S is "1" and the signal state at input R1 is "0", the specified operand is set to "1". If the signal state at input S is "0" and the signal state at input R1 is "1", the specified operand is reset to "0".

Input R1 takes priority over input S. If the signal state is "1" at the two inputs S and R1, the signal state of the specified operand is reset to "0".

The instruction is not executed if the signal state at the two inputs S and R1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

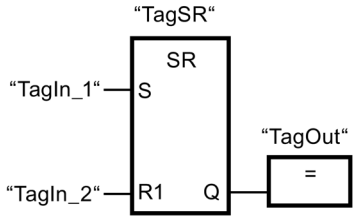
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
S	Input	BOOL	Enable setting
R1	Input	BOOL	Enable resetting
<Operand>	Output	BOOL	Operand that is set or reset.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagSR" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagSR" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Both operands "TagIn_1" and "TagIn_2" have signal state "1".

13.3.2.8 RS: Reset/set flip-flop (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Reset/set flip-flop" instruction to reset or set the bit of the specified operand based on the signal state of inputs R and S1. When the signal state is "1" at input R and "0" at input S1, the specified operand is reset to "0". When the signal state is "0" at input R and "1" at input S1, the specified operand is set to "1".

Input S1 takes priority over input R. If the signal state is "1" at the two inputs R and S1, the signal state of the specified operand is set to "1".

The instruction is not executed if the signal state at the two inputs R and S1 is "0". The signal state of the operand then remains unchanged.

The current signal state of the operand is transferred to output Q and can be queried there.

Note

If you want to use a formal parameter of an F-FB/F-FC for the operands of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the operands of the instruction.

If the operand area "local data (temp)" is used for the edge bit memory of the instruction, the local data bit used must be initialized beforehand.

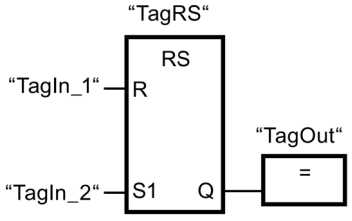
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
R	Input	BOOL	Enable resetting
S1	Input	BOOL	Enable setting
<Operand>	Output	BOOL	Operand that is reset or set.
Q	Output	BOOL	Signal state of the operand

Example

The following example shows how the instruction works:



Operands "TagRS" and "TagOut" are reset when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- Operand "TagIn_2" has signal state "0".

Operands "TagRS" and "TagOut" are set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "0" and operand "TagIn_2" has signal state "1".
- Operands "TagIn_1" and "TagIn_2" have signal state "1".

13.3.2.9 P: Scan operand for positive signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan operand for positive signal edge" instruction to determine if there is a change from "0" to "1" in the signal state of a specified operand (<Operand1>). The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

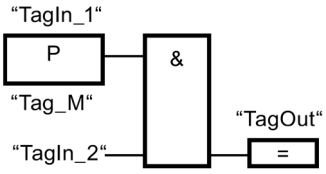
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



"TagOut" is set when the following conditions are fulfilled:

- There is a rising edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.3.2.10 N: Scan operand for negative signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan operand for negative signal edge" instruction to determine if there is a change form "1" to "0" in the signal state of a specified operand. The instruction compares the current signal state of <Operand1> with the signal state of the previous query saved in <Operand2>. If the instruction detects a change in the result of logic operation from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Enter the operand to be queried (<Operand1>) in the operand placeholder above the instruction. Enter the edge memory bit (<Operand2>) in the operand placeholder below the instruction.

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand2> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand2> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand2> of the instruction, the local data bit used must be initialized beforehand.

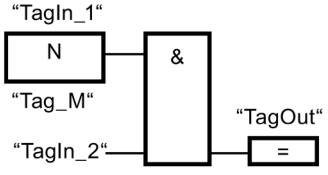
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Operand1>	Input	BOOL	Signal to be queried
<Operand2>	InOut	BOOL	Edge memory bit in which the signal state of the previous query is saved.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- There is a falling edge at input "TagIn_1".
- The signal state of operand "TagIn_2" is "1".

13.3.2.11 P_TRIG: Scan RLO for positive signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan RLO for positive signal edge" instruction to query a change in the signal state of the result of logic operation from "0" to "1". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "0" to "1", there is a positive, rising edge.

If a rising edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

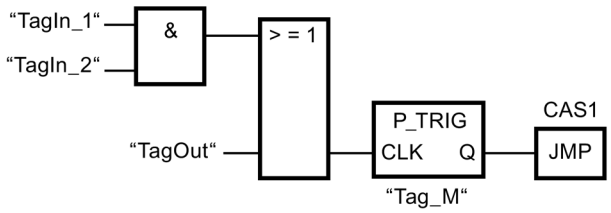
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO from the previous bit logic operation is saved in edge memory bit "Tag_M". If a change in the RLO signal state from "0" to "1" is detected, the program jumps to jump label CAS1.

13.3.2.12 N_TRIG: Scan RLO for negative signal edge (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Scan RLO for negative signal edge" instruction to query a change in the signal state of the result of logic operation from "1" to "0". The instruction compares the current signal state of the result of logic operation with the signal state from the previous query, which is saved in the edge memory bit (<Operand>). If the instruction detects a change in the RLO from "1" to "0", there is a negative, falling edge.

If a falling edge is detected, the output of the instruction has signal state "1". In all other cases, the signal state at the output of the instruction is "0".

Note

The address of the edge memory bit must not be used more than once in the program, otherwise the edge memory bit would be overwritten. This would influence edge evaluation and the result would no longer be unequivocal.

Note

If you want to use a formal parameter of an F-FB/F-FC for the edge memory bit <Operand> of the instruction, it must be declared as an input/output parameter.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You cannot use the "process image", "standard DB" and "bit memory" operand areas for the edge memory bit <Operand> of the instruction.

If operand area "local data (temp)" is used for the edge memory bit <Operand> of the instruction, the local data bit used must be initialized beforehand.

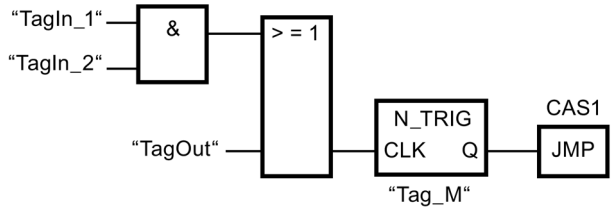
Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CLK	Input	BOOL	Current RLO
<Operand>	InOut	BOOL	Edge memory bit in which the RLO of the previous query is saved.
Q	Output	BOOL	Result of edge evaluation

Example

The following example shows how the instruction works:



The RLO of the previous bit logic operation is saved in edge bit memory "Tag_M". If a change in the RLO signal state from "1" to "0" is detected, the program jumps to jump label CAS1.

13.3.3 Safety functions

13.3.3.1 ESTOP1: Emergency STOP up to stop category 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements an emergency STOP shutdown with acknowledgment for Stop Categories 0 and 1.

Enable signal Q is reset to 0, as soon as input E_STOP takes a signal state of 0 (Stop category 0). Enable signal Q_DELAY is reset to 0 after the time delay set at input TIME_DEL (Stop Category 1).

Enable signal Q is reset to 1 not before input E_STOP takes a signal state of 1 and an acknowledgment occurs. The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets output ACK_REQ to 1, as soon as input E_STOP = 1.

Following an acknowledgment, the instruction resets ACK_REQ to 0.

Every call of the "Emergency STOP up to Stop Category 1" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ESTOP1_DB_1) or a multi-instance (e.g., ESTOP1_Instance_1) for the "Emergency STOP up to Stop Category 1" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note: Only one emergency STOP signal (E_STOP) can be evaluated for the instruction. Discrepancy monitoring of the two NC contacts (when two channels are involved) in accordance with Categories 3 and 4 as defined in ISO 13849-1:2006 / EN ISO 13849-1:2008 is performed with suitable configuration (type of sensor interconnection: 2-channel equivalent) directly through the F-I/O with inputs. In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
E_STOP	Input	BOOL	Emergency STOP
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	1=Acknowledgment
TIME_DEL	Input	TIME	Time delay
Q	Output	BOOL	1=Enable
Q_DELAY	Output	BOOL	Enable is OFF delayed
ACK_REQ	Output	BOOL	1=Acknowledgment necessary
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	-—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	x	
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After an F-system startup, when ACK_NEC = 1, you must acknowledge the instruction using a rising edge at input ACK.

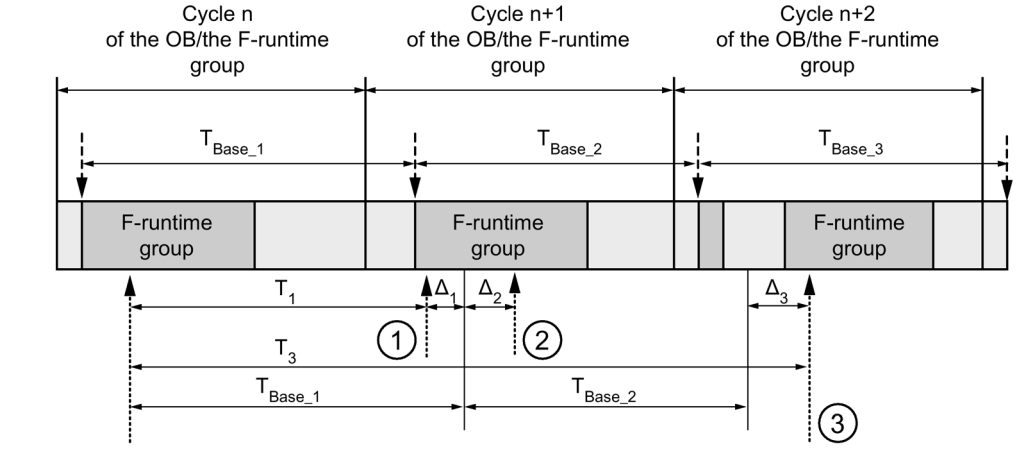
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 1 to 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect TIM_DEL setting	Time delay setting < 0	Set time delay > 0
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Acknowledgment not possible because emergency STOP is still active	Emergency STOP switch is locked	Release interlocking of emergency STOP switch
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of emergency STOP switch	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Emergency STOP switch is defective	Check emergency STOP switch
		Wiring fault	Check wiring of emergency STOP switch
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

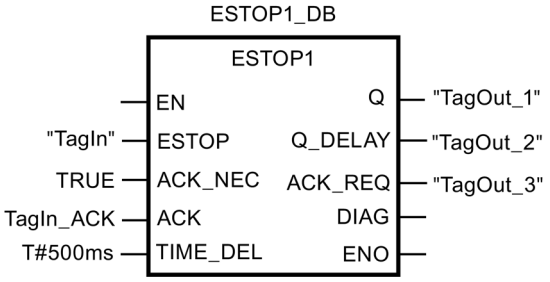
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

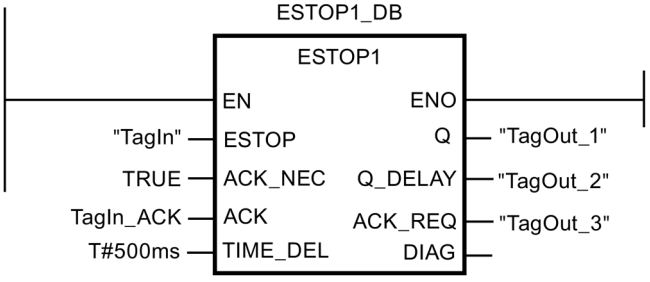
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.3.2 TWO_HAND: Two-hand monitoring (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction implements two-hand monitoring.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Two-hand monitoring with enable". The application "Two-hand monitoring with enable" replaces the instruction "Two-hand monitoring" with compatible functions.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN2 = 0). Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time. Enable signal Q can never be set to 1 if the discrepancy time is set to values less than 0 or greater than 500 ms.

Every call of the "Two-hand monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_HAND_DB_1) or a multi-instance (e.g., TWO_HAND_Instance_1) for the "Two-hand monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (type of sensor interconnection: 2-channel non equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, you must assign "Supply value 0" for the behavior of discrepancy during configuration. If a discrepancy is detected, a fail-safe value of 0 is entered in the process image of the inputs (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 is set in the relevant F-I/O DB. (See also F-I/O access (Page 122))

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

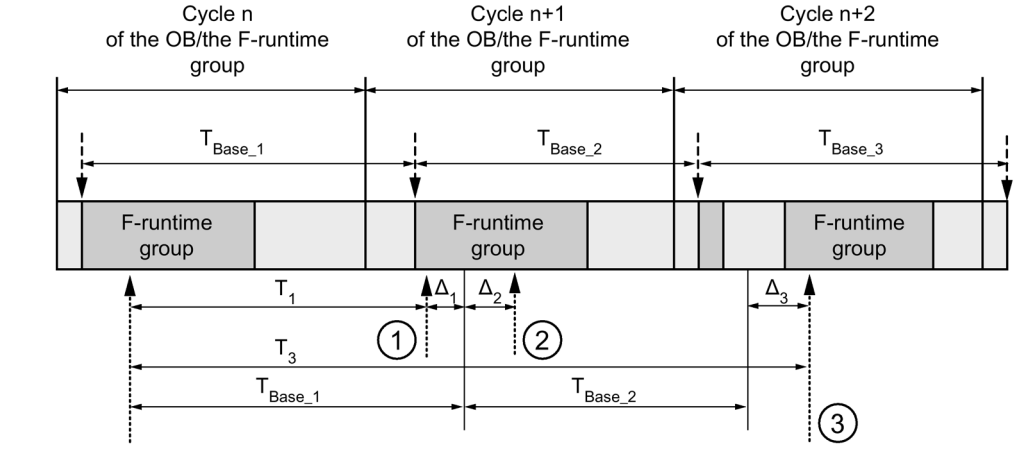
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

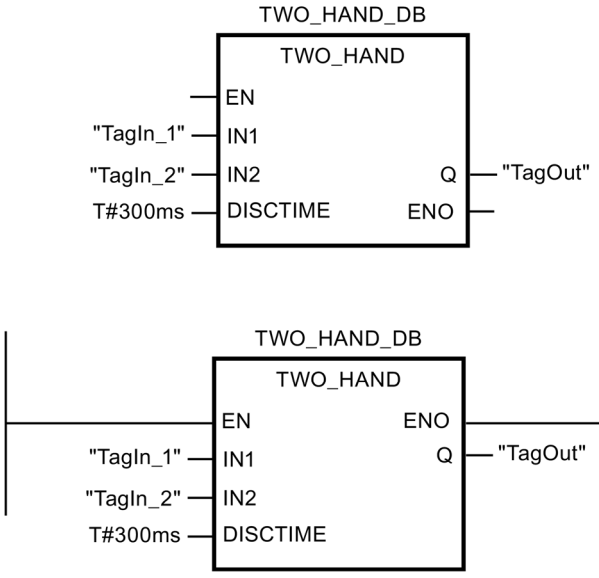
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.3.3.3 TWO_H_EN: Two-hand monitoring with enable (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements two-hand monitoring with enable.

If pushbuttons IN1 and IN2 are activated within the permitted discrepancy time DISCTIME ≤ 500 ms (IN1/IN2 = 1) (synchronous activation), output signal Q is set to 1 when existing ENABLE = 1. If the time difference between activation of pushbutton IN1 and pushbutton IN2 is greater than DISCTIME, then the pushbuttons must be released and reactivated.

Q is reset to 0 as soon as one of the pushbuttons is released (IN1/IN 2 = 0) or ENABLE = 0. Enable signal Q can be reset to 1 only if the other pushbutton has been released, and if both pushbuttons are then reactivated within the discrepancy time when existing ENABLE = 1.

Every call of the "Two-hand monitoring with enable" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., TWO_H_EN_DB_1) or a multi-instance (e.g., TWO_H_EN_Instance_1) for the "Two-hand monitoring with enable" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

The instruction supports the requirements in accordance with EN 574:1996 + A1:2008.

Note: Only one signal per pushbutton can be evaluated in the instruction. Discrepancy monitoring of the NC and NO contacts of pushbuttons IN1 and IN2 is performed directly during suitable configuration (type of sensor interconnection: 2-channel non equivalent) directly through the F-I/O with inputs. The normally open contact must be wired in such a way that it supplies the useful signal (see manual for the F-I/O you are using). In order to keep the discrepancy time from influencing the response time, during the configuration of discrepancy behavior, you must configure "Supply value 0".

If a discrepancy is detected, a fail-safe value of 0 is entered in the process image input (PII) for the pushbutton and QBAD or QBAD_I_xx = 1 or value status = 0 is set in the corresponding F-I/O DB.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Pushbutton 1
IN2	Input	BOOL	Pushbutton 2
ENABLE	Input	BOOL	Enable input
DISCTIME	Input	TIME	Discrepancy time (0 to 500 ms)
Q	Output	BOOL	1=Enable
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

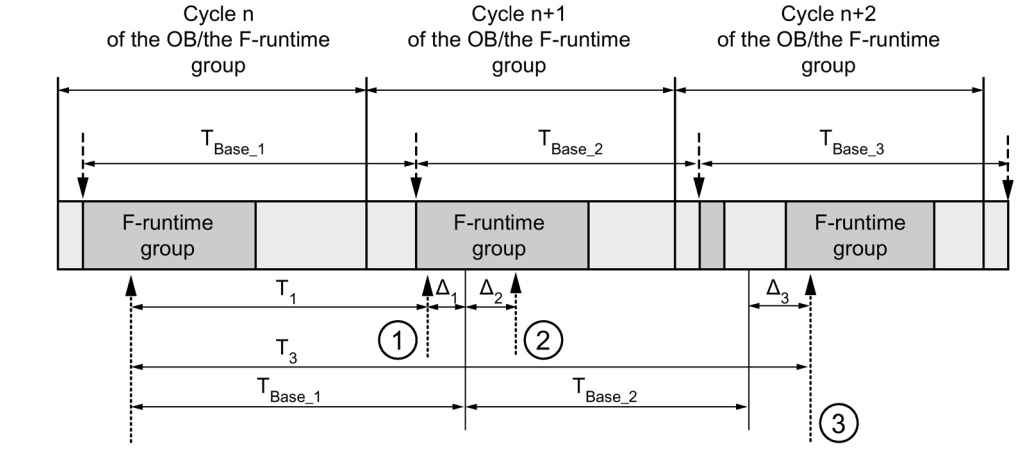
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 5 are saved until the cause of the error has been eliminated.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Incorrect discrepancy time DISCTIME setting	Discrepancy time setting is <0 or > 500 ms	Set discrepancy time in range of 0 to 500 ms
Bit 1	Discrepancy time elapsed	Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Pushbuttons were not activated within the discrepancy time	Release pushbuttons and activate them within the discrepancy time
		Wiring fault	Check wiring of pushbuttons
		Pushbuttons defective	Check pushbuttons
		Pushbuttons are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Incorrect activation sequence	One pushbutton was not released	Release pushbuttons and activate them within the discrepancy time
		Pushbuttons defective	Check pushbuttons
Bit 5	ENABLE does not exist	ENABLE = 0	Set ENABLE = 1, release pushbutton and activate it within the discrepancy time
Bit 6	Reserved	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



⇢ = Time base update

⇢ = Call time of an instruction with time processing

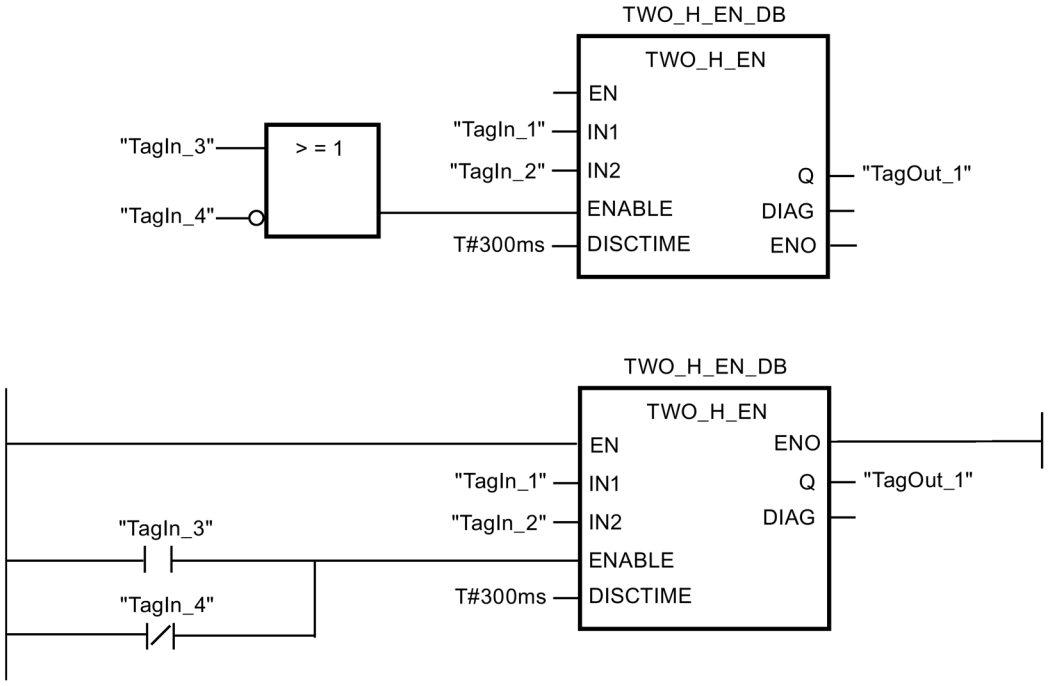
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



13.3.3.4 MUTING: Muting (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction performs parallel muting with two or four muting sensors.

Note

This instruction is only available for S7-300 and S7-400 F-CPUs. For S7-1200/1500 F-CPUs, you use the instruction "Parallel muting (Page 542)". The instruction "Parallel muting" replaces the instruction "Muting" with compatible functions.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUTING_DB_1) or a multi-instance (e.g., MUTING_Instance_1) for the "Muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

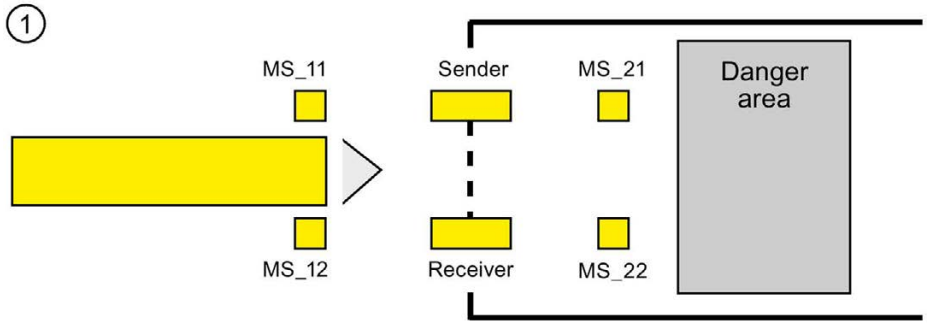
You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 1 of sensor pair 1
MS_12	Input	BOOL	Muting sensor 2 of sensor pair 1
MS_21	Input	BOOL	Muting sensor 1 of sensor pair 2
MS_22	Input	BOOL	Muting sensor 2 of sensor pair 2
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal of the muting lamp channel
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
ACK	Input	BOOL	Acknowledgment of restart inhibit
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	BYTE	Service information

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

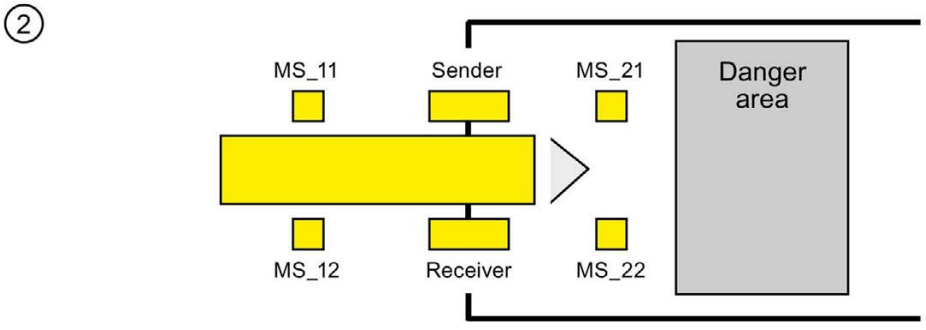


- If both muting sensors MS_11 and MS_12 are activated by the product within DISCTIM1 (apply signal state = 1), the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

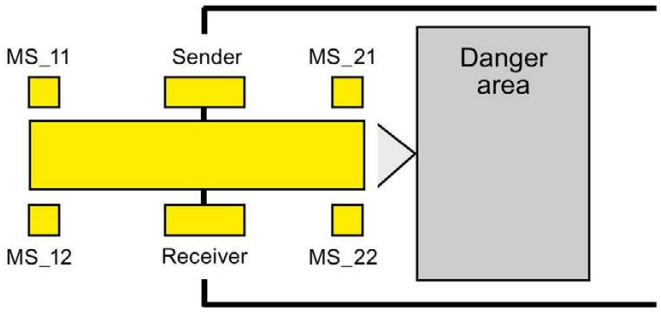
The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



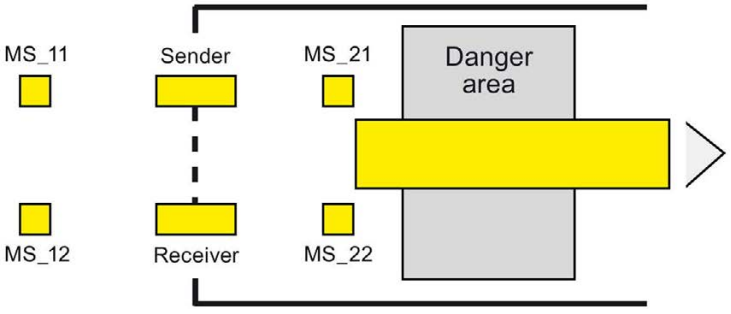
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop).

③



- The two muting sensors MS_21 and MS_22 must be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

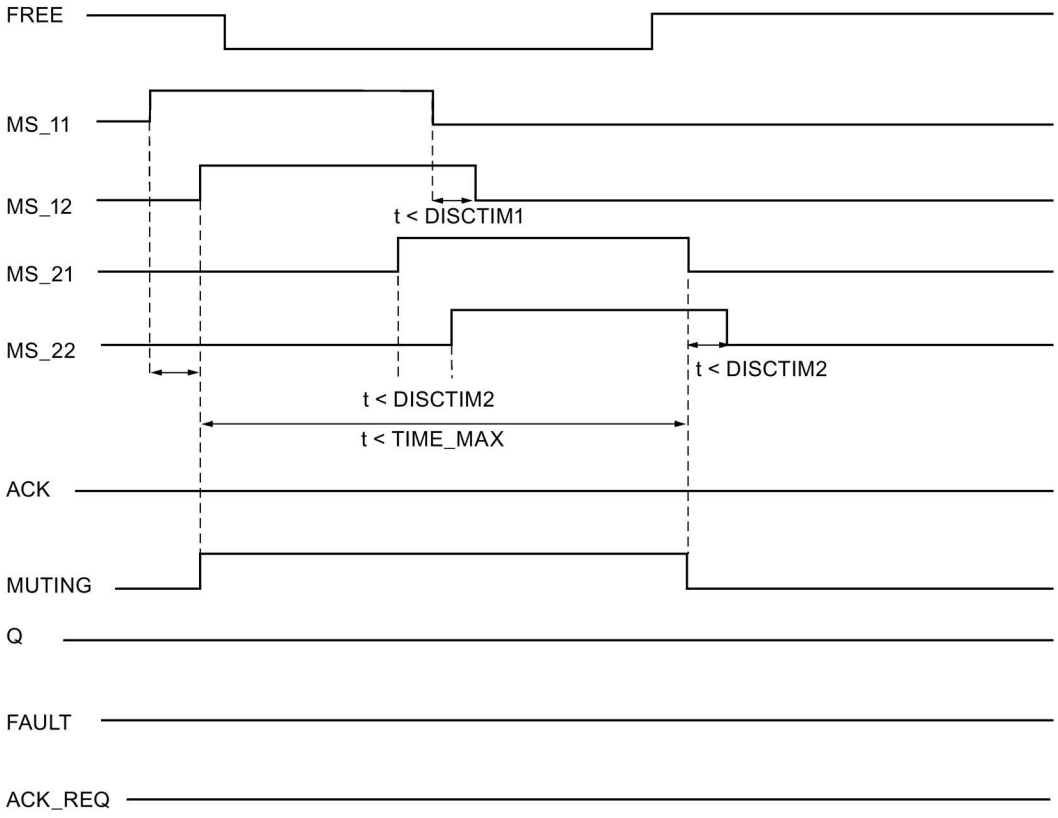


- Only if one of the two muting sensors MS_21 and MS_22 is switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

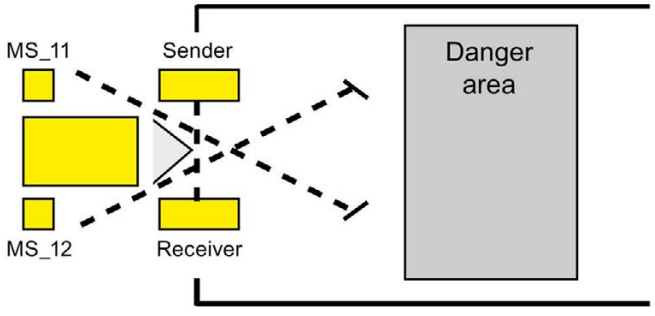


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (if MUTING is not active), when errors occur, and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- The muting lamp monitoring function responds at input QBAD_MUT
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

⚠ WARNING

When a valid combination of muting sensors is immediately detected at startup of the F-system (for example, because the muting sensors are interconnected to inputs of a standard I/O that immediately provide process values during the F-system startup), the MUTING function is immediately started and the MUTING output and enable signal Q are set to 1. The FAULT output (group error) is not set to 1 (no restart inhibit!). *(S035)*

Acknowledgment of restart inhibit

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- Errors, if present, are eliminated (see output DIAG)

  and

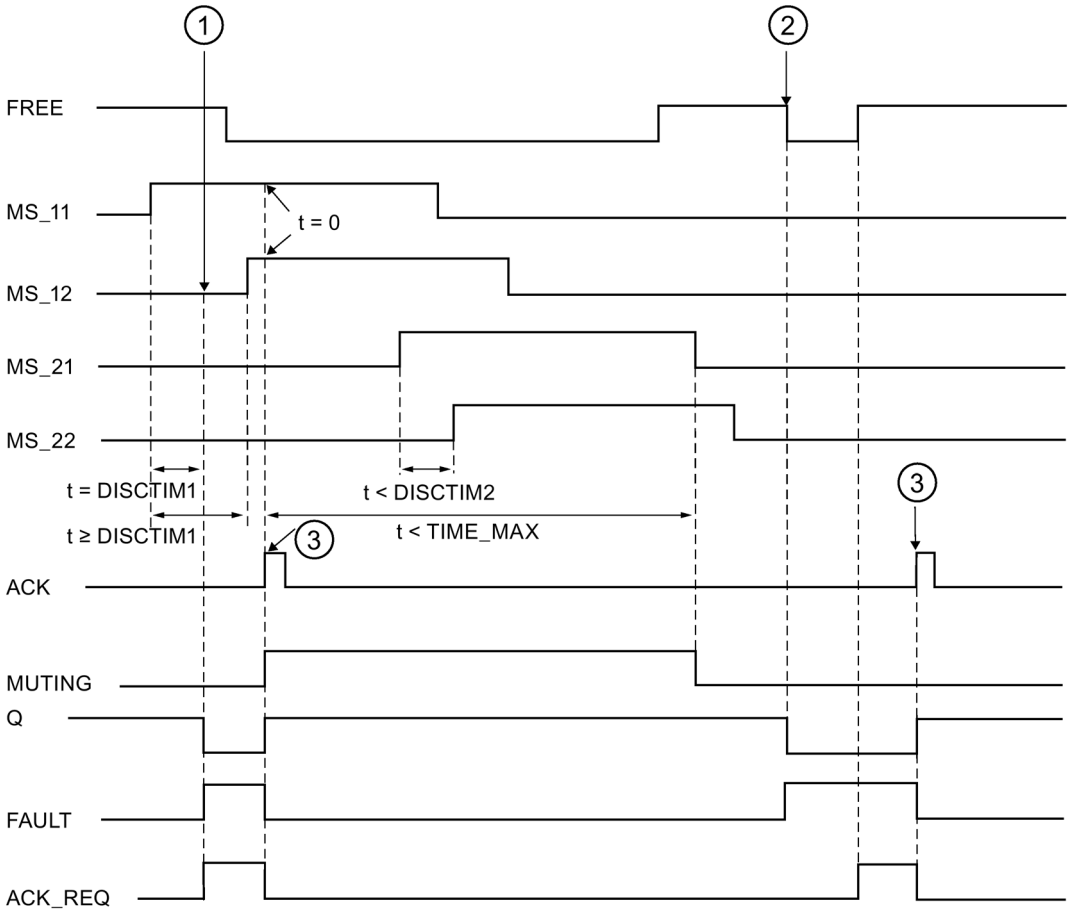
- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 151)).

The FAULT output is set to 0. Output ACK_REQ = 1 signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK-REQ = 1 as soon as the light curtain is no longer interrupted or errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

Note

Following discrepancy errors and once the maximum muting time has been exceeded, ACK_REQ is immediately set to 1. As soon as a user acknowledgment has taken place at input ACK, discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (if MUTING is not active)



① Sensor pair 1 (MS_11 and MS_12) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though the MUTING function is not active.

③ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

you must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

WARNING

When STOP = 1, the discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the error is not detected and the MUTING function can be started unintentionally. *(S036)*

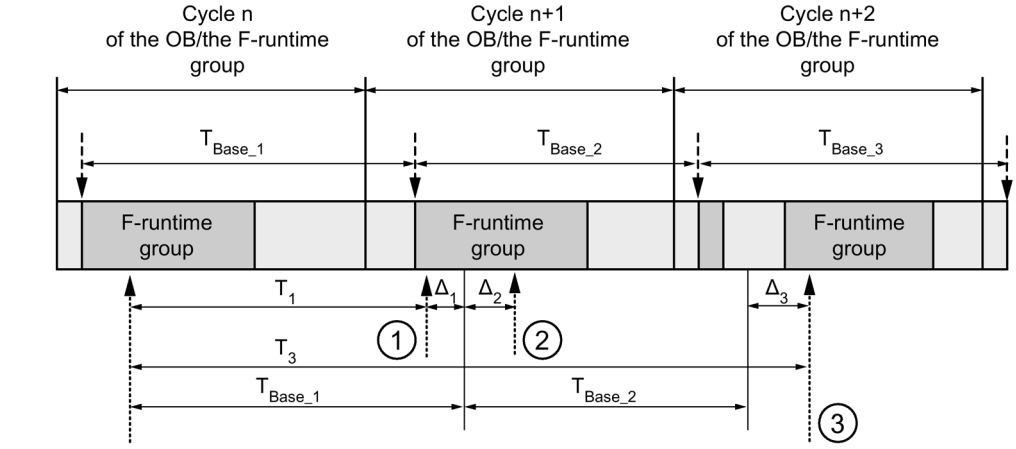
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 3 s	Set discrepancy time in range between 0 s and 3 s
Bit 1	Discrepancy error or incorrect discrepancy time DISCTIM 2 setting for sensor pair 2	Same as Bit 0	Same as Bit 0
Bit 2	Maximum muting time exceeded or incorrect muting time TIME_MAX setting	Malfunction in production sequence	Malfunction in production sequence eliminated
		Maximum muting time setting is too low	If necessary, set a higher maximum muting time
		Muting time setting is < 0 s or > 10 min	Set muting time in range from 0 s to 10 min
Bit 3	Light curtain interrupted and muting not active	Light curtain is defective	Check light curtain
		Wiring fault	Check wiring of light curtain (FREE input)
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of light curtain (FREE input)	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		See other DIAG bits	
Bit 4	Muting lamp is defective or cannot be set	Muting lamp is defective	Replace muting lamp
		Wiring fault	Check wiring of muting lamp
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of muting lamp	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 5	Reserved	—	—
Bit 6	Reserved	—	—
Bit 7	Reserved	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

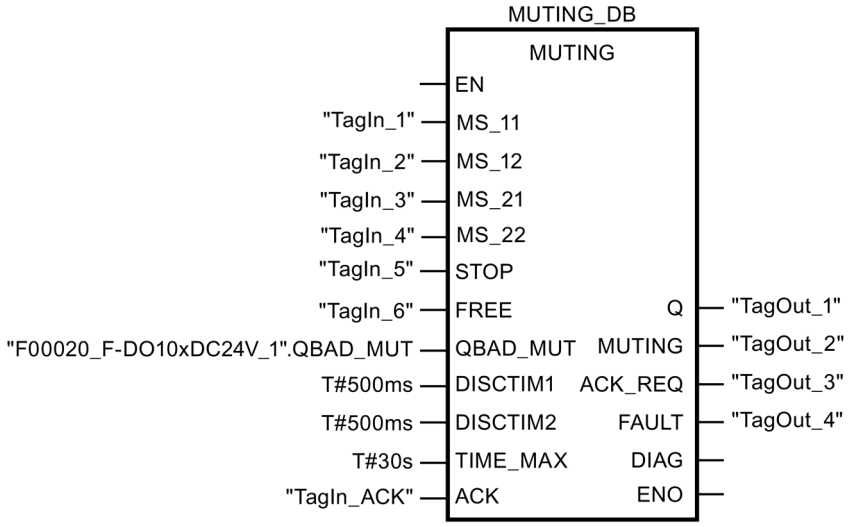
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

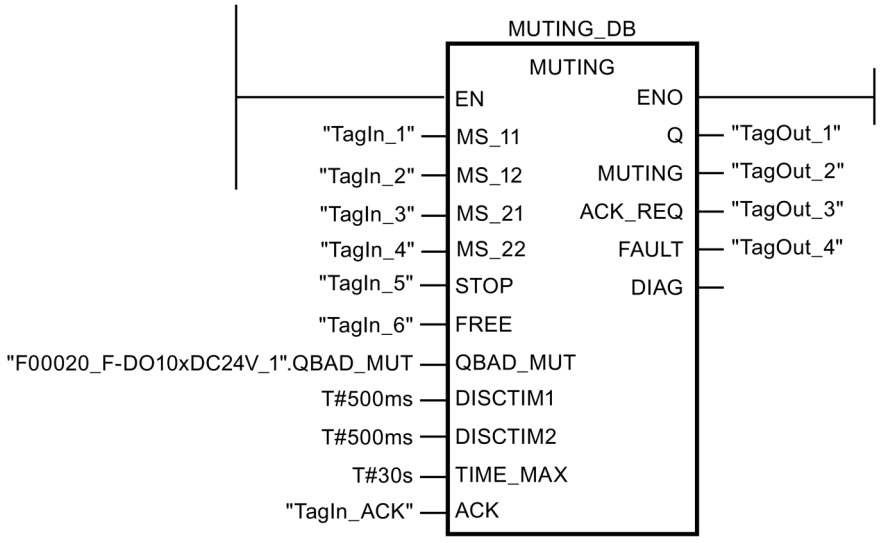
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.3.5 MUT_P: Parallel muting (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction performs parallel muting with two or four muting sensors.

Muting is a defined suppression of the protective function of light curtains. Light curtain muting can be used to introduce goods or objects into the danger area monitored by the light curtain without causing the machine to stop.

To utilize the muting function, at least two independently wired muting sensors must be present. The use of two or four muting sensors and correct integration into the production sequence must ensure that no persons enter the danger area while the light curtain is muted.

Every call of the "Parallel muting" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., MUT_P_DB_1) or a multi-instance (e.g., MUT_P_Instance_1) for the "Parallel muting" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
MS_11	Input	BOOL	Muting sensor 11
MS_12	Input	BOOL	Muting sensor 12
MS_21	Input	BOOL	Muting sensor 21
MS_22	Input	BOOL	Muting sensor 22
STOP	Input	BOOL	1=Conveyor system stopped
FREE	Input	BOOL	1=Light curtain uninterrupted
ENABLE	Input	BOOL	1=Enable MUTING
QBAD_MUT	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the muting lamp channel
ACK	Input	BOOL	Acknowledgment of restart inhibit
DISCTIM1	Input	TIME	Discrepancy time of sensor pair 1 (0 to 3 s)
DISCTIM2	Input	TIME	Discrepancy time of sensor pair 2 (0 to 3 s)
TIME_MAX	Input	TIME	Maximum muting time (0 to 10 min)
Q	Output	BOOL	1= Enable, not off
MUTING	Output	BOOL	Display of muting is active
ACK_REQ	Output	BOOL	Acknowledgment necessary
FAULT	Output	BOOL	Group error
DIAG	Output	WORD	Service information

Instruction versions

A number of versions are available for this instruction:

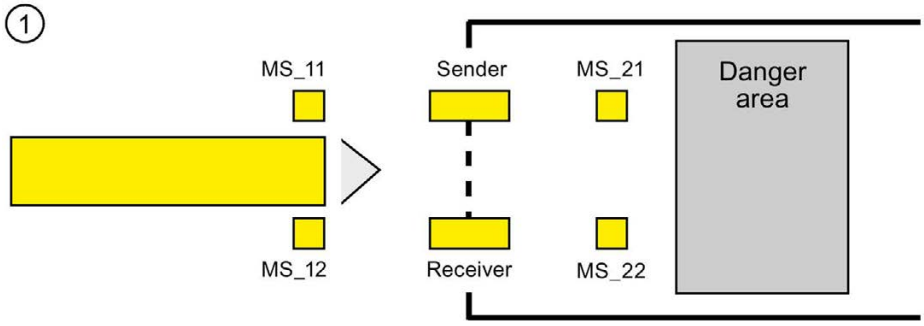
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x*	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x*	—	—	These versions have identical functions to version V1.0. The output DIAG can now be correctly interconnected with the operand of data type WORD.
1.2	x*	—	x	
1.3	x*	x	x	

* S7-300/400: When a restart inhibit (output FAULT = 1) and ENABLE = 1 is present, output ACK_REQ is set to 1 even if not at least one muting sensor is activated. Use the DIAG bits 5 and 6 for additional information.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Schematic sequence of error-free muting procedure with 4 muting sensors (MS_11, MS_12, MS_21, MS_22)

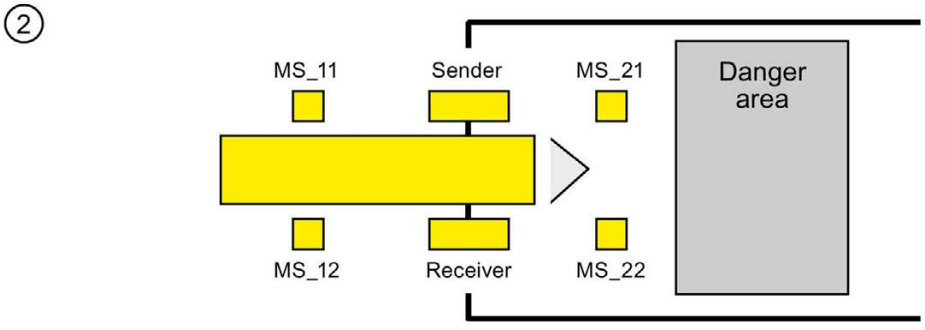


- If muting sensors MS_11 and MS_12 are both activated by the product within DISCTIM1 (apply signal state = 1) and MUTING is enabled by setting the ENABLE input to 1, the instruction starts the MUTING function. Enable signal Q remains 1, even when input FREE = 0 (light curtain interrupted by product). The MUTING output for setting the muting lamp switches to 1.

Note

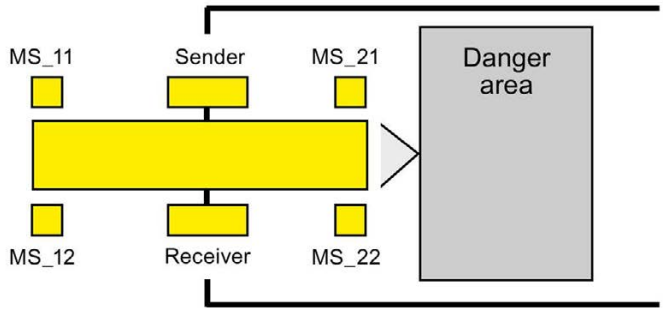
The muting lamp can be monitored using the QBAD_MUT input. To do this, you must wire the muting lamp to an output with wire break monitoring of an F-I/O and supply the QBAD_MUT input with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / with inverted value statues of the associated channel. If QBAD_MUT = 1, muting is terminated by the instruction. If monitoring of the muting lamp is not necessary, you do not have to supply input QBAD_MUT.

F-I/O that can promptly detect a wire break after activation of the muting operation must be used (*see manual for specific F-I/O*).



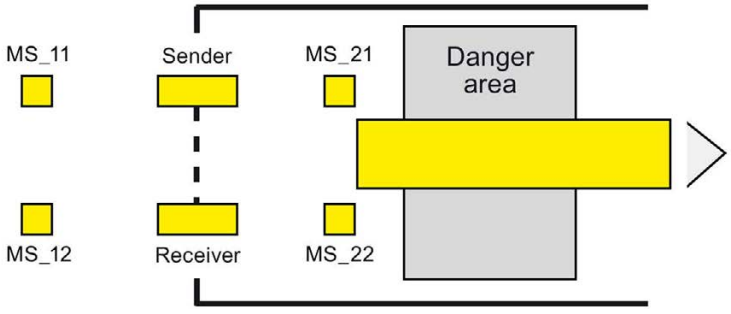
- As long as both muting sensors MS_11 and MS_12 continue to be activated, the MUTING function of the instruction causes Q to remain 1 and MUTING to remain 1 (so that the product can pass through the light curtain without causing the machine to stop). Each of the two muting sensors MS_11 and MS_12 may be switched to inactive (t < DISCTIM1) for a short time (apply signal state 0).

③



- Muting sensors MS_21 and MS_22 must both be activated (within DISCTIM2) before muting sensors MS_11 and MS_12 are switched to inactive (apply signal state 0). In this way, the instruction retains the MUTING function. (Q = 1, MUTING = 1).

④

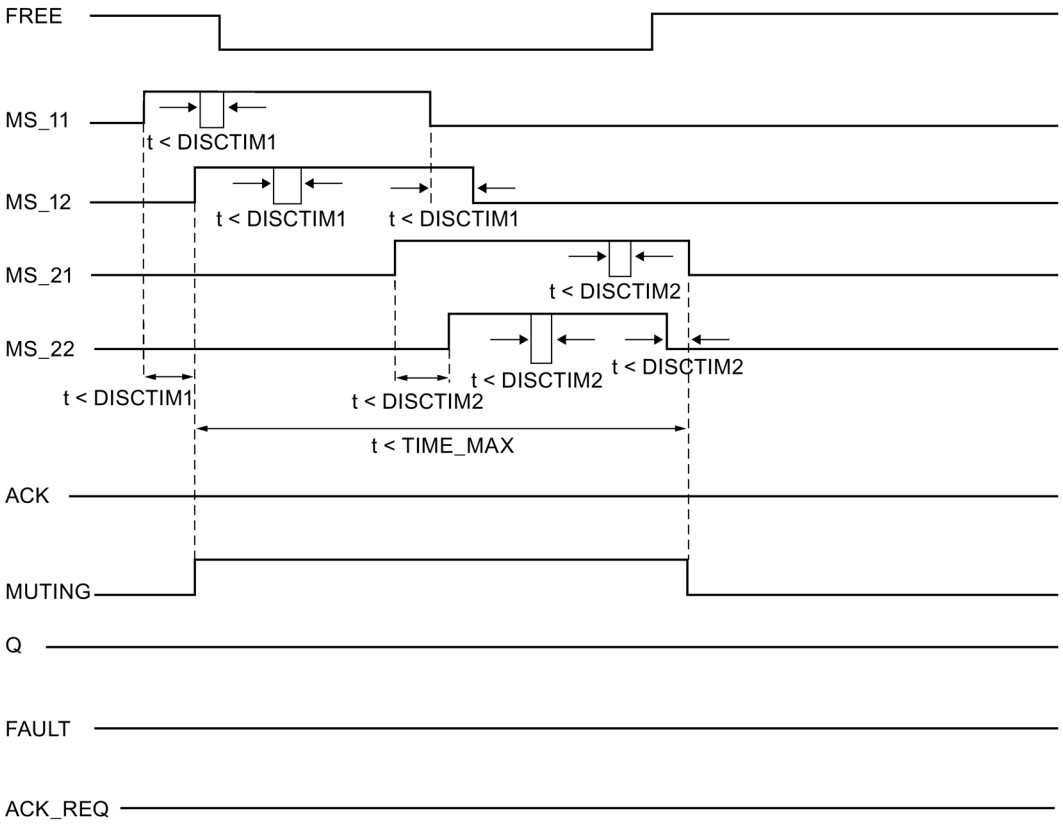


Only if muting sensors MS_21 and MS_22 are both switched to inactive (product enables sensors) is the MUTING function terminated (Q = 1, MUTING = 0). The maximum activation time for the MUTING function is the time set at input TIME_MAX.

Note

The MUTING function is also started if the product passes the light curtain in the reverse direction and the muting sensors are thus activated by the product in reverse order.

Timing diagrams for error-free muting procedure with 4 muting sensors

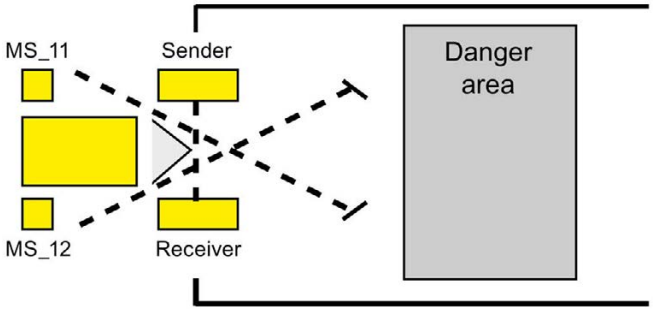


Schematic sequence of muting procedure with reflection light barriers

If reflection light barriers are used as muting sensors, they are generally arranged diagonally.

In general, this arrangement of reflection light barriers as muting sensors requires only two light barriers, and only MS_11 and MS_12 are interconnected.

The sequence is similar to that of the muting procedure with 4 muting sensors. Step 3 is omitted. In step 4, replace MS_21 and MS_22 with MS_11 and MS_12, respectively.



Restart inhibit upon interruption of light curtain (MUTING is not active), as well as when errors occur and during F-system startup

Enable signal Q cannot be set to 1 or becomes 0, if:

- Light curtain is interrupted (e.g., by a person or material transport) while the MUTING function is not active
- Light curtain is (being) interrupted and the muting lamp monitoring at input QBAD_MUT is set to 1
- Light curtain is (being) interrupted and the MUTING function is not enabled by setting input ENABLE to 1
- Sensor pair 1 (MS_11 and MS_12) or sensor pair 2 (MS_21 and MS_22) is not activated or deactivated during discrepancy time DISCTIM1 or DISCTIM2, respectively
- The MUTING function is active longer than the maximum muting time TIME_MAX
- Discrepancy times DISCTIM1 and DISCTIM2 have been set to values < 0 or > 3 s
- Maximum muting time TIME_MAX has been set to a value< 0 or > 10 min
- The F-system starts up (regardless of whether or not the light curtain is interrupted, because the F-I/O is passivated after F-system startup and, thus, the FREE input is initially supplied with 0)

In the identified cases, output FAULT (group error) is set to 1 (restart inhibit). If the MUTING function is started, it will be terminated and the Muting output becomes 0.

User acknowledgment of restart inhibit (no muting sensor is activated or ENABLE = 0)

Enable signal Q becomes 1 again, when:

- The light curtain is no longer interrupted
- Errors, if present, are eliminated (see output DIAG)

  and

- A user acknowledgment with positive edge occurs at input ACK (see also Implementation of user acknowledgment (Page 151)).

The FAULT output is set to 0. Output ACK_REQ = 1 (and DIAG bit 6) signals that user acknowledgment at input ACK is required to eliminate the restart inhibit. The instruction sets ACK_REQ = 1 as soon as the light curtain is no longer interrupted or the errors have been eliminated. Once acknowledgment has occurred, the instruction resets ACK_REQ to 0.

User Acknowledgment of restart inhibit (at least one muting sensor is activated and ENABLE = 1)

Enable signal Q becomes 1 again, when:

- Errors, if present, are eliminated (see output DIAG)
- FREE occurs until a valid combination of muting sensors is detected

The FAULT output is set to 0. The MUTING function is restarted, if necessary, and the MUTING output becomes 1 if a valid combination of muting sensors is detected. When ENABLE = 1, output ACK_REQ = 1 (and DIAG bit 5) signals that FREE is necessary for error elimination and for removal of the restart inhibit.*After successful FREE, ACK_REQ is reset to 0 by the instruction.

Note

Once the maximum muting time is exceeded, TIME_MAX is reset as soon as the MUTING function is restarted.

FREE function

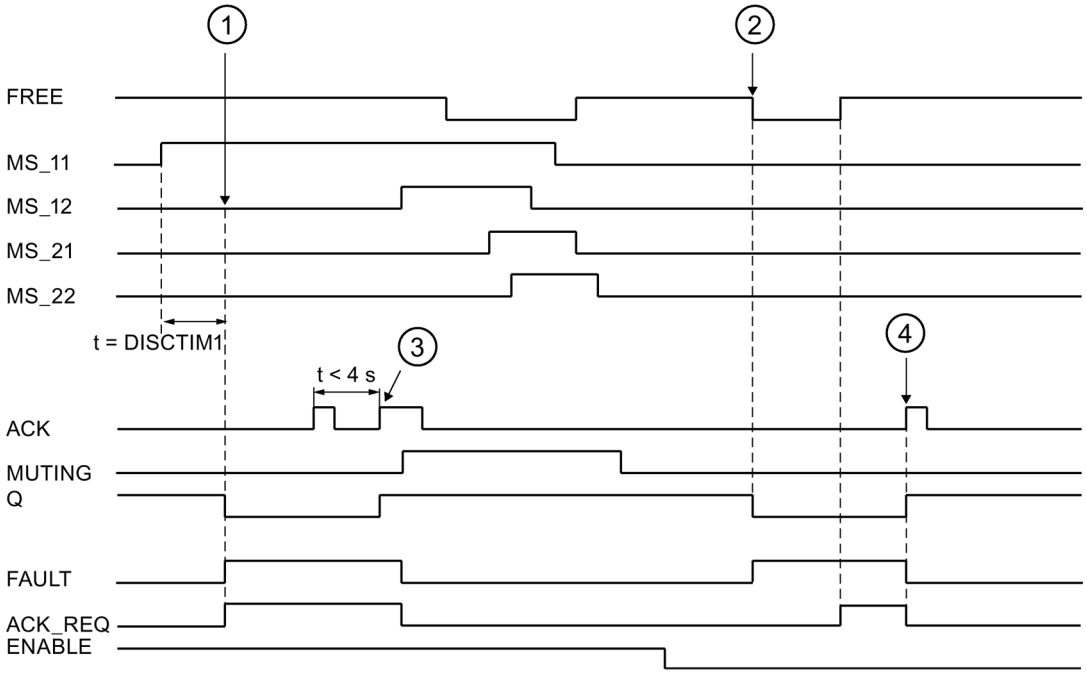
If an error cannot be corrected immediately, the FREE function can be used to free the muting range. Enable signal Q and output MUTING =1 temporarily. The FREE function can be used if:

- ENABLE = 1
- At least one muting sensor is activated
- A user acknowledgment with rising edge at input ACK occurs twice within 4 s, and the second user acknowledgment at input ACK remains at a signal state of 1 (acknowledgment button remains activated)

⚠ WARNING

When using the FREE function, the action must be observed. A dangerous situation must be able to be interrupted at any time by releasing the acknowledgment button. The acknowledgment button must be mounted in such a way the entire danger area can be observed. *(S037)*

Timing diagrams for discrepancy errors at sensor pair 1 or interruption of the light curtain (MUTING is not active)



① Sensor pair 1 (MS_11 and MS_22) is not activated within discrepancy time DISCTIM1.

② The light curtain is interrupted even though there is no enable (ENABLE=0)

③ FREE function

④ Acknowledgment

Behavior with stopped conveyor equipment

If, while the conveyor equipment has stopped, the monitoring for one of the following reasons is to be deactivated:

- To comply with discrepancy time DISCTIM1 or DISCTIM2
- To comply with maximum muting time TIME_MAX

You must supply input STOP with a "1" signal for as long as the conveyor equipment is stopped. As soon as the conveyor equipment is running again (STOP = 0), discrepancy times DISCTIM1 and DISCTIM2 and maximum muting time TIME_MAX are reset.

⚠ WARNING

When STOP = 1 or ENABLE = 0, discrepancy monitoring is shut down. During this time, if inputs MSx1/MSx2 of a sensor pair both take a signal state of 1 due to an undetected error, e.g., because both muting sensors fail to 1, the fault is not detected and the MUTING function can be started unintentionally (when ENABLE =1). *(S038)*

Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0 to 6 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time DISCTIM 1 setting for sensor pair 1	Malfunction in production sequence	Malfunction in production sequence eliminated
		Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time

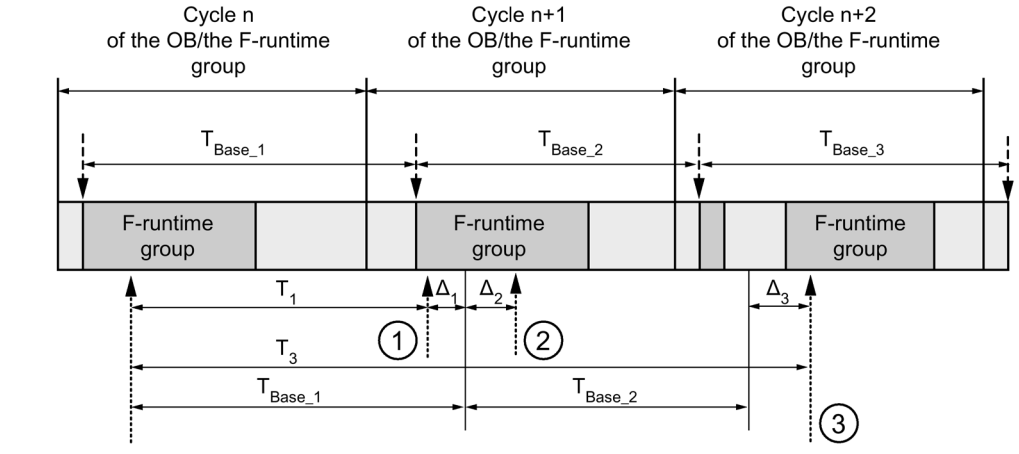
Timing imprecision resulting from the update time of the time base used in the instruction:



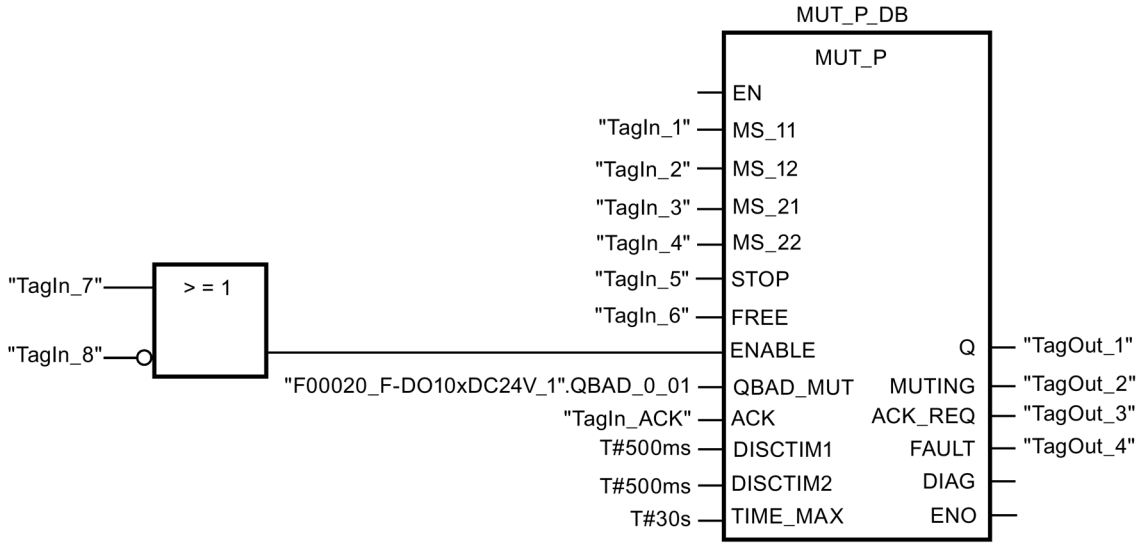
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

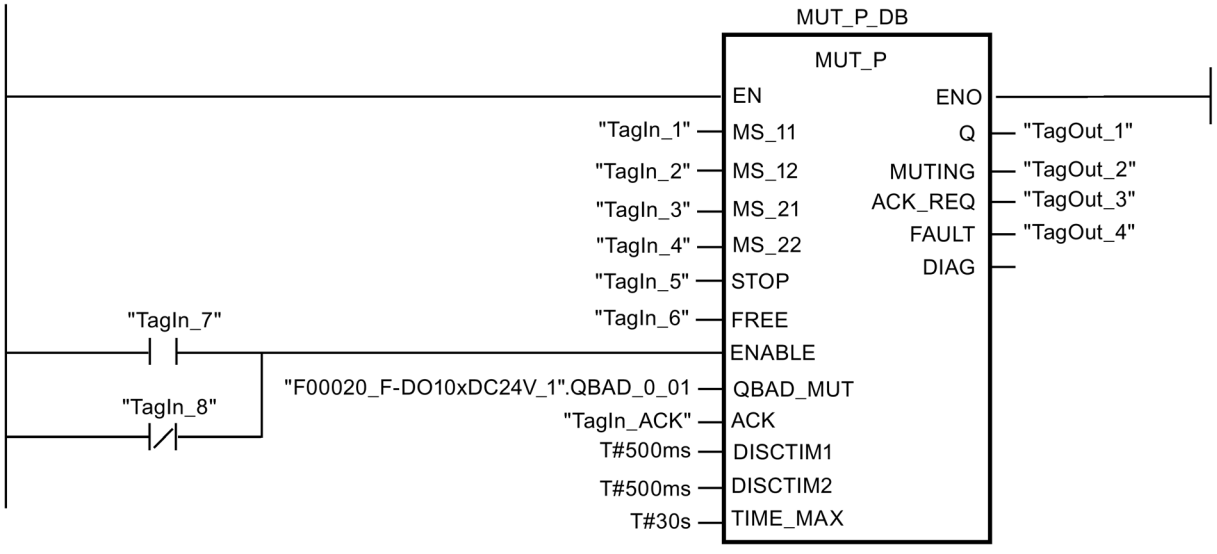
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.3.6 EV1oo2DI: 1oo2 evaluation with discrepancy analysis (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements a 1oo2 evaluation of two single-channel sensors combined with a discrepancy analysis.

Output Q is set to 1, if the signal states of inputs IN1 and IN2 both equal 1 and no discrepancy error DISC_FLT is stored. if the signal state of one or both inputs is 0, output Q is set to 0.

As soon as the signal states of inputs IN1 and IN2 are different, the discrepancy time DISCTIME is started. If the signal states of the two inputs are still different once the discrepancy time expires, a discrepancy error is detected and DISC_FLT is set to 1 (restart inhibit).

If the discrepancy between inputs IN1 and IN2 is no longer detected, the discrepancy error is acknowledged according to the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK to acknowledge the discrepancy error.

The output ACK_REQ = 1 signals that a user acknowledgment at input ACK is necessary to acknowledge the discrepancy error (cancel the restart inhibit). The instruction sets ACK_REQ = 1 as soon as discrepancy is no longer detected. After acknowledgment or if, prior to acknowledgment, there is once again a discrepancy between inputs IN1 and IN2, the instruction resets ACK_REQ to 0.

Output Q can never be set to 1 if the discrepancy time setting is < 0 or > 60 s. In this case, output DISC_FLT is also set to 1 (restart inhibit). The call interval of the safety program (e.g., OB35) must be less than the discrepancy time setting.

Every call of the "1oo2 evaluation with discrepancy analysis" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., EV1oo2DI_DB_1) or a multi-instance (e.g., EV1oo2DI_Instance_1) for the "1oo2 evaluation with discrepancy analysis" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING
The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Sensor 1
IN2	Input	BOOL	Sensor 2
DISCTIME	Input	TIME	Discrepancy time (0 to 60 s)
ACK_NEC	Input	BOOL	1 = acknowledgment necessary for discrepancy error
ACK	Input	BOOL	Acknowledgment of discrepancy error
Q	Output	BOOL	Output
ACK_REQ	Output	BOOL	1 = acknowledgment required
DISC_FLT	Output	BOOL	1 = discrepancy error
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

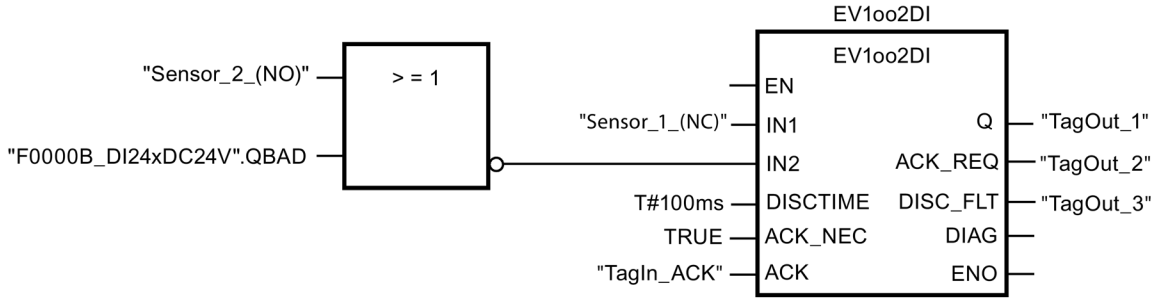
Activating inputs IN1 and IN2

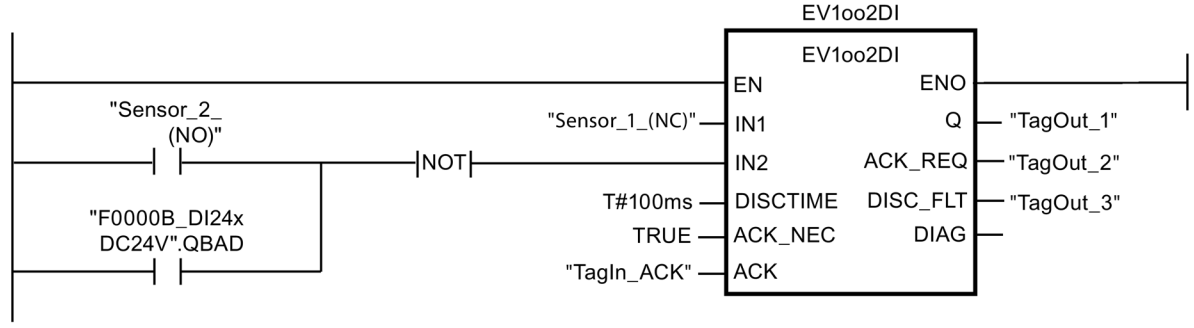
Inputs IN1 and IN2 must both be activated in such a way that their safe state is 0.

Example with QBAD or QBAD_I_xx signal

For non-equivalent signals you need to OR the input (IN1 and IN2) with which you assign the encoder signal to the safe state 1, with the QBAD signal of the associated F-I/O or the QBAD_I_xx signal of the associated channel (with S7-300/400 F-CPUs) and negate the result. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Network1: EV1oo2DI with non-equivalent signals

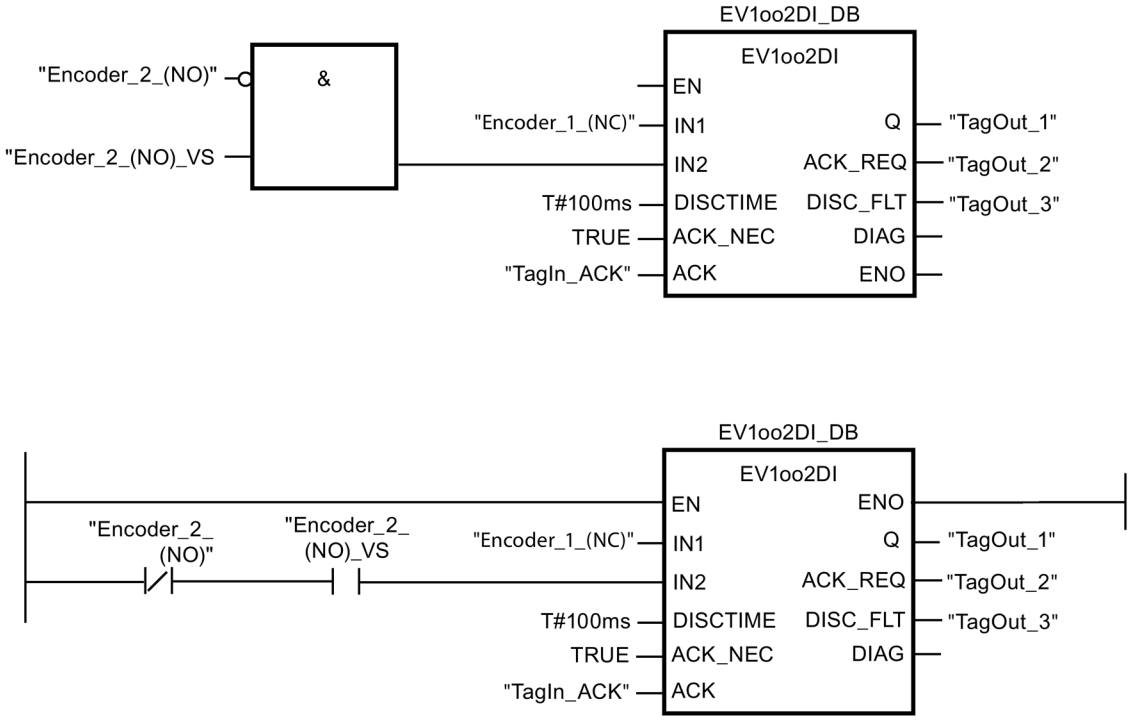




Example with value status

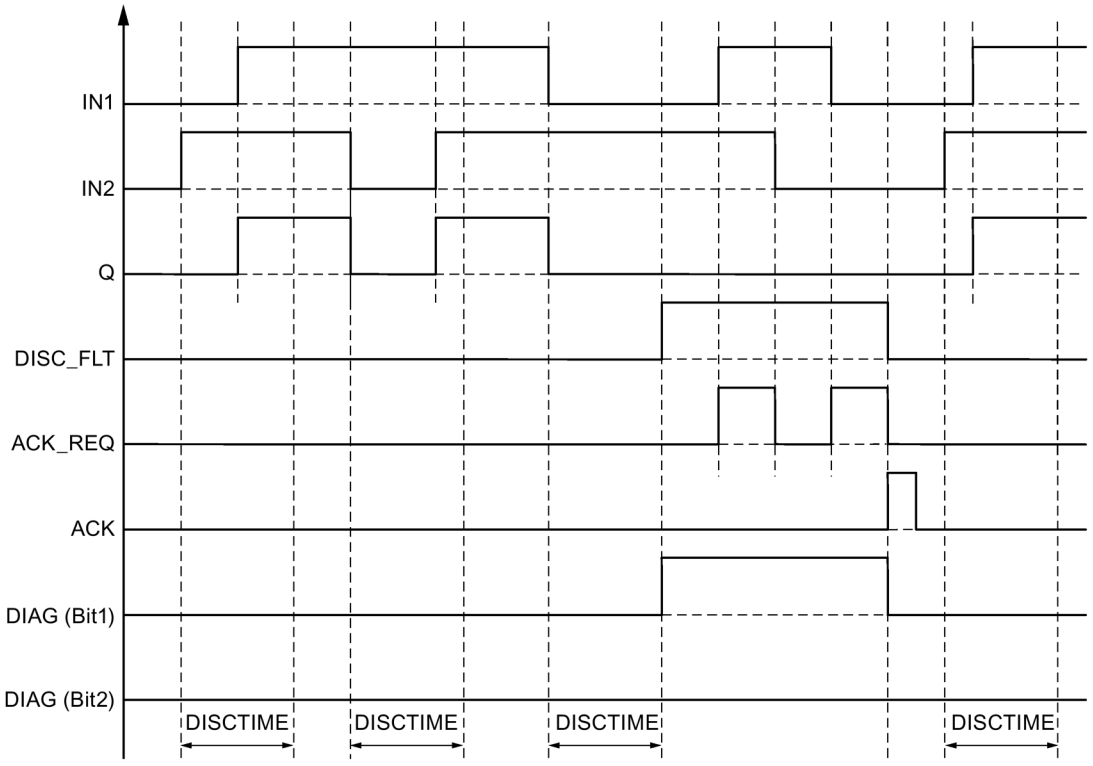
For nonequivalent signals, you have to negate the input (IN1 or IN2) with which you have assigned the encoder signal to a safe state of 1 and AND it with the value status of the associated channel. Signal state 0 is then at input IN1 or IN2 when fail-safe values are output.

Network1: EV1oo2DI with non-equivalent signals



Timing diagrams EV1oo2DI

If ACK_NEC = 1:



Startup characteristics

Note

If the sensors at inputs IN1 and IN2 are assigned to different F-I/O, it is possible that the fail-safe values are output for different lengths of time following startup of the F-system due to different startup characteristics of the F-I/O. If the signal states of inputs IN1 and IN2 remain different after the discrepancy time DISCTIME has expired, a discrepancy error is detected after the F-system starts up.

If ACK_NEC = 1 you must acknowledge the discrepancy error with a rising edge at input ACK.

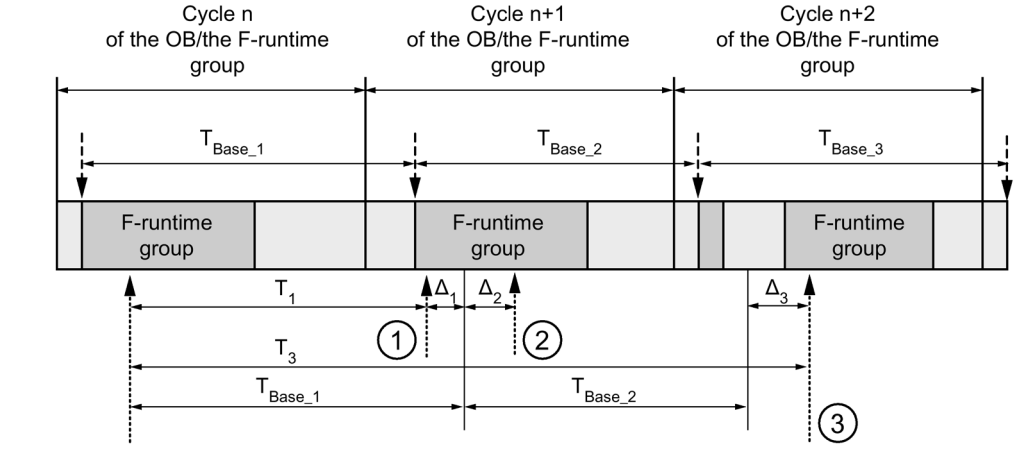
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Discrepancy error or incorrect discrepancy time setting (= status of DISC_FLT)	Sensor defective	Check sensors
		Wiring fault	Check wiring of sensors
		Sensors are wired to different F-I/O, and F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON on an F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
		Discrepancy time setting is too low	If necessary, set a higher discrepancy time
		Discrepancy time setting is < 0 s or > 60 s	Set discrepancy time in range between 0 s and 60 s
Bit 1	For discrepancy errors: last signal state change was at input IN1	—	—
Bit 2	For discrepancy errors: last signal state change was at input IN2	—	—
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For discrepancy errors: input ACK has a permanent signal state of 1	Acknowledgment button defective	Replace acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment necessary	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

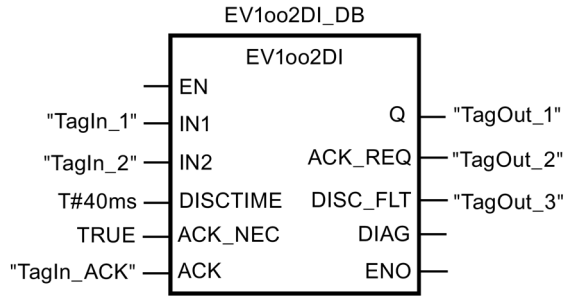
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

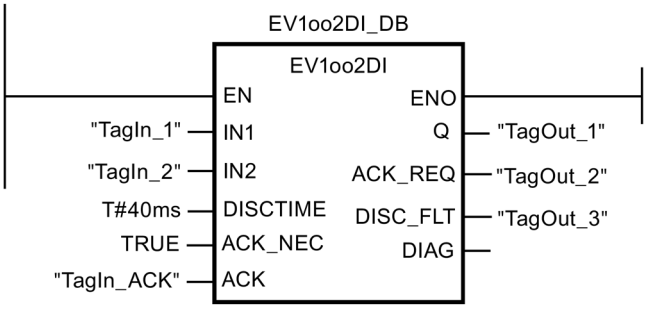
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:





13.3.3.7 FDBACK: Feedback monitoring (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements feedback monitoring.

The signal state of output Q is checked to see whether it corresponds to the inverse signal state of the feedback input FEEDBACK.

Output Q is set to 1 as soon as input ON = 1. Requirement for this is that the feedback input FEEDBACK = 1 and no feedback error is saved.

Output Q is reset to 0, as soon as input ON = 0 or if a feedback error is detected.

A feedback error ERROR = 1 is detected if the inverse signal state of the feedback input FEEDBACK (to input Q) does not follow the signal state of output Q within the maximum tolerable feedback time. The feedback error is saved.

If a discrepancy is detected between the feedback input FEEDBACK and the output Q after a feedback error, the feedback error is acknowledged in accordance with the parameter assignment of ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must acknowledge the feedback error with a rising edge at input ACK.

The ACK_REQ = 1 output then signals that a user acknowledgment is necessary at input ACK to acknowledge the feedback error. Following an acknowledgment, the instruction resets ACK_REQ to 0.

To avoid a feedback errors from being detected and acknowledgment from being required when the F-I/O controlled by the Q output are passivated, you need to supply input QBAD_FIO with the QBAD signal of the associated F-I/O or the QBAD_O_xx signal / inverted value status of the associated channel.

Every call of the "Feedback monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., FDBACK_DB_1) or a multi-instance (e.g., FDBACK_Instance_1) for the "Feedback monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision *(S034)*.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ON	Input	BOOL	1= Enable output
FEEDBACK	Input	BOOL	Feedback input
QBAD_FIO	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the Q output
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
FDB_TIME	Input	TIME	Feedback time
Q	Output	BOOL	Output
ERROR	Output	BOOL	Feedback error
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Service information

Instruction versions

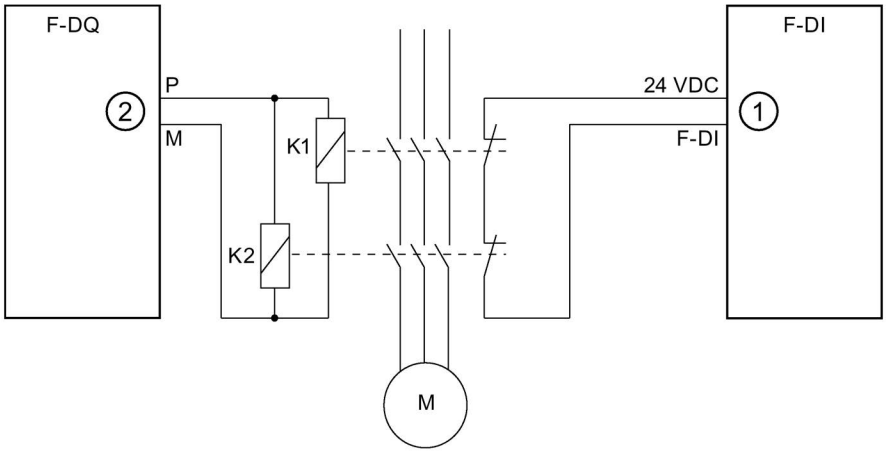
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	Version 1.0 requires that the F_TOF block with the number FB 186 is available in the project tree in the "Program blocks/System blocks/STEP 7 Safety" folder. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction. You will then avoid number conflicts.
1.1	x	—	—	These versions are functionally identical to version V1.0, but do not require the F_TOF block to have a particular number.
1.2	x	—	x	
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Interconnection example



① Sent to the FEEDBACK input of the instruction
② from output Q of the instruction

Startup characteristics

After an F-system startup, the instruction does not have be acknowledged when no errors are present.

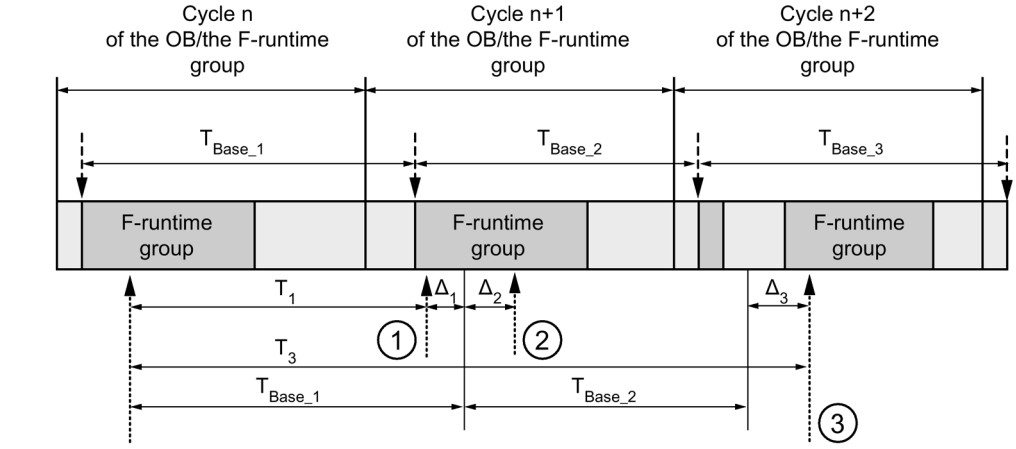
Output DIAG

The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits 0, 2, and 5 are saved until acknowledgment at input ACK.

Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Feedback error or incorrect feedback time setting (= state of ERROR)	Feedback time setting < 0	Set feedback time > 0
		Feedback time setting is too low	If necessary, set a higher feedback time
		Wiring fault	Check wiring of actuator and feedback contact
		Actuator or feedback contact is defective	Check actuator and feedback contact
		I/O fault or channel fault of feedback input	Check I/O
Bit 1	Passivation of F-I/O/channel controlled by output Q (= state of QBAD_FIO)	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 2	After feedback error: feedback input has permanent signal state of 0	F-I/O fault or channel fault of feedback input	Check I/O
		Feedback contact is defective	Check feedback contact
		F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O of feedback input	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 3	Reserved	—	—
Bit 4	Reserved	—	—
Bit 5	For feedback error: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

Timing imprecision resulting from the update time of the time base used in the instruction:



----► = Time base update

·····► = Call time of an instruction with time processing

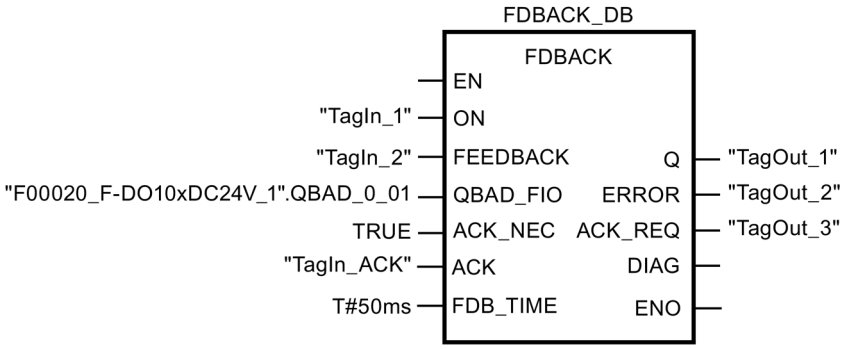
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

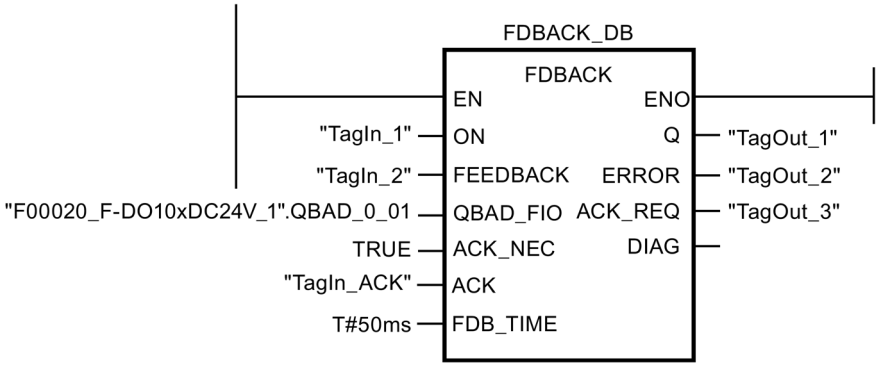
② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

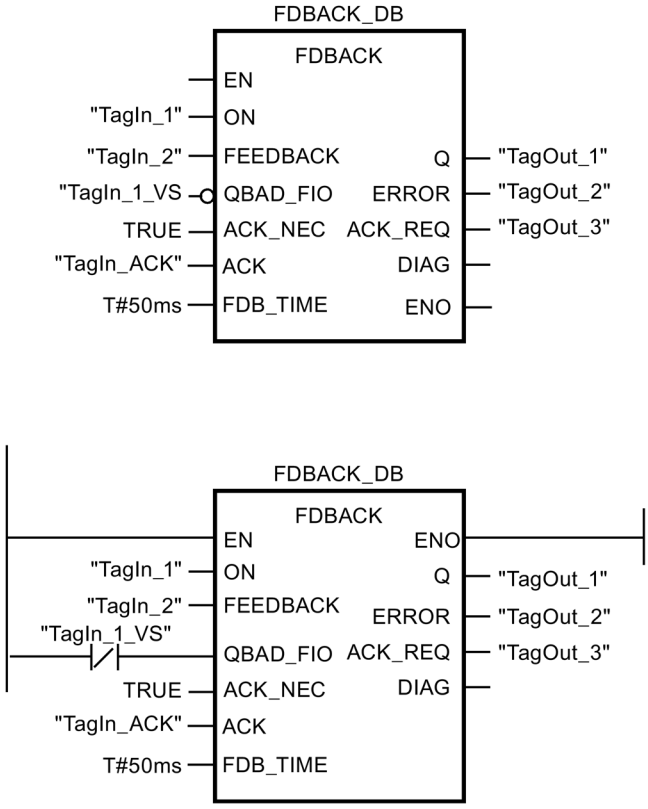
Example

The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:



13.3.3.8 SFDOOR: Safety door monitoring (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction implements safety door monitoring.

Enable signal Q is reset to 0 as soon as one of the inputs IN1 or IN2 take a signal state of 0 (safety door is opened). The enable signal can be reset to 1, only if:

- Inputs IN1 and IN2 both take a signal state of 0 prior to opening the door (safety door has been completely opened)
- Inputs IN1 and IN2 then both take a signal state of 1 (safety door is closed)
- An acknowledgment occurs

The acknowledgment for the enable takes place according to the parameter assignment at input ACK_NEC:

- If ACK_NEC = 0, the acknowledgment is automatic.
- If ACK_NEC = 1, you must use a rising edge at input ACK for acknowledging the enable.

Output ACK_REQ = 1 is used to signal that a user acknowledgment is required at input ACK for the acknowledgment. The instruction sets ACK_REQ = 1 as soon as the door is closed. Following an acknowledgment, the instruction resets ACK_REQ to 0.

In order for the instruction to recognize whether inputs IN1 and IN2 are 0 merely due to passivation of the associated F-I/O, you need to supply inputs QBAD_IN1 or QBAD_IN2 with the QBAD signal of the associated F-I/O or QBAD_I_xx signal / inverted value status of the associated channel. Among other things, this will prevent you from having to open the safety door completely prior to an acknowledgment in the event the F-I/O are passivated.

Every call of the "Safety door monitoring" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SFDOOR_DB_1) or a multi-instance (e.g., SFDOOR_Instance_1) for the "Safety door monitoring" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The ACK_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S033)*

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	BOOL	Input 1
IN2	Input	BOOL	Input 2
QBAD_IN1	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN1
QBAD_IN2	Input	BOOL	QBAD signal of the F-I/O or QBAD_O_xx signal / inverted value status of the channel of input IN2
OPEN_NEC	Input	BOOL	1= Open necessary at startup
ACK_NEC	Input	BOOL	1=Acknowledgment necessary
ACK	Input	BOOL	Acknowledgment
Q	Output	BOOL	1= Enable, safety door closed
ACK_REQ	Output	BOOL	Acknowledgment request
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

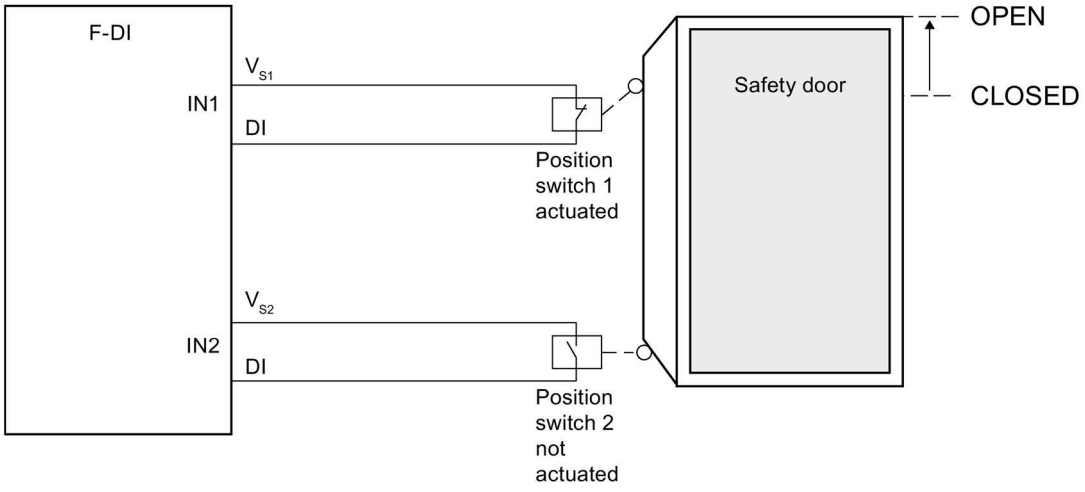
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

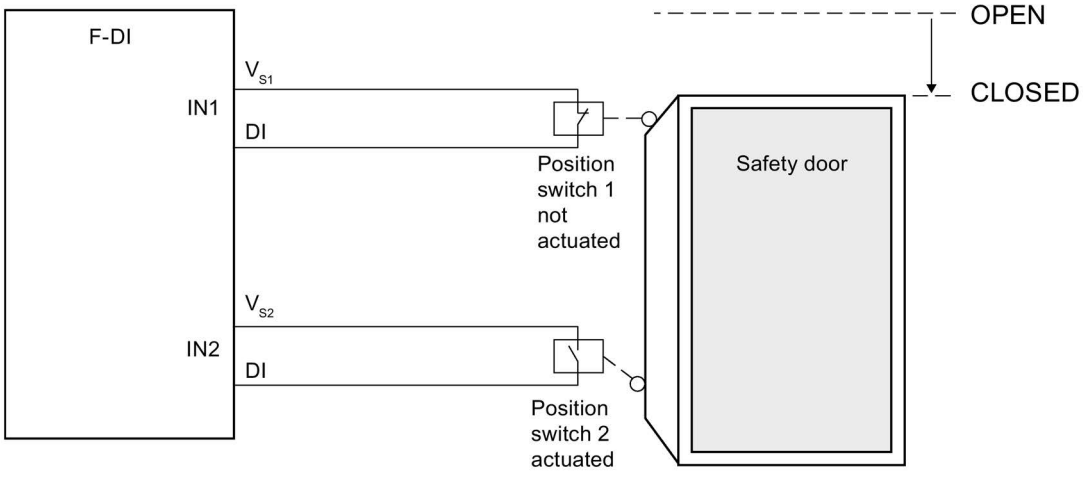
Interconnection example

You must interconnect the NC contact of position switch 1 of the safety door at input IN1 and the NO contact of position switch 2 at input IN2. Position switch 1 must be mounted in such a way that it is positively operated when the safety door is open. Position switch 2 must be mounted in such a way that it is operated when the safety door is closed.

Safety door open:



Safety door closed:



Startup characteristics

After an F-system startup, enable signal Q is reset to 0. The acknowledgment for the enable takes place according to the parameter assignment at inputs OPEN_NEC and ACK_NEC:

- When OPEN_NEC = 0, an automatic acknowledgment occurs **independently** of ACK_NEC, as soon as the two inputs IN1 and IN2 take signal state 1 for the first time following reintegration of the associated F-I/O (safety door is closed).
- When OPEN_NEC = 1 **or** if at least one of the IN1 and IN2 inputs still has a signal state of 0 after reintegration of the associated F-I/O, an automatic acknowledgment occurs **according** to ACK_NEC or you have to use a rising edge at input ACK for the enable. Prior to acknowledgment, inputs IN1 and IN2 both have to take a signal state of 0 (safety door has been completely opened) followed by a signal state of 1 (safety door is closed).

⚠ WARNING

The OPEN_NEC tag must not be assigned a value of 0 unless an automatic restart of the affected process is otherwise excluded. *(S039)*

Output DIAG

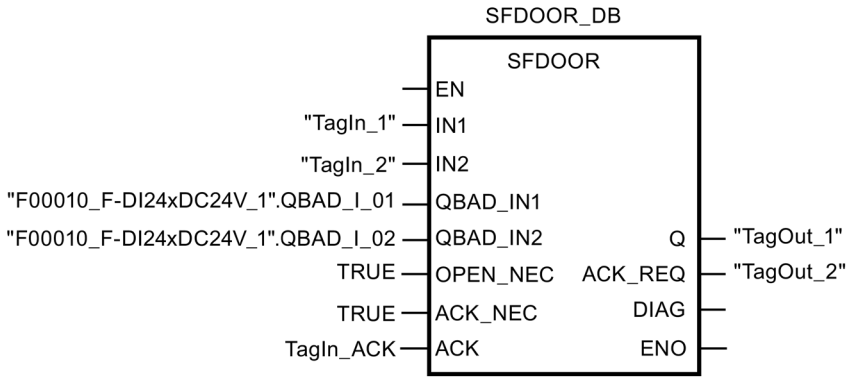
The DIAG output provides non-fail-safe information on errors for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program.

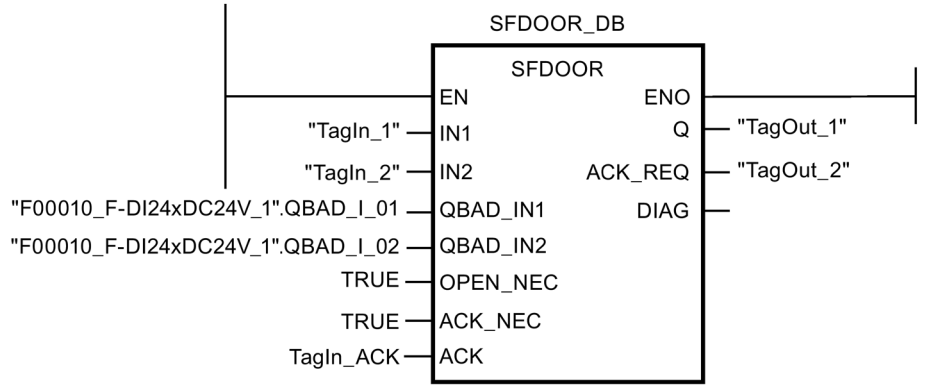
Structure of DIAG

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Signal state 0 is missing at both IN1 and IN2 inputs	Safety door was not completely opened when OPEN_NEC = 1 after F-system startup	Open safety door completely
		Open safety door was not completely opened	Open safety door completely
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 2	Signal state 1 is missing at both IN1 and IN2 inputs	Safety door was not closed	Close safety door
		Wiring fault	Check wiring of position switch
		Position switch is defective	Check position switch
		Position switch is incorrectly adjusted	Adjust position switch properly
Bit 3	QBAD_IN1 and/or QBAD_IN2 = 1	F-I/O fault, channel fault, or communication error, or passivation by means of PASS_ON of F-I/O or channel of IN1 and/or IN2	For a solution, see the section "Structure of DIAG", bits 0 to 6 in DIAG (Page 137)
Bit 4	Reserved	—	—
Bit 5	If enable is missing: input ACK has a permanent signal state of 1	Acknowledgment button defective	Check acknowledgment button
		Wiring fault	Check wiring of acknowledgment button
Bit 6	Acknowledgment required (= state of ACK_REQ)	—	—
Bit 7	State of output Q	—	—

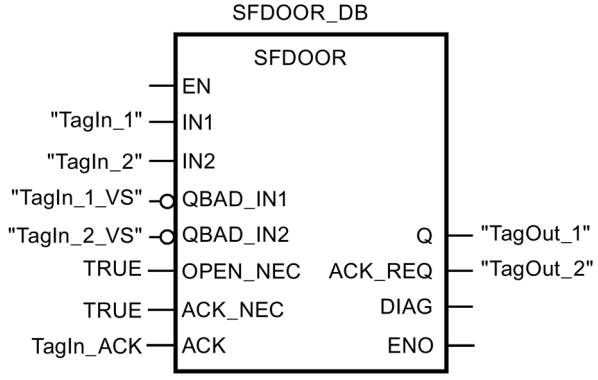
Example

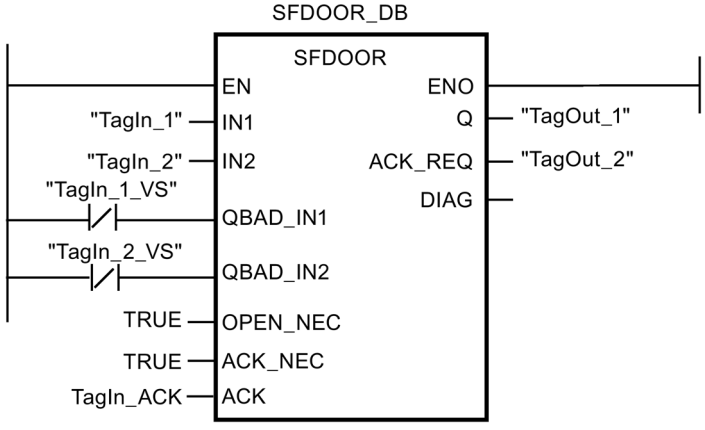
The following example shows how the instruction for S7-300/400 F-CPUs works:





The following example shows how the instruction for S7-1200/1500 F-CPUs works:





13.3.3.9 ACK_GL: Global acknowledgment of all F-I/O in an F-runtime group (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction creates an acknowledgment for the simultaneous reintegration of all F-I/O or channels of the F-I/O of an F-runtime group after communication errors, F-I/O errors, or channel faults.

A user acknowledgment (Page 151) with a positive edge at input ACK_GLOB is required for reintegration. The acknowledgment occurs analogously to the user acknowledgment via the ACK_REI tag of the F-I/O DB (Page 137), but it acts simultaneously on all F-I/O of the F-runtime group in which the instruction is called.

If you use the instruction ACK_GL, you do not have to provide a user acknowledgment for each F-I/O of the F-runtime group via the ACK_REI tag of the F-I/O DB.

Every call of the "Global acknowledgment of all F-I/O of a runtime group" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_GL_DB_1) or a multi-instance (e.g., ACK_GL_Instance_1) for the "Global acknowledgment of all F-I/O of a runtime group" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

An acknowledgment via the ACK_GL instruction is only possible if the tag ACK_REI of the F-I/O DB = 0. Accordingly, an acknowledgment via the tag ACK_REI of the F-I/O DB is only possible if the input ACK_GLOB of the instruction = 0.

The instruction is only allowed to be called once per F-runtime group.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_GLOB	Input	BOOL	1=acknowledgment for reintegration

Instruction versions

A number of versions are available for this instruction:

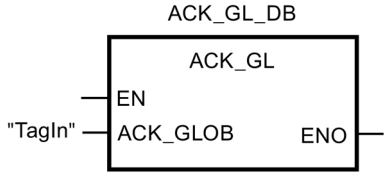
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

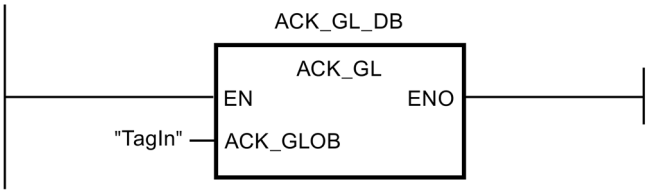
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:





13.3.4 Timer operations

13.3.4.1 TP: Generate pulse (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate pulse" instruction to set output Q for an assigned period. The instruction is started if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The assigned period PT starts running when the instruction starts. Output Q is set for period PT, regardless of the subsequent sequence of the input signal. Also the detection of a new positive signal edge does not influence the signal state at output Q as long as period PT runs.

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached. If period PT is reached and the signal state at input IN is "0", output ET is reset.

Every call of the "Generate pulse" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate pulse" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction").
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate pulse" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TP instruction in the following points:

- When a call is made with PT = 0 ms, the TP instance is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only outputs Q and ET are reset. To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the pulse, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of pulse; must be positive.
Q	Output	BOOL	Pulse output
ET	Output	TIME	Current time value

Instruction versions

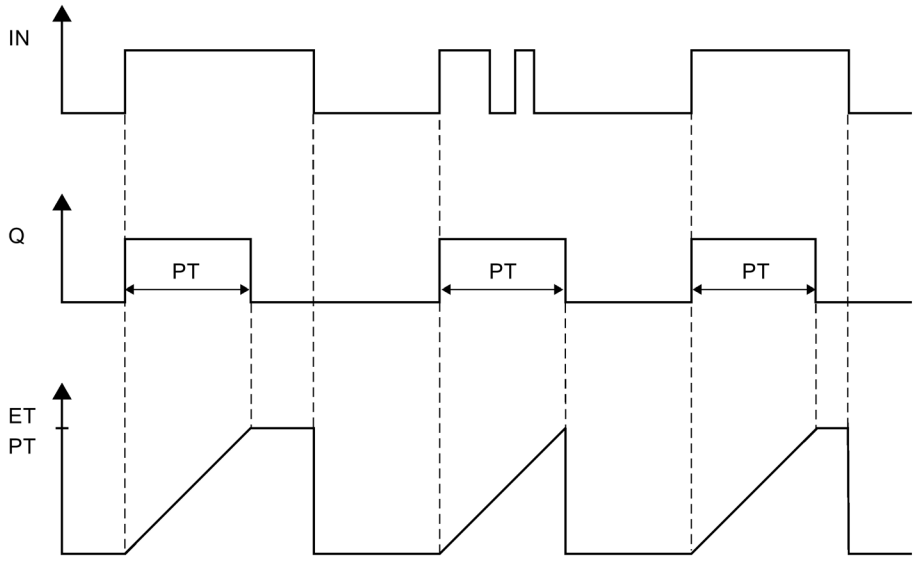
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

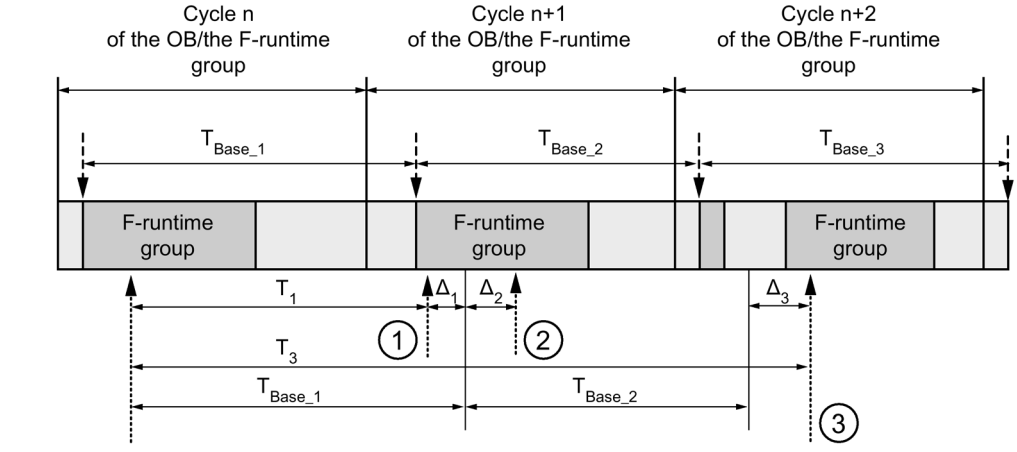
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing diagrams TP



Timing imprecision resulting from the update time of the time base used in the instruction:



---→ = Time base update

·····→ = Call time of an instruction with time processing

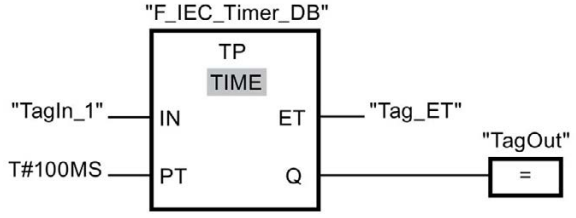
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the "Generate pulse" instruction is started and the period assigned at input PT (100 ms) runs, regardless of the further course of operand "TagIn_1".

Operand "TagOut" at output Q has signal state "1" as long as the period is running. Operand "Tag_ET" contains the current time value.

13.3.4.2 TON: Generate on-delay (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate on-delay" instruction to delay the setting of output Q by the assigned period PT. The "Generate on-delay" instruction is started when the result of logic operation (RLO) at input IN changes from "0" to "1" (positive signal edge). The assigned period PT starts running when the instruction starts. When period PT has expired, output Q is set to signal state "1". Output Q remains set as long as the start input is set to "1". When the signal state at the start input changes from "1" to "0", output Q is reset. The time function is restarted when a new positive signal edge is detected at the start input.

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached. Output ET is reset, as soon as the signal state at input IN changes to "0".

Every call of the "Generate on-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate on-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate on-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TON instruction in the following points:

- When a call is made with PT = 0 ms, the instance of the TON is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only output ET is reset. To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the on-delay, a new rising signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of on-delay; must be positive.
Q	Output	BOOL	Output that is set after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

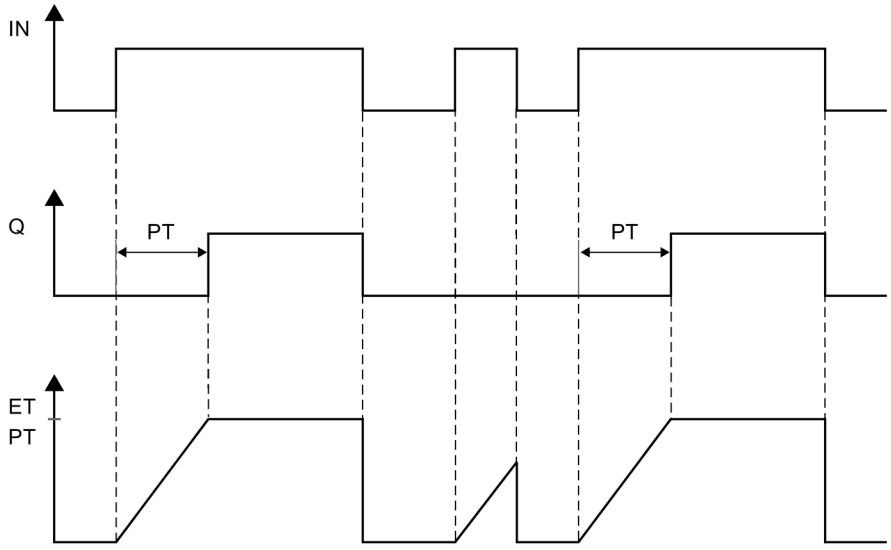
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

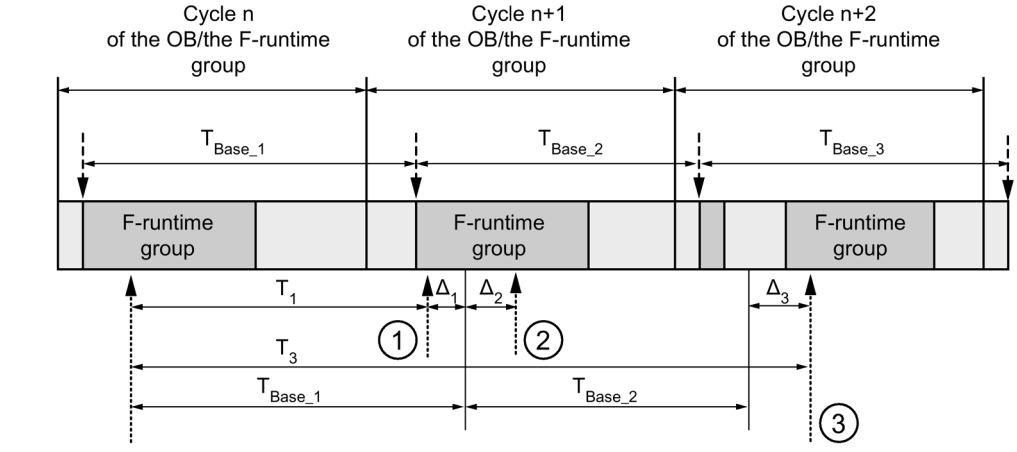
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram



Timing imprecision resulting from the update time of the time base used in the instruction:



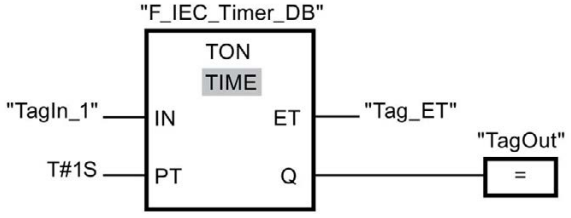
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



When the signal state of operand "TagIn_1" changes from "0" to "1", the

"Generate on-delay" instruction is started and the period assigned at input PT (1 s) runs.

Operand "TagOut" at output Q feeds signal state "1" when the period has elapsed and remains set as long as operand "TagIn_1" still feeds signal state "1". Operand "Tag_ET" contains the current time value.

13.3.4.3 TOF: Generate off-delay (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Generate off-delay" instruction to delay resetting output Q by the assigned period PT. Output Q is set if the result of logic operation (RLO) changes from "0" to "1" (positive edge) at input IN. The assigned period PT starts when the signal state at input IN changes back to "0". Output Q remains set as long as period PT runs. After period PT expires, output Q is reset. If the signal state at input IN changes to "1" before period PT has expired, then the time is reset. The signal state at output Q remains at "1".

The current time value can be queried at output ET. The time value begins at T#0s and ends when the value of period PT is reached.

Every call of the "Generate off-delay" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is in inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Timer_DB_1) or a multi-instance (e.g., F_IEC_Timer_Instance_1) for the "Generate off-delay" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

⚠ WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

The operating system resets the instances of the "Generate off-delay" instruction on a startup of the F-system.

Note

The functionality of this instruction differs from the corresponding standard TOF instruction in the following points:

- When a call is made with PT = 0 ms, the instance of the TOF is not reset completely (initialized). The instruction behaves in accordance with the timing diagrams: Only outputs Q and ET are reset. To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.
- A call with PT < 0 ms resets outputs Q and ET. To restart the off-delay, another falling signal edge at input IN is required once PT is greater than 0 again.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	BOOL	Start input
PT	Input	TIME	Duration of off-delay; PT must be positive.
Q	Output	BOOL	Output that is reset after expiration of time PT.
ET	Output	TIME	Current time value

Instruction versions

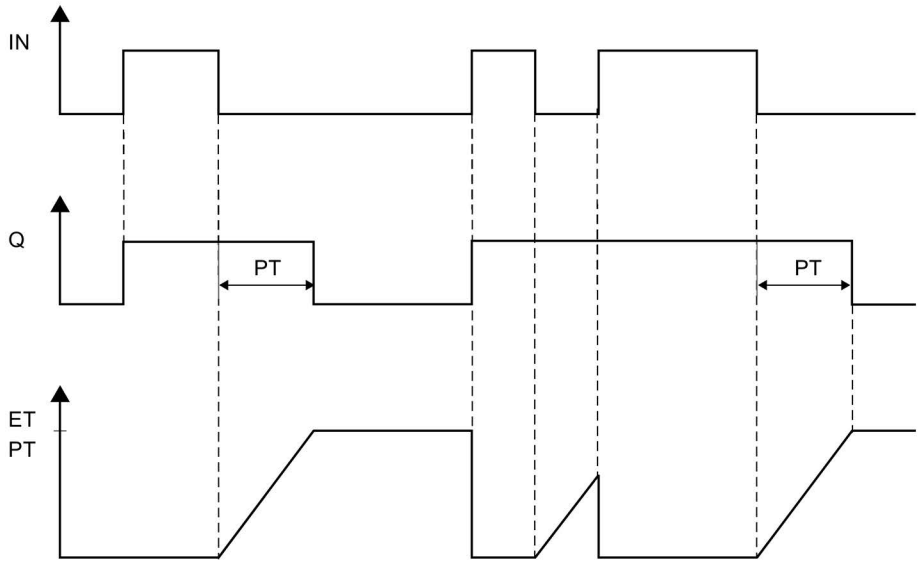
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

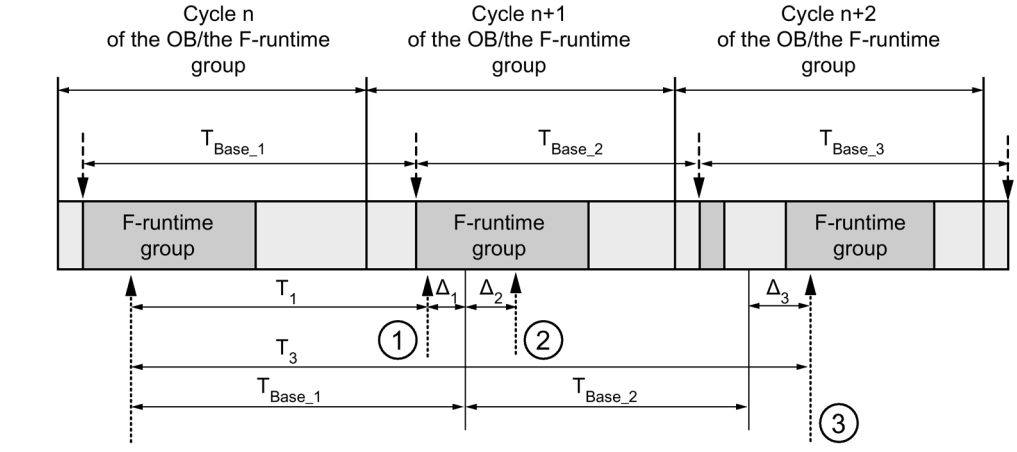
When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Pulse diagram



Timing imprecision resulting from the update time of the time base used in the instruction:



---→ = Time base update

·····→ = Call time of an instruction with time processing

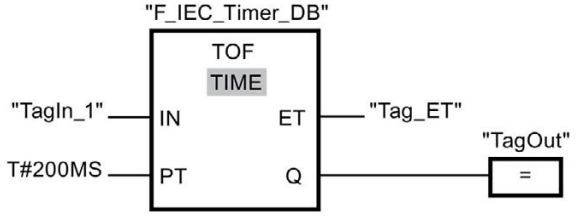
① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

The following example shows how the instruction works:



If the signal state of operand "TagIn_1" changes from "0" to "1", the signal state of operand"TagOut" at output Q is set to "1".

If the signal state of operand "TagIn_1" changes back to "0", the period assigned at input PT (200 ms) runs.

The "TagOut" operand at output Q is set back to "0" when the period expires. Operand "Tag_ET" contains the current time value.

13.3.5 Counter operations

13.3.5.1 CTU: Count up (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count up" instruction to increment the value at output CV. When the signal state at input CU changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is increased by one. The count value is increased on each detection of a positive signal edge until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the signal state at input CU no longer affects the instruction.

The counter status can be queried at output Q. The signal state at output Q is determined by parameter PV. When the current count value is greater than or equal to the value of parameter PV, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is reset to zero when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at input CU has no effect on the instruction.

Every call of the "Count up" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Counter input
R	Input	BOOL	Reset input
PV	Input	INT	Value for which output Q is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

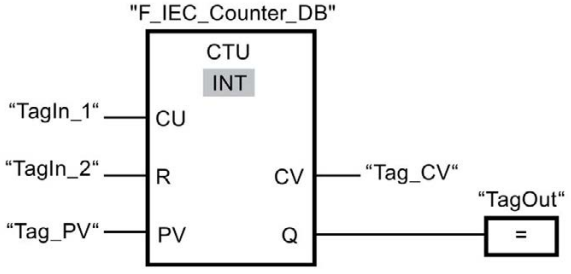
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



When the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count up" instruction is executed and the current count value of the "Tag_CV" operand is increased by one. The count value is increased on every additional positive signal edge until the high limit of the specified data type (32767) is reached.

The value at parameter PV is taken as the limit for the determination of output "TagOut". Output "TagOut" delivers the signal state "1" as long as the current count value is greater than or equal to the value of operand "Tag_PV". In all other cases, output TagOut has signal state "0".

13.3.5.2 CTD: Count down (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count down" instruction to decrement the value at output CV. When the signal state at input CD changes from "0" to "1" (positive signal edge), the instruction is executed and the current count value at output CV is decreased by one. The count value is decreased on each detection of a positive signal edge until it reaches the low limit of the specified data type. When the low limit is reached, the signal state at input CD no longer affects the instruction.

The counter status can be queried at output Q. When the current count value is less than or equal to zero, output Q is set to signal state "1". In all other cases, the signal state at output Q is "0".

The value at output CV is set to the value of parameter "PV" when the signal state at input LD changes to "1". As long as signal state "1" exists at input LD, the signal state at input CD has no effect on the instruction.

Every call of the "Count down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count down" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CD	Input	BOOL	Counter input
LD	Input	BOOL	Load input
PV	Input	INT	Value at the output CV when LD = 1 is set
Q	Output	BOOL	Counter status
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

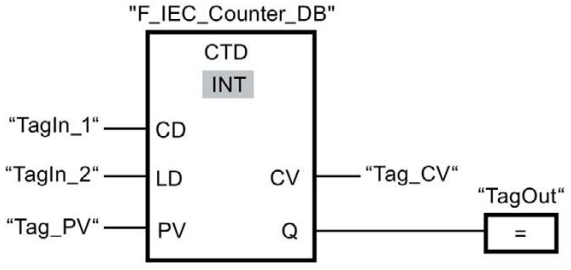
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



If the signal state of the "TagIn_1" operand changes from "0" to "1", the "Count down" instruction is executed and the current count value at output "Tag_CV" is decreased by one. The count value is decreased on each additional positive signal edge until the low limit of the specified data type (-32768) is reached.

Output "TagOut" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut has signal state "0".

13.3.5.3 CTUD: Count up and down (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Count up and down" instruction to increment and decrement the count value at output CV. If the signal state at input CU changes from "0" to "1" (positive signal edge), the current count value at output CV is increased by one. If the signal state at input CD changes from "0" to "1" (positive signal edge), the count value at output CV is decreased by one. If a positive signal edge is present at inputs CU and CD in one program cycle, the current count value at output CV remains unchanged.

The count value can be increased until it reaches the high limit of the data type specified at output CV. When the high limit is reached, the count value is no longer incremented on a positive signal edge. When the low limit of the specified data type is reached, the count value is no longer decreased.

When the signal state at input LD changes to "1", the count value at output CV is set to the value of parameter PV. As long as signal state "1" exists at input LD, the signal state at inputs CU and CD has no effect on the instruction.

The count value is set to zero, when the signal state at input R changes to "1". As long as signal state "1" exists at input R, the signal state at inputs CU, CD, and LD has no effect on the "Count up and down" instruction.

The status of the up counter can be queried at output QU. When the current count value is greater than or equal to the value of parameter PV, output QU delivers signal state "1". In all other cases, the signal state at output QU is "0".

The status of the down counter can be queried at output QD. When the current count value is lesser than or equal to zero, output QD delivers signal state "1". In all other cases, the signal state at output QD is "0".

Every call of the "Count up and down" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., F_IEC_Counter_DB_1) or a multi-instance (e.g., F_IEC_Counter_Instance_1) for the "Count up and down" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the *help on STEP 7*.

The operating system resets the instances of the "Count up and down" instruction on a startup of the F-system.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
CU	Input	BOOL	Count up input
CD	Input	BOOL	Count down input
R	Input	BOOL	Reset input
LD	Input	BOOL	Load input
PV	Input	INT	Value set at the output QU/ at which the output CV is set at LD = 1.
QU	Output	BOOL	Status of up counter
QD	Output	BOOL	Status of down counter
CV	Output	INT	Current count value

Instruction versions

A number of versions are available for this instruction:

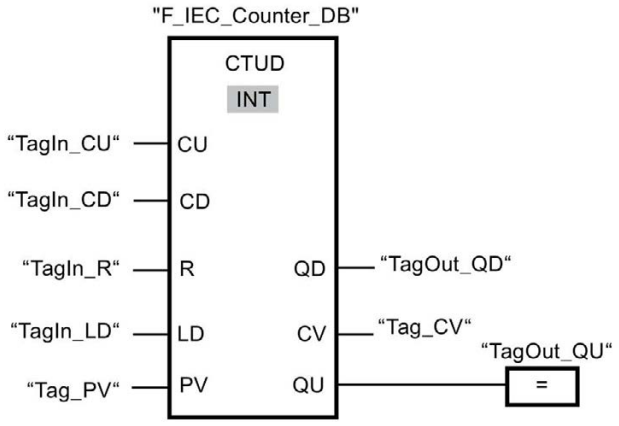
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions have identical functions to version V1.0.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



If the signal state at input "TagIn_CU" or at input "TagIn_CD" changes from "0" to "1" (positive signal edge), the "Count up and down" instruction is executed. When a positive signal edge is present at input "TagIn_CU", the current count value of the "Tag_CV" operand is increased by one. When a positive signal edge is present at input "TagIn_CD", the current count value at output "Tag_CV" is decreased by one. The count value is increased on each positive signal edge at input CU until it reaches the high limit of 32767. The count value is decreased on each positive signal edge at input CD until it reaches the low limit of -32768.

Output "TagOut_QU" delivers the signal state "1" as long as the current count value is greater than or equal to the value at input "Tag_PV". In all other cases, output TagOut_QU has signal state "0".

Output "TagOut_QD" delivers the signal state "1" as long as the current count value is less than or equal to zero. In all other cases, output TagOut_QD has signal state "0".

13.3.6 Comparator operations

13.3.6.1 CMP ==: Equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Equal" instruction you can query whether the value at input IN1 is equal to the value at input IN2.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition is not fulfilled, the instruction returns RLO "0".

Parameters

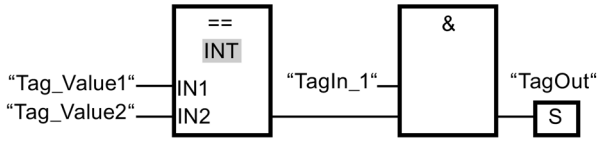
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME, WORD, DWORD	First value to compare
IN2	Input	INT, DINT, TIME, WORD, DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" = "Tag_Value2").

13.3.6.2 CMP <>: Unequal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Not equal" instruction you can query whether the value at input IN1 is not equal to the value at input IN2.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition is not fulfilled, the instruction returns RLO "0".

Parameters

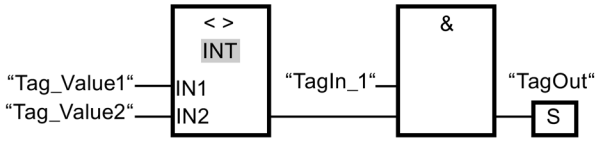
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME, WORD, DWORD	First value to compare
IN2	Input	INT, DINT, TIME, WORD, DWORD	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <> "Tag_Value2").

13.3.6.3 CMP >=: Greater or equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Greater or equal" instruction you can query whether the value at input IN1 is greater than or equal to the value at input IN2. Both comparison values must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not fulfilled, the instruction returns RLO "0".

Parameters

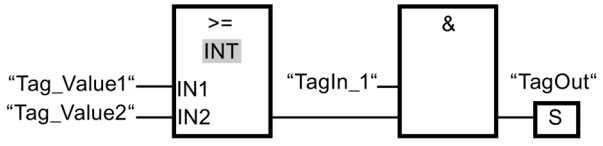
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME	First value to compare
IN2	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" >= "Tag_Value2").

13.3.6.4 CMP <=: Less or equal (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Less or equal" instruction you can query whether the value at input IN1 is less than or equal to the value at input IN2. Both comparison values must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not fulfilled, the instruction returns RLO "0".

Parameters

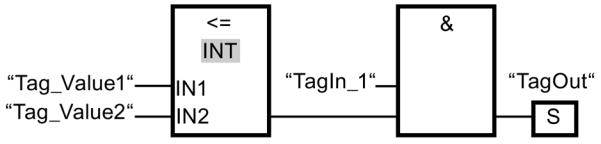
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME	First value to compare
IN2	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" <= "Tag_Value2").

13.3.6.5 CMP >: Greater than (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Greater than" instruction you can query whether the value at input IN1 is greater than the value at input IN2. Both comparison values must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not fulfilled, the instruction returns RLO "0".

Parameters

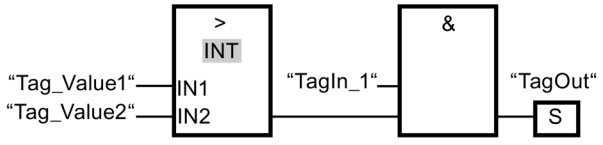
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME	First value to compare
IN2	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" > "Tag_Value2").

13.3.6.6 CMP <: Less than (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

Using the "Less than" instruction you can query whether the value at input IN1 is less than the value at input IN2. Both comparison values must be of the same data type.

If the condition of the comparison is fulfilled, the instruction returns result of logic operation (RLO) "1". If the condition of the comparison is not fulfilled, the instruction returns RLO "0".

Parameters

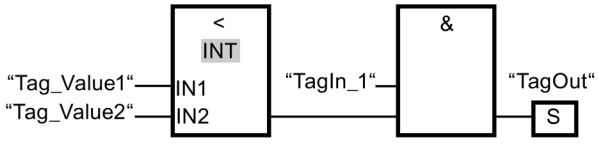
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT, TIME	First value to compare
IN2	Input	INT, DINT, TIME	Second value to compare

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



Output "TagOut" is set when the following conditions are fulfilled:

- Operand "TagIn_1" has signal state "1".
- The condition of the comparison instruction is fulfilled ("Tag_Value1" < "Tag_Value2").

13.3.7 Math functions

13.3.7.1 ADD: Add (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Add" instruction to add the value at input IN1 and the value at input IN2 and query the sum at the OUT output (OUT = IN1 + IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

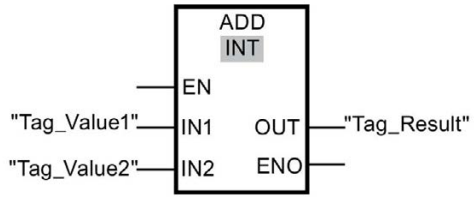
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	First addend
IN2	Input	INT, DINT	Second addend
OUT	Output	INT, DINT	Total

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

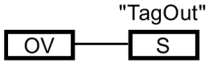
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Add" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 645)

13.3.7.2 SUB: Subtract (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Subtract" instruction to subtract the value at input IN2 from the value at input IN1 and query the difference at the OUT output (OUT = IN1 – IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

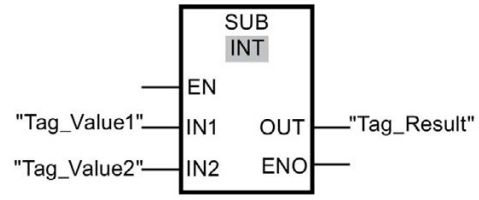
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Minuend
IN2	Input	INT, DINT	Subtrahend
OUT	Output	INT, DINT	Difference

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

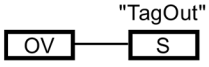
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Subtract" instruction is always executed (regardless of the signal state at enable input EN).

The value of operand "Tag_Value2" is subtracted from the value of operand "Tag_Value1". The result of the addition is stored in operand "Tag_Result".

(S7-300, S7-400) If an overflow occurs during execution of the "Subtract" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 645)

13.3.7.3 MUL: Multiply (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Multiply" instruction to multiply the value at input IN1 by the value at input IN2 and query the product at output OUT (OUT = IN1 × IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

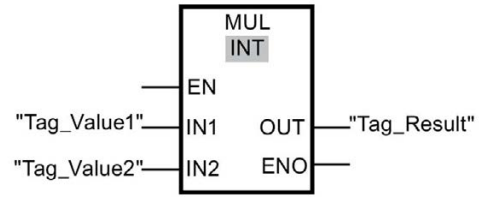
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Multiplier
IN2	Input	INT, DINT	Multiplicand
OUT	Output	INT, DINT	Product

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

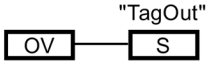
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Multiply" instruction is always executed (regardless of the signal state at enable input EN).

The value of the "Tag_Value1" operand is multiplied by the value of the "Tag_Value2" operand. The result of the multiplication is stored in the "Tag_Result" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Multiply" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 645)

13.3.7.4 DIV: Divide (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Divide" instruction to divide the value at input IN1 by the value at input IN2 and query the quotient at the OUT output (OUT = IN1 / IN2).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts in this case like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Note

S7-300/400:

If the divisor (input IN2) of a DIV instruction = 0, the quotient of the division (result of division at output OUT) = 0. The result reacts like the corresponding instruction in a standard block. The F-CPU does *not* go to STOP mode.

S7-1200/1500:

If the divisor (input IN2) of a DIV instruction = 0, the F-CPU goes to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages. We recommend that you rule out a divisor (input IN2) = 0 when creating the program.

Parameters

The following table shows the parameters of the instruction:

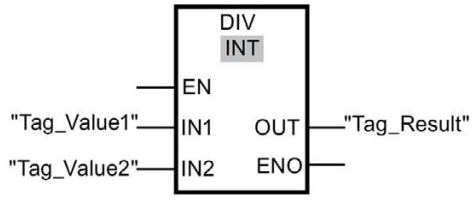
Parameter	Declaration	Data type	Description
IN1	Input	INT, DINT	Dividend
IN2	Input	INT, DINT	Divisor
OUT	Output	INT, DINT	Quotient

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

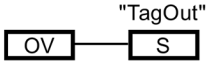
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Divide" instruction is always executed (regardless of the signal state at enable input EN).

The value of operand "Tag_Value1" is divided by the value of operand "Tag_Value2". The result of the division is stored in operand "Tag_Result".

(S7-300, S7-400) If an overflow occurs during execution of the "Divide" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 645)

13.3.7.5 NEG: Create twos complement (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Create twos complement" instruction to change the sign of the value at input IN input and query the result at output OUT. If there is a positive value at input IN, for example, the negative equivalent of this value is sent to output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

If the result of the instruction is located outside the permitted range for this data type, the F-CPU may switch to STOP. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic alarms.

You must therefore ensure that the permitted range for the data type is observed when creating the program!

(S7-300, S7-400) You can avoid a STOP of the F-CPU by inserting a "Get status bit OV" instruction in the next network, thereby programming overflow detection.

Note the following:

- The result of the instruction reacts like the analogous instruction in a standard block.
- The network with the "Get status bit OV" instruction must not contain any jump labels.
- The execution time of the instruction is extended (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).
- A warning is issued if you do not insert a "Get status bit OV" instruction.

Parameters

The following table shows the parameters of the instruction:

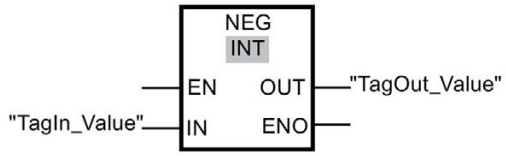
Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Input value
OUT	Output	INT, DINT	Twos complement of the input value

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

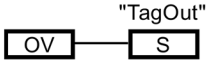
Example

The following example shows how the instruction works:

Network 1:



Network 2: (S7-300, S7-400)



The "Create twos complement" instruction is always executed (regardless of the signal state at enable input EN).

The sign of the "TagIn_Value" operand is changed and the result is stored in the "TagOut_Value" operand.

(S7-300, S7-400) If an overflow occurs during execution of the "Create twos complement" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

See also

OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 645)

13.3.8 Move operations

13.3.8.1 MOVE: Move value (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Move value" instruction to transfer the content of the operand at input IN to the operand at output OUT1.

Only identical operand widths can be specified for input IN and output OUT1.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

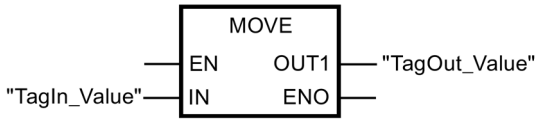
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT, WORD, DWORD, TIME	Source value
OUT1	Output	INT, DINT, WORD, DWORD, TIME	Destination address

Example

The following example shows how the instruction works:



The instruction is always executed regardless of the signal state at enable input "EN". The instruction copies the content of operand "TagIn_Value" to operand "TagOut_Value".

13.3.8.2 WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction writes the value specified in input IN to the tag addressed by INI_ADDR and OFFSET in an F-DB.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostic event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB to which the value at input IN is to be written is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

As shown in the following example, the INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT, DINT	Value to be written to the F-DB
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFS

Name	Data type	Initial value	Comment
Static			
VAR_BOOL10	Bool	false	
VAR_BOOL11	Bool	false	
VAR_BOOL12	Bool	false	
VAR_BOOL13	Bool	false	
VAR_TIME10	Time	T#0MS	
VAR_TIME11	Time	T#0MS	
VAR_INT10	Int	0	<- INI_ADDR = "F-DB".VAR_INT10 Example 1
VAR_INT11	Int	0	
VAR_INT12	Int	0	
VAR_INT13	Int	0	<- OFFSET = 3
VAR_INT14	Int	0	
VAR_INT15	Int	0	<- END_ADDR = "F-DB".VAR_INT15
VAR_BOOL20	Bool	false	
VAR_BOOL21	Bool	false	
VAR_BOOL22	Bool	false	
VAR_BOOL23	Bool	false	
VAR_INT20	Int	0	<- INI_ADDR = "F-DB".VAR_INT20 Example 2
VAR_INT21	Int	0	
VAR_INT22	Int	0	
VAR_INT23	Int	0	<- END_ADDR = "F-DB".VAR_INT23

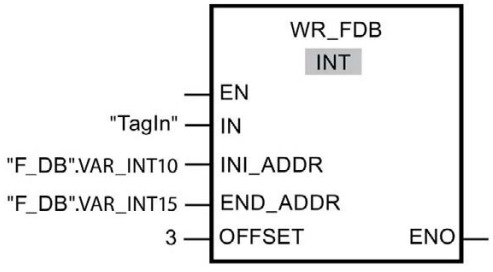
VAR_INT31	Int	0	<- OFFSET = 1
VAR_INT32	Int	0	
VAR_INT33	Int	0	
VAR_INT34	Int	0	<- END_ADDR = "F-DB".VAR_INT34
VAR_TIME20	TIME	T#0MS	
VAR_DINT10	DInt	0	<- INI_ADDR = "F-DB".VAR_DINT10 Example 4
VAR_DINT11	DInt	0	
VAR_DINT12	DInt	0	<- OFFSET = 2
VAR_DINT13	DInt	0	<- END_ADDR = "F-DB".VAR_DINT13

Example

The following example shows how the instruction works:



13.3.8.3 RD_FDB: Read value indirectly from an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

This instruction reads the tag addressed via INI_ADDR and OFFSET in an F-DB and provides it at output OUT.

The address of the tags addressed using INI_ADDR and OFFSET must be within the address range defined by addresses INI_ADDR and END_ADDR.

If the F-CPU has gone to STOP mode with diagnostic event ID 75E2, check to determine if this condition is satisfied.

The start address of the area in an F-DB from which the tag is to be read is transferred using input INI_ADDR. The associated offset in this area is transferred using input OFFSET.

The addresses transferred in input INI_ADDR or END_ADDR must point to a tag of the selected data type in an F-DB. Only tags of the selected data type are permitted between the INI_ADDR and END_ADDR addresses. The INI_ADDR address must be smaller than the END_ADDR address.

The INI_ADDR and END_ADDR addresses must be transferred fully-qualified as "DBx".DBWy or in the corresponding symbolic representation. Transfers in other forms are not permitted. Examples of parameter assignment of INI_ADDR, END_ADDR, and OFFSET are contained in WR_FDB: Write value indirectly to an F-DB (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400) (Page 614).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

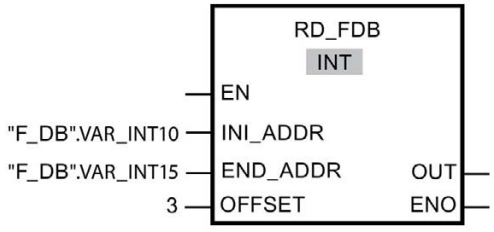
The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
INI_ADDR	Input	POINTER	Start address of the area in an F-DB
END_ADDR	Input	POINTER	End address of the area in an F-DB
OFFSET	Input	INT	Offset
OUT	Output	INT, DINT	Value to be read from the F-DB

You can select the data type of the instruction in the "<???>" drop-down list in the instruction box.

Example

The following example shows how the instruction works:



13.3.9 Conversion operations

13.3.9.1 CONVERT: Convert value (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

The "Convert value" instruction reads the content of parameter IN and converts it according to the data types selected in the instruction box. The converted value is output at output OUT.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

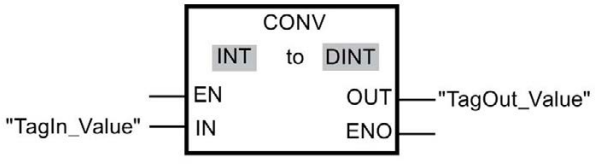
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Value to be converted.
OUT	Output	DINT	Result of the conversion

Example

The following example shows how the instruction works:



The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is read and converted to a double integer (32 bit). The result is stored in operand "TagOut_Value".

13.3.9.2 BO_W: Convert 16 data elements of data type BOOL to a data element of data type WORD (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction converts the 16 values of data type BOOL at inputs IN0 to IN15 to a value of data type WORD, which is made available at output OUT. The conversion takes place as follows: The i-th bit of the WORD value is set to 0 (or 1), if the value at input INi = 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN0	Input	BOOL	Bit 0 of WORD value
IN1	Input	BOOL	Bit 1 of WORD value
...			...
IN15	Input	BOOL	Bit 15 of WORD value
OUT	Output	WORD	WORD value consisting of IN0 to IN15

Instruction versions

A number of versions are available for this instruction:

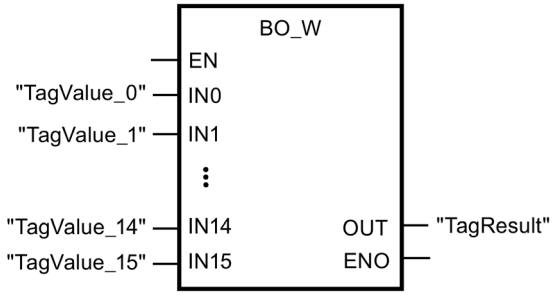
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN0	TagValue_0	FALSE
IN1	TagValue_1	FALSE
...		...
IN13	TagValue_13	FALSE
IN14	TagValue_14	TRUE
IN15	TagValue_15	TRUE
OUT	TagResult	W#16#C000

The values of operands "TagValue_0" to " TagValue_15" are combined to form data type WORD and assigned to operand "TagResult".

13.3.9.3 W_BO: Convert 16 data elements of data type WORD to a data element of data type BOOL (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

This instruction converts the value of data type WORD at input IN to 16 values of data type BOOL, which are provided at outputs OUT0 to OUT15. The conversion takes place as follows: Output OUTi is set to 0 (or 1), if the i-th bit of the WORD value is 0 (or 1).

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	WORD value
OUT0	Output	BOOL	Bit 0 of WORD value
OUT1	Output	BOOL	Bit 1 of WORD value
...			...
OUT15	Output	BOOL	Bit 15 of WORD value

Instruction versions

A number of versions are available for this instruction:

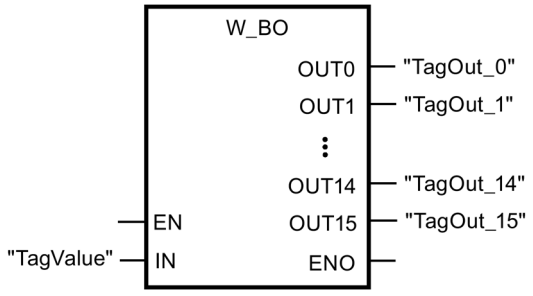
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagValue	W#16#C000
OUT0	TagOUT_0	FALSE
OUT1	TagOUT_1	FALSE
...		...
OUT13	TagOUT_13	FALSE
OUT14	TagOUT_14	TRUE
OUT15	TagOUT_15	TRUE

The value of operand "TagValue" of data type WORD is converted to the 16 values "TagOUT_0" to "TagOUT_15" of data type BOOL.

13.3.9.4 SCALE: Scale values (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500)

Description

This instruction scales the value at input IN in physical units between the low limit value at input LO_LIM and the high limit value at input HI_LIM. It is assumed that the value at input IN is between 0 and 27648. The scaling result is provided at output OUT.

The instruction uses the following equation:

OUT = [IN × (HI_LIM – LO_LIM)] / 27648 + LO_LIM

As long as the value at input IN is greater than 27648, output OUT is linked to HI_LIM and OUT_HI is set to 1.

As long as the value at input IN is less than 0, output OUT is linked to LO_LIM and OUT_LO is set to 1.

For inverse scaling, you must assign LO_LIM > HI_LIM. With inverse scaling, the output value at output OUT decreases while the input value at input IN increases.

Every call of the "Scale values" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened for this reason when the instruction is inserted in the program; in it you can create a data block (single instance) (e.g., SCALE_DB_1) or a multi-instance (e.g., SCALE_Instance_1) for the "Scale values" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	INT	Input value to be scaled in physical units
HI_LIM	Input	INT	High limit value of value range of OUT
LO_LIM	Input	INT	Low limit value of value range of OUT
OUT	Output	INT	Result of scaling
OUT_HI	Output	BOOL	1 = Input value > 27648: OUT = HI_LIM
OUT_LO	Output	BOOL	1 = Input value < 0: OUT = LO_LIM

Instruction versions

A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	This version has identical functions to version V1.0.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Behavior in the event of overflow or underflow of analog values and fail-safe value output

Note

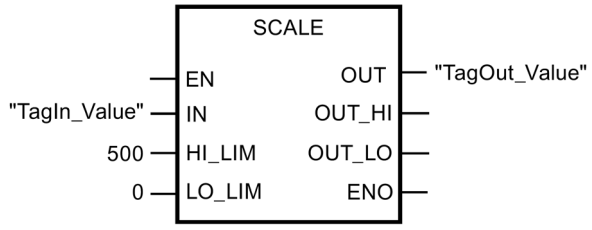
If inputs from the PII of an SM 336; AI 6 x 13Bit or SM 336; F-AI 6 x 0/4 ... 20 mA HART are used as input values, note that the F-system detects an overflow or underflow of a channel of this F-SM as an F-I/O fault or channel fault. The fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

If other fail-safe values are to be output in this case, you must evaluate the QBAD tag in the F-I/O DB (branch to output of an individual fail-safe value).

If the value in the PII of the F-SM is within the overrange or underrange, but is > 27648 or < 0, you can likewise branch to the output of an individual fail-safe value by evaluating outputs OUT_HI and OUT_LO, respectively.

Example

The following example shows how the instruction works:



When operand "TagIn_Value" = 20000, the result is "TagOut_Value" 361.

13.3.10 Program control operations

13.3.10.1 JMP: Jump if RLO = 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Jump if RLO = 1" instruction to interrupt the linear execution of the program and resume it in another network. The destination network must be identified by a jump label (Page 628) (LABEL). The designation of the jump label is specified in the placeholder above the instruction box.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "1" or the input is not connected, the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "0", the program continues executing in the next network.

Note

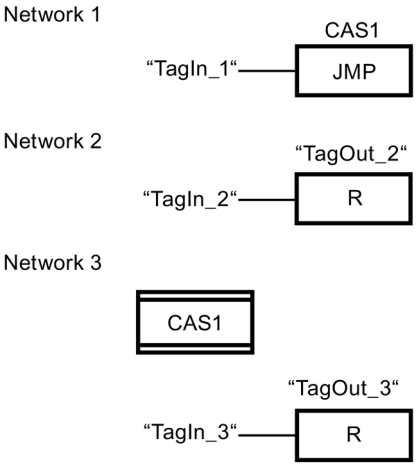
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.3.10.2 JMPN: Jump if RLO = 0 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Jump if RLO = 0" instruction to interrupt the linear execution of the program and resume it in another network, when the result of logic operation at the input of the instruction is "0". The destination network must be identified by a jump label (Page 628) (LABEL). The designation of the jump label is specified in the placeholder above the instruction box.

The specified jump label must be in the same block in which the instruction is executed. The name you specify can only occur once in the block.

If the result of logic operation (RLO) at the input of the instruction is "0", the jump to the network identified by the jump label is executed. The jump direction can be towards higher or lower network numbers.

If the result of logic operation (RLO) at the input of the instruction is "1", the program continues executing in the next network.

Note

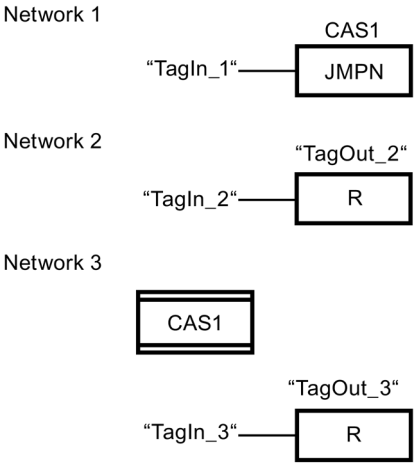
(S7-1200, S7-1500)
If the jump destination (jump label) for an instruction "JMP" or "JMPN" is above the associated instruction "JMP" or "JMPN" (backwards jump), you cannot insert any other instructions for program control (JMP, JMPN, RET, jump label) between them.
Exception: You can insert an instruction "JMP" or "JMPN" between them if you also insert the associated jump destination in between as well as below the associated instruction "JMP" or "JMPN" (forward jump).
Non-compliance can lead to compilation errors or to the CPU going to STOP.

Note

You are not permitted to insert any SENDDP or SENDS7 instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "0", instruction "Jump if RLO = 0" is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

13.3.10.3 LABEL: Jump label (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

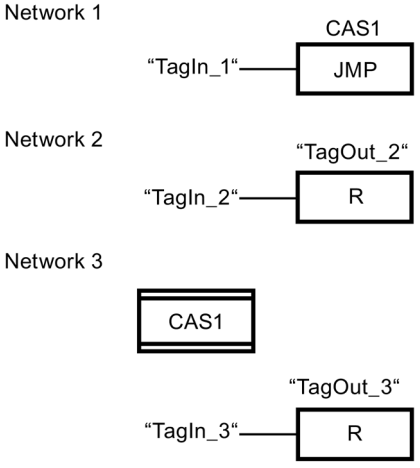
You can use a jump label to specify a destination network, in which the program execution should resume after a jump.

The jump label and the instruction in which the jump label is specified must be located in the same block. The name of a jump label can only be assigned once in a block.

Only one jump label can be placed in a network. To each jump label can be jumped from several locations.

Example

The following example shows how the instruction works:



When operand "TagIn_1" has signal state "1", the "JMP: Jump if RLO = 1" instruction is executed. The linear execution of the program is interrupted and continues in Network 3, which is identified by the jump label CAS1. When input "TagIn_3" has signal state "1", output "TagOut_3" is reset.

JMPN: Jump if RLO = 0 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 626)

RET: Return (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 629)

13.3.10.4 RET: Return (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "Return" instruction to stop the processing of a block.

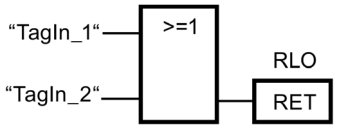
If the result of logic operation (RLO) at the input of the "Return" instruction is "1" or the box input of the S7-1200/1500 F-CPUs is not connected, program execution is terminated in the currently called block and continued in the calling block (for example, in the main safety block) after the call function. If the RLO at the input of the "Return" instruction is "0", the instruction is not executed. Program execution continues in the next network of the called block.

Note

You cannot program a "Return" instruction before a main safety block call.

Example

The following example shows how the instruction works:



If either the "TagIn_1" or "TagIn_2" operand has the signal state "1", the "Return" instruction is executed. Program execution in the called block is terminated and continues in the calling block.

JMP: Jump if RLO = 1 (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500) (Page 624)

13.3.10.5 OPN: Open global data block (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

You can use the "Open global data block" instruction to open a data block. The number of the data block is transferred to the DB register. Subsequent DB commands access the relevant blocks depending on the register contents.

Note

Note when using the "Open global data block" instruction that the content of the DB register can be changed after calls of F-FB/F-FC and "fully qualified DB accesses", such that there is no guarantee that the last data block you opened with "Open global data block" is still open.

You should therefore use the following method for addressing data to avoid errors when accessing data of the DB register:

- Use symbolic addressing.
- Use only fully qualified DB accesses.

If you still want to use the "Open global data block" operation, you must ensure that the DB register is restored by repeating the "Open global data block" instruction after calls of F-FB/F-FC and "fully qualified DB accesses." Otherwise, a malfunction could result.

Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
<Data block>	Input	BLOCK_DB	Data block that is opened

"Fully qualified DB access"

The initial access to data of a data block in an F-FB/F-FC must always be a "fully qualified DB access," or it must be preceded by the "Open global data block" instruction. This also applies to the initial access to data of a data block after a jump label.

An example of "fully qualified DB access" and "non-fully qualified DB access" is provided in Restrictions in the programming languages FBD/LAD (Page 90).

Access to instance DBs

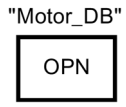
You can also access instance DBs of F-FBs with fully qualified access, e.g., for transfer of block parameters. It is not possible to access static local data in single/multi-instances of other F-FBs.

Note that accessing instance DBs of F-FBs that are not called in the safety program can cause the F-CPU to go to STOP mode.

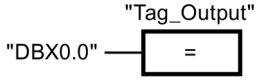
Example

The following example shows how the instruction works:

Network 1



Network 2



The "Motor_DB" data block is called in network 1. The number of the data block is transferred to the DB register. The "DBX0.0" operand is queried in network 2. The signal state of the "DBX0.0" operand is assigned to the "Tag_Output" operand.

13.3.11 Word logic operations

13.3.11.1 AND: AND logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "AND logic operation" instruction to combine the value at input IN1 to the value at input IN2 bit-by-bit by AND logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ANDed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified values.

The result bit has signal state "1" only when both of the bits in the logic operation also have signal state "1". If one of the two bits of the logic operation has signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

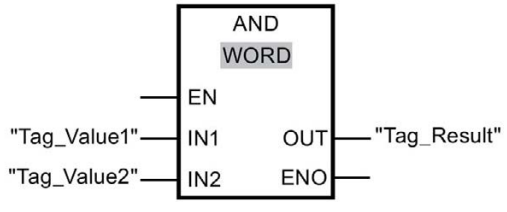
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 00000000 00000101

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ANDed. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.3.11.2 OR: OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "OR logic operation" instruction to connect the value at input IN1 input to the value at input IN2 bit-by-bit by OR logic and query the result at output OR.

When the instruction is executed, bit 0 of the value at input IN1 and bit 0 of the value at input IN2 are ORed. The result is stored in bit 0 of output OUT. The same logic operation is executed for all bits of the specified tags.

The result bit has signal state "1" when at least one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

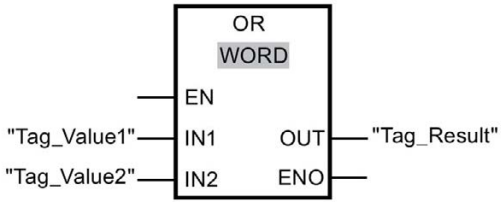
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 01010101 01011111

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are ORed. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.3.11.3 XOR: EXCLUSIVE OR logic operation (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

You can use the "EXCLUSIVE OR logic operation" instruction to combine the value at input IN1 and the value at input IN2 bit-by-bit by EXCLUSIVE OR logic and query the result at output OUT.

When the instruction is executed, bit 0 of the value at input IN1 input and bit 0 of the value at input IN2 are logically combined by EXCLUSIVE OR. The result is stored in bit 0 of output OUT. The same logic operation is executed for all other bits of the specified value.

The result bit has signal state "1" when one of the two bits in the logic operation has signal state "1". If both of the bits of the logic operation have signal state "1" or "0", the corresponding result bit is reset.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

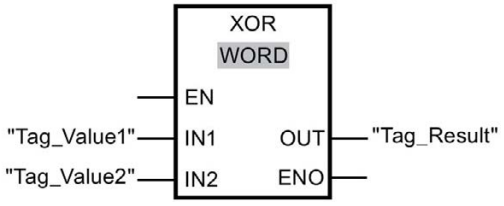
Parameters

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN1	Input	WORD	First value of logic operation
IN2	Input	WORD	Second value of logic operation
OUT	Output	WORD	Result of the instruction

Example

The following example shows how the instruction works:



IN1	"Tag_Value1" = 01010101 01010101
IN2	"Tag_Value2" = 00000000 00001111
OUT	"Tag_Result" = 01010101 01011010

The instruction is always executed regardless of the signal state at enable input "EN". The value of the "Tag_Value1" operand and the value of the "Tag_Value2" operand are logically combined by EXCLUSIVE OR. The result is mapped bit-by-bit and output in the "Tag_Result" operand.

13.3.12 Shift and rotate

13.3.12.1 SHR: Shift right (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

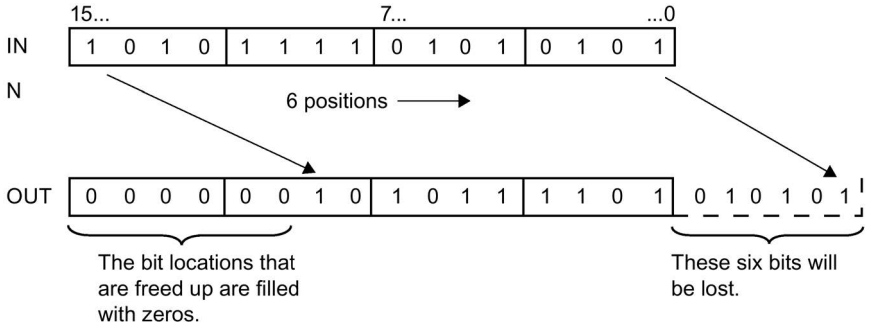
Use the "Shift right" instruction to shift the content of the operand at input IN bit-by-bit to the right and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at parameter N is "0", the value at input IN is copied unchanged to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the right by the available number of bit positions.

The bit locations that are freed up in the left area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the right:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

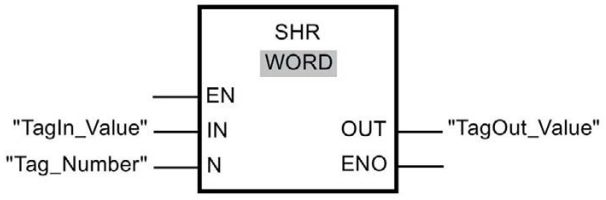
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	3
OUT	TagOut_Value	0000 0111 1111 0101

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved three bit positions to the right. The result is output at output "TagOut_Value".

13.3.12.2 SHL: Shift left (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description

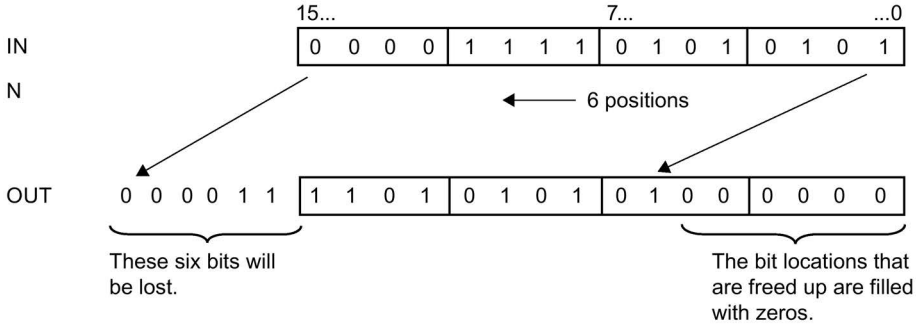
Use the "Shift left" instruction to shift the content of the operand at input IN bit-by-bit to the left and query the result at output OUT. Use input N to specify the number of bit positions by which the specified value is to be moved.

If the value at input N is "0", the value at input IN is copied to the operand at output OUT.

If the value at input N is greater than the number of available bit positions, the operand value at input IN is shifted to the left by the available number of bit positions.

The bit positions that are freed up in the right area of the operand during the shift operation are filled with zeros.

The following figure shows how the content of an operand of data type WORD is moved by 6 bit positions to the left:



Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Note

S7-300/400:

Only the low-byte is evaluated from input N.

S7-1200/1500:

If the value at input N < 0, the output OUT is set to 0.

Parameter

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	Input	WORD	Value that is shifted
N	Input	INT	Number of bit positions by which the value is shifted
OUT	Output	WORD	Result of the instruction

Instruction versions

A number of versions are available for this instruction:

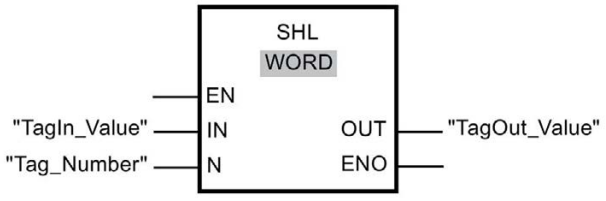
Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	These versions have identical functions to version V1.0.
1.3	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Example

The following example shows how the instruction works:



The following table shows how the instruction works using specific operand values:

Parameter	Operand	Value
IN	TagIn_Value	0011 1111 1010 1111
N	Tag_Number	4
OUT	TagOut_Value	1111 1010 1111 0000

The instruction is always executed regardless of the signal state at enable input "EN". The content of the operand "TagIn_Value" is moved four bit positions to the left. The result is output at output "TagOut_Value".

13.3.13 Operating

13.3.13.1 ACK_OP: Fail-safe acknowledgment (STEP 7 Safety V13 SP1) (S7-300, S7-400, S7-1200, S7-1500)

Description (S7-300, S7-400)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to a value of 9 within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value of 9 after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value 9 within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value 9, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name.*(S014)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note

You can read out output Q by means of HMI systems or, if applicable, you can evaluate it in your standard user program.

You can provide the in/out IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Description (S7-1200, S7-1500)

This instruction enables fail-safe acknowledgment from an HMI system. It allows, for example, reintegration of F-I/O to be controlled from the HMI system. Acknowledgment takes place in two steps:

- Input/output parameter IN changes to a value of 6 for exactly one cycle.
- Input/output parameter IN changes to the value at the ACK_ID input within a minute for exactly one cycle

Once the in/out parameter IN has changed to a value of 6, the instruction evaluates whether this parameter has changed to a value at the ACK_ID input after 1 second, at the earliest, or one minute, at the latest. Output OUT (output for acknowledgment) is then set to 1 for one cycle.

If an invalid value is input or if in/out parameter IN has not changed to the value at the ACK_ID input within one minute or the change occurred before one second has elapsed, then in/out parameter IN is reset to 0, and both steps listed above must be repeated.

During the time in which in/out parameter IN must change from 6 to the value at the ACK_ID input, output Q is set to 1. Otherwise, Q has a value of 0.

Every call of the "Fail-safe acknowledgment" instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., ACK_OP_DB_1) or a multi-instance (e.g., ACK_OP_Instance_1) for the "Fail-safe acknowledgment" instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Note

A separate data area must be used for each call of ACK_OP. Each call can be processed only once in an F-runtime group cycle.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

⚠ WARNING

The two acknowledgment steps must **not** be triggered by one single operation, for example by automatically storing them along with the time conditions in a program and using a function key to trigger them.
Having two separate acknowledgment steps also prevents erroneous triggering of an acknowledgment by your non-fail-safe HMI system. *(S013)*

WARNING

If you have HMI systems and F-CPUs that are interconnected and use the ACK_OP instruction for fail-safe acknowledgment, you need to ensure that the intended F-CPU will be addressed **before** you perform the two acknowledgment steps.

Alternative 1:

- The value for each identifier of the acknowledgment (ACK_ID input; data type: INT) can be freely selected in the range from 9 to 30000, but must be unique network-wide* for all instances of the ACK_OP instruction.
  You must supply the ACK_ID input with constant values when calling the instruction. Direct read or write access in the associated instance DB is not permitted in the safety program!

Alternative 2:

- To do this, store a network-wide* unique name for the F-CPU in a DB of your standard user program in each F-CPU.
- In your HMI system, set up a field from which you can read out the F-CPU name from the DB online before executing the two acknowledgment steps.
- Optional:

  in your HMI system, set up a field to permanently store the F-CPU name. Then, you can determine whether the intended F-CPU is being addressed by simply comparing the F-CPU name read out online with the permanently stored name. *(S047)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

WARNING

When using an instruction with time processing, take the following timing imprecision sources into account when determining your response times:

- Known timing imprecision (based on standard systems) resulting from cyclic processing
- Timing imprecision resulting from the update time of the time base used in the instruction (see figure in section "Timing imprecision resulting from the update time of the time base used in the instruction")
- Tolerance of internal time monitoring in the F-CPU
  - For time values up to 100 ms, a maximum of 20% of the (assigned) time value
  - For time values greater than or equal to 100 ms, a maximum of 2% of the (assigned) time value

You must choose the interval between two call times of an instruction with time processing in such a way that the required response times are achieved, taking into account the possible timing imprecision. *(S034)*

Note

You can read out output Q by means of HMI systems or, if applicable, you can evaluate it in your standard user program.

You need to provide the in/out IN with a separate memory word or DBW of a DB of the standard user program supply for each instance of the ACK_OP instruction.

Parameters (S7-300, S7-400)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Parameters (S7-1200, S7-1500)

The following table shows the parameters of the instruction:

Parameter	Declaration	Data type	Description
ACK_ID	Input	INT	Identifier of the acknowledgment (9 to 30000)
IN	InOut	INT	Input variable from HMI system
OUT	Output	BOOL	Output for acknowledgment
Q	Output	BOOL	Time status

Instruction versions

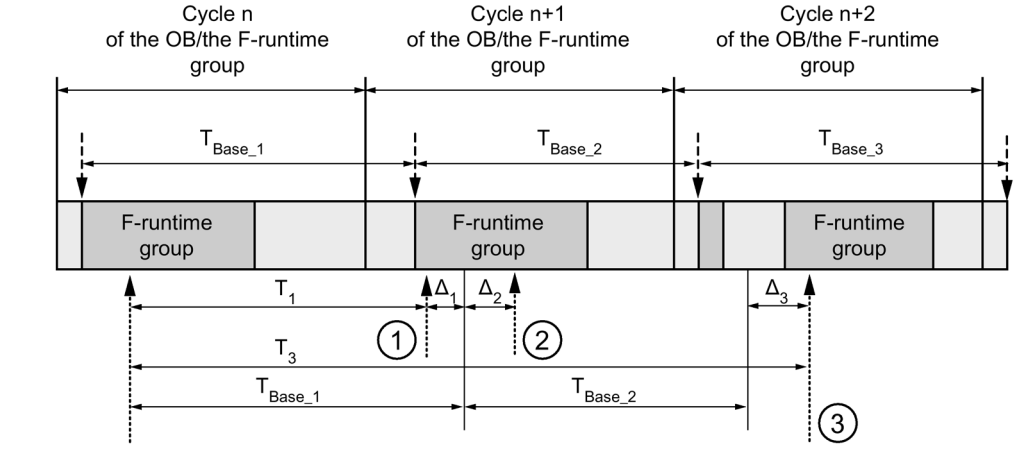
A number of versions are available for this instruction:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	x	—	x	These versions are identical in function to version V1.0 for S7-300/400 F-CPUs. The input ACK_ID must also be taken into consideration for S7-1200/1500 F-CPUs.
1.2	x	x	x	

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Timing imprecision resulting from the update time of the time base used in the instruction:



① For the first call in cycle n+1, the call time of the instruction relative to the start of the F-runtime group is earlier than that in cycle n by the amount of Δ_1, e.g. because parts of the safety program of the F-runtime group before the call time of the instruction in cycle n+1 are skipped. For the time update, the instruction takes account of time T_{Base_1} instead of the time T_1 that has actually elapsed in cycle n since the call.

② The instruction is called a second time in cycle n+1. This does not involve another time update (by Δ_2).

③ For the call in cycle n+2, the call time of the instruction relative to the start of the F-runtime group is later than that in cycle n by the amount of Δ_3, e.g. because the F-runtime group was interrupted by a higher priority interrupt before the call time of the instruction in cycle n+2. The instruction took into account time $T_{Base_1} + T_{Base_2}$ instead of the time T_3 that has actually elapsed in cycle n since the call. This would also be the case if no call occurred in cycle n+1.

Example

An example how the instruction is used is available under Implementing User Acknowledgment in the Safety Program of the F-CPU of a DP Master or IO controller (Page 151).

See also

Implementing user acknowledgment in the safety program of the F-CPU of a I-slave or I-device (S7-300, S7-400, S7-1500) (Page 156)

13.3.14 Additional instructions

13.3.14.1 OV: Get status bit OV (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Description

You can use the "Get status bit OV" instruction to detect whether a number range overflow occurred in the last arithmetic instruction processed.

The "Get status bit OV" evaluation must be inserted in the network that follows the instruction that influences the OV. This network must not contain any jump labels.

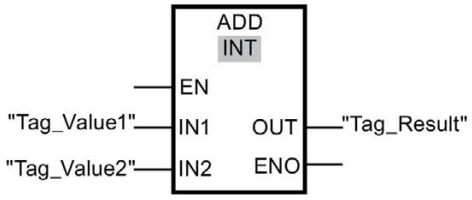
Note

The execution time of the OV-affecting instruction is extended when the "Get status bit OV " instruction is used (see also Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100)).

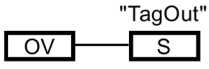
Example

The following example shows how the instruction works:

Network 1:



Network 2:



The value of the "Tag_Value1" operand is added to value of the Tag_Value2 operand. The result of the addition is stored in the "Tag_Result" operand.

If an overflow occurs during execution of the "Add" instruction, the status bit OV is set to "1". In network 2, following the query of the status bit OV, the "Set output" (S) instruction is executed and the "TagOut" operand is set.

13.3.15 Communication

13.3.15.1 PROFIBUS/PROFINET

SENDDP and RCVDP: Send and receive data via PROFIBUS DP/PROFINET IO (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400, S7-1500)

Introduction

You use the SENDDP and RCVDP instructions for fail-safe sending and receiving of data using:

- Safety-related master-master communication
- Safety-related master-master communication for S7 Distributed Safety
- Safety-related master-I-slave communication
- Safety-related I-slave-I-slave communication
- Safety-related IO controller-IO controller communication
- Safety-related IO controller-IO controller communication for S7 Distributed Safety
- Safety-related IO controller-I-device communication
- Safety-related IO controller-I-slave communication

Description

The SENDDP instruction sends 16 data elements of data type BOOL and 2 data elements of data type INT or one data element of the data type DINT (S7-1500) in a fail-safe manner to another F-CPU via PROFIBUS DP/PROFINET IO. The data can be received there by the related RCVDP instruction.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., RCVDP_DB_1) for these instructions. Once it is created, the new data block can be found in the "STEP 7 Safety" folder in the project tree under "Program blocks > System blocks". For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

With the SENDDP instruction, the data to be sent (for example, outputs of other F-blocks/instructions) are available at input SD_BO_xx or SD_I_xx or SD_DI_00 as alternative.

With the RCVDP instruction, the data received are available at outputs RD_BO_xx and RD_I_xx or RD_DI_00 as alternative for additional processing by other F-blocks/instructions.

(S7-1500) At the DINTMODE input of the SENDDP instruction you specify if the data at the inputs SD_I_00 and SD_I_01 or the data at the input SD_DI_00 is sent.

The operating mode of the F-CPU with the SENDDP instruction is provided at output SENDMODE. If the F-CPU with the SENDDP instruction is in disabled safety mode, output SENDMODE = 1.

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define the communication relationship between a SENDDP instruction in one F-CPU and a RCVDP instruction in the other F-CPU by specifying an address relationship at the DP_DP_ID inputs of the SENDDP and RCVDP instructions. Associated SENDDP and RCVDP instructions are assigned the same value for DP_DP_ID.

⚠ WARNING

The value for each address relationship (DP_DP_ID input; data type: INT) is user-defined; however, it must be unique network-wide* for all safety-related communication connections. The uniqueness must be checked in the safety summary during acceptance of the safety program. You can find additional information in Correctness of the communication configuration (Page 316).

You must supply inputs DP_DP_ID and LADDR with constant values when calling the instruction. Direct read or write access to the associated instance DB to DP_DP_ID and LADDR is not permitted in the safety program. *(S016)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/3 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Note

Within a safety program, you must assign a different start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) for every call of the SENDDP and RCVDP instructions at input LADDR.

A separate instance DB must be used for each call of the SENDDP and RCVDP instructions. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVDP instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVDP instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVDP or RCVS7 instruction called in an upstream network.

The RD_D_00 output must not be evaluated for DINTMODE = 0; the RD_I_xx outputs of the RCVDP instruction must not be evaluated for DINTMODE = 1.

(S7-1500) The outputs of the SENDDP and RCVDP instructions must not be supplied with tags from the standard user program. Exception: RET_DPRD, RET_DPWR and DIAG outputs.

You cannot use an actual parameter for an output of an RCVDP instruction, if it is already being used for an input of the same or another RCVDP or RCVS7 instruction.

The F-CPU can go to STOP if this is not observed. The cause of the diagnostic event is entered in the diagnostic buffer of the F-CPU. You can find additional information on the cause in the online help for diagnostic messages.

Note

You are not permitted to insert any SENDDP instructions between an instruction JMP or JMPN and the associated jump destination (jump label).

You cannot insert a RET instruction prior to a SENDDP instruction.

SENDDP parameter

The following table shows the parameters of the SENDDP instruction:

Parameter	Declaration	Data type	Description
SD_BO_00	Input	BOOL	Send data BOOL 00
...			...
SD_BO_15	Input	BOOL	Send data BOOL 15
SD_I_00	Input	INT	Send data INT 00
SD_I_01	Input	INT	Send data INT 01
SD_DI_00	Input	DINT	(S7-1500) (hidden) Send data DINT 00
DINTMODE	Input	DINT	(S7-1500) (hidden) 0=SD_I_00 u. SD_I_01 are sent 1=SD_DI_00 is sent
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
LADDR	Input	INT	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=RCVDP outputs fail-safe values
RET_DPRD	Output	WORD	Error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))

Parameter	Declaration	Data type	Description
RET_DPWR	Output	WORD	Error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Service information

RCVDP parameter:

The following table shows the parameters of the RCVDP instruction:

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	1=Acknowledgment for reintegration of send data following communication error
SUBBO_00	Input	BOOL	Fail-safe value for receive data BOOL 00
...			...
SUBBO_15	Input	BOOL	Fail-safe value for receive data BOOL 15
SUBI_00	Input	INT	Fail-safe value for receive data INT 00
SUBI_01	Input	INT	Fail-safe value for receive data INT 01
SUBDI_00	Input	DINT	(S7-1500) (hidden) Fail-safe value for receive data DINT 00
DP_DP_ID	Input	INT	Network-wide unique value for the address relationship between a SENDDP and RCVDP instruction
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
LADDR	Input	INT	The start address (S7-300, S7-400) or HW identifier (S7-1200, S7-1500) of the address area/transfer area: • Of DP/DP coupler for safety-related master-master communication • For safety-related master-I-slave communication • For safety-related I-slave-I-slave communication • Of PN/PN coupler for safety-related IO controller-IO controller communication • For safety-related IO controller-I-device communication • For safety-related IO controller-I-slave communication
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with SENDDP instruction in disabled safety mode
RD_BO_00	Output	BOOL	Receive data BOOL 00
...			...
RD_BO_15	Output	BOOL	Receive data BOOL 15
RD_I_00	Output	INT	Receive data INT 00
RD_I_01	Output	INT	Receive data INT 01

Parameter	Declaration	Data type	Description
RD_DI_00	Output	DINT	(S7-1500) (hidden) Receive data DINT 00
RET_DPRD	Output	WORD	Error code RET_VAL of the DPRD_DAT instruction (for a description of error codes, refer to the online help for DPRD_DAT instruction ("Extended instructions > Distributed I/O > Other".))
RET_DPWR	Output	WORD	Error code RET_VAL of the DPWR_DAT instruction (for a description of error codes, refer to the online help for DPWR_DAT instruction ("Extended instructions > Distributed I/O > Other".))
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1200	S7-1500	Function
1.0	x	—	—	When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.0 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.1	—	—	—	This version is invalid.
1.2	x	—	x	This version has identical functions to version V1.0.
1.3	x	—	x	S7-300/400: This version has identical functions to version V1.0. S7-1500: Instead of 2 data of data type INT, one data of data type DINT can be sent/received as alternative. Otherwise identical function as version V1.0.

When a new F-CPU is created with *STEP 7 Safety*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Placement

The RCVDP instruction must be inserted at the start of the main safety block and the SENDDP instruction at the end.

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDDP and RCVDP instructions). During this time, the receiver (RCVDP instruction) outputs the fail-safe values present at its inputs SUBBO_xx and SUBI_xx or alternatively SUBDI_00.

The SENDDP and RCVDP instructions signal this at output SUBS_ON with 1. Output SENDMODE has a default of 0 and is not updated, as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVDP instruction) then outputs the fail-safe values assigned at its SUBBO_xx and SUBI_xx or alternatively SUBDI_00 inputs. Output SENDMODE is not updated while output SUBS_ON = 1.

The send data of the SENDDP instruction present at inputs SD_BO_xx and SD_I_xx, SD_DI_00 as alternative, are only output again when communication errors are no longer detected (ACK_REQ = 1) and you acknowledge (Page 151) the RCVDP instruction with a positive edge at input ACK_REI.

⚠ WARNING

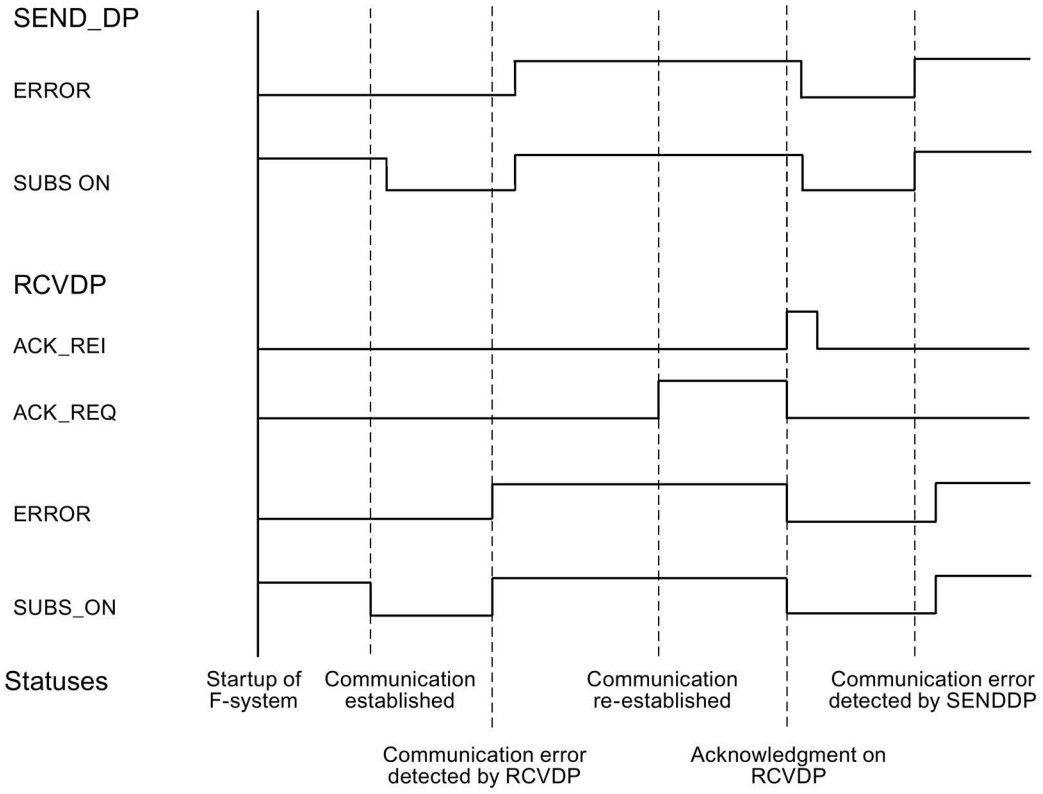
For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) for a communication error will not be set unless communication between the connection partners (SENDDP and RCVDP instructions) has been previously established. If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDDP and the RCVDP instructions, and the bus connection. You also obtain information on possible error causes by evaluating outputs RET_DPRD and RETDP_WR.

In general, always evaluate RET_DPRD and RETDP_WR, since it is possible that only one of the two outputs will contain error information.

Timing diagrams SENDDP/RCVDP



Output DIAG

In addition, non-fail-safe information about the type of communication errors that occurred is provided at output DIAG of the SENDDP and RCVDP instructions for service purposes.

You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge the errors at input ACK_REI of the RCVDP instruction.

Structure of DIAG of the SENDDP/RCVDP instruction

Bit no.	Assignment	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout of SENDDP/RCVDP detected	Interference in bus connection to partner F-CPU.	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low.	Check assigned monitoring time TIMEOUT for SENDDP and RCVDP of both F-CPUs. If possible, set a higher value. Recompile safety program
		DP/DP coupler or PN/PN coupler configuration is invalid.	Check DP/DP coupler or PN/PN coupler configuration.
		Internal fault of DP/DP coupler or PN/PN coupler	Replace DP/DP coupler or PN/PN coupler
		CP in STOP mode, or internal fault in CP	Switch CP to RUN mode, check diagnostic buffer of CP, and replace CP, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	Switch F-CPUs to RUN mode, check diagnostic buffer of F-CPUs, and replace F-CPUs, if necessary
Bit 5	Sequence number error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 6	CRC-error of SENDDP/RCVDP detected	See description for bit 4	See description for bit 4
Bit 7	Reserved	—	—

SENDS7 and RCVS7: Communication via S7 connections (STEP 7 Safety Advanced V13 SP1) (S7-300, S7-400)

Introduction

You use the SENDS7 and RCVS7 instructions for fail-safe sending and receiving of data using S7 connections.

Note

In *STEP 7 Safety Advanced*, S7 connections are generally permitted over Industrial Ethernet only.

Safety-related communication via S7 connections is possible from and to F-CPUs with PROFINET interface or S7-400 F-CPUs with PROFINET-capable CPs. See also Safety-related communication via S7 connections (Page 212).

Description

The SENDS7 instruction sends the send data contained in an F-communication DB to the F-communication DB of the associated RCVS7 instruction of another F-CPU in a fail-safe manner using an S7 connection.

Every call of this instruction must be assigned a data area in which the instruction data are stored. The "Call options" dialog is automatically opened when the instruction is inserted in the program for this reason. There you can create a data block (single instance) (e.g., SENDS7_DB_1) or a multi-instance (e.g., SENDS7_Instance_1) for this instruction. Once it is created, you can find the new data block in the project tree in the "STEP 7 Safety" folder under "Program blocks > System blocks" or the multi-instance as a local tag in the "Static" section of the block interface. For more information, refer to the help on *STEP 7*.

Enable input "EN" and enable output "ENO" cannot be connected. The instruction is therefore always executed (regardless of the signal state at enable input "EN").

Information on the F-communication DB is contained in "Safety-related communication via S7 connections (Page 212)".

An F-communication DB is an F-DB for safety-related CPU-CPU communication with special properties. You must specify the numbers of the F-communication DBs at inputs SEND_DB and RCV_DB of instructions SENDS7 and RCVS7.

The operating mode of the F-CPU with the SENDS7 instruction is provided at output SENDMODE of the RCVS7 instruction. If the F-CPU with the SENDS7 instruction is in disabled safety mode, then output SENDMODE = 1.

To reduce the bus load, you can temporarily shut down communication between the F-CPUs at input EN_SEND of the SENDS7 instruction. To do so, supply input EN_SEND with "0" (default = "1"). In this case, send data are no longer sent to the F-communication DB of the associated RCVS7 instruction, and the receiver provides fail-safe values for this period of time (initial values in its F-communication DB). If communication was already established between the partners, a communication error is detected.

You must specify the local ID - from the perspective of the F-CPU - of the S7 connection (from the connection table in the network view) at input ID of the SENDS7 instruction (see also Configuring (Page 37)).

Communication between F-CPUs takes place in the background by means of a special safety protocol. You must define a communication relationship between an SENDS7 instruction in one F-CPU and a communication relationship between an RCVS7 instruction and the other F-CPU by assigning an odd number at input R_ID (of the SENDS7 and RCVS7 instructions). Associated SENDS7 and RCVS7 instructions receive the same value for R_ID.

⚠ WARNING

The value for each address relationship (R_ID input; data type: DWORD) is user-defined; however, it must be an odd number and unique network-wide* for all safety-related communication connections. The value R_ID + 1 is internally assigned and must not be used.

You must supply inputs ID and R_ID with constant values when calling the instruction. Direct read or write access to the associated instance DB is not permitted in the safety program! *(S020)*

* A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet.

Note

A separate instance DB must be used for each call of the SENDS7 and RCVS7 instructions within a safety program. You must not declare and call these instructions as multi-instances.

The input and outputs of the RCVS7 instruction cannot be initialized with temporary or static local data of the main safety block.

The inputs of the RCVS7 instruction cannot be initialized with outputs (using fully qualified DB accesses) of a RCVS7 or RCVDP instruction called in an upstream network.

You cannot use an actual parameter for an output of an RCVS7 instruction, if it is already being used for an input of the same or another RCVS7 or RCVDP instruction. The F-CPU can go to STOP if this is not observed. A diagnostic event is entered in the diagnostic buffer of the F-CPU.

Note

You must not program any SENDS7 instruction between a JMP or JMPN instruction and the associated destination network of the JMP or JMPN instruction.

You cannot program a RET instruction prior to a SENDS7 instruction.

SENDS7 parameter

The following table shows the parameters of the SENDS7 instruction:

Parameter	Declaration	Data type	Description
SEND_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
EN_SEND	Input	BOOL	1= Send enable
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Receiving block outputs fail-safe values
STAT_RCV	Output	WORD	Status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Service information

RCVS7 parameter

The following table shows the parameters of the RCVS7 instruction.

Parameter	Declaration	Data type	Description
ACK_REI	Input	BOOL	Acknowledgment for reintegration of send data after communication error
RCV_DB	Input	BLOCK_DB	Number of F-communication DB
TIMEOUT	Input	TIME	Monitoring time in ms for safety-related communication (see also Monitoring and response times (Page 661))
ID	Input	WORD	Local ID of the S7 connection
R_ID	Input	DWORD	Network-wide unique value for an address relationship between a SENDS7 instruction and a RCVS7 instruction
ERROR	Output	BOOL	1=Communication error
SUBS_ON	Output	BOOL	1=Fail-safe values are output
ACK_REQ	Output	BOOL	1=Acknowledgment for reintegration of send data required
SENDMODE	Output	BOOL	1=F-CPU with the SENDS7 instruction in disabled safety mode
STAT_RCV	Output	WORD	Status parameter STATUS of the URCV instruction (You can find a description of error codes in the online help for the URCV instruction ("Communication > S7 Communication"))
STAT_SND	Output	WORD	Status parameter STATUS of the USEND instruction (You can find a description of error codes in the online help for the USEND instruction ("Communication > S7 Communication"))
DIAG	Output	BYTE	Service information

Instruction versions

A number of versions are available for these instructions:

Version	S7-300/400	S7-1500	Function
1.0	x	—	
1.1	x	—	This version has identical functions to version V1.0. It also supports later versions of internally called instructions. When projects that were created with *S7 Distributed Safety V5.4 SP5* are migrated, version 1.1 of the instruction is used automatically. If you want to compile a migrated safety program with *STEP 7 Safety Advanced* for the first time, we recommend that you first update to the latest available version of the instruction.
1.2	x	—	This version has identical functions to version V1.0/1.1. It also supports later versions of internally called instructions.

When a new F-CPU is created with *STEP 7 Safety Advanced*, the latest available version for the F-CPU created is automatically preset.

For more information on the use of instruction versions, refer to the help on *STEP 7* under "Using instruction versions".

Startup characteristics

After the sending and receiving F-systems are started up, communication must be established between the connection partners for the fist time (SENDS7 and RCVS7 instructions). The receiver (RCVS7 instruction) provides fail-safe values for this time period (initial values in its F-communication DB).

The SENDS7 and RCVS7 instructions signal this at output SUBS_ON with 1. Output SENDMODE (RCVS7 instruction) has a default of 0 and is not updated, as long as output SUBS_ON = 1.

Behavior in the event of communication errors

If a communication error occurs, for example, due to a signature error (CRC) or when monitoring time TIMEOUT expires, outputs ERROR and SUBS_ON = 1 are set. The receiver (RCVS7 instruction) then provides fail-safe values (initial values in its F-communication DB). Output SENDMODE is not updated while output SUBS_ON = 1.

The send data present in the F-communication DB (SENDS7 instruction) are not output before the communication error is no longer detected ((ACK_REQ = 1)) and you acknowledge (Page 151) with a positive edge at input ACK_REI of the RCVS7 instruction.

⚠ WARNING

For the user acknowledgment, you must interconnect input ACK_REI with a signal generated by the operator input.

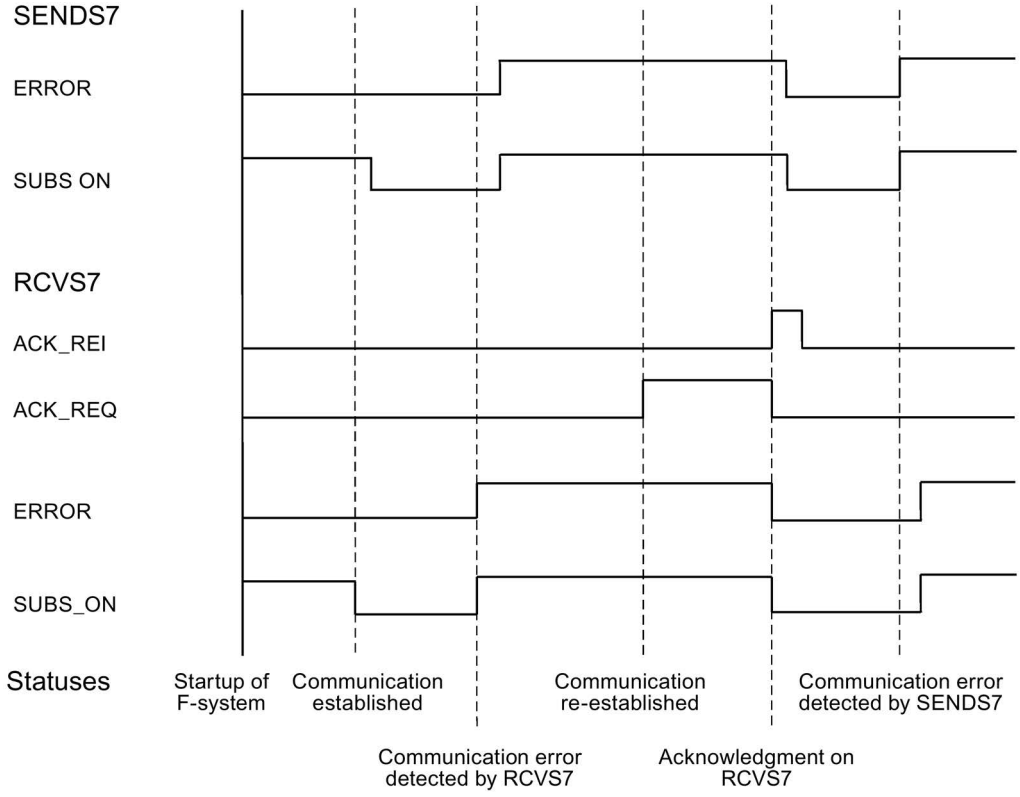
An interconnection with an automatically generated signal is not permitted. *(S040)*

Note that output ERROR (1=communication error) will be set for the first time on a communication error if communication has already been established between the connection partners (SENDS7 and RCVS7 instructions). If communication cannot be established after startup of the sending and receiving F-Systems, check the configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions, and the bus connection. You can also receive information on possible error causes by evaluating the STAT_RCV and STAT_SND outputs.

In general, always evaluate STAT_RCV and STAT_SND, since it is possible that only one of the two outputs will contain error information.

If one of the DIAG bits is set at output DIAG, also check whether the length and structure of the associated F-communication DB on both the sending and receiving ends match.

Timing diagrams SENDS7 and RCVS7



Output DIAG

Non-fail-safe information on the type of communication errors that have occurred is made available at output DIAG for service purposes. You can read out this information by means of operator control and monitoring systems or, if applicable, you can evaluate it in your standard user program. DIAG bits are saved until you acknowledge them at input ACK_REI of the associated RCVS7 instruction.

Structure of DIAG

Bit no.	Assignment of SENDS7 and RCVS7	Possible error causes	Remedies
Bit 0	Reserved	—	—
Bit 1	Reserved	—	—
Bit 2	Reserved	—	—
Bit 3	Reserved	—	—
Bit 4	Timeout detected by SENDS7 and RCVS7	Fault in bus connection to partner F-CPU	Check bus connection and ensure that no external fault sources are present.
		Monitoring time setting for F-CPU and partner F-CPU is too low	Check assigned monitoring time TIMEOUT for SENDS7 and RCVS7 of both F-CPUs. If possible, set a higher value. Recompile safety program
		CPs in STOP mode, or internal fault in CPs	• Switch CPs to RUN mode • Check diagnostic buffer of CPs • Replace CPs, if necessary
		F-CPU/partner F-CPU in STOP mode, or internal fault in F-CPU/partner F-CPU	• Switch F-CPUs to RUN mode • Check diagnostic buffer of F-CPUs • Replace F-CPUs, if necessary
		Communication was shut down with EN_SEND = 0.	Enable communication again at the associated SENDS7 with EN_SEND = 1
		S7 connection has changed, the IP address of the CP has changed, for example	Recompile the safety programs and download them to the F-CPUs
Bit 5	Sequence number error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 6	CRC-error detected by SENDS7 and RCVS7	See description for bit 4	See description for bit 4
Bit 7	RCVS7: Communication cannot be established	Configuration of the safety-related CPU-CPU communication is incorrect, parameter assignment of the SENDS7 and RCVS7 instructions is incorrect See also description for Bit 4	Check configuration of the safety-related CPU-CPU communication, the parameter assignment of the SENDS7 and the RCVS7 instructions is incorrect See also description for Bit 4
	SENDS7: Reserved	—	—

Monitoring and response times

A

Introduction

In the following, you will learn:

- Which F-specific monitoring times you must configure
- Which rules must be followed when specifying monitoring times
- Where you enter the F-specific monitoring times
- Which rules must be followed with regard to the maximum response time of a safety function

Support for calculations

An Excel file is available on the Internet (http://support.automation.siemens.com/WW/view/en/49368678/133100) to assist you in calculating approximately the runtimes of the F-runtime groups, the minimum F-specific monitoring times, and the maximum response times of your F-System.

Additional information

The monitoring and response times for the standard part are calculated in SIMATIC Safety in exactly the same way as for standard S7-300, S7-400, S7-1200 and S7-1500 automation systems and are not addressed here. For a description of this calculation, refer to the *hardware manuals for the CPUs*.

A.1 Configuring monitoring times

Monitoring times to be configured

You must configure the following monitoring times:

Monitoring...	Setting...	Parameters	See
F-cycle time or cycle time warning limit of the F-runtime groups that contain the safety program	in *Safety Administration Editor*: • Dialog for definition of an F-runtime group	Maximum cycle time of the F-runtime group	• Procedure for defining an F-runtime group (S7-300, S7-400) (Page 104) • Procedure for defining an F-runtime group (S7-1200, S7-1500) (Page 107)
of the safety-related communication between F-CPU and F-I/O via PROFIsafe (PROFIsafe monitoring time)	in the *hardware and network editor*: • Centrally when configuring the F-CPU; properties of the F-CPU; or • when configuring the F-I/O; properties of the F-I/O	F-monitoring time F_WD_TIME	• Configuring an F-CPU (Page 42) • Configuring F-I/O (Page 47) • Peculiarities when configuring fail-safe GSD based DP slaves and fail-safe GSD based I/O devices (Page 61)
of the safety-related CPU-CPU communication	Parameter "TIMEOUT" of the instructions: • SENDDP; RCVDP; SENDS7; RCVS7	TIMEOUT	• Communication (Page 646)

You do not have to configure the monitoring time for safety-related communication between F-runtime groups.

Rules for configuring monitoring times

When configuring monitoring times, you must take into account the availability as well as the safety of the F-system as follows:

- Availability: To ensure that the time monitoring is not triggered when there is no error, the monitoring times selected must be sufficiently long.
- Safety: To ensure that the process safety time is not exceeded for the process, the monitoring times selected must be sufficiently short.

⚠ WARNING

It can only be ensured (from a fail-safe standpoint) that a signal state to be transferred will be acquired at the sender end and transferred to the receiver if the signal level is pending for at least as long as the assigned F-monitoring time. *(S018)*

General procedure for configuring monitoring times

Use the following procedure for configuring monitoring times:

1. Configure the standard system.

   Refer to the applicable *hardware manuals* and *Help on STEP 7* for the necessary information.

2. Configure the specific monitoring times of the F-System with respect to availability. You use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to calculate the approximate minimum monitoring time.

3. Use the Excel file for response time calculation to calculate the maximum response time and then verify that the process safety time of the process is not exceeded. If necessary, you must reduce the specific monitoring times of the F-System.

A.1.1 Minimum monitoring time for the F-runtime group cycle time

Parameter "Maximum cycle time of the F-runtime group"

You configure the monitoring time for the F-runtime group cycle time in the *Safety Administration Editor* in the work area for definition of the F-runtime group (Page 102).

The specified maximum cycle time of the F-runtime group must be high enough to prevent F-runtime group cycle time monitoring from being triggered when there are no pending faults and causing the F-CPU to go to STOP. For S7-1200/1500 F-CPUs, you can use the "F-runtime group cycle time warning limit (Page 107)" and the TCYC_CURR (Page 115) and TCYC_LONG (Page 115) tags for dimensioning.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) to determine the minimum monitoring time for the F-runtime group cycle time. Note also the comments in the Excel file.

A.1.2 Minimum monitoring time for safety-related communication between F-CPU and F-I/O

Parameter "F-monitoring time"

You have two options for configuring the monitoring time of safety-related communication between the F-CPU and F-I/O:

- Centrally in the *hardware and network editor* during parameter assignment of the F-CPU (Page 42); in the properties of the F-CPU, or
- During parameter assignment of the F-I/O (Page 47) in the *hardware and network editor*; in the properties of the F-I/O

"F-monitoring time" = PROFIsafe monitoring time T_{PSTO}

The specified PROFIsafe monitoring time T_{PSTO} must be high enough to prevent tripping the F-cycle time monitoring when no faults are present.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) available for SIMATIC Safety to calculate the minimum monitoring time for safety-related communication between the F-CPU and F-I/O.

Note also the comments in the Excel file.

Check to determine whether configured PROFIsafe monitoring time is too short

Note

During commissioning of the F-system, you can perform a check while safety mode is active to determine whether the configured PROFIsafe monitoring time is too short.

This check of the PROFIsafe monitoring time is useful if you want to ensure that the configured monitoring time exceeds the minimum monitoring time by a sufficient amount. In this way, you can avoid the possible occurrence of sporadic monitoring time errors.

Procedure:

1. Insert an F-I/O (one that will not be needed later for system operation).
2. Assign a shorter monitoring time for this F-I/O than for the F-I/O of the system.
3. If the additional F-I/O fails and the "Monitoring time for safety message frame exceeded" diagnostic is signaled, you have fallen below the minimum possible PROFIsafe monitoring time.
4. Increase the monitoring time for the additional F-I/O just to the point where it no longer fails. This monitoring time corresponds approximately to the minimum possible monitoring time.

Conditions:

The F-I/O to be inserted additionally and the F-I/O whose PROFIsafe monitoring time is to be checked must have the following properties in common:

- They must be inserted in the same rack
- They must be nodes in the same subnet

Tip:

It may be useful to leave the additional F-I/O in place for systems that will be modified or expanded during operation after commissioning. This F-I/O will then provide an early warning in the event of changes in the time behavior, enabling you to avoid a process shutdown triggered by the F-I/O in the process.

A.1.3 Minimum monitoring time of safety-related CPU-CPU communication

Parameter TIMEOUT at SENDDP and RCVDP or SENDS7 and RCVS7

The time monitoring is performed in the SENDDP and RCVDP (Page 646) or SENDS7 and RCVS7 (Page 654) instructions of the communication partner. You must assign the time monitoring with identical monitoring time for both instructions in the TIMEOUT parameter.

The specified monitoring time TIMEOUT must be high enough to prevent tripping the monitoring when no faults are present.

Use the Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) available for SIMATIC Safety to determine the minimum value for TIMEOUT.

Note also the comments in the Excel file.

A.1.4 Monitoring time for safety-related communication between F-runtime groups (S7-300, S7-400)

The monitoring time for safety-related communication between F-runtime groups is determined automatically from the values for the "Maximum cycle time of F-runtime group" (work area for Definition of the F-runtime group (Page 102) in the *Safety Administration Editor*).

Monitoring time = (maximum cycle time of the 1st F-runtime group) + (maximum cycle time of the 2nd F-runtime group)

A.2 Response Times of Safety Functions

Definition of response time

The response time is the time from detection of an input signal until the linked output signal changes.

Fluctuation range

The actual response time lies between a minimum response time and maximum response time. You must always take the maximum response time into account in your system configuration.

Rules for maximum response time of a safety function

The maximum response time of a safety function must be less than the process safety time of the process.

Definition of process safety time of a process

The process safety time of a process is the time interval within which the process can be left on its own without causing injury to operating personnel or damage to the environment.

Within the process safety time, any type of F-system process control is tolerated. That is, during this time, the F-system can control its process incorrectly or it can even execute no control at all. The process safety time of a process depends on the process type and must be determined on a case-by-case basis.

Procedure for response time calculation

The Excel file for response time calculation (http://support.automation.siemens.com/WW/view/en/49368678/133100) is available for calculating the maximum response time of a safety function.

Use the Excel file to calculate the approximate maximum response time of the safety function and then check that the process safety time of the process is not exceeded.

If necessary, you must reduce the specific monitoring times of the F-system (see Minimum monitoring time for safety-related communication between F-CPU and F-I/O (Page 664)).

Checklist

B

Life cycle of fail-safe automation systems

The following table contains a checklist summarizing all activities in the life cycle of a fail-safe SIMATIC Safety system, including requirements and rules that must be observed for each activity.

Checklist

Glossary

Access protection

→ Fail-safe systems must be protected against dangerous, unauthorized access. Access protection for F-systems is implemented by assigning two passwords (one for the → F-CPU, and one for the → safety program).

Automatically generated F-blocks

→ F-blocks that are automatically generated and, if necessary, called when the → safety program is compiled, in order to generate an executable safety program from the safety program programmed by the user.

Category

Category in accordance with ISO 13849-1:2006 or EN ISO 13849-1:2008

With SIMATIC Safety, use in → safety mode up to category 4 is possible.

Channel fault

Channel-related fault, such as a wire break or short-circuit.

Collective F-signatures

The collective F-signatures uniquely identify a particular state of the → safety program and the safety-related parameters of the F-CPU and F-I/O. They are important for the on-site acceptance of the safety program, e.g., by → experts.

CPU-wide

"CPU-wide" means all F-I/Os assigned to an F-CPU: central F-I/O of this F-CPU as well as F-I/Os for which the F-CPU is DP master/IO controller. An F-I/O that is addressed using I-slave-slave communication is assigned to the F-CPU of the I-slave and not to the F-CPU of the DP master / IO controller.

CRC

Cyclic Redundancy Check → CRC signature

CRC signature

The validity of the process data in the → safety message frame, the correctness of the assigned address relationships, and the safety-related parameters are validated by means of a CRC signature contained in the safety message frame.

DB for F-runtime group communication

-> F-DB for safety-related communication between F-runtime groups of a safety program.

Depassivation

→ Reintegration

Disabled safety mode

Temporary deactivation of → safety mode for test purposes, commissioning, etc.

The following actions are possible only in disabled safety mode:

- Downloading changes of the → safety program to the -> F-CPU during ongoing operation (in RUN mode)
- Test functions such as "Modify" or other write access to data of the → safety program (with limitations)

Whenever safety mode is deactivated, the safety of the system must be ensured by other organizational measures, such as operation monitoring and manual safety shutdown.

Discrepancy analysis

Discrepancy analysis for equivalence or non-equivalence is used for fail-safe inputs to detect errors caused by the time characteristic of two signals with the same functionality. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same level). On expiration of an assignable period (→ discrepancy time), a check is made to determine whether the difference in levels (for non-equivalence testing, the same level) has disappeared after an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error. The discrepancy analysis is performed between the two input signals of the 1oo2 sensor evaluation (→ sensor evaluation) in the fail-safe input.

Discrepancy time

Assignable time for the → discrepancy analysis. If the discrepancy time is set too high, the fault detection time and → fault reaction time are prolonged unnecessarily. If the discrepancy time is set too low, availability is decreased unnecessarily because a discrepancy error is detected when, in reality, no error exists.

DP/DP coupler

Device for coupling two PROFIBUS DP subnets required for master-master communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

Expert

The acceptance of a system, i.e., the safety-related acceptance test of the system, is usually carried out by an independent expert (for example, from TÜV).

Fail-safe GSD based DP slaves

Fail-safe GSD based DP slaves are standard slaves that are operated on PROFIBUS with the DP protocol. They must operate in accordance with IEC 61784-1: 2010 (fieldbus profile) and the PROFIsafe bus profile. A GSD file is used for their configuration.

Fail-safe GSD based I/O devices

Fail-safe GSD based I/O devices are standard devices that are operated on PROFINET with the I/O protocol. They must operate in accordance with IEC 61784-1: 2010 (fieldbus profile) and the PROFIsafe bus profile in V2 MODE. A GSD file is used for their configuration.

Fail-safe I/O modules

ET 200eco modules that can be used for safety-related operation (-> safety mode). These modules are equipped with integrated → safety functions. They operate in accordance with IEC 61784-1: 2010 (fieldbus profile) and the PROFIsafe bus profile.

Fail-safe modules

Fail-safe modules ET 200SP, ET 200S, ET 200pro, ET 200iSP that can be used in the ET 200SP, ET 200S, ET 200pro or ET 200iSP distributed I/O systems.

Fail-safe module ET 200MP, which can be used centrally in an S7-1500 or in a distributed I/O ET 200MP system.

Fail-safe module S7-1200 which can be used centrally in an S7-1200 system.

These modules are equipped with integrated safety functions (→ Safety functions) for fail-safe operation (→ Fail-safe operation). They operate in accordance with the → PROFIsafe bus profile.

Fail-safe systems

Fail-safe systems (F-systems) are systems that remain in a safe state or immediately switch to another safe state as soon as particular failures occur.

Fault reaction function

→ User safety function

Fault reaction time

The maximum fault reaction time for an F-system specifies the time between the occurrence of any error and a safe reaction at all affected fail-safe outputs.

F-blocks

The following fail-safe blocks are designated as F-blocks:

- those created by the user in LAD or FBD
- those created by the user as → F-DBs
- those selected by the user from a global library
- those added automatically in the → safety program (→ F-SBs, → automatically generated F-blocks, → F-shared DB, → F-I/O DBs; instance DBs of F-FBs)

All F-blocks are shown in yellow in the project tree.

F-CALL

"F-call blocks" for the → safety program in *S7 Distributed Safety*.

F-communication DBs

Fail-safe data blocks for the safety-related CPU-CPU communication via S7 connections.

F-compliant PLC data type

An F-compliant PLC data type is a PLC data type in which you can use all data types that can be used in safety programs.

F-CPU

An F-CPU is a central processing unit with fail-safe capability that is approved for use in SIMATIC Safety and in which a → safety program can run in addition to the → standard user program.

F-DBs

Optional fail-safe data blocks that can be read-/write-accessed from anywhere within the safety program (exception: DBs for F-runtime group communication).

F-FBs

Fail-safe function blocks (with instance DBs), in which the user programs the → safety program in FBD or LAD.

F-FCs

Fail-safe FCs, in which the user programs the → safety program in → FBD or → LAD.

F-I/O

Collective name for fail-safe inputs and outputs available in *SIMATIC S7* for integration in SIMATIC Safety, among others. The following are available:

- → ET 200eco fail-safe I/O module
- → S7-300 fail-safe signal modules
- → Fail-safe modules for S7-1200
- → Fail-safe modules for ET 200MP
- → Fail-safe modules for ET 200SP
- → Fail-safe modules for ET 200S
- → Fail-safe modules for ET 200pro
- → Fail-safe modules for ET 200iSP
- → Fail-safe GSD based DP slaves
- → Fail-safe GSD based I/O devices

F-I/O DB

Fail-safe data block for F-CPUs to an → F-I/O in *STEP 7 Safety*. An F-I/O DB is automatically created for each F-I/O when the F-I/O is configured in the *hardware and network editor*. The F-I/O DB contains tags that the user can or must evaluate or write in the safety program as follows:

- For reintegration of the F-I/O after communication errors
- For reintegration of F-I/O after F-I/O or channel faults
- If F-I/O are to be passivated as a result of particular safety program statuses (for example, group passivation)
- For reassignment of parameters for fail-safe GSD based DP slaves/GSD based I/O devices or enabling HART communication for the F-I/O with the corresponding functionality
- In order to evaluate whether fail-safe values or process data are output

F-I/O faults

Module-related F-I/O fault, such as a communication error or parameter assignment error

F-I/Os of PROFIsafe address type 1

F-I/Os which ensure the uniqueness of the PROFIsafe address solely with the F-destination address, for example, ET 200S F-modules. The PROFIsafe address is usually assigned by DIP switches.

F-I/Os of PROFIsafe address type 2

F-I/Os which can ensure the uniqueness of the PROFIsafe address with a combination of F-source address and F-destination address, for example, ET 200MP F-modules. The PROFIsafe address is usually assigned with *STEP 7 Safety*.

F-modules

→ Fail-safe modules

F-OB

The F-OB calls the main safety block of an F-runtime group in S7-1200/1500 F-CPUs.

F-runtime group

The → safety program consists of one or two F-runtime groups. An F-runtime group is a logical construct of several associated → F-blocks. It is generated internally by the F-system. An F-runtime group consists of the following F-blocks:

→ Main safety block, F-OB (S7-1200, S7-1500), if applicable → F-FBs/ → F-FCs, if applicable → F-DBs, → F-I/O DBs, F-blocks of global libraries, instance DBs, → F-SBs, and → automatically generated F-blocks.

F-runtime group information DB

The F-runtime group information DB provides key information on the corresponding → F-runtime group and on the → safety program as a whole.

F-SBs

Fail-safe system blocks that are automatically inserted and called when the → safety program is compiled in order to generate an executable safety program from the user's safety program.

F-shared DB

(S7-300, S7-400) Fail-safe data block that contains all of the shared data of the → safety program and additional information needed by the F-system. The F-shared DB is automatically inserted and expanded when the hardware configuration is compiled. Using its name F_GLOBDB, the user can evaluate certain data of the → safety program.

F-SMs

→ S7-300 fail-safe signal modules

F-systems

→ Fail-safe systems

I-device

The functionality of the "I-device" (intelligent I/O-device) of a CPU allows data exchange with an I/O-controller and thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-device is connected as an I/O-device to a "parent" I/O-controller.

IE/PB link

Device for coupling PROFINET IO and PROFIBUS DP systems required, among other things, for IO controller-I-slave communication between -> safety programs in different → F-CPUs in SIMATIC Safety.

i-parameter

Individual parameters of → fail-safe GSD based DP slaves and → fail-safe GSD based I/O devices

I-slave

The functionality of the "I-slave" (intelligent DP slave) of a CPU allows data exchange with a DP master and, thus, its use as an intelligent preprocessor of sub-processes, for example. In this case, the I-slave is connected as a DP slave to a "parent" DP master.

Main safety block

"Introductory F-block" for fail-safe programming of the → safety program in *STEP 7 Safety*. The main safety block is an → F-FB or → F-FC that the user assigns to the calling F-OB (S7-1200, S7-1500) or block (OB, FC, FB) (S7-300, S7-400) of an → F-runtime group.

The main safety block contains the safety program and any calls of other → F-FBs/F-FCs for program structuring.

Network-wide

A network consists of one or more subnets. "Network-wide" means beyond the boundaries of the subnet. In PROFIBUS, a network includes all nodes accessible via PROFIBUS DP. In PROFINET IO, a network includes all nodes accessible via RT_Class_1/2/32 (Ethernet/WLAN/Bluetooth, Layer 2) and if applicable RT_Class_UDP (IP, Layer 3).

Passivation

When passivation occurs in an → F-I/O with inputs, the → F-system provides the safety program with fail-safe values (0) instead of the process data pending at the fail-safe inputs in the PII.

When passivation occurs in an F-I/O with outputs, the F-system transfers fail-safe values (0) to the fail-safe outputs instead of the output values in the PIQ provided by the safety program.

PL

Performance Level (PL) according to ISO 13849-1: 2006 or in accordance with EN ISO 13849-1: 2008

With SIMATIC Safety, use up to Performance Level (PL) e is possible in → safety mode.

PN/PN coupler

Device for coupling two PROFINET IO systems required for IO controller-IO controller communication between → safety programs in different → F-CPUs in SIMATIC Safety and S7 Distributed Safety.

PROFIsafe

Safety-related bus profile of PROFIBUS DP/PA and PROFINET IO for communication between the → safety program and the → F-I/O in an → F-system. See IEC 61784-3-3:2010 or PROFIsafe – Profile for Safety Technology on PROFIBUS DP and PROFINET IO; Order No: 3.192 (V2.6.1).

PROFIsafe address

The PROFIsafe address (code name in accordance with IEC 61784-3-3: 2010) is used to uniquely identify the source and destination. The PROFIsafe address consists of an F-source address and an F-destination address. Each → F-I/O therefore has two address parts, an F-source address and an F-destination address.

The F-source address is automatically assigned and is displayed for fail-safe GSD based DP slaves/fail-safe GSD based I/O devices and ET 200SP fail-safe modules. The F-source address for fail-safe modules ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 is always 1. The F-source address is the basis for the PROFIsafe addresses of the assigned F-CPU for ET 200SP/ET 200MP fail-safe modules.

You need to configure the F-destination address in the *hardware and network editor*. You assign the F-destination address for the ET 200S, ET 200eco, ET 200pro, ET 200iSP and F-SMs S7-300 F-modules with a switch. For ET 200SP F-modules and ET 200MP F-modules, assign the F-destination address in the *hardware and network editor*. For S7-1200 F-modules, the F-destination address is automatically assigned by the F-system.

Program signature

→ collective F-signature

Proof test interval

Time period after which a component must be put into error-free state. That is, it is replaced by an unused component or it is proven to be completely error-free.

Reintegration

The switchover from fail-safe values (0) to process data (reintegration of an → F-I/O) takes place automatically or following user acknowledgment in the F-I/O DB. The reintegration method depends on the following:

- The reason for → passivation of the F-I/O/channels of the F-I/O
- The parameter assignment in the → F-I/O DB or in the configuration itself (for example, ET 200MP fail-safe modules on an S7-1500 F-CPU and S7-1200 fail-safe modules on an S7-1200 F-CPU)

Following reintegration for an → F-I/O module with inputs, the process data pending at the inputs in the PII are provided again for the safety program. For an F-I/O with outputs, the F-system again transfers the output values provided in the PIQ in the safety program to the fail-safe outputs.

RIOforFA Safety

Remote IO for Factory Automation with PROFIsafe; profile for F-I/O

S7-300 fail-safe signal modules

Fail-safe signal modules of the S7-300 module series that can be used for safety-related operation (→ Safety mode) as centralized modules in an S7 300 or as distributed modules in the ET 200M distributed I/O system. The fail-safe signal modules are equipped with integrated → safety functions.

S7-PLCSIM

The *S7-PLCSIM* application enables you to execute and test your program on a simulated automation system on your programming device or PC. Because the simulation takes place completely in your programming device or PC, you do not need any hardware (CPU, I/O).

SAE

→ Safety Administration Editor

Safe state

The basic principle of the safety concept in → fail-safe systems is the existence of a safe state for all process variables. For digital → F-I/O that conform to IEC 61508:2010, this is always the value "0".

Safety Administration Editor

The Safety Administration Editor provides support for the main tasks of your safety program.

Safety function

Mechanism integrated in the → F-CPU and → F-I/O that allows them to be used in -> fail-safe systems.

According to IEC 61508:2010, a function that is implemented by a safety device in order to maintain the system in the safe state or bring the system to a safe state in the event of a specific fault. (fault reaction function -> user safety function)

Safety message frame

In → safety mode, data are transferred in a safety frame between the → F-CPU and → F-I/O, or between the F-CPUs in safety-related CPU-CPU communication.

Safety mode

1. Operating mode of → F-I/O in which → safety-related communication can take place using → safety message frames.
2. Operating mode of the safety program. In safety mode of the safety program, all safety mechanisms for error detection and error reaction are enabled. In safety mode, the safety program cannot be modified during operation. Safety mode can be disabled by the user (→ disabled safety mode).

Safety program

Safety-related user program

Safety protocol

→ Safety message frame

Safety-related communication

Safety-related communication is used to exchange fail-safe data.

Sensor evaluation

There are two types of sensor evaluation:

- 1oo1 evaluation – sensor signal is read once
- 1oo2 evaluation - sensor signal is read twice by the same → F-I/O and compared internally

Signature

→ collective F-signatures

SIL

Safety Integrity Level (SIL)according to IEC 61508:2010. The higher the Safety Integrity Level is, the more stringent the measures for avoiding and controlling system faults and random hardware failures.

With SIMATIC Safety, up to Safety Integrity Level SIL3 is possible in safety mode.

Standard communication

Communication used to exchange non-safety-related data

Standard mode

Operating mode of → F-I/O in which → safety-related communication between the F-CPU and the F-I/O by means of → safety message frames is not possible; only → standard communication is possible in this operating mode.

Standard user program

Non-safety-related user program

Startup of F-system

In the STOP/RUN transition of an → F-CPU, the → standard user program starts up in the normal way. When the → safety program is started up, all F-DBs are initialized with the values from the load memory - as is the case with a cold restart. This means that saved error information is lost.

The → F-system performs an automation → reintegration of the → F-I/O.

User safety function

The → safety function for the process can be provided through a user safety function or a fault reaction function. The user only has to program the user safety function. In the event of an error, if the → F-system can no longer execute its actual user safety function, it executes the fault reaction function: for example, the associated outputs are disabled, and the → F-CPU switches to STOP mode, if necessary.

Value status

The value status is additional binary information for a channel value. The value status is entered in the process image of the inputs and provides information on the validity of the channel value.

1: A valid process data is output for the channel value.

0: A fail-safe value is output for the channel value.
